No outstanding figure among 500 loosely knit operators can be found. No one in the ranks of these mine owners has such mastery as has Judge Gary in the steel industry. It must be remembered that Gary represents, and in a degree controls, nearly half the national output of steel. While not underrating the titanic skill and courage of that steelmaster, one cannot forget that it is not so much these qualities as the

output of the United States Steel Corporation that determines quietly and surely the issue of contending interests.

There are, however, fragments of the coal industry which are dominated. Thus in the Connellsville region the H. C. Frick Coke Co. rules not alone by reason of its wonderful output but because of its great coke-purchasing power. What wages it is willing to pay others are obliged to pay and feel they can afford to pay. Besides, as the H. C. Frick Coke Co. is willing to buy coke on a cost-plus basis, the price of coke is almost sure to follow the cost of coal production.

The coke company mentioned never hesitates to meet the increased wage with a similar increase in its coke price. Hence it is that when it posts a new wage, always somewhat higher than the last, every coke company, however small or large, posts, on the following day, the same scale, and the leadership of the H. C. Frick Coke Co. is never questioned. Nor is it feared, for its dealings are as fair as they are generous.

But the mines in the Connellsville region are non-union and therefore the H. C. Frick Coke Co., not entering the union operators' counsels, has no power

to control in union-mine affairs. The Connellsville region has its own little millpond. It has little immediate competition and it stands alone, without much influence in national coal counsels but a unit in its own. As this regards the bituminous operators only, nothing need be said of the anthracite operators with their almost complete organization. They have little direct influence on the bituminous operators but follow along behind, fixing their scale revisions, however, with some reference to the concessions already given by the coal-mine operators of the bituminous

## Pity the Poor Shipper

The value of 30 industrial stocks, according to this chart adopted from the New York Tribune, has risen in the last year from 85 to 102. Meanwhile the value of 20 railroad stocks has fallen from 72 to 64. Yet the industrial concerns—the shippers—claim that they cannot afford to do the railroads justice

region. There is no head in bituminous mine affairs. T. T. Brewster, chairman of the Scale Committee in the present dispute, is respected, not for his economic power, for that he does not possess, but for personal qualities and for individual magnetism. He is beloved, but he cannot order. He is the mouthpiece of the operators, not their master. They will have none. The public, perhaps, respects—it certainly should—the operators for their intensely human, markedly American characteristics.

As for Mr. Brewster, he is not a big-output operator; perhaps the mine owners would not accept him if he were; but, because he represents a section of Illinois that has much at issue, and because his is a good American type and he is a safe man to have in his present position, they have let him hold the post of prominence that the productive volume of his mines would not indicate.

The mine operators do not have a master. It is a safe guess to declare that they never will. Something of the conflict ever incident to democracy will always afflict yet defend them when in council.

## Putting Business Into Engineering Students

AFTER a loud cry went out that engineering students did not have any business ability, it was decided by many of the college faculties that the desideratum could be supplied by teaching mine accounting and allied subjects. Doubtless these subjects will be useful, for accounting is an extremely valuable accomplishment, yet the big certified accountants are seldom placed in charge of affairs and never in control of big business.

Rarely is a good accountant a first-class executive, and rarely is a good historian a leading statesman. A knowledge of accounting is a valuable asset but what students need on leaving college is a quality of manhood. They usually and quite naturally lack all the rounding influence of affairs. Some may emphasize the lack of manners, others the need for the quality of concentration, some may deplore most the absence of a power for sustained effort in the newly arrived student, but these matters are one and all needed. Working one's way through college will supply many of the qualities desired. Work before entering will supply them also, while careful selection before entry will assure that the student will have qualities that no training can ever supply.

One of the leading troubles with some students is that they do not want to fill the specifications for a valuable employee. They resent being cast into a utilitarian mold. They dislike the acquirement of manners, concentration and effort. They regard these as mere servilities and go to college with the hope that they may vault over the heads of others and escape what they claim are menial occupations. Engineering to them is visualized as riding around in a high-powered automobile and issuing orders. If the prey cannot promise them at least an approximation to such a vault into the saddle they are not satisfied.

## Middle Class Union

PROSPEROUS indeed seems the Middle Class Union of Great Britain. It practically is an organization of the ununionized, for it declares itself, with apologies for its name, as an association of those who are neither members of manual unions nor members of the employing class.

There are dangers in such a union. The founders of it recognize that fact and so apparently do the members. They are not declaring their belief that what are commonly regarded as intellectual pursuits should be better paid than manual tasks. All they assert is that the manual workers should not be allowed by combination to make the toilers at the desk, and in the office pay them larger wages than supply and demand would indicate.

They are opposed to any persons arraying themselves in financial battle against others who refrain from such action. They are not seeking to fight for themselves but to repel those who would fight against them. They

are against extortion and greed on the part of any persons, who combine themselves against the public interest and so are able to make living difficult for the middle class or would be able to do so if it had no organization for self protection.

It is a negative and unselfish creed and weak for that reason. But after all "Defense" is a good rallying cry and appeals strongly to the best men everywhere. The new union needs watching, of course. It may at any time develop aggressive tendencies. It may in an unguarded moment vote itself into favoring desk- as against bench-work as the more worthy and therefore entitled to the higher award. But the action and success of the Middle Class Union in combating the British transport strike is an evidence of its value when properly directed.

Many members of Parliament have entered its ranks. It immediately obtained political power. If it goes on as it has commenced it will be a wholesome factor in public life, a rallying point for those who believe that the co-operative bargain may be, and often is, a labor-trust weapon every bit as dangerous as the gentlemen's agreement or capital trust.

The faults of the bourgeois are matters not to be denied but on the whole the bourgeois tries to be fair, to live and let live. May the Middle Class Union exemplify the boast that

the middle class is one of the bulwarks of the nation.

Still, there are clouds which threaten rain. The labor unions are catering already to this new union—the salariat as it is called in opposition to the proletariat. A meeting is to be held to determine on what is to be the relation between the two classes of employees. So far the Middle Class Union has stood for sanity. It has opposed those unions which by mass action tried to carry everything before them regardless of the national welfare, or which sought ends not based in any way on the necessities which readjustment visited on them. If it continues fair and courageous it will deserve well of the public. If it sinks into the slough of union politics it will lose its membership and its present ability to act as the balance weight of the state.

## Let's Go!

THE AMERICAN Institute of Mining and Metallurgical Engineers announces a fuels conference which strikes a new note in the coal business. The stabilization of the coal industry is one of our ambitions, of course, and here seems to be a most promising effort toward this end.

A program backed by this association, which does things, and led by a man of the high standing and clear vision of Dr. Van H. Manning, Director of the Bureau of Mines, would at any time command our attention. Just now it is particularly timely.

If the coal business is to have a hand in recommending the means to this desirable end, the coal operator should attend ready to participate in this discussion and we are assured that the coal man will be welcome.

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Electric Mine Haulage

*Letter No. 5*—It will not be surprising if this discussion brings out the fact that there are many mines experiencing the same difficulty as that to which attention is drawn by Charles F. Sherman, *COAL AGE*, Nov. 27, p. 861; namely, the tendency of electric locomotives to tilt or lift the front end of the locomotive frame when starting, or when pulling a loaded trip up a heavy grade.

This is especially observable in the use of a six-ton motor that is overloaded or nearly so. This tendency of the front end of the frame to rise, unquestionably, throws the burden of the load on the controller-end armature, which results in its overheating and causing other armature troubles, while the resistance-end armature is practically free from these troubles.

In my practice, I have seen and used a number of General Electric, six-ton locomotives; and, in my opinion, it would be difficult to throw most of the weight on the front end by reversing the machine, or turning it end-for-end. Even taking the controller and the operator into account as a factor in the weight, the bulk of the frame weight would still be on the resistance end.

The locomotives I have seen are apparently designed so that most of the weight is on the resistance or front end. Still, when these motors have very much of a load the front end of the frame will lift. The question of equalizing the load and work of the two armatures appears to me to be an important feature that is much overlooked in the design and manufacture of these machines.

#### MANUFACTURERS' ESTIMATE OF HAULING CAPACITY

According to statistics compiled by different manufacturers of mine locomotives, relative to their hauling capacity when operating on clean, dry, sanded rails, a six-ton locomotive equipped with steel-tired wheels, will start a load of 127 tons, on a level track, with a frictional resistance of 30 lb. per ton; or 30-ton load, on a four per cent grade. The hauling capacity of the same machine when running is 94 tons, on a level track, or 24 tons on a four per cent grade.

As grades, generally, in well engineered mines, are in favor of the loads, the overloading of mine locomotives is well safeguarded; and, theoretically, we should be able to push a large number of empty cars, say ten or twelve, up a five or six per cent grade. I have seen this number of empty cars, weighing about a ton each, handled in this manner, with the best results, where the tendency of the front end of the locomotive to lift was minimized.

At times, it was even necessary to place a band over the bumper, above and below the coupling pocket of the locomotive, in order that the locomotive frame would not ride the bumpers of the mine cars when starting to push a trip.

The practice of pushing the load ahead of the locomotive appears to me to minimize the evil effect of throwing all the load on the controller-end motor. It is not possible, in all mine conditions, to do this; but, as a six-ton locomotive is primarily a gathering locomotive, it is always possible not to overload them, if the haulages, side tracks, layoffs, etc., are provided at suitable points in the mine.

However, until a different idea of construction and design enters into the manufacture of the locomotives, it will not be possible to fully eliminate the armature troubles in the controller end of double-armature locomotives, by reason of the tendency of the front end of the frame to lift under a heavy load. Such a load does not necessarily mean more than that allowed by the manufacturers' tables.

It does not seem practicable that a locomotive can be built, for general use, to overcome this widely recognized difficulty; nor does it seem practicable, especially on a General Electric, six-ton gathering locomotive, that more frame weight can be employed than that already provided, without tilting or raising the rear end of the locomotive. An armature of greater horsepower might be used to advantage in the controller end to take care of the added work required. Like the editor and Mr. Sherman, I would be glad to hear from others on this subject.

Thomas, W. Va.

W. H. NOONE.

### Guarantee of Mining Equipment

*Letter No. 1*—In the issue of *Coal Age*, Jan. 8, p. 63, there appeared an inquiry regarding the guarantee of the performance of mine fans, by the manufacturer of such equipment, and I was pleased to read the inquiry and reply.

The subject of the guarantee made by the manufacturer to the purchaser of any equipment has always been one that has interested me, and I have often wondered how such guarantees worked out. We are all familiar with the guarantee of automobile tiremakers who specify a certain mileage for their tires. But the guarantee practice in many lines of manufacture seems to be going out to a considerable extent. I believe this is particularly true in coal mining.

The man who takes good care of his tires is made to pay, on his bill, some of the replacement cost of the man who abuses his. The same is true, I think, of any kind of equipment. It is understood that, in purchasing equipment, reasonable care will be taken or is expected to be taken when that equipment is installed and used.

It has been my experience that the guarantee, nowadays, does not cut much ice, though perhaps in a few cases a written guarantee all "dolled up" on a paper that does not look unlike an oil-stock certificate, does play its part in the sale of the equipment.

I have heard it said that a product that is good enough to be guaranteed generally least needs a guarantee to sell it. No amount of word decorating can, in my opinion, add to the recognized quality of an article. The service record of any equipment indicates, beyond the shadow of a doubt, that if the same care in installation is used in the future, as in the past, there is no call for a written promise or guarantee.

#### WHAT A MANUFACTURER'S GUARANTEE OF MINE EQUIPMENT MEANS

A guarantee does not and should not mean that the customer will get five years of care-free service; but it does mean that should the equipment give trouble it will be repaired or replaced, as far as the equipment is concerned, by the manufacturer.

But the buyer of equipment will do well to remember that the time and labor lost while the manufacturer is making good cannot be reckoned exactly. The concern giving such a guarantee figures the probable amount of defective material that will have to be replaced, and includes the cost of this extra material and labor in the original price of the equipment. How bad must a piece of equipment become, may I ask, before it is unserviceable?

The best possible kind of guarantee that a purchaser can get is the good-faith guarantee of a reliable company. He knows the company is not in business for this year only and that, unless its product is dependable and delivers the proper service, the active life of the company is indeed limited.

L. S. YOUNGLING.

Pittsburgh, Pa.

## Authority of Shotfirers

*Letter No. 1*—The question raised by "Shotfirer," *Coal Age*, Jan. 1, p. 26, is one of paramount importance wherever coal is blasted by the use of explosives of any kind. In one Iowa mine, there have been three premature explosions of black powder, caused by ignition from a spark when the loose powder was being worked to the back of the hole with an iron scraper. The results are three men dead and one made almost totally blind by flying coal.

The inestimable services rendered by shotfirers are often either too lightly esteemed, or estimated by their assumed worth in cold cash. In support of this statement I would like to give some facts that may prove beneficial to the many readers of *Coal Age*.

Following a disastrous dust explosion that occurred in an Iowa mine in 1914 and which completely wrecked the mine causing its permanent abandonment; the mine inspection department realizing that something must be done to eliminate, if possible, the recurrence of such accidents, formulated a set of rules, revoked all the certificates previously granted to shotfirers and compelled them to come in person and subscribe to, and thenceforth rigidly observe the following rules:

1. To prohibit the charging and firing of all shots that are drilled into the solid.
2. To prohibit the charging and firing of one shot following another, and depending upon the success of the first shot; unless, the dependent shot cannot be fired until the first shot is known to have done its work properly. (This rule included all sumpers.)
3. To prohibit the charging and firing of any shot that has blown out the tamping, or, any shot that is placed too near old holes, cracks or fissures made by previous shots.
4. To prohibit the charging and firing of more than three coal shots in rooms or pillars; or more than two coal shots in entries or rooms turning. Provided further, that when making break-

throughs in entries the entrymen be allowed one extra coal shot or a total of three coal shots in entry and breakthrough.

5. To not knowingly approve or fire any shot that is charged with mixed explosives of any kind.

6. To not knowingly approve or fire any shot that is not firmly and sufficiently tamped with lawful tamping (in Iowa, sand, soil or clay.)

7. To prohibit the charging and firing of shots in those parts of the mine where Sections 34 and 35 of the State Mining Laws of Iowa are faithfully observed. (These sections apply to the lawful tamping of shots and the sprinkling of dusty roads.)

8. To observe the time (to be mutually agreed upon hereafter) to commence the firing of shots in the mine where I am employed as shotfirer, which in no case shall commence until every person (except the shotfirers) are out of the mine.

9. To devote ample time to the examining of shots and their surroundings. To make sure that conditions are reasonably safe in the firing zone to light shots; and to light them no faster than safe practice will permit.

10. To prohibit the charging and firing of any shot where explosives are stored or kept in the mine, either by operator or miner, in violation of Section 2, Chapter 130, of the Iowa State Mining Laws.

In addition to these rules we have since requested that in mines where shotfirers are employed there must be the following provision made for them, the first winter the mine is opened:

A place of refuge shall be made for the shotfirers in the solid coal with a heavy door so arranged that it can be securely barred from the inside. The shotfirers must only light a few shots at a time, then retreat to the place of refuge, close and fasten the door and remain inside until all the shots that were lighted have gone off. This is to be repeated until all the shots in the mine are fired.

This ruling has saved lives on different occasions. The following data, compiled before and after these rules were made obligatory, will prove their sterling value in preventing casualties to shotfirers: From January 1, 1902, to December 31, 1913, inclusive there were 23 shotfirers killed, and these casualties may be classified as follows: From explosions or blowout shots, 13; from flying coal, 8; from falls of roof, 2. On the other hand, since the rules went into effect in May, 1914, until December 31, 1919, there have occurred only two deaths of shotfirers, one by a windy shot and one by flying coal.

The Iowa State Mining Law gives the shotfirer the authority to protect himself by allowing him "to prohibit the charging and firing of any shot which in his judgment is unsafe." And if this right is in any way abridged or abrogated, I want to ask, where is the shotfirer's protection?

#### FIRM CHARACTER OF A TRUE FIREBOSS

I believe that above everything else the shotfirer should be a thoroughly practical, careful and reliable man and have enough moral stamina to execute his duties without fear or favor. He should strenuously resist any encroachment upon his judgment in determining the practicability of shots.

Eternal vigilance will be absolutely necessary as a part of the shotfirer's equipment, as each day brings dangers and difficulties of such magnitude and intricacy that make their safe solution, at all times, an exceedingly difficult problem. In dealing with these he will often be compelled to rely largely on his own practical experience and prudence.

However, the shotfirer should, under all circumstances, give himself (and thereby those dependent on him) the benefit of the doubt, and require as large a margin of safety in all things as it is possible to exact from everyone employed in and around the mine. It will be better for a shotfirer to be a living monument to the courage of his convictions, than to become a corpse

as the result of the mistaken or misapplied judgment of some one else.

In closing allow me to state my conclusion of the whole matter by saying, that whenever a shotfirer is denied the absolute and inalienable right to exercise his practical judgment, for his own personal protection and safety, under any and all circumstances (the committee and others with their views and opinions to the contrary notwithstanding), he is thereby stripped of all qualifications and ambition, loses his identity as a rational intelligent being and simply becomes a traveling target worth only whatever unscrupulous men are willing to pay for such perfunctory services.

Albia, Iowa. W. E. HOLLAND,  
State Mine Inspector.

## Analysis of Mine Water

*Letter No. 1*—In the issue of *Coal Age*, Sept. 11, p. 434, Donald J. Baker, discussing the drainage problem of the Edna No. 2 mine, of the Hillman Coal & Coke Co., Wendel, Penn., gives what he says is the result of a recent analysis of the mine water, the several ingredients being expressed as contained in 100,000 parts of the water.

Mr. Baker then states the quantities of "lime (90 per cent) and soda ash (95 per cent)" required, per 1000 gal., in treatment of this water for boiler use:

There is already a great deal of misunderstanding or ignorance, among practical mining men, as to just what mine water is; and the analysis presented by Mr. Baker, which is a very strange one to say the least, does not help to improve this condition but rather makes matters worse.

In the first place, it is quite unusual to calculate the "free acid as sulphur," in giving the results of a chemical analysis of water. This is a small matter, however, as compared with the more important fact that this analysis would make it appear that the water contains not only a high percentage of free acid and acid salt (iron sulphate and aluminum sulphate), but a considerable quantity of calcium carbonate and some magnesium carbonate besides.

### IMPORTANCE OF CORRECT CHEMICAL ANALYSIS

A chemist, of course, would recognize at a glance that the analysis as given must be incorrect; but the practical mining man, not having the same knowledge of the relation of chemical ingredients, would be misled as to the actual condition of the water he must handle in draining the mine, or its effect if used in the boilers for the production of steam.

Inasmuch as Mr. Baker states that this water is corrosive in its action, and the analysis given shows a high acid content and considerable calcium carbonate, which is a substance more or less opposite in its nature to an acid, it would be interesting to have an explanation of the analysis he gives. In other words, let me ask, How can a water contain both free acid and calcium carbonate, since these two ingredients would neutralize each other and result in the formation of a calcium salt (calcium sulphate).

Judging, as best one can, from the analysis given, it would appear difficult to treat this water in a way that would make it suitable for boiler use. It will be of interest to learn just how the proportionate amounts of the reagents (lime and soda ash), which he gives

as being required to treat this water, were calculated. It will be further interesting to *Coal Age* readers to know just what results were obtained in the use of this water in steam boilers.

A. G. BLAKELEY, Chief Chemist,  
Philadelphia & Reading Coal & Iron Co.  
Pottsville, Penn.

## Finding a Mine Door Set Open

*Letter No. 19*—The question in regard to how a fireboss should proceed in his examination of a mine or section, after finding a door standing open and not knowing how long it has been open has caused considerable argument, some of the writers claiming that the safest course to pursue is to leave the door as it was found, while others claim that there would be less danger in closing the door and proceeding to make the examination with caution, taking it for granted that nothing is wrong in the section.

There seems to be much difference of opinion also in regard to starting the examination on the intake end and following the air current, or beginning at the return end and proceeding against the air.

These are important questions in firebossing. My own preference is to close the door and give time for the circulation to be restored in the section. In any well-managed mine where shots are fired at night or after the men have left the mine, there are fire-runners employed to see that no feeders have been ignited by the shots. In smaller mines where the miners fire their own shots, the law usually requires every man to examine his place to see that no gas is burning.

The fireboss is warranted in assuming that there is no gas feeder burning in his section. Anything else would point to bad management in the operation of the mine. My opinion, therefore, is that he should close the door and wait a sufficient time for the circulation to be restored in the section and then proceed with the examination. It is not to be supposed that, finding gas in the first one or two rooms, a fireboss would attempt to go further, as he would be sure to get into trouble before he had proceeded far. If the workings are advancing to the rise he would expect to find more and more gas as he proceeds. If he has not closed the door before he would now be compelled to go back and close the door.

Again, it is reasonable to suppose that even with the door standing open there would be sufficient air circulating at the face of the rooms to carry the gas forward. In that case, had there been a feeder burning in the section, the explosion of the gas would have taken place before this. Reasoning thus the fireboss feels more than ever that he is safe in closing the door.

Let me say in closing that a fireboss proceeding to make an examination of a section where the circulation is cut off by an open door is in danger of being overcome with gas. Should that happen, few men would attempt his rescue before closing the door, knowing that they would be overcome quickly, as was the man they tried to rescue. In regard to starting an examination of a section at the return end, it is my firm conviction that such a course is pure foolishness and I can not conceive of a trained fireboss doing such a trick.

Mohrland, Utah.

ALEX HARRISON.

[The discussion "Finding a Mine Door Set Open" will close with letter No. 20, now on hand.—EDITOR.]

# INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

## Roof Falls in Airways

We have been troubled, of late, with an insufficient supply of air in the mine workings, which is thought to be the result of numerous falls in the main air-course. The expense of clearing up this air-course will be considerable, and we are led to ask what effect it will have in reducing the power required for the ventilation of the mine.

For example, assume an airway 6 x 12 ft. in section, and 5,000 ft. long, passing, say, 35,000 cu.ft. of air per minute, under a 2-in. water gage, and suppose that the main airway is partly blocked by falls, for a distance of 1,000 ft., so that its cross-section is reduced to an average of 4 x 12 ft., while, in a few places, the section may not measure more than 3 x 10 ft. My question is, What percentage of power will be saved by clearing up the 1,000 ft. of this airway, so as to restore the original circulation.

MINE MANAGER.

Centralia, Ill.

Without more specific data it is impossible to give more than an approximate estimate of the result of the roof falls in this air-course as affecting the general circulation of air in the mine.

It is stated that the sectional area of the airway has been reduced to an average of  $4 \times 12 = 48$  sq. ft., the original area being  $6 \times 12 = 72$  sq.ft. It is further stated that the area, in places, may not exceed  $3 \times 10 = 30$  sq.ft.

We will first assume that the power producing the circulation, in the fallen state of the air-course, is the same as what was required to pass the original volume of air before the roof started to fall. Then, taking the length of the original airway as 5,000 ft., including the return, and assuming 1,000 ft. of the air-course is partly blocked with falls as stated, there remains 4,000 ft. of airway having the original cross-section.

Now, in order to calculate the amount the circulation is reduced, the power on the air remaining constant, it is necessary to calculate the relative, part potentials, first, of the original 5,000 ft. of airway and return, and then of the 1,000 ft. of the blocked return air-course and the remaining 4,000 ft. of airway and return having the full sectional area undisturbed.

The lengths of these three sections being 5,000, 1,000 and 4,000 ft., respectively, their relative lengths are 5, 1, 4. The original perimeter of the air-course being  $2(6 + 12) = 36$  ft. and the perimeter of the blocked portion  $2(4 + 12) = 32$  ft., the relative perimeters of the three sections are 9, 8, 9. In like manner, the areas of the sections being 72, 48, 72, the relative areas are 3, 2, 3, respectively.

Then, calling the original and the reduced circulations,  $Q_0$  and  $Q_1$ , respectively, the potential of the original airway  $X_0$  and that of the blocked section and the

remaining 4,000-ft. of original airway  $X_1$  and  $X_2$ , respectively: remembering that the power on the air is  $U = Q^2 \div X^3$  and, for a constant power on the air, the quantity is proportional to the potential, or the quantity ratio is equal to the potential ratio, we write,

$$\frac{Q_0}{Q_1} = \sqrt[3]{\frac{X_0^3}{X_1^3} \cdot \frac{X_0^3}{X_2^3}}$$

The required relative potentials are then found as follows:

$$\begin{aligned} X_0^3 &= \frac{a^3}{l_0} = \frac{72^3}{5000 \times 36} = \frac{3^3}{5 \times 9} = 0.60 \\ X_1^3 &= \frac{48^3}{1000 \times 32} = \frac{2^3}{1 \times 8} = 1.00 \\ X_2^3 &= \frac{72^3}{4000 \times 36} = \frac{3^3}{4 \times 9} = 0.75 \end{aligned}$$

Now substituting these values in the first equation given above, since  $Q_0 = 35,000$ , we have,

$$\frac{35,000}{Q_1} = \sqrt[3]{\frac{0.6}{1} + \frac{0.6}{0.75}} = \sqrt[3]{1.4} = 1.1187$$

$$Q_1 = 35,000 \div 1.1187 = 31,286 \text{ cu.ft. per min.}$$

Now, to restore the original circulation, without cleaning up the airway, will require an increase of power on the air in proportion to the cube of the quantity; or, in this case, 1.4 times the original power. Hence, cleaning up the airway can be considered as a saving in power equal to  $(1.4 - 1) 100 \div 1 = 40$  per cent of the original power.

The power required to circulate 35,000 cu.ft. per min. against a 2-in. water gage is  $(35,000 \times 2 \times 5.2) \div 33,000 = 11$  hp., and the saving by cleaning up the airway may be estimated, therefore, in this case, as  $11 \times 0.4 = 4.4$  hp.

## Taking Water-Gage Readings

Please explain where water-gage readings should be taken to show correctly the resistance of the mine? Bellaire, Ohio.

MINE FOREMAN.

In order to measure correctly the pressure producing the circulation in a mine, including the shaft, the gage should be placed on the fan drift, at a sufficient distance from the fan to enable a steady reading of the gage to be obtained. If the reading of the gage is multiplied by 5.2, and that result by the sectional area of the fan drift where the reading is taken, the product obtained will represent the mine resistance plus the resistance of the shaft, in pounds.

If the gage reading, however, is taken in the cross-cut between the main intake and return airways, at the shaft bottom, the result obtained by multiplying by 5.2 and the sectional area of the air-course expressed in square feet, will be the mine resistance, in pounds, or the pressure producing the circulation in the mine, exclusive of the shafts.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Miscellaneous Questions

(Answered by Request)

*Ques.*—If, with 8 hp., a quantity of 70,000 cu.ft. of air per minute was obtained, what quantity should be gotten with 24 hp.?

*Ans.*—In the same mine or airway, the quantity of air in circulation varies as the cube root of the horsepower on the air. In other words, the quantity ratio is equal to the cube root of the power ratio, and we write, calling the required quantity  $x$ ,

$$\frac{x}{70,000} = \sqrt[3]{\frac{24}{8}} = \sqrt[3]{3} = 1.442$$

$$x = 70,000 \times 1.442 = 100,940 \text{ cu.ft. per min.}$$

*Ques.*—What horsepower will be required to drive a double-acting steam pump if the vertical distance between the point of suction and the point of discharge is 150 ft., the diameter of the pump cylinder, 9 in., the stroke, 12 in., and the number of strokes per minute, 80, adding 25 per cent for friction?

*Ans.*—The sectional area of the pump cylinder is  $0.7854 \times 9^2 = 63.617$  sq.in. For a discharge head of 150 ft., adding 25 per cent for friction, the pressure head against which this pump must operate is  $1.25(150 \times 0.434) = 81.375$  lb. per sq.in. The length of stroke being 12 in., or 1 ft., and the pump making 80 strokes per minute, the piston speed is 80 ft. per min. Therefore, the horsepower required to drive this pump, under the assumed conditions, is

$$H = \frac{81.375 \times 63.617 \times 80}{33,000} = 12.55 \text{ hp.}$$

*Ques.*—If the ratio of the diameter of a plunger to the diameter of the piston of a pump is 1:2, what steam pressure will be required in the cylinder of the pump to lift water 300 ft., assuming an efficiency of 85 per cent in the water-end and 75 per cent in the steam-end of the pump?

*Ans.*—Calling the diameter of the steam cylinder of the pump  $D$  and the diameter of the plunger or water cylinder,  $d$ , the height of the lift, in feet,  $h$ , and the steam pressure in the cylinder, in pounds per square inch,  $p$ , we have the following:

$$p = 0.49 h \left(\frac{d}{D}\right)^2 = 0.49 \times 300 \left(\frac{1}{2}\right)^2 = 36\frac{1}{2} \text{ lb. per sq. in.}$$

*Ques.*—Which is the most difficult of the mine gases to remove, and why?

*Ans.*—Carbon dioxide, accumulated at the foot of a slope or incline or at the face of dip workings or in other low places, will generally prove to be the most difficult gas to drive out, owing to the greater density of the gas which prevents it from rising and makes it necessary to employ a strong air current to drive it out from its lodgment.

Methane or marsh gas, accumulated at the head of a steep pitch or at the face of rise workings or on top

of a high fall, is also difficult of removal because of its low density, which causes it to seek the roof and other high places in the mine. The relative temperature of these gases will generally determine which is the harder to remove.

*Ques.*—With a water gage of 4 in., a fan running at a speed of 80 r.p.m. produces 35,000 cu.ft. of air per minute; what volume of air will this fan produce when running at the same speed, against a water gage of 8 in.?

*Ans.*—Disregarding any slight change in the efficiency of the fan when operating against the higher gage, it may be assumed that the power on the air is the same, for the same speed of fan. That being true, the quantity of air in circulation will vary inversely as the pressure or water gage. But, the water gage being doubled in this case, the quantity of air produced against the 8-in. gage will be one-half of that produced against the 4-in. gage.

*Ques.*—(a) There is a current of 65,000 cu.ft. per min. passing in the return airway of a mine,  $3\frac{1}{2}$  per cent of which is methane ( $\text{CH}_4$ ). How many cubic feet of this gas is being generated in the mine and what is the total quantity of air in the current? (b) Is this percentage of gas dangerous?

*Ans.*—(a) The quantity of gas being generated, in this case, is  $65,000 \times 0.035 = 2275$  cu.ft. per min. The volume of air passing in the return is, therefore,  $65,000 - 2275 = 62,725$  cu. ft. per min.

(b) This percentage of gas is undoubtedly dangerous and will require extreme caution to prevent accident, under any conditions in mining coal.

*Ques.*—There are 60,000 cu.ft. of air passing in a return airway and this current contains 1,500 cu.ft. of marsh gas. (a) What percentage of gas is present in the current? (b) Is this percentage dangerous? (c) Assuming the return current contained 1,400 cu.ft. of carbon dioxide instead of the marsh gas, what is the percentage of the gas and is it dangerous?

*Ans.*—(a) In a return current containing 60,000 cu.ft. of air and 1,500 cu.ft. of marsh gas, the total volume of air and gas is 61,500 cu.ft. The percentage of gas present is then  $(1,500 \times 100) \div 61,500 = 2.4$  per cent.

(b) In the mining of soft coal, this percentage of gas would be dangerous if the coal is highly inflammable or if it generates much dust that is carried in suspension in the mine air. In the mining of hard coal, this percentage of gas may not be considered dangerous, but requires the taking of extra precautions to prevent accident.

(c) Assuming 1,400 cu. ft. of carbon dioxide in the current, the total volume of air and gas would be 61,400 cu. ft. and the percentage of gas present would then be  $(1,400 \times 100) \div 61,400 = 2.3$  per cent, nearly. This would not be a dangerous percentage of carbon dioxide.

## Cosgrove & Co. To Own and Operate a Steamship Line

Owing to the scarcity of boats for foreign trade, Cosgrove & Co., a coal firm with home offices in the Swank building, Johnstown, Pa., has obtained a charter for one of the firm's associated companies and will operate a boat line of its own in its exporting business. Cosgrove & Co. operates coal mines extensively both in the East and in the Middle West and through a branch company exports a large part of the product.

It was announced today at the home offices of Cosgrove & Co., says the Johnstown *Tribune*, that a charter had been granted at Albany, N. Y., to the Wynngrove Line, Inc., an associated company of the Cosgrove firm. J. C. Cosgrove, President of Cosgrove & Co., explained that, owing to the scarcity of boats for the foreign trade and the rapid growth of the company's business, it had become necessary to make arrangements which would insure the foreign trade prompt delivery.

The Wynngrove Line, Inc., has purchased one boat and is completing negotiations for four others. It is planned to have the line in actual operation by spring of this year. The officers of the line are:

F. Le Maistre, President, who has been prominent in the financing of large steamship business for a number of years; Daniel J. Boylan, Vice President, well known in the New York Coal Trade as the owner of the Boylan Towing & Transportation Company; C. B. Wynkoop, Secretary and Treasurer, member of the firm of Cosgrove & Wynkoop, Ltd., and Cosgrove & Wynkoop Coal Co.

The Board of Directors is composed of men prominent in financial circles of New York, as well as coal men of equal prominence in the central Pennsylvania field. The Wynkoop Line will have its general office in the Cosgrove & Co. suite of offices in the Singer building, New York City.

## Foreign Vessels Permitted to Bunker

Under date of Jan. 27, J. W. Howe, commissioner, Tidewater Coal Exchange of New York City, sends the following communication:

"Have following wire from Regional Coal Committee, Philadelphia, reference to bunkering coal permits.

"My wire Jan. 23 is modified to this extent: Bunkering of vessels flying foreign flags sailing to European destinations will not be limited to sufficient coal to take them to Halifax, but will be permitted to bunker coal to take them to their outbound destinations. This does not change in any way the rule requiring bunkering at Hampton Roads of boats passing that port enroute to southbound destinations."

## Bunker Restrictions Modified

The following has been received on Jan. 23, from Mr. Howe, commissioner of the Tidewater Coal Exchange of New York City:

"Instructions for the bunkering of foreign flag vessels are modified to the extent that sufficient coal may be bunkered to carry vessels to outbound destinations."

## German Miners Oppose 6-Hour Day

A statement in the New York *Sun* on Jan. 27, states that a conference held in Gelsenkirchen, Westphalia, of the delegates of the Christian Miners Union, which has a membership of 100,000 workers, adopted a resolution opposing at present the introduction of a six-hour working shift in view of the prevailing economic conditions.

The resolution endorsed the principle of a shorter working day and demanded that the Government and the mine owners should strive to have it introduced as soon as possible. Meanwhile the resolution said, miners should be paid extra for working their present hours. At the same time the resolution called upon the miners to avoid possible interruption in the nation's economic activities through decreased output.

Representatives of the Ministry of Labor and of the Coal Miners Union met at Ochem to discuss the six-hour work-day issue. The Government's representative

urged the miners to desist from their attempts to force such a concession at this time in view of the industrial situation and the deliveries of coal to the Entente required under the terms of the peace treaty. He declared that the issue was one that should be left to international adjustment. He added that the Government approved the plan for the shortening of the working day and the improvement in the working and living conditions of the miners.

The Representative-General of the commission of German labor unions supported the Government's attitude and a commission comprising representatives of the Government and of the miners and mine owners was appointed to confer on the situation in the course of the next few days.

Through the closing of the Berlin railway repair shops 7,000 workers are temporarily without employment. The plants probably will be idle until the middle of February, when, it is hoped, a new wage agreement will have been decided on, based on the piece work or premium system.

## Australian Shipments

The following cablegram has been received from the American consul at Newcastle, Australia, dated Jan. 9, according to recent report of the Department of Commerce regarding the output of coal during December and the oversea shipments: During the month of December the total amount of coal mined was 401,000 tons, value at \$321,000. There were 40,334 tons, including 27,283 tons, to New Zealand, exported overseas.

Bunkers furnished overseas vessels were 32,160 tons, including 4,000 tons to those bound to New Zealand and 19,000 tons to vessels bound to the United Kingdom; 1,000 tons for Peru now being loaded on an American sailing vessel; 3,500 tons of Newcastle coal will be taken to Callao by an American vessel now discharging at Melbourne.

Strike of marine engineers, which began on Dec. 16, still in effect and likely to continue several weeks; 6,000 men most wharf laborers, are idle; at steel works one blast furnace is shut down, unable to obtain supplies of ore; other trades are affected.

## Coal for Italy

Matteo, Ghio, Genoa, Italy, writes Charles S. Allen, secretary of Wholesale Coal Trade Association of New York City, in part as follows:

"Our object is to represent eventually some first class exporting house of bituminous coals, such as New River, Pocahontas, Westmoreland, Kanawha, etc. on the Italian market. We respectfully request you to put us in communication with some such house (not yet represented here), who desires to initiate business relations with Italy.

"We are fully aware of the present coal crisis in the United States due to the recent strike, and do not expect to do business immediately, but we think best to treat now regarding our eventual representation, so that by the time we will have reached an agreement the present situation will have changed for the better. We are disposed to furnish first class references, banking and others."

## Brazil's Coal Exports

The Consulate General reports from Rio de Janeiro that during September coal imports into Brazil totaled 9,294 metric tons, of which 5,388 tons were British coal and 3,906 tons American coal. In September 1918, all the coal imported, 16,032 tons, came from the United States, and in the corresponding month of 1917 of the 25,365 tons imported 19,364 tons were American coal and the remainder, British.

## Tidewater Demurrage

News ticker advice is that the tentative decision of the Interstate Commerce Commission in the case of this Association against the Railroad Administration has been handed down, in which it is held that three days, under the average agreement, from Dec. 1, 1918, to March 1, 1919, was unreasonable and that five days would have been reasonable and that the charge of \$3 a day was unreasonable to the extent that it exceeded \$2 a day, held to be reasonable.

If this is a correct report of what is in the tentative decision it means that reparation may be recovered for the difference in

demurrage charges figured on the three day and \$3 basis, on which the hills have now been rendered, and five days average and \$2 per day.

It is to be understood, of course, that this is merely the tentative report of the examiner who heard the case and opportunity is afforded each side to file exceptions to the report and argue the same before the commission, after which a final decision in the matter is made.

## Coal and Coke Exports for December

Exports of coal and coke, as shown by returns to the Department of Commerce, for December, 1919, and those for the corresponding month of 1918, as finally revised, were as follows:

	December	
	1918	1919
Anthracite .....	292,014	345,402
Bituminous .....	1,140,455	341,064
Exported to:		
Italy .....	—	11,040
Canada .....	903,210	208,091
Panama .....	6,000	16,300
Mexico .....	9,836	8,489
Cuba .....	89,779	57,478
Other West Indies .....	21,239	19,633
Argentina .....	—	—
Brazil .....	21,974	4,590
Chile .....	15,821	4,226
Uruguay .....	41,358	—
Other countries .....	31,238	11,217
Coke .....	93,100	43,320

## Coal-Mining Developments in Holland

A bill is under consideration of the States-General to develop the coal mining industry in Dutch Limburg. It is stated in the memorandum explanatory of this bill that the output of the state coal mines amounted to 2,804,546 metric tons in 1918; and it is estimated that the output will be 5,200,000 tons in the year 1925, provided that sufficient skilled labour is available. Minerals have been discovered in the Netherlands in workable quantities in two large districts (where coal is found) viz., South Limburg and "de Peel" (Limburg); and in two smaller areas, viz., Winterswijk (rock salt and coal), and Buurse-Hengelo (rock salt).

The Government intend to develop the mining industry in South Limburg as vigorously as possible. The amount of coal in this area is estimated at 4,554 million tons situated at less than 1,200 meters below the surface. In the "Peel" district, to which belongs geologically the small area east of Roermond, in the municipalities of Vlodrop, Melick, and Herkenbosch, there are approximately 1,776 million tons of coal in workable seams at a depth of less than 1,200 meters.

It is this Vlodrop-Melick-Herkenbosch area which by the present bill is to be added to the State coal fields. The coal at Winterswijk is situated at a great depth, and it is not certain whether it can be worked.

## Coal Traffic in the Ruhr District

For the week ending Jan. 3, states a recent report in the *Colliery Guardian*, the average daily supply of railway wagons was 15,700 tons, full quantity requisitioned being available. In the same period pit stocks fell from 564,000 tons to 525,000 tons. The flooded state of the Rhine caused a decline in the operation of the Duisburg-Ruhrort tips, only barges being available for loading in the absence of larger craft.

At the same time the water in the Rhine-Herac canal rose so high as to prevent traffic passing under the bridges. The canal pits loaded an average of 22,200 tons per diem.

## English Export Levy Lifted

The following notice was posted on the Cardiff Exchange on Saturday, states a recent report in the *Colliery Guardian*, by the district secretary of the South Wales Coal Exporters Association:—

"Coal exporters are informed that as and from Jan. 1, 1920, the levy of 3d per ton made on all coal exporters, colliery owners, and ship owners, no longer continues in its old form. However, it has been found necessary to make a levy of one-tenth of a penny against the exporters only to keep in existence the machinery for supplying our different departments and foreign Governments with the usual daily returns of shipments, etc."

# COAL AND COKE NEWS

## Charleston, W. Va.

Plants in southern West Virginia operate about two full days per week ended the twenty-fourth. Chesapeake & Ohio helpless. Weather conditions hold back production. General congestion follows coal diversion. Kanawha production at lower ebb than during strike. Embargo on Eastern shipments. New River conditions bad; Monday only day coal is loaded satisfactorily.

Deep dents were inflicted on production throughout this section of the state between Jan. 19 and Jan. 24. As serious as the situation had been during the previous week, it was even more discouraging during the period mentioned, the output reaching extremely low ebb; the general average of production for the week was not over 40 per cent, while during the latter half of the week it was even less than that, the twenty-fourth in fact witnessing only about a 30 per cent supply of empties. There was possibly a 75 per cent supply of empties available on the nineteenth. From that day until the end of the week the supply grew less and less. For instance while Chesapeake & Ohio loadings reached 133,000 tons for Monday, tonnage handled dropped to 79,000 for Tuesday and Wednesday and on Friday only 52,750 tons of coal were loaded. Of course widespread suspension of operations followed in the wake of such an inadequate car supply. In the main, it may be safely estimated, plants did not operate more than two full days during the entire week. Of course protests poured in upon the Chesapeake & Ohio, but that road appeared to be helpless.

Adverse weather conditions also conspired to hold back the production and shipment of fuel from this area. While all streams were high and some of them were above their banks no serious damage to mines in any vicinity were reported. On the other hand continued rains throughout the week resulted in many slides at various points, tying up railroad traffic to such an extent as to make the movement of either loads or empties decidedly uncertain. Ice-coated rails also retarded freight movement. With motive power inadequate, even under favorable circumstances, physical conditions made it even more difficult to move loads and empties with any degree of dispatch.

Railroads operating in this section were excluding commercial customers from a supply of coal, during the week ended the twenty-fourth, through an embargo effective in certain regions against east-bound shipments, except in cases where such shipments were intended for railroad use. While contract customers were calling vociferously for coal, little coal was being sent to them, mainly because the railroads were insisting upon being served first, as they have been continuing to insist for some time notwithstanding the fact that much of the coal diverted during the strike is still awaiting disposition. As much of the coal diverted was contract coal, it is pointed out by operators that railroads have fought shy of utilizing such diverted coal in order to secure a supply at cheaper prices. General congestion as an aftermath of heavy diversions during the strike plus unfavorable weather conditions only aggravated conditions, insofar as the operators in this section are concerned. Although the continuance of an embargo as to Eastern shipments indicated congestion in the East, and hence a sufficient supply for domestic use, export restrictions were still in force much to the exasperation of exporting agencies.

Mines of the Kanawha field were laboring under many handicaps during the week ended Jan. 24. The number of cars furnished mines in the district was even slimmer than during the exceedingly poor production week ended the seventeenth. In fact production was at a lower ebb, it is believed, than at any time during the

strike, the only day on which loadings were within hailing distance being the nineteenth. After that production was under 50 per cent and most of the time during the week it was only 40 per cent. As an instance of the poor supply, only a total of 318 cars were furnished mines in the whole district on the twentieth. Consequently production was under rather than over 15,000 tons a day throughout the week, making the week's output at points on the Chesapeake & Ohio considerably below 100,000 tons. On the twenty-third, for instance, only 14,450 tons of coal were loaded. Upon the whole it is not believed the average plant was in operation more than a third of the time during the week.

Weather conditions also played a part in holding back production, slides at many points both on the main and branch lines of the Chesapeake & Ohio being frequent. For instance the Coal River branch of this railroad was out of commission for several days owing to incessant rains. Even telephone lines were out of commission. Points to which Kanawha mines could ship were limited owing to an embargo on Eastern shipments, except insofar as railroad fuel was concerned. In the face of a strong demand for byproduct and steam coal and with contract customers demanding deliveries, transportation conditions were decidedly discouraging during the week. There was also a strong demand in the district for coal for export but the lid was still clamped down except as to about 50 per cent of normal export shipments.

Conditions in the New River field were just about on a par with those in the Kanawha field, with production just about on the same level, and with transportation disabilities figuring as the most potent factor in putting a crimp in production. In comparison with the week ended the seventeenth, the district suffered more during the week ended the twenty-fourth, there being just one day when it was possible to load coal to any degree of satisfaction and that was Monday, the nineteenth. With a shortage of cars so acute, many mines were compelled to mark time during at least two-thirds of the week, and the general average of daily production throughout the period named was not more than 14,000 or 15,000 tons; loadings in the New River field, or rather that part of it supplied by the Chesapeake & Ohio, being only 14,500 tons on the twenty-third. Production for the entire week was, therefore, not over 90,000 tons, if that much. Branch lines of the Chesapeake & Ohio were also out of commission in the New River field, so that between a poor car supply, adverse weather and inadequate motive power, the week ended the twenty-fourth was one of the worst since the beginning of the November strike. On top of conditions so prejudicial to large production, there was an extremely stiff demand for New River smokeless, but neither contract coal, spot coal nor export coal was shipped in the quantities warranted by market conditions owing to the poor transportation service and the continuance of export restrictions.

## Bluefield, W. Va.

Acute car shortage, adverse weather conditions and inadequate motive power hold back production greatly. Output of Tug River and Pocahontas fields much reduced. Norfolk & Western tied up by heavy slides. Worst car shortage in recent weeks in Winding Gulf field. Both Chesapeake & Ohio and Virginian systems contribute to loss of tonnage.

What between an acute car shortage and high water, combined with severe winter weather, production was reduced to the minimum throughout the southern part of the state during the week ended Jan. 24. Indeed, production closely paralleled the output during the Christmas holidays but from entirely different causes. While from the

very outset of the week, the shortage of empties was serious enough, it grew rapidly worse during the last three days of the week.

Continued rains throughout the week not only affected railroad transportation but it also affected actual mining operations in various fields. Loading tracks in a number of instances were inundated and damaged and production generally brought to a standstill, a heavy tonnage loss ensuing. Railroads suffered most from numerous slides which forced a suspension of traffic, but sleet also slowed up traffic to a very considerable extent. Few cars came in from the West, due undoubtedly to adverse weather conditions and to a continued congestion at Western terminals and gateways.

A shortage of motive power also played a large part in holding back production and in aggravating the car shortage. The movement of such coal as had been produced and loaded was extremely slow and the delivery of empties for the same reason was far behind time, so that between the two there was considerable congestion. Then, too, not many cars were coming back very promptly from the East, as has been the case since export shipments were so materially curtailed, that of course adding to the car shortage.

An embargo became effective Jan. 24 on all shipments of coal from the Clinch Valley, Thacker and Kenova districts, consigned to tidewater, except when moving under numbered permit.

There was in the Tug River district during the week ended Jan. 24 between a 40 and a 50 per cent loss attributable solely to a dearth of cars and the causes leading to such a shortage. In other words production during the week mentioned dropped from 75 to about 50 per cent or even less, as compared with the previous week. Empties furnished throughout the week grew less in number as it advanced. In the first place inclement weather made it hard to move cars with any celerity from the West and of course the Norfolk & Western obtained few cars from Western connections. Between ice-coated tracks and high water, traffic was held at a standstill for hours at a time, long stretches of track being obstructed by slides. Inadequate motive power was another factor in holding back production. Only 55,000 tons were produced in the Tug River field during the week ended the twenty-fourth.

The car situation and other conditions in the Pocahontas region were similar to those in the Tug River district for the week ended Jan. 24 and were important factors in holding back production. The Norfolk & Western was almost completely tied up by heavy slides at various points on the Pocahontas division. Sleet and heavy rains also had quite a serious effect on operations, mines being put out of commission in some instances through high water, although no cases of serious damage have so far been reported.

As showing how seriously the mines of the Pocahontas region were affected it is only necessary to point to a car-shortage loss of 188,366 tons, with a labor-shortage loss of only 5,118 tons and a mine-disability loss of 12,254 tons. Coal manufactured into coke during the week amounted to 10,765 tons.

One of the worst car shortages in recent weeks drove production in the Winding Gulf field to a still lower level during the week ended the twenty-fourth. The shortage in existence was observed both on the Chesapeake & Ohio and the Virginian railroad systems.

## Huntington, W. Va.

Guyana field hard hit by car shortage. Transportation loss mounts to new maximum. Production more than 100,000 tons a week behind weekly average of strike period. Operator's committee goes to Washington to have "heart to heart" talk with director general of railroads.

The car shortage in the Guyan field, during the week ended Jan. 24, was more serious than it has been at any time in the last year and more far reaching in its blighting effect. It was so bad in fact that mines of the field found it impossible to produce more than 132,000 tons of coal, that representing a further decrease in production of 42,000 tons as compared with the production during the week ended the seventeenth. Perhaps a further and better idea of the heavy loss caused by the scarcity of cars may be gathered when it is stated that over three thousand hours of possible working time was lost. The transportation disability loss mounted to a new maximum, 204,000 tons being lost from that cause—10,000 tons more than during the previous week. The potential tonnage of the Guyan field is 345,000 tons. During the strike, on an average of 240,000 tons a week were produced, so that production during the week ended the twenty-fourth was running more than 100,000 tons a week behind strike production.

The situation had become so serious in fact that a group of Huntington coal operators left on Jan. 28 for Washington, D. C., where they stated they proposed to have a "heart to heart" talk with the director general of railroads, pointing out that the Chesapeake & Ohio was furnishing only a 50 per cent supply of cars, also charging that coal diverted during the strike was still being held, and that the cars in which such coal was loaded were, in effect, being utilized for storage purposes. In the party were: J. R. Vest, A. Litz, J. J. Ross, James D. Francis, Walter Thurmond, A. R. Beisel, J. A. Kelley and Herbert Jones.

Logan operators were falling further and further behind in their attempts to fill orders and their customers could not understand, it was said, why they should not be able to make better deliveries of coal. Of course under conditions described export shipments were cut to the very quick, only a certain proportion of a limited tonnage being allowed to go forward to tidewater for overseas shipment. Tonnage handled by the Chesapeake & Ohio system during the week ended Jan. 24 was 95,550 less than during the previous week, the number of cars transported dropping from 11,454 to 9,543. Between Jan. 19 and Jan. 25, a total of 6072 loaded coal cars were handled by the road through Clifton Forge, Va., for Eastern distribution.

### Fairmont, W. Va.

Serious cut in production due solely to a car shortage in northern West Virginia. On Jan. 24 there were 110 idle mines on Monongah division of Baltimore & Ohio. Adverse weather conditions interfere with movement of cars part of week. Development in regard to railroad fuel.

Less coal was produced in northern West Virginia mining fields during the week ended Jan. 24, than at any time since before the strike of Nov. 1, the serious cut in production being attributable solely to a car shortage and an extremely serious shortage at that. While in other weeks the mines of northern West Virginia have managed to load a fairly large tonnage during the first three days of the week such was not the case during the weekly period ended the twenty-fourth for at the very beginning of the week there was less than an 80 per cent supply of empties available on the Baltimore & Ohio for instance. The Tuesday supply of cars was only half of requirements. From Wednesday until the end of the week the number of empties furnished in most regions hovered around 30 per cent. On the Monongahela R.R. there was only about a 20 per cent supply of cars during the last half of the week.

Of course under such conditions many mines found it impossible to operate, there being 115 mines on the Monongah division alone of the Baltimore & Ohio idle on Thursday and 110 idle mines on Saturday. At various times during the week there were 466 idle operations on the Monongah division of the Baltimore & Ohio. Even in cases where mines were able to secure cars, empties only sufficed for part of a day's normal loading. Late placements also contributed further to a reduction in the tonnage. Similar conditions of course prevailed elsewhere in the northern part of the state and half the time mines were shut down for want of cars.

While adverse weather conditions during a part of the week also tended to interfere with the movement of coal and with the delivery of empties, yet that could not be given as an excuse for the shortage of cars lasting throughout the week. However, slides and sleet did make operations difficult for several days and on some of the

smaller roads put a complete quietus on the movement of coal for several days. While high water threatened to interfere materially with the operation of both railroads and mines not otherwise affected, streams subsided before any real damage was done; slides were the worst factor with which railroads had to contend.

The filthy condition in which empties were received, necessitating cleaning, prevented prompt loading and retarded the week's production. While it was learned that there were approximately 5,000 coal cars loaded with slag within reach of northern West Virginia regions, and while producers offered to unload the slag at railroad expense, as a means of securing more cars, yet even that failed to bring any more cars into the northern part of the state.

Railroad fuel shipments during the week ended the twenty-fourth were comparatively light. A development of the week was the notice served by the railroads on producers that the latter must fill their contracts with the railroads before shipping coal to any other class of consumers. From that notice it was inferred that railroads would resort to the assigned car system or to confiscation unless operators were "good." Inasmuch as railroads have been confiscating when the notion struck them, little heed was given to the notice.

There is quite heavy demand in all northern West Virginia fields for both gas and steam coal, a demand it is utterly impossible to fill, operators not being able to take care of contracts let alone ship any "free" coal. Since export shipments were shut off, the tonnage for Curtis Bay during the week ending the twenty-fourth was extremely light.

### Norton, Va.

Output above average in Virginia fields. Production 167,000 tons. Heavy shipments for export. Producers in financial straits due to tardy settlement for coal.

The percentage of production was somewhat above the average in the Virginia fields during the week ended Jan. 24, there being only a 15 per cent loss in production. In other words an output of 167,000 tons represented an 85 per cent production, although there was a loss of 30,000 tons attributable entirely to a shortage of cars at various points. Heavy shipments were made during the week to Norfolk, Va., as well as to Charleston, S. C., for export, there having been an especially strong demand from foreign sources.

Labor trouble has been at a minimum since the first of the year in the Virginia fields, since a few Russian agitators who terrorized the St. Charles region were removed. Producers, however, still find themselves in financial straits from November diversions of coal, since both the railroads and ultimate consumers, to whom coal was diverted, have been and are still extremely tardy in making settlement.

### Ashland, Ky.

Bad weather conditions main cause of loss in production. Slides suspend freight traffic on Big Sandy. Engine failures and poor motive power clog traffic. Production of coal in northeast Kentucky running behind that of corresponding period last year.

Heavier losses in production were sustained in the northeastern Kentucky district during the week ended Jan. 24 than during the preceding week, production dropping from 135,990 tons to 119,735 tons or from 59 to 54 per cent. There was, of course, a corresponding increase in the total loss which advanced from 94,660 to 103,110 tons or from 41 to 46 per cent. Railroad disabilities were increased to the extent of 13,000 tons, bringing the total loss in that respect to 89,000 tons or 40 per cent of the entire productive capacity of the mines.

Unfavorable weather conditions were mainly responsible for the increased production loss, as all parts of the northeast Kentucky field experienced severe sleet storm. On top of the sleet storm there were no less than six slides on Friday, the twenty-third, on the Big Sandy division of the Chesapeake & Ohio, forcing a suspension of all freight traffic. So completely was the Big Sandy division out of commission that only about 40 cars of coal were loaded on the twenty-third.

Conditions are such in fact that loading is falling behind total loadings for the month at the height of the strike when man power was greatly curtailed. Transportation disabilities alone are to blame for such conditions.

Many engine failures in the northeast Kentucky field delayed even what empties were available in reaching the mines. Likewise poor motive power also affected the movement of loads and tended toward a congestion of traffic generally.

Up until Jan. 23 the production of coal in the northeast Kentucky field was running 25,000 tons behind production for the corresponding period of 1919 when there was no market; whereas at the present time there is a particularly strong market for all grades of northeast Kentucky coal, the supply, however, because of conditions already described, running far in the rear of the demand. At the close of the week there appeared to be little prospect of any improvement in transportation conditions.

### Sydney Mines, N. S.

Extensive improvements planned by the Nova Scotia Steel & Coal Co., Ltd. Steel tipples to be constructed and electrical equipment installed at Jubilee colliery. Improvements to cost \$90,000. Development in lower seam to be pushed and daily output increased to 1,500 tons. Submarine dispute would be settled by amalgamation.

Plans are now being prepared by engineers of the Nova Scotia Steel & Coal Co., at Sydney Mines, for the construction of a steel tipples at Jubilee colliery to cost in the vicinity of \$90,000; furthermore electrical equipment for the mine and other improvements are planned, which will mean practically the doubling of the present output from the colliery within the next few months, says the *Sydney Daily Post*.

The local officials have tentative plans for the spending of large sums of money at the Sydney Mines plant, in improvements and new works. Owing to the absence of President MacDougall for the past two months on business matters of importance, it has not been possible for him to go over the plans and make any definite decision as to the extent of the outlay which will be made.

The Jubilee well, before many months have passed, be Scotia's biggest producer. Development work in the bottom seam is being pushed vigorously at the present time. The daily output from this seam is now about 100 tons, and is obtained from one longwall machine. In a short time this amount will be substantially increased. At present the men working in the lower seam are lowered to the pit bottom by means of the coal cages, but workmen are now engaged in retimbering the shaft from the top seam to the lower one, and in a short time, the miners will be lowered in the regular man cage.

Considerable electrical equipment is to be installed shortly on the surface at this mine which will mean greater and more efficient service in the handling of the mine's output. By midsummer officials hope to have a daily output from both seams of about 1,500 tons. The output from all the company's mines for the present year has not been quite as good as it was in December, there being raised approximately 2,200 tons daily. Two-thirds of this tonnage is required for the operation of the plant, and the local sales practically takes up the remainder, so that there is little left for export. Under these circumstances the bunkering trade is practically nothing.

There are no new developments regarding the dispute over the submarine areas between the Scotia and Dominion companies. Until it is definitely settled one way or the other as to whether the proposed merger between the two companies is going through, it hardly seems likely that the provincial Government will render any decision in the matter. The amalgamation of the two companies would be a happy solution of the present difficulty.

### Victoria, B. C.

Title to Vancouver Island coal area again in the courts. Granby company vs. Esquimalt & Nanaimo Ry. Big plants at Cassidy's and Anyox involved. Previous legislation reviewed. Coal and coke production statistics of British Columbia for 1919 given in detail.

Once more the title of the Granby Consolidated Mining & Smelting Co. to the Vancouver Island coal area, which they are developing, is being contested in the courts of British Columbia. The action has been brought by the Esquimalt & Nanaimo Ry. Co. against Charles Wilton and Angus C. McKenzie, who are executors under the will of the late Joseph Ganner, and the mining and smelting company.

To the Ganner estate belonged much of the coal land, to which the Granby company acquired title from the province of British Columbia under the terms of the Vancouver Island Settlers' Rights Act, 1904, Amendment Act, 1917. Since the acquisition of this property the company has installed collieries at a point colloquially known as Cassidy's, equipped with modern plant, and has built up a community which, in respect of the accommodation provided for officials and workmen, is considered to be a model, at an expenditure aggregating approximately \$2,000,000. In the short space of little more than a year, the company has put the mines of Cassidy's on a producing basis of about 700 tons a day. Depending on the coal from this colliery, the Granby company has installed at its smelting centre, Anyox, B. C. (where it is engaged in the mining and the smelting of copper ore,) byproduct coking ovens, at a cost of about \$2,500,000. For these reasons the law suit referred to is of first importance to the company and of much interest to the entire western Canadian mining industry.

The Esquimalt & Nanaimo Ry. Co. asks the courts to declare that the Crown Grant issued by the provincial Government to the defendants is null and void in-so-far as it purports to grant coal, coal oil, stone, clay, marble, slate, mineral and substances in and under the said lands, and that part of the surface of such lands to which, or upon which, the plaintiff is entitled to exercise acts of ownership, purchase or rights to easement. An injunction also is sought restraining the defendants "their servants, agents or workmen or assigns from entering and working or mining for coal and other minerals and substances and from registering or applying to register any title to the surface of the lands." The plaintiff also seeks a declaration that the plaintiff always has been the owner of the lands and damages against the defendants.

With reference to this case it is well to note that the Settlers' Rights Act of 1917, which was passed by the provincial Government and under the terms of which the Crown Grants now assailed were issued, was disallowed by the Dominion Government in May, 1918. The Grants in question were given after the passage of the Act and before the Federal Government disallowed it. The point, therefore, arises as to whether the Settlers' Rights Act of 1917 was legally operative during the period that lapsed between the affixing of the signature of the Lieutenant Governor and the receipt of the formal declaration of its disallowance at Ottawa.

The official estimate of the coal production for British Columbia during 1919 places it at 2,504,423 long tons, of which 147,205 tons were made into coke, leaving the net production for use as fuel at 2,357,218 tons. These figures show a decrease as compared with 1918 of 74,301 tons gross and an increase of 54,973 tons net. The quantity of coke made was about 98,598 tons, which is a decrease of about 90,369 tons as compared with the previous year. The decline in coke production is explained by the quite small output of the ovens of the Crow's Nest Pass Coal Co. It was affected by the long-drawn-out strike of the coal miners and by the closing down of the smelters of the boundary district.

The Provincial production of coal is summarized as follows:

	Tons of 2240 lb.
From Vancouver Island collieries	1,690,724
From Nicola and Similkameen collieries	152,731
From Crow's Nest Pass collieries	659,408
From Telkwa collieries	1,560

Total quantity coal mined.... 2,504,423  
Less made into coke ..... 147,205

Net quantity of coal produced... 2,357,218  
In addition to the above net production of coal there was made into coke the production shown as follows:

	Tons of 2240 lb.
From Vancouver Island collieries	43,517
From Nicola and Similkameen collieries	.....
From Crow's Nest district collieries	55,081

Total 98,598

It is observed that the coal mines of the province have had a fairly good year but that there were some interruptions; among which are the strike of Fernie, which closed the mines during June, July and August

(work being resumed at the beginning of September), and the fact that the Vancouver Island mines during the months of May, June and July worked on slack time, losing a production of probably 160,000 tons.

PENNSYLVANIA

Anthracite

**Shumokli**—Local coal production will be increased to the extent of several thousand tons a week shortly when the Slope Mountain Coal Co., which is opening a new colliery on the Hefenstein tract here, will begin operations. The new mine will develop deposits hitherto untouched. New York capital is largely interested in the project.

**Tamaqua**—Officials of the Lehigh Coal & Navigation Co., are said to be of the opinion that the mine fire in the Greenwood workings, one mile north of the town, is now extinguished. No. 14 colliery, one of the largest in the district, is now in full operation over the burned section; as the underlying seams are being developed no trace of the fire is found, lending strength to the belief that the fire has either burned itself out or has been smothered. This fire started more than fifty years ago.

**Pittston**—The Scranton, Pittston Coal Co. has secured a preliminary injunction against the mayor and councilmen of Pittston, to restrain the city officials from interfering with the company in sinking a shaft within the city limits without first filing plans for the new mining operations. The proceedings question the legality of an ordinance adopted by Pittston providing that a coal company, before opening any new shaft, slope or drift within the city limits, should first file a plan or draft of the extent and nature of the proposed mining operation and the precautions taken to support the surface.

**Pottsville**—It has been reported that the present policy of the Hudson Coal Co., in selling some of its collieries in the Northern anthracite field, is to gradually withdraw from the Lackawanna Valley and develop its extensive properties in the Southern anthracite basin. In connection with this report the following statement from the *Eagle* of Reading, Pa., is of interest: Fifty million dollars will shortly be invested in developing the virgin coal lands of Schuylkill County, and considerable significance is attached to an announcement that E. B. Smith & Co., bankers of Philadelphia, have leased offices in Reading and will at once open business, with their own private wires, to New York and Philadelphia.

**Hazleton**—Plans for stripping the top from the coal measures of the Crystal Ridge tract were ordered prepared by the Cranberry Creek Coal Co. The Crystal Ridge colliery has been used as a feeder for the Cranberry mines since the Crystal Ridge breaker burned down.

The old Linderman & Skeer mines, at Stockton, near here, will be drained through the Lehigh Valley Coal Co.'s Shaft colliery. Additional pumps are now being installed to take care of the water from these old workings.

It is stated that the three collieries of the G. B. Markle Co., north of here, idle since Jan. 1, 1920, resumed operation on Jan. 26. Operation of these mines ceased with the expiration of a lease from the Union Improvement Co., of Philadelphia, the land owner of the properties. A dispute arose regarding the amount of royalty to be paid and pending a settlement of this matter, 2,000 men lost employment and the coal output was reduced 3,500 tons a day. Following a recent conference in the Lafayette Building, Philadelphia, Samuel J. Livingston, secretary of the Union Improvement Co., announced that an agreement had been reached and mining would be resumed immediately. Mr. Livingston said that, aside from stoppages due to strikes and holidays, the recent cessation was the first in more than 15 years. He refused to make known the terms of the new agreement.

Bituminous

**Altoona**—Shortage of cars has reduced the production of coal in the central Pennsylvania district 40 per cent below normal and has seriously handicapped many industries. The shortage is due to lack of motive power and cars and inability to keep up with the repairs on the part of the railroads, while some 15,000 cars sent

West with coal at the beginning of the coal strike have not been returned.

WEST VIRGINIA

**Beckley**—New officers of the Glen White Mining Institute are: Robert F. Roth, president; J. A. Blake, first vice president; A. E. Barrett, second vice president; Geo. N. McLellan, secretary, and Augustus Pilling, treasurer. Quite an interesting talk was given by Superintendent J. A. Blake on the subject of mine haulage.

**Williamson**—The powder magazine of the Randolph mine in the suburbs of this town blew up recently. James Childers, the mine foreman, who was near the magazine when it exploded, was killed and another employee was seriously hurt. The cause of the explosion has not been determined and the loss is said to be heavy. The explosion shook the town and windows were broken.

**Fairmont**—At a meeting of the directors of the Consolidation Coal Co. in New York recently, W. L. Andrews was elected vice president of the big corporation. The directors also announced that they have sold the company's holdings in the Coastwise Transportation Co., amounting to 26,046 shares, to W. A. Harriman & Co., bankers of New York, for \$250 a share. This is said to mean that the Consolidation company intends to dispose of all its present holdings in shipping interests.

**Charleston**—Mines in West Virginia took a toll of 22 lives during the month of December, according to a report just made by the West Virginia Department of Mines, and all but ten of the fatal accidents were due to falling slate or coal. Three mine workers were either run over by motors or otherwise fatally injured by them, while two miners met death in mine-car accidents and one was caught in a mining machine. Two deaths also were caused by premature explosions of powder. There were two fatal accidents on the outside of the mine. Raleigh and Logan counties passed McDowell in the largest number of deaths, each having five, McDowell ending with four. The casualties in Fayette County numbered two while in each of the following counties there was one fatality: Braxton, Kanawha, Marion, Marshall, Monongalia and Ohio.

**Bluefield**—In a gas explosion at the No. 2 mine of the Yukon Pochahontas Coal Co., at Yukon, W. Va., on Jan. 20, two miners were killed and the lives of seven others placed in jeopardy, all through the failure of the company to employ a fire boss, it is charged by the West Virginia Department of Mines. The No. 2 mine is a small mine, only 12 men having been employed there recently. The explosion occurred about 2600 ft. from the entrance to the mine at the face of the main entry, gas having accumulated between the face of the entry and the second break-through from the face. It became necessary to keep the break-through partly open because of the way the main heading was dipping. So far as the Department of Mines was able to determine the canvas stretched across the second break-through had been torn down and evidently was still down on the day of the accident. While seven of the miners who were in the mine at the time the gas exploded (the seven being in the fourth left heading) were able to make their way out of the mine, three were overcome by after damp and had to be carried out.

KENTUCKY

**Louisville**—Investigations into the coal-car shortage have been started by the state Legislature. It is claimed that during the past three years there has been an increase of 100 per cent in Kentucky coal production, and an increase of ten per cent in number of coal cars. It is said that the railroads have fallen down badly in keeping up with construction work of equipment as well as roads.

**Sergent**—The Imperial Elkhorn Coal Co. has been incorporated under Delaware laws and has taken over the plant and all the property of the Whitley-Elkhorn Coal Co., at this place, near McRoberts, Letcher County. The purchase includes two operating electrically-equipped mines producing Elkhorn coal on the Lexington & Eastern Ry. U. S. Morris, president of the Superior Colliery Co., will also be president and general manager of the new company. Its offices will be located in New York City and Detroit, Mich. The output of the company will be sold by the Superior Colliery Co., of Detroit, Mich. Considerable additional

acreage has been obtained and it is proposed to start new development work that will necessitate a large outlay of capital.

#### OHIO

**Columbus**—The annual stockholders' meeting of the Hocking Valley Products Co., which operates large mines in the Hocking valley field of Ohio, was held at the Columbus office, Jan. 21. Directors elected were: John G. Bates, Samuel L. Chamberlaine, W. B. Franklin, Norbert C. Heinscheimer, Alexander C. Massen, Langdon P. Marvin, James W. Murphy, Albert M. Polack, Sidney S. Schuyler, James B. Taylor and H. Montague Vickers, all of New York. The board will meet in New York City soon to elect officers for the coming year. Reports received showed that the past year was a good one in both the coal and brick departments, and prospects for the coming year are bright. Robert Taylor, Jr., is resident manager of the concern.

The final decree in the John H. Winder-John S. Jones law suit over ownership of certain stock of the Sunday Creek Coal Co., has been approved by Federal Judge Sater and the case is now settled. In the final decree the court holds that Winder is not entitled to any of the preferred stock of the company but should be given 15,000 shares of the common stock. This stock has been delivered. The court also held that at no time did it contemplate the appointment of a receiver for the stock of the Sunday Creek Coal Co., or the Steadman Grocery Co., the latter not being a subsidiary of the former company. The court held that Jones is to be reimbursed in the sum of \$1,107,826 for moneys advanced. The suit was started about eight months ago by Mr. Winder who desired additional stock in the company.

#### INDIANA

**Terre Haute**—Fifty-one mines in the Indiana field were idle Jan. 20 on account of car shortage. Their total daily production capacity is about 45,000 tons. Eighteen of these mines are on the Vandalia R.R. in the Terre Haute-Brazil area, Bicknell field; seventeen on the Chicago & Eastern Illinois, in the Clinton, Brazil and Sullivan fields; fifteen in the Clinton and Linton fields, on the Chicago, Terre Haute & Southeastern R.R.; and one on the Illinois Central, at Dugger. As shown by a report of Jan. 24, car shortage continues to interfere with production in the Indiana coal field, on which date 67 mines, with a daily tonnage of 56,000 were idle. Three mines are reported closed because of labor troubles. At one mine the supply of union powder ran out and the men refused to use non-union powder.

#### ILLINOIS

**Divernon**—Coal rights under land in Divernon Township, Sangamon County, belonging to heirs of John A. Vincent, deceased, have been sold to Charles E. Crance for \$66,500.

**Pana**—The Springside mine of the Smith-Lohr Coal Co. in Christian County, has resumed operations after having been idle since Aug. 30, 1919, when fire consumed the surface plant. A new steel tipples has been constructed, 60 men have been given employment and others will be put to work as soon as possible. Officials of the company announce that they have a large number of contracts and the mine will be kept busy.

**Duquoin**—The first carload of coal has been shipped from a new plant which gives promise of being one of the large coal mines of the state of Illinois. It is located in Sinclair County, northwest of here, and is owned by the Donk Bros. Coal Co., of St. Louis. The mine was recently completed and has a shaft with a dimension of 12 x 24 ft. which is a margin larger than that of the Kathleen mine south of here and operated by the Union Colliery Co. The Donk Bros. mine is said to be planned to have a capacity of 10,000 tons, whereas the Union Colliery mine has only an 8,000-ton capacity. The grade of coal which is of excellent quality was found at a depth of 198 ft. The Donk Bros. Coal Co. has a number of mines in operation in this district and this one will be known as No. 4.

Coal operators from Belleville, headed by L. Senior of that city, recently purchased the mine at Winkle, 15 miles north of here, for a consideration of \$202,000 and will operate the mine in the future. The office of the new concern will be maintained in St. Louis. This mine is the same one which was purchased last summer by the Southern Gem Coal Co.

Approximately 5,000 acres of rich coal lands were bought last week by Chicago interests under the name of M. W. Borders, an attorney. It is said that immediate development, or at least within one year from date, will be made on the tract, as the 1

ing the right-of-way of the Davenport, Springfield & Southern Ry., a new road which is being built through southern Illinois. The land is in what is known as Johannisburg and Lively Grove townships.

The operation known as the St. Ellen mine, at O'Fallon, St. Clair County, was recently forced to shutdown as the result of an accident, in which the cage crashed to the bottom of the shaft. While hoisting a car of coal, the rope came loose from the cage, letting it fall to the bottom of the shaft, breaking the "safeties" on the cage, tearing out many of the guides in the shaft and damaging the timbers at the bottom of the shaft. It was necessary for the men who were at work in the mine at the time, to ascend by means of the air shaft. Several days were required in repairing the damage.

#### WASHINGTON

**Bremerton**—A considerable body of coal is expected soon to be proved on the Holmes property along the beach road west of Port Orchard, Puget Sound. A 40-ft. tunnel has been driven and a shaft is now being sunk to prove the coal. It is claimed an 18-ft. seam of lignite will be developed by these operations. It is well known that coal exists in this section as shown by wells; pieces of coal from such sources, when tested have been found to show up well.

### Obituary

**Wills E. Martin**, the treasurer of the H. K. Porter Co., of Pittsburgh, Pa., died on Jan. 12, after a prolonged illness. Mr. Martin had been connected with this company for 44 years.

**E. Fred Wood**, formerly vice president of the International Nickel Co., died suddenly at New York City on Jan. 5, in the sixty-second year of his age. Mr. Wood was born in Milwaukee on Aug. 28, 1858. He was educated in the public schools of his native city and later entered the University of Michigan. After leaving college he studied metallurgy and made extensive trips through the various mining camps of the West, living for a year at Leadville and in other mining towns where he obtained his practical experience. He later entered the employ of the Carnegie Steel Co. and held the position of assistant general superintendent of the Homestead plant for a number of years and was one of the so-called "Carnegie veteran associates." He joined the International Nickel Co., upon its organization, becoming first vice president of the company and a member of the board of directors and of its executive committee; he was an important factor in developing the mining, smelting and refining business of the concern. When the United States entered the war, Mr. Wood became a member of the Committee on Production of the War Industries Board. He was keenly interested in traveling, and had the unique distinction of having traveled around the world twice in one year. He is survived by his wife, and by one daughter, Mrs. Hilda Wood Allen.

### Coming Meetings

**Material Handling Machinery Manufacturers Association** has changed the date of its convention from Jan. 29 and 30 to Feb. 26 and 27, at the Waldorf Astoria Hotel, New York City. Secretary, Z. W. Carter, 35 West 39th St., New York City.

**Canadian Mining Institute** will hold its annual meeting at the King Edward Hotel, Toronto, Ontario, Canada, on March 8, 9 and 10, 1920. Secretary, H. Mortimer-Lamb, 503 Drummond Building, Montreal, Quebec, Canada.

**New York State Retail Coal Merchants Association** will hold its annual meeting Feb. 26 or 27, the final date depending upon arrangements made with the speakers selected. Executive secretary, G. W. Woodside, Albany, N. Y.

**American Institute of Mining and Metallurgical Engineers** will hold its annual meeting Feb. 16, 17, 18 and 19, at the Engineering Societies Building, 29 West 39th St., New York City. Secretary, Bradley Soughton, Engineering Societies Building, New York City.

**American Chemical Society** will hold its annual meeting at St. Louis, Mo., April 13, 14, 15 and 16. Secretary, Dr. Charles L. Parsons, 1709 G St., N. W., Washington, D. C.

### Personals

**Edward Graff** has been appointed general manager of all the operations of the New River Co. in Fayette and Raleigh counties, succeeding a Mr. Porter.

**George Scott** has accepted a position as mine manager of the McCraney mine at Coal Valley, Ill. The mine will be considerably enlarged.

**J. K. Tuggart**, who was the superintendent of the Stonega Coal & Coke Co., at Exeter, Va., has resigned to become general manager of the Northern Coal Co. at Norton, Va.

**E. H. Carner** has been appointed manager of the Boston office of the Consolidation Coal Co., Inc., in place of R. C. Gillespie, resigned. Mr. Carner's headquarters are at 50 Congress St., Boston.

**A. E. Oliver**, formerly superintendent of the Pinnacle mine of the Victoria American Fuel Co., at Oak Creek, Col., has resigned to take charge of the mines of the Marshall Fuel Co., of Denver, Col.

**James A. Reilly**, of the Queen City Coal Co., Cincinnati, Ohio, which was recently purchased by the Island Creek Coal Co., has been made the Cincinnati superintendent of the holdings of the latter corporation.

**Chris MacTaggart** has been appointed manager of the Monongah Coal Co. operating in the Fairmont field. Mr. MacTaggart having severed his connection with the Carper Foundry-Machine Works for which he was manager.

**Robert Lambie**, district mine inspector for the Eleventh district of West Virginia, has resigned to accept a position with the New River Co., at MacDonald, in the New River field. Mr. Lambie's resignation was to become effective Feb. 1.

**A. A. Mitchell** who has been superintendent of the Fort Hill and the Paul works of the W. J. Rainey interests for the past five years, has been promoted to the position of superintendent of the Revere, Pa., works of the same company to succeed Clarence Patterson, resigned.

**Robert Lilly**, in charge of mine-rescue stations for the West Virginia Department of Mines, has been appointed a district mine inspector for the Eleventh district, effective Feb. 1. He has been succeeded by H. S. Black, formerly connected with the U. S. Bureau of Mines.

**S. A. Westenhover**, of Martinsburg, has been appointed district mine inspector for the eastern Pan Handle, it has been announced by W. J. Heatherman, Chief of the West Virginia Department of Mines, his appointment to become effective Feb. 1. He succeeds Clyde Smith.

**J. H. Mandt** has been appointed, it is announced, general manager of the Elkhorn Piney Mining Co., with headquarters at Stanaford, W. Va. He succeeds C. M. Binford, who resigned from that post to accept an important executive position with the Main Island Creek Coal Co., being associated with Colonel James Sterrett.

**Frank R. Bacon**, president of the Cutler-Hammer Mfg. Co., of Milwaukee, Wis., has been elected chairman of the American Constitutional League. This league was formed by the influential business men of Milwaukee to take up Americanization work, which will embrace all forms of education and publicity in favor of Americanization and in opposition to all radical doctrines, which seek to overthrow our existing Government.

**Frank H. Brooks** has been appointed superintendent at mines Nos. 28, 36, 47 and 92 of the Consolidation Coal Co., his appointment having become effective Jan. 15. He succeeded W. C. McMahon, resigned. The new superintendent was formerly mine foreman at Wyatt, W. Va. Mr. Brooks has long been in the employ of the Consolidation Co.

**F. Y. Casey**, formerly connected with H. H. Lineaweaver & Co., has resigned to become the Philadelphia representative of W. J. Rainey with headquarters in the Real Estate Trust Building, Philadelphia, Pa., in the place of A. F. Kempe, who has been made assistant manager of sales and transferred to the general offices of this company in New York.

**George Arbuckle**, formerly with the Victor Colliery Co., at Tamara, Ill., and until lately mine manager for the large Kathleen mine of the Union Colliery Co., at Dowell, five miles south of Duquoin, Ill., has resigned and accepted a position with the Kanawha Fuel Co., of Duquoin. **William Stepien**, formerly of Carterville, has succeeded Mr. Arbuckle at Dowell.

# MARKET DEPARTMENT

## Weekly Review

*Car Shortage Continues—Fuel Shortage Also Prevails in Some Parts of the Country—Bunkering Restrictions Modified—Demand for Anthracite Good—Prices Continue as Before*

**S**N FACE of a continued car shortage which has reached big proportions. The mine operators are unable to meet the increasing demand for their output. Part time operation of the mines naturally continued. The districts that have been affected the most severely are certain regions of West Virginia, Kentucky and Tennessee. In the latter two districts, it is said that the condition as it now exists is possibly the worst ever experienced.

The demand for anthracite in the East is so great that it will prevent movement of much of the coal that might have been sent Westward. Because of the uncertainty of the outcome of deliberations at Washington, and also probably because of the coming meeting between the anthracite miners and operators whose wage agreement expires in March, there has been more buying, or attempts to buy—some of the buyers being successful and other buyers not.

The fuel shortage which prevails throughout parts of the country has become more and more critical, especially at the iron and steel centers, where production has fallen off to such

an extent as to necessitate many furnaces shutting down. Though public utilities and other essentials have not arrived at a critical point they have been running on a reserve which rapidly decreases and is rather hard to replenish. It is worthy of note that Syracuse University shut down temporarily, thus causing many young men to lose considerable time in the progress of their education.

Because of a modification in restrictions, allowing the bunkering of vessels to outward destinations, the export trade has picked up slightly and such ships have been well taken care of in view of the fact that a better price can be had for coal sold in this manner. However, there is another difficulty which confronts the exporter, namely, the money market. Rates of exchange are about as low as they ever have been. For example, the German mark is worth at this writing only one cent.

Conditions in the West, though this region is facing a serious situation, are made more favorable because of the supplies of anthracite now on hand. Railroads are still confiscating coal and will continue to do so until they

think conditions are more favorable.

Prices continue unchanged and are still at the Government figure. Trade associations and similar organizations are being besieged with inquiries relative to ascertaining who should absorb the miners' 14 per cent increase, the operator or consumer.

While a 50 to 60 per cent car supply prevailed in the coke region during the past week, it fell to as low as 20 per cent for one day. Railroads have recently sent to all mine owners a form sheet which is to be filled out by all operators. When these have been returned to the administration, the redistribution of cars will be made in order to alleviate conditions, which is earnestly hoped for.

Stocking in the yards in the coke regions has become a necessity for more coke has been made than has been carried away. Approximately 6,000 tons, the same as for the preceding week, has been added to the stock piles. These stock piles would soon be swept clean if there were cars enough to carry the coke to gas, iron and steel plants that are now running on a small reserve.

### WEEKLY PRODUCTION

Bad weather accentuating the shortage of cars appears to have been the cause of a decline of 737,000 tons in the production of soft coal during the week ended Jan. 24, states the weekly report on the production of bituminous coal, anthracite, and beehive coke compiled by the Geological Survey, Department of the Interior, Jan. 31, 1920. The total output, including lignite and coal made into coke, is estimated at 10,772,000 net tons, a decrease of 6.8 per cent when compared with the preceding week.

Exports overseas during December are reported at 182,064 net tons, a decrease of 43,262 tons when compared with November. December overseas exports were thus the smallest of the year, reflecting the embargoes imposed after the strike began. Exports in October had been 1,526,187 net tons.

Total overseas exports for the year 1918 from the ports covered by the operations of the Exchange (New York, Philadelphia, Baltimore, Hampton Roads, and Charleston) amounted to 8,292,414 net tons (7,403,941 gross). In spite of the strike this was the largest in any year of American history.

Coal moved to New England via tide during December is reported as 674,000 net tons. This was less than the November

tonnage but greater than October. Compared with December last year it was a decrease of 202,000 tons.

### Atlantic Seaboard

#### BOSTON

Railroad confiscations general. Continued cold also has bearing. Light receipts. Little coal available at New York piers. Price situation one of great difficulty. Ground for much uneasiness over spring outlook. Wagon-mine coal appears. Anthracite deliveries interrupted. Renewed inquiry for steam sizes.

**Bituminous**—The wholesale commandeering of steam coal by the railroads recently has broken all records. Never was a time when both shippers and consignees were so much at sea over the volume of transit. Cars started from the mines mean nothing, so large a proportion is taken en route for locomotive supply both by delivering roads and by the lines that intervene. Short car supply has something to do with it but the underlying cause is the attempt

of the railroads last spring to buy in many cases at less than cost.

Receipts are light, both water and all-rail. The slow movement because of heavy weather and delays in freeing cars are assumed to be responsible for short car supply at the mines. At this writing car shortage is very pronounced and doubtless the heavy movement West early in December accounts also for the lack of empties. There are those in the trade who look for an improvement within a fortnight, but there are others who hold out only gloomy prospects. Much depends upon the attitude of the railroads.

**Anthracite**—Shipments have lately been very much interrupted. The New Haven R.R. has been embargoed since Jan. 19 because of congestion at the transfer points and ice in the Delaware and the frozen condition of cars at the piers have each contributed to delays in shipment. There seems also to be an impression at first hand that New England has been given a liberal share and that there are other sections where, in proportion, there is more tonnage due.

Developments in bituminous have caused a scattering inquiry for the junior-steam sizes. Prices on these coals are still low, relatively, and it is expected an extra tonnage will be moved the next few weeks.

NEW YORK

All anthracite sizes in excellent demand, chestnut and stove being most unpopular, but shipments take care of current demand. Egg easy and fairly plentiful, while pea has stiffened somewhat. Steam sizes show no snap and buying lags. Bituminous situation at New York harbor shows improvement as more coal arrives at piers. Bunkering restrictions placed this week but all but one rescinded after two days. Boat congestion at piers clearing as more coal is dumped and striking tugs resume work.

**Anthracite**—The local anthracite market is quiet but very firm. A steady market continues on all the prepared sizes and good buying has been taking place. Most dealers yet are very short of chestnut and stove sizes and are calling upon shippers for these two sizes in preference to others. Egg has been somewhat slow in moving, but dealers have been persuaded to take a certain percentage of egg with orders of stove and this splitting has kept the market in a well balanced state.

Current quotations for company coals, per gross tons, at the mines and f.o.b. Tidewater, at the lower ports are as follows:

	Mine	F. O. B. Tidewater
Broken	\$5.95	\$7.80
Egg	6.35	8.20
Stove	6.60	8.45
Chestnut	6.70	8.55
Pea	5.30	7.05
Buckwheat	3.40	5.15
Rice	2.75	4.50
Barley	2.25	4.00
Boiler	2.50	4.25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

**Bituminous**—The bituminous market which has been in a very uncertain position during the past two months, is beginning to show signs of improvement. The main difficulty at tidewater has been the very limited amount of coal on hand, and this week a very pronounced improvement in the number of loaded cars on hand at the piers is shown. On a certain day this week between 3,500 and 4,000 cars were on hand, whereas the average for the past month has been around 2,500.

To protect business in this territory, on last Wednesday bunkering restrictions were applied, which if carried out would have radically cut the volume of coal moving into the bunker trade.

PHILADELPHIA

**Anthracite** trade eases slightly due to milder weather. Nut size leads in demand, closely followed by stove. Egg position better, but pea fails to improve. Retail profits shrink. Look to spring for relief. Little life to steam sizes. Buckwheat fairly active; rice and barley dull. Bituminous unimproved. Car supply causes light shipments. Coke scarce.

**Anthracite**. With a softening of weather conditions there is just a least tendency in the same direction in the coal trade. The dealers are not so vigorous in their calls upon the shippers for increased shipments, although the demand for stove and nut is extremely heavy. Usually when the retailer goes after his shipper for more of these sizes the latter takes the opportunity to urge more pea coal, which size the dealers are heartily tired of now.

It is not believed that there will be any real break in the retail trade for some weeks yet, and possibly not then. February is all before the trade and this month rarely has failed in the last ten years or more to be the most wintry of all the season and heavy buying is looked for at that time. In fact the impression is growing that the trade is going to be real active right up to April, as it is expected that the discussion of the wage question with the miners is going to keep the public in the buying attitude.

The receipts of prepared sizes have been in fair volume, especially since the question of car shortage has failed to affect the anthracite trade very much. This situation has been helped out by the fact that a large number of the small wooden coal cars which were retired and stored on the siding during the war have been released for the coal trade. This action was more welcome to the shippers than it was to the retailers, as it enables the operators to spread their tonnage of the favorite sizes.

The circular prices in effect for the month of February are as follows, being per gross ton f.o.b. cars mines and f.o.b. Port Richmond:

	Line	Tide
Broken	\$5.95	\$7.80
Egg	6.35	8.20
Stove	6.60	8.45
Nut	6.70	8.55
Pea	5.30	6.90
Buckwheat	3.40	4.45
Rice	2.75	3.65
Boiler	2.50	3.50
Barley	2.25	3.15

**Bituminous**. There is not the least sign of improvement in the bituminous trade. The one cry of the producers is for cars and yet they fail to come. All coal that is produced is being applied on regular business and the small buyer usually accustomed to have his wants filled as the need arises is in a somewhat ticklish position. The resumption of spot business seems to be as far off as ever.

Eastern-Inland

PITTSBURGH

**Production scarcely increased, but consumers receive more coal. Many cars out of commission through their coal contents being frozen.**

The past week has witnessed a slight improvement in car supplies at coal mines, but not enough to effect any appreciable change in the production. Line consumers are, however, better supplied with coal by reason of other influences. The movement for export is practically stopped, partly because permits are granted very sparingly, but chiefly because the extra price allowed on export sales is suspended, as of Jan. 27. A considerable quantity of coal is thus released for the line trade. In addition there have been the embargoes against several of the lake ports, resulting in the reconsignment of coal, to line consumers. Thus the steel mills are better off than a week ago although the coal operators are not.

There is additional evidence that the shortage in the placement of empties at coal mines is not due wholly or largely to there not being enough freight cars in the country, if all could be used. As has been reported from time to time, the cars that went far afield during the cessation of work at the union mines are not all back yet, but there has lately been another influence in addition, in that there have been large numbers of loaded cars in Pennsylvania and Ohio with the coal frozen solid, and scarcely any means at all for thawing, so that relief may not come until mild weather intervenes.

It is somewhat less difficult to buy coal in the open market, there being a moderate movement, at Government price limits, which remain at \$2.10 for slack, \$2.35 for mine-run and \$2.60 for screened, per net ton at ovens, with a 15c. brokerage allowance, to be paid by the buyer, in some instances.

COLUMBUS

There is a good demand for all grades in Ohio territory, but production is still curtailed by continued car shortage. Domestic demand is the strongest feature at this time. No hopes for improvement in the car supply is held out.

With salesmen called off the road and no effort being put forth in the selling end of the business, the Ohio coal trade can be said to depend almost entirely on the car supply. Operators and jobbers are devoting their attention to speeding shipments and to tracing cars that have been diverted under the railroad administration. The demand readily absorbs all of the coal produced in the state. Domestic demand is the strongest feature, although there is a good healthy call for all steam sizes. On the whole the coal trade is at the mercy of the railroads with no immediate hope of improvement as far as increased railroad facilities are concerned.

Retail demand is strong in every section. Dealers are urging immediate shipment on all orders booked as in many cases their stocks are entirely exhausted. Pocahontas mine-run is coming in small quantities and lump can not be obtained from that district. West Virginia splints are selling well and a fair tonnage is arriving. The large bulk of the coal sold in this district comes from Ohio mines however. Retail prices are firm at the levels which have maintained for some time. Hocking lump sells at \$6.25 while mine-run is quoted at \$5.75 @ \$6. Pomeroy Lump sells at \$6.50 delivered. Jackson lump is around \$7. West Virginia grades are quoted at \$7. for lump and \$6.75 for mine-run.

CINCINNATI

Lifting of embargoes at Northern and Western points caused coal to move more freely through Cincinnati railroad terminal last week. At no one time was there congestion here, the fault being in the ability of connections to take the coal from the coal roads.

The immense amount of coal that has come to this terminal for a fortnight is really the letting go of a "dam," and was coal mined as long ago as three weeks. Since this was mined, however, there has been a steady decline in production in the fields served by the Chesapeake & Ohio and the Louisville & Nashville so that to-day production runs from 50 to as low as 30 per cent due to the lack of coal cars.

This low production will soon be felt in the territory served by these mines. However, no hardship will be experienced here because of the confiscation power given to the Cincinnati Coal Distriouting Committee. In the New River district the car supply Jan. 25 was but 40 per cent.

During the past week coal has been coming into the railroad terminal at a rate of 50,000 tons a day or the equivalent of a four-day supply. For some time the Chesapeake & Ohio has been bringing in 600 cars a day, while the other seven railroads entering here have been registering a smaller number. Coal arriving by river has been far below normal during the past two weeks. While part of the coal that arrives in Cincinnati is taken here for domestic and commercial purposes, the bulk of it is being sent to points beyond.

Operators and distributors took exception to a report handed out last week by the Central Coal Committee dealing with the payment for coal during the recent strike of the miners. The part of the report that is criticised follows: "While coal was moved expeditiously to all points there was nevertheless an unavoidable delay in getting it to the ultimate consumer which resulted in apprehension on the part of the shippers that notices would be received too late for them to render bills to the diverte and receive payment within the same period."

Southern

BIRMINGHAM

Movement and production affected to some extent by car shortage. Inquiry good for all grades, both steam and domestic, but consumers are easier on stocks and pressure for deliveries not so great as it has been.

Aside from the effects of the car shortage, which is retarding production and the movement of coal to some extent, particularly on the lines of the Louisville & Nashville R.R., trade conditions under price restrictions have been as satisfactory as could be expected. The demand for all grades of steam is good and sufficient to keep all the coal moving as mined. Sales are confined to spot business mostly, a few short-time contracts being reported, but the uncertainty of developments affecting the industry are such as to render the entering into of long contracts inadvisable.

Domestic demand is easier with the continuation of warm and unseasonable weather, and receipts are sufficient to meet the ordinary demands of the trade, but the mines are not producing sufficient tonnage to meet contract deliveries.

The sharp advance in the price of fuel oils and the difficulty of securing adequate supply is expected to prove advantageous to the coal industry in this district, which has suffered the loss of probably 1,000,000 tons per year from plants which turned to oil for fuel, and which are now considering the use of coal again in many instances. The Seaboard Air Line Ry., which was reported to be negotiating with Mexican oil interests for a fuel supply for its Florida division, is understood to have abandoned the proposition and will continue the use of coal. The conditions in the oil fields is expected to have the effect of placing a damper on further conversion of power plants to the use of oil as fuel.

LOUISVILLE

Demand strong for all grades, with production still short due to car shortage. Operators making hard fight for cars, but getting little but promises. Demand for all grades of coal continues strong, retailers reporting a good demand, and much trouble in placing orders for lump, while jobbers report very little coal available. Production is averaging be-

tween two and three days a week in the Hazard and Harlan fields, and sections supplied by the Louisville & Nashville, R.R., while other sections report better facilities where not dependent on the Louisville & Nashville. The latter railroad reports that it is 5,000 cars short of its net ownership of equipment, figuring company-owned and foreign cars on its lines.

A committee of Kentucky and Tennessee coal men spent several days in Washington last week, and held a conference with Congressmen, Railroad Administration officials, etc., on Friday, but with the exception of promises for better delivery of empties, there hasn't been much improvement.

Coal operators are somewhat put out with wild reports relative to car supply being normal. An Associated Press dispatch out of Washington on Jan. 20, stated that Railroad Administration officials reported that there was no longer a car shortage, while the Geological Survey was reported to have issued a statement to the effect that production in the Northwest and West had increased so rapidly that many mines were idle due to lack of orders. It is felt that such reports going to consumers makes it especially hard on the operator, especially in cases where he is unable to ship on low priced contracts.

Mines are not accepting much new business just now, especially at Government prices, and are content to catch up with heavy orders on hand before taking much new business, as the future is in doubt, and there is a possible chance of Federal regulation being removed, especially in event the peace treaty is ever signed, which would knock out the Lever Act.

It is admitted that the car shortage in Kentucky and Tennessee is the worst in the country, but indications are that it is growing bad elsewhere. Demand is taking all production, and operators claim that even with full facilities it would take some little time to fill up the country again.

## Lake Region

### DETROIT

With little bituminous or anthracite arriving, Detroit's supply of steam and domestic coal is so low as to cause anxiety.

**Bituminous**—Officers of the Detroit Coal Exchange are working in the effort to avert a serious coal shortage that is now menacing Detroit. With a number of manufacturing establishments rapidly approaching the end of reserves and the yards of several dealers already barren of fuel, very little bituminous for either steam or domestic use is being brought into this city.

The cutting off of supply is due in part, the jobbers say, to the action of the Railroad Administration during the strike, when hundreds of cars of coal consigned to Detroit were confiscated, and sent to other places. Reports are coming to the dealers that some of these shipments are still in cars on tracks, instead of the cars having been unloaded, and sent back to the mines, the result being a decrease in available car supply.

Operation of the embargo, raised earlier in the year against freight consigned to Detroit, has produced a serious curtailment in supply. Officers of the Detroit Coal Exchange assert that the Regional Director of railroads in Cincinnati has been seizing, and holding back nearly all the coal destined for Detroit. Much of this coal was sent to other points while a large part of it is still in cars in and around Cincinnati, where it is reported the coal supply is greater than the city's requirements justify.

Following the removal of the embargo on Jan. 23, assurances came to Detroit dealers that the Railroad Administration would rush shipments of bituminous to the local market. Three days later the coal exchange announced that coal bound for Detroit is being held back and diverted in Toledo, apparently without regard to the lifting of the embargo. A local firm operating five yards received one car in three days, while another firm which ordinarily distributes two cars a day, received no shipments in the six days ending Jan. 26.

**Anthracite**—Owing to the curtailment of shipments of anthracite, resulting from the recent railroad embargo and the heavy consumption during the extended period of low temperature this month, stocks in the yards of most dealers are small and in the case of some have been wiped out. The heavy fall of snow, Jan. 23-24, is reported to have seriously retarded the movement of shipments bound for Detroit.

### CLEVELAND

Receipts of all grades of coal continue barely equal to spot requirements, with outlook for improvement good. End of government control of prices, and consequently increased prices, is expected by the local trade about March 1.

**Bituminous**—Minimum requirements of Cleveland and northern Ohio are just about being met. Closing of some thirty public schools and several score of factories because of a lack of coal has been threatened several times in the past week, but enough coal has come forward to obviate all this. Bituminous coal, and especially steam-coal grades, are decidedly scarce, but actual operations of factories in the Cleveland district are proof that famine conditions do not exist. The condition was most serious in the first part of last week, but the moderating temperature and slightly increased receipts, believed due to shutting down on exporting, have ameliorated the situation noticeably. It still may be said within Cleveland proper that not a factory nor school nor institution of any kind has lost one hour through lack of coal. Practically all have not more than a few days', if one day's, supply ahead, but the threatened closings always have been averted at the last minute.

Entire blame is placed upon the Railroad Administration. Labor forces at southern and eastern Ohio mines are 25 per cent under normal, but even so 30 per cent operation is considered high at present. Getting empty cars back to the mines continues the sticking point. Congestion in Ohio seems worst at the Toledo gateway. An embargo on all shipments out of Cleveland on all roads except the Pennsylvania has been in effect a week, and has cut down fuel requirements somewhat. Operators and the trade do not look for improvement until spring, and say whatever relief comes will be due to milder weather. Demand for steam coal is probably five times receipts, and prices are out of sight.

**Anthracite and Pocahontas**—Slight relief is noted in the Pocahontas situation and dealers now are taking business subject to delay of two to three weeks in delivery. Last week they would not promise any delivery. Improvement in anthracite is less marked. Domestic consumers are clamoring for both grades, feeling that prices will decrease little if any in the summer and willing to take all they can get now and hold it over until next winter.

**Lake Trade**—Coal appears to be moving off the Upper Lake docks as fast as the railroads can handle it, and the docks undoubtedly will be clean by the opening of navigation. In fact, some large all-rail shipments will be necessary to meet fuel needs of the upper lake regions. So heavy demands, however, are piling up in the Lower Lake regions that it is not believed the beginning of the season will see as many cargoes floated as in previous seasons. In April, 1919, the Lake trade took \$60,979 tons of bituminous coal; the prediction is that April, 1920, will not come near this mark owing to industrial demand.

Retail prices of coal per net ton delivered in Cleveland are:

Anthracite—Egg, \$12.20@12.40; chestnut, \$12.50@12.70; grate, \$12.20@12.40; and stove, \$12.40@12.60.

Pocahontas—Forked, \$10.50@11.00; shoveled lump, \$9.00@9.25; and mine-run, \$8.00@8.25.

Domestic bituminous—West Virginia splint, \$8.30; No. 8 Pittsburgh, \$6.85@7.00; Massillon lump, \$7.40@7.65; Cannel lump, \$11.00; and Coshocton lump, \$7.35.

Steam coal—No. 6 slack, \$5.20@5.40; No. 8 slack, \$5.20@5.50; Youghiogheny slack, \$5.25@5.50; No. 8 3-in. lump, \$6.00@6.25; No. 6 mine-run, 5.25@5.50; and No. 8 mine-run, \$5.85@6.00.

### BUFALO

Still the coal confiscation. Car shortage increases. The late heavy storm tied them up so that coal nearly gave out. Anthracite not so plentiful.

**Bituminous**—The situation turns largely on the car supply, as affected by the big storm. The cars were scarce at the outset and then there came a storm with all the possible adverse conditions, snow, wind and cold. No wonder that the trains stood still. There has been a much better state of things since, but the time lost was so great and the lead over a coal famine so small that some localities had to cut down consumption in every possible way. Central and northern New York suffered most. Side roads did not run even passenger trains for days.

It is not expected that the bituminous shortage can be made up till the cold weather and the snow are gone. Few consumers have any surplus and it is a matter of only two or three days' supply often. If there is no more extreme weather it is likely that the city will pull through in some way, but all shippers are looking after the coal on hand and favoring as much as they can those who are out.

At the same time it is reported that there is a large amount of coal, hard as well as soft, in cars, waiting for the roads to move it. Though the snow is down a trifle and the weather is again only moderately cold, the roads themselves are in a sort of panic, taking often all the coal that a shipper gets. Some of the most successful jobbers in the city are quite discouraged over the situation. The latest report is that at least some of them have arrived at an understanding with the roads, so that only a part of a shipment will be taken.

Some are of the opinion that the roads are very short of fuel, while others claim that a sort of conspiracy exists among the operators to mismanage things in order to give the government handling a black eye. Many opinions are heard to the effect that the roads will never return to normal efficiency till private ownership is resumed. Buffalo has a special shippers' committee that looks after local car movements and it is doing good work.

Coal prices are not steady. Most shippers are sticking to the government prices, but there are others ready to ask more if a consumer is found to be in straits. The regulation prices are of course the only legitimate ones, \$4.70 for Allegheny Valley sizes, \$4.50 for Pittsburgh and No. 8 lump and three-quarter, \$4.25 for all mine-run and slack, \$4.60 for Pennsylvania smokeless, \$4.70 for smithing, all per net ton, f.o.b. Buffalo.

**Anthracite**—The supply has been cut down of late, mostly on account of the slow moving of cars. Reports from the mining districts state that all available track room is filled with loaded cars and with the locomotives knocked out by the weather. The weather has now become much milder and the supply ought to run up fast. The consumers are much better supplied than those in the bituminous section, and it is expected that the surplus will last till the cold weather is mostly gone.

The Canadian supply is not as good as ours, but it is not bad, and is not likely to be any worse than at present, supposing that there are no more such storms as the one of Jan. 23. In fact this section has seldom had a worse one, for snow, cold and wind all came in together. Shippers say that as soon as the sunny days begin to arrive the demand is sure to drop off. Still the consumption is about twice that of such a winter as the last.

Some independent coal is still selling and the premium is increasing but it has not been of much amount since the lakes are closed. No report has been received from the Upper Lakes, but the supply was so much above the average that it ought to be sufficient. With an ordinary winter there would have been a large amount left over. All standard prices remain as before.

### TORONTO

Market active—Sufficient anthracite on hand for present demand but bituminous scarce. Shipments delayed by traffic congestion at the border. Serious shortage feared.

There has been an active demand for both anthracite and bituminous, owing to the continued cold weather, but so far there has been little or no hardship on account of shortage, as this winter the public have been better prepared for cold snaps than in previous seasons.

