tions the same year where abundant crops may be had. To mention all these things in detail will take up more space than is at my disposal in this department. This year abundant rains fell throughout the length and breadth of California, yet there will be a shortage of crops in some portions. Some kinds of fruits are a failure this season; so is the honey crop in other portions. The flowers were never in greater profusion, yet the nectar was "wasted on the desert air," as it were. Cold were the nights, and too oft the days were damp and dreary. The consequence was that the bees remained in the hives, or when they ventured out in such weather, they often perished from the cold. This was more the case in the lower coast counties than it was in the mid-ocean counties along the coast.

Inland the weather was more propitious. Here, near the Bay of San Francisco, the weather was not what we hoped for. Whole weeks at a time would be cool of nights and rather foggy up to 10 o'clock in the forenoon. Strange to say, during this cool spell, which has extended over 8 or 10 weeks, nearly every Sunday was a beautiful day—days well named. These Sundays were swarming-days as well as days for abundant honey-gatherings. The possessor of an apiary wished that every day was Sunday, not that he would be any more devout, but that his honey crop would be larger and his bank account be more swelled thereby.

From up the rivers I learn that there is little complaint. New honey has arrived in the San Francisco market in limited amounts and has sold for good prices—in some instances for 20 cents per pound. And the quality of the honey has been excellent. I have not tested such luscious honey since I was a boy. In those days our bees seemed to obtain nectar that reminded me of having been gathered from the flowers of sweet alyssum, so luscious was the flavor and so richly perfumed the odor. Early in April, this year, some of this choice honey found its way into the hives; the partaking of it carried me back to my boyhood days when we had American hives with honey-boxes above. But I must write the season a failure as far as I am concerned. Instead of three extractings per hive, I won't be able to make a single one from each of all the colonies—unless the unforeseen happens.

#### Cheap Hives

What is there about a bee-hive that it should cost from \$2.25 to \$2.75? I have seen a single hive of rather ordinary make listed at the latter price. By the quantity, they come at a somewhat reduced price; but, nevertheless, they come high. I can go to a mill and get the top, bottom and sides for say 50 cents; division-board, 5 cents; a complete super, including holders, sections and foundation starters, should not cost 75 cents. The rest of the hive I would have of Eastern make, costing say, 25 cents, for the brood-frames; 2 cents for metal rabbets, making the total cost of a hive made of good, sound lumber, (whole pieces being used for cover, bottoms,

etc.), \$1.75; and, I believe, one can get such a hive as is needed in a commercial apiary for less than \$1.50. It is not necessary to have the lumber dressed on both sides; in fact, the lumber stands wear and tear better when it is rough on the outside. I would have a hive always smooth inside. The rough outside should be given a coat of metallic or lead and ochre paint.

#### Tree Clover or White Broom

There are a number of varieties of this plant. It may be called a "tree-clover," hence the Greek name—*Citissus*. Bailey's Horticultural Encyclopædia says there are some 45 species in Southern

#### The Slaughter of the Drones

The drone-killing days are here—  
The saddest of the year.

There, now, that will do; no more tear-provoking gush, especially over such lazy gentry as the toiling worker-bees are now banishing pell-mell from their homes. "The drones must go, for the bees say so," might be a good battle-cry in beedom. And it would be put in practice just as sure as fate. It reminds me of the slogan of the Kearneyites of San Francisco in 1877—"The Chinese must go, for Kearney says so."

There is a time in the affairs of bees, which when—there again the poetic fancy overtakes me. But I can not help

WHITE BROOM.

*Citissus proliferous albus*, of Canary Isles.

and Middle Europe, Canary Islands, Northern Africa, and Western Asia. Like most of the pea-shaped flowers, they are rich in honey. I have *C. proliferous albus*, or white broom, growing on our place. It thrives wonderfully well in California. It was introduced, I believe, by the University of California. It blooms in February, March and April, and is a favorite with the bees. It blooms in a year or two from seed, grows rapidly, but does not attain to much of a height, not over 20 feet, I believe. Owing to its being an evergreen and valuable as a fodder-plant for cattle, it is one of the best plants for bee-pasturage in California. I think it will do well in the Southern States as well as California. Seed may be obtained free by applying to the Agricultural Department of the University of California, Berkeley, Calif. The photograph here shown was made from flowers grown on our place.

reflecting on the fate of the poor drones! They are worse than the proverbial dog. You may talk as you may, but it is not every dog that has his day—that is, a day for an ill-fate. But 'tis ever so with the drone. The husky fellow that wings his amorous flight to a successful conquest pays the penalty for his mid-air pleasure—he is soon "a dead one," and falls to the earth a useless nothingness. Then, the fellows of the hive who have tasted no other pleasure than plain honey from the combs, have to be jostled and hustled, and kicked from pillar to post, as it were, and turned out of house and home to die—unhonored and unwept. All because there's nothing for them to do. What a fate! Nothing to do! There was something for them to do; it might have been a crowning pleasure for one drone in a thousand. But now the time is past: the flowers are gone; the harvest garnered; there are no more queens to rear—so out

into the cruel world to perish from cold and hunger, the drones are driven. \* \* \* "What a vast difference is the fate of man! Every one of whom may die in a palace with his boots nicely arranged beneath the bed!"

Yes, the drone-days are here, and I notice that they are somewhat ahead of the usual time. It is June 10, and the husky fellows are being slaughtered. Usually this does not happen until July. I noticed 5 weeks ago, during a brief lull in the honey-flow, that one or two colonies in the apiary began the work

of destruction of the male occupants of the colony. Then the workers concluded, no doubt, that there would be no more honey to be gathered, and determined to cut off the useless consumers. But the flowers again gave forth of their sweetness, and the remaining males were spared—for a later fate.

And so Nature has set its mandate, and we all have to make our final bow at the proper time, and proceed to that bourne from which no traveler is said to return. Vale, ye drones; may our fate be a happier one than is yours.

#### DOESN'T LIKE FENCES AND PLAIN SECTIONS.

E. F. Atwater says (Bee-Keepers' Review, p. 171):

"After an extensive test, extending over several years, we have discarded the fence-separators and plain sections, as inferior to the older styles. The solemn truth, for our localities and our markets, is that we get less honey in the new-fangled sections and supers, it is not so uniformly salable, and it does not sell for so much money."

#### THE GAIT OF A BEE.

A bee, when it travels afoot, always moves 3 legs at a time; but it isn't a pacer. The front leg and the hind leg on one side move simultaneously with the middle leg on the other side.—Gleanings, p. 821.

#### PROTECTIVE VALUE OF TARRED PAPER.

A novel sort of protection gained by using tarred paper is thus given by E. D. Townsend (Bee-Keepers' Review, p. 169):

"With the white building paper on some of our honey-houses, the mice make these houses headquarters. One of the most mice-ridden houses was at our Isabella yard. A year ago this house was papered with tarred felt paper, and we have never seen a mouse in that house since; neither have there been any ants there either. Then, we are quite sure that the robber-bees are not nearly so bad around a tar-lined house; at any rate, they have never troubled us in these houses yet. While I do not suppose that this paper would keep out robbers if one were careless and let them get started, still, I am satisfied that tarred paper is distasteful to the bees, as it is to mice and rats. If this proves so, there may be more in this tar than we realized at first. There is one objection to this dark-colored paper, and that is, the honey-house is not so light as if it were papered with white paper."

#### JUST PLAIN HORSE-SENSE.

If you work for a man, in heaven's name work for him.

If he pays you wages that supply your bread and butter, work for him, speak well of him, think well of him, stand by him, and stand by the institution he represents.

I think if I worked for a man, I would work for him. I would not work for him part of his time, but all of his time. I would give an undivided service or none.

If put to the pinch, an ounce of loyalty is worth a pound of cleverness.

If you must vilify, condemn, and eternally disparage, why, resign your position; and when you are outside, damn to your heart's content. But, I pray you, so long as you are a part of an institution, do not condemn it. Not that you will injure the institution—not that—but when you disparage the concern of which you are a part you disparage yourself.

And don't forget—"I forgot!" won't do in business.—ELBERT HUBBARD, in Technical World.

#### PRICES FOR EXTRACTED HONEY.

An article concerning wholesale and retail prices for extracted honey, by G. A. Deadman, contains the following passage (Canadian Bee Journal, p. 139):

"I said that honey should never go below 10c retail. I will go further than this. It should be at least 12c per pound in the home market, in small quantities. In 10-pound pails, say 11c; in a 60-pound tin at 10c per pound. The retail merchant then should pay 9c and the commission man or wholesaler 8c. When honey can not be bought by the wholesaler for less than 8c, then the retail price should not be less than 12c. If it can be bought at 7c, then 10c might be satisfactory."

#### OUT-DOOR FEEDING.

Feed is put in tubs full of alfalfa-stems or excelsior by E. F. Atwater (Bee-Keepers' Review, p. 172), and this is his plan for starting all his own bees at work promptly:

"At first we start the bees by breaking up some old combs into pieces about 1½ inches square. We dip these in the feed, lay one at the entrance to each hive, kick the hive if the bees are not numerous at the entrance, and so on. Then we go around and pick up the bits of comb, with bees at work on the feed in the cells, and carry them on a queen-excluder or escape-board, to the tub, where they are all dumped into the feed. In a few minutes every colony will be at work, and the feed will be gone long before many of your neighbors' bees find it."

#### YELLOW SWEET CLOVER ON THE SAME LAND EACH YEAR.

Sweet clover is a biennial, and it has been considered possible to have it blossom on the same land only in alternate years. Now comes J. A. Green, saying that by using the yellow variety a crop on the same land can be had each year. July 18, 1906, he gathered seed, sowed it between July 20 and 25, and this year it began to bloom May 5—285

days or less from the time it was sown. If the seed ripens this year as early as last, that means a crop each year on the same land. Quite a feather in the cap of the yellow variety, even if Colorado be the only State in which it will mature so promptly.—Gleanings, p. 828.

#### FIVE-BANDERS NOT HARDY.

F. A. Lockhart says that in the past unfavorable spring his 5-banders suffered the most heavily of all; F. A. Salisbury says his extra-yellow stock are all "gone up;" and N. E. Cleaver tells practically the same story. Editor Root says:

"We have observed, time and again, that the 5-banded or very yellow bees do not seem to be able, for some reason, to stand a severe winter or a bad spring like the leather-colored stock."—Gleanings, p. 833.

#### NUMBER OF COLONIES TO THE APIARY.

E. D. Townsend (Bee-Keepers' Review, p. 168) says:

"Our bee-yards never have more than 100 colonies at a time; and this is fall-count. With this number, fall-count, we usually have, after our winter losses and queenless colonies are deducted, somewhere between 80 and 90 colonies with which to commence the season."

#### SAMPLING HONEY WITH WOODEN TOOTH-PICKS.

Wooden Toothpicks are used by Walter Harmer for giving prospective customers a taste of honey. In one corner of his canvassing case he has a holder filled with toothpicks, and one of these is thrust into a bottle of thick, ripe honey, when enough will adhere to give quite a generous taste to the recipient. One of these can be given to each member of the family, children and all. Every one getting a taste of honey on one of these new clean pieces of wood feels sure that it has never been in some one else's mouth, while the amount of honey given is just about enough to whet the appetite for more.—Bee-Keepers' Review.

## A HOME BEE-SONG.

The twilight bees to the comb,  
 And the wandering bird to the nest,  
 And the roaming sails turn home  
 Far out in the darkening west;  
 Home, home, they gladly drift,  
 Though the lawn was loved of the bee,  
 And the bird had loved the lift  
 As the sailor the open sea.

And I, who have wandered far,  
 Down unremembered ways,  
 With never a steadfast star  
 Through all these drifting days,  
 Now turn to an Inn whereof  
 I know one door stands wide—  
 And the rest is silence, love,  
 Till the world is shut outside!  
 —ARTHUR J. STRINGER.

## SPRING MANAGEMENT AND SWARMING.

I will suppose that, on April 15, you have 100 fairly good colonies that were just taken from their winter quarters, and that each colony contains a good, well-developed Italian queen not over ten months old that has been reared from some good honey-gathering strain of bees. I shall take it for granted that your hives are filled with nice worker-combs.

We will commence the season's work by putting a feeder under every hive and giving each colony about 1½ cents' worth of extracted honey, or sugar syrup, which must be made very thin, of about the consistency of nectar, and feed them about this amount every day that the weather is such they can not gather anything from flowers until about the last of May. This will require on an average, one season with another, about 50 cents' worth of honey or sugar per colony; and, if properly done, you will have, May 25, every hive crowded with brood and maturing bees at the rate of 2000 or more a day.

About two weeks previous to this we should start the rearing of four or five hundred queen-cells, which are now, May 26, about ready to hatch. Now we will divide our colonies, making two of each, and fix them so that the queenless part will mature two or more of these ripe queen-cells or virgins into nice laying queens; then about the last of June we will separate these colonies that have two or more laying queens, making 100 more increase, or 300 colonies all together.

The old colony, or the part that has had the old laying queen from the first, we have kept busy drawing out frames of foundation into nice extracting-combs, and we have also kept them from any desire to swarm by taking their combs of capped brood away as fast as they had some to spare, and giving this brood to this newly-made increase.

In this way of managing your bees you will have no swarming to bother with, and at the same time you have increased your 100 colonies to 300, and all are in good condition for any harvest that commences after July 4.—E. W. Alexander, in Gleanings in Bee Culture.

## BE CHARITABLE—NOM DE PLUMES.

I wish our great family of bee-keepers would have more charity than they

do for one another. Perhaps the majority do think well of their fellows, but there are a few who are too much given to fault finding, to seeing a man's faults and failings instead of his good qualities. I don't say that men or their actions ought never to be criticised or condemned; but many times are men fairly abused for something for which they are not to blame. I sometimes get letters accusing me very sharply of something for which I am not in the least to blame. If you think that a man has made a mistake, or has done wrong, it is not always best to ignore it or keep still about it; but before condemning a man, ask in a kind and courteous way for an explanation. Don't be ready to impugn a man's motives until you know all of the circumstances.

As a rule I do not approve of the use of a *nom de plume*. There are cases when modesty might be an excuse; where a man, or more likely a woman, might be willing to write but did not care for the resulting publicity. But when a man enters into a critical argument, and proceeds to "roast" some opponent, he ought to come out fair and square with his own signature. To strike a man in the dark, and then dodge behind a *nom de plume*, marks a man as a coward.—Editor Bee-Keepers' Review.

## TAKING MORE THAN ONE BEE-PAPER.

I hold in my hand a very complimentary letter from one of our subscribers regarding the improvements that have been made in Gleanings from time to time. He thinks it covers the whole ground so thoroughly and so well that there is no use of his taking more than one bee-journal. While we appreciate most thoroughly this voluntary expression of our correspondent, I desire to say that I believe he is mistaken. If any one keeps bees for the money he can make out of them, he ought by all means to take not only one journal but two or three of them. Gleanings does not pretend to cover the whole field of apiculture. The personal bias of an editor, even though that bias be unconscious, may cause him to emphasize certain development of bee-lore to the total neglect of all others. As I look over our exchanges I can see fields that they are covering that Gleanings is not; and, conversely, I can see fields that we are coverings that they do not.

W. L. Coggshall, perhaps the most extensive bee-keeper in the world, once said to me that he could not afford not to take all the bee-papers published in the United States; and that, moreover, he could not afford not to scan every page after they came into his hands. "But," you say, "he owns and operates some two or three thousand colonies, while I have only fifty. One journal is enough for me." Let us see how nearly correct that is. Suppose the average annual surplus is 25 pounds per colony, of comb honey. I am purposely putting the figures low so as to give my friend the benefit of the figures. We will say that he sells the honey for 15 cents at the commission man's, and that it nets him 10 cents clear. That will make \$2.50 per colony, or \$125 in all. I do not know of a bee-journal published but may con-

tain some hint that will be worth several times the subscription price for the year. If three bee-journals cost \$3.00, or on a clubbing basis \$2.50, it would be very strange if our friend with fifty colonies could not get more than \$2.50 out of them. While the net earnings can be increased on a conservative basis of only \$10, take the benefit of the doubt and invest in two more journals at least. The farmer who takes only one agricultural paper, even the very best one, may miss some valuable hints which his more progressive neighbor is availing himself of, and, consequently, will be getting ahead of him in a business way.—Editor of Gleanings in Bee-Culture.

## Heavy Loss of Bees.

The loss in bees has been very heavy in this locality—about 90 percent. I should say. I have only 100 colonies left out of 300, but they are mostly in good condition, with good prospects for a honey crop.

I like the American Bee Journal, and feel that I can not afford to do without it.

Delaware, Ont., June 25. E. M. HUSBAND.

## Much Swarming.

There will be a very considerable decrease in honey-production in this locality this season. Swarming is free—I am averaging about 3 swarms a day (non-swarming stock!) By the way my supply-trade has increased and is holding out, others must be getting swarms, too. After the disastrous winter, I suppose in some occult way Nature demands the increase—a matter you may compare with the curious fact that the birth-rate (in Europe) increases with the increase in the cost of bread.

GEORGE W. ADAMS.

Essex Co., Mass., June 19.

## Poor Prospect for Honey.

The prospect for a honey crop in this locality is very poor. I have not had any swarms yet. In fact, the colonies are not in a very strong condition.

B. G. MINNICK.

Hardin, Mo., June 22.

## Starved Brood.

I brought every colony through the winter and into spring all right; but, oh my, it was a "tug of war" to keep up brood-rearing in the long, cold, backward spring. I got the bees into summer in fine shape, all the same. The amount of starved brood that is in our Province now is something awful. Many of our bee-keepers are calling it foul brood.

Woodburn, Ont., June 24. Wm. McEvoy.

## Light Crop of Honey.

It is very hot and dry here now. The honey season is closing up with, I think, generally a light crop.

I don't know just when I commenced taking the American Bee Journal, but back in the '70's. Father died in 1879 and we took it before that. How quickly the seasons come and go! You can always count on me as a subscriber. Long live the American Bee Journal!

W. C. NUTT.

Belleville, Tex., June 21.

## Cold Spring—Feeding the Bees.

I have 65 colonies of bees. About one-half of them are weak and the rest are fairly strong. It has been the coldest April, May and June up until about one week ago, that I remember ever seeing. During fruit-bloom it was so cold and cloudy that the bees could not work much. And now it is very warm and dry. The bees are on the verge of starva-

# American Bee Journal

tion. They are killing off their drones and no signs of swarming. I am feeding them sugar syrup in the open air to keep them alive till clover-bloom. The prospect for a honey-crop is anything but bright now, but I am living in hopes that we will get rain soon to help the clover, and that we may get some honey yet.  
 GEO. H. ADKINS.  
 Ticonderoga, N. Y., June 15.

## Bees Doing Better.

We had very poor weather all spring, cool and rainy, and nothing for bees to do, but on June 14 they started to work on white clover, which is abundant, and there is plenty of nectar in it. Basswood also is going to be No. 1. I have had only 2 swarms so far, but I made 4 nuclei which are as good as primary swarms. The honey-bee is my best friend and I give her the best care possible.

I kept black bees in the old country but they were different from the black bees the bee-keepers write about here in the United States. The common bee here is a mixture. The Italian and Carniolan are extra-good honey-gatherers if handled right, but do not look so nice as pure Italians. They are just as good workers, however.

LaMotte, Iowa, June 21. NICK JENTGEN.

## Poor Season, but Improving.

The season was very poor here for bees up to about 2 weeks ago. They are doing nicely now on white clover; and the linden trees are as full of buds as I ever saw them. They will be in bloom in about 10 days. I think there is a good prospect of the bees making up now for lost time.

I divided 3 colonies about a week ago in our out-apiary. I looked into those colonies yesterday (6 in all) and they are all doing fine. We now have 7 colonies in this apiary.  
 (Rev.) J. W. STINE.

Durham, Iowa, June 27.

## Bees are Backward.

Bees are very backward. No swarming yet. There is plenty of white and alsike clover in bloom, but the bees do not seem to be working on it.  
 CHAS. DOAN.

Hull, Iowa, June 26.

## Honey Crop a Failure.

The honey crop is a failure here. First white clover gain was June 2, and only 20 pounds gain in weight since, and mostly brood. I hear of bees doing well here, but it is in cases of one or more colonies in a place. It will not affect the honey crop in the least. If prospects do not change greatly soon, there will not be any Missouri honey. Indeed, I thought 2 weeks ago I should have to feed in June to keep them from starving.

Marceline, Mo., June 17. IRVING LONG.

## Still Feeding the Bees.

I am still feeding my bees and the end of feeding is not in sight. The weather is quite warm now and we had rains week before last and the beginning of last week. There is considerable white clover in bloom, but the bees do not seem to get anything from it. I suppose the conditions are the same all over Iowa. If there is a flow anywhere I would like to have some bee-keeper write to the American Bee Journal and let us know about it.  
 EDWIN BEVINS.

Leon, Iowa, June 17.

## Swarming and Working Sections.

My bees are swarming and starting to work in sections. I think we will have a good season here. I have for main sources fruit-bloom, raspberry and blackberry, white clover, basswood, chestnut, aster, golden-rod, and buckwheat; also lots of other plants that give the bees almost a steady flow.

Jamestown, N. Y., June 17. G. B. BARCOCK.

## No Prospects for Surplus Honey.

Bees are at least 2 months behind, with no prospects for any surplus honey before September. There will not be any Linden bloom this year of any consequence, for there are no buds to speak of. Bees are gaining a little from white clover now, but not fast. Bees wintered fine, but oh, what a late spring!

I had to feed for 2 months, owing to all of the early bloom having been killed, and if it had not been killed it was so cold that bees could not fly for weeks at a time. We have had fine weather now for some days, but it is too late for some things. I had to order some honey from Chicago for my own use, owing to having to feed so late, and so much. I hope for the better things in the future.  
 Mast, N. C., June 25. A. J. McBRIDE.

## Honey-Yield Small.

The sage is about out of bloom and the yield of honey is small at this apiary, but of extra-good quality, as the backward spring caused the bees to use up all the dark and mixed honey.  
 DELOS WOOD.  
 Santa Barbara, Calif., June 19.

## First Alfalfa Flow.

Bees have had a hard time this season here. The first alfalfa honey-flow is just on. It is the first flow of any kind since everything froze during fruit-bloom.

The American Bee Journal is well worth \$1.00 a year to any one who has even one colony of bees.  
 F. G. BARKER.

Salina, Kans, June 15.

## Building Up for the Fall Crop.

The season has been excellent so far and all colonies that were strong enough have stored a nice surplus; but as the weather had been unfavorable for the rapid building up of colonies in April, and in May, it rained almost every day, most colonies came to the harvest in a weak condition, so that they could not take advantage of the harvest to the greatest extent. We do not expect a great spring crop, but this flow is certainly fine for the building up of all colonies for the fall flow, which is the one we mostly depend upon here for our surplus. The weather is fine at present, and we hope it will continue for a while longer.  
 JULIUS HAPPEL.

Evansville, Ind., June 27.

## Very Cold Spring.

We are having a very cold spring. Apples are just beginning to bloom. All weak colonies of bees have dwindled out. I have had to feed nearly all colonies up to now, but I think if the weather is good, we will get a fair honey crop yet.  
 EDWARD RICARD.

Canaan, N. H., June 12.

## Poor Season for Bees.

This is one of the poorest seasons for bees, as it is cold and rainy all the time. They go out but never return. Therefore the colonies are on the verge of starving at almost the first of June. If we do not get a change soon there will be no honey for bees or any one else. My bees came through the winter all right with plenty, but this weather is causing it all to be consumed. The supply-manufacturers will not be rushed this season for goods.  
 HIBBETS, Ohio, May 27. HENRY BEST.

## Cold Season for Bees.

I took my 147 colonies out of the cellar, all appearing very strong, on March 20 and 21, at a temperature of 85 and 93 degrees. A week later the weather "caught cold," and no amount of coaxing has been able to get rid of it. If the bees had not been in first-class shape, they never would have "stood the racket." One colony was extinct at the time of taking them out and it is there yet, and I mean to keep it there until warmer days. It had been marked "Very weak; watch" at the time of cellaring. All colonies were tar-papered, a la Hutchinson, on March 22, (hence before Hutchinson's tar-papery got into print). While I have lost some 20 colonies since from spring dwindling, I am sure the paper saved lots of bees. I afterward bought out a yard of 26 colonies and have at this time about 150. Some are yet very weak, but most would get ready for white clover with good weather, which will not be much short of 2 weeks yet. Dandelions are in "full blast" and we are hoping that overgrowth of moss, etc., can be mown off and let the sun shine through a little.

While we had several hard freezes while fruit was in bloom, the fruit seems not to have suffered total loss, and apples seem to have been hurt but little, if any, by the frost. The only explanation I can advance for it is

that the slow growth in a low temperature produced hardier buds and blossoms. Farm crops look fine. Corn needs dry and warmer weather. Judging from its appearance most farmers must have planted the "little yellow" kind this year.  
 F. W. HALL.

Hull, Iowa, June 10.

## Kerosene for Robber-Bees.

I had one of the worst cases of robbing I think I ever had. The robber-bees just swarmed in and around the hive. I closed the entrance so that but one bee could get in, and took some kerosene and painted the entrance and the cracks under the cover. Every bee left in 10 seconds. I went back in half an hour and found a few of the robber-bees hovering around, so I painted the open places again.

In painting be careful not to let any of the kerosene get into the hive. I do not remember ever seeing this cure in print, but it is sure.  
 EMERSON, Ill., May 30. W. H. H. STEWART.

## No Bloom and No Honey.

Weather conditions have been bad for bees since the last of March. My winter losses were few, but I have lost quite a number of colonies in the last 2 months. I am now feeding all colonies (about 100) in order to keep them alive, and keep up brood-rearing. There is no honey in any hive and there is no bloom from which the bees can gather it, and what is worse, there is no white clover in the fields. There is no telling how long the feeding will have to be carried on, probably for many weeks.  
 EDWIN BEVINS.

Leon, Iowa, May 29.

## Coldest Spring in 24 Years.

The oldest settlers say that this has been the coldest spring since 1883. Grain that was seeded April 30 has not come up yet. The dandelions have not commenced to bloom yet, nor the fruit-trees. So far there is no sign of buds to speak of. On May 19, last year, I extracted dandelion honey. This year there will be no extracting for 2 weeks at least from date. I notice the Southerns have their troubles, too, so, according to reports, the honey-market will not be clogged this year.  
 CHAS. O. BERGSTRAND.

Amery, Wis., May 27.

## Bees Carrying Water at Night—First Recorded Midnight Play-Spell of Young Bees.

It is all right to be suspicious when anything is reported, yet as Mr. Miller says, "It is not safe to deny something because it did not come under one's observation."

In the controversy between Mr. Hasty and myself, I wish to state that an error occurred in my last article. While I have seen bees at night around a certain barrel right at my house, I incidentally remarked that although plenty of bees are to be seen in daytime around my pump, none could be found there at night. Not all of my colonies sent out water-carriers at night, only those strong colonies having a clear track, clear right of way on hot nights. However, last fall, after bees had stopped night work for 5 or 6 weeks, one colony sent one water-carrier as late as either Wednesday or Thursday on November 3, and also another on the first Sunday in December.

To satisfy my own curiosity I made the following experiments:

1. With a Monette Queen-Clipping device I captured several bees (one at a time, of course), to see whether that certain colony whose night-worker was lost, would send out another, as never more than a single bee goes out of a hive after water. At least I have never seen it otherwise. While this caging interrupted for a while at least the water-carrying (the same work was resumed later on. Right here I wish to remark that bees never fly inside the barrel at night as they do in the daytime; no, they fly on the rim of the barrel on the side nearest the hive, and "foot it" or "leg it" down to the water.

I next wanted to know whether it was the same bees over and over again in the same and a few following nights, but failed. I remembered reading something about painting bees and queens with a quickly drying powder. Why could not I paint this night-shift of bees? After looking in vain for such a powder in a few great Chicago mail-order catalogs, I used alternately coach-paint, red,

green, and also the common white lead, painting of course only the thorax. The hive whose bees were painted stood almost at the head of my bed, and the barrel only a few feet of the other end. After painting and knocking the bee back, for she crawled again to the rim of the barrel, I anxiously awaited her return to the hive. But, oh, like George Rossett, the Syrian leper from West Virginia and New Jersey, so these red and green backs and white caps were unceremoniously hustled out of the hive. Sailing under false colors is certainly not allowed inside a bee-hive.

I next tried meal smut, sifted red brick-dust, and sulphur, but could not satisfy my curiosity. So as not to be confused by bees from other hives, all hives sending out water-carriers at night were thoroughly sprayed inside. This stopped them. Slightly spraying the alighting-board, I had found out a few nights before making the last experiment, had no effect whatever.

Mr. A. I. Root tells us in Gleanings how during some beautiful Florida night his rooster got fooled and came down from his roost. Last June, about the 20th, most farming operations were over and a little idle time was spent in queen-rearing a la Doolittle. Ten frames containing mostly sealed brood were raised above an excluder about this time. There only one night—but I don't know for certain on which night, the 5th, 6th, or 7th of July, 1906—out came a part of my young bees, probably 50, enjoying a play-spell by the light of the moon, probably about midnight. Why could not these same young bees come out on the glorious 4th? And they might, but I don't know. I think, however, it rained the night following the 4th of July. These night-playing bees also made their circles quite small, no higher than the roof of the second full story, and no more than 2 feet from the entrance of the hive. But here I ran into another puzzle. The hive contained quite a multitude of young bees, for I watched for the play-spell on the following day. Why couldn't the whole crop of young bees take their play-spell by the light of the moon, why only a part, and why circle so close to the hive?

Right here I wish to say the play-spell lasted only about 8 or 10 minutes, and old bees were going in and out before and after the play-spell right along, working on corn-tassels and also on partridge-vines. I am glad that Mr. Hasty, although doubting the water-carrying at night, acknowledges the same quality of his well-settled hybrids when "enticed by his light," viz: Why does only one bee at a time butt against his lantern?  
Fort White, Fla., May 27. D. J. PAWLETTA.

### All Colonies Light.

At this date my bees are living on sugar syrup. White clover is beginning to bloom, and the bees are working on it some. All colonies are light for the time of the year, so I think the prospect anything but flattering for the season.  
R. B. ARNOLD.

Lovilia, Iowa, June 6.

### Best Year in a Long Time.

I see in the American Bee Journal that the prospect for honey is pretty blue in many places this year. We had a somewhat late spring and little pollen came in up to March 10, but the bees came out well. I had about 29 colonies and lost 4 from queenlessness, and was prepared to increase to 50 colonies, but so far I have had only 2 swarms. The most of my colonies are working in the second super (full-sized Langstroth 10-frame) for extracted honey. It is the best year I have seen for a long time—fine weather right along. It has not been warm, but the bees have been lugging in honey, and if it will hang on, it will be a bumper crop.  
O. K. RICE.

Grays River, Wash., May 29.

### Handling Bees for Others.

Since taking the American Bee Journal, about 7 years ago, I have lost from foul brood, etc., all of my bees—about 40 colonies. If I had had time I could have cured it by transferring, etc., but I finally thought best, under the circumstances, to destroy them.

Bees do well in Walla Walla valley, averaging usually 2 to 3 supers—48 to 72 pounds. Lately Mr. A. L. Melander, from Pullman, Wash., State bee and fruit inspector, was in this valley looking after the foul brood. He is doing a great deal of good and arousing considerable enthusiasm with bee-keepers.

I handle quite a large number of bees for

others each spring. I have a good equipment and I charge 50 cents an hour, or \$4 per day. I have more calls than my limited time will permit. In all cases I have made it pay the owner double or triple. People generally have their bees in old boxes and get very little honey, and that in bad shape. Others have the standard hive with the tin rabbit in wrong, the division-boards in the center, without foundation-starters in, or put in so loosely that they fall down with heavy swarms. I shape them up at the rate of 15 to 25 colonies per day.

My method for transferring is to place the new hive on the old stand, place the old hive with the bottom ripped off on top of the new hive, then smoke them down a bit and proceed with chisel and hammer to rip the old hive to pieces. I save enough of the best brood to fill a Langstroth frame, which I get inside the hive as soon as possible so as not to chill the brood. This gives them a chance to hatch a queen if I fail to get their queen transferred all right, which is seldom. I then leave them alone for fully 10 days, as I fancy if they are disturbed before the queen-cell is capped over they may destroy the growing queen by eating out the royal pabulum. I often put several dilapidated colonies into the one new hive. I don't save the old combs as I haven't the equipment for rendering the wax. I enjoy the business immensely, and I mean to cut out other business and take up the bee-business exclusively. I have only 16 colonies now. They are without foul brood. Several have stored one or more supers full of nice white locust honey already.

Bees in this valley rarely ever winter-kill—outdoors all winter.

When I was at the business before, I made quite a thorough study of it in all lines, and by introducing Italian queens I had all Italian bees.  
A. L. McFARLANE.

Walla, Walla Co., Wash., June 15.

### Late and Cold Season.

Bees are strong this spring and are casting strong swarms. I have had 4 very strong prime swarms this spring. The spring season being late and cold, bees are hardly getting enough honey to live on. I hope the prospect for a good honey crop will brighten as the season advances.  
WILLIAM H. HEFFNER.

Mont Alto, Pa., June 3.

### A Discouraging Outlook.

We have just had a week of cold rain, and bees are doing nothing. I am feeding them and will have to feed for 2 weeks more. We have had 5 freezes since fruit-bloom, and there is nothing for the bees to do. The first crop of alfalfa was frozen and cut for hay. The second is short on account of cold and drouth. I don't know if the bees will store any surplus honey this year. It looks like a poor proposition. No fruit of any kind this year.  
J. J. MEASER.

Hutchinson, Kans., June 1.

### Good Place for Bees.

I now have 20 colonies of bees. I sold \$40 worth of honey last year. This is a splendid place for bees—white clover on one side of my farm, and smartweed and basswood on the other. I like bee-work very well.

I expect to increase my apiary gradually as I want to understand the work and management of the bees better than I do now, before I go into it too heavily.

I have been reading the American Bee Journal for over a year, and I like it very much.  
W. R. MOORE.

Hume, Mo., June 27.

### Queen's Laying—Finding Queens.

The one who claims in Gleanings that the queen lays drone or worker-eggs according to the curvature of her abdomen, is hereby requested to rise and explain how it works when the queen lays drone-eggs in worker-cells, or worker-eggs in drone-cells. The abdomen of the queen is much longer than either kind of cells, and therefore the curvature must be about the same in either case.

For several years I have been using, to some extent, feeders placed permanently under the hive-bottoms, and to which the bees had access through a hole in the bottom-board. Very frequently when I open the hive and smoke the bees the queen runs off and takes refuge in the feeder. The funniest part of it is that until a few days ago, I never thought of

taking advantage of it to secure the queen, without having to look over the combs and hunt her up everywhere.  
ADRIAN GETAZ.  
Knoxville, Tenn., July 2.

(Continued from Page 587.)

### Vegetable Physiology and Honey

BY PROF. A. J. COOK.

It is a good thing that we have such a good Weather Service. We may never know how much the weather has to do with success in the various affairs of life. We know how bad weather interferes, oftentimes, with the fun we had planned at a picnic, maybe keeping us at home altogether. We often remark how fortunate we are in California as we can generally count on good weather from April to November, and so can safely count on planning a picnic at any time in summer, and the weather will not say us nay. We know how a lack of winter rains will surely cut off the honey crop in the arid regions, and severe drouths as surely foretell failure in the East. I remember in the late '80's how we had 3 years in succession, with no honey at all, and without doubt the drouth was the cause, as we have never had such a failure in all the previous years of my bee-keeping from 1870 on to these 3 very dry years. The present season has been very cold all over the country. In Kansas it has been as dry as cold, while in Michigan and Ohio, it has been as wet as it has been dry in Kansas. In all these regions it has been a very poor honey-year. Is it possible to explain this coincidence, of lack of honey and these weather conditions?

We know that sap is to the plant what blood is to us. Sap, like blood, not only carries all the nourishment to the needy cells, but it is the food. We know that water is the most important part of the blood and of sap as well. We see, then, that growth, secretion—yea, the very life of the plant is dependent on water, and we no longer wonder that the plant so soon wilts, withers and dies when the water is withheld. Life and cell-nourishment are more important than is fruiting. But nectar-secretion is connected with fruiting, and we should expect that when there is a shortage of water, the life would be kept up, at the expense of fruit, and so we no longer wonder that the trees fail to secrete nectar—may fail to bloom at all, when the ground at the roots dries up. We used to think, in California, that we were sure of a honey-year when we had plenty of timely rains. But the two years just past make us change our views, and so we need to consider another urgent need of every vigorous plant.

The roots of the plants take from the soil the water, and in solution in this the needed mineral elements. These are carried from cell to cell in the sapwood, to the leaves as crude sap. The leaves may be said to form the manufactory of the plant. We see, then, why one reason plants rest in the winter—that is, deciduous plants—they have no leaves. The leaves take carbon dioxide

# American Bee Journal

from the air, and by use of this and water, they form sugar, starch and most of the vegetable products. But there is one indispensable condition to vegetable work or nutrition. There must be light and heat. At night the plant ceases work for the most part, as it has not the necessary light. We know how pale and sickly a plant looks under a board. It is without light. The green part of twigs and leaves—the chlorophyll, as it is called—can form only in the light, and without chlorophyll the plant is unable to do its work. Warmth is also necessary to the best work and growth of all plants. Cold, then, stops the functional activity of plants just as surely as it does of animals. In case there is too little warmth, the plant may live and make meager growth, but it will not secrete nectar, and may not even bloom. Thus we may easily explain why these cold seasons preclude the existence of nectar in the flowers, and of honey in the hive. In case the cold is very pronounced, it even shuts the bees in the hives, and they do not go forth to gather what they would seek in vain when the weather is cold and inclement.

There is one more point that is not so important to the exclusive bee-keeper, but is of exceeding moment to the fruit-grower. I refer to the fact that many of our most important fruit-trees and vegetables are sterile to their own pollen. Thus though they will bloom, they will not fruit unless they are cross-pollinated. They will therefore fail, utterly, to fruit, unless they are cross-pollinated. All flower-loving insects will aid in doing this necessary work. But where we have massed our trees as we have in our orchards, the bees are required to effect this work as there are not enough of other nectar-loving insects to do it. Thus we see why we are likely to have a meager crop of fruit in such years as this has been. The cold keeps the bees in the hive, and so cross-pollination is not effected. Even if the bees do go forth, there is no nectar to attract them to the flowers and so there is still a lack of cross-pollination, and as surely a shortage in the yield of fruit. It is plain to be seen that the fruit-grower just as much as the bee-keeper is dependent upon the warmth, the rains, and the bees for the best success.

## THE SEASON OF 1907.

I have of late passed through our country from California to Ohio, and have stopped off for a time in Kansas, Illinois, Michigan, and am now enjoying life as a "Buckeye," and everywhere I have found a very cold, backward spring. This has hit the fruit-man hard, and so far has been discouraging to the bee-keeper. It is safe to say that the fruit crop will be light in very many parts of our country. The cold in many cases has actually killed the bloom, and in many other places the cold has prevented cross-pollination, and so the fruit has failed to set and has dropped from the trees. The outlook for honey is not so bad. The rains in many localities have been very generous, and now the weather has warmed up, and there is yet time for an abundant yield of honey. It is a

fortunate circumstance that the season is in many places at least 3 weeks behind the usual season at this time of the year. The bloom of clover and linden will be late, and this will give the bees a better opportunity to fill the hives.

## SPECIALISTS IN BEE-KEEPING.

We all remember how well Messrs. Hutchinson, Heddon and Taylor argued in the olden time in favor of exclusive bee-keeping. Some of these did not "take their own medicine," as they were as successful in other lines as in their favorite work with the bees. I have of late visited several former friends. I find most of them keep bees in connection with their other farm work. They say it pays well, and, besides, they are assured that the bees are a very essential aid in their farm operations. I am delighted as well as surprised to find how generally the bee's importance in agriculture is coming to be appreciated. I have long felt that farming would be more successful if every farmer kept and enjoyed several colonies of bees.

Columbus, Ohio, June 20.

## SHIPPING-CASES TO BURN

Dovetail Hives, Sections, Foundation, and a full line of supplies by the carload, and shipped from the best shipping-point in Michigan. An all-basswood 24-pound case, 1-piece cover, 13 cents. Honey and beeswax wanted. Send for catalog and discounts.

W. D. SOPER, Rt. 3, Jackson, Mich.

## WE SELL ROOT'S GOODS IN MICHIGAN

Let us quote you prices on Sections, Hives, Foundation, etc., as we can save you time and freight. Beeswax Wanted for Cash.

H. M. HUNT & SON, Redford, Wayne Co., Michigan

## GOING OUT OF BUSINESS

Bee-Supplies of every kind, and business, for sale. Have made enough, and can afford to quit. Tired, 60 years old and want to rest, think, write and live. **Can save you money any place in the United States.** 400 hives at Watertown, Wis.—not here. **Send a list for prices. BIG CUT, and you will need to be quick.** Read the "Modern Farmer."

E. T. ABBOTT, St. Joseph, Mo.

## TEXAS QUEENS

The famous Honey-Producers have out-stripped all others this year in honey-gathering. Record up to July 1st, 320 lbs.

## CARNIOLANS, ITALIANS and GOLDENS

Tested, \$1.00 each; \$10.00 a dozen. Warranted, 75c " 7.00 " " Untested, 50c " 5.50 " "

GRANT ANDERSON,  
SABINAL, TEXAS

## By RETURN MAIL OR MONEY REFUNDED

Italian Queens—each 75 cents or 6 for \$4. Caucasians—each \$1, or 6 for \$5. Warranted purely mated.

D. J. BLOCHER, Pearl City, Ill.

"It is continuous advertising that impresses the public with the stability of a firm"

# MARSHFIELD BEE-GOODS

FRIEND BEE-KEEPER:—You have had a hard time of it; colonies dwindled to half with some, and you were nearly discouraged. But the clouds have rolled away and prospects are fine for a good crop yet. Get **Marshfield Bee-Goods**, and make no mistake.

# SPECIAL CLUBBING AND PREMIUM OFFERS

In Connection With The

## AMERICAN BEE JOURNAL

Sample copies free, to help you interest your friends and get subscriptions. If you will send us names of your neighbors or friends we will mail them sample copies free. After they have received their copies, with a little talk you can get some to subscribe and so either get your own subscription free or receive some of the useful premiums below. They're worth getting. We give you a year's subscription free for one new subscription at 25 cents.

### BEE-KEEPERS' NOVELTY POCKET-KNIFE

Your name and address put on one side of the handle as shown in cut, and on the other side pictures of a queen-bee, a worker, and a drone. The handle is celluloid and transparent, through which is seen your name. If you lose this knife it can be returned to you, or serves to identify you if you happen to be injured fatally, or are unconscious. Cut is exact size. Be sure to write exact name and address. Knife delivered in two weeks. Price of knife alone, postpaid, \$1.25. With year's subscription, \$1.40. Free for 8 new 25c subscriptions.

### BEE-KEEPER'S GOLD-NIB FOUNTAIN PEN

A really good pen. As far as true usefulness goes it is equal to any of the higher-priced, much-advertised pens. If you pay more it's the name you're charged for. The Gold Nib is guaranteed 14 Karat gold, Iridium pointed. The holder is hard-rubber, handsomely finished. The cover fits snugly and can't slip off because it slightly wedges over the barrel at either end. This pen is non-leakable. It is very easily cleaned, the pen-point and feeder being quickly removed. The simple feeder gives a uniform supply of ink to the pen-point without dropping, blotting or spotting. Every bee-keeper ought to carry one in his vest-pocket. Comes in box with directions and filler. Each pen guaranteed. Here shown 2/3 actual size.

Price alone, postpaid, \$1.25. With a year's subscription, \$1.40. Given free for 8 new subscriptions at 25 cents each.

### QUEEN-CLIPPING DEVICE

The Monette Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings. 4 1/2 inches high. It is used by many bee-keepers. Full printed directions sent with each one. Price alone, postpaid, 25 cents. With a year's subscription, 40 cents. Given free for 2 new subscriptions at 25 cents each.

### IDEAL HIVE-TOOL

A special tool invented by a Minnesota bee-keeper, adapted for prying up snipers and for general work around the apiary. Made of malleable iron, 8 1/2 inches long. The middle part is 1 1/16 inches wide and 7-32 thick. The smaller end is 1 7/8 inches long, 1-2 inch wide, and 7-32 thick, ending like a screw-driver. The larger end is wedge-shaped having a sharp, semi-circular edge, making it almost perfect for prying up covers, supers, etc., as it does not mar the wood. Dr. Miller, who has used it since 1903 says, January 7, 1907: "I think as much of the tool as ever." Price alone, postpaid, 30 cents. With a year's subscription, 45 cents. Given free for 3 new subscriptions at 25 cents each.

Exactly half actual size.

### PREMIUM QUEENS

These are untested, standard-bred, Italian Queens, reports of which have been highly satisfactory. They are active breeders, and produce good workers.

Sent only after May 1st. Orders booked any time for 1908 queens. Safe delivery guaranteed. Price, 75 cents each, 6 for \$4.00 or 12 for \$7.50. One queen with a year's subscription, 90 cents. Free for 5 new 25c. subscriptions.

### HUMOROUS BEE POST-CARDS

A "Teddy Bear" on good terms with everybody including the bees swarming out of the old-fashioned "skep." Size 3 1/2 x 5 1/2, printed in four colors. Blank space 1 1/2 x 3 inches is for writing. Prices 3, postpaid, 10 cents; 10 for 25 cents. Ten with a year's subscription, 40 cents. 5 given free for every 25-cent subscription, if requested, and no other premium.

### BOOKS FOR BEE-KEEPERS

**Forty Years Among the Bees**, by Dr. C. C. Miller. 234 pages, bound in handsome cloth, with gold letters and design, illustrated with 112 beautiful half-tone pictures, taken by Dr. Miller. It is a good, new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price alone, \$1.00. With a year's subscription, \$1.15. Given free for 7 new subscriptions at 25c. each.

**Advanced Bee Culture**, by W. Z. Hutchinson. The author is a practical and helpful writer. 350 pages; bound in cloth, beautifully illustrated. Price alone, \$1.20. With a year's subscription, \$1.35. Given free for 8 new subscriptions at 25 cents each.

**A B C of Bee Culture**, by A. I. & E. R. Root. Over 500 pages describing everything pertaining to the care of honey-bees. 400 engravings. Bound in cloth, price alone, \$1.20. With a year's subscription, \$1.35. Given free for 8 new subscriptions at 25 cents each.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle. How the very best queen-bees are reared. Bound in cloth and illustrated. Price alone, \$1.00. With a year's subscription, \$1.15. Given free for 7 new subscriptions at 25 cents each. In leatherette binding, price alone, 75 cents. With a year's subscription 90 cents. Given free for 5 new subscriptions at 25 cents each.

**Bee-Keeper's Guide, or Manual of the Apiary**, by Prof. A. J. Cook. This book is instructive, helpful, interesting, thoroughly practical and scientific. It also contains anatomy and physiology of bees. 544 pages, 255 illustrations. Bound in cloth. Price alone, \$1.20. With a year's subscription, \$1.35. Given free for 8 new subscriptions at 25 cents each.

**Langstroth on the Honey-Bee**, revised by Dadant. This classic has been entirely rewritten. Fully illustrated. No apian library is complete without this standard work by "The Father of American Bee Culture." 520 pages, bound in cloth. Price alone, \$1.20. With a year's subscription, \$1.35. Given free for 8 new subscriptions at 25 cents each.

**The Honey-Money Stories**. A 64-page booklet, containing many short, bright stories interspersed with facts and interesting items about honey. The manufactured comb-honey misrepresentation is contradicted in two items each occupying a full page. Has 33 fine illustrations of apiaries or apiarian scenes. It also contains 3 bee-songs. This booklet should be placed in the hands of everybody not familiar with the food-value of honey, for its main object is to interest people in honey as a daily table article. Price 25 cents. With a year's subscription, 40 cents. Given free for 2 new subscriptions at 25 cents each.

Three copies for 50 cents; or the 3 with a year's subscription 65 cents; or the 3 copies given free for 4 new subscriptions at 25 cents each.

**Amerikanische Bienenzucht**, by Hans Buschauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price alone, \$1.00. With a year's subscription, \$1.15. Given free for 7 new subscriptions at 25 cents each.

### THE EMERSON BINDER

A stiff board outside like a book-cover with cloth back. Will hold easily 3 volumes (36 numbers) of the American Bee Journal. Makes reference easy, preserves copies from loss, dust and mutilation. Price postpaid, 75 cents. With a year's subscription 90 cents. Given free for 5 new subscriptions at 25 cents each.

### WOOD BINDER

Holds 3 volumes. Has wood back but no covers. Price postpaid, 20 cents. With a year's subscription 35 cents. Given free for 2 new subscriptions at 25 cents each.

### BEE-HIVE CLOCK

A few of these handsome "bronze-metal" clocks left. Base 10 1/2 inches wide, by 9 1/2 inches high. Design is a straw skep with clock face in middle, suitable for parlor—an ornament for any place. Keeps excellent time, durable and reliable. Weight, boxed 4 pounds. You pay express charges. Price, \$1.50. With a year's subscription, \$1.65. Given free for 10 new subscriptions at 25 cents each.

## Queens of Moore's Strain of Italians

Produce workers that fill the supers, and are not inclined to swarm. They have won a world-wide reputation for honey-gathering, hardiness, gentleness, etc.

Mr. W. Z. Hutchinson, editor of the Bee-Keepers' Review, Flint, Mich., says: "As workers, I have never seen them equaled. They seem possessed of a steady, quiet determination that enables them to lay up surplus ahead of others. Easier bees to handle I have never seen."

My queens are all bred from my best long-tongued 3-banded red-clover stock (no other race bred in my apiaries), and the cells are built in strong colonies well supplied with young bees.

PRICES: Untested Queens, \$1 each; six, \$5; doz., \$9. Select, untested, \$1.00 each; six, \$5; doz., \$9.

I am filling orders by return mail.

Safe arrival and satisfaction guaranteed. Descriptive circular free. Address,

J. P. MOORE, Queen-Breeder, Rt. 1. MORGAN, KY.

## TAYLOR'S STRAIN OF ITALIANS IS THE BEST

Long-tongued and goldens are the best of honey-gatherers; 1 1/2 years a specialty, breeding for the best honey-gatherers. Untested, 75 cts. each, or \$8.00 a dozen; tested, \$1.00 each, or \$10.00 a dozen; select tested, \$1.50 each. Breeders, the very best, from \$3.00 to \$5.00 each. Carniolans, same price as Italians. Try them. We sell nuclei and full colonies. Bees in separate yards. Safe arrival guaranteed. Send all orders to

J. W. TAYLOR & SON, Beeville, Bee Co., Texas.

## Your Order for Queens

Will be promptly filled. We can supply both tested and untested Italian Queens, your choice of either imported or home-bred mothers.

Our bees are bred for business; our Queens will not disappoint you. Tested Queens, \$1.00 each; Untested Queens, 75 cents; \$8 per doz.

J. W. K. SHAW

20Atf LOREAUVILLE, Iberia Pa., La.

## MINNESOTA QUEENS

Nothing Better. Try Them. Three-band and Golden Italians. We warrant our bees free from disease of any kind, and guarantee safe arrival of all queens. We want your orders and will fill them promptly on and after June 1st, at 75 cts. untested, and \$1.25 for tested of either strain. A postal will bring you a circular. Send your orders to

MENNIE & FENTON, Pine Island, Minnesota.

## Angel's Golden Beauties

—AND HIS—

Bright Three-Banded Italian Queens

Have but few equals and no superiors. A fine, large Queen of either strain for \$1; an extra-select breeder for \$2.50. Have had 12 years' experience at queen-breeding. Address,

SAMUEL M. ANGEL

20A131 R.R. No. 1, EVANSVILLE, IND.

## HERE IS YOUR CHANCE

Select Italian Queens by the hundreds after July 15. Virgins, 1 to 5 days old, 30c; doz., \$3. Untested, 60c; doz., \$7. Tested, \$1. 2-frame nuclei, \$2; full colony, \$10. Big crops of honey prove the stock. Cash with orders.

GEO. N. REA, Maplewood Apiary, R. 2, Reynoldsville, Pa.

# HALLOCK'S PATENT POTATO DIGGER

Don't Close a Deal for any Digger Until You Try the O. K.

PATENT APPLIED FOR

D. Y. HALLOCK & SONS, Box 828, York, Pa.

If you're going to buy a digger you want the best digger built. We're going to help you get it and prove to you that it is the best before you buy it.

We propose to ship you one of our 1907 O. K. Potato Diggers and give you an opportunity to test it thoroughly on your own farm.

See for yourself just what it will do for you.

If it backs up our claims it is certainly ahead of any other digger ever devised.

Will You Try It? Write today for full information and our free trial plan—don't close a deal for anybody's digger until you give the O. K. a trial.

Try It at Our Expense — Write Today For Our FREE TRIAL OFFER

## THE PRAIRIE STATE BROODER

A Spring, Summer or Winter Brooder House No. 5

If you have not investigated the No. 5 you ought to get busy because it is one of the most satisfactory brooders ever made. It is portable making it desirable for use in any kind of a poultry house or as a colony house on the open range without any change. Being enclosed (see cut) it can be used as an individual lamp brooder in colder localities than the plain Universal Hover can be alone. Top is covered with a removable Cloth Screen instantly changing it from a winter to a summer brooder. Hover lifts out making it easy to clean. Consumes but little oil; supplies abundant ventilation even in hottest weather; top affords sun shade. We can't tell all its good features here—

### Get Our Brooder Catalog

showing it in several forms and describing its many useful adaptations. With the No. 5 chicks can be raised during June and July unusually successful. We will also gladly mail our 1907 Incubator catalog which tells why the Prairie State hatches extra large, strong chicks with greater ease and certainty.

Prairie State Incubator Co.,

522 MAIN STREET

HOMER CITY, PA.

No. 5 Brooder with side removed

## Well-Bred Queens

Will greatly increase the yield of honey. Am now taking orders for **Cook's Select-Bred Queens**—to be sent as soon as weather permits mailing. Also Caucasian Queens from imported stock.

**Cook's Square Honey-Jar** is the best, cheapest, and most sanitary package for retailing honey. Send for circular and price-list of Hives, Bees, and useful Implements.

**J. H. M. COOK**

70 Cortlandt Street, NEW YORK, N. Y.

The Oldest Supply-house in the East, and only Reliable Goods sold.

10 cents brings sample jar by mail.

17A13t Mention the Bee Journal

## ITALIAN QUEENS

That are bred from the best stock this country can produce Bright Golden and 3-banded Queens ready to ship May 20. I am now booking orders which will be filled and filled in rotation. After May 20 all orders will receive prompt attention. Untested Queens 60 cents each; 6 for \$3.35, or 12 for \$6.50. Tested, \$1.00, or 6 for \$5.50. 2 frame nuclei with Young Queen after June 1, \$2.00  
GEO. W. BARNES.  
15A26t Box 340. Norwalk, Ohio.

## 3-Banded Italian Queens

J. P. Moore or my own strain. My apiary is stocked with thousands of choice drones that are not kin to my breeding queens.

Queens, \$1 each; dozen, \$10

I guarantee satisfaction, and superior honey-gatherers. W. M. Parrish,  
23Atf R. R. No. 8. LAWRENCE, KAN.

## HONEY AND BEESWAX

When consigning, buying, or selling, consult

**R. A. BURNETT & CO.**

## Because You Need The Money

It's your business and if you don't attend to it, who will? You cannot afford to keep cows for fun. That isn't business, and, furthermore, it isn't necessary. There is money in cow keeping if you go at it right, and besides there is more fun in going at it right than there is in staying wrong.

You need a Tubular Cream Separator because it will make money for you; because it saves labor; because it saves time; because it means all the difference between cow profits and cow losses.

Look into this matter; see what a Tubular will do for you and buy one because you need it.  
How would you like our book "Business Dairying" and our catalog B. 306 both free. Write for them.

The Sharples Separator Co.  
West Chester, Pa.  
Toronto, Can. Chicago, Ill.

## PUT YOUR MONEY IN A GOOD ROOF

"Vulcanite" is that Roofing

ON ITS MERITS

STRONG DURABLE

**Vulcanite ROOFING**

long ago won for itself the reputation of being the Best Ready Roofing known. Realizing the value of this reputation, we have always endeavored to maintain it, not only by keeping strictly up to the original high standard, but by constantly striving to improve it in every possible way. Requires no annual painting. Samples and "Roll of Information" FREE.

Patent Vulcanite Roofing Co.,  
Department S,  
626-59 S. Campbell Ave., Chicago, Ill.

## ASPINWALL 4-ROW SPRAYER

Like a mowing machine, has its working parts or spray nozzles in front where they can be seen. Don't strain your neck and eyes with a rear spray. High pressure; Brass lined pump; Ball valves; Wider range of adjustment than any other sprayer made. Booklet free.

ASPINWALL MFG. CO.,  
282 Sabin St., Jackson, Mich.

## HAND-MADE SMOKERS

Extracts from Catalogs—1907:

Chas. Dadaot & Son, Hamilton, Ill.—This is the Smoker we recommend above all others.

v. B. Lewis Co., Watertown, Wis.—We have sold these Smokers for a good many years and never received a single complaint.

A. I. Root Co., Medina, Ohio.—The cone fits inside of the cup so that the liquid creosote runs down inside of the smoker.

All Bingham Smokers are stamped on the tin, "Patented 1878, 1892, and 1903," and have all the new improvements.

Smoke Engine—largest smoker made.....	\$1.50—4	inch stove
Doctor—cheapest made to use .....	1.10—3½	"
Conqueror—right for most apiaries .....	1.00—3	"
Large—lasts longer than any other .....	.90—2½	"
Little Wonder—as its name implies .....	.65—2	"

The above prices deliver Smoker at your post-office free. We send circular if requested.

Original Bingham & Hetherington Uncapping-Knife.

T. F. BINGHAM, Farwell, Mich.

Patented May 20, 1879. BEST ON EARTH.

Now is the Time to Order Your

Cyprian: one extra best select breeding, \$2.50; one best imported direct from Cyprus, \$3.50. Prices in July, August and September: 50 cents less than in May and June. Special price for 50 and 100 Queens. Caucasian, Italian, Cyprian, and Carniolan Queens bred the best imported breeding Queens. The addresses must be clear; payments by postal money orders, Queens guaranteed to arrive in good condition in U. S. or Canada. To Australia, Ceylon, India, etc., \$1 more.

E. HAUNSCHILD, the Queen-Breeder,  
20A13t Weissbach b. Pulanitz, i. Sa., Germany.

## Honey and Beeswax

CHICAGO, July 8.—Very little honey of the yield of 1907 has come on this market. What there has in the way of white comb has sold readily at 16c per pound. There is no call for other grades at the present time. Very little demand for extracted, and a tendency not to take it at over 7c for the best grades of white. Beeswax continues to sell well at 32c. R. A. BURNETT & Co.

PHILADELPHIA, June 25.—This hot weather has come on us so suddenly that it has stopped the sale of comb honey entirely, and extracted honey has been moving very slowly the last 10 days. We quote: Extracted honey, dark, in barrels, 6 to 7c; light extracted honey, in barrels, 7 to 8c; in 60-lb. cans, according to quality and quantity. Beeswax, 30c.

We are producers of honey and do not handle on commission. WM. A. SELSER.

TOLEDO, July 9.—Owing to the scarceness of the honey crop, and there being none in the market, there is practically no price to be made on it. However, fancy white comb honey, new crop, would bring 15c to 16c in a retail way; No. 1, 14c to 15c. Extracted, white clover, in barrels, would probably bring 6c to 6½c; amber, 5 to 5½c. Beeswax is plentiful at 26c to 28c.

THE GRIGGS BROS. & NICHOLS CO.

DENVER, July 8.—Old comb honey, or last season's crop of comb honey, has been entirely cleaned up in this market for several weeks and new crop has not arrived yet. There is no change in the situation of extracted honey, and we have a good supply to meet the local demand. Our prices are 6¼ to 7½ for light amber, and 7½ to 8½ for white, per pound. We pay from 24 to 26 cents for clean yellow beeswax delivered here.

THE COLORADO HONEY-PRODUCERS' ASSOCIATION.

NEW YORK, July 8.—A fair demand for white comb honey, with very little supply; fancy stock selling at 15 to 16c, No. 1 at 13 to 14c, No. 2 at 12c. No demand whatsoever for dark honey at this time of the year. Good demand for nearly all

"In every country the successful advertiser is the continuous advertiser."

**A GREAT IMPROVEMENT**

Will be found in

The  
**American Bee-Keeper**  
for 1907

It is profusely illustrated and enlarged, and contains only articles of the most practical as well as scientific nature. A special corps of the best writers has been engaged. The editors are Harry E. Hill and Arthur C. Miller, than whom there are no more practical or experienced bee-keepers in this country. We have published the American Bee-Keeper continually and regularly since 1890.

Regular subscription price, 50 cents a year, One year to new subscribers, 35 cents; three years for \$1.00.

Send for sample copy and our new illustrated price-list of **BEE-SUPPLIES OF ALL KINDS.**

**THE COLORADO HONEY-PRODUCERS' ASS'N.** Denver, Colo.  
9Atf Please mention the Bee Journal.

grades of extracted honey, and we quote California white at 8 to 8½c, light amber at 7 to 7½c, amber at 6½c per pound. New crop from the South brings from 58 to 65c per gallon in barrels, according to quality; strictly fancy will bring as high as 70 to 75c per gallon. The market on the Pacific Coast seems to be unsettled, and prices fluctuate more or less. West India honey is arriving in fair quantities right along, and sells at from 58 to 62c per gallon. Beeswax is somewhat weaker, although choice stock still finds ready sale at 30 to 31c. HILDRETH & SEGELKEN.

CINCINNATI, July 8.—The market on fancy comb honey and white clover extracted is entirely exhausted. We quote light amber in barrels at 5½c and 6c; in cans 1c per lb. higher. We are selling beeswax at 32c per lb. Market dull. C. H. W. WEBER.

INDIANAPOLIS, July 8.—There is a good demand for fancy white comb honey and best grades of extracted honey, but at this writing the market is practically bare. Evidently a new scale of prices will be established on arrival of new crop. Beeswax is plentiful and in fair demand, selling here at \$5 per 100 lbs. WALTER S. POWDER.

KANSAS CITY, June 28.—We have received a few shipments of new honey which sold on arrival at \$3.50 for 24-section cases; market is almost bare of comb honey, and shipments would sell readily. We quote: No. 1 white comb, in 24-section cases, \$3.50; No. 2 white and amber combs, \$2.75 to \$3.00; white extracted, 8c; amber, 7c. Beeswax, 25 to 30c. C. C. CLEMONS & Co.

CINCINNATI, July 3.—The demand for extracted honey does not come up to expectations, which is probably due to the lateness of the season. Quotations range about the same as published recently. Amber in barrels at 5½c to 6½c, according to quality. Fancy white extracted honey in crates of two 60-lb. cans, at 9c. As yet, there is no new comb honey on the market. We are paying 2c, delivered here, for choice yellow beeswax free from dirt. THE FRED W. MUTH Co.

Goes to press the 6th of each month.

**National Bee-Keepers' Association****Objects of the Association.**

- 1st.—To promote the interests of its members.
- 2d.—To protect and defend its members in their lawful rights.
- 3d.—To enforce laws against the adulteration of honey.

**Annual Membership Dues, \$1.00.**

General Manager and Treasurer—  
N. E. FRANCE, Platteville, Wis.

If more convenient, Dues may be sent to the publishers of the American Bee Journal.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food," written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey, the more honey they will buy.

Prices, prepaid—Sample copy for a 2-cent stamp; 50 copies for 70 cents; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

**3-Banded Italian Bees**

The best all-around bees on earth. My stock is composed of selections from my own strain of 3-banded Italians that were awarded diploma at the Pan-American Exposition, and The A. I. Root Co. clover stock.

Tested queens, \$1.00; select tested queens, \$1.50; fair breeding queens, \$3.00; extra-select breeders, \$5.00—ready to go promptly. Untested queens, 75c; select untested queens, \$1.00—ready early in March. Yours for a prosperous 1907.

### "BEE-KEEPER'S GUIDE"

Liberal Discounts to the Trade.

"If goods are wanted quick, send to Pouders."

Established 1889

We not only handle Bee-Supplies but we put up the finest grades of Honey, Beeswax and Nut-Butter. Believing that bee-keepers will be interested in the Nut-Butter proposition, especially when they can buy **Pouders Quality** at the following wholesale prices, we have decided to submit the following.

## Nut-Butter

**M**ADE from finest grade of number one hand-picked peanuts. We do our own roasting, our own blanching and our own hand-picking. Our improved blancher not only removes the skins from the nut, but it splits the nut and removes the sprout, which is claimed by some to be bitter. We have the best machinery that can be had, operated by electric power, and our facilities are

such that we have always a strictly fresh article to offer, and yet nut-butter does not become rancid like other butters. We do not add salt or a particle

of anything foreign. Our product is simply the nut emulsified in its own oil. Nut-butter is rich in nutriment and health-making qualities. Nut-butter is a delicious and economical health-food, the most popular of all nut-foods, due to its rich and sweet flavor, its good keeping qualities, and its moderate cost.

#### Wholesale Prices

25-cent jars, per dozen..... \$2.50  
20-cent jars, per dozen..... 1.50  
10-cent jars, per dozen..... .90

All goods carefully boxed for shipment.

If you wish to purchase finest white clover extracted honey in 5-gallon cans, write for my monthly quotations of the Indianapolis honey market.

Every bee-keeper should have my free catalog of Bee-Supplies.

## Trade Notes

### The A. I. Root Company, Medina, Ohio

Does It Pay a Planing Mill Man to Make His Own Hives?  
An unsolicited statement of the matter from an Illinois bee-keeper:

### ELIAS BAMBERGER

Manufacturer of

### SASH, DOORS, BLINDS

Contractors' and Builders' Supplies  
Including All Kinds of Window Glass  
Cor. Exchange and Adams Sts.

ESTIMATES FURNISHED ON APPLICATION

Freeport, Ill., June 11, 1907.

The A. I. Root Co.,  
Medina, O.

Gentlemen:

I received five of your AE52S-10 hives yesterday and find that I cannot make my own hives and supplies as cheap as yours and use the same quality of lumber. You can see by the head of this letter that if anyone can make hives cheaper than your prices or any of the so-called "trust hive" manufacturers, I ought to be able to do it, but using the same quality of lumber I cannot.

Yours very truly,  
(Signed) John H. Bamberger.

The above is a representative letter from the many we have to the effect that our hives and other supplies can be purchased cheaper than a local mill can possibly make them. Our enormous output enables us to reduce the cost to the minimum without sacrificing quality.

Vol. XLVII—No. 28

### Prices of 1907 Honey

There is now every indication that the crop of honey of 1907 is to be a very light one. Every bee-keeper who has a surplus to sell should recognize the fact of a shortage and not foolishly give honey away, that is, sell it at too low a price. There will be no need of it. Honey, evidently, is to be honey this year. And now that pure-food laws are getting in their good work, there is no valid reason why any first-class honey put on the market this fall shouldn't bring a good price. Fruit is scarce, and consequently high in price—in fact, practically all food-stuffs are going up, so why should not honey take its proper place in the market quotations?

Some think that No. 1, first-class, white extracted honey can be sold this year at 10 cents a pound at wholesale, and other kinds accordingly.

Our caution is that those who have any honey for sale this season do not be in a hurry to dispose of it, and perhaps fool away what little they have. If a fair price is not asked, it surely will not be secured. Some wholesale dealers are already quoting best white extracted honey at 9 cents a pound. If bee-keepers will but hold on to their honey a little while, it would seem that they should be able to realize a better price for it—more nearly what it is worth.

### Fastening a Queen-Cell in a Hive

When a queen-cell is given to a nucleus, it is generally fastened on a central part of one of the combs. This is done, even if the cell be cut from the same comb and fastened on again, for bees are quite likely to build queen-

cells on the edges of the combs, where they are kept warm enough in a strong colony, but are in danger of being chilled in a nucleus. The instruction formerly was to cut with the cell a wedge-shaped piece of the comb, then cut a like-shaped hole in the comb and insert the cell. An easier way is to lay the cell directly against the surface of the comb and fasten it there with a hive-staple. Let the cell be at one end of the staple, and press the other leg of the staple deep into the comb.

Here is still another way that can be used only with self-spacing frames: Lay one of the brood-combs on its side and lay the cell upon it. Lay upon this another comb, take hold of both together by the top-bars and set them in the hive. Of course, the cell with the adhering part of comb must be sufficiently large to be slightly pinched by the opposing sides of the 2 combs.

This last way is especially good for putting a queen-cage in a hive.

### Dual Introduction of Virgin Queens

Up to the time when each young queen must have a separate domicile, the rearing of queens is a comparatively inexpensive matter. A large number of cells may be started in succession by a queenless colony, and, when fairly started, if they are placed over a colony with a laying queen, an excluder between, the work of feeding and sealing will proceed satisfactorily. The expensive part comes when each virgin insists on a separate establishment. A queen may lay when she is 8 days old, especially in a strong colony, but in a nucleus it is oftener 12 than 8, and if this time can be shortened it is important.

The plan of Editor Root, of having 2 virgins in a nucleus at the same time, practically accomplishes this shortening. Into a colony having a free virgin a caged virgin is put, in a provisioned introducing-cage, but so arranged that the bees can not get at the candy to liberate the virgin. When the free virgin becomes a laying queen, she is removed, the covering is taken from the candy so the bees can liberate the caged virgin, and at the same time another caged virgin is put in the nucleus.

Thus each time a laying queen is taken from the nucleus a fresh caged queen is put in, there being always 2 queens in the nucleus. A virgin is 5 days old, or older, before she flies out to be mated, and the economy comes in having her spend a good part of this 5 days in a cage instead of occupying the whole attention of a nucleus.

The question that can be raised in objection is whether a queen is just as well off imprisoned in a cage as when at full liberty. One would be inclined to think not; but those who have practised the method say they can see no difference occasioned by the imprisonment, and if any harm could come of it one would suppose that some one would have said so before this. Moreover, it is the custom of the bees themselves to practise this imprisoning to a certain extent. When a strong colony sends forth a prime swarm, a number of young queens mature in the cells, and if the ear be applied to the hive the evening before the second swarm is to issue, a number of young queens may be heard quacking in response to the piping of the first emerged one. All these quacking queens are held prisoners in their cells, and this imprisonment may last a considerable time, especially if bad weather occurs to delay swarming. G. M. Doolittle tells of one case in which a young queen was laying within 3 days after leaving her cell, having been kept in her cell by the workers during a spell of bad weather. It would seem no worse to imprison a virgin in a cage than in a cell. Indeed, the advantage should be on the side of the cage, which allows greatly more liberty than the cell.

On the whole, it would seem that dual introduction of virgin queens has much to commend it.

### Where do the Field-Bees Deposit Their Loads?

On another page of this number will be found a communication from our good friend of "the land o' cakes," D. M. Macdonald. If he is right in his supposition that no one should have misunderstood any of his condensed statements, then all is well, and nothing more is to be said upon that subject.

He will pardon, however, a brief rejoinder with regard to the matter of honey, or nectar, being deposited in the brood-nest or brood-chamber and afterwards carried up into the super.

No, Mr. Macdonald, your "impossible" was not misunderstood, but was understood just as you intended it to mean—the cells being already filled it was "impossible" to use them for storing the nectar brought in from the field. If your premise was correct, your "impossible" was a legitimate deduction. The point at issue now is whether the nectar that may be shaken out of a brood-frame at a time when bees are gathering is merely "a small percentage with unsealed honey \* \* \* for the nurse-bees," or whether all the honey brought in by the fielders is first deposited in the brood-chamber.

As one shakes a brood-comb and notes the amount of thin honey thrown out, it hardly seems possible that it could all be needed for the immediate wants of the nurse-bees. On the other hand, it must be frankly admitted that when one takes comb after comb out of the brood-chamber, and notes how well filled they are, one hesitates to believe that there is room in them to deposit the gathering of a day when that gathering amounts to 5, 10, or more pounds. But we have it on the word of so careful an observer as G. M. Doolittle that such is the case, and if Mr. Macdonald is willing to accept him as proof on one point, why not on another?

Plainly, however, there is a contradiction between the day's gathering being deposited in the brood-chamber, and the combs being "literally filled with brood." But was not that last meant by Mr. Doolittle to be understood as a very emphatic statement rather than to be understood that every single cell in every comb was filled with brood? It is a common thing to speak of frames filled with brood, but did any one ever see a frame in which every single cell was filled with brood? Mr. Doolittle is not ignorant that many cells are occupied with pollen, and certainly such cells could not be filled with brood. Would Mr. Doolittle mean to have a thing understood that he knew to be "impossible"?

But we will not discuss the matter further at present; merely rest upon the statement of Mr. Doolittle that the field-bees deposit their loads in the brood-chamber; and leave it to each of the two gentlemen to convince the other that he is mistaken; and may the truth win.

### Beet Versus Cane-Sugar

For years the British Bee Journal has insisted that cane-sugar is greatly superior to beet-sugar as bee-food, and in the season when sugar is likely to be

bought by bee-keepers it is quite the common thing to find in that Journal advertisements of pure cane sugar. On this side, the matter has hardly seemed worth considering. Granulated sugar is largely from beets; it is not easy to get sugar that one can be sure is cane—indeed, practically impossible for the average bee-keeper—and, moreover, analysis shows that chemically the two sugars are precisely the same, so where's the use to bother? It may be no harm, however, to note what the British Bee Journal has to say in support of its views. On page 208 is found the following:

It is quite true that "beet-sugar" is chemically identical with cane-sugar, and in a laboratory can be produced pure; but it is most difficult to purify beet-sugar in such a manner as to get rid of all the potash salts. It is the presence of these that makes beet-sugar so liable to fermentation, and causes the general complaint among house-keepers that preserves do not keep so well as they used to before the introduction of sugar made from beet-root. Cane-sugar is free from these salts, hence its freedom from fermentation. Much of the beet-sugar is also artificially colored with aniline dyes. Referring to the complaint that cane-sugar is higher in price than beet, the difference is more than compensated for by its greater sweetening power. Chemists find that cane-sugar gives a clearer and sweeter syrup than that made from beet-

root, the clearness being due to its greater purity. Beet-sugar also varies very much, and if it were chemically pure sugar it might be admissible; but in commerce it is not so, and we do not consider it fit for bee-food. There are many things *chemically identical* that we should not consider fit substitutes. For instance, sawdust, is chemically the same, both qualitatively and quantitatively, as corn-flour, but one would hardly care to have bread, however cheap, made from sawdust. Nor would we like our butcher to send us a piece of leather instead of a beef-steak, although the composition is chemically almost identical. Cane-sugar comes next to honey as a bee-food, and even were it considerably dearer than it now is, we should consider it more economical in every way for bee-keepers to use it in preference to beet sugar. We have had practical experience that bad wintering was frequently due to feeding bees with beet-sugar, and therefore can not recommend it.

After reading the foregoing, we may well ask the question whether we might not be the gainers to adopt the views of our British brethren. If there is only a little difference in the wholesomeness of the two sugars, it would be well worth while to be to no small amount of trouble, if we must feed sugar, to make sure of the better. Certainly, if there is a sufficient demand guaranteed cane-sugar can be had. The only question is whether bee-keepers demand it.

## Miscellaneous News - Items

### A Remarkably Late Season

After an unusually warm spell in March, the weather seemed to be in no hurry to warm up, and some report the white-honey harvest nearly a month later in opening than usual, in northern Illinois white clover not beginning to yield till the last of June.

### Death of a New York Bee-Keeper

Mr. David J. West, of Middleburgh, N. Y., son of Mr. N. D. West, so well known to bee-keepers of that State, died July 15, as a result of a runaway horse that was frightened at an automobile. Mr. West was only 25 years of age, and leaves a wife and baby daughter. He was an exemplary young man, honored and beloved by all who knew him. The American Bee Journal, to which Mr. West was an occasional contributor, extends sincerest sympathy to the bereaved families.

### From a Weekly to a Monthly

As we have received some letters referring to the change in the American

Bee Journal from a weekly to a monthly, we thought it might be well to give a sample of each kind that have come. Here is one favoring the change:

DEAR FRIEND YORK:—I have wanted to write to you and extend my congratulations and best wishes ever since I heard of the change in the Journal. The only fault I ever found with it was that it was a "weekly," for a busy man does not want a weekly bee-paper. I think you have made a good choice in changing it to a monthly magazine form. The first copy shows up fine. But from my point of view you have made one mistake—you should have made the price 50 cents instead of 25 cents. It is well worth it, and I believe you would get just as many subscribers at that rate. I can't see why not, as 25c. is too "cheap"; but perhaps you have reasons that I have not considered. Any way, you have our support in the new regime.

HARRY LATHROP.

Bridgeport, Wis., July 20th.

Here is one from a good friend in Kansas who does not favor the change:

# American Bee Journal

DEAR FRIEND YORK:—For one, I am very sorry to see that the American Bee Journal is to be a monthly instead of a weekly. I fear that it is a bad mistake. I would much rather pay \$2 per year for a weekly than 25 cents for a monthly. It is too slow to get around. I have heard several complaints in regard to the change.

J. J. MEASER.

Hutchinson, Kan., July 20.

We wish to thank all who have written us on this subject. But we believe that we have done wisely in making the change from a weekly to a monthly. What we want is a large list of readers, and the great majority of bee-keepers are not sufficiently interested in bee-culture to need a weekly bee-paper. It is the majority that we want to get on our subscription list. And at 25 cents a year for the American Bee Journal once a month, it seems to us, we ought to get them, and that in a very short time.

We hope that all our present subscribers will turn in and help us roll up a list of 50,000 readers that we want to get during the next few months. Surely, it will not be hard for many to get at least 10 subscribers each, at the very low rate of 25 cents a year. (See the liberal premiums offered on another page of this issue.)

We will be pleased to send sample copies free if our present readers will kindly send us the names and addresses of their bee-keeping friends and neighbors.

## German "A B C of Bee-Culture."

The A. I. Root Co. are getting out an edition of their well-known "A B C of Bee Culture" in the German language. It is to be a complete translation of the English edition of the book, and the revision is made by Mr. F. Greiner, of Naples, N. Y. It will have about the same number of pages as the English Edition, and the price will be \$2.00, postpaid. It is to be issued in September next, and will be the best work of European and American-German authorities, as Mr. E. Bondonneau, of Paris, who made the French translation, is bringing it out. It should have a large sale among German-reading bee-keepers.

## A Post-Master Bee-Keeper

Hon. Eugene Secor, of Forest City, Iowa, on July 1st, entered upon a new line of work for him. It is no less than that of post-master. Mr. Secor is well known to almost all of our readers. He has often been called the post-laureate of bee-keeping, on account of having written so many poems relating to apiculture. Referring to his own bees, in a letter dated July 13, he says:

"Bees came through the winter pretty well, but a good many were lost in the spring, the season being 2 or 3 weeks later than common, and very cold. They are doing well now, however, but I don't look for any great surplus this year, because so few colonies will be strong enough to take advantage of a generous flow, if we have one."

Mr. Secor's experience as given in the foregoing paragraph corresponds with that of almost all other bee-keepers this

season. Surely, honey ought to bring a good price the coming fall and winter. Just now it does not look as if there would be a very large crop, so that those who are fortunate enough to harvest any honey should be able to realize for it all that it is worth.

## The Bee-Man

Kind heart, honest hand;  
Best friend in the land;  
Tills well the home farm;  
Thrives when the bees swarm;  
Loves work; enjoys life;  
Loves best the sweet wife;  
Keeps, 'till his frame's dust,  
Man's faith, woman's trust:  
You can find none stancher,  
Than the true bee-rancher;  
Great hopes, little money;  
Little talk, much honey;  
Light heart; cheery song;  
Here's luck and live long!—  
Whether he's Australian,  
English, Dutch, Canadian,  
French, or good American—  
That's the genuine bee-man.

DR. FREDERICK WEBLEY.

Santa Rosa, Calif.

## Books for Bee-Keepers

Every bee-keeper should have a book besides a bee-paper. On another page will be found all the best books offered—either at a price, postpaid, or as a premium. If you can not earn them as premiums for getting new subscriptions, it will pay you well to purchase one or more of them. You will find them of great value. There are so many things in the books that are needful to know, and that of course could not be told over and over again in the bee-papers. If a bee-keeper can afford only one, it would better be the book rather than the paper. But now that the American Bee Journal is only 25 cents a year, of course, no bee-keeper, however limited his apiary may be, can afford to be without its monthly visits.

## Subscription Credits

We have been unable as yet to make on our mailing-list all the extension credits that are due those whose subscriptions were paid beyond June, 1907, at the regular \$1.00 rate. Now that the American Bee Journal is published monthly at 25 cents a year, of course there are many paid-in-advance subscriptions that will be credited just four times as far ahead as was indicated by the date on the wrapper-label. But it may take us quite a little time to do this. So please be patient, and you will find that all will have our attention in due time.

## Apiarian Photographs

We can use such right along. Of course we want good, clear prints. If you have an apiary that you think would look well on paper, have it photographed and send to us the result. While we may not be able to use all that come, we doubtless will be able to use most of them. Please send the picture, and on its receipt we will report whether we can use it. If we can, we will then request you to send some descriptive matter to go with it when published. We prefer larger size photographs, say 8x10

inches, if possible. However, send whatever size is most convenient.

## California Bee-Ranches

One is shown on the first page this month. It belonged to E. J. Smale & Co., when the photograph was taken, and was located in Los Angeles County. It is, perhaps, as fine a specimen of a California mountain canyon bee-ranch as can be found anywhere.

California is noted for such scenes. One of her leading bee-keepers once had 600 colonies in a single apiary located in such a wild and lonesome place. But in good seasons the bees get the honey there. In 1903, the then most extensive California bee-keeper harvested a crop of 90,000 pounds of extracted, and 22,000 pounds of comb honey.

## Labeling Honey for Market

Since the National Pure Food Law was passed, many dealers seem to be in a quandary as to the proper way to label food products, among them honey. Mr. N. E. France, of Platteville, Wis., wrote to the Secretary of Agriculture at Washington, D. C., in order to get a ruling on the subject, and here is the reply he received:

MR. N. E. FRANCE.—I do not see that any objection can be made to the form of seal label which you submit. In regard to the shipment of honey without label, I may say that you do not violate the law in so doing, provided it is pure honey and not something other than what it is sold for. If the honey is shipped from one state to another and the party receiving it puts his own label on it as if he were the producer, he violates the law by representing the product as having been made in a state different from that of its actual production. The shipper, however, of such honey will not be amenable unless he is a party to the fraud and benefits thereby. The law does not require a label to be placed upon food products but does require that if one is used, it must be a truthful one. Unlabeled food products are covered by Section 8, first paragraph under foods, which states that a food is misbranded "If it be an imitation of or offered for sale under the distinctive name of another article." Thus honey which is pure and unlabeled, sold as honey, is wholly within the protection of the law, but if honey be adulterated by admixture with glucose and sold as honey, then the law is offended. If honey which is produced in Wisconsin, however, is sold to a dealer in Illinois and the dealer in Illinois places upon it his own label as if it were produced in Illinois, and sells it in original packages in Illinois or repacks and ships in interstate commerce, the law is offended, because a false statement is made respecting the state in which it is produced, which is a violation of the first paragraph of Section 8 of the law. You will find the law on standards of purity of honey in Circulares 19 and 21, which I enclose.

Respectfully,  
JAMES WILSON,  
Secretary.

# American Bee Journal

In Circular No. 19, referred to by Secretary Wilson, the following definitions are given:

### DEFINITION OF HONEY.

1. **HONEY** is the nectar and saccharine exudations of plants gathered, modified and stored in the comb by honey-bees (*Apis mellifica* and *A. dorsata*); is laevo-rotatory, contains not more than twenty-five (25) percent of water, not more than twenty-five hundredths (0.25) percent of ash, and not more than eight (8) percent of sucrose.

2. **COMB HONEY** is honey contained in the cells of comb.

3. **EXTRACTED HONEY** is honey which has been separated from the uncrushed comb by centrifugal force or gravity.

4. **STRAINED HONEY** is honey removed from the crushed comb by straining or other means.

### Fair Apiarian Exhibits

The season of Fairs is again here, and as usual, and also as should be more and more, there are exhibits of bees, honey, bee-supplies, etc., and in practically all cases prominent bee-keepers are selected as superintendents of the apiarian departments. Also, excellent lists of premiums are offered in most cases. We have been requested to publish some of the premiums lists, which we do here, and give after each list the name and address of the superintendent, who can be addressed for further information, if it is desired.

The first is the South Dakota State Fair, to be held Sept. 9 to 13, with this list:

	1ST.	2D.
Best 24 pounds light .....	\$1.50	\$1.00
Best 24 pounds medium .....	1.50	1.00
Best 24 pounds dark .....	1.50	1.00
Largest and best display of comb honey .....	5.00	3.00
Extracted honey in glass jars, tin cans, or other packages:		
Best 25 pounds light .....	1.50	1.00
Best 25 pounds medium .....	1.50	1.00
Best 25 pounds dark .....	1.50	1.00
Largest and best display of extracted honey .....	3.00	2.00
Bees and queens in one comb observatory hives not allowed to fly:		
Italian .....	2.00	1.00
Caucasian .....	2.00	1.00
Carniolan .....	2.00	1.00
Native or black .....	1.00	.50
Largest display of bees as above .....	3.00	2.00
Best 10 pounds wax .....	2.00	1.00
Best display of cakes, candies, or fruits in which honey takes the place of sugar .....	3.00	2.00
Best display of all the products of the apary .....	5.00	3.00
Best display of honey-producing plants, pressed and mounted .....	2.00	1.00

R. A. MORGAN, *Supt.*

Vermillion, S. Dak.

WEST MICHIGAN STATE FAIR, AT GRAND RAPIDS, SEPT. 9 TO 13.

	1ST.	2ND.	3RD.
Display of comb honey, quality, quantity, appearance, and condition for market to be considered .....	\$25	\$15	\$10
Specimen of comb honey, not less than 10 lbs., quality and condition for market to be considered .....	5	3	2
Display of extracted honey, quality, quantity, appearance, and condition for market to be considered .....	25	15	10
Specimen of extracted honey, quality and condition for market to be considered .....	3	2	1
Best display of extracted honey in granulated form .....	5	3	2

Most attractive display of beeswax, quality to be considered .....	5	3	2
Most attractive display of best honey-producing plants, pressed, mounted and named, not to exceed 25 varieties .....	5	3	2
Italian bees and queen, single-frame nucleus, in observatory hives .....	3	2	1
Black bees and queen, single-frame nucleus, in observatory hives .....	3	2	1
Carniolan bees and queen, single-frame nucleus, in observatory hives .....	3	2	1
Caucasian bees and queen, single-comb nucleus, in observatory hives .....	3	2	1
Queen-rearing nucleus, showing frame of queen-cells in observatory hive .....	5	3	2
Full colony in full-size observatory hive, showing different parts and appliances of hive, most attractive .....	3	2	1
Full colony in full-size observatory hive, showing different parts and appliances of hive, most instructive .....	3	2	1
Largest, best and most instructive display of nuclei of different races of bees in single-comb observatory hives .....	5	3	2
Largest, best, most interesting, attractive and instructive exhibition in this department, all things to be considered .....	15	10	5

A. G. WOODMAN, *Supt.*

Grand Rapids, Mich.

KANSAS STATE FAIR AT HUTCHINSON, KAN., SEPT. 16 TO 21.

	1ST.	2ND.	3RD.
Best case of white comb honey, not less than 24 sections .....	\$5	\$3	\$2
Best case of amber comb honey, not less than 24 sections .....	5	3	2
Best and largest display in comb honey, not less than 200 pounds .....	15	10	5
Best frame of white comb honey .....	3	2	1
Best frame of amber comb honey .....	3	2	1
Best case of basswood white honey .....	3	2	1
Best case of white clover honey .....	3	2	1
Best samples of sweet clover honey .....	3	2	1
Best 12-lb. cans of white extracted honey .....	3	2	1
Best 12-lb. cans of amber extracted honey .....	3	2	1
Best and largest display in extracting honey, not less than 200 lbs. .....	10	5	2
Best 5 lbs. of yellow beeswax .....	5	3	2
Best 1-frame queen and bees in observation hive .....	5	3	2
Best 1-frame 2-story queen and bees in observation hive .....	5	3	2
Best Italian bees (dark) and queen in cage .....	5	3	2
Best Italian bees (golden) and queen in cage .....	5	3	2
Largest display of Italian bees and queen .....	10	5	3
Best designs in comb honey .....	10	5	3
Largest and best display in designs of beeswax .....	5	3	2
Best home-made hive for Kansas .....	5	3	2
Best display in bee-keepers' supplies .....	5	3	2

J. J. MEASER, *Supt.*

Hutchinson, Kan.

WORCESTER CO., MASS., BEE-SHOW.

In Horticultural Hall, Worcester, Sept. 13 and 14, 1907.

1. The exhibition is strictly free to all. There are no entry fees. There are no charges for space. The exhibition is free to the public.

2. The purpose of the exhibition is three-fold: To bring together for display and competition the products of bee-keepers. To bring together for competition and display the products of manufacturers, publishers, and tradesmen. To educate the public.

3. A first, second, and third prize (consisting of a ribbon) will be granted in each scheduled exhibition. An award of merit will be granted all worthy displays by manufacturers, tradesmen and others whose exhibit is not provided for by numbers 1 to 15 of the schedule.

4. The Hall is central, large, well-lighted, and fully equipped with tables, covers, dishes, elevator, etc. For special conveniences, communicate with the Secretary, or Mr. A. A. Hixon, Horticultural Hall, Worcester, Mass. Exhibits may be sent so as to reach the Hall any time the week of Sept. 8, and will be taken care of till the exhibition.

### SCHEDULE.

- HONEY.**—In numbers 1 to 5, there will be two classes—one for those living in Massachusetts, and one for those outside of Massachusetts.
- For the best 5 pounds of comb honey in section-boxes.
  - For the best case of comb honey packed for market. Neatness of package will be considered.
  - For the best 2 frames of comb honey for extracting. Weight, color, quality, as well as general appearance will govern.
  - For the best display of chunk honey.
  - For the best display of comb honey in general. This is open to the taste of the exhibitor.
  - Extracted honey. For the best 5 pounds of extracted honey in glass. Color, quality, and general neatness will govern.
  - For the most attractive display of extracted honey.
- VINEGAR.**—For the best display of vinegar made from honey. Sharpness and clearness will govern.
- BEE-SWAX.**—For the best pound of beeswax. Softness and color will govern.
- BEES.**—All bees must have been reared by the exhibitor. Nos. 11 to 15 are to appear in single-frame nuclei. Each nucleus must contain a queen. Nos. 15 to 17 may be shown as exhibitor desires.
- For the best Italians.
  - For the best black or German bees.
  - For the best Carniolan bees.
  - Varieties not scheduled.
  - For the best display of bees.
  - For the best display of queen-bees ready for shipment.
  - For the best display of a queen-rearing outfit, showing cells in different stages of development.
  - General Display. For the best display of bees, honey, wax, bee-furniture, etc. Exhibitor given full freedom. Products and bees must be of his own production. Please write to Secretary that space may be reserved.
  - COOKERY.**—For the best cake made with honey. Recipe attached.
  - For the best cookies made with honey.
  - For the best display of cake, cookies, and confectionery made with honey.
  - PHOTOGRAPHY.**—Photograph of a swarm of bees.
  - Best photograph of a New England apiary.
- Displays not scheduled above are solicited. Meritorious exhibits will be awarded a diploma. Manufacturers, tradesmen, and publishers, are urged to make a display. Free space will be awarded each applicant. Points of merit are neatness, perfection of workmanship, as well as instructiveness and general effectiveness of display.
- Communications may be addressed either to the secretary or to A. A. Hixon, Horticultural Hall, Worcester, Mass.
- There will be lectures by people prominent in the bee-world, on both days of the Fair. Clark University, A. H. ESTABROOK, Worcester, Mass. *Secretary.*

### Getting New Subscriptions

How about getting new readers for the American Bee Journal? It seems to us that at only 25 cents a year every bee-keeper in the land, not now a subscriber to the American Bee Journal, would be glad to hand his or her subscription to any one who asks for it. There is nothing published in America to-day in the line of bee-keeping that compares with this Journal at the price. During the year it will contain everything necessary to make a success of bee-keeping, aside from that already in bee-books. See the many premiums offered on another page for getting and sending in new subscriptions. You can earn some of them with little effort, if you try.

### "Forty Years Among the Bees."

The following letter has been received:

EDITOR YORK:—Dr. Miller says in "Starting in Bee-Keeping," page 523, that if you get only one book on bee-keeping you can not go amiss to get, etc.; then names other books than "Forty Years Among the Bees," as if they are better for the amateur bee-keeper. I believe the Doctor does himself and his own book an injustice in that article, as I own several of those same books and I value his book as highly as any of the others; and when I want to look up something right quick, I always look at his book first, and I believe I get just as much information as is wanted.

F. P. DAUM.

This correspondent is not the only one who has thus expressed himself, and while for him the book in question may be as valuable as any other—even if indeed it should be more valuable—Dr. Miller insists that for a *first* book the beginner should have one of a more general character, his book being rather supplementary, in his opinion. It is probably a fact, however, that any bee-keeper who already possesses one or more of the text-books would find it money wisely invested to procure a copy of Dr. Miller's book. Some new kink found therein, or some old truth presented in a new light, may be worth many times the cost of the book. This book, which is cloth-bound, and has 344 pages, is mailed from the office of the American Bee Journal for \$1.00; or with the Bee Journal one year—both for \$1.15.

### Opportunities of Today

This is the name of a new, high-class monthly magazine built upon entirely new and original lines, which makes its initial bow to the public with the September number. As its name implies, the publication will deal with bringing to the notice of opportunity seekers, the many and various chances for wealth and home-making that are opening throughout all the United States.

The home of the new magazine is the entire 17th floor of the Majestic Building, 73 and 75 Monroe St., Chicago, where Mr. R. L. Bernier, the editor and publisher, has surrounded himself with a thoroughly experienced and competent staff of assistants. Advance sheets of the publication indicate that no expense will be spared to make it one of the most striking and elaborate pieces of work of its kind ever published in this country. The first issue will represent an expenditure of very nearly \$30,000.

Agriculturists will be particularly interested in the articles which will appear from time to time, dealing with the advanced ideas of farming, the development of farm and stock lands in the various parts of the continent, and the irrigation and reclamation of lands, and in fact everything pertaining to the productions of the country.

### Bee-Keeping in New Zealand

We have received the following from Mr. Burton N. Gates concerning the

RUAKURA STATE APIARY, NEW ZEALAND.

progress of bee-culture in New Zealand:

The Report of the Department of Agriculture of New Zealand for 1906 shows the vitality of bee-keeping in that country since bees were first landed in New Zealand; now she has her expert in the national department of agriculture, has an experimental apiary, with an assistant, Miss L. Livesay, in charge. All this, and more, in a few years.

The State Apiary, at Ruakura, Auckland, is Mr. Hopkin's—Apiarist of New Zealand—latest move. In September, 1905, he started with 32 colonies on the farm, "most of which were weak," he says. The following season was backward, which, notwithstanding, "we increased, by dividing, to 46, 40 of which have been Italianized; and we secured about half a ton of honey." This shows that some one knows how. The station is soon to have its honey-house, plans for which are included in the report.

"An Apiaries Bill" has been introduced in order to check the spread of brood-diseases, which exist from

one end of New Zealand to the other, says Mr. Hopkins, and must be eradicated if bee-keeping shall progress. To quote again: "One prominent bee-keeper, who now owns a hundred colonies, says that until the Bill is passed, he will not keep more than a hundred colonies; but when the Bill becomes a law, he is prepared to increase to 5,000."

New Zealand surely has the natural resources; she seemingly has the right sort of men to harness them. She has made a vigorous start; there is a good example in her methods for the American bee-man. Just now, in various parts of the United States, we are running hard up against the disease problems. The sooner they are attacked with some such progressive spirit, as that of New Zealand, the better and the easier they will be controlled. This comes home to many of us, and has the feeling of "at-homeness to the New Zealander." Keep your eyes open to progress.

BURTON N. GATES.

Worcester, Mass.

Conducted by EMMA M. WILSON, Marengo, Ill.

### Hybrid Bees vs. Italians

DEAR MISS WILSON:—Is there another sister who can give us a little of her experience with Italian bees? In the American Bee Journal everybody and everything is all Italian bees. My experience with them for the past 3 seasons has been that I never want any more—in my locality, at least.

To begin with, 3 years ago, I had a queenless colony. I sent for a selected tested Italian queen from a well-known advertiser in the American Bee Journal. I was only a beginner at the time, and wanted to go slowly and

surely. I paid \$2.00 for the queen and successfully introduced her. By the end of the season she had reared an exceptionally large and fine colony. But only about 2 sections of surplus honey, and they were all built crooked, and not at all nice. And they were the ugliest colony of bees you ever saw. I was very much surprised at this, as in all my reading in regard to Italians, every article pronounced them much more gentle than black or hybrid bees. I laid this fact to their being queenless for about 2 weeks before I found it out. I thought to myself that next season they will be all right.

# American Bee Journal

The next season they worked up the most quickly of any of my 7 colonies. But they were uglier than ever, and seemed possessed to sting. I paid no attention to that and put on the supers, and cared for them just the same as I did for my hybrids. In June of that year they cast a mammoth swarm. The swarm would fill a 10-quart pail full to overflowing. And they clustered so conveniently close and low, on a young cherry tree that I put the hive under the tree and shook them in. Then I had 2 fine, large, strong colonies of Italian bees so cross that I never allowed any one to go near the hives unless with a bee-hat, etc. I put on supers with bait-sections, and not one ounce of surplus did they gather that whole season—either colony. But the brood-frames became so full of honey that there was no room for the queen. So I took one or 2 out at different times and exchanged with other frames. They went into winter quarters last fall in fine shape. In fact, all my bees were in the best shape last fall of any year I have had bees. This spring they seemed to be all right when the first warm weather came in March. Then we had it very cold, and much snow, away down to the first of June. During the time from March to June I lost 3 swarms. One swarm was from one of the strong Italian colonies. They were the first bees I ever lost.

One June 29 of this year I had my first swarm. It came from the remaining Italian colony. It was a fair-sized swarm, and settled in a bad place. They settled on the trunk of a pear-tree about 3 inches in diameter. Such a time as I had to get them! I finally got most of them into the hive, and then, to my astonishment, they came out and settled right back on the pear-tree. I got them in the hive a second time, and then they came out again. I smoked the tree well and made the air around the tree full of smoke, and they went back to the mother colony. I thought perhaps the queen was lost or injured, and that was why they went back.

Several days after this there was a colony on a stump one morning at 5 a. m. They were Italians, and must have come out the day before, unknown to us. They were in nearly as bad a place as before. But I got them into the hive, and this time they stayed. In 4 or 5 days I looked in to see what they were doing, and found they had gathered a lot of honey, but not a sign of an egg. So I found a fine queen-cell in my best hybrid colony and gave them that. Then I looked into the other Italian colony and found they were queenless. So I brushed all the bees in with the colony where I put the queen-cell. This was several days ago. I have not opened the hive and taken out frames since, as I was afraid I might injure the fine queen-cell, nearly ready to hatch.

Can any one tell me why I had such a time? and such poor success with these Italian bees, when I worked them, and did the same for them, as I did for my hybrid with good success? Was it my fault, or the strain of bees, or just that I happened to get a cranky-tempered queen?

I sent for a cheap Italian queen early this spring, and, after successfully introducing her, I found after she began to lay that she laid 2, 3, and 4 eggs in one cell. In a few days I looked again and she was gone. Whether she was lost, or died, I could not find out. So you see I do not feel like trying any more Italians.

My hybrids have done pretty well, considering that I was a beginner 4 seasons ago, and had everything to learn, and with 4 bad springs, and 3 poor seasons for honey. They are also much more easily handled, and they worked when the Italians loafed, and I could not get them to work in the supers, to save me, no matter what I did. I gave them extracting supers, and then when they would not work in them I gave them comb-honey supers.

I do not find any advertisements in the Bee Journal for hybrid queens. How am I to get one unless I rear it? This I do not care to do, as my time is not my own long enough to rear queens and produce honey, too. I work every day and can not spend any more time than I have to, to study and take care of my bees for honey.

My hybrid bees are doing well now. They have one super full of honey, and the second one started. They seemed to get to work and build up fast as soon as the weather was at all warm enough for them.

I, for one, must express myself on changing the American Bee Journal from a weekly paper to a monthly paper. I like it very much better, as I could hardly read one paper thoroughly before the next one was here. I also felt I could not miss a paper, and so when they come once a month I can read them slowly and digest it all before the next paper comes.

(Miss) ELSIE A. CUTTER.

Grand Rapids, Mich., July 13.

Yes, here is one sister who will be glad to give her experience, and speak a good word for hybrids. For years we have been rearing queens from our best honey-gatherers without regard to color, but giving preference to those showing little inclination to swarm, consequently our bees are mostly hybrids, although we have a number of colonies that might pass for pure Italians. We have some colonies that are undeniably cross and that makes it seem as if they were all cross, as 3 or 4 cross colonies will furnish enough cross bees to make a whole apiary appear cross. But we have a good many colonies that are just as gentle as pure Italians, and our bees are certainly hustlers.

I think Dr. Miller has slandered our bees by calling them little demons to sting. Some of them are, I will admit; but not all. Give me the hybrids, every time. I think that your experience is rather exceptional in that your Italians were cross. My experience, so far, with extra-yellow bees, as a rule, is that

they are beautiful, gentle, and, like yours, rear rousing colonies, but don't compare with the hybrids as honey-gatherers. I'll take a few stings, thank you, if my bees will hustle. I have no use for handsome loafers.

As to getting hybrid queens, although no one advertises them, they are, by no means, scarce, and if you ask for them you will no doubt get them from almost any dealer.

## Some Sounds of the Bee

The following, written by Miss Mary Ritchie, science mistress at a college in South Africa, is taken from the *British Bee Journal*:

"To distinguish all the sounds of the bees would require a sense of hearing keener than that possessed by human ears, but even the dullest ear, after long listening, becomes familiar with many bee-notes, and finds meaning in what to the novice is nothing but a bewildering confusion of sound.

"In practical bee-keeping there is nothing the beginner will find of greater service than to learn to interpret these various sounds from the every-day happy hum of the bees in the flowers, varying as it does in intensity and eagerness, but expressive always of satisfaction and delight, to the strange peep-peep of a princess in her, as yet, unopened cell.

"When the weather is warm and honey plentiful, each bee leaves the hive with a flourish, 'Whizz, I am off!' exclamation; or is it a hymn of gratitude for a new day and its sunshine?

"The noonday play-spell is a living song of gladness—an ariel dance in which the young bees join and learn the joys of flight—a thorough ventilation and refreshment of the hive, but often a source of consternation and alarm to the beginner in bee-keeping, for he is sure that in all this uproar his bees are swarming or robbing or doing something dreadful, until he discovers it is only play and that each hive repeats this performance at the same time every day. To the uninitiated the noise is suggestive of swarming, and he watches with some concern until the bees have gone back and the usual quiet is restored.

"One of the most interesting sounds is the 'call of the queen,' or the 'call of the home'—the sound that when a swarm is being hived leads them up the entrance in such unerring lines.

"All these are sounds that one is glad to hear, but there are unpleasant sounds as well—the sound of the robber; the high, angry note of an enraged bee; the bee that has a grudge against you and is determined instantly to pay it off. A bee 'calls out' when it is being captured or crushed, and a queen when she is frightened. Bees annoyed by ants call in distress and spit at their tiny tormentors, like defiant kittens. The wail of a queenless colony is easily known, and utterly sad, though most pathetic and pitiful of all is the sound of bees that have lost themselves in the rain or darkness."

## “’Tis Sixty Years Ago” — Apiarian Progress

BY D. M. MACDONALD.

The whirligig of time works many changes. Sixty years ago Americans could not boast a single volume on bee-keeping. What small essays had appeared “gave little or no information of practical utility.” These small works were “simple compilations, servilely following through truth and fallacy. English and Continental writers.” Miner’s work, 1849, claims to be even ahead of the most popular European treatise. If so, we can safely base on it some interesting comparisons, showing the difference between apiculture now and then.

What would, for instance, some of your most advanced queen-breeders say to the following bold assertion as to what makes the magic change which produces a queen: “It is not in the power of man ever to go beyond a simple conjecture on this point?” He speaks of “large apiaries, say of 15 or 20 hives.” What a contrast to those hundreds now numbering a thousand up. Of even this limited number the best our author can say is that “half of the hives in existence at the present time are not in that condition that nature intended a family of bees to be in.”

On the then vexed question of drones American knowledge was quite at fault. “What these drones are thus allowed to live for, is a question that will never be answered.” But worse ignorance is displayed when the question of egg-laying is considered. “In May the queen deposits from 100 to 200 eggs a day.” And she produces only 25,000 workers in a season; counting her own produce and that of any swarm, they will not even total up to more than 40,000. These assertions are marvelous to our modern minds.

“It is probable that propolis is an elaborated substance, and here the question must forever rest. Where the bees obtain it, or how they obtain it, must be a secret not for man to unfold.” He falls foul of Huber for making the assertion that combs are fixed up with propolis, and maintains that his own contrary opinion “can not be controverted by all the apiarians of Europe.”

That no other substance was ever brought into a hive but honey and pollen, is his firm opinion, after close observation.

