The brood-space is then spread, as the queen requires space, but I am to get and keep every pound of honey in sections if possible until September, when they will be sure to store in honey for winter, in most seasons. I use only frames enough to accommodate the queen in the start, preferring to have all the bees at work on surplus. The same bees which draw out the first three combs will draw a fourth and a fifth, and care for the brood as fast as they are done, so I make the same amount of bees attend the queen, fill the hive with brood, and work on surplus.

Last year was one of the poorest honey years since I have kept bees; and yet my best colony—the only one that went into the honey-harvest in good condition—yielded very nearly 150 pounds of comb honey, which brought me more than \$19 in cash. Others—some of them very weak last year—used most or all of the clover crop to build up on; but note produced less than 40 pounds during the season. Seven colonies, all that the winter left me out of 47. gave about 475 pounds of comb honey during the season.

fast as they are tilled, or have bees to use them, taking cases in which the bees are at work (if honey is coming is colonies in short Langstroth frames, ing theory that has be the reason and experikeepers, it seems to me

and using "comb honey-racks" and sections, and all the usual fixtures, but perhaps less careful on the points I have urged above, reports from as good or better location than mine, 175 pounds of honey all told; and few reported any surplus around here last year.

Bees have wintered badly out-ofdoors in this locality for four years, but mine all wintered in the cellar. I have a remarkable crop of willow honey this year—ten-frame bives filled and new comb built from starvation fare.

Custer, & 111s.

For the American Bee Journal.

The Winter Stores of Bees.

#### JAMES HEDDON.

I am surprised at Mr. Clarke's claims on page 293. Is it possible that a man like Prof. Cook—a man we all have to look up to as authority in these matters—should "put a quietus on the 'pollen theory,'" and never realize it, but all the time think that he was stating truths that sustained it? Is it not more likely that Mr. Clarke and some others have understood only a part of the Professor's essav?

Mr. Clarke tells us that the pollen theory went down when Prof. Cook stated that bees could not breed without pollen, and that we know that they do breed in confinement and come ont in good health in the spring. Why, certainly, we knew this before the pollen theory was conceived, and this fact in no way disproves that theory. We are having a hard time to impress our opposition that pollen will not cause diarrhea in a bee, unless that same bee consumes the pollen. Bees making chyme to feed brood, do not consume the pollen, for two different individuals cannot both eat the same food. In my article on page 213 of the AMERICAN BEE JOURNAL for 1885, I quote from Prof. Cook as follows:

"The fecal mass is mostly in the intestines; sometimes it is so abundant as also to crowd the true stomach. It is not likely that the alimentary canal back of the honey-stomach, and true stomach, are ever used to form the larval food; I think not, back of the sucking or honey-stomach. If the pollen is used up for larval bee-food, it could not appear in feces."

Now this "fecal mass" is pollen first, and pollen last, and pollen all the time; and this "mass" is the cause of the intestinal disease that destroys our colonies in winter and spring. If it were true that pollen can, under certain conditions, be safely consumed in confinement, whether voided dry or otherwise, it still remains a fact that this ruinous fecal mass is pollen, and this fact leaves more of the "pollen theory" than is now left of any other wintering theory that has been sifted by the reason and experience of beekeepers, it seems to me I have no faith, however, in the "dry-feces theory." It seems to me that if that hypothesis were correct, it would have ceased to be a theory long before any of us were born, and would have been clearly defined science. I see no reason why this would not have been the case. On the other hand, it is only now and then that some one is able to find a few droppings that seem to be excreta, and in nearly every case chemical analysis proves they are not. On this point, last year, Prof. Cook said : "There is no foundation in the dryfeces theory, I am sure." Again : "Bees do not normally void feces in the hive, and never dry feces." I can see no place for the shadow of a doubt, hut that fecal matter is *the* cause of the all destructive bee-diarrhea; and that such matter is composed almost entirely of pollen, *i.e.*, its solid part the only damaging part.

The majority of the readers will recollect that about a year ago I sent specimens of excreta and pollen to Prof. Cook for analysis, and that he reported as follows:

"I have subjected the pollen to a very careful examination with a onesixth objective. I find several kinds of pollen grains, two of which are by far the most common. One is oval, rather pointed at the ends, with a longitudinal slit and numerous projections; the other is globular and thickly set with projections much like those in the other. I then studied the excreta, and had some one else made the change, I should have stoutly maintained that the objects were the same that I had just studied. The kinds of pollen were exactly the same in style and markings. The pollen you sent had been liberally appropriated by the bees whose excreta you sent."

I suggested that the Professor seek some diarrhetic specimens near his home, which he did, and reported as follows:

"I went to a neighbor's bees, all of which are dead. and I took three with long, black, turgid bodies and dissected out their alimentary canal as before. The stomach and intestines were fairly bursting with repletion; slight pressure sent the black, odorous excreta flying. This was almost one exclusive mass of pollen-grains held in a watery mixture."

A few weeks ago I mailed him specimens of diarrhetic excreta from 2 colonies that died with the disease, and the following is his report: "The thick feces is loaded with pollen of various kinds, and is largely insoluble in water. It has also many spherical fungi. The other also has much pollen, but less. It also has the spherical bacteria or fungi, and in addition, some forms which are chain-like in appearance. This is more soluble than the other, but after boiling for some time in water, there is quite a residue that is insoluble."

It will be remembered that I have all along declared that I believed the trouble rested with food and tempera-

ture, and that natural stores were not safe at all times and in all places, even if the temperature was kept up to a proper degree. I said that I did not believe that bees would devour bee-bread if not exposed to a low temperature that caused exertion, and consequent waste of tissue, but that I thought that our honey frequently contained an amount of floating pollen, that the bees necessarily consumed when such consumption could only end in diarrhea, and do no good in any direction.

Mr. Barber and others living in different localities, thought differently, and believed that temperature alone would insure success with good, average, natural stores. Their experience made it look so. I am not inclined to be bigoted, and I began to hope that they were nearly right. My "hope" was rather a larger share of wish than expectation. However, \$600 for sugar (cash down), with 20,000 pounds of honey unsold, was (and is) an argument in favor of natural stores, wherever they will do, and will be such until we can realize cash at will for our product, the same as for wheat, corn, etc.

I fed a part, and most of that part only part sugar - syrup stores. I tried damp and dry cellars; I tried fresh air and stagnant ventilation, or almost no ventilation at all. A beehouse was dry and ventilation reduced to the minimum; one cellar was damp, and nearly as poorly ventilated; another was dry and well ventilated; in all, the temperature was kept between  $45^{\circ}$  and  $50^{\circ}$ , Fahr. I could discover no effects from humidity or ventilation. No colony on all sugar syrup showed any signs of bee-diarrhea. Those with mixed stores had it only when they reached their natural stores, whether the change of stores was the cause or not. Over one-third of my colonies had it more or less toward spring; a portion died of it, and I am left on the old stand. Pure and only sugar syrup stores will warrant certain success in this locality.

Twice have I brought a large number of colonies through in perfect condition, with no pollen in the combs, and although they did not and could not rear any brood till they gathered new pollen, they were my strongest colonies when the surplus harvest came. The old bees, having vitality, did not drop away as usual, so when increase began it gained surely and rapidly. With my many experiments. I expected to lose a number of colonies, but that number was larger than I looked for, only proving against my desire, that I have been nearer right about the matter of food vs. temperature than I wish I was; and that I must look to cane-sugar for perfect success, or take the chances with natural stores. Dowagiac.  $\circ$  Mich

127 The 5th regular meeting of the Hill County Bee-Keepers' Association will be held on the first Tuesday in July, 18-65, at the apiary of Hon. J. M. McDaniel, of Peoria, Tex. At the same time and place will be held a bee-keepers' honey picnic. H. A. GOODRICH, Sec.

### For the American Bee Journal. Frozen Fish in Florida.

#### JOHN Y. DETWILER.

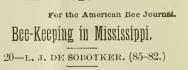

Shortly after sending my communication on page 60, I received the following which the writer wished me to reply to through the columns of the AMERICAN BEE JOURNAL. Realizing that it is outside of the style of articles usually sent to the BEE JOURNAL, yet to satisfy our friend an explanation may be in order. The writer says:

"In your communication on page 60 you say that 'fish have been frozen by the thousands, green turtles are floatiug on the water perfectly benumbed, etc." That is something that we Kentuckians never saw. Nor did I ever hear of fish freezing. Were they in the river, lakes or ponds ? Perhaps you are joking. Doubtless you are truthful, but the tale seems big. You promised to report later. Will you please give the readers of the AMERI-CAN BEE JOURNAL an explanation of your 'fish story ?'"—M. D. L. C., Texas, Ky.

Persons accustomed to write for the press are, from time to time, criticised more or less severely, especially if their statements seem exaggerated, or, as in this instance, "fishy." So far as my articles are concerned, criticisms are in order. Experience has taught me that individuals sometimes take exceptions to statements made, and a safe plan is to stick to facts, however subborn, and be sure authorities quoted are reliable. If by any means an individual is wronged unjustly in a communication, it is no disgrace to "come down like Crockett's coon," and make a satisfactory apology.

According to my observations the mercury sank to 20° above zero, the falling temperature of the day previous (Saturday, Jan. 9) caused the salt water to relinquish its heat, and the effect upon the fish was similar to a mixture of snow and salt to the hand. On the ocean beach but few fish were found except those usually found in shoal water. On the inside, or on the Hillsboro and Halifax rivers, also the Lagoon, the destruction was immense, especially among the trout. The fish were not frozen solid, as I do not remember of having seen any ice save in fresh water.

New Smyrna, O Fla.

We had some pretty high winds and chilly weather during the past week, but it has not prevented the bees from brood-rearing in the least. They are very active and busy gathering pollen and nectar; some of the colonies in "gums" are throwing out natural swarms with beautiful queens. I have now 50 gallons of honey of 11% pounds each. In bloom we have at

present white clover, wistaria-vine, grape-vine, and a very prominent and plentiful vine, calledhere the "poison oak," which resembles the Indian vine of the West Indies. It blooms where of the west findes. It blooms profusely, and the bees go wild over it; the bloom resembles that of the grape. It has three large leaves on each stem, and the flower growing just where the stem of the leaves join the branches. They are small, bunchy, white flowers. I should like to end out the name of it. We also to find out the name of it. We also have mustard, white clover, some hawthorne, and a few scattering locusts. I am told that in the woods near here can be found nearly all the principal annuals, perennials, shrubs and trees that are mentioned in Prof. Cook's Manual as growing in the several months mentioned therein, in the South, with the exception of palmettos, sumacs, black mangrove and magnolias—these latter grow in the State, but farther south. Will some one please say why the bees visit constantly the kitchen refuse-harrel, also the cooking water, coffee grounds, and also the contents of the dry-earth closet, etc. ? Can it be for the salt contained in these articles ? Since I noticed this, I have been sprinkling salt on a board close to this place, and the bees go heartily for it. Riverton, 9 Miss., May 22, 1886.

For the American Bce Journal Shooting into a Swarm of Bees.

#### G. P. HACHENBERG, M. D.

Sometime ago a fine, large swarm of bees rested on the top branch of a high live-oak tree in my apiary, be-yond all ready means of securing it. On the principle that a swarm will not bear much disturbance while it is forming a cluster, I took a shot-gun, loaded with fine bird-shot, and de-liberately fired into it. This brought at once to the ground some portion of the bees. As they were about fairly gathered again into a cluster, a serwant emptied the contents of his gun into the swarm. The bees now took wing, and went with precipitation back to their hive. I then secured them by artificial means.

A few days later another swarm located about the same place. I fired one shot into it, and it took wing and settled in another tree close by, lodging again inaccessibly high. I re-newed the firing into it, and the swarm again took wing as before and settled on another tree. The last settling of this swarm occurred withit, but to complete the experiment, I repeated the firing. The swarm now took wing again, diffusing itself considerably over the apiary as if greatly bewildered, and finally returned to its hive, where I secured it.

If the shooting is done at a long range, which should always be the case, there will be less bees sacrificed, than may at times occur in the ordi-

is sometimes necessary to secure it, and tends to drive it back home. Of course there is risk of killing the queen by this operation; but should that occur, the loss would not be serious, as the bees are forced back to the hive, and there resume work as a powerful colony. A few days ago, a single shot into a swarm, that took its position on a high tree, brought it back to its hive. I left it there to await results.

This method of treating bees may meet with criticism, at least where shooting is not rife, as deprecatingly as it is said to be in Texas. Although I am not much inspired with sentiment for the bee. I would not kill one unnecessarily; indeed, I often pity-ingly help them out of the toils in liquid honey. But when they come into the way of a rational experiment. If fear I regard their lives but at their commercial value. I take pleasure in managing bees, as all their operations are exceedingly interesting, but that pleasure, too, savors much of the excitement of a war with an enemy that is vicious, treacherous and thievish in an extreme degree.

Austin, O Texas.

### Are Bees Taxable Property ?

### J. E. POND, JR.

On page 309, Mr. T. B. Blair asks the above question. There is no question as to whether bees are property or not, and all will admit that they have a marketable value. With this admission is there any reason why they should not be taxed at their full value, the same as any other property? If the question had been asked, are bees taxed as property? I should say, as a rule they are not. This, however, is the fault of the assessors (and, as some might say, fortunately so); but to the abstract question of whether bees can be legally taxed, I say most emphatically yes; unless the statutes expressly provide to the contrary!

Custom is said to make law; this idea is only true in a measure, and cannot be made to apply to the question at issue. Some classes of prop-erty, for reasons of public policy, are exempted by statute from taxation; bees in my own State are not, although I do not know of a single instance where they have been made the subject of taxation. Probably bees will not be taxed in any State unless a "hue and cry" is made in regard to the matter, and my advice is, if you do not want to have the assessor ask you the value of your bees, to keep quiet and say nothing about it.

It is true that bees are uncertain property, but we pay taxes on our horses, cattle and sheep; four-legged chattels are as "unsartin" at times as are our winged pets, and there is no more reason in avoiding the tax on than may at times occur in the ordi-nary method of hiving them. This heroic treatment will force the swarm to change its position, which

that a tax can be legally assessed and collected on bees, at a fair valuation, the same as on any other class of personal property, unless an express statute exists, exempting them spe-cially from such assessment.

### Northern Ohio Convention.

The Northern Ohio Bee-Keepers' Association held its convention in the Town Hall at Wellington, Ohio, on April 30, 1886, President Daniel White in the chair. The Secretary's report was read and accepted. The Treas-urer's report showed a balance of \$14.95. Seven dollars and seventy-five cents was allowed the Secretary for

The election of officers resulted as follows: Pesident, H. R. Boardman, East Townsend; Vice-President; C. McClave, New London ; Secretary and Treasurer, H. W. Minns, New Lon-

don. The Secretary read a communica-tion from Mrs. C. Robbins, of Indianapolis, Corresponding Secretary of the North American Bee-Keepers' Society.

The programme for the day was announced by the Secretary. The first was an essay by M. W. Shepherd, on "Spring Management." It was an able essay on this subject, advocating the feeding of maple sugar early, to stimulate breeding, and the use of division-boards to contract the space to the size of the colony. These were considered indispensable by all pres-ent. The convention then adjourned ent. The cuntil 1 p.m.

#### AFTERNOON SESSION.

At the appointed time the President's gavel brought Mr. S. F. New-man to the front with his subject as per programme, viz: "Bee-keeping as a business." He described vividly the expectations and disappointments of bee-keeping, saying that thousands of dollars have been thrown away by beginners who are lured to the business by the glowing accounts of the bee literature of the present age; and although he had "great expectations" for the future, he could not be induced to engage in bee-keeping ex-clusively. Mr. Boardman had made it his entire business, and could say that it was his only source of income, and can attribute his source of income, and can attribute his success to un-tiring industry and close attention to details. Mr, Knapp had by figures proven his bees to be the best paying thing on his farm. But he would not like to mortgage the farm for more mutical to improve the farm for more capital to invest in bees and fixtures.

The unanimous voice of the assemblage would advise a beginning with few colonies, and increase as experience and capital were obtained from the business. Mr. Smith asked if failure was a necessity, and was an-swered by Mr. Newman in the nega-

sections below those that are nearly or quite finished. In case of swarming, he follows up the working bees with their unfinished work, putting combs into the brood-chambers of the new home

Mr. S. F. Newman said that a brood-nest of the Simplicity hive was too large for comb honey. He would contract it by division-boards. He places a comb of sealed brood in the upper story to encourage the bees to go into the sections. He also said that their is more profit in extracted honey at 10 cents than comb honey at 15 cents per pound. Mr. White produces extracted honey almost exclusively. Mr. Boardman, who reports 550 colonies, has not used his extractor for years.

An essay on the "Best method of increase," was read by Daniel White. He had found that by the purchase of 3-frame nuclei in the spring of 1885, he could increase the number very rapidly. Such a method, how-ever, did not at once increase his bank-account. The discussion presented many ways of increasing. Reports of wintering from those present showed a loss of 55 colonies out of

1,127. The convention then adjourned to October, at Norwalk, Ohio. H. W. MINNS, Sec.

For the American Bee Journal.

# My First Bee-Hunt.

J. H. ANDRE.

Many years ago my father was away from home in the fall of the year superintending a job of work, having left a younger brother and myself to finish up the late harvest and attend to the stock, etc. One day in the latter part of September, I ascertained that bees had been seen getting water at a creek about half a mile distant, and as it had been well known by many that an old resident bee-tree had been lined to the hills near this place, and none of the hunters had been lucky enough to secure the prize. I thought that I would try my boyish skill. I had accompanied other members of the family in their hunts, but had never gone alone.

After getting the work for the day done, and the necessary accoute-ments ready, I set out one day at 2 p.m. I found the bees on the flowers, and caught some and put them to work on a piece of comb containing sugar syrup. Sure enough, when filled, and after much circling, they started up the mountain on the line of the famous old tree. A creek run at the foot of the mountain, but my boyish blood was up, and pulling off boots and socks I waded through and started along the line which ran diagonally up the mountain, which stood at an angle of not less than 55°. diagonally' up the mountain, which sunshing April is to have the best stood at an angle of not less than 55°. stimulating conditions possible. It is Tree after tree was eagerly scanned our cold, damp, cloudy, backward for one-third of a mile or so, when I springs that do the mischief. Here came to a large pine stub that had been broken off by the wind some 30 feet or more from the ground. It years. During such seasons bees die

proved to be hollow 15 feet from the ground, and a woodpecker had made an opening for a nest years before, which made an entrance for the bees, and the prize was mine.

On arriving at my home and telling my brothers of my success, all agreed that it was the tree of old, and were eager to see it downed. After dark several of the neighbors were invited, and we started off. By an oversight we had but one ax, and after a few blows the helve broke off close to the eye. Fortunately it was a single-blade, and a fire was built, the piece burned out, and the helve put in again, which took until late in the night.

The tree was felled and a slab cut out of the side, when it was found to contain comb 6 feet in length, and the diameter of the hollow was fully 18 inches. Every inch of space was filled, but as the comb was so old not one-half of it was filled with honey, and we secured only 130 pounds. The colony must have been at least ten years old. We could not carry the dry comb that evening, and it was piled up, and the tree being dry, it all took fire a few minutes after we left, and made a splendid bonfire. Lockwood, 9 N. Y.

# For the American Bee Journal. What to do with Weak Colonies.

4-GEO, F. ROBBINS, (60-58).

The recent reading of the answers to Query, No. 246, "When to unite weak colonies," and Mr. Doolittle's pamphlet detailing his method of management, have prompted me to write this article. Mr. Doolittle is, about right in saying that when several colonies are united into one in early spring, that that one is very likely to die after all. I am not yet satisfied whether it is better to unite thus, or not, except when one colony is queenless; in that case, unite by all means.

But Mr. Doolittle agrees with a number of other answers to this query, that it is better to build up weak colonies. By analogy it would be better for me, if I owned one acre of land, to start a gold mine on that acre than to plant it in cabbages. I have found that many times it would be about as easy to do the latter as the former. Do what I may to build up, often while the weak colonies do not increase, the strong ones dwindle. Such has not been the case so much Such has not been the case so much this spring. I have not endeavored to build up the few weak colonies I have, but I have not had a case of dwindling except in case of the loss of the queen. The reason is that the season, especially during April, has been favorable. To have a warm, sunshing April is to have the best stimulating conditions possible. It is

off just about in proportion to the effort made to strengthen them.

Mr. Doolittle's method of building up colonies is essentially as follows: If a colony has two frames containing brood he inserts a frame of honey with the capping broken, in between them. At the end of about a week he inserts another frame in the broodnest in like manner; in another week. another frame, and so on. At the end of three weeks the first frame of brood begins to hatch, and, according to my experience during our back-ward seasons, at this time those three frames of brood is about all you will have left. If there are plenty of stores in the hive, or coming in, the instinct of a good queen is to fill five or six frames with brood as rapidly as the bees are able to feed and protect eggs in a cell, confining herself to two frames, and all my efforts to build that colony up by inserting frames of hatching brood and of honey failed. The outside frames would be left empty as soon as the old brood hatched out.

I am aware that sometimes conditions that might have been remedied, helped to cause this failure, namely, a flat or shaded location. But other colonies well situated did not fare very much better. Now, what shall we do? If we can neither unite nor build up to advantage, what shall we do? To a large extent we can do nothing. I have about become convinced that all we can do during such vernal seasons as I have described, is to confine the bees to the number of frames they can cover well, see that they have plenty of good stores, pack them dry and warm, get them into a dry place in the sunshine, and leave them alone until settled warm weather.

Unfortunately such weather and white clover have been pretty much in the habit of coming on together, in this latitude, about June 1; but to us who run chiefly or only for honey, I think this is not necessarily so great a misfortune as it appears to be. Unless our winter losses have been bives and fixtures cost money, and that the honey-yield of any field is limited, very much increase is not profitable. With the swarming instincts that my bees have, I always have to do some uniting to avoid this over-increase of colonies. In doing this I have utilized such weak colobuild them up. The first swarm that issues I hive on the old stand. The old hive I place down beside one of these weak colonies, and in the even-ing, or in a few days, I unite them, giving the extra frames to a colony work to more than a set of the set of th not so weak, or putting them any place where I can use them to advantage. I have had colonies thus formed go to work in surplus boxes in three days thereafter, and cast a swarm in about two weeks.

Mechanicsburg. O Ills.

The next annual meeting of the Michigan State Bee-Keepers' Asso dution will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. II. D. CUTTING, Sec.

Good Prospects in Canada.-R. F. Holtermann, Brantford, Ont., on May 22, 1886, says :

Reports from various quarters state that there have been several natural Everywhere bees are in condition. Prospects in swarms. splendid condition. Canada never were better for an abundant honey harvest.

Taxing Bees.-L. A.Dosch, Miamisburg, • O., says :

I have always paid taxes on my bees. They are listed on the asses-sor's printed blanks the same as any other agricultural stock. The assessor asked me how many hives of bees I had; I told him, and he put his own value on them at \$3 each, without seeing them.

Excellent Spring for Bees.-H. L. Wells, Defiance, O., on May 24, 1886, writes:

I began the winter of 1885-86 with 53 colonies—47 on the summer stands, and 6 in the cellar. Those put into and 6 in the cellar. Those put into the cellar were very weak, and would not cover more than one frame, with the exception of one colony. I lost 3 outright, 3 became queenless, and I united them with others to save them. I sold 3, and I now have 44 splendid colonies, most of them occupying from 16 to 20 frames in both upper and lower stories. I am looking for swarms every day. I saw the first white clover bloom on May 15. Locust and raspberry are in full bloom, and white clover will be out in ten days more, I think. It has been the best spring I ever have known for bees. If the season continues as it has begun, I will get from 100 to 150 pounds per colony.

Heavy Yield Expected.-Reuben Havens, Onarga, & Ills., on May 18, 1886, writes :

spring for bees within my recollection. the income of honey, which means two weeks before I had put into each

There have been but very few days since the first fruit bloom that the bees have not been busy gathering either pollen or honey, and have built up very fast. I had a fine swarm on May 15, nearly a month earlier than usual. My hives are full of bees, and many of them with the bees clustering on the outside. White clover is commencing to blossom, and I see that the bees are already working on it. I think I never saw a finer growth of clover. If the weather continues as favorable as the past month, there will be a heavy yield of honey. There is not more than one-third as many bees here as there was two years ago, some having lost all they had. I know of but two or three persons that have as many colonies as they had two years since. There is but little of last year's crop of honey on hand in this part of the State.

Convention at Kiel, Wis. - Ferd Zastrow, Millhome.o+ Wis., its Secretary, reports as follows:

The Wisconsin Lake Shore Center Bee-Keepers' Association met at Kiel, Wis., on May 20, 1886, with President E. Peterman in the chair. About 40 bee-keepers were present, and the list of members was increased by 12 new ones. The convention was an enthusiastic one, different essays were read and discussed, and listened to with great interest. Four hundred and eleven colonies were reported in good condition, mostly by farmers that keep from 2 to 20 colonies for home use. They were nearly all in favor of out-door wintering, the hives packed in chaff. The annual meeting will be held on Oct. 7, 1886, at 1 p.m., in Koehring's Hall, at Kiel, Wis.

Nothing for Bees to Gather.-G. M. Doolittle, Borodino, N. Y., on May 24, 1886, says :

I notice on page 307 that most of the bee-keepers of the United States are having a joyful time with bright prospects ahead. Well, I am glad of it, even if I am now compelled to feed my bees to keep them from eating and destroying their brood. Our spring was tine until fruit bloom, so that the bees reared lots of brood, and consumed most of their old honey, making them now strong in numbers. During fruit bloom it was cool, cloudy and rainy, so that the bees could not work; now it is warm and fair, but there is nothing for them to get; the result is as above.

Worth Ten Times its Cost.-E. Kretchmer, Coburg, 9 Iowa, writes:

I have had the pleasure of hastily examining Dr. Miller's new book, "A Year Among the Bees," and I find it brimful of practical directions for "making dollars ont of bees." For years we have had Simplicity hives, and now we have "Simplicity Man-agement" in Dr. Miller's book; for from first to last he guards against all This has been the most favorable avoidable expenses, and works for

money. Although an "old stager" among bees, I can find a great number of points that are worth to me more than ten times the cost of the book. I would advise all to obtain a copy, and I am confident that even the most experienced bee-keeper will find something in it worth more than the cost of the book, which is, in addition to its valuable contents, printed on good paper, in clear type, and excellently bound in cloth.

Good Increase.-Theo. Alexander, Bowling Green, vo O., on May 26, 1886, says :

1 have 2 colonies that have cast 7 good swarms, the first came out on May 3, and the seventh on May 22. Who can show a larger increase?

Cellar Wintering, etc.-J. Jardine, Ashland, 0+ Nebr., on May 24, 1886, writes:

I got over 3,000 pounds of honey last year, and it is all sold now. I could have sold much more if I had had it. It was all in one-pound sections, and all gathered from the heart's-ease. from Aug. 15 to Sept. 20 is our honey-flow in this part of the State. On Dec. 12, 1885, 1 put into winter quarters 105 colonies, keeping the tempera-ture in the cellar at from  $40^{\circ}$  to  $45^{\circ}$ 9, and found 103 colonies strong in bees, and 2 of them queenless. They went to work in a few days after they were out, and to-day I had a fine swarm. The cellar wintering is good enough for me. I hope we will have a good year for honey. A few days since I got two fine Carniolan queens that they were a for a fine a fine a fine a fine a fine bat two more of form imported to be that were reared from imported stock. They are fine looking queens, and I introduced both nicely in 24 hours. what the bee that produces the nicest white comb honey. I have tried the Italians, the Germans, the Albinos, The Albino is a fine bee, a good etc. worker, and very gentle; but the Syrians are too cross for me, at times. I use mostly the 8-frame Simplicity hives, and like them very well, so far.

Feeding Plant-Louse Nectar.-L. Reed, Orono, Mich., on May 24, 1886, writes:

My winter loss was 20 per cent. My whiter loss was 20 per chine previous to April 12, when I put them out to stay, and they were in splendid condition, hives full of bees, and they seemed to be doing finely. They seemed to be doing finely. They worked very strong on willow and soft maple, and the prospect never was better for the time of year. On May 7, upon going into the bee-yard, I noticed bees on the outside of seyeral hives, and the ground literally covered with bees crawling in every direction. They could not fly, and seemed to be crippled. They were mostly young bees. My first thought was that they were starving, but on examination I found that they had plenty of honey. There is only one way that I can account for it. About

of 10 lives one frame of plant-louse nectar all capped over, about 6 pounds to the frame. This honey I got of my son whose bees all died. I had Iny son whose bees all died. I had about 80 pounds of it, and I supposed that it would be safe to feed bees when they could fly every day. These 10 colonies were affected the worst. The rest of the honey I had at the same time I put out, so that they all helped themselves. A few colonies died with brood in the combs. They are over it now, but two-thirds of them are very weak, and one-third of them that were not affected are strong, and will be ready for the raspberry which will be in bloom in about a week. Some of my neighbors think that the bees were poisoned, but I cannot think so. Will some of the prominent bee-keepers give their opinion about this case? I picked up some of the bees and put them back into the hive, but they ran out as quickly as possible. It was a sad sight for me. I never have seen any-thing like it, and I hope never to see the like again.

Storing Honey Finely.—G. W. Rankins, Weston,+o Ky., on May 21, 1886, says:

Bees are storing honey finely now. I wintered my bees on the summer stands; put away 10 colonies, and had 9 this spring. I lost one by starvation. I have had 2 nice swarms, one on May 13, and the other on May 14. I think that we will have a good honey harvest this year.

Bees Taxable in Indiana.-D. C. Noble, Larwill, & Ind., says:

On page 309, Mr. T. B. Blair asks, "Are bees taxable property?" In this State bees are taxable property, valued at one or two dollars per colony. They are assessed on April 1 of each year. We also pay ene dollar per head on dogs.

Frost, Feeding Bees, etc.—Fred F. Rockwell, Leonard, & Texas, on May 21, 1886, writes :

On March 28 we had a heavy frost, followed by cold rains, which was followed by a storm that destroyed all blooms on plum, red-bud and haw, that the frost had not killed; and also attacked the elms, so that they looked as though a fire had run through them. I at this time was away on the farm and did not notice the bees for a week or so, and in fact I rather looked for swarms. Easter Sunday I noticed my "first swarm" hanging on a peach-tree. I hived them, and about 3 p.m. they came out of the new hive and settled on another hive containing Italian bees. I then gave them two combs of brood and bees from a strong Italian colony, and changed their stands, and they remained all right, and went to work. A few bees were flying around a hive that had a strong colony, which attracted my attention, and on opening it I found eggs, unsealed and sealed brood, but no honey and no bees. So

the "first swarm" undoubtedly came from this hive, having deserted it. On Monday morning Hooked over the entire yard, and found the bees actually starving and dying in April in Texas. All drones had been killed, and my only fair colonies were the ones that were comparatively poor before. Will some one advise me of the best way to feed bees under such eircumstances, so as to build them up the most rapidly? We have had a splendid flow of rattan honey, and the colonies that are strong are doing rapid work, and are storing surplus boney. It seems strange though not to see a drone or to have had a prime swarm yet. It is my first experience of the kind. I hope to have my bees in good condition for the horse-mint, should that plant yield any honey.

Bees Heads and Honey-Cells.—R. Woodward, of Cheltenham, England, writes:

I have lately discovered a curious connection between the head of the worker bee and the honey-cell, which may perhaps throw some light upon comb-building. Suppose a worker bee's head is severed from its body and laid flat on a sheet of paper, the angle which would be represented, if lines were drawn on the paper along and beyond the side of its head, would, by careful measurement, be found to contain  $60^\circ$ . Now, as the angle formed in the honey-cells contains  $120^\circ$ , it will be seen that this angle is just double the size of the one formed by the bee's head, or if we place two bees' heads side by side, we shall then obtain the exact angle of the honey-cell or hexagon, namely, an angle equal to  $120^\circ$ . This is surely a singular coincidence, as the worker bee, apart from instinct and reason, seems to contain *in the shape of its head* an angle-setting-out instrument suitable to the construction of the cells that it has to build.

"Balling" Queens, etc.-W. S. Douglass, Lexington, Tex., on May 12, 1886, writes :

A great many bee-keepers think that when they see bees "balling" their queen that they intend to kill her. This, however, is not always the case. Bees often "ball" their queen to protect her. I had a second swarm the other day, and I made then very wet; I then shock them into a tin pan and then poured them on an old door laid down flat. I saw that they had two queens. By that time a swarm came out of another bive and commenced to settle with this swarm on the door, the bees of which were so wet that they could not fly. As soon as they commenced settling with the swarm on the door, I watched them. Of course I could not have known them apart if they had not been wet. I saw them make for their queens, and I thought that they intended to kill them. On each queen there was a lump of bees as large as a hen's egg. I then began to rake them off, and was surprised to

find that not a single bee was trying to hite or sting their queen. They were protecting them from the other bees. The same is true when a col-ony of bees are being robbed. As soon as the robbed colony finds that they are being robbed, and robbers are inside of the hive. they at once cover their queen for protection, and if the robbing is not stopped in a day or two the queen will surely die; for they will stick to her till the robbers leave. The queen either dies from fear or smothers; I have not been able to discover which. Bees are working on the persimmon now. The horse-mint is commencing to bloom, and the hives are overflowing with worker bees. Some of my hives I believe have a half bushel of bees hanging on the outside. I expect many swarms during horse-mint bloom.

Working on Locust, etc.-T. F. Kinsell, Shiloh, & O., on May 25, 1886, writes:

Colonies are very strong, and are working now on locust and raspberry. White elover is just commencing to bloom. Without a dronth or excessive rains, we have no break in honeyflows, up to the close of white clover bloom, and the season so far has been much better than the average. Last year was not a good one for bees, and the winter losses previous to that season, left bee-keepers pretty blue.

Preventing Increase.—Mr.3 H. M. Parker, Plymouth, & O., on May 25, 1886, writes:

Can I keep the bees from increasing by managing them in this way ? After the swarm issues, put all the frames containing brood in the lower story, and tilling it (the lower story) out with frames of foundation; then put the frames containing honey in the upper story, tilling out with frames of foundation; then run in the swarm or put on the top story, after hiving the swarm. I could place a frame of foundation between the frames of brood to change the interior of the hive so that the bees would hardly know it was their old hive. When the upper story is filled with honey, I can extract it. I have never read or heard of this way; will it work ?

[Yes, if you cut out the queen-cells, you will prevent immediate increase, and in the interim other conditions may surround that will prevent their swarming for the season-perhaps a copious honey-tlow. But why do you use a brood-chamber so large that only part of the combs are filled with brood? Is this economy? Again, I do not want combs built, or drawn, between completed combs. Such are apt to be made unnaturally thin. In my locality, colonies treated as you describe are almost sure to repeat swarming within 10 to 15 days. Besides this, your plan has proven by repeated tests to be too laborious for practical adoption in large apiaries. We want, and I think we will get, something better and easier .- JAMES HEDDON.

Issued every Wednesday by THOMAS G. NEWMAN & SON. PROPRIETORS.

923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAGER.

To Correspondents. -- It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list. ----

When Renewing your subscription please try to get your neighbor who keeps bees to join with you ln taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information over put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides their own, with \$3, for one year, we will present a copy of this valuable book.

Our New Catalogue of Bee-Keepers' Supplies for the spring of 1886, is issued, and will be sent to any one desiring a copy. Send name and address, plainly written, on a Postal Card for it.

" Don't Stop "-that is what many write to us about their papers, when their time is nearly out. One subscriber says : "This has been a year of disaster, and it is not eonvenient for me to send you the money now to renew my subscription. It runs out with this month; but don't stop sending it. I will get the money to you within three months." Such letters are coming every day, and so for the present we have concluded not to stop any papers until requested to do so.

The Convention History of America and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.15.

#### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 10 a.m., May 31, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO.

IIONEY.-Comb is coming forward more freely and prices now are 15@16c, for 1-lb. sections. Ex-tracted is in light demand at 5@7c. Comb honey, in 2b, sections, 9@12c. BEESWAX,-23@24c, per lb. Not much offered. R. A. BURNETT, 161 South Water St.

#### NEW YORK.

. NEW YORK. IIONEY.-We now quote: Fancy white comb In 1-lb. sections, 12@13c.; In 2-lb. sections, 9@10c. Fancy buckwheat boney in 1-lb. sections, 9@; in 2-lb. sections, 7@8c. Of grades 1@2c. per lb. less. Extracted, white,6@7c; buckwheat, 5@5%c. Cali-fornia, 5@6c.; Southern, as to color and flavor, per rallon, 50@60c. BEESWAX.-27@28c. MCCAUL& HILDRETH BAOS., 34 Hudson St.

BOSTON.

HONEY.-One-lb. sections, white clover, 19@15c; 2-pound sections, 11@13c. Extracted, 6@8c. BEESWAX.-25 cts. per lb. BLAKE & RIPLEY, 57 Chatham Street.

#### SAN FRANCISCO.

IONEY.-The Brst new comb honey of the sea-son-a sample lot of extra choice-brought 14 cts. We quote: White to extra white comb, 110914 cts; amber, 7600c. Extracted, white liquid, 4½63c; light amber colored, 4 to 4½c; dark amber colored, 3½ to 3¾ cts. BEESWAX.-Quotable at 20 to 24 cts. O. B. SMITH & Co., 423 Front Street.

#### DETROIT.

HONEY.-The market is almost bare of comb honey, and very little is wanted. Best white in 1-ib. sections 14 cts. BEESWAX.-Scirce at 25c. M. H. HUNT., Bell Branch, Mich.

#### ST. LOUIS.

HONEY.—Choice comb, 10@12c. Strained, in barrels, 4@5c. Extra fancy of bright color and in No.1 packages, ¼ advance on above prices. Ex-tracted in barrels, 5@5%. BEESWAX.—Firm at 22c. for prime. D. G. TUTT & CO., Commercial St.

#### CINCINNATI.

HONEY.—Trade is perhaps duller than usual. We quote : Extracted honey brings 4@8c, and choice comb honey brings 12@15c, ha globbing way. BEESWAX.—In demand at 20@25c. for yellow. C. F. MUTH & SON. Freeman & Central Ave.

#### CLEVELAND.

HONEY,-There is an excellent demand for best 1-b, sections of white honey, and all arrivals sell readily at 14c. 2-15b, and glassed sections sell slowly at 12c. Extracted, 7@8c. BEESWAX.-Scarce at 25@28c. A. C. KENDEL, 115 Ontario Street.

#### KANSAS CITY.

HONEY.-Sales of comb are good, while extrac-ted is very dull and low. One-pound sections are scarce: tocks of all other grades are well supplied. Calif. 2-lbs. bring 11@12c.; Eastern 2-bs., 12@13c.; 1-bs., white, 14@15c.; dark, 12@13c. Extracted 5@6c.; Southern, 3½@4c. BEEESWAX.-23c.

CLEMONS, CLOON & CO., cor. 4th & Walnut.

#### MILWAUKEE.

HILWAUKEE. HONEY.-The market seems quite dull for all qualities of comb honey, with but a moderate de-mand for extracted. We quote : Cholce, white j-lb. sections, 17618c.; the same in 2-lbs., 166017c.; dark 2-lbs., 156016c. Extracted, white, in barrels or keys, 7680c, dark, in same packages, 66075c. BEESWAX.-24625c A. V. BISHOP, 142 W. Water St.

To any One sending us one new subscriber with their own renewal (with \$2.00), we will present a copy of the new "Convention llistory of America."

To give away a copy of "Honey as Food and Medicine" to every one who bnys a package of honey, will sell almost any quantlty of it.

#### **OUR CLUBBING LIST.**

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

Price of both. Club The American Bee Journal ...... 100..

# The NEW Heddon Hive.

We have made arrangements with the Inventor by which we shall make and sell the Heddon Reversible Hive, both at wholesale and retail; nailed and also in the flat.

The engraving gives a good idea of the bive. The brood-chamber is in two sections; also the surplus arrangement, which may be interchanged or inverted at will. The cover, bottom-board, and top and bottom of each sectional case has one-half of a regular bee-space, so that the surplus cases with the sections, may be placed between the two brood-chambers, or the latter may be transposed or inverted—in fact, all parts of this hive are perfectly interchangreable. The behood-frames will ALL be bored for wires.

ALL be hored for wires. A SAMPLE HIVE includes the hottom-board and atand; a slatted honey-board, and cover; two 6-noch brood-chambers, each containing 8 frames; two surplus arrangements, each containing 8 frames; two surplus arrangements, each containing 8 sone-ponad sections, one with wide frames and acpara-tors, and the other without separators. This latter chamber can be interchanged with the other stories, but cunot be reversed. It is NAILED AND PAINTED, and ready for immediate use. Price, \$4.00, complete.

It is absolutely essential to order one nailed hive as a pattern for putting those to the flot together correctly.

HIVES READY TO NAIL—In filling orders for these bives, in the flat, we make 6 different com-binations, so that our enstomers may make a selection from the sample nailed bive, witbont waiting for us to quote prices, and the different kinds will be known by the following numbers:

No. 1 consists of the stand, bottom-board, cover, two 6-inch brood-chambers, 16 frames, and the slatted honey board. Price, \$1.55 each.

No. 2 is the same as No. 1, with the addition of one surplus story containing 28 sections without separators-interchangeable, but not reversible,-Price, \$2.00 each.

No. 3: is the same as No. 2, with two surplus storles as therein described. Price, \$2.50 each.
 No. 4: is the same as No. 1, with the addition of one surplus story containing 28 sections in write frames with separators, which can be reversed, inverted, and interchanged, the same as the brood-coambers. Price, \$2.30 each.
 No. 5: is the same as No. 4, with two surplus arrangements as therein described. Price, \$3.00.

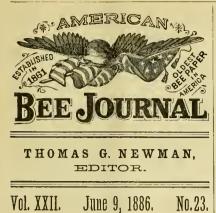

No. 6 contains all the parts as described in the sample nailed hive. Price, \$2.75 each.

sample nailed hive. Price, **\$2.75** each. Those desiring the hives *withpatt* the stand, honey-board or sections, may make the following deduc-tions from the above prices : Stand, 14 cents; honey-board, × cents; and the 28 or 56 sections, as the case may be, at ½ cent each, respectively, We will also make the following deductions on quantities ordered all at one time : For 10 or more hives, 5 per cent. discount; for 25 or more hives, 7 1-2 per cent.; for 50 or more, 10 per cent.

THOMAS G. NEWMAN & SON. 923 & 925 West Madison-St., CHICAGO, ILL.

Doolittle's Queens.

There's Always a river to cross, Always au effort to make, If there's anything good to wiu, Any rich prize to take.

The rougher the way that we take, The stonter the heart and the nerve; The stones in our path we break, But ne'er from our impulse swerve;

For the glory we hope to win, Our labors we count no loss ; Never pause and murmar because Of the river we have to cross.

Tycard Sons, Pittsburg, Pa., have sent us their price list of Glass Honey Jars.

The Cincinnati Exposition opens on Sept. I and closes on Oct. 9, 1886. This is the thirteenth annual exhibition. Full particulars may be obtained of L. H. McCammon, the Secretary, at Cincinnati, Ohio.

. . . . . . .

A Queen-Introducing Cage, from Peter Brickey, Lawrenceburg, Ky., is en our desk, and as requested is placed in our Museum. It is similar to the one illustrated in "Alley's Bee-Keepers' Handy-Book," on page 204.

The Hasilian Friars, of Northern Greece, for a breach of one of their rules, sentence the offender to a week's "Lenten fare," consisting of "milk, barley-bread and honey"-not a very disagreeable sentence we should imagine.

We have Received from the publisher, Mr. A. I. Root, Medina, Ohio, T. B. Terry's new book on "The Winter Care of Horses and Cattle," considered from a humane point of view, as well as from a dollars-andcents view, and a consideration of the relation one bears to the other. Price 40 cents. It contains 50 large pages, and points out with certainty and in detail the most humane and profitable treatment for horses and cattle. It can be obtained of the publisher or at this office.

**Hee-Suit in California.**—On page 358 the statement is made that this suit has again been lost. Mr. Bohn has asked for a new trial, claiming that the jury were instructed erroneously by the court on the meaning of the words "willful" and "negligence." That our readers may see what these instructions were, we copy some of them as follows:

The word willfully, when applied to the intent with which an act is done or omitted, applies simply a purpose or willingness to commit the act or make the omission referred to. It does not require any intent to violate haw or to injure another or to acquire any advantage.

The word negligence imports a want of such attention to the nature or probable consequences of the act or omission as a prudent man ordinarily bestews in acting in his own concerns.

It is negligence in the owner of bees to keep them in such a manner that they trespass upon and injure the property of another.

It is a well established rule of law that every person must so use and control his own property as not to injure the property of any other person.

If you find from the evidence that the defendant's bees did injure the plaintiff's grapes either while said grapes were on the vines or while they were drying on trays, then defendant is responsible to plaintiffs for such injury, and it is for you te determine from the evidence in the case the amount of money that will compensate plaintiffs for such injury.

plantiffs for such injury. Although a person can only have a qualified property in bees, the person having them in his possession is liable for any injury they may do to the property of another person : and they are in the possession and under the control of the owner of the hive as long as they continue to use the hive as long as they continue to use the hive as their home. The owner of the hive does not cease to be the owner of or lose his control of the bees simply because they are off of the owner's premises gathering honey or pollen to store in the hive in accordance with the usual habits of the hive, escape from the owner of the hive and their identity is lost, that the owner of the hive ceases to be their owner.

Trespass is any misfeasance or act of one man whereby another is injuriously treated and damnified either in his person or property, and the term any misfeasance signifies the doing of a wrongtul act or the improper performance of a lawful act, and the Court instructs you that the bee-keeping and culture of bees in aplaries is a lawful occupation.

National Bee-Keepers' Union.-On page 357 will be noticed a portion of the First Annual Report of the Manager of the National Bee-Keepers' Union, which is now being sent to all the members, with a blank voting paper to be nsed in voting for officers for the ensuing year; together with a call for dnes (25 cents) and one assessment (\$1) for the year commencing on July 1, 1886.

In order to explain and answer some inquiries we will add that the Union is a voluntary affair. To remain a member requires 25 cents a year annual dues, hesides the assessments called for. If the assessments or dues are not paid within the specified time — membership ceases; all claims against former members are lost, and all claims to the protection of the Union are dissolved. It is not intended to have more than one assessment a year, unless some urgent case should make it necessary, and then there are but few who would not cheerfully respond to a call for an extra dollar.

The California Honey Crop for the present year gives promise of being large and of excellent quality. A trade eircular from San Francisco remarks thus;

The promised abundance of honey this season, the liberal supply now in foreign markets, and the extreme chcapness of almost every article of consumption, especially of sugars, syrups and the like, which come into competition with honey, make it altogether improbable that anything approaching fancy values will be realized, although for superior qualities comparatively good figures may be obtained, provided we are favored with free foreign orders. The first new comb of the season, a sample lot of extra choice, hrough 14 cents,

The California Grocer says that the crop of 1885 was about 1,250,000 pounds. The foreign export from San Francisco during the year was approximately 8,800 cases. The shipments East by rail were 360,000 pounds from San Francisco, and 910,000 pounds from Los Angeles, including both comb and extracted. We notiee that another California paper estimates the erop of 1885 at 2,000,000 pounds, and the crop of the United States for 1885 was put down at 26,000,000 pounds. We do not think these figures are quite large enough, though it was an exceedingly poor crop.

**Barrels** for extracted honey is an important item. Much good honey is ruined by being put into old molasses and whisky barrels. Some very foolish persons have used old kerosene barrels for extracted honey. One case of the latter came under our notice only a short time age; and of necessity the honey was entirely spoiled. It is a mistake to use very large barrels; they are se troublesome to handle, and generally hold too much honey to be easily sold.

The best packages are soft-wood kegs made of "Norway pine." They are convenient to handle, and are well suited to cater to the popular demand for hency in small packages. When compared with large barrels holding from 300 to 500 pounds each, they are fully as cheap and often cheaper. They need no waxing, but should be thoroughly scalded with boiling water before used, but not "soaked." Considering the cost and trouble of waxing, the less of honey by leakage, and the ease with which these kegs can be handled and shipped, with an actual saving in original cost, it is apparent that they are the best. Often a five or ten gallou keg of honey can be sold where a barrel might go begging for a customer.

Adulteration a Crime.—The Monetary Times of Toronto, contains this item: "Vermont has passed a law making the adulteration of maple sugar or honey with any substance whatever, punishable by a fine of from \$25 to \$50." Do any of our Vermont subscribers know of the passage of such a law? We hope that if such a law exists, that it will be rigidly enforced.

**CONTINUES OF THE SET OF THE SET** 

#### Replies by Prominent Apiarists.

fIt is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them: get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-ED.]

### Shading Hives—Division-Boards.

Query, No. 261.—1. What is the best way to make both artificial and uatural shade for hives with thin walls? 2. How is the best kind of a division-board made?—E. B.

1. We shade our hives under trees and cover them with a rough board roof. 2. Our division-board is a  $\mathcal{X}_{-}$ inch board with oil-cloth rounded over the ends to make a tight fit and loosen easily .- DADANT & SON.

1. Artificial shade is all that is used in my apiary. A shade-board made of any cheap lumber or shingles suits me best.—G. W. DEMAREE. A shade-board made

1. For artificial, use a thin board; for natural, use grape-vines. 2. I use an inch board the size of the inside of the hive below the rabbet, tacking on the top-bar of a frame for it to hang To make it fit tightly and still by. not swell tight in wet weather, tack strips from old rubber boot-legs to the sides and bottom.-G. M. DOOLITTLE.

I prefer a light board 2x3 feet held in place by a weight. I have used sun-flowers to good advantage. 2. It is made by the bees, and is a good worker comb. If it is not tight fit-ting, and you wish it to be so, tack strips of cloth to its edges.—W. Z. HUTCHINSON.

1. Grape-vines or trees, for natural shade, being sure of good circulation of air; that is, not having so dense a shade near the ground as to stop circulation. For artificial shade, boards projecting on the south side over the hive with an air-space under, or a bunch of tall grass or hay laid on top with a stick of fire-wood for ballast. Do you think that thin walls are as good as inch walls? 2. I have never seen a division-board that fully suited me. I am using a plain pine board 3/8-inch thick, but it is not possible to make a close enough fit without making it too hard to move.-C. C. MILLER.

1. Trees are the best natural shade. In using such the "bees wont go to Mahomet," so you must carry them to the trees. For artificial shade I have found nothing better than a flat board laid on top of the hives, and large enough for the purpose, "*a la* Heddon." A little ingenuity and a wide board or a piece of old sail-cloth or burlap will make all the shade re-quired. 2. A piece of ¾-inch deal, the size of the frame, with the top- royal progeny of one race of bees is POND, JR.

POND, JR.

1. The best shade is a wide shade-board raised by cross-pieces so as to rest about 4 or 6 inches above the hives. If we are afraid of wind, we can arrange to place bricks on the under side, which will weight the boards and yet not show. I use crossboards 4 inches wide and connect these by a third board so nailed as to hold one or two bricks.—A. J. COOK.

What the best way is I do not know, but I can give you my way. My hives are among grape-vines on all sides. I also use a board larger than the top of the hive, letting it project on the south and west sides. 2. I use divissouth and west sides. 2. I use divis-ion-boards that just fit the inside of the hive, made of  $\frac{3}{4}$ -inch lumber; also  $\frac{1}{4}$ -inch lumber, but I see no dif-ference. Nail it on a top-bar of a frame, and let it hang on the metal strip that holds the frames. In win-ter 1 use a division-board for small colonies 2 inches thick, packed with chaff.—H. D. CUTTING.

1. Where hives cannot be protected by the shade of trees or vines, a large shade-board is a good thing. 2. To make a serviceable division-board, cut a board 2 inches shorter than the hive is inside, and nail cleats on the ends.—G. L. TINKER.

ALL should be shaded, and when 1. so, the thin-walled hives are coolest. Let natural shade go, and shade your hives with a board, or combination of boards measuring 2x3 feet. 2. We need no division-boards, I think.— JAMES HEDDON.

### Pure Queens-Mating of Queens.

Query, No. 262.-1. Would an Italian queen reared from the egg, by a black colony of bees, be as pure as one reared by an Italian colony? 2. Is a queen reluctant to mate with a drone from the same hive that she herself is from ?-J. M. C.

1. Yes.-H. D. CUTTING.

1. I think so. 2. This can only be guessed at.-G. M. DOOLITTLE.

1. I think so assuredly. 2. No one knows, but from analogy I should say no.-A. J. COOK.

1. Yes. 2. I do not think that a queen could tell from what hive a drone came; if she could, I doubt her having any objections to one from the same hive as herself .- W. Z. HUTCH-INSON.

1. Yes, of course. 2. We think not. -DADANT & SON.

1. Yes. 2. Yes, exceedingly so. The queen's disposition to mate with a drone of a foreign scent is so great that I have found it very difficult to get them to unite with such drones though not at all related.-G. L. TINKER.

1. I think they would. I do not think that the nursing bees exercise any influence as to the purity of blood, by merely nursing the young gneens. I have had large experience

bar nailed on, makes as good a affected in the least by being nursed division-board as anything. -J. E. and fed by another race. -G. W. and fed by another race.-G. W. DEMAREE.

> 1. There is no reason either in theory, or practical facts, that would tend to show that she is not. I should consider her progeny pure if she was purely mated. 2. No one can tell. I do not think that any difference will be discovered, however.-J. E. POND.JR.

> 1. Just as surely as a child of yours tended by a black nurse-girl would grow up a white child. 2. At a guess I should say she would hardly recognize the difference, but it is quite possible she might.—C. C. MILLER.

### Straining and Purifying Wax.

Query, No. 263.—What is the best and quickest way of straining and purifying wax? I am experimenting with some of my bees, to secure the greatest yield of wax and less of honey. Out of a hundred hives I get a good deal of wax, as I remove it freely ; but I do not like the looks of it after it is strained. I am at a loss to know how to get rid of the sub-strata of impurities after it is strained and cooled — Austin Tex strained and cooled .- Austin, Tex.

The sun wax-extractor promises to its use there is no substrate of im-purities to get rid of.—G. L. TINKER.

I have no trouble in obtaining nice wax with any of our modern tin wax-extractors.—H. D. CUTTING.

After all that has been said about improved wax-extractors, I have the best success with a large kettle and bags of thin burlap. To purify the wax frequent melting in plenty of hot water gives me the best results. Hot wax should never come in contact with cold water.—G. W. DEMAREE.

Melt it over a great deal of water, and do not boil too highly. Let it cool slowly, and strain over a sieve if you choose.—DADANT & SON.

To every 10 pounds of wax add 1 quart of water and 1 pint of good vinegar. When all is melted, strain and put it in a warm place so that it will cool slowly. When cold, scrape the dirt from the bottom where it will be found all together, leaving the wax clean and nice.—G. M. DOOLITTLE.

I know of no better way than to allow the wax to cool in deep tin-cans surrounded by sawdust, or some nonconductor of heat. As the wax cools very slowly the impurities settle to the bottom. The cans should be smaller at the bottom than at the top. -W. Z. HUTCHINSON.

Melt a large quantity together, having it deep rather than shallow; let it cool very slowly, and you will succeed in scraping off all impurities from the bottom.-C. C. MILLER.

Melt it in water, and continue the melting process till it becomes clear. When cold, after first melting, most of the sediment will be found at the bottom of the cake. Shave this sedi-ment off, and melt it over again; shave off the sediment and so con-tinue till all is clear. Two or three meltings at the most has been found sufficient with myself, even when exceedingly dirty combs are used.-J. E.

Explanatory .- The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previeus spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is lecated near the center of the State named;  $\delta$  north of the center;  $\hat{\varphi}$  south;  $\varphi$ + east; • west; and this & northeast; `O northwest: • southeast; and 9 southwest of the center of the State mentioned.

# Constructing Bee-Hives.

C. W. DAYTON.

There are many different arrangements for joining the covers and upper apartments to the brood chamber, of which the mitre, rabbet and telescope joints comprise the greater number. There seems to be an idea with some that a hive-cover cannot be perfect without some sort of a rim attached, whether the rim is 2 inches wide to serve the purpose, or 8 inches wide to cover a case of sections. These joints are calculated to keep out cold and water. There is nothing better than a quilt spread over the hive held in place by a straight board carrying a small sized stone. That arrangement forms the closest fitting of all the joints, I believe.

As surplus stories are adjusted after the cold of the spring, and before it begins in the fall, a cold-excluding joint is as useless for its intention, as it is restrictive of needful circulation in mid-summer. There is nothing to go in at the joint but a driven rain, and that would not get on the combs, but would run down on the inside of the hive; and bees that are loitering their time away on the side of the hive ought to get wet.

Though water would not be very objectionable, I believe that it is usually the case that driven rain could not enter a joint between two parts of a hive, because of the wax and propolis deposited there; as I have known on several occasions four-story hives being tipped over, and remained unseparated and were righted by lifting by the topmost part.

Since using these arrangments side by side for the purpose of testing them, I greatly favor putting one hive on another as though they were ordinary boxes. In the construction of hives of this kind it requires not much more than one-half of the labor and three-fourths of the expense of the other kind of hives, and this in producing honey at 5 cents per pound, as we may have to do in a few years, will be grite a garine. will be quite a saving. Since begin-ning apiculture, and not being satis-fied to follow exactly in the footprints of others, it has been a continued set to set to be a save time, the slides work According to my experience, bees seem to winter better when there is succeeded in obtaining a verdict in

change from one arrangement to another, so that years of study and experiment have led me to adopt the above cheap, practical and efficient arrangement.

While a plain cleated board does well for a cover, the one I like best is a %-inch cleated board, ¼ inch each way larger than the hive, containing in its upper side, to prevent warping, saw cuts 4 inches apart, running with the grain and ½-inch in depth. Then it is covered with tin extending down on the sides  $\frac{1}{2}$  of an inch below the edge of the board. The tin should be cut and soldered at the corners, so as to fit closely, a tin handle soldered to the centre of the top, and a coat of paint makes it complete. In this 1 find a cover that is cheap in the end, is not disturbed by wind, never leaks, and in connection with a quilt laid over the brood-nest, makes a very heat-confining joint. Bradford, & Iowa.

Country Gentleman.

### The Ventilation of Hives.

#### L. C. ROOT.

In my own locality (Central New York) the period is so short during which we must secure our surplus honey, that we must manage our bees bee-keeper is aware that to control swarming, care must be exercised in shading and ventilating the hives. In any section where it is found difficult to prevent swarming, a properly ar-ranged ventilator in the bottom of the hive is very essential. In fact, I might say that I consider a ventilator desirable in any hive, whatever the loca-tion. I find that where hives are placed on pieces of 4x4 scantling, they are so near the ground that the air which enters the hive under the bottom-board is sensibly cooled, and thus aids in lowering the temperature within.

For many reasons I would have the ventilation ample. To meet all re-quirements, an opening 10x12 inches in the bottom-board would be found pero tao large. At each side of this none too large. At each side of this opening nail a cleat with one corner rabbeted out, to receive a slide by which the ventilation can be regulated.

In some of my hives, in which I do not winter bees, I nail a piece of wire-cloth on the upper side of the open-ing, to prevent the bees from coming out when the slide is drawn; but for various reasons, I prefer to have the wire-cloth on an extra slide, and nail the wire-cloth on the under side of it. In this way, you will be able to close the opening entirely, when necessary; or to admit the air and confine the bees, as required in moving bees; the wire screen may be slid in place, or both may be left out, if desired. In constructing this routilator all work constructing this ventilator, all work should be thoroughly done, so that when closed it will be perfectly tight, and at the same time, the slides work

an opening directly under the cluster. They seem more certain of their free-dom, and as the dead bees fall, they will drop out of the hive. When only the entrance is left open, it often be-comes clogged. To secure the condi-tions which I suggest, some bee-keepers remove the hives from the bottom-heavily and set them directly bottom-boards, and set them directly upon pieces of scantling. I prefer the ventilator, as it saves labor, and is more agreeable when carrying the hives to and from their winter quarters.

I am not advising this ventilator for such as will not avail themselves their bees. There are those who think that when they purchase a movable-comb hive, Italian bees, a smoker, and other fixtures, they have insured success, and have no part to perform in the matter themselves. A box-hive with a piece of bark for a root, is all that will be of value to such, until they learn that these appliances are only valuable, as far as they can take advantage of them, in a more intelligent management of their bees.

During an extended practical ex-perience, I have tested the worth of a good system of ventilation, and have proved it to be indispensable. If on some warm day during the best honey-flow, any observing bee-keeper will test this matter by opening the ventilator in one hive, and leaving it closed in the one next to it, he will soon be convinced of its necessity. If during such honey-flow, bees are seen idly clustering upon the front of the hive, it is conclusive evidence that they either lack room for storing their honey, or the hive is not properly ventilated. For warmer climates, it seems to me that ample ventilation must be an absolute necessity.

Mohawk, 5 N. Y.

The National Bee-Keepers' Union.

The following is a selection from the report of the General Manager for the past year:

The past year has been an eventful one for the "National Bee-Keepers' Union," which was organized one year ago, and charged with the duty of "protecting the interests of bee-keepers," by "defending their rights" under the laws of the different States where they reside.

Besides giving the moral encouragement to the pursuit of bee-keeping which such a National organization naturally bestows, it has materially assisted in several cases where the law was invoked to crush the interests of our industry.

In June of last year Mr. Freeborn, an extensive apiarist of Wisconsin, was sued by a neighbor who kept a flock of sheep, and imagined that the sheep were deprived of their pastur-age by Mr. Freeborn's bees, and

prejudice of a jury, other bee-keepers would be likely to be sued to recover damages done to pastures, vineyards, and gardens by bees; and any one owning a few square rods of land, devoted to almost any purpose, may try to recover damages from all the owners of bees in the vicinity.

As soon as this Union was formed, I made the necessary preparations to defend this sheep-bees case. Among other things I wrote to Messrs. Demaree and Pond, as both were lawyers as well as bee-keepers, to know upon what terms they would undertake the defense of the case. Mr. Demaree responded that it would be difficult for him to leave his home at the time mentioned, but if it was deemed essential, he would do so; but sug-gested that the case might be studied by Mr. Pond and others, and "points of law" might be written out for use by the local attorneys, and it would be less expensive and do just as well as to take the more expensive method.

Mr. Pond replied that if it was deemed necessary he would go to Wisconsin and conduct the case, but that he did not think the Union could afford to employ him, and pay the necessary traveling expenses. Ile said that he could not afford to do it for less than "day-pay" for the time occupied in coming and going, etc.

After consulting with the Executive Committee, I concluded to employ local attorneys, and have Messrs. Demarce and Pond review the case, examine the authorities, and write out "points of law" for use at the trial.

This arrangement was made, and the "briefs" were prepared and sent to me; several other lawyers also prepared "briefs" and presented them to the Union. These were all sent to the local attorneys for use at the trial.

I paid \$50 each to the two local attorneys, \$25 to Mr. Pond, and \$6 for court fees. Mr. Demaree gener-ously donated his "brief" to the "Union Defense Fund."

The Judge made a thorough ex-amination of the laws of the State, and concluded that their existed no laws or rulings upon which he could instruct the jury; and thus ended that case.

The Union made such a stir in the matter, showing such fighting en-thusiasm among bee-keepers, that there would have been a *lively time* had there been a trial on, the merits of the case.

In California, a suit has been tried in a Justice's Court against Mr. Bohn, for alleged damage done to grapes by his bees. This suit was lost in the lower court, because witnesses were obtained who testified that they had seen the perforation and destruction of the grapes done by Mr. Bohn's bees. In vain did the defendant's attorneys prove by a score of wit-nesses that the bee's tongue could only be used to extract sweets from the flowers—not to bore after them. The evidence of the eye-witnesses of the plaintiff had weight with the jury, and they accordingly returned a verdict against the defendant for \$75

his favor, either by the ignorance or and costs of suit, which amount to prejudice of a jury, other bee-keepers over \$60. The damages claimed were \$299.

The National Bee-Keepers' Union advised Mr. Bohn to appeal from the decision of the Justice's Court, and assured him that the Union would stand by him, and aid in the appeal by sending money, obtaining legal advice, depositions from scientific experts as to the incapability of bees to puncture grapes, etc. The appeal was taken and again lost. The representative of the Union in San Bernardino wrote as follows concerning this trial:

"The case occupied the Superior Court for five days, there being about twenty witnesses on both sides. The jury retired on the evening of the fifth day, and on the morning of the sixth brought in a verdict in favor of the plaintiff for the sum of \$25 and costs of suit. A very strong defense was made, and had it not been for what we claim a mis-instruction of the court, we would have won the case. The jury asked to be instructed by the court the meaning of the words "willful" and "negligence," and in defining the latter is where the error, we claim, was committed, taking the facts from the province of the jury. Mr. Bohn has asked for a new trial.

As Manager I have been appealed to for advice and encouragement in settling disputes relative to the interests of bee-keepers, and their rights under existing law, and I have cheerfully given the necessary time and attention to these cases, and obtained legal advice in order to "defend the rights of bee-keepers" against jealous or envious neighbors.

or envious neighbors. In January, as Manager of the National Bee-Keepers' Union, I served a notice on the Rev. Robert West, editor of the Advance, to either pub-lish a retraction of his false state-ments relative to the manufacture of comb, filling it with glucose, and dettly "capping the so-called honey-cells by machinery"—or take the consequences of a law suit. After much squirming, he published a re-traction, saying : "We were misled by what seemed to be good authority." by what seemed to be good authority."

In the case of Mr. Freeborn, we are well aware that the bees did not annoy or damage the sheep as claimed. In the case of Mr. Bohn it has been shown that the bees cannot puncture sound grapes, and that they did no damage to the raisin industry. These cases grew out of the jealousy and ill-will of neighbors, and the bee-keepers should be defended in their rights, in the interest of the pursuit in general.

A few cases have been noted where the bees were a *real* annoyance and injury to neighbors—in all such cases it is but just and right that the bees should be removed when a compromise cannot be otherwise effected.

#### THE BEE-KEEPERS OF AMERICA

should lose no time in joining an organization created for the purpose of defending the rights and protect-ing the interests of bee-keepers. Where there has been only hundreds during the past year, there should have been thousands. It has to some

extent been a trial year-an experiwith a small membership. Now let us all co-operate, and, if necessary, maintain our rights as bee-keepers in the highest courts of the land? That the highest courts of the land? That can be done only by having sufficient money to defray the expenses, and such are usually high. This will be a small matter, if all will bear their part of the burden. One thousand dollars of expenses when divided among 1,000 persons, is only a dollar for each, and can easily be borne; but when one has to pay it all, it becomes a beavy burden: and to it becomes a heavy burden; and, to many, one that would be impossible to bear. United effort is essential to successfully defend our chosen pursuit! If we can raise a column of patriots sufficiently strong to present a formidable front, we shall dure the envious ones to "bring on their law-suits," and by "an imposing array" and "unbroken front," gain a lasting and permanent victory !

It is with considerable satisfaction that I submit to the members of the Union the following

#### FINANCIAL STATEMENT.

There are 324 members in the Union, and there has been one assessment of \$1 each for the Defense Fund, making \$324; and 25 cents each for the General Fund, for printing, stamps and stationery, amounting to \$81.00. Total receipts, \$405.00.

The expenditures on defense account were for legal expenses and the Bohn case, \$118.75; leaving a balance in the treasury on June 1, 1886, of \$74.25.

The disbursements from the General Fund for printing, stamps and stationery, have amounted to \$66.00, leaving a balance of \$15 in the treasury. \* \*

\* \*

As I stated a year ago, I neither sought nor desired the office of Manager, and accepted it as a *duty*. I have done my best for the interest of the Union, and am both ready and willing to transfer the office to my successor as soon as such is elected.

Fraternally, THOMAS G. NEWMAN. General Manager.

Read at the N. Y. State Convention. Musings of a New York Bee-Keeper.

#### WM. F. CLARKE.

A New York bee-keeper, whose native modesty forbids his name appearing in print, has favored me with some notes of his "midnight mus-ings," as he calls them, and I have permission to utilize them in any way calculated to advance the interests of bee-keeping. It may be premised that he is a firm believer in reversible frames, out-door wintering, and hibernation. I have much pleasure in voicing some of these musings and enabling my quiet correspondent to whisper audibly for the benefit of bee-keepers generally. He is evi-dently impressed with the duty of letting his voice be heard, for he says: "I expect to pass through this world but once. Any thing therefore that I can do, or any kindness I can show to a human being, or any word that I can speak for others, or any new light I can throw on bee-keeping, let me do it now. Let me not neglect or defer it, for I shall not pass this way again."

How to prevent swarming—or at least how I have prevented it for the past two seasons : I reverse the combs containing unsealed brood once a week during the honey-flow. When so reversed, the bees have invariably, in my experience, destroyed all queencells, and gone to work storing honey with renewed vigor.

#### REVERSING COMBS.

Our mutual friend, Mr. Demaree, on page 260 of the *Bee-Keepers' Magazine*, tells us that reversible frames are all fuss and feathers, and says that in his opinion the verdict of practical bee-keepers will be against them. I wish to say that so far as my experiments go I am paid, and donbly paid, if I gain nothing more than the prevention of swarming, and keep my bees at work while I am away attending to other business. It is no small satisfaction to know that they are busy in the hive, and not up a tree !

#### CHEAP HIVES.

Mr. Pond, on page 275 of the American Apiculturist, writes a good article. but I take exceptions to what be says in favor of cheap hives. He thinks that a hive should be constructed as plainly and simply as possible, with as few "contraptions" as necessity demands, and is of the opinion that a plain box with a few rabbets is all that is needed. Would he advise a \$1 hive for a \$10 queen ? Or a cracked box for a \$20 colony of bees ? What would he think if I should advise a \$50 harness to put on a \$5 mule ? The business-like modern hive with its reversible brood-combs and reversible section-frames; with its side-storing arrangements, movable inside upper story and surplus receptacle, ends of brood-nest packed solid to retain the heat; so arranged that cool nights do not drive the bees out of surplus boxes, nor the hot rays of the sun drive the bees ont of the body of the hive-requiring no cellar to winter the bees—but so arrayed that with the division-boards placed close to five frames containing the brood-nest, and above that five frames containing the honey stores, all can be packed outside with sawdust 5 inches thickmay not be so charming an object to the eye of the painter or poet as the artistic little single-walled hive on the verge of a splashing mountain brook near an old-fashioned farmhouse, its roof covered with moss, and the queer old couple on their daily rounds among the bees looking for swarms.

But sentiment is a secondary consideration to the practical bee-keeper, and it is the unromantic bee-hive that rapidly coins the golden honey into chinking dollars. A big guarantee from the makers of dollar hives does

not help a bee-keeper much when he comes to place his products in the market. There they must stand or market. There they must stand or fall on their merits, in competition with the honey stored in the new-process hives, and no guarantee cau compensate in the slightest degree for the ignorance of the men who build cheap hives and try to persuade their customers that any thing in the shape of a box so fixed as to hold frames, is as good as the best hive ever constructed. We want a hive adapted to good reversible combs, so that we can get the honey out of the brood-nest and up into the sections, and one in which the bees can be readily packed winter in safety. Cheap hives are a nuisance to such as believe in outdoor wintering, and who prefer chaff hives on hibernating principles. Good, double hives built on hibernating principles and good management generally must now co-operate in order to secure even moderate success, and to build up a highly prosperons business, the conditions must be unusually favorable.

#### ERAS OF BEE-KEEPING.

The first era was that prior to the introduction of the suspended movable frame.

The second has lasted for about 40 years, and has been marked by the use of suspended movable frames, the extractor, and comb foundation.

A new era has now arrived, and we are on the brink of a great revolution. Henceforward hives will be handled instead of frames, the extractor rarely used, and surplus honey produced in the comb, and kept stored in a state of nature until sold and eaten.

#### DISCOVERING THE ADVANTAGE OF REVERSING COMES.

One day I and a few fellow beekeepers were experimenting in my apiary. Mr. Dakin and myself were looking over a hive, when we accidentally broke a very heavy comb of honey in such a way that we could not return it to the hive right side up. Mr. Dakin said that we must put it back somehow bottom side up. took a saw and cut off both ends of the top-bar close up to the side-bar. Reversing the frame, we tacked a strip to the other side of the frame as a top-bar, so the frame would hang suspended as before, only the other side up. We closed the hive, put on the honey-board, also the sections, and left the hive for about one week. When it was again opened, we found the honey all removed from the re-versed frame and stored in the sections.

I again tested the effect of reversal with an old box-hive, placing an empty Langstroth hive on top of the box-hive, now bottom side up. We cut a hole in the bottom-board of the Langstroth hive. In less than three weeks the bees had transferred themselves and all their stores to the Langstroth hive. Many subsequent experiments with reversed frames have satisfied me that bees will work more vigorously and gather just as much honey, and I think more than if

the extractor is used. Bees appear to get discouraged if you take away their hard earnings with the extractor; whereas, by reversing the broodcombs, the bees find the honey out of its natural position, and will at once all go to work to elevate it and place it just where you want it—in sections ready for the market or table. This is a great advantage, for we all know that honey in sections will command a higher price than the extracted article, so augmenting the prolits of the bee-keeper.

#### CHIEF ADVANTAGES OF REVERSIBLE FRAMES.

I now make my frames not only reversible, but interchangeable, for use in these ways, viz:

1. As brood-frames.

2. When empty of combs or foundation, they answer for sections.

3. In this form they can be placed outside the brood-frames for sidestoring, and when nearly full of honey, they can be lifted out, reversed, and then placed in top, movable, interchangeable surplus-arrangements—bees and all. New side-storing sections can be put in their place to be reversed and placed on top in their turn as the honey-storing proceeds. By this means we start the bees at top-storing, and get them the more readily to finish up sections.

4. When the brood-frames are reversed and the bees remove the honey "up-stairs," the queen has more room to deposit her eggs, and thus a smaller number of frames answers for the brood-nest.

5. Next follows a most important advantage. All queen-cells will be destroyed and swarming prevented by reversing the brood-combs. If this be done every six or seven days during the honey-flow, the bees will devote all their energies to honeygathering until the harvest is over, when they may be divided, one-half receiving a new queen.

#### DOUBLE-WALLED HIVES.

Having worked single and doublewalled hives side by side, I know that fully 50 per cent. more honey can be obtained in the double-walled hives. In single-walled hives the bees are apt to forsake the section cases during cool days and nights, while on hot days and nights they hang out and refuse to work. It is then that the swarming fever is apt to seize them in the very height of the honeyflow, and much valuable time is lost when it is most precious. The fluctuations of temperature do not affect double-walled hives, and the bees keep the even tenor of their way and work while the season lasts, without let or hindrance. By the use of double-walled hives we get brood quicker in the spring (as in heat there is life, and in cold there is death), and a steady warmth without fluctuations is essential to brood-rearing.

Recognizing these indisputable facts, various difficulties are surmounted, such as, how to keep the bees at home; how to make them gather honey whenever there is any to be had; how to make them place it in where the owner can sell it in its natural shape, as the bees make it, so dispensing with the extractor, honeyboards, and single-walled hives.

One item more : Single-walled hives cannot with safety winter bees on the summer stands, and for one, I will quit the business if I cannot winter my bees on the summer stands.

I winter bees on the summer stands as follows: First, I contract the brood-frames to six, and push up the division-boards snug. This I do about Sept. 15, after taking all snrplus caps away. Afterwards I put the surplus-arrangement above the broodnest, which is the same size as the six frames below. Into that I put five frames of solid, well-ripened honey, which gives the bees at once a sufficiency of natural stores. I cover them with a woolen sack of sawdust. I now have a hive inside of another, as one would say, 9 inches wide by 15 inches long, and 21 inches in depth, surrounded with 5 inches of packing on all sides and the front, both with sawdust 21 inches deep, and the sack on top makes 4 inches more. I now bank up on the back and sides with earth nearly 4 inches, so that no air can get under the hive. The entrance I leave open 5 inches by  $\frac{3}{8}$ . On that plan I have been successful.

It will be noticed that I place the honey above the bees, which is where they would place it if they had the chance to do so. Naturally bees go up instead of sidewise in search of stores. I never look for pollen, neither do I feed sugar. Honey is what they want, and honey they shall have. You may say it is extravagant to give the bees so much honey. What do they want with 50 or 60 pounds of stores? Well, I know how to dispose of what I take away the five upper frames, and replace with frames of sections with foundation starters as early as it is safe to unpack them. What honey is left in the frames taken away I un-cap and put them below, outside the division-boards, which space allows two frames on each side. The bees will have a busy time elevating the honey to the sections, and will set the queen to at once put the crown on her head and make things hum.

Here I am in the sixth season, with the best record yet as to wintering my bees. Here I am the third season with the best record I ever had, getting on the average, spring count, two hundred and eighty pounds per colony. So much in favor of reversible frames and double-walled hives, being a sursuspended frames of 200 pounds per colony in the same locality.

Now, to be more definite in setting forth the claims of reversible frames as compared with suspended ones, I make the following calculations: Safety in wintering, 20 points. This is because they are packed early, giving them natural stores in their proper position, and left on the summer stands where they are not looked

second, placing the honey in a compact form, easy to sell, and dispensing with the extractor, and daubing up the entire apiary with cappings and empty frames.

Convenience, 10 points, because we manipulate a hive in 20 minutes or less, and the hive is as easy and light as a single-walled hive.

Superiority, 40 points, because we can get nearly 60 per cent. more honey out of our bees. The reversible frame is no longer an experiment. Experience has demonstrated its superiority, and if I were obliged to return to the suspended trame, I would quit the business altogether. The reversible frame is free from all complications, and easy to manipulate. Its rival, the suspended frame, has received honorable dismissal from my apiary, its day being done, its usefulness gone, and its place more effectively filled by its reversible successor.

Wintering Bees in Warm Temperatures.

#### IRA BARBER.

Mr. C. Theilmann, on page 311, tells us that he has had trouble with bees this spring, by their getting too hot. He says that he kept them in a building above ground, and that between the warm weather and the great heat that the bees created, they became so hot that they nearly suf-focated. I do not doubt his state-ment in the least, for I had just such a case as he describes, some 30 years

ago. I do not consider his criticisms of my plan of wintering bees just or manly; nor do I think that he has any reason for connecting it with the plan that I gave in the essay that he mentioned. I stated that the cellar should be damp where the tempera-ture was allowed to become so high, and that no currents of fresh air should reach the bees.

Mr. T. asks if my article would not have misled many bee-keepers had it not been for Mr. Doolittle's sad ex-perience in warming his cellar by burning coal oil. Now I wish to say that I have never recommended his plan, for the reason that it did not prove a success with me. I have never tried Mr. Doolittle's plan, for the reason that it proved a failure with him; but I did wish last winter, that I knew of some way to raise the temperature of my bee-cellar about  $40^{\circ}$  higher than it was.

Again, he says that I have gone down one-half in my idea of the proper temperature, and asks me to account for it. The explanation is very easy, for my bees are now at home, and are wintered in a large cellar, one that 600 colonies could be wintered in, and not crowd it as the one was crowded when the high temperature was given.

at nor disturbed in the least until settled weather in the spring. Economy, 20 points in two ways: First; not so many hives to handle; satisfied with the tests that I was able

to make in November and April. I have not given a colony ventilation at the top of the hive for 20 years, while in winter quarters. Mr. Doolittle said that I knew nothing about the temperature of my bee-cellar. Is it not reasonable to suppose that if the temperature was  $65^{\circ}$  in the cellar, when the mercury was near zero outside, and at 65° outside the mercury showed 90° inside, that the temperature was but slightly affected either with heat or cold?

Mr. T. thinks that the mass of bees 5 feet high were smart bees to be able to separate all right. As he only gave to separate all right. As he only gave the height of the mass I will give the length of the pile, which was 19 feet, and the width 13 feet—all one solid mass of bees, to all appearance, and yet all the loss was just one queen. Does any experienced bee-keeper be-lieve that a deer acude have been lieve that a door could have been opened to cool them off, without a great loss? They were left to cool off slowly, when the weather changed.

I have no time to follow Mr. Theilmann in all the points he has taken exceptions to regarding my high-temperature theory, but I will say to him, and all others who may doubt my statements, that there can be nothing said by any one that can change the fact that it proved a complete one fact, that it proved a complete success for the 6 or 7 winters that I win-tered my bees in that way. Why, I there in yoles in that way. Why, I have been wintering my bees at  $45^{\circ}$ to  $50^{\circ}$  for the past two years, is be-cause they winter fairly well; and I have not yet been to the expense of partitioning off the cellar, for the reason that I may take my bees away to better fields et any time when our to better fields at any time when our pasture for bees fails in this locality. I hope that none will try to winter their bees at so high a temperature in a dry room or dry cellar, for my experience is that it cannot be done without heavy loss.

### Eradicating Foul Brood.

#### JOS. H. FISHER.

In this neighborhood foul brood has existed for nearly a year, and most of our bees, both tame and wild, have been thoroughly inocculated with the disease. Even if we could effect a cure, under these circumstances, would they not bring the disease home again from our neighbor's defunct apiary, old combs and hives lying around loose, bee-trees, etc. ?

I would not discourage apiculture by any means, for the value of honey for medicine alone, if for nothing else, could not be dispensed with. But, let us face the truth and the evil, and fight our best to exterminate it. There are remedies to stay the disease and keep it in bounds, that are but little expense or trouble, but I cannot say that it will effect a cure, except with the aid of time and surrounding circumstances.

I have melted all my old combs into wax, and subjected my frames to a heat that would kill any animal or

vegetable matter, and have laid them carefully away for future use, where they will not be exposed to the disease until I am sure it is safe to use them. My hives I shall heat in the same way; or clean and repaint on the inside and out, making all cracks and joints as tight as wax. I have a few healthy colonies that I shall watch very closely, and will not try to increase my stock, and I will treat with the best remedy I know of, until I lose them or effect a cure.

It might be a good idea to call a bee-keepers' convention and devise some means to exterminate this thing; and by so doing we can act in harmony. I think unless every beekeeper takes an interest in 'trying to annihilate this foul brood, it will be hard to get rid of.

## Description of the Hive I Use.

#### J. H. ANDRE.

Last season I gave a description of a new hive that I had tried, and as I have made some alterations and improvements in it, I will describe them also.

For the body of the hive use lumber 29-32 of an inch thick, cut 16 inches in length. Use square strips in the corners to nail through, of the exact thickness of the lumber, and nail through both ways. This is far better than a mitre joint, as it cannot give, warp or split. The body of the hive is 11% of an inch deep, with frame-rests cut down all around the top  $\frac{5}{8}$  of an inch, and  $\frac{1}{2}$  of an inch back. A cross is put in exactly in the centre of the hive, of 5-16-inch strips,  $1\frac{1}{2}$  or 2 inches deep. The frames are made of  $\frac{1}{4}$ x1 inch, and 7x10 inches inside; 20 are used. Hang in 5 in each space, with the inside one nearly close to the cross-piece, and with their inside top-bar should project only  $\frac{3}{8}$  of an inch, and the outside one  $\frac{3}{4}$ of an inch. Opposite corners should be warm frames, and the other two cold ones. This gives the bees a chance to get to any part of the hive without going under or outside of the frames, and a frame of brood or boney may be taken as desired.

In shipping, 4 or 5 frames will go in a little space, and be in neat shape. A colony may be confined in  $\frac{1}{4}$  of

the bive and winter safely. No tin rests are needed, as the inner ends of the frames may be loosened easily.

For the bottom use pieces 22 inches long, one 8, and the other 10 inches wide, with an entrance cut in  $\frac{3}{8}$ x12 inches. Bevel the edge of a piece of board  $\frac{4}{14}$  inches wide, to give it  $\frac{1}{12}$ inches drop, and fasten it to the end of the bottom-board at the front with a hinge at each end; this gives an incline, and in winterit may be turned back, and if wintered out-of-dors it will keep out the snow; if wintered in-doors it will keep ont the light, and takes less room; but it does not close the entrance.

The bottom is 34 of an inch thick, as is also the cap. The side-pieces of the cap are 7¼, and 18 inches long. The gables rise to 934 inches. The roof is 12x22 inches (two pieces of course). The cap is nailed together with strips in the corners, the same as the body of the hive. The case rests on top of the hive, and may be arranged as desired. I have used some cases without any divisions, simply by nailing strips across the bottom of the case where the sections come together. I believe that style will be used altogether in the near future, for it is less work to make it, and in taking out and putting in sections it requires not half the labor. More room may be used on a hive, and it is warmer for the bees.

To make three hives it needs one board  $\frac{3}{4}\times12$  inches, and 12 feet long, for rooting; ore 29-32x12 inches, and 16 feet long, for bodies; one  $\frac{3}{4}\times10$ inches, and 16 feet long, for caps and bottoms; and one  $\frac{3}{4}\times8$  inches, and 16 feet long, for caps and bottoms. Only three different widths are used, and the humber cuts without waste.

After examining plans of all the hives I have ever heard of, I have adopted this, for it is the only style that may be used and have the broodchamber in the shape it should be square— without heavy, unhandy frames, and also secure the other advantages described above.

Lockwood, 9 N. Y.

For the American Bee Journal. Changes in Apiarian Fixtures.

#### T. E. TURNER, (50-90).

In looking over the pursuit of apiculture for a few years past, and viewing the many changes that have taken place, and that have been advocated by bee-keepers, the inquiry has arisen in my mind, have not too many changes been made in apicultural fixtures for the interests of apiculture in general? I verily believe that "too much change" for beginners is very disconraging, and that in some way there should be more uniformity among bee-keepers, in the hives, sections, section-racks, and shipping-cases used, allowing a change in these and other things used in the apiary only after something better has been tested and adopted by many of the most experienced apiarists.

Every beginner, especially of small means, should have the very best and cheapest appliances to begin the business that can be obtained. If he gets catalogues from different supply dealers and examines them he will find a great many different hives, sections, section-racks, or surplus arrangements, shipping-cases, and various other things, in use and highly recommended for use by those engaging in the pursuit, and he is bewildered. He knows not which to adopt, and is just as likely to choose the poorest one of the list as the best, until he has experience and knows what is best. Experience in this matter has prompted me to write this article for the benefit of the inexperienced.

There is but one solution of this difficulty, and that is for the beginner to take the advice of some reliable bee-keeper of his acquaintance, as to what fixtures he should use, and the advice given will generally be such as should be followed. There also should be a recommendation, adoption, and use of an article by several experienced bee-keepers. The writer has recommended hives that he was using himself for the adoption and use of beginners, but now, after 13 years' experience in the use of various hives, and watching the reports from difterent experienced bee-keepers, he can heartily recommend to beginners a hive that he does not use.

Look at the changes in hives from what was formerly used. In my A B C days in bee-keeping, we had a hive in two sections, with a double set of frames of the Gailup style. Then we had the patent Buckeye hive, with a shallow surplus frame on top of the brood-frame; then we used the hive invented by Rev. L. L. Langstroth, for a short time, until a be-keeper made for us what he claimed was better than that, a 9-frame hive, 11x16 inches inside measure. After a careful rescearch after the best hive for all purposes in four years, another change was made, and the bees were moved into a Langstroth style of hive holding 8, 10, 11, 12 and 13 frames, 11x11 inches inside measure, where they still reside. Having visited many bee-keepers who had more varied experiences in changing from one hive to another than myself, the universal opinion expressed is that there has been too much change in hives among bee-men.

One uses a particular hive with a specific object in view, and he will keep on changing hives until that object is attained. Another individ-ual will start out with a different hive, with a different object in view, and he will repeat the conduct of the first, until he finds the hive to suit the special purpose. Then the same individual may have different to bjects to gain at different times, and if they are numerous, he will find that different hives must be used to accom-Then the wise apiculplish them. turist wants the hive that is adapted to the attainment of the greatest number of objects, in order to be successful in the highest degree. Beekeepers want to keep in view the fact that success in their pursuit is somewhat like that in other pursuits—the greater the number of ends success-fully met by the use of a single instrument, the better in the economy of time and expense, other things being equal.

Though I am not using the Langstroth hive, but may use it in the near future, and have no hives of any kind for sale, my advice from past experience would be to all beginners, to adopt and use the 8 or 10 frame Langstroth hive, as adapted to accomplish the greatest number of apicultural objects of any hive adopted and recommended by a large number of the "experienced." Every feature that is of any "intrinsic value" to the great mass of bee-keepers, experienced or inexperienced, is contained in it.

New hives, or anything new for the use of bee-keepers, that is of value, should be encouraged, but beginners should beware lest they are driven here and there until shipwrecked in the beginning of an apicultural voy-age by various recommendations of new things; far better for them to accept and act upon the advice that comes from the experience of many tried sailors on this line. Experimenters are a great blessing in apiculand yet the results of their labors should be tried and recommended by the experienced rather than by the beginner; for one is better prepared for failure than the other, if such should be the result. Change is all well enough when it is made with caution, but too much change is both expensive and dangerons to our pursuit.

### Feeding Sugar Syrup to Bees.

#### EUGENE SECOR.

I am glad to see the AMERICAN BEE JOURNAL, and many prominent bee-keepers also, expressing themselves on what I have always thought to be the right side of this question of feeding. There is little use in bee-keepers, *i. e.*, honey producers, trying to quiet the public fear of adulteration when any considerable number of them practice feeding on a large scale. If we cannot make bee-keep-ing pay by utilizing only the nectar provided by nature for this purpose, I am certain that in the outcome we shall not by supplying cane syrup to winter our bees on.

But many apiarists are not content to feed merely enough for winter, but supply it also in the spring, and some of them in the summer, during a do not care how many professions of honesty a man may make, 1 do not believe that there is one living so far above suspicion that if he feeds his bees anything cheaper than honey, but what some of his neighbors will by the bers; and if they repeat the story of his practices, a great many people will cease to use honey, because, as yet, it is only a luxury, and very few persons will buy, if they do not believe it to be the actual dis-tillation of flowers—something which they can get in no other way.

If the practice of feeding sugar for the purpose of increasing the yield of honey continues, the time will come, honey continues, the time will come, when, by the increase of the product and the decrease of consumption through fears of being defrauded, honey will be cheaper than sugar. That time has nearly arrived now on the east side of the Rockies, while on

the west side it has actually been the cheapest. In California 1 suppose they never feed sugar, and no one would ever expect to find adulterated honey there.

In the Northern States the practice is defended on the pollen theory argument that pure cane-sugar is the argument that pure cane-sugar is the only safe winter food. If that is so, this world has been running wrong for a long time. If the Almighty ever makes another planet which is to be the home of honey-bees, some of these nineteenth century discoverers ought to be called to the coursil before the to be called to the council before the iob is undertaken

When I am convinced that grass is not the proper food for the cow, and that the pig's nose was made for ornament and not to dig artichokes with; that hens ought to chew the cud and sheep roost in the old appletree, I may come to the conclusion that God did not know what He was about when He provided honey as the proper food for bees.

But I do not wish to argue the pol-len theory or any other theory. We ought to produce only the pure article of honey, and to convince people that we are doing it, we must avoid the *appearance* of evil. Suppose a few colonies do die in winter because they happen to have too much pollen, or because we do not know enough to regulate the temperature so that they will not eat it; or suppose the re-mainder do not store quite so much surplus honey because they have to lay by enough to winter on; perhaps what they do give us will bring just as much money, because a scarcer article.

To illustrate: It requires a certain number of bushels of wheat to feed this world for a year. If a few mill-ions less than the required amount were produced in any one year, would it not bring about as much money as though the crop were twice what was needed ? But honey is a luxury, and he will succeed best who produces the nicest article and gets it to the con-sumer with the least suspicion of fraud about it. There are always plenty of people who will buy such luxuries and pay good prices for them.

Buying sugar by the barrel to feed bees, and selling honey by the dray-load is not for the best interest of the industry, in my opinion. Forest City, & Iowa.

#### Honey as Food and Medicine.

127 To create Honey Markets in every village, town and eity, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remunerativo prices. " lloney as Food and Medicine" are sold at the following prices :

Dec. 1, 2.-Michigan State, at Ypsilanti, Mich. H. D. Cutting, Sec., Clinton, Mich.

1 In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.-En.

Working on White Clover.-J. L. Strong, Clarinda, 9 Iowa, on May 31, 1886, writes :

Bees wintered well, and they now gather honey from white clover, when the sun shines hot. Unfortunately we have had but few days of clear weather since fruit bloom came out. Last Saturday the gain was 3½ pounds in one colony on the scales. Yesterday it was rainy, but to day they are booming again, and I think the increase will be better than it was Saturday.

Return of Swarms .- A. H. Lind, Calumet Harbor, o+ Wis., on June 3, 1886. writes :

On May 17 one of my colonies cast a swarm, but the bees soon returned to the hive; on May 18 and 19 they did the same thing; on the 19th I put on the sections and they did not swarm again until May 23, but then again returned to the hive. That day I heard young queens. On the 24th they swarmed with success. What was wrong with that colony?

[The queen was evidently from some cause unable to go with the bees, until the 24th, when a young queen accompanied them.-ED.]

Flattering Prospects.-Mr. E. M. Coombs, Memphis, 9 Ind., on June 1, 1886, says :

The prospect for honey is very flattering. I have extracted about 60 pounds, and have had two good swarms. I lost one on account of being away from home.

Paper Comb.-D. Brown, Cuero, 9 Texas, writes :

In conversation with a gentleman from Kentucky, the subject of bees came up, and he said that he had a cousin in Kentucky who had about 200 colonies of bees, who used arti-ficial comb made from paper. and

who said that the comb was perfect, cells of the right size and proper depth, and sold for 50 cents per yard. All the bees had to do was to way the paper and fill it and cap it. He was sure that he was not mistaken. I have been working with the bees 6 years, have been a constant reader of the BEE JOURNAL for 4 years, and I have never heard of this "paper comb" before. If there is such a thing, why is it not spoken of or advertised?

[There is no such thing. The man is mistaken, and like many others, talks about something he knows nothing of.—ED.]

Swarms and Swarming. – R. F. Holtermann, Brantford, Ont., writes:

In answer to Mr. J. C. Rawlins, on page 330, I would say that I have had a natural swarm with nothing nearer a queen than eggs in the queen-cells. The swarm may have come out sooner than it intended, owing to my having examined them a few minutes before they issued. Doubtless they had filled themselves with honey and were nearer being ready for swarming. My first swarm, this year, I had on May 29. It was a fine one.

Queenless Colony, etc.—D. R. Rosebrough, Casey, o+ Ills., writes :

In my spring report I stated that I had a queenless colony. It has a queen now, but it is not worth as much by \$5.00 as the others, for all the other colonies are overflowing with bees, and are working in the surplus apartments. The one that had to rear a queen is only a mere nucleus. Speaking of bees as a nuisance, I have my bees very near a house in which lives my tenant, and he calls my bees tame bees. A part of them are Cyprians. The only trouble is in winter, when the bees speck the clothes hung out to dry.

Length of Drones' Wings.-Dr. G. L. Tinker, of New Philadelphia, 0+O., says:

Recently I have taken the measurements of a large number of dones' wings, and find more variation than I had supposed. The Italians measure quite uniformly ½ inch in length, and 5-32 of an inch in breadth of the large wings. Pure Carniolans are from 1-16 to 1-32 shorter, and the same width. Some of my best Syrio-Albino drones have wings nearly 9-16, or almost 1-16 of an inch longer than those of any other I have found. The breadth is also slightly more than 5-32 of an inch. It occurs to me that such drones are the ones we should get our queens mated with. If we select the most active and swift-winged it will surely add one good point to our stock in breeding up a superior strain of bees, I should be glad if others would take measurements of their drones' wings and report in the BEE JOURNAL. Have any got drones with wings longer than 9-16 of an inch ? If

who said that the comb was perfect, so, does the race possess superior cells of the right size and proper qualities?

Honey Locust. – C. H. Dibbern, Milan.∞ Ills., on May 27, 1886, writes:

I send two specimens of the bloom of the honey locust. You will observe that they are entirely different. Please tell us through the BEE JOUR-NAL if these are different species, or are they male and female? I will state that they grow on separate trees, and there seems to be about an equal number of each.

[The flowers of the honey locust are what the botanists call polygamous, that is, they are sometimes perfect, having both stamens and pistils, and sometimes these organs are in separate flowers. In this case they are evidently upon different trees, and the case is not a very uncommon one. Probably these trees will continue year after year to do just the same thing; still it would not be surprising upon close looking if some of both kinds of flowers should be found on the same tree. I find on one of the specimens sent, both the male and female organs .- T. J. BURRILL.]

Drouth in Texas.—B. F. Carroll, Dresden.& Texas, on May 31, 1886, writes:

We have not had a drop of rain since April 24. The honey crop is a complete failure. The horse-mint is in bloom, but we get no honey. If we get rain soon we may have a few pounds from the cotton bloom.

Extracting, Prolific Queens, etc.— 26—Jonas Scholl, (72—70), Lyons Station, 0+, Ind., on May 27, 1886, writes :

-16 I commenced extracting to-daydays earlier than last year, and 10 days earlier than two years ago. The honey is quite thick, and very good, being mostly from poplar bloom. Bees wintered just splendid the last four years. I winter my bees only on the summer stands, and on natural stores with blankets and leaves above. For rapid increase of brood through April and May, I have not yet seen any better or more convenient arrange-ment. The leaves and blankets stay on until ready for the surplus ar-rangement. I have this spring taken more particular notice of the spreading of the brood-nest, and among 70 colonies I have seen but few that failed to rear brood to the very top-row of cells in the frames; so that reversing would not pay on that score. Perhaps my way of retaining the heat above the cluster has something to do with it. On page 279 Mr. Heddon makes a statement that I think should not near that in the should not go unchallenged. He says: "By interchanging and inverting we can develop one half more brood than we get from the same brood-capacity in ed to all.

non-invertible hives." Now I claim to have queens just as prolific as any that Michigan can produce, and if he were here I could show him some 65 of them that are running 10 Langstroth frames to their full capacity of brood; and to get them to do double, or even one-third more by any reversible arrangement, is simply impossible. The time set for the meeting of the North American Convention, at Indianapolis, on Oct. 12-14, 1886, is certainly very appropriate, and will, I think, suit Indiana beekeepers generally.

Excellent Season So Far.—Wm. B. McCormick, Uniontown, 9 Pa., on May 29, 1886, says:

We have had an excellent season so far in this section for bees and honey. The white clover is now in full bloom, and the bees are booming. So far I have had 12 swarms, two of which were second-swarms; the first being on May 18.

Abundance of White Clover.—Alex Rose, Sullivan, O Ills., on May 31, 1886, writes:

I am among the bees every day. wintered 22 colonies out of 24, only losing one, and one was queenless, with which I have a swarm which is doing well. I bought 9 colonies this spring for \$9, and I now have 48 colo-nies. Some of the hives of the old ones are full of honey, and the bees have commenced to cap it over, but swarming checks that for a few days. I have been keeping bees for 8 years, but I never have seen such a crop of white clover—the country is perfectly white with the bloom. The linden or basswood is beginning to bloom. am looking for a large crop of honey this year. I use 2-pound sections. I sold honey last year for 20 cents per pound in sections. Some in frames and some broken up honey I sold for 10 and 15 cents per pound. I do not expect so much this year. My record I do not shows that I put on sections last year on June 16; this year from May 6 to May 12. I expect to take off several hundred pounds of honey before June 16, this year.

#### Convention Notices.

The 5th regular meeting of the Hill Chunty Bee-Keepers' Association will be held on the first Tuesday in July, 1886, at the apiary of Hon. J. M. McDanlel, of Peoria, Tex. At the same time and place will be held a bee-keepers' honey plonic. H. A. GOODRICH. Sec.

The next annual meeting of the Michigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886.

H. D. CUTTING, Sec.

The regular semi-annual joint meeting of the bee-keepers of Hendricks and Boone counties of Indiana, will be held on Thursday, June 17, 1886, at the residence of J. P. Catterson, 4 miles northeast of Brownsburgh, Ind., and 2 miles west of Trader's Point. A cordial invitation is extended to all

Issued every Wednesday by THOMAS G. NEWMAN & SON, PROPRIETORS, 923 & 925 WEST MADISON ST., CHICAGO, ILL.

At One Dollar a Year.

ALFRED H. NEWMAN, BUSINESS MANAGER.

Special Notices.

To Correspondents. - It would save us much tronble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Rinder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides their own, with \$3, for one year, we will present a copy of this valuable book.

Our New Catalogue of Bee-Keepers' Supplies for the spring of 1886, is issued, and will be sent to any one desiring a copy. Send name and address, plainly written, on a Postal Card for it.

" Don't Stop "-- that is what many write to us about their papers, when their time is nearly out. One subscriber says : "This has been a year of disaster, and it is not convenient for me to send you the money now to renew my subscription. It runs out with this month; but don't stop sending it. 1 will get the money to you within three months." Such letters are coming every day, and so for the present we have concluded not to stop any papers until requested to do so.

The Convention History of America and the AMERICAN BEE JOURNAL for one year, will be elubbed for \$1.15.

#### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 10 a. m., June 7, 1886.

#### The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO.

HONEY.-Honey of all grades sells slowly at present, and prices are weak-14@15c. being the outside figure for best comb boney. Extracted is in light demand at 5@7c. California comb hoaey, in 2b. sections, 9@12c. BEESWAX.-25c. for good yellow. R. A. BURNETT, 161 Sonth Water St.

#### NEW YORK.

NEW YORK. HONEY.- We oow quote : Fancy white comb in 1-b. sections, 12@13c, in 2-b. sections, 9@10c, Fancy buckwheat, honey in 1-b. sections, 9c, in 2-b. sections, 7@8c. Off grades 1@2c, per lb. less. Extracted, white, 6%7c; huckwheat, 5@5%c. Cali-fornia, 5@6c; Sonthern, as to color and flavor, per gallor, 59@60; EESWAX.-27@28c.

ESWAX.—27@28c. MCCAUL & HILDAETH BROS., 34 Hudson St.

#### BOSTON.

HONEY.-One-lb. sections, white clover, 13@15c; 2-pound sections, 11@13c. Extracted, 6@8c. BEESWAX.-25 cts. per lb. BLAKE & RIPLEY, 57 Chatham Street.

#### SAN FRANCISCO.

HONEY.-The first new comb honey of the sea-son-a sample lot of extra choice-brought 14 cts. We quote : White to extra white comb, 11@14 cts.; amber, 7@10c. Extracted, white liquid, 44@5c; light amber colored, 4 to 4½c.; dark amber colored, 94 to 24 cts. 4 to 3% cts. BEESWAX.- Quotable at 20 to 24 cts. О. В. Sмітн & Co., 423 Front Street.

#### DETROIT.

HONEY.—The market is almost bare of comh honey, and very little is wanted. Best white in 1-b, sections 14 cts. BEESWAX.—Scarce at 25c. M. II. HUNT., Bell Braach, Mich.

#### ST. LOUIS.

HONEY.—Choice comb, 10@12c. Strained, in barrels, 34@4c. Extrs facey of bright color and ic No. 1 puckages, 14 divance on above prices. Ex-tracted in barrels.56535, Fermented goods, 25@3c BEESWAX.—Pirm at 22c for prime. D. G. TUTT & CO., Commercial St.

CINCINNA'EL

HONEY.—Trade is perhaps duller than usual, We quote : Extracted honey brings 4@8c., and choice comb honey brings 12@15c. in a jobblog way. BEESWAX.—In demand at 20@25c for yellow. C. F. MUTH & SON, Freeman & Central Ave.

#### CLEVELAND.

HONEY.-There is an excellent demand for best 1-lb, sections of white boogy, and all arrivals sell readily at 14c. 2-lbs, and glassed sections sell slowly at 12c. Extracted, 7@8c. BEESWAX.-Scuree at 25@28c. A. C. KENDEL, 115 Ontarlo Street.

#### KANSAS CITY.

HONEY.—Sales of comb are good, while extrac-ted is very dull and low. One-poind sections are scarce; stocks of all other grades are well supplied. Calif. 2-lbs. bring 11@12c.; Eastero 2-lbs. 12@13c. 1-lbs., white, 14@15c.; dark, 12@13c. Extracted 5@6c.; Southern. 35@4c. BEESWAX.-23c. CLEMONS CLOON & CO. cor. 4tb & Walnut.

CLEMONS, CLOON & CO., cor. 4th & Walnut.

MILWAUKEE.

HIONEY.-The market seems quite duil for all qualities of comb boney, with but a moderate de-mand for extracted. We quotes Choice, white 1-lb, sections, 17@18c.; the same in 2-lbs., 16@17c.; dark 2-lbs., 15@16c. Extracted, white, in harrels or kees, 7@5c.; dark, in same packages, 6@7%c. BEESWAX.-24@25c A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

HONEY.-Small lots of new are arriving, both comb and extracted. There is some inquiry for best qualities, and sales of cholec honey can be made in a small way to fair advantage. White to extra white comb, 116914c.; amber, 76010 cents. Extracted, white liquid, 4466c.; light amber col-ored, 4004 4400; dark amber colored, 326034c. BEESW &X.-200242c. in lots from first hands. SCHACHT & LEMCKE, 122-124 Davis St.

To any One sending us one new subscriber with their own renewal (with \$2.00), we will present a copy of the new "Convention History of America."

#### **OUR CLUBBING LIST.**

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

Farmer's Account Book...... 40, 300 Guide and Hand-Book...... 150, 130 Heddon's book, "Suecess,"... 150, 140

Italian Queens.-We can supply them by mail, postpaid, at the following prices : Untested, \$1.00; Tested, \$2.00; 6 Tested Queens for \$9.00.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

#### -----System and Success.

28 All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

 For
 50 colonies (120 pages)
 \$1 00

 "
 100 colonies (220 pages)
 1 25

 "
 200 colonies (420 pages)
 1 50

The larger ones can be used for s few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

HOME SEEKERS or Tourists For amonnt of Information not to be found elsewhere at any price.

#### A cloth-bound book, 4x7 inches, 288 pages Price, 50 Cents.

The following is only a part of the Contents:

Colored Maps of all the States and Territories, including Alaska and District of Columbia.

Dingrams abowing area, population, products. Government, State, School and Indiaa Landa of the several States.

But and the second and induced hands of the several States.
 Histories of each of the Stotes from the Eartiest Times. #### THE BRITISH BEE JOURNAL AND BEE-KEEPER'S ADVISER.

The BRITISH BEE JOURNAL is published every Week, at Ten Sbillings and 10d, per anonum, and contains the best practical information for the time being, showing what to do, and when and how to do it. It is edited by T. W. Cowan, Esq.

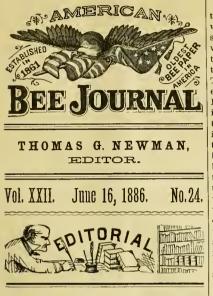

The British Bee Journal and the AMERICAN BEE JOURNAL, one year, for \$3.50.

### THE AMERICAN BEE JOURNAL.

PURE Italian Bees, of the cest strain. In Langstroth or Galing hives. Send for Circular. 11Atf O. CLUTE, Iowa City, Inwa.

366

Take Care how you speak or write about one another. Do not set down at a venture that which comes uppermost.

**Often** it costs more to "trace up" a falsehood than it does to endure the wrong it inflicts.

Price Lists have been received from H. P. Langdon, East Constable, N. Y., and from Mucci & Bro., Lexington, Ky.

**Do Everything** in the apiary just at the right time. One hour's work done when it is needed is worth two or three at some other time.

**Catnip** is excellent bee-forage. The flowers are rich in honey, and it blooms late in June, and continues in July and Angust. It can be raised from the seed.

**Hulletin** No. 15, issued by the Agricultural College of Michigan, is on our desk. It emanates from the Chemical Department, and is concerning the "Manurial Value of Asbes," by R. C. Kedzie, Professor of Chemistry.

We are Not Responsible for any views or expressions of our correspondents, and must not be supposed to endorse them, unless we distinctly state our endorsement. Hold caeh Individual writer alone responsible for the views stated in the communication—and no one else.

**Comb Foundation** should be used plentifully when hiving swarms, unless you have plenty of old combs. The mannfacture of wax is costly, and takes the time of the bees which should be given to gathering honey. It is economy the give them comb foundation; it saves time and labor, and prevents the loss of the honey-flow, which often is passed and gone by the time a swarm has built out the comb to receive it.

Beginners often write to us for information on the most simple matters connected with the apiary, but they neglect to buy and study a Manual. An exchange gives this wise advice : "There is nothing in which the beginner can better invest a few dollars than in the purchase of a good bec-book. They contain the garnered knowledge and experience of years of our best bee-keepers. It is desirable that those who are commencing should become familiar not only with the necessary but with the best appliances in order to begin intelligently and to continue in the right direction. The natural habits of bees and their requirements should be closely studied, and the care and attention given them that knowledge teaches them to require. The precise condition of the bees should always be knewn, whether they are weak or strong, without a queen, or in any way requiring assistance from their keeper. To succeed in this industry or anything else, one must become interested in the work, then annoyances and discomforts will seem trivial, as compared to the success which patience and perseverance will surely bring the earnest worker."

Must the Bees Go?—Since the California grape growers seem to have decided that the "bees must go" as well as the Chinese, the *Thincs* of Oakland, Calif., gives the following under the caption of "A Word for the Bees :"

"The little bnsy bee" has been honored by man in all ages and countries. No insect has received so great commendation as the bee; and no other has paid back so well, and so honestly for all the good things that have been said of it. It has been a constant, tireless little worker ever since its creation; and works on as uncomplainingly as ever. It does not make a fuss or grumble in the least at its compeer in industry, the Chinee, but says as plainly as though uttered in words, that it can work by the side of anybody or anything. It is a mean thing now to turn around and accuse this quiet little fellow of eating grapes, as some Stonma county man Francisco Chronicie. We rely upon the President to protect the bees of California; at least until such legislation can be had as will settle the grievances between them and the grape growers. Pitch into the Chinese first and get rid of that evil. It will be time euongh then to say, "The bees must go."

This has been an Umisnai Season, says the Indiana Farmer, there has been almost a constant flow of honey since the first bloom of early spring. However, the quantity of honey gathered has not been large; but little more thau is required by the daily wants of the bees for home consumption. It has put them in the very best condition, and we stand a good chance of reaping a large harvest; but that harvest, if gathered at all, will come after the 10th of June, in any place north of the Ohio river. Bloom out of season seldom produces honey. The warm, close, snltry nights of June and July produce our honey crop. Years of a carefully kept record verify this.

Mr. W. A. Pryal's Father, of North Temescal, Calif., was on the 24th nlt., injured by an accident. He was thrown out of a wagon on a down grade, and one of the wheels ran over hlm, hreaking one of his ribs and otherwise injuring him. He is being tenderly cared for, and hopes are entertained of his nltimate recovery.

Marketing Honey will be the next question to be settled. Before considering long as what market you will take your honey to, just try your home market. Either get some pamphlets on "Honey as Food and Medicine," with your name and address on them, and stating that you have pure honey for sale; or offer it through your local stores at a reasonable price, and you can sell lots of it. Be sure to put it up attractively, and label each package with your name and address, as a guarantee of purity.

Now is the Time to Join the Union. —Let every bec-keeper send for a copy of the Annual Report and a Voting Blank—fill it up, and become a member. It is to the interest of every one to do so. The dnes are only 25 cents a year; and it is intended only to call for one assessment (of \$1.00) each year. Send to this office for the Report and Voting Blank.

The Oleomargarine Bill has been passed by the House of Congress. The following are the material points in the Bill as it passed the House :

It treats all the oleomargarine and butterine products as counterfeits, and proceeds on the principle that they should be regulated as such. For this purpose their manufacture and sale are placed under the control of the Internal Revenne Department. Provisions are made to cause the manufacture to be as little secret as possible. Special taxes are imposed on the manufacturers, wholesalers and retailers, which are equivalent to licenses. All of these are to keep books, which will show the extent of their business, and the retailer is required in specific manner to make known the imitation product so that buyers cannot be deceived. The article has to be put up in wooden or paper packages; the provisions for canceling the stamps are like those on other internal revenue articles. The fines for failing to brand the article properly or for effacing the branding are heavy, as they are also for failing to take out the required license. Where information is given of violations of the law one-half of the fine goes to the informer. A tax of 5 cents per ponnd is levied on the spurious product when it is put up in imitation of butter.

Simmins' Non-Swarming System is the tile of a new English hee-book. The anthor claims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, becanse no other condition exists in the economy of the hive that can be applied to bring about the desired result —a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now he nbtained at this office.

A School Teacher in Southern New England was told by her physician that to live she must seek another climate, and be in the open air as much as possible. She is now in one of the Western States taking care of 200 colonies of hees, with the help of several girls and women. She finds health and money in hee-keeping. So says the *Farmer and Manufacturer*. Now, we would like to hear from that school teacher—Who is she? Where does she live? How does she succeed?

### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here .--- ED.]

### Building Worker Comb.

Query, No. 264 .- What is the best way to get natural comb huilt with the best results ; i. e., in getting all-worker comb, or nearly so ?-Clevelaud.

Allow newly hived swarms to build it.-W. Z. HUTCHINSON.

New swarms, young queens, small crop. Worker comb-guides or foun-dation.—DADANT & SON.

Get it while the colonies are not very strong; or else from swarms just hived.—A. J. COOK.

I use comb foundation.-H. D. CUT-TING.

Keep strong, prolific queens, and contract the brood-nest, giving the bees room just as fast as the queen can fill the combs with eggs. No drone comb will be built as long as the queen fills the combs with eggs as fast as they are built.—G. W. DEM-AREE.

Have it built in weak colonies-or between drone combs-or in a strong or weak colony which has been moved so as to lose most of its field-force; or, better still, on wired frames of foundation.—C. C. MILLER.

Put in starters; give enough drone comb fully built to supply the demand of bees, and cut out drone comb when it is built in frames where not desired. Ordinarily foundation will be found far the cheaper and better for the purpose. It requires the knowl-edge and experience of a Doolittle, and a locality similar to his, to get good results in worker-comb building without the use of foundation. I prefer foundation about 6 to 7 feet to the pound for the brood-chamber, fixed on wired frames.-J. E. POND, JR.

1. Hive swarms on full sheets of worker foundation, securely held to proper position by wires. 2. If you do not use full sheets use guides of foundation not more than  $\frac{3}{4}$  of an inch wide, and the whole length of the top-har, and hive on them. 3. Use swarms of brown German bees.-JAMES HEDDON.

or nuclei, the latter preferred, hav- sis.-J. E. POND, JR.

ing a young laying queen. If swarms are used, contract the hive to 5 or 6 frames, and put on the surplus ar-rangement. If no foundation is used in either, worker comb will be built below and drone comb above. If foundation is used in the sections, worker comb will be built in both as a rule.-G. M. DOOLITTLE.

The best way is to give the bees (if a swarm) a small brood-chamber, with starters of heavy foundation 2 or 3 inches wide. By way of caution I will say that it is not best to hive a swarm in a small brood-chamber-the space must be ample or the swarm is very liable to swarm out. The contraction is to be effected on the third traction is to be effected on the third day after hiving. Colonies with young queens are not apt to build much drone comb, but instinct teaches them to do it, and in my opinion a colony does better with a few square inches of drone comb.—G. L. TINKER.

### Strange Actions of Bees.

Query, No. 265 .- Last summer I had several colonies that acted as if about to swarm, but instead they would crawl into the adjoining hive. They did not seem to fight or rob, but simply to make it lively for a short time; then they would return to their own hive and quiet down. They repeated that several times during the summer. They did not do very well in storing honey. Can you tell the cause of their actions ?-Iowa.

No.-W. Z. HUTCHINSON.

Discontentment, I should think .--H. D. CUTTING.

Perhaps the hives were too close together. I never had bees to act in the manner you have described.— G. L. TINKER.

I cannot say, as I never have seen bees act so. If I had a colony that repeated such bad actions, I would re-queen it.-JAMES HEDDON.

You do not say whether the bees took wing as if they were going to swarm, and you do not state how far swarm, and you do not state how far the hives were apart. As you state it, I infer that the hives were too close together, otherwise the bees would not have "crowded" into the adjoining hive. In a poor season bees will do any and everything but gather borow if you reverge the model. honey, if you manage them hadly.— G. W. DEMAREE.

This conundrum cannot be answered satisfactorily, as not sufficient data is given to enable one to form a definite opinion. I should judge, however, that the colonies might have been queenless. Possibly they might have been lacking in stores. If give it up. When the diagnosis of a difficult case is wanted, every symptom should be given; and even then a personal examination may be need-Get it built by swarms just hived, ed in order to make a correct diagno-

### Late in Occupying the Sections.

Query, No. 266 .- One of my old and large colonies, although lively, and seemed to be doing well, and cast two swarms, did not go into the honey-boxes to store honey until in the fall. What was the trouble with them ?-Iowa Falls.

Perhaps the swarming business.-C. C. MILLER.

Too many swarms came from it .--W. Z. HUTCHINSON.

In this locality it would be too many swarms.—H. D. CUTTING.

Colonies that cast second swarms seldom make any surplus. They were left too weak in numbers to enter the honey-boxes.-G. L. TINKER.

Too many swarms. One swarm from a hive gives the best results in surplus. With the second swarm went what what would have been your surplus, had they staid.—G. M. DOOLITTLE.

They did enough besides. If our bees send out two good swarms, we usually ought not to expect much honey.-A. J. Cook.

Considering the honey-flow of your locality, I surmise that your bees did so well in swarming that they did nothing else.—JAMES HEDDON.

They were weakened by casting two swarms just at the time when they ought to have been working in the honey-boxes, and the early honeyharvest was over before they got strong enough to enter the surplus boxes. They recovered their strength in time for the fall harvest. In my location no colony can cast two swarms and give any surplus honey, unless they store it before the first swarm issues.—G. W. DEMAREE.

Who can tell without an examination (and sometimes not then) what causes the peculiar vagaries of our hees? Probably the combs were spaced too wide apart in the broodchamber. Bees sometimes refuse absolutely to go into sections, but since I have adopted the plan mentioned in the BEE JOURNAL a while ago, 1 find no trouble; that plan is, shave combs to %-inch wide and put them into the brood-chamber just bee-space apart, putting in sections as soon as the honey-flow begins.—J. E. POND, JR.

#### System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

- For 50 colonies (120 pages)......\$1 00
- " 100 colonies (220 pages)
   1 25

   " 200 colonies (420 pages)
   1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

Explanatory .- The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is located near the center of the State named;  $\delta$  north of the center; 9 south; 9 east; •O west; and this o northeast; `O northwest: O sontheast; and 9 southwest of the center of the State mentioned.

### For the American Bee JournaL When to Unite Weak Colonies.

#### G. M. DOOLITTLE.

I wish to explain my position re-garding Query, No. 246, as I notice that scarcely one of those answering that query fully agree with me. Most of them seem to think that if the uniting of weak colonies is to be done, the earlier in the season it is accomplished the better the result; while from years of experience along this line, I am positive that such early uniting is a mistake.

One says that if united early "two weak colonies will sometimes pull through; if left alone, they may die." This is just exactly what I used to This is just exactly what I used to think, and so practiced early uniting till I became convinced that if a colony would "pull through" at all it would do so alone just as well as when united. After being forced to this conclusion, I thought to more positively prove it; so, one spring, as I had 10 weak colonies I united 6 in one hive, 3 in another and left one one hive, 3 in another, and left one alone, which was scarcely an average of the whole, as to strength. This uniting was done about May 1, and in less than three weeks' time the colony formed by uniting the 6 was all gone, but 8 bees and the queen, when I preserved the queen and closed the hive. During the same time the one not united " held its own," while that where the 3 was put together was scarcely better than was this. On June 10 the one having no help had by actual count 85 bees beside the queen and the one made from them, 102.

As I was then anxious for all the bees I could get, I did the best I could with them without helping them from other colonies. The one having the 85 bees built up and stored 5 pounds of honey in sections, besides having enough for winter; while the other got in good condition to winter safely, as did the other. Since then I have united no more weak colonies in early spring.

After a careful watching I find the reason for this scemingly inconsistent having the queen is round, when this frame that become, of some other other other other and the reason for this scemingly inconsistent having the queen on is put outside the In extennation of this advertising the queen on is put outside the In extennation of this advertising the queen on is put outside the In extennation of this advertising the queen on is put outside the In extennation of this advertising the queen on is put outside the In extennation of this advertising the queen on is put outside the In extennation of this advertising the queen on is put outside the In extennation of this advertising the queen on is put outside the In extennation of this advertising the queen on is put outside the In extennation of this advertising the queen on the put of No. 2, when the four frames of the put in the plea that Father to great activity, by strange bees brood, bees and all from No. 1 are to say brood, bees and placed in each alternate tised a new bee-hive. I have to say

a large lot of brood, the care of which wears their life out so that they perish with old age before any young bees hatch to take their place, while those not united do very little, and rear only enough brood to take the place of those slowly dying off, thus keeping their numbers about good when these few (now) young bees are able to hold 5 times the brood they could in early spring, so that they now rapidly increase.

From the above it will easily be seen why I would not unite weak colonies early in the season.

Now for the reasons why I would unite just before the honey harvest, rather than let each colony build up, as most of the answers say we should do: If these colonies are left to themselves the result will be little if any better than I gave, from the two mentioned above; while by uniting just before the honey harvest I secure a splendid yield of honey from the united colony and get the two in good condition for winter.

My plan of work in uniting, and looking toward that end, is as fol-lows: As early in the spring as the bees can be looked over, all of the weaker colonies are shut on as few combs as they have brood, in using a division-board for contracting the hive. They are now left till warm weather comes, being sure that all have stores enough where they can conveniently get at them to carry them until this period. They are now built up as rapidly as possible by reversing the brood, etc., so that by June I the best of them will have five frames of brood, others four, and so on down to one, for the very weakest. As soon as the best has its five frames filled with brood down to the very bottom corners (and none are allowed more combs till they have them thus filled), a frame of hatching brood is given to one having but four frames and an empty comb put in its place. In taking a frame of hatching brood in this way I generally take all the bees there is on it right along, only being sure that I do not get the queen, so that all the young bees on this comb helps to give strength to the next weaker.

In a few days a frame of brood and bees is taken from each of these two five-frame colonies, and given to the one having but three frames, and so keep taking until all have five frames each. Do not make the mistake and try to strengthen the very weakest first, as we are often told to do, for by so doing from  $\frac{1}{2}$  to  $\frac{2}{3}$  of the brood will perish from cold. By the above plan we are always safe, and advancing warm weather is in our favor also.

In a few days after all have five frames of brood, we are ready to unite, and if all has been done as it should be, the uniting will be done about the time white clover begins to yield honey nicely. To unite, look the frames over of No. 1 until the queen is found, when this frame

space between the trames of No. 2, closing the hive. Return the frame having the queen on to No. 1. placing beside it an empty comb; adjust the division-board and the work is done.

In two or three days put the sec-tions on the hive No. 2, or tier up for extracting, and see what a "pile of honey they will roll up." At the same time place an empty frame be-tween the two filled ones in No. 1, and in a few days you will have a frame filled with as nice worker-comb as you ever saw. Nearly all the old bees carried to No. 2 will have returned by this time, so that No. 1 is a splendid, strong nucleus, just right for building nice, straight worker-comb.

As soon as the first frame is full of comb insert two more empty frames between the three full ones, and thus keep on till the brood-chamber is filled. If at any time they should start to building drone comb, then use frames filled with foundation, for this is the time foundation can be used profitably. By fall this colony will be in good condition for winter, while No. 2 will have given three times the honey the two would have done if left to themselves, or had they been united in early spring.

Thus, in brief, I have given the reader the way experience has taught me to be the most profitable in handling weak colonies. Borodino,⊙ N. Y.

#### For the American Bee Journal

### Work in the Apiary.

#### G. W. DEMAREE.

Some years ago I read with greediness everything in the shape of beeliterature that fell in my way. I have changed wonderfully in this respect. I now read nothing concerning bees but such as promises to instruct or amuse me. With these preliminary remarks the reader will be prepared to understand what I shall have to say about Dr. Miller's little book, "A Year Among the Bees."

I have read this little modest work with more than ordinary pleasure. Not that I think that the book gives the best methods of apiarian work as a general thing, but because it con-tains a life-like picture of "work in the apiary" and in such a variety of work and manipulations I bave gathered some really valuable hints that I shall profit by in the future. One of the pleasing features of this little book is, it is wholly free from the advertising feature so prominent in most works on bee-culture. The experienced reader, when he lays down Dr. Miller's "Year Among the Bees," cannot but feel graefful that he has not been bored with the author's horizontal, longitudinal or perpendicular bee-hive, or some other bee-trap.

in answer to this that Mr. Langstroth and his contemporaries introduced, and advertised a radically new system of bee-keeping which was essential to the use of the new hive. No such causes as led Mr. L. to adopt that method of making his invention known to the public could possibly exist at the present day. There is no more probability that there will ever be a radical change in the present system of bee-keeping than there is that the farmers of this period of time will in the future grow their corn and wheat with the "other end" down; so much faith do I have in Mr. Langstroth's system. Of course we must have improvements to keep pace with

the progressive age, but they will only be improvements, not radical changes. I have worked in the apiary this season with renewed interest and pleasure, and Dr. Miller's little book has contributed somewhat to this state of things. The season so far-June 5—has been moderately good, though we have had very cool nights for nearly ten days past. This has for nearly ten days past. This has given me the opportunity to test several new devices now under trial in my apiary. A plan to operate a queen-nursery heated by two strong nuclei has been a hobby of mine for some time, and the very changeable weather we have Lad of late has put the device to the severest test. Night after night the temperature has gone down to 50°---and one night to 44°-and with this severe trial my new queen-nursery has performed its part admirably, hatching the cells with promptness.

The new queen-nursery is made like a common Langstroth hive, but wide enough for a wire-cloth department in the centre that will hold three or four combs, and room for two four-frame nuclei, one on each side of the wire-cloth department. It is so con-structed that either of the depart-ments can be opened without interfering with the others. The nuclei are kept crowded with bees and furnish plenty of heat for all practical purposes; besides, they are engaged in nursing queens all the time; thus I heat my nursery as nearly as possible without cost.

A frame of 18 nursery-cages hangs A frame of is nursery-cages haugs in the nursery, and the young queens as fast as they hatch are introduced to nuclei, if they are ready for them; if not, they are transferred to the cages where they are kept until the nuclei, for them. nuclei are ready for them.

I had quite an interesting experience the other day in connection with the queen-nursery. While I was absent from the apiary a short time a young queen hatched and proceeded to bite the top off of a cell, leaving the white back of the nymph exposed to view. I removed her before she could sting her victim. I just left the cell as it was, and to my surprise the young queen matured all right, and was as lively as any of her sisters. Christiansburg, 5 Ky.

### For the American Bee Journal Our "Union" for Defense.

#### JAMES HEDDON.

Upon reading the report, on page 357, of this yet "young" and small organization, I felt that we were lifted one more notch in the scale of dignity to which our pursuit belongs. I realize that the day is nearing when bee-keepers will be credited for the ardent work they are now doing to bring the honey product before the public, and also for defending the rights and privileges that justly belong to them.

Being confident that even a ma-jority of the members of this Union do not realize all their rights, I will give my views, hoping that it may help to enlighten them on the subject:

The history of any country where one phase of politics or religion overwhelmingly swallowed up all others, shows that the people long associated therewith, became incapable of dis-cerning what were the natural rights of the small minority. This same ele-mentary principle is to-day bearing against the natural rights of bee-keepers. Very many lines of legitimate business, as well as legitimate pleasure, necessarily carry with them more or less annoyance to the neighbors thereof. Our wealthy neighbor's horse stable will occasionally waft a disagreeable odor into our open door, Mr. Brown's saw-mill whistles are disagreeably loud, and attract our children into dangerous places, besides presenting a cluttered and uninviting scenery. Railroads necessarily come too close to many dwelling houses to be pleasant, and thus depreciate the value thereof. And so we might go on, until the dullest in-tellect could not fail to plainly see that in nearly all of our relations with each other, compromises are not only right, but absolutely necessary.

Acknowledgement of this fact is Acknowledgement of this fact is universal among our people, regard-ing such kinds of business as are fre-quently met with. We have learned that we must respect that calling which supplies its follower and his family with the necessaries of life, and helps in furnishing mention and helps in furnishing mankind at large, a greater variety of these nec-essaries. Certainly, both custom and law protect such industries, over-looking approximate arising from looking annoyances arising from them, and further, lending substantial encouragement to them. All who vote for the laws protecting these industries do not comprehend the principle of justice in such laws; perhaps cipie of justice in such laws; pernaps very few do; but they realize on a broader and more selfish basis that interest demands them. The farmer, standing at the base, is the honored and protected of all. Injure his call-ing and you injure all; destroy it, and we all perish together.

Honey has been a luxury ; bee-keeping one of the unimportant side-issues. II oney-producing, as a business, is yet an infant. The general public have scarcely yet heard of its birth. It has not yet become old enough, or large phere receive its substance? "Oh l

enough, to command the respect it deserves.

I presume that the laws against stealing and murder were not en-acted because of any keen sense of right and justice existing within the minds of the originators, but because they seriously objected to parting with the results of their labor, without receiving an equivalent, or to being killed. So it is with our young, being killed. So it is with our young, little, minority pursuit. We will not be respected until such respect is enforced; and no one will enforce it, if we do not. The National Bee-Keep-ers' Union is the speaking trumpet through which we are to be heard and felt.

As carefully as we would avoid nsurping the rights of others, we will as determinedly maintain our own. We do not ask for charity, we ask for justice. So illy respected have always been the rights of minorities that I have heard, even bee-keepers, make statements showing that they did not realize how far their natural rights extended.

If a neighbor's wife is canning fruit, and the odor attracts, daubs and scalds your bees unto death, you must not ask her to desist in that which destroys your property, but you must buy wire screen to put over her win-dows to keep out your bees for a few days (and flies for a few months). If you do not, she will ask you to move them into the country, and when your country neighbor's wife begins to boil cider, she will ask you to move them into the realms of space. Some women, and some men too, are not so exacting; they say, "If you don't keep your bees away from here, they will get scalded."

Bee-culture is new; it is respectable, but not respected. The same neigh-bor has a little worthless, snapping poodle-dog; in your back yard you have discovered a rat-hole. The yard is yours, the rat-hole. The yard is yours, the rat-hole is yours, and the rat belongs to nobody else (but you wish it did), and you take some of your arsenic, and some of your meat, and place it on your own land close by the entrance to your own rat-hole, to destroy that rat, in order to curve volumble screeners that it is to save valuable property that it, in order to save valuable property that it is destroying. Now this neighbor says, and the law says, that you shall not leave this poison where it may tempt his dog to destruction. Dog culture is old; it is respected, but not al-ways respectable. There are many ways respectable. There are many more people directly interested in dogs, than in bees. It is not a ques-tion of good sense or justice, but of majorities; of habit.

Some jealous neighbors say to beekeepers, "You get your crop from others' land," But we do not harm the owner of that "others' land," by so doing. We benefit him by our bees fertilizing his blossoms. But, friend and neighbor farmer, why do you raise and plow under red clover? "Decause it is a great fertilizer." How so? "Well, in its growth it receives only 15 per cent. of its sub-stance from my ground, the other 85 being absorbed from the atmosphere."

<sup>12</sup> The next annual meeting of the Michigan State Bee-Keepera' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTING, Sec.

we all borrow from each other, after all, don't we ?

I tell you, brother bee-keepers, this is a question of vital importance to ns all. I feel that in my past season's production of nearly eleven tons of honey, I have come honestly by it; that I injured no person's linancial interest in collecting it; that by so doing I became a public benefactor; that I brought into use that which otherwise would have remained use-less to mankind; that I did my little mite to make my family comfortable and happy; and, on a broader scale, aided in enriching my city, my county, my State and my country; and while doing this, any and all annoy-ances arising from my business were far below the average arising from other avocations.

We shall finally receive the rights and respect that we deserve; and soon, if we band together and demand them. This we have done, and are still doing, but we cannot do so too fast. Our Union should now number by thousands rather than hundreds. Finally it will number by thousands, and why not now? Let us at once protect our legal rights, and the dignity of our calling. Let us all join the Union.

Dowagiac, 9 Mich.

### The Bee of the Bible.

#### PROF. C. H. HALL.

The bee is an accompaniment of civilization. Among all peoples of culture the limpid honey is a luxury of the table. The honey of Hymettus, in old classic Greece, is famous in prose and in song, and among the old Romans it was regarded almost as essential as bread is with us. Egypt, and the valley of the Nile-the land famous for its rainless seasons and its majestic pyramids-brings to us the same story of valued sweetness culled from flower and fruit by the restless bee. But the land of whose honey and whose bee we wish to speak at this hour, is the country dear to every Christian heart—the Holy Land with its Jordan and its Galilee—with its cliffs and its valleys, with its prophets and its priests, with its kings and the Christ.

The word "bee" occurs but four times in the Bible, so far as the writer is aware, but the word "honey" is of frequent occurrence. It must be re-membered, however, that honey is often used to designate a syrup made from the juice of grapes, boiled down and clarified, and very acceptable to the taste. The sweet and quaint old name of Deborah is simply the Hebrew word for bee, and is trans-lated in our language. One Deborah was the nurse of Rebekah, the wife of Isaac; another was a prophetess who judged Israel and sang the Definition of mathematical same the

from other ground, of course." Well, stroying foe-indicating clearly that in those olden times the bee was such in disposition as it is to-day. Moses, in giving a detailed account of the wonderful dealings of God with the children of Israel, their blessings and " And the their scourgings, says: "And the Amorites, which dwelt in the mountain, came out against you, and chased you, as bees do, and destroyed you in Seir, even unto Hormah." How vivid is the picture thus briefly given to him who has plunged des-perately and blindly through lilac hedge and rose-bush to escape the fierce assaults of two or three vindictive bees. To such an one at least the interpretation of this verse of scripture affords not a difficult task.

The prophet Isaiah, in one of his splendid pictures of the tuture—a picture of promise and of threat— says: "The Lord shall hiss for the fly that is in the uttermost part of the rivers of Egypt, and for the bee that is in the land of Assyria. And they shall come, and shall rest of them in the desolate valleys, and in the holes of the rocks, and upon all thorns, and upon all bushes." Here we have a most vivid picture of how their land should be over-run by foreign hosts and armies, under the imagery of swarms of bees filling the valleys and the clefts in the barren rocks, and even the useless thorn-tree and shrub,

The Psalmist, on one occasion, while magnifying the kindness of the Lord in delivering him from danger and distress, speaks of the nations who compassed him about, in these words : "They compassed me about like bees."

In these passages which have been quoted, it is plain to see how deeply upon the mind of prophet, poet and lawgiver the characteristics of the bee have stamped themselves. The bee represents resistless fury and countless hosts, and is, therefore, the symbol of a conquering foe.

One of the most perplexing riddles ever given for a foe to solve has its origin in the toil of the bee. "Out of the eater came forth meat, and out of the strong came forth sweetness," for three days perplexed the thirty Philistine guests of Samson beyond measure, until they threatened his wife's house with flames if she did not secure the answer for them. She wept and intreated him in vain for his solution until the seventh and last day of their feast, when wearied with her tears and importunities, he told her of its meaning. On a journey he met with a lion, and unarmed though he was, by the resistless strength of his naked arms he destroyed it. Returning along the same path, some-time afterward, he found that a swarm of bees had established themselves among the bones of the dried carcass. He took the comb laden with its refreshing sweetness and ate of it, and also gave to his parents. This incident furnished the occasion for the riddle with which he so much perplexed the Philistines.

"They build up a wall formed entirely of earthen cylinders, each about three feet in length, placed one above the other, horizontally, and closed at their extremities with mortar. This wall is then covered with a shed, and upwards of 100 hives may thus be maintained within a very small compass. This description is of interest on the present occasion because of a note added in which he further says: ' The bee-hives of Egypt and of Palestine are of the same kind. 'Those of Egypt are made of coal-dust and clay, which being blended together, they form of the mixture a hollow cylinder, of a span diameter, and as long as they please, from 6 to 12 feet; this is dried in the sun, and it be comes so hard that it may be handled at will.

.

Such hives as these just described were of course for the tame bees. From some accounts which reach us it would seem that they who man-aged bees in Palestine and other lands in olden time controlled them more easily than we do. The expres-sion of the prophet, about "bissing the bee," refers to their custom of widing them he come court of the guiding them by some sound of the voice, either a hiss, a whistle, or a cry. One of the old writers thus speaks of their customs: "They who kept bees were able to draw them out of their hives, and conduct them into fields, and bring them back again, with the sound of a flute or the noise of hissing." Another says : "When they are disposed to fly away, their keepers make a musical and harmonions sound, and that they are thus brought back as by a Siren, and re-stored to their hives."

The land of Palestine, moreover, was the home of multitudes of wild bees. The warm valley of the Jordon, so far below the level of the sea, with its flowers and its fruits, with its living springs and its burdened vineyards, furnished an abundant pas-turage. They built their combs in the clefts of the rocks, old trees, and wherever a vacant space could be found, as in the bones of the slain lion. Palestine, therefore, was a land, of which it was often said, "flowing with milk and honey.

While the word "bee" occurs so few times in the Bible, the product of the bee, under the names honey and honey-comb, is mentioned more than 60 times. In at least 17 places the country is called "a hard flowing with milk and honey." Under these fig-ures of speech there is emphasized that fact that the country in the that fact that the country shall produce abundantly the necessities and the luxuries of life. By milk, the necessities of life are suggested, as it contains every needful element for the healthful growth of the body; by honey, the luxury and joy and beauty of life are indicated.

Solomon. in advising the young, says: "My son, eat thou honey, be-cause it is good; and the honey-comb which is sweet to thy taste." He chooses this luxory of the table, how-In three out of four places where the Clarke, an account is given of how he further continues. "So shall the term "bee" occurs, it is used to symbolize an overwhelming and de-

high estimate placed upon honey; as is honey to the appetite and taste, so is honey to the appetite and taste, so is the knowledge of wisdom to the soul. That a good judgment should be exercised in eating so delicious and rich a viand is seen in a caution of the same writer: "Hast thou found honey? eat so much as is sufficient for thee, lest thou be filled therewith, and vomit it." The same therewith, and voint it." The same caution points a moral in another place where he says, "It is not good to eat much: so for men to search their own glory is not glory." Again he says: "Pleasant words are as an honey-comb, sweet to the soul, and health to the bones."

As much as honey was esteemed by the prophets and poets, yet it was forbidden to be offered in the meat-offerings of the religious services, "not because bees were unclean, for a tithe of honey was on one occasion paid to the priests, but either be-cause it so quickly soured, or else because it emitted an offensive odor when burnt.

In conclusion, two interesting facts are indicated—one, that he who came as the announcer of the Messiah came as the announcer of the Messnah came eating locusts and wild honey; the other fact is that so far as we know the very last meal that the Messiah ate to prove to his disciples that it was he, risen from the dead, was fish and honey comb. "And they gave him a micro of a buriled fish and of him a piece of a broiled fish, and of a honey comb. And he took it and did eat hefore them " eat before them.

#### Read at the N. Y. State Convention.

Reversing Hives, Frames and Sections.

#### J. M. SHUCK.

For the purposes of this essay, it is assumed that the normal condition of a colony of bees is that in which the members are constantly increasing, and that it is at its best when in this condition. "Keep your colonies strong," is an old adage, and as good as it is old.

The invention and introduction of the invention and introduction of the movable frame advanced the study of bees hundreds of years at a single stride. The object of these frames was the control of the combs so that we might see what was taking been in the him. No one sumosed place in the hive. No one supposed that more bees could be reared in these frames than in the trunk of a tree. They were mainly considered excellent because swarming could be controlled, colonies increased at pleasure, and because queenlessness might be prevented. By and by it began to be observed that certain manipula-tions of the frames stimulated broodrearing, and that rapid increase of bees was the result. It was also ob-served that bees entered the surplus boxes more readily when placed in close proximity to the brood in the hive. So important did this idea be-come that numberless devices were offered that proposed to effect this object. Hives were so made that boxes could be placed adjoining the sides of combs full of brood. Tri-

offered two surfaces for boxing, and square frames were hung at opposite corners so as to furnish the desired boxing space near the brood. In all these hives the same features pre-sented themselves, to-wit: brood in the upper part of the frame at the time when putting on the boxes; later, brood in the lower half of the frame, and honey in the upper half and between the brood and the boxes. The increase of the colony was checked, its numbers began to grow less, and the storage of honey diminished. Another idea here introduced itself—" contraction." Taking it for granted that brood-rearing must be thing in the world to force the de-pleted colony into the boxes by lessening their space below. It was a most common experience to have storage cease while the secretion of nectar was yet abundant; it was a cause of complaint everywhere.

The invertible hive seems to meet most of the difficulties in securing storage of honey as long as the supply lasts. In early spring the hive is set on one end, giving a vertical depth in the brood-nest of about 18 inches. The upper end of the brood-chamber being the warmest, brood-rearing is carried on their first until the upper end of the brood-nest is occupied with it. Then as the weather gets warmer, turn the hive the other end up when the the new the other end up when it will soon be occupied with brood. This takes us to May I. Now turn the hive down on the stand in the position that it is to occupy during the harvest, then within ten days turn the other side up, and ninety-nine times in a hundred that colony, if it had a fair auxily of hoos and it had a fair supply of bees, and a to had a rair supply of bees, and a good queen to begin with, is ready for profitable work. From May 25 to June I in this locality, is the time to put on sections, taking care to invert the hive first before putting on the cases. This places the cases nearest the broad and emerging because the brood and emerging bees, and always secures the best results.

When it is noticed that the sections are getting nicely filled, and combs extended so that they are strong enough, it is time to invert the cases. These cases should be so made that they touch the queen-excluder only around their edges; made thus, they may be detached and lifted off with almost the facility that a man may handle a bucket of water. To invert the section-cases, take them off and set them aside; take off the queen-excluder, and then put on the topboard with the entrance open to the rear; attach the hive-lifter and invert the hive and set it down quietly in the same place it occupied before; no bees are crushed because the hive is not set down on the bottom-board, but the bottom-board is put on top before inversion, and all turned together; now take off the top hoard, replace the queen-excluder, put on a fresh case of sections, and on top of it place the case first put on, but in an in-verted position so that the sections may be filled out plump to the bottom-

be inverted every time a new case of

sections is put on. The reading of the above seems a long process, but five cases of sections may be removed, the hive inverted, and all replaced inside of five min-utes. In a word, the invertible hive should be so made that it can occupy four different positions. The cases four different positions. The cases should be so made that they will hold the sections true and allow the bees to touch them nowhere only on the inside. Without separators, full sheets of very thin foundation should be used. If separators are used, starters

will answer. There is but little to say about re-versible frames. Even fastidious people reject "two bites to a cherry," and eight to ten or twelve bites would be incomprehensible. "All the frames at once" is the demand of the times, but they should be made so that they may be removed if necessary to be examined for any purpose; and the hive containing them should be con-structed so that the frames may be removed when either side is up.

Des Moines, Olowa.

For the American Bee Journal

### The Bee-Keepers' Repository.

#### M. M. BALDRIDGE.

As the American Bee Journal seems to be a repository for historical facts relating to bee-culture, I desire to place on record therein what the late M. Quinby thought of the Langstroth hive after having used the same three seasons. It is views, as now presented, have never, to my knowledge, appeared in any beepaper-having been prepared for and published in the Rural New Yorker some two years before the AMERICAN BEE JOURNAL made its advent.  $T_0$ those engaged in discussing the merits and demerits of new hives, Mr. Q's experience with and criticisms upon the Langstroth hive will. I think, be interesting reading. And now, with-out further comment, permit me to introduce the reader to

#### Bees and Bee-Hives-My Experience.

#### BY M. OUINBY.

In 1856 the Rev. L. L. Langstroth brought to me his movable-comb hive, with a request to test it and report the result. I saw at once that by controlling the combs, and conse-quently being enabled to inspect the interior of the hive at all times, was something not offered by the common hive. If enumerated over fifty ad-vantages that his hive gave over the common one. Although I could not discover quite so many, yet I thought I could see enough to pay me, at least, for the extra expense of construction. Near the first of May I transferred the bees, combs, honey, etc., of some half-dozen hives into the frames. I did not expect, neither could I discover that the bees worked boxes could be placed adjoining the bar as well as the top. So perfectly "more vigorously than before," but sides of combs full of brood. Tri-angular frames were invented which storage that, as a rule, the bive should swarmed naturally, others I made to swarm artificially, and second swarms were prevented effectually.

In 1857 I made nearly 100 hives on this principle, and put bees into them, which worked quite satisfactorily. The present summer (1858) I have used a large number. But a difficulty has arisen that I was not prepared for, viz: crooked combs! Last year, among the whole number, there was but one hive of them so crooked that they could not be taken out, yet there were a great many of them not perfectly straight. This year two-thirds of the swarms that have been put into empty hives have made combs in every possible direction, without regard to the bars, making them, so far as movable frames are concerned. no better than the common hive. The cause of this I have not been fully able to determine. Last year the bees gathered honey very slowly, this year very fast; probably this has some effect. A little more experience will decide.

Last season I had a great many combs made with but little or no honey stored in them; this season I have used them for swarms, putting two or three into a hive-two or more empty frames between those with combs. Even here, although they have followed the frames with their combs, some places are so very thick, and others so thin, that it is extremely difficult to raise them out. I did not expect to find these difficulties with this hive. A few weeks ago-before the present swarming season -I should have told the story somewhat differently. Even now, with all the uncertainty of the directions in which the combs are built, there is a class of bee-keepers who may make this hive pay—such combs as are not built straight can be made so by the fearless operator. But the bee-keeper who has not the energy to prepare himself to take off the top of his hive, and open the door for thousands of perhaps angry assailants to attack him; and the ignorant one, so totally unacquainted with the nature of the bee, that he could not tell what he wanted to take out the combs for, had better adhere to the common hive, because without making the frames available as intended, they are worse than useless, also money and labor thrown away. The man who has not much time or patience to bestow on his bees, who pays for a patent, wants it to work right at all times, without depending on the caprice of the bees; and when those interested in the movable trames can improve the patent with a plan that will make straight combs in all cases, with some other minor improvements, it will do much better for the common bee-keeper.—St. Johnsville, N. Y., 1858.

By all means let us have the foregoing on record where it will not become lost.

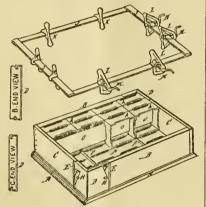

St. Charles, & Ills.

### Rays of Light. Adjustable Honey-Case.

#### OLIVER FOSTER.

This case has been in practical use in my apiaries for the past two years. While it meets the long-felt need of a case press, and holds the sections compactly together on all sides, with no spaces nor partitions between them, it is cheap and simple, and is easily and rapidly handled.

It is made of four boards as wide as the sections are high. The case is nailed at two diagonally opposite corners. The boards are mitred at the other two corners, and are clasped together by the folded angular tin plates (D), the edges of which slide in saw-kerfs in the board as shown in the engraving, at the left. These tin

corners allow the case to open half an inch larger both ways, and hold it rigidly whether opened or closed. The case when closed is a little smaller than the tier of sections. It has no bottom board, and it is the same, either side up.

To fill it with sections, place it on a level board ; open it out, arrange the sections inside, then draw them into position by pressing the case together. Now slip the light wrought-iron clamp (J) over it, and by operating the screws (M), draw it tight on the sections. Now slip in the tin wedges (F), under the tin flange (E), and the nail head (II), to hold the case from spreading. Remove the clamps and the case of sections is ready to place on the hive.

The cases are easily and quickly tiered up or may be inverted if desired. The tiers are always in perfect contact with each other, and with the honey-board below. These cases are admirably adapted to use without separators, but any number of long separators may be used in them, from one to the full set, by simply dropping them in between the rows of sections, as shown at o. They rest on the edges of two strips of tin (P P), which pass between the rows of sections crosswise at the bottom. These narrow strips are held in place like the sections by the lateral pressure of the case. The clamp is not a necessity, but very handy while filling the case or taking them off the hive. Mt. Vernon, c Iowa.

#### For the American Bee Journal.

### The Cold Weather in Florida, etc.

### BENJ. FRANKLIN.

I have just read the article by Mr. John Y. Detwiler, of New Smyrna, Fla., on page 343. One year ago last winter I was at Mr. Detwiler's house, and I believe what he writes is the truth. I was at Lake Worth through the great freeze of last Jan. 10, 11 and 12. I boarded some 3 rods from the lake, and on the morning of Jan. 12 I picked up fish enough in a few minutes to fill a one-half barrel. After they were dressed they would weigh from 2 to 10 pounds each. There was barrels of fish scattered along the shore. I picked up some that were alive, but could not help themselves on account of being so chilled.

I was nearly 200 miles farther south than where Mr. Detwiler lives, and I did not see any frost nor ice while there; but some said that there was ice on the west side of the lake near the fresh water. But I saw that the top leaves of the morning-glories was touched by the frost, and some on the sweet potato vines. Tomatoes were sweet potato vines. Tomatoes were not frozen where I was. But up at the north end of the lake it looked as though the frost had frozen the cocoa-nut leaves some. I thought that it was a sight to see the fish along the lake, but when I got up at Jupiter Inlet, in Indian river, they were so thick along the shore that it was hard work to walk and not step on fish along the edge of the water, and so it was for a great number of miles up the river. The vessel passed through acres and acres of floating fish, and the water looked white with them. The water was very clear and shallow, and I watched for miles and miles, but I could scarcely see a live fish.

There were 12 or 13 colonies of bees at the Lake. I examined some of them on Nov. 22, 1885, and took out some honey. It was quite yellow, about like our raspberry honey here. I did not like the flavor of it. The bees work on coccoanut bloom all winter, or every day that it is warm enough. There were quite a number of cool days while I was there that they did not work. If bees can get much honev from coccoanut bloom, then Lake Worth will be a good place for bees, as there are a great many coccoanut trees coming into bloom every year.

There are no mangroves around the lake, but some 20 miles north, at Jupiter Narrows, there is plenty of the red mangrove. I saw some black mangrove at Jupiter Inlet. As I came through on Jan. 16, 1886, the red mangrove was in bloom on some trees. The river is so narrow in some places that the mangrove caught the sails, and our vessel got crosswise of the channel. We had to use an ax to cut the limbs out of the way.

Further up, opposite Indian River Inlet, I saw plenty of the black mangrove. It looked as though the frost had touched the leaves. I know that the mangrove honey cannot be excelled, as a year ago last winter I

The 5th regular meeting of the Hill County Bee-Keepers' Association will be held on the first Tuesday In July, 18%6, at the apiary of Hon. J. M. McDaniel, of Peorin, Tex. At the same time and place will be held a bee-keepers' honcy plant. II. A. GOODRICH, Sec.

boarded at New Smyrna, where they had eleven barrels of it. The candied honey looked like white sugar, and I liked it better than sugar to put into coffee. I must say that it is lovely in Florida in the winter.

I lost 25 colonies out of 100, this spring. The ones I buried I have lost the most of. I have got enough of burying bees, for the present. Franklinton, o. N. Y., June 2, 1886.

## Pacific Rural Press. Production of Comb Honey.

#### WM. MUTH-RASMUSSEN.

Although comb honey is now sold cheaper than ever before, it will al-ways remain more or less a luxury, and it is somewhat to the interest of and it is somewhat to the interest of the producer to keep it so, by present-ing it to the public in the most con-venient and most attractive shape. The old-fashioned way of offering for sale a whole capful of honey, built in irregular shape, is past. Nobody wants so much at the time, nor wants to be bothered by the dripping and doub so much at the time, hor wants to be bothered by the dripping and daub-ing consequent upon cutting out piece after piece, not to speak of the difficulty of keeping it protected from dust and insects. Neither is the fashion of putting comb honey into tin cans or glass jars and surrounding it with liquid honey a proper way of doing it.

The comb honey of to-day is pro-duced in small square frames, called sections, weighing, when filled, from one-half to two pounds each, according to their size. Of these, the and most common in use. The regu-lar Langstroth wide frame holds eight of these one pound sections, while the "three-quarter Langstroth," or crosswise Langstroth wide frames hold six sections each. This is the style I use.

In order to compel the bees to build the combs of an even thickness and weight, and to prevent them from bulging the surface of the combs, which would cause them to rub against each other and leak, when packed for shipment, two strips of tin, called separators, are nailed on one side of each wide frame. These separators are not wide enough to interfere with the free passage of the bees into the sections. To start and guide the bees in building their combs, guide the bees in building their comps, a piece of thin comb foundation is fastened under the top side of each section. In my experience it is a mistaken economy to be saving with the foundation. I use full sheets, coming within  $\frac{1}{16}$  inch of the sides, and  $\frac{1}{14}$  inch of the bottom of the sec-tion, and after one year having had nearly all my sections below weight. nearly all my sections, below weight, because I only used narrow strips of foundation as starters, I shall never again use less than full sheets for that purpose.

Some bee-keepers succeed in producing straight combs without sep-arators, but as it requires an extra amount of care, and is by no means a sure thing, there is no doubt that the majority will prefer to use separators, comb honey.

even if they add a little to the ex-pense of the outit. The comb foun-dation is fastened in the sections by means of a small implement, called the "Parker foundation fastener," or

the "Parker foundation fastener," or by some similar device. When the sections are filled the division-board is removed, and trame after frame lifted out. The sections are taken out of them and new sec-tions inserted in their place, as long as their is a prospect of getting them filled. The sections are then taken to the honey house, where they are the honey-house, where they are cleaned of propolis, assorted, labeled and packed in cases for shipment. Some bee-keepers pile the sections in a small, close room, or in a large box and fumigate them at certain inter-vals with brimstone, in order to kill any moth-worms which may hatch in them; and where there is a large crop, which it may take considerable time to dispose of, this is probably the best way.

tarles are requested to forward full particulars of time and place of future meetings.-ED.

Fine Season So Far.-R. L. Moore, Boonville, Mo., on June 8, 1886, says:

We are having a fine season here for bees. I had 10 colonies in winter quarters, and they wintered well. All have swarmed; the first two swarms were cast on May 19; the last swarms were cast on May 19; the last on May 30. I mean prime swarms, as I return all second swarms to the old colonies. I have taken about 100 pounds of surplus comb honey, and have over 150 pounds now being capped, with 500 sections being worked in. Have taken 49 pounds from one hive up to this date. White clover is in abundance I now have clover is in abundance. I now have 18 colonies, having sold two swarms, and I expect to get 600 pounds of comb honey; and if the season continues for one or two months yet, I will expect 1.000 pounds of surplus

Storing Honey-Swarming.-Noah Field, Spencer, 9 N. Y., on June 7, 1886, writes :

I had a large swarm on June 1. I t had a large swarm on 5 the 1. I put a box on the parent colony when I took them out of the cellar, and it is about full of honey. The box will hold 8 or 10 pounds. Yesterday there was a large swarm settled on the slanting bottom-board of a new empty hive, that I had placed in the end of the wagon-house for the next swarm, and it is now half full of bees.

Bees Doing Well,-J. W. Sanders, Le Grand, O Iowa, on June 10, 1886, writes:

So far we have had a fine season for the bee-work. All report that bees are doing well for so early in the season. The white clover is now coming in its prime, and bids well for a great yield of honey, for the crop is im-mense, and of large growth. The weather is now dry and hot, but generally heavy dews.

Sour Honey.-B. Losee, Coburg, Ont., on June 7, 1886, writes:

On page 346, L. Reed says: "On May 7, upon going into the bee-yard I noticed bees on the outside of several hives, and the ground literally cov-ered with bees crawling in every direction." His bees were over-fed with sour honey. I found the same offect after for the same with sour honey. I found the same effect after feeding granulated honey made into syrup, fed outside the hive. Some colonies became perfectly de-moralized, as it were. Some of the bees remained out all night, but most of them recovered the next day without any bad effect, apparently.

Good Prospects.-W.B.McCormick, Uniontown, 9 Pa., on June' 8, 1886, writes:

We are having the greatest honey-White clover known in this county. White clover is in full bloom, and very abundant. The weather is all that could be desired. I had 4 swarms yesterday, making 28 in all. The bees seem perfectly crazy. I wish I knew how to prevent so much swarming. Tiering-up does not seem to have any effect. Some of my first swarms have their boxes nearly filled. 1 took off some very fine two-pound sections yesterday. I think I am good for 1,500 pounds this season.

Bee-Keeping in Nebraska-Ants.-4-Henry Patterson, (40-39), IIumboldt, Neb., on June 1, 1886, writes:

To-day our hearts are delighted with the hum of the bees, as they bring home their mighty loads of sweets from the clover. Nebraska is destined to be to the Union as June is to the year. Persons that never were in the West cannot picture the beanty of this country with its boundless prairies tilled by the most ener-getic farmers of the country. The honey resources are not yet thor-oughly tested, but so far as tried bee-

keeping has been very successful. We have no natural forest to aid us to any extent, except on the Missouri river. If our bees can make their living until August we are thankful, as our honeyflow is from heart's ease, which opens about Ang. 10. White clover does well, but the area covered by it is so small that it adds but little. So far small that it adds but little. So far the season has been good. A fine fruit-bloom followed by flowers of many kinds has kept our bees boom-ing; but June is the hardest month with us. Red clover is in bloom (and plenty of it too), but the bees do not work upon it. When we get some-thing to supply the bees in June and July that they may be ready for the July, that they may be ready for the with any State, and the quality is hard to excel. I will say for the benefit of those whose apiaries are troubled with ants, that I have been very successful with the use of kero-sine, by using it on the bottom-boards and corners of the hives, and some on the cushion or cloth.

Starch Sugar in Honey.-Dr. G. H. Kidney, Birmingham, OAla., gives the following test:

Hager (Jour. Chem. Soc.) proposes the following test for the presence of starch sugar in honey: Dilute the honey with 3 volumes of water, and filter; introduce 4 o. c. into a test tube, add 6 drops of a 10 per cent. solution of mercurie nitrate, then 4 c. e. of absolute alcohol. If the honey is largely contaminated a precipitate gradually falls, on standing; but there is only an opacity with small proportions. Hager also finds that if some of the solution of honey is put into a test tube and alcohol poured upon it so as to form an upper stratum, the development of a milky opacity at the line of contact indicates the presence of sugar.

Plenty of Clover, but no Honey.-A. W. Cumins, Woodstock, & Ills., on June 10, 1886, says :

I put my single colony into the cellar last fall, and put it out this spring all right. It bas done well, and yes-terday it cast a large swarm. I had left the case containing 24 one-pound sections on the hive all winter, and last evening I removed it; I found all the sections filled more or less with drone brood sealed, but I got about 15 pounds of honey out of it. I notice that many correspondents speak of the abundance of white elover, and seem to imagine that the bees are storing lots of honey from it. I can bear the same testimony to the growth of clover, but I have not been able to detect a bee working on it, which has been my observation in wet seasons. There is no honey in it yet out here, but if the weather continues dry for another week I expect to see a change in that respect. The swarming sea-son is about two weeks earlier than usual, and the absence of honey in the elover is the only drawback that I, so our prospects are not very sat-I notice.

Florida Bee Territory. - L. J. de Sobotker, Riverton,+oMiss., writes:

I wish to call the attention of Messrs. Hart and Detwiler to the fact that New Smyrna and Hawk's Park are not situated in central  $(\bigcirc)$  Flor-ida, but on its east coast, with only a strip of land separating them from astray, as I was led last July when I visited them in search of a location for bee-keeping. As far as my in-quiries and information received about that part of Florida, I think that Mr. Detwiler's statements are correct in his articles. All extensive landed proprietors there are constantly seeking to run Florida and its resources "up to the skies." I happened to ask a pretty old inhabitant of that musquito and sand-fly region how the people make a living in general. The answer was, "Why, in summer we live by fishing and hunting, and in winter we live on sick Yankees; that is, while we are getting an orange grove established, which takes some years, and just now the only ones doing anything around here are the bee-keepers, of which there are several, and I think Mr. Hart is the most extensive in both bees, orange groves and lands among them." I have written this as I think "fair play is a jewel." We have right here plenty of musquitos and sand-flies, but not as bad as that part of Florida.

Both are in Volusia county, and the United States Postal Guide marks that county thus : •; though it would be more correctly marked thus, o+. We follow the Postal Guide for marking localities, as we do Webster's Dictionary for spelling and defining words. Sometimes, it is true, both may be improved a little.-ED.]

Bees Not Ready for the Harvest.-C. W. Dayton, Bradford, & Iowa, on June 3, 1886, says :

In this locality the bees are at least 15 days behind vegetation. The colonies in my apiaries will average about  $7\frac{1}{2}$  combs of brood, and the fields are white with clover blossoms. This season there has been lots of warm weather; but there has been cold also, so that the bees built up slowly. Since May 25 it has been so warm that brood-rearing fairly jumped. I have noticed some colo-nies containing 7 combs that are almost solid sheets of brood, only two of which combs contained brood old enough to cap. This morning there was a heavy frost. Last evening I whose brood-combs were the most recently spread, so I think there will be no brood destroyed. Some of our elover harvest must be used in building up the colonies. I never knew but one honey-yield to last until Aug. isfactory.

Are Bees a Nuisance ?- Thomas and Benjamin Young, La Salle, & Ills., write thus on June 10, 1886 :

We were taken before a Justice of the Peace last Tuesday to answer a complaint, made and sworn to, that onr bees are a nuisance. Our neigh-bor lives at least 550 feet west of us, the Atlantic Ocean. Mr. D. lives on but passes our place to get to the this strip of land, and Mr. H. on the main road. Our hees are 25 feet main side further south. I beg to from the narrow road (2 rods), and 150 correct this, as it may lead aparists feet from the main road. When our feet from the main road. When our neighbor came home for dinner on that day there were two swarms in the air, and he drove through them and got stung "all up," as he puts it. We have no fence on the south side of our lot (one aere), and we do not know whether that would go against us. We had him agree to be satisfied if we would put up a fence about 5½ feet high. Now, what we want to know is, have we any rights as bee-keepers, and what are our rights? If we have to put away 55 or 60 colonies of bees because a man got stung while driving through two mixed up swarms, it is all up with bee-keeping.

> Open Questions.-O. P. Miner, Taylor Centre, ON. Y., asks the following questions. Any one may answer them who feels competent, through the BEE JOURNAL :

> 1. Is there any piping of queens ever heard while the old queen is in the hive, and before they swarm ?

2. Are virgin queens ever hatched before the old queen issues with the first swarm?

3. If so, do they ever go with her and the swarm ?

The following circumstances suggests these questions: On May 23 my first swarm issued, but returned to the parent hive after my trying to hive them in a new one, which they were loth to enter. At the time they had a queen-cell sealed. For several days following it was cold. On the morning of June 4 I found a dead queen in front of the hive. I listened at night and heard piping. The next day-June 5-1 opened the hive and found larve 4 or 5 days old, but I did not discover any eggs. On May 30 another swarm issued (from another hive), and in hiving them I saw three queens. Upon opening this hive I found nothing but sealed brood and honey. Perhaps in this case the old queen was superseded.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides their own, with \$3, for one year, we will present a copy of this valuable book.

Issned every Wednesday by

THOMAS G. NEWMAN & SON, PROPRIETORS.

923 & 925 WEST MADISON ST., CHICAGO, ILL.

# Special Notices.

To Correspondents. - It would save us much tronble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

When Henewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

Our New Catalogue of Bee-Keepers' Supplies for the spring of 1886, is issned, and will be sent to any one desiring a copy. Send name and address, plainly written, on a Postal Card for lt.

----

" Don't Stop "-that is what many write to us about their papers, when their time is nearly out. One subscriber says : "This has been a year of disaster, and it is not convenient for me to send yon the money now to renew my subscription. It runs out with this month ; but don't stop sending it. I will get the money to you within three months." Such letters are coming every day, and so for the present we have concluded not to stop any papers until requested to do so.

Foundation, Cheap .- We have about 75 lbs, of Comb Foundation for the Brood-Chamber, 4x161/2 inches, which we offer at 35 cents per pound. This is an odd-size lot of onr regular "Dadant" stock.

Italian Queens .- We can supply them by mail, postpaid, at the following prices : Untested, \$1.00; Tested, \$2.00; 6 Tested Queens for \$9.00.

# Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 10 a. m., June 14, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

### CHICAGO.

HONEY.-Honey of all grades sells slowly at present, and prices are weak-14@15c, hence the outside figure for best comb honey. Extracted is in light demand at 5@7c. California comb honey, in 2b, sections, 9@12c. BEESWAX.-25c. for good yellow. K. A. BURNETT, 1%1 South Water St.

#### NEW YORK.

NEW YORK. HONEY.- We now quote: Fancy white could in 1-b, sections, 12013c.; in 2-b, sections, 96410c. Fancy buckwheat boney in 1-b, sections, 96410c. Extracted, white, 5667c; buckwheat, 56654c. Call-fornia, 5666c; Southern, as to color and flavor, per gallon, 59666c. BEESWAX.-27628c. MCCAULS HULDEEND BOOS of Under St

MCCAUL & HILDRETH BROS., 34 Hudson St.

### BOSTON.

HONEY.—One-lb. sections, white clover, 13@15c; 2-poind sections, 11@13c. Extracted, 6@8c. BEESWAX.—25 cts.per lb. BLAKE & RIPLEY, 57 Chatham Street.

### SAN FRANCISCO.

HONEY.-The first new comb honey of the sea-son-a sample lot of extra choice-brought 14 cts. We quote: White to extra white comb, 110014 cts.; amber, % 10c. Extracted, white liquid, 44600.c; light amber colored, 4 to 4½c.; dark amber colored, bit to 3% cts

3% to 3% cts. BEESWAX.- Quotable at 20 to 24 cts. O. B. SMITH & Co., 423 Front Street.

# DETROIT.

HONEY.-The market is almost bare of comb honey, and very little is wanted. Best white in 1-lb. sections 14 cts. BEESWAX.-Scarce at 25c. M. 1I. HUNT., Bell Branch, Mich.

#### ST. LOUIS.

HONEY.-Choice comb. 10@12c. Strained, in barrels, 3%@4c. Extra fancy of bright color and io No. 1 packages, if advance on above prices. Ex-tracted in barrels.5@59, Fermented goods, 2%@3c BEESWAX.-Firm at 22c for prime. D. G. TUTT & CO., Commercial St.

### CINCINNATI.

HONEY.-Trade is perhaps duller than usual, We quote : Extracted honey brings 4@8c., and choice comb honey brings 12@15c, in a jobbing way. BEESWAX.-In demand at 20@25c, for yellow. C. F. MUTH & SON, Freeman & Central Ave.

### CLEVELAND.

HONEY.-There is an excellent demand for best 1-lo. actions of white boog, and all arrivals sell readily at 14c.; 2-los. and glassed sections sell slowly at 12c. Extracted, 768c. BEESWAX.-Scarce at 256/28c. A. C. KENDEL, 115 Ontario Street,

KANSAS CITY. HONEY.-Seles of comb are good, while extrac-ted is very duil and low. One-poond sections are scarce; stocks of all other grades are well supplied. Callf. 2-bs. bring 11612c.; Eastern 2-bs. 12633c; 1-lba., white, 14615c.; dark, 12613c. Extracted 566c.; Southern, 3564c. BEESWAX.-23c. Character

CLEMONS, CLOON & CO., cor. 4th & Walnut.

### MILWAUKEE.

MILWAUKEE. HONEX.--The market seems quite dull for all qualities of comb honey, with but a moderate de-mand for extracted. We quote : Choice, white 1-lb, acctions, 176/186. We quote : Choice, white 1-lb, acctions, 176/186. Extracted, white, in barrels or kers, 76/26.; dark, in same packages, 66/746. BEESWAX.-246/256 A. V. BISHOP, 142 W. Water St.

### SAN FRANCISCO.

SAN FRANCISCO. HONEY.-Aboat 700 cases arrived this week. The market has a soft tone and bids fair to favor buyers for months to come. White comb boney is offering at 90. Water white extracted was placed at 44c., and light amber at 4c. These are extreme figures to realize in the wholesale market for the qualities named, with no prospects of better rates prevailing. We quote as follows: White to extra white comb, 500 loc. Extracted, white liquid, 4546 45(c.; light anober colored, 35404c; dark amber colored, 314632/c. BEESWAX.-200724c, in lots from first hands. SCHACHT & LEMCKE, 122-121 Duvis SL

VAX.-20@24c. in lots from first hands. SCHACHT & LEMCKE, 122-124 Davis St.

# Honey as Food and Medicine.

To create Honey Markets in every village, towo and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMANO for all of their crops at remunerative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. Ou orders of 100 or more, we will print, if desired, on the cover page. "Presented by," etc. (giving the name and address of the bee-beaper web scatters them) keeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

The Graphic News, of Cincinnati, O., of June 12, is quite extensively devoted to the President's recent wedding. The illustrations -all especially interesting because of their originalityinclude the representation of the ceremony, the President receiving congratulations, the cottage at Deer Park, where the honeymoon was spent, the car in which the bridal-trip was made, and many other pictorial features of this event. Accompanying the issue of June 19 will be a magnificent colored supplement of "FABIOLA," a reproduction of a famous painting. The souvenir will be a beautiful work of art. None should miss either of these fine numbers of our brilliant cotemporary.

The Convention History of America and the American BEE JOURNAL for one year, will be clubbed for \$1.15.

# Italian and Carniolan Queens BY RETURN MAIL.

22Atf

The Resolutions proposed by Mr. Clarke, on page 389, sufficiently explain themselves. Modesty forbids onr endorsement of them so far as they relate to the Manager ; the others have our hearty approval. As to the "cane" business, it may "raise Cain," and should not be attempted ; the Manager will be abundantly able to continue to "walk straight" without its aid ! "United action" is of more importance than any public act of endorsement; harmony and persistent work far more necessary than any token of approbation !

Mr. D. A. Jones contracted an affection of the cye during his tour in Oriental Lands, some years ago, and it troubles him considerably, cansing acute pain aud much annoyance to such a "busy man" as he is. His many friends all over the world will be sorry to bear this.

Rains have been numerous lately, and as the roots of the clover had penetrated deeply into the earth after moisture during the preceding drouth, the bloom is profuse, and honey is being gathered in abundance. Mr. Wm. Malone, of Oakley, Iowa, on the 17th wrote as follows:

We are having a large crop of white clover honey. I have taken about 900 pounds of honey from white clover from 24 celonies, spring count. The linden uever was more promising for a heavy honey yield. The honey is of excellent quality. We feel good over the prospect for 1886.

Concerning the Wiley Lie about combs being made by machinery and filled with glueose, mentioned by Rev. W. F. Clarke on page 389, as being contained in Appleton's Cyclopædla for 1881, the reader is referred to an editorial in the AMERICAN BEE JOURNAL for 1883, page 209, where we ventilated the matter. We sent a copy and a letter to the Appletons at the time, but they took no notice of it. We will now do so officially, as Manager of the National Bec-Keepers' Union, and will announce the result in due time.

A Correspondent who has but just commenced keeping bees, asks whether the old or young queen goes with the first swarm. As several questions of similar import have been received lately, we will reply to them all at once.

The old queen goes with the first swarm before the young queen emerges from its cell. The old queen is prevented from destroying the young queens by the bees before swarming. Previous to the issning of a swarm the "pipiog" or shrill notes of the old queen in answer to those of the young queen yet in the cell, may be heard several feet from the hive. An experienced apiarist knows that a swarm will soon issue. But it is not consistent with the nature of bees for the young queen to hatch while the old queen is present. In some cases, when the bees need a queen to supersede an old or worn-out queen, mother and daughter live together in harmony in the same hive, but this is an exception to the general rule.

We are Sorry to learn by the Canadian Bee Journal of last week that Mr. Frank Benton, who is now in the Island of Cyprus, has an attack of fever. Our Canadian cotemporary adds the following:

We are also informed that those disagreeable quarantine regulations with which they fumigate everything passing through the mails, has prevented the shipping of queens and earrying on the operations as successfully as they could wish. We hope that these objections may soon be removed, and that friend Benton will recover, so that he may carry on his noble work. Any one who sacrifices the comforts of American life for the discomforts of life in the East, in order to carry on the operation of exporting queens, should not only receive the goodwill of every one who desires them, but deserves to have health and prosperity. We fear Mr. Benton will have to abandon the work or sacrifice his life to the climate of that country, as it is not adapted to Americans, and by the time a person becomes acclimated, his constitution would be rniped.

About Protecting Combs from the ravages of the moth, says the Indiana Farmer, we have many inquiries. One asks : "Will it keep out the miller to paste muslin over all the cracks in the hive ?" From another, "Will putting the combs in tight boxes, and closing np do, etc. ?" There seems to be an entire misconception of the moth miller. Understand, in the first place, where the combs are, the moth will be also. They live in and around the hives and combs, and in shutting up the hives you close them in instead of shutting them ont. They will do no harm nntil the arrival of warm weather, unless the combs are kept in a warm place. The best plan is to pack the combs in a tight box of some kind ; examine them at intervals of ten days or two weeks. If you find they have commenced work, fumigate the combs with sulphur. Keep all closed up tight. One time may be sufficient, but if, after a couple of weeks, you can still find signs of new work, give them another dose of sulphur. Twice fumigating will generally do the work. The fumes of snlphur will kill all the worms, and if there are no more eggs to hatch, once will suffice, but it will not destroy the eggs, so they must be watched until all the eggs have hatched. Afterwards, so long as they are kept closed up they are safe.

Shade for Hives.—The American Rural Home contains the following note concerning a new shade for hives :

N. N. Betsinger, of Marcellns, N. Y., has just invented a novelty in the line of a shade-board for bives. It is made so as to take the place of the roof, is of light material, which is covered with tin, so as to prevent leaking, and painted white, so as to absorb as little of the sun's rays as possible. This board has a projection of about 18 inches in front of the hive, so as to thoroughly shade the entrance from 9 a.m. to 3 p.m., and is hinged to the hive in such a way that when the operator wishes to manipulate the hive it tips np, and the projection holds it in place entirely out of the way. Furthermore, it has a place in what is now the top of it, for the handle of an nmbrella, so that in hot days the apiarist can sit and work in the shade. It takes but a moment to open and close the hive, and works so easily that only one finger is required to operate it. The whole thing is very ingenious, and Mr. B. deserves the thanks of beckeepers for an invention which gives comfort to both the bece shad the beckeeper.

Mr. Betsinger is tronbled very much with rbeumatism, and invented this shade because he is unable to lift anything heavy. He is one of the most prominent bee-keepers of the Empire State.

"Different Kinds of Sngar," says au exchange, "such as sucrose, glucose, and lactose, agree in containing carbon, hydrogen and oxygen, the latter two in the proportions in which they form water. This sugar becomes the heat-giver to the bee in the following manner: Air containing oxygen is taken in by the bees through spiracles (the breaking openings) in the sides of which are 14 in number, and this oxygen is by degrees united with the carbon of the sugar, which is being carried about in solution in the fluids of the insect."

The Times, published by Mr. Henry A. Cook, at Eureka Springs, (a pleasure resort of Northwestern Arkansas) is one of the brightest and liveliest daily papers among our exchanges. Mr. Cook is a vigorous writer, an excellent editor, and a good priuter. He was a pupil of the Editor of the BEE JOURNAL some 16 years ago. We wish him much success.

Mr. Ernest Root, son of the editor of *Gleanings*, "has taken unto himself a wife." The AMERICAN BEE JOURNAL wishes him prosperity and much happiness.

Now is the Time to Join the Union. —Let every bee-keeper send for a copy of the Annual Report and a Voting Blank—fill it up, and become a member. It is to the interest of every one to do so. The dues are only 25 cents a year; and it is intended only to call for one assessment (of \$1.00) each year. Send to this office for the Report and Voting Blank.

Bee-Men at Fairs attract crowds while handling bees. Do not fail to employ this method of advertising the honey product, and at the same time create thonsands of consumers of honey, who may be reminded of the value of honey for nutriment and medicine by seeing your bees and honey on exhibition.

# Replies by Prominent Apiarists.

[It is useless to ask for answers to Querics in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.—ED.]

# Trouble in Melting Wax.

Query, No. 267.—This spring, having considerable old comb, I began melting it up for wax, expecting to have plenty and to spare; but instead of wax it seemed like melted bee-bread, with only a light skimming of beeswax on top. I have made wax before and had good luck. What was the trouble ?—J. F. P.

Overboiling. Melt your wax slowly and with care.—DADANT & SON.

Old combs. I once attempted to extract wax from very old broodcombs, and hardly got a smell of wax for my trouble.—G. L. TINKER.

Did you not let the comb be exposed more or less to wet for a long time ?--C. C. MILLER.

I have had no trouble of this kind when I used a good wax extractor. I have seen cases of this kind when I thought too much heat had been applied.—H. D. CUTTING.

It would seem that the combs were old and probably filled with bee-bread and cocoon linings of cells. The newer the comb the more wax obtained. I have found that combs 6 or 7 years old would not give  $\frac{1}{5}$  part the wax that could be obtained from those one year old. The reason is obvious, and needs no explanation here.—J. E. POND, JR.

I guess that these combs had been exposed to the weather, and become rotten. I once tried in vain to get any wax out of such combs. Much bee-bread does not account for it.— JAMES HEDDON.

If the combs are moldy and rotten the wax will be dead, druggy stuff, and will not separate readily, and is worthless at any rate. The worst cheated I ever was in the bee-business, was by a supply dealer selling me a large lot of foundation made of dead, rotten wax. The combs will give me trouble as long as I tolerate them in my apiary. I would guess that your combs were old and full of bee-bread. I had a good deal of trouble with a lot of such combs myself some years ago. I finally got the wax separated and cleared by repeated melting in plenty of hot water.— G. W. DEMAREE.

# Do Queens Re-Mate ?

Query, No. 268.—Does an old queen remate about the time of going out with a swarm ?—J. E. T.

No.-W. Z. IIUTCHINSON.

I think not.-C. C. MILLER.

No, never.-G. W. DEMAREE.

No.-DADANT & SON.

I think not.—JAMES HEDDON.

I never saw anything looking that way, and I believe not.—G. M. Doo-LITTLE.

No. The external passage leading to the spermatheca closes up after a queen becomes a few weeks old.—G. L. TINKER.

That is something we know nothing about. The general supposition is that a queen mates but once.—H. D. CUTTING.

I think she never mates after the first successful meeting with the drone.—A. J. COOK.

No, sir! most decidedly not. It is claimed by some that queens do mate more than once; this may be true during the first four or five weeks after they emerge from the cell, but it is physically impossible after they have arrived at maturity. I give the above as my opinion, based on my knowledge of the anatomical and physiological formation and construction of these insects; I have given the matter some considerable attention both in the way of study and experiment, and I believe I am correct. I am open, however, open to conviction, but demand *proofs* to the contrary.—J. E. POND, JR.

# Extra Openings in Hives.

Query, No. 269.—Is it necessary to have extra openings on the back part of the hive, or on top, for ventilation, besides the entrance 2—F. S.

I do not use such.-G. M. DOOLIT-TLE.

I do not know whether it is necessary, but I practice it.—C. C. MILLER.

I think that a good, large entrance is sufficient, when the hive is shaded. -W. Z. HUTCHINSON.

Sometimes, in very hot weather; not every year, and never on top.— DADANT & SON.

No. I would have no opening but the one where the bees enter in front. -A. J. COOK.

No. I do not like them. I do not want guard-bees at every point of the hive. Keep all hives well shaded.— JAMES HEDDON.

In summer I like to have my hives so I can raise them up from the platforms about ½ inch; that gives good circulation all around, and the bees will not hang out.—II. D. CUTTINO.

I think that it is, if the entrance is small. I now make my hives with

very large entrances, and have been for several years making them a little larger. It is now made 85% inches long and 1¼ inches deep, which is not considered too large for winter or a full colony in summer time.—G. L. TINKER.

All the extra ventilation I ever give my hives is a slight raising of the cover to the hive when the weather is hot and the bees indicate lack of comfort by "laying out." A thin wedgeshaped piece of wood inserted under the cover at the back end gives a draft of air at the proper place.—G. W. DEMAREE.

I have never found it to be so. I give ample ventilation at the entrance, and find such sufficient. With a large entrance, ample room in sections, good shade, and a raised cover when extremely hot, no other or further ventilation is necessary. In winter no ventilation should be given other than at the entrance, except such as comes from covering in the frames with burlap or its equivalent, and placing a chaff (or its equivalent) cushion over all.—J. E. POND, JR.

# Amount of Water in New Honey.

Query, No. 270.-What per cent. of water is contained in new honey when gathered from the flowers ?-Mt. Sterling.

It differs.-W. Z. HUTCHINSON.

It varies so greatly that no answer can be given. Sometimes it seems nearly all water; then again the nectar is quite thick.—A. J. COOK.

It differs from one kind of flowers to another. The botanist Bonnier says that some nectar contains 75 per cent. of water. Some seasons yield more watery honey.—DADANT & SON.

The per cent, of water in the nectar of different kinds of flowers probably varies, but I think it is usually as much as 40 per cent.—G L. TINKER.

It depends from what source it comes. Basswood honey, in dry, hot weather, contains very little water when it comes from the flowers; while teasel is about five parts water to one parthoney.—G. M. DOOLITTLE.

It will vary with the different nectars and on different soils. I have reduced 40 per cent. in a large test tube, and again only 12 per cent.—H. D. CUTTINO.

It depends npon the state of the weather, and the variety of beeforage from which the nectar is gathered. Its density varies all the way from a small percentage in weight above water, to nearly the standard weight of marketable honey. At least such is the case in my locality.—G. W. DEMAREE.

I have never tested it experimentally, but I should guess about  $\frac{1}{14}$  in volume and perhaps  $\frac{1}{16}$  or a little less in weight. It will vary so much in different grades of nectar, that no more than an approximation can be made.—J. E. POND, JR.

Explanatory.—The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark  $\bigcirc$  indicates that the apiarist is located near the center of the State named;  $\eth$  north of the center;  $\diamondsuit$  south;  $\circlearrowright$  east;  $\circlearrowright$  west; and this  $\circlearrowright$  uortheast;  $\backsim$  northwest:  $\circlearrowright$  southeast; and  $\textdegree$  southwest of the center of the State mentioned.

For the American Beo Journal Report of the National B. K. Union.

# WM. F. CLARKE.

This official document is now before the constituency of the Union. It is a straight-forward, business-like and satisfactory statement of what has been done by the Manager and Executive Committee during the first year's administration. The organization has proved its right to exist by what it has accomplished during one short twelve-month, and that it is needed still, is obvious enough. There is that California suit, in which a new trial has been asked. This case, whatever it costs, must be kept alive until a decision according to the facts is put on record. It is monstrous that in this enlightened age a court anywhere within the realm of civilization should put its judicial seal to such a verdict as the one rendered, based as it is on the testimony of possibly honest, but utterly deluded wit-nesses, who declared on oath they had seen the perforation and destruction of grapes done by the defendant's This thing must be carried, if hees. need be, to the Supreme Court of the United States, and that dull scholar, the public, taught the nature of a bee's tongue, and the impossibility of its being used for purposes of fruit destruction.

I am not sure but I have a case on hand requiring attention from the Union's Manager. Some weeks ago there appeared a statement in the *Montreal Witness*, Canada's most widely circulated weekly family paper, in reply to a question about glucose as follows:

"It is also put up directly in trade as honey—with which bees have had nothing whatever to do—being put up by means of appropriate machinery, into artificial combs made of paraftine !"

In correction of this and other erroneous statements, I wrote an article headed "Spurious Comb Honey," which duly appeared in the Montreal Witness of June 9, and at the close of it this editorial note: "The statement in the Witness in answer to an inquiry concerning glucose, was obtained from Appleton's Annual Cyclopædia, 1881, article Glucose."

If this is so, attention must be at once given to the matter, and the Messrs. Appleton brought to account. I have not access to the volume quoted, and therefore beg that our Manager will forthwith look up the reference, and should it be as stated, serve a notice on the publishers named, similar to that which brought the editor of the Chicago Advance to time. It is not to be tolerated that an honest industry should be maligned after this fashion.

Other proofs might be given to show that the "Union" still has work to do. Let it therefore be sustained. I own to having been somewhat disappointed that there was not a more general rally of bee-keepers to the standard of defense, when it was unfurled, manifestly with such good and urgent cause. Still, 324 members form a large body of people, and it is not unbecoming or improper for one of their number to say that it is a select body—a "picked and packed" phalanx who mean business, and all of whom will act as recruiting sergeants to get up a vast army of defenders, if circumstances arise to require it.

After all, there appears to have been members enough for the im-mediate demand, and by marvellously good financiering, the Union has ac-complished a lot of work—all apparently that was immediately called for -and there is a balance of \$15 in the treasury. "Tres bien !" as the French say. Now let every member promptly renew, and in view of the good showing made by the report, let us have a large enrollment of new names. I would like to see a good list from Canada. Our cause is one. Legal decisions in the United States will morally have all the force and value of precedents in the Dominion. The of precedents in the Dominion. The collection of sworn scientific testi-mony will be a service performed equally for both. Criticism and correction of newspapers, cyclopædias, and other publications is work done for the entire world of literature. Education of the public mind, the prestige of association, and the power of co-operation are influences that boundary lines. So I hope that the corporal's guard from the Dominion will be swollen into a decent regiment, and that we may have during 1886-87 an army of at least a thousand strong.

I beg to move the following resolutions, and I wish I had been "right smart" and done it immediately on receiving the report in the BEE JOURNAL of June 9. However, those who have sent in their votes, will not, I think, begrudge a postal card in support of the following:

1. Resolved, That the report of the General Manager be accepted and

General Manager be accepted and approved; also that the thanks of the membership are due and are hereby tendered to the Executive, and especially to the Manager, for their efficient services.

2. Resolved, That the Bohn case be followed up until a judicial decision in accordance with truth and justice be inscribed among the national archives for all coming time.

3. Resolved, That there be an honorary life membership in the Union to be accorded to such as have rendered eminent service that cannot well be otherwise acknowledged, and that the roll be commenced with the following names:

Rev. L. L. Langstroth, who, if he had been properly defended in his rights, would now have been in circumstances to which his merits entitle him. James Heddon, as founder of the Union. Thos. G. Newman, in recognition of the ability and zeal shown by him as General Manager. G. W. Demarce in grateful acknowledgement of his having donated his "brief" to the "Union Defense Fund" in connection with the first trial case.

Properly speaking, the Manager, on whom the chief labor has thus far devolved, and who as a business man has a right to payment for his time, ought to have a salary, but we are not in a position to vote him one worthy of his acceptance; I therefore give notice of a motion to present him with a gold-headed cane at the next meeting of the North American Bee-Keepers' Society to be held at Indianapolis.

All of which is respectfully submitted.

Guelph, Ont.

[See editorial note on the foregoing article on page 387.—ED.]

Benefits of Bee-Keepers' Associations.

# PROF. D. A. OWEN.

The old and familiar adage that "Whatever is worth doing at all is worth doing well," is no truer in any other undertaking than that of the culture of bees. It was thought for a long time that the bee was guided wholly by instinct in the performance of its domestic duties, and that it did the best possible when left alone. But since bee-culture has become a science, it has been found that the bee is capable of reasoning and being taught.

The bee is much older than Adam, but it was left to the sons of Adam to make it possible for a single colony, which formerly yielded from 50 to 75 pounds of honey, to yield from 500 to 700 and even 1,000 pounds per annum. While man has enabled the bee to improve upon its old methods of work, and increase its products tenfold, it has in return taught him not a few important facts. Through observations of this little animal in the field, he has learned the best method of cross-fertilization of all kinds of vegetation. The bee has taught him that a good fruit year does not depend as much upon the fact that it is preceded by a white or black Christmas, as upon the number of bees that survive the winter.

Bee-culture is a modern science. Thirty years ago a bee-keepers' association was scarcely thought of; today they are found in nearly every progressive county of the Union,

where any attention is 'paid to the culture of bees at all. He who will take the time to run over the records of this last thirty years, will very soon discover some of the benefits derived from such associations. No single individual has ever been able to discover all that can be found out concerning any one thing. God never designed that he should. Man's de-pendency is one of the causes of his sociability; and should be become independent in any one particular thing, in that proportion will be become reserve and selfish. And so the benefits of sociability and meeting with friends and neighbors, and the exchange of opinions that come to the members of every association are found as well in this organization.

But it is our purpose to ascertain some of the special benefits derived from a bee-keepers' association. These benefits may be classed in two divisions, viz: the immediate and remote. I take the prime object of bee-culture to be the production of honey; and whatever relates espec-pecially to that in this essay, I have denominated as immediate benefits; and those things which relate to the study of the bee as an animal or to the development of the flora, 1 have designated as remote benefits.

It was thought at first that the hive most nearly like the one the bee used in its wild state, would be best suited for her demands; so a portion of a hollow log was used, and probably received the name of "gum" from the tree of the same name, from which it was taken. When the tree could not be obtained, a box opened at one end, whose diameter was about the size of the supposed tree, was Where do you find such a hive used. to-day? Show me such a hive, and I will show you a man who either does not take much interest in bee-culture, or else he has been compelled by emergency to use it merely as a temporary convenience. With such a hive the colony was almost destroyed every time the honey was taken; and then we called it "robbing" the hive; the word hardly expresses the act, unless we think of it as highway robbery, where the individual is knocked down and left for dead. To-day, with the aid of recent in-ventions, we are enabled to take the honey without aithor robbing the honey without either robbing the hive or destroying the bees.

The invention of the movable combto the real progressive spirit in bee-culture as any other one thing. With these the frames can be removed with the comb, and the honey ex-tracted without injury to either the bees or the comb. This method of removing the honey from the combs, and then replacing them, is a great saving, both in time and honey. Mr. Milton, of Wisconsin, says that it takes the bees as long to produce one pound of wax as it does to procure 20 pounds of honey; and Dr. Kirtland says they consume 25 pounds of honey in producing one pound of wax. Thus you see that for every pound of wax colony, and to all appearances they they produce it costs 45 pounds of honey. All of this is saved to the is a common occurrence that two the winters were fully as severe?

farmer by the investment of a little means in improved hives and a cheap apparatus by which the honey is driven from the combs by means of centrifugal force.

Besides the increase in honey obtained on account of the movableframe hives, they greatly aid in the regulation of the breeding. The drones are like some who go by the same name in the human family, eating much and doing little; hence, when the drone season is over the workers kill the drones or drive them out to starve. But if the workers make a mistake and form too many drone-cells, the drones will sometimes be so numerous as to eat the honey as fast as the workers can procure it; but with the improved hive containing the movable comb, the drones can be removed and a comb for rearing workers can be inserted in its place. In fact the whole breeding department can be regulated to suit the convenience of the keeper.

In the cross-fertilization and the rearing of queens the movable-frame hives, says Richard Colvin, of Baltiare indispensable. more. He savs that without them he would despair of Italianizing an apiary of even moderate size. The inventions in hives, during the last few years, have been quite numerous; and it is the design of these associations to take up these different inventions and discuss their relative values, and select the best from all.

It is of great importance to know just how to take care of bees through the winter. Some farmers seem to have excellent success with their bees without any special care, while others with all their care lose nearly all. One will leave his hives standing during the winter just in the same place and with no more protection than they had during the summer, while another places straw or perhaps carpet around his, and a few will put their hives in the cellar; and it frequently happens that each one has some peculiar experience. -In these meetings these peculiarities are made known, and their causes in-quired into. These annual or semiannual meetings are fraught with more good than we at the time realize. It not unfrequently happens that many facts are recorded with all their coincidences which at the time illuminates nothing, but in the course of a few years become of great interest.

These meetings are to a great extent for the purpose of collecting and comparing data; and among the abundance that will be collected there will be not a little which will be classed as "trash;" but a great deal of it will be of untold value to the progressive bee-keeper. In making our deductions from these data, we should be very careful to make the fullest examinations of all the facts. No conclusions must be hurriedly formed. It is not sufficient to say that one man lost his bees because they were left out-of-doors, for prob-

thermometers of the same make, and only a short distance apart, will register from 1° to 3° differently. The circumstances should be given in all their particulars, as to the make of the hive, the protection from the wind, rain and snow, how near the ground. etc.

Bee-keepers in general, who have tried it, recommend the wintering of bees in the cellar, which should be kept at a temperature of about 40<sup>o</sup>. he It has been found that the bees when well protected in this way consume about two-thirds less honey than when left exposed to the weather. The bee must be treated in a great many respects as we treat other domestic animals. They do not hibernate during the winter as a great many persons suppose. Two things are obsolutely necessary, namely, food and warmth ; without either they are sure to die. It not unfrequently happens that colonies are very poorly supplied with honey for the winter, and must be fed. To ascertain how well the provision is lasting, exami-petions must consciously be made nations must occasionally be made. This can be accomplished with any degree of satisfaction, only with the use of the movable frames.

Occasionally bees seem to die without any apparent cause, and the question is asked all over the country, "What was the matter with my bees ' They have all died while the combs are full of honey. They could not have starved to death, for the hives were found to contain an abundance of honey. It is hardly probable that they froze to death, for in former years they withstood days of severer cold." Such has been the reasoning in respect to this puzzle. 1 remember one year ago, some thought owing to the drought in the fall, the bees had been compelled to gather poisonous honey, and therefore they had all been poisoned. But all of the bees did not die; and if some colonies had gathered this poison honey, would not all in the same apiary have gathered it? The theory of being poisoned does not seem to me to be a reason-able one. I remember at the same time some reported a few hives empty of both bees and honey, and the conclusion reached was, that these were weak colonies and poorly supplied with honey, and did actually starve to death. One bee-keeper starve to death. One bee-keeper stated that a portion of his bees he wintered in the cellar and another portion were left out and were well protected. Of those that were wintered out-of-doors, nearly all died, while those in the cellar nearly all lived. It seems to me that with the evidence presented at that meeting, the coroner would have been compelled to render a verdict after this form: The majority of the bees which died during the winter of 1884-85 came to their death by freezing, but why they should not have frozen during previous winters when the weather was much colder, does not come within the jurisdiction of this

In looking over the records of the past years I find that this same question was asked by nearly all Northern bee-keepers in the spring of 1863. Mr. Richard Colvin, of Baltimore, says that this question was asked him more than a hundred times. He says that the anxious inquirer has unconsciously answered his own question, when he says, "The hives were full of honey." He says that if you had examined your hives, you would have found your bees huddled between the cold walls of honey where they froze to death; and probably by their side you would have found a late swarm which had starved to death in and between the empty combs. The simple exchange of a few full for a few empty combs between these colonies would have saved both, and placed them in their best condition for breeding in early spring; for it must not be lost sight of that the colony in which the combs are filled with honey has no room for breeding, while the others would have nothing to feed the young, if bred, until it would be furnished by the flowers, which may not bloom before the following May. If this be the true explanation of this mystery (and I have no doubt that it is) how many thousands of dollars might have been saved last year had every hee-keeper been aware of this fact. Such questions as these are the vital questions to be discussed in these meetings, and just as much of the discussion the discussion as possible should be spread upon the minutes and kept for future reference.

The methods of breeding, rearing queens, dividing colonies, producing crosses, strengthening weak colonies, etc., are subjects which cannot be discussed too frequently and with too much enthusiasm in these meetings. As a result of these gatherings, I be-lieve that more will be accomplished when each member gives his own personal experience in the work, rather than that which he has ob-tained from some work upon beeculture. Whenever anything is presented to this body that has had no practical test by any member of the association, it amounts to nothing more than a mere suggestion. You want to know what success your neighbor has had in this or that ex-periment, and he desires to know what success you have had. Theories are good, but facts are better.

Let me suggest that each one keep a diary of the working of his bees. This will be beneficial in more than one way. When you notice anything with the date; then when you notice any thing with the date; then when you come to these meetings, bring these mem-orandums with you, and I will assure you that this association will never lack for entertainment and instruction. This method will make you more observing, and will enable you to retain and use what you have already learned. When did my bees swarm? Was it a large swarm? What hive do they occupy? What kind of flowers do bees most frequent? From which do they gather the pollen and which the honey? These ques. Germany established a green-house at as a rule, stop it; o tions with their answers, and many considerable cost, and stocked it with some strong colony.

others of similar nature will be found in these records. No doubt many of you are following some such plan as this. If not, you will find that it will beget a wonderful interest in the The ladies will observe somestudy. thing of special interest concerning thing of special interest concerning the bees around the house, while the men will observe something very similar or very different, as the case may be, out in the field; and by this method you will obtain knowledge of bees that can, he obtain whether bees that can be obtained in no other

way. There are a number more of very important topics under the head of immediate benefits, that I should like to speak of, but time will not permit should I speak at all of the remote benefits.

The question has frequently been asked, "Of what use is the bee except to gather honey?" The answer will not occur to the majority of people. Nature has a use of vastly more importance than the gathering of the nectar from the golden cups to satisfy our delicate tastes. Through her our delicate tastes. energy, nature secures to the farmer or fruit-raiser a good crop, and permanence of the best varieties of fruit. Gardeners have known for a long time that bees fertilize the squash, melon and cucumber flowers by carrying the pollen from one flower to another. Some have thought that bees injure some flowers by extract-ing the pectar from them. But what is the honey for? The best botanist will tell you that it is for the purpose of attracting bees to the flowers so that they may be throughly fertil-ized. The pollen or flower-dust is the fertilizing material. In many cases the flower that hears the pollen does not contain the pistil, the organ which receives the fertilizing material; so in order that the ovules, which are in the pistil, may be fertilized, the pollen must be carried to it from some This may be done by other flower. the wind, but it is at a great risk, for the wind might carry the pollen en-tirely away from the plant and leave the pistulate flowers entirely un-fruitful. The plant has agreed to pay the bee, if she will carry this pollen to these flowers; and for this purpose, and this alone, botanists say the flowers bear nectar.

Even where the flowers contain both the fertilized and fertilizing organs, fruit is more certain when the pollen is brought from some other flower. The part that the flower and the bee play in this transaction is wholly un-conscious with both. The bee in conscious with both. The bee in placing its head in the flower brushes some of the pollen off and carries it to the next flower, and accidentally drops it upon the pistil, which re-ceives it and conveys it to the ovules or undeveloped seeds.

To the man who has an orchard, the culture of bees has a two-fold value; he not only obtains a rich sup-ply of honey, but he has the best of an assurance that everything else being equal, he will always have a good supply of fruit.

Some years ago a wealthy lady in

a great variety of choice native and exotic fruit-trees, expecting in due time to have remunerating crops. Time passed, and annually there was a super-abundance of blossoms, with only very little fruit. Various plans were devised and adopted to bring the trees to bearing, but without success, till it was suggested that the blossoms needed fertilization, and that by means of the bees the needed work could be effected. A hive of honey-gatherers was introduced the next season; the remedy was effected; there was no longer any difficulty in producing crops there. The bees disproducing crops there. The bees dis-tributed the pollen, and the setting of the fruit followed naturally.

I have thus briefly noticed a few facts, which seemed to me to be benefits that may be derived from such an association. There are others probably of just as much importance, and as the study goes on, new ones will be continually presenting themselves.

For the American Bee Journal.

# Marshall County, Iowa, Convention.

The Marshall County Bee-Keepers' Association met at Marshalltown, Iowa, on April 17, 1886, President O. B. Barrows in the chair. The minneed and approved. The constitution and by-laws of the association were read, and a number became members.

This being the time for the election of officers, the following were elected for the coming year: President, O. B. Barrows, of Marshalltown; Vice-President, A. Fogg, of Marshalltown; Jice Treasurer, G. W. Calhoun, of Mar-shalltown; and Secretary, J. W. Sanders, Le Grand.

The financial reports of the Secretary and Treasurer for the year just

closed were made and accepted. The subject of "Summer manage-ment of bees" was then discussed as

follows: I. N. Brown cleans out the hives well in the spring, keeps the broodchamber warm, and uses enameled cloth over it. He has the Langstroth hive. He keeps the ground clean in his apiary, and finds it to be a great help to the bees in the honey season. He also makes a passage-way from the ground to the hive-entrance. He puts on the sections when the hees appear to be ready for them.

S. W. Myers adds brood-frames as needed, and puts on the surplus ar-rangements a few days before the honey harvest begins, so that the bees may become acquainted with it by the time they need it. He uses onepound sections in frames.

"How do you prevent robbing ?"

A. Pinkerton contracts the entrance to suit the strength of the colony, and adds sections when the white clover comes in.

The Secretary stated that robbers can be known in the yard by the use of a little flour. The exchange of the robbed with the robbers would, as a rule, stop it; or exchange with

The President puts on surplus arrangements when he sees that the comb at the top of the frames in the brood-chamber is being tilled.

G. W. Calhoun said that if he wanted increase of colonies he would not put on the surplus arrangements until swarming is over.

A lady member stated that she found six queens with one swarm. She wanted to know how it happened. The Secretary then gave the process of queen-rearing, showing that the six queens were young queens that had hatched at the same time,

S. W. Myers reported that he at one time had three young queens and one imported queen all in a hive at one time. He removed the old queen and two of the young ones. The remaining one came out all right.

On the subject of uniting, or swarms settling together, Mr. Brown thought that the best queen would come out best. Several did not agree with him in this, but thought it best, if possible, to select the queen that the bee-keeper desires to keep.

"How do you prevent a swarm from settling in the top of high tree?"

The Mayor of the city being pres-ent, he said that he had successfully used what is called a "Yankee queen-stick." It is made by taking a stick 2 inches square, the top end dressed down to  $\frac{1}{8}$  square for about a foot; on this is nailed lath 6 or 8 inches long to form a net-work. When a long to form a net-work. When a swarm is about to settle, this queenstick is held among them, and he found that they would settle on it. The President here described a swarm-basket as used by many api-

arists. Some members explained the advantage of contracting the size of the hive by a division-board, to suit the size of the colony early in the sea-son; also how the weak may be strengthened from the strong, so as to make all good colonies early in the season; the advantage of having all hives alike in the same apiary, and the necessity of combs being straight

in the brood-chamber. The following reports were made on the results of the past winter :

I. N. Brown winters his bees in the cellar by tiering-up the hives and turning back the covers. His cellar the dining-room. He finds that those under rooms without noise did the best. He put in 39 colonies and took out 37.

Dr. Lewis wintered his bees in the cellar. He put in 10 colonies and took out 10. He lost one colony after putting them on the summer stands.

S. W. Myers also wintered his bees in the cellar, with the temperature from  $40^{\circ}$  to  $45^{\circ}$ . He put in 8 colonies and lost none.

W. H. Ford wintered his in a cellar. He put in 14 colonies and took out 11.

A. Pinkerton wintered his bees in a cellar. The temperature got as low Ilis cellar had ventilation. as 40°. Ile put in from Nov. 22 to Dec. 5, 117 colonies, and put out from April 7 to April 14, 116 colonies. He had the cellar partly light and partly dark, and found that those in the dark did the best.

J. W. Sanders wintered his bees in the cellar, with a temperature of from 38° to 45°. He had a number of light or nuclei colonies that were put away so as to save the queens if possible. Some proved a little light in stores. He put away 64 colonies in the first week in December, and on April 9 put out 56.

The subject for the next meeting is "Fall care of bees," and "How to keep honey in the best shape." Proper arrangements will then be made for the coming Fair. The association then adjourned to meet at the Court House in Marshalltown, Iowa, on Saturday, July 16, at 10:30 a.m. J. W. SANDERS, Sec.

# Read at the Mich. Horticultural Convention. Fruit-Growersland Bee-Keepers.

# W. Z. HUTCHINSON.

That bees are an important factor in the economy of nature, has long been proved. Only a few days ago I came across the following in the AMERICAN BEE JOURNAL:

"Most of the readers of the Jour-NAL are aware that in England melons, cucumbers, pumpkins and squashes cannot be raised in the open air; they are all raised in green-houses and hot-bed frames, and many hours have I worked in the garden at home in England, with a fine, long camel'shair brush, conveying the pollen from blossom to blossom, where the bees could not get to do the work; and even now in this climate, if we do not have good weather for the bees to work on the fruit blossoms, and especially on red clover saved for seed, we get but a poor crop. Last year I had a good crop of mammoth clover seed, while a few miles from here there was none, and I think I owe it to my colonies of Italian bees, for they worked on it first-rate."-W. ADDENBROOKE.

A few weeks ago I heard two old farmers discussing bees and buck-wheat. "I tell you," said one, "buck-wheat is a good thing for bees." "Yes," replied the other, "but the bees are not a very good thing for the buckwheat." "No, I suppose not," said No. 1. And thus the conversa-tion ran on until I ventured to ask Mr. Farmer how he knew that buck-When two injured by the bees. "Why, they take something from it, don't they? If they do, it injures it. How can it be otherwise?" replied my farmer friend. I then explained that I was a bee-keeper, and that I also raised buckwheat ; that my buckwheat, which was at times fairly "swarming" with bees, yielded fully as well, if not better, than buckwheat that was far removed from the busy workers. I explained how necessary were the bees for the fertilization of blossoms; that if the blossoms were covered with muslin, so that the bees had no access to them, they produced no fruit. My opponent contended that it might not be lack of visits from bees that made the covered blossoms unfertile, but lack of heat

from the sun's rays, as the result of being covered. I then cited to him the experiments of Prof. Lazenby, of Ohio, in covering strawberries with boxes, and fertilizing one variety with the pollen of another. Speci-mens that were left unfertilized pro-duced no fruit; those that were fer-tilized did tilized did.

I also told that oft-repeated story of how the fruit-growers of acertain town in Massachusetts, years ago compelled the bee-keepers in that vicinity to move their bees out of town—the bees injured the fruit, so said the fruit-growers. In a few years they were persuading the bee-keepers to bring back their bees, as the crops of fruit had been exceptionally light since the removal of the bees. The bees were brought back, and with them came abundant crops. I told him that crops of red clover seed could not be raised in Anstralia until humble bees were imported to fertilize the blossoms. I then waxed eloquent, and declared that the beautiful colors were not given flowers simply to please the human eye, the grateful fragrance to regale the human olfactories, nor did the nectar flow simply that it might be gathered up and used to tickle human palates; these things were the blossom's advertisement, which attracted to it the honey-loving bee, which came, bringing with it the fertilizing pollen from distant flowers. When I had finished, my opponent said: "Well, I don't know anything about it; maybe you are right, my friend."

Now, those of you who know that bees are largely instrumental in the fertilization of blossoms, and that the removal of the nectar in nowise injures the fruit or grain, may be in-clined to smile at the old farmer's views, but he is not alone in his ignorance ; even editors—yes, and agricul-tural editors at that—have exhibited lamentable ignorance upon this subject. The agricultural editor of a very prominent New York weekly paper very gravely informed an in-quiring correspondent that bees were an injury to buckwheat, taking the same ground as did my farmer opponent. It was this same editor who said he had watched, with interest, the progress of the Italian bees ever since the first pair (!) was brought over from Italy.

It is nearly always ignorance that leads to trouble about bees. In Wisconsin, the past season, the owner of an apiary was sued for damages alleged to have been done to sheep while grazing in a pasture of white clover. It was claimed that the bees came in swarms and drove the sheep from the pasture ! It is well known to those who are conversant with the habits of bees that, when foraging, a bee is timid, and will flee upon the approach of any object. The plaintiff in the suit was not only ignorant of the habits of bees, but seemed to forget that were it not for the services of the bees in fertilizing the white clover blossoms, there would have been no white clover pasture for his sheep. The judge in this suit decided that there was no law applicable to

the case, and dismissed the suit. The plaintiff probably mistook the attacks of the troublesome gad-fly for the attacks of bees, which he saw work-ing upon the clover. In California, recently, a bee-keeper has been sued by a fruit-grower for alleged damages done to grapes. The suit was in a justice's court; the apiarist was heaten, but has, I believe, appealed to the bigher court the higher court.

As to whether bees really do injure fruit, is a question that has been frequently asked. I presume many fruit-growers will unhesitatingly say they do, and they know they do, while bee-keepers are equally certain that it is impossible for bees to pierce the skin of fruit. At the convention of bee-keepers held last December in Detroit, Prof. A. J. Cook said : "People have several times told me that their grapes had been destroyed by bees, and I have offered to come and witness the destruction , if they would let me know when it is going on, but I cautioned them to first be sure that they had a case; I have never been called. Bees do sometimes attack grapes, however, but it seems when the weather has first caused them to crack, or something else has attacked and opened the skins." At Aurora, Ills., there is an experiment station of the United States in charge of Prof. Nelson W. McLain. The pro-Prof. Nelson W. McLain. The pro-fessor, in his report, says that he placed colonies of bees in a building, deprived them of food, except fruit of different kinds which was placed upon shelves around the sides of the room. All specimens having cracked skins, or that were intentionally per-forated, were entirely consumed ex-cept the skins; but although these bees were starved to death, not a sound grape, apple, peach or fruit of any kind was injured. It is a physical impossibility for a bee to cut open the skin of a grape; its mandibles are not capable of cutting.

Now, then, although I deny that a bee can attack and destroy a sound grape, I do not deny that bees are sometimes a source of great annoy-ance, and perhaps some loss, to the grape grower. Even if the skins of his grapes are cracked, or have been pierced by wasps or birds, the grapegrower may not wish them sucked dry; or if he does not care for the loss of the cracked grapes, the presence of the bees is a great annoyance in gathering the fruit. Bee-keepers should not ignore this; neither should the grape-growers forget that the bees are their best friends, inasmuch bees are their best friends, inasmuch as they fertilize the blossoms, and thereby produce the fruit. In the spring, when there are but few insects to fertilize the blossoms, the bees are very valuable. Both bee-keepers and fruit-growers should learn to bear and forbear. If I understand the matter, the injury and annoyance that grape-growers suffer from bees, are often of short duration only are often of short duration, only lasting a few days, and, if all parties would exhibit a neighborly spirit, it is probable that the bees might be shut in their hives a few days, with no great loss to the hee-keeper, as bees never frequent cider-mills, nor in the old way can.

suck the juices from fruit, unless there is a dearth of honey, and the loss of honey would not be great. If the weather is warm, the hives would probably require a great amount of ventilation.

But let us suppose that bees do in-But let us suppose that bees do in-jure grapes or other fruits, and that the bee-keeper cannot, or will not, keep his bees at home, can the fruit-grower, in justice, ask the bee-keeper to pay damages or to move his bees away? It may help us to turn the telescope and look through it from the other end. Let us suppose that the purces of fruits were injurious to the juices of fruits were injurious to bees, that when stored and used for winter food it led to disease among bees. Could not bee-keepers, then, as consistently complain if a vineyard was started near them, as fruit-growers can now complain when an apiary is brought into their neighbor-hood? Bees have existed as long as have fruits, and the keeping of one is as legitimate and recognized a business as the raising of the other, and if there are times when the two in-dustries clash, it is doubtful if the difficulties can be settled by legal proceedings. In my own opinion, however, there is a moral law to priority of location. If bees are the cause of loss and annoyance to a grape-grower, and this loss or annoy-ance is not counterbalanced by the benefits derived from the bees, then the man who knows this and plants a vineyard in the vicinity of an apiary, is morally bound not to complain of the depredation of the bees, while the bee-keeper who brings an apiary into a grape-growing district should feel himself morally bound to keep his bees from annoying his grape-growing neighbors.

Rogersville, & Mich.

For the American Bee Journal. Surplus-Cases—Double-Walled Hives.

# J. H. ANDRE.

On page 361 I mentioned a surpluscase which had no division-boards. As some of my writings have been misunderstood, and fearing the above would be also, I thought it might be well to make it plain now.

Suppose we have a hive that the top-bar of the frames comes just even with the top of the hive. Now make the case to accommodate as many rows of sections as you wish. Let it rest on the edges of the top of the hive, and the two sides of the case that the sections come sidewise to run down <sup>3</sup>/<sub>8</sub>. of an inch lower than the others. Nail across the bottom of the case, where the rows of sections meet, a strip of tough timber one inch wide and <sup>3</sup>/<sub>8</sub>-inch thick. Nail in short pieces of wood on the two ends of the case between the strips, and you have a case of solid sections which will be warmer, and the bees will not desert it on cold nights half as soon as where division strips are used, and which with a little care may be riddled in one-quarter the time that a case made

The case may be made even at the bottom, and the strips gained in by sawing notches in the sides of the case, which stiffen it, and if required a square block may be nailed in solid at one corner of the case that will just occupy the same space that one of the sections does.

By using this case, and <sup>3</sup>/<sub>8</sub> inch lumber to make it, the hive mentioned on page 361 may be made to accommodate the regular  $4\frac{1}{4}x4\frac{1}{4}$  sections, and thus do away with the objections that some may have to had it—its having an odd-size section.

It seems to me, so far as my observation goes, that it is useless expense in making chaff hives; they are certainly worse than single-walled hives, unless packed in a thorough manner. As I remarked once before, if not well packed, a long, cold spell will penetrate day in winter will not warm them up, and in a single wall it will. The only advantage that I can see is in springthey maintain a more even temperature during sudden changes of weather. I have seen chaff hives used side hy side with single-walled hives, and I believe before I use then I will the observation into a inclusion I will try clear pine just 2 inches thick. They will be cheaper and no trouble to pack.

I have read with much interest the way some of the leaders manage to get the hive full of brood in the spring. Now, suppose just before the apple bloom we take such a hive as I have described on page 361, in fair condition in regard to bees and brood, take out the frames and put back each five by turning them around, and also put the inside ones on the out-side—this would be the same as cutting it into quarters and putting the inside combs on the outside. The hive and also the management of it is less than a year old. My health has been so poor that I have had no chance to experiment with it, but it seems to me that it is "the coming hive" for rapid brood-rearing, for comb honey, and safe wintering. Lockwood, 9 N. Y.

### For the American Bee Journal.

# Queen-Restrictors.

## C. W. DAYTON.

I would like to describe a con-trivance which was used a little during the season of 1884, and which is now being tested with improvements. In my estimation it covers the ground of sectional hives, reversible frames, honey-boards, contractors, queen-catchers and drone-traps combined. I do not wish to verify this statement on paper, but leave it to tests in the

apiary. The "restrictor" is adapted to four frames, but there may be from two to eight. The frame material should be one inch in width all around; as that is the best width for both brood and extracting. Material of any thickness will do, so that the side-bars are strong after having holes made through them. It wants four frames of this description, the same size of the other brood-frames used in the apiary, leaving off the projecting arms. Then five others of the same dimensions, except that they should be  $\frac{3}{6}$  of an inch or a bee-space in width. Setting all of the frames on a level place, with a narrow frame between each two of the others, and a narrow one on each outside, they are all clamped together and a 3-16-inch hole is made through all of the side-bars at once edgewise, and one inch from the top or bottom of the frames. These holes are for small, flat-headed bolts that just reach through the frames, and are secured by a thin nut. The holts are 6 inches long.

Before using the bolts two sheets of perforated zinc are prepared exactly the size of the frames, and having holes in the edges to fit and correspond with the bolts, and be held securely and evenly in place upon the side of the outside frames. This completes a queen-cage into which the bees from the outside are unrestrained. Combs may be built from foundation or transferred from other frames. The queen is put inside through a hole in a top-bar.

It is also furnished with projecting wires inserted in the ends of the topbars, and near each of the four upper corners, and which wires are capable of removal to the other corresponding corners of the arrangement upon its reversion. Reversion is said to be a preventive of swarming by turning the queen-cells out of position. and being destroyed by the bees.

At the first thought this device will seem as useless, if not a positive nuisance, in a bee-hive; but connect with its use a little systematic management, and it appears differently. It is not specially intended for use until the colony is ready for the surplus receptacles, although with the zinc removed it may be used at the side of the brood and occupied gradually, or by furnishing each frame with supporting arms they may be used like other frames.

Here in the Northern States at least the main honey harvest seldom lasts more than 37 days; the length of time required to produce a honey-gathering bee. At the beginning of the harvest we would adjust the surplus receptacles as usual; at the same time caging the queen on the four empty combs, and leaving the cage or restrictor in the centre of the brood-nest. As the four combs will be filled solidly even to the exclusion of pollen, there will be a capacity in four Langstroth frames for at least 30,000 hatching bees every 21 days; employing the queen at the rate of 3,000 eggs per day for ten days, and requiring the almost mknown length of boney-yield of 47 days, that the last laid eggs might produce honey-gatherers.

adys, that the last latt eggs inget in the produce honey-gatherers. It is very probable that by the end of the ten days she would need the usual rest; and the four combs prove to be an abundance of space. With this management it would need one comb on each side of the restrictor to three combs for extracting might be placed in the most favorable position.

I believe that 30,000 hatching bees every 21 days is quite enough to maintain the working force of any colony. Many different constructions of the frames and manner of reversion have been experimented with. The reader will readily notice the many advantageous points.

geous points. "There," some will say after reading this, "he has 'ground an ax 'this time surely." I would inquire if there would necessarily be discredit connected therewith? Show me a man who has not "an ax to grind," and I will just as surely show you a very lazy one also. There is scarcely an article written that does not help to "grind an ax," and what is more, such a one could not be produced. I might say that I have had an application filed for a patent on this contrivance, so that the usual bee-keeper may make and use it at present, but the right to a patent (if there is any) I may hold. Whether it is useful or not I am not positively certain, as when one becomes excited with studying over anything of this kind, and at such a time his judgment is apt to be very poor.

If we compare the merits of Mr. Heddon's hive to the position held by the Italian bee, and the reversible frame to black bees, that this arrangement may occupy its respective position, it would be a hybrid of the other two.

Bradford, & Iowa.

### Local Convention Directory.

1886. Time and place of Meeting.

July 6.—Hill County, at Peoria, Tex. H. A. Goodrich, Sec., Massey, Tex.

July 16.- Marshall Cn., at Marshalltown, Iowa. J. W. Sandera, Sec., LeGrand, Iowa.

Aug. 31.—Stark County, at Canton, O. Mark Thomson, Sec., Canton, O.

Sept. 4.—Sheboygan Co., at Sheboygan Falls, Wis. Mattie B. Thomas, Sec., Sheboygan Falla, Wis.

Oct. 7.-Wis. Lake Shore Center, at Kiel, Wis. Ferd Zastrow, Sec., Millhome, Wia.

Oct. 12-14.-North American, at Indianapolis, Ind. F. L. Dougherty, Sec., Indianapolis, Ind.

Oct. 19, 20,—Illinois Central, at Mt. Sterling, Ills, J. M. Hambaugh, Sec., Spring, Ills,

Dec. 1, 2.-Michigan State, at Ypsilanti, Mich. H. D. Cutting, Sec., Clinton, Mich.

**17** In order to have this table complete, Secretarles are requested to forward full particulars of time and place of future meetings.—ED.

Good Report.—Geo. E. Hilton, Fremont, 9 Mich., on June 14, 1886, says:

I have just finished taking off over 500 pounds of new honey. From two hives I extracted just 70 pounds each. From another I took 50 one-pound sections; from another I took 46. My crates hold 28 one-pound sections, and the majority of my 60 colonies have two tiers nearly complete. I have never had as much honey at this time of the year since I have been keeping bees.

Pleased with the B. K. Union.-James McNeill, Hudson, N. Y., writes:

I am well pleased with the record which the General Manager has made for the Bee-Keepers' Union the past year. It certainly ought to commend the enterprise to every beekeeper, and I trust that the proof will be fortheoming that it has done so, by a much larger list the coming year.

Working on Alsike and White Clover.—B. T. Baldwin, Marion,⊙ Ind., on June 16, 1886, says :

The bees all wintered well in this locality last winter, so far as I know, and are booming now on Alsike and white clover. My 60 hives are so heavy I can hardly lift any of them. I hope that we will win the Bohn lawsuit, let it cost what it will.

**Bee-Keeping in Oregon.** — Gust Murhard, Portland, ~Oregon, on June 8, 1886, writes :

We have all prospects for an abundant honey yield this season; very warm weather with plenty of dew at nights. I have colonies of Mt, Lebanon bees, and crosses between the Mt. Lebanon and Carniolan (say  $\frac{3}{24}$ Mt. Lebanon and  $\frac{1}{24}$  Carniolan) that have in less than 14 days filled 46 twopound sections with combs and honey ready to seal over, and I have at once given them another tier of 26 twopound sections to keep them busy, and so prevent swarming, as I want the honey and not the swarms, as the honey is of more ready sale than bees. My Mt. Lebanon-Carniolan bees have proved the most desirable here in Oregon. They have wintered by far the best, are the least inclined to swarm if they have a young prolific queen of the previous season's rearing, are the most industrious honeygatherers, and their queens cannot be excelled for prolificness.

Wintering Bees.-E. G. Slayton, Chetek Wis., writes :

The hive should be placed in a dry, dark cellar as soon as cold weather begins, before snow comes—about Oct. 20—the entrance stopped up so that they cannot get out, an inch hole bored in the end of the hive, and coarse wire-cloth nailed securely over the hole to give them air. Place old gunny sacks over the frames or any absorbent in the cap of the hive over the frames. The cellar should not freeze. Where it does not freeze they eat less honey and do not fill up so hadly during the long winter. If it freezes they have to eat more to make the necessary heat. Do not take them out in the spring until soft or white maples are in blossom in the timber. Sugar making is then over, and the bees are saved from drowning in the maple sap, and it saves spring dwindling. Some winters they will winter all right on the summer stands, but it is not safe to risk so

much in this State. Noise overhead does not seem to damage the bees if not shook up too much. It has been found that the bee-moth follow civilivation. When my folks moved to Wisconsin, in 1844, the woods was full of wild bees, and it was six years before the bee-moth came into Sheboygan county. In Ohio (Lake Co.) the bee-moth destroyed bees in trees in the wood, and I have found colonies nearly destroyed by the moth in trees. One winter here my brother left his bees on the summer stands, and they wintered better than mine, and swarmed earlier in the spring. The next year his bees were all dead before Christmas, on the same stands; 7 colonies froze solid.

Expecting a Fair Yield.-Jos. E. Shaver, North River, 5 Va., on June 7, 1886, writes :

The weather has been almost too have been doing fairly well for the last week. I have taken some honey in sections from my first swarm. The Italians have swarmed two and some of them three times, while but few of the black bees have swarmed at all. White clover is in bloom now, and we are expecting a fair yield of honey this season.

Best Season for Five Years.-H. W. Carman, Custer,+o Ky., on June 14, 1886, writes :

I have been keeping bees for five years, and this certainly is the best season so far. I had one swarm on May 14. Two colonies had produced 40 pounds of surplus each by May 14. My bees are all Cyprians. I have had Italians, Holy Land and black bees, but I have discarded all but the great honey-gathering Cyprians.

Obtaining the First Honey.-G. M. Doolittle, Borodino, ON. Y., on June 12, 1886, says:

Bees are obtaining the first honey of the season now from raspberry, locust and white clover. I am glad to stop feeding.

Dry Weather, etc.-Jacob Oswalt, Maximo, & O., on June 12, 1886, says:

We are in the midst of the white clover season. My bees are doing well; I have had 12 swarms thus far. I took 35 pounds of surplus honey from one of my colonies this morning; the honey is of superior quality, nicely capped and very white. The weather is very dry—we have had no rain for four weeks.

No Time for Swarming.-George Spitler, Mosiertown, vo Pa., on June 10, 1886, writes:

Bees are working nicely on surplus. Colonies are strong, but not swarming much—have not the time. They gathered lots of honey from wild raspberry, and I think from the blackberry also. White clover is splendid.

Abundance of White Clover.-W. T. Langley, St. Ansgar, & Iowa, 'on June 11, 1886, savs :

Northern Iowa has never seen more white clover than there is just now. Bees are booming, temperature 93° in the shade.

Foul Brood Cure.-J. R. Bostwick, New Milford. ~ Conn., writes :

Mr. H. L. Jeffrey was at my place to-day, and reading the report of the Johnson Co., Ind., Convention, where it refers to foul brood, he wished me to say that he has had much experi-ence with it, and can clean it out of an apiary with pure, clean salt and water.

# Rolling in the Honey .-- John Hood, Crabb. + Iowa, on June 10, 1886, savs :

Last fall I put 23 colonies into the Last fail 1 put 23 colonies into the cellar and left 5 out-doors—1 in an old box and 4 in chaff hives. I lost 2 of those in the cellar, and after I put them on the summer stands 1 ab-sconded. All the rest are in good condition. I have increased my apiary to 42. They are just rolling in the boney from white clover honey from white clover.

Very Hot Weather, etc.-Fayette Lee, Cokato, Minu., on June 12,1886, writes:

My loss was 13 out of 124 colonies put into the cellar, and they did not have any ventilation from the out-side, for I shut both tight last fall. I have some crates of honey about ready to take off of the hives. It is very hot $-96^{\circ}$  in the shade, without any rain. If it does not rain in ten days wheat will be a failure here.

Large Crop Expected.-W. Mason, Fillmore,+o Ind., on June 14, 1886, says:

I commenced extracting on June 1 from the raspberry bloom. The boney is very fine, but highly colored. It sold readily at 12½ cents per pound. I have extracted from several hives the second time. I have several hives with extinge about ready to take off with sections about ready to take off. I started with 30 colonies, and have had 7 swarms. There is a good pros-pect for a large honey harvest. I noticed a letter by Mr. Jonas Scholl, on page 363, on management for increase for spring work, which must be conceded as good by all experienced apiarists. A prolific queen first; second, to know how to manage; and you have the secret with any good hive.

### Convention Notices.

127 The 5th regular meeting of the Hill County Bee-Keepers' Association will be beld on the first Tuesday in July, 18-6, at the apiary of Hon. J. M. McDaniel, of Peoria, Tex. At the same time and place will be held a bee-keepers' honcy plenic. H. A. GOODRICH, Sec.

The vext annual meeting of the Michigao State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886, H. D. CUTTING, Sec.

# Honey and Beeswax Market.

Office of the American Bee Journal Monday, 10 a. m., June 21, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO.

HONEY.-Honey of all grades sells slowly at present, and prices are weak-14@15c, being the outside figure for best comb boney. Extracted is in light demand at 5@7c. California comb honey, in 25. sections, 9@12c. BEESWAX.-25c. for good yellow. R. A. BURNETT, 161 South Water St.

#### NEW YORK.

NEW YORK. HONEY.- We now quote : Fancy white comb in 1-lb. sections, 12@13c.; in 2-lb. sections, 9@10c. Fancy buckwhest honey in 1-lb. sections, 9@; in 2-lb. sections, 7@&c. Of grades 1@&c. per lb. lcss. Extracted, white,6@7c; buckwheat, 5@5%c. Cali-fornia, 5@6cc; Southern, as to color and flavor, per gallon, 50@60c. BEESWAX.-27@28c. MCCAUL & HILDRETH BROS., 34 Hudson St.

#### BOSTON.

HONEY.-One-lb. sections, white clover, 13@15c; 2-poind sections, 11@13c. Extracted, 6@8c. BEESWAX.-25 ets, per lb. BLAKE & RIPLEY, 57 Chatham Street.

# SAN FRANCISCO.

HONEY.-The first new comb boney of the sea-son-a sample lot of extra choice-brought 14 cts. We quote : White to extra white comb, 11614 cts. amber, 700 C. Extracted, white liquid, 45(050c; 11ght amber colored, 4 to 45/c; dark amber colored, 85 to 33 cts. BEESW AX.-Quotable at 20 to 24 ets. O. B. SMITH & CO., 423 Front Street.

# DETROIT.

HONEY.-The market is almost bare of comb boney, and very little is wanted. Best white in 1-ib. sections 14 cts. BEESWAX.-Scarce at 25c. M. H. HUNT., Bell Branch, Mich.

### ST. LOUIS.

HONEY.-Choice comb, 10@12c. Strained, in barrels, 34@4c. Extrs fancy of bright color and in No. 1 packages, ½ advance on above prices. Ex-tracted in barrels.5635c. Fermented goods, 2½@3c BEESWAX.-Firm at 22c. for prime, D. G. TUTT & CO., Commercial St.

#### CINCINNATI.

HONEY,—Trade is perhaps duller than usual, We quote : Extracted honey brings 4@8c., and choice comb honey brings 12@15c. in a jobbing way. BEESWAX.—In demand at 20@25c.for yellow. C. F. MUTH & SON. Freeeman & Central Ave.

#### CLEVELAND.

HONEY.--Within the last two weeks honey has not sold so resdily, owing to the near approach of the new crop and the uncertainty of the new pri-ces. Best white, 1-1b, old boney moves slowly at 14 cts.; no demand for 2-1bs. Extracted, 6@7c. BEESWAX.--22 to 25c A. C. KENDEL, 115 Ontarlo Street.

#### KANSAS CITY.

HONEY.-Seles of comb are good, while extrac-ted is very dull and low. One-pound sections are scarce; stocks of all other grandess are well supplied. Calif. 2-bs. bring 11@12c.; Eastern 2-bs. 12@13c.; 1-bs., white, 14@15c.; dark, 12@13c. Extracted. 5@6c.; Southern, 33:@4c. BEESWAX.-23c. CLEMONS, CLOON & Co., cor. 4th & Walunt.

#### MILWAUKEE.

HONEY.--The unret seems quite dull for all qualities of comb honey, with but a moderate de-mand for extracted. We quote : Choice, white 1-lb, sections, 17%18c.; the same in 2-lbs. 16%17c.; dark 2-lbs., 15%16c. Extracted, white, in barrels or kegs, 7%8c.; dark, in same packages, 6%7½c. BEESWAX.-24%25c A. V. BISHOP, 142 W. Water St.

### SAN FRANCISCO.

HONEY.—The new crop is coming forward in liberal quantity. Fancy qualities are receiving some attention, but dark extracted brings very low prices. White to extra white comb, 9 to 12c. Ex-tracted, white liquid, 44(c.; light amber colored, 3 to 35/c. BEESWAX.—2002/24: in lots from first hands, SCHACHT & LEMCKE, 122-124 Davis St.

The Illinois Central Bee-Keepers' Association will hold its next meeting at Mt. Sterling, Ills., on Tnesday and Wednes-day, Oct. 19 and 20, 1886. J. M. HAMBAUGH, Sec.

Issued every Wednesday hy

THOMAS G. NEWMAN & SON. PROPRIETORS.

923 & 925 WEST MADISON ST., CHICAGO, ILL.

At One Dollar a Year.

Special Notices.

To Correspondents, - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name: many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

When Renewing your subscription please try to get your neighbor who keens bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Hinder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

Our New Catalogue of Bee-Keepers' Supplies for the spring of 1886, is issued, and will be sent to any one desiring a copy. Send name and address, plainly written, on a Postal Card for it.

" Don't Stop "-that is what many write to us about their papers, when their time is nearly out. One subscriber says: "This has been a year of disaster, and it is not convenient for me to send you the money now to renew my subscription. It runs out with this month; but don't stop sending it. I will get the money to you within three months." Such letters are coming every day, and so for the present we have concluded not to stop aoy papers until requested to do so.

Foundation, Cheap .- We have about 75 lbs, of Comb Foundation for the Brood-Chamber, 4x161/2 inches, which we offer at 35 cents per pound. This is an odd-size lot of our regular "Dadant" stock.

Italian Queens.-We can supply them by mail, postpaid, at the following prices : Untested, \$1.00; Tested, \$2.00; 6 Tested Queens for \$9.00.

# OUR CLUBBING LIST.

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted In the last column of figures. The first column gives the regular price of both. All postage prepaid.

# System and Success.

2 All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

 
 50 colonics (120 pages).
 \$1 00

 100 colonics (220 pages).
 1 25

 200 colonics (420 pages)
 1 50
 For

The larger ones can be used for a few colonies, give room for an increase of numbers. and still keep the record all together in one book, and are therefore the most desirable.

Simmins' Non-Swarming System is the title of a new English hee-hook. The author claims that it will inaugurate a "new era in modern hee-keeping," and states that "it is based upon purely natural principles. and is the only system that can ever he relied upon, because no other condition exists in the economy of the hive that can he applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides their own, with \$3, for one year, we will present a copy of this valuable book.

The July Number of FRANK LESLIE'S SUN-DAY MAGAZINE opens with an article by the Rev. Frederick Pember on "The Charterhouse, London : Its Hospital and Public School," with a number of quaint and curious illustrations, including a portrait of Sir Thomas Sutton, the Founder. Five more beautiful illustrations of Luray Cave. in Page Co., Va., are given, with descriptions ; and there are many short sketches and poems and a number of full-page heautiful engravings. This number ia the first of the twentieth volume, and this is a good time to subscribe for the magazine.

The Convention History of America and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.15.

# Honey as Food and Medicine.

To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a nEMAND for all of their crops at remunerative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the beekeeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

# Advertisements.

**TALIAN Bees & Queens at reduced** prices. Address, **OTTO KLEINOW**, (Opp. Ft. Wayne Gate), DETROIT. MICH. 25Att

HONEY-PAILS. -As 1 will dispose of my honey crop by other methods, 1 offer my stock of 3-lb, Jones' Pails at \$5.25 per 100. Several bundred of them are labeled, and the first orders will take the labeled soes. C. W. DAYTON, 25A2t BRADFORD, 10WA.

Vol. XXII. June 30, 1886. No.26.

Queens to Canada .- On page 405, Mr. Doolittie has detailed his sad experience in trying to mail queens to Canada this season, as heretofore. Until there is a new Commercial Treaty between the United States and Canada, we cannot hope for much rellef. At present it is plainly against the postoffice regulations to send queens, or any other merchandise by mail to Canada; we hope for some new regulations, and have written the following letter to the Superintendent of Foreign Mails, for any information he may possess on the subject, and any informatiou we may receive, will be given to our readers :

OFFICE OF THE NATIONAL BEE-KEEPERS' UNION, CHICAOO, ILL., June 25, 1886.

N. M. BELL, ESQ.,

Supt. of Foreign Mails, Washington, D.C.

DEAR SIR :--I have noticed some intima-tions that there will be a new Treaty with Canada, which will allow more latitude to the business by mall between the two countries.

Heretofore we have been able to send queen-bees through the mails to Canada— now they are being stopped at Suspension Bridge, N. Y.—notwithstanding there is no duly in Canada for stock imported for breeding to improve the stock. Bees are imported for durt that more and should imported for just that purpose, and should pass free.

Will you kindly advise me if such a Treaty is contemplated ? And any other particulars concerning the transportation of queen-bees in the mails to Canada "for the Improve-ment of stock" that may be in your posses-sion, will be greatly appreciated by

Yours, etc.,

THOMAS G. NEWMAN, General Manager.

Bee-Pasturage is the title of a new pamphlet by Henry Dobbic, Esq., "certified expert of the British Bee-Keepers' Association." It gives "observations and practical instructions on the cultivation and propagation of the best honey and pollen-producing plants, also their honey and pollen values, time of flowering," etc. It contains 75 pages, and is nicely printed. It is published by Jarrold & Sons, 3 Paternoster Buildings, London, England.

"A Bird's-Eye View of Bee-Keeping," is the title of a new work written by the Rev. W. F. Clarke, and being published by Jones, McPherson & Co., at Becton, Ontario, Canada. It is written in rhyme, and will be sold at 25 cents.

Hees in the Mails.-There seems to have been a new trouble sprung upon beekeepers without the least premonition. Mr. W. II. MeWilliams, of Griffin, Ga., has had a queen-bee stopped in transmission through the mails, because other bees were caged with her. He has appealed to iton. John Jameson, General Superintendent of the Railway Mail Service, who has ruled that queen-bees ONLY can be sent by mail. Wo are well aware that the Postal Guide only mentions "queen-bees," but when the Ituling was reversed on Jan. 14, 1880, the following was the press dispatch printed in all the daily newspapers, and copied into the BEE JOURNAL for 1880, page 74 :

The Postoffice Department, on recommendation of the National Bee-Keepers' Asso-ciation, has reconsidered the order excluding queen-bees from the mails. Queen-bees and their necessary attendants will be allowed to go through the mails, so long as no one is injured by them.

At the National Convention held in Chicago, Ills., in October, 1879, Prof. Cook was appointed to wait on the Postmaster General and endeavor to have the Ruling reversed, which had excluded "queen-bees" from the mails. He went to Washington in January, 1880, and having obtained the valuable aid of Hon, Edwin Willits, M. C., of Michigan, in presenting the matter to the Postoflice Department, the bees were ordered to be admitted to the mails, when put up with "double wire-screens," etc,

For the past six years, therefore, the United States malls have been freely used for the transmission of "queen-bees and their necessary attendants." This privilege has been alike valuable to the breeders of queen-bees and to the apiarists who purchase them "for the improvement of stock." Now, to apply a technicality to the wording of that "perinit," not at the time intended by the Postoffice Department (that of exeluding the queen's "necessary attendants") entirely nullifies the privilege then granted, entails a serious calamity upon a large class of our best eitizens, and is wholly un-cailedfor, unnecessary and unjust.

As General Manager of the National Bee-Keepers' Union, we have sent the following letter to the General Superintendent of the Railway Mail Service :

OFFICE OF THE NATIONAL BEE-KEEPERS' UNION, CHICAGO, ILL., June 25, 1886. HON. JNO. JAMESON.

HON, JNO, JAMESON, DEAR SIR: -1 am informed by Mr. W. H. MeWilliams, of Griffin, Ga., that a "queen-bee" of his has been stopped in the mails, because she was accompanied by other bees —her attendants.

-her attendants. Of course this is but a technicality—with-out her attendants a queen would soon perish, and to show that such was intended, the Associated Press Dispatch, on Jan. 14, attendants will be allowed to go through the

attendance will be allowed to go through the mails, so long as no one is injured by them." I noticed at the time that the "Ruling" in the Postal Guide only stated "queen-bees," but did not suppose any point would be raised on it, and so said nothing further about it.

Until now I have never heard of any trouble. During six years the bees have been transmitted in the mails-no one has been stung, and the mails have not been daubed; and now just as the time has come for bees to be sent through the mails—to have a more technicality interfore with that traffic and entail a heavy loss on bee-breeders is

and entail a heavy loss on bee-breeders is very unfortunate. Will you kindly give this your attention, and reverse the order or instructions to postmasters, so as not to destroy an industry that is the sole business of many persons? Yours, etc., THOS. G. NEWMAN, General Manager.

Prof. Cook has also written the following letter to the same person :

AGRICULTURAL COLLEGE, MICH, Jude 24, 1886. HON. JNO. JAMESON, Gen. Sup.R. W. Mail Service, Washington, D.O.

DEAR SIR :- For some years prior to 1880, queen-bees were excluded from the mails. Queen-bees were excluded from the mails. Cause of ruling, mails dauled, agents stung. This resulted in serions hardship to bee-keepers. In sparsely settled localities ex-press offices were often a score of miles away, while the postoffice was near by. Again, express was often dollars while postage would only be a few cents. I waa appointed to visit Washington, and urge a change in the ruling. I did so, and met with success. In January, 1880, the following Associate Press Dispatch was sent out from Washington. "The Postoffice Department, on application of the Ree-Keepers' Associa-tion, has reconsidered the order excluding queen-bees from the mails. Queen-bees and queen-bees from the mails. Queen-bees and their necessary attendants will be allowed to go through the mails so long as no injury is done.

The way queens have been sent since then

The way queens have been sent since then makes it certain that no danbing of the mails, or stinging is possible. This privilege has been a great aid to an important and valuable industry. Of late you have ruled and so instructed the postmaster at Griffin, Ga., that onLy queens can be sent. Now, as queens cannot be sent without a few worker bees, this ruling practically places an absolute inter-dict on the business. Surely, you cannot have known this or you would have ruled otherwise. The presence of ten or fifteen worker bees can in no wise do harm, while they are absolutely necessary to care for they are absolutely necessary to care for queen. the

May we not, Dear Sir, hope and expect that you will change your order and so inform the postmasters? Otherwise you will seriously eripple, and in many cases, ruin many who are engaged in this impor-tant industry.

Again, in a few postoffices, notably that at Again, in a few postoffices, notably that at Niagura Falls, queens are forbidden to pass into Canada. Must this be so? They have been allowed to pass freely all these years, greatly to the advantage of both countries, then the norm to use advantage of both countries. though more to our advantage than to that of the Canadians.

Now inasmuch as there is no duty on stock secured for breeding to improve our herds, which describes queens exactly, may we not hope for a ruling that queens may pass unobstructed as heretofore into the Dominion? Yours truly, A. J. COOK.

Hon. E. Willits, President of the Miebigan Agricultural College; has also written a strong letter to Mr. Jameson, with whom he is personally acqualnted. This was done at the solicitation of Prof. Cook. President Willits has many times proved himself a true friend of the bee-keepers of America. and on their hehalf we tonder him their sincere thanks.

While awaiting the result of the foregoing correspondence, we lay it before our readers, knowing full well that they will appreciate our endeavors, as well as be painfully Interested in the result.

The Rush has Come, and supply dealers find it very difficult to fill the orders for sections, foundation, etc., as fast as they come. We advised all to send their orders early; but, alas, this advice was unheeded, and now manufacturers are running day and and night to accommodate the pressing demand for goods. They would have been glad to have had these orders in April and May. Retailers are between two fires-consumers and manufacturers-and are trying to keep up with their orders. There is but little delay, however, except for "special sizes" not usually kept in stock. This ought to teach a lessen of uniformity ; use regular sizes of everything; buy "foundation" in 50 or 100 pound boxes, and sections in 500 or 1,000 packages.

# Replies by Prominent Apiarists.

fIt is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-ED.]

# Syrians and Italians.

Query, No. 271.-1. Are the Syrian bees better honey-gatherers than the Italians? 2. Are they, or are they not, more gentle and docile than the Italians ?-C. T. C.

The Syrians that I have had were no better honey-gatherers than the Italians, and not nearly so docile.-W. Z. HUTCHINSON.

1. With me the Italians are far the best honey-gatherers. 2. Full-blood Syrians are nothing near as gentle as the Italians.—G. M. DOOLITTLE.

1. I think not. 2. I have every rea-son to believe that they are more irritable and belligerent. I have never owned any, and I judge from observation .- JAMES HEDDON.

1. I think so; only, however, be-cause they breed faster, and so are stronger. 2. At first they seem crosser, but soon they are handled as easily. The first year our Syrians were quite irritable; since which they are very amiable.—A. J. COOK.

No. but the crosses between Syrians and Italians prove excellent honeygatherers. Pure Syrians are nearly, if not quite, as gentle and docile as Italians, but they must be handled differently.—G. L. TINKER.

1. I doubt it, but I have had little chance to know. 2. I never noticed any difference, but, as before, I have had little chance to know.— C. C. MILLER.

Some colonies of Syrian bees are extra-good honey-gatherers; also the same with Italians. It will take years yet to decide that point. My limited experience with Syrians is this: They will handle just as well as Italians, but you must not jar them in the hive; if you do they will "boil up and over."—H. D. CUTTING.

1. There is not much difference in 1. There is not much difference in the honey-gathering qualities of Ital-ians, Cyprians and Syrians. 2. Purely bred Italians are the gentlest bees I have ever had in my apiary. Some colonies of Syrians and Cyprians are just as gentle and amiable as any Italian colony, but such is not the rule, as scores of experienced apiarists will testify.—G. W. DEMAREE.

I have not seen that any particular difference exists. They are not more gentle and docile than the Italians. I have seen those that were as ferocious as Mexican hornets. I have my doubts, too, about the purity of these new races—so-called—at least those that were first offered as "dollar" queens. Nothing, as yet, has been found that will compare with our noble, thoroughly-tested Italians .-- J. E. POND, JR.

Query, No. 272. - Are bees taxable property ?-Wis.

Yes.-DADANT & SON.

In my opinion they are.-W.Z. HUTCHINSON.

I pay taxes on mine. I think I ought to.-C. C. MILLER.

They are taxed in Ohio; and I know of no reason why they should not bear the burdens of taxation like other property.—G. L. TINKER.

They are not usually taxed, but I see no reason why they should not be. -А. Ј. Соок.

Yes, unless specially exempted from taxation by statute. This is the case in Iowa, and perhaps in other States. If bees possess a marketable value, why should they not be taxed ?-J. E. POND, JR.

They are taxed here when a person is not in debt, the same as other stock. If in debt, no stock is taxed. As our assessors do their work in the month of June, nothing unfair is likely to occur, as bees are on the increase then rather than on the wane. -G. M. DOOLITTLE.

I asked a prominent judge in this county a few years ago, this same question, and he said that "he did not know, but if we talked about it very much we would have them all taxed." His idea was this: If bees were taxed in some sections and not in others, to have an act passed in each State exempting bees from taxation.-H. D. CUTTING.

I hope so. We ought to be willing to assist in paying for the blessing we share in enjoying, had we not? 1f we want our property rights respected, let us insist that bees are property, and taxable property, too. Property in bees has been so long degraded that not one bee-keeper in a thousand realizes what his rights are .--JAMES HEDDON.

If bees, when in a State of domestication, are "property" in the com-mon meaning of that term, why may they not be taxed as other property is, without violating principles of human rights, is a question that is self-answering. The fact that bees iu the past have been regarded in law as being *feræ naturæ*, when not re-claimed from the wild state, or when at large, and without means of iden-tification, cannot affect the right or power of the State to tax them as other 1. Some say they are. These mostly power of the State to tax them as other frames have an equal chance, if yo offer queens for sale. As for myself property when their state has been want nice combs.—JAMES HEDDON.

changed from the wild to the domestic state, and made useful and profitable. -G. W. DEMAREE.

Query, No. 273 .- My loss is 27 out of 44 colonies; 13 died in the hives, and 14 have dwindled. The combs can be considered in fair condition. Shall 1 use the combs for increase? If so, how can I use them to the best advantage for increase and honey? Shall I use any comb foundation? I use the 10-frame Langstroth hive, increase by natural swarming, and prevent second swarms.-Ont.

Yes. Use them to make divisions. -DADANT & SON.

You can use them to the best ad-vantage by working for extracted honey. Hive the bees upon the empty combs.—W. Z. HUTCHINSON.

Why not give them to new swarms? Unless nice, they can be melted up and foundation given to new colonies. -A. J. Cook.

If the combs are worker combs I should use them all before using any foundation. Give them to the bees just as fast as they can take care of them.—C. C. MILLER.

Tier up the combs on the hives in use, and when the colonies become very strong, make divisions. If a swarm issues, and comb honey is wanted, hive it on a few combs, and adjust sections at once.—G.L.TINKER.

Work for extracted honey and use all of your extra combs. It will de-pend upon your locality and honey yield whether you will want to use foundatiou or not. Prevent all second swarms if you want honey in place of increase.—H. D. CUTTING.

1. Yes. 2. Give each new swarm five of the combs, and put on the surplus arrangement when the swarms are hived. Contract the hive to the five frames, using dummies.-G. M. DOOLITTLE.

I would use the combs for obtaining I would use the combs for obtaining increase, and for taking extracted honey. By no means would I use foundation as long as I had good combs to supply the bees. I regard a large supply of good combs as one of the essentials to a good outfit to the apiary. If I have more than I can find use for, I keep them until I do need them.—G. W. DEMAREE.

1. Yes. 2. By giving them to coloand building up the same with the combs. A little care and the exercise of judgment will utilize all the combs you have on hand.-J. E. POND, JR.

1. Yes, use your combs. Run a part for extracted honey, making one queen do double service for a time, and when both sets of combs are well filled with brood, divide the colony if it does not swarm. Do not place full combs and empty frames, or frames of foundation side by side. Let all frames have an equal chance, if you want pice combs. Let we upper

Explanatory.-The figures BEFORE the names Indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is located near the center of the State named; 3 north of the center; 9 sonth; 9 cast; • west; and this of northeast; `o northwest: • southeast; and ? southwest of the center of the State mentioned.

for the American Bee Journal. Mailing Queen-Bees to Canada. G. M. DOOLITTLE.

In the BEE JOURNAL for 1883, page 511, I had occasion to speak of send-ing queens by mail to Canada, giving there how I had managed, until there was no more trouble with their going safely than in the United States, for queens had then been sent to that place so long that it had become a custom with the postmasters of both countries to look upon queens as mailable between the United States and Canada, although every Postal Guide printed said plainly that such was not the case.

Knowing that the laws in force between the two countries would pro-hibit queens from the mails to Can-ada, if such laws were executed, I closed my article thus: "As the queen traffic is assuming large pro-portions between the two countries, I would suggest that a better way than the above would be for some of the bee-keepers of either country, having influence with the postoffice departments, to see if a law cannot be obtained allowing queens to pass in the mails between the two countries, thereby avoiding the very appearance But as queens were allowed of evil. in the mails we settled down with folded hands, contented to let things remain as they were, until now we are rudely awakened by queens being returned from the lines as "unmailable to Canada."

On May 16, among a lot of queens placed in our postoffice, was a choice selected queen directed to Ontario, Canada. Four days later the same queen came back with "unmailable to Canada" written on the tag, sent by the postmaster at Suspension Bridge, N. Y. The package was directed as hundreds of such going safely had been before it, saying, "Queen-bee for the improvement of stack" and to contain meatures target stock," and 10 cents in postage stamps affixed. I immediately wrote to the Suspension Bridge postmaster as follows:

"Borodino, N. Y., May 21, 1886. Postmaster at Suspension Bridge, N. Y.-Dear Sir: The enclosed tag

you will doubtless recognize as one attached to a little box containing a queen-bee and her attendants, which you returned to our postmaster as unmailable matter to Canada. I am aware that the postal regulations say that you are right, but to help advance a growing industry, both in Canada and the United States, postmasters of the past have allowed queens to pass to and from Canada as samples of merchandise (which they really are), much to the advantage of all concerned. I have sent during the past five years hundreds of queens to Canada, all of which have gone safely, since I wrote queen-bee for the improvement of stock on the tag. Now, will you not please do as former post-masters have done, and help advance our industry? By so doing you will only be following a custom of the past, and receive the heart-felt thanks of bee-keepers in all parts of the United States and Canada. Please reply telling me what I may expect, as I have orders for a score or more of queens from Canada."

The following is his reply:

"Suspension Bridge, N.Y., May 25, 1886.—Mr. G. M. Doolittle—Dear Sir : Yon letter at hand this a.m. Post-masters who have allowed bees to pass into Canada by mail have not understood the rulings of the post-office department. By reading Note 4 on page 770, in the January, 1886, Gnide, and also Note 20 on page 753 of the same Guide, you will see that merchandise is not mailable to Canada. I send to your postmaster a letter which I have from the department on the bee-question. Please call at the postoffice and see this letter. You can then write to the department and ask them to remedy the matter. We cannot allow them to pass through the mail.—Wm. Carr, P. M."

Upon calling at the postoffice I found the following letter in the hands of our postmaster:

No. 71924 Canada.

"Postoffice Department, Office of Foreign Mails, Washington, D. C., May 6, 1886.—Sir: In reply to your letter of the 4th inst., inquiring as to the rate of postage applicable to bees addressed to Canada, I have to in-form you that the transmission of articles of merchandise by mail between the United States and Canada is limited by the postal arrangement in force between the two countries to bonafide trade patterns or samples (specimens) not exceeding 8 ounces in weight, and that articles of merchaudise such as queen-bees, sent for sale, in execution of an order or as gifts, are not bonalide samples, and are not transmissible by mail from one coun-try to the other. In this connection see Note 4 of foreign postage table on page 770, and paragraphs 20 and 21 on page 753 of the United States Official Postal Guide for January, 1886.-Nicholas M. Bell, Superintendent of Foreign Mail.

To postmaster at Suspension Bridge, N. Y."

It will be noted that the postmaster at Suspension Bridge had taken occasion to write to the superintendent of foreign mails 12 days before I mailed any queens to Canada. What caused him to do so is unknown to me. In a day or two after this I fitted up a cage to go in an ordinary letter envelope, put the queen in and mailed it via Buffalo, N. Y., by registered mail. As the queen arrived safely sent in two sealed envelopes (my envelope and the register envelope), it would look as if our precaution regarding the ventilation of queen-cages is not necessary

When I heard that the queen was safely in Canada, I again wrote to the postmaster at Suspension Bridge, thanking him for so kindly returning the queen to me instead of detaining the gueen to me instead of detaining her until dead, or sending it to the dead letter office. I also showed him from letters in my possession, and from clippings from the kee-papers, that queens were passing through other postoffices to Canada, and ask-ing if he could not allow queens to pass until arrangements could be made and a new law rendered which would allow ensures to pass localize. would allow queens to pass legally. also asked him how he came to stop queens now when he formerly let them pass. Here is his reply:

"Suspension Bridge, N. Y., June 4, 1886.-G. M. Doolittle-Sir: Your letter of the 2d at hand. I am sorry I cannot allow your bees to pass into Canada. We have allowed them to pass until quite recently, and them stopped only on receiving a letter from Washington from the superin-tendent of foreign mails. I shall at once refer your letter to the Depart-ment, and hope they may make satisment, and hope they may make satis-factory arrangements.-Wm. Carr, P. M.-per D."

I have written to the Department to see what can be done, for I<sup>•</sup> have orders waiting for some 25 or 30 queens, with more still arriving against us, and as most of the mail to Ontario passes there from the East and South, our traffic must stop un-less something can be done. Now, brother bee-keepers, let us arise and brother bee-keepers, let us arise and unfold our hands, and make such a "racket" that something will be done. As Prof. Cook did us such good service when the mails of the United States was closed against queens, I would suggest that he, by the cuttering of the Reak Reagence. the authority of the Bee-Keepers' Union, negotiate with the Depart-ment at Washington, and in Canada, to see if we cannot be protected by a law to the mutual advantage of our industry in both these countries. What say you, friend Newman? Borodino,⊙ N. Y.

[See editorial note on the foregoing article on page 403.-ED.]

# Convention Notice.

187 The 5th regular meeting of the Hill County Bee-Keepers' Aasociation will be held on the first Tuesday in July, 18-6, at the aplary of Hon. J. M. McDaniel, of Peoria. Tex. At the same time and place will he held a bee-keepers' honey plocie. H. A. GOODRICH, S.c.

# For the American Bee Journal

# Bee-Keeping in Tennessee.

# E. C. KEMPER.

The past spring was very backward and wet, but when it did open up it came off very dry, so that becs gath-ered but very little honey from poplar, which is counted our best flow here. Yet we have some white clover here which began to bloom about May 10, and yielded finely for a few days; but it has rained the most of the time since-28 days out of 30.

I have about 250 colonies of bees all in movable-frame hives, and have only taken off about 1,000 pounds of honey. I am afraid if this weather continues two weeks longer I will be obliged to food. Sour wood is inst obliged to feed. Sour-wood is just coming into bloom, but unless the weather becomes settled very soon there will be no honey gathered from it; that is about the last that we can expect any surplus from, as the fall flow is very light here; so I consider the honey crop in this portion of the State almost a complete failure for State almost a complete failure for 1886, and while other Northern beemen are reaping a good harvest, I shall live in hopes that there will be a harvest for us another year.