There is enough hard coal on hand for present requirements, but bituminous is scarce and shipments are arriving slowly. Many consignments being delayed by freight congestion at the border. Unless the situation is speedily relieved the shortage threatens to become serious. Prices for soft coal are somewhat fluctuating with a decidedly upward tendency.

Quotations for short tons are as follows

Retail—

Anthracite egg, stove, nut, and grate.	\$12.75
Pea	11.25
Bituminous steam	10.00
Slack	9.00
Domestic lump	10.00
Cannel	12.50
Wholesale, f.o.b. cars at destination—	
Three-quarter lump	6.75
Slack	6.00

Unless this city receives more coal from the United States, there is a possibility of a decrease in production, especially in large manufacturing plants.

Middle West

MID-WEST REVIEW

If the reports brought in from the country are to be believed, the Middle West is facing a very serious situation. Illinois and Indiana mines are seriously handicapped on account of the car shortage, and, added to this, is the fact that shipments are delayed in transit.

Retail dealers complain that coal shipped them as far back as December is still in transit, and that the railroads are often unable to give any record of the shipments in question. Even before this situation developed there was a coal shortage, practically everywhere in the Middle West, except Chicago, so it can be readily determined just how serious is the present state of affairs. The retail trade is up against it as well as the steam users.

The bigger factories seem to be suffering more than the smaller ones. Perhaps the reason for this is that the average purchasing agent for a large manufacturing concern is inclined to believe himself infallible, while the purchasing agents of the smaller concerns are a little more humble and inclined to take advice.

The question of car supply, from early reports, is still far from satisfactory. Indiana has suffered more than Illinois so far this week, but whether or not this will hold true for the balance of the week remains to be seen. In Illinois the supply on the Chicago, Burlington & Quincy R.R. appears to be as good as any. The Illinois Central and the Chicago & Eastern Illinois R.R. and others are not so fortunate. Illinois miners will probably receive a 60 to 70 per cent car supply this week, while Indiana will run even lower.

Nearly all the mines in this territory, except a few in Franklin County, are now booking orders at the Government prices. The market is in a good vigorous condition.

CHICAGO

Dealers and steam plants in this city have not as much coal on hand as was thought.

A week ago that it was hard to sell coal here and a number of shippers were called upon to divert coal already rolling towards Chicago. Now the situation has changed and consumers are calling for more shipments.

There is a great demand at this writing for all grades of Eastern coal—particularly gas and byproduct coal. Shipments are moving so slowly from the East, and the car shortage is so serious in West Virginia and eastern Kentucky that a number of gas plants, as well as malleable foundries, are in bad shape—such had shape that some will have to close down if assistance is not forthcoming soon.

ST. LOUIS

The car shortage is appalling. Railroads taking all coal. Movement of equipment unusually slow. Demand everywhere for all grades and sizes far exceeds supply. Weather reasonable.

Local conditions in St. Louis are in good shape, but the demand for both steam and domestic far exceeds the supply in Mt. Olive and Standard. There is a light tonnage of Carterville coming in—so light that it is not a factor in the local situation.

In the Standard field the trunk-line carriers have prominently displayed the same old incompetent management. No storage fuel is ahead and there remains failure to move either loads or empties. A few days in this week every trunk line West of St. Louis was embargoed by the delivery lines East of the river. This helps St. Louis locally, but the outside territory is actually suffering for fuel. Two days a week is good working time now on account of car supply. On the short coal roads three and four days has been the rule. The same condition governs in the Mt. Olive field.

There is much dissatisfaction among the miners over the fizzled-out Railroad Administration for the shortage of cars. In these fields there is no promise of better conditions in the immediate future. If severe weather continues the situation will actually be acute.

In the Carterville field of Williamson and Franklin Counties the car shortage is serious. From Jan. 21 to Jan. 30 not one car of domestic coal was listed as being loaded on the Missouri Pacific lines with a total of about 25 mines.

The car supply was for about two days a week and the railroad took all of the coal. Industries on the Missouri Pacific R.R. are in a sorry plight, for there are no rates from other mines to a big Missouri Pacific territory. This has caused a growing shortage of dissatisfied men at many places. The Chicago Burlington & Quincy is supplying the most equipment and shows best movement.

An investigation as to the prices charged by the Franklin County Association members is being arranged for through the Attorney-General's office at Washington for alleged violation of the anti-trust laws and Fuel Administration rules.

A little anthracite still moves in, with no smokeless and nothing from the Arkansas fields. Coke is in fair demand throughout the country sections and is apparently growing in demand in St. Louis proper. Prices same as last week on wholesale.

The retail prices on coal delivered f.o.b. sidewalk are:

Carterville lump egg and nut	\$6.20
Mt. Olive "	5.70
Standard "	5.45

MILWAUKEE

Shortage of soft coal beginning to cause inconvenience. Hard coal in good supply, however. Prices unchanged, except on Illinois coal, which is selling from 35c. up to meet miners' recent advance.

The coal situation in Milwaukee is assuming a serious phase, because of a shortage of soft coal, and dealers are finding it difficult to meet contracts and at the same time supply the transient trade. All soft coal is practically sold up, the stocks in evidence on the docks being held to protect contract obligations.

Under the circumstances dealers are forced to depend upon rail consignments for relief. With embargoes at Chicago and in the East because of congested tracks the outlook in this direction is not promising. In some instances coal en route to Milwaukee has been confiscated by railroads for their own use.

Fortunately hard coal is in better supply than it has been in several years. Prices continue unchanged, but an advance on future rail supplies is looked for. Illinois coal demands a premium of 35c per ton since the recent advance in miners' wages.

Coke

CONNELLSVILLE

Divergent practices as to billing contract coke within Government limits. Production rate steady, limited by car supplies.

The matter of billing coke at the Government price limit when the shipment is made against a contract calling for a higher price, referred to in last report, has become a very live matter in the coke trade. A number of coke producers made readjustments with their customers as soon as they became convinced that the regulations do not permit of billings at above the Government limits and have since billed at the limits when the contracts as written called for higher prices. Others, and probably the majority, have not followed this course, and are greatly perturbed, but apparently as much perturbed at the publication of the facts as at the existence of the facts.

An important circumstance is that consumers of coke have shown little disposition to raise the issue as to the invoice price of coke, and perhaps the coke producers involved had hastily reached the conclusion that the point would not be raised at any time. As coke is scarce, and to start a controversy might result in shipments being shut off, as no allocating is being done by the Government, the buyers may simply be biding their time, as claims for readjustment could probably be made just as well at some later time.

There is practically no free coke coming into the open market, at least at the Government limits. Occasionally an operator offers coke at a higher price, in disregard of the regulations. For several weeks it has been the belief in some quarters that much business of that description has been done, although somewhat quietly.

Production is limited by car supplies to approximately the average obtaining in November and December, while the demand is much greater, and that is true despite the fact that the byproduct ovens are producing more and more freely, though few have thus far attained anything like capacity operation.

The market remains quotable at Government limits, \$6 for furnace, \$7 for foundry and \$7.30 for crushed, over 3-in., per net ton at ovens.

The Courier reports production in the Connelville and Lower Connelville region in the week ended Jan. 24 at 239,606 tons, a decrease of 1,884 tons.

BUFFALO

The situation is not much changed, the demand from the furnaces being rather moderate. The fact is that it seems to be hard to get back to normal production. Reports from the local district complain that the ore moves out slowly. The car situation may be to blame for some of this, but there are also others which tend to hold up the production of the local furnaces. It appears that the furnaces are doing pretty well now. One company reports this week that it is now running strong, as though it had not been till now. Incidentally this furnace is still using beehive coke, but the management expresses the hope that the byproduct plants will soon make an end of the wasteful methods of the system. Local coke prices continue at \$9.60 for 72-hour Connelville foundry, \$8.80 for 48-hour furnace, and \$7 for off grades, with domestic sizes \$8 per net ton, f.o.b. Buffalo.

## If We Cannot Be Just, Let Us Be At Least Prudent

By R. DAWSON HALL

**P**UBLIC opinion regarding Government ownership has travelled in the last year or so from the aggressive to the defensive. When in the war, Government management of public utilities was advocated, it was urged on us because private ownership was believed to be wasteful and inefficient. It was stated that the railroads would be able to eliminate duplication of service, would be conducted with a broad view of public needs, and that the nation would be able to save money where the railroads were wasting it. Now we are told pathetically that—how the viewpoint has changed!—federal does not compare unfavorably with private management, which also is not so wonderfully frugal in its operation.

During the war we were assured by the socializers that with the Government in charge there would be no strikes. Now the tune changes and we are coaxed to an uncertain comfort by the reflection that there would have been at least as many disputes between capital and labor had private corporations held the reins. Before Government took hold we were informed that there would be, after the first few months, no inadequacies in service. Now we are only asked to believe that the railroads, if they are again placed under private control, will be just as unequal as the Government to meeting public requirements.

Freight rates, as established, have been such as to discourage the purchase of absolutely necessary

equipment. Thus they have made every period of national prosperity a moment of peril, lest transportation fail at a crucial juncture. They have caused industry of all kinds to run part time and they are to be blamed for the high prices which an undue constriction of the market inevitably causes. For

this reason, surely, it would be the better plan to put up freight rates high enough to make prosperity absolutely sure and bring them down if it is found that a mistake has been made. In fact, seeing that the railroads have had short commons for many years, why not let them have, even for a year, some of the prosperity which the luxury industries have enjoyed unchecked from time immemorial? A year in the sun for them with the makers of non-essentials would seem not an over-liberal measure of generosity.

IMPOVERISHED STEED (to Overfed Driver)—"If you would ride me, you must also feed me."

If the public must control their profits, let them be restricted to dividends, far below those earned and permitted to the automotive industries, and be required to spend the excess in suitable reconstructive work and in the purchase of much-needed equipment. If we do not like the railroads, if we must treat them as pariahs to work for us with a minimum of personal well being, let us at least give them a chance to become competent servants of the public instead of the weak, unstable creatures they now are. The Cummins bill is no solution of the railroad problem. The difficult question will be with us again and again till justice is done, for in the long run the public pays for its injustices and pays dearly

# IDEAS AND SUGGESTIONS

PRACTICAL SCHEMES THAT MAKE THE DAY'S WORK EASIER

## An Electric Motor and Gasoline Engine Driven Fire Pump

It is always desirable to have two independent sources of power for a fire pump so as to lessen the chances of its being put out of commission when a fire occurs. In some states, a double drive is required by the Underwriter's regulations. The usual form of drive is a steam engine and electric motor, though where there are two separate sources of current, two electric motors are frequently used. Sometimes neither steam nor a second source of current is available, and in that case a pump can be coupled up to a gasoline engine which may constitute the independent source of power. As an illustration, a pump of 1500 gal. per min. capacity can be driven by a suitable 150 lb., alternating-current motor and a 140 hp. gasoline engine of some convenient type and make.

For use in the mines where fires are liable to start, no matter what precaution has been taken, resulting perhaps in a great loss. The combination of an electric motor and gasoline-engine driven fire pump might prove highly serviceable.

## A Trackman's Rule

J. H. RITTER  
Belington, W. Va.

The advantages of certain mechanical devices such as the slide rule for engineering computations is well recognized. There are, however, certain calculations that cannot be made with facility on this instrument. In order to perform with ease and accuracy the calculations necessary for the laying of switches and other track work in and about the mines, J. H. Ritter of Belington, W. Va., has devised the trackman's rule shown in the accompanying illustration.

This consists of two arms, hinged together at one end and bearing exactly similar divisions, together with a protractor attached to one of the arms with its center at the hinge, and a rule standing at right angles to this same arm and sliding upon it. Both arms and the sliding cross piece are graduated in divisions representing feet to some convenient scale. The sliding arm in its attachment to the scale upon which it travels (which scale is known as the fixed radius rod) is provided with a window carrying a black crosshair and a red crosshair 0.5 division from it.

Now suppose that it is desired to find the lead of a switch on a curve of 63 ft. radius. Set the sliding arm (black crosshair) on the 63 ft. division of the fixed radius rod; move the swinging radius rod until the same division (63) just touches the edge of the sliding arm. As may be seen in the accompanying illustration this will be at division 21. This shows that the lead from point of frog to point of switch should be just 21 ft.

The frog number, as is well known, is the switch lead divided by twice the track gage. In this case, assuming that the gage is 42 in., the frog number will be

$$\frac{21}{2 \times 3.5} = 3,$$

showing that a No. 3 frog is required.

In addition to calculating trackwork, latitudes and departures, sines and cosines may be found with this instrument for angles within the limits of the sliding arm. The distance centre to centre of rooms not at right angles to the heading may also be found.

TRACKMAN'S RULE BEING USED FOR COMPUTATION

The employment of some easy, rapid and accurate means of making track calculations will go far toward securing properly constructed tracks. These in turn go far toward insuring satisfactory operation and service from transportation equipment. As all mining men know bad track is responsible for more wrecks than any other one cause. It takes a skilful driver or motorman to haul coal safely over improperly proportioned or improperly laid frogs and switches while the veriest tyro can safely haul it over track that is designed and constructed correctly.

## Bringing Out Over-Exposed Blueprints\*

S. F. GIBSON  
St. Louis, Mo.

When blueprints have been permitted to remain in the printing frame for such a long time that they are over-exposed, they may be restored almost to their normal color by adding about one-teaspoonful of hydrogen-peroxide solution to each quart of the water in which they are washed.

The procedure is to first wash the prints in clear running water, until all the blue liquid which results has been washed away. The prints then are soaked in the peroxide solution until the proper color appears. After this, the prints are again washed thoroughly in clear water. A print which has had the correct exposure or one which has been under-exposed, will not be adversely affected by the process.

## Guard Railings

BY G. E. DOUGHERTY

Pikeville, Ky.

Permanent guards around stationary machinery are frequently the cause of the machine being left unguarded because of the guards being taken down and not promptly replaced. To overcome this danger and the inconvenience in making repairs a removable guard is more satisfactory.

An adequate guard can be built by any one with a

RAILINGS IN PLACE

set of pipe tools, by placing holes in the floor around the machinery to be protected and placing short lengths of pipe in them flush with the floor. The pipe in the floor should be made just enough larger than the pipe used in making the guard or fencing so that the latter will fit snugly but may be lifted easily out when desired. The accompanying sketch shows how the guard is held in place.

## Safety Device for Emery Wheel

As emery wheels have a tendency at times to break and fly to pieces the master mechanic of the Burnside Colliery of the Philadelphia & Reading Coal & Iron Co. near Shamokin, Pa., has designed a special adjustable shield to cover such wheels.

This shield consists of two iron brackets bolted to the frame under the wheel and passing around to the top. These two brackets are connected with a piece of sheet iron bolted rigidly to them. Another piece of sheet iron goes over the top of the first piece and

is provided with two slots through which are placed bolts. The slots allow this piece of iron to be adjusted over the emery wheel to any desired point. When in the proper position the bolts are tightened and the sheet iron stays in place giving full protection.

The only part of the emery wheel then exposed is that portion that the operator is actually using. The accompanying drawing shows the idea in detail.

## Electric Drive for Breaker Machinery

The St. Clair Coal Co. at St. Clair, Pa., has done away with the corliss engine driving the breaker machinery and substituted an electric drive. It now employs a 600-hp., 2,200-volt, 3-phase, 60-cycle General Electric alternating-current motor.

The one unusual feature about this installation is that the old crank disk of the corliss engine has been utilized for one-half of the clutch between the end of the chain drive and the bull wheel. From the motor to the bull wheel the drive is by means of a Link Belt silent chain.

The company has been using steam drive, but after the change from steam to electric it was able to abandon its boiler plant, which was out of date and inefficient, and purchase its power from a central station located at Pottsville, Pa. As the current furnished is 2200 volts it is not necessary to install a sub-station.

Electric drives appeal both to the designer of mining machinery and to the engineer responsible for the upkeep of the mechanical equipment. The absence of long drive shafts and belting simplifies the design of breakers and also largely does away with many troubles incident to such devices. Group electric drives are advocated by some engineers rather than the use of individual motors for each piece of equipment; for example, one motor for a group of jigs

## Guard for Circular Saw

BY G. E. DOUGHERTY

Pikeville, Ky.

Adequate guards for dangerous machinery are often a hindrance to ease in operation or to working about the guarded machine.

A fairly satisfactory home-made guard for a circular

GENERAL VIEW OF THE SAW GUARD

saw is being used in the car shop of the Blue Beaver Coal Co. of Prestonburg, Ky.

This is composed of a 1/2 in. iron rod so bent as to cover the saw a few inches above it. This guard is bolted to the saw stand. The arrangement can be so set as to allow any piece of timber to pass under the guard. The sketch explains the arrangement.

## Granby Consolidated Company's Colliery, Cassidy, B. C.

BY R. R. WILSON  
Cassidy, B. C.

**T**HE Granby Consolidated Mining, Smelting & Power Co. has been one of the most enterprising organizations operating in Canada. This company has developed the two largest copper smelters and the second largest copper mine in the British Empire and has now provided the province of British Columbia with its first modern byproduct coking plant and a coal mine that represents the last word in what has been called the industrial betterment movement.

The colliery is situated at Cassidy, about 8 miles south of Nanaimo on Vancouver Island. It was ac-

quired and opened mainly to insure a supply of coke for the copper smelter at Anyox. At this point a bed of coal about 10 ft. in thickness outcrops in the bed of the Nanaimo River, the seam being known as the Upper Douglas from which the first coal was mined on Vancouver Island in 1852 by the Hudson Bay Co.

Following the satisfactory prospecting of the area by diamond drilling, a saw mill was erected having a capacity of about 20,000 ft. of lumber per day and as the timber was felled on the townsite it was cut into lumber and utilized in the construction of various buildings or stored for use in connection with mining operations at some later date. Timber suitable for use underground was stored until required.

The townsite having been cleared, a start was made in opening the mine and the first coal was hoisted from the main slope in June, 1918. This slope was sunk through gravel and quicksand, necessitating the use of tongued and grooved spiling. A railroad spur was then constructed for  $\frac{1}{2}$  mile connecting with the Esquimalt & Nanaimo Ry., and a temporary loading plant installed so that coal could be shipped as development work progressed and until the permanent tippie and washery could be constructed.

This done plans were prepared setting aside ground

for a residential section, a mine and plant section as well as details of streets, water works, sewerage and electric lighting systems, recreation ground, flower gardens, and sites for various buildings in order to meet as fully as possible the requirements of the industry and its community of employees.

As has been said the colliery is situated about 8 miles south of Nanaimo. A more beautiful industrial townsite could hardly be found anywhere. The area set apart for a residence district comprises about 80 acres of bench land overlooking the Nanaimo River to the north, and Haslam

Creek to the south. It is sheltered by forested ridges to the east and west which are being preserved as a park. In the background can be seen Mount Buttle, Tye and other mountains.

The townsite was carefully planned to present a pleasing appearance. The streets are boulevarded and the houses surrounded by fresh green lawns and flower gardens. Shade trees have been planted along the boulevards on each street, and the streets named after the particular tree planted on that thoroughfare such as hawthorne, maple, etc. The town is furnished with a modern sewerage disposal plant and also with an up-to-date water works system.

The colliery is provided with one of the finest athletic parks in the country. There is a baseball diamond, football ground, tennis courts, bowling green and a quarter mile track. The athletic field is so large that a baseball and football game can both be played at the same time without interference and the entire field is as level as a billiard table. The hillside back of the athletic field forms a natural grand stand, and the company has reserved this as well as the timber on the other side of the town as a natural park.

The school is to be erected close to the athletic field and playground equipment installed so that the children

This colliery was developed to furnish coal to the byproduct coke plant at Anyox. Town and plant have been designed and built with great care, strict attention being paid to fundamental idea that the plant should be modern and efficient, and the town a good place to live in. Both these objects have been accomplished.

will be enabled to enjoy all the advantages of the facilities provided for clean healthy sport.

A striking feature of the company's plans in laying down ideal conditions under which the men may work is the program of entertainment and physical and mental relaxation provided. A temporary recreation hall has been built with gymnasium, dance hall, library, reading room, billiard and pool room, thus furnishing a suitable place for wrestling, boxing and every other means of amusement and recreation that it is possible to give the men.

The town is within a short distance of bathing beaches, in a first-class game country where pheasants, grouse, deer, wild duck and other game are plentiful.

paring machine, tables heated by steam coils to keep dishes hot, large bake oven and refrigeration plant. Living accommodation is provided up stairs for the help.

In order that there may be no waste, the scraps from the mess house are fed to pigs. A vegetable garden will furnish all vegetables for the mess house.

The change house is in charge of Mr. Bond, an old British campaigner and experienced first-aid man. Here the miners can turn in their working clothes, if they are wet, and have them placed in the drying room by the attendant so that they will be perfectly dry and comfortable when they are ready to go to work in the morning. The change house is equipped with steel lockers (which are heated with steam coils from underneath), shower baths and large lavatories. The building is clean and well lighted and there is not a cockroach to be found anywhere.

A modern temporary hospital and first-aid station has been established in one of

MAIN HOISTING SLOPE—385 FT. DEEP AT GRANBY COLLIERY NO. 1

INTERSECTION OF RETURN AIRWAYS AT CASSIDY, B. C.

It is also within a few hundred feet of the best fishing waters on Vancouver Island.

The homes are neat and commodious, the architecture varied and each house is equipped with every modern convenience. The streets are lined with shade trees and lighted with electric lights.

The rooming house for the accommodation of single employees is a gunitite structure built in the form of a double L. It contains about 80 rooms all of which open to the outside veranda or balcony. The rooms are steam heated, electrically lighted and each is provided with running hot and cold water. The floor is a patent material, "Raccolith," and the rooms can be washed out with a hose when necessary. On the verandas and balconies are window boxes for flowers. The company supplies the furniture and bedding as a precaution to insure cleanliness and comfort of employees.

The mess house or dining room is a gunitite structure and is equipped with every modern convenience. The men enter the building through a lobby equipped with wash basins and running hot and cold water so that they may enjoy a refreshing wash, hang up their hats and then proceed through a pretty, vine-covered pergola to the dining hall. At the entrance to the dining room a drinking fountain is provided where a stream of clear cold water is constantly available. The dining hall is bright and comfortable, cool in summer and steam heated in winter. Each table accommodates six men. No enamel dishes are used.

The kitchen is equipped with every labor saving and modern device—electric dishwashing machine, vegetable

the larger houses until the permanent hospital can be constructed. This hospital is in charge of a skilled matron and trained nurse.

Between the change house and the manway portal are the powder house in which the stock of explosives is limited to one day's supply, the larger magazine being on the opposite side of a hill from the town, the time-keeper's office, lamp house and mine-rescue station. The lamp house is equipped with 300 Edison storage battery electric lamps. The mine-rescue station is supplied with

TIPPLE AND CAR HAUL AT THE PLANT

WORK SHOPS AT THE PLANT

From left to right: Blacksmith, Machine and Carpenter Shops

Gibbs apparatus, a lungmotor, smoke chamber, etc., and a large lecture room for holding first-aid or mining classes. These buildings are all heated with exhaust steam from the power house. The tippie is equipped with Fairbanks scale, rotary dump, Marcus screen and the necessary loading booms. The railroad cars are handled with Fairmont car retarders. The track scale is a Fairbanks standard, all steel and concrete, with a capacity of 100 tons. The rock cars are handled by a special Wilson rotary dump.

The washery is equipped with 2 two-compartment jigs having a capacity of 40 tons per hour each. The tippie and washery were designed by Roberts & Schaefer of Chicago. The washery is equipped with sludge recovery and uses the same water over and over again.

The washed slack is used in the new byproduct plant

at Anyox in making coke for the copper smelter while the lump, nut and some pea coal are sold. The bone coal is burned under the colliery boilers.

The boiler plant at present consists of two Badenhauzen water tube boilers of 260 hp. each fired by mechanical stokers. The ashes are removed by washing and fluming to the dump. The feedwater is heated by a Webster feedwater heater and forced draft is used. The brick stack is 8 ft. in diameter and 125 ft. high. The boilers and steam pipes are all insulated with asbestos and magnesia to prevent loss of heat. Venturi meters are used to check the quantity of water at the pump station and at the

TIPPLE AT CASSIDY, B. C.

boilers. The compressor is a Rand, cross-compound, condensing machine with a capacity of 2,000 cu.ft. of air per minute. The air is used for running the underground drills, pumps and hoists.

MAIN HOISTING SLOPE AT ENTRANCE OF GRANBY COLLIERY NO. 1

Electric power is supplied by an Allis-Chalmers 450-kw. generator (2,300-volt, 3-phase, 60-cycle, at 360 r.p.m.) and also an auxiliary unit of 250 kw. capacity (2,300-volt, 3-phase, 60-cycle, at 450 r.p.m.), both direct connected to vertical high speed engines (Goldie & McCollough). The remainder of the electrical equipment is of Westinghouse make. The power house is equipped with the Bower oil-handling system. A Worthington fire pump with a capacity of 1,000 gal. per minute, size 18 x 10 x 12 in., is ever in readiness for an emergency. The entire plant is equipped with an exhaust steam heating system, the condensation being returned to the boilers.

The shops are all thoroughly equipped and well lighted, and will be connected with the mine tracks. The carpenter shop is fitted with a rip saw, band saw, planer, boring and mortising machine.

The machine shop is equipped with a large lathe, small lathe, planer and shaper, pipe threading machine, drill press, emery wheel, etc. The shafting

GENERAL OFFICE OF THE GRANBY CONSOLIDATED CO.

The coal bed dips at about 18 deg. and the coal varies in thickness from 5 to 20 ft., averaging about 10 ft. The roof and floor are of shale and subject to rolls. The roof is fairly regular, however, most of the rolls occurring in the floor.

The mine is opened on the dip of the bed, the main slope having been driven to a depth of approximately half a mile. It is being driven 7 x 14 ft. in the clear to allow for double track and is timbered with 12 x 14 in. framed sets spaced 4 ft. centers. A separate manway is provided as a travelling road and employees are not allowed to use the main haulageway in passing to and from their working places. The mine is worked on the pillar and stall system. The operation is divided into relatively small panels as a precaution against mine fires and large pillars are left along all main haulage roads and permanent airways, the idea being to extract a maximum amount of coal at least cost rather than to take out cheap coal for a few years to the final detriment of the mine as has been done in many operations on Vancouver Island and elsewhere.

The mining is planned so as to deliver the coal from the face to the main haulage system by gravity as far as possible. Storage-battery locomotives are used on the levels underground. No horses or mules are employed.

The drainage system has been carefully planned so that surface water entering the mine will drain by gravity and water from workings below the drainage level will run to a central sump.

The mine is ventilated by a Sirocco fan, with a capacity of 150,000 cu.ft. per minute. The operation is provided with a double intake and return airway throughout and the workings are so planned that the air can be taken to the face where required with a minimum of loss.

The fan house is a concrete fireproof structure. It

POWER HOUSE

is all well guarded. The master mechanic's office adjoins the machine shop.

The blacksmith shop is fitted with two forges, a steam hammer and a swing crane. Adjoining the blacksmith shop is a special tool house where miners' picks are kept after sharpening. All scrap iron is sorted out and stored in pockets built for the purpose. Racks are provided for storing iron and steel stock.

The pump station is equipped with two Morris centrifugal pumps each having a capacity of 300 gal. per minute. These pumps elevate the water to the two 50,000 gal. storage tanks situated on top of the hill overlooking the town from whence it flows by gravity through the water mains. The pumps are driven by 50 hp. Westinghouse electric motors. A Venturi meter records the quantity of water leaving the station at all times. The Nanaimo River furnishes a plentiful supply of pure fresh water for domestic and power purposes.

The colliery is equipped with a complete telephone system which connects all surface offices, shops and buildings with the underground workings.

ROOMING HOUSE AT CASSIDY, B. C.

also house, the telephone exchange and motor generator set for charging the storage-battery locomotives. The fan is driven by a 150 hp. Westinghouse electric motor.

The mine cars are built of wood and have a capacity of 1 1/4 tons of coal. The track gage is 26 in. Hadfield

# Repairing the Ruined Mines of Lens

BY MARK MEREDITH  
Liverpool, England

**A**LTHOUGH all possible efforts at reconstruction of the mines of Lens (France) have been, and are being made, there is now no hope that a single ton of coal will be extracted before 1921. Even if the work can be carried on without interruption, which is by no means certain, it will take all 1920 to clear the underground workings of the debris of all sorts with which they are choked, as the result of the policy of destruction carried out by the Germans.

The clearing of the upper works is going on more quickly. Twelve surface plants have been cleared of debris, four are partly cleared and five are not yet touched. Most of the workings, and all the deeper ones, are flooded as a result of the destruction of the shaft lining. A plan for dewatering has been arranged; all the pumps will be electrically driven and the current will be supplied by the Electrical Society of the Pas-de-Calais mines, a company created by the officials of the ruined mines in the Pas-de-Calais district for this purpose. The reconstruction and repair of the shaft linings will be carried out by German workmen, and the cement for the purpose will be brought from Germany.

### UPPER WORKS ARE RAPIDLY BEING CLEARED

A number of German experts recently visited the mines in order to make an exact estimate of the damage done. They admitted that the tubing of the 15 principal pits was entirely destroyed. This is scarcely to be wondered at, as the Germans began their methodical destruction of the Lens mines as early as 1915, and did their work thoroughly. The German experts estimated that it would be necessary to remove 130,000 cu.yd. of debris per month in order to have the pitheads relatively clear by the end of 1920. The pumping out of the mines is a far more serious matter and will require at least three years. It is hoped that by next year it will be possible to extract coal from the first galleries, which are only some 650 ft., or even less in depth, but it is not expected that the water will be entirely removed from the lower workings, which run down to about 2,300 ft., until 1923 or possibly 1924.

### TRANSPORT CRISIS IS A SERIOUS DIFFICULTY

The transport crisis is also a serious difficulty in the way of reconstruction. The railways in the Lens district will not be completely repaired before 1921, although it is hoped that the quay at Pont-a-Vendin will be opened for water transport soon. The question of housing also remains to be solved. Of the 800 workmen's dwellings belonging to the Miner's Society, not 100 can be repaired. For the Lens mining district 400 concrete huts are to be built in which it is hoped to house the 5,000 workers who will be employed in clearing the pits for the next two or three years. Although every effort is being made to bring back to Lens its former prosperity the task is so immense that it is not expected that the town and its mines will return to anything like their former state before 1928 or 1929.

At the present time France is facing a severe coal shortage. Until recently the embargo which was effective in the United States cut off that source of supply. But this embargo has lately been lifted.

COAL OUTCROP-BANK OF NANAIMO FIELD AT COLLIERY NO. 1 OF GRANBY CO.

manganese steel, self-oiling wheels 18 in. in diameter and with 3 in. tread are used. The mine cars are built in the company shops at the mine and have no end doors.

Cassidy is the conception of F. M. Sylvester, vice president and managing director of the Granby company as to the manner in which a great corporation should provide for the welfare of its employees and his ideas have been carried out in a generous and whole-hearted man-

ner. It is the ideal, which should make for harmony and good fellowship between the company and the men, and is a long step toward the dawn of that day when employer and employee shall recognize that their interests are one, thereby enabling operations to be conducted to the best advantage of all concerned, capital, labor and the general public.

# Mine Inspection as It Affects Output

BY M. S. BEDDOW  
Scranton, Pa.

Since the cost of a breakdown of almost any electrical equipment used in a mine is by no means measurable by the cost of the repair parts it behooves every mine electrician to prevent such failures by every means possible. One of the most effective means of securing this end is the making of conscientious and thorough inspection of electrical equipment at frequent intervals.

**T**HERE is an old saying that an ounce of prevention is worth a pound of cure. Nowhere is this more truly applicable than in the electrical apparatus applied to coal mining. So dependent has the mining and preparation of coal become upon electricity that prevention rather than cure must be the order of the day. Times without number the electrical equipment used in connection with the extraction of coal is allowed to go out of commission, solely because the operator who guides its destinies forgets, or neglects, to do some little thing which he knows should be done. Then comes the breakdown with its consequent loss of coal and piling up of upkeep cost.

This neglect if persisted in soon becomes a vicious circle widening and ever widening into an orgy of breakdown which seemingly has no ending. Of course this condition cannot prevail if the efforts of all concerned are directed into the one central channel of prevention. Prevention, by actual test, is the one sure way of keeping the rolling stock on the move to and from the faces of the chambers.

The way to put a system of this kind into actual practice seems so easy and plausible on the face of it that one wonders just why it has not become universally prevalent long before this. It needs, and must have, the undivided co-operation of all concerned in the mining of coal. It is an immediate, vital problem, and must not be confused with lesser ones which are taking up the time of many officials and employees. The hub about which it revolves is contained in just two words—periodic inspection. And this must be an honest inspection for there are inspections of so cursory a nature that they might better not have been made. These are mere shams.

## AFTER LONG RUNS LOCOMOTIVES SHOULD BE INSPECTED

After ten and twelve hours of the severest kind of work an electric locomotive, taking this machine as an instance, is so hot in most of its operating parts that there are likely to be a hundred-and-one little things just on the verge of giving trouble. Right then is the time to make a careful inspection with a view to catching these weak spots and preventing the mischief that would surely develop at the beginning of the next workday. This may seem to be of minor importance at the time, but there is no knowing to

what lengths they would reach if they are not checkmated at the proper time.

A weak spring in a brush-holder, although of small moment in itself, and easily replaced, has been known to cause the burn-out of an armature and its field coils and run up a bill of expense not covered this side of several hundred dollars. And not the least important part of this stop was the forfeiture of from 50 to 60 cars of coal with its consequent loss of wages to miners, laborers and others in the section of the mines effected. Thus what would originally have taken a half hour of a motorman or electrician's time was allowed, through neglect, to drag over a period of 10 or 12 hours bringing in its train delay and expense that would be hard to measure accurately in dollars and cents. And the original effect of all this, if those directly responsible are permitted to go uncensured, is to make all hands still more careless and there soon will be other stops. The solution, then, would certainly seem to be periodic inspections rigidly adhered to by electrician and motorman.

## MAKE HONEST INSPECTIONS ON TIME

The logical man to see that these inspections are made on time, and made honestly would seem to be the colliery electrician, for after all he is responsible for seeing that the equipment is kept in service. It does not matter materially that a particular electrician is able to get a locomotive, hoist, pump, coal-cutter or what not into service again after a stop. Most electricians are able to do this in a shorter or longer period of time dependant upon their respective abilities. The big problem is to keep going. Make your break-downs few and far between and of a minor character. Keep your equipment in such shape that there will be no stops and great will be your reward. It is much easier than you think and requires only honest endeavor coupled with a determination to give of your best. And these attributes are inherent in every one of us.

I have come into direct contact with hundreds of mine electricians in the last 16 years; as a class they are well worth studying. Invariably they are honest and want to "make good" in their chosen profession. Point out the proper path to follow in order to keep things moving and nine out of ten of these men will do their level best to meet you more

than half way. And that is why I want to repeat here what I said previously, and I desire to lay special emphasis upon it: It is easy to put this "practice of prevention" into execution because you have these men to work with you and carry out your wishes in the matter. And with this kind of help, working as a team, your breakdowns will be less and less frequent.

But, the question may be raised, is not this only a part of their regular work? Why repeat something known to be a truism?

Periodic inspection is unquestionably a part of their work, but make them understand it is part of your work, too, and just as soon as they learn that you are interested in what they are doing just so soon will their efforts be redoubled, and you will reap the reward in the shape of less breakdowns and of course, increased output.

Twenty years or more ago when mine locomotives were unknown in the anthracite fields mule haulage was the type of transportation in vogue. This answered the purpose well until the veins became smaller and the hauls longer. The work that a team of mules could do was naturally limited, and when one of them was put out of commission because of some accident, the loss in output was infinitesimal when compared to the total tonnage. This of course arose from the fact that there were several hundred mules in the one operation.

As time went on these mules were gradually supplanted by the electric locomotive, two or three of the latter doing the work that had been performed by several of the animals in question. Naturally, then, when a locomotive goes out of commission today the loss in coal is enormous, and there is a combined effort on the part of all concerned to repair the damage wrought so that the locomotive can again be put on the road.

Now if one twentieth part of the energy feverishly expended at such times had been previously employed in prevention the wheels of output would have rolled merrily along without this aggravating stop, and the dispositions of all concerned would have remained much sweeter as a natural consequence. Hard words are often said at such time, too, that would never have been given utterance to had there been no stop, for the tempers of superintendents, foreman, driver-bosses, etc., are beyond understanding when the coal is not moving toward the foot of the shaft. It is truly the end of a perfect day when there are no stops to curtail the output of a coal mine.

#### PREVENT BREAKDOWNS BY MINOR INSPECTIONS

This question of prevention brings with it still another thought that might stand discussion. This takes into consideration again using the mine locomotives as an example, whether or not the apparatus is operating in normal fashion. To better make this plain I will say that I recently came upon a locomotive which had been giving a great deal of controller trouble. Upon investigation it was found that someone had connected up the blow-out coils so that they opposed each other. The result was that the arcing from the fingers when the controller was thrown to the off position was not smothered, and this fire held over a sufficient length of time to destroy fingers and segments. Several times the whole inside of the controller had to be renewed. It of course took several hours to set things right each time.

This same mistake has been made with reference to motor field coils, also, and in this case, if it is not discovered soon, the result will be a burned-out armature together with its fields. Thus it behooves us to not only be careful in our periodic inspections but to be equally careful in our installation work as well. It is evident, then, that the more careful one is when installing electrical equipment the less will one find out of order when the inspection is made.

Keeping these two facts ever in mind, will mean that the whole organization will be keyed up to a higher point of efficiency. This must of necessity result in an increased yield, for electrical deterioration finds its most severe expression in loss of coal.

#### LESS BREAKDOWNS WITH MODERN LOCOMOTIVES

Recent years have seen many changes in connection with mine locomotives. Each of these has made the work of the electrician a little easier, of course, and the equipment more efficient as a whole. Less breakdowns have been experienced, also, for the reason that as each of these improvements was incorporated in the general make-up of the machine, it was more able to withstand the heavy shocks and stresses forced upon it by a too-energetic motorman all too willing to make it do in five or six hours the work it should be given eight hours to perform. Not the least important of these changes was the ball bearing on the armature shaft which has nearly put the old sleeve type of bearing out of business.

Probably one thing which the electricians of the old school hated most to see happen was an armature dragging on the poles because of worn babbitt in the bearings. This was bound to happen now and again and probably has occurred to every electrician at some time in his career. Nevertheless it is something that no electrician is proud of and does his utmost to avoid, for while the blame may not be directly traceable to him he must feel that it is a reflection upon his capability just the same.

#### LOCOMOTIVE BEARINGS REQUIRE CAREFUL ATTENTION

However since the ball bearing largely has taken the place of the older type of journal, armatures are found on the poles extremely seldom. It must not be supposed however that inspection is not needed even with these most efficient of all bearings for mine locomotives. They will go dry, too, just as easily as the old sleeve type, but, thanks to their greater durability, the damage wrought is not nearly so disastrous. In order to get the most out of these bearings they must not only be inspected periodically but must be washed out with kerosene oil every two or three months. This will remove foreign substances and any acids that might tend to destroy the bearings themselves.

Another detail of construction that has kept locomotives from breaking down under the hard usage of recent years is the fact that they are now over-motored instead of being under-motored as was the case up to about ten years ago. Time was, and not long ago, when it was thought by designing engineers that about 6 hp. per ton was sufficient for all practical purposes. How far they were wrong was evidenced by the locomotives that are being turned out at the present time. Ten horsepower per ton seems to be the acceptable rating now, and this does not seem to be in the least too much. It was an easy matter to overload a locomotive.

tive with the old rating since because of the too heavy weight on the drivers, it was not possible to develop sufficient torque to turn the drivers and thus allow the armatures to turn sufficiently fast to generate the counter electromotive force which would hold the current taken from the line at a point where it could do no harm. Frequently the load was so great that wheels could not move at all and armature and fields for the time formed a direct path to the ground. The current taken and the heat developed at such times is enormous, and there is no wonder that as the coils were taken from the burned out armature the insulation fell from them like water from the proverbial duck's back.

A motor that cannot develop sufficient horse-power to turn the wheels when the load becomes excessive can be expected to give trouble, and burn-outs of armatures, fields, resistance, controllers and other electrical parts must be looked forward to as a natural result. Motors in modern locomotives are of sufficient horse-power to move a load whose draw-bar-pull does not exceed 20 per cent of the locomotive's own weight when the machine is equipped with cast iron wheels, or 25 per cent when steel wheels are used. Thus a locomotive properly motored and weighing seven tons (14,000 lb.) will pull a load whose resistance does not exceed 2,800 lb. This, of course, assumes that the locomotive is equipped

with cast iron wheels. For steel wheels coefficient of friction of which is greater, a load whose resistance does not exceed 3,500 lb can be pulled.

Loads in excess of the above are an evil and should be shunned as such. Prevention here would consist in knowing the grades over which trips must be handled, and then placing a limit on the number of cars that should be hauled on these grades, for while the drivers might be turning regardless of the grade or load, and the horse-power developed might be much below what the motors are capable of giving, continued efforts to surmount a nasty hill after repeated failures does not do the equipment a bit of good, and are doubtless the main contributing causes for many of the stops, the reasons for which cannot be explained satisfactorily.

Summing up, then, it might not be amiss to state that the plan as set forth in this article has been tried out with quite happy results. Breakdowns were so infrequent as to make their occurrence a matter of surprise rather than of expectancy. It is gratifying, at least, to the fellow who is responsible for upkeep to see week after week go by without the customary call for help from the operators of the equipment, and the time thus saved can be put to good advantage in repairing feed lines, signals, telephones and other parts of the system which have a habit of kicking up a fuss when least expected.

# Lengthening the Life of Track Rollers

By R. Z. VIRGIN  
Pittsburgh, Pa.

WHERE rope haulage is employed, whether on inclined planes, slopes, or level roads, track rollers, either of metal or wood, are necessary. In the majority of cases, however, wood is employed for this purpose. Track rollers are necessary because they reduce friction and thus save power, which is desirable at all times. They lengthen the life of the ropes by preventing them from dragging on the ground, and they save the ties by holding the rope off of them and thus keeping it from sawing the ties in two, thus weakening the tracks and causing wrecks. Track rollers should be placed at such intervals as to prevent the rope from dragging on the ties. They should be of generous diameter since their life is in general proportional to the diameter and a thick roller is stronger and does not revolve as fast as one of small diameter. Ordinarily, track rollers are suspended and revolve upon gudgeons or spindles, which should be from  $\frac{3}{4}$  in. to 1  $\frac{1}{4}$  in. in diameter, depending upon the size of the roller. In many instances, they can be made from ends or short pieces of pipe.

The usual diameters of wooden rollers vary from 4

to 9 in., depending upon the size of the car wheels. The larger the diameter of the car wheel, the larger may be the diameter of the track roller employed. Wooden track rollers, like all other mine supplies, have increased in price within the past few years. At

the present time such rollers cost about three times their former price, so that attention must be paid to the roller's efficiency and life, and each roller should be so placed as to secure its maximum service before it is necessary to discard it. Fig. 1 shows a method of placing rollers so as to secure this maximum service. The practice of placing all rollers in a straight line upon an inclined plane slope or haulageway looks orderly but permits only about one-third, or even less, of the maximum life or service of the roller to be secured. Many foremen are instructed to place rollers

Plan

Elevation

MAXIMUM SERVICE IS SECURED BY THIS ARRANGEMENT

in alignment, but where this method is followed, the cost of operation and maintenance of rollers should not be charged in its entirety to equipment or repairs, but to inefficiency of management.

If rollers are placed as shown in Fig. 1, they may be turned end for end in their bearings and twice as much

service secured by this reversal. They may then a third time be placed in brackets where the rope will bear on the roller in the center. This secures three times the service available for one setting of the roller only.

If rollers are used on an incline, those near the drum should be turned up with a convex face; that is, they should be larger in the center than at the ends. This will allow the rope to travel from one end of the roller to the other as the rope changes location by its winding upon the drum. This shape of roller is shown near the end of the drawing.

Where trucks are hauled with considerable speed up an incline, and where cars are heavy, drags or dogs are often hung on the rear of the truck to prevent the cars, should the trip be broken, from running backward down the slope. These drags or dogs are often of considerable weight but are required by law in certain states.

Every mining man knows the effect of such a drag pounding along the track and bouncing onto and off of the ground and onto the roller, and either bending or breaking the grudgeon, either of which will affect

or probably ruin the free movement of the roller.

Fig. 1 shows a bumping block of suitable size nailed or bolted to the tie immediately in front of the roller. This block is so proportioned and placed as to take the blow of the drag. It thereby protects the roller and is sufficiently strong to resist a considerable blow, one which delivered upon an unprotected roller would probably bend its spindle.

If a bumping block similar to the one shown is placed on the tie in such a manner as to extend out over its edge, as shown in the drawing, it will greatly assist in preventing large pieces of coal or rock from choking the roller and thereby obstructing its free rotation, since by this method if a piece of coal passes the bumping block it has a considerable space to fall into and thus prevent its wedging.

Whatever type of roller brackets are employed, they should be reinforced either in the roller groove or on the side with a piece of iron. This will prevent the roller from cutting into the bracket and thereby secures greater life to the roller support. Discarded or broken car ribs make excellent reinforcement for this purpose.

## Resetting Return Tubular Boilers

BY C. R. WEIHE  
Star Junction, Pa.

**P**ROBABLY no industry gives as little thought to the fuel wasted in the boiler room as does that of coal production. Nevertheless, if this waste were actually realized there is no doubt but strenuous attempts would be made to reduce it. It is not the purpose of this article to discourse on the willful waste that exists at some coal mines but to offer a means by which some of this waste may be reduced.

The most common type of steam generator used at American coal mines is the return tubular boiler, the nominal ratings of which range from 100 to 200 hp. Of the older boilers of this type, the 66-in. x 16-ft. and the 72-in. x 18-ft. are the most common. It has been my experience that these boilers as a rule are set too close to the grade for the successful burning of bituminous coal. They can, in most cases, be made to give much better results if set approximately as shown.

When attempting to increase the efficiency of any boiler plant, the main considerations that should not be lost sight of are: How near perfect is the combustion in the fire box and how rapidly can this combustion be made to take place while still being kept nearly perfect, that is, without an excess of air.

### EXAMPLES OF RAISING BOILER SHEET

As an example of what the raising of a boiler sheet above the grate may mean, take the case of a 66-in. boiler. Such a steam generator is usually set so that there is from 20 to 26 in. between the grate to the boiler shell. The volatile hydrocarbons that rise from a fuel bed 6 to 8 in. in the thickness will not be properly mixed with air before they come in contact with the relatively cold boiler sheet, and, since it takes a temperature of from 1,800 to 2,000 deg. F. to burn these gases or cause the atoms of carbon to combine with those of oxygen supplied with the air, the fire

produced in such a setting more strongly resembles a smudge than a real fire for producing steam. Such conditions as these actually obtain in many cases where return tubular boilers are employed. This may be obviated, however, at least as far as the smudge is concerned, by admitting a surplus of air into the firebox. This, however, does not improve the efficiency. Although it may make some steam, it is highly wasteful of fuel.

ABOVE METHOD GIVES EXCELLENT SATISFACTION

The distance from the bridge wall to the boiler shell is also an important consideration, and, in many instances, this is not made sufficient. If the heating of the boiler had to be all accomplished at the shell above the bridge wall, and nowhere else, the theory of a close bridge wall would be correct. One important consideration that must be continually borne in mind and carefully watched where the distance between the bridge wall and boiler is large is the admission of air above the grate. This air tends to stratify and if its velocity is

fairly rapid it will pass next to the boiler and tend to keep the boiler shell temperature down. This is not generally the case where the bridge wall is close to the boiler shell, since the gases are forced to intermix to a certain extent, thus raising their minimum temperature.

By raising the boilers higher above the grate, the combustion chamber is made larger. This is beneficial, since it affords greater room for the ashes carried over the bridge wall. The greatest gain is not, however, the space it affords for these ashes, but arises from the increase in cross-section of this chamber, so that the gases decrease their velocity and have an opportunity to thoroughly mix and burn completely before their journey through the tubes. If the combustion of gases is not complete before they reach the tubes it will never be complete, since in these tubes their temperature will be lowered to such a point that combustion cannot take place.

A lack of excess air increases furnace and combustion chamber temperatures. This is, of course, not a detriment, but provision must be made therefor. One particular detail of construction in a horizontal return tubular boiler is the blowoff pipe, which, in this type of steam generator, must necessarily pass through the combustion chamber. In Fig. 1 is shown a method that has given excellent satisfaction. As here shown, the blowoff pipe is inclosed in a firebrick pier and trench. The pier is built up with a good grade of firebrick laid in fire clay or loam. The space surrounding the pipe has a minimum of about one inch from pipe to brick.

Approximately 6 in. from the boiler shell an opening of about 2 x 4 in. is left in the pier so that air will be drawn into the combustion chamber by the draft. Care should be taken that this opening be not closer than shown in the drawing, since there is a blow pipe effect at this point where combustion is nearly complete and where the draft is strong. The trench inclosing the horizontal portion of the blowoff pipe is also constructed of firebrick laid up in loam or fire clay with a space left between the brick and the pipe. The trench is covered with tile and plastered up tight.

#### PURPOSES OF AN INCASING PIPE

Where the blowoff passes through the rear wall of the boiler setting, it is inclosed in a piece of pipe several sizes larger than the blowoff. This is built into the setting permanently. This incasing pipe serves two purposes: It admits air to the pier and a new blowoff pipe can be passed through it and installed without its being necessary to remove any of the setting bricks.

It is advisable to use double-strength pipe for the boiler blowoff, even when protected in this manner. In any case, the elbow and other fittings should be double strength or extra heavy malleable iron. Although the pier and trench above described afford excellent protection for the blowoff, it should nevertheless be examined every time the boiler is taken off the line to be cleaned or washed.

When raising and resetting or when the setting of any return tubular boiler is rebuilt, it is well to place the rear of the boiler 2 or 3 in. lower than the front or firebox end. This greatly aids in washing out the boiler if it is made with more than two sheets. It also helps the circulation of the water.

Care should be taken when boilers must be forced that they be thoroughly clean and that the circulation of water is good. If the boiler is kept clean and the

water level is carefully watched, a boiler even when driven far above rating will not require any more upkeep than some that are operated under present conditions.

When rebuilding a return tubular boiler setting, between 60 and 70 per cent of the old brick can be used again if the original setting was laid up in lime mortar. It would not be advisable to re-employ the old firebrick in the new firebox, but they may, however, be used in the combustion chamber to advantage.

#### MATERIAL FOR RESETTING TUBULAR BOILER

The rebuilding of a setting for a 66-in. x 16-ft. return tubular boiler requires about 28,500 to 30,000 bricks. The walls should be battered about 4 in. in 10 ft.

BETTER RESULTS ARE OBTAINED BY THIS ARRANGEMENT

and the grate should be approximately 2 in. lower at the back than at the front.

When contemplating raising a boiler, it should be remembered that the mere fact that the boiler is raised will not attain the desired results unless the distance between the boiler and grate is increased. When this is done a spacer must be provided to fill in the front equal in width to a little less than the amount the boiler is raised. It has been found advantageous in some instances to arrange the front of the boiler as shown in Fig. 1. In this case the fireman is given about 1 ft. more floor space, and should the front man-head leak, the water will not run down the arch inside the setting and cause it to disintegrate.

#### Shot Firing

OF ALL the archaic, moss-grown, semi-modern so-called safety ideas, that of employing shot firers is probably one of the most harmful and dangerous. This practice is an open acknowledgment that a dangerous condition exists. It attempts merely to smooth over a real peril. Frequently it actually increases the danger since it releases in a very short interval of time the quantity of gas that would ordinarily be released in 24 hours. It is woefully inefficient.

Probably one of the most telling arguments against the shot-firing system is that with increase of real safety departments, mine after mine is abolishing it. This does not apply where the safety department is composed of porch lizards. But take one of your sure-enough, honest-to-goodness safety men and he'll turn up-side-down any shot-firing system yet contrived. Away, then, with the present shot-firing systems and their attendant danger and waste of time and labor.

Spend just half as much money in real ventilation and make the mine really safe.

# Use of Electricity in Pennsylvania Coal Mines Discussed

STATE and Federal mining officials, coal operators, miners and manufacturers of electrical equipment held a session on Jan. 27, at the Capitol in Harrisburg, Pa., and discussed new rules and regulations to govern the use of electricity in the coal mines of Pennsylvania. The State Chief of Mines, S. E. Button, presided at the meeting, and it was the intention of the state mining department to discuss all phases of the application of electricity that pertain to trolley motor, storage-battery locomotives and coal-cutting machines; but the conference advanced no farther than the question of storage-battery locomotives, and the meeting adjourned at 9 p. m. until Feb. 10. For some time complaints have been made to the State Department of Mines against the storage-battery locomotive, and Mr. Button ordered a commission to make an investigation of these motors, calling the conference for the purpose of hearing suggestions that might improve present conditions.

The mine inspectors of the bituminous region believe that the storage-battery locomotives as now constructed, are unsafe in gaseous mines, and, are of the opinion that the motors do not comply with the requirements of the bituminous mine law; therefore they should be restricted to areas where there is little likelihood of their encountering inflammable gas.

It is contended that these locomotives produce sparks and flashes in regular operation. The controller and motors will, when operated, ignite gas due to the flashes consequent upon the breaking of electrical current. Other parts of the storage-battery equipment may produce sparks or flashes, the inspectors claim, in the course of their regular operation or as the result of accident. The locomotives are able to go to any part of a mine where there is a track, making it quite difficult to place any limit on the activities of such equipment.

The committee of mine inspectors and the department electrical engineer, Charles M. Means, went into the question quite thoroughly, and have made certain recommendations to the Department of Mines.

The inspectors, for the purpose of their report, have considered the various parts of a storage battery locomotive liable to cause ignition of gas and have divided them into three classifications as follows:

"Class 1: Includes all parts that may produce sparks or flashes as a result of normal operation of the locomotive. In this list the following parts are included, which list may be extended when new features are incorporated: Motors; resistances; controllers; fuses and switches used in regular operation.

"All the parts above enumerated should be enclosed in explosion-proof cases, as defined by the act of June

9, 1911. These cases should be designed to withstand, without rupture, the maximum pressure that can develop as the result of an ignition of the most explosive mixture of methane and air when the case is entirely filled with such a mixture.

"All flanges between parts of the casing should be so arranged that no flames will pass between the flanges without being cooled to a temperature below the ignition point of gas. All bolt or stud holes should be so made that in case a bolt or stud is left out, there will be no hole from the inside of the casing to the outside. "Class 2 includes such parts as may produce sparks or flashes when operated but which need not be used in regular operation. In this class we have change-over-switches and charging receptacles in case their terminals are 'live' during normal operation. These parts may be placed in a locked box and only operated in the charging station.

"Class 3 includes all parts which do not produce sparks or flashes as a result of normal operation but may do so as a result of accident. This class includes: Battery; battery enclosures; wiring; battery connections; headlights and instruments.

"A battery of good design, fitted with proper terminals and connections, does not seem to offer any hazard if it is properly protected from mechanical injury. The design of the connections is well standardized for the various batteries and the connections are not likely to become loose if a proper amount of care in maintenance is used.

"Unless the battery cells are insulated from the trays in an approved manner, the battery trays shall be insulated from the battery box with porcelain or equivalent insulators of adequate dimensions.

"The headlight should be constructed of a metallic case and fitted with a heavy glass lens which should be protected, in so far as possible, by the casing. This headlight should be of explosion-proof construction, unless some circuit-breaking device is used that will automatically and safely open the circuit in case of accident. The headlight should be so located on the locomotive, or protected, that it will be least exposed to damage from accident.

"The wiring should be in iron conduit or its equivalent. In general, the battery connections and wiring can be so constructed that with a proper degree of attendance there is no likelihood of a spark or flash being produced.

"The matter of charging, while in a manner foreign to this investigation, does have a direct bearing on the problem. It is quite important that all charging stations be ventilated with fresh air which must be carried to the return after passing through the charging

**S. E. Button, Chief of the Pennsylvania State Department of Mines, has investigated the question of the safety of electrical equipment in gaseous mines, and recently called together those most interested to discuss the situation. The recommendations of a commission, appointed by Mr. Button, reported to the meeting at Harrisburg and a brief review of the suggestions made are noted in this article.**

room. This room must be treated as a highly-dangerous locality, due to the liberation of hydrogen by the batteries during charging.

"The room must be of fireproof construction throughout and all wood or other combustible material entirely eliminated. No inflammable material shall be stored or allowed in this room. If doors are used, they should be of steel and sufficient openings provided to allow a free circulation of air at all times. This reference to the charging station is suggested by the fact that these rooms have been a prolific source of trouble and represent a hazard that cannot be ignored."

The manufacturers' representatives stated that they were willing to make any changes in their locomotives to comply with the law and do anything to save human life, but were anxious to know if, after spending time and money to produce what they would consider a perfect machine, the State Department of Mines would accept it and allow it to be used. They also contended that to build a machine as required by the State Department of Mines and to meet the requirements of Schedule 15 of the Federal Bureau of Mines, would make quite a costly motor, and that the operators would then probably refuse to put so much money into storage-battery locomotives. Chief Button, of the state mining department, does not deem it advisable to establish fixed standards that might in any way handicap the future development of this class of equipment, but impressed it upon the conference that he would insist that these motors be made safe or the Department of Mines would refuse to allow them to be used in gaseous mines until they are made safe.

### Great Britain Looked Ahead

WHEN THE WAR ended the people of the United States, with a genius for self-depreciation, at least, as obvious as their tendency toward self praise, declared that Great Britain had a definite after-war policy, whereas the United States was floundering around without any plan. Everybody admitted we had no definite program. Great Britain had everything plotted and prepared. As usual it looked bad for us. How could we get along without diagram or charted course?

Perhaps it is true that the British were not so clear as to the direction in which to tread as our traveling journalists tried to indicate. Perhaps also there were jarring interests in the United Kingdom as there were here. In fact, it appears that there were. It would be strange, indeed, in that realm of individualists if every one thought the same and traveled in the same direction.

Still the Government did have some sort of plan of control that it hoped would rule and that it trusted would succeed. Advocates of Government control were more numerous than here. The British have during the war at least been a few laps ahead of us in socialism. There is just now a profounder belief in government ownership in Great Britain than in the United States and a greater deference to governmental authority.

What has been the result of British foresightedness? Nothing but disappointment. The mines under government restrictions have proved less fruitful than ever. The output of British collieries has fallen from 5,500,000 tons per week in 1913 to between 2,500,000 tons and 4,750,000 tons per week in the past year. British coal no longer dominates foreign markets.

The payment to the unemployed has made idleness satisfactory if not profitable. Exchange has fallen from \$4.87 to \$3.50 and lower. Prices have risen more than wages. All this has partly arisen from causes which have inevitably ruled the situation, but more perhaps from a bad practice of looking ahead at the goal instead of making strides to reach it and taking the obstacles as they arise.

Meantime we, who did not look ahead, have found conditions far better, and the difference has largely been that we were on the whole less hampered by government interference, did not have any hearty, yet pension-receiving, unemployed, had not entirely forgotten that on production rested the good fortunes of all our citizens and still remembered the wholesome fact that work is the happy heritage of the poor and rich alike. "Greater," yes, and happier, "is he that serveth than he that sitteth at meat."

Our government will not save us. It is our own strong arms and healthy impulses that will move us onward to prosperity. It is perhaps a good thing to distribute, with admirable precision, a shortened necessity, but better is it to spend time and energy on the producing so much of a necessity that we can let the distributing follow natural lines.

In Great Britain the government fears to advocate production for fear it may raise a quarrel about a distribution of the product. Here, we are not afraid to approach the question of production and, if production be large enough, distribution may be suffered to regulate itself.

Of course, we have no great reason for congratulation. We have Great Britain's foibles in large measure. Production has fallen; shorter hours and more privileges are under discussion; strikes have been many. While we have avoided many of the British heresies, we have in part accepted them and in a degree we have dallied with them.

To produce to produce and again to produce is the simplest solution of our after-war difficulties. To have faith in the future and in work as the saving element in all economic troubles is the surest way of meeting the future. Let us have no diagram but work, and faith in work. No nostrum will meet high prices. It is well-directed labor, that old specific for national ills, which will put the elixir of life into a war-stricken body.

Let the year of unrest and uncertainty and strikes be followed by a year of hard work and industrial co-operation. Let the miner co-operate with the farmer so that each supplies the other generously with products. Let the worker in metals do his part in supplying both with steel for tracks, tractors and automobiles.

### Variation of the "Buy Early" Campaign

In Salt Lake City, Utah, has been formed the Mutual Coal Co. which offers its stock in blocks of five shares or over to coal dealers and agrees to give its stockholders coal during June, July and August at cost, charging current market rates through the rest of the year. It hopes to promote storage in this manner and keep its mines working every day in the year that cars are available. Its coal land (640 acres in extent) is under lease from the state of Utah. It has a fee holding of 160 acres for tippie, storage yard and townsite. The capital is \$250,000.

# Use of the Geophone for Mine Signalling

BY MARK MEREDITH  
Liverpool, England

**A**MONG the interesting inventions which were developed during the trench warfare in France was an apparatus known as the geophone. This device was employed to detect the direction in which mining operations were being carried on by the enemy. It proved of great service and, in its final form, was found to possess a remarkable sensitiveness.

The principle involved is that of the seismograph, in which records of earth movements are obtained through the relative motion between the earth and a suspended mass possessing large inertia. The relative motion in the case of the geophone takes place between an iron ring which is in contact with the ground, and a lead disc, fastened between two mica discs, and thus held within the iron ring in a central position. Two metal caps hold the mica discs in place, and a hole bored in the upper cap communicates variations in internal air pressure to the ear by means of a rubber tube. When the case is shaken by the feeble tremor from a distant blow, the lead disc is comparatively undisturbed, and hence there are compressions and rarefactions of the air within the case which produce characteristic sounds.

Happily there are no longer anxious men sitting in stifling underground tunnels straining their ears to detect the sounds of the German picks, and it is now proposed to apply the geophone to rescue work in mines. Tests have been made to determine the limiting distance at which disturbances can be heard. The sound of a pick striking a rock was distinctly identified at a distance of 900 ft. through coal and earth, while a heavy blow delivered with a sledge hammer was heard 1,150 ft. away. It appears that the presence of galleries and rooms in the intervening space makes little difference in the loudness of the sound, but the amplitude varies to some extent with the nature of the material traversed, metalliferous rock transmitting sound better than coal deposits.

## GEOPHONE DETERMINES DIRECTION OF SOUND

Because of the fact that the ear is easily able to detect differences in the amplitudes of two sounds when they are made in separate ears, it is possible to use the geophone to determine the direction from which impulses shaking it are arriving. Two similar instruments are used, one being moved until the sound appears equally loud in both ears. The direction of the impulse is then known to be perpendicular to the line joining the two instruments.

This method, which might seem incapable of giving great accuracy, has been proved by experience to be of considerable service in assisting in the alignment of tunnels, and instances have been already recorded where the direction of an approaching tunnel head has been obtained by the geophone and found to coincide, with remarkable exactness, with that determined by the accurate surveying instruments upon which it is usual to rely. The distance of the disturbance can be found from experience if the impulse is constant in amount. This is, however, an inefficient, unsatisfactory method, and better results may be expected by taking simultaneous observations at two separate points and finding the point

of intersection of the lines indicating the direction of the approaching disturbance.

There can be little doubt that this ingenious, simple contrivance will facilitate the task of establishing communication with entombed miners after an explosion and enable the work of rescue to be undertaken rapidly and efficiently. One interesting and valuable feature of the apparatus is the ease with which the character of the disturbance can be identified. A blow from a pick or shovel produces a sound which is quite different from that made by a fall of rock.

The question of the likelihood of the geophone being frequently employed in mines depends to some extent upon the future developments of the wireless telephone. The possibility of transmitting speech direct is attractive, and has been the subject of experiments dating back as far as 1887, when A. W. Heaviside succeeded in transmitting telephonic messages through 350 ft. of earth. In these experiments two metallic circuits each over two miles in length and parallel to each other were used, one laid on the ground from the pit mouth and the other in a gallery of the mine.

The remarkable advance of the sensitiveness of receiving instruments which has taken place recently will almost certainly make it possible to communicate from a sending station above ground with any position within the mine. The apparatus for receiving the message is, however, necessarily complicated and requires trained operators, so that the simplicity of the geophone and the possibility of its use by the unskilled are important arguments in its favor at present.

---

## Fuel vs. Water Power

The Division of Power Resources of the U. S. Geological Survey publishes the following tables of production of electric power and consumption of fuel by the public-utility power plants of the United States during the second, third, fourth and fifth months of last year.

It states that the daily output in kilowatt-hours was in February, 106,531,000; in March, 101,609,000; in April, 100,870,000, and July, 101,366,000, while the percentage produced by water power was 39 in February, 42 in March, 43 in April, and 39 in July.

Reports were not received from all the sources from which they should have arrived. About 3,000 electric power plants have been heard from, and the generator capacity of these plants is, roughly, 90 per cent of that of all the public-utility power plants of the United States. To make the returns complete, estimates were made from available information of the output of plants regarding which no returns were received. The figures are subject to revision in subsequent statistical records of the U. S. Geological Survey relating to power production.

A comparison as to the most efficient use of water power or fuels, which compromise coal, petroleum and derivatives, such as kerosene, gasolene, etc., and natural gas can readily be observed as soon as statistics are completed, showing conditions during the latter months of the year. These will also be published.

PRODUCTION OF ELECTRIC POWER AND CONSUMPTION OF FUEL BY PUBLIC UTILITY POWER PLANTS IN THE UNITED STATES FOR THE MONTHS OF FEBRUARY, MARCH, APRIL, AND JULY, 1919

Thousands of Kilowatt-Hours Produced

## THOMAS F. HOLMES

ON JAN. 26, 1920, passed away Thomas F. Holmes, one of the most prominent figures in the coal industry in Illinois. At the time of his death he was general superintendent of the properties of the Chicago, Wilmington & Franklin Coal Co.

Mr. Holmes was born in Brooklyn, N. Y., Feb. 7, 1861. He came to Illinois with his parents when he was about five years old and has resided at Lincoln, Ill., almost continuously since that time. He was educated in the Lincoln schools and began work as bookkeeper in one of the mining offices of that town in 1883. From that time he has been identified with the production of coal. He served as workman, foreman, and in various other capacities, until 1889. In that year he became mine superintendent at Niantic, Ill., in which position he remained for three years. He then returned to Lincoln, accepting the superintendency of the Citizens' Coal Mining Co.'s property, and here he continued for 24 years, acquiring later an interest in the local mines at Lincoln.

He was one of the pioneers in the Illinois Coal Operators' Association, the organization that bore the brunt of the collective bargain that just then developed. He was, in fact, a charter member in the association. Later Mr. Holmes became superintendent of the Chicago, Wilmington & Vermillion Coal Co.'s mine at Thayer, Ill. He held this position for five years, and was then appointed general superintendent of the Chicago, Wilmington & Franklin Coal Co.'s properties, which at the time of his death included eight mines with a daily production of 22,000 tons.

Mr. Holmes was married on Sept. 8, 1885, to Miss Jenny McCann. He is survived by his widow, three sons and three daughters, two brothers (Stephen Holmes and W. H. Holmes), two sisters (Mrs. Ellen Maloney and Mrs. Mary Thompson) and one grandson. He was an ideal father and took special pride in his family of fine children. He was a member of the Lincoln Elks and Redmen's Lodges.

Mr. Holmes combined the qualities of kindness and consideration for others, which gave him an unusual standing with his workmen, with a fidelity to his duty as he saw it. These qualities made him invaluable to the concerns with whose work he was entrusted. His sound judgment, strict justice and absolute conscientiousness made him sought after in councils, and for 15 years he served as a member of the Executive Board of the Illinois Coal Operators' Association. He served on the Illinois State Powder Commission for two years and was throughout his life identified with matters of civic welfare and social improvement.

### AN OBITUARY

His loss will be greatly felt not only by his associates in the Chicago, Wilmington & Franklin Coal Co. but by the entire industry of the state. His life was marked by a most faithful performance of duty, a constant appreciation and participation in the aims of the organization which he served, and a most remarkable record of accomplishment. The properties coming successively under his management progressed under his logical plans and prospered as the outcome of his untiring energy. He was never too busy to give matters his personal attention and up to the time he was stricken by his last illness he daily might be found in an active discharge of his duties. His capacity for work was unusual and he enjoyed the game of constantly surpassing the old records of accomplishment.

To those who are not Illinoisans it may be permissible to add that the Orient No. 1 Shaft was one of the eight mines mentioned as those over which Thomas F. Holmes had charge. It is the leading shaft of the country from the point of output, and many of its original features are becoming standard practice in the southern Illinois field. Other mines the operation of which he directed were Benton No. 2 at Benton, Ill.; "B" Mine, at Herrin, Ill.; "A" Mine at the same place; Thayer No. 1, at Thayer, Ill.; South Wilmington at a village of the same name, and the Royal Colliery, at Virden, Ill.

In honor of Mr. Holmes the operation of all his company's mines was stopped on Thursday, Jan. 29, when, in the little town of Lincoln, his body was lowered into the grave. The suspension of work lasted only from 9:30 to 9:45 a.m., and the organization, which largely lived and breathed with the power he had put into it, again took up his work, doubtless to exhibit the fact that acts of industrial leaders are not disconnected performances but serve as inspiration and power to those who come after. What one man has done others succeeding them can and will do profiting by the example of their predecessors.

The Chicago, Wilmington and Franklin Mining Co., through President Geo. B. Harrington, of Chicago, paid high tribute to Mr. Holmes in a letter addressed to the company's employees. To quote his words: "From the foundation of the company in 1914, Mr. Holmes has given tireless devotion to his work, and his leadership has been a constant inspiration to his associates. To him must be given a very large measure of credit for the success which the company has won."

Mr. Holmes was not quite 59 years of age when he died but he had outstripped meanwhile many men with larger advantages but less force of character.

## WHAT THE ENGINEERING SOCIETIES ARE DOING

### American Engineering Standards Committee

**A**N INTERNATIONAL body to approve American engineering standards and to co-operate with similar organizations in other countries is made possible by a new conference termed the American Engineering Standards Committee. Similar organizations are now functioning in Great Britain, France, Switzerland, Holland and Canada.

Through the new committee the methods of arriving at engineering standards will be unified and simplified and, by co-operation, the duplication of standardization work will be prevented. Standards will not be created without giving all interested an opportunity to participate.

The "approval" of a standard by the American Engineering Standards Committee does not mean that the committee has itself worked over and approved each detail, but rather that the work has been carried out by a sectional committee adequately representing the industry concerned, and sponsored by one or more bodies of ability, experience and standing, so that the result may stand for what is best in American engineering practice.

The committee is not only ready for business but it has made considerable practical headway. It has approved specifications for standard pipe threads, for which the American Society of Mechanical Engineers and the American Gas Association are sponsors, and are representing America on this subject at an international conference in Paris. Co-operation is in progress with the National Screw Thread Commission, authorized by Congress and composed of representatives of the various technical societies, looking forward to standard screw threads. Through this arrangement, direct co-operative work with the British, which is not possible by the official commission, is being carried out. The committee is also in active co-operation with the Canadians on bridge specifications, with the British on specifications for machine tools, and with the Swiss on specifications for ball bearings. In each case the detailed work is being carried out by sponsor bodies by means of sectional committees.

### When the E. S. N. E. P. Banquets

When the Engineers' Society of North-Eastern Pennsylvania meets to banquet, as it did at the Hotel Jermyn in Scranton, on Wednesday evening, Feb. 4, a more lively bunch of fellows can scarcely be found. Serious grinds, who have taken up with mathematical sciences and steeped themselves in erudition come to the banquets of the Engineers' Society and exhibit a frolicsomeness that would make one seriously question how

they could take up such dour studies and embrace such a serious profession as that of engineering.

Menus in the form of a bottle were the only bracers provided at the banquet. They showed a picture of a man watching a whisky still, labelling it: "A Very Hazardous Branch of Engineering—A Drawing from Still Life." The menus add "The banquet committee, at this sober moment, wishes to invite attention to the following terms used frequently by those in the engineering profession and asks that suitable substitutes be furnished in order that we may enjoy the freedom that is guaranteed to us under the Eighteenth Amendment: 'gin' pole, 'whisky' jack, 'spirit' level, 'bar'-wound armature, 'still'-son wrench, 'siphon,' 'tank,' 'tipple' and 'flask.'"

Evan C. Jones, assistant district attorney of Luzerne County, a witty Welshman, congratulated the party on the merriment they had achieved upon water. Some few, he said, had been able to get something stronger than water and they were entitled to even greater congratulations. He stated in his remarks that he and his Wilkes-Barre associates, who had come to Scranton in large numbers, had been promised surface support and in return were giving their moral support.

Gustave F. Smith, the president of 1919, reported an increased income during the past year of \$715 with 55 new members and 434 members in good standing. Hugh A. Dawson, the incoming president made a short address. Con. McCole, who can imitate the dialect, mannerisms and appearance of all the polyglot peoples inhabiting the anthracite region had the party convulsed with his witticisms. He wound up with his "Miner's Convention." He tries to avoid repeating this feature, but his admirers—and who may not be numbered among them—will never allow him to sit down without this part of his repertoire.

Col. Joseph Thompson addressed the banqueters on "The Engineers in France," who did everything but engineering. Of 1,000 men in his command only 55 privates, one noncommissioned officer and himself came out on their feet. He had both his arms in a sling. The colonel declared himself of the belief that the co-operation between officers and privates during the war was possible between officials and workmen in peace if only the latter knew the plan and purpose as well as did the privates during the war.

Dr. O. F. Lewis spoke on "The Social Unrest and Its Causes," laying it to inhibited powers and ambitions. He believed that community councils would do much to furnish the antidote, permitting of activities which undirected would be likely to drift into improper channels. A Welsh quartette, named Cambria after the old Latin name of the principality, exhibited well how much the Welsh element in the anthracite region helps to maintain the musical standing of that community.

## Hayes Resigns Presidency

On Feb. 6, the international executive board of the United Mine Workers of America accepted the resignation of Frank J. Hayes, the international president, putting Vice-President John L. Lewis, of Springfield, Ill. (long acting vice-president) in his place. Philip Murray, the president of the Pittsburgh district, becomes vice-president. For more than a year Hayes has been in poor health, the outcome of a nervous breakdown. After some months in a sanitarium he went to Denver and is there now, endeavoring to recover his lost health.

Robert R. Gibbons, who is vice-president of the Pittsburgh district, will succeed Philip Murray as president of that district. He came to the city of Pittsburgh from Scotland in 1903 and in July, 1916, was appointed vice-president to which office he has been elected twice.

## Operators Make Their Case

At the hearings of the operators before the Bituminous Coal Commission the earnings of leaders were illustrated by Mr. Crews by the following table for January, 1919, which begins with loaders who worked at least twenty days of the twenty-seven days running time:

WAGES OF MACHINE-COAL LOADERS

Number of Men	Days Worked	Average Earnings for the Days Worked
46	20	\$116.39
62	21	127.65
52	22	131.76
61	23	138.02
77	24	145.88
48	25	154.00
30	26	169.84
21	27	197.06

WAGES OF MACHINE RUNNERS AND HELPERS

Number of Men	Days Worked	Average Earnings for the Days Worked
4	20	\$168.00
4	21	159.75
7	22	185.57
12	23	211.17
6	24	212.33
11	25	186.00

At this stage of the presentation of the earning and working sheets of the mining corporations, Mr. Crews said to the Commission: "If you could analyze the question of absenteeism without cause down to a final and definite conclusion you would find, and the figures so indicate, that the machine runners are much less often absent than the pick miners or loaders."

The relative merits of the contentions of the miners and operators as to the actual earnings of the miners, and the far-reaching effect of the failure of a large proportion of individual miners to work the full time available, were put in an entirely new light by the data submitted to the commission for the operators by Attorney Crews of New York when the commission resumed its hearings Monday morning, Feb. 2.

The figures were new, taken from the mine records, and giving for the first time the fundamental statistical facts of the coal industry for the ten months' period from January to October, 1919. The trend of the data was that during those ten months previous to the strike the miners made appreciably more than the "decent living wage" which their representatives have urged they were unable to make.

Authenticity of the figures, Mr. Crews explained, rested upon the fact that they were taken bodily from the pay-rolls of the mines themselves, and as a further voucher

for their reliability he informed the commission that the compilation had been made by C. E. Leshner, who, as an expert of the U. S. Geological Survey, was in charge of the mineral fuel statistics.

On account of the time limitations imposed upon the inquiry and the requests of the commission that the results obtained be submitted forthwith, the operators had been unable to carry the data to the full extent originally mapped out when the compilation was begun last December. The data as offered embrace 15 per cent of the working forces of the mining fields involved. It covers both the thick-veined and the thin-veined districts of Western Pennsylvania, Ohio, Indiana and Illinois, all embraced by the Central Competitive field.

It was made clear by Mr. Crews that the data were taken impartially from the mine records in such a way as to give actually representative figures and not "hand-picked" data such as would arbitrarily make out a favorable case for the operators. This was borne out by Mr. Leshner's statement that the mine managers had been directed to select the mines with reference to character, both industrial and fuel, to divide up the fields so reports would be given of mines with the poorest running time, as well as the best, and so that car supply should likewise be taken into consideration.

### IRREGULAR WORK CAUSES LOW EARNINGS

Tables showing a striking variation from the claims hitherto advanced by the miners as to their total monthly earnings and revealing the great extent to which the irregularity of the miners in pursuing their work detracts from their potential earning power were then read into the record.

That the miners were able to make much more than an average of \$5.00 a day, as argued by the miners' representatives, was shown by a table offered for the Pittsburgh thin-vein district. In this table, taken direct from the mine sheets, it was shown that during the month of January, 1919, pick miners who worked the maximum running time of 27 days made over \$9.50 per day, while the miners who worked two-thirds of the time made over \$6.23 per day. The table follows:

WAGES OF PICK-MINERS

Number of Men	Number of Days Worked	Average Earnings for the Period Worked
10	1	\$7.81
3	2	5.20
5	3	19.82
2	4	18.20
3	5	34.86
6	6	42.31
1	7	18.94
7	8	39.54
9	18	112.29
14	19	138.58
13	20	150.48
14	21	161.61
15	22	157.92
27	23	157.76
37	24	179.86
30	25	207.43
27	26	227.14
30	27	244.43

### TIME WASTED BY THE MINER

Taking up the tables for October, 1919, the last month preceding the strike, it was said that although the conditions for marketing and for car supply were 100 per cent favorable to the miner putting in full time, neither the pick miners nor loaders availed themselves of the opportunity to make a maximum wage. "But take the machine runners," pursued Mr. Crews, "There is nobody working one day only; nobody worked just two days or three days."

He cited the following table for machine runners for October, 1919:

Number of Men	Days Worked	Average Earnings per Man for Period Worked
2	4	\$31 50
1	5	50 00
2	9	67 50
1	12	57 00
1	13	82 00
1	14	94 00
1	16	129 00
1	18	155 00
2	20	109 00
2	21	154 00
2	53	173 50
9	24	218 78
14	25	224 79
28	26	222 50
8	27	247 00

The greatest average of men in any district in Illinois who worked 75 per cent or more of the time at their disposal, Dr. Honnold said, was 61.2 per cent. In two thick-seam districts of the Central and Southern fields of the State, where more than 50 per cent of the State's tonnage is produced, he said, only 28.3 per cent of the men put in three-fourths of the time offered them.

In the most productive district of the State, Dr. Honnold showed, 38.8 per cent of the men were idle for half the time, while in the poorest district 71.7 per cent labored less than half time, 36.2 per cent working less than one-fourth of the days open to them.

#### MORE INDUSTRIUS MINERS EARN \$3.74 A DAY

Dr. Honnold's figures showed that the more industrious miners easily averaged \$7.34 per day, while the men who worked but part of the time averaged from \$4.34 to \$6.62 per day. These figures were taken from the ten months of 1919 before the 14 per cent wage increase was given the miners.

#### CAR-LOADERS' TIME OFF AFFECTS COST

Failure of coal-car loaders to report for work and get the coal out of the mine added 10 per cent to the production cost of the coal, said Dr. Honnold. This was because the men paid by the day had to be carried on, even though the coal was not up on the ground where they could handle it.

Emphasizing the necessity of a penalty clause to make the miners keep their contracts, Mr. Maurer called the attention of the commission to the number of strikes which have occurred in Ohio in spite of the Washington agreement. A summary for the district of Eastern Ohio showed that 70 mines had been affected by 102 strikes, with a loss in days of 25 8 and in tonnage of 327,700.

"In Southern Ohio," continued Mr. Maurer, "the exhibit shows by reason of strikes a total loss in hours of 2,088, and in tonnage of 109,207, this being during 1919. They carried through their tonnage loss by the general strike in November and show the total loss in hours to be 70,905, and in tons of 2,687,153.

#### MINERS' HEALTH SHOWN BY RECORDS

Authoritative reports and statistics from insurance officials, physicians and other reliable sources clearing up misconceptions regarding health and hazards in the mining industry, were introduced by Tracy L. Guthrie, of Pittsburgh, for the operators. Attacking the miners' statements that the work was dangerous to health, he filed a synopsis of replies from 49 physicians to the tenor that claims of the prevalence of miners' diseases were greatly exaggerated.

Regarding assertions that children were forced to stay out of school on account of lack of food or suitable clothing, virtually all of the physicians reported that no cases of malnutrition come to their notice.

From the annual report of the Pennsylvania Insurance Commissioner, on the subject of the hazards and dangers of mine work, figures were presented showing that coal mining is only half as dangerous, as to accidents, as threshing machine or concrete work. In fact, according to the commissioner's reports, next to blast-furnace work and the making of rough building papers, mining ranked as the least dangerous of 53 occupations listed, being even one-third less hazardous than the collecting of garbage.

## Would Unionize Pocahontas Region

State-wide interest is manifested in the arrival at Bluefield, W. Va., in the heart of the Pocahontas region on Jan. 30 of John L. Lewis, acting president of the United Mine Workers of America, to take personal charge of the preliminary movement to organize not only the Pocahontas region but the vast territory in southern West Virginia including the smokeless and high-volatile regions which furnished the bulk of production during the November strike, this being the first real attempt to organize the miners in the southern end of the state, aside from the effort in the Guyan region.

#### PREPARE GROUND FOR COMPLETE LABOR TRUST

This sudden move on the part of the head of the United Mine Workers at a time when many mooted questions are pending before the Bituminous Coal Commission at Washington created a flurry not only in the Pocahontas region but in all the unorganized fields in southern West Virginia including the Winding Gulf, Tug River, Williamson and Guyan fields and it was generally regarded as the forerunner of another general strike, because, when the recent nationwide strike occurred it was the unorganized West Virginia fields that prevented the United Mine Workers from forcing a complete suspension of the coal mines of the country. It is therefore assumed that the mine workers are seeking to strengthen these weak points in preparation for another general strike.

A number of other labor leaders accompanied Lewis to Bluefield. It was reported that C. F. Keeney, president of District 17, was a member of the party, but Keeney, it was learned, was in Charleston during Lewis' sojourn in Bluefield. A number of conferences were held between Lewis and the labor leaders in Bluefield, and, it is said, the matter of obtaining quarters for representatives of the United Mine Workers' organization was under discussion. Lewis admitted that an effort would be made to organize the miners throughout southern West Virginia and that the campaign with that end in view would be waged with Bluefield as the center of operations.

#### INDISPOSED TO UNIONIZE INTERNATIONALLY

While admitting it was the purpose of the United Mine Workers to bring all miners in southern West Virginia into the fold of organized labor, he was rather loath to discuss details, but did claim that he had been in touch with representatives of his organization who had been making a survey of conditions in the Pocahontas field. He also claimed that he had visited several points on the Norfolk & Western Ry. and that he had found mine workers inclined to favor the formation of local unions. Much doubt is entertained as to whether the miners as a whole desire the advent of the organization, for the earnings of the non-union miners are larger than those of the miners in the union fields further to the north.

Furthermore, during the strike, many union miners migrated to the non-union fields of West Virginia and while some of those who deserted from the union may still desire to see it take in new territory it is believed that the men who came from the union to the non-union fields have created sentiment against, rather than for, the organization of the unorganized regions and that the recent strike instead of strengthening the chances of organizing the Norfolk & Western territory and adjoining areas has rather weakened such chances.

#### REMBRANDT PEALE AND WHITE COMMENDED

After commending Commissioners Rembrandt Peale and John P. White for their services as members of the United States Fuel Administration under Dr. Garfield, during the war, Mr. Lewis quoted both Mr. Peale and Mr. White as having recommended in 1918 that some increase be given the miners "as a patriotic matter." "If this recommendation had been followed," said he, "the country would have been spared the distressing conditions of the past few months." He also referred to Dr. Garfield's decision in 1918.

## What the 14 Per Cent Increase Means to the Operators

What the application of 14 per cent wage advance means to the operators was emphasized by Mr. Crews in his summing up. He adverted to the financial analysis of labor and other costs, income and tonnage produced by the coal industry during the first ten months of 1919, derived from mine reports compiled by Attorney Jean Paul Muller of Washington, D. C., as constituting the best evidence as to this. To obtain results representative of the Central Competitive bituminous territory, typical of the situation as a whole, Mr. Muller's analysis was centered on the reports of the Pittsburgh Coal Producers' Association, the Pittsburgh Vein Operators' Association of Ohio, the Southern Ohio Coal Exchange, the Indiana Coal Operators' Association, Coal Trade Bureau of Illinois, Illinois Coal Operators' Association, and the Central Illinois Coal Bureau for each of the ten months ending Oct. 31, 1919.

### PROFIT IN PITTSBURGH FIELD 4 PER CENT

"If we look upon the ten months ended Oct. 31, 1919, as the basis for the present," reported Mr. Muller, "we find that the Pittsburgh Coal Producers' Association reports 22,127,736 net tons of coal produced at a total labor cost of \$29,997,749.79, while the margin, or amount left over after all the standard costs of producing the coal at the mouth of the mine were deducted from the sum total realized from the sale of coal was \$5,784,852.64. At 6 per cent per annum on a capital charge for investment in property amounting to \$6.30 per ton produced, the compensation for capital investment required would be \$8,364,284.21, so that the margin on coal represented little over 4 per cent.

"Under the present labor scale involving an increase in labor costs of 14 per cent, on the same tonnage produced, this increase will absorb \$4,199,684.97 out of the margin of \$5,784,852.64, leaving the compensation for capital investment approximately 1 per cent.

"The Pittsburgh Vein Operators' Association of Ohio on a production of 5,353,494 tons shows a labor cost of \$6,900,605.30, with a margin of \$1,239,323.40. If the 14 per cent increase in labor cost amounting to \$966,084.74 is deducted therefrom, the compensation for capital invested is less than 1 per cent.

"The same is true of the Central Illinois Coal Bureau, while the following will not have any compensation for capital invested but actually will fall short of meeting expenses.

### OHIO, INDIANA AND ILLINOIS WILL LOSE MONEY

"The Southern Ohio Coal Exchange with a marginal loss of \$208,244.75, plus 14 per cent labor increase of \$615,008.17 would have a total loss of \$823,252.92;

"The Indiana Coal Operators' Association out of a margin of coal of \$357,256.04 will have to meet a 14 per cent increase in labor costs amounting to \$1,776,831.41, thus facing a deficit of more than \$1,400,000.

"The Coal Trade Bureau of Illinois out of a margin of \$161,276.71 must meet a 14 per cent increase in labor costs amounting to \$338,293.54, leaving it more than \$220,000 short of meeting its expenses, while the Illinois Coal Operators' Association, out of a margin of \$1,655,726.89, will have to meet a 14 per cent increase in labor costs of \$2,933,239.82, leaving it nearly \$1,300,000 short of meeting expenses."

In summing up the arguments during the morning session for the United Mine Workers, Acting-President Lewis expressed the opinion that the facts laid before the commission by the operators had not impaired the position of the miners. In spite of the original sources from which the payroll summaries were taken, Mr. Lewis maintained that the earnings of the miners were inadequate, saying that the best the pick miners could make a year was \$1600, whereas an estimated budget of the yearly income required to support a miner's family of five was \$2243.94.

Mr. Lewis quoted from a letter written to him by Secretary of Labor Wilson recapitulating the latter's view that the miners should be given a flat advance of 31.6 per cent

or 27½c. per ton, and \$1.58 per day for day laborers. He also attacked former Fuel Administrator Garfield's method of arriving at the 14 per cent advance.

## Penna Declares Miners Are Prosperous

Vigorous summing up by representatives of the miners and the operators on the points in controversy in the investigation by the President's Bituminous Coal Commission into the Central Competitive Field, embracing Ohio, Indiana, Illinois, and Western Pennsylvania, occupied the commission's proceedings on Feb. 3, the other bituminous-coal regions being heard later.

After Acting-President John L. Lewis and Secretary William Green of the United Mine Workers had argued once more for a 60 per cent wage advance, with the six-hour day and five-day week, representatives of the coal operators in reply insisted that the existing wage is adequate and that the miners' demands are unreasonable and unjustified.

Attacking the wage demands of the miners, Phil H. Penna, head of the Indiana operators exclaimed:

"Reduced to the last analysis the demands of the miners are: 'More money for less work'. Let us face the facts without camouflage". One outstanding difficulty the operators have to face in dealing with the miners' union representatives, he said, was the failure of the unions to keep their contracts with the operators. Both sides, he insisted, should be held responsible.

### CONTRACT BREAKERS AND SLACKERS

"Our contracts now are mere scraps of paper so far as observance by the miners goes". He went on to say that there were 114 mine strikes in Indiana in spite of 'strike-proof' contracts between the operators and the miners.

"The mine workers' representatives have become special pleaders for violation of contracts." "If it were in my power today to operate non-union mines instead of union mines, I would do so. The position of the non-union mine operator is not so good, but it is better than being in the clutches of the union. I say this in spite of the fact that I recognize the right of working people to unionize. This commission should make agreements enforceable, or make no contract at all".

Mr. Penna denounced what he characterized as the "slacker" among the miners, the man who, as he put it, declines to avail himself of the full opportunity afforded him to work. He declared that this type of miner, regardless of his own responsibility, was seeking to influence the entire mining industry. The slacker calls for shorter hours and more pay. The existing scale of wages, he said, was ample for the man who took full advantage of the working time.

Mr. Crews urged that inadequate car supply seriously embarrassed the coal industry today, and urged a better distribution for coal to the market. He attacked the data of average wages offered by the miners, saying that the miners had not used typical instances, but had endeavored to show by arbitrary figures that wages in general were low.

If the commission wished, he said, the operators would produce ample figures to show that the potential earnings of the miners could be increased 25 per cent, if they would work the time offered to them.

### MINE WORKERS ARE SAVING MONEY

To demonstrate the prosperous money conditions of communities made up largely of miners, Tracy L. Guthrie of Pittsburgh gave the commission reports from savings banks, and other financial institutions in twenty-eight mining towns, selected at random in western Pennsylvania, showing that savings deposits had increased \$12,000,000 in the last four years. The report embraced 46 banks in operation since 1914 and seven banks established since.

Demands of the operators touching basic points in the controversy were spread upon the commission's records during the day. Among these is a demand for the abolition of the check-off system, under which the operators, by an arrangement with the miners, collect dues for the Mine Workers' Union from the miners' pay. This "check-off" produces \$15,000,000 for the United Mine Workers.

## Where Miners Violated Injunction

So far as is known the only section of the country in which the mine workers' strike continued after Dec. 11 was that part of the New River field of West Virginia where the operators refused on Sept. 1 of last year to enter into a contract with the miners that would grant them the "closed-shop" and the "check-off." These operators represented about 20 per cent of the tonnage of the New River district. Their declination to become a party to the new contract caused the mine workers to declare a strike at the mines owned by those so refusing, although there were many miners who would have been glad to have continued at work. The strike remained in full force until about the middle of November, the miners still occupying the houses of the coal companies.

When, however, the New River contract of Sept. 1, none too popular anyway among the miners of District 29, became automatically abrogated owing to the miners of the district as a whole going on strike and the miners generally in the field returning to work without the check-off, even voting to return to work without it, a great many of the miners in the field where the new contract had never been in force also began returning to work. Of course in many instances miners who did return to their picks and shovels were non-union miners, but that was not wholly true.

The point is that the miners in the particular section affected were not ordered back to work by officials of District 29, the leaders in that district making the plea that the Indianapolis agreement did not apply to that part of their district where there had been a strike prior to Nov. 1. It will be recalled that the same plea was made by Alex Howat for the Kansas miners and that it was not until after Howat was threatened with a sojourn in jail that he ordered his miners back to work.

The New River situation was exactly similar yet so far as is known neither officials of District 29 nor the Government have taken any action to force a compliance with the Indianapolis agreement even though the continued strike in the face of the Indianapolis agreement and a Federal restraining order issued by Judge Keller culminated in an attack by strikers on miners while on their way to work at the mines of the Willis Branch Coal Co, on Tuesday, Jan. 20. Not satisfied with an attack on mine workers, strikers also entered and wrecked the electrical hoisting machinery of the company, causing damage amounting to thousands of dollars.

No precaution had been taken by the company to guard its property because officials of District 29, United Mine Workers, had assured mine owners that no violence would be tolerated or permitted. It is understood that the question of stopping the strike in the New River field has been referred to the President's Bituminous Coal Commission. Inasmuch as the commission is to pass on such matters it is also believed by the operators of the New River District as a whole that it is proper for the commission also to pass upon the restoration of the check-off now being demanded by the miners.

## Central Competitive Operators' Demands

The demands of the Scale Committee of the Central Competitive Field as presented before the Coal Commission are as follows:

No. 1.—The present system of collecting dues and initiation fees from the mine workers, and enforcing the payment thereof by deductions from their earnings through the offices of the operators imposes burdens upon the operators for which there is no economic justification, and is unjust to many employees of the operators. The operators therefore request that the practice be abolished.

No. 2.—As the house rent charged the mine workers and the price charged them for their domestic coal have been written into the contracts in some of the states, and the adjustment of those charges, from time to time, is the cause of much dissension, we request that the commission, in its findings, fix an equitable method of dealing with these matters.

No. 3. The operators request that the commission recommend to the Congress of the United States the enactment of legislation requiring associations of employees which make contracts of employment with employers to take such action as will make them legally responsible for the fulfillment of the contracts so entered into.

No. 4.—The operators request that the national officers of the United Mine Workers of America and the national organization, being parties to the making of the contract, be required to assume responsibility for enforcing the terms of such contract in the various districts, notwithstanding the present limitations in the Constitution of the United Mine Workers of America.

No. 5.—As a matter of safety to employees, and as there is now no system by which the actual working time of the mine workers can be determined, the operators request that the contract shall provide that time clocks or time devices may be installed at mines, and that the miners and inside day-men be required to register when they enter or leave the mines, and that the outside day force be required to register when they arrive at or leave the mine. All men refusing to comply with such requirements to be subject to discharge.

No. 6.—The operators request that the commission, in its award, provide for the introduction of devices or machinery which may serve to reduce the cost of coal, and consequently the cost to the public, and for which there is no scale of wages in the then-existing contract.

## Farrington's Wage Figures Untrue

When Frank Farrington, president of the Illinois United Mine Workers, told President Wilson's Coal Commission that the miners in Illinois are now getting only \$3.72 a day, he could not have been thinking of those who work around Edwardsville and Collinsville. At these places the men are receiving from \$8 to \$12 a day and it is understood that these figures represent the miners' earnings throughout the Illinois field adjacent to St. Louis.

The Consolidated Coal Co. paid at its mine No. 17 at Collinsville, a few days ago, \$36,231.50, an average of \$103 a man for two weeks' work. The pay at the Donk Bros. Coal and Coke Co.'s mine at Edwardsville about the same.

The men might be making more, but officials of operating companies declare that they are holding down production. At the Consolidated mine it was stated that if the loaders had loaded as many cars a day as they did in the latter part of October, there would have been an increase of approximately 20 per cent in their earnings. It is understood that the word has been passed to the men to hold down the production until after the Coal Commission acts.

Miners in the Illinois field are threatening to change their occupation unless higher wages and shorter hours are granted. Propaganda to that effect is being circulated.

## British Miners Want Cheaper Coal

Premier Lloyd George of Great Britain recently met a committee of mine workers who demanded that the Government immediately reduce the price of industrial and export coal, limit coal operators' profits not only in the future but retroactively and reduce the price of food and clothing, threatening that if these demands were not complied with they would demand an all-round increase of five shillings daily. That amount was before the war about \$1.22, but now it is only 87½c.

## Foreign Born Miners

Figures compiled for the use of Congress in connection with the discussion of Americanization legislation showed that of the total number of employees engaged in the mining of bituminous coal, 61.9 per cent were of foreign birth; 9.5 per cent were of native birth, but of foreign father; and 28.5 per cent were native born persons, having native born fathers.

# NEWS FROM THE CAPITOL

BY PAUL WOOLTON

## Anthracite Cost and Prices

DETAILED costs of anthracite coal and a statement concerning margins, including profits, are contained in a pamphlet just made public by the Federal Trade Commission, referred to in last week's issue, entitled "Coal No. 2—Pennsylvania Anthracite." The figures cover costs for 1917 and 1918 and show an increase in costs from January, 1917, to December, 1918, of \$2.02 (approximately 80 per cent) or from \$2.64 to \$2.47. Margins range from 54c. per ton in the first quarter of 1917, and 72c. in the second quarter of the same year, to 35c. in the third quarter of 1918, and 39c. per ton in the last quarter in 1918. It is quoted in part as follows:

"From 99 to 95 per cent of the total tonnage of the commercial production comes directly from the mines, and of the remaining 5 to 10 per cent the greater part is reclaimed from culm banks which were formed in years past through the dumping of coal which was then unmerchantable, but which has since acquired sufficient market value to be worth reclaiming. The product obtained directly from the mines is usually known as 'fresh mined,' that from culm banks is known as 'culm-bank washery,' or simply 'washery.'

### AVERAGE COSTS SHOWN

"The average costs and sales realizations per gross ton are shown below for five specified periods during 1917-1918, for operators who produced about 99 per cent of the total anthracite output in those years.

#### COSTS PER GROSS TON

Period	Labor	Supplies	General Expense	Total F. o. b. Mine Cost	Sales Realization Per Gross Ton	Margin (Sales Realization over total F. o. b. Mine Cost)
<b>Fresh-mined product of 65 operators:</b>						
January-April, 1917	\$1 79	\$0 41	\$0 46	\$2 66	\$3 29	\$0 63
May-August, 1917	1 96	44	46	2 86	3 65	79
September-November, 1917	2 03	53	49	3 05	3 82	77
December, 1917-October, 1918	2 57	61	53	3 71	4 18	47
November-December, 1918	3 41	81	62	4 84	5 20	36
<b>Culm-Bank Washery Product of 23 Operators</b>						
January-April, 1917	35	16	34	85	1 81	96
May-August, 1917	43	22	30	95	2 26	1 31
September-November, 1917	44	24	35	1 03	2 50	1 47
December, 1917-October, 1918	65	29	33	1 27	2 91	1 64
November-December, 1918	93	39	35	1 67	3 32	1 65
<b>Combined Fresh-Mined and Culm-Bank Washery Product of 84 Operators</b>						
January-April, 1917	1 71	40	48	2 59	3 23	64
May-August, 1917	1 83	44	47	2 74	3 57	83
September-November, 1917	1 90	53	51	2 94	3 76	82
December, 1917-October, 1918	2 38	61	53	3 52	4 10	58
November-December, 1918	3 10	77	62	4 49	5 03	54

"About 99 per cent of the total production of the larger sizes of coal (the 'prepared sizes,' which enter principally into domestic use) is obtained from the fresh-mined coal. About 75 per cent of fresh-mined coal consists of prepared or domestic sizes and about 25 per cent of small or 'steam' sizes, which are used

in industries. Most of the coal recovered from culm banks consists of these steam sizes.

"In this report are shown the total f.o.b. mine cost, the sales realization received by the operators, and the margin between it, and the total f.o.b. mine cost. From this margin would have to be paid any sales expense, interest and Federal taxes, the remainder being available for surplus and dividends.

### COST OF FRESH-MINED PRODUCT INCREASED

"Comparing the first period with the last period in the above table, it will be seen that the total f.o.b. mine cost of the fresh-mined product increased 82 per cent (from \$2.66 to \$4.84 per gross ton), the sales realization increased 58 per cent (from \$3.29 to \$5.20 per gross ton), while the margin decreased 43 per cent (from 63 to 36c. per gross ton).

"Average costs and sales realizations for operators producing about 42,000,000 gross tons annually (of which about 39,000,000 tons was fresh-mined product, and 3,000,000 tons was culm-bank washery product) are shown below for the fresh-mined product for 19 significant periods between Jan. 1, 1913, and Dec. 31, 1918.

#### COST PER GROSS TON

	Labor	Supplies	General Expense	Total f.o.b. mine cost	Sales realization per gross ton	Margin (Sales realization over total f.o.b. mine cost)
January-March, 1913	\$1 58	\$0 43	\$0 33	\$2 25	\$2 69	\$0 44
April-August, 1913	1 60	0 35	0 34	2 29	2 60	0 31
September-December, 1913	1 60	0 36	0 36	2 32	2 71	0 39
January-March, 1914	1 71	0 38	0 39	2 48	2 70	0 22
April-August, 1914	1 57	0 30	0 36	2 23	2 60	0 37
September-December, 1914	1 56	0 31	0 36	2 23	2 73	0 50

May-August, 1917	1 91	0 48	0 46	2 85	3 57	0 72
September-November, 1917	1 97	0 58	0 49	3 04	3 74	0 70
December, 1917—						
March, 1918	2 58	0 62	0 53	3 73	4 12	0 39
April-August, 1918	2 45	0 65	0 50	3 60	3 99	0 39
September-October, 1918	2 55	0 72	0 55	3 82	4 17	0 35
November-December, 1918	3 31	0 80	0 61	4 72	5 11	0 39

Note: The bill of material above is for a washhouse 3 ft. narrower than the one given in the detailed drawing and for 6 rows of benches instead of 8; otherwise everything else is the same.

## \$50,000 Appropriated for Coal Commission

Without question the House Committee voted the \$50,000 appropriation asked by the Bituminous Coal Commission for its expenses. The appropriation is to cover the salaries of the Commissioners, secretaries, chief clerk and other expert, clerical and other assistance; equipment and supplies, including law books, books of reference, newspapers and periodicals; traveling expenses, per diem allowances in lieu of subsistence, and for printing and binding done at the Government Printing Office.

As some time must elapse before the appropriation can be approved by the Senate and the President.

## Our Growing Soft-Coal Shortage

**D**URING the twelve months of the year past we used 458,000,000 tons of soft-coal, or roughly 9,000,000 tons a week. This winter, business has picked up so prosperously that, with all the soldiers returned, there must be almost as great an industrial activity as during the war. The scarcity of labor certainly seems to prove it. While labor may not produce as much as before, it assuredly needs, for as many hours as working lasts, about as much power and as much heat or even more than it did when labor was more energetic.

Consequently, increasing man power compensating for decreasing working hours, the average consumption of fuel, the year through, is probably no less than it was during 1918, the closing year of the war, when it averaged about 11,100,000 tons a week. In making that estimate no deduction in the figure for consumption is made for the large stocks left at the end of the year 1918, because the reasons for these stocks were exceptional conditions—the mild winter and the failure of business following the armistice.

It must be remembered that there were reasons why in 1919 the tonnage produced was small. The year commenced with heavy stocks, business was bad, and it ended with no stocks and everyone conserving fuel because of the strike and coal shortage. The past year was certainly abnormal. So looking at the subject broadly it may be safely assumed that our normal needs the year over at the present stage of prosperity are about 11,000,000, rather than 9,000,000 tons weekly.

Just now, we are faced with cold weather and bad working conditions. As a result the amount of coal needed is at its full winter height. Perhaps, if a guess may be hazarded, 14,000,000 tons a week is not too large a figure to put on our present consumption.

As a rule there are big stocks that are gradually eaten into during the winter. During the strike that marked the close of 1919 these stocks were considerably depleted. They were abnormally small, in any event. Consequently it is not surprising that we are faced by a bigger shortage than existed after the strike was concluded. Our output, owing to car shortage, averaged only 11,334,000 tons in the first three weeks of the year and totaled 8,531,000 tons in Christmas week.