“Where,” he exclaims, “are the rules for the practical management of bees?” and echo answers, “Where?” Yet he instances Weeks, Thacher, and Townley as American writers, and Bagster, Bevan and Huish as English writers, but

only to declare that on reading them “you will find nothing to satisfy—nothing to fill the void.” “A greater cloud of darkness hangs over the management of bees than over any other branch of rural economy.” If I might interject an aside here I would give Saul’s place in the Israelitish women’s song to Mr. Miner’s work, while I would assign David’s to any one of the three writers he names.

On the question of hives this writer has ideas, of a kind. “We stand in the same position we did a hundred years ago relative to this important question.” His own ideal was a simple box 12 inches by 12 inches. Large hives were an abomination to him, and for the following original reason: “When a family of bees have enough laborers, more are worse than useless, and they rather retard than advance the labors of the hive.”

He is severe on “patent” hives, but rather takes the edge off his railing by puffing several of his own. Hives even about 14 inches by 15 inches he considers to be “entirely at variance with the natural requirements of the bee.” No wonder swarms were a result of his management, and he calculates that one colony may increase the 10th year to 512 families!

“The size of the hive, sir, is *everything*,” and so he proceeds to cut up all his layer hives to his foot-square ideal size, with the bees in them! Remember, they had no frames, not even bars. Indeed, he utterly condemns Dr. Bevan’s hive chiefly because of its bars. He had cross-sticks, though, fixed similarly to what they used to be in old straw skeps, which last Miner thought worthy of being used only “in a state of abject poverty.” Yet “log-gums” are good enough for him to recommend, while, strange to say, “of all the styles of hives used in England and on the continent I can find none to recommend.” Patriotism, eh?

He trots out a “Bee-House,” artistic no doubt, but scarcely practicable for common use, and claims it is the first of its kind laid before the public, whereas I could produce as fine, and 200 years older, the work of Winters, whose “exploded theories have been weighed in the balance and found wanting,” according to the views of this “modern” bee-keeper.

Basswood, maple, and white clover are names of 3 of the staple sources of supply for nectar, and where all 3 are to be found together “is the apiarian’s true El Dorado.” Red clover he sets down as “perfectly useless.”

Tobacco moistened and rubbed on the part stung he considers “acts like a

charm.” He rubbed honey inside his hive when taking a swarm, and amongst other articles indispensable when hiving was a *blanket*—the only time I think I have ever known this “implement” named as part of a bee-man’s paraphernalia.

Fifteen thousand bees he considered a “strong colony,” and 40 pounds a decent surplus. “Very large apiaries were those where from 25 to 100 colonies existed.” The practise of “burying bees or immuring them in cellars” he considers all wrong.

Apparently the more modern bee-man’s *bete noir*—foul brood—was unknown in 1849, for it is not even named. “If famine is kept from the door, all diseases will vanish from our apiaries,” is his final conclusion.

Many points in this book might be named to be contradicted, but many more showing good sound sense, and the practical experience of a long series of years the author boasts he spent among his bees, are even more worthy of reproduction; but the chief aim of my few short extracts and comments is to show the great strides bee-keeping has made during the past 60 years.

Banff, Scotland.

## Transferring Bees from Box-Hives

BY G. M. DOOLITTLE.

A subscriber to the American Bee Journal wishes me to give an article on the old method of transferring bees from box-hives into movable-frame hives. As such transferring was exploited last summer at a bee-meeting where there were more than one thousand present, it will hardly do to call such transferring an “old” method, but one right in vogue at the present time in our apicultural knowledge. At this meeting strings were used to keep the combs in the frames after transferring, but I think 3 or 4 holes through each piece to the frame in which wire-nails are to be slipped, is much the better plan.

There are only two really favorable times for transferring, although it can be done at any time by using care. The first is during fruit or apple bloom, and the second is 21 days after the first or prime swarm. If done during fruit-bloom, there will be little honey in the combs, and not much brood will be near the side of the box-hives, or gums, so there will be little loss from either honey or brood, while, as a rule, enough nectar will be coming in from the blossoms to prevent robbing, as well as to enable the bees to repair their combs rapidly, which must necessarily be mutilated more or less. If done 21 days after swarming, there will be no brood in the hives except a little drone-brood or a few eggs or larvæ from the newly-laying queen, so there will be no loss of brood from cutting, as all of the bees from the eggs laid by the old queen will now have emerged, while the young queen will have just begun laying.

Besides having the bars to the frames all bored, with the wire-nails ready, a board about 2 feet square will be

# American Bee Journal

necessary, and a barrel or box of suitable height for the operator to place the board upon. On one side of the board should be tacked 3 or 4 thicknesses of cloth so the brood and combs will not be injured by being placed upon it.

Having these things all in readiness, place the whole on a wheelbarrow, together with a lighted smoker and a long-bladed knife, when you will proceed to the colony you wish to transfer and blow a few puffs of smoke in at the entrance to alarm the bees, so they will not rush out to sting you, when the box-hive is to be turned bottom-side up, and the frame hive placed on the stand the box-hive had just occupied.

Now blow a little more smoke over the exposed bottoms of the combs, and place the cap to the hive, or any box, over the bottom of the hive, fixing it so that one side or edge of the box comes in contact with some one side of the hive, so that the bees can crawl up into this cap or box.

Now, if you are to work further, as was done before the one thousand alluded to above, you will make sure that the joint between the box and the old box hive is bee-tight, by winding an old sheet or cloth around this joint, when you will proceed to take up sticks of stove-wood and pound on the sides of the hive for 10 to 15 minutes, in order that the bees may be "drummed" out of the hive up into the box from which they are to be hived upon the transferred combs at the close of the operation.

But allow me to say that such tight joint is entirely unnecessary, and the 10 or 15 minutes pounding on the hive is just so much time entirely wasted.

Having blown the smoke over the bottoms of the combs and the box set above, proceed to the splitting apart of the old hive preparatory to getting the combs out. Select the side of the hive to which the combs run parallel, if possible, and proceed to pry off the side, using a cold-chisel to cut the nails, if necessary. If there are cross-sticks through the center of the hive, these must be cut off with a saw or otherwise. By this time the bees will all be off the combs next where you are working, when the first one is to be removed by cutting with the long knife next the hive wherever it is attached.

Now lay this comb on the board you have made ready for its reception, when one of the frames is placed on top of the comb, and the comb marked by running a knife just inside of the frame all the way around. Now take the frame off and cut the comb a hair larger than the marks so that it will fit snugly in the frame when it is placed therein. Next, press the frame over the comb until it nicely fills the frame, when the wire-nails are to be pushed through the holes into the comb, so as to hold it in place in the frame when hung in the hive. To take from the board, raise board and all until the frame stands in the position it will assume when it hangs in the hive, for by thus doing there will be no danger of the comb

falling out in the lifting, as there would be were you to attempt to pick it up as it lay flat upon the cloth-lined board.

Now place this transferred comb in the hive, when the bees which have returned from the fields will at once enter the hive and take possession of it, licking up all drip, beginning their work of repairs, etc. Proceed to cut out the rest of the combs and fit them in the frames in the same way until all are used, and set in the new hive, always placing them in the new hive in the same relative position which they occupied in the old, as nearly as possible to do; otherwise some of the brood may be lost, and the bees work to a disadvantage.

If drone-comb to any amount is found, it is well to leave the most of it out. If many pieces of nice worker-comb are made by the combs cutting to disadvantage, they can be fitted into frames and fine wire wound around to hold them in place. If this is done, the hive must be opened in a few days, as soon as the bees get the combs securely fastened and the wire removed. Otherwise the hive needs no opening after the operation to remove anything, as the wire-nails will do no harm if they always remain in the frames and combs just where you left them when pushing them through the frames into the comb.

As soon as all the combs are in, close the new hive, and hive into it the bees which are in the box, the same as any swarm would be hived, when the job is done.

If a scarcity of honey exists at the time of transferring, so that robbing is liable to occur, a bee-tent to set over the hive and operator is a good thing.

Borodino, N. Y.

## Parcels Post and Technical High Schools

BY PROF. A. J. COOK.

There are very few improvements that have come with such benefit to a large class of our most deserving citizens as the Free Rural Delivery. Said one of our brightest farmers to me the other day, "Greatly as I prize the telephone, and much that it gives to us of comfort and time-saving, yet it is no comparison at all to the rural delivery as an aid and convenience to us farmers." He added, "But we might get vastly more, and at an actual saving to the country, could we have a cheap rate on parcels up to 25 pounds. This is sure to come, as we need it, and deserve to have it, and could get it in a very short time if we would all pitch in and demand it."

No doubt my friend is right. We are behind all the peoples of Europe, and even Mexico is ahead of us. This all comes because the express companies have their grip upon us, and wish to grow rich at the expense of the people. The railroads stayed off the Panama canal for years, greatly to the Nation's hurt, and now the express companies are playing the same shabby game.

We now can send 4 pounds in a single parcel, and must pay 16 cents per pound to do this, whereas we should

be able to send any weight, and at never more than 5 cents per pound.

The salary of the carriers has been increased, and is surely none too much. I believe that we do this work at an annual loss of about \$30,000,000. It is certain that with a parcels post, and no limit to the weight, the whole thing could easily be made a source of profit, with no harm to any one except the men who are at the head of the express companies, and they have fattened quite long enough at the expense of the people.

The loss to the people in the rural districts, from not having cheap rates on packages with no limit to weight, is said to be \$100,000,000 a year, and, with such a system, the Government would have a fine profit instead of a deficit.

A cabinet member told me the other day that no one could be more heartily in favor of cheap parcels post than was he; and when asked if the President was in favor of it, he replied, "Of course, he favors anything that helps the people; and what would be of more benefit than a parcels post, such as they have in all parts of Germany and most of the other countries of Europe?" And is not that emphatically true?

The National Grange is also working with all its great influence to secure action by Congress, that will give us this greatly-needed postal improvement. A writer in the last New York Outlook, who seems to have given this subject much study and attention, says that with a rightly-managed equipment, all mail could be sent for one cent a pound with no weight-limit except in case of letters, and be self-supporting. Even if it did cost more than was secured from selling stamps, for a time, it would be a wise outlay, as nothing could be more of an educating power than this would be.

I believe that nothing could be more serviceable to our people than this, and in the Pacific States, so wide from the East, it would come with added blessing. We ought all to urge it on all occasions, to write for the papers in its behalf, to get others to do so, and fairly to flood our congressmen with petitions in favor of a parcels post, as liberal and well-managed as the best in the world at the present time. It is bound to come soon, and it will be our fault if it is not forthcoming *very* soon.

### TECHNICAL HIGH SCHOOLS.

Congressman Davis of Minnesota has a bill before Congress which should interest all of us. It promises as much for our people as has come from the Morrill Bill which passed in 1862, and which by donating lands to the several States secured the Agricultural Colleges, that have raised Agriculture in our country to a degree that is hard to appreciate.

This Bill has the hearty support of the Secretary and Assistant Secretary of Agriculture, the Master of the National Grange, and will very likely pass at the very next session of Congress. It surely will if we all do our part to urge its merits and importance upon Congress.

The Act proposes to appropriate to each State, from the funds of the Gov-

ernment, ten cents for every citizen—man, woman and child—as shown by the last census. Half of this goes to the country and half to the city, and is to be expended to teach only Agriculture in the country high schools, Mechanics in the city schools, and Domestic Science in both. Thus we will give to our boys and girls just such instruction as they will need as they engage in the sterner duties of life. This money is not to pay for buildings, nor for instruction in other lines, but is to be used wholly for the purpose of technical instruction.

This is not a new plan, but has been tried in four States, and with most gratifying success. Georgia, Alabama, Nebraska and Minnesota have all established these Agricultural High Schools, and although they were started in Georgia wholly as a private enterprise, they are now taken over by the State and are to be found in every county of the State. We have one such school in California, and it is doing good work, and will make it easy to multiply such institutions.

These schools have been so well received where they have been started, that it will not be difficult to get this Bill passed almost unanimously, by the coming Congress, and we should all do all we can to help in the matter.

This plan carried out promises much in many ways: It will make more efficient farmers, more intelligent laborers; will give education a more practical tone, without lessening its disciplinary value, and will tend to swell the already large and rapidly-growing attendance at our agricultural colleges. The business of agriculture will be elevated, as more intelligence is brought into it, and the call for trained men in these Agricultural High Schools, will bring a demand for more knowledge and research in these directions, which must be worth much to our people.

It is also proposed to unite with each of these high schools a research station, where the pupils will be trained in actual investigation. This will require a trained man to lead in the work, and will surely be of rich service to the pupils, and to the whole country.

The whole trend of education at the present time is toward technical studies, and the above plan will surely fill a felt need. I hope that this measure will meet as much approval as will that of the "Parcels Post."

Columbus, Ohio.

## A Visit to a Nebraska Bee-Keeper

BY C. P. DADANT.

Wife and I have never traveled much together. We have always been too busy. In our young days it was out of the question to take a wedding trip, for we could not afford it. But during the present season we concluded to take a trip out West. The bee-business was very dull—all that the bees needed in the early part of June was feed. No honey, but little work, and a very limited sale of comb foundation! Besides, our young people are

all able-bodied and fully suited to the requirements of the business. So we could be foot-loose for the first time in our lives during the month of flowers, and yet not feel that we were neglecting anything that needed attention.

The morning of June 13 found us at Grand Island, Nebr. Mr. Wm. Stolley, one of the oldest settlers of that part of the country, has been a good friend of mine for 20 years or more, but we had never met, although we had often exchanged views and had found that our political, social, religious and apian ideas were very similar.

On our arrival at the hotel in Grand Island, we telephoned Mr. Stolley, who was waiting for this signal, to come after us. He was soon on hand with

clms, etc., and is in a large shed in the shape of a half moon.

Our host is an amateur in bee-culture. He has at present only about 45 colonies, and he aims to keep down increase. His method was new to me. It consists in removing all the brood from the colony, or colonies, that try to swarm, placing the brood in a hive-body just above the old colony, and from time to time returning the young bees to the parent colony. This method seems to give good results with the large hives, but I would not trust it with small hives, for I saw an example of failure right there. The hives used by Mr. Stolley are large American 14-frame hives, and in those the method succeeds, but he has also a few Heddon

WILLIAM STOLLEY.

his carriage, and in a few minutes we were riding towards his home, and chatting happily. We were promised a hearty reception from the ladies, and we certainly got it, for there are no more congenial persons than Mrs. Stolley and her two daughters.

The road to the Stolley home is shaded most of the way by forest trees, which Mr. Stolley told us had been nearly all furnished by himself. Before arriving at his home he drove through his grove—forest, about 50 years old, planted and cared for by him. It contains between 40 and 50 acres, and is cut by several lanes. Mr. Stolley takes great pride in his grove, and the avenues through it are as well cared for as the drives of a city park. Native and foreign trees are growing in this timber, and we saw a magnificent German oak-tree, also a number of foreign basswoods.

The apiary is situated on the south edge of the grove, shaded by maples,

hives. One of the colonies in those hives had swarmed two days before, and its brood had been removed as mentioned. On the day of our visit it swarmed again, and upon opening it we found that there were only a few eggs, but several of these were in queen-cells which had been hurriedly built by the bees. The colony was so intent upon swarming that there were perhaps 50 queen-cells started, in most cases only a rudiment, but they had evidently not given up their intentions, for so small a matter as the loss of their brood.

Another interesting thing I found was the evidence of the quest of a home by what has ordinarily been called "scouts," and of which some authors are inclined to deny the existence. Mr. Stolley has, at the top of his shed-apiary, four decoy hives, placed in full view, and containing combs already built and in good condition. He often harvests swarms, which enter those hives of their own

accord. On the second morning of our visit we noticed a number of bees busy at one of the decoy hives, and Mr. Stolley asserted that they must be scouts, getting ready to swarm into this hive. Two hours later the issuing of a natural swarm confirmed his assertion. But the swarm was hived and the scouts abandoned the decoy hive at once. This shows conclusively what I had already decided in my own mind from some ulterior observations; that when a colony is about to swarm, some of the bees, probably among the most active and most experienced, start out early in search of a home and begin to clean it up at once, while some of their number direct the swarm to this selected home. But the swarm generally alights first on a branch or a bush, in order to get together. This little indication of the great intellect of the bees was very interesting to me.

Our host is no longer in active business, his farm is rented, and he and his son (the only one of his sons who is at home) are both busy taking care of their surroundings, and making home comfortable. Some of the nicest nooks and corners are to be found about that apiary, that are in existence anywhere.

Little grass plots, carefully cut with the lawn-mower are discovered here and there, surrounded with beds of flowers and a few fruit-trees. To any one who has visited the naked plains of the West, it is a charming thing to find such delightful spots produced by the careful hand of progressive men.

Mr. Stolley is a lover of Nature, and it is no wonder that he loves the bees. Two or three easy chairs are kept in one end of the bee-shed, and in these chairs, brought out under the trees, we spent several of the warm hours of the day, while the bees were hurrying back and forth. The honey crop had hardly yet fairly begun, for some hives had no honey. But the fields were thick with white clover, alfalfa and sweet clover. A number of the honey-plants are tried by him, but those named are the main reliance for honey.

While walking about among the trees, and from one little lawn to another, we came to an open space containing one little bunch of dried grass, evidently freshly cut. Mr. Stolley called to my wife, "Mrs. Dadant, let me show you something nice." He lifted up the grass and showed us—five little rabbits snugly hidden in their nest. "I found them," said he, "while cutting this grass, and for fear they might be hurt, I covered them with this bunch of hay. But I left an opening in the hay, so the mother could get to them. When I came back, I found that the mother had discovered them and had carefully trampled the hay down, so that no trace of them could be seen. Do you hear my dog howl at the barn? Yes, I have him tied, for fear he might hurt these little fellows. In 2 or 3 days they will be able to take care of themselves, and I will turn the dog loose again." It is of such mettle that our good apiarists are built—lovers of nature and observers.

Mr. Stolley is 76 years old, looks hardly 60, and is of such cheerful disposition that he is probably good for 20 years or more. His ambition seems to be to be happy and make others happy around him, and I believe he succeeds. After all, are we not all seeking happiness, and does happiness consist only in piling up dollars behind the doors of a bank vault?

Mr. Stolley's grove, his bees, and his pets, give him ample satisfaction. We were told that some 3 years ago Roosevelt visited Grand Island and made a speech there. And as the Stolley grove is the finest drive around that section, the citizens took Roosevelt to the Stolley grove. He saw the lanes, the arbors, the lawns and the bees, and he was so delighted that he enthusiastically remarked, "Mr. Stolley, I envy you."

But I am not through with the bee-question. Mr. Stolley cures rheumatism with bee-stings. Before I tell you of his method, I must first inspire your faith in his medical skill, by telling you that in the old days—in the '60's—he was a "medicine man" among the Indians, and had many friends in their tribes. Being naturally of an observing mind, as I have shown above, he had noticed that the Indians suffered generally from over-eating. Accustomed to fasting for days and weeks when the game was scarce, if they happened to kill a buffalo or a deer, they would eat to excess, and their intemperance led to indigestion. Mr. Stolley took note of this, and repeatedly cured his sick savage friends by giving them a good dose of epsom salts. That is how he became a renowned medicine man. So I take it for granted that the knowledge of this will make you more willing to try his rheumatism cure.

Mr. Stolley has cured numerous cases of the worst kind of rheumatism—in some instances where persons had almost entirely lost the use of their limbs—by administering bee-stings; beginning with one sting, if there was any doubt of the ability of the patient to stand a greater number, but usually beginning with 5 the first day, then 7 or 8 the second day after, then increasing the dose once a week, until 12 or 15 were inflicted at one time. His method of applying the stings is as follows:

Catch the bees, bring them to the house and let them fly to the window-pane. Then with a wet sponge catch a bee while it is on the window, bring it to the suffering limb and press the sponge down, slightly releasing the bee from the grasp of the sponge, and it will at once protrude its sting in self-defence. Mr. S. asserts that he has cured many difficult cases which the doctors could not improve. This remedy is worth trying.

After a two day's visit, during which we enjoyed many a chat, and heard dozens of interesting anecdotes concerning the life of the pioneer among the Indians and the buffaloes, we took leave of our kind friends and continued our journey towards the West.

## From Foreign Fields, With Notes.

BY F. GREINER.

Such old veteran bee-keepers of Germany as Dzierzon and Guenther held, and hold, that the queens from post-constructed cells are just as serviceable and long-lived as queens from pre-constructed cells, and E. Bohm, forester in Seegefeld, defends this theory in the late number of *Leipz-Bztg.*, at the same time he condemns American methods of rearing queens; I suppose he refers here to the transferring of larvæ into artificial or otherwise obtained cells, predicting that this practice will soon be out of date and disappear like an infertile blossom, which will wither and drop off.

The only difference between a queen from a post-constructed cell and one obtained by transferring larvæ to prepared or natural cells, is the transferring act, for we have it in our power to select larvæ of the same age, as would be taken by the bees. If cells were constructed by the bees over eggs (normally) there might be more reason for objecting to the American practice of transferring larvæ, but as the bees do not do so there can be no objection except it can be shown that in transferring the larva is injured.

We know that bees have no sympathy with any of their kind when accidents occur, or when a sister is ailing. On the other hand, they show no mercy, and cast the injured babies or sisters out of the hive. They are the worst cannibals that may be imagined, for they appropriate the blood of the cast-out babies to their own use before casting the cadaver aside. If we injure a larva or nymph, the inmates of the hive discover this at once and proceed to remove it. If we injure a larva in transferring, I judge they will not be slow to remove it; the fact that they do not remove it is in itself the proof that the little bee-baby is all right. If it had been injured, it would not grow and develop into a perfect insect, as we have occasion to see it every season.

It is my opinion that, if a queen reared according to the American method, is not as good as one reared from the eggs as in swarming-time, or a supercedure-queen, then the queens from post-constructed cells are not as good.

Our German friends claim that our American queens are short-lived. How true this is I am not prepared to say, but I have not observed that there is any difference in this respect between naturally-reared queens from untampered black stock and the queens we rear by transferring larvæ to artificial or natural cells.

It is possible, perhaps, to overtax a colony of bees by compelling them to rear too many queens, or to have queens reared at an unseasonable time. It may be that inferior queens are thus reared and sent out by some queen-breeders. But when a big, rousing colony during the honey season rears no more than 8 or 10 queens at a time, I can see no reason why these queens should not be as good as any grown in post-con-

structed cells, although the larvæ may have been transferred by the bee-keeper.

I am inclined to the belief that the queens, which are reared without any interference of man during the swarming season, are a little the best, but I do not know. Some hold that by rearing queens out of the swarming season, and by compelling the bees to use worker-larvæ for the purpose, a strain of bees will result which is less inclined to swarm. I find this opinion expressed by German and American bee-masters alike.

Herr E. Bohm speaks in the same paper of the new method of having queens mated from queenright colonies, i. e., without removing the old fertile queens. That this may be done is fully explained in Doolittle's "Queen-Rearing," of 1889. Herr B. in a way gives credit to the Americans, but says that their method is uncertain and unreliable, as well as too complicated and taking too much time to be practical. He himself is conducting experiments along this line which he expects to finish this year, and which promise to be superior in result to anything known. This is good news, and we will be thankful to Mr. B. if he gives us a practical method to mate queens in this way, but he will not be able to claim priority of the idea, although he mentioned this idea to visiting friends last season.

I never had an entire success mating queens this way, but my method was not laborious. From the fact that queen-breeders and bee-keepers employ fertilizing-boxes it will seem, that the latter method of mating queens is regarded as safer and cheaper.

#### DEMAND FOR PROPOLIS.

There does not exist a demand here for propolis. I do not know what use it may be put to, but I notice that the article is wanted in Germany. R. Spiegler in Grosshennersdorf, offers to pay about 25 cents to 50 cents per pound for it, according to purity.

After scraping my wide frames and supers I had about 8 pounds of propolis saved. Of course, some little wax-particles went in with it, such as little "legs," which the bees build at times to connect the comb and the separator. I have not much trouble this way, but once in a while I find a colony which is great in this. I find, also, sometimes, a little wax on the underside of the bottom-bars, and in a good honey season, or during the heaviest flow, pure wax is sometimes used in lieu of propolis.

To separate this wax from the propolis, I dumped the whole mess into an iron kettle, which was placed on a hot stove. When all was melted, the wax, being lighter than the propolis, rose to the top and stood there in little puddles. I poured it off from time to time into a pail of cold water; to obtain the last, I dipped it off with an iron spoon. The melted propolis was finally poured out on to a wet board. It formed a cake of 5 pounds with a very little wax still in it. The obtained wax is of fine quality and weighs 3 pounds. It will not bother me to find a market for this, and I shall save up the propolis for a future buyer.

I supposed at one time that propolis and wax could be melted together and form one mass, as in making grafting-wax of resin, wax and tallow, but it does not do so with me; the two substances separate when hot.

Naples, N. Y.

## Spring Stimulative Feeding of Bees

BY A. C. F. BARTZ.

These words have headed many an article of bee-papers, in recent years, and many and hot have been the discussions on this very important topic, by the advocates as well as by the non-practitioner; and I believe that sometimes the reader has been led to believe that the writers taking either side of the question did not know what they were talking about, as they, pursuing one way one season and finding it a success, would very often prove the contrary another season. I, myself, have very often been "at sea" to know exactly whether or not it would be profitable to feed bees in the spring in order to stimulate brood-rearing; but with the experience I have now, I feel safe to say to the bee-keeping world, when to feed and when not to feed. In the following I shall endeavor to explain why it *does* pay to feed, and why it *doesn't*.

Some of the readers of the American Bee Journal will remember my advocating feeding bees in cold weather. Notwithstanding the protests made by some, against the feeding of bees in cold weather, I am now ready to take all and every responsibility, as far as to damages done to bees by feeding in early spring, (excepting the feeding at daylight in cold weather), upon my own shoulders, and if any one would get a chance to go through an experience like the one I am just passing (May 14) with my 250 colonies of bees, and seeing the results of what feeding does, I do not believe there would be any more disputes as to whether or not it pays to feed.

Now I will tell how I came to find out. After taking my bees from the cellars on April 1st, and finding that they had wintered in first-class condition, I felt satisfied that nothing was to be done after that, only to see that each colony had enough honey to carry them through until they could gather some from the soft-maple and hard-maple sap, in which this country abounds.

I just gave them a hasty inspection, and marked all colonies light in stores, and also those having too much honey, which were about 50 or 60, as I generally do take away from those having too much and give to those having not quite enough; but this last-named chance I was not to enjoy this year, as we did not get a day, after April 3, on which it was safe to open a hive, until away into May.

I was compelled to put feeders on those colonies not having enough honey, and feed sugar. So I put on 12 feeders of large dimensions, and about 24 smaller ones; and I fed those bees every day that I found their feeders empty, leav-

ing those 60 colonies with their surplus honey to themselves, hoping from day to day to get a chance to take away some of their honey, but such a spring I never saw!

A change in the weather came at last, and on May 13 I was permitted to see what I had been doing; hence this article.

In the 60 colonies with too much honey, not one of them contained 4 combs of brood, and their number of bees had melted away to half the strength they had been when taken from the cellars; others with not so much honey had perished entirely, and others dwindled down to mere handfuls. But what about those fed? I'll tell you. I was never more surprised in my life, and I don't remember ever being much more pleased than I was when opening the hives of those I had been feeding, especially those 12 with large feeders—why, some of them have brood in 9 combs, none less than 6, and they're "boiling over" with bees, so much so that I have given them a second story, and some even a third! They look like so many mammoth hives. I can divide every one of them, and will do so in a day or two; this will give me at least 24 rousing colonies.

Now, you see what this feeding did—it not only stimulated the bees to the highest activity of brood-rearing, but it prevented spring dwindling entirely—the very thing which is so much feared by some of our writers; when writing about feeding in early spring they claim the bees leave the hives when the weather is unfavorable, and get lost, and thereby dwindle. This is a theory, and entirely wrong, and "falls all to pieces," as Mr. Hasty says, when brought against practical experience.

I wish to say, further, that the sugar I fed was the best granulated cane-sugar, made to the consistency of half sugar and half water, by measure, and fed very hot.

My feeders have a galvanized iron bottom, and cover the entire top of the hive. Certainly the heat from this feed had considerable to do with the bees breeding up so fast, but I could not get the heat unless I used the feed.

Another thing I'd like to mention is, that the amount fed to those colonies was more than they could use—they stored a little—from 5 to 6 pounds per colony, and the feed was given at night, sometimes by lantern light.

I just want to mention that if bees gather pollen every 2 or 3 days—or even water—they need no stimulative feeding in early spring, providing they have plenty of honey in the hive, because pollen is a stimulant, as well as water; in fact, anything they can gather outside arouses them to activity, but when they do not fly for 2 or 3 days or weeks, or even a month, then the thing assumes a different aspect altogether; and should it become so cold as to compel the bees to form a solid winter cluster, then it will clip from day to day part of the cluster, and many of the young bees within the cluster will drop off for want of honey, because there is not unsealed honey enough within the cluster to carry on breeding, and nour-

ish the young bees, and hence spring dwindling.

I therefore conclude that I shall feed my bees, after this, in early spring, when the weather is too cold for them to fly for 3 or 4 days, no matter how much honey they have in the hives, unless it will prove that it is better to give each colony about 10 pounds of unsealed honey as soon as they are taken from the cellars, which I expect to experiment on another year. Others might try similar experiments, and report in the American Bee Journal.

Keystone, Wis., May 14.

## Under Cross-Examination on Matters Apiarian

D. M. MACDONALD.

At your special desire, and in agreement with your express wish, I step up into the witness-box to be cross-questioned. You accuse me, on page 389, of three instances of ambiguity consequent on the brevity of my extracts from the veteran Dr. Miller's work; and on page 429 you seek to pillory me for use of the word *impossible*. I really think that on all the points animadverted on, if you had read with your usual perspicuity, the so-called puzzles would have been evaporated. But lest I unwittingly do injury to any one of our mutual friend's "kinks," or mystify your or our readers in any way, let us proceed to evidence, first premising that the extracts were merely intended as texts on which to hang sermons; and that they were supplied to whet the appetite of British readers for "some more." I have reason to know the result was that several additional copies of "Forty Years Among the Bees" found their way across the "herring pond."

1. In regard to securing all worker-comb from starters, Dr. Miller is not singular in considering the very best way of insuring this is to work for it in weak colonies. This is a truism which I deem requires no elucidation from me. Any amplification, even, is not necessary, because in two almost preceding "extracts" will be found a description of the Doctor's frame, with his process of "wiring" in full sheets of foundation, in his words "providing beautiful comb," thus showing as clearly as words can that this "grand old man" of apiculture knows how to get all worker-comb in various ways.

2. Reducing the brood-body to about 8 frames at the opening of the honey-flow, in order to force the bees to engage in super-work, is a very general practise. As the extract objected to for its ambiguity follows one dealing with the opening of the flow, and another treating of the sections used, its brevity should not lead even a novice astray. Indeed, the natural sequence of half a dozen extracts distinctly shows how, why, and when the number of frames should be reduced.

3. Increase by taking frames of brood to an out-apiary is an excellent style of procedure. Dr. Miller shows a liking for it and recommends it, but the two preceding extracts show as clearly as possible that Dr. Miller has more

than one string to his bow, and practises home increase. "Plugging with green leaves" implies nuclei in the home-apiary, while "taking a frame from a nucleus" to requeen leads us to infer that nuclei are there for more than one purpose.

Now, let me deal with page 429. I still stick to the "Impossible" argument. Apparently you read the word as if it meant that bees *can not* place newly-gathered nectar in brood-combs. In this sense of course the contention would be manifestly absurd, as everyone who has handled frames finds in them very frequently a thin liquid "which looks like nectar, tastes like nectar," and *is* nectar. But my original paragraph most distinctly stated as much where I mention "unsealed honey ready for the nurse-bees."

So much for the sense in which the word was used; but let me take a step further, and show why I deem the doctrine of transference an old wives' fable. Read what I wrote, how every cell is already occupied, and tell me, if

these cells are already full, how they can admit this nectar. They can not be twice filled with two different substances at the same time. *C'est impossible!*

I will now step down from the witness stand and call on Mr. Doolittle (who was supposed to favor your first contention) to give testimony in my favor. Read Gleanings, page 691:

"To give the best results in supers, the combs at the commencement of the honey harvest must be literally *filled with brood*. With the combs thus full of brood the first storing is done in sections, and, having commenced therein, the bees continue with little honey (very small percentage) being put in the brood-chamber till near the close of the season."

Any jury, British or American, will acquit me of error or even exaggeration in claiming it is impossible for nectar to be stored in the brood-nest, when it is already full of brood. Therefore, let us revise our ideas if we find them wrong.

Banff, Scotland.

### Keeping Colonies Always Strong

It is one thing to talk and write about keeping bees always strong and ready for any unexpected honey-flow in this State, and another to do it, and especially is this true if you have more than one yard to look after.

In February and a part of March we had unusually warm weather, and the bees bred up in a way that was pleasing to the apiarist, and a few of the most thrifty colonies cast swarms in March, only to repent of their folly, perhaps, as the next two following months were the worst I ever saw for bees in the 49 years I have been in Texas. It was cool—yes, cold—cloudy and dry almost the entire time, with the result that a great many of our queens stopped laying in the height of the breeding-season, and today most of our colonies are weaker than they were the first of February; and that, too, after having fed several barrels of sugar. So it's not so easy to "keep all colonies strong" where one has out-yards that he can visit only once in 10 days or 2 weeks.

### Against Handling the Bees During the Honey-Flow

A good many of our best apiarists advise working with bees in time of a good honey-flow. That is very good advice in some cases, but there are se-

rious objections to working with bees in time of a heavy honey-flow, one of the worst being the killing of bees. At such times the bees are all filled with honey, and are very much disposed not to get out of the way while manipulating them, and are crushed. Then, another objection is, it seriously hinders them from their work, and at a time, too, that we can least afford it, for the honey-flow is usually short at best, and the least disturbance during such times is by far the best, provided, of course, you are sure they have plenty of room. My advice is to watch and study your locality and if you don't know when to expect your main honey-flow, you should by all means find out, and do the principal part of the work with the bees *just before* it starts. Then let the bees alone—if you are *sure* they have plenty of room—until the flow is about over.

I am off to my 3 out-yards to see how the bees are doing this evening, (June 17). The weather is hot and dry, and a light flow is on from mesquite. I want to put on shade-boards, and help the bees in every possible way I can, so as to get them built up good and strong by the middle of July. That is when we expect the sumach to bloom here. If we don't get more rain, though, the bloom will be very light.

L. B. SMITH.

Rescue, Texas.

After all, Mr. Smith, I still believe

that a *bee-keeper* can keep his colonies *always strong* if he is a *bee-keeper*. Take, for instance, the case of Dr. C. C. Miller, of Illinois. The season there was not unlike ours. Warm weather caused bees to breed up and become strong, when the cold snap came upon them. Now, Dr. Miller, old and experienced bee-man that he is, knew, or thought he knew, that his bees were suffering, and would come through weak. But did they? No, there were just enough stores for them, and they were strong in bees, and in fine condition when warm weather came again. Then, the Doctor *was* bee-keeper enough to examine them—found them at the starving-point, and gave them nice, fat combs of sealed honey from his reserve stock, and, presto! his bees are in fine condition for the harvest.

It might be intimated that the locality had something to do with it, especially since Illinois and Texas are quite a few paces from each other. But hold, just a bit south of Rescue, Tex., there is a fellow who did exactly what Dr. Miller did—not with only one yard, but a dozen of them.

Distance and locality had very little to do with it in this instance, for, let us jump up into Michigan (see editorial, *Bee-Keepers' Review*, page 179). Exactly the same condition still farther north, and making a greater distance between Mr. Hutchinson's apiaries and my own here.

Leaving plenty of honey in the fall, equalizing stores in the spring and giving protection to the hives in the spring, if they are not already in a sheltered place, will help much in keeping colonies strong throughout even a season such as this one.

It will be only fair for me to remark that North Texas, where Mr. Smith resides, is a peculiar one for bees in the spring. There is very little natural resource for them in the early spring, compared with most localities, and this is later followed by an entire dearth until about July 1. It is a problem to keep bees over this "gap," in good condition. All the stores are used up in spring in rearing brood, (no matter how much honey is left in them. Colonies "rich" in stores will swarm, only to starve later, unless helped. This is a problem to be contended with there.

### Work for Improvement

A picture of much interest to many of us nowadays is shown here. Although box-hives are a thing of the past in many localities, there are still a few of them.

Now for the improvement that could be worked for in an apiary of this kind: First, the very style of hives does not allow of proper manipulation of the bees, etc., hence best results can not be obtained. Control over the bees is hampered to such an extent that the race of bees is far from a good one; and this combination with an over-abundance of swarms, can mean only a meager income for the owner who claims to obtain an average of "a gallon of strained honey apiece from the good colonies

### The Old Way

### The New Way

during a good season." An average of 12 pounds!

Far better to transfer the bees to modern hives, double up the number of colonies, introduce good queens, prevent, as far as possible, an over-abundance of swarms, and obtain much larger yields of superior surplus honey, an increased income, with less "fussing."

There is a difference between these two apiaries. In one, the owner prides himself with the number of "gums" he has; in the other, how much surplus honey he obtains from his colonies, and

how much *pleasure* and *profit* they realize him.

We know that the larger the number of colonies in a given location, the more honey is consumed before any surplus goes to their owner. I have preferred *intensive* bee-keeping rather than *extensive*; but, of course, this does not mean that bees should not be kept extensively at the same time. Keep better colonies—not only a large number—and make all there is in it out of them, is a good rule for all of us to go by.

## Canadian Beedom

Conducted by J. L. BYER, Mount Joy, Ont.

### Another Poor Honey Season

The clover has come and gone, and from reports to hand the honey crop from that source is but little better than the year 1906. The poor condition of the bees in general throughout Ontario, to a certain extent explains this result for some sections, but in our own immediate district there was almost no honey in the clover. Just why, is

hard to explain, as the clover was in splendid condition, and the weather, at least some of the time, simply ideal. True, it has been very dry with us, yet many a time I have secured good crops when it was much dryer than this year. In my 3 yards only 8 swarms issued, and 6 of these came in fruit-bloom. Colonies in the home-yard that about filled a super from fruit-bloom, did not store 10 pounds from the clover. With two

# American Bee Journal

years in succession being failures, the outlook is certainly somewhat discouraging; but as our average from clover for the 7 preceding years was about 100 pounds per colony, we still look for a return period of prosperous years. Any way, as the President of the Ontario Association said last year in his address, "We are one year nearer a large crop, than we were a year ago."

The basswood looks well and is just opening, and as I write (July 22) we are having a splendid rain. With favorable weather we might get some honey from that source, but basswood, with us, is such an uncertain yielder that any honey from it will come as a happy surprise. Quite an acreage of buckwheat has been sown, so there is a possibility that the bees may get enough at least for winter stores.

## Heavy Loss of Bees

During the past month I have been in different sections throughout Central Ontario, and the thing that has struck me most forcibly is the tremendous loss of bees during last spring and winter. Fifty percent would not be an exaggeration, and while the heaviest losses are among the farmers who have bees, yet many of the specialists have been hit—and hit hard, too. One thing is certain, for the next few years, for what honey is obtained, good prices are assured.

Another thing that has impressed me, is the great carelessness that so many bee-keepers show in the care (?) of their bees, and the wonder is that some have any bees left at all. In different places one will find section-cases on the hives without any foundation in the sections, and, in a few places, cases without even empty sections in. It reminds one of the Egyptian taskmasters who forced the Israelites to make "bricks without straw"; and yet these same bee-keepers will wonder why their bees "don't do well!"

Needless to say, when foul brood is found in bees kept under such lax conditions, it means a lot of trouble for the bee-keepers, inspector, and all concerned.

## Requeening Colonies

At the Chicago-Northwestern Convention last year, the following question was asked:

"Shall we requeen colonies having old queens, or let the bees do the work of superseding?"

In the discussion on this question, opinions were about equally divided, such veterans as Dr. Miller, Hutchinson and others were undecided in their views; Taylor, Abbott and some others would leave the matter to the bees; and Mr. France would practice requeening.

My own experience would lead me to say that if we know that a queen is about to fail, by all means supersede her, as here, in "our locality," the bees do not always, by any means, attend to the matter. As one member pointed out, queens are not all *old* at the same age, some playing out at one year, while others will give good service at 3 or 4

years. Yet, as a rule, queens in their third year are not to be depended upon. As an exception to this rule I might mention the fact that last year we had a queen that was 7 years old. There was no mistake about this at all, as the queen—a Carniolan—was clipped, and up to the 6th year her colony was always one of the best in the yard. In the spring of her 5th year, the queen looked more like a large ant than a queen-bee, and the hive was marked for supersedure. In the spring of her 6th year she was still there, looking much the same; and in 1906—her 7th year—the colony was only in medium condition, the queen hardly able to crawl around, a daughter taking her place during fruit-bloom.

Previous to the past spring, nearly my entire loss during winter and spring was from failing queens; and I think I am safe in saying that fully 90 percent of the weak colonies I have examined this year have been headed by old, failing queens. By all means, let us requeen more, and not trust to the bees to do their own superseding.

## Methods of Rendering Beeswax

A short time ago, while traveling, I met a gentleman who is proprietor of a silver-plating establishment. Finding that I was a bee-keeper, he informed me that they used a very large amount of beeswax in their factory in the process of manufacturing their different wares. He was anxious to buy wax, but would do so only by having samples first submitted for trial, as he said that wax rendered by certain processes was absolutely useless for their purpose. He referred to the process of pressing out the wax under hot water, and said they had bought a large quantity of wax rendered in this way, and that they could not use it. Wax from cappings was not suitable for their purpose, either; the ideal wax for their use being that rendered from old combs in the cold-press—the Hatch-Gemmill for instance.

While wax rendered by the hot-water press is all right for foundation purposes, from unbiased reports to hand, there seems to be no question that for some purposes it is not as good as wax taken by the old processes.

Only a few days ago I received a letter from a prominent Ontario bee-keeper who has both styles of presses. He says: "The hot-water press gets all the wax all right, but the quality of wax is not nearly so good as that taken from the Hatch-Gemmill." Although he has the hot-water press, yet he first puts the old combs through the unheated press, and afterwards runs the slumgum through the other machine.

While on the subject of wax-presses, I believe the writer owes the American Bee Journal readers an apology for not reporting, as promised, results of experiments in heating some hundreds of pounds of slumgum with the Hershiser press. By way of excuse, I will say that circumstances have prevented me, up to the present, from doing the work. However, the slumgum is still on hand, and as soon as the work is done, results will be published.

## Making Increase by Dividing Colonies

In the present article I wish to call attention to a few of the details of "shook" swarming that are of prime importance if this method of handling bees is to be made a success.

When increase is desired part of the bees and queen are shaken out in front of a hive placed on the old stand and fitted with frames of foundation or drawn-out combs. The old brood-combs with some adhering bees are then placed upon a new stand, and the queen-cells already started are allowed to remain. To prevent after-swarming only one or two of the best cells are left, and from these the mother of the colony is produced.

This plan has several very severe faults, and, if practised for any length of time, will result in a deterioration of the whole yard. Chief among the objections to it might be mentioned three that are of primary importance:

First.—The shaken swarm on the old stand is not as strong in bees as it might be, because part of the bees have been left with the brood.

Second.—Much of the brood set on the new stand will perish, especially the younger portion of it, even if a considerable quantity of bees are left to look after it.

Third.—The resulting queens are about the most worthless productions that it is possible for the bee-keeper to turn out.

A plan that will give all the bees to the shaken swarm, and dispose of the brood in such a way that it is all saved, and at the same time give opportunities for a considerable increase if desired, is outlined below.

First, set aside several colonies that are strong enough to enter supers readily if such should be given. These are to be used as nurse-colonies for the brood taken from the shaken swarms, and when the season has advanced so that preparations for swarming have commenced in some colonies, take away all the brood from such, and replace with frames of foundation. During this operation smoke the bees well and see that they have filled up with honey. Clean all the bees off the brood-combs, and let them run in with the rest, and give them back their supers. This puts all the bees in with the shaken swarm.

Go over the brood and destroy the queen-cells that may have been started. Put queen-excluders on the nurse-colonies and divide this first lot of brood up among two or three in supers placed above the queen-excluders. By using judgment, and not giving a colony at first more brood than it can attend to, the brood-combs will all be looked after, and the nurse-colony to which they have been given will increase in bees at a surprising rate. In a very short time the supers can be filled out with brood-combs taken from other shaken swarms, and after these have been in the hive for a few days, whole supers of combs can be added at a time, until the hive is several stories high above the queen-excluder. After these brood-combs have been tiered up for a week

# American Bee Journal

or to days they are in prime condition to divide up for nuclei. The uncapped brood will all be sealed over, and cells from which the young bees have hatched out will be filled up with fresh honey, and the hive will be running over with young bees that will stay in a new location.

To start the new colonies take from 2 to 4 combs with adhering bees, give them a ripe queen-cell, and place on the stand they are to occupy. Examine in 10 or 12 days, and if eggs are present in the combs the young queen has hatched out and mated; give them more room as needed, and if any further shaking is done after the nuclei are made up, the combs from such can be distributed among them, one or two to each, depending upon their strength and ability to look after the uncapped brood. This uncapped brood in the nuclei will indicate whether or not a queen is present. The bees will start queen-cells upon it should she be missing. If such is the case then insert another cell. Should the honey-flow drop off suddenly it would be as well to stimulate these nuclei with a little thin sugar syrup and by fall they will be the best colonies in the yard.

In order to get ripe queen-cells at the proper time there is no simpler or better way than by saving the cells from some of the best colonies that have swarmed. Instead of shaking these colonies let them swarm out, and hive the swarm on a new stand. The brood and queen-cells will then have the best of care, and in about 6 days after the swarm has issued, cut out the best cells carefully and proceed to make up the nuclei as outlined above, giving one cell to each. This work must be done very carefully—no jarring the combs that the cells are on, nor injuring them in any way.

If one is acquainted with Doolittle's method of transferring larvæ into prepared cups, and giving them to a populous colony above a queen-excluder, there is no better way to secure ripe cells at this time of the year. True, this method requires some study and experience, but it is time well spent by any bee-keeper, for not only are the queens obtained by it first-class in every respect, but it has the further advantage of hatching them out at exactly the time they are required.—F. P. ADAMS, in Canadian Bee-Journal.

Brantford, Ont., June 1.

for some distance in adjoining fields. Hedges that were formerly white with bloom in June are now practically bloomless because the road authorities keep the hedges cut low so that motorists can see each other coming.

## CONTROLLING QUEEN-FERTILIZATION.

The matter of control of the fertilization of queens has generally been given up as impracticable, if indeed desirable. A tent has not been immensely successful, and if it is ever made a success it will probably be a very large tent, hence expensive. Editor Root has been raking among the archives of a quarter of a century ago, and from Gleanings for April 15, 1882, produces the following item:

"Last season Dan White took all the wingless queens he found, tied a delicate silk thread around their bodies, hitched it to tall pole, when the drones were out thick, and let them buzz around with the stumps of their wings. Three out of ten were fertilized, and he has them laying now."

Dan White is considered a reliable man, and if he could succeed with 30 percent of the wingless queens, might not success be still greater with those having whole wings? As an improvement, Editor Root proposes to substitute for the pole a toy balloon. This, with enough string, would go higher than any pole, and the balloon being anchored below could be hauled down at intervals for observation. It might be added that if, for any reason, wingless queens were better, it would not be a difficult feat to make any queen wingless.

## DEEP TANK FOR CLEARING HONEY.

It is not an easy thing rapidly to get rid of the minute air-bubbles in extracted honey that give it a cloudy appearance. Walter S. Ponder takes advantage of increased weight by increased depth, using a tank 30 inches deep and 12 inches in diameter. The weight of the 30 inches of honey above causes a more rapid rising of the air-bubbles at the lower part, and at this lower part the clear honey is drawn off. He says that this clearing retards granulation, preventing "that soapy appearance that occurs when jars are heated after being filled."—Gleanings, page 966.

## CARBOLIC ACID FOR SWARMS.

A bottle of dilute carbolie acid, a piece of sponge, and a long pole, are recommended in Prakt. Wegweiser to be always on hand in the apiary at the swarming-time. If a swarm settles in a high or undesirable place, quickly pour some acid on the sponge, thrust it up where the swarm is, and like a cloud the bees scatter. If the swarm settles in a place still undesirable, the act is to be repeated, and the tendency each time is for the swarm to settle lower; but the editor warns that too many repetitions may cause the swarm to leave.

## MOTH-INFESTED SKEP.

In the British Bee Journal a correspondent with a colony of bees in a skep badly infested with bee-moth asks whether he shall set the skep over

## Beedom Boiled Down

### TESTING FOR HONEY-GATHERING.

D. M. M. says (British Bee Journal, 192):

"In selecting a queen-mother I would place her honey-gathering qualities high above any other trait, but the query arises in my mind—Have even the so-called "tested" queens ever been tested as to their abilities in this line? Certainly not in nine cases out of ten."

That's a very cautious statement. Is there any such testing in 1 case out of 10? In 1 out of 100?

### JARRING EMBRYO QUEENS.

It is a common thing to caution beginners against handling roughly a queen-cell or letting it drop, as the jar may result in a crippled queen. John W. Moir (British Bee Journal, page 217) suggests carrying this a step further, making practical use of it to prevent swarming. He asks, "Might it not be possible to go around an apiary once a week, and, lifting every brood-chamber so many inches, let it drop suddenly, and thus kill the embryo queens in every cell where they might be?"

But because the fall of a queen-cell may cripple the embryo queen, it does not follow that one would be killed without a jar sufficient to crash the entire fabric.

### ANNUAL RENEWAL OF COMBS.

In this country old combs are in good repute, a comb being considered all

right so long as there is no objection to it besides age. But in England and in Europe it is the practise, at least with some, to renew combs every 5 years, or oftener. One writer in the British Bee Journal even goes so far as to renew combs annually, counting this a help to avoid foul brood. G. W. Avery, British Bee Journal, page 235, raises a protest against such extravagance. While not advocating keeping combs in use so long as 25 years, he cites an instance of combs being kept in use that length of time without any detriment. It is doubtful if any real objection can be raised against mere age in combs, unless it be that after 50 years or so they might need a trifle wider spacing on account of the thickened septum.

### DEAD-BEAT HONEY-BUYERS.

General Manager France is collecting a list of these, which he will send to any member of the National who applies for it. To many this will be worth alone several times the annual fee of \$1.00. Of course, any one who has discovered any of these dead-beats should report the same to Mr. France, Platteville, Wis.

### AUTOMOBILES CONDEMNED.

W. Woodley (British Bee Journal, page 223) complains that the great amount of dust raised by passing motors settles in the nectaries of flowers

# American Bee Journal

a frame-hive to save the brood. The reply is, "On no account would we put the skep above a stocked frame-hive. To do so would carry the wax-moth pest into the latter." On this side a strong colony would count it "a picnic" to clean out that skep. But it must be remembered that in England blacks are in favor, which is quite another affair. One of the strong points of Italians is the readiness with which they clean out the wax-moth.

## PUTTING EMPTY SUPERS OVER FULL ONES.

"Never put an empty super over one which is filled. Bees do not like to pass over the honey." That's the advice given in *L'Apiculture Nouvelle*, page 164. While it may not be to the taste of the bees to pass over full combs to work on empty ones, yet not a few good bee-keepers in this country oblige them to do so. In the case of extracted honey, E. D. Townsend says that if the empty super be placed over the full one, the brood-nest will not be extended up into it as when placed under. In the case of comb honey, even those who place the empty sections under during the early part of the flow, place them above toward the close of the season, when 1, 2, or more full supers must be traversed to reach the empty ones.

## BIG PRICE FOR HONEY IN SOUTH AFRICA.

In *The American Bee-keeper* it is reported that D. Cairncross, Pretoria, So. Africa, gets an average of 70 sections per colony, which are never sold at less than 2 shillings 6 pence each. Think of 62 cents a section for honey!

## THE PREVENTION OF SAGGING.

In *The American Bee-keeper*, page 145, is given a plan to prevent foundation sagging in brood-combs that is said to be very successful. The process is protected by patent, and is as follows:

"After the sheets of foundation have been secured in the frames, by any of the methods usually employed, it is placed upon a board similar to that used in imbedding wires. A small paint-brush is dipped into melted beeswax and 3 or 4 dextrous strokes applied lightly to the side-walls on each side of the foundation along the top and downward towards the center, where the sagging is usually apparent."

## HARDINESS OF GOLDEN BEES.

An editorial in *Gleanings* saying that golden bees were bad in the matter of spring dwindling, has called forth a note in *Gleanings* from Doolittle & Clark, page 889, in which particulars are given showing that their goldens come through good and strong. There is a wide difference in the hardiness of goldens; all of them are not of the same origin, and some strains seem of feeble constitution.

## BEE-MOTH A GOOD THING—IN SOME RESPECTS.

"I do not look upon the wax-moth as entirely an enemy to bee-keeping, as there is no doubt that they render harmless many a bee-tree, hive, or other repository in which the bees have built

combs and in which the disease foul-brood lingers."—R. F. HOLTERMANN, *Gleanings*, page 906.

## FOOT-ROOM WHEN UNCAPPING OR EXTRACTING.

When one has an extractor or uncapping fixture so arranged that the whole affair comes down to the floor for the toes to strike against, the slight stooping over thus produced is tiresome. C. W. Dayton (*Gleanings*, page 909) avoids this fatigue by having the apparatus raised enough for the feet to go under.

## WASHINGTON STATE COMMISSION LAW.

The State of Washington is making an experiment which will be watched with considerable interest in all parts of the country. A law was recently passed by the legislature of that State, compelling all commission houses to file a bond. Houses not rated at more than \$20,000 have to put up \$3,000 for the faithful performance of their duty toward those who ship goods to them. Another provision is that an account-sales must be sent to the shipper within 48 hours after the receipt of the goods.—*Gleanings*, page 890.

That seems to make a safe thing of sending on commission, but will not be obliged to sell within 48 hours result sometimes in very low prices? Is it not possible that there is a mistake in the matter, and that the law requires an account sales within 48 hours of the sale of the goods?

## ALEXANDER PLAN FOR WEAK COLONIES.

J. L. Byer says in *The Canadian Bee Journal*, page 163:

This spring I have received several

reports from bee-keepers who have tried the Alexander system of tiering up weak colonies over strong ones. While these reports have been somewhat contradictory, it is noticeable that where success is reported, the bees were pure Italians, and where failure attended the plan, in most cases the bees were blacks and hybrids.

## A COW WITH A SWEET TOOTH.

R. F. Whiteside says in *The Canadian Bee Journal*, page 178:

"My old cow tipped over 10 or 12 supers full of extracting combs (left for the bees to lick out) and ate clean up over 100 good combs for the sake of the honey in them, last November, when I was at the Toronto Bee Convention."

## GIVE THE BEES THEIR SHARE.

There are some who think it poor economy to cheat the bees out of their well-earned stores. E. G. Hand says, in *Canadian Bee Journal*, page 180:

"The writer prefers not to be greedy any more, but to let the outside lower combs be filled solid with the best honey there is, which is none too good for the bees in their long winter confinement."

## POOR CONSOLATION.

Aunt Lucindy was in deep distress over the loss of her son Jim, and a neighbor sought to console her, saying:

"Don't grieve for him, Aunt Lucindy. He has gone to a land flowing with milk and honey."

With a dismal countenance, the old darky replied:

"Jim never did like milk, an' honey always made him sick."

Send Questions either to the office of the American Bee Journal, or to  
DR. C. C. MILLER, Marengo, Ill.  
Dr. Miller does *not* answer Questions by mail.

## Dividing Colonies—Introducing Queens—Putting on Sections

1. Will bees do all right if they are divided with brood-comb and no queen?
2. How late can I divide them and have them do well?
3. What is the best time to introduce a queen? Do I have to kill the old queen before I put in the new queen?
4. What time is best to put on sections?

NEBRASKA.

ANSWERS.—1. They may do all right, and they may do all wrong. If they are strong enough, especially in young bees, and have eggs or very young brood, they may rear a queen of their own and be all right. But a full colony

is none too strong to have a queen-cell up to the time it is sealed. If you give your nucleus, or divided part, a cell nearly ready to hatch, then it is likely to come out all right.

2. That depends on the season. Some years, and in some places, a colony might be divided in the last of August and do well, but if there is little pasturage after that time it would be a failure.

If you are going to make such division, merely separating the colony into 2 parts and leaving to the bees the rest, let me suggest that you do it as soon as possible, and proceed in this way: Take half the brood and bees *and queen*, and put in a hive in a new place, leav-

ing part on the old stand. The flying force will be on the old stand, and being strong that part ought to rear a good queen. There is a possibility that a swarm might issue in something like 2 weeks after the division.

3. Any time when bees are doing well and gathering. Generally the old queen is removed before the new queen is introduced. Sometimes the new queen is caged in the hive perhaps 48 hours before the old queen is removed, then the old queen is removed, and at the same time the candy is left exposed in the cage, so that the bees can liberate the new queen. This latter plan is safer.

4. As soon as, or a little before, there is anything for the bees to store in them. In white clover regions that will be about as soon as clover is in bloom.

Let me advise you very strongly to get a book of instruction on bee-keeping. It may be worth several times its cost to you, for a good book of that kind might double your success.

### Late Reared Queens—Wintering Virgin Queens

1. How late in the season can queens be reared and mated?

2. Can virgin queens be wintered over in nuclei, and mated in the spring?

OREGON.

ANSWERS.—1. That depends on the season. If honey is yielding, any time through September. But you are not likely to have good queens if you rear them too late, and losses on wedding flights will be greater.

2. I doubt it.

### Nucleus and Swarming Questions

1. Two years ago I sent away and got 2 3-frame nuclei of bees. I will designate them as No. 1. and No. 2. No. 1 I put into an 8-frame hive on full frames of old comb; No. 2 in a 10-frame hive with old comb. No. 1 in the 8-frame hive built up and gave me one swarm. I hived them on the old stand. They built up and swarmed again, and gave me 30 pounds of section honey. No. 2 did not swarm, and gave me no honey last year (1906). No. 1 gave me a number of swarms and 100 pounds of section honey. No. 2 did no swarming and made no section honey; and this season No. 1 is doing fine, while No. 2 has done no swarming, nor has it done anything in the sections. No. 1 has sent out 2 swarms and is working well in the sections.

What is the trouble with No. 2? What can I do to make them more profitable? They seem to be fairly strong and have a queen and brood, but never have swarmed nor given me any honey.

2. If when the first, or prime, swarm comes out and is hived on the old stand with the old colony beside it, and in 6 or 8 days the old colony is moved and it should send out an after-swarm in a few days after being moved, would it do to put them in with the prime swarm on the old stand, or would it be better to put them back with the old or parent colony?

3. Which would be best for the production of section honey?

4. If put back with the old swarm, would it be better to put them back at once, or have them on empty frames, and in 24 hours restore them?

5. Would it be all right to return a prime swarm if one did not care for increase? If so, how should one proceed to do it?

MAINE.

ANSWERS.—1. It looks very much as if the trouble lay in the character of the bees themselves. If that is the real difficulty, the remedy lies in changing the stock, which you may do by replacing the queen with one reared from your colony of better stock.

2. Generally there should be no trouble in either case, but they would be more certain to be received kindly if returned to the mother colony; in fact, there would be no question about such reception. But the usual thing would be not to have any second swarm when the treatment you mention is used.

3. Returning to the swarm, probably as the mother colony is generally so reduced that it does little in sections.

4. Generally it would make no difference. But if there was any danger of further swarming it would be better to wait 24 hours before returning, for in that time the surplus queens would likely be put out of the way.

5. Yes, but you would be likely to have a good bit of returning to do, But if you are willing to return the swarm every time it issues, the result will be very satisfactory, in all probability. But you can cut out most of the swarming in this way: When the prime swarm issues, return it, killing the old queen. You can kill her before you return the swarm or after. Then somewhere in the neighborhood of 8 days a swarm will probably issue with the first of the young queens. Hive it in a separate hive, and a day or 2 later return to the old hive.

### Storing Honey Near the Apiary

Can I store honey in or near my apiary without the bees "fussing" around the box or house in which it is stored? The box, of course, is bee-tight.

ILLINOIS.

ANSWER.—If you store honey so that the smell can escape, you may count on the bees "fussing" about it at times when forage is scarce. Especially is this the case when first put there. After they have tried to get into it, and failed, they are finally likely to give it up.

### Bees Don't Work in Supers

I have lately started to keep bees. I have both Italians and blacks. The hives are full, but the bees won't work in the supers. Why?

NEW JERSEY.

ANSWER.—Without knowing anything more about the case it is not easy to be sure just why the bees do not work in the supers. The safest guess is that they don't need to, there being too little honey gathered to make it necessary to store it outside the brood-chamber. If

there is really anything for them to store in supers, you can hasten a beginning by putting some sort of a bait in the supers. If you have any sections that have been partly filled and then emptied, they will make good bait. In lack of anything else you may put into a section a piece of comb cut out of a brood-comb. If you use extracting-supers, no bait is needed other than drawn-out combs, although if you put a comb from the brood-chamber in the extracting-supper (provided the frames in both apartments are of the same size), the bees will start storing there at once if they have anything to store.

### Italian Bees and Yellow Bands

1. Do Italian bees all show yellow bands? If some show less, what are they?

2. I have one colony that has two kinds of drones. About half show yellow bands, while the others do not. The workers do not all show 3 yellow bands. What race are they?

TEXAS.

ANSWERS.—1. The workers of Italians should show 3 yellow bands, but the first band—the one nearest the head—is narrower and more indistinct than the other two. If some of them show less than 3, they are hybrids.

2. The drones are not uniform, and only the workers are relied on to decide purity. Your colony of bees that do not all show 3 yellow bands are hybrids, unless some bees have entered from other hives—a thing that often occurs. To be entirely sure, examine the young bees that have not left the hive; if all of those have 3 yellow bands you may count them Italians.

### Balled Queen—Jumbo and Dadant-Blatt Hives

1. When passing through the backyard a few days ago, I saw a ball of bees at the entrance of one of the hives, and placing my firmer-chisel back of the ball I threw it out on the ground in front of the hive. Then I smoked the bees till the ball opened so that I could see a queen-bee inside. I caged the queen, and then made an examination of the colony. I found only one queen-cell, and that was sealed. When superseding a queen do bees often kill her at this stage of the operations?

2. What is the difference between the Dadant hive and the Jumbo hive? I have some hives with bodies 20 inches long and 12 inches deep, made to take 10 frames. Such hives, I believe, were called in Europe the "Dadant-Blatt" hives. After making and using some of these hives for quite a while I began to read in the bee-papers about the Jumbo hive. Does it differ from the Dadant-Blatt hive?

IOWA.

ANSWERS.—1. Unless I am very much mistaken, the case you mention is a very unusual one. So many cases have been reported in which the mother and the superseding daughter were in the same hive together that it is not considered the rarity it was some years ago. If no further queen-cells were started, the existence of the colony

would be jeopardized by the killing of the queen. You do not say whether the queen had been laying continuously, leaving eggs and brood in all stages present. If no unsealed brood was present, it may be that the queen was no longer capable of laying, hence voted of no value by the bees, in which case it would not seem so very strange that they should get rid of her. But if the eggs were still present, I should feel inclined to inquire whether the queen you found balled had not come from some other hive, the queen belonging to the colony still remaining at work. Of course, you could decide this by seeing whether laying continued after the removal of the queen.

2. The Jumbo hive is a modification of the Langstroth hive made for the benefit of those who might wish to try a deeper frame without the expense of making an entirely permanent change. The only difference is that hive and frame are in the neighborhood of 2 inches deeper ( $2\frac{1}{8}$  inches deeper, if memory serves), so that they could be cut down to the regular depth if the owner desired to change back. Moreover, cover and bottom-board would be the same for the Jumbo as for the shallower hive. The Dadant, or Quinby, frame is  $18\frac{1}{2} \times 11\frac{1}{4}$ , the same depth as the Jumbo, but  $\frac{7}{8}$  longer. I'm not sure whether the Dadant-Blatt is the same thing.

### Queen and Nuclei Questions

1. Some time ago I started to make a few nuclei, taking one frame (with adhering bees with nearly all of the brood sealed in each frame) from each colony, the youngest larvæ or brood not over 6 days in these frames, and there was very little of this unsealed brood in each frame used to form these nuclei, and the most of the nuclei formed were made 2-frame strong, but I made 2 nuclei with 4 frames in each hive, and all of the nuclei were given a mated queen that had laid in nuclei before, and the queens were given to the nuclei in introducing-cages, one day to 3 days after the nuclei were formed. The 4-frame nuclei that I formed I gave a queen in cage 3 days after they were formed, and these 4-frame nuclei killed the queens some time after they had commenced to lay eggs in the frames. Now the two 4-frame nuclei had queen-cells started with at least 6-days-old larvæ in the cells when I was about to put in the cages to them, but they were destroyed, and the next time I looked at these 4-frame nuclei I found that the queens had started to lay, but had been killed, and that the bees had started to make queen-cells from the eggs in the frames where the dead queens had laid. I took away the frames that the queens had laid eggs in, and then gave them virgin queens, and when they had released them they killed them, too. I then gave them a frame each of newly-laid eggs; they started queen-cells at once, and they hatched out a queen each in these 2 nuclei, and these queens are now laying queens. Why did these bees not want the queens, and virgin queens I gave them in introducing-cages?

2. Is it any safer to introduce queens to one or 2-frame nuclei in place of a 4-frame or a colony of bees?

3. Or, is there any harm if there are any young larvæ in the frames given to make the nuclei?

4. About what is the right time to give to a nucleus a queen, or to a colony, after it has been made? That is, how long should the bees be queenless?

5. I have the best luck in introducing queens to bees that have been queenless for 5 days and over, but not over 10 days.

6. When worker-bees have commenced to lay in queenless colonies, what is the best way to do with them to get any use of these bees? Is there any danger in giving them to one or two colonies that are strong, without being in danger of killing the queen that I gave these bees to? Or will queenless bees given to stronger colonies kill the queens where they are shaken off?

NEBRASKA.

ANSWERS.—1. It is an unusual thing for bees to accept a queen long enough to allow her to lay, and then to kill her. Sometimes, however, they do it, and I don't know why. As a random guess, perhaps because they are not entirely satisfied with the queen, but allow her to lay long enough to give them the material from which to rear a successor.

2. Perhaps there is no difference, but if there is any difference it is safer to introduce to the weaker.

3. No.

4. It is probably just as well to put the queen in when the nucleus is first formed, but of course caged, so that she will not be liberated for a day or two.

5. Perhaps you would succeed just as well to try the Abbott plan. Put the new queen in the hive without disturbing the old one, the new queen being in a provisioned cage, and the candy covered so the bees can not get at it. After 2 days remove the old queen, and at the same time the covering from the candy so that in a day or two the queen will be liberated by the bees.

6. Break up a colony with laying workers, distributing bees and combs to other colonies. No danger to the queen unless you give so many bees from the faulty colony that they outnumber the colony to which they are given.

### Air-Slacked Lime for Robber-Bees

I wish to give some experience with robber-bees among my bees, and the way I have stopped them. When I found robbing going on I closed the hive-entrance till only a single bee could pass through, and then took air-slacked lime and applied it freely at all places where robber-bees were trying to force an entrance. I applied it directly

on the bees, and awaited results. I could also find the ones that were robbing.

Cantril, Iowa. \_\_\_\_\_ LESLIE SMITH.

### Light Honey-Flow

We have a light honey-flow from white and sweet clover. It began about July 20. The bees were on short rations till that time. It looks now as if we would take a little surplus, with a fair prospect of the bees going into winter quarters in good condition. It has been the worst season for queen-rearing I ever saw.

Oswego, Ill., July 25. \_\_\_\_\_ ROBERT B. McCAIN.

### Bees Outdoing Themselves

We are in the midst of the basswood honey-flow, and bees are just outdoing themselves. We had a nice flow of white clover honey, so, with the prospects of plenty of buckwheat for the bees to work on later, we feel pretty well pleased.

Troy, Pa., July 25. \_\_\_\_\_ C. N. GREENE.

### Light Honey-Flow in Mexico

There seems to be a light honey-flow here this summer, owing to the dry weather. I have increased from 7, spring count, to 15, and all are fairly strong. One swarm issued April 8. I hived it and later moved it to a new stand. I closed the entrance 24 hours. All the combs melted down and the bees smothered.

Aldama, Mexico, July 19. \_\_\_\_\_ WILLIAM WINKLER.

### Bees Wintered Badly

I am 73 years, 6 months, and 10 days old. I have been in the bee-business over 30 years, and have taken the American Bee Journal all but one or 2 years during the entire time.

December 3, 1906, I put 52 colonies in a new stone and cement cellar under the house. On May 15 I removed them to the apiary. I had 50 colonies in the worst condition of any year since being in the business. I think the new cellar and buckwheat honey were responsible. I now have 63 colonies in good condition. The white honey-flow is nearly over. I have hundreds of sections partly filled. The weather is rainy and cool here now.

Success to the American Bee Journal.  
D. R. VAN AMBURGH.  
Benzonia, Mich., July 22. \_\_\_\_\_

### The Pecos Valley Country.

It is some time since I wrote anything for the American Bee Journal. I have removed to Eddy County, New Mexico, which is in the center of the wonderful artesian belt of the famous Pecos Valley. I think this is destined to be one of the finest locations in the world for bees. Near Roswell, which is located at the upper end of the Valley, there are several bee-keepers who get large crops of honey. I am located 49 miles south of Roswell, on the Santa Fe Railroad, and this town only about 2 years old. Land here is comparatively cheap.

Roswell is about 15 years old, and land sown to alfalfa brings \$60 to \$100 annually from 5 cuttings, and land is worth \$200 to \$300 per acre. Mr. Hagerman has 700 acres in orchard, which he has refused \$1,000 per acre for. Parker Earl, who was for 16 years President of the American Horticultural Society, received \$15,000 from one crop of pears from a 10-acre pear-orchard. This seems like a fairy tale, but it is true. This locality has just as good land, and it is real cheap as yet.

The artesian wells are a wonder to behold—wells that all you have to do is to open the valve and the water flows at the rate of from 1500 to 4000 gallons per minute—enough to irrigate from 160 to 320 acres of land.

Men are planting hundreds of acres to alfalfa here, and one man near Dayton has 440 acres in orchard. Many have smaller orchards. Nearly all unbroken land is covered with bunches of mesquite, which grows only about one to 3 feet high, but has been in blossom ever since I came here—nearly 4 months. They bear loads of beans in pods, and I think produce lots of honey. There are almost no bees in this locality, as every one who comes here sees a chance to

# American Bee Journal

make big returns from crops, and consequently has no time to work with bees.

The land produces wonderful returns here: Alfalfa \$50 to \$100 per acre; Kafir corn \$30 to \$50 per acre. But any one coming here should first come and investigate, and be shy of irresponsible land agents who work on 40 and 50 percent commission. For that reason I have asked the Dayton Development Co., to put an advertisement in this issue. This Company is composed of Dayton merchants, bankers, and farmers (26 in number), to help prospectors to choose land, and buy what they want at the lowest price, with only a small commission added.

The climate is very healthful, and people plow here all winter. Oats are sown in the fall, or any time in winter.

Now, for fear of being accused of booming the country, I will stop. I can't tell anything about my bees, as I brought only one colony, and they received such rough treatment on the car that they died, but I expect to get some bees in the spring.

All land must be irrigated to produce crops, as we have only about 14 inches of rainfall per year. We are only about 60 miles from the mountains, and there they have about 50 inches of rainfall, which furnishes the artesian water. A large reservoir is to be built about 12 miles above Dayton to irrigate 10,000 acres of land. Land out there is still being homesteaded, but most of it is taken up. Most people here are from the North, and Dayton has a fine school and churches, and very little drunkenness. At some future time I will tell more about bees, as I have my extractor, 40 hives, supers, several thousand sections, foundation, and I lack only the bees.

Eddy Co., N. Mex. J. E. JOHNSON.

## Two Queens Laying in Same Hive.

I have one very strong colony of bees, and about June 20 I thought I would look through them and see if there were any sign of their swarming, and I found a queen-cell, but already hatched, so that I thought they had superseded their queen; and on July 7 my friend, J. F. Ryan, came over and we examined the hive and found both queens laying in it. This can be vouched for by Mr. Ryan. So I divided the colony into 2.

There does not seem to be much honey coming in yet; but sweet clover is just beginning to bloom.

Chicago, Ill., July 15. JOHN DUTNALL.

## Bees Working Well.

I put 2 weak colonies of bees on top of 2 strong ones this season, and had success with both. One colony had wire-cloth placed over the bee-zinc for 24 hours, and then removed. The other colony had one thickness of newspaper put under the zinc and was left there to be eaten away by the bees. Both colonies are now on their own stands, and seem to be doing well. We had copious rains about a week ago. Since then we have had cool nights and warm, clear days. The bees are working well, and I think they have stored a little honey.

Leon, Iowa, June 29. EDWIN BEVINS.

## Fine Honey-Country.

In case any of the readers of the American Bee Journal are looking for a good location for bees, the Bighorn basin in Wyoming can not be beaten. Texas and California are not in it. Bees winter nicely here out-doors in any kind of a hive. They store honey here from wild flowers and alfalfa. We brought the first bees in this vicinity 4 years ago this spring. There was no alfalfa here then, but they filled their hives chuck-full of an amber-colored, very clear honey, with a very superior flavor. I kept bees in California for 15 years, but California is a poor honey country beside this. There is no bee-moth here, and if there is anything here in the insect line to bother bees I have not found it so far. For quality and quantity the honey crop beats anything I have seen yet. I have no ax to grind. I am simply telling this for the benefit of others. I well know what a poor living a lot of bees make for a bee-keeper that is not in a good honey country, and I well know what a nuisance bee-moths, ants, and other insects are to a bee-keeper. There is no need here of setting a bee-hive on 4 stakes driven into the ground, in an irrigating ditch, to keep the ants out of it, as I have seen in California. I have no time here to attend to bees. I put on large supers in the spring of the year.

The super is 24 inches long, 15 inches wide, and 12 inches deep. In the fall and winter, and sometimes in the spring, I lift them off, and that is all I do to them. I have kept bees in Oregon, Washington, California, Missouri and Ohio, but here is the place for bee-keepers to "pitch their tents."

J. D. KAUFMAN.

Bighorn Co., Wyo., July 15.

## Bees Hauling Out Drones.

My bees have not swarmed much this season, nor have they stored any honey to speak of. They spend most of their time hauling out drones. There will be no white clover honey to speak of, and but little basswood. I have put in an acre of buckwheat for fall feed.

E. E. KENNICOTT.

Glenview, Ill., July 7.

## Hope for a Fair Crop.

Notwithstanding the cold, backward spring, for the last 4 weeks the bees have done a fine business. We hope for a fair crop of honey yet.

Central Lake, Mich., July 11. H. A. DOTY.

## Bees Storing in Supers.

Bees are doing fine work now. The weather is favorable and they are storing some in the supers, and just commencing to swarm.

(Rev.) J. W. STINE.

Durham, Iowa, July 12.

## Poor Spring for Bees.

The last was a very poor spring for bees in this locality. I lost 28 colonies through winter and spring dysentery, while in the cellar. That seems to be the general complaint in this vicinity. What are left are doing very well now.

Kimball, Minn., July 10. URSON WHITE.

## He has Bee-Fever.

I started in the spring with 8 colonies. I divided 3 and increased to 11; I took 5 out of trees, one out of a porch, and one out of a chimney; bought one, and transferred 2 for the bees. I now have 21 colonies. I have the bee-fever, my wife says.

Albany, Ore., July 3. RUFUS THOMPSON.

## Not a big Crop Expected.

We have had a very bad spring for bees. I lost none in wintering, but lost several colonies in April on account of the bad, cold weather. I have 45 colonies now, well-filled below, and they are commencing to work in the supers. Basswood will be late this year. It will be in bloom in about a week. We may get some honey yet, but I do not look for a big crop. I will report later.

WM. CLEARY.

Algona, Iowa, July 8.

## Nucleus Method of Increase.

Some years ago I read from the pen of G. M. Doolittle the same method of increase given by him on page 537, and started out to try it. I do not run for comb honey, so did not have any shipping-cases, but as I always save all boxes that come in my way, especially those made of thin lumber, I went to this pile and found one about 8 or 9 inches square at the end, and about 15 inches long, that I thought would do, and started in to make more out of other boxes. When I got the third one completed I had no more screen-cloth at hand. Then for a funnel (I was not near a tin-shop, nor had I any tin on hand), I again went to the pile of boxes and found 2 boards, ¼-inch thick and 9 or 10 inches by 24. These with a couple more ⅝-inch thick and 6 inches wide at the upper end, I tapered down until when nailed together they made quite a good funnel. For a tube I took a 3-pound fruit-can body, cut it open, and riveted it in the proper shape to fit the hole in the nucleus-box at one end, and covered the opening in the funnel at the other, and nailed it on to the funnel.

Armed with these I went to the colonies where the bees were to spare, one after another, until I had a good, strong swarm in the box. I soon had all 3 full. Then came waiting, for I did not have material at hand for

more boxes. It occurred to me that the bees could just as well remain confined until they realized their hopeless queenlessness, in a hive where I wanted them to remain, if I shaded them well, as in any place else.

So I now go around in the morning and ascertain how many queens I have out, and immediately set about preparing a hive for each queen, as follows:

I place in the hive from 2 to 4 or 5 frames of honey, as there may be much or little to come in yet; and fill out with frames of full sheets of comb; set the hive where I want it to remain; close up the entrance bee-tight; on top of this I place an empty hive, over which I put a frame of screen-cloth so that no bee can get in or out; on top of this I lay the cover for the present. Then by 9 or 10 o'clock, when most of the field-bees are out, I go around with the nucleus-box and funnel to hives that can spare the bees and take out until I have a good, strong colony, being careful not to get a queen; carry it to the prepared hive; uncover it, being careful to lay the screen cover so that I can pick it up quickly; loosen the fastenings of the door of the nucleus-box and hold it shut with my hand while I give it a little jar on the ground to settle the bees to the side opposite the door; and, before they have had time to recover themselves, I dump them into the hive and cover up quickly with the screen cover; shade well with boards or green brush. So I proceed until all my hives are loaded, using only one nucleus-box.

I leave them in this shape from 4 to 6 hours, when they are ready to accept any queen. Just before it is too dark to see, I go around and drop in a queen, and leave them confined until the evening of the third day. Then I open the entrance. I keep watch of them pretty closely until I find the queen laying. Sometimes the queen fails to get back from her mating-trip. In such cases I take steps to get them a queen as quickly as possible.

I now make what increase I want in the above manner in preference to any other. My main surplus flow begins with sage from April 20 to May 1, and for about 6 weeks I get white honey—I think the finest ever. Up to the beginning of this flow I do all I can to increase my bees without increasing colonies, and if all has gone well I have booming colonies.

About the middle of June darker and off-flavored honey begins to make its appearance. I watch the flora closely, and when I see this about ready to begin, I extract all white honey. Then on the darker and not so finely flavored honey, I make increase as above, governing the increase by the amount of honey in sight. These colonies are all beaded by young queens for the next season, which tends materially to curtail swarming, and in many other ways gives the apiarist control of the bees.

A. J. BURNS.

San Diego Co., Calif., June 28.

## Booming on Clover.

Bees are just booming on clover, with very little swarming. Some of my colonies have stored nearly 50 pounds of nice white clover comb honey.

E. M. LAWRENCE.

Mayfield, N. Y., July 4.

## The Season So Far—Bee-Keeping Children.

Our apiary of about 90 colonies came out of winter quarters, here at Bridgeport, in good condition. We had good weather in March and then followed the long, cold wet period that lasted nearly all through April and May. Many apiaries in Wisconsin report very severe losses during this period, but our loss here was practically nothing. We attribute this largely to our sheltered position rather than to management. Our hives were regular single-walled hives, not protected by outside wrapping. We fed outside when the weather became warm enough for bees to fly, but, in spite of all, most of the hives were very destitute of stores at the coming of white clover.

Since then there has been abundance of bloom, consisting of white clover and raspberries mostly, but too much rain has retarded work to a considerable extent. We gave super-room very promptly, giving strong colonies two 8-frame Langstroth stories for a brood-chamber, and have had, to date (July 20th), only 6 swarms to hive at this yard.

Now I will tell of something better than bees: My daughter "Amy," 17 years old, has

entire charge of our yard of 60 colonies at Monroe, and is doing fine. The losses in that yard were light also, but a good many were weakened badly by the adverse conditions. However, they must have built up nicely as Amy reports that she has about all the surplus combs on, and will begin to extract this week.

Amy and her mother are at present occupying our Monroe home, but the mother can not go near the apiary. A bee-sting poisons her so that it is a serious matter.

We want improved stock in our yards, but it is also a very important and blessed thing to train a son or daughter to be a practical bee-keeper, while yet in their teens. I have now a son and daughter, each of whom are competent to handle an apiary. My son has been away to school and has had many chances to let other things crowd out this work, but it was very pleasant to me to hear him say during the past year that he "loved the bees." Taking into consideration the stings and trying incidents that will occur at times, it is a delicate task to train a boy or girl in such a way that they will be ready, on reaching early manhood or womanhood, to volunteer the above confession. But I know this: Every father who really loves bee-culture longs to note a like feeling in the heart of his child; and when he does recognize it he values it above all the mere profit that the bees may furnish in dollars and cents.

I wish that our bee-keepers may have success with their bees, but more than all, I wish them success with their children.

HARRY LATHROP.

Crawford Co., Wis., July 20.

## Average Yield from Buckwheat per Acre.

In this locality, bees, like everything else, are late. I had my first swarm June 20. For the past 2 weeks they have just about got their living, and now that white and alsike clovers are beginning to bloom, I am hoping for something more. Eight colonies out of 52, in my apiary, succumbed to the cold, backward spring.

That story of M. V. Facey's (page 534) is almost too big to swallow. Seven-hundred-fifty to 800 pounds of honey from an acre of buckwheat nearly equals the amount—in pounds—of seed produced; 900 pounds of seed per acre denotes rather better than an average yield in this locality, which is not so very far from Preston.

I can swallow about as many "Buckwheat Cakes and Honey" as the next one, but when it comes to "holting" 800 pounds of honey from an acre of buckwheat, I'll stand aside and let Mr. Facey have the floor. His whole article (which I have read in the "Farmer"), gives an optimistic view of bee-keeping for farmers that the facts hardly substantiate. For the past 10 years, until last season, my bees had not gathered 50 pounds of buckwheat honey, all told, and there has been plenty of buckwheat within reach, too. Perhaps it's the "climate" (?) A. F. FOOTE.

Mitchell Co., Iowa, July 3.

## Ten-Frame and Heddon Hives.

I am 73 years of age, and have kept bees over 40 years with varying success, as a sideline to farming and fruit-growing. I keep my apiary down to about 20 colonies—sometimes more and sometimes less—by smothering them, and extracting honey. Many swarms went to the woods last year, as I was obliged to "keep back" part of the time, and I could not be at the house watching for new swarms, and out in the field at work, at the same time; consequently I had only 11 colonies, mostly Italians, in the fall. I lost 4 of them in the winter and one queen which wintered proved to be a drone-layer, so I killed her and gave the few bees left in the hive a queen-cell a week ago, leaving 6 good colonies.

The actions of my bees this season have been on a par with the weather—perfectly idiotic. The first 3 colonies to swarm issued 2 times each, returned both times, and swarmed at the end of 10 days, accompanied by young queens. I cut out all the queen-cells but one in each hive. The 4th swarm was led by a well-behaved queen, and clustered. I hived them all right. The 5th swarm I hived twice in 2 days on frames filled with foundation, but they absconded to the woods, not stopping to say good-bye, nor anything else. The 6th colony sent out a swarm yesterday, which

returned without clustering, and it issued again today and returned each time. It will likely be 10 days now before they issue again, as they have probably lost their queen.

I use mostly 10-frame hives, which take the Hoffman frame. I also use the Heddon hive, which is all right until you want to cut out queen-cells; then I am sure to miss some of them, as they seldom are all built between the cases of shallow frames. To make a sure thing you must take out each frame and examine it separately, which is a nuisance. I much prefer the 10-frame hive on that account. I am thinking of discarding the Heddon hive as I lose too many afterswarms from it.

I find the American Bee Journal very interesting and instructive, and like it very much. Highland, Mich., June 23. WM. MARTIN.

### Wisconsin State Inspector's Report

We have received the following from Mr. N. E. France, of Platteville, Wis., who has been Inspector of Apiaries for Wisconsin for 10 years, making him the oldest in point of service:

April and May, 1907, have been continuously cold and wet, keeping the bees in the hives, causing diarrhea in many hives, and brood-rearing stopped. Spring losses will be more than in the winter past. Those that have taken my advice and protected each hive with building paper as soon as taken from cellar have much stronger colonies of bees. When I began this work, 10 years ago, many

bees several miles away were taking the disease to their hives.

The crooked combs in hive-bodies, also in sections of comb honey, showed the need of better methods. Many thought that if bees were inspected and disease found among them, I would burn all their bees and hives, also present them a big bill of expenses. I was not called for, nor welcome to many apiaries. Several times I was ordered from the premises, and even threats made if I hesitated. In each case, before leaving, I explained my duty, the law, how themselves to know the several stages of bee-diseases and treatment; saving all hives, bees and wax. But few were prepared to save much wax from old combs. Several years I took with me the best wax-press on the market (German wax-press), and helped the bee-keeper save his wax from diseased combs.

Recently the Hershisher wax-press has come on the market, which saves a greater portion of the wax, and is much cleaner and also safer to render diseased combs, so that this season I take on with me where needed in rendering diseased combs, saving the wax worth 30 cents per pound, so the wax pays all expenses of treating colonies. The greater portion of Wisconsin bees are now healthy, better methods of handling are in use, and all are pleased to have me call.

I have organized several local bee-keepers' associations in Wisconsin for

HOT-WATER WAX-PRESS

A, lever 12 feet long; B, half-barrel; C, standard; D, cleated head or follower; E, block bolted to bee-house; F, spout for wax when several pressings are wanted; G, underside of upper barrel, so liquid wax can easily escape to surface; H, plank under barrel to prevent bottom of barrel being pressed out.

apiaries were diseased. But few bee-keepers gave their bees much attention. Scarcely any one knew anything about bee-diseases, and but three in Wisconsin had cured diseased bees. Where disease had killed or weakened the colonies of bees so that no honey harvest was obtained, it was simply called "bad luck." The bee-keeper saved all the diseased combs for future use when swarms increased next year.

Diseased hives, old combs full of diseased honey were left exposed where

mutual help and coöperation. It has improved Wisconsin bee-keeping in those localities greatly. Allow an illustration: In 1906, the St. Croix Valley Association bought their supplies together, (\$4000), thus saving much to each member; and also 7 carloads of honey, (5 carloads to one buyer), all cash at car door. They now produce more honey and in much better marketable shape. All are well pleased.

METHODS OF TREATING DISEASED BEES. I have tried many methods of treat-

# American Bee Journal

ment of diseased bees. All drug methods only check for a time. Baldrige method often a success, but sometimes fails where full combs are used; but the so-called "McEvoy method," if carefully followed, never fails.

## STATE LAWS.

Wisconsin was first to have a State Inspector of Apiaries. Others seeing the benefit of this law have secured a similar one. Now California, Colorado, Connecticut, Idaho, Michigan, Minnesota, Missouri, Nebraska, New Mexico, New York, Ohio, Texas, Utah, Washington, and Canada, have either County or State bee-inspectors.

## BLACK BROOD OR EUROPEAN FOUL BROOD.

For a few years this disease has been serious in New York, destroying entire apiary after apiary, and had it not been for the careful work of the four New York Inspectors, all New York bees would have become extinct, and also in other States.

In 1906, Dr. Phillips, of the U. S. Department of Agriculture, in charge of Apicultural Investigations, Washington, D. C., after carefully investigating this fatal disease in New York, went to California, where, with J. M. Rankin, of the Bureau of Entomology, located at Chico, Calif., found the same disease in localities there, in some places quite serious. From there Dr. Phillips investigated and found it in Illinois, Michigan and in Indiana in local spots. Serious wherever found.

## CONVENTION CALLED.

While making these investigations, Dr. Phillips, by agreement, met August 3, 1906, in Milwaukee, the Michigan and Wisconsin State Inspectors, and, after a day's convention, decided to go together at once to Michigan where the several stages of this disease could be seen. August 4-5-6, the above committee of three inspected several apiaries diseased with Black Brood or European Foul Brood. One apiary of once 300 colonies had only 12 diseased colonies alive; another of 130 colonies with 100 diseased. It was decided that a National convention of all State and County Inspectors was much needed, and November 12, at San Antonio, Texas, was selected, it being the day following the convention of the National Bee-Keepers' Association. This meeting was a valuable one. About 50 bee-keepers, inspectors from 14 states, Dr. Phillips, and Dr. White, were present.

N. E. FRANCE,  
Inspector of Apiaries.

Platteville, Wis., May 28, 1907.

## Size of Cells in Comb Foundation

William Findlay, of Basco, Ill., has been doing some measuring and comparing, and writes as follows:

"In cutting the comb out of some old box-hives, that had been occupied by common black bees, I was surprised to find such superbly built combs in one of the hives, uniformity of cells and but little drone-comb, some 170 cells being counted. Sheets of "Light brood" foundation were procured from three

manufacturers—A. I. Root Co., Dadant & Sons, and Gus Dittmer. A comparison of the different makes was made. The A. I. Root sheet, contained 50 cells to 10 3/4 inches; Dadant, 49 1/2 to 10 1/4 inches; Dittmer, 50 to 10 5-16 inches. A comparison was made with the worker-comb of the box-hives, and a Root sheet of foundation. A horizontal range of cells, counting from 24 to 48, were compared, the comparison, as to count and distance, often agreeing; some of the sheets of natural-built comb show an excess of one cell, in a count of 30, compared with the foundation; another sheet lacked one cell, in a count of 34 cells, in comparison with the foundation.

It will be noted that there is a slight variation in the size of natural-built worker-brood cells; this is caused by the bees starting to build comb at separate points; where the separate points are united, the cells often average a trifle larger in diameter than the average; on the other hand, the texture of the cell-walls of comb built by black bees is somewhat lighter than that built by Italians.

Sometimes we hear people talk of "the little black bees," and "the small black bees," implying that the black bee is smaller than the Italian. If this be a fact, are we going to cause our Italians to degenerate, by forcing them to build comb, by furnishing them foundation that has too small a cell-base? To arrive at a definite conclusion, some experimenting is required to be done. Select a colony of your best "long-tongued hustlers," remove a comb from the center of the brood-nest, and insert in its place an empty frame; a plain wax-line may be used as a comb-guide.

The Weed-process foundation that is sent out this season is a shade smaller in cell-capacity than that manufactured 5 and 6 years ago, the comparison being, new 46, to 43 cells of the old.

WILLIAM FINDLAY.

The point made by Mr. Findlay seems to be that if Italians are larger than blacks, the comb for Italians should be larger, whereas his counting shows the comb-foundation put upon the market only large enough for blacks. The whole matter is one worthy of careful consideration. It is probably safe to

"Bees build their cells not exact hexagons, but with the transverse diameter greater than the two oblique diameters. Following this, Rietsche makes foundation with cells having a transverse diameter of 5.6 millimeters (.220452 of an inch, or 4.5357 cells to the inch), and oblique diameters of 5.45 millimeters.—*Apiculteur*, p. 113."

That gives 4.5357 cells to the inch, measuring transversely, as against 4.6606 to the inch, measuring obliquely. The measurements of foundation made by Mr. Findlay give an average of about 4.849 cells to the inch. That is about .188 of a cell in an inch more than in the Rietsche foundation measured obliquely, and about .313 more than in the Rietsche measured transversely.

But is the Rietsche cell patterned after nature? Another Stray Straw on the same page says:

"Italians, says R. Pinot, *Apiculteur*, page 113, build cells having a mean diameter of 5.5 millimeters, while the natives reach only 5.2 millimeters."

According to that the Italians build an average of 4.6182 cells to the inch. The Rietsche average is 4.6189, practically the same as that built by the bees.

It is worth while to notice the other point in the last quotation, the difference of .3 millimeters between the cells of blacks and Italians. The mean diameter of the blacks, 5.2 millimeters, is equivalent to 4.8864 cells to the inch.

If there has been no mistake in the data, and no mistake in the figuring, it looks as if the cells of American comb foundation are unnecessarily large for blacks, and a trifle too small for Italians.

After sending the letter above, Mr. Findlay sent the following:

After the above-mentioned circular letter was sent out, Dr. C.C. Miller's "Stray Straws" came to hand, with two notes, as to the transverse diameter of worker-bee cells. The data there stated, for "natives," supposed to be the common black bee, is a mean diameter of 5.2 millimeters to the cell. This is in very close agreement with the data arrived at by myself: Calling the (transverse) diameter, of common black bee worker-cells, 5.2 millimeters, will give us 5 1/2 cells to 10 1/4 inches.

## COMPARISON OF DATA

The A. I. Root Co., Foundation.....	50 cells to 10 3/4 in.	4.877 cells to inch
Dadant & Sons, Foundation.....	49 1/2 "	4.828 "
Gus. Dittmer, Foundation.....	50 " 10 5-16 in.	4.849 "
Black Bee Worker-Comb.....	50 1/4 " 10 1/4 in.	4.926 "
Rietsche Foundation, ("S. S.").....	46.596 "	4.535 "

say that anything that would diminish the size of Italian bees is not desirable.

The count of the natural comb showed considerable variation. It is just possible that Mr. Findlay did not take into account the difference in the three diameters of a cell, and he may not always have measured in the same direction. Upon this point the following Stray Straw from Gleanings, page 821, is pertinent:

This comparison goes to show, that the popular brands of comb-foundation, as now manufactured, would be suited for neglected common black bees; for select-bred, it would be a shade small in cell capacity.

The writer has no natural-built comb, built by improved Italians, on hand, nor has he any colonies that are in favorable condition to build any at the present time. Some years ago we heard consid-

erable about "tongue-reach." Those that are rearing this strain of Italians, should give them a free swing at comb-building, and see what they can do at diameter of cell-reach; the two qualities may be somewhat related.

WILLIAM FINDLAY.

A still later Stray Straw (Gleanings, page 887) is as follows:

"Abbe Pincot (*L'Apiculteur*, 52) says that larger cells give larger workers, and that cells measuring 4.57 to the inch are the largest that Italians accept for worker-brood."

Evidently there is a mistake somewhere, for the Rietsche foundation has a larger cell (4.535 to the inch) than Abbe Pincot's limit of 4.57 to the inch. At any rate, there is nothing unfair in asking the question whether it might not be an improvement to have larger cells in foundation, especially as one of the Stray Straws to which Mr. Findlay refers says that natural comb built by Italians has a cell diameter of 5.5 millimeters, or 4.618 cells to the inch, while none of the foundation gives a cell larger than 4.828 to the inch.

### The Lake Geneva Fair

On July 26 and 27 was held at Geneva Lake, the Fair in the interest of the Lake Geneva Fresh Air Fund Association, an organization in which not only the people in and around Lake Geneva, Wis., are interested, but especially the many wealthy Chicagoans and others who have their summer houses at that most beautiful resort.

The Editor of the American Bee Journal was invited to judge the apiarian exhibit, as on two former occasions, with the following result:

Case of 24 sections of white comb honey, 1st premium (blue ribbon) L. R. Buell; 2d (red ribbon), Miss E. V. Rumsey.

One-frame nucleus of Italian bees, 1st, Franz W. Fischer.

Beeswax, 1st, L. R. Buell.

Mrs. H. C. Buell, a lady bee-keeper living at Hebron, Ill., was superintendent of the bee and honey department.

### Excursion via Nickel Plate Road

to Boston and return, \$21.00, Aug. 6, 10, 20, 24, Sept. 10, 14, 24, 28. Limit 30 days from date of sale. Meals in Dining Cars 35c to \$1.00. Stopovers. Ticket office, 107 Adams St., Chicago. Phones, Central 2057 and 6172. La Salle St. Station, on Elevated R. R. Loop.

## HONEY AND BEESWAX

Chicago, Ill.

### Bee-Supplies and Berry-Boxes

Lewis Ware at Factory Prices. Bee-keepers, club together, send me list of goods wanted, and let me quote you prices, I give the regular discounts. Beeswax wanted. Send for Catalog.

6Etf W. J. McCARTY, Emmetsburg, Iowa.

Mention Bee Journal when writing.

## QUEENS OF Moore's Strain of Italians

Produce workers that fill the supers, and are not inclined to swarm. They have won a world-wide reputation for boney-gathering, hardness, gentleness, etc.

Mr. W. Z. Hutchinson, editor of the *BEE-KEEPERS' REVIEW*, Flint, Mich., says: "As workers, I have never seen them equalled. They seem possessed of a steady, quiet determination that enables them to lay up surplus ahead of others. Easier bees to handle I have never seen."

My queens are all bred from my best long-tongued three-banded red-clover stock (no other race bred in my apiaries), and the cells are built in strong colonies well supplied with young bees.

PRICES: Untested queens, 75c each; six, \$4; doz., \$7.50. Select, untested, \$1.00 each; six, \$5.00; doz., \$9.00.

Safe arrival and satisfaction guaranteed. Descriptive circular free. Address

J. P. MOORE, Queen-Breeder, Rt. 1, Morgan, Ky.

Mention Bee Journal when writing.

## ITALIAN QUEENS

Five young prolific 3 and 5 banded Italian Queens, by return mail. Untested only 60c, or \$6.50 a dozen. Tested, 75c or \$8 a dozen. Extra fine queen, \$1.

J. L. Fajen, ALMA, Mo.

Mention Bee Journal when writing.

## A NEW BEE-SUPPLY HOUSE

### —AT LITTLE ROCK, ARK.—

I am prepared to furnish you the best of bee-supplies, manufactured by The A. I. Root Co. Let me send you my catalog of bee-keepers' supplies. Also have for sale the very best strain Italian queens and nuclei or full colonies. Satisfaction guaranteed.

W. J. LITTLEFIELD.

Mention Bee Journal when writing.

## FOR SALE

\$1 to \$3 a pair. Registered Homing Pigeons; Big Squab Breeders. Also Angora and Belgian Hares; Fancy experiment station; crosses in all colors. Mail orders filled.

HULBERT GLEN ELLYN, ILL.

Mention Bee Journal when writing.

# Raspberry Honey

I have produced a crop of extracted honey from the wild, red raspberry of Northern Michigan. It would be a very easy matter to send this entire crop, in a lump, to some dealer, but I prefer to give each of my friends an opportunity to supply his table with this truly delicious honey—a honey with a flavor all its own—a flavor that smacks of the wild raspberry of the forests. The honey is put up in bright, new, shiny, 60-lb. cans, two in a case, and is offered at ten cents a pound, or \$12.00 for a case of two cans. Perhaps some will think that this is a high price, but we must take into consideration the great loss of bees last winter and spring, the almost total failure of the white clover honey crop, as well as that of California, together with the upward tendency in the price of nearly all commodities. Remember, too, that this is not an ordinary honey—it is **raspberry** honey; and, besides this, it has been left on the hive until it was all sealed over and thoroughly ripened, and is as far superior to ordinary honey as ripe fruit is more delicious than green. If you prefer to taste the honey before ordering, drop me a postal, and I'll mail you a generous sample—enough so that the neighbors, too, can have a taste, and perhaps will wish to join in ordering a case, if you do not care for that much yourself.

W. Z. HUTCHINSON, Flint, Mich.

Mention Bee Journal when writing.

## BEE-BOOKS

Sent postpaid by GEORGE W. YORK & CO.,  
118 W. Jackson, Chicago, Ill.

**Advanced Bee-Culture.** Its Methods and Management, by W. Z. Hutchinson.—The author of this work is a practical and helpful writer. You should read his book; 330 pages; bound in cloth, and beautifully illustrated. Price, \$1.20.

**A B C of Bee-Culture,** by A. I. & E. R. Root.—A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing,** as Practically Applied, by G. M. Doolittle.—A method, by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 75 cents.

**Bee-Keeper's Guide,** or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee,** revised by Dadant.—This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**Honey as a Health Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food," written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy. Prices: Sample copy for 2-cent stamp; 50 copies for 70 cents; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies.

**Forty Years Among the Bees,** by Dr. C. C. Miller.—This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. About 20 years ago he wrote a small book, called "A Year Among the Bees," but that little work has been out of print for a number of years. While some of the matter used in the former book is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**"The Honey-Money Stories."**—A 64-page-and-cover booklet, 5¼x8½ inches in size, printed on best quality paper. Many short, bright stories interspersed with facts and interesting items about honey and its use. The manufactured comb honey misrepresentation is contradicted in two items, each occupying a full page, but in different parts of the booklet. It has in all 33 fine illustrations, nearly all of them being of apiaries or apiarian scenes. It also contains 3 bee-songs, namely, "The Hum of the Bees in the Apple-Tree Bloom," "Buckwheat Cakes and Honey," and "The Bee-Keepers' Lullaby." This booklet should be placed in the hands of everybody not familiar with the food-value of honey, for its main object is to interest people in honey as a daily table article. Price, 25 cents, or 3 copies for 50 cents.

## SPECIAL CLUBBING AND PREMIUM OFFERS

### In Connection With The

# AMERICAN BEE JOURNAL

Sample copies free, to help you interest your friends and get subscriptions. If you will send us names of your neighbors or friends we will mail them sample copies free. After they have received their copies, with a little talk you can get some to subscribe and so either get your own subscription free or receive some of the useful premiums below. They're worth getting. We give you a year's subscription free for one new subscription at 25 cents.

### BEE-KEEPERS' NOVELTY POCKET-KNIFE

Your name and address put on one side of the handle as shown in cut, and on the other side pictures of a queen-bee, a worker, and a drone. The handle is celluloid and transparent, through which is seen your name. If you lose this knife it can be returned to you, or serves to identify you if you happen to be injured fatally, or are unconscious. Cut is exact size. Be sure to write exact name and address. Knife delivered in two weeks. Price of knife alone, postpaid, \$1.25. With year's subscription, \$1.40. Free for 10 new 25c subscriptions.

### BEE-KEEPER'S GOLD-NIB FOUNTAIN PEN

A really good pen. As far as true usefulness goes it is equal to any of the higher-priced, much-advertised pens. If you pay more it's the name you're charged for. The Gold Nib is guaranteed 14 Karat gold, Iridium pointed. The holder is hard-rubber, handsomely finished. The cover fits snugly and can't slip off because it slightly wedges over the barrel at either end. This pen is non-leakable. It is very easily cleaned, the pen-point and feeder being quickly removed. The simple feeder gives a uniform supply of ink to the pen-point without dropping, blotting or spotting. Every bee-keeper ought to carry one in his vest-pocket. Comes in box with directions and filler. Each pen guaranteed. Here shown  $\frac{2}{3}$  actual size. Price alone, postpaid, \$1.25. With a year's subscription, \$1.40. Given free for 10 new subscriptions at 25 cents each.

### QUEEN-CLIPPING DEVICE

The Monette Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings.  $\frac{4}{8}$  inches high. It is used by many bee-keepers. Full printed directions sent with each one. Price alone, postpaid, 25 cents. With a year's subscription, 40 cents. Given free for 2 new subscriptions at 25 cents each.

### IDEAL HIVE-TOOL

A special tool invented by a Minnesota bee-keeper, a adapted for prying up supers and for general work around the apiary. Made of malleable iron,  $8\frac{1}{2}$  inches long. The middle part is 1 1-16 inches wide and 7-32 thick. The smaller end is 1 7-8 inches long, 1-2 inch wide, and 7-32 thick, ending like a screw-driver. The larger end is wedge-shaped having a sharp, semi-circular edge, making it almost perfect for prying up covers, supers, etc., as it does not mar the wood. Dr. Miller, who has used it since 1903 says, January 7, 1907; "I think as much of the tool as ever." Price alone, postpaid, 30 cents. With a year's subscription, 45 cents. Given free for 3 new subscriptions at 25 cents each.

Exactly half actual size.

### PREMIUM QUEENS

These are untested, standard-bred, Italian Queens, reports of which have been highly satisfactory. They are active breeders, and produce good workers. Sent only after May 1st. Orders booked any time for 1908 queens. Safe delivery guaranteed. Price, 75 cents each, 6 for \$4.00, or 12 for \$7.50. One queen with a year's subscription, 90 cents. Free for 6 new 25c. subscriptions.

### HUMOROUS BEE POST-CARDS

A "Teddy Bear" on good terms with everybody including the bees swarming out of the old-fashioned "skep." Size  $3\frac{1}{2} \times 5\frac{1}{2}$ , printed in four colors. Blank space  $1\frac{1}{2} \times 3$  inches is for writing. Prices—3, postpaid, 10 cents; 10 for 25 cents. Ten with a year's subscription, 40 cents. 5 given free for every 25-cent subscription, if requested, and no other premium.

### BOOKS FOR BEE-KEEPERS

**Forty Years Among the Bees**, by Dr. C. C. Miller.—34 pages, bound in handsome cloth, with gold letters and design, illustrated with 112 beautiful half-tone pictures, taken by Dr. Miller. It is a good, new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price alone, \$1.00. With a year's subscription, \$1.15. Given free for 8 new subscriptions at 25 cents each.

**Advanced Bee Culture**, by W. Z. Hutchinson.—The author is a practical and helpful writer. 330 pages; bound in cloth, beautifully illustrated. Price alone, \$1.20. With a year's subscription, \$1.35. Given free for 10 new subscriptions at 25 cents each.