The bee-business is very much neglected here in the South, and the most of the bees here are kept in "log gums," and are all black bees. I bought 50 colonies of Italian bees, and I am Italianizing all of my bees. I lind it quite difficult to get the queens purely mated, as the country is so full of black bees, and especially the sides of the mountains.

Pikeville, o+ Tenn., June 16, 1886.

Prairie Farmer. Bees Deserting their Hives, etc.

# MRS. L. HARRISON.

When a swarm re-issues, the hive When a swarm re-issues, the hive should be thoroughly examined to ascertain the cause, for their is sure to be one. If they leave silently and alone, it will generally be found that the queen returned to her former home, and the bees followed suit. Sometimes they leave the hive and cluster, but I have had them take a "bee-line" for the woods on re-issuing. In my early days of bee-keeping a swarm came out several keeping a swarm came out several times and clustered; on examining the hive I found the entrance to be much smaller than in the other bives, and they left because the ventilation was insufficient. A swarm once emi-grated because the hot sun shone upon the hive the next day after hiving. New hives that have been stored in a close room where there are barrels of kerosene, will acquire an odor that is distasteful to bees, and they will desert them.

While writing the foregoing, I saw, through the window, that a large swarm of bees had clustered upon the body of a small cherry tree, sur-rounded by raspberry bushes. Hiving bees from the bodies of trees, fences

and stumps is not the pleasantest work in the world, but it must be met work in the world, but it must be met occasionally. I covered the raspberry bushes with a sheet, and shook the bees into a dish-pan, which I covered with an apron and carried them to the hive prepared to receive them. After I thought I had most of the bees hived, I discovered a large cluster at the foot of the tree, and another on the fence, and had to bring the hive there, and drive them into it with smoke. If they had clustered upon the branch of a tree, they could have been secured easier.

Some bee-keepers claim to be able to entice bees to cluster wherever they want them to. I have tried these bee-bobs, time and again, and have never been able to get the bees to notice them ; have fixed up devices resembling small clusters of bees, and with bees strung on threads hanging from them, all to no purpose. I once found a colony of bees with worker were diminutive. I took a new hive, brushed the bees off the combs and put them in it, placing it where the old one stood, with a queen and drone excluder m front, thus preventing their entering the hive. These frames contained brood only; these were put in the centre of the hive with divisionboards each side, after shaving the heads off the drones, with an uncapping knife. I pinched the head off the queen, and destroyed the drones as they were prevented from entering the hive by the excluder. The bees will build queen-cells, and when they are capped I will destroy them, and give them others ready to emerge, reared in good colouies. There is as much difference in bees as in other stock, and those who keep them for profit, cannot afford to keep scrubs. All inferior colonies should be weeded out, and this can be done by destroying only one bee, the queen or mother. New blood should be introduced yearly into the apiary by a few queens from reliable breeders.

In walking among the hives, I noticed in front of one of them a ball of bees as large as a walnut. I conjectured that a queen was in the centre of this nucleus, and poking off the bees, and thereby getting several stings, found I was correct. I caught the queen, held her in my closed hand, and procuring a queen-cage to before a window, so if she got away, she could be caught upon the glass. I did not discover the colony to which she belonged, as all the bees I offered her to, rejected her; so I introduced her into a queenless colony.

To save a queen when balled, throw the entire mass into water ; then selfpreservation will occupy the attention of each bee, and she can be picked out without danger from stings or of injuring the queen. It is risky to pick off the bees from a balled queen, as they in the excitement are liable to sting her. Queens do not sting, but the sensation of holding one in the closed hand is peculiar.

The first swarm of this year issued May 22. There would probably have I think that it would be impossible been earlier ones if brood had not to handle them so roughly as to cause

been taken from the strong to build up the weaker. This swarm issued about noon and clustered upon a small peach tree. I took a hive full of frames of comb and put it near the cluster, with a broad cover in front of it, and scraped off some of the cluster with my hands upon the cover in front of the hive, and drove them in with a little smoke. When they had all en-tered the hive, I placed it upon its summer stand. Some bee-keepers recommend putting a frame of un-sealed brood into the hive of a swarm to prevent its leaving, as bees do not desert uncapped brood. I have never found this necessary, as bees will seldom desert a clean, cool hive, placed in the shade as soon as put in it. If old hive provide the base it. If old hives are used, they have heretofore been thoroughly cleansed; if new ones, rinsed with cold water to remove dust and freshen them.

Peoria, O Ills.

# For the American Bee Journal. The Cancasian Bee. H. E. HILL.

Ilaving had the pleasure of spend-ing the season of 1885 in the "Wood-stock Apiary," of J. B. Hall, in Can-ada, I took great interest in observing the results of the numerous experi-ments which were constantly being made. Of those affording the most intense interest was the Caucasian bee. They are a triffe smaller than the common bee are very dark with the common bee, are very dark, with a distinct silvery band bordering each segment of the abdomen, and, in mass, present a bluish cast.

They do not seem to know how to gather honey. One of the assistants thought that "they went to the field to get what they wanted to eat in the honey season, and came home with-out any." Although they are accused of being unprolific, I believe they can of being unprolific, I believe they can rear more queens and drones to the square inch than any other race of bees in America. If the apiarist is so kind as to furnish them with plenty of nice honey (for it is a fact that they will gather scarcely enough to subsist on, when other colonies are getting from 10 to 20 pounds per day). their energy in building queen-cells is remarkable. Queen-cells stuck to both ends of each comb and were scattered promiscuously over the sides of not only the combs, but actually attached by the dozen to the sides of the bins, then up stairs in the constituthe hive; then up-stairs in the section-boxes until the apiarist has queen-cells " by the pound."

Another peculiarity (but one in their favor) is their gentle disposition, The Cancasian is the strain of bees to which Mr. Hall referred at the Onwhich Mr. Half Feferred at the Off-tario Bee-Keepers' Convention held at Toronto, on Sept. 10, 1885, when he said "they were the quietest bees he had ever handled." But somehow the BEE JOURNAL'S correspondent, on page 579 of the volume for that year, makes him to say "Carniolans" instead.

them to attack and sting the operator; but do not think that "they can't;" for if by any means one should be squeezed or otherwise forced to do so, squeezed or otherwise forced to do so, the operator would soon be convinced to the contrary. They appear to be very hardy winterers. As Mr. Hall did not value them at all after having tested them, he took no pains in preparing them for winter; but not-with the discussion of the di withstanding the disadvantages with which they had to contend, they came through the disastrous winter of 1884-85 in good condition.

When crossed with Mr. Hall's "comb honey" bee, they are very prolific as comb-honey producers, and are beautiful as well as gentle. With these bees the apiarist runs no risk of heing left with unfinished comb honey on hand after the honey season, even though they might have had one or two extra supers during the whole season.

In entering the sections they occupy one row across the super (or perhaps two rows, or even more if the colony is very strong), leaving other rows having foundation without touching it. Sometimes, after finishing several supers, and the season is nearly closed, if another is given them in removing them, the apiarist will find one row (perhaps across the end of the super) nicely finished without having drawn out any other foundation. Honey capped by these bees is easily distinguished from any other. The cappings do not show the side-walls of the cells, as does that capped by other bees; but it presents a flat, wrinkled appearance. Titusville, ~ Pa.

# For the American Bee Journal. Spiders and Empty Combs, etc. 8-JOSEPH BEATH, (19-29).

In answering Query, No. 258, I was surprised that there was not one of the answers that mentioned the plan made known by Father Langstroth last year, in the BEE JOURNAL, namely, introducing spiders where the empty combs are kept, to eat the moth or miller's eggs. I stored mine in supers and piled them one on top of the other, last fall, and left them there until I wanted them this spring. I put the last in use a few days ago, and I did not see a sign of moth. They were piled in an empty bin in a granary, and as soon as I could find spiders in the spring I put one or two in each pile, and by that time I found they were going there themselves.

My supers are simply boxes the size and depth of the hive without top or bottom, so that the spiders could go from top to bottom through each tier. I have just examined a box of pieces of comb that was beside the other, but was closed until a couple of weeks ago, and I found only a sign of moth, and this after having a very early and warm spring, so that I have corn now in tassel.

it came into bloom the bees were killing drones. It had been very dry, but we then had a good shower, and the bees began to hum. We have had a shower once a week since, so they are still happy—and so is their keeper. Corning, 9 Iowa, June 17, 1886.

The Bee-Moth.

Mr. C. W. Banker, of Menomonee, Wis., asks the following about the bee-moth, dated June 17, 1886:

I would like to ask through the BEE JOURNAL how the moth gets into the hive. I am told that moth eggs are deposited first in the flowers, and then gathered np in the pollen by the bees, carried to the hives and deposited in the cells with the pollen, and there hatched ont into moth worms. If this is so it would be worth a good deal to me to know.

We cannot do better than to quote the following from Prof. Cook's Manual, in order to satisfy our correspondent:

The bee-moth (Galleria Cereana) belongs to the family of snout moths,

Fig. 1.-Bee Moth.

Pyralidæ. This snout is not the tongue, but the palpi, which fact was not known by Mr. Langstroth, who is usually so accurate, as he essayed to correct Dr. Harris, who stated cor-"very short and hardly visible." This family includes the destructive hop moth, and the noxious meal and clover moths, and its members are very readily recognized by their nuusually long palpi, the so-called snouts.

The eggs of the bee-moth are white, globular and very small. These are usually pushed into crevices by the female moth as she extrudes them, which she can easily do by aid of her spy-glass-like ovipositor. They may spy-glass-like ovipositor. They may be laid in the hive, in the crevice underneath it or about the entrance. underneath it or about the entrance. Soon these eggs hatch, when the gray, dirty-looking caterpillars, with brown heads, seek the comb on which they feed. To better protect themselves from the bees, they wrap themselves in a silken tube, which they have power to spin. They remain in this tunnel of silk during all their growth, enlarging it as they eat. By looking closely, the presence of these larvæ may be known by this robe of glisten-ing silk, as it extends in branching ing silk, as it extends in branching outlines along the surface of the comb. A more speedy detection, even, than the defaced comb, comes from

moth-larvæ are at work. Soon. in three or four weeks, the larvæ are full grown. Now the six jointed, and the ten prop legs-making sixteen in all. the usual number of caterpillars—are plainly visible. These larvæ are about an inch long, and show, by their plump appearance, that they at least, can digest comb. They now spin their

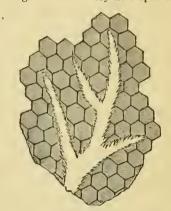

Fig. 2.-Moth-eaten Comb.

cocoons, either in some crevice about the hive, or, if very numerous, singly (Fig. 3, a) or in clusters (Fig. 3, b) on the comb, or even in the drone-cells (Fig. 3, c) in which they become pupe, and in two weeks, even less, some-times, during the extreme heat of summer, the moths again appear. In winter, they may remain as pupe for months. The moths or millers-sometimes incorrectly called mothmillers—are of an obscure gray color, and thus so mimic old boards, that and thus so mimic old boards, that they are very readily passed unob-served by the apiarist. They are about  $\frac{3}{4}$  of an inch long, and expand nearly  $\frac{1}{4}$  inches. The females are darker than the males, possess a longer snout, and are usually a little larger. The wings, when the moths are quiet, are flat on the back for a

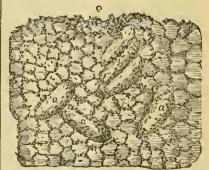

Fig. 3.-Cocoons.

narrow space, then slope very abruptly. They rest by day, yet, when disturb-ed, will dart forth with great swift-ness, so Reaumur styled them "nimble-footed." They are active by night, when they essay to enter the hive and deposit their one or two hundred eggs. If the females are held I have corn now in tassel. Bees have been booming here for nearly three weeks on white and Alsike clover, but the first few days abdomen, and still more strange, while the latter was being dissected.

It is generally stated that these are two-brooded, the first moths occurring in May, the second in August. Yet, as I have seen these moths in every month from May to September, and as I have proved by actual observa-tion that they may pass from egg to moth in less than six weeks, I think under favorable conditions there may be even three broods a year. It is true that the varied conditions of temperature-as the moth larvæ may grow in a deserted hive, in one with few bees, or one crowded with beelife-will have much to do with the rapidity of development. Circum-stances may so retard growth and development that there may not be more than two, and possibly, in extreme cases, more than one brood in a season.

It is stated by Mr. Quinby that a freezing temperature will kill these insects in all stages, while Mr. Bet-singer thinks that a deserted hive is safe, neither of which assertions are correct. I have seen hives, whose bees were killed by the severe winter, crowded with moth pupe or chrysalids the succeeding summer. I have sub-jected both larvæ and pupæ to the freezing temperature without injuring them. I believe, in very mild winters, the moth and the chrysalids might be so protected as to escape unharmed, even outside the hive. is probable too, that the insects may pass the winter in any one of the various stages.

> For the American Bee Journal Another Canadian Apiary.

# R. F. HOLTERMANN.

Another Canadian apiarist who has for quite a number of years attended the North American Bee-Keepers' Conventions, and is known to many, is Mr. S. T. Pettit, of Belmont, Ont., President of the Ontario Bee-Keepers' Association. Like Mr. Hall, of Woodstock, Ont., Mr. Pettit can rarely be induced to contribute to a bee-paper. He is a strong advocate of the idea that bee-keeping should not be held up in too bright (or per-haps in bright) colors, and no one should be induced to become a beekeeper-if anything, discourage the idea

Mr. Pettit's bees, consisting of some 80 colonies, were apparently in very good condition, his winter loss being 2 colonies. The bees have heretofore been wintered on the summer stands with a rough clamp about them, which gives ample packing all around; but material was already upon the ground for a cellar with a frost proof honey-room above, and in future the calculations are that the bees will be wintered in-doors. The reasons given are: As our country becomes more and more devoid of forest and shelter, the climate becomes more and more unsuitable for our bees, and to obtain the hest results Mr. Pettit thinks that we must winter our bees in-doors.

The hive used by Mr. P. has a wider frame than the Gallup, and I think slightly less shallow. Like in think slightly less shallow. Like in Mr. Hall's apiary, the lower story is disturbed but little; perforated metal is used between the lower and upper story, and from the latter the honey is extracted. The honey is permitted to be pretty well capped before ex-tracting. The system of extracting before the honey is ripe, and evaporat-ing in cases has been tried with the ing in cases has been tried with the result being an inferior honey, and has been discarded.

Mr. Pettit has a fairly good locality. On his farm, which his son works, there are some fine linden trees; Alsike clover, too, has been grown successfully, yielding a very handsome return. I was a little surprised that Mr. Pettit should have let his neighbors know about the profit to be derived from raising Alsike clover seed—the market for it,like the honey market. might become glutted in consequence; certainly many in the vicinity are sowing it. But it only shows us that even our showned in only men will, in unguarded moments, "let the cat out of the bag."

Mr. Pettit's results, as to honey yield, are about the same as those of Mr. G. M. Doolittle.

Feeding sugar to the bees for winter stores has also been resorted to, but discarded. The result of such feeding was that some men looked with marked suspicion upon the practice; then, as a bee-keeper, it was throwing so much more honey upon the market, and when it required more of an effort to dispose of honey, the entire transaction from its various stand-point was considered injudicious and unprofitable.

I here saw a case of drones having wintered in a colony not queenless. Mr. Pettit says it will occur rarely, as they disappear within a few days. Brantford, Ont.

### For the American Bee Journal.

# Queens and Swarming.

# J. H. ANDRE.

I noticed on page 379 of the BEE JOURNAL, Mr. O. P. Miner's open questions. In regard to piping of queens before the old queen leaves the hive, I am not sure, neither am I sure of a young queen hatching before the old queen leaves the hive, but it occasions. In a good, strong colony that would cast a swarm on the morrow, providing the weather was suitable, and if one of those long-continued cold storms come on that we sometimes have at summer solstice, which might keep them back two or three days (for first swarms hardly ever come forth in bad weather), it would be nothing strange if a young queen should leave the cell, and the hive also, with the first swarm. not recollect of ever seeing more than one queen with a swarm, which I was sure was an old queen, but I have swaru, with seen as many as five queens in plain sight at once with one swarm, and a off the cases. small one at that.

I do not believe queens ever make war upon each other in the parent colony, no matter how many there may be after they come forth from the cell. I think that is the reason they sometimes have such a swarming fever, and keep it up until there is only one queen left, and leave the colony so weak that it is an easy prey for swarms. Last season I had a col-ony that cast five swarms. I think that a young queen came out with the first swarm, met the drone, returned to the parent colony and deposited a few eggs, and the last swarms were her offspring instead of the old queen's.

The queen is superseded much oftener than most bee-keepers imagine. Last season fully one-half of my first swarms had young queens. Quite often a colony will swarm every other day, and sometimes each day, until they have cast three or four swarms (small ones). This is caused by a loss of the queen, superseding, or otherwise. It is always best to re-turn one or two of the last swarms, where more than two are cast, unless increase is wanted, and then there is a chance of giving up the old colony to worms, and the weak swarms will hardly ever pull through the winter.

I hardly ever have any trouble in putting two or three small swarms together; if they are agitated too much, smoke them a little, and sprinkle them with water every time they act like separating. After they have been in the hive one night, they l had a colony cast a third swarm. It was in one of these muisances, a boxhive, and as I had fixed a case on it containing 18 sections, and was calculating on getting some surplus from it in a week or two, I left the swarm about six quarts of bees, which came out at 2 p.m., and the next day at 7 p.m. I returned it, and it gave me no further trouble.

I have seen it stated by several that it did not pay to feed colonies in the spring that were in fair condition. I think that depends on circumstances, but of one thing I feel assured, I can get surplus earlier by feeding, than without. Early feeding will fill the brood-chamber, or at least keep the stores good, and will stimulate early breeding. Discontinue feeding at the time fruit begins to bloom. They will hardly ever start queen-cells in this latitude until clover blooms. The feeding and fruit bloom together will give them plenty of stores and brood, which will be hatched, and will be of just the right age to gather the crop of clover honey. One of my colonies gave me 40 pounds of surplus by June 17, and is now busily at work on 32 small sections. This is by the natural work of the bees too, without any contracting of the brood-chamber. the season is good, 1 will divide it when they get the second case full, and then try and get 30 pounds from each during the buckwheat bloom, which will satisfy me, making 130 pounds from one colony, and one good swarm, without any labor, only by dividing, and putting on and taking

Lockwood, 9 N. Y.

# Read at the Rhode Island Convention. Alsike Clover, Honey Ripening, etc.

# SAMUEL CUSHMAN.

All writers for agricultural and bee papers agree as to the superior qualities of Alsike over other clovers for pasturage or honey, having fine stalks and little woody fibre it is eaten clean by all stock and yields heavily, often producing three tons of good hay per acre. It is said as a fertilizer for land it has no superior if an equal. While it pays well as a farm crop, it is also our best crop for honey, and all bee-keepers recommend it in the highest terms, as will be seen by reading the reports of all the bee-keepers' conventions held last winter. It is claimed that as great yields may be obtained from it as from basswood, and the quality of honey much superior.

J. M. Hicks, of Battle Ground, Ind., says in a late article in the Canadian Bee Journal: "We have no hesitancy in saying that Alsike clover will produce 500 pounds of the richest and best honey per acre in a good season." As a seed crop it pays well, the seed bringing from \$6 to \$7 per bushel, and an acre frequently yields 4 bushels of Hill, N. Y., gives the net profit on his crop as \$60 per acre, and speaks of the hay as the best he ever fed.

If the bee-keepers of Rhode Island are to supply the State they will have to offer something better than dark honey, and if each one will distribute among his neighbors every spring a bushel or two of this clover, I believe we would soon be able to compete with any honey in the country, and to keep 100 colonies with profit in the same area that now supports but ten. Vermont produced 160 tons, and Maine 192 tons of honey the past sea-son, and much of it was from clover.

Alsike clover does best on clay or wet land, and is sometimes unsatis-factory on dry or light soil. It is said to be hardy, and does not easily win-ter-kill. From 4 to 6 pounds are sown per acre. Part of the piece can be mowed before it blossons, and fed to stock. It will then blossom late after stock. It will then blossom late after the usual bloom is over. From this it would be seen that by a compara-tively small outlay we will get it back a hundred fold, besides benefitting the parties who raise the crop. The poison of the bee is found to be mostly formic acid, which we are told is a great preservative, and that the raw pectar of flowers mostly not

the raw nectar of flowers, mostly nat-ural sugar and water by evaporation, and the addition of this acid by the bees is changed to the smooth, mellow sweet known as honey. A plentiful supply of this acid is necessary or the change will be slow and imperfect It is also said that bees are able to cure foul brood and similar diseases by its use.

Now it is not proven that a gentle bee has a delicient secretion of formic acid, or that bees that sting readily more about it, I shall favor this view, Well, as I desired to make the work as and shall not object to stinging bees short concise and cheap as possible, be as freely drank as lemonade? It

as long as I am able to protect myself from their venom when they are disturbed.

Much honey is capped that is not ripe, and is sold in that shape; but it is much oftener the case with ex-tracted honey. Evaporation may thicken, but I cannot believe it will ripen it. When working for comb honey I shall depend upon hybrids, but if working for extracted honey or keeping bees for pleasure, I should keep pure Italians.

Pawtucket, 5 R. I.

For the American Bee Journal, Inventions—"Axes to Grind," etc.

# JAMES HEDDON.

Number 25 has just been laid upon my desk. Seeing the name of C. W. Dayton (who wrote an article in last *Gleanings* relative to the rights of bee-keepers, which I should like to see copied into the AMERICAN BEE JOURNAL), I at once read the article which relates to my favorite branch of apiculture, — hive-construction. While from my stand-point I do not conceive that the arrangement he describes is at all practical, that it will ever meet the wauts of producers of honey, yet I am conscious that I may be in error, and I am glad to learn that Mr. D. recognizes his right to the results of his labors, prove they more or less.

But I wish to take issue with him in regard to the "ax to grind" statement, found near the close of his article. I do not see why he should acknowledge any such motive. If he wrote for the purpose of extolling the merits of the manufacture described, with a pecuniary end in view, I should call that "an ax to grind," but simply because he is the inventor and patentee of what he believes to be an improvement in one art, does that rightfully exclude him from giving Lis best thoughts to us? We want the best he knows. We acknowledge his right to the patent, and we expect nothing else than that he would patent the result of his best thoughts.

One editor complained that my book was too much like an advertisement; that it described and extolled one hive, and that was the one I used: one I had invented and patented. Well, is that strange? I know that some other books illustrate and de scribe numerous hives, and rather leave the reader to "choose ye"--partly in the dark, not only as to which might be the best hive, but even which the writer thinks is best. As I stated in the introduction to my book, I wrote it from my own standpoint of 18 years' experience as a specialist; not to take the place of any other work, but merely to supplement the several good books already out.

Should I write a book and omit the most important branch of the industry; the one which I had made a special study—the hive? Surely not. Well, as I desired to make the work as

should I have described a lot of hives I considered inferior? If so, should I have stated that 1 so considered them? What would the gentleman have said them? Have I not the same right and duty before me to state my choice in hives as well as queen-cages or methods of preventing afterswarms?

If I do place before the reader what I claim to be the best hive, should not that claim accord with my honest belief? Would I patent a hive which I thought inferior, and thus inten-I thought interior, and thus inten-tionally throw away my time an' money? If I sell a hive should I not sell the one I thought valuable enough to patent and use? Should I pat-ent and use one and sell another? I thought, and still more firmly believe that my new hive is the back that my new hive is the best bee-hive ever used. If I had not, I should never have patented it.

Will some one please tell me what I should have done about the hivematter when writing a book, the inspiring motive of which undertaking was to describe implements and methods that would prove a help to the reader, more and more practical as time rolled along, and do honor to the writer?

I wrote this argument in reply to the unjust editorial, but it was re-fused a place where the readers of the former could see it. I hope that some who read that will also read this article. The charge was utterly ill-founded, and very easily proven so, but I could not be heard

I desire to say that the AMERICAN BEE JOURNAL is the only paper in which I have always been allowed the rights that I thought belonged to me -the only place where I could hold a successful controversy with the editor when I had the right on my side, and when I had the right on my side, and the ability to prove it. I am by no means the only complainant. It is but just to add that in late years *Gleanings* has done me justice. Let us be honest, fair and just. Let us be friendly, and be very careful of how we allow jealousy to warp our judgment. We can be plain, bold and vigorous in our discussions of important principles, and yet not be false to ourselves or others. To claim false to ourselves or others. To claim as our own that which we know be-longs to another, to impute false motives to another, are all soul-stains that are not good to sleep with.

Dowagiae, 9 Mich.

For the American Bee Journal

# Seasonable Suggestions.

# 11, O. KRUSCHKE.

We have bee-associations without number, and although it is a good thing to commune with the fraternity, I would like something more practi-cal; something that will yield dollars and cents. Let us make up and offer large prizes for information that will create a greater demand for honey; apply it to various uses for which it is not, now employed. Would it not be good if a drink was made that would

could be made in extensive establishments, shipped in kegs or bottles! How to make the best vinegar so that it can be made to rival cider vinegar. Give \$1,000 or more if something good can be attained. Give enough so that our best scientists will experiment in that line.

I have also thought we should have suitable receptacles in which to sell our honey, so that it may be placed directly on the table (I mean ex-tracted honey). A vessel which will show at a glance that it contains honey; no reading of label or word from the landlady. For instance, a glass bee hive of the old straw pat-tern, with a large queen-bee for faucet at the fly-hole. By pressing or lifting the wings between the thumb and finger, the honey may flow from the queen's mouth. Such a thing would take. It could be made of silver or gold, and be an ornament on any table. I have also thought we should have gold, and be an ornament on any table. When once such a receptale is owned, it will be kept filled with *honey*. No one would debase her or himself by putting syrup in it. Or, again, make them like syrup cups new in use, but for the top there should be a bee-hive; also the word honey in gold in front of the body of the cup, fixed between the glass as fancy saloon bottles are now made.

Believe me there is money in the above suggestions, more than in dis-cussing "theories" or "prohlems." Necedah, Wis.

17 In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.-ED.

Immense Flow of Honey.--Wm. Bitzer, Wheeling, 5 W. Va., on June 17, 1886, says:

During the past week we have had an immense flow of honey from white clover. At present it is very cool, but the prospect is fair for a good crop of most excellent honey.

Building Worker Comb.-Charles Mitchell, Molesworth, Ont., on June 23, 1886, writes:

I have been innocently following the advice of Mr. W. Z. Hutchinson, in answer to Query, No. 264, by hiving large first swarms on 6 empty frames with starters 1/2-inch wide, and on with starters ½-inch wide, and on the sixth and seventh days putting on upper stories; and I thought I was stealing a march on the use of comb foundation. However, I am always a little suspicious, and looked into the hives to see what was going on, when to my disgust I found that they were completely ruined. There was not a worker comb the size of my hand in completely runed. There was not a worker comb the size of my hand, in the six hives. Had I followed the same advice this season I should have lost from \$300 to \$500 this summer, all for saving the cost of a few pounds of comb foundation. I have bought 100 neurols of work for market bought 100 pounds of comb foundation, and I for pointed of combined of and in the man who cannot buy a few pounds of foundation had better let bees alone.

Virgin Queens, etc.-E. C. Kepner, Pikeville, o+ Tenn., on June 22, 1886. answers the open questions on page 379. thus:

To the first l will say, yes, when the hive contains a virgin queen. I say yes to the second question. This will occur during continued wet or cool, occur during continued wet or cool, cloudy weather. I also say yes to the third question; this occurred in my own apiary but yesterday. I had a swarm come off with a virgin queen, and also an old queen, as I keep my old queens' wings all clipped. I was at the entrance of the hive soon after the swarm began to issue. The first the swarm began to issue. The first queen that came out was a virgin queen, and soon after the old queen came forth. On examining the hive I found several young queens just ready to hatch.

Bee-Keeping in Mississippi.-20-L. J. de Sobotker, (85-83), Riverton,+0 Miss., on June 15, 1886, writes :

Since the last week in May we have had fearfully hot and sultry weather—  $90^{\circ}$  to  $95^{\circ}$  in the shade. The bees have lost a good deal of time between 8 a.m. and 4 p.m. daily for over a week. They actually clustered out-side the hives in such a manner that a novice would certainly have thought that they would all soon be going to the woods, and leaving the hives empty-empty of bees they certainly were from 9 a.m. to 3 p.m. on several days, and I felt atraid that if such heat should continue much longer, that the brood would be injured and the combs commence to melt. Just as suddenly as the great heat had come on so suddenly on June 3 the temperature lowered 24° in a few

quite busy again, and there is no noticeable check in the flow of nectar from the fields. I have also been troubled a good deal with robbing, especially with those that had been left in box-hives after dividing; but in one day I stopped them by wetting thoroughly a large bunch of grass and putting it in front of the entrance for a few hours, and continuing to sprinkle the robber bees with water. Toward sunset I took a strip of glass 6 to 8 inches long and 2 inches wide, and placed it on edge against the front of the hive over the entrance, so that it made a very narrow passage-way at either end, and that would only admit a couple of bees at a time. This gave the robbed bees a chance to fill up the passage and keep the robbers at bay, which effectually broke up the robbing. The weather is now good, there is a profusion of bloom, plenty of nectar in the field, and the bees are doing well.

Report. - B. Betten, Goodell's, o+ Mich., on June 21, 1886, writes:

I bought a 2-frame nucleus on July 21; the bees wintered well and have increased to four strong colonies. I think I can increase them to ten this season all right. The honey-flow is good here.

[Ten colonies from one nucleus is too much. You will be very likely to lose them all next winter.-ED.1

That New England Lawsnit.-Marshall Darling, Waterbury, 9 Conn., on June 21, 1886, writes:

My lawsuit in the District Court has not been tried yet. It has been postponed twice now, but it will be tried, I think, on June 28. My bees have never done better at this time of White clover is plenty here this year. I have had 5 swarms. I have sold some of them and have 12 colonies left.

Preventing Annoyance by Bees.-C. II, Dibbern & Sou, Milau, vo Ills., on June 17, 1886, write:

From reading the statement of Messrs. Thos. and Benj. Young, on page 379, it seems evident that they are somewhat to blame themselves. If we expect to keep large apiaries in towns and cities, and remain at peace with our neighbors, we must manage them so that they will trouble other people as little as possible. It will not do to let the bees swarm all over town, and get people all "stung up." If they cannot keep their swarms from getting mixed up, and straying off, they should use a few swarmcome on so suddenly on June 3 the temperature lowered  $24^{\odot}$  in a few hours, and then changed to bleak, chilly weather. This the bees did not relish either, as they kept out of sight in the hives enjoying, I suppose, the fruits of their toils during the early mornings and late evenings of the hot spell; however, now they are

some protection for driving near the apiary, but a row of rapid-growing trees formed into a hedge would be much better. By a judicious planting of trees, bees can be made to fly where we want them, to a great extent. We have over 200 colonies in a box-elder grove, and compet the bees to fly straight up through open spaces. When bees are once high in the air, they will not bother to come down again to annoy anything. If we wish to keep people from complaining, we must do all we can to remove the cause.

Feeding Sugar - Uniting Weak Colonies.-W.Z. Hutchinson, Rogersville, & Mich., says:

Some of the grounds upon which the feeding of sugar to bees is opposed are a trifle amusing to say the least. Much is said about honey and pollen being the natural food for bees, hence no trouble should arise from that source. Did bees never perish when left to "their own sweet will." in all forcible; but when undisturbed by man's reason, the bees meet an un-timely fate, it is evident that nature have united weak colonies in the spring and supposed that it was bet-ter to do so. Mr. Doolittle's views upon this subject, as given on page 373, are reasonable. I think that this is one of the best articles that Mr. Doolittle has given us for sometime.

Swarming Fever. - H. H. Flick, Lavansville, 9 Pa., writes:

The season thus far has been good. The clover yields honey in abundance, and the bees are in good condition. 1 have been experimenting for a number of years to prevent swarming, and I have succeeded to a certain degree. I have settled wintering long ago. Now, if I can fully control the swarming impulse, bee-culture will be very much pleasanter and more profitable. It can then be reduced to a sure thing, all except the weather governing the honey-flow. I have always found a flow of honey sometimes during each season, and if the bees are then in good condition they will get a good supply.

Returned Swarms. - L. T. Hill, Canton, Dak., on June 20, 1886. writes:

On June 7 I had a second swarm of bees come out, and in their flight passed over the hive that contained the first swarm that came out, and about one quart clustered on the front of the hive and on the ground in front, and went into the hive. After watching them for awhile I upticed a few bees flying about 40 feet beyond, and, after looking there, I found the swarm. I thought when I saw them clustering on the front of the hive that they were the swarm. On the 8th of this month a neighbor had a swarm come out and cluster; he hived them, and in about half an

Such a fence as mentioned might be hour they came out, and followed the bank of the Big Sioux river, and went on over the river and across the prairie into Iowa. They were gone about two hours and returned and clustered within 20 feet of where they did the first time. He put them into the same hive, and they remained. Has any one noticed similar cases ? Bees have done remarkably well here since the first of May; never have done better in this county.

> Home Market for Honey.-C. W. Dayton, of Bradford, & Iowa, on June 15, 1886, writes :

I shall not neglect my home market; A large share of my nome market; that would be money out of pocket. A large share of my tast year's crop was sold in ½-pound and I-pound tumblers at a net price of from 11 to 14 cents per pound, and this season I will sell all I can produce in that way. Nice, clear houey in small glasses, having a small but showy label, is the best ornament with which enterprising grocers can ornament their showcases, as its coming between the ob-server and the light it appears much more beautiful than gold itself. City folks like nice things, so I am going round price in glass jars. I cannot now call to mind but one store where I could not make a sale of some of these packages. There are three-story hives in my apiary containing 30 combs that are entirely filled with brood and honey; ready for a fourth story. Last year at this time I had to feed my bees to keep them from starving. The honey-flow began on June 7-ten days earlier than usual.

Making Division-Boards, etc.-6-J. M. Dondna, Alexandria,+o Minn.,

on June 11, 1886, writes:

I put 58 colonies in the cellar on Nov. 1, 1885, and took them ont on April 20, 1886, without the loss of one. I united four weak ones; the balance were in splendid condition-not a case of diarrhea among them. They had natural stores. Only a few had any brood in the combs. The season has been very good thus far. I had 2 swarms on May 22, and about 40 up to this time. I notice E. B., in Query, No. 261, wants to know how to make a division-board. This is the way I make it: Cut a %-inch board % of an inch shorter than the hive, and as deep as the frames below the top-bar. Nail a flat top-bar on this, and get thin cheet rubber, such as is sold for steam packing; it is about 1-16 of an inch thick. Cut it in strips ½-inch inen thick. Out it in strips ½-inen wide. Tinner's squaring shears do it nicely. Nail it on the side of the board, letting it project ¼ of an inch. Lay a fold of eloth on the top and put on the honey-board. The rubber will cost less than one penny for each heard and in generating the solution board, and is far superior to old rub-ber boots. The prospect for basswood bloom is very good.

# Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 10 a. m., June 28, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

### CHICAGO.

HONEY.-Honey of all grades sells slowly at present, and prices are weak-14@15c. being the outside figure for best comb honey. Extracted is in light demand at 5@7c. Californis comb honey, in 2b. sections, 9@12c. BEESWAX.-25c. for good yellow. R. A. BURNETT, 161 South Water St.

### NEW YORK.

NEW YORK. HONEY.-We now quote : Fancy white comb in 1-ib. sections, 12@13c.; in 2-ib. sections, 9@10c. Fancy buckwheat honey io 1-ib. sections, 90; iu 2-ib. sections, 70%C. Off grades 10%C. per lb. less. Extracted, white,60%7c; buckwheat, 50%5%C. Cali-fornis, 50%60; Southero, as to color and flavor, per gailon, 50%60; BEESWAX.-2762%C. MCCAUL & HILDRETH BROS., 34 Hudson St.

#### BOSTON.

11ON EY.—One-lb. sections, white clover, 13@15c;
 2-poind sections, 11@13c. Extracted, 6@8c.
 BEESWAX.—25 cts, per lb.
 BLAKE & KIPLEY, 57 Chatham Street.

#### SAN FRANCISCO.

HONEY.—The first new comb honey of the sea-son-a sample lot of extra choice-brought 14 cts We quote : White to extra white comb, 11014 cts; amber, 7610c. Extracted, white liquid, 4½63cc; light amber colored, 4 to 4½c; dark amber colored, 3½ to 3¾ cts. BEESWAX.—Quotable at 20 to 24 cts. 0. B. SMITH & Co., 423 Front Street.

#### DETROIT.

HONEY,-There is a little new honey in the market, and is selling at 13 cts. for white in 1-ib. sections. The demand is limited, however. BEESWAX.-Firm, at 25 cts. per pound. M. II. HUNT., Bell Branch, Mich.

#### ST. LOUIS.

IIONEY.—Choice comb, 10@12c. Strained, in barrels, 34@4c. Extra faney of bright color and in No. 1 packages, ½ advance on above prices. Ex-tracted in barrels, 5@5%. Fermepted goods, 2½@3c BEESWAX.—Firm at 22c for prime. D. G. TUTT & CO., Commercial St.

#### CINCINNATI.

CINCINNATI. HONEX.—The demand for extracted honey has been very light of late, but it seems to be improv-ing gradually for manufacturing purposes. There is considerable honey in the bands of commission merchants, and prices are very low—3% to 7 cts. per pound is the range of prices. Prices of comb honey are nominal. BEESWAX.—Arrivals are good and the demand fair. We pay 18@22. for fair to choice yellow. C. F. MUTH & SON, Freeman & Central Ave.

### CLEVELAND.

HONEY.-Within the last two weeks honey has not sold so readily, owing to the near approach of the new crop and the uncertainty of the new pri-ces. Best white, 1-1b, old honey moves slowly at 14 cts.; no demand for 2-1bs. Extracted, 6@7c. BEESWAX.--22 to 25c A. C. KENDEL, 115 Ontario Street.

#### KANSAS CITY.

KANSAS CITY, HONEY.-Seles of comb are good, while extrac-ted is very duil and low. One-pound sections are scarce; stocks of all other grades are well supplied. Calif, 2-lbs. bring 11@12c.; Eastern 2-lbs. 12@13c.; 1-lbs., white, 14@15c.; dark, 12@13c. Extracted. 5@R6c; Southern, 32@4c. BEESWAX.-23c. CLEMONS, CLOON & Co., cor, 4th & Walnut.

#### MILWAUKEE.

HONEY.-The market seems quite dull for all qualities of comb honey, with but a moderate de-mand for extracted. We quote : Cbnice, white 1-lb. sections, 17:418c.; the same in 2-lbs., 16@17c.; dark 2-lbs., 15@16c. Extracted, white, in barrels or kegs, 7@8c.; dark, in ssme packages, 6@7%c. BEESWAX.-24@25c A. V. BISHOP, 142 W. Water St.

### SAN FRANCISCO.

SAN FRANCISCO. HONEY.-Heavy arrivals and a weak market is quoted. Competition is confined to sellers. The choicest extracted is being offered at 4%c, and comb is being urged to sale at correspondingly low figures. There are very few buyers, and none show a disposition to purchase in a wholesale way. White to extra white comb, 9@12c; extracted, white liquid, 4e44/c; light amher colored.3%4%c.; BEESW AX.--200e23c. SCHACHT & LENCKE, 122-124 Davis St.

<sup>137</sup> The next annual meeting of the Michigan State Bee-Keepers' Association will be held to Ypsilnuti, Mich., on Dec. 1 and 2, 1886. II. D. CUTTING, Sec.

Issued every Wednesday by

THOMAS G. NEWMAN & SON, PROPRIETORS.

923& 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN, BUSINESS MANAGER.

Special Notices.

To Correspondents. — It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

1

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to de withent it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions—with \$4.00 direct to this office. It will pay any one to devote a few hours, to get subscribers.

Our New Catalogue of Bee-Keepers' Supplies for the spring of 1886, is issued, and will be sent to any one desiring a copy. Send name and address, plainly written, on a Postal Card for it.

"Don't Stop "—that is what many write to us about their papers, when their time is nearly ont. One subscriber says: "This has been a year of disaster, and it is not convenient for me to send yon the money now to renew my subscription. It runs out with this month; but don't stop sending it. 1 will get the money to you within three months." Such letters are coming every day, and so for the present we have concluded not to stop any papers until requested to do so.

Foundation, Cheap.—We have about 75 lbs. of Comb Foundation for the Brond-Chamber, 4x16½ inches, which we offer at 35 eents per pound. This is an odd-size let of our regular "Dadant" stock.

Italian Queens.—We can supply them by mail, postpaid, at the following prices : Untested, \$1.00; Tested, \$2.00; 6 Tested Queens for \$9.00.

# Create a Home Market.

W To ereate Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and seatter them plentifully, and the result will be a DEMAND for all of their ereps at renuncrative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 cts.; per doz., 40 ets.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; er 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the beekeeper who scatters them).

To give away a copy of "Honey as Feod and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Now is the Time to Join the Union. —Let every beckeeper send for a eopy of the Annual Report and a Voting Blank—fill lt up, and become a member. It is to the interest of every one to do so. The dues are only 25 cents a year; and it is intended only to call for one assessment (of \$1.00) cach year. Send to this office for the Report and Voting Blank.

Job Lot of 2-lb. Sections, Cheap.-See our offer of a job lot at \$3.50 per 1,000, on page 416. If you can use this size of section, there is a bargain for you. They can be shipped the same day the order is received.

-----

**Red Labels** for one-poind pails of honey, size  $3x4^{1}$  inches. — We have just gotten up a lot of these Labels, and ean snpply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apiarist printed on them—by mail, postpaid.

**Special Sizes of Sections** cause much confusion; and if such luxuries are indulged in they should be ordered long before the "rush" comes, in May and June. Special sizes cost more, and when ordered during the "rush," create considerable dissatisfaction by the consequent delay in getting them made. We have a lot of special sized two-pound sections 5¼ inches high and 6 inches wide, narrow tops, and square groove, which we can ship instantly at \$3.50 per 1,000. They are 7 to the foot.

To any One sending us one new subscriber with their own renewal (with \$2.00), we will present a copy of the new "Convention History of America."

The Convention History of America and the AMERICAN BEE JOURNAL for one year, will be elubbed for \$1.15.

287 The Illinois Central Bee-Keepers' Association will hold its next meeting at Mt. Sterling, Ills., on Tuesday and Wednesday, Oct. 19 and 20, 1886. J. M. НАМПАЧОН, Sec.

# **OUR CLUBBING LIST.**

We supply the American Ree Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

Price of both. Club The American Bee Journal ......100..

| and Gleanings in Bee-Culture2 00 1 75 |

# System and Success.

**C**<sup>T</sup> All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

| For | 50 eolonies | (120 pages) | \$1 00 |
|-----|-------------|-------------|--------|
| 44  |             | (220 pages) |        |
| 44  |             | (420 pages) |        |

The larger ones can be used for a few eelonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

**Simmins' Non-Swarming System** is the title of a new English bee-book. The author claims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based npon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can new be obtained at this office.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides their own, with \$3, for one year, we will present a copy of this valuable book.

THOMAS G. NEWMAN, EDITOR.

Vol. XXII. July 7, 1886. No.27.

Something Beantiful has vanished, And we sigh for it in vain; We behold it everywhere, On the earth, and in the air, But it never comes again.

**Honey** and flour made into a salve is an excellent remedy for boils.

Latest French Statistics on bees and beney are for 1881. Then there were 1,669,-759 colonies of bees in France, and the houey product was about 18,000,000 pounds. Wax 5,500,000 pounds. Value 16,500,000 francs, or \$3,000,000.

**Concerning** our pamphlet entitled "Honey as Food and Medicine," Mr. Samuel Simmins, of Brighton, England, writes : "I do not think you can claim too much in regard to the vast amount of good that pamphlet is doing, and iikely to do, for the honey trade." Employ it to build up your home market.

-

Mrs. L. Harrison, of Peoria, Ill., writes us that she has been an invalid for a month past, suffering severely with a diseased condition of her cars and head. It must be very annoying for such a "busy" worker to be unfit for duty in this the busiest season of the year—in the apiary. The BEE JOURNAL hopes for her full restoration to health in a short time.

**Honey** is an excellent palliation in eoughs, colds, sere throat, baby sore mouth, and early stages of diphtheria.

Use of Honey in Cholera Times.— In the Bulletin de la Societe d'Apiculture de la Somme, J. B. Voirnot says the constant use of honey is without the slightest danger, even during an epidemic of cholera. He says :

Honey prevents or cures constipation. The formic acid which honey contains makes it useful in affections of the mouth, throat, organs of respiration and chest. Professors, and all who have to speak in public, should consequently make frequent use of honey. It is also good for colds, coughs, hoarseness, quinsy, pulmonary affections, eatarch and asthma. A little goose-grease mixed with it adds to its curative properties.

Another Triumph.—Our readers will be pleased to learn that through the united efforts of Prof. A. J. Cook, Hon. Edwin Willits, and the Manager of the National Bee-Keepers' Union, the serious difficulty mentioned last week has been overcome, in reference to transmitting attending bees with queens through the United States mails.

On the first of July we received the following letter from the General Superintendent of the Railway Mail Service :

To Thomas G. Newman, General Manager of the National Bee-Keepers' Union :

Sin-Yours of June 25th regarding the admission of queen-bees to the mails is at band. I am happy to inform you that the regulation will, in the next monthly Postal Guide, be modified so as to read "queenbees with necessary attendants." This, it think, will obviate the difficulty. The matter has been brought to the attention of this office by the postmaster at Griffin, Ga., and he has been advised of this modification. JNO. JANESON, Gen. Supt.

A similar letter was sent to the Hon. Edwin Willits, and in reference to forwarding queens to Canada, Mr. Jameson replies as follows :

# HON. EDWIN WILLITS :

SIR-III regard to forwarding queen-bees to Canada, this office, of course, has nothing to do. I see no objection to the postmaster at the mailing office receiving them for such dispatch, and if the Canadian authorities see fit to receive them, this office eertainly has no objection. This question has been referred to the Superintendent of Foreign Mails. JNO. JAMESON, Gen. Supt.

Prof. Cook sent us the above letter on July 1, 1886, and then added :

DEAR MR. EDITOR—We are triumphant again, you see ! I think this very satisfactory. Yours truly, A. J. Cook.

Again we score a victory for the National Bee-Keepers' Union ! and exhibit another benefit secured to bee-keepers generally by its effort ! No individual bee-keeper could have accomplished what has just been done by the Vice-President, and the Gen. Manager of the Union, assisted by Pres. Willits, the personal friend of Vice-President Cook.

And yet there are some who inquire— "What good will the Union do me?" Others aver that the Union is of no benefit to them, and selfishly refuse to become members. In the face of the showing for last year's work, which we gave—and the accomplishments of the present, we are ashamed to state that only 4 new members have joined the Union during the past month.

Those who supinely fold their arms and selfishly refuse to aid a Society created solely for their benefit—are—are—(we were about to use some strong adjectives—but upon second thought we will add that they are), to say the least, standing in their own light, and unworthy of the name of progressive and patriotic apiarists. There ought to be a thousand now members where there has been one. Now what shall be the result during July? Let us see.

We have not yet received a reply to our letter to the Superintendent of Foreign Mails. We will publish it as soon as it is received. From the foregoing note to President Willits, we see no reason why queenbees cannot be forwarded to the Canadian lines, and if they are received by the Canadian postal authorities, there will be no trouble but we await results.

**To Prevent Robbing.**—Mr. J. Halter, in the *Bienen Zeilung*, gives his method. By the use of glass over the entrance he deceives the robbers. He says:

After trying the nsual methods to stop it, when, owing to extracting, robhing had been going on rather extensively, and these remedies failed, he succeeded in putting an end to it in a very simple manner. He placed a piece of window-glass, about 8x5 inches, in front of the flight hole, the top resting against the hive, and the lower end about 1¼ inches from the entrance, so as to enable the bees of the hive to go in and out at the sides. The next morning the robbers made an attack on the hive in great numbers, but going straight at the entrance were stopped by the glass. They swarmed in front of the glass, but could not find the entrance at the sides, and very soon returned in digust. To effectually put a stop to further robbing the glass shuld be allowed to remain for several days, until the robbers forget the spot.

The Calcdonian Aplarian Society will have a Bee and Honey Show at Dumfries, Scotland, on July 27-30, 1886. Prizes are offered on bees, hives, comb foundation, honey, honey drinks, honey cake, honey plants, etc., under the able management of Mr. Robert J. Bennett, 50 Gordon Street, Glasgow, Scotland, who has for years been the honorary secretary. It will doubtless be, as usual, a grand success. We remember with pleasure the exhibition of this Society in 1879, when we were there, and made many friends.

Mr. J. N. Arnold, of Richmond, Iowa, has written to Hon. A. J. Baker, Attorney General of Iowa, for his opinion as to whether bees are taxable in that State, and here is his reply :

.....

I am not permitted to give you an official opinion any more than a judge of a court would be to give an individual an opinion on a matter that might come officially before him for adjudication.

him for adjudication. Look in Sec. 1, Acts. of 15 General Assembly ; see McClains Code, 1st Vol., page 189 and 190, and at subdivision 4, and you will see what private property is exempt from taxation. Bees are not included in it. The question is, are they property? I guess if some man were to steal yours, you would insist they were. Yours truly, A. J. BAKER.

**Congress and Adulteration.** — The *Anti-Adulteration Journal* makes the following very sensible remarks on this subject, and we fully endorse them :

There is no use of so much difference of opinion in Congress, as to the kind of legislation needed. There is but one just demand and that is the passing of an act that will fix a standard for all pure productions, and the enforcement of all producers stamping such articles with a stamp supplied by the goverument.

The impure articles should only be allowed sale, if wholesome; injurious preparations should not be allowed sale under any eircumstances for food. All stamps should be supplied at merely cost of printing,

The way to suppress an injurious food is not by high tax stamp, but by actual prohibition of sale. To prevent fraud, simply provide inspectors to supervise production and sale, and arrest and punish all faise stamping of foods.

There is certainly nothing in the Constitution denying the general government the right to pass such law. The States can pass whatever local law is necessary, and Congress can pass such general law as is necessary. On so vital a question there can be no conflict.

# Replies by Prominent Apiarists.

It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-ED.]

# Management for the Most Increase.

Query, No. 274.-I wish to work all my hees for all the increase possible this summer, and not interfere with my honey crop any more than can be helped. I have built up as many 3-frame nuclei as I have heavy colonies, which now have young queens about ten days old. If by giving the parent colonies one of these queens immediately after they swarm, would it keep back afterswarms, and get the larger crop of honey by so doing? By building up my nuclei again I would get two swarms from one colony .- A.

For this locality your plan would work well, provided you was careful and cut out all queen-cells .-- II. D. CUTTING.

You cannot expect much clover honey from a colony that has swarmed. The giving of queens to the strong colonies might help them for the fall crop, however.-DADANT & SON.

I think that it would be as well to let colonies take their usual course, and build up nuclei into strong colo-nies as rapidly as possible without reducing colonies.—A. J. COOK,

Much depends upon the locality as to management for honey. In my locality it would be bad policy to make nuclei as early as you have done. I should *guess* that in some cases giving a young cucon to the cases giving a young queen to the parent colony would prevent after-swarms; in others not; but I have had no experience.—C. C. MILLER.

Not where I live. Build up the nuclei to full colonies, and allow but one natural swarm from each full colony, hiving the swarm on the stand of the old colony; move the old colony to a new stand, and let them rear their own queen. This is applicable to this locality.—G. M. DOOLITTLE.

In a good honey-flow like the pres-ent, the bees will not allow a queen, either fertile or unfertile, to destroy cells, whether sealed or unsealed. But if the new colony be placed upon the If the new colony be placed upon the old stand, the queen given to the old colony may be allowed to tear down the cells, and she will certainly do it if a large part of the bees be shaken down in front of the new hive on the if the result of the new hive on the this case the queen may be given at if. D. CUTTING.

any time. With a contracted brood-chamber and the use of perforated zinc this latter procedure is one of the very best in working for comb honey. -G. L. TINKER.

I should never give a parent colony a queen immediately after casting a swarm. The colony needs the short absence of a queen. The hive is full absence of a queen. of brood when the colony swarms. It would not prevent after-swarming, as a rule, unless all queen-cells were de-stroyed. You can successfully build up the nuclei.-JAMES HEDDON.

It would, in this locality, usually prevent after-swarming, but would not be the means of securing any larger crop of honey, than would the practice of what is called the "Hed-don method;" while it deprives the uclei of their queens at a time when they can illy afford to spare them.— W. Z. HUTCHINSON.

It is difficult in any given case to advise. In my own locality 1 should give all the room that could be used, and return all swarms that issue; leaving the matter of increase of bees till the honey season was over. Other localities may demand different methods. Test the matter in the light of precedents given in the BEE JOUR-NAL during the last four or five years. -J. E. POND, JR.

# Queen Laying Many Eggs in a Cell.

Query, No. 275 .- A weak colony lost its queen in March. They reared a very nice, large queen which commenced laying late in April, from 1 to 6 eggs in a single cell. Bees eovered only two frames. What is the eause, and what is the remedy? Will this queen become all right as she gets older, and the colony becomes strong in bees ?-J.R.

If not a drone-layer, she probably will.-G. M. DOOLITTLE.

The queeu is probably unfecundated and should be superseded by a good queen.-G. L. TINKER.

Very likely when there are bees enough, you will find that you have an excellent queen.-C. C. MILLER.

There were probably too few bees to care for all the eggs she laid, and the best she could do was to put sevseral in a cell. She will probably be all right as the colony becomes stronger.—W. Z. HUTCHINSON.

I guess that she laid thus irregularly because she did not have room within the limits of the warmth of the bees to engage her time. In such a case I never "jump at a conclusion." When the bees begin to seal the brood is time enough to judge of the worth of a young queen under such circum-stances.—G. W. DEMAREE.

Probably this queen was reared at a time when no drones were flying, and did not become fecundated. The remedy is to give the colony a fecun-dated queen at once, as the one mentioned will probably never become fecundated.—J. E. POND, JR.

That queen has more eggs than she had room for. She is a good queen. A queen will never lay outside of the cluster in cool weather.—DADANT & SON

She may be a drone-layer, or may be she is all right, and behaves as she does because of the small size of the colony. I would give brood from other strong colonies and watch the effect.—A. J. COOK.

Usually the cause is a lack of bees to keep a prolific queen's eggs warm, this is your case, the queen is all right—a good one.—JAMES HEDDON.

# Re-Waxing Honey-Barrels.

Query, No. 276 .- Would you wash out and re-wax extracted honey barrels before re-filling with this year's crop ?-G. D.

I do not think that I should, if they have been kept clean, and are sweet. -A. J. Соок.

Not if tight, sweet, and clean, and the same kind of honey is to be put in them.—G. M. DOOLITTLE.

I would wash them out, but not wax them. I would not use a barrel that needed waxing.-W. Z. HUTCHIN-SON.

I should, most certainly. It will be necessary to dry the insides thor-oughly before re-waxing. — J. E. POND, JR.

Give your barrels a good washing, put a light in at the bung and ex-amine; if you find them well coated, all is well.—H. D. CUTTING.

No, if they are all right and did not leak. We never wash them, but bung them up light when empty.— DADANT & SON.

I would wash them out, if needed, but I would never was barrels for honey. It costs too much. If they will not hold honey without waxing, "wax" your cooper.—JAMES HED-DON.

I would scald and wash out any vessel that had been previously used for honey, but I would buy good barrels that do not need waxing. It is expensive to wax barrels; besides, a barrel that will not hold without waxing, is not entirely safe when waxed.—G. W. DEMAREE.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample eopies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

Explanatory .- The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is located near the center of the State named;  $\delta$  north of the center;  $\hat{\gamma}$  south;  $\hat{\varphi}$  east; \*O west; and this 6 northeast; \*O northwest: • southeast; and 9 southwest of the center of the State mentioned.

For the American Bee Journal.

Fenced Bee-Yards, Making Reports, etc.

# W. H. STEWART.

On page 720 of the BEE JOURNAL for 1885, Mr. Tiffany asks Mr. L. C. Root to describe a tight enclosure for a bee-yard. In reply Mr. Root said : "I would say that the fence around my yard is 8 feet high, and close to the rear of hives. If the fence is in front of the hives it should be several feet from the front row. If the location is in a very bleak place, I would have it higher. It should be made of matched boards, or battened to make it tight."

My opinion is, that such a fence would at times be of advantage to the bees, and at other times a great disadvantage, and, all things considered, it would be much better than if no fence of any kind were within 50 feet of the bives. If a tight, 8-foot fence was placed on the north and west sides of the bee-yard, and the hives stood within 12 feet of the west fence, and they were to remain on the snmmer stands through the winter, in this climate, then the snow would drift over the fence, and bury the dives nearly or quite S feet deep un-der the drift, which would be equal to, if not better, than an ordinary cellar for the bees; but in early spring, when cold, raw winds were blowing from the northwest, and at the same time the sun was shining brightly in the forepart of the day, the warm sun would be reflected down on the hives by this tight "fence," and the cold wind entirely broken off, it would be many degrees warmer at and near the hive than 10 or more rods away in either direction; this would be the case also with bees that had been wintered in the cellar, after they were put out in the spring.

This state of things would deceive the bees; they would think that the weather (or temperature) was the same throughout their flying distance, as it was in their cozy shelter : thus they would venture out when it was barely warm enough at the hive to they would be caught by the cold blast, and in a moment be chilled and fall to the ground to rise no more, Thus a good colony could be depleted methods of management, the winter periments and observations; but I

50 per cent. in one day; and, be it remembered, that in such case it is the best colonies that thus stir out first, and the most, and also the most healthy and energetic bees of any colony that work earliest and latest; and the bees that would thus be lost ore the work effort are the ones that we can least afford to lose.

Again, in a hot July day, when basswood is in bloom, and we want all surroundings arranged to the best possible advantage in order that the bees may do the greatest possible amount of labor, this tight fence would shut off the refreshing western breeze (that is of great advantage to bees as well as men), and instead of storing and sealing honey, many of them would be compelled to lay idle on the outside of the hive.

Mr. R. says of such a fence, "if in front of the hives, it should be several feet from the front row." The reason for this is, no doubt, that the head would not be accounted to the bees would not be compelled to rise so directly upward to scale the fence; but the truth is that bees do not always start out for stores in the same direction that the hive fronts. It makes not a particle of difference with the bees which way the hive fronts after they are well out of it, on starting out for work.

My bee-yard slopes to the south and east, and the hives front in the same direction; the basswood is northwest, and as the bees leave the hive they start immediately northwest; thus if I had such a fence at the rear of the hives, it would hinder them more than

if it were in front. Furthermore, if bees are wintered on the summer stands, and are near this fence on the south side, the snow would not, in this locality, form a drift to cover the hives, and the reflected sun, as above mentioned, would lure the bees out in bright, winter days, when the cold at a few tcet distance from the hives would teet distance from the nives would chill them. It is true that during severe cold and windy weather in winter, the hive would be protected from the wind; but bees in a good hive do not feel the winter wind, and the degrees of temperature are the same, wind or no wind.

True, this fence would be a barrier to thieves, but a barb-wire thickly woven would be cheaper, more desirable, and out of the way of the bees.

# HOW TO MAKE REPORTS.

Away back in the BEE JOURNAL for 1883, page 287, I gave my idea of the proper and improper manner of making out annual reports by beekeepers. When I wrote that article I felt quite confident that the frater-nity would try to profit by the hints thrown out. I have read the BEE JOURNAL closely ever since, and have been able to find nothing on that subject.

For many years previous to the writing of that article, bee-keepers generally had suffered heavy winter losses, and I foresaw then what I now see is a matter of fact, namely, that from the loose and indefinite manner in which all were reporting their

ing problem would never be solved. Losses of the following winter were greater and more general than during any other winter for 43 years that had been wintering bees. slow progress indeed! This is

In my article I stated that "to us it seems impossible to get a full and correct statement of our condition, products and prospects in any other way than to get a full and correct report from each individual engaged in the business.... To be useful, a report should embrace an experience for at least one whole year; not only so, but that year should begin and end at such dates that we could learn from it what effect such and such management through the spring, summer and fall had on the bees during the winter; and the manner they were wintered."

I am now well satisfied that if the plan of making out reports that I there gave, had been carefully carried out, we could, from the reports that would have been given the following spring, have learned very nearly, or perhaps exactly, what was the prime cause of the great loss; but now the truth is that bee-keepers as a mass are literally confused on that subject.

Last spring the oldest and most experienced were as much in the muddle as the novice ; and since that time more brain power has been expended in the attempt to solve the problem than on all other matters concerning apiculture. My opinion is, that the fate of the bees was fixed before they went into winter quarters.

It will be remembered that in the fall of 1884 many bee-keepers in dif-ferent localities reported that the fall crop of honey was short, and in many localities an entire failure. Where such is the case it is well understood that breeding was discontinued early, and in such a case very few, except old bees, go into winter quarters; and in late winter and early spring the mortality must be rapid and unavoidable.

Now, if we could know by such re-ports as I have snggested, where the fall crop was a failure, and where a and the failure, and who was wise enough to feed all through that scarcity of honey, in order to keep up breeding; and in each case whether the mortality was greatest where breeding in the fail was least, then we would be able to decide whether one theory (*i. e.*, all old bees) was the cause of the loss or not. Many now believe with me, that that was the cause, but cannot prove it, from the

fact that we have not the reports. Some have said that they believed that old bees were as good as young ones to go safely through the winter and spring. If I should write such things, I would expect others to accuse me of having a desire to ruin all except myself.

### WINTERING-HIBERNATION.

On page 5 is quite an interesting article from Dr. G. L. Tinker. Mr. T. makes some good points, and I wish to thank him for giving us a detailed account of his careful ex-periments and choceneticaet but J.

cannot quite agree with him in all of his conclusions. He says: "I am now able to say that if we ever ex-pect to winter bees scientifically perfectly—we *must* provide them with conditions and surroundings that they may hibernate." (Italics are mine.) In another paragraph he says: "My belief is that we shall not be able to winter bees perfectly until we shall master the problem of hibernation until we shall secure to them that perfect rest, etc." It seems to me that "perfect rest" would be absolute death.

Again he says: "What hiberna-tion is, and how it can be secured, will appear from the following." He then gives a detailed account of his experiments and observations, which being summed up amounts to about this: If bees can be placed in a cellar where the temperature is and con-tinues at  $41^{\circ}$ , they will "hibernate" and enjoy "that perfect rest," and winter "scientifically and perfectly."

The following are some of my reasons for thinking that the Doctor has not as yet discovered the plan of wintering bees that will give perfect and certain success:

When I built my bee-cellar in a sandy hill, it was made deep enough to have all the bees below the natural surface of the earth. It was then covered first with oak poles; then 2 feet of dry straw; next 2 feet of sand; then I foot of straw, and finished with 2 feet more of sand. When the bees 2 feet more of straw, and missied with 2 feet more of sand. When the bees were in this cellar the temperature was invariably 45° for the three first winters, one of which was extremely cold, and another very mild and open; the third about an average. Through these three winters I had from 80 to 180 colonies in this cellar, and not a single one was lost, except 2 that starved. Then came the winter of 1884-85, and by this time the straw in 1884-85, and by this time the straw in the roof had decayed, and the maked sand came down on the poles. The weather became very cold soon after the bees were placed in the cellar, and the covering of sand froze solid all the way through. The cold, frozen under-surface of this sand roof so re-duced the temperature that the mer duced the temperature that the mercury stood at 41° without change until March. (I have a thermometer hange infing on a string that I can draw up through a small pipe ventilator in the roof at all times. I watch this closely.)

When the bees were put in, in November, they were warm enough to make lively movements, and if Mr. Tinker is correct in his conclusions, Tinker is correct in his conclusions, then those 200 colonies should have hibernated in a few hours, and have remained in "that perfect state of rest," and should have wintered "scientifically-perfectly," till breed-ing, at least. But the fact is that out of the 200 colonies only 50 came through alive, and all were poor, puny, weak things—hardly worth the trouble and care to "pull them through."

The three preceding seasons had given our bees a good flow of fall? honey, and breeding had continued late, which gave a plenty of young bees for winter and spring; and in

addition to successful wintering there

was no "spring dwindling." In the fall of 1884 our bees got no fall honey, and breeding was discontinued early, and bee-death came early also. There is nothing like young bees for wintering and for the spring.

It is my opinion, that in the nature of things, all attempts to keep a beecellar at a temperature of 41° through the winter will be a failure; thus, if Dr. Tinker's theory should be true, it is not practical; and if not practical, Is not practical; and if not practical, and if, as he concludes, we will never be able to "winter bees scientifically —perfectly," until we are able to "provide them with conditions and surroundings"— 41°—that they may hibernate from the beginning of winter to the time to begin breeding, then it follows that we must give up in despair and never expect to winter our bees successfully.

Bee-Keeping for Women, etc.

# MRS. MAHALA B. CHADDOCK.

Bee-keeping is too hard work for women-I have said it before, and I say it again. When I say women, I mean, of course, American women. German and Swede women can keep bees-they can do anything that requires lifting; American women cannot. All American women have a tendency to heart disease, consump-tion, or kidney disease, and carrying bee-hives and boxes of honey is not good for any of these diseases.

good for any of these diseases. Mrs. L. Ilarrison employs Irishmen to do her lifting; Mrs. St. Julienne Moore, of Louisana, bas colored women to help her; the Linswik sis-ters hoist the hives around some how and get along. I am always watching and waiting to get some man to help me carry hives and honey. I have no Irishmen and no colored women, and the men are always have. I want the the men are always busy. I want the old colonies carried away just when the bees are working most briskly, and that is just the time that the men are away off in the fields.

are away off in the helds. Yesterday evening I wanted some honey taken off, but there was the hay to get in, and everybody was just as busy as they could be. I took off the forty-pound boxes, and as I could not carry them to the house, I rolled them (if that is the proper thing to say of a square box) all the way to the boxes litted them in and lat the heas house, lifted them in, and let the bees go out. I always put my honey-boxes on the floor close to the screen-door in the dining-room, and as fast as the bees gather in bunches on the screen, I brush them out with a whisk broom. Once last year I took off several boxes of honey at one time, and as the day was cool the bees became chilled after leaving the honey-boxes, and fell down inside the screen-door, looking down inside the screen-door, looking just like dead bees. I gathered up a gallon and put them in the cages that the bees were shipped in, and laid them on the chimney over the kitchen stove; in two hours they all revived, when I gave them to a colony.

I have been hiving my bees in empty hives, a la Hutchinson, all but the one comb of brood that I put in the centre, and I am getting a splen-did lot of drone-comb. They seem to build drone-comb for about four days, after that they settle down to build-ing worker comb. I take out all sheets of drone-comb and hang them in the upper story of a Simplicity hive, and let them fill it full of honey. I have three of these completely full now. This honey I will sell or use at home, as it is not in shape to sell, and I have no extractor.

Bees are working on red clover now; the honey is better than the white clover honey, to my taste. Is it a fact that flowers do not secrete nectar when the nights are cool? I notice that Mrs. L. Harrison gives that as a reason for the nectar not coming in. Now, I am very loth to dispute anything that a noted bee-keeper says, but *it is a fact* that we have had hot days and cool nights ever since the white clover bloomed, and my bees have gathered and are gathering honey right along. Perhaps the wetness or dryness of the atmosphere has something to do with it. If it is cool and wet the chemicals do not work right, but if cool and dry they do. We have had dry weather only one good rain in six weeks.

# Horses and Bee-Stings.

### WM. MUTH-RASMUSSEN.

The following article from the San Francisco Chronicle of June 17, will, no doubt, be of interest to readers of the AMERICAN BEE JOURNAL:

It is a very common occurrence to hear of horses being stung to death by bees. All bee-keepers know that the little insects have a peculiar aversion to the odor of the stable, and for this reason they are obliged to exercise great care in going near the hive after handling a horse, as they are almost sure to be badly stung should there be any of the odor of the horse observable. Horses going near the hives, especially if in a state of perspiration, are particularly susceptible to attack, and the result is almost invariably death. A correspondent of the San Diego Union offers a valuable suggestion, founded upon his own experience, on this point. A swarm of bees at-tacked a valuable horse and stung him in a terrible manner, so that the animal rolled upon the ground in his agouy. A smudge was made with damp straw, and the bees thus driven away from the horse. Then the ani-mal was given a good dose of laudanum-several tea-spoonfuls altogether num-several tea-spoon its artogetter —and in this manner the pain was considerably relieved. If soon re-covered sufficiently to be taken to the stable, and was then thoroughly sponged with a strong solution of common baking soda and water. This was repeated, and the result was the avimal entirely recovered, wherethe animal entirely recovered, where-as if this treatment had not been

adopted he would unquestionably have died. While the soda is an excellent remedy, perhaps a better thing to have used would be a solution of ammonia. It is well known that a little of this will quickly relieve the pain when a person is stung, and it would doubtless act much quicker on the horse than would the soda solution. However, either is good, but the application of laudanum to quiet the suffering animal seems to be a novelty in veterinary practice.

Cayuga Advocate.

Haldimand Bee-Keepers' Convention.

The Haldimand Bee-Keepers' Association met at Hagersville on Saturday, June 5, pursuant to adjourn-ment. The minutes of the last meeting were read and approved.

The President expressed himself in favor of natural swarming; if increase was desired, dividing was the most rapid plan, providing queens were given to the new colonies.

Mr. Armstrong said that if increase was desired, artificial swarming was the way to do it, but it was necessary to rear good queens for the new hives, or buy them; he preferred artificial swarming, as it could be done when convenient, and obviated the necessity of watching the hives to prevent swarms from absconding. A good plan, if you want honey, is to allow one natural swarm, and prevent after-swarms by cutting out queencells.

Mr. Atkinson and Mr. Rose gave their plans, and approved of what had been said by the previous speakers.

The President gave his plan of dividing, which was slightly different from that usually adopted.

Mr. Armstrong took three or four frames of brood and adhering bees. into a new hive, and gave them a laying queen, and they soon became a good colony.

Mr. Smith thought natural swarming the best unless a laying queen was given to the new colony.

The President said that the best queens were reared in the natural way by the bees themselves; he had reared them both ways, and preferred the natural way, but a queen-nursery is very valuable.

Mr. Ross thought the best way was to rear queens only from the best and purest colony.

Mr. Atkinson spoke in favor of rearing queens in a two or three frame nucleus.

Mr. Armstrong described his plan of rearing queens, which is the same as that practiced by D. A. Jones, and exhibited a queen-nursery.

Mr. Jeffrey thought as good queens could be reared by the bee-keeper, as were reared under the swarming impulse.

In answer to Mr. Rose, how to winter bees, the President advocated plenty of feed, a good, strong colony, and protection from the cold weather.

Mr. Armstrong believed in plenty of protection from the cold, plenty of stores and good ventilation.

A general discussion took place on hiving swarms, and Mr. Armstrong exhibited a swarming-box he used for the purpose—a very handy and useful implement.

The statistics of those present were: 461 colonies in the fall; 330 in the spring.

Moved by Mr. Smith, seconded by Mr. Anguish, that the next meeting be held at Caledonia, on Monday, Aug. 23, at 11 a.m. E. C. CAMPBELL, Sec.

Read at the National Convention.

The Influence of Honey on Wintering.

# CH. DADANT.

Nobody will question the influence of the food on health. Plants cannot thrive in a soil unsnited to them; man, as well as every kind of animal. needs a food easily digested and able to sustain life; bees are not an exception to this rule. Nay, more than man, more than most of the animals, they sometimes eat some kinds of food which, according to circum-stances, can sustain their life or cause their death.

You have 2 colonies of bees entirely destitute of honey; you give one of these colonies for food a comb of good and well ripened clover honey; you give the other colory some molasses. Both colonies will seem to thrive equally well, if you make the experiment in summer, when they can en-joy a daily flight. But if you shut up both hives for two days, when you release them the bees of the one with clover honey will go out to void their intestines without you being able to see their feces. These will be so small, so light in color, that they will fall unnoticed, as in the every day purifying flight of a healthy colony. On the contrary, the bees of the colony fed with molasses will let large dame of dark and four matter will drops of dark and foul matter soil all the neighboring objects. If, in lieu of the two days' confine-

ment you prolong it for eight days, then, at the opening of both entrances. the bees of the colony with clover honey will act the same as after their two days' confinement, while the bees of the colony fed with molasses will crawl out, discharging their feces around the entrance; some, if not the greater part of them, will have their abdomens so much distended that they will be unable even to void their contents. These poor bees will crawl everywhere around their hive, and perish on the ground.

I can give another illustration of the influence of honey on bees during a close confinement: For years the importation of Italian queens into this country was attended with much loss; sometimes half of a shipment were alive. Such a result was then considered as a lucky one, for most of the time hardly one queen was re-ceived alive, to show that the bees were not all dead when put in the

Of course such a business was far from being prolitable, and more than one enterprising bee-kceper was deterred from continuing it, after a few trials.

What was the cause of such ill success? The main, if not at times the only cause, was the quality of the honey given to the bees for food during the journey. In Italy bees gather largely from a

diversity of plants. Persuaded that success in that branch of business was possible, I began, with my shipper, a series of experiments to ascertain which kind of honey was the best for such a long confinement. After several careful experiments during two years, we succeeded so well in the selection of honey that we have many times received boxes containing queens which had barely a dead worker bee after a journey of 22 days. Then our importing business became a success, and paid back all the money lost in seven years of un-successful importation, giving handsome profits besides. Both these illustrations show what

happened during the winter to the bees, according to the quality of the food that they have to eat.

Every bee-keeper has noticed that when, after winter, we find some of our colonies dead, if they have not starved or smothered they have perished with diarrhea, and that this same malady, it we can call it malady, has also made sad havoc in the population of some of our colonies, while some others have passed through the winter safely. I have even noticed that in such a diversity of fate, a few colonies were so free of diarrhea that I was unable to see a drop of foul matter around their hives.

Now let us see what had produced such a difference in the condition of these colonies. The indispensable food for bees is sugar, and chemistry shows that the most easily and most thoroughly digested form of sugar is cane sugar. Honey contains sugar in two different forms-cane and grape sugar. Some plants give honey with more cane, others with more grape sugar, consequently a honey contain-ing the most of cane sugar, such as clover honey, will prove more nourish-ing than fall honey, which contains more grape sugar, and leave besides in the intestines of the bees a smaller quantity of undigested residues. Our bees in winter are confined for weeks, even for months, and it is easy to understand how the colonies with good honey, having less residues in their intestines, were able to remain in good health ; while the colonies which had a poor quality of honey to eat, perished more or less rapidly, accord-ing to the quality of this honey—the bees with juice of fruits or honey-dew being ahead.

When the honey is stored in cells partly filled with pollen the bees eat some of this pollen and their intes-tines are readily filled up. The same result follows when the honey is not sealed, for, not only is it watery, but the quantity of water that it contains is increased by the property that it possesses to absorb moisture. This water accumulates in the intestines of the bees, and if they are prevented by cold from voiding it, they become

uneasy and perish. Now that we understand this, one of the causes of sickness in bees during winter, let us remember :

1. Not to remove in summer all the spring honey that the bees have stored, leaving in the hives a suffi-cient reserve for the coldest part of winter.

2. To remove all the combs containing honey stored in cells partly filled with pollen. These combs are easily found on account of their opacity. They are splendid for bees in the spring, for this mixture will incite breeding.

3. To remove all the unsealed honey that the bees will be unable to consume before winter.

4. To remove also the honey-dew,

when there is any. 5. To prevent bees going to the cider presses, or to remove the cider stored in the hive. This liquid always remains unsealed.

6. To replace with good sealed honey, or with good thick syrup all the honey taken out, so as to give to the bees sufficient provisions. The the bees sufficient provisions. The best syrup is made with one pound and one-half onnce of water for two pounds of granulated sugar.

Of course such precautions are not indispensable every winter; for a bad food can keep bees alive if they have frequent flights. Besides, as it is very difficult to follow my advice to the letter, 1 have been accustomed to awake my colonies in winter every day when I foresee that the ther-mometer will reach  $45^{\circ}$  in the shade. This precaution is especially neces-sary with chaff hives, for the sun cannot easily warm them inside. The bees, thus awakened, enjoy a good flight, and return with empty bowels, ready for another confinement.

Hamilton,+0 Ills.

Prairie Farmer. Storing Honey—Extracting, etc.

# MRS. L. HARRISON.

The best place to store honey when removed from hives, is in hot, well do, but I have none in which the honey will not in time get thin, break the capping and run from the boxes; and extracted honey grows thin and bubbling. One year, while experimenting to find a suitable place for storage, some was put in an airy chamber, some in the cellar, and a portion put on the top of a cupboard in the kitchen, where a coal fire was kept, and the thermometer at times in the shade. In the latter place, the honey kept perfectly, and in the others grew watery, oozing from the combs.

I have eaten honey gathered in the canyons of California from the cele-brated white sage, from orange groves, and cacti, but not equalling in flavor our white clover. Some bee keepers in the country, so few are join the as seasons Texas boasts of her tons upon members of the Union, is prima facie the work.

tons of horse-mint honey, and Florida a never failing supply from palms and mangroves, and yet not equalling the famed clover of the North. During a good flow of clover honey, when comb is built rapidly, it is so delicate and tender as to be almost imperceptible, and of snowy whiteness. As this honey is so fine, every effort should be made to secure as much of it as possible, and in the best shape, unmixed with other honeys. As fast as the comb is sealed, it should be re-moved, so that its delicate whiteness may not be impaired by the bees.

Where extracted honey is the pro-duct sought, the bees should be provided with clean, white comb, and uct extracted until well ripened and sealed. White clover honey, unmixed with any other, is the most delicious and healthful sweet known, and every care should be exercised to keep it intact. The uncapping knives should be clean, not stuck up with other honey, and also the extractor, and the utensils into which it is drawn. Jars are very good receptacles for holding it, and should be covered with muslin tied down closely to prevent the ingress of insects, and give it an opportunity to ripen by evaporation. If the jars are piled one upon another they should have cross sticks, not close boards to prevent the air circulating freely. Some pro-ducers say there is no need of straining the honey as it runs from the ex-tractor, as all debris will rise to the top, and can be easily skimmed off. prefer straining through cheese cloth, and when the jars are piled away, feel certain they contain nothing but pure honey—no comb nor bees. Peoria,⊙ Ills.

For the American Bee Journal. Importance of "Our Union."

# J. E. POND, JR.

I have read with real pleasure our Manager's report of the workings of the "Union" during the last year, the "Union" during the last year, and heartily concur in all that Mr. Clarke says in regard to it and Mr. Newman. I am, I must confess, however, somewhat surprised that so few of our vast army of bee-keepers have enrolled themselves under its banner. The "Union" is a means of defense; and while perhaps the many may never need its aid and assistance, no one can tell where or when a blow may be struck by our enemy.

To-day there are virtually no precedents of law, but I fear that an attempt is being made to create such. Suits will, I fear, be brought in localities where no defense will be made, and judgments given on default or for want of proper defense, that will come up in the future to work us harm.

Our aims and objects are well known, and our weakness in point of numbers is equally as well known, and the very fact that of the many

evidence that we do not take that interest in the matter that we ought, and that we may not be able to make a vigorous fight.

The moral effect of numerical strength is great, and many battles have been won by sheer force of numbers, and without striking a blow. So with us; if we can show an un-broken front, composed of a majority of the bee-keepers of the country, and cause it to be understood that each and every one of us are pledged to pull together in unison and harmony for defense of our rights, we shall bear down all opposition by this moral weight alone.

We must at all events fight every suit brought, and carry the battle if needs be to the decision of the highest courts of the land, and thus prevent the establishment if possible of any dangerous precedents. Two or three cases won against us will tend to make a law that it will be hard in the hereafter to overcome; but if we can prevent such a state of things, and by so doing show the enemy that we fight each for the other, and that the enemy of one is the enemy of all, it will cause our jealous neighbor to pause and consider the chances before he begins a suit against us.

A fight against 300 or 400 is a far different thing from one against that many thousands, and while the one might prove an easy conquest, the other would prove a disastrous defeat.

Rouse yourselves, brother bee-keepers' send in your names and of your substance, and thus make our 'Union " a sure defense.

Foxboro, o+ Mass.

Eureka Springs Daily Times. Eureka Springs, Ark., Convention.

On June 19, 1886, the bec-keepers of Eureka Springs, to the number of over thirty, met at Eureka Springs, for the purpose of organizing a bee-keepers' association.

After several addresses on the subject of bee-keeping, a constitution ject of bee-keeping, a constitution and by-laws were adopted, and the following officers elected for the fol-lowing year: President, W. F. Bragg; Vice-President, J. W. Hart; Secretary, Dr. S. S. Purcell; and Treasurer, T. F. Hawley.

The object of the association is to promote good-will among the mem-bers of the association; to exchange ideas on bee-keeping; to discuss the merits of the different kinds of flowering plants and shrubs as regards bee-pasturage, and the different kinds of hives and the manner of keeping bees through the winter.

The association adjourned to meet in August next at the call of the President. In the meantime all in-terested in bee-keeping not present are requested to correspond with the Secretary, by mail or otherwise, so that they may receive notice of the next meeting. All parties interested are cordially invited to be present, join the association and take part in

Country Gentleman.

# Bee-Keeping and Gardening, etc.

# GEO. A. STOCKWELL.

Bee-keeping has made great strides within a few years. Formerly it was not thought of, except as connected with agriculture. Apiculture and agriculture go hand-in-hand to-day, but the one has proved so remunerative that it has become a separate industry, carried forward successfully, independent, and without the aid of agriculture.

In this country to-day are more than 3,000,000 colonies of bees in apiaries, each having from a halfdozen to 1,000 or 1,500 hives. In the large apiaries extensive and costly machinery is employed to minister to the wants of the bees. If a thousand colonies be on hand at the opening of spring, a thousand new hives will be required in the swarming season. If every colony does not swarm, some may swarm twice, and a thousand hives would not be too many to provide for the season's work. In each hive will be required ten frames -10,000 in all; also two divisionboards for each hive, or 2,000; 5,000 separators, and 100,000 sections, and many other lesser instruments and aids. All these appliances are made by machinery constructed for the purpose, and apiarists whose sole industry is bee-keeping, are provided with the means of supplying themselves at first cost with all implements needed.

An apiary of 500 or 1,000 colonies is not unusual, especially in California, the land of honey, if not milk and honey, and the outlook gives the future a more promising aspect than the past had. The only check to the California honey 'yield will be the protest of the wine-growers, who claim that the bees rob the grapes. Bees cannot injure whole fruit, as they have no power of penetrating the outer covering, but they will attack unsound fruit.

Although there are 3,000,000 colonies of bees in the United States, and there may be 6,000,000, more or less, before the close of another year, yet to the great body of the people honey is a luxury, not because it is high in price, but because it is unknown; that is to say, notknown and accepted as other articles of food are. In a town of 1,200 inhabitants, a storekeeper sold less than 12 pounds of honey between fall and spring. This was due wholly to the fact that the people were unacquainted with honey, and it was proved by this fact. Later an inhabitant of this town became interested in bees, and sold in the town nearly 200 pounds of honey the first year after his apiary was started. Of course personal solicitation and push started the sale, and then the people "having a taste," wanted more, and a trade was established.

Last fall there was reported an oversupply of honey. There has never been more pure boney offered than could be sold, if means were employed to sell it, but there has been in cities

an over-supply of something called honey. In New England there are a few

In New England there are a few apiaries maintained independent of some other calling, but the interest in apiculture has increased wonderfully within the last few years. Bees have been introduced, one hive, two hives at a time, on many New England farms. This was done ostensibly "to please the boys," to keep them at home. It succeeded, and not only pleased the boys, but the old folks, too.

It is related that a farmer, outside of New England, became so much interested in apiculture, that he devoted the whole farm to bee-pasturage, and gave his whole attention to bees. But few farmers will do that, yet they are willing to give apiculture a trial in connection with some other branch of agriculture. Bee-keeping is particularly adapted to helping the small farmer, or gardener. Such workers condense labor into a small space, and can have an eye to any and every part at all times.

On a small farm, bee-keeping, if honey be the object, will be profitable and satisfactory. The outlay in labor will be very little. By this is not meant that bees will take care of themselves, although they will do so very nearly; at least they will take themselves off, often without any help. The gardener wishes to economize space and time, and buys say 5 colonies of bees, and places them on the south side of some wall or fence, where, as he works, he can see them and attend to them in a moment, if any service be needed.

The space required need be only the width of a hive, and 15 feet in length, and a number of such places may be found on any farm, that cannot be utilized in any other way. A southern exposure is best, but bees may be placed anywhere, high or low, on the top of the house, over a porch, on a broad-shelf attached to the side of the barn, in the attic of the house, in the loft in the corn barn, in any place whatsoever. They may do better in some places than in others, but it is sufficiently well established that the place of the hive is of little importance, provided it is convenient for the bee-keeper. Bees have stored large quantities of honey in hives on the roofs of high buildings in the centre of cities, and in other out-ofthe-way places.

The first Italian bees in Maine, easily distinguishable from the natives, were seen twelve miles from their hives. It has been shown again and again, that the distance traveled by bees was at least five and six miles, and that they went that distance from choice, when pasturage was nearer.

The gardener has 5 colonies. If they are in box-hives, he must watch them closely in swarming time, and this will be no task, because he is nearly all the time engaged in other work. When the swarm appears, he has only to hive it and place it with the others. Of course the hives must be in readiness beforehand. If the gardener's interest prompts him to use the movable frame hive, he may know to a

day when his bees will swarm, by an examination of the brood-nest. For example, if he examines every hive on Monday, and finds no queen-cells begun, he may know that no swarm will appear for a week at least. This is a great advantage, because with the knowledge obtained by examining the hives, he may be away from home several days, and know that no swarms will issue during his absence.

But the product of honey is not the only profit to the gardener. Perhaps the greatest labor for man performed by bees is the distribution of pollen from flower to flower. It is believed that the bee is profitable to the farmer, even if not an ounce of honey be produced for the farmer's use. A gardener in Southern New England raises early cucumbers under glass. There will be no fruit unless the flowers are fertilized, and for this purpose a colony of bees is placed in the greenhouse. A florist employs bees for the same purpose, keeping the hive inside the house at first, and afterwards moving it into the garden.

Bee-keeping stands upon its merits, and is profitable as a separate, a sole industry, and with small farming and gardening it is particularly agreeable, inexpensive and satisfactory.

Providence, 5 R. I.

# Create a Home Market.

To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remnnerative prices. "Honey as Food and Medieine " are sold at the following prices."

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the beekeeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

# OUR CLUBBING LIST.

We supply the American Bee Jonrnal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

# Local Convention Directory.

Time and place of Meeting. 1886 July 6.-Hill County, at Peoria, Tex. H. A. Goodrich, Sec., Massey, Tex. July 16. – Marshall Co., at Marahalltown, Iowa. J. W. Sandera, Sec., LeGrand, Iowa. Ang. 31.—Stark County, at Canton, O. Mark Thomson, Sec., Canton, O. Sept. 4.-Sheboygan Co., at Sheboygan Falls, Wis. Mattle B. Thomas, Sec., Sheboygan Falls, Wis. Oct. 7.-Wis. Lake Shore Center, at Kiel, Wis. Ferd Zastrow, Sec., Milibome, Wis. Oct. 12-14.—North American, at Indianapolis,Ind. F. L. Dougherty, Sec., Indianapolis, Ind. Oct. 19, 20.—Illinois Central, at Mt. Sterling, Ills. J. M. Hambsugh, Sec., Spring, Ills. Dec. 1, 2.—Michigan State, at Ypsilanti, Mich. H. D. Cutting, Sec., Clinton, Mich.

1 In order to have this table complete, Secretarles are requested to forward full particulars of time and place of future meetings.-ED.

Much Swarming.-A. F. Currier, Du Plain, Mich., on June 28, 1886, says:

I have a colony of bees that cast its first swarm on June 1; another in a few days, and both large swarms; on June 12 it cast another fair swarm, and on June 13 I found two queens in the parent hive. I started with 7 colonies in the spring, and I now have 24. Some that have swarmed three times are working in the sections well.

Plenty of Clover, but no Bees.-R. G. Hogue, Loydsville, O., on June 28, 1886, writes:

I am in hopes that many more will deem it a necessity to become members of the Bee-Keepers' Union. does not look right for a few to stand good for the whole band of bee-keep-ers, which is virtually the case; for the word will go abroad that the beekeepers have formed a Union for selfprotection, and any person that hears of it would rather compromise a difficulty with a bee-keeper than run the risk of getting into the clutches of such a Union. This has been a very good season until last week, when it turned so wet that the bees have done nothing for a few days. A great many bees have died during the last winter in this neighborhood. My count last fall was 24; this spring 4. It looks like a great waste to see so much white durar and another bort white clover and scarcely any bees to gather the nectar from it.

Good Clover Crop. - E. Pickup, Limerick, 5 Ills., on June 24, 1886, writes:

We are having mostly cool nights and mornings, with showers, which shorten the day's work for the bees; yet white clover is good, and they fall with their loads. I seldom see them fill up so in the sections be-ling three that were queenless. The

tween the first and second swarms; also after swarming 3 or 4 times, in a few days they are in the sections again; some have stored 40 to 60 pounds, and cast several swarms. T am tiering up my new colonies to keep them from swarming, as some did 10 days ago.

Number of Frames for Winter.-Master R. B. Ross, of Montreal, Canada, on June 22, 1886, writes thus:

Please tell me how many combs to leave for, winter supply in each hive.

An older person (probably his father) adds this explanation :

This is from a little subscriber to your JOURNAL, 9 years old. He has two hives (with 8 movable frames in each), and he wants to know how many of these frames should be left in, for a strong colony for winter, after the one-pound sections in the surplus department are taken away.

[Our young subscriber is welcome to send in a question. We are glad he has been so thoughtful as to calculate ahead about preparing his bees for winter. Four frames will be sufficient to leave in each hive for winter. They must each contain about five pounds of honey for the bees to live on during the winter months. Each colony should have bees enough to fill the spaces between these frames. -ED.]

Sweet Prospects. - Eugene Secor, Forest City, & Iowa, on June 25, 1886, writes :

It is only about two months since the bees were removed from the cellar, and 25 colonies worked for comb honey have stored nearly 1,000 pounds. White clover has been very abundant and very rich in nectar. The sections that I am taking off rival in whiteness the celebrated California product. Linden will soon be in bloom. If that yields well 1 am going to have the best crop of honey 1 have ever secured.

Good Prospects for Basswood.-S. II. Mallory, (68-104), Decatur, 9 Mich., on June 28, 1886, says:

Bees have been doing well for two or three weeks on clover, although quite dry until within a few days. We are having plenty of rain now, almost every day. I never had a better showing for clover honey so early in the season, and basswood yet to hear from, which is about coming into bloom, and looks fair for giving a big yield.

Too Much Swarming, etc.-D. F. Park, Athens, 5 Pa., on June 28, 1886,

early season put them in good condition for white clover, which has been profuse in bloom, but the weather has been too cold and dry for the best results. My first swarms began on May 18, and have filled up their sections. The old colonies are doing very well, but are swarming too much for my comfort, being largely in excess of any former year. There is but little sale for bees or honey in this section. I have heretofore used full sheets of foundation in brood-frames, but this season I have put in one-half size, and I get just as good results.

Pleased with the B. K. Union.-John Rey, East Saginaw, Mich., writes :

1 think that the National Bee-Keepers' Union is but a small "nucleus vet, considering the thousands of beekeepers there are in our land of honey; but if we will only take a lesson from our little, busy bees, we will soon in-crease to a large "colony." Remem-ber the larger the "colony " the bet-ter the defense. I, for one, am well pleased with the Bee-Keepers' Union. and I only wish that it may live until the last bee dies in our land.

Who Owns the Bees?-W. R. H., Mt. Carroll, vo Ills., on June 18, 1886, writes thus:

Just at sundown my bees swarmed and left. I followed them. They went directly towards my neighbor, one-quarter of a mile away. As they went over my neighbor's barn-yard, his hired man saw them and com-menced pounding on pans, etc. The bees went directly into my neighbor's hive. Most of them were in before I got there. Who owns the bees, my neighbor, his hired man, or myself? hive. Most of them were in before I got there. Who owns the bees, my neighbor, his hired man, or myself? I immediately took the bees out of the box-hive and put them in my own, but left them there. If the bees are mine, what should I pay my neighbor (he don't claim them); or what should I pay the hired man (he claims them)?

[The bees are yours by all points of law. If any of your neighbor's property was injured or destroyed by the transaction, equity would say: Pay him for it. If the hired man was put to any expense, or used time not already sold to his employer, pay him for it. He certainly has no claim on the bees, either in equity or law. If his time belonged to his employer, settle with your neighbor for that .--ED.]

Very Fine Season.-E. T. Jordan, Harmony,+0 Ind., on June 24. 1886, writes:

This has been a very fine honey season until the last few days, which have been cool and rainy. There is

had extracted from the upper T stories of 22 colonies 1,767 pounds of honey. This season's honey is a shade lighter than last season's, and of very line flavor.

National Bee-Keepers' Society .--Mrs.L.Harrison, Peoria, Ollis., writes:

At the last meeting of the North American Bee-Keepers' Society, at Detroit, St. Louis, Mo., was taken into consideration as the second place of meeting of this Society, Mr. Dadant and myself favoring that location. Do the bee-keepers of the South and West favor this location? If so, will they give it their hearty support? It would be well for those thus located, to express their views before the next meeting at Indianapolis, either through the BEE JOURNAL or to Mr. Dadant or myself. A place of meet-ing, wisely chosen, has much to do with the prosperity of the Society.

Introducing Queens.-L. J. Keyes, Nora Springs, 6 Iowa, on June 23, 1886, asks:

In introducing a queen to the hive, are her attendants put into the introducing cage with the queen, or only the queen herself?

[Only put the queen in the introducing cage. Let the accompanying bees fly away. Their presence in the hive would be annoying, and might result disastrously.-ED.]

Bees Doing Well.-Ernst Bernschein, Ft. Dodge, OIowa, on June 30, 1886, says:

We are having very dry weather just now, but bees are doing very well gathering honey. There has been but little swarming so far. We are about two weeks ahead this season, and our prospect is very good for a honey crop. I have 88 colonies of bees of my own, and 12 which I am keeping on shares.

Enlisted for the War.-Dr. Geo. II. Kidney, Birmingham, O Ala., writes on June 24, 1886 :

I wish to become an active and living member of the National Bee-Keepers' Union. I am bound to help our cause to the uttermost in every way, if it costs twice what is asked. Let us have a decision on that California case that is just. Witnesses should know concerning what they swear about in such cases.

" Don't Stop "-that is what many write to us about their papers, when their time is nearly out. One subscriber says : " It is not convenient for me to send the money now to renew my subscription. It runs out with this month ; but don't stop sending it. I will get the money to you within three months." Such letters are coming every day, and so for the present we have concluded not to stop any papers until requested to do so.

Issued every Wednesday by THOMAS G. NEWMAN & SON.

PROPRIETORS.

923 & 925 WEST MADISON ST., CHICAGO, ILL.

At One Dollar a Year.

ALFRED H. NEWMAN, BUSINESS MANAGER.

## Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to devote a few honrs, to get subscribers.

Frank Leslie's Popular Monthly for July is full of good things. "Camping Out" is an attractive subject in this weather, and Mr. W. P. Stephens's article with its breezy pictures certaioly tempts one to try it. Liszt, the great composer and planist, is so widely known that this sketch of him comes in very aptly as an introduction to the article by Dr. Pearce on "Modern Music Schools," full of notes of the past and suggestions for the present. "A Turkish Dinner on the Nile" is a pleasant traveler's sketch. The stories in the July number of this popular magazine are like the articles-bright, breezy, just suited to reading in sultry days.

Italian Queens.-We can supply them by mail, postpaid, at the following prices : Untested, \$1.00; Tested, \$2.00; 6 Tested Queens for \$9.00.

The Convention History of America aod the American BEE JOURNAL for one year, will be clubbed for \$1.15.

----

To any One sending ns one new subseriber with their own renewal (with \$2.00), we will present a copy of the new "Convention History of America."

### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 10 a. m., July 5, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO.

HONEY.—The new crop of honey is coming for-ward quite freely, and looks well; demand is likht, however, at 14 to 15c. Extracted, 5 to 7c. per lb. BEESWAX.—Scarce at 25c. R. A. BURNETT, 161 South Water St.

#### NEW YORK.

NEW YORK. HONEY.-We how quote: Fancy white comb In 1-b, sections, 126(13c.; in 2-b, sectiona, 96(10c. Fancy buckwheat honey in 1-b, sections, 96.; in 2-b, sections, 708c. Off grades 1@2c. per lb. less. Extracted, white, fastor: buckwheat, 505%c. Cali-fornia, 566c.; Southern, as to color and flavor, per gallon, 506(4)c. BEESWAX.-27@28c.

MCCAUL & HILDRETH BROS., 34 Hudson St.

#### BOSTON.

HONEY.-One-b. sections, white clover, 13@15c; -pound sections, 11@13c. Extracted, 6@8c. BEESWAX.-25 cts, per lb. BLAKE & RIPLEY. 57 Chatham Street. 2.

#### SAN FRANCISCO.

HONEY.-New honey is comlag forward freely. The quality is exceptionally fine and the crop will be large. White to extra white comb.%3ile. Ex-tracted, 4%4Xc. for white ; 3½@3¾c, for amber. BEESWAX.-22@23c. 0. B. SMITH & Co., 423 Front Street.

### DETROIT.

HONEY.-There is a little new honey in the market, and is selling at 13 cts. for white in 1-lb. sections. The demand is limited, however. BEESWAX.-Firm, at 25 cts. per pound. M. H. HUNT., Bell Branch, Mich.

### CINCINNATI.

HONEY.—The demand for extracted honey has been very light of late, but it seems to be improv-ing gradually for maou facturing purposes. There is considerable honey in the bands of commission merchants, and prices are very low—3% to 7 cts. per pound is the range of prices. Prices of comb honey are normal hon

oney are nominal. BEESWAX.-Arrivals are good and the demand sir. We pay 18@22c. for fair to choice yellow. C. F. MUTH & SON, Freeman & Central Ave. fair

#### CLEVELAND.

110NÈY.-Wihin the last two weeks honey has not sold so readily, owing to the near approach of the new crop and the uccertainty of the new pri-ces. Bet white, 1-10., old honey moves slowly at 14 cts.; no demand for 2-10s. Extracted, 667c. BEESWAX.-22 to 25c A. C. KENDEL, 115 Ontario Street.

#### KANSAS CITY.

HANSAS CITY. HONEY.-Our new crop is arriving freely and is very fine. Sales are slow and prices low. One-lbs., white claver, 14c.; dark 1-lbs., 10 to 11c.; 2-pound white claver, 12c.; dark 2-lbs., 8 to 10c.; California 2-lb., white sage, 10 to 12c.; dark 2-lbs., 8 to 9 cts. Extracted white clover, 5 to 6c.; dark, 3 to 4 cts.; California white sage, 5 to 5½c.; dark, 4 to 4½c. BEESWAX.-20 to 22c. CLEMONS, CLOON & Co., cor. 4th & Walnut.

#### MILWAUKEE.

MILWAUKEE. HONEY,--Tbe demaod is limited but the supply is very much better in quantity as well as quality. The new crop receipts are very fine. We quote : Choice white in 1-b. sections, 16a/17c. same in 2-h. sections, 15a/16c.; dark, nominal, 10@15 cls. Extracted, choice white in in, 7@9c.; same in barrels and kegs, 6@7c. HEESWAX.-24a/25c A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

HONEY.-The market is very much depressed. Sales of water white extracted have been made at 3%c. Some of the honey coming forward is in light weight in so poorly soldered as not to beer handlug, occasioning trouble and expense to the receiver and waste and loss to the solpper. White to extra white comb. 8 to 10c. Extracted, white liquid, 3%c.; light amber colored, 3 to 3%c. BEESWAX.-20623c. SCHACHT & LENCKE, 122-124 Davis St.

CT The Illinois Central Bee-Keepers' Association will hold its next meeting at Mt. Sterling, Ills. on Tnesday and Wednes-day, Oet. 19 and 20, 1886. J. M. HAMBAUGH, Sec.

127 The next annual meeting of the Michigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTINO, Sec.

### System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

 For
 50 colonies
 (120 pages)
 \$1 00

 "
 100 colonies
 (220 pages)
 1 25

 "
 200 colonies
 (420 pages)
 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

Simmins' Non-Swarming System is the title of a new English bee-book. The author claims that it will inaugnrate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides their own, with \$3, for one year, we will present a copy of this valuable book.

Now is the Time to Join the Union. -Let every bee-keeper send for a copy of the Annual Report and a Voting Blank-fill lt up, and become a member. It is to the interest of every one to do so. The dnes are only 25 cents a year ; and it is intended only to call for one assessment (of \$1.00) each year. Send to this office for the Report and Voting Blank.

Job Lot of 2-lb. Sections, Cheap.-See our offer of a jub lot at \$3.50 per 1,000, on page 432. If you can use this aize of section, there is a bargain for you. They can be shipped the same day the order is received.

Red Labels for one-pound pails of honey, size 3x41/2 inches. - We have just gotten up a lot of these Labels, and ean supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apian'st printed on them-by mail, postpaid.

Special Sizes of Sections cause much confusion; and if such luxnries are indulged in they should be ordered long before the "rush" comes, in May and June. Special sizes cost more, and when ordered during the "rnsh," create considerable dissatisfaction by the consequent delay in getting them made. We have a lot of special sized two-pound acctions 5¼ inches high and 6 inches wide, narrow tops, and aquare groove, which we can ship instantly at \$3,50 per 1,000. They are 7 to the foot.

## DOUBLE - WALI Langstroth Hives

### FOR WINTERING BEES ON SUMMER STANDS.

THEY are made identical and interchangeable with our Standard Langstroth Hives, as adver-tised and described in our Catalogue. All upper stories and aurpius airrangements made by us will fit this double-walled brood chamber. Prices : Nailed, 50-c, in the flat, 35-c, per hive, in addition to our prices of the Standard Langstroth. We also make our 75-inch Caps with a sloping or Cottage Roaf, which is worth 20-c, nailed and 15-c flat, in addition to the prices of the Standard Langstroth hive, which has a flat top.

THOS. G. NEWMAN & SON. 923 & 925 West Madison-st., Chicago, Ills.

TALIAN QUEENS, by Return Mail, Tested, 1.00. Untested, 75 cents. Tested, 1.00. Untested, 75 cents. 26Atf GEO. STUCKMAN, Nappanee, Ind.

Bingham & Hetherington Uncapping Knife.

## Patented May 20, 1879.

Bingham shokers and knives bhave Revolutionized the Smoker and Knife Trade, and have made hee-keeping a pleasure and a success. They are the only lasting and satisfactory Snokers and Knives now used by experienced bee-keepers in Enrope, Australia, Cuba, and America. They are covered by patents, and while they are always the best that can be made, they are also the lowest priced.

A TREATISE giving an index of diseases, and the symptoms; cause and treatment of each, a table giving all the principal drugs used for the horse, with the ordinary dose, effects and antidote when a poleon; a table with an engraving of the horse's teeth at different ages, with rules for telling the age of the horse; a valuable collection of re-elpes, and much valuable information,

Price 25 cents-in Eoglish or German.

THOS. G. NEWMAN & SON,

923 & 925 West Madison Street, CHICAGO, 1LL

A Summer Pieture is thus given by a correspondent in the Youth's Companion :

A clondless sky, and a stretch of meadow Dotted with daisy and clover blooms ; A farm-honse old, in the white trees nestled, And hum of bees in the lilac plumes ;

And hum of bees in the lilac plumes; Tassels of alder so tenderly swaying, And flower-bells swinging in every breeze; A song of bird from the woodland shadow, And carol of joy in the budding trees; A lake's dark calm in the distance lying, With elif's gray turrets reflected deep, And flag-fringed shores where the trees are bedding

bending

O'er stilly shades where the lilies sleep.

Bees are of great benefit to the fruit. growers and horticulturists, but they seem not to realize it-or at least many of them pretend not to know it.

In New York there is to be an apicultural station. The Bee-Keepers' Magazine says : "We are glad to note that the Empire State is about to bave an apicultural station of its own. Prof. J. Henry Comstock, Professor of Entemology, at Cornell University, is making au effort, we understand, to establish a department of apiculture in that institution. We hope he will be successful in his endeavor, and we shall be most happy to de everything in our power to help him iu his work."

"Bee-Culture is to be distinguished from bee-keeping ;" says the Rev. O. Lawson, " because the latter, if it implies merely the careless and neglectful possession of one or more colonies of unfortunate bees, will invariably be found both uninteresting and unprefitable ; for in this, as in all agricultural pursuits, want of care and of that degree of skill which is to result from care, will lead to disappointment and failnre. But on the other hand, it is elaimed that bees, with good management and timely attention, need but little of either, but what they do need they need imperatively-at the right season, and can be made a source of

An Old Bee-Gum.-The following is a fine specimen of ignorance about bees, and we print it ad literatum:

Letcher Co Ky June 20, 1886 Jents—as to how Longe will Bies Liv in hives befor they die out I will say to you I owne a bie hive that is a bout 30 years scena Scence I put them in agum and they ar Still a live and working it is the oldes hive of Bies I ever new I want to now if any has any older bie-hives pleas publish it in your paper. Yors truly J. B. Clay.

Mr. Clay's old "bee-gum " reminds us of the boy's old jack-knife; it was very old; bad seen a good deal of service; had worn ont several blades; and the old handle had been replaced with a new one,-but it was the same old jack-knifel 1 Just so it is with Mr. Clay's old bee-gum-it is 30 years since he put the bees into it! From fifty to one one hundred generations of bees have occupied that gum; and twenty or thirty queens have succeeded one another-but it is "the same old gum;" and the bees he put there 30 years ago " are still alive and working!" It is "the eldest hive of bees he ever knew!"

Mr. Clay stands upon the pinnacle of fame -he has the most wonderful hive of bees in the world-he looks over the timber and prairie, and congratulates himself upon having the oldest bee-gum in existence. He prondly asks, does any one know of any older bees? Ordinary bees live only a few weeks, or a month at most, but his bees which he put in that gnm 30 years ago "are still alive and working," and "don't you forget it." Extraordinary old bees ! Wonderful old bee-gum 11 Happy old Clay 111

The Yucca Brush is employed for removing bees from the combs. Mr. W. W. Bliss, of Duarte, Calif., speaks thus concerning them :

Ever since the invention of the movable comb hive, has there been a demand for something suitable for brushing the bees off the combs. Quite a number of articles have been brought into use for this purpose, from a goose-quill to a bunch of grass. The latest as well as the most effective article for this purpose is the yucca brush. The species of yucca (*pueza bacata*) from which these purpose is the yucca brush. The species of yucca (*yueca* )*baca*(*a*) from which these brushes are made, are a native of Southern California. They grow in vast numbers along the foot-bills and mountain sides; when in bloom, their towering shafts of white flowers can be seen for several miles. Their growth somewhat resembles the cen-Their growth somewhat resembles the cen-tury plant, but having a greater number of leaves, which are about one inch bread and two fect in length, tapering to a point, where they are armed with a sharp thorn like a cometimes called Spanish Bayonets. The yucca, like the century plant, dies when it blooms; just bow old they are before they bloom, is not known, After the plant blooms and has died, the leaves are gathered and made into brushes as here shown.

They are a soft, vegetable fiber and do not irritate the bees. As each separate fiber ex-tends the whole length of the handle as well as the brush, they are almost indestructable. When they become sticky with hency, they can be washed, and when dry, are as good as ever ever.

The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy without having to hunt for one. We can supply both pleasure and profit."-Indiana Farmer. them at 5 cents each, or 50 cents a dozen.

Bees in Cyprus during February are thus described by Mr. Frank Benton in his Larnaea Circular :

Larnaca Circular : The winter seems to have been severe all over Europe and in all Mediterranean conn-tries, but while in more northern climates my bee-kceping friends write they were buried in snows, I was away off where the winds blow from Africa's Great Desert and at the beginning of February was hiving swarms and extracting beautiful rosemary honey. Celonies that had net gotten short of stores during the mouths of December and January, and were protected from rains so their hives' were dry inside, were quite populons, some of them occupying twenty-four frames, twelve to fifteen of them fairly filled with brood. February 15th, I counted righteen frames of brood in one hive, each frame having 120 squire inches; 350 queen-teells formed by a single colony preparing to swarm, were counted on twelve frames. Here in Cyprus the colonies are less ad-vaneed, for even Cyprians cannot get boney vaneed, for even Cyprians cannot get boney out of bare rocks and barren sand.

Over \$250.00 in Premiums are offered at the St. Joseph, Mo., Inter-State Exposition which opens August 30, 1886. A bee-convention will be held on the Monday following. Send to the superintendent, J. G. Graham, Agency, Mo., for a preminm list.

Bees at the Zoological Gardens in Philadelphia, Pa .- Mr. Arthur Todd, on July 5th "opened up" a bee-exhibit at the "Zeo," with a lecture upon "the habits of the bees." A similar lecture will be given every Wednesday at the same place. The Public Ledger of June 29th, contained the following notice concerning it :

Preparations are now being made at the Zoological Garden to add to the interesting Preparations are now being made at the Zoological Garden to add to the interesting features of that place a permanent collec-tion of bees, so that the visitors may be shown something about bee-keeping and given an opportunity to study the habits of the insects in question. It is expected that the collection, which will probably comprise about 15 hives, will be taken to the Garden very shortly by Mr. Arthur Todd of this city. Superintendent Brown says that Mr. Todd will have a supervision over the exhibition, and it is proposed to make an arrangement with him whereby he will deliver lectures at the "Zoo" from time to time about bee-keeping, so that those who are interested in becs can obtain practical information about the way of caring for them, etc. A one-story frame building opposite the monkey-bouse, which was formerly used as a photo-graph stand, and contains two roems, will be eonverted into an apiary. In the back room three glass cases have already been placed in position on small stands, it being intend-ed to ntlize the cases for bee-hives. These eases are put close to the back wall of the apiary in such a mannerthat the bees will be able to escape out into the garden by means of holes cut in the wall. A plot of ground, about 20 feet square, of holes cut in the wall

of holes cut in the wall. A plot of ground, about 20 feet square, situated ucar the bear-plits, is also being en-closed with a wire fencing in order that an ordinary colony of bees may be placed with-in it, thus forming another interesting fea-ture of the bee-exhibit. Superintendent Brown says that a fear is sometimes ex-pressed on the part of persons visiting bee-hives that they may be stung, but considers that, with the methods now employed in the systematic eare of bees, there is but little danger of any one being so injured.

Oldest Apicultural Publisher.-In L' Apiculteur M. Hamet says he is the oldest member of publishers of bee-literature.

The Apiculteur is in its thirtieth year, and The Apicultew is in its thirtieth year, and besides this he has issued several other pub-lications. By the end of 1886 he will have issued 70,000 volumes and pumphlets, viz., 40,000 vols of L'Apiculteur, 18,000 vols. of *Cours d' Apiculteur*, 8,000 *Calendiers apicoles*, 4,000 *Anesthesise*, and several others jointly with other authors.

### Replies by Prominent Apiarists.

[It is useless to ask for answers to Oneries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-ED.]

### Separating Swarms.

Query, No. 277 .- I. At swarming time it often happens that two or more swarms issuing at the same time settle altogether ; what is the best plan of separating them? 2. Is it true that they will separate themselves if put in a very large box so that they might be dipped up, each swarm by itself, and hived? Bnt is it not possible that the bees of several swarms being mixed up, that any or all of the queens may get killed? I mean all these swarms to be prime swarms with laying queens. 3. Or is it necessary or best to divide them immediately, giving a queen to each division made? This latter plan I have practiced, but I find it very inconvenient in the middle of the day, and I am afraid to postpone the operation until evening. What can you offer as better or best ?--C. W.

Clip all the queens' wings, then the queens can be caught, and all will be well. This fact alone is enough to make clipping desirable, were this all. -А. Ј. Соок.

1. Keep them apart with the Fountain Pump, if possible, and when they do get together, just how to perform is too long a story for this department. 2. Sometimes. Experience and tact are needed in these cases, and each case may need different treatment .-JAMES HEDDON.

It would take a long article to explain all the methods of dividing two swarms. But it should be done when hiving, as they will usually mix and kill either queen, or both.-DA-DANT & SON.

The answer to this would require an article to do the subject justice. 1. Put one-half in one hive and one-half in another hive. Catch a queen if you see her. When one swarm shows signs of queenlessness give it the queen caught. 2. I have heard so, but I have never tried it. There would be danger of the queens being killed. 3. I can offer no better plan.-W. Z. HUTCHINSON.

1. My plan is to hunt up the queens, cage them and divide the bees as nearly equal as possible. 2. Some-times they separate, but more often they do not. Many things in bee-keeping will be found inconvenient; keeping will be found inconvenient; so they will in any other business. We must take things as they come, L. TINKER.

and be thankful that they are no worse.-J. E. POND, JR.

Divide all swarms as soon as possible; for directions see any of our leading works on bee-culture. 2. This is not true in my experience. 3. This would be my plan of operation. It may be a little inconvenient, but it will be successful.-H. D. CUTTING.

It is easy enough to divide them if a swarming-box is used and a queen given to each; but my plan has been to hive all together, taking away all but one queen in hiving. The conbut one queen in hiving. The con-tracted brood-chamber is used with queen-excluding honey-board (zinc and wood), and enough section-cases piled upon it to accommodate the whole part of the cases being taken from the hives of the colonies casting the swarms.—G. L. TINKER.

1. I think I should hunt out the queens and divide the bees equally among them. 2. They might happen to separate, but I should generally expect all but one queen to be killed. 3. 1 doubt if you can better your present plan, but as my queens are clipped, I have had little experience. -C. C. MILLER.

1. Every one will have to decide this for himself. 2. Yes, as a general thing. On several occasions  $I_have$ lost queens from this cause. 3. I used to practice the same plan yon here mention, but not with uniform suc-cess. I now keep a wide hive that will hold 20 frames, that has an entrance extending the full length of the hive. I fill it with combs, and hive the whole of the "pile" in the wide hive, strewing them all along the entrance. After they have divided off I lift out each division on the combs and put them where I want them.—G. W. DEMAREE.

1. Have the queens' wings clipped, and you can handle them as you please. 2. This is very doubtful. 3. Hive the two together, giving lots of surplus room if you do not care for increase. Having the queens' wings clipped does away with all this trouble. I have had as many as II swarms all together, but as I had all the queens, it was easy putting one-eleventh of the bees and one queen into each hive.-G. M. DOOLITTLE.

## Paralyzed Bees.

Query, No. 278.-A colony of hees in a log sawed off and set upon end has wintered well for seven winters, and eame out strong this spring, apparently prospering, nntil seven days ago when the bees began to erawl ont in a paralyzed coudition, with their tongues rnn out. They would turn over, and kick, and soon expire. A quart of bees each day for seven days past has erawled out and died. I broke out some comb, and found from the egg to the fullgrown bee in apparently healthy condition. There is plenty of sealed stores in the hive. What ails the bees ?- Maine.

I do not know unless they are pois-oned.—W. Z. HUTCHINSON.

This seems a disease which ought to be carefully investigated. It has appeared in many States, from Iowa to Maine.—A. J. Cook.

Take some of the honey and feed to some nucleus, and see if it is poisonous. If it does not affect them, then you will know that it is not the honey that is at fault.-H. D. CUTTING.

I could not judge the case at this distance. I prefer to believe that robbing was going on, and the bees that crowded out in a paralyzed condition had been stung. Sometimes bees carrying on robbing in a stealthy, mysterious way, and may puzzle almost any one to discover the trouble.—G. W. DEMAREE.

This peculiar disease has been mentioned several times, but as yet no one has either ascertained the cause or made public a remedy. It is one of those things that cannot be explained without an examination, and possibly could not even then. Are the stores pure? or may not the bees have brought in some poisonous honey ?-J. E. POND, JR.

### Ants in the Hives.

Query, No. 279.-Upon examining a colony of bees the other day, I discovered countless numbers of small black ants in the top part of the hive. (I have tried salt and chalk-marks, but they do not seem to mind it). What is the remedy ?-W. M. B.

Try borax. I have never found that the ants did any harm, except the annoyance on opening the hives. -C. C. MILLER.

They are there for warmth. I find it easy to dislodge them by simply brushing them off.—A. J. COOK.

Give the ants no lurking place. Have no crack where the ants can go and the bees cannot follow.-W. Z. HUTCHINSON.

They get there for warmth, and do no injury except to annoy the opera-tor when the hives are opened. I know of no remedy except to be happy in thinking the ants are having a good home.—G. M. DOOLITTLE.

Put green tansy in the top of the hive and you will not have any ants to trouble you. They do not seem to disturb the bees. It is such a nice place for them to hatch their eggs over a good, warm colony.—H. D. CUTTING.

I have seen ants around my beehives, but never experienced any loss from them. A good colony will not let them enter the hive; they lodge in its crevices about the outside to enjoy the heat from the bees. Trouble from ants is mostly imaginary.-JAMES ILEDDON.

I use wet salt and find it effective. Dry salt is of no value for this purpose, and I infer that many have failed to derive benefit from the use of salt because they use it in a dry state. The adult ants do not care for salt

much, but wet salt destroys the ant larvæ and eggs, and ants will not lodge in a place where they cannot rear young.—G. W. DEMAREE.

Get an atomizer and spray them with equal parts of carbolic acid and alcohol. This is a certain remedy and will do no harm if it does not reach the bees. In cool weather long strings of small red ants may be often seen entering hives, but they do little harm as compared with the little, flatbodied black ant, which is a real pest, and makes a habitation of the top part of the hive.-G. L. TINKER.

If the ants actually trouble the bees place the legs of the hive-stands in cups of water, and sprinkle powdered borax in the tops of the hives. Find the ants' nests and give them a dose of borax or kerosene. I have driven ants away by the use of borax. If the colonies are strong they will not be injured by the ants, and will prob-ably drive them out finally.—J. E. POND.

### OUR CLUBBING LIST.

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

### Home Market for Honey.

128 To create Honey Markets in every village, town and eity, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remunerative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 ets.; per doz., 40 ets.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the bee-keeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of lt.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one Intending to get up a club can have sample coples sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

Explanatory .- The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is located near the center of the State named; or north of the center; Q south;  $\Theta$  east;  $\Theta$  west; and this  $\delta$  northeast;  $\infty$  northwest;  $\infty$  southeast; and  $\beta$  southwest of the center of the State mentioned.

### C. P. HEWEIT.

Winter Depositories for Bees.

I do not consider a cellar under a dwelling a fit place for a depository for wintering bees. They do not get that quiet that they should have. Neither do I think that ventilation is as essential as other conditions and surroundings-such as cold, dampness from the cellar bottom and walls, and the floor is not sufficient covering to give them the dry temperature that they should have. Ventilation of the hives is quite important. One may have the best depository in the world and yet the bees may be destroyed by and yet the bees may be descrived by not giving the hives proper ventila-tion. Artificial heat is the worst thing that can be given them. A de-pository should be out of reach of the data with moderatibilities frost, and then with good ventilation, the temperature may be controlled almost to a degree.

As for stores, I cannot see any dif-ference—I am using syrups in some of my hives. My depository is in a sandy knoll. I dug three feet and set in a regular frame and boarded it up tight. tight. This frame I made live feet in height with a gabled-roof. I then covered it with straw and earth one foot in depth, then covered that with marsh grass. I put two ventilators 4x6 inside, one at the end from the door and one eight feet from the door; this place is \$x24. I then put in a ventilator coming in at the bottom under the frame. This ventilator comes under the door and runs under the ground about sixty feet, and is four feet under ground, 4x6 inside. It continues in the shape of a drum the whole length of cellar, and after putting my bees in. I cover this with loose boards and then cover the whole bottom with chaff one foot in depth, so what air comes through into the cellar comes through this chaff.

My hives are on shelves, and are so constructed that air can pass clear around the cluster, but not through it, and pass out at each corner through the top of the hive. I use no cushions; I have no use for them.

I venture to say that there was not one pint of dead bees from my 74 colonies. When I open the door it is

very light and strikes square into some of the hives, and one might easily think that there was not a living bee in the hives, they are so quiet, but upon putting the ear to the hives and giving them a tap with a finger they would respond.

A neighbor who had a few colonies in with mine, went in with me on January 15, to see how they got along. The first hive he came to be said, "I guess they are dead." He put his ear

gness they are dead." He put his ear to the hive and gave it a tap and found they were alive and all right. In order to get hibernation, all con-ditions must be complied with to bring it about. November is the month for bees to commence hiber-nating in this latitude, as much as lune is the summer month. A word June is the summer month. A word about pollen. If bees are put into winter quarters and the condition of the depository is such that they cannot hibernate (or nearly so), and they go on a racket all winter, I think then it would be a good plan to have no pollen in the hives; but if they are so handled that they hibernate, then I would prefer the pollen in the hives. There should be bees enough in the depository so that when the ventilators are closed the temperature would gradually rise, or the ventilators would be of no use. Hibernation does not set in very rapidly; some-times it will take weeks, with the times it will take weeks, with the best conditions, but continual treat-ment will bring it about. The time is coming when apiarists will look into this matter. A depository in which bees will not hibernate will be a thing of the past. Kingston, Wis.

### W. Z. HUTCHINSON.

Had Mr. Mitchell (see page 410) put on upper stories at the time of hiving, instead of waiting six or seven days, he would probably have arrived at a different conclusion. The upper ne would probably have arrived at a different conclusion. The upper stories should be furnished with combs or foundation, and a queen-excluding honey-board used to keep the queen below. The "replies to oueries" are necessarily builds but queries" are necessarily brief, but had I supposed that anybody waited six or seven days after biving a swarm before putting on supers, I should have explained a little more fully. If Mr. M. has the BEE JOURNAL for 1884, on page 745 of that volume he will find the subject treated exhaustively.

I may say this much, however, when honey is coming in freely, and the bees are compelled to build comb in which to store their honey (not to rear brood) they will build store or drone comb; but if they are given access to a super containing comb or foundation they will store their honey there, while in the brood-nest they will build worker-comb and fill it with brood.

Mr. Mitchell reports exactly the con-dition of things that I should have ex-pected with such management as he gave.

I do not belong to that class who cannot "buy a few pounds of founda-tion," as I shall probably use 100 pounds of it this season, but not in the brood-nest, as I have experimented until I am satisfied that I use it there only at a loss.

I have hived between 40 and 50 swarms this season in the new Hed-don hive; they have all built their own combs in the brood-chamber, and I do not think there has enough dronecomb been built to fill one hive; while the combs are as straight and true as one could wish.

Rogersville, & Mich.

..... Read at the Cynthiana, Ky., Convention. How to make Bee-Keeping Profitable.

### C. F. MUTH.

The experience of some of the past years has been hard on bee-keepers, as well as on farmers, manufacturers, and every other branch of business. There is, apparently, an over-produc-tion, or there is no demand, and many times sales could not be made unless at low figures. Business was unprofitable to manufacturers and merchants. Again, the misfortune of the farmer, *i.e.*, cheapness of produce, was the good fortune of the masses. The ever restless change of time does not allow us to despair; for, sooner or later, matters will turn again in our favor, and only the week-kneed will fail. The low prices of corn, hogs, etc., being at times in many localities, below the cost of production, should as soon induce farmers to quit, as the low prices of honey should weaken the interest of the bee-keeper. We must produce and stimulate consumption. To find a market is, although secondary, of as great importance as production, and every individual interested should do his share in this respect. Just as the fruit-farmer or gardener supplies his neighbors, so should the bee-keeper. He can realize better prices when retailing, and, if his crop is larger than his retail trade requires, let him sell the balance to a dealer.

The idea advanced by some, to avoid all middlemen, is absurd. A fair dealer, although he cannot do without a profit, takes upon himself a larger amount of work, and is under a heavier expense than most producers imagine; and he finds a market for more surplus honey than a thousand or more producers could do. It is to the dealer's advantage to obtain good prices, and this re-acts on the pro-ducer, who shares in the profit. Let us, however, expose all adulterations. that our honey may have a respectable name. Some enormous adulterations, which are very profitable to the opera-tors, are practiced in this country; these increase the so-called stock on the market many times, fill the consumer with distrust, and create a dull market. Every vocation has its drawbacks and unpleasantness, and bee-keeping cannot be expected to be an exception to this rule. It has proven detrimental to many to confine them- their hive, such as building new

selves to bee-keeping alone. The same has been the case with other specialties; and in order to avoid such The disappointments, we should not "hazzard our fortune on one number."

Honey has made good headway in proving a table necessity, and is becoming a competitor with cane-sugar for manufacturing purposes. To produce a full crop should be our object. The best manner in which to accomplish this is the aim of this article.

As a number of different bee-keepers, with more or less knowledge of the business, are to be reached, and, in order to save repetition, allow me, here, to reproduce an article written by me, some time ago, for the Com-mercial Review, which, although in-tended for the beginner, rather than for the experienced bee-keeper, may make the modus operandi of honeyproduction more comprehensible to many :

## "BEE-KEEPERS OF THE PRESENT AND PAST."

When, twenty-five years ago, the bees would swarm it would create an excitement and a sort of feast in the farmer's family. Old and young would ring bells, drum on tin pans, and make as much noise as possible to When this cause the swarm to settle. was accomplished, pater familias would put on his bee-jacket, gauze-wire face in front, tie up his sleeves and trousers, put on a pair of mittens, and carefully approach the swarm. A white cloth was spread under the limb or bush on which the swarm had clustered, and a good stroke landed the swarm in the box beneath, which was then placed on the cloth and left there until dark, when a new place was assigned it. The job was consid-ered a good one, if the "king" had been secured.

The farmer next proceeded to take the honey. All the combs the old colony had built in the upper part of the hive were cut out, placed in crocks or buckets, and taken to market; or they were broken, the liquid honey pressed through a cloth and preserved for future use. This honey was taken from the hive at a time when the remaining bees could least spare it; as all the old bees, which are the sole honey-gatherers, had left with the swarm, leaving behind them only young bees, which, for the first eight or ten days, are nurses and comb-builders and do not leave their hives until after that time. Consequently they would starve to death with flowers around them ever so full of nectar, if, unfortunately, not enough honey was left in their brood chamber, to examine which the farmer of those days would never have thought of.

The queen is the only perfectly de-veloped female in the colony, lays all the eggs, and is the mother of all the Her fertility is so great that bees. she will lay 3,000 eggs per day when in her glory—*i.e.*, during the time when the colony is prosperous and honey comes in freely. Worker bees are imperfectly developed females, and do all the work inside and outside of

combs, preparing old ones for the reception of eggs or honey, foraging, etc. One can see plainly when they have been cleaning house. They take care of the brood; supply the larvæ with food, and cap the cells over (on the eighth day after the eggs are laid) when the larvæ have turned into nymphs-have taken the shape of bees. On the twenty-first day the young bees emerge from the cells. Of this, also, our good friend knew nothing. But, a swarm had left, was hived, and the first honey crop had been secured from the old colony. When a swarm issues, the colony has generally made for several days previous, preparations for queen-cells, *i. e.*, they selected a number of cells containing worker eggs, which would ordinarily produce their like; they build these cells louger and larger, and snpply the growing larvæ with the necessary food, when, in 16 days after the egg is laid, a perfect female, or queen gnaws through the capping. After she has fairly stretched herself and feels comfortable, one can see her running busily over the combs, and wherever she finds a sister's cell she bites it open, and, introducing her stinger, kills the young queen inside. No rival queens are tolerated in a colony. On her fourth, fifth, or sixth day, according to the weather and her own maturity, she takes her bridal flight, and if successful will lay eggs on the second or third day thereafter.

Of all this the bee-keeper of old Of all this the bee-keeper of old knew nothing; and, if the queen's bridal trip had been unsuccessful, which is of daily occurrence, he would say the coming fall, that he had had bad luck with his bees, and that the bee-moth got among them. In the fall he had another crop. Every hive would be lifted, one after another, and while the heavy ones were conand, while the heavy ones were considered safe for wintering, the light colonies were doomed to the brim-stone pit. His honey would be pressed through a cloth, together with pollen, larvæ, and other animal matter, and the combs rendered into wax. An average yield of 15 pounds per colony would be considered a good harvest.

Since the introduction of movablecomb hives, honey-extractors, and comb foundation, a system has been attained in bee-keeping. The beeattained in bee-keeping. The bee-keeper of the present controls every part of the hive or colony. He knows that a swarm is at the expense of his honey crop, prevents all such desires of the bees, and make his swarms just about the time harvest is over. He does not believe that natural swarms are the best, because he can give his swarms made by division all the young bees they need, as well as all the honey, pollen, combs and a healthy queen. Young bees are the nurses and comb-builders. Without them no colony can prosper, and it is herein that a good many err. Bees over 10 days old are foragers, and detest housework so much that they absolutely refuse to accept a new queen when their own is lost, and their attempts to rear a new one have failed, and their nurse-bees have become foragers in the meantime. They (the workers) make, however, a desperate

effort at self-preservation, and lay an abundance of eggs, not as the queen does in her own regular manner, de-positing an egg in a cell, but as many as 10 or more eggs in a cell, irregularly dispersed over the combs. Their eggs being unfertilized produce drones only. The only way to save one of these colonies is to give it a few combs of hatching brood and adhering young bees from another hive, when they will readily accept a queen or hatch out a queen-cell given them.

It is not generally known that bees attain an age of only six or eight weeks in the summer. They wear themselves out with hard work. Their wings become ragged, when they fall an easy prey to birds, drop into the water, or perish in some man-ner. Thousands of young bees hatching daily more than make up for the loss. It is essential to know another item. Bees swarm when they are crowded. It is the queen which, by her restless roving over the combs. creates the swarming fever, when by a bountiful flow of honey her broodnest becomes crowded, and she can find no room for depositing her eggs. In such cases she is one of the first to leave the hive, followed by the old bees, and the young able to fly. If, however, the workers become crowded for want of room to deposit honey, and this is generally the case, they start the commotion, a swarm issues, and the queen is one of the last to leave the hive.

In a well arranged apiary of the present day the combs are all movable and fastened or built in frames, so that each one may be examined and re-arranged at the pleasure of the bee-keeper. The most popular hive, and perhaps the most practical one, is the "Langstroth," because of its shallow combs and simple arrangements. It being the nature of the bees to store above their brood, there is the broodchamber below, and the honey-chamber in the upper story of the hive. Ten frames of comb compose the brood-chamber, affording a surface of over 1,300 square inches, with a hatching capacity for over 60,000 young bees. The upper story, or honey-chamber, may be arranged for comb or extract-ed honey, to suit the fancy of the bee-keeper, but it should never be put on write there from a the lower story. until all ten frames in the lower story are filled with brood, and honey is coming in. Whenever this precau-tion is observed, swarms will be the exception and not the rule, because plenty of young bees are emerging and the queen is kept busy refiling with eggs, their vacated cells.

Combs are built only during a flow of honey. When flowers cease to yield, all progress in comb-building stops. Combs are wax which is manu-factured by the bees. They consume large quantities of honey when small scales of wax sweat out between the segments of their bodies; the bees take these from one another and form them into combs, clustering about the spot, and creating thereby the necessary heat for moulding their wax.

hive with comb, or manufacture four pounds of wax. It is here where the invention of comb foundation does wonders in the eyes of the uninitiated. Comb foundation is sheets of beeswax with the impression of cells made on each side with even greater regularity than if they were made by the bees. A brim of wax is left around each cell for the bees to finish it with. The bees make use of these improvements very readily and waste no time or honey with comb-building when supplied with foundation. After the cells are filled with honey they are emptied of their contents by the centrifugal honey-extractor, and given back to the bees to be refilled. This process is repeated as long as the season lasts, and the same combs can be used year after year. The result is an average crop per colony of 100 to 200 pounds of honey in a good season. Bee-keeping has now become an avocation, and honey production has become a profitable business. I am acquainted with bee-keepers whose product is from 25.000 to 50,000 pounds of honey annually.

Bee-keeping is divided into two branches, viz: queen-rearing, and honey production. The former requires close observation, strict integrity of the operator, and a thorough knowledge of the nature of the bee. Only a person with a strong inclination in that direction should follow exclusively that particular branch of the business.

### HONEY PRODUCTION

is generally the aim of all bee-keepers as the most remunerative part of the business, and should, therefore, be also understood. It is a fact that while bees are kept by many there are but few good bee-keepers, and while honey can be produced by almost every body in a good season, there are but few bee-keepers who can give a large average result per colony, or navigate their bees safely through a bad season or a severe winter.

The production of extracted honey pays best generally because it requires the least labor and expense. By good care the same honey-combs can be used year after year, and nothing is necessary but a good honey-extractor, a vessel or vessels for evaporation, and good barrels. Extracted honey will remain unchanged for any length of time if kept in a dry place, and there is almost no risk in transit when shipped; besides, more than double the quantity can be produced of ex-tracted than of comb honey, even if sections are filled with foundation.

If comb honey is our object, we have to use sections, fasten starters under the top-bars, watch the progress of comb-building, and straighten up whenever we find an inclination of the comb to one side or other of the section. Dark combs are unsalable; consequently only white comb honey should be produced. After all the sary heat for moulding their wax. Close observation has shown that bees must consume about one hundred pounds of honey in order to fill their which should have glass sides, and

hold no more than 20 to 25 pounds net. While one-pound sections are perhaps the most salable style for comb honey, two-pound sections are the next most desirable size. There is more or less desirable size. There is more or less loss connected by breakage with almost every shipment of comb honey, and if not sold during the same season the quality is apt to be damaged by the wax moth, or soiled by flies, dust, etc. However, the production of comb honey should go hand in hand, as experience will soon tell of which to produce the most.

Populous colonies in early spring are our "stand-bys" in the honey season, and to prepare for them we must commence in the fall. When bees are prepared for white, every one of their combs should be ½ or ¾ fullof honey, with the lightest combs toward the sides of the hive. I prefer for the middle, two combs with their upper halves well filled. It is immaterial if part of the honey is uncapped, and immaterial if our bees have access to cider mills. The principal factor in safe wintering is plenty of honey within easy reach of the cluster, and a dry, healthy air in the hives. This can be accomplished in several different ways. My own way during late years has been to cover the brood-chamber with the 3 (so-called) " third covers," with which most bee-keepers are acquainted. The boards have generally shrunk somewhat, while the battons have not, which will leave a crevice between them of about 1-16 inch, when all bee glue is scraped off in the latter part of fall. These crevices will permit the exhalation of the colony to pass off, while a straw mat or its equivalent placed on top of the boards will prevent draft, cause a gradual renewal of the air, and retain the necessary heat. If the covers are tight an inch hole should be bored in one or two of them. A winter pas-sage should be cut through the center of every comb, which is perhaps easiest done by running the blade of a pocket-knife through and turning it. The full width of the hive-entrance is to be left open. A small colony can be wintered in this manner with almost the same safety as a large one, provided we give them, between two division-boards, as many combs only as they can cover, and fill the spaces between the division-boards and the sides of the hive with soft hay or its equivalent. If combs of honey were placed on the outside of divisionboards, instead of hay, with blocks in front, they would become mouldy and affect the colony, while without the blocks the abode would be too cold in a severe winter. The second-story is placed over the brood-chamber, and roof on top as usual.

Bees prepared in the above manner will winter every time; and when opened on a nice day in March you will find their combs entirely free from mould, and brood-rearing hardly commenced, unless there has been very warm weather. Now move the heaviest combs nearest the cluster, put a division-board on each side, and contract the entrance. Division-boards used in spring should not touch the bottom by about three-

eighths of an inch, that bees may go around and help themselves to honey placed on the other side. Bees can better control the temperature of their hive when in close quarters, and nothing is a better stimulant for broodrearing than division-boards properly nsed. I put division-boards in and entrance-blocks on at a time when, in my estimation, cold weather is over. It is generally best that bees be kept from rearing brood too early, for a late frost may compel the ten to contract their cluster and thus expose their brood to being chilled, which sets them back, sometimes, for a whole season. A colony should have be-tween the division-boards no more when breeding goes on lively they should be looked after every 10 or 12 days, and a new comb inserted if the additional number of young bees hatched justifies it. Some experience is necessary to do this properly, and I should advise beginners to be rather too slow than too fast, as a great deal of mischief is done by a premature spreading of brood. All spreading is an evil unless the bees can cover their brood well during a cold night.

In a country like ours where white clover is the only source, we should prevent all early swarming; but in due time equalize our colonies. As some colonies will always be found stronger than others, combs with hatching brood and adhering bees from strong colonies should be exbe exchanged for empty combs of weak colonies; but this should not be done until our spring colonies are very strong, almost ready for swarming.

As our honey harvest begins at the latter part of May, or beginning of June, all the colonies shoud be ready for the emergency by that time, and every one of the combs in the broodchambers should be filled with brood before the honey-chamber or secondstory is put on. Some little items should here be mentioned which may be unknown to many. In no case will Lees from a hive with a virgin queen be accepted by a colony which has a laying queen. The last one of the former will be killed before the fight ends. Nor should a comb with adhering bees from a strong colony be added to a colony having a virgin queen, for she is sure to be killed. One had best wait until the young queen is laying, when combs may be added with impunity. The only precaution to observe is that the queen be not on that side of the comb against which the new comb is placed, as a too sudden contact with the new bees might en-danger her life. Do not let combs mostly filled with honey remain in the brood chambers during the honey season, but exchange them for empty combs and place them where the little brood they contain does the most good. A large brood-chamber is synonymous with a large number of workers, without which no large crop of honey is possible; while from a small brood-chamber we realize a large number of The combs of the brood-chamber of almost filled should be raised and new should, therefore, not be crowded with honey. When there is honey in

the blossoms there is nothing more inducive to coax bees into the second story than to have the brood-frames full of brood. Many people bave no idea what a tendency it has to prevent swarming.

In ten frames of the brood-chamber there is a hatching capacity for about 60,000 young bees. Between 2,-000 and 4,000 young bees are hatching daily during the season, and the queen being busy refilling with eggs the vacaut cells, never causes the swarming impulse; nor do the bees, provided there are enough empty cells for them to store honey in.

A friend stood by on June 27, 1885 when I was overhauling a strong colony of bees, which had the upper story full of honey and which would have swarmed the same day if the weather had been favorable. 1 broke out five queen-cells, two of which contained mature young queens which I at once introduced to newly made colonies. The queen having an aged appearance, was left in the hive, though it was full of brood and an apparently mature queen-cell: ten empty combs were placed in the second story. My friend thought that I had a chance for a swarm in a day or two; I replied that such was possible. but that it was more likely that the young queen would batch and lay eggs at the same time with her mother until the latter should disappear. Three days afterwards the young queen was quietly crawling about the combs without any signs of a swarm. Honey comes in lively from a large patch of wild mustard and linden trees about a mile off, while white clover is an entire failure.

To keep the brood-chamber full of brood, and the honey-combs above it emptied promptly when filled, or ex-changed for empty ones when they be-came heavy, is the best means I know of to prevent swarming and to realize a full crop of honey.

When comb honey is the object, the same precautions have to be observed in regard to the brood-chamber; every comb must be full of brood. Sections may be filled with thin-bottomed foundation to within a ¼ of an inch above the bottom. Full sections should be removed as they are finished, and replaced by new ones duly primed; or when a set of sections are almost finished, they should be raised and a new set placed under them. For one-pound sections 1 prefer a sectionbox, covering the whole brood-chamber. For two-pound sections, being larger, I prefer a section-box in three separate parts, or three section-boxes covering the whole brood-chamber. Bees, needing a certain amount of heat for comb-building, etc., form themselves into clusters for this purpose, and thrive best the less empty space is given them inside of their hives. It is therefore best to put on only one section-box at a time and to add another when the previous one is nearly filled, and so on; section-boxes

### EXTRACTING FROM BROOD-COMBS.

It is the greatest folly to extract honey from combs containing brood. A close examination will show every time that even brood in capped cells is injured. If you are ever so careful you will find larvæ floating on top of the honey; and while a mere dislocation in the cells may not kill the larvæ it cannot be beneficial, and we often find them removed by the bees on the following day. The larger the num-ber of our working bees during the honey season, the larger our honey crop; it pays, therefore, to take care of the brood before and during the honey season. The honey being se-cured we can afford to let the brood hatch before the comb is extracted. I have seen good bee-keepers-so-called -extract every comb of the brood-chamber even for an inch or two of honey stored under the top boxes; and I know of one case where an apiary of some 70 colonies was almost ruined by such foolish proceedings. A rainy spell of two weeks set in just after extracting was over, when most of his colonies were starved out, and those remaining were minus all uncapped brood. After every extract-ing there should be enough honey left in the hive to prepare for a rainy or cold spell. I admit that feeding is necessary in some cases, but I consider those who do the most feeding none of our best bee-keepers. What benefit does any one derive by reporting 100 pounds of honey or more per colony when he is obliged to feed 40 or 50 pounds of sugar to run his bees through the winter and up to the time honey is coming in the following spring? I do not want to feed whenever it can be avoided, because my time is worth something and sugar costs money. But I always take care to have a number of full combs on hand to supply a needy colony. We know that by their natural in-

stinct bees store honey above their brood most readily. As profit or the production of honey is our object, we use shallow brood-frames, frames just deep enough to warrant a safe wintering, *i.e.*, Langstroth frames. We have the honey-chamber commence just where the brood-chamber ends. Allowing under the top box of the brood-frames about an inch for honey, we have in a two-story frame-hive a breeding capacity for about 60,000 bees, which is synonymous with at least that number of a worker force, consequently, a large crop of honey, and not many swarms, but large swarms if any. Towards the close of the honey season the extent of the brood diminishes and honey takes its place, growing gradually but steadily in extent. The combs next to the sides of the hives become filled first; as brood hatches the cells are being tilled with honey, and bees and queen concentrate towards the center of the brood-chamber, where, at the approach of winter, we find the emptiest combs and the last brood of the season. Such will be the state of affairs if extracting has not been too close and the season has been an average one, and the precaution has been taken, at about the close of the sea-

son, to confine the colony to the broodchamber, and no feeding will be necessary. If, however, the extracting has been done too close, during the honey season, even if our fall yield is not below an average one, the bees will generally be unable to hind the necessary supply for winter. When everything is in our favor, precautions are unnecessary, as a matter of course, but to provide against reverses, shows the standard of the bee-keeper.

A number of bee-keepers argue in favor of eight-frame hives, and even smaller ones, claiming that they get more honey above eight, seven, six, or even five frames. They are correct to a certain extent. The queen occupies every cell in the brood chamber and keeps doing so until the season is past, and every drop of honey coming in can only be stored in the honey-chamber. The queen having a certain number of eggs to lay, is unrestrained at first and keeps the brood chamber gradual decrease in breeding takes place, and when winter approaches the combs of those colonies are empty, and the bees would die of starvation if not supplied with their winter stores. This takes away our profit, unless our time is worth nothing, and sugar considerably below its present market value.

Another fact needs mentioning in connection with wintering: It has been repeated over and over again that one or another wintering his bees successfully for years, while he lost all he had another season, wintering them in the same cellar and having prepared them in the same manner. Others again, wintered their bees successfully in double-walled or in chaff bives, while all they had were lost another winter. As stated above, successful wintering can be accom-plished in a number of different ways. I have tested the matter to my satisfaction, that, in our climate, it re-quires neither cellar, nor chaff hive. With plenty of food within easy reach of their cluster, and a dry air in their hives, bees can withstand a greater amount of cold than most of us imagine. My bees have been in well-made chaff hives, in double-walled, and in single-walled hives for at least 20 years, and in no spring have I been able to say that they wintered better in the one kind of hive than the other; but I am positive in stating that my strongest colonies in spring were never is chaff hives. Single-walled hives are handiest for many reasons, and have proved to me the most desirable of any, although during the winters the mercury has for weeks ranged in the twenties below zero. Cincinnati, 90,

### For the American Bee Journal. Some Troubled Bee-Lore.

### C. W. DAYTON, (116).

As Mr. Barber predicted, many beekeepers are "holding up their hands in horror" at wintering bees in a temperature of 60° to 90°; and Mr. Barber brands them "unmanly and un-just" in doing so. I winter my bees so that I can watch the motions of the bees, and the degree of hiberna-tion. Usually the bees appear entirely motionless, and continue so for months at a time. In a few instances the temperature was raised to 62° or 65°, and the bees remained as motionless as before; but there was an increase of the roaring. At other times a slight raise in the temperature from  $45^{\circ}$  set every cluster in the cellar in motion.

What puzzles me the most is, how Mr. Barber can maintain a temperature of even 60° for one-fourth of the time. After trying frost-proof cellars that were as air-tight as stone and mortar could make them, and filled with almost a colony of bees to the cubic foot, I find them unable to maintain a temperature as high as 50°. I have kept thermometers standing in the clusters of colonies nearly all winter, and it varied, when the bees quiesced, never above  $72^\circ$ , and some-times below  $60^\circ$ . As the temperature of the earth at cellar-depth is about 45°, and as cold is much the stronger element, it is plain that a temperature maintained by quiescing bees would not be very high; even if the cellar was one solid cluster of bees it might fall below 65°.

Other tests were made with thermometers where the temperature ranged from  $75^{\circ}$  to  $87^{\circ}$ , but the bees were in an unsettled condition, and bees cannot pass the winter in a state of activity. I believe that Mr. Bar-ber only claims that the temperature was  $60^\circ$  when the colonies were put was  $60^\circ$  when the colonies were put in, and  $90^\circ$  when they were put out, with no record of temperature be-tween times; until of late, since he practices wintering in a temperature of 45° to 50°. On page 293, Mr. W.

F. Clarke states what was said at the Detroit convention, and amplifies with what appears to me some pretty well de-formed ideas. Note the following: Mr. Itali's honey crop averaged 250 pounds of comb honey per colony; and Mr. Clarke thinks that Mr. Hall can go to other localities and equally as well. On May 20 Mr. Hall's colonies averaged about 6 or 7 combs of brood, and the honey-yield ends about July 20. On page 212 of the BEE JOURNAL for 1883 Mr. Fayette Lee says that he wants 9 combs of brood in every hive by May 25, and the manner in which it is said conveys the idea that he is able to get them. Mr. Lee's honey yield ends about July 25, and his average is less than 100 pounds per colony of extracted honey. I have always failed to get more than 7½ combs of brood in every hive by May 25, but there was an aver-age of 6 or 7 combs of brood in my

hives by May 20 this year. Now a query is this : Does Mr. Hall have his hives overflowing with bees, and yet not containing but 6 or 7 combs of brood? I think not. From this it may be seen that our stock of bees on May 20 is equal to Mr. Hall's, and his good management or excellent location for honey is the secret of his success. Mr. Clarke attributes the success to wintering in a high temperature.

In my experience it would be im-possible to store enough bees in a cellar to maintain a temperature of  $60^{\circ}$  if they were at all quiescent; and if they do not need to quiesce, then the hibernation theory goes immediately down. Not long ago a bee-keep-er told me that it would be an easy matter to maintain that temperature in his cellar, as potatoes had sprouted and grown. He had not tested with a thermometer. Now I hind that where potatoes are kept in a steady temperature of 50° they will not grow; but they may be kept in a temperature of 40°, and taken into a high tempera-ture for 48 hours, they may be re-turned to the low temperature and they will immediately sprout and grow.

From an experience in building up a large number of colonies in the spring, it has become my belief that the strength of a colony cannot be reasonably increased in a temperature no higher than 60°, as the labor in caring for brood wears out bees as fast as new ones can be reared. Even with strong colonies it is hard to make much progress before the arrival of May and June weather, or a time when one bee is enabled to care for several cells of brood.

Reports that colonies reared brood and came out more populous in the spring than they were in the fall, in my opinion, is "four-thirds" mistake; and placing the colony in the cellar on a cold day with a contracted cluster, and putting it out on a warm day would make such a mistake possible. Experience has taught many, also, that the amount of brood a colony has when it is taken from the cellar, is a very incorrect measure of the career of the colony in the future length of time which may not exceed 60 days.

Bradford, & Iowa.

" Don't Stop "-that is what many write to us about their papers, when their time is nearly out. Oue subscriber says : " It is not couvenient for me to send the money now to reuew my subscription. It runs out with this month ; but don't stop sending it. I will get the money to you within three months." Such letters are coming every day, and so for the present we have coucluded not to stop any papers until requested to do so.

-----

The Convention History of America and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.15.

Our Catalogue of Bee-Keepers' Supplies will be seut to any one desiring to get a copy. Send uame and address, plainly written, on

### Local Convention Directory.

Time and place of Meeting. 1886 July 16. - Marshall Co., at Marshalltown, Iowa. J. W. Sanders, Sec., LeGrand, Iowa. Aug. 31.-Stark County, at Canton, O. Mark Thomson, Sec., Canton, O. Sept. 4.-Sheboygan Co., at Sheboygan Falls, Wis. Mattle B, Thomas, Sec., Sheboygan Falls, Wis. Oct. 7.-Wis. Lake Shore Center, at Kiel, Wis. Ferd Zastrow, Sec., Millhome, Wis. Oct. 12-14.-North American, at Indianapolis, Ind. F. L. Dougherty, Sec., Indianapolis, Ind. Oct. 19, 20.-Illinois Central, at Mt. Sterling, Ills. J. M. Hambaugh, Sec., Spring, Ills. Dec. 1, 2.-Michigan State, at Ypsilanti, Mich. H. D. Cutting, Sec., Clinton, Mich.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings .- ED.

Bees Destroying Queen-Cells.-G. H. M., Burr Oak, 9 Mich., on June 25, ISS6. writes:

I had a colony that I divided on June 4, and it did very well until it swarmed, when it had 7 queen-cells; as fast as these hatched, the bees destroyed them. I made an examina-tion to see if they had a queen, but found none. I then went to a hive that had east a swarm and cut out 4 queen-cells and put them in the former hive, but they were destroyed. I made another examination, but found no queen. What shall I do with them ?

[You do not say which part of the divided colony it was that swarmed. You say, "as fast as the cells hatched, the bees destroyed them." Do you mean the cells, or the queens? You "made an examination ;" did you look for queen or eggs ? You say yon introduced more cells, and they were destroyed. Was there not a virgin queen in the hive at the time? Look for eggs and brood, and if you find none, put in a frame of eggs and larvæ, and 3 days after introduce a fertile queen or a queen-cell.-JAMES HEDDON.]

Bees Working Well.-Abe Hoke, Union City,+o Ind., on June 28, 1886, says:

Bees have worked well and gathered lots of honey when the weather was warm enough. I have one colony on scales, and on Saturday, June 26, it gained 7 pounds in weight. On Sun-day, June 27, it was cold all the forenoon; the afternoon was warmer, but the colony lost 1½ pounds in weight. There is an abundance of bloom, and if the weather should get warm soon we will have a pretty good crop of honey. So far I have had only seven honey. So far I have had only seven nectar, and the bees have been very lowing that instinct. I have noticed prime swarms, and no after-swarms. much inclined to robbing. I have no difference in the slant of the cells,

One came out, but I put it back, and cut out all queen-cells but one for the colony.

Honey-Dew.-J. J. Waller, Pleasure Ridge Park, & Ky., writes as follows on June 23, 1886:

I herewith enclose a few leaves from a grove of black walnut, which grows on my place, and ask that you have them examined and report the result through the AMERICAN BEE JOURNAL. These leaves, as well as all in the grove, have their upper sides covered with a sweet substance very much like dew in appearance. Upon the under side there are a great many very small, pale-green insects. I do not find any on the upper part of the leaf. I examined a hickory tree which is so situated that a part of the leaves are under or near the walnuts, and the rest some distance off. Those near the walnuts are covered with this sweet, while those at a distance have none. I believe this sweet is produced by the insect, but there is one difficulty in the way, and that is, that in order to reach all parts of the trees the substance must be ejected with considerable force, and I cannot see why the under side of the leaf would not contain it as well as the upper. I have 64 colonies of bees, and they are very busy gathering in this "honey-dew." It has been about three days since it first made its appearance. Some ten years ago, about this time of the year, and dur-ing weather very much like the present, this same kind of thing appeared on the leaves of this grove, and the bees gathered it in great abundance. but it was so dark and disagreeable in taste that it was almost useless. Perhaps I may report further when I see the outcome of this, to me, strange and unnatural affair.

[The insects are aphides, too crushed to be identified. They are probably Aphis punctatilla. They work on the under side of leaves, and, as in all such cases, the nectar falls upon the upper surface of the under-hanging foliage. As suggested by Mr. W., they often eject the nectar with some considerable force. The plant-lice were never more common and widely distributed than this season. I presume the dry season is very favorable to this growth and development. Usually this nectar does no harm to trees; last year seemed an exception in the case of blackberry plant-lice in Northern Michigan.—A. J. COOK.]

Report from Mississippi.-L. J. de Sobotker, Riverton, o Miss., on June 26, 1886, writes :

We have had some very changeable weather, being warm, sultry, chilly and rainy for the last ten days. There has been a check upon the supply of

been extracting right along, except the last week in May and the first in June, but I had to do so with the hive-entrances reduced to a one-inch passage, and heavy smoking in open-ing the hives. The bees cluster out heavily around the hives, and it is with some difficulty after a day or two that they go to work again. The hives are well ventilated. In bloom we have plenty of alders and white clover yet, some bell-flower-shaped vines in the woods, and plenty of very small shrubs with yellow bloom, something like the asters, but the bees bring only pollen from these. There is plenty of honey in the hives, but I have been sick for two weeks, and had no help in extracting. I have now 100 good colonies, 16 nuclei, and 26 colonies in box-hives.

Questions.-H.Weidman, Riverside, ⊙ N. J., writes thus on June 24, 1886 :

would respectfully submit the following questions to be answered in the BEE JOURNAL: I. Will the size and shape of the brood-frames have any bearing on the future successful wintering of our bees? 2. It being well known that bees in building comb always build the straight rows of cells horizontally, and the foundation being made the same way, would it not be an advantage to have the rows of cells run vertically instead of horizontally in the foundation ? Would this prevent the bees from slanting the cells along the top-bar of the frames? Would it make the comb stronger or weaker? Would it retard the work of the bees any, or not. in drawing out the foundation? Would it be possible to make bees build comb in this way without the use of foundation ?

[1. After experimenting and observing for 18 years, I am confident that if the depth of brood-frames has aught to do with successful wintering of bees, its influence is so slight that it is utterly obscured by other and far more potent influences. I prefer long frames to short ones, whatever their depth may be, because I believe that fewer and longer ranges of comb give the cluster better access to their stores during long cold spells in winter. This, however, is by no means a vital factor, and I advise constructing hives for the convenience of the apiarist.

2. I have used considerable of the Dadant comb foundation, made with cells in rows vertically, in which position many claim the foundation is less liable to stretch and sag. I have never noticed any difference in the despatch or excellence of comb-building and combs. Bees always row the cells horizontally, if not guided, but I think they gain nothing by following that instinct. I have noticed

though I have not observed that point carefully. I do not think it possible to induce the bees to build cells in vertical rows without the use of cells of full length .- JAMES HEDDON.]

Bees Bringing in Basswood Honey. -Joshua Bull, Seymour, O+Wis., on July 8, 1886, writes:

My bees have done fairly well thus far. When white clover should have been at its best, it was so hot and dry that it could not yield much nectar; then came a rainy week, and by the time the weather got settled again. the best of the bloom was gone. I think the bees are bringing in basswood honey to-day, and the prospects are good for an excellent harvest, if the weather should continue favorable for the ingathering thereof. We have had some extremely hot weather; on the 6th inst, the mercury was up to  $98^{\circ}$  in the coolest shade that could be found. The heat was very oppressive, thrifty growing plants wilted be-neath the scorching rays of the sun, and bees spread over the outside of their hives.

Prolific Bees, Lots of Honey, etc. -J. M. Hambaugh, Spring, +0 Ills., on June 29, 1886, writes :

This has been one of the most wonderful years in the history of the country, for increase of bees. Everybody's bees are swarming, swarming, swarming, until old nail-kegs, boxes, etc., have been resorted to, and many have absconded to the woods, and the consequence is, the woods are full. have managed to hold my own level-in about 125 colonies I have had 15 swarms, and extracted nearly 3,000 pounds of honey, and 1,500 pounds more waiting. Forty-nine colonies more waiting. Forty-nine colonies produced 1,065 in 6 days, and partially sealed the same. Cool weather has checked the flow at the present.

More Misrepresentations about Honey.-E. M. Hayburst, Kansas City,+o Mo., writes thus:

On page 420 of the "Home Hand-Book of Domestic Hygiene, by J. H. Kellogg, M. D., of Battle Creek, Mich.," I find the following unquali-fied statements, under the head of Adulterated and Artificial Honey:" "A large share of the strained

honey in market is adulterated with glucose, as well as are syrups. In some cases so-called honey contains not a particle of the genuine article, being simply a flavored syrup of glu-We have examined specimens cose. in which considerable quantities of sulphuric acid were present. It is stated that another very ingenious form of adulteration of honey has been quite extensively practiced. What is termed the foundation of the comb is made of paraffine, a wax-like substance made from petroleum. This saves the bees much labor, as they have but to build up the cells on the foundation furnished them. Then to make due amends.-ED.]

still further economize their time and labor, they are abundantly supplied with glucose in solution, which they have but to transfer to the comb, thus avoiding the trouble of gathering sweets from distant fields. \* \* \* This certainly caps the climax of adultantiana adulterations.

Dr. Kellogg, the writer of the above, is also Physician-in-Chief of the Sanitarium, at Battle Creek, Mich., and editor of their periodical, Good Health. The copy from which the extract is made, is of the 13th thousand, 1885. Dr. Kellogg's publications have a wide-spread influence, and the foregoing statements, which are mislead-ing and practically false, are calculated to do great damage to the interests of bee-keepers-an industrious and honorable class of people.

[As General Manager of the Nation-Bee-Keepers' Union, we have sent the above to Mr. Kellogg, with the following letter:

OFFICE OF THE NATIONAL BEE-KEEPERS' UNION, CHICAGO, ILL.,

DR. J. H. KELLOGG: *Dear Sir.*—By the enclosed "proof" of an article for the AMERICAN BEE JOURNAL, you will see that we have a "bone to pick" with you. You have simply repeated the falsehoods of Prof. Wiley, who has admitted that he wrote them as scientific pleasantries," never thinking that any intelligent person would imagine them to be facts !!

Your assertion about paraffine comb being filled with glucose is a little im-provement upon Prof. Wiley's; he had it made complete comb, filled with glucose and capped by ma-chinery." You assert that it is simply comb foundation, built out by the bees and by them filled with glucose, etc.

You should be well aware that bees will not take glucose when honey is to be obtained, and only when starving to death will they touch it.

You ought to know that the comb foundation almost universally used by bee-keepers is to aid the bees hy giving them wax sheets just when needed to receive the pure boney when it is found in the flowers, or else to aid the queen to keep up the strength of the colony, by giving her cells to lay in at the proper time—and is made of pure beeswax. If any adulteration of it can be found it does not amount to it can be found it does not amount to one pound to a thousand pounds of the pure. Your statement is there-fore not true, and o great damage to an honest industry. I hope you will at once retract it, and by all proper means counteract its evil influence.

### Yours, etc.

### THOMAS G. NEWMAN, General Manager.

f We are surprised that Dr. Kellogg should make such assertions-without the slightest shadow of proof. If he is honest, however, he will be glad to

Dry Weather.-P. Sunday, Goodells. o+Mich., on July 5, 1886, says :

The honey season has been good up to the present time, but it is getting very dry here and if we do not get rain soon our honey-flow will be cut short. Basswood is just commencing to blossom, but I do not think we will get much honey from it on account of the dry weather.

### Bees in a College Building.-D. R.

Rosebrough, Casev, O+ Ills., writes:

In a village in this county is a college building that was built 25 years ago. It is a large, two-story brick, and has old-fashioned cornice. Several years ago some bees took possession of it, and now they are working in it at live different parts of the cornice. I should like to know whether they swarm, or do they move around the building from the one colony. The cornice is some 2 feet high.

[I have had no experience nor opportunity for observation in this line, but from what I know of the instincts and habits of bees, and from what I have been told by persons that had no object in deceiving, 1 conclude that bees in these large cavities do divide, becoming separate colonies, each with its own queen, and sometimes pass out and in through a common entrance, as they are seen coming from ledges of rocks along some of our American rivers. If the five different places of ingress and egress are quite a distance apart, and a good working force passes each, I should conclude that there was more than one colony and one queen in the cornice.-JAMES HEDDON.]

Bee-Keeping in Virginia.-J. Few Brown, Winchester, 5 Va., on July 2, 1886, says:

The bees in this section came through the winter stronger than for a number of years. Our honey sea-son is nearly over; hail, rains and cool nights have curtailed the surplus yield considerably. We have had yield considerably. We have more swarms than for five years.

Good Indications .- John Moller, Sr., Fremont, O+ Neb., on July 1, 1886, says :

I commenced in the spring with 60 colonies, and increased them by natural swarming to 120 colonies. The prairies are covered with a profusion of bloom; the weather is sultry and hot. The bees are storing fast; every indication of a good honey season.

Frank Cheshire's new book on Bees and Bec-Keeping, can be had at this office .-Vol. 1, bound in cloth, \$2.50, postpaid.

Issned every Wednesday by

THOMAS G. NEWMAN & SON. PROPRIETORS.

923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAGER.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, he sure to give the address we have on our list.

A New Crate to hold one dozen one-pound sections of honey .- It has a strip of glass on each side, to allow the honey to be seen. It is a light and attractive package. As it holds

but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 cts. per crate. Glass 1%c. per light, extra.

Italian Queens,-We can supply them hy mail, postpaid, at the following prices: Untested, \$1.00; Tested, \$2.00; 6 Tested Queens for \$9.00. Orders filled at once.

Special Sizes of Sections eause much confusion ; and if such luxuries are indulged in they should be ordered long before the "rush" comes, in May and June. Special sizes cost more, and when ordered during the "rush," create considerable dissatisfaction by the consequent delay in getting them made. We have a lot of special sized two-pound sections 514 inches high and 6 inches wide, narrow tops, and square groove, which we can ship instantly at \$3.50 per 1,000. They are 7 to the foot.

### System and Success.

2 All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

 
 For
 50 colonies (120 pages)
 \$1 00

 "100 colonies (220 pages)
 1 25

 "200 colonies (420 pages)
 1 50
 For

The larger ones can be nsed for a few colonies, give room for an inerease of numbers, and still keep the record all together in one book, and are therefore the most desirable.

SimmIns' Non-Swarming System is the title of a new English hee-book. The anthor claims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles. and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

### 2 Our stock of Simmins' pamphlet on Swarming is exhausted, with several orders unfilled. We have more on the way, and as soon as they come all orders on hand will he filled.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and hinding are excellent, and the book is well worth a dollar, To any one sending us two new subscribers besides their own, with \$3, for one year, we will present a copy of this valuable book.

Now is the Time to Join the Union. -Let every bee-keeper send for a copy of the Annual Report and a Voting Blank-fill it up, and become a member. It is to the interest of every one to do so. The dues are only 25 cents a year ; and it is intended only to call for one assessment (of \$1.00) each year. Send to this office for the Report and Voting Blank.

To any One sending ns one new subscriber with their own renewal (with \$2.00), we will present a copy of the new "Convention History of America."

Job Lot of 2-1b. Sections, Cheap.-See our offer of a job lot at \$3.50 per 1,000. on page 448. If you can use this size of section, there is a bargain for you. They can be shipped the same day the order is received.

Red Labets for one-pound pails of honey, size 3x412 inches. - We have just gotten np a lot of these Labels, and can supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apianst printed on them-by mail, postpaid.

### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 10 a.m., July 12, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO

HONEY.—The new crop of honey is coming for-ward quite freely, and looks well; demand is light, however, at 14 to 15c. Extracted, 5 to 7c. per lb. BEESWAX.—Scarce at 25c. B. A. BURNETT, 161 South Water St.

#### NEW YORK.

NEW YORK. HONEY.- We now quote : Fancy white comb in 1-lb. sections, 12@13c.; in 2-lb. sections, 9@10c. Fancy hnckwheat honey in 1-lb. sections, 90; in 2-lb. sections, 70@c. Off grades 16@c. per lb. less, Extracted, white,6@7c; huckwheat, 5@5%c. Cali-fornia, 5@c.; Soutbern, as to color and flavor, per gallon, 50@60c. BEEEWAX.-27@28c. McCAUL & HILDRETH BROS., 34 Hudson St.

BOSTON.

HONEY.-Oae-lh. aections, white clover, 13@15c; -pound sections, 11@13c. Extracted, 6@8c. BEESWAX.-25 cta. per lb. BLAKE & RIPLEY, 57 Chatham Street, 9

SAN FRANCISCO. IIONEY.-New hore is coming forward freely. The quality is exceptionally fine and the crop will be large. White to extra white comb.9011c. traced. 4@4%c. for white ; 3%@3%c. for amber. BEESWAX.-22@230c. 0. B. SMITH & Co., 423 Front Street.

### DETROIT.

HONEY.- There is a little new hooey in the market, and is selling at 13 cts. for white in 1-lb. sections. The demand is limited, however. BEESWAX.-Firm, at 25 cts. per pound. M. H. HUNT., Bell Branch, Mich.

### CINCINNATI.

CINCINNATI, HONEY.—The demaod for extracted honey has been very light of late, but it seems to be improv-ing gradually for manufacturing purposes. There is considerable honey to the bands of commission merchants, and prices are very low—3½ to 7 cts. per pound is the range of prices. Prices of comb honey are rominal. BEESWAX.—Arrivals are good and the demand fair. We pay 18@22. for fair to choice yellow. C. F. MUTH & SON. Freeman & Central Ave.

#### CLEVELAND.

HONEY.--Within the last two weeks honey has not sold so readily, owing to the aear approach of the new crop and the uncertainty of the new pri-ces. Best white, 1-1b., old boney moves slowly at 14 cts.; no demand for 2-1bs. Extracted, 6@7c. BEESWAX.--22 to 25c A. C. KENDEL, 115 Ontarlo Street,

### \* KANSAS CITY.

HONEY.—Our new crop is arriving freely and is very fine. Sales ure slow and prices low. One-lbs., white clover, 14c: dark 1-lbs., 10 to 11c.; 2-pound white clover, 12c.; dark 2-lbs., 8 to 10c.; California 2-lb., white sage, 10 to 12c.; dark 2-lbs., 8 to 9 cts. Extracted white clover, 5 to 6c.; dark, 3 to 4 cts.; California white sage, 5 to 5½c.; dark, 4 to 4½c. BEESWAX.—20 to 22c. CLEMONS, CLOON & Co., cor. 4th & Walaut.

### MILWAUKEE.

MILWAUKEE. HONEY.--The demand is limited but the supply is very much better lo quantity as well as quality. The new crop receipts are very fine. We quote : Choice white in 1-b. sections, 16%17c.; same in 2-b. sections, 15%16c.; dark, nominal, 10@15 ets. Extracted, choice white in tho, 7@9c.; same in barrels und kegs, 6%7c. BEESWAX.-24@25c A. V. BISHOP, 142 W. Water St.

### SAN FRANCISCO.

SAN FRANCISCO. TIONEY.—The market is very much depressed. Sales of water white extracted have been made at 3%c. Some of the honey coming forward is in light weight in so poorly soldered as not to bear handing, occasioning trouble and expense to the receiver and waste and loss to the shipper. White to extra white comb. 8 to 10c. Extracted, white liquid, 3%c:, light amber colored, 3 to 3%c. BEESWAX.—2006.23c. SCHACHT & LEMCKE, 122-124 Davis St.

The Illinois Central Bee-Keepers' Association will hold its next meeting at Mt. Sterling, Ills. on Tuesday and Wednes-day, Oct. 19 and 20, 1886. J. M. HAMBAUCH, Sec.

The next annual meeting of the Michigao State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTINO, Sec.

## Advertisements.

WILL sell 400 full Colonics of Bees in lots to suit buyer; or will sell Apiaries already stocked up. Now is your time. Address, H. R. BOAR DMAN, 28Atí EA. TOWNSEND, Huron Co., O.

STRONG 3-Frame Nuclel.-1 will now sell my 3-frame Nuclei (full-sized frames), with tested Italian Queens, at \$5,00 for 2, shipped by Express In one box. Safe arrival guaranteed. Address, 28Ait REV.J.E.KEARNS, Morning Su, Jowa.

CoLONIES of Italian Bees in 10-frame hives at \$5.00; Tested Queens at \$1.25; Untested Queens at 75 cts.; 2-frame Nucleus (no queen), \$1.50; three-frame Nucleus (no queen), \$2.00. Address, OTTO KLEINOW, (Opp, Ft. Wayne Gate), DETROIT. MICH. 28Atf

It makes the finest extra thin Foundation for comb honey. For Sale by

THOS. G. NEWMAN & SON,

923 & 925 West Madison Street. CHICAGO, ILL.

We Have Received a photograph of the apiary of Mr. John II. Thornton, of Lima, Ills. It shows 140 eolonies of bees, but he says there are more over the hedgefence. That is pretty well for a young man of 25 summers—and unmarried, too. He says he has been making bee-keeping his special business for six years, and that the prospect is good for this year's crop to amount to eight or ten thousand pounds. We bave put it in our office album.

The Election of officers for the Union resulted in an average majority of over 100 in favor of the officers of last year. All the votes which were not for the re-election of last year's officers were very seattering ; no one receiving over a dozen votes, and it would be quite uninteresting to publish the list of names. There were several "blanks," either wholly or in part; the only unanimous vote being that for manager. This must be interpreted as a quanimous vote of confidence in, and indorsement of all his official acts during the past year. He accepts it as such, and while he would have welcomed any good manager as his successor, the unanimity exhibited by the vote nerves him up to continue the battle and "fight It out on that line," cost what it may.

The Austro-German Bee-Keepers' Association meets this year in Troppan, Austria. We acknowledge the receipt of a very pressing invitation to he present, and would be glad to avail ourselves of the opportunity were it possible to do so-but that is out of the question, we are sorry to say. Mr. C. Ernst Muhlan, at Troppan, has also very kindly urged us to accept an invitation to make his residence our homo during the convention. We should enjoy that very much, and it would be a great pleasure for us to renew the acquaintances made at the meeting of the Austro-German and other European conventions of seven years ago; but we dare not entertain the thought. We feel very sorry to deeline, but it must be so, and we bow submissively to circumstances.

The California Fruit-Bees Lawsuit in San Bernardino, has been again deeided against the bees. It was taken to the Superior Court on au appeal, and Mr. Bohn writes us that his attorney says that the decision really beats the respondent as well as the appellant, and that it will probably rest there. We have advised Mr. Bohn to make no move unless the fruit-men make such necessary. They expressed considerable surprise that the National Bee-Keepers' Union had a hand in the suit, and we imagine they will not be so anxious to fight the whole fraternity as they were to annoy oue member of it. The expenses of the suit and appeal have amounted to \$384.50; of this the Union has paid one-half and Mr. Bohn the other half. We shall now let the matter rest, unless the fruit-men make a stir. We have not yet received the judge's decision. When it comes we will publish it.

Mr. Bohn remarks thus concerning some of the advice that has been offered by some of our correspondents:

As to Mr. Heddon's article, where he speaks of compromise, I think I can stand the test in this case. I have allowed these very fruit-growers to run two large irrigating ditches through different parts of my place, without charging them any damages. As to Mr. Hutchinson's article about bees troubling grapes but for a few days, it is a mistske, as there are two erops to dry. In from ten to twenty days of the first drying, the second comes. The latter dries in from fifteen to thirty days, if they dry at all, which they do not always do. I have known them to be stacked up ten trays high for a week at a time on account of foggy and rainy weather, until they resembled a grape skin full of fermented juice and were thrown away.

So I, reeognizing the impossibility of confining my bees to keep them from the fruit, offered to remove my bees if they would buy my place, asking them but one hundred dollars more than I paid for it two years before. They then offered me twenty-five dollars less than my price, at the same time making nse of this bluff, that I could not keep bees on the place anyway, when I told them that I thought I could, and that I would keep them there as long as the lsw allowed me to do so; saying also that if I could not keep them there I could not keep them anywhere lawfully.

Sending Queens to Canada by mail is a matter that may be arranged in the new treaty soon to be made between the United States and Canada. On page 459 the Hon. N. J. Hammond, Congressman from Georgia, promises to aid us in getting the matter straightened out.

The Canadian Bee Journal, in its last issue, promises to see that no obstructions are made on the Canadian side. Mr. J. R. Cuthbertsen, of the Toronto postoffice, says that he finds nothing to hinder bees from belng seut in the mails, when eoming from the United States. He also says that the Inspectors of Customs there have not been notified of any restrictions, etc. He has also written to the Canadian Postal Department about it, and has received this reply :

SIR:--I have to inform you that the Department does not object to the bringing of queen-bees into Canada by mail, provided they are put up in such a way as to guard against their causing any inconvenience or damage in the handling of the mail.

This shows that the trouble comes from the over-officiousness of the officials on this side of the line, which we expect will soon be over-ruled, by the influences already brought to bear on them—the National Bee-Keepers' Union and its friends. Earthquakes in New Zealand.—On June 9, the natives of Faranza, Auckland, were awakened at 2 a.m. by repeated vivid fiashes of lightning, which continued at rapid intervals up to 4 a.m., when a tremendous earthquake occurred, followed quickly by others. The earthquakes continued to follow one another in quick succession up to 7 a.m., when a leaden-colored cloud was observed advancing from the south, spreading out until it covered the sky. While still moving it hurst with the sound of thunder, and shortly after showers of fine dust began falling. An exchange says :

falling. An exchange says : The severity of the shocks led many of the people to believe that the island would sink into the sea. The sensation exportenced is said to have been fearful beyond description. Immediately after the first shock the inhabitants rushed frantically in all directions. When the second shock came the entire country for miles around was lit up by the glare from a volcano which had suddenly burst into activity. The scene was as grand as it was awful. Huge volumes of smoke, illuminated with flames, simultaneously burst forth from a range of mountains over sixty miles in length, and above the smoke could be seen huge masses of flre resembling meteors rushing through the sky.

For the first time in tradition the extinct volcano of Rhapeha was awakened into activity. The entire country, over an extent of 120 mlles long by 20 in breadth, was nothing but a mass of flame and hot, crumbling soil, which in places rose to the height of 4,000 feet, capped at the highest point by the Tekopha Geyser, said to have been one of the grandest in the world.

been one of the grandest in the world. Numerous small villages were totally destroyed. Wairoa was covered to a depth of ten fect with dust and ashes. One hundred and seventy persons are known to have lost their lives. The loss of extle starved to death from the destruction of pastures by the dust is very heavy, and great distress exists throughout all the Auckland Lake district. In most eases where bodies were found they were dead.

Signor Agostino Mona, one of the most extensive queen-breeders of Italy, died at Bellinzona, Tessin, Italy, on May 28, 1886, after a short illness. Signor Mona was a distinguished apiarist, and a noted author. He was a pains-taking student of apicultural science, and a professor of languagesspeaking fluently French, German and Italian. Signor Mona was known quite extensively a quarter of a century ago among the aplarists of America, as the breeder of many of the imported queens which were then received on this side of the Atlautic Ocean. What a change-a quarter of a century makes ! How many of those who were then prominent in the apicultural world, have passed beyond the stage of action !

"A Mountain of Strength" is what the Canadian Bee Journal calls the "National Bee-Keepers' Union." In the last issue of that paper, the editors remark thus:

That the Bee-Keepers' "Union" is in itself a mountain of strength to the bee-keepers of the United States, is a fact beyond dispute. The postal laws were so construed during the past month that a few bees were not permitted to go with the queen by mail, and this meant nothing more nor less than that the traffic in "queens by mail" was put an end to. Thanks to the "Union" and the efforts of one or two influential gentlemen outside, the barrier has now been removed, and the necessary attendants allowed transmission along with the queen.

### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.—ED.]

### Ants and Shading Hives.

Query, No. 280.-1. What harm do ants in bee-hives? 2. Is there any danger of having too much shade for bees under spreading beech-trees where the sun only reaches the hives very early in the morning and late in the evening ?-W. J. A.

1. See answer to Query, No. 279. 2. I think not.—G. L. TINKER.

1. They annoy the bees when the hives are opened. 2. I cannot say, but I think not.-W.Z. HUTCHINSON.

1. None at all, but they bother the apiarist. 2. No, if they have a good flight-passage.—DADANT & SON.

Ants do not injure my bees so far as their prosperity is concerned, but it makes bees cross and disagreeable when annoyed by the presence of ants.—G. W. DEMAREE.

I cannot say that they do unless they consume some honey. I think they act as scavengers. I have kept them away by putting tansy in and around the hives.—H. D. CUTTING.

1. See answer to Query, No. 279. 2. Not during June, July or August, but I would not like it in the spring or fall. I use and prefer a movable shade.—JAMES HEDDON.

1. The small ones do no harm except to annoy the apiarist. One kind of our large black ants will gnaw into the wood of the hive, and if molested they will fasten to the hees' legs so securely that the bees cannot get rid of them. This kind of ant I kill when they are found. 2. Bees thrive better in the sun. Too much shade is a detriment.—G. M. DOOLITTLE.

1. Ants have been plentiful in my apiary at times, but have never harmed strong colonies, as I could see. 2. I prefer a board for shade, but I do not think that trees will do any harm in the heated season. In winter they will probably do no harm as the bare limbs will not shade the hive to any extent.—J. E. POND, Ju.

1. Usually they do little or no harm. In the South, however, they are said to worry bees, and sometimes even to kill the queen. I keep them away as given in Query, No. 279. By using poisoned syrup in a vessel so made

that ants can enter it, but not bees, the ants are easily killed. 2. I believe that shade-boards are better. Such shade as mentioned makes it too damp.—A. J. COOK.

1. They crawl over one's hands and bite when opening the hive; they also bite the bees. At other times they seem to do no harm. 2. I have had hives become moldy from too much shade. The hives may be kept so cool that more bees must stay at home to keep up the heat of the hive than if the sun shone on the hives longer.—C. C. MILLER.

### Getting Rid of Laying Workers.

Query, No. 281.—What is the best way to get rid of a laying worker when it once becomes established in a hive ?—L. J. M.

Introduce a good fertile queen by caging her 48 hours.—A. J. Cook.

Break the colony up and establish a new one, is the quickest and cheapest in the end.—G. M. DOOLITTLE.

Give a comb or two of brood and the adhering bees, and introduce a queen.-W. Z. HUTCHINSON.

Put in a small swarm, queen and all, or introduce a cheap queen.— DADANT & SON.

This is quite a long story; two efficient methods are given in my book, "Success in Bee-Culture."— JAMES HEDDON.

Keep the bees supplied with all the brood they can cover till they rear a queen; or unite them with a colony having a good queen.—C. C. MILLER.

Take the frames a few rods away, shake off all the bees, and give them empty combs with one of young brood in all stages if possible; or better still, give them a queen or a queencell ready to open.—H. D. CUTTINO.

Remove the combs with bees adhering to your comb-box, and supply their place with two or more frames of hatching brood with accompanying bees. Now carry the combs in the comb-box a few rods away, and shake the bees down on the ground and let them shift for themselves. I have never seen this plan fail. They will now accept a cell or queen as readily as any other colony or nucleus.—G. W. DEMAREE.

If desirable to save the colony I should change places with a strong colony and give a fertile queen. Where but few bees are left, I should take away the combs if it was not convenient to unite them with two or more nuclei. This latter plan never fails, but the queen must be introduced in the usual way by caging.— G. L. TINKER.

I have had experience with only one laying worker, and I got rid of that one by introducing a queen to the colony. Probably the best way is to break the colony up, giving a frame of comb and adhering bees, each to as many colonies as there are frames. -J. E. POND, JR.

### Queens Mating in the Hives.

Query, No. 282.—Will queens leave the hive with swarms before they are fertilized? 2. If their wings are clipped at the time of swarming, will they mate in the hive ?—T.A.

1. Yes. 2. No.-JAMES HEDDON.

1. Yes.-H. D. CUTTING.

1. Yes. 2. No.-G. L. TINKER.

1. Yes. 2. No.-G. M. DOOLITTLE.

1. Yes. 2. I think not. - W. Z. HUTCHINSON.

1. Yes. 2. No.-DADANT & SON.

1. Yes. 2. Not generally.— A. J. Cook.

1. Yes. 2. No.-C. C. MILLER.

1. Yes, all after-swarms have virgin queens. If you clip their wings before they are mated they will never mate in the natural way. They never mate in the hive—never. -G. W. DEMAREE.

The fecundated queen leaves with the prime swarm; a second swarm always has an unfecundated queen. If the so-called second-swarm does not issue till its queen has mated with a drone, that swarm is a prime swarm, although the second one out of the same hive.—J. E. POND, JR.

### Home Market for Honey.

**127** To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remunerative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the heekeeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who huys a package of honey, will sell almost any quantity of it.

**CONTINUES OF CODIES** OF the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

When Renewing your subscription please try to get your neighbor who keeps hees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a **Binder** for the BEE JOURNAL to auy one sending us four subscriptions—with \$4.00 direct to this office. It will pay any one to devote a few hours, to get subscribers.

Explanatory .- The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is located near the center of the State uamed; 5 north of the center; 9 south; 0+ east; •O west; and this of northeast; `O northwest: O southeast; and 9 southwest of the center of the State mentioned.

### For the American Bee Journal. **Extra Colonies or Manipulation**, Which ?

### G. M. DOOLITTLE.

Not long ago a friend from the eastern part of this State wrote me that he was going to keep more bees than he had formerly kept, and do less work with them, for he believed that double the number of colonies would give him fully as much if not more honey than he had been getting, even if he did not manipulate them at all. He said that he believed that the system of management which I recommended caused a greater recommended caused a greater amount of extra labor and manipulagreater tion than there was any use of, and tion than there was any use of, and henceforth he should adopt exactly the reverse of what I gave in the bee-papers, and put more bees into his field, so that he would get the same amount of surplus as before, with very little labor. All that would be required would be the investing of little more capital in the share of the times, and soon would be, if I was not already, the only one who would work on the plan he had previously used.

I have not quoted his words, but I have given the substance of his letter. As this came from a friend who was well meaning toward me, it behooved me to consider the matter a little, and if I were on the wrong track to get right. After carefully looking the matter over I believe that there is one item regarding these extra colo-nies which the advocates of it forget, that is great enough to more than pay for the manipulation, so that the investing of capital in more hives for the extra number is worse than thrown away. The item I allude to is that each of the extra colonies put in a field in order to secure the honeysecretion from a given area with but little or no manipulation, costs at least 60 pounds of honey each year to support. The question is, which is the cheaper, a little extra manipula-tion, or the extra colonies, hives, etc., and the honey that they consume?

Suppose that 100 colonies produce an average yield of 50 pounds each, and by so doing secure all the nectar in a field, year by year. This will make 5,000 pounds of surplus as our he or she chooses, for the matter of

share of the field, while each of the 100 colonies will use 60 pounds, or 6,000 pounds as a whole, as their share to carry them through the year. Thus we fail to get one-half of the honey from our field, by employing an extra number of colonies.

On the other hand, if we employ the "manipulation" or economy plan, which our English friends do, of getting the same amount of produce off an acre of land that we Americans do from three or four, we shall find our statement thus: 11,000 pounds is the product of our field; 50 colonies are all that are needed with good manipulation to get it. Then 50 colonies must use 3,000 pounds of this for their support, leaving 8,000 pounds for the manipulator. It will be seen that the manipulator gets 3,000 pounds of honey for his manipulation, and uses little if any more time than he would use on the 100 without manipulation; hence from the stand-point of over-stocking a field, my system is 3,000 pounds ahead of my friend's plan of keeping an extra number of colonies. The same holds good, be the number kept great or small.

A man can care for one-half the number of colonies on my plan as easily as he can for double the num-ber on my friend's plan, and this same one-half will give the apiarist as good results in dollars and cents as will the whole of my frieud's, and save the extra honey consumed by the extra one-half of the number of bees, as clean gain to the bee-keeper. This is not mere fancy, but facts which the success of the two plans prove, as will be obvious to all who have closely watched the reports in our bee-papers for the past ten years.

My friend says that I am the only one, or soon will be, who is working on my plan, and that I am falling behind the times—as if that detracted from it. I care not whether I am behind the times or ahead of them, so long as my plans give me a larger yield of honey for the colonies kept and labor performed, year after year, than do the plans of those who recommend keeping an extra number of colonies with little or no manipulation.

While at a large bee-convention not many years ago, as the proprietor of a large apiary (which numbered nearly 1,000 colonies) was telling of his plans of working, a man sitting by my side kept whispering to me. I chided him and asked him if he was not anxious and asked him if ne was not charge to hear the plans adopted by so large His reply was, "Why an apiarist. His reply was, "Why should I care for his plans so long as I succeed in getting on an average each year more honey from my 200 colonies than he does from his thousand. Two hundred colonies properly worked will give more honey to the apiarist than 1,000 will not so worked." I could quote others who I know are working on the same plan that I do, believing that by so doing they can course the greatest amount of income with the least capital and labor, but that would not necessarily help the

being alone has little weight with me. I simply give the plans I use to accomplish given results, and all are free to use them or let them alone, as they see fit; neither do I give them because I have a supply business back of them that needs bolstering up, for I manufacture no supplies for sale, but I give them to others as part payment for the debt I owe to those who wrote years ago, and to whose writings 1 owe the success I have had in hee-culture.

My plans are often called expensive, and my bive and fixtures complicated; but I believe there is as little labor and cash outlay by my plan of pro-ducing \$1,000 worth of comb honey as any plan in existence. As proof, I will say that from less than 50 colo-nies of bees (spring count) I have cleared over \$1,000 each year, for the past 13 years, taken as an average. have not hired 13 days' labor in that time in the apiary, nor had any apprentices or students to do the work for me, although I have had many applications from those who wished to spend a season with me. Besides my labor with the bees I take care of my garden and a small farm (29 acres); have charge of my father's estate; run my own shop and steam engine, sawing sections, hives, honeycrates, etc., for myself and neighbors; write for seven different papers, and

answer a host of correspondence. The old saying is, "The proof of the pudding is in the eating," and so I now say, as I have said before in these columns, that all I have to recommend the plans I use, is the success attained by them. Borodino, N. Y.

For the American Bee Journal.

### Does Bee-Keeping Pay? etc.

### J. H. ANDRE.

This question is often discussed at conventions and by apicultural papers, and probably no avocation has so much difference in opinions in regard to profit and loss as bee-keeping; also, if we look into the wide range of circumstances to be taken into consideration in answering this question, we do not wonder at the various opin-

ions in regard to it. First of all in bee-keeping, is a place for an apiary easily accessible to and fro for the bees, not blocked with trees or buildings. Some may succeed well in such places, but they would succeed far better if the bees were given a free chance. Second, is a place sheltered from high winds? Third, is there an outlying pasturage? and if possible to the westward, for bees will not thrive as well that have to go eastward for their supply of stores, as nearly all of our heavy showers are from the west, and bees that go eastward do not get warning at all times to reach the hive and are caught in the storm; and if late in the day and a cold night many die. Add to these a skilled apiarist, and in a good season success is certain.

I quite often hear the expression, "Why, John, your bees do well. You

make bee-keeping pay. Well, there is more money in bees for the same amount invested than anything else in the world." O, blissful ignorance! I have tried it and know that if my health would admit I could make more chopping cord-wood, peeling tan-bark, hewing railroad ties, or any branch of farming. And bee-keeping is no easy work either; but there is one thing about it for one in poor health, the work, with the exception of marketing honey, is all at home; but to the one who intends to start in bee-keeping to get rid of work, let me say, do not start at all; it is the most weary, watching occupation of any I ever tried. Making maple sugar any I ever tried. Making maple sugar in the backwoods, and carrying sap by hand, is fun by the side of bee-keeping. Only for experimenting I should have quit before this; as it is, I keep only a few colonies. The poison left in the system by the stings of the bees, I am satisfied sow seed for many discases, especially of the for many diseases, especially of the nerves.

Two years ago a neighbor called on me one evening accompanied by his wife, and said: "My wife wants me to purchase some bees, and has perto purchase some bees, and has per-suaded me to come and see yon as to how the business pays. "This man was a blacksmith by trade, and I quickly answered, "It will not pay you." He seemed greatly surprised until I explained that the grim and dirt necessary to his occupation the bees would not like, and his customers would not like to wait for him to would not like to wait for him to attend the bees, either, when they were in a hurry. He concluded that he did not want any bees.

### MARKETING HONEY.

One of the greatest curses upon bee-keeping is the holding of honey by some until fall or spring. I went to market with my first lot of honey on June 20, and had hard work to dispose of it on account of so much old honey. Now it might just as well be shoved through as to keep the market full of old honey, and one year's product putting a curse on the next.

Some prefer a few sections in a case well filed with honey, instead of a case full of sections half-filled with comb; I will take the latter every time, two to one, for early honey the next season.

In my article on page 408, third column, and in the ninth and tenth lines, it should read "an easy prey for worms," instead of "for swarms." Lockwood, 9 N. Y.

### New York World.

## Description of the Carniolan Bees.

### FRANK BENTON.

The bees of Carniola are noted for their great gentleness. They only rarely resent manipulation, and need very little smoke to subjugate them. It might be thought that they were lacking in pronounced qualities, but on the other hand, they show decided traits peculiar to themselves and ac-companied by distinctive markings,

and are therefore as justly entitled as any bees found in Europe to be called an established race.

The typical, select Carniolan queen has a deep copper or bronze-colored abdomen, thorax thickly set with gray fuzz, large, strong wings and a large, stout-looking body. Carniolan queens are larger, on the average, than those of any other race, having especially broad abdomens. Some queens are advantage of the second second second second and a second of the common race, do not produce bees in any way inferior to other Carniolan queens. Also pure Carniolan queens are occasionally met with which are as yellow as Italians; yet they invariably produce workers and drones which are distinctively Carniolan.

In all parts of Carniola some queens are found which produce bees having the first segment of the abdomen somewhat rusty-red in color, and they are as often seen among the finest and most prolific queens as among those of any other grade. Nevertheless, variation in color and quality is less with Carniolans in their native land than with Italians in Italy. Yellow workers are not found in Carniola, while black bees-natives, too, are not imported—exist in Italy. The re-markable size and general bronze color of Carniolan queens, in contrast with the grayness of their progeny, make it easy to find them on the combs. They are exceedingly prolific, and herein lies one of the very valuable qualities of this race.

The drones are veritable "gray-coats," and stout, active fellows. having especially large wings.

Carniolan workers are silver-gray in color, large-bodied and strong-winged. The thick fuzz of the abdomen is disposed in light-colored bands, and as dark drab is the ground color of the bee the effect is a decidedly ringed

The following are the good qualities of the Carniolans: 1. The race is a prolific, well-established one. 2. The workers are gentler than any other bees. 3. They submit more readily than other bees upon the application of a small amount of smoke. 4. They are excellent comb-builders, and their sealed combs are of snowy whiteness. They gather very little propolis. 6. Colonies in a normal condition are vigorous defenders of their hives. The workers are the largest bees of the species Apis melifica, and their individual strength is greater than of other honey-bees. 7. Carniolans clus-ter very compactly and quietly, and winter remarkably well. 8. Queens, workers and denote are more becutiful workers and drones are more beautiful than those of common bees.

Their faults are, so far as I know: 1. When made queenless they are thrown into great excitement and neglect at tirst to defend their hives well. 2. They are slightly more disposed to rob during honey-dearths, than are Italians, though far less troublesome in this respect than blacks, or Italiaus crossed with blacks.

Some might be disposed to bring up as a grave fault the disposition which and this young woman was crying be-

Carniolans frequently show to cast numerous swarms. I believe this disposition in any race depends almost entirely upon the prolificness of the queens; in fact it is, with all races, greater in proportion as the queens are prolific. Prolificness in queens is the bee-keeper's corner-stone. Swarming is nature's escape for the snrplus strength of the colony, and the beemaster has but to direct this force. Whoever cannot do this, is not a mas-ter in the art. This, to some, seem-ingly "bad trait" is preferable, therefore, to one of the most indispensable qualities-prolificness of queens-and is implied and properly included under the seventh point above.

It has been objected by people who claimed to have some knowledge of bee-keeping, and even to know a good deal about foreign races, that " they deal about foreign races, that "they could not tell Carniolans from com-mon bees." Such persons will find there is still something for them to learn. A number of writers have said that they could not be distin-guished from the black bees only by an expert. This is not true of the ones I have seen. There is very nearly as much difference between them and "blacks" as there is between them and the Italians, and we think any child twelve years old would be made to see this as soon as its attention was called to it.

Even if this objection were sustainable it could not be regarded as a very grave fault. Color is quite a secondary matter as compared with qualities, and as regards the latter, I am satisfied the Carniolans are superior to all other European races of bees. Munich, Germany.

Apiculture and Political Economy.

For the American Bee Journal.

### WM. CAMM.

I was both surprised and disappointed in reading the answers to the query about taxing bees, on page 404. I had formed the opinion that bee-keepers, as a class, were above the average in general intelligence and in extracting ideas out of printer's ink; yet here are the "doctors" of the profession answering a question that connects their calling with all others, or with political economy, and answering it in total ignorance of the greatest revolution the world has ever known, in ignorance of the simplest fundamental principles which are fast becoming known and understood by thousands every day here in our own country.

It is hardly surprising that Messrs. Pond and Demaree should answer as they have done; for they belong also to the legal profession which walks backward and judges of everything by precedents and examples of the past. Mr. Heddon's talk about bees being degraded property because they are not taxed everywhere, reminds one of a young wife in one of the Danubian principalities, where it was the custom for husbands to exhibit their affection by beating their wives,

cause her husband did not love her well enough to give her a sound thrashing, though they had been married three weeks.

Here bees are not taxed, and I should "bowl" if they were; for the avocation is only in its infancy and has not only many obstacles to overcome, but much prejudice to combat and ignorance to destroy. Where I first commenced bee-keeping, in Missouri, not only bees were not taxed but land planted to fruit was also exempt. So far as custom should guide or govern, the general rule has been not to discourage any new industry by taxing it, and certainly upon this ground alone, bees should be exempt from taxation. But a custom how-ever venerable is not always based upon justice, and Mr. Demaree to the contrary notwithstanding; it is violation of the principles of human rights to tax bees or any other product of human labor; for there are but two things we can tax, and common sense tells us that labor should not be taxed and that land alone should be taxed. would not give a snap of the finger for all the laws against adulteration, so long as we continue to set at defiance the very principles upon which the prosperity of all human society is based, and we shall continue to do this so long as bees, or anything that is the fruit of human care and industry is taxed anywhere in this broad land.

We have worn threadbare many of the themes which occupy the columns of our bee-periodicals, yet we have hardly touched our calling with a view of finding out its true relations to all others. If I wanted an illustration in disproof of the Malthusian theory, the silly, superficial idea that Heaven puts more human beings in this world than it can support, I should refer to the improvements in apiculture for the last ten years only. Every mouth to be fed, and every back to be clothed, that comes into this world, bring with them two hands and a brain, hence the limit of human intelligence and human endeavor. Look at our vocation for the last decade only, and who is bold enough to state where that limit is? "Well! well!" exclaimed a gruff old farmer the other day as he looked through my honey-room door, "Why, here are thousands of pounds of stuff that makes a man's mouth water to look at, all out of these little blossoms too, where I did not think there was a drop!" "Yes" I replied, "there is more in your land, more in nature's bounty everywhere than we have ever dreamed of in this scramble to live."

One of the things that attracted me to bee-keeping was that I could enjoy my natural rights, and not have my labor forestalled by some one laying claim to that which would have been here if he had never been born, and compelling me to pay for the pasturage of my bees.

"Look here! neighbor," said a large land-owner to me one day, "your bees suck on my white clover, and I have never received anything for it. Why don't you bring me some honey?"

"There are several hundred pounds in my honey-house waiting for you to come and get it," said I.

"Yes, yes, but you'll charge me for that," he replied.

"Only what it is worth to gather it," was my rejoinder.

"You would not have saved one drop of it, for you kept no bees, and you surely do not expect me to work for nothing and board myself because your pasture lies in the way of my bees."

Of course that man was silenced, and perhaps set to thinking; for barring improvements, made by the landlord and used by the tenant, it applied as much to producing corn or wheat on his land as it did to gathering honey. But while I enjoy immunity in this respect from that curse that circles the carth, as the fabled girdle encircled the waist of the mythical Pandora, yet I found it of no real advantage to me unless my customers enjoy their rights in their vocations as I did in mine. In other words, I found myself, after all, "in the same boat" with my fellowlaborers, and with them must either float or sink.

Following the advice so constantly given, I tried to make a home market for my honey. The community was almost a purely agricultural one, and even the towns within reach were supported by the farmers. When I went to a man who was reputed wealthy, he was almost sure to be close-fisted, and nine out of ten were sharp at bargaining, and not over scrupulous, for these were mainly scruptious, for these were mainly the qualities that had enabled them to distance their fellows in the acquirement of wealth, and they would try to Jew me down without shame. Moreover, in the struggle for money they had contracted habits and tastes that were coarse and cheaply supplied. When J went to cheaply supplied. When I went to laboring men, who were far my best customers, they could not always buy if they would. "It's too high, though if they would. "It's too high, though I love it." "My wages do not justify me in buying it." "I do wish I could afford it "-were common expressions, and I soon found that I must come down to the level of their wages, and work for as little as others.

Agricultural labor is more poorly paid than any other; and upon it all the mistakes and burdens in other classes are ultimately, yet inevitably, thrown; hence so many are driven into town and city, into trade and trickery; hence so many have to live like the Anglo-Saxon lived under his Norman master, when "bacon" remained Saxon, while "beef" and "mutton" became Norman, and I have an article for sale which they have long learned to do without. Wheat, too, has gone from 80 to 50 cents a bushel; butter is down to 5 and 8 cents a pound, and spring chickens 9 cents a pound; so honey must come down to a bare living on a good season, and less on a bad one.

I may speak reprovingly, but earnestly, and in the friendliest manner to all my brother bee-keepers—we must unite with others in changing conditions that make failures the rule

and successes the exception, or the natural advantage we enjoy in obtaining honey will be lost in disposing of it.

Murrayville,+0 Ills.

For the American Bee Journal.

### Hive Construction and Manipulation.

### JAMES HEDDON.

If I am not mistaken but little has yet been placed before the public in any periodical concerning the merits and methods of using the new double brood-chamber hive. Most of the space given regarding the invention was relative to who owned the results of my labor, and as that is now prety well settled, and it has been voted to sustain that settlement in the United States courts rather than bee-papers, I have only to deal with the merits and manner of properly constructing and manipulating the hive.

As near as I can estimate, about 200 bee-keepers are now using it to a greater or less extent, but of course no one's experience reaches back of the present season, except that of Mr. Hutchinson, my foremen, my students and myself. As we are now well into our third season's use of the hive, having been brought face to face with nearly or quite all of the advantages and disadvantages connected with its construction and use, and as I am almost daily in receipt of letters asking questions relative to the subject, I presume I am qualified to pen this article, which seems to be demanded, and is quite appropriate.

As the majority are already aware, the central points of invention are, having the hrood-chamber divided in two or more parts horizontally, and the use of one-half bee-spaces for the purpose of inverting. A "bee-space" is known among bee-keepers as that space which will not only pass a drone, queen or worker, but in which the workers are less liable to place brace-combs and propolis, and which measures  $\frac{3}{6}$  of an inch, or that a triffe scant, and these correct spaces are all formed throughout by constructing the brood-cases, surplus-cases and honey-board with a half bee-space (3-16 of an inch) on each side, so that all are invertible, and at all times all bee-spaces are correctly maintained; all of which is fully described in my book.

My object in writing this article was to speak more fully of the demerits than merits of the new hive. Like all other hives, it is not without its faults. In the use of it in the apiary I do not know just what to mention as objections. Whatever they may be, they are so small when compared to its superiority over any other hive that I have ever used, that it seems like "straining at a gnat" to attempt to name any. This is, however, by far from being the case, when we are considering the construction of the hive. It costs at least 25 per cent. more than our modified Langstroth, and to successfully carry out its peculiar and most useful functions, the greatest accuracy in workmanship is required.

I am as willing as 1 am compelled to admit that this is no small objection to its introduction, yet I feel sure that its many other superior qualities will far over-balance this objection, and at the close of this season I look for a proportionately greater number of strong testimonials than any other late apicultural invention has elicited. I am looking for a small number of failures with its use, and I fully be-lieve that every such failure may be credited to imperfect construction. I fear that in some of the hives sent out, not withstanding our pains tak-ing, the bee-spaces are too deep, and in some there may have been a shrinkage in the frames, etc. I buy all of the frames, and have found it difficult to get them made as ordered. However, 1 am rapidly learning how to overcome these mechanical difficulties. My greatest fear is with reference to hives constructed by others.

I have cut all flat material from dry lumber, and at the same time shopdried our pieces, after which they have been hand-worked to the exact width, and I consider this necessary to the best results. The hive is designed for handling very rapidly and with greatest ease, and to carry this out in practice accurate work-manship is required. Many have ordered one or two hives to "test." While they may, to some extent, test its functions, they will get no test whatever of the ease and speed of manipulation. This hive is altogether different from any other, as regards its management. A bee-keeper who is trained in all the movements required in handling suspended-frame hives, and who is daily handling many of them, will be hardly competent to test the claimed superiority of manipulation of the new hive, by the occasional use of one or two which will ever meet him as something peculiar, and which he is unused to. Two or three bee-keepers have each between one and two hundred of them in use, while others have considerable but lesser numbers, and these gentlemen will be able to tell us something which all will be bound to receive as evidence. Here, we are more and more pleased with the new hive as our experience with it enlarges.

Dowagiac, 9 Mich.

For the American Bee Journal.

### Taxing Colonies of Bees. E. B. SOUTHWICK.

I notice in the BEE JOURNAL of June 2, some answers to Mr. Blair's question on page 309—" Are bees tax-able property ?" Mr. Roberts of Iowa has given some quotations but none have any reference to the question asked. That bees are property I do not deny, but that they are absolute property I do most emphatically deny, and I claim that none but absolute

law to that effect. For instance: Dogs are taxable when there is a special law to that effect; bees would be taxable under the same rule.

Some time since I tried to show that bees were property and as such for the damage they did, the owner was liable; and now there comes forth a California judge and in his charge sanctions what I had previously stated (see editorial on page 355.) Bees, as I had previously stated are only quali-fied property. Now the way is to find out if such property is taxable, and that can only be done by inquiring of the ablest and most learned in the law, and not those who have a mere surface knowledge of it. Inquire of one who knows the difference between absolute and qualified property.

Mr. Pond also has an answer to the question. Well, I would not mention it were it not for a hint that he gives, that if the "hue-and-cry" continues we may all have to pay taxes on our bees. Now, if bees are taxable I want them taxed; I want all absolute property taxed. There are many millions of property unjustly exempt from taxa-tion now, a load that the honest taxpayer has to carry. I say let the "hueand-cry "go on, not only in the bee-papers but in every paper in the Union, and every society, until every kind of absolute property be justly taxed.

Sherman, ~Mich.

For the American Bee Journal.

### Getting Law for Bee-Keepers.

### W. A. PRYAL.

It seems to me that the only way for California bee-keepers to get ahead in lawsuits is for some beekeeping-horticulturist to have one of his neighbor bee-keepers bring a friendly suit against him in the Su-perior Court, for say \$350, for dam-ages, etc., done by the defendant's bees to the plaintiff's fruit. A suit like this could be easily arranged; the costs would not be much to try it before the gourt without a juw could before the court without a jury, and the losing party could appeal it to the Supreme Court, and then its decision would be final, and would be the law of the State, till reversed, or the legislature enacts differently. And, besides, the courts of other States would quote such a decision, and it would have great weight in other cases of a like nature.

The costs of such a suit let us say will be, for filing complaint, \$7.50; serving summons (this is a little high, but the bee keepers may live quite a distance from the Court House, which will make the milage of the sheriff "run up"), \$10. This would be all the costs up to the end of the trial, when the stenographer would want his fees for reporting, which are about \$10 per day—say 1½ days, \$15; entering judgment, \$5; \$37.50 would asked. That bees are property I do not deny, but that they are absolute property I do most emphatically deny, and I claim that none but absolute property is taxable, without a special

than an officer is allowed for such service.

By two persons like those named getting together, or, in fact, a number of bee-keepers meeting and select-ing two such persons from their number, and have one of them, who is a fruit-raiser or grape-grower, bring action against the other for the cause already stated, the whole lot to "work the racket" for all it is worth, an interesting suit would be the result. Fifty dollars they could raise among themselves. They could easily find two ambitious young lawyers who would be willing to see the suit through for the "glory there is in it." (Let me whisper, California lawyers don't care much for the "glory" a case brings unless some-thing else more substantial comes with it); still, I am sure there are to attorneys who would gladly tackle such a suit and see it through if the parties were to pay all costs of the snit.

In appealing, the costs come a little higher: To the clerk of the Supreme Court for certifying to papers (this will be hardly necessary as the at-torneys will be able to agree that they are correct, and so stipulate), say \$3; a couple of affidavits, say say \$3; a couple of affidavits, say \$1.50; printing transcript on appeal, at 75 cents a page for pica (this is the Oakland price, though the usual rate is \$1), say 50 pages, \$37.50; filing transcript with the clerk of Supreme Court, \$15; printing briefs for both sides, say 12 pages each, at 75 cents, \$18; and other expenses, say \$10, making a total of \$125 making a total of \$125.

The costs may run a few dollars above these figures, but I think they may be kept within \$100. If the beekeepers cannot stand the whole of this amount, they may call on the "Union" for the balance.

I would like very much that some bee-keepers would agree to fight this matter out on such a basis, and get the law so arranged that it would be plain sailing thereafter. One thing I would here state is, that it might take some two or three years ere a decision could be had in our highest court, as its calendar is now pretty lengthy. In the Superior Court a decision could be had in the course of a few months. Still, however, I am certain that as our Superior Court has had its machinery augmented this last year, it may in a year exhaust the calendar and be ready to take up a case soon after its being filed.

I see no reason why the course out-lined above could not be pursued in some other State just as readily as in this State. Let the readers of the BEE JOURNAL look into the proposition and report. We want as many strong decisions in favor of the beekeepers' rights as we can possibly get, and if bee-keepers can secure such ones by fair means let them do so, no matter if there are two or three pending in different States at the same time. New York, Massachu-setts and California cases would be preferable, with perhaps an Illinois,

Let us have more light on the subject. Speak out, you legal beekeepers.

North Temescal.+o Calif.

For the American Bee Journal

Extracting Honey—Some Observations.

### C. W. DAYTON.

To-day I worked alone at the apiary in the country extracting honey. The amount taken was 706 pounds, and I also hived 3 swarms of bees.

I was surprised when I examined the record of three of the colonies from which I took honey. The record, dated June 8, says Nos. 6, II and 73, each had 8 combs of brood, and were ready for the upper story of combs for extracting. The stories were put on the bives of these colonies on June for extracting. The stories were put on the hives of these colonies on June 9. The queen in No. 6 was confined in a "restrictor" on 6 empty combs at that time. On June 15, No. 6 and No. 73 were capping the honey in the upper story, so another story was added. On June 17 a story containing 6 combs in one end was added to No. 11. On June 22 another story was placed upon No. 6, making it four hives high. To-day the honey in these colonies being nearly all capped, I began to extract, taking 102 pounds from No. 6, leaving 15 pounds in the lower story; No. 73 yielded 78 pounds, with 20 pounds left in the lower story, and two combs from above, while in No. 11 there was about 25 pounds divided about equally in 26 combs, and which I considered too tedious a job to extract, except two combs which were about one-half Now as to brood : In No. 6 of course The American Bee Journal ...... 100. filled.

there could not be more than 6 combs, but they were entirely filled. No. 73 contained 7 combs of brood, which had a narrow line of honey along the upper edges; and as I use no excluding honey-boards, the queen of No. 11 had 23 of the 26 combs three-fourths full of brood.

The friction comes about in this way: Basswood is just beginning to days, much less last 37 days, as it would need to, that a little of that brood might gather honey. When basswood is gone our honey harvest is always ended. The situation is like this: As I do not want increase (if I did it would only make things worse) that brood is taking the money from my pocket in consuming honey; and 1 would feed it to the chickens if it were possible.

It is highly probable that the rearing of brood at that rate would make the difference in the honey-yield. Twenty pounds of honey to feed the overplus of brood above what was contained by the other colonies, and 40 pounds the bees might gather while caring for the brood, should not be too large. By this way of figuring I have already lost \$5 on the brood in that already lost \$5 on the brood in that colony, and a very fair prospect of losing more is still before me.

In flying-bees these colonies appeared about equal, and none of them had attempted to swarm. I did not describe them because they were better than others in the apiary, but more because they were examined to-day.

I am about to conclude that the bees never carry eggs to place in queen-cells when they have a queen to lay them; also, that the queen puts eggs into queen-cells of her own accord, and the bees direct the swarming; that when the bees do not swarm out the queen will destroy the swarm out the queen will desirely the cells a day or two before the young queens are ready to hatch, unless they are defended by bees; but the bees, I think, will not defend them if there is plenty of space for storing honey in the hive. If the cells happen to be in some out-of-the-way place not frequented by the queen, they are allowed to hatch, and in this way I have several times known an old queen and a virgin queen also to accompany the first swarm.

If the above is true, it will be seen that the queen may be confined to a few combs, and though there may be queen-cells built if there is plenty of room for the bees, she will be caused to destroy the cells for her own safety, checking swarming meanwhile, which would occur should a young queen hatch and "notes of war" be heard. Bradford, & Iowa.

### **OUR CLUBBING LIST.**

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepald.

Getting Considerable Honey.-Will B. Robinson, Upper Jay, & N. Y., on July 13, 1886, says :

We are getting considerable white clover honey this season. I com-menced the season with 8 colonies of black bees, and have had only three swarms as yet, but they each gave me a 25-pound case of honey before they in the sections. If basswood turns out good, we will have a bountiful harvest.

Long Honey-Flow, etc.-W. M. Woodward, Custer, & Ills., on July 13, 1886, writes:

Clover is still yielding honey after almost seven weeks. I have almost 1,000 pounds stored now, when all is finished off, and more coming, to all appearance. I have increased my apiary from 17 to 48 colonies, and nuclei that will easily build up. The early hear's ease is opening out, and will be sufficient, I think, to carry the honey-flow through until frost, with good weather. I expect to get 150 pounds of clover honey from one colony of black bees. The Albinos colony of black bees. The Albinos have not done well. They do nothing but swarm, having swarmed twice all around. The Syrians have not swarmed, and are now piling in the honey. They are the best bees I have seen in every way, except that they cap their honey so thin that it shows through badly.

Very Dry Weather.-F. Roulo, Portville, 9 N. Y., on July 12, 1886, savs :

I commenced in the spring with 100 colonies, and increased them to 179 full colonies and 18 nuclei; the most of them contain 6 frames. I have taken, so far, 2,600 pounds of honey. It is very dry now. Basswood has commenced to blossom, but the bees work only a little while in the more work only a little while in the morning and toward night. I produce mostly comb honey.

Viper's-Bugloss.—Adam H. Wallbridge, Jr., Bellville, Ont., on July 13, 1886, writes:

Within the last four years there has appeared here a plant or weed the name of which I do not know, but it is visited by bees constantly in preference even to white clover. It must be an excellent honey-plant. Is it the rag-weed? This is the only thing I can liken it to, yet it does not exactly answer the shape of the flowers on that plant. Would you be kind enough to favor me with the name of the plant, and if convenient its value as a bee-plant?

[The plant sent by Mr. Wallbridge, is viper's-bugloss, or *Echium vulgare*. Gray says it is a troublesome weed in Virginia, but rare in the North. I think I have heard Mr. D. A. Jones say that he considered this one of our best honey-plants, and I well remember seeing it entirely covering the waste places about one of his beeyards. It is a large plant with dense blue flowers, and with its near relative, borage, seems to secrete in "rain or shine."—A. J. Cook.]

**Disconraging Prospects.**—Ira Barber, De Kalb Junction, & N. Y., on July 12, 1886, writes:

The prospect is that the crop in this locality will be a perfect failure. There has been quite a fair amount of clover, but it has only secreted just enough honey to give bees a living, and a light start in the sections. Basswood has been in bloom nearly a week, but so far there has been no honey in the flowers, and it must secrete honey soon or we will not get any of the sections filled. Swarming has been the lightest that I have ever known, as only 8 colonies have cast swarms in my yard of 140 colonies. My opinion now is that the outlook for surplus honey from this locality this year will not lower the market price of honey in the cities very much.

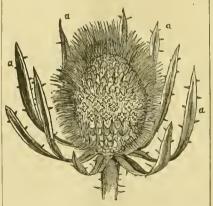

Bees in Florida.—John Y. Detwiler, New Smyrna,⊙ Fla., on July 2, 1886, reports :

Bees are comparatively idle, so far as external appearance of the hives are concerned. Prospects seem favorable for a heavy bloom of the cabbage palmetto later. So far I have not observed any mangrove bloom. For several days I have been engaged in clearing a piece of mangrove marsh near my residence. I find nearly half of the larger trees killed to the root, and the balance throwing out sprouts from the body several feet from the ground. I have not the least doubt but that in two years from now, our supply of bloom from that source will be more than sufficient for all the colonies on the coast.

Teasel Honey.-C. A.Camp, Painesville, & O., on July 2, 1886, writes :

It has recently come to light through private sources, that Mr. Doolittle's success of \$1,000 per year from less than 100 colonies of bees, comes from teasel, which is cultivated. Now of what worth is his experience to any one who does not raise or have teasel? And why has he not told the world where his honey came from ? I have written to the other bee-papers about the teasel matter. Probably there is not 10 square miles of teasel in the United States.

[Mr. Camp must have been sleeping while so much has been said about "teasel for honey" in the bee-periodicals. It has been well understood that Mr. Doolittle's honey crop came from "teasel" for several years; but lately it has been of but little value because of its being killed in winter so easily, and its consequent unreliability as a crop. In 1877 he was awarded the "Thurber Gold Medal" on honey from "teasel," and it was so stated at the time in all the beepapers, and we here re-produce the

engraving of teasel which we then used in the BEE JOURNAL in publishing the account of that medal award. It is not, and never has been a "secret," and we cannot imagine where Mr. Camp has been during the past decade, not to have known it.— ED.]

**My Experience with Bees.**—A. B. Colquhoun,Blooming Prairie, Q Minn., on July 5, 1886, writes :

On July 4, 1885. I obtained a young yield per colony has been 98 por but line colony of Italian bees. They went to work immediately, and by fall had 30 pounds of surplus honey gathered, but I only took half of it out until spring. I put them in the cellar on Dec. 3. and took them out on the 12th of last April. I cleaned the dead bees out of the hive every week or two during the winter, and I think half of them died, but they were

pretty strong in the spring. I have obtained 20 pounds of nice honey, gathered this spring from the willows, dandelions and white clover. They swarmed five times, but the last swarm was so small that I caught the queen and returned the swarm to the old hive, so that I have five good colonies. Being afraid that the old colony might swarm again, I looked over the frames and found as many as a dozen queen-cells, all of which I cut out, as well as a lot of drone-comb, and placed them so that I could see whether the bees would build drone-comb again or not, and I find that they are not; they are building it up with worker-comb instead. My first swarm came out on June 14; the next on June 24; the next on June 26; the next on June 27; but the old colony is still pretty strong. In the hive of the second swarm I had strips of foundation about an inch wide stuck all along the frames. I had a glass in one side of the hive so that I could see what they were doing. They commenced to work on the other side of the hive, and have some of the combs built pretty nearly down, and I have been watching, and they have not built one bit of drone-comb yet.

**Abundant Yield.**—Wilson Sherman & Son, Chester Centre, Q Iowa, on July 12, 1886, write :

There has been an abundant yield of honey through central Iowa this season. Our bees have done the best this season that we ever have had bees do since we commenced keeping bees. We commenced the spring with 20 colonies, increased them to 28, and obtained 3,400 pounds of white clover honey. I do not think we will have a very large fall crop, as we have not had a good rain for two months.

The Season in California.—S. M. W. Easley, Newbury Park, Q Calif., on July 3, 1886, writes :

The honey season for this part of Southern California is now over. The production was much less than was expected. The early warm weather in January and February, and the cold in March and April, and then no rain in May or June, has made the honey yield one-half or two-thirds less than in 1884. I moved my bees last year when they were full of brood and honey, and lost nearly one-half; and what I had left was in poor condition. I started with 280 colonies and increased them to 624, which I expect to reduce to 500 by uniting, as the season has turned out so dry. My yield per colony has been 98 pounds of extracted honey. The average yield of 2.000 colonies in this part of Ventura county, has been 124 pounds. My yield per colony was 317 pounds for 1884. Last year I took no honey, except four tons that I left in the supers in 1884. As you can see by the market report, honey is very low in San Francisco, though I think prices are likely to come up soon.

Bees in the Mails.-II. Walter Mc-Williams, Griffin,+o Ga., on July 8, 1886. writes :

In regard to shipping queen-bees I bave received the following through the untiring efforts of N. J. Hammond, of Georgia, a personal friend of mine :

"Hon. N. J. Hammond, House of Representatives.—Dear Sir: Yours of June 24 is received. In regard to queen-bees mailed at Griffin, Ga., I will say that it will be changed so as to read queen-bees with necessary attend-I think this will obviate the ants. Will change next Guide. JOHN JAMESON, Supt." difficulty. Yours,

Please give Hon. N. J. Hammond credit in the JOURNAL for this. He also informs me he will do all in his power for the above, in the new treaty with Canada.

[The thanks of bee-keepers are due to the Hon. N. J. Hammond for his efforts in their behalf. We hope that he will be able to help us also in the formulation of the new treaty with Canada. We cannot now send as much as a small electrotype of a bee into Canada by mail. The trouble on the "line" is a very great annoyance in very many ways. We can mail many things to Europe more readily and cheaply than we can to Canada, even if we can do it at all. All this needs revision and improvement-ED.]

Securing Worker-Comb in Brood-Frames.-9-Jno. C. Gilliland, (15-24), Bloomfield, 9 Ind., on July 8, 1886. writes:

The Hutchinson-Doolittle plan of securing worker-comb in brood-frames, without foundation, works like a charm. I use one section of the new Heddon hive with combfoundation starters in each frame, 34 to 1 inch wide, with queen-excluding honey-board above, and put on sur-plus boxes at the time of hiving swarms; part of the boxes containing full sbeets and part only starters of foundation, and the bees build workercomb in brood-frames and store as much in boxes as swarms hived on full frames of foundation in brood frames. You must be sure to put on frames. You must be sure to put on the surplus-case at time of hiving, and not the next day or next week, as Chas. Mitchell did; as in that case they will only build drone-comb as his bees did. From experience with scored colorise L do not betieve that several colonies I do not believe that the young queen hatches until within an hour or so of the swarming of second swarms. I have opened several hives this season, one and two days after the queens began to call, to cut out queen-cells, and I found

out of the hive the queen would come out. I have also seen queens fly in one minute after coming out of the cell. The bees decide whether to swarm or not, and if swarming is the programme, they keep all queens in the cells until about ready to start. If they decide not to swarm they allow the oldest cell to hatch and then destroy the other cells. I had one colony of black bees in which the young queen was calling before the prime swarm issued, and, taking the frame containing the queen-cell, I made a new colony which has never swarmed, and this is the fourth summer since. The old colony swarmed about four weeks after division, and left for parts unknown.

Honey-Dew from Oak.-C. Theilmann, Theilmanton, Minn., on July 12, 1886, writes :

I send a few oak branches on which will be found honey-dew; also acorns which seem to be pierced by some insect, or else it is an overflow of the sap of the tree. My bees are working vigorously on both leaves and acorns, while basswood is still in bloom. would like to know whether the honey on the leaves is "bug-jnice" or louse honey, or Nature's own make. What causes the honey on the acorn ? Please answer through the AMERICAN BEE JOURNAL, as it will probably interest a great many bee-keepers.

[The nectar which seemed to stream out of the acorns and drop on the leaves came wholly, so far as I could learn, from acorns which were pierced by a caterpillar, probably a Tortricid or a Tæneid. I do not know the moth that comes from these larvæ, but I should like to know. The acorns were being eaten by the larvæ, and probably the saliva of the insect acted as a ferment to change the starch of the acorn into sugar. The nectar then may be called sap from the nut, which owes its existence to the irritating presence of an insect. This nectar was in such quantities that it could easily be sampled, and I pronounced it very pleasant, as did several of our students. I could see no sign of plant-lice anywhere. We often read of bees getting honey-dew from oak. It would be interesting to know if it is always from this same source.

In the third line from the end of my reply to Mr. Waller's question on page 442, for "trees" read bees.—A.J.COOK.]

Bee-Cellar, etc.-F. Roulo, Portville, 9 N. Y., on July 13, 1886, enquires thus:

1. Would it be safe to winter 100 colonies of bees in a bec-cellar mostly on queen out of the cell, but one or two with caps of cells partly cut off, and as soon as the frame was taken the ground to the upper floor in the times as N. Y., instead of Ky.

middle, and 4 feet under the eaves. The upper floor is arched, with a ventilator 5x6; a ventilator under ground of two 3-inch tiles. There is a bank of dirt 3 feet thick up to the eaves, and the rest is covered with 18 inches of sawdust and a board roof over it. I wintered 62 colonies of bees in it last winter. They wintered well; only one colony was dead when I took them out. 2. My bees are in Heddon hives. Would it be best to take the cover off and cover the frames with a piece of burlap before putting them in the cellar, and put a stick on the back part of the hive in piling them up, for ventilation ? How thick should the stick be?

[1. Yes, I should prefer 100 colonies rather than less in a repository like the one you describe. When the weather is cold keep the temperature of the repository up, by closing the ventilators. Do not allow the mercury to go below 45°, Fahr.

2. No, if I removed the cover I should replace something thicker and more non-conducting than "a piece of burlap." I believe that if you will experiment you will find that you will not need to remove the board covers at all. Give full lower ventilation.

In my reply to Mr. Weidman, on page 442, and closing on page 443, the last four words, "cells of full length," should read comb foundation .- JAMES HEDDON.]

Bees Near a Railroad .-- A subscriber at North Manchester, & Ind., asks the following :

A friend of mine who had been very successful with bees for 15 years, moved to town where he aimed to keep a few for his own use; but he was compelled to place them within 50 feet of a railroad track. The three years he has had them there have been followed with heavy winter losses, and loss of swarms in summer. Will they ever do well that close to the track?

[The above is replied to fully in the answers to Queries 198 and 199, page 100.-ED.]

Drouth in New York.-A. Flag Robson, Italy. N. Y., on July 9, 1886, says :

The best prospect for years, of a large honey crop, is blighted by the drouth in this locality. Basswood yields scarcely a living for the bees; although there is a fair bloom on the same the bees seem to be taking a midsummer vacation.

By some oversight the address of M. & H. F. Coffin, Milton, Kentucky, in an advertisement, has been published for 3 or 4

THOMAS G. NEWMAN & SON. PROPRIETORS,

923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAGER.

# Special Notices.

To Correspondents. -- It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near ooe postoffice and get your mail at another, he sure to give the address we have on our list.

A New Crate to hold one dozen one-pound sections of honey .- It has a strip of glass on each side, to allow the honey to be seen. It is a light and attractive package. As it holds

but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 ets. per crate. Glass 1% e. per light, extra.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

Italian Queens.-We can supply them by mail, postpaid, at the following prices : Untested, \$1.00; Tested, \$2.00; 6 Tested Queens for \$9.00. Orders filled at once.

Hees for Sale .- We offer to sell a few strong eologies of Italian bees, in teg-frame Simplicity hives, at \$6.00 each.

Red Labels for ene-pound pails of honey, size 3x41/2 inches. - We have just gotten up a lot of these Labels, and ean supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apianst printed on them-by mail, postpaid.

### System and Success.

2 All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

The larger ones can be used for a few celenies, give room for an increase of numbers, and still keep the record all together in one hook, and are therefore the most desirable.

Simmins' Non-Swarming System 1s the title of a new English bee-book. The anther elaims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that ean ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illnstrated. Price 50 eents. It ean new be obtained at this office.

Our stock of Simmins' pamphlet on Swarming is exhausted, with several orders unfilled. We have more on the way, and as seon as they come all orders on hand will be filled.

-----

The Western World Guide and Hand-Book of Useful Information, centains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides their own, with \$3, for one year, we will present a copy of this valuable book.

Now is the Time to Join the Union. -Let every bee-keeper send for a copy of the Annual Report and a Voting Blank-fill It up, and become a member. It is to the Interest of every one to do so. The dnes are only 25 cents a year; and it is intended only to call for one assessment (of \$1.00) each year. Send to this office for the Report and Voting Blank.

Yueca Brushes are employed for remeving bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable.

When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as te always have one handy. We can supply them at 5 cents each, or 50 ceuts a dozen.

### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, to a. m., July 19, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO.

HONEY.—The new crop of honey is coming for-ward quite freely, and looks well; demand is light, however, at 14 to 15c. Extracted, 5 to 7c. per lb. BEESWAX.—Scarce at 25c. R. A. BURNETT, 161 South Water St.

#### NEW YORK.

NEW YORK. HONEY.—The honey market is almost devold of interest, more particularly in comb honey. We find quite a large stock carried over in dealers hands, although our stock is small. What we have is dark and off grades, which leaves us in a good position for the coming crop. It is difficult to tell what prices will be, but reports received from nearly every section of the country. Indicate that prices will be low. Present quotations are as follows: Fancy white como In 1-th. sections, 10<sup>6</sup> 12c.; fancy white comb in 2-la sections, 8<sup>4</sup>00c; buckwheat In 1 and 2-lb. sections, 5<sup>60</sup>8c; extracted white clover, 6c; extracted, California. 4<sup>4</sup>/<sub>2</sub>%5c; extracted, Southern, per gallon, 45 to 55c. BEESWAX.—23 to 28c. MCCAUL& HILDRETH BROS., 34 Hudson St.

#### BOSTON.

HONEY.-One-lb. sections, white clover, 13@15c; 2-poind sections, 11@13c. Extracted, 6@8c. BEESWAX.-25 cts, per lb. BLAKE & RIPLEY, 57 Chatham Street.

#### SAN FRANCISCO.

HONEY.-New honey is coming forward freely. The quality is exceptionally fine and the crop will be large. White to extra white comb, 9010c. Ex-tracted, 4@4%c. for white; 3%@3%c. for amber. BEESWAX.-22@23c. 0. B. SMITH & Co., 423 Front Street.

### DETROIT.

HONEY.-New honey is coming in quite freely, nd is bringing from 11 to 13c. BEESWAX.-Firm, at 25 cts. per pound. M. H. HUNT., Bell Branch, Mich. ดท

### CINCINNATI.

HONEY.—The demand for extracted honey has been very light of late, but it seems to be improv-ing gradually for manufacturing purposes. There is considerable honey in the hands of commission merchants, and prices are very low-3½ to 7 ets. per pound is the range of prices. Prices of comb honey are naminai. BEESWAX.—Arrivals are good and the demand fair. We pay 18622. for fair to choice yellow. C. F. MUTH & SON, Freeman & Central Ave.

### CLEVELAND.

IIONEY. -- Within the last two weeks honey has not sold so readily, owing to the near approach of the new crop and the uncertainty of the new pri-ces. Best white, 1-1b., old honey moves slowly at 14 cts.; no demand for 2-1bs. Extracted, 6@7c. BEESWAX.-22 to 25c A. C. KENDEL, 115 Ontarlo Street.

#### KANSAS CITY.

HONEY.-Our new crop is arriving freely and is very line. Sales are slow and prices low. One-lbs., white clover, 14c.; dark 1-lbs., 10 to 11c.; 2-pound white clover, 12c.; dark 2-lbs., 8 to 10c.; California 2-lb., white sage, 10 to 12c.; dark 2-lbs., 8 to 9 cts. Extracted white clover, 5 to 6c.; dark, 3 to 4 cts.; California white sage, 5 to 5½c.; dark, 4 to 4½c. BEEEWAX.-20 to 22c. CLEMONS, CLOON & Co., cor. 4th & Walnut.

#### MILWAUKEE.

HONEX.—The demand is limited but the supply is very much better in quantity as well as quality. The new crop receipts are very fine. We quote : Choice white in 1-h. sections, 15&16c; same in 2-lb. sections, 14&15c; dark, nominal, 10&15 cts. Extracted, choice white in th, 6@\*c; same in barrels and keys, 5&7c. BEESWAX.—24@25c A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

HONEY.—The prices of honey on this coast are now so low that producers can hardly make any profit, and a good many apiarists will quit the business if prices do not improve soon. The crop is large, and the quality of very choice quality. We quote 3½ to 4¼ c. in a jobbing way, and per-haps a triffe more ; but if bolders wish to force sales, lower prices must be taken. Comb bouey sells slowly at 6 to 9c, but just now it is not the season for comb honey, and prices may improve. BEESWAX.—Is generally held at 22 to 23c. for average lots. SCHACHT & LEMCKE, 122-124 Davis St.

### Convention Notices.

The Cortiand Union Bee-Keepers' Asso-ciation will hold a basket plonie at Little York, N. Y., on Wednesday, Aug. 18, 1886, All interested in bee-culture, with their families, are cordially invited to attend and have a good time. D. T. SHATTUCK, Sec., Homer, N. Y.

Association will hold its next meeting at Mt. Sterling, Ills., on Tuesday and Wednes-day, Oct. 19 and 20, 1886 J. M. HAMBAUGH, Sec.

The next annual meeting of the Michigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTING, Sec.

Advertisements.

WILL sell 400 full Colonies of Bees iu lots to suit buyer ; or will sell Apiaries already stocked up. Now.is your time. Address, H. R. BOARDMAN, 28Atf EA. TOWNSEND, Huron Co., O.

CoLONIES of Italian Bees in 10<sup>6</sup>frame hives at \$5.00 ; Tested Queens at \$1.25 ; Untested Queens at 75 ets.; 2-frame Nucleus (no queen), \$1.50 ; three -frame Nucleus (no queen), \$2.00. Address, OTTO KLEINOW, (Opp. Ft. Wayne Gate), DETROIT. MICH. 28Atf

TALIAN QUEENS, by Return Mail, Tested, 1.00. Untested, 75 cents. 26Atf GEO. STUCKMAN, Nappanee, Ind.

**FINE Tested Italian Queens** of this year's breeding, for \$1 each; Untested Queens only 65 cts. each, by return mail. Hives and Sections at rock-bottom prices. B.J. MILLER & CO., Nappanee, Ind. 29Atf

I CAN use a few thousand pounds of Extracted Honcy of good quality, if cheap. Address, H. R. BOARDMAN.

28Atf EA. TOWNSEND, Huron co., O.

HONEY-PAILS. -As 1 will dispose of my honey crop by other methods, I offer my stock of 3-lb, Jones' Palls at \$5.25 per 1(%). Several bundred of them are labeled, and the first ordera will take the labeled ones. C. W. DAYTON, 25A2t BRADFORD, 10WA.

Select Tested Italian Queens !

Large, Handsome and Extra-Prolific Queens

\$1.50 Each, or Three for \$4.00, By return mail. Safe arrival guaranteed. Make Money Orders or Postal Notes payable at Salem, Masa. Address, **HENRY ALLEY**. 29Att WENHAM, MASS.

Bingham & Hetherington Uncapping Knife.

BINGHAM SMOKERS and KNIVES have Revolutionized the Smoker and Knife Trade, and have made bee-keeping a pleasure and a success. They are the only lasting and satisfactory Snokers and Knives now used by experienced bee-keepers in Europe, Australia, Cuba, and America. They are covered by patents, and while they are always the best that can be made, they are also the lowest priced.

### Prices, by mall, post-paid.

"If the weather is fale," Said the butterfly, juintfly and free, "If the weather is fair, f'll go dance in the mendow there !" "And 1," said the prindent bee, "Will be early at work, you will see-If the weather is fair."

Make a Market for honey in every village and dity throughout the country. Honey Leaflets will do it.

E. France & Son, of Phiteville, Wis., have taken from their bees about 42,500 pounds of honey; and what is better, they invessed a good share of it without shipping it to any large market.

A Koll of Honor might well be started with the mame of E. Stahl, Kenner, La. He has so much faith in the National Bee-Keepers' Union, that he has paid dues and assessments up to the year 1890. And yet there are thousands who have not become members, even for one year 1

In Switzerhand statistics show that there are 207,373 colonies of bees kept. These ligures were obtained by the consus which was taken on April 21, 1886. The number varies in the different Cantons from 500 to 40,000 colonies. The amount of honey obtained from them is not stated.

-----

An Average Crop of Honey has been produced this year, taking the country all over. In some places it is a very ingreerop; in others very small. Basswood was a total failure in some sections; in others only a moderate yield. The fail crop will be very finited. In view of this, the prices for honey should not be as low as they are now quoted. The prospect is good for an advance rather than a decline.

Heeswax is nothing more than the voluntary exerction of the honey-bee, like perspiration from the human body.

Reserves on the second second

BATTLE CHERK, Mich., July 17, 1886. Thos. O. Newman, General Manager of the National Bee-Keepers' Union, Chicago, Ilis.

Feeding Bees with glucose to preserve life, when hencey is not to be obtained from the flowers, is quite different from making combs of paralline and getting the bees to fill it with glucose for the purpose of naluteration.

That Wiley lie is reponsible for nearly all that has been written on the subject of "artificial comb honey." He has done more durings to the pursuit of bee-keeping, by publishing that ile, than he could make amends for in a life-time of a thousand years. To his eternal disgues be it safe, that he has done scarcely mighting to counternet the influence of that so-called " scientific pleasantry" since it was perpetrated.

Glass to Prevent Hobbing. On page 419, we gave an item from the Blench Zeilung, upon which Mr. C. W. Dayton remarks as follows:

----

While the method of using glass before the entrance does well for awhile, the bees will become accustoned to it, and the glass will be discarded. It may naiver for heglaners and uniterns to experiment with, but the true apiarist will prefer strong colonies and precention.

**Paralyzed Bees.**—Mr. W. F. Kanzler, of Fulda, Ind., writes us as follows concerning the disease causing this trouble ;

-

In the Bienen Zellung, of Nordlingen, for 1881 you will find on page 6 an answer to Query, No. 278, a full description and a drawing of a disease called "May-sitchness" or Mucorine, which betalls bees in May and June, so that they, by hundreds, run on the ground, cannol fly, and die in a short three afterwards. This disease is cansed by a fungus (Macor Macedo) which sprouts out, between the rings of the abdomen, and is perimps the same as befell the bese of the sender of Query, No. 278. Now I would request you to consult frod. A. J. Cook, and publish the drawing and description of the said disease, Macorine.

If we can find the paper alluded to, we will do as requested.

To Assort and Grude the itoney is very necessary. It must be insisted upon over and over again that such should never be neglected. Mr. C. It. Hildern, in the *Plauman*, gives the following very good advice :

With the production of a crop of honey comes the task of taking care of 1 and getting it ready for market. Comb honey should always be stored in a dry, warm room. As it comes off the hyves, carefully sort it into at least two grades, and a third grade will be necessary later in the sonson. After it has been removed from the bives two weeks, it must be thoroughly fundigated with sulphur, to kill the hitching notiuntervals during the warm weather. The sections must be scaped of every particle of propolis, and then alcely packed in new crates holding 15 or 24 sections each, with glass on at least one side. We cannot be too eareful in packing and grading our toney, as our reputation ingely depends on the way it is packed for market.

The Fall Crop of Honey will be very light, where dependence is made upon fail Bowees in general. Those who are fortunate enough to have sweet clover are rejoicing in the prospect for a good fail erop. The markets have for some time been quite bare of honey, and we hope that bee-keepers will not rush their honey on the great cities, and thus glot the market. Honey will bring a fair price, if care is taken to supply all the local markets, and thus distribute the honey over the whole country, instead of glutting the city markets.

. . . . . . .

The National Convention is to be held at Indianapolia, Ind., on Oct. 12, 13 and 14, 1886. Mr. F. L. Dougherty, the Secretary, writes as follows :

. . . . . .

Please say that the committee is hard at work perfecting arrangements for the coming convention, and will soon be ready to announce particulars. Prospects are prombing for a prosperous meeting.

President Cutting also writes us that he is inhoring to get up a very interesting meeting. Let the Convention for this year he the most interesting and prolitable apleuitural assembly over congregated on American soil.

We are duly expecting a lot of Ymeen brushes. As soon as they arrive, all orders now waiting will be filled.

The July Number of the Philadelphia Ladies' Home Journal contains the second chupter of a story written for its columns by flarrick Presect Spolford, a seasonable article on Gurden Parties and out door entertaining, by Christine Terhane Herrick, an interesting article on common grammantcal errors, and how to appear and talk well in company.

an intereasing arrives of common grinningcal errors, and how to appear and talk well in company. Mrs. Louisa Knupp, its editor, has metwith a remarkable success in building up that paper to a circulation of over 370,000 paid subscribers in three years by her rareinstincts of her sex, in the rich feast of good intimests of her sex, in the rich feast of good influence and is a perfect gean, bandsomely printed and linestrated, and employs only the beat writers, such as Harriet Pressort Spofford, Marton Harland Rose Terry Cooke, Mrs. Curbathe Terhue Herrick (Marton Harland's daughter, Mrs. J. H. tambert, of Polladelphia, Mary Abbott Rand. Elizabeth Stunct Phelps, Louisa Aleoit, and Joubh Allen's Wite have promised to contribute the coming automa, provided health and strength will permit of additional work.

### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be pnt in type, and sent in about a dezen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.—ED.]

### Using Plain Sheets of Wax.

Query, No. 283.—Do you know of any bee-keeper who has tried putting in a wired frame a plain sheet of wax without the delineations of the cells pressed upon it, and then gave it to a colony of hees for working up into comh? If so, please say what the result was; if not, please try the experiment and report through the AMERICAN BEE JOURNAL.—L. J. S.

The experiment has been tried frequently with unsatisfactory results.— G. W. DEMAREE.

I have heard that it has been done, but I do not remember with what result.—H. D. CUTTING.

I have used plain sheets of wax in sections in that way. The result generally was that they were left as they were.—G. M. DOOLITTLE.

The bees often build comb on it, hut it is very irregular, and may be drone-comb as well as worker-comb. -DADANT & SON.

I tried something of the kind before foundation was made, but not with wire. It was not always successful.— C. C. MILLER.

Yes, several of us have tried plain wax-sheets with uncertain and unsatisfactory results. If you try it you will use nothing but printed sheets after the experiments.—JAMES HED-DON.

I do not know of any one who has tested the matter, and I cannot see any practical value in such a test. If any one has the curiosity and time sufficient, they may find out how much longer it takes to draw out comb than to build new from simple starters.—J. E. POND, JR.

### Space Between Brood-Frames.

Query, No. 284. — How much space should be allowed to a frame? or what should be the respective width of an 8 or a 10 frame hive ?—G. R.

For a %-inch top-bar allow 1½ inches from centre to centre of the frames.—II. D. CUTTING.

I use 1½ inches to the frame.-G. M. DOOLITTLE.

An inch and three-eighths works nicely.—W. Z. HUTCHINSON.

About 1½ inches to a frame-8 frames in 12 inches.-A. J. COOK.

With perfectly straight combs I am inclined to favor 1¼ inches from centre to centre; certainly not closer, and perhaps this is too close. I am anxious for light on the matter.—C. C. MILLER.

There are advantages both ways. After many experiments Father Langstroth gave a net space of  $14\frac{1}{8}$  inches for 10 trames. I use and prefer  $11\frac{1}{2}$  inches for 8 frames.—JAMES HEDDON.

One and three-eighths inches from centre to centre of the frames is just right for the brood-nest, though they may be worked a little closer or a little wider apart. I make my 10-frame hives  $14\frac{1}{2}$  inches wide. They give entire satisfaction.—G. W. DEMAREE.

After much experiment I am confirmed in the belief that brood-frames should be spaced from centre to centre 1% inches, no more nor less. Onefourth inch should be allowed at each side.—G. L. TINKER.

The space between frames should be not less than  $1\frac{1}{5}$ , nor more than  $1\frac{1}{2}$ inches. Mr. Langstroth used 1 7-16 as a standard; we use  $1\frac{1}{2}$  inches.— DADANT & SON.

A 10-frame hive should be 14 inches wide to give the best results in surplus comb honey; for extracted honey it should be  $\frac{1}{24}$  to  $\frac{1}{26}$  inch wider. The regular Langstroth 10-frame hive is 14½ inches wide inside. My belief is that frames are spaced too wide apart, as a rule, to give the best results in comb honey.—J. E. POND, JR.

### Clarifying Beeswax.

Query, No. 285. — What is the best method of clarifying wax? If acid is used, of what quality and strength? Does it in any way injure the texture of the wax?—R.

Allow it to cool slowly when heated. I do not know, but I should think that acid might do harm.—C. C. MILLER.

Heat the wax slowly, and let it cool very slowly. Acids will do for bleacher's wax, but not for foundation wax.--DADANT & SON.

To every 10 pounds of wax use one pint of vinegar, together with one quart of water, in melting. Strain and fix so it will cool very slowly. When cold scrape the sediment from the bottom.—G. M. DOOLITTLE.

Frequent melting in clean hot water, in my opinion, is the best way. Acid of any kind cannot be used without injuring the wax.—G. W. DEMAREE.

Let the melted wax cool slowly in a tall tin can. Surround the can with sawdust or some non-conductor of heat.-W. Z. HUTCHINSON.

Explanatory.—The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark  $\bigcirc$  indicates that the apiarist is located near the center of the State named;  $\eth$  north of the center;  $\blacklozenge$  south;  $\circlearrowright$  east;  $\circlearrowright$  west; and this  $\circlearrowright$  northeast;  $\circlearrowright$  northwest:  $\circlearrowright$  southeast; and  $\blacklozenge$  southwest of the eenter of the State mentioned.

### For the American Bee Journal. The Winter Stores of Bees.

### WM. F. CLARKE.

Surprise is expressed at my claims, on page 293, and Mr. Heddon asked, "Is it possible that a man like Prof. Cook, a man we all have to look up to as an authority in these matters, should put a *quietus* on the pollen theory, and never realize it, but all the time think that he was stating truths that sustained it?"

I answer unhesitatingly, it is both possible and actual, which positions I shall now proceed to prove.

Prof. Cook is an extraordinary genius. Extremes meet in him. He is like a noted clergyman who was wont to say that he could preach the best and the worst sermon of any man in London, (Eng.) On some phases of apiculture, Prof. Cook is away ahead of all his competitors; on others he is just as much in the rear. He reminds me of the proverb, "It takes great men to put forth great nonsense," or as a certain old book has it, "Great men are not always wise." I could easily cite illustrations of the correctness of these statements from the Professor's writings, but instead of doing this I shall call up an impartial and competent witness, Mr. Frank Cheshire, who, in the scientific volume of his great work on bee-keeping just published, page 90, says Prof. Cook has made "several statements which are astoundingly inaccurate," and on pages 94 and 98 repeats the assertion. On page 128, Mr. Cheshire says concerning a certain point, Prof. Cook "is so inaccurate in every particular," that he is best refuted by quotation," precisely the way in which I claimed to have refuted him at Detroit, after listening to his essay on the pollen theory. The following from pages 132 and 133 is pretty hard ou one whom " we all have to look up to as an authority." Mr. Cheshire says: " An old French entomologist publiabed some envirts drawing of hood

"An old French entomologist published some capital drawings of bees' legs, but his numbering read backwards, since the reversing action of the printing press had been forgotten. He was copied by Blanchard, who, failing to note his authority's mistake, called the drone leg the queen leg, while the latter went to the credit of the drone. Dr. Duncan translated Blanchard, and quite innocently, and very pardonably, repeated Blanchard's blunder; while Cook, who has taken many of the illustrations in Part I of his Manual from Duncan, continues to the present hour, to publish the error. Surely, after eleven editions, the time has come for breaking the spell, and giving the queen her own legs back again."

Now, in view of all this, Mr. Heddon will surely admit that it is "possible" even "that a man like Prof. Cook" may be mistaken, as well as other folks.

I now proceed to perform the other half of my task, and will show that Prof. Cook, when trying to establish the pollen theory actually knocked it in the head, and gave it its "quietus." Here I must complain of being only partially quoted by Mr. Heddon. I do not accuse him of wilfully sup-pressing any part of my argument— he is incapable of that—but he has overlooked what I regard as a most overlooked what I regard as a most important substantiation of my "claims;" probably from not viewing the matter in the same light that I do. He says: "Mr. Clarke tells us that the pollen theory went down when Prof. Cook stated that bees could not breed without pollen, and that we know that they do breed in confinement and come out in good confinement, and come out in good health in the spring. Why, certainly, we knew this before the pollen theory was conceived, and this fact in no way disproves that theory." But this is only half of what I stated on page 293. Here is the whole sentence: "He" (Prof. Cook) "has maintained that bees cannot breed without pollen, and that they cannot stand work without it." Mr. Heddon says: "Bees making chyme to feed brood, do not consume the pollen, for two different food." The reply I made to this plea at Detroit was that when mothers chew food and give it to their infants, they are not very particular about swallowing some of it, and, in fact, often do swallow a portion. But, I said, apart from this, when bees are rearing brood they work hard, they are not in that inactive state in which they can do without such food as is needed to repair wasted tissue. Consequently, they must and do consume pollen for their own wants, when they rear brood.

Here is the argument which I turned against him in Prof. Cook's own words:

"As honey contains no albuminous food, except the pollen in it, it follows that bees must have bee-bread to rear brood, and also to preserve their organisms intact during the busy part of their existence To say that bees may breed with no bee-bread, or that the active workers need none, is to say that you can have an ocean without water, a desert without sand, or bricks without clay."

I asked, "Is it not a busy part of their existence" when bees rear brood? Are they not then in the active working condition? If so, they must have pollen, and the fact

that they rear brood largely in winter quarters, proves that they can and do consume pollen safely, which knocks the bottom out of the theory.

Mr. Heddon appears to prefer that his bees should not breed when in winter confinement. Mr. Hall, on the other hand, considers it essential to his success to have plenty of brood in the hives when he takes them out of the cellar. His bees are imprisoned longer than Mr. Heddon's, and on Mr. Heddon's theory, must be subject to greater fecal distension, yet they consume pollen freely, for they rear brood largely. Notwithstanding, they winter with a very small percentage of loss. "How is this thusly," if the pollen theory be true? The conundrum is too hard for me.

Here I cannot resist the temptation of turning Mr. Heddon's own flank. In his report of a year ago last April, he said : "I am quite positive that there is something about breeding, whether in confinement or when the bees fly regularly, which is very depleting to them." That is to say, a la Cook, it causes great waste of tissue, to repair which they must have pollen. In a recent article Mr. Heddon quotes my statement to the effect that bees breed in confinement, and come out in good health in the spring. Then he sets up a little "crow," and says triumphantly : "Why, certainly, we knew this before the pollen theory was conceived, and this fact in no way disproves that theory." He says in that same article in the AMERICAN BEE JOURNAL for April 8, 1885, that he can adduce abundant evidence that bees can breed "hivefuls" of of young brood while in confinement, without becoming loaded with fecal matter. Now let us put all this together, and see what a "crazy quilt" of an argument it makes :

1. If bees consume pollen to any extent while in winter confinement, they will get "the all-destructive diarrhea." 2. If they rear young brood they must eat pollen, for (Mr. Heddon) "brood-rearing is very depleting;" (Prof. Cook) "it causes great waste of tissue," and "they can no more breed without pollen than bricks can be made without clay." 3. But, there is ample evidence (Mr. Heddon) that bees can breed "hivefuls" of young brood while in confinement, without hecoming loaded with fecal matter; *i.e.*, without getting the diarrhea.

Instead of harmonizing this fact of breeding in confinement with the pollen theory, Mr. Heddon goes off at a tangent to discuss dry feces. About all he does, however, is to quote the Professor, who says with an air that would well become the Great Mogul of apiculture, when we appoint that potentate, "There is no foundation in the dry feces theory, I AM SURE." Again, "bees do not normally void feces in the hive, and NEVER DRY FECES." That settles it, unless, indeed, this should prove to be one of "several statements which are ascording to Mr. F. Cheshire, Prof. Cook is sometimes betrayed into.

Mr. Heddon wandered off in a similar manner from the pollen theory to the question of dry feces in his last year's report. He says: "Let us all thank the Professor for setting us aright in this respect." In what respect? The true functions of the "sucking-stomach," using. Mr. Cheshire tells us, an old, but extremely misleading title, for he adds, "this wrinkled membrane could no more exert suction than could a balloon extract gas from the main." After this outburst of thankfulness for nothing, Mr. Heddon quoted the dogmatic assertions to which he has again treated us in his recent report. I replied at some length to these positive utterances in the AMENICAN BEE JOURNAL for May 27, 1855. It is unanswered, and, as I believe, for the best of all reasons, viz., that it is unanswerable.

Guelph, Ont.

A Grape-Grower Defending the Bees.

Southern Planter.

### O. M. CLAY.

For long years in the United States many species of wood-peckers were called "sap-suckers," a name unknown to European scientists, whereas the so-called sap-suckers were wood-peckers, enlarging the orifice of holes made by the borers, in order with their barbed tongues to pull out the grubbs or larvæ, and eat them. I had a hard struggle here to overthrow this popular error and to prove that the wood-peckers (the "sapsuckers") were the best friends of the horticulturist, though eating some fruit.

So, now, after long years of culture of bees and grapes, through nearly three-quarters of a century, I am of the fixed opinion that bees do not and *cannot* puncture fruit. Let us look at this question at first *a priori*. As bees multiply so rapidly, and are armed with stings and poison to destroy their enemies, what would be the result if bees could puncture fruit? They would, of course, attack fruit, as more easily done, rather than seek flowers for honey—and destroy all sweet kinds in a short time. Nature provides for equilibrium in the production and maintenance of general and species.

For a long term of years I have had bees in the third story of my dwelling, and grape-vines, on the walls; and thus I have great opportunities for observation. I am also a cultivator of water-melons. When I cut the melons I leave the rinds near the house till evening for the bees to suck the juices, of which they are very fond. A few first find the melons; then they increase in numbers till the whole colony seems to be engaged in carrying off the treasure to their store-room.

Now if the bees could puncture the grapes, one being found, as the grape is much richer in sugar than the melon, it is logical to suppose that they would attack the grapes in force; but no such action takes place; a few bees find the broken hulls and suck the juices, but I have never seen any indication of a perforation of whole-skinned grapes.

For many years wasps were plentiful about my house, but finding them depredators upon grapes. I have broken up their nests and killed them out at all times; and now I hardly ever see one. The bees have of late failed to be seen about the grapes. This year the crop was unusually good, and left on the vines till frost; yet the grapes were all sound—whilst the melons were visited, as usual, with great avidity. I conclude, then, that at times the wasps and other insect-borers of the grape, are killed by the bad winters, when the attacks upon grapes subside. If the bees could puncture the grapes, why should not their attacks be regular? I have also some vines on trellises of posts and wire in the open ground. Here the leaves fall more early, and the grapes are attacked by birds and insects, and the bees then aid in the destruction of the grapes, whilst those on the walls, hidden under the late leaves, escape insects, birds and bees?

White Hall. Ky.

[We are glad that a man of such extended observation and practice as Mr. Clay. sustains the views presented in our last issue in regard to the question whether honey-bees ever puncture and injure grapes.—EDITOR SOUTHERN PLANTER.]

For the American Bee Journal. Formation of "Cells" by Bees.

### W. II. STEWART.

Much has been written on the wisdom of the honey-bee, as manifested in many ways, and more especially in the construction of honeycomb. I will give but one quotation from a noted German writer, who asserts as follows:

"The cells of bees are found to fulfill perfectly the most subtile conditions of an intricate mathematical problem. Let it be required to find what shape a given quantity of matter must take in order to have the greatest capacity and strength, occupying at the same time the least space and consuming the least labor in its construction. When this problem is solved by the most refined mathematical processes, the answer is, the *hexagonal*, or six-sided cell of the honey-bee, with its three four-sided figures at the base."

I agree that a portion of the above statement is true; but I must insist that other portions are erroneous. Man, and bees, are products of Nature; they are subject to natural law; they cannot defy or operate outside of "natural law;" from it there is no divorce.

Let us resort to a simple experiment "to find what *shape* a given quantity of matter must take in order to have the *greatest capacity*." Place in a suitable vessel a quantity of soft water; add to it enough soft soap to make a strong suds; dip the bowl of a clay tobacco pipe into this soap water, holding the mouth of the bowl downward. When the pipe is raised out of the water, "a given quantity" of the slimy or soapy water will be found adhering to the inner surface of the pipe bowl. Now blow in the stem of the pipe, and the current of air will form a bubble, and if the current of air is kept up through the pipe-stem, this "given quantity" of slimy water will take the shape of a globe; as yet more air is forced into this globular bubble, it increases in dimensions, all the while retaining the same shape until its strength is overcome, and it breaks.

Now the shape of this hubble was dictated by natural law. It was no accident. The experiment may be repeated, times without number, and the bubble will be globular every time, minus its elongation by gravity.

If the given material in the bubble would have contained a greater amount of air in the shape of a hexagon, then natural law and its cohesiveness would have dictated that it should take that shape before surrendering to pressure.

The law actuating fluids to press in every direction alike, would never admit of the formation of a single or lone bubble, in the shape of a hexagon; and if I mistake not, bees never form a lone or single cell in that shape. If we examine the scattered drone-cells found here and there on the surface of worker brood-combs in queenless colonies, where layingworker eggs are being developed into drones, we will find all that part of such lone cells, that is raised above the plane of the worker-cells, round, and not hexagonal. Queen-cells are never six-sided.

Now experiment again with the pipe and soap-water: Immerse the bowl of the pipe, and blow through it while it is under water, and thousands of bubbles will be formed on the surface. Examine them and you will notice that all are hexagonal. Why is this? It is because the air in each bubble presses in all directions alike, and as each individual cell comes in contact with its surrounding fellows; and all having equal tendency to globular shape, the sides of each are flattened alike, and the tendency of the watery mass to fill all the space oecupied by it, brings the bubbles in contact with each other with equal force on all sides. The surface of this mass of bubbles will exactly represent the surface of honey-comb. The side walls of both are "six-sided."

Four-sided and six-sided cells are the only ones that will fill the whole space, and as the effort is for round cells, the hexagon is nearer round than those having four sides; hence the hexagon.

Bees wishing to build round cells, and at the same time occupy all the space, are compelled to build them

hexagonal; but it is not because of their wisdom any more than because of the wisdom of soap-suds that the bubbles are hexagonal.