The public breathed a sigh of contentment when the strike ended. Naturally, the consumer thought his difficulties were at an end, but the coal shortage was not cured by the cessation of labor trouble; it was only retarded from continuing to go from bad to worse as fast as it did while the strike lasted. The condition was none too good before the strike; it was disheartening at the end. Yet, with agitation in the New River and Pocahontas fields, the production of coal may soon decline and conditions get rapidly worse.

The public is comparing the output of this winter with that of other winters. But is that safe? We have produced more than in the winter of 1918-1919 because there was, at that time, a glut of coal, the market being overstocked and the winter being mild. We have sent more coal to market than in the winter of 1917-1918 because, then, a big storm prevented the railroads from functioning, because the nation had borrowed many expert and energetic workers from the railroads, and industry had taken from them all the roustabouts and maintenance-of-way men and because equipment ordered for America had been diverted to France, and a licentious red tagging of cars had demoralized traffic and filled every railroad siding.

But not with such times should we be content to make comparisons, for the winter of 1917-1918 was a time of heatless, workless days, imposed by authority and the winter of 1918-1919 a time of joblessness when the nation waited for the word that it was safe to buy goods. We do not wish such conditions to be resumed. Now a severe storm has made matters worse, and the prospects grow less hopeful hour by hour.

Our troubles did, indeed, begin with the strike, but, assuredly, cannot be said to end with the return to work. The evil has been done and only saving and diligence can cure it.

### From the Hills of Prosperity to the Valley of Nothing Doing

In 1901 nearly 6,000 miles of railroad were constructed while in 1919 construction dropped off to 686 miles, and 689 miles were abandoned

## What Can Bankrupt Railroads Buy?

**E**VEN THE railroads are not certain as to the outcome of the immediate future. Coal men are wondering whether in the coming spring the railroads will be any more free of unfair practices and delayed purchases if the Government is going to make it impossible for the railroads to undertake financial reestablishment. They naturally wonder whether a commission judging the affairs of corporations will be able to use good judgment, when the U. S. Railroad Administration, making its own rates, did not have political courage enough to make railroad operation profitable. If the commission keeps rates down till it sees how much they must needs be raised, and that is what the outgoing Railroad Administration has done, then the coal year will begin with bankrupted railroads and a penury so great that coal cannot be purchased.

## Get a Declaration of Principles

WHEN A MAN declares for the regulation of the public utilities and requires that they be kept down to a profit of 5 per cent or thereabouts, get from him a declaration of principles. Request him to say that he believes that all industry should be kept down to that maximum or that he believes that only those whose services are universally helpful should be restricted to such a profit.

Ask him why sewers and roads, things so useful that they are being built by municipal corporations, are being paid for by bonds that are paying that amount of interest, 5 per cent, a rate necessary to obtain the money. And such bonds have the tax-free privilege added. Ask him also if an industry with an element of risk can borrow money, or, if it can, should borrow it, at the same rate of interest or a trifle more than is paid by a municipal enterprise in which there can be no risk so long as the community is solvent. Get from him a declaration of principles.

Most men, having declared exactly what they think they believe, are astounded at the wrong thinking into which they have been led, not by logic but by self-interest. The baiters of corporations are people who do not think. They are temperamental people who feel without thinking. They well know, when the facts are brought to their attention, that they have been surprised not in thinking but in an envious and ungenerous feeling. They would not run any such risks for a small interest which only in fifteen or twenty years would double their money, and they think that there are others who should take that risk. Most of such persons, when they, themselves, invest want to be assured that they will double their money in a year. Of course, only rarely do they achieve their ambition.

They think they believe that the man who devotes his time or his money in a public service should consent to do it for far less than the man who does the same in a trade that does no one any good but rather tends to debauch the public. A little thought would protect them against such odd notions, but how rare is such thought!

## Weighed on Its Own Scales

IT MUST be confessed that we are still sitting in judgment over Government ownership and trying it by the standard it set for itself. It promised us a new United States, and we have not seen it. Instead we see that Government ownership has at least left us in the same stranded situation that we would have

been in if the railroads had been suffered to continue private management under the old system of excessive and unsympathetic public control.

The advocates now say that we should try two years more of Government ownership. It is asserted that the Government may be able, if its powers are extended, to go on operating without any further aggravation of our present misfortunes. We have endured Federal mismanagement for several months; with a little courage and self-negation we might endure it for a further period of time of at least equal duration.

The tune has indeed changed. It is now more nearly in harmony with the facts. We now know that Federal ownership is no better than Federal supervision.

## Federal Trade Commission

"THE TRUTH, the whole truth, and nothing but the truth" would be a good maxim for the Federal Trade Commission. It stops short of the whole truth when in making its statements regarding the cost of producing coal it overlooks

hazards, interest on investment, all kinds of taxes and other like charges. "It would be a fair day if it were not for the rain" must be a reflection of many an anthracite operator who sees in the report of the commission a differential between production and selling cost which he was somehow never privileged to put into his pocket. Seeing, however, that there is a differential between total income and outgo, the public and miner feel that here is something for which they may profitably fight. The chunk of "meat" is mostly bone, but those battling for it do not know that. It looks a goodly morsel, but when the gristle of investment

and the ivory of income and excess profits taxation is considered, it is nothing but a dry, unappetizing bone.

Dr. Garfield admitted that he guessed wrong and put prices too low and declared that if the war had continued he would have had to have made an adjustment.

To quote the report: "The costs shown by the Federal Trade Commission are not intended to include any of the following items: Reserves for uninsurable hazards, such as mine fires, floods, cave-ins, squeezes, strikes or similar causes contributory to destruction of property and idleness at the mines (especially as revealed in greater overhead per ton by reason of lessened output); increased risk in the recovery of the capital involved in extra cost of development work under a normal régime in prices of coal; selling expense, where a selling organization other than the mine office force, is maintained in order to market the product; interest on the investment including borrowed capital; allowances for income and excess profits taxes."

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Electric Mine Haulage

*Letter No. 6*—Kindly permit me to express my opinion in regard to the question raised by Charles F. Sherman, *Coal Age*, Nov. 27, p. 861, in reference to the tendency of a mine locomotive to lift at the front end when pulling a load.

This is a common occurrence with all electric locomotives of the four-wheel, two-armature type. Mr. Sherman is correct in believing that the load hauled acts with a leverage to lift the front end of the machine, the rear axle being the fulcrum. This has the effect to relieve the front wheels of some of the weight resting on them and causes them to spin, although the wheels may not be lifted clear of the rails.

Now, my idea is when a locomotive is hauling a trip of cars on a level track there is what I would call a line of pull extending from the rear car to the front of the locomotive. When the motor is pulling its maximum load this line of pull is a straight line that resists bending. Consequently when the front wheels of the motor approach a low joint in the track the straight-line pull tends to hold up the front end of the machine. In hauling a lighter load the drag or drawbar pull is less and there is not the same lifting tendency.

The best that can be done to avoid the trouble is to have the locomotive drawbar at the same height as the drawbar of the cars. To lower the drawbar of the locomotive as Mr. Sherman suggests would have the effect of reducing the tractive effort of the rear wheels and increasing that of the front wheels, without any gain. Assuming that the locomotive is properly handled by an experienced motorman and that the load does not exceed the maximum haul, I would say the best remedy is to surface the track so there will be no low joints and all four wheels of the locomotive will bear equally on the track.

GEORGE COLE.

Donora, Pa.

### Authority of Shotfirers

*Letter No. 2*—Referring to the inquiry of "Shotfirer," Nortonville, Ky., *Coal Age*, Jan. 1, p. 26, relative to the authority of shotfirers, allow me to express the opinion that it is the height of folly for any mine committee or miner to arbitrarily question or condemn the practice of the shotfirer, whose action based on his judgment and experience concerns not only his own life, but the lives of all the employees in that mine. The shotfirer is held responsible by the state and by the company who employ him for the safety of the men working the mine. It is his responsibility alone, and any damage or disaster resulting from the unwarranted interference of the mine committee would mean but little to the committee.

The laws of many states protect the shotfirer in his extremely hazardous work, and give the competent man supreme authority to exercise his own judgment in the performance of his duties, in the belief that the minimum of risk is thereby taken by all the employees of the mine. The state has defined the qualifications of the shotfirer and, without question, his competency as well as his duties should be judged by a higher court than that of the mine committee.

#### FOOLISH OPPOSITION TO AUTHORITY

A miner would be very officious to attempt to supersede the authority of a shotfirer, fireboss or any other mine official, or to disregard the injunctions of the Bureau of Mines, which may cause some little inconvenience to the miners because of certain enforced practices that insure the greatest amount of protection to the health and lives of the workmen. No committee or miner can afford to be pig-headed or arbitrary with a shotfirer or other mine or state official, because it would only expose the objector to ridicule and lessen his chances of securing a hearing for his alleged grievances.

Placing one's self in contempt of the law does not make the authorities more kindly disposed toward a person, and no self-respecting and progressive shotfirer, who is fair enough to listen to reason, will be moved or bullied by the threats and demands of the miners bent on following the practice offering the least exertion, regardless of safety.

#### CAUSES OF FAILURES IN SHOOTING

Assuming that black powder is in use, if a good grade of stiff paper is employed a sufficiently long cartridge can be made up, and it will be rarely necessary to make two sticks or more. It is bad practice to use newspaper or other soft paper, in making up even a short cartridge, as the powder will easily cause the stick to bulge or break, in ramming the charge back to the end of the hole, and scatter the powder along the length of the hole. The charge is also liable to stick in the hole, making it both dangerous to tamp and to fire, besides lowering the force and efficiency of the shot.

In my own personal experience in shooting with black or permissible powders and using two or more sticks, I have rarely failed to have them all explode at the same time. When that was not the case, I attributed the failure to lack of care in preparing the sticks or inserting them, or tamping the hole. If the hole is thoroughly cleaned and the sticks all tamped back to the end of the hole, the chief source of failure is eliminated.

In the use of permissible powders, many failures are due to leaving the powder inside the mine till it has absorbed much moisture, or to the detonators being likewise affected. Few failures of the sticks not all

going off at the same time have ever occurred in my experience, unless an extremely poor grade of permissible explosive was used. It is sometimes possible that one will get a poor quality of powder from even the best of the powder manufacturers, and this may be a fifty-pound box that has, perhaps, been damaged by moisture, in shipment or in storage.

In the case of the mine committee's contention, cited by the correspondent writing from Nortonville, it is probable that everybody else concerned would be willing to have the State Department of Mines decide the issue. If the Department of Mines decides that it is a safe practice to tamp holes with loose powder or open cartridges, this should be considered the last word. However, it is very unlikely that the State will sanction a recommendation that places in jeopardy the lives of its miners, and especially the lives of the shotfirers, in order to gratify a whim containing no more merit than an occasional shot failure, perhaps due to another cause having no connection with the point in dispute.

Thomas, W. Va.

MINE WORKER.

## Unaccountable Explosion

*Letter No. 1*—No doubt many readers will be deeply interested in the account given by "Superintendent," describing an explosion that occurred under mysterious circumstances, in a mine at Buffalo, Ohio. It is stated that the mine was working the Upper Freeport seam of coal, in the Cambridge district; and the explosion occurred in a room where the pillar was being drawn by machine. A short time before the explosion occurred, the place had been examined and reported as "free from gas," by the fireboss.

Without going into the technicalities of the question, it can be said that similar trouble has been experienced by many mining men working under like conditions. The incident related serves a double purpose, however, since it emphasizes the danger that arises when undercutting coal with machines, besides suggesting the fact, often overlooked, that gas will frequently be produced in large volume through the cutting of a clay vein.

The fact is well known that coal-cutting machines make large quantities of fine dust, which renders the work of mining with machines more dangerous than pick mining, unless due precautions are taken to clean up the places and load out the fine cuttings as they are made. It is evident to any practical man that the condition surrounding the drawing of pillars with machines are such as to invite just such an explosion as this, described by "Superintendent."

For the sake of illustration, let me assume a mine having a pillar section where the coal has been worked all around, by rooms and headings. We will suppose that some gas is given off from the floor of the seam, but the circulation when driving the rooms was such that open lights have been used without danger. When the work of drawing back the pillars in this section is commenced, machines being used for the purpose, there will naturally be large quantities of fine dust produced and much of this dust will be found floating in the mine air.

Under conditions such as these it is quite possible that the air charged with gas and dust would be ignited on the open lights of the machinemen and, once ignited, the presence of the dust will certainly cause a violent explosion and produce the effect mentioned in this

inquiry. The danger, in that case, would be all the greater if the machine should chance to cut a vein or fissure that gives off a fresh quantity of gas.

It is common, in mining practice, to find mines that have always been and are still considered as "free from gas," because they do not generate gas in sufficient quantity to be detected by a safety lamp. In many of these mines, it is possible to ignite the gas, however, by bringing a naked light close to a fissure coming from the bottom coal or from the floor of the seam.

Nevertheless, the gas rising diffuses rapidly into the air and gives little or no trouble in the working of the seam, provided the circulation is sufficient to dilute and carry away the gas generated. Mines such as these make the judgment of practical mining men often of more value than the results of the chemist in his laboratory. They are conditions that must be viewed from a practical standpoint.

In my experience, I have frequently been in places where it was possible to pass along the rib of a room and ignite small jets of gas coming from the seams in the coal, and yet no standing gas could be found at the face of such rooms, owing to the rapid diffusion of the gas into the air current, which made the use of open lights quite safe in those places. I have no fear but that many of my fellow mine officials will bear me out, by recalling similar experiences of their own. It will be interesting to learn of these conditions, which throw light on many unaccountable occurrences.

Where gas is generated in the floor of a seam, the use of electric coal cutters should be discouraged, as affording a dangerous element that is liable to cause the ignition of the gas before it has had an opportunity to diffuse into the air. The presence of the fine dust produced by the machines makes this danger all the greater.

It is also worthy of consideration that a sudden in-burst of gas may have occurred due to a recent gob fall releasing some pent up gas in the abandoned area, with the result that it was ignited when the machinemen entered the place holding their lights down near the floor. There would seem to be no proof, in the account given, that this place was not filled with gas; and it may be wrong to assume that the gas ignited was accumulated at the floor of the workings.

## Effect of Wire Gauze on Flame

*Letter No. 1*.—The effect of the wire gauze, which is one of the essential parts in a mine safety lamp and furnishes the needed protection when the lamp is surrounded by an inflammable or explosive mixture of gas and air, is a question that always creates much interest in the minds of young men studying the science of mining.

In the anthracite mine foremen's examination, *Coal Age*, Dec. 11, p. 902, the following question is asked:

Are there any conditions under which the flame will pass through the gauze of a safety lamp?

In many of these examinations for mine foremen and firebosses, the question is asked:

What prevents the passage of flame from within the lamp to the outer gaseous atmosphere?"

It is usually explained that the cooling effect of the wire gauze lowers the temperature of the gas burning within the gauze chimney and extinguishes its flame, as the gas passes out through the mesh. As stated

in the answer given in *Coal Age*, however, "flame will pass through the gauze when the wire has become heated."

It must be remembered that there is an appreciable amount of space between the cool wire of the gauze and the flaming gas. This is due to the absorption of the heat from the film of gas-charged air in immediate proximity to the gauze, owing to the lower temperature of the wire. It is this absorption of heat by the wire that cools the gas close to it so that its temperature is too low for burning.

After many experiences, Sir Humphry Davy found that a wire-gauze mesh, consisting of 28 wires crossed by 28 wires and making 784 holes or apertures to the square inch, was best suited for the purpose of a safety lamp. The fact that, today, 100 years later, the same mesh is the approved standard in safety-lamp construction, in this country and in England, shows how well and carefully he performed his work.

The size of the wire forming the mesh recommended by Davy is No. 28 B.w.g., which has a diameter of 0.014 in. A little calculation shows that this standard mesh provides an area of opening of 21.6 per cent, and 78.4 per cent of the mesh is solid metal. The air required to support the combustion of the flame of the lamp must enter through these small openings in the mesh of the gauze.

In the accompanying figure, I have attempted to show one of the effects of the entering air on the air within the chimney of the lamp. This air is not only charged with the products of combustion of the lamp flame; but it contains, besides, whatever gas is in the air surrounding the lamp and fed into the combustion chamber. As indicated in the figure, each little streamlet of entering air pierces the inside atmosphere like an arrow.

The practical effect of these entering darts of air is to pierce and cool the heated atmosphere of gas within the gauze and which may be flaming or ready to burst into flame. Thus, in immediate proximity to the gauze, the inner atmosphere presents a saw-tooth surface, which is the effect of the entering jets of air. The general effect is to increase the cooling power of the gauze and lower the temperature of the atmosphere in contact with it.

As the action and reaction progresses, there will be little bursts of flame that die out almost as quickly as they form, unless the lamp is exposed for too long a time to the gas-charged air surrounding it. In that case the effectiveness of the gauze and the entering air jets to prevent the passage of flame through the mesh is greatly reduced, until a temperature is finally reached at which they offer no resistance at all.

The cooling effect of metal on flame is clearly illustrated in the use that many firebosses make of the lamp pricker when making a test for gas. After lowering the flame as far as possible without extinguishing it, there

is still a small bright yellow spot at its base, the light from which interferes with the ready observation of the flame cap.

In order to eliminate this bright spot, the fireboss pulls down the pricker of his lamp into the flame, until it rests on the wick or nearly so. The effect of doing this is to cool the temperature of the flame, so that the bright spot disappears and in its place is a non-luminous and hotter flame for testing. I should state that the temperature of ignition for methane is 1212 deg. F., and ignition of this gas only takes place when this temperature is reached and maintained for an appreciable period of time. The ignition of the gas is not instantaneous.

Carnegie Institute of Technology.

Pittsburgh, Pa.

## Co-operation Among Mine Officials

*Letter No. 4.*—I have read with much interest the letter of James Touhey, which appeared in *Coal Age*, Dec. 11, p. 900, regarding the need of co-operation among mine officials. Co-operation among the officials themselves and co-operation between the officials and their men are urgent factors where the best results are to be obtained.

Close practical interest is demanded of every unit where smooth running of the organization is desired. While this is needed today more than ever before, it has always been a recognized fact in the past that earnest co-operation is most fruitful of results. On the other hand, the marked absence of co-operation in an organization is harmful and disruptive, as it breeds distrust, fear, suspicion and contempt of one party or faction for the other.

Harmony, understanding and even sympathy sometimes mean more than anything else in the building up of an organization so efficient that it is practically immune to attack from radicalism and labor unrest. We can nearly always trace the absence of co-operation to the absence of a mutual understanding, or an unwillingness or aloofness and, later, open hostility, which is shared alike between the employer and employee.

### CO-OPERATION NO BAR TO MINE DISCIPLINE

It is not necessary to confuse co-operation, with a leniency that breeds disorder in an intelligent system of discipline, through a laxity of authority that eventually defeats its own purpose. Intelligent discipline is always impossible without co-operation. For the enforcement of discipline, there must always be respect for authority and officials must create that respect if they are to retain their authority.

Beginning with one of the boon principles of co-operation a mine official should be able to readily mingle and mix with his employees, in order that he may at once disarm them of any suspicion or distrust. This is not possible when an official holds himself aloof from his men.

Some officials feel themselves so far superior to their employees that they consider it highly discreditable to their station to be even in close enough touch with them to properly perform the duties of their office. It would be well for such to remember that a certain familiarity does not breed contempt; but builds the foundation for a good strong organization and creates a uniform respect for discipline and authority.

It is a good habit, and one that is easily acquired, to speak to everybody, and to encourage and help those who are doing good work. Poor workers, not inherently so, have often become good or fair workers under proper handling. Nevertheless, if a man is a part of the human driftwood and will not or cannot work, he can be released without a verbal explosion, which only makes him worse and more vindictive than ever and his next employer finds him of little use and again he goes away with the feeling that he would like to tear everyone to pieces.

#### RIDDING THE MINE OF INDIFFERENT WORKERS WITHOUT INCURRING THEIR ILLWILL

There is a way of discharging a man and still retaining his good will. Some officials have the faculty of discharging an unsatisfactory employee and making him feel that he is doing him a great favor. I have worked in mines where the miners were lax and careless in setting timbers and there was little discipline. Explosives were scattered around loose; the rooms were driven wide and off the points; and other flagrant violations of the law were observable.

I have listened to mine foremen fume, fuss and threaten their men in a manner that it seemed sure the men would lose their jobs and be sent to jail the next minute; but, in each such case, I have failed to notice that it brought about any improvement in conditions. On the other hand I have gone into mines where the foremen manifested good fellowship and mixed with and encouraged their men. In these mines, it was noticeable that but few if any violations of law and bad conditions were found.

It is a wise foreman that will say, "Mike, here, will never get his head cracked. His place will be timbered right to the minute when he gets this one set," at the same time indicating with a piece of chalk where a prop should have been set. In response, Mike would explain the reason for his neglect and proceed to set the post at once. A good foreman will always find a pleasing and conciliating way of calling men's attention to a breach of discipline. Such a foreman's organization is the acme of co-operation and efficiency, and represents the achievement of the highest possible results.

Thomas, W. Va.

EFFICIENT.

## Finding a Mine Door Set Open

*Letter No. 20*—I have followed this discussion closely and have wondered at the many different opinions in regard to an open trapdoor. After something like 30 years' experience in mining, I am led to condemn in the severest terms the general use of doors in mines.

It has often been a wonder to me how a mine door came to be called a "trap." There is no doubt in my mind, however, but that the name originated from the fact that all such doors are real "traps" and are certain to cause injury or death to someone, sooner or later. I only wish I could give statistics that would show a true record of the injuries and death of men, boys and animals, and the number of explosions caused by these doors. It is claimed that we have reached the progressive age in mining, and yet this discussion shows that the majority of mining men have little inclination to do away with this source of danger in mines.

Let me say, briefly, in reference to the points in question, that the only safe way for a fireboss to proceed, on

finding a mine door set open when starting his examination, is to return at once to the surface and, taking with him a competent man and breathing apparatus for their protection, proceed to examine the section for the purpose of ascertaining if there is any fire burning therein. Then, return and close the door if everything is found to be safe. I would suggest that the fireboss write the word "danger" on the door and ask the foreman to have the door taken out and an overcast built or the circulation arranged so as to avoid the need of a door.

Regarding the other points in question, allow me to remark that a fireboss should never start to examine his section at the return end. There should be no need of giving a reason for this statement when one recalls the deadly effect of carbon monoxide or even black-damp that may be present in the return air. Consider, for a moment, the danger that would arise if there was methane present in the air.

Even assuming that the fireboss carried only his safety lamp, he runs a risk of having it extinguished in the gas, or, possibly, igniting the gas when proceeding against the current. With his lamp extinguished, there is little chance for escape to fresh air. It would seem that what we need is a wider spread of the practical training of mining men along these lines, which are so essential to safety, and this training should be conducted in every mining district in the country.

#### PRACTICE CONDEMNED ANGERS FOREMAN

Not long ago, when working for the Inland Collieries Co., at Harmarville, Pa., I condemned much of the system employed in the mine, in respect to trapdoors, timbering and the handling of locomotives in haulage. For this, the mine foreman called me a "meddler" and used his influence to get me out of the mine. But, the superintendent realized that there was much truth in what I said. He knew that, some time before, I had left a mine after informing the mine boss that there was every probability that the place would blow up, which happened within a week after my leaving. Fortunately, it occurred on a Sunday when few men were in the mine and these we were able to rescue.

From my own knowledge, the past year has recorded many casualties as the result of trapdoors, poor timbering, improper systems of haulage and other details of mining. It is my belief that these accidents could be largely avoided by the proper education and training of all men in charge of underground work. Too often it happens that a long established custom results in disaster, because no one has dared to say that it was unsafe. For example, the hauling of powder in a mine car attached to a mantrip, as was the case in the accident at Wilkes-Barre, not long ago.

In closing, let me urge that the trapdoor will only cease to be a source of danger in mining when it is kept out of the mine. There is no economy in its use; on the other hand, it is a source of expense. The only way to get rid of a bad habit is to quit it, and my answer to this discussion is, to do away with the use of a trapdoor.

C. W. ATKINS.

## INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

### Shifting the Worker

An incident occurred not long ago, in connection with my work, and I would like to have the views of others in regard to the treatment I received at that time, at the hands of the mine superintendent. In this narration, I will endeavor to be as brief as possible and yet give the facts necessary to enable a just opinion. They are as follows:

An experience of 12 years, working at various jobs in and around coal mines, had enabled me to do almost anything required in the mine. At the time to which I refer, I was operating a substation and received a small salary, which was less than I could make at other work. For this reason, I wanted a change that would take me into the mines. As a motorman or a shotfirer I could make more money. For five years, I had filled the position of motorboss in another mine, but had been only a short time in my present position at the substation.

Knowing of my desire for other work, the mine electrician dropped into the station one morning and told me he had a job for me that would give me better pay. The work was bonding track with an arc welder. It was then Sunday morning and he told me he would like me to report for work Tuesday morning. I replied, "All right, I will see the boss tomorrow and get a transfer if he will give it to me."

The following morning, Monday, I got the nightman to stay in my place while I went to the superintendent's office. Finding the superintendent at his desk, I stated the case to him, explaining my desire for other work and better pay and asked him for a transfer. I explained that I had a large family and could not support them on the small salary of \$110 a month. The job that had been offered me by the mine electrician paid 69c. an hour, which would mean an increase of at least \$30 a month in my pay.

The superintendent began to curse and swear. He said, "I will not do any such d—— thing," and asked, "What will you do if I do not transfer you? It is against the rules of the company for a man to leave one department, for work in another." To this I replied, "I can get better work and more money by going to another company." The result was that the superintendent gave orders to the mine electrician that he was not to employ me on his work, and I quit the company and secured a position as shotfirer at another mine, although it put me to the expense of moving.

My own thought regarding this incident is about as follows: As superintendent of a mine and having one of the men apply to me for a transfer, under similar conditions, I would have answered him, "Well, I haven't got anyone to fill your place; but you stay on a day or two, until I can get a man, and I will see the electrician and have him hold the job for you, as I am glad that you can earn more money in another place." It will

be interesting to learn the views of others, some of whom may have had like experiences with mine.

Fleming, Ky.

A. H.

This is a fair question that will without doubt find an echo in the experiences of many ambitious and hard-working men, who are filling temporary places in hopes of being soon transferred to positions they are fitted to fill. *Coal Age* believes that men always make better and more efficient workers when employed at tasks to their liking and for which they are fitted. At the same time, all cannot be firebosses, or motormen or drivers. It is up to the worker to earn his advancement. Let us hear from many on this point.

### Supporting Roof, Pittsburgh Seam

In view of the growing scarcity of mine timber, to which attention has frequently been called in *Coal Age*, it seems to me that it is not amiss to ask for the views of practical men in regard to methods that can be adopted for supporting the roof in mine workings when the time comes that the supply of props and other timber for this purpose fails.

In my opinion, this is a situation that we must all face sooner or later. It is particularly true of mining operations in the Pittsburgh district. As one who is deeply interested in the problem, I want to ask for the views of *Coal Age* and its readers. I would suggest that the discussion have particular application to the Pittsburgh thin vein and the Pittsburgh thick vein, both of which are under practically the same cover. The height of the coal in the two seams is, say 6 and 9 ft., respectively. The question is, how can the roof be supported, in working these seams, without the use of timber?

Perryopolis, Pa.

INQUIRER.

This is certainly a timely subject for discussion. In some mining districts, the scarcity of timber is becoming acute. In numerous instances, operators of large mines, in districts where the timber supply has become depleted, have already resorted to the use of iron supports, consisting of T-iron and channel bars of specified sizes and dimensions.

This method of supporting mine roof has been called "steel timbering," and has given much success in its application. One of the chief points to be considered in steel timbering, is a suitable form of joint that will permit such frames or sets to be readily placed in position and taken down and moved when needed elsewhere. Steel timbering will also call for special consideration in order to give ample footrest where the bottom is soft, and to protect the metal from corrosion.

*Coal Age* will be glad to receive the views and suggestions of practical readers, many of whom have had valuable experience in this line.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Miscellaneous Questions

(Answered by Request)

*Ques.*—What quantity of water will a double-acting pump deliver if the plunger of the pump is 4 in. in diameter and the piston speed 100 ft. per min.?

*Ans.*—The diameter of the plunger being 4 in., its sectional area is  $0.7854 \times 4^2 = 12.566$  sq.in. The piston speed being 100 ft. per min., the plunger displacement is  $12.566(100 \times 12) \div 231 = 65.28$  gal. per min. Now, allowing a water-end efficiency of 85 per cent, the quantity of water delivered by this pump would be  $0.85 \times 65.28 =$  say,  $55\frac{1}{2}$  gal. per min.

*Ques.*—With 3 hp. we are producing 25,000 cu.ft. of air per minute; how many horsepower will be required to produce 60,000 cu. ft. per min., in the same airway?

*Ans.*—Disregarding any difference there may be in the efficiencies of the ventilators, the power producing circulation will vary as the cube of the quantity of air circulated, in the same airway. In other words, the power ratio will equal the cube of the quantity ratio. Hence, calling the required horsepower  $x$ , we have,

$$\frac{x}{3} = \left(\frac{60,000}{25,000}\right)^3 = \left(\frac{12}{5}\right)^3 = 2.4^3 = 13.824$$

$$x = 3 \times 13.824 = 41.472 \text{ hp.}$$

*Ques.*—What are the advantages of a double over a single hoisting engine?

*Ans.*—A double or duplex engine has two cylinders connected with crankarms set at right angles to each other on the drumshaft. The advantage of this arrangement is that the engine is never on dead center, but is always able to start its load in any position of the crankarms.

*Ques.*—With a water gage of 5 in., we are producing 50,000 cu. ft. of air per minute; what will a 9-in. water gage produce in the same mine?

*Ans.*—Assuming that there is no change in the circulation of the air or in other conditions in the mine, the quantity of air in circulation will vary as the square root of the pressure or water gage. In other words, the quantity ratio is then equal to the square root of the water-gage ratio. Hence, calling the required volume of air  $x$ , we have,

$$\frac{x}{50,000} = \sqrt{\frac{9}{5}} = \sqrt{1.8} = 1.34$$

$$x = 50,000 \times 1.34 = 67,000 \text{ cu. ft. per min.}$$

*Ques.*—(a) If a pressure of 2 lb. per sq. ft. produces a velocity of 200 ft. per min. in an airway, what pressure will be required to produce a velocity of 400 ft. per min., in the same airway? (b) What pressure will produce a velocity of 600 ft. per min., in the same airway?

*Ans.*—(a) The pressure producing circulation, in a given airway, varies as the square of the velocity. To double the velocity in the same airway, therefore, will

require four times the pressure; or, in this case,  $4 \times 2 = 8$  lb. per sq. ft.

(b) To increase the velocity three times will require  $3 \times 3 = 9$  times the pressure; or, in this case,  $9 \times 2 = 18$  lb. per sq. ft.

*Ques.*—A cross-entry that was driven up from a main entry having caved in, it was decided not to clean up the cross-entry, but to start a road 300 ft. back on the main entry in a direction to strike the cross-entry 800 ft. in from its mouth. Using a tape for that purpose, how can sights be given on the entry for driving this cutoff?

*Ans.*—Assuming that the cross-entry runs at right angles to the main entry, the cutoff when driven will form the hypotenuse of a right triangle whose two sides are 800 and 300 ft., respectively. The direction for driving the cutoff, starting at a point 300 ft. back from the mouth of the cross-entry, on the main entry, can be indicated by drawing a right triangle on the roof at that point. The shorter side of this triangle must correspond to the direction of the main entry and the longer side be at right angles to it. The ratio of these two sides is 300:800, or 3:8. That is to say, for every 3 in. on the line parallel to the main entry, 8 in. must be measured on the line at right angles to it. The line joining the extremities of these two measurements, or the hypotenuse of the right triangle, will indicate the direction for driving the cutoff.

*Ques.*—An airway 4,500 ft. long, 4 ft. 3 in. high, and 9 ft. 3 in. wide, is passing 54,500 cu. ft. of air per minute; what is the velocity of the current?

*Ans.*—The sectional area of this airway is  $4.25 \times 9.25 = 39.3125$  sq.ft. The velocity of the air current at the point where these measurements were taken is, therefore,  $54,500 \div 39.3125 = 1386+$  ft. per min.

*Ques.*—Explain the formula,  $pa = ksv^2$ .

*Ans.*—This is the formula for calculating the total resistance ( $R = pa$ ) in an airway where the rubbing surface is  $s$  and the velocity of the air current  $v$ . In the formula,  $k$  is the unit of resistance, or the resistance offered by 1 sq. ft. of rubbing surface to an air current having a velocity of 1 ft. per min. The resistance varies with the square of the velocity. Therefore, multiplying the unit resistance ( $k$ ) by the rubbing surface ( $s$ ) and that product by the square of the velocity ( $v^2$ ) gives the total resistance or total pressure concerned in moving the air through the airway.

### Correction

The last two lines of the first paragraph of the answer to the first question, *Coal Age*, Jan. 29, p. 246, should read: the assumed velocity of the air current  $450 \times 100 \div (100 - 3) = 463.9$  ft. per min. Then, the last two lines of the following paragraph would read: the quantity of air passing is  $72 \times 463.9 = 33,400$  cu.ft. per min.

# FOREIGN MARKETS AND EXPORT NEWS

## Wasteful Methods of Working in India

A report has been made by Mr. Trehan Rees to the Secretary of State for India on the working of the Indian coal mines. He has made a survey in accordance with the suggestion of the Industrial Commission, with a view to introducing economies in mining methods. Mr. Rees, who is a partner in Messrs. Forster Brown and Rees, of Victoria Street, London, S. W., comes to the conclusion that one-third of the coal in Indian mines is being lost, owing to bad methods of working, and that three-quarters of a million tons are lost annually by wasteful power working of the collieries.

He notes the absence of supervision, such as inspection by agents of land owners or by Government officials to prevent wasteful methods of working, and the lack of covenants to work economically and guard property for the future. The result has been that in a large number of properties the colliery has been worked chiefly with the object of producing outputs at the earliest possible moment, without due consideration being given to the most efficient methods of laying out collieries for the future.

The waste is abnormally high, and he concludes that the quantity of coal destroyed or lost by present methods is not less than one-third of the total amount in situ. The longwall system is generally unsuitable, while in thinner seams coal-cutting and coal conveying machinery should be more widely introduced. The time has arrived when companies have to consider the winning of more valuable coal at greater depths. Sinkings are at present actually being made to win seams lying at varying depths of about 1,000 ft. Mr. Rees points out that over-pressure of superincumbent strata at these depths will make pillar working still more wasteful. In view of the comparatively shallow depths from which coal is at present won in the two main fields at short distances, he considers that the average annual consumption of fuel for producing power, more than 10 per cent of the total annual output, is excessive.

It should be reduced to not more than an average of 5 per cent by the application of electricity for winding, hauling, pumping, etc. Several of the larger companies have erected electric generating stations, and have effected thereby considerable economies. But steps should be taken to insure the more general use of electricity, and those companies whose mineral areas are too small to admit of the initial outlay necessary for individual generating plant should have facilities for obtaining suitable electrical power at reasonable rates for use at their mines.

A general survey should be made of the Jherriah and Raniganj coal fields, and central generating stations should be equipped on a large scale to centralize work as far as economically possible. The system in India is criticized under which the mine sidings are owned and maintained by railway companies and constructed mainly at their expense. The system prevents a colliery company, without permission of the owners of these connections, from obtaining access to another railway company's system, causing in some instances detour of traffic.

If the colliery companies owned their own branches, ran their own locomotives, and became responsible for any damage accruing to railway company's wagons while on colliery property, railway companies would be safeguarded and large quantities of coal would be liberated for working. Coal left for support of colliery branches would be reduced by these means, and also by the colliery companies centralizing their loading depots.

With the erection of central electrical

power stations there should be sufficient power not only for working collieries, but for conveying coal to central loading depots and electrifying railway sidings and branch lines within coal fields.

Most serious efforts should be made to increase the number and improve the type of wagons in the main coal fields. Mr. Rees proposes the setting up of a controlling authority to supervise negotiations for leases. To insure better supervision of coal extraction, he suggests that all coal when brought out of the mine should be weighed and an accurate account recorded in books at the colliery. The labor force is described as insufficient and unambitious. Methods are suggested for improving the conditions of labor, so as to settle non-fluctuating industrial populations near the mines.

He also recommends modern coking, the utilization of byproducts, and the manufacture of briquettes. He states that the introduction of hydraulic packing will increase the cost of production of coal from seams in which it is employed to the average extent of 1 rupee per ton.

## Foreign Freight Rates

During the past week the market has softened considerably to all destinations outside of the West Indies. Many additional steamers were chartered to transport coal to ports in South America and Europe at very favorable rates and conditions, says W. W. Battie & Co.'s coal-trade report.

Because of the continued demand for coal in this country, the demands of the export shipper are not favorably met. A terrible storm such as occurred the past week was another hindrance in last week's shipping.

Export licenses are still very difficult to obtain. To West Indian ports the rates were firmer the latter part of last week owing to the report that licenses already issued would be withdrawn unless steamers were declared against these licenses.

Shipping Board rates by steam are as follows:

## FOREIGN FREIGHT RATES

	Rate	Tons Displaced
Genoa/Leghorn	\$26 50	— 1,000
Spezia/Savona	26 50	— 1,000
Piraeus	28 50	— 1,000

## Holland's Coal Imports Increased

Holland's consumption of coal has constantly increased during the past years, states a recent report of the Geological Survey. In 1901 about 5,000,000 tons sufficed; in 1905 over 6,000,000 tons were consumed; in 1913 about 10,000,000 tons were required, and this figure is now accepted as the normal requirement of the country. Of this amount approximately 8,500,000 tons were imported bituminous and 1,500,000 tons were anthracite, practically all the latter being home production.

The normal consumption of coal, in tons per annum, was distributed approximately as follows:

Railroads	1,200,000
Bunkers in Dutch ports	1,200,000
Gas factories	1,500,000
Other uses	6,100,000
Total	10,000,000

The following table indicates the net imports of coal into Holland. Germany supplied much the greater part of these imports, approximately 70 per cent coming from that country just before the war. England supplied about 20 per cent, and about 10 per cent was credited to Belgium.

## MONTHLY IMPORTATION OF COAL INTO HOLLAND FOR NINE MONTHS, BEGINNING OCTOBER, 1917

## Nova Scotia Coal Co. Acquires Another Company

The official announcement is made of the acquirement of control of the Acadia Coal Co. by the Nova Scotia Steel and Coal Co. During the administration of the Belgian interests, which the Scotia people have now taken over, the property of the Acadia coal field was more thoroughly and more scientifically prospected than it had ever been previously, and the Belgian management did unusually good work in a coal field of extraordinary complexity.

The number of coal seams already proved in the Stellarton area controlled by the Acadia Coal Co. is 16, but there is very reasonable possibility that others may be encountered at lower depths. Another undeveloped asset of this field is the oil shales and oil coals which are associated with the coal seams in much profusion. The Stellar, or oil coal seam (from which the town of Stellarton receives its name is a case in point.

## English Premier Meets Miners' Committee

The Parliamentary committee of the Trade Union Congress and the executive committee of the Miners Federation will be received by Premier Lloyd George tomorrow, states the *Sun* and *New York Herald* dated Feb. 4, and will ask for the nationalization of the mines, railways, shipping, shipbuilding and other key industries covered by the resolutions of the Glasgow conference, which was called to discuss the high cost of living and electoral reform.

In the miners' case nationalization would eliminate 1,500 colliery owners and 400 royalty owners, and the mines could be worked on a basis of wholehearted co-operation by both technical and manual workers and greater productive efficiency could be brought about.

In coalition circles it is believed the Prime Minister will reply to the delegates that the Government has no intention of adopting nationalization and will announce his readiness to introduce legislation insuring that the workers shall have a share in the control of industry and a share in the profits based on actual production. It is expected the committee will refuse this offer pending a decision by the Trade Union Congress on Feb. 28, and at the same time will demand an increase in wages of \$1.25 a day. The trend of feeling in railway circles indicates that the men are not satisfied with the recent settlement, and already the lodges are discussing the possibilities of new demands, the chief of which will be the immediate nationalization of the railways.

## Full Industrial Demand in Scotland

The effect of the holidays has practically worn off, states a recent report in the *Colliery Guardian* and business is once again very active. Industrial demands are pretty full. Household requests are very large, but unfortunately supplies are limited, and great difficulty is experienced in meeting ration allowances. Fair shipments are going to Irish ports, chiefly of industrial qualities, consignments of house coal being very small. A fair amount of foreign business is in the market and Allied orders too are pressing.

The clearances during the past week, however, were almost entirely oastwise. Full coal and splint are very busy and still realize about 86s. and 90s. neutral, and 76s. and 72s. allied respectively, with treble nuts 78s. 6d. neutral, and 65s. Allied t.o.b. Glasgow. Shipments amounted to 61,961 tons, against 55,287 in the preceding week, and 46,209 tons in the same week last year.

With a Government-fixed price on a much higher level there is every inducement for operators to withhold deliveries on contracts and to the best of their ability take care of orders on which the prescribed price can be charged. In many instances the railroads are insisting upon their full requirements before cars are placed for other buyers, this under threat of not hauling the cars away, and in still other cases cars are supplied only for railroad fuel. The whole railroad-coal situation is certainly 'n had shape, and because of this a large number of consumers in this territory are utterly unable to count upon any current receipts all-rail or by rail to the Tidewater ports.

The sustained cold weather through most of January has also upset many plans. More coal was burned than it was expected would be required and together with confiscations and generally light shipments there is slightly less complacency among buyers than was the case a month ago. Stocks are being gradually depleted, but there is nothing like the alarm among industrial steam users that is so evident among railroad fuel agents.

There are quiet efforts to secure spot coal, in some cases to replace contract shipments that have been confiscated, and in still other cases, usually of small plants, there is threatened distress, but on the whole there is even now surprisingly little snap to inquiry.

At the New York and Philadelphia piers there are only small tonnages available. Confiscations have been general and shippers of low volatile coal who were hoping to profit by the premium allowed for export coal are now obliged to bill to the railroads at the Government price.

1,468,135 tons, according to the information which has just appeared in the Swiss press, as against 2,103,915 tons for the corresponding period in 1918.

However, the coal situation in Switzerland appears to be better than in any of the neighboring countries, and, with the continuation of the present rate of importation the country should be able to get through the winter without serious difficulties.

The supply of industrial coal appears sufficient to avoid any cause for immediate alarm. The greatest shortage appears in the quantities available for household purposes; but the rationing of coal was abandoned some months ago, and there appears to be no immediate need or prospect for reviving this system.

## General License for England's Exports Issued

The English Board of Trade announces that, with a view to the decentralization of coal export control, an open general license has been issued, with effect from Thursday, Jan. 1, 1920, states the *Colliery Guardian*, permitting the export of coal, coke and manufactured fuel to all destinations abroad except Russia, Germany, Hungary, Austria, Turkey, and Bulgaria, subject always to the approval, previously obtained, of the Controller of Coal Mines, or his duly authorized representative, and subject to shipment being made in a vessel approved by the Commissioners of Customs and Excise or their officers.

The Customs authorities will require entry to be made in all cases; and at ports where there is a duly authorized local representative of the Controller of Coal Mines, the approval referred to above will be signified by his indorsement on the pre-entry form, which must be presented to him for the purpose, before shipment.

Where shipment is proposed to be made from a port not included in the list given, it will be necessary for application for the Controller's approval to be made to the Export Branch of the Coal Mines Department in London. Similarly, shipments from all ports in the United Kingdom to the destinations excluded from the purview of the general license must still be covered by an export license from the Coal Mines Department.

## German Troops Check Miners' Strike

The expected strike this week in the coal regions has been prevented by the strategy of the Government, which moved large numbers of troops to the neighborhood of the mines with orders to arrest immediately any workman who attempted to lay down his tools at the end of the six-hour work shift, for which the miners were to strike.

All the railroad shops also have reopened on a piece work basis after the lockout, and the Government reports that work is progressing peacefully.

Coincidentally with this announcement *Zeitung am Mittag* declares that the exceptional measures of the Government while they may be toned down somewhat, will remain in force until the elections. The right of public meeting will be extended within certain limits, and suppression of the press will be only for a defined period.

## Danish Coal Imports

In times of peace Denmark obtained most of its coal and coke from the United Kingdom. The difficulties of ocean transportation made it necessary to import coal from Germany. This explains the enormous increase from \$2,520,000 to \$27,599,000 in the imports of "Coal and other raw minerals." In 1913 Denmark imported from Germany only 362,920 metric tons of coal, coke, briquets, and cinders, valued at \$2,000,000; in 1917 these imports aggregated 1,257,467 metric tons, valued at \$25,844,000.

## French Coal Situation

Coal shortage remains acute in France. The great rains have caused water transport to be almost impossible, and railway transport has not improved. Among other impediments is a combined strike, states a recent report in the *Colliery Guardian*, of the penic owners and of the tugboat mechanics which has started at Rouen, which is full of coal.

## English Colliery Deputies Discuss Grievances

Important matters were discussed in London at the Coal Mines Production Department on Wednesday affecting the wages and hours of colliery officials, states the *Colliery Guardian*, when a deputation of the Federation of Colliery Firement, Deputies, and Examiners of Great Britain waited upon the Coal Controller's representatives. The questions in dispute related to the demands of deputies employed in collieries at Yorkshire in respect to the hours of their working shifts.

The Controller's representatives promised to give the case their immediate attention. The demands of the Yorkshire deputies, if sanctioned, will mean an increase of 1s. 6d. a day upon base rates, which would thereby cover the additional working time involved by the present effect on hours.

## Hull Coal Trade for December

Figures which have been extracted from the statement compiled by the Hull Chamber of Commerce and Shipping, from a return made by the coal inspector to the Corporation, W. Herbert Truman, state that during the closing month of last year 236,955 tons of coal were consigned to Hull from the collieries, as compared with 177,402 tons in December, 1918. Of this amount, 226,732 tons were transported by rail and 10,223 tons by river. The total quantity imported into Hull during the completed year ending Dec. 31 was 2,101,648 tons, as against 2,605,602 tons in 1918. The totals for the last 12 years were as follows:

Year	Via River	Via Railway	Total
1908	665,256	5,241,624	5,906,880
1909	633,608	5,467,032	6,100,640
1910	539,368	6,335,784	6,875,152
1911	522,392	5,933,592	6,455,984
1912	462,636	6,549,342	7,011,978
1913	517,488	7,428,477	7,945,965
1914	431,944	5,220,689	5,652,633
1915	261,346	4,406,387	4,667,733
1916	217,849	3,072,432	3,290,281
1917	195,431	2,616,925	2,812,356
1918	160,930	2,444,672	2,605,602
1919	164,080	1,937,568	2,101,648

## Swiss Coal Situation Improved

During the month of November, 1919, states Trade Commissioner H. Lawrence Groves, Geneva, in *Commerce Reports*, the importations of coal into Switzerland, and the sources from which it came, were as follows: 17,262 tons from the basin of the Saar; 14,577 tons from the basin of the Ruhr, of which 11,464 tons came in under the 6-months' coal agreement that is now in operation between Switzerland and Germany; 3,779 tons from the basin of the Rhine; 16,712 tons from Belgium, 7,349 tons from France, 13,689 tons from England, and 89,934 tons from the United States. The total for the month was 163,302 tons. In the corresponding month of 1918 the imports were only 79,188 tons.

The notable increase has been brought about largely by the shipments from the United States, but, in spite of the recent availability of American coal for the first 11 months of 1919, the imports were only

# COAL AND COKE NEWS

## Charleston, W. Va.

**Greater car shortage on Chesapeake & Ohio than any other road in the state. Few mines operate more than two days in the last week in January. Embargoes removed. Car shortage most acute in Kanawha field; production for last week of January only 60,000 tons. General strike in New River field materially reduces output of coal. Strike to force return of "check-off" system.**

While car service on the Chesapeake & Ohio had been extremely poor throughout the earlier weeks of January, it was worse by far during the last week of that month than at any other time not only during January but in recent months. The supply on Monday, Jan. 26, was far below the usual Monday supply so that it was not surprising, during the remainder of the week, to observe quite a serious shortage of equipment. Less than half enough cars were furnished, in fact, for mines on the Chesapeake & Ohio in this territory, the supply averaging not more than 25 per cent during the last three days of the month.

So far as it was possible to determine, the Chesapeake & Ohio had less cars available for coal loading than any other road operating in the state, even though there was also a shortage on other lines. On branch lines the supply of cars fell as low as 26 per cent, according to authentic reports. Under such conditions few mines were able to operate more than two days out of the week, so that the output of fields in this part of West Virginia fell below 50 per cent of capacity. Weather conditions were far more conducive to larger loadings and to the better movement of loads and empties than during the previous week. Despite such improvement in the weather, however, there was little or no improvement in service, motive power continuing to be far short of requirements.

Embargoes in force earlier in the month had been removed by the beginning of the last week of January and had there been a larger production there would have been a heavier Western tonnage. The curtailed production also had the effect of decreasing export shipments.

Production in the Kanawha region, during the week ended Jan. 31, was seriously crippled through a shortage of empties, as acute as has been witnessed at any time since the severe weather of 1917-18, mines without number throughout the region finding it necessary to suspend operations because of absence of loading facilities. Few if any mines in the field were operated more than two days out of the six. Toward the latter part of the week not more than 10,000 or 11,000 tons of coal were being loaded per day in the entire Kanawha field. It is estimated in fact that production for the entire six days did not reach more than 60,000 tons.

In some parts of the region the supply was as low as 25 per cent. The situation has become so serious, in fact, in the Kanawha as well as in other regions, that traffic managers are being employed with a view to going into the subject of car supply more thoroughly and finding out just what the trouble is.

Under date of Jan. 26, notice was received in the Kanawha field that exports, in so far as that field was concerned, would be allowed only where shippers could show that boats would be available by a certain time after shipments were made. That of course tended to cut down the export tonnage.

Between a serious shortage of cars and a general strike in the New River field, affecting 26 different operations at one time, during the final week of January, production was materially reduced in the region mentioned. Of course with a strike in effect at a number of mines, the need for cars was not so pressing as it would have been had all mines been in operation. Production was limited to about 90,000 tons. With exports still limited, more New River coal was finding its way westward

than is usually the case when the movement of such coal is unrestricted. The New River field was affected to some extent also by inadequate motive power. The strike in this field during the early part of the week affected only three mines. However the middle of the week found at least 16 operations affected, and by the end of the week the number had grown to 26. The strike was preconcerted and a part of an effort of the leaders in District 29 to force a return of the "check-off" system of some of the New River operators. District officials of the United Mine Workers were unable to induce a general walk-out in the field.

## Bluefield, W. Va.

**Last week of January brings improved car supply in southern West Virginia. Norfolk & Western only road here showing improvement. John L. Lewis determines to organize non-union fields here. Virginian Ry. mines work 3½ days and Chesapeake & Ohio mines two days a week. Winding Gulf feels shortage; Tug River and Pocahontas fields increase output.**

In a part of the smokeless and high-volatile areas of southern West Virginia, there was a slight improvement as compared with conditions during the week ended Jan. 24, the last week of January bringing a somewhat better car supply at least at Norfolk & Western mines. That appeared to be the only road reaching into the coal regions in the lower part of the state where there was any improvement, however, and production continued to be far below normal even on the Norfolk & Western.

Usually cars are less plentiful during the last half of the week than earlier in that period, but in that respect conditions were reversed, as January came to a close, in southern sections, loadings being nearer normal in several fields during the last three days; the car supply, in fact, being not far short of normal on one of those days. Weather conditions, for one thing, were more favorable to the movement of traffic and the Norfolk & Western was better able to accept empties from western connections at junction points previously congested.

Coal men in the southern part of the state were considerably interested in the expressed determination of acting President John L. Lewis to organize all non-union fields in southern West Virginia. Mr. Lewis was in Bluefield during the last two days of January.

Severe blows were dealt the mining industry in the Winding Gulf field during the final week of January owing to the scarcity of empties in the field. Insofar as the Virginian Ry. was concerned, that road was able to furnish only enough empties to keep mines on its line in operation for 3½ days during the week. Conditions were even worse at Chesapeake & Ohio mines, operations on that road averaging only two working days out of the six. In other words Virginian mines were operating on about half time and Chesapeake & Ohio mines on one-third time. Such a curtailed car supply made serious inroads on the tonnage shipped from the Winding Gulf region and had pretty well taken the starch out of the industry in that particular district, companies being utterly unable to take advantage of present market opportunities, either at home or abroad.

While the output of the Tug River field was increased during the week ended Jan. 31, the increase was slight, only 61,700 net tons being produced. In other words the mines of this field were only mining about two-thirds of capacity, working on an average of only four days a week. Such conditions are not only injuring operators financially but are creating a spirit of unrest among the miners, and operators find it difficult to understand why there should be any shortage, in view of the fact that congestion has been relieved, unless it is

that the coal cars are being used for storage purposes and that there is indiscriminate diversion. Not only are export shipments limited by the curtailed tonnage, but it is impossible to keep up with contract requirements.

The curve of production in the Pocahontas field was upward during the last week of January, mines in that field loading 295,540 tons or about 40,000 tons more than during the week ended the twenty-fourth; yet the failure of the Norfolk & Western to supply an adequate number of cars was responsible for the loss of 132,000 tons, a reduction, however, of about 50,000 tons in the loss as compared with that of the preceding week. During the first few days of February, mines were only operating on a half-time basis, since mines were able to secure only about half enough cars. The coke production in the Pocahontas region was somewhat in excess of the previous week, the tonnage of coal coked amounting to 14,000. Up until the end of January influenza had not been prevalent enough to interfere with the mining of coal.

## Huntington, W. Va.

**Absurdly low tonnage for Logan field in last week of January. Similar shortage in Guyan production. Logan operators' commission goes to Washington to secure relief from Railroad Administration. Chesapeake & Ohio weekly movement of cars.**

While the mines of Logan field managed to produce 13,000 more tons of coal during the final week of January than during the previous week, yet the output was still short of 50 per cent of capacity, reaching only a total of 145,000 tons; this tonnage is absurdly low for the Logan region where the average output during the strike, for instance, was nearly 250,000 tons a week. The best index to conditions in the Guyan field, however, was found in the increasing loss from car shortage, a total of 236,000 tons having been lost from that cause alone—an increase of 32,000 tons.

Thus it will be seen that the car shortage in the Guyan field was most grave and was playing havoc with mining conditions in that field. At no time during the week was that maximum production over 30,000 tons a day. During the last two days of the week the output was less than half of the figures just given. As the shortage grew worse and worse, a hurry-up call was sent out to the operators and a special committee of Logan operators was sent to Washington to secure some relief from the Railroad Administration; the committee made the complaint that although mines west of the Ohio River were receiving a fairly adequate supply, as shown by Geological Survey reports, yet Chesapeake & Ohio mines were limited to less than a half supply. Some assurances of relief were given, but the committee was not very hopeful of any improvement in the transportation situation.

There was an unusually heavy demand for Logan coal and for gas coal especially, but the supply was so disproportionate to the demand that producers were utterly unable to even keep up with contract deliveries. The continued shortage is playing havoc with their business, not to speak of creating dissatisfaction among the miners, and some connection is seen by operators between the pronounced car shortage in non-union fields and the campaign about to be launched for the organization of such fields.

Another index to curtailed production was furnished in the weekly movement of cars on the Chesapeake & Ohio system, only 9,087 cars of coal having been handled on the whole system during the last week of January against 9,543 during the previous week; this represents a decrease of 456 cars, the decrease in tonnage—22,800 tons—being the difference between 477,150 and

454,350 tons. During the week ended the twenty-fifth, 6,072 loads were handled by the Chesapeake & Ohio through Clifton Forge, Va., for the East, the eastern movement representing about two-thirds of the total tonnage handled. The average eastern movement for each day of the week mentioned was 867 as compared with 664 cars per day average during the same week of 1919.

### Fairmont, W. Va.

Three-fourths of northern West Virginia mines idle during some days of last week of month. Acute car shortage. Some mines operated only two full days out of ten. Most of northern West Virginia coal going east. Coal sent to New England by rail.

The end of January in northern West Virginia mining fields witnessed one of the worst car shortages since the winter of 1917-18, with the supply running as low at times during the week as 25 per cent, so that there were days during the final week of the month when fully three-fourths of the mines in northern West Virginia were not in operation. The only day during this period, in fact, when there was anything like an adequate supply was on Monday, Jan. 26, when cars furnished were equal to about 85 per cent of requirements. There was a drop from that figure to about 25 per cent, that representing the average for the remainder of the month. Late placements tended to further curtail production.

While the scarcity of cars was most marked throughout the final six days of January, the twenty-eighth was probably the worst day in the week, there being only a little more than 400 cars available, for instance, in the Fairmont region on that date, with about 1,600 ordered. The shortage on that date resulted in a suspension of operations at 132 mines. A large number of mines were also closed down because of no cars on each of the last three days of the month. Weather conditions were in no wise responsible for the inadequate supply since exceedingly mild weather prevailed throughout the week.

On nearly all other roads operating in northern West Virginia, the shortage of cars was equally serious. The supply sank as low as ten per cent on the Monongahela R.R. at one period during the week. Consequently there was a general reduction in the output throughout all northern fields. Cars were so scarce that, for one mine of a company able to operate, there were several of the same company in complete idleness. In some instances mines were not able to operate more than two full days out of ten, and such a situation was causing much unrest among miners as well as demoralizing mining conditions generally.

The eastern movement of coal from northern West Virginia regions far outstripped the tonnage going west. Ohio and Michigan sections were the principal points of Western consignment. Railroads in the East, in so far as it was possible to tell, were not taking as heavy a tonnage as they had earlier in the month. There was also a material decrease in Curtis Bay shipments, but the fact that coal for New England and other Eastern points is now being shipped by rail alone may have had something to do with that. A somewhat larger wagon-mine tonnage than usual was reported.

### Ashland, Ky.

January production for northeastern Kentucky only 10 per cent. Loss of output due to car shortage. Big Sandy and Guyan operators go to Washington to learn cause of shortage. Other districts favored with cars. The reason given and operators assured of improvement in supply. Future export business promises well. Labor plentiful, assuring large output when railroad conditions are normal.

Production in the northeastern Kentucky district during the week ended Jan. 31—reaching only 91,730 tons—fell behind production for the same week of 1919 (112,070 tons) when "no market" was seriously curtailing the output. During the month just ended the output in this district was 520,605 tons, or a decline of 53,000 tons, as compared with the same month of 1919. With production reaching only 40 per cent of capacity during the last week of the month, it follows that there was a loss of 60 per cent or 137,095 tons. Nearly all of such loss (131,220 tons), representing 58 per cent, was due to a car shortage.

During January the loss from a car shortage amounted to almost 500,000 tons,

so that the situation has become quite serious in this field. During the week ended Jan. 31, there were 470 mine days when no cars were supplied; that meaning a loss of 112,500 tons. In other words, out of a total of 153 mines in the district, which during the week would have worked 918 days, 470 mine days were lost because of no cars; the loss figures being augmented because of the fact that other mines received less than their full supply on some days. As a whole, there was less than an average of 2½ working days for all the mines during the week.

When the Geological Survey reported the production (for the week ended Jan. 17) for the entire country, as the largest production for any week in January during the last three years, the operators along the Chesapeake & Ohio (getting only 50 per cent supply) became quite agitated with the thought that other districts were being favored in the supply of cars from the pool. On short notice, therefore, a delegation of Big Sandy and Guyan operators hurried to Washington to ascertain, if possible, the reasons for this apparent preferred treatment. The Car Service section of the Railroad Administration frankly admitted the inability of the lines serving the eastern coal fields to handle the cars offered them at the important junction points and, when this condition continued indefinitely, the idle cars awaiting delivery to the eastern lines were diverted to the more western coal fields close at hand. This enabled the miners in the western and southern fields to work almost to maximum capacity, bringing about quite a marked increase in production in those fields.

Severe winter weather was mainly responsible for the railroad deficiencies and now, with a return to a normal temperature, the railroads are feeling the serious effects from the inroads of the influenza epidemic. Assurances were given the delegation of Chesapeake & Ohio operators that, if favorable weathers continues, improvement in the car supply would result and that the Car Service section was exerting every effort to supply the eastern railroads to their fullest capacity to handle, hoping in a short time to make the present disparity in the relative supply between the western and eastern fields a thing of the past.

Other radical steps are being taken to further improve the supply along the Chesapeake & Ohio by the addition of extra equipment from the anthracite railroads in the North and the several railroad lines in the South. With such assurances as have already been mentioned a more optimistic view immediately became manifest and it was decided to watch carefully any changes which might occur.

Considerable activity on the part of consumers for their next year's requirements has been noticed in the northeast Kentucky field, at prices ranging close to the present Government price and continuing the usual labor clauses covering any increased cost resulting from an increased wage scale. Requests for quotations on export business are almost a daily occurrence, and the shippers are anticipating quite a heavy movement from the northeast Kentucky district to Charleston, S. C., immediately after the Lever Act is nullified and tide-water embargoes lifted. It is safe to assume that quite little if any tonnage, other than the usual current tonnage reserved by the operators, will remain uncontracted for by March first, to begin with the usual time of contracts on April first.

The mines are reporting the best complement of labor in their history and, once the railroads experience a return to their normal performances, quite large production increases will immediately result. Very little fear is felt by the shippers in this field on an overproduction for some time as, even though the mines were able to increase their production, it is safe to assume that the railroads will be prevented from handling any greater tonnage than the normal 12,000,000-ton average per week and, with stocks almost entirely depleted and the opening of the Lake season near at hand, together with the great export tonnage, it will be some time before the consuming trade begins to catch up with its usual normal supply.

### Louisville, Ky.

Coal-production tax bills brought up in Kentucky Legislature. Details of bill introduced by Assemblyman Beckman. Includes tax for state and county purposes. State Tax Commission proposed. Comment of state press on coal-production tax. How the coal-tax matter stands in other coal states. Kentucky operators expect to see measure defeated.

Bill introduced into Kentucky Legislature to amend law relating to miner's checkweighman. Affects mines employing as many as 20 men. Duties and privileges of checkweighman noted. Methods of his payment. No interference with his rights. Fine in case of violation of act.

Assemblyman Beckman quite recently introduced a bill into the Kentucky Legislature whose purpose is to impose a license on any person, firm, corporation or association engaged in the mining of coal in the state and authorizing counties also to impose a tax for road, school and county purposes.

This bill aims to provide that every person, firm, corporation or association engaged in the business of mining coal in the state shall, in lieu of all other taxes imposed by law, annually pay a tax for the right or privilege of engaging in such business in the state of 1c. per ton on all coal mined in the state, and this tax shall be for state purposes. In addition any county in the state may impose a like tax of ½c. per ton for road purposes, county purposes or school purposes on all coal mined in such county, and the Fiscal Court of any county may levy the tax for county purposes, determining what fund or funds shall receive the taxes when collected; when coal is mined in any separate taxing district in a county, the Fiscal Court shall equitably distribute such taxes between the county and such taxing district.

Those mining coal in the state within the meaning of this act shall make a report to the State Tax Commission on July 1, 1920, and every three months thereafter, showing the number of tons of coal mined during the previous three months and the mine from which it was taken. All such reports are to be made upon blanks prescribed and furnished by the State Tax Commission. Failure to make such a report within 30 days after it is due, on conviction, is punishable by a fine of \$50 for each day thereafter the report is not made.

The bill provides that the State Tax Commission shall determine the correct number of tons of coal mined in any county in the state, by any person, firm, corporation or association, from the date this act goes into effect until the day on which the first report is required to be made, and thereafter from the day on which the last report was made until the day when the next report is required to be made. The Commission shall certify as to the correctness of this report to the County Court clerk of the county in which such coal was mined, within ten days after the correct number of tons of coal has been finally ascertained.

All taxes due under the provisions of this act shall be payable 30 days after notice has been given by the State Tax Commission, and all taxes due to any county shall be payable 30 days after the certification is made to the County Court clerk. Failure to pay such taxes, after receiving 30 days' notice, imposes upon the delinquent a penalty of ten per cent on the amount of the tax, and thereafter such tax shall bear interest at the rate of ten per cent per annum. All such state taxes shall be paid to the state treasurer, and all county taxes to the sheriff or collector. The reports giving the correct number of tons of coal mined shall be made by the various companies through their chief engineer or other agent in the state and shall be duly verified.

The introduction of this bill renews the old fight for the tonnage tax on coal and considerable discussion has been aroused over the matter. In his message to the Legislature, Governor Morrow asked for a production tax on oil and gas but not on coal. It has been said that the tonnage tax on coal was not asked for because the competing states of Pennsylvania, Tennessee, Indiana and West Virginia do not tax their coal interests, except nominally; and that for Kentucky to take such action would be to put coal operators at a disadvantage in a strong competitive market. The coal-tonnage tax matter has been thoroughly thrashed out in Alabama, where a 2-cent production tax on coal was enacted into law last year. References to this matter appeared in the July 31, Aug. 14 and Aug. 28, 1919, issues of *Coal Age*. The question of a production tax on coal was also brought up in the Pennsylvania Legislature within the last six months.

Other coal production-tax bills have been introduced in the Kentucky Legislature and some of the newspapers of the state are advocating that positive action be taken. The *Louisville Times* suggests that the governors of the coal-producing states arrange for representatives of their respective tax departments meeting and drawing

up a uniform bill, which will affect all operators in all of the coal states alike.

The Kentucky operators have defeated several similar attempts to force a legislative act to place a production tax on coal mined in the state. It is said that they have been successful in the past due to the fact that such taxation was not in effect in other states and would work a hardship on operators. The operators seem to be solidly arrayed against this bill and plan to make every effort to defeat it in the Legislature. In the case of the Alabama coal tax, the governor of that state included it among the state administration measures and was said to be largely responsible for its enactment into law against strong opposition. On the other hand Governor Morrow of Kentucky does not seem to favor the introduction of such a tax measure in the Legislature of his state.

Assemblyman McCandless recently introduced a bill in the Kentucky Legislature to amend and re-enact Section 2733-A of Carroll's 1909 Edition of Kentucky Statutes. The bill was referred to the committee on Mines and Mining.

Paragraph 1 is amended and re-enacted to read substantially as follows: That when a majority of the miners engaged in digging or mining coal at any mine in this state (Kentucky) at which as many as 20 men are employed request the owner or operator of such mine to allow the miners to employ, at their own expense, a person to inspect the scales at the mine and to see that the coal dug by the miners is properly weighed and accounted for, and perform such other duties as will assist in bringing about correct weighing, the owner or operator is to permit such a person to be employed by the miners making the request, and it shall be the duty of the owner or operator to permit the weighman selected to deduct his wages from the miners each day upon the proper sheet, to turn this coal sheet into the company's pay-roll clerk and receive his pay in the same manner as any other employee of the company; provided the person so employed has an honest and trustworthy reputation and also that he is an employee of the owner or operator at the time of his selection as set forth. This weighman chosen by the miners is to hold his office for a period of three months or until his successor is elected and qualified, and the appointment, under the provisions of this act, of each inspector and assistant weighman shall be approved by the judge of the County Court of the county wherein the same is made.

Paragraph 2 states that the person appointed and employed by miners to perform the duties noted in paragraph 1 shall at all times have free access to the scales at the mines and shall not be hindered or prevented from a proper performance of his duties by the person who weighs coal for the owner or operator of any mines, nor any of the agents or employees of the operator. On the other hand the miner's checkweighman shall in no way prevent the weighman or other employees of the owner or operator from performing their duties in a proper manner.

Paragraph 3 notes that any person violating any of the provisions of this act shall be fined not less than \$10 nor more than \$50, and each day on which any of the provisions of this act are violated shall constitute a separate offense.

## Norton, Va.

Virginia fields produce 176,000 tons of coal in last week of January. Gain of 9,000 tons. Labor more plentiful than ears. Large export tonnage.

Production in the Virginia fields during the last week of January amounted to 87 per cent as against an 85 per cent output for the preceding week; the total output advancing from 168,000 to 176,000 tons, a gain of 9,000 tons. The production loss during the week ended the thirty-first was 31,000 tons. The entire loss followed in the wake of a car shortage, the labor supply having been such as to have been conducive to a 100 per cent production. Since radical agitators were weeded out of the Virginia fields, miners have been extremely regular in their work.

As was the case during the previous week, there continued to be a large volume of tonnage for export through Charleston, S. C., and through Norfolk, Va., the demand far outstripping the supply, in fact, as was also the case with reference to the domestic demand.

## PENNSYLVANIA

### Anthracite

**Pottsville**—Prospects are bright. It is said, that the entire anthracite coal region will be working on a daylight-saving plan in the spring. Under the leadership of Mayor F. P. Mortimer, Council was asked to indorse the proposition. Council unanimously acquiesced in the plan and the coal companies will work in harmony with the proposition to move the hands of all clocks forward one hour on the last Sunday in March. The big repair shops of the Philadelphia & Reading Coal & Iron Co and the Eastern Steel Co.'s works will be operated under the plan.

**Jeddo**—Highland No. 5, Jeddo No. 4 and Ebervale mines of the G. B. Markle Co., north of Hazleton, are still idle, due to the nonrenewal of the lease of these lands, which are owned by the Union Improvement Co., of Philadelphia. Employment agents are working among the idle Markle employees, and are inducing many to leave for work in steel mills. The Freeland and Hazleton Chamber of Commerce, in separate resolutions, asked Attorney General Palmer to use his office in getting the idle Markle mines in operation.

### Bituminous

**Indiana**—Judge J. N. Langham has appointed D. J. Jones, of Ernest, Pa., as the miners' representative on the mine foremen's examining board of the Twenty-Fifth Bituminous district. He succeeds J. R. Balls, of Ernest, resigned. The other board members are, W. B. Wardrop, of Iselin, representative of the operators, and Thomas S. Lowther, inspector of the district.

**Pittsburgh**—Thomas K. Adams, of Mercer, Pa., president of the Pennsylvania Bituminous Mine Inspectors' Advisory Association, has called a meeting of all the bituminous mine inspectors of the state, together with the other members of the mine foreman's examining boards, to be held at the Seventh Avenue Hotel here on Friday, March 5. The meeting promises to be attended by about one hundred mining men. The purpose of the meeting is to set the dates for the annual mine foremen's and fire bosses' examinations and to discuss the questions which will be asked the candidates.

**Rositer**—The new repair shop of the Clearfield Bituminous Coal Corporation, here, has been completed. It is said that it will be one of the most modern mine repair shops in central Pennsylvania and will include repair departments for electrical machinery and section for the building of mine cars. A large blacksmith shop is in one section and a modern store room in another part. One end is devoted to a large office for the mine foremen of the three Rositer mines, each foreman having his own compartment. The building is of fire-proof construction and is 60 x 160 ft. The sides are practically all glass and the window frames are of steel.

## Coming Meetings

**Material Handling Machinery Manufacturers' Association** has changed the date of its convention from Jan. 29 and 30 to Feb. 26 and 27, at the Waldorf-Astoria Hotel, New York City. Secretary, Z. W. Carter, 35 West 39th St., New York City.

**Canadian Mining Institute** will hold its annual meeting at the King Edward Hotel, Toronto, Ontario, Canada, on March 8, 9 and 10, 1920. Secretary, H. Mortimer-Lamb, 503 Drummond Building, Montreal, Quebec, Canada.

**New York State Retail Coal Merchants Association** will hold its annual meeting Feb. 26, at the Pennsylvania Hotel, New York City. Executive secretary, G. W. Woodside, Albany, N. Y.

**American Institute of Mining and Metallurgical Engineers** will hold its annual meeting Feb. 16, 17, 18 and 19, at the Engineering Societies Building, 29 West 39th St., New York City. Secretary, Bradley Stoughton, Engineering Societies Building, New York City.

**American Chemical Society** will hold its annual meeting at St. Louis, Mo., April 13, 14, 15 and 16. Secretary, Dr. Charles L. Parsons, 1709 G St. N. W., Washington, District of Columbia.

**New England Dealers' Association** will hold its annual meeting March 24 and 25, at Springfield, Mass. President, W. A. Clark, 141 Milk St., Boston, Mass.

**North Western Pennsylvania Coal Operators' Association** annual meeting will be held at Butler, Pa., March 2. Secretary, F. B. Itelmann, Butler, Pa.

**National Coal Association** annual convention will be held May 19, location to be decided later. Secretary, W. H. Reed, Commercial Bank Building, Washington, District of Columbia.

**American Wood Preservers' Association** will hold its annual meeting Feb. 16, 17 and 18 at Chicago, Ill.

**American Concrete Institute** will hold its annual meeting Feb. 16, 17 and 18 at Chicago, Ill. Secretary, Henry B. Alvord, 6 Beacon St., Boston, Mass.

## Trade Catalogs

**Catalogue 53.** The American Pulverizer Co., St. Louis, Mo., pp. 16; 8½ x 11½ in.; illustrated. A description of the pulverizing and grinding machinery made by this company.

**Blowforms.** The Blaw-Knox Co., Pittsburgh, Pa. Folder. 1 p. 4; 3¼ x 6½ in.; illustrated. Gives a brief idea of the extent to which Blaw steel forms are being and can be used in connection with concrete construction.

**Mine Car Lubrication.** Standard Oil Co. (Indiana), Chicago, Ill. Bulletin. Pp. 15; 6 x 9 in.; illustrated. This bulletin points out losses in coal transportation from the face to the tippie and also methods of eliminating such losses.

**Handbook of the I. T. E. Circuit Breaker.** The Cutter Electrical & Manufacturing Co., Philadelphia, Pa. Series M. 1 p. 263; 6½ x 9 in.; illustrated. Bound in cloth and marginal indexed. Printed on coated paper and well illustrated. Complete information for prospective customers.

**Worthington Condensing Apparatus.** Worthington Pump & Machinery Corp., New York, N. Y. Pp. 115; 6 x 9 in.; illustrated. Information about the various condensers made by the company together with useful information on condensation. Printed on heavy coated stock.

**W-C-K City.** Westinghouse, Church, Kerr & Co., Inc., 37 Wall St., New York, N. Y. Folder. pp. 4; 15 x 21 in.; illustrated. Half of the folder presents a large group of buildings erected by the company giving the appearance of a city. General data about the work here illustrated.

**Evans Scraper Loading Apparatus for Loading Coal into Mine Cars.** Engineering Development Co. of America, Scranton, Pa. Bulletin 1. Pp. 12; 8½ x 12 in.; illustrated. Describes the method of scraper loading and illustrates by photographs taken in the mine. List of parts given and illustrated.

**Recent Coal Washing Plants.** The Roberts & Schaefer Co., Chicago, Ill. Bulletin 36. Pp. 26; 8½ x 11 in.; illustrated. Description of some of the recent coal-washing plants designed by the Roberts & Schaefer Co. for the preparation of coal for coking, domestic-fuel and railroad-fuel requirements.

**Harris Electric Mine Pump Bulletin.** Harris Pump & Supply Co., Pittsburgh, Pa. Pp. 114; 8½ x 11; illustrated. Bulletin 400. Illustrates and describes completely the various pumps handled by the Harris company; also pipe, valves and fittings for mines and other requirements. This bulletin is a valuable guide as well as catalogue.

**Saving Fuel Automatically and Scientifically in the Boiler Room.** The Northern Equipment Co., Erie, Pa. Booklet. Pp. 24; 5½ x 8½ in.; illustrated. A digest of some of the data prepared for the U. S. Fuel Administration during the war, together with comments by the technical press and mechanical engineers on hand and mechanical feeding and mechanical regulation.

**Engines and Equipment.** Ideal Engine Co., Lansing, Mich. Catalogue 719. Pp. 40; 6 x 9 in.; illustrated. Description of the Ideal type of gasolene engines in their several sizes, also Ideal equipment for contractors and industrial plants.

**Brown Pyrometers.** The Brown Instrument Co., Philadelphia, Pa., Catalogue 12. Pp. 88; 8 x 10½ in.; illustrated. This catalogue is elaborately illustrated on heavy coated paper and contains much "real meat" on the subject of pyrometry. Thousands of dollars worth of work is turned out of furnaces and kilns the quality and spoilage of which is dependent upon the accuracy of pyrometer readings. The Brown instruments indicate and record temperatures; over 20,000 Brown pyrometers are said to be in successful operation.

## Industrial News

**Williamson, W. Va.**—The Himler Coal Co. has completed the work of sinking a shaft near Warfield, Ky., and is producing coal although a bridge across Tug River has not so far been completed. In the meantime the coal is being stocked and the company is now engaged in work on a slope.

**Sullivan, Ind.**—R. E. Price, acting as agent for the Mutual Coal Co., of Dugger, has purchased the Keeley mine from the Dugger State Bank and John E. Griffith and has leased 200 more acres of coal land, which should make the mine a producer for 12 to 15 years. Work of cleaning up preparatory to driving new entries will start at once.

**Peoria, Ill.**—An agreement involving a consideration of \$150,000 and the transfer of 1,132 acres of coal lands in Peoria County, Ill., has been filed. John A. Hoffman, of Kickapoo Township, transferred the lands to Frank L. Bunn, of Bloomington, Ill., under an agreement whereby Mr. Bunn will serve as agent for Mr. Hoffman in selling the properties to parties who desire to develop the coal lands.

**Princeton, W. Va.**—The Virginian Ry. expects shortly to open bids for the construction of about 14½ miles of branch railroad up Miami Fork in Wyoming County, W. Va. This branch line will be known as the Virginian-Wyoming R.R.—a branch of the Virginian. It will open up a large territory of smokeless coal which is under the control of Godfrey Himes, of Boston.

**Pittsburgh, Pa.**—The American Blower Co.'s Pittsburgh branch announces that the office here is now under the joint management of Thomas Chester and Edwin C. Evans. The former has been with the company for 12 years including six as chief engineer; Mr. Evans has been in the service of the American company for 15 years. The Sirocco and Ventura mine fans are made by the American Blower Co.

**Morgantown, W. Va.**—According to information received here, the Connellsville Coke Co. has purchased 210 acres of coal land in Redstone township of Fayette County, Pa., from the Republic-Connellsville Coke Co., the consideration being (it is understood) \$454,500. It is also reported here that the Consolidated Coke Co. has sold to J. H. Hill, Jr., 110 acres of coal land in Nicholson and German townships of Fayette County, for a consideration of \$99,000.

**Elkins, W. Va.**—The Brewer-Harrison Coal Co., which recently incorporated with a capital of \$125,000, has perfected its organization, and plans are being arranged for the development of properties located in Lewis County. It is proposed to install complete mining machinery and equipment, including mine cars, etc., as well as to construct a new tipples, to have an annual capacity of about 150,000 tons. W. W. Brewer, Belington, W. Va., is president and manager.

**Erie, Pa.**—The Ball Engine Co., of this place, has distributed a large wall calendar which should be of considerable interest to those using steam shovels or contemplating engaging in this kind of work. The Ball Engine Co. makes the well known Erie type of steam and electric shovels, also railroad ditchers, locomotive cranes, drag-line excavators, etc., for contracting and general excavating requirements. The calendar shows a number of the types of shovels and apparatus made by this company.

**Bethlehem, Pa.**—The Bethlehem Fabricators, Inc., of this place, has distributed an unusually attractive calendar of interest to coal men. It is made of pressed steel and includes a good photographic reproduction of the Lorée coal breaker, erected for the Hudson Coal Co., at Plymouth, Pa., in the northern anthracite field. The steel work for the breaker was designed, fabricated and erected, by this company, within 82 days from the signing of the contract—a noteworthy feat. The calendar is 9 x 13 in. in size.

**Newark, N. J.**—The Hyatt Roller Bearing Co., of this place, announces that after 13 years of service with this company, B. C. Koether has been promoted to the vice-presidency of the organization. In a short time he will leave Detroit for Harrison, N. J., where he will have his headquarters as head of the entire sales and advertising departments of the company. Mr. Koether was assistant sales manager of the Hyatt company at Harrison when he was promoted to the position of sales manager ten years ago, at which time he went to Detroit to take up his new duties.

**Towson Heights, Baltimore, Md.**—The Black & Decker Mfg. Co. has further extended its permanent organization by the establishing of a branch office at 6523 Euclid Avenue, Cleveland Ohio. Garth A. Dodge, formerly connected with the Austin Co. at its Cleveland headquarters, has recently joined forces with Black & Decker in the capacity of branch manager for the states of Ohio and Indiana, and will be in charge of the Cleveland branch.

**Ackerman, Miss.**—The Mississippi Oil & Gas Co-operative Joint Stock Co., of this place, furnishes the following information. On Jan. 27, 1920, the company opened up a 4-ft. seam of coal by means of an inclined shaft 300 ft. long. The mines are at Ackerman, and the coal is of the semi-bituminous variety. The Mississippi company is now busily engaged sinking the shaft 200 ft. deeper to an underlying 7-ft. seam of coal which is said to rest on a floor of fine grindstone rock. The company holds more than 50,000 acres of territory underlaid with coal, iron ore and clays.

**Pittsburgh, Pa.**—The annual meeting of the stockholders of the Bostaph Coal Co. was held on Jan. 30, 1920, at the office of the company, First National Bank Building, Pittsburgh, and the following officers were elected: Luster L. Corbin, president; L. L. Carson, vice president; Adam W. Tritsch, treasurer; James G. Armstrong, secretary, and W. A. Libengood, superintendent. The Bostaph Coal Co. owns and operates an electrically-equipped coal mine at St. Petersburg, Clarion County, Pa., on the Butler-Kane branch of the Baltimore & Ohio, and produces a high grade of steam coal. The Weaver Coal Co., Inc. of Buffalo, N. Y., handles the output.

**Pittsburgh, Pa.**—The Iron-Trade Products Co., Farmers Bank Bldg., Pittsburgh, Pa., has increased its capital to \$200,000 to take care of its growing business. W. J. Strassburger remains president as heretofore, with the following elected to fill the other positions: J. L. Hukill, vice president; L. J. Adler, treasurer; E. M. Morgland, sales manager, steel department; C. E. Kitchen, sales manager, coal department. Mr. Kitchen was formerly car distributor for the Pennsylvania Lines, then with the Valley Camp Coal Co., and for the past four or five years with the Fort Pitt Coal & Coke Co., Pittsburgh, resigning his position as sales manager to come with the Iron Trades Products Co.

**New York, N. Y.**—A proposition to continue the Tidewater Coal Exchange which, it is reported, will be discontinued on March 1, when the railroads return to private ownership was considered at the annual meeting of the Wholesale Coal Trade Association of New York, at the Whitehall Club, on Jan. 20. A tentative set of rules were considered. The committee of the association that studied the situation says that the exchange, in the nine months, February to October, inclusive, of last year (by reason of the facilities for exchanging coal in the pools) worked a saving in car demurrage of \$731,462 out of a total of \$1,263,218 demurrage. Figured on the individual shipper basis, it means an average saving of 11.3 c. per ton.

**New York, N. Y.**—The Steinmetz Motor Car Corp., with executive and sales offices in the Zigler Bldg., here, has been chartered under the state laws of Maryland with a capital of \$2,000,000, to manufacture a new type of light weight electric delivery truck and an improved electric industrial car for use in manufacturing plants. Both cars are the invention of Dr. Charles P. Steinmetz, chief consulting engineer for the General Electric Co., of Schenectady, N. Y. Dr. Steinmetz will act as consulting engineer to the Steinmetz corporation and will also serve on its board of directors. The concern has acquired a manufacturing plant at Baltimore, Md. A. Robert Elmore is president; J. P. Story, vice-president; Nelson H. Truett, secretary and treasurer.

**Huntington, W. Va.**—A syndicate of Columbus, Ohio, capitalists have purchased the holdings of the Lynne Block Co. operating in the vicinity of East Lynne, Wayne County, W. Va., the price paid, it is understood, being \$100,000 in cash. The Lynne Block mines have been in operation for several years, there being about 500 acres in their holdings, underlaid with a six foot seam of coal. The officers of the Lynne Block company were, Dr. A. K. Kessler, president; L. P. Miller, vice president; M. J. Ferguson, treasurer; S. H. Bowman, secretary and Frank Bosley, general manager. The Columbus people who have acquired the Lynne holdings expect to install much additional machinery and to enlarge and improve the plant so as to materially increase its capacity.

**Beckley, W. Va.**—The Crab Orchard Coal Co., opening up a property near here, will be in the market for supplies and equipment about March or April. The railroad siding to the mine will take 75-85 lb. rail and good second-hand material will be acceptable. Equipment needed includes mining machines, motors and mine cars. Rail for mine track will also be in demand. The company expects to buy electric power either from the Virginian or the Appalachian power companies and will erect a substation at the plant installing rotary converters. The capacity of the plant will be about 500 tons per day. Prince E. Lilly is the manager in charge of the work.

**Beckley, W. Va.**—Semi-official information is to the effect that the capital stock of the Inter-State Coal & Dock Co., of Chicago, will be much increased and that the company will handle a greatly increased tonnage hereafter, adding smokeless coal to the high-volatile product which the company has heretofore been handling. It is well understood that producers of the Winding Gulf and New River fields will become stockholders under the plan for an increase in capital. As a part of the company's plan for handling a heavier tonnage, branch offices will be opened at Beckley and at Tidewater. The Inter-State company has large dock interests on the Lakes, and will now also engage in the export business and will be able under the new arrangement to handle about 2,500,000 tons of coal a year.

**New York, N. Y.**—At the annual meeting on Jan. 20, the following were elected members of the board of directors of the Wholesale Coal Trade Association of New York: C. Andrade, Jr., Matlack Coal & Iron Corporation; George M. Dexter, Dexter & Carpenter, Inc.; E. Kelley Downey, B. Nicoll & Co.; Wallace D. Eyre, Eyre Fuel Co.; E. W. Lewis, M. A. Hanna & Co.; Wilbur A. Marshall, (resigned—vacancy to be filled) W. A. Marshall & Co., Inc.; Charles A. Owen, Imperial Coal Corporation; Henry M. Payne, Bertha Coal Co.; Gardner Pattison, Pattison & Browns; Charles F. Randolph, Thomas, Neale & Co.; W. M. Woodward, Wentz Corporation. At the meeting of the new board of directors on Jan. 21, the following officers were elected: C. Andrade, Jr., president; Charles A. Owen, vice president; Henry M. Payne, treasurer; Charles S. Allen, secretary.

**Huntington, W. Va.**—Having leased a large property in Dickinson County, Virginia the Virginian Elkhorn Byproduct Co. has been organized with a capital of \$300,000 to develop the acreage under lease. The new company has been fully financed by Huntington, W. Va., Pittsburgh, Pa., and Marietta, Ohio, men. The roster of officers includes: J. R. Slayton, president; J. F. Ratcliff, vice president; H. H. Morris, secretary; A. C. Thomas, treasurer; W. H. Cunningham, consulting engineer. On the board of directors are the above named officers and Samuel R. Upham of Pittsburgh; John McLeod of the Carnegie Steel Co., Pittsburgh; Forest Kyger, Marietta. The general offices of the company will be at Huntington. The Company will begin construction work in the very near future on a large modern plant and will, in addition to the plant proper, erect a large number of houses for miners, a church, recreation hall, medical dispensary, etc. The company expects to be able to begin mining at an early date and to ship north and to the seaboard via the Carolina, Clinchfield & Ohio R.R.

**Washington, D. C.**—The appeal of the United States for the revival of certain indictments against J. V. Thompson, of Uniontown, Pa., which were quashed by the United States Court for the Western District of Pennsylvania, is being argued before the Supreme Court. The Government is represented by W. C. Herren, special assistant to the Attorney General, and Mr. Thompson by J. E. B. Cunningham, of Greensburg, Pa.; W. C. McKean, of Uniontown, Pa., and Robert Gibson, of Pittsburgh, Pa. It is now currently reported that Mr. Thompson himself is the principal in the Piedmont Coal Co., which some time ago purchased from the Thompson Creditors Committee, a large block of the Thompson coal lands in Fayette and Greene counties, Pa. Considerable consternation is felt at this action in many quarters. It was at first reported that the H. C. Frick Coke Co. was behind the Piedmont company, color being lent to this supposition by the fact that Mr. Samuel McClay, of Pittsburgh, was named as president of the Piedmont Coal Co., and he is a member of the law firm of Reed, Smith, Shaw & Biehl; attorneys for the H. C. Frick Coke Co.

# MARKET DEPARTMENT

## Weekly Review

*Coal Shortage Continues—Car Supply, Though Improved, Continues to Be a Menace—Stormy Weather Prevents Better Distribution—Influenza Curtails Production—Retail Trade Active.*

HAVING received little coal to replenish their stockpiles, public utilities and manufacturing plants along the Atlantic Seaboard still continued to make urgent demands. This may be exemplified by the conditions in New York City, where the largest local traction company, the Interborough Rapid Transit, had but 7,000 tons, and was using 2,200 tons a day, thus making it necessary to consider pooling reserves to tide over the emergency.

Although alarm was taken at the rate with which the supplies were dwindling, no city was actually without coal for its public utilities. Receipts were below normal, but still these receipts kept up to the minimum requirements.

Moderate weather had been prevalent during the week before last and both consumer and operator hoped this would continue, but it changed to colder and brought with it on the Atlantic Coast the worst storm of the winter. This hampered the car dis-

tribution in those sections and also reduced the production at the mines, but at the present writing the outlook favors the idea that the weather will be milder, and the traffic movement should from these indications be slightly improved.

Influenza, bringing with it a larger number of deaths than the week previous, was also a hindrance to the operators. The number of absentees at the mines was greatly increased, and, moreover, the number of men available for train crews was reduced, thus giving the Railroad Administration another possible excuse for not supplying enough rolling stock.

Then, too, in Canada, where an embargo exists against the smallpox, now rapidly spreading along the lake fronts, trade is suspended. However, there is not quite enough coal to meet the entire demand of those lake ports in the United States; much less is there enough to supply points outside the national borders.

Steam sizes are being used in larger

amount than before, especially where there are no other sizes available. Retailers are having a busy season in such sizes as they are able to obtain, but it seems that the anthracite operators have not received all of the cars that were recently sent West to meet the demands in that section or to anticipate its wants. Cars are still being diverted, and shippers still suffer losses due to confiscation made by the railroads.

In the coke regions the demand from the iron and steel plants still continues, but, there too, the inadequate supply of cars affects the producers, so that although there is enough coke obtainable, only a small amount can be shipped.

Bunkering of foreign vessels was still allowed to continue, but the supply to this trade was limited. Then, too, the stormy weather and high tides, possibly the highest tides on record on the Atlantic coast, made it impossible to get these vessels satisfactorily under way.

### WEEKLY PRODUCTION

A slight increase in the production of bituminous coal was recorded during the week ended Jan. 31. The total output (including lignite and coal coked) is estimated at 10,638,000 net tons. Compared with the preceding week this was an increase of 175,000 tons, or 1.7 per cent.

The recovery has once more carried the line of 1920 production above that of 1917. Present output is thus again in excess of any attained during the last three years, the period over which the records of weekly production extend. The production of the corresponding week in 1917 was 10,512,000 tons; in 1918 it was 9,492,000 tons, and in 1919, 8,316,000.

Production in the month of January is estimated at 48,732,000 tons. Unless revised downward, this establishes a new record for the month.

The achievement is the more remarkable when it is remembered that it was attained under the handicap of severe winter weather and of a transportation situation of exceptional difficulty resulting from the strike.

The production of anthracite during the week of Jan. 31 is estimated at 1,790,000 net tons, an increase of 80,000 tons, or 4.5 per cent, over the preceding week, but less by 31,000 tons than the output of the corresponding week last year.

The cumulative production since the beginning of the coal year, 1919-20, is now 6,429,000 tons below that of the year 1918-19.

The weekly statistics of beehive coke production published by the Geological Survey are based on reports of cars loaded by the principal coke carriers. The 26

railroads reporting loaded 97 per cent of the rail shipment of coke in 1917. On this basis the output of beehive coke during the week ended Jan. 31 is estimated at 473,000 net tons, an increase over the preceding week. The cumulative production from Jan. 1, 1920, to date is 1,976,000 tons, a decrease of 466,000 tons, or 2.4 per cent, compared with the corresponding period last year.

### Atlantic Seaboard

#### NEW YORK

Storm conditions around New York seriously interfering with movement of coal in harbor. Coal blocked in transit to piers. Pier dumpings far below normal through men not reporting for work. Heavy demand for all domestic sizes. Bituminous market chuntic. Public utilities and traction companies in desperate need for coal. Shipping delayed for lack of bunkers. Bituminous stocks at piers increasing.

**Anthracite**—The severe snow storm which hit the Atlantic seaboard last week, covering various cities with a foot or two of snow, has almost completely paralyzed the boat movement in New York harbor. Fortunately, household consumers have protected themselves by heavy buying during the earlier part of the winter, and are now in a position to meet such a condition.

The movement of coal in New York harbor has been restricted to about 25 per cent of normal, through the men not reporting for work at the principal piers. There is a good supply of coal on hand at the piers, but this coal has been frozen

tight in the cars, and before being dumped must go through a thawing process to enable dumpings to be carried on.

Reports from the mines indicate that transportation has been seriously interfered with and at certain sections trains were forced to suspend schedules. Therefore within the next few weeks, we can expect smaller receipts of anthracite coal, due to delays en route to the mines. Also difficulties are said to be arising at the mines, due to the railroad companies having trouble in bringing sufficient cars to the collieries to keep them working to capacity.

Current quotations for company coals, per gross tons, at the mines and f.o.b., tidewater, at the lower ports are as follows:

	Mine	F.O.B.
Pea.....	\$5 30	\$7 05
Buckwheat.....	3 40	5 15
Rice.....	2 75	4 50
Barley.....	2 25	4 00
Boiler.....	2 50	4 25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

**Bituminous**—The bituminous market is in a very precarious position. This is not due to any shortage of soft coal at the piers, to the contrary, the surplus of coal on wheels has been increasing. The situation has become desperate through the inability of the piers to effect dumpings, owing to the piers being partially crippled by the recent snow storm. Also at Arlington, Port Reading and South Amboy men have been reporting to work very slowly, and lack of labor has played a heavy part in reducing materially the number of barges being loaded.

The heaviest call for coal coming in this distressing period is from the traction, electric and lighting and railroad plants. Surplus stocks at these various large plants have been very slim all winter, and last week the storms came near interrupting the movement of all coal by barges which would have meant the stoppage of all transportation in and around New York, including Brooklyn.

Among the utility plants, the New York Edison Co. is one of the largest consumers. At the height of the storm last week, this company had in its station bunkers 22,045 tons of coal; alongside stations, 19,591 tons; at Shadyside, 7,584 tons, and has received by collier from Hampton Roads, 3,245 tons of Pocahontas coal, making a total of 52,465 tons. This is considered a two weeks' supply.

At this same period another large, the Consolidated Gas Co., had enough coal on hand to carry on operations for nine days; the Brooklyn Union Gas Co. enough for two weeks. The Interborough Rapid Transit Co. at its 59th and 74th St. power plants had a surplus on hand of 6,500 tons, and this tonnage is not a week's consumption. All the utilities are protected by ample contracts and have coal en route to the piers, but the railroads are pursuing their confiscatory methods, are taking loaded coal cars regardless of the character of their ultimate consumers.

The steamship trade have been expensive sufferers from the delay in securing coal in the harbor. Large liners have been delayed in port from four days to a week waiting for sufficient bunkers. Loaded cargoes can quickly secure the premium of \$1.35 for spot bunker business.

Government prices prevail on all spot business, which are as follows:

	Mine	F.O.B. Tidewater
Broken	\$5 95	\$7 80
Egg	6 35	8 20
Stove	6 60	8 45
Chestnut	6 70	8 55

#### PHILADELPHIA

**Anthracite stirred by winter storms. Dealers meet demand for fuel. Pea stocks come in bandy. Mines handicapped by weather. Car supply cut. Nut in chief demand, followed by stove and egg. Pea druggo. Independents maintain their 75c. premium. Spring prices under discussion. Buckwheat only active steam coal. Bituminous unimproved. Car supply chief trouble. Heavy snow delays delivery of coal. Consumers anxious for coal.**

**Anthracite**—With an old fashioned snow-storm descending upon the city this week, the retail dealers were beset with requests for coal. With snow on three successive days, and with eight to ten inches on the ground, deliveries were only made with the greatest difficulty. Fortunately, with the large number of people who had put in their coal during the summer, the urgent cases were reduced to a small proportion. As it was, the storm proved to the consumers more than anything else, the advisability of having their supplies on hand.

So far as stocks on hand were concerned the dealers were not in very good shape to stand heavy demands for fuel. There is an extremely small tonnage of stove and nut on hand, and even egg had melted away to the point where most dealers were anxious to replenish. Fortunately for those who simply had to have fuel of any kind, the stocks of pea coal were well able to meet their needs, and the tonnage of this size put out was real encouraging to those dealers who were becoming distressed with the quantity of this size in the yards.

The receipts of all sizes this week have been most meager, and very little prospect is held out for the next week. Storm conditions were even more severe in the anthracite region and on one day this week every mine was closed down due to the men being unable to reach their work through the drifted snow.

The only encouraging feature to the local trade was the fact that with heavy storms outside the bay all tide shipments to Northern coast points were shut off. The result of this was that much coal originally consigned to the piers was diverted to line consignees. However, even a large percentage of this coal was simply consigned all-rail.

Egg had begun to waver and some dealers had begun to report having fair stocks of stove and nut, until it began to look as if a break must come. This is now changed for the time being, but it is not believed that the individuals can insist much longer on their 75c differential; at least it is not believed that they can carry it right up to April 1.

Of course many shippers had been getting even more than 75c. on stove and nut, but the demand at these fancy prices had ceased several weeks since. Despite weather conditions pea coal continues in most abundant supply, and no dealer now expects to be able to clean up his stocks by spring.

**Bituminous**—With the coming of heavy snows the soft-coal situation has grown more acute. Less coal has come into this market this week than in any week for several months past. Despite the fact that the railroads had promised a much better car supply by the diversion of cars from other districts, it would appear that the weather has interfered with their plans. Many of the mines in the Pennsylvania district have received only 15 to 25 per cent of their requirements. In addition there has been almost two feet of snow in that district and the movement of the loaded cars has been very much delayed.

The same holds true of the coal destined here from the Fairmont region, where the haul over the mountains is even more severe than in the Pennsylvania district. Consumers are extremely anxious for coal and are calling on the shippers daily for increased shipments, and from the present outlook it would appear that the situation will likely be somewhat worse before there is any real improvement. There is no coal whatever in the spot market. Even contract customers are receiving but a portion of the fuel consigned to them, as much is confiscated by the railroads.

### Eastern-Inland

#### PITTSBURGH

**Car supplies not increased. Better situation expected soon. Rumor of demurrage charge revision.**

Car supplies in the Pittsburgh district have shown no material improvement, and there is no question but that there has been some loss. The movement is still a long distance from the 70 per cent which it was intimated at the time of the placing of the price restrictions on coal would mark the point at which it would be considered safe to remove the price control.

There is a somewhat larger volume of coal moving in the open market, and buyers in urgent need of coal are generally able to pick up some, though they rarely get the tonnage or the quality they desire.

A much easier market situation is expected to be developed by the fore part of March, through the double influence of better weather, increasing the railroad movement, and of there being a seasonal decrease in the consumptive demand.

There are rumors that the Interstate Commerce Commission has ordered reductions in demurrage charge in coal, but the precise scope of the changes it not known. The operation of the usual demurrage rules, when the movement of coal has been so peculiar, has worked a hardship to many consignees.

The market remains quotable at the Government limits: Slack, \$2.10; mine-run, \$2.35; screened, \$2.60, per net ton at mine, Pittsburgh district.

#### COLUMBUS

**Demand for all grades is increasing, while products are still held below the 50 per cent mark by lack of cars. No immediate hope for improvement is seen. Railroads are in bad shape generally.**

A feature of the Ohio coal trade is the strong demand for all grades, including both steam and domestic sizes. With short stocks in every locality buyers are placing orders briskly and all ask for immediate shipment. With car shortage growing worse instead of better, production in all Ohio fields is still low and this is having its effect on general market conditions. The tone of the market is good and a brisk demand is expected for several months.

Many causes are given for the growing car shortage. Principally is the lack of cars due to the fact that during the strike loaded cars were sent far and wide and the empties have not yet been returned. Still another cause is the lack of motive power on all of the railroads, which mitigates against a promptly handling of both loaded cars and empties. Then the influenza epidemic has played havoc with the train crews and as a result conditions are getting worse as the time passes. The severe winter has also had its bearing on the railroad situation.

Retail trade is exceedingly strong in every respect and dealers are clamoring for stocks. In many cases retail stocks are very low and dealers have been compelled to restrict orders to small lots. Practically no Pocahontas lump is coming

in now and only a limited amount of mine-run. Some West Virginia splints are being sold as a fair tonnage is arriving. The large part of the retail trade, however, is confined to Hocking and Pomeroy varieties. Retail prices are firm at the levels which have prevailed for several weeks.

Hocking lump retails at \$6.25 and mine-run around \$5.75 to \$6. West Virginia splints sell at \$7 for lump. Pocahontas mine-run is quoted at \$7.50@7.75, while Pomeroy lump sells at \$6.50. Jackson lump retails around the \$7 mark.

Steam trade is also strong, as many of the larger consumers are short on stocks. Reserves were reduced during the period of suspension and purchasing agents have been unable to accumulate a surplus since that time. All lines of manufacturing are buying actively with iron and steel concerns and rubber plants in the lead. Public service corporations are also good purchasers. Hospitals and schools are now pretty well supplied. On the whole the steam trade is showing more strength in every section.

#### CINCINNATI

**While there is no concealment of the fact that there is a pronounced car shortage in this territory hampering operations in West Virginia and Kentucky fields, reports from throughout Ohio and Indiana district indicate an increase of more than 100 per cent in cars loaded with coal.**

For the last two weeks of January there were 14,470 cars loaded with coal. For the last two weeks of January 1920 there were 31,305 cars loaded with coal in this district. Delegates from these fields have gone to Washington and returned with promises, but no cars in sight to relieve the situation. Right now there is a shortage of fuel for domestic and industrial uses.

Immense quantities of coal poured into the Cincinnati terminal last week, and were promptly sent on their way. There is no congestion of any kind in the Cincinnati terminal, and no embargoes on it, while in other terminals, Toledo in particular, there are much congestion and a number of embargoes.

Operators say the lack of cars is decreasing production 60 per cent. Labor is also effecting further decreases. The situation is close to a famine in Ohio, especially in the small towns. One of the largest coal operations in this vicinity mined 19,000 tons of coal on its biggest day last week.

The demand is keen for all grades, although it is believed that if all mines in this locality had full car supplies the deficit would be made up quickly.

Instead of improving, the car supply has been even worse that it was last week. Dealers attribute this to a number of causes.

Coal companies report that some of their money is coming in from confiscated and diverted tonnage, but the bulk of it is yet to be heard from. Operators are not taking on much new business as they are far behind on deliveries, and no one wants new business for future delivery at government prices, with a possible chance of the peace treaty knocking the Lever Act out of commission.

Receipts by river were below normal the past week. Dealers are not optimistic as to the prospect of any immediate relief. No one sees any chance of the situation being straightened out to pre-war basis until spring.

Several dealers report that they have still deliveries to make on last summer's orders. The tonnage allotted to jobbers is being decreased weekly according to reports. The mild weather in this vicinity during the past ten days has helped the situation considerably.

### Southern

#### LOUISVILLE

**Better production reported from the state fields. Demand for steam coal continuing good, with block not quite so active, due to retailers' stocks showing improvement, and lack of domestic demand.**

As a result of numerous conferences in Washington with Congressmen, Senators, Railroad Administration officials, committees, etc., and the coal operators' committees from Kentucky, there has been some improvement noted in car supply in Kentucky, and production is on the up grade. It is claimed that the state showed a production of better than sixty per cent last week on the Louisville & Nashville lines, with the exception of the Hazard field, which ran about fifty-four per cent. Other railroads

are managing to provide better car service as a whole.