**A B C of Bee Culture**, by A. L. & E. R. Root. Over 500 pages describing everything pertaining to the care of honey-bees, 400 engravings. Bound in cloth, price alone, \$1.20. With a year's subscription, \$1.35. Given free for 10 new subscriptions at 25 cents each.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—How the very best queen-bees are reared. Bound in cloth and illustrated. Price alone, \$1.00. With a year's subscription, \$1.15. Given free for 6 new subscriptions at 25 cents each. In leatherette binding, price alone, 75 cents. With a year's subscription 90 cents. Given free for 6 new subscriptions at 25 cents each.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook.—This book is instructive, helpful, interesting, thoroughly practical and scientific. It also contains anatomy and physiology of bees. 544 pages, 295 illustrations. Bound in cloth. Price alone, \$1.20. With a year's subscription, \$1.35. Given free for 10 new subscriptions at 25 cents each.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic has been entirely rewritten. Fully illustrated. No apian library is complete without this standard work by "The Father of American Bee Culture." 520 pages, bound in cloth. Price alone, \$1.20. With a year's subscription, \$1.35. Given free for 10 new subscriptions at 25 cents each.

**"The Honey-Money Stories"**—A 64-page booklet. Containing many short, bright stories interspersed with facts and interesting items about honey. The manufactured comb-honey misrepresentation is contradicted in two items each occupying a full page. Has 32 fine illustrations of apiaries or apiarian scenes. It also contains 3 bee-songs. This booklet should be placed in the hands of everybody not familiar with the food-value of honey, for its main object is to interest people in honey as a daily table article. Price 25 cents. With a year's subscription, 40 cents. Given free for 2 new subscriptions, at 25 cents each. Three copies for 50 cents; or the 3 with a year's subscription 65 cents; or the 3 copies given free for 4 new subscriptions at 25 cents each.

**Amerikanische Bienenzucht**, by Hans Buechbauer, is a bee-keeper's handbook of 198 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price alone, \$1.00. With a year's subscription, \$1.15. Given free for a new subscription at 25 cents each.

### THE EMERSON BINDER

A stiff board outside like a book-cover with cloth back. Will hold easily 3 volumes (36 numbers) of the American Bee Journal. Makes reference easy, preserves copies from loss, dust and mutilation. Price postpaid, 75 cents. With a year's subscription 90 cents. Given free for 6 new subscriptions at 25 cents each.

### WOOD BINDER

Holds 3 volumes. Has wood back but no covers. Price postpaid, 20 cents. With a year's subscription 35 cents. Given free for 2 new subscriptions at 25 cents each.

### BEE-HIVE CLOCK

A few of these handsome "bronze-metal" clocks left. Base 10 $\frac{1}{2}$  inches wide, by 9 $\frac{1}{2}$  inches high. Design is a straw skep with clock face in middle. Suitable for parlor—an ornament for any place. Keeps excellent time, durable and reliable. Weight, boxed 4 pounds. You pay express charges. Price, \$1.50. With a year's subscription, \$1.65. Given free for 12 new subscriptions at 25 cents each.

## The Pecos Valley

If you want reliable information concerning the Pecos Valley, write to the DAYTON DEVELOPMENT CO. They are a party of citizens at Dayton who have all the desirable land listed that is in the Dayton localities, and sell same at the lowest price. This Company was organized to protect prospectors from irresponsible Real Estate Agents, and will show you the land around Dayton free of cost; all they ask is that you come and see, and investigate this country yourself. The Dayton Country has greater prospects than any part of the Valley, as it is located right in the center of the Artesian belt; and in addition to this it has the Penasco Reservoir project, which will add 10,000 acres of irrigated land to this locality. Improved land sells here in the Valley as high as \$200 to \$300 per acre, while land just as good, not under cultivation quite so long, at Dayton, can be bought at \$5 to \$75 for the best, and unimproved land with water for irrigation is as low as \$20 to \$30 per acre; also unimproved land without water is from \$5 to \$30 per acre, according to location. Let them send you some literature free, so that you may learn more concerning the great possibilities of this country. Address the General Manager—

A. H. KENT, Dayton, New Mex.

## THE POULTRY DIGEST

25 cents per Year.

An Enterprising, Pushing and Progressive Poultry Journal. A live and instructive Periodical Different From All the Rest.

True to name, a concise and boiled down digest of all the doings in the Poultry World—A time-saving periodical, methodical, to the point, and conservative.

## Because You Need The Money

It's your business and if you don't attend to it, who will? You cannot afford to keep cows for fun. That isn't business, and, furthermore, it isn't necessary. There is money in cow keeping if you go at it right, and besides there is more fun in going at it right than there is in staying wrong.

You need a Tubular Cream Separator because it will make money for you; because it saves labor; because it saves time; because it means all the difference between cow profits and cow losses.

Look into this matter; see what a Tubular will do for you and buy one because you need it.

How would you like our book "Business Dairying" and our catalog B. 306 both free. Write for them.

**The Sharples Separator Co.**  
West Chester, Pa.  
Toronto, Can. Chicago, Ill.

## A SPINWALL 4-ROW SPRAYER

Like a mowing machine, has its working parts of spray nozzle in front where they can be seen. Don't strain your neck and eyes with a rear spray. High pressure; Brass lined pump; Ball valves; Wider range of adjustment than any other sprayer made. Booklet free.

ASPINWALL MFG. CO.  
282 Sabin St., Jackson, Mich.

## Bees and Supplies

FROM  
N. Y. City

For 14 years, we have been furnishing Bees and Supplies of every description to bee-keepers in the East. We have studied the East as a honey-section, know its honey-flows, and the line of goods best adapted to produce honey here. This is not theory with us, as we have about 700 colonies of bees, in four different sections, which produce a good crop of honey for us.

Honey-jars are now seasonable. We have several styles, No. 25 Jar, \$5.50 gross, 5 gross \$5.25 a gross; 1-lb. square Jars, \$5.00, 5 gross \$4.70 gross; 12-ounce round Jar, \$4.50 gross.

We handle both comb and extracted honey in season. Catalog free.

## QUEENS Caucasians, Italians, Cyprians and Carniolans

Prices in May and June: Caucasian—one extra best select breeding Queen, \$3.00; one best imported direct from Caucasus, \$4.50. Golden all-over Italians and Carniolans: One best extra select breeding, \$2.00; one best imported, best Italian or Carniolan Queen, \$2.50. Cyprian: one extra best select breeding, \$2.50; one best imported direct from Cyprus, \$3.50. Prices in July, August and September, 50 cents less than in May and June. Special prices for 50 and 100 Queens. Caucasian, Italian, Cyprian, and Carniolan Queens bred the best imported breeding Queens. The addresses must be clear: payments by postal money orders. Queens guaranteed to arrive in good condition in U. S. or Canada. To Australia, Ceylon, India, etc., \$1 more.

E. HAUNSCHILD, the Queen-Breeder,  
20A13t Weissbach b. Pulsnitz, i. Sa., Germany.

## Honey and Beeswax

CHICAGO, July 8.—Very little honey of the yield of 1907 has come on this market. What there has in the way of white comb has sold readily at 16c per pound. There is no call for other grades at the present time. Very little demand for extracted, and a tendency not to take it at over 7c for the best grades of white. Beeswax continues to sell well at 32c. R. A. BURNETT & Co.

PHILADELPHIA, June 25.—This hot weather has come on us so suddenly that it has stopped the sale of comb honey entirely, and extracted honey has been moving very slowly the last 10 days. We quote: Extracted honey, dark, in barrels, 6 to 7c; light extracted honey, in barrels, 7 to 8c; in 60-lb. cans, according to quality and quantity. Beeswax, 30c.

We are producers of honey and do not handle on commission. WM. A. SELSER.

TOLEDO, July 9.—Owing to the scarceness of the honey crop, and there being none in the market, there is practically no price to be made on it. However, fancy white comb honey, new crop, would bring 15c to 16c in a retail way; No. 1, 14c to 15c. Extracted, white clover, in barrels, would probably bring 6c to 6½c; amber, 5 to 5½c. Beeswax is plentiful at 26c to 28c. THE COLORADO BROS. & NICHOLS CO.

DENVER, July 8.—Old comb honey, or last season's crop of comb honey, has been entirely cleaned up in this market for several weeks and new crop has not arrived yet. There is no change in the situation of extracted honey, and we have a good supply to meet the local demand. Our prices are 6½ to 7½ for light amber, and 7½ to 8½ for white, per pound. We pay from 24 to 26 cents for clean yellow beeswax delivered here. THE COLORADO HONEY-PRODUCERS' ASSOCIATION.

NEW YORK, July 8.—A fair demand for white comb honey, with very little supply; fancy stock selling at 15 to 16c, No. 1 at 13 to 14c, No. 2 at 12c. No demand whatsoever for dark honey at this time of the year. Good demand for nearly all

"In every country the successful advertiser is the continuous advertiser."

**A GREAT IMPROVEMENT**

Will be found in

The  
**American Bee - Keeper  
for 1907**

It is profusely illustrated and enlarged, and contains only articles of the most practical as well as scientific nature. A special corps of the best writers has been engaged. The editors are Harry E. Hill and Arthur C. Miller, than whom there are no more practical or experienced bee-keepers in this country. We have published the American Bee-Keeper continually and regularly since 1890.

Regular subscription price, 50 cents a year. One year to new subscribers, 35 cents; three years for \$1.00.

Send for sample copy and our new illustrated price-list of **BEE-SUPPLIES OF ALL KINDS.**

Guaranteed highest quality at lowest price. Address,

**THE W. T. FALCONER MFG. CO.**  
Dept. B. JAMESTOWN, N. Y.  
[Established 25 years.]

**ITALIAN QUEENS**

That are bred from the best stock this country can produce Bright Golden and 3-banded Queens ready to ship May 20. I am now booking orders which will be filed and filled in rotation. After May 20 all orders will receive prompt attention. Untested Queens 60 cents each; 6 for \$3.35, or 12 for \$6.50. Tested, \$1.00, or 6 for \$5.50. 2 frame nuclei with Young Queen after June 1, \$2.00. **GEO. W. BARNES.**  
15A26t Box 340. Norwalk, Ohio.

**Western Bee-keepers We Will Show You**  
how to save money. Send for our new catalog of the best Bee-ware made.

**THE COLORADO HONEY-PRODUCERS' ASS'N,** Denver, Colo.  
9Atf Please mention the Bee Journal.

grades of extracted honey, and we quote California white at 8 to 8<sup>1</sup>/<sub>2</sub>c, light amber at 7 to 7<sup>1</sup>/<sub>2</sub>c, amber at 6<sup>1</sup>/<sub>2</sub>c per pound. New crop from the South brings from 58 to 65c per gallon in barrels, according to quality; strictly fancy will bring as high as 70 to 75c per gallon. The market on the Pacific Coast seems to be unsettled, and prices fluctuate more or less. West India honey is arriving in fair quantities right along, and sells at from 58 to 62c per gallon. Beeswax is somewhat weaker, although choice stock still finds ready sale at 30 to 31c. **HILDRETH & SEGLKEN.**

**CINCINNATI, July 8.**—The market on fancy comb honey and white clover extracted is entirely exhausted. We quote light amber in barrels at 5<sup>1</sup>/<sub>2</sub>c and 6c; in cans 1c per lb. higher. We are selling beeswax at 32c per lb. Market dull.  
**C. H. W. WEBER.**

**INDIANAPOLIS, July 22.**—Fancy white comb honey sells to the retail grocery trade in lots of 1 to 10 cases at 17<sup>1</sup>/<sub>2</sub> to 18 cents. Best extracted honey in 5-gallon cans sells for 12 to 10 cents. Other grades are not yet on our market, although I have seen some foreign extracted honey offered at slightly lower prices. Beeswax sells here at \$35 per 100 pounds.  
**WALTER S. POWDER.**

**KANSAS CITY, June 28.**—We have received a few shipments of new honey which sold on arrival at \$3.50 for 24-section cases; market is almost bare of comb honey, and shipments would sell readily. We quote: No. 1 white comb, in 24-section cases, \$3.50; No. 2 white and amber comb, \$2.75 to \$3.00; white extracted, 8c; amber, 7c. Beeswax, 25 to 30c.  
**C. C. CLEMONS & Co.**

**CINCINNATI, July 3.**—The demand for extracted honey does not come up to expectations, which is probably due to the lateness of the season. Quotations range about the same as published recently. Amber in barrels at 5<sup>1</sup>/<sub>2</sub>c to 6<sup>1</sup>/<sub>2</sub>c, according to quality. Fancy white extracted honey in crates of two 60-lb. cans, at 9c. As yet, there is no new comb honey on the market. We are paying 28c, delivered here, for choice yellow beeswax free from dirt.

If more convenient, Dues may be sent to the publishers of the American Bee Journal.

### The Roofing Question

Every day the roofing question is becoming more serious to the farmer. Shingles are getting scarce and expensive, while the quality is getting poorer. Metal is too costly, and requires repainting yearly or it will rust and leak.

What, then, shall the farmer use?

There is but one answer—a good, ready-prepared roofing. "Vulcanite" Ready Roofing meets the requirements, makes a better roof than either shingles or tin, last longer, and does not require annual painting. It is cheaper than tin or shingles, and can be laid by any one who can drive nails.

The saving in the labor of putting it on is no small item in these days of high wages of carpenters and tanners and the scarcity of help.

Before you repair or build, write to the Patent Vulcanite Roofing Co., 626 South Campbell Ave., Chicago, Ill., for free copy of their booklet, "The Right Roofing and the Reasons Why," describing what "Vulcanite" is, and how "Vulcanite" roofing is made. It will help you settle your roofing question right. Please mention the American Bee Journal when writing.

CHICAGO, ILL.

"If goods are wanted quick, send to Pouder."

Established 1889

We not only handle Bee-Supplies but we put up the finest grades of Honey, Beeswax and Nut-Butter. Believing that bee-keepers will be interested in the Nut-Butter proposition, especially when they can buy **Pouder Quality** at the following wholesale prices, we have decided to submit the following.

## Nut-Butter

**M**ADE from finest grade of number one hand-picked peanuts. We do our own roasting, our own blanching and our own hand-picking. Our improved blancher not only removes the skins from the nut, but it splits the nut and removes the sprout, which is claimed by some to be bitter. We have the best machinery that can be had, operated by electric power, and our facilities are

such that we have always a strictly fresh article to offer, and yet nut-butter does not become rancid like other butters. We do not add salt or a particle

of anything foreign. Our product is simply the nut emulsified in its own oil. Nut-butter is rich in nutriment and health-making qualities. Nut-butter is a delicious and economical health-food, the most popular of all nut-foods, due to its rich and sweet flavor, its good keeping qualities, and its moderate cost.

#### Wholesale Prices

25-cent jars, per dozen..... \$2.20  
30-cent jars, per dozen..... 1.80  
10-cent jars, per dozen..... .90

All goods carefully boxed for shipment.

If you wish to purchase finest white clover extracted honey in 5-gallon cans, write for my monthly quotations of the Indianapolis honey market.

Every bee-keeper should have my free catalog of Bee-Supplies.

Including All Kinds of Window Glass  
Cor. Exchange and Adams Sts.

ESTIMATES FURNISHED ON APPLICATION

Freeport, Ill., June 11, 1907.

The A. I. Root Co.,  
Medina, O.

Gentlemen:

I received five of your AE52S-10 hives yesterday and find that I cannot make my own hives and supplies as cheap as yours and use the same quality of lumber. You can see by the head of this letter that if anyone can make hives cheaper than your prices or any of the so-called "trust hive" manufacturers, I ought to be able to do it, but using the same quality of lumber I cannot.

Yours very truly,

(Signed) John H. Bamberger.

The above is a representative letter from the many we have to the effect that our hives and other supplies can be purchased cheaper than a local mill can possibly make them. Our enormous output enables us to reduce the cost to the minimum without sacrificing quality.

## Editorial Notes and Comments

### Backward Season General

Reports from different parts of the world seem to show that almost everywhere cold and wet have delayed the season. One result has been loss of colonies from starvation where the owners have not been thoughtful enough to replace stores used up by the unusually long spring. The editor of the Irish Bee Journal says: "In our own apiary, feeding was continued daily up to July 9, when the rain stopped."

Where colonies were kept supplied with stores, bees seemed to develop in strength wonderfully, in spite of the cold, and in some places at least, the spring running into summer did not seem to have such a very bad effect, for it merely postponed the time of blooming. In Northern Illinois June and July are par excellence the months of white-clover bloom generally. This year there was more clover bloom in August than in June, if, indeed, not more than in July.

Next spring may not be so late as the past one, but it is likely to be late enough, and this is a good place to repeat the advice to store up a number of combs of sealed honey to be used next spring wherever they will do the most good.

### Strengthening Weak Colonies

If one has a greater or less number of weak colonies on hand, the manner in which they are to be strengthened depends upon circumstances. Whatever the plan taken, the idea should be to have each colony so strengthened or united that it shall have enough bees to cover 5 or 6 combs. A colony with

3 frames of bees may be united with another having 2 or 3 frames of bees; understanding by a frame of bees enough bees to cover well a brood-frame, or brood-comb. Three colonies having 2 frames of bees each may be united into a single colony. If one should have several colonies of 4 frames each, then one or more of them can be broken up, and one or 2 frames given to each of the others. If, fortunately, there is only a single weakling, its bees may be given to one or more of the weaker of the full colonies. These will be just so much the stronger, whereas, if the weakling is left it will be practically worthless.

### Extra Combs of Honey for Next Spring

This subject may have been mentioned times enough so that many may be excused from reading this item. But its great importance for the many new readers is a sufficient excuse for mentioning the subject again.

Unwarned upon the subject, the beginner who has an early flow of light honey and a late flow of dark honey is likely to get all of the fall honey as surplus, except what the bees store in the brood-chamber. This last, if it be not exhausted before, is pretty certain to be all used up at the time the white-honey harvest begins the next season. Of course, the brood does not entirely fill all of the cells in the brood-chamber, and the vacant cells will be filled with several pounds of white honey. Now if said beginner had had extra combs of fall honey to give to the bees in the spring, this first white honey, instead of going into the brood-combs,

could just as well have gone into the surplus apartment. It will be seen that it is a plain question as to whether so many pounds for the market shall be light or dark.

Nor is this all the difference in the case. A colony in the spring will not rear as much brood with a meager supply as it will when abundant stores are present. The beginner is likely to think, "So long as the bees are not allowed to run out of stores, I don't see why they'll not rear as much brood with a half-pound ahead as if they had 10 pounds in sight." Well, they'll not; no matter how they may reason about it, they *seem* to know that when they have a big lot of stores in sight they can go into brood-rearing on a large scale.

So when the fall flow begins, see that a fair share of it is in sealed brood-combs ready for the next spring, as well as to meet any emergency in the fall. For 8-frame hives 2 or 3 such combs for each colony in the spring will be none too many. For 10-frame hives, a less quantity may or may not be needed.

### Wintering Reserve Queens

About this time of year the question is often raised whether one may not keep over extra queens, ready to be given in the spring to any colonies that may have become queenless. No way seems to have come into general favor that differs greatly from keeping each queen in a weak colony. Considerable can be gained, however, by keeping 2 nuclei in a hive. Separate the hive into two compartments by means of a division-board  $\frac{1}{4}$  to  $\frac{3}{8}$ -inch thick, and be sure that it is bee-tight. Let the brood-nest of each nucleus come close against this division-board. The bees of each nucleus will cluster close against this partition, forming what seems to be one globular mass, with the partition thrust between them.

In the spring, if one of the queens is needed elsewhere, it can be taken, and the 2 nuclei united into a full colony. If there is no need to take either queen away, let the nuclei build up until too large for their narrow quar-

# American Bee Journal

ters. Separately they would make very slow work at building up in early spring; but a surprising difference will be seen if they are allowed to remain together, thus furnishing mutual heat. When either nucleus becomes crowded, each one can have a full hive to itself.

This plan may be varied by having the partition to one side of the hive instead of in the middle. The smaller compartment may be large enough to contain a 2-frame nucleus, and into the larger compartment may be crowded a full colony.

## Why Do Bees Swarm?

E. W. Diefendorf discusses this question in the *Bee-Keepers' Review*, and gives—not at all in a dogmatic, but in a sort of tentative way—as a possible answer, that the queen becomes tired or exhausted. He gives some good arguments in favor of such view: A queen reared at the opening of the swarming season is not likely to come off with a swarm during that season; a queen can not become exhausted in a nucleus, and he has never known such a one to swarm; in Dr. Miller's foundation treatment the queen is allowed a rest, etc.

## Abuse of Smoke on Bees

Smoke is a good thing, but it may be used so as to do harm. To quiet bees it is not necessary to deluge them with smoke until they boil out all over the hive. A little, at first, and a little more afterward if they need it, but only as they need it.

But there is another way in which smoke may become an abuse that sometimes is not thought of. It is when taking surplus honey from the bees. A sufficient amount of smoke will entirely rid of bees the sections or extracting combs, but the amount required is generally so great that the flavor of the honey will be badly injured. Some may think that the smoke will be evaporated in a little while. Such persons should remember the enduring flavor of smoke in smoked hams. The flavor of smoke may be relished in hams, but it is very bad in honey.

## Improvement in Introducing Queens

If the queen of a colony be removed and a strange queen, at the same opening of the hive, be placed upon the combs, one may confidently expect the bees promptly to seize the intruder and ball her till she is dead. Instead of putting her loose on the combs, if she be caged in the hive for 3 or 4 days, and then set free upon the combs, she may expect a kindly reception. That kindly reception is made more sure if she be allowed to walk out of the cage quietly at a time when there has been no disturbance by the opening of the hive. To this end a passage filled with bee-candy is provided, so that the bees may quietly release the queen, but they will do this generally inside of 24 hours, which is too short a time for best results. The Abbott plan, leaving the queen caged in the hive 48 hours, then removing the old queen and at the

same time giving the bees access to the candy, works well. To avoid the trouble of opening the hive a second time, use has been made of a piece of cardboard over the candy, which the bees must gnaw away before getting at the candy, thus prolonging the time of imprisonment.

Dr. Miller reports a plan he is trying, which he thinks may be an improvement. Take a splint of wood 1-16 inch square and a little longer than the tube of candy, and thrust it through the center of the candy. That's all; the bees do the rest, taking about 3 days to liberate the queen.

It will be well if others who try the plan repeat what success or failure they meet.

## Saltpeter for Lighting Smokers

Much time is lost one time and another in blowing a smoker to get the fire started. One of the best lighters is a piece of cotton rag lightly saturated with saltpeter. If heavily saturated, the rag burns up too quickly, almost like an explosion, and the fuel has not time to be lighted. A pound of saltpeter to 2 gallons of water is a sufficiently strong solution in which to soak the rags. Let them be thoroughly wet through, wring or drain them out, and then dry as you would dry a washing.

When you wish to light your smoker, take a rag 5 or 6 inches square, roll it up into something like a ball, touch a match to it, throw it into the smoker, quickly fill the smoker with fuel, and then blow. No fear of putting it out; if the smallest corner is lighted it will not go out till the whole rag is burnt up, and if your fuel is at all fit, it will be surely lighted.

A supply of saltpeter rags prepared in the spring—the preparation is a trifle—will save many a 5 minutes throughout the season, as well as some loss of temper.

## Weber's Entrance Comptroller

A sample of Weber's patent entrance comptroller and protector for bees during spring and winter flights has been received. This is a very ingenious contrivance for use in outdoor wintering, or for early spring use, after bees are brought out of the cellar. Its object is to keep the bees confined to the hive, and at the same time allow the entrance of fresh air. This is easily accomplished by closing the entrance with wire-cloth; but thus confining the bees while the light is allowed to shine in the entrance is well known to be ruinous. Mr. Weber has taken advantage of the fact that light proceeds in straight lines, and will not readily travel around a corner, and has so arranged that an entrance 4 inches long and  $\frac{5}{8}$ -inch deep may be open all winter long for the admission of air, but coarse wirecloth prevents the passage of bees, and the course the air travels prevents the admission of light.

A metal slide, centrally located, closes the direct entrance. When thus closed, the air passes sidewise  $3\frac{1}{2}$  inches, turns a corner and passes around a middle partition, traveling sidewise again an-

other  $3\frac{1}{2}$  inches to enter the hive. By the time light travels this distance in such a devious way, its strength will have been dissipated. At any time when it is thought best to allow free exit, the slide may be withdrawn, giving the bees the full direct entrance. The slide may be shoved sidewise, so as to make the entrance any desired width from that of allowing a single bee to pass at a time up to the full 4 inches, allowing at the same time the direct entrance of the light. Or, if it be deemed advisable to allow a limited entrance without the admission of light, the metal slide may close all but an inch at one side, while an outside block covers all but an inch at the other side; thus again taking advantage of the fact that light travels in straight lines and objects to turning corners.

Just how much advantage there may be in the use of such a contrivance can only be told after trial, but it certainly seems well designed for the purpose it is to serve.

## Bee-Disease in the Isle of Wight

That Isle-of-Wight disease, according to information in the *Irish Bee Journal*, is a more serious matter than might have been supposed. Of the bees on the island, 85 or 90 percent are dead and others dying, and H. W. Cooper, local secretary of the Association says:

"Those of us on the spot who know something of the havoc by this scourge, have not as yet discovered anything wrong with the brood."

Which makes it much to be feared that a new bee-disease is to be added to the list, and as such diseases are not always careful to confine their attentions to a small island, we in this country can not fail to be interested in keeping on the watch as to the outcome.

## Unite Colonies in Good Season

At this time of year there are likely to be a good many colonies so weak that if left as they are they will stand small chance to live through the winter. The beginner, anxious to increase the number of his colonies, keeps hoping that they will build up strong enough, and finally he is likely to enter the winter with a lot of weaklings on hand, and a lot of empty hives next spring. No time should be lost in uniting such colonies until no weakling is left. The time will be none too long for the united colonies to get settled down into comfortable shape for winter. Besides, bees will unite more kindly now than later.

## Bees Balling Their Own Queen

It seems a strange thing, but it is true, that sometimes a colony will ball its own queen. Perhaps the excitement of opening the hive is the cause, and if the excitement is kept up by the bee-keeper trying to free the queen, her death may result. If the hive is quickly closed when a queen is found balled, the bees will of themselves generally release her without any harm. So don't try to release the queen from the ball, but close the hive, and don't open it again that day.

## Miscellaneous News - Items

### Subscription Price Now 50c a Year

On July 1, 1907, when we decided to change the American Bee Journal from a 16-page weekly to a 32-page monthly publication, we reduced the price from \$1.00 a year to 25 cents. We have since discovered that the 25-cent rate is entirely too low, in view of the kind of a bee-paper we are making every month. We do not wish to lower the standard now, and as labor, materials of all kinds including white paper, etc., have advanced in cost, we feel that the best thing we can do—in fact, the only thing to do—is to put the subscription price at 50 cents a year; in Chicago, 75 cents; in Canada, 60 cents; and in all other countries in the Postal Union, 25 cents a year extra for postage, or 75 cents. These new rates will begin with September, 1907.

We are sure that our hosts of readers and friends will feel we are doing the right thing in this, as they certainly would not want us to continue at too low a subscription price. At 50 cents a year, this 32-page copy would cost the subscriber only about 4 cents—two 2-cent stamps—surely cheap enough, when its valuable contents are considered. Why, "Dr. Miller's Question-Box" alone is worth many times the subscription price, to say nothing of all the other valuable departments.

It is our intention to keep the old American Bee Journal at the head of the procession, where it has been for so many years. And to do this we will need the hearty co-operation of all our readers. There are yet thousands of bee-keepers who have never heard of the American Bee Journal. Many of them are your neighbors; can you not show them what they are losing by not having it every month?

On another page we offer many useful things as premiums for getting *new* subscriptions. We will be pleased to mail sample copies to any names and addresses of bee-keepers that may be sent to this office. If every present subscriber would send in just one new subscription during this month, by Oct. 1st our list would be doubled. Why not do at least that much to help along a good cause—your own cause? We are ready to do our part—will you, dear reader, not join with us in putting the monthly circulation of the old American Bee Journal up to where it ought to be?

### The National at Harrisburg

It has finally been definitely settled that the 1907 convention of the National Bee-Keepers' Association is to be held at Harrisburg, Pa., on October 30 and 31. On account of the Jamestown Exposition there will be low rates on the

railroads, and stop-overs at Harrisburg can be had on tickets from the west.

The last of October should be a good time for bee-keepers to go. Why not assemble here in Chicago on October 28 or 29 and go in a special car the rest of the way? Perhaps this can be done.

### Swarm of Bees in a City Street

Some reader in California sends us a clipping from the Los Angeles Times, which describes a "pointed" and amusing experience with a swarm of bees in a Los Angeles street recently. It is surprising how fully most people let bees alone when they are not accustomed to them, or when not dressed for a bee-reception.

### Cause of American Foul Brood

Dr. G. F. White, who is now connected with the Bureau of Entomology of the Department of Agriculture at Washington, D. C., has written an article on the above subject, which has been issued as Circular No. 94. It will be found on another page of this number, and deserves a careful reading. Dr. White acknowledges the assistance of Dr. E. F. Phillips in the experimental work done which led up to the preparation of the circular mentioned.

### The National Association

On August 8th, General Manager, N. E. France, of Platteville, Wis., sent out the following information relative to the National Bee-Keepers' Association:

I ask each of our members to mail to me a few questions on bee-keeping with the name of the persons they prefer to have answer them. At the Convention, which meets at Harrisburg, Pa., October 30 and 31, 1907, I will read the questions that are sent in.

The National Association is planning to make a creditable exhibit of honey at the World's Pure Food Show to be held in the Coliseum, at Chicago, November 19th to 25th. I would ask any bee-keepers who are willing, and can do so, to help in this display by furnishing me one pound of choice, extracted honey of each kind their bees gather. Be sure to display your honey at the County Fair this fall. It is a good place to advertise.

What honey you produce and sell you can label with your name as producer. If you buy honey to sell, it must not have your label on it unless it also has the words, "Distributed by" in brevier type. "It is the intention of the law

that labels on all food products should not be misleading in any particular."

All over the United States, until in June, bad weather was reported. Colonies of bees were weak and dying so that when the honey crop came there were very few bee-keepers who had bees ready to take advantage of it. I have seen reports from nearly every State, and but few have an average crop; many have nothing. During the last few days the reports have been better, especially in the clover belts. Basswood has generally yielded no honey, or at least a very small amount. Sweet clover and alfalfa did better. On the whole there will not be over half a crop of honey this year. Prices should be better than last year, and I hope they will be asked.

N. E. FRANCE, *Gen. Mgr.*

### Some Generous "Donations"

"Ye Editor" and wife have been the recipients of some good things to eat during the past month or two, from several of our generous readers. We wish to return our thanks for the following:

Strawberries, from Dr. and Mrs. C. C. Miller, of Marengo, Ill.

Peanut butter, from Walter S. Poudner, of Indianapolis, Ind.

Blackberries, from J. L. Strong, of Clarinda, Iowa.

We wish to mention specially the peanut butter, which is a somewhat new article on the market, we believe. The kind Mr. Poudner makes is great.

### Kind Words from Contemporaries

The Bee-Keepers' Review was the first to note the change of the American Bee Journal from a weekly to a monthly, in this paragraph:

"The American Bee Journal is to be changed to a 32-page, 25-cent monthly. Brother York hopes thereby to greatly increase the circulation and usefulness of his journal—that every bee-keeper, even with a single colony, will become a subscriber."

The American Bee-Keeper for August contained this very complimentary notice:

"The American Bee Journal, for many years a weekly periodical, appeared for July as a monthly, and will be so issued in the future. The subscription price has been reduced to 25 cents a year, and a very marked improvement in the general appearance of the paper results from the use of a high-grade stock of paper. The cover design of the first monthly edition is the handsomest that has adorned any bee-journal of modern times, being a skillful combination of photograph, wash and air brush. Really artistic pictures are rare in the apicultural press, but the American Bee Journal's cover scores an average above ninety. Congratulations, Brother York!"

Gleanings in Bee Culture had this cordial paragraph in its issue for August 15th:

"The 'Old Reliable' is now issued as a monthly of 32 pages at 25 cts. per year, instead of a weekly of 16 pages at \$1.00. The new monthly has a new half-tone

# American Bee Journal

cover that is very neat, and the general make-up, appearance, and contents are practically the same as heretofore. The low price of the publication (25 cts. per year), and the general excellence of the matter, should and probably will make it very popular. We wish it abundant success."

## Midnight Swarming Bees

Mr. A. Straub is a Chicago bee-keeper who has 18 colonies of bees. He called at our office recently, and reported that about midnight of August 14 one of his colonies cast a swarm of bees. It was about a peck in size, and settled on a small tree near his home. The swarm was hived the next morning, and went to work in good earnest. It must have been that they were too busy to swarm in the day-time.

## World's Pure Food Show

More than one-third of the space for the World's Pure Food Show at the Coliseum, Chicago, next November 19 to 25, has already been contracted for. The big food interests throughout the country are heartily in accord with the exposition, and are eager to compete for awards before the greatest pure-food tribunal ever gathered together. The Commission on Tests includes Dr. Harvey W. Wiley, chief of the bureau of chemistry of the United States department of agriculture; Hon. Alfred H. Jones, Illinois State Food Commissioner; Dr. James A. Egan, Secretary Illinois State Board of Health; Dr. T. J. Bryan, State Analyst of the Illinois State Food Commission; Dr. W. A. Evans, Chicago Commissioner of Health; Dr. Walter Haines and half a dozen other leading chemists of the United States.

A California Association has announced its intention to ship huge bunches of many of the 640 varieties of grapes grown in the Golden State to the exposition for decorative purposes. Schwarzschild & Sulzberger Co., were the first of the big packers to sign for space, and have taken an entire section of over 1,500 square feet. The food departments of The Fair, The Boston Store and other big Chicago department stores will be represented.

Other prominent exhibitors will be The Great Western Cereal Co., The International Banana Food Co., The Blue Ribbon Chewing Gum Co., Red Cross Olive Oil, Rueckheim Bros. & Ekstein, etc.

All the booths in the big building will be uniform in design and color. An aisle 15 feet wide will run all around the building. This will be flanked on the outside by scenic representations of shops of all nations and times.

It is the purpose of the management to dispose of all space at least 2 months before the date the exposition opens, so that every effort can be devoted to attracting an enormous crowd of spectators. Sufficient aisle space has been allowed to handle over 20,000 spectators daily.

We referred to the coming pure-food show in these columns in June. We

understand that the National Bee-keepers' Association is to have an exhibit of honey. General Manager France has already begun to work it up. We will doubtless have more to say about it next month. Honey-producers should be well represented, as they produce one of the finest of all foods.

## Mr. Secor and His Yucca Plant

Hon. Eugene Secor, of Forest City, Iowa, sent us recently the picture herewith, showing himself and a yucca plant that was 5 feet and 7 inches high on July 30, 1907, when the picture was taken. Mr. Secor is well known to bee-

keepers, not only as an expert apiarist, but also on account of the many beautiful poems he has written bearing on the bees and their interesting nature. It seems almost time for another one to come from his mellifluous pen. Perhaps the muse's spirit will soon possess him, and his many friends will possess another rhythmic gem.

## The Kansas Convention

The Kansas State Bee-keepers' Association will hold its next annual meeting at Hutchinson, September 18 and 19, 1907. All persons interested in bees are invited to attend. This meeting will occur during the State Fair, so there will be reduced rates on all the railroads. The meetings will be held at the Commercial Club rooms. The first session will be 2:30 p. m., Sept. 18. Head-

quarters for bee-keepers will be at the Midland Hotel. O. A. KEENE, Sec.  
Topeka, Kans.

## Fair Apiarian Premiums

In last issue we gave the apiarian premium lists of several leading Fairs. There are no better places for bee-keepers to educate the public to the use of honey, and to the growing importance of bees and their products.

On Sept. 27 to Oct. 5, at Springfield, will be held the Illinois State Fair. The premiums offered on bees and honey are as follows:

	1st.	2d.	3d.
Display of Comb Honey .....	\$20	\$15	\$10
Collection of labeled cases containing 12 or more pounds of White Honey from different flowers .....	8	5	1
Collection of labeled cases containing 12 or more pounds of Amber or Dark Honey from different flowers .....	8	5	3
Case of White Clover Comb Honey, 12 to 24 pounds .....	4	3	2
Case of Sweet Clover Comb Honey, 12 to 24 pounds .....	4	3	2
Case of Basswood Comb Honey, 12 to 24 pounds .....	4	3	2
Case of Amber Comb Honey, 12 to 24 pounds .....	4	3	2
Display of samples of Extracted Honey, not less than half-pound each .....	5	3	2
Display of Extracted Honey .....	20	15	10
Honey extracting on the grounds .....	5	3	2
Frame of Comb Honey for extracting .....	5	3	2
Display of Candied Honey .....	20	15	10
Display of Beeswax .....	15	10	5
One Frame Observatory Hive			
Dark Italian Bees .....	4	3	2
Golden Italian Bees .....	4	3	2
Carniolan Bees .....	4	3	2
Honey Vinegar, one-half gallon, with recipe for making .....	4	3	2
Display of Designs in Honey .....	15	12	8
Display of Designs in Beeswax .....	20	12	8

## TENNESSEE STATE FAIR, SEPT. 23 TO 24, AT NASHVILLE.

	1st.	2d.	3d.
Best 10 lbs. extracted honey .....	\$10	\$5	\$3
Best display extracted honey .....	15	10	5
Best case comb honey .....	10	7	3
Best display comb honey .....	15	10	5
Best display beeswax .....	5	2	1
Nucleus dark Italian bees .....	5	2	1
Nucleus golden Italian bees .....	5	2	1
Nucleus Caucasian bees .....	5	2	1
Nucleus any other race bees .....	5	2	1
Largest and best display of bees and bee-products, implements, etc., by individual exhibitor .....	25	15	10

J. M. BUCHANAN,  
Franklin, Tenn. Superintendent.

## Books for Bee-Keepers

Every bee-keeper should have a bee-book besides a bee-paper. On another page will be found all the best books offered—either at a price, postpaid, or as a premium. If you can not earn them as premiums for getting new subscriptions, it will pay you well to purchase one or more of them. You will find them of great value. There are so many things in the books that are needful to know, and that of course could not be told over and over again in the bee-papers. If a bee-keeper can afford only one, it would better be the book rather than the paper. But now that the American Bee Journal is only 50 cents a year, of course, no bee-keeper, however limited his apiary may be, can afford to be without its monthly visits.

Conducted by EMMA M. WILSON, Marengo, Ill.

### Bees Refusing to Work in Comb-Honey Supers

MISS WILSON:—I have just read in your department of the American Bee Journal the account of 2 colonies of very cross Italian bees that would not work in comb-honey supers, as related by Miss Elsie A. Cutter. I do not know that I can suggest any way to overcome the crossness complained of, except by the use of brimstone or a change of queens, but I think I can tell Miss Cutter how to get the bees at work, but not in comb-honey supers.

I had a very strong colony this season that refused to work in sections day after day, when other colonies of like strength were storing rapidly. I thought if they would not work in sections I would try to get them to work in something more to their liking, and so put on another hive-body filled with drawn combs. This seemed to take away all excuse for laziness, and the bees went immediately to work in this upper story.

If one does not want the home of the colony established in this upper story he can, after a few days, put an excluder between the two hives, taking care that the queen is in the lower one. It is better that the bees be at work even if they do not work just where one wants them to.

I note that Miss Cutter says she gave her bees extracting supers, and that the bees would not work in them. It would be of interest to me to know whether she put an excluder under the extracting super. It seems almost incredible to me that a strong colony in the midst of a good honey-flow, and with a brood-chamber full of brood and honey, should refuse to extend their work in an upper story full of empty combs, if there were no hindrance in the shape of a queen-excluder. If the excluder is kept on until brood is found in the upper combs, and then inserted it is most likely that the work will be continued above. If I had a colony that would not work under such circumstances, I would find the queen and cut off her head at the earliest opportunity, and give the colony another queen.

I will here remark that I have a high regard for the working qualities of hybrid bees. It is my practice to introduce a number of pure Italian queens into the apiary every year.

Leon, Iowa.

EDWIN BEVINS

Thank you, Mr. Bevins, for your suggestions. I think your plan would work in most cases; I would have said in all

cases, if Miss Cutter had not said that she failed to get them to work. Your plan is the same as the one used sometimes in our apiaries, with the exception that we put the excluder on at the time we put the upper story on, but we always place a frame of brood in the upper story to induce the bees to go to work at once. I think you will find that in that case the bees will go to work just as quickly, and it has the advantage of being all done at one operation.

I am inclined to think that the queen's head would come off in this locality if she could not be induced to work in sections.

### Trained Nurse as Bee-Keeper

DEAR MISS WILSON:—Will I be intruding, if I ask you to send a thought in my direction?

My work for some years has been that of trained nurse, but with the advice of my physician, I am giving it up, and it is essential that I engage in some other line of work not quite so wearing on the nerves, and I have been considering and reading up a little on the bee-industry, thinking that possibly next spring I might engage in the work, if there is the least possibility of success. Will you kindly give me your opinion regarding this, and also the amount of money a beginner should invest?

ILLINOIS.

There is no question but bee-keeping is a splendid occupation for a nervous woman, but there are many things to be considered before advising to embark in bee-keeping as an occupation.

There are women, and women. Not every woman will make a success of bee-keeping. There must be a liking for the business. Of course, you can't tell until you have tried it. To make any considerable outlay until you have tried it would be reckless; best get 2 or 3 colonies to begin with. You can get a whole lot of experience out of 2 or 3 colonies, and a whole lot of fun besides, and gradually grow up into the business, making the bees pay their own expenses, which is much the better way of doing, for if you can't make a few colonies pay, you surely can not a large apiary. This may seem like a slow way of doing, but in time you will come to think it is the best way, as only a very small outlay is necessary to begin with, for a colony of bees can be bought at somewhere from \$5 to \$10. Besides this,

you should invest a dollar or so in a good text-book on bees and a newspaper.

### Some Swarming Experiences

I am quite prepared to agree with Dr. Miller, that swarming is not a very delightful experience, and I have been wrestling with it in great shape this summer. Now, don't anybody say, "That's your Carniolan's." I can't really see that they are bigger sinners than the others in this case, at least. But I have noted one thing: When you find a hive where the bees have refused to enter the sections—where every available spot in the brood-nest is crowded, and out they come—these are not Carniolans.

It seems to me as if everything in the yard, with one or two exceptions, was bound to swarm, and more than once, if allowed.

I read of Dr. Miller's piles, and gaily I reared a pile to see the bees pour out later, as it would seem by the bushel!

"A queen of the present season's rearing will rarely swarm," but they are at it none the less. It goes without saying that there is plenty of honey coming in.

While swarming in general does not delight me, there was a swarm today that did. I must tell you about it.

In the foreground of the picture may be seen a hive of peculiar shape and distinguished appearance, which I call "The White House." It is a hive con-

APIARY OF MRS. AMOS.

taining 10 closed-end frames, 10x12 inches in size. By all odds the bees ought to have wintered in that hive, but they did not last winter. It is the only hive now standing in my yard containing empty combs—at least, I might so have written yesterday. I have been intending to put bees in it rather late in the season. I did not want them in early as the hive lacks the tiering-up opportunity the others afford.

Now, mark what happened. A swarm was hived yesterday. Today I saw it sailing out again into space, and I thought, "Now that's to do over again."

Not much; those delightful bees only circled a few times and went pouring into the portico of the white house!

I said to myself, "I must have out a decoy or two right off. If bees will single out the only empty hive in the yard, and vote that it is a good place

to live, it goes to show that there is not much that concerns them in their vicinage, of which they do not take cognizance."

Mrs. A. L. AMOS.

Comstock, Neb., July 31.

## Taste for Sweets an Index of Wholesomeness

It is gratifying to note that the sugar consumption of the United States has grown until it now equals that of England, which was heretofore regarded as the greatest sugar-consuming nation on earth; for nations may be rated by their taste for sweets. Latest statistics show that the sugar used in the United States and England is equal to 80 pounds a year for each man, woman and child in these two nations. Of course, the sugar employed in the manufacture of jams, preserves, confections, etc., aids in forming this average, but sugar is sugar, whether it is eaten raw, or in the coffee or in pies, or preserves, or in candy, and the average person of the United States and England eats more than twice as much sugar as any other person in the world. As against the American and Englishman's 80 pounds of sugar a year, the German eats but 33 pounds, the Austrian eats but 34 pounds, Russia 20 pounds, and Italy only 7 pounds.

Nothing could be said in greater praise of a people than that they have a taste for sweets. It shows a wholesome, vigorous, healthful condition,—an appetite not jaded from excessive indulgence. The child whose appetite has not become polluted or calloused from false relishes, smarting sauces and burning drinks, and dissipation, loves sweets; so does the girl of bright eyes and untainted youth, as is evinced by her fondness for ice-creams and desserts; the young athlete among men loves sweets, nearly as well as does the child.

The bar-room lounge, the beer-soaked twaddler, the tobacco-scented smoker of cigars and pipes, the cigarette fiend, the bleary-eyed absinthe drinker and the red-nosed whisky drinker, the dope fiend and the deprived of all other classes do not like sweets. Long since their minds and appetites have lost the desire for everything pleasing to the natural palate. Among these people you will find the eaters of foul-smelling cheese, which the older and more rancid it is the better it is liked; the lovers of moldy sausage, of old, dried fishes, and of pickled eggs of fishes; of goose-livers, made vile by natural and artificial decomposition; of meats and fruits that are allowed to spoil before they are eaten. Such vulturine tastes dote on pate de foie-gras, caviar, salted mackerel, limburger and roqueford cheese, pickled olives, pickled anchovies and a hundred other vitiated foods, the viler they are the more they are esteemed. All other kinds of foods these appetites pollute with repugnant sauces, and they wash them down with fiery drinks, rated in esteem according to their age.

And from these causes, France, China, Russia, Spain, Austria, Germany and Italy laugh at the United States and

England and say that our foods are not fit to eat. England has been called the nation of a hundred dishes and one sauce. The Russian peace commissioners went back home and said the American foods were unspeakable. Some people base their aristocracy on the fact that they are able to eat caviar. These people all want something foul and rancid, something sour or bitter—never anything sweet, and the taste which enjoys sweets they call amateurish or barbaric.

The vulture is known by its habits as well as by its name, and people are of what they eat. A definition of the word sweet, therefore, may aid in the distinction of these nations. Here is one definition of the word:

"Having a certain agreeable taste or flavor, like or resembling that of honey or sugar—opposed to sour and bitter.

"Not changed from a sound or wholesome state; not stale; not sour; not putrescent or putrid.

"Mild, soft, gentle."

Then as people are what they eat, and as things that are equal to the same thing are equal to each other, we may make this deduction:

The people who like sweets are sweet of nature; they are agreeable and pleasing; they are not changed from a sound or wholesome state; not stale; not sour; not putrescent or putrid; they are mild, soft, gentle.

The people who do not like sweets are not sweet of nature. They are not agreeable nor pleasing; they have been changed from a sound and wholesome state; they are stale, sour; they are putrescent and putrid.

So let's rejoice in the fact that America and England eat twice the amount of sweets of any other nations in the world.

But let it not be understood that this

is an argument in favor of the unlimited eating of sweets. While the taste for sweets is a natural desire, there is danger in the excessive gratification of even natural desires. This truth is especially manifest in children's liking for candies, which often is productive of most serious consequences. When a people have lost a natural desire, altogether, and substitute therefor a desire that is unnatural, it betokens unwholesomeness and possible degeneracy.—What To Eat.

The foregoing article from the magazine What To Eat is well worth pondering over. It will probably be news to many a member of our circle to learn that she is using in her household 4 times as much sugar as her Russian sister, and 11 times as much as her sister under the sunny skies of Italy, and it will be some comfort to learn that this greater desire for sweets points to a more desirable condition of body and of mind.

It would be well if What To Eat would expand that last paragraph a little farther. More than one reason may be given for the "serious consequences" arising from the excessive gratification of children's liking for candies. Unwholesome—not to say absolutely poisonous—ingredients are too often to be found in candies. Let us hope the pure-food laws may help in this regard. Candies are eaten between meals, and the "picking habit" grows until many a child and many a young woman clogs the stomach before mealtime, and then fastidiously rejects the wholesome dishes at the regular meal. If honey were substituted at the regular meal, there would be less craving for candy, and on account of the more ready digestibility of honey as compared with sugar, little or no danger of any interference with the most robust health.

Conducted by J. L. BYER, Mount Joy, Ont.

## Honey Crop and Prices for 1907

The honey crop committee of the Ontario Bee-Keepers' Association have issued the following report:

The honey crop committee of the Ontario Bee-Keepers' Association met in the Secretary's office, at Toronto, Friday, August 9, 1907. Over 100 reports from different parts of the Province, and a number from Quebec, were laid before them. Reports would indicate that a very great loss of bees has been sustained since last season, and that probably 50 percent perished during the winter and spring. The honey-flow

in a few localities is reported good or fair, others light, and in many nothing has been harvested—probably an average of less than one-third crop in all.

In view of these conditions, and the shortage of the fruit crop in all variations, and the higher prices prevailing, it is the opinion of the Committee that an advance over last season's rates should be reasonably expected, and suggest the following:

No. 1 light extracted honey, 11½c. to 12½c. per pound, wholesale; retail, 14c. to 15c.

No. 1 comb, \$2.50 to \$2.75 per dozen, wholesale.

No. 2 comb, \$1.75 to \$2.25 per dozen, wholesale.

On the darker grades not yet harvested, a reasonable advance over last season's prices should be obtained.

H. G. SIBBALD,  
WM. CROUSE,  
W. J. CRAIG,  
P. W. HODGETTS, Sec.

While the prices suggested, may, to some, seem a little high, yet when everything is taken into consideration, there is no good reason why they should be lower. Some have thought that foreign honey would be shipped in, but with the general shortage of the crop in the large producing centers, coupled with the 3 cents per pound duty, there is not much danger from that source.

## "Mother Earth" for Cleaning "Bee"-Daubed Fingers

Strange how some of our notions are sometimes apt to "change without notice," quite suddenly.

When I first read Dr. Miller's plan of cleansing the fingers of honey by means of rubbing them with earth, I thought the method—well, rather *dirty*.

Last week it was my lot to examine a large apiary, and as the frames in the hives were spaced "any old way," with lots of honey along the top-bars and in burr-combs, my fingers were constantly being "stuck up." No water being near the yard, I was at a loss to know how to keep smoker, etc., free from honey, when I happened to think of the Doctor's plan. Say, it works like a charm, and a good many times during that day was a handful of dry earth called into use. To be sure, when doing any work by way of handling honey, etc., a basin of water is the proper thing, but in cases like the one mentioned, Mother Earth is par excellence. Doubtless, try it, and be convinced.

## Alfalfa Honey in Ontario

Frank Adams, of Brantford, Ontario, reports that this year, again, his bees did well on alfalfa. Reports like this are rare in Ontario, and in our own locality I have yet to see the first bee working on this plant.

## Fair Season—Two Queens in a Hive, Etc.

FRIEND BYER:—The honey season has closed with a jolt in this locality. Bees have gathered only a fair surplus. Without an exception colonies headed with young queens did the best. A few of the best averaged 160 pounds each, and the rest all the way down to 25 pounds. Colonies that were considered weak in May gained up and did much better than those that were very strong. The latter swarmed in spite of all I could do, and thus cut down the surplus.

With the two-queens-in-a-hive system I had the following experience this season: In looking through a colony of Italians I discovered a young queen.

She was a worthless-looking little insect, so I killed her, and supposed that the old queen had previously been killed. There was an extracting super on this colony, and when I introduced a new Italian queen into it I lifted the super off and placed the cage between the top-bars of the brood-nest. I left the excluder off, and replaced the super. In 5 days I examined them again and found the old original queen with clipped wing in the brood-nest, and so concluded they had killed the new queen. Two days later I examined the extracting super and found the new queen had taken up her quarters there. I introduced the new queen later into a nucleus. The old queen is still living and doing good work, and I am wondering why they reared that young queen which I found in the first place. If they were trying to supersede the old queen why have they not tried it again? or do they only try that once in a season?

There was only enough basswood gathered to flavor the clover honey. I am feeding now to stimulate the queens. I have given up spring stimulating to a great extent, as I find that colonies strong with young bees in the fall do not require spring feeding. I have them strong to go into winter quarters by light feeding just after the flow.

The hint given in one of the bee-papers in regard to getting all-worker comb built from starters by weak colonies headed with a young queen, has been worth something to me. I made a number of 3-frame nuclei and gradually added frames of starters. Each colony drew out 7 frames of beautiful worker-comb. I did not feed them any, and they have abundance of honey. I tried the same thing with a weak colony with an old queen, and a fine frame of drone-comb was the result. I wish

I knew the *why* of some of those bee pranks.

H. A. SMITH.

Palermo, Ont., August 5.

You may be thankful, Mr. Smith, in having secured a crop of honey this year. Only in a few localities are bee-keepers able to report even a "fair" surplus, and in our immediate section we have scarcely any honey. To make matters worse, the weather has been so very cool and dry that buckwheat is not yielding anything and prospects now are that we will have to feed more for winter stores than what we have taken from the bees.

As to your superseding experience, quite possibly that old queen will fail before next spring, even if she is doing all right now. About 4 weeks ago I found a colony headed with a queen of this year's rearing, making arrangements for superseding. I broke down the two cells started, and up to the present they have not tried to supersede again. But I shall take note of that colony and see if the queen does not fail in the near future. Past experience leads me to think, that such is likely to be the case.

Yes, weak colonies headed by young queens will do fine work, by way of building worker-combs from starters, but, as you intimate, it does not work that way when old queens are in the hives. However, I am a little doubtful if it pays not to use full sheets of foundation even in weak colonies, especially if the bee-keeper produces his own wax for foundation, and does not have it to buy. Unfortunately with us this year, except during fruit-bloom, foundation in any shape would not be touched by the bees, and the 40 nuclei I started were got into shape for winter only by giving them combs of brood and honey from the old colonies.

## Different Methods of Liquefying Granulated Honey

BY C. C. GREINER.

Ever since I have been on the road selling honey, I have taken extra pains to inform and educate the honey-consuming public within my reach, in regard to the granulating process of all pure honey. But in spite of all my efforts along this line it is still the general belief that granulation indicates adulteration, and even those people, who know all about this natural change prefer to buy extracted honey in its liquid state. My endeavor to furnish such goods as the market calls for, has forced upon me a fair amount of experience in liquefying granulated honey, both in

retail glass packages and in the larger 60-pound tin cans.

Occasionally inquiries are made in regard to liquefying honey in glass jars. Well, here is what I know about it:

The most important feature of the operation is time—lots of time—but as little heat as possible. It is a job that can not be hurried, if we wish to retain the fine flavor of our honey. We must therefore take time by the fore-top, and begin in season.

After my honey is put up in glass cans, it begins to thicken, and look milky, as soon as colder weather sets in. This takes place, generally, during September, and, long before winter begins, every can, if let alone, would be as solid as a rock, figuratively speaking. But I don't give it the chance, if I

can help it, for as soon as it begins to look milky, I begin to remelt it. It takes less heat, and it can be more quickly done at that time than later, after it has had time to become solid. This, too, seems to answer all the purpose, for it will generally remain liquid all through the winter after this one treatment.

We have over our kitchen stove a shelf that holds one dozen quart cans. With the common firing for family use honey placed on this will liquefy, ready for closing the can, in about 24 hours. It is very essential that every granule should be melted to prevent granulation a second time later on. I always unscrew the top of each can a very little when I expose the cans to the heat. This may not be necessary. Years ago I liquefied pound-bottles in the same way without removing the corks, and it seemed to work just as well. However, I think it is better to give the packages a chance to "breathe."

As long as I have liquid honey on hand to supply the market, I keep this shelf only occupied with cans, changing whenever necessary, but later on, when the markets begins to call more regularly for honey, the shelf is too slow. To keep ahead of my orders, I use a two-wick oil-stove with a sheet-iron oven. (See illustration.) The latter accommodates two dozen cans at a time, and with the blaze turned so low that the cans can be handled comfortably bare-handed at any time, two batches can be liquefied in a day. This gives me a liquefying capacity, including the dozen on the shelf, of 5 dozen a day, more than enough to keep me supplied.

To liquefy 60-pound cans of honey is a very unpleasant job, the best we can make of it. They are too heavy to handle, with no chance, except the little wire loop, to get hold of them—they slip and slide like so much quick-silver. I aim not to have any 60-pound cans, or honey in still larger bulk, to liquefy. What I expect to sell in this shape is put up in these packages, but all the rest is put up in retail glass cans or tumblers at extracting time, or as soon as the honey is fit to be handled. But as we can not foretell the conditions of the season's trade, our plans and calculations do not always materialize just as we expect, and thus it happens that I have to liquefy more or less honey in 60-pound cans every fall or winter. In this case I resort to the hot water plan.

For the outside water receptacle I use the bottom-part of an uncapping can. This is a pan with square sides 10 inches deep. In the bottom of this I place a little wooden frame, and when the can to be liquefied is set on this, fill in the water. To supply the principle of "lots of time," the whole outfit is placed on the back part of the kitchen-stove a day or two before I intend to use the honey. As we use coal, and keep fire constantly day and night, the water is kept at about the right temperature all the time, so that when I am ready to do the putting up, the honey will flow readily from the can. If it is yet a little thick or milky at that time, I fill the jars just the same,

and let them have a turn in the little oven.

Formerly I always filled jars direct from the 60-pound cans, but of late years I have a better way. I empty them first into a large cream-pail—melting-pail, as I call it—holding about 85 pounds, which I had made for this purpose. It has a hoop of 1¼-inch band-iron soldered to the bottom to keep the latter from coming in direct contact with the stove, and at the same time prevent the honey-gate from striking on the level surface. The advantages of an implement of this kind are several. When filling jars, honey should always be drawn from the bottom. It may be free from all impurities otherwise, but the melting process produces more or less foam, which rises to the top, and thereby improves the appearance of the honey drawn from below.

Another point is worth considering.

GREINER'S RELIQUEFYING APPARATUS.

It is much more convenient to fill small packages from a honey-gate than from the opening of a 60-pound can. With the latter, try as we may, occasional spilling and mussing is almost impossible to prevent.

In cases of necessity the slow process of waiting a day or two for a 60-pound can to melt, may not be just the thing. To save time, the matter can be hurried considerably without running any risk of injuring our honey. We will suppose that the depth of our hot-water receptacle is only about one-half the height of the can to be melted. It is not likely that many of us are the owners of a suitable implement that will admit of submerging a can clear out of sight. In the first place, the temperature of the water can be raised a little higher, say to about 120 or 125 degrees. This is a temperature that a person's hand can bear a short time, but it may become a little uncomfortable after awhile. In about 3 hours the lower or submerged part of the honey will be melted enough so that it can be turned into the melting-pail, after a hole has been drilled by means

of a long knife through the upper part of the yet granulated honey. This having been done, the second step would be to screw up the can and replace it bottom-side-up in the hot-water. If the water has been deep enough to submerge one-half of the can, it does not take as long to melt the remainder as it did the first part, because during the melting of the honey below, all the rest has been slightly warmed.

The operation can also be performed in a reverse order by first placing the can in the water, top down. Then it can be turned out whenever it is melted enough to run, without being obliged to open a way through the upper part of the honey. To facilitate the handling of the can it is advisable, as a makeshift, to wrap a small rope—a piece of a clothes-line will answer the purpose—two or three times around the can, and tie with the usual half-bitch. This will make a much better lifting device than the frail, little wire-loop of the can.

As soon as the first can be emptied, a second one can take its place in the hot water. After once started, no time need be wasted; the work connected with our retail-packages, such as washing, labeling, filling, sealing, etc., will occupy our time while the honey in the next can is melting.

## Outdoor Wintering of Bees

BY C. P. DADANT.

I have received the following questions for reply:

MR. DADANT:—I wish to try wintering a portion of my bees on the summer stands, and as I am informed that you do it successfully, I trust you will be kind enough to give me your method of preparation. I want to know what you use, and how you use it. Do you use a honey-board? If you use enamel-cloth, how do you maintain a bee-space between it and the tops of the frames? And what else do you use and how do you apply it?  
Knox Co., Ill. F. B. HAZLETT.

We do not use any honey-board on our hives at any time. In the spring and summer months we use a cloth over the top of the frames, or over the top super, and a straw-mat on top of this cloth. In winter we remove the cloth, which is usually impervious to moisture, and use the straw-mat directly over the frames of the brood-chamber. We have never tried to use any device for a bee-space at the top. Perhaps a bee-space would be best, and, in this case the Hill's device is as good as anything. It is kept for sale by nearly all the dealers.

The straw-mat is not used by many people, and yet we would not willingly do without it. It is warm in winter, cool in summer, flexible and not easily propolized, even when left over the frames in the busy season. But at this time, the bees fasten it to the top of the frames and it is soon torn to pieces. So we have always used a cloth during the working season.

Our purpose, in using the straw-mat for winter, is to have a cover which will retain the heat and still allow the moisture to escape. This may be secured in the same way by the use of old woolen carpets. Two or three thicknesses

placed over the brood-chamber will absorb moisture while keeping the bees warm.

Some theorists on wintering bees have held that it is not necessary to have absorbents for moisture in the top of the hive, and that the bees will winter as well if the ceiling is absolutely air-tight. This is correct in ordinary winters—when the bees have a chance to fly once in every two or three weeks, or when an occasional day is sufficiently warm to allow the frost to thaw and the hive to become dry—but I have seen winters when the long, protracted cold weather caused such a large amount of moisture to accumulate in a hive where there was no upward escape for moisture or absorbents for this purpose, that the bees were practically soaked with the dampness produced by their own breath, accumulated during months of confinement. A ceiling which allows the moisture to pass into the cover, without permitting the escape of heat is positively the best for outdoor wintering. I believe that our successful cellar-wintering bee-keepers also approve of a slight amount of top ventilation or of absorbents, even in the cellar, though it is of less importance there.

Our method is to place forest leaves in the cap over the top of the straw-mat, but this is because we have the forest leaves handy in most of our apiaries. Anything else, such as chaff, woolen cushions, corncobs, or even dry shavings, will answer the same purpose. It is of some importance to have this material arranged so that it will not spill over the combs, when placing it or removing it.

As to the lower ventilation of the hive, it is of less importance. But if there is no top packing, a much larger amount of lower ventilation should be given, so that the moisture which may gather be enabled to escape or dry out. But with a good, warm packing above, only a small entrance-space need remain. Of course there should be no chance for mice to crawl in. They would disturb the bees much during cold weather, besides the ravages they might make in the unoccupied combs.

Weak colonies may be wintered on the summer stands, by covering them entirely with outside cases. An ordinary Langstroth hive could be covered with a dry-goods box. This keeps the bees much warmer than outside exposure. But the outside cover must be removed or thrown back in warm days so that the bees may be able to take flight. If they were confined during warm days, it would be fatal, as they worry a great deal when the weather is warm, if they cannot get out.

We aim to have our colonies as sheltered as possible on all sides, but the sunny side, and we want that to be the side of the entrance. So we try to face our hives as nearly south as possible, although a southeastern or southwestern exposure will do nearly as well.

When there is snow, we try to keep the bees quiet, especially if they have had a flight shortly before. But if the snow is thawing and the weather warm, it is better to let them fly, even if some are lost on the snow, than to

try to keep them confined. In very heavy snows, during the coldest months, we have often found colonies whose hives were entirely buried in the snow to go through all right. The only danger from the snow is, if it should thaw, and the water from it should afterwards freeze and close all the openings. When there are absorbents in the cap over a porous cover, there is air enough to be had through this to insure the bees against smothering. But when the snow melts, it should be cleared from the entrance and the alighting-board, for, if it is allowed to remain, it will make a large amount of water, and the bees will often get soaked in trying to go in or out. We want to see the entrance dry at all times when the bees are flying.

A good colony, of average strength, will usually produce enough warmth to thaw the snow at the entrance before the sun begins to act upon it. If the hive is slanting forward, as it should always be, it will not be difficult to clear the snow away and allow the water to run down and off the alighting-board, at the first rays of the sun, on any day when it is likely to be warm enough for the bees to fly. In cold weather, better let it alone.

As a matter of course, we must make sure, before winter, that our bees have enough stores for winter, and that the honey is of good quality. The ordinary amount considered necessary for wintering is 25 pounds. We would prefer 40 pounds, and in large hives we have nearer to this last quantity than to the first-named. If there is fruit-juice or honey-dew in the combs, it should be extracted. We have at times failed to comply with this requirement, but have always regretted it. It will always pay to remove fruit-juices, honey-dew or unsealed honey from the combs. The last, however, will not be injurious if the colony is not over-rich, as this unsealed honey will be consumed first. But we have seen winters, after extraordinary productive seasons, when unsealed honey at the lower edge of the outside combs remained late enough to absorb moisture and fill the cells to overflowing. This watery honey was death to the bees that consumed it during cold weather.

If the bees are in proper condition, a very ordinary colony will be able to withstand a very cold winter.

Hamilton, Ill.

## Where Do the Field-Bees Deposit Their Loads?

BY G. M. DOOLITTLE.

Under the above heading, on page 614, the Editor finishes up his little "sermon" in a way pointing toward a "scrap" between Macdonald and Doolittle. Now Doolittle wants no battle with any one, and he would not step in to interfere with this Macdonald-York matter at all, were it not that Doolittle is apparently misunderstood by one or both of them. And in order that I may be the better understood I will simply give the readers a brief account of how I find things

along the line of this controversy, "and leave it to each of the two gentlemen to convince the other that he is mistaken."

Up to the honey-flow, I work as far as may be to get all the brood possible in the combs. With a really good queen, I succeed in having 8 out of the 10 frames (of Langstroth size) used in a hive, filled with brood, and the other 2 from half to three-fourths full. With queens not up to this "good" standard, some have 6 combs full, 2 others from half to two-thirds full, and the remaining 2 with no brood in. If any queen, having a fairly good chance, does not come up to this latter standard, the hive containing her is marked, and she is superseded as soon as the harvest is over, unless I find out the condition of things so that she can be more profitably superseded before the flow of nectar commences.

With the first standard, all of the 10 frames are allowed to remain in the hive when the supers are put on; but with the second standard, and all colonies not coming up to it, dummies are put in to take the place of all frames not having brood in them, and in this way each colony is compelled to labor in the sections according to the population they may have. In this the reader has one of the "kinks" Mr. Macdonald speaks about.

If all of the combs was left in the hive, where a colony did not have brood to an amount greater than 6 combs full, little or no section honey could be secured, for the first deposit of honey (*not nectar*) would go into the combs in the brood-chamber, and with this "start-out" the combs would contain the "bank account" and the sections little or nothing. But with only brood in the combs of the brood-chamber at the commencement of the honey harvest, the bank account is sure to be in the sections. Here I say "only brood." Mr. Macdonald quotes me as saying combs "literally filled with brood." Without taking time to look up the matter, I will say that I doubt not that he quotes me correctly, for, as the editorial hints, I am given to emphatic statements.

Now, just what do I mean by combs or frames containing only brood, or literally filled with brood? In general terms, just what is needed for the brood. I very much doubt whether a square foot of comb was ever seen not having a single cell in it unoccupied with brood. In other words, the best frames of brood will have, here and there, scattered about among the cells, one or more which do not have an egg, larva or pupa in them, while the average frame of brood, at the time of the commencement of the flow of nectar, will contain cells to the number of several hundred with pollen and thin honey, scattered all about among the brood, needed for the immediate demands of that brood, and the *every-day* use of the colony. This they must have. If they do not, no *bank account* will ever find the credit page for that colony, either in the combs or in the sections.

There is a great difference between a *brood-nest* and a *brood-chamber*. What I want you all to see is that, if we

would secure the *very best* results, the brood-nest *must fill* the brood-chamber, and when such is the case that brood-chamber is literally filled with brood, or has in it *only* just what is necessary for the every-day wants of the brood. If the brood-chamber is only partly occupied with the brood-nest, at the time of the commencement of the honey harvest, then that honey *not* needed for the daily wants of the brood, which is brought in from the fields, goes into the part of the brood-chamber *not* occupied by the brood-nest, and thus the brood-chamber becomes the "bank" in which the surplus is deposited, and not the sections:

If we are working for extracted honey, and put on supers of empty comb, then there is little need of working so hard to have the brood-nest occupy the *whole* of the brood-chamber, for bees will enter a super filled with empty extracting combs and deposit their surplus there nearly, if not quite, as quickly as they will place the same in empty cells on the outside of the brood-nest. But to go into a super, all cut up into little section apartments, having separators for partitions, and comb foundation in each section, instead of empty comb, the case is altogether different, and we must work accordingly if we are to secure good results from our bees.

With this long preliminary, I come to the matter of "Where do the field-bees deposit their loads?" Surely, not in the cells of the combs, either in the brood-nest, brood-chamber or in the surplus apartment of the hive, if my observations count for anything. I have stood, sat, and lain by the side of an observation hive for minutes, and hours, till these will count into days, and I never yet saw a single bee coming in from the field with a load of nectar, deposit the same in the cells of the comb. The loaded field-bee seeks out a young bee—one less than 16 days old, or those which do the work inside of the hive, when a colony is in a normal condition—and the load of nectar is given to this inside worker, and the sac of this inside worker holds that nectar until it is sufficiently evaporated for depositing in the cells, unless more comes in from the fields than the sacs of the inside workers can contain. When this happens, then this thin nectar is deposited in the cells, generally in those scattered about amongst the brood, so far as they will hold it, as the nurse-bees use this thin nectar or honey in preparing the chyle for the larvæ. If the vacant cells in the brood-nest will not hold the surplus of nectar, above what the sacs of the inside workers can contain, then these inside workers deposit it anywhere that vacant cells, not containing evaporated nectar (or what has now become honey), can be found.

In an abundant yield from basswood, I have seen such nectar deposited in a comb left standing near the entrance of the hive on the outside, when on shaking the bees off this comb, the thin nectar would fly out of the cells the same as it will during a good flow from the brood-combs. And it is not necessary to have an observation hive to prove this

part of the matter. Just supersede a black queen with one of the golden Italians about a month before your expected flow of nectar, so that at the time of nectar you will have black field-bees and yellow inside workers, and you will see the black field-bees giving their loads of nectar to the golden young bees when they are on a comb you hold in your hands, just taken from the hive.

Now for another simple proof: At 10 a. m. look at the entrance of any hive where such an exchange of queens has been made from 28 to 36 days previously, and you will see only black bees coming in with loads of nectar. Now open the super of sections and look for black bees depositing their loads in the combs. Surely they will be doing this, if the old ideas of the bees working their way from the fields up through the crowded mass in the hive so they can deposit their loads in the supers, was correct; or that an entrance was needed in the super so that the field-bees could go direct to the sections to deposit their loads. But instead of finding black bees there, if the date be 36 days after the golden queen began to lay, you will find 9 out of every 10 bees in the sections are as yellow as gold, and all transparent from the loads of nectar from the basswood blossoms their honey-sacs contain.

Now, Messrs. Macdonald and York, I am not in this fight of yours. If either of you can get any good or comfort out of the above, or if the readers of the American Bee Journal get anything out of it which will be of benefit to them, I shall feel well paid for the part I have taken in the matter.

Borodino, N. Y.

## Some Practical Don'ts for Bee-Keepers

BY E. W. ALEXANDER.

While we are so free to tell the inexperienced what they should do in order to succeed, would it not be well to remind them of some things they should *not* do?

### INVENTING HIVES.

First, don't spend either time or money in trying to construct a new form of hive—not but that there are some serious faults in nearly all of our standard hives, but let the experienced bee-keeper remedy those faults.

### MANAGEMENT OF WEAK COLONIES; HOW TO PREVENT ROBBING.

Don't allow your bees to acquire the habit of robbing. Hundreds of weak colonies are lost annually by this provoking habit which is frequently caused by the neglect of their owner. One of the worst features of taking bees from their winter quarters, a few at a time, is that it almost invariably starts robbing. The colonies that are taken out first, and have had their cleansing flight, being well located are in prime condition to attack every colony that is taken out later, and before they become located the bees from those that were taken out first have full swing at their

less fortunate neighbors. In order to prevent this costly and unpleasant state of things, where you have to set out your bees at different times, first contract the entrance of every colony; then as soon as you find a colony that is being robbed, even though it is only just started, close it up and keep it so for several days; then if they have any brood, set them on top of a strong colony with a queen-excluder between. If they have no brood, and still have a queen, give them a comb containing brood from some other colony.

In putting two colonies together in this way don't disturb either of them any more than you can help, especially the stronger one. If you keep a close watch on your apiary, and treat them as above described, you can save nearly all of your weak colonies with but little trouble, and at the same time prevent your apiary from getting into that demoralized condition which they frequently do when they find several weak colonies which they can over-power with but little loss of bees.

### CAUTION AGAINST MAKING INCREASE TOO RAPIDLY.

Then the desire for more bees is almost sure to tempt the inexperienced to divide his colonies to that extent that they are almost worthless, either for surplus or to try to winter. So, don't make your increase too fast. If you do, you will not only lose your prospect of securing a fair surplus, but the chances are that you will lose many colonies during the following winter.

### KEEP GOOD BEES AND PRODUCE GOOD HONEY.

Then don't be contented in keeping bees that are not good honey-gatherers. This is the principal thing we keep bees for; and if they fail to give us a good surplus when they should, supersede their queens with queens of a good honey-gathering strain.

Then don't produce poor-looking comb honey. You have no more excuse for producing poor stuff than the dairyman has for producing poor butter; but produce a quality that you will take pride in stamping on every package of it your name and address.

Don't set your bees in a place where they will annoy the public. Either keep them where they will not disturb any one, or sell them and go out of the business.

Don't allow drone-comb in any hive except one or two, and see that these hives have choice breeding queens. There is no more profit in keeping a colony of bees where a large percent of their combs is drone-comb than there would be in keeping a poultry yard of roosters.

Don't allow kingbirds, skunks, toads, and snakes to hang around your apiary. If you do they will weaken the working force of every colony.

Don't think that bees will give you good results in either increase or surplus honey if you neglect them and fail to do your part. The day is past when the word "luck" has any bearing on bee-keeping. The man who conducts his business in a careless, slipshod way, taking it for granted that this and that

will come out all right, is only fooling himself; and the sooner he realizes it to be a fact, the better for all concerned. So, don't try anything of the kind, but look close to all the minor parts; and when you have united them into one fine method for practice you will be well rewarded for your study and perseverance.

Don't spend any time in worrying over the frequency of poor seasons, but spend your time in preparing your bees to make the most they can of any kind of season that comes, then you will be almost surprised to see how few poor seasons there are. We have not had a really poor season in 25 years, while some of my neighbors complain of a poor season nearly every summer.

#### SECOND-HAND HONEY-PACKAGES.

I almost beg of you not to buy second-hand packages to ship extracted honey in. I don't know when I ever read better advice than Mr. Muth gave us a short time ago on this subject. Don't use those poor packages. If you do, you not only bear down the market price of honey, but you indirectly raise the freight-rate.

Don't bother with starters of comb foundation in your breeding or extracting frames; but put in full sheets of foundation and prevent your bees from building that worst nuisance of the apiary—namely, drone-comb. The man with a few colonies may have time to fuss with starters; but if you have many hives to care for, the sooner you cut out this starter business, and the shifting around the apiary of brood, the better it will be for your net income. The earlier in the spring you can have every hive in your apiary, and every comb in those hives filled with worker-brood, then keep them so to the end of the season, the less reason you will have to worry about poor honey seasons and over-stocking. We have never had a strong colony of bees backed up with a hive full of worker-brood fail to give us a good surplus.

#### PREPARING FOR WINTER.

Don't neglect to prepare your bees early in the season for winter. This part of the business should here at the North be all finished before September 10. To a certain extent we are preparing our bees all summer for the next season; then when the final finish comes, the last of August, we have but little to do, and I am sure that they will winter with less loss if they have a chance to quiet down and are undisturbed during the fall months.

Don't try to winter weak colonies. If you are anxious to save all you can, then feed them syrup made from granulated sugar as soon as the harvest commences to close, so as to keep them breeding until they are strong in bees. If you attend to them in this way they will often be your best colonies in the spring; but if you can not do this you had better unite two or more together in the fall; for a weak colony in the fall is usually a dead one in the spring.

Don't try to winter a queen the third winter. I am sure it doesn't pay. She is almost sure to die, either in the winter or early spring; and if she lives

she is so slow to start brood in the spring that you will have a weak colony until mid-summer; and it will require more valuable time to build it up than three queens would cost.

Don't fail to keep your bees as warm and comfortable as is possible during the first four or five weeks after taking them from their winter quarters. We contract the entrances of all colonies to  $\frac{3}{8}$  by 1 or 2 inches. In doing so it prevents robbing to quite an extent, and helps them to enlarge their brood-nest, which is very important at this season of the year. We also try to retain all the heat we can at the top of the hive. We put a piece of canvas first over the top of the frames, then a board under cover, cleated so as to form two dead-air spaces; then our outside telescope top, which is kept well painted so as to prevent any rain from entering the hive. You may think this is taking more pains than is necessary. We think it has much to do toward helping the bees to give us a nice surplus during the summer.

Don't put your bees into winter quarters that will subject them to unnatural conditions. If you do you will lose many colonies, both during the winter and spring. It is almost impossible to save a colony that has been poorly wintered. We may talk and write of the thousand and one different things connected with successful bee-keeping; but when they are all summed up the whole combined is not of as much importance as perfect wintering. We could make more money the following season from strong colonies when taken from their winter quarters if they were in nail-kegs than could be made from little, weak, sickly colonies in the best hive that was ever constructed.

I will close by saying, before I run off on the subject of wintering, that close attention to all things connected with your bees is the magic word that unlocks the door to success in bee-keeping.—Gleanings in Bee-Culture.

### Feeding Bees Diluted Honey and Sugar Syrup for Winter Stores

TRANSLATED BY J. G. BAUMGAERTNER.

Coming across an article on some very interesting experiments along the lines of winter feeding with diluted honey and sugar syrup, by Mr. J. H. Clasen, of Wisconsin, in the *Acker und Gartenbau Zeitung*, I think it worth while to translate it for the benefit of the readers of the *American Bee Journal*. Mr. Clasen says:

"In writing this I am well aware of the opposition I shall arouse, for most apiarists consider this method of feeding bees as objectionable, and detrimental to the health of the bees. Yes, even more. Until recent years I have myself held the erroneous idea that such feeding was an impossibility, until I have been convinced by repeated tests, that this way of feeding is entirely harmless, and under certain circumstances even recommendable.

"In order to place my experiments and their results or failures plainly before my readers, I am obliged to reach back.

"About 16 years ago an old apiarist told me that in his home in Bohemia, many bee-keepers feed their light colonies in mid-winter by filling a wine-bottle with diluted honey, tying a coarse cloth over the mouth of the bottle, and inserting this bottle, mouth downward, into a hole in the top of the hive where the bees had access to it.

"This matter seemed worth a trial, and having 2 colonies in the apiary in a condition that made their ability to pull through doubtful, I soon proceeded to try on them this method of feeding. They both stood on the south side in an open house-apiary. I wrapped the bottles in cloth to protect them against freezing. The bees really took a part of the food, but as, in spite of the wrapping, it cooled off too rapidly, they could not take it all. Both colonies died the following spring from dysentery.

"A few years later I conducted another experiment. This time I made preparations for it in the fall, by cutting a hole about 3 inches in diameter in the honey-boards on the hives intended for the experiment. The circular blocks cut out of these boards I nailed on a 5x5-inch piece of board each, and replaced them in the opening. The bees soon closed the saw-kerf with propolis, leaving the honey-boards practically sound. The hives were now placed in protecting-cases, with chaff-packing, and a super put on the hive when the hood of the protecting-case was put on.

"That winter I used 1-quart Mason fruit-jars for feeding. I filled the jars with two parts of extracted honey and one part of warm water, tied a piece of coarse linen over the opening, inverted the jars, and set them in the holes in the honey-boards. I re-heated the food by wrapping a few hot bricks and placing them in the super around the jars. As near as I could judge, the bees were near starvation when the food was given, and they took it all down in 24 hours. But also the results of this experiment were no success, for in a few days the hive-entrance was almost clogged with dead bees. They were fed three times during the winter, and after every feed I found a number of sticky, dead bees on the bottom-board. The surviving bees in these colonies (I had fed several) came through the winter in a very weakened condition, and, in spring, showed signs of dysentery.

"Discouraged by the non-success of this experiment—from which I had anticipated good results with a high degree of certainty—I ceased all further experiments with liquefied food in outside-wintered colonies. And I believe, even now, that this method of feeding outside-wintered colonies is ill-applied.

"Still, I have reaped some benefits from these tests, for my attention has thereby been called to the convenient way of feeding bees by means of a jar, and I have since fed all my colonies with the above-mentioned hole cut in the honey-board. In performing the after imperative spring feeding, I simply set a jar of warm food (closed as above) inverted into the hole in the

# American Bee Journal

honey-board on the hive, and wrap an old cloth around it. In warm weather this is sufficient protection. However, if the weather is cool and windy, I put on a super and slip the hood down over it. In mild weather the bees take the food down in a few hours. I also use this method when feeding in the cellar, of which I shall now speak.

"A few years after my unsuccessful experiment, I read in foreign papers that bee-keepers water their bees in winter. I concluded that if that disturbance did not harm them (I erroneously thought that the cause of my failure was due to the disturbance of this feeding to the bees), no harm can come from adding some honey or sugar to the water, thus feeding the bees at the same time. I now have a well-equipped, dry bee-cellar, and had, in previous years, fed the cellared bees liquid food; but never before near spring and after a previous cleansing flight. I now concluded to try this feeding before a cleansing flight, in winter.

"For this purpose I took, in the fall of 1904, 3 colonies into the cellar, each having about 10 pounds of honey. On Feb. 1, 1905, I gave each of these colonies about a quart of a mixture consisting of two parts clover honey and one part water. The bees took this food in about 6 hours, and remained very quiet in the dark cellar. In 2 weeks this was repeated with the same results. About 3 weeks later I gave each colony about 2 quarts in 2-quart jars. This time it cooled before the bees had taken it all. After the jars were about half empty, I took them, heated the food, and then returned it to the bees, when in about 24 hours the last drop was taken out of the jars.

"On March 28, 1905, these bees were taken out of the cellar. They had brood in all stages, and no sign of dysentery noticeable. However, they had to be fed once more during spring. But they were the first of 91 colonies wintered, to cast swarms. One of these colonies swarmed on May 28—unusually early for this locality.

"Encouraged by these results, I purposely placed 16 light colonies in the cellar, in the fall of 1905. The amount of honey present in these colonies varied from 10 to 12 pounds. The first feed, consisting of 2 parts of white sugar and one part of water, was given them on Feb. 14, 1906. I gave each colony a quart of this mixture. In about 2 weeks another quart of sugar syrup was given each colony. This time 2 of the colonies refused to take the food, the remaining 14 colonies taking it in the usual way. About the middle of March the feeding was repeated, and at the end of March once more. In all, these 16 colonies were fed about 145 pounds of sugar syrup. Since about 1-3 was water, the cost of wintering the 16 colonies was about 6 pounds of sugar and 11 pounds of honey per colony.

"On April 2, 1906, these colonies were taken from the cellar. The two colonies which, after the first feeding, refused to take more food, were found very weak in number of bees, but the other 14 colonies were in excellent condition, and swarmed very early. Each

of these colonies was in every respect equal to any of the other 91 colonies wintered on combs of honey. Last fall, I placed several exceedingly light colonies in the cellar and began feeding very early. I shall report the success or failure next spring."

New Memphis, Ill.

## The Cause of American Foul Brood

BY DR. G. F. WHITE, PH. D.,  
Expert in Bacteriology.

For several reasons much confusion exists as to the present status of our knowledge of bee-diseases. It is hoped that this circular will give information which will to some extent clear up the subject of American foul brood from a bacteriological point of view. The symptoms of this disease are given in Circular No. 79 of the Bureau of Entomology, entitled, "The Brood Diseases of Bees." American foul brood is the prevalent disease in America, and, judging from reports received from Europe and from descriptions in European bee-journals and books, it is the prevalent one there. There is another diseased condition, which Cheyne examined, and to which we now refer as "European foul brood."

When the author began his work on bee-diseases, in the summer of 1902, he observed, in combs containing American foul brood, in the dried remains of the dead larvæ, known as the scales, a very large number of spores which failed to grow when inoculated into the media ordinarily used in the laboratory. It was clear, then, that these spores are not *Bacillus alvei*, and that this disease is not the "foul brood" of Cheshire and Cheyne. The following year the study was continued and a medium was devised in which the spores found in this disease will germinate. This medium consists of an agar made by following the directions ordinarily used in the laboratory, with the exception that bee-larvæ are substituted for meat. By the use of this medium were obtained pure cultures of the micro-organism which is found so abundantly, in the form of spores, in the dried scales of American foul brood.

In reporting these findings the author referred to this organism as "*Bacillus X.*" Further study was subsequently made, and the species was given the permanent name *Bacillus larvæ*. The description of this species may be found in Technical Series No. 14 of this Bureau. In his publications the author has made no claim that *Bacillus larvæ* is the cause of American foul brood, but has made the statement that it is found to be present in all the samples of this disease which have been examined by him. No inoculation experiments were made, for the reason that sufficient cultures in suitable condition could not be obtained from any medium then known.

Since the media used in former investigations are not suitable for obtaining cultures for purposes of inoculation, in taking up the further study

it has been necessary to devise a medium which would be satisfactory in this respect. Such a medium has been discovered, and large amounts of the culture suitable for experimental inoculations have been obtained. This medium is prepared and used as follows: Healthy bee-larvæ or young pupæ are picked from the comb, crushed, strained through cheese-cloth, diluted with 20 to 50 times their volume of water, filtered through ordinary filter-paper, and then passed through an earthenware filter (the Berkefeld filter is satisfactory) to remove any bacteria which are present. The sterile filtrate thus obtained may be filtered into tubes or flasks and stored until needed. When *Bacillus larvæ* is to be isolated, a tube of the ordinary agar of the laboratory is liquefied and cooled to 45° or 50° C. Then about c.c. of the filtrate mentioned above is added to it. A very small amount of the decaying larvæ affected with American foul brood is then added. The procedure from this point is as usual in making agar plate cultures; these plates are afterward incubated. When a large amount of culture is desired for experimental purposes it is convenient to use the ordinary agar medium in large test-tubes to which has been added, as above, about 2 c.c. of the sterile larvæ filtrate. These agar tubes are then inclined and the surface of the congealed agar is inoculated. In no case should the larvæ or filtrate reach a high temperature. The object, of course, is to obtain a medium which contains the food constituents which are afforded the bacteria in the living larvæ.

Inoculation experiments have been made by feeding to a healthy colony the scales from combs which had contained brood affected with American foul brood. The result of the feeding was that the colony became affected by disease, the symptoms of which were the same as those observed in the apiary where American foul brood is found. Like symptoms have been produced by feeding scales which had been put into ordinary meat bouillon, incubated for twenty-four hours, and then heated to 65° C. for twenty minutes.

On microscopic examination of the decaying larvæ dead from the disease thus produced experimentally, the same large number of spores and rods are seen as when samples are examined which are taken from an apiary affected with American foul brood. From these dead larvæ pure cultures of *Bacillus larvæ* were obtained from plates, using These experiments show that by the feeding method the disease may be produced and that the contagion is found in the scales. The second experiment tends to indicate the cause of American foul brood as found in the scales is not killed by heat at 65° C. applied for twenty minutes.

Up to the present time there is no authentic record of this disease having been produced by experimental inoculations of pure cultures.

Knowing that by the feeding method the disease may be produced, pure cultures of *Bacillus larvæ* have been mixed with sterile sugar syrup and fed to healthy colonies with the result that

the disease appeared in the colonies within 3 weeks with symptoms identical with those produced by feeding the scales of the disease. In theropy brown mass of the decaying larvae in the disease which is produced experimentally by feeding pure cultures of *Bacillus larvae* there are found the same large number of spores and rods as when the disease is found in an apiary. Pure cultures of *Bacillus larvae* have been obtained from the larvae dead from the disease produced experimentally by feeding pure cultures of *Bacillus larvae*.

Some European investigators of brood diseases omit the symptoms so that it is impossible to tell which disease they are investigating. Their descriptions of micro-organisms also are entirely too brief. These facts have led to much confusion, and they necessitate much additional work on the part of other investigators. They have also added to the present confusion. From what can be gained from their papers, the author is inclined to believe that Burri has been working with *Bacillus larvae* and has been referring to it as the "bacillus difficult of cultivation;" that Maassen has been working with *Bacillus larvae* and has been referring to it as *Bacillus brandenburgensis*, and that von Buttell-Reepen has referred to *Bacillus larvae* as "*B. burri*." It is hoped that this confusion may soon cease to exist.

In the study of *Bacillus larvae* on this new medium some interesting additional facts have been observed in the morphology and cultural characters of this organism which will be given in a bulletin from this Bureau in the near future. One fact is mentioned now because it seems to have caused one German investigator, Dr. Albert Maassen, to fall into error in the interpretation of certain findings. This fact is that this species, *Bacillus larvae*, produces a large number of giant whips. (Giant whips are at present believed to be in some way a modification of flagella, the motile organs of bacteria.) These giant whips appear in pure cultures of *Bacillus larvae* and persist there for a long time. The structures which Maassen evidently saw and reported in two different publications, naming them *Spirochaeta apis*, are nothing other than giant whips which normally belong to *Bacillus larvae* and which are formed by the growth of *Bacillus larvae* in the larvae of the bee.

Maassen seems to have no further evidence that the structures which he saw are spirochetes than what could be gained by a microscopic examination of the remains of the dead larvae which had suffered from this disease. The appearance which he interprets as a spirochete in the process of division can be seen in the giant whips obtained from pure cultures of *Bacillus larvae*. These giant whips are found in the decaying larvae which are dead from American foul brood experimentally produced by feeding pure cultures of *Bacillus larvae*.

The author has observed these structures in a large number of examinations of American foul brood, especially in

the hanging-drop preparations made directly from the dead larvae. There is nothing else contained in the dead larvae which can be seen that resembles a spirochete, and since Maassen made no mention of the giant whips found there so abundantly, it is quite certain that he has made this mistake.

This preliminary note will be followed by a bulletin which will contain in full the results of recent investigations by others on the brood disease of bees and a detailed account of the work done here.

The results may be summarized as follows:

(1) In previous publications the author has made no claim that *Bacillus larvae* is the cause of American foul brood.

(2) A medium has been devised by which cultures of *Bacillus larvae* may

be obtained in large quantities suitable for experimental inoculation. This medium consists of the sterile filtrate obtained by diluting and filtering the crushed bodies of bee-larvae through a Berkefeld or other fine filter.

(3) American foul brood has been produced by feeding pure cultures of *Bacillus larvae*, and the symptoms of the disease are the same as those produced by feeding the scales of this disease and as those observed in the apiary where colonies are affected with this disease.

(4) The structures described by Doctor Maassen, of Dahlem, Germany, as spirochetes and named by him *Spirochaeta apis* are not spirochetes, but normal structures produced by the growth of *Bacillus larvae*. These are known in bacteriology as giant whips. Washington, D. C.

Conducted by LOUIS H. SCHOLL, New Braunfels, Tex.

### Shallow Divisible Hives—What Depth Should They Be?

Mr. LOUIS H. SCHOLL:—I have been interested in your mention of the divisible-brood-chamber hive. I have used principally the 8-frame dovetail for an extracted-honey hive, and like it quite well. But for a few years I have used some hives that were the same size except that they are just 7 inches deep. I like them, and think of putting in an entire apiary in that size of hive. One or two of them make a good winter hive, and in the honey season I would tier up as far as necessary. I think the bees ripen a super of these combs so that only ripe honey will come from them better than they will supers of greater depth. I would like to know what objection you would have to this depth in comparison with the one you are using?

I hope to get out to Texas some day to see the country, but it is so big I fear I would not get over much of it.

Referring to the above, I think of using Hoffman style of frame, closed-end only 2 or 2½ inches. What would you recommend?

HARRY LATHROP.  
Bridgeport, Wis., May 16.

Localities differ! So do bee-keepers! Yet, I do not think that locality makes much difference with some kinds of hives, as some are more adapted to all kinds of localities than are others.

The right kind of management must go with the hive, however. Do not try to handle shallow, divisible, brood-chamber hives like you would a deep-frame hive. Leave the handling of combs behind, and handle the shallow chambers.

The combs need hardly ever be handled except when the honey is to come out of them in the extracting house. You would not handle sections individually, and brush off the bees in the apiary, but take off by supers full.

The 9-inch depth hive is too deep for me to accomplish just what I want. I have tried it, and the Danzenbaker and Acme hives. It is very rarely that I use only one section, (as I call all of my shallow hive-bodies), for a brood-nest, except once in a while for living shaken swarms; but even then an empty one is placed beneath it and soon becomes half of the brood-chamber proper. Two or more sections are always used throughout the greater part of the entire season, and for the majority of my colonies. The bees generally winter in 3 sections, the upper one containing honey.

The ideal sections I use for my hives are the regular shallow extracting supers on the market, with shallow 5½-inch deep Hoffman frames, V-edge end-bars, the kind I would recommend after trying all kinds of frames thoroughly. The only trouble with these regular-style frames is that the top-bars are too wide. I am using and prefer one only ⅞-inch wide and ½-inch thick, full, and no groove for inserting foundation, as this only weakens the top-bars. The groove is not needed for fastening foundation, especially since our frames are used again and again in bulk comb-honey production, after the comb has been cut out. This should cheapen the frames all around, as they are easier to make than those put out now. I shall have several thousand more made this fall.

# American Bee Journal

Such a depth frame will take regular-sized sheets of super-foundation to fill them, and saves bothering about odd-sized foundation often causing much worry. In fact, our idea should be to have everything of standard size, so that we can get it whenever and from wherever we want it.

The 10-frame hive is to be preferred for all localities in the South, and I would use the 10-frame divisible brood-chamber hives in the North, for these can be made into the largest hives, or contraction can be practised at will, and better results obtained than with an 8-frame hive. Two of the sections for a brood-chamber, as I am using them, are just the same size as the Dadant hive, or the Draper or Jumbo barns. The advantage over these I claim to have, is that I can manipulate my brood-chambers and accomplish results that can not be obtained with deep-frame hives.

Two of the sections make an ideal shaped hive for winter, deeper than the Langstroth. As spring advances and honey comes in freely from fruit and other bloom, room is given, *not on top*, causing the bees to clog the brood-nest, but a section of empty combs is slipped in between the lower and upper sections of the brood-chamber, thus moving the upper one, already partly filled with honey, to the top as the super. Here it is completely filled later, and the bees remodel their brood-nest in the two lower sections.

If this is done just preceding the swarming period it will knock swarming in the head to a greater extent than anything else I have been able to find. The secret is to break up the solid mass and crowded condition of the brood-nest, and I know of no better and easier way than simply to slip a section of empty combs between the two halves of the brood-nest. It provides laying-room for the queen, and room for the bees, and you have stronger colonies instead of swarms.

And when the early white honey-flow comes the brood-nest is in an ideal condition for it—free from honey, which has gone up into the super, and filled with brood. Now, the comb-honey super with foundation is given—*not on top*, but again in between that ideal brood-chamber and the full, shallow extracting super. The bees are used to storing above, there's no honey in the upper part of the brood-combs, and you had provided breeding room for a strong colony for this flow. So what happens but that the bees go to work immediately, and with a vim not possessed by colonies treated in the old way? And is there any better way to accomplish this? Can it be done so satisfactorily and easily with any of the deep-frame hives? I can not do it.

Yes, and when removing honey, more all-ripe honey can be removed sooner, and a better quality can be produced, especially of bulk comb honey, as much thinner foundation can be used in full sheets, or if starters are used, less drone-comb is built, which is very "gobby" in comb honey. For extracting combs I prefer them. They are easier to free from bees, easier to uncap, and

two of them go into the 11-inch baskets of the extractor.

After reading my manipulations thus far, you will readily see that anything deeper than my sections would be too deep. There's too little difference between the 7-inch and the Langstroth. A 10-frame 7-inch section would be too heavy for one when full; too deep for me, as, in the majority of cases, it would be too much room to give at one time to obtain best results, especially for slipping between the sections of the brood-chambers in spring.

Then, a 7-inch extracting super left on top would take too much honey to fill before the white honey-flow before the bees work in the comb-honey supers. And, again, two of the sections then comprising the brood-chamber would be too deep, and much of the white honey would go into the upper brood-combs.

There are other reasons why I prefer the shallower hives.

## The Death of L. Stachelhausen

Through the death of Mr. L. von Stachelhausen, the bee-keepers of Texas, and of the entire bee-keeping world, have sustained an irreparable loss, and never before have the Texas bee-keepers mourned a greater loss. Mr. Stachelhausen had a world-wide reputation among bee-keepers, not only contributing much to the literature on bee-culture of this land, but in Europe also.

L. STACHELHAUSEN.

His loss will be felt there as much as here in our own country.

Ever ready to impart information, and to lend assistance to further his beloved pursuit—apiculture—he gained the friendship of all who knew him. He was ever an active member of the Texas Bee-Keepers' Association, and its members feel greatly the loss of a fellow bee-keeper and a friend from their midst.

At the last meeting, in July, at College Station, a half-hour memorial service on the forenoon of Wednesday, the 24th, was held by the convention in commemoration of his death and his departure from among those who held

him in their highest esteem. He was praised and honored by all who knew him, and the following resolutions were adopted:

"WHEREFORE, It has come to the knowledge of our Association that our beloved friend and brother bee-keeper, L. Stachelhausen, has very recently been removed by death from our midst, we deem it the bounden duty of this Association to make some fitting memorial; therefore, be it

*Resolved*, That we, the Texas bee-keepers in convention assembled, bewail the loss of our esteemed, brilliant and honored member, and while we deem it an irreparable loss to the Texas bee-keepers, as well as to the bee-keeping world, we bow our heads in humble submission to the will of the Great Ruler of the Universe, who doeth all things well.

We would illuminate the life of our deceased brother in that he lived a life of honor, usefulness and sobriety; that he was a lover of the cause and calling he had espoused; that he lived a life of devotion wholly for the good of others. It was always his pleasure to attend our meetings, and today we miss his kindly face, we fail to hear his cheerful words, and a vacant chair stands among us. It is also

*Resolved*, That a copy of this resolution be spread upon a page of our minutes and that that page be bordered in black; and that a copy of it be also sent to the bereaved family, and to the various bee-papers for publication.

Respectfully submitted,  
LOUIS H. SCHOLL,  
W. H. LAWS,  
C. S. PHILLIPS,  
*Memorial Committee.*

## How Does the Queen Fertilize the Eggs?

This question has not yet been answered. It has been held that compression on the queen's abdomen in the act of laying will cause fertilized eggs to be laid, but I do not believe that there is anything in it. There are several reasons for this. First, when a queen lays in newly-built comb with cells only  $\frac{1}{8}$ -inch deep, there can, of course, be none of that so-much-talked-about compression of the abdomen. Neither is there such when eggs are laid in queen-cells, most of which are very wide-mouthed and shallow when the egg is deposited in them.

In a recent issue it was hinted editorially that perhaps the depth of the cell has something to do with the position of the queen when laying. It was thought that there may be something in this as regards the difference in depth of drone-cells and worker, the latter being shallower than drone-cells. As the writer had never seen that eggs were laid in shallow drone-cells or before they were fully drawn out it might be true.

But, are not, in most cases at least, the cells of a comb all of about the same depth as long as they do not yet contain brood, the drone-cells being later drawn out longer than the worker

# American Bee Journal

when the brood is capped? Then, too, I have seen eggs laid in drone-cells considerably shallower than the worker-cells on the same comb; the drone-comb being in batches at the lower corners where the comb is generally more or less rounded off.

And, again, I have seen eggs in newly-built drone-comb with cells only  $\frac{1}{4}$ -inch

deep, and the cells were only later drawn out full-depth. Anybody can try this during early summer, when the queens are anxious to lay drone-eggs, by simply giving an empty frame in the brood-nest.

And all this goes against the "compression of the abdomen" theory, and that of the different depths of the cells.

## PREVENTION OF SWARMING.

E. F. Atwater gives in *The Bee-keepers' Review*, the Rauchfuss or Aikin plan of preventing swarming, which Mr. Rauchfuss says will give more honey than any other plan—at least for arid belt conditions—the chief fault that Mr. Atwater finds with the plan being that sometimes a colony is left hopelessly queenless by the failure of the virgin to return safely from her wedding trip. He says:

"Put most of the brood in the lower story of the hive, on this a queen-excluder, on this a second story, with one frame of bees, brood and the queen, the balance of the combs empty or containing some honey.

"Brood-rearing will leap ahead in this upper story, receiving the heat from the mass of brood and bees below. The bees can't swarm, as the queen can not pass the excluder. Nine or 10 days later, set the upper story containing queen, bees and new brood, off to a new stand. The hive on the old stand now contains only sealed brood. Destroy the queen-cells, if any, give a ripe queen-cell, or run in a virgin queen, and put on the supers. The bees will not swarm, as they have no eggs or larvae from which to start queen-cells.

"As soon as the young queen begins to lay, the honey will go up into the supers in a rush. For some conditions the method may be better than forced swarming as usually practiced; for the hatching brood reinforces the field-force for about 10 or 12 days after the old queen and her hive of new brood is removed to a new stand."

## VALUE OF PROTECTIVE SURROUNDINGS.

Over at Port Huron, where I met my Waterloo last spring, there was a sheltered nook at one corner of the yard. The wagon-shed, the barn, a high board-fence, and one or two big apple-trees, all combined to shut off the cold north or west winds. Scarcely a colony perished in that sheltered nook; and even of those that lived, not one was as strong, when I moved them away, as were most of the colonies in the sheltered corner of the yard. Away out in the field, beyond the influence of this shelter, scarcely a colony was left alive, and those were weaklings. It seems strange that some of us are so long in learning the true value of outside protection in the winter and spring.—*Bee-keepers' Review*, p. 200.

## STRENGTHENING WEAK COLONIES.

The Alexander plan of putting weak colonies over an excluder on a strong colony in spring seems to be gaining in favor. It appears that if the two colonies are stirred up at the time of putting together, the bees of the stronger colony kill the upper queen. To avoid this some allow a wire-cloth between the colonies for about 2 days, thus allowing them to gain the same scent before the bees from below can get above. Others gain the point by doing everything so quietly that the bees of the two colonies are not likely to get together for some little time.

The Canadian Bee Journal reports,

## POISON FOR MICE.

Strychnine is extremely bitter, and mice or rats are not fond of it. The following has proved very useful with me: Take one part flour, one part sugar, and one part arsenic; mix thoroughly, and place in hives or where the mice pass, and they will disappear very fast.—J. E. CRANE, in *Gleanings*.

## VIRGIN QUEENS DO NOT ALWAYS FIGHT.

Editor Root gives an exception to the rule, perhaps first one on record. He says in *Gleanings*:

"Not six weeks ago we found in one hive nearly a dozen virgins on one frame, living peaceably together. It was a case where a lot of cells had been given to the colony to complete, and they had hatched before the apiarist got around to them. Some of the queens were from 2 to 3 days old, and yet there they were all together like a happy family."

## CLOSING ENTRANCE WHEN MOVING BEES.

When moving bees, cut a strip of burlap 2 or 3 inches wide, the length of the entrance to your hive for each colony, and when ready to close them, leave these pieces in a pail of water. Crowd one into each entrance with a jack-knife; better than sticks, screen or anything I ever used. No hammering to disturb the bees, and the moisture tends to quiet them, as well as being much the quickest way. Try it.—*American Bee-keeper*.

## TARRED FELT NOT ALWAYS DESIRABLE.

S. D. Chapman found it an actual detriment, the bees being warmed up by the dark color, and flying out on days when it was so cold that they were lost. In the *Bee-keepers' Review*, Editor Hutchinson comments:

"If the location is exposed and windy, I can see that the results might possibly be like those reported by Mr. Chapman, but in the sheltered locations where my brother and myself have used this kind of protection we have always found it a decided advantage."

## ROASTING OUT WAX-WORMS.

Combs infested with larvae of the wax-moth are set out in the sun against some obstacle so that there are no sheltered parts under which the "worms"

may hide from the sun. Then watch them "hike out," and the sun gets them, leaving the combs free of the pest. Don't leave the combs out too long or in too hot a sun or they will melt. Hundreds of combs have thus been "disinfected" in this way in our yards.—LOUIS H. SCHOLL, in *Gleanings*.

## SHAKEN SWARMS.

Under this title, F. Greiner, in the *American Bee-keeper*, gives an excellent summing up of points, among which are the following:

Some bee-keepers brush all bees from the brood-combs and place the beeless combs on top of other colonies; some leave bees enough on the combs to take care of the brood, and thus form a new colony, giving the motherless family either a queen or a ripe cell; which latter answers just as well. Some bee-keepers give the brushed bees a little brood to hold them.

All authorities on shaken swarms agree that the bees ought to be made to fill themselves with honey before they are shaken or brushed from their combs.

After a swarm is shaken, dissatisfaction sometimes arises among the masses, possibly also among the royalty, although I don't think that occurs. I think the queens are subject to the workers and must go if they so decide. When the masses become dissatisfied with the conditions as the bee-master (?) has arranged matters, they just pull out. They seem to think that they can lose nothing, so there they go. If the queen is able to fly, and nothing else hinders her following the bees, our hive will be found empty of bees when next we make them a visit. They may swarm out after 3 or 4 days. I hardly consider the same safe before the seventh day. When the queen is clipped, of course she cannot go with the bees. After sailing around they decide to come back, for really they have no other place to go. The queen crawling about in front of the hive enters it also when the bees return.