Now in regard to the "three foursided figures" at the base: I have already shown that the base of a lone or single bubble, is hemispherical. It will be noticed that the tops of all these soap-bubbles are hemispherical. If each would contain more air by being capped over with the material in the shape of "three four-sided figures," then they would naturally assume that shape.

Bees try to make the base or bottom of their cells hemispherical, but as bees on the opposite side of the foundation are building cells in the opposite direction, and using the same material for the base of that set of cells, each set of bees striving for round bottoms, and in different directions, the base of the cells comes in the shape that we find them—with the "three four-sided figures"—not because of the wisdom of the bees, but in spite of them.

Try an experiment with a frame full of foundation. Let the bees work on one side, and shut them away from the other, and you will find where cells are only built on one side of the foundation. all will have the hemisperical base, and the bees will turn out minus that "peculiar wisdom." Orion, 9 Wis.

### W. Z. HUTCHINSON.

It is a well-known fact that sex is not confined to the animal kingdom alone, but extends to the vegetable kingdom as well. The sexual organs of plants and vegetables are located in their blossoms. The majority of plants produce perfect blossoms; that is, blossoms having both stamens and pistils. But we sometimes find blossoms having only stamens, or male organs, others having only pistils, or female organs; and these male and female blossoms may be borne on the same plant or on different plants. Some varieties of strawberries are called pistillates, because their blos soms have only pistils. These strawberries will not bear fruit unless planted near those varieties whose blossoms have stamens.

The squash or pumpkin vine bears both kinds of blossens on the same stalk. Soon after a squash vine has put forth runners, the blossom buds begin to appear at the junction of the leaf-stalks with the vine. As the buds develop the stems develop also, until they are a little longer than the leaf-stalks. The blossoms now open, and we have large yellow flowers. At the centre of each flower is a yellow cylinder, about an inch in length, covered with fine yellow pollen. These are the male flowers, and, from their structure, can never produce squashes; their office is wholly to supply pollen to fertilize the pistillate blossoms. The first pistillate blossom rarely appears nearer the root than the seventcenth leaf. Instead of having a long stem to support it, this dower opens close down to the junction of the leaf-stalk with the vine. It has a small globular formation beneath it, which is the embryo of the future squash. If the structure of the blossom is examined, it will be found to differ from the tall, male flower, in having the central cylinder divided at the top into several parts. These are what botanists call the pistils, and it is necessary that the fine yellow dust of the male flower should touch them, to fertilize them, that seed may be produced and a squash grow. This may be proved by so confining a blossom that no pollen can gain access to it, when the blossom will wilt, and the embryo squash turn yellow and decay.

When the conditions are most favorable, the flower sends out a fragrance which attracts the bees. Prof. Gray calls this perfume the flowers' advertisement. The bees instinctively read therein that they are welcome to all the exuding nectar they bear away, if they will earry the pollen on their legs and bodies to the pistils. It has been suggested that honey is placed in the flower to attract the bees. After a bee has found honey in one flower it will be very likely to examine others of a similar appearance. In the spring, when the blossoms first open, many of the bees, very likely the young bees that have never before seen a flower, will be seen examining the leaves, branches, and even rough wood of the trunk of a tree, until they find just where the eoveted treasure is located. After a bee has dived deep into one blossom and tasted the neetar, it knows where to look the next time. It is plain to be seen that flowers were not given their bright colors simply that we might feast our eyes upon their beauty.

Nature, that most careful econo-mist, not only deals out honey in small doses, but she places it in the most cunning nooks and corners that the bee may be obliged to twist itself into all possible shapes, around and among the stamens, until the pollen is most surely dusted all over its body and legs. Within the flowers of the barberry there is a contrivance by which on the touch of the proboses of the bee the stamens spring forward suddenly and shower the insect plen-tifully with pollen with which it may fertilize some other barberry blossom. The flower secretes no honey until the pollen is ripe and ready to do its work; then the boney slowly exudes into the neetaries, so that the bees may be kept coming and licking it out, in every hour of the day, and the flow of honey ceases just as soon as the pollen is ripened and gone. Mr. A. I. Root says: "The Catawba is a very desirable variety of grape, as is also the Delaware; but the former is very small. Dr. Grant originated the Iona, by fertilizing the blossoms of one with the pollen of the other; but, in his fort of the other; but, in his first attempt, he failed repeatedly, because the bees were sure to upset all his experiments by their

eovering the flowers from which he wished to produce the hybrid seed, with lace or something of a similar nature to keep the bees away, he succeeded at once; and we now have the Iona as the result, a grape that is just about half way between the Delaware and Catawba, having very distinctly the flavor of each."

It has very frequently been urged that bees injure truit and grain by taking honey from the blossoms; and I believe the matter was carried so far in a town in Masachusetts, that an ordinance was passed obliging a hee-keeper to remove his bees to another locality. After a year or two had passed, the fruit-growers decided that they would rather have the bees brought back, because so little fruit set on the trees, in proportion to the number of blossoms that appeared. As it was a fruit-growing district, it was a matter of considerable impor-tance, and the bees were brought back. Of course with the bees came fruit in abundance, for many kinds of fruit absolutely depend upon the agency of bees to fertilize the flowers. thus enabling them to produce fruit. It has been stated that unless we have a few hours of sunshine when early cherries are in bloom, we shall have no cherries at all; and we occasionally have a season when cold rainstorms so prevent the bees from getting out that not a cherry is produced.

While the honey-bee is regarded by the best-informed horticulturists as a friend, a strong prejudice has been excited against it by many fruit-growers, and, in some communities, a man who keeps bees is considered as bad a neighbor as one who allows his poultry to despoil the gardens of others. Even the warmest friends of the bee may be heard lamenting its propensity to banquet on their beautiful peaches and pears, and choicest grapes and plums. But it should be remembered that the jaws of the bee, being adapted chiefly to the manipulation of wax, are too feeble to enable it to readily puncture the skins of even the most delicate grapes. If it were otherwise, whole crops of fruit would be destroyed by bees whenever a period of protracted drouth eut off their supplies of honey. Wasps and hornets, which secrete no wax, being furnished with strong, saw-like jaws, for cutting the woody fibre with which they build their combs, can easily penetrate the skin of the toughest fruits. After the mischief has been begun by other insects, or wherever a crack or a spot of decay is seen, the honey-bee hastens to help itself. In this way they undoubtedly do some mischief; but before war is declared against them, let every fruitgrower inquire if, on the whole, they are not more useful than injurious. If the horticulturists who regard the bee as an enemy, could exterminate the race, they would act with as little wisdom as those who attempt to banish from their inhospitable premises every insectivorous bird, which helps itself to a small part of the abundance it has aided in preserving. Rogersville, & Mich.

## Building Drone-Comb, etc.

### MRS. MAHALA B. CHADDOCK.

The following letter of inquiry was sent me by the editor of the AMERI-CAN BEE JOURNAL, with the request that I reply to it:

"I see that Mrs. Chaddock has been hiving bees in empty hives and getting a 'splendid lot of drone-comb.' Will she please give the particulars? How many frames were given ? What was the size of the frames? Were the bees admitted to the surplus apartment at the time of hiving? Were the queens old or young? Were -well, anything else she can think of."-W. Z. Hutchinson, Rogersville, Mich.

I used Simplicity hives; hived the bees on 6 frames, one containing brood, the others empty; no starters. I shut them in with division-boards, and put propolized muslin over the empty spaces to keep the bees from going down from the sections. I have no honey-boards. 1 put on a honeybox that belongs on the Gallup hives, because the section-cases that I have for the Simplicity hive do not tier up. This honey-box holds from 33<sup>1</sup>/<sub>3</sub> to 38 pounds of honey when filled. It was tilled with foundation in two-pound sections. On top of this honey-box I put the section-case that had been on the colony before itswarmed. It was half full of honey. I lived 6 swarms in this way, the only difference being that some of the top-cases were fuller of honey than others.

One of the queens was one year old, two of them were two years old, and the other three were three years old. The bees would not stay in the hive, but clustered all the time on the outside. Some of them worked, however, for they carried in boney very fast. After they had been hived two or three days, I examined them. The one-year-old queen had all workereomb; the two-year-olds had about half worker-comb, and the three-yearolds had all drone-comb. I took out the division-boards, put another Simplicity hive with 10 empty frames on top, and they all went to work.

Of course I know that as soon as I took out the division-boards and gave them the whole Simplicity hive for a brood-nest, and then doubled the capacity of that, that there was no "Hutchinson" about it any more. It was Chaddock's idea to give them all the room she could find, and let them build drone-comb to their heart's content.

I know that Mr. Hutchinson will say that I did not give them room enough in the sections. I think if I had put on ten section eases, all the bees would have worked; but whether it would have made a difference in the drone-combs I cannot say. In two.days after I gave them the "big room," they built nothing but workercomb. After that I hived the rest without contracting the brood-nest,

and one swarm containing a queen a year old, built no drone-comb, while the colonies with old queens built all drone-combs for four or five days, then worker-comb. I took out all the drone-combs from the brood-nest, and gave them to my "crazy" bees, replacing with foundation that had been partly drawn out in other colonies.

I have about 250 pounds of this drone-comb full of as nice white clover honey as man ever ate; and as Mr. Chaddock is always fearful that we will run out of honey, I have dedicated the whole lot to family use. I believe I rather like the idea of having honey in these big slices, instead of prying out sections when we want to eat the honey.

Vermont,+0 Ills.

P. S.-The bees were given free access to the sections before they were all in the hive.—M. B. C.

For the American Bee Journa

### Taxing Colonies of Bees.

### DR. E. B. SOUTHWICK.

I notice that the question, "Are bees taxable?" is gaining in notoriety, and as I am the only one who has said that they are not taxable without a special law to that effect, it becomes necessary to give some reasons why they are not taxed and should not be. I will give the following four reasons why they are not and should not be taxed :

1. They are wild and cannot be tamed. 2. They are a public benefit. 3. They are a public benefit.
3. They are teachers of industry and frugality, and by the practice of the same save millions of wealth to the world.
4. They are not protected by law, but are liable to be destroyed when they can be without trespassing.

First, bees are wild and cannot be tamed. It is well known that a swarm of bees coming out of a tree in the woods can be hived and controlled just as well as though they came out of a hive in the apiary (convenience for handling being the same). They can be taken into a parlor, put in the bay-window, given a chance to get out and in, and they will work and defend their home, sting the passers by, if they come too close, and do in every respect as they did in the woods; and when that colony sends out a swarm, and it goes to the woods, that swarm will do just as its parent colony did when it was in the woods, and show thereby that its nature has not been changed by its sojourn in the domestic circle.

It is well known to all handlers of bees, that bees act and can be handled just the same (convenience consid-ered) in the woods as in the apiary. If they are wild in the woods, they are wild in the apiary. If they are ever wild they are always wild. This is settled by the California judge's charge, where he states that the owner can have only a qualified inter-est in bees. That they are always classed as qualified property cannot

be disputed, and if taxable in the apiary they are taxable in the woods also. The thing to be decided is, is qualified property taxable?

Second, they are public benefac-tors. It is said that "he who makes two spears of grass grow where only one grew before, is a public benetactor." Do not bees, by conveying the fructifying dust from one flower to another, fertilize them so that not only two grow where one did, but makes many grow where none would have been had it not been for them. Botanists, I believe, agree that fruit and seed are greatly in-creased by bees flying from flower to flower. If the man, who sued for damages that the bees did his sheep, had been a scientific man, he would have known that the bees were doing him a vast amount more good than harm. Thus the "little busy bee" flies from flower to flower, taking from one its surplus, and leaving with others what they lack ; thereby equalizing the life-producing dust, making all productive, and so doing good to all and harm to none. Should they be taxed, considering the great benefit they are to the people, when millions are exempt that are piled up in grand edifices for no other purpose than for the aristocrat, the monopolists, the grinder of the poor, the robbers of honest toil, to meet in and display their ill-gotten wealth, and chuckle over the poor honest people they are abusing? I say no !

Third, they are teachers of industry and frugality; not as is taught in the pulpit by precept, but by that nobler and more impressive way—by ex-ample. In the working season they are always busy. In the daytime they are prospecting over the country seeking and saving every little particle of sweet that would without them be totally lost, and in the still hours of midnight yon can hear the continued buzz of their industry. They save thousands of dollars worth of wealth that would be entirely lost were it not for them. We can say of them what we cannot say of many men and The world is better for women, viz: their being in it.

The man who brings bees into a country greatly benefits that country. He saves for them what they cannot save. and places before them a healthy article of food or luxury. In short, he is a public benefactor.

We exempt our school-houses be-cause they assist education, and education is a public good. But a man pays his money for his education which enables him to earn much more than he could without it; ought he to be taxed for it? If gives to others without lessening his own, but rather increases his own and benefits all. So with bees; they gather from the flowers wealth without lessening their value and usefulness, but, on the contrary, they increase them. If a man should be taxed for his bees, the educated man should be taxed for his education.

turkeys are killed away from home. Michigan offers a premium on the using of wide-tire wagons because they benefit the roads. They ought to offer a premium on bees for the good they do in increasing the production of the country and saving its

wealth, health and happiness for all. Tax your scloons, your liquor-makers, your olemargarine manufactors, your tobacco-mongers, your gamblers of all classes and kinds; your high-steepled edifices where the rich congregate, not to worship God, but to exhibit their finery, their diamonds and their silks, gotten by wrongs inflicted on the working class-the only real wealth-producers outside of nature in the country; and tax all other nuisances-tax them heavily; but let the little, innocent, industrious. frugal, honey-saving, children-pleasing honeybees go free.

Sherman, ~ Mich.

For the American Bee Journal.

Wintering Bees, Hiving Swarms, etc.

### GEO. A. WRIGHT.

On page 411, Mr. W. Z. Hutchinson claims that "when bees are undisturbed by man's reason, they meet an untimely fate;" and so they do when disturbed by man's reason. My father kept quite a large number of colonies of bees in large box-hives, up colonies of bees in large box-inves, up to the time of his death, four years ago, and he rarely lost any "when left to their own sweet will;" but when he began to put on boxes, and take all of the early honey, and then compel the bees to live on pollen and peer honey, then they began to die poor honey, then they began to die. If Mr. H. were here I could take him to a man that hives his bees in large box-hives, and "leaves them to their own sweet will," and when all of the rest of us have lost heavily this man has passed winter after winter with-ont the loss of a single colony.

I can winter bees just as well on early, well-ripened honey as I can on sugar. When the bees have gathered no honey, and we are obliged to feed or let them die, it may be all right to feed sugar; but as long as we feed sugar we may expect to be accused of adulteration.

I notice that some are having trouble in trying to get the bees to build worker-comb. With me this season it has worked like a charm. hive my swarms on from 5 to 7 frames; the frames are spaced 1¼ inches from centre to centre. If they are put farther than this they are sure to build drone-comb. I look through the hives four days after hiving, and if drone-comb is started I cut it out, and they usually give no trouble after that. Some colonies built their five frames full of worker-comb without being touched.

I put the boxes on when I hive the swarm. Where this is done a queen-excluder is needed. I had no queen-excluder, and 3 or 4 queens entered the boxes and filled a few of the sec-

This has been the poorest honey season, so far, that I have seen in 15 years. Basswood is in full bloom, and not a drop of honey is being put into the boxes. Some colonies are actually going backward. Glenwood, & Pa., July 13, 1886.

For the American Bee Journal.

### Feeding Sugar to Bees.

### H. E. HILL.

In answer to Mr. Hutchinson, on page 329, where he so courteously re-plies to my letter on the above sub-ject, I would say that for the very reason that Mr. II. "would consider it wisdom to feed sugar," the ones of whom I wrote would give as a reason, if they were asked, why they did not feed also. But they would be sure to add, "And I want to keep it so." For in most instances it is attributable to the fact that such carry on the business independent of any inferior foreign substance; that the price of honey remains above that of sugar according to its comparative value in their local market; and the profit to be derived by extracting the honey and substituting sugar for winter would be so meagre, compared with the loss of bringing honey down to a level with that of sugar, that they do not care to enter into any such speculation.

No, Mr. Hutchinson, we do not "expect such a sacrifice on the part our less fortunate brothers;" of "simply because it may assist in giv-ing color to an *unjust* accusation." But in the face of the fact that sugar feeding has and still is lessening the is it better that the few (compara-tively) bee-keepers who cannot winter should sacrifice their natural food, should sacrifice their gain by the practice? or that the future pros-perity of the honey-producing community should be sacrificed a

I agree with Mr. Geo. A. Wright, in *Gleanings* for Feb. I, when he says that "sugar feeding, or bee-keeping, has got to go down." Nothing will put "bee-keeping down "so quickly as putting down the price of honey. It is for the price of the honey that bees are kept, and the fact that bee-keepers are now using bundreds of keepers are now using hundreds of barrels of sugar annually has put down the price, and the demand for

To those that wonder "if it is really necessary to feed sugar to in-sure safe wintering," just recall sure safe wintering," just recall America's most successful apiarists— those who for many approximations and the safe set of the same set of t those who for many years have lost no bees, practically; those who produce the greatest amount of honey, etc. (Do not hastily conclude that because a man is a popular apiarian writer, that he is a successful apiarist.) Then find out how many of these gentlemen feed sugar; and draw your own conclusions.

If bees are getting so "high-toned" during the past few years, over the modern system of apiculture, that honey is not good enough for them, are not then quiet, raise the hive at the bottom by degrees until they be-come quiet. What I mean by a very not believe your own eyes.

what will we have to feed in ten years from now, if the present rate of progress continues? If this is not the reason, let some one who knows, tell us who has fed cane-sugar since the foundation of the world, in order to keep the race extant, and even in-creasing at a rate that seems to compare favorably with that of all other animated creation?

Mr. Hutchinson asks: "Did bees never perish when left to their own sweet will?" This granted ; is there not twice as many bees wintered successfully on their natural food as there is on sugar? I should imagine there would be more "amusement" in listening to the incredible theorizing argument of those opposed to sugar-feeding, than there is in hearing a dealer say in the presence of a shopful of customers, that "since these big bee-keepers make their honey out of sugar, there is no sale for it;" and receive in exchange for an explanation, the sincere sympathy of all present, for your exhibition of ignorance, when "everybody knows that you cannot get pure honey any more." But" the innocent must suf-fer with the guilty."

Titusville, ~ Pa.

### For the American Bee Journal

### Prevention of Bee-Diarrhea.

### E. GALLUP.

Here is a question that I have been asked repeatedly, "How do you man-age your bees when they get the diarrhea?" or, "What do you do for your bees when they have the diarrhea?"

Well, my friends, my bees do not have the diarrhea; and, in fact, I have come to the conclusion that have come to the conclusion that there is no such disease. Here, me-thinks, I hear friend Pucket say, "That is some more of Gallup's bun-com !" And I hear others say, "My bees certainly had the diarrhea." Well, mine, too, used to have it, or what is called as come 25 or 20 poors what is called so, some 25 or 30 years ago, but they know better now. But let me explain: It is a condition of the colony, or of the hive, and not a disease.

I have found a colony in the spring, in a hollow tree, with the entrance at the top of the cavity or hollow; and when they first flew out in the spring, they did not so much as speck the at the bottom of the hollow, will dis-charge large quantities of feces on their first flight. This is in their natural state.

When bees are kept in cellars or a special repository, a large or strong colony, if not properly ventilated, will be too warm, and consume large quantities of honey, more than can be evaporated by insensible perspiration. These will have the diarrhea, and will, in all probability consume all their stores and starm before my intertheir stores and starve before spring. The remedy in this case is to take off all of the honey-boards, and if they are not then quiet, raise the hive at

strong colony, is such a colony as Novice would have from a two-story hive on reducing it to one-story in the fall. It is best in such a case to take out one or two combs from the sides of the hive and move the re-mainder further apart, so as to give more room for the bees between the combs. On the other hand, when we have a small colony that occupies just two or three ranges of combs in my two or three ranges of combs in my hive (a nucleus, if you please, in which we are wintering a spare queen), we will say we have them in the right hand side of the hive, we move the hive to the right or the batter heard so as a close the leaver bottom-board, so as to close the lower entrance. The division-board must be adjusted to suit the number of combs; and the piece of honey-board over the bees can either be moved a trifle or raised : and your nucleus or small colony will winter exactly as well as the large one. The small colony will not consume any more honey in proportion to the number of bees, than a large one. But should you attempt to winter such a small colony in a large hive, they would consume more honey in proportion to the number of bees, and in all probability have the diarrhea.

The bees of a small colony with too much ventilation, will, on you going into the cellar with a light, come out and discharge on the outside of the hive. Give less ventilation, and the remedy is applied at once. A late colony that has thin, watery honey will have the diarrhea. To prevent this, give it in the fall some combs from an old colony containing good honey; and give them the thin honey in the spring, when the bees can fly out.

I wish to be understood on this subject of wintering. ventilation, etc., because it is of great importance to know that bees cau be wintered with out consuming much honey. Walk down into my cellar and see the bees, it will take but a few minutes. Step up and look at them by the light of the lamp. Do you see the striped fellows in this hive? "Yes, but Gallup, they are dead as a door-nail." Not a bit of it. "Well, they don't stir." Let us breathe on them a trifle. "They are alive: that is a fast. Do

"They are alive; that is a fact. Do they keep as quiet as that all winter?" Certainly. And that is not all; they scarcely consume any honey all win-ter. "Well, Gallup, I do not want to tell you that you lie, but I do not be-lieve a word of it." "Well, sir, your disbelief does not alter the fact one particle." "Why, Gallup, here is your pork, potatoes, and other vegetables; your women must come down here two or three times a day with a light. Don't the bees come out?" Do they come out now? "They do not appear to, that's a fact. Why, Gallup, I always supposed that bees, Gainth, I always supposed that bees, when kept in a cellar, had to be fast-ened in with a straw mat, patent bee-preserver, or something of that sort." Well, you see that mine are kept in with a little common sense, do you not? "Yes, but I can hardly un-derstand it." That is because you do not helious your own eves 474

I had only 10 colonies of bees, and never calculated to keep any more than that number, and had no cellar, I would build a place on purpose to winter them in, and save honey enough every year to pay the expense. Osage, lowa.

[The above article is republished from Vol. IV of the BEE JOURNAL, page 145, as requested by Mr. G. M. Doolittle on page 215.-ED.]

Little Fall Bloom Expected.-J. F. Hays, Macomb,+o Ills., on July 22, 1886, says:

I have 130 colonies at present all in first-class condition. The bees can do nothing as present, as the clover is dead and dry, and there is but little prospect of much fall bloom. I can-not get along without the BEE JOURNAL.

Kerosene Oil for Bee-Stings, etc.-11-M. L. Spencer, (77-120), Little Genesee, 9 N. Y., on July 21, 1886, writes:

In respect to Query, No. 297, about ants, I would say that our common kerosene oil, the kind burned in lamps, will kill them, eggs and all; every one that it once covers is defunct. A few drops on the hives, or in the cracks of the hive will keep the ants away. I also use it for beethe ants away. I also use it for bee-stings. I extract the sting in the usual way, by scraping, and put a few drops of oil on the wound, and work some into the same. It kills the pain and prevents the swelling. I think the acid left in the oil from relining kills the poison. Although the sting does not swell, on me as formerly, I believe the pain is as bad as ever, if I

I never saw bees bring such loads of pollen as they got from sumac, and at that time I had quite a lot of white comb about capped, but not sufficiently capped to take off, and con-sequently I have a lot of sections sequently 1 have a lot of sections nicely yellowed from the pollen. They are not stained as are those left on too long, that is, darkened, but yellowed. I think our season, so far, is the poorest in years. We have had very cold nights and dry weather.

More Honey-Dew.-C. Theilmann, Theilmanton, Minn., writes :

I send another sample of louse-It is so great and distinct that the dew even runs off the leaves at the lower ends; also the lice are there on the under side of the leaves, and have, it seems, extracted honey on the same side they were on last night, while the leaves were lying (the same as packed) on the window-casing. These milk-weeds stood on a clear The corn-leaf enclosed, which has honey-dew on it also, was under an oak-tree. I could not discover any honey-dew elsewhere on the corn in the open air in the field. The woods is full of honey-dew, every brush and weed is covered thickly with it; the leaves on the trees are getting crip-pled, and have many dry spots. I could not discover any scale or bark lice anywhere, and have examined closely, but the corn-leaf seems to be evidence of them. Will Prof. Cook please explain to us fully, through the AMERICAN BEE JOURNAL, his conclusion.

[I can hardly come to any very satisfactory conclusion. The milk-weed is loaded with nectar and thickly covered with lice, which are unquestionably the source of the sweet liquid. Corn has often been referred to as yielding abundance of honey. It may be that corn does, at times, vield honey from extra floral glands. In this case the nectar may have come from the overhanging oaks. This very dry year is remarkable for the numerous lice, and wherever the lice are, there the nectar may be looked for.-A. J. COOK.]

### Spring Use of the Reversible Hive. -Mark Thomson, Canton, & Ohio, on

### July 19, 1886, writes:

Since apple bloom the honey-flow has been continuous, and colonies properly managed, have done remarkably well. Swarms hived on foundation in the new Heddon hive have given a surplus of 50 pounds to the colony. The most of those that I know who use this hive are well believe the pain is as bad as ever, if I pleased with it thus far. The ques-nse nothing for relief. I keep the oil tion that comes to most is, can we in a small, spring-bottom can (sewing-machine size), and it can be injected into cracks and crevices of the hives. Quinby?

Injustice to Honey-Producers.-W. Mason, Fillmore.+o Ind., says:

I am much pleased with the pluck you displayed in reply to Dr. Kellogg's article of injustice to the honest honey-producer. It is very unjust to make such charges in such general terms. I admit that fraudulent honey may be found in the markets by manufacturers of shoddy honey, just as the olemargarine butter gets there; but the honest honey-producer should not be responsible for this dishonesty practiced by scoundrels, and I suggest that every producer of honest honey should label his honey with a guarantee, stamped on it in such a way as to remove all doubts, and if he is not willing to do that then let him fall. In this way we can protect our busi-ness, or else ask Congress to do so for us, as in the butter trade.

Appreciating the "Union."-Mrs. H. Hills, Sheboygan Falls, o+ Wis., writes :

MR. NEWMAN: - Permit me to thank you for your very kind and courteous letter in answer to my appeal to you in regard to my local honey market, etc. I would like, also, to express my high appreciation of what is being done by the "Bee-Keepers' Union." I should hardly have dared to presume to ask for your nave dared to presime to ask for your advice, in the matter above referred to, but for that Society. Your ready sympathy, and kind answer, amply repay me for what I have paid to the "Union." I cannot conceive why other bee-keepers do not avail them-solve of the privilege of becoming selves of the privilege of becoming members.

[It is exceedingly surprising that so few seem to appreciate the splendid work being accomplished by the Union for the pursuit of bee-keeping. There ought to be at least ten thousand members now instead of only a few hundreds.-ED.]

Unprecedented Drouth. - James Heddon, Dowagiac, 9 Mich., on July 21, 1886, says:

The drouth here is unprecedented. I fear we shall have no fall honey at all, if rain does not soon come to our relief. Farm crops are all drying up. On several occasions the sun has lifted millions of caldrons of water from the bosom of old Lake Michigan, and cruelly poured it back into the lake, and right before the eyes of suffering humanity. I have only about 25,000 pounds of clover and basswood extracted honey from 250 colonies (after spring sales), for basswood gave us less than one-half an average yield. My comb honey will nearly all come from the new hives, and amounts to only two or three thousand pounds. I had but 10 swarms throughout, but have doubled my colonies by dividing them. Ncarly all of New England reports "total failure;" much the same comes from many other localities. I think that the general crop is very short, and that prices will rule firm.

Basswood a Failure.-D. 11. Coggshall, Jr., West Groton, ON. Y., on July 16, 1886, writes :

We are getting no honey here as a surplus. Basswood is almost a total failure, there being but little in bloom. We think that there is an insect that works in the bloom, and then there are but few trees that have any buds on them. Buckwheat is our only hope for a surplus from this acction which blocks and this section, which blooms about Aug. 1.

Bees Have Done Well.-D. D. Herrick, Libertyville, & His., on July 20, 1886. says :

We have had a very dry time for the last four weeks, but we are getting a nice shower now. My bees have done much better than I had any idea they would, for we have had cool, damp nights for the most of the time. I have seen the bees laying out on the hives only two nights this sum-mer. Some of my first swarms have stored from 40 to 50 pounds of surplus, and one as high as 75 pounds. I think that good enough.

Few Swarms and Little Honey.-O. L. Hershiser, Water Valley.+0 N. Y., on July 20, 1886, says:

For the last 2 or 3 days bees in this locality have been very busily at work on the foliage of the basswood, and on red clover. Upon examination I found great numbers of plant-lice on the under side of the leaves, and in the case of the clover, there were many fine globules of a sweetish substance secreted on the under side of the leaves, which the bees are gather-ing with great vigor. The bees work on the upper surface of basswood leaves, but the lice are on the under side. This is, I suppose, the honey-dew which we have read of in bee-papers and bee-books. Bees in this immediate locality have done very poorly this season. The drouth cut short the white clover crop, and cool weather through April held the bees back so that but few swarms issued. In our own apiary of over 100 colonies we have not had over a half-dozen natural swarms, and other apiaries in this vicinity have had none. The hives are very populous now, and I fives are very populous now, and 1 fear a swarming-time during buck-wheat bloom. Basswood bloomed very sparsely in this locality--not more than one-fourth of the trees having any bloom whatever. Those trees that did bloom did not secrete honey to any whether water the more of the to any great extent; many of the honey-glands in the blossoms were perfectly dry, while in a few a mere trace could be seen. Although our honey crop is short in this locality, and increase almost nothing, I am informed that the shortage is only local, and that less than 20 miles northeast of here they have had many

swarms, and a good flow of honey. A few specimens of the Chapman honeyplant, which we are testing at this place, are in bloom, and it seems to be full of honey: from two to six bees on a head of bloom all the time; there seems to be no limit to the flow of nectar.

Much Swarming .- W. F. Clarke,

Guelph, Ont., on July 20, 1886, writes:

I am now writing under the shade of a magnificent Northern Spy apple tree, beneath which I have a rustic seat and a table, where I have spent many happy hours listening to the hum of the bees, watching them at work, and weaving theories about them, since swarming began. 1 never had such a time in my life, owing to the bees swarming without notice. Usually they hang out for a day or two or several days-this season there has not been a solitary outside cluster in my apiary. My first swarm came off very early—May 19—just as I was going down town to the postoffice, about 11 a.m. 1 had noticed that the hive was getting very populous, but never dreamed of the colony swarm-ing. From that day I have kept close watch, and not a colony that has swarmed has hung out the usual signs and portents. The bees have come out with a rush, as on the spur of the moment, and I have had the or the moment, and I have had the most provokingly *small* swarms; little clusters that had no business to start house-keeping on their own account. Why is this thusly? Is it a peculiarity of the season, or is our contracting method belittling the swarms? I have some fears that what with our division-boards and dividing colonies we are getting the bees into a confused condition. Are they bound to swarm anyhow, do as we may, and will they go off in handfuls if they cannot go more numerously? I have had only one decent. old-fashioned, <sup>3</sup>4-of-a-bushel swarm this year, and a disgusting lot of little quart clusters, that will barely get enough stores for wintering, let alone giving me any-thing for my care and trouble with them.

Bee-Sting Remedies, etc.-B.Novis, Blauveltville, N. Y., on July 16, 1886, writes :

The other day a horse was stung to death by bees, at Arcola, N. J. At first one bee stung the animal, which made a spring into the air and landed upon a stand on which were several hives. In a moment the horse was literally covered with bees, and despite the efforts of his owner to rescue it, he died in one hour. The owner was stung so severely as to owner was sting so severely as to need medical treatment. There is no doubt, I believe, that the recipes for bee-stings, published from time to time in the BEE JOURNAL, have cured those by whom they have been recommended, but they (particularly ammonia) have no more effect on me than so much water. It must be that than so much water. It must be that the remedies have different effects on different systems. Perhaps some will devote a few hours, to get subscribers.

find the following as sure a cure as I have: Dissolve a table-spoonful of salt in a half-goblet of vinegar, and make it tepid ; apply to the sting with a rag. Since using this remedy a beesting has lost all its terrors to me. A lady told me. the other day, that an onion cut in halves and rubbed on the sting was a sure cure. I shall try it the next time I get stung.

#### **OUR CLUBBING LIST.**

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

The American Bee Journal ...... 100.,

| Cook's Manual                                        | $     \begin{array}{c}       2 & 00 \\       1 & 75 \\       1 & 60 \\       2 & 00 \\       2 & 10 \\       3 & 00 \\       1 & 30 \\       1 & 40 \\     \end{array} $                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

#### Home Market for Honey.

23 To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leatlets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remunerative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 ets.; per doz., 40 ets.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the bee-keeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Now is the Time to Join the Union. -Let every bee-keeper send for a copy of the Annual Report and a Voting Blank-fill it up, and become a member. It is to the interest of every one to do so. The dues are only 25 cents a year ; and it is intended only to call for one assessment (of \$1.00) each year. Send to this office for the Report and Votiug Blank.

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to

923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAOER.

# Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

A New Crate to hold one dozen one-pound sections of honcy .- It has a strip of glass on each side, to allow the honcy to he seen. It is a light and attractive package. As it holds

but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 cts. per crate. Glass 1% c. per light, extra.

Italian Queens .- We can supply them by mail, postpaid, at the following prices : Untested, \$1.00; Tested, \$2.00; 6 Tested Queens for \$9.00. Orders filled at once.

Bees for Sale .- We offer to sell a few strong colonies of Italian bees, in ten-frame Simplicity hives, at \$6.00 each.

Red Labels for one-pound pails of honey, size 3x41/2 inches. - We have just gotten up a lot of these Lahels, and can anpply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apiar of printed on them-hy mail, postpaid. | stop any papers until requested to do so.

#### System and Success.

2 All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

 For
 50 colonies (120 pages)
 \$1 00

 "
 100 colonies (220 pages)
 1 25

 "
 200 colonies (420 pages)
 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers. and still keep the record all together in one book, and are therefore the most desirable.

Simmins' Non-Swarming System is the title of a new English bee-book. The author claims that it will inaugnrate a "new era in modern bee-keeping," and states that "it is hased upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can he applied to bring abont the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

2 Our stock of Simmins' pamphlet on Swarming is exhausted, with several orders unfilled. We have more on the way, and as soon as they come all orders on hand will be filled.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides their own, with \$3, for one year, we will present a copy of this valuable book.

Yucca Hrnshes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable.

When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 cents a dozen

" Don't Stop "-that is what many write to us about their papers, when their time is nearly out. One subscriber says : " It is not convenient for me to send the money now to renew my subscription. It runs out with this month ; but don't stop sending it. I will get the money to you within three months." Such letters are coming every day, and so for the present we have concluded not to

#### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL. Mouday, 10 a. m., July 26, 1886.

The following are the latest quotations for honey and beeswax received up to this hour.

#### CHICAGO.

HONEY.--It is coming on the market very freely this week, and there are advices of other lots at this time in transit. We are practically without any demand, so prices are nominal. Offers of 20 13c. would be accepted; yet 14c. is being asked. BEESWAX.--Scarce at 25c. R. A. BURNETT, 161 South Water Ft.

#### NEW YORK.

HONEX. - The present quotations are as follows: Fancy white comb in 2-lb. sections, 10% 120.; fancy white comb in 2-lb. sections, 8% 10c; buckwheat in 1 and 2-lb. sections, 5% 8c; extracted white clover, 6c; extracted, California, 4½% 5c; extracted, Southern, per gallon, 45 to 55c. BEESWAX.-23 to 28c.

ESWAA,—23 to 28с. MCCAUL & HILDRETH BROS., 34 Hudson St

#### BOSTON.

HONEY,-Ooe-b. sections, white clover, 13@15c; -pound sections, 11@13c. Extracted, 6@8c. BEESWAX.-25 cts. per lb. BLAKE & RIPLEY, 57 Chstbam Street.

#### DETROIT.

HONEY.--New honey is coming in quite freely, nd is bringing from 11 to 13e, BEESWAX.--Firm, at 25 cts, per pound. M. 11. HUNT, Bell Branch, Mich. ar

#### CINCINNATI

CINCINNATI HONEY.—The demand for extracted honey bas been very light of late, but it seems to be improy-ing gradually for manufacturing purposes. There is considerable honey in the bands of commission merobauts, and prices are very low—3b to 7 cts, per pound is the range of prices. Prices of comb boney are nominal.

boney are nominal. BEESWAX. -Arrivala ure good and the demand fair. We pay 18@22c. for fair to choice yellow. C. F. MUTH & SON. Freeman & Central Ave.

#### CLEVELAND.

HONEY.--Within the last two weeks honey has not sold so readily, owing to the near approach of the new crop and the near this sold the new pri-ces. Best white, 1-1b., ald honey moves slowly at 14 cts, in demand for 2-bb. Extracted, 667c. BEESWAX.-22 to 25c A. C. KENDEL, 115 Ontarin Street.

#### KANSAS CITY.

HONEY.—The receipts of new honey are good and very fine. The demand is good and stocks in store are light of one-poond sections. We quote : 1-b. sections of white clover, 14@15c; 1-lbs.,dark, 10@12c; 2-lbs., white clover, 14@15c; 2-lbs., dark, 8@90c; California white 2-lbs., 10@11c; dark, 3@90c Extracted white dover, 5@6c, dark, 3%@4c; Cal-ifornia white, 4½@5c; dark, 3½@4c, BEESWAX.—20 to 22c. CLEMONS, CLOON & Co., cor. 4th & Walnut.

#### MILWAUKEE.

MILWAUKEE. HONEY.—The market is fairly supplied with boney, trade is dull, prices depressed, and the out-look is for a large production. Already some is being pedded shout the city by the producers themselves, demoralizing the prices, which should not be done. We quote: Choice white in i-pound sections, 14@15c; 2-lbs. 13@15c. Dark honey not wanted. Extracted, white, in barrels and kegs. 5@ 7c; in tin cans, 6@%c; dark in barrels or kegs.4@6. BEESWAX.—25c. A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

SAN FRANCISCO. HONEY.—The prices of honey on this coast are now so low that producers can hardly make any profit, and a good many apiurists will quit the business if prices do not improve soon. The crop is large, and the quality of very choice quality. We quote 3½ to 4½c, in a jobbing war, and per-haps a trifle more; but if bolders wish to force sales, lower prices must be taken. Comb honey sells slowly at 61 09-c, but just now it is not the season for comb boney, and prices may improve. REESWAX.—Is generally held at 22 to 23c.Or average. SCHACHT & LEMCKE, 122-124 Davis St.

HONEY.-New honey is coming forward freely. The quality is exceptionally fine and the crop will be large. White to extra white comb. 9010. Ex-tracted, 4@4¥c. for white : 3½@3¾c. for amber. BEESWAX.-22@30. O. B. SMITH & Co., 423 Front Street.

#### ST. LOUIS

110NEY.-Choice comb, 10@124c.; latter price is for choice white clover. Strained, in barrels, 34@4c. Extra isncy of bright color and in No, 1 pickages, 4 advance on above prices. Extracted in barrels, 44@35c.; in cans 6@7c. Fermented goods 24@3c.

goods, 25603c. BEESWAX.-Firm at 21%c for prime. D. G. TUTT & CO., Commercial St.

#### **Convention Notices.**

# MANUFACTORY

## Hives, Sections, Shipping-Crates, Supers, etc.,

of all kinds. I make a specialty of LANG STROTH AND MODEST HIVES. Correspondence with supply dealers solicited. My Sections are all made from Poplar. Address,

GEORGE TAYLOR, DUNDEE, Kane Co., ILLS.

Ruby red, honey sweet— You and I, in laughing weather, Sung a lay of love together; Petals falling on our feet. When shall summer be so light? Never more 1 Oh, never more 1

N.W.McLain A.I.Root and L.C. Root were appointed a committee by the Detroit Convention to investigate the Chapman Honey-Plant. They are now engaged in that work, Mr. McLain having gone East for the purpose of meeting Mr. Root, and together making the investigation. In due time their report will appear in our columns.

The Annual Show of the Royal Agricultural Society of England, was held at Norwich last month, and we notice that Messrs. George Neighbour & Son, of London, England, carried off the first and third prizes on hives for all purposes; first prize for Cottager's hive, and the first prize for the best collection of hives and implements for bee-keepers. We congratulate them on the success they so richly deserve.

The Hancock County Fair will be held at Greenfield, Ind., on Aug. 24 to 27, 1886. Those interested should send to the secretary, Charles Downing, Greenfield, Ind., for a copy of the Premium List. The premiums for bees and honey amount to \$32, besides diplomas and a queen offered by George Cole for the best display of honey from one colony.

**Toads** are sometimes very annoying in the aplary. A correspondent mentions the fact that upon going to the hives one morning during the late drought, he noticed a toad at the entrance of each hive. He says that the toads were apparently asleep, but every time a bee approached, the tongue of the toad would shoot out like lightning and convey the unsuspecting insect into its capacious mouth.

Why is it Mysterious?—From Mr. H. Banks, Reisterstown, Md., we have received the following item taken from the Port Tobaceo, Md., *Independent*:

Tobacco, Md., Independent: A correspondent from White Pialns writes that several persons In that vicinity were poisoned not long since by eating honey taken out of a hox in a bee-bive, whereas that taken out of the adjoining hives was absolutely pure and harmless, as is known by its being eaten by two or more that were poisoned by the other. The effect produced was that of an indescribable burning and alternately chilly sensation, with nausea, vomiting and great prostration of vital forees. The persons thus affected were Mrs. George R. Roby and daughter, Mr. John Murray (ex-sheriff), Mrs. J. T. Davis and Mr. Wm. Davis, to whom Dr. P. W. Hawkins administered, to neutralize the venom that was received into the system, whatever that was. The whole affair seems to be involved in mystery.

Mr. Banks asks, "Can you fathom the mystery?" In the human mind there seems to be a great passion for the mysterious! If anything is in the least strange, it is at once set down as a mystery! But we can see nothing of the kind in the above item.

We are well aware that such a good authority as Prof. A. J. Cook claims that there is no such a thing as "poisonous honey"-hut we are compelled to dissent from that view. Xenophon, the Greek historlan and general, tells us that his soldiers were poisoned hy eating the honey of Trebizond, and that it produced the effect of a temporary insanity. In 1704, Tournefort, the great French botanist, found that the honey made from the Azalea Pontificia produced the same effect as that described by Xenophon. In 1838, Mr. Abbott wrote to the secretary of the Zoological Society that he had himself witnessed the effect of this honey, and confirming all that the Greek general had said. The evidence is too great to admit of doubt ; at least it seems so to us.

In the above ease the bees might have gathered honey from the "kill-calf" or "mountain laurel;" and while some hives may have contained considerable of this, others may have had little or none. There is no necessity for a "mystery" in the case ! The boney in the hives was just what remained of that which the bees had gathered.

Fortunately, that kind of honey is found in hut few places, where hees are kept in log-gums and box-hives, and only when there is a scarcity. Like glueose, bees will not touch it if anything else is available. It is never shipped to market, and the cases of poisoning always occur in remote places, backwoods, etc. It is a fact that though some cases of poisoning have been reported, hut very few deaths are recorded from its effects.

A Contemporary says "earefully lay up the honey erop." The best place to lay up a honey crop is in the stomach of buyers as quickly as it can be gotten there.—Farm, Field and Stockman.

Now is the Time to Join the Union. —Let every bee-keeper send for a copy of the Annual Report and Member's Blank—fill it up, and become a member. It is to the Interest of every one to do so. The dues are only 25 cents a year; and it is intended only to call for one assessment (of \$1.00) each year. Send to this office for the Report and Membership Blank.

Auother Lawsuit has been bogun. On page 491, Mr. M. Darllng remarks that his case has been tried, and the judge withholds his verdict for the present.

Now comes Mr. S. W. Rich, of Hobart, N. Y., who has been sued by his rich neighbor for \$1,500 damages, and also to compel him to move his apiary.

It seems that hts neighbor is more troubled in mind over the alleged *nuisance* than in reality. He boasts that he will do all that money can get done to compel the removal of the bees. The apiary is in a small village, hut there never has been a case reported of either a man or beast helog stung ; neither bas there been any trouble caused by them. It seems to be a real case of disagreeable fault-finding.

Mr. C. H. Dihhern, in the *Plowman*, sensibly suggests the following :

I can easily imagine cases where bees would become a nuisance, and the continued keeping of them would be an imposition, to say the least. Yet I am satisfied that most of such complaints have but slight foundations. There are some people who cannot see others prosper, and such are usually the complaining onces. Of course every beekeeper should do everything possible to prevent his bees annoying any one. He should select such a location for the apiary that will be least objectionable to neighbors. If his aplary adjoins another man's land, plant a row of rapidly growing trees near such line, and train the branches to form a sort of hedge. This is also a good plan near a public road, where bees might interfere with teams passing. It is a good plan to have the aplary in a grove of small trees, and compel the hees to fly straight up, for when they are once high up in the air they will never bother to come down to annoy anything.

**The National Convention** will be held in Indianapolis on Oct. 12, 13 and 14, 1886. *Rays of Light* remarks as follows concerning that meeting:

We urge especially all Indiana bee-keepers to begin now to arrange to attend this meeting; it is a rare opportunity for us, and we should show hy our attendance our appreciation of the favor conferred hy holding it in our State, and that we are not lacking in *enthusiasm* and energy in our beloved enterprise, hee-culture. We hope and expect this to be the largest and most interesting meeting yet held by the association.

Foster's adjustable case for comb honey has been received and placed in our Museum. It was described and illustrated on page 377, in an article by Mr. Foster, and further description now is unnecessary. Its use is fully described in his pamphlet on "How to Raise Comb Honey." which can be obtained at this office for 5 cents.

The Tri-State Fair will be held at Toledo, O., on Sept. 6 to 11, 1886. Dr. A. B. Mason, of Wagon Works, O., is the Supt. of the Apiary Department again this year. The premiums amount to ahout \$135 in eash, besides diplomas, etc.

Frank Cheshire's new book on Bees and Bee-Keeping, ean he had at this office.--Vol. 1, bound in cloth, \$2.50, postpaid.

Italian Queens.-We have a few untested queens which we can send by return mail. Three for \$2.75; six for \$5.00; twelve for \$9.00.

#### Replies by Prominent Apiarists.

-----

[It is useless to ask for answera to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-ED.]

## Bees Hanging Out.

Query, No. 286 .- What would be the hest, under the present circumstances, to prevent the beea in the entire apiary from hanging out all over the outside of the hives? The weather is and has been very warm the past week-say 90° in the shade, from about 11 a.m. to 2 p.m., and then goes down to 85° until 10 p.m. The operations of the hives are nearly stopped during these hours, although the bees have plenty of brood and storage room. The hivea have pitch-roof covera, and are ventilated at both ends with holes with wire-cloth over them, and they are deep enough to hold a crate of 28 one-pound sections each. I have no sections on the majority of them, but have them tiered up two stories high, and working for extracted honey. They are pretty well shaded, but I have enameled cloth over the tops of the frames in the second story, but still there is plenty of air-space between the cloth and the ventilating holes. I tried a few hy taking off the cloth, but they crowded up in the cover. I smoked them, but in vain ; they only work some from 4:30 a.m. to about 9 a.m., and then from 4 p.m. to 7 p.m. There is no sign of preparing to swarm, or any other trouble, but simply ldleness and signs of suffocation. They keep up a terrible hum, notwithstanding there is plenty of bloom and nectar in the fielda.-Mississippi.

Give them more air by raising the hive off the bottom-board. Perhaps there is no honey in the blossoms, if they do not work.—DADANT & SON.

Try Mr. L. C. Root's plan, of a large given in the BEE JOURNAL not long ago.-G. M. DOOLITTLE.

From the statements made I judge there is no honey in the fields for the bees to gather. If they are bringing honey freely, give them another story of frames. If the first supposition is correct, there is nothing to do for them, as there is nothing for them to do.—J. E. POND, JR.

I should give a large entrance, at least 1 foot long and ½ inch wide. I should also cover above the hive with a wide shade-board raised at least 4 inches above the hive. With this I can always keep bees at work when there is honey or nectar to gather .--A. J. COOK.

I should say that they want bottom the platform from ½ to 1 inch high. At least that is just what I would do in this locality .- H. D. CUTTING.

You might try moving the second story forward so as to leave chance for a current of air through the broodchamber from the entrance to the open space at the upper and back part of the brood-chamber.—C. C. MILLER.

I think all this is caused by the lack of nectar in the flowers. I have seen the same thing during a dearth of honey in hot weather. It is not objectionable, except that it shows there is little honey to be gathered.— W. Z. IIUTCHINSON.

Use thin-walled hives; keep them well shaded, and have no double walls between the bees and "all-outdoors "over either the brood or sur-plus department. Give abundance of lower ventilation, and try upper ventilation, if you choose. With the bives you have, adapt them to the above conditions as nearly as possible. Do not let your colonies "clog" the combs with honey.—JAMES HEDDON.

During such spells of weather as you mention, my apiary presents the very same appearance you so lucidly describe. There is no help for it. You are mistaken about there being plenty of nectar in the flowers in the heat of the day during such heated per-iods. The absence of nectar at such times is the main cause of bees clustering on the outside of the hives in idleness—in my locality. Ventilation below, and the admission of air be-tween the cloth and hive-cover is the best I can do under such circum-stances.-G. W. DEMAREE.

In your apiary I know of no infallible plan to prevent the bees from hanging out. Give more shade to hanging out. Give more shade to your hives. This will relieve the inside heat to some extent; but when bees can only work a few hours in the morning, before the hot, dry air dissipates the nectar in the flowers, and have to remain idle the balance of the day, they will hang out for the reason that it is more comfortable outside than in. "Hanging out" is not always a sign that the hive is foldal with here is filled with honey or crowded with bees. In dull seasons, weak colonies destitute of stores will often hang out. Too close extracting will sometimes cause a sort of demoralization of the bees, and they will cluster out. -J. P. H. BROWN.

When the temperature is 90° and above in the shade, it is too warm for many bees to stay in a hive without large bottom ventilation. We have had such weather here, and I find had such weather here, and I find the narrow, 7-frame, single-walled hives cooler than any double-walled hive. Raise the hives up from the bottom-boards on blocks at the cor-ners. There will be no danger of robbing if a 2-inch space be given all around L of no boos into the coraround. Let no bees into the cap, as they will be sure to go to the top and build comb there. A cap to a hive is a nuisance any way. With single-vanquished, but generally not. I have

walled hives and plain covers, ventilation can best be given at the top at high temperatures.—G. L. TINKER.

The cause of the bees hanging out and remaining idle, is because there is nothing for them to do. It is no proof of "plenty of nectar in the fields" because there is plenty of bloom. Give them a feed in the open of the plenty of the provided the plenty of air at any time when they are hanging out on the hives, and it will satisfy you why they are idle.--H. R. BOARD-MAN.

## Cause of Worker-Bees Dying.

Query, No. 287 .- Last week I found a couple of quarts of dead worker beea in front of the hive of my first swarm of the season. I had taken off 24 sectiona, and have since taken 46, and more are nearly ready to come off. No apparent harm has been done, hut I would like to know the cause of their dying .- Grinnell, Iowa.

Probably some other swarm tried to join them and a fight ensued.--DADANT & SON.

In all probability the dead bees are the remains of some stray swarm that went into the hive and was killed .--J. P. H. BROWN.

I should say that a stray swarm tried to enter the hive and was killed. --G. M. DOOLITTLE.

The cause can only be guessed at. It might have been a small swarm that attempted to join the colony.— W. Z. HUTCHINSON.

Perhaps a small swarm tried to force an entrance and was killed.-C. C. MILLER.

Probably some little after-swarm tried to enter the hive of your "first swarm of the season," and was dispatched by that colony .- JAMES HED-DON.

Hard work and old age. I have often found bees dead in the field, and even on flowers. This is what we might call "dying in the harness."-A. J. COOK.

Who can tell? I confess I cannot. It might be robbers or old workers, and it might be many other things that caused the trouble. From the data given a guess only can be made. -J. E. Pond, Jr.

I had a like experience to the one I had a like experience to the one you describe, the present season. I attributed it to the attempt of some bees trying to enter the hive when a swarm was in the air. Something of the kind was the cause of the trouble in your case. A colony that has a queen will not tolerate the intrusion of other bees.—G. W. DEMAREE.

It not infrequently bappens that a colony of bees quarrel over the supercolony of bees quarter over the super-seding of a queen, when a quart or more of bees will be killed and scat-tered over the ground in front of the hive. Their contracted abdomens will show that they have been stung. Sometimes the party of discontent is opened hives during such battles and found the queen "balled," or a queencell started, or both.—G. L. TINKER.

## Natural Swarms or Nuclei-Which?

Query, No. 288.—Does it pay to let bees swarm? Or is it best to form nuclei? Or does it pay to let them hang on the hive 5 or 8 days, walting for them to swarm, and very likely they do not swarm at all, as I have had them to do this before, and those colonies were the very ones that had to be fed in the winter ?—W. A., Mo.

1. No. 2. Yes. 3. No.-DADANT & SON.

1. Yes. 2. Yes. 3. Give room so they can work instead of hanging out. -G. M. DOOLITTLE.

1. There are many opinions in regard to this matter, and each must decide for himself. 2. I most certainly should divide ordinarily. If, however, no honey was being gathered from the fields, the bees would be very excusable for not working, there being nothing for them to do.— J. E. POND, JR.

It will pay to let bees swarm if you want increase. If bees are managed rightly, and given room at the right time, and in the right way, they will not hang out in idleness if there is nectar in the flowers. Sometimes a colony will seem to waste time in an unaccountable way, but they are exceptions to the general rule; under proper management, dividing such colonies will break the spell.—G. W. DEMAREE.

If increase is desired it may pay to let them swarm, but even for this object it would be still better to divide. If I were working the bees for honey, I should not want over one swarm from a colony, and if there was no demand for bees, I should not allow any increase. My experience is, that strong colonies that do not swarm, if in a normal condition, and with a fair season, will always gather enough to winter on. If they fail to do this, then the fault belongs to the season and not to the bees.—J. P. H. BROWN.

It pays usually to let them swarm. If bees "hang out" five or eight days during a flow of honey, when they have room for storing it, are shaded, and have sufficient entrance to the hive, etc., I should say it was a very poor strain of bees, and should change the queens at once. There is much "food for thought" in the above query.—W. Z. HUTCHINSON.

If they are ready to swarm, and you find it convenient, then let them swarm. If it is more to your convenience form nuclei and build up. I have to do this, and find it works well. If the bees do not swarm as I wish them to do, I make them contribute to build up nuclei. Did not poor management keep them idle ?— A. J. Cook.

Whether it pays to make increase by dividing colonies, or to encourage or discourage natural swarming, de-

pends upon circumstances that I know not of in your case. At no time should your bees be idle, "hanging on the hives," increase or no increase, if there is nectar to be gathered.— JAMES HEDDON.

1. Yes, in some cases. 2. In some cases, yes. 3. It does not pay to let them hang on the hive waiting. What are you doing all this time? I do not keep that kind of a queen long.—II. D. CUTTING.

Let the bees swarm if they cannot be prevented by giving them surplus room early, and as often as they need it. There will be no loss of honey in the operation, if properly managed, and only a little more work for the apiarist. If the bees lay out, refusing to work in the sections when honey is coming in, I would place in the super a partly-filled section from another colony, and get comb-building started. If the bees that hang out are found full of honey, they are not idlers though they do not swarm at all. They are secreting wax if comb-building is going on inside of the hive.—G L. TINKER.

#### OUR CLUBBING LIST.

We supply the **American Bee Journal** one year, and any of the fellowing publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

#### Home Market for Honey.

27 To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remunerative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the beekeeper who scatters them).

**To give away** a copy of "Honey as Foed and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

To any One sending us one new subscriber with their own renewal (with \$2.00), we will present a copy of the new "Convention History of America."

Explanatory.—The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark  $\bigcirc$  indicates that the apiarist is located near the center of the State named;  $\eth$  north of the center;  $\blacklozenge$  south;  $\circlearrowright$  east;  $\circlearrowright$  west; and this  $\circlearrowright$  northeast;  $\circlearrowright$  northwest:  $\circlearrowright$  southeast; and  $\Uparrow$  southwest of the center of the State mentioned.

## For the American Bee Journal Caging and Introducing Queen-Cells,

------

#### G. M. DOOLITTLE.

Years ago it was ascertained that if a colony of bees had been queenless from 24 to 48 hours, a queen-cell of any stage of advancement might be given this colony, and the colony accept the queen hatching therefrom the same as it would one hatched from its own brood. Advantage was taken of this to change inferior stock to such stock as was desired, and what has been known as the "cell plan," has been more largely used for the improvement of stock during the past century than any other.

When the queen traffic sprang up, so that the bee-keepers reared queens and sold them the same as other stock was sold, it became an object to place a nearly mature queen-cell in a colony or nucleus, at the same time the queen to be sent off was taken away. Upon trial it was found that the bees did not propose at all times to accept of such an exchange, and especially before they had realized that their laying queen had been taken away from them. Their nonacceptance of cells given in this way proved with me to be a rule, although a few have reported favorably. In fact, unless I waited from 36 to 48 hours after the removal of a laying queen, before giving a cell, 19 out of every 20 would be destroyed; while other apiarists have reported nearly the same result. As waiting two days every time a queen was sold from a nucleus before acell was given, and then from one to two more before it hatched, was quite expensive, I tried many plans to obviate the difficulty, none of which gave me satisfaction.

One night, after thinking the matter over, I fell asleep. After sleeping an hour or two I suddenly awoke with the vision of a cage for caging queencells appearing before me. Now the idea of caging queen-cells is old, and cages specially adapted for this purpose have been advertised for a good many years, but the ideal cage presented before me at this time was for the special purpose of allowing the safe introduction of a queen-cell nearly mature, to a colony at the time of taking away its queen, the cage being so constructed that the queen could hatch and walk right out among the bees the same as if no cage was there; while at the same time the cell was safely secured against the bees, so they would not destroy it.

All are aware that when the bees destroy a cell they bite into the side or base of it, and never at the point. Well, the cage I saw upon awaking was to be made so as to protect all parts of the cell from the bees except the point, and this was not easy to their mandibles. The cage was made by rolling a small piece of wire-cloth around a V-shaped stick, so that a small but not very flaring funnel was made, the hole in the small end being as large as an ordinary lead-pencil. After making the cage 1 cut off a piece of %-inch cork for a stopper, put a nearly mature queen-cell into the cage with the point down into the lead-pencil hole as far as it would go, when the piece of cork was put in so the bees could not get at the base.

I now took a fine wire and run it through the meshes of wire-cloth just above the cork, so as to keep the cork in place, while the other end of the wire was bent so it would hold on to the top of the frames, so as to hold the cage in the position I wished it between the combs. This caged cell was hung in the hive at the time the queen was removed, and in from 24 to 48 hours, according to the age of the cell, I had a nice virgin queen in the hive. As soon as I saw that it was a success, I made more cages, so that now I have no more trouble with bees destroying queen-cells, not having a cell destroyed when thus caged.

The cage protects the cell everywhere except at the point, but allows the bees to get accustomed to the presence of the cell the same as if the cage were not there. The lead-pencil hole allows the queen to hatch the same as if the cell were not caged, while the bees can feed the queen and hold her in the cell as long as they please, so that she cannot get out till they are ready to accept her.

After getting thus far, about a month ago another thought came to me, which was, that I had some old queens which were not keeping their hives filled with brood as I desired, and why could I not use my invention in this case, so as not to lose any time to the colony of bees, to any nuclei, or to be to the expense of purchasing any queens? To think was to act, and the next day found me putting a caged queen-cell into each hive which had a present that did not account had a queen that did not come up to nad a queen that did not come up to my standard of prolificness. In a few days I looked into these colonies, finding that in every case the queens had hatched all right, and in all the hives thus treated, all but one had the old queen quietly depositing eggs, while on another comb was my young wirgin queen as much at home as if no virgin queen as much at home as if no other queen was in the hive. In the one exception, I found the young gueen out at the entrance dead, showing that although the bees could not prevent her hatching, yet they de-cided they had no use for her. In this they were correct, for in this case | cared for the two apiaries alone.

their queen has since come up to the standard of prolificness that I require. The young queens in all the other hives became fertilized in due time, and one after another of the old queens passed away, except one which still has both the old and the young queen laying in the same hive, and often on the same comb.

Another thing: None of these colonies thus treated have swarmed, save one, but have kept steadily at work giving me a nice lot of honey, while other colonies having good queens last spring, have done less, owing to their disposition to swarm.

After the honey harvest begins to wane is the time with the bees for a general superseding of oldish queens, in this locality. For this reason I am now rearing a fine lot of cells from my most valued queen, which cells are soon to be used in the above described cages, a cage being placed in every hive I have reason to think may have a queen that is not good for another year, thus getting a queen from choice stock in every hive where an exchange is to be made. If the queen does not need superseding, and the bees kill the queen hatching from the cell, I am out only a little trouble, while in every oue which is accepted I get much value.

The above is only an item which I have studied out, and if as good as I believe it to be, it will only be an item to be added to the general fund of knowledge. As I have freely gathered item upon item of value from the AMERICAN BEE JOURNAL in the part so L as freely size this in the past, so I as freely give this item to the readers, that we may be of mutual benefit to each other, and help to make the AMERICAN BEE JOURNAL of the present what it has always been in the past—the best exponent of bee-knowledge in the world.

Borodino, O N. Y.

For the American Bee Journal.

## Report, Honey-Dew, etc.

## C. W. DAYTON.

Our chance to obtain a honey crop has again come and gone. I think that figuring for the last 12 years it hardly equals an average, but of the last 5 years it was somewhat above the average. The honey-flow began very suddenly on June 7, and very dry weather caused a slow and steady yield for 35 days, ending July 12 with basswood. The colonies run about yield for 35 days, ending July 12 with basswood. The colonies run about 100 pounds each, part comb and part extracted honey, with 90 per cent, in-crease. One colony gathered 462 pounds of surplus besides a winter supply, and in amount it was closely followed by two others. Twenty other colonies only stored enough for winter after building up winter after building up.

I had the bees equally divided in two apiaries of 58 colonies each, and three miles apart, and while 50 or more swarms issued in one apiary not one issued in the other; so I easily

To get a large yield the bees should to get a large yield the bees should be of the right age, should not have much brood to care for, should be shaded, have plenty of room for honey, and should not desire to swarm. By close attention these conditions may be easily brought about, bnt a small amount of neglect may overturn any one of these condimay overturn any one of these conditions and effect an immense difference For example: The stories for ex-tracting should be adjusted just before the queen is ready to place eggs in queen-cells. If we wait until eggs are placed in queen-cells, nine times out of ten it will cause swarming, idleness, and perhaps annoyance and vexation to the apiarist. If we furnish the space in time, and as fast as it is needed, and that space is immediately occupied, a colony may be easily car-ried through the season without swarming, and by that plan I run an apiary through the season without the issue of a swarm.

For years, while Mr. O. O. Popple-ton and others located only a few miles east of here, have been report-ing yields of 100 pounds per colony without the aid of basswood, I have been making desperate efforts, but always failed to equal it, until this year when I partly solved the mystery. Perhaps some may look upon the figures that I have given as useful in bringing about low prices on honey.

It may be outside the boundaries of my "say," but if such opinions are admissible, I would venture that the harping upon such subjects as the aphidæ product, or "bug-juice," may bring out a rival of the famous (?) Wiley. It has been proven what some kinds of honey-dew is, and where it comes from, and it ought not to be held up as extensively existing. Tf hee-keeping is to become an industry, its mysteries should disappear and its most pleasing features greet the view of the injurious.

On page 419 the Attorney General of this State presumes to answer the of this State presumes to answer the question, "Are bees taxable in Iowa?" He says they are not in the list of exempt property, so they must be taxable. Again, we find that they are not in the list of taxable property, so again we infer that they are exempt from taxation. But there is one thing we know, and that is, that there is a special law in Iowa making bees exempt from taxation. Now, what remains is, whom to look to for this law on bees-our legislature, this law on bees—our legislature, sundry officers, or a vicious neighbor. I am not specially opposed to the taxation of bees, as I pay taxes on my bees every year, while I still know them to be exempt; yet I am not certain but the uncertainty of apiculture and the mutual benefit of bees should be enough to make them exempt from taxation. Perhaps a pow-erful "bee-keepers' union" might bear upon our law-making powers so as to turn that point in our favor. All of the laws apiculture will admit of will be erected as soon as it becomes an industry, and will be to a large extent at our favor or disfavor, ac-cording to the dollars and brains accumulated in its defense. This shows one of the reasons why every bee-keeper should join the "Union." Bradford, & Iowa.

For the American Bee Journal.

## Horse Killed by Bees, etc.

FRIEDEMANN GREINER.

In my experience with bees, the killing of any animal by stings had not come under my observation as yet. Yesterday I witnessed a case which dispensed with all my doubt about the possibility of the thing. J. V. Weir, Esq., left his riding-horse by the gate of his dooryard, as usual, while he went to dinner. An apiary of 45 colonies was within three rods of the spot where the horse was tied, and the bees in great numbers at and the bees in great numbers at-tacked it in our absence of not over 12 minutes. When we discovered the state of affairs, the horse's head was almost covered with mad hees and swarms of them around it; which would sting everything and everybody anywhere near. I could not induce the animal to move at first, and to protect it I kept it covered with blankets; but after awbile, and after blankets; but after awhile, and after procuring more help, I succeeded in getting it out of the reach of the bees, and we then applied remedies, as washing with cold water and soda, then besmearing with linseed oil; internally we gave whisky with laud-anum, but all efforts were in vain, and the near animal offers estructed of the poor animal after a struggle of three hours was dead.

Moral: Let us not give cause for complaint to our neighbors and the complaint to our neighbors and the public in general by keeping bees near the roads nor in closely-settled places; let us surround our apiaries by high fences, and, still better, by evergreen hedges. Other suggestions could no doubt be made. An abnormal case of this kind may not occur in one's life time, but that it can, should be reason enough that we should be reason enough that we should be careful and take the necessary pre-cautions against the possibility of its occurrence.

The honey season with us still con-tinues to be good, contrary to Mr. Brown's statement (page 443) of the honey season being nearly over. Some of our colonies filled 24 1-lb. sections from July 12 to July 20; that does not look much like a slack. Virginia will furnish quantities of honey this year. White Post, & Va., July 22, 1886.

For the American Bee Journal "Bird's-Eye View of Bee-Keeping,"

#### DR. C. C. MILLER.

I make no question as to the general truth contained in Solomon's statement about there being no new thing ment about there being no new thing under the sun, but it hardly applies literally to Rev. W. F. Clarke's new book, "A Bird's-Eye View of Bee-Keeping." A book entirely devoted to bee-keeping, and every word of it in poetry, is certainly a new thing to me. I would like to give the readers

of the BEE JOURNAL a fair description of this little book, but how can I unless I quote almost the whole book in its practical form ? As the entire work costs only 25 cents, it can easily be obtained by all, so I will content myself with sampling its pages here and there. Its author says:

This treatise is for novices, and such Should take care not at first to attempt too much.

Then follows advice as to books and papers to be obtained "before a bee is bought."

None should attempt the business till they learn it, Or hope to make a cent unless they earn it. None who are seeking a soft place to lie on, Need trouble themselves this pursuit to try on.

None who are seeking a soft place to life on, Need trouble themselves this pursuit to try on. If you propose to be a specialist in keeping bees, permit me to assist Your cogitations, by, in brief, suggesting A few pre-requisites before investing. That knowledge of the business and then fitness To foliow it are needful, facts bear witness. But what is fitness? Well, it is, in part, To have quick eye, soft hand, and hon-heart; A miod to grasp the most minute details, And, with it all, patience that never falls, Promptness to do all work in its right season, And clear perception from the facts to reason. It is to have a perfect self-control. A big with sevel habit once beach, A big with evel habit once beach, A big with evel habit once beach, A big with a bit once beach A big with beat the ord so reas to beat, A do most beat the aver fails or flags. A dig with beat the all honor's claims to meet. The golder rule and law of love your aim. And year wholly koorant of bees, And you are wholly koorant of bees, You must content yourself to be a creeper, Go slowly, do not be in foolish haste, Nor think that you your time and money waste In making full and careful preparation. The author waries the usual advice

The author varies the usual advice and says:

Beginners, 1 advise to raise comh boney Until they scrape together enough money To purchase an extractor, pails, aud things, Necessity for which extracting brings.

When hiving a swarm,

When hiving a SWarm, Be sure that your new hive is clean and neat, Smear it with beceawar and with honey sweet, Have no foul smell about it, for the beces Are mostly all old-maids, whom you must please By making things quite tidy and "so-so," Else in a fit of dudgeon, off they go 1 I go for out-door wintering, on a stand Where you can manage them with ready hand, Free from laborious lifting to add fro, Which makes the luckless bee-man'aback ache so. I set my hives two feet above the ground. Where ease of handling them is always found. The man who first devised a four-lach stool To set bit hives on was an arrant fool, And acedlessly condemned himself to stoop Till with fatigue and pain his spirite droop.

Of course "hibernation" is not omitted.

And now, the season's cycle is complete, The summer hours march on, with nimble feet, Soon once again the welcome time will come When honey-gathering bees, with cheerful hum, Will do the work they understand so well, And store sweet nectar in each vacant cell, Smoothing and polishing the surface all With that small trowel, we a dagger call, But which by them employed ao much is in giving honey-comb its final touches.

Then after some advice on a few special topics, the book closes with-

Farewell, and in a brighter world than this, May you enjoy a life of perfect hiles : Where thrilling music through the welkin ringe, And nectar sweet is gathered without stings i

Marengo, & Ills.

The St. Joseph, Mo. Inter-State Bee-Keepers' Association will hold its annual meeting on Wednesday evening of the Exposition week, Septemher 30, 1886. Arrangements are being made to have an interesting meeting. The place of holding the meeting will be published in our local papers on Tuesday and Wednesday a.m.

## The New Honey-Plant.

T. F. BINGHAM.

The "Chapman Honey-Plant" is not only pleasant to behold, but it is unusually attractive to honey-bees and their larger cousins—the beauti-ful humble-bees. I shall not presume to predict—and as only three buds are yet open, it would not be safe to say that it is the only plant likely to prove a success as an exclusive honey-plant. This, however, may be said, that it is a vigorous grower, and may be easily raised; perhaps it would grow without special care. As all the readers of the BEE JOURNAL may not be able to see the plant in bloom, The "Chapman Honey-Plant" is not be able to see the plant in bloom, I will briefly describe it.

It grows from 3 to 4½ feet high, and has on each root or crown from 6 to 16 buds or heads. These buds are round like an apple, and from 1 to 1% inches in diameter. The surface of this bud is covered with small white flowers having bluish stamens. Like clover, the whole sphere is not in bloom at one time. The top opens first and gradually continues to open down the sides for about four days. The heads or buds are of all sizes and ages, and will require at least three weeks to mature and bloom. It is therefore safe to conclude that it will continue to attract bees not less than the above-mentioned period of time.

It will be observed that I do not state that bees gather honey from it, but that the flowers are very attrac-tive to bees, and from the fact that only three of my plants are in bloom, and that only one head on each of the three plants is yet open, no doubt people not enthusiastic will be sur-prised that any one should presume to call attention to such a plant on so slight an acquaintance.

I must say that while I should have been incredulous as to the interest bees take in it, had that interest been described to me, I should not have been more incredulous than I was surprised when I found ten honeybees and one humble-bee on a single head at one time, all busy in extract-ing nectar. The three heads now in bloom are not without from 3 to 10 or 15 bees on each one all the time. The 15 bees on each one all the time. The bees do not seem to be interested in the pollen of the flower, although it has it in abundance, but continue to thrust their tongues to the bottom of the flowers. One of the peculiar fea-tures of their visits to the flower is the large time they remain upon them

the long time they remain upon them. How extensively these plants have How extensively these plants have been distributed among bee-keepers, I cannot say; all I can say is, that as I am able to regard Mr. Chapman (Capt. Chapman, as he is familiarly called where he lives) as a tried friend, having lived by and known him for a period of 20 years, it was not strange though entirely upon not strange, though entirely unex-pected, that I should be made the delighted recipient of 50 of the above plants by express last spring, in time to observe the bees upon them, still in too small numbers to really know the amount of honey produced.

It is of importance that they bloom when they do—just after clover and basswood are past. Particularly is this true in a dry season like this, when, after July 6 (the close of the basswood honey season here), bees could find no flowers to visit, and of course an unusually large number of sections are left incomplete.

sections are left incomplete. If now a plant like the Chapman honey-plant could come forward and furnish honey for even a few days, until the uncapped sections could be rounded off and completed, it would add greatly to the income of my beeranch.

Abronia, 9 Mich.

Rural New Yorker. One thing that Fraud cannot Counterfeit.

A. J. COOK.

I am surprised to note the following I am surprised to note the following response to an inquiry in the Farmers' Club of a late *Rural New Yorker*: "It is prohably true that men, with-out the aid of bees, now make and sell comb honey in which neither wax nor honey is used; and that the comb is made of parafilne and filled with a substance like honey." Now, Mr. Editor, I wish to say that the above is not only not probably true, but that it is utterly absurd, mischievously false, and entirely impossible. No false, and entirely impossible. No such thing has ever been done, and it is very certain that no such thing ever can be done. Only Nature's deft and delicate fingers can fashion the beautiful comb honey. Comb honey is one thing that fraud cannot coun-Whoever purchases the beauterfeit. tiful, white, incomparable comb honey, may be sure that he has Nature's product, pure and genuine. A few years age Prof. H. W. Wiley, now Chemist of the Agricultural Department at Washington, published an interesting article on sugar, in the *Popular* Science Monthly, in which he made the above statement, apparently in all soberness. Afterward, when Prof. Wiley was called upon for proof of what was palpably absurd to any one who knows of the real nature of comb who knows of the real nature of comb honey—a substance which is clearly inimitable—he replied: "I only wrote it as a scientific pleasantry." This statement was apparently as candid and earnest as any part of the article, and so was widely copied by the press of the country, and now, like all untruthful statements it is, ever and anon lifting its upgracious head only anon, lifting its ungracious head only to do mischief.

Comb honey owes its excellence to very delicate structure. The cell-walls of the comb are only 1-140 of an inch in thickness, and thus the delicate wax breaks up in the mouth almost without any extraneous force, and just serves to reduce or dilute the exquisite honey, and so becomes one of the coveted articles of diet. It seems almost like sacrilege to say that such an incomparable article can be made artificially. As before stated, it is utterly impossible, never

many papers that have spread the error may be equally quick to fling out the correction; even then much wrong will be done, for as we all know, falsehood will traverse the globe, while Truth is hitching up her horse.

For the American Bee Journal.

Taxing Colonies—Non-Swarming Bees.

J. E. POND, JR.

Mr. Camm, on page 454, in discussing the matter of taxation of bees, may have been surprised and disap-pointed by the auswers given to Mr. Blair's query, and why he should be so, is plain from the reading between the lines of his article. Insofar as my own answer is concerned, I have to say that I answered the question as I then understood and now under-The matter was not instand it. quired into, whether bees ought to be taxed or not, either morally or as a business proposition; the question being whether bees could be legally taxed, and were so taxed in any of the States or not. I said and still say that an apiary is as subject legally to taxation as any other species of personal property, statute exemption being the only means of relief there-from. In answering I spoke only for my own State-Massachusetts.

Mr. Southwick makes the point that hees are not absolute property, con-sequently legally exempt from taxa-tion. In this he is partially correct. A colony of bees hived in my own apiary are absolutely my property, they are solely under my control, and if stolen the thief is punishable for the larceny, which would not be the case were they not absolute property. They fall under the same category as pigeons or doves, and are not ferce nature while in my hives and located in my apiary, any more than are pigeons or doves when in the cote of the owner.

As to the point that if a "hue and cry" was made in the matter, all bees would be taxed anybow, the remark was made jocularly, and I supposed it would be so understood. To Mr. Camm I will simply say, the com-munistic idea that nothing but real estate should be taxed under any circumstances is hardly a question for discussion in a bee-paper, else I might give him my views on the subject, which, although based on political economy, are decidedly in favor of the idea that all products that possess an intrinsic merchantable value should be taxed for public support.

Mr. Pryal, on page 456, gives us a novel way or manner of obtaining favorable decisions from the courts of highest resort in the various States. The same thing was hinted at in the BEE JOURNAL a few weeks ago. As a lawyer, all I can say in regard to the proposition is, that our Massachusetts courts would disbar an attorney who has been done, and never can be done. Should bring a fictitious suit before See that the cellar is perfectly dark, I hope, Mr. Editor, you will publish them for the purpose of getting an that it is well ventilated, that it is as this correction at once, and that the opinion or decision. We have some quiet as is possible, that it is free

rights; I for one would prefer to have them all trampled under foot, than maintained by fraud or evasion.

STRAIN OF NON-SWARMING BEES.

Have any of our bee-keepers on a large scale-say keepers of 100 or more colonies-ever attempted to form a colonies—ever attempted to form a strain of non-swarming bees by using queen-cells from which the queens were just ready to emerge, as the means of heading colonies, and fol-lowing down on that line for several generations? This question is one of interest to myself, and theoretically I believe the plane is correct. believe the plan is correct. Introduce a queen-cell just on the point of letting out the young queen, say on the fifteenth day; keep close watch of this hive, and draw from it in the same way before a swarm issues; continue this plan for two or three years, and I think and believe that a non-swarm-ing strain will result. In order to carry the point to a nicety, the drone mothers should be produced in the same way. I have been able only to test the

matter slightly, as my apiary is small. It is possible that the majority would not care for a non-swarming strain; still, as a matter of experiment, it might prove interesting, and of im-portance in ascertaining how far the matter of education can be carried. I have a colony that has not sent out a swarm for two years; the queen that now heads it is in her third year, and is the third generation from a and is the third generation from a queen-cell introduced as above, each of the intermediate queens, as well as this last one, having been introduced in cells from which they were just ready to emerge. This case alone proves nothing; still it is a straw or pointer; and if the same result should follow in a number of instances, I think the theory which I intimate would be well proved. Has any one the time and inclination to test the matter?

Homestead.

Preparing Bees for Winter, etc.

#### O. CLUTE.

With the bees, winter is the time of quiet. But the wise bee-keeper will be active in the care of his little friends, for upon such care depends his success for the summer that is coming.

If bees are wintered in the cellar, care should be exercised as to the time of putting them into the cellar. If they are put in too early the weather will be warm, the cellar will be of too high to concerning and the be at too high a temperature, and the bees will be injured by too great activity. The hives should not be put into the cellar until cold weather really sets in. They should be carried in on a cold, dry day. In carrying them in they should be disturbed as little as possible. If the temperature of the cellar is not above 50° they will see he cuit of the being with will soon be quiet after being put in.

from rats and mice, and that the temperature is kept as near as may be at 45°. If it goes up to 50° occasionally, no harm seems to result. If now and then it falls to nearly the freezing point, no harm ensues. But keep it as near as you conveniently can at 45°.

Bees wintered on the summer stands have probably been protected in some manner. See to it that the protection is all right. Have all entrances small. It is a good plan to put at each en-trance somewhat early in the fall, a screen that will keep out mice but will let bees pass. Then when the mice begin to look about for a warm place in which to pass the winter they find their entrance to the hives barred. Mice have a great liking for making their nests on top of the frames, im-mediately over the cluster of bees. The heat from the bees keeps the nests warm, and the mice are very fond of eating the honey and pollen, and the bees also. If the entrances front east or south they will get less wind than if they front north or west. But a piece of board should always be stood before the entrance, leaning against the hive, so as to keep the wind from hlowing directly into the entrance. Keep all hogs and cattle away from the yard where the bees are kept...

When snow comes it is wise to bank it closely against the hives, all around except over the entrance. Some re-liable men advise putting it over the entrance too, and they relate how they have wintered bees successfully under a snow bank which completely covered the hives. Perhaps snow over the entrance is sufficiently pervious by the air, so that bees will not smother; but there is always danger that the entrance to the hive will be come filled with ice, by the freezing of water that runs out from the con-densation of moisture in the hives. If the entrance does thus become clogged with ice the bees will smother and die. Hence I do not advise banking snow against the entrance. If snow drifts all over the hives, I should advise that it be shoveled away from the entrances frequently, and that the bee-keeper assure himself that the entrances are not clog-ged with ice. Sometimes dead bees collect against the entrance inside the live, and so prevents sufficient venti-lation. This can be prevented by thrusting a small stick in and moving the dead bees to one side.

#### WINTER MEETINGS OF BEE-KEEPERS.

During the busy season of the year it is difficult for bee-keepers to get out to meetings. Much work keeps them at home. But in the winter they have more leisure. It would be well to have a winter meeting of our State Association in Des Moines, for listening to essays and addresses, and for practical discussions as to methods of work, and as to markets, and other questions of general importance to bee-keepers. In some States such meetings have been held for a number of years, and have proven of much interest and value. Our Iowa beehaving such a meeting, but thus far it has not seemed possible to arrange one. But as our bee-keeping interests develop we shall doubtless be able to get the co-operation of a sufficiently large number of the most intelligent bee-keepers to make a profitable gathering.

Some of us find that railway fare and hotel bills in going to Des Moines and hotel bills in going to Des Montes for a meeting are a serious obstacle to our going. But this objection does not apply to meeting in each county. If the bee-keepers of each county would come together for a meeting, at least once during the winter, and discuss all questions of special inter-est to them, they would find many good results coming from the meetings. If an address from a really able man, or one or more essays from practical bee-keepers, can be prepared for such a meeting, it is well. But do not put men on for addresses or papers unless they know something about bee-keeping. Better have no address and no essays than to have the time wasted in listening to men who know nothing.

Some of the most profitable meet-ings of bee-keepers I have ever at-tended had no addresses and no essays; but they had a question-box. Each member wrote questions on slips of paper, put them into the box, the chairman drew them out and called on a competent man to answer. This often led to remarks from others, and we got thus the best practical knowledge of all on every question that was asked.

Iowa City,⊙ Iowa.

Being incapacitated for manual labor by a fall from a load of hay, and judging the honey-flow about at an end, I thought it safe to report for the season. I have buckwheat sown, and we generally have an abundance of fall flowers, the principal ones being goldenrod and carpenter's square, so I anticipate a fall-flow of honey, but not sufficient to expect any surplus, as I always confine my colonies to the brood-chamber, and let them store the fall-flow for their own use. I have 12 colonies that averaged a little over 100 pounds each; some of them have stored 150 pounds, and on examining them yesterday I find very little honey in the brood-chamber, it being used to its fullest capacity for broodrearing.

Some apiarists claim that it is safer to winter bees on white clover honey. I do not doubt that in the least, yet with me I find it difficult to grade the bees' food to comply with all the whims of the theorists, so I look to having a good, warm receptacle for them, either wet or dry, and not too much ventilation. As to their food, I depend upon the fall flow for the of years, and have proven of much interest and value. Our Iowa bee-keepers have thought much about wintering. Last spring I took from Since the old queen came out with

my cellar 61 colonies, one of which was very nearly starved, the queen and only about half of the bees being still alive. After they were through swarming out and deserting their hives (a freak to which my bees are addicted in early spring) I had 55 left; I now have 94 colonies, and they have produced 2,000 pounds of extracted and 1,500 pounds of comb honey. I have sold 400 pounds of comb honey for an average of 11 cents per pound, and 360 pounds of ex-tracted honey for 8 cents per pound. I cannot get the big prices that I read about.

I could have done better with my bees, but being the assessor of our township, which includes the county-seat of 3,000 inhabitants, you may guess it was rather a hard job to be accomplished in two months, al-though I had the advantage of considerable experience, as this is my fourth term.

The season here has been remark-ably good, but at present the long absence of rain has begun to show on vegetation, and unless it rains soon I fear our bees will be short of winter stores.

Sharpsburg, O Ills.

For the American Bee Journal.

Two Queens in One Hive.

#### E. C. KEPNER.

I have a colony of bees that cast a swarm about June 10, and at that time it had plenty of brood and sev-eral capped queen-cells. I put the eral capped queen cens. I put the section-boxes back again, and did not look at them until July 19, and, on opening the hive, to my surprise I found neither brood nor larvæ; and supposing their queen had been lost in mating, I did not look for eggs, but went at once to a good, strong colony and got an old queen and introduced her to the supposed queenless colony. After leaving her caged for 48 hours I turned her loose, and they accepted her all right.

I thought nothing more of her until I happened to pass by the hive to-day, so I thought I would examine them and see how she was doing. I opened the hive and lifted a frame from the centre, and I at once noticed larvæ which was too old to come from her laying, for she had only been free for three days; I turned the frame around and I saw a young queen. I then supposed my old queen was dead, but she was not for on taking out the supposed my one queen was dead, but she was not, for on taking out the next frame I saw her on it busily depositing eggs. This proves that there had been two laying-queens, and also that they accepted an old laying-queen while at the same time they had a yourg laying encous in the they had a young laying-queen in the hive.

I have frequently seen two laying queens in the same hive, but it was the old queen and her daughter, but never before have I known a colony to accept a laying-queen when it had

one. Where did this young queen come

the swarm, and I know she came out, for I keep all my old queens' wings clipped, and I am always at the hive about as soon as a swarm commences to issue, so I know just where she is. If this queen hatched from one of the eggs of the old queen, and hatched in 16 days after the swarm issued (which is hardly probable, for they had capped queen-cells, as stated before), and had waited the full 21 days before laying, it would make the full 37 days; and I know that the colony was without a laying queen for that length of time, and as near as I can tell from the larvæ, a little longer.

This young queen, I think, is a hybrid, and the colony spoken of are pure Italians. I have a few hybrid colonies in my apiary. Do you not suppose that that particular colony stole an egg from a hybrid colony and reared this young queen from it? reared this young queen from it? This is my belief. But what about their accepting the old queen when they had a laying queen ?

After fifty days of rain, the weather has become settled and is fine now, except the nights are a little cool; but our bees are doing nicely on sumac, and we will have plenty of bloom for two months yet, which will be mostly cow-peas, fall asters and goldenrod. Pikeville,⊶ Tenn., July 24, 1886.

## Bee-Stings for Rheumatism.

A bee-keeper in Iowa informed a neighbor that the stinging of bees was a cure for rheumatism. As the neighbor was a sufferer from the disease, he concluded to try the remedy. The story in his own words is as fol-

lows: "Thinks I, we've got the medicine right here at home, and it won't cost anything, and I will just try a few; I think people, as a rule, take too much medicine any way: better try more medicine any way; better try more home remedies. So provided with a small paper sack and some courage (for I must confess I was always a little careful not to disturb bees, for it hinders them from gathering honey, you know), I held the open sack at their entrance and soon had it well filled with the buzzing creatures. I hilled with the buzzing creatures. I then made straight for the house, gave sack and bees to wife and held open my pants leg and said: 'Now start 'em up.' She pushed sack and all up arm's length, and laughed a little and asked, 'Are they going?' Says I, 'You het!' Just then one administered, and I grabbed for him (as is natural on such occasions), and from that every last one laid to and from that every last one laid to, and four doctors with eight resurrecters couldn't do business so lively as those bees did. I, in a rather commanding manner and tone, screamed for wife to take 'em out, but she seemed to be slow about it, so I got out, and left breeches and bees in the same room, and I went to bed in untold misery.

The sufferer was, however, not in so bad a plight as the genius who thought if a little was good, a good deal was better, and so had a whole colony emptied into bed with him.— Exchange.

"Paradise Regained."-P. P. Nelson, Manteno, + Ills., on July 23, 1886, savs:

We are having a very prosperous season with the "blessed bees;" compared with the past two seasons, it seems like "Paradise Regained." They have swarmed profinsely, and have stored and are still gathering an abundance of the most beautiful honey.

Motherwort.-Jno. D. Gill, Philipsburg. Pa., on July 26, 1886, wrote as follows:

1. I send by this mail a specimen of a plant on which bees have worked vigorously for several weeks. Please give its name and characteristics. It is a rare plant here. I have never noticed it before.

2. Do bees get honey or only pollen from asparagus?

[1. The plant is motherwort, which yields honey in abundance, and is a great favorite with the bees.

2. Asparagus furnishes nectar to the bees.-ED.]

Leaves Containing Honey-Dew.-J. W. Sanders, Le Grand, O Iowa, on July 20, 1886, writes:

I send a sample of leaves containing the so-called honey-dew. I desire Prof. Cook's opinion on it, through the BEE JOURNAL, as there are many bee-kcepers interested in it, and I fear are misled about its origin. Some claim that there was so much sweet in the flowers; that it evaporates through the day, condenses at night, and is found in the form of dew on the foliare the following and is found in the form of dew on the foliage the following morning. The idea amused me, as I supposed it was from an aphis of some kind. So I went yesterday six miles and ob-tained these samples. They are not as good as could have been obtained two weeks ago. The leaves that are whitehead are some that were covered two weeks ago. The leaves that are weather comes, and no keeping whitened are some that were covered through the winter is necessay; I with it then. I send several kinds of mean "silk-culture," which assumes

leaves that contain more or less of it. The grove in which it is found is principally oak of small growth. I also send some of the leaves of the oak taken from the above place, where the sweet substance was to be found. Some leaves showed large drops of it, and others a fine spray. Yesterday it was only to be found in spots, while about two weeks ago it was generally on the lower foliage. The proprietor had not seen his bees working on it, but supposed they did. White clover and linden were at the time at their best, and he has a nice lot of fine comb honey in his apiary ; but from what I could see and learn I think but little was from the so-called honey-dew. If my samples are suffi-cient, I hope the Professor will give the origin of this sweet substance, and tell us if it is produced in any other way except by plant-lice of some kind.

[The leaves and secretion are so well described by Mr. Sanders that I need not repeat. The nectar, as secreted, is in such quantity that we can get quite a taste. There are no cost skins of lice on the leaves, which there would be if the sweet was secreted by lice working on the leaves containing the sweet. With others I tasted of the nectar, and could plainly discern not only sugar - probably starch sugar-but also a perceptible taste like oak-juice or tannin. I presume this sweet comes from the same source as mentioned in the last number of the BEE JOURNAL, from acorns attacked by an insect. This would account for the peculiar oak-juice flavor, and for the appearance of the nectar in such considerable quantities in a single place; a wounded acorn was just above.

That the sweet secretions or nectar from flowers ever evaporate and then fall as dew, I have never seen reason to believe. I think that we can always find other explanations. Even in a sugar-house where hundreds of gallons of nectar are evaporated, we never find a deposit sufficient to attract insects, although in such a case a little sugar-very little, is driven off with the steam, probably by the expulsive force of the steam .-- A. J. COOK.]

Bee-Culture and Silk-Worms.-H. Fisher, Oshkosh, O+ Wis., on July 18, 1886, writes :

While I am unable to report good news about my bees, on account of unsuccessful wintering, I am engaged in an industry as interesting as bee-culture, which proves more successful because the work is done before cold quite an important prospect. Several years ago I began to make the test with about fifty Russian mulberrytrees, and now I have many thousands of them, finding them perfectly hardy enough to stand our cold climate. They are excellent fast growers, which furnished me food for about forty thousand silk-worms, producing a fine, good quality of silk, which finds a ready sale this summer. I find it very interesting, pleasant and light work, similar to handling bees. work, similar to handling bees. Nearly 50,000 persons are engaged now in this new industry, but there is room yet for 100,000 more to supply our 380 silk mills with raw silk, be-sides the many new ones which will be started.

Bees Doing Well.-P. L. Gibson, Muscatine, + Iowa, on July 23, 1886, savs :

Bees are doing well in this locality. I started with 22 colonies in the spring, and I have just doubled the number, all now being strong colonies. My last swarm was on June 24. White clover honey was pretty plenti-ful, but lasted only a short time, mostly\_being consumed by young mostly being consumed by young bees. We have had no rain for four weeks. Bees are gathering some honey-dew, and are working morn-ings and evenings. I have taken off about 500 pounds, and there is that much more in the hives ready for capping. Should we have a rain soon we will get a bountiful crop of fall honey.

What? What? - J. H. Hassler, De Pue, & Ills., on July 29, 1886, writes :

My nice white sections of honey are nearly all spoiled by being filled around the edge with some very dark honey, having the appearance of muddy water. From what is it gath-ered? I have some sunflowers in the garden for the first time, and as I never before had such honey I thought perhaps the bees got it from them. If I find that they are the source, I will cut them down at once.

[Cultivated sunflowers are of no value for honey, and may have caused the trouble, though it might be traced to some other bloom in the neighborhood of your apiary .--- ED.]

Are Bees a Nuisance ?---Marshall Darling, Waterbury, 9 Conn., on July 23, 1886, wrote as follows :

The trial of the suit against my keeping bees (as mentioned on page 339), came off in the District Court on June 28, before Judge Bradstreet. It took about all day to try the case. The Judge reserved his decision and has not given it yet, and may not until September, when the District until September, when the District honey. Thanks to a kind Providence Court meets again. The plaintiff the promised later rains came. My could only prove in court that he had lost only 12 days rent—one family having moved out on May 13, and another one moved in on May 25 and paid the same rent. I still keep 12 colonies of bees. I have sold 11 colo-

nies. There is no complaint from them now. I never had bees do bet-ter than they are doing now. This is all the Waterbury *Evening American* said about the case: "To-day the said about the case: "To-day the District Court heard the very inter-esting case of George L. Stanley vs. Marshall Darling, application for an injunction to prevent the defendant from keeping bees. The plaintiff's house is situated close to where the bees are kept, and it is claimed that they are an injury."

Very Dry Weather, etc.-L. G. Purvis, Forest City, Mo., on July 26, 1886, says :

Bees have done very well here this season. I commenced with 48 colo-nies, have increased to 74 by natural swarms, and so far I have taken 3,220 pounds of extracted honey, and about 100 pounds of comb honey, with from 300 to 500 now ready to extract. It is very dry here; we have had no rain for a month, and I fear it will cut our fall crop short, which is usually good here.

Curing Foul Brood.-Dr. J. C. Thom, of Streetsville, Ontario, writes this request for publication, on July 28. 1886:

I would like to have the experience recorded in the AMERICAN BEE JOUR-NAL of those who have tried the Cheshire method of curing Bacillus alvei, commonly called "foul brood," a disease which is not unknown in Connede. If these who really have Canada. If those who reply have succeeded, will they kindly tell us just how they did it, and if it is a permanent cure?

[This is a good suggestion, and we would like to record the modus operandi if a cure was effected, as well as the disappointments of those who have experimented with it unsuccessfully, if such there are.-ED.]

Bee-Keeping in Texas .- Jno. A. Emison, Mission Valley, •o Tex., on July 21, 1886, wrote :

After five year's experience in the handling of bees, I find much written in the bee-papers and bee-manuals that will not do in Western Texas. Experience though often a hard tutor is the one most to be relied upon. There is a universal wail going up from Western Texas. There is not one pound of surplus honey, and most of the colonies have died from starvation. I have 40 remaining out of 120 in May. The cause was a cold, backward spring, followed by a drought, and the failure in the horse-mint. I might for emphases of distress say tetotal failure of mint. My experi-ence has been, no mint, no surplus honey. Thanks to a kind Providence

the black bee for this locality. I was congratulating myself upon having my apiary so nearly Italianized, but out of 6 pure black colonies I lost but one. My strongest colonies are the remaining 5 blacks. The advocates remaining 5 blacks. The advocates for Italians contend that they work earlier and later in the day, hence are better honey-gatherers. I do not find it so, but the reverse. The great obit so, but the reverse. The great objection I have to the black bee is its disposition to rob. I am in no wise discouraged. I have had quite a lot of comb to render. I wish to thank Mr. Demarce for the light he gave in the Query Department on the subject of wax-rendering. In fact I find more information boiled down to a few words in the "Queries" than I ever found in all the profuse and verbose articles. It is the wheat without the chaff.

Bloom in Mississippi.-L. J. de Sobotker, Riverton, +o Miss., on July 6, 1886, says :

The weather has been and is still very pleasant for the gathering of nectar. We have now in full bloom all around us the Indian corn, and the bees are very busy on the tassels, extracting the nectar, which is a very clear and fine flayored sweet; but not having a tin evaporator prevents me from taking this delicious honey separately, and as there are also several other blooms at present there might be some difficulty in doing this, al-though by examining the surplus combs in the second story of the hives, the corn honey can be distinctly known,especially when having noticed the direction of the flight of the bees to the surrounding extensive corn-fields on the eastern side of the apiary; on the north, south and west is woods. The other bloom is, but-ton-bush, alders, milk-weed, white clover, red clover, and a variety of others, their names, as yet, unknown to me; also a few magnolias, these latter having been planted and culti-vated here, although about a hundred miles further south there was pointed out to me a place called Magnolia Bluff, where they grow in great abundance. There is no lack of variety of bloom at present, still I find that the gathering is not in proportion to the strength of the colonies. Occasionally we get a natural swarm, but they get so high up on large trees that they cannot be taken and hived in this busy season, with 142 colonies for one man.

#### Convention Notices.

The Cortland Union Bee-Keepers' Asso-clation will hold a basket picnic at little York, N. Y., on Wednesday, Aug. 18, 1886. All interested in hee-culture, with their families, are cordially invited to attend and have a good time. D. T. SHATTUCK, Sec., Homer, N. Y.

1287 The Illinois Central Bee-Keepers' Association will hold its next meeting at Mt. Sterling, Ills., on Tuesday and Wednes-day, Oct. 19-20, 1886. J. M. HAMBAUGH, Sco.

THOMAS G. NEWMAN & SON. PROPRIETORS. 923 & 925 WEST MADISON ST., CHICAGO, ILL.

At One Dollar a Year.

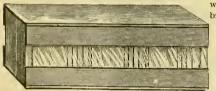

ALFRED H. NEWMAN. BUSINESS MANAGER.

# Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name: many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

A New Crate to hold one dozen one-pound sections of honey .- It has a strlp of glass on each side, to allow the honey to be seen. It is a light and attractive package. As it holds

but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 cts. per crate. Glass 1%c. per light, extra.

Italian Queens,-We can supply them by mail, postpaid, at the following prices : Untested, \$1.00; Tested, \$2.00; 6 Tested Queens for \$9.00. Orders filled at once.

Bees for Sale,-We offer to sell a few strong colonies of Italian bees, in ten-frame Simplicity hives, at \$6.00 each.

Hed Labels for one-pound pails of boney, size 3x41/2 inches. - We have just gotten up a lot of these Labels, and can supply them at the following prices: 100 for \$1.00 ; 250 for \$1.50 ; 500 for \$2.00 ; 1,000 for \$3.00; all with name and address of apiarst printed on them-by mail, postpaid.

### System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

- For
   50 colonies (120 pages)
   \$1 00

   "
   100 colonies (220 pages)
   1 25

   "
   200 colonies (420 pages)
   1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

Shumins' Non-Swarming System is the title of a new English bee-book. The author claims that it will inangurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

The Series of Articles by prominent men of the country in the Graphic News, of Cin cinnati, is attracting great attention and the best and highest praise. In the issue of July 31st, the Hon. Cassius M. Cisy, of Keptucky, Ex-U. S. Miniater to Russia, and one of the ablest statesmen of the land, will write upon "Forests and Rainfall." The subject is an especially interesting one, and is most effectively handled. In the issue of Aug. 6th will be printed a lithographic anpplement of Mrs. Gov. Foraker, of Ohio, the first of a series of portraits of prominent people.

Yucea Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable.

When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are aold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 cents a dozen

Frank Leslie's Popular Monthly for August gives a most attractive sketch by George Makepeace Towle of "The Nestor of Enrope," the Emperor William of Germany. Daudet's sketch of "Tartarip in the Alps," and stories like Towner's "Hermon Drake's Ashes," Boutelle's "The Lost Lady," "An Unknown Name," and "A Scrap of Paper," will certainly tempt readers. Laura C. Holloway gives a very readable account of Lady Burdett-Coutts, the philanthropist ; Lncy H. Hooper, the queen of correspondents, tells of the "Water Supply of Parls"; "A Ship-Portage from Sea to Sea" is an able discussion of the merits of the proposed ship-railway at Tehuantepec. F. C. Valentine tells us of "Ceotral American Women," and Prof. Eaton discusses the important subject of "Fresh aod Foul Air."

#### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 10 a. m., Aug. 2, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO.

HONEY.--It is coming on the market very freely this week, and there are advices of other lots at this time in transit. We are practically without any demand, so prices are nominal. Offers of 120 13c. would he accepted; yet 14c. is being asked. BEESWAX.-Searce at 25c. R. A. BURNETT, 161 South Water St.

#### NEW YORK.

HONEY. — The present quotations are as follows: Fancy white comb in 1-1b. sections, 1969 12c, if abegy white comb in 2-1b. sections, 860 (c; buckwheat in 1 and 2-1b. sections, 5% c; extracted white clover, 6c; extracted, California, 4% 65 c; extracted, Southern, per gallon, 45 to 55c. BEESSWAX.-23 to 28c.

ESWAA.-23 to 28c. MCCAUL & HILDRETH BROS., 34 Hudson St.

#### BOSTON.

HONEY.-One-b. sections, white clover, 13@15c; -pound sections, 11@13c. Extracted, 8@sc. BEESWAX.-25 cts, per lb. BLAKE & HPLEY, 57 Chatham Street. Θ.

#### DETROIT.

HONEY.--New hopey is coming in quite freely, nd is bringing from 11 to 13c. BEESWAX.--Firm, at 25 cts. per pound. M. H. HUNT., Bell Branch. Mich.

#### CINCINNATI.

HONEY.—The demand for extracted honey has been very light of late, but it seems to be improv-ing gradually for manufacturing purposes. There is considerable honey in the hands of commission merchants, and prices are very low—3½ to 7 cts. honey are nominal. BEESWAX.—Arrivals are good and the demand fair. We pay 18@22c. for fair to choice yellow. C. F. MUTH & Son. Freeman & Central Ave.

#### CLEVELAND.

HONEY.--Within the last two weeks honey has not sold so readily, owing to the near approach of the new crop and the necertainty of the new pri-ces. Best white, 1-10., old honey moves slowly at 14 cts.; no demand for 2-1bs. Extracted 6@7c. BEESWAX.-22 to 25c A. C. KENDEL, 115 Ontario Street.

#### KANSAS CITY.

HONEY.—The receipts of new honey are good and very fine. The demand is good and stocks in store are light of one-pound sections. We quote : 1-b. sections of white clover, 14@15c; 1-lba,dark, 11@12c; 2-lbs, white clover, 11@12c; 2-lbs, dark, %@9c; California white 2-ba, 10@11c; dark, 3&9c Extracted white dover, 5@6c, dark, 3&64c; fCal-ifornia white, 4&65c; dark, 3&64c; BEESW & X.-20 to 22c. CLEMONS, CLOON & Co., cor. 4th & Walnut.

#### MILWAUKEE.

MILWAUKEE. HONEY.-The market is fairly supplied with honey, trade is duil, prices depressed, and the out-look is for a large production. Already some is heing pedded about the city by the producers themselves, demoralizing the prices, which should not be done. We quote : Cholce white in to i-pound acetions, 14@15c; 2-lbs. 13@15c. Dark honey not wanted. Extracted, white, in barrels and kegs. 5@ 7c; in tin cans, 6@8c; dark in barrels or kegs.4@6. BEESWAX.-25c. A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

SAN FRANCISCO. HONEY.—The process of honey on this coast are now so low that producers can hardly make any profit, and a good many apiarists will guit the business if prices do not improve soon. The crop is large, and the quality of very choice quality. We quote 3½ to 4¼ c. in a jobing way, and per-hspsa trifle more; but if holders wish to force sales, lower prices must be taken. Comb boney sells slowly at 6 to 9c., but just now it is not the senson for comb honey, and prices may improve. BEESWAX.—Is generally held at 22 to 23c. Dr average. SCHACHT & LENCKE, 122-124 Davis St.

HONEY.-New honey is coming forward freely. The quality is exceptionally fine and the crop will be large. White to extra white comb, 9010. Ex-tracted, 4@4%c. for white; 3%@3%c. for amber. BEESWAX.-22@23c. O. B. SMITH & CO., 423 Front Street.

Our Catalogue of Bee-Keepers' Supplies will be sent to any one desiring to get a copy. Send name and address, plainly written, on a Postal Card for it.

Feit Biankets, 35c. per lb. by express.

The Illinois State Fair will be held at Chicago, Sept. 6-10, 1886. The Premium List can be obtained of Chas. F. Mills, the Secretary, at Springfield, Ills., or at this office. The premiums on bees and honey amount to \$39 and a diploma. The Editor of the BEE JOURNAL has been appointed to award the prizes in that department. We hepe that there will be a good display—a thing unknown for many years past.

The Guide Book for Bee-Keepers, by Mr. Thos. W. Cowan, F. G. S., F. R. M. S., etc., editor of the British Bee Journal, has been translated into the French language, by Mr. Ed. Bertrand, of Nyon, Switzerland. We have received a copy, with the compliments of the author, and also the translator. It is a book of 180 pages, nicely printed and illustrated. It will greatly help Frenchspeaking bee-keepers, as it is fully up with the times.

Monsieur Hamet, editor of the Apicultcur, whose serious illness was recently mentioned in our columns, was so far recovered a little while ago, that he had decided to resume his classes at his practical school in the Luxemburg Gardens. On his way thither, however, and while still near his residence, he was run over by a carriage. a wheel of which passed over his left leg, without, however, breaking any bones. He had to be taken home in a cab and compelled to keep quiet for about cighteen days. He has new been able, although with evident difficulty, to resume his school duties, and there is every hope of an early recovery .--British Bee Journal.

The American Apientiurist has again changed hands, this time Mr. Henry Alley is the possessor. The August number was out on time, and is full of excellent matter. As Mr. Alley has been editor of it for months, practically there is no change. The AMERI-CAN BEE JOURNAL wishes it success, as it does every periodical that harmoniously works for the good of the pursuit.

Join the Bee-Keepers' Union.—The Bee-Keepers' Magazine for August contains the full "Report of the General Manager," and also the following editorial remarks concerning it :

In another column will be found the report of the General Manager of the Bee-Keepers' Union. We commend it as a good, sound document, showing Thomas G. Newman, Esq., to be a persou eminently fit to hold the position he does. Join the Union.

Messrs. Aspinwall & Treadwell, the editors of the Magazine, are each members of the Union, and have given it their very cordial endorsement. The only thing that causes us surprise is the fact that the Union has not now at least five or six thousand members. It is to the interest of every bee keeper to do as the Magazine suggests, viz: "Join the Union." It is no personal advantage to the Manager; the energies he has devoted to the Union have been purely gratuitons, and have been ebeerfully rendered for the welfare of the pursuit.

Now, reader, a word to you. From ten to twenty thonsand bee-keepers will read this, and every one of yon ought to become members at once. It is to your interest to do so. It is your duty to do so 1 How many of you will send on \$1,25 for yearly dues and one assessment for the defense fund? Let us see !

Several have written to us for names and addresses of good, responsible commission houses that handle honey. We must, however, be excused from doing so, for this reason : About seven years ago a beekeeper made a similar request, and we referred him to a commission firm, the senior member of which we had known for many years. We stated this fact, and 'said we helieved him to be honest and reliable. The honey was shipped to that firm, and just at that time the senior member was taken sick, and for months could not leave his residence. Meanwhile the other members of the firm became disgusted, sold out [the goods on hand (including the honey), and left for parts unknown.

Our correspondent claimed that he should not have shipped the honey to that house but for our codorsement, and as he could get no returns from the house, he [should look to us for the pay—that we were morally, and perhaps legally responsible for it.

After considerable correspondence, and thinking that the commission-man would soon arrange matters and start in business again, we paid for the honey. But though seven years have elapsed, not a cent of it have we ever received—the commisson-man claiming that be was runned by the stealing of his partner while he was sick.

Therefore, excuse us 1 And at the same time take our advice, and do not ship the honey at all. Create a home market for it. ft will bring nearly double the prices now ruling in the large commercial centres. You will save the freight charges and breakages, and it will be better for many other reasons. Sell it at home.

Bees have for some time held undisputed possession of the Christian church at Harmony, fils. The citizens gathered on Wednesday, Aug. 4, 1886, and tore off the siding from the foundation to the roof, disclosing a mass of honey 16 feet in height.

Still Another Lawsuit.-Mr. C. C. Richardson, of Tipton, fnd., has been sued for maintaining an apiary on bis land, which is declared by the complainant to be a nuisance. Mr. Richardson gives the following information concerning it:

f field myself involved in an action for maintaining a public nuisance on account of ny bees. The facts in the case are these: For the last two seasons I have kept my bees on an adjoining lot to the complating witness. Last season my apiary consisted of some 40 colonics; this season some 60 odd. However, I have built up my apiary in the same block they occupy now. A public street continually traveled is on the west, and an alley on the south, much used. I have had no complaint from teamsters, passers-by, or the neighborhood, except by the complainant. But on the contrary my apiary is much admired by the public, and passers by frequently stop to watch me manipulate the bees.

The lot that I occupy has no shade trees or shrubs on which the bees can cluster, or shrubs on which the bees can cluster, while the complainant's lot has many trees on which the bees will cluster when they go in that direction ; otherwise they cluster on the shade trees along the street. Last season the complainant objected to the bees clustering on bis trees, claiming that it would injure them, though I removed them very carefully. I tried the sweetcning process; it worked charmingly, so much so that at the close of the season he came to the conclusion that he must have a colony, provided he could spare the money to pay for them. This season, however, war was inaugurated long before the time for the sweetening process to commence.

sweetening process to commence. Since then we have heard nothing but exclamations about "horrid bees" from that quarter, and an effort on their part to stir up the beightorhood against my bees. About the middle of June the complainant gave me orders to move the bees, or he would prosecute me. I could not move them then, and do not feel disposed to do so now, unless there was a general complaint.

I should have stated that a number of parties are keeping bees in our town; one apiarist, with his hees, being located within half a square of the complaining witness.

half a square of the complaining witness. My house is surrounded on three sides with bees. We keep our doors and windows open continually during the bot weather. The bees do not bother us, and I cannot believe that they bother the complainant only as stated above. Bees have always been kept in our thriving little city, during my residence of 2I years, though without success as apiarists. As far as I know, I am the only successful bee-keeper in the county. I am proud to say that I have made a success the last five years in the beebusiness, though I have not resorted to selling either bees or supplies. In connection with my bees I follow

In connection with my bees I follow sprouting plants for the trade and gardening. During the season for bees to fiy there is almost a continual string of callers for plants and honey. At least two thousand callers during the season for the last five years, I think would be a low estimate, and but one has been stung out of that number.

Mr. Richardson desired to know what the Union would do to help him to defend the suit, as he was one of the first to join the Union. The Manager has made arrangements to have a good attorney defend the suit, and hopes to prevent malice from gaining a victory over right and old age.

When Marketing Extracted Honey, it is a sad blunder to use barrels bolding from 300 to 500 pounds—they are too large to be desirable for the trade, too bulky to be bandled with care in transportation, and too dear to be lucrative to the producer, for boney put up in such large barrels is subject to a discount of one cent per pound, hecause of the difficulty in disposing of it without repacking and dividing into smaller lots.

### AND Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.—ED.]

## Swarms Returning.

Query, No. 289.—What causes a swarm of bees to return to the old hive after being hived ?—J. L. P.

Prohably the old queen did not go out with them.—A. J. COOK.

"Dissatisfaction" in many cases. Sometimes they do not get the queen with them.—H. D. CUTTING.

Perhaps the queen did not go with them.-C. C. MILLER.

If the queen was not with them they would return.-W. Z. HUTCHINSON.

Usually it is the queen that is missing.-DADANT & SON.

Usually failure of the queen to go with the swarm, or to stay with it, if she did go.—JAMES HEDDON.

They have no queen with them, or else she is balled by a few strange bees, so the bees fail to realize that their queen is there.—G. M. DOOLIT-TLE.

The queen either failed to go with the swarm, or was lost. There may be a few exceptions to this rule, but it is correct in ninety-nine cases in a hundred.—J. P. H. BROWN.

The only cause I know, is that the queen did not accompany the swarm, or else was lost in hiving it.—J. E. POND, JR.

The queen may be killed in the operation of hiving; she may be unable to fly, as is often the case, and be lost; or she may not come out of the hive at all. In either of which cases the swarm will return to the old hive. -G. L. TINKER.

The most common cause is that they miss their, queen and return home because that is the best they can do. I have known a queen to be unable to go with the swarm on two or three occasions, and then succeed at last. A neighbor of mine hived a swarm three or four times this season before the queen succeeded in going with the swarm. If swarming is delayed until the young queens begin to hatch, one or more of them may go with the first swarm, and a swarm with more than one queen may do almost anything.—G. W. DEMAREE.

## Destroying Drones and Drone-Brood.

Query, No. 290.—I have a strong colony of Italian bees at work in the surplus boxes that, a few days ago, killed off all the drones in the hive and carried them out, and are now carrying out the drone-brood. The white clover season has just commenced, and is growing better every day. What was the probable canse?—Manchester, N. H.

The cause was undoubtedly lack of nectar in the flowers.—H. R. BOARD-MAN.

They propose to run for honey. Such are just the bees to breed from. -A. J. Cook.

I do not know, unless there was a dearth of honey-yielding. — JAMES HEDDON.

They may have given up the idea of swarming.-W.Z. HUTCHINSON.

Probably just at that time the clover yielded little or no honey, although you thought that it was.—G. M. DOOLITTLE.

The cause was a honey-dearth at the time it was done.—DADANT & SON.□

It was caused either by a dearth of honey or the bees abandoned for the present the idea of swarming.—J. P. H.;BROWN.

Very little honey coming in was the cause. I have seen in this locality the ground covered with white clover and not a drop of honey from it. I then commenced feeding and they stopped killing drones.—II. D. CUT-TING.<sup>4</sup>.<sup>4</sup>

A few days of unfavorable weather or temporary failure of nectar secretion will often cause bees to fear the worst and destroy the drones and drag or drive out those just hatched. Rarely they carry out the immature larvæ upon a complete failure of the flowers.—G. L. TINKER.

"Bees do nothing invariably." The honey season might have commenced just after they killed the drones, but the carrying out of drone-brood while gathering honey freely, is one of those unaccountable things that no one can tell anything about.—J. E. POND, JR.

The prohable cause is that there was a dearth of nectar just before white clover bloomed, and the bees were discouraged and commenced to banish their drones; and having commenced the persecution they did not know when to quit. If you remove the queen when a colony is persecuting their drones the bees will keep it up for several days before they seem to realize their condition.—G. W. DEMAREE.

Sometimes bees kill off all drones as soon as a newly-reared queen gets to laying. It would be nothing strange if your bees had superseded their old queen just before clover bloom.—C. C. MILLER.

## Fastening Combs to Separators,

Query, No. 291.—Why do my bees fasten combs to tin separators, more so this year than usual? What must J do to prevent them from so doing? J use 2-inch sections and comb foundation.—F., Mich.

Use clean tin. If the tin is old, rub over the surface lard or hutter.—II. D. CUTTING.

A few of my colonies used to do this, but a change of queens has apparently stopped it.—G. M. Doo-LITTLE.

Our bees do so very little this year. Is it not because you gave them so little room that they were much crowded.—A. J. COOK.

Use sections not more than 1% inches wide. I get nice sections of honey without separators, but I use a section-case only one tier deep, and sections not wider than 1% inches. Improved section-cases will banish separators.—G. W. DEMAREE.

In my experience I find bees more prone to stick the combs when 2-inch sections are used than when sections approach nearer the natural distance of near  $1\frac{1}{2}$  inches from septum to septum. I much prefer sections of  $1\frac{5}{8}$  or  $1\frac{3}{4}$  inches in width, to 2 inches in width.—J. P. H. BROWN.

A weak colony or one working slowly will fill one side faster than the other, thus pushing the bottom of the foundation to one side. Level your hives from side to side, have strong colonies, and then hope for a rapid flow.—C. C. MILLER.

In a good honey-flow, if bees have insufficient room to store surplus, or the cases of wide sections are not tiered up soon enough, the bees are apt to build brace-combs to separators. If honey is coming in rapidly the cases of sections should be tiered up as soon as a good start is made in them. This course will not only prevent largely the building of bracecombs between the cases, but the evil complained of.—G. L. TINKER.

#### Home Market for Honey.

**CP** To create Honey Markets in every viliage, town and eity, wide-awake honey producers should get the Leafiets "Why Eat Honey" (only 50 cents per 100), or clse the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their erops at remunerative prices. "Honey as Food and Medicine " are sold at the following prices:

Single copy, 5 cts.; per doz., 40 ets.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the beekeeper who scatters them).

**To give away** a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Explanatory.—The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark  $\bigcirc$  indicates that the apiarist is located near the center of the State named;  $\eth$  north of the center;  $\blacklozenge$  south;  $\circlearrowright$  east;  $\circlearrowright$  west; and this  $\circlearrowright$  northeast;  $\circlearrowright$  northwest:  $\circlearrowright$  southcast; and  $\blacklozenge$  southwest of the center of the State mentioned.

> For the American Bee Journal. Experience and Experiment.

## G. W. DEMAREE.

The honey crop will be short again this year in Kentucky, and perhaps in all the Middle States as a general thing. Our bees in this State came through the winter in a weakened condition; never were my colonies so weak in the spring as they were early last spring. But favorable weather brought them forward rapidly, and swarming commenced as early as usual. The honey season was really good until about half way through the usual period of time in which black locust and white clover yield nectar in quantity to furnish surplus, and then unfavorable weather set in with prevailing north and east winds, and the honey-flow was at an end.

Early in July we had a few morn-Early in July we had a new morn-ings that gave our bees a lively time gathering the so-called honey-dew, the first thing of the kind that I have observed for several years. The insects producing this sweet liquid sub-stance were not the ordinary scale or bark-lice which produce the black, filthy stuff, so appropriately called "bug-juice" by a number of writers in the bee-papers, but is a lively little insect of a pale yellow color, has six well-formed legs, large compound eyes, between which are located the long, slender antennæ that are nearly always in motion. A beautiful pair of gauze-like wings extending beyond the extremity of the abdomen completes the external appearance of this strange little honey aphis. They are so very small that it requires a glass of considerable power to exhibit the insect to good advantage. Frequently while I had a specimen under a Cod-dington lens it would spread its gauzy wings and fly away, or walk grace-fully out of the range of the glass. I saw them nowhere but on the

I saw them nowhere but on the leaves of the black walnut. They were found on the under side of the leaves, while the tops of the leaves, many of them, had a glazed, shiny appearance to the unaided eye, but when put under the glass they presented the appearance of being sprayed with a transparent liquid as clear as water, and sweet to the touch of the tongue.

While the dew was on in the morning, the bees would hurry over the leaves licking up this dew-like substance with the greatest eagerness. I should have no fear of this aphis honey injuring my bees, though it was ever so abundant.

I have discovered some things this season that I do not remember of seeing in print or of hearing them mentioned by any one. One of which is the fact that young queens sometimes, perhaps 3 per cent. of them, have their heads turned the wrong way in the cells, and being unable to cut through the base of the cells they perish in the cells. In case of retarded hatching I discovered by opening a cell that a well-formed and perfectly-developed queen was in this predicament. I rescued her from her entombment and set her at liberty. This circumstance led me to making close observations, and I have since found two more queens reversed in the cells.

#### THE SUN WAX-EXTRACTOR.

This is the third season that I have operated a sun, or solar wax-extractor, and when properly made I know of no device that will do its work so cheaply and so well as the sun waxextractor. Of all the methods that I have tried the sun wax-extractor is the only device that will separate the wax cleanly from old, and pollenfilied combs, scrapings, etc. It would surprise any one to see how much honey can be extracted from the cappings after they have been well drained in the uncapping-can, by subjecting them to the heat of the sun in the sun wax-extractor.

To make the device work well the pan that holds the combs, cappings. etc., must be made in the form of a nalf-cylinder, with the back end closed while the front or drip end is left open. This circular shape of the pan or bottom of the extractor permits the wax to drain from the refuse of the combs much more readily and cleanly than can be the case when a flat pan with elevated rim is used.

A sash that will just take three panes of glass  $12\times20$  iuches will furnish heat sufficient to render all the wax that is ordinarily produced in an apiary of 100 colonies. The glass should have nothing between them to cast a shadow; just let the edges of the glasses fit close together. The sash to my sun wax-extractor is made of  $\frac{7}{8}\times2$  inch stuff, so made as to stand on the frame-work like a shallow box 2 inches deep. It has a shallow rabbet at the top to receive the glass, which are secured in place by tin points. The sash is made to slide between guides, so that it can be shoved backwards and forwards. The frame-work is simply a box with four legs like an old-style bee-hive. The proper pitch of the draining pan is obtained by blocking up or letting down the back end of the frame-work.

It would astonish any one who had never tried it, to see how much heat will be generated by this device on a clear, hot day. My apparatus will melt and run down a cake of wax 3 or 4 inches thick in a few hours; and if robber bees rush in when the sash is slid back for any purpose, a few feeble struggles ends their existence.

I am quite sure that when beekeepers learn how to make and use the sun wax-extractor it will take the place of all other devices for common purposes.

#### THE TIERED BROOD-CHAMBER.

I have again this season employed a limited number of my shallow extracting-cases for brood-chambers, using two of them, tiering one on the other. My extracting-cases are  $5\frac{1}{4}$ inches deep, taking frames  $4\frac{1}{2}$  inches. The top and bottom bars of the frame are made to project  $\frac{3}{6}$  of an inch beyond the end-bars, and are held in a central position in the case by means of folded strips of tiu inserted in saw-cuts 3-16 of an inch from the top and bottom of the case, thus leaving a shallow bee-space at the top and hottom of the frames. The strips of tin at the bottom of the case are nailed fast, while the two top strips are movable. This makes the frames movable, and the case reversible.

The idea of a shallow bee-space at the top and bottom of the frames and section-boxes originated with myself. though I notice that this idea is prominent in Mr. J. M. Shuck's patent hive, a sample of which I have in my apiary; but I suppose that Mr. Shuck does not claim this as his property, as it would be impossible to define what a "bee-space" is, in actual measurement.

After trying the double-broodchamber hive pretty thoroughly, I feel sure that it will never come into general use. Those who wish to manipulate all the honey out of the brood-nest into the surplus department, with the view of feeding cheaper food than honey to their bees for winter stores, and have no qualms of conscience if some of the "cheaper food" does go into the surplus at the beginning of the early honey harvest, will probably hold on to the tiered brood-chamber for sometime to come, or until the honey business is well nigh ruined. It costs more to make a hive in two parts. It requires more time and labor to manipulate a double-brood-chamber, for double the number of frames must be handled, if the frames are to be handled at all, and if not, then the movable frame is a useless expense.

There are some serious defects about the double brood-chamber that seems not to have attracted attention at this early stage of its use. If you wish to have queen-cells built, or wish to save the cells after a swarm issues, you will generally find the best cells built from the lower edge of the upper tier of combs and extending down through the bee-space and attached to the top-bars of the lower tier of combs, so that when the two divisions are separated the cells are torn to pieces. The same is true of the worker brood; bees are most likely to build bits of comb between shallow departments, and as the worker brood reared in shallow frames —especially in the lower tier is usually crowded up to the top-bars, the worker brood is not unfrequently torn and mutilated when separating the divisions of the brood-chamber.

But the greatest objection of all is the certainty of having your apiary in a starving condition at the close of the honey season, and that without enough honey over and above what be obtained from the single may brood-chamber hive to compensate for the heavy loss sustained where feeding back to bees honey that has been taken from them, to say nothing of the delirium of excitement, and consequent wear on the bees at a time when nature designed that they should be quiet.

I believe that a large majority of tee-keepers will agree with me when I say that no greater calamity can overtake the bee-keepers than a starying apiary at any season of the year. It is mighty easy to say "feed them," certainly it is, but feeding must be done at a heavy loss of stores, and at a loss in every way. Christiansburg. 5 Ky.

## Pacific Rural Press. Arrangement of the Hives. WM. MUTH-RASMUSSEN.

In laying out the grounds for an apiary, and at the annual addition to the same, it is of considerable importance how the hives are arranged, both in their relative position toward each other and toward the honeyhouse and other objects on the ground. I will proceed to point out, first, the way in which they should not be placed; second, the different ways in which they may be arranged, both in regard to the safety and comfort of the bees, and also in regard to the convenience of the owner.

Hives should not be placed too near each other, as there is danger of the bees (particularly the younger ones) entering the wrong hive and being killed as intruders; also of the queens making the same mistake when re-turning from their "wedding trip" or in swarming, when a queen with clipped wing running on the ground and finding herself unable to follow the swarm attempts to re-enter the hive.

Hives should not be placed together on benches, as one hive cannot be examined or manipulated without disturbing all the other hives on the same bench, putting the bees on their guard and making them ready for an attack on the bee-keeper before he opens another hive. Benches also afford a convenient runway for ants, to the great annoyance of the bees as well as their owner. Hives should not be placed near willow hedges, cottonwood or any other trees which harbor ants, nor under evergreen-trees, which give shade when the bees ought to have the full benefit of the sun.

A high knoll exposed to severe wind; uneven ground, interspersed with gullies or boulders; low, damp ground, abounding in grass or weeds, which interfere with the free circulation of air around the hives, and

which harbor toads and other enemies are to be avoided. Close sheds, boarded up on all sides but the front, will make it uncomfortably hot for the bees during summer, and may cause the combs to melt and break down.

Hives should not be placed in close proximity to dwelling houses, stables, line-fences or public highways, as the bees are liable to be disturbed and to become annoying, and often danger-ous to people and animals; nor near haystacks, as the fire occasionally employed in the apiary may, through an accident, become the cause of a conflagration. Hives should never be placed close against a building or fence. There should be sufficient room so that the operator can stand at the rear of the hives when he is at work, and thereby avoid annoying the bees by being in their way while they are flying out and in at the entrance.

A clean, sandy plat, free from brush, weeds, bushes, evergreen-trees, boulders and other obstructions, is the best location for any apiary. The ground should have a gentle slope, and the hives face towards the east or southeast, that the morning sun may shine on the entrances, which will induce the bees to fly out earlier in the morning, than if the entrance is shaded. The entrance to all the hives should be in full view from the honeyhouse, that the owner may see at a glance from which hive a swarm is issuing, or where robbing is going on.

For the safety and convenience of the bees and queens, the hives should be as near the ground as possible, each hive resting on its separate stand, made of boards, or simply of four bricks or of blocks, sawed from the scantling. When a building is erected, there will often be a lot of ends and waste pieces of scantling, which can be sawed into such blocks instead of using them as kindling and fire-wood. Hives should not be placed directly on the ground, as it will rot the bottom-boards and harbor ants, but the earth may be banked up even with the entrance, so that spiders, toads and lizards cannot find a hidingplace underneath.

The hives may be placed in long rows, in hexagonal form or in any other position toward each other, which will make it most convenient for the operator, but should always be so far apart that a wheelbarrow can be run between them in any direction. If shade-trees are planted in the apiary, they should be so placed that they do not interfere with such free passage ; they should be kept trimmed up, that the lower branches do not annoy the bee-keeper at his work, and should be thinned out, when necessary, that they do not give too dense a shade. All other trees or bushes, provided for the swarms to settle on, should be on the outer edge of the apiary.

A small, running stream, or a well near the apiary, is indispensable. It will be most convenient to have the apiary located at the rear of the honey-house. If the ground is slop-tracted honey I hardly want less than ing, and the house below the hives, it will facilitate the carrying of honey well. Also, when we confine bees to

from the hives to the house. The space in front of the honey-house should be left unobstructed, so that a team may be driven up to the front door.

## Space between Brood-Frames.

#### GEO. F. ROBBINS, (57-95).

I am the author of Query, No. 284, and when I sent it in 1 was anxious to and when I sent it if I was anxious to know about it, so while waiting for the answers to the query, I was test-ing the matter myself, and long before the answers came, I had arrived at my own conclusion. However, I read the answers with as much interest as if I had not decided the matter myself, and I found in doing so that at least one well known and successful apiarist—Dr. Miller—was not so well satisfied as 1 myself.

In two cases last spring where I could find combs thin enough I put nine of them in a 12-inch hive, and I did the same thing several times during the summer. I found the plan worked tolerably well, when combs not too thick, and that hung straight, could be found. When our frames are exact and true, if we put in only foundation starters, to have them thus close together is an excellent way to get combs built straight. Nothing is much worse than wide spaces for that. But when we come to manipu-late frames so close together we ind it difficult, injurious, and ofttimes im-possible. There is not sufficient movpossible. able space even for very straight combs, and an apiarist of any experi-ence well knows that in numbers of cases, for reasons impossible or inexpedient to help, combs will be built very uneven or to hang crooked in the frame. To be jamming such frames so close together is often very damaging; besides the thinner the comb when capped over the greater the cost of time and material to the hees.

On the other hand, nothing con-tributes more to make uneven combs than so liberal a space as  $1\frac{1}{2}$  inches. Moreover, so much space is not the best economy, for two reasons : First --It is a loss, because so much room is unnecessary. Second—The bees will build out and fill with honey so much more of the upper part of the frame. When the space is narrower they will fill the frames with brood almost or quite to the top-bar, and where we practice top-storing, as the most of us do, that is an important item. Hence I am satisfied that for item. Hence I am satisfied that for general purposes 1½ inches is too narrow a space; 1½ inches is too wide. I have varied the spacing of frames considerably this season, and as the result of my experiments I have set-tled down to the conviction that, all things considered 13 inches from things considered, 1% inches from centre to centre is about right. In

five frames for wintering, I prefer to have them built a little thicker than 1¾ inches. Mechanicsburg,⊙ Ills.

Gravenhorst's Illustrated Bee Journal. Autobiography of Baron Von Berlepsch.

#### C. J. H. GRAVENHORST.

August, Baron von Berlepsch, was born at Seebach, near Langensalza in Thuringia, June 28, 1815. Being a Thuringia, June 28, 1815. Being a precocious boy he made up his mind while still a pupil of the Gymnasium (High School), to study ancient classic philology, but his father objected and compelled him to study jurisprudence. He became reconciled to the science of law at the Universities which he attended in so for no to study server. attended, in so far as to study corpus *juris* industriously, and with philoso-phical exactness. But his father further insisted on his practicing law in the hope of seeing his son some day become Minister of Justice. The dull routine of work, however, disgusted the young lawyer in a few years, in consequence of which he quitted the law and devoted his time to scientific studies in Munich until the death of studies in Munich until the death of his father, which occurred in 1841. From 1841 till 1858 he lived on the family estate of Seebach, occupying himself with bee-keeping, pomology, and his fayorite study of classic philology. From 1858 to December, 1866, when he married at the ad-vanced age of fifty-one, he resided at Cotha and from that time he and his Gotha, and from that time he and his wife had a most happy home at Coburg.

I have the original of the above memoir before me, being in the handwriting of the Baron's well known consort, Lady Lina von Berlepsch, who is also an authoress on apiculture. The Baron either dictated to his wife this biographical sketch or communi-cated it to her for the purpose of baving it written down. The words interlined in the printed text are additions made by the Baron himself. This memoir dated from the year 1868, This memoir dated from the year 1808, when I published an article in the *Gartenlaube* headed "The Leaders of German Bee-Keepers," with the like-nesses of Dr. Dzierzon, Von Berlepsch, Kleine and Von Siebold, accompanied by biographical notes. Before comby biographical notes. Before compiling this article I applied for par-ticulars to Von Berlepsch, with whom was in active correspondence at that time.

that time. Baron von Berlepsch took an inter-est in bees when still a child, and even kept a few colonies when at the University. On his taking possession of the estate of Seebach, it was his intention to give special attention to bee-keeping, for which purpose he established a large apiary there. He first used hives with immovable combs. When at that time Dr. Dzierzon invented hives with mov-able combs, he watched with the greatest concern this revolution in apiculture, and declared it to be a apiculture, and declared it to be a calamity which would do a great deal of injury to bee-keeping. However, he paid a visit to Dzierzon, and hav-

ing convinced himself of the correctness of the method of the latter, he became a warm supporter of Dzier-zon's theory, which had hitherto been strongly opposed by him; he, indeed, became the most zealous advocate of the hive with movable combs; and his letters on apiculture, which appeared in the Eichstadt Bienenzeitung, and which silenced Dzierzon's opponents, largely contributed to the success of the new system. That Von cess of the new system. That Von Berlepsch carried out a great many valuable investigations in regard to the economy of bees, and that he is the inventor of the frames, and of the so-called Berlepsch hive and the pavilions, are well-known facts. In 1858 he parted with his Seebach

estate and gave up bee-keeping, but he continued to take a deep interest in bees up to the time of his death. From Coburg he removed to Munich, where he died on Aug. 17, 1877. Von Berlepsch is the author of a

large work on bees, entitled, "Bees and bee-keeping in districts poor in mellifuous plants, considered from the present state of the theory and practice of apiculture;" the first edition of which appeared in 1860. This book is very beautifully written, and quite fascinated the readers at the time. Of course it is no longer in accordance with the requirements of the present time, still it contains much of lasting value and of deep interest to all thoughtful bee-keepers. Braunchwelg, Germany.

## Taxing Colonies of Bees.

#### W. J. ROBERTS.

A very self-satisfied correspondent in noting an article or two on the above subject, says: "Now the way is to find out if such property is taxable, and that can only be done by inquiring of the ablest and most learned in the law, and not those who have a mere surface knowledge of it.' And then the next issue (June 28), as though the whole bee-keeping fraternity had asked him, as that ablest and learned man, the question, he informs the world that they are not taxable, without a special law to that effect. Saying that they are not tax-able without a special law, is nothing more than saying they are not taxable unless they are taxed.

The Supreme Court of the United States, in Nathan vs. Louisiana, 8 How. 73, held that "the taxing power of a State is one of its attributes of sovereignty, and where there has been no compact with the Federal Government, nor cession of jurisdic-tion for the purposes specified in the constitution, this power reaches all the property and business in the States." That power is exercised by legisla-tion, designating the property to be taxed, and authorizing some agent of the State to levy and collect the tax. of a State is one of its attributes of the State to levy and collect the tax. Until the power is exercised, it is as though the power did not exist.

All that is necessary is some legislation. In each State in the Union, all property therein is covered by the general leglislation on taxation. Such property as the legislature has de-cided shall be taxed is designated in one way or another. All other prop-erty is expressly or by necessary implication exempt.

All that any bee-keeper has to do to determine whether his bees are taxable property is to consult the statute law of his State. Accordingly as he shall find bees included or excluded in the enumeration of personal property to be taxed, will the ques-tion be determined. There is no oc-casion for consulting "the ablest and most learned in the law "of the beekeepers of this country. Keokuk, ∧ Iowa, July 29, 1886.

[We think that quite enough has been said on the subject of taxation, and we now ask our correspondents to desist, at least for the present. The one who asked the question which started this discussion ought to be quite satisfied by this time.-ED.]

## Honey-Dew on Wheat.

#### J. O. SHEARMAN, (100-135.)

One of my neighbors reported to me that my bees were working in swarms on his wheat, in the time of swarms on his wheat, in the time or basswood flow, which was from July 6 to the l6th here, this year. Then after the wheat was cut the bees worked on the stubble. Do any of the fraternity know of a case similar? The bees would fly up in swarms ahead of him as he walked through the field (they did not offer to sting). The honey-dew was so thick all over the wheat while he was binding that it stuck to his bands and clothes like gum. No aphides or plant-lice were present, but the wheat was a poor crop, not well filled. Some patches a rod or two across would not have a handful of grain, although the straw was of good growth-the outcome of the drouth, as we had no rain worth mentioning for six weeks previously, and very warm days with a few cool nights at the time of the honey-dew. I did not hear of it until it was past, or would have gone to the spot to investigate it more particularly, but my neighbor is a responsible man, and I was busy at the end of that flow, basswood coming at the same time.

I did not find any honey of a spurious nature or bad taste in the combs from which we extracted a few days afterwards; it all tasted like basswood and clover mixed.

That was a mile or more east of us, and at the same date 1½ miles west, another neighbor reported that bees were at work for several mornings (from 7 to 9 o'clock mostly) on a walnut tree so plentifully that he thought It is silly to say there must be there was a swarm alighting there, special legislation in the case of bees. and going near by to see, noticed that the leaves of the tree looked "shiny and gummy," and the bees were on every leaf and twig. No plant-lice

Were noticeable. How is that? White clover and alsike yielded well here, but shortened up a little by the drouth. Basswood was short and Goldenrod may yield some now that rain has come plentifully, for the first time in seven weeks.

New Richmond, 9 Mich.

Read at the Indiana State Convention. Winter Protection of Bees. EVA SCHOLL.

There is perhaps nothing connected with the care of bees that has been the cause of so much anxiety, study and thought by bee-keepers as win-tering; and, well it may, when official statistics show, that of 78,526 colonies in this State in the fall of 1882, 29,842, or more than one-third, were dead by April 1, 1883. Nor have we fared any worse than a number of other States, in proportion to the number of colo-nies kept. Such facts and figures show that with all our knowledge in other branches of business, successful wintering of bees is an art yet to be learned by many bee-keepers.

While there is uniformity in many things in the management of bees. when it comes to wintering, the plans and methods given are so many, and so various, as almost to distract the beginner. Uniform success will probbeginner. Uniform success will prob-ably never be attained; nor is it possible for all to adopt the same plan. Let us then first consider what a colony needs protection against.

The food of the bee being liquid, nearly all is exhaled in the form of moisture. This passes off in moderate weather, but in cold it is condensed on the comb and sides of the hive in the form of frost. To prevent the accumulation of frost near the cluster, it is necessary to provide means for warmth as well as dryness. With the brood nest contracted, and a good absorbent above the bees, we have, perhaps, the best known way to secure this; something that will re-tain the natural warmth of the cluster and allow the moisture to escape.

The principal points embodied in the plan of wintering here given, were suggested some twelve years ago by our esteemed friend, Mr. J. S. Hill, of Mt. Healthy, Ohio, and after ten years of uniform good success, I see no necessity of any essential change.

The hive I use is the 10-frame Langstroth, having double walls and bot-tom, with an open space between. This I consider of prime importance; not only as a winter hive, but also as a protection against heat in summer, as such hives need no shade, the air-space around the brood-chamber preventing all danger of comb melting down. The extra bottom with deaddown. air space is a safe-guard against mois-ture from the ground. The extra work required on such hives need not cost over 75 cents each, and does not select the place for the next meeting, add perceptibly to their size. As a which will be held at Elie Smith's,

10-frame hive is too large for safe wintering, division-boards are used. These are made of two pieces of 1/4inch lumber, with air-space between. Division-boards do not reach the bottom of the hive by ½ inch. Eight frames give sufficient space for the strongest colonies. When chaff division-boards are used, there is room for only six or seven frames. Every brood comb has two half-inch tin tubes through it for winter passages. Five or six sticks, half-inch square, are placed across the frames, and a woolen blanket lined with muslin is then put on. The blanket should fit so closely all around that not a bee can get above it. A stretcher made of burlap tacked on a light frame, that drops loosely into the upper box, and rests on four short nails a half inch from the lower edge of the box, allows the box to be lifted off when filled with packing.

My experience is that dry beech leaves make the best packing. The box should not be more than ¾ full. Chaff is inclined to retain moisture. A little ventilation over the packing is necessary to allow the escape of moisture constantly arising from the moisture constantly arising from the bees. This is secured by slightly raising the cover. The entrance is tightly closed with a long block hav-ing a small notch about 4 inch square, cut in the under side. Four inches above this entrance is an inch hole, so protected with a slide as to prevent a direct draft into the hive. Sleet and ice cannot close this upper entrance. Straw or refuse hay is packed under the hive at the first approach of cold weather; and a portable fence 4½ feet high is erected for a windbreak.

It is very important that all preparations for winter be made early, before the weather becomes too cool for bees to fly. Bees are very sensi-tive to the first cold, and it is very injurious to disturb them by any manipulations or feeding after they have entered dormancy, or their nat-ural period of rest.

Lyons' Station. O+ Ind.

## Boone and Hendricks Co. Convention.

The joint association of bee-keepers of Boone and Hendricks Counties, Ind., met at the residence of Mr. James Catterson, of Hendricks county on June 16, and was organized by off Julie 16, and was organized by electing Ora Knowlton, of Boone, President; Nathaniel Gossett, of Hendricks, and W. H. Higgins, of Boone county, Vice-Presidents; and John Lingerman, of Hendricks county, Secretary. After some prelimi-nary business the association ad-journed to dinner, which consisted of a bountiful supply of the good things that the ladies of this association know how to prepare, and the society is much indebted to the efforts of Mr. and Mrs. Catterson in making the meeting both useful and pleasant. The first business after dinner was to

Boone county, near Fayette, on the third Thursday of September next. Mr. Catterson's bee-house was one

of the attractions of the meeting. The members took a lively part in the discussions, and Miss Martha Cox read a paper on "The Honey Bee." read a paper on "The Honey Bee." The President gave an address on the general features of bee-keeping. We had with us Mr. Mason, of Putnam county, who was full of information, and I. N. Cotton, of Marion county, President of the State Association, who gave us some of his stock of mirth and wit. The meeting was not only useful but lively, often indulging in applause. The social part of the meeting was more than pleasant. meeting was more than pleasant.

JOHN LINGERMAN, Sec. ORA KNOWLTON, Pres. -

#### For the American Bee Journal.

## My First Colony of Bees, etc.

## W. M. BARNUM.

When I was a hoy of 16 or 17 years, a friend offered me a colony of bees in an old-fashioned box-hive, if I would come and get them. Being glad of the chance, I accepted his offer, and told him that I would be after them the next morning. On the morrow, bright and early, taking one of the men with me, we started with the two-horse wagon. Arriving at Mr. W's we found nobody astir, so we went into the apiary of perhaps 15 to 20 melanics and melanics and melanics. to 20 colonies, and picking out the heaviest hive, we covered it with an old carpet and carried it to the wagon. The roads at that time of the wagon. The roads at that time of the year were in a terrible condition, so we drove over into Mr. W's meadow, which extended almost half way to our place, and arrived home all right.

Taking a large round fence-post we drove it into the ground (a few rods back of the house), and sawing it off about 2 feet above the ground, we securely nailed a board to it, which securely halled a board to it, inter-was perhaps 5 or 6 inches wider than the hive. Putting the hive upon this, I imagined that my "trials and tribulations were o'er;" but no. 1 tribulations were o'er;" but no, l soon found to my regret that they had but just begun. Rolling a log up within a few feet of the hive, I sat down to watch those "blessed bees." I had not been seated five minutes before I came to the conclusion that a little help. I had arisen, and per-haps taken three or four steps towards the house, when a bee lit on my left ear. That bee died very suddenly, and if it had not been that that colony was a present, etc., there might have "sunthin" happened to "that." But I gave them some sugar syrup, and called up a lot of robber bees, and in my attempt to rescue the dish of syrup, I got stung again. Along to-wards night it commenced to snow, and the next morning the number of dead bees around that hive was astonishing.

I did not get over a pound of sur-plus honey that year, and only one swarm; two went to the woods. I often laugh as I think of those days,

and how proud I was of my first colony. But now, how changed l Since the advent of the movableframe hives bec-keeping has taken a wonderful step forward, and is to-day one of the most promising industries mankind has yet discovered.

I think that any one of Mr. Doolitthe's articles is worth many times the price of the BEE JOURNAL. I wish that he would give his plan of wintering bees.

I notice on page 474, Mr. M. L. Spencer's reference to my query con-cerning ants in the hives (Query, No. 279). He says: "Our common kero-279). He says: "Our common kero-sene oil, the kind burned in lamps, will kill them, eggs and all." Yes, I do not doubt it at all, and I should think it would kill the bees too. I find Mr. G. W. Demaree's remedy quite effective, viz: wet salt. I tried it the day I received the paper, and to-day there is not an ant to be seen. I was surprised at Prof. Cook's an-swer, *i.e.*, "I find it easy to dislodge them by simply brushing them off." I had tried that several times before would always be there when I after-wards examined the hives. Angelica, 9 N. Y.

Read at the Maine Convention. Label all your Honey. LYMAN F. ABBOTT.

There are important points of con-sideration constantly arising in prac-tical apiculture. The question of honey-production in Maine or New Devloyed income how we have the production of the product of England, is no longer one of doubt, and that to a profitable degree. As the business has become better understood, and bee-keepers have been derstood, and bee-keepers have been willing to devote the study, time and care that this somewhat peculiar business demands, to make it a suc-cess, honey-production has been fairly remunerative. The highest success in any branch of industry as measured by the present standard, is only at-tained by the application of strictly business principles and thorough knowledge of all the facts and rela-tions bearing upon that particular tions bearing upon that particular branch of productive industry.

In the matter of honey-production the Maine bee-keepers, as well, in fact, as the producers of honey in any part of the country, have some ad-verse influences to contend with. Before the management of bees and the adaptation of implements suited to the best manuer of manipulating the hive and the production of honey were so well known as now, what honey was produced found ready sales at good prices, and the supply was never half adequate to the demand. Those days, however, have passed. In common with all branches of industry, apiculture has made wonderfulstrides in the way of improvements in all features connected with the business.

While good progress has been made in the matter of producing the pro-ducts of the hive, there have been influences at work, modifying to some extent the relation of production of hive products to the market. We have fallen upon an age of adulteration. It is surprising and alarming to contemplate the extent the adulteration of foods has assumed. Not only that, but in the case of honey the most absurd statements have been invent-ed, and these circulated from one end of the country to the other. This has created a prejudice and mistrust in the minds of the reading public regarding the purity and genuineness even of comb honey.

We have reasons for saying that Maine honey, like most of her pro-ductions, excels in the market. The only trouble is that we do not produce enough of it. It is safe to say that the past season where we produced one ton of honey, two tons could as well have been harvested, had the requisite number of colonies of bees been on hand to gather it.

This matter of selling pure honey will soon stand on a firm foundation, if bee-keepers take the right course. The time is not far away when the man who will not label his goods so as to equivocally declare their honest contents, will beg for a market.

Honey, like butter, must be sold on its merits. We are educating the public up to nice distinctions in the matter of domestic articles. It is but a few years, comparatively, since one man's butter discriminated in the matter of price over another's dairy. The same was true with honey, and The same was true with honey, and largely that is the case now. But the educated bee-keeper knows, and a discriminating public is beginning to find it out, that all honey is not the same in taste, color, texture and purity. It is safe to say each apiary in Maine may, as a general rule, make at least three qualities of extracted at least three qualities of extracted honey during the season.

As I have intimated, bee-keepers should put their names upon every package of honey sent to the retailer. in a plain, conspicuous manner, so as to carry conviction that the contents of the package are just what it prom-ises to be—a pure product of the beehive. In this way prejudice will be overcome, and faith in the honest bee-keeper be established. Lewiston, 9 Maine.

#### OUR CLUBBING LIST.

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

#### Local Convention Directory.

1886 Time and place of Meeting. Aug. 31.-Stark County, at Canton, O. Mark Thomson, Sec., Canton, O.

Sept 4.-Sheboygan Co. at Sheboygan Falls, Wis. Mattie B. Thomas Sec., Sbeboygan Falls, Wis.

Oct. 7.-Wis. Lake Shore Center, at Kiel, Wis. Ferd Zastrow, Sec., Minhome, Wis.

Oct. 12-14.—North American, at Indianapolis, Ind. F. L. Dongherty, Sec., Indianapolis, Ind.

Oct. 19, 20,-Illinois Central, at Mt. Sterling, Ills. J. M. Hambaugh, Sec., Spring, Ills.

Dec. 1, 2.-Michigan State, at Ypsilantl, Mich. H. D. Cutting, Sec., Clinton, Mich.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.-ED.

Bee-Killers.-Wm. H. Smith, Centreville. + Ind., writes :

I send some insects that kill bees by the hundreds when they gather honey from my sweet clover. I have not seen them any place else. They catch them and suck the honey out of the bees. What are they?

[These insects are Asilus Missouriensis, commonly called bee-killers. They are very destructive enemies of the bees, quick on the wing, and not easily captured. We have a collection of over 100 different kinds of these bee-killers in our Museum .--ED.]

No Swarms and No Honey.-M.W. Shepherd, Rochester, 5 O., on July 29, 1886. savs :

I can record a total failure in beekeeping here this season. We have had no swarms and have obtained no have no swarms and have obtained no honey. Basswood and white clover never looked more prosperons, but failed to secrete nectar. Some colo-nies have not as much honey in the hives as they had the last of May. Nuclei have to be fed to keep them from starving.

Cause of Paralyzed Bees,-F. J. McConoughey, Hilliard, 9 Mich., on July 30, 1886, writes :

Seeing in the BEE JOURNAL of July 14 a query in regard to paralyzed bees, I thought that perhaps I might throw a little light on the subject. The description of those bees' actions exactly tallies with the actions of bees posioned by working on Digitalis —the "foxglove" of our flower--the "foxglove" of our flower-gardens. Some years ago I saw some beautiful specimens of foxglove a few miles away from here, and of course must have some in my flower-garden. We got them, and in due time they blossomed, but they never got the chance to do so again, in our yard. The bees do not always get home to die, some of them dying before they can get out of the flower. If there is *Digitalis* growing in flowergardens in the neighborhood of the querist, I dare say that he will find, if he watches, that his bees have visited them.

One of the Goldenrods.—Fred F. Rockwell, Leonard & Texas, on July 29, 1886, writes:

I enclose a small sprig of a flower that bees are fairly "booming" on just now. It is very thick on a large grass farm near us. Will you kindly give me the name of it?

[It is one of the many goldenrods (*Solidago*), exquisite in appearance, and excellent for honey.—ED.]

Season in Southern New York.-J. II. Andre, Lockwood, 9 N. Y., on July 30, 1886, says:

The honey harvest this season began the earliest in Southern New York of any year since 1865, and continued good until July I, when the extreme hot weather shut off all resources by which the bees could obtain honey; since that time they have barely made a living. In fact, one colony which I had made by division, and given the old queen with but little honey and two frames of brood. I fed for fear they could not gather enough to take care of the brood. I suppose some are looking forward for a good yield of surplus from buckwheat, etc. Now I hope they will not be disappointed, but I sum it up in this way all through this poor honey yield: The colonies, with the exception of a few of the strongest, are weak, containing only about half as many bees as they should at this season of the year, and if we get a few weeks of good honey weather, which I think we will, as everything is favorable now, the first thing the bees will do will be to build up in numbers, and that will take nearly all of the honey gathered. Add to this an early frost, and the outlook is not favorable. I do not doubt but what many June swarms will not gather enough for winter stores, especially if hived without foundation. I have already begun to build up the few weak colonies I have, as I think it is well done, than wait until late in the fall and do it then.

Teasel Honey.—C. A. Camp, Painesville, & O., writes :

In regard to Mr. Doolittle and teasel honey, I would say that it is not proposed to give it up in this manner. Now I assert that not one apiarist in one hundred knows that Mr. D. has "from 4 to 6 weeks" of honey-flow from teasel. When he makes the statement of 135 pounds of comb honey per colony, as he does in his circular, without stating that it eame in part from teasel, it is certainly misleading.

It must be remembered that Mr. D's articles are sometimes copied into agricultural papers, and are read by those who are not apiarists, and when such yields of honey are stated without mentioning the source, it induces many to embark in the business, and only half-yields of honey can be the result. The whole truth should be told. On page 458 the editor stated that in 1877 the "Thurber Gold Medal" was awarded to Mr. D. on teasel honey, and the bee-papers made the fact known "at the time " Why, Mr. Editor, do you not know that within nine years thousands of apiarists have been made, and many, very many, have been born since 1877? and I fail to see how it could have remained anything except a profound "secret" to all these people, and I shall do the best possible to let the cat out.

[This "secret" business and "letting the cat out" is perfect nonsense. Those who were made apiarists or born since 1877 are *not* the complainants now. We have requested Mr. Doolittle to tell all he knows about Teasel as a honey-producer, and his article will be published next week.— ED.]

Shipping Bees.—A. Carder, Varna, ⊙ N. Y., asks the following :

1. What kind of a car is the best to ship bees in, a grain or a stock car? I want to ship about Sept. 10. 2. Will wire-cloth over the top of the hives give bees enough ventilation when shipping them?

1. A grain car is best; an open car would admit too much soot and dust. Pack them so that the frames are parallel with the track.

2. Remove the cover, and put three strips across the frames over the wirecloth for ventilation. If the hives have porticos, nail wire-cloth over them, leaving the entrance from the frames to the portico open.—ED.]

Severe Drouth.-D. J. Myers, Republic, 5 O., on July 26, 1886, writes:

We had a splendid season for bees in this locality until July 10, but the continual drouth throughout July scorched all the white clover. We have had three heavy honey harvests, fruit-bloom, white clover and basswood. These are our honey-producing flowers. Bees are now beginning to work on corn-tassel blossoms and pumpkin blossoms. I put out on the summer stands 21 colonies; increased to 36, sold 6, and have 30 left. I expect 1,000 pounds of comb honey. I took off from one hive June 29, 80 pounds, and expect 40 more. Extracted honey is of very slow sale in our market. Comb honey is selling from 10 to 13 cents per pound. We do not expect much fall honey, as we had no rain for six weeks to do any grood.

**Bee-Bunglers.** — C. W. Dayton, Bradford, & Iowa, on Aug. 2, 1886, writes :

I might say, as the general report goes, that everything is drying up, so there is no prospects for a fall crop. Fire will run through the grass in the pastures. We have had the greatest drouth ever known here. I think the bees get a little honey-dew, which may be beneficial, by cleaning out some of the "one-horse bee-bunglers" who rush their honey into the market early, all at once, and at any price, much to the disgust of the skilled and posted apiarist.

Honey Crop Almost a Failure.—H. R. Boardman, East Townsend, & O., on Aug. 2, 1886, writes :

This bas been the poorest season for honey in this locality ever known. The season opened unusually promising, but a severe drought and cool nights ruined the surplus yield. The brood-chambers are unusually heavy. In several of my apiaries surplus is a total failure. I have hundreds of colonies that have not gathered a pound of surplus honey, or had any increase. I am very sure that the early reports have given a false estimate of the honey crop in the country. I think it will be found to be very poor, and in many places a total failure. A little honey-dew has made its appearance in some places, but not sufficient as yet to do any harm.

An Absconding Swarm.—Lawrence Beleal, Cassadaga, 9 N. Y., writes:

On June 16 a swarm issued while I was away, and left for parts unknown; but strange to say on the next day they came back and settled on a hive that had a colony in it. I looked them over, and found they were queenless. The colony they issued from did not swarm again.

Fall Honey Bloom a Failure.—J. N. Arnold, Richmond, on Iowa, on Aug. 2, 1886, writes :

Bees wintered very successfully in this locality last winter. I had 25 colonies on the summer stands in the Quinby hive; they increased to 50 colonies, and got 4,000 pounds of extracted honey from white clover and linden. I do not think there will be much fall honey; it is very dry. We have not had a good rain for ten weeks.

Are Bees Animals?—J. O. Shearman, New Richmond, 9 Mich., on July 26, 1886, writes :

Mine are taxed in this way: I report to the supervisor so many second-hand hives worth, say \$ each on an average, with one bee in each over six months old worth from 50 cents up to \$3 (but few \$3 ones); average, say \$1.50. Last spring he put them all at \$2 each, as all property of that kind was low. I do not want to shirk responsibility as a tax payer, and my principal business is in the bee-line. The Michigan law states expressly that no animal less than six months old shall be taxed, or rather all over six months shall, and all my bees but the queen are less than six months old. Are bees animals? Well, they are not vegetable or mineral. Are chickens animals? And are they taxable?

Drouth Broken.-C. P. Dow, Covington, & Neb., on Ang. 2, 1886, writes:

i have about 180 colonies of bees. We have no white clover here, and so depend wholly on wild forage for our honey, such as willow, box-elder, sweet-elder, sumac, goldenrod, etc.; the latter is our main dependence, as it yields bountifully, if not nipped by frost. Our drouth of over 45 days is at last broken by frequent showers, and I expect to see an abundant yield from goldenrod, although my bees have done remarkably well so far. I have taken off a good quantity of as time a quality of honey as can be found in Sioux City, white clover not excepted.

**Peculiar Season.**—Wilber G. Fish, Ithaca, $\bigcirc$  N. Y., on Aug. 2, 1886, writes:

The season here has been a peculiar one. White clover bloomed very profusely, but the drouth was so severe that no honey was secreted, and apiaries depending solely upon that for early honey, have no surplus. Alsike yielded sparingly; I have extracted an average of 25 pounds per colony from it, and bees are now working upon its second bloom. Basswood is an entire failure. The late rains have brought on buck wheat, and the indications are favorable for a good yield from it.

Not Much Basswood Honey, etc.— S. S. Sleeper, Holland, +0N. Y., writes;

The honey crop in this county is light. There is no basswood honey compared with what we generally have; only about one-third of a crop. The AMERICAN BEE JOURNAL is a welcome messenger every week. I could not think of keeping bees without it. What an inestimable benefit it has been to the bee-keepers of America. It has placed apiculture in in this country on a firm basis, so that it can be relied upon as a pursuit.

**Unwise Bee-Keepers.**—A. W. Fisk, Bushnell,+o Ills., on Aug. 2, 1886, writes :

Bees in this locality that were properly managed did remarkably well the forepart of the season, and honey was abundant. Some bee-keepers sold their honey too soon and flooded our Bushnell market—some selling as low as 5 cents per pound for extracted, and 10 cents a pound for nice comb honey. I think this is doing themselves a wrong, and damaging to the bee-business. But it has been very dry for the last four or five weeks, and

bees are doing nothing, and the price of honey is advancing, for there is no show for a fall honey crop unless we have heavy rains immediately.

The Chapman Honey-Plant.—T. F. Bingham, Abronia, 9 Mich., on Aug. 2, 1886, says:

I send you a half-open head of the Chapman honey-plant. It is a wonderful attraction to the bees. My plants have one or more bees on every open head from morn till dark. Their hum is constant among my fifty plants. I have never seen a plant half so frequented before.

Hunting Bees, in the Woods.—F. H. Webster, Lynn, & Mass., on Aug. 2, 1886, writes to us asking for information concerning the capture of bees in the woods. Several others have asked for similar information, and as we have had no experience in that line, we will let Mr. F. M. Johnson, an experienced bee-hunter, give his methods as follows:

You require a small box, which can be made of any kind of wood. The box is of a slanting shape, and should be made according to the following dimensions: Bottom, 4x6 inches; sides, 4 inches at one end, beveled down to  $1\frac{1}{2}$  inches at the other; end pieces, one, 4x4 inches, the other  $1\frac{1}{2}$ deep by 4 inches long. The top should be a separate piece, and made as follows: Width, 4 inches, whole length 12 inches; cutting down 4 inches on end for handle, and inserting a glass 3x1 inches, flush with the under side at the other end, as near the end as convenient.

The box should contain a piece of honey comb about 14 inches in thickness, which should be scented with bee bait (the directions for making this are given below), covering the bottom of the box. Taking the box in the left hand, and the cover in the right, and approaching the bee while at work on the flower or shrub, von insert the box under the bee, and quickly putting the cover on the top (in such a manner that the light can shine in), you have the bee secure in the box; then put the box on a stake 3 or 4 feet high, taking care not to jar the box more than necessary. Then the box more than necessary. shove the cover down so as to shut out the light from the glass, when the bee will go to work on the honey, which can be ascertained by holding the ear to the box, as it will cease its "humming" as soon as it commences on the comb. Then the cover can be taken off and the bee will remain on the honey. Then take a position where you can have an unobstructed view of the box and its surroundings, and wait for the bee to come out, which it will do in from one to three minutes, and commence circling in the air, gradually enlarging the circles until it finds its latitude, at which it

tion it goes. You must now wait for a short time, when the bee will return and re-enter the box, which it will repeat as long as the box remains. If the tree should be near by, the other bees will accompany it on its second or third return; if at a great distance it will take a longer period for the bees to "double up."

If you have gotten 15 or 20 bees at work on the line you can safely take the box to a point as far distant, in the course the bee has taken, as you choose, being careful not to pass where the bee is likely to tree, as they will not follow the other way. Now, open the box again, and if you are on the line the bees will find it in a very few minutes. If they do not you will know that yon are off the line, or have passed the tree, and should move your box to a point that you know is on the line. This is to be repeated until you run the bee to its tree.

If you have but a few bees it will be necessary to shut them in the box and move them in this manner from 30 to 60 rods at a time, then open your box and wait for them to go and return. This is to be repeated until you have found the tree.

Cross lining is important. If anything should prevent you from following the bee in a direct line from where you lirst start it, you can move the box a distance to the right or left and start it again, by which means you can centre the bee on some prominent object, whereby yon can invariably locate the tree within a radius of 5 or 6 rods.

Half an ounce of tincture of annis mixed with a half dozen drops of oil of organum, to be kept in an air-tight bottle.

Instead of using honey in your box, put a quantity of granulated sugar in a bottle and dissolve it with cold water until it becomes a thick syrup, and fill the comb in the box with this liquid, which is better than the real honey.

[A pair of climbers is quite necessary when climbing trees, and a rope tied around the waist with which to draw up the desired tools. The limb or tree should be cut off above the hollow containing the bees, and allowed to fall. Then tie a stout rope about the log hive, pass it over a limb above, cut the hive off and lower it to the ground. Let it there remain an hour or so, or until sun-down, when the bees will have found and entered the hive again. Then cover the entrance with wire cloth, take it away, and then transfer the bees in the usual way to a frame hive.-ED.]

The Cortland Union Bee-Keepers' Association will hold a basket picnic at Little York, N. Y. on Wednesday, Aug. 14, 1886. All interested in bee-culture, with their families, are cordially invited to attend and have a good time. D. T. SHATTUCK, Sec., Homer, N. Y.

The next meeting of the Stark County Bee-Keepers' Society will be held in Grange Hall, at Canton, O., on Aug. 31, 1886. M. THOMSON, Sec.

Convention Notices.

THOMAS G. NEWMAN & SON: PROPHIETORS.

923&925 WEST MADISDN ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAGER.

# Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

A New Crate to hold one dozen one-pound sections of boney.—It bas a strip of glass on each side, to allow the honey to be seen. It Is a light and attractive package. As it holds

but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 cts. per crate. Glass 1%c. per light, extra.

Bees for Sale .- We offer to sell a few strong colonies of Italian bees, in ten-frame Simplicity hives, at \$6.00 each.

Hed Labels for one-pound pails of honey, size 3x41/2 inches. - We have just getten up a lot of these Labels, and can supply them at the following prices: 100 fer \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apianet printed on them-by mail, postpaid.

Itallan Queens .- We have a few uptested queens which we can send by return mail. Three for \$2.75; six for \$5.00; twelve for \$9.00. For Tested, double the prices.

Yncea Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable.

When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 cents a dozen; if sent by mail, add 1 cent each for postage.

Simulus' Non-Swarming System is the title of a new English bee-book. The author claims that it will inaugurate a "new era in modern bec-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied npon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

----

The Western World Gulde and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides their own, with \$3, for one year, we will present a copy of this valuable book.

The Convention History of America and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.15.

To any One sending us one new subscriber with their own renewal (with \$2.00), we will present a copy of the new "Convention History of America."

128 Sample Copies of the BEE JOURNAL will besent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

Frank Cheshire's new book on Bees and Bee-Keeping, can be had at this office .-Vol. 1, bound in cloth, \$2.50, postpaid.

#### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 7 a. m., Ang. 9, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO.

HONEY.--Prices are nominal. Offers of 1269 ic. would be accepted; yet 14c, is being asked. BEESWAX.--Scarce st 25c. B. A. BURNET, 161 South Water 81

#### NEW YORK.

NEW YORK. HONEY.— The present quotations are as follows: Fangy white come in 1-th, sections, 106 12c, if angy white comb in 2-th, sections, 860 (c) buckwheat in 1 and 2-th, sections, 560 (c) white clover, 6c; extracted, California, 4½65c; extracted, Southern, per gallon, 45 to 55c. BEESWAX.—23 to 25c. McCAUL & HILDRETH BROS., 34 Hudson St.

BOSTON.

HONEY.-One-lb. sections, white clover, 13@150; pound sections, 11@13c. Extracted, 6@8c. BEESWAX.-25 cts. per lb. BLAKE & RIPLEY, 57 Chatham Street.

#### DETROIT.

HONEY.—The market is a little dull, fruit in-erfereing with the demand. Best comb honey in -In. sections, 13c. BEESWAX.—Firm at 23c, for fair quality. M. H. HUNT. Beil Branch, Mich.

#### CINCINNATI.

CINCINNATI. IIONEY.—The demand for extracted honey has been very light of late, but it seems to be inprov-ing gradually for manufacturing purposes. There is considerable honey in the bands of commission merchants, and prices are very low—3% to 7 cts. per pound is the range of prices. Prices of comb honey are nominal. BEESWAX.—Arrivals are good and the demand fair. We pay 18@22c. for fair to choice yellow. C. F. MUTH & SON. Freeman & Central Ave.

#### CLEVELAND.

HONEY.--Within the last two weeks honey has not sold so readily, owing to the near approach of the new crop and the uncertainty of the new pri-ces. Best white, 1-1b, old honey moves alowly at 14 cts.; no demand for 2-1bs. Extracted, 6@7c. BEESWAX.--22 to 25c A. C. KENDEL, 115 Outario Street.

#### KANSAS CITY.

KANSAS CITY. HONEY.-There ceelpts of new comb honey are fair, with a good demand, and light stock in the city. Extracted is in light demand. We quote : 5(-b), sections, 16a: , white clover, 1-b, 13@14c; ; dark, 1-b, 10@12c, ; white clover, 2-bs, 11@12c, ; dark, 2-bs, 9@10c, ; white sage California, 2-ba, 10@11c, ; dark, 2-bs, 8@9c, ; extracted white clover, 5@6c, ; dark, 3@4c, ; white sage California, 4@5c; ; dark, 3%@4c. BEEESW AX.-20@22c. CLEMONS, CLOON & Cc., cor. 4th & Walnut.

#### MILWAUKEE.

MILWAUKEE. HONEY.-The market is fairly supplied with honey, trade is duil, prices depressed, and the out-look is for a large production. Already soome is being pedied about the city by the producers themselves, demoralizing the prices, which should not be done. We quote: Choice white in 1-pound sections, 14@15c; 2-lbs. 13@15c. Dark honey not wanted. Extracted, white, io harrels and kegs, 5@ 7.o.; in tin cans, 6@8c.; dark in barrels or kegs,4@6. BEESWAX.-25c. A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

SAN FRANCISCO. II (NEY.- Arrivals of honey have been smaller in the last week, as the prices are so low that producers or owners cannot afford to sell without a loss to them, and they prefer, therefore, to store their honey either here or in the country for better prices. The crop has been represented much larger than it really is; and prices are im-proving a little, or are at least a little firmer. Some large sales at 34 to 42, for choicest quality for export have been made. We quote 34 to 34 the latter for choicest quality is a fobbing way. Supplies are very small, but soon they may lo-crease, and quality promises to be choice. BEEESWAX.-According to quality. 206230. SCUACHT & LEMCKE, 122-124 Davis St. HONEY.-Prices are so how that honey-pro-

HONEY.-Prices are so how that honey-pro-ducers are holding back their product; still the market is well supplied. We quote: Comb, ex-tra white, 8%(30:c; of grades. 6%(3%), ex-tracted, white, 464%(c; amber, 3%(3%), c; dark, 30, BEESWAX.-22%(32), O, B, SMITH & Co., 423 Front Street.

#### ST. LOUIS.

110NEX.—Choice comb, 10@12½c.; latter price is for choice white clover. Strained, in barrels, 3¼@4c. Extra fancy of bright color and in No. 1 pickazes, ¼ advance on above prices. Extracted in barrels. 4½@5½; in cane 6@7c. BEESWAX.—Firm at 22c for prime. D. G. TUTT & CO., Commercial St.

#### System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it the prices are reduced, as follows :

| For | 50 colonies  | (120 pages) | <br>00   |
|-----|--------------|-------------|----------|
| 6.6 | 100 colonica | (220 pages) | <br>1.25 |
|     | 200 colonies |             | 1 50     |

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

The St. Joseph. Mo. Inter-State Bee-Keepera' Association will hold its annual meeting on Wedneaday evening of the Exposition week. Sep-tember 30, 1886. Arrangements are being made to have an interesting meeting. The place of hold-ing the meeting will be published in our local pa-pers on Tuesday and Wednesday a.m. E. T. ABBOTT, Sec.

Association will hold its uext meeting at Mt. Sterling, Ills., on Tuesday and Wednes-day, Oct. 19-20, 1886. J. M. HAMMAUGH, Sec.

The next annual meeting of the Michigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTING, Sec.

# Advertisements.

WILL sell 400 full Colonies of Bees in lots to suit buyer; or will sell Apiaries already stocked up. Now is your time. Address, H. R. HOARDMAN, 28Atf EA. TOWNSEND, Hurop Co., 0.

## Metal Reversible Frame Corners.

#### EXCELSIOR Wax Extractor.

EXCELSIOR Wax Extractor. We make two sizes, the smaller one having a larger capacity than the swiss Wax Extractor. Prices, smaller size, \$4, large size, \$5, 60. Some of the advantages of this Extractor are: 1. It is more easily operated, there being no necessity for removing the top to re-bill with water. 2. It melts the wax quicker, because the shorught into a more direct coor-tact with the steam. 3. It is more economical, because the steam has access to the center-thereby extracting all the wax from the refuse matter. 4. The Biller for after acts also as an indicator, sho willer frame the amount on is required. Keep a kettle of hot water rendy to re-bill when required. **PUBE PUENOL.** 

#### PURE PHENOL.

Folt the cure of Foul Brood, used by Mr. Cheshire, of London, Eng-land. As it is a liquid, it can be sent oaly by express. Price, 25c. per oz.

TIN POINTS, for Olasalag Sections

SQUARE or V-shaped, 1,000, by mail, 50c. By express or freight, 40c.

Fifty-Two Dividends from the investment of one dollar is just what every subscriber to the AMERICAN BEE JOURNAL receives. Can any better interest be found for the investment of one hundred cents? If so, where?

Charles E. Gates, a bee-keeper of Gerry, N. Y., called a few daya ago at the office of the BEE JOURNAL. He came all the way from New York on a bicycle. He was on the way to St. Paul, Mion.—looking up the conntry and taking notes of the crops, etc.

To Educate Consumers of Honey on the difference between the "strained" honey of commerce and pure extracted honey, is now the duty of the hee-keepers. The strained honey of commerce is obtained mostly from South America and the island of Cuba. Extracted honey is the pure nectar taken from the combs by centrifugal force, that the combs, which are of more value than the honey, may be returned to the hives to be again and again filled by the bees.

**Dr. J. H. Kellogg**, In his paper, Good Health, for August, takes back what he said about the adulteration of comb heney, as mentioned ou page 443 of the BEE JOURNAL. He acknowledges that he was deceived by that *lie* of Prof. W. H. Wiley. If it was intended as a "scientific pleasantry," it is not very pleasant to be obliged to brand it as an unacientific lie every day. Wiley has done more harm by that falsehood than he *could* possibly balance with good, if he should live a thousand years.

The Editor of the AMERICAN BEE JOUR-NAL was on the 10th instant elected to the honorable position of "Grand Commander" of the State of Illinois, in "the American Legion of Honor," a life-insurance organization, having over sixty thousand members. This item may interest some of his apicultural friends; others will please pass it by nunoticed.

The Bees of Mount Sinai are mentioned by a correspondent of the Leisure Hour, I. B. Bishop, when describing a pilgrimage to Sinai. The sight was grand in the extreme, under the bright Arabian sun, with "the intense blue of the Arabian sky spreading in a clear vault of purity over the great expanse of naked mountains." Amid its awful sublimity the correspondent wrote these words : "I write from Mount Sinai. I wish I could linger here to stamp its form and surroundings Indelibly on my memory." Speaking of the peak, where ,traditiou says "the Law was given to Moses 3,500 years ago," the correspondent continues in these words :

It looks as it it had been splintered by fire, frost and earthquake, most desolate and awful.....

Barren, naked, and blasted as is this peak of sublime memories, the bees hum as gaily on it as on the thymy moorlands of Tobermory; and on the awful front of Sinai a small forget-me-not raises its fragile cup to-day as though "blackness, darkness, and tempeat" had never velled the mountain with their gloom.

As the early rose-flush gave place to day, each monntain peak, sun-kissed, turned rosy, and the red granite peaks became vermition-colored. The splendor of the morning was nearly overwhelming, and the day has been perfect, absolutely cloudless, while the beat of the sun has been tempered by a keen north wind, which bere, as elsewhere, gives a peculiar brilliancy and clearness to the atmosphere.

In the glorious senset the mountain landscape was seen to perfection. There was a complete carnival of color. I might multiply words without conveying ideas—it was indescribable. The colors changed constantly, ran one into another, faded, deepened, intensified, fiamed. There were metallic gleams on the hill sides—orange,carmine, vermilion, brown madder, green-brown, redbrown, cobalt, indigo, lilac, butf, olivegreen, blue-grey, green-grey, while as the aun declined and the shadows lengthened the ravines became filled up with red-purple, changing into violet-blue atmosphere, which faded into a tender grey, while the sky took to itself manifold tints uf pink, green, red, and orange, the green hrightened by delicate lines of pure vermilion.

The editor of the BEE JOURNAL can imagine something like the sublimity of Mount Sinai, when contemplating the views he obtained in company with Mons. and Madam Bertrand, in Switzerland, of that grand old mountain of light-Mount Blanewhich, at sunset, constantly changed color. the hues ever blending into each other ; and also when viewing the eternally snowcapped mountains in the glacier region of the Alps. There, too, on the sides of the mountains are millions of honey-bees. One of the apiaries of Mons. Bertrand (our friend and brother editor who publishes the Bulletin d'Apieulteur at Nyon, Switzerland) is located on the side of a monntain in the Alpine region.

If beea are not fond of magnificent seenery, certain it is that they are found in many of the grandest portions of the earth.

J. E. Poud, Jr., writes us that he has lost his father, and as we know that his many friends will sympathize with him, we will quote this from his letter :

I have just lost a dearly loved father, who was buried on Saturday last. The house is lonely now. No one can tell how much a father is missed till the loss comes; and in my case the loss is the greater from the fact that he has lived with me for 25 years. He was almost 78 years of age, and a "full shock ripe for the harvest."

Local Markets for Honey is what the BEE JOURNAL has been advocating for years, and believes it to be the only solution of the question of marketing the erop and keeping the prices up. Had our advice heen followed, the present low prices would not have been reached. A correspondent writes as followa:

I notice that great stress is placed upon creating local honey markets, by scattering the Leaflets, "Wby Eat Honey?" I bave heen trying this plan, and find that it will greatly help to sell in a home market. If apiarists would give this aubject more attention, instead of rushing the honey to city markets, it would be better for both the producer and consumer.

There can be no doubt about the efficacy of this method of educating the public concerning the use of honey, and we believe that if there were a judicious distribution of the Leaflets, entitled, "Why Eat Honey?" one erop would all be sold before another erop is produced.

Another point of vital importance is the fact that more than double the price can easily be obtained in the local market (when we consider the cost of harrels, transportation, commissions and leakage), than that price which can be obtained in quantity in the wholesale markets.

There are many methods of advertising honey for sale, which will be found to pay well. A sign at or near the residence or apiary with "Honey for Sale" in large lettera, will be a valuable help. A few lines in the local paper, announcing the fact, will be valuable. Scattering "Leaflets" or "Honey as Food and Medicine," with the producer's card printed on them, will sell tens of honey in almost any locality. Just try it !

We have Received some samples of comb foundation which it is claimed are new inventions. Two samples are "thin foundation," made from bleached wax, which has proved decidedly objectionable to the bees in past years, the aroma and pliability of the wax having been lost in bleaching. Some of the first sent out by Mr. Hoge, being of bleached wax, caused its condemnation by several bee-keepers who tried it at that early day.

In another sample coarse cloth is dipped in melted wax, the cloth forming the "midrib," as the English apiarists call it, and ia in fact the base of the cella. Still another is made on very coarse cloth, the threads being ¼ of an inch or more apart. These are both very objectionable, because the beea will very often amuse themselves by removing the threads, and thus "spoil the fun" of those who put the threads there.

We cannot see where the claims for "improvement" or "new invention" come in. The ideas are old, and the plans have been tried and discarded many times during the past 12 years.

Now is the Time to Join the Union. —Let every beckeeper send for a copy of the Annual Report and Member's Blank—fill it up, and become a member. It is to the interest of every one to do so. The dues are only 25 cents a year; and it is intended only to call for one assessment (of \$1.00) each year. Send to this office for the Report and Membership Blank.

## Replies by Prominent Apiarists.

It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent iu about a dozen at a time to each of those who answer them: get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-ED.]

## Priority Right of Location.

Query, No. 292 .- Mr. A started an apiary 15 years ago. Two years afterward an agricultural association established a location for eandy stands within 40 rods of the apiary; then 3 years ago they established horse-stalls opposite the fence where the becs were, and within 40 feet of the apiary. Would not the previous establishment of an apiary take precedence as a business location, with a sign, "Apiary of Italian Bees," put up at the time of locating the same; establishing the fact that the association knew well they were locating their grounds and stalls elose to an apiary?-P., Wis.

I hardly think so .- G. M. Doo-LITTLE.

Experience in bee-keeping will hardly help one to answer this. One good lawyer ought to tell more about than ten bee-keepers. -C. C. īt. MILLER.

I think you are correct. But if you were to take the matter into court it would depend on how good a lawyer you could get on your side.-H. D. **ČUTTING.** 

I should vote "aye," and in addi-tion I would say that anything that Mr. A can do within the bounds of reason, to prevent his bees from annoying the horses and candy-makers, should be done.-W. Z. HUTCHINSON.

Not at all. Bee-keeping as yet is not so acknowledged as a business, either in law or by custom, as to allow it to become a nuisance or dangerous. Priority of occupation gives no rights in the matter.-J. E. POND, JR.

There is no law that covers such a case, so far as I know. It is a question of moral bearing, and a man on a horse will hardly see the rights of his neighbor who "fools with bees." Were I situated with my bees as you describe, I would use due care to prevent accidents and annoyances, previous occupancy would have a strong moral bearing in favor of the bee-man,—G. W. DEMAREE.

the weaker party, and sorry as we may feel about it, "it is money that makes the mare go," especially when lawyers hold the reins.-A. J. COOK.

I should say Mr. P. has an indis-putable right to keep his bees where they have had priority of location. The association could protect the candy-stands with screens at no great expense, and if the bees are not molested by the apiarist at the time the stalls are in use 1 do not think the stalls are in use, I do not think the horses would be stung. Horses the horses would be stung. Horses are driven within a few feet of my apiary almost every day without ever being stung, but I keep no ugly bees. -G. L. TINKER.

I think not, provided the annoyance of the bees rests in the fact that they sting animals outside of their in-closure, to any considerable extent. It is not a question of who began business first, but no man has any right at any time to keep bees in any place where they will go off from their owner's land to sting persons or animals in defense of their homes. It is my opinion that for no other act can bees justly be declared a nuisance. But if apiculture is a legitimate business at all, the bee-keeper has a right to keep bees, whether they eat grapes or not, no matter who began produc-ing honey or grapes first. Bees must be considered free-commoners in every thing except the use of their stings, or else we must close up busi-ness. This is where, I think, it will end.—JAMES HEDDON.

## Is Late Breeding Necessary ?

Query, No. 293 .- Is it considered necessary to keep up late breeding by feeding during a dearth of fall pasturage, in order to insure successful wintering ?-- R. P., Ills.

No.-JAMES HEDDON.

No, we do not do it .- DADANT & SON.

Opinions differ. I think not .- W. Z. HUTCHINSON.

Opinions differ. I think they might be the better for the feeding.-C. C. MILLER.

Not in my locality, if the bees have stores enough for winter. Late breeding is of no advantage in my apiary. -Ğ. W. DEMAREE.

I think not, though at times it may aid not a little.—A. J. COOK.

Not by the writer. I have failed to reap any benefit by such a procedure. -G. M. DOOLITTLE.

It may not be absolutely necessary, but I think the colonies are in a safer condition to winter with a reasonable proportion of young bees.-H. R. BOARDMAN.

No; old bees will winter as well as young ones. For several years my bees stopped breeding in September, and came through in good condition. -II. D. CUTTING.

or South, to go into winter quarters with from 20 to 30 pounds of stores, if we desire the colony to come out strong and prove prolitable the next season.—J. P. H. BROWN.

Opinions differ. I am decidedly of the opinion myself that it is necessary; others seem to think that old bees will winter as well as young ones. I prefer a full colony of young bees to go into winter quarters with. -J. E. POND, JR.

No; but they must have pollen or bee-bread to begin breeding in late winter at the usual time, about Feb. 1. In fact I know of no reason why any bees should not have bee-bread in winter as nature has provided.-G. L. TINKER.

## Buckwheat for Honey,

Query, No. 294 .- If a bee-keeper has one aere of buckwheat, and the season is favorable for a good flow, would it do 100 colonies much good, if they have nothing else ?-- Indiana.

Not much.-W. Z. HUTCHINSON.

"No."-JAMES HEDDON.

I cannot say, but I should think it might be valuable if the season was favorable.—A. J. COOK.

Not much.—G. M. DOOLITTLE.

No, though it will be better than nothing .- DADANT & SON.

One acre of buckwheat in the most favorable season would only be a drop in the bucket divided among 100 colo-nies of bees.—J. P. H. BROWN.

I do not think it would ; 100 colonies of bees require a number of acres of the best bee-forage to make surplus. To produce a large surplus there must be hundreds of acres of white clover. -G. L. TINKER.

It might possibly keep them stimu-lated to constant brood-rearing, but would be of little value otherwise. Still it would be of value so far as it would go round.—J. E. POND, JR.

It would be a little help to keep them busy, but if there was nothing else you would not get any honey from the buckwheat. When it is a good season for buckwheat it is good for the blossoms of other plants.-H. D. CUTTING.

It would keep the bees busy a few hours in the morning and give them a little honey for daily consumption. I doubt if a single acre of buckwheat will yield a gallon of nectar, accessive to the bees, each day on the average, and this perhaps would represent a quart of honey-a mere taste for 100 colonies of bees. It requires a wide spread supply of honey-producing flowers to give bees profitable em-ployment.—G. W. DEMAREE.

It would do them one acre of good, and ten acres would do more good. One acre might keep up breeding if that is desired; as, according to esti-mates I have seen, an acre of buck-wheat yields on a good day 25 pounds I am not lawyer enough to decide. While it may not be necessary to mates I have seen, an acre of buck-While Mr. A might and probably keep up late breeding in order for successful wintering, it is all-impor-cally, and doubtless financially he is that for a colony, either in the North successful winter in the

**Explanatory.**—The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTFR, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark  $\bigcirc$  indicates that the apiarist is located near the center of the State named;  $\eth$  north of the center;  $\blacklozenge$  south;  $\circlearrowright$  east;  $\circlearrowright$  west; and this  $\circlearrowright$  northeast;  $\backsim$  northwest:  $\circlearrowright$  southeast; and  $\blacklozenge$  southwest of the center of the State mentioned.

## For the American Bee Journal Teasel—Its History and Value, G. M. DOOLITTLE.

From the numerous letters I am getting each mail relative to teasel and its cultivation, I judge I cannot please the readers of the BEE JOUR-NAL better than to give an article on this subject, in which I will give all the facts regarding it, as far as I know them. There are others, like C. M. Goodspeed, of Thorn Hill, N. Y., who might tell more of the mode of cultivation than I can, and if any are expecting to go into teasel raising it would be well to write to him.

Among my first recollection of this plant aside from the wild ones growing over the greater part of the United States, was this story which was told in this locality for a fact, the truthfulness of which I have no reason to doubt :

A young Englishman came to this country and went to the house of a farmer who possessed the title to 100 acres of good land, but who owed a rich neighbor for nearly the full value of the land. This Englishman had no money, but proposed to put in 5 acres of teasels on shares on the farmer's land, and if possible work enough for the farmer to pay for his board and clothes, besides tending the teasels. He convinced the farmer that there was money in this, to the farmer an unbeard-of plant; so the farmer consented. The next year he proposed to put in 10 acres more, they to hire the money to procure the needed help to harvest the first 5 acres (as it takes 2 years to grow teasels) and tend the others. The farmer reluctantly consented to the knowledge of his English friend. To make the story short, the teasels made the large yield of 300,000 per acre, and were sold for \$5 per thousand, thereby taking both from poverty and making them well-to-do in the world, the farmer paying for his farm and having money beside.

This caused a great "boom" in teasel culture here, so that teasels went down, down, till the price of 40 cents per thousand was reached. As 75 cents per thousand is about as low as teasels can be raised, and pay for

the cost of production, of course a reaction took place, which, together with their winter-killing so badly of late years, made the acreage sown very small from 1877 to 1884. However, many of the farmers raised some each year, some holding the crop for higher prices. During the fall of 1884 the price went up to \$2 per thousand, and in the spring of 1885 a large acreage was again sown throughout the teasel belt, so that while I write millions of teasel are just going out of bloom within from one to ten miles of here, the nearest piece being one mile distant, while from three miles on, is the range of flight my bees have to make to get where teasel is plentiful.

#### TEASEL CULTURE.

The plant is bi-ennial as a rule, although a part of the smaller plants may not produce teasels or heads till the third year. Such three-year-old plants are called "voors." The ground for teasels is prepared as for corn or potatoes, the rows being 3 to 3½ feet apart, the marks being made only one way. The seed is now sown in the marks, and, as a rule, left for the rains to wash in. The ground should be fitted as early in the spring as possible. If a little late, it is well to brush the seed in.

When the plants first come up they are very small, and the caring for them is a tedious, back-aching job, about the same as it would be to care for carrots, onions, or beets. The plants are cultivated and hoed, or *should* be three times. Farmers usually plant beans or turnips between the rows the first year so as to get a little something to pay expenses during the first season. Latterly, since they have winter-killed so badly, corn is planted between every third or fourth row, which is "topped," and after husking the balance of the stalks are left standing to catch the snow which is a great protection to them.

The second year, during the month of May, they are cultivated and slightly hoed, when they are left to "run," as it is termed. The largest or first heads at the top of the stalk are called "kings," and commence to bloom about a week before basswood, or from July 1 to the 10th, continuing in bloom for about a week or ten days. The first blossoms appear a little above the centre of the head, blossoming toward the tip and base, and ending off at the base. As soon as the blossoms have all fallen off they are cut with a stem about 6 inches long on each head, drawn to the barn and stored about 6 inches deep on scaffolds to cure. When cured they are put into large boxes and shipped to manufacturers for the purpose of raising "nap" ou cloth. The "middlings," as they are termed, commence to blossom when the kings are about half through, and the "buttons" come last, making from 20 to 30 days of bloom, according to warm or cool weather, from the commencing of the kings to the ending of the buttons. The middlings and buttons receive the same treatment as the kings, and all are mixed and sold to-

gether, 10 pounds making a thousand. While an extra good acre may yield from 250 to 300 thousand, there are more acres that do not yield one-third of that amount, say nothing of the hundreds of acres which winter-kill, except a small margin around the fences where the snow-drifts protect them.

#### TEASEL FOR HONEY.

Since my articles regarding this plant in 1876, 1877 and 1878, hundreds have written me, saying that bees do not work on teasel with them. It is evident that the "teasel with them" is the wild kind, upon which I never saw a bee at work. All the illustrations of this plant that I have ever seen, portray a head of the wild teasel, as the spines are always pictured as standing straight out, the same as they do on the wild kind, while on the tame variety, or fuller's teasel, these hundreds of spines all hook down like the upper bill of a hawk, and are almost as strong. A tame teasel head thoroughly hooked into a garment cannot be pulled off without tearing the cloth, unless the cloth is very strong. I have dwelt on this part thus at length so that all could understand.

Bees work on teasel all hours of the day, and no matter how well basswood may yield honey, a few bees will be found at work on teasel. A bee that works on teasel is readily distinguished from those at work on basswood, by the tip and upper part of the abdomen being covered with a white dust. By this means it is easy to tell what proportion of a colony is at work on this plant. Black and hybrid bees work on it in larger proportion than do the Italians. For instance, when both basswood and teasel are in full bloom, about every fourth bee in a hybrid colony will have this dust on it, while not more than one out of 12 to 16 will show it with the Italians.

The boney from teasel is very thin and white—in fact, the whitest honey I ever saw—but it is not of as good thavor as either clover or basswood. This thimness of the nectar, and its coming just when basswood does is the great drawback to it. From careful tests I should say that it would take four bee-loads of it to be equal to one bee-load of nectar as gathered from basswood, or seven loads to be equal to one load of ripened honey. Then, coming as it does with basswood, makes it of no great advantage except that it usually lasts from 6 to 10 days after basswood is gone, so it helps to finish up partly-filled sections.

Again, my bees have to fly from 2 to 10 miles to get at this thin nectar, as I am on the most southern edge of this teasel belt. According to those who believe bees only fly 1/2 to 2 miles for honey, I should not get anything from teasel, but to quiet their fears I will say that I have repeatedly seen my bees thying to and from the teasel fields, from our church door, which is  $2^{1/2}$  miles from my apiary in line with the fields.

As to about what proportion of my crop of honey has come from teasel

the past 15 years, I should say about one-tenth; some years more, and some years not a single pound. In 1877 I got the largest yield, while from 1878 to 1884 little if any was obtained.

Mr. Camp, on page 458, seems to think that I am trying to keep the matter of teasel as a honey-plant a secret; but such is not the case. 1 have sent out package after package of the seed to different individuals, and have written hosts of letters giving instructions how to grow it, and had supposed that all were aware of what I had witten.

In conclusion let me say that I have no seed to sell, nor the time to write further on the subject, for there is in this article all I know about the plant. If any are desirous of trying Goodspeed will furnish any farther instructions that they may desire.

Borodino, ON. Y.

## Guelph Central Convention.

The Guelph Mercury of August 5, reports the proceedings of a meeting held the day previous for the purpose of organizing a bee-keepers' association. Mr. Thos. Simpson was elected chairman, and A. Gilchrist was appointed secretary, pro tem.

Mr. R. L. Mead spoke of the advan-R. F. Holtermann, of Brantford, and M. F. Holtermann, or Branton, and others made some remarks on the same subject. It was then moved by Mr. Clarke that a bee-keepers associ-ation be formed, called the "Guelph Central Bee-Keepers' Association.

The following officers were then cletted : President, the Rev. Wm. F. Clarke; Vice-President, J. Ramsey; Secretary-Treasurer, A. Gilchrist.

A discussion followed on the hibernation theory. R. L. Mead did not believe in the theory. He explained his method of wintering bees, with which he had been very successful. He keeps the temperature of his beehouse at 45° to 50°. J. Ramsey wished Mr. Clarke to explain his theory of hibernation, as he did not understand how bees could enter such a state.

Mr. Clarke then explained at some length his experience and views on the theory which he claimed to be the father of, until recently, when he dis-covered to his surprise that Prof. A. J. Cook had enunciated the theory in February, 1875.

A general discussion followed on the marketing of honey, all taking a part. The convention adjourned to Mr. James Goldie's grounds to see a new honey-plant, fifty specimens of which had been sent to Rey. W. F. Clarke in the spring for trial, by Mr. Hiram Chapman, of Versailles, N. Y., and of which Mr. Goldie had kindly taken charge. Though it was late in the afternoon, bees of all sorts and sizes were working on it very busily. It was generally agreed that, from all appearances, the bees must be getting considerable honey from the plant, vided with no balloon by which they but whether it was desirable or safe may be borne by the wind. The seed

to have it generally cultivated could not be determined without further knowledge of it.

Mr. Goldie's grounds and garden looked their best. The evergreens, shrubs and trees were carefully in-spected, but the aviary, in which are many choice foreign birds, seemed to take the eye. All present were very much delighted with their visit. A vote of thanks was tendered Mr. Goldie for his kindness and attention. This brought to a close the first and very successful meeting of our new Association.

#### For the American Bee Journal.

## The Chapman Honey-Plant.

#### N. W. M'LAIN.

The committee appointed by the North American Bee-Keepers' Society to investigate the merits of a honeyproducing plant now being cultivated by Mr. Hiram Chapman, of Versailles, N. Y., met at that place on July 28. One member of the committee, Mr. Manum, of Vermont, was unavoidably detained at home. Mr. Chap-man exhibited a specimen of this plant and made representations concerning its value to bee-keepers at the Detroit convention in December, 1885, which led to the appointment of a committee which was instructed to investigate and report at the next annual meeting of the society.

This plant, which Dr. Beal, of the Michigan State Agricultural College, tells us is *Echinops Spherocephalus*, and native of Central France, is, by common consent, beginning to be known as the Chapman honey-plant, thus designated on account of Mr. Chapman being first to cultivate the plant in this country, and first to call the attention of those engaged in beekeeping to its value as a honey-bearing plant.

The appearance of the plant has been well described by Mr. T. F. Bingham, on page 487, where he says : "It grows from 3 to 4½ feet high, each root or crown bearing from 6 to 16 round buds or heads, from I to 13/4 inches in diameter. These heads all stand upright, and the entire surface is covered with small white flowers having bluish stamens." The stalks and leaves so nearly resemble those of the thistle that were it not for the head, this plant might easily be mis-taken for the thistle. There is, however, in this particular, a very marked difference, the appearance of the head being aptly described by its bontani-cal name-round headed, and in ap-pearance like a hedge-hog.

The flowerets on the top of the head open first, then they open later along the sides, continuing in the order of nature around the entire surface of the sphere. Near to the stem the last flowerets open, after the hlossoms on the top of the heads have disappeared, and the seed capules of the first blossoms have hardened. Unlike the thistle the seeds are pro-

is in weight and appearance very like a small grain of rye, is enclosed in a capsule and falls directly to the ground if not seasonably gathered, not spreading more than oats if left to fall without harvesting.

From the time of the first appear-ance of bloom upon the top of individual heads until the fading of the last blossoms on the lower half of the head near to the stem, is about eight days, the continuance of bloom depending upon the nature of the soil and the season; but the heads or buds sent out from each individual shoot and forming each individual cluster, vary in age and size, so that the nat-ural term of blooming and honey-bearing may safely be reckoned at from 20 to 30 days.

The term of blooming may, however, be prolonged to a considerable extent by cutting back a portion of the plants, and the facility with which the honey harvest may thus be prolonged, constitutes an important eature when estimating the value of this plant.

The plant is hardy, easily propa-gated, and perennial, and appears to flourish in all kinds of soil, and there is no danger of it becoming a pest or noxious weed. It does not bloom until the second season, and as it does not spread, its extirpation would be easily accomplished. It may be planted in waste places, or it may be sown in drills or hills like onion seed. It seems to be characteristic of the plant to root out all other vegetation and take possession of the soil. No weeds and but very little grass was seen growing in the three-acre plat observed.

As to the value of the plant to the honey-producer, there appears to be no room for doubt, whether quality or quantity, or both be considered. Within reach of Mr. Chapman's apiary no other resources were accessible for honey-gathering, the severe and prolonged drouth having destroyed all other honey-yielding blossoms, and yet in some instances the bees were making an excellent showing in the hives.

The number of colonies (about 200) foraging upon the three acres in bloom was, however, so great that no definite conclusion could be reached definite conclusion could be reached as to the probable returns in pounds of honey from a given area. That the returns would be highly satis-factory is evidenced by the fact that the entire area was "alive with bees," and they visited the flowers from daylight until dark, and sometimes eight or ten bees were upon a single head at one time. Mr. Hubbard, who is cultivating some of these plants ob-tained from Mr. Chapman, reported that he had counted the number of from 5 a.m. to 7 p.m. He reported the number as being 2,135, actual count.

In order that the committee might have some idea of the quantity of nectar secreted in the flowerets of a single head, the day before our arrival, Mr. Chapman had wrapped a thin paper about a head, the half of which was in full bloom, and tied the paper

around the stem with tape, thus pre-venting the bees from appropriating the nectar for 24 hours. I cut off the the nectar for 24 hours. I cut on the tape, and removing the paper, held up the ball before Messrs. A. I. Root, L. C. Root, and others—the flowerets were dripping nectar, and the drops sparkled in the morning sun, and their eyes sparkled with delight and astonishment. L have made similar astonishment. I have made similar tests with like results, using the plants which I have here at this Apicultural Station.

Mr. Chapman has distributed this plant over a wide extent of country, from Vermont to Nebraska, and each member of the committee has been furnished with two-year-old plants for cultivation and observation during the present summer. All the facts obtainable will be given to those in-terested when the committee make their formal report to the Society at the next annual meeting.

U. S. Apicultural Station, Aurora, 9 Ills., Aug. 5, 1886.

## For the American Bee Journal Honor to Whom Honor is Due. JUSTICE FAIRMAN.

I am surprised at the latter portion of Mr. Demaree's article, on page 501, wherein he condemns the double brood-chamber, and lays claim to the one-half bee-space, as he did to the double brood-chamber on page 102.

As a reason for my surprise, please allow me to quote the following, as found on page 102, where, in criticis-ing Mr. Heddon's new hive and principles, Mr. Demaree says :

"As to the utility of a hive made in horizontal sectional parts, I am not without experience. I have experimented in that direction for the past six years, and I now have bees win-tering in a hive made of cross sec-tional parts, only 5% inches in depth. When the bees were prepared for winter, in September, they were shut down in a single sectional part of the hive, the frames being only 5½x17¾ inches, outside measure. I have experimented quite extensively with the sectional shallow-frame cases, using them for brood rearing, tiering them up to suit the size of the colony, them up to suit the size of the colony, and for queen-rearing, using a single sectional case; and I have employed them largely for taking extracted honey on the tiering-up plan.....In the discussion between my dis-tingushed friend, Dr. Southwick and myself, published in the AMERICAN BEE JOURNAL, Vol. 19, pages 370 and 371. I mentioned my shallow-frame 371, I mentioned my shallow-frame system, using it as an argument in favor of shallow frames."

Near the close of this criticism of Mr. Heddon's one-half bee-space, Mr. Demaree says: "It is proper to say that the frames are adjusted in the case, so as to leave a shallow beespace both at the top and bottom of them, and the case will work with either side down or up. Comment is unnecessary." Now imagine my surprise at reading

the following on page 501:

"The idea of a shallow bee-space at the top and bottom of the frames and section-boxes originated with myself. though I notice that this idea is prominent in Mr. J. M. Shuck's patent hive, a sample of which I have in my apiary; but I suppose that Mr. Shuck does not claim this as his property, as it would be impossible to define what a "bee-space" is, in actual measurement.

"After trying the double-brood-chamber hive pretty thoroughly, I feel sure that it will never come into general use. Those who wish to manipulate all the honey out of the manipulate all the honey out of the brood-nest into the surplus depart-ment, with the view of feeding cheaper food than honey to their bees for winter stores, and have no qualms of conscience if some of the "cheaper food" does go into the surplus at the beginning of the early honey harvest, will probably hold on to the tiered brood-chamber for sometime to come, or until the honey business is well nigh ruined."

This does not seem to harmonize with Mr. Demaree's criticisms as cited from page 102. Allow me to quote from Mr. Hutchinson's article on page 152. Speaking of Mr. Hed-don's new hive in reply to Mr. Dem-aree, on page 102, he says: "There ean be a imaginary question as fo can be no imaginary question as to the newness of thus arranging frames so as to have the bee-space ou either side, or divided between both, at will."

Here allow me to quote from Mr. Heddon's book, page 123: "The term 'bee-space' does not only denote a space that will admit of the passage of a bee, but it refers to that space in which bees are least inclined to build brace-combs or place propolis, or bee-glue; which is a scant 3% of an inch."

On page 214. Mr. Heddon lays down six of the claims of his late invention. No. 2 reads as follows : "Arranging frames within a case which is beespace deeper than the frames, in such manner as to leave one-half of that bee-space on either side of the frames.'

We also find it clearly described on page 91 of his book. If Mr. D. has read that book, I do not see what prompts him to mention Mr. Shuck, and ignore the one who first made it public, and I believe first invented it. I am not talking about patents, but about respectfully and honestly giving "honor to whom honor is due;" and here allow me to quote from Mr. Heddon, from page 53 of the AMERI-CAN BEE JOURNAL for 1885, wherein he is discussing the question of the moral rights of inventors. He says:

"Let the prior inventor remember that such priority is not enough for a claim of 'right." We have no money or time to spend settling complicated claims of secreted priority. The first man who benefits us all by publishing, thus giving to us the advantages of his invention, let us hold entitled to all the honorary and financial benefits accruing from such discovery, and the exclusive right of manufacture of the same for a reasonable length of time."

The above strikes me as being in harmony with reason and justice, and precludes the wrongs that might be perpetrated through falsehood. Upon referring to Mr. Demaree's cited con-troversy with Dr. Southwick, I find that his shallow sections were all surplus sections, and that the brood-apartments used by him are plainly described as one story, and of Lang-stroth depth. I have used Mr. Heddon's divisible brood-chamber, and I consider it of immense value, and firmly believe that the same conclusions will be formed by others who are testing it. Let us see, when they report.

## Having an Ax to Grind, etc. C. W. DAYTON, (200).

----

On page 409 Mr. Heddon says that he does not see why I should acknowledge any such motive as having an "ax to grind," when I described the "queen-restrictor," on page 393, un-less I wrote for the purpose of exless I wrote for the purpose of ex-tolling the merits of the manufacture with a pecuniary end in view. I think that I did not acknowledge such motives, but suggested that some might acknowledge it for me; but in that it might be possible that I judged too strongly. I gave the "ax to grind" statement from a remem-proce of its having been employed brance of its having been employed to show that the description of fixto show that the description of fix-tures described were not for adver-tisement; and as such action would be stealing advertising space, and very discreditable, I asked if there would necessarily be discredit con-nected therewith, if I wrote because I had an "ax to grind;" as I believed that it might be for the purpose of gaining glory, or what would appear hetter in the public press, mutual benefit. benefit.

As Mr. Heddon cannot see (from his stand-point) my arrangement as at all practical, etc., I thought of predicting in my former article, presuming such stand-points to be on the roof if not behind a sectional hive, to which hives my arrangement cannot be adapted. Doubtless he has formed connubial relations with the idea that the revolutionizing of bee-keeping must incur a full change of hives and contents instead of the simple arrangement of a few ordinary frames.

It is my opinion that the sections should be where the bees wish to put the honey, instead of shutting them up (from the queen) in an out of the way place, and then attempting to drive the bees into them. Ou the whole, it is much like the stock laws in some sections of our country, where \$100 worth of fencing is used to confine \$10 worth of stock in the highway; while \$10 worth of pasture fence would restrict \$100 worth of stock, and save an immense amount of labor and care.

## O. CLUTE.

President Poppleton, of the Iowa State Bee-Keepers' Association, has issued a call for the annual meeting of the Iowa Association on the Fair Grounds, in Des Moines, on Tuesday, Sept. 7, at 2 p.m. The association, in accordance with a plan suggested several years ago, has procured a large tent which will be put np on the Fair Ground, and will be used for the meetings, for the head-quarters of the President and Secretary of the association, and for the convenience of bee-keepers generally. All Iowa bee-keepers should make

an effort to be present at this meet-ing. Matters of importance to all will be discussed. Come prepared to state your experiences. Tell us where you have succeeded, and on what your success was based. Tell where you have failed, and what were the causes

have raned, and what were the causes of your failure. These meetings are open not only to the bee-keepers of Iowa--bee-keepers from all parts of the world are welcome. All are heartily in-vited. It is probable that some of the bee-men can bring blankets with bee-men can bring blankets with them, and find a place to lodge in the tent

The Iowa State Fair is in progress from Sept. 3 to the 10th. For many years this Fair has been a very large and important one. This year the Society has new grounds and new Society has new grounds and new buildings, all arranged and built in accordance with the suggestions of those who have had much experience in Fairs. It is believed that when the grounds and buildings are all complete they will be equal to any-thing, for the same purpose, in the world. The new grounds and build-ings are giving such an impulse to all ings are giving such an impulse to all classes of exhibitors throughout the West, that it seems probable the ex-hibit in all departments this year will be even better than in years just passed. It will richly repay a visit. This has been a good year for bees,

This has been a good year for bees, in spite of the dry weather. The honey crop is large in quantity, and of very superior quality. The bee-keepers of fowa and adjacent States should see to it that a very large and instructive exhibit of bees, honey, and instructive is made. The State and implements is made. The State Agricultural Society has offered gen-erous premiums in the bee-department, which are open to competition from the whole world. Come, all of you, and bring your exhibits along.

The Inter-State Bee-Keepers' Asso-ciation meets at St. Joseph, Mo., on Sept. 1. This is the week of the St. Joseph Exposition, which has become famous for its size and excellence. It also gives generous premiums in the department of bees and honey, and the exhibit in this department has been for several wears a good one been for several years a good one. Bee-keepers everywhere should bear in mind this exhibit, and make a dis-play at it. And they should not fail to attend the meetings of the Inter-State Bee-Keepers' Association.

Parties desiring to see the list of premiums offered in the department of bees and honey at the Iowa State of bees and honey at the Iowa State Fair, can get a copy of the premium list by addressing Hon. J. R. Shaffer, Secretary of the State Agricultural Society, Des Moines, Iowa. Those wanting the St. Joseph list of pre-miums can get it by addressing E. T. Abbot, Secretary of the Inter-State Bee-Keepers' Association, St. Joseph, Mo. Mo.

## A. W. OSBURN.

It affords me much pleasure to read the reports of a bountiful honey crop nearly throughout the United States, for the efforts of the bee-keeper is none too well paid at best. With us the outlook is not so bright. For the last three months we have been feeding our bees, and shall have been reed-tinue to feed for at least three and one-half months longer. The good reports that have been made from time to time from this Island have been the aggregate amount of honey been the aggregate amount of noney from the country, not from any one apiary or locality, which, in the poor-est season, would make quite a re-spectable showing, for the reason that it seldom happens that the eastern end of the Island fails to produce a televelue fair area of heavy as in that tolerably fair crop of honey, as in that locality are large tracts of woodland, locality are large tracts of woodland, swamps, low lands, creeks and rivers, and this is where the bulk of the bees of Cuba are kept. There is more rain there than in the western end of the Island. Then these forests and swamps (some of them at least) are little more than a matted mass of bell-flower vines, which is the best honey plant of Cuba.

Again, these low lands are in the Again, these low lands are in the interior, removed from the influence of the coast winds that sweep along the country near the ocean in the winter months, making the secretion of honey an impossibility, for several days at a time. Yet it is not so hard for an American to choose between these two localities, the one near to Havana and the coast, or removed from both. In the former he has protection of life and property, and the chance of securing an average protection of life and property, and the chance of securing an average crop of honey (or what would be called an average crop for most countries); while in the latter, with the almost positive assurance of a big yield of honey, he is removed from the protection that the country near Havana affords; compelled to live in a very think softlad country away a very thinly settled country, away from society, a long ways from ship-ping points, with transportation to and from his apiary the most difficult, owing, in the main, to the bad roads, which, in Cuba in the rainy season, are almost impassable, and then only by an ox-cart, with from 2 to 4 yoke of oxen on a cart to draw 2 casks of

nois or New York can produce; and in a thickly settled country, free from all the annoyances of life in the in-

I send a hearty welcome to the new members of the National Bee-Keep-ers' Union, and a word of encourage-ment to the old ones, that they may never flag in their efforts and deter-mination to protect the rights of beekeepers. Cuba, W. I.

For the American Bee Journal.

## Feeding Sugar to Bees.

#### W. Z. HUTCHINSON.

What grand, good times we do have in the columns of the "old reliable" AMERICAN BEE JOURNAL! How I do enjoy these apicultural discussions; especially when so conducted that, when the battle is over, each combat-ant stands higher in the estimation of his opponent. This "sugar feeding" controversy promises to be of that character. I shall *try* to be fair and courteous, and I think that my oppo-nents will be.

nents will be. Although probably unintentional on the part of Mr. Wright (page 472), I think that his quotation from my letter on page 411, does not fairly represent the meaning that I in-tended to convey. He says: "Mr. Hutchinson claims that 'when bees are undisturbed by man's reason, they meet an untimely fate.'" Beg par-don, Mr. W., I did not make such a claim. I said, in substance, that the opposing of sugar feeding upon the grounds that it was "against nature" was ridiculous; then I said (now let grounds that it was "against nature" was ridiculous; then I said (now let me give the whole sentence from which Mr. W. quoted): "Did bees never perish when left to' their own sweet will' in all things, this argument would be more forcible; but when un-disturbed by man's reason, the bees meet an untimely fate, it is evident that nature has made a mistake some-where." (I have italicized the part that Mr. W. attempted to quote.) Does not Mr. W. see that I did not claim broadly that "when bees are undisturbed by man's reason, they meet an untimely fate?" The point is just this: We have

The point is just this: We have been repeatedly informed that honey been repeatedly informed that honey and pollen is the *natural* food of bees; it is "according to nature" that they should live and thrive under its con-sumption; that it was the height of folly to say that death lurked in *nature's* food. Some bee-keepers very feedicity (2) poslect to a ling the wings foolishly (?) neglect to clip the wings of their queens, and, as a consequence, a swarm occasionally hies away to a forest home of its own choosing—to a home furnished by nature—it stores natural food and leads a natural life until—it dies of diarrhea during some "disastrous winter." Nature made a mistake. Is it any more inconsistent to say that the mistake lay in the food she furnished then that it lay in she furnished, than that it lay in some of her other furnishings?

honey. We are located 10 or 12 miles west of Havana, on as good a road as Illi-

extant ?" Honey differs in character. Seasons vary. Localities are not all similar. The world is large. It seems there has always been enough good honey, or good something, somewhere in the world, so that bees enough for seed have always been left. A plarists are endeavoring to ascertain under exactly what conditions bees will always winter successfully. We can put bees in a repository and keep the temperature at any desired point. We can do this year after year. If moisture and ventilation have any bearing upon the problem, these can be con-trolled. I think that few, if any, dispute that food is a factor in the problem. The food is a factor in the prob-in character, in all instances, if we "follow nature."

Mr. Wright says (page 472) that his father rarely lost bees when he kept them in large box-hives, and "left them to their own sweet will," but when he began to put on boxes and take all the early honey, and compel the bees to live on pollen and poor honey, then they began to die. He also mentions a man who hives his bees in large box-hives, leaves them to "their own sweet will" and loses no bees. Let me ask, where is the profit in such bee-keeping ?

Living about 16 miles from here is a bee-keeper who, a few years ago, kept black bees in large box-hives, leaving them undisturbed. He seldom lost bees, and ridiculed Italian bees, movable-comb hives, etc., attributing the loss of bees to these "new-fangled fixin's." Finally, in one of those "disastrous winters" all his bees died "just the same" in spite of their being so nearly free from man's disturbing hand.

Mr. Wright thinks that if the bees have gathered no honey, and need feeding, it may be all right to feed sugar rather than let them die. This is exactly the line of reasoning followed by those who advocate the use of sugar for winter stores, viz: that "it may be all right to feed sugar rather than let them die"-of the diarrhea.

I agree with Mr. Hill in thinking that the difference in price between extracted honey and sugar is so slight that it is doubtful if it would be profitable to extract the honey and substitute sugar, *i. e.*, laying aside the superiority of sugar as a winter food; but when we can so manage that nearly all the honey is stored in the shape of comb honey in sections, the price of which is at least twice that of sugar; and all we have to do is simply to put on a feeder and feed the sugar syrup to the bees, then the difference is not quite so meager. Mr. Hill says that those of whom he wrote Hill says that those of whom he wrote would not feed sugar because it would lower the price of honey. Farther along he quotes Mr. Wright as saying that "sugar feeding or bee-keeping has got to go down." Mr. Hill adds: "Nothing will put bee-keeping down so quickly as putting down the price of honey." Whether lowering the price of honey will "put bee-keeping down" depends alto-gether upon what lowers the price. If it is lowered as the result of an

increase in the number of producers, then bee-keeping, or rather a large number of bee-keepers will go down. It will be the "survival of the fittest." But when the price of honey goes down as the result of using improved hives, fixtures and appliances, and of adopting superior methods of man-agement, then bee-keepers are more prosperous than ever. As the price of a commodity decreases, its con-sumption *increases*, and the demand becomes more steady.

Mr. Hill says the using of sugar by bee-keepers has put down the price of honey. Let us suppose, for the sake of argument, that the use of sugar by bee-keepers has lowered the price of honey; has it not also lowered the cost? Did not the extractor lower the price of honey? Has not comb foundation cheapened honey? Has there been a single improvement in bee-keeping that did not cheapen honev?

Mr. Hill says: "Recall the most successful apiarists, then find out how many feed sugar, and draw your own conclusions." Did I not say, in a former article, "The advice to feed sugar for winter stores is not intended for those who are uniformly successful with natural stores?" but what shall those do who are not successful a

Mr. Hill further asks, "Are there not twice as many bees wintered sucthere are on sugar ?" To get at the true inwardness of the matter, he should have asked for the pro rata loss of beca wintered on guarantee acoustics of bees wintered on sugar stores, compared with that of those wintered on natural stores.

The only fair objection that can be brought against the use of sugar for the winter stores of bees, is that "it may assist in giving color to an unjust accusation," in the same manner that the use of foundation "may assist in giving color to an unjust accusation. As my opponents failed to notice this point, I will again repeat, "Shall we stop using foundation ?" Rogersville, & Mich.

For the American Bee Journal.

## Reversed Queens, etc.

#### REV. M. MAHIN, D. D., (40).

On page 501 of the current volume of the AMERICAN BEE JOURNAL, G. W. Demaree tells of young queens having their heads the wrong way in the cells, and not being able to cut their way out. I have more than once found young queens in that condition, but at the same time I discovered how it happened, and there is no mystery about it at all. When a young queen cuts out of the cell she does not always wait to cut off the whole circumference of its end or point, bnt leaves on one side as it were a hinge. This allows the lid to close so neatly that one may handle the cell, as I have repeatedly done, without observing that the queen had ent out.

As a further fact to be considered. it should be rembembered that there ought to be some of the so-called royal jelly left in the cell when a queen hatches; and in search of this she in many if not in all cases, re-enters the cell. If the end be open she can back out, and no harm will be done; but if the lid of the cell is still hinged to it, and makes a close fit, the bees crawling over it will close it push it open, and she will perish in her prison. I have found queen-cells from which queens had hatched with the lids waxed fast. Whether it was done by accident or design I cannot say.

It is not at all likely that in any case a queen would be in a reversed position in the cell. She could not spin her cocoon in that position without spinning it at the base of the cell; and, in fact, while spinning it her weight and her motion would so crowd her down into the point of the would be impossible, and, further, her food would be at the wrong end and separated from her by the web of her cocoon. In view of these facts I do not hesitate to express the opinion that a careful examination of the cells, in the case of Mr. Demaree's reversed queens, would have revealed the fact that they had been opened. and that the queens had re-entered them. I hope that if he shall find another case of the kind he will carefully examine the point of the cell.

#### THE SEASON OF 1886.

In this part of Indiana the season has been very dry; and yet there has been a fair yield of white clover honey. The yield has been very much better than I would have supposed, in view of the small amount of rain. Basswood was an entire failure; only a few of the trees bloomed, and the few that did bloom yielded little or no honey. All of my bees except one colony are still at New Castle, Ind. I have no place here where I can keep them; and so when I want to see how they are doing I must take a railroad trip of 60 miles. At New Castle there has been much more rain than here, and if I could have given my apiary proper attention I would have had a fair yield of white clover honey. But though basswood trees abound within reach of my bees, there is not the slightest trace of the peculiar aroma of basswood in the honey.

I miss my bees very much, as I take great pleasure in manipulating and observing them. My one colony in this place is six blocks from the parsonage, and is not visited very often. Bluffton, & Ind., Aug. 12, 1886.

When Marketing Extracted Honey, it is a sad blunder to use barrels bolding from 300 to 500 pounds-they arc too large to be desirable for the trade, too bulky to be handled with care in transportation, and too dear to be lucrative to the producer, for honcy put up in such large barrels is subject to a discount of one cent per nound because to a discount of one cent per pound, because of the difficulty in disposing of it without repacking and dividing into smaller lots.

#### Local Convention Directory.

Bee-Keeping in Minnesota .-- J. W. Powell & Son, Mankato, 9 Minn., on Aug. 4, 1886, writes :

The weather has been generally dry here this season, still we have had local rains covering a small tract of country in our immediate vicinity. think this county (Blue Earth) will have the best crops of any in the State. We will have an average yield of honey this season. We have taken about 4,500 pounds of extracted, and have about 4,000 pounds of comb honey ready to take from the hives. honey ready to take from the nives. We began in the spring with 140 colo-nies in Simplicity hives, and have increased them to 240, by natural swarming. The prospect is good for a fall yield of honey. Why do not more bee-keepers join the Union? Is it because mon always neglect their it because men always neglect their bees and their preacher when they are short of money?

Hive with Transverse Passages.-J. H. Andre, Lockwood, Q N. Y., on Aug. 5, 1886, writes:

Bees are beginning to bring in honey from the early buckwheat. If we do not get early frosts hard enough to kill fall flowers, there will enough to kill fall flowers, there will be a good chance for the bees to build up in numbers, if not in stores, and those that have plenty of good stores will be apt to winter well. I gave a description of the hive I use, on page 361, and I find there is not room enough to work the frames so wide; they should be  $7\frac{1}{24}$  inches wide out-side measure, and instead of cutting the frame-rests in the side of the the frame-rests in the side of the hive, nail on a strip  $\frac{3}{8}$  of an inch square where the frames come, endwise to the side of the hive. This will admit of a shorter end-bar being used (5-16 of an inch), which is needed in changing the frames inside ends to outside of the hive. Each end-bar must be short, or the inside end will

strike the side of the frame hung in the other space and prevent its being placed close to the cross, which must be done in order to keep the bees from building comb under the cross. After the strips for the frame-rest are securely nailed on where each frame rests, a piece may be sawed out berests, a piece may be sawed out be-tween each frame to give a free pas-sage for the bees at the end of the frames. I shall put in 24 frames in each hive next season, for that will give more room for brood, and the way the frames are arranged will admit of their being spaced closer the year around than any other hive.

Acorn Honey. - C. Theilmann, Theilmanton, Minn., on Aug. 4, 1886. writes :

My bees have done fairly so far, My bees have done fairly so far, though white clover has not yielded very well on account of cold, windy weather nearly all through June. Basswood was almost a failure on account of the frost we had on May 4, when the buds made their appear-ance. My bees have stored about 3,000 pounds of honey from the acorns which were pieced by an insect, thus ensuing boreaute run out thus causing honey to run out.

Prevention of After-Swarms, etc.-David L. Howe, Woodstock, 9 Vt., asks the following questions :

1. What is the Heddon method of preventing after-swarms? 2. Will honey be augmented by covering the section-boxes in the hive with a mat or something of the kind during the honey-flow? 3. Should the brood-nest be covered with enameled cloth or a mat or some substance that will give ventilation when prepared for winter?

[1. A comprehensive answer to this question is too long for this department, and can be found in the BEE JOURNAL for 1883, page 126, or in Gleanings for 1885, page 414, or in Prof. Cook's book, or in mine.

2. No. Use a board cover in summer.

3. Some say "yes" and others say "no," and each class winter their bees and lose them with diarrhea when adopting each plan. I have succeeded and failed both ways .-JAMES HEDDON.]

Honey-Dew Observations. - Wm. Willis, Pomona, o+ Kans., on Aug. 9, 1886, writes :

near Honey Lake, Utah, the honeydew hangs in great drops on the sage-bush in such quantities that the wings of the sage-hens become so loaded that they cannot fly. There are no oak trees there, and not many do not make honey, but gather it, and I think it equally reasonable that plant-lice do not make honey, but subsist on it. If plant-lice do make If they make it out of a green acorn they can excel the honey-bee and all the professional chemists combined. It is not improbable that bugs of any sort may gorge their stomachs on honey-dew until it will pass undigest-ed; hence the "bug-juice" so much talked of to the great injury of our honey market.

Paper Comb Foundation.-Chas. F. Henning, Citra, Fla., on Aug. 4. 1886. savs :

So far my bees have done very well. I have taken a little over 207 pounds on an average, per hive, and all are full again. Wax for foundation has been very scarce with me, and I have tried many experiments of which I will speak some other time, but the following in particular I am well pleased with: I take strong but very thin paper, cut it the proper size for brood-frames, dip it into wax twice, run it through the mill, and I have very for brood-frames. very fine foundation for brood-frames, and foundation that my bees never go by. It is stronger, never sags, and does not take more wax than thin foundation for surplus. I will report later.

Partridge Pea, Reversing Combs, etc.-T. M. Coleman, Glendon, +o Iowa, on Aug. 5, 1886, writes :

I send a plant that grows very plentifully here, and the bees work on it a great deal, but it looks to me as if there could be but little for them in it. I would like to know what it is, and whether it is a good honey-plant. Our bees have done better than I ever knew them to do in May than I even knew them to do in May and June, but they have done very little since. I tried reversing a hive by nailing strips of lath across the top of the frames and turning it over just before putting sections on. It was a strong colony, and the frames were full of brood and honey during basswood bloom, yet they did but very little in the sections for about a week. There were brace-combs, and every space filled with honey, crowd-ing the tops of the frames very closely. When turned over, the bees 1 have been an observer of the vexed question of honey-dew for nearly 40 years. If there is no dew, there will be no honey-dew or nectar in flowers. That is the rule here, and honey-dew is not confined to oak or any other kind of tree or plant. In a State or Territory where the most honey-dew is found, the most honey is produced. California is the great-est honey-producing State of the Union, and in parts of California, and

hive. Thanks to Mr. Dadant for his advice to paint cloths for covers for sections; they are just what I wanted. I use yellow ochre and linseed oil on any coarse cloth, coffee sacking, etc. I am decidedly opposed to bevels and rabbets for two-story hives. I think a square joint much the best, and prefer loose top and bottom boards.

The plant is partridge pea (Cassia chamæcrista), and furnishes nectar in abundance. The flowers are very attractive to honey-loving insects, and are visited by such in great numbers. At the base of each compound leaf there is a curiously-stalked, button-shaped gland, which also excretes a sweet fluid, and which attracts the bees.-ED.]

The Trials of Bee-Keeping,-W. Stearns, Lima, & Iowa, on July 27, 1886, writes :

We have had a very good flow of honey from both white clover and basswood, and now from the so-called honey-dew. I am very much of the opinion of J. II. Andre, as stated in his article on page 453, that there is a great deal of hard and hot work about bee-keeping, if one is to be success-ful. Although I have managed to sell all of my honey up to date, the outlook now is not very encouraging. Honey is a drug in the market, and is sold at ruinous prices. I am fully convinced that honey will never be-come a staple article of consumption, as very many cannot eat honey, and others do not like it. I have had both rheumatic and malarial fevers, and though I did not at the time attribute my sickness to being stung often, and thus poisoning my blood, yet I am somewhat of that opinion at present.

Building Drone-Comb - Hiving Swarms.-Chas. Mitchell, of Molesworth, Ont., writes:

I cannot tell how I made such a to on page 437; if correctly printed it is too sweeping. What does any one suppose I do with my supers in use before the bees swarm? I am not so far behind the times as to let my bees lose time building drone-comb in 6 empty frames, and my supers in the house for a week. Many of my first house for a week. Many of my first swarms had to get two comb honey supers to let them inside at the time of swarming. Next came the trouble of swarming out from such pent up colonies. I had more trouble with swarming out than I have had in 6 years, until I gave them more room below, when all went well. Those are the colonies I meant, that got no supers until they needed them. I had several colonies finish 120 pounds of

he will get it back, as I think he has changed his hives twice in about 3 years, which means expense. I cannot conceive how his system destroys all wish and instinct of the bees to build any more drone comb. However, I will try it once more, and will be very ready to give the author full credit. In six years of close observa-tion, only once have the bees, that hatched after the first swarm, been of any use to me. We have had two very dry seasons; honey failed alto-gether about July 10. I have many colonies that were given foundation, that have about honey enough to winter on, and those that had to build their combs are starving. This has happened for 3 years. It is pretty hard to have to turn round and buy sugar for 100 colonies run on 6 frames all summer; this thing is fast putting down the price of honey, and making millionnaires of our sugar merchants.

#### Honey-Dew for Winter Stores.-P. Lattner, Worthington, O+ Iowa, on Aug. 6, 1886, writes:

Bees have done well here. I started with 50 colonies, extracted 11,500 pounds of good white clover honey, and have 100 pounds of comb honey. On July 17 the bees brought in honeydew which spoiled the balance in the hives. The hives are now full of that kind of stuff. Will it do to winter bees on? It is so dry now that I fear we will have no fall crop, unless rains should come soon. The stuff gath-ered is of a dark green color, very thick and sticky, and tastes as though oak leaves had been stewed in molasses.

Those who take the risk of wintering bees on honey-dew, take a very heavy one.-ED.]

Phenol for Foul Brood.-A subscriber in Michigan gives the following experience with it: "

I notice on page 491 a request to know if any one has been successful in treating foul brood by the Cheshire method. I will say that I have cured foul brood with phenol, and did not take the pains to follow the treatment as laid down by Mr. Cheshire. In 1884 I received a large number of colonies of bees from the South. Late in September I found that they were affected with foul brood. As it was late in the season nothing was done, and several colonies were lost. The next season it again made its appearance; the stores were extracted at ouce, and the bees were fed a syrup made of honey and water, which was boiled and skimmed, and about one-fourth tea-spoonful of the absolute phenol added to the syrup, which was 5 quarts. The mixture was then put comb honey which came off before July 10, and every drop was clover the brood also being covered and honey. That does not look like idle supers. How many colonies had Mr. II. that equalled this, in either the reversible hive or the other? I cer-tainly know that Mr. Hutchinson is

not stingy with his bees, if he thinks did not seem to injure the bees any, he will get it back, as I think he has and did not kill any as I expected it would. I regard this as a sure cure, as the disease has not made its ap-pearance since the treatment, and the affected colonies did better at once after being thus treated.

> Some Honey-Dew, Marketing, etc. -2-J. II. Larrabee, (16-33), Larrabee's Point,+o Vt., writes:

> I think that I have a case of honey-dew, even in the old "Green Mountain State." An elm-tree situated in the centre of the pasture near the house, I found the other morning to be swarming with bees, and upon obtaining some of the leaves they were found to have small, sticky, shiny and sweet spots on their upper surface, and from 3 to 6 small green aphidæ on the under surface of each leat. My bees have had an average season, but are doing nothing now but draw from their winter stores. I have a colony which, on June 15, sent out a first swarm, that lost its queen and re-turned to the old hive. I supposed, of course, that the young queen would come around all right, but upon ex-amining them about July 20, I found them queenless, with no brood or eggs in the hive, showing that they had had no laying queen since swarming. I am unable to find laying-worker signs. I introduced a virgin queen which they would not accept. I have removed three frames replacing them with frames of brood, and will introduce a queen. I wish that some able apicultural writer would give us a good, practical article in the BEE JOURNAL on "Relative market val-ues, city and country." Ignorance and carelessness as to cost of production, etc., are responsible for much of the low prices. We need much more light on markets, not marketing honev.

#### Convention Notices.

The next meeting of the Stark County Bee-Keepers' Society will be held in Grange Hall, at Canton, O., on Aug. 31, 1886. M. THOMSON, Sec.

27 The N. W. 118. & S. W. Wis. Bee-Keepers' Association will hold its next meeting at the resi-dence of F. D. McKibben, 1/8 miles cast of Dakota, on the Milwaukee & St. Paul R. P., on Sept. 6, 1886. JONATHAN STEWART, Sec.

The Cedar Valley Bee-Keepers' Association will hold its anonal meeting at the office of Jerry Mosher, East Side Waterloo, Iowa, on Ang. 18 and 19, 1888. An exceedingly good programme has been arranged. All interested in apiculture are most cordially invited to attend. H. E. IlUBBARD, Sec.

The 4th annusl basket picnic of the East-ern lowa and Western Illinois Bee-Keepers' As-sociation will be held at Schuetzen Park, lowa, on Thursday, Auz. 26, 1886. All interested in bee-culture are eernestly requested to be present and make this the grandest picnic in the history of the Organization.-1. V. McCagg, Wm. Gronroll, and Wm. Goos, Committee of Arrangements, Da-venport, lowa.

The lowa State Bee-Keepers' Association will meet on the Fair Grounds in Des Moines, on Tuesday, Sept. 7, 1986, 46 2 p.m., continuing in session during that and the following two or three days. A large and substantial teot has been se-cured and is now at hand for the use of the soci-ety. Any or all of the 6,000 hee-keepers of lowa are urgently requested to be present and help make the meeting a pleasant sup rofitable one. A. J. NORRIS, Sec.

O. O. POPPLETON, Pres.

THOMAS G. NEWMAN & SON. PROPRIETORS.

923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

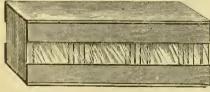

> ALFRED H. NEWMAN. BUSINESS MANAGER.

Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

Dr. Miller's Book, "A Year Amoog the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

A New Crate to hold one dozen one-pound sections of honey.-It has a strip of glass on each side, to allow the honey to be seen. It is a light and attractive package. As it holds

but one tier of sections, no damage from the drippings from an upper tier can occur. We ean furnish the material, ready to nail, for 9 ets. per erate. Glass 1%c. per light, extra.

Bees for Sale .- We offer to sell a few atrong eolonies of Italian bees, in ten-frame Simplicity bives, at \$6.00 each.

Red Labels for one-pound pails of honey, size 3x41/2 inches. - We have just gotten up a lot of these Labels, and ean supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apiarist printed on them-by mail, postpaid.

Italian Queens .- We have a few untested queens which we can send by return mail. Three for \$2.75; six for \$5.00; twelve for \$9.00. For Tested, double the prices.

#### System and Success.

2 All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

 For
 50 eolonies (120 pages)
 \$1 00

 "
 100 eolonies (220 pages)
 1 25

 "
 200 eolonies (420 pages)
 1 50

The larger ones ean he used for a few colonies, give room for an increase of numbers. and still keep the record all together in oue book, and are therefore the most desirable.

Yneea Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable.

When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to alwaya have one handy. We can supply them at 5 cents each, or 50 cents a dozen; if sent by mail, add 1 eent each for postage.

Simmins' Non-Swarming System is the title of a new English hee-book. The author elaims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be

obtained at this office. When Benewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one

ean afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to devote a few hours, to get subscribera.

The Western World, Guide aud Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides their own, with \$3, for one year, we will present a copy of this valuable book.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

#### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 7 a. m., Aug. 16, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

CHICAGO.

HONEY.—Prices are nominal. Offers of 12@ 3c. would be accepted; yet 14c. is being asked. BEESWAX.—Scarce at 25c. R. A. BURNETT, 161 South Water St.

#### NEW YORK.

HONEY. - The present quotations are as follows: Faucy white comb in 1-lb. sections, 16@ 12c.; fancy white comb in 2-lb. sections, 8@10c; buckwheat in 1 and 2-lb. sections, 5@8c; extracted white clover, 6c; extracted, California, 4½@5c; extracted, Southern, per gallon, 45 to 55c. BEESWAX.-23 to 28c.

MCCAUL & HILDRETH BROS., 34 Hudson St.

#### BOSTON.

HONEY.-One-lb. sections, white clover, 13@15c; -pound sections, 11@13c. Extracted, 6@8c. BEESWAX.-25 cts. per lb. BLAKE & RIPLEY, 57 Chatham Street. -2.

#### DETROIT

HONEY.-The market is terfereing with the demand. Best comb honey in 1-b, sections, 13c. BEESWAX.-wirm at 23c. for fair quality. M. H. HUNT., Bell Branch, Mich.

#### CINCINNATI.

HONEY.-Demand is slow for all kinds and shapes of honey. Prices of extracted honey range between 3½@7c., according to quality; and choice comb honey brings 14@15c. in a jobbing

Way.
 BEESWAX.—Demand is good and arrivals fair.
 We pay 20c, for good yellow.
 C. F. MUTH & SON, Freeman & Central Ave.

#### CLEVELAND.

HONEY.—The demand for honey is not very lively at present, but prices are steady. Choice new honey in 1-b, sections is selling at 14c.; 2-bs, 12@13c. Old honey is very dull at 10@12c, Ex-tracted, 6@7c. BEESWAX.—25c. A. C. KENDEL, 115 Ontario Street.

#### KANSAS CITY.

KANSAS CITY. HONEY.-The receipts of new comb boney are fair, with a good demand, and light stock in the city. Extracted is in light demand. We quote: 5(-b). sectiona, loc.; white clover, 1-lb. 13@14c.; dark, 1-lb., 10@12c.; white clover, 2-lba., 11@12c.; dark, 2-lba., 9@10c.; white sage California, 2-lba., 10.0.1c.; dark, 2-lba., N@9c.; extracted white clover, 56c.; dark, 364c.; white sage California, 4@5c.; dark, 3/@4c. BEEESWAX.-20@22c. CLEMONS, CLOON & CO., cor. 4th & Wainut.

#### MILWAUKEE.

MILWAUKEE. HONEY.-The market is fairly supplied with honey, trade is duil, prices depressed, and the out-look is for a large production. Already some is being peddled about the city by the producers themselves, demoralizing the prices, which should not be done. We quite: Choice white in l-pound sections, 14@15c; 2-ibs. 13@15c. Dark honey not wanted. Extracted, white, in barrels and kegs, 5@ 7c; in th cans, 6@8c; dark in barrels or kega,4@6. BEESWAX.-25c. A. V. BISNOP, 142 W. Water St.

#### SAN FRANCISCO.

SAN FRANCISCO. HONEY, Arrivals of boney have been smaller in the last week, as the prices are so low that producers or owners cannot afford to sell without a loss to them, and they prefer, therefore, to store their honey either here or in the country for better prices. The crop has been represented much larger than it really is; and prices are im-proving a little, or are at least a little firmer. Some large sules at 34 to 4c. for choicest quality for export have been made. We quote 34 to 34, the latter for choicest quality in a jobblug way. Supplies are very small, but soon they may in-crease, and quality promises to be choice. BEEESWAX.-According to quality. 200220. SCHACHT & LEMCKE. 122-124 Davis St. HONEY Disces are no as that honey-price

HONEY.-Prices are so low that honey-pro-ducers are holding back their product; still the market is well supplied. We quote: Comb, ex-tra white, 8%@10c; off grades. 6%@7%c. Ex-tracted, white, 4@44;c; amber, 3%@3%c.; dark, 3c. BEESWAX.-22%@23c. O. B. SMITH & Co., 423 Front Street.

#### ST. LOUIS.

IIONEY.-Choice comb. 10@12%c.; latter price is for choice white clover. Strained, in barrels, 34@4c. Extra fancy of bright color and in No, 1 puckares, % advance on above prices, Extracted in barrels, 4%@5%; in cans 6@7c. BitESWAX.-Firm at 22; for prime. D. G. TUTT & CO., Commercial St.

### Home Market for Honey.

EF To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remunerative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the bee-keeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

Frank Leslie's Sunday Magazine for September opena with a second installment of Mr. Powell's interesting " Leaves from My Life," with portraits of Robert Southey, Wm. Wordsworth, S. T. Coleridge, Leigh Huntand Miss Landon. A very interesting article is, "Why do Church-bella Annoy ?" hy S. Austen Pearce, Mus. Doc. Oxon, which is illustrated by no less than 14 cuts. This le appropriately followed by Bulwer's translation of Schiller's "The Lay of the Bell," with three illustrations. There are numerous articles, poems and midaummer illustrations, making up a bright and interesting number of this favorite family magazine.

We are in receipt of a large and very carefully executed engraving of the new Standard Oil Company Building, 26 Broad-way, New York, which is neteworthy as the finest business structure on the greatest commercial thoreughfare of this continent. The enormous granite pile, 200 feet deep, and almost 200 feet in height from founda-tion stone to pinnacle, is entirely given np to the executive effices of the Company, which is entitled to credit for having added so imposing and enduring an example to the great commercial monuments of the Metropolis. We are in receipt of a large and very Metropolis.

137 The St Joseph, Mo, Inter-State Bee-Keepers' Association will hold its annual meeting on Wednesday evenlug of the Exposition week. Sep-tember 30, 1886. Arrangements are being made to have an interesting meeting. The place of hold-ing the meeting will be published in our local pa-pers on Tuesday and Wedneaday a.m. E. T. ANBOTT, Sec.

237 The Illineis Central Bee-Keepers' Association will hold its next meeting st Mt. Sterling, Ills., on Tuesday and Wednes-day, Oct. 19-20, 1886. J. M. HAMBAUGH, Sec.

137 The next annual meeting of the Michigan State Bee-Keepers' Association will be held to Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTNO, Sec.

# Advertisements.

WILL sell 400 full Colonies of Bees in lots to suit buyer; or will sell Apiaries already stocked up. Now is your time. Address, H. R. ROARDMAN, 28Atf EA. TOWNSEND, Huron Co., O.

ATTENTION, BEE-KEEPERS ! ! Now is the time to Italianize Cheap. New is the time to Italianize Cheap. Having all my orders filled to date, will sell Fine Queens from my well-known Strains, at the following very low rates: 1 Queen, 80 ets.; 6 Queens, \$4.50; 12 Queens, \$8.00; 1 Tested Queen, \$2.00. Safe arrival of all Queens guaranteed, and Queens sent by return mail. Address, Wm. W. CARY, 32Att COLERAINE, MASS.

## HOW to WINTER BEES. **LOOK HERE!**

THE October number of the American THE October number of the American Aplentments will contain essays on "Wintering Rees," from the pens of James Heddon, G. M. Doolittle, A. E. Manum, Frot. Cook, Dr. Tinker, J. E. Pond, Ira Barber, J. H. Martin, and other conally prominent aplasfists. Every bee-keeper should scenre a copy. For teu cents in stamps this number will be mailed to any address on September 25. No speci-men cepies of this number will be sent out. Baeule subwrition price \$100 per year

Regular subscription price \$1.00 per year. Single copies 10 ets. each. Copies of back numbers will be sent free. Address, AMERICAN APICULTURIST,

WENHAM, MASS.

33 A 6f.

In use 30 years. The only successful remedy for Nervous Debility, Vital Weakness, and Prostration, from over-work or other causes \$I per vial, pr 6 yials and large vial powder, for \$5 SOLDEY DRUGGIST, or sent postpaid on receipt of price.-Humphreys' Medicine Co., 109 Futon St., N. Y.

I CAN use a few thousand pounds of Extracted Honey of good quality, if cheap. Address,

 The server and style as the 2-frame to basket to revolve upon leaving to the basket to revolve upon leaving to the basket to revolve upon leaving to the states, show and the performance of the states to the states the states to revolve upon leaving to the states to the states to revolve upon leaving to revolve upon revolve upon leaving to revolve upon leaving to re EXCELSIOR Wax Extractor. We make two sizes, the smaller one having a larger capacity than the Swiss Wax Extractor. Prices, small size, 84; large size, 85.00. Some of the advantages of this Extractor are: 1. It is more easily operated, there being no necessity for removing the top to re-till with water. 2. It melts the wax quicker, because it is brought lato u more direct con-tact with the steam. 3. It is more economical, because the steam has access to the center, thereby extracting all the wax from there is extracting all the wax from the refuse matter. 4. The filler for water acts also as an indicator, showing the animation we cape through the till of how there ready to re-fill when required. PURE PHIENOL.

#### PURE PHENOL.

FOR the cure of Foul Brood, used by Mr. Cheshire, of London, Eng-land. Asit is a liquid, it can be sent only by express. Price, 25c. per oz.

#### TIN POINTS, for Glassing Sections

SQUARE or V-shaped, 1,000, by mail, 50c. By express or freight, 40c.

#### SHUCK'S BEE-FEEDER.

FOR feeding bees at the entrince of the hive, any time; it feeds much or little, as mny be desired; feed can be reached only by the bees from the inside of the hive. Price, by mull, 30c. By express, 25c, each, or \$2.40 per doz.

#### PERFORATED-ZINC.

DRONK and Queen Excluders.-We carry in stock two sizes : 194/x146 ioches, for Langstoch hives-price 25 cents each ; ulso in sheets 3xN feet-24 sq. (t.-price, \$2.75 per sheet. We will cut pieces at 15 cents per sq. ft.

#### HONEY KEGS.

5 gallon, to hold 50 lbs...... 40c 0 " " 100 lbs...... 60c 7 " " 175 lbs...... 80c

A discount of 10 per cent. on 25, or for postage. We can thread to take here and the rest of the second sec

#### LABELS FOR PAILS

# OF these we have 20 styles, and when O, 00 retred in quantities of 250, 500 or 1000, we print the same and address of the apiarist. Prices range from 25 cents for 250, and upwards. Samples sent upon application. LONG RUBBER GLOVES.

 $\begin{array}{c} FOR SIZE, lay the open hand, palm \\ for down, on u sheet of paper, and \\ mark the outline of hand and fibgers with a pencil. Price, by mall, $1.75. \end{array}$ 

WOODEN PAILS for HONEY W OODEN water palls, well-painted ight-fitting wood cover, at \$2.25 per dozen. They will hold 35 lbs. of honey, and when empty, can be utilized for use as an ordioary household pail.

#### HONEY KNIVES.

IN ONLY KNIVES, IN osing Binghum & Hetherington's Honey Knives only the thin, sharp, beveled edge rests on the combs, and the caps, after being cut off, silds up in large sheets and roll over on the knife, like shavings on a pisne. They are 2-in, wide, tempered and finished like a razor, and will last a life-time. Price, \$1. By mail, \$1.15.

Muth's Honey Knife, 50c.; by mail 65c.

#### BEES AND QUEENS.

FULL Colonies of Italian Bees, in Langstroth hives, bred to highest standard of excellence for all the best points, \$8.00. Tested Queens, \$2.00.

#### WIRING TOOL

FOR pressing foundation into wired \$2.50. Sample, by mail, 10c. Feit Blankets, 35c. per ib. by express.

As you may surely see.

The Colonial Exhibition is to be held in London, England, next month, and many prominent Canadian apiarists have started across the ocean to attend and exhibit Canadian products.

The Northwestern Convention, usually meeting during the Exposition at Chicago, will this year unite in convention with the National at Indianapolis, Oct. 12-14, 1886. The reasons are given in full by the Sceretary, on page 539. Let there be a general rally.

----

Catnip is one of the most valuable plants for bees. The flowers are rich in honey, and for several months, commencing with June of each year, yield it freely at all hours and in every kind of weather. A patch may easily be raised from the secd, sown the latter part of summer or early in the spring.—Indiana Farmer.

The Rev. W. F. Clarke intended to have gone on the annual excursion of the Canadian Press Association, which elected him an honorary member on the 5th inst., but this is what he says: "A bad attack of sciatica compelled me to forego the pleasure of joining the excursion." He intends to be at the National Convention at Indianapolis in Oct. 12-14, 1886. We are snrry to hear of his illness.

XXXI Wander-Versamlung. — The thirty-first annual Convention and Bee and Honey Show of the Austro-German Bee-Kcepers' Society will be held next Monday, Aug. 30, and continue through the whole week at Troppan, in Sileaia, Austria. This is the oldest bee-keepers' society, and the largest and most important one in Europe.

New Postal Regulations, concerning the transmission of "beea," "honey," etc, in the United States mails, were issued on July 17, 1886, by the Postmaster General, under the title of "Order No. 143."

This is the section which relates to been; S. Queen bees and their atlendant bees, and dried insects, may be sent in the mails when properly put up so as not to injure the persons of these handling the mails, nor soil the mail-bags or their contents.

This governs the mailing of honeyknlves:

5. In the ease of sharp-pointed instruments, the points must be capped or encased so that they may not by any means be liable to cut through their inclosure ; and where they have blades, such blades must be bound with wire su that they ahall remain firmly attached to each other, and within their bandles or nockets. Needles must be inclosed in metal or wooden cases so that they cannot by any means prick through or pass out of their inclosures.

This section admits honey, when properly prepared for the mails :

4. Admissible liquids and oils (not exceeding 4 ounces liquid measure), pastes, salves, or articles easily liquefiable, must conform to the following conditions: When in glass bottles er vials, such bottles er vials must be strong enough to stand the shoek of handling in the mails, and must be enclosed in a wooden or papier-mache bloek or tube not less than 3.16 of an inch thick in the thinnest part, strong enough to support the weight of mails piled in bags and resist rough handling, aud there must be provided between the bottle and its wooden case, a cushien of eork-erumbs, cotton, felt, asbestos, or some other absorbent, auflielent to protect the glass from shoek in handling; the bloek or tube water-tight, and to prevent the leakage of the contents in lease of breaking of the glass. When inclosed in a tim eylinder, metal case, or tube, such eylinder, ease, or tube, such eylinder, ease, or tube, such eylinder, and the same water-tight, and abould be securely fastened in a wooden or papier-mache bloek (neor only at one end, and not less in thickness and strength than above deseribed. Manufacturers or dealers, intending to transmit articles or samples in considerable quantities, should submit a sample package, showing thefr mede of packing, to the postmaster at the mailing of the securely astend the reading the mode of packing, to the postmaster at the conditions of this section are carefully observed.

Here are the instructions to postmasters concerning these regulations :

224. Postmasters will exercise great care respecting the admission of articles of the fourth class to the mails. Whenever articlea are offered for mailing, under the provisions of the two preceding sections, postmasters must earefully examine them and not admit them, if the prescribed conditions of their admission have not been fully complied with. In case of doubt the matter should be referred to the General Superintendent of Railway Mail Service.

Mr. S. Corneil has been experimenting to test the correctness of Sir William Thempson's table of thermal conductivities given in the "Encyclopædia Britannica," ninth edition. According to that table, wood conducts heat nearly five times as fast as dues earded wool. Mr. Corneil finds that this is correct, and has therefore science on his side in the use of quilts lined with earded wool for eovering up his bees during the winter. One season's use of these quilts has eenvinced us that they are the best top packing for bees that we have ever tried, and we shall have more to say on the subject as the season for making winter preparations approaches.-Rural Canadian.

The Honey Season in Great Britain is thus described by a Lannrkshire Beekeeper in the London Journal of Horticulture for Aug. 5, 1886 :

The weather up until July 26, was very changeable. The honey season seldom extends beyond this date, and this year with us it has not yet appeared. There have only been seven days in July that beesstored any surplus, and these days occurred at intervals being all the worse for the secretion of honey. There have been only two consecentive fine days, and the weather is, while 1 write, gloony with a low temperature. There are some localities where a fair surplus has been gathered, but with us it is much below the average.

During the height of the elover season, and for three days in suecession, the wind blew a perfect hurrleane, never before experienced here in July. At least 50 per cent, of my colonies have sent off swarma, which not only gave me extra labor, but taxed my ingenuity to make the most of them.

Among the Curiosities of Invention recently advertised is a bee-smoker that uses no fire. The substitute for smoke is a mixture of carbolic acid, oil of tar and water, properly proportioned. A bottle of the mixture, enough to last two seasons, is advertised in the British Bee Journal for the small sum of sixpence. The recipe does not appear to be for sale. In the absence of a particular description of the way of using this mixture, we suppose that a sponge is saturated with it. The instrument by which it is applied can be affixed to an ordinary smoker. Among the testimonials of the cflicaey of this plan, there is one bearing the distinguished name of Frank Cheshire, who says: "1 find by experiment that the most vicious of Eastern bees are utterly beaten at once." So says the Rural Canadian.

Mr. J. Stewart, Secretary of the Northwestern Illinois and Southwestern Wisconain Society writes us that he made a mistake in the date of the convention called on page 523. It should be Tuesday, Sept. 7, 1886. It is correctly stated on page 539 of this issue of the BEE JOURNAL.

A Swiss Bee-Keeper Cures Foul Brood by means of thyme. This common herb is dried, put into an ordinary smoker, set alight, and the smoke blown plentifully into the bive by the entrance. After doing this eight evenings, he found the larvæ, which had died from the disease, quite dry, and the new brood in a perfectly healthy condition. He continued the fumigation another eight days, which ended in a complete enre of the disease. So says the British Bee Journal.

When placed under a microscope the sting of a bee presents a polish of dazzling beauty; but when placed in the end of a man'a nose the polish is missing, and the appearance more like that of rat-tail file dipped in vitriol. This is official.— Lige Brown.

The American Agriculturist for September, contains the Fair List for this year. This List has been gathered by special correspondence, and ia very complete. In 495 counties no fairs will be held this year.

#### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are In a "hurry" for replies, do not ask for them to be inserted here.-ED.]

# Pollen in the Sections.

Query, No. 295 .- How can I keep the pollen out of the sections? My bees are mostly on 10 frames, Gallup size, with honey-boards arranged to break joints with the frames. I also tried putting 2 honeyboards on so they would break joints, but they still put the pollen in. They put some in drone-comb. It is worse in old colonies that have not swarmed, or, in fact, any that are very strong. They do this way only during white clover bloom, which yields a great deal of pollen, and is the main crop for honcy here. Surplus is all taken from the top. I have had trouble with this every year, but I believe it is worse this year than others.-Clinton, Ills.

In this locality we are not troubled with pollen in sections.-II. D. CUT-TING.

I have only found pollen in one single section. You had better try the queen-excluding honey-board.— A. J. COOK.

I have no trouble in that way, and I do not know that I could suggest a remedy.—G. M. DOOLITTLE.

As I never have trouble of this kind, I cannot account for yours.— JAMES HEDDON.

With a square frame and top storwith a square frame and top stor-ing I should not expect trouble from pollen in sections. I have no trouble even with the new Heddon hive. There may be something in the locality, strain of bees, or manage-ment.—W. Z. HUTCHINSON.

There are two causes of pollen going into sections—one of them is a narrow section, the other a small brood-chamber. Narrow sections are brood-chamber. Narrow sections are filled and sealed up the soonest. Wide sections from 7 to the foot up to 6 to the foot require more time for the honey to cure in them; but if properly tiered up there is no loss of honey by using them. Wide sections may be used with a queen-excluder on a small brood-chamber, if it does not contain less than 700 square inches of comb, without pollen going into them; but not so with a narrow 1% section. It seems that the rinc queen

some reason there must be a lack of cells in which to store pollen in .our brood-chambers. I think some recommend contraction of the brood-chamber. I doubt its success.-C. C. MILLER.

You are certainly mistaken about white clover yielding "a great deal of pollen." Here, white clover yields but little pollen, of a pale green color. I presume that your locality produces an abundance of pollen-bearing flowers, in which case do not adjust an the surplus departments of the hive (and thereby get the bees in the habit of storing the pollen above the broodnest) until the honey-flow has actually commenced.—G. W. DEMAREE.

I would like to know myself. This is one of those vagaries that are constantly happening, and for which there is no special or specific remedy that I know of. If the case was mine I should experiment somewhat and see if I could ascertain the cause.-J. E. POND. JR.

# Drone-Comb in Second Story.

Query, No. 296 .- Why do bees build drone-comb in sections in the second story and fill them with honey? The colony is strong in numbers, and has filled one tier of sections. They have not swarmed .- Bristol, Miun.

Strong colonies are very apt to build drone-comb, especially during a busy season.—A. J. COOK.

It takes less wax and less time to store honey in drone-comb than worker comb.—C. C MILLER.

When comb is built for honey-storing it is of the drone size.-G. M. DOOLITTLE.

Bees are apt to build more dronecomb in sections when the queen is old.-G. L. TINKER.

Some colonies are disposed to build drone-comb more than others, es-pecially with old queens. If you will use worker foundation you can pre-vent it.—H. D. CUTTING.

I find that bees are more apt to build drone-comb in sections when honey is rapidly coming in, and also in cases where there is no drone-comb in the brood-chamber. In the first case it is presumable that drone-comb is quickest and easiest constructed for the reception of honey.-J, P. H. BROWN.

Bees prefer to build drone or store comb to store honey in, because they are guided by the strictest laws of economy. It is a matter of economy and convenience with them.-G. W. DEMAREE.

Simply to follow the established rule that they prefer large and deep cells for storage of honey, and will always build and use such for that section. It seems that the zinc queen-excluder is no hindrance to the carry-ing above of either honey or pollen.— G. L. TINKER. I have very little trouble in this direction, but cannot tell why. For

dation on which the bee-keeping of the future will be built, as by living up to it, we can cause stores and brood both to be placed where we desire, and without extra trouble or labor.—J. E. POND, JR.

Colonies that have not swarmed are quite apt to build drone-comb. When honey is coming in freely, and the bees must build comb in which to store it, they often build drone-comb in which to store the honey, as they can furnish storage room more rapidly by so doing.-W. Z. HUTCHINSON.

It is their instinct to build dronecomb where full worker foundation does not prevent, especially for store comb. They are almost sure to build drone-comb in the sections, if they have none in the brood-chamber, and breed drones in them, too, if a queen-excluder is not used. If you cannot afford full sheets of foundation all around, cut short in the brood-chamber hirst.-JAMES HEDDON.

# Hybrid Bees.

Query, No. 297.-1. What is the appearance or markings of a cross between Italians and blacks? 2. Can they be known with certainty from pure Italians? 3. What is their value compared with other bees ?-J. M. C.

1. They are very indefinite. 2. A whole colony, yes; individual bees, no. They are often very excellent.— A. J. COOK.

They vary in the same hive from three-banded bees, which cannot be distinguished from pure Italians, to two-banded, one-banded, and black, such crosses are good honey-gather-ers, and are a decided improvement upon the blacks.—J. P. H. BROWN.

1. Some bees are black; some show one band of yellow, some two, and some three. 2. The three-banded hybrids could not be distinguished by their appearance. 3. As honey-gatherers they equal either variety, but as comb-builders they are a little behind the blacks.—W. Z. HUTCHIN-SON

1. A part of the worker-bees show the three yellow bands like the Ital-ians, and a part are black, with an indistinctness of markings on others between the two. 2. Yes. Good Ital-ians all show the three yellow bands. 3. An Italian queen mated with a German drone produces workers of good honey-gathering qualities; but a farther cross toward the blacks tend toward deterioration.—G. M. Doo-LITTLE.

1. The question of pure mating of an Italian queen can only be known by her worker progeny. If the queen is pure and purely marked, all her workers will show at least three yellow bands. I have had two queens whose workers chowed four values

plained above. 3. In some cases they are nearly as good honey-gatherers; some say equally so. Their irascible disposition makes them a perfect terror to the majority.—J.E.POND,JR.

1. Part of the workers are marked like pure Italians, part like pure blacks. After the first cross, one and two-banded bees appear. 2. In the cross the workers will not all have three yellow bands as in the pure stock. 3. For producing honey I think I would as soon have a first or second cross as pure stock.—C. C. MILLER.