Demand for steam coal continues very strong, as many industrial concerns are short and are stocking all the coal they can get just now. Prepared sizes are still in good demand, but not as active as they were, as retailers are fairly well stocked, and report a very slack demand from the domestic consumers, who as a rule are well supplied with stocks from last summer and fall, as the winter has been as mild as that of last year, and consumption has been light.

An epidemic of smallpox in the Harlan fields is general, although the cases reported show a light form. It is feared that the disease may spread, and the State officials are discussing plans for placing a quarantine, and would have done it before except for the fact that coal is needed, and it is a bad time to block production.

Heavy rains in eastern Kentucky have resulted in many bridges, rights of way, etc., being washed out of branch lines. Whitesburg reports that it will probably be several weeks before service will be resumed on Carr's Creek and Rockhouse branches of the Louisville & Nashville, into eastern Kentucky, as much track has been totally swept away.

### Lake Region

Wholesale, f. o. b. cars at destination—	
Three quarter lump.....	6.75
Slack.....	6.00

#### BUFFALO

Still the car shortage. Buffalo is sure that it is to blame for the coal shortage. Local association contradicts the opinion expressed in Washington. No relief yet. Anthracite rather scarce.

Bituminous—The situation does not change much. All shippers are busy trying to keep up the supply. They say it would be easy enough if the railroads would stop diverting it to other sources. If they would merely use what they need at present there would not be much complaint, though the idea is that the roads should buy their coal as other consumers do and pay for it when they buy it. This they would never do and it is to be hoped that the agitation is kept up till they are obliged to fall into line, like other consumers.

The chief complaint against the Railroad Administration is that it has lately diverted coal from certain needy consumers and turned it over to others who did not need it any more than those did to whom it was consigned. At the same time it is most discouraging to sell a thing and then find that it is in the hands of someone else and out of your control. So much of this sort of thing has been done lately that some of the city shippers have about given up trying to do business till there is a better understanding with the roads.

At the same time it is the belief of all bituminous shippers that there would be coal enough mined to meet all needs if the cars were moved promptly. Reports come from all mining sections that the sidings are full of cars loaded with coal. Of late the weather has had much to do with the delays, some storms being so severe that trains could hardly be moved at all, but at the same time shippers say that, though coal is going to be short for some time the situation can be kept from getting any worse if the railroads will do their share of the work.

Buffalo is suffering along with other localities. Some of the factories have only a few days' supply and in some instances shippers, though with contract demand for all the coal that the roads will let alone, have come to the rescue and helped out this or that institution or factory.

Prices are not talked about much, but are supposed to be based on the government regulation of \$4.70 for Allegheny Valley sizes, \$4.50 for Pittsburgh and No. 8 lump and three-quarter and \$4.25 for all mine-run and slack, with \$4.70 for Pennsylvania smithing and \$4.60 for smokeless, all per net ton, f.o.b. Buffalo.

Anthracite—The consumption of anthracite has been so heavy all winter that it has been a hard matter to keep the sup-

ply up to the demand. While the weather is not now so severe as it was it is anything but mild most of the time. The trade will take a long breath as soon as the sunny days of March are here, for the consumer is no longer scared and will not order more than he needs. Any day may now see the letting up of the winter severity. It took place on Feb. 6 two years ago. The solid freezing weather after that date gave way to a goodly amount of mild days and the situation became easy.

Buffalo does not hear much of the Canadian situation, for the smallpox embargo is still on and few members of the trade there are coming here. It is really quite as well, so far as the trade as a whole goes, for the shippers here try to distribute the supply according to the needs and what one dealer gets by personal application is merely diverted from someone else. At the same time the rail line trade west is not likely to be satisfied till it is warmer weather. The Upper Lake situation is fairly good, due to the big shipments in that direction last fall, though it does not now look as if any loading into vessels would be done before spring. Some seasons there are hundreds of thousands of tons ready to go as soon as the lakes open.

#### CLEVELAND

All of the local markets appear to have settled down to a low level which the trade believes will continue at least until March 1. Receipts of all grades still are far below normal, but apparently sufficient to satisfy all requirements.

Bituminous—Conditions in the steam-coal trade are little changed, with the possible exception that receipts in the past week have decreased slightly. This reflects poorer car supply at eastern and southern Ohio mines. Moderating weather, it is believed, will work for improvement in the next few days. Because of a shortage of engine crews—due to the influenza epidemic—considerable time is being lost in the yards here.

Despite the unusually small number of cars of steam coal now coming into Cleveland, so far as known no industry yet has had to suspend operations for lack of fuel. Minimum requirements are being met, and that is all. The local trade considers it is doing remarkable, in the light of difficulties confronting it. Demand from apartments and domestic consumers has increased somewhat; to this class of consumers dealers are allotting their supplies on the basis of past purchases.

Belief still prevails here that about March 1 government maximum price regulations will again be abrogated. By that date receipts of bituminous coal here will be close to 70 per cent of normal, it is believed, and most of the domestic demand for this winter will have been satisfied. An open market is bound to result in increased prices, with supply so small and demand so large.

Pocahontas and Anthracite—Demand for these grades, like that for domestic bituminous, has taken on new life the last few days. Dealers are paring down allotments to one ton to one and a half tons. Were all of the Pocahontas and anthracite booked by dealers to come through without being diverted the supply would be ample, dealers say. Diversion constitutes their biggest problem.

Lake Trade—Iron ore selling now is on in earnest, and this is the forerunner of the early fixing of carrying charges. Fixing of ore carrying charges always is followed by the same action in regard to coal. Lake vesselmen expect to get 1918 charges on ore, and this presumably will be the case with coal. In 1918 the carrying charge on coal per net ton from Lake Erie ports to Duluth was 48c. and to Lake Michigan 55c. The 1919 and 1917 rates were 42c. to Duluth and 47c. to Lake Michigan. Increased car supply at the head of the Great Lakes is fast making the docks bare, and early-season shipments will be limited only by receipts at the Lake Erie loading ports.

Prices of coal per net ton delivered in Cleveland are:

Anthracite—Egg, \$12.20@12.40; chestnut, \$12.50@12.70; grate, \$12.20@12.40; and stove, \$12.40@12.60.
Pocahontas — Forked, \$10.50@11.00; shoveled lump, \$9.00@9.25; and mine-run, \$8.00@8.25.
Domestic bituminous—West Virginia splint, \$8.30; No. 8 Pittsburgh, \$6.85@7.00; Massillon lump, \$7.40@7.65; Cannel lump, \$11.00; and Coshocton lump, \$7.35.
Steam coal—No. 6 slack, \$5.20@5.40; No. 8 slack, \$5.20@5.50; Youghiogheny slack, \$5.25@5.50; No. 83", \$6.00@6.25; No. 6 mine-run, \$5.25@5.50; and No. 8 mine-run, \$5.85@6.00.

#### DETROIT

Consumers of steam and domestic coal in Detroit are again confronting a shortage due to failure of railroad transportation facilities.

Bituminous—Though hundreds of cars filled with coal for Detroit are reported on railroad sidings between the mines and Detroit, very little coal is being brought into the city. The blame for this situation is placed with the federal railroad administration.

Alexander Dow, president of the Detroit Edison Co., asserts that many Detroit industrial plants will be compelled to close within 10 days, unless there is hastened delivery of the delayed coal shipments. With only six days' supply of coal on hand, Mr. Dow says the Detroit Edison Co.'s daily receipts do not average a one-half day's supply, although coal in quantity sufficient to meet the company's full requirements is somewhere on the way between the mines and Detroit. Messages have been sent to Congressman Doremus in Washington and A. T. Hardin, Regional Director of the Railroad Administration in New York, urging that action be taken immediately to relieve the situation.

Jobbers assert that representatives of the Railroad Administration in Ohio are continuing the confiscation of coal sent to Detroit, and are diverting it to supply the needs of railroads which neglected to make provision for their fuel requirements last summer. This is regarded as an injustice to Detroit users of steam and domestic coal.

Cincinnati is reported to have a generous supply of coal on tracks, but Detroit consumers are still receiving notifications from the regional director there of confiscation and diversion of coal consigned to them for use of railroads and industries in Ohio.

The failure to get coal to Detroit is attributed chiefly to the railroad shortage of motive power and in part also to the congested terminal yards in Toledo.

Anthracite—Supplies of anthracite in the yards of retail dealers have been largely depleted by the increased demand of household consumers, resulting from the long period of very cold weather in January. While temperature conditions have moderated and the season is now well advanced, the return of extremely cold weather would be likely to find many of the dealers unable to provide for requirements of their customers.

### Middle West

#### MIDWEST REVIEW

With the car shortage as it is, and with shipments delayed, it is very easy to see that there is a strong market for coal, practically all kinds, and all sizes, both steam and domestic. A week or so ago, there appeared to be a slight softening in the market on steam sizes, but this has changed completely, as all coals are now in strong demand.

A representative of the Coal Age spent part of the week in the outlying districts of this territory, in order to get a true idea of what the coal situation is in the middle west. In brief, the situation in the country is that there is a serious coal shortage. Hardly a retail dealer had enough coal in his bins to take care of his trade more than a few days. One of the largest retail dealers in the city of Rockford has had his bins empty for some time. As fast as the mines where he buys his coal ships the cars to him, they are unloaded into his waiting wagons, and delivered to his trade. Practically every dealer has coal in transit, but the transportation question is so unsettled at this time that he cannot count on when his coal will arrive.

The situation with the steam trade is almost the same. Steam coals, however, have not been so scarce as domestic coals. The average steam plant in the territory visited, has from one to two weeks' supply on hand. Of course, manufacturers have some storage coal, but we are talking about the average plant, not the exceptional one. The manufacturing class of consumer has coal in transit, too, but is unable to count on when this coal will reach destination. It was found that one reason for the poor service that the railroads are giving is that their crews are badly crippled with the "flu."

Many freight yards, as well as freight thains, had but one half of their normal crews, the other half being ill or absent for one reason or another. An additional reason why the railroad service is poor at this time is that the men appear to

be very discontented with the present wage scale. They feel that they ought to have more money, and ought to have it before the Railroad Administration goes out of office. This has put them in a discontented frame of mind, and the efficiency per man has dropped considerably on this account.

One item of great interest to the coal industry, in Illinois, is that one of our largest producing companies has discontinued selling its coal at the Government prices. This company is now selling its prepared coal at \$3.10 f.o.b. mines, these mines being located in southern Illinois, and the Government price being considerably below this \$3.10 figure. The reason for this is that the company has been operating for the past six or eight weeks at a loss, as they have been unable to sell their coal at the Government price, and make both ends meet.

The legal advisors of this company argue that under the Levr Act the company is entitled to a fair profit, and in raising the price to \$3.10 they are fully covered. It is generally believed, in coal circles, that this company is acting entirely within its rights, and cannot be molested. It will be interesting to note whether other coal-producing companies follow this example.

**CHICAGO**

Retail trade in Chicago is far better off than others.

A great deal of coal coming into Chicago, comes in direct and this coal is shipped direct from the mines to the city, on the originating line. This does away with delays at transfer points, etc., and consequently the city retail trade are able to figure, from day to day, just what their supply will be.

Eastern coal continues to be extremely hard to get, and is very slow in arriving in Chicago. There is a big demand but very few dealers have been able to place orders. Coal from the West Virginia, Pocahontas and New River districts and Block coal from eastern Kentucky, are most in demand, after anthracite.

Demand for coal in this city is much better than it was a week or so ago, as the car shortage has shown both dealers and manufacturers the difficulties the operators are having in producing enough coal for all. All grades, both steam and domestic, are holding firm, and will continue to be firm in price, until the car shortage situation clears up, which will not be for some few weeks, at least.

**ST. LOUIS**

Car shortage bringing disaster to the coal industry in Middle West. Motive power partly the cause. Warm weather causes easing up in demand. Country districts suffering on account of embargoes. Steam demand keeps up.

The local situation continues fair. This is because embargoes on trunk lines West keeps coal in the local switching limits. The car shortage is worse now than at any previous time. Warm weather has made it easier for the shipper who couldn't ship, but even at that, many outside

places are short of fuel. On the Missouri Pacific lines South no coal is moving because that road has cars for about two days work a week, and the road needs that coal for its own use and is taking nearly everything loaded.

In the Carterville field of Williamson and Franklin Counties the work is light everywhere, although the Chicago, Burlington & Quincy is doing far better than any other road in equipment. A little more than half time is the best that any mines get even when located on three or more roads.

Labor is short, but the men are working at every chance. Influenza is raging through the Illinois coal districts, not so much with the miners as with their families, and this is cutting tonnage down in some places.

Railroad tonnage continues heavy in this district. Conditions are much the same in the Duquoin field, but two days a week is the best that the Illinois Central R.R. can give cars for.

In the Mt. Olive field the mines work almost three days a week. Railroad tonnage is good here, but embargoes cause a one-sided distribution. Steam demand is good, and domestic is far behind on shipments.

In the Standard field the railroads have let up some on their tonnage, but this does not release any coal for the open market on account of no cars. The few cars that are furnished are those from the East. It is impossible to get men to unload them, and at many mines they are too high to go under the tippie.

The market on this coal is easy. Embargoes force it for local use, and while there has been no surplus, lump has been plentiful. For country shipments it is impossible to make promises. Steam sizes are in good demand.

Prices on all coals remain firm. Almost no Franklin County coal is coming in here since the United States Attorney has ruled that on orders taken prior to Oct. 30 where no price was specified, the price to be charged was the government price, regardless of how the acknowledgement was worded.

The United States Attorney at East St. Louis is now charged with an investigation to determine whether there has been a violation of the anti-trust laws in these operators fixing prices and selling conditions.

No smokeless is coming in and practically no anthracite. Prices are the same as last week.

Prices per net ton bituminous coal f.o.b. mine today as compared with a year ago are as follows:

	Williamson and Franklin Counties	Mt. Olive and Staunton	Standard
Prepared sizes (lump, egg, nut, etc.)	2 55@2 70	2 55@2 70	2 55@2 70
Mine Run	2 35@2 50	2 35@2 50	2 35@2 50
Screenings	2 05@2 20	2 05@2 20	2 05@2 20

Williamson-Franklin rate to St. Louis is 10, other rates 0.95.

**MILWAUKEE**

Youghiogheny, pile run	6 25

Dealers report an unsatisfactory market, owing to a scarcity of popular grades of coal. Anthracite about exhausted. All Eastern coal sold up.

There is a fair demand for coal, but the supply is unsatisfactory and dealers are having considerable trouble in satisfying their trade. Anthracite is about sold out, except pea and buckwheat, of which there is a reasonable amount in stock. Pocahontas mine run is the only grade of that coal to be had. There is only enough Eastern coal on hand to meet contracts and dock companies are urging those holding contracts to take in their supplies at once.

The transient trade will have to depend upon rail supplies from now on. The rail situation is better, and cars are moving in and out of the yards in a more satisfactory way than has been the case for weeks. Illinois coal is arriving on track daily, but very little Eastern coal is finding its way here at present. Prices continue unchanged.

**Coke**

**CONNELLSVILLE**

Connellsville production very steady. By-product greatly increased, 15 per cent more pig iron being made in January than in December.

The Connellsville coke trade has given a remarkable exhibition of steadiness and lack of developments since Christmas. The curtailment in production resulting from that holiday was recovered from, and from that time to now there has been practically no change in the rate of production.

The rate has been far from satisfactory, seeing that many more blast furnaces desire a supply of coke than two months or three months ago, but the railroads have shown at any rate that they are not really disorganized, in that they have furnished substantially the same car supply each week since Christmas. The Connellsville, Courier reports show that since Christmas the weekly output has varied no more than about 1,000 tons either way from a mean of about 240,000 tons, which means a remarkably steady gait.

The production of pig iron in the United States in January was 15 per cent greater than the output in December, the increase proving quite a surprise when there was so much complaint in January about coks shortage. Undoubtedly there was a coke shortage, but the furnaces were endeavoring to operate at a much heavier rate than formerly. The increase in supply of coke in January chiefly came from the byproduct ovens, which were better supplied with coal, although they are not yet fully supplied.

The coke market remains stagnant, as the output is going out on contracts. Many of the contracts were made originally at above the Government limits, reinstated Dec. 8, and while it seems clear that the regulations require that invoice prices on such contracts be the Government limits, less than half the coke involved has been adjusted to the lower price. The market remains quotable at \$6 for furnace, \$7 for foundry and \$7.30 for crushed, per net ton at ovens.

The Courier reports production in the Connellsville and Lower Connellsville regions in the week ended Jan. 31 at 241,935 tons, an increase of 2,329 tons.

**BUFFALO**

Coke—The demand is increasing all along the line. Not only are the smaller private consumers in the market, but the furnaces are increasing their demand.

If the jobbers were allowed and profit on it they would be able to work up a good trade, but as it is they only sell to accommodate, for the producers will by no means favor them with a reduction of price. The output can be sold direct.

Quotations continue at \$9.60 for 72-hour Connellsville foundry, \$8.60 for 48-hour furnace, and \$7 for off grades, with \$8 for domestic sizes. It appears that the market for Lake Superior iron ore is good, so that the lake vessel owners are trying to get better carrying rates for next season. The old dollar rate from Duluth to Buffalo was cut to 80c. last season and the vessels made a poor showing, so the effort is making to restore the rate.

# COAL AGE

Volume 17

New York, February 19, 1920

Number 8

## Shall We Store Coal in Summer or Dollars in Winter?

BY R. DAWSON HALL

WING to the unusual degree with which the public, and especially the Railroad Administration abstained from the buying of coal during the early part of the past year, and to the coal shortage that has followed, the coal industry has managed to convince the public that it should buy coal early and spread the production evenly over the entire twelve months. Owing to the mine workers' bitter complaints and their loud demands for more wages, the public has begun to see that it is both fruitful and fair to do something to relieve the seasonal condition of the coal industry.

But it behooves the industry itself to take stock of the situation and question whether there is not some duty that can be performed by those employed in producing coal to alleviate the situation. Unfortunately, the miner is prepared to argue that the consumer, who may be only a poor man after all, should save money and buy coal when he does not need it, in order that he may have it on hand when he desires to use it. He is asking the consumer to exhibit a frugality and foresightedness in which the miner himself is too often lacking

There is no reason why the miner should not work his hardest in the winter and put away his money so that he can meet the trade depression which begins in April and lasts often until the early fall. Too many miners, in the winter, desire to work only as much as will enable them to make living expenses during that period of the year. Three days a week and five hours a day are too often the total effort that can be obtained from the miner, and as a result he is not able to lay by for the period of slackness which occurs in the summer.

Civilization has been described as a foresighted preparation for future needs. The difference between

the lower animals and man is the fact that for the most part the animal is disposed, and able only, to look after immediate necessities. He cannot prepare for the difficulties with which he may be faced in the future.

Too many mine workers are disposed in the winter to let the summer take care of itself. That statement is as true as another which has more general currency, namely that the consumer is willing in the summer to let the winter look after its own problems.

As one looks over other fields of enterprise one notes a different disposition among workingmen. The farmer, the carpenter, the paperhanger and decorator, and the man who moves goods from place to place, just to mention a few of an extremely numerous body of men, work their hardest when the opportunity to work is furnished them, knowing that the chance to labor is not spread in equal measure the year over. By this means they keep needless men from thronging into the industry. They fill the need of the hour, so that no one notices the scarcity of help in the time of need, or at least suffers so much from it as he otherwise would. The labor market is not, therefore, cluttered with men who must necessarily during the period of short demand find time hanging heavily on their hands.

The coal miner is responsible for the slow time from which he suffers during the summer. If he had been more keen to work in the winter and less disposed to leave his work to hunt or to observe all kinds of festivals and to lay-off for all kinds of imaginable causes, he would have had less men in the industry in the summer to compete for the little work that is then available. There should be no difference in the attendance at the mines between the early portion of the fortnight for which payment is made and the last few days toward the end of the pay period.

FIG. 1. PANORAMIC VIEW

## Burnside Colliery of the Reading Company at Shamokin, Pa.

Although Intricate, the Process of Preparation Is Thorough—Concrete, Steel and Other Incombustibles Have Been Employed in Remodeling This Colliery—Much Ingenuity Is Exercised in Securing Ample Water Supply.

**A**LTHOUGH the Burnside Colliery of the Philadelphia & Reading Coal & Iron Co. near Shamokin, Pa., is not entirely new, a number of features both underground and on the surface have been embodied in it that are of interest. Some innovations not in common use have been adopted at this colliery. The surface plant has been entirely remodeled during the past few years which makes the colliery one of the really new and model installations in the southern anthracite coal field. The system of mining in itself is not different from that followed in numerous other collieries in the field, but some uses of materials underground possess possibilities to which attention should be called. That which most impresses a visitor to this mine is the amount of concrete used throughout the operation, particularly at important points. The mine abounds in numerous concrete arches, columns and walls. This can be readily seen in the accompanying illustration (Fig. 4) showing a heading on the bottom lift of the shaft.

All these concrete supporting structures are protected from having any great weight thrown suddenly upon them. This is accomplished by providing a cushion of

timber between their tops and the weight they must sustain. A sudden load would thus be applied to the timbers first and must crush them before acting on the concrete. This tends to prevent the concrete from cracking because of sudden stresses, allowing it to take the

load gradually from the timber. The timbers employed are small, not being over 3 or 4 in. thick. Another underground feature that attracts attention is the mine stable. This is on the second level of the mine and is probably one of the cleanest, best designed and best equipped existing in this section of the coal fields. In compliance with law, no wood is used in its construction except for the flooring, and the columns and supports for the roof are made either of cast iron or concrete. The mangers, built of concrete, are designed for two mules. They

FIG. 2. CAR DUMPING AT TOP OF CAR HOIST

are 10 ft. long with a small box at each end for the grain feed with a large space between them for the hay. These mangers are arranged in one straight line so that it is possible to have a track on which is a small car to carry the feed from the feed room to the manger. Back of the mangers, at a sufficient distance to allow plenty of room for the mules, another track is laid on

OF THE SURFACE PLANT

which the car for removing the manure is run.

One particularly interesting feature of the stable is the method by which the mules are watered. A 10-in. pipe has been cut in half and run just between the feed track and the mangers. This pipe is so arranged that it is kept full of a running supply of fresh water, allowing the mules to drink whenever they desire. Fig. 1 shows the interior of the stable and the watering trough.

To the left of the entrance to the stables there is a large feed room. In this the grain feed which consists mainly of oats together with a little corn is kept in large waterproof iron boxes. The hay is stacked up on one side of the room. Practically no dampness is encountered in this room because a steam condenser here installed keeps the temperature rather hot and drives off the moisture.

#### MEN'S ACCOMMODATION LOOKED AFTER

At each of the shaft stations concrete rooms supplied with benches are built for the accommodation of the men waiting to go to the surface. The approaches to these waiting rooms are so arranged that the men do not have to cross either the loaded or empty tracks at the shaft bottom nor any of the main haulage tracks. This tends toward safety at all times.

The waiting room and the pump room at the bottom of the shaft are one and the same structure. A duplex Jeansville pump 23 and 40 x 12 x 48, is here installed. This has a vertical lift of 730 ft. and a capacity of 2,000 gal. per minute. The water from this pump is discharged into a creek on the surface and flows a distance of about 400 ft. when it is again picked up by another pump and used in the breaker. A description of this latter will be referred to later. The roof of the pump room is supported by concrete arches surmounted by lagging made from old 40-lb. steel rails. Fig. 9 shows the pump end of the waiting room. At the junction of all headings and manways a sign is placed giving full directions as to how to go either to the shaft bottom or to the foot of the main manway.

The underground hospital at this mine is well equipped and absolutely fireproof, no wood being used in any part of its construction. The end wall is built of concrete and has a steel door, and the three closets at the rear are of concrete with steel doors. The floor is of concrete. The roof is the natural rock. Hot and cold water is

supplied at a wash basin just to the left of the entrance. The furniture is substantially built and is covered with black oil cloth. The closets contains a full supply of everything needed in the hospital. On the wall at the right of the entrance is the stretcher. A man is in continual attendance.

On the surface one is impressed with the beautiful lawns that have been laid out and the general cleanliness and attractiveness of the grounds and buildings. This is well shown in the panoramic view Fig. 1. The paths and walkways have been so laid out that it is absolutely unnecessary for any man to cross a single track or conveyor line in order to go from one part of the plant to another.

All the buildings are of the same general design having concrete foundations and concrete sidewalls to a height of about 8 ft. Above this height the construction is of wood. The wood work is painted red and makes an attractive contrast against the green lawns and white concrete.

The men's welfare is as carefully guarded on the sur-

FIG. 3. INTERIOR OF MINE HOSPITAL

face as underground. This company has established excellent wash houses built of brick with concrete floors and wooden roof trusses. The wash house at this mine has a capacity for 340 men. The usual arrangement for taking care of the men's clothes by raising them up

in the air with a chain passing over a pulley together with a locking device is provided. All wash houses are steam heated and have a vestibule so arranged that when the outside door is opened the inside door stays closed and vice versa. This prevents cold drafts from striking the men while they are dressing. One shower bath is provided for each 20 men. The fire bosses, assistant mine foremen, etc., have their own separate wash house which accommodates about 20 men.

The use of the old-fashioned safety lamp has been dispensed with as much as possible at this colliery, these lamps being now used for testing purposes only. The Edison electric head lamp has been substituted. The lamp house has a complete charging outfit for about 100 lamps.

A well-equipped machine, carpenter and car shop combined has been built at this plant. The machine shop proper is provided with a large shear capable of

drops it through an opening into the dull tool compartment. From here the blacksmith takes and sharpens it, after which it is sent to the issuing room and the next morning just before the miner goes underground he goes to this point and procures the tools which are marked by his check and which are issued to him by the room clerk. This prevents a man from getting someone else's tools.

The car-supply house is divided into four rooms. The first two are small and in them the metal parts of the mine cars are kept. Immediately adjoining these is the lumber stock room. This lumber room is divided into a number of sections by iron pipes, which extend from the floor to the ceiling. Each section is distinctly marked showing the size of the pieces stored therein. Each course or layer of lumber is separated from the courses adjoining by small strips of wood allowing a free circulation of air thus preventing warping.

FIG. 4. CONCRETE CONSTRUCTION ON HEADING ON BOTTOM LIFT

cutting a piece of iron 6 in. wide by 1 in. thick, a Leyner Drill Sharpener, (also equipped to make bolt heads), a bolt threader, two forges, one drill press, one steam hammer, one large lathe. This lathe is so arranged that it can cut threads on pipe up to 10 in. in diameter.

The carpenter and car shop is equipped with two cut-off saws, one band saw, one mortising machine, and a two-ton Yale electric hoist for handling the mine cars so arranged that it can be used as a travelling crane. The cutoff saws are provided with special safety devices for the protection of the men as is also the emery wheel. Besides the machinery already mentioned, there is here installed a roll in which the sheet iron that has been used in chutes, underground and on the surface are straightened out allowing its reuse.

#### EVEN MINERS' TOOL HOUSE IS OF CONCRETE

A small concrete building called the miners' tool house is also here used. This is divided into two parts, one for the reception of dull, and the other for the issuance of sharpened tools. When a miner desires to have any tool sharpened he attaches his number to the tool and

The fourth compartment of the supply house is so arranged that in summer it can be used as an outside repair shop. The men working on the cars are well protected from the elements by a large shed roof and are much more comfortable than if working inside. During the winter all such work is done in the carpenter shop.

Another building is divided into three parts, one of which is used for the storage of cement and another for the storage of company tools. At the end of this building is a small room for the use of the men working in the timber yard.

The hoisting engine employed at this mine was built at the shops of the company in Pottsville and has a maximum capacity of 495 cars of coal a day, each car having an individual capacity of  $2\frac{1}{2}$  tons. The most interesting feature of this hoist is the method used to allow either cage to be operated from any level in the mine. The two hoisting drums are entirely separate, but can be fastened rigidly together by means of a toothed clutch. This permits one of the drums to be held stationary by the brake, while the other drum with its cage can be run to any desired position in the shaft.

FIG. 7. INTERIOR OF STABLE

from the office a traveling crane is installed. This crane is a 6-ton Yale electric hoist mounted on a traveler. The crane runs from the salvage yard across the railroad track, past the end of the supply building, across a mine track to a wagon road. This permits the unloading of a railroad car direct to either a mine car, a wagon, or the supply house, or vice versa.

#### MINE VENTILATION WELL TAKEN CARE OF

In addition to the exhaust fan built by the company (with a capacity of 100,000 cu.ft. of air per minute) there is installed in a brick building a 4 x 6 ft. Jeffery blowing fan with a capacity of 100,000 cu.ft. of air per minute. This is driven through a belt by a 50 hp. General Electric motor.

The surface tracks are well laid out as may be seen from the accompanying map, Fig. 5. The breaker at

FIG. 8. SPECIAL NOZZLE USED ON FIRE PROTECTION SYSTEM IN BREAKER

this plant serves three openings, the Stirling slope, the water level and the main shaft. The loaded cars all come to the foot of a Green car hoist. Those from the water-level opening are brought by a trolley locomotive to the hoist as are those from the shaft. The cars from the Stirling slope reach the hoist by means of a tail rope. The cars carrying slate are placed on a separate track and run to the foot of the refuse hoist where they are dumped into a large hopper.

The Green car hoist above mentioned is 400 ft. long and extends to the top of the breaker. The cars enter on the lower deck of the hoist and are so placed that the doors are on the rear end. Upon arriving at the top a trip device is so arranged that the doors are opened automatically. The coal is dumped from the cars, while they are in motion, into a long chute, Fig. 2. The cars themselves never stop. As soon as a car reaches the top and is completely dumped it passes into a cage which lifts it from the lower to the upper deck where the car hoist takes it back down the slope. The cage, that lifts the car, works on a pivot and moves through an arc of 45 deg. There has never been the breakage of a single link on this car hoist. It is operated by a 150-hp. General Electric alternating current 440-volt 3-phase 60-cycle motor.

The water used in the breaker as mentioned before is pumped from the mine to a creek and from thence to a tank on the mountain side 125 ft. above the creek. This tank is made of wood and has a capacity of 90,000 gallons.

At times there is not sufficient water furnished by the mine and the creek for the operation of the breaker. It then becomes necessary to procure more water, and this is secured from the Stirling slope. The water from this slope is pumped to a trough or flume on the mountain side and flows by gravity to the creek at a point near the breaker from whence it is picked up by the breaker pump. The flume is shown on the map, Fig. 5.

The breaker is well protected in case of fire. Pipe lines from 1 to 8 in. in diameter are run throughout the building. Special nozzles are so arranged that the whole interior of the breaker can be drenched. Water is not allowed to stand in these pipes but in case of fire they can be filled and put into use by the turning on of a valve.

The coal after it is dumped from the mine cars is separated into two parts. These each pass over a lump shaker, which separates the lump coal from the balance. The lump coal then passes over a traveler (picking table) where the slate and bone coal is removed. The slate goes direct to the refuse chute. The lump coal from the two travelers passes through a No. 1 roll, and from thence to a shaker which separates the steamboat from the finer sizes.

The bone coal which was picked from the lump traveler passes through a No. 1 roll and then goes into a hopper. At the same time the coal which passes through the lump shaker and through the steamboat shaker is also delivered to hoppers.

From these hoppers the coal is fed by an automatic feeder to double-decked shaker screens on which the steamboat and broken are separated. The steamboat from these two screens is mixed with that from the first steamboat screen and then passes over a traveler on which the slate and the bone are picked, the slate going to the refuse chutes. The steamboat then is passed through a No. 3½ roll and over a shaker and the broken separated. The broken then passes through a No. 3 roll and thence over a shaker on which the egg is separated, going direct to the egg pocket.

The fine coal from the broken and egg screens then passes over a series of shakers where the fine sizes are separated going to their proper pockets.

The fine coal from the screen which separates the steamboat and broken passes over two shakers, which separate this coal into egg, stove, nut, pea, buckwheat, rice, barley and silt. The egg, stove, nut, pea, and buckwheat then pass through the jigs and from the jigs over baby shaking screens, which separate the under-

sized coal. The proper-sized coal then passes direct to the pockets. The undersized coal is carried by an elevator back to the last shaker for retreatment.

The rice and barley coal are not jigged but pass directly from the shakers to their respective pockets or to a storage pile. The bone coal from the steamboat shaker passes through a No. 3 roll and is delivered to the shaker separating the finer-sized coal just before they pass into the jigs.

#### TREATMENT OF EGG COAL

In case there are not sufficient orders to absorb all of the egg coal an arrangement is provided whereby it can pass into a No. 4 roll and then to the shaker that separates the fine coal that has passed through the egg screens.

The silt from all the operations passes into a tank just above the pump room and is fed by gravity to the silt pump which takes it to the top of the mountain to a storage pile. The method by which the coal is handled can be readily seen by referring to the flow sheet Fig. 5.

In the pump room in the breaker there are two sets of pumps, one of which handles the silt, which is smaller than barley in size, to the storage piles on top of the mountain. This pump is 16 and 24 x 14 x 36 in. and handles a sludge containing 25 per cent solid matter to a vertical height of 180 ft. The suction is so arranged that the sludge flows into the pump, by gravity, the storage tank being higher than the pump itself. This makes it unnecessary to agitate the material in the tank.

A separate building has been constructed for the accommodation of the domestic supply. The coal is

FIG. 9. PUMP END OF THE WAITING ROOM ON THE BOTTOM LIFT

FIG. 10. CAR HOIST AT THE PLANT

brought from the bins in the breaker by means of a drag line conveyor to the bins in the domestic supply house. Arrangements are made to handle 6 different sizes of coal. The coal in passing from the bin to the wagon moves over a small screen over which a jet of water plays, washing out the fine material. The coal then passes over a chute into the wagon. At times instead of open wagons, covered ones have to be loaded and a special tilting chute which can be raised and lowered by means of chains is provided for this purpose, and deposits the coal in the rear end of the wagon.

#### CURRENT DELIVERED FROM SUB-STATION

There is no electric plant at this mine, but the current consumed is generated at the Bear Valley power plant, three miles away and is delivered to the sub-station in the boiler house at 2300 volts. The sub-station has two direct-connected motor-generator sets. One of these sets is a Ridgeway machine and consists of a generator delivering 250 volts at 900 r.p.m. and a 300-hp. motor using 2,200 volts 3-phase 60-cycle current. The other motor generator set is of General Electric manufacture. The motor is a type ATI 300-hp. 720 r.p.m. 2,300 volts 60-cycle machine while the generator is a type DMC 250 volts. The switchboard consists of six panels built by the General Electric Co.

The boiler feed passes through a large Cochrane-feed water heater. In the boiler room proper there are installed 18 return tubular boilers carrying steam at 110-lb. pressure. These boilers are all hand fired with a mixture of rice and barley coal.

The ashes from the fires are raked direct to a pit immediately in front of the fire door. This pit is covered with a steel plate, when the fire is not being cleaned. From the pit the ashes are sluiced by running water to a chute on the outside of the building, down which they pass to the bottom of the rock haul.

The power house is entirely of concrete construction.

On the wall of the boiler room directly in front of the boilers is placed a 12-in. spiral steel pipe provided with 2 by 6-in. slots covered with sliding doors. To one end of this pipe is attached an electric blower having a capacity of 5,000 cu.ft. of air per minute. By opening the slots it is possible to secure a circulation of fresh cool air during the summer.

The fuel coal supply is brought up from the breaker by a drag line conveyor to a point on the mountain side above the power house. From here it is discharged into a horizontal drag line conveyor and distributed to convenient points in the building. This also permits the storage of a large amount of coal at this point. By means of a series of chutes this coal can be returned to the breaker for the filling of orders.

The refuse from the mine, from the boiler house and from the breaker is hauled to the top of the mountain by a barney engine hoisting plane. The cars on the top are taken away to the point of discharge by a Porter steam locomotive.

#### Four Billion Balance of Trade

The excess of American exports over imports in 1919 amounted to \$4,017,000,000, a new record, according to a statement issued today by the Bureau of Foreign and Domestic Commerce. Exports for 1919 totaled \$7,922,000,000, as compared with \$6,149,000,000, while imports were valued at \$3,904,000,000, against \$3,031,000,000 in 1918.

December exports amounted to \$681,000,000, a falling off from the \$741,000,000 recorded for November. Imports also fell off for December, the total being \$381,000,000, as compared with \$425,000,000 for November. Both exports and imports were higher than in December a year ago. The imports of gold in 1919 amounted to \$77,000,000 compared with \$62,000,000 in 1918.

# Germany's Coal Supply, Past and Present

BY M. MEREDITH  
Liverpool, England

IT MAY be truthfully said that Geheimer Berg-rat Stutz holds the fate of the German nation in his hand. For upon the coal he supplies every household depends, and so also every industry—all lighting, heating, cooking, and most of the means of transport. The organization over which he presides was established on March 1, 1917. Whatever previous government administration regulated the coal production and distribution during the war was more or less perfunctory. Herr Stutz, unlike most of the German ministers, public officials, and business men, is conversant with the coal problems of England and France and therefore realizes the difficulties which the allied countries have in assisting Germany in her plight—quite apart from the many sacrifices properly imposed upon Germany as the result of the war.

The output of coal in Germany, excluding lignite, amounted in 1913 to 15,960,000 tons per month, and July, 1919, to 11,805,000 tons per month (of which 800,000 tons came from the Sarre and 200,000 tons from Lorraine).

In 1913, 12,233,000 tons were removed from the Sarre district for German consumption, or roughly an average of 1,000,000 tons per month. In September, 1918, the amount received by Germany had fallen to 771,000 tons. From Alsace-Lorraine, in 1913, the amount received for German consumption was 3,816,815 tons, or roughly an average of 300,000 tons per month. In July and August, 1918, the output had fallen to about 200,000 tons per month.

The loss of the Sarre and Alsace-Lorraine coal fields will deprive Germany of an appreciable fraction of the coal supply she enjoyed before the war. The 7-hr. miners' day was not then in practice, and transport facilities and other conditions were satisfactory. Germany's production must suffer greatly for a long time from the reduced hours of labor. The gravity of the situation did not end with the enormous reduction in the amount of coal available. The question of transportation was probably equally as serious. From the Westphalian coal fields in peace time an average of 33,000 coal cars (each containing ten tons) were daily filled and shipped.

## ONLY 23,000 CARS LOADED DAILY

During the war the amount loaded out daily fell to about 23,000 cars. The number of coal trucks now required by the mines in the Ruhr area daily amounts to 18,000, but this number was not available, mainly owing to an insufficient number of locomotives (5,000 engines having been handed over to France), and to the delay in the return of cars in which coal had been sent to France. The result is that on Oct. 1, 1919, 8,000 cars of the 18,000 daily required in the Ruhr district could not be supplied and on Oct. 10, 3,000 of the daily 18,000 could not be provided. Were it not for these difficulties the output would certainly reach 17,000-18,000 cars daily, and even more, as considerable quantities of coal lie on the mine-dumps—in the Ruhr district 669,381 tons (Oct. 6), in the Upper Silesia 575,000 tons (Oct. 4). The short-

age of locomotives was also intensified by the moving of the beetroot and potato crops.

From Upper Silesia the number of coal cars filled and despatched daily was: In peace times, 13,000; in war time, 11,000, and now, 4,000.

The Prussian railways in 1918 held reserves for 35 days' supply, and traffic was then much greater than now. Traffic on the Prussian railways has now been reduced to 56 per cent of the traffic of 1913, and the coal reserve amounts only to enough for 8 or 9 days (Oct. 8, 1919). In 1918, Bavaria, Baden and Wurttemberg had stocks for 56 days ahead. Bavaria has now coal for only 20.4 days (coal transport by the Rhine closes in winter Wurttemberg, 23.2 days, and Baden, 11.5 days).

## SITUATION IN BERLIN BECOMES CRITICAL

In 1918 there was an average of 31 days' coal reserve in the gasworks throughout Germany. In 1918 Berlin had 35 days' reserves. On Oct. 1, 1919, the reserves at all the gasworks in the German Empire amounted to 1.8 day's supply, and in many places gasworks had been closed. On Oct. 8, 1919, the Berlin gasworks held only 4 days' reserve, and quite recently 2 days' supply was all that was available. The situation in Berlin was critical because, during the winter months, the railways in Upper Silesia are occasionally snow bound, thus interfering with the regular delivery of coal to the metropolis. It was more than likely that, before the winter was over, Berlin would be in darkness from time to time. In order to cope with the emergency, it was intended to institute public kitchens, at which the poorer classes could cook their food when the gas was cut off from their homes. Needless to say, political difficulties and riots were to be expected if there was no gas for heating or lighting in Berlin.

## RATION CARDS DISTRIBUTED

Every consumer is rigorously rationed under a system of monthly ration card. A certain amount of coal is allocated to various districts or towns on the basis of the size of the towns and the industries therein. Before the war the average consumption per family of four persons was at least three times as great as that permitted at present. Furthermore, of the amount promised by ration cards (i.e., one-third of peace-time consumption) to communities of under 10,000 inhabitants, for three months, including August, 1919, the public had only received from the coal controller, in Prussia, 40 per cent; in Bavaria, 42 per cent (where some Bohemian coal had been received), or an average for the whole of Germany of 41 per cent. Of the amount promised by the coal controller, in towns of over 10,000 inhabitants, the population had only received, in Prussia, 56 per cent; in Bavaria, 31 per cent. Great towns, such as Berlin, had received 62 per cent of their promised allotment.

Industries were strictly rationed, and were controlled by the coal controller's inspectors, some of whom never left the premises in which the coal was

consumed. The amount the coal controller had been able to give, from April to July, inclusive, of the restricted supply was, in percentages:

Chemical industries.....	53.1 per cent
Glass and porcelain factories.....	46.4 per cent
Textiles.....	54.5 per cent
Iron and steel industries (metal and smelting works, mining, etc.).....	64.2 per cent
These received more because many lay near the coal mines, and therefore required no railway transport.	
Machine and locomotive works.....	45.3 per cent
Kali and salt works.....	59.1 per cent
Gasworks.....	60.9 per cent
(Of the allowance, which was again based on 80 per cent of their pre-war consumption.)	

At this time, agriculture suffered most of all industries from the dearth of coal. In many parts of eastern Germany a great area of land could not be tilled because no coal was procurable for steam plowing. In east Prussia nearly one-third of the land has not been plowed, and, could not be tilled last autumn so that at best only the spring sown crops of lower yield can be cultivated. On the fertile island of Rugen 25 to 30 per cent of the 1918 grain crop has not yet been threshed for want of fuel.

#### FUTURE MINING PLANS PROPOSED

It has been proposed that the 8-hour day should be resumed forthwith, and 25 per cent higher pay given to the miners during the winter in order to secure the coal required. The men's representatives have refused these terms, but it is possible the promise of a 6-hour day two years hence may lead to the acceptance of the 8-hour day now. Another suggestion to encourage the men to further work is that a premium should be granted so that if a man received 50 marks per day for producing two tons of coal per day he would receive a premium of 20 marks for an additional half ton, and 30 marks for the next half ton. Others recommend that the minimum wage now payable to a miner, even if he practically does no work, should be reduced by 30 to 50 per cent, so as to make him work and that unemployed pay should be abolished, or be confined to the supply of one hot meal daily at some institution.

## Galvanized vs. Blue Sheet Iron Chute Linings

BY DEVER C. ASHMEAD  
Tarrytown, N. Y.

IT HAS been the custom for a number of years to use blue-annealed sheet iron, black sheet iron, or common sheet iron as it is variously called for chutes or chute linings in the breakers, tipples, washeries or the rooms of the coal mines, particularly in the anthracite regions of Pennsylvania but to a less extent in the bituminous coal fields. This sheet iron is also used for linings of pockets so that either the pocket will not wear so rapidly or when the surfaces are of slight inclination the coal will slide easier and at a less angle.

This sheet iron is a great help in the handling of the coal but it often causes delays especially in the morning by the coal sticking, requiring the miners or their helpers to push or "buck" it out of the way. This same trouble occurs in the breaker and during the first hour or so in the morning considerable difficulty is encountered because of the chutes clogging requiring men to maintain strict watch to keep them clear. After an hour's run this trouble generally ceases and no difficulty is encountered throughout the day.

This trouble arises from the rust forming on the sheet iron when standing over night and until this rust is removed by the action of the coal passing over and polishing the surface the coal is liable to stick and hang. New sheet iron gives better results than old, no matter how well it may be polished. This is because of the fact that as the sheet iron is used the continual rusting and polishing eats a series of small pits into the metal and these pits have a retarding effect on the particles of coal. of course they only directly affect the fine coal but this in turn affects the larger grains, and as a result there is a tendency to retard the general movement of the coal.

During the war the Trevorton Colliery Co. at the Katherine Colliery near Shamokin, Pa., had considerable difficulty in procuring sheet iron for use in the mine. As a result George H. Jones, the general manager, finding that he could secure galvanized sheet iron, purchased one ton for trial purposes. As a result of this trial this firm has been using the galvanized iron for a period of two years with excellent results and has entirely abandoned the use of the old plain sheet.

This company found that the new iron did not rust and that coal slid just as well in the morning as it did at any other time of the day. Because of this non-rusting galvanized sheets do not pit and therefore there are no minute depressions to retard the fine particles of coal. By actual tests the coal company claims that it was found that coal will slide on an angle of 8 deg. less pitch on galvanized sheet iron than it will be on blue-annealed sheet iron.

The pitting of the blue-annealed sheet iron has another effect besides retarding the passage of the coal. The pit immediately makes a point of attack for wear since it is a thin spot in the sheet. The retardation of the coal by the pits has a tendency to cause a grinding action on the iron at this point and as a result a hole extremely small in size is formed. Possibly hundreds of these minute holes are formed close together and as a result the wear soon connects them and the sheet is worn out.

With the galvanized sheet iron this tendency to wear in the same manner as the blue iron does not exist. The galvanized iron does not rust and as a result, rust does not cause pits and therefore points of intensified wear. Galvanized iron of course wears but its wastage is even and not concentrated as is the case with the blue annealed sheet iron.

#### ADVANTAGES OF GALVANIZED SHEET IRON

A further proof as to what advantage the use of the galvanized sheet iron has over other kinds is shown by the figures the Trevorton Colliery Co. has compiled. During the year 1916 it used 53,000 lb. of the blue annealed sheet iron and in 1917 it used 30,000 lb. of galvanized sheet iron. In 1917 the production of coal was 33 per cent greater than in 1916 and the use of sheet iron was 43 per cent less. This shows an actual saving of about 40,000 lb. of iron.

From the above the following conclusion may be reached: That galvanized sheet iron is better for use in mines and breakers than blue-annealed sheet iron because coal will slide upon it at a lower angle; chutes will not clog; it will not wear out as rapidly since pitting will not take place; it wears out evenly and slowly giving a longer life.

As a result of two years use of galvanized sheet iron at this colliery a number of other operators are beginning to use it instead of the old blue sheet iron.

# Slush Breaker and Mine-Water Problems

BY JOHN GRIFFIN  
Scranton, Pa.

**SYNOPSIS**—*Breaker or washery slush is now a nuisance and in most cases represents an actual waste. Breaker water is often a source of no inconsiderable expense. Much of the coal in the slush can be recovered and the water clarified by means of suitable apparatus. Mine water may also be made available for breaker use. A source of additional output and profit is thus made available.*

**I**N THE anthracite-coal region wet methods of preparation have been almost universal. In the so-called Middle and Southern fields they have for years been used and now the Northern field has almost entirely adopted them.

The enormous quantity of water required for wet preparation of anthracite is indicated when it is realized that a breaker shipping 2,000 tons per 8-hr. day requires about 2,000 gal. per minute of water or 4,000 tons per day. To obtain this quantity of water is often a problem and the disposal of the waste water or slush in such manner as to prevent stream pollution presents many difficulties.

The gradual extension of the mines has caused a constant increase in the volume of mine water made, most of which must be pumped. According to the reports of the mine inspectors of Pennsylvania for the year 1916, approximately 600,000 gal. per minute of water was pumped from the anthracite mines. Almost invariably the pumping load is continuous for 24 hr. per day, which means that 3,500,000 tons of water must be handled per day. The extension of the mined area has also had a decided effect upon the character of the mine water. The oxidizing action of air on ground waters in mine workings, active and abandoned, results in the formation of free sulphuric acid and soluble acid sulphates. Any appreciable quantity of these produces a water extremely corrosive upon metals and destructive to vegetation. The extension of mine workings increases the production of these corrosive agents and as a result mine waters tend to grow more and more corrosive, increasing their menace as a pollutant and

when used for washing coal, increasing the maintenance cost of breaker equipment enormously.

It will perhaps be of interest to take up these problems separately, analyze the situation and point out the results of the latest steps toward handling these problems most effectively and economically.

Breaker slush at present is a nuisance and source of expense to the coal companies, whereas it should be a source of additional revenue because of its large content of coal which can be recovered and made available for industrial or domestic use. An extended study of the problem shows that an increased recovery amounting to from 3 to 5 per cent of present production is easily possible. Fully 3,000,000 tons per year can be added to anthracite production from the same mine output. This does not include additional tonnage that can be recovered from culm banks.

## POTENTIAL VALUE OF SLUSH RECOGNIZED

The coal companies, recognizing the potential value of coal wasted in slush, and desiring to reduce pollution of streams to a minimum, have endeavored to retain as much of the solid contents of slush as possible in settling ponds or by back filling underground. The settling pond proves an inefficient expedient since the retained solids

STOCKPILE OF DORR FINE COAL

are generally unfit for use, without preparation, and the water discharged still carries large quantities of fine solids which pollute the streams. Back filling with slush is generally uneconomical as the cost of operation is not warranted by the solids retained.

Settling tanks, consisting of a bucket elevator partially submerged in a tank, or a slow moving conveyor

line working in a trough are in operation and furnish a partial solution of the problem. In these machines no attempt is made to recover all the solids, and the size of the recovered coal cannot be definitely controlled. Maintenance costs on the bucket-elevator type of recovery are usually excessive.

A consideration of the quantities and character of the solids in breaker slush will throw considerable light on the problem. As a rule the total solids amount to from 4 to 10 per cent. They vary in size from steam sizes down to the finest slime. An ash analysis of the various-sized solids shows that generally the coarser sizes are reasonably low in ash, or mainly coal, while the ash content increases with decrease in size.

It will be noted in Table 1 that, generally, the ash content increases markedly in the material finer than 100 mesh. It is often possible to obtain a product relatively low in ash by recovering only the plus 100 or plus 60 mesh material. If not, the impurities in these sizes can be removed easily and cheaply, which is not the case with the material finer than 100 mesh. This generally from 40 to 60 per cent of the solids in slush can be recovered as a fuel of relatively low ash. As a rule the balance of the solids must, at present, be considered an absolute waste because of their high ash content. When low in ash they can be recovered for use as pulverized fuel, or they may be briquetted.

The latest development in a plant to recover the fine coal from breaker slush is illustrated in Figs. 1 to 4. This plant is designed to recover the plus 60 mesh coal, without elimination of slate or sand, and with a minimum of undersize: its operation is entirely continuous.

EQUIPMENT USED

The equipment used consists of a Dorr hydroseparator and three Dorr duplex classifiers. The function of the hydroseparator is to reject the bulk of the water and the greater part of the solids finer than the desired size. It also serves to stabilize the quantity and dilution of the feed to the classifier. The classifiers serve to eliminate the remaining fine solids and at the same time to dewater the finished product. No screens are used and in consequence maintenance costs are exceedingly low.

The Dorr hydroseparator consists of a wood tank

with an overflow launder around its periphery at the top and a discharge at the center of the bottom. Suspended in this tank is a mechanism consisting of a central vertical shaft with radial arms at the bottom equipped with ploughs to bring the settled solids by means of the slow rotation in the mechanism, to the discharge opening at the center. The slush is fed at the center of the top of the tank. The area of the tank is proportioned to the average flow of slush, so that the solids larger than 60 mesh fall to the bottom of the tank while most of those smaller than 60 mesh, together with the bulk of the water, overflow the edge

of the tank. The overflow may either go to waste or be clarified for reuse, as described later. The underflow, containing the coarse solids, is controlled by a suitable valve by means of which a any desired proportion of water and solids may be maintained. The operation of the separator is not materially affected by the wide variation in rate of flow usual with breaker slush. The separator can be designed to make a sizing split either coarser or finer than 60 mesh.

The Dorr classifiers receive the pulp discharged from the bottom of the

separator and complete the removal of the water and of material smaller than 60 mesh. The classifier consists essentially of a settling box or tank in the form of an inclined trough open at the upper end and equipped with mechanically-operated reciprocating rakes which remove the coarser material as fast as it settles onto the bottom of the tank, the water and finer solids overflowing at the closed lower end. The tank is set at a slope of 2½ in. to the foot for a 60-mesh split.

The rakes are made up of angles attached to the bottom flanges of two channels placed on edge. The construction of the rakes is similar to that of a ladder, and they are carried by suitable hangers from bell cranks connected by rods to levers which terminate in rollers. These latter press against cams attached to the crank shaft, which is driven by belt through a counter shaft and spur gears. The rakes are lifted and lowered at the opposite ends of the stroke by the action of the cams. The horizontal motion is produced by cranks and transmitted to the rakes by connecting rods. The motion imparted to the rakes is, therefore, a forward stroke along the bottom of the tank toward

INTERIOR OF DORR COAL RECOVERY PLANT

TABLE I. PER CENT ASH ANALYSES OF VARIOUS SIZES OF COAL IN SLUSH

Mud size used Per cent total solids	Minersville ¾ in. round 8.04			Shenandoah ¾ in. round 8.58			Wilkes-Barre ¾ in. round 5.00			Scranton ¾ in. round 3.86

Recovery as per cent of present shipments		3.0			5.6			4.3				3.8

the upper discharge, a lift of the entire rake at the end of the stroke, a return stroke in the elevated position, and a lowering to the initial position at the end of this stroke, thus completing the cycle of movement.

The classifiers used are duplex, that is, they consist of two rakes operating in parallel in the same tank. The rakes are arranged to alternate in such manner that the weight of the moving parts is largely counter-balanced and the power required is only that necessary to overcome friction and advance the settled solids. The design is such that all bearings are well removed from exposure to the material treated.

The feed is delivered to a trough across the tank toward the lower end, where the water forms a pool

to recover the plus 60 mesh material with a minimum of undersize. The product recovered averages between 150 and 160 dry tons per day and carries about 15 per cent undersize, and 22 to 26 per cent of ash. The product is delivered to the stock pile with 35 to 40 per cent moisture which drains down in a few hours to 15 to 18 per cent moisture. The loss of plus 60 mesh material is low. The plant is operated by one man and driven by a 10-hp. motor. At present capacity, and allowing 20 per cent fixed charges of which 10 per cent covers amortization of plant, the first charges per ton of product amount to 7 to 8 cents. Three months of operation have shown no maintenance expense. The plant will handle nearly double the present tonnage, as it was

designed to treat slush made through a  $\frac{3}{16}$ -in. round screen.

Where it is desirable to obtain a product relatively low in ash some sort of wet concentration device must be used. Operating experience in the bituminous fields and tests run with anthracite slush indicate that the concentrating table, similar to that used in lead, zinc and copper concentration, offers the most advantages. Adjustments of the table allow a wide range of products. In general the loss of coal in the refuse increases as the ash in the finished product is reduced. Test runs with this device indicate a capacity of 4 to 6 tons per hour and a coal product as low as 10 per cent in ash, if desired. Usually 15 to 18 per cent ash is satisfactory and in such case the waste product will analyze between 65 and 75 per cent ash, giving only a small loss of coal in the process.

The concentrating tables are installed between the hydroseparator and the classifiers, the latter machine thus treating only the coal product from the tables. Any pyrite contained in the slush can be recovered in the same operation.

Operation in the soft coal fields indicates that 10 cents per ton will cover tabling costs.

The recovery of fine coal, plus 60 to 100 mesh, as a usable fuel removes about one-half of the solids which would cause pollution. The recovery of the balance in the form of a thick sludge which can be stored easily is possible at relatively little cost for equipment and operation. At present between 3,000,000 and 4,000,000 tons of such material are discharged each year from breakers and washeries in the anthracite region.

The equipment available for this recovery is the Dorr thickener. Its arrangement is identical with the Dorr hydroseparator already described. By simply enlarging the area of the tank, the settling velocity of the slush is so reduced that practically all of the suspended

PLAN AND ELEVATION OF HYDROSEPARATOR

which extends only part way up the sloping tank bottom. The granular solids settle through the pool and are advanced up the inclined bottom of the tank by the rakes. After emerging from the pool and while ascending the sloping bottom the solids have an opportunity to drain before being finally discharged from the upper end of the tank. In this case, the material minus 60 mesh overflows the closed end with the water. The classifiers can be adjusted to make a separation either finer or coarser than 60 mesh.

This plant is handling from 3,500 to 4,500 gal. of slush per minute made through a  $\frac{3}{16}$ -in round screen and containing 5 per cent of solids or a total of 360 tons of solids per day. The ash content of these solids average from 30 to 32 per cent. The plant is designed

solids settle to the bottom and the water overflows the edge of the tank clear or only slightly turbid. Such thickeners in sizes up to 200 ft. in diameter are in operation in other industries. The tank can be constructed of wood, steel or concrete as proves most advantageous.

In the bituminous fields this system is now being introduced. Practice in this field is referred to in a paper by J. R. Campbell, presented at the Chicago Meeting, September, 1919, of the American Institute of Mining and Metallurgical Engineers; also by Ernst Prochaska in his paper on "Preparation of Bituminous Coal," VI., in *Coal Age* of July 3, 1919.

At the washery referred to, which has a capacity of 4,000 tons of raw coal per 16 hours, two 70 ft. diameter Dorr thickeners were installed to take the overflow from the washed-coal settling basin, and one 50 ft. thickener for the overflow from the refuse settling basin of wasted coal.

Mr. Campbell gives the following results on the operation of the two 70 ft. thickeners:

	Influent	Effluent	Underflow
Water, per cent	98.0	99.7	47.2
Solids—coal, per cent	2.0	0.3	52.8
Specific gravity, per cent	1.0052	1.0008	1.1580
Total per cent	100.0	97.0	3.0
Tons per hour	500.0	485.0	15.0

The underflow carrying 47.2 per cent of moisture is either fed with the coarser washed coal to the mechanical dryers, or delivered on top of the washed and dried coal going to the coking plant. The latter practice adds about 3 per cent of moisture to the final washed product.

Since Mr. Campbell's paper was written, the installation of a third 70 ft. thickener has been completed.

The three coal thickeners now take a total slush feed amounting to 6,150 gal. per minute containing 275 tons of coal per day. Of this there are recovered 269 tons per day or 97.87 per cent in the form of a sludge carrying 48 per cent moisture.

The overflow carrying less than 0.15 per cent. of solids, together with the overflow from the 50 ft. thickener, is returned to the washery circulation. This return constitutes 98 to 99 per cent of the water fed to the thickeners. The net consumption of water exclusive of evaporation, plant leakages, etc., is thus reduced to 40 to 45 gal. per ton of coal washed. Anthracite practice requires approximately 480 gal. of water per ton of finished coal when the breaker slush is run to waste.

In the anthracite fields no such thickener plants are as yet in operation, but tests made at several plants show the following possibilities:

Volume to be treated, gal. per minute	1,500
Solid content, per cent	1.3
Size of thickener, ft. dia.	72
Solids in overflow, less than, per cent	0.03
Removal of solids, per cent	98
Recovery of water, per cent over	95
Sludge, gal. per minute	55
Dry solids per day, tons	35
Cost of thickener plant, complete	\$10,000 to \$12,000
Direct annual operating costs	\$500 to \$600
Annual fixed charges at life of 15 yr.	\$2,000
Operating cost per gal. of water recovered	1c.

### MINE WATER TREATMENT

Of the total of 600,000 gallons per minute of mine water pumped, no data are available as to the quantity which contains an excessive amount of sulphuric acid and acid sulphates. Although the mining companies appreciate the expense entailed by the use of such water in preparing coal, their efforts have been directed toward obtaining supplies of good wash water rather than development of methods to purify the mine water.

That much mine water is of a corrosive nature is well

recognized. It would appear that more such water is produced in the Middle and Southern fields than in the Northern field.

It is well known that all the free acid and most of the acid sulphates may be removed by treatment of the water with finely ground limestone or milk of lime. The free acid is precipitated as calcium sulphate, while the reaction with the acid sulphates precipitates both calcium sulphate and iron and aluminum salts.

The precipitate is bulky giving a dirty water and one that will produce rusty-looking coal unless the solids are removed.

That such treatment of mine water is feasible has been demonstrated at one of the large coal mines in the Pittsburg district, where 1,250,000 gal. of mine water per 24 hr., containing about 30 grains per gallon of free acid and 60 grains per gallon of combined acidity, is being regularly treated. A 70 ft. diameter thickener serves to clarify the treated water, the precipitated solids being continuously collected and removed in the form of a thick sludge. The clarified water contains but a few grains per gallon of acid sulphates and suspended solids, and has little effect upon piping or other iron parts.

In the anthracite region some much worse mine waters exist. One mine pumping station is handling 430,000 gal. per day of water carrying 130 grains per gallon of free acid and 140 grains per gallon of combined acidity. This water, of course, cannot be used for washing coal, but goes direct to the river.

### TYPICAL REGIONAL SITUATION

The following is perhaps more typical of the situation in this region and this water is used in a breaker. This mine water amounts to 1,300 gal. per minute, and the analysis shows 29 grains per gallon of free acid and 39 grains per gallon of combined acidity, a total of 68 grains per gallon. It is of interest to see what this means as to quantity of sulphuric acid per day. In 8 hr., 624,000 gal. of this water are put through the breaker which contains 2,500 lb. of 100 per cent sulphuric acid. Added to this is the corrosive effect of the combined acidity, which is equivalent to another 1,000 lb. of 100 per cent acid. Eight tons of storage battery acid (electrolite) contains about 3,500 lb. of 100 per cent sulphuric acid. In other words, the equivalent of one ton per hour of battery acid is going through the breaker.

This corrosive agent can dissolve about 1,400 lb. of iron per day. If only 5c per pound is taken as the price of the iron, \$17,000 worth can be consumed per year. The assistant general manager of the company operating this breaker estimates that the extra breaker maintenance cost due to the acid water amounted to roughly \$20,000 annually.

The cost of plant to treat this water will be about \$10,000. Direct operating costs would be about \$4,000 annually, of which lime accounts for \$2,000. The total cost per 1,000 gal., including liberal fixed charges, is about 3½ cents.

### BREAKER WATER SUPPLY

It will be seen that the clarification of slush besides solving the pollution problem offers a source of water suitable for breaker use at little expense—from 1c to 2c per 1,000 gal. In many cases breaker water can be obtained only by pumping from considerable distances against high heads, and sometimes in case of drought,

can be obtained only by purchase from water companies at considerably in excess of 2c per 1,000 gal. In such cases, clarification of breaker slush would be justified by the water-supply cost only.

In conclusion a brief summary of the universal application of these processes to the entire hard coal region will indicate the comparatively small investment required for the benefits obtained.

The recovery of fine coal would produce upwards of 3,000,000 tons annually of high grade anthracite that can be converted into a fuel for either industrial or domestic purposes. The investment cost would amount to only about \$3,000,000 for the entire region. The product certainly would be worth 50c per ton at the mines and, at this figure, the coal companies could make 15c a ton profit as a minimum.

If this fine coal were briquetted it would add 8 per cent to the domestic anthracite production. The market for briquets as a domestic fuel is gradually being established. Briquets can be sold at about the prices of pea coal and would in this case yield a net profit of 50c per ton. The investment for briquetting plants to handle this 3,000,000 tons of recoverable coal would be about \$10,000,000.

At the present time the investment in the anthracite industry per ton of annual production averages about \$8. This combination of fine coal recovery and briquetting shows less than \$5 investment per ton.

## Industrial Unrest and Its Cure

BY JACK L. BALL

**W**ILL 1920 prove to be a banner industrial year, or will it be one of sabotage, strikes and discontent? Conservative minds are moving heaven and earth, as it were, to discover a panacea for the present industrial unrest; radical leaders—spurious to the core—are busily devising ways and means in an attempt to destroy the sane and logical ideas that are advanced for the good of all the people.

The basic industries of the United States are so closely co-ordinated that when the production of one is lessened it ultimately affects, through reaction, not only the employers or employees of that particular industry, but the whole population of the land.

As citizens of the United States we are granted the privilege of life, liberty and the pursuit of happiness. If we are good citizens, we should see that these three privileges are enjoyed by our neighbor as well as ourselves. We are fully agreed that every man has the right to benefit in the fullest measure possible from his labor, but no man or group of men should be accorded the power to exact a wage higher than his or their actual earning capacity warrants. When this occurs one group profits at the expense of the others.

Money is a necessary and essential commercial medium. We can exchange it for those commodities which bring to us and our families the pleasures that the world has to offer. Moreover, it should be a pleasure for a man to labor if he expects something in return that he can utilize in a beneficial way. If our work is a task and we cannot enjoy it, we should find a pleasure in the beauty or usefulness of that which we produce and in the ultimate pleasure that it will bring to others. It is becoming more apparent, however, that we are asking for a beautiful and bountiful harvest without the necessity of planting the seed; asking the other

fellow to give his fullest measure so that we may secure something for nothing.

People have acquired a kind of madness in their attempt to buy all the luxuries—not actual necessities—that can be produced. The war with its super-demands and abnormal wages is, in a measure, responsible for this condition of affairs. With the cessation of hostilities it was thought that people would drift back to their former mental equilibrium of pre-war days, but the reverse is true. The universal idea is to demand and exact wages without proportionate production. John Smith proved the fallacy of this Bolshevik principle at Jamestown three hundred years ago, proved it false because it conflicted with economic law.

Panics began in the United States in the first quarter of the 19th Century and have occurred with astonishing regularity ever since. Soap-box orators assert that panics—call them hard times if you wish—are caused by over-production. Well-informed men maintain exactly the opposite and say that prices are due to under-production and the resultant price inflation. If the prevailing thoughts in the minds of the workers continue in the same channel as now, the business and industrial world will not be stabilized except by a gradual upbuilding after the crash that is certain to come. And this panic that the country is facing cannot be blamed upon over-production.

If the men and women workers of the United States would put forth their individual maximum efforts for 90 days, the prices—not wages—of the necessities of life would take a slump such as legislation could not effect in five years.

Employers and employees have always misunderstood each other. Russia has proved to us that capital and labor depend directly upon each other. When these two powerful factors of our economic life are bound together by the link of mutual understanding, and when all men are willing to perform an honest day's work for an honest day's wage, than, perhaps, a universal remedy will have been found for our present and demoralizing industrial ills.

Let us put into the discard the bitter feelings of both the past and present and employ in their stead those new standards of benevolence, which the war has given us, so that we may effectively combat the common enemy of the human race, industrial unrest.

## Philadelphia Retailers Protest

Confiscation is again becoming general, states the National Retail Coal Merchants' Association in a letter to its members, and not only that but diversions are being made from retail merchants to manufacturing plants. There is of course a great chance for the playing of favorites.

They advised the retail coal trade to have recourse in every case to the only remedy available, namely "that which we advised the Director-General we were going to follow. We stated to him that claim would be filed for all coal taken, whether confiscated for railroad use or diverted from retail consignees, covering in addition to all general damages, all special damages, including the following:

- Loss of profits.
- Increased cost of doing business.
- Damages for loss of or interference with business, or by delaying or preventing delivery of fuel to consumers.
- Causing breach of contract by the retailer to supply fuel.
- Injury to reputation of business and character of service, etc.

## Waterford Lake Power Plant of the Dominion Coal Co.

BY FRANK H. KNEELAND  
 Editorial Staff, *Coal Age*

**D**URING the past few years much interest has been manifested in the application of pulverized coal to power purposes. This fuel unquestionably possesses certain obvious advantages while as experience has shown its use also involves equally obvious disadvantages. Among the former are usually claimed perfect and smokeless combustion, high efficiency, and great flexibility. The disadvantages include considerable complication of machinery, the expense of drying and pulverizing the fuel, and usually a high upkeep charge entailed by the intense local heat generated.

Although it has long been known that coal pulverized to a sufficient degree of fineness would burn while suspended in air, practical application of this principle has only been made during comparatively recent times. Pulverized fuel has been successfully applied to cement burning of several years and to metallurgy and steel manufacture (e.g. the open hearth furnace) for a shorter period. Its application to steam generation involves several problems not encountered in the processes above enumerated and unless special attention is here given to furnace construction, difficulties arise.

The secret of successfully burning powdered fuel in steam-boiler furnaces appears to lie in providing sufficient combustion space within the furnace to insure complete combustion of each coal particle before it shall leave the furnace or come in contact with the comparatively cold boiler surfaces. Various expedients have been resorted to in order to secure this result.

One of the first boilers to successfully use powdered coal was the Bettington. This boiler had its origin in South Africa, and was designed especially to burn this fuel.

Briefly the Bettington boiler consists of an annular mud drum connected by water tubes to a compound

**This is believed to be the only coal-mine power plant in America burning powdered coal under Bettington boilers. The fuel arrives at the plant as slack and is ground when and as needed. One of the advantages of these boilers is the rapidity with which steam can be raised.**

upper drum. This upper drum is made up of a central portion or drum proper surrounded by and connected with an annular ring into the lower surface of which the above mentioned water tubes are expanded. The tubes are thus arranged in the form of a skeleton cylinder open at the bottom. Special fire

brick with a U-shaped cross section straddle the tubes and extend from the upper or steam drum to within two or three feet of the lower or mud drum and form the furnace of the boiler. Pulverized coal and air are blown through a water-jacketed nozzle placed in the centre of the lower end of the cylindrical furnace. The burning fuel thus passes upward through the centre of the furnace, turns outward and moves downward to the lower end of the fire brick baffle or furnace lining. The products of combustion here again turn outward and move upward between the boiler tubes and through the superheater to the breeching or uptake. The whole boiler is, of course, incased with a suitable jacket.

The Bettington boiler is by no means a common type of steam generator in America. While a few have been imported and installed it is believed that only

one coal-mine plant West of the Atlantic generates current from steam raised in these boilers fired with powdered coal. A description of this plant will, therefore, doubtless be of interest.

The plant in question is located on the shore of Carney Lake about 8 or 10 miles from the town of Glace Bay, Nova Scotia. It is the property of the Dominion Coal Co., and is known as the Waterford Lake Power Plant. It is not at or in close proximity to any coal mine and fuel is shipped to it in railroad cars. The lake furnishes an abundant and cheap supply of water, which was probably the reason for placing the plant where it is. Current here generated is transmitted to and is consumed at various coal developments throughout the mining region of which Glace Bay is roughly the centre.

As may be seen in the accompanying illustration, the plant consists primarily of two buildings in close proximity to each other. One is a frame and corrugated iron structure and houses the boilers while the second is of brick and contains the turbines, generators and auxiliary equipment.

In the boiler house four stoker-fired 500 hp. B & W boilers are installed on one side of the central alley. They are equipped with economizers and superheaters. On the opposite side of the building stand four Bettington boilers each 18 ft. in diameter and 26 ft. high, the tubes being 20 ft. long. Each of these boilers has a rated capacity of 20,000 lb. of steam per hour. These boilers also are provided with economizers and superheaters as well as having air heaters in the breeching or uptake through which the air blast is drawn and heated prior to passing to the furnace nozzle. Steam is normally carried at 180 lb. gage pressure and 150 deg. superheat.

#### HOW COAL IS BROUGHT TO THE BOILERS

Coal is brought to the plant in railroad cars and dumped into a hopper. From here it is taken by a bucket conveyor and delivered into the overhead bunkers in the upper portion of the building. Downcomer pipes from the bunkers lead the coal to the hoppers of the Taylor stokers serving the B & W boilers and to the hoppers of the beaters or pulverizers grinding the coal for the Bettingtons.

Four pulverizers are installed or one for each powdered-coal boiler. Any two of these machines will however run all four of the boilers. These pulverizers are combination machines—they not only grind the coal but furnish the blast by which the fuel is carried to the so called carburetter and subsequently to the boiler furnace. In the carburetter the fine coal is screened, the coarse particles being returned to the pulverizer while those of suitable fineness are sent to the boiler. Two of the pulverizers are driven by 35 hp. 550 volt motors running at 1,500 r.p.m. The other two pulverizers are driven by steam turbines.

One stack is provided for each two Bettington boilers. This is placed directly above the economizers in the rear of and between the boilers.

The pipes carrying fuel from the pulverizers to the furnaces are of sheet iron and about 12 in. in diameter. The orifice in the fuel nozzle is 9 in. in diameter.

In addition to the equipment above described the boiler house contains two vertical Weir and one Terry feed pumps. Two American Blower Co. fans, direct connected to engines made by the same firm, supply draft to the Taylor stokers.

In the power plant or generator room proper the following machinery is installed: One Rateau horizontal steam turbine, direct connected to a Siemens Bros. 2,500 kv. 6,600 volt, 273 amp. 3 phase 25 cycle generator. This unit operates at 1,500 r.p.m. One General Electric horizontal turbine direct connected to a 2,000 kw. 6,600 volt, 195 amp. 1,500 r.p.m. G. E. generator. These two machines operate in synchronism with each other and in parallel with two other power plants about 15 miles distant also owned and operated by the Dominion Coal Co.

#### ABUNDANT EXCITING CAPACITY FURNISHED

Two exciter units, Siemens Bros. 45 kw., 110 volt, direct current, shunt field generators, are joined by a flexible coupling and driven by a Belliss & Morcom engine at 525 r.p.m. Another exciter unit consists of a Canadian Westinghouse 75 kw. 125 volt generator driven at 290 r.p.m. by a direct connected 12 x 12 in. Ideal engine made by the Goldie & McCulloch Co., of Gault, Ont.

An eight-panel switchboard provided with all necessary switches and instruments is installed in one end of the generator room. A 30 ton hand-operated crane spans the building and may be traversed from end to end.

As may be seen in the accompanying illustration, barometric condensers are installed just outside the building. Circulating water is drawn from and returned to Carney Lake. About 28½ in. of vacuum is normally obtained. Under ordinary circumstances the circulating water is handled by a turbine-driven, single-stage centrifugal pump. Two engine-driven centrifugal pumps are also kept as standbys. These machines as well as two vacuum pumps are installed in the basement of the power plant. All steam piping leading to the power units and auxiliaries is also carried in the basement. This relieves the turbine room proper of all piping and makes possible an extremely neat appearance.

As was stated in the beginning one of the chief objections to a pulverized fuel boiler is the high upkeep charge. This has not been entirely escaped in this boiler plant and repairs are frequently necessary to the firebrick furnace lining and to the beaters or pulverizers. On the other hand the Bettington boilers are efficient steam makers and extremely "lively" in starting. With cold water in the boilers at the start a full head of 175 lb. of steam has been developed in them in exactly 25 min. after the fires were lighted.

#### OVERALL EFFICIENCY OF THE PLANT

An idea of the overall efficiency of the plant may be gained from the fact that power is delivered to the bus bars of the switchboard for 3 lb. of coal fed to the boilers for each kilowatt hour. The coal burned is slack with a heat content of about 13,000 B.t.u. per pound.

The plant above described is under the direct charge of Everett McPherson, a machinist by trade, and a man of wide experience. V. McFadden is mechanical superintendent of the Dominion Coal Co., thus having general supervision over all its mechanical equipment. And since this company is probably the biggest coal producer in Canada and operates many mines in North-eastern Nova Scotia, many of which include submarine areas, it will readily be appreciated that the Waterford Lake Power Plant is only one of several of its generating stations.

## West Virginia Accountants Organize

AT a meeting held at the Hotel Farr, Huntington, W. Va., Jan. 30, 1920 a number of accountants who were present organized what is now known as the West Virginia Accountants Association.

The following officers were elected for the fiscal year ending Dec. 31, 1921: M. P. Morris, president and general manager; R. L. Baugham, vice president; H. E. Meadows, secretary; T. M. Bowman, treasurer; J. C. Riggs, director.

The object and purposes of the association are:

1. To standardize the science of accounting, and bring about plenary understanding of theory, practice, technology, terminology, books, forms, files, formulas, rulings, spacing, sizes, weights, colors, binding and references, incident to administration and representation of the affairs of corporations, associations, individuals and the public generally.

2. To co-ordinate the actuarial, statistical and economic experiences of statesmen, lawyers, bankers, chemists, experts, civil and mining engineers, accountants and administration men to the point of common understanding of commercialism, and the fundamental principles of accounting, the elements of cost and component factors thereof.

3. To classify by decimal system of expansion and contraction the assets, liabilities, earnings and expenses of corporations, associations, individuals and the public generally.

4. To perfect and adopt by resolution, uniform standards for balance sheets, financial statements, profit and loss statements, cost sheets, inventories, tax renditions, and all other forms necessary and incident to authentic representation and common understanding of comparisons.

5. To acquire, own and operate all real estate, construction, equipment, other property and investments, necessary and incident to the successful maintenance and operation of the association and branches thereof.

6. To solicit and admit to membership corporations, partnerships and individuals and to charge and collect fees and dues as regulated by the constitution and by-laws of the association.

7. To examine and admit to membership, accountants, auditors, statisticians, economists, secretaries, clerks, stenographers, bookkeepers, cashiers, pay roll clerks, store managers, purchasing agents, civil and mining engineers, experts and efficiency men, foremen, superintendents, managers, officials and directors, and to award certificates as to their proficiency and knowledge of association methods, and to charge and collect fees and dues as regulated by the constitution and by-laws of the association.

8. To practice the profession of public accounting in all of the United States and foreign countries as regulated by the constitution and by-laws of the association.

9. To investigate, examine, audit, adjust, report, and certify the legal, financial and statistical affairs and conditions of corporations, associations, and individuals, and to charge and collect fees therefor as regulated by the constitution and by-laws of the association.

10. To assemble the membership in conventions at stated periods and to provide ways and means for the furtherance of the best interests of the association in

accordance with the statutes, made and provided and as regulated by the constitution and by-laws of the association.

President Morris stated further that the association was not a competitive organization, the nature of the work being mainly a missionary service to the industries, and that the association had an authorized capital of \$10,000.00, the major part of which has been subscribed in order to become legally responsible and to protect the association against malignment and being characterized as a union of bookkeepers, or an employment agency by those without the state, whose desire it is to capitalize the necessities of the industries.

## Urges Continuance of Coal Exchange

AT THE annual meeting of the New York Wholesale Coal Trade Association recently held in this city the members voted in favor of a continuance of the work of the Tidewater Coal Exchange. On March 1 when the railroads are turned back to private ownership and the Railroad Administration is dissolved, the Tidewater Coal Exchange is also slated to pass out of existence. Therefore, in view of the large savings which have accrued to those using the pools, efforts are being made by the above association to put the exchange on a permanent basis. Charles A. Owen, chairman of the committee to furnish data concerning the work of the exchange, addressed the meeting and presented very vital figures concerning past history of the exchange, and also of its necessary character to tidewater shippers.

Mr. Owen stated that in nine months from February to October, 1919, the exchange had effected a saving in car demurrage of \$731,462, out of a total of \$1,263,218, figured on the individual shipper basis, or an average of approximately 11c. per ton. Mr. Owen told the members present that through the pooling arrangement a daily average of around 6,000 cars on hand was sufficient to take care of the harbor trade, whereas if we resorted to the old method of every shipper for his own coal, double the number would be necessary to be kept on hand, thereby materially increasing demurrage bills.

A vote was taken and it was unanimously agreed that a committee of seven be appointed to investigate further and adopt a policy to be outlined to members of the trade at a meeting to be held at a later date.

## Industrial Safety Codes Discussed

ON DEC. 8 there was held at the Bureau of Standards in Washington a notable conference on industrial safety codes, at which there were representatives of practically all organizations of a national scope interested in any of these wide phases of industrial safety. The conference grew out of an earlier one held on Jan. 15, 1919.

There was a thorough discussion of the whole situation, the consensus of opinion being that there should be a large number of industrial safety codes—perhaps 50 or even 100—developed during the next few years.

## Coal Age Index for Last Half of 1919

The index to *Coal Age*, Volume 16, covering the last half of 1919 is now ready for distribution, and will be sent free to anyone addressing a request to the subscription department of *Coal Age*, New York City.

# Government Returns For 1919

**P**RELIMINARY returns on the byproduct coke industry indicate a total production for the year 1919 just short of 25,000,000 net tons.

Compared with the record year, 1918, this was a decrease of 1,000,000 tons or 4 per cent. The decrease was general with the exception of New Jersey, Ohio and Pennsylvania. In the last-named state the completion of new byproduct ovens brought output to approximately 5,750,000 tons, an increase of 25 per cent over 1918. Ohio ranked second with 5,450,000 tons and Indiana, third with 3,560,000.

The year 1919 was a turning point in the history of coke manufacture in the United States. For the first time the tonnage of byproduct exceeded that of beehive coke. In 1918, 46.0 per cent of the total coke output was

made in byproduct ovens, the percentage from beehive ovens being 54.0. In 1919 these proportions were reversed, 56 per cent coming from byproduct and only 44 per cent from beehive ovens.

The rise of the byproduct coke industry from its small beginning in 1893 is shown below:

ESTIMATED PRODUCTION OF BEEHIVE COKE BY STATES IN 1919 WITH COMPARATIVE (NET TONS) FIGURES FOR 1918

	1918 (Final)	1919 (Estimates)
Pennsylvania and Ohio	22,276,000	14,861,000
West Virginia	2,717,000	1,061,000
Alabama, Tennessee and Georgia	2,042,000	1,695,000
Virginia and Kentucky	1,535,000	1,201,000
Colorado, Oklahoma, and New Mexico	1,401,000	558,000
Washington and Utah	510,000	274,000
<b>United States total</b>	<b>30,481,000</b>	<b>19,650,000</b>

# THE LABOR SITUATION

## To Present Public's Viewpoint

The Coal Commission appointed by President Wilson to investigate the bituminous industry on Feb. 11 fixed Tuesday, Feb. 17, as the day to begin hearings of the public's side in the inquiry, when representatives of public-utility corporations, individual consumers, manufacturers and consumers were to appear, this phase of the inquiry to run on for at least a week.

It is stated that the commission has received a number of protests from representatives of the consumers urging that it take no action that would increase the price of coal in the market. These protests have carried with them strongly-worded requests to be heard, after the respective cases of the miners and operators were in.

## Committee on Price Investigation Established by Coal Commission

Chairman Robinson of the Coal Commission announced the personnel of a sub-committee of five which will consider the effect of the recent 14 per cent wage advance upon operators' profits. The sub-committee will consider the protest of the operators, voiced before the commission, that, under the fixed price for coal of \$2.35 a ton, at the mine, together with the wage advance, their profits have disappeared, while many mine operators actually face possible bankruptcy.

Commissioner Robinson, touching upon the fixing of prices, before the Coal Commission has emphasized the point that the commission had no authority to fix any prices, and that it did not expect to ask for such authority from the President, even in the event that it considered a readjustment of prices necessary, until the commission had agreed upon its final award.

In announcing that the commission would look into the matters of coal prices, he said:

"There have been references and statements made by both operators and miners bearing on the subject of past and present profits of operators," said Mr. Robinson. "The commission desires to say that it will treat the question of profits as one of the factors, and that in making its award, including the fixing of prices, if it shall fix prices, it intends to use available evidence on profits both as it relates to wage scale and to prices, if the latter are to be fixed.

### COMMISSION WITHOUT POWER TO FIX PRICES

"The commission desires to say further that it has no authority to fix prices, that it does not expect to ask for authority until it has unanimously agreed on its final award, including the fixing of prices, if it concludes that there is a need for price fixing. In making the award the information furnished to the committee will be used, together with other information bearing on the subject.

"It is the belief of the commission that this method will enable the determination of cases brought before it more quickly than as if it now had the authority to fix prices, and should take up cases separately with the idea of adjusting the particular situation.

"It is fair to assume that the President expected that the 14 per cent increase would be applied by the operators and miners in a manner to stabilize the industry, pending the survey and final award of this commission. In making this award the commission will consider and determine the application of the 14 per cent average wage increase."

The sub-committee is as follows: John P. Cameron, chairman, a Pittsburgh mine operator, regional distributor for central Pennsylvania under the Fuel Administration during the war; C. E. Leshner, of Washington, D. C., statistical expert for the Geological Survey; Percy Tetlow, of Salem, Ohio, statistical expert for the United Mine Workers of America and a secretary of the Bituminous-Coal Commission; D. M. Reynolds, of Pasadena, Cal., Western representative of the Council of National Defence, and Paul White, of Cleveland, Ohio, son of John P. White, the latter of whom is the representative of the miners on the Bituminous-Coal Commission.

The sub-committee will sit in Washington, devoting itself entirely to the question of fixed prices, and their effect on operators' profits, in relation to the wage advance. Chairman Robinson, in announcing the personnel of the committee, reiterated his statement of Monday that the commission has no authority to fix coal prices and will not determine whether to ask the President for authority to do so until after it has "unanimously agreed in its final award." Mr. Robinson added: "In making the award the information furnished to the sub-committee will be used, with other information on the subject."

The operators have contended before the commission that no wage advance to the miner is needed and that even the 14 per cent advance was not necessary to enable the miner to meet the advanced cost of living.

As regards coal shortage, Mr. Robinson recently said: "The commission also desires to say that both the operators and miners have referred to a car shortage, and car irregularity, but the reference has been general. The commission desires to give to both operators and miners, opportunity of presenting reasons, so far as the same can be established, for this shortage and irregularity."

The various sections outside the central Competitive region are presenting their individual cases before the commission. In particular the Central Pennsylvania region is anxious for the complete elimination of car pushing, urging that mine cars are increasing in size and that the placing of them at the face or on the parting is work appropriate to mule or locomotive.

## Check-Off Restored in New River Field

The check-off has been restored in the New River field. It has been the subject of controversy between the operators and the miners of that region ever since the contract of Sept. 1 was abrogated automatically on Nov. 1 by a strike of the miners of the New River field, in violation of their contract. Decision to restore the check-off was reached at a meeting of members of the New River Operators' Association held in Charleston on Wednesday, Feb. 4. The meeting of the operators' association preceded a joint meeting between representatives of the New River Operators' Association and the representatives of the miners of District 29 of the United Mine Workers of America.

As soon as a decision had been reached at the operators' meeting, representatives of the miners were called in and a joint meeting was held, and the decisions reached will doubtless end the 10-day strike that has prevailed at a number of plants in the New River field. This action on the part of the operators followed a long interchange of communications with the authorities at Washington. The chiefs at the capitol have insisted that the "status quo" of Oct. 31 must be restored despite the fact that the miners

broke their newly signed contract without any occasion on Nov. 1.

It is considered likely, although no definite statement has been made to that effect that the restoration of the check-off was directed from Washington. On the other hand there were several of the larger companies in the New River field who had continued the check-off system and there were still others who were insisting that the check-off be restored, as by doing so, production would be no longer hampered. As a result of the meeting of Feb. 4 the contract of Sept. 1, although broken by the miners when they went on strike, has been restored as of Feb. 1, the deduction for union dues, etc., commencing on that date. The three principal items in the agreement are as follows:

"1. No fines are to be imposed, no initiation fees collected and no penalties of any character imposed, nor is any form of discrimination to be shown against any employee of any operating coal company in the New River field that is a member of the New River Coal Operators' Association, on account of such employee continuing to work, or resuming work at any time after the strike was declared on Nov. 1, 1919. All employees are to be reinstated to their former employment as nearly as possible.

"2. It is understood and agreed that the operating companies, members of the New River Coal Operators' Association, will not collect any dues, assessments, initiation fees or fines, for the period previous to Feb. 1, 1920.

"3. The employees at any of the mines of the members of the New River Coal Operators' Association are to resume work immediately and are to be notified to do so not later than Feb. 5."

While the miners who had been on strike were prepared to return to work on the date fixed in the agreement, they were unable to do so in many cases owing to the fact that no cars were available until the very end of the week or until about Feb. 7, so that the signing of an agreement did not accomplish immediately just what had been hoped for.

Since the first pay day in November no check-off has been in effect in the New River field except at the operations of two large companies. The Charleston agreement of Feb. 4 establishes it everywhere except in the mines of the group of operators in the Glen Jean section, who resisted about 10 per cent of the field. They have always resisted the check-off and the closed shop.

## Not Safe to Shoot at Workingmen

After a second trial, Tony Stafford, an unnaturalized Italian, a resident of this country for fifteen years and an organizer for District 29, United Mine Workers, was found guilty of an attempt to commit murder in the first degree, by a jury in the Criminal Court of Raleigh County on Jan. 28. Stafford was charged with being the instigator of an attempt to kill a number of mine workers at the plant of the E. E. White Coal Co. at Glen White, W. Va., on Nov. 16, 1917. Stafford was indicted as one of the principals and was tried at the October, 1919, term of court, when the jury was unable to reach a verdict. The situation was very tense at that time, the miners having made numerous threats that the defendants would never be brought to trial.

At the second trial the chain of evidence was more complete and the jury lost no time in reaching a verdict. Briefly it was alleged that Stafford had advocated the use of force to win a strike of miners even though the Government was then at war, and in pursuance of a general plan of violence Stafford organized a party who, stationing themselves on a hillside overlooking the Glen White tippie proceeded to riddle the tippie with bullets endangering the lives of men who had just come up on a cage at 4 p.m.

Stafford was implicated in the trouble on Cabin Creek in 1912-1913 and was sentenced at that time to serve a term in the penitentiary, but was pardoned by Governor Hatfield. Stafford has frequently boasted that the law could not touch him. Others awaiting trial as accomplices of Stafford are Lawrence ("Peggy") Dwyer, international board member of the United Mine Workers for District 29, and Obe Clendenin, an organizer.

## Colorado, Wyoming, Montana and Washington Present Striking Evidence

On Feb. 9 the Bituminous Coal Commission took up an inquiry into the bituminous mountain districts of Colorado, Wyoming, Montana and Washington. Striking evidence showing the wage earnings of miners in those districts was offered by Mr. White, representing the operators of Montana. Mr. White put in figures taken from the mine records, showing that contract miners earn from \$7 to \$10 a day, and that day labor is paid \$5.64 to \$6.95 a day. The day wage rate has increased in Montana since 1915 from 70 to 90 per cent.

"During the year 1919 practically every commercial operator in the state," Mr. White said, "has operated at a loss, even though selling prices have advanced from 30 to 55c. a ton for lump coal." He urged that some way be found to make the miners responsible for their contracts with the operators. Strikes in violation of contract, he said, have worked a tremendous hardship to the industry.

## Will Try to Unionize Pocahontas

During the visit of President John L. Lewis of the United Mine Workers of America to Bluefield, W. Va., in the Pocahontas region he indicated that a corps of organizers would be sent into the Pocahontas field just as soon as a plan of campaign was completed. He therefore devoted part of his time while in Bluefield in trying to find quarters for such organizers and other members of the United Mine Workers' staff who might be detailed to such work. He also sought to establish financial connections at a Bluefield bank, but arrangements for the opening of an account were not completed during Lewis' stay owing to the fact that the question of accepting a deposit had to be submitted to the directors of the bank.

Sentiment not only among the coal operators of Bluefield and other sections but among business men in general is decidedly against the organization of the Pocahontas or any other region now unorganized, in southern West Virginia, and decided views were expressed by citizens of Bluefield, the Bluefield chamber of commerce adopting a resolution against the proposed organization of the miners. On the other hand, organized crafts and brotherhoods in and around Bluefield are favorable to the proposed unionization of the southern coal fields.

Much doubt is expressed in coal circles as to the ability of the United Mine Workers to bring their campaign for the organization of the Pocahontas and other regions to a successful outcome. Announcement has been made from time to time by district officials of the U. M. W. of A. in West Virginia that they expected to make an attempt to organize the miners of the Pocahontas field. Operators, therefore, were not unprepared for the present move of the United Mine Workers' organization and if the southern fields are unionized it will not be without a struggle, as the operators of the sections which would be affected have made plain since the advent of Lewis and his associates.

## Strikes in the Indiana Field

Twenty-one strikes in the bituminous coal fields of the Terre Haute field during the month of January, causing a loss of 28 days of mining time, were reported at the headquarters of the Indiana Bituminous Coal Operators' Association at Terre Haute, Ind. Practically one-fourth of the mines in the field, numbering 85, have been on strike and the loss in production amounted to 28,108 tons.

## Want Maintenance Work Divided

Instead of striking for shorter hours and less work, miners employed at what is known as the Webb mine at Shadyside near Wheeling, W. Va., went on strike during the last week of January for more work, asserting that they were entitled to a share of the maintenance work given other day men when the mine was idle.

## Making Trusts by Enactment

THE PLAN to consolidate the railroads is but a scheme to make them forcibly into trusts. When each region becomes an organic whole there will be no other plan open to the public than to prevent the trusts by Government ownership or control, from oppressing the public, for at all times, if the oppression is not actual, the potentiality of it will be a nightmare (imaginary possibly, but nevertheless a nightmare) to the politician.

A certain tyrant once said: "Oh that the people had but one head that I might lop it off." Congress seems to pray for monocephalous railroad systems that it may use them in the same manner.

---

## A League of Essential Industries

WHAT IS here said is really not about essential industries at all, but about industries that the people regard as so essential that they wish to curb and control them. Some are not so really essential, as sugar for instance, and all are essential only in part, because in many cases they only minister to inessentials.

Then, again, the automotive industries say they are essential, but if you test the persons engaged in them by saying they are so essential that profits and wages must be curbed they declare with vehemence that they are essential but do not have that element of essentiality which makes them fit subjects for price control.

But all those who are attacked, which must eat soured corn to please their masters, the luxury industries, should be one in demanding justice. Not from the coal men should come a call for unfair freight rates, not from railroad men should come a cry for unfair coal prices, not from the street-car and power companies should be heard a shout for mine control, not from the packers should there be complaints against the transportation industry. All the essential industries should be one in a cry for justice and fair dealing. The public needs require that the essentials stand together for their rights. Otherwise they will perish and the public will suffer.

A host of distributors, middlemen and caterers to public foibles, a crowd of people who have money for folly and none for useful things, surround the public utilities with their selfish clamor. Let us rally together round a standard of fair play and honest purposes. The owner of the *Dearborn Independent*, who in a few years has made his tens of millions in making automobiles, is leading the hosts against those who are making scarcely a profit and often a loss.

The multi-millionaires of nondescript industries are clamoring for subservient utilities that will serve as men with the hoe. We want no trust but merely a truce. Let every useful industry, assailed by the children of fashion and ease, leave every other useful

industry alone and unhampered so long as its course is fair and honorable. Let us forget the past or remember it only in proper proportion. Have not the industries that make trade-marked proprietary articles also watered their stock and profited? Are they not doing it yet? Why hunt up the past of the essential industries and be stoneblind to the present of the non-essential?

---

## Where Bolshevism Failed

NO ONE knows just exactly what Bolshevism is. Some would define it as the ownership by the worker of the tools of his employment and the receipt by him of the entire outcome of his labor. Neither of these provisions will work in practice, but they have at least, a goodly outward appearance.

Whatever Bolshevism may be in theory, in practice it is confiscation pure and simple. The Bolshevik takes what another man has labored to produce. If the Bolshevik does not destroy it, he uses it for his own convenience. What is the outcome? No one wants to produce, for it will be taken from him when he has produced it, and if he needs anything for which he has not labored there is always the way of loot to get what he covets. Consequently the well-disposed person produces little and hides what little he creates, and the ill-disposed person relies, at least for a while, on getting by force what he believes the better-disposed person will produce. Soon no one is producing, and then, at last, everyone becomes convinced of the necessity of toil and the ill-disposed realize that loot as a law of being has its disadvantages.

It is a long way from Russia to the United States, but still there are people who need to learn that the errors of Bolshevism are prevalent here and ensconced in high places. Railroads in the anthracite region have built and put in service many coal cars that their mines may work steadily. The Railroad Fuel Administration finding cars in demand in Chesapeake & Ohio Ry. territory takes cars from the anthracite fields and puts them to hauling coal in West Virginia. Does that encourage car buying either in the anthracite region or by the Chesapeake & Ohio? The first will not buy what it is not allowed to use, and the second will not purchase cars when they can be taken from some other more foresighted company.

Similarly, when industrial companies were allowed increased car allotments by reason of their ownership of freight cars, they bought them freely and helped to equip the railroads. Afterwards, when they were forbidden that advantage they bought no more, and the supply of cars failed to keep up with the demand. The use of the cars was practically diverted from their owners and granted to others who had no share in the ownership.

In like manner the repeated grant of the right to seize coal in transit to the Railroad Administration did not encourage it to buy and store coal in the summer. It felt that it would not be so well assured of its supply by storing as it would be if it were permitted to commandeer it at pleasure.

Eventually commandeering of product and controlling of industry must cease. It is a "babying" of the weaklings of industry and a disheartening of the strong and self-reliant. It gives to the infrugal the product of the frugal; it hands to the careless the savings of the prudent; it makes judgment and energy unprofitable

and madness and laziness no disadvantage. He who risks borrowed money on improvement finds his competitor is given the use of his investment, and he is indeed fortunate if the risk he has taken does not bankrupt him when the appropriate usufruct is denied him.

### Our New Slogan "Do Without"

OF ALL the sad reminiscences of the European war one of the most persistent is the slogan "Do Without." No doubt it is the part of patriotism to accept with resignation all the necessary burdens of war shortages, but now peace is declared they seem to be more numerous than ever, and we are beginning to learn that the trouble is in the remedies by which we are continually trying to meet them.

We consistently endeavor to cure symptoms rather than diseases. The cures do well for a while, but the root of the evil is not reached. A palliative is not a cure. In the winter of 1917-1918 we were ordered to do without work during the celebrated workless days in order that coal might be moved on the railroads and the ships in the harbor might be coaled, and we did as we were ordered, even those of us who had stocks of every kind of material, including coal, on hand or were using water power or electricity generated by the energy of water or were using coal that did not pass over the railroad tracks and materials that had already passed with much difficulty through the railroad muddle.

It was said that by doing without work we "mortified our souls" and learned as in no other way what the war meant. In this manner the Administration in the midst of a great war excused itself for an immense waste of human energy in the districts supplied by hydroelectric power, in industrial works that had been forehanded enough to provide themselves with fuel and in establishments so near the mines that shipment by motor truck or horse wagon was practiced or was possible.

It was said that Dr. Garfield knew that he was following the wrong and indirect course, that the railroad embargo was the right cure, but he wilfully adopted the wrong remedy because William D. McAdoo, then United States Railroad Administrator, would not admit

that he was nonplussed and would not consent to declare an embargo. This story may or may not be true, but even if true it does not save Dr. Garfield, for he could easily have given exemptions to all industries not calling on the railroad for fuel, as he did to those plants which were essential to the nation's defense and sustenance and were rightfully given that exemption.

But this was only the beginning of the campaign of "Do Without." It was followed by many others of which everyone approved, but what is difficult of understanding is why the condition continues. Why should the mines have to do without cars, the people to do without coal and the miners to do without work? Simply because we have declared that expenditures must be made without due profit and services rendered without meet compensation. Men might be found willing to lend money without return, but they will not run the risk of losing their money unless some hope of reward is given that will overbalance the risk.

In the cities men are doing without street-car service and are walking the pavements because inadequate returns are being allowed the street-car companies, which are drifting, or have drifted already, into bankruptcy. Our schools are being closed or taught by inefficient teachers because a fair compensation is not paid to the instructors.

Sugar is scarce because the rewards provided were not adequate to make the public build more mills. All things are in short supply and this is so, in part at least, because the railroads fail under inadequate rates to meet the need for transportation facilities. Nothing "does without" except labor, and the luxury industries. The two are getting the savings that should vitalize the railroads and other public utilities.

The married couple that fails to raise a family lives easily on its income. Never-

theless childlessness marks the closing days of any nation. So the workman who is allowed to consume all he makes, soon puts an inglorious end to the national growth. No man who uses all he produces for his own advantage holds in his hand any gift to aid the progress of the nation. We must always remember that as we grow in numbers we must provide for larger output and that can only be done by national saving.

# NEWS FROM THE CAPITOL

BY PAUL WOOTON

## Mineral Leasing Bill Near Passage

House Expected to Adopt Conference Report on the Measure

THE OIL and Coal-Leasing bill, agreed to in conference and ready for final action of Congress, in the opinion of Representative Frank W. Mondell, Republican House leader, is the "greatest triumph of the cause of proper conservation of public resources up to this time," and represents real constructive legislation. The House is expected to adopt the conference report.

By its terms coal under 50,000,000 acres of land, gas and oil in the remaining public domain of 700,000,000 acres and the phosphate and sodium in the public domain would be reserved in public ownership. The rights to develop these minerals would be given to individuals under leases, and the proceeds of rents and royalties would be divided between the states in which the minerals are found and the Federal Government. The latter's share is to be placed in the reclamation fund for future development along irrigation lines in the Western States.

MANY BILLS HAD BEEN PRESENTED IN CONGRESS  
BUT NONE HAD BECOME LAW

"For more than ten years," said Mr. Mondell, "the question of providing legislation which would retain in the hands of the government the title to the remaining public coal, oil and oil shale, gas, phosphate and sodium lands, and the deposits of these minerals that have been reserved in lands to which a limited title has passed, and the adoption of a system of development under leases controlled and supervised by the Federal Government, has been before the Congress, and bills proposing such a policy, to a greater or less degree, have passed both Houses several times, but the bills did not satisfy the friends of real leasing legislation and failed to become law.

"Under the provisions of the bill the minerals referred to, and to a certain extent the lands which contain them, will be leased to citizens of the United States in limited areas at royalties which, in a large measure, are to be determined by public bidding, and under conditions which insure the mining and utilization of the minerals without unnecessary loss and under conditions favorable to the health and safety of those engaged in these enterprises.

PRESENT BILL TO SAFEGUARD THE PUBLIC

"The bill is a decided improvement over the legislation that has preceded it, because it is strictly a leasing measure and its provisions safeguarding the public interests are more carefully guarded than heretofore. Its provisions affecting the rights of those now claiming under the present land laws containing these minerals are believed to be just and equitable."

## Payne Chosen for Secretary of the Interior

Shipping Board Chairman Selection as Lane's Successor; Ex-Senator Shafroth Slated for the Place

John Barton Payne, chairman of the Shipping Board and formerly general counsel of the Railroad Administration, will become Secretary of the Interior March 1, succeeding Franklin K. Lane, whose resignation becomes effective on that date. While White House officials declined confirmation, it was understood that former Senator John Franklin Shafroth, of Colorado, has been offered the place vacated by Mr. Payne.

Chairman Payne said tonight that he would accept the appointment to the Cabinet because it was the wish of the President, but "my heart is in the Shipping Board."

Mr. Payne said he would ask the President that he be permitted to stay on at the Board for a few weeks to enable him to leave a comparatively clean slate for his successor by disposing of the immediate business before the Board, including the sale of the former German passenger ships and the reorganization policy now being effected.

## Bureau of Mines Asks for \$20,000 Appropriation

In addition to the \$576,877 which already has been appropriated for investigating mine accidents and operating mine-rescue cars, Dr. Van H. Manning, the director of the Bureau of Mines, has asked for a deficiency appropriation of \$20,000. This is intended largely for the printing of miners' circulars. The need of these circulars, as explained by Dr. Manning, has been laid before the Committee on Appropriations.

## Coke Producers Protest Fixed Prices

Coke producers are pointing out to officials here the injustice of having the limits maintained on coke prices while iron rises to \$40 a ton. This, it is claimed, gives the steel interests an additional profit at the expense of coke manufacturers. A modification of the order is asked so as to permit contract prices to be in effect as in the case of coal where it exceeds the Government price.

## Railroads Refuse to Change Contract Price

Refusal of the Railroad Administration to readjust contract prices when the price exceeds the government level has resulted in a vigorous protest by the National Coal Association. A large number of operators are affected.

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Ballasting Mine Tracks

*Letter No. 2*—I read with much interest the excellent letter of Jerome C. White, *Coal Age*, Nov. 6, p. 756, giving his experience in the use of broken stone for ballasting mine tracks. Kindly permit me to add a few lines describing my own practice in mine trackwork.

First, a good mine track is very necessary to obtain the best results in either mule or motor haulage. A straight road, with easy curves and light grades is also an essential factor wherever conditions will permit. In any case, however, it is of the utmost importance to have and maintain a good solid roadbed that is well drained and ballasted with material that will hold the track in line and prevent low joints.