I have watched many swarms with clipped queens, and I never saw one go astray. Hives, however, must not stand close together, and the alighting-board to each must reach the ground; otherwise there would probably be trouble.

# American Bee Journal

page 208, that E. P. Adams "says he was at first disappointed with the plan, and had stated so, as the queen in the weaker colony was almost invariably killed and the 2 colonies merged into one below. He has since found, however, that the lower colony must be really a strong one; it does not matter much how weak the upper one may be, so long as it has a laying queen. He puts them together in the evening, or toward evening, when they have about ceased to fly, and with-

out using smoke or jarring them at all. To assist in this he makes all possible preparation early in the day, placing the queen-excluder on the top of the strong colony, leaving off the cover, etc. He is also careful that the weaker colony is in proper shape, the hive-body made loose on the bottom-board, and all ready to be lifted and placed on the top of the other. He says that these points all go toward the success of the plan, and that he is highly pleased with the results.

given, and then they are likely to be all right.

3. I would rather have it daily, and would be willing to give as much for a good daily bee-paper as I give for a daily newspaper—yes, more. But there are not enough who would be willing to pay a fair price for a daily bee-paper, and so no publisher could in all probability afford to publish it. And I suppose the publishers thought the number who want a weekly bee-paper is very small compared with those who want it monthly, so you and I must be satisfied with it one-fourth as often. But the American Bee Journal costs so little now that we can afford to take another bee-paper or two besides.

4. That depends altogether upon circumstances. In a very poor year one is too often, unless one is careful to feed well, and no feeding is quite so good, either, as getting the natural stores from the flowers. In an extra-good season you might divided a colony as soon as the flow began, and each part might be ready to be divided again in a month, perhaps in less time, and that might be kept up if the flow should keep up.

## Late Swarms

1. Why don't my bees swarm? If they have swarmed we don't know it. They were very weak when we put them out in the spring. They come out once a day and have their "play," as I call it, but go back in again.

2. Would they need to be fed if they swarmed now, or would they gather honey enough for themselves?

MINNESOTA.

ANSWERS.—As you say, they were weak, it may be that is sufficient reason for their not swarming. It is possible that the poor season may have something to do with it. It also may happen that a strong colony in a good season may be good enough not to swarm. A number of my colonies make no offer to swarm each year, and I wish they were all of like mind. My biggest yields come from these non-swarving colonies.

2. If there is a good fall flow they ought to get their winter stores; otherwise not. In any case it is good practice to feed when a swarm is first hived. If bad weather should happen at the time, it would be a setback without such feeding.

## Too Many Drones

1. I bought a colony of bees last spring, and there are now about as many drones as worker-bees. We would like to know how to get rid of the drones.

2. How can we prevent so many drones being reared?

SOUTH DAKOTA.

ANSWERS.—1. Excluder-zinc in some form will help out. If you have not a regular drone-trap, use enough excluder-zinc to close the entrance at a time of day when the drones are flying out. Then in the evening you can easily catch them, feed them to the chickens,

or dispose of them in any way you like.

2. The easiest way to prevent a large number of drones is not to have much drone-comb in the hive. To make sure against it, a great many think it best to have frames filled with worker-foundation, thus securing worker-combs in all the frames. If you have frames largely filled with drone-comb, supply their places with better. If there are patches of drone-comb, cut out and fill the holes with worker-comb or worker-foundation. You may also slice the heads off sealed drone-brood, or sprinkle salt or salt-water on the unsealed brood.

If the drones are as numerous as you indicate, I'm afraid it may be a case of laying workers. See if the sealing of worker-cells, instead of being flat, is raised like little marbles. If so, it is a case of laying-workers, and the best thing is to break up the colony.

## Few Drones—Dividing Colonies

1. My bees have had no drones to speak of this season, except on 2 or 3 days, when I saw 4 or 5 flying from 2 of the hives, and the bees killed them right away. What was the cause?

2. Will bees do all right if put in a nucleus without any queen?

3. I think I would rather have the American Bee Journal every week than to have it monthly.

4. How often can I divide a colony of bees and have them do well?

NEBRASKA.

ANSWERS.—1. The absence of drones may be due to the poorness of the season. Keeping drones is a sort of luxury that bees indulge in when they are prosperous, and when forage is scarce they do not feel they can afford it.

2. No. They would, to be sure, rear a queen, and in time build up into a full colony, but a queen started in a nucleus would be likely to be a poor one. They should at least have a sealed queen-cell

## Moths in Hives

How can I get rid of moths in my beehives? The bees are not working well, for the moths bother them.

WASHINGTON.

ANSWER.—There is no cure for moths better than bees. A strong colony is not likely to be bothered with them, whereas a weak one, especially if it has a lot of combs more than it can cover, will have lots of trouble. But there is a big difference in the kind of bees. A weak colony of Italians will keep off the moth where blacks would succumb. Hybrids are nearly, if not quite, as good as Italians. So if you get in some good Italian blood, your trouble will probably disappear.

## Bees Hanging Under Brood-Frames—“Go-Backs”—Supers

1. I have several colonies that hang in great numbers under the brood-frames, so as to show at the entrance. What does it mean? Should I smoke them up into the super or let them alone?

2. When I have "go-backs," should they be put on alone, or will it do to have another super under them ordinarily?

3. How often should supers be looked after, or rather examined, as to how far they are filled?

4. Do you prefer putting an empty super under or over a half-full one? I mean right during a good flow.

5. Would you contract a wide entrance during a cool spell in summer?

NEW YORK.

ANSWERS.—1. One thing it means is that the colony is strong. If they are clustering out during the middle of the day, it may mean that there is nothing afield for them to do. If a colony clusters out while others are at work, it may mean that they are about to swarm, or it may mean they are lazy. In any

# American Bee Journal

case it will do no good to smoke them in.

2. That depends. If early enough in the season so that you think another super can be finished, a "go-back" may be put on with another super, or even with 2 or more other supers. More than one "go-back" may be put on a colony. Measure the strength of your colony and the strength of the flow, and act accordingly. Late in the season be cautious about asking too much. (It should be explained that a "go-back" is a super filled with unfinished sections taken from a number of supers and put back on a hive to be finished. If you wait till the corner sections of a super are all fully sealed, sometimes it will take so long that the middle sections will be darkened.)

3. Every 10 days is not far out of the way, generally, only make sure that they are never crowded so as to lack storing-room.

4. My practise has been to put the empty one under until near the close of the season. Some good bee-keepers, however, prefer to put them over every time.

5. No. Takes too much work. But if I had only a few colonies, and worked them as a sort of pastime, I might change the entrance according to the weather.

## Swarm Spotting Clothes

A swarm that issued recently spotted the clothes on the wash-line. Is it a common thing for swarming bees to spot clothes? I thought it occurred only when the bees have a cleansing flight in the spring? INDIANA.

ANSWER.—I don't suppose it is a common thing, and I don't know enough about it to say why it should have been so in your case. One can imagine, however, that if bad weather had delayed the swarming for a day or more, and the swarm should issue immediately upon the weather brightening up, that the bees might empty themselves a little after the manner of a spring cleansing flight.

## Uniting Swarms—Wintering Bees Outdoors—Kind of Bees

1. How can I unite a swarm with one that has swarmed 3 or 4 days ago? (Second and third swarm from the same hive.)

2. How would you advise me to winter my bees, as my cellar isn't very good? How would it do to put them all in a row about 6 inches apart and put straw between them, and over the top of them? Should the hive be left open at the entrance or should it be closed?

3. Enclosed find bees out of 2 colonies, Nos. 1 and 2. Are they the same kind of bees? and what kind are they? CENTRAL MINNESOTA.

ANSWERS.—1. In such a case there ought to be no trouble if you merely hive the third swarm in the same hive with the second swarm. Both have queens and bees from the same hive having probably the same scent.

2. Your plan ought to work fairly

well, of course with some sort of roof to keep the straw dry.

3. I don't know. It isn't easy, indeed impossible, to tell by seeing a single bee what the blood of a colony is. For example, take a colony of hybrids: one worker may be selected that to all appearances is pure Italian, and another that is pure black. Then when you put a bee in a letter and have it mashed in the mail, the case is still more difficult. I can only say that I should guess there is some black blood in each of the specimens sent.

## Laying Workers Fill Cells With Eggs

I have one colony of bees in which I find many cells with from 2 to 6 eggs in each. And at the front end of some of the combs there are cells that seem to have 30 or 40 eggs in each. I never saw anything like it before. I could not find the queen. Did laying workers try to fill the cells with eggs? IOWA.

ANSWER.—Almost certainly it is the work of laying workers. You will probably find that if any drone-cells are in the broodnest the nuisances have been specially favorable to them. Also, you will be likely to find one or more queen-cells, and in these there may be as many as a dozen eggs in each. Better break up the whole business, giving combs with adhering bees to other colonies.

## Late Transferring of Bees

Last fall I purchased 3 colonies of bees in home-made hives of the Langstroth pattern. I found that the frames were badly made so that the combs were crooked—in fact, they zigzagged in every shape. I left them just as they were, fed the bees steady all winter, and they are good and strong now, but will not get more than enough honey to feed themselves through the coming winter. I would like to get these bees out of the old hives. Would you advise transferring them at this time (August 3)? ARKANSAS.

ANSWER.—Perhaps it may be as well to leave them as they are till next spring or swarming time. Still, it may be all right to transfer this fall, if you are sure of a good fall flow after transferring.

## Requeening Colonies—Spring Protection of Hives

1. If I wish to requeen my apiary without the trouble of hunting the old queens, may I not buy fertile queens of this year's rearing, and place them (in the cages that they are shipped in), in the hives, and let them eat their way out with the help of the worker-bees? And then will not the young fertile queens kill the old ones? Or is the old one likely to kill the young one?

2. I wish to give my hives spring protection. I have read of roofing-paper or felt being used, but would not this plan do? That is, just get some dry-goods boxes (which can be done very cheaply), and both sides and bottoms being made of matched lumber,

take the tops off, and invert the dry-goods box over the hive, a sufficient hole for entrance being cut into the dry-goods box to open over the hive-entrance? I figured on no packing of any kind between the box and hive.

3. Would not ordinary oats-straw covered over the hives, leaving an entrance, be good spring protection? Or would a wet spring keep the hives too damp? WISCONSIN.

ANSWERS.—1. If you put a laying queen, no matter how young, into a colony, leaving the old queen present, you may count on the new queen being killed as soon as she gets out of her cage—no, not killed immediately, but balled, and maltreated till she is dead. The same holds true with regard to a virgin introduced; only if it be late in the season, and the bees have a queen that they desire to supersede, the virgin would be allowed to supersede her. Possibly this might hold good at any time when the bees desire to supersede a queen, and possibly it be as true of a laying queen as of a virgin; I don't know.

2. Your plan may work, but the trouble is that when the sun shines out for a short time, or even for a long time, the bees don't get the benefit of it, the dry-goods box keeping them cool; whereas with the black felt they would be made warmer than with the naked hive.

3. It will be all right if some covering to shed the rain is over the straw, or if the straw is so placed as to shed the rain.

## Afterwards—Cotton Honey for Winter Stores, Etc.

1. After a swarm has issued and has been hived, what shall I do to keep the parent colony from swarming again, or casting after-swarms? Shall I cut out the queen-cells? If so, how long after the swarm has issued shall I do it? After the swarm has been hived, shall I set the swarm, or new colony, on the old stand, and move the parent colony a few feet away?

2. I have only starters in my hives. Would it be advisable to give the new colony a couple of frames of brood from the old hive, or let them draw out the starters and fill up the combs themselves?

3. The queen in the colony is not clipped. Would it do to clip her this late in the year?

4. Cotton is one of the chief crops raised here. I understand it is a great honey-producing plant. Would it do for the bees to winter on? You know it has the peculiarity of expanding and bursting the cells if kept for a while in the combs.

5. What are the names of the different bee-papers that have been started and discontinued in the United States? OKLAHOMA.

ANSWERS.—1. If you cut out all queen-cells but one a week after the swarm issues, there ought to be no more swarming. But sometimes a queen-cell is so hidden that you will be pretty sure to miss it. Again, the only cell you leave may have only a dead grub

# American Bee Journal

in it, leaving your colony hopelessly queenless. If you set the swarm on the old stand and move the mother colony some distance away, the swarm will get all the field-force, weakening by just so much the mother colony, making it less likely to swarm. But a lot of young bees are hatching out all the time, building up the colony to such extent that when the first virgin is ready to go with a swarm, which will be in about 8 days, there may be a strong enough force to go with her.

I'll give you a better plan than either: When the swarm issues, put it on the old stand, and put the old hive close beside it. A week later move the old hive to a new stand. That, you will see, will not only drain the mother colony of all the field-bees it had at the time of swarming, but also of all that have become fielders since then, leaving it so weak and discouraged that it will not be likely to have any thought of swarming.

2. Some think it best to give a frame of brood to the swarm—not 2—while others give none. I don't know which plan is best—perhaps giving the one brood.

3. After a queen is laying she may be clipped at any time when most convenient.

4. I have had no experience with cotton honey, but from the fact that I do not recall seeing any objection to it for winter stores I suppose it is all right.

5. That makes me throw up my hands. The number is legion, and I'm not sure that a whole day's searching would make sure of getting them all. Besides, what good? Why not let 'em rest quietly in their graves?

## Varying Effects of Bee-Stings

My little girl, 11 months old, has been stung 3 times lately. The first time just below the ear, the second time on the hand, and neither sting swelled much or seemed to cause her much pain. The last time she was stung on the hand, and it swelled very tight, almost to her elbow, and caused her much pain for several hours. The bee that stung her was given her in a poppy by her sister.

1. Why did the last sting swell so much more than the others?

2. Would the fact that the bee had been feeding on the poppy have anything to do with it? The bees work on poppies here in the early morning, and as my children say, they "go crazy" for a short time. They don't seem to bother them in the afternoon.

COLORADO.

ANSWERS.—I don't know. Very likely the place had something to do with it. There is a great difference in the painfulness of stings, and also in the amount of swelling, and it is not easy to say just why in all cases. A sting on one part of the hand may swell more than on some other part. One sting may be deeper than another. One may be left in longer than the other, giving more time for more poison, hence more swelling.

2. If the poppy should make any dif-

ference, one would suppose it would have a quieting effect. I don't suppose, however, that the poppy made any difference. Still it is not impossible that it might.

## Introducing Queens—Carniolans

1. I was thinking of buying as many queens as I have colonies next spring, and introducing them as Mr. Abbott says, putting the new queen on top of the frames for a day or two, then dividing the colony, putting the new queen in one hive and the old queen in the other. I thought in this way to get two strong colonies from each one. Do you think the plan would be a success?

2. Is an untested queen guaranteed to be mated, and to lay worker-eggs?

3. Do queen-breeders furnish a queen-cage with each queen?

4. Do you think Carniolans are more hardy than Italians for wintering? Would it be wise to cross them?

NEVADA.

ANSWERS.—1. The plan will work. It may be well to leave the old queen on the old stand, putting the caged queen with the larger part of the brood on a new stand. If this is done about the usual time of swarming, or a little in advance, and all the brood is given to the new queen, you will have a shaken swarm, with little danger of the old queen swarming again.

2 and 3. Yes.

4. I'm not sure, but I don't believe they are hardier. If you have an apiary of pure Italians, better try any sort of crossing only on a small scale until you are sure you will like the cross better.

## Why Use Improved Hives?

I am not a young man in years, but am young in the knowledge of bees. I keep bees only for the honey I can get. What use is there for me to use patent hives when I know nothing about them? Why is not my old-fashioned gum with a good big, plain box-cap just as good for getting the same amount of honey in a season as the patent hives?

MISSOURI.

ANSWER.—Let me say, first, that most of the hives in use now by practical bee-keepers have no patent on them, the patent on the Langstroth movable frame having expired some years ago. So your question probably is, What advantage is there for you in movable-frame hives over common box-hives? Perhaps there is no advantage. It depends upon circumstances. The movable-frame hive is no better for the bees than a box-hive; in general not so good. It has really only one advantage over a box-hive, but sometimes a single advantage counts for much. A man with his head on has the single advantage over one with his head cut off that he still has his head on; but that is a considerable advantage. The one advantage that the movable-frame hive has over the box-hive is that the frames can be taken out and put back again. But that advantage is of no value to those bee-

keepers who never lift out the frames from one year's end to the other. If I had no notion of ever lifting out a frame, I would prefer box-hives.

Possibly you may want to know what advantage there is in being able to lift out frames. For one thing, you can tell by lifting out the frames whether a colony is queenless or not, and if it is queenless you can remedy it. With a box-hive it is practically impossible either to detect or to cure queenlessness. That one difference between the two kinds of hives is enough to decide in favor of the movable-frame kind,—provided one intends to take advantage of the movable feature. It would be a pretty long story to tell all the things that can be done with a movable-frame hive that can not be done with a box-hive, among which are examining for disease and treating for the same, introducing queens, strengthening weak colonies by giving frames of hatching brood, etc.

## Starting New Colonies of Bees

When is the proper time to start new colonies of bees in this climate—40 miles south of St. Louis? What is the best method for a beginner to take in doing so?

MISSOURI.

ANSWER.—The very best time is at the time when bees are inclined to swarm naturally. Bees begin to swarm when honey begins to yield well, and more or less colonies may swarm so long as honey yields, although most colonies do their swarming during the early part of the honey-flow. You may even make increase successfully in the month of September if you make the new colonies strong enough. The earlier you start a colony the less need of its being strong, as it has a longer time to build up before winter.

It is not easy to say what may be the best way for you. What may be best for one may not be best for another. Perhaps the easiest way is to take half the combs, bees and all, out of a hive and put into another hive, filling out each hive with combs or frames filled with foundation, setting the hives side by side, as nearly as possible on the old location, trusting to the queenless part to rear its own queen.

A better way is to look four days later and see which hive contains eggs, and give a laying queen to the other part. That, of course, involves buying and introducing a queen.

If you want the bees to rear their own queen, here is a better plan: Find the queen, and put her with 2 frames and all adhering bees into another hive on a new stand. A week later a number of queen-cells will be in the now queenless colony, when you let the hives exchange places, and the bees will do the rest. If you want to have more than one new colony, you can divide the queenless part, putting the larger half on an entirely new stand.

As you have just obtained the book, "Forty Years among the Bees," you will do well to turn to page 252, where you will find several pages about artificial increase.

## Breeding Bees by Selection for Improving their Honey-Producing Character

BY F. W. L. SLADEN, F. R. S.

It is a fact well known to breeders of animals that to obtain and maintain permanent improvement in any character it is necessary to breed strictly by selection from both parents in successive generations. Such breeding by selection has in many cases resulted in great improvements and in the production of many new varieties. Domestic poultry are a familiar example. In the case of bees selection of the male parents has hitherto been practically impossible, at least in this country, in all parts of which ordinary bees are to be found, because pairing takes place upon the wing some distance from the hives, and we cannot prevent some of our queens from pairing with drones from neighboring apiaries.

In my early efforts to improve the honey-producing character of my bees I found no great difficulty in selecting the best honey-producing colonies, and breeding from them in successive generations on the female side; but on the male side I had to content myself with rearing each season a large number of drones of best honey-producing parentage and grandparentage, and eliminating as nearly as possible all drones of other parentage. By this means a considerable number of unions between queens and drones of best honey-producing parentage were effected, but I found very great difficulty in identifying the offspring of these unions, so that in breeding the next generation it was impossible in every case to tell whether outside blood had been included or not, and thus much of the improvement that had been effected was liable to be lost.

In 1905, however, the great difficulty in identifying the offspring of the unions between queens and drones of my best honey-producing parentage was practically overcome by the employment of a method of selection by color. . . . The object of the present paper is to explain more fully this method of selection by color for the improvement of the honey-producing character.

The common bee of this country, as everybody knows, has the ground color of the body entirely black. In 1901 and 1902 I crossed my bees with selected individuals of one of the best honey-producing strains of the American Golden Italian bee, in which a considerable portion of the abdomen is of a bright golden-yellow color. The result in the second and third generations of the cross-breeds was that the queens were exceedingly prolific (in spring), and the bees very vigorous, but in almost every other character these cross-breeds were extremely variable. Taking the two characters of color and honey-production, I got—

1. Dark-colored bees that were poor honey-producers;
2. Dark-colored bees that were good honey-producers;
3. Bright-colored bees that were poor honey-producers; and
4. Bright-colored bees that were good honey-producers,

as well as bees that were intermediate between these varieties. The best colonies of good honey-producers produced larger amounts of honey than colonies of ordinary English bees, a fact which I attributed partly to the greater prolificness of the queens, partly to increased vigor, and partly to slight augmentation of the good honey-producing character due to cross-breeding. Some of the best honey-producing colonies were of the brightest color. It was therefore clear that there was little or no correlation between the color character and the honey-producing character—in other words, that the two characters were inherited independently.

My next step was to eliminate all the bright-colored bees except those that were best honey-producers, and to rear queens and drones from the latter only, and these in the largest possible numbers. Thus the only drones of bright-colored parentage that paired with the queens reared were of best honey-producing parentage. These drones considerably brightened the color of their young, and thus it became possible to distinguish, by the brighter color of their young, the queens that had been fertilized by drones of my best honey-producing parentage from those that had been fertilized by drones of variable honey-producing parentage and by drones from neighboring apiaries, all of which produced darker young. This distinction could be made as soon as the first few hundred workers had hatched—namely, in less than a month after the queen was fertilized.

This method of selection by color for the improvement of the honey-producing character was also employed and rendered more precise during the season of 1906.

The laws governing the inheritance of characters in cross-bred plants and animals have always been a puzzle to breeders. Lately, however, they have been carefully studied and much elucidated by Bateson and others by means of elaborate breeding experiments. An excellent account of some of these experiments, with the conclusions they point to, is given in a report to the Royal Society by Prof. Bateson and Miss E. R. Saunders, published in 1902. This important work confirms a remarkable law which was first discovered and enunciated by Mendel as long ago as 1865, as the result of experiments he made in cross-breeding varieties of the garden pea. Mendel's discovery is too lengthy to be given here, but the essential part of it is "the evidence that the germ cells of gametes produced by cross-bred organisms may in respect of given characters be of the pure parental types, and consequently incapable of transmitting the opposite character; that when such pure similar gametes of opposite sexes are united together in fertilization, the individuals so formed and their posterity are free from all taint of the cross." (From Bateson and Saunders' Report, page 12.)

For instance, in the second and later generations of cross-breeds between hoary-leaved and glabrous-leaved varieties of the garden stock, Miss Saunders obtained certain numbers of hoary-leaved individuals which, when bred together, were found to be incapable of producing glabrous-leaved individuals, and nearly all

the glabrous-leaved individuals that were obtained, when bred together, were found to be incapable of producing hoary-leaved individuals. Atropa (the Deadly Nightshade) was also found by Miss Saunders to obey Mendel's Law in the inheritance of yellow-colored and black-colored fruits. Prof. Bateson found that poultry obeyed Mendel's Law in the inheritance of "single" combs and "rose" combs, and in that of "single" combs and "pea" combs. More recently Hurst has found that poultry obey Mendel's Law in the inheritance of many other pairs of opposite characters. In their Report Bateson and Saunders give a long list of pairs of characters in animals and plants that had, up to 1902, been observed to obey Mendel's Law; one of the most remarkable of these is the waltzing habit and the absence of the waltzing habit in mice.

Bateson and Saunders' work, which only became known to me in the winter of 1905-6, is likely to be a great help in the work of endeavoring, in my cross-bred bees, to obtain individuals with the bright-color character and best honey-producing character that are incapable of transmitting any mixture of the opposite dark-color and poor honey-producing characters to their young. In the case of the bright-color character it is likely that this object has already been attained in some examples. The best honey-producing character is a complex one, and there are indications that it is largely the result of the combination of several characters, and that some of these are more or less correlated to one another, and that others, like vigor, are the direct result of cross-breeding. The best honey-producing character is partly dependent on longevity (of workers), prolificness in late spring (which acts favorably), prolificness at other seasons of the year (which may act unfavorably), and on other characters. It is impossible to forecast how much improvement in the honey-producing character will be obtained when, by cross-breeding and selection, its component parts have to some extent been separated and re-united in new combinations.

The honey-producing character of a certain race or variety of bee may certainly vary very much in different climates. In the climate of some parts of the United States the honey-producing character of the Italian bee is exceedingly good, but in the climate of Great Britain, which during the honey-flow is much colder, more cloudy, and more windy than that of the United States, the Italian bee is not a good honey-producer, and the English bee is a better one. This shows that breeding for the improvement of the honey-producing character in Britain must be carried on in the British or in a similar climate; also that the English bee is a better bee to work upon than the Italian. Crossing the English bee with sufficient Italian blood to enable one to brighten the color for practicing selection by color improves it for the purpose of breeding for the improvement of the honey-producing character, because it gives it increased prolificness in spring, vigor and variability.

In the second and third generations of my cross-breeds it was a common thing to find a queen that would produce some

# American Bee Journal

individuals (workers and queens) that were quite dark, and others that were as extensively bright-colored as, or even more so than, individuals of the original American Golden Italian strain. Of course these bright individuals had no more of the American Golden Italian blood in them than the dark individuals. It is therefore plain that it is impossible to judge the amount of foreign blood in cross-breds by the extent of the bright color they show, especially in the case of individuals that are the result of selection by color.

Although the bees now bred by color-selection in Ripple Court Apiary differ entirely in nature from any foreign bees, yet in appearance they closely resemble American Golden Italian bees: the queens are superficially indistinguishable from imported American Golden Italian queens, and in many colonies the workers can only be told from American Golden Italian workers by their much more active running over the combs when the hive is opened, and by their generally more distended bodies and sometimes larger size.

To distinguish the brightly-colored bees bred in Ripple Court Apiary for the improvement of the honey-producing character, the name of "British Golden" has been given to them. This name was first applied to the 1906 selection.

As regards the results of the breeding by color-selection in Ripple Court Apiary, it is too early to say much. The honey-producing results of the 1906 selections will not be known until the summer of 1907, so the results of only one season's work, that of 1905, have so far been obtained. These were very satisfactory, and it has become evident that selection by color has already changed the bees from variable cross-breds into a distinct variety with many characters that are fast becoming fairly constant; at the same time a great improvement in the temper has been noticed.

There is a difficulty in the transmission of worker characters through drones besides that of selecting the drones. I refer to the difficulty—by no means great or insurmountable—that results from the theory that the drone is produced parthenogenetically. The workers of a colony inherit their characters through the drone that fertilized the queen of the colony, as well as through the queen herself, but the drones that are produced in the same colony by the same queen inherit their characters through the queen only. The said workers therefore, having a mixture of fresh blood, give a very unreliable indication of the worker characters the drones will transmit to their offspring, and in order to find out what worker characters the drones are likely to transmit we must go back to the colony that produced their mother. In the case of a fixed race or variety, the workers of the colony that produced the drones' mother show fairly accurately the characters that the drones are likely to transmit, but in the case of variable cross-breds, they are not likely to do so on account of variation. In the latter case, if a large number of sister queens are employed to produce drones, the drones may be expected, on the average, to transmit the characters exhibited by the colony that produced the drones' mothers, but drones produced by indi-

vidual queens might sometimes transmit different or opposite characters: the workers produced by these individual queens would give some indication as to whether they would be likely to do so or not. Therefore in breeding drones it may be well to state, on the assumption that the drone is always produced parthenogenetically, that the characters shown by the grand-parental colony are always of great importance, and that those shown by the parental colony are of some importance in cross-breds, but of very little importance in pure-breds.

—British Bee Journal.

## Poor Honey Crop.

The honey crop is poor here. Bees will probably get enough, however, for themselves through the winter,—but no more.

JULES BELKNAP.

Sulphur Springs, Ark., August 3.

## Working for Comb Honey.

I have 16 colonies of bees, and am working them for comb honey this season.

I like the American Bee Journal very much. I would not be without it. I find many useful hints and suggestions in it.

Springfield, Mass., August 6.

## Nothing from White Clover.

So far white clover has yielded just about nothing. What has been gathered has been used in brood-rearing. Basswood is just opening now, so there is a chance of getting some surplus yet.

The monthly American Bee Journal is a dandy. If it doesn't succeed it will certainly not be the Editor's fault.

CHAS. O. BERGSTRAND.

Amery, Wis., August 1.

## Good Honey-Flow.

We have had a good honey-flow for about 10 days. A day or so ago it seemed to stop suddenly, but it has started again, and we have quite a little honey from the second crop of alfalfa. We have an average of about one super per colony on 175 colonies. This has been a cold, backward season, and I am afraid the honey-crop will be quite a little below the average. We have had 3 swarms from 175 colonies, and they were small ones.

Rifle, Colo., August 3. JOHN STORRS.

## Disappointing Bee-Season.

The bee-season here has been very disappointing up to the present time. We got nothing from the first cutting of alfalfa, but there is a fine scope of bee-pasture here, and the bees are doing splendidly. If it continues good weather for a reasonable time, strong colonies will produce a large surplus of honey.

The American Bee Journal is a good help for the bee-keeper.

J. E. PATTON.

Death, Nev., August 7.

## Worst Spring—Non-swarming Bees.

After the worst spring in the memory of the "oldest inhabitant" the white clover and basswood harvest has come and gone, giving us about 5,000 pounds of honey—about one-half, or a little more, being extracted—from about 155 colonies. The prospects are fair for winter stores, though there may be a little fall surplus.

It seems Mr. Hasty does not believe exactly in non-swarming bees, does he? I wonder if he ever had a colony that did not swarm when rightly attended to. And if he bred his stock from it, did the bees swarm as much as those that were bred in the time-

honored way of taking a swarming cell from a swarming colony?

When a man is always expressing doubts, it seems to me he ought to give a reason for the doubts that are in him, once in a while. I have never been called an optimist even by my best friend, but I have seen enough of bees to believe thoroughly that a practically non-swarming strain of bees can be bred, and will be developed within the near future. They will save a lot of labor for the apiarist.

E. S. MILES.

Dunlap, Iowa, August 2.

## Fair Honey Crop Promised.

The honey crop promises to be fair at present. Thunder showers and hot weather prevail.

JOHN SEMMENS.

Prowers, Colo., August 5.

## Bee-Keeping Slow.

With us bee-keeping is slow. It looks now as though the bees might go into winter with plenty of stores. I am having my surplus honey stored in brood-frames, in shape for feed next spring.

N. P. WHITMORE.

Gardner, Ill., August 12.

## Not Much Honey.

I have 13 colonies of bees, and have had 8 swarms. I put 3 back into the hives they came out of, and they are staying all right as yet. They are working on sweet clover.

There has not been much honey taken here so far. I have about 100 pounds in sections. It is fine. I have sold all I had and could sell more, to neighbors and friends.

F. S. FOULK.

Arrowsmith, Ill., August 10.

## Bees Have Done Well.

The bees have done very well so far. Some colonies having stored over 100 pounds, and are still rolling the honey in. White clover is yet in bloom, and the prospects are for a very good fall flow, if the weather permits.

B. F. SCHMIDT.

N. Buena Vista, Iowa, August 3.

## Honey from Alsike Clover.

I have had 12 swarms from my 44 colonies, spring count, and the majority of them have been, and are, doing some work in the supers. They stored some section-honey from alsike clover, which is quite plentiful here, and they are now working on every little patch of white and sweet clover they can find; but the total product will be small at best.

A. F. FOOTE.

Mitchell Co., Iowa, August 12.

## Bad Year to Work with Bees.

My bees are getting honey now from the goldenrod. The comb honey is nice that I have taken so far. I expect my bees will average about 100 pounds per colony this year, but I do not know exactly yet.

This has been the worst year I ever saw to do anything in the bee-yard. Either the wind blows, or something else interferes. It has also been the worst year to mate queens. I have reared all young queens this year, and am in a bad place to mate them. There are Carniolans on three sides of me, and I think they have a little yellow mixed in with their gray. Mine are all pure Italians now, and I am hoping to Italianize all of the bees around here next spring.

PERLEY S. SMITH.

Strong, Maine, August 15.

## Yields of Honey.

Some correspondents seem to take exception to some of the honey-yields I quoted in my article to The Farmer, as mentioned on page 534. This is only what might be expected, as every bee-keeper measures the yield of every other bee-keeper by his own yields. But the honey crop more than any other crop is apt to vary according to the management of the bee-keeper.

The yield of honey from a field of buckwheat, which I mentioned, is an actual experience. The honey came in so rapidly from the field that the bees having access to it—a trifle over 30 colonies—would completely fill the hive with thin, newly-gathered honey in a single day.

In that article I was giving the possible

# American Bee Journal

yield, and, therefore, the largest yield I had obtained from any given source, and not the average yield. As a rule, buckwheat does not yield a great amount of honey here, as our weather during its bloom is not usually favorable to a yield of honey from it. During the past 25 years, I have had yields only during 4 or 5 years, and this promises to be one of the good years.

Our principal sources of honey are dandelion, white clover and basswood. Our white clover yields are often excellent, but our basswood yields are often better; in fact, it has in a number of cases quite equaled the buckwheat flow I have referred to.

As to localities making a difference, I have had yards not 12 miles apart, that were almost opposites in conditions of the yield, with also a great variation in the time, while conditions in other yards hundreds of miles apart may be almost identical. M. V. FACEY.  
Preston, Minn., August 12.

## Best Crop in Three Years.

I see complaints from most places, of the light honey crop, while we on the Western Slope have the best crop in the 3 years I have handled bees. The spring was very late, and I fed heavily until June 10, when my 25 colonies were very strong. The alfalfa commenced to bloom then, and I have taken off 23 supers of honey, and have 40 supers on, with at least 20 of them nearly full. I think I will have all full, if the honey-flow lasts until September 10. But I have no swarm when there is a poor honey-flow.

There are so many bees in the valley here, that we get but little honey. There are 5,000 colonies in this part of the valley in Montrose County. It is about 20 miles long and from one to 5 miles wide. I kept bees in Missouri, but they never produced honey there as they do here. E. C. WRIGHT.  
Montrose, Colo., August 13.

## No Basswood Honey.

The basswood bloom is over now, and has been for a week or so. The result is no honey gathered from basswood this year, and I can say the same about clover. I have colonies with three stories full of bees, and when the basswood bloom was over, they had but 5 pounds of honey, so feeding is now the order of the day.

Yesterday, one of my colonies was overrun with robber-bees. The guilty colony was located immediately. While watching them in disgust, I recalled the plan of swapping places with the two hives, or, in other words, putting the guilty one where the robbing was being done. That settled it for a few hours, and then everything was worse than ever—robbing all over. I thought of trying the kerose plan given on page 600, by W. H. H. Stewart, and it certainly settled the business. CHAS. O. BERGSTRAND.  
Amery, Wis., August 12.

## Good Honey-Flow Expected.

I notice by the American Bee Journal that the prospects for honey have been very bad in a great many places. Our bees rolled in honey during the last week of April and during May, but since the first of June we have not had any surplus honey. It has been so cold and cloudy that it is about all the bees could do to keep up brood-rearing in good shape.

We expect good weather during August, and a good honey-flow from the white clover.

We enjoy reading the American Bee Journal very much, and do not want to be without it. WM. WRIGHT & SON.  
Westport, Ore., July 27.

## Apiarian Photographs

We can use such right along. Of course we want good, clear prints. If you have an apiary that you think would look well on paper, have it photographed and send to us the result. While we may not be able to use all that come, we doubtless will be able to use most of them. Please send the picture, and on its receipt we will report whether we can use it. If we can, we will then request you to send some descriptive mat-

ter to go with it when published. We prefer larger size photographs, say 8x10 inches, if possible. However, send whatever size is most convenient.

## Excursion via Nickel Plate Road

to Boston and return \$21, September 10, 14, 24, 28. Limit 30 days from date of sale. Meals in Dining Cars 35c to \$1.00. Stopovers. Ticket office, 107 Adams St., Chicago. 'Phones, Central 2057 and 6172. La Salle St. Station, on Elevated R. R. Loop.

## A Prophet of Profit

There is plenty of money in Chickens if your effort is intelligently directed. Learn the right way to do things by subscribing for

## Profitable Poultry MILTON, WIS.

For a limited time only 25 cents per year.

Mention Bee Journal when writing.

## Fashion Book Free!

I want to send you my handsome new book showing over 400 of the latest styles with illustrated lessons on cutting and dressmaking. I will agree to sell you all the patterns you want for 5 cents each. They are the same patterns you have always paid 10c and 15c for at the stores, made by the same people, and correct in every detail.

**HOW I DO IT.** I publish *The Home Instructor*, an illustrated woman's magazine and I want your name on my subscription list. *The Home Instructor* is bright, entertaining, clean and instructive—just the sort of a paper you should have in your home. It has departments for every feature of home life, and prints the choicest fiction every month.

Every issue has several pages devoted to the latest fashions, fully illustrated.

## My Special Offer.

Send me 25 cents and I will send you *The Home Instructor* for two years and will send my big fashion book to you free. I will also agree to sell you any pattern you want thereafter for 5 cts. I can sell them for 5 cents because I buy them by the thousand and don't make any profit. I don't want the profit, I want your subscription to *The Home Instructor*. You will save many times the cost of my offer in a year. Write to-day. A. OTIS ARNOLD, Dept Quincy, Ill.

Mention Bee Journal when writing.

**MORE CHICKEN MONEY** If you want your chickens to be profitable feed them plenty of cut green bone—it's a cheap feed—makes lots of eggs—fine, fat birds. Grind it in this *Standard Bone Cutter* and feed it fresh for best results. This \$8.50 Cutter just what you want for the farm. Write today for free trial plan and prices of other sizes—all made and guaranteed by a responsible concern. **Standard Bone Cutter Co., Milford, Mass.**

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food," written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey, the more honey they will buy.

Prices, prepaid—Sample copy for a 2-cent stamp; 50 copies for 70 cents; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

## EASY TO EARN A WATCH

**BOYS  
&  
GIRLS**

Any bright boy or girl can sell eight 5c. boxes of our Fragrant Bouquet Toilet Soap in a little bit. That's all you have to do to get this fine nickel case, stem-wind watch. Guaranteed a good time-keeper. Special small size for girls. No money needed. Just send for the soap and we will ship it prepaid any place in the U. S. east of the Rockies and North of Oklahoma for this introductory offer. When you have sold the eight boxes of soap, send us the \$2 and you will receive the watch at once. Both soap and watch guaranteed satisfactory or money back. Soap may be returned if not sold. No risk for you.

**CROFTS & REED,  
Austin Ave. Dept. 764, Chicago, Ill.**

## Because You Need The Money

It's your business and if you don't attend to it, who will? You cannot afford to keep cows for fun. That isn't business, and, furthermore, it isn't necessary. There is money in cow keeping if you go at it right, and besides there is more fun in going at it right than there is in staying wrong.

**You need a Tubular Cream Separator because it will make money for you; because it saves labor; because it saves time; because it means all the difference between cow profits and cow losses.**

Look into this matter; see what a Tubular will do for you and buy one because you need it. How would you like our book "Business Dairying" and our catalog B. 306 both free. Write for them.

**The Sharples Separator Co.  
West Chester, Pa.  
Toronto, Can. Chicago, Ill.**

## THE PRAIRIE STATE BROODER

**A Spring, Summer or Winter Brooder House** No. 5

If you have not investigated the Prairie State Brooder No. 5 you ought to get busy because it is one of the most satisfactory brooders ever made. It is portable making it desirable for use in any kind of a poultry house or as a colony house on the open range without any change. Being enclosed see cut it can be used as an individual lamp brooder in colder localities than the plain Universal Hoyer can be alone. Top is covered with a removable Cloth Screen instantly changing it from a winter to a summer brooder. Hoyer lifts out making it easy to clean. Consumes but little oil; supplies abundant ventilation even in hottest weather; top affords sun shade. We can't tell all its good features here—

**Get Our Brooder Catalog**

showing it in several forms and describing its many useful adaptations. With the No. 5 chicks can be raised during June and July unusually successful. We will also gladly mail our 1907 Incubator catalog which tells why the Prairie State hatches extra large, strong chicks with greater ease and certainty.

**Prairie State Incubator Co.,  
522 MAIN STREET HOMER CITY, PA.**

No. 5 Brooder with side removed

# SPECIAL CLUBBING AND PREMIUM OFFERS

In Connection With The

## AMERICAN BEE JOURNAL

Sample copies free, to help you interest your friends and get subscriptions. If you will send us names of your neighbors or friends we will mail them sample copies free. After they have received their copies, with a little talk you can get some to subscribe and so either get your own subscription free or receive some of the useful premiums below. They're worth getting. We give you a year's subscription free for sending us two new subscriptions at 50 cents each.

### BEE-KEEPERS' NOVELTY POCKET-KNIFE

Your name and address put on one side of the handle as shown in cut, and on the other side pictures of a queen-bee, a worker, and a drone. The handle is celluloid and transparent, through which is seen your name. If you lose this knife it can be returned to you, or serves to identify you if you happen to be injured fatally, or are unconscious. Cut is exact size. Be sure to write exact name and address. Knife delivered in two weeks. Price of knife alone, postpaid, \$1.25. With year's subscription, \$1.50. Free for 5 new 50c subscriptions.

### BEE-KEEPER'S GOLD-NIB FOUNTAIN PEN

A really good pen. As far as true usefulness goes it is equal to any of the higher-priced, much-advertised pens. If you pay more it's the name you're charged for. The Gold Nib is guaranteed 14 Karat gold, Iridium pointed. The holder is hard-rubber, handsomely finished. The cover fits snugly and can't slip off because it slightly wedges over the barrel at either end. This pen is non-leakable. It is very easily cleaned, the pen-point and feeder being quickly removed. The simple feeder gives a uniform supply of ink to the pen-point without dropping, blotting or spotting. Every bee-keeper ought to carry one in his vest-pocket. Comes in box with directions and filler. Each pen guaranteed. Here shown  $\frac{3}{4}$  actual size. Price alone, postpaid, \$1.25. With a year's subscription, \$1.50. Given free for 5 new subscriptions at 50 cents each.

### QUEEN-CLIPPING DEVICE

The Monette Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings.  $\frac{1}{2}$  inches high. It is used by many bee-keepers. Full printed directions sent with each one. Price alone, postpaid, 25 cents. With a year's subscription, 60 cents. Given free for 2 new subscriptions at 50 cents each.

### IDEAL HIVE-TOOL

A special tool invented by a Minnesota bee-keeper, a adapted for prying up supers and for general work around the apiary. Made of malleable iron,  $8\frac{1}{2}$  inches long. The middle part is 1 1-16 inches wide and  $7\text{-}32$  thick. The smaller end is 1 7-8 inches long, 1-2 inch wide, and  $7\text{-}32$  thick, ending like a screw-driver. The larger end is wedge-shaped having a sharp, semi-circular edge, making it almost perfect for prying up covers, supers, etc., as it does not mar the wood. Dr. Miller, who has used it since 1903 says, January 7, 1907: "I think as much of the tool as ever." Price alone, postpaid, 25 cents. With a year's subscription, 60 cents. Given free for 2 new subscriptions at 50 cents each.

Exactly half actual size.

### PREMIUM QUEENS

These are untested, standard-bred, Italian Queens, reports of which have been highly satisfactory. They are active breeders, and produce good workers.

Sent only after May 1st. Orders booked any time for 1908 queens. Safe delivery guaranteed. Price, 75 cents each, 6 for \$4.00, or 12 for \$7.50. One queen with a year's subscription, \$1.00. Free for 3 new 50c. subscriptions.

### HUMOROUS BEE POST-CARDS

A "Teddy Bear" on good terms with everybody including the bees swarming out of the old-fashioned "skep." Size  $3\frac{1}{2} \times 5\frac{1}{2}$ , printed in four colors. Blank space  $1\frac{1}{2} \times 3$  inches is for writing. Prices—3, postpaid, 10 cents; 10 for 25 cents. Ten with a year's subscription, 60 cents. 6 given free for one 50-cent subscription.

### BOOKS FOR BEE-KEEPERS

**Forty Years Among the Bees**, by Dr. C. C. Miller.—344 pages, bound in handsome cloth, with gold letters and design, illustrated with 112 beautiful half-tone pictures, taken by Dr. Miller. It is a good, new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price alone, \$1.00. With a year's subscription, \$1.25. Given free for 4 new subscriptions at 50 cents each.

**Advanced Bee Culture**, by W. Z. Hutchinson.—The author is a practical and helpful writer. 330 pages, bound in cloth, beautifully illustrated. Price alone, \$1.20. With a year's subscription, \$1.45. Given free for 5 new subscriptions at 50 cents each.

**A B C of Bee Culture**, by A. I. & E. R. Root.—Over 500 pages describing everything pertaining to the care of honey-bees. 400 engravings. Bound in cloth, price alone, \$1.20. With a year's subscription, \$1.47. Given free for 5 new subscriptions at 50 cents each.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—How the very best queen-bees are reared. Bound in cloth and illustrated. Price alone, \$1.00. With a year's subscription, \$1.25. Given free for 4 new subscriptions at 50 cents each. In leatherette binding, price alone, 75 cents. With a year's subscription, \$1.00. Given free for 3 new subscriptions at 50 cents each.

**Bee-Keeper's Guide, or Manual of the Apiary**, by Prof. A. J. Cook.—This book is instructive, helpful, interesting, thoroughly practical and scientific. It also contains anatomy and physiology of bees. 544 pages, 235 illustrations. Bound in cloth, price alone, \$1.20. With a year's subscription, \$1.47. Given free for 5 new subscriptions at 50 cents each.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic has been entirely rewritten. Fully illustrated. No apiarian library is complete without this standard work by "The Father of American Bee Culture." 520 pages, bound in cloth. Price alone, \$1.20. With a year's subscription, \$1.45. Given free for 5 new subscriptions at 50 cents each.

**"The Honey-Money Stories."**—A 64-page booklet. Containing many short, bright stories interspersed with facts and interesting items about honey. The manufactured comb-honey misrepresentation is contradicted in two items each occupying a full page. Has 33 fine illustrations of apiaries or apiarian scenes. It also contains 3 bee-songs. This booklet should be placed in the hands of everybody not familiar with the food-value of honey, for its main object is to interest people in honey as a daily table article. Price 25 cents. Given free for 1 new subscription, at 50 cents.

Three copies for 50 cents; or the 3 with a year's subscription 75 cents; or the 3 copies given free for 2 new subscriptions at 50 cents each.

**Amerikanische Bienenzucht**, by Hans Buschauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price alone, \$1.00. With a year's subscription, \$1.25. Given free for 4 new subscriptions at 50 cents each.

### THE EMERSON BINDER

A stiff board outside like a book-cover with cloth back. Will hold easily 3 volumes (36 numbers) of the American Bee Journal. Makes reference easy, preserves copies from loss, dust and mutilation. Price, postpaid, 75 cents. With a year's subscription, \$1.00. Given free for 3 new subscriptions at 50 cents each.

### WOOD BINDER

Holds 3 volumes. Has wood back but no covers. Price postpaid, 20 cents. With a year's subscription 60 cents. Given free for 1 new subscription at 50 cents.

### BEE-HIVE CLOCK

A few of these handsome "bronze-metal" clocks. Base 10 $\frac{1}{2}$  inches wide, by  $9\frac{1}{2}$  inches high. Design is a straw skep with clock face in middle. Suitable for parlor—an ornament for any place. Keeps excellent time, durable and reliable. Weight, boxed, 4 pounds. You pay express charges. Price, \$1.50. With a year's subscription, \$1.75. Given free for 6 new subscriptions at 50 cents each.

**PUT YOUR MONEY IN A GOOD ROOF**

**“Vulcanite” is that Roofing**

**ON ITS MERITS**

**STRONG DURABLE**

long ago won for itself the reputation of being the Best Ready Roofing known. Realizing the value of this reputation, we have always endeavored to maintain it, not only by keeping strictly up to the original high standard, but by contantly striving to improve it in every possible way. Requires no annual painting. Samples and “Roll of Information” FREE.

**Patent Vulcanite Roofing Co.,**

Special Offer. —For \$1.15 we will send the Rural Bee Journal for one year.

## Bees and Supplies

FROM  
N. Y. City

For 14 years, we have been furnishing Bees and Supplies of every description to bee-keepers in the East. We have studied the East as a honey-section, know its honey-flows, and the line of goods best adapted to produce honey here. This is not theory with us, as we have about 700 colonies of bees, in four different sections, which produce a good crop of honey for us.

**Honey-jars** are now seasonable. We have several styles, No. 25 Jar, \$5.50 gross, 5 gross \$5.25 a gross; 1-lb. square Jars, \$5.00, 5 gross \$4.70 gross; 12-ounce round Jar, \$4.50 gross.

We handle both comb and extracted honey in season. Catalog free.

**I. J. Stringham, 105 Park Pl., New York**  
Apiaries, Glen Cove, L. I.  
Mention Bee Journal when writing.

## The Rietsche Press

Made of artificial stone. Practically indestructible, and giving entirely satisfactory results. Comb foundation made easily and quickly at less than half the cost of buying from the dealers. Price of Press for L. frame sheets, \$2.00. Other sizes, 25 cents extra. Price of the Press making the foundation directly on the wired frames, \$2.50, any size wanted.

## BEE-BOOKS

Sent postpaid by **GEORGE W. YORK & CO.,**  
118 W. Jackson, Chicago, Ill.

**Advanced Bee-Culture.** Its Methods and Management, by W. Z. Hutchinson. —The author of this work is a practical and helpful writer. You should read his book; 330 pages; bound in cloth, and beautifully illustrated. Price, \$1.20.

**A B C of Bee-Culture,** by A. I. & E. R. Root. —A cyclopedia of over 500 pages, describing everything pertaining to the care of the honey-bees. Contains about 400 engravings. It was written especially for beginners. Bound in cloth. Price, \$1.20.

**Scientific Queen-Rearing,** as Practically Applied, by G. M. Doolittle. —A method by which the very best of queen-bees are reared in perfect accord with Nature's way. Bound in cloth and illustrated. Price, \$1.00; in leatherette binding, 75 cents.

**Bee-Keeper's Guide,** or Manual of the Apiary, by Prof. A. J. Cook, of Pomona College, California. This book is not only instructive and helpful as a guide in bee-keeping, but is interesting and thoroughly practical and scientific. It contains a full delineation of the anatomy and physiology of bees. 544 pages. 295 illustrations. Bound in cloth. 19th thousand. Price, \$1.20.

**Langstroth on the Honey-Bee,** revised by Dadant. —This classic in bee-culture has been entirely re-written, and is fully illustrated. It treats of everything relating to bees and bee-keeping. No apiarian library is complete without this standard work by Rev. L. L. Langstroth—the Father of American Bee-Culture. It has 520 pages, bound in cloth. Price, \$1.20.

**Honey as a Health Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on “Honey as Food,” written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to “Honey-Cooking Recipes” and “Remedies Using Honey.” It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey the more honey they will buy. Prices: Sample copy for 2-cent stamp; 50 copies for 70 cents; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of the front page on all orders for 100 or more copies.

**Forty Years Among the Bees,** by Dr. C. C. Miller. —This book contains 328 pages, is bound in handsome cloth, with gold letters and design; it is printed on best book-paper, and illustrated with 112 beautiful original half-tone pictures, taken by Dr. Miller himself. It is unique in this regard. The first few pages are devoted to an interesting biographical sketch of Dr. Miller, telling how he happened to get into bee-keeping. About 20 years ago he wrote a small hook, called “A Year Among the Bees,” but that little work has been out of print for a number of years. While some of the matter used in the former hook is found in the new one, it all reads like a good new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price, \$1.00.

**“The Honey-Money Stories.”**—A 64-page-and-cover booklet, 5 3/4 x 8 1/2 inches in size, printed on best quality paper. Many short, bright stories interspersed with facts and interesting items about honey and its use. The manufactured comb honey misrepresentation is contradicted in two items, each occupying a full page, but in different parts of the booklet. It has in all 33 fine illustrations, nearly all of them being of apiaries or apiarian scenes. It also contains 3 bee-songs, namely, “The Hum of the Bees in the Apple-Tree Bloom,” “Buckwheat Cakes and Honey,” and “The Bee-Keepers' Lullaby.” This booklet should be placed in the hands of everybody not familiar with the food-value of honey, for its main object is to interest people in honey as a daily table article. Price, 25 cents, or 3 copies for 50 cents.

# American Bee Journal

## QUEENS OF Moore's Strain of Italians

Produce workers that fill the supers, and are not inclined to swarm. They have won a world-wide reputation for honey-gathering, hardiness, gentleness, etc.

Mr. W. Z. Hutchinson, editor of the BEEKEEPERS' REVIEW, Flint, Mich., says: "As workers, I have never seen them equaled. They seem possessed of a steady, quiet determination that enables them to lay up surplus ahead of others. Easier bees to handle I have never seen."

My queens are all bred from my best long-tongued three-banded red-clover stock (no other race bred in my apiaries), and the cells are built in strong colonies well supplied with young bees.

PRICES: Untested queens, 75c each; six, \$4; doz., \$7.50. Select, untested, \$1.00 each; six, \$5.00; doz., \$9.00.

Safe arrival and satisfaction guaranteed. Descriptive circular free. Address

J. P. MOORE, Queen-Breeder, Rt. 1, Morgan, Ky.

Special prices for 50 and 100 Queens. Caucasian, Italian, Cyprian, and Carniolan Queens bred the best imported breeding Queens. The addresses must be clear; payments by postal money orders. Queens guaranteed to arrive in good condition in U. S. or Canada. To Australia, Ceylon, India, etc., \$1 more.

E. HAUNSCHILD, the Queen-Breeder,  
20A13t Weissbach b. Pulsnitz, i. Sa., Germany.

## Honey and Beeswax

CHICAGO, Aug. 31.—The market is quite active in comb honey, and the choice grades of white sell at 18c per pound. There is not much call for anything that grades under No. 1, but prices are firm though not established on all kinds of honey. Extracted, clover, brings 8c; the ambers 7 to 7½c, with dark at 6 to 6½c. Beeswax sells readily at 32c per lb. No surplus here of any kind.  
R. A. BURNETT & Co.

KANSAS CITY, Aug. 19.—The demand for comb honey is good, but receipts light, with no extracted in the market. We quote No. 1 white comb, 24-section case, per case \$3.50; No. 2 white and amber, \$3; extracted, white, 8c; extracted, amber, 7c. Beeswax, 28c. C. C. CLEMONS & Co.

INDIANAPOLIS, Aug. 23.—Fancy white comb honey sells to the retail grocery trade in lots of 1 to 5 cases at 19 to 20 cents. No. 1 white 17 to 18 cents. Best grades of extracted in 5-gallon cans, sells for 11 to 12 cents. Some foreign extracted honey on the market is offered at slightly lower prices. Beeswax is plentiful, but in fairly good demand, at \$35 per 100 pounds.  
WALTER S. POWDER.

CINCINNATI, Aug. 22.—The market on comb honey is good, selling for 16½c wholesale. Extracted, white, in 60-lb. cans, at 10c; amber in barrels, at 5½ to 6c. Beeswax show at 33c.  
C. H. W. WEBER.

CINCINNATI, Aug. 22.—Fancy and No. 1 comb honey finds ready sale at 15 to 16c. The present supply is about equal to the demand. The price of extracted honey is steadily advancing. We have quite a big stock on hand, and for that reason continue to quote amber in barrels at 5½ to 6½c, according to quality. Extracted, fancy white clover, in 60-lb. cans, at from 8 to 9c. For choice yellow beeswax, free from dirt, we are paying 30c.  
THE FRED W. MUTH Co.

NEW YORK, Aug. 22.—We are beginning to receive small shipments of the new crop white comb honey, but do not expect to have any large lots until a few weeks from now. While the crop

"In every country the successful advertiser is the continuous advertiser."

## A GREAT IMPROVEMENT

Will be found in

# The American Bee-Keeper for 1907

It is profusely illustrated and enlarged, and contains only articles of the most practical as well as scientific nature. A special corps of the best writers has been engaged. The editors are Harry E. Hill and Arthur C. Miller, than whom there are no more practical or experienced bee-keepers in this country. We have published the American Bee-Keeper continually and regularly since 1890.

Regular subscription price, 50 cents a year, One year to new subscribers, 35 cents; three years for \$1 00.

Send for sample copy and our new illustrated price-list of BEE-SUPPLIES OF ALL KINDS.

Guaranteed highest quality at lowest price. Address,

**THE W. T. FALCONER MFG. CO.**

Dept. B JAMESTOWN, N. Y.

[Established 25 years.]

## For Sale

—1500 lbs. of extra-fine Clover Honey. This honey was extracted August 1st, from new combs. Since extracting, it has been kept at a temperature ranging from 80° to 120°. It is light in color and of a very heavy body. In fact, I am so proud of this honey that it will be a pleasure to mail you a sample. I shall put this honey up in clean new 60-lb. cans, and ask only 10c per pound for it.

JAY NORTH, North Adams, Mich.

is certainly very short in some sections of New York State, and in the East in general, there are some sections where they produced a larger crop than that of last year, but, of course, not enough to off-set the shortage in other localities. The quality is reported to be fine. The demand is good; no doubt white comb honey will find ready sale all through the early fall, providing prices are not prohibitive. Let us bear in mind the fact that comb honey is not a necessity but a luxury, and unless people can buy it at a certain price they will do without it. This we have experienced more than once heretofore. Fancy stock will find ready sale at 16c per lb. No. 1 at 14 to 15c, and No. 2 around 13c. Prices on dark and buckwheat not established as yet. The season is very backward, and we do not expect to have any buckwheat until middle of next month, if then. Extracted honey is in good demand, and prices are very firm. We quote California white sage at 8½ to 9c, light amber at 7 to 7½c. Choice grades in barrels or kegs at 7 to 7½c per lb. Average common Southern at 60 to 65c per gallon. Beeswax steady at 30 to 31c, according to quality.

HILDEKETH & SEGELKEN.

TOLEDO, AUG. 15.—There is practically no market on honey yet established, as bee-keepers are all holding their honey expecting to get enormous prices. We are getting for honey, fancy white clover in a retail way, 16 to 16½c; No 1, 15 to 15½c, with no demand for darker grades. Extracted white clover, in barrels, brings 7 to 7½c. Beeswax 26 to 28c.

THE GRIEGS BROS. & NICHOLS CO.

PHILADELPHIA, June 25.—This hot weather has come on us so suddenly that it has stopped the sale of comb honey entirely, and extracted honey has been moving very slowly the last 10 days. We quote: Extracted honey, dark, in barrels, 6 to 7c; light extracted honey, in barrels, 7 to 8c; in 60-lb. cans, according to quality and quantity. Beeswax, 30c.

We are producers of honey and do not handle on commission. WM. A. SELSER.

DENVER, July 8.—Old comb honey, or last season's crop of comb honey, has been entirely cleaned up in this market for several weeks and new crop has not arrived yet. There is no change in the situation of extracted honey, and we have a good supply to meet the local demand. Our prices are 6½ to 7½ for light amber, and 7½ to 8½ for white, per pound. We pay from 24 to 26 cents for clean yellow beeswax delivered here.

### Books for Bee-Keepers

Every bee-keeper should have a bee-book besides a bee-paper. On another page will be found all the best books offered—either at a price, postpaid, or as a premium. If you can not earn them as premiums for getting new subscriptions, it will pay you well to purchase one or more of them. You will find them of great value. There are so many things in the books that are needful to know, and that of course could not be told over and over again in the bee-papers. If a bee-keeper can afford only one, it would better be the book rather than the paper. But now that the American Bee Journal is only 50 cents a year, of course, no bee-keeper, however limited his apiary may be, can afford to be without its monthly visits.

## I Am Now Filling Orders BY RETURN MAIL

### QUEENS OF Moore's Strain of Italians

Produce workers that fill the supers, and are not inclined to swarm. They have won a world-wide reputation for honey-gathering, hardiness, gentleness, etc.

Mr. W. Z. Hutchinson, editor of the BEE-KEEPERS' REVIEW, Flint, Mich., says: "As workers, I have never seen their equal. They seem possessed of a steady, quiet determination that enables them to lay up surplus ahead of others. Easier bees to handle I have never seen."

My queens are all bred from my best long-tongued three-banded red-clover stock (no other race bred in my apiaries), and the cells are built in strong colonies well supplied with young bees.

PRICES: Untested queens, 75c each; six, \$4; doz., \$7.50. Select, untested, \$1.00 each; six, \$5.00; doz., \$9.00.

Safe arrival and satisfaction guaranteed. Descriptive circular free. Address

J. P. MOORE, Queen-Breeder, Rt. 1, Morgan, Ky.

## VULCANITE ROOFING

### OVER OLD SHINGLE ROOF

is dust-proof and fire-resisting, easily laid, and saves all the expense and work of tearing off old shingles. Special long nails furnished when it is to be laid over shingles. For new roofs Vulcanite is better than shingles or metal; cheaper, too, and requires no annual painting. For over 60 years Vulcanite has been the standard Ready Roofing—better today as we are constantly striving to improve it in every way possible. Before you build or repair write for samples and booklet, "The Right Roofing and the

Reasons Why." Sent free on request.

PATENT VULCANITE ROOFING CO., Dept. 38  
Franklin Warren Co., O. or 626-59 S. Campbell Ave., Chicago.

## Trade Notes

### The A. I. Root Company, Medina, Ohio

Does It Pay a Planing Mill Man to Make His Own Hives?  
An unsolicited statement of the matter from an Illinois bee-keeper:

### ELIAS BAMBERGER

Manufacturer of

### SASH, DOORS, BLINDS

Contractors' and Builders' Supplies  
Including All Kinds of Window Glass  
Cor. Exchange and Adams Sts.

ESTIMATES FURNISHED ON APPLICATION

Freeport, Ill., June 11, 1907.

The A. I. Root Co.,  
Medina, O.

Gentlemen:

I received five of your AE52S-10 hives yesterday and find that I cannot make my own hives and supplies as cheap as yours and use the same quality of lumber. You can see by the head of this letter that if anyone can make hives cheaper than your prices or any of the so-called "trust hive" manufacturers, I ought to be able to do it, but using the same quality of lumber I cannot.

Yours very truly,

(Signed) John H. Bamberger.

The above is a representative letter from the many we have to the effect that our hives and other supplies can be purchased cheaper than a local mill can possibly make them. Our enormous output enables us to reduce the cost to the minimum without sacrificing quality.

## Editorial Notes and Comments

### National Convention at Harrisburg

The last two days of this month (October 30 and 31) will be held the annual convention of the National Bee-Keepers' Association, at Harrisburg, Pa. It has been many years since it met in Pennsylvania, where now there is a strong State organization of bee-keepers.

From Chicago there will be a 10-day rate at that time of \$17 for the round-trip, or a 15-day rate of \$22.25, to the Jamestown Exposition (Norfolk, Va.), with stop-over privilege at Harrisburg to attend the convention. With such low rates and generous privileges, it seems there should be a large number of bee-keepers who would avail themselves of the opportunity to attend the National convention of bee-keepers this year. Pennsylvania will make every effort to have a successful meeting.

We hope that as many as possible of the readers of the American Bee-Journal will plan to go to Harrisburg. It is a little less than a month now before the convention. We are hoping to be present, but just now we can not say definitely, as there are circumstances over which we have no control that may prevent our attendance this year.

### The Honey Market for 1907

It is a mistake to hold on to honey until too late, expecting an advance in price that is never to come. On the other hand it is a mistake to let it go for any old price that may be offered, said offering being based upon the fact that the buyer who makes the offer has already bought at a very low figure. The amount bought at that low figure may be merely a few pounds produced by some ignorant bee-owner with few

colonies and less experience, and it is hardly the right thing that such a transaction should be considered as settling the price.

It is now very evident that the crop is short, and there is no good reason why the price should not be correspondingly long. Even if the crop were of the usual amount the upward tendency of all prices in general demand that honey should also advance. Taking both conditions together, scarcity of the article and a general rise in prices, it certainly looks as if honey should be honey this year. While there is a gratifying advance in quotations in some cities, in others there seems a tendency to keep somewhat nearer old prices. The bee-keeper will, of course, consider difference in prices, as also distance to different markets, and be governed accordingly. Above all, he should look out for his home market, and not be in haste to sacrifice the fruit of his season's labor.

### Beginners Should Study Foul Brood

The beginner who fails to read up on the subject of foul brood, thinking that it is time enough to do so when the disease appears in his own apiary, is making a serious mistake. After a time he finds something unusual in one or more of his colonies, and is frantic lest it be foul brood, whereas if he had informed himself he might have been saved needless anxiety, since there may be nothing in the case to excite needless alarm. Or, if the disease has really appeared, it is of first importance that he be informed in advance, ready intelligently to identify it, and to know at least something about what should be done, instead of being thrown into a

panic wasting precious days before finding out what to do.

Again, the insidious enemy may make its appearance unsuspectedly, and be spread throughout the whole apiary before he suspects it, whereas a little reading would have enabled him to spot it while it was still confined to a single colony, allowing him to take precautionary measures to prevent its further spread.

As a practical authority on the subject, no one stands higher than the Canadian expert, Wm. McEvoy. As his latest deliverance upon the subject, after his many years of rich experience in dealing with the pest in many apiaries, will be found an article on another page of this number, the said article being copied from the Canadian Bee Journal. Its reading is heartily commended to all who are as yet uninformed upon the subject. Those who are informed will probably read it anyhow.

### New Way of Introducing Queens

The Alexander plan of introducing 2 or more queens into a colony may be equally used for the ordinary introduction of a single strange queen. It has the same advantage over the ordinary candy plan that the Abbott plan has, in that the colony is left queenless less than 12 hours; and Mr. Alexander claims in Gleanings that it is very much easier than the usual candy plan.

### Dr. Miller's Double-Queen Plan

Dr. Miller writes that while waiting for Mr. Alexander to make known his plan of getting several queens into the same colony, he has been doing some experimenting on his own account, and has met with entire success in part of his trials. His plan is exceedingly simple:

Put into a provisioned cage 2 queens, put the cage into a queenless colony, and after 6 days' imprisonment let the queens out upon the combs. That's all. This takes considerably less of the bee-keeper's time than the Alexander plan, but takes much more of the bees' time. Moreover, it is doubtful if it is so safe. The queens with which he succeeded

were 3 years old. He put into the same cage 2 queens that had been laying only a few days, and they showed fight. Possibly success might be obtained with any 2 queens, if, instead of being put in the same cage, they were put into 2 different cages and imprisoned in the same hive. Certainly there could be no fighting during the time of imprisonment in the cages, and at the end of that time they might be ready to be good to each other.

#### Attachment of Sections to Separators

For some reason it sometimes happens that a little bridge of wax is built between the separator and the sealed surface of a section. This is more likely to be the case if there is some crowding for room, which favors bar-combs in general. Once in a while a colony seems to have a special tendency in that direction, many of the sections in each of its supers being thus fastened to the separators, and it is not a bad plan, at the first convenient opportunity, to replace the queen of such a colony with a queen of better tendencies.

When this trouble exists, and the sections are taken out with no special care, the capping is sure to be pulled away, resulting in a "bleeding" section. To avoid this, before the sections are taken out of the super, cut through the bridge with a sharp knife having a thin blade. Still better, cut through with a heated blade which melts the wax.

#### Extracting-Combs on Till Close of Season

Years ago the Dadants stood pretty much alone in the practise of leaving extracting-combs on the hives till the close of the season. With the idea that more honey could thereby be obtained, in many cases honey was thrown out of the comb when little or none of it was sealed. Some claimed it could be ripened out of the hive as well as in. Whether that be correct or not, the fact was that it was not well-ripened in most cases, and the amount of unripe stuff thrown upon the market had an effect from which extracted honey suffers till the present. It seems to be conceded now that there is no real gain in the amount obtained by extracting before sealing; only loss in the quality of the honey. Even if it were just as well to extract one time as another, the matter of convenience should incline toward waiting till the rush of work at the bees is over. Artificial heat can make the combs even warmer than when just taken from the hives.

#### Comb Honey by Express

We have received the following in regard to shipping comb-honey by express:

EDITOR AMERICAN BEE JOURNAL:—

Ought we not to do something to make express company employes handle honey more carefully? If the sections are in regular shipping-cases, with glass fronts and hand-holes, why should honey arrive in a great big mess? I shipped a lot to New York, and 25

percent was smashed. Everybody knows, of course, with what keen sense of responsibility and most delicate feeling our trunks are dumped from the express-car on the truck! Why such a fragile article as honey should not be handled carefully, I really do not understand.

Let us be up and doing, to bring some pressure to bear upon the head men of the express companies, so that they will instruct their employes to exercise the proper care in handling other people's property. To patronize a concern, pay for transporting charges, and then have one's goods damaged and smashed, is an outrage.

Angelica, N. Y.

This, of course, is a serious matter to bee-keepers who wish to send comb honey by express. But it is a difficult matter to ship comb honey safely if it is not properly protected or packed. It would seem that if the express companies accept comb honey, they ought to be held responsible for any damage to it while in their hands.

This is a matter that the Committee on Freight-Rates, of the National Bee-Keepers' Association, might well consider. Why not have it brought up at the Harrisburg convention, Oct. 30 and 31?

#### Two Queens or More in One Colony

A few months ago, the somewhat startling announcement was made in Gleanings that E. W. Alexander had succeeded in having in the same colony, not separated by excluder zinc, but with free access to each other, 2 or more laying queens. Mr. Alexander has at last made known the plan by which he succeeds in accomplishing this, which plan will be found on another page of this number. A hasty reading may make it seem to some that a good deal of time and labor is involved in the proceeding, but a careful study will make this appear a good deal less.

It would be premature to say just how successful others will be in carrying out the plan until it has been thoroughly tried. For such trial many will still have opportunity this fall. Of course, all uniting of weak colonies should have been done before this, but equally, of course, some colonies are likely still to be left that are not as strong as might be desired. One or more weaklings may have been left merely for the chance of wintering over their queens. If 2 such queens can be induced to live peaceably together, the chances of wintering over will be increased by the union of the colonies.

Let it be urged that whoever tries the plan should follow strictly the instructions given by Mr. Alexander. A slight deviation in a single particular, even if it seem of no consequence, may bring failure. Let it be noted that although it is only incidentally mentioned, the first step in the process—removing the queen and brood, and putting the bees in the box—is taken in the morning, giving from that time until sundown for the distress of the queenless bees to reach its climax.

If it turns out that Mr. Alexander's plan can be generally carried out with

success, it is hard to estimate its importance. If nothing more could be gained than the wintering over of one or more extra queens in a colony, that alone would be an immense step in advance. But Mr. Alexander claims another advantage that many will estimate still more highly. He says he has never had a colony with 2 or more laying queens prepare to swarm. While some might not value this, there are others who would gladly double together every pair of colonies in the spring if they might be safe from all anxiety about swarming.

#### Producing Best Extracted Honey

In the Bee-Keepers' Review for August there is quite a little about producing well-ripened honey. On receipt of that copy, Mr. R. A. Burnett, who is perhaps the oldest honey dealer in Chicago, wrote us the following comment:

EDITOR YORK:—The first two articles in the Bee-Keepers' Review of August make the blood in the writer circulate with the freedom of youth. Just to think that the wise editor has reached the autumn of life before he knew what he describes in these words:

"It is then perfectly ripened and all sealed over, and has a body and flavor of which I never dreamed until I put this method into practice."

What practice? you may ask. It is that of letting the bees complete their sacrifice in ripening the honey in their homes.

Mr. Townsend has proved for himself that more honey than he can produce, of a perfect quality, is needed to supply those who once get a taste of such as he describes. The writer has maintained for many years that the greatest enemy of the bee-keepers is the bee-keeper who offers unripe honey for sale. If honey-producers will heed the prayer of Mr. E. D. Townsend, uttered in the last sentence of his article above mentioned, it will bring them money, and blessings.

R. A. BURNETT.

Chicago, August 28th.

The particular statement to which Mr. Burnett refers is contained in this from Editor Hutchinson himself:

"In the frontispiece this month I am showing you a view of the Morey apiary. No honey has yet been taken off, but you can see that we are to get a fair crop, and by the time these lines greet the eyes of my readers, much of the extracting will have been done. You see, we have plenty of supers and combs or sheets of foundation, and when a colony is in need of more room it is given, but all of the honey is left on until the end of the season. It is then perfectly ripened and all sealed over, and has a body and flavor of which I never dreamed until I put this method into practice. The honey will be taken off with bee-escapes, and then warmed up artificially before it is extracted. One end of the honey-house is partitioned off, making a room 5x12 and six feet high. By means of an oil stove we can bring the temperature in this room up to 110 degrees, if we wish, and 95 is high enough. Honey warmed up arti-

# American Bee Journal

ficially to as high a degree as it will bear without softening the combs too much, can be extracted quicker and cleaner than honey as it usually comes from the bees. Another thing, there is no need of any hurry about it. Just have plenty of supers, and pile them up until the season is over, then take off the honey with bee-escapes, and extract it at your leisure. In this way, bee-keeping is robbed of much of its strenuousness. Of course, it is not absolutely necessary to leave on all the honey until the season is over. When the honey in a super is all sealed over, it may be removed, and such full supers may be stacked up in the house until we are ready to extract."

As the subject of producing only well-ripened extracted honey is such a vital one, not only to bee-keepers themselves, but also to the dealers in honey, we wish to make a few more extracts from that same copy of the Review. The following is written by Mr. E. D. Townsend, a leading Michigan bee-keeper:

## "GRADING EXTRACTED HONEY."

"For several years our extracted honey has been graded; that is, our early, white honey for table use, with our system of giving additional upper stories *on top*, any partly-full upper stories are on top at the close of the season, when we do our extracting. Of course, with this way of managing, especially as we try to have every upper story possible sealed, and finished, still, with all the precaution one can take along this line, with these 50-pound-capacity upper stories, there will be a good many partly-full upper stories at the close of the season, the best we can do. The way we manage to get our superior grade of honey that sells for one or 2 cents above the market price, is to take off all these partly-full upper stories, and extract them by themselves. As they are all on *top*, this is not much additional labor, and, in a good season, this first extracting will not amount to more than one-fourth the crop. We call this grade No. 1, as even this, our lowest grade, is superior to the ordinary honey on the market.

"Another way, where one has two extractors, and a little more time, is to set up two extractors, near together for convenience, then run all the partly-sealed combs through an extractor before uncapping. In this way, we get a larger percent of the superior grade of honey, but it is some more work. With this latter plan the unsealed honey is not of as good quality as our No. 1 mentioned above, and ought to go for some other purpose than table use. This plan of using two extractors, originated with me, and our whole crop at the Kalkaska County yard was handled this way during season of 1905.

"The reason for using two extractors is that the sealed combs of honey would get so cold standing around, waiting their turn, that it would be impossible to extract the honey unless it was returned to the bees to be warmed up. If one had artificial heat to apply in the latter case, it would work fine. Some of the slickest, cleanest, dryest combs I

ever extracted were heated up artificially.

## "PRODUCING AN ARTICLE THAT ENABLES THE PRODUCER TO SET THE PRICE."

"It will not be necessary to tell the experienced extracted honey producer that this honey, after being left on the hive clear through the season, then, having all the latest-gathered and unsealed honey taken away, and kept in a grade by itself, that we would be likely to get a fine article; more, *it would be the acme of perfection*. Isn't the system very simple? Just add a few more upper stories, keep giving the bees more comb-room clear through the season, then leave it as long as there is no danger of getting dark, or inferior, honey mixed with it, even if it is the last of August, if you have no fall flow, and I assure you, you will not regret it. You will have an article in a class by itself. To find its value, you do not have to look at a market quotation. *You make customers; there is a scramble for it.*

"Any one producing the ordinary article of honey one finds on the market, is not only losing much on his *own* crop, but is a very great damage to the fraternity at large. It is an undisputed fact, that every pound of good honey that is put on the market increases the demand for honey, while every pound of inferior honey decreases the demand. Can't you see how the land lays? Have you been producing just the *ordinary* honey in the past? Has the price been unsatisfactory, and the sales slow and far between? If so, there is a better way. The better way is so simple that there is not a particle of excuse, for not practicing it. Brother bee-keeper, let us produce just a little better honey during 1907 than we did in 1906."

The following are two of Mr. Hutchinson's editorials, taken from the same number of the Review, as they bear directly upon the subject under consideration:

## "GET GOOD PRICES FOR YOUR HONEY AND DON'T FOOL IT AWAY."

"Last winter and spring were terribly hard on bees; the mortality was great. Then, on top of this, came an almost total failure of the white honey crop. The result is one of the shortest honey crops that this country has experienced in a long time.

"The National pure food law has cut out the glucose competition and largely removed the suspicion of adulteration.

"Coupled with all of the foregoing comes a general advance in the price of nearly all commodities, and beekeepers certainly ought not to be so far behind the times as to neglect to take advantage of this opportunity; or, rather, to claim what is rightfully theirs. I do not advise the asking of an exorbitant price, even if it could be obtained; and it can't, as honey is a luxury (not a staple like bread, meat and potatoes) and few people will pay a fancy price for it.

"Under these circumstances, I think strictly first-class, white, extracted honey should bring 10 cents at wholesale, and the same grade of comb honey at

least 16 cents. I believe any man having any of that grade of honey can secure those prices between now and January if he only holds on to his honey and takes the proper course to secure customers. I am already getting orders for my honey at that price; but there is occasionally a retail dealer who 'balks' at that price, saying his trade will not allow him to pay that figure. The prices at which honey has been retailed in the past will not allow such a price at wholesale, but retail prices must be advanced, and there never was an opportunity like the present for advancing them—'there is a reason.' Retail dealers must explain to their customers that bees died largely as the result of the late cold spring, that the clover harvest was almost a failure, and the result is a very short crop with the consequent advance in price. Call attention to the additional fact that the prices of nearly everything are advancing—people *know this*, and can comprehend why the prices of honey should also be advanced. A little careful explanation like this on the part of the retailer will enable him to put the price of honey where it ought to be under the circumstances."

## "HOW TO GET GOOD PRICES."

"I have urged my readers to ask a good price for their honey, but simply *asking* is not enough. It is a very easy matter to ship off a crop of honey to some dealer and get the ordinary, ruling market price for it. If you wish to secure more than the market price, then some effort must be put forth. In the first place, there must be some *reason* why a good price shall be received. Take my own case, for instance; my honey is not ordinary honey, it is raspberry honey. Then it is thoroughly ripened—left on the hives weeks after it is capped over—and is thick, rich and delicious; and it is put up in bright, *new* 60-pound cans. It is impossible to produce an article superior to this. Having produced such a fine article, and put a proper price upon it, the next step is to let consumers know about it—advertise it and send out samples. I am now advertising it in three of the bee-journals. Of course this costs something, and if a man were to be in the business only a year it might not pay him, but a man can gradually build up a trade, and secure a class of customers that will buy his honey year after year without any advertising. I am now receiving orders from men who bought honey of me last year. They don't even ask for samples; they say, 'If your honey is like that of last year, you may send me so many cases,' and they send on the cash.

"Now, friends, isn't it worth while to have such a trade? To be able to sell your honey year after year to the same men—those who are willing to pay you from one to 2 cents a pound above market price, and send cash with the order, because they *know* that no finer honey can be produced, and that it is worth what you ask for it? The whole thing can be told in a few words: *Produce* honey of superior quality, and then let consumers know about it—the latter is fully as important as the first."

### Does the Queen Will the Egg-Sex?

Some maintain that the size of the cell decides automatically the sex of the egg laid in it. To this it is replied that if the cells are only  $\frac{1}{2}$  inch deep, the queen still lays the proper egg in the corresponding cell, as a general rule, only sometimes when drone-comb is in the way, and she does not desire to lay drone-eggs, she fills these drone-cells with fertilized, or worker, eggs; and so it is perhaps the general belief that the will of the queen decides whether each egg, as it is laid, shall be impregnated or not.

Dr. Miller, in *Gleanings*, declares he does not know which theory is correct, but says that in the few cases he has known of worker-eggs being laid in drone-cells the workers have always narrowed the mouths of the cells by making a heavy margin of wax, and wants to you, you know, why it is that if the sex of the egg depends upon the will of the queen she can not will to lay eggs in drone-cells without any bother of first narrowing the mouths of the cells.

### Spring Stimulation of Brood-Rearing

Allen Latham says in the *American Bee-Keeper*:

"Few bee-keepers escape and fewer resist the temptation to practice brood-stimulation in spring. Some succeed apparently in their efforts and tell of their success, while many fail and say nothing about their failures. That brood-stimulation is a matter to be let alone—let severely alone—by the novice is acknowledged by all who are honest in their advice and to their own conviction."

In support of his belief he then relates how, during the past inclement spring, he gave special care to the bees in his home apiary, while 8 colonies a mile and a half away were left severely alone, and these neglected colonies came out stronger than the others. The neglected colonies were in larger hives than the others, and the question may be raised whether this item made no difference.

### Get a Bee-Book—Good Advice

The editor of the *Irish Bee Journal* puts it in this wise: "The height of folly is to try making money by bees without a thoroughly reliable book of instructions." And that's just as true in this country as in Ireland. A man with only a single colony of bees can gain or save enough in a single season, oftentimes, to pay for a text-book on bee-keeping twice over. If you can not have both a bee-book and a bee-paper, by all means have the bee-book first, and then the periodical as soon after as you can.

Speaking of bee-books, that same Irish editor—Rev. J. G. Digges—has written the "*Irish Bee-Guide*," a book which has had high words of praise, and no one familiar with the bright scintillations of wit in the *Irish Bee Journal* could be easily persuaded that a book written by its editor would be very dull reading.

### The National's Membership

It is still growing. On September 26 it had a total of 2471 members. Surely more than enough will come in before the Harrisburg convention, Oct. 30 and 31, to put it away over the 2500 mark mentioned some time ago. There are many of our readers who should become members at once. Send \$1.00 to N. E. France, Platteville, Wis., which will pay a year's dues.

The National Bee-Keepers' Association is the greatest organization of bee-folks on this continent. If all will lend a hand, it will increase in power and usefulness as the years come and go. If you, dear reader, are not now a member, better join today.

### Apiary of M. A. Salazar

Mr. W. H. Laws, of Beeville, Tex., sent us the following taken from a local newspaper, last June:

Yesterday morning M. A. Salazar hived the most remarkable swarm of bees, in some respects, that has ever been seen in the Falfurrias Country.

These bees—a big swarm—were actually building comb, storing honey, etc., among the branches of a tree near Mr. Salazar's house on West Rice Street. They were as busily at work as if they had been at home in a hive, and, contrary to the usual bee laws and regulations, were building comb and rearing

such as was afforded by the leaves of the tree.

They had been there long enough to have some sealed brood, and a larger quantity of larvæ and eggs, and in a short time would have been hatch-

AN OUT-DOOR COLONY

ing out, had nothing happened to interfere with them, but Mr. Salazar decided to put them in a more up-to-date hive. No one knows where the swarm came from, but Mr. Salazar is certain they used good judgment in

APIARY OF M. A. SALAZAR

brood as though intending to make their permanent home in the open light of day, and without the slightest protection from sun, wind and rain, except

stopping near his large apiary.

Mr. Laws also kindly sent us the accompanying pictures which were on souvenir postal cards.

# American Bee Journal

## Getting a Late Honey Crop

In a letter from Mr. C. P. Dadant, of Hamilton, Ill., dated Sept. 11, he wrote as follows:

"Our boys are now glad that they kept pushing the bees that looked so bad in the spring, for they are now being rewarded with one of the latest crops of honey we ever had. It was fully Aug. 20 before the bees started to store in good earnest, but we now feel sure of over 15,000 pounds of extracted honey, which is more than could be expected after such a backward season."

We hope that the foregoing experience will be general throughout the whole country. If it is, the bees will not only enter winter quarters well supplied with stores, but the fall crop of honey will go quite a distance toward helping to make up for the loss of the white honey crop. Then if we can have a good honey season next year, everything in beedom may be evened up all right.

## Advertising Honey For Sale

We have received the following from Mr. Jay North, who offered 1,500 pounds of extracted honey for sale through a small advertisement one time in the American Bee Journal:

EDITOR YORK:—Please drop my advertisement from your next issue, as my clover honey is all sold. It went fast at the 10 cents a pound.

This is the first time I ever advertised my honey, and can say that I am well pleased with the results.

JAY NORTH.

If you have any good honey to sell, why not do as Mr. North did? An advertisement in the American Bee Journal should do as well for you.

## Apiarian Exhibit of C. M. Nichols

The picture herewith shows the exhibit of bees, honey, etc., made by Mr. C. M. Nichols, at the recent Michigan State Fair at Detroit, and also at the West Michigan Fair held at Grand Rap-

ids. We understand that he won a large share of the prizes and honors at both Fairs, and cash premiums amounting to over \$200. Besides this he sold quite a lot of honey at fancy prices to the fair officials and others.

The Grand Rapids *Daily Herald* comments very interestingly on the exhibit made by Mr. Nichols, calling it the most fascinating and instructive exhibit to man, woman, and child. The display stood out in bold relief, its inviting rows of pure extracted honey in various sizes and shapes of glass bottles being attractive to the eye as well as to the appetite of those having a sweet tooth.

Mr. Nichols operates 5 bee-yards, which makes him one of the leading bee-keepers of Michigan. He exhibited bees in over 30 observation hives, besides having a large screen-covered cage which he entered and demonstrated the various manipulations of bees. This and many other features of his exhibit made it the most instructive and attractive on the grounds.

While the staging and care of such an exhibit as Mr. Nichols showed at the two Fairs referred to mean a lot of work and expense, we believe there is no better way in which to interest the public in honey. Surely there are no other exhibits that always attract so much attention as those of the apiary department of any Fair.

## Mr. Caley's Cleome Apiary

When sending the picture shown on the front page this month, Mr. G. D. Caley, of Cozad, Neb., wrote as follows:

EDITOR YORK:—I have about 50 colonies of bees, but the plants are so large that they hide part of the hives. It is Rocky Mountain Bee-plant, or *Cleome integrifolia*. I think it is one of the best bee-plants we have in Nebraska. The bees work on it from daylight till dark.

G. D. CALEY.

Mr. Caley attended the San Antonio convention of the National last November, when we had the pleasure of meeting him. He is also an old-time friend of the American Bee Journal and sub-

scriber thereto. His Cleome or Rocky Mountain Bee-Plant apiary is certainly very attractive. Cleome is a beautiful plant, growing 4 or 5 feet high, and branching out several feet. We remember seeing it for the first time when attending the Denver meeting of the National several years ago. It is a rich honey-plant.

## A Spanish Bee-Paper

For the second time, an attempt is being made to publish a bee-paper in Spain. This magazine, entitled, "La Apicultura Espanola," is published at Barcelona, Spain, by Mr. Pons-Fabregues, who is an enthusiastic bee-keeper, and has already published several works on bees, translated from the French. We trust he may make a success of his new venture. July and August numbers are the first of this paper.

## Mr. Strong at the Clarinda Fair

Mr. J. L. Strong, of Clarinda, Iowa, made an interesting exhibition at the Clarinda Fair recently. He had a cage made of screen-wire, in which he placed a colony of bees that he manipulated at various times during each day of the fair. As usual it was a very attractive demonstration. Mr. Strong is one of the best informed bee-keepers in Iowa, as well as perhaps its leading queen-breeder.

## "Honey-Guides" for the Bees

The following is taken from the New York Christian Advocate, which may interest the younger members of the family, even if it is quite fanciful:

"Mother, what are those lines on the morning-glory for?"

"Those are honey-guides," said mother. "Each one of these lines runs into the center of the flower where the honey is. God put them there, so when a bee a-lights on a flower it can go right to the honey; and that is what the bees go into the flower for, you know—to get the honey in the center of the flower. Now go out and sit under the morning-

APIARIAN EXHIBIT OF C. M. NICHOLS, AT TWO MICHIGAN FAIRS

glory vines and watch the bees for a little while, and see for yourself."

So Nellie ran out of the house. "Oh, mother!" she cried, "the bee did follow the line right up from the outside to the middle of the flower, and she got some funny yellow stuff on her, too."

"That was pollen," said mother; "the bee will take that home to feed the babies."

"Well, isn't that queer?" said Nellie, and she ran back to learn some more about the bees.

### Great Big "Bee-Cave"

In the Australian Bee-Bulletin appears the following item:

"The biggest bee-hive in the world is in Kentucky, and is known as the 'Mammoth Bee-hive.' It is in reality a huge cave, the main compartment being 150 feet high, while the floor covers 10 acres in extent."

Wonder where our Australian contemporary came across that item. Every school-boy knows about the Mammoth Cave in Kentucky, but has any one ever heard of bees in it?

### Bee-Keeping in Bermuda

The following relating to bee-keeping in Bermuda is copied from a letter sent to a friend of ours in New York State:

Bee-Keeping has been tried several times here in Bermuda during the last 20 years, the last time by a Mr. Morrison, who afterward became bee-inspector to Sir Daniel Morris' Department in the West Indies; but all failed to make it pay, for in our damp climate the bees became sluggish and would not work. In Jamaica they have two crops called "logwood" and "mango," each of which is equivalent to our heather at home. Here in Bermuda we have a few scattered flowers all the year around.

T. J. HARRIS.

Public Gardens, Bermuda, Aug. 30.

### British Bee-Keepers' Guide-Book

We have just received a copy of the new edition of "The British Bee-Keepers' Guide-Book," by Mr. Thos. Wm. Cowan, of London, England. It is almost entirely re-written, and has many new illustrations. The chapter on diseases of bees is perhaps the most complete that has yet been printed. This present edition consists of 19,000 copies, and is the 69th thousand. There are not only 4 extra lines on each page over the former editions, but there are 46 extra pages. A most excellent portrait of our good friend, the author, Mr. Cowan (who is also editor of the British Bee Journal) graces the page fronting the title-page. It is a book that should find a place in every bee-keeper's library. It is also a gem typographically and mechanically.

### Pleased with the Monthly

We have received the following from an Iowa subscriber:

EDITOR AMERICAN BEE JOURNAL:—In regard to the change of the American Bee Journal from a weekly to a monthly,

I will say that I subscribed for it just because it was a weekly at that time. I have noticed that many a hint came along weekly just when wanted, but if I had to either wait a month for the expected help or remember it a month my recollection of the matter would be a little indistinct. However, your July and August numbers are so attractive and full of good matter that the change may be for the better, just the same. I enclose you a list of bee-keepers whose names I have gathered, and hope they will all subscribe for your paper. Please send them sample copies and go after them, and keep after them.

Yours truly, JOHN EGENES.

### Queen-Mating Station

At the Colorado convention, as reported in the American Bee-Keeper, an animated discussion took place regarding the establishment of a station to which virgin queens could be sent, to be there mated and returned. This scheme is carried out with satisfaction in Switzerland, and there is no reason why it might not be as successful in this country.

### Central Tennessee Convention

The Central Tennessee Bee-Keepers' Association met at the rooms of the

Nashville Board of Trade, on Saturday, Aug. 31, with about 25 members in attendance. Pres. J. M. Davis occupied the chair, and J. M. Buchanan was Secretary.

Mr. Leslie Martin read a very interesting paper on, "The Different Races of Bees," and Mr. Davis gave an instructive talk on "The Queen-Bee." The question-box was opened, and various topics of interest were discussed.

It was decided to make a nice exhibit of bees and bee-products at the Tennessee State Fair, Sept. 23 to 28. In connection with the exhibit will be held a daily bee-demonstration in a wire cage. Sept. 26 was named as "Bee-Keepers' Day" at the Fair.

Several new members were received, and the prospects for the success of the Association are very bright.

The convention adjourned to meet at the call of the Executive Committee.

J. M. BUCHANAN, Sec.

### Northern Illinois Convention

The annual meeting of the Northern Illinois and Southern Wisconsin Bee-Keepers' Association will be held in Freeport, Ill., in the Supervisor's room in the Court House, on Tuesday, Oct. 15, 1907. All interested in bees are invited to attend.

B. KENNEDY, Sec.

Conducted by LOUIS H. SCHOLL, New Braunfels, Tex.

### Bulk or Chunk Honey, Etc.

MR. SCHOLL:—Are we not liable to get in a mess here by producing so largely chunk honey? Think what a fix one with a carload of the stuff would be in if the market here in the South should be more than supplied, and it must be shipped to a colder climate. Mr. Toepperwein says he is having a great deal of trouble, and advises bee-keepers to heat their honey to 150 degrees to prevent granulation. Now it seems to me a way might be devised, and laid before the bee-keepers of Texas, that would reduce this danger to a minimum, and cheapen the production of fancy comb honey at the same time.

I am thinking of fitting an apiary for producing comb honey without separators, so as to avoid so much outlay of cost on the start, time in cleaning separators, and getting plump sections—sections which to my views are superior to the much-praised plain section. I must confess, however, that I have had but little experience with comb honey, and that was so long ago that I am not certain as to facts. I am of the opinion

that comb foundation put carefully in the center of sections and given only to good, strong colonies—better perhaps to those that have been started on a shallow set of extracting combs—would be completed, with few exceptions, so that they would crate as well as the plain sections, or it may be a little better. I would use the same kind of super that supply-dealers advise for shallow extracting combs, and practice Mr. Danzenbaker's method of moving sections to the center for finishing when the season was poor, but tier up when the season was good. It might be better to use a separator to every other section-holder, but I doubt it.

If a colony did not prove its ability to do first-class work, go up into every section at once, and complete in good shape, better let them give you the good, old-fashioned extracted honey which the pure food law is apt to make a market for, and you will then have a honey you can liquefy without trouble. If we do have many uncratable sections, the chunk-honey plan will catch them. If we could use for a small package a large-mouthed can or jar, so that a lit-

# American Bee Journal

the heating around the sides when left in moderately hot water would enable the consumers to remove it, it would, it seems to me, be an excellent plan. Any one who has melted honey containing comb knows the effect on the flavor of it.

Mr. Toepperwein, to whom I have written concerning transporting comb honey, refers me to you as best prepared to furnish the desired information. I wish to know if it is much damaged when shipped a distance. What is the cost by freight to, say, Kansas? As I am planning to engage largely in the production of honey—chunk, section, and extracted—I would be glad to know which to give the lead. Your opinion will be highly valued. It seems to me to be a good plan to bring the subject up in your Department for discussion. "In the counsel of many there is wisdom."

J. B. COLTON.

Olmito, Texas, July 22.

It does not seem to me that it is a serious matter to dispose of any quantity of good honey, either comb or extracted, provided it is rightly done. The greatest trouble that confronts us, as bee-keepers, is the marketing of our crop, and it is no other's fault save our own. We know how to produce a crop of honey year after year, if these are favorable, but that is generally all. We must have somebody else to market our honey, and that one gets our profits. We must make up our minds to pay more attention to *proper marketing of our own honey; to distribute it properly, and to get profitable returns for our honey and our efforts.*

Neither does it seem to me that there would then be any glut in the markets so that we could not profitably dispose of our bulk comb, or any other kind of honey. It is true that a good deal of the early honey from some points in southwest Texas did granulate this year on the market, but this can, should, and must be avoided. It can be done simply by heating the liquid honey to 150 degrees, Fahr., which does not hurt it in any way. Do not heat it hotter. Some honeys will stand it, but others will not. The honey in the comb will hardly granulate, and with this heated extracted honey poured over it, our bulk comb can safely be put on the market.

With the experience I have had in the production of section honey, lasting through 5 or 6 years, I would not now go back to that way of producing comb honey with its labor and expense, and the "fussing" to produce a saleable article that brings little more than the comb honey that is so easily produced in larger frames, with less work. And I would never attempt to produce section honey without separators. Neither would I think of using all those uncratable and unfinished sections for bulk comb honey. It would be far too expensive. Instead of rigging up for producing section honey as you propose, I would rig up for the production of bulk comb honey, using shallow extracting frame supers. Then, when there is no market for bulk comb (?), why, simply extract the combs, for there will surely *always* be a market for extracted

honey. All unfinished combs not fit for bulk comb honey are extracted, and there is no loss. The profits, however, here in the South, will be greater than if you "fuss" with section honey.

The difference in the price is not large enough; besides, section honey in glass shipping-cases goes at double first-class freight, while comb-honey in cases, and cases in wooden cases, like extracted, goes at fourth-class rates.

Considering all this is why we are all producing bulk comb honey instead of sections, as we used to do.

## De Bizzy Honey-Bee.

"No one's makin' speeches  
'Cep de honey-bee.  
De principles she teaches  
Sounds right sensible to me.  
She says: 'Keep lookin' foh de sweets  
Dat's growin' everywhere;  
An' if some no-'count weeds, you meets  
Pass on an' don't you care."

"As she comes a-bringin'  
De goods f'um 'roun' de farm.  
She say: 'A little singin'  
Ain't gwinter do no harm.'  
I tells you, lots of us would get  
Mo' joy f'um life if we  
Kep' follerin' de example set  
By de bizzy Honey-Bee."

—Washington Star.

## Caucasian Bees vs. Italian Bees

I have not seen much pro and con about the Caucasian bees from the Southern bee-keepers. Surely they have them under test and will report from time to time. It has been said that we have much inferior honey in the South, and it is true in many locations, and can be attributed only to the fact that the bees do not give it the proper attention while evaporating and capping it. They quit it too soon, and the result is that it soon sours, or ferments. Also, granulation will begin sooner than it should.

It is the thin honey that gives us the most trouble, and the fact is that the bees do not give it a body. The black bees do not gather much of the thin or inferior honey, but other strains do, and it often gives them a lot of trouble. I have seen the Italian bees recap it many times, until cappings were  $\frac{1}{2}$  of an inch thick. This is all they seem to know to do to it, when the trouble was that they capped it too soon.

I have always found this fault in the Italian bees, that they are too hasty about capping their honey. If there is a check in the honey-flow for a few days, they will cap the honey and not give it the attention they should.

Cotton is becoming a great honey-plant here. It is yielding better each season. I can remember when it was considered only a pollen-plant. Now we get from 25 to 100 pounds of surplus honey per colony from it, and our bees winter on it. But its honey is thin, and soon ferments, and is not wholesome.

The Caucasian bees are giving this and other thin honey a good body. This fact is not due to season or locality, for in the same yards, side by side, the honey of the Italian colonies had soured when we got around to extracting, while that of the Caucasian was as fine

honey as we ever produced, and shows no sign of souring nor granulating, and they gathered more of it, too. It has a heavy body, and the flavor is very much improved.

In a previous article I mentioned some of their good qualities, and at the same time I noticed the care they were giving their honey, but only mentioned that they gave me a surplus of a few pounds of nice comb honey. Now that I have tested them extensively, I send another report.

I might also add that the Caucasians have as large a brood-nest as other strains of bees, but better compacted. They are very quiet on their comb while handling them. They cap their brood and honey more evenly than other races, raise the caps about as the black bees do, and have a beautiful appearance. Also, they are great cell-builders. During the flow of our best honey, the Italians kept pace with them very well.

Crisp Co., Ga. J. J. WILDER.

## Not Good Fall Prospects— Superseding Young Queens

I could not help having a feeling of regret come over me when I read the announcement in the June issue of the good old American Bee Journal, that in the future it would be issued only monthly. It seems to me there surely are bee-keepers enough in this broad land of ours to support a weekly journal, if they take the interest they should.

### FALL PROSPECTS.

The prospects for fall honey are anything but good this year, and I expect that a good many will make the same mistake as last year—that is, extract too close, leaving the bees in almost destitute condition for winter. If we get a fall crop in this portion of the State it will be something very unexpected, indeed, for our main source for fall honey (broomweed) is a failure this year, and we would need to have one of those "unexpected" honey-flows if we get any more honey this year.

The above is not given for the true state of affairs throughout the State of Texas, but for this locality. You know Texas is a large State, and weather conditions vary considerably.

### SUPERSEDURE OF YOUNG QUEENS.

We have had more new experience this year with the bees. Last fall one of my best colonies of bees commenced to supersede their queen, which was in her 4th year. But as fast as they would build and cap the cells, I would remove them to nuclei with the hope of getting a choice lot of queens from one of my best breeders, and I succeeded in getting 12 or 14 nice young queens, from these cells, to laying before the old queen died. Like most cells built in the natural way, the queens that hatched from them were large and well developed, and all proved to be good layers last spring. They are among my best colonies. Now here is the strange part of the proceedings to me: Some 5 or 6 of those young queens have al-

ready been superseded by the bees before they were a year old. Whether this was accidental, or was caused from

the peculiar season, I can not tell. Who will offer a suggestion? L. B. SMITH.  
Rescue, Tex.

handle it, untie, fill up and re-tie again, and so on till all is in.

When all the old comb is in the sack, and has been worked with the hoe several times, fasten each end of the log-chain to the ears of the kettle, or, if the kettle has no ears, fasten on either side of the kettle-holder, while the middle of the chain is to be fastened to the short end of the scantling or pole. Now put the rounded plank end of the standard on the sack and sink it to the bottom of the kettle, when the top end is to be inserted in the mortise in the pole, and the pin or bolt put through the desired hole. Next, go to the long end of the pole or lever and see how you can make the wax rise by bearing down. When bearing down, sway the lever back and forth, and from side to side, thus liberating the wax. If you have your lever long enough, and things fixed as they should be, you will bring hundreds and thousands of pounds to bear on the sack, and thus have a better pressure than with any of the wax-presses made, as none of these, with which I am acquainted, can give a rocking pressure while squeezing.

After a little you will have reduced the bulk in the sack so you can again shake the debris down and re-tie the sack so that the plank end will cover the whole, when with another pressure with the rocking motion every last particle of wax can be brought out to rise on top of the water in the kettle. Being sure that the wax is all out, you can hang a weight on the lever and leave it. Don't dip off the wax unless you have lots of time, and consider it only fun to do so, for I assure you that the next morning you will find it all caked nicely on top of the water, when you can break it up and get it ready for a second melting and moulding, which all wax should have before being put on the market or for using in making foundation.

After taking off the wax, take out the sack, empty out the refuse and rinse and dry the sack, when it and the rest of the implements used in this rendering are to be stored away for future use.

I know the description of this seems quite long, but I believe that in practice it is the shortest known process to get out a large lot of wax from old comb, and has to its advantage that no large sum of money has to be paid out for a wax press or extractor. If you think the iron-kettle holder too expensive, set the kettle on three stones. If stones are used, they should first be subjected to heat, else they may fly to pieces and upset the wax.

Borodino, N. Y.

## Syrup for Feeding Bees

BY OTTO LUHDORFF.

Many bee-keepers will have to feed their bees again. We hear often of sour honey in combs, of bees perishing during winter, and often people do not know what the cause of it is. If bees are short of stores, sugar syrup properly made is about as good as the best honey; but not properly made, as for instance is recommended in some cata-

## Rendering Combs into Bees-wax

BY G. M. DOOLITTLE.

A correspondent writes thus: "My bees have black brood, or at least the inspector says they have, and I wish to try to cure them by the shaking-off process. This will leave me with a lot of old brood-combs to render into wax. Now I wish you would tell us through the columns of the American Bee Journal how I can best do this."

It would seem from the many articles given on this subject that no more should be necessary; yet I am aware that beginners are constantly entering our ranks, and for these, the articles in the papers during the past are not usually at their command.

There are different ways of rendering wax, the heat of the sun, that of steam, and hot water, being those of most common use. For cappings from combs and the general accumulation of odds and ends of comb from the apiary, the solar wax-extractor is the one that I use and would recommend. With it I have no trouble in securing from 98 to 100 percent of the wax in the material put into it. And as an ordinary mortal can make one of these extractors during a spare day or two during the winter, when the common run of bee-keepers are not pressed for time, no apiary should be without one of these extractors.

The steam wax-extractors I know very little about, except the smaller ones of the past, such as the "Swiss," etc. These did their work quite well, but were slow, and required a cost for fuel which is eliminated with the solar. But for a lot of old combs, filled more or less with cocoons, pollen, etc., I know of nothing better than boiling water in a caldron or other kettle fixed something as follows:

Instead of hanging the kettle over the fire as is usually done, take a measure of the kettle on the outside, a little way up from the bottom, and go to your blacksmith and tell him you wish a piece of old, heavy wagon-tire welded so that the inside shall represent your measure. To this you want three or four (the latter being preferable) square or round bars of iron welded, at equal distances apart, for four legs. These should be of suitable size to give strength enough to support the weight of the kettle and contents, and long enough to raise the kettle from 4 to 6

inches from the ground at its lowest point.

After getting the kettle-holder home, place 4 flat stones just under the surface of the ground where you wish the kettle to stand, at proper places, so that each leg will rest on one, having it at such a point or place as will be handy for all of the work done with such a kettle, such as heating water for many purposes, boiling food for stock, etc., for the smallest part for our iron friend will probably be the rendering of wax.

After once having the kettle fixed in this way, you will never go back to any of the old ways of "hanging" a kettle, if you are at all like the writer. Besides the kettle, you will want a sack made of burlap or some other stout, open cloth, which you are to fill with the old comb, stamping it in so as to get all in as compact a condition as possible.

Next take a piece of 4-inch soft-wood plank, or two pieces of 2-inch plank spiked together will answer, though not quite so good. Now, round one side of this, so it will fit the bottom of the kettle, leaving the other flat. To the flat side fasten (by cleats or otherwise) a standard of suitable length, which should be flattened at the top and have several holes bored in it. Then get a 3x4-inch scantling, or a suitable pole from the woods, and mortise through it near one end for the top of the standard you have made, boring a hole through it in an opposite direction for a pin or bolt to pass through it and the standard. Besides this you will want a log-chain, which is usually near at hand about all farm houses. Having these things we are ready to fill the kettle two-thirds full of water and start the fire under it. In doing this use only light fuel so as not to have a hot fire after the water boils; for, if otherwise, it would be too warm for agreeably working around it, and after considerable wax was in the water it might boil over.