1. In a straight cross between Italians and black bees, a few of the workers may look like pure Italians, and a good many jnst like black bees; while the greater number will show intermediate markings. 2. Yes, beyond question. It may be difficult to always detect a mere taint or trace of black blood in Italians. 3. As honeygatherers the first cross between Italians and blacks compare favorably with the best bees of any race. But subsequent crosses make inferior bees; at least such has been my experience. —G. W. DEMAREE.

1. That depends. Sometimes the workers are nearly all two and threebanded. Again, they vary from three bands to no bands at all. 2. No, sir, I have had hybrid colonies that contained all three-banded bees, and no one could tell them from some best pure Italians, did they not know from whence the mother came. 3. They are the best bees I know anything about when rightly crossed.—JAMES ILEDDON.

1. Very irregular marking, some being all black, others with one yellow mark, others with two and three marks. 2. Yes, in a full colony. 3. In many cases the hybrids are the best honey-gatherers. Some prefer them to pure blood. As a general thing they are very much crosser.— H. D. CUTTING.

The term hybrid has been limited, as it should be, to crosses between the German or black bees and the yellow races, like the Italians, Syrians and Cyprians. Crosses between the latter races cannot be properly termed hybrids, since very little change in the worker bees of such crosses is apparent. Hybrids have from one to threebanded workers, but often all are marked with only one or only two bands. 3. My experience is that hybrids are inferior as workers to crosses between the yellow races. If there is any "bug juice" to be collected, they are always the first and the last to dabble in it, while the yellow races gather little or none.—G. L. TINKER.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one seuding ns two new subscribers besides his own, with \$3.00, for one year, we will present a copy of this valuable book.

Explanatory.—The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonics the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark O indicates that the apiarist is located near the center of the State named;  $\eth$  north of the center;  $\blacklozenge$  south;  $\circlearrowright$  east;  $\circlearrowright$  west; and this  $\circlearrowright$  northeast;  $\circlearrowright$  northwest:  $\circlearrowright$  southeast; and  $\blacklozenge$  southwest of the center of the State mentioned.

# The Honey Season in Iowa.

### REV. O. CLUTE.

The spring of 1886 opened early, but not too early. When it came, it came to stay. There was little of cold, windy weather to deplete the hives. Yet there were some losses among bees after they were taken from the cellar. The bright, warm, weather made all bees very active. The strong colonies, not finding enough honey in the fields to employ their energies, pitched upon the weaker ones, and robbed them out. I hear of considerable losses from this robbing-out. But bees in the main wintered well in cellars, and, but for the robbing-out, got through the spring well.

The ground was well-covered with snow all winter. It came in good season in December, and staid by us. The fields were scarcely bare at all. Hence the bee-keepers' best friend, the nectar flowing white clover, was well wrapped up in a warm snow blanket during the fierce attacks of cold in January and February, when the mercury several times marked 35° below zero. The clover came through all right. As soon as the snow was gone it began creeping everywhere. Helped on by the genial snn and the early and abundant rains it soon covered almost every foot of land that is not under the plow. The meadows and pastures were one wide, beautiful stretch of white flowers. Every roadside had its belt of emerald green. To all the streams it gave a verdant fringe. Over the knolls and hills it spread its soft carpet, more delicate beneath the feet than any luxurious fabric from the famous looms. The warm weather brought on early The bloom, and soon all of this part of Iowa was densely covered with those delicate white balls whence the faithful bees bring such wealth of amber honey to the waiting hives. The profusion of bloom was a joy to me.

Better weather for honey-gathering was never known. Happily we did not then know that the bright, warm, still days were the beginning of one of the most bitter drouths that the Great West has ever been afflicted with. Day after day the sun rose in

a cloudless sky, and gave to our fertile soil abundant warmth. All day long for weeks and weeks the winds were still. No bee, however laden with its burden of honey, was dashed to earth, never again to take wing, by murderous gnsts. The measureless amount of honey-bearing bloom, the long procession of days of peaceful calm, the tropical sun glowing in a cloudless sky made a time, which from the bee-keepers' point of view. could not be surpassed.

The linden in this part of Iowa is found along all the streams. It did not seem to feel the touch of the drouth, though by the time it bloomed, the drouth was upon us in all its fierceness. Probably the roots of the linden go to some depth, and those depths were not then dry. Both clover and linden yielded honey of remarkable thickness and weight. It is about a pound per gallon heavier than in ordinary years. I looked daily to see the clover dry up, but it held out wonderfully. I expected hardly any flow from linden, but it did yield well.

I supposed that the dry weather would surely stop all honey-flow as soon as linden failed, but, strange to say, the honey kept abundant for some time after every flower on the linden was dry. As to where this late honey came from I am not sure, but I think it was from red clover. The red clover fields had a dense growth, which came early to maturity, and was cured for hay. This hay was cut when the drouth had begun to get down to business. The glowing sun when the drouth hat belowing sun down to business. The glowing sun beat down upon the clover stubbles, and everything but the deep-rooted clover yielded to its withering touch. The meadows have no after-growth the devent the clover. The roots at all, except the clover. The roots of this go down so deep that it was able to get some moisture, and to send up struggling tufts of growth that are but the ghosts of what red clover ought to be, on our soil of luxuriant fatness; and these feeble tufts hastened forward to a somewhat abundant bloom. But the heads were small. In order to get the honey from these short corolla-tubes it was not necessary to wait until we can breed the "bee of the future," whose tongue shall have the two or three hundredths of an inch added to its length, of which Prof. Cook so ably writes. The tongues of our active Italians could reach the honey in this second growth of red clover. So even when white clover and linden were gone the bees found for some time enough nectar to add a little each day to their luscious stores.

From these sources, and possibly from others that have escaped my eye, our bees have done well. A neighbor of mine reports 127 pounds of clear, white, extracted honey per colony. Another reports the very large yield of 3.200 pounds from 12 colonies—extracted honey, of course. Those running for comb honey have also done well. In this neighborhood, therefore, we have no reason to complain. Probably in those parts of Iowa, and of other States, where the white clover is not yet abundant. and they depend on fall flowers for their surplus, there will be a short crop, for the grip of the drouth has been terrible, and the fall bloom will probably be very light. Our drouth began the middle of May, and yet there is only a slight let up here—in some quarters there is no let up of some quarters there is no let up at all. But, happily, other sections have recently been visited with copious showers.

Here at Iowa City the month of July gave us one-tenth of an inch of rain-fall, when the average here is, for that month, five inches. When it is remembered that for half of May and all of June the rain had been equally light, and that the temperature has been higher than usual, some faint idea can be had of how our country is parched and sizzled. Probably some of our brother bee-keepers, who are getting no honey at all this year, will say that we ought to be satisfied with such a yield as I have reported above. But of course we are not *satisfied l* and, may be, we ought not to be. To be satisfied means rest and strengtion. But of course is all the and stagnation. Progress in all the affairs of life comes from those who are not at ease. To be dissatisfied is the condition essential to future growth.

Iowa City, 0+ Iowa, Aug. 17, 1886.

Gleanings.

# Bee-Keeping in Cuba.

#### A. J. KING.

The honey-bee was introduced into Cuba from Spain at a very early period of its history; and being a land of perpetual flowers, with no winter to impede their labor, they soon spread to all parts of the island, and beekeeping has long since become one of the established industries. There is probably no other country of equal extent on the globe, which has furbeeswax. The latter has, for more than two centuries, illuminated the churches of both this island and the mother country, besides furnishing the supply needed for other purposes, while the former has found a remu-nerative market in all civilized coun-tries, chiefly in Germany, England, France, and the United States.

A Cuban bee-hive is very simple, consisting merely of a hollow palm log, or oblong wooden box, 10 to 15 inches in diameter, and 5 to 6 feet in length open at both ends. These length, open at both ends. hives are arranged in a horizontal position, 3 or 4 feet high, supported on a frame work of long bamboo poles resting on posts driven into the ground. When these hives are full of honey, the Cuban bee-keeper, after thoroughly smoking the bees, thrusts into one end of the hive, a long swordshaped knife and cuts the combs loose from the inside walls. He then in-serts a long iron rod, flattened at the end, and hent in the form of a right angle, clear into the brood-nest (which end, and hent in the form of a right angle, clear into the brood-nest (which generally occupies about 15 inches in length of the centre of the hive), cuts the combs, and pulls them out one by

He then performs the same one. operation on the other end of the hive, and so continues until the whole apiary is gone over. The combs are now submitted to pressure, and the wax separated from the honey. Of course, the honey so obtained is not very pure, being nixed with pollen, propolis, dead bees, and the juices of larvæ, all of which tends to cause fermentation; Cuban honey (than which, when pure, there is no finer in the world) has gained an unenviable repulation. Native apiaries, of from 50 to 300 or 400 colonies are frequent, 50 to 300 or 400 colonies are frequent, and sometimes as many as 2,000 are kept in a single yard. The season for surplus honey extends from October to April, the height of the flow being from the middle of December to the middle of February; but there is almost always a sufficiency for breed-ing purposes and benea the Cuban ing purposes, and hence the Cuban bee-keeper never resorts to feeding. He "robs" his hives only once or twice during the year, and seems satisfied with an average production of 75 to 100 pounds of honey, and 4 or 5 pounds of beeswax per hive.

Nearly three years ago the writer introduced for the Messrs. J. N. & P. Casanova, 100 colonies of Italians in movable-frame bives, together with all the modern appliances necessary to insure success. They were located about 18 miles southeast of Havana, 8 miles from the ocean, and, we be-lieve, constitutes the first apiary on neve, constitutes the first aplary on modern principles ever seen in the island of Cuba; and to the gentlemen referred to belongs the credit or this great change in the systems of bee-keeping, from which promising re-sults will undoubtedly be realized by many of their brethren in the near future future.

#### MODERN BEE-KEEPING VS. THE OLD WAY.

The year following the introduction of these bees, 113 colonies of them gave, in a period of four months, 43,000 pounds of choice boney, being over 380 pounds per hive, or more there four times the mount of them the than four times the amount produced on the old plan. The success of this experiment far exceeded the most sanguine expectations of the Casanova brothers, and, being gentlemen of means, they at once set about and completed one of the best appointed modern apiaries to be found in any country; and for the benefit of the readers I will briefly describe it.

The apiary and buildings cover nearly three acres of ground, in the form of a rectangle, sloping to the southeast with a descent of 10 feet in a hundred. Near the centre of this plot are two sheds, each 200 feet long, extending across the plot in parallel lines, east to west, and about 30 feet apart. Opening out from the northernmost of these sheds are 6 others, extending to the north line of the plot in parallel lines 25 feet apart. At the centre of the south one of the two first mentioned is another shed

fording perfect protection from sun and rain, and are always comfortable, even in the hottest weather.

Along both sides of the sheds, just Along both sides of the sheds, just inside of the eave-lines, are the long rows of two-story hives, painted white, 5 feet apart, and, of course, facing outward, so that the flight of the bees in no way interferes with the workmen. The ground, all slop-ing toward the honey-house, makes the wheeling-in of the loads of well-filled comba comparatively easy. The filled combs comparatively easy. The extractor is a 6-frame reversible, of heavy galvanized iron, and delivers the boney through a large pipe on top of the centre of a broad screen, covering the top of an evaporating-tank holding 8,000 pounds, where the honey is freed from any little pieces of comb, etc., which may have got in by acci-dent. From the concave bottom of this tank an iron pipe extends down the sloping ground 60 feet further, to a broad covered shed where the honey is received directly into the bung-holes of the tierces by merely turning the large faucet on the end of the pipe. Along the lower side of this harreling shed, and coming close up to it, is the roadway, which is enough lower than the floor of the shed to admit of the rolling of the filled tierces into the carts ready for transportation to the depot.

It will thus be seen that, from first to last, there is no dipping or lifting of honey required. We might go on and describe the uncapping arrange-ment, with their screen bottoms and troughs leading to the evaporating-tank, and many other useful appli-ances of the large airy extracting room; but our "story" is already drawn out beyond the space we sup-posed necessary to tell it; so we will close by saying that everything is built substantial, ample, and yet simple, and contrasts strongly with some of the little "cluttered up" ar-rangements too often seen in our own It will thus be seen that, from first rangements too often seen in our own country. New York, ∧ N. Y.

## Phenol and Foul Brood.

#### D. A. DIMITRY.

After noting the editor's approval of the suggestion made by Dr. J. C. Thom, on page 491, in reference to the cure of Bacillus alvei, by the Cheshire method, I thought it would not be amiss to give my experience in the matter.

Last summer I found among 14 colonies that I had purchased, 5 or 6 that were badly affected with the malady, it such it may be termed. The bees were in box-hives. At first I determined to destroy bees, hives and all, and in that way remove all possibility of the disease spreading. Further thought convinced me that this was a cure rather too heroic; and I concluded to transfer the infected colonies immediately to movable

movable frame hives almost as badly affected as in the box-hives.

I then decided to try Mr. Cheshire's method. I sent for his pamphlet on foul brood, and a quantity of phenol. I may have deviated a little from the rules laid down in the pamphlet, but I will tell exactly what I did.

To 1 tea-spoonful of phenol I measured and added 400 tea-spoonfuls of water, that had previously been boiled; with a pint or two of this mixture I added honey from a healthy colony, in a sufficient quantity to make a thin syrup. I offered it in feeders to the bees; they would not touch it. They seemed to shun and fear it. I added more honey, making a thick syrup; still they would have nothing to do with it. I concluded to add 100 more parts of water. This I did, and made more syrup. I placed did, and made more syrup. I placed this new syrup in clean feeders (en-trance feeders) and placed them be-fore the hives of the diseased colonies, just before dark. The next morning I found that it had all been removed and stored. The next day I opened the hives, and after shaking off all the bees, I took the frames and combs to the extracting room and sprinkled to the extracting room and sprinkled the combs well with the mixture, and and rubbed it on the wood work with a soft rag. The frames were replaced in new hives, and the bees shaken in from the old ones.

Last fall I took the honey from these five hives as closely as I could, and then fed them plentifully with the phenolated syrup. Last winter, having been a terrible one on bees and everything else, I found it neces-sary to feed some of my colonies early in the spring. For this food I made a solution of 1 part phenol to 750 parts water, adding sufficient honey to make a fairly thick syrup. All the hear took it madin bees took it readily.

Instead of burning the old hives, I simply placed them, with the covers and bottom boards off, in a place where the sun and rain could always strike them. After three weeks or so I gave them a wash inside with powerful phenolated water, say 1 part of phenol to 50 parts of unfor of phenol to 50 parts of water.

If any one should wish to see my the best colonies of my apiary, I think I would show him the 5 colonies that were claimed as victims by the Bacillus alvei last summer. I found I found 1-400 too strong, and nothing could induce the bees to go near it. With 1-500 I found a cure perfect in every respect, acceptable to the bees, and satisfactory in every way. I found honey taken from a healthy colony 1 found much superior to sugar of any kind, with which to make the mixture. The syrup can be lukewarm or cold, as you please, except that which is sprinkled on the brood, which must be warm, to avoid chilling the brood.

I do not think that foul brood does or can enter into the system of the queen, or those bees that escape it; because the queens that were reigning at the time of the trouble, are now turning out good, healthy bees, and they themselves have no superior in

my error, and found the brood in the appearance. Prof. Cheshire deserves much praise and credit for discovering and giving to the bee-fraternity this great remedy for foul brood. Morgan City, 9 La.

For the American Bee Journal.

## Winter Depositories for Bees.

#### F. F. SOULE.

As the time is approaching for the practical consideration of a "Hotel d'Bee" for the winter, perhaps an ex-perience that I had several years since, might throw some light on the yet unsolved problem. The winter of 1878 I resided in Mansonville, Quebec, where Wm. B. Manson (my father-in-law) "kept bees," using the box-hive and shoe boxes of every description and shape. The cellar used for win-tering was under his hotel, 100x50 feet, with an L 100x40 ft., and cellar un-der the entire building; the cellar under the main part was used for storing vegetables, and never froze; in fact it was always warm. On shelves in this part was where bees were stored. In the extreme north end was a large wood furnace, draft being supplied with air from the bottom of the cellar, besides a large opening was made in the bottom of the furnace wall for cold air for heating chamber. A large chimney (unused) extended to the bottom of the cellar, in which were two 8-inch holes left open; directly underneath the bees was a planked drain 10 inches square, with the outer end open several (say 40)

rods away. The L part of the cellar was cold, in which beef, fish, etc., could be kept frozen the entire winter. A partial wall separated this from the main cellar, while in the main cellar vege-tables would grow the entire winter.

Now the strange part of the story is this: The bees would be placed on the shelf, say in the last of October or later, and regardless of noise and confusion would remain perfectly quiet the entire long winter, coming out strong and healthy in the spring, showing no signs of diarrhea, or later on, spring dwindling. In the fall of 1878 we put in one colony with the rest, that was weak and entirely without stores. I told my father that we would put them in and feed as an experiment to see if we could bring them through the winter. In that day we knew nothing of feeders, or had we the movable frame to give them; but I, myself, the entire winter, made a syrup of sugar and water, placed a piece of comb on a plate, turned the cells full of this syrup, raised the hive, rapping on it, and at the same time my wife would hold the light so the rays would shine in-side, and those poor bees would come down en masse as eager as calves to get their rations.

Now if any should doubt this they can write to Wm. B. Manson, Man-sonville, Quebec (who has been a keeper of bees for 10 or 12 years), who witnessed the performance repeatedly. another queen-cell, and in due time This colony came out all right in the repeat the search for eggs. It is many

spring, and rapidly built up. I do not recollect of finding but few dead bees during the entire winter, and I now believe that breeding must have taken place some time, as the colony seemed stronger when put on the will add that all the hive had large openings at the bottom, in fact the bottom-board fitted very loosely all around, owing to warping, etc. Where the bees were kept it was quite dark.

To sum up: 1. A constant circu-lation of air was going on. 2. The furnace kept the cellar entirely free from dampness, besides it furnished one of the very, very best of floor ven-tilators. 3. The open work of the L part admitted an abundant and con-stant supply of pure, fresh air, and as the furnace was in the north end, and the bees in the extreme south of the cellar, the cold air would naturally be drawn to the furnace first, and pass around so that when the bees received it, all dampness and chill was re-moved. Bees have been kept in this same cellar, and under the same circumstances, for a number of years (say 12). What do bee-keepers think (say 12). about it?

Charles City, & Iowa.

# Fall Work in the Apiary.

#### W. H. STEWART.

In an article published in the BEE JOURNAL for Sept. 23, 1885, I stated that at the middle of the basswood honey flow I started the building of several queen-cells. We will now suppose that it is eight days later, and that the supers and surplus combs are all cared for.

If I wish to increase my stock of bees, I divide the strongest colonies, giving each hive about equal portions of bees, combs, brood and stores that was contained in the old hive; each was contained in the old inve; each hive is now half full of combs; lill each hive with brood-combs, and move the original hive 18 inches to the right, and the new one 18 inches to the left of the centre of the old stand. They are new 2 forth each stand. They are now 3 feet apart, and both facing in the same direction, and looking as near like the old home and tooking as near the old stand vacant between them. Do this work late in the afternoon. In the morning the bees will work at both stands about alike.

I pay no attention as to which col-ony has the old queen with them, but open them two days after and find queen-cells started in the queenless one. I then take a queen-cell from my stock of queen-cells that are now nearly ready to hatch, and place it between the top-bars of the broodcombs of the newly made queenless colony. In due time I look the colony over, not for the queen, unless I chance to see her, but for eggs, and if I find them then I mark OK on the registering slate that hangs on the hive. If no eggs are found I give times quite difficult to find a queen, but it is very little trouble to look for eggs in the brood combs. Very few colonies fail to rear a queen from the first cell given them. Now that this work is done, I proceed to prepare all for winter.

In a subsequent article I will tell how it came that the brood-combs in all the old colonies were only  $\frac{7}{8}$  of an inch thick from top to bottom; and as the winter stores should all be in the upper half or one-third of the brood-combs, these combs are so thin, and the cells so shallow, that the upper parts have not the capacity to contain the required amount of stores.

I now go to hive No. 1, take off the covers, and spread the combs so that they measure about 1¾ inches apart from centre to centre; take out one or more of the nearest empty ones, and then all those that have capped honey in them 1 uncap, and then cover the hive for three days. I work each colony in regular order, as when I extracted. Then 1 look them all over again, and if honey is coming in, I find that all combs that contain no brood in the upper edge are being built out and filled with honey; but if there are no signs of new honey, then 1 begin to feed freely at the entrance, every evening at sundown, or later; when the combs will soon be built out and filled with honey and capped. If the fall crop of honey should be plentiful, and the bees begin to load the lower portion of the combs so as to hinder breeding, then I remove one or more of the outside combs that are full of honey (and that seldom has much or any brood in it at this late season), and extract the honey and return the comb. If new honey keeps coming in I repeat the operation.

If at any time the honey-flow should cease, then I begin at once to feed, and keep it up until cold weather. I would feed at night during a honeydearth if I had the hive so full that I had to take the honey away the next day to make room for the next feed.

Some may ask, why all this trouble? I answer, it is for several reasons, viz:

viz: 1. f find that bees thus managed through the fall of the year, will build out the upper portion of the combs (what some call bridging them over), and a good supply of well cured honey, nicely capped over, is thus placed over the cluster, where it should be for winter.

2. The lower portions of the combs, that the bees cluster on through the winter, are so separated that large clusters can find ample room between each pair of combs. The bees are not so much divided. They preserve more of their animal heat, consume less food, and winter better.

and the spring of the spring.

On the other hand, if bees are able to gather no late honey, and no feed is given them regularly (as above), they will discontinue the breeding much earlier, and all bees that go into winter quarters are well advanced in life, and before young brood can take their place in the following spring these older ones will have lived out their life; and as they leave the hive to die, it is soon found depopulated, with only a lonely queen and a few helpless bees that are quite insufficient to keep up the required animal heat to prevent the chilling of the newly laid eggs, through the cold spring nights. This is what some call "spring dwindling," but I think it is no more nor less than the effect of early, discontinued breeding the previous fall.

# Plain Sheets of Wax.

### J. F. HAYS.

On page 468 L. J. S. asks for information in regard to the use of plain sheets of wax. While I have great respect for the judgment and experience of the seven bee-men who so discouragingly answered the query, yet my own experience prompts me to squarely take issue with them. I have repeatedly used plain sheets of wax, both in the brood-chamber and in the surplus department, with the best results, never having discovered a single drone-cell built on the unprinted sheets of wax. But let it be remembered that I never use plain sheets over 4 inches wide.

From the answer of Messrs. Dadant & Son one would suppose that honeycomb was always a very clumsy, haphazard affair, until the genius of man enabled the bee to build its comb without mixing drone and worker cells together in au indiscriminate mass. They doubtless gave their honest opinion, but it is decidedly not my observation. I have examined the combs in a number of colonies that were hived on empty frames, without any starters whatever, and I found no more drone-cells than in colonies that were hived on full sheets of workercomb foundation. Now let Messrs. Dadant & Son explain why bees should be more disposed to build an irregular mass of drone and worker-cells on plain sheets than where there are no starters at all.

Again, I have had queens to become drone layers, and whole frames of worker-comb that contained but very few drone-cells were in a short time converted almost entirely into dronecomb. The facts in the case are that when bees want drone-comb or worker-comb they build it regardless of the kind of foundation used or any manipulating of man.

Is it not assuming just a little too much to say that bees are as apt to build drone-comb as worker-comb, unless they have printed foundation, as though they have no sense of arrangement or distinction whatever? they would then act as evaporating

On the other hand, if bees are able Such might do for those who believe gather no late honey, and no feed that man is the only being possessing given them regularly (as above), the power of reason, but I think that hey will discontinue the breeding unch earlier, and all bees that go into

Mr. J. E. Pond, Jr., rather contumeliously remarks that he cannot see any practical value in such a test, and strongly intimates that he has never had *time* to make such an experiment. Well, he ought to console himself with the fact that he is not the only man who imagines that he has not the time to step out of ruts worn smooth by men who have gone before.

Now if L. J. S. wishes to test the matter, let him not be alarmed by the discouraging answers given to his question.

Macomb,+o Ills.

For the American Bee Journal

Evaporating and Grading Honey, etc.

#### L. J. DE SOBOTKER.

I omitted to mention in my former reports that "king cotton" began to bloom early in June, has been blooming ever since, and will continue until frost. The bees have been and are working upon that and "Prince Indian corn"—the two greatest agricultural crops grown here; there are thousands of acres of them within a radins of six miles, from the northeast, east and southeast of this apiary. Strange to say one of our neighboring bee-keepers, Mr. W. C. Stacy, paid me a visit a few days ago, and told me that this apiary was far abead of any around here, in honey and wax produced so far this season. The hives are at present nearly filled with honey, but it is true that I am two weeks behind with extracting, and can get no help. I am getting full frames of comb completely filled with honey, and entirely capped over.

Had the weather been somewhat more favorable, I judge that this locality would have given very good results as far as quantity of honey is concerned, but under the present methods of operation the great difficulty is to grade the honey, there being so many different blooms at the same time right along after the season is properly started; but this, I think, could be overcome by erecting a small house, attached to the boneylouse; this should be with fine wirecloth sides, having loose, light wooden-shutters to keep out bad weather, the roof of glass, and in this room a good-sized, heavy, tin solar honey evaporator—one by which the honey just stored and extracted could run over slowly into a wooden tank lined with tin inside. This tank should be kept under the solar evaporator, and run upon four wheels, truck-like, on rails, and be constantly covered over with line wire cloth; to be pushed out from under the evaporator when the weather was hot, and to be pushed back under the evaportor when cloudy or cool. Two or three such would still be better, as they would then act as evaporating deposits, which Mr. Muth recommends as requisite to procure a good

mends as requisite to produce a good article of honey. By the use of such evaporators I think the nectar could be better graded as to color, taste and quality or density. At present the honey is nearly all of an amber color, and at the North, where a good deal of our honey is sent in whisky and molasses barrels, it is looked upon as dark honey, and considered of inferior quality. This is surely owing to the flavor and richness of the honey being contaminated by the former contents of such barrels, as I have proven right here that the honey taken in this apiary this season, and taken right from the extractor, is very aromatic and highly flavored; in fact it has just as fine and pleasant a taste as any honey I have ever seen in the North-ern States or the West Indies; but unfortunately, the Southern States have gotten a bad name for the honey producel in their apiaries, and we are going to have a hard job to put it upon the same footing as the North-ern honey. This can only be done hy grading our honey and putting it in proper receptacles for shipment. If intended for manufacturing purposes, then we must put into large ones, to save much expense; if for family use, then in small packages. Whisky and molasses barrels should become things of the past in the South.

I am glad and thankful to see that not less than a dozen of our most prominent apiarists have kindly answered my query about bees hanging out, on page 484, by giving their opin-ions, which are pretty much alike, forming the conclusion that there could have been no nectar in the bloom then existing during the hot-test hours of those days. I trust that those who replied will excuse this explanation: At the time I wrote I had tried everything proposed by them all, but the reason for my put-ting the query was that I had three hives, each containing a pretty strong colony, made or increased from two-frame nuclei, which I just then gave the second story of the hive filled with 10 wired Langstroth frames contain-ing full sheets of Dadant's heavy Ing tuil sheets of Datant's heavy brood foundation. They at once went to work; worked up the combs, filled them and capped them over in 8 to 10 days, right in that weather and with-out shade-boards over the hives; the other hives had shade-boards, and were all ventilated on three sides around the bottom boards, as I had put 1/2-inch blocks upon the bottom-boards. The three had also the same ventilation, but they never dreamed of hanging out or idling. So it will be seen that there was nectar in the bloom, as I stated at the end of query.

How often have I seen a profusion of bloom without the sign of nectar; this is no doubt owing to atmospheric influences. which I am aware we cannot control, and which would cause bees to hang out in idleness, as Mr. J. E. Pond, Jr., very tersely observes when he says: "There is nothing to do for them, as there is nothing for them to do."

Riverton,+o Miss.

## Experience with Foul Brood.

### N. H. WARD.

I have had considerable experience in attempting the cure of foul brood, and I will try and inform Dr. J. C. Thom what I have learned.

In 1881 I had 10 good, strong colo-nies of bees that were affected with foul brood. I did not know what it was, but a friend of mine informed me, and I went to work, using sali-cylic acid and borax. In the spring of 1882 I had no bees. I sent to the South early and got a start again, and my bees had no foul brood that year. In 1883 it appeared again, and it has been in my apiary ever since until now. In 1885 I used 20 parts of water to one part of phenol, and 1 part of the mixture to 20 parts of A sugar syrup. I used it after the honey-flow, so that the bees took well to it. It did not effect a cure, but I believe the remedy kept the disease in check. I learned by close observation that after the foul broody matter had dried in the upper and outer edges of the brood, the bees would fill them with honey and seal it up; then, when honey was not coming in sufficiently, they would use that honey for broodrearing. Hence, so many opinions that foul brood matter is contained in the honey. By the use of such honey, foul brood will continue to exist; and, further, I do not wish to doubt the opinion of any one, but I do not believe that foul brood can be cured with medical treatment of any kind.

On page 139 I gave my plan of cleansing hives and combs. I still endorse the same opinion for hives and frames, but it will not do for combs. At the beginning of the white clover flow I prepared a hive thus cleansed, illed with foundation. I brushed the bees carefully off the I brushed the bees carefully off the combs in the hive thus arranged, dug a pit, cut out the comhs, and burned all, and so far the diease with it. The cleansing with lye is not original with me. W. O. Pierce, Professor of Latin at the Asbury, now the De Pue University, made mention of it, and asked me to try the remedy. I now have 4 of the best colonies of bees that I ever owned.

Winchester, o+ Ind.

#### Convention Notices.

The 4th annual basket picnic of the Eastern Iowa and Western Illinois Bee-Keepers' Association will be held at Schuetzen Park, Iowa, on Thursday, Auz. 26, 1886. All interested in bee-culture are earnestly requested to be present and make this the granization.—1. V. McCagz, Wm. Gronroll, and Wm. Goos, Committee of Arrangementa, Davenport, Iowa.

O. O. POPPLETON, Pres.

#### Local Convention Directory.

1886. Time and place of Meeting. Aug. 31.-Stark County, at Canton, O. Mark Thomaon, Sec., Canton, O. Sept. 4.—Sheboygan Co., at Sheboygan Falls, Wis. Mattie B. Thomas, Sec., Sheboygan Falls, Wis. Sept. 6.-N. W. 111s. & S. W. Wia., at Dakota, Wia. Jonathan Stewart, Scc., Rock City, 111s. Sept. 7.—lowa State, at Dea Moinea, lowa. A. J. Norria, Sec., Cedar Falla, Iowa. Oct. 7.-Wis. Lake Shere Center, at Kiel, Wis. Ferd Zastrow, Sec., Millheme, Wis. Oct. 12-14.—North American, at Indianapelis, Ind. F. L. Dougherty, Sec., Indianapelis, Ind. Oct. 19, 20.—Illinoia Central, at Mt. Sterling, Illa. J. M. Hambaugh, Sec., Spring, Ills.

Dec. 1, 2.-Michigan State, at Ypsilanti, Mich. H. D. Cutting, Sec., Clinten, Mich.

1 In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.-ED.

Another Bee-Paper Gone,-B. F. Carroll, Dresden, & Texas, on Aug. 14, 1886. savs :

The weekly visits of the AMERICAN BEE JOURNAL are cheering to Texas bee-keepers in this trying hour. I have just returned from Waco, Texas, where I went, Gabriel like, to see if the *Texas Bee Journal* could be resur-ected: A loud blast from Gabriel's horn did not awake the quiet sleeper, and alas, I fear the *Texas Bee Journal* is forever lost; unless future genera-tions should find out its hiding-place. It may be buried In some secret vault under the ruins of its former home, but I could find no letters, words, marks, figures or characters to point out its final resting place. Requiescat in pace. From all over the State comes a wail—"no honey." My crop am thankful for this little mite. I may get more in September. Bees here are in good condition.

Spanish-Needle Honey - Convention.-J. M. Hambaugh, Spring,+0 Ills., on Aug. 16, 1886, writes as follows:

My honey product so far is 7,390 pounds of extracted and 200 pounds of comb honey from 105 colonies, spring count, with flattering prospects of a good fall yield. The long protracted dry weather cut our honey-flow short, but it has ended with copious rains within the last few days. Spanish-needle is taking a luxuriant growth on the low lands, and the honey pro-duced from this plant is fast coming into public favor. Its rich, bountiful golden color, exquisite fragrance and taste, with heavy, rich body, weighing about 12 pounds to the gallon, make it a favorite among epicures, and is sought for in our home market above all others, and should be quoted in prices with white sage, white clover and linden. We hope the public that

The Iowa State Bee-Keepers' Association will meet on the Fair Grounds in Des Molnes, on Tuesday, Sept. 7, 1885, at 2 p.m., continuing in asssion during that and the following two or three days. A large and aubstantial tent has been se-cured and is now at hand for the use of the soci-ety. Any or all of the 6,000 bee-keepers of Iowa are urgently requested to be present and help make the meeting a pleasant and profitable one. A. J. NORRIS, Sec.

are in any way interested in honey production will bear in mind that our Illinois Central Bee-Keepers' Conven-tion will take place at Mt. Sterling, Ills.,on Oct.19 and 20,1886,and that no pains will be spared in making it one of the most enjoyable and instructive events of the season; and we trust that every one so interested will make it a point to be present and take part in the discussions of this important but sadly neglected industry. We are but sadly neglected industry. negotiating for hotel accommodations, which cannot be excelled in the State, for a city of its size. Farther reports will be given, as the time approaches.

Bee-Sting Remedy - Introducing Queens .-- Chas. Smith, Plum Tree, 6 Ind., on Aug. 13, 1886, writes :

My bees are doing splendidly, and there is a good prospect for an ex-cellent honey crop this fall, as there is an abundance of white clover and other pasture. I would like to give a remedy for bee-stings. Take the barrel of a key and place it over the spot where the bee has stung and press it, and it will extract the sting and it will not swell. We are talking of forming a bee-keepers' association Will the bees kill the in this county. old queen when a new queen is put into the hive in a cage? Is it too late to introduce a queen? If so, when is the best time?

We have published the key-remedy for bee-stings many times. It is not .too late to introduce queens; it may be done on any fine day. When a new queen is caged, the old queen is in no danger, unless the bees intend to supersede her anyway.-ED.]

Honey Improving by Age.-Dr. R. M. Burwell, West Winsted, 9 Conn., writes:

I would like to inquire whether honey improves by age. I have some honey which has a strong or rank taste. If I thought it would lose that strong taste, I would keep it for a year, or a time at least. I have been told that it would improve by age. We got no honey from basswood this year.

[Age will modify the strong taste in some measure, but much depends on the flora from which it was gathered.-ED.]

My Experience with Bees.-Wm. M. Rowe, Lawrence, O+Kans., on Aug. 7, 1886, writes :

I commenced last spring with 4 colonies, and have increased them to 10. I secured 2 swarms, 2 got away, and I made 4 colonies by division; consequently I have not obtained much honey in sections. I have considerable in the brood chambers, but I do not know just when I ought to take it out. Should it be "now or take it out. Should it be "now or never?" The method I used to fasten

I took a piece of pine 1-16 of an inch narrower than a folded section, and half as wide; nailed it to a board 5x7 inches; procured a tin vessel with a spout, into which I put sufficient wax. (It holds half a pint.) I put it on the stove, and when heated wax. (It holds half a pint.) I put it on the stove, and when heated enough to run I placed the section on the board, then the piece of founda-tion (which should be cut with a square edge) on the block, poured on the provide the section of the section of the section of the section (which should be cut with a square edge) on the block, poured on the wax, and by holding it at the proper angle I could run it all around and back into the vessel again if there was too much. If the wax is too hot it will melt the foundation. By using two blocks, and thoroughly wetting one occasionally, the wax does not adhere, and time is saved. I want to transfer 3 colonies to better hives. Should it be done this fall? or had I better wait until springtime comes again?

[If the amount of honey in the brood-chamber prevents the queen from depositing the eggs necessary to keep the colony supplied with young bees, with which to go into winter quarters, then extract all over about 25 pounds, which they will require during the winter. You can transfer the bees during any warm afternoon, when the bees are actively at work. About the time of fruit bloom is generally preferred, because then they will have but little honey in the hives -still it can be safely done now.-ED.]

Sow Thistle.-B. Losee, Cobourg, Ont., says:

I send a honey-plant that is new in this section. Like the blue thistle of the dandelion tribe, it has white, milky sap. It reaches 2 feet in height, and comes into flower just after basswood; and, like the dande-lion, it is very attractive to bees. It produces a very yellow pollen. It has come to stay, and, like the dandelion, it takes in any rich soil, and propagates itself by division, it being a bybrid; it has no seed to signify. What is its name?

[This is Sonchus asper, or sow thistle. Most all of the compositæ furnish more or less food for bees.-A. J. COOK.]

Prevention of Second-Swarms, etc. -D. R. Rosebrough, Casey, O+ Ills., on Aug. 18, 1886, says :

The way I managed my bees to prevent their swarming the second time, was to take out of the hive 2 to 4 frames of brood and give it to the swarm. It worked very nicely. Out of 25 colonies I did not have a second swarm. The advantages are these: It will hold the swarm whether the queen is with it or not. More honey can be secured, for the new colony is not out of the sections three days. It always insures straight combs. Tt never?" The method I used to fasten saves foundation. It is necessary to queen-cells, and at the same time foundation in sections is as follows: give full sheets to the old colony, for have the queen caged ready to slip in

when the young bees have no queen they always build drone-comb; but the new colony has their queen with them and will not build drone-comb, and by putting empty frames between the frames of brood you will have a strong worker colony, and the old colony will build up and be ready for the fall crop. This has been a very ordinary season. The bees came through the mixture incodes between through the winter in good condition, but it was dry, and yet honey has been coming in slowly ever since the middle of April. There has not been a large yield, but I got a ton of the finest white clover honey I ever saw. Spanish-needle looks promising.

Removing Young Bees. - T. T. Phlegar, Pearisburg, 9 Va., on Aug. 9, 1886, savs :

Will you please tell why my bees carry out their young? The young bees are perfect and nearly strong enough to fly. They are carried out in great numbers and allowed to starve. Will they act thus when the honey-flow is cut short? How can I remedy it? Our season has been very poor ever since poplar ceased to bloom. It has been very wet and cool all summer. To-day it is cool and cloudy. What honey the bees have is very thin and watery.

[A cessation of the honey-flow is not a sufficient reason for the actions of the bees you mention. Evidently there is something wrong, but not being there to critically examine, we cannot determine what it is. Probably the bees are imperfect in some way. Have any of our readers noticed similar actions among their bees? If so, will they please give a description of it in the BEE JOURNAL.-ED.]

Fumigator for Introducing Queens. -Thos. G. Glover, Palmetto, 9 Fla., on Aug. 7, 1886, writes:

Bees have done very well this summer, considering the damage done by the cold of last winter. The follow-ing is the way I make a cheap fumigator for introducing queens, etc. have a Quinby smoker. I cut a piece of wire-clotb about 2 inches square, and push it well down in the nozzle of the smoker; drop in a few cotton rags on the wire-cloth and pour in about a table-spoonful of smoking tobacco; put in a few more rags and light it with a coal of fire or match. I have ready another piece of wire-cloth about 4 inches square to press down on the rags and tobacco to hold all in place; put the nozzle on the smoker and blow. This makes a good fumigator with but little cost or labor. I have introduced a number of virgin queens to full colonies without loss so far. For the benefit of some beginhar. For the bench of bank bank bank ner I will tell how I did it. Unqueen the colony in the evening, and let it remain until the second evening (48 hours), then open and destroy all queen-cells, and at the same time between two combs of brood and honey. Press the frames together to hold the cage in place. I uncap a few cells of honey before putting the cage in, so that the young queen can get plenty to eat. Close the live, and about sunset the next evening open the hive. Take the stopper out of the cage and fill the hole with comb honey cut out of the frame by the side of the cage. Close the live and blow in a liberal supply of tobacco smoke at the entrance. The bees will re-lease the queen during the night and receive her kindly. This is the Alley method, or something near it. If the hive is not opened for a few days, all the better.

#### Sources of Honey-Dew. -R. F. Holtermann, Brantford, Ont., writes:

The sources of so-called honey-dew appear to become more and more numerous day by day. I have often heard that bees gather honey from "wheat stubble," but I never paid much attention to the matter. I should think in the case mentioned on page 503, that owing to an abnor-mal condition of the wheat, the crop being a poor one, the matter which should have been converted into starch and possibly fibrine, although the abundance of straw would lead us to believe to the contrary, had re-mained or been converted into sac-charine matter. Only a week ago I was asked whether I had ever seen bees working on clover leaves. I con-fessed that I had not, and was then told that in Waterloo county they had several times worked freely upon a saccharine substance which had been found upon such leaves. The theory that such a substance is excrement from aphides has been pretty well exploded. It is also doubless fre-quently an excrement from plant life, due to an abnormal condition owing to season, foreign bodies in the plant, or kindred causes. In this locality the present season has, to the best of my knowledge, given us but little honey-dew, and that little from the oak.

The Northwestern Convention at Chicago .- W. Z. Hutchinson, of Rogersville, & Mich., Secretary of the Northwestern Bee-Keepers' Society, on Aug. 19, 1886, writes:

The date for holding the Convention of the Northwestern Bee-Keepers' Society in Chicago, is a *fixed* date —that it is held during the last week of the Exposition. Knowing this, and thinking that many of the mem-bers were also aware of the fixedness of the date, the secretary neglected to announce the date in the Convention Directory, and in the bee-papers until the time for holding the meet-ing approached. Usually this late announcement answers every purpose; this year, however, by this neglect, the officers of the North American Bee-Keepers' Society have, by accident, chosen the same date for holding their convention. When the mistake was discovered the officers of the North

American invited the Northwestern to again join them in convention, and have one grand union convention at Indianapolis. To hold two conventions of a National character, in such close proximity at the same time, or close proximity at the same time, or even at nearly the same time, would be an injury to both. Better one grand meeting than two *thin* ones. The officers of the North American very kindly offered to *postpone* their meeting, if the Northwestern *refused* to join them, but, as they were in the field months ago with their published date, and the time is now near at hand, they could not insthe be near at hand, they could not justly be asked to put off their meeting; and the only gentlemanly, brotherly course left is for the Northwestern to accept their invitation, and then, in return, invite the North American to meet with the Northwestern in Chicago, next year.

The Indiana State Association, several county societies, as well as the Northwestern of Chicago, will all meet with the "North American" in union convention on Oct. 12, and two succeeding days. Let there be a general rally and a monster convention.-ED.]

### **OUR CLUBBING LIST.**

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

#### Convention Notices.

127 The St. Joseph, Mo. Inter-State Bee-Keepers' Association will hold its annual meeting on Wednesday evening of the Exposition week. Sep-tember 30, 1886. Arrangements are being made to have an interesting meeting. The place of bold-ing the meeting will be published in our local pa-pers on Tuesday and Wednesda. T. Aubort, Sec.

The N. W. Hils. & S. W. Wis. Bee-Keepere' Association will hold its next meeting at the resi-dence of F. D. McKibben, 1% miles east of Dakota, on the Milwsukee & St. Paul R. R., on Tueeday, Sept. 7, 1886. JONATUAN STEWART, Sec.

The Illinois Central Bee-Keepers' Association will hold its text meeting at Mt. Sterling, Ills., on Tuesday and Wednee-day, Oct. 19-20, 1886. J. M. ILAMBAUGH, Sec.

The next annual meeting of the Micbigan State Bee-Keepers' Association will be held to Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTING, Sec.

**19**<sup>37</sup> The next meeting of the Stark County Bee-Keepers' Society will be held in Grange Hall, at Canton, O., on Aug. 31, 1886. M. THOMSON, Sec.

#### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 7 a. m., Aug. 23, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO.

IIONEY.-It continues to arrive very freely. The demand is light and sales are made chiefly at 126013c. Extracted is also quiet with prices un-changed. Refr. BEESWAX.-It is easier, and 23c. is about all

will bring. R. A. BURNETT, 161 South Water St.

#### NEW YORK.

HONEX. -- The present quotations are as follows: Fancy white comb in 1-lb. sections, 10@ 12c.; fancy white comb in 2-lb. sections, 8@10c; buckwheat in 1 and 2-lb. sections, 5@8c; extracted white clover, 6c; extracted, California, 4½@5c; extracted, Southern, per gallon, 45 to 550. BEFSWAX.-23 to 28c.

MCCAUL & HILDRETH BROS., 34 Hudson St.

#### BOSTON.

HONEY.—One-lb. sections, white clover, 13@15c; pound sections, 11@13c. Extracted, 6@8c. BEESWAX.—25 cts. per lb. BLAKE & RIPLEY, 57 Chatham Street. 2

#### DETROIT.

HONEY.-The market is little dull, fruit in-terfereing with the demand. Best comb honey in I-lb, sections, 13c. BEESWAX.-Firm at 23c, for fair quality. M. H. HUNT., Bell Braach, Mich.

#### CINCINNATI.

HONEY.-Demand is slow for all kinds and shapes of honey. Prices of extracted honey range between 34e97c, according to quality ; and choice comb honey briogs 14@15c. in a jobbiog

way. BEESWAX.—Demand is good and arrivals fair. We pay 20c. for good yellow. C. F. MUTH & SON, Freeman & Central Ave.

#### CLEVELAND.

HONEY.—The demand for honey is not very lively at present, but prices are steady. Choice new honey in 1-b. sections is selling at 14c.; 2-bs. 12@13c. Old honey is very dull at 10@12c. Ex-tracted, 6@7c. BEESWAX.-25c. A. C. KENDEL, 115 Ontario Street.

#### KANSAS CITY.

KANSAS CITY. HONEY.-The receipts of new comb honey are fair, with a good demand, and light stock in the city. Extracted is in light demand. We quote: je-b. sections, ifc.; white clover, 1-ib. 1364[4c; dark, 1-ib., 1061[2c]; white clover, 2-ibs., 1161[2c]; dark, 2-ibs., 960[0c]; white sage California, 2-ibs., 1061[1c]; dark, 2-ibs., 869[5c]; extracted white clover, 5-6c]; dark, 36[4c]; white sage California, 465[5c]; dark, 36[4c]; white sage California, BEESWAX.-2002[2c]; CLEMONS, CLOON & CO., cor. 4th & Walnut.

#### MILWAUKEE.

MILWAUKEE. HONEY.--The market is fairly supplied with honey, trade is dull, prices depressed, and the out-look is for a large production. Already some is being peddled about the city by the producers themselves, demoralizing the prices, which should not be done. We quote : Choice while in 1-pound sections, 14@15c; 2-lbs. 13@15c. Dark honey not wanted. Extracted, while, in barrels and kegs, 5@ 7c.; in tin cans, 6@8c.; dark in barrels or kegs,4@6. BEESWAX.-25c. A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

IIONEY.--It has been extensively bandled the last week, and prices are firmer. The supplies of choice honey are by no means excessive in this city, and all lots of choice extracted honey find ready buyers at about 4c. Oweers are reserved and refuse to sell under 4c. In the country, as prices seem low. We quote 3%64c. for extracted honey, and 760e. for comb honey, according to quality. BEESWAX.--It finds buyers at lower prices-20 to 22c. for choice. SCHACHT & LEMCKE, 122-124 Davis St.

HONEY.-Prices are so low that honey-pro-ducers are holding back their product; still the market is well supplied. We quote: Comh, ex-tra white, 8%@10c; off grades, 8%@7%cc. Ex-tracted, white, 464½c; ; amber, 3%@3%c. ; dark, 3c. BEESW AX.-22%@23c. BEESW AX.-22%@23c.

#### IST, LOUIS.

HONEY.-Choice comb, 10@12%c.; latter price is for chnice white clover. Strained, in barrels, 34@4c. Extra fancy of bright color and in No, 1 packazes, % advance on above prices. Extracted io barrels. 44@5%c.; in cans 6@7c. BEESWAX.-Firm at 22c for prime. D, G, TUTT & CO., Commercial St.

THOMAS G. NEWMAN & SON. PAOPRIETORS. 923&925 WEST MADISON ST., CHICAGO, ILL.

At One Dollar a Year.

ALFRED H. NEWMAN. BUSINESS MANAGER.

# Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live uear one postoffice and get your mall at another, be sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

A New Crate to hold one dozen one-pound sections of honey .- It has a strip of glass on each side, to allow the honey to be seen. It is a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 ets. per crate. Glass 1% e. per light, extra.

Bees for Sale .- We offer to sell a few strong colonies of Italian bees, in ten-frame Simplicity hives, at \$6.00 each.

**Red Labels** for one-pound pails of honey, size 3x41/2 inches. - We have just gotten up a lot of these Labels, and cau supply them at the following prices: 100 for \$1.00 ; 250 for \$1.50 ; 500 for \$2.00 ; 1,000 for \$3.00; all with name and address of aplarist printed on them-by mail, postpaid.

Yucca Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable. When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 ceuts a dozen; if sent by mail, add 1 cent each for postage.

## System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

 
 50 colonies (120 pages)
 \$1 00

 100 colonies (220 pages)
 1 25

 200 colonies (420 pages)
 1 50
 For

The larger ones can be used for a few colonies, give room for an increase of numbers. and still keep the record all together in one book, and are therefore the most desirable.

Simulas' Non-Swarming System is the title of a new Euglish bee-book. The author claims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." lt contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

Sweet Clover, or Melilotus Alba, is almost the only resource for honey now, on account of the late severe July drouth. If the seed is planted in September, it will come up this Fall and bloom next year, in its second season.

We have a large lot of this seed on hand. and offer it at the following Reduced Prices, by express or freight :

One pound .

saek-S0 lbs .... 8 00

It will pay to buy it by the sack and self it again in smaller quantities.

If you want a chance to make some money, and provide pasturage for the bees during the Fall months, this is your opportunity !

Frank Leslie's Popular Monthly for September contains a brilliant article on "Charles Stewart Parnell," illustrated by a series of pictures of Avondale, the home of the greatest Irish leader after O'Connell in this centary. Mrs. C. Ingersoll Gara describes, with pen and pencil, the charming land and sea scapes at Erie, the ancient Presqu' Ile. This number is a most attractive one and fall of attractively told facts and charming pletares.

2 Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

HONEY EXTRACTORS

THE \$8 and \$10 sizes are made to sait those who desire a cheap but practical mechine. The cans are smaller, the sides of the baskets are sta-tionary, and they have no covers, straibers, or metal standards.

Being made entirely of metal, they are very light and darable, and bave lags for firmly fastening to the floor.

Those who want the BEST honey extractor are referred to those who are now using the Excelsior.

| For 2 | frames, | 13x13 | inches | 8 | 8 00  |  |

|       |         |       |        |   |       |  |

The 3-frame basket is in a can of the same size and style as the 3-frame. The 4-frame basket is in the larger can; the latter 4 have metal standards for the basket to revolve apon. leaving room underneath the basket for 50 or 80 pounds of honey.

#### EXCELSIOR Wax Extractor.

EXCELSIOR Wax Extractor. We make two sizes, the smaller one having a larger capacity than the Swiss Wax Extractor. Prices, small alze, \$\$1; large size, \$5.00. Some of the advantages of this Extractor are: 1. It is more easily operated, there hends no necessity for removing the top to re-cill with water. 2. It melts the wax quicker, because it is brought into a more direct con-tact with the stam. 3. It is more economical, because the steam has access to the center, thereby extracting all the wax from the refare mutter. 4. The diller for water acts also as an indicator, showing the amount of

4. The difer for water acts also as an indicator, showing the amount of water in the boller; when the steam escapes through the filler, more water is required. Keep a kettle of hot water ready to re-dll when required.

#### PURE PHENOL,

FOR the cure of Foul Brood, used by Mr. Cheshire, of London, Eng-land. Asit is a liquid, it can be sent only by express. Price, 25c. per oz.

TIN POINTS, for Glassing Sections SQUARE or V-shaped, 1,000, by mail, 50c. By express or freight, 40c.

# SHUCK'S HEE-FEEDER.

For feeding bees at the entrance of the hive, any time; it feeds much or little, as may be desired; feed can be reached only by the bees from the inside at the hive. Frice, by mult, 30c. By express, 25c. each, or \$2.40 per doz.

Rallroad Rates for the round trip from Chicago to Indianapolis to attend the National Convention, are now under consideration, and we bope in our next issue to be able to state the definite amount and the method of obtaining them. The "pool" now has it under consideration. Meauwhile let every one who can do so, make arrangements to go to the Indianapolis convention. The programme will soon be issued, and all can obtain a copy by applying to the secretary, Mr. Frank L. Dongherty, at Indianapolis, Ind.

The State Fair, at Chicago, will open on Monday, Sept. 6, and continue during the week. It promises to be very largely attended, and the exhibits will be more magnificent than ever. There will no doubt be a good display of honey. We hear of several bee-keepers who expect to make an exhibit, and there are many others of whom we have not heard. The editor of the AMERICAN BEE JOURNAL has been appointed one of the judges in the Bee and Honey Department. For many years past bees and honey have been unknown at our State Fair, and we are glad to see that there is to be a change this year.

The Percheron Horse Show, which is to be held under the auspices of the American Percheron Horse Breeders' Association, will be a grand exhibit. The premiums offered by the State Board of Agriculture and the Percheron Association amount to about \$7,000. It is claimed that nearly 300 fine bred Percherons will be exhibited by about 50 breeders in the United States and Cauada, and that in addition thereto there will be several bundred grade Percherons on exhibition. It will be ao immense show in itself; and when it is remembered that all other draft horses are to he exhibited it will be seen that this will be a most noble horse exhibition.

Mr. Renben Havens, of Onarga, Ills., made an excellent exhibit of honey at the Fair at Watseka, Ills., and the Watseka *Times* notices it thus:

One of the most interesting exhibits in the domestic department is that shown by Reuben flavens, an apiarist of considerable repute, from Oparga. The extracted honey shown in neat glass jars was so clear that some good housewives accustomed to the old methods of honey getting, seemed doubtful that this article was strictly pure, but it is. Mr. Havens has made a study of bee-keeping and handlug the boney, and his honey (both extracted and in the comb) is clear and enticing to view and to palate.

English Boyalty and the Bees.-The Southampton Bee and Honey Show was visited by the Princess Beatrice and Her Royal Consort, Prince Henry of Battenberg. The Princess has for some years been the honorary President of the "Hampshire and Isle of Wight Bee-Keepers'Association," and upon the oceasion of her marriage last year. the Society made her an appropriate present in the form of a diamond brooch, shaped like a bee, eliciting from Her Royal Highness a graceful acknowledgement, which, no doubt, resolved itself into a ready acceptance of the invitation afterwards tendered her by the Association to come to the meeting at Southampton and distribute the prizes gained in the exhibition of hees and bee-implements.

The ancient town of Southampton was in gala attire; military display, triumphal arches, banners, flags, flowers, processions, enthusiasm and cheering being indulged in.

The Rev. E. H. Bellairs escorted the royal party, consisting of the Princess Beatrice and her husband, Prince Henry of Battenberg, through the exhibition of honey and bee-implements, and explained the uses of the latter. Her Royal Highness expressed herself extremely interested in the display of honey, particularly with the honey-comb design exhibited by a cottager named Woodley, of Newbury, consisting of the letters "H. R. H." and "P. B. B." worked in comb by the bees. Her Royal Highness compared the specimens of honey with some she had seen in the Riviera, and showed that general knowledge on this and other subjects common to the members of the Royal Family.

At the door of the tent the bonorable secretary presented Mrs. Bellairs, with whom Her Royal Highuess shook hands, and from whom she received a section of comb honey, framed in an elegant silver ease, and also a copy of the book entitled, "Modern Bee-Keeping," an elegant volume bound in moroceo. The honorable secretary then conducted the royal guests to the beetent, where the Rev. W. Medlicott, of Swanmore, Bishop's Waltham, gave a short lecture, pointing out how nnnecessary it was to destroy the bees in order to obtain the honey, and how very much more profitable the modern methods of bee-management were as compared with the old fashioned way of keeping them merely in straw hives.

The bees were then driven from an oldfashioned straw-skep by Mr. Evan Maberly, of Christehureh, and Mrs. Bellairs, having obtained the Royal permission, then entered the arena and assisted in the driving, in order to demonstrate thefacility with which women as well as men may practice the new industry—for a new industry it is as practised under the rules and recommendations of the modern bee-keepers' associations. Mr. Maberly having driven the bees into an empty skep, eaptured the queen, which was placed in a bottle for inspection by their Royal Highnesses, who took the greatest interest in the proceedings.

It was remarked that the Princess, in compliment to the occasion, wore as her only ornament the diamond-bee brooch presented to Her Highness by the beeassociation on the occasion of her marriage. A Royal reception and luncheon, followed

by toasts, speeches, etc., was indulged in, inice and very attractive.

and as all the arrangements seemed to be perfectly made, the whole affair was a magnificent success.

The distribution of prizes was conducted in this manner : The secretary called the successful competitors, who filed past the elevated dais, His Royal Highness Prince Henry putting the prizes into silk bags, bearing in gold letters "Presented by H. R. H. Princess Beatrice, 1886," handing these to the Princess, who duly presented them to the fortunate winners amid the plaudits of the visitors. When it came to the turn of Mr. Bellairs, who had succeeded in carrying off the first prize for extracted honey open to all England, the Prince and Princess cordially congratulated him with a shake of hands, and the Rev. Walter Medlicott also came in for a large share of public applause.

The band played the National air, and the Royal visitors were escorted back to the pier, where the Royal yaeht awaited them, and took them back to Osborne Palace.

----

The Bee and Honey Show of Scotland was held at Dnmfries, on July 27 to 30, 1886, The weather was very cold; on the morning of the 27th it was 32° on the ground ; on the 29th it rained nearly all the day, making things very disagreeable. The show was a success, owing to the energy of the honorable secretary, Major R. J.Benuett. That gentleman devotes much time and spares no expense for the purpose of helping on the working classes to better their condition by the aid of bees. The exhibits were numerous, the entries being 150. Some of them reflected great credit on the owners for their enterprise in being able to bring forward such grand displays in such an untoward season.

Mr. E. McNally, of Rutherglen, exhibited a classified display of dried and tresh flowers and plants, announting perhaps to 1,000 specimens, including seeds of many of the same, together with the dates of their time of flowering and percentage of honey yield. The exhibit consisted of two large volumes filled with them and others mounted on card-board. These, together with the fresh flowers, nearly covered oue side and end of the exhibition tent, which contrasted well with the opposite side, and its beautiful display of honey and honeycomb, tiered to a great height on graduated steps, setting it off to great advantage.

. . . . . .

The Indiana State Fair and Exposition will be held in Indianapolis during the week commencing Sept. 27, 1886. Premium Lists can be obtained of Alex. Heron, Secretary, Indianapolis, Ind. We presume there, will be a good bee and honey show, as usual. Such exhibitions are now indispensable in this "era of progress" and no enterprising farmer or mechanic can afford to remain away from the Indiana State Fair the week commencing Sept. 27. Railroad rates are now uniform for all the Western State Fairs.

E. L. Goold & Co., of Brantford, Ont., have sent us samples of their varnished Honey Labels, with price-list. They are nice and very attractive.

-----

### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.—ED.]

# Is the Locality Overstocked ?

Query, No. 298.—I have been a successful bee-keeper for seven years, and am in just an average locality. By counting mine I find there are 500 colonies of bees within a radins of 3 miles. Now I think that these bees have ent my average down one-balf. Do you not think so? Would it ever be profitable with so many bees so close?— Subscriber, Ind.

I agree with "Subscriber." It would probably be much more profitable if less bees were kept.—W. Z. HUTCH-INSON.

Your locality is overstocked. It is very doubtful if your bees will prove profitable, unless large areas are sowed to clover and buckwheat.—J. P. H. BROWN.

I should prefer to have fewer beekeeping neighbors. It is possible that in very excellent seasons you would do well despite the ill surroundings.— A. J. COOK.

It is impossible in the short space alloted, to answer the question. It is one of great importance to many of us. I should think that the 500 colonies in some seasons might overstock so as to cut down the average yield of surplus, and in other seasons I think they would not.—H. R. BOARDMAN.

1. They have tended to decrease your yield without doubt. 2. Only in extra good seasons if the sale of honey is the only income from them—G. M. DOOLITTLE.

Localities differ so much that it would be impossible to give a correct answer. In my locality it would be all we should want. I have read of places where three times 500 colonies were kept, and all did well.—H. D. CUTTINO.

Conundrums are always in order in this department, and this is as good as any. All answers will be theoretical, but in my opinion no difference will be found if all the 500 colonies mentioned should be moved 100 miles away. In an average locality 1,000 colonies so situated in a good season would gather as much honey individually as though there were but 100; in a poor season each would gather as little. Lest I may be accused of claiming to "know it all," I will say the above is simply a matter of opinion.—J. E. POND, JR. You are touching upon a subject that must come prominently to the front if honey-producing is to become a permanent business, Just how much your average has been cut down depends upon your numbers. If you kept 400 and others 100 you are not cut down much by them; but if you had 100, and 400 more have been added, one-half is probably gone, and it will not pay you to stay.—C. C. MILLER.

I guess there are too many bees in your field. There are certainly too many that belong to others to make it an object for you to make the business a specialty in that location.— JAMES HEDDON.

At the time when your surplus honey season is on hand I do not "think so." I doubt if your average is cut down at all. I am in a like situation with yourself, but I was the first to try bees here, and once had practically an open field; since "my field " has been heavily stocked with bees, I obtain about the same surplus that I did before. But I believe my bees suffer loss on account of "overstocking" at such times, as there is but little honey in the fields to be gathered, to keep up breeding and to prevent shrinkage of stores.—G. W. DEMAREE.

I believe that a good white clover district as this has been the past season, under the influence of frequent rains, cannot be overstocked by 1,000 colonies of bees in one locality. We have still (Aug. 17) much clover bloom, but for the greater part of the season there never was known to be so much white clover heretofore. The bees were surfeited with nectar, and comb honey could be left for days any where without being molested by them. In other years 200 colonies has seemed to be too many when we had little clover. Taking one year with another, I do not think 500 colonies too many for the locality named. —G. L. TINKER.

# Using Sheets of Perforated-Zinc.

Query, No. 299.—Which is the best way to use sheets of perforated zinc—with two bee-spaces, one below and one above, or only with a bee-space above the zinc ?—H. S.

Either would answer.-G. M. Doo-LITTLE.

With two spaces.—W. Z. HUTCHIN-SON.

I prefer two bee-spaces, so as to keep all the sections neat.—A. J. COOK.

I have never had any use for perforated-zinc honey-boards. — II. R. BOARDMAN.

It is best to use them with beespace below and above.—H. D. CUT-TING.

I do not know, but I think the one space may be better.—C. C. MILLER.

Either way succeeds well, but the space between the zinc and the top of the brood-frames should not be over  $\frac{1}{2}$  inch.-G. L. TINKER.

Two, every time. Do not let the zinc rest against the brood-frames, nor sections, nor anything else within bee-space. All are coming to this, and do you not see it ?-JAMES HEDDON.

I presume the zinc-excluders are made to suit the "make" of the hive used. As for myself I make all my hives and cases so as to have a shallow bee-space above and below the frames and sections, hence the honeyboard or zinc-excluder must have the shallow space above and below its surface or plane. I much prefer this system for too many reasons to explain here.—G. W. DEMAREE.

I use single sheets. If it is meant to inquire if two sheets should be used, one above the other, I can see no good reason for so doing. If intended to ask whether the zinc should be so placed as to leave a bee-space on each side of the zinc (and which, I presume, is the intention), I should say, give such bee-space on each side, but be sure and give no more, else brace-combs will surely be built.—J. E. POND, JR.

Number of Frames in a Hive, etc.

Query, No. 300.-1. Cau both black and hybrid bees come from one colony? 2. Which is best, 10-frames or 9-frames in a hive 14 inches wide inside? My hive is 14 inches wide, 12 inches high lnside, and 14% inches long inside. The frames I use are  $11\frac{1}{2}$  inches deep, and 14 inches long outside -almost the same as the Adair frame-and I would like to know if this is as convenient as others, or if it is too short for the width and length? For extracting I use two of these hives, one for a brood-chamber and one for extracting. For comb honey I use only one.-AMANA.

See answer to Query, No. 297. For comb honey I would recommend nine frames in the hive you use.—J. P. H. BROWN.

1. If you mean as the progeny of one queen, no, although they may look like it. 2. If combs are straight, ten frames for summer and nine for winter.—C. C. MILLER.

1. Some of the bees in a "hybrid" colony are black bees, to all appearances; others show one band, and still others two or even three. 2. I should consider it too short.—W. Z. HUTCHINSON.

1. Yes, if I understand the question rightly. There are always some black bees in a hybrid colony. 2. I use nine frames in 13½ inches of space. I prefer the Gallup frame to all others, but this is only one of my preferences.—G. M. DOOLITTLE.

1. If the querist wishes to know if there are a few all-black bees in hybrid colonies, I answer yes. 2. If the hive must be so large, the more frames the better, provided they are spaced from centre to centre 1% inches. For extracting, it matters little what the size and shape of the brood-chamber is, but for comb honey

your brood-chamber is too large, as well as too deep. One thousand square inches of comb is plenty, and only 700 in a reversible hive does remarkably well on trial.-G.L.TINKER.

1. I presume you mean to ask if the progeny of a hybrid queen can or does show a mixed lot of bees, some hav-ing the markings of black bees, and others the yellow markings common to hybrids, all from the same colony. If so, I answer yes. See answer to Query, No. 297. 2. Ten frames. Your hive would not suit me, but one will get used to any sort of frame and hive. I prefer the standard Langstroth frame, which is 173% x91% inches.-G. W. DEMAREE.

1. Not unless the queen has been changed. In colonies that are well mixed with black bees some workers may look like good Italians. Again a very little black admixture will show in some of the bees wanting the three bands. 2. The worst feature of your frame is its oddity. The Langstroth frame is the best, as so many are in use.-A. J. COOK.

1. Yes, in color. 2. Nine frames. I find by careful inquiry, and from statistics gathered at our State conventions, that more bee-keepers use a frame nearer 10x14 inches than any other size .-- H. D. CUTTING.

2. Ten. Yes. Not for James. Were I going to establish a standard frame for one-story brood-chambers, I should make it 1½ iuches shallower than the standard Langstroth frame now is .- JAMES HEDDON.

1. No sir! except that some of the worker progeny of an impurely mated queen may be found as black as are any black bees. 2. If it is desired to devote the lower story to brood en-tirely, ten frames should be used, spaced just bee-space apart. If it is desired to have stores placed below as well as brood, use nine frames. So far as frames are concerned, I prefer the Langstroth frame; others, deeper frames. The rule is, I take it, that the frame one is accustomed to, will be the one he prefers.-J.E.POND, JR.

#### Convention Notices.

The lowa State Bee-Keepers' Association will meet on the Fair Grounds in Des Moines, on Tuesday, Sept. 7, 18-6, at 2 p.m., continuing in session during that and the following two or three days. A large and substantial tent has been secured and is now at hand for the base of the society. Any or all of the 6,000 bee-keepers of Iowa are urgenly requested to be present and help make the meeting a pleasant and profitable one. A. J. Noukus, Sec. 0. O. POPPLETON, Pres.

O. O. POPPLETON, Pres.

Association will hold its annual meeting on Wednesday evening of the Exposition week, Sep-tember 30, 18%. Arrangemeeting and the bare an interesting meeting. The place of hold-ing the meeting will be published in our local pa-pers on Tuesday and Wednesday a.m. E. T. ABBOTT, Sec.

The N. W. Ills, & S. W. Wis. Bee-Koepers' Association will bold its pext meeting at the resi-dence of F. D. McKibben, 1% milescastof Dakota, on the Milwankee & St. Paul R. R., on Tueaday, Sept. 7, 1856. JONATHAN STEWART, Sec.

227 The Illinois Central Bee-Keepers' Association will hold its uext meeting at Mt. Sterling, Ills. on Tuesday and Wednes-day, Oct. 19-20, 1886. J. M. HAMBAUGH, Sec.

Explanatory .- The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark O indicates that the apiarist is located near the center of the State named;  $\delta$  north of the center;  $\varphi$  south;  $\circ$ + cast; • west; and this & northeast; `` northwest: • southeast; and ? southwest of the center of the State mentioned.

# For the American Bee Journal. The Sting Structure of the Bee.

#### WM. F. CLARKE.

Man is a creature of extremes. When I announced the hibernation theory 1 did it with too great a flourish of trumpets. On making known another discovery of mine in the realm of apiculture. I went to the opposite extreme, and was too modest. I refer to the functions per-formed by the sting of the bee. I broached this matter at the Detroit Convention, and did it in such a way that some thought it was a "scientic pleasantry." How strange it is that when one man gets off a "scientic pleasantry" it is forthwith echoed through the land as a truth, although it carries the stamp of absurdity on the face of it; while if another man propounds a truth, well-nigh selfevident. it is taken as a joke ! At the Rochester meeting of the New York State bee-keepers in February last, Mr. Isham and others congratulated me on having made a most important hit. This astonished me, for I had begun to think that I should not be permitted to "diskiver" anything. llaving been recently ousted from the paternity of the hibernation theory by the last man in the world whom I expected to find ahead of me in pro-pounding that theory, viz: Prof. Cook. I must hang on to the only rag and shred of discovery that is left me, or I shall be nothing but a "full private" in the great army of beekeepers !

But, joking apart, I became satisfied from observations made last summer. and repeated during the present season, that the most important function of the bee's sting is not stinging. It had often seemed to me that to get up such an elaborate and exquisite piece of machinery merely for the purpose of inflicting a wound was hardly harmonious with the economy of nature. Waste of appliance is never to be found in the material world, and if only stinging had been meant to be done by the stinging apparatus of the bee, I do not see why it need have been more complicated than the proboscis of a mosquito, or the ovipositor of a gall-fly. If you If you examine the sting structure of a bee as represented in a good engraving I do not think there is this prelimi-

which shows it magnified about thirty times, and study it closely, even with unscientific eye, as I confess mine is, you cannot help feeling that there is an extravagance of complexity and delicacy in construction altogether inexplicable on the supposition that the sole function of this beautiful piece of machinery is that of a weapon of attack and defense.

My observations and reflections have convinced me that the most important office of the bee-sting is that which is performed in doing the artistic cell-work, capping the comb, and infusing the formic acid by means of which honey receives its keeping qualities. As I said at Detroit, the sting is really a skillfully contrived little trowel with which the bee tinishes off and caps the cells when they are filled brimful of honey. This explains why honey extracted before it is capped over does not keep well. The formic acid has not been injected into it. This is done in the very act of putting the last touches on the cell-work. As the little pliant trowel is worked to and fro with such dexterity, the darts, of which there are two, pierce the plastic cell surface and leave in the nectar beneath it tiny drops of the fluid which makes it keep well. This is the "art preservative " of honey. A most wonderful provision of nature truly! Herein we see that the sting and poison-bag with which so many of us would like to dispense, are essential to the storage of our coveted product, and that without them the beautiful comb honey of commerce would be non est.

If these things are so, how mistaken those people are who suppose that a bee is, like the Prince of Evil, always going about prowling in search of a victim! The fact is that the bee attends to its business very diligently. and has no time to waste in picking unnecessary quarrels. A bee is like a farmer working with a fork in his hay-field. He is fully occupied and very busy. If molested or meddled with, he will be very apt to defend himself, with the involument he is himself with the implement be is working with. This is what the bee does, and man by means of his knowledge of the nature and habits of this wondrous little insect, is en-abled, in most cases, to ward off or evade attack. It is proof of their natural quietness, industry and peaceableness, that so many thousands of them will go through a summer of of ceaseless activity close to your dwelling house, and perhaps not half a dozen stings be inflicted during a whole season.

Since the above was written, I have re-read Cheshire's chapter on the stinging apparatus, which, in common with all other works on the structure of the bee, recognizes no other use for the sting than that of inflicting a wound. But how perfectly suited it is for that other purpose for which I feel sure it is mainly intended. I am especially struck with the adaptation of that pair of very beautiful organs called *palpi*, supposed to be feelers by means of which the bee examines the

nary examination in stinging. It is done in a flash, and when bees are angry, they are not particular what substance they run a muck at. They will sting an iron pot as quickly as any softer article. These organs are shaped very much like the brush of a well-tailed fox, and I believe that the process of cell-tinishing is performed very much as a plasterer linishes a smooth wall, alternately using both trowel and brush. In a similar manner the bee alternately uses the sting and palpi. "How skillfully she builds her cell, How neat she spreads her wax !"

Guelph. Ont.

-----For the American Bee Journal.

Building Drone-Comb—Feeding Sugar.

#### W. Z. HUTCHINSON.

Mr. Mitchell now says, on page 523, that he did not mean that he waited 6 or 7 days after hiving before he put on supers, but rather that the bees swarmed out because he did not give them room enough, and he then gave them more room in the brood-chamber; and at the sixth or seventh day, as he went to put on more supers, he then found them building drone-comb in the brood-chamber. At least, this is how I now understand Mr. M.; if I am wrong I wish to be set right.

When he gave them more room in the brood chamber, does he not see that he thereby brings about a condition conducive to drone-comb build-ing, viz: a large brood-chamber which enables them to store honey therein? and if honey was coming in such a flood that some colonies stored 120 pounds of surplus before July 10, it is no wonder that they built dronecomb in which to store it.

He says that he cannot conceive how my system destroys all wish and instinct of the bees to build any more drone-comb. The *desire* to build drone-comb eases when the swarm issues, and if they build drone-comb immediately after swarming it is because they are gathering honey rapidly and must build comb in which to store it; or because the queen is so old that she will soon be superseded. Mr. M. says he will "try once more." Good. If he finds it necessary to give the bees more room, in order to make them contented, let him try giving it in the surplus apartment.

Mr. M. says: "I have many colonies that were given foundation that here that were given foundation that have about honey enough to winter on, and those that had to build their combs are starving." It is quite evident that there is a difference somewhere in the management or locality, or he could not report ex-cetter sensitive from weath When I use no foundation in the prood-nest, I secure much the most honcy in the supers, while the broodchamber is nearly free from honey, as compared with the brood-nest of the swarm that is furnished with founda-tion. The honey thus secured in the supers is sold for at least twice what it will cost to replace it with sugar.

One season I secured more honey in the aggregate (*i. e.*, counting that in both the supers and brood-nests) from the colonies that built their own combs in the brood-nest.

I do not consider it so very "hard to have to turn around and buy sugar for 100 colonies run on six frames all ' when this condition of the summer,' brood chambers is the result of haying squeezed all the honey into the sections, in which shape it can be sold for twice what it costs to replace it with sugar. This course may put down the price of honey, but it also puts down its cost, and helps us to successfully winter our bees; and as for making millionnaires of our sugar merchants, I see no reason why this will injure bee-keepers or any one else.

Rogersville, & Mich.

#### For the American Bee Journal

Feeding Bees-Removing Surplus.

#### J. H. ANDRE.

Last season I gave a description of how I fed my bees for the purpose of building up weak colonies. or in order to get the brood-chamber well filled with brood. Since that time I have made some improvements over the style of feeder then used, and as it suits me the best of any arrangement for feeding in moderate weather that I have seen mentioned, perhaps it

may please some others also. To make the feeder, use lumber 3/8 of an inch thick for the sides of the box; cut one piece 2 inches longer than the other three, and nail them together in a manner that will leave the box square inside; this will give a projection of one piece at two of the corners of one inch. The side pieces will need to be 2 inches wide. Fasten on the bottom with screws or in a way that it may be easily taken off. In the side of the box which has the long piece, bore an inch hole, or a piece may be sawn out nearly to the bottom. Cut a neat piece of comb that fills the box, or two or more pieces if well matched together. Nail a piece of wire-cloth with meshes just small enough to keep the bees from getting out on the top of the box. Bore a hole in the back side of the hive, place the box against the side of the hive with the hole to correspond with the one in the hive, and fasten with screws through the piece on the side that projects by the corners. The cover should be somewhat larger than the box, and fit fairly well, and well cleated on top to keep it from warping.

In using this feeder pour the feed through the wire cloth, taking care not to run the comb over and let it drip through the bottom of the box, as it might create a desire to rob. The idea of putting on the bottom so that it may be easily taken off, is for the purpose of removing the comb when one is through feeding, for unless ex-tra care is taken it would go to feed the worms before wanted again.

This method of feeding will not an-swer for cold weather or in chaff

hives, but for single-walled hives of any description, box or frame, I want nothing better in moderate weather, as one can see and tell just what he as one can see and tell just what he is doing; can feed at any time of the day without any danger of being stung, and, if careful, without any robbing. An ordinary tea-pot with crooked spout answers best with which to pour the feed in.

I notice that some advise taking out the full sections from the cases as soon as a few are filled, and replacing them with those containing founda-tion. This may do if separators are used, but the majority of bee keepers at the present time are not using separators with the one-pound sections, and if their experience is the same as mine, they will find in nearly every instance where a section containing foundation is placed beside one nearly full, that the honey in the full one will be carried out into the empty one; and if one is placed between two, it insures a very thin comb, making it bad to take to market un-less one is careful and places them in the same position in the crate that they were in the case.

In taking off surplus I take case and all, and those sections that are nearly full I put together; those that are only half full I put in another part of the case, and hill out the case with empty ones, which is put on when I take off the next one. It does not invitate the heat one in the case with irritate the bees so much, is just as well done (in fact very much better unless one takes time to fix them when removing the sections), and it is a great deal more quickly accomplished.

Lockwood, 9 N. Y.

For the American Bee Journal. Coffee for Curing Foul Brood. J. DENNLER.

With each spring we have here and there foul brood showing itself. Like a black and bideons spectre this the worst of all diseases amongst bees, from time to time makes its appear-ance. It brings death and destruction to many an apiary, and gives to the apiarist much trouble, and often, loss.

The nature of this disease is well known, and of late has been suffi-ciently written about not to require repeating here. As to the remedy, however, opinions vary very much, some recommend salcylic acid, carbol acid, or camphor. etc., and will be certain of good results. On the other certain of good results. On the other hand a great number doubt the quiet disappearance of the disease, and only advocate the entire destruction of the colony as the only proven remedy for saving the remaining colonies. If it were permissible to make a statement here we would like make a statement here we would like to make the following : The former have operated in good, the latter in poor honey seasons. In good honey seasons the discase disappears of itself.

The opinion that we advance, that heretofore nature has been the active combater of foul brood, is shared by many experienced bee keepers. Records prove this, and we will refer to them hereafter. Lehzen wrote some years ago in *Centralblatt* that in certain localities in North Germany foul brood appeared from time to time, but also again disappeared. If this latter were not the case as Lehzen affirms, nature would not be able to battle with this great pest; yes, more, this creature, the bee, would long have disappeared from the face of the earth. After all this we therefore stand aside from nature, pretty helpless as to foul brood, and therefore the more welcome must be the following communication by Herr Wust, of St. Amarin (Oberelsasz), on

#### "COFFEE AS AN ANTISEPTIC."

On Sept. 1, 1885, at the general assembly in Colmer, all the remedies for the cure of foul brood in general. were too impracticable, too expensive, too uncertain, and only flames and fire were left as a radical remedy to be recommended to the practical. 1 consoled myself with the hope, that our men of science would yet succeed in finding a remedy. As it appears to me now it had already been found on Alsacian ground through first staff physician, Dr. Oppler, in Strasburg, a remedy convenient in every home; in short, coffee roasted and ground to a fine powder.

In the December number Deutchen Militararsztlichen Zeitschrift will be found several uses and experiments with coffee as an "antiseptic," which were conducted with blood, glue and flesh, such substances as will easily mix with coffee. In a glass 10 g. of blood and 1 g. of coffee powder were well mixed, and in a temperature of 16° there was for two days no percep-tible odor. The prepared blood, which had become putrid, was mixed in a rain-glass with 1 g. of coffee powder, and well shaken, which then in half a minute before ceasing the shaking had become odorless, and remained so for 1½ days. Ten g. of a foul smelling solution of glue was mixed with 1/2 g. of coffee powder; in one-half minute it became odorless, and continued to be so for 20 days, in spite of its being in an open glass exposed to the atmosphere. Twenty-five g. of meat chopped small, impregnated with 11 g. of coffee powder resulted in the same manner. Fifty grains of meat with 9 g. of coffee powder mixed with it is, after three days, without a trace of smell, and dried so that it can be rubbed to a powder with a loss in weight of 67 per cent.

After it was proven indisputably that coffee was effectual as a preventive of decay, and also effectual to arrest putrefaction, it was next nec-essary to test it for this purpose for wounds. Two soldiers had, during a fall down stairs, given themselves severe wounds upon their heads. The wounds of the one were already festering; every time the wound was treated with coffee powder it became dry and coated, and the third day the man was again fit for service.

With such excellent results, the

known that bacteria are the carriers of the cause of the disease foul brood. It seems hardly admissible that there should be a doubt as to the success of the bee-keeper to battle foul brood with coffee powder. The advantages are apparent to all. The remedial agent can be secured everywhere; it is cheap, can readily be applied, and is harmless in even large doses.

The best mode of applying the remedy the unfortunate apiarist will soon find out. As for myself I will dust all suspected cells or fill them. Where colonies are affected badly, dust all brood-cells, which, as they will at least thoroughly dry out, can be cleaned more readily. A very liberal application can hardly injure, so it would in such cases not hurt to dust the full and empty cells.

Quite an evident advantage lies in this, the remedy is applied dry; it soaks up all moisture, and by means of this facilitates the cleansing of the combs for the bees. Also as a preventive the addition of a little coffee to the water for bees must be a real advantage. I beg these words will be taken as they are intended—an inci-tation to use it as a remedial agent. It is so cheap, so simple, that it would be wrong without having tried it, to consign our pets to the flames.

Bee-keepers! coffee as a prevention of putrefaction has drawn the atten-tion of the scientific world to it. If we follow the advice of Herr Wust, we will try this simple antiseptic whenever the appearance of foul brood offers an opportunity; it can do no harm. We will not let this question rest until we have found the remedy and are able to free conseluer remedy and are able to free ourselves of this foul pest whenever it appears, or are able to totally prevent it.

Enzheim, Germany.

## Pumpkin Honey.

#### A. J. KING.

That certain flowers in one section yield a bountiful supply of honey, while in others they yield little or none, is now a well-established fact practical apjarists. That among practical aplarists. That this is the case regarding pumpkin bloom, I am led to believe from the very meager reports respecting it, which we occasionally see in the beeperiodicals. As a matter of fact, where the proper atmospheric condi-tions prevail, it has very few superiors, producing a fine straw-colored nectar of excellent flavor, and very heavy body, weighing 12 pounds per gallon.

Our large apiary in Cuba was surrounded on two sides by a corn field of eight or ten acres, in which pump-kin seeds had been "stuck" in every third or fourth hill, producing vines which completely covered the ground. During the month of February we took five tierces (6,000 pounds) of honey from these blossoms alone.

At the base of the blossom surremedy was used as a weapon against rounding the projecting centre, are Well, there came a time when the bacteria in veterinary. It is well three little openings equally distant honey had to be taken off, and the

apart, leading to a little circular cavity containing the nectar. I have fre-quently observed three or four bees on a single blossom, each with its little tongue thrust into these open-ings and "pumping" away for "dear life." The yield of pumpkins was the largest and linest I saw on the island, which, I infer, was due to the frequent fertilizations performed by the bees.

Botanists tell us that the nectar Botanists tell us that the nectar secreted by the flowers, contributes in no way to their beauty or the growth of the stalk, but simply at-tracts honey-loving insects which, in flying from bloom to bloom, carry with them on their hairy bodies the pollen which cross-fertilizes all the blossoms they enter, and produces fruit, perfect in flavor, large in quan-tity, and beantiful to the eve. If tity, and beautiful to the eye. If fruit-growers and flower-gardeners would more fully recognize this beau-tiful provision of an all-wise Providence, the world would be greatly benefited and beautified.

For the American Bee Journal.

# A Chapter of Lamentations.

### JOE KING.

When I read Dr. Miller's proposi-tion, on page 44, to hire out to the editor of the BEE JOURNAL at a salary, to look up and report the failures in bee-keeping, so that we might bave the failures as well as the successes, it struck me very favorably, and I thought of applying for the second appointment, for it seemed to me that I had experiences to qualify me to understand that side of the question, as I have been keeping bees tor 12 or 15 years, and my even toler-able yields of honey were always in next year's expectations ; but if I did not produce what I wanted to eat, I could buy it at the grocery, and I was contented and happy.

But in an evil hour something put it into my head to subscribe for the AMERICAN BEE JOURNAL, and I did, but then was where I made a mistake for last fall I put my bees into the cellar as directed, leaving the caps on the summer stands, and nothing over the brood-frames but a piece of burlap. I put a thermometer and a stove into the cellar and used to watch the bees so comfortably tucked up in their little beds. I put them out in the forepart of April, and I thought I had "done it."

All seemed to work nicely till the white clover bloomed, and then the eternal hum of those bees seemed to be "more section cases," "more sec-tions," "more room," all the time. Talk of your 8 hours for labor, 8 hours for improvement, and 8 hours for sleep, why, sir, I worked 18 hours out of 24, and then could not keep up; work all the time, only to fall asleep to dream of bees buzzing around my ears; no picnics, no Fourth of Julys, no Sundays, but work all the time!

question was, what to do with it. I piled it up in the porch until the floor began to bend under the weight, and I found it would all be down in a week. I then wiled it up in the share mash. I then piled it up in the chamber over our bed-room until we feared it would break down in the night and kill us; and "down on us came our neighbors, a couple of dozen strong, and lent their kiudest service to help the thing along;" and they bought fifty cents, one dollar, two dollars, three dollars, four dollars, and some even five dollars worth, and all paid in silver—and then what to do with that! If I put it in the bank it might break; if I carried it in my pockets it would scon wear them out; and, besides, there was danger of burglars breaking in at night and stealing it, and I tried to keep awake to watch it, but my system being full of that bee-poison, it made me so nervous that I could not keep awake even to read the BEE JOURNAL after 9 o'clock.

So in the agony of my spirit I cried, "Away with your new-tangled no-tions! Let me return to the practice of my fathers, when we used to hoe corn until the old tin horn blew, and then we all rushed to the house, and we boys beat on tin pans until we got the bees to alight somewhere, pro-yided they did not go off to the timber; and father hunted up a board and made a box, not forgetting to put in the cross-sticks to keep the comb from breaking down. Then the table was brought out, a sheet spread on it, and after the hive was washed out with sait and water, and rubbed on the inside with bee-balm, the bees were put into it, and they staid just as contentedly as bees do with all your gim-cracks. Then in the fall when we wanted honey we killed the bees with brimstone. But, alas, the bees have abolished the 'brimstone' theory altogether, have spoiled Snn-day, and soon all the old landmarks will be gone, and like Hofed in his dream, we will be groping around in a world of chance."

P. S.-I do not consider the above lamentation worthy of publication, but if the editor thinks best he could send it to that man Andre of New York, to help him out with his lamentations, given on page 453.

Marshalltown, Olowa, Aug, 23, 1886.

For the American Bee Journal.

# Pleurisy-Root as a Honey-Plant.

### JAMES HEDDON.

While the subject of honey-plants is being discussed, I wish to add my mite by describing a plant that grows mite by describing a plant that grows wild here, and also in some other localities, I think. It is called pleu-risy-root (Asclepias tuberosa), and is the plant I described in Gleanings some time ago. Still another year's observation of this rapidly increasing honey-plant makes me think that it is not excelled by any other known to bee-keepers.

my students that have watched it during the last three years, will con-cur in this belief. I would rather have one acre of it than at least three acres of Melilotus alba. I discovered the first specimen of it four years ago, the first specimen of it four years ago, and was attracted toward it by seeing it "covered with bees," a sight that always may be seen when it is in bloom, and cold, or excessive raining does not prevent. Its rapid increase during the past four summers, from an isolated plant here and there to thousands of them at this time, and ne nore robbing after basswood is as no more robbing after basswood, is as wonderful as gratifying. I account for this marvelous increase mainly from the favorable habits of the plant, for the latter and the source of the particle and to some extent from the perfect fertilization secured by the bees of my apiary. All know that Darwin tells us that "the more flowers, the more flowers, the more bees; the more bees the more seeds; the more seeds the more flowers." This is not only a well established fact, but one for which

we may be glad. The plant is a perennial, the root living on till it dies of old age. The top dies yearly, but always re-appears in due time. It blooms quite variedly, the first appearing about the middle of the basswood bloom, and the last leaving about the middle of August. It is at its height, just in the right time to fill the break that occurs between basswood and the August flowers in this latitude.

Among other valuable qualities possessed by this plant, are the following: 1. It has no thorns, and cannot be-

come an obnoxious weed. 2. Its honey is of the finest quality,

2. Its honey is of the intest quarty, both in color and flavor. 3. The plant is extremely hardy, readily asserting supremacy among weeds and grasses, and even in a matted sod it grows luxuriantly.

4. It bears extremes of wet or dry weather better than any plant I have ever seen; not only looking bright, but continually yielding honey through these extremes. Bees work on it in the rain, and in our past excessive drouth it never stopped its secretion.

5. Each seed has a balloon, which insures a broader dissemination of the plants in all waste places. By means of the draft made by railroad trains, our land along the railroad track is strewn with it.

Bees never neglect this plant for basswood or any other blossoms, but are always found upon it in numbers that must certainly overstock it in this locality. In two instances my students have found plants in isolated places that had been overlooked by the bees—once in basswood time, and this morning during the buckwheat bloom, and in each case the drops of white nectar are exuding from the nectaries.

I have several times examined basswood blossoms when they were yield-ing bountifully, and could never see the nectar in the blossoms to the extent that I find it in the pleurisy-root. So far as I can yet discover, this plant has but one objection, as I do If there is any plant that will pay for giving the full control of land, I think it is this. I believe that all of not find any specimens of it on our around as the sun advanced, to get

rich prairie soils. It seems to delight in poor soil, and no old, sandy, worn-out field is too poor for it. To just what latitude it properly belongs, and what is the best time and manner to sow the seed I do not yet know. Whether it will succeed well on heavy soils is a matter for trial.

I send a specimen, and as I put it in with this article, little drops of honey are sparkling in every blossom ; but where that honey will be when it reaches the BEE JOURNAL office, the editor can tell us.

Dowagiac, 9 Mich.

The "sparkling honey drops "were in the blossom when it came to us, looking like so many tiny diamonds. Sometime or other bee-keepers will "come up" to the idea we have so often advanced, concerning their duty to plant for bee-pasturage, and when that time comes, pleurisy-root will, no doubt, be one of the favorites .--Ep.1

For the American Bee Journal.

# Solar Wax-Extractor.

#### JAS. M'NEILL.

I can fully endorse Mr. Demaree's opinion of the solar wax-extractor, as given on page 501. I have used one for the past two seasons, and no implement about the apiary has afforded me greater satisfaction. Before I had one I used sugar-barrels in which to store the cappings till I had time to melt them over a fire; but drain them melt them over a fire; but drain them as well as I might, they would drip, and drip, and continue to drip with the persistency of the Dutchman's setting hen, till my ingenuity and tin-pans would be exhausted in my efforts to preserve my honey-house floor from pools of honey. But the solar wax-extractor has changed all this: the cappings of one day's exthis: the cappings of one day's ex-tracting being converted on the next, into a cake of nice yellow wax of  $\frac{1}{4}$ their bulk.

The amount of honey which goes off with the wax is generally two or three times its bulk. The heat of the extractor scorched this honey, and made it unsalable, until it occurred to me to try the plan of placing a per-forated tin-pan above the tray, which I had formerly used. This was made the same size as the tray, with short legs soldered on to give space for the honey and wax to flow. By this arrangement the honey is out of the heat of the sun before it is damaged, and I also think that the quality of the wax is improved for the same reason. Much less refuse, also, is swept into the receptacle with the stream of wax. The perforations must be large enough, about 3-16 of an inch, or they will become clogged with the refuse.

I blocked my extractor up at one end the first season to give the tray the proper pitch, and to have the glass at the proper angle with the sun. I also found it necessary to shift it

the full benefit of the sun's rays. But I have thought out and adopted a better plan to accomplish these re-sults. It is as follows :

To two pieces of 2x4 inch stuff, three pieces of string-piece are nailed flat-wise, one at each end and one in the middle, so as to make a frame the length and width of my extractor. Two of these frames are needed. Throngh the centres of the middle pieces a hole is bored, into which a bolt is dropped, so that these two frames revolve horizontally with the bolt as a central pivot. One of these frames is leveled on four bricks, and upon the other rests the extractor; one cad being supported at any de-sired height by means of two strips and two thumb-screws. Two thumbscrews also hold the tray at the proper angle. I am thus enabled with very little trouble to adapt my extractor to the progress of the snn toward the west, as well as its progress toward equinox.

Hudson, & N. Y.

For the American Bee Journal. Reversed Queens, Discussions, etc.

## G. W. DEMAREE.

I ought to thank Rev. Dr. M. Mahin for his kind effort to help out my new discovery of reversed queens, as evi-denced by his criticism on page 521. The Doctor evidently takes me to be a novice, or at least a very superficial observer. He assumes without ques-tion that I mistook the very common practice of young queens to re-enter the cells head foremost, for the pecu-liar abnormality which I described, and which is not a mystery at all, because of its frequent appearance to observing students of nature. We all know that young queens frequently re-enter the cells in quest of the food left in them, and it is not improbable that they might in rare cases be entrapped by the bees sealing the ad-hering cap to the cell.

During the present season I have had a great number of queens hatched in a queen-nursery, where the bees do not have access to the cells, and here is where I made the first discovery. I have seen and examined four queens in all, which were reversed in the cells. One of them was yet in the pupa state, when I discovered her. If I had any doubts about the matter before, there could be none whatever in this case.

I shall not insist on the Doctor ac-cepting as a fact something that he has not seen with his own eyes; but I am reminded of a case in point, which took place some years ago. The editor of the defunct American Bee-Keeper denied positively that there was any such thing as fertile (laying) workers, and gave as a reason that he had never seen one. Mr. Thomas replied that the editor, Mr. Harrison, had never seen his own brains, and by parity of reason he had none.

nothing more than his articles published in the bee-periodicals from time to time to judge of his ability, but the illustration may serve to make most of us a little cautious as to how we deny any and every thing because we have not seen them with our own eyes, and because they seem to be improbable to us.

Who is "Justice Fairman," of Louisville, Ky., whose article ap-peared on page 519? I have a large acquaintance with prominent bee-men in Kentucky, and ought to know something about the well-posted beemen of the State, but for all this 1 never before heard of Justice Fairman as authority on bees and hives. I suspect that he writes under a nom de plume. Whatever may be the facts, his attack on me on page 519 is not devoid of good reading, since he has quoted so extensively from my articles.

The fact that Mr. J. M. Shuck's patent hive, which embraces the fea-tures about which I wrote, and to which Mr. Fairman (?) takes excep-tions, antedates any other *patent* hive which embraces the same features, was sufficient reason for my making mention of Shuck's hive, and no other. The fact that the patent-office authorities have issued patents on more than one hive embracing this feature, shows clearly that they did not intend to cover that feature by patent.

There is a wide difference between giving "honor to whom honor is due, and the disgusting servile toadyism so prominent in much of our modern bee-literature. It has come to pass in these days that no man can write a practical article on any subject pertaining to hives or apiarian imple-ments without having some sore-headed patent-hive man (or his hench-men) pounce on him with their slurs and insinuations. I wish here to enter my protest against the "advertis-ing" of bee-hives, etc., which fills the reading columns of the bee-periodicals to the exclusion of other matter of interest to all. It is an imposition or interest to all. It is an imposition upon the proprietors of the papers, and on those who patronize them. And when I say that, the sooner the whole thing is "shut off" the better for all concerned, I believe I speak the sentiments of a large majority of bee-men generally.

Christiansburg, & Ky.

[True, Bro. D., but have you not done as much as any one to continue the discussions which brought such "advertising" into the reading columns? Your pen has been "dipped in gall " about as often as any one's, but your articles are so "vigorous" and "interesting" that we like to read them, even if we are obliged to "pull out an occasional sting," or allow a reply which smacks of "advertising in the reading columns," against Of course 1 do not apply the above many subjects in our columns, simply are breeding heavily at this time of illustration to Dr. Mahin, as I need because of this tendency and the run- year, and one or two good colonies

ning of one subject so persistently asto disgust our readers; and had we not done so there is no telling to what lengths our correspondents would have gone.

Now let all try to write on subjects. for the purpose of bringing out their true merits, and not simply to combat something which has been beforestated. Here is a "lesson" which ought to be learned, and what a 'grand improvement" in bee-literature would be the result? Bro. D.: Will you please " second the motion," and thus set the example ?-ED.]

Florida Dispatch.

# Bee-Enemies in Florida.

In the whole list of enemies of the honey-bee in this State, which list is honey-bee in this State, which list is a long one, probably the dragon-fly, bee-hawk or devil's darning-needle (*Libellulæ*), as it is variously called, is the most destructive. It is a four-winged fly, puts in an appearance towards account and confirmed its winged hy, puts in an appearance towards evening, and continues its work until dark. Here they make their first appearance in large num-bers during March, and continue so-until late in May, when they largely disappear, but sometimes become out optiful for a while again in the quite plentiful for awhile again in the fall. They are voracious eaters, and if they confined themselves strictly to a honey-bee diet, it would surely in-terfere very seriously with apiculture here. Being gross feeders, however, their diet consists of quite a long list of insects, many of which are classed among the destructive or annoying ones, like the mosquito, of which it is very fond, and will catch and eat by the dozens every evening, when they are plenty. That they destroy a great many bees is without question, but still I do not think that their depredations would interfere seriously with success in bee-keeping, if it were not that some seasons they catch many queens when out to mate, and even in this they are not as destructive as one would expect, who saw them swarming about the apiary.

Mr. A. J. Smith, a skillful bee-keeper, and a reliable man, tells me that out of fifty young queens reared this season during the visits of the mosquito hawks, forty-five were fer-tilized, and are now doing duty in prosperous colonies. I have kept a less strict account of my own queens, but I think the record would run about the same, and would compare well with that of other sections of the United States, all having their particular bee-enemies and suffering more or less loss from their depredations.

The loss of workers by mosquito hawks is apt to be alarming to the novice at bee-keeping, and is quite which you now so vigorously protest / We have been obliged to *shut down* on many subjects in our columns, simply because of this tendence and the run.

will produce daily more bees than are killed by all the enemies combined. A mere handful of bees with a good queen will rapidly build up to a good strong colony in the spring, notwith-standing the most plentiful visits to the apiary of this fierce enemy.

The only remedy that I have learned of so far for these pests, is to thresh them down with switches while flying thickly before the hives of exemption. at evening. It is claimed that this will frighten away to a great extent those that are not killed at once. Those who wish can try this, but I have seldom resorted to it as I have so far been able to succeed satisfactorily at bee-keeping without it.

Next in order, in degree of destructiveness, is the large red or warrior ant. These ants live in decayed wood or under old stumps or piles of trash, and are usually plenty among palmetto trees. They live in large colonies, and will sometimes make a raid upon a luckless colony of bees in the evening, and entirely destroy

them by morning. Remedies: Clean up the ground thoroughly about your apiary, leav-ing neither stump, rotten root, hollow tree or piles of rubbish, for them to tree or piles of rubbis, for them to nest in. Then, after dark, walk through the apiary, and if the ants are at work on any colony it can be easily known by the sounds given out by the harrassed bees. When disby the harrassed bees. When dis-covered, get a light and follow their line of march back to their nest and destroy it, killing as many of its occupants as possible. After they are once cleared out of a neighborhood, and the ground cleaned up, they are not apt to return in any quantities. I bave never lost a colony of bees by these depredators, but some of my neighbors, located on lands more favorable to their multiplication, have only succeeded in overcoming them after suffering considerable loss. While starting an apiary and getting the grounds in shape, probably as good a way as any is to make a stand for each hive, or one for every two hives, but there are great advantages in having your hives rest either upon the ground with short pieces of board at the front and back for it to rest upon, or else to have it near enough so that an alighting-board reaching from the ground to the entrance can be used. Stands of all kinds and contrivances for keeping ants away from the hives while they still swarm upon the ground about them, are nuisances and should be discarded as soon as possible.

Other and smaller ants are often seen about the hives, and sometimes along the edges under the cover, but none of them do any harm worth noting, as they are only at work on dead or crippled bees that have been crushed, or those thrown out by the other bees. The white ants, termites, or wood-lice as they are called, are so that they need renewing occa-sionally, but they do not trouble the bees in any way.

One more item in connection with ants that I nearly forgot to mention, is the inclination of some of the

smaller varieties to attack queens and their attendants while caged for shiping through the mails. Southern queen-rearers use a fine brass wirenetting over their eages, with meshes so close that the ants cannot get through; but it is always a safe plan to keep all caged queens, after re-ceived or before shipment, on a stand surrounded with water, or in some other way safely protected from their enemies.

#### Local Convention Directory.

Time and place of Meeting.

1886.

Sept. 4.—Sheboygan Co., at Sheboygan Falls, Wis. Mattle B, Thomas, Sec., Sheboygan Falls, Wis. Sept. 6.-N. W. Ills. & S. W. Wis., at Dakota, Wis. Jonathan Stewart, Sec., Rock City, Ills.

Oct. 27-29.—Western, at Kansas City, Mo. P. Baldwin, Sec., Independence, Mo.

Dec. 1, 2.-Michigan State, at Ypsilanti, Mich. H. D. Cutting, Sec., Clinton, Mich.

135 In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.-ED.

Western Fair in Canada.-Wm. H. Weston, London, Ont., on Aug. 23, 1886, writes :

The Western Fair, which is usually held at London, Ont., will open on Sept. 27 and close on Oct. 2, 1886. The prize list of the bee and honey depart-ment is quite liberal. In 1883 the amount given in prizes was \$11; this year it has reached \$115. We are anxious to have as many as pos-sible of our friends from "over the lines" exhibit with us, which will be of mutual benefit, no doubt. Arrangements have been made with the Cus-tom Department to admit from the United States, free of duty, all live stock or articles intended for exhibition purposes only, by giving the customary hond. All bee-keepers customary hond. All bee-keepers who may wish to exhibit can obtain a prize list with blank forms, etc., by sending a postal card to me, or to the Secretary of the Fair, Mr. Geo. Mc-Broom, at London, Ontario, Canada. Rates will be reduced on the different lines of railroad during the Fair.

Bees did Nobly.-H. M. Parker, Plymouth, 5 Ohio, on Aug. 23, 1886, writes:

partly filied, I raised it and placed a new case of sections under it. I tiered them up three cases high before re-moving any honey. My bees did not swarm until this month, and then there were only a very few swarms. I have one colony that swarms every eight or ten days. Of eourse I cut out all queen-cells and put them back. By going through the hive every five or six days, and cutting out the queencells, I can keep them from swarming; this I have done a few times. but as I rather enjoy hiving them I usually let them swarm. Just what the matter is with them I cannot tell, but I pre-sume they have the "fever." To-day my bees are booming again, they come in heavily laden, working on goldenrod and buckwheat. Should this weather last a week or so I shall be able to render a good report this year.

Value of Swarm-Catchers.-J. W. Bailey, Ripon, & Wis., on Aug. 23, 1886, writes :

On page 499 I notice that Mr. C. C. Richardson, of Tipton, Ind., has been sued for keeping an apiary, and his bees are considered a nuisance. The complainant says that the bees cluster upon his trees, etc. I do not wish to criticize a bee-keeper too closely, but had Mr. Richardson used a good swarm-eatcher he would have a good swarm catcher he would have avoided all this trouble; and the money he will pay out for defense would have bought "catchers" enough to have lasted him a thousand years. But hold ! neither I nor any one else who have used such things, need speak in their praise, or we might be considered by those who keep bees, as having " an ax to grind."

Taking off Comb Honey .-- A. H. Baer, Sterling,+o Ills., on Aug. 24, 1886, says:

I have harvested a crop of over 4,000 pounds of comb honey in sec-Yesterday I alone took from tions the hives 1,500 pounds.

Carniolan Bees, Separators, etc.-6-F. J. Crowley, (40), Batavia, + N. Y., writes:

This superior race has already been fully described by Mr. Frank Benton, on page 454; but as some who claim to be experts in bee-matters are forming the delusive idea that the Carnioing the delusive idea that the Carno-lan bees are idlers, and undiscernible from native bees, I wish to give my testimony to the contrary. I find that they excel Italians, Syrians, Cyprians, or any other foreign race known at the present time. My bees are reared from imported mothers, shipped direct from their native land. I have Utalians, Carniclans, and a cross be-Italians, Carniolans, and a cross be-tween these races, but I find the Carniolan the best, with the cross closely following. I also obtained one tested My bees up to July 1 did nobly, every colony giving me from 50 to 75 well filled 1-pound sections. I prac-ticed tiering up. When I saw the bees had the first case of sections why does any breeder defend the

Italians, and run down the Carniolans ? Simply because he has not fully tested the Carniolan bees, or he has a trade established in Italians. Hear what Frank Benton says on the in-troduction of Carniolans : "The demand for them far exceeds that of the Italians in every land, save per-haps Australia, and there they have been rather successful in importing Italians from Italy, but seem to be changing slowly in favor of Cyprians. In England, Ireland and Scotland the trade is mostly Carniolans and Cyp-rians; Norway and Sweden, Syrians and Italians; United States, Carniolan and Cyprians. Our trade shows the Italians to be decreasing." Among those who have imported Carniolans, and say they are the best bees of toand say they are the best bees of to-day, I may mention S. W. Morrison, M. D., G. L. Tinker, M. D., H. F. Shannon, J. B. Mason, and D. A. Jones. One prominent in our beeassociations, and living near me, who was not in favor of separators, has a nice mess; the combs are all bulged, and, of course, they cannot be crated. It is a pleasure to record another convert to the use of separators.

Bitter Honey. - C. B. Fassett, Forkston. & Pa., on Aug. 23, 1886, asks the following question :

What plant in Northern Pennsylvania has honey with a strong, bitter taste, some so strong that one can hardly eat it? It was gathered dur-ing the white clover season, and is white like clover. Some sections are all right, and others are bitter. My neighbors complain of the same thing. I never knew of any here before.

We give it up. Will some one of our readers in Pennsylvania answer the query ?-ED.]

Buckwheat, etc. - T. F. Kinsel, Shiloh, & Ohio, on Aug. 24, 1886, says:

I sowed 4 acres of buckwheat on July 15, and in four weeks it was blossoning some. Bees work on it "thick and fast" each forenoon. They go toward their homes loaded with pollen, and perhaps honey, too. With all the promise of a goodly yield early in the spring, the season has not been above or scarcely equal to an average. I have no great amount of surplus. Colonies run for extracted honey have done the best. Comb honey retails at 15 cents for 2-pound sections; 1-pounds 17 to 18 cents. Purchasers seem unwilling to pay the difference.

Bee-Keeping in Alabama.-M. II. Freeman, Olustee Creek. Ala., on Aug. 23, 1886, says :

Our bees are now idle, and I sup-pose it is caused either from exces-sive heat or from the absence of nectar in the flowers. This state of things is not unusual at this season of the year. We have just had a poor year for honey, owing to so much rain during the proper season. I started 8 very weak colonies in the 27-29, 1886. with -

spring, and 1 have had 2 natural swarms, and have taken only about 150 pounds of extracted honey, and that came from 3 colonies; the others had just built up to strong colonies when the rains set in. The agriculwhen the rains set in. The agricul-tural interest has suffered also in many ways. I like the AMERICAN BEE JOURNAL better than any of the periodicals that I have seen on api-culture, and think it the best and cheapest bee-literature obtainable, especially for beginners. The Query Department alone is worth many times the cost of the paper.

Good Report .- Fayette Lee, Cokato, ⊙ Minn., on Aug. 23, 1886, writes :

Bees are in fine condition. I have already obtained 4,400 pounds of honey, and the fall crop to come yet, and it promises to be good. The and it promises to be good. upper stories are full of honey. My bees have been swarming since June, from I to 8 swarms a day. I returned 75 swarms. Basswood was only half a crop. I took 84 pounds of comb honey from one new colony, and they tilled a 10-frame hive. I have 144 of the heaviest colonies I ever saw.

Drouth and Fires in Michigan.-L. Reed, Orono. Mich., on Aug. 19, 1886, writes :

We have had a very dry season, having had scarcely any rain since June 1, and still the drouth continues. Bees have done a great deal better than I expected; some colonies have stored 90 pounds of surplus in one-pound sections, and some have stored no surplus at all. I had but very few swarms. The bees seem to be storing some honey now, and for the life of me I cannot see what they are getting it from. Every thing is dried up; the fruit trees are dying. I went through my yard and lifted all the hives, and they are very heavy. I shall not have to feed. The raspberry, one of our hest honey plants, is mostly destroyed by fire. Almost one half of the country is burned over, and fires are still raging. Some farmers have produced scarcely enough to keep one cow over winter.

Season of 1886.-Robt. A. Vance, New Hamburg, Ont., on Aug. 16, 1886, writes :

This has been a very poor season for bees. The spring was very cold. They got some maple honey, and fruit bloom was very poor. White clover bloomed well, but the nights clover bloomed well, but the lights were cold and the days very warm and dry. The basswood was a fail-ure; there was a tree here and there that bloomed. There is very little goldenrod in this part, as it grows on low, swampy land here. The BEE JOURNAL is a welcome messenger every week.

The annual meeting of the Western Bee-Keepers' Association will be held in Pythian Hall

(11th & Main Sts.), at Kansas City, Mo., on Oct.

P. BALDWIN. Sec.

#### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 7 a. m., Aug. 30, 1886.

The following are the latest quotations for honey and beeswax received up to this honr :

#### CILICAGO.

HONEY.--It continues to arrive very freely. The domand is light and sales are made chiefiy at 12@13c. Extracted is also quiet with prices un-changed. 667c. BEESWAX.-It is easier, and 23c. is about all

will bring. R. A. BURNETT, 161 South Water St.

#### NEW YORK.

HONEY. - The present quotations are as follows: Fancy white comb in 1-ib. sections, 106 12c. ; fancy white comb in 2-ib. sections, 8010c; buckwheat in 1 and 2-ib. sections, 500c; extracted white clover, 6c; extracted, Culifornis, 45205c; BEESWAX.-23 to 25c. BEESWAX.-23 to 25c. MCCAUL & HILDRETH BROS., 34 Hudson St.

#### BOSTON.

HONEY.-Onc-lb. sections, white clover, 13@15c; -pound sections, 11633c. Extracted, 6@8c. BEESWAX.-25 cts. per lb. BLAKE & RIPLEY, 57 Chatham Street.

#### DETROIT.

HONEY,-The market is improving. The de-mand is better and the prices are also improved. Best comb in 1-pound sections brings 14215c. BEESWAX.-+ irm at 23c. for fuir quality. M. II. HUNY. Bell Branch, Mich.

#### CINCINNATI.

HONEY.-Demand is slow for all kinds and shapes of honey. Prices of extracted honey range between 34@7c., according to quality and choice comb honey brings 14@15c. in a jobbing

way. BEESWAX.—Demand is good and arrivals fair. We pay 20c, for good yellow. C. F. MUTH & SON, Freeman & Central Ave.

#### CLEVELAND.

HONEY.—The demand for honey is not very lively at present, but prices are steady. Choice new honey in 1-lb, sections is selling at 14c.; 2-lbs. 12@13c. Old honey is very dull at 10@12c. Ex-tracted, 6@7c. BEESWAX.—25c. A. C. KENDIL, 115 Ontario Street.

#### KANSAS CITY.

HONEY.—The msrket is active and sales of the comb are large. Extracted is firm with no stock in the city. We quote: One-pound sections of white clover, 13@14c.; dark 1-lbs., 11@12c.; 2-lbs. 11@12c.; dark 2-lbs., 8@10c.; 2-lb. Calit. white sage, 10@11c.; dark 2-lbs., 8@69c. Extracted white clover, 7&8c.; dark, 4½@55c.; Calif. white sage, 54@6c; dark, 4½@55c. BEEESW AX.—20@22c. CLEMONS, CLOON & Co., cor. 4th & Walnut.

#### MILWAUKEE.

MILWAUKEE. HONEY.-The market is fairly supplied with honey, trade is dull, prices depressed, and the out-look is for a large production. Already some is being pedied about the city by the producers themseives, demoralizing the prices, which should not be done. We quote: Choice white in 1-pound sections, 14@15c; 2-1bs. 13@15c. Dark honey not wanted. Extructed, white, in barrels and kegs, 5@ 7c; in tin cans, 6@&c; dark in barrels or kegs, 4@6. BEESWAX.-25c. A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

SAN FRANCISCO. HONEY.--It has been extensively handled the last week, and prices are firmer. The supplies of choice boney are by no means excessive in this city, and all lots of choice extracted honey find ready buyers at about 4c. Owners are reserved and refuse to sell under 4c. In the country, as prices seem low. We quote 3%4c. for extracted honey, and 76% c. for comb honey, according to quality. BEESWAX.--It finds buyers at lower prices-20 to 22c. for choice. SCHACHT & LEMCKE, 122-124 Davis St.

HONEY.-Prices are so low that hopey-pro-ducers are holding back their product; still the market is well supplied. We quote: Comb, ex-tra white, 84@414c; amber, 34@3%c; dsrk, 3c, BEESWAX.-224@32c. O. B. SMITH & Co., 423 Front Street.

#### ST. LOUIS.

110NEY.-Choice comb, 10@12%c.; latter price is for choice white clover. Strained, in barrels, 34/a4c, Extra fancy of bright color and in No. I packages, 4 advance on above prices. Extracted in barrels, 44%o5b;; in cans 6@7c. BEESWAX.-Firm at 22c for prime. D. G. TUTT & CO., Commercial St.

PROPRIETORS. 923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAGER.

Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; mauy others having no Post-Office, County or State. Also, if you live uear one postoffice and get your mail at another, be sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will elub for \$1.50.

A New Crate to hold one dozen one-pound sections of honey .- It has a strip of glass on each side, to allow the boney to be seen. It ls a light and attractive package. As it holds hut one tier of sections, no damage from the drippings from an upper tier eap oceur. We ean furnish the material, ready to nail, for 9 ets. per erate. Glass 1%e. per light, extra.

Bees for Sale .- We offer to sell a few strong colonies of italian bees, in ten-frame Simplicity hives, at \$6.00 each.

Red Labets for one-pound pails of honey, size 3x41/2 inches. - We have just gotten up a lot of these Labels, and can supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apiarist printed on them-by mail, postpaid.

Yucca Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable. When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 cents a dozen ; if sent by mail, add 1 eent each for postage.

#### System and Success.

23 All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

- For
- For 50 colonies (120 pages)
   \$100

   \*\* 100 colonies (220 pages)
   125

   \*\* 200 colonies (420 pages)
   150

The larger ones can be used for a few colouies, give room for an increase of numbers, aud still keep the record all together in one book, and are therefore the most desirable.

Simmins' Non-Swarming System is the title of a new English bee-book. The author elaims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that eao be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one ean afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay auy one to devote a few hours, to get subscribers.

E Sweet Clover, or Melilotus Alba, is almost the only resource for honey now, on account of the late severe July drouth. If the seed is planted in September, it will come up this Fall and bloom next year, in its second season.

We have a large tot of this seed on hand, and offer it at the following Redneed Prices, by express or freight :

- One pound
   \$0
   20

   " peck-15 lbs
   2
   25

   " buskel-60 lbs
   7
   00

   " sack-80 lbs
   8
   00

It will pay to buy it by the sack and sell it agaiu in smaller quantities.

19 If you want a chance to make some money, aud provide pasturage for the bees during the Fall months, this is your opportunity 1

Italian Queens .- We have a few uutested queens which we can seud by return mail. Three for \$2.75; six for \$5.00; twelve for \$9.00. For Tested, double the prices.

When Marketing Extracted Honey, t is a sad blunder to use barrels holding from 300 to 500 pounds-they are too large ito be desirable for the trade, too bulky to be handled with eare in transportation, and too dear to be lucrative to the producer, for boney put up in such large barrels is subject to a discount of one cent per pound, because of the difficulty In disposing of it without repacking and dividing Into smaller lots.

137 The next annual meeting of the Micbigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTING, Sec.

# **OUEENS** for SALE or EXCHANGE.

"Jerseyville, Ills., July 23, 1886,-Mr. Jamea T Wilson : Dear Sir-Tbe 55 Italian Queens that 1 bought of you last year were all purely mated except one. The most of theu were Choice-Queens, and just as good as higher priced ones, for general purposes.-E. Armatrong." One Queen, 75c.; 6 for \$4.90, Will work as well on red clover as anybody's Queens. I will ex-change Queens for Honey, Alsike Clover Seed or Foland-China Hogs. IF Al Queens sent by Return Mail, unlese notified to the contrary. Address, 25Alt L T WILCON Nicholcowills Kr.

35Alt J. T. WILSON, Nicholasvills, Ky.

# THE CHAPMAN HONEY-PLANT.

INE GRAPMAN NUNET-PLANT, The bas botheen my sim to say much about, or offer any secd of my Honer-Plant for sale till after the report of the committee appointed by the North American Bee-Resper's Society to examine and determine its value as a Honer-Plant. The committee met at my place on July 28 (all but Mr. Manum, of Vt, who was prevented by unforeseen circumstances). The committee prevent was A. 1 Root of Medina, O. L. C. Koot, of Mohawk, N. Y., and N. W. McLain, of A urora, lik. They will report to the annual meeting of the Society at Indianapolis, Ind., oct. 12-14, 1885, Since the meeting of the committee at my place, members of it have written so favorably of the Plant in the hee-papers that 1 have received a large number of letters of Inguiry, requiring; much of my time to answer. I now wish to say that I have no seed but the present season's growth, which will not be ready to send out nutil about Oct. 20. After the report of the committee at in all the leading bee-papers. It will be sold in half-ounce, onnce, 2-ounce and four-onnce packages. The prices will then be determined. IFI. CEHAPMAN,

WENHAM, MASS.

THOMAS G. NEWMAN, EDITOR.

Vol. XXII. Sept. 8, 1886. No.36.

Hundreds of dewdrops to greet the dawn, Hundreds of bees in the purple clover, Hundreds of butterflies on the lawn,

But only one mother, the wide world over.

A Hand-Book of Bee-Keeping for India has been published by Mr. J. C. Douglas.

To Raise Prices by individual effort, work your home market for all that it is worth, and ship as little as possible to the cities, so as to avoid a "glut in the market."

Five Thousand new subscribers to the BEE JOURNAL is what we have made our calculations for; they will come in clubs between now and next spring. Installments are coming every day.

Bird's-Eye View of Bee-Keeping.-We have received from the publishers, Jones, Macpherson & Co., Beeton, Ont., a copy of this little book. It is written by Rev. W. F. Clarke, and contains 60 pages. Of the contents Dr. C. C. Miller has already advised our readers on page 487. It is certainly new and novel, all of it being in rhyme; as well as "lively, entertaining and practical." It can be obtained at this office for 25 cents.

**Bound Trip Tickets to the Conven**tion .- As Manager of the National Bee-Keepers' Union, we have made arrangements with the Indianapolis lines of railroad for round trip tickets from Chicago to Indianapolis and return to Chicago, good from Monday to Saturday, Oct. 11 to 16, 1886, for \$7.30. The fare one way is \$5.50, and this is one fare and one-third. To obtain these tickets, it will be necessary to get a certificate signed by Thomas G. Newman, stating that the bearer is entitled to the reduced fare. Now, do not wait until you come to Chicago to get this certificate, for we may have gone before you come. Send for the certificate at once; and it will be sent by return mail.

The Programme for the National Convention at Indianapolis may be found on page 565. The Northwestern of Chicago, the Indiana State and soveral other societies are to meet at the same time and place in a union convention. The "North American" was horn there on Dec. 21, 1870. The report of that meeting makes this statement :

Accordingly, on Dec. 21, a large number of the most prominent and enterprising of bee-keepers of the United States and Canada, met in convention at the House of Representatives, in Indianapolis, and held six sessions, the last one ending at midnight on Dec. 22, 1870. Every seat in the House was occupied : the States represented being Indiana, Illinois, Michigan, Obio, Wisconsin, Kentucky, Iowa, New York, Tennessee, Missouri, and Pennsylvania. Delegates were also present from Vitah and Canada. On the whole, it is safe to assume that never in the history of America has bee-culture been represented in a convention by so large an assemblage of wide-awake, intelligent and enterprising bee-keepers.

Since then only about sixteen years have passed away, and almost all of those who were the most active and "the brightest lights" have passed to "the beyond," or are awaiting "the angel's message" announcing that their time is up. But few of those whose names figured largely in the report of that meeting, are now actively engaged in the pursuit of bee-keeping. We may count them on the digits of one hand. Prof. A. J. Cook, Rev. W. F. Clarke, and M. M. Baldridge are still with us, but where are the rest?

Of those who formed the committee to prepare a constitution, Aaron Benedlet and Rev. W. F. Clarke are the only ones found among "the workers" of to-day, as will be seen from the following extract:

On motion of Dr. Bohrer, of Indiana, a committee of one member from each State represented, was appointed to prepare a constitution and to nominate officers, viz : Z. S. Richardson, of Indiana; Ezra Rood, of Michigan; D. L. Adair, of Kentneky; M. L. Dunlap, of Illinois; Aaron Benedict, of Ohio; Adam Grimm, of Wisconsin; Elisha Gallbp, of Jowa; Dr. T. B. Hamlio, of Tennessee; Robert Bickford, of New York; W. D. Roberts, of Utah Territory; Daniel Mc-Ilvaia, of Pennsylvania; J. L. Smith, of Missonri, and Wm. F. Clarke, of Canada.

When another sixteen years shall have passed, how many of us will then be known among the laborers in the pursuit? We should "act well our part," and leave it to history to record the efficiency of the services we have rendered.

To this end, let us make a general rally at Indianapolis. There are just four weeks in which to prepare to go, and to lay out our work so as to be able to do it. Indianapolis is happily chosen. It is centrally located, and has a complete net-work of railroads, so that it is readily accessible from all parts of the compass.

----

The Fairs are now being held, and many of our readers who are going to exhibit have sent to us for sample copies of the BEE JOURNAL to put into the bands of those who keep bees, and happen to be at the Fairs. If any others are intending to exhibit at any Fair, please send at once to this office for as many "samples" as you think you can use to advantage in getting up a club. Do not put off sending for the copies until time for the Fair, get them at once and start the club, finishing it up at the fair.

St. Louis Fair .- Woacknowledge a complimentary ticket to this Fair, but shall not be able to use it. The Fair opens Oct.,4 and continues six days. Seventy-three thousand dollars is offered in cash premiums, to be distributed among the exhibitors. During the entire week the streets of the city will he illuminated by 50,000 gas jets, intermingled with hundreds of calcium, incandescent and arc electric lights. On the night of the Tuesday, Oct. 5, the grand annual nocturnal pageant of the "Veiled Prophet," comprising 35 floats, will be given, at an expense of thousands of dollars. All railroad and steamboat companies have generously made a rate of one fare for the round trip during the entire week.

**Colored Posters** for putting up over honey exhibits at Fairs are quite attractive, as well as useful. We have prepared some for the BEE JOURNAL, and will send two or more free of cost to any one who will use them, and try to get up a club.

The Illinois State Fair is now being held at the West-Slde Driving Park, Chicago. This is the 34th annual Fair of the Illinois State Board of Agriculture. It lasts the whole week, Sept. 6 to 10, and is well patronized.

To Vice-Presidents.—President H. D. Cutting desires the following notice carefully read :

All vice-presidents of the North American Bee-Keepers' Society who cannot attend the convention at Indianapolis, Ind., Oct. 12 to 14, will please make out their reports and send them to the secretary, F. L. Dougherty, Indianapolis, Ind. It is hoped and expected that all vice-presidents will report, that we may have a general expression from all parts of the United States and Canada.

The Texas "Bee Journal" is dead, and there is another calling itself a "Bee Journal" in Maine just born. The latter is well printed, and edited with ability—but why it should select the name of "Bee Journal" when there are hundreds of other good names, is more than we can explain. Every little paper that, as Novice expresses it, "lives awhile and dies awhile, and then lives and dies again." wants to name its baby some kind of a "Bee Journal;" for which there is not the shadow of an excuse for this paper has rightly possessed that name for over a quarter of a century.

Our Book Premiums .- To encourage all our present readers to get one or more additional subscribers we will present 25 cents' worth of books for every new subscriber (accompanied with \$1 for one year's subscription), sent direct to this office. Thus for five new subscribers with \$5, the getter up of a club gets \$1.25 in valuable reading matter, to be selected by himself from our list on the second page of this paper. It will pay you to devote a few hours to the interests of the BEE JOURNAL. Every one who keeps bees ought to take it. We will furnish sample copies free in any quantity to those who intend to get up clubs. We expect to get 5,000 new subscribers before Jan. 1, 1887.

#### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-ED.]

Rearing a Large Number of Workers.

Query, No. 301 .- What is the best plan to secure a large number of workers and force them into the fields at the beginning of the honey-flow ?-A. S., Ark.

Slight speculative feeding early in the season .- DADANT & SON.

stimulative feeding and good care all the year .- A. J. Cook.

I have given my plans in back vol-umes of the BEE JOURNAL. An adequate answer would be too lengthy for this department.—G. M. Doo-LITTLE.

Keep the best of queens, and their bees will go into the fields when the honey comes, without any forcing.— H. D. CUTTING.

If the bees are wintered well, and furnished sufficient stores, a sufficiently large number of workers will be the result, and they will force themselves into the fields, as soon as there is honey to gather. I do not, as a general thing, approve of spreading the brood, changing the combs about, etc.-W. Z. HUTCHINSON.

For your latitude put your bees into winter quarters with a hive full of bees, and from 20 to 30 pounds of stores, and then in all probability your colonies will be prepared for the early honey-flow. This plan is pref-erable to that of being all the time tinkering" with them by feeding .-J. P. H. BROWN.

See that your colonies have good strong queens, good protection at the top of the brood-nest, and more important than all. plenty of stores and to spare, in the early spring, and the bees will force themselves into the fields when there is anything for them to do.-G. W. DEMAREE.

Use a reversible or an interchangeable sectional brood-chamber not too large, if working for comb honey. Adjust the supers early. Reverse the hive or interchange the sectional parts every 5 or 6 days in building up. There is no advantage in reversing or There is no advantage in reversing or interchanging except to rapidly ex-tend the brood. Get the brood early and rapidly by the process of revers-ing, and we will then be sure to get the honey, if any is to be had. There is no use to reverse combs or hives after we have sufficient brood and bees.—G. L. TINKER.

The best I know is to use a double. interchangeable and invertible broodchamber, with which, by speedy manipulation, we breed bees the fastest, and when the harvest is well upon us, crowd the multitude into the fields and sections by contraction by simply removing one of the brood-cases.—JAMES HEDDON.

Force the queen to laying up to her full capacity as early as possible by covering the frames well with blankets to confine the heat to the hive, and also by stimulating as much as possible, either by feeding diluted honey or sugar syrup, or by uncap-ping the combs within the hive. As it requires about 35 to 40 days for a bee from the egg to become a forager, one can, by knowing when the honey season begins, know just when to start brood-rearing. Look out, however, for early swarms .- J. E. POND, JR.

# Prevention of Increase.

Query, No. 302. - What is the best method of preventing an increase of more than one from each colony ?-S. J.

Placing the swarm on the old stand and giving it the surplus boxes .- DA-DANT & SON.

Extracting is sure; Heddon's method is good; and plenty of room above will usually suffice.—A. J. Соок.

The Heddon method of preventing after-swarming has worked well with me.-W. Z. HUTCHINSON.

Divide the colony and give a young laying queen to the queenless part .-J. P. II. BROWN.

Removing the old hive to a new location, and putting swarms on the old stand is generally successful. The Heddon plan may be better.-C. C. MILLER.

After they have swarmed once, cut out all queen-cells and run in a young queen. If you have no young queens on hand, leave one queen-cell and watch results.—H. D. CUTTING.

I believe the surest method is to let them swarm naturally, and prevent after-swarms by what is called my method. This, may be the best method, all things considered.—JAMES HEDDON.

In a multiplicity of opinions, it is hard to say what is the best. My plan, and the best for me, is to make my increase on the nucleus plan; by this plan I can keep the increase down to less than one swarm from each colony without difficulty. -J. E. colony w Pond, JR.

In a good honey-flow it is best to let virgin queens run into every hive soon after casting a prime swarm. Second-swarms will be prevented in about half the cases so managed. I prefer to let second-swarms issue, and return them after cutting out queen-cells and selecting the queen of my choice.—G. L. TINKER. do for the only of the miles of your apiary. For open side to be pressed into the comb. —J. P. H. BROWN.

By taking the combs with the few adhering bees, when the swarm is out, to a new location and hiving the swarm in the old hive on the old stand. In 24 hours give a mature queen-cell or a just-hatched virgin queen to the reduced old colony in its new location. This is a modification of the Heddon plan, which I prefer after testing both for three seasons. -G. M. DOOLITTLE.

After all, the cheapest plan and the most sure plan is to hive the swarm on the old stand, reverse the entrance of the old hive, placing it close to the new hive. Then on the seventh day after the swarm issues, take out all the frames in the old hive and shake off nearly all the bees in front of the new location in the apiary. No queen-cells need be cut out. The The swarm will give you the surplus, and the old colony will build up all right. -G. W. DEMAREE.

# Rearing Oneens and Italianizing.

Query, No. 303 .- If you had several eolonies of blacks to Italianize, describe the manner in which you would rear and introduce queens ?-Sub., Ark.

Get good Italian queens in the spring and follow the directions of the books.—A. J. COOK.

Perhaps rear queens in nuclei and unite the nuclei with black colonies after destroying the queen.—C. C. MILLER.

Read some good standard work on bee-keeping.-H. D. CUTTINO.

I have done so in my book .--- JAMES HEDDON.

Methods of "queen-rearing" and "introducing queens" have been repeatedly given in the BEE JOURNAL, and can be found in the text-books. There is not room here for a proper answer,-W. Z. HUTCHINSON.

Any of the text-books (among which I can refer to "Bees and Honey" as being among the best) give a full description of the methods by which Italianizing should be per-formed. The size of the apiary other than the colonies desired to Italianize would be an important factor in the case; the text-book. "Bees and Honey." explains the matter tully.— J. E. POND, JR.

If your colonies are all black, your best plan would be to purchase pure Italian queens either tested or untested, and introduce them. If you have a pure Italian queen to start with, rear queen-cells or queens from her. Take the precation to allow no drones to issue from your black colo-nies, but bread all, the drouge were set nies, but breed all the drones you can from your Italians. The majority of your queens will purely mate if there are no black drones within a radius

Rear queens by keeping the Italian colony swarming so as to give the best of queens. Introduce by the caging plan, or direct introduction, called the "Simmins' plan," as is best Of course the queens must be ferti-lized in nuclei.—G. M. DOOLITTLE.

I would rear the Italian queens in nuclei, and after they begin to lay eggs I would remove the black queens and introduce the Italian queens in their places. I could not describe the proceedings particularly here for want of space. Italianizing can be cheaply done by introducing queen-cells from pure Italian colonies a few days after the black queen has been removed, but some failures must be expected when thus proceeding, because some colonies seem to be "dead set" on rearing their own queen-cells .-- G. W. DEMAREE.

If no other black bees were near I should prefer to take two Italian colonies late in the season, one having drones. Take out the black queens of nine days, and give a small piece of comb with just hatching eggs from the colony without drones. If there are a few black drones left, they must all be killed. This plan never fails, and is the next best if you do not wish to purchase the queens from a queen-breeder.—G. L. TINKER.

# North' American Bee-Keepers' Society.

FRANK L. DOUGHERTY.

The North American Bee-Keepers' So-ciety will hold its 17th annual convention Oct. 12, 13 and 14, 1886, at Indianapolis, Ind. The meeting will be held in Pfofflin's Music Hall, 82 and 84 North Pennsylvania Street, one of the most pleasantly situated halls in the city, having good ventilation and plenty of light. The Society head-quarters will be at the Occidental Hotel, corner of Wash-ington and Illinois Streets. The regular rates of this hotel are \$3 per day: special at the Occubinar Hole, come of wash-ington and Illinois Streets. The regular rates of this hotel are \$3 per day; special rates for those in attendance at the con-vention, \$1.50 per day. The North western Bee-Keepers' Society, the Lociara Citeta Casting the Porter.

The Northwestern Bee-Keepers' Society, the Indiana State Society, the Eastern Indiana, with various county and joint societies will meet in union with the North American, making it one of the most important meetings of bee-keepers ever held in the conntry. Ever thing possible will be done to make the meeting pleasant and entertain-ing. An earnest, cordial invitation is ex-tended to all.

The following is the programme for the three days :

#### FIRST DAY-TUESDAY.

Forenoon Session, 10 a.m.-Convention Forenoon Session, 10 a.m.—Convention ealled to order. Address of welcome, by Gov. I. P. Gray; "Response "by the President, H. D. Cutting; "Welcome to the City," by Mayor Caleb S. Denny; "Thanks," Dr. C. C. Miller, President of the Northwestern Society. Calling the roll of members of last year. Payment of numuel dues. Peaception of poor mombers annual dues. Reception of new members and distribution of badges; reports of Sec-retary and Treasurer. Announcements.

Afternoon Session, 2 p.m., Special Busi-ness.—Annual address of the President; "Bee-Studies," Prot. A. J. Cook, Agricul-tural College, Mich.; "Apicultural Jour-nalism," John Aspinwall, Barrytown, N.

Y.; "Bee-Literature," Thomas G. New-man, Chicago, Ills.; "The Coning Bee-What encouragement have we to work for its advent?" R. L. Taylor, Lapeer, Mich. Subject for discussion, has "Apis Ameri-cana" been reached? Evening Session, 7:30 p.m.—Announce-ments. Microellongene husingene. Discour-

ments. Miscellaneous business. Discus-sion of questions that may have accumulated during the day.

#### SECOND DAY-WEDNESDAY.

SECOND DAY-WEDNESDAY. Morning Session, 9 a.m.—Announce-ments. Communication. Call of the Northwestern Society to elect officers. Election of officers of the Indiana State Society. Call to order. "Rendering Comh into Beeswax," C. P. Dadaut, Hamilton, Ills.; "Foul Brood," A. J. King, New York. Selection of place for holding meeting in 1887. Election of officers. Afternoon Session, 2 p.m.—Announce-ments. Miscellaneous business. "Bee-Keeping and Apicultura! Station, Anrora, Ills.; "Feeding Bees for Winter," Jas. McNeill, Hudson, N. Y.; "Wintering Bees," Dr. J. B. Mason, Wagon Works, Ohio; Subjects for disension, "Is the use of Foundation Necessary in Modern Bee-Culture ?" "Are Perforated Honey-Boards a Success ?" Unassigned essays. Evening Session, 7:30 p.m.—Announce-

Evening Session, 7:30 p.m.—Announce-ments. Miscellaneous business. Discus-sion of questions in question-hox. Social communications.

#### THIRD DAY-THURSDAY.

Morning Session, 9 a.m.—Announce-ments. Miscellaneous business. Com-munications. "A Talk on Hives," James Heddon, Dowagiac, Mich.; "Reversible munications. "A Talk on Hives," James Heddon, Dowagiac, Mich.; "Reversible Hives and Frames," J. E. Pond, Jr., Fox-boro, Mass.; "Drones and Drone Comb," W. Z. Hutchinson, Rogersville, Mich.; Reports of Vice-Presidents; "Progress of Bee-Keeping in Indiana," Jonas Scholl, Lyons Station, Ind. Afternoon Session, 2 p.m.—Announce-worts. Wiscellencers Ducinees. Explo

ments. Miscellaneous business. Explanation of various articles on exhibition.

Many good things yet to be added to the programme are not sufficiently developed to give.

Indianapolis, Ind.

#### Convention Notices.

127 The St. Joseph, Mo, Inter-State Bee-Keepers' Association will hold its annual meeting on Wednesday ovening of the Exposition week, Sep-tember 30, 1886. Arrangements are being made to have an interesting meeting. The place of hold-ing the meeting will be published in our local pa-pers on Tuesday and Wednesday a.m. E. T. ABBOTT, Sec.

237 The Illinois Central Bee-Keepers' Association will hold its next meeting at Mt. Sterling, Ills., on Tuesday and Wednes-day, Oct. 19-20, 1886. J. M. HAMBAUGH, Sec.

The annual meeting of the Western Bee-Keepers' Association will be held in Pythian Hall (11th & Main Sts.), at Kansas City, Mo., on Oct. 27-29, 1886. P. BALDIWIN, Sec.

137 The next annual meeting of the Michigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. I and 2, 1886. H. D. CUTTING, Sec.

187 The Eastern Indiana Bee-Keepers' Associ-ation will meet at Richmond, Ind., on Sept. 16, 1886. M. G. REYNOLDS, Sec.

127 The hee-keepers of Moultrie and adjoining counties will hold a meeting in Turner's Hall, at Lowington, Ills., on Saturday, Sept. 11, 1886, at 1 p.m., for the purpose of organizing. All bee-keepers are respectfully invited to attend. Ladies are especially invited.-By order of Committee.

Explanatory .- The figures BEFORE the oames indicate the number of years that the person has kept bees. Those AFTER, show the number of colonics the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist Is located near the center of the State named; 5 north of the center; 9 south; 0+ east; • west; and this of northeast; `northwest: • southeast; and ? southwest of the center of the State mentioned.

For the American Bee Journal.

# Grading Honey for Market.

#### G. M. DOOLITTLE.

\_\_\_\_\_

I am asked to give my "views about grading honey for market," and as the season of the year is near at hand when our product is to be gotten ready for market, a few words on this subject may not be out of place.

From 10 to 15 years ago when I sold all my honey readily to one man in Syracuse, N. Y., at from 25 to 28 cents per pound, he instructed me to put about alike proportion of the different grades of honey in each crate, as that was the way he preferred it, as this gave him the best results in the end, he said. As he died in 1878, I was obliged to seek a market elsewhere, and as I am not given to peddling I began to ship my honey on commis-sion, filling the shipping-crates as I had before been instructed. The parties to whom I consigned the honey soon began to write to me saying that they could obtain more satisfactory prices for me if I would make at least three grades of my white honey, put-ting dark or buckwheat honey as a fourth grade. The next year I tried the plan with a part, and sent the rest as I had heretofore done. The result was as I had been told, the graded was as 1 had been told, the graded bringing me quite an advance over the other not so graded. For in-stance, No. 1 sold at 20 cents per pound; No. 2 at 18 cents, while No. 3 sold at 14 cents, making an average of a little over 17 cents per pound. That which was not graded sold at 16 cents. The reason for this seems to be that two or three sections of poor honey in a crate has a tendency to disgust people so that they can scarcely see the good honey at all; while if all are poor they do not expect to purchase it for less than twothirds the price of good honey.

Again, the contrast between good and poor honey, both being in the same crate, is greater than it is when in separate crates, unless the two are side by side so that one can be com-pared with the other. Human conception taken in through the eye is faulty to a certain extent, unless the things to be compared are so arranged that the eye can take such things in as a collection, at one glauce. For

instance, I have a grade of all No. 1 honey in my house, or a sample of it, and all No. 2 honey in my shop 3 rods distant. A purchaser comes along and stops at the shop first. I show him the No. 2 houey. He calls it fine and thinks it compares favorably with any honey that he has seen. I now take him to the house and show him the No. 1 honey, and nine chances out of ten he will say he sees little differ-ence in the two lots. But take some of No. 1 and No. 2 and put them side by side and he will say there is quite a difference, "that's a fact."

Now taking advantage of this fact, and all the lessons of the past, I grade my honey as follows: Every perfect section of nice white honey is placed in crates as No. 1. To be No 1 the comb must be smoothly and evenly capped over throughout its entire surface, with no discoloration of the comb near the bottom of the box. The section itself must look new and clean, while no cells of bee-bread must be seen while looking through the honey toward the light. No. 2 honey is to be the same as No. 1, except that in it is put all the sec-tions with discolored or soiled combs near the bottom of them (so discolored or soiled by the bees traveling over them), together with such sections as with honey) when held up to the light. In the No. 3 grade 1 put all sections having a few unsealed cells at the bottom of the combs, those that by accident or hy brace-combs have their surface marred ; all such as have pollen in them to any extent, and all that are badly soiled or discolored by the travel of the hees. If I have any sections in which brood has been reared, or that are one-third unsealed, they are put by themselves and go as No. 4 or dark honey. As a rule the un-sealed ones had better be extracted and the combs kept over till another season.

In shipping this honey I send only one grade to one commission merchant, preferring not to consign the different grades to the same party, for when I have done so it often happens that No. 2 will sell for from 2 to 4 cents less per pound than No. 1, while if No. 2 is sent to another party he will sell it for nearly if not the same price that the No. 1 is sold at. Here comes in the point of comparison again. I might go on and multiply words by citing several instances in confirmation of the correctness of the above conclusions, but I think this will be sufficient, so that the reader will "catch on."

Borodino, ON. Y.

# For the American Bee Journal. Marketing Honey.

#### C. W. DAYTON.

In traveling about this country from town to town selling honey, I am surprised at the varying condi-tions of the market. In some towns tions of the market. In some towns over-production, and hold the honey I find nice comb honey retailing at 10 to 18 cents per pound, and some- should be preferable to rushing it into Mr. Armstrong replied, that the

times extracted honey is comparatively unknown. Drive on 7 or 8 miles and we find the comb honey at 15 cents and extracted at 10 cents per pound. In some towns I am enabled to sell a little extracted honey only by downright argument, where in other towns they will come running from all directions with pans, jars and pitchers as though the supply was very limited.

I have gone into towns where I could not sell a pound of extracted honey to the merchants, but retailed it from the wagon as fast as it could be weighed out. Adulteration had traveled that way. At other times where comb honey was a drug at 12 cents, and extracted a stranger and not wanted at the stores, the one who was with me declared that we left extracted honey at quite every house in the town; and the sales increased in the amount taken with every trip. Sometimes they quote comb honey as low as 9 and 10 cents, and as 8 cent extracted honey is the lowest price of any 1 carry, the market is dull indeed.

Do you ask why this state of affairs exists? Why, the answer is this: Because there is a pack of "apicul-tural nuisances" "tagging after," and trying to hang on our pursuit. There trying to hang on our pursuit. There are those who are just "cranky" enough to continue knocking down the price of comb honey until ex-tracted has no sale, and the comb honey being a luxury, and nothing else, it remains in the same old channels, and the amount taken is never increased, as luxurative appetites are not fluctuated by low prices. Some-times an old farmer who keeps bees in his "gums" amongst the worms, will bring in comb honey by the panful and knock the price down to 5 or 6 cents, and unless there is an api-arist foolish enough to follow, the price rises again when the farmer's honey is sold out.

The footprints of adulteration are often seen ; also the effects of offering a poor grade of extracted honey where a good article was expected. Now there is, it appears, those who have knocked themselves on the head so much in the sale of honey that where they could have sold extracted at 8 cents and comb honey at 15 cents per pound, they find their operations con-fined to about the same amount of comb honey only, and that at starva-tion prices. In instances of this kind I have several times found their local I have several times found their local markets bare of extracted honey be-bause they offered comb honey so cheap that the merchants did not want extracted honey at any price, and the bee-keepers at such towns were "toting" their extracted honey to other towns to play "hog" with other apiarists. I would say, let them exercise a little common sense at home and then extend it abread at home and then extend it abroad.

Let us hold to one remunerative price, and contine to convas and sell at that unaltered price, and when we have not the time to sell our honey and care for the bees also during the year, then conclude that honey is an

consumption for a short time during the fall, and leaving the market bare the rest of the year. It may be that the stomach of the consumer is a good store-house for honey, but I be-lieve the length of time from the time it leaves the producer until it is deposited in such stomach is worthy of consideration also. It strikes one with amazement how many stomachs there are to be filled, and the amount of honey required to fill them. When we learn to properly administer the honey, the more we fill them the emptier they will become. Bradford, & Iowa.

# Haldimand, Ont., Convention.

A meeting of the Haldimand Bee-Keepers' Association was held at Caledonia, on Monday, Aug. 23, 1886. The minutes of the last meeting were read and approved.

How to prepare bees for winter was then discussed. The President said it was necessary to have plenty of stores, plenty of bees, and a good queen. When the weather begins to get cold he packs them with chaff and leaves them alone until spring. Before putting on the top story he puts a couple of strips across the frames so that the bees can pass from one frame to another. Mr. Armstrong gave his plan of wintering, which was about the same as the President's. Ile also used a double walled Jones hive, and was very successful in win-tering his bees. He uses a clamp for single-walled hives; the clamp is packed with sawdust on all sides and on top of the hives, and he had not lost a colony on account of cold weather. He described his way of making the clamp, which any one can

build. Mr. Richardson asked whether it was advisable to put the bees out-ofdoors so as to give them a flight on a warm day. Mr. Armstrong said not, as long as they were quiet.

Mr. John Kindree gave a very in-teresting account of his experience with bees, relating his losses through not knowing how to handle them. In answer to Mr. Richardson, the Presi-dent said that about 25 or 30 pounds of honey was sufficient to winter a colony. The more they were protected the less honey they would consume.

The President said he had not had much experience with bee-diarrhea, but he thought if the bees were properly prepared for winter, there would be no diarrhea, and an ounce of pre-vention was better than a pound of cure. One cause of the disease was too long confinement owing to cold weather, and the bees being unable to change their position in the hive, would eat pollen, which was sure to cause the disease. The remedy was to keep the hive warm and dry.

Mr. Armstrong said if colonies were properly prepared for winter and the hives kept warm and dry, there would be no danger of diarrhea.

spring was the best time, if the bees were to be moved a short distance, but for a long distance summer was the best time.

Mr. Jones asked which was the best time to put the bees into winter quarters? The President and Mr. Armstrong said it depended upon the season, but they should be put away before settled cold weather.

The next meeting will be held in the Town Hall at Cayuga, on the third Tuesday of January, 1887, at 10 a.m. E. C. CAMPBELL, Sec.

For the American Bee Journal.

# Sugar Stores for Bees in Winter.

#### 4-GEO. F. ROBBINS, (57-92).

I have been an on-looker during the progress of the controversy about the matters of sugar stores and pollen in their relation to the bee-wintering problem. It seeems to me that some points have been overlooked by most parties in the discussion. One of these points is the relative value of certain kinds of evidence. At least one of the disputants—Mr. Pond—is a lawyer. I think that I know at least one valuable law in the science of equity. It is this: That the testimony of an eye-witness over-weighs all other kinds of evidence.

Theories of the most plausible and convincing kind are seldom, perhaps never, wanted in any court of trial. Courts and juries want to know what the witness has seen and heard—the testimony of experience, in fact. Two men might theorize in the most logical style by the hour; while other men, in whose intelligence and integrity judge and jury have confidence, might simply tell what they have seen and heard; and though what they have witnessed may be contrary to reasonable theory and general belief, such a court will take the testimony of the latter rather than the former.

Now the questions, "Does pollen cause bee-diarrhea and death ?" and "Is sugar better than honey as winter food for bees?" are on the docket. The testimony of theory is this: "The Creator made the bees for honey, and honey for the bees, and He meant both honey and pollen for the bees to eat, and it follows that honey and pollen cannot be injurious to the bees." The argument appears reasonable and conclusive. But now comes Messrs. Heddon and Hutchinson on the stand, and the latter deposes that he put some bees into a cellar, others he buried, and still others he packed in chaff on the summer stands. Some he wintered on natural stores, some on all sugar stores, and a few on a mixture, or rather partly of each. At least three winters in succession he did this with virtually the same result, viz: Those on natural stores were badly affected with the diarthea; those on part honey and part sugar stores were slightly affected, and became so when they reached the natural food; while those on wholly sugar stores had not

a trace of diarrhea. Read his reports in various bee-papers, and see how nearly identical the results were. In the last one especially he says: "One fact stands out beautifully in bold relief—not one colony with nothing but pure sugar stores has perished from or showed a symptom of diarrhea."

Now turn to page 342, where Mr. Heddon gives a chapter in his experience with the two kinds of food, wherein he shows that he was convinced by experience—by costly experience—against his hope and wish, that his only safety is in sugar stores. He, too, has made repeated experiments with the two foods in connection with his tests of pollen and no pollen, the results of which all tend toward the same end. Here are two intelligent and honest witnesses testifying to facts as sure and undoubted as consciousness can make them. If such evidence is not proof, then I do not know what evidence is. The only way to meet those arguments is to prove the utter fallacy of the facts, or oppose them with like facts—experiments under like conditions of the same kind, with opposite results.

Read then what Mr. Heddon and Prof. Cook say on the pollen theory and cognate points. It would be too tiresome to sum up the evidence there given—facts in experience and scientific investigation, showing that pollen, when consumed, is the most fruitful cause of diarrhea. First: Colonies wintered on sugar syrup without any nitrogenous food have not a trace of diarrhea. That is their uniform experience.

Second: Colonies with honey and considerable pollen die with diarrhea, or at least have the disease badly. That is uniformly the case, or almost so.

so. Third: This diarrhea is due to the accumulation of fecal matter. Those having and consuming pollen accumulate such matter; those with no pollen or nitrogenous food do not. The testimony on this point is pointed and unvarying.

Fourth: The excreta of the diseased bees is composed of the same nitrogenous elements, and the same kind of pollen grains as the food consumed by the bees. Such is the testimony of the witnesses cited. If the evidence they adduce does not prove the point claimed, I repeat that I do not know what evidence is worth.

I have been a reader of a prominent bee-paper nearly ever since the pollen theory was broached at all, and I feel certain that I have seen no opposing testimony to meet the evidence given, squarely and on the same ground. If I have I have forgotten it, and will "own up" if shown such testimony.

Tather partly of each. At least three minters in succession he did this with had given some on page 191 of *Glean*virtually the same result, viz: Those on part sugar stores were badly affected on the summer stands and natural stores were badly affected on the summer stands and natural stores, with considerable pollen. But his winter was not so long nor so slightly affected, and became so when they reached the natural food; while they reached the natural food; while those on wholly sugar stores had not any pollen. He does say that they had not sugar stores they reached the natural food; while those on wholly sugar stores had not s

did not consume much food at all. Besides, his testimony is only negative, while that I have briefly referred to is positive. I have seen much other material of the same kind.

The most forcible contribution of the opposition that I have seen is that given by Mr. Doolittle in *Gleanings.* pages 231 and 344, 1885. He gave a colony, the autumn before, live combs clear of pollen, as he thought, and fed them about 25 pounds of granulated sugar syrup. They took the diarrhea and died. He sent a part of one comb from which the bees had not taken the food, to Prof. Cook, who found on examination pollengrains at the bottom of the cells. Mr. Doolittle himself says (page 343): "Hence it will he seen that these particles of pollen were scattered about the bottom of all these cells when the combs were given to the bees."

Those bees consumed nearly all their stores by the last of February. Some of the bees had previously been sent to Prof. Cook, who, although be found no pollen-grains, did find evidences of nitrogen in their intestines. Now, mark the facts: Nitrogen in the bees, and pollen in the combs. It is at least a reasonable probability, since they ate nearly all their food, and reared a little brood, as he says, that they consumed that pollen which gave them the diarrhea. Certainly they obtained nitrogen some way, and in the light of these things, Mr. Doolittle's experiment does not even prove a negative. Mr. Doolittle is not very explicit as to degrees of cold and dampness. I could adduce a great deal more of this sort if I had time, and the readers' patience. The statement of this point is very incomplete.

Authorities all agree that the causes of bee-diarrhea are dampness, long confinement and improper food. One, more or all of these ingredients must be present. Now I have generally wintered my bees on the summer stands, and stores of honey and pollen. I have never lost more than 3 colonies in one winter, although a few always merely come out. I have never had a bad case of diarrhea where the hive kept everything dry. Now why is my experience so different from Mr. Heddon's and others ? Why, there have never been forty days in succession on which my bees could not take a flight. Those of Mr. Hutchinson, for instance, have been confinement, and often spot the snow and hives considerably. That flight relieves and saves them. Mr. H's bees do not get that relief. Do you not see the difference? Not all our country has the long, cold winters of Michigan. Mr. Heddon himself intimates that his treatment is necessary only in such extreme latitudes. They comprise comparatively a small portion of the country. Hence the fact that apiarists throughout the rest of the country may winter their bees successfully on natural stores, does not make the teachings of these three men any the less true. It seems to me if this fact were properly considered, a great deal that has been written would have remained unwritten.

Mechanicsburg, O Ills.

# Cedar Valley Bee-Keepers' Convention.

The Cedar Valley Bee-Keepers' Association met at the office of J, Mosher, of Waterloo, Iowa, Aug. 18, 1886. The meeting was called to order by President C. P. Hunt, at 1:30 p.m. The Secretary then read the report of the last meeting, which was accepted, after which was the election of officers for the following year: Mr. C. P. Hunt, of Waterloo, re-elected President; J. Mosher, Vice-President; H. E. Hubbard, of La Porte City, was chosen Secretary, and A. J. Norris, of Cedar Falls, Treasurer.

The President then proceeded to draw questions from the question-box as follows :

Question: If any one having 50 or more colonies has them in hives that he likes, all things considered, is it better for him to change the size in order to get his supplies cheaper? Answer: No. What is the best ventilation for hives in winter? Some use burlap

What is the best ventilation for hives in winter? Some use burlap and others a tight honey-board. Mr. A. J. Norris thinks it the most perfect ventilation to have a tight honeyboard and then raise the hive from the bottom-board.

What is the best size for the entrance of a hive for a large colony of bees in hot weather? Three-cighths of an inch high and the whole width of the hive.

How long after comb honey is capped over should it be taken off? The sooner the better.

Will bees commence to work in sections as soon when there is a whole case, or is it better to put on a few sections at a time? Part were in favor of a whole case while others only a few at a time.

What is the best shade for beehives? Mr. A. J. Norris said that an apple orchard was the best shade; Mr. J. Owens thought it best to let the hives set in the sun with shadeboards on top of them.

Can bees eat sound grapes when their skins have not been broken? President C. P. Hunt says that be has had his bees for the last 25 years close to his grapes, and has never seen them touch good sound grapes. Several other members have had the same experience.

Do bees injure small fruit while in bloom ? No.

What is the best method to keep bees from swarming? Put on the honey receptacles early in the season and give plenty of room.

What is the proper distance to put frames from centre to centre in the brood-chamber of the hive? One and one-half inches.

Is it advisable to use whole sheets of foundation in the brood-chamber ? Some thought that it paid while others thought it did not.

Where is the best place to keep surplus combs? Some keep them in a cellar. Mr. Robt. Quinn keeps his in a tight room, and then fumigates them with sulphur.

Is it advisable to clip the queens' wing ? No.

What is the best way to get bees out of sections? Drive them down with smoke and then carry the case to the boney house and let the bees out at the window. There were several other methods given.

What is the best way to feed in the spring to simulate weak colonies? Feed on top of the hive in a feeder.

#### EVENINO SESSION.

At 7 p.m. the convention re-assembled, and continued the questions as follows:

Which is best for comb honey, a deep or shallow frame? A shallow one, except with chaff hives, with surplus room.

Will it pay to raise any crop for honey alone? If so, what? Yes, if one has cheap land. Alsike, buckwheat and rape are good, as these are also valuable seed crops; and sweet clover in places where it succeeds well.

Shall we use more than a starter of foundation in sections? Starters only.

What is the best method of extracting and clarifying wax? Using the solar wax-extractor, as it extracts cleanly and partially bleaches the wax.

Adjourned until 9:30 a.m. on Aug. 19.

#### FORENOON SESSION.

Questions were continued as follows:

Which is the most profitable, to produce comb honey at 10 cents per pound, or extracted at 5½ cents? Mr. Robt. Quinn said that he would rather produce extracted honey at 5 cents than comb honey at 10 cents per pound.

' Is there any such a thing as bees becoming honey-bound in the broodchamber? Yes.

How near the bottom-board should the brood-frames come? C. P. Hunt said  $\frac{34}{4}$  of an inch, while others thought  $\frac{1}{2}$ -inch enough.

Which is the best, loose or tight bottom-boards? Loose boards.

What should be done with partly filled sections when bees swarm and leave them ? Some let them be on the old hive, while others take them and put them on the hive of the new colony.

#### AFTERNOON SESSION.

Is it profitable to extract from the brood-chambers? Not as a rule.

Will not hives filled with combs built from comb foundation stand more heat than natural combs? It was generally thought they would.

Are bees taxable property? No.

Which is the best race of bees, all things considered ? Italians.

How close to the cellar bottom should hives rest in winter? From 2 inches to I foot.

Fifteen members reported 1,150 colonies, fall count, 875 spring count, and 1,308 colonies as their present number. The amount of comb honey reported as being produced by these colonies was 55,500 pounds, and 16,700 pounds of extracted honey. It was stated that nearly the entire crop has already been disposed of at reasonable prices.

It was decided that the next meeting be held at Vinton, Benton county, Iowa, on Dec. 7, 1886.

The following resolutions were adopted, after which the convention adjourned :

adjourned: Resolved, That we, the members of this association, tender a vote of thanks to Mr. Jerry Mosher, for his kindness and the use of his office; and

*Resolved*, That the members of this association approve of the "Bee-Keepers' Union," and most respectfully urge bee-keepers of Iowa to become members of it.

H. E. HUBBARD, Sec.

Farm, stock and Home.

# How to Get a Large Surplus.

#### F. A. TICKNOR.

Now that the season is about closed, and another years' experience is added to our knowledge of bee-keeping, perhaps a few reflections might be in order. If the apiarist has not received 150 pounds of surplus from each colony, spring count, and 100 per cent. increase, he surely does not belong in the front rank.

But little rain has come to us the present summer, still those slight refreshing showers from time to time have been sufficient. Our rich dark soil has stood boldly up against all obstacles, and brought forth her increase; again demonstrating to those who love bees that they are blessed by living in the honey-State of the Union. But still much depends upon the apiarist and his observance of natural law, Different locations and forage bring different results and experiences.

Some may ask how must it be done? The first answer would naturally be, rear worker-bees where, if left to themselves, drones are produced; to accomplish which, see that all brood frames contain worker combs. No fear need be entertained of lack of drones for all practical purposes. A second answer is, to restrict swarming, and keep at all times during the honey-flow large colonies of worker bees free from the swarming fever, and but little honey in the broodframes. To accomplish this there are many ways. I have not yet reached a settled system, and will simply leave it for those to answer who know. It now appears to me a subject for a volume.

During the preparation of the broodcombs and spring management, I clipped the wings of all the queens two years old, and any others not bearing an extra record; when they issued with their swarms they were

easily found upon the lawn in front of their hives, and were quickly killed, the swarm of course returning to its old hive, and there remaining and doing considerable work in complet-ing the partly-filled sections, until led off by the young queen, usually about ten days after killing the old one. During this ten days the increase of the colony by hatching brood brings a much larger swarm than would have been received if the first issue had been hived; you have the first and second swarm in one, led off by a young queen.

Now hive the swarm upon empty frames prepared with heavy foundation starters; in one week remove all new combs and replace with empty frames as above. The young queen will now commence to lay and the bees will build mostly worker combs as fast as they are wanted by her.

The sections should now be placed upon the hive, and plenty of them. Extract the combs removed, cut them ont for use as starters in the sections. Cut all but one hatching queen-cell from the old colony, and in one week, examine the combs for the young queen, and, if laying, extract all the brood-combs. But little brood now remains unhatched, and is all firmly sealed, and is the only practical time of the season to extract the brood-combs. Should no increase be desired, while the swarm is out, cut all queen-cells, extract the combs, and return the colony to the old hive, tiering up with sections.

Austin. Minn.

For the American Bee Journal. Bee-Lawsuit—Buckwheat for Honey.

#### T. F. KINSEL.

A few years ago a case like this occurred three miles from here: A party owned a colony of bees (having paid \$10 for them), which was left on the farm of another. This latter farm was rented to an intemperate man, who was some annoyed by the bees. The owner of the colony neglected to move them, and the renter took them to the road (a few rods away) and burned them. He did this in the evening when all the bees were in the hive. A lawsuit was the result, by which the man who burned the bees had to pay \$10 for them, and the costs in all the case was ably argued, so you see that the officials of Richland County, Ohio, have some respect for bees, and considerable regard for their legal rights.

I have learned by dissecting, that bees carry honey and *pollen*, at the same load, from buckwheat, and that they work on it only in the morning. There is not a bee to be seen on the buckwheat blossoms in the afternoon. Will this pollen injure the bees? Will it militate against wintering? Will some one who knows, answer these questions? This buckwheat (4½ acres) is 14 rods from my apiary, and questions? This buckwheat (4½) acres) is 14 rods from my apiary, and early in the day it is literally swarm-ing with bees, loaded with pollen and hang from the boughs of the trees,

honey, as far as 1 have tested the matter by dissection of bees. If pol-len is injurious, what shall I do?

So far the bees have only stored surplus in colonies run for extracted honey, but the combs in the broodchamber are very full of brood, nearly 5 to 6 frames in a 10-frame Simplicity hive. There certainly will be no lack of young bees to go into winter quarters if there is any good in this fact.

All honor to the "Query Depart-ment" in the BEE JOURNAL. It alone is worth the price of the sub-scription. A bee-keeper, however, in adopting another's opinion or plan, should never forget that we have a large country, and that a course pur-sued successfully with bees in New York by Mr. Doolittle, *might* fail en-York by Mr. Doolittle, *might* fail en-tirely in Texas, though carried out to the letter.

Shiloh, & O., Aug. 30, 1886.

#### For the American Bee Journal

# Native Bees of Ceylon.

#### J. H. ANDRE.

Volume XXI of the BEE JOURNAL mentions at different times a race of foreign bees, by some person who has seen them in their natural state. cannot give their names, etc., but in "Rifle and Hounds in Ceylon," a book of sports of 40 years ago, the author, Sir Samuel Baker, drops out of his regular line of elephant, buffalo and elk hunting, at times, and in one instance gives a short sketch of the native bees, which I doubt not are the same as mentioned in the BEE JOURNAL; and thinking that many would be interested. I have copied the part referring to the bees, and will let the Englishman tel! his own story:

"The principal underwood in the mountainous districts of Ceylon is the nillho. This is a perfectly straight stem from 12 to 20 feet in length, and about 1½ inches in diameter, having no branches except a few small arms at the top, which are covered with large leaves. This plant, in proportion to its size, grows as close as corn in a field [We doubt not but what the author means grain, as that is their national style to speak of all kinds of grain, such as wheat, oats, barley, etc., as "corn"], and forms a dense jungle difficulty to penetrate.

"Every seven years this nillho blossoms; the jungles are then neither more nor less than vast bouquets of bright purple and white flowers. The perfume is delicious, and swarms of bees migrate from other countries to get their harvest of honey. The quantity collected is extraordinary. The bee-hunters start from the low countries and spend weeks in the jungle, in collecting the honey and wax. When looking over an im-mense tract of forest from some elevated point, the thin blue lines of smoke may be seen rising in many directions marking the sites of the

and a man ascends with a torch of green leaves which creates a dense smoke. He approaches the nest and smokes off the colony, which, on quit-ting the exterior of the comb, exposes a beautiful circular mass of honey and wax, generally about 18 inches in diameter, and 6 inches thick. The bee-hunter being provided with ves-sels formed from the rind of the gourd attached to ropes, now cuts up the comb and fills his chatties, lowering them down to his companions below. When the blossom of the willow fades, the seed from this is a sweet little kernel with the flavor of sweet little kernel with the flavor of a nut. The bees now leave the country and the jungles suddenly swarm, as though by magic, with pigeons, jungle-fowl and rats. At length the seed is shed and the nilho dies. The jungles then have a curious appearance. The underwood being dead, the forest trees rise from a mass of dry sticks like thin hop-poles. The roots of these plants soon decay, and a few weeks of high wind howling through the forest, levels the whole mass, leaving the trees standwhole mass, leaving the trees stand-ing free from underwood. The ap-pearance of the ground can now be imagined. The young nillho grows rapidly through this, forming a tangled barrier which checks both man and dogs."

Lockwood, 9 N. Y.

#### Local Convention Directory.

Time and place of Meeting. 1886. Sept. 16.—Eastern Indiana, at Richmond, Ind. M. G. Reynelds, Sec., Williamsburg, Ind. Oct. 7.-Wis. Lake Shore Center, at Kiel, Wis. Ferd Zastrow, Sec., Millhome, Wis. Oct. 12-14.-North American, at Indianapolis, Ind. F. L. Dougherty, Sec., Iudianapolis, Ind. Oct. 19, 20.-Illinois Central, at Mt. Sterling, Ills. J. M. Hambaugh, Sec., Spring, Ills. Oct. 27-29.-Western, at Kansas City, Me. P. Baldwin, Sec., Independence, Mo.

Dec. 1, 2.-Michigan State, at Ypsilanti, Mich. H. D. Cutting, Sec., Clinten, Mich.

In order to have this table complete, Secretarles are requested to forward full particulars of time and place of future meetings .--- ED.

Using Separators.-R. S. Becktell, Three Oaks, 9 Mich., says :

On page 555, Mr. F. J. Crowley says: "One prominent in our beeassociations, and living near me, who was not in favor of separators, has a nice mess; the combs are all bulged. etc. It is quite evident that the man was not a practical bee-keeper, and that he used the old style of 2-inch wide sections. I have been using 1pound sections. 45%x45%x1½ inches, for the past four years, without separators, and not one comb in 100 could be called bulged. I have 10,000 of them full of clover and basswood honey, and I would not go back to the old style.

Bees Hanging Out.-W.M.Barnum, Angelica, 9 N. Y., on Ang. 25, 1886, asks the following questions:

Will yon kindly give the address of the British Bee Journal, and is it a weekly or monthly? 2. One of my colonies seems persistent in hanging out of the hive. I have been noticing them for a week or two, and I think that most of them lay out at night. What is the trouble with them ?

[1. The British Bee Journal is a weekly, published at \$2.50 a year. We club it and the AMERICAN BEE JOUR-NAL for \$2.75 a year.

2. This is not uncommon. The bees are numerous, the breeding apartment full of brood and honey, and there is but little or nothing in the fields to gather. There is therefore nothing for them to do.-ED.]

Keeping Bees on Shares, etc.-E. S. Hildemann, Ashippun, o+ Wis., writes:

As I had rented my farm and had not bees enough of my own, I took 3 apiaries on shares, one apiary of 6 colonies, one of 9, and the other some 30 colonies. The one of 6 colonies, of which I took particular account, had one queenless colony, and a very few bees in it at that. I gave it brood from which to rear a queen. I obtained from the 6 colonies 140 pounds of comb honey, and 610 pounds of ex-tracted, in all 750 pounds. I have 28 colouies of my own. I got of white elover and basswood honey, of mine and my share, 2,000 pounds, which I retailed at the following prices: Ten cents per pound, or 11 pounds for \$1, and 50 pounds at 8 cents per pound. Comb honey I sold at 12½ cents per pound. All of it I sold in one town. By this way I saved all of my honey-kegs, which I can use another year. My honey was well ripened, conse-quently it was well liked, and I always have calls for more. We have had some honey-dew this year, but not as much as last year. I have noticed some honey-dew on poplar leaves near lakes and rivers, which is so thick that it will not come out by extracting.

Bee-Keeping in Oregon, etc.-Gust Murhard, Portland, o Oreg., on Aug. 27, 1886, writes :

The honey yield in Oregon and Washington Territory is an entire failure this year. The season opened well, and everything was most promising, when the drouth set in and cut everything short. Unless many bees are fed they will have to die of starvation, and many have already left their a Cyprian queen mated in Carniola with a Carniolan drone, to try the crosses between the Cyprian and Corniolan here to compact here with Carniolan bees, to compare them with the crosses between the Mt. Lebanon and Carniolan bees, which proved so satisfactory to me. which have

Cyprian bee seems the favorite of European bee-keepers, and also of Mr. Benton. I have two objections to the pure Cyprians, viz., their vicious stinging propensity, and stinging propensity, and ch swarming. The former their much swarming. The former should not be any more objection in a honey-apiary, however, than the vicious disposition of a cow in a dairy, if the cow is a No. 1 milch cow. I never had a Cyprian queen from Mr. Benton, and this is the first one for the purpose of cross-breeding. I have received several letters of inquiry from Eastern farmers concerning Oregon and Washington Territory, all of which I have answered cheerfully, with the exception of one from Missouri, which I have not been able to answer because the letter has been mislaid, and I wish through the BEE JOURNAL to ask that the man who wrote the letter, write me again, so as to enable me to answer him.

Silk-Culture and Bees.-H. Fisher, Silk-Culturist, Oshkosh, O+ Wis., on Aug. 30, 1886, writes:

To those desiring to write to me about the above subject, I wish to say that in order to avoid all mistakes, and to insure a prompt answer, please address me hereafter as stated above. This precaution I deem necessary, as letters that were intended for me (after I had made the few encouraging remarks about silk-culture, on page 490) were delivered to a namesake of mine.

Report, etc.-E. Jarvis, Fair Grove, o+ Mich., on Aug. 28, 1886, writes :

Bees did well here this year, es-pecially in early swarms, and a dry July gave them rest, but they held their own, and now with the showers we have recently had, colonies are strong in bees, and are filling up the hives fast with brood and honey. On page 538 it is requested to state our experience with "removing young bees" from the hives. I saw a bee drawing out another, and my first impression was that of war, but I saw no fighting. I could not tell which was the youngest, or the most perfect This continued more or less for bee. 2 or 3 weeks in July.

Non-Swarming Hive, etc.-V. W. Clough, Geneseo, vo Ills., on Aug. 27, 1886, writes :

I am a constant reader of the BEE JOURNAL, and I often wish I was a writer, for I could tell a very interwith bees. I started with 14 colonies, only 10 of which were very strong. 1 bought my bees from my father, who, after 25 years' experience with bees and general farming, wished to retire from active business and move to town. From the 14 colonies I have secured 1,200 1-pound sections of 8 comb honey, with an increase of 8 new colonies, all of which have filled the brood-chambers besides filling 125 the brood-chambers besides filling 125 have sections of nice honey. I have one The hive that I consider very valuable. I ony came out nicely in the spring, not

do not know who made it, or what its name is, but for the last three years I never knew its colony to swarm, but it would fill with honey all the space given. I believe it to be a non-swarming hive. This year that col-ony has already filled 220 sections, and I do not know how many more it will fill by the end of the season. believe, though, that it will fill 40 more, because I have just given it a case of 40 sections, and the bees have gone into them just as they do in the spring when everything is in bloom. This colony is at work all the time while the others are doing compara-tively nothing. I believe in order to get a large flow of honey we must have a strong colony and the right kind of a hive. I get 13 cents per section, or two for 25 cents, for all of my honey here at home. I would not keep bees to produce extracted honey.

Bees Working Vigorously, etc.-R. F. Holtermann, Brantford, Ont., on Aug. 28, 1886, says :

In my letter regarding the sources of honey-dew, page 539, the 23rd line should read : The theory that such a substance is excrement from aphides alone, etc. It will be seen from what follows that this is as it was intended. Bees are working vigorously on buck-wheat, mullen, etc. I have secured from the first and thistle sufficient to give me 40 pounds per colony, spring count; and bees are in very line condition. Upon extracting, the yield may prove to be more. I secured 80 pounds per colony from clover.

Fall Honey Crop. etc.-A. M. Gander, Adrian, Mich., on Aug. 26, 1886, says :

Bees are getting some fall honey in this locality at present. The crop of white honey was fair, but not a full one. I would as soon think of living without working as to get along successfully with bee-keeping without my bee-papers. It would be like groping around in the dark.

One of the Bonesets.-J. P. Cedarholm, Galesburg, 9 Mo., writes :

I send you some leaves and blooms of a honey-plant that has yielded plenty of honey this season. Please give its name.

[It is one of the "bonesets," and yields rich golden nectar.-ED.]

Wintering Bees.-W. F. Smith, Dutton, Ont., writes:

About March 7, 1885, I wrote to the BEE JOURNAL, saying that I had constructed a winter hive embracing the seven requisites named in the book, "Bees and Honey." I had at that time 24 colonies in these hives, but I could not tell at that time, of that the severest winter ever known in this country, how they would come in this country, how they would come

even one queen being lost. I also wintered 24 colonies last winter in the same bives, and they all came through in good condition, dry and clean. Neither winter seemed to have any effect upon the bees. I thought at that time I would get it patented, but I changed my mind and thought I would test it a few winters. and if it proved good I would let the bee-fraternity have the benefit of it. I am satisfied with these two winters' tests that I can winter bees in these hives with the same safety and certainty that cattle can be wintered in good stables. I intend to winter 36 colonies in these hives the coming winter, and I have not the slightest doubt that they will come out in the spring all right.

Peculiar Queen.-H. E. Hill, Titus-

ville, o Pa., on Aug. 27, 1886, writes thus:

I send you a piece of comb cut from a hive having a young queen that commenced laying on Aug. 14. She is working on two combs only, leaving the others, which are perfect brood-combs, without any eggs, while those two have many cells without eggs; other cells contain from 10 to 15 eggs. Some cells have 3 or 4 hatched larvæ and several eggs. The queen is ordinarily large, and is "losing her feathers," which is evidence that the bees are displeased with her in some way. What is the cause?

[Such cases have not been unknown. I have experienced two or tbree during 18 years, and the ownership of thousands of queens. It seems to be an effect of abnormality in the queen. Why it is so I do not know .-JAMES HEDDON.]

The Season-Stealing Bees.-Mrs. C. M. Kingsley, Elvaston,+o Ills., on Aug. 27, 1886, says :

We had a favorable spring. My June crop was 50 pounds per colony. Then came the long-continued drouth, and bees were idle for some time; but recent rains have set them to work again in good earnest. On Oct. 22, 1885, a lover of honey came in the night and carried off one of my beehives, bees, honey and all. It was full of honey. I can get no clue to the thief, but if I ever should, it is likely he will have to pay for that joke.

Bees in a Glass Globe.-11-John Rey, (68-100), East Saginaw, OMich., on Aug. 26, 1886, writes:

I read an article in Gleanings for Jan. 15, 1886, on "Upper absorbents, or can bees winter in open-mouthed bottles?" I thought I would try it, but I could not get a bottle large enough for a colony of bees, so I got a glass globe 18 inches high, 14 inches long, and 8 inches wide. (It is a reg-ular flower vase.) I then made a bot- time.

tom stand, with entrance in under the bottom-board  $\frac{1}{2}x^6$  inches, and then I nailed in 2 frames filled with comb foundation, and one with brood, and put the glass globe over them. Over the glass globe I put a wooden box. Everything is dark on the in-side. I then put a swarm of bees in it that had just issued, and I expected It that had just issued, and I expected that they would come out again, but they did not; they went right to work just so if they seemed to like to live in a glass hive. I put them in on Aug. 16, and they are building comb nicely. The queen is laying finely. There is a clear space of 6 inches from the top of the frames to the top from the top of the frames to the top of the glass globe, and the bees could not hang in a cluster to build comb downward, so they are building comb upward. I think they will winter all right.

#### Pollen in the Sections.-B. Losee, Cobourg, Ont., says:

In Query, No. 295, it is desired to know how to keep pollen out of the sections. Dr. G. L. Tinker says it seems that the zinc queen-excluder is no hindrance to the carrying above of either honey or pollen. Mr. J. E. Pond, Jr., says: "I would like to know myself." I would advise using round perforated zinc; it is more por-ous, and takes off the pollen when the bees pass through it. The openings in the zinc should be the size of a drone's head, allowing worker-bees only to pass. Here bees work when it is  $90^{\circ}$  in the shade.

The Chapman Honey-Plant.-T. F. Bingham, Abronia, 9 Mich., on Aug. 28, 1886, says :

The new Chapman honey-plant adds a five weeks' honey-flow just after the clover and linden bloom is passed, and before the autumn flowers blossom. The great richness of the secretion of nectar, the opportune period of bloom, and the hardiness and beauty of the plants promise much to the practical honey-producer.

Bee-Keeping in Mississippi.-L. J. de Sobotker, Riverton,+o Miss., on Aug. 24, 1886, writes :

The weather is very hot and sultry, and the bees are hanging out again, although all the precaution had been although all the precaution had been taken as advised by our most practi-cal and experienced apiarists in the United States, in Query, No. 286; especially Mr. H. R. Boardman's answer. I put honey in the open air, and was extracting with the honey-house wire-screen door and window open, but no bees troubled me or the honey. I have a couple of nuclei building up into colonies that are never idle; this proves that there is houey, or rather nectar, in the corn and cotton bloom around us, even in the heat of the day. We expect to work with honey until frost comes; several minor fall flowers are in bloom, which will last until that

#### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 7 a. m., Sept. 6, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO

HONEY.--1t continues to arrive very freely The demand is light and sales are made chiefly a 126a13c. Extracted is also quiet with prices un-changed, 6607c. BEESWAX.--It is easier, and 23c. is about all

will bring. R. A. BURNETT, 161 South Water St.

## NEW YORK.

NEW YORK. IlONEY.—The market for the new crop of comb honey is just opening. We note an improvement in vales and prices. Most of the comb that has arrived is badly colored, which makes it second grade, which we suppose is due to a poor season and long funishing. We quote 1886 crop aefollows; Fancy white in i-the sections, clean and neat packages, 1560 fcc; 2-lbs, 1200 lic; fancy buckwbeat 1-bs, 1161/2c; 2-lbs, 1900 lic; fancy buckwbeat 1-bs, 161/2c; 2-lbs, 1900 lic; foncy buckwbeat 1-bs, 161/2c; 2-lbs, 1900 lic; foncy buckwbeat 1-bs, 161/2c; 2-lbs, 9610c. White clover ex-tracted in kers and small barrels, 656 7-c; Califor-nia cumb hore, 10611c. BEESWAX.—Prime yellow, 22024c. MCCAUL & HILDRETH BROS., 34 Hudson St.

#### BOSTON.

HONEY.-One-lb. sections, white clover, 13@15c; pound sections, 11@13c. Extracted, 6@8c. BEESWAX.-25 cts. per lb. BLAKE & RIPLEY, 57 Chatham Street. 2

#### DETROIT.

HONEY,-The market is improving. The de-mand is better and the prices are also improved. Best comb in 1-pond sections brings 14@15c. BEESWAX.-Firm at 23c, for fair quality. M. HUNT. Bell Branch. Mich.

#### CINCINNATI.

CINCINNATI. HONEX.-The market is very quiet. Demand from manufacturers is elnw, and there is only & fair trade in new comb boney and extracted in square glass jars. Extracted honey brings 31-2% 7c.; comb huney, 12 to 14c, for good to choice, in the jobbing way. Prices are low for all produce and no speculative feeling is noticed anywhere. Unless better prices are realized for other prod-uce, prices of honey are not likely to sdvance. BEESWAX.-It is in good demand and arrivale are fair. We pay 20c. for good yellow. C.F. MUTH & SON, Freeman & Central Ave.

#### CLEVELAND.

110NEY.-The demand for honey is not very lively at present, but prices are steady. Choice new honey in 1-b. sections is selling at 14c.; 2-bs. 12@13c. Old honey is very duil at 10@12c. Ex-tracted, 6@7c. BEESWAX.-25c. A. C. KENDEL, 115 Ontario Street.

#### KANSAS CITY.

HONEY.—The market is active and sales of the comb are large. Extracted is firm with no stock in the city. We quote: One-pound sections of white clover, 13@14c.; dark 1-lbs., 11@12c.; 2-lba., 11@12c.; dark 2-lba., 8@10c.; 2-lb. Callf. white arge, 10@11c.; dark 2-lba., 8@9c. Extracted white clover, 7&8c.; dark, 44@55/cc.; Callf. white sage, 5½@6c.; dark, 44@55/cc.; Callf. white sage, 5½@6c.; dark, 44@52c. BEESWAX.-=20@22c. CLEMONS,CLOON & Co., cor. 4th & Walnut.

#### MILWAUKEE.

HONEY.—The market is about the same as when last reported—may be quoted a little lower to soll. Choice comb In 1-b.sections,12013; 2-b.s.,1103124 centa; dark not wanted, Extracted, white, in kegs,666%c; same in the cans,6 1-267c; dark in barrels and half-barrels,565 1-2 cts. BEESWAX.—No demand. A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

SAN FRANCISCO. HONEY.—The demand for honey remains very good for fine qualities, and they are readily taken for home consumption, and shipments to Europe and the East at 465:46. job here. Most of the boney is held at 4%c. and more, and it seems that sconer or later such prices will be paid, as offer-ings are rather small. Comb honey is not sought after so far, but with the colder weather more de-mand will come in, and as applies are rather small. we anticipate full prices. We now quote 7(6:10C., as the quoties to the duil, but buyers have to pay 226:23c. for choice lots. SCHACHT & LEMCKE, 122-124 Davis St. HONEY.—Prices are so low that honey-nor

HONEY.-Prices are so low that honey-pro-ducers are holding back their product; still the market is well supplied. We quote: Comh. sr-tra white, 8%@10c; off grades, 6%@7%c. Ex-tracted, white, 4@44(c; amber, 3%@3%c; dark, 3c, BEESWAX.-22%@32c. O. B. SMITH & Co., 423 Front Street.

THOMAS G. NEWMAN & SON. PROPRIETORS.

923 & 925 WEST MADISON ST., CHICAGO, ILL, At One Doffar a Year.

ALFRED H. NEWMAN. BUSINESS MANAGER.

# Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

A New Crate to hold one dozen one-pound sections of honey .- It has a strip of glass on each side, to allow the honey to be seen. It is a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 cts. per erate. Glass 1%c. per light, extra.

Bees for Sale.-We offer to sell a few strong colonies of Italian bees, in ten-frame Simplicity hives, at \$6.00 each.

Red Labels for one-pound pails of honey, size 3x41/2 inches. - We have just gotten up a lot of these Labels, and can supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with uame and address of apiarist printed on them-by mail, postpaid.

Yucca Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bces. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable. When they become sticky with honcy, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 cents a dozen ; if sent by mail, add 1 cent each for postage.

## OUR CLUBBING LIST.

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

| Price of both.                   | Club |

| Heddon's book, "Success," 1 50   | 140  |

Simmins' Non-Swarming System is the title of a new English bee-book. The anthor claims that it will inangurate a "new era in modern bce-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages ; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

Sweet Clover, or Melilotus Alba, is almost the only resource for honey now, on account of the late severe July drouth. If the seed is planted in September, it will come up this Fall and bloom next year, in its second season.

We have a large lot of this seed on hand. and offer it at the following Reduced Prices, by express or freight :

- me pound
   \$0 20

   "peck-15 lbs
   2 25

   "bushel-60 lbs
   7 00

   "sack-80 lbs
   8 00
   One pound
- It will pay to bny it by the sack and sell it

again in smaller quantities.

27 If you want a chance to make some money, and provide pasturage for the bees during the Fall months, this is your opportunity !

Italian Qucens .- We have a few untested queens which we can send by return mail. Three for \$2,75 ; six for \$5.00 ; twelve for \$9.00. For Tested, double the prices.

"Cash in Advance" is the rnlc, but no longer than six mooths of grace can be allowed on the small sum of one dollar. Subscriptions may commence at any time, and discontinuances may be ordered at any time when arrearages are paid up.

#### Home Market for Honey.

To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remunerative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the beekeeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

#### System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

| For | 50 colonies  | (120 pages) | <br>  | 00 |
|-----|--------------|-------------|-------|----|
| 6.6 | 100 colonies | (220 pages) | <br>1 | 25 |
| 64  | 200 colonies | (420 pages) | <br>  | 50 |

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

When Marketing Extracted Honey, it is a sad blunder to use barrels holding from 300 to 500 pounds-they are too large to be desirable for the trade, too bulky to be bandled with care in transportation, and too dear to be lucrative to the producer, for honcy put up in such large barrels is subject to a discount of one cent per pound, because of the difficulty in disposing of it without repacking and dividing into smaller lots.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides his own, with \$3.00, for one year, we will present a copy of this valuable book.

" Don't Stop "-- that is what many write to us about their papers, when their time is nearly out. One subscriber says : "It is not convenient for me to send the money now to renew my subscription. It runs out with this month ; but don't stop sending it. I will get the mouey to you within three months." Such letters are coming every day, and so for the present we have coucluded not to stop any papers until requested to do so.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

Bees for Sale, 50 COLONIES of italians in 11-frame Langatroth HiVES, Queens. Will sell at once at \$4,00 per Colony-as 1 am going to Nebraska. MAYFAIR, Cook Co., ILLS.

GLASS PAILS

BEES and HONEY,

Management of an Apiary for Pleasure and Profit; hy

#### THOMAS C. NEWMAN, Editor of the American Bee Journal.

It contains 220 profusely illustrated pages is "fully up with the times" in all the im-provements and inventions in this rapidly developing pursuit, and presents the apiar-ist with everything that can aid in the successful management of the honey-bee, the and at the same time produce the most honey in its best and most attractive con-dition. Bound in cloth, \$1.00, postpaid.

## A Liberal Discount to Dealers, by the Dozen or Hundred.

THOS. G. NEWMAN & SON,

923 & 925 West Madison St., CHICAGO, ILL. The AMERICAN BEE JOURNAL for a year and the book, "Bees and Honey," will be sent for \$1.75.

# Vandervort Foundation Mill.

6 Inch, Price, \$20.00. It makes the finest extra thin Foundation for comb honey. For Sale by

THOS. G. NEWMAN & SON 923 & 925 West Madison Street. CHICAGO. 1LL.

## HPERS Or, MANUAL OF THE APIARY. 13,000 SOLD SINCE 1876. 14th Thousand Just Out !

10th Thousand Sold in Just Four Months! 5,060 Sold Since May, 1883.

More than 50 pages, and more than 50 fine illus-trations were added in the 4th edition. The whole work has been thoroughly revised, and contains the yery latest in respect to bee-keeping. It is certainly the fullest and most scientific work treating of bees in the World. Price, by mail, \$1.25. Liberal discount to dealers and to clubs.

A. J. COOK, Author and Publisher, Agricultural Coilege, Mich. 1417

## to WINTER BEES. MIE October number of the American

THE October number of the American Apienturist will contain essays on Wintering Bees," from the pens of James Heddon, G. M. Boolittle, A. E. Manun, Prof. Cook, Dr. Tinker, J. E. Pond, Ira Barber, J. H. Martin, and other equally prominent apiarists. Every bee-keeper should scenre a copy. For ten cents in stamps this number will be mailed to any address on September 25. No speei-men copies of this number will be sent ont. Baenler subscription price \$1.00 per year. Regular subscription price \$1.00 per year. Single copies 10 cts. cach. Copies of back numbers will be sent free. Address,

What the Bees Sing.-In that excellent monthly, *Viek's Illustrated Magazine*, M. E. Whittemore gives the following as a reply to the question :

MEREN

The bees are ever busy, They work the whole day long, Humming ofteo to themselves This soft, low, happy song :

"We gather from the flowers Sweet honey as we fly, And store away this treasure For winter by and byc.

"We work for one another, Nor leave our task undone, But toil from early morning Until the evening sun."

Let us then learn the lesson, Fill each hour of the day With kindly words and actions, While passing on our way.

Bees are at Work now on the bloom which has resulted from the late rains.

**Sweet Clover.**-Concerning this excellent honey-plant, Prof. Cook, in the *Prairie Farmer*, remarks as follows :

Having grown sweet clover for several years I know that it is beautiful, both in foliage and blossom. It is much superior as an adornment of the roadside to either rag or May weed. It is a most excellent honeyplant, comparable to white and Alsike clover, or to basswood in value. It is slow to expand, and in meadow and pasture is soon choked out by our cultivated grasses. When once in possession of a spot, it is easy to extirpate it if it is desired to do so. As is well known, sweet clover is a biennial, and so must come from the seed once every two years. The plants grow from seed one year, and the next year blossom and die. Thus we have only to cut the plants while in bloom before the seed matures to extirpate the plants *in toto*. Two such cuttings in adjacent years will do the work most thoreughly.

In view of all these facts we can hardly find a more safe and valuable plant for waste places, and for roadside planting. Farmers should encourage its growth both for its beauty and worth.

The seed will grow if planted at any season of the year, but if sown early in the fall, it will come up this year, and bloom next year. Or it can be sown later, even on the snow in winter, and will thrive and do well.

The Illinois State Falr is over. It was a fine show of almost everything except bees and honey. Of bees there were none on exhibition; a fine opportunity was lost to bring honcy prominently before the many thousands of visitors to the Fair.

Of honey there were only four entries. Mr. J. V. Caldwell, of Cambridge, Ills., had 10 crates of 1-pound sections of nice comb honey, which took the first prize, §8. Mr. H. S. Hackman, of Pern, Ills., had 5 crates of 1-pound sections (two tiers in a crate), and 4 crates of 2-pound sections of honey ; this took the second prize. Mr. Hackman also exhibited 18 glass jars of honey ; this took the first prize on extracted honey. This was all the exhibits except a box, 1 foot square, cootaining 5 frames, with combs built in every direction—a disgrace to the intelligence of the 19th century, and an insult to the Illioois State Fair.

When prizes are offered, space provided, and an invitation given to bee-keepers to make an exhibit of bees and honey, and still no more than the above named are entered for exhibition, what premiums can we expect in the future? There should have heen ten thousand pounds of honey on exhibition, at least; and a good bee-show besides. The publishers of the BEE JOUR-NAL made no display on account of the editor having been appointed a judge, and to encourage producers of honey to make a good exhibit; but we think it will be differeot another year.

**Teasel.**—Maoy inquiries are made regarding this plant, and in order to auswer them all at once we will state some facts concerning it. The fuller's teasel (*Dipsaeus fullerorium*) is used in fulling cloth, and the heads may be seen in woolen mills arranged on the surface of large cylinders, over which the cloth passes. Wild teasel (*Dipsacus sylvestris*) is a troublesome weed in some localities, and may be recognized by the following characteristics :

following characteristics : It is a biencial herb, stout and coarse, growing from the seed the first year without flowers, the root living over witter, producing flowers and seeds the second year, after which the plant dies. It is prickly throughout on stems and leaves. Few of our herbaccous plants have prickly stems. The leaves are oblong, lacceshaped, much longer than broad, tapering but slightly upward, attached directly to a stem without leaf-stalks. They are opposite, in pairs, on the stem, and their bases often are united around it. The flowers are small, pale purple, many collected together in a dense eggshaped cluster or head, similar io structure to the heads in the composite family, to which the teasel family is related. Within the cluster, by the side of each small flower, is a scale which tapers to a slender point, projecting beyond the flower, so that the head, outside, is a circle of stiff leaves forming an involucre, projecting and curved upward. They are of unequal length, and prickly like the stem.

It Pays.—The Fremont, Mich., Indicator of Sept. 2, makes the following remark concerning one of the citizens of that town, who is well-known to our readers :

George Hilton contemplates adding considerably to his apiarian facilities. His "plant" has become one of the important industries of our town.

year. Or it can be sown later, even on the snow in winter, and will thrive and do well. Honey from the fall bloom is reported to for the certificate at be coming in quite freely in some localities. sent by return mail.

Bees as Missionarles.—One of our exchanges makes these very sensible remarks concerning the "mission of bees" in nature, and the value of bees to the various branches of horticulture :

The bee is almost as much a part of choice fruit and beautiful flowers us the branches upon which they grow. The flower with its honey and the bee are factors in one of nature's most beautiful and interesting problems, and through the intricate workings of this problem are born the brightest colors, finest perfumes and richest flavors. Countless flowers are fertilized by the bee, which would otherwise perish from the earth; but it does more than this, it carries pollen of self-fertilizing plauts from flower to flower, thus preventing constant in-breeding and consequeed deterioration. In fact the bee is nature's protest against incest; and flavor, when the protest is heeded, teaches a powerful lesson on the great subject of the proper and healthful progration of species. Where bees are not, fruit and dower show the effect of a violation of a law of nature by slowly but surely degenerating. The bee is as necessary to the flower as the flower to the bee: is neousling in the set is an event.

Sweet Clover for Honey.—Mr. G. W. Demarce, of Christiansburg, Ky., io an article on the "Bee-Forage of Kentucky," published in the *Bee-Keepers' Magazine*, remarks as follows:

marks as follows: For cultivation as a honey-plant, under proper management, sweet clover is the promising plact. In this locality it will not succeed in waste places. The plant is too feeble when it first appears above the ground to hold its place among the weeds indigenous to the soil, but when the plants once get of some size they will crowd their way and grow rapidly. In favorable places I have seen the plants grow 10 feet high, throwing out numerons branches, all thickly set with spikes crowded with delicate little white flowers. My "patch" of sweet clover this seasou was a perfect wonder of swarming bees, crowding each other like robber bees contending for illegitimate gain. I have had best success with it when sowed in the early spring with oats. It will bloom the following year just as does red and Alsike clover, and if left to itself it will bloom at the same time that white clover does, as they have all that they can do to gather the white clover harvest. To retard its growth and make it succeed the white clover bloon, the sweet clover should be grazed lightly by sheep or young cattle when the plants to throw new shoots that will bloom later in the season than they otherwise would. I now have some plants in full bloom is short-lived, and I have failed to so manage it as to have it bloom at any other time than when white clover was at its boest.

Round Trip Tickets to the Convention .- As Manager of the National Bee-Keepers' Union, we have made arrangements with the Indianapolis lines of railroad for round trip tickets from Chicago to Indianapolis and return to Chicago, good from Monday to Saturday, Oct. 11 to 36, 1886, for \$7.30. The fare one way is \$5.50, and this is one fare and one-third. To obtain these tickets, it will be necessary to get a certificate signed by Thomas G. Newman, stating that the bearer is entitled to the reduced fare. Now, do not wait until you come to Chicago to get this certificate, for we may have gone before you come. Send for the certificate at once; and it will be

#### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-En.]

## Second-Swarms.

Query, No. 304.-Suppose a colony is ready to send ont a second swarm, or will be ready in a day or two. It all the immature queen-cells are destroyed, and the young queens just gnawing out are liberated, so that two or more young queens are in the hive, but no queeu-cell, will the bees swarm? -S. J. M.

Yes, sometimes.-DADANT & SON. Not generally. I have had one or two do so.-G. M. DOOLITTLE.

I have never tried it, but I think they would not swarm. - W. Z. HUTCHINSON.

I should expect they might.-A. J. COOK.

I am not sure, but I think that the bees will rarely, if ever, swarm.-C. C. MILLER.

Yes, in many cases, unless all vir-gin queens are killed but one.-H. D. CUTTING.

As a rule, yes. The safe plan if desired to prevent the second-swarm, is to remove all queen-cells and all queens but one.—J. E. POND, JR.

It is the queens piping in the No. cells that causes all second-swarms. Cut out all the queen-cells, and if there be a half-dozen young queens just hatched, there will be no swarming.-G. L. TINKER.

They will swarm in the majority of cases. Not only this, but often when all the queen-cells are destroyed or removed when the colony is on the verge of swarming, and all the batched queens removed but one, the bees, not all knowing the destruction of the cells, will issue with the only queen, leaving the parent colony hopelessly queenless.—J.P.H.BROWN.

I think they will ofttimes swarm. I believe that one of the reasons why parent colonies are so much oftener found queenless than are secondswarms, is because in many cases all the queen-cells are hatched, and all the young queens go with the afterswarms.-JAMES HEDDON.

Sometimes they will and sometimes they will not-generally they will, so far as my experience goes. I have this state of things under my obser-vation frequently. I have picked a virgin queen from among the bees which were clustered outside of the bive when there was one or more queens guarded on the inside. I have had swarms lately hived to swarm out and settle in the usual way be-cause there were two or more virgin queens with the swarm. Those persons who claim that bees never swarm except when they have a queen-cell or queen-cells, are mistaken.-G. W. DEMAREE.

## Prevention of Absconding Swarms.

Query, No. 305 .- My business requires me to be absent from my apiary until abont 3 p.m. each day. What system had I best pursue to prevent my swarms from going to the woods? My apiary consists of 25 colonies.-Pa.

Practice dividing colonies.-J. P. H. BROWN.

I should increase the colonies by division in this case.-G. M. Doo-LITTLE.

I think by dividing you would have the least trouble.—H. D. CUTTING.

It is not yet known-at least not by me.-JAMES HEDDON.

Produce extracted honey, and thus almost totally prevent swarming.-DADANT & SON.

Clip the queen's wing, and keep a sharp lookout. I am in the same condition, and very rarely meet with any loss.—A. J. Cook.

An apiary of that size will pay to employ an assistant to hive the swarms. Let the bees swarm nat-urally for best results.—G.L.TINKER.

Use Alley's drone and queen trap to catch the queen, and return the swarms, and then if you desire in-crease, divide.—H. R. BOARDMAN.

Have the queen's wing clipped, and a boy or girl can cage them when swarms issue. Perhaps Alley's trap would answer as well.-C. C. MILLER.

Use "Alley's queen and drone trap," and make your increase by dividing on the nucleus plan. Your case is my own, and by following the advice I have given I do not have any trouble in this direction.—J. E. POND, JR.

Produce extracted honey and you will have few swarms. You might try clipping the queen's wing, but as you would not be there when the bees swarmed, I fear the "remedy would be worse than the disease." Dividing be *vorse* than the disease." Dividing may help you, but the probability is that the bees will try *their* hand at it after you get through. Why not give up your "business" and embark in bee-keeping ?—W. Z. HUTCHINSON.

Alley's drone and queen trap would likely help you out of the trouble. To clip the wings of your queens would prevent the bees from absconding, but should the swarming impulse become rampant. all your queens with clipped wings would soon he lost or killed by the bees, and virgin queen from among the bees second or after swarms would begin terview, by sending the names to this which were clustered outside of the to issue, and very soon your apiary or we will send them all to the agent.

would be utterly demoralized. I do not see how an apiary is to be man-aged without the presence of some one in swarming time.-G. W. DEM-AREE.

Increase or no Increase—Which ?

Query, No. 306 .- In my locality I count on no surplus after elover, which ends in July. Will a colony that swarms, with its increase, or the same colony without swarming, give me the larger crop of comb honey? -M. E. W.

I think that the colony without in-crease will produce the most.-C. C. MILLER.

The first usually, I think .- A. J. COOK.

I think the colony that does not swarm will give the most surplus.-W. Z. HUTCHINSON.

I should think that the colony without swarming would give you the greatest yield of comb honey.-H. D. CUTTINO.

The colony that does not swarm will give the most, usually.-DADANT & SON.

The colony that swarms, with its increase, will, with proper management, give the largest yield of surplus comb honey.—H. R. BOARDMAN.

Without knowing anything about your location, I will venture to say that with one increase and the parent colony, you can get more comb honey than it no increase.—J. P. H. BROWN.

If your swarm issues early enough so that both the swarm and the parent colony will be well stocked with foragers, more honey will be gathered than if no swarming is allowed; otherwise, the contrary.—J. E. POND, JR.

If a colony would work contentedly no increase would give the best results; but as nine out of ten will be kept from increase only at a loss, I should prefer to let one swarm issue from each old colony, and treat them as I described in Query, No. 302.—G. M. DOOLITTLE.

From the description you give of your locality, it is similar to mine as pertains to the surplus honey season. In my locality a colony of hees that does not swarm-all things else being equal-will store more surplus honey than any colony with its increase.-G. W. DEMAREE.

With proper management the colony that swarms will produce more comb honey than a colony that does not swarm, provided the flow of honey lasts more than 21 days. If of short duration, then the colony that does not swarm will produce the most.—G. L. TINKER.

Sample Copies of the BEE JOURNAL will be sent FREE upou application. Any one intending to get np a club can have sample copies sent to the persons they desire to interview, by sending the names to this office,

Explanatory .- The figures BEFORE the names indicate the number of years that the persen has kept hees. Those AFTER, show the number of colonics the writer had in the previens spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is located near the center of the State named; 5 north of the center; 9 sonth; 0+ east; •O west; and this 6 northeast;  $\circ$  northwest: • southeast; and 9 southwest of the center of the State mentioned.

> For the American Bee Journal. The Sun Wax-Extractor. G. W. DEMAREE.

As it would require too much of my

time to answer private letters de-scribing the sun wax-extractor as I employ it in my aplary, I will have to ask the permission to publish a mi-nute description of how to make and use the apparatus. I claim nothing in connection with the device excepting the trough-shape wax-pan, or bottom of the wax-extractor. A con-versation with Mr. O. O. Poppleton, at the North American Convention in at the North American Convention in 1881, concerning its use, set me to in-vestigating the matter, and after some experimenting I became con-vinced that a flat bottom did not drain the wax from the refuse of old and pollen-filled combs as cleanly as economy would dictate. But after making an extractor with a hollow or concave bottom, I found that this objection was overcome and the de-vice was practical for all purposes connected with rendering wax.

My plan of making it is as follows: Make a plain box 19½ inches wide, 14 inches deep, and 35½ inches long, inside measurement. Nail on a bottom and have it bee-tight. Now nail on some legs at the ends, and the box is ready for the wax-pan, etc. To make the wax or draining pan cut a piece of sheet-iron (1 prefer sheet-iron to anything else) 24 inches wide and 28 inches long. To get the concave 28 inches long. To get the concave shape of the pan, get out a board from half-inch stuff, 5 inches wide and 19½ inches long, and cut one of Now bend its edges to a true circle. Now bend the sheet of metal around the circular board and nail it closely. This gives a concave pan 19½ inches wide by 28 inches long, with one end closed and the other end opened.

To adjust the pan in the box or frame-work, get out a board 7 or 8 inches wide, and 19½ inches long, and hollow out one of its edges to correspond with the circular shape of the pan, and nail it crosswise in the box, so that when the open end of the pan rests on it, the pan will project about 2 inches over the board and be about 6 inches above the bottom of the box. This will give room for the wax ion can be formed on the data fur-monds under the drip end of the nished by a single season's observa-

wax-pan. Two beveled strips of wood 28 inches long, nailed one on either side of the box, supports the

sides of the metal pan. When all is ready the wax-pan is shoved down into the box or framework until its open end rests in the hollow board, and the sides of the pan on the beveled strips. It is pan on the beveled strips. It is secured in position by nailing through the wooden head of the pan and into the end piece of the box, and the sides of the pan are nailed closely to the beveled strips at the sides of the box or frame-work.

The sash is made like a shallow box 2 inches deep, rabbeted at the top to receive three panes of glass 12x20 inches, and slides back and forward between strips of wood at the sides of the frame-work. Some pressed pans 3 or 4 inches deep and 7 inches wide at the top make good wax-moulds. When one is filled it is shoved aside and another put in its place. The filled pans are left in the box to cool gradually during the night. My wax-extractor is left in the apiary the year around. It has a board cover for it when not in use.

I hope that I have made the matter plain to those who have written to me for particulars, and also to others. Christiansburg, 5 Ky.

#### For the American Bee Journal.

## Chapman Honey-Plant in Canada.

#### WM. F. CLARKE.

I believe mine is the only experimental plantation of the above-named honey-plant in the Dominion. Fifty specimens were sent for trial to myself and to Mr. D. A. Jones, respec-tively, but unfortunately those for-warded to Mr. J. were overlooked, owing to the carelessness of a team-ster, and left in a shed until too late to plant.

My garden-plot being rather limited, I consigned the plauts to the care of a friend who is an enthusiastic botanist, and who was formerly a bee-keeper. They have had the best of care, have made a luxuriant growth, and blossomed magnificently The and blossomed magnificently bees began to visit the plant on July 19, when only here and there a flower 19, when only nere and there a hard had opened, and from that day on for upwards of three weeks, frequented it in increasing numbers. When at it in increasing numbers. When at its best, the blooms were crowded with bees, both wild and tame.

Of course one cannot give an opin-ion as to the yield of honey from a single season's trial with only a few But we know that bees do plants. not assiduously visit flora out of idle curiosity, and blossoms that are crowded from dawn to dusk must reward the honey-gathering visitants, or they would certainly be deserted. The plant is worthy a place in flower-gardens, owing both to the beauty of the load ord the popular her bits. the leaf and the peculiar loveliness of the blooms. Judging by its habit of growth, I do not think it will give trouble as a weed. So far as an opin-ion can be formed on the data fur-

tion of a small number of plants, it seems to me there is promise enough to justify bee-keepers in going into its culture, at any rate on a small scale, and so subjecting it to a general and thorough test.

Guelph, Ont.

#### For the American Bee Journal

Peculiar Experience with a Colony.

#### MRS. II, A. CUNNINGHAM.

Last July I had a colony made by division, that failed to rear a queen from the cell I gave it, and as I was quite interested in the description of the Syrio-Albino bees, I thought I the Syrio-Albino bees, i thought i would try an untested queen of that kind; and accordingly on July 16 I ordered one. On July 22 I received a card stating that it would be shipped on July 26. The colony had then been for sometime without the means of rearing a queen, and as the new queen would not arrive for nearly a week, and 1 wanted a young queen to supersede an old one that I had in another colony, I thought 1 would let them eccump the time while writing them occupy the time while waiting by making some queen-cells for that purpose. So I gave them a frame containing eggs, and by July 26 they had several started and one sealed. I then formed a purplex then formed a nucleus by placing the frame containing the queen cells, and one more with the adhering bees, in another hive, and placed it about a foot away. On July 28 the new queen arrived.

I immediately removed her to a cage made of wire-netting rolled up, but I was surprised on opening the hive to put her in, at finding a number of queen cells, some containing eggs. I cut them out, however, and left them over night, with the caged queen in the hive. I intended to keep her caged two days, but on looking in the next day she seemed so restless and anxious to get out that I thought I would let her out on a comb and see how the bees seemed to feel toward her, and if they acted hostile I could cage her again. I did so, and watched her nearly half an hour without seeing any hostile demonstration; so I concluded that it would be safe to leave her at liberty.

After two or three hours I opened the hive and found her balled; a little smoke dispersed the bees, and I found her uninjured. I then watched her crawl about for some time without seeing anything to convince me that they wanted to hurt her, but after awhile I lost sight of her for a moment, and then I saw a knot of bees on the board on which a corner of the former measured. This time of the frame was resting. This time the smoke did not have much effect, and I only got the bees separated in time to see the poor queen receive her death wound.

I then looked and found that more queen-cells had been started, which I cut out and then shut up the hive. They kept starting queen-cells, and I kept cutting them out until Aug. 2, when I put another caged queen into the hive. They still regularly started

The great question was, where did the eggs come from that were in the queen-cells? If laid by a laying worker, why were not eggs laid in other cells of which there were thou-sands of empty ones by that time? But I could not find an egg except in these cells, and not in all of them. had read of bees stealing eggs from other hives. so I supplied them with water and closed the entrance with wire netting, and kept them all shut in for two days. If them exprined in for two days. I then examined them, and lo and behold, there were the cells and eggs just as usual

I was about at my wits' end. but I thought of one more thing that I would try. I had by this time added frames to the nucleus till there were four or five. I took out all the frames four or five. of the cranky colony's hive and carried them off to a little distance. and placed in the hive three frames containing no eggs or young larvæ, with the adhering bees from the nucleus. I then shook off the other bees on the ground, dividing the empty frames between the two hives, and leaving the best to find their way back as they might. On looking the next day, though, it was the same old story -queen-cells, a part with eggs and a part with none.

The next morning I went out determined to form a new colony by taking frames from several hives, and break this one up by distributing its frames in their places, but first I dis-covered that the queen in the nucleus had begun to lay, when I thought my best plan would be to unite the two, and give the caged queen to the colony for which the nucleus queen was designed; this I did, and succeeded in uniting them safely by giving the nucleus one or two frames a day till all were in. Can any one tell what was the matter with those bees ?

Normal, 9 Ills.

## Ventura, Calif., Convention.

The Ventura Bee-Keepers' Asso-ciation met in Union Hall, at San Buenaventura, on Aug. 7, 1856. Mr. Wilkin was elected President and C. M. Drake Secretary.

Mr. Richardson made a report of a warehouse for holding the honey of the county. 40x100x9 feet. with concrete floor and iron covering, with a capacity of 500 tons of honey, saying such a building would cost about \$550. Mr. Mercer said a brick one would cost double that amount.

Mr. Corey gave several good reasons why honey is low. Mr. Blanchard thought we should organize and work together: store it and borrow upon it instead of forcing sales early in the season.

The following address was read by S. C. Gridley, of Nordhoff :

DISPOSING OF THE HONEY CROP.

I offer these thoughts with the bope that they may lead to financial good tion on each and every section. Take to ourselves. I offer them as sug- the wax as it comes in and render it

their cells, which I as regularly de-stroyed until Aug. 7, by which time I over—to alter or amend for the good was rather tired of the game. of the cause—and if anything in this essay proves to be of any benefit. I shall feel that I have been of some help.

We must combine in some form to protect ourselves against the middleman-the speculator-and the many hands our honey passes through be-fore it reaches the consumer. We must divert some of these profits to ourselves, or our business is ruined. The fruit-men bave shown us the way and the benefits derived from union of interests. "In union there

enough to hold the crop of the county, with an office and a large room be-sides, for purposes which I will mention further on. It is not necessary to build this warehouse where land is expensive. Find out where the railroad line will run, and build close to it on cheap land. The railroad will build a switch to it. Let the incor-poration be called the "Ventura Connty Honey-Packing Association. or any other name that will be appro-priate. Let the sole business be in honey and wax in its various forms. Let the bee-men store their honey and wax in this warehouse, and arrange so that money can be drawn from the association on the honey deposited in the warehouse. That will give every man a chance to help himself at once without waiting, and will release the honey market. form a selling pressure, and tend to equalize the price of honey. Further, I would propose to have a good, reliable man —one who is used to selling goods—go over the country with samples of this boney and sell it. Go to the best markets with it. Merchants buying from such an association would be assured of getting just what was represented, and from a reliable source.

Now, use the large room I spoke of before, to repack the honey as fast as the orders come in. When the salesthe orders come in. man sells to a retailer, he wants it in a nice. attractive package—one that will strike the eye. Well, put it up so. Put up a dozen in a case, with handsome labels, the association's trade-mark. and with recipes for using honey in place of sugar for making cakes and preserving fruit, and in this way create other uses for honey, and so stimulate the demand. Also, put a handsome show-card, full size of case, in each and every case. to hang up in some conspicuous place in his store. Make it handsome enough so that he will think it an ornament and preserve it, instead of throwing it away. Let it be as hand-some as the art of lithographing can make it. In this way Ventura honey will make a name for itself, and will be in demand, and in the course of time orders will come of themselveswill need no salesman. Comb honey should have the stamp of the associa-

and make it clean. Have appliances to bleach it, and thereby get a larger return for it. When our salesman strikes a brewer or tobacconist. he will want it in bulk. Well, put it up to suit him too, and put the association's brand on it. He will be suited with the lower grades of honey.

The cost of cans and cases, as we all know, is a very large item of total loss to the apiarist. Let each and every bee-man provide himself with enough barrels lined with tin or some other material to hold bis crop. The first cost would be considerable, but then they would last for years. Let Now. I propose the following as suggestions: First, incorporate: then build a fire-proof warehouse large enough to hold the crop of the count barrels, and rent them to the bee-men at so much the season or ton. The association could pack the honey much cheaper than the individual, for they could buy in large quantities at a less cost: or they might have machiney for making cans, and man-ufacture for themselves, and save all the profit. I bought cans and cases in San Francisco this season at 65 cents each. Here they are 85 cents -a wide difference.

Now. a very important question comes up: What will all this cost? llow much money will it take? It will require considerable capital to handle the honey crop of the county this way; but I think a finance committee appointed by this meeting might induce some capitalist to embark in the enterprise. I think we ought to be able to make a good showing for a fair rate of interest on the money—but not one per cent. per month. We should be able to get the money at from 6 to 8 per cent. per annum, and I think it could be done. The association would have to raise the money for building the ware-house and accessories among its members; but after that there will be no trouble in raising money on warehouse receipts. There are 600 tons of honey in this county. An assessment of one-quarter of one cent per pound would bring \$3.000; one-half of one cent, \$6.000, which would be ample to build the warehouse. The bee-men could pay their assessments on honey at the market price, let it be sold, and the proceeds devoted to building the warehouse, etc. Then let the stock be issued to each one to the amount of his assessment.

The advantages of such an arrangement, to my mind, would be numer-ous. One of the greatest would be that every bee-man, big or little. when he gathered his crop could raise money on it at once, and that along would be a great boon to most of us. Another, we would get rid of middlemen and speculators; we would save all their profits to ourselves. That would largely increase the price of honey to us at once.

Now, as to the division of the proceeds of the business. Let a certain percentage be set aside for interest and the various expenses, and for a sinking fund. Let the sinking fund be liberal, so that the corporation can soon clear itself from debt, and in the course of a few years the surplus would be large enough to enable the association to furnish all the money for every purpose. After the season's business is finished, let a dividend be declared to every one depositing honey in the warehouse in proportion to the amount and kind of honey deposited. If this can be carried out I believe the honey-producers will receive a larger return for their crops than they have ever done.

I offer these thoughts as sugges-tions: My only wish is to help the good cause, and get 10 cents a pound for onr honey. if we can.

A committee of five, consisting of Messrs. Wilkin. Barrows, Richardson. Blanchard, and Grimes was ap-pointed to report at a future meeting. concerning a warehouse, storing and selling honey, organizing, incorporating. etc.

Adjourned to meet at Santa Paula, Calif. C. M. DRAKE, Sec.

## For the American Bee Journal Using Plain Sheets of Wax.

#### CHAS. DADANT & SON.

In answer to Query, No. 283. on page 468, on the result of using plain sheets of wax in the brood-chamber, we said that bees build on those sheets very irregular comb. which may be drone-comb as well as worker-comb. On page 536 Mr. J. F. Hays writes :

"From the answer of Messrs. Da-dant & Son one would suppose that honey-comb was always a clumsy, haphazard affair, until the genius of man enabled the bee to build its comb man enabled the beet to build its comb without mixing drone and worker cells together in an indiscriminate mass. They doubtless gave their honest opinion, but it is decidedly not my observation. I have examined the combs in a number of colonies that were hived on empty frames without any starters whetever and I without any starters whatever, and I found no more drone cells than in colonies that were hived on full sheets of worker comb foundation. Now let Messrs. Dadant & Son explain why bees should be more disposed to build an irregular mass of drone and worker cells on plain sheets than where there are no starters at all.

Our answer to the query was not our "opinion." as Mr. Hays supposed, but the result of our experience. About 15 years ago we put a plain sheet of wax, filling a whole Quinby broodframe, between two combs, in a very populous colony. The bees began immediately to build cells on it, but they started the work in S or 10 dif-ferent places at the same time; some working at the top, some at the mid-- dle; some preparing worker-cells. some others drone-cells. When the some others drone-cells. When the an incident round related in one of in winter does not cause disease. sheet was about finished it had a our Lord's parables, which runs thus: in winter does not cause disease. The above. I believe a full and fair statement of our writer's argument, and it looks plausible on first sight, independently from each other. The However, I like his practice better

answers of several bee-keepers on the same query show that they have obtained as bad results as we did. Mr. Hays' better success was probably due to the narrowness of the sheet nsed.

As to bees changing worker combs in drone comb, as Mr. Hays has noticed in his hives, we think that his bees are very much different than ours, for we have never seen it done. If sometimes they build drone comb on worker foundation, it is the fault of the comb foundation, or of the bee-keeper, not of the bees. If the wax used is not altered by the manufac-turer—if the sheet is prevented from stretching, either by its thickness or by 2 or 3 wires, all the cells will re-main worker cells.

For about 20 years we have advised bee-keepers to replace all the drone combs in their hives with worker combs; we did it ourselves by buying the combs of dead colonies around us, and we have not yet seen a single us, and we have hot yet seen a single worker comb replaced with drone comb. For 20 years we have had colonies which do not rear 100 drones yearly! Therefore, if Mr. Hays thinks that he obtained a result different from ours, he had better observe again, and with a little more care. Hamilton,+0 Ills.

For the American Bee Journal.

Does the Pollen Theory "Hibernate ?"

#### R. L. TAYLOR.

When I had read Mr. Wm. F. Clarke's article on page 468, a wicked thought for a moment took possession of me, that he was in the predicament of a certain attorney, who having been employed by the defendant to attend to the case, when the case came on for trial, found his brief consisted of this only: "No case—abuse the plaintiff's attorney." But on sec-ond thought I knew that Mr. C's character would never permit such a conrse, and that his skill and genius would always prevent its necessity.

I need not say how greatly I have admired hot say now greatly 1 have admired his frantic efforts to make it appear that the pollen theory has re-ceived its "quietus." the more per-haps because it does not seem to be of the kind that "hibernates." Posof the kind that indernates. Pos-sibly calmer treatment on his part would have a greater tendency to make it sleep. But I admire his efforts chiefly because he makes his statements squarely and positively, without "ifs" or "buts," or "in-my-opinions." No one can fail to know "bore he grants to stand even though where he wants to stand even though he may not always be found standing. He is, I believe, the father of the attempt to induce apicultural writers meekly to insert one of the above, or a similar qualifying word, with every statement, but when we consider his practice one is forcibly reminded of an incident found related in one of

than his precept. He gives as hard knocks as he can in a capital spirit, and will be content, no doubt, to take hard knocks given in the same spirit.

One is a little surprised at first that Mr. C. has not, in order to make his position impregnable at every point, squarely attacked Prof. Cook's argnment which seems to many to actually demonstrate the truth of the theory. If he would do so it would relieve many of us of most of our wintering terrors. His making a straw man out of a couple of detached phrases, taken their connection, pieced out out of with a like number from the writings of Mr. Heddon, and knocking that over, gives us hope, but no relief. And even hope wavers, for I fear he has made even the straw man too strong, for I am more than apprehen-

sive that *it* has not yet toppled over. Let me protest here against his over generosity in giving Prof. Cook all the glory of having given this whole thing its "quietus." Even if it were well to dispose of the spoils before they are captured. I insist that they belong to Mr. C., and at least when he brings the relief let his be the glory. and we may too suppress the glory : and we may, too. suppress our surprise at the course of his argument, for we may not hope to divine the plans of genius. No doubt many harder blows are in reserve. Indeed. I more than half believe that all his attacks hitherto have been purely feints.

In anticipation of the onsets yet to be made, let us look over the field to see as best we can how the contest now stands. Prof. Cook argues fairly now stands. Frof. Cook argues faily that the consumption of pollen in any considerable quantities by bees in winter, when they are long confined, from the nature of the food and the habits of the bee, is apt to result in an over accumulation of fecal matter, which courses the disease known as which causes the disease known as diarrhea, the great foe to the safe wintering of bees. He further shows that facts learned from the examination in many cases of the contents of the intestines of bees affected with the disease, supports his reasoning, and that his many experiments in and that his many experiments in wintering bees, with and without bee-bread, prove it true Many others of our most careful bee-keepers are satistied that they also have proved the theory true in the same way—by actual tests in wintering. To meet this argument and to show that Prof. this argument and to show that Pfor. Cook gives the pollen theory its "quietus," Mr. Clarke uses the fol-lowing argument, using for premises quotations from Prof. Cook and from Mr. Heddon, and I will put it briedy and in simple form that it may be the margared dir. computational definitions of the second definition of more readily comprehended :

more readily comprehended: Pollen is necessary for bees when they work: breeding is work, there-fore pollen is necessary for bees in breeding. And then: Pollen is nec-essary for bees in breeding: bees breed in confinement in winter with-out disease therefore the computer out disease, therefore the consumption of pollen by bees in continement

amination will see that it proves General conclusions nothing. drawn from *particular* premises. We may see how quickly the argument breaks down by re-stating the first syllogism, making the major premise general, as Mr. Clarke assumes the conclusion to be thus: When any work is going on in the hive, pollen is necessary for all the bees of the colony in order to keep their tissues intact; breeding is work going on in the hive -and we have not the conclusion he gets, but, therefore, when breeding is going on in the hive, all the bees of the colony require pollen to keep their tissues intact.

It is at once evident from this that he assumes that all the bees, or the bees generally, of a colony work when breeding is going on, whereas it re-quires proof. The nurse-bees may be a very small proportion of the whole. In the cases of successful winter breeding claimed by Mr. Hall and Mr. Barber, the bulk of the bees seemed to be "hibernating" on the outside of the hives.

Again, to make the conclusion of any validity in the further argument, it must first be proved that the bees actually use pollen to keep the tissues intact. Do they do it in conlinement when all the circumstances are favorable? Do they not under favorable conditions of temperature and food prefer to grow lean and die as of old age, rather than to risk bringing disease to their household by the con-sumption of pollen? This seems to be probable from the well known fact that in hives where there has been breeding during winter, much greater numbers of dead are found.

Does not the quotation which Mr. C. makes from Mr. Heddon with such strong expressions of approval, viz: "I am quite positive that there is something about breeding, whether in confinement or when the bees fly regularly, which is very depleting to them," tend to prove the same thing? Mr. Clarke makes "depleting" here synonymous with "waste of tissue," *i.e.*, that the bees grow lean. If that is the true meaning of it here, it indicates that the bees in nursing brood do not always use pollen to keep their own tissues intact, for if they did they would not become depleted in this sense; and who knows but that such is the devotion of the nurses to the young of the hive, that they forego the use of necessary food, they forego the use of necessary food, and so sacrifice their lives, unless after a time they turn to some other kind of work? But has he not given the word in its connection here a forced meaning? I hardly think that Mr. Heddon had in mind the state of the time of the individual here but the tissue of the individual bees, but rather the state of the colony-that it is depleted by the continual perishing of the nurses. This brings us to the same result, viz: that the nurses fail to use the food necessary to restore their perishing tissues. In either their perishing tissues. In either view the attempt to use the above quotation in piecing out an argument against the pollen theory, seems like a slip. However we may look at it by all this first part of the argument, by all this first part of the argument, so as to direct the spray well over the absolutely nothing is proved, and all combs and bees—not brushing off the

the further argument, as it gets its support only from the validity of this, must fall with it.

But granting for the sake of argument that the true conclusion is as he assumes it to be as he progresses in the argument, and we have this: When breeding goes on in the hive all the bees of the colony require and use pollen to keep their tissues intact; bees breed in confinement in winter without disease, therefore the consumption of pollen by bees in con-finement in winter does not cause disease. But after granting him his major premise, we find his minor premise subject to the same infirmity as was the major in the former syllo-gism, *i.e.*, while it expresses a par-ticular limited and exceptional fact which we may admit, he assumes that it expresses a general universal fact, viz: bees breeding in confine-ment in winter always do so without disease, which is not admissible, indeed, which is palpably contrary to the facts in general, except possibly a few isolated ones which only serve to make the rule more noticeable and undoubted.

Lapeer, - Mich.

[With this reply to Mr. Clarke, we much prefer to let this matter rest, while we devote our attention to something else.-ED.]

For the American Bee Journal

# Foul Brood—Prevention and Cure.

#### N. W. M'LAIN.

I submit to the readers of the AMERICAN BEE JOURNAL a prescription for the cure of foul brood, as well as one for its prevention :

Take of soft water, 3 pints; of dairy salt, one pint. Use an earthen vessel. Raise the temperature to 80<sup>°</sup>, Fahr.; do not exceed 90°. Stir till the salt is thoroughly dissolved. Now add one pint of warm soft water in which has been thoroughly dissolved four tablespoonfuls of bicarbonate of soda (use the crystal). Stir thoroughly. Àdd the crystal). Stir thoroughly. Add to this mixture sufficient sugar or honey to sweeten it, but not enough to perceptibly thicken it. Now add ¼ ounce of pure salicylic acid. Mix thoroughly. Let this mixture stand for two hours, when it becomes settled and clear.

Treatment.-Shake the bees from the combs, and extract as clean as possible. Now thoroughly atomize the combs, using the mixture and a large atomizer. Return the frames to the colony

If there is no honey to be obtained from the fields, feed honey or syrup to which has been added 3 table-spoonfuls of the mixture to each quart of honey or syrup. Stir well. The honey just extracted may be used without injury to the bees, if the mixture is added; but no more should be furnished thus is compared. be turnished than is consumed. Ato-mize the colony two or three times more, simply setting the frames apart

bees: three or four days should intervene between the times of treatment. The last may be given on top without removing a frame.

As a preventive, apply on top of the frames, or in any way by which the bees may get it. Also burn old dry bones to an ash, and pulverize. Mix up 1 gallon to each 50 colonies in the apiary, of the above mixture, adding enough sugar or honey to make it very sweet (say two or three times as much honey or sugar as would be a proper quantity for use in the atomizer). Stir in a full half-pint of the powdered bone ash. Place this gallon of mixture in, say four shallow vessels—perhaps bread pan feeders with floats on top—and stand these four in different parts of the apiary. You will be surprised at the rapidity with which the depleted colonies will recuperate and grow strong again. If you fear that the exposure of sweets in the apiary will induce robbing, the mixture can safely be fed the custo-mary way on top of the frames in the hive.

I would recommend that you give the entire apiary one application of the mixture prescribed for cure, as this treatment frequently prevents the presence of the disease where it the presence of the disease where it the presence of the disease where it was not before possible to detect it. The quantity prescribed for use by means of a large atomizer is sufficient to treat 150 colonies. Not reckoning the sugar or honey used, the cost will not be more than 15 cents. I have prescribed this treatment with entire satisfaction and uniform success for satisfaction and uniform success for the past two years. I will mention the facts in two or three of the api-aries for which I have prescribed this treatment:

1. Number of colonies in the apiary, 46; number apparently diseased, 13; number actually diseased, 28; disease so far progressed that the stench was very offensive in the yard ; bees crawling out of the hives to die, by tens of thousands; effect of treatment apparent in one day; a permanent cure in each case.

2. Number of colonies, 60; serious cases, 38; combs black and putrid; a few had already been burned; effect of treatment apparent at once; a permanent cure in each case.

3. Number of colonies, over 150; number of colonies diseased, 60; bees swarming out; stench from hives nauseating; combs black and rotten; brood putrid; whole apiary treated; disease immediately arrested; effect of treatment on affected colonies instantaneous, even on apparently hopeless cases; every colony cured; dis-ease eradicated, leaving no trace be-hind. Colonies all soon became strong, healthy and prosperous. For the purpose of further experiment, the combs of healthy and diseased colonies were exchanged ; combs from colonies were exchanged; combs from diseased colonies being given the healthy colonies, and the combs of healthy colonies placed in the diseased colonies. The treatment was applied to both alike. In every case the dis-ease would immediately disappear, and in meny cases the diseased color and in many cases the diseased colonies were soon more populous and prosperons than those which had had

no disease, and had been undisturbed. This treatment, which is simple, cheap, and easily and rapidly applied, seems to be efficacious in the most virulent forms of foul brood, and seemingly furnishes immunity from the dreaded scourge.

Aurora, & Ills.

For the American Bee Journal.

## Spring Management of Bees.

## W. H. STEWART.

In this locality we have cold weather about Nov. 20, and I put my bees into the cellar at that time. I carry them in after dark. My reasons for doing so are given on page 424 of the BEE JOURNAL for 1885. I have also given a description of my bee-cellar, but as it has become nnreliable, I will tell in what respect, and also how I have it now prepared. I at first made an excavation in the

side of a dry sand-bank, then walled it up with oak logs. I placed also oak 2 feet of straw, next 2 feet of sand, then 2 feet of straw, and finished with 2 feet more of sand. On the lower side I made the entrance. I walled up on the sides and covered it with plank, and banked up and covered 6 feet thick with sand. I hung one door even with the wall of the cellar, and another at the outer end of this entrance-room, thus making a deadair space between the two doors. I put a 4-inch pipe through the cover-ing, and left it open all winter for npward ventilation. By hanging a thermometer in this pipe with a cord reaching down to the centre of the cellar, I could draw it up at any time, and as I did so, I found that after the bees were in the temperature was generally 45° above zero.

This state of things continued for three years, and the fourth winter the mercury was never found above  $40^{\circ}$ . The reason of this change was that at first the two layers of straw made a kind of dead-air space between each layer of sand, and the under side of the roof never became cold; but the straw decayed, and allowed the sand to form a solid mass top to bottom; and as the roof was elevated like a mound, about 6 feet above the natural surface, the wind kept the snow off, and the roof froze through, and kept the cellar cold.

I have now built a large stack of wild hay on the cellar over the 4 feet of sand, and built out the entrance room so as to admit of the third door, which, I think, will hold the temperature again at  $45^{\circ}$ .

About March 20, or a little later, the weather in this locality becomes warm enough to make it safe to put the hives on the summer stands. As I examine them I generally find a little brood in 2 or 3 combs. In the fall I so manage them as to have the upper portion of the combs built out thick, and filled with winter stores; thus it is that what brood they now have is in the lower part of the combs; and although the upper portion has been emptied of most of the stores, yet the cells are too deep for breeding purposes, and also the lower portions of the combs (where the brood is found) are too far apart for breeding at this season of the year.

I then place a tent over the hive to prevent robbing, and have with me the honey-knife and the coffee-pot of hot water. I open the hive (smoke the bees a little) and then lift out the combs that contain the brood; carefully brush the bees down into the hive, and then trim the upper portion of the combs down to a %-inch thick-ness, and on returning them to the hess, and on returning them to the hive, I leave only 3% inch bee-space between them. I then place a comb containing honey next to the brood. When thus prepared, the queen will occupy nearly the whole of the sur-face of these combs before passing over to others that one yet arread over to others that are yet spread apart. This keeps the early brood in a compact shape until the weather gets warmer; and as I open the hive later, and find that the queen needs more room, I trim other combs, and move them closer together until the hive is thus snugged up and filled with brood. It is sometimes, when not too cold, a good plan to part the combs of brood, and hang an empty one be-tween them; but if this is done indiscreetly, the brood thus separated and not well covered with bees, is apt to be chilled. It will do when the weather is quite warm.

I generally find some colonies short of stores, and others having more than they need, and to make all equal, I change combs over from hive to hive until all are about alike. In trimming the top edges of the combs, it is sometimes necessary to cut through some honey that has not yet been used by the bees; but if one is careful not to drop any outside of the hive, no robbing will be induced. I have a dish with a cover to hold the shavings of comb and honey, and I do not allow robber bees to get a taste of it.

This explains why the combs in the brood-chambers were too thin in the fall to contain sufficient winter stores; and it will be apparent to all that combs thus thin, and cells so shallow, would necessarily have to be filled nearly to the bottom-bar to hold sufficient stores for winter and spring. Again, bees require empty combs to cluster on in winter. Combs that are full of honey, and so near together that but few bees can cluster between them, are too cold. If it becomes necessary to feed in the spring, I prefer to fill the combs with honey or sugar syrup, and hang them in the hive next to the brood.

I sometimes find queenless colonies in the spring, and some of them have plenty of bees and stores, and seem to lack nothing but a queen. (I do not like the idea of holding combs in the open air a long time in trying to look up the queen. One can very quickly ascertain whether there are eggs in the combs, and during the breeding season no eggs means no queen.) In this climate the nights, and many of the days are so cold that it is almost impossible to get a queen from abroad without her becoming chilled. I have found that if I give these queenless colonies combs containing eggs, they will rear a queen in due time, but at this season there are no drones, and we cannot get them flying before about June 1, and thus this queen would be so old before being mated that she could not make a successful mating; and so I allow her to live about ten days and then destroy her, and two days afterward I give the colony another frame of eggs and brood, and they rear another queen which will be in time for drones, and the brood thus given will keep up the colony. I have several times thus reared the third queen before one would be mated, and then the colony would give a good surplus that season.

About June 1 some of the strongest colonies begin to show plenty of bees and brood. From these colonies I sometimes take frames of hatching brood, and exchange them with weaker colonies for empty combs. This very much assists the weaker ones to get ready for the coming honey-flow. It is best, however, to be a little careful how we thus reduce the strength of our best colonies; for, if the season is too far advanced for this work, we may thus keep all so weak that a goodly part of the early flow will pass before we have any colonies ready for the supers. It is better to get surplus from a part of the colonies than to lose it all.

In early spring, and sometimes in the fall, the strongest colonies will begin to rob out the weaker ones. I have tried many ways that have been recommended to stop this robbing, but I have tried nothing that proved effectual after the work was well under way, but to carry the one that is being robbed to the cellar, and let it remain there in the dark two days.

Sometimes when bees are being over-powered by robbers, they seem to get confused and disorganized like they do when they are alarmed by smoke, and in that condition they are able to make but a feeble resistance; but if they are placed in the dark room for a short time they again organize, repair damages, and are again ready to defend their home. It is well to keep the entrance of the hives smaller in the season, and I prefer to have all hives face the southeast; this gives them the morning sun, and keeps out the northwest winds that sometimes are very destructive to the young brood in this northern climate in the springtime.

Some think it best to keep chaff or some other non-conductor around the hive in the spring. I do not like it. Hives thus protected do not get warmed by the snn, and the temperature remains about the same day and night, and "there is no let up," and "long continued cold" "is a giant" in the spring. When the hive has only single walls, and a single board for a cover, the sun will often so raise the temperature in the hive that the bees can safely break the cluster and fix up matters to their advantage. I never shade a hive in the spring.

Orion, 9 Wis.

## North American Bee-Keepers' Society.

FRANK L. DOUGHERTY.

The North American Bee-Keepers' So-ciety will hold its 17th annual convention Oct. 12, 13 and 14, 1886, at Indianapolis, Ind. The meeting will be held in Pfofflin's Music Hall, 82 and 84 North Pennsylvania Street, one of the most pleasantly situated halls in the city, having good ventilation and plenty of light. The Society head-quarters will be at the Occidental Hotel, corner of Wash-ington and Illinois Streets. The regular rates of this hotel are \$3 per day; special rates for those in attendance at the con-vention, \$1.50 per day.

rates for those in attendance at the con-vention, \$1.50 per day. The North western Bee-Keepers' Society, the Indiana State Society, the Eastern Indiana, with various county and joint societies will meet in union with the North American, making it one of the most important meetings of bee-keepers ever held in the country. Ever thing possible will be done to make the meeting pleasant and entertain-ing. An earnest, cordial invitation is ex-tended to all. The following is the programme for the three days:

three days :

#### FIRST DAY-TUESDAY.

Foreboon Session, 10 a.m.—Convention ealled to order. Address of welcome, by Gov. I. P. Gray; "Response" by the President, H. D. Cutting; "Welcome to the City," by Mayor Caleb S. Denny; "Thanks," Dr. C. C. Miller, President of the Northwestern Society. Calling the roll of members of last year. Payment of annual dues. Reception of new members and distribution of badges; reports of Sec-retary and Treasurer. A unouncements. retary and Treasurer. Announcements.

retary and Treasurer. Announcements. Afternoon Session, 2 p.m., Special Busi-ness.—Annual address of the President; "Bee-Studies," Prot. A. J. Cook, Agricul-tural College, Mich.; "Apicultural Jour-nalism." John Aspinwall, Barrytown, N. Y.; "Bee-Literature," Thomas G. New-man, Chicago, Ills.; "The Coming Bee-What encouragement have we to work for its advent?" R. L. Taylor, Lapeer, Mich. Subject for discussion, has "Apis Ameri-cana" been reached? Evening Session, 7:30 p.m.—Annonnce-ments. Miscellaneous business. Discus-sion of questions that may have accumu-lated during the day.

lated during the day.

#### SECOND DAY-WEDNESDAY.

Morning Session, 9 a.m.—Announce-ments. Communication. Call of the Northwestern Society to elect officers. Election of officers of the Indiana State Society. Call to order. "Rendering Comb into Beeswax," C. P. Dadant, Hamilton, Hils.; "Foul Brood," A. J. King, New York. Selection of place for holding meeting in 1887. Election of officers. Afternoon Session 2 and Amount

meeting in 1887. Election of officers. Afternoon Session, 2 p.m.—Announce-ments. Miscellaneous business. "Bee-Keeping and Apiculture," Prof. N.W. Me-Lain, U. S. Apicultural Station, Anrora, Ills.; "Feeding Bees for Winter," Jas. McNeill, Hudson, N. Y.; "Wintering Bees," Dr. J. B. Mason, Wagon Works, Ohio; Subjects for discussion. "Is the use of Foundation Necessary in Modern Bee-Culture ?" Are Perforated Honey-Boards a Success ?" Unassigned essays. Executed Search 7:30 n m — Announce-

Evening Session, 7:30 p.m.—Announce-ments, Miscellaneous business. Discus-sion of questions in question-box. Social communications.

#### THIRD DAY-THURSDAY.

Morning Session, 9 a.m.—Announce-ments. Miscellaneous business. Com-unnications. "A Talk on Hives," James Heddon, Dowagiac, Mich.; "Reversible Hives and Frames," J. E. Pond, Jr., Fox-quality.

boro, Mass.; "Drones and Drone Comb," W. Z. Hutchinson, Rogersville, Mich.; Reports of Vice-Presidents; "Progress of Bee-Keeping in Indiana," Jonas Scholl, Lyons Station, Ind.

Afternoon Session, 2 p.m.—Announce-ments. Miscellaneous business. Expla-nation of various articles on exhibition.

Many good things yet to be added to the programme are not sufficiently developed to give. Indianapolis, Ind.

1886.

Time and place of Meeting.

Sept. 16.-Eastern Indiana, at Richmond, Ind. M. G. Reynolds, Sec., Williamsburg, Ind.

Oct. 6, 7.-Kentucky State, at Frankfort, Ky. Jno. T. Connley, Sec., Napoleon, Ky.

Oct. 7.-Wls. Lake Shore Center, at Kiel, Wis. Ferd Zastrow, Sec., Millhome, Wis.

Oct. 12-14.-North American, at Indianapolis, Ind. F. L. Dougherty, Sec., Indianapolis, Ind.

Oct. 16.—Sheboygan Co., at Sheboygan Falls, Wis. Mrs. H. Hills, Sec., Sheboygan Falls, Wis.

Oct. 19, 20,-Illinois Central, at Mt. Sterling, Ills. J. M. Hambaugh, Sec., Spring, Ills.

Oct. 27-29.-Western, at Kansas City, Mo. P. Baldwin, Soc., Independence, Mo.

Dec. 1, 2.-Michigan State, at Ypsilanti, Mich. H. D. Cutting, Sec., Clinton, Mich.

In order to have this table complete, Secre tarles are requested to forward full particulars of time and place of future meetings .-- ED.

Bee-Keeping in Kentucky.-Jno. T. Connley, Napoleon, 5 Ky., on Sept. 6, 1886, writes:

The season has been rather an unprofitable one for bee-keeping throughout this State, yet all the apiaries so far as heard from are in good condition, and the apiarists are all cheer-ful and look forward for a good "honey year" soon. Bee-keeping as a business is gradually getting on a better footing through the educational influence of the bee-papers and bee keepers' associations, of which our State society is one of the hest.

Value of Alsike Clover.-S. J. Youngman, Cato, O Mich., on Sept. 1, 1886, says :

I wish to say in defense of the Alsike clover, that notwithstanding there has been the greatest drouth known in Michigan in 25 years, the Alsike produced a large crop of hay, and yielded a large amount of fine honey. I now have a piece in full bloom, and the bees working on it inely, from which had been cut a large crop of hay in July. The Alsike is a fine plant for hay, and stock of all kinds relish it greatly. I am now mowing it and feeding it to stock confined to the stable. I also regard it as one of the finest honeyyielding plants known, as it yields a large quantity and of the finest

Earthquakes and Bees.-Dr. J. P. H. Brown, Augusta, or Ga., on Sept. 7, 1886, writes :

For the past week old Mother Earth has had a violent attack of colic, and has been "quaking" in a manner not flattering to persons of weak nerves. Hattering to persons of weak nerves. From the papers all have learned of the destruction to the city of Charles-ton. Augusta fared much better, but still many buildings have been in-jured, and chimneys knocked down. At my place, four miles from the city, the first shocks were very heavy. The bouse rocked like a vessel at sea for a few seconds. But we sustained The house rocked like a vessel at sea for a few seconds. But we sustained no damage except a few cracks in the plastering, and a few broken vases. Courage and valor in battle avail much, but such qualities are worth-less in fighting earthquakes. This matter seems to be in the hands of a Higher Power. All the negroes, and very many of the whites, are very much demoralized. My bees took it very differently. In the morning, after the "quake," they went to work joyous and happy, gathering honey from sumac. What little philoso-phers these bees are ! phers these bees are !

Some of Bee-Bungler's Honey .-- P. J. England, Fancy Prairie. OIlls., writes :

Not long since I was in one of the leading grocery stores of Springfield, and saw some tin cans containing honey. They were ornamented with brilliant labels on which were high-sounding words. But the contents were almost *nauseating*. It is a shame for any man who claims to be a *scientific* bee-keeper, to put such stuff on the market.

Bees Still Working.-A. Wortman, Seafield, ~ Ind., on Sept. 6, 1886, says:

My bees have been doing splendidly for the past two weeks, gathering nectar from buckwheat and smart-weed, and other fall flowers. I had 6 swarms in August. I now have 6H colonies and 3 nuclei.

Curing Foul Brood with Coffee .--Dr. J. W. Vance, Madison, 9 Wis., on Sept, 2, 1886, gives his experience as follows :

I have just read Mr. Dennler's arti-cle on page 550, on "Coffee for Curing Foul Brood." I read last winter in a German agricultural paper the article quoted from the Militarartzlichen Zeitschrift, which gave the results of ex-periments made with coffee as an antiseptic. Last year I had the mis-fortune to have all of my colonies affected with foul brood. I discovered the disease late in the fall end of the disease late in the fall, and at that time, knowing only the destructive and starvation plans of cure, I destroyed all but two, intending if the two, which were the strongest and least affected, survived the winter, to treat them according to the Jones' starvation method. During the win-ter I read the article above alluded to, and determined to try it on one,

and also hearing of Cheshire's phenol treatment, I thought I would experi-ment with it on the other and see which was the better method of cure. Both colonies wintered well in the cellar, and when I took them out in found foul brood in each. I used powdered browned coffee, dusting over the combs and bees, three times, about a week apart. The last of July I examined them, and found them in a flourishing condition, and not a trace of foul brood in the hive. I regard the coffee as a successful remedy for the disease, easily applied, and not in the least injurious to bees or honev. I hope others also will test it. The coffee must be finely powdered in order to render it the most effective.

Egg-Bound Queen.-F. A. Gemmill, Stratford, Ont., on Sept. 6, 1886, writes .

I send a queen-daughter that is 2 months old. She is certainly a ferti-lized queen, but lays scarcely any-only an egg now and then. She is, I think, egg-bound. She is one of my own rearing. I have on several occasions found an egg attached to her. Will Prof. Cook kindly give his opinion of the case in the BEE JOURNAL.

[Such cases as are mentioned by Mr. Gemmill are not very rare. Sometimes the queens recover and become excellent; oftener they remain forever worthless. That such cases should occur is not strange. We find partially or wholly barren animals among all classes, and so such queens are not exceptional in their kingdom any more than in their species. This queen is a fine looking one, and I shall keep her till spring to see if she recovers. In most cases the best way is to kill such queens at once.-A. J. COOK.]

How I Sell my Honey .-- J. E. Cady, Medford, 9 Minn., on Sept. 6, 1886, writes:

The following is an outline of my manner of disposing of my honey : advertise in each of the county papers; then I use a business card, also a guarantee card signed by seven of our principal citizens. I often meet people who wish my name and address; others say, "Is this made honey, or is it made by bees?" I sometimes have had to swear in my honey, when an explanation of the method of taking extracted honey is necessary. This takes time, and time means money when away from home on expense. One of my business cards that I gave to a wagon maker, and which he tacked up in his shop, has sold 3 he tacked up in his shop, has sold a barrels of honey already to one man, and he says he shall need several barrels more. I have already sold over 4,000 pounds, and have nearly 6,000 pounds on hand; and the supers to come off of 100 colonies, some of which are full, not having been ex-

tracted since July 10. Then there are sections on 42 colonies, with a few more or less filled. I took 20 nicely-filled 1-pound sections out of 56 from one colony, two or three days ago. It has been very hot and dry here this season, and certainly it must have shortened the honey crop. W having a nice shower just now. We are

Partridge-Pea, etc.-Otto Bussanmas, Bevington, 9 Iowa, on Sept, 2, 1886, writes :

I send a plant with its flowers, which please examine and state its name and value. In this part of Iowa the season has been very dry, and yet there has been a fair yield of white clover honey. I harvested 3,400 pounds of white clover honey in 1-pound sections from 31 colonies, spring count. I increased them to 65 colonies. I could not do without the BEE JOUR-NAL for double its cost.

[The plant is partridge-pea (Cassia chamcecrista), and furnishes nectar in abundance. The flowers are very attractive to honey-loving insects, and are visited by such in great numbers.—ED.]

#### Convention Notices.

137 The annual meeting of the Keotucky State Bee-Keepers' Association will be held at Frank-fort, Ky., on Oct. 6 and 7, 1886. All interested in bee-culture are earnestly requested to attend and help to make this meeting a pleasant and profita-ble one. The State Centenniai will be celebrated at Frankfort, on Oct. 7, and excursion rates can be obtained on all railroads. A large attendance of bee-keepers is solucited. JNO. T. CONNLEY, Sec.

The St. Joseph, Mo, Inter-State Bee-Keepers' Association will hold its annual meeting on Wednesday evening of the Exposition week. Sep-tember 30, 1886. Arrangements are being made to have an interesting meeting. The place of hold-ing the meeting will be published in our local pa-pers on Tuesday and Wednesday a.m. E. T. A BBOTT, Sec.

25 The Illinois Central Bee-Keepers' Association will hold its next meeting at Mt. Storling, Ills., on Thesday and Wednes-day, Oct. 19-20, ISS6. J. M. HAMBAUGH, Sec.

The Sheboygan County Bee-Keepers' Asso-ciation will meet at Chaodler's Hall, at Sheboygan Falls, Wis., on Saturday, Oct. 16, 1886, at 10 a.m. MRS. H. HILLS, Sec.

The annual meeting of the Western Bee-Keepers' Association will be held in Pythian Hall (11th & Main Sta.), at Kansas City, Mo., on Oct. 27-29, 1886. P. BALDWIN, Sec.

The next annual meeting of the Michigan State Bee-Keepers' Association will be held in Ypsilaoti, Mich., on Dec. 1 and 2, 1886. 11. D. CUTTING, Sec.

The Eastern Indiana Bee-Keepers' Associ-ation will meet at Richmond, Ind., on Sept. 16, 1886. M. G. REYNOLDS, Sec.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides his own, with \$3.00, for one year, we will present a copy of this valuable book.

#### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 7 a. m., Sept. 13, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO

HONEY.--lt continues to arrive very freely The demand is light and sales are made chiefly a 120013C. Extracted la also quiet with prices uo changed. 6007C. BEESWAX.--lt is easier, and 23C. is about all

will bring. R. A. BURNETT, 161 Sonth Water St.

NEW YORK

NEW YORK. HONEY.—The market for the new crop of comb boney is just opening. We note an improvement la sales and prices. Most of the comb that has arrived is badly colored, which makes it second grade, which we suppose is due to a poor sensor and long finishing. We quote 18% crop aefollows ; Facey white in 1-1b. sections, clean and neat packages, 15@16c.; 2-1bs, 1@011c.; facey huckwheat 1-1bs, 11@14c.; 2-1bs, 1@011c.; facey huckwheat 1-1bs, 11@14c.; 2-1bs, 1@011c. White clover ex-tracted in kers and amall barrels, 6%@7c.; Calif-ornia extracted in 60-1b. cans, 5@5 1-2c.; Calif-ornia extracted in 60-1b. cans, 5@5 1-2c.; Calif-ornia extracted in 60-1b. cans, 5@5 1-2c.; BEEESWAX.—Prime yellow, 22@24c. MCCAUL & HILDRETH BROS., 34 Hudson St.

#### BOSTON.

HONEY.—One-lb. sections, white clover, 13@150; pound sections, 11@13c. Extracted, 6@8c. BEESWAX.—25 cts, per lb. BLAKE & HIPLEY, 57 Chatham Street.

#### DETROIT.

HONEY.—Best white in one-pound sections is bringing 14 cts. BEESWAX.—Firm at 23c. for fair quality. M. H. HUNT., Bell Branch, Mich.

#### CINCINNATI.

HONEY.-The market is very quiet. Demand from manufactherers is alow, and there is only a fair trade in new comb honey and extracted in square glass jars. Extracted honey brings 31-26 7c.; comb honey, 12 to 14c. for good to choice, in the jobbing way. Prices are low for all produce and no speculative feeling is noticed anywhere. Unless better prices are realized for other prod-uce, prices of honey are not likely to advance. BEESWAX.-It is in good demand and arrivals are fair. We pay 20c. for good yellow. C. F. MUTH & SON. Freeman & Central Ave.

#### CLEVELAND.

HONEY.—The demand for honey is not very lively at present, but prices are steady. Choice aew honey in 1-lb. sections is selling at 14c.; 2-lbs. 12@13c. Old honey is very dull at 10@12c. Ex-tracted, 6@7c. BEESWAX.—25c. A. C. KENDEL, 115 Outario Street.

#### KANSAS CITY.

HONEY.-The market is active and sales of the comb are large. Extracted is thrm with no stock in the city. We quote: One-pound sections of white clover, 13@14c.; dark 1-lbs., 11@12c.; 2-lba., 11@12c.; dark 2-lba., 8600c.; 2-lb. Call: white sage, 10@11c.; dark 2-lba., 8600c. Extracted white clover, 73@c; dark, 44g655c.; Calif. white sage, 54g66c.; dark 44g655c.; BEEESWAX.-=20@22c. CLEMONS,CLOON & Co., cor. 4th & Walput.

#### MILWAUKEE.

HONEY.-The market is about the same as when last reported-may be quoted a little lower to sell. Choice comb in 1-bacetions.126313; 2-ba.1163124 cents; dark not wanted. Extracted, white, in keys, 66.646c; same in the cans, 61-267c; dark ib barrels and balf-barrels, 5651-2 cts. BEESWAX.-No demand. A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

SAN FRANCISCO. HONEY,—The demand for honey remains very good for fine qualities, and they are readily taken for home consumption, and shipments to Europe aod the East at 465/4c, job here. Most of the honey is held at 45c, and more, and it seems that sooner or later such prices will be paid, as offer-ings are rather small. Comb honey is not sought after so far, hut with the colder weather more de-mand will come in, and as supplies are rather small. we anticipate full prices. We how quote 760/0c, as to quality, wholesale. BEESWAX.—It is dull, but huyers have to pay 226/23c. for choice lots. SCHACHT & LEMCKE, 122-134 Davis St. HONEY — Drives tax so low that honey.pro-

HONEY.-Prices are so low that hopey-pro-ducers are holding hack their product; atill the market is well supplied. We quote: Coub, ex-tra white, 84,610c.; off grades, 54,677cc. Ex-tracted white, 464,16.; amber, 35,6334c.; dark.3c. BEESWAX.-225,6025c. O. B. SMITH & CO., 423 Front Street.

THOMAS G. NEWMAN & SON, PROPRIETORS,

923 & 925 WEST MADISON ST., CHICAGD, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAGER.

# Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name: many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

A New Crate to hold one dozen one-pound sections of honey .- It has a strip of glass on each side, to allow the honey to ho seen. It is a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We ean furnish the material, rendy to nail, for 9 cts. per crate. Glass 1 %c. per light, extra.

Bees for Sale .- We offer to sell a few strong colonies of Italian bees, in ten-frame Simplicity hives, at \$6.00 each.

Red Labels for one-pound pails of honey, size 3x41/2 inches. - We have just gotten up a lot of these Labels, and can supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1.000 fnr \$3.00; all with name and address of apiarist printed on them-by mail, postpaid.

Yneea Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable. When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 cents a dozen ; if sent by mail, add I cent each for postage.

#### **OUR CLUBBING LIST.**

We supply the American Bee Jonrual one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

| Price of both.                   | Club |

Simmins' Non-Swarming System is the title of a new English bee-book. The author claims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

Sweet Clover, or Melilotus Alba, is almost the only resource for honey now, on account of the late severe July drouth. If the seed is planted in September, it will come up this Fall and bloom next year, in its second season.

We have a large lot of this seed on hand, and offer it at the following Reduced Prices, by express or freight :

 One poind
 \$0
 20

 " peck=15 lbs
 2
 25

 " bushel=60 lbs
 7
 00

 " sack=80 lbs
 8
 00

It will pay to buy it by the sack and sell it again in smaller quantities.

237 If you want a chance to make some money, and provide pasturage for the bees during the Fall months, this is your opportunity !

Italian Queens,-We have a few untested queens which we can send by return mail. Three for \$2.75; six for \$5.00; twelve for \$9.00. For Tested, double the prices.

"Cash in Advance" is the rule, but no longer than six months of grace can be allowed on the small sum of one dollar, Subscriptions may commence at any time, and discontinuances may be ordered at any time when arrearages are paid up.

#### Home Market for Honey.

To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honcy as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remnnerative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the bee-horder to the beekeeper who scatters them)

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantlty of it.

#### System and Success.

23 All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

The larger ones can be used 'for a few celonies, give room for an increase of numbers. and still keep the record all together in one book, and are therefore the most desirable.

Our Book Premiums.-To encourage all our present readers to get one or more additional subscribers we will present 25 cents' worth of books for every new subscriber (accompanied with \$1 for one year's subscription), sent direct to this office. Thus for five new subscribers with \$5, the getter up of a club gets \$1.25 in valuable reading matter, to be selected by himself from our list on the second page of this paper. It will pay you to devote a few hours to the interests of the BEE JOURNAL. Every one who keeps bees ought to take it. We will furnish sample copies free in any quantity to those who intend to get up clubs. We expect to get 5,000 new subscribers before Jan. I, 1887.

When Marketing Extracted Honey, it is a sad blunder to use barrets helding from 300 to 500 pounds-they are too large to be desirable for the trade, too bulky to be handled with care in transportation, and too dear to be lucrative to the producer, for honey put up in such large barrels is subject to a discount of one cent per pound, because of the difficulty in disposing of it without repacking and dividing into smaller lets.

Colored Posters for putting up over honey exhibits at Fairs are quite attractive, as well as nseful. We have prepared some for the BEE JOURNAL, and will send two or more free of cost to any one who will use them, and try to get up a club.

Frank Cheshire's new book on Bees and Bee-Keeping, can be had at this office .-Vol. I, bound in cloth, \$2.50, postpaid.

"Don't Stop "-that is what many write to us about their papers, when their time is nearly out. One subscriber says : " It is not convenient for me to send the money now to renew my subscription. It runs out with this month ; but don't stop sending it. I will get the money to you within three months." Such letters are coming every day, and so for the present we have concluded not to stop any papers until requested to do so.

Advertisements.

In use 30 years.