One of the chief requirements in mine haulage is that the rails shall be supported on solid wood ties of a size that will hold the track in place and prevent derailment of the cars through the spreading of the rails. The best wood for track ties, in mines, is oak, tamarack, or hemlock. Track ties should be slabbed on two sides, so as to give a flat bedding for the ties and rails. The bark is preferably left on the remaining two sides. It is my belief that this method will give the best results.

The size of mine-track will depend on such conditions as the kind of haulage employed, weight and size of mine cars and locomotives in use, character of roadbed and floor of the seam, conditions regarding drainage and care and maintenance of the tracks, all of which must be considered in the selection of good ties.

In a small mine employing mules and where the haulage is light, the ties should have a thickness not less than 3 in. and a width of 4 or 5 in. Under a heavier service employing mechanical haulage, either rope or locomotive haulage, the track ties should be at least 5 or 6 in. thick and from 6 to 8 in. wide. The size should be uniform throughout, as ties of different dimensions should not be placed on the same roadway. Mine-track ties should be spaced, say 16 ties to a 30-ft. rail, or 18 ties to a 33-ft. rail, under fairly normal conditions of roadbed and bottom.

Much interesting information is given on the selection of material and the laying of mine tracks, in a little book entitled "Mine Tracks, Their Location and Construction," by McCrystle. Speaking of ballasting the tracks, Mr. McCrystle gives the preference to the

use of the following: 1. Broken stone, which he regards as excellent. 2. Cinders and ashes from the power house, good. 3. Breaker slate, only fair. 4. Coal slack and other refuse, poor.

The same author states that all rock used for ballast should be broken to a size that will pass through a 3-in. ring. He also says that there should be at least 3 in. of ballast on all roads, and this should be thoroughly tamped, particularly under those portions of the tie directly beneath the rails.

The practice described in Mr. McCrystle's little book agrees with that recommended by Mr. White to whom I referred previously. It also conforms to my own experience, in respect to the use of crushed stone for ballast. In connection with this subject, I have introduced a little sketch intended to illustrate what I have found equally good as ballast and often cheaper than broken rock. As shown in the figure, stone, or a good quality of slate, is built on each side of the track and the middle portion of the bed filled in with coarse gravel. I have found that this makes a very good roadbed whenever such material is available for use.

Rawdon, Quebec, Canada.

C. MCMANIMAN.

### Labor and Democracy

*Letter No. 4*—The readers of *Coal Age* are to be congratulated on the opportunity presented for the discussion of the present relation of labor to democracy. I was greatly pleased to read the letter of "Loyal Worker," which appeared in the issue, Dec. 25, p. 938. The writer of that letter could not have stated more plainly and concisely my own convictions as derived from personal experience.

In commenting on what the "closed shop" means to an honest workman, this writer makes the following statement, which is well worth repeating: "In the closed-shop plan, the worker is not his own master. He is not free to express himself if his thoughts are opposed to the ethics of the leaders. The very atmosphere of the shop breathes fear and distrust in the worker." Many who have passed through these experiences can vouch for the truth of this statement. The worker in a closed shop most assuredly has a rope about his neck and, as our friend has expressed it, must "watch his step" if he would avoid difficulty.

INJUSTICE DONE AN HONEST MEMBER OF MINERS' LOCAL

The same writer speaks of the man committing a "breach" that gives the watchful committee their longed-for opportunity to recommend his discharge. I could give an instance where it is not necessary for the worker to commit a breach to bring him into disfavor with the committee, and others can probably do the same, as such instances are of common occurrence. For nearly two years, to my knowledge, a certain honest worker has fought for his rights and for justice.

PROPOSED METHOD OF BALLASTING TRACK

Some time ago, this man was charged with committing an act that merited a penalty as a member of the local to which he belonged. His act was right in accordance with the Washington agreement, made in 1918, and the penalty was wrong under the Lever Act of Congress. When the penalty was imposed on this worker, he requested of his local to be informed where he had violated the district contract or local bylaws.

The member making the complaint assured the man that there was an entry on the minute book of the local that he had violated. For two years, however, this honest worker has been on record as having requested to be shown the minute of the local that it was claimed he had violated and for which he was penalized to the amount of \$5 and other expenses, without receiving any satisfaction in answer to his request.

#### FAIRNESS AND JUSTICE A CHIEF REQUIREMENT

In the same letter, "Loyal Worker" states: "Conservative forces will always accept a solution that is tempered with fairness and justice." In the instance to which I have referred, the penalized member deserved justice at the hands of the District Executive Board to which he applied. His claims, however, were met with perjured rebuttal and forged signatures, which perverted the ends of justice and caused the Executive Board to misjudge this suffering member.

The readers of *Coal Age* can judge for themselves as to the course to be pursued in securing justice. Appeal to the War Labor Policy Board, in this case, brought the suggestion that it was a matter to be placed before the Fuel Administration. In the opinion of the assistant attorney-general, it was not the class of business that concerned the Department of Justice. The only satisfaction the suffering member received was that the Fuel Administration thought he must have violated some law of the U. M. W. of A.

To make a long story short, repeated requests made of his local and appeals to the district president to be informed as to what part of the contract he had violated, or what bylaw of the local he had broken, have met with no response. In view of these facts and numerous others of like import, my opinion is that labor is fast becoming an autocratic government over its members. My advice is that all honest workers should fall back and line themselves with democracy if they desire a healthy development of labor conditions in the future. It goes without saying that no one, of his own free will, would desire to be under autocratic rule or a member of an organization where justice is preached but not practiced.

W. H. LUXTON.

Linton, Ind.

## Health and Industry

*Letter No. 1*—Some time ago I recall reading an excellent Foreword in *Coal Age* (Vol. 15, p. 519), entitled "Health and Industry." At no time have the suggestions made in that Foreword been more timely than at the present, and I wish to emphasize a few of the points mentioned and urge their application in combatting the present condition that prevails to so large an extent in the coal industry, today.

The author of the Foreword, Floyd W. Parsons, makes the following statement: "The degree of health that employees enjoy determines largely their degree of

happiness, contentment and efficiency." Few who have been close observers of industrial conditions in coal mining will deny that those workers who enjoy physical health perform more efficient and valuable services to the companies who employ them, than those who suffer from ill health or are physically weak. The healthy man looks on life from a different viewpoint. He is contented and happy, while the less able-bodied man is discontented and often unhappy. The results of these two conditions in the health of the worker are plainly evident to their employers.

#### SANITARY CONDITIONS PROMOTE HEALTH

Coal operators who neglect or refuse to consider the physical health and the sanitary and social environment of their employees make a vital mistake. There is no question but that wholesome and pleasant environment promotes health and happiness, which mean contented and efficient workers. This being true, it is of prime importance that mine officials make every possible provision for the health, comfort and enjoyment of their miners. By this means they may be won over more successfully to higher and better methods of living and become more efficient workers and better citizens.

The question of contentment among workers is an important factor in the operation of coal mines. There are diseases of the mind as well as ailments of the body, and the former are often more baneful and more to be dreaded than the latter. The diseased mind is fertile soil for sowing the seeds of radical socialism, unrest and discontent, which if unchecked will develop into Bolshevism. The disease is contagious and spreads rapidly, bringing strikes and labor disturbances. The most effective cure for a diseased mind is more desirable living conditions and a healthier social environment.

#### MORAL AND SOCIAL ATMOSPHERE IMPORTANT

In addition to the consideration of the health and contentment of workers, there is another important factor, namely, the moral and social atmosphere surrounding them. It will not be denied that moral and sober men make a better class of miners.

Compare the miner who cleans up for Sunday, attends church and Sunday School with his family, with the man who shuffles out from his home every Sunday morning and spends the day loafing about town. Is there any question but that the former type of individual makes a more reliable, constant and efficient worker than the latter? The one learns to respect himself, which develops a high regard for others, while the negligent and careless habits of the other engenders a lack of self-respect and a disregard for others.

In my judgment, all efforts to educate and train mine workers and improve their living conditions along the lines suggested cannot fail to prove a paying proposition. To the extent that a man sets a higher value on himself and his fellows, to that extent he becomes more valuable as a workman.

#### PRACTICAL RELIGION THE NEED OF THE HOUR

The report of Roger W. Babson, who made a careful study of the social, economic and political problems confronting the American people today, contains this statement: "The need of the hour is more religion." He states, "The solving of the labor situation is wholly a question of religion." He would have the reformation

start with Congress and follow down the line to factories and mines. I believe his conclusions are right and that the differences between capital and labor depend on the honest application of the Golden Rule.

In my opinion, there is enough religion in the world, but it is of a kind that goes no farther toward changing and reforming the life than subscribing to some creed and having one's name enrolled on the church record. Such religion is mere hypocrisy and will never settle labor troubles by the Golden Rule.

#### A SOUND MIND IN A SOUND BODY

Referring once more to the Foreword, we read in the closing paragraph the following: "Above all things, at the present moment, we need sound minds, and these we cannot have unless first we have sound bodies." Nothing can come nearer to the truth than that a sound and vigorous mind, free from selfishness and actuated by a Christian spirit, will rightfully adjust all differences between capital and labor.

Let employer and employed each remember that an honest day's work calls for an honest wage. The worker who possesses a Christian spirit and whose life is measured by the Golden Rule will give an honest day's work, and the employer of like spirit will reward him in the same measure. Strikes and lockouts will then be a thing of the past and labor troubles will be ended.

JOHN ROSE,

Dayton, Tenn.      Former District Mine Inspector.

## Maximum Coal Extraction

*Letter No. 1*—To those who have studied the problem of obtaining a maximum extraction of the coal from a given seam, in the light of practical experience, it is often surprising that the methods employed in certain districts yield the percentage claimed.

The discussion just closed relating to the extraction of 50 per cent of the coal in one of the important coal fields of this country is an illustration of the need of studying carefully the conditions before deciding on what method to employ for working out the coal.

The study of the conditions affecting extraction, in a mine where the recovery is low, will generally show that in order to reduce the loss of coal in that mine a radical change in the method of working is very necessary. In many instances it will appear surprising that the loss has not been greater.

#### MINE SQUEEZE THE DESTRUCTIVE FACTOR

The big factor to be considered in most cases is the squeeze and the elements producing it, and, having done this to apply some system of mining that will offset these destructive elements.

Squeeze or creep is generally due to a weak floor, small room pillars and often to some extent, to the structure of the coal which may rash easily at some point in the seam. The height of the seam too aggravates a squeeze after it has once developed. Comparatively speaking the roof strata may be good, and yet other conditions that exist may be such as to invite squeeze in the working of the mine.

It frequently happens, that too much ground is opened up at once. The panels are laid out too large, and too much time is consumed in development, before room pillars are extracted. In such cases, a whole year may be required to drive a panel entry and the same length

of time consumed in driving the rooms which means that the pillars adjacent to the panel entry have to stand for two years approximately before they are extracted. Should it happen that the room pillars are too small, it would not be surprising if a squeeze developed before the rooms are completed and the pillars drawn back to the entry.

In mines where the conditions are quite favorable it is not considered good mining practise to leave room pillars in place for a great length of time. Speed in extraction is one of the essentials to a good recovery, and pillars must be extracted, as soon as possible after the rooms are driven up, and the roof strata allowed to cave behind so as to reduce the overhead pressure.

#### TOO RAPID DEVELOPMENT INVITES FAILURE

When the attempt is made to work up a large output as quickly as possible the really important features, which enter into the ultimate success of the mine, have been lost to sight. As stated previously, before deciding on the method of mining to be adopted in any mine, it is essential that the nature of the overlying strata, the underlying strata, depth of cover, character of the coal and the area to be extracted should be fully considered.

The latter information is highly essential and can be had by sinking a series of boreholes, at various points on the property, before any development work is attempted. It may appear to some that this would mean a high initial cost, which will be true in some cases; but if the area to be mined out is large the information gained from the drillhole records is invaluable and will in the long run save money.

It is a mistake, under most conditions, to open too many rooms at once, as such a method brings on an excessive overhead pressure which can not be relieved until the room pillars are extracted and the roof strata allowed to cave. If the floor strata is weak that fact, combined with small room pillars left in, will add considerably to the causes producing squeeze and incidentally lower the recovery.

#### THE WORKING OF PILLAR COAL

Under ordinary conditions, pillar coal should be mined as economically as the room coal or narrow work. If the pillars are made large and not left in place too long it should be possible to mine part of the pillar by machine and take out the pillar butts left in against the gob, by hand. The roof strata should be made to cave as early as possible after a few of the pillars have been extracted. If it does not do so some means should be adopted to start a cave, so as to preserve the pillars adjacent to the gob, which will not be possible if a large standing arear is maintained in the gob.

In the latter case when the roof breaks over a large area it is more than likely that it will ride over several of the pillars adjacent to the pillar-extraction line, which may start a slight squeeze on the advancing rooms, causing delay and considerable expense. Except under extraordinary conditions of the roof strata, no serious trouble should be experienced in getting the roof to cave almost when and where desired.

I also favor reducing as far as practicable the width of the rooms, in order to develop more quickly. Any increase in per-ton cost that might result from doing so will be more than offset by the increased recovery and ultimate saving effected by mining on the retreating

method. By adopting this method it will not be necessary to wait until all the rooms are completed, before commencing to extract the pillars. The pillars in this case can be extracted immediately when each room is finished. It can also be arranged to have the rooms completed slightly in advance of the pillar-extraction line. In each case, the room and the pillar-extraction line should cross the roof-strata cleavage planes, say at an angle of 45 degrees.

DESCRIPTION OF A PANEL SYSTEM IN WHICH THE COAL IS TAKEN OUT IN SUBPANELS

By following this method, the pillar extraction line can be more uniformly maintained and the roof strata will be less liable to break in the advancing rooms. In mining a thick seam it is well to leave the top coal up

driven to the boundary or barrier before any rooms are turned off. As soon as the first few rooms are completed in No. 1 subpanel the pillars in those rooms are immediately extracted.

It will also be observed that the rooms reach the boundary slightly in advance of the retreating pillar-extraction line, and in this way the pillars are not allowed to stand for any length of time before being extracted. The extraction line of No. 1 subpanel is kept in advance of No. 2 subpanel extraction line; and No. 2, in turn, in advance of No. 3 extraction line.

Barriers are left in against No. 2 and 3 subpanels, which are later mined out in line with the room pillars, in each case. Barrier pillars are also left in against the north and south and the east and west panel entries, which can be mined out as the management sees fit and proper. The size of the panels and subpanels, the width of rooms, and the dimensions of room pillars, also the general ventilating system, are clearly outlined in the plan shown in the figure.

In closing let me say one matter that deserves consideration is the cutting of the coal. In mining domestic coal, it is desirable to have as large a percentage of lump as possible. In that case the cutting should be done in the bottom coal, but if that is quite hard I would suggest mining in the softer coal, which in any case will go into the fines. The type of machine in use may be an undercutter, however, and in order to cut in any other part of the seam than the bottom it may be necessary to install a new machine. In that case the matter would require to be fully considered before any change is made.

When working a mine generating much explosive gas and subject to squeeze the use of open lights and safety lamps, to my mind, is not consistent with the safety-first idea and should be discontinued and only locked safety lamps used throughout the

mine. The illuminating power of the more recent types of safety lamps is such that the efficiency of working need not be lowered through such lamps being adopted exclusively. In any case, the practice of using closed and open lights in a gaseous mine is dangerous and is certainly not in line with modern coal-mining practice. In conclusion let me say, it is the duty of all mining men to conserve the natural resources of the country. I am of the opinion that the time is not far distant when the state will take this matter in hand.

J. H. McMILLAN,

Jasper Park Collieries, Ltd.  
Pocahontas, Alta., Canada.

METHOD OF EXTRACTION BY SUBPANELS WITHIN A LARGER PANEL

(SCALE, 400 FEET PER INCH.)

in the advancing rooms. No trouble should be experienced in recovering this coal later when the pillars are being extracted. There may be other matters relative to recovery, which I have not stated and which would have to be studied on the ground before deciding on the method of mining to be adopted.

Allow me, here to present the plan shown in the accompanying figure, which I have used and found to work successfully, in mining 6- to 8-ft. coal overlaid with a hard shale roof, at a depth of 500-ft. below the surface. It will be observed that, instead of having one large panel, there are three subpanels, which are worked out as separate units. The cross- or room entries are

# INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

## Semianthracite vs. Semibituminous Coal

Several times, recently, I have been asked to explain the difference between semianthracite and semibituminous coal. This question answered in *Coal Age* would interest many.

SAGE COE.

Scranton, Pa.

The change that takes place in the formation of coal from vegetable deposits is slow and continuous, from the peat bogs to the anthracite beds and the still harder graphite. Semianthracite and semibituminous are grades of coal between anthracite and bituminous, the former containing from  $7\frac{1}{2}$  to  $12\frac{1}{2}$  per cent volatile matter, and the latter from  $12\frac{1}{2}$  to 25 per cent. Any greater percentage of volatile matter classifies the coal as bituminous, although this is merely an arbitrary distinction, there being no exact line of division.

## Dead-End in Trolley Haulage

I have been studying a course in coal mining and cannot find where it tells how close the trolley line should be carried to the face of a heading when the heading is being driven and the coal hauled out by a trolley locomotive. I was asked this question the other day by an electrician and also by a wireman.

As I understand it, at the end of a trolley line, an anchor bolt is driven to hold the trolley wire. The question is, how near to the face of a live heading should this anchor bolt be placed? Some say it should be about 30 ft. from the face, while others state that the dead-end of a trolley line should not approach the face closer than 50 ft. As I am a reader of *Coal Age* and appreciate the help given inquirers, I would like to ask for information on this question.

Rawl, W. Va.

ASSISTANT FOREMAN.

It must be rather exceptional practice to carry a trolley line beyond the last parting or sidetrack where the trips are made up to be hauled out of the mine. It is customary, in mine haulage using the trolley system, when the gathering haul is made by mules, to carry the power line to the inby end of the last parting on the haulage road. Where a trolley gathering locomotive is used, the trolley wire can be extended a distance further, so as to permit the locomotive to proceed to the head of the rooms turned off the entry.

As a rule, however, the rooms for a good distance back from the face of the heading will not have been driven to such a depth but that the locomotive can reach the face, by the use of its own cable unwound from the reel. In any case, replying directly to the question asked, we would say that the dead-end of the trolley line should not approach closer to the face of

the heading than the length of the cable on the locomotive.

It is a great advantage, in electric mine haulage, to employ a storage-battery locomotive for use on the gathering haul. A storage-battery locomotive can proceed to any point on the entry and enter the rooms, under its own power, thereby avoiding the use of a reel and cable and the added annoyance of frequently extending the trolley wire. Let us hear from others.

## Location of Regulators in a Mine

Allow me to ask the following questions: A shaft mine lying at a depth of 550 ft. below the surface is ventilated by an air current of 200,000 cu.ft. per min. The mine is very extensive and generates an abundance of gas in the gobs. The air current is divided into four separate splits, and the number of men working in each split is practically the same. It is necessary, however, to use regulators to divide the air between the splits.

The questions I want to ask are: 1. Is there any choice in placing the regulators in the different splits in a mine? 2. What advantage or disadvantage, if any, results from placing the regulator; (a) at or near the intake or mouth of a split; (b) at a point somewhere midway between the mouth and the inby end of the split; (c) at the last open crosscut in a split?

Perryopolis, Pa.

R. W. LIGHTBURN.

Theoretically, it makes no appreciable difference whether the regulator is placed at the beginning, midway, or at the inby end of a split. The pressure on the return side of a regulator is always the natural pressure concerned in moving the air, while the pressure on the intake side is greater than this by the amount required to pass the air through the regulator. As a consequence, the density of the moving air is slightly greater before it reaches the regulator than after passing through the opening.

Although this increased density of the air may act to increase the frictional resistance of the current, the effect is very slight and wholly inappreciable. On this score, therefore, the location of a regulator in an air split is quite immaterial.

Viewed from the practical side, however, the case has a different aspect, as a regulator should always be placed where it will least obstruct the operation of the mine. It has been the general custom to place the regulator on the back entry of a pair, outby from the last crossover through which coal is being hauled.

The objection to placing a regulator in the last open crosscut in a split would be that it would have to be moved, from time to time, as the entries are advanced. A location must always be chosen that will be the most permanent and prove of the least hindrance to the daily operations of the mine.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Miscellaneous Questions

(Answered by Request)

*Ques.*—What must be the sectional area of a square airway that is required to pass 50,000 cu.ft. of air per minute under a 1-in. water gage, the length of the airway including the return being 5200 ft. Use Fairley's coefficient of friction,  $k = 0.00000001$ , in the solution of this problem.

*Ans.*—First, write the formula for the water gage in terms of the quantity of air passing and the dimensions of the airway; thus,

$$w.g. = \frac{p}{5.2} = \frac{k l o q^2}{5.2 a^3}$$

Calling one side of the square airway  $d$ , its area is  $a = d^2$ ; and its perimeter,  $o = 4d$ . Then, for a square airway, the expression,

$$\frac{o}{a^3} = \frac{4 d}{(d^2)^3} = \frac{4}{d^5}$$

Now, substituting for the expression  $o/a^3$ , its value just found,  $4/d^5$ , we have, for the formula for finding the water gage, in a square airway,

$$w.g. = \frac{4 k l q^2}{5.2 d^5}$$

Solving this equation with respect to  $d$ , we have, for the length of one side of the required square airway,

$$d = \sqrt[5]{\frac{4 k l q^2}{5.2 w.g.}}$$

Now, substituting the given values in the last formula, we find the length of one side of the required airway; thus,

$$d = \sqrt[5]{\frac{4 \times 0.00000001 \times 5200 \times 50,000^2}{5.2 \times 1}} = \sqrt[5]{100,000} = 10 \text{ ft.}$$

The sectional area of the required airway is, therefore,  $a = d^2 = 10 \times 10 = 100$  sq. ft.

*Ques.*—Calculate the centrifugal force developed by a mine ventilating fan making 100 r.p.m., assuming a cubic foot of air in the fan weighs 0.0766 lb., the outer and inner diameters of the fan being 16 ft. and 9 ft., respectively, and the width of the fan blades 4 ft.

*Ans.*—The area of a circle corresponding to the outer diameter of the fan is  $0.7854 \times 16^2 = 201$  sq. ft. The area of the central opening of the fan is  $0.7854 \times 9^2 = 63.6$  sq. ft. Subtracting the area of this opening from that of the full circle of the fan gives  $201 - 63.6 = 137.4$  sq. ft., which is the area of the annular space covered by the sweep of the blades. Multiplying this area by the width of the fan blades gives for the volume of the fan,  $4 \times 137.4 = 549.6$ , say 550 cu.ft. The weight of the revolved air within the fan is, then,  $550 \times 0.0766 =$  say 42 lb.

In order to calculate the centrifugal force developed by the revolution of this air in the fan, it is necessary to first find the radius to the center of gravity of the air contained in a single compartment of the fan and its velocity, in feet per second. Calling the outer and inner diameters of the fan  $D$  and  $d$ , respectively, and the radius to the center of gravity,  $R_g$ , we have for the length of this radius, in feet,

$$R_g = \frac{1}{3} \left( \frac{D^3 - d^3}{D^2 - d^2} \right) = \frac{1}{3} \left( \frac{16^3 - 9^3}{16^2 - 9^2} \right) = 6.4 \text{ ft.}$$

The velocity of this center of gravity, at a speed of 100 r.p.m., is then  $v_g = 100 (2 \times 3.1416 \times 6.4) \div 60 =$  say 67 ft. per sec.

Now, calling the total weight of air revolved within the fan  $W$ , the force of gravity  $g$  (32.16 ft. per sec.), the required centrifugal force developed at the given speed,  $F$ , we have,

$$F = \frac{W v_g^2}{g R_g} = \frac{42 \times 67^2}{32.16 \times 6.4} = 916 \text{ lb.}$$

*Ques.*—Assuming the efficiency of the fan, in the previous question, to be 60 per cent, find the quantity of air it will deliver, at the given speed (100 r.p.m.), when operating under conditions where the mine resistance is such as to give a 2-in. water gage, in the fan drift, where the sectional area is 80 sq. ft.

*Ans.*—For an efficiency of 60 per cent, the force applied to move the air in the fan drift is  $0.60 \times 916 = 549.6$ , say 550 lb. The mine resistance is  $80 (2 \times 5.2) = 832$  lb. Since the ratio of the acceleration ( $f$ ) due to a force, to that due to gravity, is equal to the ratio of the accelerating force ( $KF$ ), to the resistance ( $pa$ ), we have for the acceleration of the ventilating current, in this case,

$$f = \frac{K F}{p a} g = \frac{550}{832} \times 32.16 = 21.26 \text{ ft. per sec.}$$

The quantity of air the fan will deliver is then found by multiplying the total force ( $KF$ ), applied to move the air, by one half the acceleration ( $f/2$ ), and dividing that product by the unit pressure ( $p$ ), which gives for the quantity of air delivered per minute, by the fan, under the assumed conditions,

$$Q = 60 \left( \frac{K F}{p} \times \frac{f}{2} \right) = 60 \left( \frac{550}{10.4} \times \frac{21.26}{2} \right) = 33,730 \text{ cu. ft. per min.}$$

*Ques.*—Find the horsepower required to drive the fan, mentioned in the two preceding questions, at the given speed (100 r.p.m.), and under the assumed conditions.

*Ans.*—The power required to drive the fan is the power applied to the crankshaft. For an assumed efficiency of 60 per cent, this power is

$$H = \frac{Q p}{K} \times \frac{1}{33,000} = \frac{33,730 \times 10.4}{0.60 \times 33,000} = 17\frac{1}{2} \text{ hp.}$$

# FOREIGN MARKETS AND EXPORT NEWS

## Irish Coal Fields Assuming Greater Importance

Within the last few years Ireland's coal resources have assumed an unexpected importance. A few years ago British coal could be delivered at Irish east coast ports at a cost of from 10s. to 15s. a ton, and coal for domestic use was correspondingly cheap. At the same time, owing to lack of transport facilities, the transport charges alone on coal from the Irish collieries delivered at coastal towns exceeded the cost of imported coal.

As the majority of Irish industrial works are located along the coast, it was evident that there was only a very limited field for the use of Irish coal. However, when sea freights had now increased some five-fold, and imported coal at the Irish ports had advanced to three times its pre-war price, the question of developing Irish coal resources to the fullest extent becomes a very important and pertinent one.

There has not been any geological or mining survey of Ireland which would suffice to determine her coal reserve within a reasonable degree of accuracy.

There is, however, a substantial reserve of coal in Ireland, which, under existing conditions will well repay exploitation. There are coal measures under about 1,800,000 acres—beds of coal have been found in Antrim, Donegal, Tyrone, Fermanagh, Monaghan, Cavan, Leitrim, Roscommon, Westmeath, Kilkenny, Carlow, Clare, Dublin, Queen's County, Limerick, Cork, Kerry and Tipperary.

Coal fields and collieries worthy of consideration are the Castlecomer Collieries, Kilkenny, Wolfhill Collieries, Queen's County; Coalisland Collieries, Tyrone; Arigna coal field, Roscommon and Leitrim, and at Slieveardagh in County Tipperary. The lignitebeds at Murlough, Bay and Ballycastle, County Antrim and in the Lough Neagh district, and at Rossmore, Carlow, might also be profitably worked, though they are of lesser importance. The coal fields which have been proved, or closely estimated are; Leinster, 152,000,000 tons; Tyrone, 97,000,000 tons; Antrim, 14,000,000 tons; Tipperary, 20,000,000 tons; and Connaught, 9,000,000 tons. These figures are probably all under-estimates especially in the case of Connaught.

The estimated coal reserves in the Castlecomer fields is 60,000,000 tons; in Wolfhill, 60,000,000 tons; in Coalisland, 10,000,000 tons; in Arigna, 20,000,000 tons; and in Slieveardagh, 10,000,000 tons. Though the figures seem modest they mean that the coal practically in sight would suffice Ireland at her present rate of consumption for 35 years, even if no coal were imported, and no other power resources developed.

Ireland imports from Great Britain some four and a-half million tons of coal a year, the purposes for which it is used being approximately: Domestic consumption, 2,155,000 tons; industrial works, 1,400,000 tons; and electrical works, 125,000 tons. There is also in addition a considerable quantity of peat used, almost exclusively for household purposes. The coal consumption of Great Britain is about 185,000,000 tons per year, or 4.4 tons per head of the population; or 2.068 tons per square mile of area. Ireland consumes one ton per head of the population, and 142 tons per square mile of area.

## New Rates on Coal to South American Ports

Further changes in the shipping rates on coal and coke from Atlantic and Gulf ports to South Emergency Fleet Corporation were issued last week by the U. S. Shipping Board. Effective Jan. 9, to destinations on the east Coast of South America, rates

are \$16 to \$19.50 per ton of 2,240 lb., while the rates to West Coast ports vary from \$12 to \$32.50 per ton. The new rates on coke to West Coast ports are \$18 per ton.

The new coal tariff, No. 23-A, replaces coal tariff No. 23, which has been cancelled.

COKE		Per ton of 2240 lbs. (1a ton)	Guaranteed daily discharge (1a ton)
West Coast —			
Guayaquil, Ecuador, to Talcahuana, Chile, inclusive	\$18.00	525	

Conditions—Coal: Loading 1,500 tons daily; discharge as above indicated, with time counting 24 hours after arrival of vessel, whether in berth or not, Sundays and holidays only excepted. If loading and discharge is not completed within the time specified, demurrage to be paid at the rate of \$1 per net registered ton per running day, payable day by day. Coke: Loading 800 tons daily; discharge as above indicated, with time counted and demurrage payable under same conditions as apply on coal.

## South African Coal for France

Extreme scarcity of fuel in all parts of France is causing much disorganization of business, many factories and works of all kinds being brought to a standstill for lack of steam power. The latest expedition, however, is the purchase of 5,000 tons

of South African coal for delivery at Marseilles from the port of Durban, Natal, on which the freight alone is £7 10s. per ton.

The Natal collieries have for some time been supplying the coaling depots in Eastern waters, Perim, Colombo, &c., but this is the first recorded instance of a cargo shipment to Europe.

## Japanese Coal Trade Increases

Production of coal during the six years 1915-18 in Japan aggregated 141,392,580 metric tons. The output in the first year totalled 21,315,962 tons, but while there was an increase to 22,293,419 tons in 1914, the following year witnessed a fall to 20,490,747 tons, the smallest out-turn of the series.

In 1916, however, there was a recovery to 22,901,580 tons, which was followed by an expansion to 26,361,420 tons in the ensuing year, and a further increase to 28,029,452 tons in 1918. The exports during the period under review amounted to 18,427,108 metric tons. The first year, 1913, showed the largest figures, at 3,870,600 tons, and, with the exception of a slight recovery to 3,016,947 tons in 1916, there was a continuous decrease until, in 1918, the shipments were approximately only 2,215,201 tons.

The coal arriving in Japan during the same period totalled 4,192,487 metric tons. The yearly figures show great irregularity. The 1913 imports were 576,772 tons; those of 1914 jumped to 614,677 tons, and in 1916 a further shrinkage to 556,110 tons. There was a substantial upward movement to 713,080 tons in 1917, and the country's receipts of coal from abroad were again enlarged in 1918, when 774,189 metric tons were imported.

## 1,187 Ships Built in First Half of 1919

During the first six months of the current fiscal year, beginning July 1, 1919, the output of American shipyards was 1,176 vessels of 2,213,448 gross tons, not including 11 vessels of 17,000 tons built for foreign owners. The output consists chiefly of vessels built with funds from the United States Treasury for the Shipping Board and is the United States' largest output for a six-month period.

## Oil Fuel Projects in South Wales

There are signs that Lord Fisher's prophetic vision of the general adoption of oil as fuel for steamers may find speedier ful-

## Anthracite Shipments for December, 1919

The shipments of anthracite for December, 1919, as reported to the Anthracite Bureau of Information at Philadelphia, made the largest record for that month since 1915. The tonnage sent out in December, 1919, amounted to 6,138,460 gross tons, against 5,971,671 tons in November, an increase of 166,789 tons, and, as com-

pared with December, 1918, when the shipments were 5,736,260 tons, a gain of a little more than 400,000 tons. As compared with 1916, the latest normal years, the shipments in December showed an increase of something over 550,000 tons. Shipments by initial carriers for December, 1919, compared with December, 1916, were:

Railroads	December 1919	December 1916	Coal Year 1919-1920	Coal Year 1916-1917
Philadelphia & Reading Railway	1,442,571	1,040,645	10,741,052	9,424,306
Lehigh Valley Railroad	1,057,627	964,007	9,689,287	9,038,756
Central Railroad of New Jersey	506,840	527,080	4,798,731	4,781,181
Delaware, Lackawanna & Western Railroad	907,119	953,565	8,109,167	7,875,133
Delaware & Hudson Company	674,172	591,874	6,068,559	5,368,560
Pennsylvania Railroad	414,155	449,052	3,747,576	4,114,390
Erie Railroad	679,827	634,190	5,801,163	5,609,681
New York, Ontario & Western Railway	171,465	147,007	1,535,828	1,431,156
Louisville & Nashville Railroad	284,684	275,329	2,619,218	2,025,214
	6,138,460	5,582,787	53,110,381	49,668,357

fillment than has been generally expected. In view of these possibilities, considerable importance attaches to some recent commercial developments.

An agreement was recently entered into between the Scottish-American Oil Co., and Messrs. L. Gueret, Ltd., one of the most important coal-exporting firms in Great Britain, with coaling depots at ports in France, Algeria and South America. It is felt that the price of coal will remain high for a long time and that bunker supplies will not be so steady as in the past. Under these circumstances Messrs. Gueret feel it imperative that their various coaling depots should be able to offer oil as well as coal to ships.

Messrs. Williams, Corey and Son, coal distributors, have entered into arrangements with leading shipping and oil firms with the object of using their widespread organization for oil distribution. It is suggested that there may be some dramatic surprises in the next few months, for events are moving rapidly. The steady boom of the shares in William Cory and Son is one indication.

William Cory & Son, Ltd., represent an agglomeration of interests connected with the distribution and selling of coal. The company was registered in its present form in 1896 to take over the English business of coal factors, merchants, lightermen, etc. of a number of firms.

The result of various transactions is that the company, besides holding a commanding position in the home trade, has very large bunkering steamships at foreign ports. So important is its position in this respect that it is generally understood that it is now largely bound up with the P. & O. Co., which holds a considerable proportion of its capital. Dividends have ranged from 8 to 10 per cent, of which one-half was paid tax free.

### Britain's Coal Output in 1918

The total value of the minerals raised in Great Britain during 1918—the figures for which are only now available—amounted to £257,079,792, an increase of £33,145,803, as compared with 1917.

The total output of coal was 227,748,654 tons, and the value £238,210,760, showing a decrease in output of 20,750,586 tons and an increase in the value of £30,433,866 on the figures of the previous year. The average price of coal for 1918 was 20s 11.06d. per ton, and for 1917 16s. 8.08d. per ton.

The quantity of coal exported, exclusive of coke and manufactured fuel, and of coal shipped for the use of steamers engaged in foreign trade, was 31,752,904 tons. Of these, France received over 16½ million tons, Italy over four million tons, Egypt nearly 1½ million tons, Gibraltar over 1½ million tons, Norway over 1½ million tons, Malta nearly 1½ million tons, and Sweden and Norway each over 1 million tons.

The amount of coal remaining for home consumption was 181,358,158 tons, or 4,385 tons per head of the population; 39,954,974 tons of coal were used in the manufacture of coke and briquettes, as compared with 40,981,757 tons in 1917; and 2,806,840 tons of coal and 11,286,680 tons of coke, which together are equivalent to 21,417,973 tons of coal, were used in the blast furnaces for the manufacture of pig-iron as against 2,816,318 tons of coal and 10,961,734 tons of coke, or a total equivalent of 21,085,875 tons of coal in the previous year.

During the past forty-six years (1873-1918) 9,192,072,000 tons of coal have been raised, and of this amount 2,219,868,000 tons, or more than 24.1 per cent of the total production, have been shipped abroad as exports in the form of coal, coke, and

manufactured fuel, and as coal used for steamers engaged in foreign trade.

The percentage of the output of coal shipped abroad in each quinquennial period from 1873 to 1917 and the percentage for the year 1918 was as follows:

	Per Cent
1873-1877	13.8
1878-1882	16.1
1883-1887	19.0
1888-1892	21.2
1893-1897	23.0
1898-1902	25.7
1903-1907	29.5
1908-1912	32.4
1913-1917	26.16
1918	19.1

Of the metallic minerals raised in the United Kingdom iron ores is by far the most important. During the year the output of ores of this metal was 11,613,032 tons, valued at £7,106,656. The ore yielded 4,581,772 tons of iron, or more than half of the total quantity of pig-iron made in Great Britain.

### Nitti Shudders at Italy's Plight

Premier Nitti, in a speech to the Senate shortly before his departure for Paris, said he was quite certain Europe could not expect any more financial assistance from America. Consequently, he added, Italy must be prepared to stand almost alone.

"We are in a situation which makes one shudder," he said. "Coal, which before the war cost 30 lire a ton is now more than 600 lire. A pound of coal is now worth more than the pre-war price of a pound of rice. Italy must depend almost exclusively on her own resources since in September last not only the foreign Governments but foreign banks refused her credit."

## Coal and Coke Exports from the Port of New York in 1919 Compared With 1918

In 1918 the total amount of anthracite that was shipped from the port of New York was 82,477 tons which valued \$534,087, as compared with 70,984 tons shipped in the next year (1919), amounting to \$624,809.

In 1919, \$200,706 worth of bituminous coal was shipped which was the value of 29,286 tons. Italy, Danish West Indies and the

Netherlands received the largest amount of this coal as compared with shipments to other countries.

The following table shows the tonnage, value and countries to which anthracite, bituminous coal and coke were shipped from the port of New York during 1919, and for purposes of comparison the same figures for the year 1918.

Coal and Coke Export Shipments from the Port of New York

	Anthracite				Bituminous				Coke

# COAL AND COKE NEWS

## Charleston, W. Va.

Number of mining communities in grip of influenza. Would have cut production if there had been cars to load. Many mines idle more than two-thirds of week. Export permits not to be granted for present. Whole situation so unsettled, little done on next year's contracts. Influenza most serious on Cabin Creek and Coal River in Kanawha field. Worst car shortage in New River region for last two years.

While serious inroads would have been made on the production of coal in this section of West Virginia, during the first seven days of February, owing to the fact that a number of mining communities were in the grip of the influenza epidemic, yet the appearance of that disease had less effect on production than would otherwise have been the case, owing to the fact that there were no cars to speak of into which to load coal. The car shortage, in fact, in the areas covered by the Chesapeake & Ohio, was more discouraging than was even the case during the last week of January. Between 1,200 and 1,300 cars was about all the road was able to place on an average throughout the week, with the possible exception of Monday, when cars were equal to about 85 per cent of requirements. The general average supply for the other five days of the week was about 33 per cent.

In many instances mines were idle more than two-thirds of the week, and in some cases no cars were secured by mines until the very end of the week. Not only was the supply of cars on the Chesapeake & Ohio almost down to zero point but the supply on the Kanawha & Michigan was equally meagre, as was also the case on the Kanawha & West Virginia. Of course production suffered to some extent in the New River field owing to the strike there, but, even when that was settled, there was no increase in production because there were no cars to load.

Promises made by executives of the Railroad Administration at Washington, for improvement in transportation facilities, had given rise to the hope that there might be more cars available, but the benefits promised failed to materialize, nor did there appear to be any prospects of improvement. Operators in this area found it difficult to understand why there should be such an acute car shortage, in view of the fact that there was no congestion on the Chesapeake & Ohio, yet not only was the supply limited, but at the same time some operators at least were notified that no more permits (for the time being) would be granted as to exports. Otherwise no embargoes were in effect as to the shipment of coal from this section.

Producers were running far behind as to contract deliveries, although customers were demanding that they be given at least a portion of their fuel supply, a demand with which it was impossible to comply. Not only has the transportation breakdown affected operators adversely from a financial standpoint, but it has caused much friction between them and their customers, and it is said the present situation will have an important bearing on the making of contracts for next year. The situation generally is so unsettled that little has been done toward arranging for next year's contracts.

Mines in the Kanawha field at the outset of February labored under the double handicap of a car shortage and sickness. The car shortage was, however, more general than the influenza which incapacitated many miners for work. It had not appeared in as severe a form as during 1918 and it had just begun to make its presence felt during the first week of February, the greatest number of cases being reported on Cabin Creek and on Coal River. There were at least 100 cases of influenza, however, among the miners at Sharon, on Cabin Creek.

Of course with cars scarce, a reduction in working forces made less difference than

would otherwise have been the case, and cars were indeed extremely scarce in the Kanawha field during the period already mentioned—more so than during the previous week. In fact the general average covering the week was in the neighborhood of 33 per cent, the inevitable result being suspension for several days at a time at the majority of plants in the region. Production on the third was about 24,000 tons but by the middle of the week loadings were down to 10,000 tons a day, although there was a slight recovery on the sixth. For some reason not explained, permission to export coal from the Kanawha field was withheld. No embargoes were in effect, however, at least during the greater part of the week. Operators stated that they believed there were less loads on the line of the Chesapeake & Ohio than at any time in six months.

While a strike in force in the New River field might have accounted for the greatly restricted production in that field during the first half of the week ended Feb. 7, yet it had nothing to do with the greatly curtailed production during the latter half of the week for the strike had been called off. Nevertheless, even under the changed status of affairs and with miners ready to report for work, there was no increase in production, unless possibly it was on the seventh, owing to the most pronounced scarcity of cars yet felt in the New River region during the last two years. The strike referred to was adjusted through a return to the "check-off" and "closed-shop" system in the New River field, miners agreeing to go back to work, but as stated it had no effect on production. With the car supply averaging a little more than one-third of normal, there was much idleness among the mines in the New River section. New River shipments, for instance, on the fourth reached a total of only 12,850 tons and on the fifth shipments amounted to only 9,000 tons. With total shipments so small, naturally little coal was going to tidewater for export, nor to domestic markets either for that matter. The existing unstabilized conditions of course have left the contract situation for the coming year very much up in the air, mines being far behind with deliveries for the current coal year.

## Fairmont, W. Va.

First week of February sees worst car shortage in northern West Virginia since winter of 1917-1918. Some 161 mines idle in Fairmont region alone. Influenza interfered with train operation. Railroad fuel contracts must be completely filled before all other contracts are honored. Operators fear wholesale confiscation by Baltimore & Ohio.

Pessimism among the operators of the northern West Virginia mining regions was much in evidence when the worst car shortage observed since the winter of 1917-1918 developed in that part of the state during the first week in February. It had been believed that the supply could be no worse than that furnished during the final week of January, but there was a more alarming shortage at the opening of February than has been witnessed at any time during the last year.

There was a fairly adequate supply on Monday, Feb. 2, but by Wednesday the supply had slumped to 25 per cent, and there were, for instance, in the Fairmont region on that date only 341 cars available. From that time until the end of the week the supply was such as to daily increase the number of idle mines. Wednesday, the fourth, saw 140 mines shut down. The following day only 373 cars were available and 132 mines had to suspend operations. There were only 153 cars available on the sixth, with 131 mines not able to operate. With only 125 cars available, there were 161 mines in the Fairmont region alone unable to operate. The same conditions prevailed elsewhere in northern West Virginia and producers were becoming des-

perate, while at the same time miners were unable to earn enough to meet their living expenses.

While the influenza had not affected mining operations to any appreciable extent, limited as they were, yet it had interfered with train operation; railroads in the northern part of the State were reporting a shortage of crews, so that there is a possibility that if loadings had been anything like adequate, it would not have been possible to handle them with any degree of promptness.

Railroad fuel contracts must be filled before any other class of contracts, according to word received in the northern West Virginia fields, instructions to that effect having been received from Director General Hines. In other words, companies having railroad fuel contracts will be required to fill their entire railroad contract requirements before attempting to fill any commercial contracts; in order to enforce such instructions, railroads (it has been understood) have been directed not to accept billing, notwithstanding the marked shortage of cars. Operators charge that the railroads are resorting to this method of extorting their pound of flesh in preference to confiscation, which would require that coal be paid for at the price paid by other consignees. Protest has been lodged by the Northern West Virginia Operators' Association against the proposed plan of the Director General.

It is reported, however, that the Baltimore & Ohio has resorted to confiscation of coal for railroad use in some instances, and operators generally are apprehensive lest there be wholesale confiscation. There is a tendency, northern West Virginia operators believe, for the railroads to confiscate coal indiscriminately; this has not only resulted in much confusion but has worked a hardship in view of the inability of commercial consumers to secure even a small supply of coal. Shipments from all northern West Virginia points were extremely light during the first seven days of February, although customers were clamoring for supplies and there continued to be, as was natural, quite an acute demand.

## Piedmont, W. Va.

Acute car shortage in Piedmont and western Maryland fields. U. S. Senators and Congressmen appealed to for relief. Miners leave coal fields in search of work.

Failure of the Baltimore & Ohio to move coal cars on its lines has resulted, it is charged by operators in this section and in western Maryland, in quite an acute car shortage; a shortage so serious in fact that producers have found it necessary to appeal to U. S. Senators and members of Congress for relief. Until the loaded cars, which now almost choke sidings, are moved, operators contend, it will not be possible to secure an adequate supply owing to the lack of empties available. With cars so scarce, lines have been working on a half-time basis, this having resulted in a wholesale migration of miners from the coal fields of this section to Akron, Ohio, and Detroit, in search of employment.

## Norton, Va.

Railroads confiscating 60 to 70 per cent of coal produced in Virginia. Protests filed. Coal production dropping from week to week. Labor affected.

Wholesale confiscation of coal is being resorted to at mines in Virginia, the coal so taken being utilized as railroad fuel. The railroads, in other words, are confiscating from 60 to 70 per cent of the coal produced in this section for fuel, and this autocratic exercise of power, which the operators claim is not vested in the railroads, has created widespread indignation throughout the Virginia mining fields; the result has been the filing of rather sharp protests with the Railroad Administration,

none of which appear to have done much good. The railroads have resorted to the practice of going direct to the mines and of helping themselves to fuel, without regard to the rights of commercial customers; refusing to accept commercial billing.

There was a decline in production in the Virginia fields during the week ended the seventh, owing to a growth in the car shortage, the production dropping from 176,000 to 160,000 tons, a loss of 45,000 tons being attributed to a scarcity of cars. The percentage of loss from lack of cars is being increased from week to week.

The labor situation has been and is still being affected because of the fact that the operation of mines is becoming more irregular, this making for a feeling of unrest.

## Ashland, Ky.

Production gains slightly in northeast Kentucky, but output only 40 per cent of capacity. Car shortage still serious. Operators desperate. Railroad Administration introduces "average" adjustment in car distribution. Influenza cripples operations at one or two points. Kentucky legislation noted.

Slight gains were recorded in the northeast Kentucky district during the first week of February, but the car shortage was just as large, in proportion to total production, as it had been in previous weeks. The output reached 106,700 tons, that representing 46 per cent of a total potential capacity of 232,000 tons. During the week ended January 31, production amounted to 91,000 tons or only 40 per cent of capacity, so that there was a gain of 15,000 tons or about 6 per cent. The total loss was cut down about 12,000 tons, or from 137,000 to 125,300 tons. Yet of that loss the car shortage was responsible for 122,000 tons or 52 per cent all told.

During the first week of February, 1919, the total production was 112,070 tons, but at that time "no market" losses were the principal handicaps against a full production, so that last year's loading cannot be taken as a criterion of conditions. As perhaps illustrating somewhat more clearly just what conditions existed during the week ended the seventh, out of a total of 918 mine-days, there were 500 mine-days when mines were without cars.

Transportation facilities afforded mines in the northeast Kentucky field continue to be so poor that operators in that field are becoming desperate. They cannot conceive why it is that after three weeks of normal weather, there still should be such a pronounced shortage, as no reasonable excuse exists for such a shortage any longer. Repeated attempts to secure relief from the Railroad Administration have failed, and the stage has been reached where they cannot even secure acknowledgments of communications addressed to this Federal department.

Complaint is general in the northeast Kentucky field that operators are being penalized and discriminated against through adjustments of what the Railroad Administration is pleased to call "average." In other words, at a time when every car is precious, the railroads are deducting from the supply, for excess cars furnished the mines during the "no market" slump, during the shopmen's strike and at other periods when cars were not so badly needed; yet for these conditions the mine owners were not responsible. For instance, 900 cars were deducted from the January supply, to cover "average" for November and December, or the period of the strike.

Influenza has reached the northeast Kentucky field and has seriously crippled operations at one or two points, being complicated by other diseases. The epidemic appeared in its worst form at Seco, Ky., where the Southeast Coal Co. has a splendid plant. While here three nurses had been secured, it had not been found possible to secure the number of physicians desired.

Bills had been introduced early in the second week of February in both branches of the Kentucky Legislature, proposing a production tax of 2c. a ton on all coal produced. Measures are also now pending having for their object an increase of 100 per cent in the Workmen's Compensation rates. Still another bill has been introduced making the construction of wash-houses compulsory.

## Dallas, Tex.

Increased output of northern central Texas mines since strike settlement. Railroads taking greater part of output. Fuel shortage at communities near mines. Great development of Texas lignite in next few

years forecast. Predicted discontinuance of oil as fuel. Cheaper lignite to be substituted.

Bituminous coal mines in the Strawn and Thurber districts of Texas have increased their output since the settlement of the coal strike to such an extent that a total of 1,400 tons is being mined daily, according to reports from mines in these sections. At Thurber, coal is worked in only two shafts, and the daily output there is 900 tons, while Strawn is turning out 500 tons a day.

Most of the coal mined in these two districts is being contracted to Texas railroads, the Texas & Pacific and the Missouri, Kansas & Texas taking a large portion of the output. The Wichita Valley lines, the Abilene & Southern and the Roscoe, Snyder & Pacific are getting their coal supply from the Strawn district. Some of the coal is being sold for domestic consumption, but the output is far below the demand and many communities adjacent to the mines are experiencing fuel shortage.

Mines at Newcastle are also working at full capacity, but the supply from these mines is also being taken by railroads, the Rock Island using a large part of it. Little of the Newcastle output is reaching domestic users.

Great development of the vast lignite beds of Texas within the next few years is forecast by James Z. George, vice president and general manager of the Texas Chamber of Commerce. Mr. George, speaking before a gathering of business men from all parts of the state in Dallas, a few days ago, pointed out the great possibilities along this line and predicted early development of lignite mines in Texas.

"Twenty-three billion tons of lignite lie in a belt running from Texarkana southwest to the Rio Grande, and passing within a few miles of Dallas," said Mr. George. He added that any industrial community must have cheap fuel close at hand, and predicted that at no far distant date the use of petroleum as fuel would be discontinued. A cheaper fuel will be found, and that fuel will be the lignite taken from the vast beds in Texas. Mr. George said the time was near at hand when practically all industries in Texas would be operated with lignite.

## PENNSYLVANIA

### Anthracite

**Pottsville**—That the stubborn fire in the inside workings of the Wadesville colliery, of the Philadelphia & Reading Coal Co. has been conquered was evidenced on Feb. 1, when officials, protected with smoke helmets, entered the mine and found the last vestige of the flames extinguished. By tightly sealing the area that was burning, the fire was effectually smothered.

### Bituminous

**Uniontown**—It is being freely reported around the Connellsville coke region that considerable stock of the Tower Hill Connellsville Coke Co., has lately been changing hands and it is thought that one of the large steel companies is responsible therefor. This is in line with the action recently taken by some of the steel companies to gain a foot-hold in the region. The Tower Hill company operates two large coal and coke plants in Fayette County between Uniontown and Brownsville. The main office of the company is in Uniontown.

**Indiana**—The Clearfield Bituminous Coal Corporation has under course of development and construction new mines at a town to be known as Commodore, in Indiana County. The new town will adjoin Lovejoy and is situated on the Dixonville & Cherry Tree R.R., which is an outlet for both the New York Central and Pennsylvania railroads from the western end of Indiana County. There will be two openings to develop the 5,000 acres of coal available and it is said that it will be one of the largest plants in central Pennsylvania. Power will be furnished from the company's central power plant at Sample Run.

**Johnstown**—At the annual meeting of the stockholders of the Imperial Coal Corporation, held in the Johnstown Trust Building, officers were named as follows: President, Charles A. Owen; vice president, James P. Thomas; secretary, Frank D. Baker; treasurer, Philip E. Thomas; general superintendent, James M. Cook; assistant superintendent, E. H. Zimmerman and assistant secretary Harry A. Ling. The directors re-elected were: Charles A. Owen, of Atlantic City; James P. Thomas, Philip E. Thomas and Harry A. Ling, all

of Philadelphia; Frank D. Baker and James M. Cook, Johnstown and E. H. Zimmerman, New York. The company was formed in July, 1919, by the merger of the Shade Creek, Diamond Smokeless, Cambria Smokeless and Imperial coal companies.

**Brownsville**—The Redstone Coal & Coke Co. has been organized as a subsidiary of the Wierton Steel Co. to operate the Thompson-Connellsville No. 1 coke plant at Republic, Fayette County, Pa., recently taken over by the former company. The Thompson-Connellsville plant is on Redstone Creek.

The Superior Coal Co., on the Monongahela R.R., in Fayette County, Pa., between Uniontown and Brownsville has been taken over by the American Coke Corporation; the latter company is controlled by the Reilly-Peabody interests of Pittsburgh, Pa., recently formed to take over the Orient Coke Co. and supposed to be holding this company in the interest of one of the large steel companies. The Superior company owns one large mine, but though located in the Connellsville coke region has no coke ovens.

**Connellsville**—Thousands of employees of the H. C. Frick Coke Co. and their families are to be inoculated against influenza and pneumonia. Already five of the company's doctors are at work and are meeting with gratifying success. Influenza has not yet gained a foothold in the coke region. Officials of the company hope, through inoculation, to prevent the slowing down of production which they feel would follow an epidemic. No charge is made for the treatment.

That only 44 fatal accidents occurred in the last two years in the mines of the H. C. Frick Coke Co., which employs about 30,000 men, was the statement made by William H. Glasgow, assistant superintendent of the Frick company at a big banquet given here. It was stated that the number of tons of coal mined by the Frick company, per fatal accident, is larger than any in the state with two exceptions—both small concerns. Mr. Glasgow said the accidents were preventable, due to poor judgment, bad practices and disobedience to the company's rules and state laws. A renewed campaign for safety was urged.

## WEST VIRGINIA

**Logan**—About 30 officials and employees of the Lundale Coal Co. organized the Lundale Mining Institute at a meeting held at Lundale on Jan. 30. Practical problems in connection with mining will be discussed at monthly meetings. The officers of the temporary organization selected were: J. M. Schweitzer (general superintendent of the Lundale company), president; W. R. Foglesong, Jr., secretary.

**Bluefield**—Fire recently totally destroyed the tippie and fan house of the No. 1 mine of the Thomas Coal Co., on Crane Creek, in Mercer County. It was not learned just how the fire started. There was no interruption to operations, the company having a connection between its No. 1 mine, where the fire occurred, and its No. 2 mine, coal being removed through the mouth of the No. 2 operation.

**Huntington**—The annual meeting of officers of the Logan Coal Operators' Association was held here on Feb. 2, the principal feature of the session being the election of officers. The officers elected are as follows: J. J. Ross, of the Logan Mining Co., president; A. R. Beisel, of the Island Creek Co., first vice president; W. R. Thurmond, Thurmond Coal Co., second vice president; C. W. Jones, treasurer; W. P. Ellis, secretary. One of the principal features of the annual meeting was an address by J. D. A. Marrow, vice president of the National Coal Association, dealing with the general coal situation.

**Charleston**—The appointment of traffic managers for each of the several district coal associations in West Virginia has become necessary as a result of the continued serious car shortages. That such traffic managers would be appointed for the purpose of giving special attention to car shortages, ascertaining the causes thereof and taking the necessary remedial action, was the statement made on Jan. 30, by T. L. Lewis, secretary of the New River Operators' Association; the appointment of a traffic manager by the Kanawha Coal Operators' Association followed on the heels of Mr. Lewis' announcement. The association selected as its traffic manager, A. R. Yarborough, of Charleston, demurrage claim agent of the Kanawha & Michigan Ry. Mr. Yarborough entered upon the discharge of his duties on Feb. 2.

**Grafton**—The Tygart's Valley Mining Association was formed here recently. Its membership including superintendents, mine foremen, fire bosses and others engaged in mining. The object of the institute is the study of mine problems and securing of greater efficiency in mining. The meeting was called by W. H. Sandridge, inspector of the Second Inspection District of West Virginia; both Mr. Sandridge and W. Samples urged the organization of an institute for the study of mining problems and to insure a greater degree of co-operation between mine officials and the West Virginia Department of Mines, not only in averting accidents but in bringing about improvements in mining methods. W. Samples was elected chairman of the association, W. H. Sandridge, of Grafton, president and J. R. Lennon, of Independence, secretary. The association will hold its second meeting on March 6, at Grafton, arrangements for that meeting being in charge of W. H. Sandridge, G. H. A. Kunst and J. R. Lennon.

#### KENTUCKY

**Louisville**—J. N. McCormick, head of the Kentucky State Board of Health, reports a light but general epidemic of small-pox in the Harlan fields of southeastern Kentucky, and is threatening to place a quarantine on the county to prevent spread of the epidemic throughout the fields. Mr. McCormick stated that his only reason for not embargoing the county was the drastic need for coal throughout the country. He charged that the mine operators are not co-operating properly, and are not showing proper interest in the situation. The influenza epidemic is getting worse in the larger cities of the state, but is not causing much trouble in the mine districts.

#### ALABAMA

**Birmingham**—Work on the \$3,000,000 plant of the Birmingham Coke & Byproducts Co. has been completed and the ovens were fired for the first time recently. Coke and chemical byproducts will not be produced for about a month, says the *Iron Trade Review*. The plant, which is located just outside of Birmingham, between Boyles and Tarrant City, is to be the center of a big industrial section, as a number of industries which will use the coke and byproducts of the ovens will locate on the land reserved especially for that purpose by the owners of the Birmingham Coke & Byproducts Co. The plant now has 50 Koppers ovens, and was built so that 150 more ovens, in units of 50, may be added.

R. A. Terrell, a local capitalist and banker, has been appointed umpire under the Garfield agreement to pass upon questions of dispute between miners and operators in this district. Miners and operators presented to Federal Judge W. I. Grubb six names each, from which to make a selection. Mr. Terrell being on the coal-men's list. Mr. Terrell's appointment has been approved by Attorney General Palmer, but he has not yet signified his acceptance of the position. Judge H. C. Selheimer, former umpire, resigned on account of ill health.

At the semi-annual examinations of applicants for certificates of competency as mine foremen and fire bosses, held by the State Mining Board recently, certificates were granted to 29 first class and 20 second-class foremen and to nine fire bosses.

#### OHIO

**Toledo**—Some improvement in the congestion on the railroads at this place is reported by traffic officials. The more favorable weather that has been prevailing has enabled traffic men to move some of the loaded cars which have been blockading the Toledo gateway. But there is still bad congestion and embargoes on many of the roads entering Michigan still prevail. Social permits are necessary to ship to many Michigan points.

#### INDIANA

**Evansville**—The St. Bernard Mining Co., with mines in Webster and Hopkins counties, Kentucky, a few miles south of this city, has announced that a deal with Drexel banking interests of Philadelphia has been called off. The officials of the mining company state that the mine is not for sale. It was reported at one time recently that the Drexel interests would finance a large coal-mining deal in this vicinity.

**La Fayette**—The Monon Route handled 220 carloads of coal in its Linton district on a recent day, the largest in any one day in the road's history. Activity in this coal district has increased steadily since the mine strike ended. The Little Giant

and the Gould mines, two of the largest in the Linton field, have had an average daily output of 1,250 tons each since the big strike ended, and the Monon has been handling an average of 200 carloads daily in this time. The major part of this output is transported to points in Indiana, Illinois and Michigan. The Monon road requires for its own consumption, for stationary power and locomotive uses, from 25 to 30 carloads daily. The entire daily output of coal in the Linton field, including the two large mines mentioned and the 23 others, is averaging 11,000 tons, the largest in the history of the field.

**Petersburg**—An important deal in Indiana coal fields has been consummated at this place, the transaction involving the leasing of several thousand acres of coal land; the coming spring and summer should see increased activity in the coal fields of northern Pike County and southern Daviess and Knox counties. The oil development in this part of Indiana has brought to the attention of coal operators what is said to be one of the best fields in the Central West, with five workable seams. The seam here is said to average from 2 to 5 ft. in thickness. Thousands of acres of land underlain by No. 6 coal is being bought for stripping purposes at from \$70 to \$150 an acre. Furthermore it is reported that 25,000 acres of land containing No. 5 coal has been bought in the last few months, the Pike County Coal Co. alone having purchased 10,000 acres. The American, Indiana Creek, Globe and other companies are leasing tracts of coal land. No. 5 coal is found at depths ranging from 80 to 150 ft., in seams from 5 to 11 ft. thick; and the coal is said to be free from gas. No. 4 coal is found in Pike County in seams ranging from 4 to 7 ft. in width, at depths ranging from 250 to 450 ft. No. 3 coal seams are found at a depth of 500 ft., and are from 10 to 14 ft. in thickness.

#### ILLINOIS

**Belleville**—Ninety miners have been enrolled in the free night school just organized at the Belleville Township High School. Thomas Wright, former county mine inspector, and a deputy state mine inspector, is the instructor. The purpose is to make miners more practical in their work. Sparrows and mice are being trapped to be used in testing gases encountered in mines. The chemists of the high school will prepare samples of carbon monoxide and other gases similar to those originating in mines, for experiments.

**Duquoin**—The Madison Coal Corporation, one of the big coal mining companies of Illinois, is planning to sink a new mine near Blairsville, seven miles southeast of here. Plans call for a steel tippie to be erected at the new mine, and all equipment will be modern. The mine will be served by several roads, including the Illinois Central and the Iron Mountain, both of which run close to the site. Construction work on the new mine, which has been planned, will begin just as soon as the weather opens up and it is expected that by fall the plant will be well under way. The company owns most of the coal, which will be mined, a small part being held under lease. The field where this mine is to be sunk is one of the best in southern Illinois, the large Kathleen mine of the Union Colliery Co. is only about four miles from the spot. Several weeks ago representatives of the Southern Gem Coal Co., of Chicago, optioned 6,000 acres of land joining the Madison tract, and it is said as many as three or four mines will be sunk in that district during the next three years.

Jesse Diamond, president, and Herman Rea, secretary of the Southern Gem Coal Co., were in this city recently taking options on 6,000 acres of coal land five miles southeast of town. It was stated that the options were being taken up with the view of sinking shafts on the property in the near future. The Southern Gem Coal Co., which was organized only last summer, now owns or has under option or lease many thousands of acres of coal land in Franklin, Perry, Jefferson and Williamson counties. The same company is also contemplating the purchase of the Victory mine at Tamaroa, ten miles north of here, owned by the Victory Collieries Co. This mine is now being operated successfully and the purchase of it by the Southern Gem will make that company the owner of five mines, all of which have been bought during the last six months, the other four being at Winkle, West Frankfort and two at Sesser, respectively. The land which the company optioned near this city is directly adjacent to the holdings of the Union Colliery Co., of St. Louis, on which was sunk the large Kathleen mine.

Extensive improvement have been completed at Mine 2 of the Franklin Coal & Coke Co., of Chicago, located at Royalton, south of here. Owing to power trouble the mine has, for the last few months, been using current furnished by the Central Illinois Public Service Co., but this power has proved unreliable, causing the company to install new generators. Two 100-kw. Ridgway engine-generator units have been installed and will be used in connection with two 200-kw. synchronous-motor generator sets which are located in the mine. The power will be used for mining machines and haulage motors. These installations are in a way only temporary; later on the company intends putting in two 400-kw. Ridgway engine sets which will furnish power for mines 1 and 2, and also for the city.

The Bell & Zoller Mining Co. is excavating a large reservoir at Mine 1 near Zeigler, the work of excavating being done by one of the largest machines in the country of the type which was used digging the Panama Canal. The reservoir is expected to hold over 1,000,000 gallons of water.

### Obituary

**George W. Erwin**, 40 years of age, a prominent coal operator connected with the Midland Mining Co., of Perry County, in the Hazard field, Ky., died in New Mexico recently, where he had been endeavoring to regain lost health. The body was brought to Hazard for interment.

**Horace T. Knight**, formerly superintendent of the Madison district mines of the Keystone Coal & Coke Co., at Greensburg, Pa., died recently from influenza. Mr. Knight was 45 years of age. He was a graduate of Mercersburg Academy and Lafayette College. He had been in Greensburg 18 years.

**Samuel Matthew Robins**, for many years a prominent figure in connection with the coal mining industry of British Columbia, died on Nov. 4, 1919, in Devonshire, England, where he took up his residence after the Vancouver Island Coal Co.'s holdings on Vancouver Island passed into the hands of the Western Fuel Co. This happened in the year 1901. It was in 1884 that Mr. Robins took charge of the old company's business in this province making his home at Nanaimo, B. C.

**Alexander Ewart**, pitt boss in the Middlesboro coal mines, at Middlesboro, B. C., was murdered on the evening of Jan. 19. He returned to the mine to assist in straightening out some trouble the ropers were having with the cables. He had just reached his objective when a masked man stepped out from the darkness and discharged two revolver shots at him from point-blank range killing him instantly. Mr. Ewart had been engaged in the coal-mining business in the province for some time.

### Personals

**Edward Bottomley**, superintendent for the Kathleen mine at Dowell, five miles south of Duquoin, Ill., has resigned to accept a more responsible position with the Peabody Coal Co. since the sinking of the Kathleen shaft, over two years ago.

**Charles McKay** has resigned as superintendent of the Republic coal mine of the Republic Iron & Steel Co. at Republic, Fayette County, Pa., effective April 16, 1920. He was succeeded by William Fowler, mine-foreman of the same mine.

**W. Bruce Wagner**, former county commissioner of Indiana County, Pa., has been appointed lumber and timber inspector for the Rochester & Pittsburgh Coal & Iron Co. Mr. Wagner's headquarters will be at Indiana, Pa.

**H. M. Rogers** has been named as store manager of the Consolidation Coal Company stores at Monongah, W. Va., having succeeded C. E. Bartlett, resigned; the latter was store manager for the company for a period of 28 years or until forced by ill health to resign.

**J. B. Johnston**, formerly manager of the ordinance department, Crucible Steel Co. of America, Harrison, N. J., has been appointed general manager of the Standard Scale & Supply Co., Pittsburgh, Pa. This company specializes in the building of railroad track scales, coal and heavy duty industrial scales.

W. G. Stanton has accepted a position with the Ohio Brass Co., of Mansfield, Ohio. For the last 20 years Mr. Stanton has been identified with the electric industry, having started with the General Electric Co. and remaining with this corporation for a period of 18 years in the testing, engineering and sales departments.

C. E. Jaycox, formerly connected with the Central Illinois Traffic Bureau, has been appointed to fill the position, made vacant by the resignation of Percy F. Kuhleman, as traffic manager for the Rudge & Taylor Coal Co., Chicago. Mr. Kuhleman resigned recently to accept a position in the distributing department of the Sterling-Midland Coal Co., of Chicago.

Clarence Patterson has resigned as superintendent of the Revere, Pa., plant of the W. J. Rainey company. He has accepted a position with the Grasselli powder company. At a farewell dinner given by W. J. Rainey officials at their club rooms at Revere, Mr. Patterson was presented with a cash gift by the employees at the Revere plant.

Thomas D. Thomas, superintendent of the Lucerne mines of the Rochester & Pittsburgh Coal & Iron Co., at Homer City, Pa., has been promoted to the position of private mine inspector for all the mines of this company and its allied interests. F. R. Vinton has been made chief private mine inspector in charge of all the mines of these companies in Indiana and Jefferson counties.

Guy M. Freer, secretary of the Central Coal Association, has been appointed director of the National Industrial Traffic League, with offices in the Tacoma Building, Chicago. His duties will be to look after and protect the interests of shippers with the return of the railroads to private ownership. R. R. Glover, assistant secretary of the Central Coal Association, has been named successor to Mr. Freer.

James L. Burns, Jr., has resigned as assistant to George P. Bell, executive vice-president of the Northern West Virginia Coal Operators' Association. Mr. Burns' resignation was announced Feb. 6. He is succeeded by C. M. Stubbins, of Grafton, W. Va. Mr. Burns will take charge of a branch office of the Cortright Coal Co., of Pittsburgh, Pa., which is being opened in the Professional Building, at Charleston, W. Va. Mr. Stubbins was formerly superintendent of fuel loading in the Allegheny district of the U. S. Fuel Administration.

F. P. Truesdale, former division freight agent of the Pennsylvania R.R., with offices in Uniontown, Pa., has launched a coke brokerage business in Pittsburgh, Pa., under the name of the Snowdon Fuel Co. Associated with him in the new enterprise are G. H. Snowdon and C. L. Snowdon. Offices have been opened in the Oliver Building. Since leaving Uniontown more than a year ago, Mr. Truesdale has been engaged in the selling end of the coke industry for other firms and has now launched into business for himself.

Charles L. Snowdon, of Pittsburgh, is part owner and former president of the Snowdon Coke Co., operating near Brownsville, Pa., and his son George H. Snowdon, also of Pittsburgh, is part owner of the Franklin Coke Co., operating in Somerset county near Somerset, Pa.

## Coming Meetings

Material Handling Machinery Manufacturers' Association will hold a convention Feb. 26 and 27, at the Waldorf-Astoria Hotel, New York City. Secretary, Z. W. Carter, 35 West 39th St., New York City.

Canadian Mining Institute will hold its annual meeting at the King Edward Hotel, Toronto, Ontario, Canada, on March 8, 9 and 10, 1920. Secretary, H. Mortimer-Lamb, 503 Drummond Building, Montreal, Quebec, Canada.

New York State Retail Coal Merchants' Association will hold its annual meeting Feb. 26, at the Pennsylvania Hotel, New York City. Executive secretary, G. W. Woodside, Albany, N. Y.

American Chemical Society will hold its annual meeting at St. Louis, Mo., April 13, 14, 15 and 16. Secretary, Dr. Charles L. Parsons, 1709 G St. N. W., Washington, District of Columbia.

New England Dealers' Association will hold its annual meeting March 21 and 22, at Springfield, Mass. President, W. A. Clark, 111 Milk St., Boston, Mass.

Pennsylvania Bituminous Mine Inspectors' Advisory Association. A meeting has been called by Thomas K. Adams, presi-

dent, of all the bituminous mine inspectors of the state, together with the other members of the mine foremen's examining boards, to be held at the Seventh Avenue Hotel, Pittsburgh, Pa., Friday, March 5.

National Retail Coal Merchants' Association. Executive meeting will be held in Philadelphia, Pa., March 5. Annual meeting is to be held in Detroit, June 10, 11 and 12. Secretary-manager, Ellory Gordon, Philadelphia, Pa.

## Industrial News

Charleston, W. Va.—There is a movement on foot in this city among coal men of the New River, Kanawha, Winding Gulf and Elk fields, adjacent to Charleston, to erect a large office building here, such a movement having been planned at a recent meeting of the Charleston Coal Exchange.

Pittsburgh, Pa.—At a meeting of the board of directors of the Pittsburgh Coal Co., on Jan. 28, A. K. Oliver was elected a director to take the place of Henry R. Rea, who died recently, and James Carstairs, of Philadelphia, was elected a director to take the place of J. J. Fisher, who died some time ago.

Centralia, Wash.—The Lincoln Coal Co., a new corporation, has taken over the mines of the Lincoln Coal Mining Co., at Galvin, west of this city. The mines at present have a daily capacity of 150 tons, but this will be increased to 500 tons immediately. The officers of the new company are T. E. Martin, president, and J. O. Humbert, secretary-treasurer.

Pittsburgh, Pa.—H. D. Mason, Jr., secretary of the Coal Mining Institute of America, announces that all material for the bound proceedings is now in the hands of the printer and that books will be mailed within the next month. A feature of this year's book will be the including in the proceedings of the banquet addresses.

Wheeling, W. Va.—Youngstown, Ohio, interests identified with a large new steel industry, it was announced here tonight, have acquired for \$1,250,000 the mines and 2,000 acres of Pittsburgh seam coal in Belmont County, Ohio, near here, from Burgess Lewis and the Industrial Coal Co. It is said that the property will be developed on a large scale.

Gordon, Pa.—The Hillone Coal Co., Scranton Life Building, of this place, in Schuylkill County, is having plans prepared for the construction of a new coal washery at its local operations. The structure is estimated to cost about \$25,000. Frank B. Davenport, Coal Exchange Building, Wilkes-Barre, Pa., is engineer.

Wilton, N. D.—The tippie of the Washburn Lignite Coal Co., at No. 2 mine, of this place, was recently destroyed by fire. The Roberts & Schaefer Co., of Chicago, was awarded the contract for the reconstruction work. A modern steel tippie, which will have incorporated in it a Marcus picking-table screen, will be erected.

Mallory, W. Va.—The Faulkner Coal Co., of this place, plans to start work at once on houses for its employees also to instal motors and to be in the market for rail. The plant operates a drift mine and the improvements are estimated to cost \$150,000 when finished and the ultimate capacity of 500 tons a day is realized. S. E. Scholl is the superintendent in charge.

Toronto, Ont.—The Canadian National Railways will be arranging shortly for their supplies of locomotive and other fuel, for the coming year. Inquiries should be addressed to A. L. Graburn, General Fuel Agent, Toronto, Canada, quoting prices at the mines for 3 lump and run-of-mine and giving present freight rates to Lake Erie points for water shipment and all rail rates to Toronto, Cobourg, Ottawa, Montreal and St. Hyacinthe.

Madisonville, Ky.—An option placed with the Drexel banking interests of Philadelphia, for the sale of the property of the St. Bernard Mining Co., with the largest operations in western Kentucky, expired on Jan. 30, and the St. Bernard people will continue operating the properties as heretofore. It is reported that an extension of the option was asked, but not given. The properties are said to be valued at \$2,500,000.

Mullens, W. Va.—With a branch of the Virginian Ry being projected from Mullens into the Laurel Fork region of Wyoming County, coal resources of that part of the county are undergoing rapid development. Not less than 600 miners' dwellings are being constructed near McGraw's post office. Development of the section named will materially increase the annual tonnage

of Wyoming County during the coming year.

Chicago, Ill.—The Edmund T. Perkins Engineering Co., announces the centralizing of all branches at the First National Bank Bldg., Chicago. Having a complete corps of engineers, this company is prepared to carry on a general engineering practice, including reports and valuations, irrigation, drainage, flood protection, river regulating, water-power and topographic mapping.

Wheeling, W. Va.—A deal has been closed by the Goodyear Tire & Rubber Co., of Akron, Ohio, it is understood, in the name of the International Coal & Coke Co. for 2,000 acres of coal land in eastern Ohio near Harrisville. The property is on a branch of the Wheeling & Lake Erie R.R., and the consideration is said to be between \$2,000,000 and \$3,000,000. Included in the purchase are going mines. Extensive improvements are contemplated with a view to materially increasing the capacity of the mines, and 1,500 houses are to be built for the use of miners.

Penn., Ill.—The Smith-Lohr Coal Mining Co., of this place, has contracted with Roberts & Schaefer Co., of Chicago, for a complete steel tippie and re-screening plant to be built at its mine at this place. The tippie will be complete with a Marcus picking-table screen, "Rands" shaker loading booms, and rock-disposal machinery. The plant will also have incorporated in it facilities for cleaning and crushing run-of-mine coal. The re-screening bins will be built of re-inforced concrete and steel, and will be equipped with special facilities for careful handling of coal into the bins, and the loading of coal into the railroad cars.

Charleston, W. Va.—Having taken over leases covering 10,000 acres of coal land in Greenbrier County, in the smokeless area, Charleston coal men and others have also secured control of the Greenbrier & Eastern Ry. and have reorganized that road, John B. Lang, of Lewisburg, having been elected president. The company is evolving plans now for the development of land under lease. Those associated with Mr. Lang in this venture are: W. E. Deacons, of Hinton; A. B. Crichton, of Charleston; J. W. Bell, of Bellwood; Henry Blackman, W. S. Wood and Quin Morton, of Charleston.

Pittsburgh, Pa.—Colonel G. A. Burrell, formerly Chief of the Chemical Warfare Service, U. S. Army, has organized the Burrell Technical Supply Co., with offices in the Chamber of Commerce Building, Pittsburgh, Pa. Colonel Burrell is president of the company, the other officers being: J. T. Ryan, vice president; G. H. Deike, treasurer; G. C. Nelms, secretary. The personnel also includes G. H. Burrell, E. H. Kellogg and K. P. Masc, formerly Chemical Warfare Service men. The company will conduct a general laboratory and technical supply business and will issue catalogues in the near future. Work on the new buildings in Pittsburgh, which will give this company greatly added facilities, is being rushed to completion.

Chicago, Ill.—The Chicago Pneumatic Tool Co. on Jan. 21 and 22 held a general conference of executives, plant and branch managers and salesmen at its Detroit plant, on the occasion of the formal opening of a large five-story addition. At this conference the expansion program of the company for 1920 was outlined, calling for largely increased production not only at Detroit but at the five other American plants of the company. It was reported that much of the proposed increase in production was already absorbed by orders for future deliveries. The plan of nationwide chain of service stations which the company has opened and supplied with complete stocks of spare parts, machinery and tools and provided also with facilities for handling territorial repairs for users of the company's products, was also outlined in detail.

Nelsonville, Ohio.—The Echo Coal Co., of Columbus, recently chartered with a preliminary capital of \$10,000 has purchased the East Hill Coal Co., operating a modern mine on the Hooking Valley Ry. near this place. A modern tippie was erected last year. It is planned to increase the output from 300 tons to about 800 tons daily. The product will be handled by the Essex Coal Co., of Columbus. S. Cottingham is president and Fred Essex, secretary and treasurer of the company.

The operating mine of the Hazelton Coal Co., located near Nelsonville, has been purchased by the Essex Coal Co., of Columbus, which is operating it and selling through the Columbus office. The property is known as the old Gem mine. Harry Spencer was president and F. M. Spencer, secretary of the Hazelton Coal Co.

# MARKET DEPARTMENT

## Weekly Review

*Operators Complain of Continued Car Shortage—Milder Weather Aids Distribution—Frozen Cars Prevent Dumpings—Demand for Both Bituminous and Anthracite Brisk.*

**M**INE operators still continue to complain of their car shortage, especially in that district of Kentucky located along the Louisville and Nashville Ry. lines where the car supply has fallen as low as 10 per cent of capacity. Although the railroads have made an effort to improve conditions, they have not been able to remedy them materially.

Almost all the districts that were affected by the heavy fall of snow found other difficulties confronting them when the downfall ceased. The milder weather of the daylight hours thawed the snowy coating, making the coal wet and ready to freeze hard in the cold and windy nights. Once frozen through, it was almost impossible to dislodge it from the cars at dumping points.

When coal is frozen solid, as is the case with recent anthracite shipments in and around New York piers, unloading is delayed by the time required to put the coal through the thawing process, and this is especially annoying where inadequate thawing facilities are provided. Because of the ice in the river, boats in the harbor have also been held up. The only

possible solution of the tied-up condition is a spell of milder weather.

At Hampton Roads, there has been observed a slight improvement. Although the embargo on exports still continues to be enforced, bunkering is allowed to continue, and boats, where coal has been contracted for early, are loading what is considered a fair volume. This class of trade does not fall, however, to wholesale dealers.

Demand for bituminous coal has shown some slight signs of weakening in view of the possibility that milder weather may soon set in, but most of the coal now to be obtained is consumed by the railroads. Though the Railroad Administration is being besieged by representatives of the districts which complain of small stocks of coal, the railroads still continue to confiscate and divert shipments.

Diseases which have interfered recently with the activities of the coal industry have now become less prevalent, but while the number of cases of influenza has not been greatly increased, more deaths have been reported. Smallpox, both in Canada and Harlan County, Kentucky, still continues to be a menace.

The prices of bituminous coal are still those ordered as a maximum by the Government, and as a result there is not much coal offered in the spot market. More attention is being paid to contract consumers, on which the wage advance of the miner is added to the price. No decision has been reached by the commission investigating wages and prices in Washington, D. C.

Demand for anthracite has been satisfactory, but the dealers complain of poor deliveries. Local conditions such as cold and the snow prevent timely deliveries to the domestic consumer.

Expectations as to production were not realized in the Connelsville coke region for, although 413 ovens were added to the active list the week previous, these are being hampered in production because the coke cannot be removed from the oven wharves by reason of poor car supply. Operations throughout the Connelsville district worked practically with the same degree of halting uncertainty as during the week previous, iron and steel plants securing an inadequate supply of coke.

### WEEKLY PRODUCTION

The weekly report on the production of bituminous coal, anthracite, and beehive coke, compiled by the Geological Survey, Department of the Interior, Feb. 14, 1920, states that the cumulative effect upon transportation of continued snow, sleet, and storms, caused the production of soft coal to decline again during the week ended Feb. 7. The total output, including lignite and coal made into coke, is estimated at 10,004,000 net tons, a decrease of 597,000 tons, or 5.3 per cent, when compared with the preceding week.

For the first time this year the line of current production has fallen below the curve of 1918, although it remains above those of 1917 and 1919. The output for the corresponding week of 1917 was 9,769 tons; of 1918, 10,424,000 tons, and of 1919, 7,946,000 tons.

The decline in production was admittedly due to transportation disability, which in turn was caused by continued bad weather. After a month or more of favorable weather in December and early January, an extended period of snow and cold set in. The week of Jan. 24 was marked by exceptionally heavy rain, snow, and sleet. It was followed by a cold wave affecting the Middle Atlantic States, and especially New England. During the week of Feb. 7, the falls of sleet returned, accompanied by high winds along the Atlantic Coast. Drifting snow blocked the roads and interfered greatly with rail transportation as well.

The production of beehive coke during the week ended Feb. 7 is estimated on the basis of rail shipments, at 433,000 net tons. This was a 9 per cent decrease when compared with the preceding week. The decrease was general throughout the principal producing districts.

That the demand for coke is still very active is evidenced by the willingness of blast-furnace operators to pay the dollar premium on 72-hour coke allowed in certain cases by the Government prices. Shortage of cars, particularly in the Connelsville region, is at present the limiting factor in the production of beehive coke. The total output since the beginning of the year now amounts to 2,410,000 tons, a decrease of 533,000 tons, or 18.1 per cent, when compared with 1919.

### Atlantic Seaboard

#### BOSTON

New England embargoed. Wholesale confiscations continue. Extremely light movement all-rail. Coal Committee gets busy again. New York and Philadelphia piers short of supply. Hampton Roads situation shows slight improvement. Anthracite domestic sizes still in strong demand. Better request for steam sizes.

**Bituminous**—Following closely upon restrictions placed against the movement of

steam coal to tidewater, the Regional Director at New York announced a general embargo against all coal to New England all-rail, anthracite and bituminous, railroad fuel alone excepted. The reason given is that this territory has in transit a very large volume, ample for immediate needs, and that other sections are in greater need. Meanwhile, Governor Coolidge of Massachusetts has been exchanging telegrams with Mr. Hines, who has promised that everything possible will be done "to meet the situation."

Could New England steam users be assured that coal en route would be protected against seizure there would be measurable relief, but so far as we are advised there have been no steps taken in this direction. It was rumored that the Washington authorities were anxious that the railroads should not be in the position of turning over to private owners any larger reserves of fuel than would safely be required for this time of year, but at the rate coal has been confiscated the past four weeks for railroad supply one might suppose the roads were trying to stock for the whole spring. March 1 cannot come too soon, in the judgment of the trade, if thereby we shall have some relief from the fast and loose methods that have lately been employed.

It should be remembered that confiscations lately have also been in favor of large utilities, particularly those in the vicinity of New York City. The consumers have been at a decided disadvantage be-

cause of slow movement to the piers and the great difficulty in handling frozen coal.

The Sub-Coal Committee, for this district, is again issuing broadsides of advice and promising all manner of assistance, but to the trade there is apparent an increasing lack of co-ordination between different branches of the Railroad Administration. While members of the committee besiege Washington for increased shipments, the Regional Director takes steps to shut off what we have. The press gives prominence to efforts of the committee which were said to result in 70,000 tons extra from Hampton Roads for distribution to New England industries but several of the agencies take serious exception to this. Coal at, or en route to the piers through usual channels and already destined for New England, with ships waiting, has now been seized for dumping into other ships for distribution in New England through other agents; wherein New England is the gainer. More than the trade can figure out. From the publicity given it might be supposed that 70,000 tons would run New England for at least four months.

Because of adverse weather and all the conditions incident to it there is great difficulty getting even a minimum of tonnage dumped over the Philadelphia and New York piers. At the latter the situation is very serious and, in spite of all efforts, only the most urgent requirements can be met. The piers are sadly lacking in thawing facilities and it is taking hours instead of minutes to dump cars. There is much confusion over permits for bunkering, and seizures of commercial coal are made regularly from day to day.

At Hampton Roads there is observed a slight improvement. Boats for New England are loading in four to six days and, so far as contracts are concerned, a fair volume is moving in this direction. Agencies who are confining themselves to bunker and export trade are giving no attention to this market, but yet they are more often the channels through which the authorities expect emergency coal will be satisfactorily distributed. On the Virginia roads there are the same difficulties with regard to car supply, but movement is much better than in Pennsylvania.

**Anthracite**—Retail dealers are still exerting pressure to get forward domestic sizes, especially stove and chestnut. Egg is not much in demand, although there are signs of better request for March delivery. Household trade is very active, but deliveries are difficult and for that reason stocks are not being moved as would otherwise be the case. It is apparent also that the larger dealers, especially, are making every effort to increase their receipts because of the probable advance in freights, both water and rail, when the railroads are turned back. There is reasonable certainty also that coal itself will cost more at the mines when the new adjustment is made in the spring. Discussion is once more general about a possible re-sizing. Some of the companies are considering this seriously and doubtless will fall into line, if it can be shown that the plan can be carried through uniformly with all the shippers. Retail dealers are generally in favor of the scheme and it only remains to be seen how the public will view the possible change.

Before the embargoes were put on the trade was developing a much better request for steam sizes. Some of the regular shippers of the junior sizes have fallen off in deliveries, and this has caused somewhat more inquiry than usual. There is nothing like the broad demand, however, that was anticipated, and this is another point in favor of the argument that the great urgency for bituminous in New England is really confined very largely to the railroads themselves.

#### NEW YORK

Shortage of anthracite possible unless improvement comes in harbor situation. Unloading at piers extremely slow. Dealers' yards becoming bare of domestic sizes. Embargoes resorted to for congestion relief. Bituminous production very low as car shortage becomes critical. Some mines receiving only 10 per cent supply. Railroads running short of coal. Public utilities stocks also running low. Many plants closing for want of coal.

**Anthracite**—While there is plenty of anthracite coal at the various piers, dumping is being carried on so woefully slow that a shortage is beginning to be felt at the water destinations. Cars frozen solid with their coal at the piers are a detriment to prompt loading, and the time required for cars to go through the thawing process greatly reduces the volume of dumpings. Considerable congestion is going on at the piers. Boats have been waiting in line for cargoes many days, and any shipper with a loaded boat to offer, which is seldom,

can quickly secure premiums on egg down to the buckwheats.

From the dealers' viewpoint, all has been going out and little coming in. True, the disastrous condition of New York's main thoroughfares prevents large deliveries of coal, but nevertheless dealers are receiving less coal than they are delivering to householders, causing their stocks to become depleted. Stove and chestnut are particularly short, and stocks of egg coal, which retailers have been taking in order to secure prompt shipments of stove and chestnut, are now finding a ready market.

Last week the congestion at the piers became so marked that the Central Railroad of New Jersey placed an embargo on all shipments east of Bound Brook. At the same time, the Pennsylvania R.R. issued an embargo restricting all shipments east of Trenton.

Current quotations for company coals, per gross ton, at the mines and f.o.b. tide-water, at the lower ports as follows:

	Mine	F.o.b. Tidewater
Broken .....	\$5.95	\$7.80
Egg .....	6.35	8.20
Stove .....	6.60	8.45
Chestnut .....	6.70	8.55
Pea .....	5.30	7.05
Buckwheat .....	3.40	5.15
Rice .....	2.75	4.50
Barley .....	2.25	4.00
Beller .....	2.50	4.25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

**Bituminous**—The greatest setback to increased production is the very poor car supply, which from week to week places the mines in a worse plight. Dispatches this week from the regions indicate that very little improvement is in sight. Many mines report that the total of their car supply for the week averaged around 10 and 15 per cent, while the majority has been approximately 25 per cent of normal, and the best to be reported has been around 50 per cent.

At the present rate of production, the railroads consuming their normal volume of coal could use the entire present production. Incidentally, the railroads are said to have but little coal on hand, and the large storage accumulations put by last fall are showing heavy signs of depletion.

At New York harbor the bituminous movement is very restricted. The handicapped condition of the piers is bringing a dangerously close fuel famine. Many of the smaller consumers who have been so unfortunate as to secure but negligible shipments during the past month, are on the point of closing down their plants. Some are resorting to the smaller sizes of anthracite coal, but to burn these satisfactorily over 50 per cent soft coal must be used, which many of the plants have not got. The bulk of the coal now being dumped at the piers is for the traction interests and public utilities who are having first call for coal in this territory.

No spot business is being carried on around New York. Bunkers are easily commanding their premium of \$1.35. Government prices prevail on all coal not shipped on contract, which are as follows.

	Mine-Run	Prepared	Slack
Central Pennsylvania .....	\$2.95	\$2.95	\$2.95
Western Pennsylvania .....	2.35	2.60	2.35
Fairmont (Gas) .....	2.50	2.75	2.25
George's Creek, Upper Cumberland and Piedmont fields, .....	2.75	3.00	2.50

#### PHILADELPHIA

**Anthracite** retail deliveries held up by snow. Scarcity of large sizes gives pea slight boost. Premiums still effective on prepared coal. Consumers' stocks need replenishing. Pea wholesale price of pea cut. Car supply fair. Consumers place orders for spring. Buckwheat active. Steam size, rice and barley fair with prices cut. Bituminous trade in wretched shape. Car supply unimpaired.

**Anthracite**—While the weather so far as temperature is concerned was far from rigorous, the dealers nevertheless have been severely handicapped on account of the great quantity of snow on the ground. The thermometer has been mostly above the freezing point, which softened the snow until deliveries were next to impossible to make. In addition it has been extremely difficult to keep the men at work under conditions wherein pretty nearly every load of coal has to be carried.

The demand from the consumer continues extremely brisk, with the burden, of course, being on stove and nut sizes. Due to the extremely slow deliveries from the mines quite a few dealers are at the lowest point on these sizes, and many a one has no

coal of these sizes at all. Yet with it all the tonnage received has been just about as much as the dealers could deliver.

With the stronger tone in the market for the three prepared sizes, the individual producers and brokers are still in position to demand good premiums on these sizes. Among the more conservative of the independents they are holding strictly to the 75c. differential over company, while other houses are asking prices around \$7.40 for egg, \$7.80 for stove and \$7.90 for nut. Even at these prices most of the smaller shippers are still insisting that pea accompany the larger sizes at the premium price. Oftentimes when shippers are hard pressed for orders on pea coal they are known to sell this size as low as \$5.40, and in some few instances there have been cuts about 25c. below that. However, in those cases it is believed to have been due to cars standing on demurrage, and quick disposition was necessary.

In the steam trade buckwheat remains the real active size. The big companies have about all they can do now to fill orders for this size, and the smaller shippers are less inclined to cut from the \$3.40 price. This has all been due to the bituminous situation being unrelieved. To a much lesser degree rice and barley have been affected. As a matter of fact the company price of \$2.75 on rice is frequently cut as low as \$2.40 and barley has been sold down as low as \$1.50.

**Bituminous**—The bituminous trade is in a wretched state. Stocks of coal which many consumers thought sufficient to carry them for long periods are dwindling fast, as new shipments fail to arrive. All the blame for the present situation seems to be placed against the car supply, although some producers are reaching the point where they openly declare this cannot be the sole cause and insist that mismanagement must be playing a part in the situation.

The point has now been reached where plants have been shut down for portions of the week from the lack of coal, and these have not always been the smaller plants, either. Public utilities, of course, are being taken care of, but in some instances only by the diversion of coal from other consignees. The situation has entered the serious stage and in various communities consumers have been taking joint action by appealing to the Government for relief.

If anything, less coal has arrived here last week than during the previous period. Prices for such coal as reaches the consumer are around \$3.30, as all of the production is being applied on contracts, where the wage increase applies. The only business at tide is bunkering, as the authorities still withhold permits for export business.

#### BALTIMORE

Very little government-priced coal but coal is offering here above the maximum on round that it is a "fair profit sale." Car, supply and movement poor. Hard coal men talk of poor preparation and enter protest.

**Bituminous**—The market here is fairly tight but there is no real suffering. Coal is not in as liberal supply at tide as it was a week since, and there have been repeated diversions of coal from the terminals to all-rail points. For instance, the daily average of around 1,200 cars at Curtis Bay recently has been cut within the past week to 500 cars a day or less on reserve there. From the mining regions come reports of a car supply that runs as low as 30 to 40 per cent on some days.

While reports come of a big national production the movement east is far below normal because of poor car supply. The movement on the Baltimore & Ohio division has dropped to around 1,500 cars a day, or less, against the normal of some 3,500. The weather is now more open, however, and there has been promise of improvement from the Railroad Administration in response to some hot telegrams of protest from western Maryland, in which business men and operators declared that miners were deserting the regions by the score because they could not keep up work in the face of the poor car movement.

There is very little Government-priced coal offered and it is an acknowledged fact that some coal is offered for sale considerably above the Government maximum. It is claimed by some operators that their books will show that they can not sell coal at the Government price without a continued loss, and that, as the Lever Act provides for a fair margin of profit, they can sell at such a fair margin. Coal under this idea is offering in the open market at from \$3.50 to \$4.00 per ton.

No action has been taken by the government so far to prevent such selling. The export movement here is dying out

as the export permits expire. A few more loadings will terminate this permit list apparently, unless there is modification of the ban, and there are strong rumors that such modification is coming in a few days.

**Anthracite**—The hard coal dealers report that the supplies are now coming through fairly well. There is considerable complaint as to preparation by many operations. Many letters have been sent out of Baltimore on this subject, and it is learned that the National Retail Coal Merchants Association has been asked to aid in securing a better run of hard coal to this section. Lack of grading of sizes, burdensome slate runs, and general lack of preparation in many cases is charged. The quality of hard coal coming here is called "worse than that received under the Fuel Administration in war days."

**Eastern-Inland**

**PITTSBURGH**

Coal operators are still looking for better car service.

There has been somewhat of a loss in coal production owing to the inability of the railroads to measure up to the car-supply situation, although there are signs appearing of some relief very soon. It had been hoped that at least a 70 per cent movement would be brought about, but this is not so, although buyers are picking up coal in fairly large-sized quantities.

While there is a larger volume of coal moving in the open market, buyers are not disposed to be satisfied with the tonnage or the quality either. With the approach of spring, when the weather conditions normally are better, and the fulfillment of promises by railroad men, added to the increased demand for consumption, an easy market condition is expected to develop. There is no change in the market quotations, as follows: Slack, \$2.10; mine-run, \$2.35; screened, \$2.60, per net ton at mine, Pittsburgh district.

**COLUMBUS**

Reduced output in all mining fields in Ohio is still reported. Car shortage and railroad congestion are holding down production to about 45 per cent of normal. There is a good demand for all grades.

No improvement in car supply is reported in any field of the Buckeye State and as a result production is still below the 50 per cent mark. Operators are making strenuous efforts to better this condition, but they are powerless, as the railroads are in bad shape as far as equipment and motive power is concerned. With prospects for a trainmen's strike, large steam users are trying to accumulate some surplus stocks, but conditions so far have prevented any special reserves, and many of the large users are operating from hand to mouth. The tone of the market is not satisfactory, although demand for all grades is good.

Domestic business is strong in every regard. Producers and shippers have a large number of orders booked on which they are unable to make shipments. Dealers' stocks generally are low, and in many localities retailers are compelled to limit orders to make the available supply go around. With a severe winter and the failure of the natural gas supply, demands from the householder have been quite strong. Consumption is estimated at 10 per cent over normal years and about 25 per cent more than last winter.

Deliveries have been hindered by the ice on the streets and roads but that condition is rapidly passing away. Retail prices are slightly higher, permitted by the higher cost of handling. Hocking lump is selling at \$6.50 while mine-run is quoted at \$5.75. West Virginia splints sell at \$7.25 for lump and \$7.75 for mine-run. Pocahontas lump is not offered, but mine-run sells in the neighborhood of \$7.50. Lump would be around \$8.25 if available. Pomeroy lump sells at \$6.50 and Jackson lump around \$7. Practically no anthracite is offered on the Columbus market.

**CINCINNATI**

Determination of the Mine Workers' Union to unionize the open fields of southern West Virginia may cause trouble and hamper production. This region, which furnished practically all of the bituminous coal for this territory during the strike and some time afterwards, comprises five of the largest bituminous fields in the country.

Operators are of the opinion that if the intention of the union is carried out, it will mean a general strike. The operators are determined, however, they will not submit

to the organization without a struggle, and for that reason it is almost certain trouble is ahead.

Every phase of production and shipments in Ohio at present is conducive to a large production, except transportation systems; the total inadequacy of the car supply is playing havoc not only with production but at the same time bringing the market and consumers nearer and nearer an acute shortage of coal. Not only was a serious car shortage still seriously crippling operations in the Kanawha field from which the local market draws the bulk of its fuel, but influenza made its appearance in certain parts of the region about the middle of the week and joined hands with a car shortage in cutting further holes in the output. It is hoped that conditions will improve next week.

**Southern**

**LOUISVILLE**

General demand good, but deliveries running low due to car shortage. Retail demand slackening off somewhat, and demand for block coal showing effect of mild weather. Steam coal active.

Kentucky producers are badly disgruntled over the continued discrimination in placing cars with the Louisville & Nashville Railroad, on the part of the Railroad Administration, which is resulting in steady shortages at the mines, and many mines are doing well to get in two days full time per week. Threatened suits against the Railroad Administration may bring some relief, but it is doubtful.

At the present time the operators have a demand that will take care of full production if cars are available. However, it is alleged that due to the discrimination they are unable to take advantage of the demand, and that it is injuring the market, and driving buyers into other fields. It is claimed that the operators in the Kentucky field are practically out of the market at a time when there is a strong demand which means that if they ever do get cars it will be at a time when other fields no longer need them and when there is no demand to keep them going.

**BIRMINGHAM**

Good market for all grades coal. Production and movement retarded by shortage of equipment for loading. Labor deficiency, caused in some instances by an unusual amount of sickness among mine workers, also cuts down output.

The requirements of the trade for coal from this district are holding up well and market conditions are active. Ample business is offered and in hand to take care of all the coal that can be mined and there is no delay in the movement of fuel except that occasioned by a shortage of cars. The Louisville and Nashville R. R. is furnishing a lower percentage of requirements than any other lines, and other roads have instructions to furnish a 75 per cent supply of equipment to mines on their rails, any surplus to be turned over to the Louisville & Nashville to bring up their average as much as possible.

The Tennessee Coal, Iron & Railroad Co. has been in the market lately for considerable tonnage, an effort being made to close some six-month contracts needed to supply the requirements of its furnace and other operations. This company has not mined sufficient coal for its needs for some months, and is now preparing to open "Hamilton Slope" on the Mary Lee seam, from which a production of 1,000 tons per day is expected.

Domestic trade is easy, receipts being light but sufficient to meet the requirements of the retail trade, which has been buying sparingly.

Labor at a number of operations in the district has been short and irregular the past week due to pay days and the prevalence of considerable sickness in the camps. The output for the week ending Jan. 31, as compiled by the Alabama Operators' Association, was 355,000 net tons, which was about 13,000 tons short of the previous week.

**Lake Region**

**BUFFALO**

Cars better distributed. Would have been much trouble otherwise. Storm troubles did not reach here. Enough trouble without them. Protesting against confiscation. Anthracite slow, but enough to go around.

**Bituminous**—The situation is slowly improving. Some shippers still fail to see any improvement, but the two weeks of soft weather must have its effect. This district did not get the big storm, and the snow is not deep here, but the wind and cold for a time made it difficult to move trains even here, so nobody wonders at the stoppage in places where the snow fell heavily to add to the difficulty. It is to be hoped that so many adverse conditions will not come together again right away.

Add to all this the fact that neither the coal output nor the car supply is up to the normal at the best and anyone will wonder why there was not real distress in many parts of the Northern districts. As it is it will be sometime, with good service, before the supply is really good. There is dispute as to the reason for the tight movement from the mines. The Government authorities have said that the mining was light, but members of the bituminous trade agree generally that there would be more coal shipped if cars were to be had in plenty.

All bituminous prices remain on Government basis, \$1.70 for Allegheny Valley sizes, \$1.50 for Pittsburgh and No. 8 lump and three-quarter, \$4.25 for all slack, \$4.60 for smokeless, \$4.70 for Pennsylvania smelting, all per net ton f.o.b. Buffalo.

**Anthracite**—The trade is tranquil. There is no teasing for coal and there is not likely to be any, for spring cannot be far away and the idea is that the supply is sufficient, which means a great deal in the trade. At the same time, there has been some shortage at times, due mostly to the scarcity of cars and the storms. Sometimes the motive power would run short and the sidings would fill up with loaded cars. The true gauging of the state of the trade is in the way independent anthracite sells. As a rule the premium that can be obtained is small, sometimes nothing, though it was sometimes \$3 a ton before the public became convinced that there was coal enough.

The consumer complains of the high price of anthracite, but it is claimed by operators that prices have not advanced as much as in case with other things. It is observed here that gas-house coke, which used to sell for \$4.50, is now bringing \$9 a ton delivered. Experts say that the owners of anthracite mines would lose money unless present prices are kept up and that they are pretty sure to be higher before long.

It does not look as if there would be any anthracite surplus for loading into Lake vessels before spring. Heavy ice would be likely to prevent movements. The harbor was seldom frozen up as completely as now, especially as the usual winter grain fleet is absent, so that the work of navigating the ice has been less than usual.

**TORONTO**

Conditions in Toronto have not been satisfactory both to the dealer or to the consumer.

Most of the coal that is sold is largely to contract consumers. Cold weather prevents dumpings. Retail prices are as follows:

Anthracite, egg, stove, nut and grate.....	\$12.75
Pea.....	11.25
Bituminous steam.....	9.00
Slack.....	8.00
Domestic lump.....	9.00
Canal.....	12.50

Wholesale, f. o. b. cars at destination—	
Three-quarter lump.....	6.75
Slack.....	6.00

**CLEVELAND**

Fuel supplies in this district are the lowest in months—not even excepting the period of the strike. Weather conditions are better, but inability of railroads to get cars back to southern and eastern Ohio mines is the sticking point. Steam coal prices have been advanced sharply.

**Bituminous**—Typical of the present stringency in steam coal in Cleveland and northern Ohio is the fact that the largest public utility company, always the first to have its wants taken care of, is down to a two-days supply. When the coal strike broke on Nov. 1 this interest had more than 50,000 tons stored. This reserve, it appears, has been all but wiped out, and the local coal committee is diverting to this plant a large part of the steam coal arriving in Cleveland. This has worked a hardship on industrials, and the number of plants operating on a day-to-day basis is larger than ever before. The trade so far has been enabled to keep all plants going, even if on a hand-to-mouth arrangement, but the cracking point appears to have arrived.

Domestic bituminous-coal prices stand, but steam coal prices all have been revised upward sharply on the basis of January sales. Generally speaking, slack is bringing around \$6 a ton, while mine-run ranges from \$6.30 to \$6.85, depending on whether it is for factory or other use.

**Lake Trade**—Great Lakes bituminous shipments in the season of 1919 went to the following districts, figures now show: Head of Lake Superior, 8,395,982 tons; Portage district, 776,194 tons; Fort William and Port Arthur, 1,357,943 tons; See river, 1,157,047 tons; Georgian Bay, 741,190 tons; Milwaukee, 3,109,226 tons; Chicago district, 1,811,310 tons; Other Lake Michigan ports, 1,763,711 tons; Lower rivers, 713,188 tons; and St. Lawrence river, 949,650 tons. Movement of this coal off the upper lake docks continues good, and the opening of navigation will see demand heavy, the head of Lake Superior will take at least 12,000,000 tons in the 1920 season, or over 3,000,000 more tons than in 1919, it is believed.