Having the sack stamped full of the old combs, tie the mouth of it and put it in the boiling water. After allowing it to boil 3 or 4 minutes, with an old hoe press and squeeze the sack against the sides and bottom of the kettle, rolling it over each time as you press. The wax will rise with each pressing of the sack; and if the old comb is not all in the sack, you can soon raise the mouth of it out from the water, and after it has cooled a little so you can

logues for many years, it may often cause disaster. A certain one has this: "If you are careless enough to let your feeding go till late, use 4 parts sugar and 3 of water, and  $\frac{1}{4}$  pint of vinegar, or 10 pounds of good honey, to the 100 pounds of syrup, to prevent granulation," etc.

I beg to make the following remarks concerning this recipe:

Most vinegar of bee-keepers is probably made at home by natural fermentation, and this same product is handled by many storekeepers. Such vinegars, if not pasteurized, contain generally small quantities of fungi which will cause later sour fermentation of the thin honey. Great quantities of commercial vinegar are made from wood by distillation, and these are healthy and safe, they contain no ferment. If the vinegar naturally fermented is heated up to 55 degrees Celsius, or about 131 degrees Fahrenheit, all fungi will be destroyed, and as long as no new fungi are formed the vinegar is healthy and safe.

The addition of vinegar is recommended to cause the cane-sugar to go over into an article similar to honey—in other words, to change the saccharose ( $C_{12}H_{22}O_{11}$ ) into dextrose ( $+C_6H_{12}O_6$ ) and levulose ( $-C_6H_{12}O_6$ ).

But we can accomplish this same result without the dangerous vinegar, and with absolute safety, if we take tartaric acid or citric acid in place of vinegar.

A proper and safe recipe is: 100 pounds best cane-sugar, 100 pounds water, and 1-10 pound tartaric acid or citric acid. This should be boiled slowly from 2 to 3 hours.

Late in the season the quantity of water may be reduced, leaving the other parts in the same proportion.

## Wonderful Organs of the Bee

BY PROF. A. J. COOK.

We often refer to man as at the head of all God's creation, and I doubt not but this is true, only, however, as the greatest development of man—the brain—stands in our estimation as the highest part of the animal organism. Man is pre-eminent only in brain and hand. I am free to say that in variety of function the honey-bee stands first—ahead even of man himself. As function must have organs, and special development, so we are not surprised at the wonderful developments that we find in our study of the honey-bee.

The bee gathers honey and must have special organs, and does have marvelous development to do this work. We know how the bee can get honey from the deep flower-tubes, from a surface on which the nectar is thinly spread, and as easily, and more quickly, from a huge nectar-drop, such as is seen in the linden-bloom and in the figwort, and of course there must be, as we know that there is, a marvelous development of tongue and mouth organs to accomplish all of this. Man has learned, through the supremacy of his brain, to discount the bee in what he does—its range and reach. Yet man has not to

depend upon his modified organs to do his marvels—he fashions the means. He makes his knife and chisel, while in the case of the bee the knife and chisel are a part of the bee herself.

The bee gathers propolis or bee-glue, and has her own cart as a part of her bodily equipment, and has not to make it of wood and iron. The same equipment is used also to carry the pollen, and other proteid food. In case of the pollen there are additions, like pockets—brushes, curiously modified hairs, all useful to collect and carry the pollen, which is the special and peculiar food-element of all bees. Indeed, we might almost describe the great family of bees as that family of insects that live wholly or largely on pollen.

But there is another feature of bees that is in some respects more interesting than all, as it concerns the formation of a very peculiar secretion—wax—and its manipulation to form comb. We should expect that this would call for extra modification of organs and parts. We know that comb is one of the most exquisite and delicate structures known to man, and so anything that concerns its origin and formation is, and must be, a subject of great interest.

### WAX-GLANDS.

Glands are the organs of secretion. Our spittle comes from the salivary glands. The function of a gland is to take from the blood elements and form the secretion. The secretion is not in the blood, but its elements are, and the gland has the wonderful power to select, from the great nourishing fluid, just the substances that are needed to form the special secretion.

The special agents of the gland that do this work are the cells. There are in every considerable gland, thousands, often millions, of these little cells—the real workers—that do this important service. Cells are the most important part of plant or animal, as all the work of every kind performed in the body is done by the cells. We have in an egg—really the yolk, the real egg—an example of a cell. The blood discs or corpuscles are other illustrations, and the individuals of the entire branch of animals known as Protozoa, consist of a single cell. While almost all of these Protozoans are microscopic, and so very minute, there are some that can be seen without the magnifier. The very minute Sporozoan, that causes malaria, is one of these Protozoans, and so is just a cell, and so very small that we can only see it as it is magnified many thousand times.

The wax from which the incomparable comb is formed, comes from glands that are situated on the under side of the worker-bee, just back of the thorax. These are racemose glands, and are much like a bunch of grapes in appearance. Of course, the grapes, in this case, are very minute, and represent—or are little sacks, the walls of which are formed by the cells already described. The stems of the grapes, and the larger stems, are represented in the glands by ducts, or tubes which carry the secretion off. There are four of these glands on each side, and so there

are formed eight wax-scales at a time.

I suppose that all glands have times of rest. In many cases we know that they are inactive at times. We know that our salivary glands are only active when we are eating, and the saliva or spittle is needed. Milk-glands are only active at times of lactation, and then it is probable that only a part of the cells are active, at any one time. It is curious about the wax-glands of bees. They would seem to be wholly under the control of the bee. When wax is needed, as when there is a lack of comb, and more is to be made, then most, if not all, of the bees are secreting the wax-scales. As in all cases that we know of, the action of glands is wholly involuntary, we may be pretty sure that wax-secretion is involuntary on the part of bees.

I have often wondered how it is that the bee has, or seems to have, control of this matter of wax-secretion. We all know that when the bees need much wax, they cluster in absolute quiet in the top of the hive. In case they have just swarmed—and this is usually the case when they stand in greatest need of comb, and so of wax—they have just filled their stomach—honey-stomach—to repletion with honey. I am inclined to the opinion that the full stomach, or surfeit of food, and the stay in all exercise, give the wax-secretion.

We all have just about so much energy. If we spend this energy in one way, we can not spend it in any other. If we fret and worry we can do less work; if our cattle are chased by dogs, the cows will lose materially in milk. I once milked a great shortcorn cow on my Owosso, Mich., farm, and secured 14 quarts of milk. She was a very large, heavy cow, in full flesh. The next two days I led her to the Michigan Agricultural College. I took two whole days for this, and went very slow, as I wished to do her no harm. I thought that she could go safely 14 miles a day. The night of the second day she gave less than three quarts of milk. She did not get over the strain all the year through. I believe that the bees have about so much energy, gauged by the amount of food that they eat and digest. If they cease from exercise, then this energy goes to wax-secretion, and we get the wax-scales and material for the comb. If this is correct, then the bees simply regulate wax-secretion by regulation of habits. Much food and great quiet means wax.

Claremont, Calif.

## Have Bees Reasoning Powers?

BY W. H. LAWS.

A few years ago in company with a neighbor bee-keeper, we drove to his apiary on the Nueces River. Casting our eyes about the apiary we spied a large swarm of bees hanging on a limb about 6 or 7 feet from the ground. Taking a hive, we at once prepared to hive it. On examination we found the bees had built several large sheets of comb, as I remember, the center one was nearly as large as a dinner-dish. And there was an abundance of sealed

# American Bee Journal

brood and some little honey over the present needs of the colony. This was about sunset, and, on disturbing the swarm, they very promptly showed fight and gave us to understand they regarded that spot as their home. Seeing some transferring had to be done, we postponed the job until morning. Other important work in the apiary prevented immediate attention to the swarm, and before again disturbing them in the least, the whole swarm (not leaving a bee) decamped to parts unknown, about 10 a. m., leaving their babies and a little honey also.

Why did those bees leave? Did our disturbing them on the previous evening cause suspicion? or had their pasturage become short and exposure to depredations of robber-bees and other pilferers, caused it? Perhaps they reasoned thus: "Shall we stay here on this bush and risk our life as a colony, or shall we desert our babies and all this 10 or 15 days' labor, and go to some hollow tree where we can begin anew and be in position to protect our labor and a new crop of babies?"

There must have been some mental decision, and each member of that swarm must have accorded with that decision. I've seen large bodies of men ponder for days on matters of much less importance, and never reach a decision. Shall we accord to the bees a greater reasoning faculty than man—that personage whom, it is said, God endowed with the highest and greatest of reasoning faculties?

Beeville, Tex.

## Curing Apiaries of Foul Brood

BY WILLIAM MCEVOY.

In the honey season when the bees are gathering freely remove the combs in the evening and shake the bees into their own hives; give them frames with comb foundation starters on and let them build comb for 4 days. The bees will make the starters into comb during the 4 days, and store the diseased honey in them which they took with them from the old comb. Then, in the evening of the fourth day, take out the new combs and give them comb foundation to work out, thus completing the cure.

By this method of treatment all the diseased honey is removed from the bees before the full sheets of foundation are worked out. Where you find a large quantity of nice brood with only a few cells of foul brood in the most of your colonies, and have shaken the bees off for treatment, fill 2 hives full with these combs of brood, place one hive of brood on the other, and shade this tiered-up brood from the sun until the most of it is hatched. In the evening shake these bees into a single hive, give them frames with comb foundation starters on, and let them build comb for 4 days. Then, in the evening of the fourth day, take out the new comb and give them comb foundation to work out to complete the cure. After the brood is hatched out of the old combs the latter must be made into wax or burned, also all the new combs made

out of the starters during the 4 days must be burned or made into wax on account of the diseased honey.

Where the diseased colonies are weak in bees, put the bees of 2, 3 or 4 together, so as to get a good-sized colony to start the cure with, as it does not pay to spend time fussing with little weak colonies. All the curing or treating of diseased colonies should be done in the evening, so as not to have any robbing or cause any of the bees from the diseased colonies to mix and go in with the bees of sound colonies. By doing all the work in the evening, it gives the bees a chance to settle down very nicely before morning, and then there is no confusion or trouble.

When the bees are not gathering honey any apiary can be cured of foul brood by removing the diseased combs in the evenings and giving the bees frames with comb foundation starters on. Then, also in the evening feed the bees plenty of sugar syrup, and they will draw out the foundation and store the diseased honey which they took with them from the old combs. In the fourth evening remove the new combs made out of the starters, and give the bees full sheets of comb-foundation, and feed plenty of sugar syrup each evening until every colony is in first-class order. Make the syrup out of granulated sugar, and put one pound of water to every 2 pounds of sugar, then bring it to a boil.

Where you find the disease in a few good colonies after all honey-gathering is over, do not tinker or fuss with these in any way until an evening in October. Then go to the diseased colonies and take out every comb and put six combs of all sealed or capped stores in their place, taken from sound colonies, and on each side of these all-capped combs place a division-board. This will put these colonies in first-class order for winter, with little or no bother at all, and the disease crowded clean out at the same time.

But some say that the disease cannot be driven out so simply in the fall by taking away the diseased combs and giving the bees 6 combs that are capped all over right down to the bottom of the frames. It can and does cure every time when properly done, and if you will stop to think you will see quite plainly that the bees must keep the diseased honey they took out of the old combs until they consume it, as they cannot find any place in all-capped combs to put it, and that will end the disease at once.

Many bee-keepers will no doubt say that this fall method of treatment will not work in their apiaries at all, because they would not have enough of the all-capped combs to spare from the sound colonies, even if they could find some all-sealed. Very true; but you can very easily secure abundance of all-capped combs by putting Miller feeders on your sound colonies in the evenings in September, and feeding these colonies all the sugar syrup you can get them to take. Then in October each of these fed colonies can spare the two outside combs, which will be nicely capped all over right down to the bottom of the frames, and with these combs

you will be provided with plenty of good stores to carry out my fall method of treatment. I finished the curing of my own apiary in the fall of 1875 by this sealed-comb treatment. All of my methods of treatment are of my own working out, and none of them ever failed when properly carried out.

Empty hives that had foul brood in do not need disinfecting in any way.

In treating diseased colonies never starve the bees, because it unfits them for business and makes them thin, lean and poor, and is also hard on the queens. I never starved any bees, but always tried to see how fat I could make them while treating them, by feeding plenty of sugar syrup when the bees were not gathering honey.

If you have nice white combs that are clean and dry, and that never had any brood in them, do not destroy one of these, as they are perfectly safe to use on any colony of bees just as they are, and are very valuable to any bee-keeper. I have always saved this class of combs for every bee-keeper. I have always advised bee-keepers to convert into wax all old combs that ever had one cell of foul brood in them, and the only article that will take all the wax out of the old combs is a good wax-press. As these will pay for themselves many times over their cost, I urge the bee-keepers everywhere to buy one.—Canadian Bee Journal.

Woodburn, Ont.

## The "Ups" and "Downs" of Bee-Culture

BY C. P. DADANT.

I do not believe there has ever been a better time to preach perseverance to the novices and beginners in bee-culture than at present. No business in the world is more apt to encourage or discourage to excess, those who enter it, than this occupation of ours. When the honey crop is good, the bees swarm freely, and the number of colonies in an apiary increases rapidly, the bee-keeper who has but a short experience thinks he has struck a mine of the finest gold; but when the summer is too dry, and the bees decrease in numbers, go into winter quarters with a small force, and dwindle down in the spring, he is very apt to conclude that there is nothing in the pursuit worth caring for.

In an experience of some 40 years, we have seen many of these ups and downs. Some 25 years ago we had a wonderful season for swarming. I was then handling an apiary of about 60 colonies on shares, in addition to our own 5 apiaries. These bees, located near the Mississippi River bottoms had a very nice range of fall bloom. They swarmed until the number of colonies was almost trebled, and many hives filled their supers besides. The oldest son of the family, then about 18 years old, concluded that there was nothing to equal bee-culture, and assured me that he would go into the business in good earnest the following spring. But the winter was very severe. A number of

the late swarms were not strong enough in bees to withstand the terrible cold, and scores of colonies died with plenty of stores in the brood-chamber. This changed our young man's ideas, and he concluded that if there was a "royal road to wealth," bee-culture was not on that road. I tried to explain to him that winter losses could soon be recouped as long as there were a number of colonies remaining to breed from, and plenty of combs and honey to make increase by divisions, or what is now called "shook-swarms." But nothing would do, and at his instigation the father sold me most of the bees and kept only a few colonies.

There have been plenty of instances of such discouragements after good seasons. The success and failure of most lines of business, and of many crops, are like the waves of the seas—full of ups and downs. Now you are on the crest of the waves, and now between two billows that threaten to engulf you. But with a good rudder, and a good, determined man at the helm, there is no such thing as "fail." The methods are always being improved, and the management is becoming easier every day.

But we must not expect sunshine every day, neither should we expect a storm every night. I remember that, a few years ago, a man living in the vicinity of East St. Louis had sold something like \$2,000 worth of cabbages from 5 acres. The next season everybody around him planted cabbages, with the result that they could hardly be given away, and had to be shipped to a distant market. Then all those who had so willingly rushed into this business rushed out again with the same eagerness. But the man who has experience and perseverance does not give up because of a failure. He knows that after the storm, comes the sunshine, and he makes ready for that sunshine, while the storm is raging.

In this part of Illinois, the summer of 1906 and the spring of 1907 were probably the worst known in 40 years for bee-culture. At any rate, I had never seen such unfavorable conditions for bees, up to the beginning of June, 1907. But so long as we have bees enough to build up again, there is no need to give up. On the contrary, it is then that one must persevere with renewed energy, for there are going to be plenty of weak hearts, and those who give up make the market better for those who stay in the business. See the prices of honey rising. It is because of poor crops and discouragements. But some of the bee-keepers are already reaping a reward for perseverance. Those who have held on and sustained their apiaries are in many places harvesting good crops, for which they secure a good price.

This is not the case only with bees or cabbage. Take the grape-growing business. For years grapes have sold at a loss to the producer, because they were too cheap. This year, many vineyards have been destroyed, and those who took care of their grapes are securing a good price.

So dear friends, if you have had bad seasons, do not give up; care for your

bees with renewed courage and firmness. But if you have had good seasons—extraordinary crops—do not imagine that there are no more storms ahead. On the contrary, take heed, for by and by, another storm will come. Bad winters and dry summers are not over; but, on the whole, remember that there is money in bee-culture for the man who "stays with it."

In my opinion, the prices of honey are destined to remain firm for many years. There have been short crops, apiaries are less numerous, and, in addition, the new pure-food law is putting a stop to much of the adulteration, so that we have a much better chance to inspire confidence in the consumer, when we tell him that we "guarantee our honey to be absolutely pure." A few years ago he might have taken this as empty talk, but he now knows that there is a penalty for deception in foods, and this is helping us out.

Hamilton, Ill.

## Are a Queen's Drones Affected by Her Mating?

BY T. W. LIVINGSTON.

Our bee-books and periodicals have long taught that a queen's drones are unaffected by her mating, so that a pure Italian queen, for instance, that has mated with a black drone will produce pure Italian drones, nevertheless. Now, I think it is time for this theory to be exploded, and I propose to explode it, and I want all bee-keepers interested to hear it "bust," because facts have never failed to show me its falsity when given the chance.

Many years ago I had some 20 colonies of black bees, and, wishing to Italianize, I purchased a \$5 tested queen, and from her reared queens and supplanted all my black ones, first suppressing all the black drones I could, and allowing the Italians to rear all the drones they would, so that about 2-3 of the young queens were purely mated.

The next year I thought I would have things pretty much my own way, for at that time I did not know any better than to believe what I had read on the subject, but facts always were stubborn things, and that year about 90 percent of the queens I reared showed unmistakable impurity in their worker progeny, but less, as a rule, than the impurely mated ones of the previous year. Since then I have carefully suppressed all drones from mismated queens with satisfactory results.

Last year found me with 25 colonies—all hybrids or blacks except 3 apparently pure Italians, and one Golden recently purchased, whose bees were all 3 to 5 banded. I reared queens from these pure Italians, but mostly from the Golden, and supplanted these hybrid and black queens. This year I reared my queens from the Golden, but, as I expected, this time only 3 out of 12 failed to have some black bees among their worker progeny.

I have recently visited a neighboring bee-keeper and he showed me some colonies whose queens he said he had reared from a pure Caucasian mother,

but which had mated with Golden drones, and, as I expected, their drones were (some of them) fine Golden in appearance, like some of their workers. Now, who would expect that these drones mating with pure Caucasian queens, would fail to mark their progeny with the golden coloring?

Bee-keepers, you need not take my word for it, but just try it as I have done, and let the facts speak for themselves; and when you are convinced by the facts, we may then indulge in a little philosophizing as to *why* it is so. But let the facts speak first.

Leslie, Ga.

## The Bacteria of the Apiary

BY ADRIAN GETAZ.

"The Bacteria of the Apiary, with Special Reference to Bee-Diseases," is the title of a bulletin by Prof. G. F. White, published by the United States Department of Agriculture.

The first point to which Prof. White calls our attention is the fact that not only the bacilli, or other kinds of bacteria which produce diseases, will be, or may be, found on or in the base, but also a number of others. Nearly always those producing putrefaction or decomposition in dead vegetable or animal substances are present in large number, not only on the bees and combs, but, in fact, everywhere. Occasionally those producing other diseases in other animals, for instance, those producing colds or consumption in the human race, may be found on the bees or on the combs, or even in the bodies of the bees where they may have been carried in, either with the food or by the respiration. As a matter of fact, however, Prof. White found much less of them than would be naturally expected.

To the uninitiated, it may seem singular that all these different germs are so different to recognize. We easily distinguish the ordinary plants and animals because we can ascertain all the details of their organizations. But it is not so with the bacilli and other bacteria. The bacilli producing the European foul brood, when looked at through a microscope enlarging them 1,000 times look something like this:

Suppose that cats, dogs, foxes, etc., were not larger than that, how could we differentiate them? Furthermore, they are mixed with the globules of blood or fat, or particles of flesh, or other substances belonging to the animal with which they have found lodgment, and all that increased the difficulties.

The only way to separate them and study them is by "cultivation." The bacteria live at the expense of the animals or substances with which they associate. For instance, those that produce the alcoholic fermentation eat the sugar contained in the fruits. The alcohol resulting is the excreta, or matters transformed and rejected by them. The

# American Bee Journal

glue-like substance produced by the foul brood is of a similar origin. What is left after something is rotten belongs also to the same class of products. Some of these products, in fact the majority, are not unwholesome; a few are quite beneficial, but some are among the rank-est poisons. The bacillus producing cholera is one. It lives in the matters contained in the intestines as well as in other parts of the body, and also in decaying substances outside. The bacillus itself is inoffensive, but its dejectives are exceedingly poisonous, and that's what kills the patient. Occasionally some of these poisonous bacilli develop in ice-creams, oysters, etc., and cause the accidents heard of now and then. A peculiarity of these cases is that the poisons thus produced kill the bacilli themselves as well as the animal affected, or even better. The most striking examples are furnished by fevers and other diseases that run a course of a certain duration. After the bacilli have multiplied sufficiently and produced enough poisonous matter to kill themselves, the disease has run its course, and the recovery of the patient, if he is not dead already, depends upon what strength may be left.

## CULTIVATION OF DISEASE-GERMS.

To the one who may never have heard of it before, the idea of "cultivating" the germs of a disease must seem quite funny. But if we reflect a little and consider that these germs, bacilli, or bacteria, develop at the expense of animal or vegetable matter, living or dead, the possibility of raising a lot of them in a small vial or tube of glass is at once seen. And, furthermore, the possibility of studying them thoroughly is apparent at once. Some vials like those used for holding homeopathic remedies are usually used for the purpose.

As most of the disease-germs live at the expense of the flesh or blood of the sick animal, or in its intestines, the "medium" in which they are "cultivated," or, to use plain English, the food we furnish them, and in which they can live, is usually beef-broth or meat-juice, sometimes milk, or blood deprived of its corpuscles. Occasionally sugar syrup or gums are used—whatever the case may require. Some bacilli are not very particular, and will develop in almost anything. Others are very difficult to cultivate and cannot live except in certain substances. Quite a number have not been fully identified until the right kind of "medium" was finally discovered.

Suppose we have bees afflicted with the European foul brood, and we want to study it. A number of these small vials are prepared and filled with bee-broth, or whatever kind of medium is thought best, and then sufficiently heated to destroy any kind of germ that might have gotten in accidentally. We also make sure that the "medium" is not acid, as very few kinds of bacilli will develop where the least acidity is present. But there are exceptions. A little bit of the blood of a diseased bee is then introduced in the vial, and the stopper replaced. Then the bacilli that may be in the blood will develop in the

vial and can be studied at leisure. The peculiarities of the disease—for instance, the glue-like ropiness of the foul brood—will appear in the "culture."

But that is not enough. We want to be sure that the discovered and cultivated bacillus is the one that has produced the disease. So we reverse the process. Instead of taking a little blood of the diseased bee and putting it in the glass vial, we take a little of the infected culture and feed it to a colony of healthy bees, but mixing it with sugar syrup or honey. That colony will soon show the disease with all its characteristics.

## FOUL BROOD.

As stated at the beginning of this article, the first thing done by Prof. White and his associates was to find which kind of germs and bacteria might be found accidentally on the bees or on the combs. Quite a number are mentioned, and a few of those that might be easily mistaken for the cause of the disease are carefully described.

There are two kinds of foul brood, the European kind, which is produced by the *bacillus alvei*, and the American kind, which is produced by the *bacillus larvæ*. I will not describe the diseases, as they have so often been described lately that the readers of this paper undoubtedly know what they are. The chief difference between the two is that the dead brood from the American foul brood shows considerably more ropiness and glue-like consistency than the other. The two kinds of bacilli are so near alike that they cannot be distinguished with the microscope alone. A "cultivation" is necessary to ascertain "which is which" when found. There is, however, a considerable difference in the "cultivating" results. The *bacillus alvei* will propagate easily in almost any kind of "medium." Beef-broth is the best. The *bacillus larvæ*, on the other hand, is extremely difficult, almost impossible, to cultivate. In fact, Prof. White is the first bacteriologist that has succeeded.

The *bacillus alvei* was thoroughly studied by Cheshire and Cheyne between 1880 and 1885. They had the bees and all the necessary facilities, and ability to do the work. All the investigations made since have confirmed their descriptions and assertions. Cheshire was aware that there was another kind of disease similar to that produced by the *bacillus alvei*, but he did not publish any description of it.

From that time until recently it was generally admitted that there was but one kind of foul brood, and that it is produced by the *bacillus alvei*. Nevertheless, now and then came some dissenting voices. The descriptions given did not tally. In fact, they could not since there were two diseases. The "cultures" made sometimes yielded the *bacillus alvei*, sometimes not. In that last case, the operator usually succeeded in cultivating some bacillus or other that just happened to be there, but had nothing to do with the disease. Those who confined their observations to the microscope mistook the *bacillus larvæ* for the *bacillus alvei*, as they are too near alike to be distinguished by the

microscope alone. As both diseases are common, both here and in Europe, it is very likely that in many of the cases observed both diseases existed together.

Finally, a few years ago, Dr. Burri, of Switzerland, discovered beyond a doubt that there were two diseases, produced by two different bacilli. He had no difficulty in cultivating the *bacillus alvei*, but completely failed to cultivate the other. On this side of the Atlantic the existence of two diseases became evident a few years ago, and one of them received at first the name "black brood."

To Prof. White belongs the honor of having cultivated and studied the *bacillus larvæ* in a scientific way. After trying the usual medium without success, the idea occurred to him that since the *bacillus larvæ* was living in the bodies of the bees, or rather their larvæ, it would probably live and develop in a broth made of bee-larvæ. Success crowned his efforts, and he thus was able to cultivate and investigate the *bacillus larvæ*.

## BEE-DYSENTERY.

Incidentally, dysentery came also under consideration, while Prof. White and his associates were studying the *bacilli* and other similar organisms that are found in the intestines of healthy bees.

An immense number of different kinds of such organisms are found in the lower intestines of all the animals, man included. As the matters contained in the intestines are very near the same in all, the same organisms are found indistinctly in all, or nearly so.

In studying those contained in the intestines of the healthy bees, many of those that infest the higher animals were recognized. This could be expected since the intestinal matters contained in them are very similar. As long as the movements of the intestines are regular, these organisms are carried out nearly as fast as they multiply, and do not cause any trouble. But if through some cause or other the movement ceases, then they may accumulate to such an extent as to cause serious disease. Hence the dysentery of the bees, when they are confined and do not void the contents of their intestines.

## SPORES IN HONEY.

Like Cheshire, Prof. White found that the honey from the hives infected very seldom contains any foul-brood *bacilli* or their spores. However, considering how small they are, they may often have escaped observation. Furthermore, a single one might be enough eventually to infest a whole apiary.

There is quite a misunderstanding on this matter among our bee-keepers. Even our best writers are not exempt. To understand the case fully, we must consider how the *bacilli* propagate themselves. The *bacilli* of both foul-brood diseases are very small, rod-like things. They grow in length rapidly, and when they have attained a certain size they break in two pieces, and there are then two different individuals where before there was but one. These grow and divide like their predecessors, and as the process is very rapid, a division occur-

# American Bee Journal

ring every few minutes, the increase in numbers, under favorable circumstances, is quite astonishing. This process continues as long as there is something to eat, but when there is nothing left they change completely. They become almost round instead of rod-shaped, and then stop growing. They become what is called "spores." These spores are to the adult bacilli what the seeds are to the ordinary plants. They are far more resistant to extremes of temperature or chemical agents than the bacilli. The majority of them, however, dry out and die in the sunlight and the open air. Some, however, resist quite a long time. But we know how beneficial the open air and the sunlight are in all the human diseases, and how dampness and obscurity favor the development of all disease germs, molds, putrefactive bacteria, etc.

The experiments made a few years ago by Dr. Howard show that the spores of the foul-brood bacilli do not resist the sunlight and open air more than a day or two. That explains why the hives contaminated do not need disinfecting, the spores that they contain are soon destroyed by being exposed to the open air.

On the other hand, these spores will keep indefinitely in honey, but without developing. The honey protects them against the open, dry air, but on the other hand, its acidity, while not sufficient to destroy them, nevertheless prevents them from developing.

And that is where the danger exists. The spores do not propagate themselves as such. When they are placed where they can develop they turn back into rod-like bacilli which immediately grow and divide as before described.

If the bacilli could propagate in honey they would soon destroy it as effectively as they destroy the brood in the diseased colonies, or the cultures in which they are placed. But they don't. Their spores remain there without any change, and then, as soon as they are brought in contact with the brood, they begin to develop at once.

Knoxville, Tenn.

## Food Value of Honey as Compared With Other Food Stuffs

BY PROF. G. L. TANZER, PH.G.

No question affecting the human race is of so much importance as that of food stuffs. Evolutionists are well aware of the fact that the two great forces—the two great agencies—by which animal species were evolved, the one from the other, and the human race from them all, are food and climate. With the latter we have nothing to do at this time, and with the former we are only to consider briefly one of the many food compounds which is offered for the appropriation of men and women, to-wit, that of honey.

It is evident to my understanding that the whole question of food stuffs is to engage the attention of scientific men in the near future, not only from the old standpoints of pure physics, but from

the newer view-point of the psychological welfare of our race.

Up to the present time whatever research scientific men have made regarding the value or adaptability of foods has resulted exclusively in determining their utility in assimilation by the bodily organs of digestion and assimilation as to purely physical results.

It is far to say that we are progressing as a race, and rising to higher summits of knowledge and experience. The time is rapidly approaching when the value of food stuffs to be appropriated by human beings will be determined not only with reference to their purely physical results, but also with reference to that assimilation of foods, which reaches out to the building up of the higher faculties.

Science is already disclosing to our vision that there is a wonderful interdependence of the life foods appropriated by a life organization. We know there is not a square inch, so to speak, of any surface of the exterior of the human body that does not contain scores of hungry mouths that are constantly devouring foods, and these foods comprehend all substance from magnetism to heat, harmony and light, or colors. Hence we see that the assimilation of food in a life organization, such as a human being, reaches to all of the qualities of substances of our universe.

Holding our subject in thought from this standpoint, we see at once that science has a mighty work on hand in determining what so-called bodily foods, or foods appropriated through the stomach, will best assimilate through the bodily organs, in conjunction with the other foods I have named, so as not only to produce the best physical results in and for the physical bodily organs, but the best contributions to the upbuilding of the psychological organization of the man or woman.

It is within our knowledge that many of the so-called bodily foods work out in their assimilation injury to the mental and psychological welfare. I am of the opinion that nearly one-half of the volume of so-called bodily foods and drinks now appropriated bring about these regretful results, and that they should be discontinued by people generally as rapidly as possible. I will further state that it is my opinion that the next quarter of a century will witness the abandonment of a great many of the foods now appropriated and will demonstrate that the people generally, especially those who enjoy the higher planes of civilization, are devouring or appropriating, so far as volume, bulk, and variety are concerned, more than double that which they should appropriate.

Men and women are eating too much, speaking from the standpoint of quantity, and are overloading the physical machinery and thereby chaining their lives to the physical, whereas by a better selection of food stuffs, they will more rapidly rise in the scale of our destined life qualities.

There are three classes of food stuffs to which I desire to direct your attention. These are honey, eggs and milk.

It is remarkable that these foods are

compounded for the consumption of the human race by the three great divisions of the animal kingdom, to-wit, by the insect, the bird and the mammal tribe. The bee provides the honey, the bird produces the egg, and the mammal yields to us the milk.

It is scarcely necessary to point out to you the fact that with the exception of certain vegetables, these three food stuffs rank higher than any others known to scientific research. We find from statistics that the relative value of these three foods, that is to say, the relative fuel value of them per pound in calories, is as follows:

1. Honey .....	1520 calories
2. Hens' eggs uncooked, average .....	720 calories
Hens' eggs boiled, average .....	765 calories
3. Milk average of market product .....	325 calories

I should observe in this connection that the yolk of the egg when boiled has an average of 1705 calories and has an exceedingly high fuel value. It will be seen, however, that honey stands pre-eminently at the head of this list as a fuel or energy-giving value. But let me say in addition to this, honey stands transcendently higher than the other two as a life-giving food from the standpoint of its power of assimilation in supporting and developing the higher faculties of a human life organization. This partly arises from the fact that, while milk and eggs contain a considerable percentage of animal substance, honey is composed almost entirely of vegetable substance of a high quality, including only such exceedingly small traces of mineral substance, and that of such a quality as to contribute to its tonic value. We do not appropriate as food the flesh of the insect, from the laboratory of whose body the honey is compounded, but we do appropriate as food the flesh of the fowl, in the laboratory of whose body the egg is compounded. We also appropriate as food the flesh of the mammal, in the laboratory of whose body the milk is compounded. Better by far for the human race, if men and women generally would eschew completely the two latter classes of food stuffs.

Pure honey is a syrupy liquid of a light yellowish, to pale yellowish-brown color. It is translucent when fresh, but gradually becomes opaque and crystalline, having a characteristic aromatic odor and a sweet, faintly acrid taste.

Analyses of honey vary somewhat in their composition, due to climatic conditions and the sources of supply.

The average composition is as follows:

Dextrose .....	34.4
Levulose .....	39.2
Dextrine .....	4.0
Mineral substance .....	0.2
Formic acid .....	0.2
Water .....	22.0

100.0

Let me call your attention to some observations concerning honey contained in the United States Dispensatory, a large volume well known to all chem-

# American Bee Journal

ists and druggists. This work, which is a standard book of science, behind which are such names as Dr. George B. Wood and Dr. Franklin Bache, is now in its eighteenth edition, and I regret to say that it is not up to date, not abreast with scientific research in regard to honey. On one of its pages it states that naturalists have not yet determined whether it is a secretion of the bee (*apis mellifica*), or exists already formed in plants. This work further says that honey probably undergoes a change in the organs of the bee, as the saccharine matter of the nectaries, so far as it is possible to examine them, lacks some of the characteristic properties of honey.

Now, let me explain to you just how honey is manufactured, or compounded, if you prefer that word. Let us see just what part the bee performs in its work and what part the flower performs. Modern science has determined that honey is the result of fermentation, and that it is not secreted as honey by the flowers. The first bee that visits a flower and enters its petal does not obtain any honey. The bee simply makes a scratch at the base of the petal so as to set at liberty the sap of the flower. After the bee has lanced the flower, it begins to "bleed," or to emit the sap. This emitted sap contains traces of starch. This sap thus exudated undergoes fermentation. When this takes place the compound honey is the result. Now, the fermenting element was contributed by the bee when it first visited the flower, but when it did not obtain any honey. After a little time the first bee, that contributed the fermenting element, was succeeded by another, which obtained the honey. Thus it will be seen that the honey does not all come from the flower, although nearly the whole volume of its substance does proceed from the flower, but that a leaven, which leaveneth the whole lump, is contributed from the life organization of the bee itself. Thus the force or principal in the honey is the product of the bee, and this sub-store of honey, like the yeast in the bread, and like spirit in life, is the active, life-giving element of the compound, which renders it unlike any other compound in the universe, and as such the most potent and the highest contributor to a human life organization.

It is indeed gratifying to observe the inauguration of a campaign to educate the public of the great merits of honey, as a food product, and it is to be hoped that the praiseworthy efforts of the agricultural press with the exhibit of the bee-keepers' associations of the Western and Northwestern States, at the Portland exhibition, will result in bringing this product into greater prominence and daily use in every household.

A good deal has been said about honey pro and con, and it cannot be denied that, to a great extent, the public mind has been influenced—unjustly influenced—against the use of this wholesome and nourishing food product, by constant cries of adulteration, and again by the publication of articles of alleged cases of poisoning by honey.

Let me call your attention to a well known handbook for pharmacists and

physicians, written by Prof. Joseph Remington, one of the prominent pharmacists of the country and a professor of a pharmaceutical college. We find under the head of "Mel" (honey) the following:

"Large quantities of honey are obtained from California, the southern States and the West Indies. A still larger amount, however, is manufactured by flavoring and coloring artificial glucose." Further on he states: "Owing to the difficulty of obtaining pure honey in large cities and towns, its place in many medicinal preparations has been filled by substituting syrups or glycerine."

Can there be anything more astonishing than such a statement? Think of it for a moment. Honey substituted by syrup or glycerine in drug stores, where the term substitution should not be known, and should certainly never be practiced.

If some unscrupulous persons have in the past made, or even continue to make, or practice adulteration of honey, it would be far more satisfactory and just to all parties to locate and prosecute the offenders instead of discouraging the use of this splendid food product, by the circulation of such literature.

Regarding some cases of poisoning by honey, which occurred in New Jersey and other States, it can be said that no case of poisoning by honey would be on record if some care were exercised in not placing an apiary in a locality where many of the Ericaceae abound, even though it appears to be an ideal spot otherwise, as it is well known that honey produced by bees having access to certain Ericaceae, acts as a narcotica-irritant.

However, such a poisonous product can generally be distinguished readily, because it never thickens; the color is redder than usual, and the honey emits a peculiar smell which immediately produces sneezing.

There is absolutely no reason why the public should hesitate to cast aside their suspicion with regard to honey, because no honey can be adulterated in such a way as to correspond to the genuine article in every detail. The chemical analysis may fail to detect the adulteration, but the spectroscope cannot be cheated.

We will now direct our attention to the fuel value of honey as compared with meat and some agricultural and horticultural products.

By fuel value is meant the number of calories of heat equivalent to the energy which it is assumed the body would be able to obtain from one pound of a given food material, provided the nutrients of the latter were completely digested:

## FUEL VALUE.

	CALORIES
Honey, average .....	152c
Green Butter Beans, average.....	370
Green Lima Beans, average.....	255
Dried Lima Beans, average .....	1625
String Beans, (cooked) average...	95
Beets (fresh) average.....	215
Cabbage, average .....	145
Cauliflower, average .....	140
Corn (green) average .....	470
Cucumbers, average .....	80

Kohl-rabi, average .....	145
Mushrooms, average .....	210
Peas (green) average .....	465
Peas (dried) average .....	1655
Potatoes (raw) average .....	385
Potatoes (boiled) average .....	440
Sweet Potatoes (cooked) average..	925
Pumpkins, average .....	120
Sauerkraut, average .....	125
Spinach, average .....	260
Butter (market product) .....	3605
Sugar (market product) .....	1860
Sugar (maple) .....	1330

The fuel value of fresh fruits is almost the same as of vegetables and I will state but a few of them for the sake of comparison:

	CALORIES
Apples, average .....	290
Apricots, average .....	270
Bananas, average .....	460
Cherries, average .....	365
Figs, average .....	380
Grapes, average .....	450
Oranges, average .....	240
Pears, average .....	295
Plums, average .....	395
Watermelons, average .....	140

## ANIMAL FOOD.

Roast Beef, average .....	1620
Round Steak, average .....	840
Sirloin Steak, average .....	875
Corned Beef, average.....	1271

Now, it can readily be seen that the fuel value of honey exceeds some animal foods and a great many vegetables and fruits, and has the advantage of being more readily digested and assimilated than the majority of the articles mentioned.

Speaking from a medical point of view, it is a well known fact that honey has been used with great advantage for the cure of coughs and colds. It has been a favored remedy of the old-time practitioners, who no doubt would have strenuously objected to a substitution by syrups or any other substance.

In justice to the up-to-date druggist, it may be stated, that but few adopt such practices, as set forth in the handbook named, and only on very rare occasions are such substitutions practised. It is safe to say that at least in this State, there will not be found a single druggist who does not keep a quantity of strictly pure honey in stock for dispensing purposes.

In this connection permit me again to say, that the science of physics does not exercise a complete mastery over the substance of food stuffs. Science in this respect can reach, to determine their qualities, only the coarser physical elements. We must ascertain the nature of the elements contained in any food compound, not only from the standpoint of natural history science, but from the viewpoint of natural philosophy. The higher elements in a food compound may be the most potent life giving and life-extending factors in that compound. Thus it is that honey, as we have already seen, in all of the elements of its finer and higher substances can not be brought to vision, even by the science of optics. We must arrive at the fact of their existence in another way.

However, enough has been said to demonstrate clearly that honey ranks

high as a food, and used in the proper connections with other food stuffs, it may be regarded as, in actuality it is, one of the most complete solvents for assimilation that can be appropriated in the human stomach.—Read at the Washington State Convention.

We submitted the foregoing article to Dr. E. N. Eaton, ex-analyst of the Illinois State Food Commission, who reported as follows:

"The conclusion to the article is undoubtedly correct.

"I am inclined to doubt scientific basis for statement that certain foods build up the higher faculties, or that it is advisable to eschew eggs and milk

because the flesh of the animals which furnish them is used for food.

"As to the composition of honey, I believe it to be a fact that dextrose and levulose are present in nearly equal proportion; that dextrin is hardly ever present to the extent of 4 percent, and that cane-sugar or sucrose is normally in from 2 to 7 percent.

"While the statement has frequently been made that honey contains formic acid, I do not regard it as positively proven.

"The amount of calories or heat-producing power of a food is not a criterion of its food-value, but only of its energy value, presuming that it is digestible. Honey, however, has a high value in this line." "E. N. EATON."

after placing on the mat and cover, put on extra covers to keep the heat off the new colonies, and opened up or took off the wire-screens the following evening—Tuesday.

I think our nucleus colonies are all right so far; but of course the disadvantage of this method of increase is that we can not tell for sure where the queen is, and it is too late, really, for the bees to secure queens for themselves, as I think the probabilities are that we will get frost within the next 2 weeks.

My plan has been to use the surplus honey from our 11 supers to help out these young colonies, and to buy a few queens to supply deficiencies. I shall watch closely, and where I find freshly-laid eggs, of course, I will know the queen is present, and will mark that hive "O. K." Where no eggs appear we will reserve for the queens bought. If they start queen-cells for themselves, so we will have some extra queens, we may possibly be able to make one or 2 more new colonies.

The lowest I ever had my bees was the first fall, when we put into the cellar 30 colonies. I mean to work these up to 80 colonies as fast as possible. It seems very queer not to have a pound of extra honey, when in times past we have had as high as 5 tons from 64 colonies.

I think the cause of our heavy mortality in the winter was the jars and slamming that went on overhead. I could not seem to make my chore-man understand the importance of keeping the bees quiet.

Best wishes and kindly greeting to our "sisters"—and the "brothers," too, if they care for it. F. E. WHEELER.

Chazy, N. Y., August 22.

Thanks for so full and candid a report. It takes many and many a year's experience to steer clear of starving colonies in winter. Some colonies seem to take a spiteful pleasure in starving when they are as heavy with stores as other colonies that winter all right. As one cannot know which these exceptional colonies are, that require an extra amount of stores, the only safe way is to treat all as exceptional cases, and see that they have not only enough, but a good bit more than enough to take them safely through until they can gather again.

Early in the season preparation should be made for having extra combs of sealed honey ready for any emergency. Then at the close of the season put these heavy combs into the hives wherever they are needed.

We always weigh each colony unless we know that they are so very heavy that they are away beyond the danger-point. Whatever combs are not needed in the fall will come in very nicely in the spring to replace empty combs. We would have been in bad shape last spring had we not had 250 heavy combs of sealed honey to give our bees, although they went into the cellar very heavy, indeed, with stores. But we don't often have such a very, very bad spring as we did this year. The weather was so bad that the bees would not have left the cluster to take feed and I feel sure we would have lost heavily but for those heavy combs of honey.

Conducted by EMMA M. WILSON, Marengo, Ill.

### Beginning With Bees

DEAR MISS WILSON:—I write to ask your opinion on getting some bees. I have wanted a few colonies for years, but not knowing how to manipulate them, and having no one near to help me, I have never started. I am not able to take a course in bee-culture, but do you suppose with the aid of a good book on bees I could learn the work? This is a very good locality for them.  
(Miss) SARAH HARRIS.

Concord, N. C.

Whatever advantages there may be in a course of instruction, the probability is that the great majority of bee-keepers began with no other advantages than you have. Get a good text-book and put in your extra time this winter studying up on bees. Also take one or more of the bee-papers. If you are thinking of making a business of bee-keeping you cannot afford to get along without them.

In the spring get 2 or 3 colonies of bees, and you can begin to put into use the knowledge you have stored up. You will make mistakes, but that's the way to learn.

### Starved Bees—A Sister's Report and Experience

DEAR MISS WILSON:—I mean to have a good, solid "bee-talk" with you today, and so beg your patience and kindly interest.

Our bees at Clovernook have had a simply awful year of it. I need not recall to you what last winter was as to sustained and vigorous cold, and you doubtless know what kind of a

spring and summer this northern end of Lake Champlain has caught.

Our apiary usually numbers between 80 and 90 colonies, but during the last 3 years has dwindled somewhat, so that last fall we put into the cellar only 56 colonies. These, however, were in good, healthy condition, and had plenty of honey for all reasonable demands.

Last spring I lost all but 23 colonies. There was no honey left in any of the hives, and most of the bees must have starved to death in the cellar. We have caught only one swarm this summer, and our bees were not ready for supers until August 15, when we put on 11. There is but very little honey in them now.

All this summer I have watched for a favorable condition of affairs to do some artificial increase work in the yard, for I am not content to let our apiary rest in such a reduced condition; but if a suitable time did come, my man was away, I was sick, or we had a hurried shipment of ducks to get off, so the summer had drifted by until last Monday, when I became desperate. With my man's help we placed 8 clean hives on some of the empty stands, each with 6 good worker-combs, and put into the center of every hive 3 to 4 frames of capped brood with the bees clinging to them, from the 12 colonies I had reserved for this work. Where they were good and strong in brood we took 3 frames, in others but 2, and in a single case but one. Several of the nuclei have but 3 frames of brood. The rest have 4 frames.

We did this work in the afternoon, and of course had wire screens over the entrances to keep the bees in till accustomed to their new homes. We also,

# American Bee Journal

Those who are so unfortunate as not to have such combs must resort to sugar syrup or candy.

A nucleus with 4 frames of brood the third week in August ought to have no trouble in building up for winter, and in this locality they would be pretty safe as to rearing queens, but it would have been much better if there had been a sealed cell to give to each nucleus. Of course there is always some risk as to young queens being lost, and in your peculiar climate there may be unusual loss, but let us hope for the best.

It is not certain that your heavy mortality in the winter was due to the jars and slamming. Bees will stand a lot of noise and jarring overhead, especially if it be somewhat regular.

## Harvesting Sweet Clover Seed

Those readers who favored me with orders for seed of yellow sweet clover may be interested in seeing how we gather it at our house. All the help we can get from the men-folks is the

POUNDING OUT SWEET CLOVER SEED

mowing. I get one of them into the field when I think it is ready, preferably while the clover is damp or wet, so that the seed will not shell so much as it does when dry. It is then allowed to lie on the ground for a few days to finish ripening, when the girls and I go out with the buggy canvas to get the seed. We go in the morning, while the clover is damp with dew, and load up a good pile which we leave till towards evening. It is now thoroughly dry, and yields very readily to the feet and sticks of the harvesters.

Day after day we do this *until the crop is in*. I like to get the seed off the ground even if no one wants it, for if left on it seeds itself too heavily. Treated as we do, a field gives good results year after year.

(Mrs.) A. L. Amos.  
Comstock, Neb.

## Swarm Settling on a Sister's Face

While Miss Richards, of Mabe, Cornwall, was watching her bees, a swarm suddenly settled on her face and neck. Fortunately, she had courage enough to allow them to remain undisturbed, and eventually the bees were successfully drawn off and hived, without having caused the slightest injury to Miss Richards. I thought an incident so unusual and so illustrative of the lady's courage would be worth recording.—British Bee Journal.

## A Sister's Experience In South Africa

At Marian Hill, one of the sisters from the cloister was trying to capture a wild swarm which a Kaffir woman had told her about. She thus tells the story according to Unterfr. Biene:

"\* \* \* \* \* Alas, with lightning speed and great noise and confusion came the whole swarm flying upon me. I had the feeling as if great hail-stones

she should run to the mill, some 10 minutes away. Trappists were there at work, and she should bring a queen from Brother Caspar who kept bees. After a long time I finally succeeded in getting the bees onto the scapulary; from there I shook the swarm into the swarm-catcher, and ran away, glad to escape from death. If I had undertaken a struggle with the bees, and resisted the attack, they would certainly have killed me."

The sister relates that only a few bees stung her; but they scratched her face with their claws, and with their little tongues and jaws had picked and bitten her, and especially burrowed continually into her eyes.

## WINTERING QUEENS THE THIRD WINTER.

E. W. Alexander having advised not to try wintering a queen the third winter, Dr. Miller raises the question whether there is not a difference caused by locality, strain of bees, or something. He has had in his hives the past season 24 queens that had passed their third winter, and says:

"I don't see but they average fairly with others, some of them the best. I don't believe longevity in bees is appreciated as it should be. If six weeks is the average life of a worker in summer (lately the tendency is to discount that a little), and if it takes to the field at 16 days of age, then a worker that lives 48 days instead of 42 ought to gather 23 percent more than the average. Even if it lives only a day more than the average, it ought to gather 104 pounds for every 100 pounds gathered by the average bee. If a strain of bees has queens that last three years and do good work, and another strain has queens that are good for only 2 years, would you not naturally expect that there would be a difference in the ages of the workers from the 2 queens? And how will you encourage long life in the workers any better than by favoring long life in the queens? The thing is worth thinking over."—Gleanings, 1128.

## VITALITY OF QUEEN'S EGGS.

J. L. Byer says, in Canadian Bee Journal, that one of the best known and most successful apiarists "claimed that if a comb was inserted in the brood-nest in the fall, when the queen was yet laying, and then taken out again as soon as eggs had been deposited, these eggs would develop the following spring if the comb was put in a hive again. The comb could be stored any old place, at a zero temperature would not hurt the eggs in the least."

## LONGEVITY OF BEES.

Mr. Beuhne says we can't have short-lived queens and long-lived workers. Roughly speaking, he requeens every 2 years, but his extra-good queens are allowed to live as long as they will, and by breeding from such queens he secures longer-lived workers. H. L. Jones says he has a very yellow queen 6 years old that is doing good work still.—Australasian Bee-Keeper, 232.

Conducted by J. L. BYER, Mount Joy, Ont.

### Fall Honey Crop a Failure

Throughout many sections of Ontario there has been a total failure of the fall crop of honey. Consequently feeding now is (or should be) in full progress. In our own apiaries we find it necessary to feed just about as much as was taken away earlier. Pretty discouraging; but wait till next year!

### Short Crop and Honey Exhibits

Although the honey crop in Ontario this year is very short, if any one had no knowledge of this condition and should take a stroll through the honey exhibit at the Canadian National Exhibition, he would not be apt to think that such was the case. Our American cousins quite often give our Canadian bee-keepers the credit of being able to produce good honey, and also of knowing how to put up a good exhibit. Results at the Pan-American would seem to bear out such assertions, but aside from any opinions of past exhibits, the display, both as to quality and staging at the present Toronto Fair, is certainly of high merit. That the honey went in "streaks" this year is shown by the absence of some exhibitors who usually are in evidence. Messrs. Arthur Laing, George Laing, E. Grainger and D. Anguish, are the only bee-keepers showing any quantity of honey, and these four gentlemen certainly are to be congratulated for the trouble they have taken to arrange such large and attractive exhibits.

Mr. Arthur Laing has an original and unique display in the shape of a complete apiary in wax. The honey house is *shected* with comb-foundation, and the miniature hives and stands, which are perfect models of standard goods, rest upon a moss-covered lawn. As an educational feature such an exhibit cannot fail to be of great value.

Mr. E. Grainger has observatory hives in which Italian, Carniolans and Caucasian bees are shown. As is usually the case, the center of interest for visitors is the queen, and quite amusing it is to stand near a live bee-exhibit and listen to the different comments and suggestions of people, as they are looking for her Majesty.

Mr. Grainger tested the Caucasian bees this year, and says they did not do nearly as well as the Italians. I am inclined to think that the boom for Caucasians will be short-lived; in fact, we are not hearing nearly so much about them as a year ago at this time.

### McEvoy Treatment of Foul Brood

On page 63, in Bulletin No. 70, issued by the U. S. Department of Agriculture, there appears to be some misunderstanding as to what the McEvoy treatment for foul brood really is. A number who claim to use the McEvoy system, omit one of the most important details—the second shaking. While once shaking will often cure mild cases, the second shaking is necessary to secure uniformly successful results. For this reason Mr. McEvoy has always insisted on shaking the bees on full sheets of foundation, after having for 4 days been on foundation starters.

In the Bulletin referred to, Dr. Phillips is credited with saying, "He [Mr. McEvoy] recommends the second shaking after the bees begin to drop from starvation." While no one will think for a moment that Dr. Phillips would knowingly misrepresent Mr. McEvoy, yet to show that just the opposite to starving is Mr. McEvoy's advice, I quote the following from the pamphlet entitled, "How to examine apiaries and cure them of foul brood," issued by the Ontario Department of Agriculture:

"In treating diseased colonies never starve the bees, because it unfits them for business, and makes them thin, lean and poor, and is also hard on the queens. I never starved any bees, but always tried to see how fat I could make them while treating them, by feeding plenty of sugar syrup when the bees were not getting honey."

### Bees and Horticulture

From a report relative to the peach crop, lately issued by the fruit-growers of the Niagara peninsula, I clip the following:

"The earlier reports sent out of an average crop were too optimistic, based on the number of fruit-buds. However, owing to the late cold spring, and the absence of bees at the right time to fertilize the blossoms, the fruit did not 'set,' and consequently men who were counting on thousands of baskets will now be glad to obtain that many hundred."

It is gratifying to note that all progressive fruit-growers now recognize the honey-bee as a necessary adjunct to successful horticulture. Not so many years ago, such was not the case, and as a consequence complaints of fruit-trees being sprayed while in bloom were quite prevalent. Now all this is changed,

and it is only on rare occasions that we hear of the law against spraying being violated. When a man is once convinced that the doing of a certain thing is detrimental to his own interests, such knowledge is of more effect than any law compelling him to refrain from doing this same thing because of the injury resulting to others. At the same time, the law against spraying trees while in bloom, has answered, and is answering, its purpose, and possibly has been the means of helping to bring about present satisfactory conditions. It is surprising that at least one of manufacturers of sprayers continues to send out with his machines, circulars in which it is advised to spray while trees are in bloom. It is needless to say that said manufacturer does not live in Canada, but the wonder is (no matter where he lives) that he manages to sell his machines to enlightened fruit-growers. Certainly the bee-keepers should "sit" upon such a man, and "sit hard," too.

### Stingless Bees All Dead

One of the most fascinating experiments ever attempted in apiculture, according to *Discovery*, was begun last summer at the American Museum of Natural History, New York City, and has ended, as was expected, in failure through the death of the insects.

The subjects of the experiment were a colony of brown stingless bees—probably the first ever seen in New York.

They were brought from the interior of Venezuela. In the insect gallery visitors could see them busily at work in a glass-covered box, in which they had built the queerest nest imaginable. Rising to a peak, it resembled nothing so much as an irregular, jagged mountain, of a very dark chocolate color.

The box was placed at a sunny window, in the lower frame of which small apertures connecting with the box afforded egress and ingress to and from the outside world. The little foreigners when installed immediately set about making themselves familiar with the city and its parks and the surrounding country.

Hard by, at another window, was a colony of American honey-bees, stingers these. The visitors were brought to the United States with the idea that they might be crossed with the honey-bees and a new stingless species thus produced combining this advantage with the superior qualities of the native insect.

The species were so remotely related and the habits of the stingless variety so highly specialized, however, that the scientist at the museum considered hybridization to be an impossibility.

The honey of the stingless bee, although much appreciated in Cuba and South America, where it is supposed to possess valuable medicinal properties and is an article of food, is very inferior both in quality and quantity to that of the honey-bee. As pollen gatherers, however, they are vastly superior to the latter, being able to carry much heavier loads and to work longer and

in weather when the honey-bee would not venture out. In this capacity they would have been important allies of the agriculturist in the cross-pollination of flowers and in increasing the fruit supply.

Through the long warm days of summer and while the woods took on their autumn tints the stingless bees, which when they arrived numbered about 300, thrived and multiplied amazingly, but the chill, drying winds of the late fall brought disaster to the busy inhabitants of the hive.

They did not seem to mind the cold so much. Indeed, their resistance to it was a matter of astonishment to the experts. What they could not bear up under was the dryness which comes with the approach of winter. The hive box was taken from the window into the warmth of the steam-heated museum and honey in abundance was given to the workers, which at once began storing it in their pots. But indoors the air, if comfortable from the point of view of temperature, possessed, like that outside, the fatal quality of being too dry, and though fighting bravely against this unaccustomed and impossible condition, the bees one by one died off, until now none remains.

Of late we have not heard much about the stingless bees, through the columns of the apicultural press, and it seems we have to "go away from home to get news." Just how much of the foregoing is truth, and how much is reporter's twaddle, would be interesting to know. Who can give us the necessary information?

### Bee-Management for Beginners

The month of May, 1907, has been perhaps the most backward for the bees, as well as for everything else, on record. It contained fewer good days—days in which the bees could fly and gather honey and pollen—than usually occur in the month of April. Only bees that had abundance of honey in their hives early in the spring have been able to pull through, unless feeding was resorted to to keep them supplied and to keep the queens laying. Snow has fallen several times during the month, there being half an inch or so on the morning of the 28th. Even at the best of times the cool nights prevented the secretion of nectar in the dandelions and other early flowers that persisted in blooming in spite of the weather.

The beginner who succeeded in having his bees come through the past winter and spring in good condition may rest assured that the conditions existing in the hive last fall have stood the most severe test successfully, and if he knows just what those conditions were, and can have them the same every year, he should never be troubled with winter and spring losses to any extent. But the same conditions do not always produce the same results, and "beginners' luck" often makes the novice's hat too small for him. It is almost safe to say, however, that none of the younger class of bee-keepers has come through the past month with the

idea still clinging to him that bee-keeping is all "beer and skittles," and the earlier in his experience the beginner learns this fact the better it is for him.

But that is in the past—or should be by this time, if we are to have any honey season at all this summer, and what is no doubt worrying the beginner now is, when to put his supers on and a few other things like that. The average beginner seems to have an idea that, as soon as a hive appears to be full of bees, they are ready for a super, or top story. This, however, is not always correct. Let us see:

The super is for receiving the surplus honey, that is, the honey gathered by the bees over and above what they require to feed themselves, and the brood in the hive, and to produce wax (for the production of wax by the bees necessitates the consumption of a large amount of honey). Now, the mere fact that the bees appear to be carrying in a lot of honey is no sign that they need additional room to store. Perhaps they are not carrying nearly so much as would appear to an inexperienced person to be the case, and until clover is well in bloom, it is seldom, very seldom, that the bees gather honey faster than they use it, for they use it wonderfully fast at this time of the year. There are cases where a hive becomes so crowded with bees before the rush of the white honey harvest commences that it is necessary, or advisable, to add an upper story to prevent too much crowding, which induces swarming. In these cases, if the bee-keeper has any dark-colored combs, a hive-body filled with these is placed over the colony and the queen allowed to occupy them with brood until the time arrives for putting on the white combs or the section supers to receive the main honey-flow, which, as mentioned above, comes chiefly from clover and basswood over most of Ontario.

When the rush of honey begins, this upper story of combs is removed, and any containing brood may be given to colonies which lack one or two combs of having their hives fully occupied with brood of their own. The bees must, of course, be shaken or brushed (brushing is better for combs containing brood) into or in front of the hive from which the combs are taken. If, before lifting the upper story off, a few good whiffs of smoke are sent down between the combs, the queen, along with many of the bees, will be very likely to run below and so be out of danger of injury in handling the frames. Allow about a minute for the bees to run down after the smoking before lifting off the upper combs.

How are you to know when honey is coming in faster than the bees are using it? When clover is nicely blooming and you see the bees coming in with heavy loads—so heavy that they often have trouble in navigating, and fall short of the entrance of the hive when returning to it—take a peep in the top of the hive. If you see, between the top-bars of the frames, that the bees are whitening the edges of the combs with new wax, and depositing little flakes of white wax on the sides

of the top-bars, as if they were looking for a place to build more comb, it is a sign the supply of honey is greater than the demand, and the time has arrived for the storing of surplus honey if there is to be any worth storing.

When you see these conditions, remove the cover and the cloth under it, if there is one, and there should be. If running for extracted honey, put on a queen-excluder, and on that place the super of combs or full sheets of foundation. Put on the cloth and cover, and there you are. When running for comb honey, a queen-excluder is not generally used, as a queen will not lay eggs in the small combs in the sections, except in very rare instances. When the white honey-flow begins, any colony which has not yet filled its hive with brood and honey may be contracted by having the combs which are not occupied removed and replaced with "dummies" or blocks of wood the size and shape of a comb. This prevents the bees from expanding their living-room sidewise and forces them into the supers. If the combs below are left in their places, the bees will fill them principally with honey, before going into the supers. This principle of contracting the brood-chamber to hasten the storing of honey in the super is all right when one wishes to see how much honey he can secure from his bees, without regard to how much feeding he will have to do in the fall to get his colonies up to the winter weight. The writer prefers not to be greedy any more, but to let the outside lower combs be filled solid with the best honey there is, which is none too good for the bees in their long winter confinement. Buckwheat honey may be all right for winter stores where no honey-dew is stored along with it, but that's not in Victoria county, as some bee-keepers have learned to their sorrow during the past two winters.

It seems early to be talking about getting ready for winter, but if you are going to be a successful bee-keeper, there is one thing you must keep in your mind in all your season's work, and that is, that there is a winter coming. Don't think that because honey is rolling in in June that it is going to keep on rolling until the fall. If you do, you will render yourself liable to disappointment. Clover lasts about 6 weeks, as a rule. Basswood follows it (sometimes) and lasts from 2 to 10 days. When basswood is done the white honey-flow is past.—E. G. HAND, in Canadian Bee-Journal.

Fenelon Falls, Ont.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food," written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey, the more honey they will buy.

Prices, prepaid—Sample copy for a 2-cent stamp; 50 copies for 70 cents; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

## Beedom Boiled Down

EMPTY COMB, NOT EMPTY SPACE, PREVENTS SWARMING.

Listen to what that veteran bee-keeper, Moses Quinby, wrote: A large amount of room filled with empty comb will entirely prevent swarming; and years of experience and experimenting has proven that Mr. Quinby was right. Let me illustrate this thing for you a little further: Let a strong colony occupy a dry-goods box, the same being 4 feet square on the inside, they having a space of only about 2,000 cubic inches occupied with comb, and that colony will swarm, notwithstanding all the room there is in the box. But if the whole box is filled with comb, no swarm will issue under the conditions described.—G. M. Doolittle, in *Gleanings in Bee Culture*.

### BREEDING FOR NON-SWARMING.

At the convention of Victorian apiarists, the prevailing opinion seemed to be that much could be done by proper selection toward breeding out the swarming impulse. W. Garrett was reported as having a colony that had not swarmed for 2 years, and by breeding from that colony he reduced swarming to 5 percent. H. L. Jones said that 20 years ago he was frantic through chasing swarms, and has no trouble now, through rearing his queens under a non-swarming influence. Mr. Bolton said that by rearing queens out of the swarming season he had almost reached a non-swarming strain.—*Australasian Bee-Keeper*.

### HUTCHINSON AND LATE EXTRACTING.

Editor Hutchinson has become an advocate of leaving extracting-combs on the hive till the close of the season, and is quite enthusiastic over it. He says, "It is then perfectly ripened and all sealed over, and has a body and flavor I never dreamed until I put this method into practise."

As to having the honey warm enough to work well, he says:

"Honey warmed up artificially to as high a degree as it will bear without softening the combs too much, can be extracted quicker and cleaner than honey as it usually comes from the bees."

He thus gives particulars as to heating, in the *Bee-Keeper's-Review*.

"Last year I heated up the honey by means of a coal-stove; this year we are using a Perfection kerosene-oil heater; and it is perfection. It is the first oil-burning stove I ever saw that would not smoke. It has a cylindrical wick, and just above the wick is a round plate of iron called the 'flame spreader,' and the wick is turned up until it strikes this 'spreader,' when it can go no higher,

and it won't smoke and can't be made to do so. One end of the honey-house, or cellar, is partitioned off, making an 'oven,' as we call it, large enough to hold 50 or 60 supers. We fill this up at night, light the stove just before we go to bed, and turn the wick part way up, so that the temperature at the top of the room will stand at about 100 degrees. In the morning we re-fill the stove, turn it on full blast, and go to extracting, taking the first supers from the top of the room. As some of the piles are lowered, more supers are taken from other piles and added to these, thus bringing more honey up into the heated 'zone.' As fast as there is vacant room, more supers are brought in, and sort of a routine is followed whereby one always has hot honey to work; and more a-heating. It uncaps so easily, extracts so easily, and strains so easily."

### SEVERAL QUEENS IN ONE HIVE WITHOUT EXCLUDER.

First, prepare a small box, about five or six inches square, by boring a one-half-inch hole in one end. This you will for the present close, then remove a part of its two sides and cover with wire cloth so as to ventilate it well. This we call our introducing-box. Take this box and a common queen-cage to the colony to which you wish to introduce your choice queen, or several of them, in fact; remove its combs and put its queen, without any bees, into the queen-cage you have. While doing this shake about a pint of bees of the colony into the introducing-box. Close it and take all their combs from the colony. These can be placed on top of almost any hive until next day. The hives now made broodless, fill about half full of combs containing some honey but no brood. Leave the colony alone until about sundown, after which it will show distress over the loss of its queen and brood. Now take the box of bees to the honey-house, and at the same time the queen, but don't set them near each other. The bees in the little box will soon miss their queen and have lots of trouble.

After they have been confined about five hours prepare some warm thin honey, placing it in a dish so that, by laying the box on one side, the bees can easily reach the honey through the wire cloth, but can not daub themselves with it. Leave them this way until you are sure that every bee in the box is as full of honey as it can be, then give them a little shake and remove the cover from the hole in the end of the box (remember it is about five hours since they were confined in the box), and let run in any number of queens you wish, including their own mother.

Now return them to their dish of honey so they can help themselves to all they can eat until about sundown; then take this introducing-box with its bees and queens to the hive from which you took the bees and their queen in the morning; set them to one side and feed the colony all you can induce it to eat. Remove some of its combs and pour in some of the honey you have been feeding to the bees in the box. Shake some of this honey out of its combs on these bees, so every one will soon be full. Now remove the cover of the introducing-box and set the box in the hive alongside the combs. Close up the top of the hive, and in the morning all the bees and queens will be clustered on the combs, and some of the queens will have commenced to lay. You can now give them the brood you took away from them the day before, or let them fill their combs with eggs, which five queens will do in three or four days. That is all there is of it.

You now have the colony all together with their brood and their mother-queen, and as many other queens as you care to have in one colony. There has not been a queen balled or injured in any way.—E. W. ALEXANDER, in *Gleanings in Bee Culture*.

### ROOT ROUTS ROBBER-BEES.

It is not to the credit of a bee-keeper that he allows conditions that induce robbing; but sometimes a case will happen even with the most experienced, and when bees have a good start at robbing it is not the easiest thing to stop them. Editor Root has a plan that would seem to fit the most desperate case. He says, in *Gleanings in Bee Culture*:

"Very lately we have found a remedy that does away with the whole trouble, and that, too, within a very few hours. This consists simply of the use of a robber-trap. This is nothing more nor less than an ordinary hive having a contracted entrance and a bee-escape on the inside, so placed that bees can pass in readily but not out. A wire-cloth cone, or, perhaps, better, a regular Porter should be used.

"We will assume that a bad case of robbing has suddenly developed in which the colony or nucleus is nearly overpowered if not entirely so. If the attack is confined to the one colony, the problem is much simpler. In that case we remove the attacked hive immediately, and put it down cellar with the windows all darkened but one, so that the bees that do not belong in the hive can escape and go back. On the stand of the hive of the colony removed we put the hive with the bee-escape on the inside of the entrance, or what we will call our trap, when, presto! all the robbers will rush into this hive and be imprisoned. It is only a matter of an hour or so before they are all caught; and what was once a perfect uproar in the yard will now be as quiet as though nothing had ever happened. When this condition prevails, or toward nightfall, the attacked colony that was put in the cellar is put back on its own stand, but with its entrance contracted down to a space so that only one bee can pass at a time. A frame of young bees is shaken into the hive, and nearly all the

# American Bee Journal

honey is taken away, if any is left, and in its stead will be given a cake of hard dry candy. The robber-trap, with its gang of mischief-makers, is now put down cellar where it will be cool, and where there will not be much danger of suffocation. Strips of broken sections, or any pieces of wood not more than one-eighth inch thick, are now carefully slid between the cover and hive-body containing the confined bees. One of these is placed at each of the four corners. This will make a gap of

one-eighth inch between the cover and the hive, or a crack just too narrow for the bees to pass through. This is to give the bees ventilation; and a cellar is just the place to put a lot of confined bees. After being confined for two days they may require to be fed. We would advise keeping them shut up for a week, or better, take them to an out-yard or some location about two miles away from the scene of their recent pow-wows. Give them a queen or queen-cell, and let them start house-keeping."

and bees as you suppose, for unless the bees are exceedingly weak they will not allow the ants anywhere inside the brood-nest itself. Very likely you use quilts, or in some other way there is a chance for the ants to find shelter somewhere where the bees can not reach them. When I used quilts, the ants seemed quite fond of making their nests on top of the quilts, perhaps mainly for the sake of the warmth to be found there. With board covers that afford no such protection from the attack of the bees, the ants keep their distance. Logically, the thing to do is to avoid making any such shelters where the bees can not get at the ants.

Sometimes the ants have their nests outside, and annoy the bees by trying to get in. In that case, trace them to their nest, take a crowbar and make a hole into the nest, pour in 2 or 3 tablespoonfuls of bisulphide of carbon, and cover up quickly. If too much trouble to get the bisulphide, gasoline will do some good.

Whether the nest be inside or outside, you may poison the ants. Take 2 thin little boards, put a piece of wood  $\frac{1}{8}$ -inch thick or less (a piece of section is right) between the 2 at each side, and that will allow the ants to get between them but keep out the bees. Now put Paris-green or some other poison mixed with honey between the little boards, but not near enough the edge for the bees to reach it, and place where it will be convenient for the ants.

## Ants in Hives

What is the best remedy for ants in bee-hives?  
OHIO.

ANSWER.—Prevention is better than cure. Have no place in the hive that an ant can go and a bee can not. If the ants have nests outside, pour bisulphide of carbon in their nests. Gasoline will also answer pretty well.

## Ventilating Hives—Tiering Up Hives in Wintering—Replacing Brood-Combs

1. To give ventilation to a dove-tailed hive on a reversible bottom, would any harm come from sliding the hive backward until there is a bee-space between outside edge of back of bottom and inside edge of back of bottom, or would sliding the hive forward be better?

2. To what extent would you advise tiering up hives for outside wintering, say not more than 2 or 3 high?

3. To utilize all room on my 20-foot platforms next season, is it advisable to place hives 6 inches apart, with entrances alternated north and south?

4. I wish to replace all of the brood-combs next spring with frames of full sheets of foundation, leaving the 2 best combs for the outside ones. Is this going it too strong, provided I do it when fruit-bloom is on? IOWA.

ANSWERS.—1. Sliding back would make the bottom-bars rest on the rim of the bottom-board, and the bees would glue the two together, so sliding forward would be better. When

Send Questions either to the office of the American Bee Journal, or to  
DR. C. C. MILLER, Marengo, Ill.  
Dr. Miller does not answer Questions by mail.

## Feeding Back Honey in Shallow Frames

1. I have a number of shallow frames of honey, and no extractor. I wish to feed them back to the bees. What is the best way to do it?

2. Some of these frames, which were left in hives and put in a room upon being taken from the hives where they were made, have become infested with wax-larvæ. I have fumigated them with bisulphide of carbon. Will it be all right to use these to feed back?

IOWA.

ANSWERS.—1. I suppose the frames are the same in size as those of the brood-chamber, only not so deep. While it would be better if they were full depth, it will work very well to use them in place of full-depth combs, putting them in at the sides. Very likely you can not thus dispose of them all this fall, but they will come in very handy in the spring, when you will take out any combs that are emptied, or nearly so, and put in shallow ones. Of course, you must look out that they do not get too close to the brood-nest, for it would make trouble if brood should get into any of them, and they must be removed before the queen has a chance to lay in them.

2. Yes.

## Moving Bees—Preparing for Winter—Increase

Some time ago I bought 5 colonies of bees. What is the best way to move bees from place to place? to prepare them for winter? to increase my stock.

INDIANA.

ANSWER.—If bees are moved as much as a mile there will be little or no trouble about their returning to their old location. If moved only a few rods, with no precaution, nearly all the field-bees will return to the old location upon

their first return from the fields. To prevent this, screen them in the hive for a day or so, then just before opening the entrance thump good and hard upon the hive so the bees will be excited and mark the location when they come out. A board placed in front of the entrance for them to bump against when they come out will also help. If you wait till they have stopped flying for a week or so, they will stay pretty well wherever they are put without any precaution.

To answer fully your other questions would exceed the limitations of this department, which is meant to supplement the teachings of a book of instructions in bee-keeping, and not to take its place. If I should take up several pages telling all about making increase, the old subscribers would raise a hornet's nest about my ears for taking up room with stuff that might be copied from any good bee-book. If you cannot have a paper and a book, too, let the paper go and get the book. You'll find a whole lot of things in it, any one of which will be worth the price of the book; and when you have become familiar with it there will still, most likely, be questions you would like to ask, and such questions will be answered most cheerfully in this department.

## Getting Rid of Ants

I have a colony of bees that are mixed with black ants. I saw some on the hive last spring as soon as warm weather commenced. Taking off the lid to see if there were any honey in the supers, I found that there looked to be almost as many ants as bees. How can I get them separated without killing the bees? I am a beginner and have read about ants being troublesome, but know no way to get rid of them.

NEW JERSEY.

ANSWER.—The probability is that there is not so thorough a mixture of ants

# American Bee Journal

working for extracted honey it is a good plan to have an opening above for ventilation, by shoving the upper story forward so as to leave a crack of  $\frac{1}{4}$ -inch. Even when working for comb-honey I make use of this kind of ventilation during the hottest part of the season.

2. Except the labor, and the trouble to the bees in changing the location of their hives, I know of no objection to piling up hives 3 or 4 high, and there is some advantage in the matter of heat.

3. That will work, but you will probably find it better to have them in pairs, the first 2 facing north, the next 2 south, and so on. The bees are not likely to make a mistake in getting into the wrong hive of a pair; much more likely to make a mistake in a row alternately facing in opposite directions.

4. Yes, that would be going it rather too strong to ask the bees to give up their brood and start all anew at a time when every effort should be made to increase the force for the coming harvest. Wait till just before the time when there is danger of swarming, and then it will be what is so popular with many, shaking a swarm.

## Using Brood-Frames for Extracting Frames—Old Honey-Extractor

I have some American frames about 12x12 inches inside, with a bar across the center, top-bars  $1\frac{3}{8}$  inches, and notches for bees to pass up through. The swarms were hived on starters in 1905, and the frames have been used for brood ever since. I want to discard them as brood-frames, and had thought of making supers and using them for extracting, over 10-frame Langstroth hives. Of course, the frames would be crosswise, also the supers, and being about an inch narrower than the hives, it would leave an offset at each side for bees to travel over when going up the side of the hive. There is considerable drone-comb in these frames.

1. Would these combs cause the honey to be inferior in any way?

2. Would bees store nearly as much (or quite) as in other extracting frames?

3. Do you think it would pay me to use them for extracting?

4. If I buy a 2-frame non-reversible extractor 25 years old, will I be sacrificing many improvements?

PENNSYLVANIA.

ANSWERS.—1. Honey in those combs ought to be as good as in any combs used for the same length of time for brood-rearing. Generally it is considered that there is no difference between extracted honey taken from new combs and that taken from the very old, black combs. Some, however, who want to get the very lightest honey for exhibition purposes prefer new combs. If you take a very black comb and let it stand for some time filled with water, the water when thrown out will be pretty black, and it is claimed that honey in such combs will also be to some extent colored. But for ordinary purposes the difference is not considered.

2. There ought to be no difference.

3. Yes, but for the sake of having all frames alike many would prefer to transfer the combs into your regular frames.

4. Your question itself suggests that one of the improvements would be self-reversing—a matter of considerable importance. If you do a small amount of extracting, the probable difference in price would over-balance any disadvantage; if you do a large amount, better pay for all the improvements you can get.

## Queer Noise Among Bees

What is it that I hear in my Italian bee-hive this time of year? It makes a fuss like a queen. I heard the same noise last spring before I shook a swarm from it. Those bees have always done queer things. Are there 2 queens in there? and are they destroying one?

ANSWER.—Without hearing the noise I cannot say what it means, and possibly I couldn't say if I should hear it. I've often put my ear to a hive and heard the bees making various noises without being able to make anything out of it, except the piping or quacking of young queens when an after-swarm is contemplated. It is, of course, possible that 2 or more queens are present in the case in question.

## Bees Troubled With Moth-Larvae

My wife's father has a colony of bees here that are not doing well (Aug. 6). They swarmed along the fore part of July or the latter part of June. I was not here then and the folks did not see them swarm, but I am confident they did swarm, as there were several indications to show that they had. They seemed to be gathering some honey and had quite a lot of bees, some having gone to the super, but they had not stored an ounce of honey in the super, and had been carrying out lots of young bees, in size from the small larvæ in the bottom of the cell to the bees just emerging from the cell. On opening the hive yesterday I found a lot of honey and pollen in the comb, brood in all stages, and 7 out of 8 frames with eggs. The older bees that were carried out seemed to have a sort of white web around them which made them unable to fly, and in some cases almost unable to walk. There were a few moths in the hive last spring, but none in the combs that I could see. I found a few moth-worms under the frames covered over or hemmed in with wax. What is the disease, and what is the remedy for it? The bees do not seem to build up as they should, but there is plenty for them to work on and other bees are doing fairly well now. IOWA.

ANSWER.—The bee-moth is the miscreant that causes the whole trouble, almost certainly. The larva of this pest makes its gallery of silk along the surface of the comb and deeper, and the young bees thus injured are thrown out of the hive by their older sisters. It is hardly fair, either, to say that the bee-moth causes the trouble. The cause is a weak, inefficient colony, and the

bee-moth comes in only because the colony is not vigorous enough to resist.

The remedy is a stronger colony, or bees of greater vigor. Italian bees are greatly superior to blacks in fighting off the bee-moth, and if your bees are black, the introduction of Italian blood is the thing indicated. It is also possible that the queen is at fault, either through age or some other cause. The case is worse if there are more combs than the bees can cover.

You may do something to help the bees get rid of the larger worms present. Take out a comb, note where a worm has built its gallery, with the point of a wire-nail pick a hole in one end of the gallery, then start at the other end and pick along till the worm drops out, when you can treat it as your conscience dictates.

## Queen Passing Through Entrance-Guard—Swarm Deserting—Introducing Queens

I bought a full colony of Italian bees, which were shipped by express in a shipping-case. As soon as I hived them, off they went. I caught the swarm and hived them again. I saw the queen go in, got almost all the bees in the hive; put on an entrance guard, and a half-hour later all the bees were out again on the same tree. I did not bother with them any more, but before night they all went back to the hive. The next day the same thing happened, and I did not see her any more. The bees went to work. I had put on only starters. Three weeks later 2 frames were fully built and 2 half built, but laying never began. I am sure now that there is no queen at all.

1. Can a queen pass through an entrance-guard?

2. Why did the bees go out after I had hived them in a new hive with foundation-starters?

3. I never use either veil or smoker while I examine the hives, and take the frames out one at a time, and never was stung. Why did they sting me the last time? Just as I had removed the cover they rushed at my face and I got 3 stings.

4. What is the best method of introducing a queen to a queenless colony?

LOUISIANA.

ANSWERS.—1. Not if the entrance-guard is perfect and the queen of normal size. Some have thought that when a queen is not laying, her abdomen consequently smaller than usual, she might get through a perforation smaller than when in full laying. But it is not the size of the abdomen that prevents her passage, it is the thorax. The abdomen is soft and yielding, and when at the largest it will easily flatten out to go through any perforation large enough to allow the passage of the thorax. The thorax is a sort of bony structure which is the same whether the queen is laying little or much.

2. I have no means of knowing, but the most common reason for the desertion in such cases is that the hive is in too warm a place, and too close. Leaving the cover open a trifle helps, also shading and sprinkling with water.

It also helps to give a frame of brood from some other colony. If nothing but starters are present, the bees may easily desert if everything is not entirely to their liking.

3. Hard to say; there might be something in the disposition of the bees, in the state of the weather, or in your handling.

4. For ordinary cases the usual plan with a provisional introducing-cage is pretty reliable. Somewhat safer is the Abbott plan of caging the new queen in the hive for 2 days without disturbing the old queen, and at the end of the 2 days removing the old queen and allowing the bees to liberate the new queen by eating out the candy. If you want to be entirely safe, put 2 or more frames of sealed brood over an excluder on a strong colony, leave it till all the brood is sealed, then take this brood, *without any bees*, put it in an empty hive, put the queen in, close it up bee-tight, and set it where the brood will not chill. In 5 days it may be set on the stand where it is to remain and a small entrance be opened. Of course, the brood should be old enough so that bees will be hatching out when the queen is put in. These very young bees know no other mother, and will be entirely kind to the queen. One way to keep the brood warm during the 5 days' confinement is to set it over a strong colony with 2 sheets of wire-cloth to prevent communication between the 2 hives.

#### Breeding Up for Winter—Drones from Mismatched Queen—Honey Deteriorating on Hive

1. I have 2 colonies that have had drone-laying queens for at least 6 weeks. Both queens were reared this year. I sent for 2 tested queens and introduced them to-day (Sept. 25), first removing the drone-layers. Both colonies are still strong in bees. By stimulative feeding will the queens breed up to be in shape for winter?

2. Are the drones from a mismatched Italian queen still pure Italian, or are they hybrids?

3. A claims that by taking the combs off a hive immediately after they are sealed he can extract more and better honey out of the combs than he can by leaving them on a few weeks longer. B claims that honey does not deteriorate nor grow less in bulk or weight after it is sealed when left on the hive a few weeks longer, or until the end of the honey-flow.

ONTARIO.

ANSWERS.—I. Maybe, and maybe not. Something depends upon the length of time since any worker-eggs were laid in the hive. You say drone-laying queens have been present "for at least six weeks." Of course it may have been much longer than that, and all the workers present may be getting pretty old to go into winter quarters. It is also difficult, even with feeding, to get queens to lay at this time of year as they would in the early part of the season. Even so, as the colony is still strong in bees, if they are not too old, the wintering may be successful.

2. It is generally considered that the

drone progeny is not affected by the mating of the queen, although some maintain that the blood of the queen may be so affected as to affect the character of the drone progeny but slightly in the direction of the drone which the queen met.

3. Better compromise, and say that the honey will improve in quality by being left longer on the hive, part of the improvement being that the honey becomes thicker, and thus less in weight. Some of the best bee-keepers leave the honey on till the close of the season, believing that the little loss in weight will be more than overbalanced by the gain in quality. Some bee-keepers have done themselves lasting harm by throwing on the market honey not fully ripened.

#### Kind of Hive, Frames, Honey, Bees, Etc.

1. What kind of a bee-hive would you advise me to use in Northern Minnesota, 8 or 10-frame dovetailed?

2. Are Hoffman self-spacing brood-frames all right for extracted honey?

3. What kind of cover and bottom would you advise me to use? Is the double air-spaced cover all right for the North?

4. What kind of honey would you work for, comb or extracted?

5. Which is the cheaper to produce?

6. Is it necessary to wire frames for extracted honey?

7. What race of bees is best for all-around purposes?

8. What bee-book do you think best for a beginner?

9. How do you increase bees artificially?

MINNESOTA.

ANSWERS.—1. Whether an 8-frame or a 10-frame hive is best depends upon circumstances. If you work for extracted honey, take the 10-frame. If you work for comb-honey, the 8-frame may be best. But its small size makes toward great danger of loss in wintering unless it have closer attention than would be given by those who do not make bee-keeping a good deal of a specialty. So it will be the safe thing for you to adopt the 10-frame hive for either comb or extracted honey, unless you expect to give the business very close attention.

2. It is used by many for that purpose, although some object that the shoulders of the end-bars are in the way of the uncapping knife.

3. A double cover with an air-space between the 2 parts is all right for North or South, summer or winter. In winter it is warm, and in summer the dead-air space helps to ward off the heat of the sun. For a bottom-board it is getting more and more to be the thing to have a deep space under the bottom-bars in winter. But if there be a deep space under the frames in summer the bees will build combs down under the bottom-bars. To meet this a reversible bottom-board is much used, one side allowing  $\frac{1}{2}$ -inch or less in summer, the other side allowing  $\frac{3}{4}$ -inch or more of space in winter. Although the reversible bottom-board is

my own invention, I no longer use it, preferring a deep space both summer and winter. My bottom-boards are 2 inches in depth, and in summer I fill the space partly with a sort of open-work rack, which prevents the bees from building down, while at the same time allowing them more air.

4. If it were so that comb honey is the best to work for under all circumstances, then all bee-keepers would be producing comb honey, and the same might be said of extracted. The fact that some produce one kind and some the other shows that comb is best for some and extracted for others. I don't know which would be best for you. Possibly you can find out by trying both on a small scale.

5. The outlay for comb is much more than for extracted; but of course comb brings the higher price of the two.

6. It may not be absolutely necessary, but while combs are still new, if you attempt to use them for extracting without having in them wires or some other sort of support, you are likely to break enough combs to pay a big price for wiring.

7. Italians are generally considered best in this country.

8. You cannot go amiss if you have either or all of "A B C of Bee Culture," "Bee-Keepers' Guide," or "Langstroth on the Honey-Bee." If you want still another, you might get "Advanced Bee-Culture," or "Forty Years Among the Bees."

9. Yes, but it's a long story, and there are many ways. After you have got your book and studied up the subject in that, if there are any special questions you have on the subject they will be gladly answered in this department. You will find several pages devoted to the subject in "Forty Years Among the Bees."

#### Fair Honey Crop.

We have a fair honey crop in this district. The Ideal Hive Tool is light and effective.

JOHN S. SEMMENS.

Prowers, Colo., Aug. 30.

#### No Honey or Half a Crop.

I got no honey from our California apiaries this year, and about half a crop from the apiaries here in Utah.

THOS. CHANTRY.

Ferron, Utah, Aug. 30.

#### About Half a Honey-Yield.

I have had only about half a yield of honey so far this season. But there is a fine prospect for a fall honey-yield from asters and golden-rod.

W. S. FEEBACK.

Carlisle, Ky., Sept. 2.

#### May be a Fair Fall Flow.

Bees are still bringing in some alfalfa honey. If the weather favors us we may have quite a fair flow from the last of heartsease and alfalfa bloom.

G. BOHRER, M. D.

Lyons, Kans., Sept. 2.

#### Gasoline for Foul-Broody Combs.

Take some combs where the bees have foul brood; uncap them and soak them in gasoline;

# American Bee Journal

put them in the extractor; throw the gasoline out, and put the gasoline back into the can for future use. I use the combs again after this treatment. I find them perfectly safe to use. I would like every person to try this that has foul brood in the apiary.

W. H. H. STEWART,

Emerson, Ill., Aug. 28.

## Poor Season for Bees.

This has been a very poor season for the bees in this part of the country. The fore part of the season was cold and wet so that they have had a very poor chance to do anything.

JOSIAH SWINEHART,

West Salem, Ohio, Sept. 10.

## Good Fall Honey-Flow.

The summer honey crop here was only a third of a crop, but we are now having a wonderfully good fall flow. I shall get some surplus from golden-rod and asters for the first time for several years.

ALLEN LATHAM,

Norwich, Conn., Sept. 20.

## Very Little Honey.

I have had 2 swarms from 70 colonies, and very little honey this year. The bees are doing very well now. We live in hopes that they will be better next year.

Palmyra, Mo., Sept. 14. JOSEPH H. BAKER.

## Backward Season—No Honey.

This has been a very backward season, and now it is very cool—60 to 65 degrees above zero. The bees ought to be putting in their best licks on Spanish-needle bloom, but there is no honey to speak of so far.

Milo, Mo., Sept. 11. CHAS. M. DARROW.

## Poor Honey Season.

This has been a very poor honey season with me. One out-yard of 10 colonies produced 500 pounds of extracted honey, and the other out-yard of 30 colonies, only 280 pounds of extracted honey. The home-yard of 20 colonies will have no surplus honey.

L. E. ALTWEIN,

St. Joseph, Mo., Sept. 10.

## Poor Prospects for Fall Flow.

We are having very dry weather here, and poor prospects for a fall honey-flow, but most of the bees have plenty of good stores for winter, also a good reserve in the honey-house for feeding in case of need.

GRANT ANDERSON,

Sabinal, Tex., Aug. 27.

## Bee-Culture Discouraging.

Bee-culture here is very discouraging this year. I have 25 colonies and will not get one pound of surplus honey. The bees are hardly making a living, as there is too much cold and rainy weather in the Ohio Valley.

HENRY LEWEOAG,

Wheeling, W. Va., Aug. 28.

## Honey for Local Demand.

The early part of the season was poor for honey, but the last month or so the bees have done well, and there will be more than enough to supply the local demand. Comb honey sells for 15 to 20 cents per pound. This county, I believe, is the banner bee-county in Illinois.

Warsaw, Ill., Sept. 24. PAUL HEISE.

## Fall Honey Crop Promised.

I have 98 colonies of bees. The honey-yield was light from clover. There promises to be considerable fall honey at this time, as the flow is about half over. We had a frost late in May, which killed all of the early bloom.

W. A. SWEARINGIN,

Epworth, Ky., Sept. 23.

## Sumac—Wormwood—Psoralea.

I send you 3 different kinds of plants, as I would like to find out their names. I have attached a number to each.

No. 1 in any way a poisonous plant? The berries of this plant are the same as on sumac, but the leaves are different. It grows to the height of about 6 feet and in bushes.

No. 2 a good honey-plant?

No. 3 grows to the height of about 2 feet, has a smell somewhat like peppermint, has

small blue blossoms, and yields quite a little honey, and also grows in bushes.

Stratton, Colo., Aug. 4.

PETER BOHM.

[Plant No. 1 is the fragrant sumac—*Rhus aromatica*—and is not poisonous. Several of the sumacs are poisonous. The sumacs are generally good honey-plants.

No. 2 is the Kansas wormwood—*Artemisia Kansana*—and is probably a good honey-plant in common with the wormwoods in general.

No. 3 is the black-dotted Psoralea—*Psoralea obtusiloba*—and as it belongs to the pea family, would naturally produce honey.—C. L. WALTON.]

## Light Crop of Honey.

I have had a very light crop of honey this year; and never have I had so much swarming in the month of August in my 30 years' keeping bees. They are breeding strong, and consuming more honey than they are bringing in from the field.

J. C. CREIGHTON,

Harrison, Ohio, Aug. 30.

## Hard Year for Bees.

This has been a hard year on bees here. But by close attention I have done very well with them. I have taken as high as 100 pounds of surplus honey from some hives. Most of the bees in this country are kept by haphazard bee-keepers, and hardly any of them have secured any surplus at all.

J. W. FERGUSON,

Pierce City, Mo., Sept. 2.

## Very Poor Season.

This has been a very poor season here. It was either too cold or too dry, or both.

I started in the spring by purchasing a 3-frame nucleus, which has built up, by feeding, into a rousing-strong colony, but they have gathered no surplus at all this year. They just about made a living, and that is all. I intend to try natural swarming for a few years till I find out more about the business, before making artificial increase.

Curtis, Okla., Aug. 12. J. W. JACKSON.

## Starting with Bees—Catnip.

Only one year ago last spring I put my attention to bee-culture, having been keeping bees in what might be called a pot-luck, haphazard way. To start with I had 14 old blacks and bought 4, making 18. I then bought 2 nuclei of the so-called Red-Clover Italians, and went to Italianizing my black bees by the introduction of Italian queens, changing 10 of them. In the fall I had increased to 39 colonies, with a surplus of 800 pounds of section honey. I then put 5 colonies in the cellar for wintering, leaving the balance on the summer stands with winter protection.

My winter loss was 2 in the cellar, and one colony out-doors, leaving me 36 to start with last spring—22 blacks and 14 Italians. Only 3 of the blacks gave me any surplus, and none of them swarmed. I have since, for the last 3 weeks, been giving them Italian queens, reducing the blacks to 13, which I will also renew.

The 14 Italians gave me, up to this date, 5 natural swarms and 2100 pounds of section honey. One swarm that came off May 20 has stored 146 pounds of honey, and will likely fill another 28-section super. The 14 will average over 85 pounds apiece, and are just boiling over with bees. I am now taking off supers and dividing each of a part of them into 2. As to any difference in the different breeds of Italians, I much prefer the 3-band or all-yellow small bees to the long-tongued Red-Clover strain, for work and hustle. The small yellow ones are hustlers, and seemingly more hardy and prolific.

I have hit upon a shade or protection from the hot sun by planting a hop-root at the sun-side of each hive, which runs up on poles about a foot above the top of the hive, and as the shoots come out, I twine them in and soon have a perfect shade from early in July. And they are now full of hops, making a fine show.

Last summer, just after harvest, I set out 1000 catnip plants in rows, 3 feet apart, and have cultivated until too large to get through this season. On July 15 it began to bloom and has been in continual bloom ever since, and will be till frost takes it. There are new shoots coming out all the time, till now it has as high as 300 or 400 heads on one plant, and is just swarming with bees from as early as 5:30 in the morning till dark in the evening, which is not the case with any other

honey-plant I know of, some yielding no tar only in the forenoon. And the plants will last at least two seasons if not three, and still longer. I have now set out for the next season over another thousand. Some one said that it would not pay to cultivate a pure for bees alone, but I think he is mistaken.

As to other honey-plants and nectar yielding sources, we have basswood, some white clover, smartweed, and a large amount of sumac, which is a large part of our bee supply. There is plenty of golden-rod, but the bees seldom work on it. There will also be quite a crop of the fall asters—blue and white. Our buckwheat doesn't seem to yield much nectar. There were only about 3 or 4 forenoons of the bloom.

W. S. WILLIAMS,

Martha, Pa., April 23.

## Subscription Price Now 50c a Year

On July 1, 1907, when we decided to change the American Bee Journal from a 16-page weekly to a 32-page monthly publication, we reduced the price from \$1.00 a year to 25 cents. We have since discovered that the 25-cent rate was entirely too low, in view of the kind of a bee-paper we are making every month. We do not wish to lower the standard now, and as labor, materials of all kinds including white paper, etc., have advanced in cost, we feel that the best thing we can do—in fact, the only thing to do—is to put the subscription price at 50 cents a year; in Chicago, 75 cents; in Canada, 60 cents; and in all other countries in the Postal Union, 25 cents a year extra for postage, or 75 cents. These new rates began with September, 1907.

We are sure that our hosts of readers and friends will feel we are doing the right thing in this, as they certainly would not want us to continue at too low a subscription price. At 50 cents a year, this 32-page copy would cost the subscriber only about 4 cents—two 2-cent stamps—surely cheap enough, when its valuable contents are considered. Why, "Dr. Miller's Question-Box" alone is worth many times the subscription price, to say nothing of all the other valuable departments.

It is our intention to keep the old American Bee Journal at the head of the procession, where it has been for so many years. And to do this we will need the hearty co-operation of all our readers. There are yet thousands of bee-keepers who have never heard of the American Bee Journal. Many of them are your neighbors; can you not show them what they are losing by not having it every month?

On another page we offer many useful things as premiums for getting new subscriptions. We will be pleased to mail sample copies to any names and addresses of bee-keepers that may be sent to this office. If every present subscriber would send in just one new subscription during this month, by Nov. 1st our list would be doubled. Why not do at least that much to help along a good cause—your own cause? We are ready to do our part—will you, dear reader, not join with us in putting the monthly circulation of the old American Bee Journal up to where it ought to be?

## Pennsylvania Convention

The 4th annual meeting of the Pennsylvania State Bee-Keepers' Association will be held at Harrisburg, Oct. 29, 1907—the day before the National—in the

Capitol building. The first session will convene at 1 p.m., and be devoted to business. In the evening there will be an informal meeting without any fixed program.

The National and the U. S. Hotels, and the Hershey House, have offered to accommodate those who attend the conventions for \$1.50 per day. The Y. W. C. A. will entertain the ladies for 75 cents per day.

Owing to the unsettled conditions no reduction in railroad fare will be granted us this year.

A cordial invitation is extended to all who are interested in bees. There will be exhibits of honey, and all are invited to contribute to them.

FRANKLIN G. FOX, *Sec.-Treas.*  
Erwinna, Pa.

**For Sale**—Alfalfa honey. If you want nice honey for the table try a can of Colorado alfalfa honey, \$5 a can of 60 lbs. F. O. B. -3 A. A. LYONS, R. F. D. No. 2, Ft. Collins, Colo.  
Mention Bee Journal when writing.

**For Sale**—40-acre honey, beet, fruit and alfalfa ranch, with 125 colonies of bees. Cheap, if taken soon.  
R. S. BECKTELL, Grand Valley, Colo.  
Mention Bee Journal when writing.

**For Sale**—200 surplus young tested Red Clover and Golden Queens—50c each. H. A. ROSS, 1709 Upper Sec. St., Evansville, Ind.

#### Bright Three-Banded Italian Queens

Have but few equals and no superiors. A fine, large Queen of either strain for \$1; an extra-select breeder for \$2.50. Have had 12 years' experience at queen-breeding. Address,

SAMUEL M. ANGEL

20A13t R.R. No. 1, EVANSVILLE, IND.

## Write for My Introductory Offer on a Fine Sample WILLIAMS PIANO or ORGAN

I am sending some of the finest, sweetest-toned Williams Pianos and Organs we make into many communities as samples of our work. It's our special way of advertising, as we have no agents or stores. If you write at once, I will tell you how you can try one of these fine sample instruments in your own home entirely at our expense of freight and all. Then, after you've tried it for a month or so—after you've had your friends try it—after you've tested its easy action—after you've enjoyed its rich, sweet tone for which Williams Pianos and Organs are celebrated—after you are convinced that—all in all—it's one of the finest-looking, sweetest-toned instruments you ever saw or heard, then, if you wish, you may

buy it at our special introductory price and take

### Your Choice of 27 Plans of Easy Payment

on the piano or of five plans on organ. You may select the plan that's easiest for you and we will trust you, no matter where you live. I guarantee each sample piano and organ to be as fine as those I made for the famous song writers, Prof. E. O. Excell, Prof. C. H. Gabriel, and the hundreds of other well-known musicians you will find in the free book we are going to send you. This is the best chance you will ever have to get a fine piano or organ on your own terms. WRITE A POSTAL OR LETTER TODAY and say, "Send me free Sample Offer, Plans of Easy Payment and Book about (state which book—piano or organ)." Address carefully as follows:  
6W H. B. WILLIAMS, Vice-Pres., Williams Organ & Piano Co., Room 601 57 Washington St., Chicago

## Articles Wanted

The Bee-Keepers' Review would be glad to examine, with a view to their purchase, articles of a helpful nature for practical bee-keepers. It is not that it has run short of material, that this request is made, but because it wishes the best correspondents that it is possible to secure, and takes this method of letting bee-keepers know of this desire. It would especially like articles on the production of comb honey. If the information can't be crowded into one article, then write two, or three, or even half a dozen; in fact a series on this subject would be particularly desirable. Don't hesitate to write because of inexperience in that line—a new writer sometimes turns out to be a treasure, while an old writer's articles may be "twice told tales." If you have had experience, or possess knowledge, the telling of which may help your brother bee-keepers, send in an article. If used, it will be paid for, generously. W. Z. Hutchinson, Flint, Mich.

## HAND-MADE SMOKERS

Extracts from Catalogs—1907:

Chas. Dadant & Son, Hsmiton, Ill.—This is the Smoker we recommend above all others.

G. B. Lewis Co., Watertown, Wis.—We have sold these Smokers for a good many years and never received a single complaint.

A. I. Root Co., Medina, Ohio.—The cone fits inside of the cup so that the liquid creosote runs down inside of the smoker.

All Bingham Smokers are stamped on the tin, "Patented 1878, 1892, and 1903," and have all the new improvements.

- Smoke Engine—largest smoker made.....\$1.50—4 inch stove
- Doctor—cheapest made to use.....1.10—3½ "
- Conqueror—right for most apiaries.....1.00—3 "
- Large—lasts longer than any other......90—2½ "
- Little Wonder—as its name implies......65—2 "

The above prices deliver Smoker at your post-office free. We send circular if requested.

Original Bingham & Hetherington Uncapping-Knife.

T. F. BINGHAM, Farwell, Mich.

Patented May 20, 1879. BEST ON EARTH.

**OPPORTUNITY KNOCKS AT YOUR DOOR NOW.** We are compelled to convert these books into money at once. To protect our interests as finance agents, we have assumed control and offer without reserve the remaining sets of the Publisher's latest and most important publication—"Library of Universal History," fifteen sumptuous volumes, over 5,000 pages, 100 specially engraved maps, 700 beautiful illustrations, copious marginal notes and chronological index. This is a new publication from cover to cover, prepared by a staff of the most famous historians of the world. Cost to produce nearly \$250,000.00. Positively the first edition printed from these new plates, made from type cast expressly for this work. Each volume is 2 inches thick, 7 inches wide and 10 inches high.

**Read Our Offer:** Beginning with the dawn of recorded thought and tracing the progress of mankind, these Sixty Centuries of Progress leads us step by step through Ancient, Mediaeval and Modern Times. In this great panorama we see the birth, growth and development, the decay and death of races and nations. The pure, simple and enchanting language used in depicting these great events makes this story of human progress more fascinating than fiction. Young folks will use this work and read it with delight, charmed by its splendid pictures and vivid style.

These 15 massive volumes shipped free

**Our Offer!** We send the books, complete set, 15 volumes, prepaid, to you at once for five days' free examination. If found satisfactory, send us 50 cents within five days and \$2 monthly for 10 months for Silk Cloth binding. (This is \$20.50 for the 15 volumes, while the publisher's price was \$45.00.) For 3-4 Red Morocco binding, send us 50 cents within five days and \$2.75 monthly for 10 months or a total of \$28. Publisher's price was \$60. If the library is not perfectly satisfactory after five days' examination in your own home, notify us and we will have it returned at our expense. You run no risk whatever, but act promptly as the sets are going fast. Cut out and mail the coupon herewith, or a copy of it now.

# SPECIAL CLUBBING AND PREMIUM OFFERS

In Connection With The

## AMERICAN BEE JOURNAL

Sample copies free, to help you interest your friends and get subscriptions. If you will send us names of your neighbors or friends we will mail them sample copies free. After they have received their copies, with a little talk you can get some to subscribe and so either get your own subscription free or receive some of the useful premiums below. They're worth getting. We give you a year's subscription free for sending us two new subscriptions at 50 cents each.

### BEE-KEEPERS' NOVELTY POCKET-KNIFE

Your name and address put on one side of the handle as shown in cut, and on the other side pictures of a queen-bee, a worker, and a drone. The handle is celluloid and transparent, through which is seen your name. If you lose this knife it can be returned to you, or serves to identify you if you happen to be injured fatally, or are unconscious. Cut is exact size. Be sure to write exact name and address. Knife delivered in two weeks. Price of knife alone, postpaid, \$1.25. With year's subscription, \$1.50. Free for 5 new 50c subscriptions.

### BEE-KEEPER'S GOLD-NIB FOUNTAIN PEN

A really good pen. As far as true usefulness goes it is equal to any of the higher-priced, much-advertised pens. If you pay more it's the name you're charged for. The Gold Nib is guaranteed 14 Karat gold, Iridium pointed. The holder is hard-rubber, handsomely finished. The cover fits snugly and can't slip off because it slightly wedges over the barrel at either end. This pen is non-leakable. It is very easily cleaned, the pen-point and feeder being quickly removed. The simple feeder gives a uniform supply of ink to the pen-point without dropping, blotting or spotting. Every bee-keeper ought to carry one in his vest-pocket. Comes in box with directions and filler. Each pen guaranteed. Here shown  $\frac{2}{3}$  actual size. Price alone, postpaid, \$1.25. With a year's subscription, \$1.50. Given free for 5 new subscriptions at 50 cents each.

### QUEEN-CLIPPING DEVICE

The Monette Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings. 4 1/2 inches high. It is used by many bee-keepers. Full printed directions sent with each one. Price alone, postpaid, 25 cents. With a year's subscription, 60 cents. Given free for 2 new subscriptions at 50 cents each.

### IDEAL HIVE-TOOL

A special tool invented by a Minnesota bee-keeper, a adapted for prying up supers and for general work around the apiary. Made of malleable iron, 8 1/4 inches long. The middle part is 1 1/16 inches wide and 7-32 thick. The smaller end is 1 7/8 inches long, 1-2 inch wide, and 7-32 thick, ending like a screw-driver. The larger end is wedge-shaped having a sharp, semi-circular edge, making it almost perfect for prying up covers, supers, etc., as it does not mar the wood. Dr. Miller, who has used it since 1903 says, January 7, 1907; "I think as much of the tool as ever." Price alone, postpaid, 25 cents. With a year's subscription, 60 cents. Given free for 2 new subscriptions at 50 cents each.

Exactly half actual size.

### PREMIUM QUEENS

These are untested, standard-bred, Italian Queens, reports of which have been highly satisfactory. They are active breeders, and produce good workers.

Sent only after May 1st. Orders booked any time for 1908 queens. Safe delivery guaranteed. Price, 75 cents each, 6 for \$4.00, or 12 for \$7.50. One queen with a year's subscription, \$1.00. Free for 3 new 50c. subscriptions.