Mr. W. Z. Hntchinson has taken a car load of bees, honey, and implements to the Michigan State Fair. That speaks volumes for bis enterprise, zeal, and entbusiasm, and puts to shame those who ought to have exhibited at the Illinois State Fair-but failed at the critical moment.

Wr. F. M. Johnson sends us a dollar for a Weekly that is "always on time," and "ene that all bee-keepers should read, and then take heed-especially beginnera." He gives no name to the paper, but, of course, we send him the AMERICAN BEE JOURNAL. knowing that it " fills the bill of particulars.' He certainly is also on time, for his dollar pays for it until Jan. 1, 1888.

Round Trip Tickets to the Convention .- As Manager of the National Bee-Keepers' Union, we have made arrangements with the Indianapolis lines of railroad for round trip tickets from Chicage to Indianapolis and return to Chicago, good from Monday to Saturday, Oct. 11 to 16, 1886, for \$7.30. The fare one way is \$5,50, and this is one fare and one-third. To obtain these tickets, it will be necessary to get a certificate signed by Thomas G. Newman, statiog that the bearer is entitled to the reduced fare. New, do not wait until you come to Chicago to get this certificate, for we may have gone before you come. Send for the certificate at once; and it will be sent by return mail.

To Indianapolis there are three routes from Chicage - the Kankakee, the Pan Handle, and the Chicago & Eastern Illinois. On all of these the reduced rates for a round trip for \$7.30 can be had upon the presentation of a certificate signed by Thomas G. Newman. We wish it to be distinctly understood that we have not been able to secure rates for any other points, only a round trip from Chicago to Indianapolis and return to Chicago. Several have written to us to get them reduced rates on other routes, and from other points-and we should be glad to do so, but have not been able to do it. We make this announcement te save correspondence on the subject. The tickets are good frem Monday to Saturday, Oct. I1 to 16, 1886.

Hee-Keepers at the Zoo.-A Philadelphia paper gives the following as a report of the meeting of the bee-keepers at the Zoological Gardens at Philadelphia, Pa. :

The members of the Philadelphia Bee-The members of the Philadelphia Beo-Keepers' Association held their third annual eonvention and pienie at the Zoological Garden. President Dr. Henry Townsend, of 1514 Vine street, presided, and John Shall-cross aeted as Secretary. Among the well-known members present were: H. N. Twining, Joseph M. Neaglei, Prof. Brien, Artbur Todd, J. H. Lutgers, Thomas David-son, and Miss Annua M. Crew, of Moorestown, N. J. English charts of all varieties of bees and their wonderful workings were hanging over all the wells of the building while over all the walks of the building, while tables loaded with variegated species of fruits stood in the centre, a present from

fruits stood in the centre, a present from Mr. Neaglei A large number of ladies and misses had everything prepared in the way of eatables, and hives of bees were placed promiseuously around the rooms. Dr. Townsend, at the opening of the session, said that although they had a choice between bees and ele-phants, he preferred to learn more about the between. Use were concerned anone on book

opening of the session, said that although they had a choice between bees and ele-phants, he preferred to learn more about the bees. He read several papers on bees and consumers of honey, and regarding the prospects this year for honey, said : "This bas not been what could be called a first-class season, by reason of the dryuess in the early part of the year, and the wet weather during white clover bloom time. Reports from nearly all parts of the United States indicate a general falling off in the quantity. In the vicinity of Philadelphia the crop was not only small, but not of very good quality, and not much has been done in the bee-line."

Arthur Todd, owner of the bees on exhibi-tion at the "Zoo," furnished the gathering with a new and fine quality of honey ice with a new and fine quality of honey ice-eream. Nearly all the afternoon was de-voted to a discussion of bees. Head-keeper P. J. Byrne entertained the assemblage with several well-rendered solos. Thanks were tendered to Mr. Neaglei and Superintendent Arthur Irwin Brown of the "Zoo." Mr. Todd and other members of the association expect to exhibit bees at the State Fair.

With honey lee-cream and instrumental and vocal music, as well as excellent speeches, that convention ought to be a success.

How to Put on a Postage Stamp.-We get many letters with the stamps entirely gone. The persons putting the stamps on the letters had lieked all the mueilage off, and bence the stamps would not remain when they were put on the letters to start them. In rubbing together in the mail sacks they loosen and are lost. A correspondent in the Boston Traveller tells how to put ou the stamps in the right way. He says :

A man can always learn something if he will only look about him. I was at the Post Office Department the other day and 1 noticed an employee busy affixing stamps to envelopes. Every time he moistened the right hand corner of the envelope and then placed the stamp upon it. I asked him if there was any advantage in wetting the envelope instead of the stamp, and he said : "You notice that I moisten the envelope first; well, I do that because it is the right way. There is a right and a wrong to every-thing, and consequently there is a right and way. There is a right and a wrong to every-thing, and consequently there is a right and wrong way to put on postage atamps. It is impossible to moisten a stamp with the tongue unless a small proportion of the gum adheres to it. Now this gum is by no means injurious, but then the Department does not advertise it as a health food; so the only way left is the right way, and that is to moisten the envelope first." After listening to this brief statement I felt as though I had to this brief statement I felt as though I had emerged from the deep shade of ignorance to the glorious aunlight of knowledge.

We Regret to learn that the wife of Mr. T. M. Cobb, of Grand Rapids, Mich., died on the 1st inst. The BEE JOURNAL condoles with Bro. Cobb in his bereavement.

A Laughable Item was in the London Daily News of Aug. 23, 1886. It is in a report of a law court, where a man asked for redress from trespassing bees. Here is the item :

item : CURIOUS APPLICATION.—In the eourse of the atternoon a man eame before Mr. Chance and stated that he was in the employ of Mr. Jousiffe, whe merehant and cordial manufacturer, of South-Place, Kennington. For some days applicant was almost unable to attend to his work, owing to swarms of bees coming to the place, and he wanted to know what he could do to prevent it.—Mr. Chance : Where do the hees come from ?— Applicant : From a place not far off where hives are kept.—Mr. Chance : Why do they come to where you are ?—Sergeant Under-wood : The bees no doubt, your worship, are attracted by the cordials and spirits.— Mr. Chance : I suppose they prefer this kind of thing to flowers. (Laughter.)—Ap-plicant : I don't know, but I do know I am often stung and unable to get any rest from the pain. I could not get on with my work to-day owing to the bees.—Mr. Chanee I am afraid I cannot assist you. The bees are not included in the list of animals to be muzzled or kept under control. (Laughter.) They can scarely be described as ferocious. (Renewed laughter.)—Applicant : But they sting very sharply.—Mr. Chance : I am sorry for it, but I do not see how I can help you. There have been un or regulations at present to keep bees under control. Perhaps you might trap them or kill them.—Applicaut : I have killed numbers, but more seem to come.—Mr. Chance : Perhaps you could protect yourself by putting on a wire mask, and wearing gloves.—Applicant : I don't know what to do. I have had to go to a doctor in consequence of the atings.—The applicant thanked his worship and with-drew. CURIOUS APPLICATION .- In the course of

Would'nt a man have a fly-time of It when trying to muzzle a few iraseible bees I How lively they would make it for the muzzler l How numerous they would seem to him I and what an "object" they would make him appear in a few minutes ! Justice Chance could find no law for muzzling them, and if he could, he would'nt try it the second time.

Honey in Ventura Co., Calif.-A correspondent in the Ventura Free Press gives his opinion as follows on this subject :

his opinion as follows on this subject: As there have been conflicting reports published in reference to the yield of honey in Ventura county this season. I have ob-tained personal reports from thirty of the leading bec-keepers. These reports give the number of hives of bees on hand before swarming, also the amount of honey each bee keeper produced; most all extracted honey. The average yield per hive was 150 pounds. I then obtained from the county assessor the number of hives assessed before swarning, which was 7871. Supposing there were 129 hives not given in, it would make in round numbers 8,000 hives, which, aver-aging 150 pounds each, would give to the country 1,200,000 pounds, or 600 tons of honey. The quality of honey in this county was never better than the present crop. Near the coast the quality is not so good, and the amount only half as much as that produced twenty miles or more back from the ocean, where it was warmer and less foggy. foggy.

Present Indications point to a large and enthusiastic meeting at Indianapolis. There have been several additions to the programme, and more still will be made, in the future.

No More Back Numbers can be supplied to new aubscribers. Our stock is all exhausted. We give this notice because many are asking for back numbers from last January, and all will please take due notice.

#### Replies by Prominent Apiarists.

It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them : get them returned, and then flud space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask fer them to be inserted here.-ED.]

Disposing of Surplus of Bees.

Query, No. 307 .- It is necessary for us to reduce the number of our colonies onehalf. They have swarmed butouce, and are consequently all very strong. Will it be any advantage to double up the bees of 2 colonies in one hive instead of killing half, provided we can do it without their fighting? -H. & S.

I think it would be best to unite at least the young bees.—C. C. MILLER.

Kill half the colonies if you cannot sell them. Do not unite very strong colonies.—W. Z. HUTCHTNSON.

You do not say why you want to double them up. I should say let them alone.—H. D. CUTTING.

No. There is no advantage in doubling strong colonies.-G. M. Doo-LITTLE.

Do not kill, but double up. Do this late in the evening and they will not fight. If any choice of queens, de-stroy the poorest and cage the others to be sure of their safety.—J. P. II. BROWN.

If your hives are without bottoms, for wintering out-doors, unite in the fall by setting one colony on the other with honey cloth or board be-tween, with small openings, and then remove and let them altogether after two or three days, and leave them in the double hives all winter. If wintered inside, simply set one colony on another as you put them out in the spring. There are some decided ad-vantages in this method. - II. R. BOARDMAN.

If my colonies were of average size, I would never unite other bees with them, no matter what had to be done with the surplus bees. If it be-comes necessary to do so, it is as proper to kill bees as it is to kill any domestic animal for the benefit of mau.-G. W. DEMAREE.

What do you wish to kill any bees for ? If all are strong, why double up ? Leave them as they are, as pos-sibly a severe winter may follow and kill off as many colonies as is desired or desirable. I can see no advantage so far as safe wintering is concerned, in doubling strong colonies. It can be done, however, without any per-ceptible loss from fighting.-J. E. POND, JR.

My experience teaches me that it would not. Such, however, may not always be the case in all localities and in all seasons, though I think it is a rule.-JAMES HEDDON.

It is better to double up colonies than to kill a part where it is neces-sary to reduce the number. As very large colonies do not winter so well as average sized ones, the doubling up should be done as soon as the seathan Sept. 1. Doubling up is easily done by making one of the colonies to be united, queenless for nine days. Then cut out queen-cells and unite by using a little pepermint water.-G. L. TINKER.

## Age of Queens.

Query, No. 308.-1. Will an Italian queen live longer than a black one? 2. How long does a queen live and keep her colony well furnished with eggs ?-- C. K. S.

1. No, we think not. 2. Three or four years.—DADANT & SON.

1. No. 2. Usually about 3 years .-G. L. TINKER.

1. I think not. 2. From 2 to 4 years. -H. D. CUTTING.

1. I presume not. 2. I have had queens live and remain excellent for five years. This is rare, however .--A. J. Cook.

1. I think there is little difference as to length of life of the queens of the two races, if both have the same treatment. 2. From 3 to 5 years, with me.-G. M. DOOLITTLE.

1. Probably not. 2. It varies very much; may be 4 years, may be not a year. Some think it pays to super-sede all queens over 2 years old.—C. C. MILLER.

1. I do not know that she will. 2. The average life of a queen is 3 years of good service. First and second years the most prolific; third year on the decline.—J. P. H. BROWN.

2. If she is not "horse whipped" by spreading the brood, or exhausts herself by keeping a large brood-nest filled with brood, she may last four years.—W. Z. HUTCHINSON.

1. I know not. There is no reason why she should, other things being equal. 2. Ordinarily a queen will prove prolific for 2½ to 3 years. I had, last season, a queen 5 years old that was as prolific as any I ever saw. About 3 seasons, however, is the average with myself.—J. E. POND, JR.

1. I have not noticed any difference in the longevity of the queens, but Italian workers are longer lived than Germans. 2. Good ones live and keep up to the laying standard 3 to 4 years, and when they fail they fail all at once, and are superseded.—JAMES HEDDON.

1. I do not think the matter has ever been tested on a scale of sufficient magnitude to decide it with any certainty. So far as I am able to judge and Bec-Keeping, can be had at this of there is little if any difference in the Vol. I, bound in cloth, \$2.50, postpaid.

longevity of the two races. 2. It dequeen. In other words, it depends upon her constitutional strength as to how long she will be useful. She ought ordinarily to do two years' good service. In exceptional cases she may do good work for 3 or 4 years. -G. W. DEMAREE.

## Building Combs on Wired Frames.

Query, No. 309 .- When only a strip of foundation 4 inches wide is used on a wired Langstroth frame, will the bees build the rest of the comb so that the wires are in the middle of the comh ?-H. M.

That we have never tried, nor would we like to try it.-DADANT & SON.

I do not know, but I think not always.-C. C. MILLER.

If the wires are drawn taut, I think they will.—W. Z. HUTCHINSON.

They will build it near enough for all practical purposes.-H. D. CUT-TING.

I should not use wire when using only a strip of foundation.-G. M. DOOLITTLE.

Not always. I prefer my frames to have tri-angular comb guides, and the foundation securely fastened to this guide; then I have no use for wires, which are at best a nuisance to the bees.—J. P. H. BROWN.

I always use full sheets with wire. I should suppose the wire would trouble some with only starters.-A. J. Cook.

The experiment has not worked well with me. I avoid wiring frames in all cases as much as possible. I much prefer combs well built in the frames without wire.—G. W. DEM-AREE.

No; but why use wires in brood-frames? They are a needless and useless expense, besides being a great annoyance to the bees.-G. L. TINKER.

My experience is more limited than I meant that it should be at this time, but in the few cases tried, the bees have followed the wires perfectly every time.—JAMES HEDDON.

They do with me. I have as an experiment given a starter only 1/2-inch where on where traines, and found the comb was built directly on the wires. The frames, however, should be wired plumb centre, and hung ex-actly plumb in the hive.—J. E. POND, JR. wide on wired frames, and found the

Colored Posters for putting up over honey exhibits at Fairs are quite attractive, as well as useful. We have prepared some for the BEE JOURNAL, and will send two or more free of cost to any one who will use them, and try to get up a club.

Frank Cheshire's new book on Bees and Bee-Keeping, can be had at this office .-

Explanatory .- The figures BEFORE the names Indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apjarist is located near the center of the State named;  $\eth$  north of the center;  $\clubsuit$  south;  $\circlearrowright$  east; •O west; and this & northeast; ~ northwest:  $\circ$  sontheast; and 9 southwest of the center of the State mentioned.

For the American Bee Journal.

# Markings of Hybrid Bees.

#### G. M. DOOLITTLE.

In answer to Query, No. 297, I find that five out of the ten answering that query, say that hybrid colonies will have individual bees in them, which will show one and two yellow bands; while two others speak of two yellow bands only on such individual specimens. Now in all candor I wish to ask those seven persons if either of them ever saw an individual bee that had any yellow on either one of the first three horny scales or segments of the abdomen, beginning at the thorax, which did not have yellow on all three of them. If so, they have seen something which I never saw.

To be sure, I have seen bees which appeared to have but one or two yel-low bands, from a casual glance, but close inspection always showed that if there was any yellow on the bee, that bee had yellow on all three of that bee had yenow on all three of these first bands. The best of Italians appear at times to have only two bands, while such bees spoken of by Mr. Pond, which show four yellow bands, have times of showing but the three bands. three bands. This is wholly owing to the conditions of their surroundings causing them to appear thus, while the same bees under other cir-cumstances appear very differently. The only way to tell perfectly just how a bee is marked, is to cause it to become tilled with honey and then place it upon a window, when all the markings on the segments of the abdomen will show forth clearly. Will not these persons take some of their one and two banded bees and examine them as here given, and then tell us what they find ?

Mr. G. W. Demaree once wrote that the meanest hybrids he could find, showed (when examined as above) yellow in splatches, etc., etc., on all three of the bands, if the yellow was shown on any, or words to that effect, which set me to looking into the mat-ter more closely than 1 had before, when I soon found that he was cor-rect. Why we talk of one and twobanded bees is because we do not stop such bees as appear to have but one and two yellow bands.

In June and July, when brood-rearing is going on rapidly so that all bees over three days old are filled with chyme, or with honey for wax secretion, and the field bees are com-ing in loaded with honey, a colony of bees show off to their best advantage, as all except those under three days old look much the same as the filled bee does upon the window. At such a time almost any one would call a 34-blood Italian colony good enough, and speak of it as containing all three. banded bees, as did Mr. fleddon of his hybrid colony in answering the query mentioned above.

Now wait until October or November, when the bees are getting ready for their winter's nap, and look at the same colony and they will be pronounced one and two banded bees by The reason for this is that the seg-ments of the bee's abdomen are made so that one shuts over the other, telescope fashion, and when not in active employment the abdomen is so contracted or drawn np by one ring sliding into the other that all except the widest yellow band is covered up, so that the bee looks as if it possessed but one yellow band.

To show more perfectly what I mean, we will take one of Mr. Pond's four banded bees, and a close exami-nation will show the first horny seg-ment next to the thorax to be composed of yellow and black, the yellow lorgely predominating. The next largely predominating. The next segment is the one having the most yellow on, and is the one yellow band which is always seen at all times, if any yellow is observed upon the bee. On good specimens the black on this segment is very narrow, often being hardly discernible, only as a mere line around the upper part of the abdomen. The next segment is (except on ex-cellent specimens) about one-half yellow and one-half black; while the fourth segment will appear about as the second, only that the black takes the place of the vellow, so that only a small line of yellow appears on the front of the segment. In extra speci-mens I have seen this fourth segment have as much yellow upon it as is usually upon the third, while the lifth segment showed the yellow line around it. This is the way one of Mr. Pond's bees will look when shown at its best. Now let another bee sting it and in less than one minute the segments will so slide into one another, as the bee contracts in death from being stung, that all would pro-nounce the bee a two-banded bee, while if it showed but the three yellow bands while at its best it would so contract that but one yellow band would show enough to attract attention.

Bees, when first hatched, or when they go into their quiescent state preparatory for their winter's nap, appear which has been stung to death, so that a good colony of Italians appear almost like hybrids when looked at late in the fall.

My way of examining a colony of bees is to carefully look the bees over bees is to carefully look the bees over till the poorest bee possible is found. Ciation met during the Fair. The

This bee is caught and killed. I now take the head of it between the thumb and forefinger of my left hand, when the point of the little blade of my jack-knife is inserted just under the horny scale of the lifth segment of the abdomen. I then put my thumb-nail down on this segment and draw out the abdomen, carrying it over and around the finger holding the bee's around the linger holding the bee's head. If when thus tested the bee shows three clear, well-cut yellow bands, the colony is pronounced good enough for any use I may wish to put it to. If, on the contrary, the yellow is in splatches, or mingled with the black, or spots of black appear in the yellow, the colony can hardly be called as time a thorough-bred as can be obtained. bred as can be obtained.

## The Iowa State Fair.

#### EUGENE SECOR.

The honey and apiarian supply exhibit at the State Fair was a very creditable show. Every one who took part in it has reason to feel proud of the display. It was by far the best I have ever seen in the State. The exhibit at the New Orleans Exposition did not compare with it. The great bulk of it was comb honey. The disburk of it was comb honey. The dis-play of extracted honey was not very large, but was put up in very attrac-tive and tasty packages. Glass pails, and the Muth square bottles were the principal ones used.

The comb honey was shown mostly in pound packages, either in glassed shipping cases or tastily arranged on graduated shelves. Nearly all the modern hives were on exhibition. Not only the Shuck Invertible and the Hill Telescope hive, but a sort of cottage hive which looked something like a smoke house with lean-tos on two sides. Mr. Poppleton and myself stopped to examine it and to listen to the laudations of the person in charge. It was arranged for side and top storing, and had as many apartments as a Saratoga trunk. Its chief value, however, according to our informant, seemed to be that its capacity was equal to two common hives, and therefore it would yield twice as much honey. "You see," said the person in charge, "the way we man-age is this: The first season we do not attempt to get any honey, but let it fill up with hose and the wet see it fill up with bees, and the next sea-son we have a colony twice as strong as a common one, and get twice as much honey!" Farm and county rights for sale. We did not invest. No practical bee-keeper would give 10 cents a cart load for such newfangled patent contraptions.

Most of the modern implements were on exhibition, and also the different races of bees in observatory hives. The crowds of interested questioners who huddled around the exhibit, showed that these object lessons were being studied.

attendance was quite good, and the interest encouraging. It may be said to the credit of the association, that through its influence, that is, through the wise management of Messrs. Pop-pleton and Clute in arranging the premium list, the fine show was due. The premiums were liberal. That fact probably accounts for the interest taken by bee-keepers in the Fair, and was prohably the canse of the large display.

The State association is as yet in its infancy, but the benefit to be de-rived from it is already apparent. The advantages which such an or-ganization affords by way of ac-quaintance with co-laborers, the unity of action and pnrpose which it in-spires, cannot but be beneficial.

## Summer Management of Bees.

## W. H. STEWART.

About the middle of June our strongest colonies are ready for the supers. Those that are ready, and have their work well done in the brood-chamber, will begin to lay out on the alighting-board in small clus-ters during the heat of the day, and will have plenty of patch-work of new white comb at the top-bars, and attached to the cover board attached to the cover board.

White clover is now in full bloom, and I add a second-story like the one that contains the brood-combs. I bring up from the brood-chamber a frame of batching brood, fill its place with an empty comb or a frame of foundation, hang this frame of brood in the centre of the super, hang an empty comb each side of the brood, and if I have no more empty combs I fill the balance of the super with full frames of foundation. If frames frames of foundation. If frames only partly filled with foundation are hung in the supers, the bees will fill the balance of the frame with drone comb. If I have plenty of empty combs I prefer to fill the supers with them instead of foundation. Brush down all the bees from this frame of brood that is in the super, to make sure that the queen is not left to deposit eggs above. The same cover-board that was on the brood-chamber covers the super.

Thus prepared and previded with extra room, the bees will go imme-diately to work and fill the two frames in left to have their own way they will soon have all full, if the honey-flow is good. But if the frame of brood is allowed to remain there the queen is apt to deposit eggs in the lower part of the adjoining combs, and thus fill the super one-third full of brood. Thus it is better to remove this brood after two or three days, and give it to some weaker colony in exchange for an empty comb; but if no other colony has room for it, then move it over next to the wall of the super, and it will not be likely to in-duce the queen above while the brood to remain in the hive. When I no-2nd. Dr. H. Besse, of Delaware, wax-

is hatched out, and then the comb will be filled with honey.

Now, we have come to the time that calls into action all the brain and muscle that the apiarist possesses. The work in the aparts possesses. The work in the supers must be closely watched, and as soon as the combs are sufficiently advanced, the honey must be extracted, or the super must be raised up and a third hive (or sec-ond super) filled with empty combs or foundation must be placed between the brood-chamber and this super No. 1 that is now nearly full. It will not do to let the bees lay idle for a moment at this time, for we have now only a few days in which we are to obtain our harvest, and if everything is not most closely attended to at this origin then our that the base have crisis, then all that we have done, or may do through the remainder of the year, will avail us nothing.

year, will avail us nothing. If one would wish to obtain the best quality of honey, then it is bet-ter to thus "tier-up" the supers, and allow the honey to remain with the bees until it is thoroughly cured. But if it is desired to get the greatest pos-sible amount of honey, and to evap-orate it mechanically, then it is better to extract it as soon as it is capped half way down the comb. If the sec-ond super is not given, and the combs ond super is not given, and the combs are left after they are capped half way for the bees to complete the capping over the entire combs, it will be found that the last part of this work will advance very slowly.

It is time now that we begin to expect natural swarming, and it has been calculated that after we have thus prepared our bees for storing thus prepared our bees for swring surplus, it is better to keep the entire force of the colony at work together, than to allow them to divide their strength by casting a swarm. This fact has often prompted the question, "How can we prevent natural swarming?" Many ways and means have been devised and given, and yet every convention. I, for one, doubt whether we will ever be able to keep bees in a prosperous condition through the forepart of the summer, and at the same time prevent natural swarming. I have, however, demonstrated the fact that bees, after they are pre-pared as above for "storing surplus," can be allowed to swarm and still retain the full working force, or so nearly so, that no practical difference can be perceived. I have given a full explanation of my plan on page 329 of the BEE JOURNAL for 1885. This plan may be so carried out as to allow the bees to cast the first swarm, and never an after-swarm, and never reduce the working force of the old colony.

For a few days before a colony casts its first swarm, the hive will be crowded full of bees, and during the heat of the day large clusters will often hang on the outside of the hive and remain idle until the temperature is reduced in the hive. I think that bees behave thus more for the fear that their combs will melt, than because of the want of air to breathe. These idle bees could just as well be

tice them thus clustering out, I raise the hive-covers (not enough to allow bees to pass out or in), and slip the point of a small wedge into the open-ing, and the pent heat passes out; thus a healthy current is immediately moving up through the hive, and the cluster outside of the hive seems to be soon made aware of the fact, and be soon made aware of the fact, and will all enter the hive in a short time, and resume work. This plan works much better than giving extra ven-tilation below and none above. These wedges must be taken out at sundown.

Orlon, 9 Wis.

## For the American Bee Journal.

## The Ohio State Convention.

#### EARLE CLICKENGER.

The bee-keepers of Ohio convened at State Fair on Sept. 2, 1886, and the following are a few of the questions answered at that meeting :

Who has had any experience with Syrian or Cyprian bees? Mr. New-love claimed good results from Cyprians, and said that they are good workers but rather vindictive. Dr. Besse argued in favor of Syrians as being productive.

A. Benedict does not want too much late breeding in the fall. Mrs. Culp does not pay any attention to stimu-lating brood-rearing in the fall. J. Irick gave some good experience in stimulating and wintering bees. Mr. Jones, of Delaware county, claimed that he lets his bees take their natnral course.

Mr. Benedict does not want too many late young bees reared in the fall, and compares them to late, unfeathered chickens, consuming more food in the first three weeks of their lives than afterward.

Is there any better bee than the Italian? No. Would it be a good plan to introduce all the different strains of bees in the same apiary? Yes.

Is it best to remove old combs ? Dr. Besse replied that old combs were the best to winter bees on, with the honey near the bees.

Earle Clickenger, of Columbus, said that he extracts his honey when partly capped; places the honey in jars in a warm room at a south win-dow, leaving one cloth down in the honey, and another tied over the top. He finds that the honey will evaporate and thicken as well as when left on the hive, and with less expense and work.

It was confirmed that the display of honey on exhibition was the best ever shown in the State. The following is a list of premiums awarded : A.S. a list of premiums awarded: A.S. Goodrich, of Worthington, on comb honey, 1st premium; on extracted honey, 1st; on comb and extracted, 1st. Earle Clickenger, of Columbus, on comb honey, 2nd premium; on extracted honey, 2nd; on comb and extracted, 2nd; on honey-extractor, 1st; on bee-feeder 2nd; on bee-live.

extractor, 1st premium; thin foundation, 1st; shipping-crate, 1st. Chas. Melane, of New London, best 12 sections, 1st premium; crate of comb honey, 1st. Aaron Benedict, Benington, nucleus of Italian bees, 1st preton, nucleus of Italian bees, 1st pre-mium; display of queen bees, 2nd. C. E. Jones, of Delaware, heavy comb foundation. 1st premium; shipping-case, 1st. J. W. Newlove, of Colum-bus, queen-bees, 1st premium; nu-cleus of bees, 2nd; wooden feeder, 1st; extractor, 2nd. Elias Cole, of Ashley, Bincham, hee, smoker, 1st premium; Biugham bee-smoker, 1st premium; uncapping-knife, 1st; bee-veil, 1st; bee-hive. 1st.

Columbus, O Ohio.

## Gleanings. Sweet Clover for Honey.

#### J. A. GREEN.

There is a great deal of sweet clover in this locality, growing along the river banks and other waste places, as well as along the roads, which in some places are lined with it for miles. I find that most persons are apt to regard it as a nuisance along the roadside, and many land-owners wage war on it with more or less persistency and success. Some of the objections which they make to it are well founded, while others are un-founded or unimportant.

The principal reason why it is objected to, I think, is the fear that it jected to, I think, is the fear that it may prove a noxious weed. It is a strong, rapid grower, readily becom-ing established, usually holding its own tenaciously when once it gets a start, killing out other plants, and spreading from year to year. These are the recognized qualities of the worst weeds; and the farmer who sees it march along the highway and settle down in front of his place, as though it had come to stay, is apt to be alarmed at the thought that some be alarmed at the thought that some day it may perhaps take a notion to invade his fields in just that way. His fears are groundless, though. Its seed will not start in a close sod; cultivation readily kills it; and even after it has taken complete possession of the soil, close mowing, so as to prevent any seed from maturing for two successive seasons, will eradicate it completely.

I have ridden for miles along a road where all the space between the fences, except a narrow wagon-track, was thickly covered with sweet clover, yet not a single plant was to be seen inside the fields. I have occasionally seen sweet clover growing inside the fence along the roadside; but it is a suggestive fact that it is almost always the old tumble-down fence that lets the sweet clover through, while a good fence keeps it from the well-tilled fields beyond, as com-pletely as it repels stray stock. There is a moral here, if you go deep enough.

Now, what can we say in favor of sweet clover, to the man who cares sweet clover, to the man who cares nothing about its value to the bee-keeper as a honey-producing plant? I can only say that it often takes the

place of less desirable plants, and that its modest blossoms with their grateful perfume combine to render the highway beautiful and fragrant. Can we say anything more practical?

Many who object to the rapid spread of melilot on the highway, accuse the bee-keeper of planting it, when they themselves not only cultiwhen they themselves not only culti-vate the ground, but sow its seed. Sweet clover, unaided, can do little to extend itself. Its seed is too heavy to be carried far by the wind, and it is not provided with any means of attaching itself to passing objects. The most efficient agent in distribut-ing its seed is the man who leaves the ordinary track for the roadside when the roads are muddy in the spring. In this way the surface of the ground is broken up and prepared for seed, while the wheels of his wagon and the feet of his horses, sinking into the ground where seed fell the autumn before, pick up por-tions of the soil filled with the seed and carry it along for rods, and some-times for miles, and there drop them to form a new nucleus of growth. Sweet clover is apt to spring up wherever any grading of roads is done; and the man who plows the roadside for the purpose of scouring his plows, though an enemy to humanity in general, is a friend to the bee-keeper in a sweet clover district.

While under favorable circum-stances the seed will grow and do well if sown at any time of the year. it will be much more apt to grow on uncultivated ground if sown in the fall, so the snows and rains of winter and spring may beat it iuto the ground.

The sweet clover honey gathered here is nearly if not quite as light colored as that from white clover, while the flavor is, in my opinion, superior. When the honey is un-mixed it requires no expert to tell that it was actioned from arout that it was gathered from sweet clover, especially if freshly gathered. In extracting newly gathered sweet clover honey, the current of air com-ing up out of the extractor is laden with a perfume as distinct and un-mistakable as that experienced hy holding a bunch of the blossoms to the nose.

Dayton, & Ills.

## For the American Bee Journal.

## Sugar for Winter Stores, etc.

## J. H. ANDRE.

For several months past this subject has been quite thoroughly dis-cussed in the BEE JOURNAL. A great deal of it has been interesting, while some has been amusing. Some claim that it puts the price of honey down, and builds up the sugar business.

Suppose one does not use an ex-tractor at all, but works his bees for comb honey; he has no honey to feed

pound, which will make syrup of the same consistency for less than half the cost per pound, does he make or lose? If he has extracted honey to feed it is a little better, but now suppose he takes it and trades pound for pound of sugar and uses it instead of a honey (I prefer a pound of sugar to a pound of honey for feeding purposes); he disposes of his honey and gets sugar which answers his purpose better, certainly in quantity, and, so far as I can see, in quality also, for according to popular opinion it is no use to feed in the fall (see page 516), and not in the spring until pollen begins to come in ; and at any time it does not make that daubing work that honey is apt to, unless care is used, and as it has but little odor it is not apt to call robber bees.

The usual price for extracted honey will purchase about one and one-fourth pounds of sugar for one-pound of honey, and if it will answer just as well, is it not like using a rake all day with half of the teeth out for the sake of saving one standing handy by in perfect order, to use honey instead of sugar? I fail to see how anything can be lost in disposing of an article and purchasing another that will answer the same purpose at less cost.

If my memory is right, sugar becomes cheaper each year, and if feed-ing it to bees helps the trade it must do it by an increase in the amount sold, instead of increase in the price. I have used sugar in the spring for the purpose of hurrying up breeding, and also to help till up the brood-chamber, for I do not think one will get much surplus with a large empty brood-chamber, and I think for each pound of syrup fed, costing less than 5 cents per pound, I have received 3 pounds of comb honey. In regard to getting a name for selling sugar-honey, I am not at all afraid of it; each section is labeled "warranted pure," meaning that it was gathered from the flowers, and it is a pretty dear job to accuse of adulteration without proof. I make no secret whatever of telling wherever I sell my honey that I feed sugar in the spring.

Buckwheat furnished an unusual quantity of honey this season. For several days bees came in heavily laden late in the evening, and during a bad drouth too. They hardly ever work upon it here in the afternoon. But as I predicted some time ago, it all went into the brood-chamber, with the exception of a few strong colonies. Some stored 20 pounds of surplus from it. I shall be thankful if they have secured enough for winter stores. It is quite likely it will be mostly used in brood-rearing, and leave many colonies light in stores, but otherwise in a prime condition for winter.

One of my colonies gave me over 100 pounds of surplus; another S5 pounds. The average will be about 50 pounds per colony, spring count.

I wish to give a description of a knife that I use: Take a piece of cross-cut saw plate of ordinary thicka cold-chisel will cut it, or if the chisel will mark it, do not draw the temper. Cut out a piece 71% inches long, leave one end from 21% to 214 inches wide, run it down tapering 4 inches in length to 1½ inches, also 1½ inches at the end. Dress off the edges smooth drill three holes through the handle part, get a good piece of wood for a handle a foot or more in length, and dress one end of it in the shape you wish it for a handle. It should be quite large. With a ripsaw split it in the centre far enough for the handle, slip in the knife, fasten with screws and saw off the handle the length you wish. (Apple wood makes the best handle.) Do not grind the blade too thin nor too sharp. It should also be hard and

stiff. It is one of the neatest things about an apiary to clean sections and hives or pry frames loose. Three hours' work was all the time it took to make mine, and I would give \$5 for one for one season if I had 20 colonies of bees to take care of, rather than do without one. If one cannot get the plate steel of the right thickness, it would be best to send to some cutlery manufactory and get it made, for a com-mon blacksmith would not be apt to make a good one.

Lockwood, 9 N. Y., Sept. 6, 1886, ?

For the American Bee Journal. Convention at Indianapolis.

WM. F. CLARKE.

MR. EDITOR :- Your editorial remarks on the above subject, on page 563, are timely and impressive. They are well calculated to make us all,

"Walk thoughtful on the sad and solemn verge Of that vast ocean we must sail so soon."

It affects me much to think how few are left of the "original charter members" of the North American Bee-Keepers' Society. I think you are in error when alluding to Prof. Cook as having been present at the meeting of Dec. 21, 1870. He was one of the most active in getting up the meeting, but, if my memory serves me correctly, he was not there. You as "the only ones found among the workers of to-day," who were on the committee that framed the constitution. Is not Elisha Gallup still "to the fore" as an "active worker" in California? I shall make a great effort to be at the Indianapolis meet-ing, and it looks very much as if I should have to say, if present, "I only am left!"

With the utmost good nature, perfor speaking of the forthcoming meet-ing as the "National Convention." From the outset, it has been "Inter-national" and "Continental." We From the outset, it has been "International" and "Continental." We canadians are very sensitive on this point, and want to have it duly recognized at all times. I must admit that where the canadians are very sensitive on this point, and want to have it duly recognized at all times. I must admit that where the canadians are very sensitive on this point, and want to have it duly recognized at all times. I must admit that where the canadians are very sensitive on this point and want to have it duly recognized at all times. I must admit that where the canadians are very sensitive on this point and want to have it duly recognized at all times. I must admit that where the workings of God's law where the workings of God's law of over 200, only one proved faulty,

the programme looks very "Na-tional," as there is not a Canadian on it; but we are told there are "many good things yet to be added," which are not "sufficiently developed." I shall therefore hope that this de-ficiency will be supplied in a revised programme.

It is unfortunate that the convention comes at a time when several of our most prominent Canadian bee-keepers will be absent in England. D. A. Jones, President Pettit, R. Mc-Knight, and S. Corneil are at the great Colonial Exhibition at Kensington, England, at which Canadian beekeepers are making a grand display of honey with a view to creating a more extensive British market for that product. Owing to their absence, I fear there will be a kind of baulk in connection with the annual meeting of the Ontario Bee-Keepers' Associa-tion, which should be held next week, but which it is proposed to convert into an informal "bee-talk."

I have not yet heard of any other Canadian beside myself who proposes Canadian beside myself who proposes being present at the Indianapolis Convention, but when I meet "the brethren," as I expect to do next week at Toronto, I shall do my best to persuade some of them to go. It will be too bad if I have to "play a lone hand" as I did Dec. 21, 1870; nevertheless, even in that case, I shall try have dut locest to goor one point! try hard at least to score one point!

Guelph, Ont.

[Upon further investigation, we rather think that Prof. Cook was not present at the meeting on Dec. 21, 1870. Mr. Gallup has for more than ten years been lost sight of in beekeeping circles; only once in awhile even writing a few lines for publication; he certainly is not "one of the workers of to-day." As to our use of the words "National Convention," Mr. Clarke is correct. It should be called "International" or "Continental." It is so generally called the "National Society," that we for once fell in with the crowd. We hope that there will be a large attendance at the International Convention of Bee-Keepers at Indianapolis.-ED.]

For the American Bee Journal.

## Wintering Bees. etc.

#### O. N. BALDWIN.

Mr. G. F. Robbins, on page 567, asks for witnesses on the "pollen theory." He gives the evidence in brief that has been written out at length in the BEE JOURNAL, to show why bees die with diarrhea. If bees die from wintering on natural stores, our great King of the universe made a great mistake when He created the bees with an instinct to gather the nectar and pollen from flowers, and

and see how carefully and wisely each cog fits its fellow pinion, we shake our head and say, thy foolishness is our wisdom.

It is hardly reasonable to think that those who advocate that bees will not winter on natural stores as well as sugar, really believe it is a fact. There is nothing in it, absolutely nothing. If you put your bees away in a temperature of  $40^\circ$ , with plenty of good nat-ural stores, in a dry, dark place, with ventilation top and bottom, so that their breath will not mould and sour their food, you will not lose a colony from their eating pollen.

I obtained 4 colonies from a neighbor last fall, about Nov. 1. They had scarcely any honey, but were strong in bees. I moved them into my honey-house and transferred them on foundation in continement. 1 then rendered the pollen, honey, wax, and strained all I could through a sieve, and added sugar and water to make 10 gallons of thick syrup. I took the was off the top when all was cold and fed the rest to the bees. These bees were not allowed to have a flight till Dec. 31, when they were taken out of the cellar (where they were removed to from the honey-house after feeding), and were left out to fly four days during the warm weather of the first of last January. On Feb. 16 they were again put out, and two of the strongest colonies were dead, but. upon examination they had not died until they had eaten all of the pollen and honey (died for want of pollen). The two still alive were put back and fed after having a flight, and taken out again on April 1 to stay.

I keep my bees in a dry cellar, I keep my bees in a dry cellar, light, tight, at a temperature of about 40°, with ventilation top and bottom sufficient to keep the combs from molding, and I never lose any only from the want of pollen and honey. Try it, and you will never have to save your bees by giving them taffy.

I notice that Mr. F. A. Ticknor says on page 568, that the apiarist who does not get an average of 150 pounds of honey and one swarm from each colony, spring count, is not up to the standard in bee-culture. I would like to put Mr. Ticknor and his bees on our pasture for one season, when I think I would convince him that this world is not all a garden of Eden for bees to work in. Yet I consider that I have done well to get 50 pounds per colony, when my neighbor, not 40 rods away, has not obtained 50 pounds from 30 colonies the whole season, and another only 125 pounds from 40 colonies.

In answer to Query, No. 302, to pre-vent after-swarms, the method given by G. W. Demaree is par excellence. I have tried it, and I am satisfied that it is the most practical plan. But I do not just understand how to keep bees from issuing the first time, pro-vided one has all the bees he wants, and does not desire increase.

and I now believe that it is not nec-essary to ever have a failure. The trouble is not in the queen, as has been so much reported; she may be fertilized at any time within an hour after she crawls out of the cell, or when she is 20 days old.

Clarksville, 3+ Mo.

#### GEO. H. HOYLE.

The following are some of the facts I intend to prove; and I hope I state them plain enough, that those who wish to argue the question, can see exactly the position I take: 1. That the disease is not conta-gious, in the manner generally sup-

posed.

2. That it cannot be cured by drugs or starvation.

3. That it does not appear (of any moment) in a good honey season.

4. That most cases can be cured by extracting and boiling the honey and feeding it back; and that any case can be cured by feeding good honey or sugar syrup; except in a very few rare cases where the fault lies with a puny, no-account queen.

I claim that the chief cause of this disease is bad honey or honey-dew. Whether some of the inferior honeydew gathered by the bees is poisonous to the larvæ, or whether it lacks the necessary essentials for the larvæ's healthy development. I am unable to say. It is certainly one way or the other.

A little over a year ago, when I was trying to cure my bees of foul brood, I was as firm a believer in the germ theory as any of my readers can possibly be; but since having a great deal of experience with the disease, and having read every thing on the subject in the bee-papers, I am firmly convinced that bacteria never attacks the larvæ of the honey-bee except when the larvæ are weakened, or ill from some other cause; and, that there is no remedy known that will benefit a colony of bees afflicted with the disease, unless it is accompanied by good healthy food. In fact the food is all that is necessary.

It has been a puzzle to a great many bee-keepers, why bees would carry the disease in the honey and not on their bodies. Considering how small the spores are said to be, and regard-ing the disease from the germ-theory ing the disease from the germ-theory stand-point, that they do not carry the disease on their bodies is a won-der indeed. That "the disease is carried in the honey," is admitted by nearly every writer on the subject; although the germs in the honey have yet to be discovered by the microscopist. I say it is in the honey too, but not the spores of the bacteria, but that the honey is from some other cause unit for the use of bees in brood-rearing. As to the bees carrying the disease in the honey, why, certainly if the honey is unfit for the larvæ in one hive it is unfit for those in another.

To those whose bees have the disease, I wish to say that if they were to burn everything connected with their apiary, and commence again, their bees would be just as apt to have it next year as they will be if they keep the same combs they have now. The advocates of the different cures have sufficient reasons for their beliefs, and I respect them as much as I ever did; for 1 do not believe (as some writers seem to) that in order to gain popularity in my belief, I must depreciate the works and good understanding of those who happen to differ from me.

Mobile, 9 Ala.

## For the American Bee Journal. The Season of 1886, etc.

#### ASA PINKERTON.

When the honey season commenced I had 106 colonies, the most of them in pretty good condition, but I was behind with sections; yet I thought I was all right, as I had the best kind of a hired man, and we had the garden and field work all in good shape. But just when the honey season commenced my man was taken sick, and continued so for a month, so that left too much work for myself. and I was depending upon a neighbor to furnish me with sections, and he got behind and let me get clear out of sections twice before the honey season was over.

But after all the trouble, I got a little honey, and increased my bees to 170 colonies. 1 have taken off 5,164 pounds of comb honey, and I think I have 100 or 200 pounds to take off yet. and I will have over 6,000 pounds to take on yet, extracted honey. I feel that I have been paid for my trouble, if I did work hard, and you can guess whether I had to work or not, as for quite awhile that I had from 5 to 12 swarms I put all second-swarms per day. back.

I told a man one day that the time would come that we would have the bees trained to swarm and go into the hive themselves, and that same day, just after dinner, I had a large swarm come out, and they made a few whirls and came over the top of the cherry trees and right down to the ground and into a hive that I had placed on a stand three or four days before. That That was June 12, and they filled their hive and stored 56 pounds of honey in the sections. I had one swarm issue on June 7, and I picked up the queen in front of the hive, and she had no sign of a wing. I hived them, and they filled the hive and stored H2 pounds in the sections, and the old colony stored 79 pounds in the sections. The best colony I had that did not swarm produced 142 pounds in the sections.

I notice on page 551, a chapter of lamentations written by Joe King. I am not acquainted with the gentleman, but I think that the bee-stings and the wonderful quantity of honey, and great heaps of money, must have affected his mind as well as his nerves, or else his house is not so very strong, as I have been told by a lady

that he only has a few bees and about a wagon load of honey. For myself, I have not been alarmed yet, though I sleep under 4,000 pounds, and eat under 5,000 pounds of honey, and I never think of getting "sweetened up." I have been selling from 25 cents to \$39 worth every trip, and I do not have any fears of the bank's breaking, as long as I can furnish them plenty of money; nor I do not fear burglars, as long as it is warm enough so I can sleep with the doors and windows open. My pockets are all right, and it they do wear out, a ½-pound of honey will get cloth for a new pair. that he only has a few bees and about new pair.

Should the above appear in the BEE JOURNAL it might be the means of Mr. Joe King and his neighbor beekeepers getting better acquainted. Marshalltown, Olowa, Sept. 1, 1886.

#### For the American Bee Journal.

## Feeding Sugar to Bees. H. E. HILL.

I think that few, if any, will dis-pute Mr. Ilutchinson's claim, that "whether lowering the price of honey will put bee-keeping down, depends altogether upon what lowers the price." But if the price is lowered as the result of producers' giving the public occasion to believe that honey is obtained by feeding sugar (which Mr. H. acknowledges to be a fair objection to the use of sugar), are "beekeepers more prosperous than ever ?" I think not.

Then Mr. Hutchinson broadly re-fers to "sugar feeding," the "ex-tractor," "comb foundation," etc., as "improvements in bee-keeping." I frankly acknowledge this to be too rankly acknowledge this to be too deep for my comprehension, as I have yet to learn why the use of an article that ("fairly") gives grounds for suspicion, thereby decreasing the de-mand, and consequently the price of our product, should be regarded as an 'improvement.'

As another excellent feature of sugar to bee-keepers, Mr. Hutchinson infers that by its use the cost is re-duced. This needs only to come before the notice of some benevolent enthusiast to cause a repetition of the "Wiley" sensation. I think the article, as it is copied from one paper to another, will stand: "A promi-nent Michigan apiarist says," etc. However, we will suppose again, that by the use of sugar the cost of pro-ducing honey could be reduced 25 per cent., and as the result of giving the public "fair" ground for making "unjust accusation" and circulating false statements, the returns from our business are reduced 40 per cent., is the prosperity of bee-keepers advanced by the practice ?

I have never known any one to dispute that the extractor was an improvement in apiculture, and with one or two exceptions I believe comb foundation was heartily welcomed by all as a decided improvement; but when an "improvement" requires several years of writing up to convince a very small per cent. of bee-keepers that it is otherwise than an absolute curse to our business, and its advocates are compelled to ac-knowledge that it "may" give cause for unjust accusation. I think the term "improvement" is scarcely applicable.

Thanks, Mr. H., for your correction, and if you will act in accordance with the suggestion, by stating "the pro rata loss of bees wintered on sugar stores compared with that of those wintered on natural stores," although it may not assist your argument a very great deal, you will confer a favor upon many readers of the BEE JOURNAL.

With regard to "Shall we stop using foundation?" Foundation is made from pure beeswax, which is solely the production of the apiary, and certainly its use should not be abandoned on the grounds that "sngar feeding" is objected to. Titusville, 5 Pa.

## For the American Bee Journal, Experiments in Bee-Keeping.

#### F. M. JOHNSON.

In three Langstroth and two American hives placed in a dry, dark cellar, with no extra ventilation, I observed that with the temperature at 36° (during a cold spell last January), the colonies (all strong) were buzzing quite lively. At the same tempera-ture in February, they were all quiet, the 5 colonies, however, seemed a little nneasy, having closed top frames except a row of small holes across the centre of the frames. Moisture would condense and drip from the hives. When taken out on March 18, the combs were damp and moldy, which was not the case with the other 3; having porous material over them, not half a tea-cupful of dead bees was taken from all of them, and no sign of any disease.

At the commencement of apple bloom I transferred those in Ameri-can hives into Langstroth hives, which were first to swarm. All did well until the drouth was fairly on, when they loafed about as too many others do that do not produce honey, or anything else, in fact.

To experiment, I used plain foun-dation starters in sections on four different hives, placing from two to ten in different parts of the case; in every instance the bees would nearly or quite lill the sections where pressed foundation was used, and would not work on the plain, only as they were compelled to, which is in harmony with the answers given to Query, No. **2**S3.

of dividing the sections into groups of two to five, by wood and tin sep-arators; but I could perceive no difference as to straightness of combs or ortherwise.

I use sections  $5\frac{1}{4}x5\frac{3}{4}x1\frac{3}{4}$  inches, three tiers with  $\frac{1}{2}$ -inch divisionboards, which fills the case; or two tiers crosswise of the frames, with 1/2-inch division-board, which I prefer, with the ends of cases rabbeted for shallow frames. I can change from producing comb honey to extracted in the whole or in a part at any time with the same case. The division-board is flush with the top of the sections. A strip of thin iron  $\frac{3}{4}$  of an inch wide, put on with two small screws, renders the case invertible; which I have tried with good results. I prefer a bottom-board just the size of the hive,  $\frac{5}{8}$  or more thick, with a cleat  $\frac{7}{8}x1\frac{1}{2}$  inches nailed on its back end, and one 5 inches halled on its back end, and one 5 inches wide at the front end, which is 3½ inches for alighting-board, with the end of the bottom-board beveled also. The inner edge of the end board of the hive prevents storms from beating into the hive. It is clamped or hooked to the bigs. to the hive.

Augusta, Iowa.

## North American Bee-Keepers' Society.

#### FRANK L. DOUGHERTY.

The North American Bee-Keepers' So-ciety will hold its 17th annual convention Oct. 12, 13 and 14, 1886, at Indianapolis, Ind. The meeting will be held in Profilin's Music Hall, 83 and 84 North Pennsylvania Street, one of the most pleasantly situated halls in the city, having good ventilation and plenty of light. The Society head-quarters will be at the Occidental Hotel, corner of Wash-ington and Illinois Streets. The regular rates of this hotel are \$3 per day; special rates for those in attendance at the con-vention, \$1.50 per day. vention, \$1.50 per day

The Northwestern Bee-Keepers' Society, The North western Bee-Keepers' Society, the Indiana State Society, the Eastern Indiana, with various county and joint societies will meet in union with the North American, making it one of the most important meetings of bee-keepers ever held in the country. Ever thing possible will be done to make the meeting pleasant and entertain-ing. An access cordial invitation is ex-

ing. An earnest, cordial invitation is ex-tended to all. The following is the programme for the

three days :

FIRST DAY-TUESDAY.

First DAT-TUESDAT: Forenoon Session, 10 a.m.—Convention called to order. Address of welcome, by Gov. I. P. Gray; "Response " by the President, II. D. Culting; "Welcome to the City," by Mayor Caleb S. Denny; "Thanks," Dr. C. C. Miller, President of the Northwestern Society. Calling the roll of members of last year. Payment of annual dues. Reception of new members and distribution of badges; reports of Sec-retary and Treasurer. Announcements. retary and Treasurer. Announcements.

I also tried one tier of sections with open sides as well as top and bottom, in the centre of case with division-boards out, so that they might have fair sailing over and around them. They went into the end tiers first. I think they will answer in hot weather with a good flow of nectar. I do not want them, or plain foundation either. I also tried Dr. Tinker's suggestion,

Evening Session, 7:30 p.m.—Announce-ments. Miscellaneous business. Discus-sion of questions that may have accumulated during the day.

#### SECOND DAY-WEDNESDAY.

Morning Session, 9 a.m.—Announce-ments. Communication. Call of the Northwestern Society to elect officers. Election of officers of the Indiana State Society. Call to order. "Rendering Comb into Beeswax," C. P. Dadant, Hamilton, Ills.; "Foul Brood," A. J. King, New York. "North American Bee-Keepers' Society—Past, Present and Future," Rev. W. F. Clarke, Guelph, Ont. Selection of place for holding meeting in 1887. Elec-tion of officers. tion of officers.

tion of officers. Afternoon Session, 2 p.m.—Announce-ments. Miscellaneous business. "Bee-Keeping and Apiculture," Prof. N.W. Mc-Lain, U. S. Apicultural Station, Aurora, Ills.; "Feediog Bees for Winter," Jas. McNeill, Hudson, N. Y.; "Wintering Bees," Dr. J. B. Mason, Wagon Works, Ohio; "Solid Truths relative to the Ap-icultural Interests of the east coast of Vo-lusia county, Florida," by John Detwiler, New Smyrna, Fla. Subjects for discussion, "Is the use of Foundation Necessary in Modern Bee-Culture ?" "Are Perforated Honey-Boards a Success ?" Unassigned essays. essays.

Evening Session, 7:30 p.m.—Announce-ments. Miscellaneous business. Discus-sion of questions in question-box. Social communications.

#### THIRD DAY-THURSDAY.

THIRD DAY-THURSDAY. Morning Session, 9 a.m.-Announce-ments. Miscellaneous business. Com-munications. "The National Bee-Keepers' Union," by Thomas G. Newman, Chicago, Illinois. "A Talk on Hives," by James Heddon, Dowagiac, Mich.; "Reversible Hives and Frames," J. E. Pond, Jr., Fox-boro, Mass.; "Drones and Droue Comb," W. Z. Hutchinson, Rogersville, Mich.; Reports of Vice-Presidents; "Progress of Bee-Keeping in Indiana," Jonas Scholl, Lyons Station. Ind. "The Future of Bee-Culture," G. W. Demarce, Christiansburg, Kentucky. Kentucky.

Afternoon Session, 2 p.m.-Announce-ments. Miscellaneous business. Expla-nation of various articles on exhibition. Indianapolis, Ind.

#### Convention Notices.

The annual meeting of the Kentucky State Bee-Keepers' Association will be held at Frank-fort, Ky., on Oct. 6 and 7 1886. All interested in bee-culture are earnestly requested to attend and help to make this meeting a pleusant and profita-ble one. The State Centennial will be celebrated at Frankfort, on Oct. 7, and excursion rates can be ohtained on all railroads. A large attendance of bee-keepers is solicited. JNO. T. CONNLEY, Sec.

The St.Joseph.Mo. Inter-State Bee-Keepers' Association will hold its annual meeting on Wednesday evening of the Exposition week. Sep-tember 30, 1886. Arrangements are being made to have an interceting meeting. The place of hold-ing the meeting will be published in our local pa-pers on Thesday and Wednesday a.m. E. T. Abhort, Scc.

The Shebaygan County Bee-Keepers' Asso-ciution will meet at Chandler's Hull, at Shebaygan Falls, Wis., on Satarday, Oct. 16, 1886, at 10 a.m. MRS. H. HILLS, Sec.

The annual meeting of the Western Bee-Keepers' Association will be held in Pythian Hall (11th & Main Sts.), at Kansas City, Mo., on Oct. 27-29, 1886. P. BALDWIN. Sec.

The next annual meeting of the Michigan State Bee-Keepers' Association will be beld in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTING, Sec.

The southern Illinois Bee-Keepers' Associ-ation will bold its next meeting at Benton, Ills., on Thursday, Oct. 21, 1886. F. H. KENNEDY, Scc.

#### Local Convention Directory.

1886. Time and place of Meeting. Oct. 6, 7.-Kentucky State, at Frankfort, Ky. Jno. T. Counley, Sec., Napoleon, Ky. Oct. 7.-Wis. Lake Shore Center, at Kiel, Wis. Ferd Zastrow, Sec., Millhome, Wis. Oct. 12-14.-North American, at Indianapolis, Ind. F. L. Dougherty, Sec., Indianapolis, Ind. Oct. 16.—Sheboygan Co., at Sheboygan Falls, Wis. Mrs. H. Hills, Sec., Sheboygan Falls, Wis. Oot. 19, 20.-Illinois Central, at Mt. Sterling, Ills. J. M. Hambaugh, Sec., Spring, Ills. Oct. 21.-Southern Illinols, at Benton, Ills. F. H. Kennedy, Sec., Duquoin, Ills. Oct. 27-29.-Western, at Kansas City, Mo. P. Baldwin, Sec., Independence, Mo. Dec. 1, 2.-Michigan State, at Ypsilanti, Mich. H. D. Cutting, Sec., Clinton, Mich.

17 In order to have this table complete, Secretarles are requested to forward full particulars of time and place of future meetings.-ED.

Favorable Season.-W. J. Cullinan, Mt. Sterling,+o Ills., on Sept. 9, 1886, writes:

This season may be classed among the favorable seasons for this locality. the favorable seasons for this locality. My bees averaged 60 pounds of comb honey and 11 pounds of extracted up to Sept. 1, after leaving them ample stores for winter; and they are now storing honey as rapidly as at any time during the summer. I could have secured 150 or 200 pounds more honey only for rearing encours. honey only for rearing queens. I find it expensive business to rear queens early in the season. We had a nice rain last evening, which will help the flow in this vicinity.

Heavy Fall Flow of Honey.-Wm. H. Graves, Duncan, O Ills., on Sept. 10, 1886, says :

I now have 100 colonies of bees. I have had one of the heaviest flows of fall honey I ever saw up till now. Bees are still at work, mostly on black-heart. I live on Spoon river, and the bottoms are covered with it.

The Lexington, Ky., Fair.-N. H. Rowland, Keene, Ky., on Sept 9, 1886, writes:

The Lexington, Ky., Fair has just closed. It was, as ever, a splendid show. The exhibition of "live "live show. The exhibition of a hyperbolic stock "was not to be excelled, and rarely equalled in the world. The attendance was the largest ever known in the history of the association. Among other distinguished visitors was the Governor of Utah, who is a native Kentuckian. The bee and honey department was repre-sented chiefly by the Mucci Bros., who showed some very fine imported queens, together with the original

told me that he had succeeded after much trouble and correspondence in Italy. A "spring frame hive" was exhibited by Mr. Martin—the same hive which took the premium at the New Orleans Exposition. Careful examination revealed no new feature of any practical benefit, The frames have no projecting top-bars, but rests on legs; a brass wire in each end of the frame slips in a saw-cut in the end of the hive, and holds the frame laterally, but does not support the weight of the frame when full of honey, consequently any operation requiring the super to be lifted would allow every frame to slip out of the hive! There are also two sizes of frames in each hive, which fact alone would preclude its extensive use. The old gentleman is an enthusiast, how-ever, and thinks he has a bonanza ! Mr. W. Frank Storm, a bee-keeper of the city, made conspicuous by his badge of scarlet and gold lace, was on hand showing and explaining to the curious and interested. Everything shown was neat and attractive.

Good Results .- D. S. Way, Urbana, Q Iowa, on Sept, S, 1886, writes:

Bees are in splendid condition in this part of the country. I have ex-tracted 1,200 pounds of white clover and basswood honey from 14 colonies, this season, which I think is good for a new hand at the business.

Cleaning Bee-Smokers.-Robt. Corbett, Manhattan, & Kans., says:

For cleaning the nozzle of a beesmoker, take a piece of hard wood the full size of the base of the nozzle, tanered to fit completely. Rim off one corner and insert a steel or iron plate at right angles, having the same bevel. Use this while the nozzle is hot, as a scraper, followed by a swab of the same taper, and you can keep your smoker in order. If it is not in order the force of the bellows, in a measure, is lost. To tell 3, 4, or 6 months ahead, when a cold spell is coming in the summer: Whenever the moon news or changes, with the sign of or zodiac in the neck, we will have frost in all the Middle States, and cold in the more southern States. No matter whether in May, June, July or August, it is sure to come at the time.

My Experience with Bees.-Rev. J. Hunt, Plain City, Ohio, on Sept. 14, 1886, writes:

I have been engaged in the beekeeping about ten years. I have now about 20 colonies; I have had more at times. I started with one colony of Italian bees, bought for \$12, and all I have now have sprung from them. I started with no experience, but with enthusiasm and hope; I have made 

lation to make a dollar as it would average in other kinds of business. When I commenced, white clover honey in boxes sold for 25 cents; now the best comb honey in sections is sold for 17 cents; probably to fall still lower. To have an outlit in an apiary of what is convenient and necessary, is expensive, and unless one is a good mechanic and aims to keep down expenses, he will find it difficult to pay them out of his bee-profits.

Building Combs on Trees.-Grant Stinger, Unadilla, o+ Neb., on Sept. 6, 1886. writes:

On Sept. 1, 1886, I found a swarm of bees on a box-elder tree, that must have been hanging there longer than bees usually do when they swarm, as they had built comb enough to fill 5 Langstroth frames, had brood hatching out, and were going on with their work as busily as if they had been in a hive. They had nothing over them but the green leaves and blue sky. Is not this strange? I have S colonies of Italian bees; can I winter them successfully in chaff hives out-of-doors ?

[It is not usual for bees to locate and build combs without anything to protect them from the weather. You can successfully winter bees in chaff hives on the snmmer stands if not in a locality too cold or too much exposed.-ED.]

A Kentucky Bee-Killer.--Clarence M. Weed, Champaign, O+ Ills, writes:

Mr. G. H. Lillard, of Napoleon, Ky. sends a specimen of a large black and yellow fly much resembling a bumble-bee, stating that "they catch the bees and suck the life from them;" and asking to what species it belongs, The insect proves to be Mallaphora orcina Weid, which, so far as known to the writer, has no common name to distinguish it from the several other bee-killers or bee-catchers. It belongs to the great family of predatious two-winged flies, asilidæ, and hence is related to the Nebraska beekiller (Promachus bastardii). This with a wing expanse of 1% inches. An excellent description with a rather on page 320 of the eighth edition of Prof. Cook's Manual of the Apiary. Of the habits of these flies, Prof. Cook writes: "Their flight is like the wind, and perched near the hive they rush upon the unwary bee re-turning to the hive with its full load of nectar, and grasping it with their hard strong legs, they bear it to some perch near by, when they pierce the crust, suck out the juices and drop the carcass, and are then ready to repeat the operation. A hole in the bee shows the cause of its sudden taking off. The eviscerated bee is not always killed at once by this rude

THOMAS G. NEWMAN & SON. PROPRIETORS.

923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAOER.

# Special Notices.

To Correspondents. - It would save us much trouble, it all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, he sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50. -----

A New Crute to hold one dozen one-pound sections of honey .- It has a strip of glass on each side, to allow the honey to be seen. 11 is a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tler can occur. We can furnish the material, ready to nail, for 9 ets. per crate. Glass 1%c. per light, extra.

Bees for Sale .- We offer to sell a few strong colonies of Itallan bees, in ten-frame Simplicity hives, at \$6.00 each.

Red Labels for one-pound pails of honey, size 3x412 inches. - We have just gotten up a lot of these Labels, and can supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apiarist printed on them-by mail, postpaid.

-----

Yucen Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable. When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always bave ono handy. We can supply them at 5 cents each, or 50 cents a dozen; if sent by mail, add 1 cent each for postage,

Sweet Clover, or Melilotus Alba, is almost the only resource for honey now, on account of the late severe July dronth. If the seed is planted in September, it will come up this Fall and bloom next year, in its second season.

We have a large lot of this seed on hand, and offer it at the following Reduced Prices, by express or freight :

- One pound
   \$0
   20

   • peck-15 lbs
   2
   25

   • bushel-60 lbs
   7
   00

   • sack-80 lbs
   8
   00
- " sack-80 lbs .....

It will pay to buy it by the sack and sell it again in smaller quantities.

If you want a chance to make some money, and provide pasturage for the bees during the Fall mouths, this is your opportonity 1

Our Book Premiums .-- To encourage all our present readers to get one or more additional subscribers we will present 25 cents' worth of books for every new subscriber (accompanied with \$1 for one year's subscription), sent direct to this office. Thus for five new subscribers with \$5, the getter up of a club gets \$1.25 in valuable reading matter, to be selected by himsell' from our list on the second page of this paper. It will pay you to devote a few hours to the interests of the BEE JOURNAL. Every one who keeps bees ought to take it. We will furnish sample copies free in any quantity to those who intend to get up clubs. We expect to get 5,000 new subscribers before Jan. 1, 1887.

The Latest Thing in the way of cheap books is a complete, unabridged, and illus-trated edition of "The Count of Montetrated cannon of "The Count of Monte-Cristo," by Alexander Dumas, just published by T. B. Peterson & Brothers, Philadelphia, in a large octavo volume of six hundred pages, for 50 cents, making it one of the cheapest books ever published.

2. All are respectfully invited to attend the next meeting of the Ree-Keeper' Association of Eureka Springs, which will be held at Eureka Springs, Ark., on Oct. 23, 1886. Businese of im-portance to every beckeeper Northwest Arkanasa will be before the meeting. DR. S. S. PURCELL, Sec.

## North American Bee Keepers' Society

The Chicago, St. Louis & Pittsburgh Railroad ("PAN-HANDLE ROUTE") take pleasure in hereby announcing to all delegates and their families desiring to attend the National Convention of Bee-Keepers' Union to be held at Indianapolis, Oct. 12, 13, and 14, that we have arranged to sell tickets to Indianapolis and return at \$7.30 each on certificate signed by Mr. Thomas G. Newman, General Manager Bce-Keepers' Union.

Tiekets good going Oct. 11, and returning up to and including Oct. 16.

Morning trains leave Chicago, from the Union Depot, at 8:30, reaching Indianapolis at 3:50 p.m. Evening train leaves at 8:30, Night train has through sleeping-ear, and day train has through parlor-car to Indianapolls.

We can offer you superior accommodations and would be pleased to receive your patronage.

Tickets will be on sale in exchange for certificate at Union Passenger Station, corner of Canal and Madison Streets, Chicago, also at 65 Clark Street, corner of Randolph Street.

#### Honey and Beeswax Market.

Office of the AMERICAN BEE JOURNAL, Monday, 7 a. m., Sept. 20, 1886.

The following are the latest quotations for honey and beeswax received up to this hour :

#### CHICAGO.

HONEY.—It continues to arrive very freely The demand is light and sales are made chiefly at 120413c. Extracted is also quiet with prices un-changed, 607c. HEESWAX.—It is easier, and 23c. is about all

## will bring. R. A. BURNETT, 181 South Water St. NEW YORK.

#### BOSTON.

HONEY.-New boney is coming in and selling fairly well, but the revent hot ware has checked it some. We have heard from most of the bee-men of Addison comity, Vt., and they report that there will be but hall a crop in that section. We are selling one-pound packages of white clover honey at 14@15c; 2 pounds at 13@44c. BEESWAX.-25 cts, per lb. BLAKE & RIPLEY, 57 Chatham Street.

#### DETROFT

HONEY.-Best white in one-poind sections is bringing 14 ets. BEESWAX.-Firm at 23c, for fair quality. M. H. HUNT., Bell Branch, Micb.

#### CINCINNATI.

HONEY.-The market is very quiet. Demand from manufacturers is slow, and there is only a fair trade in new comb honey and extracted in square giass fars. Extracted honey brings 31-26 7c.; comb honey, 12 to 14c. for good to choice, in the johnma way. Prices are low for all produce and no speculative leveling is noticed anywhere, Unless better prices are realized for other prod-uce, prices of honey are not likely to advance. BEESWAX.-It is in good demand and arrivals are fair. We pay 20c. for good yellow. C.F. MUTH & SON, Freeman & Central Ave.

#### CLEVELAND.

110NEX.—The demand for honey is not very lively at present, but prices are stendy. Choice new honey in 1-1b, sections is selling at 14c; 2-lbs. 126 13c. Old honey is very dull at 106/12c. Ex-tracted, 667c. BEESWAX.—25c. A. C. KENDEL, 115 Ontario Street.

#### KANSAS CITY.

HONEY.—The market is active and sales of the comb are large. Extracted is firm with no stock in the city. We quote: One-pound sections of white clover, 13604.c.; dark 1-lbs., 11612c.; 2-lbs., 11602c.; dark 2-lbs., 86640c.; 2-lb. Calif. white sage, 10611c.; dark 2-lbs., 8660c.; 2-lb. Calif. white sage, 10621c.; dark 2-lbs., 8660c.; Calif. white sage, 55660c.; dark 4-26656c.; Calif. white sage, 516252WAX.-20022c. CLEMONS.CLOON & Co., cor. 4th & Walnut.

#### MILWAUKEE.

HONEY.—The units about the same as when last reported—may be quoted a little lower to soll. ('holee comb in 1-lb.sections, 12:0313; 2-lb.s., 11:03122 cents; durk nnt wanted. Extracted, white, in kegs 66676.c.; same in the cans, 61-2:037.c.; dark in barrels and half-barrels, 56:05 1-2 cts. BEESWAX.—No demand. A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

SAN FILANCISCO. HONEY.-The demand for honcy remains very good for fine qualities, and they are readily taken for home consamption, and shipments to Europe and the East at 44cs and more, and it seems that sconer or later such prices will be paid, as offer-ings are rather small. Comb honcy is not sought after so for, but with the colder weather more de-mand will come in and as samples are rather small, we anticipate full prices. We now quote 7cs/loc, as to quelity, wholesale. BEESWAX.-It is duil, but huyers have to puy 22cs/25c, for choice lots. SCHACHT & LEMCKE, 122-124 Davis St. LONUX. Descident and the and the anglited is.

HONEY.-Receipts are light and the market is very quiet. We quote: White extracted, 46444C.; anber, 353. Comb. 546010. for white. BEESWAX.-19.0220. O. B. SMITH & CO., 423 Front Street.

Large, Handsome and Extra-Profile Select Tested Italian Queens \$1.50 Each, or Three for \$1.00.

By return mail. Safe arrival guaranteed. Make Money Orders or Postal Notes payable at Salem, Mass. Address, **HENRY ALLEY**, SSA24. WENHAM, MASS.

# TO HORSE-OWNERS.

Peck's Ring Bone & Spavin Cure.

A new discovery. Warranted to cure any case of king Bone and Spavin without blistering or removing the hair, or money refunded. Price, \$1 per box, with full directions; prepaid to any ad-dress in the United States or Canada. Address. 10. S. PECK& CO., PENN YAN, Yates Co., N. Y.

Vol. XXII. Sept. 29, 1886. No.39.

Sweet Clover has another credit mark. Mr. C. F. Muth, who has kept bees for many years, says that this season is the first time that his bees ever gathered much honey in July. He says that it is all owing to the sweet clover growing profusely on the surrounding hills.

As there is Another firm in Chicago by the name of "Newman & Son," we wish our correspondents would write "American Bee Journal" ou the envelope when writing to this office. Several letters of ours have already gone to the other firm (a commission house), causing vexations delay and trouble.

We have made arrangements by which we can supply the Weekly AMERICAN BEE JOURNAL and the Monthly Bee-Keepers' Magazine for 1887, both periodicals for the very small price of \$1.25, or the above and Gleanings for \$2. Three bee-periodicals for the usual price of one 1

-

Married, on Wednesday evening, Sept. 1886, at the residence of the bride's mother, at Wilmette, Ills., by Rev. J. D. Leek, Miss Sallie A. Ward and Mr. George W. York, (an employe at the office of the BEE JOURNAL, and who is known to many visitors at this office.) Our congratulations are extended to the happy pair, and we hope they will never regret this important event of a lifetime.

Badges for the Indianapolis Convention .- The Corresponding Secretary of the North American Bee-Keepers' Society (Mrs. Robbins) is getting up a very pleasant surprise to those attending the convention at Indianapolis, in the way of badges. With the good taste Mrs. Robbins has always displayed in such matters, it will, no doubt, be a badge of which we shall all be preud, and carry to our homes as a beautiful memento of our visit to Indianapolis.

Colored Posters for putting up over boney exhibits at Fairs are quite attractive, as well as useful. We have prepared some for the BEE JOURNAL, and will send two or more free of cost to any one who will use them, and try to get up a club.

Among the Many scores of visitors at the office of the AMERICAN BEE JOURNAL during the past week, the mest distinguished visitor was Mr. J. S. Harblson, of San Diego. Calif. Mr. Harbison is one of the pioneers of modern bee-culture, and figured quite largely in the bec-literature of a quarter of a century ago. He is the author of a hecbook, inventor of a hive and sectional frames for comb honey, as used on the Pacific Coast, and generally called "California frames." He is the most extensive bee-keeper in the world, owning from 3,000 to 3,500 celonies of hees, in many apiaries, and is noted for having the largest honcy crep of any producer in the world. Next to Mr. Harbison comes Capt. J. E. Hetherington, of Cherry Valley, N. Y., who has about 2,000 colonies of bees. Strange to say that within half-an-hour after our distinguished visitor left, in walked Mr. O. J. Hetherington, of East Saginaw, Mich., brother to the Captain just mentioned

We had an excellent visit with these gentlemen, as we did with many others wbo called on us, which space forbids our mentioning in detail, at this time.

Round Trip Tickets to the Convention .- As Manager of the National Bee-Keepers' Union, we have made arrangements with the Iudianapolis lines of railroad for round trip tickets from Chicago to Indianapolis and return to Chicago, good from Mouday to Saturday, Oct. 11 to 16, 1886, for \$7.30. The fare one way is \$5.50. and this is one fare and one-third. To obtain these tickets, it will be necessary to get a certificate signed by Thomas G. Newman. stating that the bearer is entitled to the reduced fare. Now, do not wait until you come to Chicago to get this certificate, for we may have gone before you come. Send for the certificate at once; and it will be sent by return mail.

Red Clover Honey,-Quite a number have reported that this year their bees have gathered honey from red clover. Mrs. L. Harrison accounts for it thus in the Prairie Farmer: "In consequence of the droutb the clover heads grow small, and the tubes of the flowerets are short. This enables the bees to reach the nectar. There have been many conflicting reports, with reference to the utility of the red clover as a boney plant, but it is apparent that when the conditions are favorable for the production of small heads, either by reason of the soil or lack of moisture, Italian bees can reach the nectar."

The Publishers of the American Agriculturist, 751 Broadway, New York, will forward a copy free to every person who has been a subscriber to it, but is not now one (provided they send their name on a postal card), to the end that they may see the great improvements that have been made in that periodical. We club it and the AMERICAN BEE JOURNAL for \$2.25 per year.

Frank Cheshire's new book on Bees and Bec-Keeping, can be had at this office .-Vol. I, bound in cloth, \$2.50, postpaid.

Stands at the Head .- The Bee-Keepers' Magazine says that sweet clover stands at the head of the list of honey-plants, and adds : "We know by personal observation the following facts in its favor, viz : The number of bees on it per square foot of clover is equal to the basswood when ln full bloom. The length of bloom is greater than any other boney-plant we know of. The honey from it is of benutiful light color. It will secrete in the dryest, botest, or rainiest seasons, and will thrive on almost any land. Rain does not wash the nectar from the flower. It secretes from daylight till dark. It is not hard to eradicate it from the soil when required."

The Bee, says an enthusiast, does not deface your fields by clipping the growing grasses, like the domestic animals ; it does not mar the garden plants or levy taxes on your grain. Bees differ from the whole insect world. No tree, shrub, plant or flower is injured by their presence. He might have added that without the presence of bees many of the plants would soon cease to bloom, and even cease to live. Bees are the best friends of horticulturists and fruitgrowers.

Linden Honey is the pame by which what has beretofore been called "basswood honey," is hereafter to be known in Canada. This has been decided by a committee appointed to consider the question of an appropriate name for that nectar. Now let it be also called by the same name in the United States. It is appropriate and much more euphonious.

. . . . . . .

To Indianapolis there are four routes from Chicago-the Kankakee, leaving at 9.10 a.m. and 8.00 p.m.; the Monon, 6.05 a.m. and 7.30 p.m.; the Pan Handle, 8.30 a.m. and 8.30 p.m.; and the Chicago and Eastern Illinois, at 8.00 a.m. and 8 p.m. every day. On all of these railroads the reduced rates for a round trip for \$7.30 can be had upon the presentation of a certificate signed by Thomas G. Newman. We wish it to be distinctly understood that we have not been able to secure rates for any other points-only a round trip from Chicago to Indianapolis and return to Chicago. Several have written to us to get them reduced rates on other routes, and from other points-and we should be glad to do sn, but have not been able to do it. We make this announcement to save correspondence on the subject. The tickets are good from Monday to Saturday, Oct. 11 to 16, 1886.

National Bee-Keepers' Union.-There will be a meeting of the officers an members of this Society at Indianapolis, Ind., on Wednesday, Oct. 13, 1886, at an hour to be announced at the meeting of the North American Bee-Keepers' Society, to consider business of importance. THOMAS G. NEWMAN, General Manager.

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

#### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-ED.]

## Uniform Temperature in Hives.

Query, No. 310 .- Is there any practical method by which practical uniformity of temperature can be maintained within a hive in the winter season, when wintering on the summer stands? If so, what is that method ?-R.

No.-DADANT & SON.

I do not know of any-G. M. Doo-LITTLE.

I doubt it.-C. C. MILLER.

I know of nothing better than surrounding the hive with non-conduc-tors of heat.—W. Z. HUTCHINSON.

Just the right kind and right quantity of "packing" might accomplish it .- JAMES HEDDON.

It is a question. Of course thick packing comes the nearest to it.—A. J. COOK.

Mathematically, no; but sufficient "practical uniformity of temperature can be maintained" by judicious and proper packing to answer all practical purposes for successful wintering.— J. P. H. BROWN.

1. I do not know of any. 2. A large colony well protected from the winds, with some absorbent on the tops of the frames that will allow moisture to pass off, and the heat to be re-tained.-J. E. POND, JR.

Yes, put a thin board cleated on top, with a half bee-space beneath, over the frames, and shut off all up-ward ventilation. Give a large en-trance guarded against high winds, and protect the hive with 3 inches of fine, dry chaff or sawdust packed close all about the hive. Such prep-aration prevents currents of air through the hive and all undue loss of heat, enabling hibernation in early winter, and the hest possible condi-With just enough combs to hold needed stores, it is the only highly successful methods of wintering outof-doors .- G. L. TINKER.

There has been no attempt so far as I know, to keep up a uniform tem-perature in the hives while on the summer stands. There is certainly no practical method known to the art theory." 2. No.-G. M. DOOLITTLE. theory." 2. No.-G. M. DOOLITTLE. I theory." 2. No.-G. M. DOOLITTLE. I think no one can do this. It varies not only with different kinds of honey, and I believe at different

vals during protracted cold spells, so that the bees could change their posi-tion, take food, etc. This might be done by introducing warm air into the bive by means of a very simple ap-paratus.—G. W. DEMAREE.

## Alsike Clover.

Query, No. 311.-1. Is Alsike clover a hybrid elover? 2. How tall does it grow ?-Cincinnati.

2. About a foot high here.-G. M. DOOLITTLE.

2. Nearly as high as red clover.-C. C. MILLER.

1. Yes. 2. From a few inches to 2 or 3 feet, depending upon the soil and season.—W. Z. HUTCHINSON.

It is said to be a hybrid between the common red and the white clover, hence the name *Irifolium hybridum*. Surely its appearance favors the statement. Its growth depends upon the quality of the soil. We have it 18 inches long on our light, sandy beds. -А. Ј. Соок.

Alsike is supposed to be a cross be-tween red and white clover, and grows very tail, or rather long, some-times, for when it reaches 6 or 7 feet in length, it ceases to stand up. Usually, however, it grows to about the length of red clover.-JAMES HEDDON.

1. It is supposed to be. 2. It will depend upon the soil and cultivation. It has been known to grow from 5 to 7 feet high under favorable conditions in this locality; this, however, is only a few stalks in a field. Two to 3 feet is an average.-J. E. POND, JR.

1. Alsike clover is said to be a hybrid plant. Whatever may be the facts, no close observer can examine the plant carefully without being impressed with the idea that it is a cross between two or more varieties of clover. 2. My experience is limited in the cultivation of Alsike clover. As far as I have tried it, it grows nearly as tall as common red clover. So far as my neighbor bee keepers and myself have tried it, it blooms profusely the second season after sowing, produces seed, and perishes like all biennial plants do.—G. W. DEMAREE.

## Floating Pollen in Honey.

Query, No. 312 .- It is admitted that all honey contains more or less "floating pollen" (so-called); ean you give an analysis that will fully determine the proportion of pollen contained in both spring-gathered and fall-gathered honey? If so, please do so ?-G.

1. Some think so. My opinion is, that it is "straining" at a "far-fetched" idea to protect the "pollen theory." 2. No.-G. M. DOOLITTLE.

times with honey from the same kind of bloom.-A. J. COOK.

I cannot: I have never seen any practical necessity for so doing, as I do not deem floating pollen a dis-advantage but an actual neccessity, if early brood-rearing is desired or desirable.-J. E. POND, JR.

I cannot and do not know who can, but should think almost any chemist could. If all of the honey in our apiary was alike, I think such analysis would give us a grand cue as to the safe wintering of our bees.— JAMES HEDDON.

That is hardly a question for a man that makes his living producing honey, but for the chemist or amateur who keeps 2 or 3 colonies, and whose experiments are of more value to the fraternity than some are willing to admit.—C. C. MILLER.

It is not admitted that "all honey" contains pollen in quantity sufficient to have a practical bearing in an ordi-nary analysis of the article. Some honey contains more pollen than other honey does, for the reason that more of the farina of the flowers is floating in the air at one time than at another. Microscopically speaking, there is pollen in every thing, and everywhere during the summer months.-G. W. DEMAREE.

Guibourt, Calloux, Wurtz and other of honey. Probably the most reliable analysis is the one made by Dr. J. Campbell Brown, an English chemist. His average percentage numbers are as follows : Laevulose, 36.45; dextrose, as follows: Laevulose, 36.45; dextrose, 36.57; minera! matter, .15; water ex-pelled at  $100^{\circ}$  C., 18.5, and at a much higher temperature, with loss, 7.8t; the wax, pollen, and insoluble matter vary from a trace to 2.1 per cent. The amount of "floating pollen" in a given quantity of honey can be ascer-tained as a sediment by mixing the honey with water so as to make it very thin.—J. P. H. BROWN.

Honey contains pollen that may be seen by a microscope, but it is so little that practically it amounts to nothing. The theory that "floating pollen" in honey is ever a cause of disease in bees, rests upon the feeblest kind of evidence. No two samples of honey would be apt to contain the same proportion of pollen, whether fall or spring gathered, and I cannot think that if the average was known it would be of benefit, aside from university to be be been as a second curiosity, to bee-keepers. -G. L. TINKER.

## Taste and Odor of Honey.

Query, No. 313 .- My neighbor has been in the bee-business for a number of years, and says that his bees store honey from peppermint, and that the honey tastes and smells of the same. Will bees store honey that will taste and smell of the flowers from which it is gathered ?-H.B.

Yes.-W. Z. HUTCHINSON. Yes, of course.-DADANT & SON. Yes, the aroma of flowers is contained in the honey obtained from them.-G. L. TINKER.

I have never tasted such honey except buckwheat. Even this does not have the exact aroma of the flowers. --G. M. DOOLITTLE.

I think it is so in general. Why do you not taste and smell the honey, and then you will know?—C. C. MILLER.

Yes. I think the bulk of the honey takes its flavor and aroma from the flowers from which it is gathered. These properties diminish with age.— J. P. H. BROWN.

All honey contains the aroma of the flowers from which it is gathered; and there is no reason why strongly aromatic plants like the mints should not give their distinctive flavor to the honey gathered from them.—J. E. POND, JR.

Yes, some honey will do so. I once received a sample of extracted honey from the South tasting so strong of tobacco that it was supposed by the owner to be worthless. I gave him a good customer of mine, who bought 3 or 4 barrels per year to moisten tobacco.—JAMES HEDDON.

I think this matter needs investigating. I should look about and see if some one had not been careless with the peppermint bottle. We have large peppermint plantations in Michigan, and I have never heard such a statement here. So far as I know fruit-blossom honey is the only kind that would suggest its origin by its flavor. And even in that case one would be more sure to guess (?) correctly. if he *knew* before guessing.— A. J. COOK.

Decidedly they will. But it depends somewhat upon the state of the weather at the time the honey is gathered. In the rainy year of 1882, the common milk-weed could be smelt and tasted plainly in the honey, so much so that I could not eat it. Also the smart-weed imparted its smell and taste to the honey. I am glad to say that such is not frequently the case.—G. W. DEMAREE.

Hive-Ventilation—Side-Open Sections.

Query, No. 314.—1. Is it a good plan to raise the hive ½-inch from the bottom-board in hot weather ? Will it make any difference about storing surplus ? How about preventing swarming ? 2. Is it any advantage to have openings at the side of sections, so that bees may pass from one to the other without going below or above ?—R. D. R.

1. It works well with me. I have done so for a good many years with the best of success. 2. I have not used any with side-opening.—H. D. CUTTING.

1. It worked well in my apiary, and makes no difference about the surplus crop, nor about the swarming, so far as I have been able to see. 2. Decidedly, no.-G. W. DEMAREE.

1. To the first part, yes, and more too. To the second part, not if the weather is very hot. It will help to prevent swarming, by making the bees more comfortable. 2. Yes.— DADANT & SON.

1. It depends upon the size of the entrance before raising. It too close it may hinder storing in very hot weather, and favor swarming. 2. I was prejudiced in favor, but a trial in 1885 showed no advantages.—C. C. MILLER.

I. I do not so raise them. An entrance  $\frac{3}{4}\times14$  inches I consider ample room for all the requirements of the bees. 2. I do not use such, but I should judge that it might help some. -G. M. DOOLITTLE.

If the entrance is not large enough it would be a good plan. Shade and ventilation probably retard swarming. 2. I have never used such sections; and should not think there was any advantage in their use.—W. Z. HUTCHINSON.

I see no objection to it; neither do I see any great advantage in it if the hive is well shaded. It would make no difference in storing surplus. 2. I think there is some advantage in having openings on the side of sections.—J. P. H. BROWN.

I. I always desire to have ventilation enough to keep the strongest colonies active, even in the hotest weather. I do it by large openings to the hives. Improper ventilation, I think, might lead to swarming, and certainly enforces idleness. 2. I have never tried such sections. I should not suppose that they would be any better, though some praise them.—A. J. COOK.

1. I abandoned the practice. It did not prevent any tendency to swarm, neither did it give me more surplus. It compelled the bees to guard the hive from every side, and both they and I prefer one side.—JAMES HED-DON.

It is a good plan to give ample ventilation in hot weather. More surplus will be stored when ample ventilation is so given. It may or may not prevent swarming. 2. Sections should have such openings as will allow of free communication from one to another, and side-openings are necessary for this purpose.—J. E. POND, J.R.

1. Raising the hive from the bottom-board has little to do with storing surplus or swarming. 2. My experience the past season with sideopening sections has been such that I shall hereafter use no other kind. They remove all objection to the use of separators, cause the sections to be filled out plump at the sides, and when reversed, plump all around. The corner and side sections of the case are also completed, and ready to take off almost as soon as the centre ones are. But the facility in using separators, the advantage to the bees, and the little propolis attached to sections or separators, would amply repay any one to use side-opening sections.—G. L. TINKER.

## Moving Bees before Wintering.

Query, No. 315.—Will hees be as likely to winter well hauled 80 rods, as they would to be pieked right up and earried a few rods and put into a cellar? 1 wish to take my bees to a neighbor's cellar.—Pa.

My experience says yes,-G. M. DOOLITTLE.

They will, if carefully bandled.—J. P. H. BROWN.

It will make but little difference if yon are careful. The less you can disturb them the better.—H. D. CUT-TINO.

If they are not jarred in handling, I think they will. A light spring wagon would answer nicely.—G. L. TINKER.

I do not see any reason why they should not, if care is taken to disturb them as little as possible when moving them.—J. E. POND, JR.

I should feel afraid of the hauling, although the difference in cellars might make up for the damage in hauling.—C. C. MILLER.

They will winter best where they are least disturbed when put in, but in a good season it may make no difference.—DADANT & SON.

It may make no difference, but I should prefer to have bees put into the cellar so quietly and carefully that they would not know they had been moved,—W. Z. HUTCHINSON.

Bees may be moved from place to place late in the fall or in early spring without sustaining any injury, so far as my experience goes.—G. W. DEM-AREE.

Sometimes such shaking up does not and cannot do any harm, and again, with other kind of stores, it tends to engender bee-diarrhea, I believe, from careful observation.— JAMES HEDDON.

I think it would be just as well, though I should prefer to have them have a good flight after moving, before they are put into the cellar. I have known several times of bees being carried miles and put at once into a cellar, and yet winter well; still I should not recommend any such practice.—A. J. COOK.

## Moving Bees by Wagon.

Query, No. 316.-1. I want to move 30 colonies of bees 75 miles on an ordinary farm wagon; how must I prepare both wagon and bees? 2. Are eoil-springs for such wagons made? If so, where can they be obtained? I cannot ship by rail.-Texas.

Give the hives plenty of air—ventilation. Use a large, flat hay-rack, and put on about one-fourth of a load of hay, and then the bees on top of all, and rope them on secure. Drive carefully, and no springs are needed. Water them every five hours if they have brood in the combs.— JAMES HEDDON.

**Explanatory.**—The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark  $\bigcirc$  indicates that the apiarist is located near the center of the State named;  $\eth$  north of the center;  $\blacklozenge$  sonth;  $\circlearrowright$  east;  $\circlearrowright$  west; and this  $\circlearrowright$  northeast;  $\circlearrowright$  northwest:  $\circlearrowright$  sontheast; and  $\Uparrow$  sonthwest of the center of the State mentioned.

Intestinal Accumulations of Bees. c. w. dayton.

I have just returned from a wander down through the accumulation of ideas presented on page 567. I found (taking reports for truth) that while Mr. Heddon succeeded in preparing scores of colonies for winter without any nitrogenous food (pollen), Mr. Doolittle was unable to prepare even one colony for winter without some grains of pollen lurking about the combs. This might indicate that Mr. Heddon was a smarter man than Mr. Doolittle. But come to think about it Mr. Heddon's combs were not passed before the microscope as were Mr. Doolittle's, neither had the bees the diarrhea. On the same page we are informed that the testimony of an eye-witness over-weighs all other kinds of evidence ; yet the writer does not inform ns whether the evaporated excreta which Mr. Heddon scraped from the brood-frames could be so testified to, as being the excreta of a diseased bee or a healthy one.

Those who have read the bee-papers should recollect that the bees selected by Prof. Cook for examination were of the last in the colonies to die, and having the most turgid abdomens, and were not fair representatives of the colonies. The diarrhetic accumulations are spoken of as consisting almost entirely of undigested pollengrains, when the majority of the cases finds it to be water with the pollen afloat, and in proportion as to ten to one.

We would be led to believe that a mixture of sugar and water in a fermenting condition could not from any cause pass the stomach of the bee and amount to an excessive abdominal accumulation; and a few insist that it would not be diarrhea, because it would not spot the snow.

I wish to be credited with the idea that the intestines of the bee may become loaded even to bursting, as were those Prof. Cook dissected, and yet not bear a trace of diarrhea, and I think my evidence that it is a function of health, will stand against evidence that it is diarrhea.

There are amongst us those who know diarrhea from healthy conditions, and who have seen diarrhea

with and without the presence of pollen, and it is my candid belief that Prof. Cook can obtain diarrhetical bees for examination whose excreta or combs do not contain pollen.

On page 567 we read : "Colonies wintered without nitrogenous food have not a trace of diarrhea." I ask, have the colonies so wintered had their combs subjected to careful tests with the microscope as in the case of Mr. Doolittle's? as the writer re-peats elsewhere in his article, that there was no pollen found in the intestines of the diarrhetic bees sent to Prof. Cook by Mr. Doolittle, but because there was a trace of pollen found on the comb sent by Mr. D., it (pollen) must have been the cause of the diarrhea. A frail argument. In the logic offered us we often find a grain of pollen comparable to the particle of musk that continues its ferfume for thousands of years. other times the cells may be half full pollen, with some sugar syrup covering it, and the colony is safe.

Again, I find on page 567: Bees with no pollen do not accumulate fecal matter. Many apiarists have known bees to contain accumulations of a transparent souring substance that emitted the diarrhetic odor and caused the soiling of the surroundings. I have received bees through the mail that were fed entirely on sugar that showed unmistakble symptoms of diarrhea, but the evacuations were transparent. Call it fecal matter, or any intestinal accumulation, the effect is the same, the disease is the same, and it is caused by the same, but different cases differ in the composition of the accumulations. An experience of never having lost a colony with diarrhea is a pretty small experience to place against one of hundreds of colonies; in fact I do not know as so small an experience would admit of good judgment as to what is good evidence for or against the pollen theory.

It is indeed strange that the accumulation may consist so largely of water, and the pollen folks cannot see it; and it is far stranger still (if the pollen theory be true) that a colony may consume pollen all winter and not have the disease! Yet such men as Prof. Cook and Mr. Heddonmen who do not have time to go into the cellar, more than once or twice during a winter to observe the beesshould view the tracks and attest the cause of the disease with more certainty than the daily watcher of the bees. The discovery of the true cause of diarrhea ought to be worth a man's whole time and study for several years. I believe we are ready to admit that a colony with sugar stores is not so apt to have diarrhea as when it has honey and pollen, and also that searching the excreta for the cause should be as fruitless as to search the air we breathe for the cause of consumption.

Near the centre of page 567 it is said, "Diarrhea is due to the *accumulation* of fecal matter." The general understanding of the disease verifies that it is due to the *nature* of their product to the Colonial and Indian Exhibition now being held in London, England. Though we regretted the absence of the President, the accumulation, as the bees that

soil their hives most, and appear the most uneasy are seldom the most distended. Bees that consume food containing a large proportion of refuse substance may accumulate much fecal matter in a comparatively dry state and of a solid nature. Bees of this kind, with abdomens ever so distended, do not evacuate until they fly in the open air. If the distention is more than they are able to bear until the flight, then they die outright. When the bees are badly afflicted with diarrhea, they do not even wait until there is an accumulation, but begin early to befoul the hive or combs.

Sometimes diarrhea may set in after there is a healthy accumulation of fecal matter, in which case the accumulation would not be diarrhea, or the diarrhea an accumulation. If the pollen folks are in favor of calling constipation diarrhea, I would advise them to embark and seek an appropriate name for the "baby," and leave the diarrhea to the rightful possessors. I think the most of the points given may be considered as "testimony of experience," and therefore I hope they will secure the confidence of the jury.

## Ontario Bee-Keepers' Convention.

The annual meeting of the Ontario Bee-Keepers' Association has heretofore been always held sometime during the Toronto Industrial Exbibition. This year, the President and other leading members being away in England, and the association being in a sort of transition state, owing to its having been recently incorporated by Act of Parliament, it was thought better to defer the annual general meeting until a later date. But, as many bee-keepers are present at the Toronto Exhibition, and would be disappointed if the association did not assemble, it was decided to meet as usual, and occupy the time with appropriate bee-talk. Accordingly, on Tuesday evening, Sept. 14, 1886, a goodly number of bee-keepers met in the large committee-room of the City Hall. The meeting was called to order by the Secretary-Treasurer, Mr. W. Couse, and in the absence of the President and Vice-President, Rev. W. F. Clarke was appointed chairman. It was voted to dispense with the reading of the minutes—also to defer all routine business, and proceed at once to the discussion of practical matters.

matters. The chairman congratulated the association on several felicitous circumstances. The good attendance, although several accustomed to take a leading part, were necessarily absent; also, the excellence of the honey show at the Exhibition, notwithstanding the drain made by 35 honeyproducers having sent the best of their product to the Colonial and Indian Exhibition now heing held in London, England. Though we regretted the absence of the President, Messrs. Jones. Corneil and Mc-

Knight, yet they were serving the interests of the association better where they are, than if they were present here. They were taking charge of a magnificent display of Canadian honey, which we had every reason to believe would open the eyes of John Bull to the fact, that here in this country we can produce just as good honey as can be gathered from the flora of Old England. The result would be, without doubt, the opening up of a large and permanent market for our product in Britain. As in the case of Canadian beef and cheese, so in regard to our honey, it had only to be known and tested to secure for it free access to the British market, and a wide sale there.

Most of all, the association was to be congratulated on having attained Government recognition and become a corporate body. It now takes its place beside the Fruit-Growers' and Dairymens' Associations, and like them, is henceforward to receive a Government grant. The present year \$1,000 has been given, and this sum has been appropriated to making a show of Canadian honey in England. Results would no doubt prove that the money was well invested. It is anticipated that a regular grant of \$500 per annum will be made, and this sum wisely expended, will greatly aid in the development of practical

bee-keeping. The act of incorporation makes certain requirements, and it might be well to consider what steps, if any, should be taken at this meeting to conform thereto. On motion, it was resolved to lay this matter over for farther consideration until the next evening. The convention then proceeded to consider the subject of fall feeding, with a special reference to the question of sugar-feeding. This point was fully discussed, and proved of sufficient interest to occupy the remainder of the evening. As the out-come of the discussion, it was

Resolved, That it is desirable to take every precaution that the bees have sufficient natural stores, and that a summerent natural stores, and that a number of combs be set aside to sup-ply any shortage; that, failing that pure extracted honey be fed; and that, as the very last resort, sugar syrup be fed for wintering.

The chairman requested that all questions to be answered, and all essays to be presented be in the hands of the Secretary at the opening of next evening's session. The meeting then adjourned to 7:30 the next evening, at the same place.

#### SECOND EVENING.

The convention resumed on Wed-The convention resumed on Wed-nesday evening, with the acting President, Rev. W. F. Clarke in the chair. An essay from Mr. Allen Pringle, of Selby, Ont., the Vice-President, was read. It detailed his experience during the present season, from which it appeared that the yield had been moderately good. Two points of great importance in the fall points of great importance in the fall and winter management of bees were urged, plenty of stores, and a young, fertile queen. The temperature which most conduces to quiescence of the good until then.

bees is the best temperature, whether it be 45°, 50°, or 55°. It will range somewhere between those ligures, depending upon the hive ventilation, quilt-protection, humidity, etc. For hive ventilation, very free lower ven-tilation was recommended, with warm quilts of wool on top. On motion, thanks were presented to Mr. Pringle

for his interesting paper. A number wished to know how to ascertain if a colony had a young, fertile queen. The reply was, by inspecting the brood-chamber. If brood was found in fair quantity, it might be inferred that the queen was all right. all right.

#### ALSIKE CLOVER.

The question was asked, what were the advantages of Alsike clover as a honey-plant. The President, by re-quest, replied briefly: Alsike will grow in damp, moist places where the other clovers die out. It is a more abundant source of honey than white clover. One of our chief honey-pro-ducers this year has no crop, and one main reason is the absence of Alsike where formerly it was abundant. The chief advantage of Alsike, however, is that it is of great value to the farmer as a forage crop, as well as to the bee-keeper for honey.

#### FOUL BROOD.

A Toronto bee-keeper complained that foul brood was rife in one or two apiaries near him. He was certain of its presence in one, and had every reason to believe that it prevailed in a second. He thought steps should be taken to prevent the spread of this disease. It was also stated that there were some cases known to exist in Centre Wellington, and other parts of the Province. The President, on being asked to do so, explained the nature, symptoms, and appearance of this disease. He also urged the im-portance of every possible precaution being taken to suppress it. After a full discussion, it was, on motion

Resolved, That at the next annual meeting, the advisability of procuring legislative action for the supression of foul brood be considered, and that this convention is of the opinion that active steps are necessary for the suppression of this disease. The President stated that during

the day he had looked up the statute incorporating the association; also that he had called on the Commissioner of Agriculture to ascertain what action we need to take to bring ourselves into line with the Act; and that as the result of his inquiries he found that there were certain steps to be taken, which he proceeded to specify. After some discussion, the following resolutions were passed : *Resolved*, That as the Constitution of this Association requires that the

time and place of the annual general meeting shall be fixed by open vote of the association, Toronto, and Dec. 7 and 8, 1886, be selected as the time and place of the annual general meet-ing for the current year.

Resolved, That the present member-ship and official appointments hold

Resolved, That the executive com-

Resolved, That the executive com-mittee be instructed to prepare such amendments to the constitution and by-laws as may be necessary to con-form to the Act of Incorporation. *Rcsolved*, That the Secretary at once make the sworn return of the number of members and paid sub-scriptions required by the Act of In-corporation corporation.

After some informal talk and sundry votes of thanks, it was *Resolved*, That the association do

now adjourn until Dec. 7, 1886. W. COUSE, Sec.

For the American Bee Journal

## The Yucca or Spanish Bayonet.

#### W. W. BLISS.

This is one of California's most beautiful wild flowers. In their wild state they seldom attain the height of more than 8 to 12 feet. In the sum mer of 1884 one bloomed in Pasadena that attained the height of 25 feet or more. This one was transplanted from the mountains to an orange orchard some 8 or 9 years ago. The shaft or flower-stalk is the growth of but a few weeks; and as it stood with its top completely covered with creamy-white flowers, it was a sight that is seldom seen.

This species of the yncca (Yucca baccata) dies after it blooms; it is then that it is of special use to the bee-keeper. The broad heavy leaves that grow around the stalk near the ground are gathered and dried; when combed out, they make a nice brush, which is superior to anything for brushing the bees off the combs in extracting. They are a soft veget-able fiber, from 3 to 4 inches wide, almost indestructable, and never known to come loose in the handle; besides they can be add at a wise besides, they can be sold at a price within the reach of every one.

Duarte, 9 Calif.

For the American Bee Journal. The Poetry of Bee-Keeping.

#### JAMES HEDDON.

The past season has been for me the buisest of my life. Five hundred colonies of bees, a business larger than ever, students to instruct, a large and varied correspondence, increased and interesting experiments and inventions, have all contributed to over-work, yet have made life seem of more importance, and better worth living. I offer the foregoing facts as an excuse for my delay in expressing my thoughts upon reading Rev. W. F. Clarke's little poetical work, devoted to our chosen pursuit, and recently presented to the public. Although I had the honor of read-

ing it in manuscript and proof, it was not until this week that I could command the time to read it in its com-plete, corrected, book form. As is stated on the cover, the reading is "lively,"" entertaining,"" practical"

-aye, and more, it is spicy and re-plete with wit and wisdom. But this is not all; Mr. Clarke's "Bird's-Eye View of Bee-Keeping" is not only but being all in rhyme, it makes the strongest impression upon the reader in the fewest possible lines. In the preface the author asks if the poetry has all gone out of bee-keeping. Allow me to answer that question by asking how poetry could desert a pur-suit so beautifully and closely con-nected with nature, that is

"In every charm supreme! Whose votaries feast on raptures ever new. O for the voice and fire of seraphine. To sing the glories with devotoo due! Blest be the day 1 'scaped the wranging crew, From Pyrno's maze, and Epicurus' sty; And heid high coaverse with the god-like few, Who to th' ernaptured heart, and ear, and eye, Teach Beauty, Virtue, Trutb, Love and Melody."

Is there not always as much poetry in the works of nature as the observer is capable of receiving from it? In other words, is not the poetry in the brain that looks upon the scene? Next to field sports I have found bee-keeping best calculated to arouse the poetic sentiment within. Who can stroll over the fields during this month, watching

"The pollen-dusted bees Search for the honey-less Thut linger in the last flowers of September, While plaintive mourning doves Coo sadly to their loves, Of the development they so well permember

Of the dead summer they so well remember,' without a heartfelt gladness that the poetic sentiment is in the world, and

that he has received a share. Mr. Clarke has well claimed that in

apiultural literature there is room, yes, a demand for thoughts delivered in rhyme, for is it not true that

"Sages and chiefs long since had birth,

Safes and chiefs long since had birth, Ere (besar was, or Newton named; These raised new Empires o'er the earth, And those, new Heavens and systems framed; Vain was the chiefs, the sages' pride ! They had no poet, and they died. In vain they schemed, in vain they bled ! They had no poet, and are dead !"

I consider the book uncommonly instructive and correct in its teachings, considering its brevity and that it is written for beginners.

Without attempting to eulogize all of the many well-put assertions that I consider correct, nor criticize the few that do not agree with my experience, I will not pass without merely men-tioning my pleasure at noting Mr. Clarke's truisms, wherein he states that beginners should seek a loca-tion clear of other bees; should not expect to get rich in a minute; and should not urge every one to em-bark in bee-keeping. I endorse what he says about the treatment of angry bees, and scores of other things too numerous to mention here.

I cannot agree with him about the fitness of bee-keeping for ladies; I fear his great gallantry has led him astray. We do not agree on hiberna-tion yet, and I think few will agree with his attricent for many 15 of his with his statement (on page 15 of his book) that hybrid bees show greater tendency to swarm than pure Italians. The German bees, from whence came the cross, are, 1 believe, conceeded to be the most non-swarming race.

I cannot agree with him on page 20, that any honey-producer should wear gloves of any kind. I believe such

I know of no more appropriate place to apply the old adage, that "Cats with gloves on catch no mice." I would hardly want queens reared in the manner mentioned on page 29; yet this may be only a matter of prejudice. We all know that Mr. Clarke

"Sometimes raises scruples dark and nice, And after, selves 'em in a trice; Like one who purposely had 'catched' The itch, in order to be scratched."

On page 10 he speaks about arbitary prohibition of persons keeping a few bees, as though this prohibition was of man's rather than nature's law. That the specialist cau produce honey at a price that the dabbler cannot, is a law of nature that no one can change.

Taken all in all, looked at from my stand-point, I find, as compared with other books, very little to criticize as compared with the much to commend. I have placed the little work in my apicultural library, with a feel-ing of pride and satisfaction, and it is with perfect assurance that I say that it is worth many times more than the 25 cents asked for it, to any beekeeper, as well as to many that never expect to keep a bee.

"Call it not vain—they do nnt err Who say that when the Poet dies, Mute Nature mourns her whisperer, Aud celebrates his obsequies."

And now in closing this hasty review of another valuable addition to apicultural literature. I think I am warranted in saying, in behalf of our fraternity, that

We can but think, our faithful friend, The end Of life will find you leal, unweary Of tested bonds that naucht can rend, And e'en if years be sad and dreary, Our plighted friendship will extend!

Dowagiac, 9 Mich.

For the American Bee Journal. Foul Brood—A Real Bee-Malady.

#### T. F. BINGHAM.

That "moss covered" saying, "Nothing new under the sun," may now with æsthetic propriety be laid on the dusty shelf of the past. The disease may have been an old one, though Prof. Cook intimates that it is a matter of doubt whether Aristotle knew anything about it. To us it is not of importance, whether Aristotle not of importance whether Aristotle recognized the odor of the decaying larvæ or undigested pollen as symptoms of disease of specific types.

On page 584 is a concise and care-ful description of the process of cure and presumed prevention of foul brood; the condition and phases of the much drached diserter with ar the much dreaded disorder, as it ex-isted in the apiaries treated by the process described.

It will be noticed that while all the older writers on bee-diseases have regarded foul brood as its name im-plies, viz: a disease of the brood, and not of the older and mature bees; while the article above referred to avers that "bees crawled out of the that any honey-producer should wear gloves of any kind. I believe such would be left far behind in the race. day." There can be no misunder-were deprived of pollen died without

standing that sentence. The disease killed the old bees, and the dope cured the old bees the same day.

It is of importance to bee-keepers that we have just such descriptions of an malady which may even in a single apiary occur. Theories admit of discussion, and frequently do much to fill bee papers with debat-ble mode to fill bee-papers with debatable matter, but facts clearly set forth, as are those of Mr. McLain, shed light in dark places.

Foul brood, or the dying of partially mature bees in their cells, appears to be a very common occurrence in apiaries, and it seems also to be of such a nature, either from its character or from the influence of what has been written about it upon the nervous systems of various beekeepers and writers of bee-literature. that either from its real enmity to bee-culture, or the superstition with which it has been regarded, that it is a real malady, and oue of great moment.

While Mr. McLain's experience may have inadvertantly cast a florid hue over the dreaded—but as now appears not well named disorder-we shall all welcome as new and substantiative the facts he has so clearly given, demonstrating that combs and hives have been renovated in an easily practicable manner. While the fact seems so plausible, it behooves every seems so plausible, it ochooves every bee-keeper to remember that "eternal vigilence is the price" of success as well as liberty, and that too much care cannot be given that diseased brood does not spend in his own apiary and to those around him.

Abronia, 9 Mich.

Is Pollen Necessary for Bees in Winter?

#### SAMUEL CUSHMAN.

It would be hard to better the re-marks made by Rev. W. F. Clarke (page 810 of Vol. 21 of the AMER-ICAN BEE JOURNAL), in regard to Prof. Cook's essay on the "Pollen Theory," read at the Detroit Conven-tion. They were, that "The pollen theory had got its quietus from Prof. Cook He has mentioned that bees Cook. He has mentioned that bees cannot breed without taking nitro-genous food. If they take that food genous food. If they take that food it must be digested and the feces ex-creted. Well, Mr. Barber and Mr. Hall have proved that bees breed largely, *i. e.*, work hard, and there-fore must eat and digest strong food. The inference is plain. The bees if they excrete do it in dry feces. They must everete that is clear therefore must excrete; that is clear; therefore, there is no danger in having pollen in the hive. On the contrary it is nec-

The Professor's essay (page 25 of the BEE JOURNAL for 1886) is one of the best articles against the theory that I have seen, and it seems to me that bee-keepers who read it must realize (in spite of the Professor's conclusions) what a serious matter it would be to deprive the bees of their pollen. The fact that the bees which

showing that kind of diarrhea does not prove that bees winter better without it. It only shows that bees dying without it in their hive did not have any in their excreta or intes-tines. I fail to see anything favor-able to the theory in this. Why did they not live? If they died without they not hve? It they died without pollen, how much better off were they than if they had it, and had died showing diarrhea. It would look as though they were killed by cold in each case. Cold caused such a depression of function that food eaten was not digested, or possibly coused such aversive exertion to caused such excessive exertion to keep warm as to prevent digestion, result death from lack of nutrition. Suppose the bees both with and without polleu, had not been exposed long enough to [kill them; warm weather gave them a let up for several days, they were exhausted (in each case) from exertion and lack of nutrition. Which colonies have the best chance to repair the waste of nerve and muscle, those with pollen or those without?

Those without have only the supply contained in their bodies, which has been largely drawn upon; they will have to wait until spring, if they live until then, before they can get ma-terials for repair, while the others can supply their needs at once. You may say, if they were not exposed to such excessive cold, they would not need repairs, neither would they have diarrhea, or eat more pollen than they could digest. We are shown that pollen does no harm, if the temperature is right, and that quantities of brood are reared before their spring flight.

Animals that hibernate store their carbonaceous or heat-giving, as well as the nitrogenous elements in their bodies, enough to last all winter. Bees store both in combs, and have we any more reason to think that they have in their bodies a sufficient supply for winter of one and not the other of these elements.

Man or animals require for food carbon, nitrogen and mineral salts in certain proportions. Different seasons aud circumstances require different proportions, but neither of these elements should be entirely lacking. I do not doubt that under certain very favorable conditions bees may be brought through the winter alive with absolutely no pollen, but in my opinion, with the same conditions, they would be much better off with it.

Possibly there may be times and locations when a hive might contain too much pollen, not giving enough honey room in some combs, and if cold confined the cluster to these combs, the result would be disas-terous; but in such a core with terous; but in such a case, with enough honey in the hive to support them, and with proper temperature maintained, no trouble would occur. Bees will not eat it to harm them unless in an unnatural condition. Shall we not regulate the temperature instead of depriving them of a necessary food, because they eat excessively of that food when in an unnatural condition from lowered tem- etc.

perature. Then when they choose to rear brood they have the means to do so.

Although this theory has been ad-vocated and supported by a few such promineut apiarists and writers as Prof. Cook, Prof. Hasbrouk, James Heddon and others, it does not seem to meet with favor from the majority of bee-keepers. Our heaviest and most successful producers continue to leave a liberal supply of pollen in the hives for winter.

In the Professor's essay we are told that nitrogen may be changed or transformed into fat. Does he mean to tell us that by a vital process nitrogen may be chemically changed in the body into fat? He gives fatty de-generation of the heart as an example. I have always supposed that in this case the nitrogen was replaced by fat. that the muscle was wasted by use and slow oxidization, and through faulty nutrition was not removed, but fat being abundant in the blood, was deposited instead of the proper ma-terial. Here is another chance for our medical readers to enlighten us, and I hope they will.

Prof. Cook has rectified the impression given as to the amount of air required by bees, and I hope we shall yet be informed that it is not advisable to remove the pollen from the hives, that everything considered bees stand a better chance with than with-out it, that fermented or thin honey may also cause diarrhea, that a low temperature is harmful, pollen or no pollen, that the point to be considered is temperature and pure air, and how to keep it right.

Whether Mr. Heddon has been of benefit or not to our industry in advocating this theory, there is no ques-tion in my mind but that he has done great good and deserves much credit for perfecting and so strikingly bringing to our notice an improved system of hive manipulation, which, it seems to me, all progressive bee-keepers must appreciate. I do not refer to the reversing or inverting feature, but to the interchanging of shallow broodframes in cases, and the manipula-tion of cases instead of frames. Pawtucket, 3 R. I.

For the American Kee Journal.

## Bees and Honey at Michigan State Fair.

#### II. D. CUTTING.

The Michigan State Fair opened on Sept. 13, with ten exhibitors in the bee and honey department. A. D. D. Wood, of Rives Junction, had a large exhibit of one-piece sections, comb-foundation mills, honey-extractor, comb fo undation, extracted honey in tin pails, 2 colonies, and several other articles. W. D. Higdon, of Jackson, exhibited several cases of comb honey, 2 colonies, beeswax, smokers, houey-knife, queen-cages, and a case of bee-literature. O. A. Quick, of Leonia, showed comb and extracted honey, implements, case of sections, make it interesting.

Mr. Shelby, of Jackson, exhibited 10 pounds of extra fine beeswax; W. D. Soper, of Jackson, a section-case; W. Z. Hutchinson and brother Elmer, a large lot of comb honey in shipping-cases (14 sections to the case), ex-tracted honey in Muth jars, honey-bearing plants mounted (about 80 in all), several different hives, honeyextractor, a good line of implements, 8 colonies of bees, case of bee-literature, beeswax, etc

The writer exhibited comb and extracted honey, a large collection of implements consisting of 226 differ-ent articles, 3 colonies of bees, case of bee literature, foundation mills, extractors, honey-bearing plants (170 in number), bees-wax, sections, foundation, bee-hives, smokers, knives, etc.

The Agricultural College exhibit, in charge of Mr. Gillette, consisted of a large and very line collection of honey-bearing plants, samples of the different varieties of honey, and a colony of bees. Prof. Cook "hit the nail on the head" when he sent his able assistant, Mr. Gillette, to repre-cont the College in this department Every day at 2 p.m. Mr. Gillette placed a bee-tent over the colony of bees, opened the hive and showed to the large crowd of visitors "just how to do it." Ilis lecture was very in-structive and intertaining. Mr. Gillette will long be remembered for his gentlemanly courtesy by the many visitors and exhibitors.

Miss Anna Cutting showed a case of comb honey. Two ladies exhibited honey-plants in bloom, but F cannot recall their names; also one exhibit

of a case of comb honey. Dr. A. B. Mason, of Wagen Works, Ohio, presided as judge of the exhibit, his usual good nature. with He brought and placed on exhibition a piece of granulated honey 10x10x12 inches, as white as coffee C sugar, hard and dry. It was admired by many visitors. On the last day of the Fair one exhibitor sold over 100 packages of extracted honey, and to a careful observer you could see that the greater portion went to persons that were not accustomed to eating that were not accustomed to taking honey. This is one of the best places to make consumers of honey, if you first-class article. We to make consumers of honey, if you give them a first-class article. We find many persons prejudiced against extracted honey, but when they per-sist in calling it "strained" honey do not appear vexed, but explain to them that it is not strained, but ex-tracted honey, and show them just how it was done, and in this way you help to educate the masses in the use help to educate the masses in the use of nature's purest sweet-honey.

We missed Mr. R. L. Taylor as an exhibitor this year, but he came and made a two days' visit. The State Agricultural Society are well pleased with our efforts to make a success of this department. The premium list is large (\$300), and now all we want is more exhibitors. We should have at least twenty every year. The greater the exhibits the more interest will be taken. Several that are not in the habit of making exhibits have promised to be on hand next year and Clinton, Mich.

## North American Bee-Keepers' Society.

FRANK L. DOUGHERTY.

The North American Bee-Keepers' So-ciety will hold its 17th annual convention Oct. 12, 13 and 14, 1886, at Indianapolis, Ind. The meeting will be held in Pioffin's Music Hall, 82 and 84 North Pennsylvania Street, one of the most pleasantly situated halts in the city, having good ventilation and plenty of light. The Society head-quarters will be at the Occidental Hotel, corner of Wash-ington and Iflinois Streets. The regular rates of this hotel are \$3 per day; special rates for those in attendance at the con-vention, \$1.50 per day. vention, \$1.50 per day.

The Northwestern Bee-Keepers' Society, the Indiana State Society, the Eastern Indiana, with various county and joint societies with meet in union with the North American, making it one of the most important meetings of bee-keepers ever held in the country.

Every thing possible wilt be done to make the meeting pleasant and entertain-ing. An earnest, cordial invitation is ex-tended. Following is the programme :

#### FIRST DAY-TUESDAY.

FIRST DAY—TUESDAY. Forenoon Session, 10 a.m.—Convention called to order. Address of welcome, by Gov. I. P. Gray; "Response " by the President. H. D. Cutting; "Welcome to the City," by Mayor Caleb S. Denny; "Thanks," Dr. C. C. Miller, President of the Northwestern Society. Calling the roll of members of last year. Payment of annual dues. Reception of new members and distribution of badges; reports of Sec-retary and Treesurer. Announcements. retary and Treasurer. Announcements.

retary and Treasurer. Announcements. Afternoon Session, 2 p.m., Special Busi-ness.—Annual address of the President; "Bee-Studies," Prot. A. J. Cook, Agricul-turat College, Mich.; "Apiculturat Jour-nalism," John Aspinwall, Barrytown, N. Y.; "Bee-Literature," Thomas G. New-man, Chicago, Ills.; "The Coming Bee-What encouragement have we to work for its advent ?" R. L. Taylor, Lapeer, Mich. Subject for discussion, has "Apis Ameri-cana" been reached ? Evening Session, 7:30 p.m.—Announce-ments. Miscellaneous business. Discus-sion of questions that may have accumu-lated during the day.

lated during the day.

#### SECOND DAY-WEDNESDAY.

SECOND DAY-WEDNESDAY. Morning Session, 9 a.m.—Announce-ments. Communication. Call of the Northwestern Society to elect officers. Election of officers of the Indiana State Society. Call to order. "Rendering Comb into Beeswax," C. P. Dadant, Hamilton, Ilts.; "Foul Brood," A. J. King, New York. "North American Bee-Keepers' Society-Past, Present and Future," Rev. W. F. Clarke, Guelph, Ont. Selection of place for holding meeting in 1887. Elec-tion of officers. Afternoon Session, 2 p.m.—Announce

tion of officers. Afternoon Session, 2 p.m.—Announce-ments. Miscellaneous business. "Bee-Keeping and Apiculture," Prof. N.W. Mc-Lain, U. S. Apicultural Station, Aurora, Ills.; "Feeding Bees for Winter," Jas. McNeill, Hudson, N. Y.; "Wintering Bees," Dr. J. B. Mason, Wagon Works, Ohio; "Solid Truths relative to the Ap-icultural Interests of the east coast of Vo-lusia county, Florida," by John Detwiler, New Smyrna, Fla. Subjects for discussion, "Is the use of Foundation Necessary in Modern Bee-Culture ?" "Are Perforated Honey-Boards a Success ?" Unassignet essays.

Evening Session, 7:30 p.m.—Announce-ments. Miscellaneous business. Discus-sion of questions in question-box. Social communications.

#### THIRD DAY-THURSDAY.

munications. "The National Bee-Keepers' Union," by Thomas G. Newman, Chicago, Illinois. "A Talk on Hives," by James Heddon, Dowagiac. Mich.; "Reversible Hives and Frames." J. E. Pond, Jr., Fox-boro. Mass.; "Drones and Drone Comb," W. Z. Hntchinson, Rogersville, Mich.; Reports of Vice-Presidents; "Progress of Bee-Keeping in Indiana," Jonas Scholl, Lyons Station, Ind. "The Future of Bee-Culture," G. W. Demaree, Christiansburg, Kentucky. Kentucky.

Afternoon Session, 2 p.m.—Announce-ments. Miscelfaneous business. Explanation of various articles on exhibition. Indianapolis, Ind.

#### Local Convention Directory.

Time and place of Meeting.

1886.

Oct. 6, 7.-Kentucky State, at Frankfort, Ky. Jno. T. Connley, Sec., Napoleon, Ky.

Oct. 7.-Wis. Lake Shore Center, at Kiel, Wis. Ferd Zastrow, Sec., Millbome, Wis.

Oct. 12–14.—North American, at Indianapolis,Ind. F. L. Dougherty, Sec., Indianapolis, Ind.

Oct. 16.—Sheboygan Co., at Sheboygan Falls, Wis. Mrs. H. Hills, Sec., Sheboygan Falls, Wis.

Oct. 16.-Western Iowa, at Stuart, Iowa. J. E. Pryor, Sec.

Oct. 19.-Central Mich., at Lansing, Mich. J. Ashworth, Pres.

Oct. 19, 20.-Illinois Central, at Mt. Sterling, Ills. J. M. Hambaugh, Sec., Spring, Ills.

Oct. 21.-Southern Illinois, at Benton, Ills. F. H. Kennedy, Sec., Duquoin, Ills.

Oct. 27-29.-Western, at Kansas City, Mo. P. Baldwin, Sec., Independence, Mo.

Dec. 1, 2.-Michigan State, at Ypsilanti, Mich. H. D. Cutting, Sec., Clinton, Mich.

1 In order to have this table complete, Secretarles are requested to forward full particulars of time and place of future meetings.-ED.

Bees Carrying in Honey and Pollen.-J. W. Sanders, LeGrand, Olowa, on Sept. 23, 1886, writes :

Our great drouth is over, and the pastures and roadsides have changed from a dark brown to a bright green, which makes it look as though green, which makes it look as though spring had just set in. The thermometer, yesterday, indicated 92° in the shade, and to-day it is near 90°. Bees seem to be on a boom, and are carrying in both honey and pollen. We have had no frost yet to hurt the fall flowers. The white clover begins to look as though it was getting ready for another bloom; some heads already appearing. Cool weather may soon put a check to its rapid growth. There is but little fall honey yet.

Plain Sheets of Wax, etc.-J. G. Norton, Macomb,+o Ills., on Sept. 15, 1886, writes :

The season of 1886 has about closed, and I can say that it has been a very good one for honey. I have disposed of nearly all my crop at 10 cents a pound on cars here, 12½ cents being the highest price at retail that can be obtained an euromethet how boom Morning Session, 9 a.m.—Announce- the highest price at retail that can be them, into a swarming-box with a ments. Miscellaneous business. Com- obtained, as our market has been slide door on one side and perforated

destroyed by a few that have been trying to keep bees here within the last four years. Our County Fair was held last week, and was a suc-cess. The display of bees, bee-hives, crowds of people. I succeded in win-ning all the first premiums on bees, bee-hives and combs, and extracted honey, and 1 am well satisfied for the time and trouble taken. I think it an excellent way to advertise. In regard to using plain sheets of wax in beeto using plain sheets of wax in bee-hives, I consider it a foolish practice. I have kept bees for 15 years, and have made many experiments, and know positively that bees do not build drone comb on worker founda-tion; neither do they in any instance change worker comb to drone comb, or vice verse. So if Mr. J. F. Hays will experiment again he will find his will experiment again he will find his mistake. Old or inferior queens or laying workers lay eggs in worker combs, and these eggs hatch drones, but the size of the base of the cell is always the same, and cannot be changed. No system has yet been found to guarantee all-worker comb every time without the use of full sheets of foundation; and in my opin-ion if it does not not to not full sheets of foundation; and in my opin-ion, if it does not pay to use full sheets of foundation, it does not pay to keep bees. Bees will go into win-ter quarters in good condition this year, but the fall crop of honey will be very light, as not any surplus has been stored yet, and we can now ex-pect frost on any night.

No Basswood Honey.-Will B. Robinson, Upper Jay, & N. Y., on Sept. 13, 1886, writes :

Basswood was an entire failure in this section, but I obtained 275 ponnds of comb honey from 8 colonies, spring of comb honey from Scolonies, spring count. I purchased an Italian queen, which I successfully introduced on Sept. I. I opened the hive a few days later, and saw plenty of eggs and larvæ. This is my first attempt at introducing queens. I also built up a colony with the black queen. In in-tend to Italianize my apiary in the spring. I think that I owe to the BEE JOURNAL all I know about bees.

Report. - Preston Taylor, Roodhouse,+o Ills., on Sept. 9, 1886, says :

I began in the spring with 14 colo-nies, increased them to 33, and have extracted 1,900 pounds of honey. My bees seem to be in good condition at the present time.

Italianizing Colonies.-J.L.Dewey, Sealy, Texas, writes:

The following is my plan of finding the native queen, for the purpose of Italianizing, and would like any sug-gestions if it can be improved upon to modifie motives. I that reactions expedite matters: I first prepare a new hive with comb foundation, and an Italian queen caged within. Renew nive with comb foundation, and an Italian queen caged within. Re-move the old hive and bees, placing the prepared new hive on the old stand. I then drive all, queen among them, into a swarming-box with a

zinc on the other side, darkened with a sheet of plain zinc, to remove at pleasure. After all are in I slide out the sheet of plain zinc, and a few puffs of smoke make the bees get out of the hiving-box with a rush, and fly back to their supposed old home, to find a new outfit for house-keeping, and a well-charged feeder, at their pleasure; and all go to work as if there had been no change. Poor Mrs. Native Queen is found in the box alone, and no hunting. Who will improve on my plan?

# Manilla Paper for Hives.-Albert Neuman, Rolla. Mo., writes :

I am making a double-walled bee-hive out of manilla paper. This I think will prove to be a first-class think will prove to be a first-class hive in every respect; a perfect non-conductor, strong, cheap, and a com-plete double-story hive, and only weighs 40 pounds. The material con-sists of 6 feet of  $\frac{1}{2}$ -inch lumber, in 2-inch wide strips; 50 plaster laths, 32 feet of manilla paper for inside and outside walls, about 3 cents worth of  $\frac{3}{2}$ -inch wire nails, 24 2-inch nails, and 1 plut of papint for a two-story hive: 1 pint of paint, for a two-story hive; 10 frames in the brood-chamber 121/ 121/2 inches, outside measure. I would 12½ inches, outside measure. I would not have said anything about this hive until I had wintered my bees in it, but I did not wish any one to get hold of it and have it patented, for I desire this hive, if it proves to be as good as I think it will be, to be the property of the bee-keepers of this country. In the future I will describe how I make my skeleton as a founda. how I make my skeleton as a foundation for the paper. Anybody that can handle a saw, hammer and square, can make it.

# Was it Copied ?- Chas. Dadant & Son, Hamilton,+o Ills., writes:

We were very much astonished, in perusing the BEE JOURNAL lately, to see that one of our leading writers, who has the reputation of an intelligent apiarist, has written an article on bee-culture partly copied from one on bee-cluture party copies from one of the leading bee-books, without any reference to the original. This is commonly called *plagiarism*. To make matters plain, and give "honor to whom honor is due," we refer the readers to page 471, and ask them to compare the last half of the middle column with the different paragraphs on pages 85, 86 and 87 of "Langstroth on the Honey-Bee," fourth edition.

[Desiring to do uo injustice, we sent the above to Mr. Hutchinson, so that we may present his answer with it, and here it is.-ED.]

Yes, Bro. D., not only the portion of the article to which you refer was copied from Father Langstroth's work, but several other portions were copied from other works. The article, when written, which was nearly four years ago, was not intended for pubyears ago, was not intended for pub-lication, but for reading at a horticul-tural meeting. After its reading it occurred to me to send it to the *Country Gentleman*, which I did, and it was published four years ago the less risk of losing your valuable be applied to bring abd -a total absence of an It contains 64 pages; illustrated. Price 50 obtained at this office.

coming winter. In the original manuscript, quotation marks were used to indicate the extracts, but the printers in the office of the Country Gen-tleman, by an oversight, or from some reason, omitted nearly all of them. I might say that I have a habit of making my quotation marks very small and light. I did not think very much about it when preparing the address, but now I know that it would have been better to have given *full* credit, instead of simply using quotation marks. Bro. D. has my best thanks for taking me to task, as I shall try and profit by the lesson. I cannot close without also expressing my pleasure at the honorable manner in which he has brought up this matter, thereby allowing me to publicly make the amende honorable.-W. Z. HUTCH-INSON, Rogersville, Mich.

Uniting Colonies.—E. K. Dean, of Amenia Union, N. Y., writes as follows:

I formed a nucleus recently and gave it a valuable queen, which I had just bought, placing it close along-side of a large colony whose queen I wished to supersede, and intending to unite them when everything was favorable. A few days since, when the new queen had gotten well settled in her new home, and the nucleus was getting moderately strong, the colony sent out a large "buckwheat swarm. and now I thought was the time to and how I thought was the time to unite them, so I watched the cluster till I discovered the queen, and de-stroyed her. Then I went imme-diately to the hives, and after smok-ing well, began by shaking every comb at the entrance of the hive of the colony which had guaranteed and comb at the entrance of the hive of the colony which had swarmed, and put all the combs outside on the ground, except the one with the queen which I left until the last. About this time the swarm dis-covering the loss of their queen, came rushing back, and I quietly lifted the queen from the remaining comb and let her run in at the entrance, and then afterward shook the to get a general mixing up by allow-ing two or three combs to get loaded three or four times, and shake them off again before I liberated the queen. I had no sooner got everything nicely closed up, however, before a general onslaught began, which was kept up, I think, till they annihilated the nucleus, and they were so fierce that they would drag out and source they would drag out and murder freshly hatched bees, which, when I released and gave to other colonies, were allowed undisturbed admission. I feared the queen would share the same fate, but I found her all right same fate, but 1 found her all right a day or two since, and just beginning to lay again. She did not begin lay-ing for several days. Queries: 1. In uniting what did I do, or leave un-done, which should have been other-wise? 2. Do you think the value of the queen was impaired by the opera-tion?

queen by introducing her twice to strange bees. Usually this slaughter among the workers will not take place under such circumstances, but the queen is the most likely to be killed. I presume they have now killed her. because of your opening the hive to see how she was received. I once had such a case of slaughter, and all my uniting and scenting the bees proved to be of no use. I think your queen is all right if now alive.-JAMES HEDDON.]

# Convention Notices.

The annual meeting of the Kentucky State Bee-Keepers' Association will be held at Frank-fort, Ky., on Oct. 6 and 7, 1886. All interested in bee-culture are earnestly requested to attend and help to make this meeting a pleasant and profita-ble one. The State Centennial will be celebrated at Frankfort, on Oct. 7, and excursion rates can be obtained on all railroads. A large attendance of bee-keepers is solicited. JNO. T. CONNLEY, Sec.

The St.Joseph, Mo, Inter-State Bee-Keepers' Association will hold its annual meeting on Wedneeday evening of the Exposition week. Sep-temper 30, 1886. Arrangements are being made to have an interesting meeting. The place of hold-ing the meeting will be published in our local pa-pers on Tuesday and Wedneeday a.m. E. T. ABBOTT, Scc.

The Sheboygan County Bee-Keepers' Association will meet at Chandler's Hall, at Sheboygan Falls, Wis., on Saturday, Oct. 16, 1886, at 10 a.m. Mass. H. HHLS, Sec.

The annual meeting of the Western Bee-Keepers' Association will be held in Pythian Hall (11th & Main Sts.), at Kanaas City, Mo., on Oct. 27-29, 1886. P. BALDWIN, Sec.

17 The next annual meeting of the Michigan State Bee-Keepers' Association will be held in Ypsilaoti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTINO, Sec.

17 The Southern Illinois Bee-Keepers' Associ-ation will hold its next meeting at Benton, Illa, on Thuraday, Oct. 21, 1886. F. H. KENNEDY, Sec.

The Union Bee - Keepera' Association of Western lowa will meet at Stuart, lowa, on Satur-day, Oct. 16, 1886. All interested in the busy hee are requested to be present. J. E. PRYOR, Sec.

The Semi-Annual meeting of the Central Michigan Bee-Keepers' Association will convene in Pioneer Hall, in the Capitol Building, Lansieg, the third Tuesday of October, at 10 o'clock, a.m. J. Asuworth, Pres.

237 The Illinois Central Bee-Keepers' Associatiou will hold its next meeting at Mt. Sterling, Ills., on Thesday and Wednes-day, Oct. 19-20, 1886. J. M. HAMBAUGH, Sec.

The attack of the second secon

Simmins' Non-Swarming System is the title of a new English bee-book. The author claims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be

THOMAS G. NEWMAN & SON, PROPRIETORS.

923 & 925 WEST MADISON ST., CHICAGO, ILL, At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAGER.

Special Notices.

To Correspondents. -- It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name: many others baving no Post-Office, County or State. Also, if you live uear one postoffice and get your mail at another, be sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

A New Crate to hold one dozen one-pound sections of honey .- It bas a strip of glass on each side, to allow the honey to be seen. It Is a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 ets. per crate. Glass 1%c. per light, extra.

Red Labels for one-pound pails of honey, size 3x412 inches. - We have just gotten up a lot of these Labels, and can supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apiarist printed on them-by mail, postpaid.

Yueea Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable. When they become sticky with honey, they ean be washed, and when dry, are as good aa over. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 cents a dozen; if sent by mail, add 1 cent each for postage

The Convention History of America and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.15.

# North American Bee Keepers' Society

The Chleago, St. Louis & Pittsburgh Railroad ("PAN-HANDLE ROUTE") take pleasure in hereby announcing to all dele-gates and their families desiring to attend the National Convention of Bee-Keepers' Union to be held at Indianapolis, Oct. 12, 13, and 14, that we have arranged to sell tickets to Indianapolis and return at \$7.30 each on certificate signed by Mr. Thomas G. Newman, General Manager Bee-Keepers' Union. Tickets good going Oct. 11, and returnlog up to and including Oct. 16. Morning trains leave Chicago, from the Union Depot, at 8:30, reaching Indianapolis at 3:50 p.m. Evening train leaves at 8:30. Night train has through sleeping-ear, and day train has through parlor-car to In-dianapolis.

We can offer you superior accommodations and would be pleased to receive your

and would be pleased to receive your patronage. Tickets will be on sale in exchange for certificate at Union Passenger Station, cor-ner of Canal and Madison Streets, Chicago, also at 65 Clark Street, corner of Randolph Street.

# The Monon Route to Indianapolis.

The Monon Route is the short line between Chicago and Indianapolis, and those desiring to attend the National Bee-Keepers' Convention, Oct. 12–14, should bear this in mind. The morning train leaves from the Dearborn Station at 8:35, arriving at Indianapolis 3:45 p.m. Evening train leaves at 7 30 p.m., and has attached elegant Pull-man sleepers. Tickets good going Monday, Oct. 11 and returning up to and including Saturday, Oct. 16, will be on sale at Dear-born Station, corner of Fourth Avenue and Polk Streets, also at the city ticket office, 73 South Clark Street. For further informa-tion call or address E. O. McCormiek, G, N. P. A., 73 South Clark Street, Chicago, Ills.

Frank Leslie's Popular Monthly for October opens with a most interesting article, "The Tragic Close of a Strange Reign," the story of Louis II. of Bavaria well told and illustrated. The charming "Walks about London" capitally illustrated, is as good as an actual visit to the vicinity of the great capital of England, while "Summer Saunterings about Lake George" makes us feel that we have in our land all that is grand and romantic and interesting. Altogether, the number is one that, io Altogether the number is one that, io variety of topics, charm of writing and fineness of illustration, is unmistakably a hit. The plate, in gold and colors, is exquisite.

2 Sweet Clover, or Melilotus Alba, is almost the only resource for honey now, on account of the late severe July drouth. If the seed is planted in September, it will come up this Fall and bloom next year, in its second season.

We have a large lot of this seed on hand, and offer it at the following Heduced Prices, by express or freight :

- One pound
   \$0 20

   "peck=15 lbs
   2 25

   " bushel=60 lbs
   7 00

   " sack=80 lbs
   8 00

It will pay to buy it by the sack and sell it again in smaller quantities.

COR If you want a chance to make some money, and provide pasturage for the bees during the Fail months, this is your opportunity 1

Five Thousand new subscribers to the BEE JOURNAL is what we have made our calculations for; they will come in clubs between now and next spring. Installments are coming every day.

The Canadian Exhibit of honey in England consists of 40 tons. The comb honey was packed with great care, and arrived in good condition ; it amounted to some 15 tons. The exhibit is for the "Indian and Colonial Exhibition." We will give further notice of it next week.

We Learn that G. L. Marshall & Co., of La Salle, Ills., who wanted consignments of honey, are frauds, and that they have been arrested for using the United States mails for fraudulent purposes. It will not do to ship honey to unknown parties.

. . . .

Reader, do you not just now think of one bee-keeper who does not take the Weekly BEE JOURNAL, and who should do so? Perhaps a word or two from you will induce him to do so. Will you not kindly oblige us by getting his subscription to send on with your own renewal for next year? When you do so, please select any 25 cent book in our list, and we will send it to you poat-paid, to pay for your trouble. We are aiming to get 5,000 new subscribers for 1887, -will you not assist us to obtain them?

Their Main Stay .-- Mrs. L. Harrison, In the Prairie Farmer, during the late drouth, remarked aa follows concerning sweet elover:

The blue grass has turned brown, and crumbles under the feet, by reason of the drouth, yet sweet clover blooma, and is visited from early morn until eve by the bees, which are making a living chiefly from it, which is another proof of its great value as a honcy-plant, as it fills the interim be-tween clover and tall bloom.

As there is Another firm in Chicago by the name of "Newman & Son," we wish our correspondents would write "American Bee Journal" on the envelope when writing to this office. Several letters of ours have already gone to the other firm (a commission house), causing vexatious delay and trouble.

Reduced Railroad Rates to the Convention at Indianapolis has been secured only for the round trip from Chicago to Indianapolis and return. Mr. Dougherty. the Secretary, has made several applications for reduced rates without avail. On Sept. 29, 1886, he sent us the following for publication:

Please announce in the BEE JOURNAL OUR failure to secure reduced rates. Our friends think strange that rates have been secured from Chicago and no further. I have again been before the Passenger Agent Pool here, but they refuse to do anything, even over the roada from Chicago. FRANK L. DOUGHERTY.

After his first refusal he wrote to us, and we also applied through the Pool Agent here, but was refused in the same language exactly as that used to Secretary Dougherty. Then we "pulled another string," through a friend of ours here, and obtained reduced rates on all the roads between Chicago and Indianapolia. We mention this only to show that the Secretary is in no wise to blame for not getting the usual reduction. Had the Convention been held in Chicago we might have succeeded in getting the reduction asked for ; but when it was proposed to earry passengers away from Chicago, we found it up-hill business; and we do not think we should have met with any success had it not been for our friend who assisted us in "pulling the ropes" in the right direction.

Wednesday .- It is a serious blunder to appoint a District or National Convention to commence on Tuesday morning. In order to get there, persons living at some distance are obliged to leave their homes on Sunday (and some on Saturday night) in order to get there at the first meeting. This is true also of some who live on railroads requiring two or three "changes" to "get there." As this mistake is so often innocently made by those having the matter in charge, we have concluded to make this public protest against such blundering in the future.

The North American Bee-Keepers' Society this years is called to mee at Indianapolia, Ind., on Tuesday at 10 a.m. We know of several prominent aplarists who cannot get there until Tuesday night or Wednesday morning, unless they pay some \$8 or \$10 extra, which, of course, they do not wish to do, and hence will be absent from all the first day's sessions.

We do not blame the present executive committee for this-they have but followed the example before them, the last few meetings of the society having been begun on Tuesday-but we desire to enter an earnest and public protest against any future meetinga being called before Wednesday morning.

The October number of the Apiculturist has eleven articles on the winterlng problem. These articles cover the entire ground, and are by some of our best apiarists.

Five Thonsand new subscribers to the BEE JOURNAL is what we have made our calculations for ; they will come in clubs between now and next spring. Installments are coming every day.

The Last Call for the intellectual feast at Indianapolis, beginning next Tuesday. Oct. 12, 1886. If you miss being there, you cannot blame the BEE JOURNAL for not giving you due notice. The meeting will be largely attended by many of the principa apiarists of America, and promisea to be an Intellectual feast, from which you cannot afford to absent yourselves. If you go by way of Chicago, write to the editor of this paper AT ONCE for a certificate to entitle you to reduced rates on the railroads between Chicago and Indianapolis. The tickets are good from Monday to Saturday. Oct. 11 to 16, 1886.

To Indianapolis there are four routes from Chicago-the Kankakee, leaving at 9,10 a.m. and 8.00 p.m.; the Monon, 6.05 a.m. and 7.30 p.m.; the Pan Handle, 8.30 a.m. and 8.30 p.m.: and the Chicago and Eastern Illinois. at 8.00 a.m. and 8 p.m. every day. On all of these railroads the reduced rates for a round trip for \$7.30 can be had upon the presentation of a certificate signed by Thomas G. Newman.

On the Kankakee Route, trains leave the depot at the foot of Lake Street; on the Pan Handle, traina leave from the Canal Street Depot; on the Monon and Chicago and Eastern Illinois, trains start from the Polk Street Depot. We make these announcements to prevent mistakes.

Sweet Clover.-Prof. A. J. Cook, in answer to a question in Gleanings, makes the following statement concerning sweet clover and its eultivation :

- -----

and its eultivation : 1. Sweet clover is a very excellent honey-plant. 2. It is very beautiful, both trom its rich fine foliage and graceful aweet-scented blossoms. Surely, ragweed, mayweed, smartweed, etc., bear no comparison to it as an adornment to the highway. 3. It is not bad to apread at this place. We rarely find it starting at any considerable distance from our beds; and when it does start in meadow or pasture it rarely holds on, being choked ont by our cultivated grasses. 4. When once started it is no difficult matter at all to get rid of it. As is well known, this clover is a biennial, and grows from seed, flowering the second year. Thus by cutting while in bloom, or before the seed smature, we aball quickly extirpate it. It cannot re-main longer than two years after such cutting, as it must come from seed every other year. So I am free to urge farmers to foster rather than destroy this plant. At this writing our beds of sweet clover-(metilolus alba) are in full bloom, and it is bard to say which is more attractive to the bees-this or the basswoods, which are also in full bloom. the bees-this or the basswoods, which are also in full bloom.

Oleomargarine. - The act of the late session of Congress regulating and legalizing the sale of oleomargarine takes effect on Oct. 31, 1886. Instructions, prepared by the Commissioner of Internal Revenue, are being sent to the revenue officers in the several districts, with the necessary revenue stamps, etc. We understand that the Commissioners construe the Act of Congress as relating only to imitations of butter consisting of mixtures of tallow, suct, beef-fat, etc. Mixtures of lard not being included under the term oleomargarine.-Exchange.

Frank Cheshire's new book on Bees and Bee-Keeping, can be had at this office .-Vol. I, bound in cloth, \$2.50, postpaid.

# Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries In this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them: get them returned, and then find space for them in the JOURNAL. If you are In a "hurry" for replies, do not ask for them to be inserted here.-ED.]

# Getting Bees into the Sections.

Query, No. 317.—All our surplus this year is from white clover. When it first began to bloom, bees worked very actively. The weather became a little dry, and in-stead of putting the honey into the supers, which were filled with the best of founda-tion, they stored it below. As fast as a young bee hatched, they filled up the cell with boney, instead of letting the queen lay in it, until in the whole 8 frames there was not a space 6 inches square that was not filled with nectar. I exbansted my ingenuity in trying to force them into the sections; but go they would not, and go they did not until the scason was about half over, then they weut up slowly, and averaged only about 25 pounds to the colony. They did not swarm, and when they should have been booming at the end of the clover bloom, they were quite weak. How can I prevent an occurrence of this another sea-son ? It is the first time I ever had queens crowded out, and I want it to be the last. Other colonies within 100 yards of mine gathered 50 or 60 pounds each.—W. P. K.

If they would not put it in the sec-tions then I would put it in the extractor.-H. D. CUTTING.

It is difficult to answer without knowing more of the management. Could there have been any fault with the queens or the strain of bees ?—W. Z. HUTCHINSON.

Contract the brood-chamber, or remove the comb in the brood-chamber and fill above in sections with foun-dation. Reversing the brood-frames also helps, as does uncapping honey in the broad-frames.-A. J. COOK.

You do not mention what it took to to exhaust your ingenuity, so we are in the dark as to what further to sugguest. They might have done better with less room in the brood-chamber. Possibly uncapping their frames of honey and putting them in the middle of the brood-nest might have been effective.-C. C. MILLER.

The trouble is in the strain of bees. A little Syrian blood will effectually remedy the difficulty. Syrio-Albino or Syrio-Italian bees never choke up the brood-combs with honey, it matters not how much may come in or how little the room may be. They how little the room may be. They are greatly superior to Italians, in my estimation, for comb honey.-G. L. TINKER.

I never, in any year, had any bees act so badly. I can conceive that bright, golden Italians in a deep hive, with bad communication to the surplus department, would do this years diluted the honey with water in feed-ago. I had these bees act similarly ing.-G. L. TINKER.

in less favorable times of the year.-JAMES HEDDON.

The above question is a long one, and the only explanation I cau give is, that the queens were failing in prolificness. The size of frames not being given, perhaps the queen was crowded out by having too small a brood-chamber.—J. E. POND, JR.

Contract the brood-chamber so that at the beginning of the honey-flow only brood is in this apartment. Empty comb in the brood-chamber at the beginning of the honey-flow gen-erally leads to the crowding of the queen, and little honey in the sec-tions.—G. M. DOOLITTLE.

Without knowing the exact condition of the bees at the time of the commencement of the bloom, it is difficult to give a correct answer. Sometimes we find colonies that hesitate about working in sections, and have to be coaxed there. But in all probability your bees had not work-ing force enough, at the time of the harvest, to gather any more honey than what they found room for below. There may have been bees enough to run the lower story, but not the sections. Have your colonies strong at the proper time.-J. P. H. BROWN.

I think it most probable that while your colonies may have been strong in bees, you had comparatively few field workers at the beginning of the honey harvest. I have often lost beavily on this account. If you put some sections in the section-case, which contained drawn comb and some honey, and the bees did not commence work there you may know commence work there, you may know that that was the trouble.-G. W. DEMAREE.

# Feeding Back Extracted Honey.

Query, No. 318.—Has the experiment ever been tried of feeding bees good ex-tracted honey to be stored in the sections? I can buy all the extracted honey I want at 5 cents per pound, and can sellcomb honey for 15 cents per pound; but I cannot sell extracted at any price.—W. M.

Yes, but as a rule it does not pay.-G. M. DOOLITTLE.

The experiment has been tried time and again, and nearly, if not quite every one who has tried it has abandoned it.—W. Z. HUTCHINSON.

Unless you can succeed better than I have done, you will never get rich feeding 5-cent extracted honey to produce 15-cent comb honey.—C. C. MILLER.

The experiment has been tried, but has often failed even with experts.-A. J. COOK.

Yes, but I do not think it has been a pecuniary success. You might try a few hundred pounds on some of your very strongest and richest colo-nies.—J. P. H. BROWN.

I have tried it, but for some cause the honey soon candies in the combs, and becomes almost as hard as maple sugar. Perhaps it would not if I had

It has, but the experiment as yet has never been found to pay, so far as I have any knowledge of the matter. I have tried it several times myself, but the results have been far from satisfactory.-J. E. POND, JR.

If all of the needful conditions were known and supplied, I do not know but it might be made to pay, but no such difference between the price of comb and extracted honey can long exist anywhere. It can hardly pay to gather a crop twice and feed it once in order to have it ready for market.-JAMES HEDDON.

It has often been tried, and gen-erally without success. I could not give my plan here, to convert ex-tracted honey into comb, for want of space. But if you will distribute some nice extracted honey among your neighbors—poor and rich—as a friendly gift, tell them you want them to try your nure liquid honey—if you do not get some orders for it after that, please let me hear from you.— G. W. DEMAREE.

It has been tried, but from many reports it did not pay unless there were a lot of unfinished sections to fill out. -H. D. CUTTING.

Honev-Dew-Bee-Poison.

Query, No. 319.-1. Is the honey gath-ered from honey-dew a wholesome article of dict, both for man and the bees? 2. Does often being stung by the bees, so poison the system as frequently to bring on malarial and rheumatic fevers ?-Iowa.

1. It may be unwholesome, but I prefer to be a little sick before I should want to eat it. 2. I do not know.—H. D. CUTTING.

1. It depends upon the nature of the honey-dew. We have seen some that we liked better than ordinary molasses, although it was as dark as the latter.-DADANT & SON.

1. It may be in some instances. 2. Some bee-keeepers feel certain that they have been so afflicted.-W. Z. HUTCHINSON .;

1. It is from some species of honey-dew. 2. I do not thimk so. I have been stung as high as fifty times a day, with no ill effects.—J. P. H. BROWN.

1. I have never seen any honey-dew, so I could not say. 2. I could not say, but I think not. I have had both fever and ague and the rheumatism since I have been keeping bees.-G. M. DOOLITTLE.

1. It may be, but very frequently it is not. I do not think so. Before keeping bees I was much troubled with malarial fever. Since then bardly at all, and I have had my share of stings. The pain and irritation at first was considerable; now it is very slight.—A. J. COOK.

1. The common expression, " honeydew," is very indefinite. Some stuff I have seen gathered from the bark-lice is filthy and unwholesome be-yond question. But some samples I have seen that was gathered from the leaves of trees looked nice, and I

see no reason why it is not whole-some.-G. W. DEMAREE.

1. We have so little of this "honey-dew" that I can only say that friends tell me that some samples of it winter bees as well as honey. 2. It might, I should think. I feel sure that a chronic rheumatic neuralgia or neuresthenia is no uncommon result from years of bee-poisoning .- JAMES HED-DON.

1. I have had very little experience, but I can hardly believe that honey with so disagreeable a taste as some of it has, can be wholesome for man or bee. Many winter losses have been laid at the door of honey-dew. 2. I think not. It has some reputa-tion (whether justly or not I am not prepared to say) as a remedy for rheu-matic affections.—C. C. MILLER.

1. It is not so considered by the great majority. 2. I am not aware that such is the case; in fact many claim that the opposite results follow in rheumatism. I cannot conceive in rheumatism. I cannot conceive how malarial fevers can be cured by inoculation of the poison of the sting of the honey-bee, as it is antiseptic in its nature.—J. E. POND, JR.

1. I do not think it is. 2. No. a bee-sting has only a temporary effect. The poison does not accumulate in the system. I believe, however, that after being stung enough to cause fever, that one should be careful not to get over-heated by working in the hot sun. The use of the common tomato as a food is in my opinion productive of ten fold more injury to the human system than being frequently stung by bees.-G.L.TINKER.

# Wintering Bees in Second-Stories.

Query, No. 320.—In wintering bees in a two-story chaff hive, how would it do to put in 3 or 4 brood-frames in the first story for the bees to cluster on, and the same number of frames with sealed honey in the second story, over the brood-frames, for winter stores; then use two division-boards, letting them extend from the bottom-hoard of the hive to the top of the second story? Then there will be 3 or 4 inches of dead air space on each side of the bees and stores in addition to the double walls packed with chaff. What I want to know is this: 1. Will it do to put winter stores above the hrood-nest? 2. Will the bees cluster on the brood-frames and go up-stairs for food, or will they go up in the second story and stores all in the upper story and leave the lower story How would it do to place bees and stores all in the upper story and leave the lower story empty (as an air-chamber) except one frame of comb to act as a ladder for the bees to go up and down on? The cluster would then be so far from the entrance that the cold air coming in would not affect them so much.--Florida.

1. Yes. 2. Yes. 3. It will work well in your climate. But in Florida you do not need chaff hives, nor any other fixtures intended for a cold climate.—J. P. H. BROWN.

There is too much room for escape of heat above in such a plan. We do not like it, but it may do for Florida. We do -DADANT & SON.

My experience is, that bees will go up-stairs and stay. Have had the best success with eight frames in the body of the hive, and it on the platform.-H. D. CUTTING.

1. I think so. 2. As soon as the brood and most of the honey is gone, they will likely move up-stairs to stay. 3. I can see no harm from the empty space below, and it might be some benefit.-C. C. MILLER.

The proposed plan might work well here at the North, but for Florida I should think it would be labor thrown away.—G. M. DOOLITTLE.

I think the bees would cluster on the honey and stay. I think the last mentioned plan a good one.-W. Z. HUTCHINSON.

1. The bees, so far as my experience goes, winter in the tops of the hives. I prefer a single story, as I find a frame as shallow as the Langstroth is safer for wintering than a deeper frame. 2. They will go for food till too cold for them to do so. 3. It would be far better than the first proposi-tion, but would give, in my judg-ment, too much space below.-J. E. POND, JR.

I have wintered bees for years in two-story hives; sometimes they winter in the lower and sometimes in the upper story. I have seen little dif-ference whether they winter above or below. When they go above to stay there they sometimes exhaust their stores above, and starve with plenty of stores in the lower story; for this reason I prefer to have all the stores in one apartment.—G. W. DEMAREE.

I should not do it. If they clustered below with little honey, and it came very cold, they would starve. I see no use in their having the double space to warm. Could I secure it easily I should like 2 inches below the brood-frames.—A. J. Cook.

The bees should, and usually will, cluster where the stores are in chambers of the size you mention. They would go into your second story and stay. The idea of empty story under the home would do no harm, if you still have room for thick packing above. Many believe it to be very advantageous.—JAMES HEDDON.

There will be too much trouble and expense about the plan suggested to make it desirable, even if it was a good one. The successful bee-keep-ers of the future will be those who use the cheapest hives and fixtures, and the most expeditious methods capable of fulfilling the purposes required.-G. L. TINKER.

# North American Bee-Keepers' Society.

# FRANK L. DOUGHERTY.

The North American Bee-Keepers' So-ciety will hold its 17th annual convention Oct. 12, 13 and 14, 1886, at Indianapolis, Ind. The meeting will be held in Pfoffin's Music Hall, 83 and 84 North Penpsylvania Street, one of the most pleasantly situated halls in the eity, having good ventilation and plenty of light. The Society head-quarters will be at the Occidental Hotel, corner of Wash-ington and Illinois Streets. The regular rates of this hotel are \$3 per day; special rates for those in attendance at the con-vention, \$1.50 per day. vention, \$1.50 per day.

The Northwestern Bee-Keepers' Society, The Northwestern Bee-Keepers Society, the Indiana State Society, the Eastern Indiana, with various county and joint societies will meet in union with the North American, making it one of the most important meetings of bee-keepers over held in the country ever held in the country.

Every thing possible will be done to make the meeting pleasant and entertain-ing. An earnest, cordial invitation is ex-tended. Following is the programme :

### FIRST DAY-THESDAY.

Forenoon Session, 10 a.m.—Convention called to order. Address of welcome, by Gov. I. P. Gray; "Response "by the President, H. D. Cutting; "Welcome to the City," by Mayor Caleb S. Denny; "Thanks," Dr. C. C. Miller, President of the Northwestern Society. Calling the roll of members of last year. Payment of annual dues. Becention of new members annual dues. Reception of new members and distribution of badges; reports of Sec-retary and Treasurer. Announcements.

Afternoon Session, 2 p.m., Special Busi-ness.—Annual address of the President; "Bee-Studies," Prot. A. J. Cook, Agricul-tural College, Mich.; "Apicultural Jour-nalism," John Aspinwall, Barrytown, N. Y.; "Bee-Literature," Thomas G. New-man, Chicago, Ills.; "The Coming Bee-What never never the work for book for What encouragement have we to work for its advent?" R. L. Taylor, Lapeer, Mich. Subject for discussion, has "Apis Ameri-cana" been reached?

Evening Session, 7:30 p.m.-Announcements. Miscellaneous business. Discus-sion of questions that may have accumulated during the day.

#### SECOND DAY-WEDNESDAY.

Morning Session, 9 a.m.—Announce-ments. Communication. Call of the Northwestern Society to elect officers. Election of officers of the Indiana State Society. Call to order. "Rendering Comb into Beeswax," C. P. Dadant, Hamilton, Ilis.; "Foul Brood," A. J. King, New York. "North American Bee-Keepers' Society—Past, Present and Future," Rev. W. F. Clarke, Guelph, Ont. Selection of place for holding moeting in 1887. Elec-tion of officers. tion of officers.

tion of officers. Afternoon Session, 2 p.m.—Announce-ments. Miscellaneous business. "Bee-Keeping and Apiculture," Prof. N.W. Mc-Lain, U. S. Apicultural Station, Aurora, Ills.; "Feeding Bees for Winter," Jas. McNeill, Hudson, N. Y.; "Wintering Bees," Dr. J. B. Mason, Wagon Works, Ohio; "Solid Truths relative to the Ap-icultural Interests of the east coast of Vo-Insia county, Florida." by John Detwiler, New Smyrna, Fla. Subjects for discussion, "Is the use of Foundation Necessary in Modern Bee Culture ?" "Are Perforated Honey-Boards a Success ?" Unassigned essays. essavs.

Evening Session, 7:30 p.m.—Announce-ments. Miscellaneous business. Discus-sion of questions in question-box. Social communications.

### THIRD DAY-THURSDAY.

Morning Session, 9 a.m.—Announce-ments, Miscellaneous business. Com-munications. "The National Bee-Keepers' munications. "The National Bee-Keepers' Union." by Thomas G. Newman, Chicago, Illinois. "A Talk on Hives," by James Heddon, Dowagiac, Mich.; "Reversible Hives and Frames." J. E. Pond, Jr., Fox-boro, Mass.; "Drones and Drone Comb," W. Z. Hutchinson, Rogersville, Mich.; Reports of Vice-Presidents; "Progress of Bee-Keeping in Indiana," Jonas Scholl, Lyons Station, Ind. "The Future of Bee-Culture," G. W. Demaree, Christiansburg, Kentucky Kentucky.

Afternoon Session, 2 p.m.-Announce-ments. Miscellaneous business. Explanation of various articles on exhibition. Indianapolis, Ind.

Explanatory .- The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is located near the center of the State named; of anoth of the center; \$ south; \$\$ east; \$\$ west; and this \$ northeast; \$\$ northwest; \$\$ southeast; and \$\$ southwest of the center of the State mentioned.

For the American Bee Journal.

# A Call on Mr. J. B. Hall. WM. F. CLARKE.

Mr. J. B. Hall does not like noto-riety. He prefers to keep shady, and to be let alone. How far a man is to be indulged in this love of privacy and concealment, is a somewhat perand concealment, is a somewhat per-plexing question to one who is always "takin notes" with an ultimate de-sign to "print 'em." I got rather a brusque reception the other day when, being in Woodstock, I took the opportunity of dropping in on Mr. Hall. "Are you going to drag me before the public again ? I suppose we shall soon have quother ?50 pounds we shall soon have another 250 pounds we shall soon have another 250 pounds of honey story going the rounds." I felt chagrined and annoyed at myself for not having contradicted that 250 pound mistake. How it got into print, whether by a slip of the tongue, a slip of the pen, or a mistake of the printer, I do not know, but I quite intended to correct it, and ought to have done so long ago.

have done so long ago. I am inclined to think I got Messrs. Jones and Hall "mixed up" in my mind. Mr. Jones made an average one year of 250 pounds of honey, spring count. But it was extracted. Mr. Hall's was comb honey, and should have been reported as 150 pounds average, spring count. I hope this explanation will be satisfactory to all concerned, including Mr. C. W. Dayton. See his article on "Troubled Bee-Lore," on page 441 of the AMERI-CAN BEE JOURNAL for this year. CAN BEE JOURNAL for this year.

Mr. Hall objected at the Detroit convention that the bee-periodicals report successes but not reverses in bee-keeping. Having given publicity to success in his case, it is only right to success in his case, it is only right for me to balance up matters by chronicling the opposite condition of things. A sad reverse has befallen our friend, the present season. To quote his words: "Total failure is my record for 1886." There are sev-eral explanations of this. Mr. Hall was absent from home last fall at-tending Fairs, and his bees did not get the usual thorough preparation for winter. A number of colonies was too light. He was building a new house and, as usual, the contrac-tors were behind time in fulfilling their contract. Hence it was late,

too late when the bees were put into winter quarters.

Again, a defect in the drain caused the presence of water in the bee-cellar to a depth of about six inches. Finally, the furnace fire was let out too soon, with the idea that it would not affect the bees, there being a 12inch brick wall between the furnace and the cellars. But it did affect them enough to check brood-rearing, so that the multiplication of workers was not accomplished in time for the first run of honey. That first run was all there was around Woodstock. After a brief harvest from the earliest white clover blooms, there was abso-lutely no honey yield. Alsike clover has been a most important source of honey-gathering heretofore. This year there was none from that source, and none from the linden.

Our friend was not despondent or in tribulation over this state of affairs. He says he makes it a prin-ciple not to cry over what he can't help. Well, I suppose we all do that, but some of us are not entirely suc-cessful in carrying out the principle. Mr. Hall is. Perhaps he has a more comfortable bank account than some of us That has a great deal to do of us. That has a great deal to do with the ease or difficulty of being consoled under unfortunate circum-stances. This is the second time in fifteen years of bee-keeping that Mr. IIall has had an experience of "blasted hopes."

On the former occasion the year of failure was followed by one of double failure was followed by one of double success, and taking the average of the fifteen years, the showing is not discouraging. All the readers of the AMERICAN BEE JOURNAL will join with the writer in the hope that this year of dearth, like the former one, may be succeeded by a year of plenty that will make up for losses and keep that will make up for losses, and keep up the average to the point of encouragement.

Mr. Hall has had hardly any swarms the present season, and though he obtained fifty of the new Heddon hives, is unable to report any practi-cal experience with them. He has the finest specimens of the Caruiolan bees I have yet seen, and is favorably impressed with them. I am sorry that we shall not see his genial face that we shall not see his genial face at the Indianapolis convention. He is getting very skeptical about con-ventions. Perhaps we pumped him too much at Detroit. Never mind, friend Hall. It is "give and take" at these meetings. Last time it was "give" in your case. Come again and "take" all you can get! Guelph Ont.

Guelph, Ont.

the greatest amount of honey and increase combined.

The first year I kept bees I allowed natural swarming; and although I had but 7 colonies, they were the source of a great deal of trouble and annoyance, causing me to climb trees, saw off limbs, and perform other dangerous and disagreeable teats, far better suited to the gymnasium than to the apiary. No wonder I became disgusted with this old, fossilized, moss-grown method of "handling bees.

So this year I took a step forward and began practicing the new method of dividing and artificial swarming, by which method I not only saved my trees from disfiguration, and my limbs from a possible worse tate, but secured a more than two-fold yield in proportion to the number of colonies kept, and doubling the number as I had done the previous years by the swarming method.

Judging from an experiment made the past season, I believe I can take 10 good strong colonies of bees in this locality, where the average is from nothing up to 50 or 60 pounds per colony, of a good season, treble the number and procure 200 pounds of comb honey per colony, spring count.

An instance to illustrate: From a three-frame nucleus made on the 17th of last May, and furnished with a ripe queen-cell from an Italian colony, ripe queen-cell from an Italian colony, the young queen of which afterwards mated with a black drone, I obtained 48 pounds of comb honey in one-pound sections, and 27 pounds of ex-tracted honey, making 75 pounds in all, and a full colony of bees at the wind-up. And this amount of sur-plus might easily have been aug-mented by judicious management. This humble actical is offered for

This humble article is offered for the benefit of those who wish to turn from the "smooth-worn ruts" of our fathers, and enter upon the higher and better plane where brains will in the future be appreciated, and labor better compensated.

Mt. Sterling, +0 Ills.

# For the American Bee Journal.

# Plain Sheets of Wax.

J. E. POND, JR.

On page 536 Mr. J. F. Hays accuses me of "contumeliously" answering the question of L. J. S. in regard to plain seets of wax. I desire to say, that in answering the various ques-tions sent me for the Query Depart-ment, I have endeavored to give noth-ing but my own opinions, based on my own experience, and so far as I am aware L have never indulged in con-

mates something in regard to "ruts worn smooth," I will say that I have been more or less prominently before the public as a bee-keeper, and writer for over 16 years, that I have always for over 16 years; that I have always boldly traveled out of the old ruts, when I saw anything to be gained thereby; and further, even, that I think that during the last 16 years instead of following, I have been pretty near the front, and have doue my share of making the ruts that are now being traveled in, by the most experiperienced of my brethren.

I still say that with the low price of foundation, and the ease by which we can control the matter of cell sizes by its use. I fail to see any practical advantage that will follow the use of plain sheets of wax, even if but 4 inches wide; and further, that as drone comb is not usually built at the tops of frames, I should not expect that any would be built on starters in the brood-chamber, especially if room was given for so doing elsewhere. Foxboro, Mass.

# For the American Bee Journal. Has Nature Made a Mistake? GEORGE F. ROBBINS.

Mr. O. N. Baldwin, on page 600, does not meet the gauntlet thrown down at all. I say again, this talk about nature ("or the "Great King") making a mistake amounts to little or nothing, as against the testimony of experience. And, reasonable or unreasonable, I do believe that under certain conditions, or in certain localities, as I said in my article on page 567, bees will winter better on sugar tban on natural stores, because the array of evidence presented in the testimonies of Heddon, Hutchinson and Cook is conclusive, and has never to my knowledge been fairly met.

I repeat, to successfully controvert those testimonies, they must be op-posed by precisely the same experi-ments, under like conditions, with exactly opposite results. I appeal to any fair and candid man if that posi-tion is not good. Now, what oppos-ing evidence does Mr. Baldwin offer ? Why, he gives one experiment with 4 colonies, and instead of being shut in gaol for five long months without a break, they have two good flights in that time. There is a vast difference that time. There is a vast difference between the conditions in Missouri between the conditions in Missouri and Michigan. My latitude is higher than that of Mr. Baldwin, and my bees winter very well on natural stores. The argument that, because 2 colonies died of starvation, they died for want of honey and pollen, is a stunner. It is too bad that they did not have access to some sugar syrun about that time syrup about that time.

Mr. B. says nothing about the quantity of stores they had when put away, whether they had been breed-ing much, or showed signs of diarrhea, etc. Altogether his testimony proves nothing. The fact that sugar syrup may be safer winter food for bees in Michigan than natural stores, does not argue that nature has made mis-

take. We find laws of death as well as life permeating all nature, and for good reasons, although we may not always undertand them.

The same Diety who made the atmosphere for man to breathe in life and health, has charged it with malaria and pestilence to produce disease and death. But He has at the same time created roots, herbs and minerals, and endowed man with faculties to discover and apply their properties so as to largely over-rule these forces of death. So He has created the honey-bee with instinct and nature to multiply with wonderful rapidity where conditions demand it; but at the same time He has sown the seeds of death to prevent them becoming an evil rather than a good. And He has made man, in this as in a million other cases, lord of the very laws and forces of nature to over-rule them to his own good. To meet the exigen-cies that arise in a state of nature, the instinct of the honey-bee is to rear drones in such numbers as to become a nuisance in modern bee-culture.

But this same rule in nature may be and is annulled by the art of man. So, also, if adverse conditions may discriminate against certain regions of country, man possesses the power to put these laws of death under his feet—by the very simple expedient of using sugar syrup. There, my triends, is some theorizing, if that is the proper term, as plausible as any that have been offered, I think. Mecbanicsburg,⊙ Ills.

For the American Bee Journal. Au Apicultural Review. EUGENE SECOR, (30-40). I suppose we all think the season

just past the most remarkable one we ever knew in Iowa. Perhaps that is because we have the most vivid recol-When we do not keep a record of the weather, the last cold snap is apt to be the coldest, the last dry spell the severest drouth, and the recent heated term the hottest weather we ever experienced.

That is the way we bee-keepers talk about the season just past. We say we never saw such a peculiar year; that contrary to all past experience the spring opened favorably, and the honey-flow began at once, and then after a brief but plentiful yield the supply suddenly ceased—a thing hardly known in this part of the State.

In saying this is unprecedented we may be a little outside of the truth. As we have not always kept bees, and a faithful record of the weather is not at hand, we have to draw on our im-pressions for our facts. It has certainly been widely different from any

year immediately preceding it. After a very protracted and very severe winter, the bees were removed from their depositories in fine condi-tion, and with but slight loss. This This Spring came with such etherial mildness that breeding began at once. Scarcely any unfavorable weather to chill the hatching brood or to cause spring dwindling. The early wild flowers were rich in tempting sweets. Fruit blossoms yielded up their wealth of nectar. Every opening petal seemed to invite to a feast of bees around the entrances showed their readiness to respond to the stimulating effects of the weather and the flowers.

At the beginning of white clover bloom, about June 1, most of them were populous enough to go into the supers. There was the time that a supers. There was the time that a knowledge of the situation was needed. The wide-a-wake bee-keeper at once righted up his pitcher ready for the shower. The Rip Van Winkles' did not wake up until the shower was about over. All the honey we got this year, substantially, was gathered in forty days. Everything came with a rush. The white clover harvest lapped over on to basswood bloom so perceptibly that the bees seemed bewildered at the profusion of ambrosal sweets. They were reluctant to leave the pearly drops of the former for the equally tempting chalices of the latter.

Usually, white clover is gone before linden blooms. We often get, also, a good yield from sumac. This year not a drop. Quite generally the last half of July and August give us the bulk of our surplus. This year scarcely any more honey was gathered after the middle of July than the bees re-quired. The long continued drouth seemed to effectually dry up the honey fountains in all the fall flowers. Buckwheat yielded some honey, but so little of it is raised in this vicinity so fittle of it is raised in this vicinity that the amount was not noticed. What surplus we have is therefore mostly white honey of excellent quality. My own colonies averaged about 75 pounds, spring count, one-fourth extracted, balance mostly in one-pound sections. In consequence one-pound sections. In consequence of the light fall yield there are some unfinished sections.

Forest City, & Iowa.

# For the American Bee Journal.

Doolittle's Report—A Peculiar Season.

# G. M. DOOLITTLE.

No other industry in the world is probably more dependent upon the weather than is apiculture. For growing crops the weather may be bad at times, but when it does come good weather, they are generally ready to make a rapid growth, thus regaining what was lost by the previous in-clement weather. It is not so with honey gathering, for if the weather is bad while the honey-producing flora is in bloom, all the good weather afterward cannot make up for the was the case with every one who had loss. If the rearing of bees so as to bees. It did not seem to matter much how they were wintered, either. is of bee-keeping, then the same

thing applied to growing crops would be applicable to bees, especially if the apiarist supplied a little feed occa-sionally; but if the bee-keeper is to be successful as a honey-producer, nothing but good weather through some one of the periods during which nectar - bearing flowers bloom can make that success.

These thoughts are called out upon looking over the honey season just past, for taking it all together this has been the most peculiar season I witnessed for bees. ever Spring opened very favorable, much more so than has been the case for the past eight years, which, together with little or no loss in wintering, caused the bee-keepers about here to be jubilant. Bees reared more brood in April than they commonly do in May, and by the time apple and other fruit trees were in bloom, many of the col-onies were strong enough to swarm, companying the they are strong enough to swarm, especially those wintered in cellars.

Right here I wish to mention a curious fact. I had always thought that if the weather could only be good for the first three weeks after the bees were out of their winter repose, so that they could fly every day we would have no trouble with what is called spring dwindling. Well, we had just such a time the past April, so the bees could fly every day for the first 24 days after they began to fly, and the result was that one-third of my colonies wintered on the summer stands died down so that at the end of those 24 days the hives were nearly depopulated of all their flying force, and colonies that a week previous seemed full of bees contained nothing but brood and young fuzzy bees, the old ones lying dead of old age almost in heaps in front of the hives.

While this was the case with those wintered on the summer stands those from the cellar which were left in until twelve of these pleasant days passed seemed to thrive beyond all conception, and were hanging out on the outside of the hives in large clusters during the bad weather in May.

But to return : This early brood-rearing consumed a large part of the old honey in the hive, and gave a force of bees large enough to work on the fruit bloom to good advantage, so that five days of warm, pleasant weather at that time would have secured from 30 to 50 pounds of honey to the colony, because we had the laborers to gather it, which laborers are generally deficient in other years. But the weather was warm and pleas-ant up to within three days of the bloom, when it came off cool, cloudy and rainy for two weeks, so that this force of bees was kept in the hive consuming honey rather than produc-ing. The result was that the bees had to be fed for three weeks to keep them from starving; for the pleasant weather which came later, was of no use, for we always have a scarcity of flowers which yield honey between fruit bloom and white clover.

As the bees had to be fed, and the weather was bad, nature told them to retrench as much as possible, so they almost ceased to rear brood at just honey is the safest food for bees to heard blessing the man who invented the time brood was most needed so as winter on in this locality, allowing comb foundation, or expressing senti-

to give bees at the right time to secure the honey from our main dependence, basswood. During the first week of clover bloom the weather was life, and as a part of the force was left (not having died), the bees did well on the little white clover we have here, many of the colonies getting started in the sections nicely. It now came cold and wet again, so that no more gain was made from that source, although the bloom lasted 20 or more days longer. The last half of any bloom always seems to afford the most honey when favorable weather continues, so it will be seen that opportunity was given for the bees to work only at a disadvantage.

Besides, the bees began to die off rapidly of old age, so that colonies which were in good condition, and at work in the sections two weeks pre-viously, had scarcely bees enough left to care for the now rapidly increasing brood. In fact the mortality was so great that all over the bee-yard and about it in every direction the ground was thickly strewn with dead and dying bees. Basswood opened on July 8, while on the 9th the ten days of s, while on the 9th the ten days or splendid honey weather we had been having ceased, and rain, rain was the "order of the day" for the next ten days. Two pleasant days now oc-curred during which the bees did their level best, what there was of them of the proper age to work, when the bloom came to a close.

I had hoped that the teasel would give some surplus, as there was a large acreage of that plant, but this yielded little more than a living for the bees, so that I was about to de-clare the season of 1886 a failure for honey in this locality, when all at once, as it were, the bees came in quite heavy loaded, and work in the sections was resumed, much to my joy and surprise. Upon looking about I found that the drouth, now setting in, had caused the large kind of red clover (of which there were many large fields saved for seed) to yield honey to such an extent that those fields seemed fairly alive with bees. This state of affairs continued for about ten days or two weeks, so that I now find that my crop figures up to 2,022 pounds, all of which is comb honey.

My report a year ago gave my number of colonies as 95, all of which had their own stores of honey. Out of the 95 three died during the winter, two became queenless, and were united with others, leaving 90. These were reduced by sales to 60, which number were largely drawn upon to form nuclei for queen rearing. From the above only 40 swarms issued, owing to the poorness of the season. I am now preparing the bees for winter, and shall put into winter quarters just as many colonies of bees as I have natural stores for, which number will be somewhere from 85 to 100. The be somewhere from 85 to 100. The colonies will be doubled down to suit the stores, weeding out the inferior queens so as to improve my stock as much as possible. My experience has taught me that

the bees all the pollen there is in the combs. If otherwise I should try the sugar as some others do, regardless of what has been said against bee-keep-ers using sngar for bees. As to the pollen all my experience proves that it is impossible to remove it all, and It is impossible to remove it all, and that there is enough left to give the bees the diarrhea if they choose to have that disease. By dividing the 2,022 pounds of honey by 60 colonies (spring count) it gives  $33\frac{2}{3}$  pounds as the average yield per colony, which is the smallest yield I have had during any season, for the past 14 years. Borodino, N. Y.

For the American Bee Journal.

Foundation in the Brood-Chamber.

# FRANKLIN P. STILES.

The theory of hiving swarms on empty frames, giving starters only, and placing partly-filled sections above has always seemed sound to me, and each year since so strongly recommended by Mr. Doolittle, a portion of my swarms have been so treated. Notwithstanding the vehement assertion that I would "never be such a fool again," the plausibility of the theory has each year secured a con-tinued trial. Mr. Ilutchinson's ad-vocacy of the plan still further strengthened my faith, and last year more careful experiments were made, wherein several new features were developed. The results, however, were far from favorable.

When Mr. Heddon's new hive first came to my notice, I felt sure it would settle the problem in a conclusive manner, for among the many admir-able advantages it offered, its adaptability to the above plan seemed clearly apparent. Spring found me with 40 of the new hives with which I hoped among the many interesting experiments to get a positive solution to this solution. Dame Nature, however, had a word to say, and the poorest season for several years per-mitted the use of but 15 of the num-ber for prime swarms. While more ber for prime swarms. than fulfilling my most sanguine anticipations in every other respect, I am forced to admit that with me it has not settled the vexed question of the best method of hiving swarms, and that "the ghost still rises before me and will not down."

So far as drone comb is concerned there has been but little trouble, nor do I think any one will be bothered with it if the colony has a good queen, and the partly-filled sections from the old hive are immediately put in posi-tion on the new. Most of the swarms so hived built combs which would be considered very fine by any one not accustomed to handling those built on foundation in wired frames. They were nearly all somewhat "wavy," and when reversed to have them fastened solidly to the bottom-bar, required more or less straightening. Three colonies built combs so crooked that in getting them into working order, the apiarist was frequently heard blessing the man who invented

ments which, by opposition, might be so construed.

Looking at the subject from the stand-point of this year's experience I find it true that the habit of storing I find it true that the habit of storing in sections is most likely to be un-interrupted if starters only are given in the brood-chamber. This is a most valuable advantage. I believe that the different results received from apparently equally good colonies, the cause of which is so universally "shouldered off" on to the queens, can frequently be traced to the api-arist's failure to control the habits formed by the bees in early spring.

I also find that the most surplus, in a majority of cases, is secured by hiving swarms on starters only. You may say that ought to settle the whole matter. Perhaps it would if un-limited time was at the disposal of the apiarist, but such is not generally the case, and he may be "paying too much for his whistle."

I believe I can so manage the new hives that 35 cents worth of founda-tion in the brood chamber will in no to more than balance the first cost, have infinitely better combs, while the "fearful looking forward" is made to give place to a serene trust in the future solid comfort we have thereby securely provided. Thus thereby securely provided. Thus while my experiments, as a whole, rather favor empty frames, my lean-ing is towards the "luxury" of comb foundation

Haverhill, o Mass.

For the American Bee Journal. Sugar for Winter Stores.

## W. Z. HUTCHINSON.

Mr. A. E. Hill, in his first paragraph on page 601, says: "But if the price is (of honey) is lowered as the result Is (of honey) is lowered as the result of producers giving the public occa-sion to believe that honey is obtained by feeding sugar, are bee-keepers more prosperous then ?" It will de-pend, of course, upon the extent to which the price is lowered, as com-pared with the cost of sugar, plus the greater surety of wintering the bees upon surer stores. It is difficult to upon sugar stores. It is difficult to ascertain the extent to which the public can be led to believe this falsehood, or to learn how much it really cares about the matter if it does believe it. Notice the extent to which commercial syrups are used, when it is known that they are adulterated with glucose, a substance which many regard as unhealthful, while there is no question as to the healthfulness of cane sugar. The use of foundation is open to objection upon the same grounds, yet no one thinks of dis-carding it.

In his second paragraph Mr. Hill says be cannot understand why I class "sugar feeding " with "founda-tion," and the "honey-extractor," *i. e.*, as an *improvement*. I think there is no question in regard to the ex-tractor defined by the set tractor and foundation being improve-ments; but when extracted honey arguments? Mr. Hill admits that was first thrown upon the market, its the right way would be to compare the season, but as they were not iu

beautiful clearness led many to believe that it was adulterated; and even now extracted honey is looked upon with suspicion, because of the ease with which it can be adulterated. Shall we make this an objection to the use of the extractor? I have several times called attention to the fact that foundation was all that ever gave any "backbone" to the Wiley sensation, still it is regarded as an "improvement." Now, when it has been shown that the use of sugar for winter stores enables many to winter their bees more cheaply and successfully, and to secure larger crops of honey, I am told that it is no "im-provement." Why? Simply because it may assist in giving color to unjust accusations.

Other improvements are open to the same objection, but these other improvements are now old and well established, and to oppose them would be folly. But let no one suppose their would these old improvements had not to run the gauntlet—the same ordeal through which all improvements must pass. I wish I had space to quote the whole of an article published on page 54 of the Bee-Keepers' Magazine for 1878, but must content myself with a few extracts: "Extracted honey, from its very nature, will be liable to such adulterations; and we already see the effect upon the market by this cry thus early raised against it."

Again: "Let any bee-keeper of experience contemplate for a moment the purity of commercial beeswax, or, what is more to the point, a quantity of refuse comb before it is adul-terated. Containing, in addition to other impurities, dead bees in various stages of putrefication; with moth worms of all sizes, dead and alive, to-gether with their excrement, and this to be cooked together in a kettle of water until the savory extract has thoroughly flavored the beautiful yellow wax, destined to become a delicious morsel, and component part of comb honey. And, in case your own stomach is not affected, I ask, cannot such a picture be used by our opponents against us ?"

"We must keep comb honey free from the impression that it is other than the pure, beautiful food God has made it, working through the wonderful instinct He has implanted in these little creatures."

"But let the impression once go forth that it is otherwise, that it is 'doctored,' that it contains anything of questioned purity, that the beauti-ful comb is not the work of wonder-ful instinct, but a thing gotten up by machinery in any sense, and you have deprived it of an interest to the con-sumer that must effect the sale of it as an ornament and luxury to the table."

Do you not see, my brothers, how the honey extractor and comb foun-dation had to "catch it" when they were introduced? Almost exactly the same arguments were used against them as are now brought against the use of sugar for winter

"the pro rata loss of bees wintered on sugar compared with that of those wintered on natural stores," and then asks me to give the pro rata of loss. He well knows that this is something no one can do, as no accurate statis-tics have been kept. In my own case the loss upon sugar has been nothing, while upon natural stores it has averaged 50 per cent. In his last para-graph, with regard to "Shall we stop using foundation?" Mr. Hill says: "Foundation is made from pure beeswax, which is solely the production of the apiary, and certainly its use should not be abandoned on the ground that 'sugar feeding' is objected to."

The fact that foundation is made of a "product of the apiary" is neither here nor there; the point is just this: Mr. Wiley stated, in a scientific journal, that artificial comb was made by machinery, that it was filled with scented glucose, and sealed over with a hot iron, etc. This was widely copied and read, people saw the smooth, white, perfect sections of honey; and at fairs and exhibitions they saw comb foundation and mathey saw comb foundation and ma-chines for its manufacture; putting all this together it made quite a plausible showing, and many believed the story. Nothing has done more, and is still doing more to give color to this unjust accusation than the use of comb foundation; and that use of comb foundation; and that foundation is made from a production of the apiary has no bearing whatever upon the case, and as its use assists in giving color to an unjust accusation, again I ask: "Shall we stop using foundation ?"

Please remember that I do not assert that the use of sugar for winter stores will ever become universal, as has the use of the honey extractor or comb foundation; neither do I assert that those who now use sugar will always continue its use; but I do assert that this practice must stand upon its merits, and if it does possess merit, no amount of argument will bring about its abandonment.

Rogersville, & Mich.

# For the American Bee Journal.

Marshall County, Iowa, Convention.

The Marshall County Bee-Keepers Association met at Marshalltown, Iowa, on July 17, at 1 p.m., but owing to the busy harvest season at that time, but few were present; still the meeting seemed to be one of interest to all present.

The subject, "Fall bee-manage-ment," was discussed by Mr. Koeper and others, showing the necessity of and others, showing the necessity of looking over and preparing all colo-nies in good conditiou for winter, by contracting the brood chamber to suit the size of the colony, evening up the stores to suit their necessities, and teeding when neeeded. Also showing the desirability of late breed-ing in order to successful wintering.

Several other subjects were mutually talked over, we think to the benefit of all. Some reports were made for

fnll, and as there were but few memfull, and as there were but few mem-bers present, we withhold it till the next meeting, hoping to get a full report from all our members then. The subject for discussion at the next meeting will be "Winter man-agement of bees," and reports for the

season.

At the opening Mr. Louis Koeper read an essay on "Modern Bee-Keep-

ing," in which he remarked as follows: "Honey and bees were known at a very early period, but the art of modern bee-keeping was nnknown until the 19th century, when the Rev. Dr. Dzierzon, of Germany (who was a great naturalist), studied the habits of the honey-bee, and found that it was one of the most intelligent of insects. He placed them in trans-parent hives, and let them build in moundle frames, where he studied movable frames, where he studied their habits, and saw how quickly

"On the foundation of Dzierzon's Theory, Barron Von Berlepsch, near Linaberg, in the State of Hanover, Germany, also studied the habits of the bees, and improved the art by taking out full frames and replacing them with empty ones. He also inthem with empty ones. The also in-vented the triangular top-bar, dipped it in wax, and by it guided the bees in building comb. In America the Rev. L. L. Langstroth, Mr. M. Quinby and Mr. Harbison improved upon this modern system of making it. The modern system of making it. The dry weather here in Iowa, this summer, and the a bundance of white clover gave a splendid honey harvest to those who used the opportunity to get it."

Asking all bee-keepers in the vicinity of Marshall county to meet with us, the society then adjourned to meet at the Court House in Marshalltown on Saturday, Oct. 16, at 10:30 a.m. J. W. SANDERS, Sec.

Le Grand, O Iowa.

### Convention Notices.

The Sheboygan County Bee-Keepers' Asso-elation will meet at Chandler's Hall, at Sheboygan Falls, Wis., on Saturday, Oct. 16, 1886, at 10 a.m. MRS. H. HILLS, Sec.

The annual meeting of the Western Bee-Keepers' Association will be held in Pytbian Hall (11th & Main Sts.), at Kasasa City, Mo., on Oct. 27-29, 1886. P. BALDWIN, Sec.

The next annual meeting of the Michigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTING, Sec.

The Southern Illinois Bee-Keepers' Associ-ation will hold its next meeting at Benton, Ilis., on Thursday, Oct. 21, 1886. F. H. KENNEDY, Scc.

The Union Bee - Keepers' Association of Western lows will meet at Stuart, lows, on Satur-day, Oct. 16, 1886. All interested in the busy bee sre requested to be present. J. E. PRYON, Sec.

The Semi-Annual meeting of the Central Michigan Bee-Keepers' Association will convene in Pioneer Hail, in the Capitol Building, Lansing, the third Tuesday of October, at 10 o'clock, a.m. J. Ashworrht, Pres.

Association will hold its next meeting at Mt. Sterling, Ills., on Tuesday and Wednes-day, Oct. 19-20, 1886. J. M. HAMBAUGH, Sec.

All are respectfully invited to attend the next mecting of the Bee-Keepers' Association of Eureka Springs, which will be held at Eureka Springs, Ark. on Oct. 23, 1886, Business of im-portance to every hee-keeper Northwest Arkansss will be before the meeting. DR. S. S. PURCELL, Sec.

Oct. 23.- Wabash County, at Wabash. Ind. Aaron Singer, Sec., Wabash, Ind.

Oct. 27-29.—Western, at Kansas City, Mo. P. Baldwin, Sec., Independence, Mo. Dec. 1, 2.-Michigan State, at Ypsilanti, Mich. H. D. Cutting, Sec., Clinton, Mich.

17 In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings .- ED.

Gathing Honey Yet. -- Charles Sandhoff, Clifford, Ont., on Sept. 27, 1886. writes :

We started the season with 7 colonies of bees (6 six strong and 1 weak). They yielded an average of about 150 pounds of good comb honey. Extracted honey is of no account around here. Comb honey is selling at 20 cents, and extracted at 15 cents, but the sale is small. Last winter was a very hard one on bees; almost all died by starvation. The white clover blossoms and basswood was plentiful, and the bees are busy gathering honey yet.

Compelling the Removal of Bees.-John Booth, of Barry,+o Ills., asks the followiug question, which is answered by Mr. J. E. Pond, Jr., at our request, as he is a lawyer, and knows best what may be done in such cases :

Has the town board a right to pass a law compelling all bee-keepers to move their bees outside of the incor-porate limits of the town? Please Please answer in the BEE JOURNAL.

Mr. Pond replies as follows, to the above question :

So far as my own State is concerned, the town board (select men) have no right to pass such a law. If it can be the town board (select men) have no in width, fastened to the top-bar of right to pass such a law. If it can be shown that the bees are a nuisance, then the courts, upon petition, can should be. My brood frames are order their removal. If they affect wired in the usual way, *i. e.*, perpen-the *health* of any persons, the town board, as a board of health, can order their removal, but even then have no the wires are drawn taut, the hive

power to enforce the order. They must go to the courts for their remedy. What the statutes of Illi-nois may provide I do not know, but at common law no town board has the power to compel removal, even if they have the right to pass such an order; and such order can only be passed on the ground that the bees are a *nuisance*, and *that* must be proved before the courts. So I say, to sum up, that town boards *cannot* compel any one to remove bees by the simple passage of an order so to do.

North American Bee-Keepers' Society.-A. J. Fisher, East Liverpool, 6 O., on Sept. 22, 1886, gives the following suggestions :

As this society has held conventions twice in New York, twice in Cincin-nati, and this time twice in Indianapolis, Ind., I with many others would suggest that it would be justice if the members at the Indianapolis meeting would unanimously cast their votes for the next meeting to be held in the beautiful city of Cleve-land, O., where the society was born. If held there in 1887, it should be the largest, most interesting and instruc-tive ever held in America. Let us all who were there before (except those who have passed over to the other shore) meet again and learn of the progress made in our pursuit since the last meeting there, which will be 18 long years. Let us meet in Cleveland, O., for 1887, and have a good time.

[It is very encouraging to know that there are at least three places already suggested for the next meeting-St. Louis, Chicago and Cleveland. It is but a few years ago that it was located without invitation, with the hope that no one would attend, and that it would there die. Now all want it. What a change .-- ED.]

Wired Frames .-- Iu reference to building combs on wired frames, in Query, No. 309, on page 596, Mr. J. M. Shuck, of Des Moines, O Iowa, sends this answer on Sept. 23, 1886:

Draw the wires taut, paint them with melted beeswax, level the hive laterally, and the centre of the comb will follow the wires. Use foundation for a starter.

Charles Sitts, of Brasie Corners, & N. Y., on Sept. 27, 1886, sent the following on the same subject:

I have 65 colonies of bees whose combs were built in the brood-chamber, on wired frames with only foun-dation starters from ½ to 1½ inches in width, fastened to the top-bar of stands level, not tipping sideways so that the frames will hang perpendic-ularly, and I give the hive a pitch forward towards the entrance, from 1½ to 2 iuches. I find the wires no nuisance to the bees; on the con-trary I consider them a help in securing straight combs, and I would not dispense with them for any consider-ation. I wish it distinctly under-stood that I do not advise it in the second story or surplus department; there it would be sure to fail, as the combs are built too thick. Perhaps it is well to say that I use Hoffman-Langstroth frames, spaced 1% inches apart from centre to centre, and No. 36 tinned wire.

Our Bee-Pasturage.-H. M. Cates, Shideler, o+ Ind., on Sept. 5, 1886, writes:

This has been a very poor honey season, bees having swarmed but little. Many colonies did not swarm at all. Mine, that did not swarm, will average about 25 pounds to the colony. In looking over my new colonies I find themall short of stores, and will have to food. and will have to feed. There was the grandest white clover bloom I ever saw, but cold nights, I think, was the cause of there being no nectar in the flowers. There has been just enough honey coming in this fall to keep up late breeding. As a general thing bees are very strong in numbers. Our main honey source is white clover and basswood, the latter being a total failure this year; goldenrod is in abundance, but bees have not given any attention to it so far. As a gen-eral thing bees work on it from day-light until dark. I have a small patch of Alsike clover, and while the bloom lasted it was swarming with bees. I have two acres of sweet clover that will bloom next year. If these clovers prove to be a success, I shall sow more of them.

Must Feed for Winter.-O. P. Miner, Taylor Centre, N. Y., on Sept. 27, 1886, writes :

The honey season is over with us here, and not much surplus has been gathered. The dry weather reduced the yield from white clover, and basswood was a total failure. I com-menced the season with 6 colonies, one of them very weak. I had only 3 matural swarms, and one I divided, making my number 10, now. I have received from them only 140 pounds of comb honey. Some in this section have done better, and others very much worse. One man, who has over 100 colonies, told me he would not receive over 5 pounds to the colony, and would have to feed 500 or 600 pounds of sugar for winter stores. I have introduced 4 Italian queens this season, and like them much better to handle than hybrids.

To any One sending us one new subscriber with his own renewal (with \$2.00), we will present a copy of the new "Convention History of America."

# Honey and Beeswax Market.

The following are our very latest quotations for honey and beeswax:

CHICAGO.

HONEY.-Fur comb honey, we quote 12@13c. Extracted 6@7c. BEESWAX.-23c. R. A. BURNETT, R. A. BURNETT, 161 South Water St.

# NEW YORK.

NEW YORK. HONEY.-We quote this year's crop as follows : Fancy white in 1-b, sections, clean and neat packages, 15616c.; 2-bs., 12613c.; fair to good 1-bs., 12614c.; 2-bs., 10611c.; fancy buckwheat 1-bs., 11612c.; 2-bs., 9610c. #### BOSTON.

HONEY.-The demand has improved. We are selling one-pound packages of white clover honey at 14@l5c; 2-pounds at 13@l4c. BEESWAX.-25 cts. per lb. BLAKE & RIPLEY, 57 Chatham Street.

#### DETROIT.

HONEY.-Owing to more liberal arrivals the parket for boney is lower' Best in 1-lb. sectiona,

12%13c. BEESWAX.-23c. M. H. HUNT., Bell Branch, Mich.

# CINCINNATI.

HONEY. - Extracted honey brings 3 1-2 @ 7c.; comb honey, 12 to 14c. for good to choice, in the

bobbing way. BEESWAX.—It is in good demand and arrivals are fair. We pay 20c, for good yellow. C. F. MUTH & SON, Freeman & Central Ave.

#### CLEVELAND.

HONEY.-Choice new honey in 1-lb. sections is selling at 14c.; 2-lbs. 12@13c. Old honey is very dull at 10@12c. Extracted, 6@7c. BEESWAX.-25c. A. C. KENDEL, 115 Ontario Street.

#### KANSAS CITY.

HONEX.--The market is good for all grades, and sales are large, while the aupply is the same. Prices remain the same. One-pound sections, white clover, 1363/4ct; dark 1-bs, 11% 12ct; 2-lbs, 11% 12ct; dark 2-lbs, 96 10ct; ½-lbs, 11% 14% 15c. Extracted white clover, 667ct; dark, 465c; white sage, 5665/4c. BEESW AX.--200% 22c. CLEMONS, CLOON & CO., cor. 4th & Walnut.

# MILWAUKEE.

HONEY.—We quote as follows: Choice comb in 1-ib.sections, 12@13; 2-lba,, 11@12% cents; dark not wanted. Extracted, white, in kegs. 66@46e; same in thi cans, 61-2@7c.; dark in barrels and half-barrels, 5@51-2 cts. BEESWAX.—No demand. A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

HONEY.-We now quote 7%10c, as to quality wholesale. BEESWAX.-It is dull, but buyers have to pay 22%23c. for choice lots. SCHACHT & LEMCKE, 122-124 Davis St.

HONEY.-Receipts are light and the market is very quiet. We qunte : White extracted, 4@44c.; amber, 3%c. Camb, 8%@10c. for white. BEESWAX.-19@22c. O. B. SNITH & CO., 423 Front Street.

#### ST. LOUIS.

HONEY.-Choice comb. 10@12\4c.; latter price ls for choice white clover. Strained, in barrels, 3\464. Extra fancy of bright color and in No. 1 packazes, 4 advance on above prices. Extracted in barrels, 4\463\4c.; in cans 667c. BEEEWAX.-Dull at 21c. for prime. Sep. 30. D. G. TUTT & CO., Commercial St.

Simmins' Non-Swarming System is the title of a new English bee-book. The author claims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

# Home Market for Honey.

128 To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remunerative prices. "Honey as Food and Medicine " arc sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will pint, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the bee-keeper wbo scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantltv of it.

# System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

 For
 50 eolonies (120 pages)
 \$1 00

 "
 100 colonies (220 pages)
 1 25

 "
 200 colonies (420 pages)
 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides his own, with \$3.00, for one year, we will present a copy of this valuable book.

National Bee-Keepers' Union.-There will be a meeting of the officers and members of this Society at Indianapolis, Ind., on Wednesday, Oct. 13, 1886, at an bour to be announced at the meeting of the North American Bee-Keepers' Society, to consider business of importance.

THOMAS G. NEWMAN, General Manager.

THOMAS G. NEWMAN & SON. PROPRIETORS. 923 & 925 WEST MADISON ST., CHICAGO, ILL,

At One Dollar a Year.

ALFRED H. NEWMAN. BUSINESS MANAGER.

# Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, he sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

A New Crate to held one dozen one-pound sections of honey .- It has a strip of glass on each side, to allow the honey to be seen. It Is a light and attractive package. As it helds but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 cts. per crate. Glass 1%c. per light, extra.

Red Labels for one-pound pails of honey, size 3x41/2 inches. - We have just gotten up a lot of these Labels, and can supply them at the fellowing prices: 100 fer \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apiarist printed on them-by mail, postpaid.

Yucca Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and de not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable. When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any hee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 cents a dozeu : if sent by mail. add 1 cent each for postage

The Convention History of America and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.15.

# North American Bee Keepers' Society

The Chicago, St. Louis & Pittsburgh Railroad ("PAN-HANDLE ROUTE") take pleasure in hereby announcing to all delegates and their families desiring to attend the National Convention of Bee-Keepers' Union to be held at Indianapolis, Oct. 12, 13.

Union to be held at Indiauapolis, Oct. 12, 13, and 14, that we have arranged to seli tickets to Indianapolis and return at \$7.30 each on certificate signed by Mr. Thomas G. Newman, General Mauager Bec-Keepers' Union. Tickets good going Oct. 11, and returning up to and including Oct. 16. Morning trains leave Chicago, from the Union Depet, at 8:30, reaching Indianapolis at 3:50 p.m. Evening train leaves at 8:30. Night train has through sleeping-car, and day train has through parlor-car to In-dianapolis.

day train dianapolis. We can offer you superior accommodations and would be pleased to receive your

patronage. patronage. Tickets will be on sale in exchange for certificate at Union Passeuger Station, cor-ner of Canal and Madison Streets, Chicago, also at 65 Clark Street, corner of Randolph Street.

# The Monon Route to Indianapolis.

The Monon Route is the short line between Chicago and Indianapolis, and those desiring to attend the National Bee-Keepers' Convention, Oct. 12-14, should bear this in mind. The morning train leaves from this in mind. The morning train leaves from the Dearborn Station at 8:35, arriving at Indiauapolis 3:45 p.m. Evening train leaves at 7 30 p.m., and has attached elegant Pull-man sleepers. Tickets good going Monday, Oct. 11 and returning up to aud including Saturday, Oct. 16, will be on sale at Dear-born Station, corner of Fourti Avenue and Polk Streets, also at the city ticket office, 73 South Clark Street. For further Informa-tion call or address E. O. McCormick, G. N. P. A., 73 South Clark Street, Chicago, Ills.

12 Sweet Clover, or Melilotus Alba, is almost the only resource for honey new, on account of the late severe July drouth. If the seed is planted in September, it will come up this Fall and bloom next year, in its second season.

We have a large lot of this seed on hand, and offer it at the following Reduced Prices, by express or freight :

- One pound
   \$0 20

   " peek-15 lbs
   2 25

   " bushel-60 ibs
   7 00

   " peek \$0 lbs
   \$ 00
- sack-80 lbs ..... 8.00

It will pay to buy it by the sack and sell it again in smaller quantities.

19 If you want a chance to make some money, and provide pasturage for the bees during the Fall months, this is your opportunity 1

Round Trip Tickets to the Convention .- As Manager of the National Bee-Kcepers' Union, we have made arrangements with the Iudianapolis lines of railroad for round trip tickets from Chicage to Indianapolis and return to Chicago, good from Monday to Saturday, Oct. 11 to 16, 1886, for \$7.30. The farc one way is \$5.50, and this is one fare and one-third. To obtain these tickets, it will be necessary to get a certificate signed by Thomas G. Newman, stating that the bearer is entitled to the reduced farc. Now, do not wait until you come to Chicago to get this certificate, for we may have gone before you come. Send for the certificate at once; and it will be sent by return mail.

Our Book Premiums.-To encourage all our present readers to get one or more additional subscribers we will present 25 cents' worth of books for every new subscriber (accompanied with \$1 for one year's subscription), sent direct to this office. Thus for five new subscribers with \$5, the getter up of a club gets \$1.25 in valuable reading matter, to be selected by himself from our list on the second page of this paper. It will pay you to devote a few hours to the interests of the BEE JOURNAL. Every one who keeps bees ought to take it. We will furnish sample copies free in any quantity to these who intend to get up clubs. We expect to get 5,000 new subscribers before Jan. 1, 1887.

"Cash in Advance " is the rule, but no longer than six months of grace can be allowed on the small sum of one dollar. Subscriptious may commence at any time, and discontinuances may be ordered at any time when arrcarages are paid up.

When Marketing Extracted Honey, it is a sad blunder to use barrels holding from 300 to 500 pounds-they are too large to be desirable for the trade, too bulky to be handled with care in transportation, and too dear to be lucrative to the producer, for honey put up in such large barrels is subject to a discount of one cent per pound, because of the difficulty in disposing of it without repacking and dividing into smaller lots.

We have made arrangements by which we can supply the Weekly AMERICAN BEE JOURNAL and the Monthly Bee-Keepers' Magazine for 1887, both periodicals for the very small price of \$1.25, or the above and Gleanings for \$2. Three bee-periodicals for the usual price of one l

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

Colored Posters for putting up over honey exhibits at Fairs are quite attractive, as well as useful. We have prepared some for the BEE JOURNAL, and will send two or more free of cost to any one who will use them, and try to get up a club.

Mother! Of all the words in our langnage, this is the holiest and grandest ! To our minds, it presents the purest love, the most unfailing affection, and the tenderest care. The death of a mother severs the holiest tie in this world, and overwhelms the surviving family with sorrow. This is the case to-day with the editor of this JOURNAL. His mother has just passed to the "haven of rest" after 86 long years of toil and aorrow ; having spent just one-half of her years (43) as a widow. She died at Kent, Portage County, Obio, on Thursday, Oct. 7, 1886, and was there buried last Sunday. Death in this case was not unexpected, for our mother has been awaiting the angel's call for many years-and now, she has gone ouly a few years before us. We are all following one another to the tomb-and aoon our time will come. Our faith and hope lead us to look for a re-union on the other shore of all the loved-ones who have gone before us, for

"Part of the host have crossed the flood, And part are crossing now."

A Company has been organized to be known as "The International Honey Co.," whose intentions are to establish aplaries in Cuba, the United States and Canada. They have accordingly made all arrangements to sail from New York on Oct. 14, for Cienfnegos.Cuba, with everything necessary for the equipment of a first-class apiary, at which place they intend to locate and establish a large apiary during the coming winter. During the summer season, when the bloom of Cuba does not yield nectar in sufficient quantities to render the business profitable in that island, they intend to come north (where they already have one apiary), and locate their next in Middlesex Co., Ontario. The Company is composed of A. T. Finn, H. E. Hill and R. M. Muller. In this they calculate upon obtaining good results by having a honey-flow the whole year around. They will report the result of the experiment in the BEE JOURNAL in due time.

The Canadians in London, who have charge of the Canadian honey at the "Indian and Colonial Exhibition," are being received with open arms by the British apiarists. On Wednesday, Oct. 6, at 2 p.m. the British Bee-Keepers' Association had a luncheon, at which the Colonial bee-keepers were their gnests. They all visited the Colonial exhibit of honey in a body, and at 5 p.m. held a conversational meeting. Mr. J. M. Hooker, in the British Bee Journal, thus describes the exhibit and exhibitors :

About 40 tons of Canadian honey have arrived at the Exhibition, and are now being unpacked, and will be all in order by the end of this week.

end of this week. There are four gentlemen who are delegated by the Ontario Bee-Keepers' Association to see to the whole thing, and right well they appear to be doing it. Our old friend Mr. D. A. Jones, of Beeton, is one. Mr. Cornell, of Lindsay, Mr. McKnight, of Owen Sound, and Mr. Pettit.of Belmont. By accident I met Mr. Jones, who introduced me to the others; they represent different parts of Ontario, living over a hundred inles one from the other. I spent part of hast Thursday afternoon with them, seeing them unpack some of the comb hooey, which yon will be pleased to hear bas come with few hreakages. There are 15 tons of comb honey of very good quality, principally clover honey ; the packing was very cleverly done, and has well repaid them for the great care and skill bestowed upon it by the result. They were most courteous to me, and gave me every isformation, and look forward to making the acquaintance of some of our fraterpity. All bee-keepers should make a point of seeing this grand exhibit.

We congratulate our Canadian<sup>§</sup> friends upon the success attending their adventure.

Death interferes with everything, and will in all probability interfere with the editor's arrangements to be at the Indianapolis Convention on the first day. He will be there, however, as soon as he can return from the East, whither he has been summoned by telegraph to attend his mother's funeral.

Red Clover Honey has been gathered quite freely in many localities this season. It is quite thick, having considerable body, but the flavor is not nearly as good as that from white clover, while the color is darker than the amber honey from fall flowers.

Money Orders can now be obtained at the Post Offices at reduced rates. Five dollars and under costs now only 5 cents. As these are absolutely safe, it will pay to get them instead of the Postal Notes which are payable to any one who presents them, and are in no way safe.

**Exactly So !-**The American Apiculturist for November contains the following offer :

The AMERICAN BEE JOURNAL is the best weekly bee-paper published in the English langnage. Price, \$1 per year. If any new subscribers to the American Apiculturist, or those who renew er desire to take the Weekly BEE JOURNAL, we will send both papers for \$1.70. The above offer is to commence with the November number of the Apiculturist.

Of course we will make the same club rate for the two papers, when sent to this office. The change in management has resulted in an infinite Improvement in the tone of the "Api." We wish it success.

Bee-Keepers have themselves to blame for many of the "inistakes" now so commonly made when speaking of matters concerning the pursuit of bee-keeping. An extensive advertiser for years persisted in calling comb foundation by the mistaken cognomen of "artificial comb;" thus giving the only plausibility to the "scientific pleasautry" of Prof. Wiley. Others talk and write about bees making honey, when they know full well that they simply gather what is already made in the blossoms by Nature. In the Prairie Farmer Mrs.L. Harrison makes a good point on the latter in these words:

A person would suppose, by reading Mrs. Lizzie E. Cotton's advertisement, that her hive made honey, instead of the bees gathering it. All this fuss and feathers about bees producing more honey in my hive than in yours, is all moonshine. Elisaa Gallan once said very truthtully, that "other things being equal, a colony of bees will boild as much comb, and produce as much honey in a nail-kog as in any bive, and they will produce as much honey in my nail-keg as in yours." This is one of the axioms of heelore, that bees will store as much honey in a bollow tree, log-gnm, salt barrel or boxbive, as in any controllable or reversible hive made.

Movable frame hives give ease and comfort in manipulation, and sections in which honey is to be stored only enhance its market value.

The Bee-Kcepers' Magazine for October contains the tollowing :

We see City and Country still publishes that advertisement of Lizzie E. Cotton, who is a frand, though we sent them a marked copy of the magazine containing our article upon her workings. It is rather anomalous to see the advertisement of a prominent Bee Journal on the next page to hers (or his). We should think the ads. would fight.

The Bee Journal mentioned is the AMERI-CAN, and the point is well taken. The publishers of *City and Country* are imposing on us by inserting Lizzie's advertisement when they ought to know that she has been repeatedly published as a *fraud* by every reputable bee-periodical in America.

Some Gross Libels on bee-keepers appeared in the Rochester, N. Y., Morning Herald, of July 13, 1886. A man by the name of McDowell, who had an experience of a few weeks in keeping bees, was stated by that paper to be "an expert apiarist," and is responsible for this remark :

Rather sharp practice is employed by some bee-kcepers, who place glucose near their hives and allow the bees to draw from it instead of from the natural source. This enables the bees to fill their combs quickly, and produces a bluish white honey which is more pleasing to the eye than flower honey.

This statement is damaging to bee-keepers of that locality, and we wrote the editor to correct it; but it has not been done. We now therefore publicly call upon Mr. Mc-Dowell either to prove his assertion or to "take it back," in the *Herald*. We ask ne favors-all we want is justice.

J. R. McLendon, Stoddard, Montgomery County, Ala., wishes to correspond with all the bee-keepers in Alabama relative to organization, and requests every one in that State, to send him a postal card, giving name and address. Now let Alabama be heard from with a strong society of beekeepers.

# Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.--ED.]

# Rearing Queens.

Query, No. 321.—1. If queen-eells are inserted in colonies about Sept. 10; will the young queens lay that year? If not, when will they lay? 2. Would it be better to wait until the next spring before inserting queen-eells?—E. & W.

You had better wait until spring, in our locality.—DADANT & SON.

1. In all probability they will lay in the fall. If they do not they will probably be worthless. If the cells are good ones I would put them in in the fall.—W. Z. HUTCHINSON.

1. It depends mainly upon the locality. If in this locality, no; if farther south, probably they would. 2. I should prefer to do it in August, about the 5th to the 10th.—G. M. Doo-LITTLE.

1. It will depend upon the length of the season and the quantity of flying drones; but' probably they would not. 2. Yes, most certainly. If the old queens are failing, the best plan is to insert young feeundated queens at once.—J. E. POND, JR.

1. In my locality I would not do it. If I should, some of them, perhaps most of them, would lay that year, but I should not connt on them being the best of queens. Of the balance a few would lay the next spring; the majority, never. 2. You had better wait until the honey harvest.—C. C. MILLER.

Much depends upon the season. If they did not lay the same year, they would next, if they became feeundated the same year as hatched. I would strongly urge postponing the entire work till 1887.—JAMES HEDDON.

I should say it was too late here. We usually have frosts by Sept. 15, after which work with bees is not desirable. I prefer to rear queens when bees are active. Again, we might not have any drones so late; very frequently we do not.—A. J. Coor.

You can insert your cells at the above time if you have drones to fertilize the young queens. If fertilized, they will lay the same fall, if in the South; but if in the North, they may not lay before the next season.— J. P. II. BROWN.

Yes, but the plan suggested is not ous f a practical one, as more than half of DON.

the cells will be torn down and the bees be left queenless. The proper way is to take out the queens, and in nine days cut ont all the queen-cells. Then introduce a small piece of comb with just hatching brood from the best queen, and there will be no failure and no great trouble. It is the best way to change all inferior stock. -G. L. TINKER.

If you have plenty of drones and some honey is being gathered, you will succeed very well in September. I much prefer to have good queens in the hives when spring opens. If the young queens are mated in the fall, they will be all right whether they lay in the fall or not.—G, W. DEMAREE.

Not knowing your locality I cannot say, but in my locality (Southern Michigan) I should prefer to wait until spring.—H. D. CUTTING.

# Best Capacity of Brood-Chambers.

Query, No. 322.-How many frames of the Langstroth size should the brood-chamber contain to give the queen sufficient room, get the most honey, and least inercase, or most honey and money ?--Ontarlo.

Eight would be my choice.—G. M. DOOLITTLE.

From ten to twelve.-DADANT & SON.

Through the honey harvest perhaps not more than six.—C. C. MILLER.

This varies with queens. I think eight frames enough. Ten are certainly sufficient.—A. J. COOK.

In my locality ten frames gives the best results as a general thing.—G. W. DEMAREE.

If you work for comb honey, eight or nine frames are sufficient; but if for extracted honey, I would advise ten to twenty,-J. P. H. BROWN.

With an invertible hive seven frames will give the queen ample room, and get the most honey and money. It will depend upon the management, however.—G.L.TINKER.

It depends upon the queen. I would have the brood-nest of such size that an ordinary queen could keep it full. I prefer eight combs in the spring, and five the rest of the year. With a large brood-nest there is less swarming. I get the most surplus with a small brood-nest.—W. Z. IIUTCHIN-SON.

When I knew no better way than to keep the brood-chamber one size all the year around, I used and preferred the capacity of eight Langstroth frames; but with the new system of horizontal contraction and expansion, reduced to quick, practical manipulation, I use and prefer the capacity equaling ten Langstroth frames for about one-fourth of the year, and half of that for the other three-fourths; or there-abouts, according to circnmstances too numerous to mention here.—JAMES HED-DON. Mr. Langstroth decided upon ten frames, and my own experience proves to myself that he is right. It is, however, a question of locality and method of management.—J. E. POND, JR.

This is one of the many undecided questions of the day. Locality makes a difference, and the manner of working and securing honey a great difterence. Some want six, others seven or eight, while others want only half the capacity of eight.—H. D. CUT-TING.

# Fall Honey for Winter Stores, etc.

Query, No. 323.-1. Is fall gathered honey safe or not for winter stores? If not, why? 2, In what way or manner does cold add to the danger of wintering?-A.

1. I regard it perfectly safe. 2. In the latitude of Augusta, Ga., the coldest weather has no injurious effect upon bees if they have plenty of stores.--J. P. H. BROWN.

1. It is nsually. It is not safe in a wet season, if it has not been thoroughly ripened. The floating pollen may make it more unhealthy also. 2. In my experience it is; I have never found it to injure my bees, and have always used it; the essential point is to have the honey well ripened.—J. E. POND, JR.

1. I consider it safe. 2. It causes the bees to consume much honey as fuel, and debars them from frequent flights, as nature requires where much honey is consumed.—G. M. DOOLITTLE.

1. If it is not safe it is probably because it contains considerable nitrogenous matter. 2. It contines the bees to the hive, and increases the consumption of honey. — W. Z. HUTCHINSON.

1. Fall-gathered honey is perfectly safe for winter stores for my bees. 2. Protracted cold is a condition unfavorable to healthful exhalation from the bodies of the bees, and is likely to bring about a dropsical affection dangerous to the lives of the bees. The greatest danger from protracted cold in this climate is, it sometimes prevents the bees from reaching their stores, and starvation is the result.—G. W. DEMAREE.

1. I consider fall honey as safe as any, one year with another. 2. A low temperature compels activity, and this causes waste of tissue, and this calls for nitrogen, which induces the bees to consume bee-bread, and this loads the intestines, and the bees, unless able to fly and void, become sick.—JAMES HEDDON.

1. All honey gathered from *jlowers* is safe for winter stores, if it is well ripened. If gathered late and left thin it is not. 2. Cold tends to cause bees in winter confinement to become uneasy or restless. I think it would affect bees about the same as it would a thinly clad man on a cold winter night. If he did not bestir bimself he would get into trouble, and so with

the bees. Restless bees soon become worn out, suffer rapid waste of tissue and loss of vitality. Increased con-sumption of food may repair the waste, but not the loss of vitality. Nor is their relief in frequent flights. For half the winter bees must remain in a torpid condition to winter well.-G. L. TINKER.

1. Some of it is, and some is not. In general, 1 think it is. To the other rather strange part of your question I might reply, because they do not winter safely on it. 2. I sup-pose for one thing it is a tax on the vital energies, the same as on the human system; and besides it induces a greater consumption of food, thus distending the digestive organs; but after all 1 do not know much about it.-C. C. MILLER.

1. If good honey, I think it is just as good. A year ago last winter I removed all early gathered honey and gave a number of colonies only fall honey. All the colonies wintered ex-cellently well; yet many bees died all about me. I believe real honey from flowers is all right, no matter when gathered, 2. It irritates bees, causing them to exercise and feed without the possibility of flight.—A. J. Cook.

### Convention Notices.

The Wabash County Bee-Keepers' Associa-tion will meet at Wabash, Ind., on Oct. 23, 1886, AARON SINGER, Sec.

The Sheboygan County Bee-Keepers' Asso-clution will meet at Chandler's Hall, at Sheboygan Falls, Wia, on Saturday, Oct. 16, 1886, at 10 a.m. Mrs. H. Hills, Sec.

137 The annual meeting of the Western Bee-Reepers' Association will be held in Pythian Hail (11th & Maia Sts.), at Kansas City, Mo., on Oct. 27-29, 1886. P. BALDWIN. Sec.

The next annual meeting of the Michigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTINO, Sec.

137 The southern Illinois Bee-Kcepers' Associ-ation will hold its next meeting at Benton, Ills., on Thursday, Oct. 21, 1886. F. H. KENNEDY, Sec.

The Union Bee - Keepers' Association of Western lowa will meet at Stnart, lowa, on Satur-day, Oct. 16, 1886. All interested in the busy bee are requested to be present. J. E. PRYOR, Sec.

The Semi-Annual meeting of the Central Michigan Bee-Keepers' Association will convene In Pioneer Hall, in the Capitol Building, Lansiog, the third Theaday of October, at 10 o'clock, a.m. J. ASHWORTH, Pres.

Association will hold its next meeting at Mt. Sterling, Ills., on Nov. 24 and 25, 1886. J. M. HAMBAUOH, Sec.

All are respectfully invited to attend the next meeting of the Bee-Keeper-'Association of Kureka Springs, which will be held at Enreka Springs, Ark. on Oct. 23, 1886, Business of im-portance to every bee-keeper Northwest Arkansas will be before the meeting. DR. S. S. PURCELL, Sec.

The next annual meeting of the Nebraska State Bee-Keepers' Association will be held in Lincoln, Nebraska, on Wednesday, Jan. 12, 1837. Location of Hall to be used and Hotel accommo-dations will be given after further arrangements have been made. H. N. PATTERSON, Sec.

Frank Cheshire's new book on Bees and Bec-Keeping, can be had at this office .-Vol. I, bound in cloth. \$2.50, postpaid,

Explanatory .-- The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is located near the center of the State named; & north of the center; 9 south; O+ east; • west; and this of northeast; `northwest: • southeast; and ? southwest of the center of the State mentioned.

# For the American Bee Journal. Display at the Provincial Exhibition.

# WM. F. CLARKE.

The Provincial is the most impor-tant agricultural exhibition in Canada. It embraces the entire province of Ontario, and is managed by an association to which the Government makes a grant of \$10,000 a year. It is a peripatetic institution, and is held at Ottawa, Kingston, Toronto, Hamilton, London, and Guelph in rotation. This year it was at Guelph, and it has made no small stir in our little The exhibition as a whole was city. exceptionally good, especially in the horse, cattle, and implement departments. The Provincial does not offer so tempting a prize-list for honey and apiary supplies as the Toronto Industrial, hence the competition is to a large extent local. There is a jealousy between the officials of these two organizations growing out of the rivalry between them, and as Mr. Jones has from the first been a leading spirit in the Toronto Industrial, I think he does not show at the Pro-vincial. At any rate he did not this vincial. At any rate he did not this year. It must be acknowledged that the Toronto Industrial shows a far higher appreciation of bee-keeping than the Provincial. It appropriates a whole building to this department, while at the Provincial honey is durated in write choice butters. dumped in with cheese, butter, sugar, bacon, cured meats, maple syrup, domestic wines, and a lot of sundries. Bee-keepers generally are "down" on the Provincial, for not encouraging their industry more liberally. They do not refuse to exhibit, but their "best licks" are put in at the Toronto Industrial.

This year there was a better display of honey and apiarian supplies at the Provincial than usual. The old nondescript hive which has raked in the prize from time immemorial was left at home, and the Langstroth, Blackburn, Shuck, Chataqua, and other hives made up quite a variety. E. L. Goold & Co., of Brantford, had a large and showy collection of apiarian snp-plies in charge of Mr. R. F. Holterman, conspicuous among them being the Stanley automatic extractor in the sizes.

Mr. R. L. Meade, of Nassageweya, had the largest display of honey, com-

prising about 2,500 pounds of ex-tracted, and 500 pounds of comb. It was the general opinion that he was was all in tins varying from one pound to fifty, while Sanders & Co., in addition to an assortment of tin packages, had a lot of very tasteful glass packages. In consideration of the extent and excellence of his display, he was awarded a diploma. The undersigned took first prize for honey in the comb not less than 10 pounds, for two reasons : first, use of tin separators, and second, removal of sections as soon as finished, so that they retained their snowy whiteness. Of these two points let all intending exhibitors make a note.

The last two days of the Fair were very warm, and some of our exhibi-tors having embarked in selling honey in quarter sections to be eaten on the spot, as a natural consequence bees from adjacent apiaries were attracted in large numbers, until every lunch stand and confectionery stall swarmed with them. I did not hear of any complaints of people getting stung, for it is astonishing how strictly bees attend to business under such circumstances, gathering what little sweet they can regardless of surging crowds of people. But it started the enterprise of robbing among our city bees. The day after the exhibition closed the bees made a diligent search for the lost show, only to find here and there a lady making jelly or preserves.

In the afternoon, a bright little boy came in hot haste to my house, ex-claiming, "Mr. Clarke, haven't you lost a swarm of hees?" "No, sonnie." "Well, there's about a thousand at Mrs. J's, and she wants you to come and fetch 'em home right away." "I can't do that." I replied, "I might be stealing. I do not know whose bees they are. Some of them are mine, no doubt, but I couldn't pick them out from the rest, and I wouldn't like to take any bees that don't belong to me. Tell Mrs. J. to leave the door and windows of her kitchen open till dusk. The bees will all go home to their proper owners. To-morrow (Sunday) she wont be making jelly, and she can keep the door and win-dows shut." To-morrow, happily, was cool and wet, so "the plague was stayed."

I subjoin a list of prizes and prizewinners:

Best display of extracted honey in marketable condition, Sanders & Co., Guelph, \$10. J. R. Morrison, Guelph,

Best display of honey in the comb and in marketable condition, R. L. Meade, Nassageweya, Ist and 2nd prizes, \$10 and \$5.

Best honey in the comb. not less than 10 pounds, Rev. W. F. Clarke, Guelph, \$8. R. L. Meade, \$6. F. M. Benham, \$4.

Best jar of extracted honey, A Gilchrist, \$4. J. H. Welsh, \$2. F F. McIntyre, \$1.

Best beeswax, not less than 10 pounds. J. R. Morrison, \$3. R. L. Meade, \$2.

Best bee-hive, R. L. Meade, \$3. E. L. Goold & Co., Brantford, \$2. Rev. W. F. Clarke, \$1.

Best wax-extractor, E. L. Goold & Co., diploma.

Best honey-extractor. E. L. Goold & Co., diploma.

Best and largest display of apiarian supplies, E. L. Goold & Co., silver medal.

Guelph, Ont.

For the American Bee Journal Marketing Honey—Feeding Sugar.

G. A. BRUNSON.

I have been an observer of the course of bee affairs and interests for some years, and I have come to the conclusion that bee keepers give the profits of their enterprise to the retailer, as I have learned that the consumers pay 20 cents per pound to the grocers in Chicago for the same honey that I sell at home for 10 cents. This exorbitant retail price exacted by the grocers for honey in our large cities, limits the sale of our produce to a few who have money for luxuries. This class of purchasers are in such a minority compared to the number of honey lovers, that the market in our large cities is easily overstocked; hence our cheap wholesale prices.

I notice in the address of Mr. S. C. Gridley, on page 582, a plan which I think if followed out would be of untold benefit to the bee-keepers of California, and not only that, but a like system in other central localities, or chief commercial centres of the United States would be a great benefit to the bee-keepers—a place where they could ship all their surplus over home consumption, to some warehouse where it would wait its turn and not have to be sold at a sacrifice in order to get rid of it, as we have heard of parties who have large quantities, getting scared by market reports, or not knowing where to ship or what to trust. Such bee-keepers sacrifice on a large quantity, killing the market for all others the rest of the season.

There is the item of feeding sugar, which we bee-keepers, I believe, are apt to look at in the wrong light. My observations have been that for every pound of sugar the bee-keeper buys for feeding bees, throws one pound of honey out of the market. Sugar is an inferior food for bees, and often costs more per pound than fall honey can be sold for; and if the apiarist has been feeding a large quantity of sugar, he will have all the more fall honey to crowd on the home market, or perhaps carry over until another year. Then he will see that he is out just what he paid for sugar, and the sale of an equal number of pounds of honey that nobody wants.

I found myself in about the same land, over the assumed name of "Subpredicament the past summer, as my old dark honey weighed about the same as the amount of sugar I had to his pastures by Jones' bees in exted the fall before, and now I feel quite sure that I will not feed any

more sugar as long as I have the dark honey; but I shall follow the course I did this season, as near as I can, and that is, to take off the supers of white honey before the fall or dark honey is brought in, and not put on any more supers until the hives are heavy enough for winter, then put on the supers if more room is needed, and take whatever they put in for my share of that season's crop.

By the above plan it is easy to be seen how we can prevent the buying of sugar or f eding honey, and have our colonies heavy for the coming winter, with nice capped stores, as they seem to cap it better when they bring it from the fields than when it is fed to them.

Plymonth, Mich.

Canadian Bee Journal.

# Subsoil vs. Jones.

# S. CORNEIL.

A case against a bee-keeper tried at sea, and successfully defended without aid from the Manager of the Bee-Keepers' Union.

ON BOARD S. S. SARDINIAN,

NORTH ATLANTIC, Aug. 26, 1886. Bee-men are noted for being ready to talk about their specialty on every possible occasion; the delegates in charge of the Ontario honey exhibit at the Colonial and Indian Exhibition are no exception to the rule in this respect. Conversations with their fellow passengers on board were often turned so as to bear a reference to bees and honey. Should a passenger tell a story about the methods by which travelers are often black-mailed, Mr. Jones would match it by telling how he got even when the custom house officers and boatmen at Beyrout attempted to levy "backsheesh "on him when bringing bees from the Holy Land to Cyprus. One of his cylinders was so full that he feared the bees would be suffocated. Pretending to abandon the bees rather than submit to their demands, which amounted to about \$25 for two hives, he opened this hive and allowed about a gallon of bees to escape. This caused a general stampede, the bees driving both boatmen and officers under cover. He then deliberately placed his bees in a boat and rowed to the steamer, which had been wait-ing for him half an hour, the owner of the boat lying in the bow with his head covered most of the time. Before long the Canadian bee-men on board were the best known among the pas-sengers. Their statements regarding the benefit of bees in fertilizing the crops of the agriculturist, and the crops of the agriculturity, and the virtues of honey as a food and medi-cine, were not always allowed to pass unchallenged. The outcome of the opposition was that Capt. Hamilton, manager for a shipping firm in Scotland, over the assumed name of "Sub-soil," made a demand in writing upon Mr. Jones for \$1,000 for damages done

the stings of the bees, and loss of property caused by the bees stinging his sheep and cattle. Mr. Jones refused to accede to any such demand, stating that the bees were not only not injurious, but were a positive henefit to his neighbors' pasture. Here was a direct issue. Arrangements were soon on foot for the organization of a court to try the case.

Capt. Smith, of the "Sardinian" was consulted, and he fell in with the idea at once, expressing his willingness to go into the witness box himself and testify against Jones. Soon the arrangements were all complete. Mr. Dennistoun, of Edinburgh, Scotland, arrayed in a fur cloak and ample wig, made by the boatswain for the occasion, filled the position of judge with dignity and ability. Mr. S. Carsley, a leading merchant of Montreal, acted as counsel for the prosecution, and Mr. R. McKnight, registrar for North Grey, Ont., acted as counsel for the defence. Mr. Andrew Allan, of Allan Bros. & Co., Montreal, was chosen as foreman of the jury. Amongst the jurors were a gentleman recently from Hong Kong, China, an editor from London, a banker from Ontario, a stock raiser from British Columbia, and another from Manitoba, and a gentleman from Stratford, England.

Mr. Carsley, in opening the case for the prosecution, stated in a clear and the prosecution, stated in a clear and succinct manner that his client's land produced the clover blossoms which supplied the defendant's bees with honey, that the secretion of honey in the clover-heads increased the food value of his client's pasture, or it would not be there; that since the defendant established his bee-farm in the neighborhood his client's stock had been failing; that his cows gave less milk and of poorer quality gave less milk and of poorer quality than formerly; that his sheep were poor, and, therefore, less valuable; and that his client's family required medical assistance more frequently than they did previous to the estab-lishment of the defendant's bee-farm. Since these losses were di-rectly traceable to the defendant's bees, he claimed that it was only just that defendant should remunerate his that defendant should remunerate his client to some extent for the damages he sustained. Evidence was pro-duced to sustain this contention. Great merriment was caused by Capt. Smith, who as Hodge, a servant of the plaintiff, testified that his master's stock were failing of late; that this was caused by Mr. Jones' bees, and not by carelessness, especially since he took charge; that on one occasion he took Miss Buttercup, the dairymaid, out for a drive with his master's horses and carriage, that one of Jones' hees attacked the "hosses" causing them to run away and break the carriage; that he captured that bee to show to his master, and that it was about 2½ inches long, and was one of those Eastern bees Jones brought from somewhere. This evi-dence was confirmed by that of Miss Buttercup. The counsel for the defense, in cross-examination, labored unsuccessfully to induce her to admit that at the time the accident occurred

Hodge was not minding his horses, but had his attention otherwise en-

The ship's surgeon was called and testified that the family of Mr. Sub-soil had required his assistance more frequently than formerly; that he was often called upon to prescribe for hives and erysipelas, resulting from bee-stings. He admitted on crossexamination that Subsoil's family had increased rapidly of late, which would to some extent account for his being more frequently called in. The counsel for the defense proceeded to question him as to facts not brought out in his examination in chief. This was objected to by the opposing counsel. His lordship held that the objection was well taken, but in view of the fact that this was the lirst case of the kind which had come before the courts, and of its importance to the public, he would allow coursel some latitude in order to get all the facts before the jury. The witness then stated that as in animals the lacteal fluid is only secreted so long as there is a demand for it, so in the vegetable kingdom the blossoms secrete nectar as long as it is needed to attract insects, and that it is re-plenished as fast as it is gathered. The witness stated further that honey ranks high among the sugars as an article of food because it is already partially digested by the bees, and is in a condition to be at once taken up by the absorbent vessels of the stomach and assimilated, while cane sugar and the starches of potatoes and bread require to be first changed by the saliva and pancreatic juice into glucose before they can be assimilated and passed into the circulation. He also stated that honey has important medicinal properties.

For the defense Mr. S. T. Pettit was the first witness called. He stated that he owns and manages a farm of 150 acres, on which he keeps over 100 hives of bees, about 15 milch cows, and from 20 to 30 sheep. The records at the cheese factory show that his cows gave at least as much milk as do those of the other patrons whether there are bees in their vicinity or not, and that for richness his milk stands amongst the very highest. His Southdown sheep have for years taken most of the leading prizes at the local shows, and he has always shown them off the grass and bas not fed grain. He has frequently observed that his crops of clover seed and buckwheat are far in excess of those of his neighbors, who are three miles or more from bees, although the other circumstances were at least as much in their favor.

Mr. S. Corneil gave evidence to the effect that in the vegetable kingdom there is a constant struggle for the survival of the fittest, that the weak specimens are crowded out by the stronger, and that the strongest and most perfect plants can only be se-

of nectar to attract insects, which carry the pollen from flower to flower; and that the constituents of the nectar are not drawn from the soil, as is often supposed, but are absorbed by the plant from the air. In reply to counsel, he stated that a certain number of clover heads were covered with gauze to protect them from insects, that the seeds of these and the seeds of an equal number of heads unprotected were counted, and that the seeds of the latter were as three to one of the former. Witness continu-ing, said that Chas. Darwin had made the apparently bold statement that the crop of clover seed depended, in a measure, upon the number of old maids in the country, because old maids were proverbially fond of cats; the more cats the fewer field mice. The queen humble-bee hibernates through the winter in the nest of a mouse better than anywhere else, and as a rule they are the only bees whose tongue is long enough to work on red clover, so the fewer mice the fewer deserted nests, and therefore the fewer humble-bees to fertilize the crop of the next season. The witness had learned from his lordship the bishop of Rupert's Land, who was a passenger on board, that in the city of Winnipeg, where there are few bees, he had to fertilize the blossoms of his melon vines by hand or he would have little or no fruit.

In cross-examination the witness stated that Darwin was a very close observer, that while it was they close farmers dealt with facts, men like Darwin often discovered the facts which the farmers applied, and although the plaintiff only raised clover and not clover seed, if it were not for insects it would be a question of only a very short time till there would not be a pound of clover seed to be obtained.

The defendant was called and testified that 100 colonies of bees would exhaust all the bee-pasturage in 25,-000 acres in a poor season, that as Mr. Subsoil only owned 200 acres, and wanted \$1,000, there would be 125 farmers claiming damages amounting to the sum of \$125,000. Consequently if Mr. Subsoil's claim were valid, bee-keeping would become an extinct industry.

So much interest was taken in the case that the court held three sessions before the trial was brought to a close. His lordship, the Bishop of Rupert's Land, was present during the whole trial, and manifested a lively interest in the issue.

The counsel for the plaintiff re-viewed the evidence and appealed to the jury to do justice to his client. Throughout the trial Mr. Carsley showed marked ability as an amateur counsel.

Mr McKnight addressed the jury in an eloquent speech of over half an hour's duration. He reviewed the evidence for the defense, dwelling most perfect plants can only be se-cured by cross fertilization; that the methods resorted to by plants to secure cross fertilization are often curious and interesting, amongst which are bright colors in the blos-soms, strong odors, and the secretion  $\frac{1}{2}$  evidence for the defense, dwenning especially upon the point that where there were no bees, melon vines had to be fertilized by hand to secure a crop, "and." said be, "for the privi-lege of saving Mr. Subsoil this labor my client is asked to pay \$1,000."

Instead of bees and stock being an-tagonistic, he alluded to the fact that while the land of Canaan was preeminently a grazing country its caves were also full of bees, and the country was referred to in the sacred writings as "a land flowing with milk and honey."

The judge summed up the evidence and charged the jury in dignified and and charged the jury in digmined and appropriate terms. After a short consultation the jury brought in a verdict for defendant. Counsel for plaintiff gave notice of an appeal. All admitted that many interesting and valuable facts were elicited, and that the trial contributed to the eujoyment of the passengers during a pleasant voyage.

[Mr. Corneil introduces the above by stating that it was a case "successfully defended without aid from the Manager of the Bee-Keepers' Union." True; but it was out of his jurisdiction-on the high seas-and a bogus case, at that! However, some capital points were made, as will be noticed by the reader. We are glad our Canadian friends were so jolly on their voyage.-ED.]

For the American Bee Journal.

# My Experience with Bees.

# DAVID WILCOX.

Ten years ago I bought a small box-hive of bees, thinking to have some boney which would be easier pro-duced than bought. In course of time I found a frame hive the best, and many other things I knew noth-ing about, until now I have 90 colo-nies and sumplies according. nies, and supplies accordingly. have also learned that fixtures cost money, with trouble and time to get them, which weighed heavily on the income from the bees. I had water power offered me for \$3 per month sufficient to work lumber and make my biyes are but as the transition my hives, etc., but as that would take me away from home and the care of the bees, I bought a wheel of about 400 pounds weight, hung upon rollers with treadle and small saws attached, so that my work was at home, and I sould see to the yard and farm at the same time. Eighty or 90 square feet of lumber will make almost any kind of a hive, except the surplus arrangement. For whatever hive is preferred. take the measure of each piece, and cut lumber to match; when nailed and painted the hive is complete.

The past season has been very poor in this locality. In marketing honey I take from 100 to 500 pounds on an I take from 100 to 500 pounds on an express wagon or sleigh, and go until it is sold. In almost every place there can be found those who are glad to keep a man for honey, and that reasonable. I disposed of 2,000 pounds in this way last year. I ex-tracted 170 pounds from unfinished sections (last year) which sold in glass jars more readily in some towns than comb honey. leave the house for a few weeks, I cannot report about this year's crop. Taking all things into account, beekeeping is as profitable as farming, and to me much more pleasurable, knowing from experience that one can commence small and grow up with the business, or let the business grow up with him.

Many of the suggestions of the BEE JOURNAL are valuable, and must be an encouragement and help to all. I find myself following many of them. Orford. O N. H., Oct. 1, 1886.

# The Illinois Central Convention.

For the American Bee Journal.

# J. M. HAMBAUGH.

Owing to a very enthusiastic gath-ering of the old war veterans and members of the Grand Army of the Republic, as well as citizens in gen-eral at Quincy, Iils., Oct. 19, 20 and 21, 1886 at the laying of the corner stone of the Soldiers' Home, the executive committee of the Illinois Cen-tral Bee-Keepers' Society have concluded to change the date of its meeting at Mt. Sterling, Ills., from Oct. 19 and 20, 1886, as heretofore published, to Nov. 24 and 25, 1886. We hope that those interested in the cause, will take pains to make public the change, and do all in their power to make the meeting a success.

Quite a number of prominent bee-keepers have signified their intention to be present, and each day brings additional evidence that the meeting will be one et unusual interest. The programme has been culled from a list of the most practical and instruc-tive topics, and the query-box will be full, varied and interesting, and we solicit those who cannot be present, to send us by mail their queries which will be respected and placed upon the list. We append the following programme :

### FIRST DAY-WEDNESDAY.

Forenoon Session, 10 a.m.-Convention called to order. Address by President Wm. Camm. Calling the roll of members. Payment of annual dues. Call and reception of new members. Reports of Secretary and Treasurer. Essay. "Reversible frames and reversible sectional brood-chambers, and hives—are they a valuable acquisition to bee-culture ?" by C. P. Dadant, Hamilton. Ills.

Afternoon Session, 1:30 p.m.-Presi-Afternoon Session, 1:30 p.m.—Presi-dent's annual address. — Essay, "Hives, frames and sections," by the secretary, Jos. M. Hambaugh. "Shall we use separators, if so what kind?" by J. G. Norton, Macomb, Ilis. "Economy of supply and demand," by John Bush. Marrayville, Ills. Queries. Adjournment.

# SECOND DAY-THURSDAY.

Morning Session. 9 a.m.-Communications. Essays: "Different races of bees," by President William Camm. cations. Essays: "Different races others deposit drone eggs in worker others deposit drone eggs in worker cells (generally young queens), and "Marketing honey — best methods, how and when," by W. J. Cullman. of the comb. producing long, narrow-

As I have been sick and unable to Mt. 'Sterling. Ills. "Introducing ave the house for a few weeks, 1 queens." by Thomas S. Wallace, Clayton, Ills. Queries.

Afternoon Session, 1:30 p.m.-Re-ceiving members. Election of officers. Miscellaneous business. Essay: "The wintering problem." by W. T. F. Petty, Pittstield, Ills. Gratuitous queries. Explanation of articles on exhibition ; criticisms, etc. Spring,+o Ills.

For the American Bee Journal Plain Sheets of Wax and Drone-Cells,

# L. J. DE SOBOTKER.

My experience with plain wax-sheets is as tollows: When comb foundation came into use years ago, I was running an apiary in one of the West India Islands, and I sent for some foundation, and received wired, flat-bottom foundation, which was very badly printed with cell figures scarcely perceptible, but all worker cells. I put it in unwired frames, and made the allowances all around the side and bottom-bars, and gave it to pretty strong colonies, and the bees pretty strong colonies, and the bees worked it up into good worker-cell combs; but on several of them there was a small space occupied with drone cells, especially upon those worked up in the hives that had queens between 2 and 3 years old, and in the hives that had queens from 1 to 1½ years old the comb was all worker cells; this grave me the idea to worker cells; this gave me the idea to try a few plain sheets of wax. I did so in both old and young queened colonies, and found the same result as from the badly printed sheets, with this difference, that the bees worked very reluctantly, in fact unwillingly, upon them, taking as much time to do it as they would have required in abural comb, and as far as I could observe they had to add material to them of their own make. I then tried a few strips of it from 2 to 4 inches wide and they built replace wide, and they built worker cells on them, but they became honey cells after the balance of natural comb was completed, as is generally the case, commence with. The same result was obtained in the young and old queened colonies; the old having more drone cells than the young.

I think that Messrs. Dadant & Son's experience and observations differ somewhat from mine, as I find that bees generally build their combs to suit themselves, be it even on good worker-cell foundation. beginning at the middle of the top-bar, and pretty much in the shape of a heart, storing nectar and pollen just under the topbar, even to the depth of 3 to 4 inches, and under this the brood, and where-ever they think requisite they build in several drone cells by simply altering the worker cells into drone cells, and this without the fault of "sag-ging," "stretching," or the "manu-facturers'altering of the wax." Again.

bodied drones, whose value I question very much as stock for use in reproduction. This is the case right here in this apiary; the old queened colonies have altered worker cells into drone cells, and produced pretty stout fellows, too; it looks as if it was three worker cells used for two drone cells, and then the young queened colonies have long, narrow-bodied drones hatched from worker cells. I have used nothing this season but Vial-lon's and Dadant's brood foundation, the former slightly lighter than the latter. I have put both kinds into 1,000 frames, upon 6 wires, and one centre metallic stiffening bar in each; Viallon's foundation in sheets that fill up completely the Simplicity Langstroth frames; Dadant's founda-tion with the usual allowance on the side and bottom-bars for "stretch-ing." They have not given the same result, although worked into the same hives side by side; Viallon's founda-tion gives a solid frame completely filled with solid comb, but with some drone cells among the worker cells, although the sheets when put in were all work cells; Dadant's foundation gives a frame of comb barely joined to the sides, and <sup>1</sup>/<sub>4</sub> inch space from the bottom-bar; they were put in at the same time, and had the identical advantage of being worked up, as I kept them just where the bees would do their best with them, and that is in the centre of the brood or surplus chambers; these have also some drone cells in them, and when put in it was all worker-cell sheets. Now, according to Messrs, Dadant & Son, these bees must be exactly like Mr. Hays' bees, changing worker cells into drone cells to suit their wants, but not "worker combs into drone combs," as they observed, as all will admit that foundation cannot be called comb until it has been worked up by the bees.

They further state that "for 20 years we have had colonies which do not rear 100 drones yearly !" This is all well and good, but will they please examine carefully and see if it is not worker cells that these bees have changed into drone cells to produce they may, except they have been using drone combs contrary to their advice to others to use *only* worker cell foundation or combs. I believe that Mr. Hays' experience and results are pretty much like my own, and our observations as carefully taken and now reported in this matter, as bonafide as the next man's. Please inform us if we should put all worker cell foundation in the hives, which all experienced bee-keepers generally do now-a-days, especially those who use full sheets, and if the bees did not naturally alter some of them into drone cells to suit their wants, where would we be? Where would the drones come from? Man has cer-tainly done and is still doing a very great deal towards improving apicul-ture, and assisting the labor of the bees; but nature and bee sense-not never succeed in changing, as drones they must have for the continuance

of their existence, notwithstanding we have checked their drone production to a very great extent by only giving them worker cell foundation or combs.

The bees in this apiary are still gathering nectar from the fall bloom, which has taken a good start after the few days of showery weather we have had lately, and if frost does not disturb these sunny and yet cool days, they may still gather a sufficiency to go into winter quarters, although we are preparing for that event independent of this bloom now on us.

Riverton, o Miss., Sept. 23, 1886.

For the American Bee Journal The Solution of Bee-Keeping,

# J. W. TEFFT.

As intelligence increases the relations existing between the honey-bee and man are being better understood. Air is the first and constant condition of animal or insect life; and as the close relation which its purity bears to the physical health of the honey-bee is better comprehended, the greater is the demand for a perfect mode of protecting the bee from sudden changes of extreme heat and cold, by proper ventilation. Theory after theory has been promulgated only to prove to be failures when practically tested, and the world is to-day without practical authoritative system which will work under all circumstances. Why is all this? My answer is, that the application of theories to bee-keeping has been in the hands of scientific rather than practical men. Ever since Moses Quinby undertook to ventilate his hives at St. Johnsville, N. Y., what progress has been made in ventilation and protection from extreme heat and extreme cold, is shown by the condition of our bees every spring, and by the writings in bee-papers.

If the great scientific bee-men of the past and present have failed to establish a perfect system of protection from heat and cold, sudden changes, and for ventilation, one of two considerations must be arrived at.namely, there can be no perfect system established; and that these theory men have been working on a false basis.

The first conclusion must be discarded, for a perfect system of protection from sudden changes of heat and cold and proper ventilation can be established. The second conclusion is evidently the cause of failnres. As the scientist has failed to give the world a true system, or one that may be relied upon for all time to come, would it not be better now to call upon persons who have practical understanding of bees and mechanics, as well as science, as relates to this subject; men who can combine natural laws of the honey-bee and mechanical principles in harmonious action ? All that is required to produce a perfect system, is to have a perfect understanding of the natural laws of the honey-bee, and be able to apply them by the proner mechanical contrivances to insure successful results.

Science, unassisted by a practical knowledge of mechanics, has not solved, nor can it solve this problem, The great problems of the day are being solved by practical men, men of advanced ideas, but who lay no claims to scholarly education, titles or renown. They are the men who are to evolve a satisfactory system. Bee-keeping is tired of reconciliations between two things which should never have been contrasted. Beekeepers are offended by a patronage of an ally which it professes not to need, and critics have rightly discovered that in most cases where theory, science, is pitted against practical bee-management, or fused with it, there is some fatal misconception to begin with, as to the scope and province of either.

The AMERICAN BEE JOURNAL improves with each issue, and will im-prove as the honey-producers demand We as bee-keevers scorn the unworthy sheet which panders to low taste and places before bee-keepers, reading matter not pertaining to bee-keeping. Let us as bee-keepers make the most of the situation of things, and strive to use every instrument we have at hand for the service of the bee. I believe the AMERICAN BEE JOURNAL is a pure bee-paper which furnishes clean bee-literature of a high class for pernsal by all highminded bee-keepers, and will come to be one of these instruments. It cer-tainly gives us the most sensible views. It publishes more bee-news and special views from every part of the world than all other bee-papers combined. It is not an organ, and neither apologizes for nor tolerates theories. It has opinions on all bee-subjects of the highest order. Its fundamental doctrines are for the general welfare. It has no subsidies or exclusive privileges for anybody. Collamer, ON. Y.

For the American Bee Journal

# Notes of the Season.

# J. F. LATHAM.

In this vicinity the apicultural prospect for 1886 opened auspiciously. When I made the first examination of my colonies, on April 20, the combs in most of the bives were well stocked with brood, and with few exceptions the condition of all was in an unusual degree satisfactory. A week of very line weather followed, which gave the bees an impetus to increase their brood to such an extent that some of it was chilled during the severe weather that followed, though not enough to cause appreciable harm. The cold wave was succeeded by moderate weather, and although the sugar maples failed to bloom, the pollen from the willows and an abundance of surplus stores renewed the early bloom.

perfect understanding of the natural laws of the honey-bee, and be able to apply them by the proper mechanical earlier than I have known it to com-

mence during my eight years of beekeeping. From the above date until July I, when the 36th and last swarm was disposed of, a lively experience gave me an introduction to the reality of modern bee-keeping. By July 10 the drouth had browned the white clover bloom, and the surplus season for comb honey virtually ended. During the four weeks that followed, bees scarcely made a living ; several of my colonies required feeding to carry them to the tall bloom, having stored about all of their clover honey in the surplus boxes. By Aug. 20 the fail harvest commenced, from which was stored a goodly quantity of surplus and a bountiful supply of winter stores.

As a result of my apistical efforts for the past season, I have 1,500 well filled one-pound sections of clover honey; 400 pounds of extracted honey, and an increase of 21 colonies from natural swarms, making my present stock 50 colonies in good wintering condition as regards strength, food, health, etc. Retrospectively I have no reason to complain of the general behavior of my co-workers. All of the swarms staid where they were put the "first time." No swarms absconded or attempted to abscond. The young queens were remarkably vigorous, and but one was lost during her mating flight. Althongh a large majority of my bees are hybrids of the Italio-German variety, I can recall but two instances when I have received stings that caused swelling; and those were more the result of my imprudence than the habitual malignancy of the hees.

Generally speaking, the past season has been cold and dry, although enough light rains have fallen to keep vegetation green. The nights have been unusually cool, and but few days hot; notwithstanding, while the flowers were in bloom they yielded nectar quite profusely, which fact seems to be somewhat at variance with some of the theories regarding the requisites of good honey weather. If I am correct in mv observation, the principles of distillation as practiced by nature and art, are but slightly, if at all, at variance.

The experience of last season, and thus far the present season, has led me to think that a more definite cooperative system on the part of apiarists should be adopted in selling their honey. The diction of prices, and methods of disposal should be more directly controlled by the producer and consumer. As a staple honey is increasing in prominence yearly, and its sale should be made by weight only. Much misrepresentation is often indulged by some of the "handlers" of honey, too many of whom are ignorant of its qualities, or the first principles of its production. The act of buying a lot of honey in sections weighing on an average 12 or 14 ounces, and on retailing, representing them to customers as "full pounds" does not enhance the price or sale of comb honey in a very substantial degree ; for consumers soon become educated to the fact that the vender is making more money on less

honey, while they are obtaining less honey for their money, than were the commercial quantities represented in pounds and ounces, instead of "by the piece." This should not be. Let us insist that our honey be repre-sented in its "handling" by the legitimate quantities-pounds and ounces.

In spite of the herculean efforts of the AMERICAN BEE JOURNAL to kill the hydra, the "Wiley pleasantry!" like Banquo's ghost, "it will not down." In spite of the bulwark of the nineteenth century enlightment, the idea (if it can be called an idea) exists that comb honey with its in-numerable irregularities of finish, and delicacy of construction, can be fashiored by the uniform producing fashioned by the uniform producing implements of mechanical art. Cumberland, 9 Me., Sept. 29, 1886.

For the American Bee Journal. Apiarian Exhibit at Toledo, Ohio.

DR. A. B. MASON.

I wish to give an account of the exhibits in the apiary department at the Tri->tate Fair, held at Toledo, O., last month. The exhibits in this delast month. The exhibits in this de-partment become more attractive each year. Mr. A. M. Gander, of Adrian, Mich., made a fine exhibit of both comb and extracted honey last fall, and this year did even better than last, and each year was justly awarded first premium on both, and also on best crate of comb, and on best englity of axtracted honey. He best quality of extracted honey. He was also awarded first premium on a

Stanley honey extractor. W. Z. Ilutchinson did us the honor to make our exhibit more interesting and attractive than usual by exhibit-ing some line comb honey and some very choice extracted honey. He also made a fine display of honey-produc-ing plants, and was awarded premiums on all his exhibits.

Mr. L. Eastwood, an old grey-headed and enthusiastic hee-keeper of Waterville, O., made a good display of comb honey, which was awarded a premium. C. H. Christlieb was awarded a premium on a nice exhibit of Italian bees. Mr. H. H. Overmyer, of Lindsey, O., made a display of ex-tracted boney, and sold all be had on exhibition, and took orders for a large amount besides. Mrs. Mason (that's my better half, you know) made a small but quite attraction orbibit. small Lut quite attractive exhibit of comb and extracted honey, on which she was awarded first premiums.

Being located near the Fair Grounds I made it a point to fill all the space not occupied by others. My honey exhibit was entirely of extracted. I had also Italian and Carniolan bees, and extra queens that attracted the usual amount of attention. A large lump of candied honey that I had on exhibition was the "innocent cause" of such remarks as, "See the sugar!" "O, what nice sugar!" etc., and it was just such remarks that we (beekeepers) liked to hear. for it gave us the coveted opportunity to show and teach the people what pure extracted honey is, and that it will become

candied. But one lady turned up her sharp little nose at my (to me) excel-lent talk and would not believe a word I said about it being honey, and I could not persuade her to taste of it, but her husband (sensible man) tasted " and believed,"

tasted "and believed," A lady in passing the hives where the bees were, said she did "not want any more honey if it was made by such nasty looking bugs as those." A boy said, "O, see the bed-bugs, see the bed-bugs, ain't they nice!" A the bed-bugs, ain't they nice !" A lady wanted to know "how the bees could live when they could not get ont of the hive to get anything to eat." But the best of all was a woman, with several children. There were a few dead bees lying on the bottom of one of the hives, by the glass side, and she told the children that." those are bees that would net that "those are bees that would not work, and the other bees that would not them." The bees were dragging along a nearly dead one, and she said, "See! there is one that will not work, and they are killing it now." I thought "ignorance is bliss," etc., and kept quiet.

We have had the good fortune to get first-class judges for our department each year since it was first made a part of our Fair. The editor of the BEE JOURNAL certainly will not soon forget how he kindly came over 200 miles ("free gratis, for nothing") to help us make a good start, and with Messrs. H. R. Boardman and H. H. Overmyer, served as judge, when our exhibit was quite small; and how the next year, the editor with C. F. Muth, of Cincinnati, and the Hon. Mr. Catton, of Indianapolis, served us again we have had the good fortune to secure the services of the present President of the North American Bee-Keepers' Society as judge, and I believe he has given universal catignation

satisfaction. Perhaps I have written too much, but I like to read the different reports of honey exhibits, and I believe it would be for the interest of our in-dustry if bee-keepers would improve the opportunities offered by the different State and local fairs to exhibit the products of the apiary and the implements used in it. Wagon Works, • O.

# **OUR CLUBBING LIST.**

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

Not "My Friend."-W. Z. Hutchinson, Rogersville, Mich., writes thus on Oct. 1, 1886:

From conversation with bee-keepers, at Fairs and others places, I find there is a general impression that I am the person referred to by Mr. Heddon, in his book, as "my friend." While there is no dauger of my repu-tation suffering from a continuance of such belief, still I dislike sailing under false colors, and prefer to give "honor to whom honor is due." hence I desire to say that I am not "my friend."

Winter Stores. - J. H. Andre. Lockwood, 9 N. Y., on Oct. 2, 1886, writes:

I wish to make an explanation concerning my article on page 599. Taken as it reads, it contradicts itself, and also what I have expressed hereto-fore. My meaning was that I did not wish to winter bees wholly on sugar. but if others desired to do so, I could see no harm to the honey or sugar trade either; and that I believed in stimulative feeding in the spring, and preferred sugar instead of honey for the reasons enumerated. Yesterday the reasons enumerated. Yesterday was the first day too cold for bees to work in nearly six months.