**Pocahontas and Anthracite**—Receipts of anthracite in the past week have been quite fair, the best in six weeks. Receipts of Pocahontas have been fair. Demand continues so large, however, that dealers still are rationing their supplies. Dealers have ceased quoting forked Pocahontas. With both anthracite and Pocahontas, the minimum of the spread is the ruling quotations, only small tonnages now bringing the maximum. This makes \$9 the market for shoveled lump and \$8 for mine-run Pocahontas, \$12.20 for egg and grate anthracite, \$12.40 for stove and \$12.50 for chestnut.

Prices of coal per net ton delivered in Cleveland are:

Anthracite—Egg, \$12.20@12.40; chestnut, \$12.50@12.70; grate, \$12.20@12.40; and stove, \$12.40@12.60.

Pocahontas—Shoveled lump, \$9.00@9.25; and mine-run, \$8.00@8.25.

Domestic bituminous—West Virginia splint, \$8.30; No. 8 Pittsburgh, \$6.85@7.00; Massillon lump, \$7.40@7.65; Cannel lump, \$11.00; and Coshocton lump, \$7.35.

Steam coal—No. 6 slack, \$5.75@6.00; No. 8 slack, \$5.80@6.00; Youghiogheny slack, \$5.95@6.10; No. 83, \$6.35@6.60; No. 6 mine-run, \$6.30@6.85; and No. 8 mine-run, \$6.30@6.85.

**DETROIT**

With the transportation outlook clouded by the prospective strike of the United Brotherhood of Maintenance-of-Way Employees and Railway Shop Workers scheduled for Feb. 17, Detroit consumers and the coal trade in Detroit find that the Railroad Administration has raised a new obstacle to free movement of bituminous.

**Bituminous**—From mines in the bituminous districts comes the report that an order has been issued effective from Feb. 7, forbidding the loading of coal for Detroit or Michigan, billed to pass through the Toledo gateway. As very little bituminous coal comes to Detroit by any other route, the order virtually cuts off shipments and amounts to an embargo. According to the information received by the Detroit trade, it is to continue in effect five days or longer.

It is an interesting detail that the existence of the order is not made known through representatives of the Railroad Administration in Detroit, but by notifications from the mines. While the congestion of freight on tracks in Toledo is given as the occasion for the order, jobbers are of the opinion that more coal is needed by the railroads, perhaps in preparation for the threatened strike.

**Anthracite**—With weather conditions moderate, the demand for anthracite has eased off somewhat. While some of the retailers have a fair amount, others are short of supply. Severe cold weather for a few days would likely create a demand from house-hold consumers that would soon exhaust the supply.

**Middle West**

**MIDWEST REVIEW**

Coal market in the Middle West continues strong, in spite of the fact that we have had a spell of very mild weather. We have heard of one or two cases where retail dealers have cancelled high-priced orders placed before Oct. 30, but the number of cancellations coming in is so negligible it does not affect the market.

Manufacturers appear to be a little more comfortable, so far as coal is concerned, than they were a week or two ago. While but few steam users have a reserve supply of coal on hand, nevertheless they have

received enough coal during the past week or so to assure them of fairly good running time. Practically all of the buying which is done in this market lately is done by manufacturers, and steam users, rather than by the domestic trade.

The car situation continues to be the topic of the day. Old timers, who have been in the coal business for years, almost since coal operating was put on a commercial basis in Illinois and Indiana, claim that they have never experienced a time when the car supply was poorer. A statement came out in the Chicago daily papers a day or so ago to the effect that the railroads were going to discontinue the practice of pooling their cars, as soon as they were back under private ownership.

This statement met with great approval from the Illinois and Indiana operators, as in a great number of cases, especially in Illinois—and on the Chicago, Burlington & Quincy, for instance—the coal can be mined, and shipped out to western Iowa, without leaving the rails of the original road. This, of course, will mean a better car supply on some of our Western roads which tap the coal fields in Illinois, and at the same time extend in the West to Iowa, Minnesota and Missouri. The Chicago, Burlington & Quincy has been a loser under the car-pooling system. This road, before the war, had enough coal-carrying equipment to take care of its mines, while some of the other railways, serving the same territory, had but a meager supply.

**CHICAGO**

Retail trade complains that the public are buying but little coal. It appears that although the average householder has only a small supply of coal on hand, nevertheless he is unwilling to make additional purchases, at this time, as he perhaps believes prices are a little too high, and will be reduced soon.

Dealers think that if the railroad strike ties up the traffic of the country, there will be a great many householders whose homes will be too cold for comfort. The retail trade who buy most of the Eastern coal moving into this territory are beginning to realize that they will have to pay more for their West Virginia splint and Kentucky block than they have for some time.

It is stated that operators on railroads in the East, with tide-water connections, are having no difficulty in selling mine-run at figures as high as \$3.50 per ton for export. These mines, of course, prepare their coal which moves into the Western market, and which will now have to be sold around \$4.00@4.50 per ton, to compete with the export market.

C. M. Moderwell, general manager of the O'Gara Coal Co., McCormick Building, Chicago, has addressed the following letter "To the Trade." It is dated Feb. 8. It may be noted that the Government price for Harrisburg coal is \$2.55 f.o.b. mines.

"The Fuel Administration, acting under the Lever Law, granted the miners in the Central Competitive field an advance of 14 per cent in wages, and on Dec. 12 the miners went to work on this basis. Previously the Fuel Administration had fixed certain prices on coal, in the Central Competitive field, known as Government prices. This action was taken under the section of the Lever Law which reads as follows: "In fixing maximum prices for producers, the commission shall allow the cost of production, including the expense of operation, maintenance, depreciation and depletion, and shall add thereto a just and reasonable profit."

"Since the above action was taken, the Fuel Administration has ceased to function, and there is nobody to whom we can appeal to see that we receive a just and reasonable profit. This company has now had nearly two months' experience operating under this regulation. This experience has shown that we are not able to make a just and reasonable profit as provided by the law. Inasmuch as we have found that we cannot operate at a profit under the prices so fixed, and inasmuch as there is no regulatory body to whom we can appeal, we have decided to make the following prices, f.o.b. cars at mines, effective Feb. 9, and until further notice:

6 in. Lump...\$3.10 6 x 2 in. Egg...\$3.10  
3 in. Lump... 3.10 3 x 2 in. Nut... 3.10  
6 x 3 in. Egg... 3.10 2 x 1 1/2 in. Nut... 3.10

"Prices on other grades will be quoted on application. This letter is sent you so that you may have advance information as to our policy. If you desire to cancel any of the orders placed with us, please advise us at once; otherwise, please acknowledge receipt of this letter, and we will then ship and bill in accordance with the above prices. In this connection, we desire to say that we have considered this matter carefully, and are acting, as we believe,

entirely within our rights and are prepared to take full responsibility for our action."

**MILWAUKEE**

Scarcity of popular grades of coal and poor transportation conditions make business unsatisfactory. Coke advances in price.

The coal situation at Milwaukee and its dependent territory is far from satisfactory, owing to exhaustion of stocks and insufficient transportation facilities. There is a lively demand for coal, which dealers find difficult to meet.

The supply of anthracite is now limited to the egg and pea grades, chestnut and stove being sold out. Only mine-run Pocahontas is now available.

Coal prices remain unchanged, but coke has been advanced 50c per ton. Large sizes now sell at \$12.50 and pea coke at \$11.25. Mild weather conditions alone prevent the coal situation from being serious.

**ST. LOUIS**

Anticipated railroad strike creates steam demand temporarily. Domestic demand easy, generally speaking, on account of mild weather. Car supply averages about two days a week. Demand for everything that exceeds the supply.

Locally the St. Louis market is easy, excepting for an unusual demand for steam sizes. This is on account of the threatened railroad strike. If it were not for this, conditions would be easy. Mild weather prevails and the domestic call is lighter than usual.

Country demand for domestic coal is better than for steam, but steam sizes find a ready market in Chicago and the Northwest. In the Standard district the car supply averages two days a week on all roads. This, however, comes to the mines in half-day periods. The railroad tonnage still continues quite heavy.

The conditions in the Mt. Olive field are somewhat similar to those in the Standard district, although the car supply at times is somewhat better on some roads. Embargoes were effective at different times on the Western roads, caused by congestion of the St. Louis terminals. One of the principal reasons for the car supply in this territory is the lack of motive power and the failure to utilize the available motive power to its maximum.

In St. Louis proper no smokeless is coming in and practically no anthracite. Shipments of coke on commercial orders are unusually good. The wholesale prices are the same as last week.

Prices per net ton bituminous coal f.o.b. mine today, are as follows:

Williamson	Mt. Olive	Standard
and Frank-	and	
lin Counties	Stanton	

Prepared sizes			
(lump, egg, nut, etc.)...	2.55@2.70	2.55@2.70	2.55@2.70
Mine Run ...	2.35@2.50	2.35@2.50	2.35@2.50
Screenings ...	2.05@2.20	2.05@2.20	2.05@2.20
Williamson-Franklin rate to St. Louis is \$1.10, other rates \$0.95.			

**Coke**

**CONNELLSVILLE**

Connellsville region adds more ovens to active list, but under existing conditions as to car supplies there is no advantage gained.

Connellsville coke operators always have something to hope for, and at this time it is a better supply of cars. A policy of "quiet waiting" has been adopted, and patience is expected to be rewarded very soon, with the coming of better weather and a probable shakeup in railroad circles as soon as the roads are turned back to their original owners.

Figures last week did not bear out the prediction previously made of a further increase in production and larger movement of coke, but the signs this week have been more encouraging. For the first three days of the week car supply kept around the 50 per cent mark, a matter of 10 per cent better than the same three days of the previous week. Indeed, there were several days last week when the supply of cars dropped to 30 per cent, but the average was better at the end of the week. Demand continues as before.

**BUFFALO**

The complaint comes from the ore docks that movements are slow on account of the snow, so that shipments out by rail are light. Furnaces are running as strong as they can, for the trades report a bad shortage of supplies.

STRUCTURAL MATERIAL—The following are the base prices, f.o.b. mill, Pittsburgh, together with the quotations per 100 lb. from warehouses at the places named:

	—New York—		St. Louis	Chicago
	Mill Pittsburgh	Current	One Year Ago	
Beams, 3 to 15 in.	\$2.45	\$3.47	\$4.27	\$3.54
Channels, 3 to 15 in.	2.45	3.47	4.27	3.54
Angles, 3 to 6 in., 1/2 in. thick.	2.45	3.47	4.27	3.54
Tees, 3 in. and larger	2.45	3.52	4.27	3.54
Plates	2.65	3.67	4.52	3.54

BAR IRON—Prices in cents per pound at cities named are as follows:

	Pittsburgh	Cincinnati	St. Louis	Birmingham
	4.00	3.50	3.44	4.25

NAILS—Prices per keg from warehouse in cities named:

	Mill Pittsburgh	St. Louis	Chicago	Birmingham	San Francisco	Dallas
Wire	\$4.50	\$4.50	\$4.15	\$5.75	\$5.50	\$6.90
Cut	4.925	5.40	7.00	6.90	6.90	7.40

TRACK SUPPLIES—The following prices are base per 100 lb. f.o.b. Pittsburgh for carload lots, together with the warehouse prices at the places named:

	Pittsburgh	Chicago	St. Louis	San Francisco	Birmingham
Standard railroad spikes 1/2-in. and larger	\$3.35	\$3.62	\$4.44	\$5.65	\$4.75
Track bolts	4.90-5.00	4.62	Prem.	6.65	7.00
Standard section angle bars	2.75	2.75	3.44	4.60	

COLD FINISHED STEEL—Warehouse prices are as follows:

	New York	Chicago	Cleveland	St. Louis
Round shafting or screw stock, per 100 lb. base	\$5.50	\$4.90	\$5.50	\$5.00
Flats, squares and hexagons, per 100 lb. base	6.00	5.40		5.50

HORSE AND MULE SHOES—Warehouse prices per 100 lb. in cities named:

	Mill Pittsburgh	Cincinnati	Chicago	St. Louis	Birmingham
Straight	\$5.75	\$7.50	\$6.75	\$7.25	\$7.00
Assorted	5.85	7.50	6.90	7.50	7.25

Cincinnati—Horseshoe nails sell for \$4.50 to \$5 per 25-lb. box.

CAST-IRON PIPE—The following are prices per net ton for carload lots:

	—New York—		St. Louis	San Francisco	Dallas
	Current	One Month Ago	Year Ago	Chicago	Year Ago
4 in.	\$70.30	\$65.30	\$70.70	\$72.80	\$71.00
6 in. and over	67.80	62.30	67.70	69.80	68.00

Caspipe and 16-ft. lengths are \$1 per ton extra.

STEEL RAILS—The following quotations are per ton f.o.b. Pittsburgh and Chicago for carload or larger lots. For less than carload lots 5c. per 100 lb. is charged extra:

	—Pittsburgh—		—Chicago—	
	Current	One Year Ago	Current	One Year Ago
Standard Bessemer rails	\$45.00	\$55.00	\$45.00	\$65.00
Standard openhearth rails	47.00	57.00	47.00	67.00
Light rails, 8 to 10 lb.	2.585*	3.135*	2.585*	3.135*
Light rails, 12 to 14 lb.	2.54*	3.09*	2.54*	3.09*
Light rails, 25 to 45 lb.	2.45*	3.00*	2.45*	3.00*

\* Per 100 lb.

OLD MATERIAL—The prices following are per gross ton paid to dealers and producers in New York. In Chicago and St. Louis the quotations are per net ton and cover delivery at the buyer's works, including freight transfer charges.

	New York	Chicago	St. Louis
No. 1 railroad wrought	\$28.00	\$26.00	\$27.00
Stove plate	25.00	30.00	25.00
No. 1 machinery cast	32.00	37.00	34.00
Machine shop turnings	15.00	12.00	14.50
Cast borings	18.00	15.00	16.50
Railroad malleable cast	25.00	29.00	24.00
Retraining rails	33.00		
Relaying rails	50.00		

COAL BIT STEEL—Warehouse price per pound is as follows:

	New York	Cincinnati	Birmingham	St. Louis	Chicago
	\$0.10	\$0.16 1/2	\$0.18	\$0.11	\$0.15

DRILL STEEL—Warehouse price per pound:

	New York	St. Louis	Birmingham
Solid	14c.	13c.	15c.
Hollow	16c.		

PIPE—The following discounts are for carload lots f.o.b. Pittsburgh, basing card of Jan. 1, 1919 for steel pipe and for iron pipe:

BUTT WELD					
Inches	Steel Black	Galvanized	Inches	Iron Black	Galvanized
1/2, 3/4 and 1	50 1/2%	24%	2 to 1 1/2	30 1/2%	23 1/2%

## SHOP SUPPLIES

NUTS—From warehouse at the places named, on fair size orders, the following amount is deducted from list:

	New York	Cleveland	Chicago	St. Louis
	Current	Current	Current	Current
Hot pressed square	+\$2.00	\$1.00	\$1.25	\$1.45
Hot pressed hexagon	+2.00	1.00	1.05	1.45
Cold punched square	+2.00	1.00	.75	1.05
Cold punched hexagon	+2.00	1.00	.75	1.05

Semi-finished nuts, 1/2 and smaller, sell at the following discounts from list price:

	Current	One Year Ago
New York	6%	50-107%
Chicago	50%	50%
Cleveland	60-107%	50-107%
St. Louis	45%	.....

MACHINE BOLTS—Warehouse discounts in the following cities:

	New York	Cleveland	Chicago	St. Louis
1/4 by 4 in. and smaller	25%	50%	35-50%	50-50%
Larger and longer up to 1 in. by 30 in.	10%	40%	25-50%	40-50%

WASHERS—From warehouses at the places named the following amount is deducted from list price:

	New York	Cleveland	Chicago	St. Louis
For wrought-iron washers:				
New York	\$1.50	\$4.50	\$3.00	\$3.00
For cast-iron washers the base price per 100 lb. is as follows:				
New York	\$7.00	\$3.75	\$4.25	\$4.25

RIVETS—The following quotations are allowed for fair sized orders from warehouse:

	New York	Cleveland	Chicago
Steel 7/8 and smaller	30%	55% off	4%
Tinned	3%	55% off	4%
Boiler, 1, 1/2, 1 in. diameter by 2 in. to 5 in. sell as follows per 100 lb.:			
New York	\$6.00	\$4.00	\$4.97
Pittsburgh	\$4.72		
Structural, same sizes:			
New York	\$6.10	\$4.10	\$5.07
Pittsburgh	\$4.82		

CONSTRUCTION MATERIALS

LINSEED OIL—These prices are per gallon:

	New York	Cleveland	Chicago
	Current	Current	Current
Raw, 5-bbl. lots	\$1.80	\$2.05	\$1.93
5-gal. cans	2.00	2.25	2.23

WHITE AND RED LEAD—Base price.

	Red		White	
	Current	1 Year Ago	Current	1 Year Ago

MISCELLANEOUS

GREASES—Prices are as follow in the following cities in cents per pound for barrel lots:

	Cincinnati	St. Louis	Birmingham
Cup	7-8	3.7 3.8	8 5
Fiber or sponge	7	7.2	8 5
Transmission	9-10	14	8 5
Axle	5	5	4 5
Gear	5	6 5	8 5
Car journal	5	4 7	8 5

BABBITT METAL—Warehouse prices in cents per pound:

	New York		Cleveland		Chicago	
	Current	One Year Ago	Current	One Year Ago	Current	One Year Ago
Best grade	90.00	87.00	70.00	80.00	70.00	75.00
Commercial	50.00	42.00	20.00	21.50	15.00	15.00

HOSE—Following are prices of various classes of hose:

	Fire			50-Ft. Lengths 75c. per ft. 40%	
	First Grade	Second Grade	Third Grade		
Underwriters' 2 1/2-in.					
Common, 2 1/2-in.					
	Air				
1-in. per ft.	\$0.50	\$0.33	\$0.22		
	Steam—Discounts from list				
First grade	30%	Second grade	40%	Third grade	45%

LEATHER BELTING—Present discounts from list in cities named:

	Medium Grade	Heavy Grade
New York	2%	25%
St. Louis	3%	35%
Birmingham	35%	15%
Chicago	45%	40%
Cincinnati	30-5-24%	40 24%

RAWHIDE LACING—25% for cut; 86c. per sq. ft. for ordinary.

PACKING—Prices per pound:

Rubber and duck for low-pressure steam	\$1.00
Asbestos for high-pressure steam	1.70
Duck and rubber for piston packing	1.00
Flax, regular	1.20
Flax, waterproofed	1.70
Compressed asbestos sheet	.90
Wire insulation asbestos sheet	1.50
Rubber sheet	.50
Rubber sheet, wire insertion	.70
Rubber sheet, duck insertion	.50
Rubber sheet, cloth insertion	.30
Asbestos packing, twisted or braided, and graphited, for valve stems and stuffing boxes	1.30
Asbestos wick, 1- and 1-lb. balls	.85

MANILA ROPE—For rope smaller than 1-in. the price is 1 to 2c. extra; while for quantities amounting to less than 600 ft. there is an extra charge of 1c. The number of feet per pound for the various sizes is as follows: 1-in., 8 ft.; 1 1/2-in., 6; 2-in., 4 1/2; 3-in., 3 1/2; 4-in., 2 1/2; 5-in., 1 1/2; 6-in., 1 1/2; 8-in., 1 1/2; 10-in., 1 1/2; 12-in., 1 1/2; 14-in., 1 1/2; 16-in., 1 1/2; 18-in., 1 1/2; 20-in., 1 1/2; 24-in., 1 1/2; 28-in., 1 1/2; 32-in., 1 1/2; 36-in., 1 1/2; 40-in., 1 1/2; 44-in., 1 1/2; 48-in., 1 1/2; 52-in., 1 1/2; 56-in., 1 1/2; 60-in., 1 1/2; 64-in., 1 1/2; 68-in., 1 1/2; 72-in., 1 1/2; 76-in., 1 1/2; 80-in., 1 1/2; 84-in., 1 1/2; 88-in., 1 1/2; 92-in., 1 1/2; 96-in., 1 1/2; 100-in., 1 1/2; 104-in., 1 1/2; 108-in., 1 1/2; 112-in., 1 1/2; 116-in., 1 1/2; 120-in., 1 1/2.

Boston	\$0.30	Birmingham	\$0.29
New York	.26	Atlanta	.295

## Our Time-Honored Industrial Democracy

BY R. DAWSON HALL

**T**IME was when consultation of the men with the management on the conduct of a plant would not have been considered any unusual practice, certainly not one to be dignified as Industrial Democracy. Every workman discussed matters with the boss, and the man in charge did not feel it his duty to say how every item of work was to be done. He left quite a little of the management of materials, time and labor in the hands of the workman and then confidently expected results.

Because we have drawn away from our old habits, when the employee sat down with the boss and talked over affairs and tackled every problem with a sense of teamwork, we have now got to organize what before was instinctive and for this reason we give it a name "Industrial Democracy." When we have to conjure up something with a name, a plan and a blueprint, it is an indistinct ghost of the real thing when it appears.

The old industrial democracy which rested on a complete mutual understanding was something far better than the formal schemes that have supplanted it. In those days the workman called round in the evening to talk matters over and he found the boss perhaps surrounded by his family and perhaps toiling in his office but wherever he was, he could be relied on to talk the matter over, ready to take advice and prepared to give a reason.

And to-day it need not be different where men are English-speaking. The big man perhaps may be hard

to reach by all his hundreds of employees, but each of the subordinates at least, should be willing to listen to suggestions, to recognize them when meritorious and give credit for them when adopted. There has arisen an idea that orders, orders, orders shall be transmitted from the man above to the man below. Every detail must be regulated by authority.

The workman knowing his greater knowledge of some details, whether by reason of great experience in that specified work or because of a certain understanding of the local conditions resents orders that only muddle and do not advance the work, given solely in many cases because the man must justify his tenure of office rather than because the orders facilitate the work.

A willingness to cooperate will do as much in most cases as elaborate machinery for conferences participated in by men, who are usually, whether employers or employed, better workers than talkers. The welfare creed, as preached by most expositors, makes an extremely dull sermon. If however, we could restore the old personal touch, if we could infuse with simplicity our whole system of little boss, big boss, bigger boss, and biggest boss, the problem would be well solved. It can be done. Personality can go all the way down the line, however resistant some individuals may be to its impress. Friendliness is said by some to be undignified and undermining of discipline but, persisted in, it will do much to bring back the natural, unaffected, industrial democracy of early days—and you don't need logarithms and the binomial theory, a chart or a blue-print to put it into operation.

## Welfare Work at an Anthracite Colliery

A Man's Efficiency Is Affected by His Surroundings—Anything That Fosters Contentment Among Employees Aids the Coal Company—Much Work Has Therefore Been Done Along Welfare Lines

BY DEVER C. ASIIMEAD  
Tarrytown, N. Y.

UNFORTUNATELY the coal mining company that has adopted the welfare measures here depicted is too modest and retiring to permit me to use its name. It is possible, however, that some readers may recognize the plant in question from the description given and the photographs presented.

This company has been studying welfare work and putting into operation the results of this study for more than 18 years. It has not gone into this for the pure sake of welfare, the primary purpose of its existence being of course to mine coal. The fact that a coal mine is naturally in an isolated community, however, of necessity means that something must be done for the employees in order that the best results may be obtained both for the men themselves and for the company.

### GOOD WORKING CONDITIONS MAKE GOOD WORKMEN

Anything within reason that improves the working and the living conditions of the men is to the advantage of the company. Good working conditions make the men better satisfied while at work, and therefore afford them less opportunity to grumble, while better living conditions have a tendency to keep the men at home during the evenings. This means that there is less chance for the talking over of imaginary complaints which are naturally magnified in discussion.

Too much work without a proper amount of enjoyment is also bad for the men and their families. Some play properly organized makes much better workmen and gives them something to think of and to discuss other than themselves or their work. This recreation is not only necessary for the men but also for their wives and other women folks. Dissatisfied home life has a bad reaction upon any human being and therefore interferes with his work.

Not only do the grownups need recreation, good living and working conditions but the future miner and his

wife (the children of the present miners) need these much more than do their parents. Furthermore they need the education to raise them to a higher plane of living and to so train their minds that they can understand economic conditions. Thus their relations with this company or some other when they will go to work will be on a higher plane than that of their fathers.

The first point to consider is therefore how this company provides for the children. From the child the man is made and as the child is so the man is apt to be.

Through the school the child can be reached much better than through the home and through the child the home and its conditions can be improved. The better method is to have the best in the school that can be procured.

The company does not contribute anything in cash to the maintenance of the school, its upkeep or its operation, but it does contribute a large amount in services and advice. Through a personal arrangement with the township board of education the president of the coal company selects the teachers and the very best teachers that can be secured at the stipulated salary are obtained. The township in which this colliery is located is probably the most liberal in the state in the matter of salaries.

As the teachers are so will be the children, for by their example the children are influenced. The teachers are much more important than the environment. Much more is expected from these teachers than from the ordinary pedagogue and they are as a rule much more efficient. The one main attribute that the president of the coal company particularly insists on is a high moral view point. Not only must they have a high moral view point but they must be efficient, know their subjects thoroughly, be able to enforce discipline and still be pleasant. In other words they must be as near perfect as possible and from my talks with them and after see-

ing their work I believe that they fit the conditions almost perfectly.

Next to the teachers comes the environment. It is possible with the aid of a good teacher for a child to acquire an education in dirty unattractive school rooms, but with an attractive environment and a good teacher also much better results can be obtained. The first step in providing the proper setting for a school is the location, next the attractiveness of the building and lastly the interior arrangements. These latter are probably the most important of all.

The school at this colliery is built on a side hill. On the up-hill side the second floor comes to about the level of the street. That is the reason only two stories can be seen whereas there are actually three stories. In the basement (which is really no basement at all but so called because the main entrance is on the second floor) there are four rooms. One room is the class room for the third and fourth grades, another is the study hall for the fifth, sixth, seventh, and eighth grades and the other two are recitation rooms for the pupils of these grades.

On the main floor of the building there are only two rooms, one the kindergarten and the other the first and second grades. The latest up-to-date methods are employed in the kindergarten and the two teachers in charge are graduates of an excellent Chicago school for this type of instruction. There are 38 pupils in this class between 4 and 6 years old and they have the very best of equipment. In the first and second grade room the same system is used as in the kindergarten and in the afternoon a connecting class is conducted for the older pupils in the kindergarten to prepare them for their promotion to the first grade. The kindergarten is used to spread interest among the parents and get them interested in the school and the children.

Much that is somewhat out of the ordinary is done for the pupils of this school. Emphasis is laid upon the

standard subjects and much more attention is given to fundamentals than to such subjects as drawing, music and elocution, although these are taught according to the state law.

Modern methods are exclusively employed at this school. Thus geography is taught by lantern slides. The two higher grades, the seventh and eighth, use the *Literary Digest* for the study of current events. Every week some of the officers of the coal company give talks to the pupils in the higher grades and pay particular attention to economic subjects. A small but well selected library is furnished for the use of the pupils, and their reading is directed as much as possible by the teacher.

The pupils are taught, by daily practice punctuality, regularity, discipline, and thoroughness. Good records are emphasized. Prizes are given for attendance and for high standing and the great desire to secure these prizes and to get their names on the honor roll aids in securing the high standard desired.

Besides the school studies, pleasure and recreation is furnished the children. Every evening the kindergarten room is open and two teachers are in attendance who start the children playing games and see that they are conducted properly. Besides this play-time for the children there are two sewing classes for

the girls, a boys' club, a girls' gymnasium class, a girls' glee club, a once-a-week story hour and a nature study class. In the spring, summer and fall the open air playground which is well equipped is open to the children. The school is now arranging to open a woodworking department in the basement in order to give the older boys manual training.

There are 130 pupils in this school in charge of seven teachers. The average pupil has a higher average standing than the average attained in other schools in the same district. And since this is one of the best districts in the state it follows that the average of the pupils is quite high.

MODERN EQUIPMENT USED AT THE PLANT

ONE HUNDRED AND THIRTY PUPILS IN THIS SCHOOL ARE IN CHARGE OF SEVEN TEACHERS

Probably the feature of community life second in importance to the school is the community club. This is open to all adults for it deals with the mothers particularly, but is commencing to get the fathers interested. The meetings of this club are held on the top

A WELL-DESIGNED ONE-FAMILY HOUSE

floor of the school house in a room attractively decorated and furnished with large wicker chairs, two large library tables, a piano, a circulating library of about 400 volumes and copies of the current magazines. This community club has 80 members at the present time and is growing rapidly. Meetings are held every two weeks and if those present have the "feed" on every occasion that I heard ordered over the 'phone for the meeting held the twentieth of January (6 gal. ice cream, 5 turkeys, etc.) I should think the whole town would join.

As every one will agree a healthy community is usually an industrious one. Proceeding on this assumption the company has engaged a trained nurse to safeguard general health. Every afternoon at 3:30 the nurse and doctor are at the hospital at the top of the manway and conduct a dispensary for minor injuries that the miners may have received during the day. Small cuts are cleaned and treated and as a result there is comparatively little trouble arising from infection at this plant, therefore little time is lost on account of minor injuries. Every pupil at the school is carefully examined once a year. During the day the nurse visits the homes of the miners, tends to all cases of sickness and gives instructions to the mothers concerning the care of their children and the general health of the community.

There is a well equipped dispensary and dental office in one end of the school building where the nurse gives attention to the needs of the school children and to the women of the community. The nurse's living quarters are in connection with the dispensary, so she can be reached at any time in case of emergency. The men are taken care of at the mine hospital at the top of the man shaft as described in the previous paragraph.

The company has built an excellent wash house, as may be seen in the photo. This is constructed of brick and is four stories high. The first two are used for a wash house and the upper two for other purposes. The showers are arranged along the long side of the room and lockers are provided for the use of the men. There are in all 15 showers and lockers provided for 362 persons. This wash house permits the men to go home clean and therefore relieves the women of much unnecessary work.

An excellent club house has been provided for the men and although the building is old it still serves its purpose. The company, however, is not satisfied with it and will start construction in the spring on a new club house and the old one will be turned into an amusement hall. Membership in the club is open to all the men and boys in the community. The new club house is to be large but not elaborate. There will be a spacious lounging room and dancing floor 40 x 70 ft., a kitchen, library, and reading room on the first floor; on the second floor there will be a 40 x 100 ft. basketball court. In the basement there will be the pool tables, bowling alleys, shower baths, etc. When the old club house is turned into a permanent hall it will be used for moving picture shows, plays and entertainments of various kinds exclusively.

Next to the treatment and working conditions accorded the men at the mines the store that supplies the necessities of life probably affects their feeling of satisfaction or dissatisfaction more than any other one element. If expenses are high it means wages are low. A certain rate of wage may be satisfactory or not depending on the cost of living. This coal company has adopted the principle that it is mining coal, not operating retail stores, and that its profits should come from the sale of coal, not from the sale of merchandise. The store is only an accommodation for the men, not a thing of profit for the company.

As a result of this decision and realizing the effect on the miner of unnecessarily high prices the coal company

AN EXCELLENT WASH HOUSE HAS BEEN BUILT

organized the store on a co-operative basis. The prices charged are so fixed that they conform as nearly as possible to the average for that section of the country. At the end of every six months the profits are calculated and a dividend declared which is paid to the miners according to the size of their purchases for the preceding half year. If a miner leaves before the six months period is up he forfeits his right to a dividend on the profits and his share is put in the general fund for

division among the balance of the miners. A newcomer to the community is treated the same as a customer who has been there the full period and receives the same percentage on his purchases. This system encourages the men to stay at the mines so that they will not lose their dividends. This store has 1,200 accounts at a mine employing 500 men.

The store itself is well equipped and is divided into separate and distinct departments, such as shoes, dry goods, groceries, hardware, furniture, and butcher shop. The butcher shop is exceedingly sanitary in its equipment. The ice box is fitted with a refrigerating machine. Large and well equipped storerooms permit the purchase of stock in large quantities, thus allowing the store to take advantage of special prices. The store employs seven persons to attend to the wants of customers and operates two delivery wagons.

In this community as in most others throughout the country there are a number of under-nourished children, and since the children make the future race, everything possible should be done to better their health. As it is extremely difficult because of the character of the country to have a dairy, the company is making arrangements to install a milk making machine. This takes milk powder, and adds water and butterfat and produces a good milk, enough of which will be made to let every child have all that he or she needs.

As a number of the miners own homes in other districts they have to travel back and forth on the trolley line. The miners' wives also sometimes desire to go to town and it is necessary for them also to use the trolley. This is over a mile from the camp, so the company has established automobile service between the camp and the car line.

As has been above explained, excellent working conditions are provided for the men, satisfactory store arrangements are made, entertainment is provided, their children are furnished with an excellent grammar school education, their health and that of their families taken care of, but this all means little if home conditions are not good. The men are in the mines only eight hours a day, but they are in or in touch with their homes sixteen hours a day. A dirty, nasty home either outside or inside does not make satisfactory surroundings.

Unkempt home surroundings not only affect a man's feeling through the eyesight but they make the wife careless, shiftless, grouchy, the children cross and ugly and the husband disgusted with everything. The company has realized this and is building new and attractive houses. These are of two types, one, a one-family house and the other built for either one, two or three families, depending on the size of the family or families. This latter house is rather unique in its interior design. If this building is to be used for a three family house it is arranged exactly as shown. The center outside door opens into an apartment of five rooms, while the bath room for this apartment is on the second floor over the kitchen.

The two extreme outside doors open into separate houses having two rooms each on the lower floor, with a stairway to the second floor, and there are four rooms for each of the side houses. The two middle rooms are directly over the apartment on the first story. If the family is too large for one of these apartments the wall between the two front rooms on the lower floor between either end apartment and the center apartment is removed. This makes this into one large room and adds three rooms to the apartment. If the number of rooms is still too small for an exceedingly large family a door is cut in the corresponding wall to that which was removed between the first two named apartments. This throws all the rooms in the entire house together.

MUCH CARE WAS GIVEN THE DESIGN OF THIS THREE FAMILY HOUSE

On p. 384 is shown the plan of the single family house. Ordinarily the third floor is unfinished, but if the family is large enough the company finishes the top floor. In the design of all its houses the company insists on a large kitchen, since the ordinary foreigner makes this his living and dining room. The ordinary parlor is usually shut up for state occasions. The company charges a reasonable rent for all its houses, at the rate of \$1 per room per month.

The company goes on the principle that, give a man something to live up to and he will do it. The miners after they move into these interesting houses take considerable pride in them and soon a better grade of furniture arrives and not only is the house itself more attractive but the furnishings improve also.

Besides doing all that has been described for its employees and their families the company goes a step further in its dealings with the men. It is giving them the best possible working conditions, good air, clean mine roads, rapid hoisting, timber promptly supplied and no delay. The company takes away the excuse for not working. It endeavors to make the men like the mine and their work. Previously the men lost much time. Men do not ordinarily leave the employ of the company, but remain with it for sometime.

# Some Advantages In Establishing Demonstration Coal Mines\*

Experimental Mines Established in Various Coal Fields Would Do Much to Advance Mining Practice. Many Costly and Intricate Problems Influencing Safety and Production Could be Experimentally Determined by Them

BY J. J. RUTLEDGE†  
McAlester, Okla.

AT BRUCETON, PA., the U. S. Bureau of Mines established in 1909, an experimental mine, for the purpose of testing the means available for preventing and limiting the force of mine explosions. During the last ten years numerous explosions have been caused to originate in this mine for investigative purposes and the rate of propagation of the explosion wave, the pressure developed per unit of area by the explosions, and the general results of the explosions have been carefully studied and recorded. Means of preventing mine explosions or of limiting them to the area in which they originate have been developed. Much valuable information has been derived from the work in this mine and much more useful and valuable data will be obtained in the future. I would plead, not for the opening of experimental mines in all the important coal-producing fields in the United States, but for the opening of demonstration mines, or mines in which experiments could be made upon the various details of coal mining.

The U. S. Department of Agriculture has established, in nearly every state, stations that undertake experimental work for the benefit of agricultural interests. In addition, small demonstration plots are set aside, in suitable locations throughout the farming districts, where various crops are grown under scientific direction so that the farmers in the neighborhood can note the results obtained and profit thereby. Something of a similar nature should be done for the coal-mining industry. If experimental or demonstration mines were established, methods of operation adapted to local conditions could be worked out.

## SMALL CAPITALIZATION MAKES NEW METHODS IMPOSSIBLE

Owing to competition, small capitalization, or low profits, it may be an utter impossibility for any one company to try a new method of mining. Labor conditions may prevent the trial of a new method of working. It may be impossible or inadvisable to disturb existing working conditions for fear of causing trouble

among the miners through real or fancied changes in the scale of wages.

The first and most important investigation to be undertaken in these demonstration mines would be the trial of various methods of working until a satisfactory plan had been demonstrated for each particular district. It would doubtless be necessary to carry on the work for several years before an acceptable method of work-

IF WE HAVE THIS

ing was evolved. The various details of mining associated with such a method could then be experimented with and the best methods demonstrated.

If a certain method or plan of working had been shown to be the safest and most efficient, public opinion would force coal operators to adopt it and, if they did not do so voluntarily, public opinion would furnish moral support to the operators in overcoming any opposition that the miners or other employees might manifest toward the installation of the new and better procedure.

If a new method was found to be safer and more economical than the one in use, the authority of the state could be invoked to support any operator who desired to adopt it. Few coal-mine operators would dare run counter to public opinion even were they to ignore the financial benefits to be derived from the adoption of the new plan. Compensation insurance companies, through their mine inspectors, would give credit to those operations that adopted the new methods, with the result that their liability insurance would be materially reduced in cost.

It is well known that coal miners flock to new mines and new camps, where the housing and living conditions are as a rule better than in the older camps, and the miner's working conditions underground can be made satisfactory from the inception of mining operations.

\*Paper presented before the February meeting of the American Institute of Mining Engineers. Published by permission of the Director, U. S. Bureau of Mines.  
†Mining Engineer, U. S. Bureau of Mines.

A new and better method of mining would not compel the miner to walk long distances to his working place, through poorly brushed haulageways or manways—perhaps up and down steeply pitching seams.

The new plant would take him to his working place, either by means of a safety car or a mantrip, or by a short walk through well-brushed roadways or manways, with a minimum amount of exertion. He would then be in condition to perform a good day's work, as he would not be tired by his long journey. The ventilation, also would be such that the employees would be able to do a good day's work. The operator who adopted the new plan would have his choice of the miners and their work would be efficient.

It seems strange that coal operators will expend large sums of money for improved mining machinery and fail to make conditions, both under and above ground, such that the employees will be able to perform efficient labor. It is time that technical skill was employed in the underground workings of coal mines to something like the extent to which it has been employed in planning and equipping the surface plant. The most costly sur-

WHY NOT, THIS?

face plant will be useless unless commensurate engineering skill is employed to develop and maintain the underground workings.

#### MOST COMPANIES ARE OF SMALL CAPITALIZATION

No mine can long operate unless a profit is made. Generally speaking, coal-mining companies are of relatively small capitalization and must have an immediate return on the investment—there can be no long wait for dividends, as there is in some other lines of business. No mining company can afford to abandon old prevailing methods and try out new ones, no matter how promising, for fear that the new methods will prove to be unsuccessful and no dividends will accrue. Again, owing perhaps to close competition, one or more of the mining companies may not be on good terms with the other coal producers in the same field, and hence may hesitate to try out a method of working that may prove to be successful and that eventually will be adopted by the competitor, who will reap the benefits of the new method without having expended either time or money in trying it out.

A demonstration mine, on the other hand, operated under government supervision, supported by government funds—perhaps augmented by financial support from the coal operators of the vicinity—can try out various methods of mining and by experiment find which ones

are best adapted to the field. In this way, each method of working would be given an impartial trial under disinterested engineers and miners, whose only purpose would be to learn what plan of working was best suited to the region; coal-mining men, including miners with a practical working knowledge of improved methods of working as carried out in other fields, could be used as a supervisory consulting board. Each person on the board would have a voice in determining the plan adopted and in putting it into execution.

#### DEMONSTRATION MINES WOULD BE UNTRAMMELED

Since such a mine would be under government supervision and the sole purpose for its operation would be safety and efficiency, it would probably be free from some of the onerous working conditions frequently incorporated in the wage agreements of some of the coal fields. The actual true working efficiency of man and machine could be ascertained without the result being subject to either doubt or criticism. If results of value were secured, the entire coal-mining industry in the field where the demonstration mine was located would profit thereby, since the information would be free to all. In like manner, if negative results were obtained the entire coal field would be informed so that commercial producers would not try a plan already proved defective.

Inquiries among coal operators in various fields seem to indicate that they would support such demonstration mines both morally and financially. Indeed, it is believed that were such mines to lack financial support from the government, the various mining companies in their neighborhood, who would be most interested in the results obtained, could be persuaded to furnish the funds necessary to carry out the desired experimental work, the amount necessary being raised by a voluntary assessment on each firm interested. There would be some revenue from the coal produced in the demonstration mine so that some of the money advanced would be returned to those companies that subscribed to the fund. The coal mined would probably be of such grade and quality that it would bring a good price since it would be produced under careful supervision.

Since coal beds differ in character and the same seam may greatly change its nature within the distance of a mile or so, and, moreover, since the nature of the roof or bottom may, and many times does, change within a very short distance so that a method of operation successfully followed in one mine may not be at all adapted to the conditions found in a mine a mile distant, it is, in many cases, necessary to develop plans of working suitable for each particular district.

Various methods of mining can be tried out to ascertain whether or not they are adapted to the conditions in the field where they are tried. If the work in the demonstration mine proves successful, from both an engineering and a business standpoint, the methods can, and doubtless will, be adopted by the other mines in the field where the demonstration mine is located.

Among some of the experiments that could be tried are the following:

Some satisfactory means for preventing the slacking of mine roof during the summer, by the use of gunite or some other form of protective coating.

By experiment find what method of mining is best suited to the field: If pillar and room, whether double entry, entry and air course, or panel system; best width of rooms and pillars; most economical depth of rooms, most satisfactory width and length of room necks, rooms turned off entries at right or at acute angles, or concentrated workings. If longwall, whether advancing or retreating. If advancing, whether Scotch or 45° system, or face track; by hand mining or by machine. If retreating, angle face or straight face, conveyor or face track.

A suitable method of timbering entries and air courses; details of longwall advancing, determination by experiment of the angle of break for machine and hand mining and distance between the lines of break in both methods, and the amount of subsidence.

Best methods of timbering roadways and airways in any special coal field; control of squeezes; best methods of causing roof to break; suitable means for combating bottom heaving; proper explosives; most satisfactory mining machines; method for reducing the depreciation of mining properties; improved methods of haulage; better ventilation systems; generation and distribution of power, especially electricity; most efficient pumping arrangements; safer shotfiring methods; mechanical loaders; underground dragline systems for loading coal into mine cars.

## Military Engineers' Society Is Being Organized

Association of Technical Men With Service In Any Branch of Army, is Approved by Chief of Staff

A NATIONAL association of present and former officers of engineers and civilian engineers who have served in any arm or branch of the U. S. Army—Engineers, Ordnance, Signal Corps, Infantry, Cavalry, Artillery, etc.—to be called the Society of American Military Engineers, is being organized by a committee in Washington appointed by the Chief of Engineers. The society's objects are to promote the science of military engineering and to foster the co-operation of all arms and branches of the service, and of civilian engineers, in that science. The objects and a provisional constitution of the society have been approved by the Chief of Staff.

A board of engineers was appointed Nov. 1, 1919, by the Chief of Engineers, to consider and report on the feasibility of a technical organization of officers and civilian engineers experienced or interested in military engineering. At the same time the Chief of Engineers required a letter-ballot for or against such an organization from all Corps of Engineers—officers and temporary engineer officers then in the service. The vote was overwhelmingly in favor of the proposed society.

The board then resolved itself into a committee on organization. Its members are: Colonels F. V. Abbott, Charles Keller, and G. A. Youngberg; Majors George

B. Pillsbury, George R. Spalding, P. F. Bond, Max C. Tyler, John C. Kingman, and David McCoach, and Captain Douglas L. Weart.

Following a canvass of representative opinions which showed reserve officers and others who had been in the engineering service during the war to be strongly favorable to such an organization, the committee drafted a provisional constitution and created a temporary board of directors from its membership. This constitution is already being submitted for approval or comment to individuals who are known to be interested in the organization and eligible to membership; its more important features follow:

The annually elective officers are to be a president and first and second vice-presidents. The president is to be an officer of the Corps of Engineers on the active list. There is to be a secretary, an editor and a treasurer chosen by an executive committee, the first two from the regular army. A board of directors, to have eighteen members, is to be elected by the three divisions of active membership, as follows: six by the regular army; six by the National Guard and reserve forces, and six from the membership exclusive of the foregoing two groups. There is to be an executive committee consisting of the president, the two vice-presidents and not to exceed three others to be elected annually by the board of directors from its own members. Other standing committees are: Rules and ethics; auditing; finance; membership, nominations and necrology; service relations and military policies.

The annual meeting is to be held in Washington, and its date is fixed with reference to that of the American Society of Civil Engineers in order to make possible attendance of members at both meetings. The dues are fixed not to exceed \$5 per per year, those for the present year being \$4.50.

The Society is to publish bi-monthly a journal to be called "The Military Engineer," which will supplant "Professional Memoirs" heretofore published by the Corps of Engineers.

Further information regarding the society may be secured from Col. G. A. Youngberg, Office, Chief of Engineers, U. S. Army, Washington, D. C.

## Monongahela River Great Carrier of Coal

The value of the Monongahela River as a transportation medium for the Pittsburgh district of Pennsylvania is evidenced by figures made public recently by the U. S. Engineers' Office. It was shown that, starting in 1898, when the Government took over the locks and dams in the river, the coal tonnage carried on the Monongahela has increased from a little less than 6,000,000 tons a year to more than 14,000,000 tons in 1919. An average of more than 1,000,000 tons a month are transported on the river and locked through the dams of the stream.

In addition to the coal tonnage carried, during the past year (1919), 3,000,000 tons of building material were carried by boat to points along the river. The coal tonnage record, it is said, would have been 1,000,000 tons greater last year had it not been for the coal strike which sadly interfered with production during the latter part of the year and also because the ice in December held up traffic to a marked degree.

# Planning A Mine So As To Secure Maximum Recovery\*

BY W. B. RIGGLEMAN† AND EVAN L. GRIFFITHS‡  
Clarksburg, W. Va.

**R**ECOVERY of coal is an important problem, and before any coal property is developed it should be surveyed, mapped and the entire property projected, and all haulage entries laid off to the best advantage.

This does not mean that every entry driven in the property is to be projected when the operation is first opened, but it does mean that the general plan of the mine must be worked out and definitely adopted. To project mines so as to insure the greatest possible recovery from property,

there are several considerations that must be carefully weighed. Among these are: The location of mine, haulage, drainage, actual method of working, and others. The first proposition is to locate the opening and next the main entries, face entries and butt entries, provided these passages are to be driven on the faces and butts of coal.

In order to secure a high percentage of recovery it is necessary to develop the mine upon a carefully planned projection or as nearly so as circumstances will permit. The nature and depth of the coal as well as the quality or tenacity of the roof and floor must be taken into consideration in deciding on the mine layout or projection.

This is customary in the Pittsburgh bed, particularly in the northern section of West Virginia.

Main entries are laid off and the face entries turned from the mains at regular intervals. From the face entries, butt entries are turned at the proper places, depending upon the length of the rooms. It is generally the practice in opening coal mines to prosecute development as soon as the main entries are started since this will allow some coal to be produced. This procedure invariably causes a mine to be worked in an improper manner and almost always gives trouble in the end. I have always found that it is the best policy to leave from 200 to 300 ft. of barrier pillar on each side of the main entries and from 150 to 200 ft. barrier pillars on each side of the face entries. Some may argue that it is unnecessary to leave a 200 to 300 ft. barrier pillar on each side of main entries, but after a mine is fully developed and main entry pillars are being drawn one can readily see where this coal would be highly advantageous to the mine.

### LARGE ENTRY PILLARS GIVE GOOD FINISH

It would simply mean driving rooms both ways from the main entries when the entry pillars are being drawn. This would allow the output to be kept up until the entire property was worked out.

Face entries should be turned off the main entries at intervals of 1,200 to 1,800 ft., depending on the area to be worked. Some may contend that the distance should be increased to 2,000 ft., and indeed there are a number of arguments in favor of this system, espe-

cially in a bed that dips 1½ to 3 per cent. Pillars should be started at the top of a butt entry with two to three butt entries to a panel. Rooms should never be driven until the pillars can be removed as soon as the rooms are completed.

This, of course, applies to mines where good mining rights were obtained when the coal was purchased; otherwise there would be no necessity of driving entries to their limit and driving top rooms first.

Assuming that good mining rights have been purchased, I would recommend driving room entries to their limit, then at least the top seven or eight rooms should be started and finished. When these rooms have been driven out pillars should be drawn immediately and stepped off so as to be on an angle of approximately 45 degrees. This also applies to advancing rooms on the entry as they should advance on the same angle. It is good policy to have at least two butt entries and possibly three in a panel and have the work handled in such a way as to allow no rooms to be driven until the drawing of pillars can be started. This can be done if proper attention is exercised. The room centers, of course depend considerably on the amount of cover over the coal, but where the cover is not too heavy 60 ft. centers can be worked.

FIG. 1. RELATION OF PILLARS AND ROOMS AND A METHOD OF ROBBING ROOMS

Sixty-foot room centers can be worked to good advantage in the Pittsburgh bed where cover does not exceed 250 or possibly 300 ft. Of course, trouble will be encountered if pillars are not properly stepped while removing the coal.

Where the cover runs from 250 to 500 ft. or even 600 ft., I would recommend that the block system of mining be used. This means that entries would be driven in the usual way, on say 35 or 40 ft. centers.

\*Paper presented before the West Virginia Coal Mining Institute, Huntington meeting, December, 1919.  
†Inspector, Fifth District, Fairmont, W. Va.  
‡Inspector Thrd District, Clarksburg, W. Va.

and rooms turned off every 90 ft. Cross cuts should be driven between rooms so as to make a block of coal 80 ft. square. The rooms are driven in the usual manner and when their limit is reached the pillars are removed.

It is customary to remove the pillars from two different points, one place being driven through the pillar from the room and one driven through the pillar from the cross cut. It is customary in working the block system of mining in the Fairmont field to drive rooms on 96 ft. centers with rooms 18 ft. wide and cross cuts 13 ft. wide.

When a system of this kind is followed there is little likelihood of a squeeze since the large blocks of coal will practically prohibit it. In fact if pillars are properly lined and not too many rooms opened in advance of the pillar work, there is absolutely no chance of a squeeze taking place.

The above system has been tried out extensively in the Fairmont field during the past five years and in a large number of mines it is being worked satisfactorily, especially in mines where the cover over the coal is extra heavy. It would be practically impossible to mine the coal and obtain a good recovery in some operations if the block system of mining had not been adopted. This is because of the fact that otherwise there would be considerable coal lost on account of squeezes.

The block system of mining affords considerable machine coal, as practically all the output can be undercut with machines, except small stumps that are removed by pick work. I do not mean to say that we could not mine coal in a number of mines in the Fairmont field without the block system, but it has been found that better results are obtained with this system in the deeper mines.

Of course no system will afford a good recovery unless it is given careful attention and worked properly. What is meant by careful attention is seeing that entries and rooms are driven on points and that these openings together with cross cuts are driven the proper width. Furthermore, when pillar work has been started it should not be stopped nor the pillars allowed to get too close to each other.

It has been said that 90 per cent is a fair recovery in the Pittsburgh bed. This is indeed a high figure and to obtain this percentage of coal requires that a mine be operated on a first-class system.

#### IMPROPER METHODS CAUSE GREAT LOSS

The loss, most of the coal not removed from mines, arises from improper methods of working which invariably cause squeezes. It is indeed unfortunate to lose coal in a mine from a squeeze since such settlements can be eliminated if a mine is laid out and worked in a proper manner.

We are convinced that in order to obtain the greatest percentage of recovery from any property it is necessary to lay out the mine as suggested above, deciding on the thickness of barrier pillars, and working according to projections. A large number of mines are cut up badly because projections were continually changed.

The best idea is to decide on a definite plan and see that the projections are followed unless something unforeseen develops which, of course, would necessitate making changes. Many projections are changed unnecessarily.

In some sections pillars cannot be removed on account

of roof conditions. This of course could not be taken into consideration in recovery of coal, as high recovery can hardly be expected where the full bed cannot be removed.

#### LEAVING BLOCKS OF COAL AROUND OIL OR GAS WELLS MAKES RECOVERY DIFFICULT

There are again a large number of mines where coal is worked and according to leases (or deeds) conveying the coal the surface cannot be broken. This indeed is unfortunate, but in some cases pillars are required to be left for protection of surface upon which houses or other buildings have been constructed. There is also considerable coal left around oil and gas wells, especially in the Fairmont field. This aggregates a large amount but is necessary in order to properly protect the mines. The leaving of blocks of coal around various oil and gas wells is dangerous, since a block of coal as much as 200 ft. square may be required in a section of pillars. When pillars are approaching a block of coal of this kind it always gives considerable trouble and interferes with recovery.

The roof and bottom conditions in coal mines vary considerably and this always has much bearing on the size of pillars to be left. The smaller beds which are worked more extensively in the southern part of the state have a good roof, one in fact that is much better than the roof over the Pittsburg bed of coal in the Fairmont field. The recovery per acre in the thinner seams such as the Sewell, Welch, Fire Creek, Pocahontas, etc.,

FIG. 2. SHOWING THE AMOUNT OF COAL TO BE REMOVED BY VARIOUS METHODS

should be excellent, provided the mines are laid off on a proper plan. It is almost always found, however, that the pillar work in a low seam is allowed to get behind and pillars are not drawn at the proper time.

To recover a good percentage of coal in any bed requires that a mine be laid off on a good plan and that sufficient pillars be left so that pillar sections can be started where desired.

It has been noted in a large number of operations that entries and rooms have been driven after a plan

that calls for the removal of pillars some time in the future. This may be satisfactory but will never allow a good recovery of coal, especially where the proper size of barrier pillars have been left. Pillar strength should be figured to carry its own burden plus the weight that will be added as the adjacent pillars are removed in their regular turn.

The size of pillars must naturally depend upon the nature of the material, since soft coals are more liable to chip or split off, weakening the pillar. When the bottom and roof are of different character, the pressure on the pillars will show by their being forced into the softer of the two materials.

#### PRESSURE AND STRESS INCREASE WITH BED DEPTH

In laying off a mine preparatory to development it is well to remember that the pressure, as well as the stress on the pillars, increases with the depth of the bed below the surface. The basis for estimating the size of pillars that may be safe with 500 ft. cover will not apply where the cover is 1,000 ft., neither does the same ratio hold good at 1,500 feet.

No mention has been made concerning timbering in connection with recovery of coal, but it is understood that timbering is a separate consideration, since practically all mines require a different rule for supporting the roof in working places. It is advantageous to determine a plan for timbering in each mine and follow this out with no change whatever. This means that timber will be set in all working places in accordance with a regular system, regardless of whether or not it is actually necessary, and that the same method of timbering will be carried out all over a mine. In some places timbering will be done where it is not necessary, but this will, of course, give assurance that adequate timbering will be done where needed.

In conclusion it should be stated that in order to recover a fair percentage of the coal from any property the mine should be laid out on a good plan, leaving sufficient barrier pillars and driving rooms in sections so that the pillars can be removed immediately after the rooms are finished. In no case can a good recovery percentage be realized unless some such plan is followed.

## Plant at Lynch, Ky., Is Rapidly Nearing Completion

THESE are busy days at Lynch, Ky.,—the scene of the latest of the United States Coal & Coke Co.'s operations. Construction on the plant buildings and the town itself is going forward at a pace that suggests the thought that some active dynamic force is overseeing each individual operation. Activity is manifest everywhere. In fact, the scene with its army of workers recalls similar ones in France in the spring and summer of 1918 when army base hospitals and concentration camps were springing up over night. Locomotives are busy switching to and fro; in the quarries on the hillsides, the sound of exploding dynamite is heard; steamshovels take a fitting place in the general arrangement, while no less workmanlike is the sound of the riveter's hammer and the buzz of the saw.

The latter part of 1917 witnessed the initial step in the transformation of this Kentucky wilderness. Some day in the early future Pullman porters will announce Lynch as one of the few stops on the direct line to Louisville or Cincinnati, for Lynch is destined to become a

city just as surely as "hoe-cake" is found on the menu cards as soon as the Mason & Dixon line is left to the northward.

Eleven drift entrances are already well advanced. These are located on either hillside with the town lying in the valley. Already 7,000 tons of coal passes over the tipple daily. All of the development work is at present confined to one bed. This is the "C" of the Pottsville Conglomerate Series, known in other localities as the Roda or Elkhorn. Nearly 45,000 acres of coal will eventually be developed of which it is planned to load the tonnage from 20,000 acres over one tipple at the rate of 10,000 tons daily. And even this remarkable figure will be by no means hard to attain, for the tipple has been designed to accommodate a daily output of 18,000 tons if necessary. This is truly a marvelous capacity when a comparison is made with the 3,000- and 4,000-ton capacity plants of the present or even with some of the larger Illinois mines where large tonnage is accepted as a matter of course.

Each year the coal industry points with particular pride to some individual mine with a large output and immediately the conclusion is reached that here is the limit. Yet who shall say that Lynch is to be the last word in highly concentrated mining methods when rotary dumps and the skip method of hoisting are still in their infancy, to say nothing of the possibilities of belt conveying from the working face?

From present indications it will be next fall before the plant buildings will have all been completed. One has to be in Lynch today to appreciate the vast amount of work that has been done in a relatively short space of time. The tipple, a square building of reinforced concrete and native stone construction, is equipped throughout with electrically operated shaker screens, picking tables and loading booms. However, most of the coal that will be loaded will be mine-run, for it eventually is to be coked in the byproduct ovens of the United States Steel Corporation.

The power house is of the same type of construction as the tipple and contains three Stirling boilers with an aggregate horsepower of 2,200. The steam is superheated 100 deg. and carried at a pressure of 200 lb. per square inch. Two 1,500 kw. steam turbine driven General Electric, alternating current generators will produce 6,600 volts. Three concrete substations have been constructed underground where General Electric rotary converters will produce the direct current at 250 volts after it has been stepped down by transformers. From the power plant the high-tension lines are carried underground by conduit.

The machine shop is of steel and wire glass construction which gives an admirable natural lighting effect. It will be electrically equipped throughout.

The scheme of developing the mines is purely a United States Coal & Coke Co. idea. This is a subject in itself and will not be taken up until such a time as the surface buildings have been completed and *Coal Age* is able to offer to its readers a more detailed description of the operation at Lynch. Half of the pillars are robbed advancing and the remainder in retreat. The haulage roads are solidly built and in such a manner as to guarantee a maximum of use. All room entries are double tracked and locomotives place the cars at the room necks. Much needless switching is thus avoided and considerable time saved. The thickness of the bed is expected to average 5½ ft. throughout the tract.

# Low-Temperature Carbonization of Coal\*

BY S. W. PARR† AND T. E. LAYNG‡  
Urbana, Ill.

THE low-temperature carbonization of coal involves the carrying out of the coking process under conditions wherein neither the coal mass nor any of the passageways through which the volatile products pass are heated above 700° or 800° C. (1,252° to 1,472° F.). For convenience in this discussion, the single number 750° C. (1,382° F.) will be used to designate the maximum range. This temperature is not selected arbitrarily; it is the result of certain natural conditions that are inherent in the substances involved. Two of these conditions are sufficiently pronounced to suggest a line of demarcation at this point, and are as follows: (1) Below 750° C. all the heavy hydrocarbons are expelled, which means that, at lower temperatures, the illuminants, the gases of high calorific value, and the condensible oils are discharged; above 750° C. there are given off the lean, non-illuminating gases consisting for the most part of hydrogen and marsh gas and having no condensible constituents. (2) Below 750°, there is substantially no secondary decomposition; above

temperatures the step is a moderate one, as, for example, from xylene to toluene or from toluene to anthracene. These changes are moderate in amount. Not only do the reactions proceed slowly but the gases are subjected to the decomposing conditions for only a short

time. This is evident when it is recalled that at these initial temperatures the decomposition of the coal is rapid and, if anywhere near a neutral pressure is maintained, the movement of the evolved gases is lively and reduces, correspondingly, the time of their retention in the passageways where these milder decomposing conditions exist.

It is acknowledged that the maintenance of these temperature conditions at the present time has only an ideal and not a practical status. Actual operations under these conditions, as an industrial accomplishment, is still in the experimental stage. However, many tendencies and many experimenters, not to say promoters, are working toward this goal and the topic is certain to be

one of great interest until we have come much nearer the ideal in practice. It is not the purpose of this paper to discuss possible methods whereby this end may be attained. Any industrial process has in the main only negative results to report when it is in the development stage; otherwise it would not be in that stage. There is a definite value, however, in setting forth in quanti-

tion was given to methods of manipulation and where quantitative data as to byproducts were meager and occasionally in error.<sup>3</sup>

The results in the tables are sufficiently specific and a further discussion must be reserved for a bulletin wherein it is hoped that additional data will be available concerning the composition of certain of the byproducts, especially the tars. Attention may be called to certain items as follows:

(1) The temperature conditions were maintained consistently throughout so that uncertainty on that point is eliminated.

(2) The yield of byproducts from a given type of coal is sufficient in form to afford strong presumption as to the fact that these are the normal values that may reasonably be expected under low-temperature carbonization conditions.

(3) The tars are of unusual interest and require further study to arrive at full information concerning this product. The high content of free carbon in the last two samples of Table 6 is due to dust mechanically carried over and not to secondary decomposition.

(4) The gas yield represents unusually high calorific values. The columns A, B and C, Table 7, represent the

tative terms, so far as they may have been determined, the factors that represent the normal yield to be expected if conditions are maintained as planned. An added reason for offering such data is the tendency to make extravagant and unwarranted statements regarding the value and quantities that accompany the low-temperature process.

The apparatus employed in the experiments from which the data here presented was secured is capable of handling from 25 to 35 lb. of coal at a charge. The heat is applied by means of an electric current, the amount of resistance wire being so adjusted as to produce a temperature not over 800° C. The cross section of the retort is 7 3/4 in. Pyrometer readings are taken at the center of the mass and next to the wall of the retort. The coals employed were mainly from Illinois but the experiments were extended to include samples from Indiana, Kentucky, West Virginia, and Pennsylvania. As already noted, it is the purpose of this paper to give as nearly as possible what may be looked upon as a normal value for the different products obtainable from the various coal samples employed. In this particular, therefore, it is supplementary to bulletins already published by the Engineering Experiment Station of the University of Illinois, wherein chief atten-

## NEW APPARATUS AND EQUIPMENT

### An Electric Bond Tester

One of the new pieces of apparatus being manufactured by the Joy Machine Co. of Pittsburgh, Pa., is an electric bond tester. This is of rugged construction and built to withstand the rough usage that such devices receive around coal-mine plants. This tester is self-contained and does not depend upon any return current in the rail for its operation.

Energy is supplied by a dry cell battery which is incased in the handle. The simplicity of construction

on the surface of the rail until the current is set up through the rail joint.

The lower part of the instrument incases a buzzer which operates if the current is not closed between the two rails. If the bond is defective, a buzzing sound will be heard in the receiver, the intensity of which gages the degree of imperfection of the bond. In the case of a perfect bond, the circuit between the contact points will be closed and the buzzer will not operate.

The only part of this device subject to rapid deterioration is the dry cell inclosed in the handle. It may be necessary to replace this battery every six or eight weeks, depending upon the amount of use given the apparatus. An ordinary flashlight battery is employed. This may be obtained from any merchant handling the proper size. The cell is placed in the battery-case with the zinc end upward so as to bear against the contact spring.

LITTLE EXPERIENCE IS NEEDED TO OPERATE THIS MACHINE

which necessitates but a minimum amount of care as well as experience to operate this machine makes it a valuable piece of apparatus around a coal mine. Faulty bonding is an evil that does much toward increasing transportation difficulties.

In using the instrument, it is placed in position as shown in the accompanying illustration. A pair of drill bits used as contact points bear upon each abutting rail. The switch in the handle is then closed and by means of a downward pressure, the drill points rotate and cut through any rust or other extraneous material

### Solderless Connectors

The Westinghouse-Frankel solderless connectors recently placed on the market represent a new method of splicing electrical conductors which combines reliable service with high efficiency and marked economy. These

CROSS-SECTION SHOWING CONSTRUCTION

connectors are simple in design, strong, and easily installed. They are made in various styles and sizes for adaptation to all types of splices with all varieties of wire.

In making use of a two-way connector, the insulation is removed from the ends of the cable or wire, to be spliced for a distance equal to half the length of the connector. The bared ends are then inserted into the connector so that they meet at the center, after which

A COMPLETED SPLICE

the compression nuts are tightened. These nuts are so constructed that they force inward a set of jaws at each end of the connector, causing them to grip their respective conductors firmly, forming a perfect joint. Splices with the other styles are made in the same manner as with the two-way type.

# Considerations Influencing Mine Ventilation

BY R. Z. VIRGIN  
Pittsburgh, Pa.

**P**RESENCE or rather the absence of restrictions or obstacles in mine airways are of vital importance. Such obstructions offer resistance to the air current that it is necessary to keep flowing through the mine workings, in order to insure the health of the workmen and comply with various state laws. This resistance means friction and an increased cost of power expended in ventilation.

The power required to drive the air through the mine is largely consumed in forcing it through the headings, entries and other passages of small or limited cross sectional area. Unfortunately in many mines such restricted passages are used as man- and haulageways as well as airways.

Modern coal mines are projected upon such a plan as to provide multiple entries, generally sufficient in number and cross sectional area to permit the passage of sufficient ventilation independent of the haulageways. Older mines, opened and worked upon the double entry plan, do not as a rule afford the unobstructed passages necessary to efficient ventilation. Consequently as the haulages grow longer the volume of air transmitted becomes less, the expense for ventilation power becomes greater and costs go up.

It is often the case that high ventilation cost is not rightly chargeable against the superintendent's efficiency as a manager. This is however rarely considered when comparative cost sheets are examined. It is frequently necessary therefore for the mine manager to do the

FIG. 1

KEEP ALL PASSAGES CLEAN AND IN GOOD CONDITION

best he can with the means at hand. This can, in a measure, be accomplished first by keeping all airway passages clean and in good condition and second by permitting cars to stand in airways as little as possible.

The significance of the latter suggestion is well shown by reference to the accompanying illustrations. Fig. 1 shows an entry 6 x 10 ft., or one having a cross sectional area of 60 sq.ft. The perimeter or line of rubbing contact is  $10 + 10 + 6 + 6 = 32$  ft. Let us assume that a certain quantity of air is passing through this airway and that a water gage of 2 in. is required to force its passage. This is equivalent to a pressure of  $2 \times 5.2 = 10.4$  lb. per square foot necessary to propel this air through this passage.

Fig. 2 shows the same size of airway after the introduction of a standing car or trip. This car has dimensions, as shown, of 4 x 5 ft. or an effective "obstructional" area of 20 sq.ft. This, subtracted from the cross sectional area of the entry, leaves  $60 - 20 = 40$  sq.ft. of effective area. The peculiar circumstance about

this type of obstruction, and a factor that is seldom given consideration is that while the area for the passage of air has been reduced 33 per cent the actual rubbing surface encountered by the air current has been increased by the perimeter of the car or 18 ft. making a total perimeter of  $32 + 18 = 50$  ft.

Fig. 3 shows a fall of rock in the same airway. For purposes of illustration this fall has been assumed to

FIG. 2

MINE CAR IN SAME AIRWAY AS SHOWN IN FIG. 1

have the same cross sectional area as the mine car. On account of its nature and location however it does not offer as effective an obstruction to the passage of air, since its rubbing surface is less.

In this figure the available free cross section is 40 sq.ft. as before but the rubbing perimeter is in this case only 45 sq.ft. This clearly shows that a fall of rock with a total cross sectional area equal to that of a car is less detrimental to ventilation power costs than a car. This, of course, assumes that the length of the fall is the same as that of the car or trip as the case may be.

The first law of air friction shows why this is the case. This law states: The pressure required to overcome friction varies directly as the rubbing surface. We have assumed above that the pressure required to force a given quantity of air through the unobstructed airway is equal to 2 in. of water or 10.4 lb. per sq.ft. In the second case, other things being equal, the necessary pressure would be found as follows:  $32 : 50 :: 10.4 : X$ .

or  $X = 16.25$  lb. per sq.ft.

In the second case the necessary pressure would be found similarly:  $32 : 45 :: 10.4 : X$  or  $X = 14.62$  lb. per sq.ft.

These increased pressures require increased power

FIG. 3

RUBBING PERIMETER IS LESS THAN IN FIG. 2

and increased power means additional expense. If, on the other hand, increased power is not available the volume of air flowing will be decreased. In either case explanations may be necessary from the management.

# Problems of the Coal Industry\*

Miner, Operator, Railroad and Consumer Are All Dissatisfied With Existing Conditions in the Coal Industry—The Interests of Each Must Be Safeguarded

BY VAN. H. MANNING†  
Washington, D. C.

COAL and petroleum are two great sources of power, and the state of these two industries may be compared at this time with interest. Today we face a serious shortage in our petroleum resources, and are looking to foreign fields for development in order to keep pace with our domestic demands. Foreign nations have adopted strong nationalistic policies that hinder or prevent the exploitation of petroleum resources by other nationals.

On the other hand, foreign nations are short on a supply of coal. The United States is, therefore, in a position of possessing a dominance in coal, but a dependency in oil.

Coal and oil in one form or another are used in every household in the civilized world. Therefore, it is not unreasonable for the consumer to wonder when the price of either goes up. The welfare of any industry must be considered in connection with the welfare of the people. Capital and labor cannot disregard the public.

Therefore, the public must be represented and be given due consideration. The November, 1919, coal strike was a concrete example of what the public has to suffer when the employer and the employees fail to adjust their difficulties and production is brought to a standstill.

## MANY PROBLEMS DEMAND SOLUTION

The problems of the coal industry are many, and some of them are exigent. The four parties at interest: the miner who digs the coal, the operators who own the properties and manage the industry, the railroads that transport the coal, and the consuming public which finally pays for the joint product of the other three, are all dissatisfied with conditions as they are at the present day.

Some of the problems, those that are most clearly defined and seem to offer the most promising field for definite action, are being discussed at length, but I want to paint in a background for them by briefly referring to some fundamental conditions which obtain and which powerfully affect the situation as it exists today.

The largest factor in coal mining are the wage-earners; for 70 per cent of the cost of coal as mined is paid over to the miners as wages. Who are these wage-earners and what are they like? The census figures of ten years ago indicated that over 60 per cent of them were foreigners and the proportion is doubtless larger now, since the general tendency is for the foreign-born to displace the native in coal mining.

What kind of people are these aliens when they come to us; are they experienced coal miners, men who know their job? On the contrary, in his 1916 report, the Chief of the Pennsylvania Department of Mines says,

"Most of the new miners come from southern Europe, many from the agricultural regions populated by the Slavish race, and are without any knowledge of mining and possess little knowledge in other directions." It has been estimated that three-fourths of them cannot speak the English language, and yet it is only recently that there has been any marked interest in the education of the foreign-born. And, strange to say, the present interest has been created chiefly by agencies outside the industries that employ the foreign-born worker.

## MINERS FAIL TO UNDERSTAND ORDERS

A manager who would not operate an automobile with a carburetor out of adjustment, or a lathe with a dull tool, permits the condition to exist that miners who might seriously endanger the lives of their fellow-workers and the property of their employer go to work, though barely able to understand the instructions given them by their foremen. What good are safety signs printed in six languages to a man who cannot read in any language?

And what efficiency is there in giving instructions to a man who cannot understand half of what you say? Any manager of a coal mining company who is not urging his local board of education and every other agency to furnish proper educational facilities for the adult illiterate has only himself to blame when ignorance among his employees manifests itself to his disadvantage.

More significant than this is the racial origin of these foreign-born workmen. Do you realize that of the 15 million immigrants who came to the United States in the past 20 years, two-thirds came from countries where the people have for centuries been oppressed by their rulers?

## OPPRESSION AND INJUSTICE ARE EXPECTED

There are over 300,000 of such people at work in the coal mines. They have come to us with a background of experience that all they can expect from those in authority over them is oppression and injustice, and that there is no way to achieve their liberty but to fight for it. They come steeped in Old-World superstition and ignorance, many with under-nourished bodies and untutored minds, and we think we have performed the full measure of our duty toward them if we give them a job and the protection of the common law.

They do not understand our form of government and institutions; they are no more qualified to understand them without help than an Indian "medicine man" is to understand modern medicine. Among them are many in whom the native level of intelligence is high, but this may in some instances prove a hindrance, for misdirected intelligence is more dangerous than incapacity.

I have read in the public press that the enemies of

\*Paper presented before the February meeting of the American Institute of Mining and Metallurgical Engineers.  
†Director, U. S. Bureau of Mines.

organized government in this country have 2,500 paid lecturers who devote their whole time to work among the foreign-born. Have there been 2,500 at work to explain to immigrants what their opportunities and obligations are in this land that has opened its gates to them?

The Bureau of Mines has co-operated with the employing companies in protecting them from accident and disease; we have taken care of their bodies, but who has taken thought for the mind that directs their bodies?

It is astonishing that the managers of mines are not more concerned with the dangers and drawbacks of such a situation.

When recreation and amusement facilities have been provided in mining communities, it has usually been done in order to increase the labor supply in that community, and not with the thought of bettering the quality of that labor supply. A way may be found to keep the mines supplied with cars where-with to move coal, but until a way also is found to keep the mines supplied with miners who understand the language of the country they live in, who have some reasonable idea of its government and their opportunities and obligations under it; who, in short, are members of the community and not an alien element, like sand in sugar or emery in a bearing, the industry will not be on a stable basis.

It is thus imperative to take steps to remedy this condition. Until a more intelligent and systematic effort is made to train the miner for his job, and to give him a clear understanding of the general problem of the business he works for and the community in which he lives, the mine operator cannot hold himself free from blame for conditions such as exist today.

#### FEW ENGINEERS FOLLOW COAL PRODUCTION

More than 50 years have passed since schools for the training of mining engineers were first established in the United States, and in that period a great number of technically educated men have gone out to take their places in the industry. Remembering that over two-thirds of the people employed in the mining industry are engaged in the mining of coal, it might be reasonable to assume that two-thirds of these technically trained engineers would be found in the coal mining industry; but we all know that that is not the case, and except in the case of those few schools that because of their geographical situation, have unusually close relations with the coal mining industry, it is the exception rather than the rule for the technically trained mining engineer to go into coal mining.

I will not attempt to go into the reasons why this is so, but I want to point out that it is a great disadvantage to the coal mining industry that such a condition exists. Coal mining needs the services of the best engineering talent to solve its many problems.

A short time ago, one of the Bureau engineers prepared at my request a syllabus of problems in the coal industry which need investigation, and it is significant that the majority of these are engineering problems. If

then we have the situation that the problems of the coal industry are largely engineering ones, and that the coal industry is utilizing the services of less than its due proportion of technically trained men, something is clearly wrong.

In many instances we find the men immediately in charge of actual operations are men with only limited education, who have worked their way up through the school of experience to the responsible positions they now occupy. The man who has had only practical training performs important functions in any industrial organization, but there are many others that he cannot adequately perform because he lacks the breadth of knowledge and the sound grasp of the fundamental principles of engineering that are essential to the really

efficient direction of an important and complex enterprise. It is not a matter of salary, because trained engineers on the average are not a highly paid group, and it has been the experience of general business that the economies which an engineer is able to effect more than repay the cost of his services. In my opinion, it will be necessary

**Much time, effort and money have been expended by local, state and national agencies in protecting the life and health of mine workers, but precious little has been done to improve or correct false ideas and incorrect or pernicious habits of thinking. It is as necessary to protect the ignorant alien's mind from the unscrupulous agitator as to protect his body from disease.**

for the coal-mining industry to make a definite attempt to draw into its ranks more trained engineers who will attack its problems with the impartial and scientific method of thought that the engineer is trained to exhibit.

The third thing I want to bring to your attention is the relation of the coal mining industry to the public. Less than 20 per cent of the annual production of coal is used by the domestic consumer, but that 20 per cent governs nearly 100 per cent of the public contact with the coal industry. More than ever before that third party to all industrial adjustment, the public, has to be considered in the solution of any industrial problem.

I have a great faith in the essential fairmindedness of the American public. I believe that at heart the public thoroughly subscribes to the golden rule, and that it is prepared to accord to miners a living wage and to the operator a reasonable operating profit, whatever price of coal that may make necessary, providing the public is convinced that the adjustments made are reasonable and proper.

At present the public does not know what to think. It has an uneasy suspicion that there is something wrong somewhere, but does not know where to place the blame. In a recent public address, the editor of one of the leading New York papers said, "What are the essential merits of the coal strike? Do you know? If you do, you are very fortunate. I don't although I have spared no effort to get at the facts, many of which lie further underground than the coal itself."

According to individual circumstances, some of the public sympathize in a general way with the employer, and others sympathize in an equally vague way with the miners; but none have any clear understanding of the real facts of the case.

One of the things that is most needed in the present situation is an impartial investigation and a lucid exposition of all the factors of the coal industry, so that the public may be informed as to the real facts. Once it is convinced that the prices asked for coal are reasonable

and fair, the public will be willing to pay whatever may be necessary to afford it a regular and assured supply of its source of heat and power.

The engineers of the Fuel Administration are on record as stating that their investigations show that the management of the average coal mine has no adequate knowledge of what its costs of production actually are. I am not speaking of the large, well-managed mines, but of the average mine. A statement like this filtering through to the public is not calculated to convey to the public mind an impression that the coal mining industry is so well managed that there is no room for improvement.

#### OPPORTUNITY FOR A BIG QUESTION MARK

I should like to call attention to another simple situation. The average citizen calls up his coal dealer and asks him to deliver some anthracite coal, say of nut size. The dealer tells the citizen that this will cost him between \$12 and \$13 a ton (supposing the place in question is Washington, D. C., and a corresponding figure if a different city is involved). This intelligent citizen turns to the report of the Engineers Committee of the United States Fuel Administration and finds chart No. 121, showing the cost of production of anthracite coal during the months of December, 1917, to October, 1918, inclusive. He sees there that over 95 per cent of the anthracite was produced at a cost of \$4.10 per ton or less, and 50 per cent of it was produced at a cost of \$3.60 per ton or less.

It seems clear to me that these two sets of facts will create in any normal mind a large question mark. Who is getting the difference between \$4.10 at the mine and \$12.50 on the sidewalk outside the cellar? Perhaps this citizen has some familiarity with the retail selling of coal, and may even have seen some recently published figures of a large retail firm, which show that yard expense amounts to about \$1.20 a ton, handling losses at \$0.25 a ton, and delivery cost to the customer at \$0.90 a ton; or a total of \$2.35 as the handling cost of the retail dealer.

But this only adds up to about \$6.50 a ton, or about one-half the price paid by the consumer. He knows it costs something to move coal from the mines to the retail dealer, but he has no definite idea of how much it amounts to.

#### IT IS TIME TO EXPLAIN FACTS

I do not know of any systematic attempt on the part of anybody to explain to the public where the price that it pays for coal goes, and who gets it. Perhaps no one has ever felt that it was their business to do so. It is true that the retailer is the man who is most closely in contact with the general public, but manufacturers in general business long ago came to realize that the problems of the retailer are also their problems, and are undertaking to help the retailer out of his difficulties.

I believe it would be well worth while for coal operators to undertake a publicity campaign for the sole purpose of explaining to the domestic consumer of coal why it costs him as much as it does, for the purpose of removing from his mind the suspicion that someone somewhere is making an undue profit out of his necessities.

I have touched thus briefly on three fundamental factors in the present-day problem of the coal industry. I could go on much longer in the same vein, but it is not possible to here hope to deal effectively with more than

a few definite matters. I have no doubt but that many problems which have arisen and will arise will be adequately dealt with, but after they have been disposed of there will still remain an immense field of work that will continue to demand, and for which I wish to urge, careful consideration.

## Some Kansas Coal Fields

ALL mines in the Crawford-Cherokee field of Kansas are operated on the room-and-pillar system. In the southern or Cherokee County portion, the mines are generally wet and non-gaseous, while in Crawford County or the northern section of the field, a contrast is found, in that the mines are generally dry and gaseous. Accidents from gas explosions have been reduced to a minimum in this field through the strict surveillance of the mine inspection department and the absolute enforcement of the state laws relative to gas.

However, some of the miners are still careless about the preparation of their shots and some of the shot-firers are equally as careless about firing them. On the other hand, no shots are fired until all men except the shot-firers are out of the mines at night. No mechanical shot-firing devices of any kind are used, and most of the shots are tamped by the miners. The law requires copper or wood-tipped tamping bars, and prohibits the use of coal drillings for stemming. Shot-firers' accidents have been fewer in the past three years than ever before.

A new coal field is developing in Kansas and it promises well for the future. This is the Le Cygne field in Linn County. It has two beds of coal, each about 30 in. in thickness, one being at a depth of 50 ft. and the other about 30 ft. below the surface. These measures are being worked on the longwall system. The Pleasanton field in Linn County also has promises of a good future. Mining machines and electrical equipment are being installed in the mines in this region, and some excellent longwall work is being prosecuted.

In Leavenworth County there are two or three large mines operated by the longwall system and in Osage County a considerable amount of coal is mined even though the field is on the decline. Some coal is also mined in Franklin and in Neosho Counties by drifts driven into the sides of hills. Wooden rails are used and two or three men work in each drift. Coal is mined in this small way for local consumption in the immediate vicinity.

Kansas coal as a general rule is a good quality of bituminous, and a considerable demand for it always exists. This is evidenced by the fact that when Iowa, Illinois, and other states were only working two or three days a week during the past summer, the Kansas mines were working practically every day.

LIABILITY FOR MINE FOREMAN'S NEGLIGENCE—The owners of a mine operated under the Pennsylvania Anthracite Act by a mine foreman and his assistants, who are required to see that working places are safe, are not liable for injuries to a mine laborer engaged in driving a gangway, where the accident is attributable to an error in judgment by an assistant mine foreman in assuming that a rock in a roof would not fall before the timbering should reach it. (New York Court of Appeals, *Iwanuskas vs. Philadelphia & Reading Coal & Iron Co.*, 124 Northeastern Reporter, 157.)

# Fluctuations in Coal Production—Their Extent and Causes\*

The "Load Factor" of Coal Production Is "Bad," Particularly in Spots, and the Social Loss Involved Is as Great as That of Universal Military Training—Coal Prices and Freight Discounts Might Correct This

BY GEORGE OTIS SMITH† AND F. G. TRYON\*\*  
Washington, D. C.

**A**N ELECTRICAL engineer has supplied us with the phrase that best expresses what's wrong with our coal industry—it is the "bad load factor." Whether we refer to full rated capacity or to average output, the operation of the soft-coal mines of the country from year to year, from month to month, and from day to day presents a load factor that has been too wasteful of plant and labor and too productive of high costs and uncertain supply. Engineering is needed to determine first how bad the load factor actually is in

supply, mine capacity, and average return to the industry per ton produced, are set forth in curves for the 30-year period 1890-1919. At the base of the diagram is a graphic statement of lost time in mine operation, which is the measure of wasted opportunity for the economic use of both plant and labor.

The statistics thus presented are weighted averages for a greater industry spread over a large country and carried on under conditions that are widely divergent from place to place; these are the facts from the national point of view. Locally the conditions were far better or even worse; yet an exhibit of the trend of bituminous coal production as a whole must necessarily precede any detailed discussion. The 30-year period includes the growth of an industry from an output in 1890 of 111 million tons, from mines whose aggregate capacity

FIG. 1. PRODUCTION, CAPACITY, MEN EMPLOYED, MINE PRICE PER TON AND DAYS LOST AT BITUMINOUS COAL MINES—1890-1919

this basal industry and next how that load factor can be bettered; and with both inquiries there must be combined publicity of a high order.

Those fluctuations in coal production can be regarded as *annual*, which in a large way reflect nation-wide business conditions; as *seasonal*, which express conditions of market and distribution; and as *daily*, which express conditions of labor and car supply. An analysis of this ever-changing rate of output of coal can well begin with a long-range view of the variation through a period of years. In Fig. 1, the facts of coal production, labor

FIG. 2. MONTHLY FLUCTUATIONS IN COAL PRODUCTION  
The curve represents the average production per working day for each month from 1913 to 1919. The straight horizontal line across each year is the daily average for the year. The diagram illustrates a combination of two types of fluctuations, annual and seasonal. It also shows how the war demand buoyed up production during the summer of 1917 and 1918.  
Note the peaks just before the strikes of April, 1914, November, 1919.

\*Paper presented before the American Institute of Mining Engineers, New York, Feb. 17, 1920.  
†Director, U. S. Geological Survey.

was estimated at 152 million tons and which employed 192,000 men, to the top figures of 1918, when the output was 579 million tons, the mine capacity was probably 715 million tons, and the mine workers numbered 615,000.

A few only of the outstanding facts may be pointed out in the preliminary study of these graphs. First of all, the coal curve shows more frequent and greater fluctuation than the man curve. The general trend, however, of both these lines, representing coal output and labor employed, has been steeply upward, and the curves have fortunately converged, indicating the greater pro-

but shows itself in the year following the short-time year.

Most significant for the purpose of the present discussion are the blocks at the base of the diagram, representing lost time in the soft-coal industry. In only seven of these 30 years was such lost time less than 25 per cent of the working year. The fact that coal mines are idle for many days each year is familiar to everyone acquainted with the industry in the United States, but what is not generally realized is the amount of time lost. During the last 30 years, out of 308 possible working days a year, the bituminous mines of the country were

idle on the average 93 days. Ten times during that period the time lost exceeded 100 working days. The greatest loss was in 1894 when the average for all mines in the country was 137 days, or 44 per cent of the working year. The smallest loss occurred in 1918, the year of record production, yet even during that year the mines were closed down for one cause or another for the equivalent of 59 days out of 308—nearly one-fifth of the time. These figures for lost time show only the days that the mines were not operated, and absenteeism of a part of the force when the mines were running still further reduced the output below that desirable maximum which would be profitable to miners and operators alike. That is, the figures of "average number of days worked and lost" refer to mine operation but do not necessarily represent the days worked or lost by the average miner. They show only the average opportunity offered to labor by the mines, not the extent to which the individual miner

FIG. 3. SEASONAL FLUCTUATIONS IN THE DEMAND FOR SOFT COAL, 1913-1916  
The seasonal demand for bituminous coal causes in normal years a slump in production during the spring and a peak of forced production in the fall and early winter. The rate from month to month is here shown as a relative, the base of 100 being taken as the average per working day for the year.

ductivity of the average mine worker. The production curve definitely marks the years of general business depression, 1894, 1904, 1908, 1911, and 1914.

Mine capacity is seen to have kept well in advance of output, a relation in large part attributable to ever-increasing expenditures in mine equipment, which also largely account for the increase in average production per man from 579 tons in 1890 to 942 tons in 1918. That capacity curve, is far above even the emergency output of the war period, suggests strongly that the industry has become overequipped and overmanned.

The curve indicating average price f.o.b. mine seems to show relatively little influence by the other facts set forth in this diagram. Prior to the world war the only marked deviation from a smooth curve was the 12-cent rise in 1903, which was apparently due to the anthracite strike of the previous year. A similar lag is shown for most of the years of general industrial depression, the employe's curve being a year behind in registering the effect of decreased demand. In other words, the exodus from the mine to other employment is not immediate

took advantage of his opportunity. The statistics upon which these statements are based are found in the records of the U. S. Geological Survey's annual canvass of mineral producers, running back for many years.<sup>1</sup> Each mine operator is asked to state the number of days his mine was operated, reducing part-time days to the equivalent in whole-time days. By weighting the replies to this question by the number of men employed the Survey obtains averages for the state and the country. The figures for days lost are believed to be low, if anything.

Returning to the consideration of the 30-year curves we may detect some discordance between production and capacity. The inevitable lag in time between development and active exploitation has a decided bearing upon working time. It means that during the initial period of a time of depression the disparity between production and capacity, which is the cause of poor working

<sup>1</sup>The records of the Geological Survey are sometimes at variance with the reports of the state mine inspectors. The cause of at least certain discrepancies is that some of the state averages are not weighted but count all mines alike, regardless of size.

time, increases rather than diminishes. The diseased industry is thus carried by its own inertia into a condition which further aggravates the disease.

FIG. 4. DAILY FLUCTUATIONS IN PRODUCTION

Not only are there typical seasonal fluctuations in coal production, but there is also a typical fluctuation from day to day during the week, which prevails throughout periods of active demand and is determined by the car supply. The diagram shows the number of cars loaded on each day of the week along the Pennsylvania Lines West, May 20, 1918, to May 3, 1919, excluding holiday weeks. The total number of cars loaded was 472,235.

The fact seems established that there are periodic though irregular fluctuations in working time, resulting first from general business depressions, and second from simple inequalities of growth during periods of unbroken general prosperity. It remains to attempt an estimate of the magnitude of these causes in restricting working time.

It is noteworthy that with two exceptions none of the annual periods of time lost, as shown by the diagram, has been shorter than 74 days during the 30 years covered by the record. The exceptions were the war years, 1917 and 1918, which must be excluded as abnormal. It is also noteworthy that there is a certain regularity about the heights of the columns during the prosperous years. A value of 74-78 occurs seven times, and a value of 82-83 occurs three times. These values point significantly to a figure around 78 or 80 days as the measure of the minimum loss which no ordinary increase in general prosperity is likely to remove. Is not the conclusion justified, then, that losses above this figure are the measure of the effects of annual fluctuations, and that losses below this figure are attributable to some other cause? Expressing the idea another way: if we imagine all the columns beheaded at the 78-day line, the sum of

the cut-off ends would be the measure of the loss caused by annual fluctuations and the truncated stumps below the 78-day line would be the measure of losses due to other causes and these may be called the seasonal and daily losses.

This division of lost time means, then, that out of the average loss of 93 days a year, 16 days were due to extraordinary annual fluctuations in demand, chiefly fluctuations following business depression. This amount of annual as distinct from seasonal fluctuation is not confined to the coal industry, and no help can be found for it short of doing away with business cycles of good and bad years.

There remains, however, that residue of lost time from which no normal year is free. This as yet irreducible residue, as already noted, is from 76 to 80 days, and light on its causes must be sought in the study of seasonal fluctuations in the daily rate of production of bituminous coal, by months, from 1913 to 1919, shown in Fig. 2. For convenience the average for each year is shown as a horizontal line. The general trend may be read by comparing the height of these average lines, and this trend, with its sags in 1914-1915 and 1919, is an example of the annual fluctuations which depend on changes in general business conditions. Superimposed upon this big cycle are a set of smaller fluctuations determined by the seasons. For the pre-war years 1913-

FIG. 5. SEASONAL FLUCTUATIONS IN SOFT-COAL SHIPMENTS, 1910-1918

The movement out of the Northern Appalachian region is here illustrated by shipments on certain carriers. Although demand in this region is steadied during the summer by shipments to the Lakos, it has a decided seasonal rhythm. In normal years the market sags in April and thereafter rises gradually to a peak in October, November and December. Another peak of forced production occurs in March of the even years, reflecting apprehension of purchasers over the outcome of the biennial wage negotiations.

FIG. 6. SEASONAL FLUCTUATIONS IN SOFT-COAL SHIPMENTS, 1910-1918

Movement out of the Middle Appalachian region is here illustrated by shipments on certain carriers. As the region is largely non-union the monthly shipments do not show the rugged March peak and profound April sag characteristic of union fields in the years of the biennial wage negotiations. Demand is steadied by the relatively constant movement to tide for export overseas. The typical curve of demand for the region rises from a low in December, January, and February, to a rounded high in May to October. The locus of the high is determined by the tidewater shipments to New England and the heavy movement to the Lakes.

1916 the seasonal movement is regular and exhibits the familiar summer slump in demand.

In 1917 the war demand obliterated the seasonal slump; the curve of monthly production zigzags now above, now below, the line of the annual average. The year 1918 shows a marked seasonal fluctuation, but in a direction contrary to the rule. Instead of declining from January to April, the curve of production rises without a serious break to a peak in July, August, and September and then falls. In that year the summer stretch of the curve was buoyed up by the extraordinary war demand and by the special measures taken by the Fuel and Railroad Administrations to improve the car supply. Further, the two extremities of the curve were depressed, in the first quarter of the year by bad weather and consequent transportation difficulties, and in the last quarter by the slackening demand. The year is interesting because it gives a type curve of maximum production. Our war experience showed that, given the necessary demand, it is physically possible to push the rate of coal production up during the summer even to a point much in excess of the maximum winter rate.

The 1919 curve is in part true to type, in part exceptional. It exhibits the spring

and summer depression, accentuated by the necessary readjustment of the business after the armistice. Its October peak was both hastened and steepened by the knowledge that a strike was threatening. The profound collapse of November-December was of course the effect of the great strike.

In order to study the seasonal fluctuations more easily Fig. 3 has been prepared, from which the annual fluctuations have been isolated and cast aside, leaving only the monthly changes. The two pre-war years 1913 and 1914 are typical. Each black column shows the rate of production per working day for the month represented, expressed as a percentage of the average for the year. Thus the figure 104, at the top of the column for January, 1913, means that the rate of production during that month was 4 per cent above the average for the year.

The greatest extremes shown in the diagram occurred in 1914, when the rate of production rose in March to 123 per cent and fell precipitately in April to 66 per cent. The high was thus nearly twice the low. In that year two influences were at work: the normal seasonal fluctuation was intensified and distorted by the biennial wage negotiations. The normal April slump was aggravated by strikes, in anticipation of which there had been a period of anxious buying in March. The

FIG. 7. SEASONAL FLUCTUATIONS IN THE DEMAND FOR ILLINOIS COAL, 1910-1918

Demand for Middle Western coal is here illustrated by the monthly production of Illinois. Middle Western producers are not benefited by the movement to the Lakes and to tide which steadied the demand for the Northern and Middle Appalachian coal. In consequence they have to meet a peak of forced demand from September to January, followed by a terrific depression from April to July. In the years of the biennial wage negotiations this April depression often plunges production to zero. It is then preceded by a month of feverish buying in March.

year may be taken as a somewhat exaggerated type of the fluctuation to be expected in an "even" year—the year of biennial wage adjustment. In one respect, however, 1914 was not typical. The autumn peak came in September and was followed, in the last quarter of the year, by a depression which marks the effect of the outbreak of the European war. In other years the peak was reached in November. In 1916 the peak measured 114, in 1913 it reached 115, and in 1915 the rush of Allied war orders carried it up to 124. The month of smallest production in each year was April. Except in 1914, when strikes carried it down to 66, this April low has been about 82.

The year 1913 may be accepted as a fair type of the odd year, when monthly variations represent seasonal fluctuations in demand only, uninfluenced by labor disturbances. In such a typical year the capacity required during the month of maximum demand will be from 35 to 40 per cent greater than in the month of minimum demand. In other words, a mine capacity and a labor force, if working full time, sufficient for November, would be employed in April only 70 to 75 per cent of the time; and as in actual practice the mines never attain 100 per cent, or full time, even in November, but under the very best conditions reach only 80 per cent, the time of employment which may in fact be expected during April is about 58 per cent.<sup>2</sup>

To put it another way: even in years of active demand the present inequalities in the summer and winter buying of coal render inevitable a long period in which the labor and capital engaged in the industry can not work more than 27 to 30 hr. out of a 48-hr. week. Let no one regard this as a condition to be accepted as the

<sup>2</sup>The rate in April, 1919, was only 50 per cent of full time, or 24 hr. out of a 48-hr. week. The highest percentage of full time ever averaged by the bituminous mines of the country for one week was 86.8, during July 7-13, 1918. The average for that month was 84.4 per cent. In September, 1918, an average of 84.9 per cent was reached. In November, 1917, however, when demand was intense but the zone system and other features of war-time control of distribution were not in force, the percentage averaged was only 75.3. It does not seem probable that with present transportation facilities the percentage of operation attained in November will be much in excess of 80.

FIG. 8. DAYS LOST PER YEAR—ANTHRACITE AND SEVEN BITUMINOUS REGIONS

Losses in working time vary greatly from one field to another. In this diagram anthracite and seven great groups of bituminous mines are compared. Each bar represents the number of idle days for the field and year in question. Sundays and holidays are not counted.

measure of working time necessary to meet demand. As a matter of fact the 30-hr. week is the spring ailment of the bituminous coal industry, not its cure.

In addition to the annual and seasonal fluctuations in production, a third set of variations is exemplified in Fig. 4. The railroad works seven days a week; the mines work six days. Over Sunday the carrier catches up in its work of placing cars, and in consequence the car

supply on Monday is by far the best of the week. As a result the miners work longest on Monday, but later in the week their hours of labor show a gradual decline, which is accentuated on Saturday by holiday absenteeism. Even if the mines should attain full time on Monday they could not under the circumstances expect to work more than 86 per cent of the time on Friday and 79 per cent on Saturday. But of course the Monday rate never, in practice gets up to 100 per cent, and the performance on the later days of the week is correspondingly defective.

The data on seasonal fluctuations so far presented apply to the country as a whole. The typical curve of production for the United States is in fact a composite of a large number of other curves, which differ widely from field to field.

FIG. 9. EFFECT OF IRREGULAR WORKING TIME UPON COSTS

This diagram, clipped from the Report of the Engineers' Committee of the United States Fuel Administration, is the first statistical analysis of the actual effect which interruptions of working time have upon costs. The diagram is based on the monthly records of 73 operators in the New River district of West Virginia, who produced 7,231,343 net tons of coal in 1917.

The particular cause of lost operating time here selected for analysis was car shortage. Other causes, such as mine disability or dull market, would doubtless have increased costs in the same manner. It is the interruption to operation, not the cause of the interruption, which raises costs.

The diagram shows quantitatively what everybody knew before in a qualitative way—that irregularity of operating time means higher costs per ton produced.

FIG. 10. RAILWAY REVENUE AND BITUMINOUS-COAL PRODUCTION

Railway operating revenues for Class I roads and large switching and terminal companies are represented by the dotted line; production of bituminous coal by the solid line. The monthly fluctuations of the two show a close correlation. The correlation is due partly to the influence of common causes affecting both, but very largely to the fact that soft coal contributes about one-fourth of the ton-miles carried and a sixth of the total freight revenue.

Improving the "load factor" for the coal mine would improve the railroad's "load factor" as well. It would furnish more equal employment for the one and a third billion dollars invested in coal cars.

Some of these differences are only matters of degree, the curves of some districts showing a more pronounced slump than those for others, but in still other cases the curves are unlike and the differences tend to neutralize one another and so to smooth out the composite graph.

Figs. 5, 6 and 7 give type curves for the northern and middle Appalachian regions and for the State of Illinois, and a comparison of these curves suggests how much more acute the problem of seasonal demand is in some districts than in others. Contrast for example, the great valleys and peaks of the Illinois curve (Fig. 7) with the even curve for mines along the Western Maryland Ry. (Fig. 5).

A further contrast distinguishes the union from the non-union fields. Illinois and much of that part of the northern Appalachian region covered by Fig. 5 show in the even years a profound drop in April, which marks the biennial wage negotiations. The slump is regularly preceded by a period of active buying, which often makes the March production the highest of the year. This effect is largely absent from the curves of the railroads of the middle Appalachian region (Fig. 6) which serve for the most part non-union mines.

Another notable fact is the manner in which the fluctuations for different regions tend to neutralize one another.

other. The Chesapeake & Ohio and Norfolk & Western curves, for example, seem to start upward in February and March, at the very season when the Illinois curve has begun its dive downward. To combine the two in the course of getting a composite curve for the country would yield a much flatter graph than either exhibits alone. The average for the country thus does not at all reveal the full extent of the disease from which the industry suffers. We have merely charted the average temperature of a number of patients in which the severe chill of one patient is offset by the high fever of another. This all-country curve seems discouraging enough but it in fact conceals much local trouble, and any remedy that is to better the operating conditions of both the miners and the owners must be applied in terms of local, not national fluctuations. To find this remedy further study of the district fluctuations is therefore essential.

The peculiar shape of the middle Appalachian curve is determined largely by the movement of coal to the Lakes for consumption in the Northwest. The Lake movement has as its limits April 15 and Dec. 1, and this necessarily exercises a wholesome influence on working time in Ohio, western Pennsylvania, West Virginia, and to some extent, eastern Kentucky.

The curve for Illinois (Fig. 7) illustrates seasonal fluctuation at its worst. During the "odd" years the demand in the slack month sinks to half what it reaches at the peak, and during the "even" years the production in April approaches zero. The causes of the summer slump are twofold. In the first place, the natural market

FIG. 11. THE CAUSES OF LOST TIME—WHEN DEMAND IS ACTIVE

The diagram summarizes operating conditions as reported weekly by bituminous producers in the United States from October, 1917, to the Armistice. Full time of 48 hours is represented for each week by an upright column. The black segment is the per cent of full time worked. The shaded segments represent per cent of full time shut down for specified causes.

The period covered was one of very active demand. No market, as a factor limiting production, affected the West only. It appears as a narrow lens, beginning in February, widening slightly in March and April, and contracting again to a mere slit through the summer months. A further softening of the western market began just before the Armistice.

Losses due to labor were generally small, seldom exceeding 4 or 5 per cent. Larger losses occurred in the following weeks: October 20, 1917—strikes in Illinois; December 29—Christmas; April 6, 1918—miners' holidays and Liberty Loan Day; June 1—Memorial Day, and July 6—Independence Day. The influenza epidemic accounts for the broadening of the labor zone in October and November, 1918.

The limiting factor over the period as a whole is revealed in the broad zone of car shortage and other transportation disability.

The record for the period was attained in the week ended July 13, 1918, when the mines worked 86.8 per cent of full time. On the basis of a 48-hour week this was an average of 41.6 hours.

FIG. 12. THE CAUSES OF LOST TIME—WHEN DEMAND IS SLACK

The diagram summarizes operating conditions reported weekly by bituminous producers from the Armistice to January 24, 1920. The outstanding features of the period were the pronounced slump in demand which followed the war and the great strike. Transportation disability did not assume significant proportions until August, 1919. Since then, except for the strike period, it has been the dominant factor limiting production.

for Illinois coals, as limited by transportation costs, is one in which domestic consumers rely largely on bituminous coal, and of all classes of demand that of domestic consumers fluctuates most with the seasons. Into that market, unfortunately, the steadying effects of the Lake and New England movements and of overseas exports do not enter. In the second place, the nature of Illinois coals places them at a disadvantage in competing even within this, their natural market. They do not store easily, and up to the present time they have not found favor with coke makers and therefore do not feel the steadying influence of the demand for coke.

Any industry that offers its labor and its capital an employment as irregular as that expressed by the Illinois curve is laboring under a great handicap. And yet the Illinois curve is roughly typical of the production for the whole Mississippi Valley region, from Indiana to Iowa and south to Arkansas. Some 175,000 miners and 28 per cent of the mine capacity of the country operate under a curve of this type.

The statement of lost time by districts further emphasizes this regional variation. Fig. 8 shows the averages for the seven grand subdivisions of the bituminous fields, to which is added, for comparison, the anthracite region of Pennsylvania. The figures given represent the real losses of potential working time, each day lost meaning a cut in the actual productive capacity of both mine and miner.

It is perhaps significant that there is a rough relation between the loss of working time and the degree of unionization. Those bituminous regions in which interruptions to operation are most pronounced show a tendency to become union territory. The presence of the union is both cause and effect. Wage disputes cause lost time; but, on the other hand, irregular employment

is in itself a prime incentive to unionization.