### HUMOROUS BEE POST-CARDS

A "Teddy Bear" on good terms with everybody including the bees swarming out of the old-fashioned "skep." Size 3 1/2 x 5 1/2, printed in four colors. Blank space 1 1/2 x 3 inches is for writing. Prices—3, postpaid, 10 cents; 10 for 25 cents. Ten with a year's subscription, 60 cents. 6 given free for one 50-cent subscription.

### BOOKS FOR BEE-KEEPERS

**Forty Years Among the Bees**, by Dr. C. O. Miller.—34 pages, bound in handsome cloth, with gold letters and design, illustrated with 112 beautiful half-tone pictures, taken by Dr. Miller. It is a good, new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price alone, \$1.00. With a year's subscription, \$1.25. Given free for 4 new subscriptions at 50 cents each.

**Advanced Bee Culture**, by W. Z. Hutchinson.—The author is a practical and helpful writer. 330 pages; bound in cloth, beautifully illustrated. Price alone, \$1.20. With a year's subscription, \$1.45. Given free for 5 new subscriptions at 50 cents each.

**A B C of Bee Culture**, by A. I. & E. R. Root.—Over 500 pages describing everything pertaining to the care of honey-bees, 400 engravings. Bound in cloth, price alone, \$1.20. With a year's subscription, \$1.47. Given free for 5 new subscriptions at 50 cents each.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—How the very best queen-bees are reared. Bound in cloth and illustrated. Price alone, \$1.00. With a year's subscription, \$1.25. Given free for 4 new subscriptions at 50 cents each. In leatherette binding, price alone, 75 cents. With a year's subscription \$1.00. Given free for 3 new subscriptions at 50 cents each.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook.—This book is instructive, helpful, interesting, thoroughly practical and scientific. It also contains anatomy and physiology of bees. 544 pages, 295 illustrations. Bound in cloth, price alone, \$1.20. With a year's subscription, \$1.47. Given free for 5 new subscriptions at 50 cents each.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic has been entirely rewritten. Fully illustrated. No apian library is complete without this standard work by "The Father of American Bee Culture." 520 pages, bound in cloth. Price alone, \$1.20. With a year's subscription, \$1.45. Given free for 5 new subscriptions at 50 cents each.

**"The Honey-Money Stories"**—A 64-page booklet. Containing many short, bright stories interspersed with facts and interesting items about honey. The manufactured comb-honey misrepresentation is contradicted in two items each occupying a full page. Has 33 fine illustrations of apiaries or apian scenes. It also contains 3 bee-songs. This booklet should be placed in the hands of everybody not familiar with the food value of honey. The chief object is to interest people in honey as a daily table article. Price 25 cents. With a year's subscription, 60 cents. Given free for 1 new subscription, at 50 cents.

Three copies for 50 cents; or the 3 with a year's subscription 75 cents; or the 5 given free for 2 new subscriptions at 50 cents each.

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price alone, \$1.00. With a year's subscription, \$1.25. Given free for 4 new subscriptions at 50 cents each.

### THE EMERSON BINDER

A stiff board outside like a book-cover with cloth back. Will hold easily 3 volumes (36 numbers) of the American Bee Journal. Makes reference easy. Preserves copies from loss, dust and mutilation. Price postpaid, 75 cents. With a year's subscription \$1.00. Given free for 3 new subscriptions at 50 cents each.

### WOOD BINDER

Holds 3 volumes. Has wood back but no covers. Price postpaid, 20 cents. With a year's subscription 60 cents. Given free for 1 new subscription at 50 cents.

### BEE-HIVE CLOCK

A few of these handsome "bronze-metal" clocks left. Face 10 1/2 inches wide, by 9 1/2 inches high. Design is a straw skep with clock face in middle. Suitable for parlor—an ornament for any place. Keeps excellent time, durable and reliable. Weight, boxed, 4 pounds. You pay express charge. Price \$1.50. With a year's subscription, \$1.75. Given free for 6 new subscriptions at 50 cents each.

## Honey — Who Wants Honey?

We have just received several carloads of Water White Sage Honey—the finest that can be produced—put up in 60-pound cans, two to the case. Have also several cars of White Clover and Alfalfa Comb Honey. If in the market state quantity wanted and we will be pleased to quote you.

**C. H. W. WEBER** CINCINNATI OHIO

Office and Salesrooms, 2146-48 Central Ave. Warehouses, Freeman and Central Aves.

## Honey and Beeswax

**CHICAGO, Sept. 20.**—Receipts are light of honey of all kinds. No. 1 to fancy white clover comb brings 17 to 18c; the off grades 1 to 3c less. Amber, if not too dark, 14 to 15c. Buckwheat about same price when it sells. Extracted white clover, 8 to 9c, according to quality and style of package; amber grades 6 to 7c. Beeswax easier at 30c.

R. A. BURNETT & CO.

**INDIANAPOLIS, Sept. 16.**—Fancy white clover comb honey sells to the retail grocery trade in lots of 1 to 5 cases at 19 to 20c; No. 1 white clover comb 17 to 18c, actual net weight. White clover extracted in 5-gallon cans sells for 11 to 12c. The best demand here is for white clover honey, but a deluge of alfalfa honey is being sent to this market which sells for about 2c less than above quotations, and if the deluge continues a further break in prices may be expected. Beeswax offered freely, and sells at \$35 per 100 pounds.

WALTER S. POWDER.

**KANSAS CITY, Sept. 19.**—The receipts of honey are more liberal, but the prices remain about the same. We quote: No. 1 white comb honey, 24-section cases, \$3.50; amber, \$3.25; No. 2, \$3.00. Extracted, amber, 7½c; white, 8½c. Beeswax, 25 to 28c.

C. C. CLEMONS & CO.

**TOLEDO, Sept. 21.**—The market in comb honey has weakened some, as receipts are equal to demand. We quote: Fancy white comb, 17 to 18c; No. 1 white comb, 16 to 16½c. Extracted, in bbls., 7 to 7½c; amber, in bbls. and cans, 6 to 6½c. Beeswax, 26 to 28c. Owing to high prices honey is not moving rapidly.

THE GRIGGS BROS. & NICHOLS CO.

**CINCINNATI, Sept. 21.**—The market for honey here for white clover extracted is brisk, selling in 60 lb. cans at 10c; in barrels at 9c. No. white clover comb honey 17½ to 18c. Amber, extracted, 6 to 6 1-2c. Beeswax 32c.

C. H. W. WEBER.

**PHILADELPHIA, Sept. 21.**—The sales of honey have been quite active in this market during the past week. Bee-keepers seem to have a tendency to hold back their reports as well as their stock, and therefore those who are sending honey to market are getting good prices. Later on, when the early

demand is supplied, those shipping honey will be disappointed in not receiving better returns, as during September and October honey is higher than at any other time of the year. We quote: Fancy comb honey in this market, wholesale, 17 to 18c; No. 1 white, 15 to 16c; amber, 14c. Extracted honey, water white, 7 1-2 to 8c; amber, 6 1-2c; dark, 6c. Beeswax, 30c.

We are producers of honey, and do not handle on commission.

WM. A. SELSER.

**NEW YORK, Sept. 23.**—Comb honey—the demand is good, especially so for fancy and No. 1 white. As the season has been very late, arrivals have been slow, but quite fair lots are now coming into market. We quote fancy white at 16 to 17c; No. 1 at 15c; No. 2 at 13 to 14c. No price established as yet on buckwheat, nor has any arrived. Extracted also in good demand, with prices gradually stiffening up. Receipts are mostly from California, near-by, and West Indies. We quote California white sage at 9c, light amber at 8c, amber at 7c; white clover at 8 to 9c, amber at 7 to 7 1-2c per pound. Beeswax plentiful and somewhat off in price, selling at from 29 to 30c for choice stock.

HILDRETH & SEGELKEN.

**CINCINNATI, Sept. 20.**—Since our last quotation there is no material change in the honey market, with the exception that the demand is a little better. As yet prices have not reached that high point that many people believe they will. Received this week a car-load of white comb honey which we are selling at from 15 to 16c from the store. This was the first car out of Colorado, and naturally commanded attention, which brought many purchasers. Will have two or more cars to arrive which will more than satisfy the demand, and we look forward to lower prices. Extracted honey is moving as lively as can be expected at this season of the year. Quote white clover in barrels and cans at 7 to 9c, according to the quality; amber in barrels at 5½ to 7c. Choice yellow beeswax, free from dirt, 30c, and 28c for the darker grades.

THE FRED W. MUTH CO.

# American Bee Journal

PUBLISHED MONTHLY BY

**GEORGE W. YORK & COMPANY**

118 W. Jackson Blvd., Chicago, Ill.

### IMPORTANT NOTICE.

THE SUBSCRIPTION PRICE of this Journal is 50 cents a year, in the United States of America, (except Chicago, where it is 75 cents), and Mexico; in Canada 60 cents; and in all other countries in the Postal Union, 25 cents a year extra for postage. Sample copy free.

THE WRAPPER-LABEL DATE indicates the end of the month to which your subscription is paid. For instance, "dec07" on your label shows that it is paid to the end of December, 1907.

SUBSCRIPTION RECEIPTS.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows that the money has been received and credited.

Advertising Rate, per Agate Line, 15c.

14 lines make an inch.

Nothing less than 4 lines accepted.

#### DISCOUNTS:

3 times 14c a line      9 times 11c a line

6 " 12c " "      12 " (1 yr.) 10c a line

Reading Notices, 25 cents, count line.

Goes to press the 6th of each month.

## National Bee-Keepers' Association

Objects of the Association.

- 1st.—To promote the interests of its members.
- 2d.—To protect and defend its members in their lawful rights.
- 3d.—To enforce laws against the adulteration of honey.

Annual Membership Dues, \$1.00.

General Manager and Treasurer—

N. E. FRANCE, Platteville, Wis.

If more convenient, Dues may be sent to the publishers of the American Bee Journal.

## Fashion Book Free!

I want to send you my handsome new book showing over 400 of the latest styles with illustrated lessons on cutting and dressmaking. I will agree to sell you all the patterns you want for 5 cents each. They are the same patterns you have always paid 10c and 15c for at the stores, made by the same people, and correct in every detail.

#### HOW I DO IT.

I publish *The Home Instructor*, an illustrated woman's magazine and I want your name on my subscription list. *The Home Instructor* is bright, entertaining, clean and instructive—just the sort of a paper you should have in your home. It has departments for every feature of home life, and prints the choicest fiction every month.

Every issue has several pages devoted to the latest fashions, fully illustrated.

### My Special Offer.

Send me 25 cents and I will send you *The Home Instructor* for two years and I will send my big fashion book to you free. I will also agree to sell you any pattern you want thereafter for 5 cts. I can sell them for 5 cents because I buy them by the thousand and don't make any profit. I don't want the profit, I want your subscription to *The Home Instructor*. You will save many times the cost of my offer in a year. Write to-day. A. OTIS ARNOLD, Dept Quincy, Ill.

## AUTOLOGY

Autology is no theory, no fad, no creed. That you may know and see for yourself, I will send you, postpaid, free, my "Guide to Autology."

J. F. BUCHMAYER, Iowa City, Iowa.

Mention Bee Journal when writing.

Cows' Relief is a specific Remedy for all troubles of bag and teats. It enables dairymen, farmers and other cow owners to keep their cows in a healthy and profitable condition.

Cows' Relief is one of the most perfectly penetrating and disinfecting compounds in existence. It goes directly to the seat of the trouble, relieves the congestion and breaks up the bunches that prevent a natural flow of milk.

Twelve to twenty-four hours' time is all that is required to relieve any case of Caked Bag, if applied freely at the beginning of the trouble.

**FOR HEIFERS WITH FIRST CALF**

Cows' Relief works in a most pleasing, prompt and successful manner. It relieves the soreness and swelling in the bag and is worth its weight in gold to every dairyman. It keeps the teats soft and flexible, and renders the animal quiet and docile.

H. C. Rice, Farmington, Conn., says: "Please send me two boxes of Cows' Relief. Enclosed find check for same. Please send at once. I wouldn't be without it in my stable." L. F. Cuthbert, Hammond, N. Y., says: "I have used your Cows' Relief and find it a very valuable remedy for Caked Bag."

We have scores of testimonials like the above. Ask your dealer for Cows' Relief and insist on having the genuine. If he cannot supply you write direct to us, enclosing \$1 for large package prepaid, (enough for four or five ordinary cases). Your money back if you are not satisfied. Positive guarantee on every package. Or send your name and one neighbor's who keeps cows, stating how many you each have, and we will send our book concerning "Cow Troubles," also Goldine Cow Watch Charm FREE while they last.

ESTIMATES FURNISHED ON APPLICATION

Freeport, Ill., June 11, 1907.

The A. I. Root Co.,  
Medina, O.

Gentlemen:

I received five of your AE52S-10 hives yesterday and find that I cannot make my own hives and supplies as cheap as yours and use the same quality of lumber. You can see by the head of this letter that if anyone can make hives cheaper than your prices or any of the so-called "trust hive" manufacturers, I ought to be able to do it, but using the same quality of lumber I cannot.

Yours very truly,

(Signed) John H. Bamberger.

 The above is a representative letter from the many we have to the effect that our hives and other supplies can be purchased cheaper than a local mill can possibly make them. Our enormous output enables us to reduce the cost to the minimum without sacrificing quality.

## Editorial Notes and Comments

### The Harrisburg National Convention

It was held on Oct. 30 and 31 as per announcement. There were about 100 present, perhaps the smallest meeting in many years. This may be accounted for by reason of the discouraging honey season this year.

In the main the Harrisburg meeting was a very good one. Some excellent things were said and done, all of which will appear in the published report, which will probably be issued about December 1st.

There are now over 2500 members in the National Bee-Keepers' Association. There ought to be 25,000 at least. We wish that all of our readers were members. The annual dues are only \$1.00, and just one of the papers read at the Harrisburg meeting is worth many dollars to any bee-keeper who wishes to make something out of his bees. In fact, one of the leading members present said it would have been worth \$200 to him had he been able to hear such a paper when he began with bees. It pays to know the best there is to be known, if one would succeed in any business. And bee-keeping is no exception.

At the evening session on Wednesday, Oct. 30th, General Manager N. E. France was presented with a beautiful gold watch and chain, which had been purchased with money contributed by many members, in amounts of 10 cents to \$5 each. It was a worthy tribute to a worthy and self-sacrificing man. As there was more than needed to pay for the watch and chain, a dozen silver teaspoons were bought and sent to Mrs. France, who so devotedly has stood back of Mr. France these many years, and thus has helped him do things for bee-keepers more successfully than

probably he otherwise could have done. These presentations were made in most appropriate words, by Mr. Hutchinson, and so touched the heart of the General Manager that it was not until the following morning that he was able to express his gratitude audibly.

We hope that all of our readers who are not already members of the National will each send \$1.00 at once, to N. E. France, Platteville, Wis., and thus be in line not only for a copy of the next annual report, but also for the other benefits to be derived from membership in the largest and best organization of bee-keepers in America.

### Flouring Bees When Uniting

The British Bee Journal speaks very approvingly of dusting bees with flour when uniting late in the season. This plan has been before the public for some years, but never seems to have been practised much in this country, although perhaps no one has reported adversely as to its use. Sometimes things go by fashion—perhaps too much so.

### Selecting the Best Queen

In keeping tally of the yield of different colonies so as to select best queens from which to breed, one trouble is that when by any means the queen of a colony is changed during the season it is hard to say what portion of the yield is to be credited to each queen. If the second queen comes in not more than a month before the close of the harvest, of course her workers have nothing to do with the season's storing. Close observation will perhaps show that in any case the second queen has less to do than

might be supposed with the amount stored. Take a colony of best characters as storers, and another of the poorest, in a white clover region, and exchange queens before the beginning of the harvest, but after the colonies are brought up to full strength, and see if the result is not much the same as if no such exchange had been made.

There is a field here for exact observations by careful observers.

### Is Foul Brood Honey Fit for Table?

In reply to this question, the British Bee Journal, page 357, says:

"No, it is not fit for human food unless boiled, to destroy all the germs."

It has generally been held (has it not?) that no harm would result to the human family from eating honey stored by a foul-broody colony. Of course, one would not think honey thrown out of combs containing decayed larvae would be fit for table use, but would it be any fitter for boiling? Is there any proof that germs of foul brood in honey otherwise unobjectionable is injurious to the human stomach? Possibly the generally accepted view on this subject needs revising. Can Mr. McEvoy tell us anything about it?

### Some Misunderstandings About Italians

In the American Bee Journal for 1906, page 862, the question was raised, "What is a tested Italian queen?" To the statement there made, "Subscriber" took exception, in the Journal for 1907, page 138. The position of "Subscriber" was objected to by Mr. Doolittle, page 259; by Mr. Anderson, page 266; and by Dr. Miller, page 318.

In proof of his position, "Subscriber" has sent to this office specimens of his drones, and says he has thousands like them, and has queens whose workers have abdomens that are yellow to the tip. The drones are what would be easily called solid yellow, and one of the veterans to whom they were shown, said, "I think I never saw drones quite so yellow; and it must be a beautiful sight to see a large number of them in flight, with workers to correspond."

The whole trouble lies in the fact that

"Subscriber" is talking about one thing, and the other gentlemen about another; "Subscriber" referring to Italians brought to perfection in the matter of color, as in his own apiary, and the others to Italians as they are imported from Italy. Certainly there can be no question that Italians as first imported were entitled to be called pure Italians, if any Italians can be called "pure," and it can hardly be claimed that the standard has changed. As to whether bees so modified in appearance as are the all-over-goldens should also be called pure Italians, opinions may differ. Some would probably call them modified Italians, and their greatest admirers seem to put them in a separate class by calling them "goldens"—a term not applied to pure Italians as imported from their native land.

### Superseding Queens

The question as to renewing queens is one upon which there is a wide difference of opinion. What may be best for one may not be best for another. One may think it best to take the matter in his own hands and each year replace his queens with young queens of the current year's rearing as early as such queens can be reared or bought. He may thus have a pretty strong guarantee against all swarming. Another may think it best to leave the matter of superseding entirely in the hands of the bees. He will tell you that his queens are generally superseded before they are too old for good service, and the few which are left till too old will cause him less loss than it would cost him to replace his queens regularly at a certain age.

For many—perhaps for the great majority—a combination of the two plans is best. Let close watch be kept as to what is being done by each colony; if very poor work is done, by any particular colony, replace the queen just as soon as convenient, whether the queen be old or young. Some queens less than a year old are poor, and a very poor queen may be superseded by the bees when only a few weeks old. But even if the bees promptly supersede a young queen that is poor, her royal progeny will be also.

Now is the time of year to figure up on the work of each colony. Those which, having had a good chance, have yielded less than the average, should be marked for renewal as early as profitable next season. This constant weeding out of poor queens is important, as well as breeding from the best. You may breed from the best with all the care you please, if you do not weed out poor queens you stand a chance of having the drones of these poor queens mate with your young queens.

### Does the Bee Start the Flow of Nectar?

A member of the American Bee Journal family challenges the statement of Prof. Tanzer in the first full paragraph on page 688, and asks whether there is any proof for the statement that the first bee that visits a flower gets no nectar, but merely starts business for the rest.

Whether one knows exactly the truth about such things or not may make no difference in the number of pounds of honey secured in a season, yet the more fully we are informed as to all that goes on in matters pertaining to the realm of beedom, the more enjoyment we may have in the pursuit of our vocation. And surely it is better to have the dollars plus the enjoyment than it is to have merely all the dollars that can be had out of the business. Sometimes, too, it happens that matters that seem to have no connection whatever with the practical side of bee-keeping have yet a very important bearing; although that bearing may be very indirect.

Ignorance must be frankly admitted as to whether or no there is good ground for the statement in question. If any one before has said anything of the kind, it has certainly not come very prominently into public notice. Cheshire goes into such subjects more fully than most writers on bee-keeping matters, and he says nothing of the kind. Does any one of our bee-books give anything corroborative? If what Prof. Tanzer says are facts, they are most surely interesting facts, and is it not strange that others should not mention them?

It will doubtless occur to many that in the hot-house, in the middle of winter, an abundant secretion of nectar may be found on some flowers, and in this case no first visit of a bee could be effective.

But we are open to conviction, for many a truth has been brought to light that was not in accord with previously accepted views. Our columns are open for any light that may be given, and perhaps Prof. Tanzer himself will be willing to contribute thereto.

### Value of Honey as Food

The following note is brought out by the article on page 689:

"MR. EDITOR:—I wish you would look carefully over what Dr. Eaton says, page 691, and then give us the benefit of an editorial opinion as to which is right, Prof. Tanzer or Dr. Eaton."

That is asking a good deal, is it not, for one of the laity to decide in a case where two men with handles to their names differ? But a cat may look at a king, and there may be no harm in saying just how the case looks to an outsider.

Dr. Eaton says: "I am inclined to doubt scientific basis for the statement that certain foods build up the higher faculties." Prof. Tanzer speaks of "the assimilation of foods which reaches out to the building up of the higher faculties." If by that Prof. Tanzer means that so many grams of a certain food will produce so many impulses of love to the neighbor, and that certain grams of another food will produce so many tenths of a grouch, then it may be left to the propounder of such a theory to defend it. But is that necessarily the interpretation of Prof. Tanzer's words? We all know that a man suffering from a fit of indigestion is more likely to give way to a fit of ill temper than one whose digestion is perfect, and so in this case there is relation between the

assimilation of food and the higher faculties. May not Prof. Tanzer have had in mind some such thought as this? And is it not true that with perfect digestion and assimilation the faculties of the mind are more likely to be in good trim than when something goes wrong in the digestive tract?

Dr. Eaton also doubts scientific basis for the statement that "it is advisable to eschew eggs and milk because the flesh of the animals which furnish them is used for food." In reading what Prof. Tanzer says in the last columns on page 689, it did not occur to the present writer that eating the flesh of beef and poultry was given as a reason why eggs and milk should be eschewed. Indeed, it did not at all occur that Prof. Tanzer meant to advise against eating eggs and milk. He would hardly advise such an astounding thing as cutting milk out of the dietary of a babe at its mother's breast. What probably will be understood by most readers as Prof. Tanzer's meaning is something like this: "We do not eat the flesh of the insect that produces the honey, neither should we eat the flesh of the cow that produces the milk, nor of the hen that produces the egg."

As to the constituent parts of honey, there is no small difference in different analyses, owing to differences in different samples of honey, and perhaps for other reasons as well. That is a matter for analysts to determine. Prof. Tanzer has plenty of company in believing that honey contains formic acid; indeed, that is the general belief; but the proof of its presence may not be sufficient to satisfy Dr. Eaton's mind.

As to Dr. Eaton's last paragraph, there is probably no difference of opinion between the two writers. A stick of firewood may contain many calories of heat, but a stick of firewood is hardly a proper article of food.

### Books for Bee-Keepers

Every bee-keeper should have a bee-book besides a bee-paper. On another page will be found all the best books offered—either at a price, postpaid, or as a premium. If you can not earn them as premiums for getting new subscriptions, it will pay you well to purchase one or more of them. You will find them of great value. There are so many things in the books that are needful to know, and that of course could not be told over and over again in the bee-papers. If a bee-keeper can afford only one, it would better be the book rather than the paper. But now that the American Bee Journal is only 50 cents a year, of course, no bee-keeper, however limited his apiary may be, can afford to be without its monthly visits.

### Color of Raspberry Honey

E. D. Townsend says in the Bee-Keepers' Review that the view entertained by some that raspberry honey is amber is incorrect, at least as applies to the raspberry honey obtained on the sandy loam of Northern Michigan. It is so light in color that it may easily be mistaken for white-clover honey.

## Miscellaneous News - Items

### Editor E. R. Root's Operation

In the issue of *Gleanings in Bee Culture* for October 15th, appeared the following concerning the ill-health of Editor E. R. Root:

"The editor has been temporarily away from the scene of action. On returning from a trip to the Jamestown Exposition he was taken with a severe attack of what proved to be appendicitis. Since he had suffered from many lighter attacks before, an operation was considered necessary. He is now almost well again, however, and has returned to his work with renewed vigor. A part of the editorial work for this issue was dictated from his bed in the hospital."

We are glad to know that Mr. Root is getting along all right after his operation. We can fully sympathize with any one who has to be detained from his work through sickness.

### Rio Grande Bee-Keeping

This office is in receipt of Bulletin No. 1, *Riagrandenser Bienenzucht*—a pamphlet of 51 pages, written by Emil Schenk, and gratuitously published in the German language by the government of Rio do Sul, a State in southern Brazil. Mr. Schenk has done much for bee-keeping in Brazil, and on his return from a visit to Germany last year took back to South America some Italian bees to be cultivated there. The pamphlet gives up-to-date bee-keeping as practised in Germany, largely, modified to some extent by Mr. Schenk's own practise.

### Why Honey should be High in Price

Prof. A. J. Cook, of California, writing us, Oct. 12, 1907, had this to say concerning the prospect for increased prices for honey:

EDITOR YORK:—There are two reasons for expecting a high price for honey this season:

First, because of the cold, backward season last summer, there was a small product, and this was true so far as I can learn the country over.

For a like reason, there was a very meager fruit crop. People will have some sort of a relish and need it, as food that is tasteless fails to do us the good that we need. There will be so little fruit, and that little will be held at such a high price, that we may expect other relishes will be in great demand.

Thus we may expect a much greater call for honey than is usual, and it is not presuming to expect a very high price for our product. A. J. Cook.

Referring to the present season in California, Prof. Cook wrote thus on Sept. 28:

EDITOR YORK:—We find that the present season in California has been, on the whole, a disappointment. Like the preceding one, there was plenty of rain, and the prospects for a great honey-year were exceptionally good. Yet, like the year before, the spring was very cool and damp, which, though it gave us a very comfortable season, yet the plants failed to secrete nectar, and the bees refused to fly forth to gather. Yet in many localities a third or half a crop was secured, and the honey is very fine in quality.

The requisites for a good honey-year are abundant rains, much warmth and sunshine, and a dearth of raw, chilling winds during the season of honey-flow.

A. J. Cook.

### The Chicago-Northwestern Convention

This is to be held in Chicago on Wednesday and Thursday, Dec. 4 and 5, 1907. There are those who say they prefer this meeting to the National. At any rate the Chicago-Northwestern is well worth attending, if we do say it "who hadn't ought to," as Samantha Allen often says in her books.

We hope there may be a very large gathering this year. It comes during the annual Live Stock Exposition held here in Chicago, which always insures low railroad fares. It is expected that a number of the leading bee-keepers of America will be present to help make this meeting of the Chicago-Northwestern "a hummer." Better come along, and not only get something valuable, but if possible contribute to the success of the meeting.

Secretary Moore sends us this notice for publication:

PARK RIDGE, ILL., Nov. 1, 1907.

The regular annual convention of the Chicago-Northwestern Bee-keepers' Association will be held at the Briggs House, corner of Randolph St. and Fifth Ave., Chicago, Ill., on Wednesday and Thursday, Dec. 4 and 5, 1907. The first session will be held at 10 a. m., on Dec. 4.

The Question-Box will occupy "the center of the stage," as usual.

Dr. C. C. Miller, Dr. G. Bohrer, of Kansas, N. E. France, R. L. Taylor, E. T. Abbott, W. M. Whitney, C. P. Dadant, and W. Z. Hutchinson are expected to be present.

There will no doubt be a good attendance, as many come to Chicago to attend the National Fat Stock Show, held at the same time (Nov. 30 to Dec. 7). Cheap rates at the usual schedules

are the rule at that time on all railroads. See newspapers for details.

Everybody come and bring "Mrs." and "Miss" with you.

HERMAN F. MOORE, Sec.

### Bees Increase Church Fund

The Philadelphia Press contained the following recently:

BURLINGTON, N. J., Oct. 5.—Not only did bees, which have built an immense hive in the steeple of the First Baptist Church, set an example of thrift which members will emulate in building a new house of worship, but the busy little workers have stored up a ton or more of fine honey, it is said, the sale of which will contribute some toward the proposed edifice. In fact, the trustees are counting upon the "bee fund" in the raising of \$40,000 needed for the building of a new church, \$15,000 of which has already been subscribed.

### Dr. Miller's Report for 1907

The spring of 1907 opened up one of the most discouraging I ever knew. Had it not been for a good lot of extra combs of sealed honey, my bees would have been in very poor condition; but having abundance of stores, the colonies built up and continued populous in spite of adverse weather. When clover opened in bloom I expected to see an agreeable change, but although there was plenty of bloom the bees did not tumble over each other in bringing in their loads of honey, and I can not say for sure that they got to amount to anything from clover throughout the entire season. I should have said, however, that dandelions seemed to do their full duty, which at least helped to get the colonies in fine condition.

June 28 the bees began to get more than enough for their daily needs, and honey shook out of the brood-combs. More or less surplus was stored up to July 21, when the bees took a recess, beginning again August 10, and continuing until Sept. 20, some of the time storing slowly, and at other times rapidly. I think the most of the surplus was from heartsease, but I don't know. One thing that makes me uncertain is that I have always supposed that heartsease honey was a pronounced amber, but nearly all of mine was very light, indeed whiter than white clover. The flavor was good.

The sum total for the season was 7920 sections from 120 colonies, or 66 sections per colony. That would make something more than 60 pounds to the colony.

All things considered, I don't feel like complaining. C. C. MILLER.

### The Illinois State Convention

Secretary Jas. A. Stone has sent in the following notice of the next annual meeting of the Illinois State Bee-keepers:

Rt. 4, SPRINGFIELD, ILL., Oct. 29, 1907.

The seventeenth annual meeting of the Illinois State Bee-keepers' Association will be held at the State House,

on Tuesday and Wednesday, Nov. 19 and 20, 1907.

We expect to have one of our best meetings, as we have the assurance of the presence of Dr. C. C. Miller, of Marengo; C. P. Dadant, of Hamilton; Geo. W. York, Editor of the American Bee Journal; and N. A. Kluck, of the Northern Illinois and Southern Wisconsin Bee-Keepers' Association. If no others than those named were present there surely would be a good meeting. But with the largest association (aside from the National) that there is in the United States, we expect a good meeting, which everyone will enjoy in a measure equal to the efforts each puts forth. Railroad fare now being 2 cents per mile, is equivalent to one and one-third fare last year. So that railroad rates are settled.

As to entertainment, good beds in private families can be had at 50 cents, and meals can be gotten at restaurants from 15 cents up. No one can have a cheaper or better outing than this, and also have the opportunity of shaking the hands of brother and sister bee-keepers. If you refuse to have a good time, don't come! JAS. A. STONE, Sec.

### Prof. H. A. Surface for Director

At the recent meeting of the Pennsylvania State Bee-Keepers' Association, Prof. H. A. Surface, ex-president of that excellent organization, was unanimously endorsed as a candidate for director of the National Association. The election will be held this month. Pennsylvania is one of the States having a very large membership, so they feel that they are entitled to one of the twelve directors, at least.

Prof. Surface is an exceedingly valuable man to bee-keeping, and is doing all he can to develop it in his own State. He is a born investigator in the realm of Nature, and is bound to make himself felt more and more along the line of the honey-bee.

### More Bee-and-Honey Nonsense

Mr. C. G. Chevalier, of Maryland, frequently sends us items of interest, and among several sent the past month is the following which is about as wild as anything we ever read on bees and honey:

#### BEE-HASH HONEY.

"What is heralded as the greatest discovery of modern times has just been made here by Prof. Granville Hitchings Smith, of the Lausanne Polytechnic Institute, viz., the manufacture of pure honey on a large scale by improving on nature's methods, says the Lausanne correspondent of the Chicago Inter Ocean.

"It is well known that Swiss honey is the most delicious in the world for the reason that the 'flora' of its mountains is the most varied and extensive of any on earth. The reader will please remember that the 'little honey bee' never gathers honey from flowers or anything else, but simply a sweet substance which it takes into its stomach, and which by the time it reaches its hive becomes by some unknown chem-

ical process what is called honey, and is there ejected by the bee from its stomach into the comb.

"The great discovery made by the Professor is in producing it in immense quantities by mechanical means and at a low price, probably not more than two cents a pound. Factories will be established at once on the same plan as butter and cheese plants, as the process is being patented in all countries and is simplicity itself.

"Clover, wild flowers, cornstalks, beets, watermelons, dates, etc.—in fact, any substance containing saccharine matter—can be brought to the factories and crushed between porcelain-covered rollers, the juice running into tanks, where it is mixed with a small proportion of the bee ferment, or 'sachrogen,' as the discoverer calls it.

"This queer substance is not only in the bee's stomach, but permeates its entire internal economy; therefore it has been found best in practice to cut up the bees in a kind of sausage chopper (they first having been chloroformed to prevent useless pain) and then the hash-like material is pressed through a colander and a tablespoonful of the liquid is mixed with five gallons of the saccharine juice, which after a few minutes is transformed into the purest and most delicious honey imaginable."

### Child and "Seated" Swarm

Mrs. A. L. Amos, of Comstock, Nebr., sent us the picture shown herewith, representing one of her children with a swarm of bees. The child is eating

bread, but seems not to be at all uneasy although there are so many bees so near her. The swarm is on the seat of a riding plow. It was fortunate that Mrs. Amos had her camera in working order so that she could get such an interesting picture.

### World's Pure Food Show

Owing to the great success met by the management of the World's Pure Food show to be held in Chicago at the Coliseum this month, the time for the exposition has been extended. It will run from Nov. 16 to 23, instead of Nov. 19 to 25, as originally announced.

Managing director Thos. T. Hoyne announces that the contracts for building the booths and scenic work alone will involve an outlay of over \$29,000.

The Exposition is the most elaborate that has ever been planned for the Coliseum, and the promenade of all nations in itself will eclipse the Streets of Paris Show held in the Coliseum last winter. Over 3,000 incandescent lights will be used in the decoration scheme. This number does not include nearly a thousand which will stud a miniature Eiffel tower which will rise from four booths in the center of the building to the roof.

The color scheme for the booths will be uniform and worked out in gold and white. At each end of the building there will be an enormous sunburst and a huge wind-mill in action.

The management of the Exposition expects to handle from 150,000 to 200,000 spectators during the 8 days of the Exposition, and has provided sufficient aisle-space for this purpose.

During the Exposition lectures on cooking and other matters of utmost importance to the household, including demonstrations of simple tests of the purity of foods, will be given in the Coliseum Annex.

The National Bee-Keepers' Association will have an exhibit of honey that should help to increase the demand for this best-of-all sweets. Mr. France will be in charge, which fact will insure an attractive and satisfactory exhibit.

### Bees Race Pigeons

It is not generally known that bees are swifter in flight than pigeons—that is, for short distances. Some years ago a pigeon fancier of Hamme, Westphalia, laid a wager that a dozen bees liberated three miles from their hives would reach home in less time than a dozen pigeons. The competitors were given wing at Rybern, a village nearly a league from Hamme, and the first bee reached the hive a quarter of a minute in advance of the first pigeon. The bees were also slightly handicapped, having been rolled in flour before starting for the purpose of identification.—Reader Magazine.

### Worcester County Fair

The second annual Fair of the Worcester County Bee-Keepers' Association was held in Horticultural Hall, Worcester, Mass., on Sept. 13 and 14, 1907. The displays of honey-bees and bee-implements was well worth seeing. The purpose of the exhibition was three-fold: To bring together for display and competition the products of bee-keepers; to bring together for display and competition the products of manufacturers and tradesmen; and to educate the public.

The judges were J. E. Crane, of Middlebury, Vt.; H. S. Ferry, of Mt. Vernon, N. Y. These are the awards: Best 5 pounds comb honey, first prize, F. H. Drake; second, Miss Edith M. Rolston, a Worcester schoolteacher; third, C. S. Graham. Best crate comb honey, packed for market, T. J. Lobdell; best 2 frames comb honey for extracting, F. H. Drake; best display comb honey in general, first, T. J. Lobdell; second, F. H. Drake; third, J. S. Whittemore.

Best 5 pounds extracted honey in

glass—First, F. H. Drake; second, J. S. Whittemore; third, C. S. Graham.

Most attractive display extracted honey—First, J. S. Whittemore; second, F. H. Drake; third, C. S. Graham.

Photograph of swarm of bees—J. D. Richardson.

Photograph of New England apiary—First, C. H. Lothrop; second, F. H. Drake.

Beeswax—First, Mrs. E. W. Spaulding; second, C. S. Graham.

Best Italian bees—First, C. S. Blake; second, T. J. Lobdell.

Best Carniolans—C. S. Blake.

Scientific observation hive—A. C. Miller.

Best display of bees—First, C. S. Blake; second, T. J. Lobdell.

Queen-bees—W. W. Cary & Son.

Queen-rearing outfit—W. W. Cary & Son.

General display—W. W. Cary & Son.

On Friday afternoon, Prof. Brooks, of the Amherst Agricultural College, spoke upon the relation of the locality to bee-keeping, and also the relation of fertilizers to the products of the land, wherein it affects bee-keeping. He stated that a yearly application of basic slag meal and potash salts is the best fertilizer for the growing of white clover. Phosphoric acid and potash is also a good fertilizer for white clover. Alfalfa, which is a good honey-plant, will grow well where there is much lime in the soil.

Prof. Brooks was followed by Mr. J. E. Crane, of Vermont, the Institute speaker furnished by the Massachusetts State Board of Agriculture. He spoke in rather a general way in regard to the use of insects, and especially bees, in the fertilizing of flowers. He then began to give advice to bee-keepers, viz.: Do not invent a new bee-hive. Start with a few colonies and increase gradually. Don't take off the honey too early. If you intend to go into bee-keeping for the money in it, just advertise.

In the evening Mr. A. C. Miller spoke on the relation of the worker-bees to the queen, and also some problems in wintering.

Mr. H. H. Cary was the next speaker. He told of the different methods of queen-rearing, and then went into the care of the swarm in the spring. He advised requeening every fall, if possible, at least requeening every 2 years. The reason he advocated requeening in the fall rather than in the spring was, that in the fall there would be no loss of time or disturbance; and he had found from experience that the method of requeening in the fall brought the colonies out better in the spring than the other way.

On Saturday, at 12:30 p. m., a banquet was held which was attended by about 60 people. After the banquet the speaking was resumed. Hon. J. Lewis Ellsworth, Secretary of the State Board of Agriculture, spoke to the meeting, bringing the greetings of the State. The next speaker was Mr. Crane, who spoke upon the honey-yield in Vermont. This year he had harvested 20 tons of honey from 800 colonies of bees.

Mr. H. L. Jeffrey of Connecticut, was the next speaker. He outlined a plan

used by him for many years by which he was able to keep his stock of bees of the same strain, and same general qualities. It is hoped that his method will appear in these pages in the near future.

The last speaker of the day was Mr. Latham of Connecticut, who pleaded for

the old-fashioned box-hive for the use of the farmer.

The fair closed Saturday evening, and was so successful in the minds of those in charge that it is expected that the Association will continue to hold these fairs annually.

A. H. ESTABROOK.

### SALLIE WARD YORK

Back of every man who has done anything worth while for the public will generally be found a true woman, who, as his helpmeet, has stood by him through thick and thin, helping him over the hard places, and always cheering him on to better effort. She may not be known to the public, but quietly and unostentatiously her influence is constantly exerted, and many a man has been glad to acknowledge that for his success in life he was chiefly indebted to his wife.

Such a woman was Mrs. George W. York, who was carried to her last resting-place, October 16. It was my privilege to know her better than most of the members of the American Bee Journal family, and so it is but right that I should tell them a little about the one who for so many years was so strong a factor in making the Journal what it has been, and is.

As already intimated, her influence upon the paper was indirect, but not entirely so. On mailing days she came to the office for many a year and put her hand directly to the work so that the mailing would be on time; and thus more than once it was through her help that the American Bee Journal was able to maintain its right to be called "The Old Reliable."

Perhaps the most prominent characteristic in Mrs. York's personality was her unflinching devotion to her ideals of what she believed to be right and true, and her outspoken advocacy of them, even to the point of brusqueness, whatever consequences might follow. The minister who so feelingly spoke the last words over the body which lay in the church, embowered in beautiful flowers from so many sources, said, "We come to do honor to the memory of a fearless spirit." The words were well spoken. Hers was a spirit of fearlessness wherever there was any question of right to be done, or wrong to be overcome.

The Methodist church of Ravenswood (Chicago) is a heavy loser by her departure, for her activities were many. Especially may be mentioned her work as an uncompromising foe of the liquor-traffic, her work for the Wesley Hos-

pital in Chicago, and the Methodist Deaconess Orphanage at Lake Bluff, Ill.

For a full year she was confined to a sick-room, through all the weary months of pain and suffering making a brave fight against the enemy—valvular heart disease—always a losing battle, but always a cheerful one, and most of us thus shut up would have felt excused from the activities which had been so much at heart before, but not she.

Our hearts go out in sympathy to him who will nightly return from his toil to that home so lovely—and yet oh, so lonely—because she who was its light and life has gone to return no more. May the God of all comfort, support and sustain him in his sore bereavement.

Mrs. York was a good woman; those who knew her best loved her best; and I am glad to be permitted to lay my little leaf of laurel on the brow of one who was worthy.

C. C. MILLER.

Marengo, Ill.

The following sketch is taken from the Ravenswood Citizen—a newspaper published in the suburb where Mrs. York lived:

The death of Mrs. Sallie Ward York, wife of Mr. George W. York, occurred at the home, 2611 N. Ashland Ave., Monday, October 14, at 6:45 p. m. The funeral services were held at the Ravenswood Methodist Church, Wednesday afternoon, under the direction of Mrs. York's pastor, Rev. R. J. Wyckoff, assisted by Revs. Dan B. Brummitt and S. J. Herben, respectively assistant editor and editor of the Epworth Herald. Dr. Brummitt preached the funeral sermon in compliance with the request of the decedent. A quartet composed of Mr. Ernest O. Todd, Mrs. E. C. Carlson, Miss Frances Johnson, and Dr. H. C. Peisch, furnished the music for the occasion. The numerous floral pieces and largely attended services partly evidenced the high esteem in which Mrs. York was held. Every department of the church was represented in the floral offerings. A large clock with bands fixed at the hour of death (6:45) was the offering of the Official Board. Rose Hill was the place of interment.

The decedent was born near Harvard, Ill., and in 1875 moved to Wilmette, with her parents. On September 22, 1886, she was married to George W. York. Mr. and Mrs. York moved to the West Side of Chicago shortly after their marriage, and were both active workers in the Park Avenue M. E. Church, where Mrs. York had been the soprano soloist. A change of residence was then made and the Western Avenue Church became their church home, and here Mrs. York gave liberally of her splendid musical ability for the benefit of others. She had a full, rich soprano voice which had been trained to the nicest perfec-

tion under the tutelage of the best masters of music in Chicago.

In 1893, Mr. and Mrs. York moved to Ravenswood, and it is here that the loss of Mrs. York is most deeply mourned. No hand was more ready in giving, no voice more earnest in pleading for the poor and unfortunate, and no feet have been more willing to run upon errands of mercy and help. Her life typified the very highest ideals of Chris-

During her last illness Mrs. York was the means of raising \$118 for furnishing a room in the Harris Home for Nurses, used in connection with Wesley Hospital, and this room has recently been designated as the "Sallie York Memorial."

During the year of her sickness a record was kept of the number of calls made at the home, either to see Mrs. York or to enquire as to her condition, and the figures offer addi-

harm, and unless they have about 30 pounds of honey they ought to be fed. As you probably can not tell very well how much it takes in the frames to make 30 pounds, it might be safer to figure on 40.

It would be pretty late to feed syrup as thin as half-and-half as far north as here, but very likely it will be all right in your warmer latitude. Even if the bees do not get it properly evaporated and ripened, your bees have such frequent opportunities for flight that thin syrup will not do the harm it does where bees are confined to the hive for months at a time.

Are you sure you read straight about pollen not being allowed in the hive through the winter? If you did read anything of that kind you would better forget it. All bee-keepers have pollen in their hives over winter, probably, unless it be some one who is so unfortunate as to have bad honey in the hives, and even then he may not remove the pollen, but only the honey. Bees can winter without pollen, but they can not rear brood in the spring without it, and there is no way known of removing the pollen except removing entirely the combs containing it. Don't lose any sleep over pollen in your hives.

Some honey-dew seems to be all right, both for eating and as winter food for the bees, and some is bad for both uses, so bad indeed for wintering that it is little better than poison for that purpose, and in that case it should be extracted and the bees supplied with sugar syrup. Perhaps the wisest thing for you to do is to shut your eyes and sweetly trust that there is no such thing as honey-dew in your hives. Because it is not at all a common thing for bees to be troubled with it in winter, and because it is practically impossible to tell you how to recognize it. You might, however, inquire of some experienced bee-keeper in your vicinity, and find out whether he has had any trouble of the kind, and, if he has, perhaps he can furnish you a sample of the objectionable article.

SOME FLORAL TRIBUTES TO THE MEMORY OF MRS. YORK.

tian living. During a year of terrible suffering, from valvular heart disease, no murmur of complaint escaped her lips, and in the last moments of flickering life the beautiful transforming power of a mighty faith made her death a glorious triumph.

Mrs. York was an officer of several societies at the time she was taken sick, and was especially interested in the Lake Bluff Orphanage, Deaconess' Home, and Wesley Hospital.

tional evidence of her popularity. The total was over 1,800. Gifts of flowers were brought 200 times.

Mrs. York, with all her activities, was an ideal housekeeper. She loved her home, and in the 21 years of married life not a ripple of disagreement disturbed the calm serenity of a joyful Christian companionship which has been a delight and blessing to every one who came within its influence.

Conducted by EMMA M. WILSON, Marengo, Ill.

### Feeding Bees for Winter—Pollen in Combs

DEAR MISS WILSON:—In quest of information I begin by craving your indulgence upon the ignorance of a novice in bee-keeping. A month ago I came into possession of my first colony of bees—Italians. The bees cover 5 or 6 frames of a 10-frame hive, and as wet weather has prevented them from working, they probably have not more than 2 frames of sealed and unsealed honey throughout the hive. The weather has now cleared, and if we have our usual fall weather they should be able to collect a considerable quantity of nectar from the goldenrod, as late as December, or the middle of that month.

1. But should they not be fed? And is a syrup of equal parts of granulated sugar and water the proper food?

2. The bees are gathering large quantities of pollen, which my text-book warns me should not be allowed to remain in the hive during the winter, but says naught as to how to extract it. How shall I proceed?

3. The bee-papers caution one against allowing honey-dew to remain in the hive, but I do not know what it is, how to recognize it, nor how to remove it, and here again I ask your assistance.

October 15, 1907.                      LOUISIANA.

From what you say it is possible that the bees may gather enough to winter on, but it is a safer guess that they will not. Too much is not likely to do any

### Is it "Licking Good?"—A Curious Custom

A curious custom in many Slavonian regions is given in *Praktischer Wegweiser*, page 380. After a marriage the band of wedding guests proceeds to the house of the bride's parents. At the threshold the mother greets the pair, and gives to the bridegroom, as well as to the bride, a spoonful of honey in the open hand. The bridegroom must now from the hand of the bride, and she from the hand of her husband, lick the honey, and so show the most intimate communion and love.

### Hybrids vs. Italians—Depending Upon Bees

DEAR MISS WILSON:—Thank you, as well as Mr. Bevins, for your suggestions in regard to getting the Italian bees to work in the extracting snipers. The information may be of use to me at some future time if I ever keep Italians again

—and I don't think I ever will.

I did put a queen-excluder under the empty super of drawn combs, as I did not care to mix brood and honey when extracting, as one man I saw do. However, by putting the excluder under the super with only one frame of brood, the brood would be all hatched and gone before extracting the honey.

Instead of cutting off my Italian queen's head, she committed suicide, or left, and saved me the trouble. The hybrid queen-cell that I gave the colony hatched out finely, and has given me as large and populous a colony as the Italians were, and the queen is from the best hybrid stock I have. They have not had time to gather any surplus on account of the short, scarce honey crop and lateness in getting started. I am in hopes to see a marked improvement in the colony next year.

The bees have had a hard time of it around these parts this season. The late, cold spring and then the short crop have not made honey cheap this year. I have a little over 100 pounds from 4 colonies of hybrids, as my total crop. About half is comb honey and half extracted. In proportion to colonies kept, I have a larger crop than any one of the large or small bee-keepers around here, so it has not been my fault in handling the bees wrong that I have a short crop.

At our recent West Michigan State Fair was a man who has exhibited for a number of years and has always had tons of beautiful comb honey, and a large exhibit. This year his exhibit was of necessity small, and he lost many swarms in the spring. He makes bee-keeping make him a living, and it is harder on such a person to have no crop, you might say, than for a person who keeps bees only as a pastime.

However, Michigan produces her proportion of excellent honey, and generally an average crop. I do not know but that she is one of the first States in the production of honey, mainly on account of her large and famous fruit crops.

I see some of our Western "brothers" have had a good honey crop this year. Good for them! We have good crops here, too, generally.

Personally, I'll take Michigan for mine. You can do many things here that it is impossible to do where it is always monotonous summer, and a storm is welcome to break the monotony. (Miss) ELSIE A. CUTTER.

Grand Rapids, Mich.

In deciding between Italians and hybrids, you must not leave out of the account the possibility of very bad temper working into hybrids. It almost seems as if bad temper and good gathering qualities go together: at least they do sometimes. Dr. Miller and I are not entirely agreed. I would take the best gatherers, no matter how cross; but he says if he had it to do over again he would stick to the pure-bloods, selecting from them always the best. Perhaps if pains were taken always to kill promptly the queen of any colony appearing unusually vicious, there might be secured a strain of hybrids without the ill tem-

per. But not all Italians are entirely sweet-tempered.

Yes, it is harder on one who depends upon his bees for his bread and butter when a year of failure comes, than for one who has only a few colonies; but, on the other hand, when a good year comes the one with a lot of bees gets more out of it. Any one who embarks in bee-keeping as a business, should go into it with his eyes open, expecting bad years as well as good; and until he is so situated as to stand one or more years of failure, he should not think of making bee-keeping his sole business. I know at least one bee-keeper who, when a year of failure comes, takes the matter philosophically, appearing just as cheerful as if he had a crop, saying that a succession of successes and failures is the regular program to be expected, and why not accept one as well as the other?

### Honey-Brine

Boil 20 minutes: 20 quarts of water, 9 pounds salt, 8 pounds of honey, and 10 ounces of saltpeter. Let it cool, flavor with an infusion of 7 ounces of spices, and pour over the meat to preserve it.

By this procedure the meat is preserved many days without losing its taste and nutritive qualities.—L. Apiculture Nouvelle.

### Keeping Butter Under Honey

Butter can be kept all winter, according to a writer in L. Apiculture Nouvelle, page 231. The butter is packed in 1-pound or 2-pound glass jars, thoroughly worked, and everything scrupulously clean. Over the butter honey ready to granulate is poured to the depth of half an inch. Before the butter is put into the jar a small quantity of sulphur is burned in the jar to kill any germs.

### Illinois State Fair Exhibit

The following is the list of premiums awarded in the bee and honey depart-

ment of the Illinois State Fair, held recently at Springfield, Mr. F. Grabbe, of Libertyville, Ill., being the judge:

Display of comb honey—1st, Geo. M. Rumler, of Mohawk, Ind., \$20; 2d, Mr. and Mrs. A. Coppin, of Winona, Ill., \$15; 3d, Chas. Becker, of Pleasant Plains, Ill., \$10.

Collection of labeled cases of white honey from different flowers—1st, Mr. and Mrs. Coppin, \$8; 2d, Mr. Becker, \$5; 3d, Jas. A. Stone & Son, Route 4, Springfield, Ill., \$3.

Collection of labeled cases of amber or dark honey—1st, Mr. Becker, \$8; 2d, Mr. and Mrs. Coppin, \$5; 3d, Jas. A. Stone & Son, \$3.

Case of white clover comb honey—Mr. and Mrs. Coppin, \$4; 2d, Mr. Becker, \$3; 3d, Jas. A. Stone & Son, \$2.

Case of sweet clover comb honey—1st, Mr. Rumler, \$4; 2d, Mr. and Mrs. Coppin, \$3; 3d, Mr. Becker, \$2.

Case of basswood comb honey—1st, Mr. Rumler, \$4; 2d, Mr. Becker, \$3; 3d, Mr. and Mrs. Coppin, \$2.

Case of amber comb honey—1st, Stone & Son, \$4; 2d, Mr. and Mrs. Coppin, \$3; 3d, Mr. Becker, \$2.

Display of samples of extracted honey—1st, Mr. Becker, \$5; 2d, Stone & Son, \$3; 3d, Mr. and Mrs. Coppin, \$2.

Display of extracted honey—1st, Stone & Son, \$20; 2d, Mr. Becker, \$15; 3d, Mr. and Mrs. Coppin, \$10.

Honey extracting on the grounds—1st, Mr. and Mrs. Coppin, \$5; 2d, Stone & Son, \$3; 3d, Mr. Becker, \$2.

Frame of comb honey for extracting—1st, Mr. Becker, \$5; 2d, Mr. Rumler, \$3; 3d, Stone & Son, \$2.

Display of candied honey—1st, Stone & Son, \$20; 2d, Mr. Becker, \$15; 3d, Mr. and Mrs. Coppin, \$10.

Display of beeswax—1st, Mr. Becker, \$15; 2d, Stone & Son, \$10; 3d, Mr. Rumler, \$5.

Dark Italian bees—1st, Mr. and Mrs. Coppin, \$4; 2d, Mr. Becker, \$3; no other entry.

Golden Italian bees—1st, Mr. Becker, \$4; 2d, Mr. and Mrs. Coppin, \$3; 3d, Stone & Son, \$2.

Carniolan bees—1st, Mr. Rumler, \$4; 2d, Mr. and Mrs. Coppin, \$3; 3d, Mr. Becker, \$2.

Honey-vinegar—1st, Stone & Son, \$4; 2d, Mr. Becker, \$3; 3d, Mr. and Mrs. Coppin, \$2.

Designs in honey—1st, Mr. and Mrs. Coppin, \$15; 2d, Mr. Becker, \$12; 3d, Stone & Son, \$8.

Designs in beeswax—1st, Stone & Son, \$20; 2d, Mr. Becker, \$12; 3d, Mr. and Mrs. Coppin, \$8.

The Prairie Farmer reports that the show of honey at the Fair this year was finer than that of any preceding year. And that is saying a great deal, for we have seen a number of the former annual exhibits made in the bee and honey department of the Illinois State Fair, and they have always been exceptionally good.

### Odor of Bees as Means of Recognition Between Colonies

BY C. P. DADANT.

Do bees use the sense of smell in the recognition of one another? Has the odor of the queen anything to do with her acceptance or rejection when introduced by the apiarist? The affirmative

has generally been adopted by bee-keepers throughout the world. But some exceptions have been taken to this, and it is for the purpose of considering the matter broadly that this article has been prepared.

That bees have very efficient and acute organs of smell is not to be doubted. Their flight to the honey harvest is almost entirely guided by this organ. In

our gardens are many showy and fragrant blossoms which are never visited by bees, in spite of their looks and their sweet odor, because they lack the nectar-odor. When the fields are white with clover, the bees may remain idle because there is no nectar in the bloom. Evidently the odor of the nectar is missing. On the other hand, when nectar is to be had, they will readily discover the most humble flower hidden among the blades of grass, if only there is nectar in its corolla. Pollen attracts them in the same way, but with this substance there is less avidity, probably because it is found more readily. In a time of scarcity of harvest, when they gather propolis, they are often attracted by the smell of paint or varnish, which would not draw them at all, if there were honey in the fields.

Aside from smelling nectar in the blossoms at great distances, the bees have a wonderful ability for finding any substance which may be turned to account, especially when its smell is of a nature which renders it attractive. They will very promptly discover old combs that are left exposed, even if these combs are inside of a box or of a building. Only a couple years ago we had an instance of bees carrying away some honey contained in supers in our bee-house. The bees were first noticed against the west wall of the house, but no attention was paid to them, until it was found that the bee-house was full of them. They had traced the smell of the combs to the house, and it happened that a pile of the supers were close to that west wall. A very small crack in the boards behind a beam had been sufficient to afford them passage, but as the room was well lighted, and the small opening through which they entered was in a dark place, very few of the bees returned to the hive, but they flew to the window of the bee-house where they were found in large numbers. Instances have been given of their entering through a chimney, through the key-hole, to places where honey was stored and where their organs of smell detected it.

It is hardly worth while to insist on the matter, for everybody undoubtedly is ready to grant to them organs of smell equal to those of the best dogs.

Now, as to the odor of bees. The queen, the drones, the worker-bees, have each their particular odor. The odor of the drones was noticed by Swammerdam over 200 years ago. He called this peculiar odor "aura seminalis"—seminal effluvium. The queen has a sufficient odor to attract the drones when in flight, and Langstroth and Cheshire both thought that not only the sight of her, and the peculiar sound of her wings, but her odor as well, cause the drones to pursue her. The latter writer, in describing the numerous "smell hollows" in the antennæ of the drone, mentions "his quickness in discovering a mate, whose neighborhood is to him filled with irresistible odors."

The peculiar odor of the queen is, to my mind, that which makes her loss so very promptly discovered by the bees, when she is removed. This odor must be one of the ordinary smells of the hive, and its lack at once indicates that

she is missing. Otherwise, how could a hive of several tens of thousands of the little insects so promptly recognize her disappearance? Most of our leading apiarists know how quickly the bees find out their loss, when she is removed. The writer has often noticed it within the hour, though it sometimes takes longer. Their hurried and restless search quickly indicates the accident, and persons who are accustomed to this readily recognize the wonderful behavior of a colony that has just been made queenless. How, I repeat it, could a numerous colony be apprised of the loss of the queen, if it were not for the missing of her familiar odor which they evidently consider as one of the necessities of happiness? It is out of the question to suppose that the bees are constantly asking one another whether they have met the queen lately; and yet we all know that in a crowded hive, when all are busy, there must be thousands of bees that do not see the queen once a week, much less at all hours of the day.

Has the queen a very perceptible odor? No one who has ever handled fertile queens in his fingers would answer that question in the negative, for every man has certainly often noticed how eagerly worker-bees travel over your fingers and examine them after you have had the queen in your hand for a few seconds.

Do the worker-bees have an odor of their own? Does each colony have a smell peculiar to itself? Undoubtedly as much as each of us has a sufficient individual odor that a dog may follow us and find us, if he is of good scent, a half-hour after we have passed through a certain spot. Each colony has an odor of its own through the wonderful adaptability of nature which makes no two leaves alike, though there are billions of them in the woods. Two men might have nearly the same odor, so that a dog might make an error, but this would be accidental. In the same way, similar smells, that bees could not recognize apart, would be entirely accidental and probably very rare.

Aside from the great variety which is one of the rules of nature, there are many things which will cause a difference in smell from one colony to another—difference which is sometimes so plain that man, with his very imperfect organs of smell, will himself detect. The age of the combs, the quantity of honey in the hive, its quality, its origin, its ripeness, the quantity of pollen, its source, the number of worker-bees, of drones; the quantity of brood being hatched, the source of the propolis and its greater or less use by the colony; even the location of the hive, its proximity to the soil, or elevation in the air; the age and quality of the wood or other material of which the hive is made—all these, and more, have an influence on the individual smell of the hive.

If, then, each colony has its own peculiar odor, as discernible to the bees that inhabit it as the smell of his master's clothes is discernible to the well-trained dog, or as his mate's odor is discernible to the horse who recognizes it through a plank wall, why should we deny to the bees the capacity of rec-

ognizing one another by the smell? True, it often happens that the bees will accept of strange bees without a fight, or will permit a strange queen to enter the hive and perform her functions, or will accept of strange drones; but this does not deter from our position. Will not a dog sometimes welcome a total stranger? Will not a horse welcome another horse, while he will fight a third? Likes and dislikes, conditions of prosperity or suffering and want, disturbances which change conditions of life, all these things, or each of them, may cause them to change their behavior.

We all know that in times of prosperity, when honey flows freely, and all the bees come home laden, there is no difficulty in getting a colony to accept strangers, especially young bees. Does it follow that they do not know them to be strangers? A man who comes to us with a smile and a gift is much more likely to be welcome than the man who has a frown, or with a searching or furtive appearance, as if he were seeking for something to carry away.

When we want to unite colonies of bees we smoke them and try to disturb them greatly before uniting them. Their mutual misfortune, in this disturbance, acts upon them as such things act upon the human race. During a calamity such as a great fire—the San Francisco disaster, for instance—the bonds that unite the race become much stronger and we become more fraternal. So it is with animals. Two roosters that were fighting only a few moments ago have become great friends in the misfortune of being both threatened with the cook's butcher-knife.

I think I have said enough in the foregoing to make the fact clear, that in ordinary circumstances it is well to give bees a similar odor if we want them to live peaceably together when introducing queens or bees to strange colonies. But in times of good harvest almost any method will succeed.

Hamilton, Ill.

## Where Do the Bees Deposit Their Loads of Nectar?

BY ALLEN LATHAM.

On page 653, Mr. Doolittle offers us a very readable article relative to the brood-nest and freshly gathered nectar, and answers the question, "Where does the bee deposit its freshly gathered nectar?" Now, Mr. Doolittle has stated facts that are beyond dispute, and beyond misinterpretation, and what he has to say has been said better than I should have said it, but I am one who believes in reiteration. When I see a rather important fact noted and stated in our bee-papers, I feel moved to express approval when such approval lies within my province.

I had years ago settled to my own satisfaction this question of the disposition of the nectar, but did not till 2 and 3 years ago verify my conclusions by much observation. Like Mr. Doolittle, I have spent hours by the hive, and I can say with him that I have never yet seen a field-bee deposit a load of nec-

tar in a cell. But I beg of my readers to note that I say that I have never seen it, and that I do not state that it never occurs. I must believe that it does occur, for my friend, A. C. Miller, says that he has seen it. It simply has not been my good fortune ever to have seen field-bees deposit their loads in cells.

On the other hand, I have many times seen field-bees give over their loads to younger bees. Many a time have I seen the incoming bee, unmistakable because of its pollen-dusty back, scurry about and draw the attention of younger bees. These younger bees gather about the head of the field-bee while that bee causes the nectar to drop into its mouth and rest in the depression bounded by mouth and slightly relaxed tongue. In this case the tongue is not extended, but is folded back much as it naturally lies at rest. I have seen 3 young bees at once relieving a field-bee of her load.

If one desires to see how a bee offers its load he can do so in a variety of ways. Let him drop a strange bee with load of honey amongst the bees of a colony. Except for the cringing and fear this bee will give over its load much after the fashion of a field-bee. Again, take a loaded bee in the fingers and press the distended abdomen with thumb-nail. After a slight pause the bee will cause the honey or nectar to accumulate above the folded-under tongue.

Mr. Miller, who takes a diametrically opposite view from that of Mr. Doolittle, would have us believe that the field-bee never passes over its load to other bees, but rather always puts it into the cell. This is not the first time that the Miller strain of bee has acted in a different manner from the Doolittle strain. I have never as yet had a colony headed by a "Providence Queen," but have had many a colony headed by a "Doolittle Queen." This fact may account for my agreeing with Doolittle in this matter.

I know for an absolute certainty that field-bees give over their loads to the home-bees. I do not know by my own observation that they sometimes place it in the cells themselves. I have watched for them to do this, again and again, and have never seen it done, hence I naturally conclude that the rule (though it may not be one without an exception) is for the field-bee to hand its load over to the home-bee.

It is manifestly true that in a time of heavy flow the field-bees would bring home more than could be retained by the home-bees. Whether at such times the field-bees are obliged to place the honey in the cells themselves is a matter which I hope some time to settle to my own satisfaction. That thin nectar very quickly reaches the cells, even when there are many home-bees which are not loaded to repletion, has come under my observation. This points to an early unloading of the home-bee, or else to the placing of the nectar by the field-bee.

One thing is to be noted: In a time of heavy flow all the younger bees of the colony will be surcharged with honey which they are curing, while the field-bees will in most cases lie idle in nooks and corners of the hive.

Another thing is worthy of note: Before a honey-flow the colony will not seem to be so very populous, whereas after the flow opens the hive almost immediately becomes overflowing with bees. It is simply a case of not room for bees which are full of nectar, but ample room for lank bees. Two fat persons take up the room of three lean ones on the seat of the street-car. A colony with 5,000 fat bees will seem to the novice more populous than will one of 10,000 lean bees.

Whether the field-bee puts its load into the cell or hands it over to a younger bee is not in itself of vital importance, though there is a certain satisfaction in knowing the truth of the matter. Personally, I am inclined to think that, except in times of heavy flow, practically all is handed over to the home-bees; while under pressure the field-bee disposes of it in the quickest and easiest way she can find.

Norwich, Conn.

## Are a Queen's Drones Affected by Her Mating?

BY E. V. PAGAN.

On page 687, T. W. Livingston, with quite a flourish announces that he proposes to explode the theory that the drone progeny of a queen is unaffected by her mating, and calls upon all beekeepers interested to listen for the explosion. Others besides Mr. Livingston have discredited the theory, but perhaps none of them has ever been so cock-sure of his ability to disprove it.

Some very able men have accepted the theory and defended it. In the first volume of the *American Bee Journal*, published in 1861, appears on page 41 the following sentence, evidently from the pen of its first and ablest editor, Samuel Wagner:

"The concurrent testimony of all observers, whose reports we have, is that Italian queens, fecundated by common drones, do invariably produce Italian drones, as fully and perfectly marked as, and in no respect different from, the drones produced by Italian queens fecundated by drones of their own race, and that a corresponding result occurs in the case of common queens fecundated by Italian drones."

The ground for this belief lies in the fact that an egg which produces a drone is unfertilized, and so must take its characteristics entirely from the mother. It sometimes happens that a queen which has not met a drone proceeds to lay eggs, such eggs invariably producing drones. These drones certainly can not be affected by the mating of the mother, for the mother has not mated. The question is then asked, "Can the drone-eggs of a mated queen be any more affected than those of an unmated one, seeing that the eggs are no more fertilized in one case than the other?"

To this it is replied by those who hold the opposite view that the blood of the queen, in its circulation, is affected by the contents of her spermatheca, and thus the drone progeny is indirectly affected.

If this latter view be correct, it would be interesting to know to what extent this affecting goes. If only to an infinitesimal degree, it may not be worth considering, and this is the view that some take.

Mr. Livingston believes he has established his position because his queens were all the daughters of a pure Italian queen, and yet when queens were in turn reared from these daughters 90 per cent of them showed impurity in their worker progeny. One all-important item in the case is fatally absent. That item he should have given in some such words as these:

"I have the most indubitable proof that no colony containing any degree of black blood is located near enough to my apiary so that any of its drones could have met my queens." Without this his proof is no proof whatever.

In his closing paragraph he exhorts others to try the matter as he has done. How many bee-keepers are situated so they can try it, isolated from all black blood but that in their own apiaries? Is there one in a thousand?

## Mints—Irregular Flowers

BY PROF. A. J. COOK.

Those of us who live in Southern California, will, of course, be partial to the great Labiate family of plants, for here belong the incomparable honey-plants, the white and ball sages. It is doubtful if any honey-plants, the world over, excel these in the quality or amount of honey which is furnished. The honey is like that from the clovers, especially the white clover—very mild and pleasant, and so is enjoyed by all. Of course, one who has learned to like the pronounced flavor of linden may prefer that to any other, and those that have a hankering for the almost rank taste of buckwheat will pronounce the mild sage honey as tasteless and insipid; yet it is incontestable that the most people will enjoy these mild honeys more than any other, and when they are white as are the sage and clover honeys, they will always top the markets, in most of the marts of the world.

It will be noticed that the mints, or flowers of the great family Labiatae, are irregular, and so are like the flowers of the clover family—Leguminosae, and of the figwort family (the Scrophulariaceae). All such flowers have developed to effect cross-pollination, and we should expect that they would be honey-plants of no mean rank. The irregularity and the nectar-secretion are for the same purpose, and so we should expect they would always be companions, as they are. This mint family is well named "Labiatae," as this refers to the two-lipped arrangement of the flowers. These flowers, like the same in the figwort family, are decidedly bi-labiate. This interesting conformation is obviously for the purpose of ensuring cross-pollination, as was so admirably demonstrated by the great Charles Darwin. The flowers are on the plan of five, but the petals are so united that there are two pronounced lips, and these in

turn are lobed, one lip showing two lobes and the other three.

The stamens are as peculiar as are the petals, or showy parts of the flowers. Each filament bears at its end a longer or shorter sort of a balance pole, which is termed the connective, thus all is T-shaped; and at the ends of this are the anthers, that produce the pollen-grains. Often the ends of this connective are not equal, as noted in the white sage, and often one of the filaments is wanting. The arrangement of the stamens, the lips of the flower, and the stigma, are all such as to secure cross-pollination, and the great nectar-drop at the base of the bloom is to attract the bee, that she may not fail in her part of this important office.

All the mints are nectar-producing plants, and so are valuable honey-plants. The horsemint and the white and black or ball sage are among the most noted, as they are among the best. So far as I know, all the mints produce honey that is white, and of delicious flavor. In many places various of the mints are grown for commercial purposes, and in such cases are often plentiful enough to be of value to the bee-keeper. We all know the worth of motherwort and catnip, and wise is he who sees that these plants are thick in waste-places about his apiary. I know of no plant in the East that pays better for planting along railroads, etc., than does motherwort.

The white and ball sages of California are of great importance, as they both furnish honey that is very white, very delicious, and the quantity is often phenomenal. There is a good reason for this latter. The plants are of a kind that yield heavily, and besides, the blossoms on the ball sage, as the name indicates, come out in balls and open in successive periods, and so are in bloom a long time. The white sage is equally prolonged in its period of blooming. Here the flowers are in long racemes, and as the opening commences below and proceeds gradually to the tip, the time of bloom is very great. It is not uncommon to find flowers for the space of six weeks. Both of these plants usually commence to bloom in late May or early June, yet the time varies not a little. The period of bloom is still further lengthened by the locality of the plants. Often they are on the plains at or below the mouth of the canyon, and then extend up into the latter, and this still further prolongs the period of bloom.

It is not at all improbable that the value of the sages could be much increased by artificial means. At one of our farmer's institutes in San Diego, Mr. Harbison, of bee-keeping fame, stated that he had set the black sage at a great profit. There are acres and acres of land all along the mountains of Southern California, which can never be brought into profitable cultivation, as they are in old washes, and so are so stoney that to cultivate them would be quite impossible. These are often covered with sage. In many cases the sage is absent. I believe that it could be introduced in many places, and that in this way barren spots might become valuable.

Of late it is the practice to flood these wastes in winter by spreading the water from the mountain streams, so that what would be run off is thus conveyed into the great gravel reservoirs. This is a very wise thing to do, and will surely be practiced more and more, as water will greatly aid in clothing these waste places with these valuable honey-plants.

I believe that these sages can be immensely increased with a little labor, and thus bee-keeping and the general horticulture and agriculture of the section will be immensely increased. Agricultural and pomology need the bees to do the necessary work of pollination, while the sages will make the bees so profitable that they will be kept in great abundance, and thus a great double benefit will come as a result of this wise planting.

Claremont, Calif.

## Breeding of Bees—When Done

BY G. M. DOOLITTLE

There came in my multitudinous mail of a day or two ago, a letter with questions about bees. This is not peculiar, for I have spent much of my time for the past 30 years answering questions about bees and bee-keeping. But there was one question in this letter that was peculiar, and I am going to use it as a text to say a few words to the readers of the "Old Reliable," which means the American Bee Journal. The question reads as follows:

"Will you please answer through the American Bee Journal the following question: 'Where will bees hatch the soonest, in the cellar or out-of-doors? And which will be the best hatching, in February, March or April?'"

Before answering the above question I wish to say that from its wording, and the general tone of the other questions which the letter contains, I judge the questioner is a beginner in apiculture, and, if so, I desire to say a word to him, and also to all other beginners who have thought, or will think, of asking questions on bees.

The first thing to do in starting in the bee-business is to get one of the many good books on apiculture, all of which teach the first principles of our pursuit. Thoroughly read the book, for in it you will find the most of the questions answered which you will be likely to want to ask before you get past the rudiments of this branch of agriculture. This is a duty you not only owe to yourself, but one you owe to others as well. While I am, and have always been, willing to answer all questions which come to me, (having answered hundreds and thousands when the questioner felt too poor to enclose a stamp to pay the return postage), yet it is not fair to the older bee-keepers who are readers of the American Bee Journal, to have its columns filled up with questions and answers which are of such a primitive nature that they will be of no use or interest to the great majority. After you have thoroughly mastered all there is in any one of such books as "Langstroth on the Honey Bee," "Cook's Manual of the Apiary," "Quinby's New Bee-Keep-

ing," or "Root's A B C of Bee-Culture," then your questions will be such as will be of interest to all.

Hoping that the above will be taken only in the kindly spirit in which it has been given, I will offer a few of my thoughts and ideas on the queries above propounded.

First, then, we have, "Where will bees hatch the soonest, in the cellar or out-doors?" To this I will say, that, as a rule, bees commence to breed much the soonest out-doors, with the exception of where a very warm cellar is used, and in this case my experience says they are not likely to winter as well as they would where the cellar was cool enough so that the mercury stood at from 40 to 50 degrees therein. I know that there are advocates of warm cellars for wintering bees, but my experience with cellars where the mercury was likely to run above 50 degrees has been anything but a success.

To the second question, "Which will be the best hatching?" I will say, that here our questioner makes a mistake, for in the breeding of bees there are young bees in all stages of maturity, from the egg to the mature bee just ready to emerge, or already emerging from the cell; so that there is no regular hatching, as is the case with eggs incubated by the mother hen, or in an incubator; but young bees are emerging or "hatching," as our correspondent puts it, all the time for a period of nearly nine months, or from January till November, if out-doors; or from April to November if wintered in the cellar.

When the bees first commence to breed, but a few hundred eggs are laid by the queen or mother-bee, and as these eggs hatch into larvæ, more are laid, sparingly at first; but as the season advances, an increase in prolificness is the result, till in June the queen is laying at the rate of from 2,000 to 4,000 eggs daily, so that now the hive is soon populous with bees, resulting in swarming, unless the apiarist takes measures for the prevention of the same. As the season draws to a close, the queen restricts her egg-laying, so that in October few if any more eggs are laid than in February, hence the colony is kept only about so populous, during the three summer months.

Now about early breeding: The questioner conveys the idea through his questions that he thinks the earlier the bees breed the better. The time was when nearly all thought the same, but experience with many of us has proven that some of the old notions of the past were mistaken ones, for such early breeding results in the wearing out of two old bees to where one young one is produced, owing to the great strain on the vitality of the colony engaged therein, which strain is always required to produce the necessary degree of heat for brood-rearing in cool or cold weather; while if breeding can be delayed till settled warm weather comes, the old bees can then produce 3 or 4 young workers to where one of these old bees die off, and that with less strain on the colony than is required when the bees are kept confined to the hive by cold and unpropitious weather. The heat inside the cluster of a colony

of bees, which are wintering perfectly, with no brood, is about 65 degrees, while it takes at least 92 degrees to perfect brood, the usual brood-temperature being from 95 to 98 degrees. Therefore, in order to produce brood during February and March, together with very much of April, in this locality, the bees have to "burn" much honey in order to raise the temperature of the brood-nest the 30 degrees higher than is necessary when no breeding is being done.

Then, again, the bees which are reared during winter and early spring, beyond what are necessary to take the place of the old ones which die, are of no practical value, as they in turn die of old age before the season for the gathering of the surplus honey arrives; so that this early breeding means the wearing out of the old bees in any colony which goes to breeding early, the loss of a larger amount of stores which must be consumed to raise the heat inside the cluster 30 degrees higher than is needed for the best interests of that colony, together with the rearing of a lot of worker-bees which are of no practical value after they come on to the stage of action. For these reasons, as well as better wintering, the cellar is now preferred, in which to carry our bees through the winter in our cold climate, some bee-keepers even keeping them thus housed till into May.

Borodino, N. Y.

## Bee-Keeping in the West Indies

BY A. BUTSCHE.

Although an article from the West Indies is not very likely to interest the readers of GLEANINGS particularly, there are certain items which, thanks to our continued warm weather and long honey-flow, we can more easily test than can be done in colder climates.

We notice, for instance, that there are quite different opinions prevailing concerning the use of queen-excluders. Some, like Mr. Greiner, claim that excluders considerably interfere with the crop of honey; others find them useless, as their queens never lay in the supers. The only reason I can assign for the fact that some bee-keepers have no trouble with brood in the supers is that their colonies, on account of winter losses and short honey-seasons, are never really strong. Our colonies slacken brood-rearing in December and January. The result is that, during the logwood flow in February, they are not strong enough to rear brood in the supers, although they will draw combs and store honey in two or three full-depth supers at one time. But when we come to June and July, talk about queens not going into the supers! Have I not met them crawling over the top-bars of a fifth full-depth super with eggs and brood all the way down to the bottom-board? A man here, after using excluders for one season, would no more dream of keeping bees without them than of keeping bees in box hives. Talk about Mr. Green having from one to twelve queens trespassing in the supers! I'll bet my life that, if I were

to remove all my excluders, in less than three weeks there would not be a single broodless super in any of my apiaries.

Another item that interested me very much was the numerous hive-lifting devices brought out of late. I can see no earthly advantage in them in a country like this, where you can get a dozen iron-headed Congo niggers to carry you a house 15x20, three miles away, on their heads, for 10 shillings 6 pence. And then, what about the danger of one of those hive-lifting devices toppling over with five heavy full-depth supers hanging at the end of it? A man would be a fool if he ventured to set one of those engines agoing before making his testament. I think hive-lifting would just make matters worse. There are so many things already a poor fellow has got to hold with only two hands that I do not see how I could operate a hive-lifter unless it could be done with the teeth. If God in his wisdom had wished the generality of men to be bee-keepers, I should not be surprised if he had given us a third hand. He might even have judiciously added another pair of legs, especially if he had meant us to keep hybrids.

Bee-fever is a comparatively new malady here. The place was first infected when Mr. Morrison passed here lecturing on bees. I happened to be in New York at the time; but on my return, some months later, I unconsciously caught the disease by passing one day round the corner of the building in which Mr. Morrison had been lecturing.

Mr. Alexander's articles leave one simply dumbfounded. Several queens in one colony at the same time! I think it was a pretty well established custom in hive politics that, when one queen came to the throne, she invariably killed her sisters, and even mother, to reign undisturbed, exactly as a sultan of Turkey would strangle all his brothers at his advent in order to cut short all plotting to dethrone him. We all have been accustomed to look upon a hive as a perfect specimen of the most absolute monarchy. If Mr. Alexander goes on like that I should not be surprised if, one of these good days, all of us poor bee-keepers should wake up millionaires. He seems to be wielding the magic wand, for at each stroke there is something more extraordinary turning up.

How strange there should be at the present time so many bee-keepers with endless associations and publications, especially in France and Germany, where 20 years ago, one might have roamed about the country for months without ever stumbling over a hive! In all my wanderings I have met a hive but once before keeping bees myself. It was in Brittany (France), during the dreary years of my *ologies*, as Mr. Crane puts it. I think there were three or four straw hives near a big patch of buck-wheat. How it did us fellows good after pondering for months over the tedious works of Francis Bacon, Thomas Aquinas, and others, to get a lesson of more practical and more wholesome philosophy from a hive! I guess some of us preferred the merry hum of the bees to the clumsy mediæval Latin,

which was the only language we were allowed to speak then.

The great trouble in bee-keeping here is the invariable stealing propensity of the nigger. He will take anything and everything loose about an apiary, such as covers, bottom boards, stands, etc. There is nothing the West Indian nigger won't take, from an old horse-brush to an old bottle of medicine. The hive alone he lets stand—on its own merits, I suppose. Bee-stings are evidently not much to his taste. It is even trouble to get help at extracting time, especially when one keeps hybrids as I do. The screaming and wailing that fills the air round an apiary on extracting days is enough to remind one of a Russo-Japanese battlefield.

Our average yield here is about 120 lbs. per colony. Our honey sells from 20 to 28 shillings per 112 lbs. This would correspond to about 5 to 7 cents per lb. in American money.—Gleanings in Bee Culture.

Castries, St. Lucia, West Indies, May 16.

## Helpful Hints in Extensive Bee-Keeping

BY E. D. TOWNSEND.

At this time an average colony was placed upon a set of scales. There is a rural mail route by this yard, thus I was able to get a daily, postal card report from this scale hive. A report of the weather was also sent, hence I knew at once of the drouth that cut short the last end of the honey season. I also kept in touch with the progress the bees were making in their supers, knew when they began to cap their sections, etc., and was thus able to give occasional suggestions as to taking off honey, giving additional super room, etc.

### IMPORTANCE OF KEEPING YOUR FINGER ON THE PULSE OF A DISTANT YARD.

July 4th I received a card stating things were getting very dry; still the scale hive was showing a fairly good gain. This card led me to believe that the season was probably two-thirds over; and it was about noon, July 5th, when I arrived at this yard, on my fourth visit. There were only about 300 pounds of section honey finished and off the hives; but there was more being finished, as the dry weather was favorable to the curing and sealing of honey. No more empty supers were given; and it proved that we had made a good guess as to the duration of the honey-flow, for we got all the supers finished except eight or ten, that needed just a little feed to finish sealing.

I stayed four days at this trip; and my son and I worked faithfully with the sole purpose of getting this crop of comb honey finished up. The first thing we did, was to put bee-escapes under all the heaviest, or best finished supers. This was kept up until nearly every super in the yard had been handled, and all the finished sections removed. The partly full sections were put in supers, and returned to the colonies that were the most likely to finish them. When we got through there

# American Bee Journal

was no colony that had more than one super to finish, and several had none. These colonies that were left without supers were the new swarms that were still on one section of their hive. These were now given their other section of their hive. This gave them a week or so of the last end of the honey-flow for their own use, which put them in better shape to build up for winter.

During the time that this shifting was going on, we kept in mind the fact that some colonies were finishing up honey faster than others, and these free-working colonies were given those supers containing the most work to do. We think we gained quite a considerable time by doing this.

It is a custom of ours to do lots of this shifting of supers from colony to colony. To illustrate, a colony that is a little sulky about drawing out foundation in the sections, will often finish up and seal combs quite readily; taking advantage of this fact, we keep these sulky fellows finishing up work.

We had at this yard, about 35 new swarms; 30 from the 84 comb honey colonies, and 5 from the 84 worked for extracted honey. This just made up our loss through queenless colonies during spring, and was about the number we wanted. The first new swarms were hived in one section of our shallow hive, on combs where the bees had died during spring. The sections were removed from the parent colony, and given to the new swarm, on the old stand. This was done immediately after hiving; and with this treatment, there was not a single swarm absconded. Towards the last of the season, new swarms were hived in the dead-colony hives in the extracted honey yard; so that the yard had the same number of colonies in the fall that it had the previous fall.

This about finishes the story, except that Delbert stayed and finished harvesting the crop of honey, and put it in marketable shape. There were 2,300 pounds of No. 1 and fancy comb, and 6,000 pounds of extracted. This being a poor season, the crop was short. Delbert also fed three or four barrels of sugar to colonies short of winter stores. This yard being located on the bank of Rapid river, one of Michigan's famous trout streams, do not imagine for a minute that producing honey was all we did.

## FEEDING BACK TO GET PARTLY-FILLED SECTIONS COMPLETED AT THE CLOSE OF THE HONEY SEASON.

Delbert came home the last week of August, having been in this yard a little over three months. My last, and fifth visit was the 5th and 6th of November to put the bees into their winter quarters.

I mentioned above that there were several supers that were not sealed and in condition for the market at the close of the season. In these last-filled, unfinished sections, the part that is capped, is very thin, or lean to look at, and were they finished up and capped without the cells being lengthened out, they would not weigh more than 11 to 12 ounces; and were we to feed to get them into marketable shape, the unsealed portion

would be drawn out to the regular thickness, while the part that was capped would be left untouched, thus making a bad looking job. We remedy this by uncapping the portion that is capped, letting the bees do anew the whole job of capping, and this gives us a good, smooth, even surface—about the same as they cap with a natural flow. It was good enough, so that it went with the rest, at 15 cents a pound, on the car here.

## COMPARATIVE RESULTS IN EXTRACTED AND COMB HONEY PRODUCTION. THE COMB HONEY YARD.

84 colonies at \$4.50.....	\$378.00

Total income from both yards..	\$897.00
Total expense items.....	407.32

Total profit .....	\$489.68
Total percent of profit on both yards, about 34½ percent.	

It will be remembered that the season of 1906, in the location where this

yard is located, was very poor; bee-keepers getting only about half a crop. Had the season been an ordinary one, and we had harvested, say, double the crop we did, many of the expense items would have been considerably reduced; that is, in proportion to the amount of honey secured. Take the item of labor: While there was plenty for one to do a considerable of the time, at other times there was little to do; and, had the crop been double, just a little extra help at harvest time would have secured it. This extra help, and extra supplies would not have been anywhere near as much expense, as would have been gained in the larger crop of honey; while the items of interest, wear and tear, rent and taxes, would be the same.

I think this statement would be incomplete, unless I told what my son would often say, while working this yard. The expression would be something as follows: "I could have worked five yards for extracted honey with the same labor it took to produce this crop of 2,300 pounds of comb honey."

Remus, Mich., Jan. 21, 1907.

—Bee-Keepers' Review.

## Honey Ripened on Hives, Etc.

BY F. GREINER.

In the October number of the American Bee Journal it is said that honey improves if left on the hive to the end of the season. Thousands of bee-keepers of long experience, here and abroad, have said so again and again, and green honey has been severely condemned ever since I kept bees, if I remember rightly. We all know that green honey not only lacks in body, but it has not the fine flavor of well-ripened honey of the same source; it is therefore very important that the honey-producer exercises care in extracting. The notes of warning Mr. Townsend and Mr. Hutchinson sound should be heeded, and we should at least not extract from the combs till all sealed. If found necessary to extract from unsealed or partly unsealed combs, such honey should be kept separate and sold for less money. So far, so good.

I would now ask the question: Has any extensive experiment ever been made which goes to show that honey, after being sealed, improves with age if left on the hive, say to the end of the season? I am aware that comb-honey has sometimes imparted to it a peculiar—let me call it hive-flavor—if left on the hive an unduly long time. This flavor is somewhat objectionable to many, but possibly not so to some others. I very much doubt, however, that the body and general qualities of honey can be improved after it is sealed. I have had honey sour on the hive during the summer season and raise the cappings. The bees sometimes remove a part of such honey from those cells which appear to contain the worst honey, but even that which is left in those combs by them has a sour taste and smell. The bees seem to have no way to improve it even if left on the hive to the end of the honey season, as Hutchinson, Townsend and Dadant

recommend. It is therefore necessary to go a little further in the selection of our combs before they go to the extractor. The combs which contain soured honey have a varying percent of unsealed or open cells sprinkled in among the rest. Seldom we find more than one unsealed cell in a place. Look out for such combs. Taste of such suspicious honey. If the slightest tang can be detected about it, reject it. I know of no way to improve such honey, and the only possible use that can be made of it is to put it into the vinegar barrel. It may also do for feeding bees in the early spring, but I do not know. I should want it all used up in brood-rearing if I used it in this way.

As different conditions alter cases, it would not do for every honey-producer to follow the advice of even such bee-masters as Mr. Townsend and Mr. Hutchinson to the letter, and leave all his honey on the hive to the end of the honey season, from more than one point of view. What may be proper and best for one bee-keeper may be entirely wrong for another. Located where I am, the early honey coming from the tulip tree is very dark, more so than even buckwheat, and decidedly unpleasant. The red raspberry honey and the earlier fruit-bloom honey is also objectionable on account of flavor and color. If I left on all extracting combs from the beginning of the season to the end, my honey would be very poor as to flavor and color. A sorting out of the different honeys would be impracticable, and I would be the loser in the end, for color always stands first, flavor next, and body last; this, at least, is my experience, absurd as it may be.

Now what is to be done in such a case? If extracted honey must be produced we must extract before the good white honey comes here about the last of June, then again as soon as this flow stops. We have to be on our guard so as not to have any late dark honey stored in the supers with the white. It is a very unpleasant situation. I realize how much more agreeable it is in a location where all the honey gathered is practically of one color and flavor. Virginia is one of those spots favored along this line; I have an out-yard there where practically only white honey is gathered.

In localities where it seems necessary to extract several times to keep the different honeys separate, naturally some green honey will have to be extracted. This answers nicely for feeding to comb-honey-producing colonies, and may be turned to good account in this manner. The washings from cappings can also be thus utilized if not thought best to make into vinegar.

#### BITS OF COMB ATTACHED TO SECTIONS

We sometimes come across a colony of bees which is great in attaching little waxen legs to the face of the comb and the separator. I have not found this to be owing to queen or any special strain of bees, but merely a temporary affliction. The next season, or even the next super during the same season, would be free from the trouble. When the faces of sections are thus attached to the separators by little stools, dam-

age may result if care is not taken to detach them. As suggested in the October American Bee Journal, these connecting legs should be cut loose. A small saw, however, does the work much more satisfactorily than a knife. The blade of a hacksaw which costs about 3 cents may be used in lieu of something better, and when it becomes daubed with honey it may be left in a dish of water. I should be afraid to use a hot knife for fear of doing harm.

#### CHANGING SECTIONS TO HASTEN FINISHING.

Mr. Colton suggests, on page 682, to transfer the unfinished sections from the outside of the super to the center so that they will be finished quicker. He also says that he uses no separators. It will not be satisfactory, Mr. Colton, under these conditions, unless you have sealed surfaces each side of each section to be finished. When using separa-

tors it is all right. The bees can not then help themselves, but must cap the section even.

#### COMB HONEY BY EXPRESS.

The same number speaks of sending comb honey by express, and that the express companies, if they accept such goods, should handle them with care or else pay damages. That is right. It is a very singular fact that the express companies demand a very high rate for honey, but refuse to take any responsibility as to its safe transit and delivery. I have found it unsafe—nay, impossible—to send comb honey in single cases by express and have it delivered in good order. On the other hand, I have never had comb honey damaged materially when properly put up in carriers and shipped by freight. Do not ship comb honey by express, is my advice.

Naples, N. Y.

Conducted by J. L. BYER, Mount Joy, Ont.

#### Ideal Fall Weather

The weather here in Ontario, from September 15 to 25, was ideal for preparing bees for winter, and a lot of feeding could be done in a short time. From Sept. 25 to Oct. 12 it was unseasonably cool, but now (Oct. 17) we are enjoying balmy, summerlike weather. This will give a chance for feeding where necessary, if the work has been delayed thus far. Unfortunately the writer was one who had to feed a large amount of sugar; but, really, the only undesirable part of the work was handing out the cash, as the feeding was all done in such a short time.

With three yards to feed up, the task looked pretty big, but with about 20 Miller feeders at each apiary, starting Sept. 15, all colonies were fed in less than 3 weeks. While all colonies are heavy in stores, in our own yards I think the clusters will not average nearly as large as in other years. Whether there will be difference in results as to wintering, as compared with other winters, remains to be seen.

#### The Next Ontario Convention

The Ontario Horticultural Exhibition, or as it is more generally called, the "Fruit, Flower and Honey Show," will be held this year again in Massey Hall, Toronto, on Nov. 12 to 16. At the same time (13, 14 and 15) the Ontario bee-keepers will hold their annual convention. Regarding the convention and

exhibition, the Canadian Bee Journal has the following:

"The Ontario Bee-keepers Association will hold their Annual Convention in Toronto, Nov. 13, 14 and 15, the week of the Fruit, Flower and Honey Show. A splendid program has been prepared for the Convention, a few of the addresses being as follows:

"'A Chapter of Mistakes,' by R. H. Smith of St. Thomas.

"'Foul Brood,' by Miss Trevorrow, of Meadowvale.

"'Comb Honey,' by S. D. House of Camillus, N. Y.

"'Distribution of Honey,' by W. A. Chrysler of Chatham.

"The importance of keeping the brood-nest clear of capped honey by a moderate use of the extractor, either in the production of comb or extracted honey, by E. W. Alexander, of Delanson, N. Y.

"The condition of the industry in Ontario,—10-minute reports by the 6 apiary inspectors. This series of addresses should be full of interest. Owing to excessive losses during the past winter, bee-keepers should more than ever pay greater attention to the condition of their colonies at all times of the seasons. The inspectors have been visiting thousands of apiaries during the past year, and will, perhaps more than any other bee-keepers, have acquainted themselves with the conditions that make for success in the industry. Their report as to the state of foul brood will also be of exceeding interest.

"The honey show will be on a different basis again this year as the com-

# American Bee Journal

mittee has decided to go back to the system of offering prizes. A liberal sum is being put up, and bee-keepers all over the Province should take advantage of this opportunity to exhibit their product. Too much emphasis cannot be laid on this show as a means of advertising, owing to the immense population centered around Toronto. A splendid musical program is being offered at the show again. Toronto's 4 leading bands have been engaged for the evenings, and a splendid orchestra and other music for the afternoons.

"Entries should be made through the Secretary of the Association, Mr. P. W. Hodgetts, Parliament Bldg., Toronto, as early a date as possible."

No question but that the Ontario Government is to be commended for the interest taken in apiculture and kindred pursuits, and it is to be hoped the bee-keepers of the province will reciprocate by both exhibiting and visiting the Exhibition. While the very poor season will, to a great extent, handicap the bee-keeping exhibit, yet if the splendid show of honey at the Canadian National Exhibition can be taken as a criterion, no danger but what a creditable display of honey will be in evidence.

As to the program of the Convention, the presence of some of the notable bee-keepers from "across the line" should be a stimulus towards drawing a bumper attendance at the different sessions. It is to be hoped that many of our American cousins who are not on the program, can see their way clear to attend the meeting. Fortunately, the bee-keeping industry knows no "line," and all who come to visit the "Queen City," and attend the Convention, can be assured of a hearty welcome.

Railway rates are arranged as follows:

"Nov. 13 and 14, special excursions will be run by the railways to Toronto from all points in Ontario, at lowest one-way, first-class fare. Tickets bought on these dates will be good for return up to and including Nov. 16. Those desiring to attend the Exhibition on other dates will be able to do so at the same rate, but it will be necessary for them to obtain standard certificates from their station agent when they purchase their tickets to Toronto. One-way tickets to Toronto, with Standard Convention Certificates, can be purchased from November 8 to 16, inclusive, and will be honored for the return journey free, regardless of the number in attendance, up to and including, November 20, 1907. These certificates must be endorsed by the Secretary at the Exhibition in Massey Hall before they will be honored by the railways for the return trip. A fee of 25 cents will be charged for each certificate vised."

## The Ontario Honey Show Prizes

The following is a list of the prizes offered at the Ontario Honey Show, to be held in Massey Hall, Toronto, Nov. 12 to 16, 1907:

	1st	2d	3d	4th
Best 20 dozen of comb honey in sections, (quality and finish to count 80 points, display 20 points, total 100 points).....	\$15	\$12	\$9	\$6

Best 5 dozen of comb honey in sections, (quality and finish to count 80 points, display 20 points, total 100 points).....	8	6	4	2
Best one dozen of comb honey in sections, (quality and finish to count 80 points, display 20 points, total 100 points).....	4	3	2	1
Best 200 lbs. of extracted liquid honey to be displayed, 100 lbs. in glass, balance in tins.....	12	9	6	4
Best display of 50 lbs. extracted liquid honey in glass.....	5	4	2	1
Best 10 lbs. extracted liquid clover honey in glass.....	4	3	2	1
Best 10 lbs. extracted liquid linden honey in glass.....	4	3	2	1
Best 50 lbs. of extracted granulated honey.....	6	4	3	2
Best display of 200 lbs. comb and extracted honey suitable for a grocer's window or counter, (comb to be in sections, extracted in glass jars, tins or other packages suitable for general grocery trade).....	10	7	4	2
Best 25 lbs. extracted buckwheat honey in glass.....	4	3	2	1
Best 2 dozen of buckwheat honey in sections.....	4	3	2	1
Best 10 lbs. of beeswax.....	3	2	1	
Best exhibit of 6 articles containing honey, showing the most practical methods of using honey for domestic purposes.....	4	3	2	1
Best and most practicable new invention for bee-keepers' use.....	5	3	2	1
Best display of bees and queen which may be seen by visitors.....	10	8	6	4
Best method of crating and packing comb honey, showing 12-section cases ready for shipment.....	7	5	3	2
Best packages for long distance shipment of extracted honey, showing method of packing and crating same.....	7	5	3	2
Best package for retailing extracted granulated honey, package to be filled.....	3	2	1	

The honey committee is composed of F. J. Miller, chairman; P. W. Hodgetts, secretary; and H. G. Sibbald and W. Couse.

## A Serviceable Winter-Case

In "Gleanings" for Oct. 1st, editorially Mr. Root has the following about winter-cases:

"We believe that a very good serv-

iceable winter-case can be made out of ordinary light building paper, or even a heavy grade of manilla, if oiled. The top of the hive should first be covered with several folds of newspaper, and then this manilla or building paper of suitable size should be laid on top, neatly folded around the ends and sides, and tied. Be sure to make the folds so they will shed water, not catch it."

While nothing is said as to localities where the plan outlined would be efficacious, I am quite sure that in our latitude, in severe winters, the paper protection for hives is simply "no good."

A few years ago, when A. C. Miller and some others were booming the paper for winter protection, the writer was quite enthused, and prepared a number of colonies according to directions. The result was a complete disappointment; while the bees packed in the "good old way" (the paper advocates call it the refrigerator style) came through in grand condition.

Bees in hives covered with paper, in different parts of the yard, nearly all perished, and what were left were mere nuclei in the early spring. All I have heard of in Ontario, who tried the plan, reported somewhat similar results. If any bee-keepers in Ontario have had success with the plan, I would be pleased to hear from them, so that I could possibly find out why I and others failed.

While I am at it, permit me to say that my opinion as to the use of paper for spring protection is just about the same as I regard it for winter use. Give me abundant protection over the top of the brood-nest, and I would not give 2 cents for all the tarred paper that could be wrapped around 100 hives. Already some of the prominent bee-keepers of the United States who have tried the plan, are now denouncing it, and I have an idea that inside of 5 years, some of the bee-keepers who are now advocates of the system, will keep "mum" when tarred paper is mentioned.

Conducted by LOUIS H. SCHOLL, New Braunfels, Tex.

## Questions About Shallow Hives

DEAR MR. SCHOLL:—In a late issue of the American Bee Journal you describe a system of using extracting supers for all purposes—for brood-rearing, for extracting, and for chunk honey.

1. Do you use an excluder to confine the queen in the 2 lower supers?

2. Does not rearing brood, and then using the same combs for surplus, give you dark combs and dark honey?

3. How about pollen? I should think there would be more or less of it stored

in the combs where the brood was reared. Will an extractor throw pollen out of combs?

4. Do you use this same system for extracted honey? If I understand, you spoke mostly of chunk honey.

5. Would this same system work in this locality?

I worked 10 colonies for comb honey this season, and put in almost all of my spare time cutting out queen-cells and cutting brace-combs off the faces of the sections and fences, and I am about ready for something different. Although I will make about \$75 clear of

# American Bee Journal

expenses this year, I am going to get an extractor and educate the public to eat extracted honey and not think it is half glucose or something worse. There are no extractors in this part of the country.

D. B. KINNISON.

David City, Nebr., Sept. 17.

No excluders are used in my apiaries. The queen can go into both the lower and upper half of the hive as it is in winter. As soon as the brood-nest is enlarged, becomes crowded, and more honey is coming in than is needed in the brood-nest, a case of empty combs is slipped in between the 2 halves, thus giving plenty of room for egg-laying and place for the bees. This time is just about when bees are beginning to think about swarming on account of their crowded condition, and this manipulation generally knocks it out.

The upper case now becomes our first extracting super, being gradually filled with the honey not needed below, and crowds out of it the brood. Besides, the queen has plenty of room below, and no excluders are needed.

I have no trouble with dark combs, as my honey is the same from all of them. The pollen does not fly out in extracting; besides, most of it will be used up in the upper case, and the rest will be stored in the lower ones.

The same system is used in the production of comb or extracted honey. The manipulation given above is the same for all. Later, when the flow comes, supers of either sections, frames with starters for bulk comb, or full combs for extracted honey, are given under the top case. Tying up is then practiced alike with all kinds also.

## Dry Fall in North Central Texas

Bees in this locality (Central Texas) are having a long rest-spell. Most of the queens have entirely stopped laying, and no young brood is being reared. This is for the want of pasturage for the busy little workers. The 8-months' drouth we have just passed through has parched the fields and meadows brown, and everything has more the appearance of midwinter than our usual spring-like October and November weather.

SEE TO THE WINTER STORES.

I should not be surprised if a good many bees would go into winter short on stores in the Northern and Central parts of the State, owing to the long drouth, and the bees gathering nothing since June. Our usual fall crop from the broomweed is a failure, and it would be well to make a close examination as to the amount of stores the bees have, and, if short, feed them. Don't put this off and risk it, and complain next spring that the bees didn't winter well; you had "bad luck" with the bees, etc. The days of "good luck" and "bad luck" with bees have about become a thing of the past here in the South. This is as it should be, too, for it is either pure neglect or hard-down stinginess in the apiarist if he fails to winter his bees in this climate. We have no fears of bad stores, too much pollen, or too many bees, etc. It is starvation that kills the bees here.

## REVERSE THE HIVE-BOTTOMS NOW.

If you use reversible bottom-boards, November is the month they should be reversed for the small entrance in this climate. This should not be neglected, for the hives with deep entrances are sure to be infested with mice during the winter, which are very destructive to the combs, to say nothing of the annoyance they cause the bees, and I have reasons to believe that mice sometimes cause "swarming out" in winter.

## GENERAL RAINS OVER TEXAS.

The long drouth is at last broken. We have had at least 3 inches of rain in the last 48 hours, with prospects good for more, and from reports from different parts of the State, we think the rain is general. This will be of no special benefit to the bees the present year, but

in keeping a young queen and 2 or more *old* queens in the same hive; but with *young* queens it is a failure with me. Who else has had experience along this line?

Rescue, Tex.

L. B. SMITH.

## Bee-Keeping in North Carolina

I feel it is my duty to speak up for my old State of North Carolina, and let the Northern and Western bee-veterans know that we have some honey, and bees that know how to go after it. We have had a fine honey-flow here. Our principal honey-flow is sourwood, which is very fine and clear. The flow lasted 27 days.

I am sending a view of the home of my honey-bees. I have 15 colonies,

APIARY OF G. F. JONES, OF ELKIN, N. C.

as most of our best honey-plants come up and winter over like fall-sown wheat or oats, this rain has come just right to make them do their best.

It has been a long time since we have had an old-fashioned, good honey-flow all over the State, and it is just about time we were having such a year; if these rains continue to come this fall and winter, I would not be afraid to assure a good honey crop in 1908.

Dr. C. C. Miller seems still to be in doubt about queen-bees fighting when confined together. This is something I don't quite understand for so practical a man as Dr. Miller. Old queens  $2\frac{1}{2}$  or more years old will not often fight, but young, vigorous queens that are only a few weeks or months old will *always* fight to a finish for me when confined together. I don't know that they would do this if they were at liberty on the combs in the hive, but I should expect even then for them to show more or less hostility towards each other.

Some may say, "What has all this to do with practical bee-keeping?" It has this to do with it: If we are to practice the Alexander plan of keeping 2 or more queens in the same hive, we want to know whether or not we can expect 2 or more *young* queens to work peaceably or not. I have no trouble

which averaged 70 pounds to the colony. I have the hives on foundations 8 inches high and just the width of the hive, and sloping as you will see in the accompanying picture. I arrange them this way so that the toads, which are very numerous here, can not pick up the bees at night. I notice them trying to catch the bees. But when they make a dive they lose their foothold and turn a somersault every time.

We have two robbing seasons—one in the spring and one in the fall. While we have a fine honey-flow now, my bees are robbing now the worst I ever saw. It is something that I do not understand. I would like to hear from some of the experienced bee-keepers why they should rob when we have a fine flow. My hives are all Danzenbaker style, and there is no place for the bees to start robbing. Our fall flow is from the frostweed and goldenrod, which is the last to bloom here.

I have been keeping bees 3 years, starting with one colony of Italians, and have built up to 15. I have had some gloomy times with my bees, and have never formed any acquaintance with them yet.

The American Bee Journal is one hundred percent finer, and I like it much better since it became a monthly.

Elkin, N. C., Sept. 23. G. F. JONES.

### Some Prime Essentials in Bee-Keeping

"Good morning, Mr. Robinson, I thought I would come over during a leisure moment and ask you some important questions concerning bees. I would like to have you tell me what you consider the most essential requisite to successful honey production."

"Mr. Jones, I can answer you in just two little words, 'the queen.' The queen is of the most importance to the colony, to the apiarist and to successful bee-keeping from a honey standpoint. You can build your hive of the most choice and expensive wood known to the world, but unless you have a choice queen of some good strain of bees your mouth will water for honey before you get it unless you buy it. The queen is your egg-machine, and as the eggs produce bees, and as bees gather honey, how do you expect honey, when you have nothing to produce your bees? Any queen that is not capable of depositing from 3,000 to 4,000 eggs every twenty-four hours and keep it up for weeks, just as the right time, is of no more use than a barren hen, so far as profit and honey is concerned."

"I see; but is that all that you consider to be of vital importance?"

"Why, of course not, Mr. Jones. There is the hive to look to, as to capacity for such a queen. Then there must be her breeding surface to consider. There must be storage-room supplied."

"Mr. R., what do you mean by breeding surface?"

"I mean territory, which is worker-bee combs, of sufficient capacity to deposit enough eggs in which to produce a large colony of working-bees. We practical bee-men use a hive that is known as the dovetail hive. It is made of such dimensions as to contain 8 or 10 frames, known as the Hoffman self-spacing frame. The frames are approximately 8x17 inches interior measure. There are 25 worker-bee cells to every square inch of surface. A frame contains 136 square inches of surface, and as there are 25 cells to the square inch, you have 2400 cells to the frame. As honey-comb cells are built on two sides of a center we must double the capacity of the frame, which would be 4,800 cells. As there are 10 frames in a hive we would have 48,000 cells. If the apiarist knows his business he will see to it that his good queen has this much surface in which to rear her bees."