Age of Queens.-Gust Murhard, Portland. o Oreg., writes :

On page 596 is a query on the "time of a queen's fertility and usefulness." My observations have been mostly made on Mt. Lebanon queens, both self-reared and imported. A young queen reared this season is in her prime of life, and fertility during the next season, but with the expiration of that season, she has passed the

meridian of her life and fertility, and is, therefore, on the decline, although her fertility is but half exhausted. and will last another season and winter; but in the forepart of the fourth year, her feitility will give out, when she is balled and superseded by the workers, by rearing a young queen, and it is at this time when two queens may be found in a colony. This is may be found in a colony. my repeated experience, and I do consider a young prolitic queen but for the first season good for the honey apiary, as with the expiration of that season she has passed the meridian of her life, and is, therefore, on the decline, upon the appearance of the first symptoms of which the workers' instinct of self-preservation of the race reproduction by colonial through propagation, called swarming, will be aroused. That I am correct, any bee-keeper will find if he will try the Mt. Lebanon bees where a colony with a young prolific queen of the previous season in a large hive will but seldom take to swarming the first season, but sure to do so the next season, if the same queen is still in the hive. This is the result of repeated experience, and it is for the reason that the Mt. Lebanon bees with a young prolific queen of the previous season will not swarm, that I prefer them over all other bees of a pure race for the honey apiary.

Hive Packing for Winter.-J. R. Putnam, + OIlls., makes the following inquiries :

1. How will it do to make boxes the same size as the tops of the hives, the same size as the tops of the nives, 5 or 6 inches high, and put on the bottom of them bagging, filing the same with sawdust, and put over the brood-chamber, and the cap or top of the hive over this? 2. Will it absorb so much moisture that it will freeze in the righton or will it been day and in the winter, or will it keep dry and keep the bees warm?

[I have now in use 150 of just such boxes filled with chaff and planershavings. They perfectly absorb the moisture, both in the cellar and outdoors, but I find that success or failure in wintering does not depend entirely, or mainly, upon the absorption of moisture.-JAMES HEDDON.]

No Nitrogen in Fat,-Prof. A. J. Cook, Agricultural College, 9 Mich., on Sept. 30, 1886, writes :

Mr. Samuel Cushman, on page 617, be transformed into fat. He quite misunderstood me. There is no nitro-gen in fat; nor is there any carbon, bydrogen or owner the adverte of gen in fat; hor is there any carbon, hydrogen or oxygen (the elements of fat) in nitrogen. Hence any such statement would be perfectly absurd. I did say, and it is true, that nitro-genous food can be transformed into fat, or into sugar. Feed an animal carbon food can be and the solely on albuminous food, and the liver still continues to form glycogen, and its consequent sugar. In such a obtained at this office.

change the nitrogen of the albuminous food is eliminated, and the proportions of the other elements changed in the wonderful laboratory of nature.

Sweet Melissa. - A. C. Tyrrel, Madison, 5 Nebr., on Sept. 17, 1886. writes :

I send you a specimen of a honey-plant, called by the Germans "Sweet Melissa," imported from Germany in 18st, which, after two years' trial, I consider one of our best housy-plants, being very hardy, a free bloomer, commencing to bloom in June, and continuing to blossom until killed by frost. It is better liked by bees than white clover, spider-plant or carpen-ter's square (Simpson's honey-plant). In fact they will fly past all other flowers when "Melissa" is in the field. After once sowing the seed no further effort is necessary, as it is self-sowing. I have seed sufficient for an acre of ground, and next season I will be able to make a more intelligent report. Bees here do exceedingly well, and are now bringing in honey wery fast from goldenrod and other wild flowers, of which there are hundreds of acres within easy reach. Please give its botanical name.

[This is Melissa afficinalis, a plant formerly much cultivated for its citron-like perfume. The name "Melissa" is from the Greek name for bee, on account of the attractions the plants were observed to possess for these honey-gathering insects; so the value of the plant to the apiarist has been long recognized. - T. J. BURRILL.]

# Lime in the Cellar.-M. M. Cram, Mankato, 9 Minn., asks the following :

Would it be a good plan to put a dish of unslaked lime in the cellar to take up any dampness, and purify the air for the bees ?

[I have tried it, and I cannot say that it has any perceptible effect upon successful wintering. To get rid of bee-diarrhea is the problem, and I have succeeded in doing it in very damp cellars, and failed in very dry ones.-JAMES HEDDON.]

Simmins' Non-Swarming System is the title of a new English bec-book. The author claims that it will inaugurate a "new era in modern bce-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be

# Honey and Beeswax Market.

The following are our very latest quotations for honey and beeswax :

## CHICAGO.

HONEY.-For comb honey, we quote 12@13c. Extracted 6@7c. BEESWAX.-23c. R. A. BURNETT. R. A. BURNETT. 161 South Water St.

#### NEW YORK.

110NEY.-We quote this year's crop as follows: Fancy white in 1-lb, sections, clean and neat packages, 15@16c, :2-lbs., 12@13c, fair to good 1-lbs., 12@14c, :2-lbs., 10@11c; fancy buckwheat 1-lbs., 11@12c; :2-lbs., 9@10c, Wbite clover ex-tracted in keys and small barrels, 5%@7c; Califo-ria extracted in 60-lb, cana, 5@51-2c; Califor-nia comb hnney, 10%11c. BEESWAX.-Prime yellow, 22@24c. McCa 4U, a VIII of BLOC

WAX.--Prime yenow, 2200 MCCAUL & HILDRETH BROS.. 34 Hudson St.

#### BOSTON.

HONEY.-The demand has improved. We are selling one-pound puckages of white clover honey at 14@15c.; 2-pounds at 13@14c. BEESWAX.-25 cts. per lb. We are

BLAKE & RIPLEY, 57 Chatham Street.

#### DETROIT.

HONEY.—Owing to more liberal arrivals the market for honey is lower. Best in 1-lb. sections, BEESWAX.-23c.

M. H. HUNT., Bell Branch, Mich.

### CINCINNATI.

HONEY. - Extracted honey brings 31-2 @ 7c.; comb honey, 12 to 14c. for good to choice, in the jobbing way. BEESWAX.-It is in good demand and arrivals are fair. We pay 20c. for good yellow.

C. F. MUTH & SON, Freeman & Central Ave.

## CLEVELAND.

HONEY.—Choice new honey in 1-lb. sections is selling at 14c.; 2-lbs. 12a(13c. Old honey is very dull at 10@12c. Extracted, 6@7c. BEESWAX.-25c.

A. C. KENDEL, 115 Ontario Street.

### RANSAS CITY.

HONEY.-The market is good for all grades, and sales are large, while the supply is the same. Prices remain the same. One-pund sections, white clover, 13@14c.; dark 1-lbs., 11@12c.; 2-lbs., 11@12c.; dark 2-lbs., 9@10c.; &-lbs., light, 14@15c. Extracted white clover, 6@7c.; dark, 4@5c.; white sage. 5@5%c. BEESWAX.-20@22c.

CLEMONS, CLOON & CO., cor. 4th & Walaut.

#### MILWAUKEE.

HONEY.-The murket for boney of choice qual-ity is firmer and we are trying to establish a high-er range of values. We quote 1-b. sections of white at 12%@13c.; 2-lbs., 11%@12c.; dark not wanted. Extracted. white, in half burrels and in kers, 6%@7c.; in tin puckages, 7@7%c.; in barrels, as to quality.5@5%c. BEESWAX.-No demand.

A. V. BISHOP, 142 W. Water St. Oct. 2.

#### SAN FRANCISCO.

HONEY - There is a firmer market for extrac-ted, and especially for comb boney, as the crop of the latter is rather small. Apiarlets have sold what there were obliged to dispose of for payment of packazes and labor, and they hold the bilance back at higher prices. The demand is increasing, and we quote with ready takers, 4@446, for choice extracted ; 34@336, for amber extracted ; and 8@11c, for comb honey in 2-lb. sections; 12@13c. for 1-lb. sections. BEESWAX.-It finds buyers at 20@23c. Sec 9.0 SectACTE for Extracted 122.124 horis St

THOMAS G. NEWMAN & SON, PROPRIETORS, 923 & 925 WEST MADISON ST., CHICAGO, ILL,

At One Dollar a Year.

ALFRED H. NEWMAN, BUSINESS MANAGER.

Special Notices.

To Correspondents. — It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

.

A New Crate to hold one dozen one-pound sections of hooey.—It has a strip of glass on each side, to allow the honey to be seen. It lea light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 cts, per crate. Glass 1%c. per light, extra.

Yneca Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the

brush, they are almost indestructable. When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 eents each, or 50 cents a dozen; if sent by mail, add 1 cent each for postage

Five Thousand new subscribers to the BEE JOURNAL is what we have made our calculations for; they will come in clubs between now and next spring. Installments are coming every day.

# Home Market for Honey.

Control of the solution of the

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, ou the cover-page, "Presented by," etc. (giving the name and address of the beekeeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

# System and Success.

Contained to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it, the prices are reduced, as follows :

 For
 50 colonies (120 pages)
 \$1 00

 "100 colonies (220 pages)
 1 25

 "200 colonies (420 pages)
 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

**Red Labels** for one-pound pails of honey, size  $3x4\frac{1}{2}$  inches. — We have just gotten up a lot of these Labels, and ean supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apianist printed on them—by mail, postpaid.

27 Sweet Clover, or Melilotus Alba, is almost the only resource for honey now, on account of the late severe July drouth. If the seed is planted in September, it will come up this Fall and bloom next year, in its second season.

We have a large lot of this seed on hand, and offer it at the following Reduced Prices, by express or freight:

| )ne | pound         | \$0 | 20 -    |
|-----|---------------|-----|---------|
|     | peek-15 lbs   | 2   | 25 - 25 |
| 6.6 | bushel-60 lbs | 7   | 00      |
| 6.6 | sack-80 lbs   | 8   | 00      |

It will pay to buy it by the sack and sell it again in smaller quantities.

28" If you want a chance to make some money, and provide pasturage for the bees during the Fall months, this is your opportunity 1

The Convention History of America and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.15.

As there is Another firm in Chicago by the name of "Newman & Son," we wish our correspondents would write "Americao Bee Journal" on the euvelope when writing to this office. Several letters of onrs have already gone to the other firm (a commission house), causing vexatious delay and trouble.

Our Book Premiums.-To encourage all our present readers to get one or more additional subscribers we will present 25 cents' worth of books for every new subscriber (accompanied with \$1 for one year's subscription), sent direct to this office. Thus for five new subscribers with \$5, the getter up of a club gets \$1.25 in valuable reading matter, to be selected by himself from our list on the second page of this paper. It will pay you to devote a few hours to the interests of the BEE JOURNAL. Every one who keeps bees onght to take it. We will furnish sample copies free in any quantity to those who intend to get up clubs. We expect to get 5,000 new subscribers before Jan. 1, 1887.

"Cash in Advance" is the rule, but no longer than six months of grace can be allowed on the small sum of one dollar. Subscriptions may commence at any time, and discontinuances may be ordered at any time when arrearages are paid up.

-----

When Marketing Extracted Honey, it is a sad blunder to use barrels holding from 300 to 500 pounds—they are too large to be desirable for the trade, too bulky to be handled with care in transportation, and too dear to be incrative to the producer, for honey put up in such large barrels is subject to a discount of one cent per pound, because of the difficulty in disposing of it without repacking and dividing into smaller lots.

We have made arrangements by which we can supply the Weekly AMERICAN BEE JOURNAL and the Monthly Bee-Keepers' Magazine for 1887, both periodicals for the very small price of \$1.25, or the above and Gleanings for \$2. Three bee-periodicals for the usual price of one !

\_\_\_\_

Set Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any oue intending to get up a club can have sample copies sent fo the persons they desire to interview, by sending the names to this office. or we will send them all to the agent.

**Colored Posters** for putting up over hooey exhibits at Fairs are quite attractive, as well as useful. We have prepared some for the BEE JOURNAL, and will send two or more free of cost to any one who will use them, and try to get up a elub.

When Henewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a **Hinder** for the BEE JOURNAL to any one sending us four subscriptions—with \$4.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

To any One sending us one new subscriber with his own renewal (with \$2.00), we will present a copy of the new "Convection History of America."

WANTED, an active, reliable man in every city and town in the State of Illinois to work up Councils of the American Legton of Homor, an insurance organization now having (40,400) mem-bers, and we are willing to *profiberally in cash* for services rendered in this work. It can be per-formed at odd and leisure hours without interference with regular business, and is an occupation aflording much pleasure to those engaged in it. For full explanation how to go to work and what to do, address

A TREATISE kiving an index of diseases, and the symptoms; cause and treatment of each, a table giving all the principal drugs used for the horse, with the ordinary dose, effects and antidote when a poisod; a table with an entraving of the horse'steeth at different ages, with rules for telling the age of the horse; a valuable collection of re-cipes, and much valuable information,

Price 25 cents-in English or German.

THOS. G. NEWMAN & SON,

# The NEW Heddon

We have made arrangements with the inventor by which we shall make and sell the Heddon Reversible Hive, both at wholesale and retail : nailed and also in the flat.

The engraving gives a good idea of the hive. The brood-chamber is in two sections; also the surplus arrangement, which may be interchanged or inverted at will. The cover, bottomboard, and top and bottom of each sectional case has one-half of a regular bee-space, so that the surplus cases with the sections, may be placed between the two brood-chambers, or the latter may be transposed or inverted—in fact, all parts of this bive are perfectly interchangeable. The brood-frames will ALL be bored for wires.

ALL be bored for wires. A SAMPLE IIVE Includes the bottom-board and stand; a slatted honey-board, and cover; two 6-inch brood-chambers, each containing PS frames; two surplus arrangements, each containing 28 one-pound sections, one with wide frames and separa-tors, and the other without separators. This latter chamber can be interchanged with the other stories, but cannot be reversed. It is NALLED AND PAINTED, and ready for immediate use. Price, \$4.00, complete.

It is absolutely essential to order one natled hive as a pattern for putting those in the flat together correctly.

HIVES READY TO NAIL .- In filling orders for these hives, in the flat, we make 6 different combigations, so that our customers may make a selection from the sample nailed hive, without waiting for us to quote prices, and the different kinds will be known by the following numbers :

No. 1 consists of the stand, bottom-board, cover, two 6-inch brood-chambers, 16 frames, and the slatted honey board. Price, SI 55 each.

No. 2 is the same as No. 1, with the addition of ne surplus story containing 28 sections without eparators—interchangeable, but not reversible. one separators-intercha Price, \$2.00 each.

Price, \$2.00 each.
No. 3: is the same as No. 2, with two anrplus stories as therein described. Price, \$2.50 each.
No. 4: is the same as No. 1, with the addition of one surplus story containing 28 sections to wide frames with separators, which can be reversed, inverted, and intercharged, the same as the brood-chambers. Price, \$2.30 each.
No. 5: is the same as No. 4, with two surplus arrangements as there a described. Price, \$3.00.

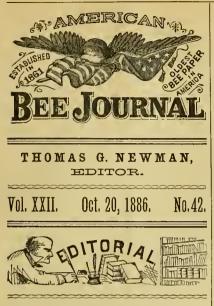

No. 6 contains all the parts as described. In the sample nailed hive. Price, **\$\$2.75** each. Those desring the hives without the stand, honeyboard or sections, may make the following deductions from the above prices : Stand, 14 cents; honey-board, sections; and the 28 or 56 sections, as the case may be, at ½ cent each, respectively,

We will also make the following deductions or quantities ordered all at one time: For 10 or more hives, 5 per cent. discount; for 25 or more hives 71-2 per cent.; for 50 or more, 10 per cent.

THOMAS G. NEWMAN & SON 923 & 925 West Madison-St., CHICAGO, ILL.

The Convention at Indianapolis, Ind,, was a very pleasant gathering of bee-keepers, and all appeared to have a very enjoyable time. The committee of arrangements had everything about perfect in preparing for the meeting. Messrs. Cutting and Dougherty and Mrs. Cass Robbins deserve much credit for their exertions to make the time a pleasant one. On the evening of the second day, Mrs. Robbins and her lady friends, assisted by Mr. Dougherty, get up an entertainment interspersed with icecream and cake, which was very enjoyable, and all the bee-keepers, both male and female, seemed to be well pleased with it. A blind young man by the name of Hansen, performed some very fine instrumental music on the piano, as well as singing several songs. A gentleman recited a poem, entitled "Fesslers Bees," which was very amusing, and produced roars of laughter. Thanks were passed by a "standing" vote to the ladies and their friends for the excellent entertainment provided, which was quite unexpected, but none the less appreciated. We give a report of the first day's sessions in this issue of the BEE JOURNAL, and the others will follow in subsequent issues.

A National Corn Show will be held Nev. 8 to 19, in the Exposition Building. Chicago, in connection with the National Fat-Stock Show. One hundred premiums will be awarded on exhibits of 20 pounds of corn in the car. Of these, 56 are cash premiums of \$10 and \$5. Competition will be between the growers themselves, in each of the seven principal corn-growing States. Four premiums of \$15 and \$25 are to be awarded as sweeptakes in the competition between the growers of the different States. Most of the express companies co-operate, by offering to carry parcels for exhibition, all distances, over their respective lines at a small, nominal charge of 25 cents if not exceeding 25 pounds, placing distance and near localities on a par. Entries close on Oct. 26. Full particulars supplied on application to the "Secretary of Corn Show," care of Prairie Farmer, Chicago, Ills.

English Honey Markets are very much excited now over the 40 tons brought by the Canadians. A bee-keeper in Surry writes this to the London Journal of Horticulture concerning that lot of honey, and the prebable result of its sale on the English maket:

The exhibit of honey from Canada, which is now ou view at the Colonial Exhibitiou, will be likely to cause alarm to timid beckeepers who already are dissatisfied, and not without reason, at the small price offered for honey, even though the honey harvest of this year has been much below the average. It is uo use trying to shut our eyes to the fact that the sale of this 40 tons of honey will sensibly affect the price of English honey. Still we venture to think that the ultimate result will be to the advantage of English beekeepers, and for much the same reasons as the late exhibition of the B. B. K. A. has done good in bringing before the public mind the great advantages of honey as food, and the capabilities of our own country for supplying a large amount of honey. At present honey has a very limited sale, and until we can educate the public mind to the fact that it is a necessary food, and not merely a luxury to be indulged in by the few, so long will there be a difficulty in securing honey even at the low price offered by the honey companies and the dealers.

panies and the dealers. To take a parallel case, we can well remember tasting our first tomato nearly thirty years ago, and thinking how uopleasant if was. For many years after this there was little or no demaod for this fruit, but within the last few years the demand for tomatoes has enormously increased, and it is said to be a better paying crop than grapes, and as far as we are concerned we never pass by this fruit, especially in the form of salad.

It would be difficult to point out the reasons for this change, but the fact remains that the consumption of tomatoes is steadily increasing. So with regard to honey, if the public will take it into their heads to use honey in larger quantities than they have done, there will be no difficulty in finding out the real value of honey.

The public press is a very good indicator of public opinion. Though the B, B, K, A, have held several shows in London during the last twelve years, very slight notice was taken of these shows, for bee-keeping was looked upon more as a hobby than an industry. But with regard to the last Show, the press quickly recognized the fact that there was something in bee-keeping, and all the leading papers had editorials on the subject, pointing out the great strides that had been made during the last few years.

At present the supply far exceeds the demaud, and, except for sections, there is not much business done in honey, as last year's stocks have not been exhausted. The Canadian exhibit will help to educate the public mind, and when once the demand is established there will be no difficulty as regards the supply either from home or abroad.

This naturally brings us face to face with the question, can we compete with Colonial or foreign beckeepers? In the Pall Mall Gazette, Sept. 17, there is an account of beekeeping in Ontario, by Mr. Jones, one of the deputation from the Ontario Bee-Keepers' Association. He estimates the average boney harvest at £100,000, and the average yield of boney from a colony at 30 pounds, though cases have been known where 100 to 600 pounds have been known where 100 to 600 pounds have been known where 100 to colony in a single season. This, of course, is an enormous yield, and we have never known a colony in Great Britain that could touch this limit, though Mr. Cowan averages 100 pounds from bis 14 colonies, and we met a beckeeper in Wales this summer who had taken 200 pounds from one colony, and still had the Heather honey harvest to increase this yield.

The price of honcy in the comb at Ontario is 1s. a pound, while extracted fetches 8d. Taking into account the cost of carriage, cummission, etc., these prices are too high for the Euglish market. Last year the wholesale price of good one-pound section honey varied from 6d. to 8d., and extracted from 4d. to 6d. per pound. This year prices have

slightly stiffened, as the harvest has been deficient, but a large bee-keeper offered to supply sections at 6s. per dozen, and said that he could at that price secure a very good profit for himself. Every one knows that the question of carriage is the burning question of the day, as far as farm produce is concerned. Foreign fruit is underselling our home fruit, because the railways give greater facilities for conveying fruit from the contineut, and chargo less for the freight than they do for fruit from the Kentish orchards, with the result that the farmers are allowing their plums to decay on the trees, as it does not pay to send them to Covent Garden. If the Canadian beekeepers can get their honey delivered in London at less cost thau we can get honey delivered, say from Lancashire, it will be a bad look-out for the Birtish beekeeper ; but though they may be able to undersel us as far as extracted honey is concerned, it will be a more difficult task to drive our section houey out of the market.

The Honey, Season in Scotland.-A Lanarkshire bee-keeper writes thus to the Journal of Horticulture :

Journal of Horticulture : Between Sept. 4 and 13, in this part of Scotland, we had heavy rainfalls, high winds, with an almost suuless sky. One day enly during that period the sun shone, and then for a short space of time only. This has been disastrous alike to bees, crops of every kind, and threatening a total destruction in some places to the potato crop. The other day, of potatoes sufficient for a family of four, only one was free from the disease. There has been only one day upon which the drones flew, the result being that only a few late-bred queeos are fertilized. I have sufficient for my own use, but some friends must be disappointed. The loss in bees is but a triffe when compared with the crops lying upon the sodden soil caused by exceedingly heavy rains. The honey of this year here in the nerth Is

ceedingly heavy rains. The honey of this year here in the north Is not only scarcer than that of last year, but is as a rule very much thinner and inferior in quality, most of it being quite subject to the extractor. The above report applies to a wide area, and in many places there is not even a surplus of honey an account of the low temperature. Where my bees stand at the Heather, we had a fall of snow on May 13 that completely buried the skep, and frost and rain have been seldom absent since.

**Photographs** of 131 of the principal apiarists of America, all on one sheet, 11x14 inches, were exhibited at the Indianapolis Convention, by Mr. E. O. Tuttle, of Vermont, who has gotten them up, and will soon offer them for sale.

Frank Leslie's Sunday Magazine for November opens with the fourth of Mr. Powell's interesting "Leaves from My Life," dealing with the poet-banker, Samuel Rogers, and the witty Douglas Jerrold. Among the elaborately illustrated articles is one entitled "The Still-vex'd Bermoothes," in which a bright description of the Bermudas is accompanied by twelve scenes from the islands. "Salem, Past and Present," shows us some scenes from the old town of witches, in Massachusetts; and many other interesting articles and fine illustrations. The number is up to the high standard of excellence attained by this magazine.

Money Orders can now be obtained at the Post Offices at reduced rates. Five dollars and under costs now only 5 cents. As these are absolutely safe, it will pay to get them instead of the Postal Notes which are payable to any one who presents them, and are in no way safe.

# Replies by Prominent Apiarists.

[It is useless to ask for answers to Querics in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-ED.]

# Transferring Bees, etc.

Query, No. 324 .- 1. Will bees do as well transferred in the fall on full hives of foundation and fed back honey, or syrup from sugar, to winter, as if transferred early in the season? 2. Is 1,000 square inches of comb large enough for a brood department, and surplus added as needed for honey storing? Here in Texas the winter is merely nominal, only about one month of freezing to kill grass .- D.. Texas.

We think your plan will do very well in Texas.-DADANT & SON,

1. I would hardly feel as safe about it. 2. I think so; although I doubt if the mildness of the winter makes less room needed.—C. C. MILLER.

1. In your locality, "yes." 2. It may do in the hands of some, but with my method of management, it would be too small for me.-H. D. CUTTING.

1. It would need repeated trials to show the truth in the matter. Iu the North I should suppose so much labor late in the season might be an injury. 2. I think not.-A. J. Cook.

1. Yes, if done sufficiently early so that the bees can get things in shape before winter. 2. Yes, unless it is in the spring before swarming time.— W. Z. HUTCHINSON.

1. For this locality I should prefer to do it early in the season, but the proposed plan may work well in Texas. 2. My experience says that it is.-G. M. DOOLITTLE.

1. They will do just as well. But then it should be upon frames of natural comb and not foundation. I transfer hundreds of colonies every fall and winter, and prefer it to the spring. 2. I consider 1,000 square inches of comb not sufficient. I would not want less than 1,500 square inches. -J. P. H. BROWN.

1. I think not, as there would be too little time given for rearing brood, and new comb does not answer as well as old, particularly that in which brood has been reared. 2. Yes, I brood has been reared. 2. Yes, I think so. I winter my bees on from 3 to 7 Langstroth size combs, such combs contain about a square foot of cells on each side. I winter my bees on the summer stands. More stores would be required for successful wintering in a warm than in a cold ter stores. It does not matter if the locality, the reason for this being ob- comb is drone.—J. P. H. BROWN.

vious. So that where only 1,000 square inches is given for brood-nest, considerable surplus should be added. -J. E. Pond, Jr.

1. I prefer spring to fall trans-ferring, although I have seen each result in success. I prefer sugar syrup to any honey for winter stores for bees. 2. I prefer to give colonies breeding room larger than you menduring a portion of the breeding sea-son, and smaller than that during another part of that season. I prac-tice the contraction method with the most gratifying results. This con-traction should be governed by locality .- JAMES HEDDON.

1. You may transfer bees at almost any time if you give them proper attention; but spring is the best time, and as you put the question I answer, no. Bees will not build comb or draw out foundation late in the season like they will in the early part of the season. 2. If you mean actual comb surface, 1,000 square inches will an-swer for brood alone, but in a Southern climate the ten-frame Langstroth bive is none too large, which has comb surface of at least 1,440 square inches.—G. W. DEMAREE.

1. If not too late in the fall I think they would. 2. This is a query of more than usual importance to bee-keepers. My opinion is that 1,000 square inches of comb is too large for a swarm, and not large for building up in the spring in working for comb honey. A swarm does best on about 700 square inches of comb, according to the time it issues, and the length of the honey-flow. After much ex-periment I prefer 750 square inches of comb, ollowing the back to wild it comb, allowing the bees to build it from starters 2 inches wide in a shallow reversible frame. For spring allowed for a swarm, or 1,400 or 1,500 square inches of comb.-G.L.TINKER.

# Honey in Drone-Comb for Winter.

Query, No. 325 .--- I have quite a number of frames of drone comb filled with dark scaled honey. Will they do to put in a hive for winter stores, or had they better be extracted and fed into worker comb? I shall have to use three or more of them for each hive. Will bees cluster on them as well as on worker comb? 1 mean for them to pass the winter on the drone comb the same as if on worker.-Granger, N. Y.

I think I would use them as they are.-C. C. MILLER.

Yes, they are all right provided the boney is of good quality .- H. D. CUT-TING.

If you remove them in the spring it will be all right, for they must be replaced by worker comb by the time the bees breed in the spring.-DA-DANT & SON.

I should use the frames of honey as they are without extracting for win-

As far as my knowledge goes bees winter as well on drone comb as on worker comb.—G. M. DOOLITTLE.

I know no reason why the bees need not winter as well on drone as on worker comb.-W. Z. HUTCHIN-SON.

They are just as good for winter. In the spring worker comb should be placed in the centre for brood.—A. J. COOK.

I have used drone combs full of honey for winter stores many a time. but I always have some worker combs between them for the queen to com-mence brood-rearing in the latter part of the winter. For winter stores they are just as safe as worker combs are. -G. W. DEMAREE.

Put them in as they are. Who ever heard that drone cells were not as well adapted to wintering as worker cells? Thousands of colonies have wintered well with hives replete with drone combs.-JAMES HEDDON.

1. If the honey is well ripened and pure I see no reason why it will not prove safe for winter stores. 2. Bees will cluster as well on drone as on worker comb, but when brood-rearing begins trouble will arise. If worker comb is given early in the spring, perhaps (?) it may come out all right to use the drone now, but I myself should prefer the stores to be in worker comb.—J. E. POND, JR.

They will do just as well on the drone comb for winter, and with some strains of bees, and plenty of worker comb, a large amount of drone comb is not objectionable un-less it be for the space it occupies.— G. L. TINKER.

# Wintering Bees in the Cellar.

Query, No. 326.-I can put my bees into a cellar the temperature of which does not vary more than two or three degrees throughout the year from 52°. Being un-connected with any building, bees in it would not be disturbed by uoises or other ontside influences. It is, however, very damp, but can be well ventilated. 1. How will this cellar answer for wintering bces? 2. How much would such a cellar be worth to the man owning 150 to 200 colonics of hees? I have always wintered my hees out-of-doors, heretofore, very successfully .- G., Illinois.

1. Not very well. 2. If we were in your place we would keep on with the wintering that gave you satisfaction. -DADANT & SON.

From the statement I should say it would be all right. How much it would be worth would depend upon circumstances.—H. D. CUTTING.

1. I think it ought to be a good cellar, but I would not pin my faith to any cellar without actual trial. 2. That depends altogether upon circumstances.-C. C. MILLER.

1 have never wintered my bees in a cellar, so my opinion would be of no value, as it would be drawn en-tirely from my reading of the experi-ments of others.—J. E. POND, JR.

If I could winter bees out-of-doors successfully, I should not bother with the cellar.—G. M. DOOLITTLE.

1. I think it will answer well, but I should be inclined to continue to winter my bees out-of-doors if "very successfully."—W. Z. HUTCHINSON.

If you have wintered your bees successfully on the summer stands, you had better let "success" alone. You might try a few colonies in the cellar, and find out by actual experiment whether you can save in winter stores more than enough to pay for rent of cellar, etc.-G. W. DEMAREE.

1. Yes, that cellar is a good one, and as it maintains so high a temperature, I should care nothing for dampness. 2. You ask how much such a cellar would be worth, but you do not state the size or durability of construction. I consider it very construction. I consider it very worthy as a bee-repository.—JAMES HEDDON.

I think the temperature of the cellar too high for early winter, but suppose it can be lowered. Bees will not hibernate at 52°, but will remain active and consume too much. If the temperature can be properly regu-lated, such a cellar would be worth its cost to a bee-keeper having 200 colonies of bees.-G. L. TINKER.

I should prefer a lower tempera-ture-45° Fahr. I have often wonder-ed whether Mr. Barber's cellar is really as warm as he thinks. As he states it I do not see how he keeps it so. Our cellar is always wet, yet it is excellent. Bees have wintered nicely in it with a temperature of about 38° fahr., all winter. I should have fears of a cellar at 52°, Fahr. A man who has wintered his bees invariably with succeess at a temperature of about success at a temperature of about 45°, thought last winter to improve well enough, as he heard the dis-cussion at Detroit. He warmed up his cellar and lost several colonies, and injured many more.-A. J. Cook.

### Convention Notices.

127 The Wabash County Bee-Keepers' Associa-tion will meet at Wabash, Ind., on Oct. 23, 1886. AARON SINGER, Sec.

The annual meeting of the Western Bee-Keepers' Association will be held in Pythian Hall (11th & Main Sts.), at Kansas City, Mo., on Oct. 27-29, 1886. P. BALDWIN. Sec.

The next annual meeting of the Micbigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTING, Sec.

137 The Southern Illinois Bee-Keepers' Associ-ation will hold its next meeting at Benton, Ills., on Thursday, Oct. 21, 1886. F. H. KENNEDY, Sec.

The Illinois Central Bee-Keepers' Association will hold its next meeting at Mt. Sterling, Ills., on Nov. 24 and 25, 1886. J. M. НАМВАЙСИ, Sec.

All are respectfully invited to attend the next meeting of the Bee-Keepers' Association of Eureka Springs, which will be held at Eureka Springs, Ark., on Oct. 23, 1886. Business of im-portance to every bee-keeper in Northwest Ark. will be before the meeting. DR. S. S. PURCELL, Sec.

# North American Bee-Keepers' Society.

The 17th annual convention of the North American Bee-Keeper's Society assembled in Pfafflin's Music Hall, in Indianapolis, Ind., at 11 a.m., on Oct. 12, 1886, with the President, H. D. Cutting, and the Secretary, F. L. Dougherty, in their respective posi-tions. About 75 bee-keepers were present at the opening session.

After calling the convention to order, the President introduced the Mayor of Indianapolis, Mr. Caleb S. Denny, who, on account of the ab-sence of Gov. I. P. Gray from the city, delivered the address of welcome both to the State and to the city. The Mayor's address was full of earnest words of welcome to the society, and contained much that indicated his kindly feeling toward this enchanting pursuit, in which so many are engaged. He admired the manner in which bee-keepers endeavored to protect their favorite industry from the attacks of the ignorant and jealous. He wished the society to know that although be himself was not a bee-keeper, yet he felt a deep interest in the cause which they championed, and would do all he could to assist in making it all that bee-keepers desired it should be. After reviewing some what the history of the organization of the society, and hoping that the present meeting would be one of the most profitable the society ever held, he again expressed the great pleasure it afforded him, of welcoming the society to the city of Indianapolis for the third time since its organization in Indianapolis on Dec. 21, 1870.

In the absence of Dr. C. C. Miller, who was to express the thanks of the society, President Cutting requested Mr. Thomas G. Newman to make the address, which was substantially as follows:

Mr. President, Ladies, and Gentle-men:-His flonor, the Mayor, has re-ferred to the birth of this International Society at this city 16 years ago, and it will be quite appropriate for me to state that our society is a power in the land, from the fact that it keeps abreast with science and invention in the progress of "to-day"-that its pulse thrills with the transcendent issues of our time-that it is its consecrated task to put into the activity of this age all the great truths of the past and present—as it were, to animate the mighty organism of bee-culture with the soul of the past, and the progressive spirit of the present and future! In this spirit, with this purpose, we meet; in this spirit, with this purpose, let us greet each other; and in this spirit and with this purpose let us pret with this purpose let us part.

We are here to enjoy the social part of our society; to create a good na-tured rivalry, to debate the subjects that are presented for we learn "little by little," " here a little and there a little," in the important subjects of the scientific management of bees, marketing and developing the means of selling our crops of honey. Here we possess the grand arena for the

best thoughts and words affecting our pursuit. We bid all a hearty welcome to our discussions, and hope that a flood of light will be the result.

The President remarked that as the minutes of the previous meeting had been published in pamphlet form, all could read them for themselves. He then suggested that a recess of ten minutes be taken, during which time those who desired to become members of the society might do so by giving their names, and \$1 each, to the Secretary. The list is as follows:

#### HONORARY MEMBERS.

E. Bertrand, Nyon, Switzerland, Frank R. Chesbire, London, England, Rev. Wm. F. Clarke, Gnelph, Ont. Prof. C. V. Riley, Washington, D. C. Hon. — Ross, Ontario, Canada, Hon. Edwin E. Willets, Lansing, Mich.

LIFE MEMBERS.

D. A. Jones, Beeton, Ont. Thomas G. Newman, Chicago, Ills.

MEMBERS. MARIBERS.
T. S. Bull, Valparaiso, Ind.
Dr. J. A. Minnich, Indianapolis, Ind.
C. P. Dadant, Hamilton, Ills.
E. C. Hubbard, Water Valley, N. Y.
Geo, Rikpatrick, New Paris, O.
T. H. Kloer, Terre Haute, Ind.
H. Chapman, Versailles, N. Y.
Layton Hawkins, Bridgeport, Ind.
E. T. Jordan, Harmony, Ind.
John Nebel, Huch Illi, Mo.
Jno. T. Dinsmore, New Branswick, Ind
E. W. Crist, Grawfordsville, Ind.
H. M. Hockett, Jonesboro, Ind.
Andrew Junlap, Terre Haute, Ind.
H. M. Hockett, Jonesboro, Ind.
Andrew Junlap, Terre Haute, Ind.
G. W. Crist, Grawfordsville, Ind.
M. M. Gorin, Westland, Ind.
H. N. Hockett, Jonesboro, Ind.
Andrew Junlap, Terre Haute, Ind.
G. W. Gedmon, Paris, Ilis.
Burr Roye, Herbst, Ind.
J. A. Reeds, Hindsburo, Ills.
W. S. Ponder, Groesbeck, O.
E. O. Tuttle, Bristol. Yt.
Mrs. J. H. Jowden, Bloomington, Ind.
Mrs. F. M. Cooper, Morzantow, Ind.
K. S. M. Cooper, Morzantow, Ind.
K. S. M. German, O.
E. H. Collins, Matrisville, Ind.
Geo, W. York, Chicago, Ills.
J. W. McKinney, Camargo, Ills.
J. W. McKinney, Camargo, Ills.
J. W. McKinney, Camargo, Ills.
J. Whitlesey, Pecatonica, Ills.
Hubrager, Adeline, Ills.
F. J. Siefert, Cincinnati, O.
H. Human, Terre Haute, Ind.
J. G. Zimmerman, Wabash, Ind.
H. Highbarger, Adeline, Ills.
F. J. Siefert, Cincinnati, O.
M. McGender, Adriun, Mich.
T. W. Abburt, Noblesville, Ind.
G. Zammerman, Wabash, Ind.
H. Hubrager, Adeline, Ills.
F. J. Siefert, Cincinnati, O.
M. McGander, Adriun, Mich.
T. W. Nobert, Indianapolis, Ind.
H. D. Ontting, Clainapolis, Ind.
H. D. Ontting, Clainapolis, Ind.
H. D. Ontting, Clainapolis, Ind.
<l

The next annual meeting of the Nebraska State Bee-Keepers' Association will be held in Lincnin, Nebraska, on Wedneaday, Jan. 12, 1837. Location of Hall to be used and Hotel accommo-dations will be given after further arrangemente have been made. H. N. PATTERSON, Sec.

After the short intermission the convention was again called to order. and the President appointed the following committees:

Finance.-C. P. Dadant and Prof. N. W. McLain.

Resolutions.-R. L. Taylor, T. L. Von Dorn, and Mrs. C. Robbins.

Exhibits.—C. F. Muth, Frank L. Dougherty, and E. O. Tuttle. Printing.—Rev. W. F. Clarke, W. Z. Hutchinson, and Dr. A. B. Mason. The convention then adjourned until 2:30 p.m.

### AFTERNOON SESSION.

At 2:30 p.m. the convention was called to order by President Cutting, after which he delivered the

### PRESIDENT'S ANNUAL ADDRESS.

Bee-Keepers of North America :-- It is a pleasure to meet so many earnest workers here to-day, and we should be thankful to the Giver of all good, that we are permitted to again meet our many friends. While we miss many familiar faces at this meeting, and learn of the misfortunes that keep many away, we have every as-surance that they are with us in mind, if not in body.

We who have been permitted to to be thankful for. Your committee of arrangements have been untiring in their efforts to make it pleasant for you all, and give you a hearty welcome. Our Corresponding Secre-tary, Mrs. Robbins, will long be re-membered by those assembled here, for the beautiful badges which she has provided you, and may you ever preserve them as a memento of this happy meeting.

No cloud of discord darkens our horizon, and to-day the North Ameri-can Bee-Keepers' Society is in a position where great good can be accomplished. During the past year I have often thought of "what could be done that would be of material benefit to this society." I would like to see this society publish each year a volume of at least 300 pages, containing the best writings of our many contributors. If we as a society, could do this, we would soon march onward from our 125 members to as many thousands; it would add greatly to our standing and usefulness at home and abroad. To do this would require a secretary of good executive ability, and he for his services. Many of our State horticultural societies are conducted on this plan. Michigan, each year, issues a volume of from 400 to 600 pages. The printing is done by an appropriation from the State, but the entire work is compiled by the effi-cient Secretary, Chas. W. Garfield. This is only the work of one State, while ours would be the work of an International Society, adding very much to its usefulness and importance.

I can see where our bee-periodicals and publications of kindred character can be of great use to this society on this point. I feel that each and every one of them would extend to this society every courtesy possible, and become identified in this work.

Right here let me thank, yes heartily thank, our fraternal pub-lishers for the many courtesies ex-tended to this society, not only the past year, but for many years, for their great help in publishing all of our notices and proceedings without any expense to this society. If you any expense to this society. If you will excuse me, I must make men-tion of one case in particular. At the meeting of this society last year, at Detroit, Thomas. G. Newman, editor and publisher of the AMERI-CAN BEE JOURNAL, with his usual liberality, offered to publish in pamphlet form the proceedings of that meeting to which he added a that meeting, to which he added a brief history of this society up to and including the Detroit meeting. It would be useless for me to tell you of the usefulness of this work; to me the past year it has been my Vade Mecum. Upon the completion of this work the executive committee purchased 200 copies, and the Secretary has mailed to each member and others a copy.

Mr. Newman then presented to this seciety, through its President, 50 copies to be used where it was thought they would do the most good. Your chairmau has sent a copy to every Agricultural College in in the States and Canada. where he could obtain the required address; also to many of our horticultural and agricultural societies and papers. I cannot speak in too much praise of the noble example of our good Brother Newman, and I earnestly recommend that this society, before the close of this convention, tender to Brother Newman many thanks for his kindness and liberality.

I cannot close without again calling your attention to this matter of publication. Such articles as are published in the AMERICAN BEE JOURNAL for this year, page 261, entitled, "Medicinal Properties of Honey," by Dr. G. P. Hachenberg, Austin, Texas; also an article on page 262, "Opposition to Bee-Keeping, ' bv C. G. Beitel, Easton, Pa., should be read by every apiarist in North read by every apiarist in N-America. The dissemination of knowledge regarding our pursuit must place every legitimate bee-keeper on a higher plane, and bring our industry to the front, and place it side by side with other recognized pursuits.

I would respectfully urge upon the Vice-Presidents of this society the necessity of corresponding with the secretaries of their respective State agricultural societies and submit to them a premium list for bees and honey and necessary appliances. The Michigan State Agricultural Society gives, by way of encouragement to a growing industry, a premium list amounting to \$300, the largest of any State that I have any knowledge of. After giving this matter close and careful attention for several years, I am fully convinced that we can do much good to an over-burdened market by making judicious exhibits of onr products. The State and County onr products. The State and County fairs held by the different societies

tions," so I will leave it with our energetic and intelligent fraternity how those exhibitions should be made to accomplish the greatest good. Many thanks are due to those who, being unable to attend the different exhibitions, have contributed articles of interest for exhibition.

I sometimes think many of us do not fully understand or realize the importance of a Bee-Keepers' Union. I look for some action on the part of its managers at this meeting, that will properly place the Union before the members of this society, that they may fully understand its objects and requirements.

You will soon be called upon to elect officers for another year; on re-tiring, allow me to thank you for the many courtesies extended to me as your presiding officer.

Mr. Thos. G. Newman moved that the address of the President be referred to a committee of three for consideration, and to report upon the advisability of the adoption of the many recommendations therein made. This was adopted, and Dr. C. C. Miller, A. I. Root, and C. F. Muth were appointed such committee.

The next essay on the programme was "Bee-Studies," by Prof. A. J. Cook; but he was not present, and as the subject required many illustrations, he declined to send it.

The following is the essay of Mr. Jno. Aspinwall, of Barrytown, N. Y.,

## APICULTURAL JOURNALISM.

A great factor in the business of bee-keeping is the source of knowl-edge by and through which we ac-quire the ability to successfully carry on this most interesting pursuit, a pursuit which requires all the nerve, the perseverance and skill a man can bring to bear upon it. Those who have not tried it may say, "My friend, you seem to think a bee-keeper must possess unusual powers of mind and skill of body, and that he must couple these to a bodily control which savors of higher things than mere bee-

keeping." "Yes," I say, "a successful bee-keeper is a very skillful man, both in mind and body."

"Well, my friend, where does he acquire his knowledge and skill?" says he. "First in books and periodicals for

theoretical knowledge, then with a bee-keeper or alone in an apiary for the practical skill," I answer.

Who can gainsay that our bee-keeping periodicals have not played a most important role in the development of bee-keeping in America, where the pursuit stands ahead of all the world a

I do not propose to enter here into a history of apicultural journalism, for there are present those who know more regarding that subject in five minutes than I do in a week, but I simply desire to present to you some of the effects produced by our periodicals, and also humbly advance my views as to the standard to which our fairs held by the different societies bee-literature should attain. Two are great helps in this direction. I do not believe in "one idea exhibi- have been performed by them. First,

disseminating the knowledge acquired by many minds through years of toil and close observation; second, by advertising those implements which are the outgrowth of that study and observation.

Bee-books are all very well in their way, but the bee-keeper wants more than that, he wants new ideas. Perhaps the methods set forth in the book he has, may not suit his particular locality, but by-and-by there will come in his bee-paper, an article from some close observer and skillful aparist that will just "hit the nail on the head." We have almost all been through just such au experience, I think.

America stands ahead of all the array of bee-papers! It is greater than all the rest of the world combined — two weeklies, one semi-monthly, and three monthlies, to say nothing of numerous other periodicals that combine bee-keeping with something else. To say that we have a greater number of apicultural papers, and to say we are in advance of all the world in our art, means one and the same thing. Now comes the question, "What should a bee-publi-cation be like?" Well, first of all it should not be run by or in the interest of a clique or ring, but should be governed entirely by the interests of two parties, first, the subscriber, and second, the publisher. It would be desirable not to have it connected in any manner with the supply business, but experience has proved that there is not sufficient profit in a publication alone. The writer has still a vivid recollection of the scene at the Northeastern Convention at Syracuse, some three years or so ago, when the American Apiculturist was put up as the official organ of that body, because it was not backed up by a supply business, and consequently said to be run in the interest of bee-keepers; how your humble servant claimed that the Bee-Keepers' Magazine, as well as Gleanings, were in their interests, business, and that the day would come when all bee-papers would be backed up by a supply-business; how, when he made this prediction, they poured upon his head the vial of their wrath and ridicule. But oh, he had a sweet revenge, for to-day every beepaper in this country is connected directly with supplies.

Great care should be used by the editors to see that they do not allow this feature to make them prejudiced. Controversies should be confined to something besides personalities.

I firmly believe the day will come when we will discard this "brother" business. It is not manly, and half the time it is absolutely hypocritical. Bee-keeping is not a *play* business, it is a legitimate industry, and it would be as ridiculous for our horticulturists, agriculturists, and stock growers, to "brother" themselves through the press as it is for us to do it.

I believe that publishing extracts from other bee-papers a capital feature, and I believe a very successful bee-publication could be conducted by

having only two departments, viz: clippings for one, and questions and answers for the other; for in the first, by careful selections you get the cream of all the bee-literature in the country, and in the second, information can be gained on particular cases. Original matter is first-rate very often, but a good deal we read, or rather glance at, is of no interest except to the writer, and he knew all about it before he wrote it. I would beg you to have charity for one who deliberately sets up his opinion before

I offer an excuse, viz: that apicul-tural journalism is a subject in which I am intensely interested and I think I see the day not far off when our industry will receive the consideration which its importance so justly deserves—and why should I not be interested ?

What has apicultural journalism done in this country besides instructing bee-men? It has done what was supposed to be an absolute imposibility—it compelled probably one of the largest, if not the largest honey-house in the world from continuing the nefarious practice of honey adulteration-a house from which the practices of honey adulteration spread throughout the land, and yet one, yes, gentlemen, only one hee-keeping monthly stood up and made that light, and it fought until to-day in the pages of that magazine you can see how the practice has been stopped—that they will never more spoil our industry, by putting vile glucose upon the market in contact with honey. Who dare say that the bee-keeping press has no power?

Gentlemen, I am proud of being connected with the magazine that fought that good fight, namely, the Bee-Keepers' Magazine. Do you not know that another bee-paper, the oldest journal of the kind in the land, the good old AMERICAN BEE JOUR-NAL, has worked to such a good purpose that at present there are joined together in close union a set of determined men who will not see our industry trampled upon, who will fight every just claim to the end, and what is more, will see justice meted out as it should be? Do you now dare say that apicultural journalism has no influence and strength? No. I say; there is power, there is strength in our magazines and journals, and may God grant it shall never be turned to any evil purpose.

Mr. Thomas G. Newman then read the following essay, entitled,

### BEE-LITERATURE.

This subject was assigned to me. without stating whether It was to be treated historically or otherwise, but I presume it was intended that should get down to dry facts, and give a condensed history of bee-litera-ture. The subject will very naturally be very monotonous, and if you go to sleep over it, I can console you with the thought that it has taken many hours from my sleep to dig out the thus: "Apiarium, or a Discourse of brief history here presented, and if Bees: tending to the best way of you catch the sleep which I had to improving them, and to the fallacies

forego to prepare this essay, you are welcome to it.

Ages before the creation of man on this planet, the flowering plants de-manded insect fertilization, and doubtless the bee was there to scatter the pollen masses, fertilize the flowers and gather the honey. Then there were no sheep-bee lawsuits, nor controversies concerning bees and grapes. These "luxuries" are a modern invention, and belong to the

nineteenth century. The writers of the Bible tell us of the early races of bees, and describe the "land flowing with milk and honey." The records of the Egyp-tians and the Chinese, cut in stone, show that bees were known to them as faithful servants that gathered the as faithful servants that gathered the sweets of the earth for their use. Three hundred years before the Christian era, Aristotle affirmed that the bee was "a magazine of all the virtues," and Virgil, the noted Latin poet, calls it "a ray of divinity." Shakespeare and Milton devoted to it their thoughts and words of praise.

It was estimated, over three hun-dred years ago, by De Montfort, who then wrote a work on bees in French, that between 500 and 600 authors had preceded him on the subject of beekeeping. Most of the books were written in Latin, and are lost to the world; and but few have been handed down to us.

I will briefly enumerate some of the books on bees and bee-culture published in the English language:

Charles Butler, at Oxford, in A. D. 1609, gave to the world an octavo work entitled, "The Feminine Monarwork entitled, "The Feminine Monar-chie; or the Historie of Bees, and the Right Ordering of Them." The sec-ond edition of this work, a quarto, was published in London, in 1623. In 1623, at London, was published "The Husbandry of Bees, with their Second Lines and A marginees "between their

Several Uses and Annoyances, " b⊽ Wm. Lawson.

In 1630, John Levett's 8vo was published in London, and the title was "The Ordering of Bees."

In 1637, in London, was published Richard Remnant's quarto, entitled

"The History of Bees." In 1655, the "Reformed Common-wealth of Bees," by Samuel Hartlib, appeared in London, in quarto form.

In 1657, a quarto appeared in London by the Rev. Samuel Purchas, with this imposing title: "A Theater of Political Flying Insects: wherein especially the nature, the worth, the work, the wonder and the manner of right-ordering of the bee is discovered and described. Together with dis-courses historical, and observations physical, concerning them.

In 1675, John Gedde's 8vo appeared in London, entitled "Method of Bee-Houses and Colonies," and in 1721 his work entitled "The English Apiary; a Complete Bee-Master " was published, also an 8vo, and published at the same place.

Joseph Worden wrote a book which was also published in London, with plates, Svo, in 1676, and its title read thus: "Apiarium, or a Discourse of Bees: tending to the best way of

that are imposed by some for private lucre on the credulous lovers and admirers of these insects." In 1680, another Svo appeared in London, by the same author, entitled "A Further Discovery of Bees.'

In 1691 a 12mo was published in London, written by John Worlidge, entitled "Apiarium; or a Discourse of the Government and Ordering of Bees; their Nature and Properties.

Two years later, in 1693, appeared a quarto, in London, by Edmund South-erne, bearing this title: "A Treatise Concerning the Right Use and Order-ing of Bees: Newlie made and set forth according to the author's own experience : which by any heretofore hath not been done." Mr. Southerne appeared to think that he was the first author on bees who had written out his experience. This closes the list for the seventeenth century.

The authors on bee-keeping in the eighteenth century begin with Joseph Warder. At London, in 1712, his Ismo, consisting of 166 pages, was given to the world, and its title read thus: "The True Amazons; or, The Monarchy of Bees: Being a new discovery and improvement of those wonderful creatures. With directions 'plain and easy how to manage them, both in straw hives and transparent boxes; so that with laying out of but £4 or £5, in three or four years, if the summers are kind. you may get £30 or £40 per annum.'" This work was the first to contemplate bee-culture as a business, and as a result nine editions were published; the last of which appeared at London in 1765.

Then came an Svo of more imposing proportions; containing 468 pages, and being illustrated with twelve copper plate engravings. It was by R. A. F. Reaumur, and was trans-lated from the French by N. Bazin, and published in London in 1744. Its title reads thus: "The Natural History of Bees: containing an account of their production, their economy, the manner of their making wax and honey, and the best methods for the improvement and preservation of them." As a scientific work, this is still held in high repute.

In the same year, 1744, an 8vo was published, with copper-plate engravings, containing 208 pages, by the Rev. John Thorley. It was a plea for the bees, and condemned the brimstone pit, as is shown by its title, which was as follows : "Melisselogia; or, The Female Monarchy: Being an inquiry into the nature, order and government of bees, those admirable, instructive and useful insects. With a new, easy and effectual method to preserve them, not only in colonies, but common hives, from that cruel death to which their ignorant, injurious and most ingrateful owners so commonly condemn them. A secret unknown to past ages, and now published for the benefit of mankind. Written upon forty years' observation and experience." A second edition of this work was published in 1765.

In 1750, at Edinburgh, "The Practical Bee-Master, by Robert Maxwell, was published : 12mo; 138 pages.

In the same year as Mr. Thorley's second edition came out, another stephen White, in the manner of taking the honey in bee-boxes, etc. That was an Svo, and was published in London in 1756, and its title, reads "Collateral Bee-Boxes: or a thus: new, easy and advantageous method of managing bees, in which part of the honey is taken away in an easy manner, without destroying or much disturbing the bees; early swarms, if desired, are encouraged, and late ones prevented."

In 1758, the noted work of John Swammerdam, M. D., was published in London, entitled, "The Book of Nature; or, The History of Insects: It was translated from the Dutch and Latin, by Thomas Floyd. Seventy-eight pages of this elaborate folio, and the copper-plate engravings are given to 'Treatise of Bees; or, an accurate description of their origin, generation, sex, economy, labors and use." This is a standard work, and is much quoted by all modern authors.

John Mills, F.R.S., wrote a work of 158 Svo pages, which was published in London in 1766. Its title was: "An Essay on the Management of Bees: wherein is shown....that the practice of saving their lives when their honey and wax are taken from them was known to the ancients, and is, in itself, simple and easily executed."

In 1768, a quarto appeared in London containing 176 pages, with copperplate engravings. It was the cele-brated work of Thomas Wildman, entitled: "A Treatise on the Man-agement of Bees: wherein is con-tained the natural history of those insects; with the various methods of cultivating them, both ancient and modern, and the improved treatment of them." A second edition was pubof them." A second edition was pub-lished in 1779.

"A Complete Guide to the Mystery and Management of Bees" was the title of an Svo by William White, published in London in 1771.

In 1777 was published in London au octavo, written by John Debraw, en-titled "Discoveries on the Sex of Bees: explaining the manner in which their species is propagated; with an account of the utilities that may be derived from these discov-eries by their application to practice."

Then comes the works of John Keyes, the first of which was an Svo, and was published in London in 1780, entitled: "The Practical Bee-Mas-"The Practical Bee-Master: in which is shown how to manage bees, either in straw hives or in boxes, without destroying them, and with more ease. safety and profit than by any method hitherto made public. The next was a 12mo of 272 pages published in 1796, and was entitled, " The Ancient Bee-Master's Farewell: or full and plain directions for the management of bees to the greatest adagement of bees to the greatest ad-vantage; declaring further improve-ments, etc." In 1814 another was is-sued, which was but little more than a re-print of the last-named, though its title read. "A Treatise on the Breeding and Management of Bees to the Greatest Advantage." This was a 12mo, and contained 272 pages.

In 1783 an octavo was issued, written by Byran J. Bromwich, entitled, "The Experienced Bee-Keeper: an essay on the management of bees."

In 1795 an 8vo was published in London; the author being James Bonner, and its title was, "A Plan for Speedily Increasing the Number of Bee-Hives in Scotland."

In 1799, a 12mo was issued in London, written by John Isaac, entitled "The General Apiarian: wherein a simple, humane, and advantageous method of obtaining the produce of the bees, without destroying them, is pointed out."

This completes the eighteenth cen-The nineteenth is commenced turv. by an anonymous publication in Lon-don of an Svo, entitled "Comfort to Aristeus: or a few useful hints on the management of bees, so as to render honey and wax a cheap and plentiful commodity, etc."

Then came, in 1806, the famous work of Francis Huber, published in London, 12mo, and entitled: "New Observations on the History of Bees," which was translated from the French.

From 1806 to 1813 a poem in 3 parts, 297 pages, was published at Sbrews-bury, entitled, "The Bees."

This was followed, in 1815, by a book of 395 pages, by Robert Huish, and published in London. entitled, "A Treatise on the Nature, Economy and Disatisal Department of Room

and Practical Management of Bees, in which the various systems of api-arians are examined, etc." In 1844 another edition was published containing 458 pages.

In 1821, at London, was published an anonymous poem, entitled "Mon-archy of Bees;" 29 pages, 12mo. In 1825, a 12mo of 112 pages entitled "The Practical Apiarian," by George

Strutt, was published.

In 1827, at Edinburgh, was pub-lished an Svo, entitled "Apiarians" Manual," by T. M. Howatson. In 1827, "The Honey-Bee : its Nat-nral History, Physiology and Man-computed "made its envegaments in

agement" made its appearance in London. It was by Edward Bevan, and the first edition contained 404 pages. Anot lished in 1838. Another edition was pub-

In Boston, Mass., was issued a 12mo in 1829, of 164 pages by James Thacher, M. D., entitled, "A Practi-cal Treatise on the Management of Bees: with the best method of destroying and preventing the depredations of the bee-moth."

And in the same place in 1831, was Jerome V. Smith, M. D., entitled, "An Essay on the Practicability of Cultivating the Honey-Bee in Mari-time Towns and Cities."

In 1833, at London, a 12mo of 71 pages appeared, entitled, "The Apiarian's Guide," by J. H. Payne.

In the next year, 1834, appeared in London a 12mo with 40 wood cuts, entitled "The Management of Bees," with a description of the "Ladies' Safety Hive," by Samuel Bagster, Jr. In 1835, in New York, was pub-lished a small pamphlet by Fraucis Kelsey, entitled "A Practical Treatise on the Management of Honey-Bees."

In the same year, Thomas Nutt issued a 12mo in Wisbech, of 269 pages, the sixth edition of which was published in London in 1846, consisting of 340 pages, entitled, "Humanity to Honey-Bees: or practical directions for the management of Honey-Bees upon an improved humane plan, by which the lives of bees may be preserved, etc."

Then in 1839 came "The Cottager's Bee-Book " by Richard Smith.

In 1840, in Boston, Mass., an 18mo of 128 pages, was issued by John M. Weeks, entitled "A Manual: or an easy method of managing bees, with infallible rules to prevent their destruction by the moth."

In the same year a pamphlet of 48 pages was issued in New Haven, by Wm. M. Hall.\_\_\_\_\_

And James Duncan, in Edinburgh, in the same year wrote a book entitled "The Natural History of Bees."

In 1842, J. Wighton issued a 12mo in London, under the title of "The History and Management of Bees."

W. C. Cotton, in 1842, issued an Svo with plates, called "My Bee-Book," and in 1843 a 12mo, "Two Letters on Bees."

In 1842, at London, was published from the *Quarterly Review* a pamphlet of 53 pages on "Bees and Bee-Books."

"The Practical Bee-Keeper," an Svo was issued in 1813 by J. Milton; and in the same year in Edinburgh, W. Dunbar, issued a 12mo entitled "Bees."

In 1846 Thomas R. Allen published in Syracuse, issued the "Bee-Cultivator."

In 1830, II. Taylor issued his "Bee-Keepers' Manual ;" 126 pages. Then followed W. A. Munn's "Bar

Then followed W. A. Munn's "Bar and Frame Bee-Hive Described."

In 1845, at London, was published a 12mo, entitled "Bee-Keepers' Manual," by D. Chylinski. In 1847 a pamphlet of 103 pages was

In 1847 a pamphlet of 103 pages was published at Dublin, entitled "The live and Honey-Bee," by H. D. Richardson, with engravings.

In 1848 E. Scudamore issued a 12mo in London, entitled "Artificial Swarming of Bees."

In 1848, at New York, a book of 162 pages was published, entitled, "Practical Treatise on Humanity to Honey-Bees," by Edward Townley.

Then in London in 1848, appeared a 24mo without name, entitled, "Hand-Book on the Honey-Bee."

In 1848, at London, was published "Golding's Shilling Bee-Book;" 68 pages.

In New York, T. B. Miner published "The American Bee-Keepers' Manual" in 1849, consisting of 349 pages, and in 1851 his pamphlet appeared, entitled, "An Essay on the Winter Management of Bees."

In 1851 an anonymous publication was issued in Philadelphia, of 126 pages, entitled "The Hive and its Wonders," and another in New York, of 119 pages, entitled "The Cottage Bee-Keeper," by a country curate.

And in 1852 an anonymous 8vo "The Honey-Bee," appeared in London.

The Rev. L. L. Langstroth, in 1853, published a 12mo of 384 pages in Northampton, entitled "The Hive and Honey-Bee;" and the second edition was published in New York, in 1857, consisting of 534 pages. In 1853, in New York, was pub-

In 1853, in New York, was published a 12mo, consisting of 376 pages, by M. Quinby, entitled "The Mysteries of Bee-Keeping Explained; being a complete analysis of the whole subject." A new edition entitled "Quinby's New Bee-Keeping," was published in 1880.

was published in 1880. The same year (1853), the Rev. J. G. Wood issued an illustrated 12mo of 114 pages, in London, entitled "Bees: their habits, management and treatment."

In 1854, Henry Eddy issued in Boston a 12mo of 60 pages entitled "Eddy on Bee-Culture" and the Protective Bee-Hive."

In 1855, in New York, was published "The Bee-Keepers' Chart," by E. W. Phelps.

In 1856, in London, a 12mo of 112 pages was published, "The Bees and White Ants; their Manners and Habits:" with illustrations of animal instinct and intelligence. From the Museum of Science and Art; with 135 illustrations, by D. Lardner, D.C.L.

"The Bee-Keepers' Text Book," by H. A. King, was published in New York in 1860, in English and German, and passed through many editions.

In 1861 a book of 440 pages was published in San Francisco, Calif., with 80 illustrations, entitled "The Bee-Keepers' Directory; or the Theory and Practice of Bee-Culture in all its Departments," by J. S. Harbison.

In 1865 "The Apiary; or, Bees, Bee-Hives and Bee-Culture," by Alfred Neighbour, was published in London. It contained 350 pages, and was extensively illustrated.

In 1867, at Buffalo, N. Y., was published a pamphlet of 64 pages, on "The Triangular Bee-Hive and Practical System of Bee-Keeping," by T. F. Bingham.

Quite a number of small pamphlets were issued about this time, to illustrate some hive or invention, but our space forbids their enumeration.

In 1870, at Edinburgh, a 12mo of 193 pages was published entitled "Handy-Book of Bees," by A. Pettigrew. In 1870, "Annals of Bee-Culture,"

In 1870, "Annals of Bee-Culture," by D. L. Adair, was published. In 1872, E. Kretchmer, of Coburgh,

In 1872, E. Kretchmer, of Coburgh, Iowa, published a book of 250 pages, entitled "The Bee-Keepers' Guide."

In 1873, at Mt. Gilead, O., was published a pamphlet of 128 pages, entitled "The Honey-Bee; its habits, culture, and management," by Aaron Benedict.

In 1875, the "North American Bee-Keepers' Guide," by J. M. Hicks, containing 104 pages, was published at La Fayette, Ind.

In 1875 John Hunter, of London, England, published a 12mo "Manual of Bee-Keeping," which, in 1879, was enlarged to 218 pages in the third edition.

In 1876, at Chicago, Ills., was published a translation of "The Dzierzon Theory, as set forth by the Baron of Berlepsch;" 48 pages. In 1876, a 50-page pamphlet waspublished at Appleton, Wis., entitled, "Fifty Years of Bee-Keeping," by A. II. Hart.

In 1876 Prof. A. J. Cook published a pamphlet called "The Manual of the Apiary," which, in 1878, reached its second edition with 286 pages, and 112 illustrations, and was published in Chicago.

In 1877, at Medina, O., was published a large Svo of about 300 pages, entitled "A B C of Bee-Culture," by A. I. Root. It was nicely illustrated, and has passed through many editions.

In 1878 appeared a 12mo in New York, entitled "The Blessed Bees," by John Allen; 178 pages.

by John Allen; 178 pages. In 1878, a 32-page pamphlet was published at Chicago, Ills., entitled "Honey as Food and Medicine," by Thomas G. Newman, in both English and German.

In 1879 a pamphlet of 80 pages, entitled "Bee-Culture," was published in Chicago, both in English and German, by Thomas G. Newman, and in 1880, a second edition, enlarged to 200 pages, and entitled "Bees and Honey or Management of an Apiary for Pleasure and Profit" was published.

In 1881, "The British Bee-Keepers' Guide Book" of 136 pages, by T. W. Cowan, was published in London.

In 1881, at London, appeared an anonymous pamphlet of 50 pages, entitled "Modern Bee-Keeping; a handbook for cottagers."

In 1881, at Chicago, Ills., was published "The Hive I Use," by. G. M. Doolittle, describing his management of bees.

In 1881, at Cincinnati, O., was published a 24mo of 36 pages, entitled "Practical Hints to Bee-Keepers," by C. F. Muth.

In 1581, at Hamilton, Ills., was published a 24-page Svo. entitled "Extracted Honey; Harvesting, Handling and Marketing." by Dadant & Son.

In 1882, at Youngstown, O., was published by A. R. Kohnke, a 14-page 12mo, entitled "Foul Brood; its Origin, Development, and Cure." In 1882 Sir John Lubbock's 12mo of

In 1882 Sir John Lubbock's 12mo of 448 pages was published in London, entitled "Ants, Bees and Wasps," giving many experiments with bees

iving many experiments with bees. In 1882, in Salem, Mass., was published an 8vo. entitled "The Bee-Keepers' Handy Book." by Henry Alley; 270 pages.

In 1883, in London, a 12mo was published, entitled "Dzierzon's Rational Bee-Keeping." It is a translation of his German work, with notes by C. N. Abbott.

In 1884, at Chicago, Ills., was published a 30-page 12mo, entitled "The Cause and Cure of Foul Brood (or Bacillus Alvei), by Frank Cheshire.

Bacillus Alvei), by Frank Cheshire. In 1884, the Rev. George Raynor, M. A., published in London a 24-page pamphlet. entitled "The Ligurian Queen-Bee; her introduction to alien stocks, and the best means of pure propagation."

In 1884, at New Concord, O. wasissued a book of 172 pages, entitled, "Bees for Pleasure and Profit," by Rev. Wm. Ballantine.

In 1884, was published at New York, a "Dictionary of Practical Apicul-ture," by John Phin. It contains 80 pages.

In 1885, at Dowagiac, Mich., an Svo pamphlet of 128 pages was published, entitled "Success in Bee-Culture, as Practiced and Advised," by James Heddon.

In 1885 "The Australasian Bee-Manual" was published in Matamata, New Zealand, by Isaac Hopkins. It is an Svo, and contains 336 pages, and is illustrated.

In 1886 a 16mo of 114 pages was published in Chicago, 11ls., entitled "A Year Among the Bees," by Dr. C. C. Miller.

In 1886, at London, appeared a 64-page 12mo, entitled "Simmins' Original Non-Swarming System." In 1886, at Mt. Vernon, Iowa, was

published a 12mo of 16 pages, entitled, "How to Raise Comb Honey," by O. Foster.

In 1886, at New York, was issued a 12mo of 134 pages, entitled, "Buz, or the Life and Adventures of a Honey-Bee," by Maurice Noel-a Novelette.

In 1886, at Beeton, Ont., appeared a poem by the Rev. W. F. Clarke, en-titled "A Bird's-Eye View of Bee-Keeping." It contains 60 pages, and is all in rhyme.

In 1886, was issued the first volume of a 12mo, entitled, "Bees and Bee-Keeping," by Frank Cheshire, F.L.S., Keeping," by Frank Cheshire, F.L.S., London, England. It contains 336 pages.

In the line of periodicals devoted to bee-culture, there is quite enough for another essay, and as this is already too long, even though condensed as much as possible, let the Periodical Literature be a subject for another time.

The books enumerated do but rep-resent "mile-stones" upon the highway to progress towards the goal to which we are all journeying; and in mentioning them, we are reminded that we are only a "small detachment" in the grand army of apiarists the world over. In the French, Italian, German and Russian languages many more books have been published than in the English language. They are all workers in the same enchanting pursuit.

Dr. C. C. Miller moved that a vote of thanks be accorded Mr. Newman for his valuable essay. Adopted with applause. Mr. C. F. Muth then followed with

his essay on

### SUCCESS IN BEE-CULTURE.

Success in life is our object-lesson from childhood. We were taught to be industrious, saving, persevering, and prudent in order to accomplish the object. It is not my intention today to give you any essay on success in life nor success in business, as these are matters which are not only taught, but lay within us to a great extent, and are often determined by surrounding circumstances, and our individual sagacity, of making use of them. My object to-day is to give you my own manner of manipulating sons when we have to save our combs

an apiary by which the largest crop of honey may be produced with the least expense and the least loss of time

I have kept bees for the last thirty years or more, and the average number of colonies I commenced each season with, for the last 25 years, was between 45 and 50. Being in the mercantile business I had the chance, almost every spring, of selling all the bees I meant to dispose of, which I did. My wintering during all this time was as successful as that of the best of my neighbors, and none of them produced larger crops of honey in proportion. I should have, therefore, an idea of 'bee-keeping, if I I should have, am no specialist.

A successful wintering of the bees is one of the foremost requirements of the coming crop. The subject having been discussed by a number of able writers, I shall not dwell upon it now, but will state that success depends upon a strong healthy colony in the fall, plenty of honey and dry comfortable quarters. Houey and pollen are the natural food of the bee, and the most wholesome, unless our negligeuce or ignorance causes them to decompose, and when, then, they act as a poison, we should blame ourselves only.

We know that the strongest coloseason, will give us the largest re-sults. Most of us have the experience that a strong colony had col-lected 150 pounds or more of honey while the product of its next neighbor, a pretty strong colony also, was not more than 10 or 20 pounds. The difference in the strength of the colo-nies was the sole reason for the different results.

"What shall I do to coax my bees into the honey-chamber?" This innocent question has brought out a number of ridiculous answers. My answer would have been: Build your brood-chamber up by having it strong in brood and bees, and then pray for a yield of nectar. Without a strong colony there will be no crop, and unless the blossoms yield, there is no honey forthcoming. If we ac-quaint ourselves with the laws of nature, we shall not commit the folly of "coaxing."

The largest crop of honey being our object, we want a large brood-cham-ber the capacity of which accommodates the laying capacity of a good prolific queen as near as this is pos-sible. We want a large surface above the brood-chamber, for we know that bees store most readily their honey above their brood. The 10-frame Langstroth hive suits me best, as it Langstroth nive suits me nest, as it affords room enough for most prolific queens, providing we manage to have the 10 frames filled with brood. All frames filled partly with brood and honey should make room, in due time, for empty combs, and be used to streagthen weak colonies. Wishtime, for empty comos, and cover to strengthen weak colonies. Wish-ing to avoid all "coaxing," no honey-chamber is put on any one of my hives until the lower story has every comb filled with brood. Exceptions are indulged in only during poor sea-

from the moth, and "coaxing" is out of the question.

It being my object to get my colo-nies strong as early in the spring as possible, they were overhauled in March or early in April, and all colonies confined to as many combs as each one could well cover. As long as the weather is cool, enough honey should be between their divisionboards, so as to have it within easy on the outside of division-boards when the weather becomes warm, answers every purpose, and are preferable as a stimulant for breeding up to all stimulative feeding of liquids. The division-boards should not touch the bottom by about ½ inch, allowing the bees an easy passage to the other side. They should be spread in due side. time, and an empty comb inserted as the growth of the colony requires it. But—make haste slowly. Brood will chill in the combs during cold nights unless there are bees enough to cover it.

In order to be prosperous, bees should be crowded from the beginning of spring to the end of the houey season, and to know what is "crowded," without over-crowding, shows the standard of the bee-keeper. When the queen feels crowded for the want of room to deposit her eggs, she imparts the swarming impulse, and is among the first to leave the bive. If, however, the queen is ever so well accommodated by young queens accommodated by young queens hatching, and thereby making room for her, and yet the bees are crowded for the want of room to deposit honey, they create the swarming fever when the queen is one of the last leaving the hive. We know that all the honey gatherers except those in the field are gone with the swarm.

No honey will be collected for a week or two, and the honey-chamber should be placed on the new swarm as soon as hived. There is no excuse for a bee-keeper allowing a second and third swarm to issue, as it is an easy job to look over the brood-chamber on the tenth day, or earlier, and to make use of the surplus queen-cells or destroy them as the case may be.

Honey being the object, we make a mistake depending upon natural swarms for an increase, as we thereby deprive our colonies of their force of foragers during, perhaps, the best flow of honey; and if a bee-keeper does so, he shows a neglect, of which, I admit, any one of us may be guilty, or he betrays a lack of knowledge, or, perhaps, a fear of the "tail end " of the bee.

As stated above, I want a large hive and a large colony of bees. I make no early swarms, but equalize my colonies before the harvest com-mences, taking, however, no frames of brood and adhering bees from any colony until it is very strong, near the point of swarming, and no honey-chamber is put on until the 10 frames of the brood-chamber are filled with brood. If this equalizing cannot be done with every one of my colonies before the season opens. I leave those weak colonies to fill their side combs with honey until they can be ex-

changed for combs with brood from strong colonies, when their honeychamber is put on also. We cannot prevent queens entirely from entering the upper story, but by an observ-ance of the above, it is the exception Tather than the rule to find combs filled with brood in the upper story. When producing extracted honey ex-clusively, brood in the upper story does not bother us any. When comb boray is produced a size division boney is produced, a zinc division-board will prove a pretty certain preventive.

When the combs of the upper story are filled with honey, I exchange them for empty ones, and whenever a comb with brood is found, it is placed on the left side in the honeychamber. When done with all, and extracting is over, those hives having overhauling. When the number of brood-combs in any one honey-chamber indicate that the queen has been neglecting her business below, the brood-chamber is looked over, and combs with honey and bee-bread, if any there be, are exchanged for combs with brood from above. Otherwise those combs with brood and adhering bees are used to strengthen up weak colonies to form nuclei, or to The parmake colonies by division. ent colonies are thereby not deprived of any of their foragers, as all the old bees return. My colonies made by division consist of 20 combs, if possible, containing brood and honey and adhering bees. A queen-cell or queen is given them on the following day. If the latter is the case, the new colony needs a looking over in the course of a week, or earlier, as the case may

be. The same process is gone over in the same manner when the combs are filled again, and so on to the end of the season. The result is that old colonies and new swarms are alike well provided, and that the latter gave me as much honey as any, in proportion, and natural swarms have not bothered me any. The queens having had ample chance to deposit their eggs, contract their brood-nest takes the place of broad in the side-combs, and if the necessary winter stores are not accumulating in the broad-chamber, it is accidental and coursed by the season Extracting is caused by the season. Extracting is never done too closely, and honey enough is left in the upper story to give each colony its full supply, and to provide for an unexpected emergency the following spring. We never calculate these combs as part of the crop of the season, as we want our bees to be self-supporting it possible.

I do not want to winter my bees on sugar syrup, and I fail to see the advantage and the good policy in doing so. It is uncertain, of course, what the next winter may bring, but as far as wintering is concerned with pollen or without it, and with natural stores, I will run a race with any one of you syrup-feeders.

bees of any one of you. The interests of sugar refiners have not been benefited at the expense of bee-keepers; my neighbors do not suspicion me of producing honey from sugar syrup, and my labor has not been excessive, but has met all the requirements of my colonies. If labor and expense are worth any consideration, my apiary proves, in only a fair season, the most grateful of any of my investments.

Mr. Muth's essay was then discussed, especially the parts referring to the profits of the apiary as compared with other investments, and the spreading of the brood. Mr. Muth stated that in one of his api-aries in "which he had 17 colonies in the spring, he had extracted three times, and had taken 2,600 pounds of honey. He said that this particular apiary paid better for the amount in-vested than did the 90-acre farm upon which the apiary was located. Mr. Muth also stated that he could easily dispose of all his crop of honey among his neighbors, at from 12 to 15 cents per pound.

Relating to the subject of spreading the brood, some thought it advisable if done at the proper time, and under the right conditions. Mr. A. I. Root Mr. A. I. Root said he believed that letting the colony alone would be just as well, and a great deal the easiest way. He also suggested that a very proper place to test and decide the advisability of spreading the brood would be in an apiary connected with a State Agri-cultural College, which every such college should have and sustain.

### THE BEE OF AMERICA

After a further exchange of ideas on the spreading of brood, the discussion passed on to the subject, "Has Apis Americana been reached?" It was thought that whether or not the bee of America had been reached, many had attained their *ideal bee*. Prof. McLain advised that in breeding if more attention were paid to the drones employed in the fertilization of the queens, far greater ad-vancement could be made, and also more rapidly; that prepotency is on the side of the drone.

After some more discussion on the subject, Mr. Newman said :

Apis Americana, when translated, simply means the "Bee of America," and I am inclined to admit that some few Americans, by careful breeding and selection, have arrived at that degree of perfection which warrant them in claiming to possess their *ideal bee*—the "Bee of America." I have just visited the apiary of Mr. L. Reed, of Kent O, and finding his anisom of Kent, O., and finding his apiary a model of perfection, examined his bees and their work, and I am satis-fied that Mr. Reed has attained to his *ideal*. Mr. Benedict, one of the first breeders of bees in America, and the oldest member of this society now present, has attained his ideal, and has a frame of live bees with the queen here on exhibition. There are With the above method I verily scores of others who now have "the believe that my bees, not my hives, Bee of America "-Apis Americana. In deciding the merits of our ideal time and place of future meetings.-ED.

bee, five points are essential, and may be enumerated thus: The queen must be prolific in order to have the hive full of bees at the proper time to gather the harvest of honey when it comes; the bees must be industrious, to let nothing escape their vigorous search while gathering the nectar: they must be *docile*, to allow the api-arist to manipulate them and the hive with ease and pleasure, in order to be profitable; they must be hardy and strong to endure the rapid changes in this very changeable climate; and they must be *beautiful* in order to secure the admiration of the fanciers of fine stock. These five points are all essential characteristics of Apis Americana l Yes, Mr. President, "our ideal bee" will be present at the very moment when the slumbering flower, under the penetrating dew, awakes to consciousness, and unfolds its buds to take in the first rays of the morning sun; and as so nicely pictured out by Brother Root in his A B C, our ideal bee will welcome "Old Sol" at the break of day, by dipping into that tiny fountain which distils the honey drop by drop, and with joy unbounded will bear away the sweet treasure to its cells of wax in its populous little home. The bee with these traits of character is well named Apis Americana-and some at least have arrived at that greatlydesired point in excellence in developing "the bee of the future."

The convention then adjourned until 7:30 p.m.

### EVENING SESSION.

At 7:30 p.m. the convention was called to order by the President. It was moved and adopted that the

minutes of the present convention be printed in pamphlet form, under the same conditions as last year.

The committee on the President's annual address reported that they endorsed the President's recommen-dations referring to the Bee-Keepers' Union, but did not think favorably of publishing a bee-keepers' annual, of 300 or 400 pages, such as is pub-lished by agricultural and kindred societies. Accepted and adopted.

After discussing the two or three questions that had been handed in to be answered, the convention adjourn-ed until 9 a.m. on Wednesday.

Issned every Wednesday by THOMAS G. NEWMAN & SON. PROPRIETORS. 923 & 925 WEST MADISDH ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN, BUSINESS MANAGER.

Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we bave on our list.

Dr. Miller's Book, "A Year Among the Bces," and the BEE JOURNAL for one year, we will club for \$1.50.

A New Crate to hold one dozen one-pound sections of honey.-It has a strip of glass on each side, to allow the honcy to be seen. It is a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 cts. per crate. Glass 1%c. per light, extra.

Yucca Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable. When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 cents a dozen ; if sent by mail, udd 1 cent each for postage

Five 'Thousand new subscribers to the BEE JOURNAL is what we have made our calculations for; they will come in clubs between now and next spring. Installments are coming every day.

128 Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

## Home Market for Honey.

To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will he a DEMAND for all of their crops at remunerative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," ctc. (giving the name and address of the beekeeper who scatters them).

To give away a copy of "Honey as Food and Mcdicine" to every one who buys a package of honey, will sell almost any quantity of it.

## System and Success.

2 All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

For

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

Red Labels for one-pound pails of honey, size 3x41/2 inches. - We have just gotten up a lot of these Labels, and can supply them at the following prices: 100 for \$1.00 ; 250 for \$1.50 ; 500 for \$2.00 ; 1.000 for \$3.00; all with name and address of apiarist printed on them-by mail, postpaid.

Sweet Clover, or Melilotus Alba, is almost the only resource for honcy now, on account of the late severe July drouth. If the seed is planted in September, it will come up this Fall and bloom next year, in its second season.

We have a large lot of this seed on hand, and offer it at the following Reduced Prices, by express or freight :

- One pound
   \$0 20

   " peck=15 lbs
   2 25

   " buskcl=60 lbs
   7 00

   " sack=80 lbs
   8 00

It will pay to bny it by the sack and sell it again in smaller quantities.

2 If you want a chance to make some money, and provide pasturage for the bees during the Fall months, this is your opportunity !

The Convention History of America and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.15.

As there is Another firm in Chicago by the name of "Newman & Son," we wish onr correspondents would write " American Bee Journal" ou the envelope when writing to this office. Several letters of ours have already gone to the other firm (a commission honse), causing vexatious delay and trouble.

### Honey and Beeswax Market.

The following are our very latest

quotations for honey and beeswax :

### CHICAGO

HONEY.-Receipts are liberal and prices vary from 10@13c. per 1b. for white in sections varying from 1 to 1% and 1% bbs. Many sales of good white 1-1b. sections are made at 11c. Extracted is quiet and ranging from 5@7c. BEESWAX,-23%25c. R. A. BURNETT, Oct. 13. 161 Sonth Water St.

#### NEW YORK.

NEW YORK. # THE CHAPMAN HONEY-PLANT,

**N** accordance with a previous notice in bee-periodicals, 1 am now prepared to fill orders for the seed of the above plant at the following prices:  $\frac{1}{2}$  ounce, \$1; 1 0x, \$2; 2 0x, \$3; 4 0x, \$5; and  $\chi$  ib., \$3. One ounce contains from 1.600 to 1,800 aceds. On account of extreme drouth my atock of seed is limited an persons ordering will be served in rotation. The aced abouid be sown in early spring and general directions for cultiva-tion will be given on each package.

The carry spring and generation contact to with va-tion will be given on each package. This plant is not an ohnoxious weed, but is as easily cradicated as clover. Having carefully watched its habits of growth and its honey-pro-ducing qualities for the past six years 1 belleve those who commence its cultivation in a liberal way will be better pleased than by commencing with a small quantity of seed. It has been tested by prominent bee-keepers all the way from Ver-mont to Nebraska and Ontario. We refer to the report of the committee appointed by the North American Bee-Keepers' Society held at Detroit in 1885. The committee reported at the Indianap-olia, Ind, convention held Oct. 12-14, and their report will be found in all bee-papers publishing the report of that convention. Write all orders plainly and give your poat-office address in full.

# Honey For Sale.

We have a large quantity of the best white EXTRACTED HONEY, in 200-lb, Kegs, for sale, which we will deliver on board the cars at S cents per pound. Orders solicited.

THOS. G. NEWMAN & SON, 923 & 925 West Madison St., CHICAGO, ILL.

# The NEW Heddon HIVE.

We have made arrangements with the inventor by which we shall make and sell the Heddon Reversible Hive, both at wholesale and retail; nailed and also in the flat.

The engraving gives a good idea of the bive. The brood-chamber is in two sections; also the surplus arrangement, which may be interchanged or inverted at will. The cover, bottom-board, and top and bottom of each sectional case has one-balt of a regular bec-space, so that the surplus cases with the sections, may be placed between the two brood-chambers, or the latter may be transposed or inverted—in fact, all parts of this bive are perfectly interchangeable. The brood-frames will ALL be bored for wires.

ALL be bored for wires. A SAMPLE IIIVE includes the bottom-board and stand; a slatted honey-board, and cover; two 6-meb brood-chambers, each containing 8 frames; two surplus arrangements, each containing 8 frames; two surplus arrangements, each containing as one-ponds sections, one with wide frames and separa-tors, and the other without separators. This latter chamber can be interchanged with the other stories, but cannot be reversed. It is NAILED AND PAINTED, and ready for immediate use. Price, \$4.00, complete.

It is absolutely essential to order one nailed hive as a pattern for putting those in the fint together correctly.

HIVES READY TO NAIL .- In filling orders for these hives, in the flat, we make 6 different combinations, so that our customers may make a selection from the sample nailed hive, without waiting for us to quote prices, and the different kinds will be known by the following numbers :

No. 1 consists of the stand, bottom-board, cover, two 6-inch brood-chambers, 16 frames, and the slatted honey-board. Price, \$1.55 each.
No. 2 is the same as No. 1, with the addition of one surplus story containing 28 sections without separators—interchangeable, but not reversible,—Price, \$2.00 each.

Price, \$2.00 each.
No. 3 is the same as No. 2, with two aurplus stories as therein described. Price, \$2.50 each.
No. 4 is the same as No. 1, with the addition of one surplus story containing 28 acctiona in wide frames with separators, which can be reversed, inverted, and interchanged, the same as the brood-coambera. Price, \$2.30 each.
No. 5 is the same as No. 4, with two aurplus arrangements as therein described. Price, \$3.00.

No. 6 contains all the parts as described in the sample nailed hive. Price, \$2.75 each.

sample nailed hive. Price, **\$2.75** each. Those desiring the bives without the stand, honey-board or sections, may make the following deduc-tions from the above prices : Stand, 14 cects; honey-board, 3 cents; and the 28 or 56 sections, as the case may be, at ½ cent each, respectively. We will also make the following deductiona on quantities ordered all at one time : For 10 or more hives, 5 per cent. discount; for 25 or more hivea 7 1-2 per cent.; for 50 or more, 10 per cent.

high aide-walls, 4 to 16 aquare feet to the pound. Circular and samples free J. VAN DEUSEN & SONS, Sole Manufacturera Sprout Brook, Mont. Co., N. Y.

# THE WESTERN WORLD GUIDE and HAND-BOOK OF USEFUL INFORMATION.

For HOME SEEKERS or Tourists, Capitalists or Laborers. A va amount of information not vast to be sound elsewhere at any price.

The Convention Report.—This week we give up the entire space of the BEE JOURNAL to the report of the convention at Indianapolis, believing it to be the most acceptable news to offer our readers. We will give a double dose of Queries next week in order to catch up.

Mr. D. W. Fletcher, known to many as a correspondent for the BEE JOURNAL, died at Lansingville, N. Y., on Sept. 6, 1886. He was between 39 and 40 years of age. For sometime his health has been failing, but last June he fell from a wagon which caused internal injuries, and at last proved fatal. At an early age he became interested in Natural History, and the result was that he kept bees, and studied the art so as to excel. His honey in New York brought the highest price, especially for the holiday trade. He had a large correspondence with apiarists all over the country, whose likenesses decorated his room, and he regarded them as personal friends. He was fond of music, and played several instruments.

Mr. H. H. Flick, of Lavansville, Pa., well-known to our readers for the past 25 years as an able apiarist, has been nominated for the State Senate in the 36th Senatorial District of Pennsylvania.

Another Bee-Master Gone.-We regret to announce that Mr. James Anderson, of Dairy, Scotland, died on Sept. 23, 1886. Mr. Anderson was one of the most advanced bee-keepers of Scotland, and in 1882 he visited America, remaining here about a year, visiting some of our best apiarists, and studying our system of keeping bees. He twice visited the office of the BEE JOURNAL, and was designated by some as the "Bee-King from Scotland." We first met him at the "Perth Bee and Honey Show" in Scotland in 1879, and enjoyed his company with other noted Scotch apiarists. He died of congestion of the lungs after three weeks of illness.

Honey Used in Manufactures.—The possibilities in the line of honcy consumption are enormous. It can be used to advantage in many manufactures, and Mr. Arthur Todd, of Philadelphia, is making a point in that line, which we are glad to see. Here is his own words in a letter just received :

While you were at the convention, Mr. Newman, I was bnsy at the Burlington County Fair (New Jersey), where I made a display of honey, bees, apiarian tools, and honey manufactures. I brought strongly before the notice of the managers the necessity to encourage the use of honey in manufactures, such as preserving truits, candles, cakes, curing hams, vinegar, etc. The result was, that the judges awarded me a special medal for honey and honey manufactures.

As far as I am aware this is the first public recognition of the successful employment of honey in various industries.

When I tell you that the cash returns for goods made with honey aold in the past three months by me, amount up into the thousands of doilars, perhaps some of the folks that see no other outlet for honey but to eat with buckwheat cakes, will think differently.

If we but mention some of the uses for honey, we fancy that many will be surprised at the *possibilities* in extending honey consumption. It is used in the manufacture of cakes, pastry, mead, metheglin, soda water, confectionery, jellies, jams, liquorice, table syrups, egg foam, vinegar, wines, liquors, preserving fruit of all kinds in the natural state, medical syrups, and medical preparations of various kinds, ointments, salves, and in making tobacco, ale, beer, and printers' rollers; also in curing hams and meats of all kinds, besides being caten for the cure of asthma, consumption, etc., and for food and medicine.

Mr. Todd is entitled to a vote of thanks for his endeavors to interest manufacturers in the consumption of honey. Det the good work go on ! Let us labor to CREATE A DEMAND for it in every possible way.

**Experiments.**—Mr. J. W. Tefft, of Syracuse, N. Y., in the *News*, gives the following particulars concerning some experiments made during the past season :

made during the past season : He selected one colony in the spring to experiment with, and naturally gave it the most attention : it contained eight 10x15 frames. During the summer he has taken 26 frames of brood and honey from this colony, and formed 5 colonies of 9 frames each, besides taking 106 finished one-pound sections, and 30 pounds of honey, in frames. The 6 will go into winter quarters with 9 frames each, averaging 45 pounds of honey to the colony. The queen was given a frame of last year's comb, selected for its perfection. At 6 a.m. and at 2 p.m. of the same day, upon examination, was found she had deposited an egg in every cell on both sides, and allowing 24 cells to the square inch, she laid the remarkable number of 7,200 eggs. With another queen he has done equally as well, excepting the honey record.

Paste for Labels on Pails, Jars, etc.— A correspondent asks for a good recipe for paste to hold honey-labels on tin or earthenware. Here is one: "Mix thin flour paste in the usual way. When nearly cooked, add about one-eighth as much of cheap Porto Rico molasses, and cook for ten minutes longer, stirring continually to prevent burning. If too thick to work well, it may be diinted with warm water, thoroughly mixed before using." Premium Worth Having,—The New York World and the AMERICAN BEE JOUR-NAL (both weekly) will be sent for one year to any address in North America for \$1.90, And in addition PRESENT to every such CLUB SUBSCRIBER a "History of the United States," containing 320 pages and 22 engravings, bound in leather and gilt.

This "History" will be sent free by express at the subscriber's expense; or will be mailed for 10 cents extra to any place in the United States or Canada.

It is arranged chronologically by years, from 1492 to 1885. Every event is narrated in the order of its date. These are not confined, as in other works, to political matters, but embrace every branch of human action. It describes under its proper date all important patents; all discoverles in science and the useful arts; fires, floods, hall-storms, tornadoes, cyclones, epidemics; accidents and disasters on sea and land; labor troubles, strikes and lockouts, and hundreds of other matters never mentioned by historians. Besides being a history in the ordinary sense, it is a condensed newspaper file for four hundred years.

This premium is worth the whole of the money sent for both periodicals, and will induce thousands to subscribe, and thus get two unrivalled weeklies for absolutely nothing. Now IS THE TIME TO GET UP CLUBS 1 The papers and book can be all sent to one address, or all to different addresses.

This offer is good for 40 days only, and hence no time should be lost 1 Sendat once. \$2 will pay for the hook and both weeklles for one year—subscriptions to begin at any time.

**Detecting Gincose.**—S. Waters & Son, of McGregor, lowa, asks this question: "By what test can we detect the adulteration of honey with glucose?" Here is a test which we published over a year ago:

A cheap and easy way to test the presence of the poorer grades of glucose in honey is to put some of it into a cup of tea made strong. If it is heavily adulterated with the poisonous compound found in glucose, it will turn black almost like ink. Another test is to pour alcohol and this poisonous compound together. Pure honey and pure alcohol will unite, but pure alcohol and this poisonous compound will separate like oil and water.

As honey is so cheap it will not pay to adulterate it now, and hence there will be nothing offered for sale but pure honey, so long as there is no lucrative temptation. They also ask if honey put up in well-corked bottles will candy. Of course it will. In time, it will even candy in the comb.

The American Agriculturist of New York (\$1.50 a year) issues another in the series of engravings illustrating the "Homes of our Farmer Presidents," 16x18 inches in slze, and presented to all subscribers for 1887. All new names for 1887, which are immediately received are entitled to all of the engravings for next year and those issued this year, also the American Agriculturist for the balance of this year. We will club the American Agriculturist with the AMERICAN BEE JOURNAL for \$2 per year. Every person who immediately subscribes to receive the engravings free for next year and this year also.

# North American Bee-Keepers' Society.

## SECOND DAY .- WEDNESDAY.

The convention was called to order at 10 a.m., President Cutting in the chair. The meeting was then adjourned, and Dr. Miller, President of the Northwestern Bee-Keepers' Society, then called *that* society to order. It was voted that the roll call be dispensed with and that the secretary be instructed to cast one ballot for the re-election of the present officers, which was done. The society then adjourned to meet in the fall (exact date to be decided upon by the executive committee) of 1887, in Chicago, Ills.

The President of the Indiana State Society then called that society to order, and officers were elected as follows: President, Frank L. Dougherty, Indianapolis, Ind.; Secretary, Mrs. Cassandra Robbins, Indianapolis, Ind.; Treasurer, Mrs. Stont. The time of meeting is to be decided in the future. The society then adjourned, and President Cutting then called to order the North American Society, and an essay was read by Mr. C. P. Dadant, entitled,

### RENDERING OF COMBS INTO WAX.

The rendering of comb into beeswax can be effected by artificial heat, or by the sun's rays. The heating on stores or by steam is the most usual way, but many inexperienced persons spoil their wax either by melting it withont water, or by overboiling, or by using dirty iron kettles. When comb is melted over a store, it is not absolutely necessary to have an apparatus expressly made for the purpose. Any ordinary boiler will answer. A great deal of water should be used, and a moderate heat applied. When the wax is thoroughly melted, it can be dipped off the top, by using a piece of wire-cloth shaped like a dipper, hung in the kettle, to prevent the coarsest impurities from being dipped out. We have never seen any old combs, no matter how old, that did not make nice yellow wax when treated in this manner, or by the use of a wax-extractor. As a matter of course a good wax-extractor, if properly used, will give cleaner wax at the first melting.

If steam is used to melt comb, it should not be turned directly on the comb, but into the water below it, the steam often damaging the wax, and making it grainy and green looking. This same unpleasant result is sometimes attained by overboiling.

If some wax remains in the dregs, it is not advisable to throw away these any process that separated them so completely that they could be called worthless. Wax-bleachers nsually press the wax out of them in a small press while hot. But a cheaper way, on a small scale, is to preserve them, or rather the best of them in a box, exposed to the weather, until more can be melted again with it. The exposure to the weather dissolves the

foreign substances, but not the wax, which, to all appearances, is indestructible.

Cappings of honey are melted in the same manner as old combs. It is well, however, to work them, first, in warm water to separate the honey that is left. This sweetened water can be used to advantage in cider or wine making, and for vinegar. Honeyvinegar is the very best that is made.

We have many times heard it said that it did not pay to melt old combs, but this is a mistake. It is not advisable to melt them with nice new comb, but any apiarist who will try rational methods, can find a profit in melting the very oldest and dirtiest combs that can be found.

The heat of the sun, in rendering comb, makes the inest beeswax, as it not only melts it, but partly bleaches it, and we have to thank our Italian brothers for the first idea of this, as well as for the invention of the extractor. Thus far, however, little use has been made of this discovery, but the time is not far distant when the solar extractors will be as plentifully found as steam or stove extractors. This method will have the advantage of giving clean wax at the first melting, without any danger of spoiling it.

After the reading of Mr. Dadant's essay, the subject of which it treated was discussed as follows :

O. O. Poppleton said: The solar wax-extractor is my "baby." About ten years ago I was experimenting in wintering bees under glass, and the heat melted some wax; from this bint I made the solar wax-extractor. The melted wax running from a solar waxextractor onght not to stand in the shade, but in the sun where it will remain melted for hours, and allow the impurities to settle, when the melted wax may be dipped off the top with a flat dipper. The heat from the sun will not injure the wax, but it gives the honey that settles at the bottom a taste or flavor of pollen. Solar wax-extractors ought not to be too large, they should be small enough so that all the combs or cappings put into them will be rendered in one day. It is the best kind of wax-extractor. I once had 500 old drone-combs, each of which were about a foot square; in rendering them I secured about one pound of wax to five combs. C. P. Dadant—We allow our cap-

C. P. Dadant—We allow our cappings to drain a long time, sometimes three or four weeks, the upper half of them is taken off, and the lower half of two "batches" is then put together.

A. I. Root—Those who have small lots of wax to render can place the cappings in a seive, when the honey can drain out into a dish-pan into which the seive is placed. After the honey has drained ont, the pan and all can be placed in an oven and the wax melted.

Dr. Miller—I have an old drippingpan with one corner broken out. This can be used as a solar wax-extractor, and when the weather becomes too cool for this, the pan can be placed in an oven and the wax allowed to run out through the opening in the pan, into a dish.

#### SEPARATORS.

Mr. N. N. Betsinger then gave an interesting talk about separators. He said in substance: I do not know to a certainty who first nsed section honey-boxes, but they were first used without separators. This manner of without separators. using them was unsatisfactory to me, and I began to devise something that would prevent the "bulge." The first substance used was glass, but many sheets broke, and many brace-combs were attached to the glass. I next nsed wood, and surprising as it may seem, the smoother the wood the greater the number of brace-combs attached. I next tried what is now used for separators all over the world. viz: tin. The only objection to tin is that brace-combs are attached : but the use of comb foundation largely decreased this trouble. In using half-pound sections I again dispensed with pound sections I again dispensed with separators, and believe that my crop was thereby increased 25 per cent., but it was so badly bulged as to greatly delay its sale. I am now using a separator that is *perfect*. I have used it four years, and I do not think anything better will be dis-covered. It is wire-cloth, with a mesh of  $\frac{1}{2}$  inch. The cloth is dipped in melted metal, which fixes the wires. It is patented. I am aware that per-It is patented. I am aware that perforated separators have been used, and there are objections to this style. They are expensive, and the perfora-tions will show, by the way of lengthened cappings upon the surface of the comb.

T. H. Kloer—Will not the bees place propolis in the meshes where they come in contact with the sections?

Mr. Betsinger-I should think they would, but they never have with me.

It was afterwards learned that in the case in which Mr. Betsinger used the wire separators, the sections did not come in contact with the separators; the space between the separators being so great that there was room for not only the section, but for a bee-space on each side of it, between it and the separators.

The following essay by Mr. A. J. King was then read, on

#### FOUL BROOD.

This much hackneyed subject has appeared on the programmes of every bee-keepers' convention, county, State or National—so far as my information extends—for the past twenty-five years, or since the first organization of bee-keepers on this continent. Like all unsolved, yet important problems in apiculture, it will not "down" until the whole round of experimenting has been completed, and not even then, nuless the necessary means for its cure have been discovered and successfully applied. To this noble element, in the mental "make up," characteristic of Americans, we owe the grand triumphs in science, art. and invention, which, in the aggregate, places the United States far in the "lead" of all nations on the globe. Were it not for this untiring disposition on the part of our apiarists, to seek out and corret the evils,

and to render available all discoveries and appliances, both scientific and mechanical, bee keeping would to-day be where our fathers left it thirty years ago.

In this headlong rush of improvement, as might be expected, mistakes are often made, good things are con-demned, and bad ones showed into prominence; yet through the agency of a few patient and careful investi-gators, assisted by the great corrector -time-the truth finally emerges from the confused mass of clashing opinions all the brighter for having

passed the fiery ordeal. The subject under consideration forms no exception to this general method of treatment, but rather stands as its chief representative. Scores of theories have from time to time been propounded, all confirmed by some and exploded by others, and still our "little pets" continue to be starved, boiled and burned.

It is the purpose of this essay to suggest that probably the true theory and radical cure of foul brood has already been discovered and confirmed, but either through prejudice or faulty experiment, a suspicion of "humbug" has been cast upon it, and so, many suffering apiarists have failed to avail themselves of its kindly have aid. I refer to what is known as the "phenol cure" advanced by Mr. Cheshire, of England, the details of whose extensive experiments are familiar to most apiarists. I will not detain you by attempting to enlighten you as to what foul brood is, its appearance and indescribable yet neverto-be-mistaken odor, etc., but I will recite my own personal experience and final complete triumph over it, leaving others to judge the value of the method employed.

In October, 1885, I took charge of an apiary in Cuba, numbering nearly 400 colonies in two-story hives, sit-uated on the side of a hill and completely protected by wide, high sheds from sun and vain. The utmost cleanliness and good order prevailed in all its appointments. The high and dry country and delicious climate left nothing in outward appearance to suggest disease, and yet I found nearly 100 colonies afflicted with foul brood, fifty of which were very bad indeed. The then superintendent had for some time been boiling hives and frames, burning combs and starving the bees, but had about given up in despair, saying that he believed the disease would continue to increase until the whole apiary would be utterly destroyed. I suggested that now would be a fitting opportunity of testing the phenol cure, but I was assured that this cure had been thoroughly tested and found wanting; that its originator was either a hum-bug, or that his bees had had a differ-ent kind of foul brood.

That phenol had been used with a lavish hand was attested by numerous empty bottles bearing that label, and by others of larger size containand by others of larger size contain-ing the liquid mixed ready for use, but that Mr. Cheshire was a humbug I could not tolerate for a moment, and the idea of two distinct kinds of bive. Such are not the facts; at least is the owl. "Stupid as an ass," and,

real foul brood was certainly very doubtful. However, I determined on entering on my duties as "new super-intendent." to give the formula of Mr. Cheshire a full and fair trial, and if successful to wait a sufficient time for the disease to reappear, if it would, before giving my experience to the bee-keeping public. I procured several bottles of pure phenol crystals, dissolved them by placing the bottle in hot water, and put one small measure full of the liquid into a tin pail, then with the same measure I added 499 parts of a mixture composed of  $\frac{1}{3}$ pure honey and ¾ water, and made a plain mark on the inside of the pail as high up from the bottom as the liquid came, and so had a correct measure by which I could make feed

rapidly. When beated to 150°, Fahr., the bees would eat it with avidity. I placed well filled combs of this feed in open hives in all the infected places, and besides visited the bad cases regularly every three days, taking out the combs one by one and thoroughly sprinkling them with the liquid. In two or three weeks I could perceive a marked improvement, and in three months the disease had almost entirely disappeared, except in three or four mild cases, purposely left to see if they would get well without treatment. As they did not they were then taken in hand and cured.

Nearly a year has now passed, and from frequent and very recent advices direct from the apiary, I learn that it has not reappeared, but that the bees are in fine condition, and give promise of great results when the season for surplus again arrives. In the experiments made with phenol, before the one I have recited, the solution was entirely too strong, as it turned the combs red; it was used too sparingly, and lastly it was not half sweet enough, nor warm enough, and the bees would hardly eat it at all.

Foul brood is not "indigenous" in Cuba, there not being a case on re-Cuba, there not being a case on re-cord in all the native apiaries; then how could it occur in this particular apiary? From several circumstances I am led to believe that it came through queens imported from in-fected districts in some of the British North American provinces. I have made many experiments, and have satisfied myself that the baccilli producing the disease belong mainly to the queen's ovaries. I would like to point out cases where requeening is necessary in treating the disease, and make several suggestions, but as my essay is now longer than intended, 1 will close by recommending all in-terested to follow Mr. Cheshire's formula literally and accurately, and they will not regret it.

R. L. Taylor said: I think that the description generally given of foul brood is not correctly interpreted by some. Many think that before the bees have foul brood the combs must

not in the first stages of the disease. At first but a few cells of diseased hrood will be found, the dead larvæ has a look resembling coffee with milk in it; it can be stretched out to the length of an inch, while the odor is not noticeable unless the nose is brought close to the brood. The larvæ shrinks and dries up until it looks like a speck of tar upon the lower side of the cell. I do not feel competent to criticise Mr. Frank Cheshire, but foul brood, in my apiary, was spread by the feeding (unknowingly) of honey taken from colonies affected with foul brood.

foul brood. Wm. F. Clarke—I think that Mr. Taylor is mistaken. The genuine foul brood is of the color of coffee without milk, and it does not dry up, and the stench is so great that in-stead of striving to use the nose, it needs protecting. R. L. Taylor-When the disease

reaches an advanced stage, some of the characteristics mentioned by Mr. Clarke may be present. I am curing the foul brood by the starvation plan.

C. F. Muth agreed with Mr. Taylor. Mr. A. I. Root gave a history of the breaking out in his apiary of foul brood. He thought it probable that it was brought there in honey that he had bought, to which the bees in some manner had gained access. They were taking away the combs from diseased colonies and burning the combs. They first used a tent to put over a colony when shaking off the bees, but this practice was discon-tinued, as flying bees that were outside the tent and belonging to the diseased colony entered other hives when unable to enter their own, and thus spread the disease. By placing the nose at the entrance of a hive, the disease could often be detected very quickly in its very earliest stages.

Rev. W. F. Clarke then read the following essay on

THE PAST, PRESENT AND FUTURE OF THE N. A. B. K. SOCIETY.

It is not my purpose to treat this theme in a way of sentiment. That has been done very skillfully by another hand, and "the harp of a thonsand strings" has been touched into plaintive strains in view of the into plaintive strains in view of the lapse of time and the passing away to "the beyond" of most of those who were prominently active in founding this organization. As one of the few who yet remain, and must soon go over to the majority, I might fitly dwell on life's brevity, and the duty of diligence while its little day lasts. I might needle many reminiscence of I might recall many reminiscences of departed ones, read a chapter of lamentations on their loss, and, like many a long-visaged divine, ply you with exhortations on the uncertainty of sublunary things, and the vanity of man as mortal. But these topics are not in my line. Neither my philosophy nor my religion teach me that there is any virtue in solemnity. I can see some sense in being cheerful

ironically, "wise as an owl" have pronically, "wise as an owl" have passed into proverbs. It is no cause for gloom that one is getting old, if only the heart be young, and mine grows younger every day! My pres-ent object is a practical one. I wish to look over the history of this or-ganization, glance at what it has accomplished, and picture some of the possibilities of the future.

The idea of a National Bee-Keepers' Convention originated in Michigan, the State which has given us a Cook, a Heddon, a Hutchinson, a Bingham, a Cutting, a Taylor, and a "Cyula Linswik," with other noted bee-keepers "too numerous to mention," also many apicultural ideas. "good, bad, and indifferent," including the best bee-bive, smoker and honey-knife extant, the pollen theory, and last but not least, the theory of hibernation.

When I read away up in Canada, the call for a National Convention at Indianapolis, Dec. 21, 1870, I said to myself, why can't this thing be international and continental? I resolved to go, and use my influence to have it so. Though I was the only representative present from Canada, my suggestion and request to have the asso-ciation called North American, were courteously entertained, and we "Cannucks" were welcomed into full fellowship, where we have remained ever since, and propose to do so long as we are well treated, as we always have been thus far, and expect to be down to "the last syllable of recorded time."

This organization was formed simply and solely "to promote the interests of bee-culture." Has it This fulfilled its mission? I contend that it has ; not so fully perhaps as it might have done, if at the outset we had possessed the light of the present, but considering our then light, great and important results were accomplished. The first was the barmonization of conflicting interests, and the reconciliation of existing differences. Without being a resurrectionist of dead jangles and quarrels, I may fear-lessly assert that from the first this organization proved itself a peace-maker. Men who had difficulties with each other were brought together, and persuaded to shake hands. Incipient cliques and rings were broken up. This association was the means of placing our venerated father, Rev. L L. Langstroth, in his rightful position before the public. It prevented the laurels he had fairly won from being torn off his brow. It banished his enemies and the ememies of progressive apiculture into obscurity. Though it could not restore to him the fortune of which he had been robbed, and which no inventor ever earned more honestly, it could and it did "confess judgment" in his favor, and it has from time to time, by little presentations, testified its sense of an obligation it is unable fully to repay. A grand old book says : "The work of righteousness shall be peace." Adjustments on a basis of righteousness led to peace, and more than peace to brotherhood and good fellowship, so that when in two years after its or- friend Newman has honestly earned *Resolved*. That the President of this ganization, this association again met the success he has won, and the Joun- society be authorized in its name and

in Indianapolis, I was able, without flattery, to congratulate the meeting from the Presidential chair on the predominant prevalence of the feeling embodied in the pithy Scotch motto: "Were brithers a'!" I added: "May this feeling be paramount to every other all through our proceedings. May all our discussions be carried on under its influence. Then, though we may have our differences of opin-ion—and it would be a dull, uninteresting time if we had not-these will not interfere with our good fellowship, nor lessen our enjoyment.

My prayer on that occasion has been answered too much. I have been like the parson who prayed for rain in a dry time. It came, and not only rain but hail. An old lady who went to look at her garden after the storm, ejaculated, as she beheld her cabbages all riddled and torn, "Dear, dear, that's just the way with our minister, he always overdoes it." I think, as you know, that we have rather overdone the "brothering" business, and have carried it so far that it interferes with free, manly criticism.

Another good influence of the asso-ciation has been to render apicultural humbugs and jimcracks well-nigh obsolete. I cannot take time to enumerate the number of these that there were sixteen years ago. Hardly any of them dared show face at our meetings, and if they did, it was like moth intruding into a hive of Italian bees they were soon hustled ont-doors.

Again, this association was the means of perpetuating the AMERICAN BEE JOURNAL, It met shortly after the lamented death of Samuel Wagner, father and founder of the JOUR-NAL. There was great danger of its coming to a stop. The widow and son, Mr. G. S. Wagner, were very anxious for its continuance, and offered favorable terms, but there was no money in it then, and no one was willing to take hold of it. Being at comparative leisure at the time, I was induced by the importunity of leading members of this association to embark in the enterprise. It was believed that by removing the Jour-NAL from Washington to Chicago, it would be in a more favorable position for securing a constituency of paying subscribers. There was not only moral support pledged at the meeting spoken of, but eleven prominent bee-keepers joined in a bond of indemnity against loss to the extent of a \$1,000. But for this moral and material backing, I should never have embarked in the undertaking, and it is quite cer-tain the backing would not have been given but for the enthusiasm kindled at that convention. The enterprise proved a success. There was no loss. proved a success. There was no loss. A boom came in bee keeping. Just prior to that boom, the JOURNAL passed into the hands of its present proprietor, a man eminently fitted to work it up—compositor, editor, pub-lisher, all in one. I hope I do not tell tales out of school when I say that every type of the JOURNAL was set by the editor's own hands, and it was run with the strictest economy. Our

NAL has been in his hands, and is today, the right bower of North American apiculture.

I have said enough to show the association's right to exist because of the good it has done, but I have not exhausted this part of my subject. Briefly, let me add, the discussions at these meetings have cleared up many obscure points, diffused correct ideas in regard to bee-keeping, and furnish-ed many novices with hints and in-structions that have been of great value. Finally, it has given oppor-tunity for forming the acquaintance of distinguished bee-keepers. When we see a name in print often, we speculate what manner of person it belongs to, and feel a curiosity for a personal interview. This curiosity has many times been gratified at these meetings, and never so signally as at Cincinnati in 1871, at Toronto in 1883, and at Detroit in 1885, when Father Langstroth was able to be present, and hundreds had the pleas-ure of seeing his benignant face, grasping his hand, and listening to the voice of "the old man eloquent."

On one, and I regret to say only on one occasion, the placid, open, genial and intelligent tace of the late Moses Quinby appeared at the annual meeting of this association. It was in Cleveland, Dec. 6, 1871, and many of us felt it no small privilege to make the acquaintance and enjoy the society of a man so pre-eminently worthy of respect and esteem, and to whom modern apiculture is so largely in-debted. These meetings have introduced to the personal knowledge of bee-keepers D. A. Jones, Prof. Cook, A. I. Root, James Heddon, and a bost of others who have become famous in the realm of apiculture. Many very pleasant friendships have been formed, and now the social element, and the happy re-unions enjoyed, con-stitute some of the mightiest magnetic influences that operate in bringing members to this convention.

That this paper may not be chargeable with the garrulity of age, I shall allude but briefly, to the present and future of the association, for the present is before our eyes, and the future is for us to make. There is one respect in which the organization has not yet attained the original ideal of it which was present to the minds of the founders. In my address from the President's chair at the second Indianapolis meeting in December, 1872. I said: "Every member of this society should strive to get up a bee-keepers' club at home. These clubs should send representatives to State, Provincial or Territorial organiza-tions, and this continental body tions, and this continental body should in due time, become representative, and be composed of a certain number of delegates from each State, Province, or Territory in North America, thus constituting a sort of high court of apiculture, to which the knottiest questions and hardest problems are submitted, and whence there shall emanate decisions and rulings of highest apiarian authority. At that meeting it was

behalf, to address a circular to all the bee-keepers of North America, nrg-ing the formation of neighborhood, county, State, territorial and provin-cial associations, auxiliary to this society.

A circular was accordingly address-ed "to the bee-keepers of North America," which will be found on page 170, Vol. VIII of the AMERICAN Dur LOUNNAL Some of the AMERICAN BEE JOURNAL. Some attempts have been made since to realize this ideal, but without any great success. Our meetings have always been largely local, and not sufficiently representa-tive. The constituency is so extended that it is difficult to avoid this, except on the delegation plan. A State, province or territory could easily afford to send one or two representatives, when the expense individually would be oppressive. Let all who can come outside the official delegation, do so, but let the whole continent be represented in this great apicultural congress.

As to the future, I would urge that the association work along the old lines, with the added feature I have been recommending. There are some who consider the organization un-worthy of preservation. A few think it an evil because it discloses the secrets of the craft, while here and there one folget accurace it of bring there one falsely accuses it of being managed by a ring. I have no sym-pathy with any of these views. If the association has been promotive of the interests of bee-culture in the past, and I have shown, I think, conclu-sively that it has, there is no good reason why it may not be equally, and even more useful in the days to come, if managed with that broader wisdom which we may expect to come with the progressive intellectuality of the age. The fear of disclosing secrets, I regard as a mere nervous weakness. You may blurt out all you know, and still bee-keeping is an art which can-not be learned by the million. It requires a peculiar combination of characteristics which few men, and still fewer women, possess. The mere fewer women, possess. The mere knowledge of all that is known by Heddon, Jones, Doolittle, Hutchin-son, or "Cyula Linswik" is not suffi-cient to produce second editions of these accomplished bee-keepers ; there is a "knack" which is the result of a bet bet work a knowledge applied, is that between a cyclopædia and a Morse or an Edison. Cyclopædias are plentiful, but Morses and Edisons are scarce.

As to the association being managed by a ring, there never was a gratuitous libel against an more organized body than this. It has no "spoils" to attract" victors." "Where the carcass is, there will the eagles be gathered together." In this case no birds of prey ready to devour. On occasions when there has been temptation and opportunity for a clique to usurp authority, there has been aris-ing above all selfish interests. Notably was this the case two years ago at Rev.W.F. Clarke, Dr. A. B. Mason, Rochester, when by the non-attend- and Mr. R. L. Taylor were appointed

ance of Western bee-keepers the Eastern men had it all their own way. I am witness with what noble selfabnegation they arose to the duty of the hour, and made such managements as issued in the best bee-con-vention ever held on this continent, and perhaps in the world. I refer to the Detroit meeting last December, the memory of which will long be green, fresh and fragrant in the minds of all who were present at that remarkable gathering. No, there is no ring, never has been, to my knowledge, and few know the association better than I do. The first and only attempt at cliquing was effectually squelched, as I have narrated in my brief history. In the same impartial way I hope and believe the society will go on, increasing in usefulness as the years pass along, until we meet in a purer, happier and everlasting fellowship :---

"Where thrilling music through the welkin rings, And nectar sweet is gathered without stings."

I cannot close without giving expression to the pleasure I feel in being once more assembled with you at Indianapolis. It is like going back to one's birth-place, for here our asso-ciation was born. What I said from the President's chair in 1872. I here beg to repeat with all the added emphasis which the lapse of 14 years can

"It is very fitting that we should meet on the present occasion in this city, where the initiatory organization was formed, and the plan of consoli-dation conceived and proposed; where, too, we received at the outset such tokens of appreciation from the citizens, the press, and the civic au-thorities, especially in the free use of the fine Senate Chamber, in whose honorable seats even our lady bee-keepers could feel for the time that they were not only suffragists but leg-islators, and now in this Supreme Court room, where we can feel that we have attained judicial elevation. From its peculiar and central position the cordial spirit of its officers, edi-tors, and people, and the number of such bodies that have seemed to come here as by some law of gravitation, Indianapolis deserves to be styled Convention City, and if it has not formally received that name, I propose that the bee-keepers here assembled do so christen it, forthwith."

The selection of the location for holding the next meeting was then declared to be in order, and Chicago, llls., was, by vote-selected. Adjourned until 2 p.m.

### AFTERNOON SESSION.

The meeting was called to order at 2 p.m., President Cutting in the chair. The first business transacted was the election of officers, which resulted as follows.

President, Dr. C. C. Miller, Marengo, Ills.

Secretary, W. Z. Hutchinson, Rogersville, Mich.

Treasurer, Chas. F. Muth, Cincinnati. O.

a committee to report names for the Vice-Presidents.

#### HONEY-PLANTS.

Mr. A. I. Root gave a talk on honey-plants as follows: If possible those plants should be raised for those plants should be raised for honey that have value aside from honey-production. Alsike clover stands at the head of the list; buckwheat next. Following these are rape and raspberries. I do not, at present, know of any plant that I am certain that it will prove profitable to raise for honey alone. It is possible that there are four plants that it will be profitable to raise for honey alone, viz: sweet clover, figwort, spiderplant, and the Chapman honey-plant. The latter will continue to yield honey during a drouth better than any plant of which I know. It is biennial, resembles a thistle, blossoms just after basswood, and continues in bloom about three weeks. It is selfseeding, and requires no attention after it is once started. The seed should be sowed in early spring. When the committee which was ap-pointed to visit Mr. Chapman and learn more about this plant, was at Mr. Chapman's place, he had two acres of the plant in bloom. He also had 130 colonies of bees, and they were gathering honey in such quanti-ties from the plant that they were building comb and storing honey. The honey is light colored, not high flavored, being of almost a pure sweet

taste, T. F. Bingham—It is not an uncommon sight to see as many as from 6 to 10 bees upon each blossom, and this continues from daylight until dark, let the weather be wet or dry. The stalk is of a very fibrous nature, and it is possible that the fiber might be used in making straw paper.

H. Chapman-I ground 2½ pounds of seed and pressed from it 9 ounces of fine, clear oil.

The committee appointed to select suitable persons for vice-presidents, would report, recommending that only those States, Provinces and Territories have vice-presidents appointed, who are represented either by the presence of delegates or the transmission of reports.

The following were then appointed Vice-Presidents for the ensuing year:

### VICE-PRESIDENTS.

VICE-PRESIDENTS, Florida-W. S. Hart, New Smyrna, Georgia-Dr. J. P. H. Brown, Augusta, Illinois-Mrs. L. Harrison, Peoria, Indiana-Jonas Scholl, Lyon's Statlon. Iowa-Eugene Secor, Forest City, Michigan -R. J. Taylor, Lapeer, Missouri-Jmo, Nebel, High Hill, Nebraska-Wm, Stolley Grand Island, New York-L. C. Root Mohawk, Ohio-A. B. Mason, Wagon W rka, Oregon-Frank S. Harding, Portland, Outarlo-R. F. Holtermann, Brautford, Pennsylvania-Arthur Todd, Germantown, Quebec-H. F. Thur, Villa Mastal, Yermont-E. O. Tuttle, Bristol.

The committee on resolutions reported the following, which were adopted :

We the members of the North American Bee-Keepers' Society desiring to express our sense of the obligation we are under to our officers and others for the aid given in making this convention successful, offer the following resolutions:

Resolved, That our thanks are due, and are hereby extended to our retiring officers, for their untiring efforts to promote the interests of this society, and especially to the General Manager of the National Bee-Keepers' Union, Mr. Thos. G. Newman, for his success in securing reduced rates on the railroads.

rates on the railroads. Resolved, That we will carry with us to our homes an abidiug remembrance of the generous hospitality with which we have been received and entertained in this city of Indianapolis.

Resolved, That we hereby tender our hearty sympathy to our honored father in apiculture, the Rev. L. L. Langstroth, in his present illness, and pray that he may be speedily restored to health.

Resolved, That we also heartily sympathize with our brother, Mr. Vandervort, on account of the serious illness in his family, which has detained him from his usual place among us.

N. W. McLain, of Aurora, Illinois, then read an essay on "Bee-Keeping and Apiculture."

Mr. R. L. Taylor, of Lapeer, Mich., gave the following on

### THE COMING BEE.

What encouragement have we to work for the advent of "the coming bee?" Shall we breed bees for color, or for honey-producing qualities? For fancy points, or for pecuniary profit? These are questions that must be fully settled in our minds before we can intelligently discuss the subject of the improvement of the honey-bee. We hear much of our breeders of white-haired bees, and gentle bees, and golden-banded bees, and patent Albino bees, but we hear little of breeders of bees for profit only, i. e., for profit in the production of honey, for, no doubt, breeders of these fancy bees tind them very profitable. They sell all the queens they can produce at from three to ten times as much as can be obtained for queens without these fancy qualities—queens without these fancy qualities—queens without these fancy qualities—queens without

We are fast degenerating into the condition of the poultry fraternity. With them, feathers fix the price of the chicken; but we err with far less temptation, for bees can never be made popular pets with which to please the eye and tickle the fancy of our uninitiated visitors. I would that all breeders of fancy bees would heartly seek with us for the bee that can produce the most; we cannot go with them, for, to use the slang of the period, we must have a bee for "business." But we who can so far liberate ourselves from the flavor of classic things as to think "American" as pretty a name as "Ligurian," and can see the most heauty in what does the most, what hope have we for the improvement of the bee ?

All honey-producers, I suppose, harbor more or less hope that the honey-bee will be found capable of

marked improvement; but our hopes undoubtedly are of all degrees of vigor and stability, according to each individual's clearness of knowledge and comprehension of the facts touching the subject, as well as to his manner of looking at these facts. Whatever improvement is possible can, without question, be most quickly reached or approximated by unity of effort for everywhere there is strength in union. It is desirable, then, that this subject be discussed until we may, if possible, come to stand on some common grouud.

As my time will permit me to set forth only an outline of my thoughts on this subject, let us take at the outset a brief view of what nature had done for the hee before it came to the hand of man. We must not forget that in a state of nature the rule of the survival of the fittest is a very different thing from what it is when guided by the hand of man. In a wild state the chief quality required by the bees to fit it to survive—to persist in living—is the ability to provide under the severest stress of circumstances sufficient food to supply its wants during the ensuing period of repose; in the ox it is not good beef, nor rich milk, but horns, strength, courage and agility to enable him to overcome or to escape his enemies and to master his mates that are not so highly gifted with these qualities.

During the roll of unnumbered centuries nature has been training the bee in the gathering of honey, and the greater the stress of circumstances under which the bee has existed, the more thorough has heen its education. With the ox most of the qualities that fit him to survive in a wild state, specially fit him in domestication to die early. To fit him for man's use, all these qualities must be changed, and to effect the change the rule of the survival of the fittest must in its application be entirely changed. Now the qualities that make fitness to survive are, the most and the best beef and milk. But note that nature's education of the bee has all been precisely in the line calculated to produce the character and qualities which man so much desires it to posess, so much does the constitution of things favor the bee-keeper. Of the ox, man gets from nature little but a germ; of the bee, the well-nigh ripened fruit.

But on the other hand, in the domesticated state the bee runs great risk of positive deterioration. The ox naturally improves under the hand of man, because selections for breeding will be made almost without thought, and his better food and protection will favorably affect the growth and development; but with the bee better pasturage and better protection too often prolong the existence of the poorest, and so their blood is perpetuated in subsequent stock. This would be true under what is known as the old method of bee-keeping, but with how much greater force does it apply to beekeeping under our new methods, with our feeders, and packing, and cellars,

and the ready means which the movable comb furnishes us of preserving the lives of queens which are ready to perish on account of a lack of attendants.

Queens have a market value, and everything having a market value must be saved without regard to its intrinsic worth 1 Many complaints have been made on account of the low price at which queens must he sold, but I sometimes think that it would be immeasurably better, since we cannot well fix their quality, if their value were so much lower than it is that there would he no temptation to preserve the lives of inferior ones.

So we have in our favor the mighty hand of Nature, which with one finger supplied the sparse pasturage of the wilderness and the mountain, and with another inexorably destroyed such colonies as did not from such pasturage lay up a sufficient supply for their wants. And on what a high vantage ground this places us! Then we have the wonderful rapidity with which we may get increase from superior stock, and we must not forget to thank our stern winters that destroy the bees of those who are careless of the comfort, and so of the qualities of their honey-producing stock.

But on the other hand, we have much to contend with. The rich pasturage of our cultivated lands generally enables bees of the poorest quality to get enough for their wants; and what an army we have of those who are careful of their bees, but careless of their quality! They preserve all their queens because it is a calamity to let a colony become queenless, and their colonies that are too poor to collect enough to supply their own wants they feed, for it is also had to lose a colony. The prevalent curse too of breeding for fancy qualities is abroad, and, like foul brood, is frightfully contagious. But worse, perhaps, than all, we have not learned to control the drones—worse because with the drones under control all these other obstacles would almost vanish.

One hundred years ago the Collingses of Great Britain undertook the improvement of the ox. For their purpose they selected stock whereever found, of whatever name or color having qualities which they desired to perpetuate. Their stock was originally improved by importing Holstein and Holland cattle which they used in crossing. Subsequently they crossed with a polled Galloway, from which was obtained a breed of great repute, and as the final result they obtained the magnificent shorthorn. We might accomplish in ten years with bees what they did in one hundred with cattle !

What ten, fifty or one hundred of our most successful honey-producers will form a syndicate, and, under competent management, on an island or a prairie, secure from any interference, put any colony or colonies they may from time to time find in their own apiaries showing more than ordinary honey-producing qualities, without respect to race, or name, or color, and let them be there bred on scientific principles, with the most relentless culling and the most careful tests ?

The mind of some one here is no doubt full of notes of exclamation and interrogation, and would exclaim: "What I would you cross and combine the races?" My reply is, yes! If we ever succeed in making a decided improvement in the honey-bee, that improved bee will not be a pure blood of any of the existing races. No existing race has a monopoly of the desirable qualities—certainly not the Italian.

Let me make a suggestion, in closing, with regard to the cross-breeding of bees. Some one, I have forgotten who, in one of our apicultural publications, to illustrate his ideas of the evils of cross-breeding, said, in substance, that he had a cow-a cross, if I remember, between a short-horn and a Jersey, that proved to be an excellent milker; but, he went on to say, a further cross would result in a progeny of little value. He was in a measure correct in his statements with regard to the crossing of two breeds, which had each been bred for a purpose so entirely and radically antagonistic to that of the other. Indeed, he might have gone farther, for his cow, the first cross might naturally have inherited the poverty stricken sinews of the one parent and the non-milking qualities of the other. But he was eutirely in error in his application of these facts to the case of the honey-bee.

As we have seen, all our races of bees have been bred by nature for honey-production, and so nearly equal are they that each race has its friends. From whichever parent a cross-bred bee inherits, it must still be a honeyproducer, and the same must be true of all subsequent crosses; and, to produce anything else, nature must "go back" on all her previously established laws.

After the reading of the above the convention adjourned until 8 p.m.

### EVENING SESSION.

The meeting was called to order at 8 p.m., President Miller in the chair.

An essay by James McNeill, of Hudson, N.Y., was read, on "Feeding Bees for Winter."

Dr. A. B. Mason then read the following essay, entitled

### WINTERING BEES.

There has been so much said and written on this subject that it would seem that among the numerous methods, each claiming to be the best, the least experienced might find some way to winter bees without the annually recurring loss.

Even among our most successful apiarists we frequently hear of heavy winter losses. This leads me to believe that it is not the want of the knowledge, but a failure to put that knowledge into practice. If it is true, as we have been told from childhood, "in a multitude of counsel there is safety," we should all be able to winter our bees without loss.

In order to be successful in wintering, we are advised by "knowing ones" to keep our bees warm, at a temperature anywhere from  $40^{\circ}$  to  $90^{\circ}$ , to keep them cool; to keep them in the wood-house, chamber, cellar, or barn; to bury them; to pack with chaff; to remove all pollen; to so fix them that they will hibernate, and to leave them out-doors without any attention whatever, each wintering at times with perfect success. But as "one bird does not make a summer," so success by any method for one winter does not establish it as a fact, that such method is the best.

Five years ago Prof. Cook, in his book, said: "If the problem of successful wintering has not been solved already, it surely will be, and that right speedily. So important an interest was never yet vanquished by misfortune, and there is no reason to think that history is now going to be reversed." Has this prediction been fulfilled? I fully believe it has, and did all use the same forethought, diligence and care exercised in their other business, all would meet with the same success in wintering bees that they do in those avocations.

I am not verdant enough to think that I can offer anything entirely new on this most important subject, and can only hope to rather hring anew before you what has already frequently been said, and with the hibernation goblin, and various other theories staring me fully in the face, I do not hesitate to say that without pollen, as well as with, I do winter my bees as safely and surely as my horses, cows, and other stock. It is not to be presumed that I am to settle this question of how to sme

It is not to be presumed that *l* am to settle this question of how to successfully winter bees, but if all thought and practiced as many who succeed best do, I believe there would be much less need of discussing this question.

The first question that would naturally be asked is, what is the cause of our winter losses? All kinds of causes are mentioned, such as cold, confinement, too much and not enough moisture, ventilation and want of ventilation; brood-rearing, bad honey, starvation, pollen, not bibernating, etc., but nearly all the lost bees have diarrhea, and I believe it is pretty generally admitted that this is the great cause of winter loss.

The next question, then, would be, what is the cause of bee-diarrhea? The answer to this is not so unanimous. That bee-diarrhea is the rerult of an over-loaded condition of the intestines will be denied by but few. But, what causes this over-loading? Some say, "cold is the real cause," but it seems to me this cannot be, for fecal accumulations take place without the aid of low temperature, and one of our most prominent bee-keepers has said that "cold alone cannot produce fecal accumulations."

In a lecture before the British Bee-Keepers' Association, Mr. Frank Cheshire said: "In prolonged spells of intense severity, stores often become (especially if unnaturally placed) so cold that the bees cannot touch them, and then the saccharine matters in their fluids being exhasted, they have to draw upon their own muscular tissues to work them into material which should be heat-producing; that is to say, the bee has now to oxidize herself, and for the present is converted into a carnivorous creature, having to devour her own body"...."A portion of the tissues remained which could not be got rid of thus. This must pass away through the bowels. A large quantity of phosphates and sulphates passes off into the bowels, and to these the urinary secretions are added. But while the bee is being loaded in this way, another unhappy circumstance is going on—the integuments of the bee were being reduced in weight, it becomes lighter and weaker; yet the bowels were getting so loaded that when the bee tries to fly it has a greater amount to carry than if it had been properly fed." So we see that starvation may sometimes be the cause of diarrhea.

If cold were the cause, keeping them warm ought to remedy the evil, but unfortunately it does not always. If continement is the cause, then why do not all that are contined die? Confinement is a necessity in producing diarrhea, but cold is not. There can be confinement without diarrhea, but can there be diarrhea without confinement?

Ventilation, unless it be at the entrance of the hive, and brood-rearing, it seems to me, need hardly be taken into account in wintering. Poor honey in the hive may, but does not always produce diarrhea. The same is true of pollen, but diarrhea is so seldom produced without pollen that the exceptions need hardly be taken into consideration. That the eating of bee-bread, and the floating pollen in the honey during continement, when not used in brood-rearing, will not produce diarrhea, it seems to me, cannot be trnthfully asserted.

That the wintering problem hasbeen solved, I think no longer admits of doubt. Many things might be named as aids in successful wintering, but I believe all may be included in two-proper food and right temperature. That bees may be wintered on a very poor quality of honey has been fully demonstrated, but success is not always assured when wintering on any other than stores of good quality.

Proper food is of first importance, and may consist of either honey or sugar syrup, or both, and may or may not, include bee-bread. If it is desired to have brood-rearing going on before the bees can gather pollen in the spring, it must be included in the winter stores. Many successful beekeepers say they do not want their bees to rear brood till they can gather pollen from natural flowers in the spring, but my own experience satisfies me that I can get a much larger yield of honey from a colony that commences to breed in January or February than I can from one that does not.

Second only to proper food is the right temperature. This question then would naturally arise, what is the right temperature? I have had the

best results with a temperature of about 45°, during the first part of the winter, and until brood-rearing be-gins, which is usually in January, although frequently it begins in December; it is seldom as late as Feb-ruary. From this time on I prefer a higher temperature, gradually in-creasing to about 55°. I have never been able to reach the high temperature from 60° to 90° that some claim to employ, for at from 55° to 60° my bees always become uneasy. If the repository is damp, I prefer a higher temperature than if it is dry.

A special repository, or a house-cellar may be used to secure this desirable result—desirable on account of the assured safety of the colonies, a large saving in honey, and their strong condition at the commence-ment of the honey season.

My method of wintering is as follows : As soon as settled cold weather arrives, in this locality about Nov. 15, and the set of the set faithful attention to the apiary, and a thorough and timely preparation for the honey-flow, swarming and wintering will make any man or woman a successful bee-keeper.

Some discussion followed on the subject of what were the qualities of the best honey-gatherers, but nothing of general importance was brought forward.

A question being asked concerning Taylor gave a description of those used by him, and thought they were of much advantage.

The remainder of the evening was spent in listening to music, songs, and recitations, feasting upon ice-cream and cake, and in delightful social

intercourse. Mr. P. J. Kelleher, who had been requested by the Indiana State So-ciety to be present, recited Riley's poem, entitled "Fessler's Bees," which was very amusing, and caused much laughter.

Mr. C. F. Hansen, a blind musician, gave several instrumental pieces on the piano, as well as two or three songs which were received with applause.

After recitations by Dr. C. C. Miller and Thomas G. Newman, a vote of thanks was passed to the ladies and gentlemen who had provided the en-tertainment, and the convention ad-journed to meet on Thursday at 9 a.m.

Mr. Newman then gave notice that the members and frien is of the Na-tional Bee-Keepers' Union would meet in the hall at 8:30 a.m., and requested a prompt attendance.

### THIRD DAY .- THURSDAY.

#### NATIONAL BEE-KEEPERS' UNION.

At 8:30 a.m. Dr. C. C. Miller, one of the vice presidents of the National Bee-Keepers' Union, called the mem-bers and friends of the Union to order, and the manager. Mr. Thos. G. Newman, was requested to read the

Constitution, and it was discussed article by article, but, after considerable debate, it was not thought de-sirable to advise any changes, and the meeting adjourned.

The North American Bee-Keepers' Society was then called to order by President Miller, and the next sub-ject on the programme was the "Bee-Wagners Unice" Keepers Union.

Mr. Newman gave a short history of the work of the Union, and of what it had accomplished. At the close of his address the following was passed :

Resolved, That in the judgment of this society the National Bee-Keepers' Union is entitled to and should receive the support of all bee-keepers.

The following were elected hon-orary members of the society :

B. Bertrand, Nyon, Switzerland.
 Frunk K. Cheshire, London, England.
 Rev. Wm. F. Charke, Guelph, Ont.
 Prof. C. V. Riley, Washington, D. C.
 Hon. — Ross, Ontario, Canada,
 Hon. Edwin Willits, Lansing, Mich.

By request, Dr. Mason took the chair, and President Miller moved that a committee of three be appointed by the chair to inquire into the desirability and feasibility of securing such legislation as will give a bee-keeper an exclusive right to keep bees in a certain territory; the committee to report at the next annual meeting. It was carried; and the following persons were appointed: C. C. Miller, I. N. Cotton, and Frank L. Dougherty.

The Secretary reported that he had received from Thomas G. Newman & Son 200 copies of the proceedings of last year, and had mailed to members of the society, 104; sold 7; donated to public libraries 5; leaving on hand 84.

A vote of thanks was passed for the presentation of 50 extra copies of the listory of the North American Bee-Keepers' Society, by Messrs. Thos. G. Newman & Son, mentioned in the President's address, as having been received and sent to the public insti-tutions and libraries of the United States and Canada.

The chairman of the finance com-mittee reported that they had ex-amined the books, also the bills, and had found all correct, with all the expenses paid, and a balance on hand of \$1.06.

As it had been voted to publish the proceedings of this meeting in pamphlet form, same as last year, a collection was taken up to supplement the small balance in the treasury, and raise the sum of \$30 wherewith to purchase 200 copies, in order to furnish each member with a copy of the Report. The amount collected was Report. \$17.35, making \$18.40 in all, and Mr. Newman generously contributed the balance necessary to make up the \$30, so that the promises made to mem-bers might be fulfilled, by each one having a copy of the Report in pamphlet form, by mail.

honey-plant (*Echinops spherocephalous*) read his report, but the subject being so well covered by the remarks made by Mr. A. I. Root in his remarks un-der the heading of "Honey-Plants," to produce it here would be somewhat of a repetition.

A letter was read from Mr. A. E. Manum, one of the members of the committee, stating that if be were present at the meeting, he would move a vote of thanks to Mr. Chap-man for the services he had rendered to hea because in the meremetica

to bee-keeping, in the propagation and diffusion of this plant. The report of the committee was received and placed on tile, and a vote of thanks passed to Mr. 11. Chapman, as suggested in Mr. Manum's letter.

An essay by J. E. Pond, Jr., was read, entitled "Reversible Hives and Frames.

After the reading of Mr. Pond's essay, the meeting adjourned until 2 p.m.

### AFTERNOON SESSION.

The meeting was called to order by Dr. A. B. Mason, who took the chair by request, President Miller having gone home. The next essay read was that of W.

Z. Ilutchinson, on

### DRONES AND DRONE COMB.

That drones perform any important function aside from fecundating queens, I very much doubt. That they assist in keeping up the heat of the hive is not disputed, but this can be done equally as well by workers, and when of sufficient age *they* gather honey. It costs honey and the time of nurse bees to rear drones, and they consume, but do not gather honey all of their lives. That the bees rear drones only when they will be needed, or the bees expect they will be needed for the fertilization of queens, and for the birds of the or drive them from the bives when there is no farther prospect of their being needed for mating with queens, is an indication that they serve no other purpose.

Just before swarming time 1 one year gave each of 25 colonies an empty frame. Every frame was filled full of drone comb, and every comb filled with drone brood. When these colonies swarmed, many of the swarms were hived upon empty frames, and these same bees that one week previous were so anxious for drones, now bent their energies to the production of worker comb. Before swarming, the bees knew that drones would be needed for the fertilization of the young queens; the newly hived swarm possessed a laying queen, and no desire to swarm, hence no dones were needed, and no drone comb was built. By the time that the drone brood had hatched in the old colonies, each possessed a young fertile queen, and there was no immediate use for drones, hence, although the drone comb occupied the centre of the

fertilization of queens? Nature is always very prodigal in all matters bearing upon the certainty of reproduction, and we can often step in and interfere to an advantage. A few dozen drones to each hive is sufficient in an apiary. And right here let me say that we have very properly paid a great deal of attention to the rearing of our queens; have reared them from the best of mothers, and in the best manner possible, while the drones have been reared hap-hazard. while the The breeders of stock well know that prepotency is on the male side, and work accordingly.

It seems that the artificial fecundation of queens is possible, but not practicable for the owner of a large apiary who produces honey for a living. We sometimes may learn to control the mating of queens as easily as the mating of other stock is controlled; and we may not, but we can do this: We can allow no drone comb except the few cells that the bees will crowd in at the corners of combs, in all ordinary colonies, while in some of our best colonies we can rear an abundance of drones. We We should rear our drones with as much care as we rear our queens.

As perhaps many are aware. I have. for the past four years, been allowing newly hived swarms to build their combs in the brood-chamber; own and that I have found it a profitable practice. Since I have written so much upon the subject, others have tried it. Some have succeeded as well as myself, while others complain that the bees build too much drone comb. In almost every instance when the bees built done comb they did not rear drones in it, but filled it with honey, which shows that they did not build it because they desired drones, but rather because honey was coming in rapidly, and sufficient inducements were not offered them to store it elsewhere, so they built store or drone comb to store the honey in, because more room could thus be secured more quickly and with less labor. The only instances in my experience in which brood has been reared in drone comb newly built in newly hived swarms, was when the newly hived swarms, was when the queens were old and about to be superseded. This bas occurred in my apiary only twice. When using Lang-stroth frames I hive a swarm upon five or six frames; and have in one instance had two frames filled with drone comb and the comb filled with brood. The queen was old. In po brood. The queen was old. In no other instance have I had more than one drone comb built, and this has not occurred more than three or four times. I have more than 50 colonies in the new Heddon hive, and so far I have found only two drone combs.

To be brief, the building of drone comb has, with me, proved to be no objection to the hiving of swarms upon empty frames. I have, through the bee pipers, several times given my method of management; but I will briefly recapitulate : Do not have the brood-chamber larger than five Langstroth frames. Have the frames supplied with starters of foundation 1/2 of an inch wide. Place the frames

not farther apart than 1% inches from centre to centre. Use a queen-excluding honey-board. Have young Remove the supers from the queens. old to the new hive at the time of hiving, adding an extra case of sec-tions, next to the hive, if necessary to give the bees plenty of room.

It is, of course, possible that there are some other points, in this matter, that I have not presented, but I have, for four years, made a success of this system, and as nearly as I can dis-cover, I have given the reasons for my success.

T. F. Bingham-Why not use full sheets of foundation?

W. Z. Hutchinson-Because they would soon be drawn into full combs. when honey that would otherwise be stored in the sections, would be placed in the brood-chamber.

T. F. Bingham - I have several times tried hiving swarms upon shal-low frames, both with and without foundation, and have secured better results by using foundation. Bees will occupy an empty brood-chamber sooner than they will a super filled with foundation.

W. Z. Hutchinson—I do not put on supers filled with only foundation when hiving swarms, but move the supers from the old hive to the new, and the sections in these supers have combs in all stages of development, and the bees are soon back at work upon the very sections that they so bastily deserted.

O. O. Poppleton-At our Iowa State Convention, held a short time ago, this subject was discussed in a lively manner, and five-sixths of those who spoke reported trouble from excessive building of drone comb. Perhaps the success of Mr. Hutchinson may be attributable to his locality; for example, the flow may be slow.

W.Z. Hutchinson-I know that I succeed, and I have given all the rea-sons I can think of why I succeed, but I am well aware that there may be other reasons, and the one mentioned by Mr. Poppleton is a fair one for consideration.

The committee on exhibits, would report the following articles on exhibition:

J. Van Deusen & Son, Sprnut Brook, N. Y., comb foundation, Thin and Heavy, the latter wired and unwired.

James Forncrook & Co., Watertown, Wis., white basawood one-piece sections.

W. Broadbeck, Indianapolis, Ind., wooden G. W

Hetherington, Abronia, Mich., d amokera. Brood-nest of ating-Bingham & honey-knife and amokera. less bees.

N. N. Betsinger, Marcellus, N. Y., woven-wire separators, and section-case.

N. D. Coffin, Westland, Ind., slat honey-board. Cera Manufacturing Company, Baltimore. Md., foundation on wood, paper and linen.

H. D. Cutting, Clinton, Mich., tin bee-feeder, and section-box former,

Dr. G. L. Tinker, New Philadelphia, O., aectiona and queen-cage

W. Mason, Filimore, Ind., extracted honey, S. Armstrong, Jerseyville, Ills., reversible

hive. G. W. Demarce, Christiansburg, Ky., supera for comb and extracted honey.

H. D. Davia, Bradford, Vt., aurplus sections and shipping case.

The Hub Manufacturing Company, New Hamp-ton, Iowa, Wells' patent window acreen for honey-house windows.

A. Cox, Whitelick, ind., "PURE HONEY," in letters as worked by the bees, also several glass globes nicely filled.

Ora Knowlton, New Brunswick, ind., very fine isplay of honey-plants mounted on card-board. aŭ G. B. Lewis & Co., Watertown, Wis., sections for honey.

T. S. Bull, Valparalso, Ind., extracted honey.

E. O. Tuttle, Bristol, Vt., photograph-medley of the principal bee-keepers in America. H. Chapman, Versailles, N. Y., Chapman honey-plant.

Dougherty & Wiley, Indianapolis, Ind., books, amokera, sections, and general stock of bee-supplies.

Chas. Dadant & Son, Hamilton, Ills., comb foun-

dation.

The essays offered at this meeting were both numerous and lengthy, and when the hour of adjournment ar-rived there were several unread essays yet on hand, and the pent-up feeling upon the subject resolved itself into the following:

Resolved, That the executive committee be instructed to select essayists and assign topics for the next convention; to have fewer and shorter essays, and to exclude, except in rare cases. all essays written and forwarded by absentees.

The convention then adjourned sine die. F. L. DOUGHERTY, Sec.

### Convention Notices.

The next annual meeting of the Michigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTINO, Stc.

The Illinois Central Bee-Keepers' Association will hold its next meeting at Mt. Sterling, Ills., on Nov. 24 and 25, 1886. J. M. Намватовн, Sec.

(37) The next annual meeting of the Nebraska State Bee-Keepers' Association will be held in Lincoln, Nebraska, on Wednesday, Jan. 12, 1837, Location of Hull to be used and Hotel accomme-dations will be given after further arrangements have been made. II. N. PATTERSON, Sec.

The over made. If. N. PATTERSON, Sec. The next meeting of the Bee-Keepers' As-sociation of Hamilton and Tipton countes, Ind., will be beid at Westfeld, Ind., on Saturday, Nov. 6, 1886. The following interesting programme has been arranged: Opening exercises; Music; Ad-drevs of welcome, H. Mills; Best method of whi-tering bees, D. Leaming; Discussion opened by Marion Moore; Best method of realizing the In-gest amount of profit on a colony of bees M. Doherty; Discussion opened by Isaac Booth, Best method and time to prepare the bees for spring work, Zimri Kivett: Discussion opened by Dixon Bray; Question box. All interested in bee-keep-ing are invited to come, bringing their baskets well filled, so as to stay all day, and make this one of the most interesting and profitable acessions that the Aasociation ever held.

The Patsaliga Bee-Keepers' Association of 137 The Patsaliga Bee-Keepers' Association of Ala, request bee-keepers throughout the State, to meet delegates from this Association in Mont-gomery, Ala, on Nov. 9, 1886, for the purpose of forming a State association. The State Agricul-tural Fair will meet there on Nov. 8, and hold one week. Liberal premiums are offered to bee men, Let me hear from every bee-keeper at once. J. R. McLEND N, Pres., Stoddard, Ala.

Our Book Premiums.-To encourage all our present readers to get one or more additional subscribers we will present 25 cents' worth of books for every new subscriber (accompanied with \$1 for one year's subscription), sent direct to this office. Thus for five new subscribers with \$5, the getter up of a club gets \$1.25 in valuable reading matter, to be sclected by himself from our list on the second page of this paper. It will pay you to devote a few hours to the interests of the BEE JOURNAL. Every one who keeps bees ought to take it. We will furnish sample copies free in any quantity to those who intend to get up clubs. We expect to get 5,000 new subscribers for 1887.

THOMAS G. NEWMAN & SON. PROPRIETORS. 923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAGER.

# Special Notices.

To Correspondents. - It would aave us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, he sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

A New Crate to hold one dozen one-pound sections of honcy.-It has a strip of glass on each side, to allow the honey to be seen. It is a light and attractive package. As it holds but ope tler of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nall, for 9 cts. per crate. Glass 1%c. per light, extra.

Yucca Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiher extends the whole length of the handle as well as the brush, they are almost indestructable. When they become sticky with honey, they cao be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can aupply them at 5 cents each, or 50 cents a dozen; if sent by mail, add 1 cent each for postage

Five Thousand new subscribers to the BEE JOURNAL is what we have made our calculations for; they will como in cluba between now and next spring. Installments are coming every day.

127 Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample oopies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

# Honey and Beeswax Market.

The following are our very latest quotations for honey and beeswax:

### CHICAGO.

110NEV.-Receipts are likeral and prices vary from 10@13c.per lb. for white in sections varying from 1 to 1½ and 1½ lbs. Many sales of good white 1-1b. sections are made at 11c. Extracted is quiet and ranging from 5@7c. BEESWAX,-23@25c. R. A. BURNETT, Oct. 18. tel South Water St.

### NEW YORK.

MCCAUL & HILDRETH BROS., S4 Hudson St.

# BOSTON.

HONEY.-The demand has improved. We are selling one-pound packages of white clover honey at 14@15c; 2-pounds at 13@14c. BEESWAX.-25 ots. per lb.

BLAKE & RIPLEY, 57 Chatham Street.

### DETROIT

HONEY.-Best white in 1-ib. sections, 12@13c.; dark, 10@11c., with a good supply in commission house. BEESWAX.-23c. Oct. 10. M. H. HUNT., Bell Branch, Mich.

#### CINCINNATI.

HONEY.—Demand is fair for choice comb in 1 and 2 ib. sections, which brings 12@15c. a pound in a jobbing way, according to quality and meatness of package. There is a fair retail and jobbing de-mand for extracted in square glass jars, while the order trade for dark grades from manufacturerals improving. Range of prices for extracted in 3½@ 7c. or ib.

7c. per lb. BEESWAX.-It is in good demand, and good yellow brings readily 20c.

Oct. 9. C. F. MUTH & SON.Freeman & Central Av

#### CLEVELAND.

HONEY.—Choice new honey in 1-ib. sections aelling at 14c.; 2-ibs. 12@13c. Old honey is ve dull at 10@12c. Extracted, 6@7c. BEESWAX.—25c. very

A. C. KENDEL, 115 Optario Street,

#### **MILWAUKEE**

MILWAUKEE. HONEY.-The market for honey of choice qual-ity is firmer and we are trying to establish a high-er range of values. We quote 1-1b, sections of white at 12%@13c, 2-1bs, 11%@12c, dark not wanted. Extracted, white, in haif barrels and in kega, 6%@7c, in tin packages, 7@7%c.; in barrels, as to quality, 5@5%c. BEESWAX.-No demand.

A. V. BISHOP, 142 W. Water St. Oct. 2.

### SAN FRANCISCO.

BAN FRANCISCO. HONEY --There is a framer market for extrac-ted, and especially for comb honey, as the crop of the latter is rather small. A pliarists have sold what they were obliged to dispose of for payment of packages and labor, and they hold the balance back at bigher prices. The demand is increasing, and we quote with ready takers, 4@446, for choice extracted; 3446346, for amber extracted; and 8@11c, for coumb honey in 2-lb. sections; 12@15c. for 1.1b.380400-... ends burgers at 200290 BEESWAX.-It finds buyers at 20@23c.

Sep. 28. SCHACHT & LENCKE, 122-124 Davis St.

HONEY.-Receipts are light and the market is very quiet. We quote : White extracted, 4641/4c.; amber, 32/c. Comb. 85/6010c. for white. BEESWAX.-196022c.

O. B. SMITH & CO., 428 Front Street.

#### ST. LOUIS.

HONEY.-Choice comb. 11%(212%c.; latter price is for choice white clover. Strained, in barrels, 3%(acc. Extra fance of bright color and in No. 1 puckages, % advance on above prices, Extracted in barrels. 4%(3%); in cans 6%7c. BEESWAX.-Dull at 21c. for choice.

Sep. 30. D. G. TUTT & CO., Commercial St.

#### KANSAS CITY.

KANSAS UITT. HONEY.-Demaud for all grades is good, and aales are large. Receipts are good and prices are ateady with a firm feeling. We quote : 1-1b. sec-lons of white clover, 136014c.; dark, 106012c.; 2-1bs, white elover, 136014c.; dark, 96010c.; Calif, 2-1bs, 96011c.; ½-1bs, white clover, 146015c. Extracted white clover, 6670c.; dark, 4655c.; white sage, 5½6c.; Calif, amber, 5c. BEESWAX.-200622c.

Oct. 15. CLEMONS, CLOON & Co., cor. 4th & Wainut.

### Home Market for Honey.

To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leafieta "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine." and scatter them plentifully, and the result will be a DEMAND for all of their crops at remunerative prices. "Honey as Food and Medicine" are sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the bee-keeper who scatters them) keeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buya a package of honey, will sell almost any quantity of it.

# \_\_\_\_\_ System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

 
 For
 50 colonies (120 pages)
 \$1 00

 "100 colonies (220 pages)
 1 25

 "200 colonies (420 pages)
 1 50
 For

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

Red Labels for one-pound pails of honey, size 3x41/2 inches. - We have just gotten up a lot of these Labels, and can supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2 00; 1,000 for \$3.00; all with name and address of apiarist printed on them-by mail, postpaid.

Sweet Clover, or Melilotus Alba, is almost the only resource for honey now, on account of the late severe July drouth. If the seed is planted in September, it will come up this Fall and bloom next year, in its second season.

Wo have a large lot of this seed on hand, and offer it at the following Reduced Prices, by express or freight :

- \$0 20 One pound ne pound ..... " peck—15 lbs " bushel—60 lbs..... 2 25
  - 7 00
- sack—S0 lba ..... 8 00

It will pay to buy it by the sack and sell lt again in smaller quantities.

157 If you want a chance to make some money, and provide pasturage for the bees during the Fall months, this is your opportunity 1

The Convention History of America and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.15.

As there is Another firm in Chicago by the name of "Newman & Son," we wish our correspondents would write "American Bee Journal" on the envelope when writing to this office. Several letters of ours have already gone to the other firm (a commission house), causing vexatious delay and trouble.

WANTED, an active, reliable man in every ity and town in the State of illinois to work in Councils of the American Legion of Honor, and avarance organization now having 60,000 mem-bers, and we are willing to pay liberally in cash ior aervices rendered in this work. It can be per-formed at odd and lelaure hours without interference with regular business, and is an occupation affording much pleasure to those engaged in it. For full explanation how to go to work and what to do, address

THOMAS G. NEWMAN, 925 West Madison St., CHICAGO, ILLS.

# THE CHAPMAN HONEY-PLANT.

IN accordance with a previous notice in bee-periodicais, I am now prepared to dill orders for the seed of the above plant at the following prices:  $\frac{1}{2}$  ounce,  $\frac{1}{2}$  1; 10.2,  $\frac{1}{2}$  22.2,  $\frac{1}{3}$  3; 40.2,  $\frac{1}{3}$ ; 3,  $\frac{1}{3}$  0.2,  $\frac{1}{3}$ ; 4,  $\frac{1}{3$ 

In early abring and generat directions for clinka-tion will be given on each package. This plant is not an obnoxious weed, but is as easily eradicated as clover. Having carefully watched lis habits of growth and its honey-pro-ducing qualities for the past ix years I believe those who commence its cultivation in a liberal way will be better pleased than by comimencing with a small quantity of seed. It has been tested by prominent bee-keepers all the way from Ver-mont to Nebraska and Ontario. We rafer to the report of the committee appointed by the North American Bee-Keepers Society held at Detroit in 1885. The committee reported at the Indianap-olia, Ind. convention held Oct. 12-14, and their report will be found in all bee-papers publishing the report of that convention. Write all orders plainly and give your post-office address in full. H. CHAPPAN,

H. CHAPMAN, 42 A tf VERSAILLES, Cattaraugus Co., N. Y.

THOMAS G. NEWMAN & SON, 923 & 925 West Madison St., CH1CAGO, ILL.

# The NEW Heddon

We have made arrangements with the inventor by which we shall make and sell the Heddon Reversible Hive, both at wholesale and retail; nailed and also in the flat.

The engraving rives a good idea of the live. The broad-chamber is in two sections: also the propuls arrangement, which may be interchanged prinverted at will. The cover, bottom-board, and of a regular hee-space, so that the surplus cases which the sections, may be placed between the two proot-chambers, or the latter may be transposed perfectly interchangeable. The broad-frames will AL be bored for wires. A SAMPLE HIVE includes the bottom-board and stand; a slatted boog-board, and cover; two surplus strangements, each containing 8 frames; two surplus strangements, each containing 8 frames; two surplus strangements, each containing 8 spars-tors, and the other without separators. This latter chamber can be interchanged with the other stories, but cannot bereversed. It is NAILED AND painter, complete.

It is absolutely essectial to order one nalled hive as a pattern for putting those in the flat together correctly.

HIVES READY TO NAIL .- In filling orders for these hives, in the fist, we make 6 different comhinstions, so that our customers may make a selection from the sample nailed hive, without waiting for us to quote prices, and the different kinds will be known by the following numbers :

No. 1 consists of the atand, bottom-board, cover, two 6-inch brood-chambers, 16 frames, and the slatted honey-board. Price, \$1.55 each.

No. 2 is the same as No. 1, with the addition of one surplus story containing 28 sections without separators—interchangeable, but not reversible.— Price, \$2.00 each.

No. 3 is the same as No. 2, with *two* surplus storles as therein described. Price, \$2.50 each.
No. 4 is the same as No. 1, with the addition of one surplus story containing 28 sections in wide frames with separators, which can be reversed, inverted, and interchanged, the asmess the brood-combers. Price, \$2.30 each.

No. 5 is the same as No. 4, with two surplus arrangements as therein described. Price, \$3.00. No. 6 contains all the parts as described in the sample galled hive. Price, \$2.75 each.

Those detering the lives without the stand, honey-board or sections, may make the following deduc-tions from the shove prices : Stand, 14 cects; honey-board, 8 cents; and the 28 or 56 sections, as the case may be, at ½ cent each, respectively,

We will also make the following deductions on quantities ordered all st one time: For 10 or more hives, 5 per cent. discount; for 25 or more hives 71-2 per cent.; for 50 or more, 10 per cent.

THOMAS G. NEWMAN & SON. 923 & 925 West Madison-St., CHICAGO, ILL.

686

THOMAS G. NEWMAN, EDITOR.

Vol. XXII. Nov. 3, 1886. No.44.

Another Union Convention is to be held in Albany, N. Y., next Jannary. See the notice on page 699. Let there be a general rally of the bee-keepers of New York at this union meeting.

W. Z. Hutchinson has sustained a loss by fire. We are sorry to learn that on Oct. 25, the store, hotel, post-office, and railroad depot at Rogersville, Mich., were consmmed by fire. In the depot Mr. H. had stored I,000 pounds of his choicest comb honey, preparatory to shipment. It was all consumed; and it is quite a loss for our friend, who is so well known to our readers, as a correspondent.

Mr. Edward R. Newcomb, of Pleasant Valley, N. Y., bad an "exhibit" and "apiary tent" at the Fair, of which the Poughkeepsie News-Press remarks as follows:

The apiary tent of E. R. Newcomb, of Pleasant Valley, was filled with visitors all through the day. Mr. Newcomb entertained his callers hy explaining to them the habits of bees, and method of preparing the comb and honey. His exhibits of bees, comb boney and extracted honey are very fine.

Mr. Newcomb has sent a photograph of the tent containing the exhibits to this office, which is placed in our Museum.

These names were omitted by the secretary, through an oversight, in the list of members at Indianapolis, on page 669 :

Rev. W. F. Clarke, Guelph, On Page C. E. Parks, Watertown, Wis, O. O. Poppleton, Williamstown, Iowa. Arthur Todd, Philadelphia, Pa. Stewart Nichols, Suzar Creek, Ind. Madison Talbert, Morristown, Ind. John Clark, Liberty, Ind. A. Leedv, Andrew, Ind. Geo. J. Frey, Lehanon, Ind. A. Cox, Whitelick, Ind.

Mueci & Bro., of Kentucky, received a queen from Italy, by mail, on Sept. 27, 1886, which was only 13 days in transit. She now has 3 frames full of brood, and they say that it was the first queen-bee to cross the Atlantic in the mails. Several bave been sent across by mail, but which was first we are now unable to say. One of the first was taken from the mail at New York, custom house fees collected, and then forwarded by express to the consignee. This was of course an outrage, but we know of no inexpensive redress, as we explained to the consignee, who complained to us at the time.

Where Honey Comes From.-It has been known for ages that honey is a vegetable product-that it is not "made by bees," as many ignorantly express it, but gathered from the flowers! Now comes a theorist who asserts the opposite in the *Rural Home* for Oct. 2, 1886, published in Kechester, N. Y., a marked copy of which was sent to us by Mr. W. E. Peterman, of Trappe, Pa. He says that "honey is not secreted by the flowers, but is held in solution in the atmosphere, and nuder favoring conditions is attracted to and condensed by flowers and leaves having affinity for it."

The author of this statement is W. M. Evans; but there is some hope for him, as be subsequently makes this atatement concerning honey-dew: "Before I came to Virginia I did not believe in honey-dew; now belief is knowledge." He may, therefore, learn something else. He then adds:

Last year, after the clover and all our honey flowers had dried up, and before fail flowers blossomed, my bees gathered 2.000 pounds from honey-dew on pines. You could see it plainly in the morning in small, white drops. In color and flavor it is equal to white clover, and in body is heavier.

We are aware that there are different kinds of honcy-dew, and some may be of very passable quality, but most of it is totally unfit for use. That Mr. Evans did not believe in its existence until recently, proves that his knowledge is very limited, and he should be very careful in making assertions in public print, so utterly unfonnded as the first extract we bave quoted.

If honey is not secreted by the flowers, how does Mr. Evans account for the fact that in "new country," before so much land is brought under cultivation, where wild flowers abound, so much more honey can be obtained than after the same lands have been enlitivated? If "the honey were held in solution in the atmosphere," cultivation which destroys the wild flowers should not make so much difference !

Again, how comes it that the boney from basawood, white clover, buckwheat, etc., so much differ in *color* and *taste* if it is held in solution in the atmosphere, and is simply "attracted to and condensed by the flowers and leaves?" If his theory were true would it not all he of the same color and taste?

Mr. Evans thau rattles off the "Wiley lie" about filling combs and glucose, and selling that which he calls "Devil's honey" for the pure article, in lots of 10,000 pounds, and denominated "apple blossom boney" in the New York market. It is all bosh! He is only adding to Wiley's nefarions lie, by "drawing on imagination for facts," and then swearing they are *true* statements of the case !! He then gets excited and writes these frenzied words in conclusion :

The hells of adultery, adulteration, brihery, corruption, and all kinds of buman cussedness have broken loose and taken hold of all classes !

We think that it is the worst kind of "cussedness" to lie about a pursuit and endeavor to ruin it by such stupidity and unreasonable assertions as Mr. Evans indulges in 1

Mr. 0. 0. Poppleton's boney crop for this year amounts to 15,500 pounds, and is mostly extracted boney—as yet all of it is unsold. In May he had 141 colonies, which have increased to 233 now.

That Lawshit against Mr. C. C. Richardson, of Tipton, Ind., for damage alleged to be done by his hees to a neighbor, will come up in the Nuvember term of court, on appeal from a Justice's Court.

At the Indianapolis Convention another neighbor of his made some assertions about the Union not having given Mr. R. any assurance of help in defending the suit. Not remembering the details of so much correspondence as of necessity he has in such matters, the Manager promised the Convention that he would examine the records in his office, on his return, and make a public statement of the case. Upon looking the matter up, he found that he had written to Mr. Richardson on Aug. 4, 1886, requesting him to make the defense as thorough as possible, assuring him that the Union would belp bim to a reasonable amount. To this Mr. R. replied that he had permitted the case to go by default in the Justice's Court in order to take an appeal to a higher court. The Manager, on Aug. 23, requested him to ascertain from his attorney the probable cost of the snit including the appeal; and again assured him that the Union would render him all the aid in its power to defend the case.

After ascertaining these facts in the case, the Manager then wrote to Mr. R. stating what had been said by a member at the Indianapolis Convention, and asked: "Did he speak thus with any authority from you?" To this Mr. R. replies ss follows, by return mail:

I hasten to answer your inquiry, "Did he speak thus with any authority from you?" with a positive denial. He had no grounds for making the statement on any authority....My case will come up in the November term....The costs of the suit will amount to about \$40. I stand by the Union, and whatever help can be rendered by it will be satisfactory. C. C. RICHARDSON.

Probably the person who made the remarks referred to at the Convention (his name is forgotten), intended no wrong, but either his memory was defective, or he failed to comprehend the facts in the case.

The Manager has copies of all his official letters, which are not a few, but are always accessible to any member of the Union who may desire to review them, in any application for defense or other official act. This is done not only for convenience but for proof, in cases like the one under consideration.

Premium Worth Having,—The New York World and the AMERICAN BEE JOUR-NAL (both weekly) will be sent for one year to any address in North America for \$1.90. And in addition PRESENT to every such CLUB SUBSCRIBER a "History of the United States," containing 320 pages and 22 fine engravings, bound in leather and gilt.

This "History" will be sent FREE by express at the subscriber's expense; or will be mailed for 10 cents extra to any place in the United States or Capada.

It is arranged chronologically by years, from 1492 to 1885. Every event is narrated in the order of its date. These are not confined, as in other works, to political matters. but embrace every branch of human action.

This premium is worth the whole of the money sent for both periodicals, and should induce thousands to subscribe, and thus get two unrivalled weeklies for nothing.

## Replies by Prominent Apiarists.

[It is useless to ask for answers to Querics in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.—ED.]

# Preparing Bees for Winter.

Query, No. 327.—My bees are all in the style of hives mentioned on page 361. I have been thinking of putting them away for the winter, with first a thicknesses of muslin, and then two or three thicknesses of quilts over the frames, with enough weights around outside to keep them in place without hoards. Will it be the best way? I winter my bees in a cellar.—J. New York.

With me, bees winter well in that way if the cellar is all right.—G. M. DOOLITTLE.

I have tried the equivalent of this for years with almost absolute success. Of course the cellar must be right.—A. J. COOK.

In a cellar we put nothing over the frames except the enameled cloth slightly opened. Quilts cannot injure, however.—DADANT & SON.

If the cellar is all right, I think they might winter well.-C.C.MILLER.

I doubt if such is the *best* way, but if your cellar keeps at a temperature of about 50°. I think your plan will give good results.—JAMES HEDDON.

That depends upon the temperature. If it ranges from  $45^{\circ}$  to  $50^{\circ}$ , there should be free upward ventilation; but if the range is below  $45^{\circ}$ , I prefer a thin, unpainted board with bee-space allowing no free upward ventilation. In the latter case I should give free bottom ventilation. -G. L. TINKER.

# Wintering Bees in a Straw-Stack.

Query, No. 328.-1. How would it do to winter bees in a straw-stack? 2. How large a stack would it take to keep the temperature above freezing? 3. Would there need be any provision for ventilation ?-H. A. C., Illinois.

I consider it impracticable to winter bees in a straw-stack, and I would not advise any one to attempt it.—G. L. TINKER.

I cannot say how such an experiment would terminate in the dry cold air of the North, but dampness would accumulate in the hives under such conditions, in this climate, and ruin the combs, and of course the bees with them.—G. W. DEMAREE.

1 and 2. That depends much upon your latitude and the severity of the winter. 3. Bees must have air in some way.-C. C. MILLER.

1. Try it and report. 2. Frost would eventually reach the centre of the largest stack unless kept warm by the ground or bees. 3. I should say not. --G. M. DOOLITTLE.

1. If it does not freeze in the centre of the stack it might answer. 3. I do not think any special ventilation would be needed.—W. Z. HUTCHIN-SON.

The same objection occurs that arises with burying bees. You could not regulate temperature, nor know whether it was right or wrong. I should not dare to submit bees to such an unknown and unknowable condition.—A. J. COOK.

A friend, a few years ago, put a small stack of corn stalks around each hive, and thought he had just "done it;" and he had, for he lost every colony so treated. When taken out, they were a wet, moldy mass.— H. D. CUTTING.

I think that bees would winter well protected by a straw-stack, if care was taken to prevent excess of moisture within the hives. My impression is, as I have frequently stated, that cold of itself does not kill our bees; but that they are destroyed by excess of moisture which freezes and prevents the cluster from getting at its stores, or else canses the stores to ferment and thus become dangerous. -J. E. POND, JR.

I believe that bees would gain much protection from being in the centre of a large straw-stack. Turn a board over the front of the hives, and that will insure all the ventilation I should care for. Guard against mice and rats. Have the hives rest on a foot of straw. The stack should be well "stacked," so as to turn water.— JAMES HEDDON.

# Boneset Honey for Winter Stores.

Query, No. 329.-Will bees winter well on honey that is gathered from boneset, when the same is nicely capped over? Or would it be hetter to extract the boneset honey out of the combs and feed the bees granulated sugar symp, or white clover extracted honey to winter on ?-G. H. D.

I should try the boneset honey if I had it.—G. M. DOOLITTLE.

Yes, winter them on boneset honey if capped.—DADANT & SON.

If well cured, honeset honey is as good as any for wintering.—J. P. H. BROWN.

I do not know but I should say at a guess that boneset honey would be all right.—C. C. MILLER.

I have had no experience with boneset honey, but from what I have read, I should prefer sugar syrup or good honey.—H. D. CUTTING.

I have no fear of such honey. Two years ago I used such honey exclusively in several colonies, and all win-

tered perfectly. Honey from autumn flowers I fully believe just as good as that from early bloom.—A. J. COOK.

I know no reason why boneset honey is not as good for winter stores as is any fall honey. I have wintered bees successfully upon boneset honey. -W. Z. HUTCHINSON.

I should consider well ripened boneset honey, well capped in the combs, superior to the syrup of granulated sugar for wintering bees.-G. L. TINKER.

I prefer properly prepared canesugar syrup to any honey, but I have had as good results from boneset, and honey from other fall flowers, as from clover or basswood honey. I should depend upon the boneset honey as soon as any.—JAMES HED-DON.

If the honey is well ripened, and the hive kept well ventilated and free from excessive moisture, there is no reason why the bees should not winter well on boneset honey. I prefer natural stores; others prefer sugar syrup in any case, no matter from what source the honey comes. Sugar syrup has proved safe for winter stores; so has honey of all kinds. The advocates of the various theories will each stick to his own so long as his bees winter well.—J. E. POND, JR.

I see no reason why they would not. Beyond question they would winter all right on such honey here. Do not feed sugar syrup to bees if you can help it, for it is almost impossible to feed syrup even for stimulating purposes without getting some of it into the honey.—G. W. DEMAREE.

# Laying-Room for the Queen.

Query, No. 330.-I work all my bees in the Simplicity hive for extracted honey. Will the average queen lay as many eggs if she is confined to the lower story with perforated zine, as she would if she had the run of the whole hive of 20 or 30 frames ?-H. L.

No.-G. L. TINKER.

No.-H. D. CUTTING.

Not if she is a very prolific queen.— DADANT & SON.

I think she will lay just as many.-J. P. H. BROWN.

If confined to the lower story, the bees might take a whim to crowd her, but I think generally not. At any rate I would risk it.—C. C. MILLER.

Just as much. It is much better to keep her from the frames used for extracting.—A. J. COOK.

I think not, but I can get the greatest dividend upon the capital and labor employed by using the excluding honey-board, and keeping the queen always in the brood-chamber.— JAMES HEDDON.

Perhaps not quite, but it will be much more convenient and profitable to have the brood in one part of the hive, and the honey in another; and I see no advantage in securing a large number of eggs from one queen. Queens are cheap compared with the cost of combs.—W. Z. HUTCHINSON.

Yes! In this matter I "speak as one having authority," for I have tested the point thoroughly. The lower story, however, must be kept extracted, so that the storage will not drive the queen out. Give her all the room she needs. Ten Simplicity-Langstroth frames will be found as many as the best of queens can keep filled, if the whole cell-space is given her to occupy.—J. E. POND, JR.

"Simplicity hive "is very indefinite, as a description of a hive, with the "Langstroth" left off. If the hive you use bas a brood-chamber as large as that of the standard Langstroth, the average queen will find as much room as she ought to have when confined to the brood-chamber with a queen-excluder. In my opinion it does not pay to let a queen scatter her brood; it is better to give her plenty of room in the "queen's chamber."— G, W. DEMABEE.

# Peculiar Actions of Worker-Bees.

Query, No. 331.—Doubtless you have noticed worker hees collected on the alightiug-board or front of the hive, moving their bodies backward and forward as though they were busily polishing their mandibles on the wood. Can you give any clue to the cause of their thus acting, or the purpose to be served by these movements.—Ky.

### No.-C. C. MILLER.

No.-H. D. CUTTING.

I cannot.-W. Z. HUTCHINSON.

I should like a correct reply to that question myself.-G. M. DOOLITTLE.

It looks as though they were cleaning the floor.—DADANT & SON.

At such times they are "knights" of idleness—no honcy to gather. Instead of "polishing" their "mandidles" they are using them to "plane" their alighting-boards and to "gnaw" their entrance larger. — J. P. H. BROWN.

This appears to be a marked trait of black bees. Syrio-Albino bees are rarely seen to do it, and then but very few. They are certainly idlers, for the movements described subserve no useful purpose.—G. L. TINKER.

I have had these peculiar movements on the part of worker-bees under observation for several years past. I sometimes notice hundreds of them stationed on the alighting-board or front of the bive, with their wings slightly elevated, and their bodies systematically moving backward and forward. I have progressed no further than this, viz: These movements are only seen at such times as there has been a cessation of brood, as after a swarm has issued, or a queen has been introduced, and then generally about the time the worker progeny begins to hatch. I would like to know more about it.—G. W. DEMAREE.

Explanatory.—The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark  $\bigcirc$  indicates that the apiarist is iocated near the center of the State named;  $\eth$  north of the center;  $\blacklozenge$  south;  $\circlearrowright$  east;  $\circlearrowright$  west; and this  $\circlearrowright$  northeast;  $\backsim$  northwest:  $\circlearrowright$  southeast; and  $\Uparrow$  southwest of the center of the State mentioned.

### For the American Bee Journal

# Some Observations in Bee-Keeping.

# G. M. DOOLITTLE.

Some items of interest to me have come to my notice the past season, and thinking that perhaps the same might not be uninteresting to the readers of the BEE JOURNAL, I will here speak of them. The first was this: During the last of May and the first of June we had a bad spell of weather for bees, inasmuch as it was cool, cloudy, windy and rainy the larger part of the time. As the bees were short of stores, I had to resort to feeding.

Before commencing to feed I had been equalizing stores, hoping that there was honey enough in the yard to supply all through the honey dearth we were then having, if it was In doing this work I noticed that nearly all the brood in the hives was in the shape of eggs and sealed brood. As the sealed brood hatched out, eggs were deposited in the cells, till there came a time that there was little else in any of the colonies beside eggs, in the brood line. These eggs the bees would not or did not hatch ; or perhaps I might say the bees prevented their hatching, or else removed them from the cells just before they should hatch, and the queen deposited more eggs in the cells again. Of one thing I was certain, the combs were well supplied with eggs all this time, vet scarcely a larva was to be found. Feeding seemed to make little difference with them, and the reason I especially noticed it, and tried to coax the bees to get those eggs into larvæ, was that these eggs were to become the bees for my basswood harvest, and unless I had such bees I could have no promise of basswood honey. So I watched them day after day till it came warm, fine bee-weather again, when to my surprise the barren combs were teeming with little larvæ in less

than three days. I wish Prof. Cook, or some other scientist, would tell us how the bees kept those eggs day after day, not allowing them to hatch, and then when they wished larvæ, hatched nearly all the eggs in the hive in a day or two. Without my stopping to explain the why and wherefore, it will

be seen that I believe that the eggs were preserved for a time, rather than that the bees kept destroying them as they were about to hatch, and the queen laying fresh eggs. I could explain why I think the same eggs were in the hive for two to three weeks, but it would be so long that it would cut out other matter which I wish to present.

After much careful observation I was led to believe that a little chyme was placed on every egg at the time that the bees wished it to hatch, and so long as this chyme was withheld the eggs were preserved. One thing was certain, I saw eggs with chyme on them, and at the base of the cells about them, which cells and eggs was marked, and after the lapse of from one to two hours the eggs were gone and larvæ had taken their place. This same thing I have also noticed with eggs in queen-cells.

To prove the matter farther, I placed a wire-cloth cage over  $\frac{1}{4}$  of a comb of eggs  $\frac{2}{5}$  days old, and in 4 days I looked to see if the eggs were there intact, but the bees had gnawed under the cage so as to get in *en* masse, hence I found nothing but little larvæ, and my experiment was in vain. Not having the time at my command to follow the matter up, I am still in the dark, and wish the help of the *sisters* and brethren in this matter. Oh! how I do wish, at *times*, that I was a scientist, but I am only a kind of a practical clodhopper. Well, it would not be best for all of us to be scientists, so I will be content with my lot

my lot. Mr. A. I. Root suggests that it was for lack of pollen that the eggs were not hatched, but I think this is a mistake, for there was plenty of pollen in the hives, besides the bees had a day, or part of a day occasionally, when they brought in pollen freely.

#### UNITING COLONIES.

We have long heard that when uniting bees, the two colonies to be united should be moved gradually day by day, until they were both together, when they could be united without any of the bees being lost by going back to the old location. This seemed a big job to me, so this fall, as I had much of this kind of work to do, I just smoked the colony to be moved, at the entrance, pounding on top of the cover of the hive at the same time with my fist. In a moment more I put the colony on a wheelbarrow and rapidly went to the colony they were to be united with. This rapid wheeling made the bees think that their house was "coming down over their heads," and caused them to fill themselves as "full as ticks" with honey. The other colony was now treated as the first, save the wheeling, when both were immediately united by alternating frames.

Nothing was done to cause them to mark their location anew, nor was the old stand altered in auy way, for the empty hive was placed back where it stood. At their next flight I saw quite a few bees about the old stands, so, to see how many would return, I placed a framehaving honey

and brood, in one hive, and a frame and brood, in one hive, and a frame containing only honey, in another, while the rest were left empty. In the one in which I placed brood, I had at night about a quart of bees with queen-cells being started, show-ing that I would have lost that many, had I not experimented farther; but that farther experiment proved that some of my former views had been hastily drawn, for I happened near the hive in which the frame of honey the hive in which the frame of honey was placed, about one hour after placing it there, when, to my chagrin, I saw bees going out of it loaded, and I believed that robber bees were carrying off the honey.

I was about to seize the frame of honey so as to prevent a general ex-citement in the bee-yard, when I saw a bee catch another which was flying about the entrance, and treat it as a robber. That caused me to think, so I went immediately to the hive to which this colony had been united with, when I saw that my robber bees, as I had supposed them, were going into this hive with their loads of house. of honey. I left them, and at night I hive, with no bees, and a contented hum at the entrance of the united colony, as we hear when a colony has other empty hives did I find any bees, and I was satisfied that all went back, even if they did hover about the old hive for an hour or so. The moral is plain without my taking time to draw it.

### SELF-UNITING COLONIES.

Another observation is this: In preparing for uniting I killed some of my poor queens, so as to keep the better queen in the united colony. These queens were killed during the middle of the day, preparatory to uniting near sunset. One day after I had killed several, it began to rain so that I could not work at the bees to-ward evening as I had proposed. Bad weather continued for three or four down when the sum broke out worm days, when the sun broke out warm soon after noon. About 2 o'clock I saw a commotion in the bee-yard, and going out there I found that one of these queenless colonies was swarming out slowly (as a swarm returns where it is hived without a queen), and going into another colony which had a queen, setting up the usual satisfied hum which all bees do when a home is found. They were received kindly, so I had one colony united without any trouble.

The above is an entirely new ex-perience with me, of having a queenless colony swarm out and go in with another; and had I not seen it, when I went to unite, I should have doubtless reported a case of robbing. As additional light, I might say that there was no brood in this hive, not even eggs, and, although I carefully watched on their next flight, not a bee went back to hover around the old hive, so I found that the bees' plan of uniting was ahead of mine after all.

Borodino,⊙ N. Y.

# Pall Mall Budget. Canadian Honey Exhibit in England.

The exhibit of the Ontario Bee-Keepers' Association, both for quan-tity and quality, it is probably the most remarkable exhibit of honey that has ever been displayed in this country. It has come over in charge of a deputation from the Association, who are at present on a visit to this country with a view to open the English market to the best honey in the world, as they constantly describe the article which they have on view.

It was with peculiar interest that we bade Mr. Jones welcome as he entered our office with two other repre-sentatives of the Bee-Keepers' Association to give particulars concerning bee-culture in Ontario.

moderate computation. We have 10,000 bee keepers in Ontario, owning, on an average, 10 colonies each, or 100,000 together. The net annual profit of each hive we estimate loosely at a sovereign, although in many cases this is very largely exceeded. We reckon the yield of each hive—or colony, as we call them in Canada—to be about 30 pounds, taking good years with bad. It is very common for a colony in a good season to yield 100 pounds, and many produce 300, while on one or two occasions it has been on one or two occasions it has been known to produce 600 pounds, or nearly a quarter of a ton of honey in one season. Many have gone into bec-keeping as a livelihood, and 'fol-low it exclusively, as other men fol-low the rearing of sheep. I have eight apiaries with from 100 to 300 colonies in each. All together I have 1 000 colonies constantly on hand " 1,000 colonies constantly on hand.<sup>2</sup>

"We claim to be located in the very heart of the honey belt of the United States," he said. "It is a remarkable fact that the specific gravity and flavor of the nectar of the flowers improves as you go north, and attains its maximum in the region where while the winter is cold, the summer is warm enough to produce an abund-ance of flowers. That region is found by experience to lie about the latitude of the great lakes. If you draw a line from the north of Lake Superior eastward and westward until it reaches the Atlantic, and another line from Lake Erie parallel to it, you will en-close a tract of country which, in the United States and Canada, is the honey belt of the Continent; that is to say, there is more honey grown there, for gathering, than anywhere else in America. Ontario is situated, as you will see, right in the heart of this helt; and there we have estab-lished an industry which, although at the present moment but in its inward and westward until it reaches the present moment but in its infancy, produces yearly a crop of honey above. It keeps the bees very by valued at  $\pounds 100,000$ . That is a very all the time the linden is in flower.

"How many bees do you reckom you have in each of your hives?"

you have in each of your nives rea . "A good strong colony is from 30,000 to 40,000. Some will run as far as 60,000, but if you average them all at 30,000 you will not do badly. So that I have about 30,000,000 of bees constantly at work. The figure sounds have a but considering that the hee large, but considering that the bee census returns of Ontario show a population of 3,000,000,000, my stock compared with that total is compara-tively insignificant." "What special advantages have you

in Ontario beyond the United States?"

"Chiefly in the linden trees. In the honey belt of the United States there is also less clover than we have, and the lindens are scarcer. The linden crop of honey is one of the most important, for linden honey is invaluable in cases of consumption or chest complaints. Our forests are full of linden trees, and the yield of honey is enormous. If you shake the tree the honey drops upon you from above. It keeps the bees very busy

"You speak of linden honey. Have you different brands of boney according to the different flowers which the bees frequent ?"

"Certainly. Not of all kinds, but of three—clover honey, linden honey, and thistle or wild weed honey."

"How can you distinguish between the honey that is collected from clover, and that which is gathered from the linden trees?"

"It is very simple. Every scientific bee-keeper in Ontario uses the honeyextractor, by which the honey is expelled from the comb without injur-The comb is placed in ing cylinder. The cening the cells. a rapidly-rotating cylinder. The cen-trifugal force that is generated, forces the liquid honey through the waxen seal at the end of the cell, and the comb thus cleared of honey is re-placed in the hive, and the bees at once begin to refill the emptied cells. The great point in hee-keeping, it must be remembered, is to save the bees trouble. The object of the beekeeper is to produce honey, not comb. .... We have three honey crops in the year, and by ordinary care it is quite possible to keep them quite separate." "Does the honey differ very much

in flavor?"

"There is all the difference in the honey that there is in the flowers from which it comes. People sometimes seem to imagine that a bee is a kind of insect-cow, which browses upon flowers and converts tho nectar into honey by a process somewhat analogous to that by which the cow converts grass into milk. A bee docs no such thing. It simply taps the flowers, stores the nectar in its bag, and empties the unchanged nectar into the cells in the hive."

"Honey in the comb we retail at "Honey in the comb we retail at Ontario for a shilling a pound. This is the finest white honey, and fully equal to that which is sold in your shops here at 2s, per pound. The ex-tracted honey, which granulates and becomes, as you will see in our ex-hibit, as solid as butter, is sold at about sd. per pound. There is no glucose or syrup in any of the Outario glucose or syrup in any of the Ontario boney. Our Association prides itself upon the purity of its produce, and offers a reward for the discovery of any adulteration. We are quite certain that it only needs that our honey be known for an extensive demand to be created, and we look forward with of the products of our honey harvest in the Colonial Exhibition."

# North American Bee-Keepers' Society.

## REPORTS OF VICE-PRESIDENTS.

# FLORIDA-FROM W. S. HART.

Bees here came through the winter in Bees here came through the winter in fine condition, but, notwithstanding that fact, 1886 has, without doubt, been the poorest year for honey that has been known in this State within the memory of the present inhabitants. In this part of the State (often called the bee-belt), where the greater portion of the State's erron is usually produced, there is, this very little loss, and the spring will long

Bees commenced to work a little early I dees commenced to work a little early in January on the maple; but on Jan. 9 to II we had the most severe cold snap that has been known for 51 years, and proba-bly for considerable over a hundred, judg-ing by the growth of mangrove killed at that time and still standing. This ruined our prospects for surplus white honey for the consen, by killing the tops of most of the season, by killing the tops of most of white honey from the cabbage palmetto, but a some apairs of the base of the base of the base white honey from the cabbage palmetto, but as some apiarists questioned its honey producing qualities, it was watched with much interest. The bees work upon it and the mangrowe at the same time and as and the mangrove at the same time, and as the latter could not give a crop this year, the season was a pretty good test. The catbage tree bloomed very freely, and the bees gathered little but pollen from it, and bees gathered little but pollen from it, and stored no surplus honey. A few days after the freeze the bees were at work again upon the maple. Honey and pollen came in slowly the rest of the winter and spring. The colonies bred up very rapidly, and by March 1 more honey was consumed by the brood than was coming in, so that in April many colonies bad to be fed

April many colonies had to be fed. Swarming commenced early in March, Swarning commenced early in March, and continued until May, although much of the time boney came in so slowly that all new colonies had to be fed imme-diately. March and April are usually dry months, but this year proved to be very wet. May and June, usually showery, were so very dry as to ruin the crop from bay, gallberry, saw-palmetto, and those plants and trees that usually give us an early surplus early surplus.

Then came the time for our main erop of the season from mangrove, which usually lasts until about Aug. 10, but this year honey was so scarce in June, July, and August that a bee-tent had to be used when working with the bees, to prevent robbing. The fall flow has also been unusually small, and the bees unusually inclined to rob. Most of us have doubled back all weak colonies, so as to carry through only the best of our stock.

Only a few reports have come in from other portions of the State in response to my inquiries, but those received all speak of small crops. Southwest Florida makes the best report, a small crop having been gathered from the wild pennyroyal early in the season. A fair increase of colonies is also reported from there.

In conclusion I will say that much of the black mangrove is putting out finely and even showed considerable late bloom.

### GEORGIA-FROM DR. J.P.H.BROWN.

The honey crop for the State of Georgia as been about an average. While the The honey crop for the State of Georgia has been about an average. While the Georgia honey will compare in body and flavor with any produced in the United States, it is much darker color than the average of the Northern product. Honey here is more difficult to classify as to its source, as we have such a multitudinous variety of honey-producing plants. Those beckeeners who work their base

Those bee-keepers who work their bees to the best advantage in frame hives, receive remnuerative returns for the labor and capital invested. The bulk of the crop is sold at home, and near markets, and I am not aware of any shipments to Northern or Western markets being made. Most of the honey is taken to market in the comb, and that which is in nice one and two pound sections sells for fully 50 per cent. more than the ordinary comb honey offered by the old box-hive bee-keepers in buckets and tubs.

During the past year the bee-keeping industry has about held its own in the State—if any move has been made, it has been on the side of progress and improve-ment in hives, appliances, and bees.

be remembered for its many genial and sunshiny days, so favorable for the devel-opment of young bees, and for the secre-tion of nectar.

Under these conditions, bees increased very rapidly, and hives were running over very rapidly, and hives were running over with bees when white clover bloomed. There were many cool nights during its blooming; yet the crop is a very fair average. As far as I have been able to ascertain, basswood never yields much in lllinois. The white clover bloom, with few exceptions, was followed by a severe and prolonged drouth, which cut short fall flowers, and only halt a crop will be the result. the result.

The intelligent management of bees is on the increase, and honey of good quality is abundant and cheap. The prayer of is abundant and cheap. The prayer of Father Langstroth, that every poor man might be able to have it on his table, is about to be answered.

### INDIANA-FROM JONAS SCHOLL.

Bees wintered well in this State, and early spring found nearly all of our wide-awake bee-keepers with their full quota of colonies, and those colonies full to overflowing with bees ready to take advantage of the early flow of honey. The elm, willow, maple and sugar-tree gave more than the usual supply of honey and pol-len. In short, the spring was very favor-able for rapid building up of colonies, and bee-keepers were jubilant over the pros-pect of once more securing a full crop of honey. But in this they were again dis-appointed, for, as the season advanced, the weather was less favorable for the secretion of honey. Repeated heavy rains coming at the time when the flow of honey is usually best through the central part of the State, and drouth in the northern sec-tions, cut short the honey crop, on a gen tage of the early flow of honey. The elm. the State, and drouth in the northern sec-tions, cut short the honey crop, on a gen-eral average, fully one-half. Yet this half crop will amount to 600,000 pounds in our State. The quality is excellent, and the bulk of our honey finds a market within the State, as our bee-keeping friends have learned, years ago, to build up a home demand for their surplus. Our main source of honey is white clover, with basswood north of the centre of the State. The yellow poplar, or tulip timber, was once vahable as a source of honey, but it is now becoming so scarce that but little surplus can be obtained from it.

from it.

Indiana compares favorably with other States in the industry of bee-keeping and the production of honey. Her varied and fertile soil can perhaps be depended upon to produce the different kinds of clover, equal to if not better than that of any of equal to if not better than that of any of the Central States; and while no particular locality can be said to produce enormous yields, yet through the entire length of the State, from Lake Michigan to the Ohio river, everywhere, with but few ex-ceptions, can bees be kept with profit. In the very important matter of wintering, Indiana bee-keepers can report as good results, generally, as others in the same latitude. In fact many of them are com-pletely successful in carrying their bees pletely successful in carrying their bees through the winter. Statistics give the number of colonies within the State at about 80,000.

### MICHIGAN-FROM PROF. COOK.

The season in most of Michigan has been characterized by a very severe and long continued drouth. Notwithstanding this I think the honey product of the State is fully 75 per cent of an average. State is fully 'to per cent. of an average. We find drouth and nectar may be compan-ions. With almost no rain in May and June, we had a fine white clover harvest, and quite an amount of basswood honey. The latter yield was cut short. Autumn The latter yield was cut short. Autumn rains have given us a fine croo of golden-rod honey. Two points I wish to em-phasize: 1. The importance of Alsike clover, which, even with an abundance of white clover, seems greatly to augment the June honey crop. 2. By the super-iority of goldenrod among our fall flowers. These plants give much excellent honey. I would add that, in my opinion, no one thing is more worthy the attention of bee-

keepers than this matter of honey-plants. How often raspberry or Alsike clover make the honey harvest which otherwise would be nothing, or nearly so, quite sat-isfactory. May it not be that we could every year be sure of a crop, if we had plants like the Rocky Mountain bee-plant, or possibly the Chapman honey-plant, which, despite drouth or rains or cool days, would still secrete nectar in quantity? I doubt if any subject con-nected with bee-keeping is more worthy of atteution. eepers than this matter of honey-plants. of attention.

### PENNSYLVANIA-FROM A. TODD.

PENNSYLVANIA-FROM A. TODD. The spring opened in Pennsylvania with every prospect of a good yield of honey, but wet weather set in and con-tinued with intermissions in such man-ner as to completely upset the anticipa-tions of early spring. A short crop of honey is the result, as far as my knowl-edge reaches. The autumn has been more favorable, and bees will go into winter quarters in good condition. The consumption of honey is decidedly on the increase by the masses, forming the popu-lation of the city of Philadelphia, and on the whole; preference seems to be given

the whole; preference seems to be given to extracted honey. I have to report the opening of a public aplary in the Zoological Gardens of this city (the first I think in the United States). Myself or a friend has, during each week, opened hives, explained bee-life, etc., to crowds of interested men, women and children. A photograph of this apiary will be mailed you herewith. The use of honey in manufactures has occupied ny attention, and honey candies,

honey ice-cream, honey lemonade, and honey ginger ale, have been made and sold this season with a most gratifying result.

#### QUEBEC-FROM II. F. HUNT.

QUEBEC—FROM II. F. HUNT. The past season has been under the average. The winter was comparatively mild with a good deal of rain during Feb-ruary. Spring opened early and warm; the months of May, June and July, how-ever, were dry, and the nights rather cool, which interfered greatly with the secre-tion of nectar in the clovers and linden. Some bee-keepers report that they did not extract a pound of honey, bees having gathered just sufficient to carry them through the winter. The average of losses in winter appears to be 34 per cent., and of the crop gathered,17 pounds per colony, spring count. spring count.

# For the American Bee Journal. St. Joseph, Mo., Bee and Honey Show.

### J. W. GRAHAM.

The apiarian display at the Interstate Exposition, at St. Joseph, Mo., about Sept. 1, 1886, was the finest ever held in the State. There were twenty exhibitors in the apiarian department, each striving to display not only his goods, but his ingenuity and skill in making them appear attractive

Of bees, there were Carniolans, Syrians and Italians (imported and home-bred), as fine as the linest. There were 18 observatory hives; and the Kretchmer, Shuck, Armstrong and Heddon invertible hives. There were honey extractors, knives and foundation mills.

There was comb honey in crates, cases, and fancy forms; extracted

honey in a variety of tin and glass vessels, arranged for the light to shine through the glass, giving it a trans-parency not always attained; and a very neat display of wax moulded in the shape of pears, looking so natural that the judges passed them, thinking they were natural fruit. The ladies had the honey-cakes,

and there were some fine displays of honey-producing plants, and several displays of apicultural literature numbering over twenty bound volumes each, besides samples of bee-papers.

But there was one general wish expressed, and that was that the Editor of the AMERICAN BEE JOURNAL was here to see how his "child" had grown. Many will remember that in 1881 Mr. Thomas G. Newman paid us a visit, when this department was in its infancy, and by a series of lectures laid the foundation of our present apicultural structure, of which we today feel so proud; and no effort will be spared next fall to have him here to enjoy, with us, the fruits of our joint labors.

Agency, vo Mo.

The following is another account which was sent without signature :

Having been attracted to the St. Joseph, Mo., Inter-State Exposition, by the liberal premiums offered in the apiarian department, aggregating over \$250, I desire to note the wideawake, progressive spirit manifested by the officers and directors of this Exposition, as I expected that such liberal premiums would bring out a fine display of everything appertain-ing to this industry.

I was astonished at the "prodig-ions" display, the neat and attractive arrangement by the many exhibitors of products of their respective api-aries, and the various implements used by them.

I will venture the assertion, however, that a finer exhibit was never made on this continent; and further, that no directors of any State, county or international association ever offered more liberal premiums, or provided for the requirements of exhibitors to as great an extent as did the officers of the St. Joseph Inter-State Exposition on this occasion. Nothing was asked of them (except space) that they did not grant. The number that they did not grant. The number of exhibitors and their large displays was so far in excess of what was expected that a very considerable amount pected that a very considerable amount of honey was not unpacked. It was impossible to provide space to exhibit all that was intended for exhibition. Exhibitors from Illinois, Iowa, Ne-braska, Kansas, Texas and Missouri were there with honey, both comb and extracted, in great abundance in yery neat attractive and tasty packvery neat, attractive, and tasty packages. The comb honey was in halfages. The contributioney was in half-pound, pound, and two-pound sec-tions; nearly all in neat and hand-some crates. There was on exhibi-tion some few "caps" (starch or shoe boxes) taken from the old log gum. The extracted honey was in glass and tin pails, in bottles and jars of beautiful designs, holding from a half to three pounds; in kegs and tin cans holding from 25 to 100 pounds.

There was an elegant display of beeswax in a large number of dif-ferent designs. Twelve entries were made for premiums on the best all-purpose hive, each of different design or pattern, showing that all beekeepers are not as yet convinced that the Langstroth hive cannot be improved, or that the Heddon sectional hive is the *ne plus ultra*.

Several very handsome observatory several very handsome observatory hives (in full blast), showing the stor-ing of honey, comb-building habits, and economy of a colony of bees, with drone and worker comb in with eggs, larve and capped and hatching brood, queen-cells, etc., which called forth a great many expressions of astonish-ment and admiration. In fact no other department of this great Expo-sition was as attractive to the thousands of visitors.

# Feeding Bees for Winter.

# JAS. M'NEILL.

In advocating the practice of feeding bees sugar syrup for winter stores, it may be well, in the first place, for me to con-sider some of the objections which are urged against the practice.

sider some of the objections which are urged against the practice. It is said that sugar feeding has a ten-dency to diminish confidence in the purity of honey. This is undonbtedly true. In many communities fully nine-tenths of the people believe that all extracted honey is adulterated. They have read that it is adulterated; nearly all with whom they talk are of the same opinion, and what is so generally accepted needs but slight evidence to be converted into absolute truth. When, therefore, such persons hear of a bee-keeper receiving a ton or more of sugar, and see him carting it through the streets to his apiary, they wink knowingly, smile self-complacently, and sagely remark : "That settles it." Even a bee-keeper of well established reputation has enough to do to success-fully combat the ignorant prejudice against his product without himself fur-nishing confirmatory proof against its punity. Nevertheless every thoroughly honest, self-respecting man feels that his manhood is degraded when he is called upon to forego what he thinks is a mani-fest advantage simply out of deference to the prejudice. ignorance and narrow

fest advantage simply out of deference to fest advantage simply out of deference to the prejudice, ignorance and narrow-mindedness of his neighbors. He who sturdily pursues a straight-forward, manly course in the conduct of his business, is sure to gain the respect and esteem of his fellow-men; and though his pecuniary interests may suffer for a time because of ignorance and prejudice, in the long run his independent honesty will bear its legifinate fruit in increased honor and confidence. confidence.

Again, some bee-keepers object to sugar feeding because of a desire, which has in it something of the sentiment of fealty to our avocation, not to build up the sugar interests at the expense of the honeyinterests.

It is estimated that there are 3,000,000 colonies of bees in the United States, and that the annual yield of honey is 120,000, 000 pounds. It is also estimated that 25 000 pounds. It is also estimated that 25 pounds of honey are required to winter a colony of bees. Now, if every bee-keeper should follow the practice of replacing this 25 pounds of honey with syrup, it is clear that the surplus honey of the coun-try would be increased more than one-half, and that an already over-burdened market would be still further depressed. Hence, the cry, "Do not elevate the sngar interests at the expense of the honey interests," seems to have in it the ring of worthy fealty to the brotherhood of beekeepers.

Let us, however, look at this matter from another stand-point. When we read the history of bee-keeping for the past 15 years, and reflect upon the great progress which the science has made, and the means by which this progress has been secured; how books and periodicals have multiplied through which every new idea has been spread abroad as soon as it was evolved; how the East has been traversed at great expense and discomfort for better at great expense and discontrol for better races of bees; how queen-breeders have vied with one another in their efforts to produce the most prolific queens—bees with tongues long enough to reach the honey in any flower—bees that get up earlier, stay out later, work harder, live earlier, stay out fater, work harder, live longer, winter better, and sting as little as possible; how supply dealers have multiplied, and flooded the land with their circulars;—when we reflect upon all these things, we marvel that some faithful friend of our chosen pursuit has not risen in solemn protest against this diffusion of knowledge, and this enlarging of our borders. For certainly this pro-gress of which we boast, and in which we rejoice, has exactly the same tendency as sugar feeding, namely: to increase pro-duction and to diminish prices.

In this matter, then, of sugar feeding for winter stores, the chief question involved, according to my view, is one of dollars and cents. If bees winter better on sugar syrup than on honey, and if, all things considered, it is money in the pocket of the bee-keeper to feed syrup, then let all who so believe act upon their belief, undisturbed by any conscientious scruples concerning their want of fealty to our brotherhood.

But there are those who believe that syrup is no better than honey for winter-It may not be better than some ing bees. honey, but that it is better than the honey which is usually found in the brood-combs at the close of the season, I have not the slightest doubt. My own experience cor-roborates this view, and it is supported by the unequivocal testimony of some of our bee-keepers. Others, again, claim that honey and sugar are so nearly equal in price that the sugar-feeder has all his labor for nothing. Let us see how this is. The best granulated sugar in New York market is quoted at 6 to 6 1-3 cents. Clover

honey is also quoted at 6½ to 7 cents. the sake of convenience we will call them both 6 cents at the apiary. According to my method of making syrup—2 pounds of sugar to one of water—the 25 pounds of sugar to one of water-the 25 pounds of syrup needed for each colony would cost one dollar, while the 25 pounds of honey would be worth \$1.50. Now I can make the syrup for 100 colonies, and feed them in three days; while the 2,500 pounds of honey would take me as long to extract. A saving of 50 cents on a hive would owner to \$50 cents on a hive would amount to \$50 on 100 hives; and this would represent the wages of a week's work; and there are few bee-keepers who would

and there are few bee-keepers who would not be satisfied with such remuneration. But some may say that syrup made in the proportion of 2 to 1 is not the equiva-lent of honey. Be that as it may, in my experience 25 or 30 pounds of syrup so made has always proved ample to carry a colour of home the subscription of the sector of the sector. colony of bees through from September to fruit bloom, and that is the amount of honey which it is pretty well agreed is necessary to winter a colony out of-doors. Feeders cost something, it is true, but the expense in that direction need not be more than \$5 or \$6 per hundred. I will now give in detail my method of feeding. If the narration shall discover to my fellow bee-keepers any good points, or if it shall call out the good points in their methods, the chief objects of this paper will be accomplished. colony of bees through from September to

paper will be accomplished.

I begin to prepare my bees for feeding about the middle of September. The

brood is usually then reduced to 3 or 4 frames. The bees are contracted to 6 frames, a chaff division-board being placed on each side of the frames. The amount of honey in the frames containing brood is carefully estimated, and the number of pounds which it falls short of 25 or 30, according to the strength of the colony, is marked on the corner of the cover. The marked on the corner of the cover. The amount of honey left in the hive usually runs from 2 to 5 pounds. This is enough to ensure the bees against starvation till I get around with my feeder. When the hives are all thns prepared, an empty body is placed upon each, and I am ready to commence feeding.

My feeder is an inexpensive affair, My feeder is an inexpensive affair, made of a gallon paint-pail and a tin pie-pan. These pails can be had for 2 or 3 cents apiece from the painters, and the pans, I believe, are worth \$3 per hundred. Two nicks are cut in the edge of the pails three-eighths of an inch in depth. These are to allow the syrup to flow out when the pail is inverted. Being filled with syrup, a pan is placed on the top of the pail and it is quickly inverted. The syrup is held in the pail by atmospheric presis held in the pail by atmospheric pres-sure, while the nick in the pail allows the pan to remain about half full. These feeders are placed on the top of the frames inside the empty body, and the frames inside the empty body, and the syrup, being close to the bees, is readily taken, even during cool nights.

I use the best granulated sugar in mak-ig my syrup. I have a boiler which holds ing my syrup. I have a boiler which holds 88 pounds of water, and a keg which holds 88 pounds of sugar. When the water reaches the boiling point it is ponred ioto a barrel, and upon it are thrown two kegs

a barrel, and upon it are thrown two kegs of sugar. This is stirred till the sugar is thoroughly dissolved, when the syrup is drawn off into the feeding pails. These are then carried out and placed on the hives while they are yet quite warm. By the time the pails are distributed another boiler of water is heated, and if we have pails enough, we may keep up our syrup making and feeding until every hive has a pailful. By the next morning the pails are emptied, and the operation is repeated until each hive has its amount. repeated until each hive has its amount.

My feeder would be improved by having My feeder would be improved by having a larger pail. One which would hold 13 pounds would, as a rule, supply the re-quired amount to a colony at two feeds. Whereas, with my feeder, holding about 9 pounds, it is necessary to go over most colonies three times. But the larger pails would cost \$14 or \$15 per hundred, while the pails which I use cost comparatively nothing. nothing.

Read at the Indianapolis Convention.

# Reversible Hives and Frames.

# J. E. POND, JR.

The matter of reversible frames, and hives is one that is to some extent en-grossing the attentiou of the bee-fraternity, and I have chosen that topic, not that I feel that I can do the sublect full justice, but that I may put myself squarely on record, so far as my views in regard to the matter are concerned; and you will please bear in mind that I state views and opinions only, and not in a dictatorial manner, and that I stand ready at all times to defend the position I have taken, without claiming that I alone an correct, and those who differ are in the wrong.

In the first place we are led to ask, what In the first place we are led to ask, what is the necessity for departing from na-ture's laws, and the well settled prac-tice of ages? The only answer that I have as yet seen is, that by reversing frames we cause the honey they contain to be carried into the sections placed above them. If there is any other answer I have not seen it. Now this so-called advantage is more problematical than real, but the theory when first stated pos-

sessed enough plausibility to lead myself to accept it without testing, and give it my unqualified approval. The first tests 1 made, however, showed me its falsity, and 1 at once "reversed" my opinion and made public that reversal.

In practice, reversing frames is un-natural. So far as the method relates to is of considerable value, and sections it many of them that would otherwise be incomplete can be made perfect. It is true, also, that occasional poorly filled true, also, that occasional poorly filled frames can be improved by reversing them; but so far will the plan go and no farther to advantage. It is unnatural, and further to advantage. It is unratural, and further more, uneconomical. All the honey forced into sections by the process of reversing, is so forced at the expense of time and labor, caused by the removal; and this would be saved by causing the honey to be deposited in the sections when first gathered. Again, it is so forced at the expense of the life of the colony itself. The brood-nest is completely broken up, and the bees left in a terribly bad condition to withstand an inclement winter season.

I need not say that in order to get the best results, we must work in accordance with natural laws, and not give our bees an extra or unnecessary step to take, or amount of labor to perform; and it can at once be seen that when honey is first deposited in the bottoms of the frames, and then re-conveyed into sections, that extra time is used and extra labor done. unless it is assumed that the honey could not have been forced into the sections Now I admit that he who finds otherwise. tault without offering a substitute is entitled to no consideration whatever. I do not propose to be caught in that trap, and so I offer a substitute; one that is in direct accordance with the laws that govern the economy of the honey-bee and hive: one that is plain, simple and inex-pensive, and one that works alike every time, and without a single failure.

One of the chief reasons why the frame hive has not been a complete success, so far as controlling swarming, and the get-ting of surplus placed where desired, is the original placed where desired is owing to the fact that we have not builded as well as we knew. We have known all the time that bees would not seal up brood in cells more than 7-16 of an inch deep. We have known also that they deep. We have known also that they would not seal up stores in shallow cells, when they could find deep ones for that purpose. This in itself ought to indicate what is required; but it would seem that the remedy is so simple that it has not been applied. That remedy I have of-fered in the bee-papers, and I again offer it here and as follows: it here and as follows :

Work the frames in the brood-chamber just seven-eighths of an inch thick, and just bee-space apart. By this means no cells will be built over 7-16 of an inch deep, and if sections with deep cells are given, nothing but brood will be deposited in the brood-chamber, so long as sufficient room for stores is given elsewhere. One of the recommendations this method has, is, that it requires nothing but what is found in every apiary. No new traps of any kind are required, and further, when the surplus crop- is stored in sections, the broad-chamber will be found in the best possible condition for wintering.

In writing the above 1 have purposely refrained from going further than stating my position, in order that nothing but a topic for discussion may be presented. I trust that the subject will be ventilated, and I assure you that I have no "ax to grind" in presenting my ideas.

The Patsaliga Bee-Keepers' Association of 137 The Patasliga Bee-Keepers' Association of Ala, request bee-keepers throughout the State, to meet delegates from this Association in Mont-gomery. Ala. on Nov. 9, 1886, for the purpose of forming a State association. The State Agricul-tural Fair will meet there on Nov. 8, and hold one week. Liberal premiums are offered to bee-men. Let me hear from every bee-keeper at once. J. R. McLENDON, Pres., Stoddard, Ala.

SELECTIONS FROM

Scent of Honey.-J. Chapman, (7), Woodville.+⊙ Mich., on Oct. 11, 1886, writes :

I was somewhat surprised when I read Prof. Cook's answer to Query 313. I had always been told from boyhood that bees would scent their honey with peppermint when gathering nectar from that plant. In the year of 1884 I extracted 100 pounds from the hives in my apiary, that was nicely flavored with peppermint. The nectar was obtained from the peppermint plant growing along the creeks about a mile from my apiary—and no peppermint bottle concerned in the matter.

Infertile Queen.—Louis Werner, Edwardsville, 9 Ills., on Oct. 19, 1886, says:

I send a queen that has not laid an egg in four months, and I wish that Prof. Cook would give her a trial test, for it is something that has never before come under my observation. She was hatched on June 25, 1886.

[As will be seen on page 77 of my "Bee-Keepers' Guide," I mention this as an occasional peculiarity of queen-bees, and comment upon it. That queen-bees should be occasionally infertile is no more surprising than that other animals, even to the bighest, should be so. It is due to some abnormal or defective peculiarity of the queen's reproductive organs.—A. J. Cook.]

Bees Still at Work.—Mrs. O. T. Jackson, Sigourney,∝ Iowa, on Oct. 20, 1886, writes :

We are having lovely weather for October, and very little frost yet; nearly every thing has the appearance of summer. The white clover is in bloom, and the bees are quite busy gathering honey from the red clover. On Oct. 12 I visited the apiary of Mr. Sears, of Thornburg, Iowa, 17 miles from here. If is a member of our State Association, and a practical beekeeper. He has about 300 colonies, and his son, who is also an expert,

very kindly offered to show me through his apiary, honey-house, and the rows of beautiful honey. Joining this is his work-shop where he makes all his hives, frames, etc. I also saw the cellar where he winters his bees, and took notes of his manner of ventilation, etc. He is a reader of the BEE JOURNAL. Mr. Sears does not paint his hives, as he thinks that they retain moisture, and there is more dead bees in the spring in a hive that is painted than in one that is not painted. I would like to know whether Prof. Cook thinks it makes any difference.

Report for 1886.—W.M. Woodward, Custer. + Ills., on Oct. 12, 1886, says :

The best honey flow of the season was from the yellow willow, and the honey is nice. It is losing the bitterness of the flavor with age. The white clover crop was prolonged, but slow and tedious, and gathered with much labor for both man and bees, but a fair crop was secured. Heart's-ease only yielded surplus honey about two weeks, and then slow, and the crop is light. All around we have perhaps a little over an average crop. My best colony of brown German bees gathered 190 pounds of comb honey in one-pound sections. My total crop was 1,400 pounds of extracted honey from 17 colonies, and increased to 54 colonies, all in good condition for winter.

Malignant Foul Brood.-A. H. Noble, Nashville, 5 Tenn., on Oct. 18, 1886, writes :

I purchased some 3 and 4 frame nuclei last spring and gave them empty combs. They built up rapidly, and did well during the honey flow of May and June, but since then they have been on the decline, gradually dwindling. Through my ignorance I supposed the queens were not doing their duty, therefore I commenced feeding them liberally, to "stimulate" the queens, as a bee-man would say. But all to no purpose. The queens looked fine, and I always found plenty of eggs in the cells, but they never hatched, became rotten, the grub turning to a brown, ropy substance, very offensive to the smeli. It finally dawned upon me that it was foul brood. In fact I was pretty well satisfied that this was what alled them. So in my helplessness I sent for a practical bee-friend of mine, who came over with his bound volumes of bee-papers, and proceeded at once to diagnose the case. The first hive we opened convinced him. Says he, "I would not have my apiary in this fix for \$500." But he could tell me nothing to do for it, but to destroy them all. Well, I have been reading up remedies ever since, and I concluded that I must do something. The disease has left them all more or less weak, so I have decided to unite them, making 2 strong colonies out of my 6 weak ones; for if they are curable, I can operate on 2 colonies better than I could 6. I

am now at "the end of my rope," and if any of the veterans in the business can suggest anything that will be of any service to me, I would be pleased to hear from them. There is no doubt that mine is a well developed case of malignant foul brood, corresponding precisely with all descriptions given of it. I have only 6 cotonies, but if I am advised to destroy them, they shall go.

[The only safe way for an amateur is to destroy hive, bees, and all, at once. It is too dangerous for such to experiment with foul brood in its malignant form.—ED.]

**Only Half a Crop.**—H. L. Wells, Defiance,  $\infty$  O., on Oct. 9, 1886, says :

I commenced last spring with 47 colonies, sold 3, doubled up the balance until I had 40 average colonies. I increased them to 100 colonies, and averaged 50 pounds per colony, spring count, 650 pounds of comb honey, the balance being extracted. Owing to the dronth the honey-flow ceased three weeks sooner than usual. The basswood was a total failure here. To average up, there was not over a half crop in this section. I think I did the best of any one in this locality, but it took hard work, and I did not let the bees lose a minute while the flow lasted. Besides the honey that I took off, I have an abundance to winter my 100 colonies without feeding a pound of sugar or anything else.

Bee-Keeping in Florida. — John Craycraft, Altoona.⊙ Fla., on Oct. 6, 1886, writes :

I find that I cannot keep bees with-out the AMERICAN BEE JOURNAL. Its scientific teachings apply to this climate if double-walled chaff hives and cellar wintering do not. Our winters here do not require such fixtures. I use a single-walled Sim-plicity hive, loose bottom-boards, and the best of tin roof, and all painted white. I also use 10 frames, 91/x131/2 inches. This size suits me and my methods and wants better than any other. I reared queens early in the season, then for comb and extracting, tiering them at times to four stories. For comb honey I use cases holding 18 one-pound sections, tiering them up as the bees progress in filling them, always placing the empty cases under the one partly filled. I work my frames close in the brood-chamber-ten frames in a space of 13 inches; but alone for extracting I use nine in the same space. I work all of my nuclei for rearing queens in the same size hives, only one story. When I double up I place the queenless colony over the one having the queen, leaving the enameled cloth between them, only turning up a little in one corner so that the bees will find their way below slowly. All will be right in a day or two. Very few bees will return to the old stand. The combs can be changed to suit the colony, and the cloth removed from between

Pleurisy-Root,-John Haskins, Empire Prairie, ~ Mo., on Sept. 27, 1886, writes:

On page 552, Mr. Heddon gives a good description of the pleurisy-root as a honey-plant; but he is mistaken in thinking that it does not grow on the rich prairies. The prairie here is very rich, the soil is black, and the It grows from 2 to 2½ feet high; one root here on the richest soil will probroot here on the rienest soft will pro-ably keep hundreds, if not thousands, of bees husy daily for weeks, and if you wish them to bloom late in the season, just cut them off. The roots grow to a large size here. The seeds can be sown like cabbage seed. Try some this foll and uset spring when some this fall, and next spring when the plants are large enough, plant them in rows 3 to 4 feet each way. One thing Mr. H. did not speak of, is that it seems to furnish no pollen, or scarcely any for the bees. I send you some of the seed in this letter, and some of the pods in a package.

[Thanks for the seed and pods, which were duly received.-ED.]

Italians vs. Black Bees.-S. L. Watkins, Placerville, O Calif.; on Oct. 6. 1886, writes :

I increased my apiary from 4 colo-Increased my aparty from 4 color-nies to 16, aud took from 1 colony of Italians over 300 pounds of comb honey; from my best black colony about 80 pounds. My Italians have shown themselves so far ahead of the black bees that I will change them all to Italians next season. They are storing honey from the hortshown to Italians next season. They are storing honey from the hartshorn, and the blacks are not doing anything. Our main honey-plant here is falacio, a small shrub about one foot high. It has a fern-shaped leaf, and a blossom something like a straw-berry. It yields honey for about two months, and the honey form it is as good if not better than that from white clover. It is also very thick, and weighs about 11 pounds to the collon California Illog is a protty gallon. California lilac is a pretty good honey-plant, and the bees worked very hard on it this season.

My Report-Asters.-Otto Bussanmas, Bevington, O Iowa, on Sept. 25, 1886, says :

In the fall of 1880 I obtained 7 weak colonies in all kinds of boxes and log gums. I lost all of them the following winter, but I was not discouraged. I then bought one colony in June, 1881, and by the fall of 1884, I had in-creased it to 33 colonies, but I lost like all other bee-keepers, and the balance (11 colonies) were very weak. I increased them to 31 colonies in 1885, and extracted 1,600 pounds of honey, and this year I have increased the 31 to 65 colonies, and harvested the 31 to 65 colonies, and harvested 3,400 pounds of white clover honey, and I think by the time I have all of my fall honey taken off, that it will be 1,200 or 1,600 pounds, besides leav-ing them from 35 to 45 pounds for sugar to bees and selling the honey. My bees are still busy. I went out

to day to see what they could work on, and I was surprised to find them on white and red clover. I found three kinds of flowers on the hank of a creek not far away, where the bees worked as hard on them as if it had been linden or white clover. I will been linden or white clover. I will call them Nos. 1, 2 and 3. Will you please name them?

[Nos. 1 and 2 belong to the family of asters, and No. 3 to the mint family.-ED.]

Honey all Disposed of .-- J. Meader, Delaware. O+ Iowa, on Oct. 6. 1886, savs:

I have endeavored to profit by the reading of the many valuable articles contained in the BEE JOURNAL from time to time. I have always tried to furnish my honey in the best condi-tion possible. I have never had any one to find fault with my sales. My crop for this year is all sold at good prices. I have held all my old customers, and have gained many new ones. This can only be done by honest and fair dealing.

One of the Asters.-A Clendenin, Morrisonville, OIlls., on Sept. 30, 1886, writes

What is the name of the enclosed plant? My bees work on it from morning until night.

[It is one of the asters.-ED.]

### Convention Notices.

The New York State, the Eastern New York and the New Jersey & Eastern Bee-Keepers' As-sociations will build their great united convention at Albany, N.Y., on Jan. Js, 19 and 20, 1886. This ennvention will be une of the largest, if not THE largest, ever held anywhere in this conntry, and it, behooves every bee-keeper to attend. A grand exhibit of aplarian flatures is promised. An un-usually brilliant programme will be prepared and announced later.

The next annual meeting of the Michigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTINO, Sec.

Contral Bee-Keepers' Association will hold its next meeting at Mt. Sterling, 111s., on Nov. 24 and 25, 1886. J. M. HAMBAUGH, Sec.

A. H. HAMBAUUH, SEC.
18. The next meeting of the Bee-Keepera' As-aociation of Hamilton and Tiptun counties, Ind., will be held at Westfield, Ind., on Saturday, Nov. 6, 1886. The following interesting programme has been arranged: Opening exercises; Music; Ad-drees of welcome. H. Mills; Best method of win-tering beea, D. Leaming; Diacnasion opened hy Marion Moore; Best method of reulizing the lar-gest amount of profit on a colony of bees M. Doherty; Discussion opened by Isaac Booth, Best method and dime to prepare the bees for apring work, Zimri Kivett; Discussion opened hy Dixon Bray; Question box. All interested in hee-keep-ing are invited to come, bringing their baskets well dilled, so as to stay all day, and make this one of the most interesting and profitable sessions that the Association ever held.

The next annual meeting of the Nebraaka State Bee-Keepera' Association will be held in Lincnib, Nebraska, on Wednesday, Jan. 12, 1887. Location of Hall to be used and Hotel accommo-dations will be given after further arrangements have been made. H. N. PATTERSON, Sec.

Money Orders can now be obtained at the Post Offices at reduced rates. Five dollars and under costs now only 5 cents. As these are absolutely safe, it will pay to get them instead of the Postal Notes which are payable to any one who presents them,

### Honey and Beeswax Market.

The following are our very latest quotations for honey and beeswax :

#### CHICAGO.

HONEY.--Receipts are likeral and prices vary from 10@13c.per lb. for white in sections varying from 1 to 1½ and 1½ lbs. Many sales of good white 1-1b. sections are made at 11c. Extracted is quiet and ranging from 5@7c. BEESWAX,-23@25c. R. A. BURNETT, Oct. 13. 161 South Water St.

### NEW YORK.

NEW YORK. HONEY.-We quote this year's crop as follows: Fancy white in 1-lb. sections, clean and oeat packages, 156/16c.; 2-lbs., 120/13c.; fair to good 1-lbs., 120/14c.; 2-lbs., 100/11c.; fancy buckwheat 1-lbs., 120/14c.; 2-lbs., 90/10c. White clover ex-tracted in keys and amail barrels, 64/69/7c.; Calif-ornia extracted in %)-lb. cana, 565 1-2c.; Califor-nia comb honey. 10/31c. BEESWAX.-Prime yellow, 22024c.

MCCAUL & HILDRETH BROS., 34 Hudson St,

### BOSTON.

110NEY.-The demand has improved. We are selling one-pound packages of white clover honey at 14@15c; 2-pounds at 13@14c. BEESWAX.-25 cts. per lb.

BLAKE & RIPLEY, 57 Chatham Street.

#### DETROIT.

HONEY.-Beat white in 1-b. sections, 12@130.; dark, 10@11c., with a good supply in commission houses. BEESWAX.-23c. Oct. 10. M. H. HUNT., Bell Branch, Mich.

#### CINCINNATI.

IIONEY.—Demand is fair for choice comb in 1 and 21b. sectiona, which prings 12@15c. a pound in a jobbing way, according to quality and neatness of package. There is a fair retail and jobbing de-mand for extracted in square glass jars, while the order trade for dark grades from manufacturers is improving. Range of prices for extracted is 3%@ 7c. per lb. BEESWAX.—It is in good demand, and good vellow brings readily 20c.

Oct. 9. C. F. MUTH & SON. Freeman & Central Av.

### CLEVELAND.

HONEY.-Choice new honey in 1-lb. sections is selling at 14c; 2-lbs. 12@13c. Old honey is very dull at 10@12c. Extracted, 6@7c. BEESWAX.-25c.

A. C. KENDEL, 115 Ontario Street.

### MILWAUKEE.

MILWAUKEE. HONEY.-The market for honey of choice qual-ity is firmer and we are trying to establish a high-er range of values. We quote 1-lb. sections of white at 12½@13c.; 2-lbs., 11½@12c.; dark not wanted. Extracted, white, in half barrels and in kegs.6½@7c.; in tin packages, 7@7½c.; in barrels. BEESWAX.-No demand.

Oct. 2.

A. V. BISHOP, 142 W. Water St.

### SAN FRANCISCO.

HONEY -- There is a firmer market for extrac-ted, and especially for comb honey, as the crop of the latter is rather small. Apjarists have sold what they were obliged to dispose of for payment of packages and labor, and they hold the balance back at higher prices. The demand is increasing, and we quote with ready takers, 4@414c. for choice extracted ; 34@32c. for amber extracted ; and @@11c. for comb houey in 2-lb. sections; 12@13c. for 1-lb. sections.

BEESWAX.-It finds buyers at 20@23c.

Sep. 28. SCHACHT & LENCKE, 122-124 Davis St.

HONEY.-Trade is quiet. Extra white comb 11c; amher, 754610c. Extracted, white, 46414c.; am-ber 3546354c; BEESWAX.-206023c. Oct. 18. O. B. SMITH & Co., 423 Front Street.

#### ST. LOUIS.

HONEY.-Choice comb, 134@12%c.; latter price is for choice white clover. Strained, in barrels, 34@4c. Extra fancy of bright color and in No, i packages, % advance on above prices. Extracted in barrels, 4%@5%c; in cans @67c. BEESWAX.-Dull at 21c for choice.

D. G. TUTT & CO., Commercial St. Oct. 21.

#### KANSAS CITY.

KANSAS CITY. HONEY.-Demand for all grades is good, and sales are large. Receipts are good and prices are steady with a firm feeling. We quote: 1-1b. soc-tions of white clover, 136046.(adx, 1060/12c, 12-1ba., white clover, 1360/14c, 1460/15c, 12-1ba., 96011c; 32-1bs., white clover, 146015c. Extracted white clover, 667c; dark, 4655c; white sage, 5½C; Calif, amber, 5c. BEESWAX.-20622c.

THOMAS G. NEWMAN & SON. PROPRIETORS. 923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAGER.

# Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing mouey) that have no name; many others having no Pest-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will elub for \$1.50.

A New Crate to hold one dozen one-pennd sections of honey .- It has a strip of glass on each side, to allow the honey to be seen. It Is a light and attractive package. As it helds but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 cts. per erate. Glass 1%c. per light, extra.

Yneca Brushes are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brush, they are almost indestructable. When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 cents a dozen; if sent by mail, add 1 cent each for postage

Five Thousand new anhseribers to the BEE JOURNAL is what we have made our calculations for; they will come in clubs between now and next spring. Installments are coming every day.

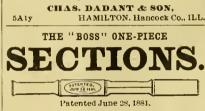

127 Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a elub can have sample copies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

# THE CHAPMAN HONEY-PLANT.

IN accordance with a previous notice in bee-the seed of the above plant at the following prices:  $\frac{1}{2}$  ounce,  $\frac{1}{3}1$ ; 10... $\frac{1}{3}2$ ; 20... $\frac{1}{3}3$ ; 40... $\frac{1}{3}5$ ; and  $\frac{1}{3}$  lb,  $\frac{1}{3}$ . On account of extreme drouth my slock of seeds a limited an persons ordering will be served in rotation. The seed should be sown in early spring and general directions for cultiva-tion will be given on each package.

tion will be given on each package. This plant is not an obnoxious weed, but is as easily eradicated as clover. Having carefully watched its habits of growth and its honey-pro-ducing qualities for the past six years I believe those who commence its cultivation in a liberal way will be hetter pleased than by commencing with a small quantity of seed. It has been tested by prominent beekeepers all the way from Ver-mont to Nebraska and Ontario. We refer to the report of the committee appointed by the North American Bee-Keepers Society held et Detroit in 1885. The committee reported at the indianap-olia, ind. convention held Oct. 12-14, and their report will be found in all hee-papers publishing the report of that convention. Write all orders plainly and give your post-office address in full.

I AM now prepared to supply dealers and others with

Hives, Sections, Shipping-Crates, Supers, etc., of all kinds. Lunkte aspedatory of LANGSTROTH AND MODEST HIVES. Correspondence with supply dealers solicited. My Sections are all made from Poplar. Address,

GEORGE TAYLOR, DUNDEE, Kane Co., ILLS.

THE APICULTURIST AMERICAN

WILL be sent one year and a copy of the 3rd Edition of the Bee-Keepers' Handy-Hook, on receipt of \$1.50. The book contains 300 pages and 100 time illustrations.

HENRY ALLEY, WENHAM, MASS.

Wo have made arrangements with the inventor by which we shall make and sell the Heddon Reversible Hive, both at wholesale and retail : nailed and also in the flat.

The engraving gives a good idea of the hive. The broad-chamber is in two sections: also the surplus arrangement, which may be interchanged or inverted at will. The cover, bottom-board, and top and bottom of each sectional case has one-half of a regular bee-space, so that the surplus cases with the sections, may be placed between the two broad-chambers, or the latter may be transposed or inverted—in fact, all parts of this hive are perfectly interchangeable. The broad-frames will ALL be hored for wires.

ALL be bored for wires. A SAMPLE HIVE includes the bottom-hoard and stand; a slatted honey-board, and cover; two e-meb brood-chambers, each containing S frames; two surplus arrangements, each containing 28 one-pound sections, oue with wide frames and separa-tors, and the other without separators. This latter chamber can be interchanged with the other stories, but cannot be reversed. It is NAILED AND PAINTED, and ready for immediate use. Price, \$4.00, complete.

It is absolutely essential to order one nalied hive as a pattern for putting those in the flat together correctly.

HIVES READY TO NALL.—lo filling orders for these hives, in the flat, we make 6 different com-binations, so that our customers may make a selection from the sample nailed hive, without waiting for us to quote prices, and the different kinds will be known by the following numbers :

No. 1 consists of the stand, bottom-board, cover, two 6-loch brood-chambers, 16 frames, and the slatted honey-board. Price, \$1.55 each.

No. 2 is the same as No. 1, with the addition of one surplus story containing 28 sections without separators—interchangeable, but not reversible.— Price, \$2.00 each.

Price, \$2.00 each.
No. 3: is the same as No. 2, with two surplus stories as therein described. Price, \$2.50 each.
No. 4: is the same as No. 1, with the addition of one surplus story containing 28 sections in wide frames with sparators, which can be reversed, inverted, and interchanged, the same as the brood-commbers. Price, \$2.50 each.
No. 5: is the same as No. 4, with two surplus arrangements as therein described. Price, \$3.00.
No. 6: a contains all the parts as described in the

No. 6 contains all the parts as described. Frice, \$5.40. Sample nailed hive. Price, \$2.75 each. Those desiring the hives without the stand, boney-board or sections, may make the following daduc-tions from the above prices : Stand, 14 cents; honey-board, 8 cents; and the 28 or 56 sections, as the case may be, at ½ cent each, respectively.

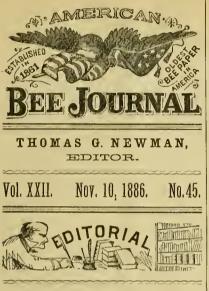

We will also make the following deductions on quantities ordered all at one time: For 10 or more hives, 5 per cent. discount; for 25 or more hives 7 1-2 per cent; for 50 or more, 10 per cent.

THOMAS G. NEWMAN & SON. 923 & 925 West Madison-St., CHICAGO, ILL.

# THE BRITISH BEE JOURNAL AND BEE-KEEPER'S ADVISER.

The BRITISH BEE JOURNAL IS published every Week, at Teo Shillings and 10d. per annum, and contains the heat practical information for the time being, showing what to do, and when and how to do it. It is edited by T. W. Cowao, Esq.

The British Bee Journal and the AMERICAN BEE JOURNAL, one year, for \$2.75.

Never Mind the crowd, lad, Nor fancy your life won't tell; The work is done for all that, To him who doeth it well.

Faney the world a hill, lad, Look where the millions stop; You'll find the crowd at the base, lad, But there's always room at the top.

Keep your eye on the goal, lad, Never despair or drop ; Be sure that your path leads upward—

There's always room at the top.

The Rev. Robert West, editor of the Advance, whose name occurred soveral times in the early numbers of this volume of the life JOURNAL in connection with the stories affect concerning the alleged manufactured comb honey, died quite suddeniy, a few days age, of apoplexy.

**\*\*A Prize of \$10** was awarded to Mr. E. C. Jordan, at the Winchestor, Va., Fair for an excellent exhibit of honey wine. Also one of \$3 for a wagen-box lok-stand. We also notice by the Winchester *Times*, that his son, E. C. Jordan, Jr., took five prizes on farm stock. He is no doubt a worthy son of a noble stre.

Honey for Catarrh.—A noted physician makes the following remarks: "When a tea-spoonful of warm honey is taken every 15, 20 or 30 minutes, it has a surprising effect on catarrh. Every family should have pure liquid honey in the house, in order, at once after eatching cold, to be able to use some."

Fanciful Design.—At the Maine State Fair, Mr. Norton's name over his exhibit was something of a curlosity. The letters were first cut out of a strip of wood prepared for the purpose, the places being filled with foundation. This the bees drew out, filled with honey and capped over. Then it was framed, a place of glass having first been put over the letters, and made an approgriate sign for his exhibit.

Is it True ?--We lind many items like the following taken from an exchange, going the rounds of the press, referring to the late convention at Iodianapolis :

There was a deluge of essays and papers, most of which had been written and forwarded by absenters. All could not be read, and to provide against mother such freshet of benbrations, it was resolved that berealier, the effusions of absent members should only be read in rare cases of special interest and merit.

Well, that is sublime 1. The facts are that there were 14 essays read, exclusive of the opening speeches ; and of these only 4 were from absentees. These were from Messrs. Aspinwall, King, McNeili and Pond; and we feel quite sure that each one of the writers were solicited to send an essay-they did not want to do so for the fun of the thing. Instead of saying that "most of the essays were from absentees," please say that about one-fourth of them were from absentees. Justice to these writers demands this public refutation 1 The editor of the HEE JOURNAL has often been solicited to send an essay to a convention (he generally declines the honor, however); but how he would feel to be one of the much-abused absentces 1 Such assertions aro unjust, absurd and insulting, after sending an essay upon urgent solicitation.

The Duty of the Hour.—In the American Agriculturist we find the following very sensible remarks concerning the present and future of our calling :

and future of our calling : Every observing bee-keeper has notified the effect upon our culling of upprofitable seasons like that just closed. Many will became discouraged, others will be indifferent and careless, and the result will be a great loss in hees, combs and fixtures. It is a noticeable fact that such a poor season is almost sure to be followed by a good noe. This heing the case, every prudent and farsighted bee-keeper will see the desirability of keeping his stock in the best possible shupe, and of holding himsolf in readiness to make the most of a better season when it comes. We should remember that this is but a teroporary embarrassment. We should avail ourselves of every advantage to winter our bees successfully. Preserve all surplus combs and sections, keeping them in the best possible condition for use next year. Seasons like this just past are full of experiences that cannot be acquired in any other

**Bees for a Body-guard.**—In Longman's Magazine we find a very peculiar item about bees, which is credited to Mr. Troudo, in his book entitled "Oceana." It reads thus :

We found, for one thing, the New Zealand hnoey especially excellent, taken from the nests of wild bees, which are now in millions all over the colony. They are the offspring of 2 or 3 colonies which wore kept, when I was at Oxford, to the reoms of Cotton of Christ Church, hetween whom and his bees there was such a strong attachment that a body-gnard of them used to attend him to lecture and chapel. Cotton went to New Zealand with Hishop Selwyn, and took his bees with him, and they were multiplied in this marvellous manoer.

Now-a-days they are not much admired in the capacity of body-guards. To fact, people generally prefer to guard their bodies from the bees-especially if they know but little about their culture.

**To all New Subscribers for 1887** wo will present the rest of the numbers for 1886; so the sonner they subscribe the more they will get for their money.

American Bee-Papers.—One item in an essay read at the Indianapolis Convention, which escaped notice, was the following :

America stands ahead of all the world in beekeeping. Look at the array of beepapers 1 It is greater than all the rest of the world combined—two weeklies, one semi-monthly, and three monthles, to say nothing of numerous other periodicals that combine beekeeping with something else. To say that we have a greater number of apleultural papers, and to say we are in advance of all the world in our art, means one and the same thing.

The assertion that our American beepapers out-number those of "all the rest of the world combined," will be guite amusing, to sny the least, to the bee-keepers of Continental Europe. Germany alone has more bee-papers than America, and had the essayist said that Germany had more of them than "all the rest of the world combinod" (including America), it would have been far nearer the truth ! We mention this, not because we like to criticise, but to give the facts ; because European aplarists aro fully aware that the editor of the AMERICAN BEE JOURNAL knows better, and we do not wish to be held responsible for the statement, even though we have printed 11

In the Destruction of nearly two-thirds of our primoval forests, by the march of elvilization on this continent, we have not only lost the forest bloom from which bees gathered hency in the summer, but also the protection afforded by such in the winter, as well as increased the danger of spring floods and summer drouths. This is a serious matter to apharists, and a very strong argument for placing bee-forage, and surrounding the apharies with basswood and other trees for protection as well as hencyproduction.

Paper Fuel for Smokers.—The Indiana Farmer of last wook contains the following concerning using paper rolls for smoker fuel:

Some find paper so useful in making smoke for quicting bees, that they buy it in large rolls. To get it in shape to use in smokers, take a slick one ball inch square and three feet long, and roll the paper around the slick until it is of sufficient size to fill the barrel of the smoker. Let an assistant the a string around the roll every live lackes. Then withdraw the stlok, and saw up the long roll into six short ones, and they are ready for use.

The Report of the Indianapolis Cenvention is now published in pamphlet form, uniform with that of last year. It will be sent postpaid for 25 cents to any address,

We have also bound it up with last year's, together with the History of the Society; this we will mail for 40 ceals. Or if you sond as one *new* subscriber (with one dollar) besides your own renewal, we will present you with a copy by mail.

Frank Leslie's Popular Monthly for November contains a very timely article on "The Great Fishing Ground, and its International Questions." As good as a janul to Jean is "Duolog at a German University :" and the "Trip to the Pyronees," takes the reader to the mountains which cut off the Peninsula frem ordinary travelers, etc.

# Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, he put in type, and sent in about a dezen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.—ED.]

# Pollen Alone for Bees.

Query, No. 332.—Can hees live on pollen alone, or will they starve during a drouth, or when the flowers yield no honey, if they have plenty of pollen but no honey?—Dawson, Ky.

Bees cannot live on pollen alone.— W. Z. HUTCHINSON.

I think they would soon starve.—A. J. COOK.

No, sir, they cannot live on pollen alone.—J. P. H. BROWN.

Bees will not live on pollen alone.— H. D. CUTTING.

I had bees starve with plenty of pollen in the combs.-C. C. MILLER.

They would starve every time, according to several tests which I have made.—G. M. DOOLITTLE.

They will starve on pollen, but when there is pollen in the field, there is almost always some honey.—DA-DANT & SON.

I have never witnessed such a test, but I believe that the bees will starve, though the pollen would prolong their life some.—JAMES HEDDON.

Bees cannot live on pollen alone in winter confinement. I cannot say as to summer time, as we never had a time here when the flowers yielded nothing. I have noticed that when bees swarmed-out from nuclei, that they leave no pollen.—G. L. TINKER,

They cannot live on pollen alone at any time of the year. I have had ample opportunity to test this matter. There is nothing whatever in the whole pollen business except that pollen is the natural food of the honey-bee while in the larval state.— G. W. DEMAREE.

Bees cannot live on pollen alone. They will starve unless they have a supply of honey or its equivalent for food.—J. E. POND, JR.

# Do Drones Work?

Query, No. 333.—Have yon ever seen a drone on bloom at work? I have always heard that drones did not work or gather anything from bloom. This is a question of some importance here.—B. S. F., Indiana.

No.-C. C. MILLER.

No.-J. P. H. BROWN.

No.-H. D. CUTTING.

Drones do not work on blossoms, or otherwise. They feed in the hive.— DADANT & SON.

No, I never have seen drones work, and I am quite firmly impressed that I never shall be able to see it.—JAMES HEDDON.

I have never seen a drone at work on flowers. It is not their work.—A. J. Cook.

I never have, nor do I believe they ever do so long as they have the "run" of the hive.—G. M. DOOLITTLE.

I have never seen a drone upon a blossom, and I am at a loss to know why the question is of more importance in Indiana than elsewhere.—W. Z. HUTCHINSON.

I have never seen a drone on a flower sipping nectar, and I do not think any one else ever did. They, however, have a use in the hive that has been grossly berated. — G. L. TINKER.

No, nor no other living man ever did; all due respect, however. In the Middle States there is a bee belonging to the "Carpenter bee" tribe so nearly like a drone (*Apis*) that a novice of considerable experience might mistake it for a drone. They live a hermit's life, and feed their young on pollen.—G. W. DEMAREE.

1 never saw a drone at work on bloom, or anything else for that matter. With their physical conformation, they cannot do it, for the reason that "they are not built that way."— J. E. POND, JR.

# Prevention of Swarming.

Query, No. 334.-1. How would it be if I should put a queen-excluding honey-hoard on the bottom-hoard of each hive to prevent swarming before the scason starts, and stand two cases of brood-frames on this, then another excluding honey-hoard on top of these, and confine the queen in these two cases, and then pile up cases on top of these as soon as necessary? 2. Will it keep the queen from swarming? 3. Is it advisable to do so if you wint a good harvest and no increase ?-F., New Jersey.

1. I would not like this method. 2. If the queen could not get out, it would keep *her* from swarming.—H. D. CUTTING.

It will keep the queens and the drones inside the brood-chamber. As to the result, you can better tell after trying. We should not like to do it.— DADANT & SON.

I think that there would be no advantage gained by the plan proposed. It is the bees which control the swarming-impulse more than the queen.—G. M. DOOLITTLE.

The best way to get an answer to this question would be to "try it on." If the queen is prevented from issuing, of course no swarming would take place; at least the bees would return if they did swarm out. I do not JAMES HEDDON.

think such a plan would be advisable at all. I should fear that the beeswould kill the queens after trying 2 or 3 times unsuccessfully to swarm.—J. E. POND, JR.

The bees would swarm, and finding no queen with them return. then a young queen would be reared and the old one generally destroyed, and if the young one could not leave, the colony would dwindle.—C. C. MILLER.

Of course it would prevent the bees from going off, although they might swarm out. I doubt if it would be desirable. If bees really get the swarming fever, they had better swarm and be done with it. Much room often keeps back the desire to swarm.—A. J. COOK.

Your plan probably might prevent the issuing of a fertilized laying queen with the swarm, and thus hold the swarm for a time in abeyance. But in many such cases the bees become angry at such perverse and obstinate queens and "ball" them to death, and then turn in and make queen-cells. The most of virgin queens could pass your honey-board with a swarm.—J. P. H. BROWN.

In one case where I tried a similar plan the bees reared cells and swarmed at the proper time. They came out twice and went back. A few days after a young queen was found dead in the excluder. I then removed it, and in about two weeksthey swarmed, the old queen with clipped wing leading. 3. I do not think it the best plan to prevent increase.—G. L. TINKER.

The plan you mention will keep the queen from going with the swarm, but the bees will swarm just like they will when the queen's wing is clipped, and if the swarming impulse runs high, the old queen will be killed in her confinement, and the slender virgin queen will slip out through the perforation, and you will have lots of swarming, of the kind I most dread, *i. e.*, after-swarms. — G. W. DEMAREE.

It would act the same as an entrance-guard, keeping both queen and drones in the hive. The droneswould die in the hive, the bees would swarm, and in time would probably kill the queen because she failed to follow them. To be a success there should be a drone-trap used in connection with the queen-excluder, and when the bees swarm some one must be in attendance to hive them and give them their queen. — W. Z. HUTCHINSON.

It would do first-rate, and you would be using one of the important functions of my new hive, and what I believe to be the best non-swarming arrangement yet devised; one which I have tested and wrote about, and you will find it described on page 104 of my book, where I briefly state the reasons of its superiority, and mention a drone and queen catcher used in conjunction with the device, and attached to the side of the hive;---JAMES HEDDON.

~

Explanatory.—The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark  $\odot$  indicates that the apiarist is located near the center of the State named;  $\eth$  north of the center;  $\blacklozenge$  south;  $\circlearrowright$  east;  $\circlearrowright$  west; and this  $\circlearrowright$  northeast;  $\circlearrowright$  northwest:  $\circlearrowright$  southeast; and  $\Uparrow$  southwest of the center of the State mentioned.

For the American Bee Journal.

Conventions, Bee-Keepers' Rights, etc.

# JAMES HEDDON.

My absence from the late convention of the North American Bee-Keepers' Society was as unavoidable as unexpected. Since reading the reports of that convention, I cannot but feel that it is possible for me to throw out a few hints that may tend to make our future gatherings more useful. Certainly it can do no harm to try, and in doing so let me assure the reader that improvement and advancement is my only aim.

I am of the opinion that Mr. W. F. Clarke is quite correct in his statement, that the North American Bee-Keepers' Society should be representative rather than local in its nature. I believe it would be a valuable change to have the members of this society elected representatives from State and local organizations. I believe it would be of more value if the meetings were more in the nature of business conventions, working for and representing the interests of subordinate societies, and bee-keepers in general.

Let me ask, is it not a mistake, after we have spent \$10 to \$50 to get to and from and attend these conventions, to have the dearly-bought time occupied by any kind of entertainment which we can get at home at our option, and for almost nothing. Among these things I may name essays which we can get through our valuable bee-periodicals, devoting our time to them when it does not cost us from \$5 to \$15 per day. I would devote this valuable time strictly to discussions of the knottiest questions and necessary business, and would avoid all the forms and ceremonies possible. I would copy after the shell-bark hickory-nut, which has a thin shell and thick meat. As "leaders" for subjects for dis-

As "leaders" for subjects for discussion, I would appoint persons to make extempore opening remarks. I agree with Mr. T. F. Bingham's expressed sentiments, that conventions are not proper places in which to read essays or make speeches framed to the pecuniary interest, or like damage of any individual, though I would not exclude a valuable fact or principle because it incidentally alluded to any person's interest or hobby. I would "hew to the line" of justice, truth and philosophy, "letting the chips fall where they might."

I have always felt a repulsion against the practice of making conventions a kind of fair for the exhibition of apiarian implements and supplies. I wish that the late convention had voted to entirely exclude the drowsy essay, which, when reported in our bee-papers, nearly always falls below the average contributions, and are, to me, far less interesting than reports of discussions.

I am glad to notice that the works of the United States Apicultural Station and Bee-Keepers' Union were brought before the convention. I am very glad that Dr. Riley induced our Government to substantially recognize our industry to the extent of establishing the Aurora Apicultural Station, with Mr. McLain in charge. While I have little knowledge of or interest in the questions of artificial fertilization, foul broad, etc., still I am aware that others have, and I have a deep interest in the question of the rights of apiarists in the community.

Mr. McLain's report regarding "Bees vs. Fruit," will prove of more value to our fraternity than all that the Station will cost us during a century. I wish that he had not said, near the close of his report, that perhaps there might be two or three days when beekeepers should close their hives till grape-owners could gather cracked grapes. I am sure that such closing of bives is entirely impracticable.

#### THE BEE-KEEPERS' UNION.

As President of the Bee-Keepers' Union, a union formed for the defense of bee-keepers, when their natural rights are attacked, I wish here to state that so far as my influence may extend, I do not mean to stop short of exact justice—a justice that will give to bee-keepers, against all others, just what rights maturally belong to them, I believe that these rights will extend thus far, that an apiarist may keep bees anywhere he pleases, so long as they do not become a nuisance. Now, when are they a nuisance? My answer is, when, and only when, they are placed in such position that they will in defense of their homes, attack persons or animals, when such persons or aniare pursuing their legitimate course on the public highway, or lands not belonging to the bee-keeper.

When John Smith's bee sallies forth from John Smith's hive, with the intent to sting in defense of that hive. I hold that bee as John Smith's property, and hold John Smith accountable for its acts. But when such bee leaves its home to peacefully pursue its labors, it ceases to become Smith's property, and Smith cannot collect damages of Brown if Brown kills that bee, so neither can Brown hold Smith responsible if Brown pinches the hee and the bee stings him, or if the bee goes into his kitchen after preserves, falls into his wellbucket or specks the clothes on the line. If Smith cannot hold Brown

accountable for the destruction of that bee, by what right can Brown hold smith accountable for the acts of that bee, after it has left its home and become public property, the same as bees in the woods.

Bees in nature, in hollow trees, whose whereabouts are unknown.may get into the preserves, water-pail, or speck the clothes, and will sting if pinched; but what can the law do about it? If, however, these bees should sting in defense of their homes, that home will be discovered at once, become the property of the discoverer, if he wishes to claim it, in which case be will become responsible for letting them remain where they will sting legitimate travelers, in defense of their homes.

It seems to me that bee-keepers must recognize the fact that our industry must either be legitimate or illegal, and if legitimate, no law must exist that will admit of compelling us to move our apiaries whenever a neighbor may see fit to hang out some clothes.

For 13 vears I kept a large apiary in the thickly settled part of our city, and never heard of their specking clothes but once; and though our own clothes-line was less than a rod from the apiary fence, our clothes were never specked; but only a few weeks ago a farmer living one-fourth of a mile from my apiary, told me my bees were badly specking the clothes on the line, while they were flying over to a buckwheat field. Now, where shall we be allowed to keep bees? I answer, any place where they will not sting legitimate passers-by in defense of their homes. The line must be drawn here, or petty courts will be drawing it in as many different places as the number of cases that come up.

### PRIORITY OF LOCATION.

Only a few months ago I wrote on the subject of "Priority-right of Location," trying to show why the prior occupant had a natural exclusive right—why such exclusive possession would result in the greatest good to the greatest number, and at the same time I declared my belief that the laws of nature would cause that condition of affairs to prevail, on the principle of "the survival of the fittest;" and I tried to show each reader how to "fit" himself to "survive." Surely, none have forgotten how malignantly my position was attacked mainly by those who had personal hatred, and who knew little of practical honey-producing. Now imagine my surprise at noting that at the Indianapolis convention a committee was appointed to inquire into the desirability and feasibility of asking our Government to legislate this condition of affairs.

dition of affairs. I believe the "survival of the fittest" plan is the better and only practical plan—the only one the Government will sauction—the only one in harmony with common law, and a sure cure for the trouble. We are now "governed too much" by legislation. Many of our laws are dead letters. I look upon it as a great mistake the moment we see something wrong, or conceive of an improvement in human affairs, to at once call for legislation.

Dowagiac, 9 Mich.

For the American Bee Journal. Uniform Temperature in Hives.

### W. F. SMITH.

In the answer to Query, No. 310, J. E. Pond says that "a large colony well protected from the winds, with some absorbent on the top of the frames that will allow moisture to pass off and the heat be retained," is the way by which practical uniformity of temperature can be maintained within a hive when wintering bees on the summer stands. The hive that I mention on page 570 embraces this as one of the prominent requisites, as it is so constructed that it combines the uniform bee-temperature of 12 colonies, with wool cushions on the top of each colony, so arranged that it carries away all the moisture and yet retains the heat, thus keeping the bees dry and warm.

Dr. J. P. H. Brown also says that with judicious and proper packing it can be maintained. The only judi-cious and proper packing, I believe, that can be found, is packing bees with bees. This I have also arranged so that each colony has bees on three sides, and packed on the fourth with wool, so that the extreme cold and sudden changes of weather can have no more effect upon them than it would upon a colony as large as 12 ordinary ones.

It is a well-known fact that the laying capacity of one queen cannot extend a single colony to the dimensions required to keep up a sufficient uniform heat to protect it from the cold and changes of weather in our severe winters; therefore, we must resort to the combination of colonies in order to obtain that uniform tem-perature. This has been my theory for the last twelve years, and for the last four years I have been trying to construct a hive on this theory, in which bees could be wintered with certainty and safety; and with two years' test it proves to be a success.

I am satisfied that it is useless for bee-keepers to struggle any longer with bee-houses, cellais, caves, clamps, single and double-walled hives, chaff or sawdust packing, or any other method that has for its object the protection of a single colony. We all know that a large percentage in these die every winter. The very largest cotony that possibly can be obtained from one queen cannot be relied upon to pass through a severe winter with any degree of certainty, with any of the above methods. While the com-bination of colonies in my hive secures a uniform and proper degree of temperature to protect them with certainty, both in winter and spring, and quite black. On leaving the it also induces early breeding, pre-vents spring dwindling, and pushes them forward ready for the first honey yield. They can be examined at any fourth or more affected, and also the hive and let them run in, the old hees-

time, and their condition ascertained brood directly across from the first without the slightest disturbance or danger.

The labor in transferring them in the fall is much less than packing them in single hives, or moving in cellars or houses, and it affords an opportunity to ascertain the true condition of each colony as they are put up for winter. It requires one-third less stores, and the mortality of bees is 50 per cent. less than that of single colonies; and I believe, from the two years' test, that the liability to diarrhea is entirely overcome by the con-stant removal of the monsture and exclusion of cold. I have 30 colonies now ready to put into these hives for the coming winter. I intend to make a model of the live this winter and send it for the BEE JOURNAL Museum.

Dutton, Ont.

## For the American Bee Journal.

# My Experience with Foul Brood.

### RANDOLPH GRADEN.

On page 601 Mr. Hoyle gives some facts, and intends to prove that foul brood is not contagious in a manner generally supposed; also that it cannot be cured by drugs or starvation; but claims that it is in the bad honey or honey-dew alone. If what bitle experience I have had with toul brood (if such it is, and I believe it is, as it is just as described in the bee-papers and books), then I differ from Mr. H. in some respects. It the dis-ease is not contagious, and it is in the honey alone, why does not the disease appear all through the hive at the same time? for, surely, if the honey or food is injurious to any part of the larvæ, it must be to all parts all through the hive or brood, and it would all become diseased at once, and in all colomes that worked on the same kind of forage.

I have seen the disease appear during the best of white clover and linden honey flows this season. It -ltfirst appeared in the colonies having the oldest or darkest brood-combs; and while those first colonies became badly affected, the odor could be smelt for rods away; while swarms that had been hived at the beginning of the honey-flow, on foundation, on hives only a few feet from the diseased colonies, were increasing in bees and also storing honey rapidly.

If honey-dew or bad honey was the only cause, those colomes would, no doubt, have all become diseased at about the same time. But I noticed that colonies, upon close inspection, were from all appearances clear of the disease, while in a few days afterwards it was found to contain a few cells of brood with the capping sunken and wrinkled in a space of about 1 or 2 inches in circumference; and upon opening their hive the young bees or larvæ were found dead and quite black. On leaving the colonies a few days longer it was found that the brood-comb contain-

appearance, and also the brood just back of the affected brood would show the symptoms of the disease, and so on until the bees are obliged to remove the honey from the outside frames, and there the last brood is hatched. At that time the colony will be a mere wreck, and an unbear-able stench will come from the hives. The brood or larvæ will be a putrid mass, so that if a pin-head is inserted it can be pulled out of the cell like a stringy, mattery substance.

I do not claim to know what the real cause of the disease is, but from what I have seen I think that the real cause is yet to be discovered. That it is incurable by drugs I am as yet unable to say, but according to Mr. McLain's statement on page 584, it appears to be, or Mr. McLain must have made a sad mistake. I am. treating mine in the following manner; whether the case will be perma-nent or not, I am at this date nnable to say:

First I take the frames containing the foul brood, and with a sharpened and curved piece of tin for the pur-pose, I shave the cappings off and then dust thickly with powdered coffce, and about every second or third evening I roll a piece of paper in a funnel shape, and put in some thyme (put it into the smoker), and ignite and blow a few puffs of smoke in at the entrance, when in a few days the odor will not be very strong. I then make a syrup of sugar and soft water, adding a tew drops of carbolic acid or phenoi to each plut of syrup. I now not the frames of the diseased brood to be somewhat shrunken and dried. I then sprinkle or swab the combs well, and also feed some of the syrup.