During the seven years shown in the diagram each of the bituminous regions has lost more time than the anthracite country. By regions the 7-year average has been as follows, arranged in order of time idle:

Region	Days Worked	Days Idle
Anthracite	260	48
Southern Appalachian	248	60
Northern Appalachian	247	61
Southern Rocky Mountain	242	66
Middle Appalachian	225	83
Northwestern	223	85
Iowa to Texas	201	104
Central competitive field	199	109

The fact of irregularity in working time is thus indisputable, and its extent is shown to be everywhere great, while everywhere it reacts unfavorably upon all

FIG. 13. STRIKES IN BITUMINOUS AND ANTHRACITE MINES, 1910-1918

This shows the average for all bituminous and all anthracite mines in the United States during the nine years, 1910-1918. Days idle include strikes. Ten and seven-tenths per cent of the time lost in anthracite mining was due to strikes, and 10.6 per cent in bituminous mining.

who have a share in producing soft coal and all who have a share in consuming it. Its injurious effect is perhaps most evident on the welfare of the miner. To him it means a direct and immediate loss of wages. In long periods of idleness following a business depression it drives him to seek employment elsewhere, in other industries, as was shown in Fig. 1. The fact that we find the same large labor turnover and the tendency to migration in other industries should not blind us to the fact that these are causes as well as symptoms of industrial unrest. The question may even be raised whether irregular employment is not largely responsible for the failure of coal miners to take full advantage of

on—not only interest charges and salaries, but a host of maintenance charges as well. And in the end the coal consumer pays the bill for the idleness of both miner and mine.

In this connection we may find instruction in an exceedingly valuable study made by Messrs. Garnsey, Allport, and Norris of the costs of production as affected by interruptions of working time. Fig. 9 is taken from their "Report of the Engineers' Committee of the U. S. Fuel Administration, 1918-19." It represents an analysis of the monthly records of 73 operators in the New River district of West Virginia. The diagram shows that there is a mathematical relation between cost of production per ton and decrease in working time. The special cause of irregular working time selected for analysis was car shortage, but any other cause of loss would presumably have affected in the same way the cost per ton. The reason for the increased cost per unit of output is, of course, that the smaller the number of tons produced the larger the share of the fixed overhead expenses which must be borne by each ton. Francis S. Peabody, testifying before the Frelinghuysen committee on Sept. 4, 1919, stated that "the earnings of the laborer and the cost of coal depend entirely upon continuous work. Our costs will vary from month to month, dependent upon the running time of our mines. There will be a variation of between 50 and 60 cents a ton from month to month, depending upon the number of hours the mines are idle."

The effects of fluctuation in coal production on our transportation system can readily be appreciated. The coal mine is the railroad's largest shipper, and the railroad in turn is the largest consumer of coal; in fact it has been remarked that coal is the nucleus around which our railroad system is built.

When the operator experiences a car shortage he is prone to blame the railroad for what he regards as a failure to meet its obligations. He does not realize, perhaps, that the railroad suffers from the seasonal fluctuations in coal production as well as the coal-mining industry, for in its business of selling transportation to the coal producer the railroad meets the same seasonal demand that the producer meets in selling coal to the retailer. An investment in coal-carrying equipment sufficient to transport all the coal that the mines can produce in November would in large part lie idle during the slack season of summer. The depreciation of a coal car standing idle on a siding is perhaps no less serious than the depreciation of the idle mine. When we remember that there are approximately 925,000 coal cars in the country, and that the capital invested in these cars is roughly one and a third billions,<sup>3</sup> we can visualize the cost to the railroads of a long period of car unemployment. If the mine owner has his car shortage, the railroad man has what might be called his "freight shortage." The capital investment in coal-carrying equipment alone is of the same order of magnitude as the capital investment in coal-mining, and it is no less desirable to provide constant employment for railroad capital than for mine capital.

The relation between the monthly volume of coal shipment and the corresponding level of railway earnings is shown in Fig. 10. The dotted line representing railway-operating revenue shows a seasonal periodicity that

<sup>3</sup>The railroad statistics here presented are in part estimated, and were employed after consultation with the Bureau of Railway Economics, Washington, D. C.

FIG. 14. TYPICAL CURVES OF MONTHLY BITUMINOUS CONSUMPTION

The above diagrams suggest the probable monthly consumption of soft coal by certain users during a year when the total production amounts to 550,000,000 net tons. They are presented as tentative and subject to sweeping revisions. Although much is known of the total annual consumption of coal by individual industries and by localities, very little is definite known as to how the annual total is distributed over the 12 months of the year. The Geological Survey offers these curves simply as a basis for discussion and as an example of a type of inquiry which it is believed will be of value and which the Survey hopes to pursue further.

The basis for the curves presented is briefly as follows:

**Railroads**—Monthly consumption records, Fuel Conservation Section, U. S. R.R. Administration, 1918-19.

**Electric utilities**—Studies of Division of Power Resources, U. S. G. S.

**Artificial gas plants**—Estimate, U. S. G. S.

**Coal-mine fuel**—2.2 per cent of monthly production.

**Coke**—Monthly fluctuations to correspond with seasonal (as opposed to annual) changes in pig-iron production during last 12 years.

**Export**—Average, 1913-17.

**Foreign bunker**—Average, 1913-19.

**Domestic fuel**—Total consumption to correspond with monthly domestic consumption of natural gas, as reported by two large northern companies.

The diagrams account for 72 per cent of the total consumption. The remaining 28 per cent is industrial consumption and its curve falls somewhere between the domestic type and the electric-power type.

Figures in scale represent millions of net tons

the opportunity to work when the mines are open. Regular employment breeds regular habits and irregular employment breeds irregular habits.

The case of the miner against irregular operation has already been forcibly set before the public. What is not so generally realized is that the case of the operator is just as damaging to him. When his operation is shut down his capital is idle, and his mine equipment instead of benefiting by a rest, is rapidly depreciating. Although the mine shuts down, his fixed charges run

closely follows the peaks and valleys in the curve of bituminous coal production. The marked correspondence between the two curves is in part at least to be attributed to the effect of common causes at work upon both. But when it is remembered that coal is about one-third of the total tonnage carried by the railroads, and that about one-fifth of their total freight revenue is derived from it, the conclusion is unavoidable that seasonal fluctuations in coal production affect profoundly the earning power of the carriers.

A complete analysis of the effects of the irregular operation of the coal mines would include references to the coal dealers, both wholesale and retail, but the consumer is of course the one whose purse suffers most, for in the long run he pays for all the wasteful practices. He must support the miner for not only the 215 days that coal is coming from the mines but also for the 93 possible working days when the mines are closed.

The immediate causes of these seasonal fluctuations are car shortage, labor shortage, mine disability, and "no market." The varying values to be assigned to all these causes are shown in Figs. 11 and 12.

STRIKES ARE COMPARATIVELY UNIMPORTANT

The minor importance of strikes in affecting the amount of lost time is shown in Fig. 13. The average number of days lost by reason of strikes for the mines of the whole country, both anthracite and bituminous, during the 9 years 1910-1918, was less than 11 per cent of the whole time lost. This is not, of course, a measure of the losses incurred locally in certain years, but it shows that other causes have had wider and more persistent effect upon the working time of the mines.

Any statement of the extent and causes of the fluctuations in coal production lacks vision unless it at least faces the search for a remedy. The limits of the statistical summary permit only suggestions, and these, although not novel, are probably worth the attention of everyone who attacks the problem of stabilization. Plainly fluctuation in production expresses to some extent fluctuation in demand.

An attempt to study the degree to which different consumers affect the seasonal market yielded the group of consumption curves given in Fig. 14. The seasonal fluctuation in locomotive consumption is seen to be a factor, for the railroads consume 28 per cent of all soft coal mined. An even larger offender in degree is the domestic consumer, although the amount involved is much smaller. The general industrial user doubtless ranks next as a contributor to the seasonal fluctuations, but the public utilities present a much more even curve, and the curve for the iron industry is somewhat the same.<sup>1</sup> Fortunately, in the case of certain other consumers, such as the cement and clay-products industries, the summer coal consumption exceeds the winter and the effect on the general production curve is beneficial. Export and bunker trade and the Lake shipments likewise tend to smooth out the seasonal curve.

The line of attack for the betterment of seasonal demand therefore seems to be narrowed down to a few classes of consumers. The problem of improving the load factor for the coal mines thus becomes a problem of encouraging the summer buying of coal. Two meth-

<sup>1</sup>The curve for the iron industry represents only the average seasonal fluctuations for the last 12 years. The annual fluctuations caused by variations in general business activity have been isolated and cast aside. As the annual changes are far more pronounced, the seasonal changes are often obscured.

ods of solving this problem have been suggested: Seasonal discounts of the coal price and seasonal freight rates. Both methods seem economically sound and both will doubtless be fully discussed. Fig. 15 presents a comparison of lost time in the anthracite and bituminous mines since the summer discount was introduced for anthracite. It will be noted that the present advantage of the anthracite mines did not immediately follow the new system—the consumer has to be educated even to serve his own interests. A seasonal discount in freight rate seems wholly justified by the railroad's interest in its own load-factor; it too can afford to bid for summer traffic in preference to the more expensive winter haul.

But these or any other methods of increasing summer buying of soft coal cannot be considered apart from the question of storage; to what extent can storage be made practicable and to what extent can it be made attractive to the consumer, large or small?

FIG. 15. DAYS LOST IN ANTHRACITE MINING BEFORE AND AFTER THE INTRODUCTION OF SUMMER DISCOUNT

In 1902 the "companies" in the anthracite region inaugurated the policy of announcing a summer discount on domestic coal. A gradual reduction in time lost followed. In the diagram the black bars represent average number of days lost. The zigzag line shows the losses in bituminous mining over the same period.

The general interest of our whole nation in bettering the load factor of the soft coal industry is large. Irregular employment is both a loss in man-power and a cause of social unrest. Society can not view with equanimity the spectacle of an excess mine capacity of 150,000,000 to 200,000,000 tons, and an excess labor force of perhaps 150,000 men. We hear talk of the social cost of universal military training. The cost of the man-days of enforced idleness in bituminous mining, during an ordinary year, is as great as that which would be involved in giving the year's class of all the young men of the country three months' military training.

To stop this industrial leak, together with its attendant evils, is the task of the engineer.

# Conference Seeks to Cure All Mine Ills

Describing the Coal Industry as "One Which Functions Badly," the A.I.M.E. Boldly Accepts the Responsibility of Setting It Up on Its Uncertain Feet

BY R. DAWSON HALL

**P**ERHAPS few sessions of the American Institute of Mining and Metallurgical Engineers have been more full of interest and instruction, or more generally attended, than those which were held in the auditorium of the Engineering Societies Building on Feb. 17 and 18.

It is hoped by Herbert C. Hoover, the president of the American Institute of Mining and Metallurgical Engineers, that as an outcome of the movement started by this discussion of the situation by engineers the stabilization of the coal-mining industry may be effected and so be a source of prosperity to the country and of increased welfare to the workingman.

Mr. Hoover declared that the coal industry was a trade which was "functioning badly." That may well be admitted. But it is only natural for the coal-mining interests of all kinds to question whether the other mining interests are functioning any better.

The gold mines are, if we may use the expression, "shot to pieces" by the price at which gold is exchangeable for goods and services. The copper industry has been working extremely short time. It is a grave question whether the mineral industry as a whole has passed through the past year as successfully as has the coal industry from the point of view of the regularity of employment on the part of the workingman. However, there is little question that any investigation which may be made at the instance of Mr. Hoover of the American Institute of Mining and Metallurgical Engineers

will be of a sympathetic and helpful character.

When some institution like the A.I.M.E. is preparing to do the industry a favor I suppose the industry should not be too careful to see from whom the gift comes, or to deny that it is a gift, just simply because the persons who tender it are in need of like help themselves. There is no question but that the metal industry in general needs to look into its situation as carefully as it does into the status of the coal industry. We may look confidently to a time when it will be the duty and privilege of the coal-mining industry to show the copper, zinc, lead, gold, silver and precious metals, and other like industries, how they can best arrange their affairs so as to keep their equipment busy and their miners steadily at work.

One cannot but feel that the trouble in the coal industry arose from two sources (1) the scarcity of demand for coal and for the work of the miner during the early months in the year, and (2) the plentitude of demand for coal and for the labor of the miner during the final

months of the year. Men do not complain until they see that economic conditions are such that it is perfectly safe for them to rebel.

In the metal industry there is such a small demand for the minerals which are now being produced that the metal miners are perforce obliged to be satisfied, but just as soon as there is a shortage of product in comparison with the amount used, we shall find that the metal miners can make as much complaint as anybody about the shortness of time which was vouchsafed to them in the year 1919. Then we shall learn that the metal industry is functioning badly.

H. C. Hoover opened the meeting on Tuesday, Feb. 17, at 2 p.m., with Horace C. Winchell presiding. He outlined the needs of the industry in a broad way, being followed by Van H. Manning, who made an address under the title of "Problems of the Coal Industry." His address appears in this week's issue. This was followed by a presentation of the fluctuations in coal production, their extent and causes, delivered by George Otis Smith and prepared by him in collaboration with F. G. Tryon. As this is also a matter of record in another part of this issue, it is entirely unnecessary to make any reference to it here. Sidney J. Jennings, a past president of the American Institute of Mining and Metallurgical Engineers and president of the United States Smelting & Refining Co., while not taking issue openly with Mr. Smith on the question of the excess of mine labor

**Functioning badly is a common fault of all industry, in which the coal business is only one of many partakers. And the metal industry is just now functioning even less acceptably than the coal trade. However, there are some ills that need correcting. The fact that they are somewhat common does not mean that they should be accepted without attempt at redress. A suggestion that Mongol labor would rectify the problem did not meet with a single expression of approval. It would probably be as unfortunate here as in other countries where cheap labor has peonized the Anglo-Saxon mine worker.**

in the United States at the present time, stated that during the war he was much troubled with the fact that at many of his mines most of the coal was mined by foreigners who belonged to 27 different nations and spoke 8 different languages. What was worse, many of them were enemy aliens. In consequence he had expected that there would be much difficulty in providing the mines with a sufficient and willing labor force.

He stated that there was difficulty in getting men to supply the increased tonnage which was demanded year by year, and he suggested that, in China, men could be obtained who would do the rough work of mining. He stated that during the war he had offers from representatives of the Chinese in this country who volunteered to provide men should the Government permit their introduction. He mentioned the success with which the Chinese had been brought into the mines of South Africa for a limited period of time, the understanding being that they were to stay not less than three years and not more than six. He thought that

the arrangement which was made in the Transvaal might be one which the United States could advantageously follow.

While Mr. Thacher succeeded Mr. Jennings, perhaps it would be well to delay comment on his remarks, to state that Mr. Hoover protested against the introduction of Chinese into this country under any contract or no contract. He said it was impossible to mix the yellow race with the white, and that the question was not one of economics but one of real national existence.

In Natal Asiatics had been brought in, and as a result there are now three classes—a sort of patrician class, an Asiatic class and persons who might best be described as "white trash." There was no question but that it had caused stratification of the people of the Province of Natal, creating a patrician class and a body of citizens whose misfortunes and standing were of the character which branded them as "peons."

#### METAL MINE WORKER MAKES 10-TON DAY

Arthur Thacher of St. Louis, Mo., who operates zinc and lead mines in Wisconsin, stated that the coal mines in Illinois were producing only about four tons per man, whereas the zinc mines in Wisconsin were producing ten tons per man per shift. He stated that this was due to the lack of co-operation between the coal miners and their employers, and stated that though coal was twice as bulky as ore the miners could, if they wished, produce much more coal per day.

He stated that in certain districts where the union did not have the authority that it had in the more important mining sections, the miners would put out about 20 tons per man per day. In those sections of the country each man did the best he could, but in others they limited their production so as to have an excuse for raising the rate of pay. He added that in his zinc mines he had a man 53 years old. Asking him how much he had loaded, he was informed that he had placed in the cars that day 75 tons. He had done as much the day before, and his neighbor had loaded 100 to 110 tons, 112 tons being his highest record. One man in one year loaded 15,000 tons.

George Otis Smith stated that the Asiatics in South Africa loaded 15 tons in 25 days, and that in view of such a record as that he thought that there would be very little advantage in the introduction of Asiatic labor. Asiatics do not seem to have the capacity which is to be obtained from workingmen such as North America and Europe will provide.

#### ARGUES THAT LOWER TONNAGE IS JUSTIFIED

Edwin Ludlow, consulting engineer of New York City, was of the opinion that a lower production should be expected of coal loaders than of metal muckers. He stated that much of the coal in the Illinois region was cut a few inches above the bottom in order to avoid impurities which were found in the base of the bed. As a result, the miner had hard shoveling and not a smooth surface on which to work. For this reason, Mr. Ludlow said, the output was obtained with greater difficulty than would otherwise be the case.

He said that it should be remembered, when a tonnage of about four tons per man was figured, that it was based on the whole labor force of the mine and the whole tonnage resulting therefrom. Consequently the tonnage per man was a unit not of coal extraction or coal loading, but a unit of output, in which the

numerator is the whole output of the mine and the divisor the number of employees of every kind employed therein.

He stated that the real difficulty which confronted the coal industry was the large number of "officers," or would-be "officers," around the mining regions. The mining army was one which lacked persons who were willing to serve as "privates" and perform the actual labor at the coal face. This difficulty was growing, especially in view of the fact that so many of the men who had hitherto done the rough work at the face were now taking boat, or had already taken boat, to Europe.

#### DECLARES COAL MINING A SELECTIVE PROCESS

Edwin M. Chance stated that coal mining was in many ways different from the mining of ore of the type described by Mr. Thacher. He said that the mining of coal was largely a selective process, and in consequence it was necessary in many cases to employ a large number of men on the picking table, or to require the miner himself to make the most careful selection of the coal fit for market. There is considerable difference between the undercutting and careful shooting of coal followed by its careful preparation from a system in which the material is all shot down without any care and then loaded in bulk into the cars, the separation of the ore and gangue being regarded merely as a mill process.

R. V. Norris declared that low production per man arose to a certain extent from the number of farmer mines and high-cost mines of other descriptions. He stated that in every district there were five to fifteen per cent. of the operations which were of such a character that they should not be operating. These mines not only reduced the production per man but tended to decrease the record number of the days worked in the year, because such mines were operated by farmers and by men who only worked in the mines when high prices for coal were paid.

#### RICE DEFENDS LOW EUROPEAN COAL TONNAGES

George S. Rice declared that the figures which were given as averages of the regular days in the mines of any state were simply averages, as the word indeed implied. Many railroad mines and mines connected with steel mills worked much more steadily than "custom mines," while those collieries that depended on trade in general were idle. Much of the hard feeling which had existed resulted from the fact that one mine might be working with a comparative degree of steadiness, while another one a mile or so away might find it extremely hard to get in one day or two days a week.

He declared that here in the United States we should not take too much credit to ourselves because our tonnage was so much larger per man. It must be remembered that in Europe the mines were of greater depth and had often extremely bad roofs. Furthermore, it must be remembered that in many countries it was practically obligatory to fill in the measure with hydraulic or other filling as fast as the coal was removed. Thus, he said, there was a double operation—the removal of the coal and its replacement with filling. He might also have said that there was a treble operation, because the filling itself has to be extracted in the first instance. He called attention to the fact that much of this filling material had to be carried quite a long way on the railroad. All these things, he said, prevented the European countries from getting out as

much coal per man as was obtained in the United States.

Mr. Hudson remarked that 40 per cent. of the operators were "economic mistakes" and should not be in the business of producing coal, because they had not the knowledge or the equipment to produce it cheaply. He stated that this 40 per cent produced about 20 per cent of the coal on the market and had a great deal to do with the fact that the mining of coal as an industry was not as profitable as it ought to be. His remarks closed the first session of the conference on the stabilization of the coal-mining industry.

On the morning of Wednesday, with Edwin Ludlow presiding, Prof. H. H. Stock read an interesting paper on Coal Shortage with lantern slides to illustrate his subject. He quoted Abram S. Hewitt to show how irregular work at an early date made severe difficulties for the coal industry. Mr. Hewitt was president in 1876, but his presidential address seemed as true to today's conditions as to those he was describing at that distant date. He quoted the experience of the Commonwealth Edison Co., which had kept coal in continuous storage for 10 years without the coal once firing.

#### SHOULD WE VENTILATE COAL STORAGE PILES?

He spoke against the ventilation of coal piles unless the ventilation was made adequate to keep the air cool despite the rapidity of oxidation, which such aeration causes. He stated that Canada had been successful in providing such ventilation without evil result. Pipes were put at 4 ft. centers, instead of as far apart as was customary in United States storage piles. However, Mr. Stock added, Canada has the advantages of a colder climate, and the less torrid summer of that country did not subject the coal to so severe a firing test.

The cost of storage, he said, ran between 2½c. and \$1.50 a ton. These were, however, quite exceptional limits. With moderately good mechanical equipment the cost ran between 10c. and 50c. or 60c. per ton. These figures covered only the cost of labor and supplies. Depreciation of the equipment and coal, the spoiling of the coal by mixture with impurities scooped up with the stored material when the bottom was reached, and the cost of the use of the land on which the coal was stored were not included in any such storage charges. A common rule was to estimate 10c. for putting coal into storage and 10c. for taking it out, but the increased cost of every form of service makes it necessary to revise these figures upward.

#### WATER WILL QUENCH FIRE IF IT PENETRATES

He stated that coal could readily be quenched with water, if only enough of it were used and if it were compelled to enter the coal piles and not allowed to run off without doing its work. Coal which heats gives off a tarry material which causes the fuel to be bound together in such a manner that the water sprinkled on it by sprays runs down on the outside of the heated area and drains onto the ground around without having performed its intended work.

Ralph Bradley, of the Boston & Maine R. R., said that New England always stored large quantities of coal, because it knew that it must store fuel or do without. The B. & M. uses 5,000 tons a day during the summer and 6,000 tons a day during the winter. It stores 400,000 tons of coal in the summer where richer roads that are near the mines have, instead of over two

months' supply, only enough for the needs of four or five days. It seemed unfair to him that during the month of November when the strike was going on, his road was allowed no coal at all because it was possessed of so large a stock on hand. There is no reward given to those who lay out their money if the infrugal are to be allowed, when trouble comes, to protect themselves by confiscation.

#### NEW ENGLAND AND NORTHWEST STABILIZE TRADE

There are, he added, two areas in the United States where preparation to meet the winter needs is provided. These areas are the Northeast (New England) and the Northwest. He advocated that the practice of having the individual coal user store his own coal was expensive both in the use of land and in the installation of storing equipment. He declared that the small consumer dumped coal from the hopper onto the ground and had it laboriously shoveled by hand into a motor truck wasting not only labor but also unnecessarily holding up the equipment of the railroad and of the consumer.

Hence he advocated the creation of central storage plants in control of producers, wholesalers and consumers, capable of storing, on expensive land, large quantities of coal and equipped so as to put the fuel into storage and remove it therefrom with a minimum of expense.

Mr. Bradley's experience convinced him that there was just as much risk of firing when the coal was stored under cover as when it was not provided with any protection. He informed his hearers that he had stored the coal from the Clinch Valley for several months, in piles 30 ft. high, and had never had the least trouble.

#### ROADMASTER, NOT KNOWING BETTER, IS TO BLAME

Eugene McAuliffe said that his experience had been that when a president of a railroad decided to store coal against a shortage, he gave orders which passed rapidly down the line and the road master or wrecking master finally found the matter left wholly in his hands and piled the coal so that its dumping and reclaiming would give him a minimum of trouble. No care was taken to prevent the spontaneous ignition of the material, for the worthies who stored it had never made that subject a matter of a moment's consideration.

He declared that though there was a certain loss in storage from theft he never failed to get more cars of fuel out of the pile than he put in, because so much soil was mingled with the coal. This remark was given utterance, because Mr. Stoek had stated that in one case the coal instead of being laid on prepared land was actually dumped on the rough surface of a plowed field.

In relation to the notion that the proper place to store coal was at the mines he stated that he was manager of a mine in Illinois (Kathleen), and that last week his men had only 17½ hr. work, owing to the defective car supply. "How," said he, "would my mine workers like to divide up cars with a storage pile that had been accumulated in the summer? Surely," he said "they would want all the cars they could get to make the conditions under which they labored bearable."

S. L. Yerkes' paper followed. The reader will not be satisfied to receive it in inadequate synopsis. He will want it in full and it will be so published. Mr. Yerkes

said that it was a commentary on conditions that at one time there were 250,000 cars idle and in 8 months that condition had been changed to one where there was a shortage of 75,000 cars. According to A. Gutheim, who spoke shortly thereafter, the first period was in February and March and the second in August. Mr. Yerkes said that 20,000 locomotives were needed and 600,000 freight cars.

H. M. Chance declared that he did not see how an increased car supply, a larger locomotive equipment or better service in the transportation department would rectify a fundamentally unsound condition in the coal industry. There were too many mines with too large a capacity manned by too many men. Even if the transportation difficulties were all solved there was not in the market demand and place for such a large tonnage of coal as the mines could readily produce. A. Gutheim of the Central Coal Committee made a long extempore address, which if specious was nevertheless interesting and illuminating. He showed that it was necessary to give the railroads the assigned car privilege, or else, what was less desirable, the right to confiscate, for that was the only way for the railroads to get coal during a period of coal shortage. When the turmoil of a coal shortage harassed an unhappy country, only by assigning coal to be loaded for specific purposes could the railroad and other public utilities be assured of getting fuel of the quantity and quality desired.

All of which is well and good, but why should a nation be pushed to such straits that it must take these high-handed methods of procuring coal when through the greater part of the year the mine operators are clamoring for orders and the mine workers restlessly waiting for an opportunity to work? The railroads and the utilities should not allow themselves to be faced with a contingency which makes it necessary to lay aside those righteous laws by which in the happier past our country was governed.

He admitted that on some roads, as Mr. Yerkes had stated, there were no cars obtainable but "assigned" cars. The consumer who had made contracts with the mine owners had no rights that the utilities were obliged to respect. He declared that when confiscation was resorted to, the cars had practically to be taken from the front end of the train; the draft was therefore neither uniform nor equitable. Sometimes the most needy consumers failed to receive their supply; sometimes high-grade coal was used for low-grade uses. The assigned-car system was the better plan. Perhaps that is so; between one form of unrighteous act and another there may be a degree of difference, but all are alike improper, and Mr. Gutheim, faced with a condition of the railroad's own making, urged the right of the railroad to take the necessary means to meet the situation. Thus may the farmer who has no wheat because he has failed to plant justify himself in an invasion of his neighbor's granary.

Mr. Gutheim declared that before 1917 sporadic short-

ages of cars, which were of short duration, occasionally occurred. They were largely due, in his opinion, to the slow movement of cars that naturally resulted from the rigors of severe winters, rather than to any real lack of equipment on the part of the railroads.

C. Andrade, Jr., treasurer of the Matlack Coal & Iron Corporation, declared that the coal-export business would stabilize the coal trade. He urged that storage of coal would mean the tying up of large quantities of capital and that would be uneconomical. A rapid turnover was what was wanted. He said that coal would have been stored in quantity had the practice been economically sound.

In opposition to what Mr. Andrade stated, it may be said that unfortunately the loss from idle men is greater than the loss from idle capital, and furthermore if the coal mines are to be equipped to meet in a few months the needs of the whole year there will be a greater economic loss than would result from a liberal amount of storage. Mr. Andrade well said that unless Europe gets coal to set her factories in operation, exchange cannot be brought up to par value, and the present crisis in Europe cannot be mended.

Mr. McAuliffe said that the practice he had followed in buying coal for the railroad had been, not to contract to purchase of any one firm any more coal than

it could supply at times when the car supply is at a minimum. In this way he had avoided much friction and had made a more general disposition of orders.

In the afternoon session, Eugene McAuliffe read his paper on the "Stabilizing of the Market," in which he presented the advantages of freight-rate differentials. He stated that at some of the small coal mines, worked during the stress of the war, the coal delivered to the cars contained as much as 50 per cent ash. The methods of loading were such that some cars were held 12 days before their loading was completed.

It was brought out, if not by him, by some one else who was present, that car shortage resulted in high prices, and high prices in the entrance of the high-cost mines with poor facilities into the business. These mines by their inefficient arrangements made the car shortage greater and did not better the situation at all. As soon as the stringency ended the high-cost mines closed down. Thus the railroads from having inadequate equipment came suddenly into a period when cars were idle.

He remarked that just before the strike one mine lost 25.6 per cent. of the time of its men owing to absenteeism. Yet these men faced a long shut down. It is impossible, he said, to get the men to work regularly. Speaking about the high cost of coal, he said that jobbers with a "shoestring" capital spring up whenever there is a coal shortage and go around peddling coal. He had himself signed vouchers to such gentry of \$1 per ton delivered. The coal industry needed relief from men of this kind.

(To be concluded.)

**Railroad stagnation rapidly changes to a severe railroad shortage. Yerkes advocates larger equipment, but Chance declares trouble is more immediate and fundamental—an excess of both men and mines in the coal industry. Gutheim defends commandeering and assigning of railroad cars, while Andrade says storage of coal is generally economically unsound or it, surely, would be more general. McAuliffe covers many industrial ills in presenting his freight-rate differential plan.**

## Sulphur Percentage and Fuel Ratios

IT WILL be a surprise to many to learn that the fuel ratios vary quite largely in the coals of the State of Illinois, that the result of dividing fixed-carbon content by volatile-matter content is about 1.5 in Jackson County and only about 1.0 in the Rock Island and Mercer coal field and that the thermal units in Jackson County are 12,488 on the British, or Fahrenheit, standard and only 10,514 in the Springfield-Peoria district, Bed No. 5.

It must be remembered that Illinois though level for the most part is not by any means a State which has not had its period of catclysms. In the Saline field may be found dykes, faults of 160 ft. throw, and dislocations of less dimension and in the La Salle field tiltings around 45 deg. By no means has all been peaceable and orderly. So much is covered by horizontal measures of later date, glacial drift among other, that it is hard to believe that there was a time when Illinois had severe earthquakes, faulting and lava flows, small of course but existent nevertheless. Such disturbances might explain the variation in the "greenness" of the coal. Some coals apparently have been artificially "aged," and some have merely matured without being toasted by heat.

An interesting table has been calculated from a diagrammatic tabulation contained in "Coal Resources of District V" by Gilbert H. Cady in the well-known series of "Illinois Mining Investigations," the analyses being taken from some 313 tests made by J. M. Lindgren. The figures show, or seem to show, like the figures which investigation develops in the more Eastern States, that there is a relation existing between sulphur content and fuel ratio, the sulphur declining as the fuel ratio increases. The table follows:

Region	Seam No.	Sulphur	Fuel Ratio	B.t.u.	Moisture
Jackson County.....	2	1.29	1.5015	12,488	9.28
Williamson & Franklin.....	6	1.53	1.4141	11,825	9.21
Saline County.....	5	2.92	1.3728	12,276	6.75

The fields are arranged in the order of decreasing fuel ratio, and it will be observed that the sulphur can only be said to increase, in general, with the decrease in that ratio. One hesitates to deduce from such a showing that the ripening of the coal reduces the sulphur content, for look at the Danville No. 7 and the La Salle coals, but remembering that different seams are likely to have different originating flora and therefore different sulphur percentages and that the sulphur content varies from place to place with the same seam, the figures are quite suggestive and add their little mite to the generous confirmation shown in other States. Low sulphur and low volatile tend to occur in the same analysis. Has not anthracite, the lowest volatile constituents and is it not remarkably free from sulphur?

The facts seem to suggest that heat readily drives off that part of the sulphur which is in organic form or that, in ageing, the organic compounds break up and secondary sulphur compounds are liberated. Especially does it appear that this action is more marked when the maturing is rapid than when it is slow.

The organic sulphur may in part be extremely stable but indications are that some of it is not any too strongly held. The action of the loosely combined sulphur is worthy of study as it may be a cause of spontaneous combustion through combination with iron aided by the heat of dissociation from the combinations in which it is found. The study of organic sulphur in coal is still in its infancy and it will be a fruitful field for the investigator for years to come.

## Did the Stabilization Conference Settle Anything?

SO MANY branches of a difficult subject were taken up by the conference on the Stabilization of the Coal Industry that it could not be expected to arrive at the basis of any of them. The only enlightening suggestion was one associated in the public mind with Mr. McAuliffe and that suggestion is not exactly new. Differential freight rates were advocated in *Coal Age* on Dec. 2, 1916, in an editorial entitled "Do Your Christmas Shopping Early," and this admonition was made the subject of some remarks by the same author at a meeting of the Coal Mining Institute of America in the same winter.

To quote the editorial: "The railroads themselves should help to smooth the seasonal irregularities. Why, when freight rates are raised, which is sure to happen soon, could not they arrange to put all that increase on the winter service? The railroads would surely gain immensely by regularity of operation, which would enable them to keep their equipment in continued profitable operation and their employees steadily at work. It would also increase their traffic at the one period of the year, when it is conducted at least cost and with least loss."

At a recent conference of the public utilities which use the public streets for their services comes the statement that storage does not pay, that the companies could store more if an inducement were afforded. It may well be conceded that storage must be made to pay if it is to be practiced extensively, and in such measure as to steady the industry, but there seems such a determination to keep coal prices and freight rates down in the winter to a level that will give a bare subsistence that there seems no hope of putting summer rates any lower. Winter rates must be made sufficiently generous as to permit of their safe reduction in the summer. This is true whether the coal industry or the railroads furnish the required differential.

Coal operators cannot be expected to run approximately nine months at either a loss or without a profit, and then be allowed to make only a 6 per cent. per annum return for the short space of three months, which would be an average of only 1½ per cent per annum, even if the summer trade were conducted without profit or loss.

Public utilities may be, and in fact are, near bankruptcy, but their necessities should not be cured by oppression of other utilities any more than of the laboring men who serve them. Their correct means of redress is by fair rates. They will gain nothing by blackening the fair repute of the coal producer or the railroads, which

are victims with them of a perverted public sentiment. Recriminations between the servitors of the people will only result in the public having a contempt for all alike and an exalted opinion of those who conduct their business without recrimination, but with great profit—to wit, the non-utility classes of industry.

### Dangers of Regulatory Bodies

AT THE meeting of the American Institute of Mining and Metallurgical Engineers, George S. Rice proposed that some syndicate method of providing for the doing away of cut-throat competition—which made the conservation and other important provisions impossible—be adopted and that a commission be appointed to regulate prices in the interests of the public and to prevent the opening of mines which were not needed for the current consumption. He declared that in his belief such a commission would be as fair as was the Fuel Administration after the first few months of its existence.

It is true that this Administration during much of the war was fair to the bituminous coal industry but, by its own admission, it was not fair to the anthracite operators, and it cannot be said that its decision regarding the strike was equitable and such as to make any coal operators anxious to revive in peace its war-time activities. It is a fact that every regulative body starts in with a fairly good record. Prices are high when it starts its operation; that is why it is called into being. The Fuel Administration had it arrived a little earlier and established the Pea-body-Lane scale of prices would have been hailed as a deliverer, and yet the profits of the coal men would have been quite a little better than merely satisfactory. But after the prices are fixed, trouble quite usually begins. The regulatory body feels it would be quite a shock to the public if it made any increase in prices owing to increased wage or material costs, or to additional expense due either to changed working conditions or to new regulations made for the purpose of securing conservation, safety or health.

As a result the regulatory board becomes readily a repressive body. Pressed by the public it fears to make an unpopular decision. It seeks to excuse itself by imagining that a profit can be made in the business should

there be sufficient business activity to reduce overhead, and, if a loss results or there is a failure to duly profit, then the hope is that the times were so abnormal that no unfavorable deductions may fitly be drawn from that highly inconvenient fact.

That most benignant of bodies, the Federal Trade Commission of the Hurley days, did not have regulation but investigation as its aim. It did not have the same occasion as the Interstate Commerce Commission, the Fuel Administration and local public-service commissions to become inimical to honorable business endeavor but nevertheless it took the same course, which shows that there is a dual influence at work—a desire to keep down the cost of living, no matter at what price and a general disposition to demand the profitless operation of all utilities.

With a commission having its life extended through the years, there is always a risk that it will reach a time when unfair influences prevail, and then we shall hear the cry, as we have with the railroads, that there is such a great difference already created between present rates and fair profits that it is obvious that the needed rectification of rates cannot be made without injury to the public welfare. Just now comes an opportunity to an old established regulatory body to support the reputation of all such institutions by just and considerate action. The Interstate Commerce Commission has laid on it the work of fixing freight rates for the railroads on such a level as will make it possible for them to do business and make a 6 per cent return. Will they do it or will they flounder with half measures as has Mr. Hines in his conduct of the Railroad Administration? Herbert C.

Hoover well said that any excessive generosity to the railroads might create a revulsion in favor of Government ownership in some new form. But there are intermediate measures that can well be taken. The railroads have been well spanked and put to bed for the Hamilton and Dayton and like offenses, so there is no advantage in spoiling the meals of the railroads by serving up such unpleasant recollections whenever they sit to meat.

Let the Interstate Commerce Commission, if it makes a mistake, make it in the direction of too high a rate instead of one too low. As the returns to the railroads are limited, there will be no loss to the public, and the screws may be brought down later if the public desires.

# NEWS FROM THE CAPITOL

BY PAUL

WOOTON

## Senate Orders Hines To Make Complete Report of Coal Stewardship

In the Senate of the United States, on Feb. 10, Mr. Frelinghuysen submitted a resolution; which was considered and agreed to and reads in part as follows:

*Resolved*, That the Director-General of Railroads is hereby directed to report to the Senate as soon as practicable:

The extent of the authority, powers, and duties with respect to the shipment, distribution, apportionment, or storage of coal or coke, which were originally delegated to the Fuel Administration under an act entitled "An act to provide further for the national security and defense by encouraging the production, conserving the supply, and controlling the distribution of food products and fuel."

The exercise by the Director-General of Railroads at the present time of the powers so delegated and the extent.

The exact contents of all papers, documents, or memoranda delegating or conferring authority, powers, or duties upon the Director-General of Railroads with respect to the shipment, distribution, apportionment, or storage of coal or coke.

## Federal Trade Commission's Report on Illinois Field

Some of the points of particular interest in the Federal Trade Commission's report on the cost of producing coal in Illinois are as follows:

(1) The situation in the bituminous-coal industry in Illinois during 1917-1918 bore a much closer resemblance to that in the Pennsylvania anthracite industry than to that in the Pennsylvania bituminous industry. In Illinois, as in the case of Pennsylvania anthracite, the increases in sales realizations were more nearly proportionate to the increases in costs.

(2) In general, in the different Illinois districts, there was not such a wide difference between the margins prior to the period of Governmental price-fixing and those subsequent thereto. This is in striking contrast to the reduction of the margin in the case of the Pennsylvania bituminous-coal industry, particularly, in the southwestern field, which took place subsequent to August, 1917, when the Governmental price regulation went into effect.

(3) Wide differences in conditions are shown to have existed between some of the Illinois districts. For example, for District 1, in the northern part of the state, where 76 per cent of the output came from mines which produced pick-mined coal only, there was a relatively high labor cost per ton. For District 6, in the southern part of the state, where only 14 per cent of the output was pick-mined coal, and over half of the output was

machine-mined coal, there was a relatively low labor cost per ton, as pointed out in the report.

Such differences in conditions involve differences between the districts in the amount of the margin necessary to equally profitable operation. In the one case the investment in mining machinery was relatively small, since the coal was mined chiefly by the direct application of hand labor, resulting in a relatively high labor cost per ton. In the other case, where the coal was mined, chiefly with machines, the labor cost per ton was relatively low. But there was a relatively heavy investment in mining machinery. The margin (i.e., the difference between the sales realization and the f.o.b. mine cost) necessary to a profitable operation should be large enough to include a suitable return on the investment, and in the latter case must provide for a return on the investment, and must provide for a return on the additional investment in labor-saving machinery.

(4) The report presents in detail many figures showing the proportion which the labor cost formed to the total f.o.b. mine cost (exclusive of any return to the capital invested) and the proportion which such labor costs formed of the amount received from the sale of the coal. Thus, in 1918, the labor cost in the different districts was from 75 to 80 per cent of the total f.o.b. mine cost, and was from 61 to 71 per cent of the sales realization."

## Ruling on Paying Railroad Claims

Below is a copy of a letter which General Counsel Underwood of the U. S. Railroad Administration has issued to all Regional Directors under date of Jan. 16, 1920, and having to do with the payment of claims on account of shipments moving prior to, and during, Federal control:

"The Interstate Commerce Commission has held in the Decker Case, I. C. C. Docket 10,696, that it does not construe the limitation in the bill of lading as prohibiting the payment after two years and one day of meritorious claims if reasonably filed.

"Claims on account of shipments moving prior to Federal control, if filed within the period prescribed in the bill of lading, should be paid or declined on their merits, notwithstanding the two years and one day clause in the bill of lading, provided that in every case, the consent of the corporation to such payment is first obtained.

"Until further notice, claims on account of shipments moving during Federal control, if filed within the period prescribed in the bill of lading, should be adjusted on their merits, notwithstanding the two year and one day clause in the bill of lading.

"Extreme care should be exercised in the settling of all claims of this class so that there will be no discrimination."

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Authority of Shotfirers

*Letter No. 3*—That is an interesting question raised by a shotfirer of Nortonville, Ky., and which appeared in *Coal Age*, Jan. 3, p. 26, regarding a dispute that arose between the miners and the shotfirers employed by the Norton Coal Company of that place. It seems that the miners wanted the shotfirers to open the ends of the sticks of powder when charging and tamping a hole, claiming that if this was not done the explosion of all of the two or more sticks charged in the same hole was not certain.

On the other hand, the shotfirers refused to fire shots prepared in this manner, claiming that there was danger of the loose powder being ignited by a spark caused by the tamping bar coming in contact with a sulphur ball in the hole, even when using a copper-tipped tamping bar.

The question might be properly asked, Who employs the shotfirers and who pays them, the company or the men; and who will assume the responsibility for their being killed? It is evident that black powder was used in this case, but no mention is made as to whether the coal was undermined or shot off the solid.

#### WHAT THE MINING LAW REQUIRES IN BLASTING

However, setting these questions aside, the fact that there are numerous methods in use for charging and blasting coal, and many accidents occur daily from the careless handling of powder and holes being improperly drilled, charged and tamped, has made it necessary to restrict, by law, the work of shooting coal in mines. In many states the law requires the employment of competent shotfirers and clothes them with authority to refuse to fire any shots that, in their judgment, are unsafe.

My opinion, in this instance, is that where a hole is charged with two or more sticks of powder, the sticks should not be opened but pushed carefully back into the hole with a wooden tamping bar. As each stick is pushed into the hole and forced home, the needle can be used to prick a small hole in the end of the stick. If this is done there will be no danger but that the entire charge will be exploded at one and the same time. Where fuse is used the charge should be made up in a single stick and tamped with a wooden bar after inserting a cart-ridge or plug of dry clay.

#### STATUS OF THE MINE COMMITTEE

The work of shotfiring is dangerous at the best and a shotfirer takes his own chances if he fires a shot that he sees is improperly prepared. While a mine committee always has the right to ask the reason why a shotfirer refused to fire a shot, it has no authority to go further and demand that he shoot the hole. Should the committee decide that the shotfirer has deliberately turned down and refused to fire a shot that they consider safe, all they can do is to ask that the miner be

recompensed for the loss of his day's work. The disputed question can only be decided, in that case, by the state mine inspector.

Shotfirers are supposed to know the law and to realize the responsibility resting on them by reason of their position, and no person has any right to question their decision in refusing to fire a shot considered to be unsafe, inasmuch as the shotfirer is employed in the interest of his own safety and the security of the mine.

Let me add in closing, that the use of black powder loose in the hole cannot be recommended, under any condition in shooting coal. Further, a charge of black powder should not exceed two feet in length, in a hole 2½ in. in diameter. When a charge of black powder exceeds 35 per cent of the length of the hole there is danger that the shot will blow its tamping, and my experience is that these limits should not be exceeded.

Farr, Colo.

ROBERT A. MARSHALL.

### Lawful Examination of a Mine

*Letter No. 10*—At a recent meeting of superintendents, mine foremen, firebosses and others closely related to mine operations, there was organized the "Upper Potomac Mining Institute" of West Virginia, for the purpose of reading appropriate papers and discussing subjects pertaining to mining. The institute is to meet once a month, and the aim will be to discuss points that are not clear and to draw out the unbiased opinions of the members.

There is little doubt but that such meetings will be of exceptional interest along practical, safety and social lines, and that not only the members but all the workers will be materially benefited. In this connection, let me remark that I do not know of a subject that could arouse more interest than this one, or that is of greater importance and more direct benefit to the men engaged in and around the different plants. Indeed, I feel that, after these meetings have been a reality for a few months, there will be a more careful analysis of the methods now used by those making the examinations in our mines, and that more efficient and safe means will be employed.

#### SYSTEM NEEDED IN EXAMINING A MINE

I note with pleasure that many of the letters that have appeared in *Coal Age* advocate the three-hour system of examination, as specified in our state mining law. But it has been my contention, for some time past, that a more systematic procedure of examination is necessary in order to have a thoroughly practical and safe mine organization.

In my opinion, a mine should be divided into sections. The opening and ventilation of every mine should involve that consideration at the start. Each section should be of such size that an assistant foreman could have complete supervision of its working places in each shift. At a large mine, all section foremen should meet

two hours before starting time, enter the mine at the same time, and again gather on the outside to compare notes of their examinations, before permitting the men to enter the mine. They would then make out their reports, consult with the mine foremen and return to their respective sections, until one hour before the miners quit work.

As a rule, miners do not work to within about an hour of quitting time, and this plan would not keep the assistant foreman away from his men but a short period. He should remain where he will be in close touch with his men and be able to help them in every way possible. In a large mine a night foreman may be necessary, but his presence is not as needful as on the day shift, although the same process of examination should be effective during the night as in the day.

#### SYSTEMATIC EXAMINATIONS WILL REDUCE ACCIDENTS

A system of this kind with efficient foremen and assistant foremen should reduce the number of accidents one-fourth to one-half. And in time, as the foremen and men entered more spiritedly and honestly into their work, accidents would be a thing of the past.

A mine would then have what I would call a "lawful examination." More practical methods and ideas would come into use. The mining laws and mine regulations would be more strictly obeyed and all workers would exercise greater care. A closer co-operation between men and officials would result. And the slogan "Safety First" would be recognized and more faithfully practiced. With this system working smoothly there would be less chance for accidents to happen, and time and money lost by the men in the past would begin to show on the credit side of their accounts.

A truly friendly atmosphere would surround such a community and the spirit of good fellowship be everywhere in evidence. Let us hope for these results.

Thomas, W. Va.

BEN.

*Letter No. 11*—This subject and that of "Finding a Mine Door Set Open," the discussion of which has just closed in *Coal Age*, are closely associated. The letters presented contain many good suggestions that cannot fail to benefit all who have followed these discussions closely, from week to week.

The experience and judgment of practical mining men make them agree that it would be far better if there were no doors to be left open in a mine. However, all men are human, and we know it is a common thing to find an open door. The door may have been broken by a derailed car and not reported, through neglect, in which case the fireboss will find it open when making his rounds in the morning.

#### WHAT IS A "LAWFUL EXAMINATION" OF A MINE?

In order to make a *lawful* examination of a mine, the fireboss or mine examiner must comply with every requirement of the mining law. In Illinois, the law requires him to see that the air current is traveling in its proper course and that the quantity of air in circulation is sufficient.

The law specifies an air volume of 100 cu. ft. per man per minute, or 150 cu. ft. if the mine is generating gas, and 500 cu. ft. for each animal employed in the mine, but the mine inspector is authorized to increase this quantity according to his judgment. The law also requires the examiner to measure the air in the last cross-cut of each pair of entries, using his anemometer for

that purpose and recording the quantity of air measured in a book kept for that purpose. He must examine all places where men are required to work or to pass, and to observe any dangerous condition of roof or accumulation of gas.

Now, in the performance of these duties, the examiner will often be compelled, in actual practice, to do some things he should not do, or act in ways that he would not choose to follow under other conditions. For example, the section of the mine in his charge may chance to have two or more air splits; and the examiner in following up one of these splits, proceeds with the air. Then, to save walking back to the mouth of the second split, he may take a short cut and start to examine the next split, proceeding against the air.

This is a practical condition and one that cannot be avoided if the examiner is to save time and report back to the shaft bottom in time for the men to enter the mine for work. Other instances could be mentioned in which practical conditions control the manner in which the examiner must proceed; but in all cases his examination of the mine must comply with the law or it will not be a lawful examination.

Staunton, Ill.

WILLIAM M. CHAMBERS.

## Avoidable Degradation of Coal

*Letter No. 2*—While I support heartily every effort made to produce cleaner coal and a larger percentage of lump, and am fully aware of the difficulties in the attainment of this object, and realize the importance of this matter in respect to marketing the coal, I feel at the same time that we are prone to overlook certain underlying factors that must be considered in determining the miners' just responsibility for the loading of inferior coal, which has long been a trying problem in the industry.

In his letter, *Coal Age*, Oct. 2, p. 586, Richard Bowen has discussed the question so ably that it would seem little remains to be said along the lines he has mentioned; namely, the need of modern machinery for the conveying, washing and sizing of the coal, and the advantage to be gained by adopting a suitable plan of mine and employing methods of working that will reduce the breakage of the coal in the mining and transportation of the product from the face to the tippie.

#### EFFECT OF THE "CONTRACT SYSTEM" IN THE LOADING OF DIRTY COAL

Mr. Bowen further urges that "more attention should be given the miner, who must be taught to use more judgment and skill in the performance of his work." This is certainly true in that it induces the miner to take a deeper interest in his work and gives a greater degree of safety.

Observation and experience convince me, however, that one vital factor affecting the problem is the contract system of wage payment, under which the miner's earnings depend on the *quantity* of coal he mines. While the contract system is fair and honorable in that it establishes a just basis of payment and promotes smooth relations between the miner and his employer, it cannot be denied that the system possesses one unfortunate feature, which is indirectly responsible for the loading of much dirty and inferior coal.

Realizing that his wages are in direct proportion to the amount of coal he can load, the average miner is

possessed with the one desire to increase his output. As a result, he is not always as particular regarding the *quality* of the coal he loads, as he is in respect to the *quantity*.

Now, whatever measures may be taken to produce cleaner coal and a larger percentage of lump, must have a restraining effect on the earning capacity of the miner, under the contract system. It tends to decrease his output, reduce his wages and incidentally increase the cost of production. These, I say, are matters to be considered in determining the miner's responsibility for the degradation of coal.

In respect to improving the quality of the coal produced, the suggestion of teaching the miner to use "more judgment and skill" in blasting his coal, seems to be an idle one, when their interests are made to depend on the *quantity* of their output. Experienced miners will generally question any suggestion that judgment and skill are wanting on their part, while they are using these factors to the extent of their ability to increase their earnings.

Since the miner must purchase the explosive to blast his coal, it is foolish to think that he is not using his best judgment and skill in placing the shots in a manner that will reap the largest harvest. I am not excusing careless, indifferent and incompetent miners, who regard lightly the degradation of coal, and use excessive charges of powder to break it down. Such men must be weeded out and taught better methods of mining.

#### STUDYING THE QUESTION IN THE LIGHT OF ITS PRACTICAL ASPECTS

The point I would emphasize, however, is that the question of the degradation of coal, as it concerns the miner, must be studied in the light of the conditions that affect his work at the face. It is my belief that the average miner realizes that it is as much to his interest to keep the mine running regularly, as it is to the interests of the company. Also, that the steady operation of the mine depends on the *quality* as well as the *quantity* of the coal produced. It is a broad question and one that requires careful analysis, in determining its right solution.

There is much food for reflection in the concise remarks of a miner who, in speaking of the quantity of dirty and inferior coal sent out of the mine, agreed that it was possible for the miner both to load cleaner coal and obtain a larger percentage of lump. But, in doing this, he claimed that "complications would arise between the miner and the company that would not be for the interests of either party." He argued that both would suffer from a reduced output and an increased cost of production, which would tend to lower the miner's wages or increase the selling price of the coal on the market.

The tendency of the times today is toward co-operation and profit-sharing between operators and workmen, in most all industries. Men prominent in financial and labor circles regard such schemes as means to secure more efficient and profitable operation and believe they point the way to industrial reform. It is generally agreed that the adoption of such schemes would lead to a better understanding between employers and employees, whose interests would become more closely identified with each other, and enable workers to take a broader view of industrial relations and comprehend their own responsibility for the business.

In closing, let me say it is in this direction that the most favorable solution of the question of the degradation of coal can be sought. However, in respect to the *quality* of the coal produced and the miner's responsibility for the same, it cannot be overlooked that the unhealthy competition existing among miners working under the contract system, and the ever-prevailing competition between different coal operations are chief factors in the problem.

WILLIAM WESNEDGE.

Ladysmith, B. C., Canada.

## Promotion of Ambitious Workers

*Letter No. 8*—The discussion of this subject has interested me deeply. Like other questions of the kind, there are two sides to the question of promotion. Some writers seem to think that all a writer must do is to go ahead and do his best, and sooner or later his reward will come. This is no doubt true as an ideal condition; but, in practice, the deserving one is often robbed of a just return for the efforts he has put forth.

How often have we seen a good man set aside because the "old man" did not fancy him for some reason; or because the boss had a friend for the place. The friend's capabilities may ill fit him for the position, but that counts little with the big boss. I have known instances where the preference for a friend has cost the company thousands of dollars.

It would seem that some companies rather expect that a new manager or superintendent will make many changes in the official capacities of the men under them. The old bosses who have long been acquainted with the particular conditions in the mines are frequently fired to make room for friends of the new man. I have even seen it appear, for a time, that the change made was for the better; but this was generally due to the fact that the new foreman was reaping the benefit of the practical foresight of his predecessor in office, and the real truth only became known later as the output would fall off and the expense of operation increased daily. These are facts that no practical man can deny. Unfortunately, it is part of the mining game, much as we regret to admit the fact.

#### AMBITION AND THE WILLING WORKER

I like the way that the matter has been put in the letter of W. H. Luxton, *Coal Age*, Jan. 22, p. 195. Mr. Luxton urges the ambitious worker to "look on the bright side and one's chances of success will be greatly improved." As he has truly stated, it is discouraging to the ambitious worker to see things done in the manner I have mentioned. However, my advice to any young man, in the mining game, is, Do your best and never give up; but show the man under whose orders you work that you have ambition to do the work that comes, in the best manner possible.

If you are sent to the bottom of the second-left entry to clean out a ditch, go to it with a will. The smearing of your hands and clothes is far better than the danger of compromising yourself by showing a disliking for the work in hand. Remember the cleaning of the ditch is as important to the boss as any other work and he will wish it done right. If the boss is the right kind and, thank God, there are many of them, he will regard highly a man's willingness to perform any work given him and do it well. He has his eye on such men for higher positions when the opportunity offers.

It may be well when a man desires a certain place to make his ambition known to his boss; but, having done this, one must let the matter rest there. Should the boss later fill the place by appointing another man, rest assured that there is some good reason for what he does. Do not let that discourage your ambition. Be sure that fitness and capability for performing the work in hand will tell in time and in the end you will reach the place for which you are best fitted.

Not long ago, I overheard the remark of a man who said, "You cannot keep a good man down; he's bound to rise." Sometimes a little pull is a good thing, but my advice is that the ambitious man should not depend on "pull," but get busy and use a self-starter. Discouragement may come once or twice; but, some time, some where, you will find your niche and get your reward.

McIntyre, Pa.

THOMAS HOGARTH.

*Letter No. 9*—This is a question that naturally excites much comment among ambitious mine workers, when a vacancy occurs in some higher position, in the course of the operation of a mine. After the appointment is made, frequent expressions of opinion are heard regarding the wisdom and judgment displayed in filling the position. It is common to hear much adverse criticism.

Instead of emphasizing the strong points of the person appointed to fill the place, the too common practice is to dwell on those points in which the person may be deficient. It can be said with some degree of assurance that these defects are later found to be purely imaginary.

#### QUALIFICATION AND FITNESS CHIEF FACTORS

To my mind, the most significant factor to be considered in the advancement of an ambitious worker is his qualification or fitness for the office. The question is, Are his qualifications such as to make for real progress in the service of the industry? Personal interest may prompt one to discuss this question in the light of his own experience, whether or not he has realized his expectations.

Another will argue from the standpoint of justice to an ambitious worker who is thought to be better fitted for the place than the one selected. At times, influence or some other characteristic will be the controlling feature of the argument. In all such personal allusions, however, it is evident that the ambition is wrongly directed, in that the merits essential to promotion are overlooked.

#### SUCCESS VS. DISAPPOINTMENT AND FAILURE

It is one thing to gain promotion, but quite another matter to make a success in a new position, the ambition to reach which has been accompanied by hard work and painstaking effort to overcome the difficulties that beset the way. Large numbers of workers have had their ambition crushed and their ardor dampened by force of circumstances that are beyond their control. Too frequently the desire to excel is practically destroyed by the discouragements and influences that have retarded the progress of the ambitious one. For this reason, words of counsel and encouragement are helpful to all whose aspirations are to fill higher positions than those they already occupy.

There are everywhere disappointments and failures arising from the unfitness of one who has attained a

higher position through influence or by reason of some circumstance or fortune, and the advancement of such a one proves a burden. Again, the exaltation of the workman may subject him to worry through the manifest jealousies of his associates of less marked abilities than his own.

#### DIFFICULTIES ARISING FROM PROMOTION

Only recently my attention was drawn to the case of a man who had reached the highest position in his particular circle, through diligence and efficient service. His ideals were lofty and his generosity knew no bounds. Success attended his every effort and, for a time, he commanded the respect of his associates. But the cancer of envy and malice grew, in a certain field among his fellow workers, and eventually destroyed all that his ambition had created. Impaired health, through worry, forced this man to resign and shortly afterward he died leaving his family in want and poverty.

The incident shows how a man may sacrifice his all on the altar of ambition. The ancient writer Lucretius, in commenting on the vanity of human ambition, remarked, "Though men try to reach the highest honors, they often render the course of their steps full of trouble and, though they attain their object, envy like a thunderbolt hurls them in time from their pre-eminence and flings them with scorn into the gloom of Tartarus."

I may be wrong, but my observation inclines me to think that a stranger, or some person from a different rank of life than the worker, is more frequently respected when promoted to a higher position in the company, than is the case with one taken from the rank and file. Such resentment on the part of one's former fellow-workers is peculiar. It may be due to the exercise of caution in regard to intimacies and familiarities that prevailed formerly, but are now under restraint. However this may be, it should not destroy the ambition of an honest worker to excel and rise in his chosen calling. The man who would succeed must stand prepared to conquer every difficulty and breast every discouragement.

WILLIAM WESNEDGE.

Ladysmith, B. C., Canada.

## Tamping Dynamite

*Letter No. 2*—Referring to the letter of Gaston F. Libiez, *Coal Age*, Jan. 29, p. 244, I fully agree with him that a charge of a low-percentage dynamite should be well tamped, while this may not be so necessary when using a high-grade explosive.

In blasting a vertical hole in rock, or a hole that dips at a sufficient angle, water is frequently used instead of solid tamping. In my opinion, however, it is little better than no tamping at all.

In my experience, all kinds of explosives give better results when some tamping is done. A detonating powder is quicker in its action, and permits of shortening stemming; but black powder, any grade, being slower should always be tamped tight to the mouth of the hole, in order to get the full effect of the explosion of the charge.

In the use of high explosives, it is quite true that the full efficiency of the explosive is not gained without some tamping is done; but care must then be exercised, as there is danger of exploding the charge if the tamping bar is used too forcibly in preparing the shot.

Rawdon, Quebec, Canada.

# INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

## Carbide Lamps in Pillar Robbing

The work of robbing pillars was proceeding in an abandoned section of our mine when the generation of carbon dioxide increased to such an extent that oil lamps could not be used, and the miners were given carbide lights, which burned more freely in that atmosphere. I want to ask to what danger, if any, were the miners exposed, in the use of the carbide lamps?

Scranton, Pa.

MINE FOREMAN.

It is a well-known fact that the carbide lamp will continue to burn, though with somewhat diminished brightness and the flame taking on a reddish tint, in an atmosphere charged with carbon dioxide to such extent that the flame of an oil lamp is quickly extinguished. The presence of the carbon dioxide causes a corresponding depletion of the oxygen in the atmosphere. Careful experiments have shown that where the oxygen content of the air has been depleted by the addition of carbon dioxide, a fatal atmosphere is produced when the oxygen is reduced to 17 per cent, the fatality being due to the toxic effect of the carbon dioxide. At that point the atmosphere contains 17 per cent oxygen, 65 per cent nitrogen and 18 per cent carbon dioxide.

While this atmosphere is generally fatal to life, if breathed but a short time, it will support the burning of the carbide flame, which will give but a faint and frequently unobserved warning of the presence of danger to the men at work and breathing the air. A recently charged carbide lamp will continue to burn, in an atmosphere charged with carbon dioxide, till the oxygen content is reduced to 14 per cent or even less, which is far below the danger point in the support of life. Another danger to which the men are exposed is the possible presence of methane in dangerous quantity.

## Working Kanawha River Coal

Having noticed that there have been answered in *Coal Age*, each week, many interesting problems presented by various readers, regarding their troubles, I take the liberty of presenting a proposition that we have had in contemplation for some time. It concerns the best method of attempting the extraction of the coal from three seams, which we understand underlie the Kanawha River bottom, in the territory surrounding Cedar Grove, W. Va., where we are now operating a small mine in a low seam of coal.

According to our information, the three seams mentioned lie at depths of, approximately, 50, 100, and 160 ft., respectively, below the river bottom. As reported by the drillers of gaswells, in the vicinity, the first two of these seams are believed to have an average thickness varying from 3 to 5 ft., while the thickness of the lowest seam mentioned is estimated as varying from 6 to 9 ft., with about 30 ft. of sandrock overlying the coal.

We are now preparing to put down three test holes, with a core drill, and if the results are favorable we want to study out the best and cheapest plan for the extraction of the coal. Without attempting to install too large and expensive equipment, we want to provide a plant that will maintain a daily output of 1,000 tons, in a working day of 8 hours. We contemplate sinking two shafts, 300 ft. apart, as required by law. These will be located at the foot of the mountain, convenient to the railroad and above the high-water level.

Knowing the high character that has marked the discussion of such problems as these by the practical readers of *Coal Age*, who have contributed generously from their own experiences in similar instances, we hope to receive much help and benefit.

Briefly stated, some of the more important considerations, in this case are: The order of extraction of the three seams mentioned, assuming that each of them contains workable coal of the average thickness named and of fair quality. I want to ask, Should the coal be taken from the upper thinner seams and these practically exhausted, before attempting the extraction in the lower seam; or should this order be reversed and the seam lying at the lowest depth be attacked first?

Again, should a shaft or slope opening be employed to give the most satisfactory results with a view to safety and economy of operation? The suggestion has been made of opening the first seam, which lies at a depth of 50 ft. below the railroad, by means of a slope equipped with some sort of conveyor for bringing the coal to the surface. On the other hand, a shaft opening has been advised sunk to the bottom seam and equipped with self-dumping cages or an automatic skip.

In connection with the slope opening, it has been suggested to weigh the coal on the slope bottom. One suggestion, in connection with the slope opening, was to build a concrete storage bin, at the bottom of the slope and having a capacity of 100 tons, and install a conveyor system that would take the coal from this bin and elevate it to the surface.

Lastly, we would much appreciate the suggestion of the best plan to adopt in the working of the coal in these seams. On the surface, the mountain rises to a height of 1,000 ft. above the railroad. The lower seam is probably that known as the "Eagle" seam, which is a gas coal and overlaid with a heavy rock top.

Charleston, W. Va.

ARTHUR L. SHELDON.

*Coal Age* gladly submits this proposition to its practical readers who are in every way fitted to give the best advice on the questions presented. Questions such as these relating to the economic and safe working of coal seams have always enlisted the deepest interest from men whose experiences have furnished them with an ample fund of practical suggestions, and we hope these will be forthcoming from those acquainted with the working of the coal in the Kanawha district.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Miscellaneous Questions

(Answered by Request)

*Ques.*—The airway in a mine measures 5 x 10 ft., in section, where the anemometer indicates a velocity of 500 ft. per min. If the barometer registers 30 in. and the temperature is 70 deg. F. what is the weight of air passing through the mine in 24 hours?

*Ans.*—The sectional area of this airway is  $5 \times 10 = 50$  sq.ft. Assuming the reading of the anemometer indicates the average velocity of the air current (500 ft. per min.), the volume of air passing is  $50 \times 500 = 25,000$  cu.ft. per min. At a temperature of 70 deg. F., barometer 30 in., the weight of a cubic foot of air is given by the formula,

$$w = \frac{1.3273 \times 30}{460 + 70} = 0.07513 \text{ lb.}$$

The weight of air passing in the mine, in 24 hr., is then,

$$\frac{24 \times 60 \times 25,000 \times 0.07513}{2,000} = 1,352.34 \text{ tons.}$$

*Ques.*—A mine has two airways: A is 6 x 6 ft., in section; B is 4 x 8 ft., in section; what will be their comparative lengths, in order that they shall pass equal quantities of air, under the same pressure?

*Ans.*—First, write the formula for the unit pressure, in terms of the airway and the quantity of air in circulation; thus,

$$p = \frac{k l o^2}{a^3}.$$

For the same unit pressure and quantity of air in circulation, and the two airways having the same perimeter;  $o_1 = 2(6 + 6) = 24$  ft.; and  $o_2 = 2(4 + 8) = 24$  ft., it is evident that the length ( $l$ ) of the airway will vary directly as the cube of the sectional area ( $a^2$ ). In other words, the length ratio is equal to the cube of the area ratio; thus

$$\frac{l_1}{l_2} = \frac{(6 \times 6)^3}{(4 \times 8)^3} = \frac{(36)^3}{(32)^3} = \left(\frac{9}{8}\right)^3 = \frac{729}{512}$$

That is to say, in order that these airways shall pass equal quantities of air, under the same pressure, the ratio of their lengths is as 729 to 512. The first airway having the larger sectional area requires a greater length, to enable it to pass the same volume of air, under the same pressure as the second airway.

*Ques.*—What weight can be lifted with a jackscrew that requires two revolutions to raise the weight 1 in.? The length of the lever is 20 in. and the force applied at its end, 100 lb. Disregard friction.

*Ans.*—The circumference of a circle having a radius of 20 in. is  $2 \times 3.1416 \times 20 = 125.66$  in. The work performed by a force of 100 lb. applied at the end of this lever, in making two revolutions of the screw, is  $2 \times 125.66 \times 100 = 25,132$  in.-lb. Since the screw lifts the weight 1 in. when making two revolutions, the

weight lifted, in this case, is 25,132 lb., or 12.566 tons, ignoring friction.

*Ques.*—What horsepower will it take to hoist 1,200 tons of coal in a shaft 525 ft. deep, in 8 hr., the resistance of the ropes and pulleys being 12½ per cent?

*Ans.*—Allowing 12½ per cent for friction, the effective work is  $100 - 12.5 = 87.5$  per cent, and the required horsepower is, therefore,

$$H = \frac{1,200 \times 2,000 \times 525}{0.875 \times 8 \times 60 \times 33,000} = 90.9 \text{ hp.}$$

*Ques.*—If a mule performs 10,000 units of work in one minute, while walking at the rate of three miles per hour, what is the pull on the chain?

*Ans.*—Walking at the rate of 3 mi. per hr., the mule travels  $(3 \times 5280) \div 60 = 264$  ft. per min. The pull exerted on the chain is then  $10,000 \div 264 = 37.87$  lb.

*Ques.*—If a room, turned at an angle of 30 deg. with the entry, is driven 300 ft. what will be the shortest possible distance to connect the face of the room with the entry; and how far along the entry will the place require to be started?

*Ans.*—The shortest distance, from the face of the room to the entry, is in a line drawn at right angles to the entry. The length of this line is  $300 \times \sin 30 \text{ deg.} = 300 \times 0.5 = 150$  ft. This distance is measured from the center line of the room, at the face, to the center line of the entry, when the length of the room is measured from the center line of the entry to the face. The distance between these two points of measurement, on the entry is  $300 \times \cos 30 \text{ deg.} = 300 \times 0.866 = 259.8$  ft.

*Ques.*—A gaseous mine is divided into three sections, A, B, C. Section A contains a firedamp mixture consisting of one part of marsh gas and ten parts of air. Section B is likewise filled with a mixture consisting of one part of marsh gas, with less than ten parts of air. Section C is filled with a mixture consisting of one part of marsh gas and more than ten parts of air. The gas being ignited in Section A, where would you expect to find the most violent explosion, and which section would be the most dangerous to explore after the explosion?

*Ans.*—The mixture of gas and air, in section A, very closely approaches the maximum explosive point of the firedamp. It is in this section, therefore that the greatest violence would be manifest.

Of the other two sections, Section B would be the most dangerous to explore after the explosion had taken place. The reason for this is that the mixture, in that section, contains less air than what is required to burn all of the carbon in the marsh gas, to carbon dioxide. As a consequence, a greater proportion of carbon monoxide is formed in this section. On the other hand, in Section C, the air being in excess, a larger proportion of carbon dioxide and less carbon monoxide results from the explosion.

# COAL AND COKE NEWS

## Charleston, W. Va.

Cars from the West permit or slightly larger production during second week of February. Yet mines here work only half-time. Severe weather checks movement of empties. Influenza generally prevalent. Some Kanawha mines receive no cars for week or more. Influenza bad in some sections of Kanawha field. No coal exported. In New River region mines work one-third time. Sickness general here. Does not curtail production with no cars to load.

With a somewhat larger flow of empties from the West during the early part of the second week of the month, more cars were available in this section; yet by the time all the cars had been distributed in the various fields, served by the Chesapeake & Ohio, the increase was almost imperceptible and yet for a day or so did serve to give impetus to production. This probably resulted in a somewhat larger output than during the first week of the month, though the increase was not such as to inspire any great amount of enthusiasm, since the car shortage was sufficiently serious as to materially limit the operation of mines.

As illustrating how the supply slid downward from day to day, on Monday the loadings on the Chesapeake & Ohio were 139,000 tons; on Tuesday, 82,150 tons; on Wednesday, 71,000 tons; by Thursday they were down as low as 61,000 tons. Aside from the supply for the first two days, cars were only numerous enough for half the requirements of mines, therefore, working time amounted to about half of a full week. Severe weather on the fourteenth, fifteenth and sixteenth checked the further increase in movement of empties from the West. It is now the general belief that there will be little relief from the present car shortage until the weather becomes milder and until export shipments are resumed on a general scale permitting a quick return of cars to the mines.

Influenza was generally prevalent in this section, but in itself it had no direct bearing on the volume of coal produced or not produced, since such working forces as were available were able to load all the cars which were furnished. The epidemic has not proved to be as serious as it was in October, 1918. Railroads have been as much affected by it, however, as have mining operations.

### Kanawha Works Half Time

Even though cars were somewhat more plentiful, as far as the Kanawha district as a whole was concerned, during the week ended Feb. 14, there was still a most pronounced shortage of equipment in the Kanawha field during the greater part of the week. With the mines of the field producing only from 10,000 to 15,000 tons a day, it will be apparent that mines were able to work only about half-time or less. It was not uncommon during the week to hear of cases where mines had received no cars for a period of a week or ten days, especially on branch lines. With mines idle so much of the time producers are way behind with their deliveries and this, of course, has brought about a condition in this section at least where there is no free coal. Many mining communities in the Kanawha region were fighting against another influenza invasion, a number of camps on Cabin Creek, Coal River and in the neighborhood of Winifrede reporting quite a large number of cases. Even so much sickness failed to hamper operations materially, owing to the scarcity of cars. No coal from the Kanawha region is being exported at the present time.

### New River Small Output

If the car supply was conducive to larger loadings in other fields, such was not the case in the New River district during the week, loadings being leaner there, if anything, than during the week ended the seventh. In fact the car supply was so execrable that on Thursday, Feb. 12, only

5,150 tons of coal were loaded in the large New River field. The large supply of cars on Monday enabling the mines to produce about 23,000 tons was only an artificial supply. It is doubtful if mines worked more than two days out of the six, that, of course, meaning about a 30 per cent car supply. Instances were not lacking where mines had no cars during the entire week. No mines had enough cars for a full day's work at any time and much valuable time was lost. Though it does not seem that there will be any railroad strike in the near future, coal operators believe that conditions could not be much worse even with such a strike in effect. With sickness general among the miners in the New River field, it did not curtail production, owing to there being so few cars to load. Coal for export continues to be shipped from the field but permit requirements make it a cumbersome way of doing business and export tonnage is limited.

## Bluefield, W. Va.

Conditions going from bad to worse in southern West Virginia. Serious car shortage. Due to severe winter weather and limited export tonnage. Rapid spread of influenza. Government confiscates West Virginia coal for Pennsylvania R.R. Tug River mines do not work half time. Winding Gulf plants work two days in six. Pocahontas works three days in the week. Considerable influenza here.

The stumbling block to any normal approaching a normal production in the mining fields of southern West Virginia during the second week of February was a car shortage of a most serious nature. Transportation conditions were not even on a par with those prevailing during the previous week. General conditions in the southern part of the state have been going from bad to worse almost continuously since the first of the year. Relief now seems remote, even the Railroad Administration admitting it is helpless to afford any relief. Only half-enough cars were supplied, so that for at least three days of the week mines were in idleness.

While not all operations in southern West Virginia felt the serious effects of sickness among the miners, yet the rapid spread of influenza at various mining communities since the first of February has undoubtedly augmented other sources of loss in output as well as affecting railroad operations. That in turn, of course, has been felt in a retarded movement of coal and in a slower distribution of empties.

Two factors are now conspiring to prevent a better car supply in southern West Virginia. One is the severe winter weather beginning on the fourteenth. That prevented a large movement of empties from the West. The other factor is the limited export shipments. Until there is a full run of export tonnage there will be more or less of a short car supply, owing to the longer distance loaded coal cars must travel.

While no confiscation of smelable coal is being reported, yet high volatile from southern West Virginia and from southwestern Virginia is being taken, orders for instance, having become effective on Feb. 9 to confiscate 600 cars of coal from the Thacker and Clinch Valley fields, this being done at Bluefield scales. Such confiscation is being continued at the rate of 25 cars a day. What is peculiarly significant in this connection, however, is the fact that the coal is being taken for use by the Pennsylvania R.R. West Virginia operators cannot understand why the Pennsylvania R.R., running through a bituminous field, should use West Virginia coal; unless it is that central Pennsylvania operators will not make contracts with the railroad and, further, that they enforce the payment of contract prices when coal is confiscated. There seems to be no reason why the Government should confiscate West Virginia coal for use on the Pennsylvania R.R.

Loadings in the Tug River field for the week ended Feb. 14 amounted to only 66,600

net tons, which is below the loading of the previous week. Cars were so scarce during the period mentioned above that a considerable number of mines in the field were not able to work even half time on account of not having enough empties. The outlook for the third week of February indicated that it would be the slimmest from a production standpoint since the second week of January, when loadings slumped to 55,000 tons.

### Winding Gulf Works Two Days

How little and not how much coal was produced in the Winding Gulf field during the second week of the month may be imagined when it is stated that the car supply in that field was not sufficient to keep the mines operating more than two days throughout the week, the supply amounting to about 35 per cent of requirements. According to the operators there does not seem to be any immediate hope of more than a 40 per cent car supply. Both the Chesapeake & Ohio and the Virginian were at fault in the small number of empties furnished. Nearly all Winding Gulf coal is moving eastward at the present time, some of it for export, all export shipments being under special permission, however.

### Pocahontas Sharp Decline

A description of conditions existing in the Tug River field also applies with equal force to the Pocahontas district, covering production for the second week of February. There was a sharp decline in the output during that period as compared with the previous week, and a more pronounced shortage of cars than had been in evidence in recent weeks was the principal cause of this sharp decrease. There were not half-enough cars on hand to supply the mines. Consequently, half the working time of the week was lost or, in other words, mines were limited to about three days work for the week. With weather conditions extremely unfavorable no relief from the car shortage was anticipated during the third week of the month. There has been considerable influenza among the miners of the Pocahontas region since the seventh, but while the complement of men at some plants has been greatly reduced by the malady other plants have escaped a visitation.

## Frankfort, Ky.

Bill introduced in Kentucky Legislature creating a state Geological Survey. Old Department of Geology and Forestry outlawed. New act to fill the breach. Scope of the new survey outlined, duties of the director noted and provision made for proper assistance to carry on the survey work. Co-operation with Federal departments arranged for. Reports and pablietty of survey work to be authorized.

A bill was recently introduced into the Kentucky Legislature by R. Lee Stewart to create a State Geological Survey. This bill has the following provisions: The Kentucky Geological Survey is to be created and established with a single executive officer, designated as the Director and State Geologist with headquarters at Frankfort, Ky., where are kept the geological collections, records, maps and accumulated property of former state surveys.

The governor of the state is to appoint the director of the survey, subject to the consent of the senate; this officer is to be qualified in a thorough, scientific and practical knowledge of the sciences of geology, mineralogy, hydrography and allied subjects. The director shall have had at least six years' collegiate and technical training in geology and shall be a graduate in geology from a recognized university. He shall hold his office for four years, unless removed sooner by the governor for inefficiency, incompetency or misconduct.

It shall be the duty of this director and

state geologist to administrate the affairs of the survey; to visit all parts of the State of Kentucky and make himself familiar with the needs of each section; to supervise, outline and edit the work of his assistants; to advance the interests of Kentucky by presenting in person or otherwise, before national geological meetings, authoritative statements of the geological and mineral resources of the state; to undertake such field work as his time will permit, and to perform such other duties as may properly pertain to his office. He shall be responsible for the accuracy of the work of the survey, and make a biennial report to the governor covering the activities accomplished by and proposed for the State Geological Survey.

#### Activities of the Survey

Should time permit the director may lecture at the state universities on subjects pertaining to the geological and mineralogical development of the state, but without special financial remuneration for such services. Under the direction of the state geologist, careful geological, mineralogical, chemical, physical and soil surveys of the state shall be made; mineral and metalliferous deposits are to be located and specimens of such minerals and metals collected, analyzed and classified.

Provision is made for the employment, by the director, of competent assistant geologists, paleontologists, topographers, surveyors, specialists and such other assistants as may be required for the proper conduct of the affairs of the survey.

The bill directs that the Kentucky survey shall co-operate with the State Experiment Station, the U. S. Geological Survey and other governmental departments; provided first that such departments shall furnish an amount of money equal to that allotted for such work by the Kentucky survey, and second that such co-operative agreements shall prove advantageous to the state of Kentucky. The salary of the director is to be \$3,000 per annum.

The reports of the survey shall be prepared as rapidly as possible and shall be reviewed, edited and approved by the director. Furthermore the director is authorized to publish in the daily and weekly newspapers, trade and technical journals, magazines or in pamphlet form any geological discoveries or results of special interest. No reports or maps prepared by the Kentucky survey shall be sold, but nominal charges to cover postage may be made.

For the purpose of carrying into effect the provisions of this act, the sum of \$15,000 is to be appropriated annually to cover all field, laboratory and office expenses; the further sum of \$12,500 is to be available for co-operation with the U. S. Geological Survey; provided, in this latter case, that if such co-operative work is not being conducted to the best advantage of the state, then Kentucky may withdraw from such an arrangement and the work be continued by the Kentucky Survey.

The law relating to the Department of Geology and Forestry has been repealed at this session of the General Assembly, and there are now no funds available for this work or to support a prospective geological survey; therefore an emergency is declared to exist which is to be met by this act and its appropriations.

#### Louisville, Ky.

Deplorable coal-car situation in the Southern Appalachian territory. Operators, thoroughly aroused, threaten to shut down and sue Railroad Administration. Conditions on Louisville & Nashville noted and compared with those on other roads. Numerous orders given which would have afforded relief. Orders not enforced and Railroad Administration held responsible.

It is said to be likely that individual operators of the Hazard, Harlan, southeastern Kentucky and eastern Tennessee districts, in that territory known as the Southern Appalachian district, may file heavy damage suits against the U. S. Railroad Administration, charging discrimination in distribution of coal-car supply. Figures extending back over a period of several months show that operators, on the lines of the Louisville & Nashville R.R., have suffered severely through poor distribution of cars, and movement of empties into other sections of the country, without providing for the operations of the Louisville & Nashville lines. It is charged that operators on the system in question have lost between \$3,000,000 and \$10,000,000 as a result of existing conditions in the past few months.

A telegram sent from Knoxville, Tenn., on Feb. 5, to E. L. Winchell, Regional Director of the U. S. Railroad Administration at Atlanta, asks why railroads in the South have failed to execute administration orders and turn over empties to the Louisville & Nashville at junction points as stipulated in orders. The number of pool and foreign cars turned over has been far below the stipulated figures, and since Jan. 23, the supply has been trifling, the Cumberland Valley division on Feb. 5, receiving but a 40 per cent supply. The telegram further said: "The situation is deplorable. Operators threaten shut down and suit against the Administration. We urge mandatory execution of orders."

Operators along the Louisville & Nashville lines recently filed a statement of conditions, and J. E. McCoy, secretary of the Southern Appalachian Coal Operators' Association, filed the statement with the Railroad Administration, and made an appeal for removal of the discriminations, as the head of a committee that went to Washington for that purpose. The statement showed that while the car supply last August was 85 per cent for the country as a whole, the Southern region showed but 67 per cent and mines on the Louisville & Nashville had but 59 per cent. The situation was about the same in the following months with the Louisville & Nashville securing the smallest supply in the country. It was charged that the Southern region received 11 to 18 per cent smaller car supply and the Louisville & Nashville mines 20 to 25 per cent less than other sections since August. The supply since Jan. 1 has been the worst ever known, with many Louisville & Nashville mines working but a day and a half a week. It was shown that but 56.83 per cent of cars ordered from Jan. 1 to 17 were delivered to Louisville & Nashville mines, with some districts getting but 41 per cent.

#### Promises Not Kept

It is claimed that many promises were received, much correspondence handled, and arrangements made to move cars into the section from various gateways, but that the orders were not carried out. It is stated that inasmuch as the Railroad Administration has full charge of motive power and car supply, there is no reason for discrimination, and the operators on the Louisville & Nashville want what is due them.

Operators want relief before the railroads return to private control, and believe, that if present legislation placing direction of equipment in the hands of the Interstate Commerce Commission is enacted, that the discrimination will no longer be practiced. Reimbursement is sought for discrimination and resulting losses since Aug. 1.

It is alleged that railroads north of the Ohio are 1,900 cars short of an agreement to deliver an empty car for each loaded car turned over at terminals at Ohio River crossings, this shortage occurring within three weeks time. The Southern Ry. was ordered to give up 75 empties from car pool movements to the Louisville & Nashville, at Knoxville daily, but seldom has total deliveries amounted to 25 cars a day. At other junction points the condition has been about the same. It is charged that most of the cars that have been turned over are Louisville & Nashville cars and not foreign or pool cars. In fact delivery of pool cars ceased at Middlesboro on Jan. 26.

On Feb. 5, the car supply on the Cumberland Valley division of the Louisville & Nashville was but 35 per cent; Harlan County received no cars and was shut down tight; there were but 250 cars available at Middlesboro on Friday. J. E. McCoy claimed that the Southern Ry. lines have been supplying 60 to 70 per cent of requirements. According to Railway Administration records, there has been a fluctuation of from 88 to 39.59 per cent.

It is claimed that discrimination has resulted in reduced operations, resulting in losses of eight to ten millions of dollars that would have been avoided if the Louisville & Nashville mines had been given a fair percentage of such cars as have been available. Mr. McCoy stated that it was on this account that operators planned to bring suit against Walker D. Hines, as Director General of Railroads, that the suits would probably be filed by the Hazard or Harlan operators but that Tennessee operators on the L. & N., would probably join in. It is stated that litigation is almost certain to be filed if relief is not immediately given.

Mr. McCoy further said: "The operators are being bled to death by the inability to get cars. In fact every industry is suffering severely because of the transportation problem." He stated that it had been developed that empty cars are sent on long

hauls instead of being returned to home line roads with freight moving that way. Delivery of pool cars had been expected to offset this condition, but it failed through carriers not complying with orders.

Coal operators claim that the railroads have not been playing fair with the Louisville & Nashville which has been helpless in the matter of securing anything like her net ownership of cars. For months past the road has been constantly short of cars, and the total number of coal cars on her lines has been far below ownership figures. Other lines have accepted shipments, but failed to turn over empties. The Railroad Administration is held to be responsible for not enforcing its orders.

#### Ashland, Ky.

Northeast Kentucky output half of normal. Car shortage the cause. Railroads grabbing much coal. Mines forced to fill railroad contracts before other orders. Allotment commission mine ratings irritate operators.

Production in the northeast Kentucky field during the second week of February reached only 120,000 tons, or about 50 per cent of the potential capacity (237,000 tons), with car shortages alone representing 122,000 tons, or 49 per cent loss, and mine disability and labor shortage only one per cent. During the same period of 1919, the production was 95,000 tons, with "no market" responsible for the entire loss at that time.

Railroads have begun to confiscate northeast Kentucky coal indiscriminately, especially in the premium grades. Where coal is not being so confiscated, other mines having railroad fuel contracts are being forced to supply the entire contract requirements of the railroads, before furnishing other contract holders with their coal; the operators are under the penalty of having their coal embargoed unless they fall in line. This policy is stamped by operators as wilfully unjust.

The epidemic of influenza at Seco, Ky., where Government assistance was finally afforded, has abated somewhat. Reports from the Big Sandy territory disclose the presence of the disease in light form at scattered points in that region.

Operators of the northeast Kentucky field are quite irritated over the apparent arbitrary action taken by the allotment commission, in refusing increases to mine ratings, although in many cases considerable extension of plant equipment and greatly increased labor forces are shown.

There is an unusually heavy and insistent demand for all northeast Kentucky coal at the present time in all grades; but mines in this field are making no progress in meeting such demand with a car supply only equal to half of requirements and with the railroads literally grabbing all the coal they can get their hands on.

#### Norton, Va.

Southern Ry. refuses to accept bills of lading. Confiscates coal right and left. Vigorous protest by operators. Production 74 per cent of capacity. Influenza to further curtail output.

The Southern Ry. was still confiscating Virginia coal right and left, during the second week of February, for railroad use and was not permitting any coal to go forward for commercial purposes. This refusal to accept bills of lading and this disposition to appropriate all the coal produced, was denounced in vigorous terms by Virginia operators who protested most strongly against it, as they have been doing right along, but to no avail.

Production during the week amounted to 136,358 tons or only 74 per cent of capacity; losses were entirely due to car shortage, reaching a total of 52,900 tons or 25 per cent of potential capacity. Some 42,000 tons of coal was either coked or stored during the week, or production would have been reduced at least 20 per cent more than was the case.

Promiscuous confiscation of coal was working a great hardship on commercial customers depending on Virginia mines for coal. It was estimated that production would be curtailed to the extent of at least 30 per cent more, during the third week of February, because of the rapid spread of influenza over the field, most operations, in fact, having 30 per cent of their working force out of commission owing to illness of employees.

The output of 156,000 tons, during the second week of the month, represented a loss of about 4,000 tons as compared with the previous week's production.

## Indianapolis, Ind.

State Geologist notes improvement in Indiana mining methods. Further saving in coal needed. Chief sources of waste stated. Higher prices lead to utilization of low-grade coal.

Improved methods of mining coal are eliminating much waste in Indiana, but there continues a large percentage of loss, according to a report issued by W. N. Logan, state geologist. Mr. Logan estimates that approximately 26,500,000 tons of coal are mined in Indiana annually. He says the waste here is greater than in other bituminous fields.

"In some states the waste has been reduced to 50 per cent of the coal mined, but the waste has not been reduced to this minimum in Indiana," Dr. Logan says. "And while the waste has been much greater in the past than it is at present, there is need of much greater improvement."

Waste in coal mining may be connected with the system of mining or it may be independent of the system, according to the report. The chief sources of waste in mining coal are: Not robbing the pillars in the room-and-pillar system; unclean mining in the strip-pit method; leaving coal containing partings in any system; producing unrecovered culm, leaving coal around horsebacks, bells, etc., and mining lower beds before upper ones. The principal systems of mining employed in Indiana include strip-pit method, the room-and-pillar system and the long-wall system.

Dr. Logan's report to the Department of Conservation shows that higher prices have had a tendency to decrease the waste of fine coal or culm, now utilized extensively in the industrial plants where there is a demand for coal of low heating power.

## Victoria, B. C.

Government mining engineer notes new coal development on Vancouver Island, Canadian Collieries, Ltd., drills property; Canadian Western Fuel Co., Ltd., develops extensively. Nanoose Wellington Coal Co. installs new equipment. Improvement at Cassidy Collieries.

Commenting on the coal-mining development on Vancouver Island, B.C., during the past year, Wm. M. Brewer, Government mining engineer, observes that two mines have been added to the active shippers. These are the No. 5 mine, at South Wellington, the property of the Canadian Collieries, Ltd., from which coal has been mined on a commercial scale since early in 1919 and the Wakesiah mine on the Wakesiah farm, property of the Canadian Western Fuel Co., Ltd., which began producing commercially about October, 1919.

"Amongst new development or prospecting work," Mr. Brewer continues, "there is the diamond drilling being done by the Canadian Collieries, Ltd., on the Tsa-abl River, which empties into Baynes Sound about five miles southerly from Union Bay in the Comox section of the Nanaimo mining division; also the reopening of the old slope by the Canadian Western Fuel Co., Ltd., on the Wellington seam, southerly from the Harewood mine. The slope of the latter company had been driven about 400 ft. and abandoned by the former management. During the past summer the old workings were unwatered and examined, with the result that General Manager George A. Bowen, ordered that the workings be reopened, extended and the mine placed on a producing basis. This may be worked as Harewood No. 2 mine, with a new railway connection; or the underground workings may be extended to connect with the haulage system in the Harewood mine and the coal transported through that mine to the transportation system now in use."

### New Construction and Development

Mr. Brewer also refers to the transfer of the Grant mine, Nanoose Bay, to the Nanoose Wellington Coal Co., Ltd. Since the change of management considerable new construction and development work has been undertaken. This is itemized as follows: Two return-tubular boilers, 125 hp. each; one 150-kw. electric generator; one electrically-driven centrifugal pump for coal washery and fire protection, capacity 450 gal. per min.; two storage tanks for fire protection and coal washery, capacity 25,000 gal.; a coal-washing plant including a jig washer, screening plant, picking table, loading boom and bunkers for three grades of coal, the whole to be electrically operated; a new office building, and other structures.

The underground development has been pushed steadily, consisting of a main east level and a counter level, (driven approximately 1,800 ft. in the last year) with stalls driven to the rise and a slope to the dip, and with entries turned off east and west. The mine is worked on the pillar-and-stall system.

Improvements are being made to the plant of the Cassidy collieries of the Granby Consolidated Mining, Smelting & Power Co., as their necessity becomes apparent. One of the most notable improvements completed here in recent months is a belt conveyor from the bunkers over the wharf to the scows. This makes loading a simple process. The mine is producing steadily, the product being shipped to Anox for use in the company's byproduct ovens in the manufacture of coke for the smelter.

## PENNSYLVANIA

### Anthracite

**Hazleton**—The Lehigh Valley Coal Co., it is said, will connect its Beaver Meadow drainage tunnel with its Spring Mountain workings by a tunnel about 2000 ft. long. When completed this new tunnel will take care of the water from the Spring Mountain and Spring Brook workings.

**Wilkes-Barre**—The newly-constructed \$1,000,000 breaker of the Delaware, Lackawanna & Western company, at Edwardsville, which began operations recently, is said to be the last word in breaker construction and will prepare 6,000 tons of coal for the market daily. The building is 165 ft. high and occupies a ground area 210 ft. sq., or a little more than an acre.

**Tamaqua**—Eventually the use of electricity will become general in the mines of Lehigh, Schuylkill and Carbon counties, according to the statement made by leading officials at the Harwood Electric and the Lehigh Navigation Electric companies. These electric companies say that most anthracite operators now are anxious to electrify their collieries and that only the conditions created by the war and subsequent high prices have delayed the work. Up to this time the Harwood Electric Co. and the Lehigh Navigation Electric Co. have found it difficult to take on new business as the demand for power is so great that the machinery held for reserve cannot be kept idle. The extension of the Hauto plant has already been started, and when it is completed it is expected that every demand can be met.

### Bituminous

**Pittsburgh**—In this district it is often necessary for men to work for sometime in coke ovens, making repairs, or inspecting ovens out of blast. On damp days the fumes from such ovens are most noticeable and are not only annoying but positively dangerous to those who must work in them. It has been found quite practicable for men so employed to wear an army gas mask while engaged in work under these conditions.

**Brownsville**—The Snowden Coke Co., whose plant is near here, has just had a revolving-car dump installed at its works by the Car Dumper & Equipment Co., of Chicago, Ill. This dump is 265 ft. long and capable of dumping 28 cars in 12 sec., at one operation, without uncoupling or disconnecting the hoisting rope. This is said to be the longest dump of the kind ever installed. The Snowden Coke Co. has discarded its wooden drop-bottom mine cars and installed new steel-bodied cars with tight wooden bottoms, furnished by the Koppel Industrial Car & Equipment Co. of Koppel, Pa.

## KENTUCKY

**Louisville**—A bill before the state legislature to enforce mine operators and manufacturers to install bath houses for miners, has been amended to provide that such installations shall not be necessary where mines will be worked out within a period of two years. The Senate has passed a bill providing for miners to have the power to go outside of their own company to secure a scale inspector. There was a strong fight on this bill, it being alleged by the minority that the scale inspector should be picked from men employed by the mine in question.

## OHIO

**Columbus**—Two important laws were passed at the recent session of the Ohio Legislature which affects coal operators in Ohio. One of the laws provides that all employers must keep their workmen's compensation premiums paid up in full or face

receivership proceedings. The other compels all employers to make out a full statement of the number of persons employed during the year.

Operators in Ohio are making a vigorous fight against the bill pending in the Ohio Legislature providing for a tax of 1 per cent on the market value of all minerals produced in the state. It is argued by coal men that such a tax would put Ohio coal operators at a disadvantage in competition with other states. A hearing on the bill before the house committee was attended by a large number of operators. No action has been taken on the bill and it is doubtful if it will be enacted into law.

## ILLINOIS

**Springfield**—A severe car shortage exists in the Springfield mining district. Cars enroute to western territories and will doubtless be returned to the Central states shortly, when it is expected that the car shortage will be remedied. The railroads are making every effort to minimize the shortage of coal cars. No coal carriers are allowed to be loaded with any commodity other than coal, and this order is strictly enforced in all territories. The result is that every car, when emptied, is immediately filled again with coal and all coal cars are kept constantly on the move. It is said that the Wabash R.R. was able to furnish only 14 cars to its local mines, when about 150 were needed and could have been used. This condition is unusual, however, it was said, and the roads average about a 50 per cent supply and will continue to do so for a number of days yet to come.

How the present conditions will be changed when the railroads are returned to their owners on March 1, is a matter of some concern.

## Obituary

**James D. Simpson**, general superintendent of the Berwind-White Coal Mining Co., died at his residence in Windber, Pa., of influenza-pneumonia on Feb. 11. Mr. Simpson was born in England, Jan. 29, 1878, and was brought to the United States by his parents (in 1879) who became residents of Ohio and later located in Pennsylvania.

When ten years of age, Mr. Simpson started to work as a trapper boy in the mines of the Monongahela Valley. He later became a skillful mechanic but left the mining field temporarily to accept a clerkship with the Pennsylvania R.R. During this time he educated himself for the fu-

ture through the medium of correspondence schools. He was later connected with the White Rock Coal Co., the Ellsworth Collieries Co. and the Monongahela River Coal & Coke Co. Mr. Simpson left the last named company to accept the superintendency of the Ocean mines of the Berwind-White company, at Herminie, Pa. His achievements here led to his appointment in 1913 as superintendent of the Berwind-White mines with headquarters at Windber, Pa. He succeeded W. R. Calverly, now general manager of the Union Collieries Co. Mr. Simpson was president of the Windber Hospital.

# MARKET DEPARTMENT

## Weekly Review

*Traffic Conditions Show No Improvement—Bad Weather Interrupts Car Movement—Operators Complain of Small Profits Under Present Conditions—Serious Situation Exists in Coke Region.*

IT IS the belief of some that traffic conditions now existing are possibly the worst ever known, and the railroads are slow in recovering to a normal condition. Although the diversions and confiscations continue, they are not as frequent as they have been in the past. It is worthy of note that because the Seaboard Air Line R.R. confiscated cars intended for use at the power house of the Detroit Edison Co., a discontinuance of electric power service to all non-essential industries in that city has been considered by the officials of the company, unless immediate relief is obtained.

Operators are slowly receiving more

of the empty cars that were sent West to alleviate conditions in that territory, but this movement has been interrupted by the recent zero weather such as was prevalent in the Central West. This condition is only temporary, however, and will be remedied with the arrival of milder weather.

Inability of operators to run their mines with reasonable profit under present conditions is responsible for the failure of dealers to lay up a stock of reserve fuel, but demand for bituminous coal remains about the same as last week, and the only real complaint is non-delivery.

With the export ban on coal almost

complete with the exception of low-volatile gas-coal releases at Hampton Roads, Eastern mines are finding it difficult to run, the car supply being about one-third of normal. Had the export business continued in part, the mines might not have suffered so much as more cars would have been available in that section.

Except in only a few sections, there is heard little or no word of a lack of hard coal, and anthracite dealers are satisfied with the demand for their product. In the coke region, due to car shortage, a serious situation exists insofar as it relates to the future of beehive-coke production.

### WEEKLY PRODUCTION

From the weekly report of the U. S. Geological Survey dated Feb. 21, the output for the week ended Feb. 14 was as follows: Bituminous—10,284,000; anthracite—1,773,000 and beehive coke—440,000 tons.

For the calendar year ending Feb. 14, 1920 the output was as follows: Bituminous—68,996,000; anthracite—79,443,000 and beehive coke 2,849,000 tons.

### Atlantic Seaboard

#### BOSTON

Worst traffic conditions for years. Railroads recovering very slowly. Embargo not likely to be raised this week. Confiscations still general. Practically nothing received via New York and Philadelphia piers, Hampton Roads situation improves. But one "emergency cargo" thus far received. Anthracite quiet, but shipments far in excess. Only moderate inquiry for steam sizes.

Bituminous—Railroad men are agreed that the recent storm caused the worst tie-up in their experience. Two-thirds of New England's supply comes all-rail, and until the congestion is cleared up on the roads here as well as on the intervening lines there is little chance of any free movement of coal. Several days of thaw are needed to release the thousands of cars that are frozen to the tracks. At yards like those at Worcester, Providence, and Boston there are long lines of cars ice-bound to the hubs, and the result is almost a total cessation of West-bound movement. A week ago there were days when not a single car was taken by the New York Central from the New England roads, and at this writing very few of the cars started from the mines before Feb. 5 and those in transit have yet reached the gateways. There are cases where coal slipped since the storm has come through, but coal that was tied on sidings seems for the most part effectually blocked.

Anthracite—Except in a few scattered communities there is heard little or nothing

of any distress for hard coal. This is the more remarkable when it is realized that not only does the blanket embargo apply to anthracite as well but that the latter has been embargoed from points on the New Haven R.R. since Jan. 16. The water movement has slowed up materially since the storm, the movement of barges having been attended with a great deal of difficulty. There are many cases of serious ice damage that have called for extensive repairs.

One important sidelight on the general New England situation is the very narrow and restricted market for steam sizes. Of course they are now embargoed with the rest, but right up to the date of the embargo there was only an apathetic interest on the part of steam users who usually rely upon bituminous. The trade feels there cannot be a great deal of apprehension, outside of the railroads, so long as this remains a characteristic of the market.

#### PHILADELPHIA

Anthracite demand shows little sign of easing off. Winter weather still prevails. Receipts of needed sizes fall off. Big rail for nut, stove and egg strong. Pea unsatisfactory. Delivery conditions somewhat better. Aurl reduction likely to be pushed again. Buckwheat active; other steam sizes quiet. Bituminous shortage grows. Consumers plead for coal. Plants down. Object to diversions.

Anthracite—Without a doubt more coal has been burned thus far this season than in the entire winter last year, and as a consequence the trade is experiencing the strongest kind of demand for more coal. With a couple of months of coal-burning weather still before them the consumers are not slow in appreciating the fact that there must be coal in the cellar to replace the tonnage which has been burned. Of course it is altogether likely that we have gone through the most severe weather, but the experience has always been that from the first of March right up to the end of April a good tonnage of coal is needed to care for this market.

Bituminous—The industries of this territory are in serious straits for fuel and the reports of plants closing down are

becoming common. In many respects present conditions are worse than during the strike last November.

#### NEW YORK

Coal continues scarce as demand for all sizes of anthracite increases. Transportation difficulties and frozen conditions at piers principal reasons for shortage. Dealers handicapped in making deliveries through bad traffic conditions. Yards running short of coal. Public utilities in no immediate danger.

Anthracite—There continues still to be a shortage felt of the domestic sizes. This shortage is being aggravated by conditions in the regions which to a certain extent are slowing up production. Winter conditions at the piers prevents dumpings of normal capacity. The thawing process which must still be resorted to, as practically all cars are frozen solid through, takes time and dealers are securing not more than one half of their normal supply.

Current quotations for company coals, per gross ton at the mines and f.o.b. tidewater at the lower ports are as follows:

	Mine	F.o.b. Tidewater
Broken	\$5.95	\$7.80
Egg	6.35	8.20
Stove	6.60	8.45
Chestnut	6.70	8.55
Pea	5.30	7.05
Buckwheat	3.40	5.15
Rice	2.75	4.50
Boiler	2.50	4.25
Barley	2.25	4.00

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates. Independent shippers are securing 75c. over the above prices on egg, stove and chestnut. About 20c. on pea.

Bituminous—The placing of various embargoes on coal coming to tidewater and the congestion at the piers is a very disturbing factor in the soft-coal market. For a while, but few consumers on the Pennsylvania road, the Jersey Central and Erie east of Trenton were permitted to receive consignments.

## BALTIMORE

Export ban now claimed to be the hub of present domestic shortage in East. Central Coal Committee fails to give relief. Car supply at mines very bad. Anthracite conditions improving.

**Bituminous**—With the export ban on coal almost completely effective as far as New York, Philadelphia and Baltimore are concerned, and complete with the exception of some low-volatile gas-coal releases at Hampton Roads some leading coal men are advancing the idea that this very condition is causing the present critical domestic shortage in the East through failure to provide sufficient cars for Eastern mines while the production of other districts is reported to be the largest in year.

The price situation is somewhat complex. A very little government price coal is in the market, but the majority of coal is on contract or sold undoubtedly above the government price. Some producers are saying openly that they will quote up to \$3.50 and \$4 because they can not produce at a profit at \$2.75 or \$2.95 and that the Lever Act assures producers of a "fair profit."

**Anthracite**—Conditions in the anthracite trade here are improving. The supply has run easier at a time when the shut down on bituminous came. And some dealers are short of particular sizes, but despite the increased call for late coal by consumers who burned more than they had anticipated, the distribution has been pretty good.

## Eastern-Inland

## PITTSBURGH

As far as Pittsburgh is concerned, the industry seems to be well taken care of in regard to coal supplies, although the car shortage is felt here. River transportation is very heavy, and a great deal of coal is coming down from the pools and quickly snapped up by the mills and industrial plants in this district.

The mines are working full time, but it is evident that a great improvement must necessarily take place in the return of empty cars from the seaboard before long if the miners are to be kept at work. Further West from here there is a change in the coal situation, and there are several things that enter into the problem of the Central West operators.

Lack of railroad cars and motive power, together with the inability of the operators to run their mines with a reasonable profit under present conditions, is responsible for the failure of the mines to lay up a stock of reserve fuel, or for the mills to depend on any more than will run them from day to day. R. W. Gardiner, of Pittsburgh, commissioner of the Coal Producers Association, is of the opinion that bad business conditions will be upon us unless the miners are placated with better wages and more convenient working conditions.

## COLUMBUS

Still further reductions in car supply at all Ohio mines has curtailed production. Scarcity of stocks in many sections is reported and some suffering results. Good mood for both steam and domestic sizes is reported.