"Does the queen lay in all this surface, Mr. Robinson?"

"Never. She occupies from none at all in December and January to from two-thirds to three-fourths in April, May or June, the rest being used for storing food-supplies, which is pollen and honey, this being used to feed the larvæ and for personal use. The bees' order of depositing their honey, pollen and larvæ come in the form named. First, next to the wood part of the frame, they store their honey, placing it in semi-circular form, the largest amount of honey being placed in the corners of the frame at the top. Second, is placed the pollen, in a narrow

belt just below the circle of honey, conforming to it. Third is the brood, which occupies the rest of the frame.

"If you have these conditions reigning in your hive with a young Italian queen, you can cock your hat up on the corner of your head and make sure that you will get a fine lot of honey from that colony of bees that season, if there is any to gather."

"But, Mr. Robinson, you have told me how to fix my bees, but you have not told me how to get the honey."

"You mean, Mr. Jones, how to fix the bees so as to have them deposit their surplus for you? All right, do this: Get a super just the size of the brood-chamber, one to take the same size frames as above, and fill all of them with comb foundation. Now, just at the beginning of the honey-flow, go to the hive and take 2 or 3 frames from below and put them into the super and put 2 frames with the foundation below. Set the super on top of the hive and go your way rejoicing. Choose 2 frames with just the least bit of food to place above. When you place the foundation in the brood-chamber, place it just on the inside of the outside frame of brood. This is as near as I can tell you how to do it, but you must bear in mind that it takes years of apicultural experience to do this just right, and at the right

time. If you have done this right, and at the right time, you may expect 50 pounds of honey from that colony in due time."

"Shall I take this honey out and let them alone for the year?"

"When these combs are full and sealed, take the extractor and throw out all this honey and replace, using care not to break the new, tender combs. Replace them in the hive. If the season is a reasonably good one you may expect them filled again. At the end of the honey-flow you can cut out some of these combs for comb honey if you desire some. Continue to take the honey from this top chamber just as long as the bees deposit it up there. I have taken it from some of mine as many as 4 times during a season, and have oftentimes had one colony to produce over 200 pounds of honey during one season."

"I can't tarry any longer this time, but I must tell you that if you want honey from your bees you must learn how to get good, young Italian queens into them. Further, you must cut away those old crooked combs and substitute thereof good, nice, straight worker-cell combs. Put them in a good, nice hive and then you will be all right."—T. P. Robinson, Bartlett, Tex., in Dallas News.

By W. A. PRYAL, Alden Station, Oakland, Calif.

### The Honey Crop of California

The honey crop for 1907 has been far from being what it was expected to be. The rainfall was abundant in all portions of the State—in fact, in most places it was far above the average. Vegetation made a full growth, and the flowers were abundant enough. But the nectar-secretion was deficient, owing largely to the nights being too cool. In some portions along the coast the days were rather foggy. All of this kept the bees from getting in what would have otherwise been a record-breaking honey-flow. Even the fall flowers have not yielded much nectar; it seems that the bees could not gather enough to keep them from starving. On the whole, it has been a year of cool nights. Verily, it might be written, "the year was a cold frost for the bee-keeper."

### Sun-Killed Wax-Larvæ

Last spring I took occasion in these columns to note the fact that Old Sol was a valuable ally of the bee-keeper when the latter knew how to utilize him. I mentioned a case where Old Sol and

myself (we are pretty friendly old chaps) got in and "did things" to that deservedly despised depredator of the apiary—the wax-moth larvæ. I had the "worms" "done to a finish" by the sun's rays.

Now comes the versatile Mr. Louis H. Scholl, and tells in Gleanings how "hundreds of combs have been 'disinfected' in this way in our yards." You are right, Mr. Scholl, the "worms" will hike as lively as a tramp will with a bulldog attached to the seat of his unmentionables.

### Honey Getting More in Evidence

I notice the grocery stores are now making a greater display of honey in windows and on counters than previously. Why they are putting it forward as one of the staples they carry, I do not know, but it is a good thing for the bee-keeper that they do. Possibly the pure-food law has induced the store-keepers to further the sale of the bees' product. When so much honey has been adulterated it might have made the shopman's life burdensome to answer all the questions as to the purity of the honey he carried. Now everybody takes

it for granted that what is offered him is true to label.

One thing I know just now is, that with butter at 85 cents per 2-pound roll, honey will sell better than ever. Honey has not advanced anywhere near in proportion to other commodities. From 35 to 50 cents per jar (and the jar itself is often worth a dime) is about the prevailing price at the stores for good honey. I should like to see the dealer sell honey in bulk like he does syrup. I think it would be better for producer. If we could only place a honey on the market that would not granulate, the business would be much benefited. It is all right to say that candied is *per se* pure. But every grocer is not prepared to handle it in that shape. If all honey were candied the grocer would find it easier to sell it in that form than any other. Well, perhaps we might find a way to send all our honey to market in solid form.

### Fall Flowers in California

The flowers of the fall are not over-numerous in California; neither are those we have prolific in nectar. At least such have been my observations. I believe no native flower can compare with the eucalyptus from Australia, several varieties of which bloom during the fall and winter months in California, and as they have been planted quite extensively in some places, they make good bee-forage.

Another foreign bee-flower common in California, but perhaps not planted extensively enough to be of any great benefit to the bees, is the pepper-tree (*Schinus molle*) of Chile. In this portion of the State it is in full swing in September. This year it was blooming earlier than usual—I saw some trees in a state of inflorescence as early as May, and these same trees are so continuing at this writing (August 28) and I have reason to believe they will do so for a month or more yet. I have always considered it a good honey-secreting tree.

### Wm. Muth-Rasmussen

This is the name of a bee-keeper this State has reason to be proud of; but how seldom do we hear of him nowadays. Over a quarter of a century ago he began contributing to the bee-papers, often furnishing drawings to illustrate the same. He is a genius, but for some time past he has been "hiding his light under a bushel." I believe there are few bee-keepers in the State that are better able to write upon topics bee-cultural than is this gentleman. And like the late Charles Dadant, when he began bee-keeping in this country English was, I believe, a language he was not accustomed to write; but his desire to express intelligently in print caused him to study up in this language, so that in a short time he could write better English than the average person to the manor born.

I have never had the pleasure of meeting Mr. Muth-Rasmussen, but a score or so of years ago we carried on a correspondence. By this means, and through

a series of articles he contributed to the Pacific Rural Press, about 15 years ago, I came to know something of the man and his attainments. He is a machinist, I believe, by trade, but a bee-keeper by preference. His home is in far-off Inyo County—one of the most inaccessible spots on earth, or it was so a few years ago. A railroad may have reached that section by this time.

### Naming Honey

A few days ago I had occasion to visit a gentleman connected with the shipping department of a large syrup-packing firm in San Francisco. As the gentleman was not at his place of duty at the time I called, I decided to await his return. To pass the time away, I casually surveyed that end of the business, and noted what was being sent off. I noticed that everything was guaranteed under the Pure Food Law of 1906, or bore on the label just what the package contained. Some extracted honey was being made ready for shipment, and I picked up one of the jars and read the label, which was nicely lithographed in colors. On a separate narrow label, pasted just below the cork, was the statement that the contents were packed just as it came from the package of the producer. That left the matter, if there was any, of adulteration, "up to" the apiarist. I should suppose, and it is fair to say, that that means *purity*, as no bee-keeper, I think has been known to adulterate his honey. It would not pay him to do so.

### The Eucalyptus

Prof. Cook is out again in praise of these trees of the antipodes. I indorse what he says; in fact, since 1876 I have been a warm advocate of these trees for an addition to our nectar-secreting flora. Hereabouts I am sorry to observe that large numbers of the trees are being cut down, as the land is falling into the hands of the real estate boomer. Several large groves of trees more than a quarter of a century old have been sacrificed during the past two years. I believe this is one reason why my bees have not stored any considerable amount of fall honey the past few months. The cutting of the gum-trees would be all right if others had been planted to succeed them. As far as I know, the planting of these trees has been on the wane. And this should not be, for the wood has been greatly in demand the past year for fuel for domestic purposes. Since coal has soared up in price to almost double its former price, gum-wood—as eucalyptus-wood is called—has about doubled in value, too. I understand it is selling at from \$7:50 to \$10 per cord in 4-foot lengths.

Dr. Miller does *not* answer Questions by mail.

### Best Height from Ground for Hives

What is the best height from the ground for bee-hives? I have mine 20 inches, on a 4-legged stool, each hive separate. I have each leg of the stand protected half way from the ground up by a tin shield under which is a saturated rope of tar and kerosene. This is to keep out all the insects, such as ants, etc. I have never seen this done, but thought it a good idea. Am I right? I am not certain whether I should not allow access to hive for bees that happen to get in the grass, or that fail to alight on the board. I see most hives have a sloping stand. Which is the best, all things considered?

NEW JERSEY.

ANSWER.—Locality and conditions must decide. In some parts of the

South your plan is adopted, and is absolutely indispensable, for the ants are so destructive that free access to the hives means the ruin of the colonies. In my locality I think it is much better to have the hives close down to the ground. Ants do not make much trouble, and, as you suggest, when a heavily-laden bee, returning from the field, drops to the ground from exhaustion, it is much better that it can crawl into the hive without having to fly up very high. Perched up, a hive is of more convenient height to work at, but only while one is standing. For one who works all day at bees it is easier to sit, and he will live more years than if he does his work standing. If I were living in your locality I think I should very much prefer having the hives low down, and have a comfortable seat. Costs less, too.

### Changing Hives—Doubling Colonies for Winter

1. I am taking care of a few colonies in old-fashioned immovable 8-frame hives. Can I in any way advantageously get them into 10-frame Langstroth hives, either this fall or in the spring, so as to have the full benefit of their summer's work in the new hives?

2. Some of the colonies swarmed out so late that they have not surplus honey enough to winter themselves, while others have more than I think necessary. Can a small late colony be doubled in with a large one and wintered through as one strong colony? MINNESOTA.

ANSWERS.—1. Don't think of disturbing bees by anything like transferring as late as October, or even in September. It would not give them a fair chance to get comfortably arranged for successful wintering. Wait till fruit-bloom next year, or perhaps better still, wait till they swarm, and then break up the old hive 21 days later. If the frames were not "immovable" it would be a different thing, but even in that case they better be left undisturbed till next spring.

2. Yes, although there is some danger of fighting. One way is to set one hive over the other, wirecloth between them, and after 3 or 4 days or a week arrange all the filled frames in the one hive. It may do without the wirecloth if you set the one over the other very quietly, so that each colony will stay in its own hive till a warm day comes.

### Introducing Queens

1. I purchased 7 queens and I tried to introduce them by placing the new queens in the hives they were expected to occupy and leaving them 3 days before removing the old queens. At the time I removed the old queens I gave the bees a chance at the candy. Four of the old queens I caged and placed in upper stories, so that if the young queens were killed I could let the old queens out in the hives they formerly occupied. In every hive where both old and young queens were caged, the young queen was killed when she was let out. Did the bees recognize their old mother in a cage with a quilt between her and the bees, and the young queen directly among the bees?

2. Is this the usual state of things, or do you usually leave the old queen in the hive to replace any loss?

3. In 3 hives that I had killed the old queens (upon taking them out) the young queens were accepted. But one colony had 9 sealed queen-cells and the young queen was right among them. What were they going to do?

MISSOURI.

ANSWERS.—1. Being in a cage would not at all prevent the queen from being recognized as well as if she had been at large. There was a quilt between the 2 stories, but it is not clear whether there was communication between them. If there was a chance for the bees to get up from below, even if only a small passage, then it was much the same as if the old queen had been in the

lower story, and the bees would be pretty certain to kill the new queen. If the quilt shut off all communication between the 2 stories, then it was strange the new queen should have been killed.

2. No, it is not usual to leave the old queen in any part of the hive after the bees are allowed to release the new one. If it be desired to save the old queen, she may be taken with 2 or 3 frames of brood and adhering bees, and the whole put, as a nucleus, in another hive.

3. It is nothing unusual for bees to start queen-cells when a new queen is introduced. Even if the old queen be caged, they are likely to start cells. Although a queen is in the hive, she is not laying, and they seem to think a successor should be supplied that would do better work at laying. After the queen is freed and gets to laying they may destroy all the cells, but sometimes a young queen is allowed to hatch and destroy the laying queen.

### Does Queen Lay in October?—Preventing Swarming

1. I looked into one of my bee-hives the other day to see if the colony had a queen. I found no eggs whatever, neither any larvæ. Now, as I am a beginner, I should like to know if the queen lays eggs in October. The climate is rather cool.

2. As I want to be prepared for next year, I should like to know how to keep my bees from swarming. MINNESOTA.

ANSWERS.—1. The queen sometimes lays well on into October, but in most cases, as far North as Minnesota she is more likely to stop laying in September.

2. A whole lot of people have been trying to find out that same thing for a good many years, and perhaps no plan has been found yet that is entirely satisfactory to all, although every now and then some one claims to have succeeded. Perhaps the larger number content themselves with shaking swarms as coming the nearest to entire prevention, although strictly speaking it does not prevent at all, only anticipates the action of the bees. If you are working

for extracted honey the problem is easier than with comb honey. The Daddants get along with only 2 to 5 percent of their colonies swarming, and their only means of prevention is giving abundance of room, both in the brood-chamber and in the surplus apartment. The Demaree plan with some is entirely successful in preventing all swarming. Just before there is danger of swarming, put all the brood in a second story, leaving the queen in the lower story with empty combs or foundation, and a queen-excluder between the two stories. Perhaps this may work perfectly with you.

### Wintering in Chaff-Hives—Caucasian Bees

1. I have made a number of chaff-hives,  $\frac{3}{8}$  by  $\frac{1}{2}$  inch dead space filled with dry chaff packed in moderately tight. Will my bees, all good strong colonies, winter in these set on the south side of an 8-foot fence? The covers are chaff also,  $1\frac{1}{2}$  inches in center and  $\frac{5}{8}$  on edges.

2. With an opening (entrance) say  $4 \times \frac{3}{8}$  inches, do I need any further ventilation, if I attend to keeping the entrance open during the winter?

3. What is the present consensus of opinion among bee-men regarding the Caucasians? I may as well mention that I have a colony which while not overly strong, as I robbed it of brood to start other colonies, gave me about 25 pounds of comb honey, and the season was remarkably poor. I think. Perhaps I think so because I am just commencing in the bee-business. IOWA.

ANSWERS.—1. You can tell next spring better than I can tell now; but if obliged to make a guess in the case, I should say they ought to winter all right.

2. I think not.

3. There is no consensus as yet. One says they're tip-top, another says they're not worth keeping. Perhaps there are Caucasians and Caucasians. Your opinion is as good as that of any one else, after you find out what they will do for you as compared with others.

#### A RECORD IN TAKING OFF HONEY.

We have harvested a good crop this year, and I made a record in taking off extracted honey. I should like to see this surpassed by some of the plain-frame men. In 10 hours 2 boys and myself took off extracted honey, put all the combs back, and cased 350 gallons of honey. I took off every comb and wheeled them to the tent in a wheelbarrow, four 10-frame bodies at a time. That talk about its being so hard to get self-spaced combs out of hives is all

nonsense. The day before we made this record we took our outfit 14 miles, and put the tent and everything in working order, and extracted 300 gallons. But we had to get up at 2 a. m.; but that shows what can be done if one gets in a rush.—A. H. Knolle, of Texas, in Gleanings.

#### GASOLINE ENGINE FOR EXTRACTING.

E. W. Alexander is enthusiastic as to the use of a gasoline engine for those who produce extracted honey on a large

# American Bee Journal

scale. Indeed, he thinks that a bee-keeper with 100 colonies cannot afford to do without such an engine, whose total running expense is less than 1½ cents an hour, which is always ready to work, and never complains of being tired. He says in Gleanings:

"Now the question is, in your mind, 'Can I afford to buy this outfit?' Well, I will tell you what it is doing for us, then you can answer that question yourself. One year ago, with about the same number of colonies, we employed two men during the season, and a third man part of the time. Now we can do the work much better and easier with one man. You can figure out the amount here saved. During the extracting season we usually extract our combs 6 times, and we now find that such sets of combs, when taken from the extractor, are about 2 lbs. lighter than they have ever been before. Here we gain at least 10 lbs. per colony during the season. I leave this also for you to figure out—the many dollars' worth of honey saved on nearly 700 colonies."

## DEUTSCHER IMKERBUND.

Under this title has been formed a grand union of practically all the different organizations of German-speaking bee-keepers—at least it is the expectation that those societies which have not yet done so will give in their adherence—and German bee-papers are enthusiastic over the matter. Well they may be, for the organization at its start numbers 100,000 members, with the prospect of increase to 150,000 or more.

And our National Association has only 2,500 members!

## PRICES OF HONEY.

Something out of whack about quotations in "Honey Markets." A difference of 6 or 8 cents a pound between places so near together, and a higher quotation in Frisco than New York don't look right. Fact is, the dictum of those men who make quotations has almost everything to do with settling the price, and those 16-cent men are not doing the square thing by us producers. With the advance in prices in general, and a shortage in the supply, anything like 16 cents for comb honey is out of all reason. Talk about honey being a luxury, and anything more than 16 cents being prohibitive! The fact is, honey is an economical article of food, and with our pure-food laws there's no reason why it may not take its proper place as a staple article—at 25 cents much cheaper than butter, even if you call it a luxury. Years ago 25 or 30 cents was not a prohibitive price, and it wouldn't be now. Luxuries are cut out when pinching hard times come, but times are not pinching. Never, perhaps, was there a time when people in general were more able to indulge in luxuries than now—never more willing, and they're willing to pay the price. The whole thing is, that a few men set the pace and we producers stand it. Gentlemen who do the quoting, please give us a square deal.—[That's right, Doctor. These men mean to give us a square deal; but they

do not appreciate the fact that the crop is very short; that fruit is scarce; that adulterated honey can not pull down the price of good honey as formerly. There has been a marked advance in all food products except honey. While it has advanced in some markets to a fair price it has made only a slight gain in others. This is not as it should be.—Ed.]—Stray Straw in Gleanings.

## NATURAL OR ARTIFICIAL SUPERSEDURE—WHICH?

R. L. Taylor discusses this question in the Bee-Keepers' Review, and thinks the answer depends upon which pays best financially. In artificial supersedure the first item of expense is, say for 100 colonies, not less than \$50 for queens. He does not fancy the job of looking through the 100 populous colonies to find their old queens. Mr. Taylor continues thus:

"Then, there are 100 queens to be introduced; and after all is done, what has been gained? Colonies with queens that possibly, (but by no means certainly), may average a little better, and that is all. Some of these queens, as with any introduced queens, will disappear after beginning to lay; occasionally one will not be accepted at all. It is quite probable that 2 or 3 of the colonies, unless looked after closely, may go into winter quarters queenless; and if the bees have wintered badly the queens will keep perishing in the spring just as the rejected ones would have done in the same circumstances. Queens in colonies that have wintered well, even though such colonies have not been requeened, do not disappear by the half-dozen in the spring. In an apiary of from 150 to 200 colonies I seldom find more than 2 or 3 queenless colonies—in fact, as many colonyless queens as queenless colonies.

"I will not deny that one may keep his apiary a little more uniform in strength by the requeening of an occasional colony, but I cannot escape the conviction that his care and time might be more profitably employed in a financial point of view. If the gratification of a *sentiment* is of more value in his estimation—of more value than a thicker wallet—well and good.

"Who dare affirm that, not better but as good queens can be supplied colonies by any interference of the hand of man as by natural supersedure, where all is accomplished without any excitement or disturbance? The bees, it must be admitted, attend to this very well, as was to be expected, for it is *nature*. There will be a few failures, no doubt, but if my own experience is a safe guide, 5 percent would easily cover the whole of them. How easy, then, becomes the solution of the whole matter; simply keep, with almost no trouble or expense, 5 percent more colonies.

## BEE-KEEPING ON THE DANUBE—HONEY IN VIENNA.

The following is a translation of an article in *Bienenwater*, made by Fr. Greiner of New York, for Gleanings in Bee-Culture. It is entitled, "Bee-keeping on the Shores of the Danube; Price and Market of Honey in Vienna":

I commenced bee-keeping in 1890 with three box hives. Now I increased my apiary during the following 14 years, partly by purchase, partly by natural swarming, need not be told. During the first three years there was no honey to sell; but during the next three years the crops ran between 140 and 200 pounds from the yard. This amount was easily disposed of in my little village at 40 cents per pound. It appeared that 200 pounds was about the maximum I could find sale for in the place. The bees, however, kept increasing, so did the honey crops, and soon I had a surplus of 200 pounds, yes, even 300, above what I could sell to my neighbors, and the question arose: "What can I do with it?" I put out a sign, "Honey for Sale." I advertised in the papers, putting my advertisement on wrapping-papers of the groceries; I left some honey at the stores, canvassed bakeries, drug-stores, etc., and always carried samples of honey in glass vials with me, but I failed to make sale for such a *quantity of honey*. I succeeded, however, in increasing the sale in my home market by 120 pounds, and this was the limit. What now? Must I sell cheaper or reduce the number of colonies?

It happened just at this time that an old schoolmate of my wife, then living in Vienna, called on us. After taking in the situation she suggested, "Bring your honey to Vienna. I warrant you a sale of five pounds in the house where I live." This was considered, and after a few days my wife went to Vienna and took five pounds of honey with her, which she had no trouble in selling at our old established price. After one week she made a second trip and took 10 pounds with her which she sold; and after four weeks more a third trip was made, and another ten pounds was disposed of. One family recommended our honey to another, till finally we about monopolized the honey market in this street, having honey customers in as many as twenty different houses. Today, after five years of persistent effort, my wife has sold, from June 16 to Dec. 10, as much as 1,072 pounds of extracted honey, all at 40 cents. It seemed pretty hard for the first two years to peddle honey. It went somewhat against our grain. Still, wife was always courteously received everywhere, even invited to take meals, etc. She enlightened people, and overcame the mistrust and the notions held by the general run of people. To think that she succeeded selling nearly 1100 pounds of honey in one year!—what honey-producer could make a better showing?

Vienna has a population of 1,500,000. There are 3000 streets and 3300 houses. A great deal of honey could be disposed of here in this city if the bee-keepers would go to work systematically. But one must not be ashamed of hard and honest work.

## COMMENTS BY THE TRANSLATOR.

It is an undisputed fact that there is not honey enough produced, either in Germany or Austria, to supply the demand; and still the great problem is not how to produce but how to sell. European conditions are such that "honest work" is just enough humiliating and degrading so that hundreds of bee-keepers shrink from *peddling* the product of their bees. It is next to an impossibility for the city consumer to meet the producer face to face. The more refined, the better posted and educated the latter is, the greater the barrier that separates him from the first. He would be ashamed to look other people in the face if it were known he "peddled." The American may do any kind of work and preserve his dignity.

A late article of F. Dickel, in *Die Biene*, "Proposition how to make Bee-keeping more Popular and Better Paying," concentrates its force upon the sale of honey in particular. There seems difficulty in reaching consumers. On the other hand, consumers have difficulty in finding the producers of honey. They would like to purchase a pure article, but have no way of finding out where to get it. Dickel has the idea of establishing a honey-exchange, and advertising the same in the city papers, also appointing agents in the different cities to make the sales, for which service the agent is to receive nothing. A price is to be agreed upon. The publishing of articles on bees, of general interest, he also recommends.

From all the above it will be seen that bee-keepers in other lands are wrestling with the same problem we are in America, and are considering the same means to solve it.

## A SCORE OF COMMONLY ASKED QUESTIONS.

1. Should supers be left on the hives during the winter?

# American Bee Journal

No, not unless you wish to remove the inside fixtures and substitute packing material.

2. Will it hurt the bees to open the hives in cold weather?

Yes. Ordinarily hives should not be opened after the cold weather sets in, as it breaks the propolis sealing and permits cold wind to blow through the cracks. If it is absolutely necessary, wait until a warm day.

3. Which are better—sealed covers or absorbent cushions laid on the tops of the frames?

Sealed covers. There was a time when it was considered best to place cushions directly over the frames; but since they often get wet from water of condensation, and freeze, flat covers sealed down by the bees are now recommended.

4. Should queen-excluders be left on through the winter?

No.

5. How can I tell whether there is enough honey in the hives?

By looking over the combs before cold weather comes. There should be an average of three or four pounds of sealed stores in each comb.

6. How much honey does it take to winter a colony?

From 20 to 30 pounds, depending upon the size of the colony. Bees in a cellar usually need less than those out of doors.

7. How can I winter a weak colony?

In a good bee-cellar. But it is generally best to unite the weak ones before winter.

8. Does it pay to give cellared bees a mid-winter flight?

Yes, if necessary. But the best way is to manage so that they will not need such a flight. As long as bees are quiet, don't disturb them.

9. My cellar has a damp floor; will it do for wintering bees?

Yes, if the damp floor is the only objection. If the atmosphere is dry, the air good, and the temperature kept about 45 degrees, there should be no trouble.

10. Is cork dust good for winter packing?

Yes, if you can get it cheaply. Usually it is pretty expensive.

11. Shouldn't double-walled hives have packing material under the bottom-boards?

Not unless they are raised from the ground, and in many cases it would not even be necessary then.

12. Why did four of my five colonies die that I wintered out-of-doors?

We don't know, as you haven't given us all of the particulars. Any of the following reasons might explain the trouble: Colony too weak in the fall; bees too old; packing insufficient; location too much exposed; entrance too large or small; queen dead; poor quality or too small quantity of stores; wet packing.

13. How large an entrance should I have for my colonies in eight-frame hives wintered out-of-doors?

It depends upon the strength of the colony; but  $\frac{3}{8} \times 4$  inches is probably not too small. Smaller entrances are now considered better than the larger ones advised several years ago.

14. One of my queens died in January. What can be done?

Introduce another queen if you are so fortunate as to have one. If not, unite the queenless colony with some other weak colony.

15. The packing over my bees is wet. What shall I do?

You should have put on a super cover so that the bees could seal it down. A dry cushion can be placed over this if necessary.

16. How can I keep my bees from flying out when the sun shines, and dying on the snow?

Place a board in such a position that the sun can not shine in at the entrance, thus luring the bees out when it is too cold for them to fly.

17. Can I winter my bees in a building above the ground?

Yes, if the temperature can be kept uniform at 45 degrees. Otherwise you had better not experiment.

18. How can I feed my bees in the cellar?

Place an empty super on the hive, and partly fill it with moistened loaf sugar.

19. How may I know whether my colonies out-of-doors are short of stores?

If necessary, open the hives and make an examination on the first warm day. But it would have been much better if you had made sure that there were plenty of stores in the fall.

20. Why is sugar syrup preferable for winter food to honey?

Because it is cheaper, less stimulating, and always the same. Some kinds of honey are not at all suitable for winter food.—Gleanings in Bee Culture.

## The Bravery of Bee-Keeping

BY T. MAGUIRE.

I never fully realized the possibilities of bee-keeping under the bar-frame system until I saw an "expert" at a local show handling a soap-box full of bees for the edification of the public. He was just an ordinary "expert," nothing exceptional about him to all appearances, but the way he handled those bees was a caution. He wore neither gloves nor veil, but nevertheless he treated these bees with a familiarity absolutely uncanny. He took the combs out of the box, with myriads of bees clinging to them, and showed them round to the admiring crowd. He playfully stirred the bees up with a pencil, pulled their ears, and tickled their tails, and they seemed to enjoy it. He gathered them in fist-fulls off his nose and eyebrows, and went round and caught stray ones, and brought them back to the fold, without the slightest objection on their part, and he talked volubly all the time of subduing and swarming, dividing and doubling, of queens and drones, and

workers, and many other things, in so off-hand a way that his audience were thoroughly convinced of the absurd simplicity of it all. I was delighted beyond measure to find it so easy, and I enthusiastically hastened home with some carbolic and muslin to emulate the performance of the plausible old scoundrel, putting on veil and gloves, however, just as a matter of form.

I invited two ladies to see me tame the ferocious insects, and I got them to adjust the veil, as being "experts" in that form of garment. I have since had occasion to distrust experts of every kind whatsoever.

At first everything went off beautifully. The smoke and the carbolic had a most soothing effect on the insects, and I was able to examine them at much closer quarters than I had ever done before. I was delighted, and began to feel quite proud. It did feel a bit queer to find so many stings wagging about in such dangerous proximity to my face—it was about as exhilarating as being in a somewhat flimsy cage in the middle of a forest of tigers—but I pretended to enjoy it, and explained to the two ladies that it was nothing when you got used to it. They were lost in admiration of my bravery and skillfulness, and gaining courage I began to bustle the bees round a bit, as I saw the old chap doing at the show. But they were evidently a different race of bees from his, or perhaps they found such treatment a little strange at first. At all events, they refused to be hustled. The peaceful buzz quickly changed into a vicious snarl, and it soon became evident the nasty little beggars had got up their backs and were looking for scalps. They bashed up against the veil with an angry whizz, and they fizzed round the fingers of my gloves in a way that made me thank Providence for having the kindly protection. I was rather alarmed, to tell the truth; but I felt fairly secure.

Alas! however, I had not counted on the way that veil had been fixed. Bees have evidently a very efficient intelligence department. There was a weak place in the fastening of the veil, and they found it out. I thought I could almost distinguish a chuckle from the first bee, as, to my intense horror, I felt him crawl up my neck inside the veil! Soon another followed, then several more, and in a short time they seemed to be dozens, hundreds, thousands, millions of bees crawling all over my face and neck. They explored the roots of my hair, they sounded the depths of my ears, they crawled over my face and eyelids and moustache in endless numbers. The situation was appalling. If one dropped into a nest of rattle snakes or a bears' den he could at least fight for his life, but what was an unfortunate wretch to do with a big pair of gloves firmly and relentlessly tied on his wrists, and with a veil secured in the most diabolical fashion with dozens of pins, and swarming with excited bees on the lookout for soft spots round his face, and all getting ready to sting at a given signal? When the two ladies became apprised of the situation they hastily decamped. Whilst I was trying to consider what on earth I should do

# American Bee Journal

one enterprising bee, with a very superior kind of sting, ventured to inspect the inside of my nose. I remembered a song I once heard commencing:

"Go 'way, good massa bee,  
I ain't no rose,  
Dat ain't no honeyed fow'r,  
Only my nose!"

I sniffed one desperate sniff to drive the intruder out, and then I discovered how well she was provided in the sting-department. I got it, and no mistake. I considered no longer. I caught the hat and veil, gave it one desperate tug, slashed it off, and sprinted, making a "bee-line" for the far end of the garden. The remaining bees must have been too much astonished to attend to their work properly, for I escaped fairly well considering; but what a face I had for several days after!

For some time afterwards my thoughts were principally occupied with two subjects—how to get the better of those bees, and how to accomplish a sufficiently blood-thirsty revenge on that "expert." I had almost decided on a diving suit for the former purpose, and a large pair of hobnailed boots and a knobby blackthorn for the latter when chance threw in my way a more convenient and enjoyable opportunity of killing both birds with one stone.

\* \* \* \* \*

Shortly after my adventure with the bees, I heard that the very "expert" gentleman who was the cause of it was in the locality and was looking up bee-keepers to enlighten them on the modern methods of working. Here was my opportunity. I immediately sent him a cordial invitation to come and clear up some difficult points for me, and I laughed with joy on getting his post-card making an appointment.

Now, although I made so signal a failure in my attempt to subdue my bees, I can claim to complete success in being able to stir them up thoroughly. An old countryman once told me how to do it. For obvious reasons I cannot give the recipe away, but it certainly is an infallible plan, and will convert the most amiable hive of bees into a tornado of raging, tearing demons, on very short notice. Of course, I had my swarm carefully roused up for the old chap when he came.

He is a solemn and portly gentleman, with a paunch and a double chin; an air of ponderous wisdom tempered by a smile of superior knowledge. My heart almost melted with pity for him when he came into the garden; but something in the swagger and his smile recalled the performance at the show, and I hardened up again.

He strutted over to the hive with a self-satisfied air.

"Hadh't you better put on a veil?" I asked.

"Oh, not at all," he replied. "It's not necessary. Bees know a friend when he comes to visit them. Just a little wipe of the carbolio, if you please?"

He took the lid off the hive with a sort of professional flourish, and placed the carbolio cloth in position with another. I awaited events, at a respectable distance.

"Seem a bit noisy, don't they?" he re-

marked. I assented, as solemnly as I could.

"Now, then, let's see what they're like," he said, as he removed the cloth. There was a moment's hush, and then a vigorous buzz. He replaced the cloth, and then after a minute or so took it off once more. He did the same thing again, several times, at intervals, but the noise still continued, and the bees were beginning to come out underneath, and were careering around with an unmistakable note of war in their music. Presently one settled on his hand, and stung him. He merely drawled out, "Ah!" and watched the insect in an interested sort of way, whilst it squirmed out the sting and flew off, when he smiled over reassuringly at me. But he began to look puzzled as more and more bees came out, and the war-note increased in intensity and vehemence. He must have got several more stings by this time, but his professional dignity being at stake, he made no complaint as yet.

"I'm afraid this is not their day at home," I remarked. "Better clear out, I think, as they seem in a fighting mood."

"They are certainly in a nasty humor," he replied. Just then one stung him on the nose, and he began to move off. The bees followed. He moved faster, so did the bees. Then he broke into a run, made a quick dash to one side, and doubled in his tracks like a hare. The bees seemed to enjoy it. They "zipped" down on his bald head and buzzed around his ears. They went up his sleeves and into his pockets. They were to right of him, to left of him, in front, and behind, like the cannon around the heroes of Balacava. He danced through a gooseberry bush and barked his shins over a wheelbarrow, dropping his spectacles in the process. He frolicked through a cabbage bed, and crashed into a cucumber frame like a wild elephant. He fought with his hat, as long as a vestige of it remained. He cursed and swore, and laid about him, the bees paying careful attention to business all the time.

I lay down on the grass and choked, till the tears ran from my eyes. I felt sorry for him, but if the whole empire were at stake, I couldn't stir a finger to help. I wasn't able to see exactly how he finished up, but after a time a very angry and crestfallen and dilapidated old gentleman hobbled up the garden, trying to rub his head, and his face, and his shins, all at the same time. There was no use in trying to comfort him. I decided to let him swear for another while till he cooled a little.

After he had eased himself of some picturesque words, he demanded, "Where the blankety—blank so-and-so did you get those bees from?"

"Swarmed them myself last April," I replied, as calmly as my emotion would allow.

"By— I'll swear it was the devil himself swarmed them," he roared. "They're the wickedest pack of demons I ever came across." Then he put in a good many ornamental expressions which cannot be set down here, and he earnestly requested me, in flowing language, to blow them to the utter-

most bounds of perdition with the deadliest explosive I could procure.

I now felt that he and I were more than quits, so I brought him into the house, gave him a drop of something, and said all the soothing things I could think of. He calmed down after a while, when I brushed down his clothes, fished up his ruined spectacles, lent him a hat several times too small for him, and he went off. I could hear the dull rumble of his voice as he went down the road, "Perfect demons; damnable, damnable."—Irish Packet.

## Normalities and Abnormalities of Queen-Introduction

Under normal conditions only one queen will be tolerated in a colony at a time. Should there by accident be two, when they meet there is likely to be a battle royal, when one of them will be killed; so it happens that queens are, as a rule, jealous rivals; but there are exceptions. There are conditions, as when an old queen is about to be superseded, when the young daughter may be tolerated in the hive along with the mother, and both laying side by side; but in the course of a few days or a few weeks the mother will be missing. Whether she dies of old age or the daughter kills her we do not know. There are other conditions where two and sometimes a dozen queens will be permitted to stay in the hive; but those conditions seem to be abnormal.

Again, it may be stated that a normal colony of bees will not take a strange queen, even though they have no mother of their own, much less will they accept an interloper when there is already a queen in the hive. We may, therefore, lay it down as a rule that has exceptions, like all other good rules, that we can not introduce any queen, young or old, to a colony that already has one; and even when the bees have been suddenly deprived of a queen they will not, under ordinary conditions, accept another, no matter how much they may need one, until she has been "introduced." It follows, then, in the process of requeening we are compelled to put a new queen in a wirecloth cage and confine her there, where the other bees can not attack her, until she has acquired the same colony odor or individual scent as the bees themselves. This usually takes two or three days, at the end of which time the queen may be released and they will treat her as their own royal mother. We do not know how bees recognize each other, or how they can tell a strange queen from their own, except by scent factor. It is a fact well recognized that a dog can pick out his master from hundreds of others through the agency of scent; nay, further, he can track him if he loses sight of him by catching the scent of where he has walked, in spite of the fact that hundreds of others have gone over the same ground. This scent that is so acute in a dog is undoubtedly highly developed in the bee, otherwise we should be at a loss to account for the phenomena in the domestic economy of the hive. Hence we naturally conclude that, by the sense

# American Bee Journal

of smell, the bees recognize their own mother from a new or strange one.

Again, we learn that, if two queens have exactly the same colony odor after being caged for two or three days in a queenless hive, either one may be liberated and the bees will accept one just as readily as the other. If both be liberated at the same time, one in one corner of the hive and the other in the opposite corner, both will be tolerated by the bees; but once the queens come together themselves there is danger of a royal battle resulting in the death of one. From this fact we infer that the bees, providing a queen or queens have the requisite colony odor, would accept at any time one or more such queens under many conditions; that, further, when two queens have the same colony odor, if they can be kept apart by means of perforated zinc both queens can continue to lay eggs in the same hive without let or hindrance. This condition will be allowed so long as the colony prospers and there is not a dearth of honey. When there is a disposition on the part of the bees to rob they may destroy one of the queens.

Bees that have been shaken into a box or pan, and then shaken or bumped again and again until they are demoralized or frightened, are much more tractable than those not so disturbed. Bees if made queenless just prior to the shaking, if confined without combs or brood in a cool place for a few hours, will usually accept a queen at once. The factor of colony odor then apparently does not operate, for the bees are put out of their normal condition.

Another fact worthy of consideration at this time is that young bees just hatched will at any time accept any queen. Therefore, it comes about that, when one desires to introduce a valuable breeder on which he desires to take no chances whatsoever, he causes her to be released on a frame of very young or hatching bees; but consideration will be given to this later.

Another fact worthy of note is that virgin queens, if just hatched, will usually be accepted by a colony, if not too long queenless, without the process of introduction or of caging; but when one of these queens comes to be four or five days old she is very much more difficult to introduce than a normal laying queen. Why this should be so, we do not know.

Having stated, therefore, the basic principle governing the relation of the queen to the bees we can now more intelligently proceed to the methods of introduction, most of which are based on the theory that the queen to be introduced must first have acquired the colony odor of her new subjects.

There are some methods of direct introduction by which the queen can be released without the process of caging; but in the case of queens of any value they should not be employed, and are, therefore, not given in a work of this kind designed primarily for the novice in bees.—New edition "A B C of Bee Culture."

## Reports and Experiences

### Good Honey Season.

The honey season around here has been very good. I had 15 colonies the past season, and succeeded in getting 1536 pounds of honey from them. I had no swarming.

H. F. KETTLITZ.

Monticello, Iowa, Oct. 22.

### A Good Crop.

From 64 colonies of bees I took 12,680 pounds of honey. Edwin Bevins said if any one got a good crop of honey he would like to know it.

T. L. SHAWLER.

Silver City, Iowa, Oct. 13.

### Handles Bees Like Flies.

I have been for more than 50 years among bees; have hunted them in the woods and in the mountains of different States. I have no fear of their stings, and can handle them almost as if they were flies. I have 27 colonies.

J. R. HECKMAN.

Johnstown, Pa., Oct. 11.

### Apiary of Thos. F. Rigg.

EDITOR YORK:—Find enclosed a section of my apiary. It is not a commercial enterprise, in that it is run for profit wholly. It is one of my home pleasures which fits in nicely with my fruit and poultry hobbies. Still, I like to have my hobbies pay, and in this I have been

APIARY OF THOS. F. RIGG, OF IOWA FALLS, IOWA.

very successful with the bees. As you know, this has been a very unfortunate year for beekeepers in this section. Within a few miles of me are several apiaries, and not one of them this season produced a surplus worth speaking of. I was more fortunate. Mine averaged 74 pounds, comb honey, 4x5 sections, per colony.

I know but little about the proper management of an apiary. In fact, what I do not know about covers the field. But I am learning. I must give credit, therefore, for my success, to the Danzenbaker hive. This was a very backward spring. The bees of my neighbors, in the dovetailed hives, built up very slowly, while mine came on rapidly and were monster colonies when the harvest opened. The first swarm was cast May 17. This gave me 96 sections, while the parent colony produced 64 sections.

For 5 years I have wintered my bees on the summer stands, and have never lost a colony so wintered.

Our honey supply is white clover and basswood, with an increasing amount of sweet clover.

THOMAS F. RIGG.

Iowa Falls, Iowa, Oct. 4.

### More Honey Than for Years.

We have had a wonderful year in Colorado—more honey than for years. I took from 22 colonies 65 cases of saleable honey, besides several unsealed. I have 2 colonies that stored 14 cases, 24 sections to the case. Honey is going out of Montrose by the carload, and yet the best prices we have had for years—\$2.75 for first grade and \$2.50 for second. I fed my bees until June 10, and had about given up hope of a crop, but when the flow did come, it came with a rush. Bees could be bought very cheap last spring, but I expect they will be out of sight this fall. There are 5,000 colonies by the assessors' returns in this mountain valley only about 20 miles long, and from one to 6 miles wide.

Montrose, Colo., Oct. 12. E. C. WRIGHT.

### Poor Season for Honey.

Last spring was too late for a good honey season in Northeast Nebraska. I had only 22 colonies of bees the past summer, and I run them for comb honey exclusively.

The farmers of Northeast Nebraska had the poorest crop of oats we have had in 27 years, owing to too much rain and hot weather; but we are sure of a big corn crop, for it is matured now, and no frost yet to speak of.

I think the American Bee Journal is better than ever, but it doesn't come often enough for me. I could have stood it twice a week. But I trust that the publishers know best.

Carroll, Nebr., Oct. 6. W. H. ROOR.

### Goldenrod as a Honey-Plant, Etc.

Dr. Miller and others report goldenrod of no value. I kept bees for many years in Northern Michigan where goldenrod abounded. We had at least 4 varieties of the plant there, 2 of which grew in large quantities. One variety grew from 3 to 4 feet high. It was most common on moist land. It bloomed profusely. Bees paid but little attention to it.

# American Bee Journal

I have little to busy myself about, so I write this.  
D. C. LEACH.  
Springfield, Mo., Oct. 5.

[The above letter is of especial interest as coming from a man who has not only reached his "three score and ten," but has gone to beyond it with another 5 for good measure. The hand-writing certainly indicates a younger man. One can not help wondering whether the care of those 20 colonies is not helping to keep him young.—EDITOR.]

## Extraordinary Honey-Year.

In Nebraska, especially in the vicinity of Lincoln, we have had an extraordinary year for honey. From many colonies in my small apiary I have taken 3 full cases well filled with beautiful white comb honey, making 72 pounds to the colony. It so far exceeds anything that we have had in the last 10 years, that we feel a little jubilant over the result. This, no doubt, results from requeening my apiary with new Italian queens. You will doubtless remember a year ago I wrote you that I had lost nearly all my bees with foul brood. Early last spring I took proper steps to eradicate the disease, and was successful. I was satisfied that to introduce new blood was the next step to take, and purchased queens of pure Italian blood from one of our local dealers who is an importer of the same. As an instance of what new blood in an apiary will do, I increased from 2 nuclei to 6 full colonies, each of which produced a super of honey—24 sections. This I call pretty good. Locality no doubt plays a very important part in production of honey.

I am now situated something like 2 miles from College View, on Judge England's farm. As the Judge is an old friend of mine, it is by invitation that I am thus situated in the beautiful grove of catalpa trees east of his residence.

The change made in the American Bee Journal from a weekly to a monthly is a very important one, and, for my part, I am greatly pleased with it. You have added greatly to the reading matter of the American Bee Journal. I am pleased with it as a monthly.  
Lincoln, Neb., Oct. 3. PHILIP MOHLER.

## Eastern Trip Among Bee-Men.

In a recent trip to Vermont and New York I found conditions very much the same as in Iowa in regard to the honey crop. At Albany, Vt., I spent a pleasant hour with Mr. A. W. Darby, who is an extensive bee-keeper. In Albany Co., N. Y. (the buckwheat country) I was entertained by Mr. C. J. Bolster, who supplies the local trade with honey. I was surprised to learn that the greater part of his trade called for buckwheat honey, of which there would be but very little on account of lack of moisture. Very few bees are kept in Albany county. The New York black brood has done its work very thoroughly. There is very little honey in this county, but bees will go into winter in good condition.  
C. H. MILLER.  
Jasper Co., Iowa, Sept. 27.

## A Third of a Crop—Wintering Experiences.

The honey crop in this section was about one-third of an average crop. Bees gathered no honey until after June 10, as the weather had been too cold before that time for bees to fly. I wintered my 50 colonies without the loss of one. I wintered a part of them in the cellar and a part on the summer stands. I have not lost a colony out of 50 which I have wintered during the last 3 years. Those that are populous with young bees and plenty of stores I winter on the summer stands, while my lightest colonies, or those which are not so populous with young bees, I winter in the cellar, giving them a midwinter flight if the weather permits. I also winter 6 nucleus colonies every winter in the cellar without loss, so as to have queens for queenless colonies in the spring. Each nucleus contains 3 Langstroth frames, and a hive made to hold 3 nuclei, with a tight division-board, and a separate entrance for each. There is an advantage in this method of wintering nucleus colonies, as the nuclei all help each other in keeping up the temperature during the winter.

Bees certainly acted in a freakish manner last spring. Some very populous colonies

swarmed without having gathered any honey, and during times when the temperature was not higher than 65 degrees, when the sun would not be shining more than 10 minutes out of an hour, and in every case these swarms had virgin queens. It is my theory that these colonies that swarmed had destroyed their laying queens some time before, as they were crowded with bees, and in some cases entirely out of stores; and as the weather was so cold and wet that the bees could seldom fly from their hives, I actually believe that the bees destroyed their queens to keep them from laying, and then swarmed when their young queens had hatched. I would like to have the views of those better informed as to these instances.

Captina, W. Va., Oct. 14.

## Subscription Price Now 50c a Year

On July 1, 1907, when we decided to change the American Bee Journal from a 16-page weekly to a 32-page monthly publication, we reduced the price from \$1.00 a year to 25 cents. We have since discovered that the 25-cent rate was entirely too low, in view of the kind of a bee-paper we are making every month. We do not wish to lower the standard now, and as labor, materials of all kinds including white paper, etc., have advanced in cost, we feel that the best thing we can do—in fact, the only thing to do—is to put the subscription price at 50 cents a year; in Chicago, 75 cents; in Canada, 60 cents; and in all other countries in the Postal Union, 25 cents a year extra for postage, or 75 cents. These new rates began with September, 1907.

We are sure that our hosts of readers and friends will feel we are doing the right thing in this, as they certainly would not want us to continue at too low a subscription price. At 50 cents a year, this 32-page copy would cost the subscriber only about 4 cents—two 2-cent stamps—surely cheap enough, when its valuable contents are considered. Why, "Dr. Miller's Question-Box" alone is worth many times the subscription price, to say nothing of all the other valuable departments.

It is our intention to keep the old American Bee Journal at the head of the procession, where it has been for so many years. And to do this we will need the hearty co-operation of all our readers. There are yet thousands of bee-keepers who have never heard of the American Bee Journal. Many of them are your neighbors; can you not show them what they are losing by not having it every month?

On another page we offer many useful things as premiums for getting new subscriptions. We will be pleased to mail sample copies to any names and addresses of bee-keepers that may be sent to this office. If every present subscriber would send in just one new subscription during this month, by Nov. 1st our list would be doubled. Why not do at least that much to help along a good cause—your own cause? We are ready to do our part—will you, dear reader, not join with us in putting the monthly circulation of the old American Bee Journal up to where it ought to be?

## Apiarian Pictures

We would be glad to have those who can do so, send us pictures of bee-yards, or of anything else that would be of interest along the line of bee-keeping.

**Write for My Introductory Offer on a Fine Sample WILLIAMS PIANO or ORGAN**

I am sending some of the finest, sweetest-toned Williams Pianos and Organs we make into many communities as samples of our work. It's our special way of advertising, as we have no agents or stores. If you write at once, I will tell you how you can try one of these fine sample instruments in your own home entirely at our expense of freight and all. Then, after you've tried it for a month or so — after you've had your friends try it — after you've tested its easy action — after you've enjoyed its rich, sweet tone for which Williams Pianos and Organs are celebrated — after you are convinced that — all in all — it's one of the finest-looking, sweetest-toned instruments you ever saw or heard, then, if you wish, you may

buy it at our special introductory price and take

**Your Choice of 27 Plans of Easy Payment**

on the piano or of five plans on organ. You may select the plan that's easiest for you and we will trust you, no matter where you live. I guarantee each sample piano and organ to be as fine as those I made for the famous song writers, Prof. L. O. Excell, Prof. C. H. Gabriel, and the hundreds of other well-known musicians you will find in the free book we are going to send you. This is the best chance you will ever have to get a fine piano or organ on your own terms. WRITE A POSTAL OR LETTER TODAY and say, "Send me free Sample Offer, Plans of Easy Payment and Book about (state which book—piano or organ)." Address carefully as follows. H. B. WILLIAMS, Vice-Pres., Williams Organ & Piano Co., Room 601, 57 Washington St., Chicago 6W

**I Am Now Filling Orders BY RETURN MAIL**

**QUEENS OF Moore's Strain of Italians**

Produce workers that fill the supers, and are not inclined to swarm. They have won a world-wide reputation for honey-gathering, hardness, gentleness, etc.

Mr. W. Z. Hutchinson, editor of the BEEKEEPERS' REVIEW, Flint, Mich., says: "As workers, I have never seen them equaled. They seem possessed of a steady, quiet determination that enables them to lay up surplus ahead of others. Easier bees to handle I have never seen."

My queens are all bred from my best long-tongued three-banded red-clover stock (no other race bred in my apiaries), and the cells are built in strong colonies well supplied with young bees.

PRICES: Untested queens, 75c each; six, \$4; doz., \$7.50. Select, untested, \$1.00 each; six, \$5.00; doz., \$9.00.

Safe arrival and satisfaction guaranteed. Descriptive circular free. Address

## HAND-MADE SMOKERS

Extracts from Catalogs—1907:

Chas. Dadant & Son, Hamilton, Ill.—This is the Smoker we recommend above all others.

U. B. Lewis Co., Watertown, Wis.—We have sold these Smokers for a good many years and never received a single complaint.

A. I. Root Co., Medina, Ohio.—The cone fits inside of the cup so that the liquid creosote runs down inside of the smoker.

All Bingham Smokers are stamped on the tin, "Patented 1878, 1892, and 1903," and have all the new improvements.

Smoke Engine—largest smoker made.....	\$1.50—4	inch stove
Doctor—cheapest made to use .....	1.10—3½	"
Conqueror—right for most apiaries .....	1.00—3	"
Large—lasts longer than any other.....	.90—2½	"
Little Wonder—as its name implies .....	.65—2	"

The above prices deliver Smoker at your post-office free. We send circular if requested.

Original Bingham & Hetherington Uncapping-Kaife.

T. F. BINGHAM, Farwell, Mich.

Patented May 20, 1879. BEST ON EARTH.

"In every country the successful advertiser is the continuous advertiser."

## FOR SALE

700 colonies of Bees in dovetailed hives with 400 supers for comb honey, and one full depth extracting super for each hive. This season's crop is over 21 tons of honey, from clover and alfalfa, with latest equipments of all kinds. Poor health is cause of my selling. For particulars write. Address,

B. J. COLE, Box 24, Yakima, Wash. Mention Bee Journal when writing.

## Engravings For Sale

We are accumulating quite a stock of engravings that have been used in the American Bee Journal. No doubt many of them could be used again by bee-keepers in their local newspapers, on their stationery, or in other ways. Also, if we can sell some of them it would help us to pay for others that we are constantly having made and using in our columns. If there is any of our engravings that any one would like to have, just let us know and we will quote a very low price, postpaid. Address,

GEORGE W. YORK & CO. CHICAGO, ILL.

HULBERT GLEN ELLYN, ILL. Mention Bee Journal when writing.

**Honey as a Health-Food.**—This is a 16-page honey-pamphlet intended to help increase the demand for honey. The first part of it contains a short article on "Honey as Food," written by Dr. C. C. Miller. It tells where to keep honey, how to liquefy it, etc. The last part is devoted to "Honey-Cooking Recipes" and "Remedies Using Honey." It should be widely circulated by those selling honey. The more the people are educated on the value and uses of honey, the more honey they will buy.

Prices, prepaid—Sample copy for a 2-cent stamp; 50 copies for 70 cents; 100 for \$1.25; 250 for \$2.25; 500 for \$4.00; or 1000 for \$7.50. Your business card printed free at the bottom of front page on all orders for 100 or more copies. Send all orders to the office of the American Bee Journal.

Mention Bee Journal when writing.

## Publisher Fails—Forced Sale This is your Gain

**OPPORTUNITY KNOCKS AT YOUR DOOR NOW.** We are compelled to convert these books into money at once. To protect our interests as finance agents, we have assumed control and offer without reserve the remaining sets of the Publisher's latest and most important publication—"Library of Universal History," fifteen sumptuous volumes, over 5,000 pages, 100 specially engraved maps, 700 beautiful illustrations, copious marginal notes and chronological index. This is a new publication from cover to cover, prepared by a staff of the most famous historians of the world. Cost to produce nearly \$250,000.00. Positively the first edition printed from these new plates, made from type cast expressly for this work. Each volume is 2 inches thick, 7 inches wide and 10 inches high.

**Read Our Offer:** Beginning with the dawn of "recorded" thought and tracing the progress of mankind, these Sixty Centuries of Progress leads us step by step through Ancient, Mediaeval and Modern Times. In this great panorama we see the birth, growth and development, the decay and death of races and nations. The pure, simple and enchanting language used in depicting these great events makes this story of human progress more fascinating than fiction. Young folks will use this work and read it with delight, charmed by its splendid pictures and vivid style.

**These 15 massive volumes shipped free**  
**Our Offer!** We send the books, complete set, 15 volumes, prepaid, to you at once for five days' free examination. If found satisfactory, send us 50 cents: within five days and \$2 monthly for 10 months for Silk Cloth binding. (This is \$20.50 for the 15 volumes, while the publisher's price was \$45.00.) For 3-4 Red Morocco binding, send us 50 cents within five days and \$2.75 monthly for 10 months or a total of \$28. Publisher's price was \$60. If the library is not perfectly satisfactory after five days' examination in your own home, notify us and we will have it returned at our expense.

You run no risk whatever, but act promptly as the sets are going fast. Cut out and mail the coupon herewith, or a copy of it now.

## SPECIAL CLUBBING AND PREMIUM OFFERS

### In Connection With The AMERICAN BEE JOURNAL

Sample copies free, to help you interest your friends and get subscriptions. If you will send us names of your neighbors or friends we will mail them sample copies free. After they have received their copies, with a little talk you can get some to subscribe and so either get your own subscription free or receive some of the useful premiums below. They're worth getting. We give you a year's subscription free for sending us two new subscriptions at 50 cents each.

#### BEE-KEEPERS' NOVELTY POCKET-KNIFE

Your name and address put on one side of the handle as shown in cut, and on the other side pictures of a queen-bee, a worker, and a drone. The handle is celluloid and transparent, through which is seen your name. If you lose this knife it can be returned to you, or serves to identify you if you happen to be injured fatally, or are unconscious. Cut is exact size. Be sure to write exact name and address. Knife delivered in two weeks. Price of knife alone, postpaid, \$1.25. With year's subscription, \$1.50. Free for 5 new 50c subscriptions.

#### BEE-KEEPER'S GOLD-NIB FOUNTAIN PEN

A really good pen. As far as true usefulness goes it is equal to any of the higher-priced, much-advertised pens. If you pay more it's the name you're charged for. The Gold Nib is guaranteed 14 Karat gold, Iridium pointed. The holder is hard-rubber, handsomely finished. The cover fits snugly and can't slip off because it slightly wedges over the barrel at either end. This pen is non-leakable. It is very easily cleaned, the pen-point and feeder being quickly removed. The simple feeder gives a uniform supply of ink to the pen-point without dropping, blotting or spotting. Every bee-keeper ought to carry one in his vest-pocket. Comes in box with directions and filler. Each pen guaranteed. Here shown  $\frac{3}{4}$  actual size. Price alone, postpaid, \$1.25. With a year's subscription, \$1.50. Given free for 5 new subscriptions at 50 cents each.

#### QUEEN-CLIPPING DEVICE

The Monette Queen-Clipping Device is a fine thing for use in catching and clipping Queens' wings.  $\frac{1}{2}$  inches high. It is used by many bee-keepers. Full printed directions sent with each one. Price alone, postpaid, 25 cents. With a year's subscription, 60 cents. Given free for 2 new subscriptions at 50 cents each.

#### IDEAL HIVE-TOOL

A special tool invented by a Minnesota bee-keeper, adapted for prying up supers and for general work around the apiary. Made of malleable iron,  $8\frac{1}{2}$  inches long. The middle part is 1-16 inches wide and  $7\text{-}32$  thick. The smaller end is 17-8 inches long, 1-2 inch wide, and  $7\text{-}32$  thick, ending like a screw-driver. The larger end is wedge-shaped having a sharp, semi-circular edge, making it almost perfect for prying up covers, supers, etc., as it does not mar the wood. Dr. Miller, who has used it since 1903 says, January 7, 1907: "I think as much of the tool as ever." Price alone, postpaid, 25 cents. With a year's subscription, 60 cents. Given free for 2 new subscriptions at 50 cents each.

Exactly half actual size.

#### PREMIUM QUEENS

These are untested, standard-bred, Italian Queens, reports of which have been highly satisfactory. They are active breeders, and produce good workers. Sent only after May 1st. Orders booked any time for 1908 queens. Safe delivery guaranteed. Price, 75 cents each, 6 for \$4.00, or 12 for \$7.50. One queen with a year's subscription, \$1.00. Free for 3 new 50c. subscriptions.

#### HUMOROUS BEE POST-CARDS

A "Teddy Bear" on good terms with everybody including the bees swarming out of the old-fashioned "skep." Size  $3\frac{1}{2} \times 5\frac{1}{2}$ , printed in four colors. Blank space  $1\frac{1}{2} \times 3$  inches is for writing. Prices—3, postpaid, 10 cents; 10 for 25 cents. Ten with a year's subscription, 60 cents. 6 given free for one 50-cent subscription.

#### BOOKS FOR BEE-KEEPERS

**Forty Years Among the Bees**, by Dr. C. C. Miller.—34 pages, bound in handsome cloth, with gold letters and design, illustrated with 12 beautiful half-tone pictures, taken by Dr. Miller. It is a good, new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price alone, \$1.00. With a year's subscription, \$1.25. Given free for 4 new subscriptions at 50 cents each.

**Advanced Bee Culture**, by W. Z. Hutchinson.—The author is a practical and helpful writer. 330 pages; bound in cloth, beautifully illustrated. Price alone, \$1.20. With a year's subscription, \$1.45. Given free for 5 new subscriptions at 50 cents each.

**A B C of Bee Culture**, by A. I. & E. R. Root.—Over 500 pages describing everything pertaining to the care of honey-bees. 400 engravings. Bound in cloth, price alone, \$1.50. With a year's subscription, \$1.75. Given free for 6 new subscriptions at 50 cents each.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—How the very best queen-bees are reared. Bound in cloth and illustrated. Price alone, \$1.00. With a year's subscription, \$1.25. Given free for 4 new subscriptions at 50 cents each. In leatherette binding, price alone, 75 cents. With a year's subscription \$1.00. Given free for 3 new subscriptions at 50 cents each.

**Bee-keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook.—This book is instructive, helpful, interesting, thorough, practical and scientific. It also contains anatomy and physiology of bees, 544 pages, 295 illustrations. Bound in cloth. Price alone, \$1.20. With a year's subscription, \$1.45. Given free for 5 new subscriptions at 50 cents each.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic has been entirely rewritten. Fully illustrated. No apiarian library is complete without this standard work by "The Father of American Bee Culture." 520 pages, bound in cloth. Price alone, \$1.20. With a year's subscription, \$1.45. Given free for 5 new subscriptions at 50 cents each.

**"The Honey-Money Stories"**.—A 64-page booklet. Containing many short, bright stories interspersed with facts and interesting items about honey. The manufactured comb-honey misrepresentation is contradicted in two items each occupying a full page. Has 33 fine illustrations of apiaries or apiarian scenes. It also contains 3 bee-songs. This booklet should be placed in the hands of everybody not familiar with the food-value of honey for its own object is to interest people in honey as a daily table article. Price 25 cents. With a year's subscription, 60 cents. Given free for 1 new subscription, at 50 cents.

Three copies for 50 cents; or the 3 with a year's subscription 75 cents; or the 6 copies for \$1.00. Free for 2 new subscriptions at 50 cents each.

**Amerikanische Bienenzucht**, by Hans Buschbauer, a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price alone, \$1.00. With a year's subscription, \$1.25. Given free for 4 new subscriptions at 50 cents each.

#### THE EMERSON BINDER

A stiff board outside like a book-cover with cloth back. Will hold easily 3 volumes (36 numbers) of the American Bee Journal. Makes reference easy, preserves copies from loss, dust and mutilation. Price postpaid, 75 cents. With a year's subscription \$1.00. Given free for 3 new subscriptions at 50 cents each.

#### WOOD BINDER

Holds 3 volumes. Has wood back but no covers. Price postpaid, 50 cents. With a year's subscription 60 cents. Given free for 1 new subscription at 50 cents.

#### BEE-HIVE CLOCK

A few of these handsome "bronze-metal" clocks left. Base 10 $\frac{1}{2}$  inches wide, by 9 $\frac{1}{2}$  inches high. Design is a straw skep with clock face in middle. Suitable for parlor—an ornament for any place. Keeps excellent time, durable and reliable. Weight, boxed, 4 pounds. You pay express charges. Price, \$1.50. With a year's subscription, \$1.75. Given free for 6 new subscriptions at 50 cents each.

## Honey and Beeswax

**CHICAGO, Oct. 23.**—There is a good demand for the best grades of comb honey at 17 to 18c per pound. There is also less prejudice against the travel-stained combs than formerly. Amber grades range from 12 to 15c. Very little dark honey in the comb offered. Of extracted there is a fair supply: at present, prices range from 8 to 9c for the white, and 6 to 7 1/2c for amber and dark. Beeswax, 30 to 32c. **R. A. BURNETT & Co.**

**DENVER, Oct. 23.**—Comb honey available for car-load shipments has all been disposed of and shipped out of the State, but there is sufficient left to supply the local trade. We quote No. 1 white, per case of 24 sections, \$3.25 to \$3.50; light amber and No. 2, \$2.75 to \$3.00. Extracted honey, white, 7 1/2 to 8 1/3c; light amber, 6 1/4 to 7 1/2c. We pay 24 to 25c for clean, yellow beeswax here.

**THE COLO. HONEY-PRODUCERS' ASS'N.**

**TOLEDO, Oct. 10.**—Owing to large receipts of Western comb honey, prices have weakened. Fancy and No. 1 brings 16 to 16 1/4c in a retail way. Not much demand for lower grades. Extracted in barrels and cans remains firm, and brings 7 1/2 to 8 1/4c; amber, 7 to 7 1/2c. Beeswax, 28 to 30c. As the season progresses producers are letting go of their crops, and not holding for high prices expected, and we look for the market to decline on all grades, as by Dec. 1 demand lets up. Producers having crops to sell will do well to market same promptly.

**GRIGGS BROS. & NICHOLS Co.**

**PHILADELPHIA, Oct. 25.**—The sales of honey have been quite active in this market during the past month. We quote: Fancy comb honey, wholesale, 17 to 18c; No. 1 white, 15 to 16c; amber, 14c. Extracted honey, water-white, 7 1/2 to 8c; amber, 6 1/2c; dark, 6c. Beeswax, 30c. We are producers of honey, and do not handle on commission.

**WM. A. SELSER.**

**CINCINNATI, Oct. 15.**—The receipts of both comb and extracted honey have fallen off considerably within the past two or three weeks, which is probably due to the shortness of the honey crop throughout the country excepting the far West. Many car-loads of Western comb honey have been placed upon this market, which has weakened the demand. Quote our fancy comb at 16 to 17 1/2c. The demand for extracted honey

is exceptionally good. We are offering our fancy water-white extracted honey in barrels and cans at 10c; amber in barrels at 6 to 7 1/2c, according to the quality. For choice yellow beeswax, free from dirt, we are paying 30c delivered here.

**THE FRED W. MUTH Co.**

**KANSAS CITY, Oct. 19.**—The supply of comb and extracted honey is fair, and the demand good. We quote: No. 1 comb, white, 24-section cases, \$3.50; No. 1 amber, \$3.25; No. 2 amber and white, \$3.00. Extracted, white, 8 1/2c; amber, 7 1/2 and 8c. Beeswax, 25 to 28c.

**C. C. CLEMONS & Co.**

**CINCINNATI, Oct. 23.**—The market is bare of white clover extracted. There is a good demand for white extracted honey, selling in cans from 9 1/2 to 10c. No. 1 white clover comb honey at 17c; alfalfa at 16 1/2c. Amber extracted from 6 to 6 1/2c. Market is good. Beeswax, 30c.

**C. H. W. WEBER.**

**NEW YORK, Oct. 24.**—There is a good demand for all grades of comb honey. Arrivals are now coming in more freely and in good-sized lots, and finds ready sale at good prices. Fancy sells at from 16 to 17c. No. 1 at 15c, No. 2, white, at 14c, dark and buckwheat at 12 to 13c. Extracted is also in good demand, with sufficient supply, principally from California. We quote water-white at 9c, white sage at 8 1/2c, light amber at 6c, dark and amber at 7 to 7 1/2c, according to quality. Southern and West India honey in barrels at from 70 to 80c per gallon, according to quality. Beeswax quiet at 29 to 30c.

**HILDRETH & SEGELKEN.**

## Two Years for One Dollar

After a man succeeds in publishing a good journal, the next step is that of getting it into the hands of the people, of getting them to reading it, and becoming acquainted with its merits. This can be done by advertising, sending out sample copies, circulars, etc. All this costs money. I think I am safe in saying that for every new subscriber I have received I have paid out \$2.00 in advertising; hence, I have often said that a publisher of a good journal could afford to send his paper one year free, for the sake of getting it into new hands. It would cost no more than other forms of advertising, and would be very effective, but, for obvious reasons, this plan could not be put in practice, but I am going to come as near to it as I can. I have between 200 and 300 complete sets of back numbers for the present year, and as long as the supply holds out I will send a complete set, and the rest of this year free to anyone who will send me \$1.00 for the REVIEW for 1908.

### THE REVIEW FOR 1907

It is impossible, in this space, to touch more than briefly upon a few points. Perhaps the leading feature of the year is a series of articles by E. D. Townsend. Mr. Townsend has been a specialist for many years, probably

frequent contributor, is Mr. M. V. Facey, of Minnesota; and I think the most helpful feature of his writings is that of trying to tell his readers how to

#### Making More Clear Money

out of bees than has any one else in Michigan. You may have read occasional articles of his scattered through the different journals, but in the Review for the present year he began at the beginning and wrote in a consecutive manner—just as though writing a book. One article, showing the comparative cost of producing comb and extracted honey, is especially valuable just now when some are thinking of abandoning the production of comb honey.

Another man, whose experience and success have probably equaled Mr. Townsend's, Mr. E. F. Atwater, of Idaho, has furnished the Review with several articles the present year. If asked to give the keynote of these articles, I should say that it was the control of increase, or

#### Diagnose inside Conditions

of a colony by outside symptoms. Many bee-keepers think they must open every hive and take out all of the combs before they can know the condition of the apiary. It is wonderful, as you will admit after reading these articles, that an apiary may be managed with so little work—so little opening of hives.

A strong feature of the Review is its editorials. By actual count, 276 have appeared this year. They are helpful, inspiring, and encouraging—often the result of

#### Prevention of Swarming

Perhaps the most satisfactory plan was the use of the Dudley tube; a very simple device that not only prevents swarming, but there is no dividing, no shaking, no absconding, no sulking, and no scattering to other hives, but *big results*.

Another successful specialist, who has been a

#### Actual Personal Work

in the apiary. The Northern Michigan apiaries and their management are delightfully pictured with both pen and camera, and have brought forth more enthusiastic praise than any feature of the Review for several years. It is a record of actual work with hundreds of colonies—the failures and successes. Two editorials deal at length with "Simplicity in Hive Construction," showing how the Editor made hives and frames, and wired the latter and filled them with sheets of foundation, all the work being done at home, and at a low cost.

What the REVIEW has been in the past, it will be in the future—a real help to practical bee-keepers who are in the business to make money. Send me \$1.00, and you will get the REVIEW for 1907 and 1908; and after you have read it these two years I feel sure that you will become a life-long subscriber. For \$2.00 I will send you the REVIEW for 1907 and 1908 and also a copy of the book "Advanced Bee Culture."

W. Z. HUTCHINSON, FLINT, MICH.

# AMERICAN BEE JOURNAL

Louis H. Scholl, (See page 747)

**A Pioneer California Apiary.**  
(Established by A. D. Pryal, in 1865, but owned for many years past by his son, See page 743.)

PUBLISHED MONTHLY BY

**GEORGE W. YORK & COMPANY**

118 W. Jackson Blvd., Chicago, Ill.

### IMPORTANT NOTICE.

THE SUBSCRIPTION PRICE of this Journal is 50 cents a year, in the United States of America, (except Chicago, where it is 75 cents), and Mexico; in Canada 60 cents; and in all other countries to the Postal Union, 25 cents a year extra for postage. Sample copy free.

THE WRAPPER-LABEL DATE indicates the end of the month to which your subscription is paid. For instance, "dec07" on your label shows that it is paid to the end of December, 1907.

SUBSCRIPTION RECEIPTS.—We do not send a receipt for money sent us to pay subscription, but change the date on your wrapper-label, which shows that the money has been received and credited.

Reading Notices, 25 cents, count line.

Goes to press the 6th of each month.

## National Bee-Keepers' Association

### Objects of the Association.

- 1st.—To promote the interests of its members.
- 2d.—To protect and defend its members in their lawful rights.
- 3d.—To enforce laws against the adulteration of honey.

Annual Membership Dues, \$1.00.

General Manager and Treasurer—  
N. E. FRANCE, Platteville, Wis.

If more convenient, Dues may be sent to the publishers of the American Bee Journal.

### Books for Bee-Keepers

Every bee-keeper should have a bee-book besides a bee-paper. On another page will be found all the best books offered—either at a price, postpaid, or as a premium. If you can not earn them as premiums for getting new subscriptions, it will pay you well to purchase one or more of them. You will find them of great value. There are so many things in the books that are needful to know, and that of course could not be told over and over again in the bee-papers. If a bee-keeper can afford only one, it would better be the book rather than the paper. But now that the American Bee Journal is only 50 cents a year, of course, no bee-keeper, however limited his apiary may be, can afford to be without its monthly visits.

### Apiarian Pictures

We would be glad to have those who can do so, send us pictures of beeyards, or of anything else that would be of interest along the line of bee-keeping.

## SPECIAL CLUBBING AND PREMIUM OFFERS

In Connection With The

# AMERICAN BEE JOURNAL

Sample copies free, to help you interest your friends and get subscriptions. If you will send us names of your neighbors or friends we will mail them sample copies free. After they have received their copies, with a little talk you can get some to subscribe and so either get your own subscription free or receive some of the useful premiums below. They're worth getting. We give you a year's subscription free for sending us two new subscriptions at 50 cents each.

### BEE-KEEPERS' NOVELTY POCKET-KNIFE

Your name and address put on one side of the handle as shown in cut, and on the other side pictures of a queen-bee, a worker, and a drone. The handle is celluloid and transparent, through which is seen your name. If you lose this knife it can be returned to you, or serves to identify you if you happen to be injured fatally, or are unconscious. Cut is exact size. Be sure to write exact name and address. Knife delivered in two weeks. Price of knife alone, postpaid, \$1.25. With year's subscription, \$1.50. Free for 5 new 50c subscriptions.

### BEE-KEEPER'S GOLD-NIB FOUNTAIN PEN

A really good pen. As far as true usefulness goes it is equal to any of the higher-priced, much-advertised pens. If you pay more it's the name you're charged for. The Gold Nib is guaranteed 14 Karat gold, Iridium pointed. The holder is hard-rubber, handsomely finished. The cover fits snugly and can't slip off because it slightly wedges over the barrel at either end. This pen is non-leakable. It is very easily cleaned, the pen-point and feeder being quickly removed. The simple feeder gives a uniform supply of ink to the pen-point without dropping, blotting or spotting. Every bee-keeper ought to carry one in his vest-pocket. Comes in box with directions and filler. Each pen guaranteed. Here shown  $\frac{2}{3}$  actual size.

Price alone, postpaid, \$1.25. With a year's subscription, \$1.50. Given free for 5 new subscriptions at 50 cents each.

### QUEEN-CLIPPING DEVICE

The Monette Queen-Clipping Device is a fine thing for use in catching and clipping Queen's wings.  $4\frac{1}{2}$  inches high. It is used by many bee-keepers. Full printed directions sent with each one.

Price alone, postpaid, 25 cents. With a year's subscription, 60 cents. Given free for 2 new subscriptions at 50 cents each.

### IDEAL HIVE-TOOL

A special tool invented by a Minnesota bee-keeper, a adapted for prying up supers and for general work around the apiary. Made of malleable iron,  $8\frac{1}{4}$  inches long. The middle part is 1-16 inches wide and  $7-32$  thick. The smaller end is 1-7-8 inches long, 1-2 inch wide, and  $7-32$  thick, ending like a screw-driver. The larger end is wedge-shaped having a sharp, semi-circular edge, making it almost perfect for prying up covers, supers, etc., as it does not mar the wood. Dr. Miller, who has used it since 1903 says, January 7, 1907; "I think as much of the tool as ever."

Price alone, postpaid, 30 cents. With a year's subscription, 60 cents. Given free for 2 new subscriptions at 50 cents each.

Exactly half actual size.

### PREMIUM QUEENS

These are the finest, standard-bred, Italian Queens, reports of which have been highly satisfactory. They are active breeders, and produce good workers.

Sent only after May 1st. Orders booked any time for 1908 queens. Safe delivery guaranteed. Price, 75 cents each, 6 for \$4.00, or 12 for \$7.50. One queen with a year's subscription, \$1.00. Free for 3 new 50c. subscriptions.

### HUMOROUS BEE POST-CARDS

A "Teddy Bear" on good terms with everybody including the bees swarming out of the old-fashioned "skep." Size  $3\frac{1}{2} \times 5\frac{1}{2}$ , printed in four colors. Blank space  $1\frac{1}{2} \times 3$  inches is for writing. Prices—3, postpaid, 10 cents; 10 for 25 cents. Ten with a year's subscription, 60 cents. 6 given free for one 50-cent subscription.

### BOOKS FOR BEE-KEEPERS

**Forty Years Among the Bees**, by Dr. C. O. Miller.—34 pages, bound in handsome cloth, with gold letters and design, illustrated with 112 beautiful half-tone pictures, taken by Dr. Miller. It is a good, new story of successful bee-keeping by one of the masters, and shows in minutest detail just how Dr. Miller does things with bees. Price alone, \$1.00. With a year's subscription, \$1.25. Given free for 4 new subscriptions at 50 cents each.

**Advanced Bee Culture**, by W. Z. Hutcheson.—The author is a practical and helpful writer. 320 pages; bound in cloth, beautifully illustrated. Price alone, \$1.20. With a year's subscription, \$1.45. Given free for 5 new subscriptions at 50 cents each.

**A B C of Bee Culture**, by A. I. & E. R. Root.—Over 500 pages describing everything pertaining to the care of honey-bees. 400 engravings. Bound in cloth, price alone, \$1.50. With a year's subscription, \$1.75. Given free for 6 new subscriptions at 50 cents each.

**Scientific Queen-Rearing**, as Practically Applied, by G. M. Doolittle.—How the very best queen-bees are reared. Bound in cloth and illustrated. Price alone, \$1.00. With a year's subscription, \$1.25. Given free for 4 new subscriptions at 50 cents each. In leatherette binding, price alone, 75 cents. With a year's subscription \$1.00. Given free for 3 new subscriptions at 50 cents each.

**Bee-Keeper's Guide**, or Manual of the Apiary, by Prof. A. J. Cook.—This book is instructive, helpful, interesting, thoroughly practical and scientific. It also contains anatomy and physiology of bees. 54 pages, 228 illustrations. Bound in cloth. Price alone, \$1.20. With a year's subscription, \$1.45. Given free for 5 new subscriptions at 50 cents each.

**Langstroth on the Honey-Bee**, revised by Dadant.—This classic has been entirely rewritten. Fully illustrated. No apiarian library is complete without this standard work by "The Father of American Bee Culture." 320 pages, bound in cloth. Price alone, \$1.20. With a year's subscription, \$1.45. Given free for 5 new subscriptions at 50 cents each.

**"The Honey-Money Stories"**—A 64-page booklet. Containing many short, bright stories interspersed with facts and interesting items about honey. The manufactured comb-honey misrepresentation is contradicted in two items each occupying a full page. Has 33 fine illustrations of apiaries or apiarian scenes. It also contains 3 bee-songs. This booklet should be placed in the hands of everybody not familiar with the food-value of honey, for its main object is to interest people in honey as a dietary article. Price 25 cents. With a year's subscription, 60 cents. Given free for 1 new subscription, at 50 cents.

Three copies for 50 cents; or the 3 with a year's subscription 75 cents; or the 3 copies given free for 2 new subscriptions at 50 cents each.

**Amerikanische Bienenzucht**, by Hans Buschbauer, is a bee-keeper's handbook of 138 pages, which is just what our German friends will want. It is fully illustrated, and neatly bound in cloth. Price alone, \$1.00. With a year's subscription, \$1.25. Given free for 4 new subscriptions at 50 cents each.

### THE EMERSON BINDER

A stiff board outside like a book-cover with cloth back. Will hold easily 3 volumes (36 numbers) of the American Bee Journal. Makes reference easy, preserves copies from loss, dust and mutilation. Price, postpaid, 75 cents. With a year's subscription, \$1.00. Given free for 3 new subscriptions at 50 cents each.

### WOOD BINDER

Holds 3 volumes. Has wood back but no covers. Price postpaid, 50 cents. With a year's subscription 60 cents. Given free for 1 new subscription at 50 cents.

### BEE-HIVE CLOCK

A few of these handsome "bronze-metal" clocks left. Base 10 $\frac{1}{2}$  inches wide, by 9 $\frac{1}{2}$  inches high. Design is a straw skep with clock face in middle. Suitable for parlor—an ornament for any place. Keeps excellent time, durable and reliable. Weight, boxed, 4 pounds. You pay express charges. Price, \$1.50. With a year's subscription, \$1.75. Given free for 6 new subscriptions at 50 cents each.

## Trade Notes

### The A. I. Root Company, Medina, Ohio

Does It Pay a Planing Mill Man to Make His Own Hives?

An unsolicited statement of the matter from an Illinois bee-keeper:

### ELIAS BAMBERGER

Manufacturer of

### SASH, DOORS, BLINDS

Contractors' and Builders' Supplies

Including All Kinds of Window Glass

Cor. Exchange and Adams Sts.

ESTIMATES FURNISHED ON APPLICATION

Freeport, Ill., June 11, 1907.

The A. I. Root Co.,  
Medina, O.

Gentlemen:

I received five of your AE52S-10 hives yesterday and find that I cannot make my own hives and supplies as cheap as yours and use the same quality of lumber. You can see by the head of this letter that if anyone can make hives cheaper than your prices or any of the so-called "trust hive" manufacturers, I ought to be able to do it, but using the same quality of lumber I cannot.

Yours very truly,

(Signed) John H. Bamberger.

The above is a representative letter from the many we have to the effect that our hives and other supplies can be purchased cheaper than a local mill can possibly make them. Our enormous output enables us to reduce the cost to the minimum without sacrificing quality.

GEORGE W. YORK, Editor

CHICAGO, ILL., DECEMBER, 1907

Vol. XLVII—No. 32

## Editorial Notes and Comments

### Merry Christmas—Happy New Year

These are our wishes for all the readers of the old American Bee Journal when the approaching Holiday Season arrives. And that the fullest fruition of your highest hopes may be attained in 1908 is our further wish for you all.

### Report on Bees and Honey for 1907

On page 764 will be found a report blank which we wish every one of our readers would fill out at once and mail to the office of the American Bee Journal, 118 W. Jackson, Blvd., Chicago, Ill. Then in the January number we expect to give a summarized statement for the benefit of all. We believe that a report made up of all the individual reports sent in, would be very interesting and helpful.

We do not expect to publish any names, so don't be afraid to give true and correct answers to the questions asked. The information as given by individuals will not go outside of this office and will be known only to the Editor. Only a summarized report will be given out or published.

If a satisfactory number of our readers will take hold of this effort we believe the result can be made of untold value to every bee-keeper who produces honey for the market. It may result in quarterly reports later on, which can be used to fix the right price on honey, beeswax, etc. We believe that if all who are interested in getting worthwhile returns from their bee-keeping, will help in this effort that we are now starting for the benefit of all, they will not regret it, but will be pleased with the information that may be secured for their guidance in the sale of honey.

At any rate, let us see what can be done now toward getting an idea as to the amount of honey produced the past season by the readers of the American Bee Journal; the condition of the bees this fall; and as to the clover and other honey-plant prospects for 1908.

If you do not wish to cut this number of the American Bee Journal, just copy the questions on any sheet of paper, answer them, and then mail to us as directed in the first paragraph.

### Feeding Bees for Winter in Canada

The divergent views of writers on bee-culture is a source of perplexity to the beginner. A notable instance of this divergence of views occurs in the Canadian Bee Journal for October. F. P. Adams, speaking of the harm done by late disturbance, says:

"The only safe way to overcome this difficulty is to prepare for winter before the cool weather sets in, and our most successful apiarists recognize this fact by commencing their winter preparations at the close of the honey harvest. It is true that at this time the hives usually contain a lot of brood, but it is surprising what a quantity of syrup can be forced into the brood-nests by heavy feeding."

J. L. Byer says this: "While there is more danger of feeding too late rather than too early, experience has taught me that, for various reasons, it is not wise to do much feeding previous to September 20."

Then comes Editor Hurley, saying: "Mr. Byer, in his notes appearing in this issue, urges feeding in September. In our experience this would not be satisfactory. We prefer to feed when the last batch of brood has hatched.

Wintering bees on empty brood-frames is dangerous."

Of Mr. Adams the editor says: "The pronounced success that he has had with his bees, makes anything he writes of great interest." Mr. Byer has for years conducted a department in the Canadian Bee Journal in a very able manner, and Editor Hurley may well be supposed to know something on the subject. After reading these three varying views from three authorities, and all under the same cover, is it any wonder the beginner should feel somewhat dizzy?

### Specialty Not Best for Every One

As is well known, Editor Hutchinson had adopted for his slogan the cry, "Keep more bees!" and from the vigorous manner in which he has kept up the cry it is not strange if he has been understood by some as advocating an indiscriminate launching into the business on a wholesale scale by all and sundry. The following from The Bee-Keepers' Review, will show that such a view is erroneous:

"While the Review believes in and advocates specialty, it recognizes the fact that not every bee-keeper is in position to take advantage of it. To illustrate: A letter was recently received that read something as follows:

"You write so convincingly of specialty that I am sometimes almost tempted to adopt it, but I have a family of 5 children to support, and I dare not take the risk of abandoning my regular occupation for that of bee-keeping as my sole occupation. At present I have only 12 colonies."

"This man would be the last one that the Review would advise to engage in bee-keeping as specialty. It would be almost as sensible to advise him to engage in the practice of medicine. A man whose experience is limited to what he has acquired in a year or two with only 12 colonies of bees is in no position to go into the business as a specialist. Bee-keeping is a profession that must be learned, the same as any other, before it can be followed extensively and exclusively. The men whom I advise to make of bee-keeping an exclusive business are those who

# American Bee Journal

have learned it from A to Z, but continue, year after year, to fuss along with a single apiary of 75 or 100 colonies, lacking the confidence, or the 'nerve,' to drop some other business that is holding them back, and double their profits by enlarging their bee-business to the extent of their abilities."

## Where to Put a Caged Queen

Some practise caging a laying queen for a time in the hive, so that no eggs shall be laid while she is thus caged. Little or nothing has ever been said as to any difference resulting from caging the queen in different parts of the hive, but according to G. M. Doolittle it makes a very material difference where she is caged. He says in *Gleanings*: "I find that, when she is at this point, the bees as a rule work right along the same, or nearly so, as they would if the queen had her liberty. In other words, when I cage a queen and put the cage near the top of the brood-chamber the bees seem to feel as if they were queenless, start queen-cells at once, or as soon as they would if the queen were taken from the hive, and lack in energy about working, very much the same as a queenless colony does. But cage her near the entrance, at the bottom of the hive, and work goes right along, often without any queen-cells being started at all."

## The Two-Queen Plan

In *Gleanings* for Nov. 15, a good deal is said about having more than one queen in a hive, but the talk seems to be almost altogether about queens separated by excluder zinc. This seems a great disappointment to those who had hoped that, like E. W. Alexander, they could have two or more queens peacefully working side by side with no sort of separation. If queens must be kept apart, two in a hive will be little if any better than the Wells plan, about which so much was said a few years ago, especially in England, but about which almost nothing is said at the present time. In the Wells plan, the two colonies are separated by a perforated wooden partition.

One man reports that he can keep a young queen in the same hive with one or more old queens, but the attempt to keep more than one young queen in the same hive has always been a failure. How old a queen must be before she will dwell in peace with a younger queen is still an unsolved problem.

While we may still hope that good may come from the plan, there is no denying that the prospect does not look as bright as it did.

## Study the Subject of Bee-Keeping

The editor of *The Irish Bee Journal* says:

"Our correspondence during the past few months shows that the number of bee-keepers who know little or nothing of their business, is not small, either here or in Great Britain. We strongly advise all such to devote some time to study during the winter months. A good guide, a volume or two of a re-

liable bee-periodical, will well repay the cost if carefully read. Naturally we recommend the 'Irish Bee Guide,' and the *Irish Bee Journal* for the purpose, not only because we believe in them ourselves, but also because hundreds of experienced bee-keepers have testified that the two publications named are hard to beat. Whatever the book or the paper to be selected, we think it safe to say that any bee-keeper who is not sufficiently interested in the subject to read it up, would be wiser to go out of the business altogether."

To all of which we give a hearty "Amen," even to endorsing the book and periodical mentioned, and also making application of the general sentiment to American bee-keepers; and would especially commend a careful reading of the last sentence of the clipping by any one who is yet without *both* a book and a paper about bees. Of course "in this locality," the *American Bee Journal* is supposed to be an excellent publication, but if you think you can find something better you have our gracious permission so to do; only be sure to get *some* book and *some* paper, and spend some time during the winter in reading up so as to be an intelligent bee-keeper, if you are not already in that class.

## Reading Bee-Literature

The time for reading up on bee-literature will soon be here. What with the bee-papers and many good bee-books, there is no reasonable excuse for everybody, who desires, not knowing a great deal about bees and their cure—theoretically, at least.

The advice is given, that of the two—the bee-papers and bee-books—the book is the first that should be read by the beginner, and that is good advice, too. Of course, *we* say, get *both* book and paper. For \$1.50 or \$1.75 the very best bee-book can be had with the *American Bee Journal* a whole year. Surely it must be a very small business that would not warrant an outlay of less than \$2.00 for the best obtainable information concerning it.

In these days of strenuous competition, a man or woman needs to know all that it is possible to know about any business in which he or she embarks. And so one must invest in some good literature relating to the work which he expects to do.

## Parcels Post in the United States

Just now there is a revival of interest in this matter from the fact that the Post Master General is championing a movement in the direction of greater facilities for sending through the mail articles of merchandise. Americans are somewhat given to consider themselves as in the van of progress, but so far as cheap carriage through the mails is concerned, or indeed so far as its carriage in any way in small parcels is concerned, they are sadly in the rear.

Is there not something wrong with post-office regulations that allow a package to be sent to Germany for less money than required to take it 5 miles to the next post-office? In the *British Bee Journal*, W. J. Farmer reports

what he considers a postal curiosity, owing to regulations on this side. He mailed 3 pounds of honey at his local post-office to be sent to America, paying 50 cents thereon as postage. A few days later he received notice from the postmaster at Liverpool, saying that although the package might be sent to any part of Great Britain, honey was not allowed in the mail to the U. S., but if he would send 75 cents more the package would be sent by a semi-official company. He promptly sent the additional 75 cents, and was surprised a few days later to have it returned to him with the information that the 3 pounds of honey would be sent for the 50 cents paid at the beginning, because they had discovered that it was comb honey and not extracted honey put up in a tin can!

The Post-Master General has the best wishes of the people, but whether he can accomplish anything is somewhat problematical so long as the U. S. Senate is controlled by the express companies rather than by the people.

## An Invitation to Readers

As the time of longer evenings is again arriving, we would like to invite our readers to send in their reports of the season of 1907 with the bees.

It may be, also, that some have been trying experiments, or have had some things to develop that would be of interest to all. If so, we would like to have such write out their experiences for publication, and send them in. No doubt what you have read in the *American Bee Journal* has been a great help to you, so why not *you* add your mite to the general fund of information about bees?

It may often happen that your way of doing things may seem very simple to you and of not sufficient importance to describe in print. And yet, such may be of great interest and help to others. Why not let us have it for the columns of the old *American Bee Journal*?

## World's Pure Food Show

This great exposition opened Nov. 16 and continued up to and including the 23d. As previously announced the National Bee-Keepers' Association had an exhibit of honey which was in charge of General Manager France. It was a most excellent display, containing honey from some 15 States and 5 foreign countries, all arranged in artistic form. It was a great attraction, and should help to popularize the use of honey, as there were visitors from all over this country.

We expect to have more to say about it next month, as the show is still in operation while we are writing this item.

## The Illinois State Convention

This was held in Springfield, Ill., Nov. 19 and 20. The attendance was fully as large as in any year for some time. We had the pleasure of attending also. It was a good meeting. The report will be published in pamphlet form and mailed to the members. One of the

# American Bee Journal

most important subjects discussed was that of securing for Illinois a foul-brood law similar to that of Wisconsin.

The election of officers for the ensuing year resulted as follows: President, J. Q. Smith, of Lincoln, 1st Vice-Pres., G. W. Cave, of Kirkwood; 2d, W. H. Hyde, of New Canton; 3d, A. L. Kildow, of Putnam; 4th, S. N. Black, of Clayton; and 5th, C. P. Dadant, of Hamilton. Secretary, Jas. A. Stone, Rt. 4, Springfield. Treasurer, Chas. Becker, Pleasant Plains.

We are told that the Illinois Bee-Keepers' Association is the largest of all the State bee-keepers' organizations. Illinois also has the largest number of members of any State in the National Association. But the memberships in

both organizations should be greatly increased in Illinois. The annual dues of \$1.00 will pay for one year in both the State and the National. Send the dollar to the Secretary Jas. A. Stone, Rt. 4, Springfield, Ill., and he will forward one-half the amount to the National. You will then receive a receipt from both associations. Of course this is meant for our Illinois readers. We wish that every bee-keeper in the State were a member of the two organizations. It is a good time to join if not now a member.

Naturally, being located in Illinois, we have considerable pride in seeing this State lead; and yet we would rejoice to see every State advance all along the line in everything apianian.

given the implement a pretty thorough trial, and one who reads the article is hardly likely to care for any further trial. To mention no others, one objection is that instead of making a clean cutting of the cappings, there is little more than a

scratching, leaving the cappings partly attached to the comb, to be thrown away by the bees, some of the small particles of wax clogging the screen of the extractor, or falling in the honey—a real loss of value in wax.

But perhaps others have found the uncapping-fork shown herewith to be of value to them.

## Bee-Keeping in Australia and Here

Upon reading reports from Australia, some have cast longing looks in that direction. That some longing looks are directed in the opposite direction is shown by the following wail in the Australian Bee Bulletin:

"Would not it be nice if Australian bee-keepers had the beautiful clover-fields of Great Britain and North America, suitable for grazing as well as bee-keeping? When the honey-trees are cleared away to make wheat-fields, good-by to bees."

## Bees Attack Passengers

Mr. H. W. Gander, of Pennsylvania, clipped the following "special" from the Philadelphia Record of Nov. 7:

"A swarm of bees escaped from a hive that was being loaded on a train at Tyrone to-day, and attempted to settle on the waiting passengers, causing a panic and a dash for cover.

"The bees then tried to get in the train in a body; but the passengers quickly closed the windows, while the trainmen, with overcoats over their heads, kept many of them away from the doors.

"A number of persons were stung, and the swarm was later captured and sent west."

## "The Golden Bee"—Wonderful!

Hon. Eugene Secor, of Forest City, Iowa, sends us the following regarding a newspaper clipping which he also enclosed, the clipping being dated Oct. 18, 1907, and taken from the Iowa State Register and Farmer:

DEAR MR. YORK:—Am I so far behind the times that I haven't heard of the "Golden bee" and its propagation—or evolution—as described in the enclosed clipping from the "Iowa State Register and Farmer?" I must confess that I haven't read of this \$25 to \$100 bee.

I'm not criticising the editor, who is a good friend of mine, but just wondering where the wonder is advertised. That's just the bee I should have had this year—one that would have given me 185 pounds of honey, regardless of the weather! I want her bad. I've a

# Miscellaneous News - Items

## Index for 1907

In this number appears the annual index for 1907. It shows what a great variety of topics have been considered during only one short year, in the American Bee Journal. To all who have preserved their copies as received, the index will be of great value for reference. It is a very complete index, as will be found on examination.

## Canadian Bee Journal Changes

With the October number of the Canadian Bee Journal, now in its 15th year, come some notable changes. It has been sold to James J. Hurley, of the Hurley Printing Co., a practical printer and enthusiastic keeper of bees, a combination which ought to fit him out well as editor and publisher. The publication has no longer any connection with the bee-supply business, and has been increased to 40 pages. Success to it and its new editor.

## An Old Apiary in California

The apiary shown on first page was established originally in 1865 by A. D. Pryal, as mentioned elsewhere in this issue. It is located at the base of the hills near the southern boundary line of the city of Berkeley, Calif., and lies directly opposite San Francisco. It was never conducted as a large commercial apiary, as is so often the case in that State; rather it has been a home beeyard, furnishing delicious honey for a large family. In years of a good honey-flow the surplus has been disposed of at a fair profit, thus augmenting the proceeds of the place, which has been mainly run as an orchard and small fruit ranch.

In 1876, Mr. Pryal turned the apiary over to his son, William A., who has

continued to care for it ever since. None of the original hives are in use, though some portions of them have been utilized in the construction of some of the hives shown in the half-tone.

As may be noted, the photograph was made in the winter, and shows the way bees are usually wintered in California. Sometimes the supers are removed at the approach of winter; at other times they are not. It is found that with good, strong colonies it is easier and cheaper to protect the combs from moth-worms, etc., by leaving them on the hives, rather than by removing them and storing them in the honey-house, or other place.

The trees shown are cherry, English walnut, apricot and oranges, the latter being the dark masses in the middle at the right.

## Japanese Bees

In *l'Apiculture Nouvelle*, is given an account of Japanese bees. They are much like Italians, although a little smaller. Only a single colony had been seen by the correspondent, but that showed a very peculiar trait. The entrance guards acted also as ventilators, *with their heads toward the entrance*. Was that a freak performance of the occasion, or is it the rule with bees of Japan?

## Uncapping-Fork

For uncapping purposes there has been in use in Europe for some time an implement that has been so highly praised that one has wondered why such a good thing has not been introduced into this country. In appearance it reminds one just a little of the clippers used to shear horses, or the smaller clippers used by barbers, if one may judge from the illustrations. An article by C. P. Dadant in *l'Apiculture Nouvelle*, gives good evidence that he has

# American Bee Journal

notion to advertise in your "want" column.

Yours in need of honey,

EUGENE SECOR.

The clipping referred to reads thus:

## "THE GOLDEN BEE."

"A subscriber from Story county writes: 'I have been reading about the golden honey-bee, and I have been trying to know more about it.' Will you give through the columns of the Register and Farmer some information of this variety of honey-bee?"

"The golden bee was evolved from the Italian bee, which was the lightest of any in coloring. A number were imported to this country some years ago and the experiment of producing the really golden creature was begun. The Italian bees were kept apart from others and a careful process of selection was inaugurated. Careful watch was kept, and when the queens were born the lightest-colored one was isolated. She was then introduced into a hive, from which she was sent out to mate. When she returned and began laying eggs the vigil was all the more closely kept. Day after day the bees were visited, and when the young queens emerged from their cells the lightest colored was often selected and isolated.

"This process was repeated over and over again during a summer, and then for summer after summer years went on and the experimenting apiculturist saw his bees losing the leathery bands which encircled them, and assuming a lighter color.

"The golden bee is actually golden and is one of the rarest of bees, and it is as gentle as it is beautiful. So rarely does it sting that it has been called the 'non-stinging bee.' It may be handled almost with impunity. Furthermore, it is an amazing producer of honey, one hive having collected annually about 185 pounds of the golden sweet. As to the value of the queen, they sell at prices ranging from \$25 to \$100 apiece."

This is truly wonderful! And to think that bee-keepers didn't know about it in time to get 185 pounds per colony the past poor honey season! Well, there are more seasons coming so there will be time yet to invest "\$25 to \$100 apiece" for a few queens that turn out the golden bees that produce the gold through their honey!

## "Langstroth on the Honey-Bee"

One of our readers wrote us as follows recently about this bee-book, originally written by Rev. L. L. Langstroth, the Father of American bee-keeping:

EDITOR YORK:—The book, "Langstroth on the Honey-Bee," which you sent me, arrived all O. K., and after reading it over I must say I am exceedingly well pleased with it. I could not, had I been there, with all the books before me, suited myself better. The book is so interestingly written, and the instructions are so plain, that one as little versed in bee-culture as I, can not help but understand. And with what a difference I now read the bee-papers, for I now understand what they are talking about.

Is it not wonderful, how Mr. C. P. Dadant quotes from old writers, what

they say on certain subjects, and then what Mr. Dadant has seen, all brought down so nicely? I don't see how a better book for the beginner could be written.

Now allow me to thank you cordially for the interest you have shown.

T. T. ARMSTRONG.

Hiawatha, Kans., Nov. 20.

The book referred to by Mr. Armstrong certainly is a valuable one. It contains over 500 pages, and was revised this very year, so it is fully up-to-date. We mail it for \$1.20, or with the American Bee Journal one year—both for only \$1.45. No mistake will be made by any one who gets this book.

## Wedding Bells in Missouri

Oct. 31, 1907, Mr. John C. Stewart, of Hopkins, Mo., and Mrs. Henrietta Larch (widow of the late Dr. Larch, of Savannah, Mo.) were married. Mrs. Larch was a popular lady where she lived, and owned a 160-acre farm, on which is a \$500 bee-house, excellent orchard, etc. Mr. Stewart is one of Missouri's best-known bee-keepers. Our congratulations are hereby extended to the happy couple.

## The Chicago-Northwestern Convention

By the time this copy of the American Bee Journal is in the hands of its readers another annual convention of the Chicago-Northwestern will have been held. At this time (Nov. 23) the prospects are for a splendid meeting. We hope it may be such. Next month we hope to be able to give a good report of it in these columns.

## The Michigan Convention

The Michigan Bee-Keepers' Association will hold its annual meeting at Saginaw, the first session being on Wednesday evening, Dec. 18 and the last one on Friday afternoon the 20th.

Headquarters will be at the Sherman House, at which the special rate of \$1.50 per day has been secured.

Among the speakers will be R. F. Holtermann, of Brantford, Ont.; L. A. Aspinwall, of Jackson, Mich.; E. D. Townsend, Remus, Mich.; W. J. Manley, Sandusky, Mich.; and W. Z. Hutchinson, of Flint, Mich.

An exhibit of honey and wax will be made, and premiums are as follows:

Best single section of comb honey—  
one Advance Bee-Veil.

Best 6 sections of comb honey—500  
Lewis sections.

Best 5 pounds of beeswax—one Hil-  
ton hive.

Best 5 pounds of extracted honey—  
Choice of one year's subscription to the  
Bee-Keepers' Review, or a copy of "Ad-  
vanced Bee Culture."

Best suggestions or plan offered to  
increase the membership to Association.  
Same to be in writing and not more  
than 150 words—one copy de luxe edi-  
tion of the "A B C of Bee Culture."

For further information, write to the  
Secretary, Elmore M. Hunt, of Red-  
ford, Mich.

## Tennessee Fair Apiarian Premiums

The Tennessee State Fair held the last week in September at Nashville, was a decided success, in every respect, and was universally pronounced the greatest Fair ever held in the South.

In the Apiary Department there were some fine displays of comb and extracted honey, wax, bees, implements, etc. Mr. Leslie Martin gave a daily live-bee demonstration in a wire cage, and this feature attracted a great deal of attention, as it was something new here. The following awards were made:

Best 10 pounds extracted honey—1st,  
J. M. Davis, of Spring Hill; 2d, J. M.  
Buchanan, of Franklin; 3d, Chip Hen-  
derson, of Murfreesboro.

Display of extracted honey—1st, J. M.  
Davis.

Best case of comb honey—1st, J. M.  
Buchanan; 2d, E. B. Buchanan, of  
Franklin; 3d, Ira Moore, of Nashville.

Display of comb honey—1st, J. M.  
Buchanan.

Display of beeswax—1st, J. M. Buch-  
anan; 2d, Mrs. W. M. Joseph, of Nash-  
ville.

Nucleus of dark Italian bees—1st, J. M.  
Davis; 2d, J. M. Buchanan; 3d, Leslie  
Martin, of Lebanon.

Nucleus of golden Italian bees—1st,  
J. M. Davis; 2d, Mrs. W. M. Joseph.

Nucleus of Caucasian bees—1st, Les-  
lie Martin; 2d, J. M. Davis; 3d, J. M.  
Buchanan.

Nucleus of Carniolan bees—1st, J. M.  
Davis.

Best display of bees, bee-products, im-  
plements, etc.—1st, J. M. Davis; 2d,  
J. M. Buchanan; 3d, Mrs. W. M. Jo-  
seph.

Mr. Fred W. Muth, of Cincinnati, was  
the Judge in this department.

J. M. BUCHANAN, *Supt.*

## "Gus Dittmer Company"

Beginning with Nov. 29, 1907, the  
business conducted for so many years  
by Gus Dittmer, of Augusta, Wis., will  
be run under the name of "Gus Dittmer  
Company," which was recently incor-  
porated under the laws of Wisconsin,  
with a capital stock of \$20,000. Gus  
Dittmer is the president and treasurer;  
Mrs. Jennie Dittmer, vice-president;  
and Fred M. Dittmer, secretary. This  
is a wise move, and we trust that the  
Gus Dittmer Company may continue to  
be even more successful than was its  
predecessor.

## Result of the National Election

The following were elected last  
month as officers and directors of the  
National Bee-Keepers' Association:

President—Geo. E. Hilton, Fremont,  
Mich.

Vice-President—George W. York,  
Chicago, Ill.

Secretary—W. Z. Hutchinson, Flint,  
Mich.

General Manager and Treasurer—N.  
E. France, Platteville, Wis.

Directors—(in place of three expir-  
ing)—Wm. McEvoy, Woodburn, Ont.;  
E. W. Alexander, Delanson, N. Y.; and  
R. C. Aikin, Loveland, Colo.

Conducted by J. L. BYER, Mount Joy, Ont.

### Report of the Ontario Convention.

The Ontario Bee-Keepers' Association met according to program, in Toronto, on Nov. 13, 14, and 15, 1907. Despite the fact of the bee-keepers having passed through a poor season, the attendance was good, and intense interest was manifested throughout the different sessions.

#### THE VICE-PRESIDENT'S ADDRESS.

In the absence of Pres. R. H. Smith, Vice-Pres. Miller occupied the chair. Mr. Miller makes a good presiding officer, and during the different meetings conducted the proceedings with tact and courtesy, to the satisfaction of all present. In his address he referred to the short crops, but thought that the present high prices would in a measure make up the deficit. Specialist bee-keepers should look upon their calling as a dignified one, and should aim to place the business upon a higher level.

He referred to the fact that the Minister of Agriculture for Ontario—Hon. Nelson Monteith—was ever ready to help along towards this desired end, and that as bee-keepers, we owed his Department a debt of gratitude for help already received.

The new system of having 6 inspectors instead of one, he believed to have been entirely satisfactory, and the closer union of the Association with the Department of Agriculture, by having Mr. Hodgetts of the Department, as Secretary of the Association, had proved to be a decided advantage to all concerned.

As regards the prospects for the future of bee-keeping, the speaker regarded them as being very bright. The population of Canada, particularly in the West, was increasing at an enormous rate, and for some years at least we would not need an export market, as the home trade would take all the honey we could produce.