I have just examined 2 colonies thus treated, that three weeks ago had patches of foul brood the size of an ordinary tea-cup at the top, and in one colony I found no foul brood, but found the cells filled with honey and some of it capped, and in the others I found only one cell containing any foul matter, and most of the cells contained honey. I have just mixed some of Mr. McLain's preparation to try on some of the diseased coloures. Taylor Centre, Mich.

### A. M. GANDER.

The spring opened early after a moderate winter, and bees came through in good coudition, except 2 or 3 colonies which were weak, but there was plenty of pollen and some honey to be had right along from the time warm weather began. There was soon plenty of brood and young bees to spare from the stronger colo-nies, and by the time the honey baryest nies, and by the time the honey harvest was here all were ready for the supers.

taking wing and returning to their hive; by so doing there is no brood lost by the bees not being able to protect it, as the young bees are taken from colonies that are crowded and have plenty of bees to spare; the stronger one will not be injured, but benefited by being relieved of the crowd of young bees (or a part of them) that are not yet needed for the honey harvest, and their place will be filled in a day or two by bees that are filled in a day or two by bees that are constantly batching from the solid sheets of brood. The queen in the weaker colony is now given a chance to lay to her full capacity (which she could not do before, for lack of bees to protect and care for the eggs and brood), and this colony soon becomes as strong as any. Young bees may be taken from several colonies, and the weak one made as populous at once as any in the yard. If a comb or two of hatching brood is put in at the same time, all the better, as there are now bees enough to protect it.

Having the colonies all in good strength, and the honey season being for this section. The yield from clover was moderate, but from bass-wood it was light. The bees have gathered more fall honey this season than in any season for three years. As the result of the season's work I have 4,150 pounds of nice honey, 1,250 have 4,150 pounds of nice honey, 1,250 pounds being splendid comb honey, and 2,900 pounds being extracted. I took that amount from 47 colonies in the spring, and increased my apiary to 62 colonies to begin the winter with. All have enough honey to win-ter on. I am getting 10 cents for clover and basswood extracted honey in 5 and 10 nound lots. I sell the exin 5 and 10 pound lots. I sell the extracted honey to consumers.

Having a fine lot of honey, and wishing to dispose of it to consumers as much as possible, as is my custom, I made exhibits at Fairs this fall as a means of advertising, by bringing the product directly before the masses of people that usually attend the Fairs. This I did pretty well, as I had the largest exhibit at each of the three Fairs that I attended. For the Tri-State Fair at Toledo, Ohio, I put up an exhibit that brought out many expressions on the nice appearance of the honey, the exquisite whiteness of the comb honey, and the clearness of the extracted. What rendered it still more attractive, was the neat appearance of the packages, and the tasty and attractive way in which they were arranged all combined to make it pleasing to the eye. Some would the attractiveness of the display, by purchasing a package to tickle their palate and treat the inner man with a good, wholesome, and delicious sweet. At this Fair my exhibit was awarded the first premium for the most attrac-tive display of comb honey; for the most attractive display of extracted; best 10 pounds of comb honey, in best shape for shipping and retailing; best 10 pounds of extracted honey, and manner of putting it up for market considered; honey-extractor.

at our County Fair held at Adrian, that entirely eclipsed that made at Toledo, both in magnitude and splendor, which again brought forth many expressions in praise of the display, many saying that it was the best and most attractive display at the Fair, mainly because it was something new and different from what they are used

to seeing at Fairs. The total amount of the premiums offered in the bee and honey depart-ment was \$42.50, the most of which was taken up, there being but three exhibitors; there were not entries enough made to take up the whole list. Still we did well for a County Fair. The

next week found me at Morenci, Mich., putting up an ex-bibit there, which many said was the best of any exhibit at the Fair. Here the premiums offered were so small that it was scarcely any inducement to put up a display, but the dis-play was made any way, and did me good service by way of advertising. Had I not exhibited honey at this Fair last year and this, the bee-keeping interest would not have been represented, and the opportunity of showing the products of the honeybee lost.

Summing up the whole matter of attending and making exhibits at Fairs. I feel richly repaid for the ef-fort required, as the money received by way of premiums paid all expenses; so the time spent also fair wages for the time spent. Some honey was sold where it would not otherwise have been sold. Then there is the advantage gained by way of advertising, which is no small matter where a bee-keeper has a crop of honey to dispose of, and relies upon the people in his vicinity to consume it, thus laying the foundation for a permanent market at home. Add to the above the opportunity of meeting the many friends and acquaintances that attend the Fairs, I can say that I have had a good time, both for pleas-ure and profit. I do not wish any to think that mine was the only exhibit worth looking at, for, although I had play, there were other exhibits that needed looking at as well as mine. Nor do I wish any to think that I want to take too much praise on my-self for putting up a display. Where one has the material to make a dis-play of, it comes to one natural enough to arrange it properly.

Nitrogen, the Elements of Fat, etc.

## SAMUEL CUSHMAN.

On page 651 Prof. A. J. Cook says : "Mr. Samuel Cushman, on page 671, states that I say that nitrogen may be transformed into fat. He quite misunderstood me. There is no nitro-gen in fat, nor is there any carbon, hydrogen or oxygen (the elements of fat) in nitrogen. Hence any such statement would be perfectly absurd."

for anything from me; but lest any one should think that I have done the Professor injustice by such a state-ment, I quote the following from his essay on "The Pollen Theory," on page 25: "In some cases, as in fatty degeneration of the heart, almost pure muscle is transformed into fat." Does Prof. Cook deny that muscle is composed, the greater part of it, of nitrogen ?

In another place he says : "Again, when animals hibernate, or when they are long sick and take no food, the stored fat can, for a time, serve the purpose of all food." Then (he reasons) all organic food may under the best conditions be converted into fat. All organic food means so much albumen or nitrogen, and mineral salts, etc., as well as carbon—the fat and heat producer. This, he claims, can all be converted into fat. So much for my statement.

On page 26, he says: "We have seen that stored fat, in animals that hibernate, and in case of disease, will alone serve to keep up nitrogen." I question the truth of the statement that "stored fat will alone" serve to keep up the nitrogen, or for a time serve the purpose of all food.

Is it not well known that the nerves, muscles, and blood are all used and muscles, and blood are an used and wasted in such a case as well as fat? Of course when we are deprived of food, fat wastes the most rapidly, and it naturally would, as our daily food requires the greater proportion of those elements that may make fat, but the other elements are as surely wasted, although in a limited quantity. Pawtncket, 5 R. I.

### For the American Bee Journal.

# Are Bees Property ?

### C. L. SWEET.

Mr. Camm's article on page 454 con-An. Camm s attrict on pige 197001 tains some peculiar ideas about political economy and bee taxation. Mr. Camm says that if his bees were taxed he would "howl," and that he went into the bee-business to enjoy his natural rights. I live in the same State in which Mr. Camm does, and have paid taxes on my apiary for more than twenty years. It was as-sessed for the first time by myself.

The revenue law of Illinois enumer-ates certain kinds of property that is ates certain kinds of property that is taxable, such as horses, cattle, mules, etc., 36 questions, and then says, all other property. In another section it mentions by name particularly the kinds of property that are exempt. Now I reasoned in this way: If an apiary is property it is not exempt from taxation in Illinois. If any per-son should attempt to carry mine every without consulting me about so away without consulting me about so doing, I should be very apt to claim that bees were property. So they were assessed.

Were assessed. With my present understanding of this question, if I was the assessor in the township where Mr. Camm has his apiary, I should assess it, and then let him "howl" and fall back on his natural rights, etc. Neither would Returning from the Fair at Toledo, As the above is an answer to my his natural rights, etc. Neither would I prepared for and made an exhibit question, I suppose there is no call he be allowed to whine out on account of the keeping of bees being a new business. There have been some business. There have been some valuable inventions made in recent years, but that does not make the business new, any more than the in-vention of the last patent-churn makes the keeping of cows a new business. Besides, is it not better policy for bee-keepers to claim that the business is old for another reason? A bee is a commoner in the fields and forests, and has been for thousands of years. It has the right of way there. In Illinois if a wagon-road has been traveled even for twenty years, it is a road.

By what rule would Mr. Camm and that fast-increasing number of people about whom he tells us, value the and only for the purposes of taxa-tion, and not take into consideration the products of labor or improve-ments on such land made by labor? Would he tax a quarter section in Chicago, covered with buildings, some of which are twelve stories high, the same as he would a quarter section of barren sand-hills ? So the fertility of the land would not ligure, as it would require labor to harvest the crop. Without labor a quarter section con-taining a gold mine would be of no more value than the sand-hills. So it appears that if the land only was taxed there might be some difficulty in fixing the right amount on each tract according to Mr. C's proposed plan. I suppose this army of non-taxpayers will expect to do the most of the voting, especially when questions of taxation are being consideredbuilding school-houses, etc.

Glenwood, & Ills.

# For the American Bee Journal. The Stark County, O., Convention.

The bee-keepers of Stark and adjoining counties met in Grange Hall, at Canton, O. on Oct. 26, 1886. Mr. Oswalt, the President, on taking the chair, said that the society ought to instruct the committee appointed for that purpose, to get all the conces-sions that is possible in the way of a suitable building for exhibits, and increase in premiums, from the di-rectors of the Agricultural Society. Dr. G. L. Tinker thought that the premiums were so small, usually, that it was no inducement for bee-keepers to make exhibits, and also that the judges on such exhibits were usually incompetent.

Mr. Oswalt said that honey was classified with pies, cakes, jams and jellies, which should not be the case, but that a separate room or building should be provided for the purpose.

Dr. G. L. Tinker, of New Philadel-phia, then read the following essay on

# FOUL BROOD.

The disease of the larval brood of bees is yet wanting a scientific name. Mr. Frank Cheshire, of England, who is an expert microscopist, has investigated it and given a scientific namebacillus abrei. But this germ, if we number of plans of treatment, while are to judge by Mr. Cheshire's de-in some cases it has seemed to die out scription of it, is not the germ that is for a time only to break out anew, with 4 colonies, some of which were

the cause of true foul brood. He says that bacillus alvei is not conveyed in the honey from one colony to another, when all who have had experience with it unite in saying that honey from a foul broody colony will convey the disease promptly and surely. Mr. Cheshire also states that bacillus alvei may exist in the blood and ovaries of queens, and that in many cases the disease cannot be eradicated permawithout superseding such nently queens.

But the history of the disease has shown that every case, however virn-lent, may be cured by Mr. D. A. Jones' starvation plan, which consists in driving the bees into a box and confining them for 48 hours, or un-til all the honey in their honey-sacs is consumed; then hiving the bees in new hives on foundation. If all cases of foul brood can be cured by this plan, as is alleged, it would appear that the true germs of foul brood do not enter the blood of the bees or ex-ist in the ovaries of the queens; since, if such were the fact the starvation cure must fail to eradicate the germs in so short a time. We may conclude then that the true nature of foul brood has not been ascertained, and that we shall have to wait awhile yet for a scientific name.

That it is a germ disease, however, there is every evidence, as much so as in all the more contagious and danare now believed to be of un-doubted germ origin.

I have never seen a case of foul brood, but it is described as producing quite uniform symptoms and effects. The larvæ are usually sealed up by the bees before death occurs, after which a very foul odor arises from the combs and hives. The cap-ping of the cells becomes perforated, leaving a small pin-hole opening that seems to be a characteristic symptom. Both healthy and diseased brood may be found on the same combs, but in many cases there will be found little healthy brood left; the result being that the colony steadily dwindles initil it is robbed out by other bees of the neighborhood. Then it is that the disease is spread broad-cast, and it not checked by active interference, it will ruin the prospects of every beekeeper in its range.

But the robbing of an affected colony by healthy bees is only one way by which the contagion is conveyed. Foul brood may be conveyed in many ways, by careless bee-keepers indi-rectly to healthy colonies. The in-visible germs may attach themselves to the hands, the clothing, and to ntensils, and thus be carried long dis-tances. tances. A very common means of transmission is by means of the ex-tracted honey sold from apiaries having affected colonies. If a single drop of such honey is exposed, and taken by healthy bees it will convey the deadly venom with unerring precision.

The treatment recommended is varied, for success has attended a number of plaus of treatment, while

and usually with greater virulence at another time. Burning the coloanother time. Burning the colo-nies with fire where the disease is early discovered, has many times stamped it out speedily, and in some cases it may be still advisable to use fire, where the owner of the colonies is unable at once to attend to them. Treatment of some kind is impera-tive, and the greatest care is required to prevent any attempt at robbing by keeping all sweets out of the reach of the bees.

The starvation cure is reliable, and I believe that Prof. N. W. McLain's treatment lately given in all of the bee-periodicals is also reliable. But it is entirely useless to attempt a cure by a hap-hazard or incomplete course. The treatment must be thorough so that every germ is destroyed. There have been cases where treatment has been attempted (but ignorantly or imperfectly carried out), that the owner has abandoned his bees to their fate, leaving the evil to spread to all the other bees within reach. Fortunately we have very few such men, and I dare say none in our midst who would not make every effort to eradi-cate the disease. But special laws have been enacted in several States to compel the indifferent and refractory to do their duty. Heretofore we have had very few cases of the malady in Ohio, and no legislation has been necessary, and I shall hope that there will not arise an occasion in which an appeal to the law will ever be nec-

essary. Bee-keepers' associations are of great benefit and advantage to the apicultural industry, and if ever we shall be so unfortunate as to find foul brood in our midst, the wise counsel and action of this association may become indispensable in successfully dealing with it.

After a general discussion of the above subject, the reports were called for. Dr. Tinker reported 42 colonies, For. Dr. Tinker reported 42 colonies, spring count, and some of them weak. He had disposed of 9, leaving 33, 4 of which were weak. From these 29 colonies he secured 2,000 pounds of nice white comb honey, and 200 pounds of extracted, and increased them to 76, some of which were nuclei.

Dr. Fox, of Sandyville, commenced the spring with 1 colony, increased it to 5 by natural swarming, and ob-tained 124 pounds of honey.

A. J. Rohn had 4 colonies, spring count, increased them to 9, and ob-tained about 100 pounds of honey; left 80 or 100 pounds on the hives besides.

Jacob Oswalt commenced with 20 colonies in good condition last spring, increased them to 35, and took 1,000 pounds of surplus.

Myers Sweaney commenced the season with 9 good colonies in prime con-dition, and increased to 32, besides taking 1,034 pounds of comb honey, and thought he would take enough more to increase the amount to 1,050 pounds. One colony that did not swarm produced 211 pounds of comb

weak. He now has 9, and obtained 150 pounds of comb honey as a surplus, which, with 38 or 40 pounds left on one hive, will increase his report to that extent.

J. A. Taber reported 31 colonies in the spring. He disposed of 9, and used 3 colonies for queen-rearing; from the remainder he took 1,500 pounds of comb honey, and had Is swarms. One swarm that came off in the afternoon he placed on the scales, and found that it gathered 10½ pounds the first day, and averaged 7 pounds per day for the first four days after being hived.

Jon. M. Mewl had 5 colonies, spring count, increased them to 12, and took 450 to 460 pounds of surplus comb honey. One colony that did not swarm produced 110 pounds of surplus.

Mark Thomson commenced the season with 6 colonies. increased by natural swarming to 13, bought 7 colonies, and obtained nearly 400 pounds of comb honey.

After the reports were all given, a general discussion of the best way to fasten foundation into sections and frames followed. Dr. Tinker said that the best plan he had ever used was to take pure beeswax heated over a spirit lamp, place the starter or sheet of foundation in position, and with a camel's-hair brush run the wax along where the foundation came in contact with the top-bar.

The convention then adjourned to meet on the second Tuesday in April. MARK THOMSON, Sec. 1887.

For the American Bee Journal.

# Exhibit at the Western Fair.

## W. H. WESTON.

The exhibit of bees, honey, and apiarian supplies at the Western Fair which has just been held in London, efforts. Nearly 10,000 pounds of honey, both comb and extracted, was honey, both comb and extracted, was on exhibition, and went far to show the visitors that the honey-industry is rapidly on the increase. The county of Middlesex contributed nearly all the honey shown. The amount of honey which is annually gathered in this county must be enormous when it is known that the bases of the oxibitors gathered bees of five of the exhibitors gathered over 22,000 pounds of honey during the past season, which has been a very unfavorable one for honey-gathering. Mr. J. B. Aches, of Poplar Hill, secured more than half of the above amount

The exhibitors from this county were Messrs, Jno. Rudd. of London; R. II. Smith, of Ealing; J. B. Whealy, of Lakeside; Wm. Coleman, of De-vizes; all of whom made very tasty displays. Mrs. Rudd had a large trade in supplying visitors with samples of honey, charging each person 5 cents, and allowing them to eat all they wanted. One would think by the mass of bee-literature that is constantly being circulated through the

know the difference between extracted and strained honey; but just stand in the honey hall for one day of the Fair, and you can meet thousands who do not know what a honey-extractor is, and are about on a par with one of the judges at the Provincial Exhibition, which has been held at Guelph, who said that there was no difference between a wax-extractor and a honey extractor.

Messrs. E. L. Goold & Co., of On-tario, made a very line show of api-arian supplies. Mr. Holterman had charge of the exhibit. They have been fortunate enough to secure 25 prizes at Toronto, Guelph, and London.

Mr. F. H. Macpherson, representing the D. A. Jones Company, showed the largest amount of apiarian supplies, and the hundred and one things needed (and not needed) about an apiary, could be seen in this exhibition.

At the last session of the Ontario legislature an amendment to the agriculture and arts act was passed, agriculture and arts act was passed, incorporating the Ontario Bee-Keep-ers' Society, which places it on the same footing with the Dairymans' and Fruit-Growers' Associations, and will be the means of advancing this industry to a very great extent. The society receives opposite or the formula of society receives annually a grant of \$500. This year the grant is used by the society, as well as a special grant of \$1,000. for the purpose of opening up a market in England, for the surplus stock of honey, by making an exhibit at the Indian and Colonial Exhibition, now being held in London, England.

London, Ont.

# For the American Bee Journal.

# Southern Illinois Convention.

The Southern Illinois Bee-Keepers' Association met in the Court House at Benton, Ills., on Oct. 21, 1886, and was called to order by the President, Wm. Hutchinson.

The President gave a talk on the advantages and benefits of the association. the scores of publications on well informed we ought to be in theory. He said that conventions would help us to put these theories into practice, by giving our experience in the business and the result.

Mr. Thos. C. Stanley spoke of "api-culture as a business." He has been successful in the pursuit, and has made a better living for himself and family in the bee-business than in anything else that he had ever tried. The qualificatious for bee-keepers are wighten determined to be helpers are mind to stick to the business for the pleasure and profit there is in it.

Mr. C. M. Dixon then gave his experience with the different races of bees. The Italians were conceded to be the best. He gave a short talk on the use of foundation, saying that he could not do without its use. He also gave a plan for a sun wax-extractor country, that nearly everybody would made out of a Simplicity hive, with a -will you not assist us to obtain them?

tin reflector and tin pans with tin screen.

The constitution was then read, and signed by several. Mr. Hutchin-son read an essay from the BEE JOURNAL. Mr. Dixon gave his ex-perience in getting 146 sections of honey from one colony from the fall honey flow.

The election of officers resulted as follows: President, C. M. Dixon; Vice-Presidens, F. M. Atwood, W. R. Silkwood, and Thos. C. Stanley; Secretary, F. H. Kennedy. It was decided that we meet next spring in Benton, Ills., at the call of the com-mittee F. H. KENNEDY Sec F. H. KENNEDY, Sec. mittee.

#### For the American Bee Journal

Pan-Handle Bee-Keepers' Convention.

In response to a call, a number of bee-keepers of Ohio and West Vir-ginia met at Wheeling, W. Va., at 10 a.m., Oct. 13, 1886, for the purpose of organizing. The meeting was called to order by Henry Leweday of Wheel-ing upon whose metion Mr. H. N. ing, upon whose motion Mr. H. N. White, of Martin's Ferry was called to the chair, and W. L. Kiusey was appointed Secretary.

Representatives from the counties of Hancock, Brook, Ohio and Mar-shalt, W. Va., and Jefferson, Bel-mont, Morrow and Harrison counties, Ohio wors in attractors. Ohio, were in attendance. The morning session was taken up in discussing preliminary business, and at 12 o'clock the meeting adjourned until 1:30 p.m., at which time it was decided to name the association the "Pan-Handle Bee-Keepers' Association."

Permanent officers were then elected as follows: President, Henry Leweday, of Wheeling; Vice-Presi-dent, L. C. Seabright, of Blaine, O.; Secretary, W. L. Kinsey, of Blane, and Treasurer, August Goetze, of Wheeling.

The programme consisted of the following: Mr. Henry Leweday read a report from the Bee-Keepers' Guide; Mr. August Goetze gave his experience of two years in bee-culture; L. C. Seabright, on fall treatment; Mr. Fred Mehleman, his experience in wintering bees; Mr. W. L. Kinsey, description of locust honey; Mr. H. N. White, on wintering bees and the coming hive; Mr. Thorborn, on cellar wintering of bees.

The convention then adjourned until the first Thursday in March, 1887. W. L. KINSEY, Sec.

Reader, do you not just now think of one bee-keeper who does not take the Weekly BEE JOURNAL, and who should do so? Perhaps a word or two from you will induce him to do so. Will you not kindly oblige us by getting his subscription to send on with your owu renewal for next year? When you do so, please select any 25 cent book in ou list, and we will send it to you post-paid, to pay for your trouble. We are aiming to get 5,000 new subscribers for 1887,

Jan. 12.-Nebraska State, at Lincoln, Nebr. H. N. Patterson, Sec., Humboldt, Nebr.

In order to have this table complete, Secret tarles are requested to forward full particulars of time and place of future meetings.-ED.

Wintering Bees in Clamps.-Jno. W. Walker, Welcome, Ont., on Oct. 30, 1886, says :

Bees have not done extra well this ear in this locality. They swarmed peers have not done extra went this year in this locality. They swarmed themselves weak. I had 18 strong col-onies last spring; now I have 50. I have taken 1,500 pounds of honey in pound sections, besides quite a quan-tity of extracted honey. I do not place the hives close together. Each one weighs now between 50 and 100 pounds. I winter my bees in a clamp packed in straw and chaff with the front facing the south, so when the sun comes out strong it warms the bives. I lost one colony last winter, and that through carelessness in the spring by not having proper ventilation.

Honey-Flow Stopped by Drouth.-F. H. Kennedy, Duquoin, 9 Ills., on Oct. 30, 1886, says:

This has been rather a bad year for oney in this locality. The drouth honey in this locality. The drouth stopped the honey flow in the fall. I had a few colonies that yielded over 100 pounds apiece. While at the con-vention at Benton, I'ls., I visited the apiary of Mr. C. M. Dixon, of Parrish, Ills., who obtained 146 sections from one colony of bees from the fall honey flow.

Bee-Keeping in Texas. - W. S. Douglass, Lexington, O Tex., writes:

commenced last spring with 32 colonies, all in good condition. Wild peach opened, but it yielded very little honey. Willow yielded some honey, but on account of incessant rains, bees got very little from it. They began to get short of stores, yet the hives were full of brood from top to bottom. I began to think of food to bottom. I began to think of feeding, but suddenly bloom came and 1 never saw such a rush. The entrances were clogged with bees coming and going both early and late. This continued for six days, when it began to rain, yet between showers the bees still worked hard. Swarms began to come out then, and I got 7 swarms during rattan bloom. Other wild flowers bloomed, but the bees got no surplus from them. Smartweed, or wild tobacco, as it is generally called, came about the same time, and bees

began to gather surplus; yet, before these were half through yielding, morning-glory came, and it being more plentiful, and nearer the apiary, bees neglected everything for it. Then the hives were soon full of as nice honey as I ever saw. This is a splendid honey-plant, yielding for about 25 days. Farmers of the South are acquainted with this vine, as it grows on almost every farm. I have seen it all over corn and cotton, entirely hiding both from view. I have seen bees gather full loads from it in less than a half minute. Bees are working on scattering flowers now, and are getting some honey. I am testing Italian bees. I have 2 colonies of them.

# Bees did Well.-E. Pickup, Limerick, & Ills., on Oct. 29, 1886, writes:

On page 243 it is shown a debt of \$100 was paid with \$5. I passed Mr. Brown's note of \$70 to Mr. Jones; he passed it to Cone & Co., and they passed it back to Brown, making \$210 paid without any money. The bees will soon be taking their winter's nap. They did well in June and the nap. They did well in June and the first week in September. I like to read the BEE JOURNAL during the long winter evenings, so as to keep posted. 1 offered the county agent of the American Bible Society 1,000 pounds of honey as an "endowment" fund, and it was accepted. I weighed it this evening to deliver to-morrow.

## Counting Comb Surface.-II. J. Northrup, Lansingburg, 0+N.Y., says:

In the answers to Query, No. 324, do the writers count both sides of the comb? For instance: G. W. Demaree says that the ten frame Langstroth hive has a comb surface of at least 1,440 square inches. J. E. Pond, Jr., says that a Langstroth size comb contains about a square foot of cells on each side, which according to my reckoning would double Mr. Dem-aree's figures. Who is right? I would like to know how to count comb surface, whether one side or both.

Good Crop-Dog Killed by Bees.-J.M. Clark, Hillsdale, 9 Mich., on Oct. 30, 1886, says :

I packed 11 colonies in chaff last fall, and had the same number in fine condition to commence the season with last spring. They built up rapidly on fruit-bloom, and were in fine condition for white clover, of which we had a good crop. The basswood yield was less than one-fourth of what it was last year, but the fall crop was large and good. My 11 colonies in-creased to 23, by dividing, with a few natural swarms, most of which my wife hived, as I was away from home. My crop of honey is 1,600 pounds, mostly extracted, after leaving from 25 to 30 pounds for winter stores to each colony. I weighed my colonies, hives, honey-bees and all, and then deducted the weight of the empty hive and combs, allowing about 3 they start 100 to 150 queen-cells. The pounds for bees. All are now ready to pack for winter, and I hope to their way out of the cells for a week,

greet them in health and vigor next spring. I find a home market for my honey at 10 cents per pound. A very singular case of a dog being killed by bees, occurred in a neighboring town. She was a fine blooded dog with puppies, and was tied to a stake in pupples, and was then to a stake in-the yard while the pups were playing in an adjoining yard where there was 5 colonies of bees. They in some way disturbed the bees and ran with the bees after them to the mother, when the bees turned their attention to bee and strung because bedre that she her, and stung her so badly that she died in less than 20 minutes. The puppies escaped. The dog was valued at \$50, but there is no prospect of a lawsuit growing out of it.

Exhibit at the St. Louis Fair .--Louis Werner, Edwardsville, 9 Ills., on Oct. 29, 1886, says:

There was a large and fine display of honey, bees, and apiarian supplies at the great St. Louis Fair, held at St. Louis, Mo., on Oct. 4, 1886. The money premiums offered in the bee money premiums offered in the bee and honey department amounted to nearly \$150; also diplomas were pre-sented. Among those who secured valuable premiums for making excel-lent exhibits, were Messrs. S. D. and E. S. Armstrong, of Jerseyville, Ills.; Dr. Gao, Lichwork & Son, of Mascon-Dr. Geo. Liebrock & Son., of Mascoutah, 111s. ; Jos. Swallow, of St. Louis, and myself.

Good Results .- Wm. Ford, Marshalltown, O Iowa, on Nov. 1, 1886, writes:

I commenced in the spring with 10 colonies-S strong ones and 2 weakand increased them to 24 strong colo-nies, besides taking 700 pounds of honey, 365 pounds being extracted, and 335 pounds comb honey. I hived 3 swarms, 2 on June 7, and 1 on June 9. They were hived on frames with just starters in them. They built 20 Langstroth frames full of comb, and stored 122 pounds of extracted honey apiece, and 28 pounds in the brood frames in just four weeks from the time they were hived. My bees are all in good condition now for winter, and have from 25 to 50 pounds of good white clover honey in each of their brood-chambers for winter stores. My bees averaged 70 pounds of honey per colony, spring couut.

Cancasian Bees. - R. F. Holtermann, Brantford, Ont., writes:

Mr. J. B. Hall, of Ontario, has for some time experimented with the Caucasian bees, and kindly gave me some of the results of his observa-tions They are very docile and even quieter than the Carniolans; the hive can be jarred with impunity. They can be jarred with impunity. They are very small, with three small, dark, yellow bands heavily coated with light The drones are darker than down. black drones, and heavily coated with fur, each segment having a small line of bright golden color. When the swarming impulse seizes them,

the young queens and bees not destroying the cells or queens matured. When they swarm they mean it, and will not return to the old stand. They produce beautiful comb honey, but not much of it. They are the best wintering bees, as long as they are live on. When pure or crossed with the Italians, they do not breed fast. The queen does not deposit eggs in a compact solid sheet. The queen is slim, and perforated metal will not confine her in any part of the hive. It will be seen from the above that after careful experimenting by Mr. Hall, he found that they were not the bees likely to be of great value to the practical apiarist.

A Lady Bee-Keeper's Report.-Mrs. E. A. Cooley, Galesburg, +0 Ills., on Oct. 14, 1886, says :

I commenced bee-keeping in the spring of 1884, but lost nearly all of my mer stands. During the summer of 1885 I took as good care of what were left (5 weak colonies) as I knew how; built them up to 11, though 3 were little more than nuclei. I wintered them in the cellar, and this summer I have taken off 1,300 pounds of comb boney, the best colonies giving 150 pounds each. I worked alone with them until this summer my husband began to help me in the honey-harvest, and is now preparing the bees for winter.

"Wavy" Combs.-W. Z. Hutchinson, Rogersville. Mich., writes :

I was much interested in the article of Mr. Stiles, on "Foundation in the Brood-Chamber." I consider this an important subject. If we can dis-pense with foundation in the broodchamber, and secure better results it is quite a step. I have succeeded in doing this for the past four years; and I am willing to do all I can to enable others to succeed. Mr.Mitchell, Mrs. Chaddock and others have trouble by the bees building too much drone comb. I think that I have ex-plained why they have so much trouble from this sonree; although it is, of course, possible that I have overlooked some element of my suc-cess. Some bee-keepers have success. Some bee-keepers have suc-ceeded equally as well as myself. Mr. Stiles now complaius of some-thing that has, I believe, not given any trouble to others; viz., crooked or "wavy" combs. This is something that has given me no trouble; my combs have always been so straight and true that it would be difficult, without examining closely, to tell whether they were natural combs or built from foundation. I cannot understand why Mr. Stiles has the trouble that he reports, especially when the brood-nest is small, and the frames all supplied with starters. Mr. S. says that "last year more careful experiments were made, wherein several new features were developed." I hope he will yet learn how to secure straight combs.

### Home Market for Honey.

To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Houey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remunerative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the beekeeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

### System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

 50 celonics (120 pages)
 \$1 00

 100 colonics (220 pages)
 1 25

 200 colonics (420 pages)
 1 50

 For 66

The larger ones can be used for a few colouies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

Simmins' Non-Swarming System is the title of a new English bee-book. The author claims that it will inaugurate a "new era in modern bec-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 ceuts. It can now be obtained at this office.

### Convention Notices.

137 The New York State, the Eastern New York aod the New Jersey & Eastern Bee-Keepers' As-sociations will hold their great united convention at Albany, N. Y., on Jun. 18, 19 and 20, 1886. This convention will be one of the largest, if not THE largest, ever held anywhere in this country, and it behooves every bec-keeper to attend. A grand exhibit of aplarian fixtures is promised. An un-usually brilliant programme will be prepared and announced later.

The next annual meeting of the Micbigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTINO, Sec.

The Illinois Central Bee-Keepers' Association will hold its next meeting at Mt. Sterling, Ills., on Nov. 24 and 25, 1886. J. M. HAMBAUCH, Sec.

The next annual meeting of the Nebraska State Bee-Keepers' Association will be held in Lincoln, Nebraska, on Wednesday, Jan. 12, 1887. Location of Hall to be used and Hotel accommo-dations will be given after further arrangements have been made. H. N. PATTERSON, Sec.

Another Union Convention is to be held in Albany, N. Y., next January. See the above notice of it. Let there be a general rally of the bee-keepers of New York at this union meeting.

### Honey and Beeswax Market.

The following are our very latest quotations for honey and beeswax:

#### CHICAGO.

HONEY.-Receipts are liberal and prices vary from 10@13c, per lb. for white in sections varying from 1 to 1½ and 1½ lbs. Many sales of Kood white 1-lb. sections are made at 11c. Extracted is quiet and ranging from 5@7c. EEESWAX.-23@25c. R. A. BURNETT, Oct. 13. 161 South Water St.

#### NEW YORK.

NEW YORK. HONEY.-We quote this year's crop as follows : Fancy white in 1-lb. sections, clean and nest packages, 156016c.; 2-lbs., 126016c; fair to good 1-lbs., 12614c.; 2-lbs., 10601cc; fancy buckwheat 1-lbs., 11612c.; 2-lbs., 96010c. White clover ex-tracted in keys and small barrels, 65467cc; Calif-oroia extracted to 60-lb. cans, 5651-2cc.; Califor-nia comb honey, 10601c. BEESWAX.-Prime yellow, 22624c.

WAX.-Prime yellow, 220540. MCCAUL & HILDRETH BROS., 34 Hudson St.

#### BOSTON.

#### ST. LOUIS.

HONEY.-Choice comb, 11%@12%c.; latter price-is for choice white clover. Strained, in barrels, 3/@40. Extra fance of bright color and in No. 1 puckazes, ¼ advance on above prices, Extracted lo barrels, 4%@5%; in cans 6@7c. BEESW AX.-Dull at 21c. for choice.

D. G. TUTT & CO., Commercial St. Oct. 21.

#### KANSAS CITY.

KANSAS CITY. HONEY.-Demsud for all grades is good, and sales are large. Receipts are zood and prices are steady with a firm feeling. We quote: 1-10. sec-tions of white clover, 13644c, 1464, 10642c, 12-108-white clover, 13644c, 14645c, 12642c, 12-108-white clover, 6.47c; dark, 96210c; Calif, 2-10a, 9641c; 32-108-white clover, 14645c, Extracted white clover, 6.47c; dark, 4635c; white sage, 5½c; Calif, anther, 5c. BEESWAX.-20@22c.

Oct. 15. CLEMONS, CLOON & Co., cor. 4th & Walnut.

923& 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAOER.

## Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, he sure to give the address we have on our list.

A New Crate to hold one dozen one-pound sections of honey.-It has a strip of glass on each side, to allow the honey to be seen. It is a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 ets. per crate. Glass 1% e. per light, extra.

Premium Worth Having.-The New York World and the AMERICAN BEE JOUR-NAL (both weekly) will be sent for one year to auy address in North America for \$1.90. And in addition PRESENT to every such CLUB SURSCRIBER a "History of the United States," containing 320 pages and 22 fine engravings, bound in leather and gilt.

This "History " will be sent FREE by express at the subscriber's expense; or will be mailed for 10 cents extra to any place in the United States or Canada.

It is arranged chronologically by years, from 1492 to 1885. Every event is narrated in the order of its date. These are not confined, as in other works, to political matters, but embrace every branch of human action.

This premium is worth the whole of the money sent for both periodicals, and should induce thousands to subscribe, and thus get two unrivalled weeklies for nothing.

This offer is good only until Jan. 1, 1887, hence no time should be lost. Send at once !

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

### TO OUR READERS.

We cannot too strongly urge upon our readers the necessity of subscribing for a family weekly newspaper of the first class-such, for instance, as THE INDEPENDENT, of New York. Were we obliged to select one publication for habitual and careful reading to the exclusion of all others, we should choose unhesitatingly THE INDEPENDENT. It is a newspaper, magazine, and review, all in one. It is a religious, a literary, an educational, a story, an art, a scientific, an agricultural, a financial, and a political paper combined. It has 32 folio pages and 21 departments. No matter what a person's religion, politics or profession may be, no matter what the age, sex, employment or condition may be, THE INDEPENDENT will prove a help, an instructor, an educator. Our readers can do no less than to send a postal for a free specimen copy, or for 30 cents the paper will be sent a month, enabling one to judge of its merits more critically. Its vearly subscription is \$3, or two years for \$5. Address, THE INDEPENDENT, 251 Broadway, New York City.

### Our Book Preminnis.-To encourage all onr present readers to get one or more additional subscribers we will present 25 cents' worth of books for every new snbscriber (accompanied with \$1 for one year's subscription), sent direct to this office. Thus for five new subscribers with \$5, the getter up of a elub gets \$1.25 in valuable reading matter, to be selected by himself from onr list on the second page of this paper. It will pay you to devote a few hours to the interests of the BEE JOURNAL. Every one who keeps bees ought to take it. We will furnish sample copies free in any quantity to those who intend to get up elnbs. We expect to get 5,000 new subscribers for 1887.

Sweet Clover, or Melilotus Alba, is almost the only resource for honey now, on account of the late severe July drouth. If the seed is planted in September, it will come up this Fall and bloom next year, in its second season.

We have a large lot of this seed on hand, and offer it at the following Redneed Prices, by express or freight:

 One pound
 \$0 20

 " pcck-15 lbs
 2 25

 " bushel-60 lbs
 7 00

 " sack-80 lbs
 8 00

It will pay to buy it by the sack and sell it again in smaller quantities.

11 vou want a chance to make some money, and provide pasturage for the bees during the Fall months, this is your opportunity !

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

## The NEW Heddon Hive.

We have made arrangements with the inventor by which we shall make and sell the Heddon Reversible Hive, both at wholesaie and retail; nailed and also in the flat.

The energying gives a good idea of the hive. The broot-chamber is in two sections; also the puryerted at will. The cover, bottom-board, and top and bottom of each sections case has one-half of a regular boespace, so that the aurplus cases with the sections, any be placed between the two brood-chambers, or the latter may be transposed or inverted—in fact, all parts of this hive are particitly interchangeable. The brood-frames will all be bored for wires. A SAMPLE HIVE includes the bottom-board and stand; a slatted honey-board, and cover; two supplus arrangements, each containing 8 frames; pound acctions, one with wide frames and separa-tors, and the other withont separators. This latter stories, but cannot hereversed. It is NALED AND paintED, and ready for immediate use. Price, \$4.00, complete.

It is absolutely essential to order one nalled hive as a pattern for putting thase in the fint together correctly.

HIVES READY TO NALL.—In filling orders for these hives, in the flat, we make 6 different com-binations, so that our customers may make a aelection from the sample nailed hive, without waiting for us to quote prices, and the different kinda will be known by the following numbers :

Nn. 1 consists of the stand, bottom-board, cover, two 5-inch brood-chambers, 16 frames, and the sisted honey-board. Price, \$1.55 each. No. 2 is the same as No. 1, with the addition of one surplus story containing 28 sections without separators-interchangeable, but not reversible.-Price, \$2.00 each.

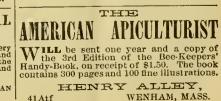

Price, \$2.00 each. No. 3 is the same as No. 2, with *two* surplus sto-ries as therein described. Price, \$2.50 each. No. 4 is the same as No. 1, with the addition of one surplus atory containing 28 sections in wide frames with separators, which can be reversed, Inverted, and interchanged, the same as the brood-commbers. Price, \$2.30 each.

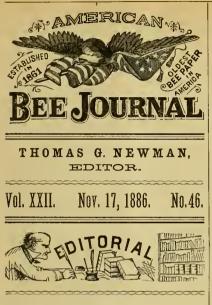

No. 5 is the same as No. 4, with two snrpins arrangements as therein described. Price, \$3.00. No. 6 contains all the parts as described in the asmple nailed hive. Price, \$2.75 each.

Those desiring the hives without the stand, honey-board or sections, may make the following dedne-tions from the above prices : Stand, 14 cents; honey-board, 8 cents; and the 28 or 55 sectiona, as the case may be, at ½ cent each, respectively,

We will also make the following deductions on quantities ordered all at one time: For 10 or more hives, 5 per cent. discount; for 25 or more hives 7 1-2 per cent.; for 50 or more, 10 per cent.

### THOMAS G. NEWMAN & SON 923 & 925 West Madison-St., CHICAGO, ILL.

Why is a bootblack like a bee? It improves each shining hour.

A Carload of honey has been shipped to Kansas City by Bittenbender & Woodcock, of Knexville, Iowa.

It would Pay producers to allow local stores a commission of 20 per eent on the sale of comb honey, if they would retail it at 20 cents per bex, or per pound. Better this than to allow the local retail prices to run down to less than the net amount you would receive from the store.

We have Received a photographic view of a portion of the public apiary established in the Zoological Gardens in Philadelphia, Pa., by Mr. Arthur Todd, Vice-President for Pennsylvania of the North American Bec-Keepers' Society. In the centre of it stands Mr. Todd in the act of viewing a frame of brood and bees just taken from a bive. We have placed it upon the walls of our office, where it will be seen by our visitors.

**Oatman & Brother,** of Dundee, Ills., bave just aold 38,000 pounds of comb honey in one lot, to a dealer for \$5,000, spot cash. They always have a good crop, always winter their bees on the summer stands with success, and always sell their honey at a good price for cash. They are successful apiarists and shrewd business men, but they are very medest and quiet; and keep their own counsels. The above facts were gleaued from a "neighbor."

Gathering Honey. — The Saginaw, Mich., Courier of Nov. 2, 1886, contains the following :

John Rey, the aplarist, has gathered in the season's work of his 118 colonies of bees, consisting of 4.000 pounds of extracted honcy, and 2.000 pounds of comh boney. His bees aro mostly Italians. They were yesterday engaged in gathering boney from raspherry blossoms, which is something unusual for this season of the year.

What Fools these Mortals be !--We have just learned of a transaction in proof of the above assertion. In a town which was considered to be a good market for honey, resides au apiarist who was supplying the town with a good article at a fair price. One day he was informed that some bee-keepers from a distance had hauled in a large lot of comb honey and retailed it "all over town" at 10 cents per pound. This ruined the market for the local apiarist, and compelled him to ship his to another town in order to get a fair price for it. Such things are to be deplored. There is no use of such ruinous competition, and every man ought to have enough honor about him not to do such a mean thing !

To prevent such transactions, would it not be well to get up a closer bond of union, and protect each other's interests? It is high time now to organize for protection. A central body should be incorporated, and issue charters for local organizations. These should have representation in the National body, and he under its control. What do you think, dear reader, of such a plau? To make the North American Bee-Keepers' Society such a central hody would be very easy, and then to control the markets of the country by ascertaining the amount of the crop, and scattering it evenly over the great marts of trade, after satisfying the local demanda.

The united wisdom of apiarists ought to be able to devise the ways and means and make a success of such an institution. We would propose that this important matter be discussed at the next Michigan State Convention, and let a committee be appointed to take the matter in hand, and after reviewing the whole ground, and corresponding with the principal apiarists of America, let the committee report through the hee-papers in time to have it acted upon by the next meeting of the International Society.

As this matter is one that interests every bee-keeper in America, we may reasonably expect that they will take hold of the matter in such a way as to bring it to a successful issue.

Let no one think that this is a scheme to Neuman-ize anything or anybody! We neither desire nor expect to have any personal control over the matter. While we will do all we cau to further the interests of the apiariats of America, in any way they may deem expedient, we would ask not to be placed on the committee, least any jealous or envious ones may thereby be discouraged from participating in this important matter. The editor of the BEE JOURNAL already has more "public duties" than he can well perform, and bears more of the "honors" which such bring than he cares to carry.

A Father can Give his Young Son no better present than a year's reading of the *Scientific American*. Its contents will lead the young mind in the path of thought, and if he treads there a while, he will forget frivolities and be of some account, and if he has an inventive or mechanical turn of mind, this paper will afford him mere entertainment, as well as useful information, than he can obtain elsewhere.

The Michigan State Convention will conveue at Ypsilanti on Dec. 1, 1886. We intended to call special attention to thia meeting, as one of the most important and influential in the United States; but the following from Prof. Cook, just received as we were closing up the forms for this issue of the JOURNAL, will answer the same purpose:

AGRICULTURAL COLLEGE, Mich., Nov.11, 1886. DEAR MR. EDITOR: - May I present through your admirable JOURNAL a special invitation to the bec-keepers, not only of Michigan, but of adjoining States, to be with us at our next annual meeting to be held at Ypsilanti, on the Michigan Central Railroad, about thirty miles west of Detroit, on Dec. 1 and 2, 1886?

Four topics of immense importance will be thoroughly discussed. "How to market our honey." "How to produce comb honey that will market itself." "Have we the best bee?" and "What of bce-forage?"

Mr. A. I. Root promises to be with us, and we hope for and expect Mesara. D. A. Jones, J. B. Hall, and S. T. Pettit, of Ontario, Dr. Mason, of Toledo, the Editor of the Ameri-CAN BEE JOURNAL, and a host of others. It will be a rare "feast," just such as Secretary Cutting can serve up. "Come one; come all." A. J. COOK, Pres.

As the Editor of the AMERICAN BEE JOUR-NAL is engaged to deliver a lecture in this city on the evening of Dec. 1, 1886, he will be unable to be present at Ypsilanti, and participate in the deliberations of the convention. His representative will be present, however, to take a report of the proceedings which will duly appear in the BEE JOURNAL. Let there be a good attendance.

The Display of Honey at the lowa State Fair was very large. Mr. J. W. Bittenbender, of Knexville, had a magnificent exhibit of nearly 4,000 pounds in crates and jars. We acknowledge the receipt of a photograph of Mr. B's exhibit, which attests its dimensions as well as the tasty manner in which it is arranged. A pyramid of extracted honey in jars, contained 14 tiers. with two or three dozen glass jars exhibited iu each tier. The crates of comb honey numbered about 16 in the lower tier, and 8 in the upper one, and 16 tiers of sections in height. There was also a display of implements for the apiary, which was quite creditable to Mr. B., who took nearly all the first premiums. The photograph also shows Mr. and Mrs. Bittenbender standing in front of the exhibit.

Buz, is the title of a new bee-novel. It gives the supposed "life and adventures of a honey-bee." It is written by Maurice Noel, and published by Henry Holt & Co., New York. We found it so very interesting that we read every word of it before closing the book. Our time is so much occupied that we could not do this except on a special occasion; this opportunity we found while returning from the Indianapelis Convention. Puck notices the book in this funny way:

"But; or, the Life and Adventures of a Honey-Bee," by Maurice Noel (Heury Holt & Co.), is a meritorious little book. It describes the cureer of a bee in a sympathetic and picturesque manner, which will be interesting to young and old at-ke. It is easy to see that Mr. Noel has never picked a honey-bee before it was ripe. He does not knew the warnth of a bee's affection for a man who is too previous. It he did, he would not be so familiar with the insects.

AND

### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-Ep.1

### Alsike Clover and Dark Honey.

Query, No. 335 .- Is Alsike clover the eanse of my honey being dark colored? Is it not an injury instead of a benefit to sow it? It commenced to blossom on May I, the same time the white clover commenced. I always had beautiful white honey every spring before my bees gathered honey from Alsike elover. It is almost as dark as buckwheat honey this year.-Cheviot, N. Y.

I think the bees gathered something else besides the Alsike. - G. L. TINKER.

No. Is there nothing else to gather honey from ? Did you not have some honey-dew ?—DADANT & SON.

I do not think that the Alsike made the trouble. I wish my bees were surrounded with it.-C. C. MILLER.

No. The Alsike boney is in every way the equal of that from white clover.—A. J. Cook.

I think not. Alsike produces light colored honey here. "Honey-dew" or something else may have colored your honey.—G. W. DEMAREE.

It is possible that the Alsike is the cause of your trouble. Alsike clover honey has a pinkish color, but not nearly so dark as buckwheat.—W. Z. HUTCHINSON.

Honey from Alsike clover proves to be darker color than from white clover, but nothing near as dark as buckwheat, in this locality. The flavor of honey from Alsike is excellent.-G. M. DOOLITTLE.

I have had no experience with Alsike clover. But I have seen honey claimed to be from Alsike that was the same in color as white clover.—II. D. CUTTINO.

Alsike clover does not produce dark honey in this locality. I think that your dark honey came from something besides Alsike. Have you not in your locality some tulip trees, more commonly known as yellow pop-lar or white wood? The large bell-shaped flowers on these trees often give a copious and continued yield of deep wine-colored honey, though of very good flavor.—JAMES HEDDON.

with the testimony of many, that Alsike is a valuable honey-plant for the reason that is one of the best of toods for our stock, and as profitable as any to both raise and feed; therefore the honey gained is all profit, as it is extra entirely.—J. E. POND, JR.

### Putting Bees into the Cellar.

Query, No. 336 .- 1. Is it best to put bees iuto the cellar before snowleomes, or after? 2. Will it do to leave on the honey-board aud raise the hive from the bottom-board? 3. Would one inch be too much for the bottom tier of hives ?-Stittville, N. Y.

1. Generally before. 2. Yes.-C. C. MILLER.

1. Before the snow comes. 2. Yes. 3. No.-W. Z. HUTCHINSON.

It is always best to put bees into winter quarters before freezing weather sets in.—J. P. H. BROWN.

1. I put mine into the cellar about Nov. 15, before hard freezing weather comes. Snow makes little difference. 2. Yes; but I prefer a quilt or saw-dust cushions, to a honey-board. 3. No.-G. M. DOOLITTLE.

1. I put them iu at the beginning of the very cold weather. 2. Leave ven-tilation above and below; but not too much. 3. One inch space is not too much for any tier of hives.—DADANT & SON.

I would put bees into the cellar before it became severely cold. Snow may come, but still it may not be too cold to leave them out. Cold winds are more to be dreaded than a few very cold nights with the air still. 2. Yes. 3. No.-G. L. TINKER.

1. Yes, before snow comes. 2. Yes, you can do so. 3. I would prefer to raise the hive and put under a frame about 1-inch deep, that would leave you a space of 13% under the frames. Leave a good entrance.—II. D. CUT-TINO.

1. I desire to have them in the cellar before very severe weather— usually about Nov. 15, here. 2. Yes, that will do nicely. 3. In a good cel-lar a space of 1 inch below would be excellent. I should like it; but the temperature of such a cellar must not go below 41°, Fahr.—A. J. Cook.

I believe it is detrimental to leave colonies out-doors until the temperature has gone low enough so that in order to keep warm they have been compelled to exercise. It is also dangerous to house them immediately after frequent and extended flights in search of nectar; for when bees are exercising, *i.e.*, laboring to the ex-tent of wasting tissue, they will be at the same time consuming bee-bread, which consumption I believe to be the cause of bee-diarrhea, if confinement prevents frequent evacuation. When our bees are regularly working in the summer, if you carefully re-move a colony to a cellar maintaining a temperature from 45° to 65°, or 60°, they will have bee-diarrhea in a few The honey from Alsike clover is not dark colored in my vicinity; on the contrary it is very light. 1 con-sider from small experience, together days. I would rather house them too

late than too early, however. "Honeyboards" and "bottom-boards" and "spaces" have little to do with causing or preventing bee-diarrhea. — JAMES HEDDON.

### Keeping Bees on Shares.

Query, No. 337 .- Last June I took 6 colonies of bees of Mr. B. to work on shares, for one-half of the increase and one-half of the honey, each to furnish our own hives. Our hives being of different construction, I found it necessary to divide the bees at the time of swarming. There were 4 swarms; the first I put into B's hive, and the next into mine, and so on alternately. Two of B's colonies lost their queens, one of them being one of his old colonics; then a new one also, one of mine, lost a queen. I advised B. as soon as I had discovered that the queens were gone, and requested him to send me queens. He made no reply, so in time I furnished the queens. This fall those colonies are short of food for winter. Who ought to furnish food ?-Ont.

Mr. B.-J. P. H. BROWN.

The expense should be borne equally by each, the one who has the bees on shares to do the feeding .- W. Z. HUTCHINSON.

On the proposition stated, I should say that each should furnish his own winter food. I judge that there was no surplus to divide, but that is "one of the fortunes of war."-J. E. POND, JR.

Partnership in bees is a poor ship to sail in, so many things will arise to cause dissatisfaction. As you state the question, you have no business to furnish queens or food for winter.— H. D. CUTTINO.

My opinion would be that B. should pay for the two queens if they were purchased. If you reared them then it was a part of your work. In either event I should say each should furnish one-half of the food required to bring the bees through the winter.-G. M. DOOLITTLE.

I think that the bee-keeper should have reared the queens and introduced them to the queenless colonies, or at least should have given them just hatching brood from which they could rear queens. The cost of food for winter should be shared by each. -G. L. TINKER.

We think you should furnish food to those colonies unless otherwise agreed. Queen-rearing is a part of bee-keeping, and a bee man should be expected to keep all his colonies sup-plied with queens. Besides, if there is any surplus honey it should be used, above all things, to supply any deficiency.-DADANT & SON.

Although you found it necessary to divide the bees at swarming time, owing to the difference in the hives, the division in fact should take place at the close of the honey season, or at such time as both of you were parties to the division, unless the original contract fixed the matter. If the queens were lost before the mutual

division, you should have learned the expense of re-queening, otherwise the other party should have done it. If the honey and bees were properly divided, in the absence of any contract, each party should winter his own bees.—G. W. DEMAREE.

I should suppose each for his own bees, though I am not authority in such matters.—A. J. COOK.

As near as I can understand the spirit of the contract, I would say that it depends upon the bargain as to who was to supply queenless colonies. Unless differently agreed upon, I should hold you for such supply; and for the shortage in winter stores, both equally, unless it can be shown that the shortage is the effect of the queenlessness which B, had agreed to make good, and failed to do; then I should hold B. alone responsible for the lack of stores, and to supply such as are needed .- JAMES HEDDON.

### **OUR CLUBBING LIST.**

We'supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

#### Convention Notices.

17 The New York State, the Eastern New York and the New Jersey & Elstern Bee-Keepers' As-sociations will hold their great united convention at Albany, N. Y., on Jan. 18, 19 and 20, 1886. This convention will be one of the largest, if not THE largest, ever held any where in this country, and it behooves every bee-keeper to attend. A grand exhibit of a doiarland fatures le promised. An un-usually brilliant programme will be prepared and announced later.

The eleventh annual meeting of the N. W. Ills. & S. W. Wis. Bee-Keepers' Association will be held in the Grand Army Hall in Rockford, Ills., on the tbird Tuesday in January, 1887. There will be a two days' session. J. STEWART, Sec.

The next annual meeting of the Michigan State Bee-Keepers' Association will be held in Ypsilanti, Mich., on Dec. 1 and 2, 1886. H. D. CUTTING, Sec.

Association will hold its next meeting at Mt. Sterling, Ills., on Nov. 24 and 25, 1886. J. M. HAMBAUGH, Sec.

177 The next annual meeting of the Nebraska State Bee-Keepers' Association will be held in Lincoln. Nebraska, on Wednesdav, Jan. 12. 1897. Location of Hall to be used and Hotel accommo-dations will be given after further arrangements have been made. H. N. PATTEASON, Sec.

13 The Cedar Valley Bee-Keepers' Association will hold its next semi-annual meeting in the City Hall at Vinton, lawa, on Dec. 7 and 8, 1886. An excellent programme will be presented, including essays by the very best of lawa aplarist. Special rates have been secured at the Hoters, and all are invited to come and help make this meeting both pleasant and profitable. H. E. HUBBARD, Scc.

Explanatory.-The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the aplarist is located near the center of the State named;  $\delta$  north of the center;  $\varphi$  south;  $\Theta$  east; • west; and this & northeast; ` northwest: • southeast; and 9 southwest of the center of the State mentioned.

### The Wintering Problem.

### W. J. CULLINAN.

The very heading of this article will doubtless prevent many from perusing the same, especially the old-timers who think that they do not need any advice on wintering bees, and do not have to give any. But "let your light shine," should be the motto of all the members of the beekeeping fraternity. If by a few words, either written or spoken, I can keep others off the rock upon which my ship was stranded, I am certainly lacking in humanitarian principles if I do not utter those "few words."

Having theorized but little upon the science of bee-culture, and never having practiced it scientifically, I shall not attempt to argue this selfimportant question from a scientific stand-point; but in homely phrase I shall tell a few things that I have learned, and paid for learning. There Heddon's book, "Success,".. 1 50 1 40 may be beginners in the field to whom these words of warning, though plainly spoken, will come greeting. While I do not wish to "tread upon the toes" of those who have been theorizing upon this problem, and studying its relation to science, I cannot help thinking that if a few grains of common-sense were mixed into many of the recipes, instead of the fine-spun theories and scientific analogies so frequently given, such recipes would be of far more service to the vast army of bee-keepers who have no time for theorizing, and no desire for the study of science. It is all right for Profs. Cook, McLain and others who have the time and inclination, to practice bee-keeping upon scientific principles-and there is no denying the fact that their researches are not only important, but of untold value to the cause. What the ma-jority of bee-keepers want, however, is a simple, common-sense method of wintering bees, a method that is practical, concise, and that any one can follow.

While I am of the opinion that the cellar is the safest and best place to winter bees, if the conditions are right, I believe that in the absence of those conditions the summer stand is preferable, provided that ample pro-tection of a proper kind is given.

As I have never had any experi-ence in cellar-wintering of bees, I shall refer the reader to the methods of Ira Barber, G. M. Doolittle, and others, frequently detailed in the beepapers; and which may be safely followed.

The first year I kept bees I wintered them unprotected and unmolested upon the summer stands, leaving them the whole of an 8-frame Langstroth hive to keep warm during the whole of that bitter cold winter of 1884-85, and the consequence was they came through very weak in bees. Last winter I acted upon the advice of a brother bee-keeper, and removed the outside frames of my 10-frame Sim-plicity hives, placed a piece of burlap next to the remaining outside combs, and filled in between that and the wall of the hive with chaff; over the frames I placed a chaff cushion, the lid fitting down tight over the same. I then grouped the hives together in twos and threes, and over and around them I piled hay and straw to a depth of about two feet on top, leaving the entrances open. No water could possible get in from the outside, and yet in the latter part of the winter water collected and ran down on the inside of the hives, completely block-ing the entrances to some of them. As a result I lost 7 colonies out of 15: and some of the surviving colonies were in a weak condition.

I am confident that none died from cold, excepting one that was weak in bees when put into winter quarters, for when raking the snow away from the entrances in the coldest weather, steam would issue therefrom, attesting the presence of sufficient warmth; and that they did not die from starvation, ample stores in the hives of the dead colonies bore testimony.

Then, what killed my bees? Upon examination I found the combs were damp and moldy, and full of dead bees, and I very naturally concluded that they died of too much packing.

This year I am preparing my bees as follows: Examining first to see that they have ample stores, I crowd the bees to the south side of the hive on 4 or 5 Langstroth frames, according to strength, placing a division-board on the north, and feed where I think it is needed. Before the advent of cold weather I shall pack between the division-board and north wall of the hive with dry sawdust, and over the frames put the same material six inches in depth; then ventilating the lid with a 114-inch auger-hole in each with earth four inches above the bottom-board. I shall then leave my pets to enter their long winter's sleep, confidently expecting them to awaken betimes in the spring and begin the season of 1897 with renewed zeal, in which case I shall consider myself well rewarded for my labor.

A word as to feed: I consider pure, well-ripened honey, either fall or summer-gathered, preferable to any other food for bees; of course in the absence of such, sugar syrup makes a good substitute. I believe the two

great essentials to safe wintering to be these, viz: plenty of wholesome food, and proper protection from dampness and cold.

Mt. Sterling,+o Ills.

For the American Bee Journal.

### Acorn Honey—Report for 1886. C. THEILMANN.

Never before this summer have my bees gathered honey from acorns or honey-dew that was noticeable, not-withstanding I have seen them work on oak-trees and acorns at times through the summer and fall for a number of years; but this summer they have gathered over 3,000 pounds of surplus from acorns alone, besides storing considerable in the brood department. The honey tastes very noticeable to me of tannin, but some people say they cannot discover any by-taste; the color is bluish white, with a muddy appearance, though the honey is clear.

On a visit to St. Paul and Minneapolis, Minn., I noticed a great deal of this kind of honey which came from this kind of honey which came from Wisconsin, Iowa, and this State. It is easily detected by the bluish white color of the capping on the combs. Prof. Cook kindly tells us that the acorns are pierced by an insect, and the saliva of the insect foments the starch of the acorn into honey, which flows from the acorns freely (as I have observed closely) runs down on the observed closely), runs down on the branches and scatters on the leaves all over the trees, and in one instant I have seen the leaves of corn sprinkled with it, which grew under an oak tree.

I am not yet convinced whether the honey is caused by the insect above mentioned, or whether it is caused by the weather under certain influences which bursts the acorn, as nearly all of them which I have closely ex-amined had an oblong cut or burst horizontally or crosswise of the acorn. When I first saw the bees working on the oak leaves, honey-dew was my first impression, and I have no doubt that many would have called it louse honey, even if they could not see any lice; if we always correctly un-derstood the origin of what is called honey-dew, we would have but little louse honey.

The milk-weeds which I have sent to Prof. Cook for examination, and which were dripping with sweets when I cut them from the stalks, I have no doubt came from the lice on them, as they have extracted some clear, sweet substance similar to grannlated sugar syrup, visible with the naked eye, and with the microscope they showed drops of crystals on the under side of the leaves while folded (underside to underside) and lying over night on a window-casing; but the curiosity was, that the bees did not touch the sweets on these milkweeds, which were in my pasture, while at the same time they worked thickly on their flowers. The leaves were dripping with sweets from the lice for over ten days, but I have not

discovered a single bee working on them, but on some stalks the ants gathered it very clean. All of my 163 colonies which I put

All of my 163 colonies which I put into winter quarters last fall, came out alive and in excellent condition. I put them out on April 10, and in less than two hours they brought in pollen and honey. The weather being very favorable through April, they filled their hives with brood very rapidly, so that on May I they were one month in advance, compared with one month in advance, compared with other years.

1 sold 15 colonies and commenced 1 sold 15 colonies and commenced the season with 148, and increased them by natural swarming to 197 colonies. My surplus honey was a little over 11,000 pounds, all of which was in one-pound sections, except about 600 of extracted, the latter being mostly from unfinished sec-tions. I never leave over any honey in unfinished sections to be finished the next season, as there is a good in unfinished sections to be finished the next season, as there is a good deal wasted and candied, and besides, it makes very bad looking honey, some of it being sour and unfit for sale. If we care anything for our good names as first-class honey pro-ducers, we should always extract unfinished sections.

The flow of honey was slow, but nearly steady from the time that white clover commenced to bloom until the latter part of August, when it ceased, with abundance of bloom, it ceased, with abundance of bloom, on account of the weather being rainy and cold. They had only two good days in September to gather much honey. The past week the weather was nice and warm, the temperature being 75° to 80° in the shade, but the bees could not get much, as a heavy frost about ten days are back killed nearly all the flowers ago had killed nearly all the flowers. My bees all have natural stores enough for winter, and are all pre-pared; some of them had not enough and others had more stores than they needed. I have equalized them ac-cording to strength and other condi-tions, by taking full frames of honey from the heavy ones and giving them to those that were too light; not believing in guess work, I went from hive to hive, weighing and equalizing them. I calculated that each colony had from 25 to 35 pounds of honey, according to strength, which should be known by the apiarist, and calcu-lations made according to, lations made accordingly.

I think it is far more important for the practical apiarist to have his hives, or rather his frames, all of one size, so that every frame fits every hive he has. He then can change frames from any and every hive, to all. This is one of the most impor-tant points in manipulating an apiary, and there is where some leading heeand there is where some leading bee-keepers make great mistakes (except for experiments) in allowing from two to a dozen or more different frames and hives in their apiaries. It is ab-solutely untrue that they can get more than double or even one-quarter more honey with one hive, than with another, other things being equal. It is not the hive that produces the honey. This should be considered by all bee-keepers.

Thielmanton, Minn., Oct. 16, 1886.

For the American Bee Journal. Painted Hives—Hatching Bee-Eggs.

### A. J. COOK.

In reply to Mrs. O. F. Jackson, on page 698, it may be said that paint surely does stop up the pores of wood, and so stop the passage of air. Hence, if it is wise to secure this freer circu-lation, which, of course, will remove moisture, then no paint would be the order.

But under proper management painted hives do well; in other cir-cumstances, all hives fail. I would always paint my hives, not that it will always pay in dolfars and cents, but for neatness sake.

I prefer to have my hives closed in the winter except at the entrances, which I would have wide open, if in the cellar, which is the best place I think in this latitude. That bees will winter well in some cases is shown in the fact that I once had a colony winter exceedingly well with a sealed cover, and ice-closed entrance. Nor was the ice melted at the entrance; was the ice melled at the entrance, it was still frozen in the spring. This hive was painted. This might not happen again, as the conditions must be just right. I expected to lose the colony. In most cases I prohably would not be disappointed.

In the interesting article by Mr. Doolittle, on page 693, he asks it bees can retard the hatching of eggs. I do can retard the hatching of eggs. not think they can, except as they suffer them to chill. By putting eggs of insects in ice-boxes, or in any cold of insects in ice-boxes, or in any cold place, the hatching can be indefinitely postponed. Thus I have known eggs to be kept three years before hatch-ing, when normally they would have hatched in less than one. Again, we can hatch bee-eggs artificially if we secure the proper heat; hence we disprove the chyme theory. In case the queen keeps laying, the bees must destroy the eggs, or suffer them to become chilled, or else there will, I think, be brood very soon. I want to add that I have tried the

I want to add that I have tried the solar wax-extractor thoroughly, and think that it is worth all its inventor, Mr. Poppleton, has said in its praise. Agricultural College, 9 Mich.

### For the American Bee Journal

Colonies Refusing to Unite, etc.

### M. W. MAHONY.

About a month ago I found that one of my colonies had dwindled considerably in numbers. I thought the queen was lost, but on examination I found a small portion of brood in all stages. I then concluded that she must be a bad layer (though only 3 years old), and was determined to remove her and unite the colony with remove her and unite the colorly with another, but I could not find her when I went to look. I did unite them, however, by transferring combs and bees of a swarm I got on July 4, into the dwindling lot, putting the the transferred bees at the back of the hive and swinkling both with the hive and sprinkling both with

syrup, into which a few drops of the essence of cloves had been put; there was very little fighting—not 50 bees killed.

killed. Now comes the extraordinary part of the business. I have examined them repeatedly since uniting them, and I find that both colonies are apparently as distinct now as when they occupied separate hives; the old bees crawl about in the same listless manner as before being joined by the others, while the latter are as frisky and as "full of sting" (there is about a fourth Ligurian blood in them) as bees ought to be. The old (dwindled) colony is one that I got in May, 1885; they were then put into a combination hive on full sheets of foundation, and did very well last year; this year I got a little over 20 sections from them.

I have examined the combs carefully, and I can find nothing wrong. I have also kept a look-out for a rejected queen, but I have not seen one. Can any of the readers of the AMERI-CAN BEE JOURNAL explain this objection on the part of the bees to unite?

I anxiously await the coming of the excellent weekly AMERICAN BEE JOURNAL, which I get here never later than 13 days after the date of publication. The past has been a bad season for bee-keepers in this country. I got more than twice the quantity of honey last year from 2 colonies of bees.

Killarney, Ireland, Oct. 6, 1886.

for the American Bee Journal.

"Simmins' Non-Swarming System."

### W. Z. HUTCHINSON.

So many of the foreign works that I have read have such a slow, measured, solemn, away-behind-the-times style about them, as compared with the quick, light, elastic "get-there" tread of our American authors, that I was most agreeably surprised to find a decidedly American air about the book entitled "Simmins' Non-Swarming System." It is quite evident that the author is a close reader of American apicultural literature; in fact, some of the methods and practices advocated by Mr. Simmins have been discussed quite recently in these columns.

Although the author writes briefly upon quite a number of bee-keeping topics, yet the grand central idea is the prevention of swarming. The principle consists in giving the bees more room than they require in the shape of unfinished combs, adjoining or next to the entrance. The author states that it is a fact that no colony in normal condition attempts to swarm unless it has all its brood-combs completed. He says that the probable reason why this has escaped the notice of bee-keepers, is because all have become so wedded to the use of foundation, that such a thing as frames having starters only as a guide to the bees, could not possibly enter their heads; and, moreover, the next

great difficulty in producing comb honey would be getting rid of the long-fixed idea that bees will never work in supers until all brood-combs are finished and occupied.

The fact is, however, that by limiting the number of brood-combs just before the season commences, then inserting below or in front of such brood-combs several frames with  $\frac{1}{4}$ inch starters only, having more room than they require in the nursery, the desire for swarming does not exist, while for all practical purposes the bees can be at once crowded into the sections; the latter being first filled with newly built combs. By carefully regulating the surplus department, and removing combs as fast as finished, the frames with starters never have finished combs.

The sections being filled with combs the bees fill those rather than go on building comb to any great extent below the brood-nest. The system offers still another advantage. The author says that he has long been of the opinion that foundation is being used in the brood chamber at a serious loss. He says that brood-combs can be produced by sugar-feeding previous to the honey-flow more cheaply than foundation can be purchased; and, moreover, when hiving swarms (natural or artificial), if frames with guides only be used instead of full sheets of foundation, the whole energy of the bees is thrown upon the how by first placing a limit on the size of the brood-nest, then averaging empty frames between it and the entrance, the bees have every opportunity to profitably apply their sur-plus secretion of wax; thus, instead of being simply a consumer of this the apiarist of the future article, will produce wax at a profit. This natural secretion of the bees is prob-ably always present during a flow of honey, so says Mr. Simmins, and instead of the wax scales being cast away for want of a suitable place to use them, this system finds room and employment for all surplus that may

The comb that is cut out below the brood-nest is fitted into the sections. If it contains eggs or small larvæ before it is removed, it is kept away from the bees until the eggs or larvæ have lost their vitality. Perhaps some will remember that Mr. Boardman remarked last December at Detroit, that he hived his bees upon empty frames, then cut out the combs and fitted them into the sections. It seemed to me at the time as being quite a task, and it still appears the same, as does this cutting out of combs below the brood-nest to prevent swarming; but I am very much interested in it—it is a new idea to me, and I presume I shall give it a trial another season simply to see how it works. Whether inverting the broodnest weekly would prevent swarming, I do not know; my experience in that line has been toolimited. In my own apiary I do not care to prevent swarming, but I can easily see that it would be a great advantage to one

To secure combs for filling the sections.Mr.Simmins puts on an upper story with frames of foundation before the honey harvest, then places dumnies, filled with dry Porto Rico sugar, upon each side of the broodnest and each side of the frames of foundation. With a good colony on the third day the foundation will be drawn out, when it is removed and a fresh batch inserted.

The author says that there has been a tendency of late to start bees upon a *few* sections early in the season. This is very well with weak colonies, but with such colonies as will give a fair profit, a larger super room should be given at the start; more particularly is this the case with the plan of obtaining combs for the sections before the honey harvest comes on. He says: "Give a good colony 40 pounds capacity, and they will fil it; give it 60 pounds and they will do the same, and so on almost without limit. Under this condition the brood-nest is left comparatively free from stores, and the population is kept at about one thing until towards the close of the season; but cramp them to begin with, and they are cramped in every way until the end of the summer."

Mr. Simmins says, also, that from the moment that surplus receptacles are put on, the production of brood should be on the decline. He farther says that it will be observed that he has laid great stress upon the necessity of so managing the surplus arrangements that the brood-nest is not crowded with honey, and on no occasion should it become necessary to extract from the brood-combs when producing comb honey, as is recommended by some writers, who thereby acknowledge their system to be at fault. When the season is over the bees will need feeding, and he advises giving them 20 pounds of sugar syrup in one or two doses. He then points out the profits of wintering the bees on sugar, and that by so doing good colonies are secured for the next season's work.

Without a doubt, says Mr. Simmins, there are no bees which cap their honey and give it such a light appearance as do the native blacks; he also adds that Ligurian queens mated to black drones are very prolitic and give energetic workers, producing honey in much larger quantities than the bees of either pure race. Their combs do not present quite so light an appearance as that of the blacks. For the production of extracted honey Mr. S. thinks that the Cyprians stand at the head of all. The direct introduction of queens is

The direct introduction of queens is treated at some length, but as this has already been given in these columns I will not notice it, except to say that I had proved it to be a success long before I had heard that any one else had practiced it.

reason why this has escaped the notice of bee-keepers, is because all have become so wedded to the use of foundation, that such a thing as frames having starters only as a guide to the bees, could not possibly enter who wishes to establish out apiaries. to the purpose. It is placed in feeders of a dummy pattern, and hung at the side of the brood-nest; it may also be placed in a feeder having a wire-cloth bottom, which is placed over the bees.

Mr. S. has also an uncapping machine, the first principle of which consists in its having two oscillating knives, which, driven by foot power, have a reverse motion while the comb is passed down between them and the cappings are quickly removed from both sides at once. In order to make this a success the combs must be built between separators, or, as Mr. S. calls them, "dividers." When pro-S. calls inem, "dividers." When pro-ducing extracted honey, Mr. S. uses these "dividers" in the supers or upper stories. It seems to me as though all this is "too much ma-chinery."

The author is opposed to reversible frames and hives, but it would seem from his remarks upon the subject that his acquaintance with them has been confined to clumsy or ill-con-trived styles. For instance, he speaks of working with a standard frame with no bottom "rail," thus he has a comb one inch deeper than those who use a thick "rail" for reversing. (1) He says he made a number of hives in 1876, which could be reversed entire, and he has proved to his satisfaction that the plan is based upon no sound principle; that it causes more labor, and no better results can be obtained. My own experience is that those re-sults which Mr. S. so justly praises, viz: empty brood-nests at the end of the season, and thus an opportunity of feeding sngar for winter can be secured with less labor by invertible hives than by any other method; and I think if Mr. S. could give the best style of invertible hive a fair trial be would be of the same opinion. One thing is certain, all things must eventually stand upon their merits.

Now let no one who reads this review write to me or to the AMERICAN BEE JOURNAL and ask questions or criticise, until they have first read the book, as they may therein find an answer. Many other topics are treated in the book, but lack of space forbids even mention of them. Books that tell us exactly *how* to do things are valuable, but if there is any book that I thoroughly enjoy it is one that sets me thinking; that furnishes me seed thoughts. Such is "Simmins' Non-Swarming System." Rogersville, & Mich.

For the American Bee Journal.

The Poetry of Bee-Keeping.

### EUGENE SECOR.

Neighbor Smith is something of a Neighbor Smith is something of a wag. Neighbor Smith is also inter-ested in bee-keeping. He has been in the habit of borrowing my bee-papers to read. One of neighbor Smith's favorite maxims is, "Never-buy anything you can borrow." Another is, "What's the use of hav-ing friends if you don't use them."

That was in violation of another of his favorite sayings, viz: "It's trouble enough to borrow a thing without having to return it." "But," he added with a twinkle in his eye, which made me think of Santa Claus, "I like those apples of yours pretty well, and as the evenings are getting long, and the time before election short, I just thought I would make an excuse to come over to talk politics,

"What part of the bee-papers do I like best? Well, I'll just give you my humble opinion that Doolittle wasn't well named; for he does more than any other writer to couvince me that he knows what he's talking about. There's no fustian about him. He don't expect to start a National bank from the proceeds of 10 colonies of bees in one season without work.

"Another thing I've noticed lately in the bee-papers which makes an old veteran like me laugh all over—that's the *poetry* of bee-keeping. I wish some of those distinguished literary lights, who have been writing poetry about the bees, and about the poetry of bee-keeping, would just come and help me take off my honey after the first hard frost, and get the bees ready for winter. If they didn't sing a dif-ferent song then, I'd have some faith in this pacture business. in this poetry business. I would like to see some who are overflowing with poetic bubbles, go through a few hybrid colonies the second day after a hard frost. If they didn't hibernate in the bosom of their families after a few charges, then I'd believe that bee-keeping was good for the sick-for the women as well-for the dude of the town or the country belle.

"I never have seen two lines of poetry in the bee-business in 25 years of hard work; and the nearest to poetry of anything that I ever read of, was when Samson extracted honey out of the carcass of a dead lion on his way to see his girl. There's a little of the "sweet hum" in that, no mistake. But we who have to rustle for a living find but little poetry in the back-aches and the arm-aches and the sting-aches of the honey-business. And, then, after we've toiled like a galley-slave to get a crop, to have some grocery-man, whose only capital is cheek, to tell us that we made it! Or, if it is comb honey, to have some honest granger who happens to have

the enormous crop of 200 pounds, demoralize the market by dickering it off for 8 or 10 cents per pound. "You who have only ten or a dozen colonies, and get just honey enough to treat your friends when they come to see you, can see all the winsome delights and poetical fancies that an delights and poetical fancies that an idle dreamer can imagine. You probably let the patient wife or the duti-ful son do all the hard work in the bee-yard. You put me in mind of a hen with one chicken. She makes just as much noise, and puts on just as many airs as though she were a notent double decled incoherer. patent, double-decked incubator. If we could understand her clack she would probably be singing about the ing friends if you don't use them." Neighbor Smith brought home the borrowed papers the other evening. In the staid old biddy borrowed papers the other evening.

every clatter, is too busy scratching worms to see the rythmical lines floating in the dreamy atmosphere down in the brush lot.

"We who produce all the honey don't have the time nor the self-assurance to tell more than we know through the bee-papers. We don't care enough about seeing our names in print to give teu pounds of honey to every local editor for a puff, either. Now you may say to any of these 'sweet hum' men who are anxious to embark in light and profitable busi-ness, adapted to gentlemen in poor health or sickly women, that I'll sell 100 colonies, poetry and all, cheap. But the poetry would be something like this:

'Tis the bees' delight to buzz and bite-They're always spoiling for a fight, And always sure to win it. They'll knock the music out of a poet, They'll make a rheumaticky subject go it, Though he couldn't stir a peg he'd shin it -

if two or three good healthy hybrids of warlike instincts struck a bee-line for some prominent bare spot about his physiognomy."

Neighbor Smith said many more things during the evening, which I have not now time to relate.

Forest City, & Iowa.

### Canadian Apiarists in London.

The Canadians who have taken their honey to London to exhibit at the "Colonial," were tendered a banquet by the British apiarists, which was a very brilliant affair. The British Bee Journal speaking of it, remarks as follows:

The bee-keepers of Great Britain have good reason to look back on the gathering that took place on Wednesgathering that took place on wednes-day, Oct. 6, at the Exhibition at South Kensington, with no slight degree of hopefulness and compla-cency. The primary object of the meeting, namely, to extend the hand of friendship and fellowship to those who in a distant country are occupied in the same pursuit as themselves, was one that would commend itself to all imbued with fraternal feelings. But while this was the principal cause that induced so many to gather together, other thoughts must have flashed across their minds when they contemplated the great number that were present at the luncheon at midday, and at the conversation in the evening.

It seems but a short time ago that ht seems but a snort time ago that bee-keeping was an industry strug-gling for a bare existence, scarcely known or recognized, disregarded by most people, practiced by few; but prescient minds conceived the idea that this industry, so weak and so obscure, might be fostered and be-come a boon to many cottagers and come a boon to many cottagers and laborers; and fraught with this view they brushed aside the indifference of those around, aud, by dint of perseverance, energy, and tact-never losing hope, marching on, they at length attained their sought-for end.

some have fallen by the way; but still many in our midst that in the past took an active part in this movement can look backward with joy and thankfulness on the results of their labors, and with hopefulness can contemplate the future that still lies be-fore them. The sight of so many bee-keepers thus brought together representatives of the respective places in which the lot of each is cast -will cause them "to renew their strength," and with firmer steps and with more determined resolve proceed on their onward way, and strive to overtake their still unfinished work.

The day of the Conference at South Kensington will be one that will ever be remembered by those present on the occasion. The arrangements were most satisfactory. The feelings that predominated in the breasts of British bee-keepers towards their Canadian brethren were hearty and sincere, and those feelings found a ready response in the hearts of those whom on this day they delighted to honor. Though embarked in the same pursuit, there will be, we are assured, no undue rivalry, but both, Canadians and British, will combine with all their strength to extend and increase the industry which they have so much at heart; and we may argue, from the spirit that pervaded the meeting, that these endeavors will not be without their full realization.

At the banquet there were about 100 ladies and gentlemen, including the principal apiarists of Great Britain. We quote again from the British Bee Journal, as follows :

The chairman, in proposing the the toast of the Queen, said he was sure that the spirit of loyalty to Her Majesty was equally as strong in the hearts of their Colonial friends as in hearts of their Colonial friends as in those of Englishmengenerally. Every bee-keeper knew that if he wished to have strong colonies he must have a good queen. Fortunately, in England they had a good Queen, and it was during her reign that Britain's colo-nial mecoscions had grown to cigantia nial possessions had grown to gigantic power and strength. (Loud cheers.)

The Hon. and Rev. Henry Bligh proposed the health of the Prince and Princess of Wales and the other members of the Royal Family. He suid that the thanks of all bee-keepers were specially due to the Prince of Wales, who was President of the Executive of the Colonial Exhibition, for his kindness in giving the neces-sary permission for the holding of their recent Honey Show, which was a grand success, and of which the meeting held that day was the out-come. Not many weeks before their Royal Highnesses, the Prince and Princess, had attended the bee-exhi-bition bold att Normiab where they bition held at Norwich, where they evinced the greatest interest in the wonders of the bee-tent. Later on in the year, and in another part of the country, Princess Beatrice had kindly assisted their cause by opening the Bee-Showheld at Southampton, where she gave the prizes to successful ex-hibitors. He thought the work in which they were engaged was a na-

tional one-he might almost say an imperial one, for they took the greatest pleasure in laboring hand in hand with their brethren in all parts of the British Empire.

The Rev. G. Gaynor, in proposing "Prosperity to the Colonies," said he thought the Colonies were certain to be prosperous, because they contained a population possessed of all those characteristics of the Anglo-Saxon race, which had shown such wonderful ability for colonizing, far greater than any other nation of the globe. When Englishmen looked on and saw the wondrous productions of their Colonies (Greater Britain, as they had, been termed) they might well doubt whether the mother country would compete with her Colonies of that day. What the future would develop no one could tell, but when they saw that the Colonies could bring to an Exhibition like the present one forty tons of the most superb comb and extracted honey, it behooved the mother country to look around and exert all her energies to keep pace with her children. The difficulty of doing so was apparent in many ways, and not least when they looked at the productions of wheat grain in the Colonies of Australia and New Zea-land—far finer than anything that could be produced in Britain. Thirtyfive years ago in Kangaroo Island. which was at the present time devoted to the breeding of Italian bees in their pure state, the Legislature of South Australia prohibited the introduction of any other race of bees in that island. They could boast of nothing like that in the old country. They imported Italian bees, but did not thought it was very likely that the Exhibition would become a permanency, in which event they would, he was delighted to say, have many opportunities of fraternizing with their brother bee-keepers from the other side of the Atlantic, which he hoped would tend to increase the bonds of amity between the mother country and her children.

Dr. May (commissioner for educa-tion, Canada) said he could not find adequate words wherewith to express his acknowledgements of the kind manner in which the toast had been proposed and accepted of "Prosperity to our Colonies." The first thing upon which he must congratulate the British Bee-Keepers' Association was that they had a taste for the beautiful, which was evident by the presence of so many ladies at their gath-ering—a proof that bee-keepers were loyal to other queens besides the queen-bee. (Laughter.) On behalf of the Colonies he was glad to say they were a prospering colony who were proud of their connection with the parent colony, and far from enthe parent county, and the from the tering into rivalry they wished to work hand in hand with the mother country. He hoped they would not think him egotistic if he spoke of his own colony in particular. Very little had been known hitherto about Can-Very little ada in the old country. Canada had been described, only recently, as being fifty miles wide, and separated by a

belt of trees from the North Pole. (Laughter.) That was an extraordi-nary statement. The fact was, that they had an area of about 3,500,000 square miles, which made their territory something like the size of Europe. They had a climate which was often spoken of as six months of winter and six months of summer. In that section of Ontario from which their friends, the honey-producers came, the winter commenced in the latter part of December and terminated in March. If they could draw a line straight across the Atlantic from South Ontario, it would be found to strike somewhere about the latito strike somewhere about the fat-tude of Rome. They would, there-fore, understand that Canada was a tract of land which was very prolific and literally flowing with milk and honey. They were a most hospitable people there, and he was sure that if any of their friends in England would pay a visit to Canada, they would find that to be a fact. With regard to the honey of his country, their En-glish friends would be enabled to judge for themselves. There was no doubt that Canadians were a people full of indomitable perseverance and energy. They were not content to sit down and be satisfied with present successes. Mr. Jones, as they all knew, had done very much for bee-keeping. He was called the king-bee in his own country. In spite of his unique position in the bee-world, he was not satisfied, because he could not find a bee with a proboscis sufficiently long to enable it to gather honey from all sources. He had been all over the world in search of such a bee, which he was determined to find or breed if possible. If they could not discover a bee with the desired proboses, they must endeavor to gain their purpose by giving artificial aid to the little insect. (Laughter.) He then referred to the excellent system of free education which prevailed in Ontario, whereby the sons and daughters of rich and poor were ed-ucated alike, by which means latent talent, which was frequently to be met with in the children of the poorest classes, was given free scope for development. They also had a Mechanics' Institute, supported by the Government for the instruction of adults. He was sorry his education in regard to bees had been very much neglected, but he remembered that little poem which began, "How doth the little busy bee," etc., and if they would allow him to improvise upon that, he would say :-

Canada is a great country for boney, It is there farmers and bee-keepers make lots of money. Our bees extract nectar from flowers so sweet, That all nations consider our honey a treat.

(Loud laughter.) With regard to the loyalty of the Canadian people, they claim to be in no way inferior to their English brethren. Anything that affected the liberty of England was a matter of the greatest interest and solicitude to her children across the ocean, who were justly proud of their illustrious parentage. (Loud cheers.)

Mr. Stewart proposed the toast of the "Ontario Bee-Keepers' Associa-tion," coupling with it the names of

Mr. S. Corneil and Mr. McKnight, two gentlemen who, as representa-tives of that Association, had honored them with their company that day. He recommended all present not to leave the Exhibition without seeing the splendid display of honey from Canada then on view. They might be quite sure of the courtesy of the gentlemen named. He had experienced it, and was much gratified with what he had witnessed under their guidance. Although English bee-keepers had made great strides of late years, they would still find some-thing to learn from their Canadian fellow-workers.

Mr. S. Corneil said it afforded him great pleasure to be present at that meeting. Bee-keeping in Ontario was quite a new industry. It was only a very few years ago since he remembered noticing in one of the papers an announcement that their papers an announcement that their friend Mr. Jones was taking a barrel of honey per day. That would be considered a very small affair in the present day. It was, however, only during the last 12 or 15 years that the industry had grown to such great proportions. He was quite sure that the news of the cordial reception he and his friends had met with from and his friends had met with from English bee keepers would be re-ceived with gratitude by his fellowcountrymen. Bee-keepers all over the world had a great deal in com-mon. They wished to discuss and compare notes. They were all learners. He had learnt several matters of im-With regard to the production of honey in Canada, he well knew that they had climatic advantages, owing to the large amount of sunshine with which they were favored during the summer months. Their climate was everything that could be desired for the secretion of nectar in the flowers. The assistance rendered by bees to the agriculturist was well appreciated in his country. They gathered the finest honey from the clover fields, and the farmers found from common observation that when their farms were close to a large apiary of bees, their fields yielded them far more seeds per acre than would otherwise be the case. Thus the bees conferred a double benefit on man; so much so that most farmers took to bee-keeping in order to increase their crops of clover seed. In Canada there were only five or six millions of people. They were scattered over a large extent of territory. Hitherto Canadian bee keepers had kept at home all the honey they produced. In Britain there were a great many more than five million people, and having heard that honey was constantly being imported from other countries into England. the bee-keepers of Canada thought that whatever profits were to be obtained by imports, friends might as well get them as strangers. They had, therefore, come over in the hope of securing a small share in the advantages of the honey trade.

Mr. McKnight desired to thank the British Bee-Keepers' Association in the name and on behalf of Canadian bee-keepers for the splendid enter-

tainment afforded to their delegates. They recognized the right hand of fellowship extended from the mother country. Ile could tell his audience that he and his friends would carry home the most pleasing recollections of the way in which they had been entertained by the bee-keepers of Britain. They, as representatives of the Ontario Association, came over to show what their country could pro-duce. Their land was veritably the Canaan of America, flowing with milk and honey. If any one doubted that, let him make his way to the honey exhibition, where he would find conclusive evidence of the fact. They came over to make glad the hearts of their own mother England. Every mother ought to be proud of her off-spring, and it must afford her gratifi-gation whom they conducted them cation when they conducted them-selves in life so as to win her approbation. He was sure that England must be proud when she saw what they had been doing beyond the seas. They had proved that they had not been lying on their oars, and, in fact, that they had added as much to the glory of Great Britain as her soldiers glory of theat Britain as her so past. and sailors had done in years past. They had made primeval forests to disappear, and in their place raise up the fruits of the earth. Those were the battle fields on which their victories had been fought and won, and it required a stout heart to engage in those fights. It was an old saying that bee keepers were a very ine class of people. (Laughter.) Well, there was no question that they possessed some excellent characteristics. Their pursuit necessitated a large amount of moral courage, patience, and per-severance. One seldom found a suc-cessful bee-keeper to be a cross-grained and bald-hearted man. Possibly the reason of this was that he had a peculiar being to deal with, and one who would defend its home and with Spartan courage. property (Cheers.)

The chairman regreted the absence of Mr. Pettit, the President of the Ontario Bee-Keepers' Association, who had been obliged to leave that day. Before his departure he requested the chairman to express his cordial acknowledgements of the kindness of the British Bee-Keepers' Association.

The Rev. F. Jenyns said he had been asked to propose the health of those who were amongst them as visitors, and whose presence added much to the pleasure of the gather-ing. Ile trusted they would do their best to carry into their respec-tive districts a knowledge of what they had seen and heard that day. The meeting was honored by the The meeting was honored by the presence of two distinguished vis-itors, namely, the Secretary of the Swiss Association, a most advanced bee-keeper, and also the President of the Devonshire Association, whose connection and relationship with Mr. Woodbury would alone entitle him to the respect of all bee-keepers. He book in on list, and we will send it to look back on that day with happy remembrances, for it was a remark-able day, not only for the pleasure it -will you not assist us to obtain them?

afforded to so many bee-keepers of coming together, but because it showed the wonderful development of their favorite industry, which, upon a retrospect of a few years, one would hardly have believed possible. That was a source of great gratification to the British Bee-Keepers' Association, to whose efforts that result, to a large extent, was due. Of course they could not but be delighted to find that their objects and aims had spread so far west as Ontario. He hoped that the meeting would tend to promote the good work in which they were engaged, and strengthen the bonds of friendship which he believed existed among all bee-keepers.

Pasteur Descoulayes (who spoke in French), Secretary of the Societe Romande d'Apiculture, said it gave him the greatest pleasure to be able to be present, and to thank them on behalf of himself and other visitors present. He said the bee-keepers in Switzerland were greatly indebted to their Chairman (Mr. Cowan) for much information, always willingly given by him at all times personally, and to his writings. He was well known and appreciated by the Continental beekeepers. He compared the British Bee-Keepers' Association to a large and strong hive that did its work well.

Mr. Horton Ellis also briefly acknowledged the toast, expressing his great pleasure at being present on so memorable an occasion; he added a few words to the effect that he looked forward to the time when an im-provement of the honey-bee might take place, by means of judicious crossing of the breeds, possibly the Indian with the Ligurian.

The proceedings in the luncheon-room being adjourned, the guests were conducted to the honey-show in the Exibition, where the magnificent display of Canadian honey, exhibited by 27 members of the Ontario Asso-ciation, was inspected, there being about forty tons of comb and ex-tracted honey.

### System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

 For
 50 colonies (120 pages)
 \$1 00

 \*\*
 100 colonics (220 pages)
 1 25

 \*\*
 200 colonies (420 pages)
 1 50

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

Reader, do you not just now think of one bee-keeper who does not take the Weekly BEE JOURNAL, and who should do so? Perhaps a word or two from you will induce him to do so. Will you not kindly oblige us by getting his subscription to send on with your own renewal for next year? When you do so, please select any 25 cent book in on list, and we will send it to you post-paid, to pay for your trouble. We are aiming to get 5,000 new subscribers for 1887

SELECTIONS FROM

Peculiar Action of Worker Bees.-E. E. Ewing, Rising Sun, 6 Md., on Nov. 4, 1886, writes :

Query, No. 331 appears to puzzle the veterans. All bee-keepers have no-ticed the bees at times "pawing" with apparently much industry on the alighting-board. It occurred to me that they might be trying to clean off the dirt which accumulates in front of the entrance, and smoking the "pawers" in, I washed the black the accumulation off with salt and water until the colonies had a white, clean porch in front of their door, when the scraping ceased. I think the industrious, tidy things not finding much to do in the fields, employ themselves in trying to scrub off their front porches.

Good Fall Weather, etc.-W. Addenbrooke, North Prairie, Wis., on Nov. 9, 1886, writes thus:

I disposed of my bees down to 67 colonies, about 50 good ones, the balance being below par; increased by natural swarming to 130 colonies, all of thick the increased condition for all of which are in good condition for winter without feeding. My bees have stored 4,000 pounds of comb honey in sections 4½x5 inches, and over 1,000 pounds of extracted honey. About half of my crop I have sold at from 8 to 15 cents per pound. We had a severe drouth near the end of the honey season, which curtailed the amount of the crop. We have had splendid fall weather up to date.

Working on Red Clover.-Joseph Beath, Corning, 9 Iowa, on Nov. 3, 1886, says :

I commenced the season of 1886 with 18 colonies, increased them to 32, took 1,100 pounds of extracted boney, and my hives are now full of honey. I think that my bees are in the best condition for winter that I ever had them. Mr. Doolittle, in his report on page 631, says that his bees worked on red clover that was saved for seed, which is the second crop. Mine did the same thing last year, and even the black bees were on it in numbers. But although the heads are coming every day.

were still smaller this year, there was no bees that worked on it. Probably there was no nectar in it. It is true that we cannot have the nectar withthat we cannot have the netter with-out the flowers, but I notice that we frequently have the flowers without the nectar. When any of our fra-ternity have bees that work on the first crop of red clover, I for one should be glad to know it.

Late Swarms, etc.-Wm. Anderson, Sherman, 0+ Mo., on Nov. 8, 1886, says :

I have reaped a bountiful crop of at the present time. On Oct. 10 I had a large swarm of bees, a strange thing for that time of the year. In June I got 3 Italian queens. I introduced one of them, but did not kill the black queen, which I had taken out. I kept her about three days, when I went to her about three days, when I went to see how the new queen was getting along. I found her all right; but not wanting to kill the black queen I let her fly away. A day or so after I went to see how the new queen was getting along, and to my surprise I found the black one back in the hive, and the new queen gone. I know the and the new queen gone. I know the new queen was all right, for after the proper time there were some Italian bees in the hive.

Severe Drouth.-B. W. Peck, Richmond Centre, & O., on Nov. 6, 1886, gives his report as follows :

I commenced the spring of 1886 with 25 colonies of bees, increased them to 40, and took 1,675 pounds of honey, 445 pounds being in one-pound sections, and the rest was extracted honey. We had a severe dronth here which cut the season short.

Case of Bee-Diarrhea. -H. J, Lansingburg, O+ N. Y., Northrup, writes:

I send a box containing samples of bees. Lay them down on a board, place a stick upon their abdomen, stand back and press down, and then tell what ails them. They have been dying in large numbers. I would like to know the cause, and the remedy, if there is any.

[This is a clear case of bee-diarrhea. The fecal mass is a combination of pollen and water, differing in proportion in different specimens. In some of the bees the mass is very watery; in others quite thick and pasty. Of course I have no chance to even guess the cause of the bees thus gorging themselves and retaining the mass unto death, as I know nothing of the circumstances .- JAMES HEDDON.]

Five Thousand new subscribers to the BEE JOURNAL is what we have made our calculations for; they will come in clubs between now and next spring. Installments

### Honey and Beeswax Market.

The following are our very latest quotations for honey and beeswax :

#### CHICAGO.

HONEY.--It has all better during this month than at any time since the new crop came on the market. Yet prices are not any higher, sules being made at 116012c. for white honey in 1-1b, sections. Fancy sections of less than 1 bb, in weight, at 13c. Extracted is unchaoged in tone or values, being 567 certs per lb. BESSWAX.-23625c. R. A. BURNETT, Wor 9. Wates 91

R. A. BURNETT, 161 South Water St. Nov. 9.

#### NEW YORK.

NEW YORK. HONEY. - We quote this year's crop as follows: Fancy white in 1-lb. sections. clean and neat packagea, 15@16c.; 2-lba., 12@13c.; fair to good 1-lbs., 12@14c.; 2-lbs., 10@11c.; faircy buckwheat 1-lbs., 12@14c.; 2-lbs., 9@10c. White clover ex-tracted in kers and amail barrels, 64@7c.; Califor-nia comb honey, 10@11c. BEESWAX.-Prime yellow, 22@24c.

MCCAUL & HILDRETH BROS., 34 Hudson St.

### BOSTON.

110NEY.-The demand has improved. We are selling one-pound packages of while clover honey at 14@15c; 2-pounds at 13@14c. BEESWAX.-25 cta. per lb.

#### BLAKE & RIPLEY, 57 Chatham Street.

#### DETROIT.

HONEY.-Best white in 1-b. sections, 12@13c.; dark, 10@11c., with a good supply in commission houses. BEESWAX.-23c. Oct. 10. M. H. HUNT., Bell Branch, Mich.

CINCINNATI

110NEY.-There is a lively demand for table honey in square glass jars, and the demaod for nice comb honey is very good. Demand from manufacturers is slow for dark grades of ex-tracted horey. The ranging prices for extracted is defree, a how the comb brings 12@15c. per 1b. in a jobbing way. BEESW AX.-Home demand is good. We pay 20@23c, per lb.

Nov.10. C. F. MUTH & SON. Freeman & Central Av.

#### CLEVELAND.

HONEY.—Choice new honey in 1-lb. aections is aeling at 14c:; 2-lbs. 12a13c. Old honey is very dull at 10@12c. Extracted, 6@7c. BEESWAX.-25c.

#### A. C. KENDEL, 115 Outario Street.

### MILWAUKEE.

MILWAUKEE. HONEY.-The market for boney of choice qual-ity is firmer and we are trying to establish a higb-er range of values. We quote 1-1b. sections of white at 12½@13c.; 2-1bs., 11½@12c.; dark not wanted. Extracted, white, in balf barrels and in kega 65@7c.; to tin packages, 7@7½c.; in barrels, as to quality,5@5½c. BEESWAX.-No demand.

A. V. BISHOP, 142 W. Water St. Oct. 2.

### SAN FRANCISCO.

SAN FRANCISCO. HONEY - There is a firmer market for extrac-ted, and especially for comb honey, as the crop-of the latter is rather amail. A plarists have sold what they were obliged to dispose of for payment of packages and labor, and they hold the balance back at higher prices. The demand is increasing, and we quote with ready takers, 46444c. for choice extracted ; 3346334c. for amber extracted ; and 9611c. for comb honey in 2-ib. sections; darker grades oring 768.c. BEESWAX.-it finds huyers at 22624c. Son 29. Such actual & Ismon 122-12 Dayls St.

Sep. 28. SCHACHT & LENCKE, 122-124 Davis St.

HONEY.-Trade is quist. Extra white comb llc; amber, 756@10c. Extracted, white, 4@414C; am-ber.336@334c. BEESWAX.-20@23c. Oct.18. O. B. SMITH & Co., 423 Front Street.

#### ST. LOUIS.

HONEY.-Choice comb, 11%@12%c.; latter price is for choice white clover. Strained, in barrels, 3%@4c. Extra fasce of bright color abd in No. 1 puckages, % advance on above prices. Extracted in barrels. 4%@5%.; in cans 6%7c. BEESWAX.-Duil at 21c. for choice.

D. G. TUTT & CO., Commercial St. Oct. 21.

### KANSAS CITY.

KANSAS CITY. HONEY.-Demaad for all grades is good, and aales are large. Receiptaare good and prices are steady with a firm feeling. We quote: 1-lb. aec-tinus of white clover, 136416...dark, 106312c; 2-lba. white clover, 1362162...dark, 106312c; 2-lba. 964116.; ½-lbs. white clover, 146315c. Extracted white clover, 667c; dark, 4655c.; white eage, 5½c.; Calif, amber, 5c. BEECSWAX.-20622c.

Oct. 15. CLEMONS, CLOON & Co., cor. 4th & Wainnt.

THOMAS G. NEWMAN & SON, PROPRIETORS. 923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN, BUSINESS MANAGER.

Special Notices.

To Correspondents. — It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this oflice. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

A New Crate to hold one dozen one-pound sections of boney.—It has a strip of glass on each side, to allow the honey to be seen. It ls a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 ets, per erate. Glass 1%c. per light, extra.

**Premium Worth Having.**—The New York World and the AMERICAN BEE JOUR-NAL (both weekly) will be sent for one year to any address in North America for \$1.90. And in addition PRESENT to every such CLUB SUBSCRIBER a "History of the United States," containing 320 pages and 22 fine engravings, bound in leather and gilt.

This "History" will be sent FREE by express at the subscriber's expense; or will be mailed for 10 cents extra to any place in the United States or Canada.

It is arranged chronologically by years, from 1492 to 1885. Every event is narrated in the order of its date. These are not confined, as in other works, to political matters, but embrace every branch of human action.

This premium is worth the whole of the money sent for both periodicals, and should induce thousands to subscribe, and thus get two unrivalled weeklies for nothing.

This offer is good only null Jan. 1, 1887, hence no time should be lost. Send at once l

When Kenewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a **Hinder** for the BEE JOURNAL to any one sending us four subscriptious—with \$4.00 direct to this office. It will pay any one to devote a few hours, to get subscribers.

Simmins' Non-Swarming System is the title of a new English bee-book. The author claims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result --a total absence of any desire to swarm." It contains 64 pages ; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

The Report of the Indianapolis Convention is now published in pamphlet form, uniform with that of last year. It will be sent postpaid for 25 cents to any address.

We have also bound it up with last year's, together with the History of the Society; this we will mail for 40 cents. Or 'ff you send us one *new* subscriber (with one dollar) besides your own renewal, we will present you with a copy by mail.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will elub for \$1.50.

To all New Subscribers for 1887 we will present the rest of the numbers for 1886; so the seener they subscribe the more they will get for their money.

Colored Posters for putting up over honey exhibits at Fairs are quite attractive, as well as useful. We have prepared some for the BEE JOURNAL, and will send two or more free of cost to any one who will use them, and try to get up a club.

Money Orders can now be obtained at the Post Offices at reduced rates. Five dollars and under costs now only 5 cents. As these are absolutely safe, it will pay to get them instead of the Postal Notes which are payable to any one who presents them, and are in no way safe.

As there is Another firm in Chicago by the name of "Newman & Son," we wish our correspondents would write "American Bee Journal" on the envelope when writing to this office. Several letters of ours have already gone to the other firm (a commission house), causing vexatious delay and trouble.

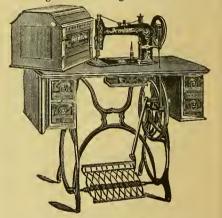

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers hosides his own, with \$3.00, for one year, we will present a copy of this valuable book.

**Red Labels** for one-pound pails of honey, size  $3x4\frac{1}{2}$  inches. — We have just gotten up a lot of these Labels, and ean supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2 00; 1,000 for \$3.00; all with name and address of apiarist printed on them—by mail, postpaid.

### Established 1855. Published Weekly.

64 columns weekly, 3228 columns a year. Good, practical information for the farmer and family. Equalled by few, excelled by none. Is *practical*, and no farmer who has read it will run his farm without it. Every member of his family will find something to interest and instruct them. Any ose interested in agricultural topics will find it of value to him. The owner of a garden will be paid many times the subscription by reading it from week to week. Its subscribers say it's the Best Agricultural Paper in the World; they ought to know. Price, \$2 per year, and worth it. Our Premium High-Arm Sewing Machine and the

PRACTICAL FARMER one year, \$22. The Sewing Machine is the latest style, all improvements, full set of attachments, guaranteed to give satisfaction. Sent on 30 days' trial and if not satisfactory money refunded on return of Machine to us. Purchasers pay freight.

Offer No. 1 Any person sending \$1 and mentioning this paper will receive the PRACTICAL FARMER for 1887 and remaining numbers of 1886 free.

Offer No. 2 Any person east of the Mississippi sending us \$22, mentioning this paper, will receive the PRACTICAL FARMER for 1887 (remainder of 1886 free) and the Sewing Machine freight paid. If west of the Mississippi, \$21 will get the paper and machine, purchaser paying freight.

By The proof of the pudding is in the eating. Try it. Address THE FARMER CO., Publishers, 1420 Chestaut St., Philadelphia, PA.

SPECIAL DISCOUNT ON HIVES.

42E6t

In order to keep our Hive-Factory running during the dull season, we will make a DISCOUNT of 10 PER CENT. on all orders for Hives, Cases, Frames, Shipping-Crates and Bee-Feeders, received during November and December, 1886.

THE MARSTON "9. 19 Park Place, New York.

# GLASS PAILS The NEW Heddon

We have made arrangements with the iuventor by which we shall make and sell the Heddon Reversible Hive, both at wholesale and retail ; nailed and also in the flat.

The engraving gives a good idea of the hive. The hrood-chamber is in two sections; also the surplus arrangement, which may be interchanged or inverted at will. The cover, bottom-board, and top and bottom of each sectional case has one-half of a regular bee-space, so that the surplus cases with the sections, may be placed between the two brood-chambers, or the latter may be transposed or inverted—in fact, all parts of this hive are perfectly interchangeable. The brood-frames will ALL be hored for wires.

ALL be bored for wires. A SAMPLE HIVE includes the bottom-board and stand; a slatted honey-hoard, and cover; two 6-inch brood-chambers, each containing S frames; two surplus arrangements, each containing 2× one-pound sections, one with wide frames and separa-tors, and the other without separators. This latter chamber can be interchanged with the other stories, hut cannot hereversed. It is NAILED AND PAINTED, and ready for immediate use. Price, \$4.00, complete.

It is absolutely essential to order one nalled hive as a pattern for putting those In the flat together correctly.

HIVES READY TO NAIL.—In tilling orders for these hives, in the flat, we make 6 different com-binations, so that our customers may make a selection from the sample nailed hive, without waiting for us to quote prices, and the different kinds will be known by the following numbers :

No. 1 consists of the stand, bottom-board, cover, two 6-inch brood-chembers, 16 frames, and the slatted honey board. Price, \$1.55 each. No. 2 is the same as No. 1, with the addition of one surplus story containing 28 sections without separators—interchangeable, but not reversible.— Price, \$2.00 each.

No. 3 is the same as No. 2, with two surplus sto-ries as therein described. Price, \$2.50 each.

No. 4 is the same as No. 1, with the addition of one surplus story containing 28 sections in wide frames with separators, which can be reversed, inverted, and interchanged, the same as the brood-cnambers. Price, \$2.30 each.

No. 5 is the same as No. 4, with two surplus arrangements as therein described. Price, \$3.00.

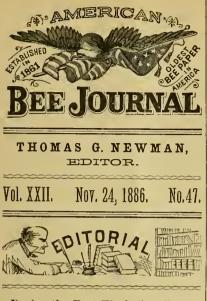

No. 6 contains all the parts as described in the sample nailed hive. Price, \$\$2.75 each.

sample halled nive. Price, 35.75 each. Those designs the bives without the stand, honey-board or sections, may make the following deduc-tions from the abuve prices : Stand, 14 cents; honey-board, 8 cents; and the 28 or 56 sections, as the case may be, at ½ cent each, respectively, We will also make the following deductions on quantities ordered all at one time : For 10 or more hives, 5 per cent, discount; for 25 or more hives 7 1-2 per cent.; for 50 or more, 10 per cent.

### THOMAS G. NEWMAN & SON. 923 & 925 West Madison-St., CHICAGO, ILL.

41Atf

During the Past Week the editor has been quite unwell, and unable to attend to his regular duties. Part of the time his physician would not allow him to leave his residence. This may explain why some letters have not been answered promptly.

Prospects for successful wintering of the bees are thus commented upon by Mr. C. H. Dibbern, in the Plowman :

Those who use large hives, and did not ex-Those who use large bives, and did not ex-tract all the early white boney, will probably come throngh all right. Owing to the ex-tremely dry summer, the late honey was of a very inferior quality, and we may expect the small hive man, who has extracted all be could get up to Angust, will be among the mourners next spring.

At the Dallas, Texas, Fair, Mr. J. W. Eckman seems to have made a "sweep" of the premiums. The Richmond Opinion of Nov. 5, says :

In the honey department Mr. J. W. Ecknau proves that his system of bee-manage-ment is par excellence, for he took the whole list of premiums, showing honey in every conceivable shape and form.

The premiums on bees and boney, which Mr. Eckman was awarded, amounted to \$52. Surely it pays to excel in the matter of putting up honey for the market, and then to make a good display of it. We congratulate Mr. Eckman upon his progressive management, and the exertions he has put forth to exhibit it to the world.

Mr. R. H. Holmes, of Shoreham, Vt., on Nov. 15, 1886, requested us to note the following announcement. As every other department of the JOURNAL is full, we give it here : "The annual convention of the Vermont Bee-Keepers' Association will be held in Burlington, Vt., on Jan. 13, 1887." The programme is not fully made up, but it is expected that there will be a two days' session.

E. H. Cook, Andover, Conn., has sent us his 28-page Club List of newspapers and magazines for 1887.

Canadian Sult Against Bee-Keeping. -R. F. Holtermann sends to the General Manager of the Bee-Keepers' Union a statement of the case as set forth on page 742, and adds, "I think you will here find a case which should be taken np." He then adds :

How far we in Canada have supported the Union 1 know not; probably not as we should; but I have seen its utility 1f prop-erly conducted, and thus far I believe it has been. I sent \$1, and am prepared to send worker out so that be the factor of the solid another, so I am not ashamed to call for aid.

In reply to this we will say that the Union for the present year has only two members in all Canada-the Rev. W. F. Clarke and G. A. Deadman. Last year there were three, if we include Mr. Holtermann's dollar sent to the defense fund, without annual dnes. Mr. Jos. Harrison, the person sued, is not a member, and the only claim that could be entertained at all, would be to prevent the recording of a precedent in the law books of America.

The "only bee-paper in Canada" bas never thought enough of the Union to mention "its aims and objects :" neither have its proprietors ever offered to become members. Mr. Harrison, in a letter dated Nov. 10, 1886, writes as follows :

If such men are permitted to obtain junctions to restrain persons from keeping bees, farewell to bee-culture in Ontario..... bees, tarewell to bee-culture in Outario....
 I cannot say when the final question will be brought up, but expect it sometime before Christmas. The judge submitted these questions to the jury:

 Did nearness of the bees cause discom-fort to the complainant in any unward.

fort to the complainant in any unusual degree 2

degree? 2. Did the complainant acquiesce in Mr. Harrison's keeping bees, by allowing him to put 28 hives of bees in his yard before be (Mr. Harrison) found fault with the dirty

The General Manager is in some doubt whether the Union should take hold of the ease in Canada, especially when the apiarist is not a member of the Union. He is now consulting with the Advisory Board, and their decision will be final.

Tasting of a Honey-Bee.-The Hartford Times recently contained the following peculiar experience with a boney-bce :

A Ridgefield farmer has a hired man named Burdick, who, a few weeks ago, was picking up apples to carry to the cider-mill. He came across a fair and ripe one and bit into it for a mouthful, without discovering a bala in it where were concerned as a hole in it wherein was concealed a bee, which stung him on the tongue. It was painful for a time, and his tongue badly swelled. For two days he suffered from constant nansea, and was scarcely able to eat. The effect then passed off and he forgot the metre. But he is now foreibly reminded eat. The effect then passed off and he lorgot the matter. But he is now forcibly reminded of it, for whenever he attempts to eat an apple he experiences the same sensation he did when stung, and if he persists in eating it, his tongue swells and the nausea returns.

J. W. Sanders, of Le Grand, Iowa, baa sent us one of his division-boards, which consists of a plain piece of hoard 34 of an inch shorter than the hive, with a piece of rubber 1/2 inch wide at each end to make it np to the width of the hive, and keep it beetight. It has an ordinary flat top-bar with projecting ends.

The frame is a regular Langstroth frame with a V-shaped top-bar, with comb foundation about one-balf the way down, and a wire run through from side to side, embedded in the foundation to keep it from bulging. Both are placed in our Museum for the inspection of visitors.

The Indianapolis Convention - the proceedings of which we have published, and a notice may be seen on page 748 of this issue-is thus commented upon by our friend, Mr. A. I. Root, in Gleanings, for Nov. 15, 1886 :

REPORT OF THE PROCEEDINGS OF THE INDIAN-APOLIS CONVENTION.

The above report is very neatly gotten up. It is a book elosely printed, of 32 pages. It is furnished by the AMERICAN BEE JOURNAL It is a book closely printed, of 32 pages. It is furnished by the AMERICAN BEE JOURNAL for 25 cents. It seems to me the matter con-tained in it onght to be worth that to any enthusiastic bee-keeper. While I am about it, I believe I omitted to make editorial men-tion of the proceedings a year ago. I regret this, as it embodied also a history of the North American Bee-Keepers' Society from 1870 to 1884. The price is also 25 cents, furnished by the AMERICAN BEE JOURNAL. This latter book contains 64 pages. While we are looking over these convention re-ports, I feel moved to say that the editor of the AMERICAN BEE JOURNAL should receive a vote of thanks for the very faithful ser-vice be has rendered at different times to this conventions. He is a most excellent reader and speaker, full of good natured pleasantry and enthusiasm; and with the experience of the last two or three conventions before me, I for one should feel sorry to fund friend Newmer obsert form me, I for one should feel sorry to find friend Newman absent from any convention might have the good fortune to be permitted to attend.

Thanks, Brother Root, but we fear we shall not have the pleasure of meeting together at the Michigan State Convention. We regret this, but it is out of onr control.

Mons. Leon Jonas, one of the founders and the Secretary of the "Societe D'Apiculteur de la Somme," in the northeast of France, died last January, and on Oct. 12, the President, Mons. Jules Madare, also departed this life. The Bulletin of the Society came out with a wide, black border for each, sbowing the esteem and affection in which they were held by the members. The death of the latter occurred while our international convention was being held at Indianapolis. It is strange that these two intimate friends should have died in the same year ! Both were apiarists of renown, and in their death the apicultural world has lost two progressive and enthusiastic bee-keepers.

The December Number of Frank Leslie's Sunday Magazine closes the Twentieth Volume. The opening article is "A Moravian Village," by Lieut. H. R. Lemly, U.S.A., who describes sympathetically the village of Salem, N. C. Mr. Powell's fifth number of "Leaves from My Life," deals with Lord Beaconsfield, "Barry Cornwall," and Alfred Domett. This Leaf is very fully illnstrated. Other profusely illustrated articles are : "Zanzibar, and Mission Work There," etc. There is plenty of miscellany in the shape of short articles and sketches, and several very beautiful full-page reproductions of paintings by well-known artista.

The Union Reading Circle is the title of a new literary journal especially devoted to home study and reading circles; it is somewhat after the plan of the Chautan-quan, but is non-sectarian, and the instruc-tion is intended to be highly scholarly, leading through complete college courses, over fifty distinguished college protessors being connected with the enterprise. Yearly subscription, \$1.00; single copy 10 cents. Address The Reading Circle Associa-tion, 147 Throop Street, Chicago, Ills.

### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, he put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-ED.]

### Fumigating Comb Honey.

Query, No. 338.-In keeping comb honey until winter, especially if the fall be warm, millers spin their webs on the combs, injuring its appearance-often destroy it entirely. How much sulphur or brimstone must be used to every 1,000 cubic feet of space, and how burned or applied ?-J. C.

A heaping table-spoonful will be sufficient for 1,000 cubic feet of space. The sulphur can be placed on live coals in an iron vessel.—J. P. H. BROWN.

Burn the sulphur in a smoker. We cannot say how much is needed, but it must be used plentifully, and yet not enough to turn the propolis green. -DADANT & SON.

I use about one-fourth of a pound overv 2.000 cubic feet. To apply, to every 2,000 cubic feet. To apply, put some ashes in an iron kettle, and on the ashes place some live coals, then your the sulphur on the coals.-G. M. DOOLITTLE.

The comb should be hung on frames in a close room, and enough sulphur burned therein to completely fill the room with its fumes. One-fourth of a pound would be sufficient to thoroughly fumigate a room 8 to 10 feet square.-J. E. POND, JR.

In a room 8 feet square I use ½ of a pound of sulphur. Put some ashes in the bottom of an iron kettle, heat an iron "red hot," put it in the ket-tle, lay on the sulphur, put an iron plate on top of the kettle, hang it in the top of the room; "get out," and close the door. After the sulphur has done its work, thoroughly ventilate. -H. D. CUTTING.

Use one pound of sulphur for 1,000 cubical feet of space. Put some ashes in a kettle, then put in the sulphur, and hang the kettle up near the top of the room. Heat a piece of iron to of the room. Heat a piece of iron to a white heat, drop it in the kettle and then close the door. Have the honey so arranged that the tumes can gain access to it.—W. Z. HUTCHINSON.

There is no trouble in keeping comb honey in a warm upper room indefinitely if there is no pollen in the combs. The sections should be the combs. The sections should be the tered, and have been so win-held up to the sunlight, and those tered, and well wintered, hut many of the bees to pay containing pollen placed by them-selves and sulphured if need be. and when all the testimony is in, it JAMES HEDDON.

Using wide sections and avoiding very shallow brood-chambers will verv remedy the trouble from hee-bread so that not one section in a hundred will have to be selected out. Bee-bread is as essential in the development of the moth-worm as the bee-larvæ, and no pains should be spared to keep it out of the sections. Very unpleas-ant results have happened from placing comb honey upon the market con-taining it.-G. L. TINKER.

I would not use sulphur at all. If I had bees that would allow such work by millers, I would re-queen them by better blood. It I had honey from better blood. It I had honey from such bees, I would go over each sec-tion and pick out all worms and webs, and approaching cool weather will do the rest.—JAMES HEDDON.

Sulphur is cheap. Use enough to fill the space densely with fumes. It can be done by placing sulphur on live coals, or in a smoker well lighted. We have only to burn our sulphur in a confined space where the combs are placed. The closer the continement the better.—A. J. Cook.

Try 2 pounds to 1,000 square feet of comb, and if it does not green any of the comb it may be all right. If the room is full of honey I think it will need less sulphur than the same room with a little honey. Put the sulphur in some iron vessel placed in another vessel to make it safe, stick a match in the sulphur and light it.—C. C. MILLER.

The millers do not spin webs, it is the moth-larvæ that spin the webs to protect them from the attacks of hees. If the combs are kept in a light place, and are not suffered to touch each other, and are free from pollen, the moth-worms do not trouble them, so far as my experience goes. In the use of brimstone I burn it in an old pot and just guess at the amount used. Moth-worms do not injure my comb honey when properly managed, its liability to sweat and become smeared being my greatest drawback. -G. W. DEMAREE.

### Wintering Bees in a Warm Room.

Query, No. 339 .- Can hecs be wintered in a warm room iu a second story of a house. where it seldom freezes ?-Burlington, Wis.

I should not want to try it.-G. M. DOOLITTLE.

Not successfully .- DADANT & SON. It is possible that they might, but the occasional freezes would not be desirable features.-W.Z. HUTCHINSON.

If the room does not get too warm at times, they can be.—G. L. TINKER,

I know that it has been done in the attic of a house in this town for several years.-II. D. CUTTING.

I see no reason why they could not if the temperature of the room could be kept say at  $45^{\circ}$  or  $50^{\circ}$ .—J. P. H. BROWN.

They can, and have been so win-

proves such a place inferior to the usual bee repositories.-JAS.HEDDON.

I think no one has ever made a success of it, although it has been tried.—C. C. MILLER.

They could not be successfully wintered in this climate in that way, unless they could fly during warm spells, as they do when on the summer stands.—G. W. DEMAREE.

I have known of such rooms being used with success. So they can be; but I should regard such a place as the very worst in the world for bees in winter.—A. J. Cook.

Possibly they may, but I think it doubtful, unless the room is made absolutely dark. Much will depend upon the degree of warmth, and whether the temperature can be kept nearly equable, and say about 42° 50°, Fahr.-J. E. POND, JR.

### Keeping Bees on Shares.

Query, No. 340 .- A gentleman wishes me to take 50 colonies of bees to work on shares, I to furnish the land, hives, foundation, boxes, etc .- in fact to furnish everything, and do all the work, and also market his share of the honey. What share of the increase and of the honcy should I get? Or, in other words, what per cent. should I receive for my share ?- Defiance Co., O.

Seventy-five per cent.-G. M. Doo-LITTLE.

Eighty per cent.-H. D. CUTTING.

About 75 percent.-J. E. POND, JR

About 75 per cent.-G. L. TINKER. Seventy-five per cent. would be about right, if you had to incur all the expense and labor .- J. P. H.

BROWN. At least  $\frac{2}{3}$  of the increase and of the honey.—DADANT & SON.

I think where each furnishes onehalf of the hives, etc., each takes one-half of the proceeds. Ask some of the men who let or take bees in this way.-A. J. Cook.

You should have rent for your land, full pay for the hives, and half pay for the foundation, sections and ship-ping-crates. The honey should be equally divided, the increase to belong to the one who furnished the bees.-W. Z. IIUTCHINSON.

It would depend somewhat on the locality. I mean by this, that the rental value of bees would be worth more in some places than in others. In an average location I suppose 66% per cent. would pay you, and would pay the owner of the bees, as he would get  $\frac{1}{3}$  of the profits for the rent of his bees.—G. W. DEMAREE.

If the bees are now in such hives as will be supplied by you for their increase, I would say that you should have one-half of the surplus honey, and all the increase, you to return the same number of colonies you receive, and at the same time of year, and in equally good condition. The owner of the bees to pay for one-half of the sections, and shipping-crates sold.—

Explanatory .- The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is located near the center of the State named;  $\delta$  north of the center;  $\hat{Y}$  south;  $\Theta$  east;  $\Theta$  west; and this  $\delta$  northeast;  $\Im$  northwest;  $\Theta$  southeast; and  $\hat{Y}$  southwest of the center of the State meutioned.

------

For the American Bee Journal. Feeding Bees-My Way of Doing it. G. M. DOOLITTLE.

# I am requested by two or three to give an article in the BEE JOURNAL on the above subject, and although I have objected on account of the arti-cle appearing out of season it is of no avail, for they say, "Now that we are interested we desire it, and can re-member it." While an article is more appropriate a little in advance of the time required for its use, yet I am ready to admit that it is often the case that an article on some phase in bee-keeping, appearing just after a person has had a trial of that very same thing, sinks deeper into the memory and does more good than it memory and does more good than it would had it come at the appropriate time. As many of us here at the East have just passed through a siege of feeding for winter, of course the matter is still fresh in our minds, and anxiety regarding this matter still exists, so I will comply with the re-quest, hoping that even those not specially interested may find some specially interested may find some-thing of value in it.

In the first place I wish to say that it is always well to look out in ad-vance for times of scarcity, and dur-ing the honey-flow lay aside a good supply of nice, sealed, well-ripened honey in frames for use in the fall in supplying any deficient colonies which we may have. I know of no nicer way of feeding than this, hence I always try to keep a supply of such combs on hand. If they are not extracted from them (by placing them in a room kept at 100° for four hours before extracting) in December as in August, so that no loss need occur if such combs are not used for feeding. On the contrary a gain is made, for the bee-keeper's time is not nearly so valuable at this season of the year.

If, however, no such combs of honey had been saved, we must resort to sugar feeding, unless we have plenty of extracted honey, which is not sup-posable, for certainly it is a great waste of time to extract honey for the fun of feeding it had again fun of feeding it back again.

There are two ways of feeding bees sugar, one of which is to make the sugar, one of which is to make the syrup, it is ready for the bees. This that we are as benighted and igno-sugar into candy, the cakes weighing feeding syrup warm has especial ad-from 1 to 10 pounds, according to the vantage where the nights are cool, as are our neighbors in the United

desire of the apiarist. 1 generally make them of about 5 pounds each, and find it a very convenient size. To best get it in the form I wish it. make a frame of the size and height I wish, which is usually about 8 inches square, and 3 inches high.

I now make little mounds of sawdust on a bench, raising them about 1 inch high at the highest point. Over this mound is placed a piece of newspaper, and on the paper the frame which is to receive the candy. This frame should be held secure by a weight or some other means, so it cannot raise up and let the candy run under it.

Having the candy boiled to the right consistency (which is known by taking out a little and stirring it while the rest is partially drawn from the fire so it will not cook too fast while you are testing it, so as to get the start of you), stir it until it is as thick as it will run, when it is rapidly poured into the frames and left until cold. Now lift the frame of candy and pull off the paper from the bot-tom, when it is ready to put on the hive, so placing it that the centre of the cluster of bees will come into the middle of the convex place in your candy, for this place was made for the bees to cluster in so that as many as possible can reach the candy. In this way the moisture from the bees during cold nights collects on the candy, which moistens it to such an extent that the bees can lick it up, thus giv-ing them a supply of food.

I find, however, that during an ex-treme cold spell, if there is nothing but caudy in the bive, the bees may fail to cluster on it and starve, therefail to cluster on it and starve, there-fore, I use this only in connection with a few pounds of honey in the hive, when it always works nicely. I es-pecially like such cakes of candy in February and March, when there is a prospect of the bees getting short of of stores.

The second plan, and the preferable one is, to make the sugar into a syrup which is fed to the bees during the warm days of September and October, so that they can store it in the combs and cap it over the same as honey. To make the syrup I find the follow-ing formula the best, after trying nearly all the different ways recom-mended: Put 15 pounds of water in a vessel that will hold about 24 quarts, and bring it to a boil. When hoiling, slowly pour in 30 pounds of granulated sugar, stirring it as it is poured in, so it will mostly dissolve instead of settling to the bottom and burning. Now bring it to a boil again and skim it, if impurities arise, when it is to be set from the fire, and 5 pounds of well ripened honey stirred in. This gives 50 pounds of feed which will be of as much value to the bees as 50 pounds of honey. The honey is put in to prevent crystallization, and with me proves far superior to vinegar or cream of tartar.

As soon as the syrup is cool enough so you can hold the hand on the outside of the tin dish containing the syrup, it is ready for the bees. This feeding syrup warm has especial ad-

and by having it thus warm quite satisfactory work at feeding can be performed as late as November.

Where a person has not the feeders or the time to prepare them, the best thing to use for such a purpose is a common milk-pan. Set this on the top of the hive and fill it with syrup, or give the desired amount, after which pull off two or three handfuls of grass and scatter it over the syrup for a float; or use shavings or corn cobs, as is preferred. The trouble with these latter is that they soak up much of the syrup, while the former does not.

Set up a small piece of board or a chip against the side of the pan, so chip against the side of the pan, so the bees can easily climb over to the feed, when a hole is to be opened to the hive below by turning up one corner of the quilt or removing a slat in the honey-board for the bees to come up through. Now scatter a few drops of feed down through the hole and our the obin ond put on the and over the chip, and put on the cover, seeing that the joints are all tight, so that no robber bees can get in. However, if a person has time at his command, feeders made as follows will prove much more satisfactory; I have used such for four years, and never had anything in the feeder line which pleased me so well, and I have tried nearly all the feeders in use :

Get out two pieces of wood, having them the size of your frame except less ¾ inch at the top, and ¼ inch thick. Nail those on each side of a frame, fitting the joints together with white lead, so as to prevent leaking. If after making, hot beeswax is run all over the inside, there is no possibility of leaking, and all soaking of the feed in the wood is prevented also. Bore a hole in the works prevented also. Bore a hole in the top-bar to the feeder for a funnel, aud your feeder is ready to be hung in the hive the same as a frame, where it can be left when not in use, if desired.

To feed, cut a little slit in the quilt to correspond with the hole in the top-har of the feeder, through which the point of the feeder, through which the point of the funnel is to be in-serted and the feed poured in. When the fuunel is removed the slit in the quilt closes up so that no bees can get quilt closes up so that no bees can get out to annoy the operator. As the feeder is only an inch wide there is no need of a float, as the bees can easily reach either side, so none stick fast or drown. By using two or more feeders to a hive the winter supply can be given at once, or the bees can be fed for stimulation as slowly as is desired.

Borodino, $\bigcirc$  N. Y.

### A Bee-Lawsuit in Canada.

### WM. F. CLARKE.

Bee-Keepers on this side of the line have been suddenly waked up from their dream of false security, by a lawsuit, the result of which, so far as it has gone, conclusively shows

States. At the Assize Court in Walkerton, Ont., a few days ago, a case was tried before Judge O'Connor, in which a blacksmith named McIntosh, which a blacksmith named McIntosh, of Southampton, applied for an in-junction to restrain his neighbor Harrison from keeping bees. It ap-pears that Harrison keeps about 80 colonies of bees. McIntosh's com-plaint sets forth that they are a great nuisance, flying all over the neighbor-hood and stinging neonle and that hood and stinging people, and that they are an especial annoyance to the plaintiff, flying about his shop and stinging horses. They were also very troublesome around the house when preserves were being made, swarm-ing about the kitchen in large numbers.

The jury brought in a verdict that they were a nuisance, and that the plaintiff was entitled to an injunction. Judge O'Connor said it was a novel case, and he would not grant the in-junction, but reserved it for argument in the full court. The case was keenly contested, the trial occupying more than a whole day. A large number of witnesses were examined, many of whom were brought from a distance by the defence. As the Judge has referred the matter to a full court, declining to act on his own individual responsibility, this case when decided will have all the weight when decided will have all the weight of a precedent, and we shall know the legal status of bee-keeping in "this Canada of ours." As yet the press has not discussed this matter to any extent, the only article on the sub-ject which I have seen being the fol-lowing from the Montreal Witness of Nov. 10, which I think is worthy of being reproduced in the AMERICAN BEE JOURNAL as a disinterested and impartial utterance on the subject: impartial utterance on the subject:

"Is bee-keeping a public nuisance ? An Ontario jury, after listening to the evidence of some neighbors of a man who keeps 80 colonies, has decided that it is, and that the neighbors are entitled to an injunction restraining the man from keeping bees. The Judge who presided over the court has declined to grant the injunction, but has reserved it for discussion before a full court. This was, doubt-less, a wise course, as bee keeping has always been considered a most commendable business enterprise which should be encouraged. If it is to be adjudged a nuisance because the bes interfere to some extent with the comfort and convenience of the neighbors, then an industry which has been rapidly growing in Canada will receive a decided check. Bees wander miles from their hives, so that bee-keepers would, if this decision is enforced, have to reside in solitude. The Egyptian bee-keepers, who keep their bives on boats which they move up and down the Nile in search of pasture, calculate that the bees pasture within a radius of nine miles. In Europe bee-keeping is encouraged in many States. Russian peasants use the honey instead of sugar, and the Russian State Church uses so many tapers that enormous quantities of wax are needed for that purpose alone. Germany goes so far as to pay teachers to travel about through the

rural districts and teach the best rural districts and teach the best methods of cultivation; and common school-masters have to pass an exami-nation on the subject before they are granted diplomas. The British Bee-Keepers' Association, established un-der the presidency of Sir John Lub-bock, is a vigorous society which has received rauge anouncement in received much encouragement in Great Britain. It must be confessed, however, that when the neighbors go in constant fear at all times of being stung by bees, and are frequently stung and disturbed in their business by bees, there is reason to regard them as a nuisance, and a jury would probably return such a decision every time. Most bees are better behaved, however, and we can find no record of a similar action at law complaining of bees as a public nuisance."

The Witness would have made a strong point had it stated that the Ontario Bee-Keepers' Association has been recognized by the Provincial Government as having charge of an industry worthy of being fostered by a grant from the public chest to the extent of \$500 a year. It would be a queer anomaly for the Government to subsidize what the judiciary de-clared to be a nuisance. I shall not be surprised, however, if the upshot of this affair is the exclusion of api-price from the converte limits of or this analysis the exclusion of ap-aries from the corporate limits of cities, towns, and villages. A strong feeling is growing up in this direction, as our friend Hall, of Woodstock, and others can testify. So far as there is reasonable ground for making complaint, bee keepers must be prepared to give due consideration to the rights and interests of the community at large. Personally, I shall not wait for any lawsuit, but whenever evi-dence is adduced that my bees are a nuisance and annoyance to my neighbors. I shall move them a safe distance. Guelph, Ont.

[See remarks on page 739.-ED.]

For the American Bee Journal.

### The Elements of Fat, etc.

### A. J. COOK.

With no unkindness in my thought, may I suggest that Mr. Cushman should either study up this whole question more thoroughly or else be question more thoroughly or else be much more guarded in his quotations? What I say is this: Nitrogenous tissues may be robbed of their nitrogen and further changed—into fat. This is proved by disease where fatty de-generation occurs. I do most certainly deny that the greatest part of muscle is nitrogen. Muscle is mainly myosin, a proteid substance. These substances a proteid substance. These substances -albuminoids-all contain from 14 to 18 per cent. nitrogen. According to our best analysis the average proportion is about as follows: Carbon, 52.8 per cent.; hydrogen, 7.1; nitrogen, 16.6; oxygen, 22.1; sulphur, 1.4 per cent. Thus we see that all albuminoids contain a large amount of carbou, oxy-gen, and hydrogen, the elements of fat.

has nitrogen any of the elements of fat. Hibernating animals can live on fat, as in their inactive state the waste is so slight that the organs are not seriously impaired, though there is no nitrogenous food to build them up. That is why our bees are better off with no pollen. They are very quiet, waste is very slight, so the body is better off if there is no hearty body is better off if there is no hearty albuminous food to digest. I do not reason that all organic food may be converted into fat. I do argue, and with truth, that all organic food may minister in the economy of the body to the formation of fat. All organic food does not mean the inorganic salts or water, but only the carbo-hydrates, fats, and albuminoids.

How much there is in a word. say, "We have seen that stored fat in animals that hibernate, and in case of disease, will alone keep up the nutri-tion—notnitrogen.\* The first is truth; the latter absolute absurdity. It is possible, nay probable, that there may be slight waste of tissues, but owing to the inactivity this is almost nothing, else albuminous food would be re-guired. So we ought to keep our bees in as quiet a state in winter as pos-sible. Then the waste is so slight that no nitrogenous food—pollen—is required.

Before I studied the subject I sup-posed that bees actually hibernated. Now we know that they do not; but if we can so reduce activity that they will feel no need, and so not seek or take pollen, we shall solve the winter problem. I wish to have my bees all winter in a room of about 45°, Fahr., then with good honey or syrup I shall have no fear, even if pollen be present.

Agricultural College, 9 Mich.

[\*Mr. Cushman wrote this word nutrition, but by an oversight it was printed nitrogen.-ED.]

For the American Bee Journal.

### Legislation for Bee-Keepers.

### DR. C. C. MILLER.

At the meeting of the North Ameri-can Bee-Keepers' Society at Indian-apolis, I was appointed one of a comapons, I was appointed one of a com-mittee of three to inquire into the desirability and feasibility of obtain-ing certain legislation looking to the securing of bee-keepers in their loca-tions as to territory. In order that we may make an intelligent report at the next meeting, it is essential that we obtain all the information possible in the interim. One way is to obtain the views of the bee-keepers, and prohably the very best way to do this is through the medium of the bee-papers. I cannot speak for the other momentum of the beemembers of the committee, but I think I am not assuming too much to say that we shall be glad to get light from any and every one.

When the resolution was first of-fered in the convention, it was received with very evident disapproba-tion. A little reflection, however, brought out the feeling that the mat-

ter was at least worth inquiring into, and I believe in the final vote there was not one who voted against making such inquiry. Can we not get at the truth in a dispassioned way? Tf any one sees anything not desirable or feasible in the legislation under consideration, let him state his objections with all the force at his command, and let him state with equal force whatever may favor the opposite view.

I have had no conference with the other members of the committee, but I shall be glad to see their views publicly expressed, and even if their views are diametrically opposed to my own, I shall take it in the most kindly manner.

I want to thank Mr. James Heddon for giving his view on page 709. I am looking for the views of Mr. N. N. Betsinger, who expressed himself as having decided convictions on the subject, somewhat, I believe, on the line of Mr. Heddon, although I did not get his reasoning.

When it comes to the matter of legal enactments, our legal brethren are the ones to whom we naturally turn at least part of our inquiries. Will they not help us out? At the time the matter was up in conven-tion I am not sure there was any lawyer present except Mr. R. L. Tay-lor, of Lapeer, Mich. That gentleman, in his usual candid manner, deprecated any hasty decision, and 1 would very much like to see his views in full.

As to my own views, I have expressed myself as at present believing that such legislation is both desirable and feasible, yet I am quite open to conviction, and it is altogether among the possibilities that a year from now I may have decided views against the desirability or the feasibility of any legislative action.

I understand Mr. Heddon to claim on page 709 (I am sorry I cannot lay my hand on the previous number to which he refers), that the prior occupant has a natural exclusive right, and that such exclusive possession would result in the greatest good to the greatest number. In this we are very nearly if not altogether in accord, certainly I am in full accord with him as to the last part of the with him as to the last part of the proposition. Just how he reconciles the idea of "a natural exclusive right" of the prior occupant, with the "survival of the fittest," I do not readily see. If I understand what is usually meant by the "survival of the fittest," it means a struggle for existence; and if I have "a natural exclusive right" to the territory I occupy, why should I he compelled to make a struggle for existence in that territory every time some inter-loper should decide to settle down beside me. Moreover, if the other fellow should happen to be the one to "survive," where would be my nat-ural right?

me that without much thought upon that branch of the subject, he has hastily settled upon the conclusion that because there was no legislation there could be none, and in that view of the case it is no doubt the proper thing to consider, as he has done, how best to make the struggle to maintain those rights for which, if all men were right-thinking, we would never be obliged to make any struggle.

I have merely touched upon the subject, believing that its importance demands much fuller mention, but space forbids. I hope to hear, as I before said, the views of others, and just as much desire their views whether they agree or disagree with me. So long as I believe as I do now, will will methods be the state of the state I will make the best fight I can, and if vanquished I will thank the victor for setting me right.

Marengo, & Ills.

## For the American Bee Journal

### The Western Convention.

The Western Bee-Keepers' Asso-ciation met in annual session in Pythian Hall, at 10 a.m., in Kansas City, Mo., on Oct. 27 and 28, 1886. After having an informal experience meeting, which, of course, was prin-cipally on bees and honey, the convention adjourned until 1:30 p.m.

### AFTERNOON SESSION.

At 1:30 the convention was called to order by the President, Mr. E. M. Hayhurst. The election of officers was postponed until the next day. The following discussion then took place:

"How has the drouth affected the bee-business this season?" It was generally conceded that the bees gathered little if any honey after the middle of July in this vicinity. A. A. Baldwin said that we would feel the effects of this year's dry weather more next year, as the white clover had died out badly. Mr. Leahey did not find the drouth very bad for his bees. J. A. Nelson said the same, as the honey season was about over before the very dry weather had com-menced. B. F. DeTar said that the bees were not much affected by the dry weather. President Hayhurst said the drouth was bad for queenrearing, but had not hindered the gathering of honey very much.

"What is honey-dew, and where does it come from ?"

Some said from insects, bark-lice, aphides, etc. Mr. Hayhurst thought that some came from punctures in tree-bark on the hackberry or ash, made by borers, as he had seen a sweet substance that oozed out and formed icides in appearance during the night, that tasled very much like good grape-sugar, and the wasps, yellow-jackets and bees worked on it very much during the day. A. A. However much thought Mr. Hed-don may have given to the matter of rights as to "priority of location," I cannot believe he has given much thought to it with the possibility of legislation in view, but it seems to

ser had seen it higher up than any other man, on the top leaves of every thing, and had looked with a microscope and could not find any aphidie.

How can moths be kept out of honey in sections ?"

A. A. Baldwin – Fumigate the honey with sulphur, which will kill the worms and millers, but not the eggs. When more eggs hatch, fumi-gate again. The honey is not apt to be bothered by moth-worms unless there is some pollen in the combs.

Some thought that the moth-eggs were laid in the combs, or near the hive entrance, and unintentionally carried in by the bees; others, that the bees got the eggs from the flowers when gathering pollen; and still others, that the eggs were hatched near the hives outside, and the worms crawled in.

The marketing of honey was much discussed, but no definite conclusions arrived at. How to get the sections finished up and to prevent too much increase at the same time, was discussed as follows :

A. A. Baldwin would return the swarms and keep the bees crowded as much as possible. P. Baldwin would get more honey from the old colony, and the increase by natural swarm-ing, keeping only the first swarms out.

Jno. Conser was of the same opinion. "What causes bees to mix up and go into the wrong hives ?"

The author of this question had his hives about 3 feet apart, which was considered too close; the best dis-tance apart for hives being about 8 feet each way, as that would also allow room to use a scythe in cutting

the weeds and grass in the bee-yard. "Does ventilation retard swarm-ing ?" Mr. Leahey and Mr. Conser said it did. A. A. Baldwin thought it did, but it was too much extra work.

At 5 p.m. the convention adjourned to meet again on the following day at 10 a.m.

### SECOND DAY.

At 10 a.m. on Oct. 28 the conven-At 10 a.m. on Oct. 28 the conven-tion was called to order by President Hayhurst. The election of officers being in order, the following were elected by acclamation for the en-suing year: President, E. M. Hay-hurst, of Kansas City, Mo.; Vice-President, R. B. Leahey, of Higgins-ville, Mo.; Treasurer, J. II. Jones, of Buckner, Mo.: Secretary, Jas. A Buckner, Mo.; Secretary, Jas. A. Nelson, of Wyandott, Kans.

The President appointed L. W. Baldwin and C. F. Lane a committee to present topics for discussion, which were presented and discussed as follows:

### MARKETING HONEY.

"What is the best method of sustaining profitable prices for our pro-ducts?"

Mr. Leahey said that it was best to educate the people in the use of honey; that it is a good thing to have in the house to use as tood and

Mr. Lane would induce manufacturers to use extracted honey, such as confectioners, cracker factories, porkPresident Hayhurst said that giv-ing Leaflets, detailing the uses of honey as food and medicine—one or two with each package of honey re-tailed—would help very much to educate the people in the use of honey.

Mr. Conser had sold about 800 pounds of extracted honey profitably by taking a 20-gallon can in his wagon, and filling the can about three-fourths full of nice extracted honey; then putting in about 40 pounds of nice comb honey cut from unfinished sections, such as were three-fourths full, and up to those not quite finished, then going around to the houses and selling by weighing it out in any quantity to suit the customers. As to comb honey, if he could not get a profitable price for it, he would take it home and hold it for a higher price. P. Baldwin would hold his honey

for the higher prices, but thinks that we could not get 2 or 3 cents per pound more than others do in the same market.

Mr. Lane said that some of the commission men seemed to make it a point to run down the prices when it was not necessary to do so. This opin-ion was concurred in by many.

L. W. Baldwin thinks that to co-operate, find out the amount of the honey crop in the whole country, and work together accordingly, also to give samples of honey and Leaflets at each house-to work up a home market in that way, would help very much to sustain profitable prices.

President Havhurst said that it would be well to advise honey pro-ducers, through the bee-periodicals, not to ship honey to commission indiscriminately, as some houses seem to be doing, but to send and get prices first, and then ship to the best market, or where they could realize the best prices.

REVERSING HIVES, FRAMES, ETC.

Jno. Conser-Reversing sections is advisable to get the combs built out full to the wood all around, and reversing brood-combs to get the honey moved to the section-boxes; but it must be done at the right time and properly, or it is bad practice.

Mr. Leahey had tried reversing the lower stories of hives, and found it a bad practice, as those let alone did very much better. His neighbor had also tried it, and found it unprofitable.

President Hayhurst reported that Mr. Hill thought it was of no use ex-cept to get combs built out to the bottom-bars, which is not needed if any one will properly use wired frames filled with foundation, when the combs will be completed to the wood all around not arow leaving a wood all around, not even leaving a hole, and every comb as straight as a board; and, what is best of all, the cells will be all worker size, so that but few droues are reared, and in some hives none are reared.

Mr. Lane thought it valuable only to get the combs in sections built well to the wood, which is much easier and quicker done by crowding the bees properly.

A vote was then taken which re-

unanimously, that it is not practical to reverse hives, frames, etc. The next subject was, "Our

Neighbors."

Mr. Gates said that wasps and some insects sting or break the skin of grapes, but the honey-bees never do either. The sting of the honey-bee is used only in defense, and they can-not bite a hole in a grape, as has been demonstrated many times; on the other hand the honey-bees are a great benefit to the fruit-grower in fertilizing the blossoms so that the fruit will set properly, and the product be abundant, as he had proven to his own and his neighbors' satisfaction in a field of buckwheat, which produced more than any other field within 7 or 8 miles of his bees.

Mr. Conser, who is a farmer and fruit-raiser, said that the bees are a benefit to all fruit crops, and will not eat grapes until the grapes are broken

Mr. Leahey would keep his bees where the neighbors are few, and thus the trouble would be reduced to the minimum.

Mr. Gates said that we should de-fend our bees. The mission of the honey-bee is to gather up the sweets that would otherwise be wasted. They do not injure grapes in any manner or form, and only eat those that are not marketable, and of no use to any one.

A vote was then taken, and it was unanimously thought that honey-bees do not injure flowers or grapes. "Can the town council legally cause

the removal of bees to the outside of the corporate limits of any town or city ?"

L. W. Baldwin said that they had tried it in Independence, Mo., and had found no law to have them moved.

Mr. Conser said that bees are a nuisance only as flies are, and can be kept out of houses by proper screens on the windows and doors.

#### WINTERING BEES.

A. A. Baldwin said that the best method is in the cellar, and is less expensive, but he does not think that it makes much difference.

L. W. Baldwin—The best method is cellar wintering. Colonies in the cellar consume only from 3 to 4 pounds each, while those outside packed on four sides and on top consumed 6 pounds each; and those packed on two sides and on top, outof-doors, consumed 8 pounds each the past winter. All wintered well. Those in the cellar were ahead at swarming. It is easier to carry bees into the cellar than to pack them out-of-doors.

Mr. Gates said that it would cost \$500 to build a cellar to properly winter 200 colonies of bees, which should be considered in the expense. He had experimented some, and those wintered on the summer stands swarmed first, or before those wiu-tered in the cellar.

The hour of noon having arrived, the convention adjourned till 1:30 p.m.

#### AFTERNOON SESSION.

At 1:45 p.m. the convention was sulted in a resolution being carried called to order by the President, the each explained how their solar wax-

other 15 minutes having been occupied in examining a surplus arrange-ment exhibited by Mr. G. W. Cook. The subject of wintering bees was then continued as follows:

Mr. Thorne winters part of his bees in the cellar and part of them out-of-doors. He prefers out-of-doors, but would rather have the cellar for safety.

Mr. Leahey has tried the cellar, but the bees swarm out and spring dwindle so much after they are put out on the summer stands. If he had a good cellar he thinks he would use it, but he would not go to the expense of building one expressly for the pur-pose. He has a cellar 5 feet in the ground and I foot above, cemented on the bottom and sides all around, with a tile pipe underground, and a pipe up to the outside for ventilation.

L. W. Baldwin has a cellar 19x25 feet, and 7 feet deep, that cost \$250. It is under his house, and large enough for 300 colonies. He could put in 400, but he thinks it would be too warm for so many in a mild winter. He never has any trouble with bees swarming out or deserting their hives in the spring when put on the summer stands. He says that the bees will mix up somewhat when taken out of the cellar if no landmarks, such as trees, grape vines, etc, are not in front of some of the hives. He has tile laid underground 150 feet long to bring a mild air into the cellar.

Mr. Conser winters his bees both in the cellar and out-of-doors, but he prefers wintering them out-of-doors.

A vote taken resulted in 7 for and 5 against wintering bees on the sum-mer stands, the other members being undecided, or not having any preference.

### FOUL BROOD.

L. W. Baldwin gave his experience with it when he lived in New York State several years ago. To cure by the starvation plan is the only way he knew of. Some of the very worst cases he cured by burning hive and all.

Mr. Lane had, a few years ago, in his apiary in Wisconsin, what ap-peared to be foul brood, and it cured itself after he had ceased exchanging combs from one hive to another.

A. A. Baldwin thinks it only affects the larvæ; that if bees gather impure water and feed the larvæ with it, it will cause foul brood he thinks. has burned some colonies, and others cured themselves.

It was moved and adopted that when the convention adjourned it should adjourn until the spring meet-ing; and that our next semi-annual meeting be held in Kansas City, Mo. Mr. Hayhurst and Mr. Otto were appointed a committee to secure a hall and furnish a programme for that meeting.

A committee of ways and means was appointed, on the suggestion of the Secretary, which resulted in a motion being carried that each member pay into the treasury the sum of 50 cents.

### RENDERING WAX.

Messrs. Otto, Hayhurst, and Conser

extractors were made, and the work-ing of the same. Mr. Hayhurst said that wax would harden at 90° or less, before it cakes; or, in other words, it will not form into a cake unless it is warmer than 90°. Mr. Thorne insisted that it takes

pressure to get all the wax out of old combs, and have them well warmed up at that. He thinks that a ciderpress does the work properly.

Mr. Leahey washes the cappings, making vinegar of the water, and melts the wax by steam. "Is it best to produce comb honey over new colonies with new combs, or over old combs?"

Mr. Conser could see no difference. A. A. Baldwin said that produced over new combs is two shades lighter than that produced over old combs.

L. W. Baldwin thought that bees colored or soiled the honey in sections by traveling over the old combs to reach the sections. Mr. Gates and Mr. Thorne thought the same. Others thought the bees ought to be taught to wipe their feet before going into the sections, using a door-mat honeyboard.

"Is it best to use combs in the sec-tions, that were built out full in the sections the year before ?"

Mr. Conser said that it induces the bees to go to work sooner in the sections in the spring and fall, but otherwise he does not think well of it. Mr. Lane favors it somewhat.

L. W. Baldwin is completely sick of using any more old combs in sections or any old sections, as it will pay better to throw them away completely if more than about half built out.

J. A. Nelson would melt all old combs in the sections if more than half built out, and burn the sections. If we want to get all first-class honey, although we may not get quite so much honey, it will be of a better quality and bring more money than the larger quantity would in old combs and sections that were carried over.

### EXTRACTED HONEY.

President Hayhurst would extract the boney when about two-thirds sealed, or even more. The longer the honey stays in the hive the better it is until it is thoroughly ripened. He thinks it still ripens after it is all sealed, if left on the hive, which opinion was generally concurred in. Extracted honey will granulate, and customers want it liquid. He keeps some melted at all times to supply the demand.

### STORING COMB HONEY.

L. W. Baldwin built a house 12x16 feet, and 10 feet high, two windows curtained, the room ceiled all around and overhead, and he thinks it would and overhead, and he thinks it would be better if it was plastered. He in-tends to paper it with heavy paper inside in the spring. Such a room will not do for severely cold weather, as freezing will crack the combs and cause them to leak. His room has screen windows and doors. Comb beyout should be kent in a dry frost. honey should be kept in a dry, frostproof room, but not in a cellar, as it will draw dampness.

Mr. Thorne, who seemed to be the only one who had any Carniolan bees, said that they are quite different from the brown bees in appearance. He does not think that they are much better than the Italian bees. They are hardier, fly earlier and later in the day, but he has not had enough experience with them to speak very positively in regard to the matter. It is quite easy to distinguish them from the black bees.

No one present had tried open-side sections, but Mr. Coleman had seen some in the city which came with crated honey from Iowa. He thought that the honey appeared to be better built out to the wood than the other sections were generally. We have sections were generally. We have honey produced in the neighborhood that cannot be excelled for perfection in all points, and not in open-side sections either.

The statistics of the honey crop for 1886 were taken, and 20 members rep-1886 were taken, and 20 members rep-resented 1,290 colonies, spring count, and 2,028, fall count; 59,290 pounds of comb honey, and 30,135 pounds of extracted; and 598 pounds of bees-wax. The largest amount reported was that of L. W. Baldwin, being 18,000 pounds of comb honey from 212 colories, spring count colonies, spring count.

The convention udjourned at 5 p.m. until the spring meeting, the time to be arranged by the executive com-mittee. JAS. A. NELSON, Sec.

For the American Bee Journal.

### The Taste and Odor of Honey.

### J. P. H. BROWN, M. D.

Prof. A. J. Cook, in answer to Query, No. 313, on page 613, says: "I think this matter needs investiga-tion. I should look about and see if some one had not been careless with the peppermint bottle. We have large peppermint plantations in Michigan, and I have never heard such a statement here."

I do not wish to contradict or take issue with Prof. Cook in regard to the flavor and odor of the honey from the Michigan plantations of peppermint; for the location, the atmosphere, and the soil may be such as to prevent the mint-aroma from being apparent in the honey; but from an experience of 30 years of close observation of melliferous plants and their nectarious secretion, I take the affirmative of the question, and contend that there are localities where the honey not only takes its flavor and odor from the flowers from which it is gathered, but it also does, to some extent, imbibe the medicinal and toxical (if any) properties of the tissues of the plant.

The study of these questions can be more successfully prosecuted in a country where there is a variety of honey-producing plants in sufficient quantities to afford the respective varieties of honey large enough to

such plants, and my data are drawn from familiarity and experience in handling such honey. Hence, in this matter theory is entirely laid aside, and only naked facts presented.

To prove that the flavor and aroma of honey is dependent upon bloom, I will cite the horse-mint honey of Texas-the goat-mint of Florida and Georgia. In this honey the mint-odor of the plant is very strong, so strong that it is unpalatable to many persons. The poplar honey of the South—from the tulip tree—when first gathered is rank with the perfume of the flower. While it gradually loses its rankness, there is always sufficient left to distinguish the bloom. same is true of the honey of the baymagnolia glanca. It is stamped with the odor of the bloom, and its flavor is accordingly individualized. Some kinds of plants impart their odor and flavor more lastingly to the honey than others. After honey granulates and is again reduced to a liquid condition, the original odor and flavor is to some extent lost. But all this does not affect the truth of the proposition in question.

That some few plants impart to the honey, besides the flavor, their me-dicinal and toxical properties is a fact, although denied by a few apiarists whose observation only extends to the familiarity with honey gath-ered from a few plants, such as white clover and basswood, and probably a few others. Illustrations: *Helenium tenuifolium* (I have beard it called dogfennel by some persons, but it be-longs to a different order of plants. Dog-fennel is another thing.) is a weed, supposed to be an exotic that is found in places in the South along roadsides. It commences to bloom about the first of August, and keeps on until frost. The leaves have a bitter nauseating taste, and the extract, in the shape of tea, was used to some extent during the war as a sub-stitute for quinine in the treatment of chills and fever. The old fields in my neighborhood are covered with it. and in some seasons considerable of this honey is gathered. It is as bitter as the plant, and possesses all the medicinal properties. Of course I cannot sell it, but it does for breeding purposes.

The yellow jasmine (Gelsemium sempervirens) is a climbing, trailing vine which grows in many portions of the South. Thousands of these vines grow within a radius of a mile of my apiary. It has a yellow, trumpet-shaped flower which blooms in February and early March. The whole plant, including the flower, is poisonby the symptoms of gelsemium pois-toxical properties of the tissues of the plant. Fortunately it is only in the plant. Fortunately it is only in the plant of the tissues of the plant of the tissues of the plant. quantities to afford the respective varieties of honey large enough to enable the experimenter to arrive at correct conclusions. Therefore I shall confine my remarks to the honey produced in the South. In this re-spect our Southern country is rich in

localities where this vine abounds, that they will never take nor eat any spring honey gathered before April. The writer knows of six cases of poisoning by eating yellow jasmine honey, within the last four years. By the way, I will remark that bees do not take to the bloom of this vine if there is any other forage at the same time. I might name some other plants to prove the truth of the proposition, but I deem it unneces-

sary. It is well here to remember that among the vast number of honeyamong the vast number of honey-producing plants, we have less than a half-dozen that secrete nectar of a deleterious quality; and nature has most wisely set limits to this func-tion by either causing them to bloom at an unpropitious season, or by making their bloom uninviting to the bees, or by curtailing the honey to the smallest possible amount smallest possible amount.

When selecting honey for medicine, and studying its therapeutical properties, due reference should be paid to the curative qualities of the plants from which it is gathered.

Do Bees Exercise to Keep Warm ?

### G. W. DEMAREE.

For several years I have noticed in the columns of the AMERICAN BEE JOURNAL, and other apicultural periodicals, expressions like the fol-lowing: "When the temperature goes down to a point dangerous to the lives of the bees, the bees begin to exercise to raise the temperature in the hives, etc." Of course I do not protond to que to from any one unitor the hives, etc." Of course I do not pretend to quote from any one writer, as I do not know who is entitled to the honor for making this wonderful (to me) discovery. If it is true, it is one of the greatest phenomena yet discovered in connection with the natural history of bees, because such a phenomenon is at variance with all we know about the effects of low temperature on the animal system.

Who ever knew bees to exercise when they were cold? Where and under what circumstances? Was it in the cellar or on the summer stand? We much light on this subject? (That We want light on this subject? That bees may sometimes "roar" when the temperature goes down, in the confines of a cellar, does not prove anything. There are other causes present under such circumstances, such as bad air, a change of ventilation. etc.

I have had this matter under observation for the past three winters, and I have visited my apiary in the daytime, and in the still hours of the night, when the temperature ranged from the freezing-point to  $10^{\circ}$  below zero. On the morning of Jan. 17, 1884, the mercury went down to  $20^{\circ}$ below zero; my bees were in singlewalled hives without any protection, except a few colonies that were in prover chaff hives for experiment. Last winter will be known in the future as "the cold winter." The tempera-

ture remained below zero for four days and nights consecutively, something entirely out of the usual order of things here. Well, at such times, day or night, when I stood among the hives, the stillness was oppressive, like one standing alone in "the city of the dead."

If bees ever "rouse themselves and exercise" to counteract the effects of a falling temperature, and then suddenly discover that they have done so at the expense of "waste of tissue," and like the wise, calculating physi-cian, look about them for that potent remedy, "nitrogen," to restore the remedy "nitrogen," to restore the waste tissue, why, I admit that they are exceedingly wise, and fully as sly as wise, for their slyness has bafiled all my patience and skill to detect them in the overt act. remedy'

I know by practical test that bees can endure intense cold for a short period of time, if they are compactly and quietly clustered, and that the lower the temperature sinks the more nearly the bees approach the true hibernal state. And I know by prac-tical test that if the cluster is broken up at such times, the bees do not have the energy to move even a few inches to regain the cluster, though their lives depend upon their doing

so. While feeding bees broken comb honey in the upper stories of hives, late in the season, I have frequently lost bees by their becoming chilled and not having the energy to return to the cluster. Experience and ob-servation have taught me that cold low temperature—has a peculiarly depressive effect upon the system of bees, common to all insect life. That the issue may be fairly and squarely made up, I deny that bees ever resort to "exercise" to raise the tempera-ture in the hive in the winter months.

I have never taken any part in the discussion of the hibernation of bees, because I am inclined to believe that the matter is not fully understood in this epoch of bee-history. Neverthe-less, and notwithstanding all that has been said to the contrary—and said with much appearance of authority it is clear to my mind, after long ob-servation, that honey-bees do hiber-nate under certain conditions, and it depends upon the conditions how long this state of things is maintained. I here venture the theory-and it is not mere theory with me—that if a colony of bees are filled with honey, and closely clustered in the natural way, and immediately subjected to a low temperature, they will live through a period of hibernation without taking food, just as do some of the wild animals that inhabit the Middle States. and like the latter, when the bees are aroused by a rising temperature, they must have food immediately or perish.

That bees feed regularly when closely confined in the cluster in ex-treme cold weather, like they do in the season of their activity, is a sup-position only—it has never been proven that they do; and if they do not, then they hibernate in the "sci-entific" and ordinary meaning of the

Be all this as it may, it is contrary to all we know about insect life, for bees to "exercise" to counteract the effects of a falling temperature. We want the light "turned on." Christiansburg, 5 Ky.

For the American Bee Journal.

### Bee-Keeping in Nebraska, etc.

### WM. STOLLEY.

Naturally this State is not very well adapted to apiculture; particularly not the middle and western portions of it. Therefore our apiarists cannot of it. Therefore our apiarists cannot successfully rival with honey-pro-ducers located in more favored sec-tions of this great country. For seven years I have kept bees, and while I obtained no surplus the first season (in 1880), from but 2 weak colonies I averaged for the next following five years only 17 pounds of surplus per colony annually; and sold 22 colonies at \$12 each, and 16 choice queens. I scon became convinced that, nuless I soon became convinced that unless I could and would improve my location by growing crops of honey-producing plants, which at the same time would be useful as nourishment and feed for cattle and horses, bee-keeping would be a rather up-hill business with me. Accordingly I began to experiment with many varieties of honey-produc-ing plants, and the result is a very gratifying one, in particular respect-ing a trial with melilot (sweet clover)

and also alfalfa clover. -Last spring I began the season with 23 colonies of Italian and Cyprian bees, of which but 9 colonies could be called "extra good," while 11 colonies were "good," and 3 in rather poor con-dition. I had about 12 acres sown to melilot, within 160 rods of my apiary. My neighbors within 2 miles of my place had about 30 acres of alfalfa clover. The result is as follows:

My honey crop this year amounts to 2,635 pounds, or about 114½ pounds per colony, spring connt. Besides my bees, about 20 colonies are kept by other parties in the city, which have shared this cultivated pasture with my own bees. While their crops went mostly into "absconding swarms," I got mine in *honey*. Of the 2,635 pounds of surplus, about 1,700 pounds are from the melilot, and the rest from alfalfa, and from fall bloom of other plants. Alfalfa honey is yellowish prown and of good favor brown, and of good flavor.

The first season melilot does not bloom, but gives a heavy crop of most excellent fodder for cattle; but it seems that horses do not relish it. It should be cut in the latter part of June. It then should be allowed to grow until late autumn, when it may be pastured by stock long after all other vegetation is frost-killed. The second year one-half may again be cut for fodder in June, while the other half should be allowed to bloom for bee-pasturage. By the time the uncut part is about ripe in the latter part of August, the part which was cut in June is about in its best, and is most excellent pasture for bees until frost kills it. A timely rain increases the blooming and honey-flow greatly, while drouth does not affect it nearly so much as it does most other honey-producing plants. The honey is nearly good sulky plow and three horses to put the stalks under ground.

Alfalfa clover also yields a very heavy crop of fodder, and bears cutheavy crop of fodder, and bears cut-ting several times, and may grow for many years without re-sowing; but it should not be cropped the first season, at least that is the experience here with us. One of my neighbors ob-tained about four tons of excellent fodder per acre-about the same as melilot-and it is relished by both cattle and horses cattle and horses.

My best colony (Italians) gave me 210 pounds of extracted honey, and has 43 pounds left to winter on; and has 43 pounds left to writter on; and my best Cyprian colony gave me 135 pounds of surplus, and has 34 pounds of winter stores left. I had only one colony (Cyprians) prepared for pro-ducing comb honey, which stored 108 pounds in one-pound sections. I in-crease by the nucleus plan, taking only frames with hatching brood, or both brood and bees as the case may both brood and bees, as the case may be, when the condition of the colony demands it, so as to prevent swarm-Thus I was compelled to allow ing. an increase of 13 colonies, some of which have given me from 15 to 20

which have given me from 15 to 20 pounds of surplus, retaining on an average of 27 pounds for winter stores. By careful selection of my breed-ing stock, and never allowing drones of the same strain to fertilize my young queens, I think that I now have a most excellent strain of bees for business. L always aim to rear have a most excellent strain of bees for business. I always aim to rear my queens and have them fertilized before the time when needed. So far I have invariably crossed my Cyprian queens with Italian drones, while my Italians are purely bred Italians yet. I find all of my Cyprians better na-tured than even my Italians.

I have never lost a colony in wintering, and the first loss I met with was last spring, when 5 small colonies with young queens dwindled down to nearly nothing. I winter my bees on the summer stands, in an open beeshed or house. Besides careful winter packing inside the hive as well as outside, I believe that sugar syrup for winter stores is the canse of my success in this respect. The coming winter will be somewhat of a trial for me, since all of my bees winter (for the first time) exclusively on natural stores-mostly melilot clover honeyas I could find no time to extract the brood-frames, and replace the honey with sugar syrup.

### PREVENTION OF ROBBING.

The following is my way of pre-venting robbing, or when robbing is going on, how I stop it *instanter*:

I have a number of frames on hand, made of 1-inch lumber, which, on one side, are covered with wire-cloth. These frames fit or cover the front of the brood-chamber of my hive ex-actly. When a colony is attacked, and may be the hive is full of robber bees, I close the entrance, by placing the screens in position. In a minute the screen is filled with loaded and

homeward-bound robber bees, when leasing them, and replacing the screen. Three or four repetitions will get the last rohber bee out of the assailed hive. In a bad case I leave the screen securely fastened in place for a day or two, after all robbers have been expelled. Early in the morning, when only robber bees are up and doing, I go to the now pro-tected hive and kill a dozen or two of the leaders, and that always ends the trouble. Of course, after removing the protecting screen the entrance should be properly contracted. Grand Island, Nebr.

### Local Convention Directory.

Time and place of Meeting. 1886.

Dec. 1, 2.-Michigan State, at Ypsilantl, Mich. H. D. Cutting, Sec., Clinton, Mich.

Dec. 7, 8.-Cedar Valley, at Vinton, lowa. H. E. Hubbard, Sec., Laporte City, Iowa.

Dec. 14.-Keyatone, at Scranton, Pa. Arthur A. Davis, Sec., Clark's Green, Pa. 1887.

Jan. 12.—Nebraska State, at Lincoln, Nebr. H. N. Patterson, Sec., Humboldt, Nebr.

Jan. 18.-N. W. Ills. & S. W. Wis., at Rockford, Ills. J. Stewart, Sec., Rock City, Illa.

1 In order to have this table complete, Secretarles are requested to forward full particulars of time and place of future meetings.-ED.

The Texas State Fair.-B. F. Carroll, Dresden, & Tex., on Nov. 10, 1886, says:

The Texas State Fair at Dallas, Tex., closed on Nov. 6, 1886. The honey exhibit was very good, and J. W. Eckman took first, premiums on honey and Italian bees. I did not take any bees for fear of foul brood, I did not as this disease has been about Dallas for several years. Mr. Eckman se-cured about \$50 worth of premiums. We held an impromptu bee-meeting on the grounds, and a friendly greeting all around. One old bee-man, for the amusement of the spectators, was walking around the grounds with a swarm of bees on his hat, shoulders, face and neck. He would take a mouthful of bees and let them crawl out over his face. My bees are boom-ing on the fall cotton bloom, and will go into winter quarters in fine condi-tion. A splendid crop of mint is now up, and I expect next year that we will have a good report. I have 50 colonies now, and took 1,000 pounds of extracted honey.

Managing the Sale of Honey .-Grant Parish, Gaithersburg, OMd., writes:

I re-voice the many sentiments expressed as to the united congress of bee-men of each State to scale the product of the apiary, and affix a

price which will lessen the profit of the middle man, and give what would fall to him to the producer, thus making a profitable realization from the bees. It can be done; it must be done if profit can be expected from this vocation. I have just heard that an extensive bee man in West Vir-ginia bas refused to market 2,000 pounds of honey on account of the low prices now reported by these commission men. This showed good judgment, but no more than could be expected from one successful in the business; it is simply protection of one's interest, and it is a deep mys-tery to me why some of the alleged oniovista will such to the protection apiarists will rush to the markets, although dazed at the half-starved although dazed at the half-starved price for honey quoted, and will sell, thus for a few dollars sacrificing the market for others. There must be action taken to "hold the market," else the past and present condition of affairs will continue, and bee-keep-ing he made questionable as to profit ing be made questionable as to profit. I would be pleased to have bee-men in Virginia and Maryland correspond with me with a view of forming protection.

Results of the Season.-Robert B. Woodward, M. D., Somerset, O., on Nov. 10, 1886, writes :

The past season has been a good one for this locality. I had 10 colo-nies to begin with last spring, in-creased to 19 colonies, and took 600 pounds of excellent honey, about pounds of excellent honey, about three-fourths of which was comb honey. My best colony (a Syrio-Italian) gave me 120 pounds of choice honey. I sold all but what we re-tained for family use, at "five pounds for a dollar," or 25 cents for a single pound, and we could have sold five times as much at home. I sold none but choice honey, and have a good reputation and that will will every reputation, and that will win every time in the honey trade. My 10 colo-nies (including increase and honey) will net me about \$120. We have no basswood, and have to depend on apple, locust, white clover, mustard, etc. I winter my bees on the summer stands, and have never met with any winter losses, and have Italian, Cyprian, Syrian and Albino bees. I keep the best, and mostly for pleasure.

### Convention Notices.

The Cedar Valley Bee-Reepers' Association will hold its next semi-annal meeting in the City Hall at Vinton, lowa. on Dec. 7 and 8, 1886. An excellent programme will be presnted, including essays by the very best of lowa apiarist. Special rates have been secured at the Hotels, and all are invited to come and help make this meeting both pleasant and profitable. H. E. HUBBARD, Sec.

127 The 20th annual meeting of the Michigan State Bee-Keepers' Association will be held in Grange Hall at Ypsilanti, Mich., on Dec. 1 and 2, 1886, beginning at 10 a.m. Reduced rutes have been secured at the Hawkins House. From the excellent essays already promised, we expect a very interesting programme. Only 2 essays will be read at each session, the balance of the time to be devoted to discussions. The committee desire to make this meeting practical and interesting. Noted beerkeepers from other States and Canada have promised to expect to exhibit please bring or send it. Come prepared to ask and answer questions, as the question-box will be an important feature. A cordial invitation is extended to all. Come and pring your beerkeepeng friends with you. H. D. CUTTING, Sec.

THOMAS G. NEWMAN & SON. PROPRIETORS, 923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN, BUSINESS MANAGER.

## Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list,

A New Crate to hold one dozen one-pound sections of honey.-It has a strip of glass on each side, to allow the honey to be seen. It is a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 cts. per crate. Glass 1%c, per light, extra.

Premlum Worth Having,-The New York World and the AMERICAN BEE JOUR-NAL (both weekly) will be sent for one year to any address in North America for \$1.90. And in addition PRESENT to every such CLUB SUBSCRIBER a "History of the United States," containing 320 pages and 22 fine cngravings, bound in leather and gilt.

This "History " will be sent FREE by express at the subscriber's expense; or will be mailed for 10 cents extra to any place in the United States or Canada.

It is arranged chronologically by years, from 1492 to 1885. Every event is narrated in the order of its date. These are not confined, as in other works, to political matters, but embrace every branch of human action.

This premium is worth the whole of the money sent for both periodicals, and should induce thousands to subscribe, and thus get two unrivalled weeklies for nothing.

This offer is good only until Jan. 1. 1887, hence no time should be lost. Send at once 1

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions-with \$4.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

Simmins' Non-Swarming System is the title of a new English bee-book. The author claims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result -a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

The Report of the Indianapolis Convention is now published in pamphlet form, uniform with that of last year. It will be sent postpaid for 25 cents to any address.

We have also bound it up with last year's, together with the History of the Society : this we will mail for 40 cents. Or if you send us one new subscriber (with one dollar) besides your own renewal, we will present you with a copy by mail.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

To all New Subscribers for 1887 we will present the rest of the numbers for 1886; so the sconer they subscribe the more they will get for their money.

Money Orders can now be obtained at the Post Offices at reduced rates. Five dollars and under costs now only 5 cents. As these are absolutely safe, it will pay to get them instead of the Postal Notes which are payable to any one who presents them, and are in no way safe.

The Western World Gulde and Hand-Book of Useful Information, contains the greatest amount of useful information over put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides his own, with \$3.00, for one year, we will present a copy of this valuable book.

### Convention Notices.

The Keystone Bee-Keepers' Association will meet in the Court House at Scranton, Pa., on Tuesday, Dec. 14, 1886, at 10 a.m. ARTUUR A. DAVIS, Sec.

The eleventh annual meeting of the N. W. Ills. & S. W. Wis. Bee-Keepers' Association will be held in the Grand Army Hail in Rockford, Ills, on the third Tuesday in January, 1887. There will be a two days' session. J. STEWART, Sec.

The next annual meeting of the Nebraska State Bee-Keepers' Association will be held in Libcoln, Nebraska, on Wednesday, Jan. 12, 1887. Location of Hall to be used and Hotel accommo-dations will be given after further arrangements have been made. H. N. PATTERSON, Sec.

13" The New York State, the Eastern New York sod the New Jersey & Eastern Bee-Keepers' As-sociations will hold their great united convention at Albany, N. Y., on Jan. 18, 19 and 20, 1885. This convention will be one of the largest, if not THE largest, ever held anywhere in this country, and it behooves every bee-keeper to attend. A grand exhibit of aplarianflxtures is promised. An un-usually brilliant programme will be prepared and announced later.

### Honey and Beeswax Market.

The following are our very latest quotations for honey and beeswax :

### CHICAGO.

CHICAGO. HONEY.-It has sold better during this mooth that at any time since the new crop came on the market. Yet prices are not any higher, sales being made at 11@12c. for white honey in 1-1b. sections. Fancy sections of less than 1 b. in weight, at 13c. Extracted is unchanged in tone or values, being 5@7 cents per lb. BEESWAX.-23@25c. R. A. BURNETT, BOY.9. 151 Sonth Water St.

R. A. BURNETT, 161 South Water St.

#### NEW YORK.

NEW YORK. HONEY.-Sales for comb honey the past month have been good, and prices fair. Large abipments from the West are coming in more freely than we anticipated. Present quotations are as follows: Fancy white in 1-lb. sections, clean and neat packages, 13@14c.; 2-lbs., 10@12c; fair to good 1-lbs., 10@13c.; 2-lbs., 9@10c.; fancy buckwheat 1-lbs., 9@10c; 2-lbs., 7@8%c. White clover ex-tracted in kers and small harrels, 6½@7c.; Califor-nia comb honey in 60-lb. cass, 5@6 cts.; Califor-nia comb honey in 60-lb. cass, 10@14c. BEESWAX.-Prime yellow, 22@24c. McCAUL & HILLORETH BROS.

MCCAUL & HILDRETH BROS., Nov. 13. 34 Hudson St.

#### BOSTON.

IIONEY.-The demand has improved. We are selling one-pound packages of white clover honey at 14@15c; 2-pounds at 13@14c. BEESWAX.-25 cts, per lb.

### BLAKE & RIPLEY. 57 Chatham Street.

DETROIT.

HONEY.-Best white in 1-lb. sections. 12@13c.; dark, 10@11c., with a good supply in commission houses. BEESWAX.-23c. Oct. 10. M. H. HUNT., Bell Branch, Mich.

#### CINCINNATI.

HONEY.-There is a lively demand for table honey in square glass jars, and the demand for nice comb honey is very good. Demand from manufacturers is slow for dark grades of ex-tracted honey. The snging prices for extracted is 3@7c, alb. Nice comb brings 12@15c, per lb. in a jobhiog way. si 3@7c. a lb. Nice comb brings 12@15c. per lb. in a jobblog way. BEESWAX.-Home demand is good. We psy 20@23c. per lb.

Nov.10. C. F. MUTH & SON. Freeman & Central Av.

### CLEVELAND.

HONEY.-The market is not very active and pri-ces a little lower. Choice i-lb. sections of best white sell at 13@14C; second grade 1-lbs.10@12C; choice white 2-lbs.11@12C. Extracted, slow at 6c. BEESWAX.-Scarce at 25c.

#### A. C. KENDEL, 115 Ontario Street. Nov. 17.

### MILWAUKEE.

HILWAUKEE. HONEY.-The market for honey of choice qual-ity is firmer and we are trying to establish a high-er range of values. We quote 1-th, sections of white at 12½@13c, 2-1bs., 11½@12c, dark not wanted. Extracted, white, in half barrels and in kers, 55%@7c.; in tin packages, 7%7fc.; in barrels, as to quality, 5%5fc. BEESWAX.-No demand.

Oct. 2.

### A. V. BISHOP, 142 W. Water St.

### SAN FRANCISCO.

SAN FRANCISCO. HONEY - There is a fracer market for extrac-ted, and especially for comb honey, as the crop of the latter is rather small. Aplarists have sold what they were obliged to dispose of for payment of packages and labor, and they hold the balance back at higher prices. The demand is increasing, and we quote with ready takers, 4@414c, for choice extracted ; 34@334c, for amber extracted ; and 9@11c. for comb honey in 2-1b. sections; darker grades oring 7@8c. BEESWAX.-It finds buyers at 22@24c.

Sep. 28. SCHACHT & LENCKE, 122-124 Davis St.

HONEY.-Trade is quiet. Extra white comb 11c; amber, 7%@10c. Extracted, white, 4@44c.; am-ber, 34@35(c. BEESWAX.-20@23c. Oct.18. O. B. SMITH & Co., 423 Front Street.

### ST, LOUIS.

IIONEY.-Choice comb, 113(@12%c.; latter price is for choice white clover. Strained, in barrels, 3%(@4c. Extra fance of bright color such in No, 1 packares, % advance on above prices. Extracted in barrels, 4%@5%; in cans @67c. Market dull. BEESWAX.-Dull at 20c. for prime.

Nov. 17. D. G. TUTT & CO., Commercial St.

### KANSAS CITY.

KANSAS CITY. HONEY.-Demand for all grades is good, and sales are large. Receipts are good aud prices are steady with a firm feeling. We quote : 1-lb. sec-tions of white clover, 13@14c.; dark, 10@12c.; 2-lbs. white clover, 13@14c.; dark, 0@10c.; Calif. 2-lbs., 9@11c.; y-lbs. white clover, 14@15c. Extracted white clover, 6@7c.; dark, 4@5c.; white sage, 5%c.; Calif. amber, 5c. BEESWAX.-20@22c.

Oct. 15. CLEMONS, CLOON & Co., cor. 4th & Walnut

## The NEW Heddon Hive.

We have made arrangements with the inventor by which we shall make and sell the Heddon Reversible Hive, both at wholesale and retail : nailed and also in the flat.

The energying gives a good idea of the hive. The brood-chamber is in two eections: also the surplus arrangement, which may be interchanged or inverted at will. The cover, bottom-board, and top and bottom of each sectional case has one-half of a regular bee-space, so that the surplus cases with the sections, may be placed between the two brood-chambers, or the latter may be transposed or inverted—in fact, all parts of this bire are perfectly interchangeable. The brood-thamee will ALL be bored for wires.

ALL be bored for wires. A SAMPLE IIIVE includes the bottom-board and atand; a slatted honey-board, and cover; two 6-mch brood-chambers, each containing 8 frames; two surplus arrangements, each containing 28 oce-pound sections, one with wide frames and separa-tors, and the other without separators. This latter chamber can be interchanged with the other stories, but cannot be reversed. It is NALLED AND FAINTED, and ready for immediate use. Price, \$4.00, complete.

It is absolutely essential to order one nalled hive as a pattern for putting those in the flat together correctly.

HIVES READY TO NAIL.-In filling orders for these hives, in the flat, we make 6 different com-binations, so that our customers may make a selection from the sample nailed hive, without waiting for us to quote prices, and the different kinds will be known by the following numbers :

No. 1 consists of the stand, bottom-board, cover, two 6-inch brood-chambers, 16 frames, and the slatted honey-board. Price, \$1.55 each. No. 2 is the same as No. 1, with the addition of one surplus story containing 28 sections without separators-interchangeable, but not reversible,-Price, \$2.00 each.

No. 3 is the same as No. 2, with two surplus sto-ries as therein described. Price, \$2.50 each.

No. 4 is the same as No. 1, with the addition of framea with separators, which can be reversed, inverted, and interchanged, the same as the brood-coambers. Price, \$2:30 each.

No. 5 is the same as No. 4, with two surplus arrangements as therein described. Price, #3.00.

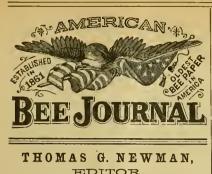

arrangements as therein described. Price, \$3, 500, No. 0 contains all the parts as described in the aample nailed bive. Price, \$3, 75 each. Those desiring the hives without the stand, boney-board or sections, may make the following deduc-tions from the above prices : Stand, 14 cents; honey-board, 8 cents; and the 28 or 56 escitone, as the case may be, at ½ cent each, respectively. We will also make the following a duction

We will also make the following deductions on quantities ordered all at one time: For 10 or more hives, 5 per cent. discount; for 25 or more hivee 7 1-2 per cent.; for 50 or more, 10 per cent.

### THOMAS G. NEWMAN & SON.

923 & 925 West Madison-St., CHICAGO, ILL.

Vol. XXII. Dec. 1, 1886. No.48. TORIAL maliniti 0mmn MARAT HITTH DIE

Only a mortal's powers are mine. Weak at their fullest strength.

We Live in deeds-not years ; In thoughts-not breaths: In feelings-not in figures on a dial.

We should count time by heart-throbs : He lives most who thinks most, Feels the noblest, acts the best.

Sufferers from Asthma are reported to have found almost instant relief from a single tea-spoonful of warm honey.

Abraham Van Arsdale, of Raritan. llis., found a colony of bees and eight feet of honey in his chimney when he put up his parlor stove this fall.

Lorenzo J. de Sobotker, of Riverton. Miss., died on Oct. 18, 1886. He came from the West Indies about a year ago to take charge of some aplaries in Belivar county, Miss. His wife has been ill, and has written to us under date of Nev. 23, 1886, as follows:

I should certainly have written to inform I should certainly have written to inform you seener, but I have since been ill; and this, together with my preparations for re-turning to the West Indies, have occupied all my time. My hnsband took a severe cold and died, the doctor says, of testites and malarial fever. His principal delight was in receiving and writing for the AMERI-CAN BEE JOURNAL, and if a single copy went astray, he would worry about it until it came to hand; but you have received the last article from his pen.

The condolence of the AMERICAN BEE JOURNAL readers is hereby extended to the widow in her sudden bereavement.

A Sweet Pyramid.-The Reveille, of Litchfield, Minn., contains the following item:

A pyramid of sweetness is displayed in the show window of the city grocery, being composed of boxes of boney from the apiary of E. Kimball, of Forest City. It makes a handsome appearance, and is com-plimentary alike to the taste of Mr. Kimball and Messrs. Branham & Hickeex, and to the industry of Mr. Kimball's bees.

Seiling Honey on Commission.-The AMERICAN BEE JOURNAL has often advised the selling of honey in home markets, and thus create for it many avenues for consumption. It does not believe that there is any over-production ; the only thing to be complained of is uneven distribution. If the honey now produced were rightly distributed there would be but little to be found in the great marts of the world to-day.

To send honey te large citics to be there sold on commission has done bee-keepers more damage than any thing else with which we are acquainted.

In our Canadian cotemporary of Nov. 17, the following item is quoted from the San Francisco Alta :

An Illinois farmer sent his heney crop to a Chicago commission man, followed the in-voice in and bought some of it of the fellow for 14 cents a pound, for which he ascer-tained the whole let was sold. But when the Chicago man made returns it was at only 12 cents. It is for reasons like this that earth-ounders avoid Chicago. quakes avoid Chicago.

Then after a similar letter from the shipper, the Canadian editor says :

Being right in the city where the AMERI-CAN BEE JOURNAL is published, the Manager of the Bec-Keepers' Union should make in-vestigation into this matter and enlighten the public still further. We take it that the vestigation into this matter and entry the the public still further. We take it that the object of the Union is to protect the bee-keeper from deceptions of this nature, as well as to preserve their legal and just rights as citizens.

The Manager of the Union interviewed the commission merthant and found that instead of its being a whole "honey crop" it was one crate, sent without previous notice and without having the name of the consignor on the crate; that the same day another lot of honey was received, and this single crate without name got mixed up with that lot ; that a crate of this honey was entered in his books as sold at 14 cents per pound, weighing 351/2 pounds. The commission merchant, upon his attention being called to the complaint, wrote a letter (of which we have read a copy) explaining how the discrepancy might be accounted for. and asking for the marks on the crates, etc. This letter has never been answered except by the complaint published in the Canadian paper. The amount in dispute is only 77 cents, and that will be sent to the complainant as soon as he makes reply.

We have made this statement, not because of its imperiance (one way or the other), but it was sought to saddle it upon the "National Bee-Keepers' Unien." We de not deem it the legitimate work of the Manager of the Union to settle petty disputes between parties, such as occur daily in the legitimate pursuit of business of every department. But when he does investigate such matters he will state the facts as he finds them.

This reminds the Manager of the following anecdote, the laughable application of which he leaves to the enjoyment of the readers :

a man was bounding round in a car on a A man was bounding round in a car on a railroad, when the conductor came through. "Can you tell me," said the man, with a great show of aarcasm, "whether this car is on the track or net?" "Sir !" replied the conductor, reaching into his pocket, "here is a volume of the rules and regulations of the road." "But what do I want of it?" "Look it ever and see if you can find any rule saying that I must spend my time run-ning alongside of the train reperting its position to the passengers. See if there is

anything in that volume that compels me to anything in that volume that compels me to go humping myself along on the prairie and yelling through the windowa 'four wheels off now l' or 'hind trucks drugging on the ties l' or 'gentlemen, the haggage car has just rolled into the ditch l' or 'passengers will please romain seated while we turn off here and scoet across the prairie after a jack-rabbit l' Look over the rules, slr, and and see if you find any of these directions. If you don't—in the tuture please take your own observations on the wheels."

The Union .- Considerable space is given in this number of the AMERICAN BEE JOUR-NAL to the affairs of the "National Bee-Keepers' Unlon." Mr. Demaree, on page 758, urges all "to give substantial aid to the Union." Mr. E. France, on page 762, suggests that at this time of the year, when thousands are renewing their subscriptions, is the right time for joining the Union. The ducs are 25 cents a year ; and one assessment (which will in all probability be all that will ever be wanted) is \$1.

The time of paying the dues was set, because of that time being the time of Instituting the organization. That can easily be altered. In fact, we are now formulating some amendments to the Constitution, and that is one of the things to be amended. These amendments will soon be submitted to vote, and will, no doubt, be carried. Meanwhile let every one who believes in defending "our pursuit" against the attacks of the misguided and perverse, send to this office \$1.25, and join the army of defenders.

It seems now to be pretty well decided that the Union will defend only its members, who became such before any lawsuits were commenced against them-hence, all should take time by the fore-lock, and "join the Union " at once !

The views of the Advisory Beard are pretty well expressed on page 761, and these vlews over the signature of each one, should be carefully perused. The line of pelicy snggested by Mr. A. I. Root, at the top of the last column on page 761, seems to have already been presented by Mr. M. B. Holmes. of Delta, Ont., in the last issue of the Canadian Bee Journal. He suggests that each member of the Ontario Bee-Keepers' Association "should place \$5 in the treasury; and appeal for justice to the higher courts." The editors of that paper approve of the proposition, and are urging others to assist in making "some decisive arrangement" in time to take an appeal. This is right ; now let the Canadians act promptly; energetic work will accomplish wonders.

A Swarm of Bees, for some unaccountable reason, have pitched their headquarters in the Baptist church spire in Gibsen, Ga. The hive is in the small part of the spire, about 60 feet from the ground, and the bees can be seen, by any one of good eyesight, coming and going continually.

Money Orders can now be obtained at the Post Offices at reduced rates. Five dollars and under costs now only 5 cents. As these are absolutely safe, it will pay to get them instead of the Postal Netes which are payable to any one who presents them, and are in no way safe.

The Michigan State Convention is now

## Replies by Prominent Apiarists.

[It is necless to ask for answers to Queries in this Department in less thme than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.—ED.]

### Cyprian and Syrian Bees.

Query, No. 341.-1. Can Cyprian and Syrian bees be distinguished by their color, or any markings? 2. Do they rear more brood than Italians? 3. What, in your opinion, are the best bees for gathering honey? -Texas.

1. Yes. 2. No. 3. Well-bred Italians.-J. P. II. BROWN.

1. Yes, by a close observer. 2. Yes, but out of season 3. Italians for this locality.-G. M. DOOLITTLE.

It is possible that they may, but I have seen most excellent anthorities (?) badly puzzled. In times of scarcity they do rear more broud. Dark Italians or hybrids are the best honeygatherers I have ever owned.—W. Z. HUTCHINSON.

1. Experts claim that they can; I am not expert enough, I must confess, to do so. 2. Not with myself. 3. Pure Italians.—J. E. POND, JR.

1. Yes. 2. Fully as much. 3. Italian bees, or a mixture of Cyprians and Italians. The Italians are the most saving race.—DADANT & SON.

1 and 2. I do not know. 3. The best bees for comb honey, so far as I know, are a cross between the best strains of Italian and German bees.—JAMES ILEDDON.

3. I have had little personal experience with any except Italians and hybrids, but from what I read about others. I am not anxious to get any other race.—C. C. MILLER.

1. Yes. 2. Yes. 3. A cross bred bee having a Syrian or Cyprian queenmother. Italian drones give the best results in crossing. The good points of such a cross can be perpetuated, and every point of objection bred out, is my experience.—G. L. TINNER.

1. Yes, by a person who has had large experience with them, but by the ordinary observer, no. 2. Yes. 3. If honey is near by and plentiful, a good strain of "black bees" will produce the most honey; but if honey is scarce, or a long distance away, then a cross between Syrian queens and Italian drones will produce the greater quantity. This is only my experience.—II. D. CUTTING.

1. Yes. 2. They have excelled in will hold together I see no this respect so far as I have tried plaster.—JAMES HEDDON.

them. If it was a mere question of the amount of honey gathered in a given time regardless of consumption by the gatherers, I would say that the Cyprians excel all other bees, so far as my experience goes; but—3. Properly bred Italians are the best bees, when all things are considered. If Italians do not gather more honey than some other varieties of bees do, they have superior qualities in the way of economy, as they manage to keep honey in store, when other bees fail.—G. W. DEMAREE.

I think so. Surely Syrians are easily distinguished from Italians. Syrians do breed faster than Italians. I cannot speak confidently yet as to the best bee. All have their good goints. The hypothetically best bee is a cross so well planned as to combine all the good qualities and eliminate the bad ones.—A. J. COOK.

### Covering Bottom-Boards.

Query, No. 342.—How will plaster of Paris do with which to cover old hottomhoards ?—F.

Try it and report.—G. M. DOOLIT-TLE.

We would prefer hydraulic cement. DADANT & SON.

It will do, but I should prefer to burn them up and make new ones.— If. D. CUTTING.

Well enough; but I should prefer the simple board.—A. J. Cook.

I think that new bottom-boards would be preferable when the old ones give out.—G. L. TINKER.

If it can be made to stay in place it might answer, but it seems to me that wood is too cheap to allow of any such "puttering."—W. Z. HUTCHIN-SON.

If to remain as a permanent fixture I should guess it might answer well, but I have had no experience.—C. C. MILLER.

I have never tried it, but I think it would work well, as it is a most excellent absorbent of moisture; and, hesides, can be easily kept clean.—J. P. II. BROWN.

I think it will answer a good purpose, but it is liable to scale off, and is not durable on that account. I have used thick whitewash made of lime and salt, which has given good satisfaction. But it pays better to have good painted bottom-boards.— G. W. DEMAREE.

I do not know of any necessity for covering old or any bottom-boards with any substance; plaster would probably do as well as anything for so covering.—J. E. POND, JR.

It would be all right, as far as the bees are concerned, if you are satisfied with the weight of it, and its lack of durability. If a bottom-board will hold together I see no use for the plaster,—JAMES HEDDON.

### Italianizing Colonies.

Query. No. 343.-How soon can I Italianize colonies after heing transferred ?-T.

Right away, or any time when most convenient.—C. C. MILLER.

Any time, before, during, or after transferring.—JAMES HEDDON.

Introduce Italian queens at the time. of transferring.—W.Z. IIUTCHINSON.

As soon as the colony gets settled, or within 4 or 5 days.—G. L. TINKER.

As soon as you are ready.—G. M. DOOLITTLE.

It depends altogether upon the season.—DADANT & SON.

Just as soon as you have queens ready to put in.—H. D. CUTTING.

I always wait until they get their "new house in order" before I give them a new queen.—J. P. H. BROWN.

At once. It will take some weeks for all the bees to become changed.— A. J. COOK.

You may Italianize them right at the time you transfer them, if you have laying queens ready. The black queen should be removed and the Italian queen caged until the bees are reconciled to their adopted mother. Or it may be done later in the season, if you do not have laying queens ready.-G. W. DEMAREE.

Just as soon as you can introduce a queen. If the introducing is done during fruit-bloom (which is the proper time for transferring), the bees will probably all prove Italians in three months, and perhaps less. If in the fall, Italianize late in the following spring.—J. E. POND, JR.

### Convention Notices.

The Keystone Bee-Keepers' Association will meet in the Court House at Scranton, Pa., on Tuesday, Dec. 14, 1886, at 10 a.m. ARTHUR A. DAVIS, Sec.

The eleventh annual meeting of the N. W. Ills. & S. W. Wis. Bee-Keepers' Association will be held in the Grand Army Hall in Rockford, Ills., on the third Tuesday in January, 1837. There will be a two days' session. J. STEWART, Sec.

The next annual meeting of the Nebraska State Bee-Keepers' Association will be held in Lincola, Nebraska, on Wednesday, Jan. 12. 1887. Location of Hall to be used and Hotel accommodations will be given after further arrangements have been made. H. N. PATTERSON, Sec.

127 The Cedar Valley Bee-Reepers' Association will hold its next semi-annual meeting in the City Halt at Vinton, lowa. on Dee. 7 and 8, 1886. An excellent programme will be presented, including essays by the very best of lowa apiarist. Special rates have been secured at the Hotels, and all are invited to come and help make this meeting both pleasant and profitable. H. E. HUBBARD, Sec.

137 The New York State, the Eastern New York and the New Jersey & Eastern Bee-Keepers' Associations will hold their great united convention at Albany, N.Y., on Jan. 18, 19 and 20, 1886. This convention will be one of the largest, if not THE largest, ever held anywhere in this country, and it behooves every bee-keeper to attend. A grand exhibit of apiariun fixtures is promised. An unusuality bilanat programme will be prepared and announced later.

Explanatory .- The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the lime of the year may require.

This mark () indicates that the apiarist is located near the center of the State named;  $\delta$  north of the center;  $\varphi$  south;  $\Theta$  east; •• west; and this of northeast; •• northwest: •• southeast; and 9 southwest of the center of the State meutioned.

For the American Bee Journal. Putting Bees into the Cellar.

### EUGENE SECOR.

Query, No. 336, appears to me to be one of the most practical ques-tions ever put in the query de-partment; and the replies thereto are extended uniform one would supso strikingly uniform one would suppose that everybody understood the importance of housing bees early. Yet I am led by observation to be-lieve that as a general thing bees are left out-doors too long. There is a lamentable amount of ignorance on the subject of wintering. This is probably one reason why so many losses are reported.

I have noticed advice in agricultural papers to the effect that bees should be left on the summer stands just as long as there is a possibility of a flight, arguing that they could not endure a long confinement, and that the imprisonment should be reduced to the minimum. And from the prac-tice throughout the country by those who are not experts, it would seem that one of the things hardest to learn in the art of bee-keeping is to house early and not remove them until late. My advice to my neighbors has been to put their bees into the cellar early —before cold, freezing weather en-ervates them—by the same parity of reasoning that I would house my domestic animals before they lose flesh and become weak from exposure.

Bees will better stand a confinement of six months if housed while in a vigorous, healthy condition, than three, if forced by exposure to eat more than would otherwise be neces-sary, distending their abdomens and weakening their constitutions by the outgoing and computations which me enforced accumulations which un-favorable weather will not permit them to discharge.

If the bees that are first carried in and the last carried out, prove to be the best colonies the following season, it pretty thoroughly disproves the theory that they cannot stand the necessary confinement.

It might be well to state, however, that the *temperature* of the cellar has much to do with successful wintering. If it is too cold perhaps the bees would be as well off in the open air. A great deal of this much-talked-of diarrhea is caused by too cold cellars.

Many persons with whom I have talked do not seem to comprehend why bees will not do better in a cellar. where the temperature sometimes goes down to the freezing point, than outdoors where it often goes down to zero. They will say, "Why, back in New York, or in Ohio, we never used to house them at all." My observation is, that a damp, cold cellar is generally fatal.

One reason why bees ought to be housed early is, after the cessation of field-labor the less they exercise the better. If the fall is pleasant they will fly every day from force of habit. They will often be seen a mile or more from home, although there is not the shadow of a possibility of their finding anything they need. Every flight they take wears them out. The colony is fast being depleted at a time when the queen is not laying an egg. It would be better for them if the temptation to fly were removed. An early housing will keep the colony stronger, and save thousands of bees that may possibly live long enough to render good service in the cluster when breeding begins.

I think the length of time that bees can be confined without a flight has lengthened somewhat in the minds of bee keepers in the last 25 years. When Langstroth wrote his book a forced confinement of four months would have been thought extravagant. Now we think nothing of leaving them in the cellar five months, and under favorable conditions, longer. Thus the improved methods are "marching on.

Forest City. & Iowa.

For the American Bee Journal. The Winter Stores of Bees.

### C. W. DAYTON.

Of this matter of feeding sugar for winter stores there are two very broad sides. The first question of broad sides. moment is, whether sugar is better or safer than pure honey. My first idea is this: Had the Maker of the bees and flowers at the time of the creation been aware that there was a food that was better suited to the wants and requirements of the bees, then the flower would have been arranged for its distillation. As to arranged for its distillation. As to its determination by man, we know that where one succeeds with sugar hundreds succeed with honey; but perhaps it requires less experience and knowledge of the wants of the bees for one to succeed with sugar. This may very likely be the case.

The next question is the cost of the sugar as compared with honey. made the estimate once, that taking the honey from the hives and selling it to buy sugar to put in the place of the honey, would take time and labor enough to make the cost of the sugar 15 cents per pound. As to honey being treatment. The ext method was to extract the no mistake. To be sure the best the same price, and the addition of the water to the sugar increases its cases washing the hive thoroughly

bulk one-half; but if we take the trouble we can obtain pure honey of buckwheat or fall flowers for one-half the price of sugar, and I think that pure fall honey is as accessible as pure cane sugar.

But there is one point which sugar feeders have overlooked or kept to themselves. That is the loss of feed themselves. That is the loss of reed when feeding colonies in this way. I have known many colonies when fed 10 pounds of syrup to put 3 pounds of it somewhere else than in the combs. Some colonies fall short one pound; others 4 pounds; making the average 2½ pounds loss. It is plain to many that it is easier, cheaper and quicker to slip into one side of the quicker, to slip into one side of the brood-chamber 2 or 3 well tilled combs of honey that we did not take the freeders, cart and melt sugar, or light robber bees. The brood-chamber must be examined or overhauled, feed or no feed; and if it must be feed. that it can be supplied in a more satisfactory manner than by the insertion of combs of honey is very questionable.

Two of the last five winters I wintered my bees without the total loss of a colony. Early on every cold morning in October, I am in the apiary stealing combs (on which the bees do not cluster) from the sides of the brood-chamber. After obtaining a comb, another is moved so that the by bees. This plan is carried out two or three times, or until only three or four combs remain, when on a very cold morning their winter stores are supplied and division-boards adjusted. No smoke is used, no stings received, and no robbing is excited. Many times their winter stores were supplied only a few minutes before carry ing them into the cellar, and I could see no difference in their wintering.

In the manipulation of 100 colonies for the production of honey, the bee-veil has remained entirely unused. I have just finished a week of preparing the bees for winter, and the total number of stings received during the time was one.

Sugar-feeding, the pollen theory, etc., are quite well answered in the words of llazen-" If you are so kindly disposed toward us, pray, let us alone; we certainly will prosper when you don't care a bit about us." Bradford, & Iowa, Nov. 13, 1886.

### For the American Bee Journal.

Curing Foul Brood with Salicylic Acid.

### JOSEPH A. SAVAGE.

My first trial was by using an atomizer to spray the combs, and a small round stick to insert in all cells in which I could discover any matter. this method left the bacteria con-cealed in the honey, and probably in the pollen, not being reached by the

with a strong solution. While this method apparently was successful, the year following in some of the hives the disease again appeared.

hives the disease again appeared. Another method was to remove all the combs from the hive and destroy them with the frames, first brushing the bees off into a cleansed hive prepared with new frames filled with foundation; cage the queen 24 hours, to prevent the deposit of eggs; prevent the exit of bees, and feed them with honey treated with a solution of the acid in proportion of a tea-spoonful to a quart of honey, this last being to correct all honey that the bees carried with them from the old hive, and I think the most important thing to do.

This last method of treatment has, with me, proved to be a perfect success, as I have not had a sign of any disease in my apiary for six years.

The presence of dead bees in the comb, or the foul smell which they occasion, does not indicate a case of foul brood as many suppose; but when partially developed larvae turned into yellow matter is found, and an odor that may be detected 20 feet from the hive, one may be certain the disease is present. Such will never cure itself, and it will require persistent and thorough work with some of the few remedies, all of which must have the power to kill the bacteria. I prefer a solution of salicylic acid prepared according to Mr. Muth's formula, because 1 have used it, and have been successful with it.

Ludlow, & Ky.

### Written for the Indianapolls Convention. The Future of Bee-Culture,

### G. W. DEMAREE.

Every thoughtful person who is about to engage in any business pursuit, or feels a deep interest in the same, naturally, and wisely, too, asks what of its future ? What of its prospects in the years to come ? Can I invest money in the business with a reasonable hope of reaping fair profits ? These are a few of the questions that the thoughtful, prudent man will ponder well in his mind. Only the rash and visionary individual will rush into a business pursuit, blindly taking the chances, whatever they may be. If we trace back the history of bee-

If we trace back the history of beeculture, we will find that any suggestions that bee-culture may be safely engaged in as a "specialty," independent of other sources of a livelihood, is of modern origin. Bee-culture is a branch of agriculture. The man who rears bees, and produces honey and wax for the market, is a farmer, an agriculturist, as truly so, as is the man who plows and produces crops. The primary meaning of the Saxon word *feorm* (farm) is to provision, to produce, and the beekeeper is a producer in every sense of the word. Furthermore, I am persuaded that in the near future it will be found profitable to plow and plant and sow for pasturage for the bees.

In my opinion the success of beeculture in the future will depend

largely upon its being connected with other suitable branches of agriculture, thereby making the income of the apiarist less precarious, and putting him in a position of full fellowship with the great agricultural cause. The great mass of agriculturists believe in "mixed farming," and are ready to smile at any person who would presume to risk his living on the precarious income from any small branch of agriculture. Is he not right in looking with suspicion on a single branch of the great agricultural business as a "specialty ?"

This idea of "specialty" in beeculture has out-grown the business, and there is no good reason for it. As I have already said, bee-culture is a branch of agriculture, and, in fact, a very small branch of so great a business as is agriculture. Hence the man who proposes to make bee-culture a specialty, must expect to create a surprise in the minds of men who engage in "mixed farming" with only ordinary success.

It has not been considered safe in the past to rely upon any one branch of agriculture for a living. Right in the cotton belt of the great South, where cotton has been produced as a specialty for many years, there is now an awakening going on looking to a system of "mixed farming" in the future, which idea is gaining ground rapidly. If bee-culture is an exception to all other rural pursnits in this respect, it argues wonderfully for the apicultural cause. It occurs to me that many of us who have written on the subject, have erred in that we have encouraged specialty in a general way. Specialty may, and will do, in certain cases, but in a general way it will never answer in any rural pursuit.

The dangers likely to beset the future progress of bee-culture are numerous. As honey begins to take its place with other commodities considered necessaries to life and com-fort, low prices must follow, and low prices must necessarily exert a depressive influence. Some will be anxious to get out of the business, because bee-culture will not pay in the majority of the cases, as a "spe-cialty." The supply business is likely cialty." The supply business is likely to be over done with shoddy goods, and the "patent hive" craze will play its part as never before. But the chief danger is the unavoidable conflict now already commenced between the fruit and bee-interests. We have had in this part of Kentucky a fair illustration in the season just past, of what may grow into serious trouble in the future. The sudden transition from drouth to seasonable weather early in August, had the effect to split the skins of the grapes to an unusual extent, and the result has been the general remark, that " the bees have riddled the grape crop." The cider-mills have been another source of annoyance.

It is clear to me that these troubles will have to be settled in the future, at the "bar of justice." The apiarist must necessarily prosecute his business with ungovernable working stock. Ile cannot hinder his bees

from going wherever their inclinations take them, and it will be a legal question in the future as to whether public policy will protect the beekeeper in his business, or ostracize him as a public nuisance.

It seems next to the impossible to arouse bee-keepers to a realization of these facts. "The Bee-Keepers' Union" is the only scheme that has been devised, which promises to aid bee-keepers in maintaining their rights. It has been in active operation for more than a year, and all will admit that its affairs have been well managed, and a good work has been accomplished through its agency, and yet comparatively few bee-keepers are found ready to support the "Union" in its endeavors to establish bee-culture with its increasing proportions on a level with other legitimate industries.

As to myself, I feel quite sure that I shall never call on "The Bee-Keepers' Union " for help, but this does not influence me in the least in choosing what my course shall be in this matter. The old maxim which says, "In helping others we help ourselves," is good philosophy. Let all of us act out this grand principle, and our rights, and the rights of those who shall lill our places in the future, will be respected.

Bee-culture is a new industry—a new enterprise as regards modern improvement, and all new industries and new enterprises must depend much for their success upon publicspirited men—men who do not look solely to the dollars and cents in immediate clutching distance; but the true stimulous is "well-grounded faith" in the enterprise, that it will feed, clothe and educate thousands of families in the future.

In conclusion I would like to suggest to those bee-keepers who have stood off and refused or neglected to give substantial aid to the "Union." that they reconsider this matter, and if they find that they cannot cooperate with the Bee-Keepers' Union on account of defects in its organization, or constitution, that they suggest some better plan, something that will meet their approval. Their silent do-nothing position is more irksome to the friends of the "Union" than would be their open opposition. Christiansburg the

The Published Report—Omission.

### WM. F. CLARKE.

The report of the North American bee-keepers' annual convention, recently held at Indianapolis, is to hand, and the publisher is to be complimented for its neat typographical appearance, and especially for the promptness with which it has been issued. It is a new thing under the sun for the members of the North American Bee-Keepers' Society to have the report in pamphlet form within three weeks of the adjournment of the annual meeting, and those who were necessarily absent will not fail to appreciate this "new departure.'

With its many excellences this publication is marred by an impor-tant omission. Most of the afternoon of the second day's meeting was taken up with a matter of which the "N. W. McLain, of Aurora, Ills., then read an essay on 'Bee-Keeping and Apiculture.'" The essay does not appear, nor is there any report of the discussion that followed. It is understood that papers read at the convention are the property of the society. At the annual meeting last December, Mr. McLain gave us ex-tracts from his forth-coming official report, and explained that these were not eligible for publication until they had been duly submitted to the United States Department of Apicul-ture. But there was no intimation that the paper presented at Indian-apolis was official, and must be held over, nor is there the least reason to suppose that it is to be embodied in the next report of the Apicultural Station.

In the absence of information I naturally infer that the manuscript has not been handed over by its au-Whatever the motive may be thor. for withholding it, such a course is, to say the least, unwise. The pith of the essay and the after discussion have been given in other published reports. It is generally known that exception was taken to the main drift of the paper, and that certain of its of the paper, and that certain of its positions were challenged. As the party who criticised Mr. McLain's paper, I beg respectfully to call for its publication. I was interrupted in my comments to give opportunity for Mr. R. L. Taylor to read his essay on "The Coming Bee," or I should have pursued them farther. I would like to discuss the subject in the AMERI-CAN BEE JOURNAL, but prefer that CAN BEE JOURNAL, but prefer that we first have the paper before us in print.

According to my notes, Mr. McLain told us there was a very large amount of bee-keeping, and but little apiculture; that the only progress now to be made is by improving the bee; that little has been done as yet in improving the bee; that dairymen have improved their cows far more than bee keepers have improved their bees; that the hive is of little com-parative account; that Father Langstroth attached overweening impor-tance to it in the title of his book— "The Hive and the Honey-Bee;" and that among the various lines along which progress is to be made, the hive holds the fourth and last place. These and other statements furnish invitable debatable ground, and it would enliven the columns of the AMERICAN BEE JOURNAL, and kindred periodicals to have them well discussed. Our convention was rather tame and dull. This matter was the liveliest episode in it, but just when there was promise of a little fun, the thing was nipped in the bud.

controversy arising in the distance no bigger than a man's hand, he wants it dispelled instanter, but all are not of that way of thinking. A friend of mine was once boasting in a company (from which his wife was absent) of the peace and love that had characterized their wedded life; why, there had never been a cross word or a difference of opinion between them, and so forth. Whereupon a married lady present exclaimed : "O, dear 1 what a dull time you must have had !" Guelph, Ont.

[Mr. Clarke is in error about the essay which Mr. McLain read at the Convention. Had it been voted "that the essay be received and placed on file," as was done with all others, it would have been the property of the society. As this was not done, Mr. McLain had a perfect right to put it in his pocket, as he did.

We will, however, add that Mr. McLain has informed us that he is revising and cutting down the essay, preparatory to offering it for publication in the American Bee Journal. Its extreme length was its greatest objection, for as originally prepared and read, it would take nearly the whole of one issue of the JOURNAL to print it.—ED.]

> Rural New Yorker. Comb Honey vs. Extracted.

### PROF. A. J. COOK.

While it is a fact that extracted honev possesses all the intrinsic excellence of comb honey, and will go much further, yet it is equally true that comb honey, because of its appearance and the fact that the comb acts as a wholesome and pleasant dilutent, will ever find readiest market. Fine comb honey is const dilutent, will ever find readiest market. Fine comb honey is so attractive that it rarely goes begging. Extracted honey, because of its real excellence and cheapness, will surely be in great and ever increasing demand as its virtues come more and more to be understood and appreciated, as they must be; but while the bee-keeper will have to push the sale of his extracted honey, the markets will come seeking after his beautiful comb honey. Hence, there is an incentive for every bee-keeper to study the methods of securing a fine harvest of comb honey.

Any novice can secure a good crop of extracted honey, while only the expert can secure as much of the heautiful comb. Some of our bee-keepers say they can secure only about one-half as much comb as extracted honey; others say they can secure nearly as much of the comb. Surely, then, it behooves every bee-keeper to study the methods of comb honey production, that he may secure the most of that which sells best.

with the least labor. There is no need of urging all to use the onepound sections, made of the whitish poplar or basswood. All know that these alone can compete in the honey markets of to-day. It is just as important to keep these sections neat and clean. Of course they can be scraped, but this is attended with labor and danger. How much better to secure our sections full of honey with the very minimum of propolis or bee-glue to mar their beauty. To do this we find the Heddon slatted honey-board just the thing. This is made board just the thing. exactly the size of the top of the hive; that is, the part containing the brood. If the outside measure of the hive is 14x20 inches, the honey-board will be 14x20 inches. For the Lang-stroth hive, I make it 13x19% inches. The slats are tacked to a rabbeted rim, which, below, is in the same, plane as the slats, but which projects above % of an inch. Thus while the whole under surface is flat and of the whole under surface is flat and of the same level, above the rim projects  $\frac{3}{56}$ of an inch above the balance of the honey-board. The slats which need not be more than  $\frac{1}{54}$  of an inch wide are  $\frac{3}{56}$  of an inch apart, and are so made as to break joints with the frames below. If the frames run lengthwise, as do the Langstroth, then the slats should extend length then the slats should extend lengthwise of the hive. If crosswise, as do the Gallup frames, then the slats of the honey-board should run crosswise.

This honey-board is used between the brood-frame and section-case, and if any one is troubled with the queen going into the section case to lay eggs, the zinc excluders should be fastened in the %-inch spaces between the slats; then the workers can go into the sections while the queen cannot. Now, if we use this honey-board in connection with the double bee-space, I find we secure our sections very neat and clean-often as free from stain as when freshly put into the hive.

To secure the double bee-space, the of an inch of the top of the hive. That is, if the rabbets for the frames are  $\frac{3}{4}$  of an inch deep, and the top-bars of the frames  $\frac{3}{6}$  of an inch thick, we shall just secure this space. Now, when the slatted honey-board is laid on the bive we note that  $\frac{3}{6}$  of an inch is the perpendicular distance between the plane of the top of the brood-frames and that of the bottom of the honey-board, and if our sections come in a plane with the bottom of the honey-case, and this is placed on the slatted honey-hoard, we have a secsurface of the sections. With these two spaces, even in crowded hives, the bees keep the sections mainly clean. I feel sure that no one, after once trying these slatted honey-boards in connection with the double space, will ever discard them. I have now used them three years, and I am more than pleased with my success.

There is just one thing that might I know we are now nuder the presi-dency of such a peace-loving "brother," that if he sees a cloud of

Get the space a little too deep or shallow, and the bees stick in the glue and brace-comb with an energy that may well discourage the bee-keeper. But why not have it just right? Accuracy should be the motto in hivemaking.

Agricultural College, 9 Mich.

For the American Bee Journal.

### Marshall County, Iowa, Convention.

The Marshall County Bee-Keepers' Association met at the Court House in Marshalltown, Iowa, at 1:30 p.m., on Oct. 16, 1886. The minutes of the previous meeting were read and approved.

The subject of winter management was the first taken up. Mr. H. Pink-erton stated that he prepared his bees for winter by doubling up light colonies; making it a point to always save the best queen and destroy the other, as he did not like to run the risk of her coming out winner in the queenship of the united colony. He feeds up colonies where he finds they need it, by taking frames of honey from those that have to spare, and giving to the needy. He said by this means he makes all strong and in good condition for the winter. He winters his bees in a cellar at a temperature of 40° to 48°. He would prefer it not to fall below 45°, or rise above 54°. He leaves the honey-board on a part; some have oil-cloth on, with the cloth turned back about one-balf, to prevent the collection of moisture, which they do badly if left down. A part he had cloths or quits on, but he could see no difference in the three sets prepared as stated. He places the hives with all the slant they will bear, one above another, with strips between them. The caps are left on the summer stands. He leaves the hive-entrance open full width, so that the bees can have plenty of air, and a good chance to keep the hives clean. His cellar is well ventilated. A part of it was light and part dark. clean. He found the most dead bees in the light part. In the winter of 1885 and 1886 he had 117 colonies in the cellar, and took out 116 the next spring, having lost but one, and that was queenless. He puts his bees in before the weather gets cold, and puts them out in the spring after it gets warm. He has no certain date to put them in or out, but is governed by the weather. The bee-room of the cellar is separated from the vegetable department by a partition.

Mr. A. Fogg had wintered his bees in the cellar the past two winters without loss. He put the hives in with the surplus arrangements on, This seemed to prevent the accumu-lation of moisture. The hives were placed with the entrances next to the wall, and ventilated by opening a window and a door. The cellar was kept light until the weather began to get warm in the spring, when he found it necessary to darken the window. The temperature of the

was some water in the cellar, but he did not see as it did any harm.

The President made a few remarks stating that he used a stove a short time in his cellar, so as to keep it at the proper temperature. He thought that and good preparations before putting the bees into the cellar, were the main points.

The Secretary stated that he liked the use of the division-board, so as to cut the hives down to 6 or 8 frames, or less if the size of the colony re-quired it. This makes them more This makes them more concentrated in space, more easily kept warm, thereby requiring less food, and being much lighter to handle in carrying in and out. The extra frames could be placed in again in the spring as needed. He preferred quilts for covering bees in the winter as they were less liable to collect moisture or mold the combs.

The Association requests all beekeepers, whether members of it or not, to send a written report to the Secretary, of the number of colonies in the spring, number of increase, amount of honey taken (both comb and extracted separately given), and the number of pounds of wax made. The report can be sent on a postal card to the Secretary. It is desired to make a full report of the honey production of Marshall county for the season of 1886. All bee-keepers are asked to report at an early date. We believe we can make a good showing of the county in honey production.

The subjects for discussion at the next meeting will be "Spring care of bees." by L. Koeper, and "Surplus Arrangements," by A. Pinkerton.

The convention then adjourned to meet in Marshalltown, Iowa, on the third Saturday in January, 1887, at 10 a.m. J. W. SANDERS, Sec.

Gleanings.

Adulterating Comb and Liquid Honey.

The following letter was forwarded to us through the kindness of the publisher of the American Grocer, with an expression that I should answer it for publication :

Editor American Grocer: -- Will you be kind enough to give me informatiou about manufactured honey, if there is such a thing? I think you have published articles on it in your paper, but I have failed to see them. If you will answer this through your paper, you will oblige. J. H. WHITE. Bridgeport, Conu., Oct. 26, 1886.

In response to the above request we sent the following reply, which was in the American Grocer for Nov. 11:

We are very glad indeed to answer in regard to our branch of agriculhance of a banch of a grief that the honey-business is getting to be a branch of no mean pretensions. When liquid honey sold at from 20 to 25 cents per pound, and glucose, or corn syrup, was worth only from 5 to 6 cents per pound, there was a great temptation toward adulteration : and eight or ten years ago it was probably a fact that a great portion of the liquid honey in glass jars and tumb-lers to be found in our markets, was cellar got as low as 34°; he would lers to be found in our markets, was will pay; but we have all found out prefer it not to run that low. There more or less adulterated. Now, how- that so large a quantity of honey

ever, when liquid honey is sold at from 8 to 10 cents retail, and 5 to cents wholesale, there is but little inducement to adulterate with glucose, especially as the quality of glu-cose at all fit for the purpose is worth from 4½ to 5 cents per pound. On this account I believe there is but very little honey to be found on our markets now that is adulterated. Perhaps I may add, that a good many mistakes, and a good deal of uncharitableness have arisen from the fact that both pure honey and pure glucose (or corn syrup) are, chemically speaking, pretty nearly the same thing; namely, grape sugar-glucose being grape sugar manufactured expressly for the purpose of making it retain a permanent liquid form. In California, excellent honey is now in quantities as low as 3 cents per pound. This state of affairs makes it more feasible and more likely that glucose should be adulterated with honey, than that honey should be adulterated with glucose. The present low prices of cane sugar, also, have been discouraging to those engaged in adulterating sweets.

Bee-keepers have also been accused of feeding their bees glucose, and then taking it from the combs and selling it as honey. This foolish piece of slander on our bee-keeping breth-ren was probably first started by some one who did not even know that bees do not make honey—they simply gather it. The act of storing it in the cells does not change it in any respect. you feed the bees sugar syrup, it will be sugar syrup when it is taken away from them. The same is true of glucose or any other substitute for bonev.

We now come to artificial comb honey. The only way in which it is possible to put a spurious article of comb honey on the market would be by feeding the bees glucose or some other substitute for honey; and there would be a greater probability of this being done, because comb honey usually commands a half more in price than liquid honey, were it not for the fact that the bees must consume a very large quantity of honey or other sweets to enable them to secrete a very small quantity of white wax from which the comb is made. This latter fact has been so well proven by the experiments of hundreds of bee-keepers, that the prac-tice of feeding liquid honey, in order to make the bees store comb honey, is now, I believe, universally abandoned. As an illustration : When the honey season closes in the fall, most bee-keepers find themselves in the possession of more or less sections of nice, marketable honey, with cells not quite finished. A large apiarist frequently has a ton or more of such untinished sections. A little feeding would enable him to finish these out, put them on the market, and get his cash, instead of waiting a whole year to have them finished. On this ac-count it would be extremely convenient to feed enough pure honey to get them finished. Well, sometimes this

must be given to the bees to get just a little put back into these unfinished combs, that even this has been mostly abandoned.

Our last point is in reply to the newspaper statements that were so widespread a year or two ago, to the effect that our comb honey on the market was made by machinery, and that neither comb nor contents ever came from a bee-hive. So widespread was this falsehood, that in our issue of Nov. 1, 1885, page 738, I offered \$1,000 to anybody who would tell me made. No one has ever given the information, neither has one ounce of manufactured comb honey ever been forthcoming. It is a mechanical im-possibility, and will, in my opinion, remain so. It is true, bee-keepers use largely what we call "comb foundation ;" that is, sheets of beeswax stamped with the impress of the base of the honey-comb. The bees use this, draw out the cells, and fill them with honey; but as these sheets are always pure beeswax (in fact, a substitute that will answer even tolerably has never yet been discovered), there is nothing really spurious about it.

I hardly need add, that the above slanderous report in regard to bogns comb honey was very damaging to the bee-keeping industry. It probably obtained wider credence because Prof. Wiley, some years ago, started it by what he termed a "scientific pleasantry."

The adulteration of our food pro-ducts is indeed a terrible wrong, and I believe the bee-men are as much in earnest about it as are the dairymen: and if there is anything we can do as a class toward putting these thieves and blacklegs behind such strong iron bars that they will have to be honest, we stand ready to do it; and thou-sands of us are willing to give our voices, our strength, and our money toward helping to punish the guilty. But let us have charity for each other, and be slow about rushing to the conclusion that everybody is a rogue except-Your humble servant.

### The National Bee-Keepers' Union.

### REPORT OF THE MANAGER.

As stated on page 739, the General Manager of the "National Bee-Keep-ers' Union" sent to each member of the Advisory Board a statement of the case against the Canadian beekeeper, Mr. Harrison, who was sued by a neighbor for keeping an alleged "nuisance" on his premises, by keep-ing bees. The Manager propounded these questions to all of them :

Will it be advisable for the Union to assist in defending this case in Canada, when the owner of the bees is not a member of the Union?

If not, what is your opinion of al-lowing an adverse decision to be placed in the law-books of America?

To these questions we have re-ceived the following replies by the Advisory Board :

So far as I can judge from the data at hand, I would decide that we, as the Advisory Board of the "Union," have no right to use its money to defend this case, even if it were policy to do so. Our organization has been of surprisingly slow growth, and in the light of this fact. I deem it not good policy to do anything that shall tend to make that growth still slower. My reasons for not defending this case are as follows :

1. It seems to me that we have no right to defend this case without con-

sent from every member of the Union, 2. If the "Union" shall defend persons who have refused to become members of the "Union" in times of peace, it destroys the one great object of joining it at all. I believe that in my original proposition relative to forming this organization, I wrote that one of its first provisions should be as follows: "Provided, however, that the 'Union' shall defend no member wherein it can be shown that said member joined the ' Union ' after it was apparent to him that there was likely to be litigation in which he likely to be intradicit in which he would become the defendant, and that in every case arising our Ad-visory Board should carefully ex-amine this feature of the case. It is my opinion that unless this rule is made and rigidly adhered to, and we defend only our own members, the membership of our organization will rapidly decrease in numbers.

3. As regards policy in this matter. we do not know but that Mr. Harrison will, and is well able to defend his case to the full extent of right and justice. As much as I would dislike to have a decision recorded against us in Canada, or anywhere else, with my present light in the matter, I am compelled to believe that it would be neither right nor politic for us to use the "Union's" money in defense of the case.-JAMES HEDDON.

I have been watching the case re-ferred to, and first of all I wish to say that there will have to be some limit to the operations of the "Bee-Keep-ers' Union." While I do not say that non-membership should always be a bar to aid from the Union (becanse cases of broad interest may arise outside of our membership, which we could not ignore without great risk to the bee-business), yet the only way to make the Union strong and efficient is to protect its members as a general rule, and let others bring their cases before the "Union" on their true merits. If I understand the suit the suit against Mr. Jos. Harrison, it is a case of nuisance under the common law, and I do not fear any *precedency* from that direction. The laws of nuisance should apply to bees as well as to other interests, or operations of men. Bee-keepers should contend for nothing more than equal rights among men. While I fear that our Canadian brethren will misconstrue our motive if we refuse to come to the rescue of this Canadian case, I am decidedly of the opinion that the "Union" had better save her ammunition for larger game; and for the hasty reasons given above, I vote "no."—G.W.DEMAREE. if we refuse to come to the rescue of

I confess that I am a good deal puzzled as to what is best to be done in this matter, but I am always willing to do my part in anything that the majority shall deem best. If the friends deem best to undertake the suit in Canada, put me down for \$5. It seems a little discouraging that the editors of the Canadian Bee Journal do not see fit to take any part in the "Union."-A. I. ROOT.

As it now looks to me, however much I might desire to aid Mr. Harrison, I cannot believe it would be the right thing that he should have the benefit of the funds of the Union. Rather than that, a special fund should be raised for him, to which those specially affected by the same laws should contribute the lion's share, and leave the funds of the "Union" for its members. I now see a possibility of difficulty from a source which never occurred to me before. Any person seeing it coming may unite with the "Union" even after the trouble has commenced, and it would be like a person taking out a policy for fire insurance after the torch had been applied to his house .--DR. C. C. MILLER.

I do not think that the "Union" should now defend cases in Canada, especially for a non-Union man. Let them join. Again, I do not think that a jury trial in a local case would be a serious precedent, however decided. I may keep bees so as to become a nuisance to my neighbor. If so, I should be compelled to remove them. This is the way I feel with the pres-ent light.—PROF. A. J. COOK.

While an adverse decision in the Canadian courts might affect us in the United States to a certain extent, still I hardly think the financial statement given would warrant us in defending that Canadian suit.—G. M. DOOLITTLE.

In his letter to Mr. Holtermann of Nov. 10, 1886, Mr. Jos. Harrison re-marks as follows:

If such men are permitted to obtain in-junctions to restrain persons from keeping bees, farewell to hee-culture in Ontario.... I cannot say when the final question will be bronght up, but expect it sometime before Christmas. The judge submitted these questions to the jury: 1. Did nearcess of the bees cause discom-fort to the complainant in any unusual degree?

degree

2. Did the complainant acquiesce in Mr. Harrison's keeping bees, by allowing him to put 28 bives of bees in his yard before he (Mr. Harrison) found fault with the dirty pig-pen?

The judge was with us all the way through, and only submitted two questions to the jury, but reserved the final one to be deeided before a bench of judges.

These were the only questions that the judge submitted to the jury, and they replied in direct opposition to the evidence.

The jury knew nothing of the nature and habits of the bee; only that it would sting, and were prejudiced against all bee keepers.

but my cellar being destroyed, 1 do not think I will be able to winter half of them. 1 am in a dilema—nearly crazed.

There was a case against the corporation of Southampton. An old man of the name of Kelley sued for damages which he re-ceived from failing on a broken sidewalk, and recovered damages to the amount of §450, and some spitcful individuals set fire to his house, and the result is that we are all burned out. They burned a great many more than they expected to.

The full statement of the case is made on page 742. It seems that there was bad feeling between the neigh-bors about a "pig-pen," and this resulted in the present trial.

The attorneys in this case say that it will cost \$20 to get a copy of the complete record, and ask that the amount be sent on at once, if it is desired. They then add as follows :

a most important case to bee-This is a most important case to bee-keepers throughout Ontario, and as it is the first case of the kind that has been tried to our courts, we should say that it would be particularly interesting to bee-keepers gen-erally to have the case in detail published to the bee-papers. The ease at present stands for judgment by the Court on the questions of hav; the jury having found the questions of inct in favor of the plantiff. We expect that it will be argued again at the settings of the Chancery Divisional Court in Toronto, sometime in December. This is

It is the opinion of the Manager of the National Bee-Keepers' Union, that except, perhaps, in a specially important case (where a decision would affect the pursuit), no one should have the Union's help who was not a member before a suit was begun.

Some editorial remarks on the Union and its work may be found on page 755, to which attention is now called.

### OUR CLUBBING LIST.

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

1 order to have this table complete. Secretaries are requested to forward full particulars of

time and place of future meetings.-ED.

Managing the Sale of Honey.-L. N. Tongue, Wonewoc, Wis., on Nov. 17, 1886, writes :

In his editorial, "What fools these mortals be !" on page 723, the editor has expressed my views. I have been on the point of saying a few words to bee-men through the valuable AMERI-CAN BEE JOURNAL. Something must be done to protect the interests of those engaged in the production of honey as a specialty. I hope this subject will be discussed freely, and some wise measures brought to the front by our solid bee-men. I have thought for a year past of asking whether it would not be far better to raise money for this object, rather than light lawsuits. I just mention the subject, hoping that others more capable may take the matter in hand.

### Comb Measurement.-G. W. Demaree, Christiansburg, 5 Ky., writes :

I think that Mr. Northrup fails to make out a case of disagreement be-tween Mr. Pond and myself, in our answers to Query, No. 324. I was speaking of square inches of comb, which I called " comb surface," meaning comb space. Seven Langstroth combs contain about 1,000 square inches of comb, while it would require a brood-chamber of nearly 1,800 square inches to accommodate the 1,000 square inches of combs. Mr. Pond speaks of *cell* surface, as indi-cated by his words, " on each side."

The Bee-Keepers' Union. - E. France, Platteville, 9 Wis., on Oct. 18, 1886, writes:

I think it would be a better time to collect the dues to the Bee-Keepers' Union about New Years. At that time very many of us are renewing time very many of us are renewing our subscriptions, and making ar-rangements for the coming year, and we are more likely to have the cash to spare at that time, having sold some of our honey. As it is, the dues for the Union fall due at the most busy time of the year when we are for the Union fall due at the most busy time of the year, when we are all in a hurry and need all the money honey kept in a dry, warm place lost

we have on hand to pay running ex-penses. One thing more, I think, ought to belong to the Union. We are producing honey to sell, and many of us have to deal with strangers. We have to ship our honey and take our chances, and the chances are that we get cheated out of our honey by some that make a business of or-dering honey and never pay for it. Have a list of all such printed and send one to each member of the send one to each member of the Union. How can we get the names? Why, when a member "gets caught," let him send in the name of the party, and have the name put on the list so we can all lookout for him. In that way members of the Union can help each other in an important matter,

See editorial remarks on these subjects on page 755.-ED.]

Satisfied with the Results.--Henry Erbrodt, La flarpe,+o Ills., on Nov. 19, 1886, writes:

I have been taking the AMERICAN BEE JOURNAL for about 4 years, to which I attribute most of my success. Last winter out of 30 colonies I did not lose one. I took 26 more on shares last spring, which was a pres-sent from Mr. Edward Pickup, of Limerick, Ills. He also gave 26 empty hives to the La Harpe Semi-nary. Thus I had 56 colonies of bees, spring count, from which I have taken about 1,800 pounds of extracted honey, and about 1,200 pounds of comb honey, mostly in two-pound sections. I am very well satisfied with the honey crop, but I had to sell it cheap—extracted honey for from 6 to 7 cents per pound, and comb honey at from 10 to 12½ cents per pound— on account of a neighbor bee-keeper who sold his honey at from 5 to 10 cents per pound. I have been very late in getting my bees into winter quarters this fall, as I had so much work to do, and I may lose some col-onies on account of it the coming winter, but I hope for the best. have now 80 colonies. I sold 8.

The Cappings over Honey.-W. Z. Hutchinson, Rogersville, & Mich., on Nov. 22, 1886, writes :

I did not arrive at Indianapolis until the morning of the second day of the convention, and about the first discussion 1 had was one with Messrs. C. P. Dadant and O. O. Poppleton, in regard to the imperviousness of the cappings over honey. Mr. Poppleton and myself took the ground that the cappings over the honey are not impervious to air and water, and are not pure wax. We argued that it was owing to this fact that honey, under certain conditions, absorbs moisture until its bulk is so increased that it oozes through the cappings, and stands in small drops upon the sur-face of the comb; a phenomenon called "sweating." In proof of the assertion that cappings are not pure

in bulk by evaporation until the cells were only halt full and the honey very thick. I also mentioned that Mr. T. F. Bingham, at a Michigan State Convention, four years ago, reported that cappings that had been ported that cappings that had been washed yielded a less number of pounds of wax than there were of cappings, owing to there being con-siderable residue. Mr.Dadant thought that the "sweating" of honey was due to fermentation, and in regard to the residue left when cappings are rendered, he said it was wax, and he could prove it. Mr. Dadant mentioned one or two things as "proof, but I will not give them here, as I wish him to write an article upon this subject, and I prefer to let him give his own proofs.

Bees Prepared for Winter .- Mrs. J. N. Heater, Columbus, O Neb., on Nov. 17, 1886, writes :

I packed my 80 colonies for winter on the summer stands last week, and it is well that I did, for to-day not a hive is to be seen for the snow-drifts. This is the second day of a fearful This is the second day of a tearing blizzard, the first of the season for us. We had a fair yield of honey in this locality during the past season, and bees go into winter quarters in fine condition. I run my apiary for comb honey exclusively, and managed to have but 12 swarms from 75 colonies. spring count, without any dividing.

Whitening Wax-A Bee-Charm, etc.-E. F. Eaton, Gibson Station, 9 Ind. Ter., (Creek Nation), gives the following recipes:

To whiten beeswax : Boil the wax after it is strained in plenty of water for one hour, in which use a few drops of chloride of soda. When the wax is quite cold lift it off the fire and leave it to dry and whiten in the open air. A charm to sprinkle on bees when uniting colonies : Oil of peppermint, 2 drops; oil of anise, 4 drops; oil of bee-bread, 8 drops; placed on a lump of loaf sugar the size of a walnut, and then dissolved in water. Can bees be moved safely by express when the weather is cold? I want to move mine 100 miles north ...

[It is better to move the bees early in the spring, when they can have a cleansing flight soon after the disturbance caused by moving them .--ED.]

Favorable Season for Bees.-Wm. Stolley, Grand Island, O Neb., on Nov. 6, 1886, writes :

The past season has been a most favorable one for the apiarist in this part of the world. We have had less high winds than usual, and rain enough to prevent drouth in my loca-tion. While the nights were rather cool, this did not seem to materially retard the secretion of honey. We had the first killing frost on Oct. 25 and 26, and the mercury then went in our lovely Shenandoah Valley.

down to 12° below the freezing point. Yesterday we had the first snow-fall. My bees are well prepared for winter. They still had considerable hatching brood as late as Oct. 15. They are brood as late as Oct. 15. strong in young bees, and have plenty of winter stores.

Higher Prices for Honey.-Jno. L. Davis, Holt, 9 Mich., on Nov. 22, 1886, savs:

I must be one of those suffering from the action of the "fools" the editor speaks of on page 723, as I have been undersold, and half of my honey is still on hand, a crop of 2,000 pounds, half of it being extracted. I do not see how we can help ourselves if some of our fellow-bee-keepers will sell cheap, and not join a compact to hold their honey for higher prices.

Honey Taken by Thieves.-Wm. H. Graves, Duncan, O Ills., Nov. 22, 1886. writes:

On the night of Nov. 17, the build-ing in which I had my honey stored was entered by thieves and about 300 pounds of honey stolen. I consider my loss about \$35. The most of it was crated and stamped in two places (16 crates), all ready for market. The crates were what is known as the "Heddon" style, single tin, and contained from 12 to 14 sections in a crate. Most of it was basswood and white clover. They jammed quite a lot of loose sections in a box, and some other things which they found, and left that damaged, greatly smash-ing the combs out and causing the honey to run out, almost ruining it for sale. I have given away several dol-lars worth of honey since I have kept bees, and have the good-will of all my neighbors, as far as I know. I have lived in this township for 43 years. am of the opinion that whoever took it would steal my pocket-book or my horses, or any other property. I write this for the benefit of the fraternity. that they may be on their guard.

Bees in Good Condition, etc.-Jno. L. Byard, Peru, 9 Vt., writes:

I began with 20 colonies last spring, from which I have taken 835 pounds of comb honey. I find ready sale for the honey at from 16 to 20 cents per pound. I put 34 colonies into the cellar to day that are in good condition, being strong in numbers, and having about 50 pounds of honey per colony for winter. I am sure that the AMERICAN BEE JOURNAL has benefitted me more than \$10 the past year; in fact I cannot do without it, and I wonder why every bee-keeper does not take it.

Bees in the Shenandoah Valley .--E. C. Jordan, Stephenson's Depot, 5 Va., on Nov. 12, 1886, writes :

There was an immense crop of honey produced here during the past season. Bees and honey are booming

#### Honey and Beeswax Market.

The following are our very latest quotations for honey and beeswax :

#### CHICAGO.

HONEY.-- It has sold better during this month than at any time since the new erop came in the market. Yet prices are not any likher, saics being made at 116/12c. for white honey in 1-ib, sections. Fancy sections of less than 11b. In weight, at 13c. Extracted is unchanged in tone or values, being 5667 cents per Ib. BEESWAX.-23@25c. It. A. BUILINETT.

R. A. BURNETT. 161 South Water St.

#### NEW YORK.

NEW YOItK. IIONEY.-Sales for comb honey the past month have been good, and prices fair. Large shipments from the West are coming in more freely than we anticipated. Present quotations are as follows: Faney white in 1-ib. sections, clean and near packages, 136/14c; 2-ibs. 1160/2c; fair to good 1-ibs., 96(10c; 2-ibs., 768/9c. White elever ex-tracted in kers and small barrels, 8566/7c; Califor-nia comb honey in 40-ib. cans. 566 cts.; Califor-nia comb honey in 40-ib. cans.; S66 cts.; Califor-nia comb honey in 40-ib. cans.; S66 cts.; Califor-nia comb honey in 40-ib.; Califor-nia comb honey in 40-ib.; Califor-McCa UL & Hill-Differrit BHOS.; McCa UL & Hill-Differrit BHOS.; S0 (2000) S1 (2000

#### BOSTON.

110NEY.-The demand has improved. We are selling one-pound packages of white clover honey at 14@15c; 2-pounds at 13@14c. BEESWAX.-25 cits, per lb. BLAKE & RIPLEY, 57 Chatham Street.

#### DETROIT.

HONEY.—All kinds of honey are dull and lower. Best white comb honey in 1-ib, sections, 1160124c. Extracted, 7605c. BEESWAX.-23c. Nov.23. M. H. HUNT., Bell Branch, Mich.

CINCINNATI CINCINNATI HONEY.- There is a lively demand for table honey in square glass jars, and the demand for nice comb honey is very good. Demand from manufacturers is slow for dark grades of ex-tracted honey. The ranging prices for extracted is 36/7c. a b. Nice comb brings 126/15c. per 1b. in a jobhing way. BEREWAX.--Home demand is good. We pay 20/023c, per ib.

Nov.10, C. F. MUTH & SON.Freeman & Central Av.

#### CLEVELAND.

HONEY.—The market's not very active and pri-ces' a little lower. Choice 1-lb. sections of best white sell at 13%-14.c; second grade 1-lbs, 10%20c; choice white 2-lbs, 11%12c; Extracted, slow at 6c. BEESWAX.-Searce at 25c. Nov. 17. A. C. KENDEL, 115 Ontario Street,

#### MILWAUKEE.

HINWAUKER. HONEY.-The market for honey of choice quat-ity is firmer and we are trying to establish a high-er range of values. We quote 1-lb. sections of white at 12½6012c; 2 lbs., 11½6012c; dark not white at 12½6013c; 2 lbs., 11½6012c; dark not kegs, 6½607c; in this packages, 7607½c; in barrels, as to quality, 5665½c. BEEESWAX.-No demand. Oct. 2. A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

SAN FRANCISCO. HONEY — There is a firmer market for extrac-ted, and especially for comb honey, as the crop of the latter is rather small. Apiarists have sold what they were obliged to dispose of for payment of packages and labor, and they hold the balance back at higher prices. The demand is increasing, and we quote with ready takers, 4@04c, for choice extracted; 34/4034c, for amber extracted; and 9/601c, for comb honey in 2-b, sections; darker grades ming 70×8c. BEESWAX.—It finds bayers at 22/024c. Sep. 28. SCHACHT & LEMCKE, 122-124 Dayls St.

HONEY.-Trade is quict. Extra white comb lie; amber, 75% loc. Extracted, white, 4@414C; am-ber, 336% 346; HEESWAX.-20@23e; Oct, 1\*, O. B. SNITH & Co., 423 Front Street.

#### ST. LOUIS.

HONEY.-Cholce comb. 14/0122(e.; latter price is for choice white clover. Strained, in barrels, 34/04(e. Extra fancy of bright color and in No, 1 packages, % advance on above prices. Extracted in barrels. 45/055/6; in eans 60/7c. Market dall. BEEEWAX.-Dull at 20c for prime. Nov. 17. D. G. TUTT & CO., Commercial St.

#### KANSAS CITY.

KANSAS CITY. HONEY.- Demand is good for all grades, and re-celpts have been very large of comb and extrac-ted. Home bee-men have kept out of the market until this month; having glassed every hb, section on both sides they are reducing prices, selling 60 ibs. of glass with 160 ibs. of honey, making our market lower. There erop is about 70,000 pounds. We quote : White clover 1-bs. 126(3)e; 2-ibs. 116: 14-ibs., 136(14c; dark 1-ibs., 10c; 2-ibs., 86)e.-California 2-ibs., 196(1e, Extracted white clover, ee; dark, 465(c; white sige Calif., 5½c; suber, 5c. BEESWAX.-22e. Nov.20. CLEMONS, CLOON & Co., cor. 4th & Wainnt

THOMAS G. NEWMAN & SON, Paoprietors, 923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN, BUSINESS MANAOER.

Special Notices.

To Correspondents. — It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live uear one postoffice and get your mail at another, be sure to give the address we have on our list.

A New Crate to hold one dozen one-pound sections of honey.—It has a strip of glass on each side, to allow the honey to be seen. It ls a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 cts. per crate. Glass 1%c. per light, extra.

**Premium Worth Having.**—The New York World and the AMERICAN BEE JOUR-NAL (both weekly) will be sent for one year to any address in North America for \$1.90. And in addition PRESENT to every such CLUB SUBSCRIBER a "History of the United States," containing 320 pages and 22 fine engravings, bound in leather and gilt.

This "History" will be sent FREE by express at the subscriber's expense; or will be mailed for 10 cents extra to any place in the United States or Canada.

It is arranged chronologically by years, from 1492 to 1885. Every event is narrated in the order of its date. These are not conflued, as in other works, to political matters, but embrace every branch of human action.

This promium is worth the whole of the money sent for both periodicals, and should induce thonsands to subscribe, and thus get two unrivalled weeklies for nothing.

This offer is good only until Jan. 1, 1887, hence no time should be lost. Send at once l

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending us four subscriptions—with \$4.00 direct to this office. It will pay any one to devote a few hours, to get subscribers.

Simmins' Non-Swarming System is the title of a new English bee-book. The author claims that it will inangurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result --a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

The Report of the Indianapolis Convention is now published in pamphlet form, uniform with that of last year. It will be sent postpaid for 25 cents to any address.

We have also bound it up with last year's, together with the History of the Society; this we will mail for 40 cents. Or if you send us one *new* subscriber (with one dollar) besides your own renewal, we will present yon with a copy by mail.

To all New Subscribers for 1887 we will present the rest of the numbers for 1886; so the sconer they subscribe the more they will get for their money.

Red Labels for one-pound pails of honey, size  $3x4\frac{1}{2}$  inches. — We have just gotten up a lot of these Labels, and cao supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with uame and address of apiarist printed on them—by mall, postpaid.

The Western World Guide and Hand-Book of Useful information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides bis own, with \$3.00, for one year, we will present a copy of this valuable bnok.

- ----

Reader, do you not just now think of one bee-keeper who does nnt take the Weekly BEE JOURNAL, and who should do so? Perhaps a word or two from you will induce him to do so. Will you not kindly oblige us by getting his subscription to send on with your own renewal for next year? When you do so, please select any 25 cent book on list, and we will send it to you post-paid, to pay for your trouble. We are aiming to get 5,000 new subscribers for 1887 -will you not assist us to obtain them ?

As there is Another firm in Chicago by the name of "Newman & Son," we wish our correspondents would write "American Bee Journal" on the envelope when writing to this office. Several letters of ours have alrendy gone to the other firm (a commission house), causing vexatious delay and trouble.

Five Thousand new subscribers to the BEE JOURNAL is what we have made our calculations for; they will come in clubs between now and next spring. Installments are coming every day.

#### Home Market for Honey.

**Constant** To create Honcy Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remunerative prices. "Honey as Food and Medicine" are sold at the following prices:

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the beekeeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

The Convention History of America with a full report of the proceedings of the Detroit and Indianapolis conventions, and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.25.

Colored Posters for putting up over honey exhibits at Fairs are quite attractive, as well as useful. We have prepared some for the BEE JOURNAL, and will send two or more free of cost to any one who will use them, and try to get up a club.

**COP** Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample oopies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

# Advertisements.

In lots of 5 gross of Jars, or more, we allow a discount of 5 per cent.

Flint glass being the nicest jars for honey, and prices being reduced, we shall keep no more green glass Jars. A small lot of 1-lb. Jars on hand yet, we offer at \$4.50 per kross.

CHAS. F. MUTH & SON. Cor. Freeman & Central Av., CINCINNATI, O. THE AMERICAN APICULTURIST Will be sent one year and a copy of the 3rd Edition of the Bee-Keepers' Handy-Book, on receipt of \$1.50. The book contains 300 pages and 100 then illustrations. HENRY ALLEY, 41Atf WENHAM, MASS.

J. A. SHERMAN'S Famous Home Treatment, the only known guarantes comfort and cure without operation or hindrance from labor! No steel or iron bands. 'The Editor is at his post-not yet restored to health, but improving slowly.

Vic. Clough, says the News of Geneseo, Ills., had an observation hive filled with bees at the Exposition in Henry county.

When a Man begins by declaring he has something to say to you "in all love and kindness," look out for Cayenne-pepper and vitriol before he gets through. Honey in the mouth—a sting in the tail.

Mr. R. F. Holtermann writes to us that he finds no fault, under the circumstances, with the decision of the Union not to defend the Canadian bee-keeper, Mr. Harrison, and adds :

If I understand aright, had Mr. H. joined the Union previously, his case would have been defended. I agree with the latter part of A. I. Root's remarks, on page 761.

The Triple Convention at Albany, N. Y., will be beld on Jan. 11-13, instead of a week later, as at first stated. This will be a union convention of the New York State, the Eastern New York, and the New Jersey and Eastern associations. Every one who can do so, should attend this very important meeting.

The Lawsuit mentioned on pages 330, 483 and 491, Staniey vs. Darling, before Judge Bradstreet, in the District Court at Waterbury, Conn., heing "an injunction to prevent Mr. Darling from kceping bees," has been quashed by the Judge. The expenses incurred by Mr.Darling for attorneys and witnesses, amount to \$50. Of this he pays one-half and the Union the other half, according to his propesition.

**Richmond, Ind.**—Some one has written a postal card to this office on business, but did not sign his name | Who is it ? We canoot do the business without knowing the name of the writer. **Producers' Association.**—On page 774 is an article by Mr. M. M. Baldridge, which will pay the honey-producers to read and think about. It is directly in their interest, and should have candid and careful consideration. Possibly many of the plans enumerated would be advantageous to aplarists, but it is quite probable that some of the plans may not be generally approved.

What de the renders of the various beeperiodicals think of excluding the market reports of commission men, and refuse to publish even as advertisements their quotations? We would like to hear from all on this subject, and if it is decided to do so, it should be commenced at the New Year. Now let us at least *discuss* this point.

It will be remembered that some six years ago a few individuals complained very bitterly because more and longer market reports were not given. Perhaps they were in the wrong, and may have demanded that which has been a detriment 1

As the subject here presented is one in which all are interested, let all give it a thorough discussion !

Before dismissing the subject it may be well for us to say this much. Of course market quotations on honey (both comb and extracted) must be published, and if not supplied by the commission men, they must be made by the producers, or a selected committee by the Producers' Association. But how are these prices to be maintained? Only by centralizing the honey preduct. How about the slip-shod, back-woods, go-as-youplease bee-men, who, ever and anon, ruin the honey markets of the country, by their lack of intelligence and uubusiness-like methods; who invariably sell their little crops for less than half their value, just because they "don't want nary a bee-paper, no bow;" they "heve had bees for forty year, and know'd it all long afore the newfangled notions were born'd ?" Yes: how to control these fellows is the question. Will Mr. Baldridge answer? Will Dr. C. C. Miller, who has had a theory about publishing honey-markets for years, tell us what he thinks about the matters proposed by Mr. Baldridge ? and all the rest of our readers-Here is a living topic for you !! Tell us what you think about it-but take time to think before writing. "Be sure you are right, then go ahead."

See-a-bright Display of Honey.—The Index of Parkersburg, W. Va., says that Mr. L. C. Seabright, of Blaine, O., carried off all the first premiums but one, in the Apiarian department of the State Fair at Wheeling, W. Va. Mr. S. is a progressive and practical apiarist, and it is no wonderful thing that he should take all the "ribbons." The Index adds:

. . . . . . . . .

This gentleman had such a nice display that it attracted a great deal of attention from visitors, who were pleased on account of the convenient shape of the psekages. The extracted honey was shewn in pint, pound, and three-pound glass pails, all being in marketable shape. His comb honey, in one and two-peund sections, looked so bright and clear, that it was universally admired and commented upon. Mr. Seabright should feel very proud of his fine exhibit, and of his premiums also. Mr. Seabright should feel very proud of his fine exhibit, and of his premiums also. Mr. Seabright has produced two tons of honey this scason from 37 celonies, which shows that his energy and enterprise is suitably rewarded. How to Find a Market for Honey.-Mrs. L. flarrison, in the *Prairie Farmer*, makes the following very sensible remarks on the above subject :

on the above subject : "Why didn't you tell me that yeu had honey to sell?" should be printed in characters as large as Barnum's show-bills, and circulated among farmers and small producers. A farmer whe runs 40 colonies for extracted honey, told the writer that he could not nearly supply the demand in his own neighborhood, and never delivered a pound, his customers coming to his house for it. He had created a market, and a brisk one too. Farmers could casily make hone y as good as legal tender, in paying man y small accounts. The blacksmith, carpenter, and repairer of farm machinery all have to wather and in many instances have to wait months for their pay-until the pigs are fattened and sold, or cattle ready to turn off. In lieu of taking honey off to town in hot weather, realizing 6, 8 or 10 cents per pound, it could with a fittle tact and judgment be dished out at from 15 to 20 cents. Whenever a farmer huys a rake, a tin cup or a reaper, he should find a koney customer if he has it to sell, and his druggist should not be obliged to send to a distant city for honey to compound his cough mixtures. "Honey for sale" should be upon the gate-posts uf all producers.

Last Week the editor was on "the sick list," and a few errors crept into the type one of which is of sufficient importance to need a correction. On page 755, we intended to say that the annual dues to the National Bee-Keepers' Union, of 25 cents, and one assessment of \$1, would in all probability be all that would ever be required in any one year. The words "annual" and "iu any one year" were omitted. Some may claim that one dollar should pay for all time ! Hence this correction.

Mr. G. W. Zimmerman, ex-president of the North American Bee-Kcepers' Seclety, informs us that he is unable any longer to attend to his bees or read the BEE JOURNAL on accout of failing eye-sight, and a paralatic stroke; since the latter affliction, he can only walk at times by the aid of two canes. He has owned and handled bees for 60 years, and was one of the pioneers of apiculture in America. The BEE JOURNAL extends its sympathy with the afflicted brother.

We have Received a photograph of Mr. Ivar S. Young, of Christiania, Norway, a bee-keeper of considerable experience, and late editor of the *Tidskrift-for-biskjotsel*, the bee-paper for Norway. The photograph is placed in the BEE JOURNAL album with thanks.

We have Received the catalogue of David Landreth & Sons, of Philadelphia, Pa., for 1887, the oldest seed house in America-66 pages.

Do you Wanta Farm Account Book? We have a few left, and make you a very tempting offer. It contains 166 pages, is printed on writing paper, ruled and bound, and the price is \$3. We will club it and the Weekly BEE JOURNAL for a year and give you both for \$2. If you want it sent by mail, add 20 cents for postage.

#### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, he put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.-Ep.]

# Bees Carrying Ont Brood.

Query, No. 344 .- We had no houey-flow until buckwheat bloomed, after the middle of August. I had stimulated my bees by feeding and spreading the brood-nest, and the hives were full of bees and brood, when the honey-flow commenced. Why did my bees carry out brood, both worker and drone brood, at the commencement of the honeyflow? They kept it up about a week after the honey-flow commenced. I examined them thoroughly for moths, but none were present. I had surplus boxes on the hives before the honey-flow commenced .- L. M. F., Nebr.

If the flow had really commenced I do not know.—W. Z. HUTCHINSON.

I never saw such a case, and cannot explain it.-A. J. COOK.

fear your "honey-flow" was mighty weak—too weak to support the great amount of brood, and for self-preservation the bees destroyed a portion of it.—J. P. H. BROWN.

I never saw anything of the kind, and should attribute the cause to the larvæ of the wax-moth, if such a thing should happen in my apiary .-G. M. DOOLITTLE.

The only reasonable guess that oc-curs to me, is that the surplus boxes were objectionable in some way as to kind or position, and the bees threw out brood to make room for honey in the brood-nest.—C. C. MILLER.

I guess your bees were bound to load the brood-chamber with honey. I would ascribe as the cause either cool nights or too pure Italian bees, or a combination of both .- JAMES HEDDON.

As is often the case, sufficient data is not given to enable an answer to be given that would be more than a guess. If the frames were spaced as they ordinarily are, the brood may have been carried out to give storageroom; and I hazard the guess that I have stated the cause.-J.E.POND,JR.

It would be hard to give an intelligent answer to your question without having all the facts to judge from. I would guess that your bees were starving just before the honey-flow commenced, and it was the starved brood that was expelled. Then that

"spreading of the brood-nest" may have resulted in chilling some of the brood, and making it necessary to remove it. Bees do not usually carry out starved or chilled brood right at the time the misfortune occurs.-G. W. DEMAREE.

Those bees were surely living on Those bees were surely living on half rations during the time the brood was being carried out, although the buckwheat was in bloom. There was no doubt a large amount of unsealed brood in the hives. The stimulative feeding was stopped, and the bees failed to get from the flowers enough to support so much brood.—G. L. TINKER.

# Amount of Honey Stored by Bees.

Query, No. 345.-How much more honey will bees store by using an extractor, and not having foundation furnished them ?-G. R. B.

It depends altogether upon conditions. If they have to build their own comb, they might not store as much. -J. P. H. BROWN.

Considerable more. Much depends upon the skill of the apiarist.— $\Lambda$ . J. COOK.

The query is incomplete. The plan of management that is to be compared with this method is left to be guessed at.-W. Z. HUTCHINSON.

I am not sure I understand the question. Many think twice as much extracted as comb can be obtained from the same colony.—C. C. MILLER.

About one-third more, as they are ordinarily worked. When worked on frames placed just bee-space apart in the brood-chamber, and plenty of room given in the sections, there is little if any difference.-J. E. POND, JR.

I do not know that I fully under-stand what was in your mind when you asked the question. In our short you asked the question. In our short honey seasons I cannot get a paying honey crop with the extractor without empty combs or foundation to com-mence with. In other words, it has never paid me to have combs built in the upper stories in the natural way for taking extracted honey.—G. W. DEMAREE. DEMAREE.

They will not store so much. If I extracted all surplus, and did not con-sider the question of profit, I should want all the foundation the bees could use. But if working for comb honey and the most profit, I should use only starters of foundation in the prood-chamber, and also in the secbrood-chamber, and also in the sections, and never allow over 750 square inches of comb surface in the broodchamber for swarms.-G. L. TINKER,

More than what? Than comb honey? Do you mean no foundation in either case, or in the case of taking extracted honey only? Well, in any case, very much depends upon the operator and the functions of the hive

# Ton-Ventilation of Hives.

Query, No. 346 .- Should all hives have ventilation in the top-story ?-S.

Not at all times .- W. Z. HUTCHIN-SON.

Top ventilation is not absolutely necessary .- J. P. H. BROWN.

Mine never have. For out-door wintering perhaps they should have. -C. C. MILLER.

I think not. Perhaps locality has something to do with these things, but it does no good in my apiary.—G. W. DEMAREE.

I do not use any ventilation except at the entrance, and consider such perfectly ample.—G. M. DOOLITTLE.

For my own use I would not put a ventilation hole in the top of any hive.—H. D. CUTTING.

Not exactly, but they need at least to have absorbents in the upper story for winter. A little npper ventilation is better than none.—DADANT & SON.

I would prefer to have no ventilation except at the one entrance at the bottom of the brood-chamber. All All others I believe needless and a bother. -А. Ј. Соок.

It depends upon the definition given to the term. In the winter that form of ventilation should be given that will retain heat and allow moisture to be imperceptibly carried off. In the brood-rearing and honey-gathering season all ventilation should be pro-duced at the entrance.—J.E.POND,JR.

Not as any one knows of is it necessary in either winter or summer. Bees winter well, and store great quantities of surplus that do and do not have such ventilation .- JAMES HEDDON.

No, but the cover should set on loosely so that it may be raised for ventilation in very hot weather. My hives for out-door wintering are made to fit close on top, so that there is no to n telose on top, so that there is not top ventilation except through cracks and the pores of the wood. The bees always come through strong and without moldy combs.—G. L. TINKER.

### OUR CLUBBING LIST.

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

Explanatory .- The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonics the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is located near the center of the State named; 3 north of the center; 9 south; 9 east; • west; and this of northeast; o northwest: • southeast; and 9 southwest of the center of the State mentioned.

For the American Bee Journal.

# Badly Stung !

WM. F. CLARKE.

All summer long, with gloves and veil, I've kept myself protected; Yet now must tell a sorry tale, About one spot neglected.

- My nose'a tip the veil would touch, And oft 1 apeculated, Whether, if bees assailed me much-(For 1 am aore bee-hated.)
- Sometime or other 1 might get A sting on the projection Of my probosels, through the net, At the vell's intersection.
- It seemed a most unlikely thing, That any inacct archer Should thus exactly aim a sting; So fear took its departure.
- But wise philosophers have taught Truth is more strange than fable, And my delusion came to naught Like the old tower of Babel.
- Achilles could not wounded he, Save in one spot-his heel; Yet there, with dire fatality, Was aimed the deadly steel.
- And 1, impervious everywhere.
- Save at my noae'a tip. Received a wicked dab right there, That made me "tear and rip !"
- It was a bright and lovely day, That third of this November, But oh ! the mischief was to pay, Aa l ahall long remember !
- While 1 was packing up my hees With forest leaves and chaff, And feeling perfectly at ease, Too confident by half,

A Parthian arrow hit my nose Just at its ultimatum. And a not mild expletive rose, "Confound the bees, 1 hate 'em !"

- The nasal organ quickly swelled To twice its usual aize : While tears of pain and anguish welled From both my weeping eyes.
- My none too lovely phiz was shorn Of all its acanty beauty; And for three days 1 went forlorn, Unit for public duty.
- I now must have a glass-front veil.
- Or a wire face-protector, And prove no more, as in this tale, A stupid nose-neglector !

Guelph, Ont., Nov. 10, 1886.

### for the American Bee Jourual.

# Curing Foul Brood by Starvation.

#### G. M. DOOLITTLE.

Why the idea has so generally obtained that it is necessary to starve the bees of a foul broody colony for from 48 to 72 hours when treating them for cure, on the Jones plan, I cannot con-ceive, unless it is because Mr. Jones membered that our departed M. Quinby treated foul brood on the Jones plan (less the starving opera-tion) before D. A. Jones thought of bee-keeping, and probably not far from the time he (Jones) was born, he (Quinby) telling us that his first case of foul brood was found in 1835, or more than 50 years are more than 50 years ago.

In treating regarding the disease, Mr. Quinby tells us that if a swarm from a foul broody colony, which issues naturally during the swarming season, is hived in an empty hive, that such swarm will not have the disease afterward, unless contracted by get-ting foul honey from some diseased colony later on in its existence, as the honey carried with them from the parent colony is all consumed in build. are the disease. I have had no experi-ence with the disease since 1872 and 1873, but all of my experience at that time proved Mr. Quinby correct in every particular.

During June of 1872 I noticed a few cells of foul brood in some 4 or 5 colothought they would swarm, which they all eventually did. These new swarms were hived in clean, empty bives, and never afterward had the disease. In three weeks after the old colony swarmed, all the bees in the old hive were driven out into an empty hive and left to build up, which they did; and they never had the disease again. In no case were these bees confined to the hive at all, but had their liberty at once, and were busy the next morning gathering honey from the fields. Later on in the season I found the disease in 2 or a more of my old colonies, and desir-ing to run no risks. I immediately drove the bees from them as before. The season was now so far advanced that I found these colonies would not have time to build comb and secure sufficient stores for winter, so I again turned to Quinby to see what was to be done. On page 219 of his "Mys-teries of Bee-Keeping Explained," I found these words: "On no consid-oration put, them (the driver here) found these words: "On no consid-eration put them (the driven bees) into empty combs, as they would be likely to keep some of the honey for their brood. If it is desirable to put their brood. If it is desirable to put them in a hive containing comb, they may be transferred to it after they have been in an empty one long enough to consume all the honey they have carried with them. If honey is have each the fine they should be fed." scarce at the time they should be fed."

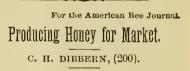

In accordance with this I left them in the hives they were driven into until the first little larvæ began to hatch. when the partially built combs were taken away from them and a complete set of combs given. These were soon filled with brood and stores for winter, while I had a nice start in the way of comb to hive new swarms upon the next year, or to set up for starters to put in sections, as the combs were beautifully white. Late in the fall I found a few cells of diseased brood in a few more of the old colonies, which were marked, and as soon as it would do in the spring these were also driven.

By the way (in this locality), there so recommended. It should be re-lis no nicer time to examine for foul

brood than in October, for in the latter part of that month there is; as a rule, no healthy brood in the hive, so if capped cells of brood are found scattered here and there in the comb. they are easily seen, while it is not easy to detect such cells at other times. As these last were driven when there was no honey in the flower, I fed them as directed by Quinby, so that they built comb right along and made profitable colonies during the season. I had now driven all my colonies, which had old combs in the spring of 1872. except 2 or 3, and these were carefully watched, but showed no signs of the disease afterward, nor have I seen a cell of foul brood since in my own yard or within ten miles of here.

What J wish to impress on the minds of the reader is that the starvation process is not necessary in curing foul brood on the Jones or Quinby plan, and besides being unnecessary, it is a useless waste of both time and a square foot or two of nice white comb built in frames by these bees with no labor, on the part of the api-arist, in first putting them in a box, lugging to the cellar or into a dark room, and then out again to return them say until a south the discom them, say nothing about the discom-fort given the bees? If these frames partly full of combs are not wanted for starters, they will be nicely filled with all worker comb if given to nuclei to complete, or quite a saving will be made over the other process if they are melted into wax, while the dis-comfort given the bees is all done away with. I hope all having foul brood in their aplaries will next year fry the plan that L have above datailed try the plan that I have above detailed, and report upon the working of it.

Borodino, ON. Y.

This all-important subject still remains in a very unsettled and un-satisfactory condition. I am glad to notice the editorial on page 723, and I think that much could be accomplished by such a course as is there marked out, and I hope to see that idea pursued. Before that plan will become entirely practicable, however, something more is required. All who produce honey for market must learn to have it in neat, clean. new sections, of uniform size, and I believe the standard one and two pound sections are best for all purposes. It must be scraped of every particle of propolis, and and the purposes of propolis. and crated in new cases before offering it for sale.

I believe that all hee-keepers who all they can for it, and that the rea-son why some sell at such very low figures is on account of the lack of information where to sell, and by not having their honey in the best shape -mixed honey, old sections, odd sizes, dustr locking sectors, bull and sectors dirty-looking crates, bulged combs, etc. Of course such a bee-keeper can-

not hope to get the prices that A. and B. do for their snowy honey in fault-B. do for their showy honey in fault-less packages. Honey in poor shape and condition is not wanted in the home market, and it is certainly not fit to ship elsewhere; it is therefore *forced* off at some price, and the mar-ket ruined for all. Now what we want is, to teach these bee-keepers to produce only, benew in the best posproduce only honey in the best pos-sible shape, and they can then ask and get a fair price. My own home market was spoiled exactly as de-scribed in the editorial above referred to, and I was forced to find other markets.

I notice that Mr. Thielmann.on page 726, advises not to use combs a second year without first extracting the honey. To bring his idea up to modern times, he should have added, "After extracting cut out the combs, melt them up, and burn the old sections." He is evidently on the right road, however, and will probably catch up after awhile.

Milan, vo Ills.

### For the American Bee Journal. U. S. Honey-Producers' Association.

#### M. M. BALDRIDGE.

One of the chief objects of this article is to stir up a hornets' nest! The nest has been in sight for years, but it has now grown so big that it has become a nuisance. There must, hy this time, be "lots" of hornets in the nest, so to begin the "fun" let me throw a few peobles at it to see how much life there is in it. Having provided myself with an iron clad armor of defense the hornets may now come if they wish !

On page 723 is one of those brief but pithy editorials which reads thus:

"It will pay producers to allow local stores a commission of 20 per cent. on the sale of comb honey if they would retail it at 20 cents per pound. Better this than to allow re-tail prices to run down to less than the net amount you would then re-ceive from the stores."

Now, there is good sense in the foregoing extract for honey-producers to analyze and heed. But will they heed it and put it into practice ? If not why not? not, why not? Why continue to ship your honey away to some large city, to be sold on commission by wholesale dealers, and neglect to supply your home markets? In any event, why not supply your home markets first? Then, if there be a surplus, will it not be time enough to ship it away beyond your reach and perhaps control? Just think of this and then act. But, says the reader, in what way should I supply the home mar-kets? Do as the Editor indicates, to-wit: By selling your honey direct to consumers through the retail dealers, and by them on commission only. Not at their price but at your price. Pay retail agents a good commission; if they disobey instructions take away the unsold honey and refuse to sup-ply them with any more until they comply with your wishes. This is

the way the flour producers on Fox river do, and have done for years, and the plan works like a charm; and this is the right way for honey-producers to do. The producers should know what is

a fair, honest price for honey when compared with its cost and the price of other commodities, and it is high time that they demand it. The power to get it lies within their reach; then why not use that power? But, says one, what is a fair price for honey? That, of course, depends upon the bird its condition and the power kind, its condition, and the supply. It seems to me that 20 cents per pound at retail is none too much, at present, for a good article of white honey in small sections, and a fancy article should command 22 to 25 cents. And 15 cents at retail, is none too much for even good buckwheat honey, in small packages, while 16 to 18 cents per pound is pupe too much for introper pound is none too much for intermediate grades in good condition. And, further, that 10 per cent. 15 per cent., or even 20 per cent. is none too much for the retail agent to have for his trouble and assistance. The idea should be "to live and let live." The consumer has a right to live, so has the agent, and so likewise has the producer. But, as the matter now stands, the producer has precious little to say about the matter, nor has the consumer. The middleman seems to be, in many cases, the dictator to both parties.

Every important trade or business. almost, has an organization to control it, to limit production, or to fix prices, hut the honey-producers have none! And why not? Simply because there has been no proper effort on their part in that direction. They can and part in that direction. They can and should have such an organization if they will. But how? Read the edi-torial on organization on page 723, then think about it, and then you may be ready to act intelligently and speedily. A honey-producers' or-ganization of the United States is a move in the right direction, and one that the writer has been advocating that the writer has been advocating, in a quiet way, for several years.

And now a few words about the commission men and the bee-papers: I claim that commission men have no right, legal or moral, to the free use of a whole column, or even a part of a column of our bee-papers. Their occasional and semi-occasional "reports" of the honey markets are a curse to honey-producers, and are nothing more nor less than a free advertisement for themselves. If they wish to advertise their calling and place of business, let them pay for the privilege as other people do. There are many reasons why the wholesale commission dealers are a curse to honey-producers; why they should have no right to a free use of our bee-papers; and, in fact, why they should all, without exception, be signified on the state of th be rigidly excluded from the use of even the advertising columns ! I will not now attempt to give all the rea-sons, but will content myself at pres-

short, they fix the price for honey, and fix it to suit themselves. They seem to care but little for the profits and welfare of honey-producers. Their chief interest in the transaction, be-tween the honey-producer and the retailer, is simply their commission. They cut and make prices simply to make sales and to get ahead of their rival commission neighbor. Having been in the honey traffic more or less for the past thirty years—producing, buying and selling, but never on com-mission—I happen to know that my statements are true. But the com-mission men are not alone to blame. The honey-producers are equally to blame. They have permitted the wholesale commission men to fix the prices on their honey for them. But for the present, as in the past, they cannot very well help themselves in case they patronize the wholesale commission merical commission men. Being unorganized, honey-producers are trying almost everywhere to undersell each other at home, and when they ship their honey away to the large cities, they give the wholesale commission dealers the same privilege.

Now this practice should be changed Now this practice should be changed to one based on sound business prin-ciples. But I see no way to do this without an organization of the honey-producers, to be known and desig-nated, perhaps, as the "United States-Honey-Producers' Association," or by some similar title. The times demand such an organization. Then why not bey at some ord before we produce such an organization. Then why not have it soon, and before we produce another crop of honey to be demor-alized in prices like the present one? I for one am not in favor of waiting until the next meeting of the North American Bee-Keepers' Society be-fore we make an effort to better our fore we make an effort to better our condition as honey-producers. I there-fore move that we have a convention of honey-producers the present winter, for the express purpose of organizing a honey-producers' association. And why not have the meeting in Chicago? that city being perhaps as central as any. Who will second the motion ? St. Charles, 5 Ills.

[For editorial remarks on the above. see page 771.--ED.]

### For the American Bee Journal.

### The Iowa State Convention.

The Iowa State Bee-Keepers' Association met in the association's tent on the State Fair Grounds at Des Moines, Iowa, on Sept. 7, 1886, at 2 p.m., with O. O. Poppleton in the chair. Many questions of interest were asked and answered, after which the convention adjourned to meet in the evening.

The evening session was devoted to a general discussion of various im-portant questions, and was greatly enjoyed by all, and adjourned to meet again at 9 a.m. on Sept. 8.

City, Vice-President; Joseph Nysewander, of Des Moines, Treasurer; and A. J. Norris, of Cedar Falls, for Secretary.

It was voted that the executive committee be instructed to form a new constitution and by-laws, and present the same at the next meeting for approval. An essay was then read by Mr. Spaulding, making clear several subjects of much interest, and several questions were asked and answered in the afternoon, and a social time generally was enjoyed by all.

Alsike clover was discussed with much favor. The meeting continued for three days, and all seemed to express the thought that it was time well spent. A majority of the members desired that when a member became delinquent in dues, he should not be considered a member until the \$1 was paid. Twenty-seven joined the association and paid the required dues.

The year's record of bees and their products was gathered by a committee, as follows: Number of bee-keepers present, 40; number of colonies, fall of 1885, 2,174, and number taken from winter quarters in the spring of 1886, 1,819; number on June I, 1,914. Pounds of comb honey taken, mostly in one-pound sections, 99,500; pounds of extracted, 83,200; honey sold,54,400. Average price received for comb honey, 14 cents per pound; for extracted, 7 cents. Number of colonies at present, 3,187; and average number of pounds per colony, spring count, 101%.

After a thorough discussion of nearly all the leading questions in bee-keeping, the executive committee were instructed to appoint the time and place for the next meeting, until which time the convention then adjourned. A. J. NORRIS, Sec.

For the American Bee Journal.

Legislation for Bee-Keepers.

#### JAMES HEDDON.

In response to Dr. Miller's candid article on page 742, I believe I can answer the argument which he makes against my views, by stating a fact which I believe nearly all who read this will admit, viz: that it is not always right, wise, nor feasible to work for right and justice through the channel of legislation.

My knowledge of the principles of common law is not very extensive, but I will venture the assertion that if we as bee-keepers desired to bring ourselves into bad repute with the legislators of our Nation, we could not do it faster than by asking them to enact such laws as are referred to in the resolution placed in the hands of the committee, to which Dr. Miller refers. There are thousands of reforms needed—reforms that would put justice in the place of injustice, that it would be very unjust to inaugurate by legislation. I will give just one example to illustrate, as follows:

Nervous dyspepsia is a most prevalent and immoral disease. It makes bad fathers, mothers, husbands and wives; begets impatience and cruelty towards children, hard feelings between neighbors, and becomes a great leader to alcoholic intemperance. We all know that the great cause of this happiness- and - morality destroying disease, is over-eating, or indulging one of the passions beyond the sanction of reason. Now, no one would be insane enough to ask legislators to create statute laws directing how, at what time, and what quantity we should eat. It is one of the very many wrong conditions that it would be nothing more nor less than a crime to attempt to correct by legislation.

It is my opinion that whoever will present this proposed legislation to an able lawyer will first receive a smile in return. I am as full in the faith to-day as at the time I wrote my article on "Priority of Location," that the position taken in that article is just, practical and best.

Perhaps in the above I have not made clear my answer to all of the doctor's questions. To have an exclusive right and do the greatest good to the greatest number, that right should be in possession of the best fitted to survive in our pursuit, and it is in just such hands that it will ultimately fall, if it is not tinkered by legislation. Now, does the Doctor get my idea of the relation between a condition of bee-keeping that will result in the greatest good to the greatest number, and the question of the survival of the fittest? "Priority of location" gives one a natural right provided he is fitted to hold that location, and I wrote that article with the endeavor to fit those who read it to hold their locations against the "interloper." I pictured the natural right of priority in order to inspire the reader to fit himself to hold it, thus giving him a right to bold it in a broad as well as a narrow sense.

Let me illustrate what I mean by a broad and narrow sense : A wealthy gentleman purchases 100 acres of land, paying all cash and receiving a clear title for the same. He at once erects an impenetrable fence around it and makes it a driving-park in which to speed his fast horses and entertain his profligate friends. The country in which this is located is thickly populated, and people are destitute of the necessary products of the soil. Thousands are sitting outside this fence, hungry and cold, begging leave to till the soil. Now we all know that in a narrow sense the gentleman owns that 100 acres, but there is a grander and broader sense in which he has not a moral tax-title to even a bowlful of dirt.

I have two apiaries in different locations, and to-day both of these localities are clear of other bees. I have no fears but that they will remain so, except as now and then some person will be unwise enough to start up, and not having astuteness enough to "catch on" to the weakness of such an attempt, will soon learn it by sad experience.as have three or four persons who have already

tried it in as many instances. I have kept matters, in these locations, in the above healthy condition hy practicing what I preached in the "priority" article referred to.

I hope I fully appreciate the spirit of the Doctor's arguments, and I trust that he will take my reply in the same spirit, for in such it is surely meant. Yes, let us hear from Lawyer R. L. Taylor.

Dowagiac, 9 Mich.

For the American Bee Journal My Experience with Carniolan Bees. C. G. BEITEL.

I wish to say a few words about the Carniolans, a race of bees which, I think, is not yet properly appreciated or understood, and in some instances is, for interested motives, purposely maligned.

In the spring of 1885 I ordered a Carniolan queen. In reply I received a postal stating that owing to the poor satisfaction they had given to his customers, the dealer quit rearing them. This was, however, not satisfactory to me—I had read too much about them, and I determined to try them myself, and consequently hearing that another bee-keeper was selling these queens, I ordered one, which I received on June 15, 1886, and at once introduced her to a 3-frame nucleus of Italians.

They bred very fast, so that by Aug. 17 they cast a tine swarm. Of course this was rather late, but I blamed myself some for it; report had it that the Carniolans used up all their surplus in rearing young, and I would occasionally feed them unfinished sections, which, no doubt, stimulated them to swarm, but I hived them back, first removing all queen-cells, and giving more frames. They at once went to work with renewed vigor, and have been satisfactory ever since.

At the beginning of the present month (November), while overhauling my colonies preparatory to packing for winter, I had opportunity to compare their conditions, and while I have Italians, Albinos, Syrians and blacks in all their purity, and hybrids and crosses of every description, not one could show as much honey as the Carniolans; they were strong in number, and their hive was solid with honey from side to side, in combs nearly as white as snow; there was no solling of the combs by the bees running over them, and I thought that like the cleanly house-keeper, they wipe their shoes before they enter the house. I attribute this to the fact that they use little or no propolis. They are not as bright in color as the Italians, and therefore, perhaps, not as attractive to a casual observer, yet to my eyes they are beauties, and answer all the points given by Mr.Frank Benton and others; and as for docility, they are superior even to the gentlest Italians.

learn it by sad experience, as have three Their frequent swarming, so much or four persons who have already urged against them, I think not a serious fault, for they are more easily manipulated than most others. I would rather handle 10 colonies of Carniolans than one of hybrids.

It is true that I got them rather late, and could not test their honey-stor-ing qualities—for I take all my sec-tions off about the middle of July, and do not care for fall honey, leaving that for the bees to winter on; but so far as my experience goes, I am sure that owing to their prolincess, do-cility, beauty, and white-comb build-ing they will play a prominent part in the future.

Next to Carniolans I find the Syrians the best honey-storers, but they are so nervous—the least jar will start them, and often make things very unpleasant; but of all the nasty, vicious creatures under the sun, the offspring of a Syrian queen mated with a black or hybrid drone is the worst.

Easton, O+ Pa.

For the American Bee Journal.

# The Non-Swarming System.

#### VICTOR W. CLOUGH.

It is just as natural for bees to and rear their young. This is the way Providence provided for bees that they might not become extinct. But I know by experience that bees placed in a rightly constructed hive, with a certain number of cubic inches to fit its colony in the brood-chamber, and plenty of surplus room on top (never at the side), will not swarm. I am convinced that the cause of

swarming is mostly in the construc-tion of hives. Not one in a hundred are made to produce the effect de-sired. Hives should be constructed with two entrances, one for the bees to cluster at (if at any time the colony becomes crowded from neglect to place on surplus room), and the other without having to crowd through 2 or 3 inches of bees. I believe that the brood-chamber should never be disturbed after the season for honeygathering has commenced, if bees are expected to gather a large surplus. It disturbs and hinders the bees more or less, the same as it would if we had our home disturbed by a windstorm, consequently we would very naturally stop our business and "fix up;" just so with the home of the bee.

I use a non-swarming hive, and in it I start the bees at work in a case of 40 sections. After the bees have this case two-thirds full, I raise it up and place under another case, and when two-thirds full I raise the two cases and place under another; when this case is two-thirds full, the top case will undoubtedly be all finished, and can be taken off, but at the same time the two remaining cases must be raised and under them placed another. Continue to do so all through the season, and when the season is over there will be a harvest of from 200 to 300 pounds of honey, without any increase. Geneseo, ~ Ills.

# Views on Legislation for Bee-Keepers.

For the American Bee Journal,

#### DR. C. C. MILLER.

I send herewith a letter from Mr. O. B. Barrows, of Marshalltown, Iowa, giving his views on the matter of legislation, for which he has my thanks. I hope we shall bear from others, and if they will send direct to the editors, the general readers will the sooner see their writings. The following is Mr. B's letter to me :

"I see on page 742 of the BEE JOURNAL you ask for bee-keepers' views on the subject of legislation to create a sort of pre-emption to certain territory for bee-pasturage. I have been keeping a few bees for a number of years, but not having sense enough to increase my bees to use all the pasturage, my neighbor, Mr. Pinkerton, stepped in, and being a smarter man than I am, has outstripped me man than 1 am, has outstripped me in the race, and now has 170 colonies of bees, which is nearly twice as many as I have, and some others in this town have a few, and still not bees enough to gather all the nectar.

Now the question is, because I have been keeping bees longer than my neighbor, and still have not gumption enough to keep enough bees to gather all the honey, should Congress step in and debar him? or should Congress say, 'Let the man keep bees who can make a success of it? Let him produce honey who can produce it the cheapest? Let him who cannot enter a fair competition with his neighbor, retire on the prin-ciple of the survival of the fittest ?'

"These are my individual opinions, but I expect sooner or later complaint will be made against my keeping them within the corporate limits, on the ground of their being a nuisance, and while I do not believe that they are a nuisance, I shall rather sell out or move than contest it. Remember, I only represent one.

"I notice that some of the bee-keepers are complaining of others putting the price of honey down. It seems to me that they might have Congress pass a law similar to what the general court did at an early day in Connecticut, that persons living within a certain distance of Norwich should receive a certain price for their wheat, and the further they lived from that point the greater the price, so as to compensate the remote farmers for drawing their wheat to market. "When I learned that one of our

grocers had bought 1,000 pounds of good comb honey, and was retailing it at 10 cents per pound, so that a man who worked ten hours for \$1.50. could take home 15 pounds of \$1.30, could take home 15 pounds of it for his day's work, and say, 'Wife, this is not a luxury, but is as cheap a dessert as I can buy; let the children have all they want of it,' I was re-joiced. And when two or three tons were rapidly sold in this town (not to a monopolist to hold) to poor laboring people, to eat on their tables, I felt glad that the bee-business had come feet apart; then nail collar pieces on

to that state of perfection when this could truly be called a 'Land flowing with milk and honey;' and when a lawyer asked me if my honey would keep, I was glad to say 'no,' they eat it up and come back for more."

Marengo, & Ills.

For the American Bee Journal

# How to Build a Bee-Cave.

#### J. W. BITTENBENDER.

Mr. Gates said at the meeting of the Western Bee-Keepers' Associa-tion of Iowa, that it would cost \$500 to build a cellar to properly winter 200 colonies of bees. As a cave is much preferable to a cellar, and the cost of it would be within the reach cost of it would be within the reach of a great many bee-keepers, I will give the way my cave is built, and the cost of all the material in it. This cave is made the same as Mr. B. F. Woodcock's, who has wintered bees very successfully, not losing a single colony out of 50 colony out of 70.

My cave is 8x20 feet in the clear, My cave is 8X20 feet in the clear, and was made by first excavating a hole in the ground 10 feet wide, 22 feet long, and 3½ feet deep, and an entrance way 4 feet and 10 inches wide, by 6 feet long, and 3½ feet deep. The drain of not less than 3-inch tile was then put in and also a sub-earth was then put in, and also a sub-earth ventilator of not less than a 4-inch tube or tile, and which is 60 feet long, and 3½ to 4 feet deep under ground. coming up out of the ground at 60 feet. A stone wall a foot thick is placed all around the cave, and a 10-inch wall in the entrance way; this gives a 3-foot stairway.

The side wall is 5 feet high, and on a sill 6x8 inches square and 22 feet long is the door-frame, made of 2x10 inch plank, with a top bearing 6x12. The door-frame is to be 2 feet and 10 inches wide and 6 feet long in the Inches wide and 6 feet long in the clear, and the door-cap to project 6 inches on each side. The gable ends are built 3 feet higher than the top of the sills; the side sills are to lay on the side wall even with the outside of the wall. The entrance front is to be 4 feet high at the front, tapering up to the lower edge of the door-cap. A piece 2x10 inches and 4 feet long is A piece 2x10 inches and 4 feet long is then laid on the front entrance wall, and then pieces 4x8 from this piece to the top door-cap, nailing and spiking it well.

Cut the rafters to fit on the inside of the gable ends, and have the same pitch as the wall, so the sheeting reaches or lays on the wall. Cut the end of the rafter to a point to rest on the sill without a shoulder; set the point of the rafter to the ontside edge of the sill, the rafters to be made of 12x6 inch lumber. If the rafters are cut right the inside edge will project The wall will be 4 inches with the wall. The wall will be 4 inches wider than the sill, if the sill is placed as I have directed. Brick is walled in this space, set on the edge, which will make a dead-air space of 2 inches to prevent frost

Suppose the rafters to be placed 3

them 18 inches above the sill (fencing will do for this), but be sure to have them true or in line, as the ceiling is to be put on this. Now, do not put on the roof yet, for you are to work from the inside to the outside. Ceil this in the inside with shiplap (as I prefer this to plastering), and when the ceiling is on, to get an inch air space, nail inch strips to the edge of the rafters, and cut inch-boards just so they will go in between the rafters and rest on this inch strip, which will make an inch of dead air space. Put heavy paper on this. Procure sawdust and lime and make a mortar; this lime will preserve the sawdust. Take 3 parts of sawdust to one part of lime, slake the lime, put in 4 buckets of water to one of lime, mix the sawdust in and get it as stiff as you can; raise the mortar-box higher at one end, scrape the mortar to the higher end, and let the water drain off. Make a stamper and spread the mortar on between the rafters 3 inches thick; when stamped down well, here you get another dead-air space of an inch.

Now put the sheeting on like a floor, and heavy roofing paper over the sheeting. It is then ready for the shingles, every layer of which is to be painted, and on the roof two coats of paint after shingling.

I omitted telling about the ventilation. Pnt a ventilator 5x6 inches in size in the inside, made of boards. Nail it to the rafters before you put on the celling, letting it project 6 inches in the inside, and let it stick out above the roof 18 inches. To anchor the sills to keep them from spreading, put a  $\frac{5}{26}$ -inch iron rod in the wall at each end. If you have brick walled in around the sills it is ready for flagging-stone and cement. Cement the sides first, and then the floor and entrance-way. Put on the inside door and double outside door. Paint the celling, doors and all the wood-work with two coats of paint. Put in the stairway, bank the ground up to the top sills, paint them well, put conductors on the roof, lay brick around the door-frame to keep the ground away, and you will have a cave that you can control the temperature in, and one that will last a lifetime.

The cost of the stone-work and cementing was \$70; roof, shingles, sawdnst, ceiling, nails and paint, \$30 30; for excavating, ventilator, tiling and tile, \$7.90; and doors, hinges and paint, \$4.65, making a total cost of \$112.85.

When the cave is completed it will be 8x20 feet in the clear, and 7 feet high in the inside, with an entranceway 3x6 feet. Use for all the best material. Perhaps others can get material cheaper than I did, as all my material was imported and bought of retailers. I have done all the carpenter work, and did not count anything for my labor—it was worth about \$10. My friend's cave was not affected when the temperature was  $26^{\circ}$  below zero. The temperature in my cave now is  $45^{\circ}$ , with the outside door open, all the ventilators open, and with 115 colonies of bees in it.

Knoxville, 9 lowa.

# Inverting the Brood-Nest.

Rural New Yorker.

#### PROF. A. J. COOK.

One of the late innovations in beekeeping which has gained favor so rapidly that we must think it has come or hives. In either case the brood-nest is turned upside down. This was first accomplished by so arranging the frames that they could be readily in-verted. Instead of the old Lang-stroth frame with its single top-bar, which had projecting ends, a perfect rectangular frame, with no projecting bars, was made to swing in a larger frame with projecting top-bar and end-bars which reached a little below the middle point of the end-bars of the inner rectangular frame. By use of wire nails the inner frame is piv-oted to the outer half-frame, so it can swing in and be inverted in a moment at any time. I have used these frames now for two years, and like them so well that I am changing all my combs into these reversible frames.

Within the last two years an at-tempt has been made to improve upon this plan by inverting the entire hive, which is about the size of the common Langstroth hive, and consists of two horizontal sections, which can be used either independently or together. Thus it will be seen that the frames in this hive are only about half as deep as those of the usual Langstroth. These frames have close-Langstroth. These frames have close-fitting end-bars, and when put into the hives, rest on tin projections, which are tacked to the bottom of the end-boards of the hive. When all the frames are put into the hives, a wooden thumb-screw which is set in the side-board of the hive opposite the end-bars of the frames, is screwed This holds all the frames firmly, up. and so when these screws are thus turned the frames are all held securely. and the entire hive can be turned bottom up in a moment.

The advantages of inverting are : 1. Combs are built and fastened to the frames on all sides. Every beekeeper knows that bees always fasten combs firmly at the top and along the upper half of the edges. When this is once done we have only to remove the frames, when the union is made complete about the whole margin of the comb. The advantages of such entire union are, that the combs are held securely, and are in no danger of falling out when extracting or shipping bees. 2. The spaces between comb and

2. The spaces between comb and frame which serve as hiding-places for queens are removed. This last is a great gain, as any one who has sought for queens is aware.

3. Reversing frames places the honey below the brood, which is unnatural. Hence, if just as the season opens, when we place the sections on the hive, we reverse the frames, the bees at once carry the honey above the brood, or into the sections where we wish it, and once employed in filling the sections they make no halt till the season closes. If, when we reverse we uncap some of the honey, we will hasten this rush to the sections. Many who have been annoyed at the persistent refusal of their bees to work in sections, will appreciate this argument in favor of reversible frames, though to the expert apiarist this is the weakest argument.

4. When a bee-keeper has all the bees he wishes he can preclude swarming by this simple work of inversion, which, in case the hive is reversible, is but the work of a moment. Curious as it may seem, the bees at once cut away or remove all queen-cells as soon as the combs are turned upside down. Thus by inverting the hives each week swarming is prevented, and all but the work of a moment.

Of course this last, and indeed all the points, argue loudly in favor of the reversible hive. To invert a hive takes a moment; to reverse all the frames is the work of several minutes.

Agricultural College, 9 Mich.

# For the American Bee Journal. Selling Honey in Home Markets.

#### CHAS. WALKER.

On March 20 I took 48 strong colonies from their winter repository, leaving the packing on them until about May 8, when I cleaned out all the chaff. I then examined them and found all in the finest condition possible, not even losing one queen. On May 18 I was surprised at seeing the first swarm issue, as it was about 3 weeks earlier than usual. I increased the 48 colonies to only 75, as their whole aim seemed to be the storing of honey. I have secured 4,080 pounds of comb honey, and 500 pounds of extracted. No account was kept of the amount sold at the honey house, so my total crop must have been some over 5,000 pounds. I am satisfied with the season's work, even if the prices obtained for honey are very low.

Our markets are mainly governed by supply and demand, but our home markets are chiefly influenced by onrselves, and I am sorry to say they are indeed poorly controlled. For instance: I procured a honey-extractor, intending to produce and sell extracted honey at 8 cents per pound; but I found to my surprise that one of my neighbors was selling the same kind of honey at 4 cents per pound. I sold a little for 5 cents per pound. I sold a little for 5 cents per pound, and then raised the price to 8 cents, and I am now selling as much for that price as I did for 5 cents. It was an imposition on our grocers, for they cannot sell a gallon of syrup when honey sells so cheap. Honey cannot be produced in this State for 4 cents per pound. I can retail all I have at 8 cents before next spring.

My bees are in the cellar, with a good fire over them, and they are perfectly quiet. The cellar has two ventilators, so at any time a current of fresh air can circulate through it, being so arranged that it can be governed by a slide from the inside of the cellar.

SELECTION SEROM

Keeping Bees in a Warm Room.— A. T. Aldrich, Wilcox, & Pa., on Nov. 26, 1886, writes :

Last year I gave an account of my experience in keeping bees in a warm room. Another year has passed and the same colony stands at my desk within 2 feet of my elbow, where it has stood for three years and a half, the brighest and best of all my colonies. I have had no carrying into the cellar, no packing, no feeding, no anything—I simply let them alone except to put on and take off sections. The temperature ranges, during winter, from  $30^{\circ}$  to  $70^{\circ}$  above zero, and the bees are always quiet and consume but little honey; they are strong in the spring, and the first to cast a swarm. This colony gave me, the past season, 114 pounds of comb honey in sections; also an early swarm which gave me 67 pounds, making 181 pounds, spring count. I am aware that old bee-men who live in more favored localities will taugh at this, but when we consider that no other of my 25 colonies gave me onehalf that amount, the showing is not so bad. As a further test I have placed two weak and two medium colonies in my kitchen chamber, where it is always warm, hoping to be able to give a good account of them next year.

Bees did Well.—David Watterson, Bristow, & Iowa, on Oct. 31, 1886, says:

My bees did very well the past season. I had 12 colonies to begin with, and increased them to 28 by natural swarming, besides taking 800 pounds of honey. I had one colony that swarmed four times, and got 110 pounds of honey, besides having plenty to winter on.

Preparing Bees for Winter, etc.-E. Pickup, Limerick, & Ills., writes:

After "endowing" La Harpe College with 25 colonies of bees, I had 16 colonies left in the spring to begin this season with. I increased them to 40, and had one ton of honey. The colony that did the best cast 2 swarms, and produced 300 pounds of honey.

spring count. Ventilation, shade and tiering-up keeps back swarming. One-third of my colonies did not swarm, and 26 others that I took care of increased to 70, and I took from them nearly 1¼ tons of honey. For the winter I have packed 40 in the sawdust and clover chaff all around, and a little board with a cleat under each end to keep the entrance open. I have 16 on the ground without bot-tom-boards, packed in sawdust, en-trances open; and 16 with windbreaks, and the caps full of oat-straw, and the rest in a bee-house which has double doors, double windows, and is covered so as to make it dark; it is double-walled with 10 inches of sawdust between battened on the outside, and on the inside covered with oiled paper, and fined with shiplap lumber on the paper; on the north and west sides is a one-inch air-space. Yester-day the temperature was 60° outside. and 47° inside; this morning, 34° outside and 46° inside. I owe my success in bee-keeping to reading beepapers, and making good use of the same. I think the last sentence of Dr. Mason's article, on page 682, is right to the point—much in a "nut-shell."

Honey-Plants from Florida.—A. A. Dodge, Palmetto, 9 Fla., on Nov. 2, 1886, writes:

I send you six different honeyplants, from which I find the bees were gathering honey to-day. We are having fine, sunny days. The thermometer shows 50° lowest, 80° highest. Bees are at work as they would be at the North in the month of July; and appear in the same condition in regard to brood, drones, etc.

[The plants sent are three goldenrods, two asters, and one thoroughwort. It needs not to be said that all are excellent honey-plants. — A. J. Cook.]

Wintering Bees in a Straw-Stack, etc.—Fayette Lee, (126), Cokato. Minn., on Nov. 21, 1886, writes the following items:

I have taken 2,000 pounds of comb and 3,000 pounds of extracted honey this year, mostly linden honey. I increased my apiary from 95 to 144 colonies. I have sold some, so I now have 126 colonies in the cellar. My honey is nearly all sold at home at 15 cents per pound for comb honey, and 9 cents per pound for extracted. When I say at home I mean that I have not gone 7 miles away from my apiary. I would say, let the Bee-Keepers' Union set the price on honey, and all sell at that price, then all will know what the price of honey is. When the Union takes this step, then it can have my \$1.25 and my help. I find in some of my colonies brood in all stages in from I to 3 combs. Does the queen lay every month in the year? It looks as if she does. They are Syrian bees.

has is from the wax or comb, and not put in by the bees' sting. If you take a section that is full of honey, and not capped, and put it in a warm room for two weeks, it will have the same flavor that sealed honey bas; extract the sections before it is ripe, or the water out of it, and put it in a jar. and you will see by letting it stand in a warm place three weeks, that it has a flat taste. One of my neighbors put 24 colonies in the middle of a large straw-stack, and they were all dead before March 1. They froze solid. with honey within 2 inches of the cluster. They would be better off in a half-inch nail keg on the bench, for there would be some change in the weather. The black bees are abead of anything for white comb honey.

The Season of 1886.—J. W. Buchanan & Bro., Eldora,⊙ Iowa, on Nov. 29, 1886, write :

We began the season with 16 colonies. bought 3 more, making 19 in all, which we increased to 33 colonies. and took 820 pounds of comb honey in one and two pound sections. We took 14 colonies on shares, 10 of them being old colonies, and 4 new ones. As it was late in June when we got them, and no sections on, they did scarcely anything. We placed sections upon their hives immediately after getting them home, and got 200 pounds of comb honey, and 7 swarms from them. The drouth spoiled the honey crop in our locality, almost all of our surplus being from white clover in June and the latter part of May. We have 25 colonies in the cellar, and 25 in a cave built purposely for them. We have sold a part of our honey (some at 12½ cents, and some at 15 cents per pound) in our home market, and have 500 or 600 pounds still on hand. We use the "Heddon-Langstroth hive," both 8 and 10 frames. We have our bees all housed for winter.

Managing Robber Bees.—Charles Mitchell, Molesworth, Ont., writes:

I have been watching the beepapers long and closely for something equal to their depredations, and I have failed; so have all the remedies thus far offered. In consequence of this I will give something which will not fail—at least it has not with me in two years. To distinguish between robbing, and colonies taking a general flight, has cost me more study than any one thing in connection with bees; and unless the reader knows his business, never treat bees for robbing until 10 or 20 minutes after heavy flying, when they will return, light on the hive, and many will fan their wings while traveling in, when all will be over. But robher bees will hover about the entrance on wing with their legs straight out behind, like a crane, lest they get caught by the feet. (This is before they are overpowered.) I am of the opinion that many of those old, shiny bees become "professors," and end their days robbing, even on into a good flow of clover honey. If contracting the entrance in time will not prevent robbing, I let them get in full blast so as to get all those "professors." Have a tent and smoker ready, get the tent over the hive, leave it a few minutes until you get all the bees which ere in leading up. Now lift which are in loading up. Now lift off the tent, having closed the en-trance first. By this time all the bees will be back, which were away unloading. Now while they are trying loading. Now while they are trying to crowd into the closed entrance, put the tent over them, go inside and raise them with the smoker, and you have nearly all those "professors" and "students." Leave them in the tent, according to the weather, until tent, according to the weather, until they are barely able to go home. If they try it the next day treat them in the same manner. Two applications have always disgusted my bees with the whole business. Of course there is generally something wrong—too many combs, too few bees, too black, or built collect from bees. or being called from home.

Feeding Bees Now for Winter .--Mary E. Hovey, Yorkville, & Ills., asks the following :

I have 25 colonies of bees, and nearly all of them are short of winter rations. I shall have to supply about "00 pounds of honey. What is the 200 pounds of honey. What is the quickest and best way of putting it into the hives ?

[Get it in the comb, either in sections or frames, or pieces, and lay it on sticks on top of the frames in such a manner that the bees can get at all sides of the combs. Cover all with something to retain the heat, and winter the bees in a repository .-JAMES HEDDON.]

Taste and Odor of Honey.-Elias Fox, Hillsborough,+o Wis., on Nov. 28, 1886, writes :

I wish to corroborate Dr. J. P. H. Brown's statement on page 745. Neither is this taste and odor conplants and trees. In this locality the honey from the white clover is readily detected by the flavor of the plant, as is also basswood honey. According to my judgment, the mildest flavored honey produced in this locality, is detected in the same manner, but of course in a mild form; and when we come to motherwort and catnip honey the flavor and edor both are very prominent, especially the latter; and no carelessness with the essence bottle, either.

Reversing Sections, etc.-Henry Willson, Clinton, O Ills., writes :

I tried reversing sections the past season, but I do not like it. They weigh some heavier, but if they are reversed after the top part is com-menced to be capped, the bees must travel over it to finish the other part, and they soil it, making it several shades darker than the last finished.

Also, there is often a seam on the line between the capped and uncapped when removed. My experience with bees is contrary to Mr. G. W. Dem-aree's. I have often noticed that they make more noise during zero weather than in moderate weather, but whether they are exercising to keep warm, or are simply uneasy, I do not know, yet I am inclined to the latter.

Learning to Keep Bees, etc.-Thos. Gavin, of Worburton, Ont., writes :

I commenced in the spring of 1886 with 2 colonies of bees, increased them to 7 by natural swarming, and obtained only about 20 pounds of comb honey from a first swarm. Can one who never saw bee-keeping carried on, and obtained all his information through bee-papers and beebooks, keep bees as successfully as one that has served an apprenticeship with a successful apiarist?

[It can be done, but good, practical lessons would be invaluable to such a beginner.—ED.]

#### Convention Notices.

The Keystone Bee-Keepers' Association will meet in the Court House at Scranton, Pa., on Tuesday, Dec. 14, 1886, at 10 a.m. ARTHUR A. DAVIS, Sec.

The eleventh annual meeting of the N. W. Ills. & S. W. Wis. Bee-Keepers' Association will be held in the Grand Army Hall in itoekford. Ills., on the third Tuesday in January, 1837. There will be a two days' seesion. J. STEWART, See.

137 The next annual meeting of the Nebraska State Bee-Kcepers' Association will be held in Lincoln. Nebraska, on Wedneaday, Jan. 12, 1887. Location of Hall to be used and Hotel accommo-dations will be given after further arrangements have been made. II. N. PATTERSON, Sec.

137 The New York State, the Eastern New York and the New Jersey & Eastern Bee-Keepers' As-sociations will hold their great united convention at Albany, N. Y. on Jan. 11, 12 and 13, 1886. This convention will be one of the largest, if not THE lergest, ever held anywhere in this country, and it behooves every bec-keeper to stitend. A grand exhibit of aplarlan fixtures is promised. An nn-usually brilliant programme will be prepared and announced later. JNO. ASPINWALL.

#### System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

| For |              | (120 pages) | <br>\$1 00 |
|-----|--------------|-------------|------------|
| 44  | 100 colonies | (220 pages) | <br>1 25   |
| 44  | 200 colonics | (420 pages) | <br>150    |

The larger ones can be used for a few colonles, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

Reader, do you not just now think of ono bee-keeper who does not take the Weekly BEE JOURNAL, and who should do so? Perhaps a word or two from you will Induce him to do so. Will you not kindly oblige us by getting his subscription to send on with your own reuewal for next year? When you do so, please select any 25 cent book In onr list, and we will send it to you post-paid, to pay for your trouble. We are aiming to get 5,000 new anbscribers for 1887, -wlll you not assist us to obtain them ?

#### Honey and Beeswax Market.

The following are our very latest quotations for honey and beeswax :

#### CHICAGO

HONEY.--It has sold better during this month than st any time since the new crop came on the market. Yet prices are nnt any higher, sales being made at 11@12c, for white honey in 1-lb, sections-gancy sections of less than 1 lb, in weight, at 13c. Fancy sections of less than 1 to, in wriget, at loss Extracted is unchanged in tone or values, being 567 cents per lb. BEESWAX,-23625c. R. A. BURNETT,

R. A. BURNETT, 181 South Water St.

#### NEW YORK.

NUV. 9.

NEW YORK. HONEY.-Sales for comb honey the past month have been good, and prices fair. Large abipmenté from the West are coming in more freely than we anticipated. Present quotations are as follows : Fancy white in 1-b. sections, clean and neat packages, 13@14c.; 2-bs., 11@12c.; fair to good 1-bs., 9@00c.; 2-bs., 9@10c.; fancy buckwheats 1-bs., 9@00c.; 2-bs., 7@8%C. White clover ex-tracted in kers and small barrels, 6%@7c.; Califo-ornia extracted in 61-b, cases, 10@14c. BEESWAX.-Prime yellow, 22@24c. BEESWAX.-Prime yellow, 22@24c. McCAUL & HILLIKETTH BROS., Nov. 13. 34 Hudeon 8t.

BOSTON.

IIONEY.--The demand has improved. We are: selling one-pound packages of white cluver honey at 14@15c; 2-pounds at 13@14c. BEESWAX.--25 cts, per lb. BLAKE & RIPLEY, 57 Chatham Street.

#### DETROIT.

HONEY.-All kinds of boney are dull and lower. Best white comb honey in 1-lb, sections, 11@12½c. Extracted, 7639c. BEESWAX.-23c. Nov. 23. M. H. HUNT., Bell Branch, Mich.

CINCINNATI IIONEY.-There is a lively demand for table-honey in square glass jars, and the demnod for manufacturers is very good. Demand from manufacturers is slow for dark grades of ex-tracted honey. The ranging prices for extracted is 367c, a lo. Nice comb brings 12615c, per lb. in BEES WAX.-Home demand is good. We pay 20633c, per lb. Noy.10. C. F. Murut for a

Nov.10. C. F. MUTH & SON.Freeman & Central Av.

#### CLEVELAND.

HONEY.—The market is not very active and pri-ces a little lower. Choice 1-lb. sections of beet. white sell at 13:04.c.; second grade 1-lbs. 10:02.0; choice white 2-lbs. 11:02.c. Extracted, slow at 6c. BEESWAX.—Scarce at 25c. Nov. 17. A. C. KENDEL, 115 Ontario Street.

#### MILWAUKEE.

MILWAURSE. HONEY.- The market for honey of choice qual-ity is firmer and we are trying to establish a high-er range of values. We quote 1-1b. eections of white at  $12\frac{1}{6}(m)2c$ ; 2-lbs,  $11\frac{1}{6}(m)2c$ ; dark not watted. Extracted, white, in haif barrels and in kegs.  $6\frac{1}{6}m^2c$ ; in this packages,  $76\frac{1}{6}$ ; c; in barrels. as to quality,  $56\frac{1}{6}$ ,  $\frac{1}{6}$ ,  $\frac$ 

#### **BAN FRANCISCO.**

IIONEY.—The market remains firm for choice qualities, of which we have a large supply on hand. We quote from 33(64%c, wholesale, for extracted honey; and 8612c. for honey in 2-lb. sections, although the latter sells only in a job-bing way at outside prices. Some fine honey to 1-lb. sections sells at 11621c. BEESWAX.—Duil at 20622c. for the hest.

Nov. 24. SCHACHT & LENCKE, 122-124 Davis St.

HONEY.-Trade is quiet. Extra white comb llop amber, 7% 700. Extracted, white, 4@414c.; am-ber 33@354c. BEESWAX.-20@23c. Oct.18. O. B. SMITH & Co., 423 Front Street.

#### ST. LOUIS.

HONEY.-Choice comb, 113(@12%c.; latter price is for choice white clover. Strained, in barrela, 3¼(@4c. Extra fancy of bright color and in No. 1 packages, ¼ advance on above prices. Extracted in barrels, 4½(@5½; in cane 6@7c. Market dull. BEESWAX.-Dull at 20c, for prime. Nov. 17. D. G. TUTT & CO., Commercial St.

#### KANSAS CITY.

KAN8AS CITY, HONEY.—Demand is good for all grades, and re-ceipts have been very large of comb and extrac-ted. Home bee-men have kept out of the market until this month ; having glassed every h, section on both sides they are reducing prices, selling 60 ibs. of glass with 160 lbs. of horney. making our market lower. There crop is about 70,000 pounds. We quote : White clover 1-bs. 12@36c.; 2-lbs., 16c ½-lbs., 13@14c.; dark 1-lbs., 10c.; 2-lbs., 18@9c.— California 2-lbs., 4@10. Extracted white clover, 6c.; dark, 4@5c.; white sage Calif.. 5½c.; umber, 5c. BEEESW AX.—22c. Nov.20. CLEMONS, CLOON & Co., cor. 4th & Walnut.

THOMAS G. NEWMAN & SON, PROPRIETORS. 923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN, BUSINESS MANAGER.

Special Notices.

To Correspondents. — It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live uear one postoffice and get your mail at another, he sure to give the address we have on our list.

A New Crate to hold one dozen one-pound sections of boney.—It has a strip of glass on each side, to allow the honey to be seen. It is a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We ean furnish the material, ready to nail, for 9 cts. per crate. Glass 1%c. per light, extra.

**Premium Worth Having.**—The New York World and the AMERICAN BEE JOUR-NAL (both weekly) will be sent for one year to any address in North America for \$1.90. And in addition PRESENT to every such CLUB SUBSCRIBER a "History of the United States," containing 320 pages and 22 fine engravings, bound in leather and gilt.

This "History" will be sent FREE by express at the subscriber's expense; or will be mailed for 10 cents extra to any place in the United States or Canada.

It is arranged chronologically by years, from 1492 to 1885. Every event is narrated in the order of its date. These are not eonfined, as in other works, to political matters, but embrace every branch of human action.

This premium is worth the whole of the money scut for both periodicals, and should induce thousands to subscribe, and thus get two unrivalled weeklies for nothing.

This offer is good only nntil Jan. 1, 1887, hence no time should be lost. Send at once !

When Benewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a **Binder** for the BEE JOURNAL to any one sending us four subscriptions-with \$4,00direct to this office. It will pay any one to devote a few hours, to get subscribers. Summins' Non-Swarming System is the title of a new English bee-book. The author claims that it will inaugurate a "new era in modern bee-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result —a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

To all New Subscribers for 1887 we will present the rest of the numbers for 1886; so the sconer they subscribe the more tbey will get for their money.

**Red Labels** for one-pound pails of honey, size  $3x4\frac{1}{2}$  inches. — We have just gotten up a lot of these Labels, and can supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apiarist printed on them—by mail, postpaid.

Money Orders can now be obtained at the Post Offices at reduced rates. Five dollars and under costs now only 5 cents. As these are absolutely safe, it will pay to get them instead of the Postal Notes which are payable to any one who presents them, and are in no way safe.

Set Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copies sent to the persons they desire to interview, by sending the names to this office, or we will send them all to the agent.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a ebeap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides his own, with \$3.00, for one year, we will present a copy of this valuable book.

As there is Another firm in Chicago by the name of "Newman & Son," we wish our correspondents would write "American Bee Journal" on the envelope when writing to this office. Several letters of ours bave already gone to the other firm (a commission house), causing vexations delay and trouble.

in these Days, when out-door sports are so generally enlitivated, many will read the article "Wby we Canoe," by W. P. Stephens, In the December number of FRANK LESLIE'S POPULAR MONTHLY, and some at least will be tempted to try an amusement so exhilarating and attractive. "A Winter in Jamaica" is a sketch of West Indla travel, very prettily told, and like the other articles in the number, well and attractively illustrated. Arthur Judley Vinton tells the story of "North American Earthquakes." "The Fisher-girl of Grand Menan," "Two Inspirations," "Shadow or Substance?" and other sturies in this magazine, justify its title of the "Popular Monthly."

#### Home Market for Honey.

Control of the second s

Single copy, 5 ets.; per doz., 40 ets.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," etc. (giving the name and address of the beekeeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

**Dr. Miller's Book**, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

The Convention History of America with a full report of the proceedings of the Detroit and Indianapolis conventions, and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.25.

Colored Posters for putting up over honey exhibits at Fairs are quite attractive, as well as useful. We have prepared some for the BEE JOURNAL, and will send two or more free of cost to any one who will use them, and try to get up a club.

Five Thousand new subscribers to the BEE JOURNAL is what we bave made our calculations for; they will come in clubs between now and next spring. Installments are coming every day.

The Report of the Indianapolis Convention is now published in pamphlet form, uniform with that of last year. It will be sent postpaid for 25 cents to any address.

We have also bound it up with last year's, together with the History of the Society; this we will mail for 40 cents. Or if you send us one *new* subscriber (with one dollar) besides your own renewal, we will present you with a copy by mail.

# The NEW Heddon Hive.

We have made arrangements with the inventor by which we shall make and self the Heddon Reversible Hive, both at wholesale and retail ; nailed and also in the flat.

The engraving gives a good idea of the hive. The brood-chamber is in two sections: also the surplus arrangement, which may be interchanged or inverted at will. The corer, bottom-hoard, and top and bottom of each sectional case has one-half of a regular bec-space, so that the surplus cases with the sections, may be placed between the two brood-chambers, or the latter may be transposed or inverted—in fact, all parts of this hive are perfectly interchangeable. The brood-frames will ALL be bored for wires.

ALL be bored for wires. A SAMPLE IIIVE includes the bottom-board and stand : a slatted boney-board, and cover; two 6-inch brood-chambers, each containing 28 one-pound scetions, one with wile transe and separa-tors, and the other without separators. This latter chamber can be interchanged with the other stories, but cannot be revorsed. It is NAILED AND PAINTED, and ready for immediate use. Frice, \$4.00, complete.

It is absolutely essential to order one nalled hive as a pattern for putting those in the fint together correctly.

HIVES READY TO NAIL.—In filling orders for these hives, in the flat, we make 6 different com-blaations, so that our customers may make a selection from the sample nailed hive, without waiting for us to quote prices, and the different kinds will be known by the following numbers :

No. 1 consists of the stand, bottom-board, cover, two 6-heeh brood-chambers, 16 frames, and the slatted honey-board. Price, \$1.55 each. No. 2 is the same as No. 1, with the addition of one surplus story containing 28 sections without separators-interchangeable, but not reversible,---Price, \$2.00 each.

No. 3 is the same as No. 2, with two surplue sto-ries as therein described. Price, \$2,50 each. No. 4 is the same as No. 1, with the addition of one surplue story containing 28 sections in wide frames with separators, which can be reversed, inverted, and interchanged, the same as the brood-enambers. Price, \$2,30 each.

No. 5 is the same as No. 4, with two sarping arrangements as therein described. Price, \$3.00.

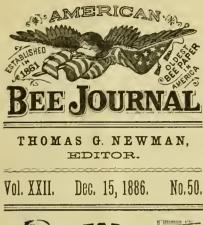

No. 6 contains all the parts as described. Frice, \$3.00. No. 6 contains all the parts as described in the sample sailed bive. Price, \$3.75 each. Those desiring the bives without the stand, honey-board or sections, may make the following deduc-tions from the above prices : Stand, 14 cents; honey-board, S cents; and the 28 or 56 cections, as the case may he, at ½ cent each, respectively.

We will also make the following deductions on quantities ordered all at one time: For 10 or more hives, 5 per cent. discount; for 25 or more hives 7 1-2 per cent.; for 50 or more, 10 per cent.

#### THOMAS G. NEWMAN & SON. 923 & 925 West Madison-St., CHICAGO, ILL.

WANTED, an active, reliable man in every eity and town in the State of Illinois to work up Councils of the American Legion of Honor, an insurance organization now having 60,000 mem-bers, and we are willing to pay liberally in cash for services rendered in this work. It can be per-formed at odd and lelsure hours without interference with regular business, and is an occupation affording much pleasure to those engaged in it. For full explaration how to go to work and what to do, address

THOMAS G. NEWMAN, 925 West Madisoo St., CHICAGO, ILLS.

Fifty-Two Dividends from the investment of one dollar is just what every subscriber of the AMERICAN BEE JOURNAL receives. Can say better interest be found for the investment of one hundred cents? If so, where?

Do not Ship honey to any one without first looking up their commercial standing, unless you know it without lonking it up. There are many who are now mourning the fact that they did not do so.

Mr. L. J. Diehl, Butler, Ind., reports that he has increased his bees from,71 colonies last spring to 273 colonies this fall, and obtained a ton of comb honey from them; he allowed natural swarming.

G. M. Doolittle, Borodino, N. Y., in a kind letter to the editor, expresses these sentiments:

l think the AMERICAN BEE JOURNAL grows better each year, but l realize that your care and management is required to secure a continuance of this—so please to take care of yourself as much as possible, for we can spare none of the good qualities from the *best* bee-paper in the world.

Honey-Producing Plants increase in a locality in proportion to the increase of bees, which cause a fuller fertilization of the flowers—therefore, the one who keeps bees in a locality is a public benefactor, and the bees are not only not a nuisance, but are a blessing to any community.

We are Sorry to learn that Mr. L. C. Root, of Mohawk, N. Y., is obliged to move to a location near sait water, on account of his health; and hence desires to sell his excellent location for honey-production near Mohawk.

Preserve your Papers for reference. If you have no **BINDER** we will mail you one for 75 cents, or you can have one FREE If you will send us 4 new yearly subscriptions for the BEE JOURNAL.

#### Concerning the Canadian lawsult, Mr. Holtermann remarked :

How far we in Canada have supported the Union I know not; probably not as we should.

We replied, on page 739, that there were only two members of the Union in Canada, and that the person sued was not a member of the Union; theo, to show that Canada had not considered itself apart of the "National Bee-Keepers' Union," and therefore not entitled to its protection, we innoceptly remarked that

The "only bee-paper in Canada" has never thought enough of the Union to mention "ita alma and objects;" neither have its proprietors ever offered to become membera.

In stating these facts we had not an unkind thought or feeling either towards Canadians or their paper, but the latter, in its last issue, takes umbrage at it, and remarks thus:

It was nothing more or less than an opportunity for venting the ill-feelings of the editor towards this *Journal*.

Well ! That is sublime ! In the first place we had no "ill-feelings" towards our Canadian cotemporary ; and, secondly, wc had no desire to "vent" what we did not possess, whether an "opportunity" was presented or not !

Our neighbor will do well not to Indulge in any such thoughts or feelings. It does not in any measure stand in the way of the AMERICAN BEE JOURNAL; our list of subscribers in Canada is larger to-day than ever before, and while we heartily wish the Canadian paper all the prosperity it desires, we must protest against its being jealous of the prosperity of the oldest bee-paper in America. As well might a child be envious at the popularity of its father, or jealous of the good fortune of its mother!

The Triple Convention at Albany, N. Y., will be held on Jan. 11-13, instead of a week later, as at first stated. This will be a union convention of the New York State, the Eastern New York, and the New Jersey and Eastern associations. Every one who can do so, should attend this very important meeting.

More Premiums.—Mr. L. J. Diehl, of Butler, Ind., offers a colony of Italian bees as a present to the person sending to this office the largest club of subscribers for 1887. The subscriptions may be sent in at any time before the first of May at our regular club rates, and additions made as desired, but it must be stated that you are working for that premium, so that we can keep account of the subscriptions.

As a premium to the second largest club we will send my mail, postpaid, a copy of the "Farm Account Book," worth \$3. The postage is 20 cents.

New Subscribers are coming in rapidly -for this our thanks are tendered to the frienda of the AMERICAN BEE JOURNAL, who are exerting their influence in its behalf. We should thribble our list at the present low rate of one dollar a year. We hope every one of our present subscribers will send at least one additional subscriber with the renewal for 1887.

The Ontario Bee-Keepers' Association will hold its annual convention at Toronto, on Jan. 5 and 6, when the commissionerwill report their trip to Europe. Speaking of the important matters to come before the meeting, the Canadian Bee Journal advises the formation of a "Union" for Canada. It says:

Another thing which late occurrences have made necessary, will be the discussion of the advisability of taking active steps towards the establisment of a "Bee-Keepers' Union," or of making the protection of bee-keeping interests a branch of the association. It is to be hoped that the meeting may be held, and some decisive steps taken to put the case of Mr. Harrison in its proper light before the judges, in time to prevent a decision adverse to the best interests of beekeepers. Let there be a rousing meeting of the whole bee-keeping fraternity, and general good will be the result.

In the same paper, Mr. Allen Pringle says that Canadians must act with "prudence, promptness and energy," and combine to defend the suit. He then adds:

And it is always more prudent for the beekeeper to mollify and placate an unreasonable or Irascible neighbor than to quarrel with him or go to law with him. A "soft answer" and a case of honey will go a great way in turning away the wrath and straighteoing out the crookedness of a captious and unreasonable neighbor. Of course I do not know whether Mr. Harrison'a attitude towards his neighbor was prudent or otherwise, but I should judge from his letter that he is a reasonable and fair-minded man. However that may be, his case, though personal to himself, has now become of public and general importance to Canadian beekeepers, and it behooves us to face the Issue without any sign of finching.

History of the United States, published by the New York World.—A copy of this book is on our desk. It contains 320 pages, and is indispensable to every person, as a work of convenient reference. It is illustrated, and the history is brought down to date. This book is offered as a premium with the BEE JOURNAL, and is indeed an elegant—

Premium Worth Having.—The New York World and the AMERICAN BEE JOUR-NAL (both weekly) will be sent for one year to any address in North America for \$1.90. And in addition PRESENT to every such CLUB SUBSCRIBER a "History of the United States," containing 320 pages and 22 fine engravings, bound in leather and gilt.

This "History" will be sent FREE by express at the subscriber's expense; or will be mailed for 10 cents extra to any place in the United States or Canada.

It is arranged chronologically by years, from 1492 to 1885. Every event is narrated in the order of its date. These are not confined, as in other works, to political matters, but embrace every branch of human action.

This premium is worth the whole of the money sent for both periodicals, and should induce thousands to subscribe, and thus get two unrivalled weeklies for nothing.

This offer is good only until Jan. 1. 1887, hence no time should be lost. Send at once !

We anticipate a largely increased list of subscribers for 1887, as \$1.00 cannot be invested by any bec-keeper that will bring him better returns.

Replies by Prominent Apiarists.

flt is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are In a "hurry" for replies, do not ask for them to be inserted here.-ED.]

Oneen-Traps to Prevent Swarming.

Query, No. 347 .- Having plenty of bees. and not desiring any increase, but to obtain the most honey, what would be the result if queen-traps were used to prevent swarming, during the swarming season ?-" Butler."

Queen-traps will not prevent swarming, and as a rule would result in loss in the hands of the inexperienced. It would be better to let them swarm and double them up the next spring to hold the numbers back.-G. M. DOOLITTLE.

I do not think that it would be profitable to prevent increase in this manner. The bees are apt to become "sulky" when their desires are interfered with in this manner. It is better to control or prevent the de-sire.-W. Z. HUTCHINSON.

Some colonies might be deterred from swarming, but you would find many queens superseded, and swarms would issue with unfertilized queens in spite of your traps.-J. P. H. BROWN.

I should like to know, and have been studying somewhat upon it. I think that the Alley queen-trap might, by a little modification, be made a success, but I have as yet made no experiments.—C. C. MILLER.

They will not prevent the swarming-fever which so demoralizes bees that they work but little. Unless I could keep the swarming-impulse back, I should prefer a swarm, or else such management as would quell the fever.-A. J. COOK.

Queen-traps will not prevent swarming. They will prevent the old queens from going with the first or prime swarms, but after awhile the young queens will begin to hatch, and some of the slender "misses" will slip out through the perforations, and you will have plenty of the meanest kind of swarming. The old queens are sure to perish before the excite-ment is over.—G. W. DEMAREE.

This can be proved only by testing. The remark that "bees do nothing invariably," applies as closely to this

Sometimes the old queen is killed after a few efforts at swarming, and again the young queens will be killed. In the former case there would be more ineffectual swarming, the colony finally having a drone-laying queen. I do not think that the most honey could be obtained by such manage-ment.-G. L. TINKER.

That would depend upon what sort it. It would require pages to tell all that would result from the use of a trap that confines the queen and drones to the hive or trap.-JAMES HEDDON.

# Getting Bees from a Bee-Tree.

Query, No. 348.-In case a bee-tree may not be cut, can I in any way secure the bees? I think that I could winter them without any honey from the tree.-S. B. L., Nebr.

It is often possible to cut out the part containing the bees. - A. J. COOK.

Climb the tree, cut out the combs. take out the bees, and transfer them to a hive.—W. Z. HUTCHINSON.

Possibly they might be smoked out if smoke could be blown into one hole. leaving another for the bees to come out.-C. C. MILLER.

If they are within easy reach you can drive them out, or smoke them out. Otherwise we would advise you to leave them alone.-DADANT & SON.

Oh, yes, in many ways, but they are not worth the trouble and expense. You can buy bees cheaper.-JAMES HEDDON.

By making a hole at the top of the brood nest and another at the bottom, you can smoke them out if the day is warm. Put the nozzle of the smoker in the lower hole.-J. P. H. BROWN.

They might be driven up and out by smoking them, but I doubt if it would be a paying job. Try and see what you can do, and report.-J. E. POND, JR.

Yes. Such colonies will generally cluster about the portion of the tree from which their honey is taken, when they can be hived.-G. M. Doo-LITTLE.

If you can cut a hole in the tree at the brood-nest you can take out the bees and honey, but if you are not allowed to cut into the tree, you had better let the bees alone.—H. D. CUT-TING.

The only way would be to climb the tree and cut out the bees. But I should think a whole neck would be worth more to you than the bees. In other words, the bees would not be worth the adventure.—G. W. DEM-AREE.

I have known men to climb trees and by means of ropes and an ax get out the bees and hive them; but they labored hard enough to earn 2 or 3 colonies in frame hives, besides runquestion as to any one thing in bee-management. The use of queen-traps for this purpose has not been a success with myself.—J. E. POND, JR. get bees.—G. L. TINKER.

# Colonies with Mixed Bees.

Query, No. 349.-I received 2 Italian queens and introduced them into two hives on Aug. 4, and I new find Italian bees in two other hives besides the two that I gave the queens. How do you account for that ?-J. G. C.

Perhaps they are stragglers.-W. Z. HUTCHINSON.

Bees often get mixed up by getting into the wrong hive.—H. D. CUTTING.

Bees frequently go into other hives than their own. This is no new thing. -A. J. COOK.

Bees frequently get into wrong hives, particularly when returning from the fields late in the evening.— J. P. H. BROWN.

Young bees often get into the wrong hive. That explains your case. --DADANT & SON.

It doubtless occurred by the young bees from the Italian colonies enter-ing the wrong hive.—G. M. DOOLIT-TLE.

One way in which it might occur, is that young queens were reared which met Italian drones at some distance, and then part of the young bees would look like pure Italians.-C. C. MILLER.

Where the hives stand close to-gether it is not uncommon for the young bees of one hive to enter other hives of one nive to enter another, and so become mixed. Otherwise the two other hives have hybrid queens, if all were black bees at the beginning.—G. L. TINKER.

You do not explain matters sufficiently to more than make an answer a mere guess. If you mean that you can detect a few Italian bees in two other hives near by the Italianized colonies, it would be plain to me that they got there by mistake. Young bees enter the wrong hives when they have been on the wing, much more frequently than most people are aware of.—G. W. DEMAREE.

There is nothing strange at all in There is nothing strange at all in this state of things. Bees are con-stantly interchanging to a greater or less extent, so much so that if I had one-half black and one-half yellow bees originally, I should expect in two or three months to find each hive con-taining some of both the yellow and the black ones.—J. E. POND, JR.

They came from your Italian colonies, and by mistake returned to the colonies where you now see them, and where they were kindly received (being so young and innocent), and where they will remain .- JAMES HED-DON.

Do you Wanta Farm Account Book? We have a few left, and make you a very tempting offer. It contains 166 pages, is printed on writing paper, ruled and bound, and the price is \$3. We will club it and the Weekly BEE JOURNAL for a year and give you both for \$2. If you want it sent by mail, add 20 cents for postage.

Explanatory.—The figures BEFORE the cames indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark  $\bigcirc$  indicates that the apiarlst is located near the center of the State named;  $\eth$  north of the center;  $\blacklozenge$  south;  $\circlearrowright$  east;  $\circlearrowright$  west; and this  $\circlearrowright$  northeast;  $\circlearrowright$  northwest:  $\circlearrowright$  southeast; and  $\Uparrow$  southwest of the center of the State mentioned.

### For the American Bee Journal.

# The Michigan State Convention.

The Michigan State Bee-Keepers' Association held its 20th annual convention on Dec. 1 and 2, 1886, at Ypsilanti, Mich. The meeting was called to order at 11 a.m. on Dec. 1, with President A. J. Cook in the chair. As the minutes of the last meeting had been widely published, their reading was dispensed with.

The first topic discussed was,

RESTORING FLAVOR OF STALE HONEY.

T. F. Bingham-At the Indianapolis convention this subject was discussed, and some asserted that when honey had been exposed to the air and lost its flavor, it could be brought back to its former excellent state by the ap-plication of heat. In proof of this assertion reference was made to the fact that when canned or preserved fruit began to show signs of fermentation or of "spoiling," the good house-wife "heated up" the fruit and then pronounced it "good." I went home to a very nice house-wife and asked for her opinion, and received a very lively answer. It was: "P-o-o-s-h! It is nothing of the kind; such boiling only causes the stale part of the fruit to permeate the whole mass. The only thing to be done is to throw it away." Honey is a luxury or it is nothing. It cannot compete with cane-sogar as a sweetcompete with cane-sugar as a sweet-ener. It is the fine flavor and aroma that give honey and maple sugar their value. Honey that is extracted when "green" and ripened by ex-posure to the air, or honey that has been long exposed to the air, never has the fine flavor of that ripened by the bees, and kept sealed up.

A. 1. Root—We once had some maple sngar that had been exposed to the air, and was not quite so nice in consequence. It was "heated up," and although not quite so nice it was greatly improved.

A lady said that when we find fruit slightly spoiled through some imperfection of the can, we skim off the top and seal the rest, when it becomes quite palatable.

A. I. Root—Dr. Miller says that honey that has candied and then been allowed to drain, is very fine when melted. T. F. Bingham—If the thin honey is skimmed from the top the rest will be greatly improved. The thin honey may be made into vinegar.

#### HONEY FROM CAPPINGS.

R. L. Taylor—We prefer the honey that drains from the cappings. The reason may be that it is in such small quantities that it becomes more thoroughly evaporated.

T. F. Bingham—Is it the consistency or the aroma, Mr. Taylor, that makes it so interesting in your family? R. L. Taylor—Both. The flavor is

R. L. Taylor—Both. The flavor is not, perhaps, a natural one, but rather one acquired from a contact with the cappings. It is a pure wax flavor, but one we prefer.

Geo. E. Hilton-There is another point. Honey from cappings is *always* thoroughly ripened; while in a large crop part of it may have been unsealed.

A. I. Root—I agree. I once extracted honey late in order to feed sugar, and the honey thus secured was equal to that drained from cappings.

R. L. Taylor—Without raising the point as to whether honey can be ripened artificially so as to equal that ripened by the bees, I will say that honey ripened and/sealed by the bees is superior to that extracted before being sealed.

The discussion here drifted into the subject of

#### RIPENING HONEY.

A. J. Cook—I believe that honey can be ripened artificially so that it will equal that ripened by the bees. I have placed both kinds before good judges, and they were unable to decide. My brother has a granary that is very warm, and he extracts his honey when thin,puts in some shallow sap-pans that have been discarded, and places them in the granary, covering them with muslin to exclude dust and insects. Mr. Rey, of East Saginaw, got some of the honey, and I should like to have him say how it compares with other honey he buys.

John Rey—It is always thick, and of good flavor and color, and is as nice as any honey I get. There is never any scum rises upon it, such as there is on unripe honey.

T. F. Bingham—There, Professor, I think I have the inside track yet, even by one of your own witnesses. Mr. Rey says there is a scum rises npon unripe honey. This scum is the result of fermentation. How can fermentation take place without injuring the honey?

Prof. Cook—I am not in favor of unripe honey. It must be thoroughly ripened. The flavor in honey is given by the flower from which it is gathered, and all that is needed is evaporation, and this is caused by heat, and why there should be any material difference whether this is applied in the hive or outside of it, I am unable to discern. Honey must be ripened, but extract it when you please.

T. F. Bingham—Would you leave your maple syrup exposed to the air, Professor? Prof. Cook—No. I would evaporate it just as soon as possible, and then seal it up. R. L. Taylor—Even if honey can be

R. L. Taylor—Even if honey can be ripened artificially so that it will be equally as good as that ripened by the bees, shall we advise such a course? One bee-keeper in a hundred might do it properly, but what of the other ninety-nine?

Prof. Cook—Then we must educate them, and if they will not be educated then they must suffer the consequences.

Mr. Macpherson—We should consider the cost; perhaps honey can be ripened artificially enough more cheaply so that it will be the better way even though the honey is not onite so good.

quite so good. T. F. Bingham—Because I have money to-day is no sure sign that I will have any to-morrow. We must look to the future. Where will our market be in ten years nnless we furnish only a first-class article? What kind of a market will our children have if we continue to put upon it the poor "stuff" that is honey only in name? Honey is a luxury. and will always remain as such even if sold for one-half the price of canesugar. What is it that makes honey and maple sugar luxuries? Is it their fine flavor, their rich aroma. their delicate "bouquet," if you please? Allow these to escape, and what is there left? A very poor quality of sweet of a low power. Honey sealed over and kept at a high, even temperature and covered by bees, improves by age and becomes smooth, rich and oily, the same as bottled wine improves by age. If we expect to hold our market for extracted honey, we must not extract it until it is fully ripened, and it must be kept sealed up from the air. Ten years

The convention then adjourned until 1:30 p.m.

#### AFTERNOON SESSION.

The convention was called to order at 1:30 p.m., by Prof. Cook, who then delivered the

#### PRESIDENT'S ANNUAL ADDRESS.

In casting about for a subject most appropriate for this annual address of the President of our Association, it has occurred to me that a *resume* of the year's progress, and a statement as to the present outlook for our apicultural pursuit, might be both interesting and profitable, even if not the most profitable theme that could engage our attention.

Let me state as a preface, that it might seem a bold undertaking to give any formal address at all, in the face of the criticisms that have recently deluged us regarding all such exercises in our apiarian conventions. It would be bold except as I promise at the outset that my address shall be brief. Let me suggest, however, in this connection, that very likely these criticisms may justly be criticised. It would seem that a sharp, terse, concise presentation of any subject by one well fitted to discuss it wisely, would be a most litting way to introduce any subject before such an association as this. A written essay, properly prepared, is methodical. well digested, thorough, none of which adjectives will apply to many of the crude addresses which one hears at most of our meetings. Indeed, a short, incise essay serves as a director, and aids to keep debate in line so that we can all gather the best fruits from the discussions. Surely, then, the only valid argument that can be offered against essays is that they may be long, illy arranged, and not well considered before presentation; and so detract from the interest of our meetings.

I do not believe such statements as the above can justly be made of the essays presented before our Association in the past. Should our experi-ence meet with a change, let us not rashly put aside what the usage of all such bodies in the past has proved to be the most valuable auxiliaries in their discussions and deliberations, but the rather appoint a competent committee to decide upon the merit of all essays presented, whose duty it shall be to carefully examine all such essays, and decide as to their merit, and whether they shall be presented before us for our instruction and consideration. Does any one think that our Association would have been so influential and helpful in the past, if we had dispensed with the many interesting and valuable essays that delighted us in all the years of our existence? Such an elimination would have left us Hamlet with the Prince of Denmark omitted. What we dewhich costs us no little time and money, is to get the best thought, methods, practice of the wisest of our craft. How few of us have that thor-ough discipline which enables us to give the best that we have in extem-pore addresses. Thus, I say, let us continue our essays and prepared addresses, lest we take a step backward, and thus show ourselves unworthy the age and the time.

The past year has been one remark-able in bee-literature. The first vol-ume of Mr. Frank Cheshire's great work truly marks an epoch in the literature of apiculture. It is a mas-terly work, and shows a wealth of study and research which will make it one of the classics among our scientific treatises. Every live bee-keeper should make it a study, for study he must would he gather all it has to offer.

Quite as startling and phenomenal is the work of our own brother api-arist, James Heddon. His work, "Success in Bee-Culture," however, is quite the opposite of that of Mr. Cheshire. It is wholly, from first to last, practical. Rarely does any work bring such a profusion of rich prace. last, practical. Rarely does any work bring such a profusion of rich, prac-tical hints as does this. On every page is some suggestion which com-mends itself to the wise apiarist. More than this, each word of advice comes with the certificate of "tried and succeeded." What wonder then that we have tried and adopted nearly every plan or practice therein recomevery plan or practice therein recom-mended ? I would say to any bee-questions which should receive our

keeper who has not read "Success iu Bee-Culture," to secure a copy at once, and study it thoroughly the com-ing winter. Nothing will tend more to win success.

Another work, "A Year Among the Bees," may be described as fresh, terse, clear, full of genial kindness, and replete with practical sugges-tions. This work details the opera-tions is the beam and inter the the tions. This work details the opera-tions in the bee-yard just as they oc-cur through the year, and so is unique among the books of our art. Here, too, we of Michigan feel proud that it is a Michigan man that has given us so excellent a work. I know that Dr. C. C. Miller lives in Illinois, but to say that such a man belongs to any one State is to say that we do not know him at all. We all claim Dr. Miller as our man.

An event of no small importance to bee-keepers, was the sending of a Commission by Ontario or Canada to represent the Dominion in London, at the Colonial Exhibition. Such an exhibit, and the wide distribution of American honey.— for though this Commission has talked Canada! Canada!! still they are a part of Amer-ica—will do much to build up a foreign demand and market not only for Canada, but for the United States as well. We owe Mr. D. A. Jones and the whole party a vote of thauks.

We also have a racy little work from England: "Simmins' Non-Swarming System." If unfinished combs next to the entrance of a hive are a sure security against swarming, it is surely an interesting fact which can be turned to good use. Mr. Simmins' idea of crowding bees into the sections, reminds me of much that has been said by two of our own dis-tinguished bee-keepers-Messrs. Heddon and Hutchinson. Simmins' method of direct introduction of queens is not new in America. This work I am sure will interest and benefit the American bee-keepers who may read it. Very few inventions have caused

more remarks of late than Mr. Hed-don's new hive. Of late prices are so low-though prices run no lower in apiculture than in agriculture and other kindred pursuits — that any scheme, method, or invention that will lessen labor will surely attract attention and win patrons. This is attention and win patrons. This is what the New Heddon hive and system promised to do; and many of us who have put it to the practical test have found that it did not promise in vain. We are proud that it is one of our own bee-keepers that has con-terred this boon upon the bee-keep-ing public. There is no doubt but that the reversing system has come to stay. Many even now have adopted it never to return to the former methods.

Another invention-the solar waxextractor—has grown rapidly into public favor the past year. It is a decided improvement, even upon the Swiss extractor. It is convenient, safe, inexpensive, and is *sure* to give the very nicest wax, and that with no trouble or expense.

most careful consideration at this time. They are as follows :

First, the price of honey, and how can it be marketed? I said to one of our large honey-producers a few days ago-one who before last year always secured 15 cents per pound for all his extracted honey, and sold last year for 8 cents, and this year for 7—are "No, indeed," says he, "it pays as well as any other farm product." Even if this is so, we may well take course! from our wiset, not due counsel from our wisest producers, and consider whether there are any measures practicable which may be adopted to stay the rapid decline in prices, and so stimulate the markets that they may come seeking our products. I hope that we may thoroughly discuss this subject of "honey mar-ket," that each may go home more hopeful, more able to solve the pending difficulty.

Second, how can we produce the finest comb honey the most cheaply? While extracted honey goes begging in some of our markets, comb honey finds a ready sale at remunerative rates. It is, then, a matter of great moment to learn how to get the most of this beautiful comb honey in the easiest way. It seems to me with the Heddon hive we have reached the paradise of the comb honey pro-ducer. Surely this is a matter that we may well discuss in the hope of gaining still greater light.

Third, the question of honey-plants is one that we may do well to discuss. How often we find our harvest cut off just at its dawn. The flowers, white clover or basswood forsooth, seem to be pouring out the nectar in profu-sion when, presto, all is changed, the bees hang idly about the hive, storing ceases, and the apiarist's profits are reduced to the minimum. Now, is it not possible to secure plants that will ensure a continuous flow despite rain or drouth ? I am sure I have seen just such results twice, once through raspberry, and again through Alsike clover bloom. In both cases white clover was abundant, but, for some subtile influence known only to Na-ture's Great Chemist, refused her sweets, while these other plants yielded abundantly.

It seems to me that here is a most fruitful field for experimentation. Happy the man who discovers and makes known how, by judicious planting, we may ensure a fine honey

product each season! Fourth: The last subject I wish to suggest is that of improved breeds of bees. We all know that the common black bee has its merits. The same is true of each of the other races-Carniolan, Syrian, Cyprian and Italian. To say that these races can-not be so combined as to produce a bee that shall combine all the merits of all our present races, with the de-merits eliminated. is to show a total ignorance of all the laws of breeding. The same skill and care that gave us our noble short-horns and Herefords, will give us the ideal bee. To secure this result we must look after both the drones and queens, and must be quick to note changes for the better

or worse, that we may lay hold of the one and stamp out the other. I well know that they are great obstacles in the way of success, but that they are insurmountable I do not believe; and here, as everywhere, success is guaged by the effort it costs.

But 1 promised to be brief; and though there is much else that I would like to discuss, I forbear, and leave these and other matters for your consideration.

Following the President's address was the following essay by Mr. T. F. Bingham, entitled,

#### WHO SHALL KEEP BEES?

Just as if, in this free country, any one should not keep bees if he wishes to! But it is not in this sense that the question was designed to be dis-cussed; but who could, to the best advantage, keep bees? No one could question the right of him who pleases to keep bees, so to do; subject, of course, to the rights of others just as in the case of poultry or other stock. No one can presume to injure the peace and health of any community in the pursuit of his own private interests, no matter what they might

be. With the thousands of domestic fowls in this country, and the almost limitless number of eggs produced by them, the United States imports from France, and other densely populated countries, millions of dozens of eggs annually, yet the question as to who shall keep hens does not occur as a question of right-it is simply a question of pleasure or inclination; and whoever wishes may try to make a success and an income in the keeping of fowls and in the production of eggs. In this generation (and I shall not pretend to say that it is in any sense better or worse than those which have preceded it) the question of who should do this or that, or em-bark in this or that pursuit, hinges entirely upon circumstances, the first of which is the wish to do something. Bees to do well must have a good and convenient pasture. Bees to be easily cared for must occupy a convenient hive. Bees to be judicially managed must be managed by an interested bee-keeper, who will use ordinary studiousness to become a thorough bee-master. In bee-keeping there are no mysteries, more than in raising fowls or potatoes. The same reason-able methods which would lead to success in one would result in success in the others. Bee-keepers, like others, are so covetous of the honors of their pursuit that they do not long keep their "light under a bushel; hence, there are no valuable secrets. Bee-culture is an open book ; he who will may read.

In reviewing the rise and fall in prices of various commodities, honey does not prove to be an exception to general rules. Whether the present price is the result of overproduction or of a general decline in values of other commodities, no real evidence

producer of a few hundred pounds a much better dividend than would the raising of a like value of pigs and fowls. At present all farm crops, as also all manufactured goods, repre-sent little more than the labor and material expenses required to produce them; yet, at this stage, when wheat rules at a point said by the farmers of Michigan to be helow the cost of production, the farmers of Michigan have planted more wheat this fall than in any previous season within the last five years. The only fact to be adduced from this is the simple one that the farmers have more labor than money, and are willing, there-fore, to give more of their labor for the money that wheat will bring than in previous years.

Bee-keepers may also, in common with others, find it advisable to produce more honey even at a less price than previously. Ample and conven-ient pastures and comparative isola-tion point to the farm as the home of the honey-bee, and to the farmer as the future successful bee-keeper. When the farmers finally realize—as realize they surely will—the value of an apiary in connection with their pigs and poultry and cows, the greatest production of honey, the best loca-tion for the apiary, and the most successful bee-keepers will have been found.

President Cook-We ought to have Mr. Heddon here to take issue with Mr. Bingham about farmers keeping bees. Perhaps Mr. Hutchinson will answer for him.

W. Z. Hutchinson-Actions speak louder than words; I expect to drop farming entirely for bee-keeping. R. L. Taylor-I think that some

men might succeed in raising pota-toes that would never succeed in pro-

ducing honey. Dr. Iligbie-Only the man who makes a specialty of one thing can hope for the highest success.

The next topic discussed was that of HANDLING BEES.

#### Prof. Cook-There are a few principles that should be understood. In simply walking among the hives, unless the bees are disturbed, there is little danger of stings. Quick motions sometimes incite the bees to an attack. Frightening bees takes away their disposition to sting. We have been told repeatedly that smoke causes bees to fill themselves with honey and then they are good na-tured. This may be true, but it is also true that simply fright will have the same effect. We raise the cover to a hive and puff in some smoke, then take off the cover and lay it upon the ground. The bees upon the cover are peaceable. They have had no opportunity to fill up.

T. F. Bingham—A wire-cloth hat arouses the ire of bees. They fly against it and think somebody has hit them. Confidence on the part of the operator is one of the greatest things other commodities, no real evidence exists. One fact, however, is present, namely, that the producing of honey at present on a small scale pays the then look out! Bees may sting a

passer-by when they are first taken from the cellar, but they soon become accustomed to the presence of the hee-keeper. When a swarm is hang-ing upon a limb, smoking the bees will cause them to cluster compactly, the same as sprinkling them with water. It will also take away their disposition to sting. If the apiary is surrounded with trees set thickly in rows, the bees will pass over the trees in their flight and not molest any one near the trees; by taking this precau-tion hees may be kept near a highway with but little danger of stings to those passing by. 1 prefer Lombard poplars, as they are tall, of quick growth, and the bees do not alight upon them.

A. I. Root-I wish to particularly emphasize the importance of not allowing the bees to gain access to honey outside the hives during a time of scarcity; as it will surely lead to

Brof. Cook-Those who have to handle bees when robbers are troublesome, will find great relief in using a bee-tent.

#### VARIETIES OF BEES.

A. D. D. Wood-I have tried the Syrians, but they are too fierce. Smoke does no good. I had to use chloroform. They fill the cells so full, and cap the honey is think to the solution of the full and the honey is the honey is dark appearance. I have discarded them for Italians.

W. Z. Hutchinson-I have tried the Carniolans in a small way, but I do not find them superior to the blacks; in fact, if obliged to choose a pure variety I should choose the blacks.

Dr. Ashley-I had one colony of Carniolaus, and itswarmed only once. They are gentle, but can be roused, and when roused they are roused. Their combs are more yellow or cream-colored than that made by other bees.

R. L. Taylor-Italians always sting more while being hived than at any other time. I would not depend so much upon color in distinguishing varieties of bees as upon other characteristics. Italians remain very quietly upon the combs, are difficult to shake off, and do not "rush things" so early in the spring as do some other varieties.

A. D. D. Wood-I had several varieties of bees in the cellar one winter. When taken out in the spins, the Italians had scarcely any brood; When taken out in the spring next came the blacks, while the "Eastern bees" had large quantities. I have had bees that were very beautiful and very gentle, but almost worthless as honey-gatherers.

Prof. Cook-I have seen such bees. You can almost knock the hive over, and they will forgive right on the spot; but are of no use as honeygatherers. No one variety has all the good qualities. We must try and unite the different varieties, and then eliminate the bad qualities. I think we owe Mr. Heddon a vote of thanks

colony. They began breeding first, and became the strongest colony, but furnished no surplus honey.

#### BEES FOR BUSINESS.

Mr. Fellows—Which would be the better way, if one wished to Italianize his apiary, to rear queens or buy them?

Prof. Cook—I was talking this matter over with Mr. Poppleton a few years ago, and his decision was that so long as we had so good queenbreeders it was better to buy queens.

A. I. Root—It is a question with me whether it is advisable to Italianize, or Syrianize or Carniolanize an apiary. I have been thinking for some time that it would not be profitable for a honey-producer to breed for a pure race. Many desire hybrids, and are satisfied with nothing else.

R. L. Taylor—I am very much pleased to hear Mr. Root speak as he does. The time has come when we must breed "bees for business," regardless of race, color, or markings.

Prof. Cook—No race has all the best qualities. We must select the best, cross them, and then weed out the undesirable qualities.

T. F. Bingham-When I stated at the Cleveland convention in 1872, that the black bee had some superior qualities, it raised a perfect "sizzle." But time tries all things, and merit will eventually win, and at last the merit of the black bee is recognized.

#### COMB FOUNDATION.

A. I. Root—I should like to know whether any one present has had any experience in using two pieces of toundation in each section ? Mr. Macpherson — Mr. Corneil has

Mr. Macpherson — Mr. Corneil has used them. The pieces are triangular in shape. John Rey—I use one piece, but

John Rey—I use one piece, but fasten it at both top and bottom.

A. D. D. Wood—l have tried this. It is a failure with two-pound sections; as the foundation sags too much. Separators must be used with one-pound sections, or there will be trouble. The foundation must be warm when it is put in, then it will not stretch so much.

Mr. Matthews—How shall we avoid having imperfect sections?

R. L. Taylor—Do not put on the sections until honey is coming in rapidly, and crowd the bees. This course is not advisable, however, as it is better to have some imperfect sections than to curtail the quantity of honey.

Prof. Cook—How far is it advisable to use toundation ?

R. L. Taylor—I think it is profitable to use it in sections, also in the brood-nest, unless it is at the time of hiving swarms. I think newly-hived swarms had better build their own combs in the brood-apartment, unless it may be that it is so late in the season that the bees would not fill the brood-nest without help.

\* Mr. Fellows—I tried taking away a few combs when the fall honey-flow commenced, and put empty frames in their places, but the bees built dronecomb and filled it with honey.

R. L. Taylor—That was not following the Hutchinson plan, Mr. II. insists upon a small brood-nest, and that the empty frames be used only when hiving swarms. You gave empty frames in the fall to an established colony; at this time the bees are reducing the size of their brood-nest, and if any comb is built it is filled with honey, consequently drone-comb is built.

A. I. Root—Will the use of drone foundation in the sections prevent the building of drone-comb below? If so, is there any objection to its use?

Mr. Fellows—I have used it in the sections, and the honey was fine, but it was black bees that did the work.

W. Z. Hutchinson—The hiving of one or two swarms upon empty frames does but little towards settling the question. A large number of swarms should be hived; hiving them alternately upon empty frames and upon foundation; weighing everything carefully, and continuing this year after year. This I have done, and I know that it does not pay me, with my management, to use foundation in the brood-apartment when hiving swarms.

Prof. Cook—I have tried Mr. Hutchinson's plan in a small way, and I must say that I am delighted with it.

W. Z. Hutchinson—What is the best way to avoid the trouble arising from the drone-comb built as the result of having old queens?

R. L. Taylor—Allow the comb to remain until another spring, then remove and extract the honey, melt up the comb, and put a sheet of foundation in its place. W. Z IIutchinson—That is the best

W. Z IIutchinson—That is the best I can do; but it is an expensive method. It can be avoided by superseding queens, but I should look upon the remedy as worse than the trouble.

R. L. Taylor-Queens do the best work the first two seasons, and if they are to be superseded, I suppose it is best to do it during the swarming time.

Geo. E. Hilton—I have taken away the old queen at swarming time, and allowed a young queen to run in the hive in her place.

The convention adjourned until 7:30 p.m.

#### EVENING SESSION.

President Cook called the meeting to order at at 8 p.m., and Mr. R. L. Taylor read the following essay, entitled,

#### WHAT I KNOW OF FOUL BROOD.

Some one has said that foul brood is a subject of discussion in every bee keepers' convention, and perhaps it would not be well that this convention should be an exception. I chose this subject, too, because I am greatly interested in it myself just now, and with the hope, first, that L may get from others some information that will be of assistance to me; and, secondly, that I may be able to give some hints that will be of value to others—not, indeed, to those who already have experience with the disease, but to those who, not having

had any particular knowledge of it, shall, in the near future, receive a visit from this insidious enemy. There are, undoubtedly, some such here. This so-called fonl brood made its appearance among my bees, so far as I know, during the present season. I first discovered its foot prints by here and there a dead larva in 2 colonies last May, but from obtuseness or incredulousness, or from the imperfections of published descriptions of it, or from a different type of the disease, I did not recognize it. Mr. Muth says: "Foul brood can

Mr. Muth says: "Foul brood can be rooted out completely and without an extra amount of trouble, provided yon are sufficiently impressed with its dangerous and insidious character, and are prepared to meet it promptly on its first appearance." But to be that, one must know it at first sight.

What are the characteristics by which it may be certainly recognized? We are told that the dead larvæ are brown or coffee-colored, but brown is brown of collectored, but brown is of several different shades; and what is coffee-colored? Is it that of the raw coffee bean, or of the parched bean, or of the pure decoction with milk in it? At the best, I think these descriptions are too indefinite. I should describe the color of the dead larvæ as being, at first, just like that of coffee, as you find it on your breakfast table, with a moderate quantity of milk in it ready for consumption. The larvæ gradually become darker and about of the consistency of a piece of dry, dark brood-comb. At this stage they lie somewhat spread out upon the lower side of the cells, are drawn back a little from the mouth of the cells, and have the ap-pearance, at first glance, of being turned up a little, somewhat like the toe of a boot. At this stage, in a good colony, with dark combs for breeding, as seen in the autumn, an inexperienced person would scarcely discover

the dead larvæ at all. Secondly: The consistency of the dead larvæ is homogeneous, there being no watery matter that may be drawn off, leaving more solid parts, at first, and for a considerable time the substance of the larvæ is ropy, tenacious, and elastic, so that if one end of a splinter is inserted in the matter and withdrawn, the matter will draw out in a thread like thick honey, but it is so much more elastic than honey that when the thread breaks, which it will do when drawn to the length of half an inch, there is no danger of any of it dropping, but the one part will spring back into the cell. and the other part to the splinter. You will, of course, understand that the dead larvæ retain their shape more or less perfectly for a considerable length of time on account of their outer membrane remaining apparently intact.

Thirdly: Much has been said about the disagreeable character of the odor arising from a colony affected with the disease; it is true that it is sufficiently so, but not to a greater extent than many other odors. It is much like that of a poor quality of glue in a warming-pot in preparation for use. The disease would ordinarily run sev-

eral weeks in a colony before one would be likely to discover it from the odor on opening the hive. Though I have had 2 colonies so diseased as to be reduced to the strength of weak nuclei, yet no odor could be discovered without opening the hive or putting the nose close to the entrance; so I do not depend upon the sense of smelling in discovering the disease.

Fourthly: Generally more or less of the cells containing dead brood have cappings, each of which has an opening near its centre, and these openings vary in size from one that might have been made with a common pin up to one-half as large as the capping itself, or even larger; as if the bees, discovering the death of the larvæ while capping the celts, at once interrupt their useless work. Sometimes many dead larvæ will be found in the cells on which the work of capping has not even been begun, and, on the other hand, sometimes a combful of dead larvæ will hardly exhibit a cell with an incomplete capping. Cells containing dead brood and having cappings which are entire, may generally be detected by the sunken

appearance of the cappings. As I have said, last May I discover-ed the effects of the disease in 2 colonies. I could not believe that it was the work of foul brood, but deter-mined to keep watch, and did so nutil-I saw them increase in strength rapidly, one of them casting a swarm, and, the busy season coming on, paid no more attention to them until early in July, when the white clover season closed. I had 3,000 sections partly filled with honey, and in order to have them finished, I selected 27 colonies to do the work, and got honey to feed them for this purpose, by ex-tracting two or three of the heaviest combs from each colony in my apiary. Everthing progressed finely for several days, until one of my employes called my attention to a colony that seemed not prosperous. On examination I decided the case to be foul brood, and found that several other colonies had the disease also, and that from 10 to 20 combs from diseased colonies had been extracted, the combs distributed through the apiary, and the honey fed to the 27 colonies before mentioned.

As the readiest method I proceeded to attempt a cure by the starvation plan, and treated 50 colonies or more very successfully so far as yet ap-pears. I do not by any means cherish the hope that there will be no more cases. I shall undoubtedly have to continue the struggle awhile yet, but I have no doubt of final success.

In closing, let me remark as fol-lows: 1. That the rapidity with which the disease will destroy a colony depends as much upon the number of combs in the hive as upon the on 8 combs, attacked by the disease in the spring, will very likely be re-duced at the close of the season to a pint or quart of bees; while one on 20 combs will perhaps cast a swarm, and still come through a good colony. 2. Honey from infected colonies certainly carries the disease. Of the 27 ducing plants, whose wealth of nectar the greater part goes to the brood-nest

colonies fed as above, 26 had the disease well developed when I stopped breeding. 3. I venture the opinion that the disease is conveyed only in-cidentally, except by infected honey, and by the matter of diseased brood. I did what I would not advise any one to do, and that was to put a diseased colony back into its own hive without disinfecting the hive, of course giving the bees, after a course of fasting, sound honey, and the disease did not reappear though a considerable amount of brood was reared.

Finally, hiving swarms from diseased colonies on foundation or empty frames seems to be all that is neces-sary to free them entirely from the disease.

Dr. A. B. Mason-I have cured foul brood by the starvation plan, and by using salicylic acid. I prefer the former plan.

P. M. Puhl-It can be cured, there is no doubt about that, but the trouble is to keep it cured; especially is this the case where there is much timber.

T. F. Bingham-I would not try to save the brood, as young bees getting into the wrong hive will spread the disease.

Dr. Mason-I should save the brood.

Mr. Smith-Bee-keepers should be careful about keeping combs containing foul brood, as when it dries, the spores are liable to float in the air, and be scattered to colonies of bees.

Prof. Cook—I think this would be possible.

Next came the following essay by Geo. E. Hilton, on the

HONEY-FLORA OF NORTHERN MICH.

If one takes the time to observe and the trouble to enumerate them, he will be astonished at the almost endless variety of honey-producing plants within this State. It would require a skilled botanist to name them all. The All-wise Father has provided nearly all trees and plants with either honey or pollen to attract the insect world. He spreads a continual feast for the bee that the important object of perfect fertilization may be more certainly attained. The bee that slips from flower to flower, rollicking in the golden dust among the new-born anthers, playing hide-and-seek in the opening corollas, is performing a work of untold value in the wise economy of nature. The honey secreted by the blossoms is for the pur-pose of inviting cross-fertilization, and to prevent in-and-in breeding.

If no insect is there to utilize the drop of nectar, it is evaporated and scattered to the four winds of heaven. No one is richer for the ungathered sweets, and no one is the poorer whose fields are searched by the tireless little worker whose instincts lead it to garner the evanescent riches which of a truth take to themselves wings and fly away. From the "trail-ing arbutus" that peeps out of the snow on some billside, to the last frost flower in autumn, there is almost a continual succession of honey-proought to be utilized as one of the sure Caliresources of this grand State. fornia may occasionally astonish us by her magnificent honey crop, but in Michigan where "the early and latter rains" are not only promised but rains " sent, we are always confident of a reasonable surplus.

The pastures and roadsides are dotted with white clover which yields the finest honey in the world. The rivers and lakes are generally skirted with linden timber, and our uplands are interspersed with the same—one of the best honey-producing trees of the world, yielding largely a nectar that is prized for its beautiful amber color and aromatic flavor. Every fence-corner and neglected field is planted by the hand of Nature, as though she were trying in some way to counter-act man's shiftlessness by making the earth bring forth abundantly some of the good things of life.

It is of the greatest importance to the bee-keeper to know just when this succession of bloom occurs, that he may have his bees in the best possible condition to secure the nectar. So far as my observation and knowledge extend, I will briefly enumerate them : About the first pollen comes from willow and soft maple, usually about the middle of April, varying with the season. In the early part of May comes the hard or sugar maple, and this tree deserves more than a passing notice. It produces both honey and pollen in large quantities, and I some-times feel that were our bees in the same condition they are at the ap-proach of the linden flow, we would receive nearly the same results.

Fortunately my bees last spring were strong early, and many of them stored considerable surplus from this source, and it being followed closely by the raspberry and blackberry bloom (with which this country abounds), I secured at least a thousand pounds of surplus previous to the opening of white clover, from my 60 colonies. White clover opens from June 1 to June 15, and in my 10 years of bee-keeping it has never failed to give a fair surplus. The flow was short the past season, on account of the drouth. but my bees being strong I took about 2,500 pounds from this source. There is no interval between clover and linden in this latitude; in wet seasons the clover often continues until after the linden ceases to bloom. The linden opens from July 4 to July 20, according to the season, but cannot be depended upon in this latitude. It is the most sensitive and more dependent on atmospheric conditions than any bloom in this latitude. We usually get two or three days, how-ever, and once I remember of ten days when it secreted honey during its block. its bloom. I find it does better along rivers and lake shores than on the uplands.

After the above llowers we have an interval in the honey-flow until buckwheat, fireweed, goldenrod, asters and boneset come into bloom, with which, aside from buckwheat, this country naturally abounds. They usually afford us some surplus, but

for winter stores; in fact I have never had to resort to feeding sugar for winter stores, and I hope I never shall.

There are many more annuals and shrubs that go to make up the honey-flora of northern Michigan, and we have some disadvantages that our Southern bee-keepers do not have; but taking all in all. I think the porthern half of the State is much better adapted to the pursuit of bee-keeping, and that the honey is of better quality than in the southern half.

Dr. Ashley—I had 300 pounds of honey that was bitter. It has been pronounced boneset. I should be pleased to know what it is. Dr. Mason—I have had honey from

boneset, and it is bitter.

W. Z. Hutchinson—So have 1. Prof. Cook—The secretion from the bark-louse is gathered in some dry seasons, and this is bitter.

R. L. Taylor–I am surprised to hear Mr. Hilton speak of basswood honey as amber colored.

Prof. Cook-1 have had samples of basswood honey that were amber colored.

T. F. Bingham-Oh, Professor, that probably came from standing in those discarded sap-pans in the granary. (Laughter.) Basswood honey usually has a greenish tinge. Dr. Mason—When bees are gather-

ing honey from one kind of plant they may also be gathering a little from something else, which will slightly change the flavor or color.

The convention then adjourned until 8:30 a.m. of the next day.

Concluded next week.

For the American Bee Jouroal, **Opinions on Legislation for Bee-Keepers.** 

W. H. OSBORNE,

On page 742, Dr. Miller asks for the views of bee-keepers, and especially for the opinions of those belonging to the legal fraternity, on the subject of "legislation for bee-keepers." The The Doctor seems to raise two questionssuch legislation as will give a beek keeper an exclusive right to keep bees in a certain territory.

The question of "desirability" is one that I think it would be difficult for us to decide with unbiased judgment. There are persons in this village who have kept bees longer than I have, and if by reason of priority I must surrender the business to them, such legislation might appear more desirable to them than to me. In other words, our own opinions as to the desirability of such legislation would naturally depend upon whether it would or would not inure to our benefit.

The question of "feasibility" perhaps we can discuss with less prejudice, and although my views may not entirely coincide with those of the the greater part of the cells are found Doctor, still I do not advance them to be capped, and the boney under for the purpose of entering into a the cappings is liquid, but thick, and or we will send them all to the agent.

controversy, but that we may consider the subject in its various phases. There is no doubt that much good might result to the specialist from such legislation as would give them absolute control over certain territory; but in what way could this be accomplished? I can see no way ex-cept it be by license, and I do not think that in this State the Supreme Court would hold a license law con-stitutional that had for its object the restriction of such a lawful industry as bee-keeping. Liquor-selling is the only business (?) which is restrained in that manner, and that is only done under the guise of a tax, which it is claimed gives no right to sell, and certainly we do not want to bring our noble pursuit down to a level with that nefarious traffic.

But if such legislation could be ob-tained, would not the effect be to foster monopolies? The specialist could keep his hundreds of colonies. and supply the market, while the poor man would be deprived of keep-ing his 2 or 3 colonies to produce enough honey for his own family use.

There is competition in all kinds of business, and by reason of such com-petition two will sometimes fail where one would succeed; but we never think of asking legislatures to decide which of the two shall yield the endifficulty I see is this: We do not pasture our bees entirely on our own land, and why should the legislature say that Mr. Smith may pasture his bees on the land of Mr. Jones, to the exclusion of Mr. Brown. or even of Mr. Jones himself? While I say nothing about the desirability of such legislation, I must say that as I view the matter, it does not seem feasible. I am a firm believer in the theory of the "survival of the fittest," and I believe that the bee-keeper who reads the bee-papers and keeps up with the progress of the times, can defy competition from those who are trying to carry on the business as their fathers and their grandfathers did before them.

Chardon, & O.

For the American Bee Journal.

# The Cappings over Honey.

#### C. P. DADANT.

On page 762 Mr. Hutchinson asks me to give my proofs for saving that honey cappings are impervious; and I hasten to respond, as it is always a pleasure for me to discuss a subject with him.

We have in our extracting room-a cold room in winter and rather warm in summer-a few cases of honey in sections that have been there ever since the fall of 1884. This comb honey has been "sweating" like honey often does, and the bottom of the cases is covered with granulated honey.

Upon examination of the sections.

evidently in good condition. But in evidently in good condition. But he nearly every section a few cells are to be found, the cappings of which, although apparently sound, are bulged out, and show by their trans-parency that the cell is partly empty. On closer examination these cappings are found to be burst outward; and the honey that has not "sweated" out of them, as well as that contained in a few cells that have cracked by variation of temperature, or by handling, is as thoroughly granulated as that at the bottom of the case. Now why is the honey in the sound, scaled cells liquid, while all the other is granulated? Is it not evident that the one is sheltered from the action of the circuit while the there is not? of the air, while the other is not?

Whether all honey-cappings exclude the air is perhaps doubtful, but that the bees "aim at compact cov-erings for their honey, while the sealing of the brood is porous (Cheshire), makes no doubt for me. Evidently even this view is debatable, else Mr. Hutchinson would not be so eager for a discussion, and I shall be glad to see it fully ventilated, by him and others.

Now, as to the nature of cappings: If the reader will take a parcel of clean, white honey-cappings on the end of a knife and place it near a light—not too close—but near enough to melt it, he will have a pretty good idea of the nature of them. That ordinary honey-cappings are not ab-solutely free of foreign matter is easily comprehended, since the travel-ing of the bees over them, in the hive, is sufficient to alter their color in a few days. In addition, the yellow coloring pigment so well known to-bee-keepers (and so little explained), and the impurities of the atmosphere, undoubtedly more or less contaminate the wax during the manipulation of this soft and plastic material.

Practically speaking, however, honey-cappings are pure wax, and if unmixed with propolis, cast skins or cocoons, from the cell walls, in ex-tracting, will give little or no residue, except damaged beeswax.

I know that it is a popular opinion that the pale, clean, grainy looking residue often obtained in rendering wax over water is pollen. It looks like pollen-grains, but is pure wax, and any one who has tried the solar waxextractor side by side with the water process, will testify to the fact that this so-called pollen residue is entirely absent in sun-rendered beeswax. On this subject 1 cannot refrain from recalling the experience of Mrs. Chaddock, who, after melting her wax 4 or 5 times over, and finding this residue more plentiful every time, came to the conclusion that it was all a sham, and that her beeswax was no beeswax at all.

Hamilton, + Ills.

Sample Copies of the BEE JOURNAL will be sent FREE upon application. Any one intending to get up a club can have sample copics sent to the persons they desire to interview, by sending the names to this office,

#### Local Convention Directory.

(887. Time and place of Meeting. Jan. 11-13.-N.Y.State, E.N.V., &c., at Albany, N.Y. Joo. Aspinwall, Sec., Barrytown, N. Y. Jso. 12.-Cortland Union, at Cortland, N. Y. D. F. Shattuck, Sec., Homer, N. Y.

Jan. 19, 20.-N. E. Ohio, N. Pa., &c., at Andover, O. M. E. Mason, Sec., Andover, O.

In order to have this table complete, Secretaries are requested to forward full particulars of time and place of future meetings.-ED.

Bees Ready for Winter, etc.-I. J. Glass, Sharpsburg, OIlls., on Dec. 3. 1886, writes:

I had just got my hees housed in the cellar when the cold wave reached us, and we have been having some zero weather since, as cold as 10° below. I have 92 colones in winter quarters, all in good condition. The temperature ranges between 45° and I do not care how warm my cel-50°.  $50^{\circ}$ . 1 do not care how warm my cel-lar becomes so I can keep the tem-perature from falling below  $45^{\circ}$ . I am fully convinced that *cold* is the cause of bee-diarrhea. I had about 4,000 pounds of surplus honey this year, 1.800 pounds of comb honey, all of which is sold. I have only one barrel of extracted honey on hand yet. I disposed of the greater part in my home market.

Ten Years of Bee-Keeping.-L. D. Ormsby, Pierpont, & O., says:

I began the season with 77 colonies, and obtained 4,400 pounds of honey. This is the poorest season for bees that I have ever experienced. Next year will make ten years of bee-keep-ing for me, and I have been a faith-ful follower of your valuable BEE JOURNAL. If you would like a ten year report from one of your readers, I will send it to you next year.

[Yes; send in the report, and let us see what you have done in ten years. -ED.]

#### Bee-Keeping in Central Texas.--E. P. Massey, Waco, O Tex., writes:

Bee-keeping in central Texas has about ceased to be pleasant or profit-able. For the last two seasons I have not had 100 pounds of surplus from 50 to 60 colonies, although they began the winter with plenty, and came out with plenty of stores and bees. We have no field crop in this country that affords any honey, ex-cept cotton, and that does not yield

it every season, and never very much. For several years previous to 1884 we got a good deal of honey from thistle and horse-mint, but these have about failed, and I cannot tell what will next turn up that will benefit us.

"'T'ls hard to toil when toil is almost vain, In barren ways,"

but I shall toil on for I do not want to give up my bees. A majority of our bee-men here have about abandoned the business. The extreme hot and dry weather in summer here is disastrous to the bee-keeper, and if he had to depend upon the business for aliving here, it would not do at all. We had a very damaging disease among our bees last spring and sum-mer, and many lost nearly all, and all lost more or less. I think it was beediarrhea, but others, as well or better informed than I, say it is not. Last spring opened early, and our bees gathered a large quantity of pollen, bred up rapidly, and later on we had a great deal of cool, misty weather, and all the old stores was consumed, and the bees had to fall back on the pollen. I believe that was the canse of the disease. I would like to have the opinions of some of the bee-masters on the subject, with a remedy.

Hard Year for Bee-Keepers.-C. A. Hallegas, De Kalb Junction, & N. Y., on Nov. 30, 1886, says:

This has been a hard year for bee-keepers throughout this section of the country. I commenced the sea-son with 112 colonies, and afterward had 8 new ones. One was robbed out this tall, so I now have 119, which are in the cellar. I had about 900 pounds of comb honey, and the most of it was of poor quality. I had 50 colonies that did not have enough honey to winter on, and consequently I have had to feed considerable.

Red-Clover Italians.-H. M. Moyer, Hill Church, Pa., writes :

Joseph Beath, on page 731, wanted to know whether any one has bees that work on the first crop of red clover. My bees (Italians) work, every year, on the first crop of red clover. This is nothing new in this locality. The black bees are not worth keeping here, should one get them as a gift.

#### -----Convention Notices.

The eleventh annual meetiog of the N. W. Illa. & S. W. Wis. Bee-Keepers' Association will be held in the Grand Army Hull In Rockford, Illa. on the third Tuesday in Jabuary, 1887. There will be a two days' session. J. STEWART, Scc.

The next anoual meeting of the Nebraska State Bee-Kcepers' Association will be held in Lincoln, Nebraska, on Wednesday, Jao. 12, 1887, Location of Hail to be used and Hotel accommo-dations will be given after further arrangements have been made. H. N. PATTERSON, Sec.

The New York State, the Eastern New York and the New Jersey & Eastern Bec-Keepers' As-sociations will bold their great united convention at Albany, N. Y., on Jan. 11, 12 and 13, 1886. This convention will be one of the largest, if not THE largest, ever held anywhere in this culotry, and it behooves every bec-keeper to atteno. A grand exhibit of apiarian dxtures is promised. An nn-usually briliant programme will be prepared and announced later. JNO. ASPINWALL.

#### Honey and Beeswax Market.

The following are our very latest quotations for honey and beeswax :

#### CHICAGO.

HONEY.--Market is well supplied with all the grades, and the demand is light. Prices are nom-insl at 11@12c, for white in 1-ib. sections. Fancy white in scant pound sections, 1%c. Very little ex-tracted is being sold, and prices range from 407C. BEESWAX.-22c. R. A. BURNETT. Dec. 8. 161 South Water St.

#### NEW YORK.

NEW YORK. HONEY.—In consequence of a large stock of comb honey on this warket, tancy prices cannot be maintained. Fancy white honey in paper box-es, or zlassed, are in better favor here than the unglassed honey, hence the difference in the price. We quote present prices as follows: Fancy white in 1-ib. paper boxes, or glassed, 13c.; same unglassed, 12c., and in 2-ib. glassed sections, 10% 10c.; off grades 1 to 2 cfs, per ib less, Callf, comb, 8%10c.; fancy buckwhest 1-ibs. %4 es e. and 2-ibs. 10%68c. Extracted white clover, none in the mar-kers and barrels, 4%5c BEESWAX.—21@23c. MCCAUL & HILDRETH BROS., Dec. 7. S4 Hudson St.

#### BOSTON.

110NET.-The demand has improved. We are selling one-pound packages of white clover honey at 14@15c; 2-pounds at 13@14c. Extracted, 6@7c. BEESWAX.-25 cis. per lb. WAX.-25 cts. per lb. BLAKE & RIPLEY, 57 Chatham Street. Dec. 7.

#### DETROIT.

HONEY.-All kinds of honey are dull and lower. Best white comb honey in 1-lb, sections, 11@12%e-Extracted, 7@9c. BEESWAX.-23c. Nov. 23. M. H. HUNT., Bell Branch, Mich.

CINCINNATI HONEY.-There is a lively demand for table honey in square glass jars, and the demand for natufacturers is very good. Demand from manufacturers is slow for dark grades of ex-tracted honey. The rangeing prices for extracted is 3@7c, a lb. Nice comb brings 12@15c. per lb. ho

a jobbing way. BEESWAX.-Home demand is good. We pay 20623c. per lb.

Nov.10. C. F. MUTH & SON. Freeman & Central Av.

#### CLEVELAND.

HONEY.—The market is not very active and pri-ces a little lower. Choice 1-lb. sections of best-white sell at 13@14c. is second grade 1-lbs. 10@12c.; cboice white 2-lbs.. 11@12c. Extracted, slow at 6c. BEESWAX.—Scarce at 25c. Nov. 17. A. C. KENDEL. 115 Ontarlo Street.

#### MILWAUKEE.

HILWACKEE. HONEY.-The market for honey of choice qual-ity is firmer and we are trying to establish a high-er range of values. We quote 1-lb, sections of white at 1246013c; 2-lbs, 1146012c; dark not wanted. Extracted, white, in haif barrels and in-kegs, 64607c; in the packages, 767½c; in barrels, as to quality, 5604bc. BEESWAX.-No demand. Oct. 2. A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

HONEY.-The market remains firm for choice qualities, of which we have a large supply op hand. We quote from 33(44/ac, wholesale, for extracted honey; and 8%12c. for honey in 2-lb. sections, although the latter sells only in a job-bing way at outside prices. Some fine honey in 1-lb. sections sells at 116/12c. BEESWAX.-Duil at 20@22c. for the best.

Nov. 24. SCHACHT & LEMCKE, 122-124 Davis St.

HONEY.-Trade is quiet. Extra white comb 110; smber, 7%@10c. Extracted, white, 4@44c.; sm-ber.3%@334c. BEESWAX.-20@23c. Oct.18. O. B. Smith & Co., 423 Front Street.

#### ST. LOUIS.

HONEY.-Choice comb, 11%(@12%c.; latter price is for choice white clover. strained, in barrels, 34@4c. Extra fancy of bright color and in No.1 packares, % advance on above prices. Extracted io barrels.4%@55.; io cans6@7c. Market dul. BEEEWAX.-Dul at 20c for prime. Nov. 17, D, G, TUTT & CO., CommercialSt.

#### KANSAS CITY.

KANSAS CITY. HONEY.-Demand is good for all grades, and re-ceipts have been very large of comb and extrac-ted. Home bec-men have kept out of the market until this month; having glassed every lb. sectboo on both sides they are reducing prices, selling 60 ibs, of glass with 160 lbs, of honey, making our market lower. There crop is about 70,000 pounds. We quote : White clover 1-ibs, 120313c; 2-ibs, 11c; ½-ibs, 136414c; dark 1-ibs, 10c; 2-10s, 8636c-Calitornia 2-ibs, %ell.c. Extracted white clover, fc.; dark,465c; white sage Calit. 5½c; number, 5c-BEESW AX.-22c. Nov.20. CLEMONS,CLOON & Co., cor. 4th & Walnut-

Issued every Wednesday by THOMAS G. NEWMAN & SON. PROPRIETORS. 923& 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN. BUSINESS MANAGER.

# Special Notices.

To Correspondents. - It would save as much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be snre to give the address we have on our list.

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a Binder for the BEE JOURNAL to any one sending ns three subscriptions-with \$3.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

To all New Subscribers for 1887 we will present the rest of the numbers for 1886; so the sconer they subscribe the more they will get for their money.

Colored Posters for putting up over honey exhibits at Fairs are quite attractive, as well as useful. We have prepared some for the BEE JOURNAL, and will send two or more free of cost to any one who will use them, and try to get up a club.

A New Crate to hold one dozen one-pound sections of honey .- It has a strip of glass on each side, to allow the honey to be seen. It is a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We can furnish the material, ready to nail, for 9 cts. per crate. Glass 1%c. per light, extra.

Five Thousand new subscribers to the BEE JOURNAL is what we have made onr calculations for ; they will come in clubs between now and next spring. Installments are coming every day.

The next annual convention of the Cort-dand Union Bee-Keepers' Association will be held in Union Hall, at Cortland, N. Y., on Jan. 12, 1897. D. F. SHATTUCK, Sec.

**OUR CLUBBING LIST.** 

We supply the American Ree Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regnlar price of both. All postage prepaid.

Yucea Brushes are employed for removing hees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the handle as well as the brnsh, they are almost indestructable. When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 cents a dozen : if sent by mail, udd 1 cent each for postage

Reader, do you not just now think of one bee-keeper who does not take the Weekly BEE JOURNAL, and who should do so? Perhaps a word or two from you will induce him to do so. Will you not kindly oblige us by getting his subscription to send on with your own renewal for next year? When you do so, please select any 25 cent book in our list, and we will send it to you post-paid, to pay for your trouble. We are aiming to get 5,000 new subscribers for 1887, -will you not assist us to obtain them ?

The Report of the Indianapolis Convention is now published in pamphlet form, uniform with that of last year. It will be sent postpaid for 25 cents to any address.

We have also bound it up with last year's, together with the History of the Society : this we will mail for 40 cepts. Or if you send us oue new subscriber (with one dollar) besides your own renewal, we will present you with a copy by mail.

Money Orders can now be obtained at the Post Offices at reduced rates. Five dollars and under costs now only 5 cents. As these are absolutely safe, it will pay to get them instead of the Postal Notes which are payable to any one who presents them, and are in no way safe.

(19) The Northeastern Ohlo, Northern Pa. and Western New York Bee-Keepers' Association will hold its 8th annual convention in Chapman's Opera Honse, at Andover, 1., on Wednesdav and Thursday, Jan. 19 and 20, 1837. First-class hotel accommodations are offered at \$1 per day to those attending the convention. A general invitation is extended to all. M. E. MASON, Src.

#### Home Market for Honey.

1987 To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMANO for all of their crops at remunerative prices. "Honey as Food and Medicine " are sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page, "Presented by," desired, on the cover-page, "Presented by," etc. (giving the name and address of the beekeeper who seatters them).

To give away a copy of "Honey as Food and Medicine" to every one who hnys a package of honey, will sell almost any quanttty of it.

#### System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one hook, and are therefore the most desirable.

Dr. Miller's Book, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

The Convention History of America with a full report of the proceedings of the Detroit and Indianapolis conventions, and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.25.

We would call Special Attention to the property advertised by L. C. Root, on page 733, in the issue of Nov. 17th. It is a choice property, and offers a rare chance for some person desiring to keep Bees under the most favorable circumstances. For particulars, address L. C. Root, Mohawk, N.Y.

# The NEW Heddon Hive

We have made arrangements with the inventer by which we shall make and sell the Heddon Reversible Hive, both at wholesale and retail ; nailed and also in the flat.

The engraving gives a good idea of the hive. The brood-chamber is in two sections; also the surplus arrangement, which may be interchanged or inverted at will. The cover, bottom-board, and top and bottom of each sectional case has one-half of a regular bee-space, so that the anrplus cases with the sections, may be placed between the two brood-chambers, or the latter may be transposed or inverted—in fact, all parts of this hive are perfectly interchangeable. The brood-framew will ALL be bored for wires.

ALL be bored for wires. A SAMPLE IIIVE includes the bottom-board and stand : a slatted boney-board, and cover; two 6-meb brood-chambers, each containing Stramed; two surplus arrangements, each containing Stone-pound sections, one with wide frames and separa-tors, and the other without separators. This latter chamber can b3 interchanged with the other stories, hat cannot be reversed. It is NAILED AND PAINTED, and ready for immediate use. Price, \$4.00, complete.

It is absolutely essential to order one nalled hive as a pattern for putting these In the fint together correctly.

HIVES READY TO NAIL.—In filling orders for these hives, in the flat, we make 6 different com-binations, so that our customers may make a aelection from the sample nauled hive, without waiting for us to quote prices, and the different kinds will be known by the following numbers :

No. 1 consists of the stand, bottom-board, cover, two 6-inch brood-chambers, 16 frames, and the slatted honey-board. Price, \$1.55 each.

No. 2 is the same as No. 1, with the addition of one surplus story containing 28 sections without separators-interchangeable, but not reversible.separators-intercha Price, \$2.00 each.

No. 3: is the same as No. 2, with two surplus sto-ries as thereio described. Price, \$3.50 each. No. 4: is the same as No. 1, with the addition of one surplus story containing 28 sections in wide frames with separators, which can be reversed, inverted, and interchanged, the same as the brood-chambers. Price, \$2.30 each.

No. 5 is the same as No. 4, with two surplus arrangements as therein described. Price, \$3.00. No. 6 contains all the parts as described in the sample nailed hive. Price, \$2.75 each.

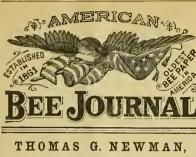

sample nalled hive. Price, \$2.75 each. Those desiring the bives without the stand, honey-board or sections, may make the following deduc-tions from the above prices : Stand, 14 cents ; honey-board, 8 cents ; and the 28 or 56 excitons, as the case may be, at ½ cent each, respectively,

We will also make the following deductions on quantities ordered all at one time: For 10 or more hives, 5 per cent. discount; for 25 or more hives 7 1-2 per cent.; for 50 or more, 10 per cent.

#### THOMAS G. NEWMAN & SON, 923 & 925 West Madison-St., CH1CAGO, ILL.

THOMAS G. NEWMAN 925 West Madison St., CHICAGO, ILLS.

FUTTOR Vol. XXII. Dec. 22, 1886. No.51.

**Iting out !** ye glorious Christmas bells, Peal loud, and sweet, and elear, And let your music, as it swells, Proclaim the peace-time here.

Ring out 1 and while you peal, sweet bells, Oh 1 let us humbly brieg. Those gifts, whose presence ever tells Each one to anthems sing.

Ring out 1 Earth's lessons we must learn, As on we walk, each day; And Christmas hours, with each return, Mark mile-stones on our way.—Ex.

It is said that there is only a very small part of a drop of poison in the sting of a bee. No matter how small the part, however, the departure of the person stung is sure. The bee "gets there" all-e-sameebut it parts with its sting.

A Weekly Feast is presented to every reader, and the following letter from B. H. Holt, of Adel, Iowa, is a sample of hundreds just received from the guests who have been regaled at our weekly banquets during the past year :

I like the AMERICAN BEE JOURNAL for the I like the AMERICAN BEE JOURNAL for the many good things which it presents each week. I always look for it with the assur-ance of inding a *feast* therein, and I am never disappointed. May its editor long live to ealm the troubled waves of discus-sion, and to keep all its correspondents in good fellowship, is the earnest wish of a constant reader constant reader.

The November Weather in England has been open and fine. A writer in the London Journal of Horticulture gives the following facts about the bees there during the past month :

Up till Nov. 26 the weather has been epen and fine. The bees carried pollen up until that date, when the winter's fog commenced. Some colonies have increased in number of bees greatly during the month. The ealm, sunny weather, permitting the bees to fly, and the young enes to clear themselves of all incumbrances as late as the 25th, will counteract other evils which, had the weather been untoward, were sure to have followed so much late breeding. The tem-perature of the month has not only been mild, but remarkable for the equality of the day and night temperature. For some nights and days together there were only 4° differ-ence in the day and night temperature. Up till Nov. 26 the weather has been open ence in the day and night temperature.

"Here we have an Objection to the Union," says the Canadian Bee Journal, and then it proceeds to give the reason for obiecting in this language :

Bee-keepers who have ill-feelings towards their neighbors have a good chance to vent it. They join the Union and then call on their neighbors to "come on," feeling that the Union will assist them, and their costs will be light, while the defendant will have to foot his own bill. Thus they can "stick" their neighbor for a lot of costs, and them-selves escape almost "seet free." We are therefore in favor of a voluntary and im-promptu defenee by bee-keepers generally, each giving what they are able to in the defence of "right and justice," when they satisfy themselves that the case calls for such a defence. such a del'ence.

The writer appears to have been sadly "mixed up," when framing the above paragraph. The bee-keeper who joins the "Union," and says to his neighbor "come on," is the defendant, if that neighbor does "come on " with his lawsuit; but the item ealls the "neighbor" the "defendant," and says he" will have to foot his own bill !"-Say plaintiff, brother-just to make sense 1

The writer is also in error concerning the "National Bee-Keepers' Unlen." It does not work on the plan mentioned in the above editorial extract. It only assists in the defense of the pursuit of bee-keeping, after investigating the cause of the trouble. If it is but a personal quarrel, the Union does not interfere with it. If, however, there is a principle involved, or the pursuit is "at stake," the Union helps to defend the ease by paying something like one-half of the costs, while the "real defendant" pays the other half. It does not by any means let the members of the Union "stick their neighbor for a let of costs, and themselves escape almost sect-free," as stated in the item quoted above.

In Switzerland, as well as throughout Europe (says Mons. E. Bertrand, of Nyon, Switz.), the past season has been very poor for honey. The first honey-flow was almost nething ; the second, where there was any, was better, but that honey is of a dark color and second grade.

Our friend, Mr. Bertrand, was elected an honorary member of the North American Bee-Keepers' Society, at Indiagapolis, and acknowledges the honor in a very polite letter to the editor of the AMERICAN BEE JOURNAL, who proposed the honor, and the following to the President, Dr. C. C. Miller, of Marenge, Ills. :

NYON, SWITZERLAND, NOV. 26, 1886. Sir :--I see by the report of the proceed-ings of the convention held at Indianapolis, that I was elected an honorary member of the North American Bee-Keepers' Society.

Allow me to thank you and the associa-tion for the honor which you have conferred upon me. I feel highly flattered in being an honorary member of the leading society in America.

I have the honor to remain, sir, yours truly, ED. BERTRAND.

Water is essectial for bees in cellars, and quite often it has restored bees to their normal condition, after a "roaring" in the bive is heard, which is caused by exeessive thirst and prolonged low temperature.

German Bee-Papers.-On page 707 we commented on the assertion made at the Indianapolis Convoction that "we have a greater number of apicultural papers" than "all the rest of the world combined." We then stated that "Germany alone" has "more than all the rest of the world combined." The British Bee Journal, for Dec. 2. not only affirms our remark, but gives a list of 23 German bee-papers devoted exclusively to bee-keeping; not including any that combine bee-culture with something else. of which there are a large number. Here is the list :

Premium Worth Having.-The New York World and the AMERICAN BEE JOUR-NAL (both weekly) will be sent for one year to any address in North America for \$1.90. And in addition PRESENT to every such CLUB SUBSCRIBER a "History of the United States," containing 320 pages and 22 fine eugravings, bound in leather and gilt,

This "History" will be sent FREE by express at the subscriber's expense; or will be mailed for 10 cents extra to any place in the United States or Canada.

It is arranged chronologically by years. from 1492 to 1885. Every event is narrated in the order of its date. These are not confined, as in other works, to political matters. but embrace every branch of human action.

This premium is worth the whole of the money sent for both periodicals, and should induce thousands to subscribe, and thus get two unrivalled weeklies for nothing.

Catalogues for IS87.-These on our desk are from

Dr. G. L. Tinker, New Philadelphia, O. Thos. G. Newman & Son, Chicago, Ills.

#### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one month. They have to wait their turn, be pnt in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.—ED.]

Cleansing Flights in Winter.

Query, No. 350.-Some advise giving bees a cleansing flight during the winter; others, put them into a cave or cellar and let them severely alone until it is time to put them on the summer stands again. Which is best? 1, for one, would like to know, as I have no anxiety to carry 120 colonies out of the cave and back again if it does no good,-Iowa.

Let them alone.-W. Z. HUTCHIN-SON.

I do not carry mine out until they are taken out to stay.—C. C. MILLER.

If they remained quiet I would leave them alone until well settled weather in the spring.—II. D. CUT-TING.

If the bees are quiet in their quarters, and show no uneasiness, I should let them alone.—J. P. H. BROWN.

Leave them in until spring. Giving them a flight causes them to breed, and they are more restless afterwards. —DADANT & SON.

I should leave them severely alone. If some of the colonies were diseased so as to be likely to die before spring, I might give them a flight. If the disease was caused by impure stores, it would be beneficial. I have thought that a flight sometimes made matters worse.—C. W. DAYTON.

From what I have read, I conclude that if the general conditions are right, viz: an equable temperature ranging from  $40^{\circ}$  to  $50^{\circ}$ , Fahr., in a perfectly dark cellar, no cleansing flight is necessay.—J. E. POND, J.R.

Never move them unless they become uneasy and soil the hive. If a cellar is just right there will be no need of any removal from Nov. 1 to April 1. We have not removed our bees for years during winter, and they winter splendidly.—A. J. COOK.

Owing to the dampness of the atmosphere in this climate, in the winter months, I doubt if it would be possible to winter bees at all without the opportunity for flight in the air two or three times during the winter months. But in a higher latitude where the air is comparatively dry—a condition of things favorable to healthful exhalation from the bodies of the bees—I doubt not but the case would be different. Those who have tried it can tell best.—G. W. DEM-AREE.

After practicing both I have come to the conclusion that only harm

comes from such a flight, say nothing of the labor. Where bees are wintered on the summer stands the case is different.—G. M. DOOLITTLE.

I prefer the latter plan—put them in early and take them out late. Long confiuement does no harm, if other conditions are right. In this I think Mr. Eugene Secor is right, and Mr. G. M. Doolittle in error.—JAMES HED-DON.

Bees in winter quarters require no flight until they can fly to some purpose. We often have pollen gathered here early in March, when they may be put out and returned after cold sets in again. In February, on a suitable day, I would set out 1 or 2 colonies, and observe if they needed a cleausing flight. If doing finely they often discharge nothing; hence a flight would be of no benefit until there was food to gather. On Dec. 11 we had a fine day, and I put out 2 colonies that were carried in Nov. 13. They had been nicely hibernating, but I wanted to see the effect. After four days they had not again assumed their former state, being very easily disturbed. I would say, then, not to put bees out before February, at the earliest, and then not unless diseased. --G, L. TINKER.

# Closed-Top Sections.

Query, No. 351.-A bee-keeper in Iowa prefers closed-top sections; but in tieringpp he uses open-top sections. Is it an advantage to have the first case and the one on top made thus? and will the combs (of course they cannot be inverted) he as straight with closed-top sections?-Augusta, Iowa.

I see no advantage in closed-top sections anywhere.—W. Z. HUTCHIN-SON,

son. It is a disadvantage to have two sorts of sections on the same hive.— J. P. H. BROWN.

We would prefer open-top sections for every purpose.—DADANT & SON.

The combs will be just as straight with closed-top as open, if you use full sheets of foundation or separators. I prefer an open-top section, as I want to "tier-up."—H. D. CUTTING.

I use open-top sections, and can see no advantage in those having closed tops.—G. M. DOOLITTLE.

I should not expect combs to be quite as straight with closed-top sections, but I have never tried them.— C. C. MILLER.

I should always prefer the open-top sections. This permits tiering-up, and enables one to see just what is going on.—A. J. COOK.

Closed-top sections are no advantage, as they can be made *closer* with a cloth spread over the top of the case or rack. The open-top sections are necessary to the "tiering up system," and the latter is necessary to the best results.—G. W. DEMAREE.

Never use both kinds on the same hive, or in the same apiary; in fact, never use closed-top sections at all. They are not good about getting straight combs, tiering-up, handling in and out of shipping-crates, seeing the condition of the super, and so bad that they are almost totally abandoned.—JAMES HEDDON.

The combs will be built as straight with closed-top sections as with opentop ones, but the former have no advantages over the latter. I prefer a thin board with a bee-space beneath to cover the sections. Many use enameled cloth.—G. L. TINKER.

I do not think there is any advautage in using closed-top sections in any case. Open-top sections can be easily closed, but closed-top sections cannot be conveniently used in "tiering-up." I prefer the open-all-around sections.—J. E. POND, JR.

# Wintering Bees Under a Kitchen.

Query, No. 352.-Do you think that it would injure the bees to put them in a cellar under a kitchen where there is lots of noise?-F. H., llls.

Not unless they are to be jarred.— DADANT & SON.

No, not if so placed that they are not jarred.—G. M. DOOLITTLE.

No. I have wintered bees in just such a place for several winters.—W. Z. HUTCHINSON.

I do not think that the noise would injure them, provided no vibratory or jarring motion was communicated to the bees.—J. P. II. BROWN.

The warmth of the kitchen fire above the bees would more than counterbalance any harm from the noise.-G. L. TINKER.

It would not injure them, but might rouse them somewhat at times.—C. W. DAYTON.

If all right otherwise, I doubt if the noise would do much harm.—C. C. MILLER.

No, not if other conditions are all right.—JAMES HEDDON.

Bees must be quiet to winter well. Unless you can keep them so in the cellar, I would advise leaving them on the summer stands well packed.—H. D. CUTTING.

I know nothing practically of cellar wintering of bees, but from what I know about the effects of "noise" on bees, I should have no fears that my bees would be injured from that cause.—G. W. DEMAREE.

I should prefer "under a kitchen" to any other place. This gives a chance for ventilation. The noise will do no harm. I know a man who has wintered his bees very successfully, and he has some loud boys, I tell you ! None too loud; boys that make no noise will make men of like character.—A. J. COOK.

Practically, I know nothing of the matter, as I have always wintered my bees on the summer stands, but if the cellar is all right otherwise, I do not think the noise will affect the bees at all. It is all theory ou my part, but the theory is based on my reading, and general observation.—J. E. POND, JR.

Explanatory .- The figures BEFORE tho names indicate the number of years that the persou has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is located near the center of the State named; & north of the center; & south; & east; • west; and this of northeast; `O northwest: • southeast; and 9 southwest of the center of the State mentioned.

For the American Bee Journal.

# The Michigan State Convention.

SECOND DAY-MORNING SESSION.

The first thing on the programme of the 2d day was the election of officers, which resulted as follows : President, Geo. E. Hilton, of Fremout; 1st Vice-President, R. L. Taylor, of Lapeer; 2nd Vice-President, O. J. Hethering-ton, East Saginaw; 3rd Vice-Presi-dent, John Rey. East Saginaw; Sec., H. D. Cutting; Treas., M. H. Hunt.

It was decided that the next annual meeting be held in East Saginaw, and Prof. Cook, W. Z. Hutchinson, and H. D. Cutting were appointed a com-mittee to confer with the State Horticultural Society to determine if it will be advisable for both societies to meet at the same place, and during the same week, but npon different days. Many persons wish to attend both meetings, and this arrangement would be a great saving to them in railroad fares.

#### BASSWOOD VS. LINDEN.

Dr. A. B. Mason read from the Canadian Bee Journal the article on page 167, of the current volume, headed "Linden Honey," in which Mr. S. T. Pettit, President of the Outario Bee-Keepers' Association, re-ported that the committee took the grounds that Canadian "basswood" honey was superior to the United States article, and recommended that States article, and recommended that the Canadians adopt the name "lin-den" for *their* honey, and thus dis-tingnish it from the inferior "bass-wood" honey produced across the line. The Doctor thought it perfectly right to make Canadian articles distinctively Canadian, but it should not be done by casting unwarranted stigmas upon our productions. We should not try to elevate ourselves by

builting down others. Mr. Macpherson. of Canada, evi-dently felt that the laugh was at his expense, but he bore it good humoredly, and said he did not think there was any intention to cast a slur upon American honey, and he doubted not that an apology would be forthcoming.

possible amount of white honey as in sections, and the brood-nest com- water and flights in the open air. I

surplus, depending upon the fall honey-flow to furnish stores for win-ter. The fall flow of honey is sometimes a failure, and he then resorts to the feeding of sugar syrup. He feeds by raising the front end of the hive and pouring the syrup in upon the bottom board. He found it necessary to do this work at night, to avoid trouble from robber bees. In feeding 6 pounds of syrup, he found there was a loss of  $1\frac{1}{2}$  pounds.

Mr. Macpherson-Mr. D. A. Jones once fed in this manner, and the work was done at night to avoid the robber bees. He has discarded this plan for feeders

Dr. Mason-I got a sample of the Heddon feeder, and it is a fine thing, but it is rather expensive.

R. L. Taylor-I object to feeding by pouring the feed upon the bottomboard, as it necessitates fast bottomboards, and even then a hive may leak.

Dr. Mason-What is your objection to a fast bottom-board ?

R. L. 'Taylor-I wish it loose so that I can clean off the dead bees in the spring; I can regulate the size of the entrance by moving the hive forward or back, and I do not wish any bot-tom-board upon the hives when they are in the cellar.

W. Z. Hutchinson-How do you get the bees off the bottom-board when you carry them into the cellar ?

R. L. Taylor-There are seldom many upon it; and I raise the cover and brush them off into the hive.

A. I. Root-When robber bees are troublesome, we do a good share of our work with bees at night by the light of a lantern. R. L. Taylor—I have tried working

as late in the day as possible, and the darker it became the more troublesome were the bees, until it was well nigh impossible to handle them.

W.Z. Hutchinson-Have you ever tried handling them by an artificial light?

R. L. Taylor-I never have.

A. M. Gander—If any one expects to be obliged to feed, why would it not be best to save frames of honey for the purpose ? Prof. Cook-This brings up the

question of the advisability of secur-ing all the white honey we can in sections, and then feeding sugar for winter stores.

Geo. E. Hilton-I should not dare to use sugar even for wintering, as I care too much for my reputation

Prof. Cook-I do not think any one need have any fear in regard to his reputation. There should be no at-tempt at concealment. The neightempt at concealment. bors should be allowed, yes, invited, to come and see what was done with the sugar, and the whole matter ex-plained to them. Further than this, if it is decided that sugar is a safer food for winter (and I think it is), and as any intention to cast a stir upon merican honey, and he doubted not hat an apology would be forthcoming. Dr. Mason then read an essay on FEEDING BEES FOR WINTER. Ile works to secure the greatest is will it pay? If we can get all our white honey in nice shape for market

paratively empty, and all we will have to do is to put on feeders and feed, it

will probably pay. R. L. Taylor—It will probably pay one to do so, if everybody else does not go at it; if they do, I do not know whether it will or not. We can-not make it pay to feed bees when they must build their own combs; but when the combs are built, then it will pay. It is a mistake to suppose that sugar stored in the brood-nest for winter stores will be carried into the where supers in the next honey harvest. We frequently have a flow of dark honey in the fall. Is any one ever troubled by this dark honey being carried into the sections the next season?

Geo. E. Hilton-I have been troub-

led in exactly this manner. W. Z. Hutchinson-How large are

the brood-nests of your hives? Geo. E. Hilton-Eight Langstroth frames

Dr. Mason-I have no fears of los-ing "reputation" by feeding bees sugar for winter. The first year I fed sugar to my bees I bought it of neighboring grocers, and took pains to inboring grocers, and took pains to in-form them and my neighbors just what I wanted it for, and *why* I used it. There was some "talk" that year, but it has all died away, and I hear nothing of it now.

W. Z. Hutchinson-I have fed sugar to bees now for years, and made no secret of it. Sometimes one neighbor and sometimes another hauls the sugar from the depot. The whole neighborhood knows that I feed sugar to the bees, and when and why I do so, and no one buys any less honey.

A. I. Root—In view of the preva-lence of foul brood, it is hardly the thing to advise the buying of honey to feed bees when they need feeding. It is better to buy sugar

F. H. Macpherson–When we feed sugar syrup we lose just about the weight of the water added. We do not think it prolitable to extract the honey and feed sugar, but in producing comb honey it probably pays.

W. Z. Hutchinson-In preparing

the syrup I use Florence lamp stoves. R. L. Taylor-I use a gasoline stove. The next topic discussed was that of

#### BEES AND GRAPES.

Prof. Cook-We can safely say that bees do not injure sound grapes. In the fall, when they are over-ripe, and the weather is just right, the grapes crack and then the bees make trouble. Which is practical, to shut up the bees or to protect the grapes? or is neither? In some places grapes can be raised only by bagging them, be-cause of the rot. This bagging greatly improves the grapes and furnishes a protection against bees as well as

rot. P. M. Puhl—It is not practical to shut up the bees, as the grape harvest lasts too long; and grapes are too cheap (one cent per pound) to allow the expense of bagging. I have tried confining bees during the time of gathering grapes, and it cannot be done. The bees are breeding, and it is hot weather, and they must have have put them in the cellar, and kept the temperature at 45°, and it is no better; it is not the time of the year when bees can be confined-they are not ready for it, and will worry them-selves to death. I am sorry that Mr. McLain said what he did in his report about confining them; it is impractical.

Dr. Mason-It is best to keep on the right side of our neighbors, then they will put up with some inconvenience from the bees.

A. I. Root—Mr. L. C. Root once told me how careful he was not to allow his bees to annoy his neighbors. When his neighbor was ready to make hay in a lot adjoining Mr. Root's bees, Mr. Root offered, yes, insisted upon doing the work next to the bees, for fear that the neighbor or his horses might be stung. When neighbors live like this there is little danger of any fault being found with the bees.

R. L. Taylor—I agree with what Dr. Mason and Mr. Root have said. I fear that no good can come of legislafear that no good can come of legisla-tion. I also fear that the Bee-Keep-ers' Union only stirs up things, *i. e.*, it "backs up" bee-keepers and makes them less careful. Many of these lawsuits grow out of some old feud, and a member of the Union may be "spoiling for a fight" with some neighbor, and takes advantage of the "backing" furnished by the Union to lead some enemy into a lawsuit. Were lead some enemy into a lawsuit. Were it not for the Union he might be less belligerent.

H. D. Cutting-I have no faith in legislation in this matter. It will simply be a question of "the survival of the fittest.

Prof. Cook—I firmly believe that this question must be eventually settled by law, and that, too, in the highest courts; and here we shall need the Union. When the question is carried to the highest courts and settled, the bees will remain, as it can be proved, and our best horticulturists now admit, that grapes cannot be successfully grown without the aid of the bees in fertilizing the blossoms.

R. L. Taylor-If these are the facts, and horticulturists can be convinced that they are facts, there will be no lawsuits. The next subject brought up was

#### MARKETING HONEY.

R. L. Taylor-It may not be the best way, but I send my honey to commission men.

flilton-I sell my own Geo. E. honey; or leave it with grocers to be sold on commission.

John Rey-I have built up a good home market by scattering the AMERICAN BEE JOURNAL "Leaflets," Amenican Bee Journat." Leaflets.," and by advertising the honey in the local papers. I give the editors some boney, and they tell how nice it is, and you ought to see the orders for honey come in ! I never allow a sec-tion or package of any kind to go out that does not bear my address, A. I. Root—We always take es-pecial pains to keep different kinds of honey put up in all styles and sizes of packages all ready for customers. It is quite a point to be ready at a mo-

ment's notice to hand out just what a customer asks for.

Dr. Higbie-We must advertise; have a neat little sign, "Honey for Sale," to hang out.

Geo. E. Hilton-This matter of marking our sections and crates is important. I stencil each side of my crates, and also put a large display card in each crate, and on the card this is printed: "Nice clover honey from the apiary of Geo. E. Hilton, Fremont, Mich." This card the grocer can hang in some conspicuous place.

Dr. Ashley—I try to keep up the market, but the trouble is that some farmer with a few colonies brings in his honey, in poor shape perhaps, and sells for whatever the grocers will pay him, and this demoralizes the market.

A. I. Root-Buy him out.

Prof. Cook-This plan will answer when a man has a "big factory and lots of money," but every bee-keeper cannot buy all the honey that somebody is bound to give away.

#### Next came a few words about

#### HONEY, AT FAIRS.

H. D. Cutting-I consider Fairs one of the greatest educational institu-tions we have. The Michigan State Agricultural Society has dealt very liberally with bee keepers, but if beekeepers expect to keep the premiums at their present figures, they must turn out better than they have lately.

Prof. Cook-When I was over in Toronto, it was astonishing to see the amount of honey that Mr. Jones sold at the Fair. One way was to cut sections of honey from corner to corner, selling each piece for 5 cents.

W. Z. Hutchinson-I should think there would be trouble from "visitor" bees.

F. H. Macpherson-We kept the honey under wire dish-covers.

A. I. Root-We sell honey at our Fair, and have no trouble with bees, but none are allowed to load up and get away. I visited all the candy, cider and lemonade stands, furnished each proprietor with a "shingle" and extracted a promise that it should be used in killing every bee that at-tempted to load up. The Fair ground is near our apiary, and the Fair lasted three days during a dry time, yet there was no trouble.

It is a pretty hard matter to knock Dr. Mason "off his pins," but it was very neatly done at this point, by making him an honorary member.

The committee appointed for the purpose, then made the following

#### REPORT ON EXHIBITS.

We beg to report as follows on the exhibits

nice samples of honey in glass buckets; also the Stanley extractor for four frames

Dr. G. L. Tinker had on exhibit his beautiblack walnut. A. D. D. Wood showed sand-papered one-piece sections in basswood and white poplar;

piece sections in basswood and white poplar; also four-piece poplar sections. A. M. Gander exhibited honey in eases of different sizes; also bottles of the Muth description; honey in sections, and a com-bined frame and hive. T. F. Bingham, of Abronia, Mich., had the "Doctor" smoker and the Bingham honey-binite hoth of which are well known

knife, both of which are well known.

Dr. A. B. Mason, of Wagon Works, Obio, showed three samples of granulated honey, and a sample of the same liquified, all of which is very interesting. Also some heads of the Chapman honey-plant, just about to bloom; which is another proof of the value of the plant, showing, as this does, its hardi-ness ness.

Mr. T. F. Bingham also showed the surplus honey department of the stingless bees of Houduras.-F. H. Macpherson, A. I. Root, and Geo. E. Hilton.

Mr. A. I. Root then called attention to a

#### QUEEN-EXCLUDING TOP-BAR.

This was exhibited by Mr. A. M. Gander. The frame had a double top-bar, i. e., two top-bars one above the other, *a la* Demarce; and in a slot, extending the whole length of the upper top-bar, was slipped a strip of perforated zinc. The upper top-bar is wide enough to make the topbars close-fitting.

T. F. Bingham—We have here a fine illustration of what a patent will do in the encouragement of invention. This is clearly an attempt to secure, in a different manner, the same re-sults as Mr. Heddon does with his honey-board. There are these ob-jections to it: To make a set of trames requires more pieces than to make an ordinary set of frames and Mr. Heddon's honey-board in the bargain; then the propolis will accumulate along the edges of the top-bar, and it entirely prevents the adoption of the "contraction method" without on immense amount of complication.

W. Z. Hutchiuson-What advantages do you claim for your frame, Mr. Gander ?

A. M. Gander-When I use a honey-board, and take it off, the bottom of it is covered with brace-combs, and I do not like this.

W. Z. Hutchinson-Why do you remove the honey-board?

A. M. Gander-Why, to handle the frames.

W. Z. Hutchinson—Why do you handle the frames?

A. M. Gander-In the fall I wish to take out some of the combs.

Mr. Bingham then made a few remarks on

#### WINTERING BEES.

He considered it important to put a rim  $1\frac{1}{2}$  or 2 inches wide under each hive in winter. It allows the bees to cluster naturally npon the lower edges of the combs; the dead hees and rubbish can drop out of the way, the combs are always dry and clean, and the entrance never clogged. He advised its use both out-of-doors and in the cellar. His bees are kept upon platforms. He prefers three hives upon each platform, and the platform is 2x6 feet in size, and raised from the ground perhaps a foot. The bees are prepared for wintering by packing them in fine hay upon these plat-forms. The bives are moved near together, and raised a few inches in such a manner as to give them a slight slant towards the entrance. Hay is packed under them, around the sides and over the top. On the Hay is packed under top. On the the sides and over the top. Panels of top it is 14 inches deep. Panels of boards are used, too, for keeping the hay in place, and the boards are held together by nailing on strips of hoopiron around the corners. Of course all is served with a roof. There is a spout or bridge from each entrance to the outside. This spout is % of an inch high, several inches wide at the back end, but tapers to one inch at the outside, where it meets an auger hole bored in the outer boards. After packing, the bees receive no more attention until it is time to make ready for the surplus. Mr. B. has been uniformly successful in wintering bees.

Mr. Root had tried closing the en-trances, and also leaving them open. He favored a generous entrance, left wide open.

The convention then adjourned sine ie. W. Z. HUTCHINSON. die.

For the American Bee Journal.

# Legislation for Bee-Keepers.

### C. G. BEITEL.

On page 742, Dr. C. C. Miller de-sires the views of bee-keepers on the desirability and feasibility of obtain-ing certain legislation looking to the securing of bee-keepers in their locations as to territory. I presume the idea is to ask Congress for this protection. If each State was to legis-late for its own bee-keepers, we Pennsylvanians could hardly consider it feasible, for to legislate for the pro-tection of bee keepers would be class legislation, and the courts of this State are opposed to such legislation, and while it is true that the courts do not make the laws, yet they construe them, and always most strictly against the class, and most favorable to the general public.

We have many laws that come within the above category, and the same laws may be found upon the statute book of other States, viz: mechanics' lien laws, for the protection of mechanics and material men; for laborers, to protect their wages, and many others. I merely mention these to show what I mean by class legislation. Many of these laws are fruitful sources of litigation, and to such an extent has it been carried, that it is hardly safe to hile liens, ex-cept under the supervision of a good cept under the supervision of a good lawyer.

In addition to this, the new constitution of Pennsylvania, adopted by the people in 1873, contains a clause, in which among other things it is provided "that the General Assembly shall not pass any law granting to shall not pass any law granting to any corporation, association, or indi-vidual, any special or exclusive privilege or immunity;" and while this does not

prohibit the legislature to pass such laws for a class of individuals, in so many words, yet in spirit it surely does, and while we lind no such prohibition in the Constitution of the United States, I doubt not that the spirit expressed in ours, would govern Congress in considering such a bill, because in principle it is antagonistic to our free institutions.

Again, when we scan closely a law such as is contemplated, we cannot fail to perceive what a source of litigation it might lead to-the question of priority of location would often be as difficult to establish as that of priority of invention, and unless Congress in enacting such a law would give jurisdiction to State courts to try these questions, they would have to be tried in the United States courts, the same as patent-right questions, which would entail enormous costs and expenses on litigants, who rather than incur them, would abandon their rights, and thus render the law nugatory.

These few hints might be greatly elaborated, but they are sufficient for me, to decide not only against the *leasibility*, but also against the desira-bility, looking at it simply from a legal stand-point.

Easton, + Pa.

#### For the American Bee Journal.

### The New Races of Bees.

#### S. SIMMINS.

With regard to the temper of these bees, I intend to confine my remarks to the character of those workers produced by *imported* queens only, and by so doing I hope to enable those as yet unacquainted with them to choose the good and refuse the least desir-able kinds; and after obtaining the varieties recommended, I feel no hesitation in saying that the truth of my words will be fully sustained.

I would ask those who have tried only one or two queens of either kind, whether they consider it fair to run down these bees upon so slight an acquaintance, and what is really no experience at all. Are they certain that their one queen was imported? To get at facts we must start at the fountain-head, or we shall never find the truth if the adverse reports given emanate from those who do not have pure bees.

With regard to Cyprians, my own experience is completely at variance with that recorded by many. It may surprise some readers when I say that of all bees yet known, I would rather work with Cyprians than any other variety. I do not for a moment say that those who have given unfavorable reports, may not have started with a vicious lot, but I do assert that out of more than a dozen colonies headed by imported queens, I have not one which cannot be handled without smoke at any time of the day, on dull days, windy or fine days,

the combs cleaner and more quickly than any others, and yet while being handled very few fly into the air. They will continue to breed and store while Italians are starving, but unlike the latter they are not suitable for comb honey production, as their cappings lie close upon the honey, pre-senting a damp-looking surface. The pings he close upon the honey, pre-senting a damp-looking surface. The workers are extremely beautiful and pleasing to the eye, and when properly handled, are as gentle as they are beautiful. The queens are very pro-lific, and will work a colony up to full strength in a remarkably short time.

That these bees are a most valuable acquisition to an apiary, no one who has thoroughly tested them can deny; but the reports as to their vindicative temper have restrained many from keeping them. I do not know whether those who speak ill of them use smoke while manipulating; if so, it explains the whole thing, as its application is a fatal error, and certain to arouse their ire. I use none, but gently turn back the quilt, wait a moment or two, and then with a quiet, firm motion do all that is required. Upon first re-moving the quilt a slight hissing noise of wings is heard, but this is caused more by the bees running from the light than by those coming up, and even if they boil over on top of the frames, if the operator will only pro-ceed as advised, he will be surprised to find that not one bee has any intention of stinging, and they may be shaken off the combs like so many flies.

One writer says that upon the slightest jarring many infuriated bees will fly out and sting him; perhaps they will if smoke has been used, but without it I have divided strong colonies in several stories, and some jar-ring could hardly be avoided; I have carried full colonies iuto my manipulating house on a dull day (to prevent chill), and have cut out a score of queen-cells at a time, with no stings, and hardly a bee has flown from the combs. And let it be noted that no matter how long the frames are left uncovered, or what length of time the operator may be about what he is doing, the bees remain good-tempered and perfectly at rest, provided only as before stated, that no smoke be used.

I have given many facts, but need I give more to prove that Cyprians are coming to stay? In time to come those who now condemn them will be forced to acknowledge the merits of these extraordinary bees, or be con-tent to fall behind in the great apicultural race of keen competition.

Mr. G. M. Doolittle has discarded Syrians because they would breed too extensively when bees are not wanted, and not well enough early in the season; also that they are very vicious. About half of my own Syrian colonies can be handled easily without smoke, while the rest are most difficult to manage; but if they were a desirable race to cultivate, there is no reason why all should not be bred from those queens which give the more gentle bees. With regard to breeding at the wrong time. I believe Mr. D. is right, though for this very reason they may

winter is not seen. Even this disposition might be modified after the lapse of two or three years, and their brood-rearing be regulated according to the state of the climate in which they may find themselves. However, they have no desirable traits other than what the more beautiful Cyp-rians possess, while they are not so quiet under manipulation as the latter; I have therefore decided that I have no use for them.

The Palestines are even more uncertain in temper than Syrians, while they have an unpleasant habit of biting the fingers of the operator, they also develop laying workers more persistently than any of the races yet named, and the probability is that there will be no permanent demand for them.

Carniolan bees are, without doubt. the most easily handled of all, as almost any amount of rough treatment fails to make them bad-tempered; and yet they are not surpassed by any in defending their homes against intruders of their own kind. Contrary to the statements of some, I have found that this race is quite distinct found that this race is quite distinct in character and appearance from the common black bee. The queens are generally dark, but bronzed on the underside of the abdomen, while many have yellow bands, and some are quite yellow; yet all produce workers of the typical sort. The lat-ter should show no yellow bands, but ter should show no yellow bands, but upon the first segment of the abdomen is generally found a scarcely distinguishable shade of that color, and then follow several extremely broad, white bands, giving the bee a very beautiful appearance.

As regards their working capabilities, they are superior to either Itatthes, they are superior to either Ital-ians or natives, and in building up in the spring, surpass all but the Cyp-rians. They are extremely active when anything is to be obtained, while in dull weather, and during winter they are particularly quiet, and bear confinement during a jour-ney better than any bees I have the source the second of the second of known. Here we have the secret of their remarkable wintering qualities, and if this good point alone be con-sidered, where is the apiary in your northern latitudes, or in our own uncertain climate, that can afford to do without them ?

While Cyprians are more suitable for extracting purposes. Carniolans, though not quite so good honey-gatherers, are particularly adapted to the production of comb honey; while a cross between a Carniolan queen and a Cyprian drone will give an "all-purposes" bee not to be excelled by anything yet found. Just here is a fact which must convince all that Carniolans are quite distinct from blacks. In crossing the latter with yellow drones, generally only one band of yellow is shown in the worker, never more than two; but when mated with a Cyprian drone, many of the bees from a Carniolan queen, though very large, will be marked like Cyprians, others not so marked like Cyprians, others not so bright, but of better color than any Ligurian bee. A Cyprian queen mated with a Carniolan drone does

not produce a single dark bee, and all have 3 yellow bands, while the color is but a shade darker than the pure yellow variety. Each of these crosses may be handled either with or without smoke.

Carniolans are not quite so steady on the combs in handling as Cyprians, neither are they so easily shaken off, and when they are so treated a great many fly around. Though equally as good tempered, it is here that my preference comes in for working with Cyprians. I can find no other fault with Carniolans, but another good quality possessed by them must not be overlooked-I find them longer lived than any other variety, a point of even more importance than their extraordinary breeding powers—one which in connection with their perfectly restful condition under confinement, renders them particularly de-sirable for all cold and uncertain climates.

I am aware that some who have had but one or two queens of this kind have spoken unfavorably as to their honey-gathering qualities, but I am in a position to assert as a fact that these bees, by the side of Syrians and Ligurians, have given more bees and more honey than any. Those who have not found it so should not discard the whole race, but try again, and see what other queens will do, and then breed from the best, just as they profess to have done with Italians.

Two other good points are possessed by both Carniolans and Cyprians. They are not given to robbing; and in making up nuclei with these bees, they will almost invariably stay where placed.

In conclusion I would say that much is due to Mr. Benton, for plac-ing before us more prominently these new varieties of bees. It would per-haps be too much to say that these bees will cause a revolution in our industry, but that the two most de-sirable kinds mentioned will soon be found superseding Italians in most apiaries, even where the former are now strongly opposed, I am fully persuaded, as their marked superiority must bring them to the front.

Rottingdean, England.

# The Honey-Producers' Association.

#### J. V. CALDWELL, (125-208).

The idea of an association to control the price of our honey crop has impressed me very forcibly. First, is there anything tangible or practical in the idea? I say no, most emphati-cally. Iloney is one of the products of the farm, and as such it must be placed on the market in precisely the same manner as any other product.

l am very sorry that our product has gone down in price, as it has this season. As I am depending upon my

of one of the best in my 14 years' experience. If we could all agree on a fixed price for our honey, and also agree to take no less under any circumstances, there might be some en-couragement to form such an association. But there are, in my opinion, at least the two following serious obiections:

1. Most bee-keepers, when their product is ready for the market, want the money for it, or its equivalent. Now, suppose the crop has been a good one, as is the case here this season, and, for instance, the price of good comb honey is placed at 20 cents per pound and the market price is per pound, and the market price is only 10 cents. What is to be done? The producer cannot hold over his honey until another year, as can the wheat and corn raiser, but he must sell. But it may be said that the price will not go to such a low figure, if it were not for the small bee-keepers, who, not making a business of bee-culture, care but little about the price they secure for their few hundred pounds.

2. What are we going to do with these farmers and small producers? They will sell, and at a low price very often, and it seems to me that we could not induce them to join any such organization as the proposed one; and, granting this to be the facts in the case, just as soon as they saw the price of honey fixed at a higher figure, they would have an induce-ment to produce more honey, and thus crowd an already overstocked market; thus making matters worse than they are at present.

It is my candid opinion that there is but one practical method of accomplishing the desired end, and that is for a few rich aplarists to form a "corner," and each season buy all the honey produced in the United States and Canada; but where, oh, where, is the Gould or Vanderbilt among us? If any of our fraternity can suggest a more practical plan, by all means let us have it.

Cambridge, o Ills.

How Bees Exercise, Hibernation, etc.

#### DR. G. L. TINKER.

On page 746, Mr. Demaree presents a very able article upon the above subject, and it is one upon which we certainly require more light. To certainly require more light. To make up the issue fairly and squarely, Mr. D. denies that bees ever resort to "exercise" to raise the temperature when subjected to severe cold. No subject pertaining to wintering has a greater practical hearing than this one of exercise. We need a thorough understanding of the conditions that compel bees to exercise, and which is the formula of all and the second the second sec the forerunner of all our great disas-ters in wintering, and of those other conditions that secure hibernation, in which all the energies of the bees are conserved in the highest degree in

is not perhaps the kind of exercise that Mr. Demaree has had in view. It is certain that they never drum with their wings or "kick up their heels." or get on a "tear," but when they wish to "warm up" to a state of activity from a state of hiberna-tion, they simply begin a forced res-piration—the opposing force coming from the effect of a low temperature. As they warm up the respirations are accelerated until a temperature in the cluster is reached that enables ordinary activity. No other movements are ever observable until a very rapid respiration is acquired, when they begin to move about as we always see bees in the working season -never at rest.

I have viewed the actions of bees at low temperatures a great many times, and have found that although there was the "oppressive stillness" to which Mr. D. alludes, yet the bees could be seen moving about con-stantly. Their short, quick respirations could also be seen. Now a con-tinuation of this state of activity of bees subjected to severe cold is all that is necessary to develop a typical case of diarrhea. The state, more-over, in no wise differs, as above intimated, from that seen in summer They are simply active, and time. the whole colony in a condition to take food at all times. Of necessity they do eat, and, as we know from the great loss of weight of unprotected colonies, they eat largely. I have had colonies in single-walled hives to lose 30 pounds of weight in winter before any breeding to speak off took place, the bees dying off until only a pint or so were left by April 1. Unavoidably they had diarrhea, and they spring dwindled. On the contrary, I have found where bees are subjected to proper temperatures in wintering that they hibernate most of the time, con-sume very little food, lose few bees, and come out in the spring vigorous and healthy colonies.

Mr. Demaree makes a strong point when he says, "that bees feed regularly when closely confined in the cluster in extreme cold weather, like they do in the season of their activity, is a supposition only—it has never been proved that they do." Allusion was made to this matter in the October issue of the Apiculturist, and I will now further explain that intervals of several days elapse between "feeding times," when bees are bibernating. The intervals are passed in a state of profound rest that is a true hibernation (I beg the indulgence of Prof. Cook) "in the 'scientific' and ordinary meaning of the term," as Mr. Demaree lucidly remarks.

The "feeding times" last two or three hours, when they assume the hibernal state again, and are as composed as the other colonies near them. I have never seen sluggish bees partaking of food in the hive, and it seems certain that they are incapable of feeding in the torpid state. The popular notion that bees eat regularly in winter confinement is based upon the known fact that they require food. There is no other reason for the no-tion. It has been said that the bees

and that the sluggish ones on the outside of the cluster are all the while crawling into the centre to get warm ! But nothing could be further from the truth. The sluggish bees remain on the outside of the cluster until the colony warms up to feed, and if they are too far away from the edge of the cluster to get warmed up, they in-variably die. Each bee helps itself to food, and none is passed from one to the other that I have been able to detect. Yet it is quite possible that they do feed each other as they ordinarily do when in the active state: but nothing can be more certain than that they do not eat at all during the intervals of torpidity.

Hibernating bees assume a compact cluster, and to the unaided eye appear the same as a cluster that has starved to death, such is the profound in-activity. Single bees can be seen in the same position for 24 hours at a time, and no doubt for days together. If we take out a comb on which the bees are clustered, we find them sticking together so closely and firmly that it is with fears that their limbs will be torn asunder in the operation. At first they have little movement, although aware of the disturbance, and appear benumbed and act like other hibernating insects as they begin to succomb to the effects of cold. Isolated bees become helpless, but the united cluster is capable of warming up and becoming active very soon. The question, therefore, arises, if all hibernating insects would congregate in clusters as do bees on non-conducting surfaces like the wax of honeycomb, would they not act much the same as bees under like circumstances?

Those who assume "to know" that bees never hibernate, must admit that their actions are very peculiar when subjected to cold ; that no warmblooded creature in existence in the state of "quietude" ceases all perceptible respiration and movement for days together. I therefore assert that the terms "quietude," "re-duced activity," "quiescence," etc., are quite inadequate to express the state that bees enter in winter confinement under proper conditions. It seems to me that the term "hibernation " expresses the state exactly, and is the proper one to use, although the hibernation of bees is a limited one of periods, probably not exceeding ten or twelve days at a time. New Philadelphia, O. O.

#### For the American Bee Journal.

# Cedar Valley, Iowa, Convention.

The Cedar Valley Bee-Keepers' As-sociation met at Vinton, Iowa, on Dec. 7. 1886, at 1:30 p.m. President C. P. Hunt in the chair. Hon. D. E. Vorris, Mayor of Vinton, gave the address of welcome, which was re-sponded to by President Hunt, and the Mayor made an honorary member.

The report of the Secretary was read and approved, and after the rou-

near the honey take it up and pass it time of business, the question-box was along the line to the hungry ones, opened, some of the questions being opened, some of the questions being answered as follows:

> Which is the most practicable, cheapest and safest plan of wintering bees in this latitude? D. W. Thayer winters his bees in a cave. stoned up and covered with earth. It has double doors, ventilation pipe running in at the bottom, and a pipe running out at at the top. It was generally thought that wintering in the cellar was better than wintering on the summer stands. About 45° was considered the best temperature.

> Are sound vegetable in the cellar a detriment to bees? All thought it best not to have any kind of vegetables in a cellar where bees are kept.

> What is the best method of getting the most comb honey, and the least increase? Keep queen-cells cut out and give plenty of room to work.

> What are the wintering qualities of honey-dew? It was thought that it is not fit to winter bees on, although Mr. Robt. Quinn had wintered his bees on honey-dew with success, but prefers good clover honey.

> To move bees a distance of seven miles, when would be the best time? In the spring, about May 1, if the weather is nice.

> Which is the better place for an apiary, a slope to the south with artificial shade, or an orchard sloping to the north? The south slope was preferred.

> After some discussion on market-ing honey, A. J. Norris, H. O. Mc-Elhany and R. Quinn were appointed a committee to report next day on the desirability of forming an association for marketing honey and obtaining supplies.

Adjourned to 9 a.m.

The President called the meeting to order at 9:30 a.m. The committee re-ported in favor of forming an associa-tion. The report as well as the following were adopted :

Resolved, That a committee of five be elected, whose duty it shall be at their earliest convenience to draft constitution and by-laws, and perfect the organization of "The Cedar Valley Bee-Keepers' Produce and Supply Union," and submit, by cor-respondence, the result of their de-liberation. They shall also be author-ized to incorrects if they thick both ized to incorporate, if they think best, to secure members, elect officers and an agent, and to call a meeting of the members at such a time as they deem necessary for the best interest of all.

The following were elected as the committee: C. P. Hunt, of Water-loo; A. J. Norris, of Cedar Falls; H. E. Hubbard, of La Porte City; G. W. Harbin, of Waterloo, and Henry Harbin, of Waterloo, and Henry Miller, of Vinton; the committee to meet at Waterloo, on Dec. 28, 1886, and select two more to act on the committee.

All persons interested in forming this association are requested to cor-respond with the Secretary of the association, who will forward all necessary information.

H. E. HUBBARD, Sec. La Porte City, O Iowa.

#### Local Convention Directory.

1887. Time and place of Meeting. Jan. 8.—Hardin County, at Eldora, lowa. J. W. Buchanan, Sec., Eldora, lowa. Jan, 11-13.-N.Y.State, E.N.Y., &c., at Albany, N.Y. Jno. Aspinwall, Sec., Barrytown, N. Y. Jan. 19, 20.-N. E. Ohio, N. Pa., &c., at Andover, O. M. E. Mason, Sec., Andover, O.

In order to have this table complete. Secretarles are requested to forward full particulars of time and place of future meetings.-ED.

Cold Wave in New York.-Ira Barber, De Kalb Junction, 5 N. Y., on Dec. 6, 1886, writes :

A cold wave is hovering over this locality, and for the past four days the mercury has been from 1° to 24° below zero, and still holds its grip. In my bee-cellar the temperature was at 46° above zero yesterday, while outside it was at  $22^{\circ}$  below zero. I would much prefer to have the temperature  $10^{\circ}$ higher in a cellar as damp as mine is, at this stage of winter. Our honey at this stage of winter. crop was a perfect failure, and the number of colonies of bees in north-ern New York will be greatly reduced for another season.

Good Season for Bees.-F. A. Snell, Milledgeville, vo Ills., on Dec. 7, 1886, says:

The past season has been a good one here. I commenced on June 1 with \$5 colonies; I now have 140 all in winter quarters, and in good condi-tion. My surplus honey crop was 5,000 pounds of comb honey and 8,000 pounds of extracted.

Winter Convention in Chicago.-James Heddon, Dowagiac, 9 Mich., writes:

I have read Mr. Baldridge's article discussing the feasibility of holding an American Bee-Keepers' Convenorganizing and taking measures for protection against the ruinously and needless steady decline in prices for needless steady decline in prices for honey. It seems to me that an or-ganization of the right kind may, as Mr. Baldridge says, effect much in the direction of our interests and rights. Mr. Baldridge has well said many things that I have often thought. Looking to our mutual rights and interests as honey pro-ducers Lam in favor of such a conrights and interests as honey pro-ducers, I am in favor of such a con-vention, and know of no better time season, from "200 to 300 pounds of for winter as do Messrs. Dadant &

to hold it than this winter; and if we could hold it as soon as New Years, could we not have the benefit of half fare over nearly all the railroads going into Chicago? I believe a convention of this kind will benefit us more than all other conventions we have held for years. All American bee-keepers, whether present or not, will be in full sympathy with us. Health permit-ting, I will promise to wave all other business and attend; bearing my share of the expenses, and doing my part of the good work.

Good Report.-J. V. Caldwell, (125-208), Cambridge, vo Ills., on Dec. 8, 1886, gives the following report for 1886:

On May 1, 1886, I had 125 colonies of bees in fair condition. They in-creased by natural swarming to 208 colonies, and gave me 13,000 pounds of comb honey, all in one and two pound sections.

Hardin, Co., Iowa, Convention.-J. W. Buchanan, Eldora, O Iowa, Secretary of the Convention, writes :

The bee-keepers of Hardin county, I he bee-keepers of Hardin county, Iowa, met in Eldora, on Monday, Dec. 6, 1886, and organized the "Hardin County Bee-Keepers' Association," with Mr. John Ely, President. The next meeting will be held on Jan. 8, 1887, at Eldora. All interested in bee-keeping are cordially invited to attend attend.

Managing the Sale of Honey .-Henry W. Haag, Pettit,+o Ind., on Dec. 6, 1886, writes:

The season this year has gone and the winter has come, and it was a good honey season in this locality. 1 good honey season in this locality. I have 24 colonies in winter quarters, which are in fine condition. I winter my bees in a cellar, and I was very successful last winter, and I hope to be the same the coming winter. I have been thinking of the same points as mentioned by Mr. L. N. Tongue, on page 762. There ought to be something done to protect bee-men that make bee-keeping a spe-cialty, as there are those in this part cialty, as there are those in this part of the State that sell their honey for little or nothing, and when we bring our honey to market, the grocer says that he can buy all the honey he wants for from 9 to 10 cents per pound; but I say that the times will become harder before I will sell for such prices. I think it would be a good plan for the honey-producer to make the price instead of the grocer doing Now let us stick together and see how it will work.

Non-Swarming Hives-Disturbing Bees.-M. M. Baldridge, St. Charles, J Ills., writes :

Some one on page 776 has found a "non swarming hive." that, if man-aged for surplus, as all good bee-keep-

honey, and without any increase." I suppose we could be sure of that much honey by using that hive, whether the flowers yield honey or not. This would be better, perhaps, than what Mrs. Cotton guarantees! What a pity it is that I did not have such a hive in 1880, when I did not get enough surplus honey from peoply get enough surplus honey from nearly 200 colonies to give me and my family one good square meal! The foregoing statement seems to be in harmony with another, in the same article, which reads thus: "The broodchamber should never be disturbed after the season for honey-gathering has commenced, if bees are expected to gather a large surplus." Now, my experience taught me many years ago, and still teaches me that, if you wish to secure a large yield of surplus honey, a proper and frequent disturb-ance of the brood-chamber will secure just that result—provided, of course, there is plenty of honey in the flowers, etc.

Opposed to Legislation for Bee-Men.-R. Gammon, Rockton, & Ills., writes:

In reply to Dr. Miller's request about legislation for bee-keepers, I will say that I think we have seen too much class legislation in the last 25 years, in favor of banks and railroads, and I for one would not want to see it for bee-keepers; as it seems to me it interferes with our free government.

The Market Reports.-O. B. Barrows, Marshalltown, O Iowa, says :

The editor asks "all the rest of his readers" to tell what they think about Mr. Baldridge's proposition to exclude the market reports from the bee-papers. If two editions were published to accommodate both factions, I think I had rather have the one containing the market reports.

Moisture in Hives.-John Rey, East Saginaw, Mich., on Dec. 10, 1886, says:

My hees are having a fine flight today; the weather is fine, just right for bees. There is no diarrhea among them yet. They are in a healthy condition, and I notice that the bees of those hives that have some water or moisture running from them, carry it it is nothing but clear water. I think that is the way bees get rid of the water or moisture in the hives when they get a chance to fly.

Results of the Season.-Mexico Sperry, La Harpe,+o Ills., on Dec. 2, 1886, says:

I have been taking the AMERICAN BEE JOURNAL for three years, to which I attribute most of my success. Last winter, out of 23 colonies. I did not lose one. I took 6 more on shares, and I have had 22 swarms and sold 15

Son. I have taken 1,900 pounds of extracted honey, and about 1,800 pounds of comb honey in two-pound pounds of comb honey in two-pound sections. I am very well satisfied with the honey crop this year, but I had to sell it cheap—extracted honey for from 5 to 7 cents per pound, and comb honey for from 10 to 15 cents per pound—on account of a neighbor bee-keeper who sold his honey for 5 to 10 cents per pound. I prepare my bees in October for winter, and I find it the best. I think that every bee it the best. I think that every bee-keeper ought to take the BEE JOUR-NAL. I would not do without the BEE JOURNAL for anything.

Good Fall for Honey.—E. W. Powers, Palmyra, 5 Tenn., on Dec. 4, 1886, writes :

I have 28 colonies of bees, all of which are in good condition for win-ter, with from 25 to 50 pounds of honey each. This has been the best fall for honey that we have had for 2 or 3 years. This locality is a very good one for an apiary I think, as we have a few of the many resources of honey, which consists of white clover, buckwheat, linden and poplar; the last yielding the greatest quantity, but continues only about twenty days. My bees work on buckwheat but very little; why it is I do not know, unless they find something better.

A Little Tennesseean's Report.-Master Charlie H. Austin, of Johnson City, & Tenn., on Nov. 30, 1886, wrote us the following :

I thought that I would write to you (as my papa is taking the BEE JOUR-NAL, and has not time to write for it), and tell you how our little Italians are getting along in Tennessee. We have 15 colonies; papa does the work, and I do the smoking. Our bees are in good condition for winter. We sold all of our spring honey in one-pound sections for 20 cents a pound. I am a a little boy just 10 years old.

Reports of the Market.-J. O. Shearman, New Richmond, 9 Mich., on Dec. 12, 1886, says:

On page 771 the editor asks all to answer the question about excluding the market reports of commission men. They are generally the first thing that I read; I would sooner ex-Those reports benefit the BEE JOUR-NAL as much as they do the commission men.

#### Keeping up the Price of Honey .-E. T. Flanagan, Belleville, 9 Ill., says:

I have talked to several bee-keepers in regard to Mr. Baldridge's arti-cle on page 774, and all say that he has struck the key-note. We must organize, we must put up and keep up the price of honey or quit the business. All agree that a convention at Chicago, very soon, would be a proper step in the right direction; and all were unanimous in regard to the commission men in large cities.

Do not allow them the columns of the bee-papers, even if they pay for their space as advertisers, as they have greatly injured the bee-business. Appoint some one in every centre to buy up the honey of the small bee-keepers that spoil the trade. I, for one, believe that a call for a convention would be responded to from all over the United States. But I may be too sanguine.

#### Securing Lower Freight Rates.-Henry L. Rouse, Ionia, & Iowa, writes:

As I wish to join the Bee-Keepers' Union I send the \$1.25. I am of the opinion that if bee-keepers would organize it would benefit them not only in holding the price of honey, but also in securing lower rates of freight. When it costs 50 cents per 100 pounds to ship honey from Iowa to Chicago, and only 80 cents per 100 pounds to ship from San Francisco, Calif., to Philadelphia, Pa., something is wrong somewhere. We (the bee-keepers) should endeavor to establish a lower rate of freight by some means or other. I should like to see the matter agitated a little anyway.

Labeling Honey, etc.-Charlie W. Bradish, Glendale, 5 N. Y., on Dec. 7, 1886, says :

At this date, when the mercury is below zero, my 140 colonies of bees are packed in the cellar in good condition. The past one has been a good condi-tion. The past one has been a good season for honey, but not for in-crease. I have sold over 4.000 pounds of honey in this county, and I can sell of the part of the search of the part of the part of the search o for extracted, and 12½ cents per pound for extracted, and 12½ cents per pound for comb honey. I label my honey, and I find that it pays to do so.

#### Convention Notices.

The next annual convention of the Cort-land Union Bee Keepers' Association will be held in Union Hall, at Cortland, N. Y., on Jan. 12, 1887. D. F. SHATUCK, Sec.

The eleventh annual meeting of the N. W. Ilis. & S. W. Wis. Bee-Keepers' Association will be held in the Grand Army Hall in Rockford, Ills., on the tbird Tuesday in January, 1887. There will be a two days' session. J. STEWART, Sec.

127 The Northeastern Ohlo, Northern Pa, and Westero New York Beckeepers' Association will hold its 8th annual convention in Chapman's Opera Honse, at Andover, e., on Wedneeday and Thursday, Jan. 19 and 20, 1887. First-class hotel accommodations are offered at \$1 per day to those attending the convention. A general in vitation is extended to all. M. E. MASON, Sec.

The New York State, the Eastern New York and the New Jorsey & Eastern Bee-Keepers' As-sociations will hold their great united convention at Albany, N. Y., on Jan. 11, 12 and 13, 1886. This convention will be one of the largest, if not THE largest, ever beld anywhere lo this country, and it behooves every bee-keeper to attend. A grand exhibit of aplarian fixtures is promised. GEO. H. KNICKERHOCKER Sec. N. Y. State. JOHN ASPINWALL, Sec. Eastern N. Y. F. E.-JOHNSON, Sec. N. J. & Eastern.

The next annual meeting of the Nebraska 137 The next annual meeting of the Nebraska State Bee-Keepers' Association will be held in Lincoln, Nebraska, on Wedneaday, Jan, 12, 1887, at Ried Ribbon Hall, commencing at 1:30 pm, and continuing for 3 days. E. Kretchmer, oi Cohnrg, Iowa, will deriver an address on Modern Apicul-ture. E. M. Hayburst, of Kanass City, and many others from abroad are expected. Members can return on one-thir fare over the B, M. U. P. and M. P. lines, by securing a certificate of phy-ment of fare to lancoin.from the agent of their sta-tion. In order to secure the reduced rates on re-turn trip members holding such certificates must present them to the Secretary of the Bee-Keep-ers' Association for endorsenent. II, N. PATTERSON, Sec.

#### Honey and Beeswax Market.

The following are our very latest quotations for honey and beeswax:

#### CHICAGO.

HONEY.—Market is well supplied with all the grades, and the demand is light. Prices ure nom-inal at 11612c, for white in 1-lb. sections. Fancy white in scant pound sections, 13c. Very little ex-tracted is being sold, and prices range from 407c. BEESWAX,=22c. It. A. BURNETT. Dec. 8. Is South Water St.

#### NEW YORK.

NEW YORK. HONEY,-In consequence of a large stock of coub boney on this market, fancy prices cannot be maintained. Fancy white honey in paper box-es, or grassed, are in better favor here than the unglassed boney, hence the difference in the price. We quote present prices as follows: Fancy white in 1-b. paper boxes, or glassed, 13c.; same unglassed, 12c., and in 2-b. glassed sectiona, 106 11c.; off grades 1 to 2 ets. per lb less. (alif, comb, %atoc; fancy bnckwheat 1-bb., 8% 496, and 2-bb. 7% 88c. Extracted white clover, none in the mar-ket. Callf, ext'd, o-lb. cans, 5% 66c.; buckwheat, in kegs and barrels. 4% 5c. BESSWAX.-21@23c. McCAUL & HILDRETH BROS., Dec. 7. 34 Hudson St.

#### BOSTON.

IIONEY.—The demand has improved. We are selling one-pound packages of white clover honey at 14@15c; 2-pounds at 13@14c, Extracted, 6@7c. BEESWAX.—25 cts.per lb. Dec. 7. BLAKE & RIPLEY, 57 Cbatham Street.

#### DETROIT.

HONEY.—The market is a trifle more active. Best white comb boney in 1-1b. sections, 11@12½0. Buckwent, 10c. Extracted, 7@9c. BEESWAX.—23c.

M. H. HUNT., Bell Braoch, Mich. Dec. 13.

CINCINNATI. HONEY.-There is a lively demand for table honey in square class jars, and the demand for menufacturers is slow for dark grades of ex-tracted honey. The ranking prices for extracted is 30% r.e. alb. Nice comb brings 12@15c. per lb. in # DEDSWAX.-Home demand is good. We pay 20@23c. per lb. Noy.10. C. F. Maru b Score

Nov.10. C. F. MUTH & SON, Freeman & Central Av.

#### CLEVELAND.

HONEY.—The market is not very active and pri-ces a little lower. Choice 1-lb, sections of best, white sell at 13@14c, second grade 1-lbs, 10@12c, choice white 2-lbs, 11@12c, Extracted, slow at 6a, BEESWAX.—Scarce at 25c. Nov, 17. A. C. KENDEL, 115 Ontarlo Street,

#### MILWAUKEE.

MILWAUKEE. HONEY.-The demand for honey is only mod-erate and the supply ample, of very fine quality and in extra good order. We quote choice 1-lo. sections of white at 12@13c; 2-lbs., 11@12c; dark not wanted. Extracted. white, in barrels, half-barrels and in kegs, 6065;c; in tin packages, 65% Arc:, dark, in barrels and ½-barrels, 5%6c. BEEESWAX.-Nominal at 25c. Dec. 13. A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

HONEY.—The market has been rather duller the last week, but prices are well maintained, par-ticularly for choice white extracted and choice white comb honey, as both kinds are not freely of-fered. We quote:  $3\frac{1}{2}\frac{64}{4}$  (i. for extracted, and  $9\frac{60}{2}$ ) (c. for cound); with easier sales for the best grades, than for the darker honey, as none seem to be able to use the dark just now. BEEESW AX.—Dull at 19 $\frac{922}{22}$ . Dec. 11. SCHACHT & LEMCKE, 122-124 Davis St.

HONEY.-Trade is quiet. Extra white comb llc; amher, 75@10c. Extracted, white, 4@454c.; am-ber.35@354c. BEESWAX.-20@23c. Oct.18. O. B. SMITH & Co., 423 Front Street.

#### ST. LOUIS.

HONEY.—Choice comb, 113/@12%c.; latter price is tor choice white clover. Strained, in barrels, 34/G4c. Extra fancy of bright color and in No, 1 packazes, ½ advance on above prices. Extracted in hurrels. 4/@5%e.; in cans 6@7c. Market dull. BEEEWAX.—Dult at 20c, for prime. Nov. 17. D. G. TUTT & CO., Commercial St.

#### KANSAS CITY.

KANSAS CITY. HONEY.-Demand is good for all grades, and re-ceipts have been very large of comb and extrac-ted. Home bee-men have kept out of the market until this month ; having glassed every lb. section on both sides they are reducing prices, selling 60 lbs, of glass with 160 lbs, of honey, making our market lower. There crop is about 70,000 pounds. We quote : White clover 1-lbs, 12(s)3c; 2-lbs, 11(c) 26-lbs, 13@14c; durk 1-lbs, 10c; 2-lbs, 26@9c.-California 2-lbs, 3%11c. Extracted white clover, 6C; dark, 46.5c; white sage Calif., 5%c; amber, 5c. BEESW AX.-=2c. Nov.20, CLEMONS,CLOON & Co., cor. 4th & Walnut.

THOMAS G. NEWMAN & SON. PROPRIETORS. 923 & 925 WEST MADISON ST., CHICAGO, ILL. At One Dollar a Year.

> ALFRED H. NEWMAN, BUSINESS MANAGER.

Special Notices.

To Correspondents. - It would save us much trouble, if all would be particular to give their P. O. address and name, when writing to this office. We have several letters (some inclosing money) that have no name; many others having no Post-Office, County or State. Also, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

When Renewing your subscription please try to get your neighbor who keeps bees to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a **Binder** for the BEE JOURNAL to any one sending us three subscriptions-with \$3.00direct to this office. It will pay any one to devote a few hours, to get subscribers.

The Report of the Indianapolis Convention is now published in pamphlet form, uniform with that of last year. It will be sent postpaid for 25 cents to any address.

We have also bound it up with last year's, together with the History of the Society; this we will mail for 40 cents. Or if you send us one new subscriber (with one dollar) besides your own renewal, we will present you with a copy by mail.

Money Orders can now be obtained at the Post Offices at reduced rates. Five dollars and under costs now only 5 cents. As these are absolutely safe, it will pay to get them instead of the Postal Notes which are payable to any one who presents them, and are in no way safe.

Reader, do you not just now think of one bee-keeper who does not take the Weekly BEE JOURNAL, and who should do so? Perhaps a word or two from you will induce him to do so. Will you not kindly oblige us by getting his subscription to send on with your own renewal for next year? When you do so, please select any 25 cent book in our list, and we will send it to you post-paid, to pay for your trouble. We are aiming to get 5,000 new subscribers for 1887, -will you not assist us to obtain them?

#### **OUR CLUBBING LIST.**

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

| Price of both.                    | Club |

| Heddon's book, "Success," 1 50    | 1 40 |
|                                   |      |

Our Book Premiums .- To encourage all our present readers to get one or more additional subscribers we will present 25 cents' worth of books for every new subscriber (accompanied with \$1 for one year's subscription), sent direct to this office. Thus for five new subscribers with \$5, the getter up of a club gets \$1.25 in valuable reading matter, to be selected by himself from our list on the second page of this paper. It will pay you to devote a few hours to the interests of the BEE JOURNAL. Every one who keeps bees ought to take it. We will furnish sample copies free in any quantity to those who intend to get up clubs. We expect to get 5,000 new subscribers for 1887.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The printing, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides his own, with \$3.00, for one year, we will present a copy of this valuable book.

da na da na

New Subscribers are coming in rapidly -for this our thanks are tendered to the friends of the AMERICAN BEE JOURNAL, who are exerting their influence in its behalf. We should thribble our list at the present low rate of one dollar a year. We hope every one of our present subscribers will send at least one additional subscriber with the renewal for 1887.

We refer our Subscribers to our offers of premiums and net club rates for new subscribers, and if they will send us one or more subscriptions from among their neighbors who are interested in bees, they will get the premiums or Cash reductions as they may indicate-to pay for their trouble ; and at the same time they will be enhancing the usefulness of the JOURNAL and contributing toward its prosperity.

Preserve your Papers for reference. If you have no **HINDER** we will mail you one for 60 cents, or you can have one FREE if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

More Premiums.-Mr. L. J. Diebl, of Butler, Ind., offers a colony of Italian bees as a present to the person sending to this office the largest club of subscribers for 1887. The subscriptions may be-sent in at any time before the first of May at our regular club rates, and additions made as desired, but it must be stated that you are working for that premium, so that we can keep account of the subscriptions.

As a premium to the second largest club we will send my mail, postpaid, a copy of the "Farm Account Book," worth \$3. The postage is 20 cents.

As there is Another firm in Chicago by the name of "Newman & Son," we wish our correspondents would write "Auterican Bee Journal" on the envelope when writing to this office. Several letters of ours have already gone to the other firm (a commission house), causing vexations delay and trouble.

Fifty-Two Dividends from the investment of one dollar is just what every subscriber of the AMERICAN BEE JOURNAL receives. Can any better interest be found for the investment of one hundred cents? If so, where?

We anticipate a largely increased list of subscribers for 1887, as \$1.00 cannot be invested by any bee-keeper that will bring him better returns.

Patented June 28, 1881.

WHILE attending the North American Bee-Keepers' Convention at Indianap-olis, we learned there was a rumor afloat that the Patent on the ONE-PIECE SECTION that the Patent on the ONE-PIECE SECTION had been set aside--circulated by unprin-cipled parties, to unislead bee keepers. We would say in regard to this, that such is not the case. It is now before the U.S. Supreme Court, at Washington, and will probably be decided before a great while, when we will notify all through the Bee Journal. Until then pay no attention to rumors. Before ordering write us for prices. We will furnish you Sections as cheap as the cheapest. Let us hear from you before you order. Address.

cheapest. Let us order. Address,

J. FORNCROOK & CO., Watertown, Wis., Nov. 1, 1886. SOL

# The NEW Heddon

We have made arrangements with the inventor by which we shall make and sell the Heddon Reversible Hive, both at wholesale and retail: uailed and also in the flat.

The engraving gives a good idea of the hire. The brood-chamber is in two sections; also the surplus arrangement, which may be interchanged top and hottom of each section are as has one-half of a regular bec-space so that the surplus cases with the elections, may be placed between the two projects ambers, or the latter may be transposed or inverted—in fact, all purts of this hive are perfectly interchangeable. The brood-frames will all be bored for wres. A SAMPLE HIVE includes the bottom-hoard of and stand; a slatted honey-board, and cover; two surplus arrangements, each containing 8 frames ; prors, and the other without separators, This latter stores, and the other without separators. This latter stores, and ready for immediate use. Price, \$4.00, complete.

It is absolutely essential to order ane natted htve as a pattern for putting those ta the flat together correctly.

HIVES READY TO NAIL.—In filling orders for these hives, in the flat, we make 6 different com-hinations, so that our customers may make a selection from the sample nauled hive, without waiting for ns to quote prices, sud the different kinds will be known by the following numbers :

No. 1 consists of the stand, bottom-board, cover, two 6-inch brood-chambers, 16 frames, and the slatted honey-huard. Price, \$1.55 each. No. 2 is the same as No. 1, with the addition of one surplus story containing 28 sections without separators-interchangeable, hut not reversible.-Price, \$2.00 each.

No. 3 is the same as No. 2, with two surplus sto-rles as there is described. Price, \$2.50 each.

ries as therein described. Price, 52.50 each. No. 4 is the same as No. 1, with the addition of one surplus story containing 2% sections in wide frames with separators, which can be reversed, inverted, and interchanged, the same as the brood-cnambers. Price, \$2.30 each.

No. 5 is the same as No. 4, with two surplus arrangements as therein described. Price, \$3.00. No. 6 contains all the parts as described in the sample nailed hive. Price, \$2.75 each.

ample halled nive. Frice, 56.75 each. Those desiring the bives without the stand, honey-hoard or sections, may make the following deduc-tions from the above prices: Stand, 14 cents; honey-hoard, 8 cents; and the 28 or 56 asections, As the case may be, at ½ cent each, respectively.

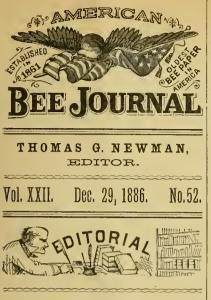

We will also make the following deductions on quantities ordered all at noe time: For 10 or more hives, 5 per cent. discont; for 25 or more hives 7 1-2 per cent; for 56 or more, 16 per cent.

THOMAS G. NEWMAN & SON, 923 & 925 West Madison-St., CH1CAGO, ILL.

11 Atf

We Wish all our readers, both young and old, a prosperous and

"HAPPY NEW YEAR."

To all our Subscribers of the past year we return thanks for patronage, and earnestly hope that every one will remain with the BEE JOURNAL family for another year at least.

Look Ont for the usual annual crop of so-called new "bee-papers." They are usually offered for next to nothing, publish a few numbers, and then cease to exist—the few subscribers they may have obtained being left to mourn the loss of the few dimes paid for a year's subscription. That which is offered for next to nothing is usually worth nothing 1 It is best to subscribe for a reliable and well-established paper. You will then get the value of your "money.

Every Day the business letters that come to this office are fully attended to and finally disposed of—none are left until the next day, except those in which the writer has omitted either name or Postoffice address. We endeavor to be prompt and accurate, and if our subscribers will practice the same virtues, more than half of the little annoyances that happen will be done away with.

We Keep this Notice standing all the year round : "Always give the name of the Postoffice to which your paper is addressed. Your name eannot be found on our list unless this is done," and yet many ask us to change their address without even mentioning to what Postoffice it has heretofore been sent. It often costs us more to find their old address than they pay for the BEE Joun-NAL for a year; as we may have to examine our subscription lists in every State, Provinee and Territory in North America. Please be more careful in the future, and never omit your name, Postoffice, county and State.

Another Votume is, to-day, closed 1 Another mnoument is reared to our favorite pursuit 1 Another valuable "book of reference" on progressive apiculture is created 1 Another mile-stone in the onward path of life is reached 1

The AMERICAN BEE JOURNAL to-day epjoys a reputation and influence second to none in the world of apiculture 1 Its weekly visits to thousands of homes all over the world is greeted with an enthusiastic welcome ! Its apicultural instruction and record of improved methods in our pursuit have been as anxiously looked for as they have been cessentially adopted by apiarists not only in every State, Territory, and Province in North America—but also in Australia, Europe, Asia, and Africa !

It is quite unnnecessary to state that we shall in the future, as in the past, endeavor to "keep abreast of the times," and place before our readers all the new things in our ever-advancing pursuit, as soon as they come to light. The record, character, power and usefulness of the AMERICAN BEE JOUR-NAL in the past is its guarantee for the future. It will further the interests of honey-producers by losing no opportunity to create a demand for this product, both at home and abroad—thus aiming to benefit the pursuit at large.

We respectfully ask for the future the same unwavering confidence and support which the present editor has enjoyed for the past 13 years. In order to be of the greatest advantage to our pursuit, we must have the largest constituency of wide-awake. progressive apiarists, and we request that if our patrons think we have labored for their interest in the past, that they will give us "the vote of confidence" in the shape of continued exertions for the prosperity of the AMERICAN BEE JOURNAL. Urge your neighbors, who keeps bees, to subscribe for a periodical that advocates their interests. supports their cause, and defends their pursuit.

The Science of Spelling is the subject of a Bill submitted to the Committee on Education of the House of Representatives, at Washington, D. C., by Maj. Chas. A. Story, of Chicago. Mr. Story desires that this new system be thoroughly "tested and tried" by governmental aid, and then, if it he found as efficient and successful as its author claims, that it shall be adopted, and introduced into our common schools. It is elaimed that by its use two years can be saved in the education of children, the two years occurring between the ages of 12 and 14 years. The new system is endorsed by some 60 of the leading and well-known men of Chicago.

The principal feature of it is, that only the sounds of the language shall, be represented, thus doing away with all silent letters in spelling. No one of intelligence, will say that something like the proposed improvement in our language is not needed, and we will venture the assertion that should the recommendation be adopted, all will hail it with a welcome becoming the progressive spirit of our times.

One Dollar invested for the weekly visits of the AMERICAN BEE JOUUNAL for 1887, will richly repay every apiarist in America.

As Bread is the Staff of Life, su is judicious advertising the staff of business I You may as reasonably expect one "good square meal" to suffice for three months, as to expect one advertisement to bring in business for that length of time! Many persons cannot remember anything longer than about seven days. To stop advertising in a dull season, is like tearing out a dam because the water is low--either plan can but result in disaster.

Enterprising queen-breeders and supplydealers know the value of advertising "all the year round." Presistently keeping their name and business continuously before buyers, will eventually place them on the successful side, if they have a valuable article to sell.

A "sign" is a mute invitation to those who may pass a mao's place of business; a "circular" will only reach the one to whom it is personally addressed; but an "advertisement" in a well-conducted and widelycirculated paper (like the AMENICAN BEE JOURNAL) has an influence "far and wide;" it finds customers and almost compels them to consider the claims of the wide-awake advertiser. To yearly advertisers the AMERICAN BEE JOURNAL offers special inducements. This is just the time to make a contract for the year 1887.

We Ask every subscriber to promptly renew his subscription and at the same time induce a neighbor to take it, by convincing him that it is for his interest to do so. By inducing your bee-keeping neighbor [to take the BEE JOURNAL for 1887, you will be doing yourself a duty, becauce he may thus be educated so as not to ruin your market for honey by selling his at a ruinous price, for lack of knowing its real worth. This matter of marketing honey will be fully discussed in these columns duing the next two or three months, and no one interested in honey-production can afford to do without its weekly visits.

Can you Use a Few Samples to advantage in getting up clubs—just send a postal eard to this office for them, saying how many you desire, and we will cheerfully send them. A favorable word from our readers, who speak from experience, has more weight with their friends than anything we might say. Every one of our readers can lend us a helping hand, in this way, without much trouble, and at the same time help to scatter correct apicaltural knowledge and promote the welfare of our pursuit.

We Point with Much Satisfaction to the Volume of the AMERICAN BEE JOURNAL for 1886, which closes with this number. It contains 832 pages, and is replete with full discussions of living topics. One hundred and eighty Queries have each been answered in the Query Department during the year by about a dozen different apiarists. A complete Index is presented this week not only to the subjects presented during the year, but also to the names of correspondents. The latter comprises nearly all of the best and most thoroughly successful apiarists of the present age. The Query Department each year presents to the readers instruction to the value of many dollars.

#### Replies by Prominent Apiarists.

[It is useless to ask for answers to Queries in this Department in less time than one montb. They have to wait their turn, be put in type, and sent in about a dozen at a time to each of those who answer them; get them returned, and then find space for them in the JOURNAL. If you are in a "hurry" for replies, do not ask for them to be inserted here.—Ep.]

# Ventilating Hives in the Cellar,

Query, No. 353.—What would be the best way to winter 75 colonies in a good, dry, warm cellar, with or without ontside ventilation? The most of them have woolen blankets on top. Are they better than honey-boards ?—N. S., Iowa.

With outside ventilation. The woolen blankets are good.-H. D. CUTTING.

Without outside ventilation. Use blankets. In using honey-boards 1 would put the thickness of a nail under the edges to allow ventilation .-C. W. DAYTON.

I do not know positively that ventilation is important. I do not think it harmfnl. I do not know that the blankets are better or worse than a board. I have tried both.-W. Z. HUTCHINSON.

If the temperature can be kept from 43° to 47°, the ventilation part makes little difference, as I have proven by closing all ventilators for a month at a time. I should prefer the woolen blankets to the honey-boards.-G. M. DOOLITTLE.

They must have a fair amount of ventilation, but a cellar generally has enough. Blankets are better than honey-boards .- DADANT & SON.

I much prefer to have outside ventilation, that is, to have the cellar well ventilated. If the honey-boards are open I should prefer the woolen .- C. C. MILLER.

Just keep the temperature from 40° Fahr. to 489, and all will be well. I do not think that the covers matter. Keep the entrance well open. Were it no trouble I should like hives raised one or two inches from the bottomboards. Because of the trouble, I have only raised a few each winter.-A. J. COOK.

I do not worry at all about ventilation. Personally, I am very sensitive to carbonic gas, and I have stepped completely full of hives containing bees, and had been tightly closed for weeks, and the bees were still and in excellent condition, and the air breathed as if fresh from the heavens. Blankets are as good as boards, if the room is warm enough.—JAMES HED-DON.

My cellar is large, but has no ven-

the time. If there was a bad odor in the cellar I would open the hatchway every night when the temperature ontside was the same or above that in the cellar. The woolen blankets on top are good, but I think no better than my thin, unpainted "under covers."—G. L. TINKER.

# Width of Brood-Frames.

Query, No. 354.—What is the right width of frames for brood, or to use in pro-ducing extracted honey? Some say  $\frac{7}{6}$  of an inch; some, just one inch; and still others,  $1\frac{2}{6}$  inches, for all purposes. Which is right?—W.

My preference is for the %,-W, Z. HUTCHINSON.

I prefer 3/8, for all purposes.-H. D. CUTTING.

I prefer 1 inch, the medium width. -C. W. DAYTON.

I use 1 inch for all except the bottom-bar, that being 1/2 inch.-G. M. DOOLITTLE.

Any of those sizes will do. But be uniform if only for the sake of looks. -DADANT & SON.

The top-bars of my brood-frames are just one inch, wide. I doubt if I could have a better width, although I never have tried anything else.—C. C. MILLER.

The distance from the centre of one frame to the centre of the other should be 1 7-16 inches. If the frames have narrow top-bars like the Lang-If close fitting ends, 1 7-16 inches wide.—J. P. II. BROWN.

I prefer 7% of an inch. If we desire long or deep cells we can place the frames a little further apart. Seven-eighths is the best for all purposes, and the same frame may be used for brood or for honey.-A. J. COOK.

I use, and most firmly and fully be-lieve the frame should be, the width of the thickness of the comb, viz: 7% of an inch. By using frames of this width, spacing can be made as close or open as is desired, or desirable.-J. E. POND, JR.

So far as the amount of honey gathered by the bees is concerned, the width of the frame cuts no figure, so far as I have experimented in this direction. But I prefer the 7%-inch top-bar for several practical reasons, chief among which are these: The narrowness of the top-bars gives a ready view of the tops of the combs when I want to see how the bees are getting on. They are more readily moved in the hive. They can be uncapped more quickly when extracting, as the wood is not in the way of the knife, as is the case when broader frames are used.—G. W. DEMAREE.

After making very many experi-ments I prefer 7% of an inch all around, except for my new hive, wherein I make the top and bottom bars 1-16 of an inch narrower, to bet-ter enable me to carry out the "shaketilation, and hence there are no drafts of air to interrupt the hibernating state. The air seems to be good all I have tried this, too. Let all be seldom used by the bees when passing

alike, and interchangeable.-JAMES HEDDON.

My experience is that one inch is the right width for brood-frames or for extracting frames. If the frames are % of an inch or less, brace-combs will give more trouble, and the topbars be more apt to sag. If more than one inch wide, the frames are difficult to handle, and if the frames are spaced only 13% inches from centre to centre, as they should be, the space for the bees to come up will be too narrow.-G. L. TINKER.

# Round Perforations in Zinc.

Query, No. 355.-What would be the right size or diameter of round holes in a zinc honey-board that would exclude the queen, and also dislodge the pollen from the workers' legs, to keep the pollen out of the surplus arrangement?-Ont.

Not having made accurate measurements, I should judge a round hole of about 7-32 of an inch in diameter would be nearly right.-J. P. H. BROWN.

It is practically impossible to construct the arrangement. Unless the on the legs of the bees, it does not dislodge so readily. I can speak from experiment on this question.—C. W. DAYTON.

I do not know, and do not believe I care to know. 1 am afraid anything small enough to dislodge pollen would hinder the bees in working .- C. C. MILLER.

I do not know. If a bee can easily pass through a round hole 5-32 of an inch in diameter, that would be the size. I should have no use for such an arrangement.-W. Z. HUTCHIN-SON.

I do not think that such a honeyboard can be made practical, for bees would not crowd through such small holes to work to advantage.-G. M. DOOLITTLE.

It would depend upon the size of the bees, some bees are considerably larger than others. Perhaps 5-32 of an inch would admit the body of the bee till she was hung on the balls of pollen; but I know by actual observation that any sort of perforations that are so small as to dislodge the pollen when the workers are passing through them, are seriously objectionable to the bees, and, 1 think, impracticable. -G. W. DEMAREE.

The right size is 11-64 of an inch. Beautiful comb honey in sections without a particle of bee-bread in them has been obtained between such boards in the centre of the brood nest, In a slight flow of nectar if comb honey is wanted very badly, such a practice might be resorted to.—G. L. TINKER.

In my non-swarming attachment (described on page 2) of the BEE JOURNAL for 1884, and also in my book), I used round holes for exclud-ing drones and queens. They meas-ured scant 3-16 of an inch. They were related used by the boost when passing

in, but always when passing out of the hive. Possibly your plan may work with the proper size of holes. Cut and try them. We have a profusion of pollen here, but no trouble about its going into the sections. All our honey-boards break joints, however .--- JAMES HEDDON.

I would not advise round holes for the purpose, as any size that would allow a loaded bee, pollen and all to pass, would most certainly allow a queen to pass also. The holes should be longer than wide, and by being so made they will allow a worker to pass handily, where, if the hole were round, she could not possibly pass, if it was the same diameter as the width of the others.—J. E. POND. JR.

#### **Convention** Notices.

137 'The Annual Convention of the Vermont Ree-Keepers' Association will be held at the Van Ness House, Burlington, VL, on January 13 and 14, 1887. R. H. HOLMES, Sec., Shoreham, VL.

The next annual convention of the Cort-land Union Bee Keepers' Association will be held in Union Hall, at Cortland, N. Y., on Jan. 12, 1887. D. F. SHATTUCK, Sec.

The eleventh annual meeting of the N. W. Ils. & S. W. Wis. Bee-Keepers' Association will be held in the Grand Army Hall in Rockford. Ils., on the third Tuesday in January, 1887. There will be atwo days' session. J. STEWART, Scc.

The Northeastern Ohio, Northern Pa. and Western New York Bee-Keepers' Aasociation will hold its 8th annual convention in Chapman'a Opera Honse, at Andover, v., on Wednesday and Thursday, Jan. 19 and 20, 1887. First-class hotel accommodations are offered at \$1 per day to those attending the convention. A general noritation is extended to all. M. E. MASON, Sec.

The New York State, the Eastern New York and the New Jorsey & Eastern Bee-Keepers' As-sociations will bold their great united convention at Albany, N. Y., on Jan. 11, 12 and 13, 1886. This convention will be one of the largest, if not THE largest, ever held any where in this country, and it heboves every bee-keeper to attend. A grand exhibit of aplarian fixtures is promised. GEO. H. KNICKERBOCKER. Sec. N. Y. State. JOHN ASPINWALL, Sec. Eastern N. Y. F. E. JOHNSON, Sec. N. J. & Eastern.

The conversion between the restance of the sector of th

Premium Worth Having .- The New York World and the AMERICAN BEE JOUR-NAL (both weekly) will be sent for one year to any address in North America for \$1.90. And in addition PRESENT to every such CLUB SUBSCRIBER a "History of the United States," containing 320 pages and 22 fine engravings, bound in leather and gilt.

This "History" will be sent FREE by express at the subscriber's expense; or will be mailed for 10 cents extra to any place in the United States or Canada.

It is arranged chronologically by years, from 1492 to 1885. Every event is narrated in the order of its date. These are not confined, as in other works, to political matters, but embrace every branch of human action.

This premium is worth the whole of the money sent for both periodicals, and should induce thousands to subscribe, and thus get two nnrivalled weeklies for nothing.

Explanatory .- The figures BEFORE the names indicate the number of years that the person has kept bees. Those AFTER, show the number of colonies the writer had in the previous spring and fall, or fall and spring, as the time of the year may require.

This mark () indicates that the apiarist is located near the center of the State named;  $\delta$  north of the center;  $\varphi$  south;  $\circ$  east; •O west; and this of northeast; `O northwest: ~ southeast; and 9 southwest of the center of the State mentioned.

For the American Bee Journal.

# "A Year Among the Bees."

#### G. M. DOOLITTLE.

I have at last found time to care-fully read Dr. Miller's book, "A Year Among the Bees," which I received sometime last March or April, if I recollect rightly; and I wish to say that I am glad the Doctor wrote the book in the style and way he did. is as fascinating as a story or novel, and much more so to me, for after 1 had once begun I was crazy over it until I had finished. I saw in some bee-paper that the book lacked dig-nity. Perhaps it does, but I should never have known it, had I not been told. This reminds me of a lady in this place who says there are a few persons who call on her professing great friendship, but while there their eyes are going from one thing to another all over the rooms, criti-cising the way she keeps her house, and telling of it afterward, rather than coming to see her for her real worth. She said to me one day, "I had much rather they would stay away." I read the book for the good there was in it, and not for the dignity, for elegance in bee-keeping as a rule does not command a very high price.

One special reason why I am glad that the Doctor wrote the book in the way he did, is that it will take the conceit all out of the reader who ex-pects to keep bees on the plan that "bees work for nothing and board themselves." The greatest trouble with most of those who enter the ranks of bee-keeping is, that they expect an easy time, in fact an easy time is what quite a share of the people of to-day are hoping for. Such is not calculated to the highest enjoy-Even the hardship of ment of life. working steadily with the bees dnring those hot days spoken of by the Doctor, wherein he "thoroughly wet with presperation" two changes of clothing a day, gives the keenest relish to a few minutes spent in the shade; while nothing to do but to sit in the shade makes the participant nothing but a chronic grumbler.

Then, such stings as made the Doctor "groan when no one was within hearing," must be borne with fortihearing," must be borne with forti- that Dr. Miller's plan of securing tude, for success in apiculture does honey is not a whit ahead of mine. In

not come without these. I do not suppose any *elegant* person, seeing me dance around as I frequently do from the pain caused by the stings I often get, would call it dignified, for 260 pounds dancing in a bee-yard at such times, does not always move grace-fully; yet all this I willingly submit to for the pleasure the pursuit gives me. If any reader who perhaps has just commenced bee keeping thinks he cannot endure such hardships, my advice would be for him to quit at once, before further money is lost in it; for I can give no assurance of success to such an one.

There are only two points which I wish to further notice at this time. Dr. Miller speaks of a single bee threatening and scolding him by the hour, and of having a colony or two so cross that a careless observer might say that the bees in the whole apiary were cross. This is the way it used to be with me, but of late years I am not troubled that way. Not that I think I have a more peaceable strain of bees, but I have taken a conrse with them which seems to be effectual in getting rid of these cross nuisances.

A few years ago myself or any other person could not step into the bee-yard without being quickly met by an angry bee; now strangers go all about the yard with me, and not an angry bee follows them. I was led to believe that the trouble all comes from letting that "scolding" bee fol-low me around. If I have a mishap at a hive so as to get the colony thoroughly angry, and a half dozen or more angry bees are allowed to follow me about, I find that those same bees are likely to keep that up as long as they live, whenever I come near the hive. Some five years ago I came to this conclusion, and I said if this was so, such bees might as well die first as last; so I made a paddle about S inches long and 5 inches wide, out of <sup>1</sup>/<sub>4</sub> inch stuff, which I slipped into a leather loop at the back of the seat that I carried about the apiary to sit on. This was always handy, and whenever a hee was angry enough to follow me 3 rods from the hive, it was quickly killed by one blow of the paddle. In this way my apiary is now kept clear of this annoyance. Of course, I use all precaution possible in not getting the bees angry, and it often happens that I do not kill one such bee in a week. Again, I have to kill 10 or 12 within a minute when I have made an unlucky move at a hive.

The other item of which I wish to speak is, that since reading the book I am better satisfied with the plans and fixtures I bave adopted than ever before. So many were saying a year or two ago that my plans of working with the bees were laborious, and my fixtures complicated; that I went to considerable expense to get sample surplus arrangements, etc., from many of our most successful honeyproducers; but after thoroughly test-ing all of them, I did not see wherein, all things considered, I could gain anything a long the line of bee-labor, by adopting them, and now I feel sure

fact. I think it requires more labor. Ite has three beside himself to work in the apiary, while I do all my work alone. Mrs. D. used to help me about the bee-yard, which lightened my cares much, as well as to be a great pleasure for us both; but since our tip-over some four or five years ago, she has all she can do to care for the house, on account of her lameness.

It is only through a thorough knowledge of the plans and work done by others that we can compare them with our own, and because Dr. Miller gives us that knowledge is why I like his book so well. I advise all to read it, especially beginners, for the knowledge gained regarding the managing of an apiary will be worth many times its cost. Borodino,⊙ N. Y.

#### For the American Bee Journal

The Honey-Producers' Association.

### M. M. BALDRIDGE.

I have read, with pleasure, the edi-torial on page 771, in regard to the Honey-Producers' Association. Many of the remarks therein were anticipated at the time, and, in fact, long before my article, on page 774, was written.

Yes, we must have a market report on honey in each and every number of our bee-papers, but such report should be the one agreed upon by the members of the association. This, of course, should be prepared, as the Editor indicates, by and through a committee selected by the association. And it would not surprise me at all if the association should be able to select a committee of honey-pro-ducers competent to attend to this matter! When such a committee fixes a scale of prices at which honey should be sold, by the members of the association, then each one should make it his or her business to adhere strictly to such prices in the sale of bis or her honey. Unless the members do this they had better not join the association. In short, any member who refuses to be governed by the prices agreed upon by such commit-tee, should be made to forfeit, as a penalty, his or her connection there-with with.

The Editor refers to the "slip-shod, back-woods, go-as-you-please bee-men," who ruin the honey markets "by their lack of intelligence, and un-business-like methods." For myself I have no fears whatever of any harm or competition from that class of beemen. In my experience, the real mischief-makers are such as are "up with the times" in the production of choice honey in modern packages. They are the ones who are running around from place to place, from vil-lage to village, and from city to city, and bragging about their big crops of and bragging about their big crops of honey at home. ranting about over-production, and wondering how they are going to dispose of them. They are the ones who are forcing the grocery-men, and everybody else, to take the "stuff" off their hands and

at their own prices. And they are especially the ones that we would like to educate by having them join the producers' association, subscribe for the bee-papers, and be willing not only to drop their "unbusiness-like methods," but to secure a fair, honest and decent price for their boney. But if we cannot induce such mischief-makers to join the association, and work in harmony with its purposes, then we, who are or may be members, should do the next best thing. And what is that? Simply to keep a close watch of their movetheir honey at a price that will harm the association, or demoralize the markets, just quietly buy them out l Then what? Simply keep our own honey out of sight until we can dis-pose of the would-be mischief-makers? crop at the prices fixed by the Asso-ciation. By this means we will be able to sell their honey, as well as our own, at a profit, and this will speedily teach them that they had better be-come one of us, and thereby reap the benefits.

benefits. It will now be seen, I trust, that one of the chief purposes of the Honey-Producers' Association is to secure control of the mischief-mak-er's honey. There are enough honey-producers in Kane county, where the writer resides, who would, as mem-bers of a producers' association, be both able and willing to watch the mischief-makers in the county, to secure every pound of their honey in case they should attempt to place it upon the markets for less than that upon the markets for less than that for which it should be sold. And I presume enough producers can be found in every county of the United States, who would be both able and willing to do the same thing. What has the reader to say on this point?

St. Charles, 5 Ills.

#### For the American Bee Journal.

## The Canadian Bee-Lawsuit.

#### WM. F. CLARKE.

For one, I entirely concur in the views expressed by the Advisory Board and Manager of the National Bee-Keepers' Union, in the Manager's report on page 761, as to championing the cause of Mr. Jos. Harrison. Only members of the Union have a right to expect its interposition on their be-half. Moreover, Canadian bee-keep-ers have not seen fit to join the Union in such numbers that they can reain such numbers that they can rea-sonably consider themselves part of its constituency. And, still further, the Union is a national body. It is not, like the North American Bee-Keepers' Society, an international organization. This latter fact has, no doubt, had its influence in deterring Canadian bee-keepers from ionized Canadian bee-keepers from joining.

any one else need "fear that our Canadian brethren will misconstrue our motive, if we refuse to come to the rescue.

But I do not understand Mr. Demaree's remark, that "the Union had better save its ammunition for larger game." The "game" is large enough in all conscience, for it involves the rights of 10,000 bee-keepers, and will certainly carry with it a *precedency* that will be quoted all over the American continent, and throughout the bee-keeping world. Mr. A. I. Root's offer of \$5 toward the defense fund is kind and generous. If it be found necessary to get up a subscription list, I have no doubt that other bee-keep-ers in the United States will contribute to it.

Mr. Harrison has written me a letter commenting on my article on page 741, from which it would appear that the trouble arose out of a quarrel con-cerning a pig-pen. He says: "I kept-bees on my place for some years be-fore my neighbor came to live beside me, and he lived beside me eight years, never finding fault with me for keeping bees until I wanted him to keep his big-pen cleaned out so that it would not cause sickness. He and his wife have always come through my bee-yard for water from my well, and the bees did not annoy them, neither did they at any time go into his kitchen to such an extent as to cause annoyance." Yet Mrs. McIn-tosh swore on the trial that the bees were troublesome when she was making preserves, and that she had to burn sulphur to stupefy them. Mr. Harrison says that Mr. McIntosh was Harrison says that Mr. McIntosh was stung three times; also, that the bees "sometimes swarmed on his place," but "did not annoy him." Mr. Har-rison denounces Mrs. McInstosh's testimony as "a lie," and affirms that McIntosh was stung "through his own ignorance and carelessness." There is much more in the letter which indicates that a had spirit had which indicates that a bad spirit had gotten into both blacksmith and beekeeper, and but for this, in all proba-bility, no lawsuit would have been instituted.

Now, we all know that bees can be very troublesome to house-keepers during preserve-making time. A single bee-sting may cause a great deal of pain. Few people, unfamiliar with bees, like to bave them swarm on their premises. In view, therefore, of the facts he admits, I do not think that Mr. Harrison is justified in saythat Mr. Harrison is justified in say-ing that the bees were not an annoy-ance to his neighbor. If, iustead of taking this ground, and accusing Mrs. McIntosh of lying, he had pur-sued a conciliatory course, perhaps the difficulty would not have occurred. Suppose he had kindly instructed his neighbor how to avoid being stung, offered to provide Mrs McIntosh wireoffered to provide Mrs. McIntosh wirescreens for her kitchen door and windows before preserving-time, and sent them a present of honey in considera-

world. One day last summer when I was in my little apiary, and he was working in his garden near by, he suddenly exclaimed, "There's a bee after me!" "Don't fight it !" I said. But I was too late with my advice. He had struck at the bee, and the bee had struck back, hitting him in the face. I was very sorry, told him what to do, and though his face swelled somewhat, he took the mishap very pleasantly. I gave him some honey as a solatium, and he has several times referred to his sting in the best of humor, always blaming himself for not knowing how to act when a bee threatened him. I have repeatedly said to him that I would move my bees to the farm if they were an annoyance to my neighbors, and he invariably replies that they are no trouble to him, although they have several times swarmed on his apple trees which adjoin my bee-yard. We often make our own difficulties by failing to act on the wise injunction, "If it be possible, as much as litch in you, live peaceably with all men."

Mr. Harrison says: "As regards moving bees to try and please people, I tried that on this summer. I had scarely got them moved before an ignoramus came out of the church near by, and exclaimed : 'It will near by, and exclaimed : 'It will never do to put those bees there; yesterday they were in the church by thousands.<sup>7</sup> I could not see what there was to attract bees into a place of worship, so I went to see if I could find out, and I could not find any bees nor anything to entice them there, so I concluded that the man was lying; so you see by trying to please every-body you will please no one." He adds: "If such people are to be allowed to get injunctions to restrain their neighbors from keeping bees, and trying to make an honest and honorable living, farewell to our liberties in Canada. We shall have to seek a home where people are a little more advanced in civilization. Since the suit I have been burned out and lost nearly all of my nice bees, and other things connected with the busi-ness, so that they will not require an injunction now. Parties were overheard to threaten to burn me out if I gained the case, but they have not waited for the final result, but have done it already. So you may judge in some measure what sort of people I have had the misfortune to live among. It is a deplorable state of things for the 19th century."

Yes, it is, but I doubt if the fault is all on one side. It is evident there has been a lot of contention and illfeeling, resulting in exasperation. It is not strange that Mr. Harrison feels bitterly the loss of his little all, and his fellow-bee-keepers will deeply sympathize with him in the calamity which has befallen him; but it ought to teach us all a lesson of kindness and conciliation. Though Mr. Harrison is tempted to think the fire may be traced to revenge, there is no positive proof of this. It may have been accidental, and even if a revengeful spirit has been awakened, there seems to have been some provocation given --perhaps much.

Another lesson this case teaches, is the duty of insuring property. It is a mournful thing for an aged man to find himself deprived of house and home. Mr. Harrison says: "I am too.old now ever to make up again. I never expect to have a home of my own in the world now." No wonder he tells us on page 762, "I am in a dilemma—nearly crazed." Notwithstanding any blame that may be justly chargeable to our afflicted fellow-beekeeper, it seems to me that there is a loud call for a manifestation of practical sympathy, and I hope this will take some tangible shape at the forthcoming meeting of the Ontario Bee-Keepers' Association. At that time, also, no doubt measures will be adopted to defend the interests of bee-culture as affected by the suit now pending. Guelph, Ont.

# The Season of 1886.

#### R. M. OSBORN.

Last April I doubled up 12 colonies, which left me 54 colonies from 66. I had 12 empty hives which I filled with bees, by natural swarming, in May. I find that increasing by natural swarming is more successful for producing honey than dividing; but dividing is the best if increase of colonies is desired. On the plan of natural swarming we get the bees with the swarming-fever all in the new hive, and leave contented young brood in the parent hive; and the bees with the swarming-fever, when put into a hive alone, will go to work with great energy. When we divide the colony while the swarming fever is on, the old, feverish bees are divided, and a portion of the feverish bees are in each hive, and they are not contented as well as they would be if all were in a hive by themselves, and no young bees or brood to bother them until they work the fever off, or work to death in a good flow of nectar.

The honey season with me was good only in May and June; there was no fall surplus crop of honey. As I am not physically able to properly attend and care for 66 colonies as they should be, and labor being high, and honey very low in price. I commenced on June 10 to prepare 54 colonies to be exterminated. On that day I took the queens out of the 54 hives, and on June 20 I took off all the queen-cells, and in the first week of July I administered sulphur smoke to the 54 colonies. I then took off all the comb honey in sections and extracted all the brood-combs, and melted the combs into beeswax. I got 2,160 pounds of beeswax.

I had selected 12 choice colonies out of the 66, to keep. From 6 colonies of pure Italians I took 349 pounds of surplus honey; and from 6 colonies of Syrio-Italians, 514. I left in each hive about 30 pounds to winter on. I prepared them for winter on the summer stands on Oct. 23. My honey

.

crop was all gathered in two months from white and red clover, the whole crop heing 3.023 pounds. I expect to increase my apiary next May to 24 colonies, that being all I am able to attend to by the aid of my wife and daughter.

\*Our zero weather commenced here on Dec. 2, and it was 8° helow zero on Dec. 3. Snow was on the ground 6 inches deep. The last good flight that my 12 colonies had, was on Nov. 14. Kane,\*O Ills., Dec. 7, 1886.

# Legislation for Bee-Keepers.

## DR. C. C. MILLER.

The following was written to me by Dr. L. C. Whiting, of East Saginaw, Mich.:

"As you wish an expression on 'the desirability and feasibility of obtaining legislation looking to the securing bee-keepers in their location as to territory,' I submit the following:

ing: "Legislation should be founded in justice. Justice means equal rights for all. Mr. Heddon's priority of location only looks to the interest of the man who starts first. Apply this theory to any other business and see how it looks. Suppose, as is usual in a new country, that cattle are allowed to run at large, to graze on the unoccupied lands. One man starts in with stock enough to eat all the grass. If this theory is right, his prior claim (for which he has paid nothing) should be protected from all others desiring the same privilege. It looks to me as though any one coming into that neighborhood has the same right to turn his cattle on the commons, as the first locater had. It is the common right of all. When these cattle or bees injure the private property of the settlers, they (the settlers) make restraining laws to protect their private interests. A few have to give up their natural rights for the benefit of the community.

of the community." "Our statute books are filled with laws for the protection of one class of people against other classes. A large portion of these laws are unjust. It is claimed by some of our most eminent jurists, that all this class legislation is unconstitutional. For these and many other reasons, I am opposed to bee-ranch protection laws."

In securing such legislation as may be considered for the greatest good of the entire community, and I certainly would want no other, it is not necessary to concede anything to priority of occupation. Still, is not something almost universally conceded to the discoverer or first occupant? Probably the Doctor knows more than I do about our pre emption laws, and does not the first man who occupies the land have the best chance to obtain a title to it? Going back to our boyhood days, suppose the Doctor and I, when "little shavers," were out fishing together. He was seated on a projecting stump—ouly room enough for one to fish—and just as he begins to get some good bites, and to pull out the "shiners," I come along, and being a bigger boy, push him off and continue the pulling out myself. He is not the boy I take him for, if he does not clamor for his rights, and insist upon it that he has a right to the place because he was there *first*; and there may be no little temptation for him to depart from his hometraining so far as to shy a stone at me by way of emphasizing his argument. But, as I said before, there is no

But, as I said before, there is no need to consider that prior occupation is an essential part of the data upon which legislation shall be based. Indeed, Mr. Heddon uses the right of priority as an argument against legislation. In a nut-shell his argument is this: I was here first. I have therefore a right here, and that right I can maintain well enough or better without legislation; therefore, no legislation is needed. I take the ground that if the first comer has the best right to the ground, legislation is needed to protect him in that right. Equally do I hold that legislation is needed if no rights be conceded to the prior occupant.

I am not sure but that the Doctor has illustrated the thing pretty well by the cattle pasturing on the commons. At first, land is so plenty and cattle so few that little attention is paid to territory, but as interests begin to clash, government steps in and marks out boundaries, saying to one man, "You can have this territory," and to another, "There is yours." Precisely this, and for precisely the same reasons, we need in bee-culture. If bee-keeping is to be a regular, permanent business, why not have the territory parceled out just as much as it should be parceled out for farming? Would it not be for the interest of the public at large ?

Marengo, & Ilis.

Practical Hints for Bee-Keepers.

#### J. M. HICKS,

At this season of the year bees should be kept in perfect quietude and not molested in the least. Beekeepers should study more carefully the nature and wants of their bees, and be able to apply such remedies as will most effectually overcome obstacles detrimental to the interests of the apiarist.

The winter problem seems to be the greatest trouble now, with many who have but recently commenced keeping bees, which, in order to succeed, should be carefully studied and put into practice so as to conform to natural laws governing the successful wintering of all farm stock.

"Time is money" to the hee-keeper, hence all implements for the apiary should be in proper condition and ready for the coming season.

Look well to the interests of the bees, and they will amply reward their keepers for all the care bestowed upon them.

Never allow your bees to swarm naturally, but use a good movableframe hive, and practice dividing colonies, and thus save much valuable time.

Late Brood-Rearing. — Frank A. Eaton, Bluffton,  $\infty$  O., on Dec. 14, 1886, says:

The weather was fine and warm here from Dec. 9 to Dec. 11, and the bees had a nice flight. In removing the extracting frames from a chaff hive which I had neglected to prepare early, I found a fine patch of eggs in one frame; something I had never seen out-of-doors on Dec. 11.

Bees Packed in Chaff.—Dayton II. Carter, Clayton, O Ind., writes :

My 10 colonies of bees are wintering nicely packed in clover chaff. We have not had much cold weather, but there is time enough yet for bees to freeze out. I have wintered bees three winters, and I have not lost any. I think that if everybody would pack their bees on the summer stands they would not lose so many; that is, if they will pack them rightly.

The Season in Nebraska.—James Jardine, Ashland, • Nebr., on Dec. 13, 1886, writes:

I took my bees out of the cellar on April 9-over 100 colonies. I sold a few colonies in the spring, and the remainder did not do very much until about June 26, I should think. They and then the dry weather set in and they did not do much until late in the fall-until we had some fine showers, then they gathered honey from the frost swarms swarmed, and of my first swarms swarmed, and of course lessened the amount of surplus honey. One colony which did not swarm gave me 132 pounds of surplus. Mr. Phil Lesler, who lives about three miles from here, also did very well, having 70 colonies last spring. He obtained 3,000 pounds of comb honey, and as we are the only ones who pay attention to the business in this locality, we control the market, having agreed not to retail it

in one-pound sections. Some of it is very nice and white, and some of it is very dark. What was gathered first is dark. I have come to the same conclusion as Mr. Stolley, of Grand Island, Nebr., viz: that we must sow more clover for our bees if we expect lots of honey. They must have the feed. I put my bees into the cellar on Nov. 15, and they all seem to be doing finely, the temperature being from  $40^{\circ}$  to  $45^{\circ}$ . I think that the cellar is just the place for bees in this country, where we have such severe storms and sudden changes. I think there is nothing gained by putting bees out of the cellar too early in the spring. Mine did nicely last spring; they had no diarrhea at ali.

The Late Drouth in Texas.—L. B. Smith, Cross Timbers, 5 Tex., on Dec. 12, 1886, writes :

I commenced the season with 16 colonies, and sold 5, which left me II. Bees in this portion of the country have gathered no surplus honey. It has been the poorest honey season since my recollection; in fact, I had to feed all of my bees through the latter part of the spring and early part of summer to prevent their starving. Nearly all the bees in this vicinity are dead. Of course the long continued drouth did it. Although it was a cold, backward spring, my bees built up to strong colonies, and were ready to gather nectar, if there had been any to gather; but at the time they should have been storing honey, they were fighting and robbing, so that it was almost impossible to open a hive at any time of the day without creating a general uproar in the apiary; since that time what few bees that were left have gathered abundant stores from the late cotton blooms, for their winter's feed. My bees are all on the summer stands.

Excellent Results.— Wm. B. Mc-Cormick, Uniontown, 9 Pa., on Dec. 15, 1886, writes:

After several years of disaster and discouragements, I have had one season of satisfactory results, though nothing in comparison with what I read about, but in excess of any I ever knew in this county. On May 1, I had 20 good colonies, most of which were Italians, and from them I obtained 1,400 pounds of comb honey (nearly all in one and two pound sections), and upwards of 50 swarms, all of which I saved, except one which absconded. I would like to have prevented so much swarming, but all my efforts proved fruitless, nearly all of my first swarms swarmed, and of course lessened the amount of surplus honey. One colony which did not swarm gave me 132 pounds of surplus. Mr. Phil Lesler, who lives about three miles from here, also did very well, having 70 colonies last spring. He obtained 3,000 pounds of comb honey, and as we are the only ones who pay attention to the business in this locality, we control the market, having agreed not to retail it

at less than 20 cents per pound, nor less than 18 cents per pound for quantities over 30 pounds. At these prices we have disposed of our entire prices we have disposed of our entire crops. I have also realized \$55 on bees and queens. I feel somewhat elated over my success. I have now 40 colonies well packed on the sum-mer stands, and 11 in the cellar. I was very much afraid, during the swarming season, that there would be complaints against me for keeping so many bees in the town, as there are streets on two sides of my apiry are streets on two sides of my apiary, with nothing but low palings between, and a grocery store just opposite. Frequently a swarm would fill the streets, and teams and persons would have to pass through them; several swarms settled on the trees in front of the grocery. But the neighbors seemed to enjoy the fun, and, to my knowledge, not even a horse was stung.

Bees Packed for Winter.-F. L. Merrick, Kankakee. O+ Ills., on Dec. 16, 1886, writes :

The past season has been fully an average one here. I commenced with S colonies in the spring in fair condition. I had 15 swarms, and bought 4, which gave me 27, and they are in winter quarters in good condition. I had 3 fine swarms in May, and each of these gave me a large swarm in July. This is something new to me, but perhaps not unnsual to old bee-keepers. These hives of three July swarms were boiling over with bees and honey before fall. A few of my old colonies gave me 40 to 50 pounds of surplus comb honey. After read-ing the views of the most eminent apiarists on "how to winter bees," I concluded to pack mine on the sum-mer stands. I have them placed in a row on 2x4 scantling, the hives 8 to 10 inches apart, two quilts over the frames, and the caps filled with oat-straw and chaff; with the same straw and chaff packed under the hives, between them, and also some 10 inches packed thick at the back of the hives, and a good shingle roof over them, that will keep them perfectly dry.

Proper Temperature of Cellars.-Dr. G. L. Tinker, New Philadelphia, O., writes:

In reply to Mr. W. H. Stewart, on page 421, I will say that my observa-tions of last winter, that 41° is the point at which bees hibernate most perfectly, are again confirmed. But Mr. S. does not agree with my finding, giving his experience of winter-ing in a bee-cellar in "a sandy hill," in which the temperature remained at 41° all winter without change. I have nowhere recommended that have nowhere recommended that bees should be kept at this low tem-perature except in early winter. After Feb. 1 the temperature should be raised to  $48^{\circ}$  by artificial means, if necessary; not be allowed to remain through the early breeding season at  $41^{\circ}$ , as did Mr. S. "The sand froze solid all the way through the roof," and "the cold frozen under surface." and "the cold, frozen under surface," added a chilly dampness to the air, if not a lower temperature at times than 41°. There is nothing impracticable about raising the temperature of a bee-celiar by means of an anthra-cite coal stove. Had I been in Mr. Stewart's place I should have immediately put a stove in that cellar and drove out the frost that was seen to accumulate on the under surface of the roof. I have never known bees to winter well in frosty hives, and it seems to me a trosty cellar must be ruinous. No wonder he lost 150 colonies in such a place.

#### Dropping the Market Reports.-S. F. McClung, Niles, 9 Mich., says:

I for one think it will not do to drop the market report in the bee-papers, for it is the only means we have of knowing the price of honey. We do not have to sell at the prices of com-mission-men, nor take their prices.

[Fear not, brother. This matter is to be fully discussed before any such important] and radical changes are even attempted.-ED.

#### **OUR CLUBBING LIST.**

We supply the American Bee Journal one year, and any of the following publications, at the prices quoted in the last column of figures. The first column gives the regular price of both. All postage prepaid.

paper or book, in order to take advantage of the prices named in the last column.

Our Book Premiums .-- To encourage all our present readers to get one or more additional subscribers we will present 25 cents' worth of books for every new subscriber (accompanied with \$1 for one year's subscription), sent direct to this office. Thus for five new subscribers with \$5, the getter up of a club gets \$1.25 in valuable reading matter, to be selected by himself from our list on the second page of this paper. It will pay you to devote a few hours to the interests of the BEE JOURNAL. Every one who keeps bees ought to take it. We will furnish sample copies free in any quantity to those who intend to get up clubs. We expect to get 5,000 new subscribers for 1887.

#### Honey and Beeswax Market.

The following are our very latest quotations for honey and beeswax :

#### CIIICAGO.

HONEX.—Market is well snpplied with all the grades, and the demand is light. Prices are nom-inal at 11/612c. for white in 1-lb. sections. Fancy white in scant pound sections, 13c. Very little ex-tracted is being sold, and prices range from 467c. BEESWAX,-22c. R. A. BURNETT, Dec. 8. 161 South Water St.

#### NEW YORK.

NEW YORK. HONEY.-In consequence of a large stock of comb hooey on this market, fancy prices eannot be maintailed. Fancy while boney in paper box-es, or glassed, are in better favor here than the unglassed honey, hence the difference in the price. We quote present prices as follows: Fancy white in 1-lb. paper boxes, or glassed, 13c.; same unglassed, 12c., and in 2-lb. glassed sections, 10G 11c.; off grades 1 to 2 cts, per lb less, Calif, comb, Nationary and the clover, none in the mar-tes, and barrels, 406c. BEESWAX.-21@23c. Dec. 7. 34 Hudson St. SHORED

#### BOSTON

HONEY.-The demand has improved. We are selling one-pound packages of white clover honey at 14@15c; 2: pounds at 13@14c. Extracted, 6@7c. BEESWAX.-25 cis, per ib. Dec. 7. BLAKE & RIPLEY, 57 Chatham Street.

#### DETROIT.

HONEY.—The market is a trifle more active. Best white comb honey in 1-b. sections, 11@12½c. Buckweat, 10c. Extracted, 7@9c. BEESWAX.—23c. Dec. 13. M. II. HUNT., Bell Branch, Mich.

#### CINCINNATI.

UNCINNATI. HONEY.-There is a quiet tone prevailing, but the demaod is fair for choice comb and extracted boney, in small packages. Manufacturers buy very sparingly. The supply is large sod prices are downward. We quote prices for extracted honey, 3@7c, per lb. Nice comb brings 12@15c, per lb. in a jobbing way. BEESWAX.-Good demand,-20@22c, per lb. for choice yellow.

Dec.21. C.F. MUTH & SON. Freeman & Central Av.

#### CLEVELAND.

HONEY.—The market is not very active and pri-ces a little lower. Choice 1-lb. sections of best white sell at 13@14c, second grade 1-lbs..10@12c; cboice white 2-lbs..11@12c. Extracted, slow at 6c. BEEESWAX.—Scarce at 25c. Nov. 17. A. C. KENDEL, 115 Ontario Street.

#### MILWAUKEE.

MILWAUKEE. HIONEY.-The demand for honey is only mod-erate and the supply ample, of very fine quality and in extra good order. We quote choice 1-lb. sections of white at 120/13c; 2-lbs., 11(a/12c.; dark not wanted. Extracted, white, in barrels, half-barrels and in kers. 660%c; in tin packages, 65%G7c; dark, in barrels and ½-barrels, 56%c. BEEESWAX.-Nominal at 25c. Dec, 13, A. V. BISHOP, 142 W. Water St.

#### SAN FRANCISCO.

SAN FRANCISCO. HONEY.—The market has been rather duiler the last week, but prices are well maintained, par-ticularly for choice white extracted and choice white comb honey, as both kinds are not freely of-fered. We quote:  $3 \log 4/4$ , for extracted, and  $9 \log 12c$ . for comb ; with easier sales for the best grades, than for the darker honey, as none seem to be able to use the dark just now. BEEESW AX.—Duil at 190022c. Dec. 11. SCHACHT & LEMCKE, 122-124 Davis St.

HONEY.-Trade is quiet. Extra white comb lic; amber, 74%10c. Extracted, white, 4@44c.; am-ber, 34%035(c. BEESWAX.-20@23c. Oct.18. O. B. SMITH & Co., 423 Front Street.

#### KANSAS CITY.

KANSAS CITY, HONEY.--Demand is good for all grades, and re-ceipts have been very large of comb and extrac-ted. Home bee-men have kept out of the market until this mouth; having glassed every lb. section on both sides they are reducing prices, selling 60 ibs. of glass with 160 lbs. of honey, making our market lower. There crop is about 70,000 pounds. We quote: White clover 1-lbs. 120/31c; 2-lbs. 11c; be-lbs., 13@14c; dark 1-lbs., 10c; 2-lbs., 8@9c,-California 2-lbs., %01c. Extracted white clover, 6c; dark, 4@5c; white sage Calif.. 5\cc; amber, 5c. BEESW AX.--22c. Nov.20. CLEMONS, CLON & CO., cor. 4th & Walnot.

ST. LOUIS.

HONEY.-Choice comb, 10@12c.; latter price is for choice white clover. Strained, in barrels, 34@4c. Extra funcy of bright color and in No.1 packages, % advance on above prices. Extracted in barrels. 14@5; in cans 5@6c. Market dull. EEESWAX.-Firm at 20%c. for prime.

Dec. 20. D. G. TUTT & CO., Commercial St.

 A Collos
 Alsike clover 409, 586, 612, 615, 724

 Asters.
 600

 Boneset
 516, 555, 549

 Chapman boney-plant 43, 487, 8
 607, 518, 571

 Globerton
 506

 Holly
 507, 571

 Superstand
 508

 Chapman boney-plant 43, 487, 8
 506, 517

 Globerton
 202, 363

 Motherwort
 202, 363

 Motherwort
 522, 597

 Plentriky-root
 552, 690

 Sweet chover
 132, 578, 589, 627

 Sweet chover
 132, 577, 589, 627

 Sweet chover
 132, 577, 589, 627

 Sweet nelissa
 651

 Peaniar queen
 571

 Patents on bee-appliances
 190

 Peculiar actions of bees.
 372, 692, 731

 Peculiar queen
 571

 Perspicoity in writing
 203

 Petrified boney comb
 51

 Phenol and fool brood
 523, 534, 537

 Polle olone for bees.
 708

 Pollen one for bees.
 708

 Pollen for bees in winter
 616

 Pollen for bees in winter
 127
 </tr

Restoring flavor of extracted

 Restoring fluvor of extracted boney
 784

 Retorning swarms
 362, 411, 500

 Reversed queens
 521 553

 Reversible framesi
 28, 56, 116, 122, 155, 171, 220, 308, 314, 359, 376, 697

 Reversible hives
 43, 74, 118, 152, 154, 167, 231, 251, 262, 376, 474, 697

| 022/                                     |
|------------------------------------------|
| Reversing brood-combs. 228, 359, 522     |
| Reversing sections 779                   |
| Revolution in bee-culture 35, 135        |
| Re-waxing hopey-barrels 420              |
| Ripening hopey 409, 789                  |
| Roaches 314                              |
| Robber bees 299, 341, 419, 467, 747, 778 |
| Room for surplus honey                   |
| Round perforations in zinc 820           |
| Rye meal for pollen 138                  |
|                                          |

 Taste and odor of honey 612, 60%, 743, 745, 779

 Tasting of a honey-bee, 739

 Tastifon of bees 309, 541, 344, 346, 347, 404, 419, 456, 472, 498, 503, 711

 Teling the bees, 216, 227

 Temperature inside of hives 309, 612

 G12
 710

 Temperature of bee-cellars .328, 825

 Pesting beeswax
 259

 Texas state fair, 747
 746

Yucca brushes..... 435, 615

THOMAS G. NEWMAN & SON, PROPRIETORS, 923 & 925 WEST MADISON ST., CHICAGO, ILL, At One Dollar & Year.

> ALFRED H. NEWMAN, BUSINESS MANAGER.

Special Notices.

To Correspondents. — It would save us much trouble, if all would be particular to give their P. O. address and name, when wring to this office. We have several letters some inclosing mouey) that have no name; many others having no Post-Office, County or State. Alao, if you live near one postoffice and get your mail at another, be sure to give the address we have on our list.

When Renewing your subscription please try to get your neighbor who keeps beea to join with you in taking the BEE JOURNAL. It is now so cheap that no one can afford to do without it. We will present a **Binder** for the BEE JOURNAL to any one sending us three subscriptions—with \$3.00 direct to this office. It will pay any one to devote a few hours, to get subscribers.

**The Report** of the Indianapolis Convention is now published in pamphlet form, uniform with that of last year. It will be sent postpaid for 25 cents to any address.

We have also bound it up with last year's, together with the History of the Society; this we will mail for 40 cents. Or if you send us one *new* subscriber (with one dollar) besides your own renewal, we will present you with a copy by mail.

Money Orders can now be obtained at the Post Offices at reduced rates. Five dollars and under costs now only 5 cents. As these are absolutely safe, it will pay to get them instead of the Postal Notes which are payable to any one who presents them, and are in no way safe.

Reader, do you not just now think of one bee-keeper who does not take the Weekly BEE\_JOURNAL, and who should do so? Perhaps a word or two from you will induce him to do so. Will you not kindly oblige us by getting his subscription to send on with your own renewal for next year? When you do so, please select any 25 cent book in our list, and we will send it to you post-paid, to pay for your trouble. We are alming to get 5,000 *new* subscribers for 1887, -will you not assist us to obtain them ?

**Simmins' Non-Swarming System** is the title of a new English bee-book. The author claims that it will inaugurate a "new era in modern bec-keeping," and states that "it is based upon purely natural principles, and is the only system that can ever be relied upon, because no other condition exists in the economy of the hive that can be applied to bring about the desired result —a total absence of any desire to swarm." It contains 64 pages; is well printed and illustrated. Price 50 cents. It can now be obtained at this office.

The Western World Guide and Hand-Book of Useful Information, contains the greatest amount of useful information ever put together in such a cheap form. The priviting, paper, and binding are excellent, and the book is well worth a dollar. To any one sending us two new subscribers besides his own, with \$3.00, for one year, we will present a copy of this valuable book.

New Subseribers are coming in rapidly -for this our thanks are tendered to the friends of the AMERICAN BEE JOURNAL, who are exerting their influence in its behalf. We should thribble our list at the present low rate of one dollar a year. We hope every one of our present subscribers will send at least one additional subscriber with the renewal for 1887.

We refer our Subscribers to our offers of premiums and net club rates for new subscribers, and if they will send us one or more subscriptions from among their neighbors who are interested in bees, they will get the premiums or Cash reductions as they may indicate—to pay for their trouble; and at the same time they will be enhancing the usefulness of the JOURNAL and contributing toward its prosperity.

Preserve your Papers for reference. If you have no **BINDER** we will mail you mue for 60 cents, or you can have one FREE if you will send us 3 new yearly subscriptions for the BEE JOURNAL.

**Yneca Brushes** are employed for removing bees from the combs. They are a soft, vegetable fiber, and do not irritate the bees. As each separate fiber extends the whole length of the haodle as well as the brush, they are almost indestructable. When they become sticky with honey, they can be washed, and when dry, are as good as ever. The low price at which they are sold, enables any bee-keeper to have six or more of them, so as to always have one handy. We can supply them at 5 cents each, or 50 cents a dozen; if sent by mail, add l cent each for postage

The Convention History of America with a full report of the proceedings of the Detroit and Indianapolis conventions, and the AMERICAN BEE JOURNAL for one year, will be clubbed for \$1.25.

**Dr. Miller's Book**, "A Year Among the Bees," and the BEE JOURNAL for one year, we will club for \$1.50.

More Premiums.—Mr. L. J. Diehl, of Butler, Ind., offers a colony of Italian beca as a present to the person sending to this office the largest club of subscribers for 1887. The subscriptiona may be sent in at any time before the first of May at our regular club rates, and additions made as deaired, but it must be stated that you are working for that premium, ao that we can keep account of the subscriptions.

As a premium to the second largest club we will send my mail, postpaid, a copy of the "Farm Account Book," worth \$3. The postage is 20 cents.

-----

As there is Another firm in Chicago by the name of "Newman & Son," we wish our correspondents would write "American Bee Journal" on the envelope when writing to this office. Several letters of purs have already gone to the other firm (a commission house), causing vexatious delay and trouble.

We anticipate a largely increased list of aubscribers for 1887, as \$1.00 cannot be invested by any bec-keeper that will bring him better returns.

**Red Labels** for one-pound pails of honey, size  $3x4\frac{1}{2}$  inches. — We have just gotten up a lot of these Labels, and can supply them at the following prices: 100 for \$1.00; 250 for \$1.50; 500 for \$2.00; 1,000 for \$3.00; all with name and address of apiarist printed on them—by mail, postpaid.

A New Crate to hold one dozen one-pound sections of honey.—It has a strip of glass on each side, to allow the honey to be seen. It ls a light and attractive package. As it holds but one tier of sections, no damage from the drippings from an upper tier can occur. We ean furnish the material, ready to nail, for 9 ets, per crate. Glass 1%c. per light, extra.

**Colored Posters** for putting up over honey exhibits at Fairs are quite attractive, as well as useful. We have prepared some for the BEE JOURNAL, and will send two or more free of cost to any one who will use them, and try to get up a club.

**Do you Wanta** Farm Account Book? We have a few left, and make you a very tempting offer. It contains 166 pages, is printed ou writing paper, ruled and bound, and the price is \$3. We will club it and the Weekly BEE JOURNAL for a year and give you both for \$2. If you want it sent by mail, add 20 cents for postage.

Frank Cheshire's new book on Bees and Bee-Keeping, can be had at this office.--Vol. I, bound in cloth, \$2.50, postpaid.

**CONTINUES OF THE SET * 

# Home Market for Honey.

To create Honey Markets in every village, town and city, wide-awake honey producers should get the Leaflets "Why Eat Honey" (only 50 cents per 100), or else the pamphlets on "Honey as Food and Medicine," and scatter them plentifully, and the result will be a DEMAND for all of their crops at remunerative prices. "Honey as Food and Medicinc " are sold at the following prices :

Single copy, 5 cts.; per doz., 40 cts.; per hundred, \$2.50. Five hundred will be sent postpaid for \$10.00; or 1,000 for \$15,00. On orders of 100 or more, we will print, if desired, on the cover-page. "Presented by," etc. (giving the name and address of the beekeeper who scatters them).

To give away a copy of "Honey as Food and Medicine" to every one who buys a package of honey, will sell almost any quantity of it.

E. Duncan Sniffen, Advertising Agent, 3 Park Row, New York, inserts advertisements in all first-class Newspapers and Magazines with more promptness and at lower prices than can be obtained elsewhere. He gives special attention to writing and setting up advertisements in the most attractive manuer, and guarantees enetir satisfaction. In all his dealings, he is honorable and prompt. Send for his Catalogue of first-class advertising mediums. Mailed 52A40t tree.

## System and Success.

All who intend to be systematic in their work in the apiary, should get a copy of the Apiary Register and commence to use it. the prices are reduced, as follows :

The larger ones can be used for a few colonies, give room for an increase of numbers, and still keep the record all together in one book, and are therefore the most desirable.

Fifty-Two Dividends from the investment of one dollar is just what every subseriher of the AMERICAN BEE JOURNAL receives. Can any better interest be found for the Investment of one hundred cents? If so, where?

Catalogues for 1887 .- Those on our desk are from

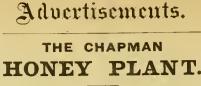

David Landreth & Sons, Philadelphia, Pa. —the oldest seed-house in America. Z. DeFerest Ely & Co's Garden Almanac and Seed Manual, Philadelphia, Pa.

Frank Leslie's Sunday Magazine for January, 1887, contains a beautiful frontispiece entitled "For the Pastor" which is a real art gem. The new serial story, "His Badner over me," by F. A. Matthews, begins in this number. It is a very fine Christmas number.

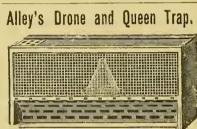

50 cents each, by mail, postpaid.

Having expended thousands of dollars in Having expended thousands of dollars in bringing before the people one of the most wooderful hooey-producing plants known in the United States, or even in the world, and testing it honestly and fairly, wish to say through your valuable JOURNAL that the seed contains so much oil that nothing but fresh sced will grow, or by thrashing, if the seed is bruised or broken, it will not grow for this reason. And by the advice of many prominent hee-keepers, I have de-cided to sell the limited amount of seed I have raised this season at the following prices, and will send to those who have already ordered the amount of seed due them at this low price: One half ounce 50 prices, and will send to those who have already ordered the amount of seed due them at this low price: One half conce 50 cents; 1 ounce, \$1; 2 ounces, \$1.50; 4 ounces, \$2; 1/2 pound, \$3; 1 pound, \$5. One pound of seed is sufficient for half an acre, if properly thinned out and re-set. Write all orders plainly, and give your post-office in full. 52A2t Versailles, Cattaraugus Co., N. Y.

Price, by Express, 50 cts.; by mail, 65 cts.; 12 in the flat, and one nailed (13 in all), \$3.50; 50, in the flat, \$12.00. Address.

# THOS. G. NEWMAN & SON.