Mr. Couse, in the discussion that followed the President's address, endorsed all that had been said, and referred to the fact that better honey was being produced than was the case some years ago; in fact, "no better honey was produced in the world than the product of Ontario apiaries." This desirable state of affairs had largely been brought about by the good work of the Ontario Bee-Keepers' Association. The honey industry is a profitable one in many ways, as the success of the clover, fruit-growing, and other industries were largely dependent upon the bees.

### DISTRIBUTION OF HONEY.

W. A. Chrysler, of Chatham, read a paper on "Distribution of Honey." The speaker had lately arrived home from a trip through the Northwest, and from observations there, relative to the honey market, he was more than ever convinced of the advantages of co-operation among bee-keepers for the handling of their product. Mr. Chrysler lives in a locality where co-operation has lifted the fruit-growing industry out of the rut and placed it on a highly profitable basis and it is only natural that he should be an enthusiast on this system of marketing. While nearly all were in favor of the idea, yet some thought that it was not likely that much would be done along that line as long as the production was limited, and prices as high as at present. In other words, history would repeat itself, and, like the fruit-growers, dairy-men, and others, the bee-keepers would not be actively concerned about co-operation until actually forced as a matter of protection to do so. However, a committee was appointed to look into the subject and report at the next annual meeting.

The President thought it good policy to send some honey to the Western Province even in poor years, in order to hold the trade for years when there was more honey to be disposed of. This year, although all the honey produced could have been disposed of easily in Ontario, yet the Middlesex County Association had shipped part of their crop West, with good returns.

### PRICE OF GOOD HONEY.

At this stage of the meeting a discussion arose as to what good honey should be sold for. The view entertained by some that extracted honey should retail for 15 cents, was in the judgment of some members a little too high in years of good crops, as there was a danger of foreign honey being shipped in. Even this year, in the early part of the season, an offer was made from Colorado to lay down alfalfa honey in Toronto at 10½ cents; and honey from Jamaica, for manufacturing purposes, was offered at a surprisingly low figure. It was thought easier to keep foreign honey out than to oust it after having once gained admission to our markets.

Mr. Storer, of Lindsey, who had lately returned from Scotland, spoke of seeing 1200 acres of raspberries near one small town, and the entire product was sold under the co-operative system to the complete satisfaction of the growers.

Mr. Hodgetts, Secretary of the Onta-

rio Bee-Keepers' Association, at the invitation of the President, also spoke along the lines of co-operation. From his connection with the fruit-growers' association he had intimate knowledge of its workings, and he had no hesitation in saying that the system had been a huge success with the members of that body. While the bee-keepers of Ontario might not be ripe for co-operation, yet he saw no reasons why it would not work out satisfactorily if given a trial.

The Honey Exchange Committee came in for a good deal of praise for the good work done, the only difference of opinion among members present being that some thought the report should be sent out earlier than was the case last year. It was pointed out that the reports covered a large territory, and, all things considered, it was hardly possible to get out a fairly accurate estimate of crop conditions much earlier than has been the case in past years.

### REQUEENING COLONIES.

In answer to the question, "When shall we requeen?" Mr. McEvoy said more requeening should be done; that some queens were good at 4 and 5 years old is no argument against the advisability of requeening. Some queens are good at 17 years, but more at 7; some men at 70, but more at 17. The same principle applied to queens.

Mr. Holtermann wished to refute the idea that a queen lays a given number of eggs and then dies; that the principle is contrary to all animal nature, poor wintering and other causes largely determining how long a queen shall be prolific.

Mr. Dickensen would requeen every 2 years, but the majority of the members would prefer to requeen whenever a poor queen was noticed, rather than practise a wholesale method, perhaps often destroying some better queens than their successors would prove to be.

### WAX-PRESSES.

Relative to a question on wax-presses, those who had tried the Hershiser admitted that while more wax could be obtained, yet the quality was not so good as that taken with the Hatch-Gemmill press. Later on during the convention, Mr. Sibbald by means of a model, explained the workings of a press (one member called it a cross between the Gemmill and Hershiser presses) which he thought superior to either the Hatch-Gemmill or Hershiser. (Cuts of this press with Mr. Sibbald's explanations will appear in the printed annual report of the convention.)

### FOUL-BROOD.

Miss Trevorrow, of Meadowvale, read a paper on "Foul Brood." She had no practical knowledge of the disease, and her paper (an admirable one) was largely along the lines of prevention rather than cure. Carefulness and neatness in the apiary was touched upon as well as the necessity of using the wax-press freely to melt up all old combs. The inspectors had many difficulties beyond their control to contend with, and it was decidedly necessary that bee-keepers should heartily co-operate with the inspectors if the dread disease is to be eradicated.

Miss Trevorrow is a highly successful bee-keeper, and is thoroughly informed in all lines of the pursuit. A hearty vote of thanks was accorded her for the excellent paper presented.

#### EXTRACTED HONEY PRODUCTION.

To the disappointment of all present, Mr. Alexander, owing to ill health, was not able to attend the convention. However, a paper prepared by him was read by Mr. Sibbald. Mr. Alexander recommended the radical course of extracting the honey from the brood-nest and feeding back, during the early part of the honey-flow. A great difference of opinion was expressed in the discussion that followed, and while a few endorsed the idea, the majority would not practise it. All were agreed that it was advisable to get as much brood as possible in the brood-nest previous to the honey-flow, yet the work and risk involved in Mr. Alexander's system was thought to be too great.

In connection with Mr. Alexander's present position of stripping the brood-nest of practically all the honey, it is interesting to compare the stand taken by him a little over a year ago on this question. In answer to a questioner as to how to avoid having light colonies in the fall, Mr. Alexander stated in *Gleanings*, Jan. 1, 1906 issue, that they formerly had this trouble to contend with, and he gave the following advice:

"In order to avoid light colonies in the fall, let your bees fill up their hives with the first honey of the season, and see that they have plenty of it capped over before you put on your extracting supers."

His present position makes it clear that he wants little honey in the brood-nest, and it is hard to understand what he really meant in the quotation I have given. Certainly in the majority of localities, if his advice were followed, vast apiaries would be badly demoralized by swarming, if supering were delayed so long.

#### COMB-HONEY PRODUCTION.

Mr. S. D. House, of New York, gave what was conceded by all to be one of the best addresses ever listened to by the Association. His talk was much on the same lines as at Brantford last year, and was business from start to finish. His methods of using the divisible brood-chamber in the production of comb honey (the theme of his address) were explained in a very lucid way to the delight of all present, and at least a few members were "almost persuaded" to adopt a hive along the lines of the one used by Mr. House.

#### FOUL BROOD AND BLACK BROOD.

The 6 inspectors of apiaries gave their reports, and out of some 400 apiaries visited, about 50 percent were found to be diseased. Of course, this represents apiaries where disease was suspected, and the percentage of diseased colonies throughout the Province is by no means as large as the figures would indicate. Some black brood was discovered, and those who had had experience with it dreaded the disease more than the ordinary foul brood.

Resolutions were passed asking that Quebec Province enact a foul brood law, and that the management of the different fairs at Toronto, London, Ottawa, and other cities, give demonstrations in methods of bee-keeping and honey-production, descriptions and illustrations of the natural history of the bee, etc.

The following officers were elected for the ensuing year: President, F. J. Miller, of London, Ont.; Vice-President, W. Couse, of Streetsville; Secretary, P. W. Hodgetts, Parliament Bldg., Toronto; Treasurer, Martin Emigh, of Holbrook, Ont.

The next place of meeting is Toronto.

Conducted by EMMA M. WILSON, Marengo, Ill.

#### When to Cellar the Bees.

The time to take bees into the cellar is always a catchy problem. Last year ours were taken in Nov. 19th. But they had no good flight after the 10th, and it would have been much better if they had been carried in *then*, as 9 days of confinement outside in freezing weather with no chance to fly afterward is perhaps harder on them than three times as long in the cellar. If they could have had a flight by staying out a week or two longer, it would have been better to have left them out. But how can one tell in advance? As a matter of fact, there was no weather warm enough for further flight, so it was well they were not left out later.

This year, again, bees flew pretty well up to November 10, and then came cold weather, the thermometer going down once as low as 11 degrees above zero. A week of this weather made us quite uneasy, and it was a question whether it were better to run any further risk, or to take the bees in without waiting for another flight. Fortunately, just about the time we had nearly decided to take them in, the weather-man was obliging enough to send us a brand of weather to make our hearts glad. Nov. 18 the thermometer went up to 53 degrees, and the bees had a glorious flight. That was yesterday, and they would have gone in today only it's too warm; but the first day that it is cold enough, in they go.

#### Feeding Bees through a Sponge.

The following is given by Mary E. Akers, in *Gleanings in Bee Culture*:

"When bees are confined in a cage or box the under side of which is of wire-cloth, they can be fed (as some have already suggested) with honey as long as their tongues can reach it. My way is to fill the receptacle with syrup; press a sponge down in it, and all the syrup will be appropriated—you would be surprised to see in how short a time, as the sponge presses against the wire, and the weight of the bee-box of whatever kind holds it down. It works finely."

Now, isn't that bright? And a wom-

an at that. But why confine that kind of a feeder to bees confined in a box? If a sponge sucked out at the top will empty feed out of a dish in which it is placed, the device may be used for feeding bees not confined, and the feeder may be placed in a hive or out in the open.

Take a box of convenient size and have a cover of wire-cloth that may be fastened on. Put in the box a dish to hold the feed, the dish being nearly or quite as deep as the inside of the box. Put in the feed a sponge of such size that when filled it will be deeper than the dish, but will be kept down in place when the wire cloth cover is fastened down. Now, why wouldn't that make a good feeder?

#### Confection of Tomatoes and Honey

Boil the tomatoes and pass them through a fine sieve. Add twice the weight of honey, skim well, and when the confection is almost done, add lemon.

#### Section - Honey in a Bee - Tree— Honey Ono Bee Gathers in Its Lifetime.

DEAR MISS WILSON:—I've just received and read the last *American Bee Journal* (No. 30), which in many ways is of especial interest to me. Those two women—one in England and one in Africa—who had swarms alight on their heads were pretty brave, and had their nerves under remarkable control. They were certainly in great danger of death connected with frightful suffering.

You may be interested in hearing about a novel sort of a bee-hive that the poet, Mr. Dodge, has on his place at Morristown, N. J. A swarm some years since made their home in the hollow trunk of a beautiful old tree near the house, and the bees have remained there and thrived to the great enjoyment of the Dodges, who, in the early days of their sojourn, fed them sugar generously, as one inducement to permanent occupancy. The first year there was no surplus honey obtained, but the

next spring our poet had a doorway cut in the tree above their brood and storage. Through this he inserted some pound section frames or boxes, and the bees filled them with honey. Every year since, the bees in this way have kept the family supplied with a very fine grade of comb honey. This is a true story, and well authenticated.

Mr. Dodge is much interested in bees, and reads very widely about their ways. He has somewhere found, as he believes, the reliable statement that a bee furnishes in its lifetime just one single tablespoonful of honey. In other words, the limit of the life-work of a bee is a tablespoonful of honey.

I, myself, do not quite see how these figures are reached. There is such a difference in localities and in seasons as to the honey crops, and also such a difference in bees, that it seems as if accuracy in averaging up would be an extremely difficult task.

I would greatly enjoy hearing from you on this subject.

FRANCES E. WHEELER.

Chazy, N. Y.

There is nothing new about bees having a home in a tree. Plenty of people have had bees in trees, and they are not poets, either. But this is probably the first case on record where section-boxes were given to bees in a tree, and the idea seems as poetical as novel.

You are right that it would be an extremely difficult task to make anything like an accurate estimate of the amount of honey that may be considered the life-work of a bee to gather, there are such varying factors in the problem. Take a bee that is born so late in the season that all gathering ceases just as it becomes old enough to be a fielder, although it has spent its 16 days at work in the hive. The next spring it commences at housework again, using the honey stored by other bees for its own use and to feed the babies, and it may never gather any.

But the problem is an interesting one, and there may be no harm in taking average conditions and doing some little figuring to see whether there is justification for a spoonful to a bee. As most of the data we have with regard to the storing of honey are in pounds and ounces, the first thing is to know the weight of a tablespoonful of honey. If honey is thick enough, half a pound or more may be lifted at once with a spoon, but what is meant is probably an even, not a heaping, tablespoonful. To obtain this a half-pound of honey in a bowl was put into a small kettle of water and set over the fire until the honey became nearly as thin as water. Then it was measured with an ordinary tablespoon, and there were just 12 spoonfuls, or 24 spoonfuls to the pound. It's worth something to know that, isn't it? That makes a spoonful 2-3 of an ounce.

Take a good colony in a good season and suppose it stores 100 pounds of surplus. The amount of honey it will consume for its own use in the course of a year is variously estimated at 100 to 200 pounds, the higher figure being probably nearer the mark. Let us call it 200,

and adding the surplus of 100 pounds to it we have 300 pounds as the year's gathering. If there are 24 spoonfuls to the pound, and if each bee gathers a spoonful, then it will take 24 bees to gather a pound, and to gather 300 pounds will take 300 times 24, or 7,200 bees. But we know well that in a colony strong enough to lay up a surplus of 100 pounds there will be many more than 7,200 fielders in the hive at one time, to say nothing of several generations of them. Evidently a spoonful to a bee is an overestimate.

Let us approach the problem from another direction: A strong colony will gather all the way from nothing up to 5, 10, and in extreme cases 20 pounds a day. It is perhaps not far out of the way to say that a very good day's work for a colony strong enough to have 30,000 fielders is 5 pounds. The life of a bee in the working season is about 6

weeks, or 42 days. The first 16 days it spends in the hive, leaving 26 days for field-work. If 5 pounds is a day's work for 30,000 bees, in their life-work of 26 days, they would gather 130 pounds, or 2080 ounces. Divide that 2080 ounces among 30,000 bees, and it gives over 1-15 of an ounce, or 1-10 of a spoonful for each bee. That is likely more than the average, although many a bee probably exceeds it.

Even at that it's wonderful to think of anything like a tenth of a spoonful being gathered by each bee. Take a spoonful of honey and look at it, and think of its being gathered by 10 bees. Why, the whole 10 could drown in it, so each bee has gathered enough honey in which it might drown itself. And yet of late there has been some talk of bees being lazy! Anyway, if they do spend some time resting, they must make up for it when they are at work.

### Glimpses of Southwestern Apiculture, and a Sketch of One of Its Leading Representatives—Louis H. Scholl

BY ARTHUR H. MCCRAY.

Three years ago the writer first met the subject of this sketch—Louis H. Scholl—at the Ohio State University. An acquaintance was formed, which, like many college acquaintances, was more abiding than simply during college life. After Mr. Scholl returned home from college at Columbus, Ohio, in the spring of 1905, a correspondence was kept up, and the writer grew more and more anxious to see the great State of Texas, with its people and vast extent of territory, some of which he certainly thought must be a bee-keepers' paradise.

At last a letter came with a message from the Sunny Southland, which was irresistible. Such phrases as, "20,000 pounds of honey and scarcely any yet taken off," "a month's vacation before going back to college will do you good," "I will give you a chance to see something of Texas," etc. Such alluring and tempting offers were irresistible, and the result was that the fall of 1906 found the writer enjoying Southern hospitality to the full. Frequent long drives to the dozen and more apiaries scattered here and there over the gently rolling slopes of Comal and adjoining counties will never be forgotten. The vast extent of mesquite (mescal) pasture, and the yellow expanse of broomweed, the acres and acres of cotton, with Mr. Scholl's enthusiastic remarks, were all-sufficient to make one for the time being an enthusiastic bee-

keeper, and make him feel like going into large-scale bee-keeping himself, forgetting all about college duties, and plans for the future.

Upon learning that Scholl had resigned his position at college, and refused a \$2,000 offer to go to East Africa, one can see without difficulty that here indeed is a man whose heart and soul are with Texas, and who believes in bee-keeping to the full extent, as a profession. One needs only to hear Scholl digress on bee-keeping and its pleasures to become enthused.

And so the writer believes that a few facts concerning this leader in the South, such as he was able to glean while there, will be of general interest, and perhaps contribute somewhat to giving "honor to whom honor is due."

The subject of this biographical sketch, while yet young in years, is old in experience, and certainly has left an enviable record behind him already, and a still more brilliant prospect for the future can but be his.

Born at Hunter, Tex., October 24, 1880, of German parents, and still residing in Texas and expressing confidence in the resources of the dear old Lone Star State above all others, our subject may well be considered one of her most loyal sons. It is said of poets that they are born, not made. The same can be said with equal truth, and without fear of contradiction, of scientists. And if the modern inquiring bee-keeper is not a scientist, who under the sun is? The conclusion follows.

Like Langstroth of old, our friend and devotee of the busy gleaners of the field, received no encouragement from his parents, but, in fact, almost every discouragement possible; and his bees,

# American Bee Journal

which he had accumulated in his minority (some 60 colonies) he purchased to save them from other hands when he attained his majority. This is according to old German custom, that whatever earnings children may make before becoming of age belongs to the parents. He was told that bee-keeping was no occupation, and that he must take up some trade. Undaunted, young Scholl struck out for himself, and we behold the young adventurer seeking his fortune with determination away from the parental roof.

Mr. Scholl was about 21 years of age at this time, leaving October, 1901, and landing in Southwest Texas, where he made a thorough study of bee-keeping conditions in this bee-paradise. Here Scholl traveled in the interests of the Lone Star Apiaries and Lone Star Publishing Co., the "Lone Star Apiarist" being started in January, 1902, with Mr. Scholl as editor. In the meantime the position of managing apiarist for the Hyde Bee Co., had been accepted. This Company at that time owned 1150 colonies distributed in several counties.

Taking an active interest in Association work, Mr. Scholl, in 1899, was elected Secretary-Treasurer of the Texas Bee-Keepers' Association, and still holds the position. About this time he began to work for an experimental apiary, and was a member of a committee having this matter in charge, and was himself largely responsible for the appropriation which was made.

In May, 1902, our friend received a telegram summoning him to the Agricultural and Mechanical College, at College Station, Tex., for the purpose of establishing the above-mentioned experimental apiary, for which he had so diligently and earnestly worked. In the fall of the same year he was sent to Colorado to study bee-keeping conditions there, particular emphasis being laid on the investigation of foul brood. After remaining in Colorado for a month he returned and went again to Southwest Texas and the Coast region, to study bee-keeping conditions, and to work on collections for the entomological department of the college.

Mr. Scholl now came home and spent the winter enlarging his own private bee-business. At this time he was on the Legislative Committee which secured the foul brood law for Texas, and in the spring of 1903 he was appointed to the position of Apiarist and Assistant in the Department of Entomology at the Agricultural and Mechanical College at College Station. The work of carrying out the provisions of the foul brood law was in charge of the State Entomologist, and the work of foul brood inspection fell to the Apiarist. Mr. Scholl was always a believer in organization, and while here made special trips to talk organization as well as to do the work on regular foul-brood inspection trips. Several local bee-keepers' organizations were the direct outcome of these efforts.

While in the Department of Entomology a good part of the time was spent in studying the cotton-boll weevil, and experiments to determine some means of exterminating the pest were conducted. During the stay at College

Station much Farmers' Institute work was performed by Scholl, and in 1904 he lectured to 42 audiences, the main topic, of course, being bee-keeping. Among the topics that of diversification of crops was also kept prominently in the foreground, bee-keeping always being brought in as one of the means of diversification.

While connected with the Department at College Station, Mr. Scholl was selected by a committee composed of College and Experimental Station officials, to fill a position under the German Government, which, becoming interested in growing cotton in its East African possessions, was searching for a trained man to assist them. This position was one of peculiar difficulties, and required a man who could speak German; with a scientific training as well as versed in practical cotton-growing; and a considerable knowledge of economic entomology was also required. The position paid \$3,000 per year, and Scholl seemed to be the only man available in the South, and was earnestly urged by his colleagues at College Station to accept the offer. After careful consideration Mr. Scholl felt it his bounden duty to refuse the offer in order that he might stay with the cause that he had espoused, viz., apiculture, saying that could he have taken Texas and his bees he would go—showing again his loyalty to his State and the cause so dear to him.

In the fall of 1904 Mr. Scholl went to Ohio State University and remained there for 6 months, returning to Texas in the spring to look after his apiaries. While at the University Mr. Scholl did remarkable work, considering his previous college training, and gained the esteem and respect of his instructors in all of his work, much of which was advanced courses in the natural sciences, notably botany, keeping in mind always the honey-yielding quality of the various plants. During his stay here he worked on his herbarium of honey-yielding plants, and now has a collection of some 300 species which is conceded to be the best collection of its kind to be found in any State. The plants are, of course, Texas species. After returning to College Station, work on the honey-plants was continued, and a compilation of notes also was taken up to accompany the plants. This matter was to have been published as a bulletin of the College, but on account of a recent change of officials the work has been delayed. Mr. Scholl resigned his position at College Station Dec. 1, 1905, in order that he might go back to his home in New Braunfels and enlarge and build up his own private bee-business, intending later to place it in the hands of a competent manager, and then resume his studies at the Ohio State University.

June 20, 1906, Mr. Scholl was married to one of New Braunfels' favorites—Miss Emma Froelich—and she was to accompany him "up North" when he came to resume his college work at Columbus, Ohio. At this time a most unfortunate accident befell Mr. Scholl, which nearly cost him his life, as no doubt it would had it not been for the constant care and nursing of the "little woman" whom he had taken as help-

mate; and nobly she performed her part; for the accident was of a serious nature, a rib being broken over the heart. Blood-poisoning set in, and Mr. Scholl had about one chance in a thousand. But thanks to medical science and careful nursing, he is today as active as ever, after an illness of 5 months, in which our subject underwent several severe operations.

This spoiled the plans for the trip North, but did not cool the ardor for bee-keeping, and as soon as Mr. Scholl could get back home and around again, he could be seen about his bees, increasing his colonies here, buying more colonies there, and establishing new apiaries, which, this past summer, when the writer was with him, numbered 14, and scattered over the beautiful slopes of adjoining country here and there, the nearest apiary being 8 miles, and the farthest 197 miles from New Braunfels. Mr. Scholl regards this stretch of territory as important, in that it gives him a variety of flora, so that if there is a failure of the honey crop in one locality, he may get it in another. His past season's crop aggregated over 20,000 pounds, worth \$2000, and this takes no account of wax and vinegar. Mr. Scholl produces both comb honey and extracted. The comb is "bulk comb honey," as they call it in the South, which is simply the comb honey cut from shallow extracting frames, such as Mr. Scholl uses, and packed in various-sized cans; then extracted honey is run in on the comb which is cut so as to fit snugly on the inside of whatever sized can is used. The proportions are 2-3 comb and 1-3 extracted.

The writer, who, by the way, is a bee-keeper on only a small scale, keeping bees for the fun of the thing as much as anything, and for study, was inclined to be skeptical in regard to Mr. Scholl's form of hive. Mr. Scholl uses only one depth of body for brood-chamber and super, and one and the same frame for brood-nest and surplus. Before leaving Texas a new convert had been gained for the divisible brood-chamber, and shallow frames identical for both brood and surplus. If you want to know the merits of this, read Scholl's articles. If they don't convince you, make a pleasure trip to Texas and have Scholl take you out to one of his apiaries where he keeps, for just such an occasion, several full-depth surplus bodies. After you have "hiked" a half-dozen or so of these heavy, bulky surplus cases out through the bushes and over the prickly pears, under the benign influence of Old Sol's most benevolent and broadest smile, if you still persist in clinging to such bungling appliances, we should say that there is probably no hope for such an one.

To continue our story, Mr. Scholl not only looks after his bees, but various side-issues as well, and these bring him in good returns. He is a hustler and a general handy man at anything that needs to be done about the house or home ground, or almost any old place in fact, and this very versatility has made him successful with his bees.

Mr. Scholl is a prolific writer, and contributes not a little to the various

bee-papers. His place in the "Old Reliable" as manager of "Southern Freedom" is too well known to require further comment.

Finally, if you have never tasted Southern hospitality, then you will have to do so to appreciate it, and Texas

is a good place to go in order to get this taste. Wonderful country, and wonderful resources! In the words of Horace Greeley, with a slight modification, we believe it to be good advice to say, "Young man, go *Southwest*."

Columbus, Ohio.

best, but we must, at the same time, do all that we may to preserve the utmost quiet in winter. In the bee-cellar the bees must not be disturbed. Every disturbance means loss of bees, and all such loss weakens the colony, and courts disaster, in late winter and spring.

It may be true that in some cases the bees may suffer no little irritation, and consequent uneasiness, and still survive the winter. Bees differ in temperament as much as do people, and so some are less disturbed by noise than others; and, again, some become, apparently, used to confusion and noise, and so come through the winter with safety, even though this rule is not observed; yet we may rest assured that they will do better, if the quiet is secured, and it should be our aim and object to secure and maintain the utmost quiet that is possible. This involves good food, as poor food will disturb and irritate the bees. The same will follow from too severe cold. The very cold winters are generally the disastrous ones. We all know how our slumbers are affected by cold feet or a general sense of chill. I imagine that the same is true of bees, and the cluster will be disturbed by a sense of cold—will move, and as a result will eat too much; and, as they can not fly, will suffer.

I fully believe that one who will heed the above suggestions, will have no difficulty in wintering bees well every winter. The ideal condition is the best food, the greatest quiet, and a uniform temperature about and outside the hive of as near 20 degrees F. as it is possible to secure. Those who attain to this have little trouble to winter bees well.

#### EUCALYPTUS HONEY.

I have always thought that honey from any plant would be good no matter how aromatic the juice of the plant, or what odors might pass from the leaves. I have grave doubts if honey is ever poisonous. We all know how strong the odor from the eucalypts is. I was eager to get some honey from these flowers, and a few years ago did so from Mr. Barber, of our Forestry Station. It was light and fine. The mints are very strong scented; yet what fine honey we get from the sages. The sap of the plant is no key to the nectar of the bloom.

Claremont, California, Nov. 11.

## Honey Crop Reports and Prices

BY R. F. HOLTERMANN.

No one can read with careful consideration the various market quotations for honey in the United States and know their quality without realizing that the prices vary by several cents out of all proportion to the cost of transportation to the various centers. The prime reason of this is lack of organization among bee-keepers, lack of apicultural information (which may in a measure at least be secured through the various apicultural journals,) and to the difference of opinion as to the

## The Problem of Wintering Bees

BY PROF. A. J. COOK.

Shakespeare is so frequently quoted by our friends of the East—"This is the winter of our discontent"—that any words that may be helpful to the beginner will be welcome at this season of the year. The question has no importance to the bee-keepers of the Pacific Coast and will have less interest to our friends of the East when the principles involved are thoroughly understood, and guide in the general practice.

#### NUTRITION AND ACTIVITY.

We have from high authority that "He that doth not work, neither shall he eat." The reverse is equally true. If one does not eat, he can not do any effective work. All exercise of muscles or mind demands corresponding nutrition and nutrition only follows, among the higher animals, on eating and digestion. In California, where the bees fly every month of the year, they must eat much more than in the East, where they are confined and inactive for months together. In the East, if anything transpires that excites the bees, so that they move about to any considerable extent, they will, perforce, eat. But if they eat, there is danger of trouble, unless the amount is very slight, and the food of the very best.

#### IMPORTANCE OF GOOD FOOD.

Of course the bees are somewhat active in the coldest winters of the East, as they preserve the heat of the cluster, and must move somewhat. There is never a time when a blow on the hive will not meet with a response, by the bees, which show that they are alive and may become awake. Thus it is evident that the bees may—yea, must—eat even in winter, and when the cold is very severe.

We know that there are two kinds of food that the bees consume—the proteids and the carbo-hydrates. The pollen or bee-bread furnishes the proteids, and the honey the carbo-hydrate part of the food. We know that they often eat of the bee-bread, or have previously done so, as dissection shows pollen-grains in the stomach. I dare say Mr.

Heddon was correct in his contention, that in long, cold winters bees were better with no pollen at all in the hive. Proteid food is essential for muscular development, and if the bees stir much they must have it. But if bees are very quiet in winter, it is safe to presume that they take very little pollen, or bee-bread; and it is safe to affirm that the taking of this food would do no harm were they to fly out often, and in such event would be absolutely necessary. But in the quiet of a severe winter, the bees will consume a little honey, and that should be of the best, and in such case it will be all digested, and will do no harm.

#### WHOLESOME WINTER STORES.

We can never be too careful in giving the bees the very best for their winter supply. This requires—if we are to be certain—that we feed them the best cane-sugar syrup. Granulated sugar will always be wholesome, and as they store it, they will reduce it or change it to reducing sugar; it will need no digestion, and so the bees will safely take what is needed for their slight activity; and other things being right, they will surely winter well.

It is true that in most cases, if we feed what seems good honey, they will do well; but we can never know what there is in honey that the bees gather. Cider, rotten-apple juice, glucose from some grocery store or leaky barrel; honey-dew, which may be good and may be rank. So we see that there are many ways that the bees may have faulty stores, in case we trust to their natural stores for the winter supplies. It is wholly safe here on the Pacific Coast, but never safe where the rigors of an arctic winter swoop down upon the apiary. In case we do as Mr. Alexander advises—and it is sound advice—extract all in spring, that we may give room for brood-rearing, we may dispense with the cold, heavy combs that are a serious hindrance, in the midst of the brood-nest; and, best of all, may practice stimulative feeding—then we shall remove all the stores, and no one can complain that we are marketing artificial honey.

#### QUIET VERY ESSENTIAL.

Again, it is not enough that we see to it that the winter stores are of the

outlook, due to difference of temperament in individuals.

It will probably ever be while this Church Dispensation lasts that the various articles of commerce will be bought and sold on speculation. If a man has goods to sell below what the market value is, he is not commercially wronged by others buying it. In fact, no one could buy goods and sell them unless he could make a profit on them.

#### PRICES.

Owing to the establishment by the Ontario Bee-Keepers' Association of a committee to secure reports of honey crops, to study all the conditions which might affect prices, and their so far doing their work with good judgment, we have been able to be more unanimous than formerly in the demand for prices on our goods.

This year our prices for first-class comb honey have been higher than ever before. The price has been fairly well maintained; the only cloud upon the horizon as to the maintenance of these prices has been the stringency of the money market with the curtailment of business generally and the lack of organization in the United States. With the price of white honey in the East so different from what it is in the West, I can come to no other conclusion than that Western bee-keepers underestimate the quality of their honey, or that they do not care to get the best price obtainable for their crop; or (and this is, of course, the most likely reason) they did not correctly estimate the market conditions. After paying 3 cents per pound duty we have actually had some lots of honey imported into Canada at 10½ cents per pound, laid down; tins supplied free. And yet alfalfa honey is now worth 9 to 10 cents in the United States. Lack of organization is then of interest to bee-keepers the world over. With organization, too, no dealer suffers what he loses one year by not being able to buy at sacrifice prices. He will gain in another when the tendency of prices is the other way, and by organization and the reasonable regulation of prices he can afford to do business on a smaller profit, *because he will run less risk by depreciation in value.*

Be the price high or low, there must be a legitimate difference between jobber, wholesale and retail prices, and if the dealer loses in his business he is more chary about his next investment.

#### HISTORY OF HONEY COMMITTEE.

The history of the Honey Committee of the Ontario Bee-Keepers' Association is this. In 1902, at the annual meeting of the Ontario Bee-Keepers' Association at Barrie, Ontario, the Ontario Honey Exchange was organized. In its report it states:

"Its object is to establish a reliable and fair market price for the product of its members, the more proper distribution of honey, and to establish, when advisable, foreign and distant Canadian markets."

"The main officers of the Exchange shall consist of 5 directors, elected by the members of the Ontario Bee-Keepers' Association at each annual meeting, and to hold office for one year, and shall direct all business of the Ex-

change. They will choose a location, and obtain by rental or otherwise a suitable office and ware-rooms in some central city, and that shall be known as headquarters."

In short, the plan was to sell—more or less co-operatively to handle the products of the bee.

In 1903, H. G. Sibbald gave a report of the Honey Exchange Committee, and by it showed that at a meeting of this committee at Woodstock, August 15, the following prices were recommended: 60-pound tins, 7½ cents in Toronto; comb honey, \$1.05 to \$2 per dozen. At this meeting it was moved by H. G. Sibbald, seconded by J. L. Byer, "that the Ontario Bee-Keepers' Association appoint a committee to collect crop reports and distribute the same to the members." This was carried, and upon this basis the committee has acted and advised as to prices ever since, with a more than full measure of success.

This committee may have more arduous work in the future than it has had in the past. The condition of commerce, the fruit crop, and home and foreign honey crop, and the duty on honey, all must be fully considered when regulating prices. It seems to me the United States, perhaps under the National Association, might with advantage do something under the above head.

Brantford, Ontario.

## Production and Ripening of Extracted Honey

BY C. P. DADANT.

I notice in the November number of The American Bee Journal an article from Mr. Greiner on the ripening of honey, and one from Mr. Townsend, taken from the Bee-Keeper's Review, on the comparison of expense in producing comb and extracted honey. I wish to make some remarks on these subjects.

We do not leave our honey on the hives beyond the time necessary to mature each separate crop. That is to say, the clover honey, which with us is the first crop, is taken off the hives just as soon as the crop is at an end, and, without waiting for the next crop. It is our experience that honey is very promptly matured at the end of a crop, and it is unnecessary to delay extracting beyond two or three days after the crop has ceased.

If the harvest is very heavy, and we run short of supers, as happened during the crop of 1903, we never hesitate to extract to make room, before the crop ends. In that case, we remove the supers which were first filled by the bees, for in such seasons we have more than one super on each hive, and sometimes as many as 4. The last supers put on will, of course, contain the freshest honey, whether they are above or below the others. So we may take 3 supers off a very populous hive and leave one on, of partly sealed and partly very fresh honey. The others will be returned after the honey has been extracted, perhaps to be filled again before the end of that crop of honey. In my mind, it is during those

very heavy crops that the advantage of the honey extractor, and its capacity for saving labor to the bees, is most apparent.

In the season of 1884, I remember extracting some 5,000 pounds of honey from an apiary of 89 colonies in 3 days. At the end of the third day, we examined the colonies from which we had extracted in the morning of the first day, and found most of them with honey in every cell from which the honey had been removed 3 days before. No amount of argument could convince me that those bees could have secured anywhere near *half as much* honey, and stored it, during the same space of time, if they had had to build the combs for it.

We do not believe in honey ripened after removal from the hives, by artificial means. But allow me to say that, in this matter, one must not be too dogmatic. There are a number of things which may cause a different result. The warmth of the summer, the greater or less amount of moisture in the atmosphere, according to location; and, above all, the condition of the honey itself when harvested—all these things, or each of them, will have an influence on the more or less difficult ripening of honey by artificial means. As good an authority as the late Chas. F. Muth, was strongly in favor of artificial ripening. Mr. Muth was a practical bee-keeper of long experience, who was also a honey-dealer, and handled hundreds of barrels of honey each year. He did ripen honey artificially in an attic over his business house in Cincinnati, and certainly had a very good article of honey, as I found by actual examination years ago.

The body of the honey, at the time of its harvest by the bees, is of very much importance. I know that it has been habitual to say that fresh-harvested honey contains something like 75 per cent of water. But there are times when it has much less water than this amount. Some grades of honey are always watery when harvested. Among these I will mention basswood honey. I have repeatedly found basswood honey that fermented in the hives, in the manner mentioned by Mr. Greiner at the foot of page 720. This and other reasons have caused me to say that the sealing of the cells by the bees was not always a criterion of the ripening of the honey, for evidently in both my experience and Mr. Greiner's, the bees had sealed this honey before it was sufficiently ripened, showing that they are apt to make errors of judgment as well as ourselves. On the other hand, when the crop is at an end, especially when it ends abruptly, as by frost, they often leave quite a number of cells unsealed, the honey of which is as thick as any sealed honey they may have; the reason they have for not sealing it is very probably that they have ceased to make comb and expect to use up that honey before long. It is simply a matter of expediency and economy with them.

That certain grades of honey are very thick when harvested may be evidenced from the fact that statements have repeatedly been made by some bee-keepers in the Old World, that

honey from heather was very difficult to extract from the combs on account of its density; some even go so far as to say that it cannot be extracted.

L. C. Root, the son-in-law of Quinby, a man of great experience in bee-culture, in discussing the ripening of honey, asserted to me that in his opinion, the thickest and best ripened honey is the slowest to granulate. I agree with this assertion. He went farther, and said that very ripe honey would not granulate. On this I think we should demur for the simple reason that there is very little if any honey that will not granulate under any circumstances. Even the thick heather honey, mentioned above as reported difficult to extract, granulates very readily. We have had honey, purchased in Louisiana, which was guaranteed by the producer to remain liquid. But we had not had it three weeks in our cold January climate of Illinois before it began to show the change.

I would most emphatically agree with Mr. Greiner in trying to keep the different grades separate. Nothing is more difficult to sell than a grade of extracted honey which is streaked in color by the uneven mixture of two different grades. When it becomes necessary to harvest mixed honey, I would insist on heating it and stirring it thoroughly to mix it. It is sometimes possible to make a very good grade of honey out of two very different crops. But much care must be exercised in not overheating it and destroying its flavor.

We had, at one time, a lot of pure basswood honey, from Lynnville, Iowa, which was so strong in basswood flavor that the average customer was afraid of it, and mistrusted its purity. We had also on hand a lot of very dark fall honey. We heated both and mixed them, and the blended flavors gave us an article that sold readily. The basswood changed the shade to a lighter color, and the fall honey had hidden the objectionable basswood flavor and odor.

In closing, permit me to emphasize the statement made by Mr. Townsend at the end of his article on page 720, as the report of his son:

"I could have worked 5 yards for extracted honey with the same labor it took to produce this crop of 2,300 pounds of comb honey."

My preference for the production of extracted honey is based on the same idea. A much greater quantity of honey can be taken care of. A less number of swarms secured. See Mr. Townsend's report on the same page—30 swarms when producing comb honey, and 5 swarms when producing extracted honey. To the beginner this may not be an important item, but to the apiarist who already has as many colonies as he cares to keep, the matter of undesired swarms is most important. What we want is honey—more honey—not more bees.

The only drawback to the production of extracted honey is the difficulty of its sale. This does not exist in Europe, and that is why so much more of it is produced there than here by large apiarists. Comb honey, in America, will long be of more ready sale than the other kind.

## Some of the Results of Bee-Keeping in 1907

BY G. M. DOOLITTLE.

"How have the bees done this year?" is a question which comes to me from my correspondents. Another correspondent writes: "You used to report the result of each season in the bee-papers. Why do you not do it any more? Just tell us through the American Bee Journal the result from the bees during the year 1907."

This reminds me of what the bee-men used to be accused of years ago, when it was said at our bee-conventions and elsewhere, that when bee-men had a good season with a large yield of honey, they were sure to rush into print with the matter, setting bee-keeping out in glowing colors; but when a poor season came, they kept as mum as a clam, and thus only the rosy side of our pursuit appeared before the public gaze, this causing many to get a false impression of our occupation and rush into bee-keeping to the detriment of those already in, through an over-production of honey. I know it is easier to tell of our successes than of our failures; but I never believed that there could be an over-production of honey while there were hundreds and thousands of mouths watering for even a taste of the honey piled up in the bee-keepers' store-rooms or on the markets of our country.

But I am not asked for an article on over-production, nor could I properly "tackle" the matter had I been, so I will content myself in telling the readers of the American Bee Journal something of the season of 1907 and its results in southwestern Onondaga County, which is a part of the State of New York.

The bees came out of the cellar in fine condition, as good as I ever knew them to do, but after a few warm days it turned cold, and it kept that way till near the middle of June, so that on June 10, at a time when the hives should have been full of bees and brood, there was not a single colony that was as good as it was the day it came from the cellar, while many colonies were not half as good. Of course the season was late, but not nearly so late as were the bees, although everything was done that could be done to advance them along the line of prosperity. With June 20 warm weather came, and this pushed vegetation along very rapidly, so that I saw that if any results in surplus honey were to be obtained it must come along the line of massing the bees together, rather than a line of expansion. To this end, brood was taken from the weaker colonies and given to the stronger ones, so that these arrived in fairly good condition when the clover and basswood bloomed later on, at which time the plan of "shook swarming" was followed, and the beeless brood given to the weak colonies from which brood had been taken to help the stronger ones up to where this "shook swarming" could be done to advantage just at the commencement of the honey-flow. And to keep these colonies to which the

brood was given from contracting the swarming fever before the time came to shake to the best advantage, all the combs not occupied with brood were taken out so as to give place for the frames of brood given, when these combs having no brood in them, but some honey, were placed in an empty hive, together with other reserved combs, sufficient to fill this extra hive, when a queen-excluder was placed on top of the hive of brood, and on this was put this hive of combs containing more or less honey. This honey helped the bees to keep up the brood below to its greatest capacity, and also gave a place for the storing of honey, should any little yield occur before the time was ripe for shaking; as well as to ward off any desire to swarm which might arise from the hive full of brood below. Besides this, it started the bees to work in the upper story, or the surplus apartment of the hive, if we please so to speak, so that at the time of shaking the bees were used to going above with any honey which came from the fields. And, besides this, at the time of shaking this hive of combs in which the bees had been at work for some time, was just the hive into which they were run when they were shaken from their brood, as it was necessary only to set this upper hive on the stand in place of the hive of brood, put on the supers of sections, and shake the bees in front.

They were then in their own home, as it were, but without brood, and as the queen continued to lay right along, the honey in these combs, together with that coming in from the fields, was rushed right up into the sections, through the force of habit they had acquired before the shaking. Every bee, or practically so, which was in both stories of the hive before shaking, was now in that hive of broodless combs and honey, and for this reason there had to be an overflow of bees right into the sections; and, as the queen demanded room for the laying of her eggs, and the bees also demanded brood for their future existence, all thought of future swarming was banished, and work with a will was at once begun right where it would count for money in the pocket of the apiarist.

The combs of beeless brood were piled 2 deep on the weak colonies, and the emerging of this brood soon made these colonies strong, with plenty of room for the storing of all the honey that came in from the fields, in the cells vacated each day by the thousands of emerging brood, for the queen was kept in her old hive by means of a queen-excluder before the hives of brood were set on top.

Now for the result of this massing plan in a poor season, for it proved to be the poorest of any season I have known since that of 1869:

The average yield of section honey from the colonies so worked was 61 1-3 pounds, or that many pound sections, while in the combs put over the weak colonies there is an average of about 45 pounds that could be extracted; but as I prefer to keep this for next season's use, it will be stored away to set over colonies next year in following out the

plan here detailed another year, should the year of 1908 prove something after the fashion of this year.

All colonies have sufficient stores for winter, as those lacking have been supplied from these combs of honey before the 45 pounds average was taken.

As far as the yield is concerned, I have done much better, but I think nothing like it before when the poor-ness of the season was taken into account. And I should not have given the matter for publication only with the hope of inspiring some one who does

not have an "eye" on the season, to get the bees and the season together in some way, so that even a very poor season may count towards success. I know that there is considerable fun poked at "locality," etc., but I am firm in the belief that those who know how best to bring the locality, the season, and the bees together, will be the successful ones; while those who pay little or no attention to these matters, or scout the idea of there being anything in them, are those who are the most liable to be candidates for "blasted hopes."

Borodino, N. Y.

who had been identified with the history-making epoch of California, especially of Oakland and Alameda County. The apiary he established on the old homestead in 1865 is still in existence, and is probably the oldest apiary in California that has been kept continuously in one place.

### The Pepper-Tree and Eucalyptus.

In writing of the pepper-tree (page 333), I mentioned that Prof. Cook was wrong when he stated that it bloomed in April. I have always found it in blossom here in September; sometimes it would commence in August and continue through September. Now, strange to relate, I notice that a large pepper-tree on our place is just showing signs of blooming; in fact, a few blooms were expanding the 26th day of April. In May there was much more bloom. But I notice that the clusters are diminutive ones less than one-fourth the size of the bunches of flowers we have in the fall. The flowering of this tree at this time must, therefore, be abnormal. The tree must be getting the season mixed up somewhat.

This reminds me that some time ago, Prof. Cook in writing about eucalyptus for the American Bee Journal or Gleanings, I forget which, stated, as nearly as I can remember, that as that tree came from a country where it bloomed in the summer, it bloomed in the winter here. That does not seem right to me. I should think that if it, for instance, bloomed in July in Australia—which is south of the equator and the dead of "winter" of that end of the earth—it would bloom in January here. Does not a plant in the matter of blooming, etc., follow the seasons no matter where it may be transplanted?

Aside from the odd time of blooming I will mention this oddity of the pepper-tree. Drop some of the leaves in water and notice them sail about. They move by "fits and starts." The water causes little explosions in the leaves.

### California—A Modern Mecca.

It may seem strange to some, nevertheless it is a fact, that a person who had lived a year or so in California, and for some reason or another was called to reside in some other portion of the world, is never contented until he is again back upon the fruitful soil and under the cheerful skies of the Golden State. For years I have observed how those who resided here for a time would come trooping back one after the other. A few months ago I had a letter from A. D. D. Wood, of Michigan, in which he stated he longed to return to California, and that he would surely do so as soon as certain ties which held him in the east were severed. I knew Mr. W. when he had charge of an apiary near here. I think he was in this State but 2 years. For the past few years he has been engaged, I believe, in rearing queens at his old home. It may not be many years before we hear of him as the leading California queen-breeder. And this is the place to rear fine queens. The wonder

By W. A. PRYAL, Alden Station, Oakland, Calif.

### In Union There is Strength.

"Bees accomplish nothing save as they work together—neither does Man."

This is one of the mottoes printed in good sized type that is conspicuously displayed in offices in San Francisco. I presume it is so posted to induce the citizens of that unfortunate city to pull together and rebuild their city as never a city was built before. That's good. But looking at the words in another light, I am constrained to remark that the fellow who wrote the motto never had an opportunity to learn what one lone bee could accomplish when she got a genuine hustle on. A bull in a crockery shop might do more damage, but I am willing to go on record that he could not "skidoo" a crowd quicker than a hybrid bee whose business end was prepared for dire vengeance. For her size, there's nothing in the world that can put a crowd so quickly "on the run" as a bee on mischief bent.

### Honey Prices Up.

I was in one of the leading grocery stores this afternoon in Oakland, making some necessary purchases, when I nearly lost my breath. Don't get scared, ye buyers of the necessities of life; it was not from the fact that I went into such a store, or because of any ill effects of the commodities therein sold, that I came near collapsing. No, but it was this: *Honey has jumped up!* Yes, jumped—"soared," might be the better word. I saw one of the clerks wrap up a small section of honey for a lady customer and demand 25 cents for the dainty morsel. And he got it.

Just think! It was only a couple of years ago when I could never get more than a dime for the selfsame article. My! If my bees had produced only a few tons of comb-honey the past season, instead of a wheelbarrow full, wouldn't I be rich? Six dollars for

each super turned off the hive instead of \$2.40, as formerly! What a difference!

But how long will it last? I suppose next year honey will be down almost as low as ever. But the chances are that it will not. I noticed to-day that good eggs are quoted at 55 cents per dozen; creamery butter is 80 cents per "square" of two pounds. And these articles, too, are higher than usual at this time of the year. What must those do who can not afford to pay these prices? It is true that many men are getting higher wages than they ever did before, but then there are others who are not getting a cent more than they formerly received. I will leave the subject, as it is getting too grave to discuss in a bee-paper.

### Death of A. D. Pryal.

As the March 14th issue of this Journal (p. 207) contained a short biographical sketch of my father, who could justly be considered one of the pioneer bee-keepers of California, it now becomes my painful duty to supplement such record with the announcement of his death. In the middle of last winter my father fell a victim to a bad attack of grip; for a time his life was despaired of. Along with that malady he was a sufferer from valvular heart trouble. He was sufficiently recovered, however, during April and May to be about and attend to his usual business, as he was always an active man, and liked to be engaged. It was while thus attending to business (he having gone with some of his employes to one of his places some distance from home) that he fell while climbing over a low rail-fence, and which fall is believed to be the cause of the abdominal abscess which terminated his life.

Thus, at the age of 76 years, passed away one of the best of men—a man

# American Bee Journal

is that the business had not been made a large one here long before this.

Lately I heard that that veteran bee-keeper and apicultural bee-editor and publisher, Albert J. King, is again a resident of California. Prof. King lived here from the middle sixties, first at old Gilroy, and then later at what is now Oakland and Berkeley. He was the first principal of the Peralta School, then a district school but now one of the largest grammar schools in Oakland. From California he went East and was associated with his brothers in the sale of the American bee-hive, of which the latter were patentees. For some years he edited and published the Bee-Keepers' Magazine, now for some years defunct; then after he sold out his interest in the magazine he was interested in large apiaries in Cuba.

Another bee-keeper of more than common renown who lived in this State many years ago, as we are won't to compute time, was Prof. A. J. Cook. I never knew just how long he was here, but I read some time ago in one of the editions of his valuable work upon bee-keeping that he had resided in or near Sacramento. Any way, for many years we found him connected with the Agricultural College of the State University of Michigan, and where his work was such as to give him a world-wide reputation. But back to California he would come, and we have since heard of him in connection with Pomona College, in the Southern portion of the State.

And so it goes.

## Freakish Things Bees Do.

When some thing of a freakish kind is shown us, we at once become interested. I suppose that's human nature. Nothing seems to interest the average man or woman so much as bees. Maybe that's because bees are freaks, or the next thing to it. Now I don't want it understood that I make this indictment against those wonderful little insects. No, I do not, but some one else has. What I would do is to say that sometimes bees do some very strange things. Witness some of the queer work they will do inside the hive, and, occasionally without. Herewith I am showing a piece of their freak-work done inside of one of my hives during the last spring. The comb attached to the division-board was made in a space not much over one-half inch wide—it was between the division-board and the wall of the hive, and I discovered it in time, else the comb would have been built in the entire space. The industry of the bee is not commendable when performed in such cramped quarters.

The photograph is one of the very best I ever secured. The effect of light and shade are good; even where the comb was broken the effect seems realistic in the picture. Now, while we may criticise the bee for going out of her way "to ply her trade," I must not let this opportunity slip by without having "a shot" at some of the makers of freak bee-hives. I would class the honey-board shown in the cut as a freak one that no practical bee-keeper would

COMB BUILT ON DIVISION-BOARD.

want to use. The old-fashioned solid board is the board for me; I'm sure other bee-keepers who want results without handling flimsy contrivances that go

to pieces upon the "slightest provocation," would sooner have a cast-iron "honey-board" than a "contraption" like the one pictured.

Conducted by LOUIS H. SCHOLL, New Braunfels, Tex.

## Prospects for 1908.

It is rather early to say anything about what the next year will bring us, but a good, wet fall and winter, so that our trees and shrubs are loaded with sap next spring, is generally followed with a good honey season. Rains have been very plentiful here and all over Texas and other parts of the South, and unless something very unusual happens, the bee-keepers may expect a good honey crop next year, for which preparations should be started at once, as now is the time to begin.

## Bees Gather Rosin.

During this year I have seen bees do what I consider a remarkable feat, and something I never read of them doing, that I remember. The remarkable occurrence is that of gathering rosin from pine boards, rich with the glue. I first discovered them gathering rosin from a very rich board last April. Several dozen bees were thus engaged, and before long they had completely cleaned the board, taking, I should judge, nearly a pound. During the summer the same board exuded another nice lot of the rosin, during which time the bees let it alone for the more useful work of honey-gathering. Just now the bees are again actively employed collecting rosin from this same board, and making some use of it, of which I have taken no pains to find out. I would guess that they are using it as a substitute for propolis to stick things up with.

If there were enough rosin-bearing boards around for all the bees to employ their spare moments, I surmise that an honest adulteration of beeswax would result. In the meantime, for my part, I do not care how much of the rosin they gather, or what they are doing with it. I am of the opinion that they will not adulterate their wax to any appreciable extent with this pine glue. I have no time to sit around and try to exploit their method of using this rosin.

I judge that some of our bee-keeping brethren in pine-wooded districts could be able to inform us to the extent of bees gathering rosin, and to the use they apply it.

T. P. ROBINSON.  
Bartlett, Texas, Oct. 28.

Bees gather a good deal of resinous propolis here in the South to close up cracks and crevices in their hives, and I am sure that's what your bees are using it for. A great deal of rosin can be found on our mesquite trees, sunflowers, etc., which the bees collect for this purpose, although I have not seen them on pine boards.

**Bee-Keepers' Exhibit at the San Antonio International Fair, Nov. 9 to Nov. 24.**

The exhibits this year surpassed all previous ones, though the work on them was begun very late in the season. This, however, shows what can be done in a good season another year, and preparations for next year's exhibit are al-

# American Bee Journal

ready taken up so that the "cream of the bee-keepers' toils of 1908" may be hoarded together for the bee-keepers' exhibits at College Station, during the annual July meeting of the Texas Bee-keepers' Association; at Dallas, during the State Fair; and then at the International Fair in San Antonio. Therefore, fellow bee-keepers, remember this during the coming year. When you have something for exhibition, let me know about it. Such exhibits are great advertisers of our own industry, you know.

W. H. Laws and D. C. Milam were the judges who passed upon the merits of the exhibits in the Bee and Honey Department of the Fair. The number of exhibitors and exhibits this year was the largest and most varied since the Fair was instituted, and as a result the judges had hard work in making their awards.

This year's display attracted great attention from nearly every visitor to the Fair. The observatory hives were a great source of constant interest, not only to the experienced bee-keepers, but also to the curious uninitiated.

The following rewards were made:

Best collection of Texas honey-yielding plants, pressed and mounted—1st, L. H. Scholl; 2d, Miss Meta Hillge.

Golden Italian bees and queen in single-comb observatory hives—1st, John W. Pharr; 2d, Grant Anderson.

Three-banded Italian bees and queen in single-comb, observatory hive—1st, W. O. Victor; 2d, Udo and Max Toepperwein.

Carniolan bees and queens in single-comb observatory hives—1st, Grant Anderson; 2d, Udo and Max Toepperwein.

Caucasian bees and queens in single-comb observatory hives—1st, Southwestern Bee Company; 2d, Udo and Max Toepperwein.

Cyprian bees and queens in single-comb observatory hives—1st, Udo and Max Toepperwein.

Holy Land bees and queens in single-comb observatory hives—1st, Udo and Max Toepperwein; 2d, Southwestern Bee Company.

Banat bees and queen in single-comb observatory hives—1st, Grant Anderson; 2d, Udo and Max Toepperwein.

Black queen and bees in single-comb observatory hives—1st, Southwestern Bee Company.

Best display of bumble-bees—1st, F. L. Aten.

Best and largest display of bees of various races in observatory hives—1st, Southwestern Bee Company; 2d, Udo and Max Toepperwein.

Best and largest display of queens of various races, in mailing cases—1st, Southwestern Bee Company; 2d, John W. Pharr.

Best case of white section comb honey, twelve pounds or more—1st, W. O. Victor; 2d, Wald C. Conrads.

Best case of light amber section comb honey—1st, Southwestern Bee Company; 2d, W. O. Victor.

Best and largest display of section comb honey—1st, W. O. Victor; 2d, Udo and Max Toepperwein.

Best display of special designs of comb honey—1st, Udo and Max Toepperwein; 2d, Frank Kraut.

Best twelve pounds friction-top pail white bulk comb honey—1st, L. H. Scholl; 2d, L. Jones.

Best six pounds friction-top pail white bulk comb honey—1st, L. H. Scholl; 2d, L. Jones.

Best three pounds friction-top pail white bulk comb honey—1st, J. W. Pharr; 2d, L. H. Scholl.

Best display of bulk comb honey—L. H. Scholl, both prizes.

Best dozen jars white extracted honey—1st, Southwestern Bee Company; 2d, Udo and Max Toepperwein.

Best dozen jars amber extracted honey—1st, Otto Sueltenfuss; 2d, Southwestern Bee Company.

Best display extracted honey, granulated form—1st, W. O. Victor; 2d, L. H. Scholl.

Best sample cake of bright yellow beeswax, not less than two pounds—1st, A. Fourrier; 2d, L. C. Rosseau.

Best and largest display of beeswax—L. H. Scholl; 2d, Udo and Max Toepperwein.

Best display in special designs in beeswax—1st, Southwestern Bee Company; 2d, L. H. Scholl.

Best display of fruit preserved in honey—

Southwestern Bee Company, both prizes.

Best honey-vinegar—1st, Moritz Rompel, 2d, Southwestern Bee Company.

Best instructive display in apiarian products and of the various uses made of honey and beeswax—1st, Louis Scholl; 2d, Southwestern Bee Company.

Best and largest display of bee-keepers' supplies—Diploma to Southwestern Bee Company.

## Packing Bees for Winter.

For out-door wintering, would it be advisable to make a box-shaped frame that would sit over the hive, leaving a space of about 6 inches on each side of the hive to be filled with hay or straw, and leaving the entrance open? This would be kept reasonably dry.

KANSAS.

ANSWER.—Yes, if you change that "reasonably dry" to "very dry," for no matter how well you pack the sides, if the top is so poorly protected that rain or snow gets in at all, there will be trouble. You say nothing about what you will have over the top, but no doubt you intend to protect it well, for it is more important to pack well over the top than the sides. A good many think it is not well to have the front of the hive packed the same as the other 3 sides, but leave it open, so the sun can shine on it when a warm day comes.

## Wide-Top Section-Holders.

1. What style of section-holder do you use? I take to the wide-top style, although I have never used any, but as J. E. Hand advocated in Gleanings, I think they would be the thing to keep the tops of the sections clean; but I do not understand how the sections can be removed easily after the bees have propolized them as all bees do.

2. Therefore, I have an idea that a section-holder could be made in a way that the top-bar could be removed easily, and in a moment's time, so as to get at the sections as in an open-top holder. Is such a complicated holder any advantage, or will a solid wide-top bar admit us to the sections without trouble?

MISSOURI.

ANSWERS.—1. I use the T-super. It is not boomed in the catalogs, and some who have tried it do not like it, but quite a number—some of whom produce honey on a large scale—prefer it; and, rightly used, I believe it the best surplus arrangement in existence.

2. Different kinds of section-holders have been made that have top-bars covering the sections, and I'm not sure but

some one tried something in the line of a removable top-bar such as you propose. I have some doubt whether the game is worth the candle. In the wide frame which was extensively in use some years ago, and is still in use by some, there was not so much difficulty in getting out the sections, even with quite a tight fit, and after the bees had glued them in. I've taken out tons of such sections, and in some cases they were probably as tight a fit as you would have with a removable top-bar. Even with this latter, you would probably find that the bees would crowd in streaks of glue between the top-bar and section. Like many others, I prefer to have nothing over the sections to prevent the bees from having access to the tops, and bees will not put as much glue on a plane surface as in angles and cracks. What glue they do put on can be scraped off.

## Bees by the Pound—Disease Carried by the Queens, Etc.

1. Would a pound of bees shipped from the South in the spring make a good colony of bees by fall, say to be shipped from Tennessee or Kentucky?

2. Would it be best to put such bees on full combs, or just on starters?

3. If I should send South for some queens and the apiarist from whom I purchased these queens had a disease in his apiary, by introducing them, would my bees be liable to get the disease?

4. What color is the abdomen of a 3-banded Italian bee beside the 3 yellow bands, black or yellow?

MINNESOTA.

ANSWERS.—1. Yes, if shipped early enough in a good season.

2. There would be a decided gain in giving them full combs; and they should also have the advantage of being kept as snug and warm as possible.

3. The most common way of carrying foul brood is by means of the honey; and if honey from a diseased colony were to be taken by the escort of worker-bees, or in the cage, you could safely count on introducing the disease into your apiary. It is generally believed

that the queen alone does not carry the disease; so when you receive a queen through the mail, and are not absolutely certain as to safety from the disease, introduce nothing but the queen alone. Take a clean cage and put the queen alone in it. Better make the change before a window in the house, so that if any workers of the escort get out you can kill them on the window. Then burn the cage in which the queen came, bees and all.

4. Back of the 3 yellow bands the rest of the abdomen looks about the same as that of a black bee.

#### Late Feeding of Bees for Winter.

I have a colony of fine Italian bees which have not stores enough to last them a month. I had to take it away last summer and have not as yet got it home. How can I feed it at this late day? It is in a chaff hive with extra super on filled with cushions.

ANSWER.—The best way is to give combs of sealed honey. Carefully take out the empty frames and put the combs of sealed honey close up to the bees, for if there is a space between the bees and the honey, and it should be quite cold for a time, the bees might starve without ever touching the honey. What's that you say? "Haven't any combs of sealed honey?" Well, that's about what I expected. But make up your mind that you'll always have them hereafter.

Well, if you haven't combs of sealed honey, maybe you have some honey in sections. You can fit some sections in a wide frame, or even a common brood-frame, by cutting away enough of the sections to make them fit in the frame. Rather an expensive way to feed; still, I've fed a good many sections in my time.

If you haven't the sections either, you can do quite well with candy. Take best granulated sugar and stir it into a very little hot water in a dish on the stove; but whatever you do, don't let it burn, for burnt syrup is death to bees in winter. Better not set it down in the stove-hole so the fire can touch the dish, but set the dish on top of the stove. Keep trying it, and when you find a little stirred in a saucer will grain, take it off quickly and pour into dishes making cakes  $\frac{3}{4}$  of an inch to  $1\frac{1}{4}$  inches thick. Put over the frames a cake of this candy that will pretty well cover the frames, or if cakes are small you can use more than one. Cover this with some kind of cloth covering, and shut up snug. Toward spring you may need to repeat the dose, but if you make the cakes thick enough and large enough no more will be needed for a good while. Your extra super on top will give you an extra chance to put on the candy and to pack it up warm.

#### Moth-Eaten Combs—Pollen.

1. I have a number of frames which look very ragged on account of moth ravages, some in which more than  $\frac{1}{2}$  of the comb is gone. Will the bees repair this and fill out the frames again if I give them to the bees next spring? or would I better cut out all this comb and put in new foundation?

2. All this comb is well filled with pollen. Will this keep over winter, and will it be all right to put in the combs next spring? My intention is to use these combs—8 frames of them—in a new hive next spring, for increase.

ILLINOIS.

ANSWERS.—1. If the comb is in good condition except for the ravages of the moth, it's good property, and it is well worth your while to keep it to give the bees again. Something, however, depends upon how the bees fill out the vacancies in the combs. If they fill them up with drone-comb, you might better melt up the combs and give foundation. If given to a strong colony in a flourishing condition you can count on a lot of drone-comb; if given to a nucleus, or to a swarm when first hived, you may count on worker-comb.

2. Pollen keeps well through winter, unless you keep it in a mouldy cellar, and pollen in good condition, pound for pound, is often worth as much as honey.

#### Amount of Sugar for a Pound of Honey.

Recently I had a suspicious customer—I often have them. I told him I did not know if bees would put glucose syrup in comb and cap it over. I agreed with him that they would put good sugar syrup in comb and cap it over, but from a little experience I had in feeding up weak colonies I had my serious doubt whether there would be any profit in it, or at least the profit would be so small that the consumer would have little to fear from that kind of a fraud.

Aside from the fraud, the work, exciting the bees to rob, and that we must feed till the body of the hive is full before the bees would put anything into the super, how much sugar would we have to feed for each pound section we would get filled?

ILLINOIS.

ANSWER.—I don't know. After everything was filled up so that the bees really began storing in sections, it is possible that it wouldn't take much more than a pound of dry sugar (of course the weight of syrup would be more) to make a pound of the stored—whatever you would call it. If any one knows any more than I do about it, please tell.

#### Hives Full of Frames for Winter.

It is perhaps a little late to ask the question, still I should like to know if it is good policy to keep all the frames in a 10-frame hive over winter, even though the cluster occupies only about 4 or 5 frames. Would you advise me to remove some of the frames and to put in a division-board? I use chaff-hives, and thought that everything was in good shape as it is, without removing any frames.

NEW YORK.

ANSWER.—Some time ago an eminent authority in France made experiments to compare the heat in a hive having part of the frames occupied by a colony and the hive filled out with empty combs, but separated by a division-board, with the same thing without a division-board. A thermometer showed

there was no difference, and he decided that a division-board was no better than an empty comb. Since then it has been pointed out that although a thermometer may have shown precisely the same temperature in one case as the other, that does not by any means prove that the division-board did no good, for in the second case the bees burnt more fuel (consumed more stores) to keep up the heat, and we know well that the more the bees eat the more their intestines are loaded, and the shorter confinement they can endure.

Clearly it would have been better if so much empty space had not been left for the bees to keep warm. Whether it is better to make any change now is another question. If the bees are in a cellar whose temperature is 45 degrees or more, it will almost surely be better not to make any change, for the disturbance will probably do more harm than the change will do good. If the bees are on their summer stands—really I don't know enough to say whether it is best to make any change or not; but I half believe I'd risk them as they are.

#### Preventing Swarming—Location for Observation-Hive.

1. I have 4 colonies of bees. If I take say 2 frames from each colony and form a new colony just before swarming time, would it have any effect in preventing swarming? Or is there a better way?

2. Has the Lyman method of swarm-control any advantage over natural swarming, except the necessity of watching the bees? If so, what is it?

3. What is the best location for an observation-hive? Would an attic with a southern exposure be good? or would the attic with a northern exposure be best? or what is the best?

CONNECTICUT.

ANSWERS.—1. There is a great difference in bees about swarming, some colonies being much inclined that way, others very little. Taking 2 frames of brood from a colony of a very swarming disposition would be likely to have but little effect. Even a colony not very bad in that respect would not be much affected by it if the frames were taken away after preparations for swarming were well on the way and queen-cells well started. Suppose, however, that we have a colony not greatly given to swarming. Indeed, the season is pretty well along, and as yet no queen-cells are started, although the colony is strong, so strong that within a very short time it will start queen-cells, and if we take away 2 frames of brood today it may be sufficient to make it give up all thought of swarming. So you see it depends upon circumstances.

2. Yes, with the Lyman method the forces of the colony are not divided up as they are with natural swarming.

3. The best location for an observation-hive is one that is most convenient for the observer, and at the same time comfortable for the bees. The most convenient place for you might be in one of the living-rooms, and that would likely be comfortable for the bees. But there might be objections to that, such

as the meddling of children, driving you to the attic, where there is danger of too great heat on the south side. In some attics the north side would be all right; in others still too hot. To decide just the place for you, conditions, and also premises, must be carefully considered.

#### Roofing-Paper for Winter Cases— Wintering on Summer Stands— Do Bees Store Candy Feed?

1. I have 4 colonies of bees. For 2 of them I have wooden cases for winter, with a 3-inch space all around, which I pack with excelsior. I also put excelsior on top. Would 2-ply roofing paper fastened around the hive and over it, be as warm as the wooden case and packing? If not, would cushions 3 inches thick, filled with excelsior or corn-husks, and then covered with roofing paper be as good as the wooden case?

2. How do you winter bees on the summer stands?

3. When bees are fed candy, am I right in thinking that they consume it only as they need it, and do not store it in the combs? CHICAGO.

ANSWERS.—1. I doubt that the roofing paper alone would be as good as the wooden case and packing, but it is likely the cushions and roofing paper might be even better. Something, of course, depends upon the closeness of the two different coverings. It is probably easier to make the wood close without cracks than the paper. But granting equal closeness in each, the paper might be the better, especially if dark-colored.

2. I don't winter my bees on the summer stands, but in cellar. When I wintered on the summer stands some years ago, I was not as successful as in the cellar.

3. You are right in your view.

#### Home-Made Comb Foundation.

I keep a few colonies of bees for my pleasure and have saved some wax. Now, I don't like to sell wax for 20 cents a pound and buy foundation for 65 or 75 cents per pound. Can you recommend the Rietsche press? If not, say "No" to my second question; but if you can, please give a few hints as to how to make foundation.

1. Are you making your own foundation?

2. Could I make foundation? I have never seen it done. OREGON.

ANSWERS.—1. My time has always been so fully occupied with other things that I never tried making comb foundation. Besides, I think I can buy it cheaper than I can make it. I use foundation mostly for sections, and it would take a good deal of practise to enable me to make anything like as nice foundation as those who make a business of it.

2. There are thousands of Rietsche presses in use in Europe, and in the foreign bee-papers one sees nothing but praise for them. With the instructions that you would receive with the press without doubt you could succeed, even

without ever having seen foundation made. It is claimed that with the press the foundation is softer and more acceptable to the bees. Situated as you are with regard to prices, I think I would get a press to make my brood foundation, and probably do some experimenting to see if I couldn't make it thin enough for sections.

#### Bees Deserting the Hive.

I transferred a colony of bees from a hollow tree to a Danzenbaker hive, filling up 4 or 5 frames with the combs from the tree. The balance of the frames had starters in them. After a few bees had gone into the hive I found the queen, caught her, and put her down among the frames. I left them there until the next day, and when I went back to get them, all of the bees were gone. What made them leave? I can't figure out any reason. There were young bees, eggs, and brood in the combs. OKLAHOMA.

ANSWER.—At this distance of time and place it isn't the easiest thing to make a guess. One of the most common causes of bees deserting a hive is high temperature. When a freshly hived swarm is set out in the broiling sun on a hot day, you may count fairly well on the bees deserting such an uncomfortable place. But it may be that your bees were in cool shade. Nothing is said about how far the hive was from the tree, their old location. If you took the bees a mile away from the tree, they would be more likely to stay. But if only a few rods from the tree, then many of the field-bees, if not all, when they returned from their first visit to the fields, instead of going to the hive, would return to the old location. Then it would be nothing so very strange if the balance of the bees would have a lonesome, discouraged feeling, and would take French leave. But as to knowing anything for certain about it, I suspect that as long as you live, every time you think about it, you can only say, "I wonder what made those bees leave."

#### Queen-Bee to Start a Colony.

Will you kindly give me the address of some reliable person from whom I can order by mail a queen-bee? Will this be sufficient to start a colony? How are they to be fed in winter? TENNESSEE.

ANSWER.—My good friend, this is not the best time in the year to make a start in the bee-business, and it isn't best to start with a queen alone. I think at this point that I hear some one say in a superior manner, "Why, any fool ought to know that colony of bees was never started with a queen alone." Now look here, don't you be getting too smart. I've heard of a colony being started with nothing but a queen, and if you never heard of it, it's time you did. What's more than that, lots of colonies have been started that way, lots and lots of them every spring. Of course they're bumble-bees, but one doesn't know about such things till one learns.

Hive-bees are social beings, and a

queen will not make much headway without a few thousand handmaids as helpers in the form of worker-bees. So you must start with a full colony or at least a nucleus, which means quite a small colony.

Before it is time to make a start in spring you will find queens and bees advertised in the American Bee Journal.

Look at the answer to "Indiana," as to feeding in winter; but if you are wise you will never need to feed in winter.

Best thing for you to do is to get at once a book of instruction about bee-keeping—you'll find them advertised in this paper—and make a study of it this winter. You'll save more than the price of the book in the mistakes you are likely to avoid next summer.

#### Rearing Queens.

Last spring I sent to Texas for a queen-bee which I gave to a queenless colony that I thought was strong enough to be worth requeening. The queen proved to be so good a one that I concluded that I wanted some young queens from her, and so gave her unlimited space for laying. I used a few combs containing eggs and larvæ in hives of queenless bees. At the end of the early white honey-flow and, before the later flow began, the queen had established herself in the second story and had several combs of brood there. The lower story had 3 or 4 combs of sealed and hatching brood, but no larvæ so young that queens could be reared from it. I found the queen in the upper story and took the comb she was on and placed it in another hive with all of the combs from this upper story that contained any brood. Then I took a comb from the lower story, containing only honey, and gave in its place the comb from the upper story, on which the queen had done her latest laying. The bees of the lower story went immediately to work and started a lot of queen-cells on this comb. I think I found one cell started on another comb, but this I destroyed. All the queens I reared on the comb given did good work later. Is there any reason why queens thus reared should not be as good as those reared by any other method? IOWA.

ANSWER.—Let's see. You divided a very strong colony into 2 parts. In one part was the queen and frames of the later brood, in the other part the more mature brood and one frame of the youngest brood. Of course, also, plenty of nurse-bees in each part. One part, supposedly, was put on a new stand, and the other left on the old stand. If the queen was left on the old stand, and the queenless part put on the new stand, the field-bees would all go to the old stand, leaving the queenless part practically in a dearth of honey, and you are not likely to rear the best queens when bees are feeling to any degree the dread of starvation.

I do not think, however, that was what you did. I think you left the queenless part on the old stand, and with plenty of nurse-bees to take care of the queen-cells, and abundance of honey coming

in, the bees would be in best condition for queen-rearing. You will be told, however, by some good bee-keepers and intelligent, that the bees will be in such a hurry to rear a young queen that they will select larvæ too old for best success. So if there was anything beyond eggs and very young larvæ in the frame of unsealed brood given them, you may expect some poor queens, if those men are correct. I do not at all believe they are correct, and my belief is based on a pretty large experience in allowing queenless bees to make their selection from brood of all ages. This, however, I have experienced: The bees continue for several days to start fresh cells, and the last started may be with too-old larvæ. So it is better to reject these latest cells. But if you have virgin comb filled with eggs and brood as given in "Forty Years among the Bees," page 237, and have your queen-cells built from this, you may count on all the cells being started from larvæ young enough. Just why this difference I don't know, only that I have reared hundreds of queens in that way, and think I have had good proof that none of them were reared from larvæ too old.

### Black Bees in Italian Colony — Fall Feeding — Non-Hatching Eggs.

I have just finished reading "Forty Years Among the Bees." I found it very interesting and instructive.

1. I had a colony swarm July 13, 1906. The young queen was very small, and never laid. August 9 I replaced her with an imported golden queen. During last spring the black bees gradually disappeared, but there were always 3 or 4 to be seen fanning in the entrance in the same corner every fine evening. June 22, 1907, I divided them, putting 4 nuclei in one 10-frame hive, and stuffed the entrances with grass. When I pulled out the grass there were 6 black bees dead in one entrance. These were the only black bees I could find in the nuclei, and the only bees that were dead, although some of the others were very weak and unsteady from suffocation. Is it possible that these bees were the daughter of the old black queen that swarmed July 13, 1906? Her swarm gradually weakened during the fall and died in early winter. My one other colony was headed by a leather Italian. There are no other bees within 2½ miles as the crow flies.

2. Is there any danger of feeding too much or too fast in the fall, either from troughs outside or from feeders inside the hives?

3. Is it common for a queen to lay eggs that will not hatch? I do not remember reading of any. I reared 6 leather queens the past summer. They are heading 6 strong colonies now. I also reared 6 golden queens. Only one of them laid, but her eggs did not hatch. She was the largest and finest-looking queen I ever saw, and laid as many as 6 eggs in some cells. She had more bees than some nuclei that did well.

PRINCE EDWARD ISLAND.

ANSWERS.—1. That's a tough one. It hardly seems credible that a worker-bee should have lived through from July 13

to the end of the following June. It is often the case that black bees stray in from other hives, but they would hardly come 2½ miles. It might be that your yellow queen was not purely black, and some of her progeny black, but in that case the number of black bees would hardly be so small as you seem to mention. I give it up.

2. If fall feeding must be resorted to, the faster the better. For late in the fall all that is expected of the bees is to store what is given them, and as it is given them, whereas when fed at the earlier and better time the feed should be thin and the bees should have time to make the proper changes in it.

3. It is very uncommon. In 47 years' experience I have had only a single case of the kind to my knowledge; and I have read of very few cases. You are not likely to have another. Of course the trouble is with the queen, and the only remedy is to kill her and replace her with one that can lay a better brand of eggs.

Possibly it may be well to mention that any queen may lay eggs that do not hatch, but in that case the fault is not with the eggs. It is perhaps the usual thing in the fall that the last eggs laid by a queen do not hatch, probably because the bees do not furnish heat enough, and the same thing may sometimes occur in the spring. But as I understand it, in the case you mention everything was favorable for the hatching of any properly disposed egg.

### Answering Questions — Wintering Bees Under Snow-Drifts — Tartaric Acid in Winter Stores.

1. Why do we never get any answers to the questions we send to you through the question departments of the various bee-papers?

2. What will be the result of wintering bees out of doors in a locality like some parts of the coast where a large proportion of the snowfalls are accompanied by high winds, that cause the snow to pile up in huge drifts and banks that often bury small objects like a beehive completely, sometimes 6 feet deep? In dividing some of my colonies last summer I unwittingly placed several hives in a location which I have since been told is in the direct path of the worst snowdrifts in the neighborhood. In fact, this is within a narrow space that catches the drifting snow from off a large field during successive snowstorms and which at times is 10 feet deep. I am very much averse to moving a colony of bees after it is once established in a place, especially during cold weather.

3. Although the following question is somewhat out of season, will you tell us the result of your experience in mixing tartaric acid or other acids with sugar syrup for winter stores? I haven't had time to experiment in this, and this fall I followed Prof. Cook's advice according to his book, and put an even teaspoon of tartaric acid into 15 pounds of syrup. I think this amount of acid is altogether too much for the amount of syrup. I believe much less acid in proportion would keep the syrup from crys-

tallizing. The bees evidently do not like it.

4. What is the result of mixing the acid with cold or boiling syrup, relatively, and in different proportions?

MASSACHUSETTS.

ANSWERS.—1. I don't know. Certain it is that a goodly number of those who send questions get answers, as is abundantly testified by the amount of space occupied each month in this department. I think I have made replies of some kind to every question ever sent me, when the writer told me in what publication he wanted the answer to appear. If, by some strange means any letter of yours has come under the head of "lost, strayed, or stolen," let us hope it may not occur again.

2. Reports of results when hives were buried in deep snow have not always been the same. I think that in most cases it has been reported that the bees have done well, the snow making a fine protection, being porous enough so there was no suffering from lack of ventilation. I have no distinct data at hand, but if memory is not at fault some cases have been reported in which the bees seemed too warm, breeding being started, with diarrhea following.

3. Some years ago I had considerable experience in feeding up for several winters with tartaric acid in syrup. I used an even teaspoonful of acid for 20 pounds of sugar. I think it worked all right. How much acid that would be to a given weight of syrup depends on the strength of the syrup. For winter feeding I used 5 pounds of sugar to 2 of water, and that made a teaspoonful of acid to 28 pounds of syrup. Prof. Cook's teaspoonful of acid to 15 pounds of syrup looks just at first glance as if he made it about twice as strong with acid as I did. Whether he really did so depends upon the strength of the syrup. Referring to Cook's Manual, edition of 1902, page 266, where he mentions an even teaspoonful of acid to 15 pounds of syrup, it will be seen that he says, "We use equal parts of sugar and water." With the proportion of a teaspoonful to 20 pounds of sugar there would be a teaspoonful to 40 pounds of half-and-half syrup. That, against his 15 pounds of syrup, shows that he made it 2-3 times as strong as I did. Mine seemed to be strong enough, and yet I think at least one man reported that with the same strength as I used his syrup granulated.

Of late years I have used no acid. If I fed at all I gave half-and-half syrup in August or early September, and the bees made it all right without any acid. I cannot help thinking this is better than later feeding with acid. My feeders are becoming idle capital, as the pasturage has so changed that a fall flow may always be counted on.

4. I have had no experience as to different proportions, nor as to stirring acid into cold syrup; but I should think it quite difficult to get the acid well mixed in the syrup. My plan was to dissolve the acid in a cup of hot water, and then stir it into the hot syrup. But I don't believe it advisable to use acid at all. If you must feed, feed thin enough, and early enough, and the bees will do the rest.

## Fine Shape for Winter.

The bees in this district have gone into winter quarters in fine shape.

JOHN S. SEMMENS.  
Konantz, Colo., Nov. 4.

## Outlook Good in Cuba.

The outlook seems quite good for a good honey-flow this fall unless the rains stop suddenly. But the preceding 9-months' drouth and cyclone, with the flood, have killed almost one-half the bees on the island.

M. E. ENGLE.  
Los Palacios, Cuba, Oct. 20.

## Fair Fall Crop of Honey.

We have had a fair crop of fall honey, and all sold so far at 10 cents a pound for extracted and 15 cents for comb, packages not included. Oceans of white clover came up last spring which is in fine shape now.

S. F. TREGO.  
Swedona, Ill. Nov. 11.

## Honey and Prices Better.

The weather is "fine as silk." Bees are on the summer stands and having frequent flights. The honey crop, while not a bumper one in size, in quality was the very best, and the prices much improved over former years. Bees appear in general to have plenty of stores to tide them over winter.

F. W. HALL.  
Hull, Iowa, Nov. 16.

## Rocky Mountain Honey—Wintering on Summer Stands.

1. I send you to-day a sample of my honey, and would like to know what you think of our Rocky Mountain product.

2. My hives are the Langstroth. The bees are strong, and I have left them on the summer stands. I put the bees all in the lower hives and put 4 thicknesses of gunny-sack over the frames, and left the top-boxes on full of honey for a reserve, and the lower hives also have plenty of stores. What do you think of that for winter?

UTAH.

1. The honey is very good indeed. It is so white, and the grain is so fine.

2. The commendable part of your packing is the great amount of stores left for the bees. A strong colony of bees will stand almost anything else if only they have abundance of stores, and are allowed to arrange those stores to their own notion. Too often the question seems to be, "How small an amount of stores can I leave the bees and risk their getting through the winter?" while you seem to ask, "How much can I manage to leave with the bees for their winter supply?" And in that you are wise.—EDITOR.]

## Extra Year for Bees.

This has been an extra year for bees and honey. Bees are going into winter quarters in fine condition, with both plenty of bees and plenty of honey. The past season I secured something like \$50 worth of honey (1025 pounds) and 2 swarms. Big yarn, but nevertheless it is true, and the honey is fine.

G. W. VANGUNDY.  
Jensen, Utah, Nov. 3.

## Virginia Bee-Keeping.

I have been down in Palmyra, Va., visiting my brother. You should see the Southern bee-hive, or "gum," as they call it. It is about 10 inches square, 2 feet high, with a space of about 6 inches of the top partitioned off for surplus honey. It was suggested that as I was a bee-keeper that I take away the surplus honey that evening, as it was cold enough to make the bees numb, and, in their opinion, make them less apt to sting me! I told them that I preferred to take the chance in the middle of the day. So the next day about noon they reminded me that it was warm enough for the bees to swarm, and offered to hunt up some gloves and old mosquito net if I wanted it. but I thanked them and lighted a bit of pitchy pine and blew a little smoke in at the entrance, then a little more at the top. Then I went to work and took the surplus honey out, and "took up" one late swarm without getting a sting, which they thought remarkable, as one bee chased 5 or 6 men away from me. Now those bees were quite a small variety of the black bee, so-called Italian bees down there.

I think that they have model places for the bee-business. If they would wake up and jump over about 50 years, and get modern hives and transfer their bees into them, they could make something out of their bees. I think that their bees are inclined to be milder than our black bees, and while their honey is not so fine flavored as our white clover and basswood, it is very rich.

E. E. KENNICOTT.

Glenview, Ill.

## Keeping Bees for Pleasure.

While the majority of writers tell us about keeping bees for the dollars and cents there is in it, I am going to tell you about my keeping bees for the pleasure there is in it.

My work is in a railroad office, and is very tiresome and trying on the nerves to one with poor health. My health is broken down, and I have not seen a well day for the past 10 years. Yet I try to nerve myself up and push forward, and not allow myself to stop and think about how bad I do feel.

To explain matters more fully, 25 years ago, while employed as a railroad brakeman, and in the act of coupling cars, my foot slipped, and I was caught between the bumpers of the cars and had my entire lower jaw and tongue crushed out. This left me in a very trying position. At first I could not eat any solid food and could not talk, not even able to utter a sound of

any description. All the surgeons and doctors who had charge of me at the hospital, as well as those that came to the hospital to see me, told me that I would never be able to speak again, as the organs of speech were all gone. This was a hard blow and made me feel very bad, as it was hard to think of going through life and not being able to speak. The old adage, "Where there's a will there's a way" came to me, and I thought, "I have the will; will the way be provided?" The Lord heard my faint call for help and came to my aid, as He will to all those who will only let Him. He gave me the gift of speech, and although it was the hardest work I ever did, I finally learned to form words so that I could talk. This has been one of the greatest blessings that I could have received. As to my eating, I have to take my food specially prepared so that I can eat it. As I can not chew any of my food, my stomach has double work to do all the time—that of mastication and digestion. Therefore I have suffered greatly with my stomach, and have at times such a distressed and nervous feeling.

I get 2 hours at noon. One I spend eating my dinner, and the other I spend working with my bees when the weather is favorable. My bees have been a great benefit to me in regard to my health. When I come home from the office weary and nervous, and on the ragged edge of despair, instead of sitting down and worrying about how bad I feel, I will go out to my bees, open up the hives and watch them working, when the sight of the little fellows hustling and tumbling over each other in their hurry to get in and out of the hive, seems to drive all the worry and care away, and makes me feel like a new man. Therefore I feel that my bees have been both a great pleasure and a benefit to me, as well as supplying myself and family with good, delicious honey, of which we consume from 350 to 400 pounds per year, using extracted honey in place of fruit, butters, jams, etc., as it is much more healthful. I use bread made from the whole-wheat flour, and spread each bite on both sides with extracted honey in order that I may be able to eat it. I find that the honey is very healthful and also very nourishing, and I feel much better after eating it than if I eat fruit butters, jams, etc.

Now, while I got away from bee-keeping to a certain extent, yet I feel that there are hundreds of others who have poor health that would be greatly benefited if they would get a few colonies of bees, a good bee-book, and one or more good bee-papers, and spend their leisure hours working with the bees, reading the bee books and papers, and try to get what pleasure they can out of life instead of worrying and fretting over what can not be cured. One can keep bees almost anywhere. I have my bees on the rear of a small village lot, and they do not molest any one.

J. T. ELLIOTT.

Colliers, W. Va., Nov. 26.

Swarming, prevention of—659.  
Swarming requirements—54.  
Swarm leaving colony hopelessly queenless—224.  
Swarm of bees at school—372.  
Swarms, behavior of—211.  
Swarm settling on sister's face—692.  
Swarm-shaker, an original—502.  
Swarm spotting clothes—661.  
Swarms, testing before living—34.  
Sweet clover honey—96, 571.  
Sweet clover, yellow—33, 589, 598, 692.  
Sweet clover (melilotus)—151, 213, 311, 318, 417, 433, 571.  
Syrup for feeding bees—685.

Taking bees out in spring—115.  
Taking bees out of cellars—200, 432, 515, 545.  
Taking more than one bee-paper—599.  
Taking off honey, record in—726.  
Tank for clearing honey—627.  
Tar-paper for protecting bees—286.  
Tarred felt—659.  
Tarred paper for hive-protection—434, 598.  
Tartaric acid in winter stores—757.  
Taste for sweets—650.  
Taxing bees—417.  
Technical high schools—620.  
Temperature of bee-cellars—115.  
Tested and untested queens—489.  
Texas honey-bloom—244.  
Thermometers—175, 265.  
Tiering up hives in winter—606.  
Toads and snakes eating bees—513.  
"To Bee or Not to Bee?" (poem)—482.  
Tomatoes and honey—746.  
Top-bar ends—570.  
Top feeders—411.  
Top protection—582.  
Traitor to bee-keepers—501.  
Transferring bees—96, 175, 215, 358, 395, 469, 595, 619, 661.  
Tree problem—27.  
Troublesome neighbor—437, 511.  
T-super, making the—524.  
T-supers, methods of filling—550.  
T-super vs. other supers—32, 95, 127, 175, 265, 337, 587, 596.  
T-super vs. wide frames—197.  
Two or more queens in a colony—337, 282, 631, 651, 678, 695, 742.  
Two-pound sections—96, 194.

Unadorned flowers—75.  
Uncapped sections in center of supers—95.  
Uncapping-fork—743.  
Uncapping honey—628.  
Unfinished sections—152.  
Uniting colonies—135, 505, 646, 709.  
Uniting colonies for the harvest—196.  
Uniting swarms—661.  
Uripe honey—171.  
"Ups" and "downs" of bee-keeping—216, 686.  
Uses of honey—211.  
Using combs on which bees died—368.

Varieties of bees—265.  
Vegetable physiology and honey—601.  
Ventilating hives—74, 266, 329, 338, 428, 570, 696.  
Vicious bees—570.  
Victor's bear-wrecked apiary—126.  
Vienna, honey in—727.  
Vinegar-making—213.  
Vine maple honey—571.  
Virgin loafing on wedding-trip—533.  
Virgin-queen introduction—613.  
Virgin queens and drone-comb—186.  
Virgin queens don't always fight—659.  
Virgin queens, wintering—629.  
Visit to home of Patrick Keating—153.  
Visit to Nebraska bee-keeper—621.  
Vitality of queen's eggs—692.  
Von Hruschka and the honey extractor—46.

Wages of apiarian help—416.  
Warped brood-frames—135.  
Washboardy honey—593.  
Water-carrying bees at night—15.  
Water for bees—594.  
Watering animals—33.  
Waxed honey without granules—136.  
Wax-extracting—28.  
Wax from steam-presses—300.  
Wax-glazes—685.  
Wax-moth larva and carbon bisulphide—430.  
Wax-presses—745.  
Wax-secretion—188.  
Wax-worms or larvae, roasting out—59, 724.  
Weak colonies—215, 418, 568, 589, 628, 645, 654, 659.  
Weather conditions, Southern and Canadian—113.  
'We be(e) brethren'—581.

Weed-killer—329.  
Weight of colonies—525.  
Weight of honey—91.  
"Wheelbarrowing" colonies—588.  
When bees are gathering—570.  
Where all is golden—415.  
Where bees deposit nectar—614, 653, 716.  
Where do flowers get their color?—540.  
Why did the bees die?—55.  
Wide frames—127.  
Wintering bees—149, 227, 319, 331, 338, 552, 595, 652, 731, 749.  
Wintering bees in a trench—174.  
Wintering bees in chaff-hives—726.  
Wintering bees outdoors, but enclosed in wire frame-work—55, 756, 758.  
Wintering bees under snow—757.  
Wintering on solid sealed combs of honey—53.  
Winter-case—722.  
Winter months, how to spend—67.  
Winter repositories—14.  
Winter stores—723.  
Wiring or splicing foundation—16, 134, 337.  
Women as bee-keepers—511.  
Women lead in bee-keeping—172.  
Wood-splints for staying foundation—114, 437.  
Worcester County Fair—712.  
Working at bees when sweating—185.  
World's Pure Food Show—482, 648, 712, 742.  
Worms in combs—429, 724.

Yellowest bees—358.  
Yields of honey—665.  
Young queen swarming and leaving mother—205.  
Yucca plant—648.

## Write for My Introductory Offer on a Fine Sample WILLIAMS PIANO or ORGAN

I am sending some of the finest, sweetest-toned Williams Pianos and Organs we make into many communities as samples of our work. It's our special way of advertising, as we have no agents or stores. If you write at once, I will tell you how you can try one of these fine sample instruments in your own home entirely at our expense of freight and all. Then, after you've tried it for a month or so—after you've had your friends try it—after you've tested its easy action—after you've enjoyed its rich, sweet tone for which Williams Pianos and Organs are celebrated—after you are convinced that—all in all—it's one of the finest-looking, sweetest-toned instruments you ever saw or heard, then, if you wish, you may

### buy it at our special introductory price and take Your Choice of 27 Plans of Easy Payment

on the piano or of five plans on organ. You may select the plan that's easiest for you and we will trust you, no matter where you live. I guarantee each sample piano and organ to be as fine as those I made for the famous song writers, Prof. E. O. Excell, Prof. C. H. Gabriel, and the hundreds of other well-known musicians you will find in the free book we are going to send you. This is the best chance you will ever have to get a fine piano or organ on your own terms. WRITE A POSTAL OR LETTER TODAY and say, "Send me free Sample Offer, Plans of Easy Payment and Book about (state which book—piano or organ)." Address carefully as follows.

H. B. WILLIAMS, Vice-Pres., Williams Organ & Piano Co., Room 601, 57 Washington St., Chicago 6W

# American Bee Journal

Cows' Relief is a specific Remedy for all troubles of bag and teats. It enables dairymen, farmers and other cow owners to keep their cows in a healthy and profitable condition.

Cows' Relief is one of the most perfectly penetrating and disinfecting compounds in existence. It goes directly to the seat of the trouble, relieves the congestion and breaks up the bunches that prevent a natural flow of milk.

## FOR CAKED BAG

Twelve to twenty-four hours' time is all that is required to relieve any case of Caked Bag, if applied freely at the beginning of the trouble.

For heifers with first calf Cows' Relief works in a most pleasing, prompt and successful manner. It relieves the soreness and swelling in the bag and is worth its weight in gold to every dairyman. It keeps the teats soft and flexible, and renders the animal quiet and docile.

H. C. Rice, Farmington, Conn., says: "Please send me two boxes of Cows' Relief. Enclosed find check for same. Please send at once, I wouldn't be without it in my stable."  
L. F. Cuthbert, Hammond, N. Y., says: "I have used your Cows' Relief and find it a very valuable remedy for Caked Bag."

We have scores of testimonials like the above. Ask your dealer for Cows' Relief and insist on having the genuine. If he cannot supply you write direct to us, enclosing \$1 for large package prepaid, (enough for four or five ordinary cases). Your money back if you are not satisfied. Positive guarantee on every package. Or send your name and one neighbor's who keeps cows, stating how many you each have, and we will send our book concerning "Cow Troubles," also "Goldine Cow Watch Charm FREE while they last.

**OUR HUSBANDS MFG. CO.,**  
716 Chapel St., Lyndon, Vt.

Mention Bee Journal when writing.

## BARNES' Foot-Power Machinery

Read what J. I. PARENT, of Charlton, N. Y., says: "We cut with one of your Combined Machines, last winter, 50 chaff hives with 7-in. cap, 100 honey-racks, 500 brood-frames, 2,000 honey-boxes, and a great deal of other work. This winter we have double the amount of bee-hives, etc., to make, and we expect to do it with this Saw. It will do all you say it will." Catalog and price-list free.

Address, W. F. & JOHN BARNES,  
995 Ruby St., Rockford, Ill.

## Engravings For Sale

We are accumulating quite a stock of engravings that have been used in the American Bee Journal. No doubt many of them could be used again by bee-keepers in their local newspapers, on their stationery, or in other ways. Also, if we can sell some of them it would help us to pay for others that we are constantly having made and nailed in our columns. If there is any of our engravings that any one would like to have, just let us know and we will quote a very low price, postpaid. Address,

**GEORGE W. YORK & CO.**  
CHICAGO, ILL

## HAND-MADE SMOKERS

**BINGHAM**  
CLEAN  
**BEE SMOKER**

Pat'd 1878, '82, '92 & 1903

Extracts from Catalogs—1907:

Chas. Dadant & Son, Hamilton, Ill.—This is the Smoker we recommend above all others.

U. B. Lewis Co., Watertown, Wis.—We have sold these Smokers for a good many years and never received a single complaint.

A. I. Root Co., Medina, Ohio.—The cone fits inside of the cup so that the liquid creosote runs down inside of the smoker.

All Bingham Smokers are stamped on the tin, "Patented 1878, 1892, and 1903," and have all the new improvements.

- |   |          |            |
|---|----------|------------|
| Smoke Engine—largest smoker made.....   | \$1.50—4 | inch stove |
| Doctor—cheapest made to use .....       | 1.10—3½  | "          |
| Conqueror—right for most apiaries ..... | 1.00—3   | "          |
| Large—lasts longer than any other ..... | .90—2½   | "          |
| Little Wonder—as its name implies ..... | .65—2    | "          |

The above prices deliver Smoker at your post-office free. We send circular if requested.

Original Bingham & Hetherington Uncapping-Knife.

**T. F. BINGHAM, Farwell, Mich.**

Patented May 20, 1879. **BEST ON EARTH.**

Publisher Fails—Forced Sale  
 This is your Gain

Ex-President Cleveland says:

"This History will fill an important place among publications intended to give wider familiarity with historical literature."

**OPPORTUNITY KNOCKS AT YOUR DOOR NOW.** We are compelled to convert these books into money at once. To protect our interests as finance agents, we have assumed control and offer without reserve the remaining sets of the Publisher's latest and most important publication—"Library of Universal History," fifteen sumptuous volumes, over 5,000 pages, 100 specially engraved maps, 700 beautiful illustrations, copious marginal notes and chronological index. This is a new publication from cover to cover, prepared by a staff of the most famous historians of the world. Cost to produce nearly \$250,000.00. Positively the first edition printed from these new plates, made from type cast expressly for this work. Each volume is 2 inches thick, 7 inches wide and 10 inches high.

**Read Our Offer:** Beginning with the dawn of recorded thought and tracing the progress of mankind, these Sixty Centuries of Progress leads us step by step through Ancient, Medieval and Modern Times. In this great panorama we see the birth, growth and development, the decay and death of races and nations. The pure, simple and enchanting language used in depicting these great events makes this story of human progress more fascinating than fiction. Young folks will use this work and read it with delight, charmed by its splendid pictures and vivid style.

**FREE COUPON**

American Underwriters Corporation,

At Root's Factory Prices

## Honey and Beeswax

**CHICAGO, Nov. 25.**—The demand for honey is not active. Sales are few, and a tendency to lower prices. Sales of comb made recently are from one to two cents below those of a month ago. Extracted is fairly steady on small lots at 8 to 9 cents for white; amber, 7 to 8c; dark 5 1/2 to 6c. Beeswax, 30c.  
R. A. BURNETT & Co.

**KANSAS CITY, Dec. 9.**—The supply of comb and extracted honey is more liberal, and demand only fair. We quote: No. 1 white comb, 24-section case, \$3.25; No. 1 amber, \$3.00; No. 2 white, \$2.75; extracted, white per lb., 8 to 8 1/2c; amber, 7 to 7 1/2c. Beeswax, 20 to 27c.  
C. C. CLEMENS & Co.

**PHILADELPHIA, Nov. 25.**—Sales of honey have been quite active in this market. We quote: Fancy comb honey, wholesale, 17 1/2 to 18 1/2c; No. 1 white, 16 to 17c; amber, 14 1/2c; extracted honey, water-white, 9 to 9 1/2c; amber, 8c; dark, 7 1/2c. Beeswax, 30c. We are producers of honey and do not handle on commission.  
WM. A. SELSER.

**DENVER, Nov. 29.**—Owing to the financial situation, demand for comb honey is not as brisk as it was during the fall; however, as there is a very small stock to be disposed of yet, prices are not affected to any extent. We make the following quotation to our jobbing trade: No. 1 white, per case of 24 sections, \$3.15; No. 1 light amber, \$3.00; and No. 2 at \$2.75 to \$2.85. Demand for extracted honey is good, and we consider ourselves fortunate in having a good stock of fine quality to supply our trade. We quote strictly No. 1 white 9 to 10c; and light amber 8 to 9c per pound. We will pay 22 to 24 cents for clean yellow beeswax delivered here.

THE COLO. HONEY-PRODUCERS' ASS'N.

**TOLEDO, Nov. 25.**—On account of money stringency, honey is moving slowly, and prices are declining. Fancy comb brings, in a retail way, 17 to 19c, according to quality; No. 1, 17 to 18c. No demand for off grades. Extracted white clover, in cans, 9 to 10c. Beeswax is in good demand, and brings 30 and 32c. We look for light sales of honey from now on, as factories are laying off help, and all goods in the eatable line are moving slowly.  
GRIGGS BROS. & NICHOLS Co.

**INDIANAPOLIS, Nov. 27.**—Demand for comb honey is not brisk, while best grades

of extracted honey are finding ready sale. Indianapolis jobbers are paying the following prices for goods delivered here: No. 1 and fancy comb, 16 to 17c per pound, actual net weight. Best extracted in 5-gallon cans, 9 to 10c. Beeswax 28c cash, or 30c in exchange for merchandise.  
WALTER S. POWDER.

**CINCINNATI, Nov. 25.**—Owing to the unsettled condition of finances throughout the country, causing much uneasiness and anxiety among the buyers, we look forward to seeing honey reach lower values in the very near future. We are at a loss to say what prices we will ask in days hence, but at this writing we are quoting extracted amber honey in barrels at 6 to 7 1/2c; fancy white in 60-lb. cans, 10c; and strictly fancy white comb honey (which is moving slowly) at 16 1/2 to 18c, according to the quantity purchased. For choice yellow beeswax, free from dirt, 30c delivered here.  
THE FRED W. MUTH Co.

**CINCINNATI, Nov. 23.**—The market on honey has eased considerably because of the stringency of the money market. Slow sales on comb honey. Colorado retails at \$4.00 per case; white clover comb honey at 17c per pound. Extracted white sage at 9 and 9 1/2c. Amber in barrels at 6 to 6 1/2c. Beeswax very slow at 30c.  
C. H. W. WEBER.

**NEW YORK, Nov. 25.**—We are having a good demand for strictly fancy comb honey. Receipts have been quite heavy and numerous of late, owing principally to the fact that most of the bee-keepers were late in shipping. We quote fancy white at 16 to 17c; No. 1, 14 to 15c; No. 2 and amber at 13c; buckwheat at 12 to 13c. The demand for extracted continues good, and we have as yet experienced no scarcity, having enough to supply our wants, and more. Prices are firm. We quote California white sage at 9 to 9 1/2c; light amber 8 to 8 1/2c; amber 7 to 7 1/2c; extracted buckwheat, 6 1/2 to 7c. Nothing is coming along to amount to anything from the South, and therefore it is hardly worth while to make quotations. What little there is sells at from 65 to 80c per gallon, according to quality. Beeswax quiet at 29 to 30c.  
HILDRETH & SEGELKEN.

**FENCE Strongest Made**

Made of High Carbon Double Strength Coiled Wire. Heavily galvanized to prevent rust. Have no agents. Sell at factory prices on 30 days' free trial. We pay all freight. 37 heights of farm and poultry fence. Catalog Free.

# Advanced Bee Culture

One of the most difficult tasks of my life is that of writing an advertisement of *Advanced Bee Culture*. Be as modest as I can, it still smacks of egotism—sounds like a parent praising his own child. If the book had been written by some other man, the writing of an advertisement would be comparatively easy. However, even at the risk of laying myself open to ridicule, of becoming a laughing-stock, I am going to

## Forget for Once

that I am the author and publisher, and write as though of another's work.

When 18 years old I visited an apiary in swarming-time; saw bees hanging in great golden-brown clusters from the swaying boughs of the old apple-tree; saw the snowy-white combs growing as by magic; saw the waxen cells filled with nectar, and inhaled that *sweetest* of all perfumes—the odor of a bee-hive in harvest time. I was filled through and through with enthusiasm. Here was a business that was most truly

## The Poetry of Life

I was that day born a bee-keeper. There was no longer any doubt as to what should be my life-occupation. I at once began buying bee books and journals, and visiting bee-keepers, and studying the business from every possible standpoint. It was six years later before I was able to engage actually in the business, but I then possessed as thorough a theoretical knowledge of bee-keeping as does a young physician of medicine when he begins to practice. All this was 30 odd years ago; and since then I have

## Run the Whole Gamut

of bee-keeping, time and time and again. I have practiced all sorts of methods for artificial increase; I have battled with the difficulties of natural swarming; I have produced tons and tons of comb honey; have tried

my hand at extracted-honey production; I have reared and sold thousands of queens; I have exhibited bees and honey for 15 consecutive years at from one to half a dozen State fairs; I have wintered bees in all sorts of ways, outdoors and in, in cellars and buried in clamps; I have attended nearly all of the conventions of a national character;

## Visited Hundreds of Bee-keepers

in their homes, scattered from ocean to ocean and from the lakes to the Gulf; I have read all the books and journals; for nearly 20 years I have published the *Review*, enjoying the confidence and correspondence of bee-keepers scattered all over the country; in short, I have been a wide-awake, enthusiastic, practical, actual work-a-day, bread-and-butter, bee-keeper all of these years, making a living for myself, wife, and little ones, out of bees. *Advanced Bee Culture* is

## The Ripened Fruit

of all these years of varied experience; it is the crowning effort of my life. I look upon it as the best piece of work that I have ever done, or, perhaps, ever will do. It is written from a bread-and-butter standpoint. It teaches how to make a living, yes, more than that, *make money* out of bees. From all of these sources that I have mentioned, from my own experience, and that of the men with whom I have associated, I have described the most advanced, the *best* methods of keeping bees for *profit*. I begin at the opening of the year, and go through the season step by step, touching briefly but clearly and concisely upon all of the most important points, showing their relationship one to the other, and how, joined together, they make a perfect whole. If I could have had this book 20 years ago, and followed its teachings, I might now have

## Been a Rich Man

I say it fearlessly, because *I know that it is true*, that no practical bee-keeper can afford not to read it. The courage, enthusiasm, and inspiration alone will be worth more to him than the cost of the book, to say nothing of the more practical instructions. Many a man fails from a lack of these very useful qualities, and the perusal of *Advanced Bee Culture* will do much to help him in this respect.

One more point: A dozen years ago I took up photography as a hobby, as a pastime. I have studied it just as you have studied bee-keeping. I have read the journals and books on the subject, attended the conventions, etc. I have lugged a large camera along with me all over the United States and Canada, and used it with loving care. *Advanced Bee Culture*.

## Contains the Gems

of this collection of all these years—a collection that is simply unapproachable in the line of apiculture. The book is beautifully printed with clear, large type, on heavy enameled paper. It is bound in cloth of a bluish drab, and the front cover embellished with a green vine of clover, a

## Bee of Gold

sipping nectar from the snowy-white blossoms of the clover. Taken all in all, it is a beautiful book. If the advertising that I have done in the past has not convinced you that you need the book then the fault is in the *advertising*; and for this once I have cut loose and said just what I think of the book, just as I would of some other book—I may never do it again.

Price of the book \$1.20, or the *Review* one year and the book for only \$2.00. And remember that just at present you get all of this year's numbers free! That is, you can get the *Review* for this year and next, and the book, for only \$2.00!

W. Z. HUTCHINSON, FLINT, MICHIGAN.