With the influenza epidemic disabling train crews, cold weather in many sections and the wide distribution of cars during the suspension, the car supply in Ohio is still further reduced. In previous weeks the average supply in Ohio was estimated at between 45 and 50 per cent of normal, but during the past week the supply has been reduced to about 30 to 35 per cent. This is causing a good deal of trouble both to producers and consumers and the end is not yet in sight. Those in a position to know say that there is no immediate hope for an improvement in the car supply and not much increase in production can be expected soon.

Steam users are now about as clamorous as retailers for coal. Many of the larger users have no reserves and are being operated from hand to mouth, as it were. This is true of public utilities and public institutions. Railroads are taking about 50 per cent of the available tonnage for steam purposes, which reduced the coal delivered to plant to a very low point. Rubber factories had rather large stocks and still have some reserve stocks.

## CINCINNATI

The market in this territory is in a very tight situation for fuel for domestic as well as for industrial uses. Business here

was never as demoralized as it is at present. The car shortage is growing worse daily and reports from the non-mine fields of West Virginia which did more than their share during the strike have received only five-days car supply during the past twenty-one days.

The numbers of buyers on the market are increasing daily, and some leave this territory with about as much satisfaction as they entered. Operations in the West Virginia and Kentucky fields have worked but about two and one-half days in the past three weeks. The domestic situation here is not so bad as in other places, as daily arrivals are taking care of current demand.

Reports show that more coal is being "burned" here than in any winter previous despite the fact that we have experienced only a week or two of extreme cold weather. As regards the retail trade demand is in excess of supply principally as a result of labor shortage. Retailers state that they could cope with the supply if they were able to obtain sufficient help.

There is little free coal to offer. There is no set price other than that ordered by the government, but that is a myth. Reports from the various districts of which this city is the gateway show that coal is still being confiscated for railway use. The river is helping to take care of the situation and during the past week heavy tows arriving helped to ease the local situation. Many box cars which were loaded with coal at the mines to help relieve the situation are being unloaded here at a loss of time. There seems to be no relief in sight and no prospect of obtaining an improvement in the car supply before next month.

A fair demand exists for steam coal on account of the fact that the industries in this locality are all working at approximately maximum production. Dealers are beginning to build larger bin capacity to store more coal for the fall and winter months of next year. No one knows what way to turn and there are plenty of firms still trying to get the money that is due them for coal that was confiscated and delivered two or three months ago.

## Southern

## LOUISVILLE

Cold weather resulting in heavier demand on retailers, whose stocks are exhausted. Deliveries very light, but milder weather relieving demand somewhat. Steam grades in excellent demand. Production continuing light due to car shortage.

Retailers faced a heavy demand for coal for a few days starting Feb. 14, when there was a sharp spell of weather. Yards are practically empty, as deliveries have been poor for the past ten days. Milder weather is relieving the pressure somewhat, but back orders are taking care of deliveries of domestic sizes as fast as they can be had. There is a steady demand for all grades of steam coal, resulting in the market being well cleaned up, with no spot coal being offered to speak of.

Production at the mines continues at the rate of two or three days full work weekly, as the car shortage is not showing much improvement, and deliveries are very uncertain. Nothing new has come up in connection with the threatened suits of operators on the Louisville & Nashville lines against the U. S. Railroad Administration for losses caused by discrimination in the matter of car supply, although action is likely at any time.

## BIRMINGHAM

Shortage of cars delaying movement of coal and also cutting production materially. Trade active with indications of a stronger demand developing. Labor shortage results from sickness in many camps.

Brokers and distributing agencies report a very active demand for all grades of coal, and, due to operating conditions, under which production is being very much restricted, predict a stronger market will soon develop. The mines are all behind on deliveries against contracts and the filling of spot orders is also suffering delay on account of the lack of cars for loading.

The spot inquiry is good and there is also a substantial amount of contract business being offered, some of which is being booked subject to the regulations of Government price control and with a clause inserted allowing a 14 per cent increase over Fuel Administration prices in case restrictions are removed during the life of the contracts.

Export inquiry is being made but there is no coal available for the foreign trade at this time and none of this business is being taken on. Additional towboats provided on the Warrior River increased shipments of coal to Mobile and New Orleans from mines in the Warrior field.

## Lake Region

## BUFFALO

Again the multiplied bizzards. Much risk of a bituminous famine, but no report of it yet. Some cars moving now. Anthracite shut off temporarily.

**Bituminous**—Two zero periods in one week, the first with much snow and wind, ought to be about the final effort of the weather this winter to do its worst. We call the shipping tie-ups worse this winter than they were two years ago, even if they stop now. February opened mild and for two weeks it promised to let up for the season. Then suddenly on the night of the fourteenth it shut down again and the car situation has been a matter of stand-still mostly since, for one blizzard was over but a single day before the next one followed.

Still the shippers and the roads have worked together better than they did last month and they have kept the coal moving to the most needy consumers, so that the complaint has not been as great as was expected. If the worst is now over, as it seems to be, the public will have great reason for joy, for the risk has been great of a general famine. In the deep snow the trains could move only on the expenditure of a great amount of work and it often happened that cars of locomotives got off the track in the drifts and made matters still worse. We do not usually like to see the snow go, but a shower of rain would be welcome now.

**Anthracite**—For some days after the fourteenth the supply was almost entirely cut off. The Lackawanna R.R., which brings in most of it, had much difficulty with snow, and, besides, some snow-plow wrecks to contend with, so that for a day or so nothing passed over the line. Other roads were not much better, and if it had not been for the fact that the consumers were pretty well supplied there would have been many a house without fires for days. As it was the shortage was somehow tided over, just how it was done nobody but those who did it being informed.

Buffalo is so near to Scranton that it has always been felt that an anthracite famine was about out of the question, but the margin has been so small in late years that no safety was enjoyed and it is now the general idea that there will be none till there is a large amount of coal stored permanently, either in the large cities or at junction points where it can be obtained quickly, either by means of local trains or trucks. The consumer will have to pay, but he is getting used to that.

## TORONTO

**Anthracite in active demand**—Shipments delayed by snow blockade, but conditions improving—Great shortage of bituminous—Prices increased owing to exchange.

Continued cold weather, during which the stocks laid in by many consumers were exhausted, has caused an active demand for anthracite. Shipments from the mines have been considerably delayed by the snow blockade at the Niagara frontier, and the shortage became serious.

The situation has lately been relieved and a fair amount of hard coal is now coming forward. Hardly any soft coal is being received owing to the confiscation of shipments for railroad use, and great scarcity prevails. Prices have advanced on account of the high rate of American exchange.

## CLEVELAND

Although stringency still prevails, the local coal market is much easier. Headway toward returning empties is reflected in increased operations at southern and eastern Ohio mines, and in turn by larger receipts here.

**Bituminous**—Another week of near-zero weather has further strained the local coal trade, but as has been the case all along, minimum requirements have been met. Diversion to meet the needs of the leading public utility have ceased, and the position of dealers is thereby better. It is estimated that receipts in the past week have been from 35 to 45 per cent of normal. In some cases small reserves—from two days to a week's supply—have been built up.

That the situation in Cleveland is easier than that in nearby districts is seen from the fact that steam-coal users, even from Pittsburgh, are seeking supplies from Cleveland operators. The present scarcity is more market in slack than in mine-run. Hope that Government price maximums would be lifted March 1 has all but been abandoned, with supplies so low. In most cases operators are rationing their output among regular customers, and "shoppers" are now getting short shrift.

Domestic bituminous demand is increasing every week. Stocks laid in last fall, on the average, would have sufficed for a normal winter, but the drain has been so heavy domestic consumers have been forced into the market again. In meeting this demand, coal dealers are more handicapped by a shortage of labor than by a shortage of coal. Here too available coal is being rationed, and domestic consumers limited from a one to one and a half. Dealers' supplies are streaky—one day they will have nothing but Masillon lump and the next nothing but No. 8 Pittsburgh—and domestic consumers must take what dealers can give them. Prices on all grades of steam coal remain unchanged.

The past few days have seen the railroads making more headway returning empty cars to the mines. This improvement has been interrupted by the recent zero wave, but this is expected to be only temporary and operators hope the peak of the shortage has been passed. Cars from Buffalo and Eastern points are slow in returning, but from the West better service is being rendered to eastern and southern Ohio mines.

**Pocahontas and Anthracite**—Pocahontas continues to come through in good shape, but last week's storm appears to have set anthracite movement back seriously. Dealers are getting about half of the Pocahontas they could sell, but not more than a quarter of the anthracite they seek. On about half the days of the week dealers can supply either grade; on the remaining days they substitute coke or bituminous. Domestic demand for Pocahontas and anthracite is heavy, buying last fall having proved inadequate to meet the needs of the severe winter. Owing to the influenza epidemic, dealers' delivery forces are about one third short.

**Lake Trade**—An inkling of what may be expected to happen to Lake Superior and Lake Michigan coal rates in the coming season may be gained from the fact that Canadian tonnage of 250,000 tons of bituminous coal to Montreal this season has been contracted for at \$2.50 a ton. This is an increase of 50 c. per ton over the 1919 rates, when ocean-going steamers built on the Great Lakes for the Emergency Fleet Corporation loaded coal for Montreal on their way to the ocean and competed with the Lake lines. The Canadian coal will be loaded at Cleveland and Lake Erie ports to the East. It is not expected Lake Michigan and Superior coal rates will be fixed before the middle of March.

Retail prices of coal per net ton delivered in Cleveland are:

Anthracite—Egg, \$12.20@12.40; chestnut, 12.50@12.70; grate, 12.20@12.40; and stove, 12.40@12.60.

Pocahontas—Shovelled lump, \$9.00@9.25, and mine-run, 8.00@8.25.

Domestic bituminous—West Virginia splint, \$8.30; No. 8 Pittsburgh, 6.85@7.00; Massillon lump, 7.40@7.65; Cannon lump, 11.00; and Coshocton lump, 7.35.

Steam coal—No. 6 slack, \$5.75@6.00; No. 8 slack, 5.80@6.00; Youghiogheny slack, 5.25@6.10; No. 8 1/2-inch, 6.35@6.60; No. 6 mine-run, 6.30@6.85; and No. 8 mine-run, 6.30@6.85.

#### DETROIT

Detroit faces curtailment of Detroit Edison service due to diversion of the company's coal supply to railroads.

**Bituminous**—Discontinuance of electric power service to all non-essential industries will be necessary, within five days, according to representatives of the Detroit Edison Co., unless immediate relief is obtained. Increasing that company's coal supply. This announcement follows the seizure Monday of 26 cars of bituminous coal just after their arrival in Detroit and while awaiting switching to the company's yards, and the notification later the same day that a West Virginia mine that has a contract to supply the company with up to 20,000 tons a month must turn over its output to the Seaboard Air Line R. R.

It is explained by representatives of the Detroit Edison Co. that the mine had a contract to supply 5,000 tons a month to the railroad but having been unable to get sufficient cars to meet this terms of its

contracts has been making a pro rata delivery. The Railroad Administration's order requires the mine to turn over 5,000 tons a month to the railroad and forbids loading coal for any other customer until it has made good all deficits on earlier deliveries to the railroad.

J. W. Brennan, purchasing agent of the Detroit Edison Co., says that 2,100 cars of the company's coal were confiscated by the Railroad Administration during the recent miners' strike and that approximately 50,000 tons have been lost from the company's reserves within the last 30 days. It is now necessary, he says, to secure sufficient coal to meet the company's daily requirements and to replenish its depleted reserves.

Various other Detroit industrial and manufacturing plants are facing a similar shortage in supply. Even assuming that the mines are again loading coal for Detroit and Michigan, jobbers feel there is little assurance that coal will be sent through in sufficient quantity to afford relief. Lack of railroad motive power and car shortage are likely to prevent much coal getting into Detroit, they say.

**Anthracite**—Because of the extremely cold weather early in the week, there has been considerable increase in demand for anthracite, with the result that stocks in retail yards are greatly reduced. Shipments are not coming in very freely, while the transportation situation has been disarranged by storms in the East.

### Middle West

#### MIDWEST REVIEW

Cold weather, and the car shortage have both contributed in some degree in keeping the market very strong and steady. A number of our best known operators and wholesalers are refusing to take business calling for shipment at any specified time, as the congested condition of their order books does not warrant it.

It will take full running time for a number of weeks for the operators to catch up on old and delayed orders. Some firms are not taking additional business, while some are taking business with the understanding that the coal will be shipped as soon as they can get around to it, and not before, which means that shipments will probably move forward some time in the middle, or latter part of March.

There has been no noticeable improvement in the car supply. In fact, the supply this week has probably been even worse than last week, although it is a little early to obtain any accurate figures. To give a comprehensive idea of the situation we will take, for example, a company with a number of mines in the Franklin County field, has a daily output of but 25,000 tons. Mines of this company are served by the Illinois Central, the Chicago, Burlington & Quincy, the Chicago & Eastern Illinois and the Missouri Pacific.

#### CHICAGO

Anthracite shipments are not coming into this market as rapidly as could be desired, and while there is not an actual shortage, a number of people who heretofore burned hard coal, are now burning soft coal.

Eastern coals are increasingly hard to get, and are in great demand. If the Government restrictions were removed, Eastern coal from West Virginia and Kentucky would be selling at a decided premium. The retail trade are nowhere near as independent today as they were a week or so ago. They are looking for coal, and looking for coal to be shipped promptly, and they are having some difficulty in finding what they are after.

#### ST. LOUIS

The greatest car shortage in history prevails in the Middle West. Incompetent management of railroads responsible for this lack of motive power and disregard of property rights.

The local condition, while it is not satisfactory, is good, everything considered. St. Louis is short of domestic sizes of coal and also short of steam, but it is nothing compared with outlying districts. A few embargoes still prevail on some of the Western lines and this forces a market in St. Louis.

In the Standard field the working time has gone down to about two days per week and some mines do not work that much. The two days car supply may be distributed over a period of four days, a few hours each day.

If it were not for Government prices coal in this field would be going at as high as \$5 or \$6. The miners are dissatisfied and say they cannot live under these working conditions. In the Mt. Olive district conditions are a little better, but in a general way similar to those in the Standard field.

#### MILWAUKEE

Shortage of coal and inadequate supplies by rail promise to precipitate an advance in prices all around. Popular grades of anthracite not to be had.

A pressing demand for coal, with exhausted stocks and an uncertain supply, makes the coal situation at Milwaukee very unsatisfactory. Prices remain unchanged, but dealers contemplate an advance as soon as they can offer sufficient reason for so doing.

They say that reason exists now, but the public will have to be convinced before the step will be taken. Bad weather and interrupted rail traffic will precipitate an advance. The only hard coal obtainable at present is egg and buckwheat. Mine run is the only grade of Pocahontas to be had.

Coke dealers defend the advance in this class of fuel by pointing to increased freight cost as they are now receiving coal by rail. The expense of production held is also continually increasing.

### Coke

#### CONNELLSVILLE

Production of Conneltsville coke seems to be all going out on contract, and the market retains very little for purchasing purposes, so that there seems to be no immediate prospect of a broadening in the market, as far as there being any increase in supplies offered.

It is presumed that where buyer and seller were negotiating a contract and had not reached final terms, when the Government control came, they simply decided to consider that they had a contract between them with the Government price as the invoice figure, a regular contract to be negotiated upon the removal of the Government control.

The coke market is not active, but at least it is well defined, at the Government limits, \$6 for furnace and \$7 for foundry. Several weeks ago one or two coke operators were disposed to suggest to prospective buyers that some coke would be available if means were devised for making it net the seller more than the Government price, but all such efforts at evasion of Government regulations seem now to have disappeared.

There has been a division between operators in the matter of billing coke when the contract stands at above the Government limit, and there are still the two parties—comprising those who have made the concession to customers and those who have not. Making the concession simply means that the law has been lived up to.

The furnaces are being well supplied with coke, that is, much better than in previous months, and yet they could do with a good deal more. It requires a daily watching on the part of the furnaces to insure a sufficient supply. The cold snap at the beginning of the week, and another coming Thursday morning, made matters doubly hard for the railroads, and in consequence the car shortage has become aggravated, so that reports next week are expected to be very pessimistic as regards production of coke—two or three days this week no coal cars were furnished in the coke region at all, while cars for coke shipment dropped to 30 per cent.

#### BUFFALO

The situation is affected by the storm, some of the furnaces being very short of any supply. Such times occur so seldom that often not much effort is made to lay down much stock, on account of the extra cost. Furnaces are running as strong as conditions will permit.

Much improvement should be made next week. It is hoped that when the railroads return to private ownership after March 1 that a better distribution of cars will be made.

The ore season ought to open early, for the full amount under contract was not delivered last fall, but the hitch over rates is still on, with vessel owners standing for an advance. Coke prices are quoted on the basis of \$9.60 for 72-hr. Conneltsville foundry, \$8.60 for 48-hr. furnace and \$7 for off grades, per net ton f.o.b. here.

## House-Cleaning Time

BY RUFUS T. STROHM

**T**HERE comes a time in early spring  
When housewives get extremely busy,  
And set their mops and brooms a-swing  
Until they drive the household dizzy;  
They scrub the floors and beat the rugs,  
Wash all the woodwork, dust the ceilings,  
Eject the spiders, moths  
and bugs,  
With no regard for  
insect feelings.

**T**HEY gather rubbish by the ton  
From closet, cellar,  
hall and attic,  
And keep the ashman  
on the run  
Until his breathing  
grows asthmatic;  
But when the house is  
clean and free  
Of trash and litter  
evil-smelling,  
It then becomes what  
it should be—  
A mansion fit for  
human dwelling.

**T**HE miners' union ought to take  
A lesson from the housewife's duties,  
And seize an opportunity to shake  
Its garments free from nasty cooties;  
For Bolshevistic bugs and fleas,

Within its shack have snugly nested,  
And anarchistic ants and bees  
Its inner chambers have infested.

**T**HEY'VE stung it with their poisoned  
darts,

And bit it in and out  
of season,  
Till, driven frantic by  
the smarts,  
It's lost its balanced  
sense of reason;  
And that's why com-  
mon people choose  
To note its actions  
with suspicion,  
Nor will they modify  
their views  
Till it regains a sane  
condition.

\* \* \*

**I**T'S got to bounce the  
rampant Reds,  
Expel the troublous  
Bolsheviki,  
And maybe dent the  
wooden heads

Of radicals who've grown too cheeky;  
Then, having purged its council hall  
Of law and order's worst maligners,  
It may at length be fit for all  
The country's honest, decent miners.

# IDEAS AND SUGGESTIONS

PRACTICAL SCHEMES THAT MAKE THE DAY'S WORK EASIER

## Safety Device for a Cutoff Saw

DEVER C. ASHMEAD  
Tarrytown, N. Y.

An interesting safety device has been devised by the master mechanic of the Burnside Colliery of the Philadelphia & Reading Coal & Iron Co., near Shamokin, Pa. This device works automatically and throws a

shield between the man operating the cutoff saw and the saw itself. When the saw is pulled forward by means of a lever a semicircular shield is thrown between the operator and the saw, just allowing sufficient space for the timber to pass between the saw and the shield. The accompanying diagrammatic illustration shows how this device operates.

## Storing First-Aid Supplies in the Mines

Nearly every coal mine plant has some particular building or portion of a building that is utilized for the storage of first-aid supplies. Taking the supplies into the mine and there storing them has always been a problem as it is always difficult to maintain the proper temperature and humidity. Materials such as

bandages not in A-1 condition are even more dangerous sometimes than no materials at all.

A simple and inexpensive box divided into three main longitudinal compartments can be readily constructed at the carpenter-shop, and can be made to serve an excellent purpose. Little explanation is needed as the accompanying illustration is practically self-explanatory.

The upper compartment is used to accommodate two stretchers. The middle compartment is divided so as to hold a first-aid cabinet, two woolen and one rubber blanket. The lower compartment is equipped with two

UNDERGROUND FIRST-AID SUPPLY BOX

60-watt, Mazda lamps employed to generate heat for keeping the supplies dry. Holes may be bored in the rear of the box to allow adequate ventilation. Any suitable dimensions can be used in constructing such a box.

At the mines of the Stonega Coke & Coal Co. in Wise Co., Va., one of these boxes is kept within 2,000 ft. of every man underground. Each miner knows the location of the box nearest his working place. Five or ten minutes delay in giving treatment in case of a serious accident may be the dividing line between life and death.

## Safe Guards for Trolley Wire

BY G. E. DAUGHERTY  
Pikeville, Ky.

How to build the most reliable and safest trolley guard is a question that has been discussed from many different viewpoints. The perfection of any system depends largely on the taste of the workman doing the job or his consideration for the adage, "Anything worth doing at all is worth doing well." There is considerable room for improvement on the present method of safeguarding trolleys in mines. This is a detail for the inventive mind upon which to do something really worth while and win fame and fortune.

Poor workmanship in hanging wire is the first cause of difficulty in keeping it guarded. A trolley frog in the wrong place, too few insulators to hold the wire level or maintain uniform curvature are matters to be first considered if guards are to stay up and haulag-

carried on. This does not take into consideration the time and money saved from broken trolley poles and consequent delays.

An adequate and reliable guard is the next requisite. This should extend from the trolley frog to 2 ft. beyond the opposite pillar so as to comply with the mining law asking for guards at all places, where men regularly pass under the wire, when less than 6½ ft. above the rail. The usual failure under this condition is to guard the space only where the motor passes under. Other places neglected entirely are side tracks, sand boxes, pumps, manway crossings, room necks, trap doors, etc. Every care should be given to safeguarding the trolley on haulageways that are also used for traveling.

The rubber guard is meeting with much favor among east Kentucky operators, being effective and easily installed. Old fire hose is the usual source of supply, but new hose is being used in many places. Guards of this kind have been in use for two years without much attention in the mines of the Pond Creek Coal Co. of Stone, Ky.

The following precaution is necessary in order to secure the best results. Insulators should be hung every 4 ft. on curves, and somewhat farther apart on straight wire. Split one side of the hose and hang it under the insulators and over the trolley clamp. Round off the end where the trolley wheel enters; in some cases a stiff wire is used to spread the mouth of the hose apart. Care should be given to the trolley wheel bolt, keeping it smooth so that it will not tear the guard.

### Water Supply for Drills

The Philadelphia & Reading Coal & Iron Co. at the Burnside Colliery has a large water tank with a capacity of about 2,000 gal. mounted on trucks for carrying

AIR PRESSURE WATER CAR

water into the mine to supply the drills used in driving the headings.

This tank is made of steel and is so arranged that the water can be forced out under pressure by attaching a compressed air pipe to the proper inlet in the tank. The accompanying illustration shows the arrangement of the connections.

### Homemade Device for Handling Oil Barrels

BY JACK L. BALL  
Amsterdam, Ohio

There is no task around a coal mine that meets with more disfavor than handling leaky oil barrels. This is a disagreeable job, especially in cold weather.

The simple device shown in the accompanying illustration is used to handle barrels at a certain mine with

highly agreeable results. It is not necessary to touch the barrel with the hands, and it is easy for one man to move a full barrel over almost any kind of a rough surface.

HOW THE BARREL TONGS ARE USED

The measurements shown are for a standard barrel. The points can be shaped so that the injury done to the heads of a barrel is of no consequence.

### Safe, Homemade, Mine-Rescue Searchlight

In mine rescue work the rescue party is in many instances handicapped through having insufficient light. Usually, conditions in the mine are of such a nature that open lights cannot be used with safety. Ordinary safety

SAFE SEARCHLIGHT FOR UNDERGROUND USE

lamps or the small electric flash lights are or may be inadequate for the purpose intended. In all cases it is advisable to have a portable searchlight as part of the mine rescue equipment. The accompanying illustration shows a portable light of high power that may be safely used in a gassy or dust-filled atmosphere.

# Colliery Boiler Plant Satisfactorily Burns No. 2 Tank Barley

Small-Size Anthracite Is Burned on Automatic Stokers and Satisfactory Results Are Obtained—Building Is Kept Cool Even in Summer By Draft Fans

By D. C. ASHMEAD  
Tarrytown, N. Y.

**N**EAR Wilkes-Barre, Pa., the Pennsylvania Coal Co. has just completed a boiler plant at its No. 14 Colliery. Its construction was a case of rebuilding while in operation. This did not, however, involve intri-

water tube boilers and five 283-hp. Stirling boilers making a total of 3,215 b.hp. At present there is sufficient space for the installation of four more Babcock & Wilcox boilers and three more 283-hp. Stirling boilers.

FIG. 1. EXTERIOR VIEW OF THE NO. 14 COLLIERY BOILER PLANT  
Concrete, brick, steel and glass have been used exclusively in the construction of this building

cate or delicate problems in construction work, so I shall not lay stress on this phase of the situation.

The new boiler house is of brick and concrete construction of the latest design and is architecturally attractive. The foundations and floors are of concrete and reinforced concrete, while the walls and stacks are built of brick.

At the present time the full boiler horse power of the plant has not been developed. There are now in continual service twelve 150-hp. Babcock & Wilcox

This will increase the boiler capacity of the plant to 4,664 hp. The foundations for the additional boilers are in place and the company expects to install at least one if not two of the Stirlings some time during the spring. The boiler working pressure is 135 lb. gage.

The coal used in generating steam is No. 2 tank barley and is fired on Coxé stokers. These stokers all have a width of grate of 5 ft. and a length of grate 10 ft. 4 in. with the exception of two which have a grate

FIG. 2. CROSS-SECTION OF THE BOILER PLANT

The convenience of the arrangement of conveyor, bunkers, downcomers, stokers, boilers, breechings, flues and ash tunnel are immediately apparent.

FIG. 3. GROUND PLAN OF BOILER PLANT AND FAN ROOM

Features of design that immediately appeal to the experienced plant operator are the spacious firing alley and the adequate interval between the boiler settings

width one foot greater. The length of these grates is, however, the same as that of the rest. The stokers have a speed of travel of 2 to 8 ft. per hour depending on the load. They are driven by a 5-hp. direct-current 250-volt motor built by the General Electric Co. The

FIG. 4. FRONT VIEW OF THE STOKERS

The coal valve wheels, chains and gate wheels are plainly visible

coal is fed to the stokers, as is shown in Figs. 4 and 5, through steel pipes 14 in. in diameter and the amount of fuel fed to the grates is regulated either by hand or automatically. Intake valves are placed near the top of the pipes and directly below the bunker. These are operated by chains from the boiler-room floor.

Williams water columns are used and the feed water is regulated by means of Williams and Copes feed-water regulators. High- and low-water signals are also employed. A central pressure gage is in view from all parts of the boiler room.

The ashes from the stokers are dumped into an ash pit directly under the boilers and from here they are washed and run by gravity into cars which travel under the chutes from the ash pit. The ash tunnel is double tracked and has a drain down the center which carries away all the water used for washing out the boilers and the ash pits, as well as that necessary for cleaning the ash tunnel. The air is kept cool and pure in this tunnel, as it is continually sucked out by the forced-draft fans. The ash cars are pushed out by hand.

The flue gases pass from the boilers through steel breechings to the main flues which are built of brick and concrete and run the full length of the boiler room. At the central point of each of these flues a stack is placed. These are 10 ft. in diameter and have a height of 190 ft. The arrangement of flue and stack is the same on each side of the power house, and each side is independent of the other.

At one end of the boiler room is a small engine room (Fig. 3) in which all the auxiliary machinery for operating the boiler plant is placed. There are two forced draft fans of the multivane type 12 ft. in diameter and built by the B. F. Sturtevant Co. Each has a capacity of 175,000 cu.ft. of air per minute against a pressure of  $2\frac{1}{2}$  in. of water. These fans are driven by 14 x 16 in. engines direct-connected. The engines are of the side-crank, single-valve, inclosed, self-oiling type and were built by the Ridgway Dynamo & Engine Co. They operate under automatic control.

The fans draw air from the top of the boiler house and also from the ash tunnel through specially built air conduits. When they were first installed they took air from the engine room only, but it was found impossible to keep the windows in the engine room, when closed, from breaking. Other arrangements consequently had to be provided. The change in source of supply was made and as a result the ash tunnel and the top of the boiler house are not now excessively hot even in the summer. The air from the fans is forced through a tunnel that passes under the front part of the boilers and is admitted to the firebox by a valve that regulates the supply of air in accordance with the needs of combustion.

At the present time the feed-water pumps are of the direct-acting type, but these are to be replaced shortly by centrifugal machines. The feed water is recorded by a Venturi meter on the 6-in. pump-discharge line. A Webster open feed water heater of 6,000 hp. capacity is used for heating the feed water and raises its temperature to 200 deg. F. before it is sent to the boilers.

Besides the feed pumps, the fans, and the feed water heater in the engine room, a small substation is here located, furnishing power to the mine. This substation contains two duplicate motor-generator sets. The generator half is 250-volt direct current, while the motor is 2,300-volt, 3-phase, 60-cycle, alternating current. A 10-panel General Electric switchboard for handling the

FIG. 5. INTERIOR OF THE BOILER ROOM

Note the vertical down-comers and the big steam gage, visible from all points of the room.

current is also installed. The current is at present furnished from another of the Pennsylvania Coal Co's plants.

The coal bunkers, or rather bunker, extends the entire length of the boiler room. Its top is 34 ft. 4 in. above the

FIG. 6. PARTIAL PLAN AND CROSS-SECTION AT CENTER LINE OF STACKS  
The relative positions of the stacks, flues, draft ducts and ash tunnel are here apparent.

boiler room floor. It is 16 ft. deep and can be filled to a height of 5 ft. above its top. The total width is 22 ft. in the clear and there is one coal outlet on each side directly in front of each stoker. The bunker is 200 ft. 10 in. in total length and has a capacity of 1,927 tons of coal, when filled up to the bottom of the distributing conveyor. This bunker is built of concrete and rests in a steel frame. The sides are of reinforced concrete.

The coal is brought from the tank barley pocket in the breaker and carried to the top of the boiler house above the bunker by means of a drag-line scraper. This conveyor traverses the full length of the bunker and the coal drops through slots in the bottom of the drag-line trough and into the coal bunker. These slots are of course so arranged that they may be closed. A coal meter is placed in this conveyor line, recording the amount of coal delivered to the bunker. The scraper line is operated through a belt by a 36 h.p. General Electric alternating-current, 60-cycle, 110-volt motor.

A fire wall has been placed between the engine room and the boiler room. The roof is supported by steel trusses and a long ventilator or skylight extends almost the full length of the building. This admits light and air and helps to keep the building cool in the summer. A steel walkway or balcony is hung in the rear and slightly above the tops of the boiler, giving ready access to any part of the piping, or the outside of the boilers themselves. This balcony runs around all four sides of the building, while iron ladders reach from it to the floor of the boiler room. From this balcony steel stairs extend to the top of the coal bunker and a steel gallery runs the full length of the scraper line.

The steam piping throughout the engine and boiler rooms is protected with 85 per cent magnesia covering. The main steam header is 14 in. in diameter and the individual steam pipes from each boiler are 6 in. in diameter. The feed water line is 6 in. cast-iron pipe. Some of the results obtained in this plant are as follows: Rated boiler capacity, 3,215 hp.; watergage air pressure, 2½ in.; temperature of feed water, 200 deg. F.; evaporation actual, 5.5 lb. of water per pound of fuel; fuel, tank barley; steam pressure, 135 lb. gage; load on

boilers, average, 150 per cent.; peak loads, 200 per cent.

The Pennsylvania Coal Co. is considering constructing a large generating station in connection with this power house during the coming spring and increasing

FIG. 7. VIEW IN THE ASH TUNNEL  
Draft air is drawn from this passage, keeping its atmosphere clean, cool and free from dust at all times.

the capacity of the boiler plant to the full amount or possibly enlarging it. The additional power thus generated will furnish electricity not only for this plant, but for a number of other operations belonging to the same company.

### Diversion of Coal to Cease

Chairman Spencer, of the Central Coal Committee, issued instructions to cease the diversion of coal, and to buy the coal at whatever price is necessary. The Pennsylvania R. R. is now offering wholesalers to take over their contracts with collieries for 30 days at whatever price the wholesalers have the coal bought from the collieries.

It will pay the wholesaler 15c. per ton profit and will agree to pay cash, ten days after receipt of invoices.

# Open Cut or Strip Mining and Its Development

Under Certain Conditions Coal Stripping gives Excellent Results and Low Unit Costs but Many Circumstances Should be Carefully Investigated Before Work is Started

BY H. B. MILLER

Pittsburgh, Pa.

CERTAIN coal areas exist in Pennsylvania, Ohio, West Virginia and other states, where the cover is so shallow and the roof "so rotten" that it will not endure extraction of the coal by underground mining methods. Consequently the coal can not be taken out by such means. Where this condition exists the open cut or stripping method should be employed, as it is the only profitable manner in which beds lying horizontal or nearly so having an overburden of alluvium, shales, or soft stratified sand rock can be mined. In the anthracite field where the beds are thick, heavy sand rock may be profitably moved. In the development of stripping territory, the method of operation selected depends on the shape and size of the tract, the average depth of overburden, local topography and the output required. In the preliminary examination, the source of water supply and its purity should be taken into consideration, as the average plant will require about 35,000 gal. of water per day of 9 hr., if the shovels are to be operated by steam. This amount will also depend upon the number and size of the units employed.

State and county roads crossing the property must also be taken into consideration, since obtaining permission for a change of their location is sometimes quite difficult, and if not granted a problem is immediately presented in the way of economical operation which may affect the success of the undertaking, as well as the plant layout. Buildings and wooded areas above the crop line, as well as railroad approach, rights of way, and the per cent of grade are also to be considered. If the plant is to be operated by electricity, the proximity to a source of power supply must be considered.

## CROP COAL IS USUALLY UNMARKETABLE

In calculating the amount of tonnage available in a stripping area where there is a crop line, it is not wise to estimate from the actual crop, but from a line 5 or 10 ft. away from the crop line, as the coal from this point to the actual crop will probably be so disintegrated as to be unmarketable. It therefore should not be included in the tonnage estimate, which should be figured conservatively.

Output and method of operation should be adjusted to the amount of tonnage available, in order to secure

minimum cost of production, including interest and amortization on the capital invested for equipment and that expended in actual stripping operations. Steam-shovel methods involve large capital outlay for equipment and preliminary stripping; hence they should be limited to work where there is sufficient tonnage available to guarantee a suitable return on this investment plus interest during the life of the operation. When properly installed and operated, stripping plants yield enormous outputs at low unit costs.

The general features of steam-shovel mining appear simple; but good management, close attention to details and systematic work are essential to success. The shape and position of the territory to be stripped should be predetermined so as to permit intelligent planning of approaches and track lay-outs, the minimizing of delays and the handling of the maximum amount of tonnage. Maintenance and repair of tracks and equipment are also important. Since the unit cost, with a given equipment, varies inversely with the output, there should be no preventable delays when the plan is once put into operation.

Quite an area may be stripped before actual mining of coal begins, or mining and stripping may proceed simultaneously, when a sufficient area has been uncovered to avoid interference between the two operations. The latter plan is the more advisable, as it reduces the initial investment required before production begins. The direction of the box cuts or excavations will be governed by the topography and average depth of overburden, and the disposition of the excavated materials on the spoil bank. Their arrangement must be such as not to interfere with or embarrass subsequent mining.

Operating costs are lowest when there is no expense for transporting stripped material to the waste dump, and the shovel output is increased by eliminating delays incident to loading into cars. The maximum daily output is a function of shovel capacity, depth of stripping and thickness of coal.

The large type of shovel, with long boom and big bucket, much used in coal stripping, moves on tracks laid on the coal bed. The overburden removed is dumped to one side, thus creating the mounds of excavated material termed "spoil banks." The first through cut is

In selecting a method of strip-pit operation the shape and size of the area worked, the thickness of overburden, local topography, required output, source and quality of water supply, position of state and county roads, buildings and wooded areas above the crop line, railroad approach and rights of way must all be considered.

termed the "initial box cut," and in subsequent cuts the materials removed are deposited in the previous excavation, thus creating another spoil bank. The large revolving shovel, has its most common application in stripping bituminous-coal deposits, on account of its operating range and capacity for sustained output.

The uncovered coal is generally blasted and loaded with a light shovel into cars. This shovel should be of the caterpillar traction type, since this variety can readily change its direction for operation, has a greater bearing area, and provides more stability, as well as being able to move and work over much softer bottom than the ordinary wheeled shovel.

On a stripping area of appreciable size, a large type of shovel having an 85 to 90 ft. boom, with a 5 to 8-yd. dipper should be used. As an example, we will assume that it is desired to strip an area having about 25 ft. of overburden, and using a shovel with an 85 ft. boom, 60 ft. handle, and a 5 cu.yd. dipper. This will make an initial box cut, overcasting the excavated materials or spoil to one side. When the shovel is in operation it revolves about a central axis or line termed the center line of rotation. Taking the pitch of the boom at 45 deg. the following results are obtained: The distance from center of track to base of box cut bank is 31 ft., or the width of the box cut at bottom is 62 ft. The width at the top would be 73.6 ft., the slope of the box cut being about 1 to 5.

The spoil bank is figured on a 20 per cent swell of materials. The distance across the base of the spoil bank would be about 109 ft., and across the top, 16 ft. From the original ground line to the top of the pile would be 37 ft., and from the top of rail on which the stripping shovel stands to the top of the spoil bank will be 65 ft. The slope of the spoil bank will be 1 to 14. The dumping radius from center line of rotation to far side of pile, will be 100.5 feet.

Sometimes instead of casting materials to one side only, conditions warrant the overcasting of spoil to both sides. In this case the box cut width remains the same as formerly, but each spoil area since there are two instead of one is reduced. Then again, as in starting on a hill-side crop, it is desirable to make the initial cut as a side cut. Later on box cuts would be made thus developing spoil areas on one side only.

**ONE SHOVEL MAY MOVE 5000 CU. YD.**

Working under favorable conditions, such a shovel as assumed above could remove, say 5,000 cu.yd. of material in a day of 9 hr. It would be safer, however, to estimate its capacity at, say 4,500 cu.yd. per day. At times it may be necessary to run the large machine night and day, in order to keep ahead of the small loading shovel. For this reason, the large shovel should be equipped with a 1-kw. 30-volt, steam-turbine generator set. The necessary lights and dynamo should be on the shovel before it leaves the shop.

For loading the coal, a small revolving type of shovel should be employed. This should have, say, a 30 ft. boom, and a 19 ft. dipper stick. Also a special flat-front coal-loading dipper of about 1½ cu.yd. struck measure. If the shovel is mounted on caterpillar trucks, it can be moved about more readily, as this method of support eliminates the use of platforms or tracks and consequently the extra pit labor required. This form of support enables the machine to make a wide cut necessitated by the great range of the coal-stripping shovel that has preceded it.

It also secures the higher lift necessary, in order to load coal into gondolas or other types of coal cars, say, on top of a 6-ft. bed of coal. A shovel of this type can load three 50-ton standard railroad gondolas in one hour, handling run-of-mine coal direct from pit into car. Either of the above shovels can be operated by steam or by electricity.

**BALANCING SHOVEL CAPACITIES**

In order to illustrate the amount of work that can be performed by the above types of shovels, the following table is prepared, assuming that 1 cu.yd. of coal in the bed weighs approximately 1 ton, and making no allowances for intrusions such as horsebacks and the like. The output (place measure), in cubic yards, divided by the depth of overburden in yards, gives the number of square yards of surface which the shovel uncovers, on top of the coal. Spoil area is figured on 20 per cent swell for loose material. Assuming that the bed is 4 ft. thick, giving 1¼ tons of coal under each square yard of surface uncovered, we have the following figures for stripping:

Depth of Stripping, Ft.	Width of Cut, Ft.	Length of Cut, Ft.	Approximate No. of Cu.Yd. of Overburden	Sq.Yd. Uncovered	Approximate No. Tons Coal Uncovered
49	60	56	6,094	373	497
35	82	48	5,102	437	583
30	89	50	4,950	494	658
25	95	56	4,928	591	788
20	101	65	4,875	729	971
15	115	76	4,855	971	1,295
10	118	110	4,800	1,442	1,922

One acre of 4 ft. coal will yield about 6,560 tons of coal, or one foot acre, will yield 1,640 tons, more or less, dependent upon the specific gravity of the coal. However, in stripping, 10 per cent loss should be allowed for mining and loading. It will be noted by reference to the above table, that when the depth of stripping is 25 ft. the big shovel will only uncover approximately 788 tons of coal in a day of 9 hr. The capacity of the small loading shovel, on the other hand, is 1,350 tons per day. Consequently, the stripping shovel would have to work double shift in order to keep ahead of the loading shovel, provided the car supply was good and no loss in loading was encountered.

Aside from the shovel tracks, if standard railroad gondolas are run direct into the pit, it is advisable to use 70 lb. rails, of course laid to standard gage. One or two locomotives for shifting would also be required as well as one flat car.

Should it be decided to haul the coal to a tippie and prepare it, instead of loading run-of-mine direct into gondolas, a different type of equipment would be used in the pit as well as lighter rails, and a narrower track gage. In addition to the pit equipment and tippie, there will in any case be railroad sidings to be provided. In some cases also there must be houses and shops, a pump house and pipe line. The use of 2½-in. to 3-in. pipe about a stripping plant will generally provide the amount of water required.

The following is a brief summary of the labor employed about a stripping plant of large capacity, where the coal is prepared and put through a tippie. The scale of wages is omitted.

Stripping Shovel:—One shovel engineer, one fireman, one oiler, one craneman, four men in the pit, one coaler.

Coal Shovel:—One shovel engineer, one fireman, two men at dipper, one man cleaning up spillage, one driller and blaster, three men cleaning off slate and dirt.

Haulage:—Two locomotive engineers, two trip riders.

**Tipple Help:**—One tipple boss, one tipple boss helper, one boss trimmer, two assistants, one ear dropper and one laborer.

**General:**—One blacksmith, one general repairman, one day boss, one time-keeper and clerk, one watchman, one superintendent.

The total pay-roll therefore amounts to 35 men for operating the plant. From the above force, because of delays from various causes, men can be provided for track maintenance about the tipple and plant. The daily cost for supplies and materials cannot be estimated accurately, but will include the following items:

Coal for boilers and engines, about 20 tons per day; oil, waste and packing; repairs and upkeep; depreciation of equipment and incidentals.

#### SUMMATION OF EXPENSES

The total of wages and salaries paid on the above labor account, plus the supply account, plus a suitable margin for interest, depreciation, insurance, taxes and expense of administration, will give the daily cost of operation. This divided by the number of tons of output per day, say 1,000, will give the cost per ton of production, f.o.b. cars. To this must, however, be added a certain amount per ton for extinguishment or a reduction of the initial investment in the project. Subtracting this total from the market price leaves the net profit per ton.

An installation to develop an appreciable area of stripping territory, using a large type of stripping shovel and a small loading shovel, figuring on a mile switch to the property, side hill cuts and fills, and including rail and other track materials, tipple construction, engines, sidings, cars, houses and shops, pump, pump-house and pipe line, and providing a surplus to start operation, would cost approximately \$325,000 at the present time.

When less than 10 ft. of cover exists over a coal, it is generally discolored and soft. Sometimes even though the overburden is much more than the depth named, and even up to 30 ft., the coal is discolored, but is not as a rule as soft as when under only 10 ft. or less of cover. Such coal is stripped at small expense, but is not the equal of coal found under heavier cover.

When cover heavier than about 10 ft. is encountered it is not generally so discolored or soft as to compel its being placed on the market at a lower price than coal produced by underground mining methods.

#### COAL SURFACE SHOULD BE THOROUGHLY CLEANED

When the overburden has been removed, the top of the coal bed should be thoroughly cleaned in advance of the loading shovel. The dirt can be swept off with a wire broom, and by thus exercising care, the overburden does not mix with the coal. Equal precaution should be taken to prevent any of the bottom becoming mixed with the product.

As the product of the strip pit is generally sold in competition with coal produced by underground mining and which has gone over picking tables and been screened and sized, equal precaution should be taken with

stripped coal. The inferior material, occurring under lightest cover, can generally be disposed of locally for domestic use, at a price below the regular market. The prejudice of the trade against rusty coal is often not well founded, but notwithstanding that it may be practically as good as the unstained variety, the market is not willing to grant this as a fact.

In some districts stripping companies run their coal through the tipple, where it goes over a picking table and is screened and sized. Such plants uphold their reputation, but pits where "everything is loaded" only have a tendency to destroy the reputation of stripped coal.

#### NO BUG DUST IS FORMED

Stripped coal should have an advantage over that produced underground, inasmuch as there is no "bug dust" to be disposed of, since no undercut is made. Stripping is sometimes termed "daylight mining," and therefore the light should favor a closer inspection of the product so that impurities such as slate, binders, etc., may be cast out. With proper care in mining and treatment stripped coal will generally have an exceptionally good appearance when it reaches the market.

Before the installation and operation of a stripping plant is undertaken by inexperienced parties, a careful study should be made of the subject. It is important that plenty of drilling should be done in order to determine the character of overburden

and thickness of coal, an accurate map should also be made of the territory showing the crop-line, buildings and roads, property lines, and the location of drill holes. At times it is desirable to have a good working map, and in this event the surface contours as well as those of the coal should be shown thereon. A map of this nature will enable one to make a layout of the necessary box cuts, and afford some idea as to the drainage problems encountered in the pit. However, a map of this sort is not always necessary as the solution of the drainage and other problems is often self evident.

In addition to the above, careful consideration should be given to the quality of the coal, and the location of any binders in the bed, the continuity of the bed, the hardness of the stratum forming the floor of the seam, as well as questions of transportation and marketing of the product, water supply, labor conditions, etc. It should also be borne in mind, that sufficient stripping territory must be available, so as to keep the equipment busy during its life, either upon the tract it is proposed to work or upon additional areas.

It is not ordinarily desirable to strip over an area that has been worked by underground mining, with the idea of recovering pillar coal. This should be considered as a separate proposition. For this reason, at times, it is not desirable to strip the outcrop coal about an old mine.

The success of stripping operations will depend largely on the shovel engineer and the ability of the superintendent, the general management, close attention to details and systematic work. The very best men obtainable should be employed for the above positions.

**Development of any appreciable strip-pit area requires a big investment in shovels, railroad track, tipple and other equipment. Making such an operation profitable depends much upon the ability of the management and the efficiency of the shovel operator. The best talent available is here almost cheap at any price.**

Items in Coal-Mining Cost\*

Stonega and Clinchfield Operations

By A. G. LUCAS AND F. E. MARCEY

Mine Inspectors, Richmond, Va.

INVESTMENT:

- Cost of land
- Cost of equipment, buildings, machinery, live stock etc.
- Cost of railroad spurs and loading tracks
- Cost of development to reach coal
- Cost of management

LABOR:

Outside

- Blacksmiths
- Blacksmith helper
- Boiler washers
- Cagers—top
- Camp inspector
- Carpenters
- Carpenter helpers
- Car couplers
- Car droppers
- Car oilers—men
- Car oilers—boys
- Car repairers
- Car trimmers—men
- Car trimmers—boys
- Dumpers
- Dumper helpers
- Electrician
- Electrician helpers
- Engineers—box-car loaders
- Engineers—power house
- Engineers—hoist
- Firemen—power house
- Firemen—helpers
- First aid men
- Inspectors—coal
- Laborers—boiler house
- Laborers—general work
- Lampmen—electric
- Lampmen—helpers
- Machine boss
- Machinists
- Machinist helpers

- Masons
- Mason helpers
- Mine clerk
- Mine clerk, assistant
- Mintormen
- Nippers
- Painters
- Pumpmen
- Pushers
- Sandmen
- Sanitary inspectors
- Slate pickers—men
- Slate pickers—boys
- Stable boss
- Stable boss helper
- Spraggers
- Sub-station men
- Superintendent
- Supply man
- Teamsters
- Tipple bosses
- Tipple men
- Tipple boys
- Tool dressers
- Trackmen
- Trackmen helpers
- Water tenders
- Water haulers
- Watchmen—day
- Watchmen—night
- Weighman—pit cars
- Weighman—R. R. cars

Underground

- Bratticemen
- Bratticemen helpers
- Cagers—bottom
- Cagers—bottom helpers
- Car couplers—men
- Car couplers—boys
- Car droppers
- Car haulers—men
- Car haulers—boys
- Car oilers
- Cleaners—roads
- Concrete men
- Concrete helpers
- Drill runners
- Driver bosses
- Drivers
- Drum runners

MATERIAL AND SUPPLIES:

- Black oil
- Blacksmith supplies
- Brattice cloth
- Car-door boards
- Cement
- Coal for boilers
- Electrical supplies
- Electricity
- First-aid apparatus
- Harness, etc.
- Hay and grain for mules
- Lubricating oil
- Lumber
- Nails
- Pit car repairs

- Props
- Rail (heavy)
- Rail (light)
- Repairs for machinery
- Rescue apparatus
- Rollers
- Sand
- Sprags
- Telephones
- Ties
- Track spikes
- Track bolts
- Waste
- Wire rope, etc., etc., etc.

GENERAL EXPENSE:

- Officers' salaries and expenses
- Other office salaries
- Rent and miscellaneous office expense
- Legal expense
- Doctor and hospital expense for employes

SELLING EXPENSE:

- Sales-officers' salaries and expenses
- Road-salesmen's salaries and expenses
- Other office salaries
- Rent and other office expense
- Advertising—commissions—miscellaneous

OTHER OPERATING CHARGES:

- Royalty
- Depletion reserve
- Depreciation reserve

- Floods
- Mine squeezes
- Mine fire

INSURANCE

- Fire, boiler, etc., workmen's compensation and mine explosions.

TAXES—Federal, State and County

STRIKES

The cost of production is made up of these 200 or more items which the Operator has to pay to put the ton of coal on railroad cars ready for shipment. The wage of the Miner is just one item out of the many.

Owing to the shortage of orders the Stonega Coal & Coke Co. did not operate regularly last year. Yet, in spite of this handicap, it mined more coal than any other concern in the state. During the period of car shortage it continued to operate the major part of its mines by dumping the coal on stock yards prepared for this purpose. While this method is, of course, expensive since it necessitates reloading the coal into railroad cars, yet the company used this means of operating in order to keep the mines running, thereby keeping its working organization intact. It has had as much as 150,000 tons on the yards at one time.

This company has made many improvements this year, building two new camps and making many changes in the old ones. It has built three new tipples and started one new operation; a modern hospital has been constructed and a first-aid team equipped. The new operation is known as the Dunbar mine located on the Interstate R. R. in Wise County and promises to be one of the company's largest operations. With a few exceptions the mines of this company are equipped with electric-cutting machines and electric locomotives with about a dozen storage-battery locomotives. The mines are ventilated by up-to-date electric and steam fans housed in brick and cement buildings.

The efforts put forth by the company in respect to safety have done much to reduce accidents in and around the mines. It employs two mine inspectors regularly and its printed safety rules are rigid. Ralph Taggart, Big Stone Gap, Va., is general manager.

The mines of the Clinchfield Coal Corporation, the next largest producer in the state, are located in Russell, Dickinson, and Wise Counties, on the Clinchfield Ry. The mines are both drifts and slopes. The coal is cut by electric machines and hauled by electric locomotives. All the coal is brought to the railroad by conveyors. This company's camps are in good condition and many improvements have been made this year. The mines are ventilated by electric fans, incased in brick and cement buildings. An up-to-date hospital is located at Dante, Va. A mine inspector is employed and the efforts put forth by the company have no doubt reduced the number of accidents at its mines. Lee Long, of Dante, Va., is general manager.

Franklin and Williamson Field Properties

Only a few years ago Franklin and Williamson Counties were a waste of barnless farms and indigent citizens. The land was said to be a land of Egypt and by that was meant, not the land of Goshen in the Nile delta, but the Egypt as it was in the long seven-year famine. Even today there companies bearing the name "Egyptian"—the Egyptian Iron Works, the Egyptian Power Co. and others. But Egypt is now closely inhabited by prosperous citizens, as the map on the opposite page well shows.

The crops of the coal in Williamson County were divided up into small holdings, as the bottom of that map testifies, but the deeper coal in Franklin County involved the introduction of shaft mines and the holdings are large and the equipment as modern as in any part of the country. A somewhat poor streak cuts the field almost in two on an east and west line.

SOUTHERN ILLINOIS COAL FIELD, INCLUDING FRANKLIN, WILLIAMSON AND ADJACENT COUNTIES

# Transportation as a Factor in Irregularity of Coal Mine Operation\*

Heavy Expenditures by the Railroads Will Be Necessary if They Are to Meet the Needs of the Country—Much of the Necessary Financing May Have To Be Done by the Industries Served

BY S. L. YERKES  
Birmingham, Ala.

**A**N adequate supply of fuel and its proper distribution is the foundation of not only our prosperity, but that of the civilized world, and regardless of all other steps in the production of fuel, all will be of no avail without adequate transportation. I will not attempt to discuss any form of transportation except that by rail and the general principles underlying it as they affect the coal industry.

At this particular time car shortage looms large and stands out pre-eminently above all other troubles of the coal industry. For many weeks past a number of the large producing districts have not averaged above 50 per cent running time on account of car shortage. Car shortage is not new, but never in the history of the industry has a surplus of approximately 250,000 open-top cars available for coal loading been wiped out and changed to a shortage of approximately 75,000 cars in the short period of eight months, yet such are the facts today. On April 1, 1919, there was an approximate surplus of 250,000 open-top cars, while today a fair estimate of the shortage is 75,000 cars.

There is an additional shortage of open-top cars needed by industry for the transportation of structural iron and steel, gravel, stone, sand, concrete blocks, and other commodities and raw materials. This shortage is estimated at 100,000 cars today. Thus the present shortage of open-top cars is approximately 175,000.

This condition is extremely alarming and shows the necessity of prompt and strong action along many lines, if proper transportation is to be made available, not only for the coal industry but for all business of the country, and the prosperity of all, in final analysis, is dependent upon a proper and adequate supply of fuel.

The available coal-car supply of the country as taken from records of the Interstate Commerce Commission for the 16 years, 1904 to 1919, inclusive, for five-year periods, is as follows:

	1904	1909	1914	*1919
Number coal or open-top cars	622,568	792,291	893,314	975,000
Average capacity in tons	33	40	45	49
Total capacity in tons	20,760,045	31,748,304	40,583,490	47,775,000

\*Estimated.  
Increase in total capacity 1919 over 1904, 131 per cent.

\*Paper presented before the February meeting of the American Institute of Mining and Metallurgical Engineers.

The production of coal, anthracite and bituminous, for the same period was:

	1904	1909	1914	*1919
Anthracite	73,156,000	81,070,000	90,821,507	86,200,000
Bituminous	278,660,000	379,744,000	422,704,000	458,063,000
Total	351,816,000	460,814,000	513,525,000	544,263,000

The five weeks' production of bituminous coal

lost because of the October-November strike would have made bituminous production in round figures 500,000,000 tons for 1919, on which basis, the increase of 1919 over 1904 would have been 70 per cent.

The industrial slackness of the first six months of 1919 should be borne in mind as a large factor in the light out-

put during the first half of the year. If the increase over 1904 is figured on the basis of the 1918 total production of 678,211,000 tons, the percentage of increase is 93 per cent.

During the same period that coal production increased as above shown, the output of other lines of industry requiring open-top cars increased at an equal or greater rate. From this it is evident that the need of the country for open-top cars in 1919 as compared with 1904 has not been met by an increase of 131 per cent in total open-top car capacity during the 16-year period named.

Transportation deficiencies existing today are not by any means confined to the shortage in the number of cars owned. Other factors, of railroad transportation such as insufficiency of power, the poor condition of locomotives and cars, lack of adequate main tracks, passing tracks, terminals, absence of whole-hearted support of employees, due in great measure to former Director General McAdoo's labor-union policy, are large contributing elements.

The failure of the railroads during the last few years of private control, and of the government during federal control, to increase the facilities as the business needs of the country demanded, needs no discussion here, as the failures of the past are behind us. What we have to deal with today is the future.

We may or may not be satisfied with the forthcoming railroad legislation as provided by Congress, but certainly the revolving fund of \$250,000,000, as proposed in the Esch bill, is totally inadequate to provide even

A marked deficiency in the available number of open-top cars, an insufficiency of power, the poor condition of existing rolling stock, a lack of main-line tracks, side tracks and passing tracks, and terminals as well as the absence of whole-hearted support and co-operation from employees are some of the present ills of American railways.

in a small way for the immediate necessities of the railroads, and the outlook is not encouraging for securing capital through the ordinary methods of financial co-operation.

Conservative estimates by reliable authorities, place the equipment needs of the country today at 20,000 locomotives and 600,000 freight cars, delivery to be made over a period of three to four years. The above requirements are necessary to meet the business growth of the country and to replace retirements of obsolete and worn out equipment. The estimated cost of locomotives today is approximately \$65,000, and of cars, approximately \$3,000. Total cost of this equipment on the above basis is \$2,100,000,000, in addition to which necessary capital for additions and betterments for tracks, terminals, shops, etc., must be provided.

I am advised by good authority that a bond issue by the government for the purpose of providing capital for railroad expenditures cannot and will not be considered, and as there is little hope of the railroads securing adequate capital from banking sources sufficient for their needs, the business interests of this country, in order to protect themselves, must, of necessity, assist in providing a large portion of the funds needed, particularly that portion essential to the purchase of equipment.

Of all business none is more vitally affected by car shortage than the coal industry, as of necessity, transportation must be available when coal is produced, storage at the mines being entirely impracticable except in a small measure and in isolated cases. Therefore, all business, and particularly the coal operator, should purchase, in such quantity as the resources of the various companies or individuals permit, equipment trust obligations of an individual railroad or group of railroads.

#### A SAFE 6 PER CENT INVESTMENT

Railroad equipment trust obligations are considered an unusually safe and sound investment. A banking syndicate could be organized to finance the purchase of equipment for the various railroads, having first secured the pledge of the various lines of business interested, to purchase in such quantity as they decide they can properly absorb, equipment trust certificates when offered by the syndicate. In order to provide capital at a reasonable interest rate, such certificates should not carry a higher rate than 6 per cent, and while this capital might be employed in its own business at a larger profit, investment in equipment trust certificates for the purpose of providing additional facilities and thereby increased operating time for industry, could be well justified, and I urge consideration of this idea by the business and trade associations of the country.

Experts may differ with me as to the number of cars and locomotives needed, or concerning the additional facilities such as tracks, terminals, shops, etc., required, and can properly say that increased efficiency, and particularly the more intensive use of cars, the storage of coal and other things, to prevent cars from being used for warehousing purposes, even for as short a period as 48 hours, would solve the problem. Shippers, and the public alike, will agree in principle that a more intensive use of cars is reasonable, but at the same time will set up what are to them insurmountable difficulties as to why faster loading and unloading cannot be had.

Today's situation is sufficient to justify community action against those in a locality who fail to do their part in the prompt loading and unloading of cars.

But I repeat, if the railroads themselves are unable through their own resources and credit to finance the purchase of necessary equipment, which need is now paramount to all others, the business interests involved, for self-preservation, must assist, and in my opinion this must be done, along the plan above outlined.

#### JUST DISTRIBUTION HAS BEEN A BONE OF CONTENTION

A fair and just distribution of available coal-car equipment has been a big question of dispute throughout the years past. In the old days of favoritism the assignment of cars to favored producers was the outstanding evil in the distribution of available equipment, and in the purchase of railroad fuel, assigned cars played the leading role. All the tricks of the carriers in the old days used in the purchase of railroad fuel, and particularly in the preferential assignment of cars, were consolidated under one head, shortly after the beginning of government control in January, 1918, that head being the well known John Skelton Williams, director of purchases, U. S. Railroad Administration.

It is not necessary to review the evils resulting from using cars preferentially in the procurement of fuel. It suffices to say that the evils multiplied, as practice made perfect, and culminated finally in the fall of 1917, and through the winter of 1917-18, in the Fuel Administration requiring, because of war necessity, the railroads to assign cars for the loading of fuel required by certain industries producing the more needed munitions of war. By December, 1917, with federal control in sight, so many cars were being assigned for, particularly, railroad fuel and war munition plant loading, that the cars available for ordinary commercial distribution on many railroads were practically nil. Needless to say, this brought on industrial chaos.

Following the establishment of the Railroad Administration, the question of assigned cars became so serious, because of the great disturbance to business generally, to labor employed at those mines receiving no assigned cars, and particularly because of the announcement by the Railroad Administration, through its Director of Purchases, John Skelton Williams, that it proposed to use assigned cars for the purpose of securing a lower price for railroad fuel than the fixed government maximum, that representatives of the coal industry began a determined fight to abolish the assigned car evil.

#### ASSIGNMENT OF CARS WAS FINALLY ABOLISHED

This campaign was conducted by the National Coal Association whose position in the matter was espoused by the former U. S. Fuel Administrator, Dr. H. A. Garfield, who, broadly, intelligently, and courageously, recognized the rights of the public, the necessities of mine labor, and the needs of the coal operators. In final analysis the controversy was settled by President Wilson, who abolished assigned cars and at the same time ordered a reduction of 10c. per ton in the fixed government price for coal, both effective as of May 25, 1918.

Following the President's order abolishing assigned cars, conferences between the Railroad Administration and coal operators resulted in the establishment of uniform mine rating and car distribution rules. These rules, with slight modifications, have been in effect since

October, 1918, and have, in the main, tended greatly to stabilize the industry from the standpoint alike of the public, labor and the operators. The resultant good from equal car distribution for the benefit of the three parties at interest, the public, labor and the operators, is so apparent that there should be no return to assigned cars after March 1 next, but when this suggestion is made, immediately there arises the question of how the railroads will secure fuel in time of car shortage.

There has been much discussion on this subject and never more than during the year 1919. In October last, prior to the coal strike, the Railroad Administration, through its Director of Purchases, H. B. Spencer, asked a committee of operators to meet with him and discuss ways and means of providing railroad fuel, as he was having difficulty in securing his requirements. The underlying causes for the difficulty need not be discussed here, as it suffices to say the railroads were in need of coal and we all recognized the necessity of their having fuel. The committee of operators suggested to Mr. Spencer that in those districts from which he was unable to secure sufficient fuel for the needs of both originating and non-originating roads, if he would indicate the tonnage needed, the respective operators' associations would undertake to secure the necessary fuel for him and at reasonable market prices. It is interesting to note here that no demand, either before or since the strike, has ever been made to those assigned to carry out the understanding reached with Mr. Spencer.

With further reference to the matter of protecting railroads with coal in time of car shortage, my personal view, based on the assumption that the railroads will fairly and honestly contract for their fuel supply, is, that when delivery cannot be made of the contractual amounts because of car shortage, the deficit should be pro rated fairly to non-contract mines and shipped without question by the non-contract operators, except to such extent as it is necessary to exempt specialty coals, such as gas, byproduct, bunker, etc., with protection guaranteed by the railroad to the operator against damage for failure to ship on commercial contracts in hand carrying priority of shipment.

This action will supply the needs of the coal-originating roads and will avoid all the evils of promiscuous confiscation which will, of necessity, be resorted to by the railroads when their fuel supply runs short. For the non-originating coal roads, I feel, in case of failure to secure requirements through general purchase in the open market, appeal by such railroads to operators' associations located in the districts from which they normally draw their supply, will result in the securing of sufficient coal to protect the needs of such roads.

If co-operation from the operators along these lines is not given, with such modifications as local conditions demand, we may expect the vicious practice of indiscriminate confiscation with all of its resultant evils to the public and the industry to be continued. I therefore urge action at this time along these lines by the

individual carriers and operators, and in so doing endeavor to forestall future controversies and resultant bad feeling on the part of the public, the railroads, and the coal producers, which inevitably arises from confiscation as usually practiced.

The plan suggested for the coal-originating roads is not of itself new, as a similar plan was used by the Fuel Administration in co-operation with the Railroad Administration during the winter of 1917-18 in order to provide the controlled lines with fuel. The plans above offered are suggested to meet the situation as it will arise under private operation after March 1 next.

A given railroad may feel that it can and should in times of shortage assign cars to its contract mines for coal in order to secure a lower price for its fuel. But when this is done such action must inevitably be followed by assigning its cars for loading fuel coal of connections, not in a position to protect contract loading with their own cars. Such practice eventually will cost the coal-originating line heavily, as sooner or later the entire car supply and transportation ability will be so used as to cut off largely, if not entirely, the supply of industrial fuel and result in closing many industries, which are large revenue producers to such carrier. This has happened

**The Interstate Commerce Commission under the new railroad bill should continue the mine rating and car distribution rules developed under Government control. Return of the roads to private ownership will probably mean improvement of conditions in the less-congested portions of the country, while in congested districts some of the Government practices should be continued.**

on some roads and can happen again.

I see no objections in all fairness, to the placement of cars delivered for loading connecting-line fuel, at mines as billed, but connecting lines should not bunch their contracts so as to bring about full running time at such contract mines in time of car shortage with resultant disturbance to mine labor at other operations receiving a less car supply under the general distribution.

It is to be hoped that the Interstate Commerce Commission under the broadened powers given it in the new railroad bill, will continue in effect along the same general lines, the mine rating and car distribution rules developed during the period of government control, as these uniform rules are of great benefit to all interested.

Upon the return of the carriers to private ownership and direction we may expect, in my opinion, improvement over government control in many parts of the country, particularly in the less-congested portions. In the congested section undoubtedly some of the practices of unified operation under government direction should be continued, otherwise, I fear service under private control will not be as good as that under government control. In making this statement I wish to say that I am an ardent advocate of private ownership and operation.

In the return to private operation we must give consideration to the question of open-top car pools, about the wisdom of which there is wide divergence of opinion, not only among coal men, but among the carriers themselves. The big question of arbitrarily allotting cars of a strong well-managed road to a weak and poorly operated line as is frequently the case in car pool operation, is one worthy of discussion. It should be con-

sidered from the standpoint of the public, mine labor, and the industry and not from an individual, a selfish or sectional viewpoint.

Personally, I am an advocate of a national car pool operating through regional pools, with original regional allotment on ownership basis, and fair maintenance of interchange balances between the regional pools, allowing for fluctuations arising from extraordinary conditions and movement.

Finally, I feel that the coal industry should approach the railroad's return to private operation with an open mind, forgetting the evils of the past, hopeful that the carriers have profited by the lessons learned, and that they will honestly and faithfully play the game with each other and with the public. We have our part to perform and should do it in the same fair manner, and if all parties will acquit themselves like men our transportation troubles are on the way to a lasting solution.

## To Conserve Coal for Future Generations\*

True Conservation of Fuel Means 100 Per Cent Extraction, Complete Utilization  
and Maximum Efficiency in Consumption—Electrification  
Will Greatly Aid in This Problem

BY EDWIN LUDLOW†  
New York City

ANY discussion of the conservation of coal can be divided into three headings: (1) The conservation of the coal resources of the country through more complete extraction and better methods of mining; (2) the utilization of the entire output of the mine; (3) the obtaining of the maximum efficiency in the use of the fuel produced. 1. Mining methods in the United States have been, as we all know, extremely wasteful and are only beginning, in certain localities, to show any improvement. The great abundance and the low selling price of coal with the small margin of profit, if any, to the operating company made the task of keeping the company solvent the most important question, and to do so it was usually necessary to mine the cheapest coal at the least cost without much thought for the future. The increased demand and the higher prices that have recently come have made it possible now to work beds at a profit that formerly could not be mined except at a loss and it is now possible, in most fields, to work the veins in a property in the proper sequence, or from the top down, rather than according to the former method of working the big measures first and trusting that the roof would not cave and prevent the mining of the smaller veins lying above.

The differences in the methods of mining and what we can learn from Europe in that regard possibly may be exemplified best by giving my own experience in northern France some years before the war. I visited a mine that was just being opened by a large French company. The machinery and equipment were of the very best that I had ever seen. Everything was not only absolutely fireproof but was built with a permanency and architectural finish that is noticeably absent from American mines. I noticed also, in looking over the plain where this mine was located, that other tipples were in comparatively close proximity on practically every side so I asked the chief

engineer how it was possible to bring out at a profit the initial expenditure represented by the plant when the area to be worked was evidently rather limited in view of the proximity of the other shafts and tipples. He told me that the first vein that they would encounter would be at a depth of 1,200 ft. and that from there downward they would have a series of veins all the way to 2,500 ft. They would open up the bed at the 1,200-ft. level and by mining it longwall would make a complete extraction.

Owing to the abundance of coal and the low prices hitherto paid for it many impediments have been placed in the way of proper mining. The higher prices at present enjoyed make scientific operation at least possible.

They would not start the next vein below until the workings on the upper measure had advanced sufficiently to bring on a settlement of the roof, making it absolutely safe to open up the lower veins without any danger of affecting the workings above. These workings would all keep one behind the other and the output of that mine would be probably a continuous one for at least 100 years. It was, therefore, necessary to build not only permanently but as much in advance, in the way of machinery and equipment, as possible so that the plant would not become too far out of date and obsolete before the coal was extracted.

The work of conservation of coal in the ground by proper methods of mining is being much assisted now by the engineers employed by the large estates who lease ground to operating companies on a royalty basis. The leases are usually drawn so that the laying out of the work is in the hands of the landowner's engineer and strict rules are given in the lease as to the mining and the percentage of extraction. Great improvements have been made in mining methods but there is still room for much improvement in nearly all fields. To accomplish the complete extraction under the economic law that a mine must pay its expenses, or close, makes conservation methods difficult of enforcement where the competition is as keen as it has been in the past.

In what was formerly Indian territory, now Oklahoma, the coal mines were taken over by the United States government, in 1895, as trustee for the Indian

\*Paper presented before the February meeting of the American Institute of Mining and Metallurgical Engineers, New York City, entitled "Conservation of Coal."

†Consulting Engineer and Vice-President of the A. I. M. E.

tribes and this coal was leased to operating companies on a royalty basis, the royalty being credited to the Indian nation owning the land. However, conservation methods have not been practiced and the methods of mining used have been as wasteful, if not more so, in that field than in almost any other. Large areas were closed by squeezes, due to insufficient pillars left in the first mining, and the cheaper coal along the outcrop was extracted and the mine abandoned when it reached a depth requiring additional machinery. A large proportion of the field now consists of outcrop slopes standing full of water. No methods of mining were specified in the lease and no supervision was given to that feature.

An example of the difficulty of operating a coal mine under an act of Congress was exemplified here where a mine, at McAlester, Okla., having coke ovens and more slack than the coke ovens could use devised the scheme of making an intermediate size of nut and pea for which a market was found. In order to maintain that market, it was necessary to jig the nut and pea as otherwise it was too high in slate for the steam purposes for which it was well adapted. The slack coal was taken to a washery and the nut and pea cleaned in jigs and the fines taken to the coke ovens. The royalty was paid to the government on the shipments. This, however, was met with an immediate protest by the government, stating that the law required that the royalty should be paid on the coal extracted from the mine and that it would, therefore, be necessary to pay royalty on the slack before it was cleaned. The result was the abandoning of the washery and the shipment of the slack "as is," as the royalty charged on the slate taken out wiped out all possible profit.

#### NEARLY ALL ANTHRACITE CAN BE UTILIZED

2. For the anthracite region, improvements have been made in grate bars and artificial draft that have enabled the utilization of the smaller grades until now the barley coal, which is being shipped, is made over a  $\frac{1}{16}$ -in. mesh. At many mines a still finer size is being made which passes through a  $\frac{1}{16}$ -in. and over a  $\frac{1}{32}$ -in. mesh. But in spite of these refinements a million or more tons a year of fine coal are being thrown away for which there are now being developed three methods of utilization.

a. Briquetting, which is gradually becoming more successful with various experiments, until now several briquetting plants are in operation and others are in contemplation.

b. Grinding this dust so that it will pass through a 400-mesh screen and burning it as pulverized fuel. Plants of this kind have been built at the mines and a plant is being erected in the cement region. Pulverized fuel has been used for some time with bituminous coal but it is only recently that developments have been made that make it practicable to burn anthracite in this form.

c. Utilization of this waste in the form of coke, which can be crushed down to stove-coal size and used for domestic purposes the same as the prepared sizes of anthracite. This process was invented by Donald Markle, who found that by adding pitch to the fine anthracite a good coke could be made in byproduct ovens. The process is now being developed by the Delaware & Hudson Co. under his direction.

In the soft-coal field, a waste product is the bone encountered in Westmoreland and other districts, where a large bench of this material is encountered in the vein and is thrown away as being too high in ash. It is capable of being used in a gas producer and a plant located at the mines could utilize this waste product in the generation of electricity, increasing the power supply of that section of the country.

#### CENTRAL STATIONS ACCOMPLISH MUCH

One of the greatest methods for stabilizing the coal industry and permitting the operation of the mines to their maximum capacity is by the installation of central electrical power plants. This can only be economically accomplished by the electrification of the railroads. The results, as given by W. S. Murray, who had charge of the electrification of the New York, New Haven & Hartford, have shown that passenger engines use twice as much fuel when coal fired as when operated electrically, and that for freight and switching engines the quantity is from three to four times as much. He also states that the repairs on electric locomotives are only one-half as much as on steam machines and they are capable of more continuous service and have better tractive effort.

The question of economy in the use of electric motive power on the railroads is no longer one of theory and the only obstacle to be overcome is the large initial expenditure required to make the change. The railroads now burn 28 per cent of the total output of the bituminous mines; with electrification this would be reduced to 10 or 12 per cent. Freight congestion and car supply troubles also would be solved, as the central power plants in the coal-producing states could be located at a group of mines, requiring only a minimum of switching service. Coal too high in sulphur for safe storage could then be burned as produced and the mines kept in continuous operation. For railroads not passing through coal fields, the power plants would require storage facilities to permit an accumulation of coal in the summer months.

Another extremely wasteful method of using coal is in the old-fashioned beehive coke ovens, that are gradually disappearing here; in Europe they were found too uneconomical to use 30 years ago. It has been estimated that enough gas goes to waste from this type of oven along the Pennsylvania R.R. to furnish the electric power needed for that railroad between Pittsburgh and Altoona.

#### BRIQUETTES AND COKE AUGMENT SUPPLY

In the anthracite field, the output of the mines in the Pennsylvania region has practically reached its maximum; and while the increase in population, especially in the seaboard states, is causing a constantly increasing demand for anthracite of domestic sizes, it will be impossible to increase that supply except by the use of briquets and crushed anthracite coke. The conservation that will have to be adopted by householders is to use the smaller sizes—such as pea and buckwheat for their heaters in place of the egg, stove, and nut—which they have formerly insisted upon buying. This is entirely possible by installing heaters adapted to the use of these small sizes, similar to the Spencer heater made in Scranton. The results have shown that the same efficiency per ton can be obtained from buckwheat as from nut or

stove. The firing is much more simple and the heater requires less attention as it is self-feeding; by a thermostat attachment it can be made self-regulating, thus requiring attendance only once a day to remove the ashes and replenish the feed hopper.

3. In the use of bituminous coal, there is the greatest extravagance in nearly all parts of the country and little attention has been paid to obtaining the full heating value of the fuel received. At a large plant I recently visited, the president pointed with pride to the fact that he always purchased the highest-grade coal and insisted that it should have at least 15,000 B.t.u.'s. I called his attention to the fact that his steam results showed that

he was only obtaining 11,000 B.t.u. and by improving his boiler and closing up the leaks he could obtain the same amount of steam with an inferior coal or use a much less quantity of the higher grade. During the functioning of the Conservation Committee of the

Engineering Council, this question was thoroughly discussed and if the coal shortage had continued it had been determined that there should be a complete survey made of the steam-using plants and that they would be rated by inspectors as A, B, and C. In class A would be the essential industries obtaining a maximum efficiency from their coal; these would be entitled to preference in obtaining fuel. In class B would be the essential industries that were not burning the coal efficiently, their attention would be called to that fact. In class C would be the other industries which were either non-essential or were not burning coal to obtain the best results. Preference in shipments would be given in the order of A, B, and C. It was felt that there would be a great improvement throughout the country if the attention of the owners was called to the fact that they were liable to be refused coal unless they improved their boiler practice. We had gone to the extent of negotiating with the boiler insurance companies for the use of their inspectors to make these surveys.

#### STEAM LOCOMOTIVES ARE FUEL EATERS

Another highly wasteful form of burning coal is in the steam locomotive. This subject was taken up by Eugene McAuliffe, who had charge of this matter for the U. S. Fuel Administration, and the reports of fuel conservation for the first nine months of 1919 are now available. They show that, in straight freight and passenger service the roads reporting consumed 76,285,955 tons of coal, as compared with 88,727,045 tons in the corresponding period in 1918. The average cost of coal in 1919 approximated \$3.45 per ton, and in 1918 \$3.25—an increase for 1919 of less than 6 per cent. The most significant figures, of course, are not those relating to total consumption, which would be affected by the volume of traffic moved, but those bearing on unit performances.

These show that in 1919 there were 186.1 lb. of coal consumed per 1,000 gross freight ton-miles, as compared with 201.2 lb. in 1918. Consumption per passenger-train car-mile, in 1919, was 17.9 lb., while for the same nine months in 1918 it was 19.3 lb. In other

words, the increased efficiency obtained per unit of service made the fuel cost per 1,000 gross ton-miles and per passenger-train car-mile less with the higher priced coal of 1919 than was true in 1918 when coal costs per ton were lower. When the difficulties in policing railroad efficiency systems in coal consumption, because of the nature of transportation service, are contrasted with the ease with which the similar regulation can be enforced in a stationary plant, the advantages that will accrue to the managers of the latter type from an intensive study of the question of how much service can be developed from a ton of coal are readily apparent. It has been shown how great

an economy in coal consumption can be accomplished by electrification of the railroads; still greater fuel economy can be obtained by the use of electricity in manufactories. The estimated saving is nearly three-tenths since the losses in steam consumption of a plant run-

ning 8 hr. and maintaining its boiler plant for 24 hr. would be entirely obviated by the purchase of electric power and the payment for only such energy as was actually consumed.

Attention has been called to this subject by Secretary of the Interior Lane and it has been suggested that an appropriation be made for the study of a high-power trunk line between Boston and Washington, into which would be fed the power generated, as far as possible, first, hydro-electrically; second, from power plants at the coal mines, where they are within reasonable distance of this trunk line; and third by the construction of large power plants at tidewater, where coal could be brought in by both boat and rail. Here in the City of New York such a power plant is needed almost more urgently than anywhere else. Every strike of longshoremen or tugboat captains or a tieup from bad storms brings out big headlines that the coal situation in Manhattan Island is bad and that probably after a few days the subways and elevated roads will have to close down for want of fuel.

It is manifest that no large storage can be maintained on Manhattan Island with its limited area and high cost of land. The Newark meadows, however, can easily be reached by all the coal-carrying roads coming into the neighborhood of New York, and also can be reached by boats from Norfolk or Baltimore. A central power plant erected there could have an unlimited storage, under water, if desired, for the soft coal that is in danger of spontaneous combustion, and coal could be brought in at a minimum of expense, unloaded on these storage piles, and a sufficient reserve to tide over any possible storm or tieup could always be maintained.

High-power trunk lines connecting this power plant to the present generating plants of the Edison, Interborough, and Brooklyn Rapid Transit and other large electric consumers would change those plants to substations for the high-tension power coming in from the central plant and the present boiler plants could be used in emergencies. Such a central power plant could be expanded to sell electric power to the railroads entering New York and all the advantages of an

**Railroad electrification means large economy in the use of fuel. A linking up of big power plants through a high-tension large-capacity trunk transmission line would obviously accomplish still further savings in coal utilization.**

enormous concentration with the highest technical advice and the greatest efficiency could be well afforded at a plant of that kind, which would be a model for the country.

New York's troubles in heat and light, to a large extent, would be eliminated by having a power plant of sufficient capacity to take care of all of its needs and with storage piles to enable it to operate every day in the year irrespective of any local troubles affecting harbor transportation, which now is such an important factor in the fuel supply of New York City.

With the successful operation of this power plant, others could be built at Baltimore, Philadelphia, Boston and Providence and by connecting them with a main trunk line, intermediate industries would receive their electric power at a minimum cost.

While the initial expenditure for such plants would be high, the saving of \$100,000,000 a year, which has been estimated as the amount that such a trunk line could save to the industries along the Atlantic coast, would well repay the interest on the investment required.

## Pennsylvania Will Provide More Electrical Safeguards

Manufacturers Will Supply, and Operators Will Pay For, New Appliances To Make Storage-Battery Locomotives Safe in Gaseous Mines—New Laws Are Needed

BY FRANK HALL\*  
Harrisburg, Pa.

**A**T THE Capitol in Harrisburg a conference was held Jan. 27, to discuss electrical equipment in coal mines from the standpoint of safety to the employees which was continued at the same place Feb. 10. Most of the state and Federal officials, coal operators and manufacturers of electrical equipment who were present at the first session also attended the second.

The chief of the Department of Mines in opening the meeting said that at the previous session there was not a single dissenting opinion to the statement made by the department that storage-battery locomotives as now constructed are not safe for use in gaseous mines. Copies of the report of the commission of mine inspectors appointed by the chief of the Department of Mines to investigate this matter, were furnished those who attended the first session, together with copies of schedule 15, containing specifications of the U. S. Bureau of Mines as to what would constitute a safe storage-battery locomotive such as could be approved by the Federal bureau.

The manufacturers of storage-battery locomotives were asked to state what they could and would do to improve and perfect the machines in accordance with the requirements of the state and Federal authorities, and there was a general agreement on the part of the manufacturers to build the future machines according to specifications. These, however, will not be completed for some time. The question then arose as to what the manufacturers and operators would do in order to make the locomotives safe which are now in use in the mines, of which there are almost 300. It was shown that it would cost probably \$400 to \$600 to add the necessary safety features to the ordinary storage-battery locomotive, but this the operators expressed a perfect willingness to pay.

Having reached this point in the discussion, the question arose as to the attitude of the State Department of Mines regarding the equipment of this kind

now in use, and the chief of the department assured the operators that it was not the intention of the department to be arbitrary in the matter, or to place hardships or undue restrictions upon them during the period in which the locomotives are to be improved to meet the requirements of the law. He stated that they, of course, realized the obligation that rested upon the department to safeguard the great army of workers employed in the mines, but he thought that proper consideration would be given this side of the question without placing too great a burden upon the operators or manufacturers. The unfortunate feature of this matter and the one that is causing trouble today is the deficiency in the mine laws of the state regulating electrical equipment.

In the anthracite region the act of 1891 is still operative, and it contains no mention of electricity. The bituminous mine code, passed in 1911, was prepared with much care and effort, and at the time was sufficiently comprehensive to meet the demands. Electricity, however, progressed so rapidly and its application has become so generally used with machinery and equipment that was formerly operated by steam power, that the bituminous code is also now far behind the requirements. This being the case, certain rules must be adopted to tide over the interim between the present time and a time when a new electrical code can be enacted.

Electricity in the mines is now applied to storage-battery locomotives, trolley locomotives, mining machines, pumps, chain hauls, drilling machines and fans. In fact in some of the best equipped mines, steam as a power has been entirely supplanted by electricity.

In carrying out the rules of the Department of Mines, the questions that arise in individual cases will be left to the district inspectors to solve and settle as fairly and justly as possible, keeping in view, of course, the main idea of safety to the employees in the mines.

\*Department of Mines, State of Pennsylvania, Harrisburg, Pa.

# Exit the Coal Pool?

A Composite Interview Reporting the Comments and Ideas of a Number of Prominent People Who Are Thinking and Talking about the Pooling of Coal and the Future Prospects of This System in Handling Our Tidewater Coal Shipments

BY A STAFF CONTRIBUTOR

WITH the end of the Federal control of the railways in sight there are many questions before us as to what is going to happen to the various activities in which our National Government has been engaged while directing these transportation systems. One such point of great interest to every coal man is the question of what will become of the system organized for pooling coal at Tidewater, which has received such a large measure of support by the consolidated railroad activities. Just now, therefore, it seems particularly timely to stop and consider the various interests which have been affected by this pooling and just what their desires seem to be at the present time. Of course, within any one of these groups of interest, there are many shades of opinion, but *Coal Age* has undertaken to analyze the situation briefly and summarize just how each group in general feels about this important matter. The first effort

made to effect the pooling of coal shipped to Tidewater was a purely voluntary one made for the purpose of handling bunker coal and foreign shipments with cooperation and efficiency. This first effort of the war period was later put into more general effect because of the interest of the Fuel Administration in these matters and particularly by reason of the large increase in the rates for coal-car demurrage established during the war when the car shortage was most acute. About a year ago the war-time form of this activity was modified somewhat, and membership became voluntary, but the railroads still continue to take the larger part in the support and operations of the Tidewater Coal Exchange.

Altogether, five distinct groups of interests have concerned themselves with pooling problems. The large producers of coal together with such of the smaller producers as maintain their own sales organizations can be considered a group separate from those smaller operators who handle most of their shipments through jobbers. A third group is made up of jobbers and wholesalers. Their trade is largely based upon purchases from the smaller producers or from those who do not attempt to maintain sales organizations.

All the railroads handling the Tidewater coal are, of course, actively concerned and they form the fourth major interest affected. The fifth group consists of the purchasers and users of Tidewater coal; this group includes the shipping interests doing coastwise and export business, users of coal in New England and other territory supplied by coastwise trade, and foreign purchasers of United States fuel.

In this classification the Tidewater Coal Exchange itself has not been considered, for it represents merely an agency by which these various interests have cooperated and it is not in itself distinct from them.

In general it can be said that everyone, at least in theory, favors some system of pooling; but with this agreement as to the theoretical advantage, any harmony in ideas as to what should be done ceases and we find many diversified and conflicting opinions.

The small producers, the wholesalers, and the railroads in general, favor the pooling of coal. As a rule, however, the large producers and many of the users do not seem to be in favor of it. It is worth while to analyze carefully the reasons given on both sides of this argument.

The railroads handling large quantities of coal to Tidewater have, in a number of instances, strongly favored pooling. It accomplishes many savings to them by reducing the

amount of switching at Tidewater, by reducing the car delay at the pool, and by enabling them to handle larger coal shipments with a given amount of track, dock and motive power.

It is obvious that if a railroad has a dozen shippers supplying altogether twenty or thirty kinds of coal it must sort out this coal not only to separate the different sizes and grades, but also to divide it according to ownership. A much larger amount of work is thus required in switching at Tidewater, than if all the coal of any one size and quality could be put together without regard to rights of possession.

With pooling all who have credits in a given kind of coal could draw upon the stock regardless of whether it is their own shipment or that of someone else. This advantage is the same as that exercised by the banker who enters deposits to the credit of the individual who makes them, but, of course, makes no effort to retain the particular coin or currency deposited by that individual for the payment of his checks when presented.

The fact that all shippers of any particular class of coal draw upon the common stock of this class for loading a vessel which they contract to supply gives large flexibility in operation and greatly reduces the car delays at the Tidewater yards, thus the railroad is relieved of much of the burden of demurrage and delay and thus has its cars available for useful transportation work. The income per car in any given length of time is, of course, thereby correspondingly increased.

Attendant upon the lesser switching and reduced complication at the seaboard coal yards is, of course,

## For Pooling—Why the Railroads Favor It

1. Less car switching.
2. Less car delay at pools.
3. More working time and larger earnings per car.
4. Larger coal-handling capacity with present trackage, docks, and motive power at tidewater.

## What the Wholesaler Gains

1. Reduced car demurrage.
2. Reduced boat demurrage.
3. Greater opportunity to enter export trade.
4. Increased chance to speculate in tidewater coal without large risk for investment.

the great advantage to the railroad that the given trackage, dock, and motive-power capacity can be used much more efficiently. Thus the income-producing power of this investment also is greatly augmented.

In view of these important advantages it is not strange that a number of the railroads have strongly favored the pooling system and can be expected to urge its continuance in some suitable form for the future. However, certain of the roads whose coal patronage lies principally among the larger producers are reputed not to favor this policy simply because their patrons do not favor it. In fact, it offers no particular advantage to them since the coal operators on their lines are each alone, able to accomplish most of the advantages of pooling without certain complications which any such co-operative effort involves. Although, of course, in any group one would not expect to find opinion entirely unanimous, the sentiment among the wholesalers seems strongly in favor of some form of coal pooling at the seaboard. With pools in operation, the wholesaler finds several large advantages. 1. He can store coal through his credits in the pool without incurring large charges for car demurrage. 2. He can by careful planning escape boat demurrages that would otherwise be incurred while assembling a sufficient quantity of coal to make up his cargo. 3. He can use the pool as a means for entering export trade, from which he might otherwise be cut off entirely because of the larger risk and frequently higher cost, when demurrage on cars and boats enters as a large factor. And lastly, a point which is of especial interest to the small jobber, he can enter in this export coal trade in a speculative manner without requiring any large investment.

This opportunity to enter the speculative export trade as it may be termed, is one that has particularly attracted a certain class of jobbers, who are characterized by some as "maintaining their office under their own hat." Such a one can arrange to ship coal to the pool without danger of incurring charges for car delay and can hold it there from periods favorable to purchase to later periods particularly advantageous for sale, with the added opportunity of slightly overdrawing his coal account in the pool, or perhaps more frequently making quick purchases through the pool, in case he finds a particularly attractive market. Such a one naturally favors this co-operative scheme. On the other hand, these very advantages to a certain class of jobber afford the basis of complaint which is mentioned below.

#### SMALL OPERATORS' PROBLEM

As a group the small operators do not hold a single opinion. Some favor the pool, others oppose it. Those who would like to see it continued, favor it because of the same factors as influence the wholesaler or jobber in his approval. It affords, especially, to the small operator, an opportunity to enter the export trade and sell at prices which at present compare very favor-

ably with those prevailing in domestic business. He is able to do this through the jobber or even working directly through the pool, whereas he could not possibly "go it alone" in this field.

To this type of operator there is the great advantage of stabilized prices which he can get for dock deliveries and the assurance that he cannot be squeezed by the wholesaler at a time of little demand for coal at this point. This latter fact is particularly true as it affects the car-demurrage charges, which he would otherwise incur if he held his shipments until the time when he could secure a more favorable price. He could not afford to do this if working absolutely alone, but through the pool he is often able to avoid the necessity of disposing of his shipments at the unduly low prices caused by temporary lack of demand.

Just at the present time, with almost famine conditions in the coal trade abroad, practically any means for handling coal overseas is accepted without much question as to the quality of the product which will be made available. However, this condition will not continue and the discriminating purchaser is expected to dominate the market again.

When this time comes, the benefit of the good name of men who have operated conservatively will be of large advantage in the market of export and bunker fuel. The small producer realizing this is anxious to have his coal associated by classification with the product from the mines of good name and large reputation. This is a

laudable ambition, of course, but at once it is seen that there are two sides to the question. And right here is where the difference of opinion between large and small producers enters.

So far I have discussed the favorable aspects of pooling as they are seen by many of the small operators. But, there are certain members of this group that find apparently good ground for opposition to any system of classification and co-operation such as has been worked through the coal exchange. Certain cases of complaint have arisen on the ground of discrimination in the allocation of the coal to various pools. Especially this has been a matter of complaint where the coal has been assigned to pools commanding a lower price than others in which the producer thought or claimed his coal belonged.

If by any reason the output of a certain mine be in pool X, which for sake of argument let us assume commands 25c. per ton less than pool Y, then the producer of this coal is at once confronted by the fact that his output everywhere in the market is likely to be regarded as at least 25c. less valuable than the coals which are classed in the other pool. For certain uses this differential of 25c. may be entirely fair, but with other equipment or for other uses it may be that the coal of pool X is substantially if not quite as valuable as that in Y. However, it is extremely difficult for the producer of the coal assigned to the pool of

#### Against Pooling—Difficulties Suggested by Large Producers and Users

1. Quality of the better coals suffer.
2. No reliable system of classification is available.
3. Adequate control of quality is impracticable.
4. A coal loses its identity in the pool.
5. Valuable trade name and reputation is lost.
6. Wholesalers and small producers are too active in export trade, to the detriment of all interests.
7. Pool makes export trade too largely speculative.
8. Permanence of export trade is endangered.
9. Pool is entering wedge for Federal activity and control of the coal business.

lower price to convince a purchaser of this fact.

Of course, it is not essential to assume for the future any more than in the past that a particular price differential need be maintained between the several pools, as for example X and Y above assumed. But the very fact that there is some classification setting a distinction between the product of different mines is a point that troubles many of the small operators and incidentally perhaps some of the larger ones, too. In any event, this appears to be a ground for decided opposition on the part of many coal producers. In general the large producer does not desire a continuance of the pooling system. In such a program his coal loses its identity; in other words, he cannot sell effectively under his own trade name. This represents a genuine loss to him, for the "good-will" involved in his trade name is worth much to him. In fact, it actually represents a large financial investment which he made while he was building up his reputation and record for quality.

In the second place, the producer of high-quality coal is likely to suffer for the sins of others when his coal enters a pool to which other producers are also admitted. The basis of the assignment to this pool is, theoretically, that all are of the same quality; but there is no definite standard for judgment nor accurate system of control. Hence, inevitably producers of better-quality material have lost somewhat.

This loss in reputation and the actual depreciation in quality are two factors which strike fear into the heart of any operator who looks forward to permanency of foreign coal trade. The reputation of American coals can be made and maintained on the highest plane, but unless the quality is carefully guarded (and under pooling this seems to be an almost impossible task), the large producer justifiably fears that our reputation will become even worse than it now is in certain quarters.

The large operator by his very bigness is at an advantage in export operations, but when a pooling system is established he is at that moment confronted with a large number of jobbers and small operators who through the pool can enter actively and more or less effectively into competition with him for this foreign trade. Moreover, with these interests in the field, the speculative element and the uncertainty of operations increases quite to the disadvantage of the larger interests.

Then, too, the very fact that any such co-operative effort as this involves national effort or perhaps Federal co-operation is a ground for fear in the mind of some persons. Anything which savors of Federal activity

is unwelcome; in fact, it is almost terrifying just now. Federal ownership and Federal control are in the minds of many only the extreme forms of this sort of activity and anything which seems like federalized effort is, therefore, taboo.

#### INTERESTS OF PURCHASERS ARE DIVIDED

The purchasers are divided in their interest. As a means of getting prompt delivery and to some extent of eliminating variable prices as a factor in seaboard-coal deliveries, pooling of coal is favored. On the other hand, the discriminating purchasers who realize the great advantage of certainty in quality and characteristics do not wish to deal with any system from which they cannot get sufficient guarantees as to the quality of the coal which they are purchasing! Where a man has been dealing with a large producer and has obtained good results from the coal and a square deal as to prices and deliveries, he certainly does not wish this satisfactory arrangement to be interrupted by any scheme which places him at the mercy of a dozen or more producers with whom he is not acquainted and whose responsibility he, to say the least, questions. On the other hand, there is the speculative element among the purchasers which favors the pooling system for the same reason that speculative jobbers desire it. This group, however, seems to be in the minority.

So long as visual inspection is the only system of coal-quality

#### IF BANKING WERE DONE THUS WHERE WOULD MORGAN BE?

The "advantage" of coal pooling "is the same as that exercised by the banker who enters deposits to the credit of the individual who makes them, but, of course, makes no effort to return the particular coin or currency deposited by that individual for the payment of his checks when presented."

control, it is doubtful whether it is really practicable to classify coal deliveries at seaboard accurately enough to fully eliminate the serious consequences brought out above. Up to the present time, the means by which the product of certain mines was assigned to certain pools has not been all that everyone could wish.

All sorts of charges of favoritism and discrimination have been made; but without entering into this question at all, it is evident that a system based on such limited knowledge of coal quality as is generally available will not be adequate to care for the problem when hundreds of shippers are all desirous of securing the best possible assignment for their output.

There is no question that there has been some justification for the charges that the quality of coal delivered has not been what it ought to have been. On the other hand, certain gross exaggerations of "poor quality" have been made. Those who argue that this system of pooling can be made entirely successful find support for their argument in the system whereby our naval authorities select "navy" coal.

However, it should be recognized that no such care has been exercised, in fact no time was available for

the exercise of such care in the assigning coal to the pools whereas there has always been due care used in selecting coal for the navy. If the same skill and care had been shown, there probably would have been little ground for the objection made on the score of the variability in quality, which thus far has been, at least to some extent, justified.

In any consideration of the quality of coal which is delivered through a pool, one should not forget that there is something of like character in any event, that is the borrowing of coal in order to make up cargoes and fill contracts. However, this practice affects only a small percentage of the coal handled and practically concerns only the man or men who practice this borrowing; hence a purchaser has a direct "come-back" on the man who, because of this practice, delivers a different quality from that he has contracted to supply. Thus borrowing affects quality much less than pooling and the practice of borrowing poor coal to fill a cargo is much easier to control. How to classify coal is much too large a problem to discuss here. It is only necessary to point out that no single characteristic is at all adequate as a basis of classification.

#### PLAN OF THE WHOLESALERS

A large number of wholesale and jobbing interests are considering a reorganization of the coal exchange in the near future and it is their hope that they will be able to continue this work and realize for their

department of the coal business the large advantages which have been pointed out above.

It is possible that a pool continued in this way may be of considerable profit to this group of interests and if they are successful in planning their system of classification the opportunity for a limited success may be considerable. It is doubtful, however, whether support will be given by the larger producing interests and under these circumstances it is sure that no pool of all embracing magnitude is to be expected.

#### WHAT SHALL WE DO?

There is no doubt, as stated at the outset, that the theoretical arguments in favor of pooling are great; and moreover, there are certain large practical advantages to many interests. However, the principle of sound merchandising recognizes that quality and service must go with the right price to make up satisfactory permanent trade relations.

At the present time, the practical difficulties of securing assured good quality and of controlling this quality at all times for all deliveries seem unsurmountable. It does not seem, therefore, to be a prophecy but rather a bare statement of existing fact, that we cannot expect coal pooling to continue to be a success with the present means adopted for the classification and the control of quality, except perhaps in the service of small parts of the coal trade operating as the jobbing interests propose to do.

## Conference Seeks To Cure All Mine Ills—II

McAuliffe Advocates That the Seasonal Differential Be 30 Per Cent—Rice Presents Advantages of a Coal Syndicate—Saint Declares That Export Business, If Not Conducted with Caution, May Be Forbidden

BY R. DAWSON HALL

**I**N THE animated discussion that followed his paper on "Stabilizing the Market" read before the American Institute of Mining and Metallurgical Engineers on Wednesday, Feb. 18, Eugene McAuliffe, general manager of the Kathleen Colliery, declared that he had proposed an increase in the winter freight rate of 15 per cent and a reduction in the summer freight rate of 15 per cent, the period of the lower rate being from March 1 to Aug. 31. In comment it might be permissible to say that a variation of any given percentage would put certain sections out of certain markets in the winter and into certain markets in the summer. A reduction of 15 per cent in the summer would make it advantageous in some sections to buy West Virginia as against Illinois coals, whereas an increase of 15 per cent in the winter would give Illinois coals the advantage. In certain parts of the country this would not occur, but in some a flat difference in rates would be fairer than a percentage. The rates being uniform over six months would tend to lump buying at the end of the summer period. The anthracite rule of monthly variations seems preferable to that which Mr. McAuliffe has proposed.

The article by Edwin Ludlow, on "Conservation," followed, and it created much interest. In reference to what Mr. Ludlow said relative to the waste of coal,

especially in Indian territory on leases under control of the United States Government, where the property was owned by the Indian tribes, George S. Rice declared that the Bureau of Mines had nothing to do with the writing of these leases, and, therefore, could not be blamed for what coal was wasted, the leasing being done before the Bureau was established. In justice to Mr. Ludlow it may be said that he did not charge the matter to the Bureau and the statement of Mr. Rice was solely to correct a possible misapprehension.

In the Alaska bill, which is now under consideration, the engineering provisions by which it is hoped to conserve the fuel of Alaska from wasteful exploitation had not been seriously objected to by those capitalists who are disposed to put their money into the development of the coal lands of that territory. The objections which have been made by would-be leasers have reference to matters not related to engineering.

Mr. Rice declared himself unfavorable to Government ownership, and said that in the Saar region of Germany, where 17,000,000 tons of coal are produced per year, 12,000,000 tons are produced by the state. He noted twelve shafts in a certain section of the Saar region which had been put down by the Prussian government and which produced an aggregate tonnage of 1,400 tons a day. The output of coal in these mines averaged 0.4

tons per man per shift. There seemed to be a delight in these mines to create elaborate engineering feats, regardless of whether the investment of capital was profitable or not.

#### WOULD IMITATE GERMANY'S SYNDICATE SYSTEM

Mr. Rich advocated that as there were too many mines, a body like the Interstate Commerce Commission should be given the power to regulate the opening of new mines so as to prevent a development in excess of needs. In fact, Mr. Rice believes that it would be well if the United States imitated the syndicate system of Germany, the prices of coal being regulated by a commission so as to keep them within reason. He made the statement that the coal companies made money under the Fuel Administration, and that it was quite likely that a commission by the government for the continuous regulation of prices would be disposed to deal fairly with the coal operators.

Hugh Archbald spoke a few words relative to the matter of efficiency in the mines and urged that no success would be attained in this direction until mine foremen were given more assistance, for as it is now it was impossible for them to keep proper watch of the operation of the daymen and so regulate matters that a steady flow of cars would be afforded the miner. With the uncertain delivery of mine cars it was impossible for a miner to put out a maximum tonnage.

Mention has been made already of the remarks of Charles S. Allen relative to the honorable character and importance of the jobbing fraternity, in which statement he was amply justified, though he unfortunately overlooked the existence of a number of people who were coal jobbers only for a time and preyed on other industries when the coal business was less brisk and profits less promising. No one is more troubled by these temporary interlopers than is the all-the-year-round jobber. He said that a discussion had been taken up with the various chambers of commerce relative to differential freights between summer and winter and had found that these chambers had been favorable to such a variation.

#### NEW YORK WHOLESALERS ASK FOR DIFFERENTIAL

He said that the New York Wholesale Coal Trade Association had directed him to bring a formal complaint before the Interstate Commerce Commission against the coal-carrying roads in the Eastern section of the country. Later it may be well to add other roads to those against whom complaint is being made. There was a general disposition to take up this matter with the roads on a voluntary basis, because there was no feeling of hostility toward them, and there was every desire to exhibit to them that the action was merely one of co-operation. However, it was thought that any action which had to be obtained voluntarily might take several years, and the Wholesale Coal Association wishing immediate action took these means to secure it.

H. Y. Saint, of the Shipping Board, then remarked that it would be necessary to fit our export trade into the domestic. The conservationists in America were quite strongly opposed in many cases to the export of coal, desiring it to be used entirely by the nation for its own development. There is a prospect that the export of coal may be forbidden, and it is likely, at least, that it will be regulated by Government enactment.

Consequently, it will be necessary for those who are

engaged in the export business to go cautiously about their work for fear that they do not in their zeal and anxiety to increase their operations, embarrass the home market. At present the export trade is being done mostly in two or three fields, and that being the case, the large demand from abroad would make it impossible to secure that class of fuel for our domestic trade unless the consumers in this country are willing to pay the high prices which are often charged in the foreign trade.

Should the domestic corporations find they could not get coal from the fields where they had been buying it, or could obtain it only at unreasonable cost, as it might seem to them, they would be apt to call upon the public to put an end to the foreign trade which created their embarrassment. A very little buying will disturb the balance of a trade and cause prices to soar beyond all reason. This is particularly the case when purchases have been confined to a certain field and not spread over a sufficiently large coal-producing area.

#### MORE SHIPS NOT NEEDED SO MUCH AS NEW PORTS

In order to prevent our foreign trade from having this disastrous effect it will be necessary to increase the port facilities, both as to their size and location. It will be necessary also to rearrange railroad freight schedules so as to make a shift possible to some ports which are not now being used. In this way it may be hoped that large enough areas of the country may be developed for export trade so that it will not interfere with the regular conduct of the nation's business.

When Mr. Saint was asked how much coal could be dumped for off-shore business per month, he stated that some declared that 1½ million tons was the limit, and others even estimated that 2 million tons could be dumped. Asked whether this off-shore business included that of New England, he said he only referred to foreign trade. He thought that one million tons could assuredly be taken care of, but he questioned somewhat whether the estimates he had just quoted were within the mark. Under the "Permit System" 500,000 tons were shipped in January.

There are many people who are talking about the United States shipping from 30 to 40 million tons a year. Such an output is impossible with the present facilities. Mr. Saint said that one item in stabilization had been overlooked, and that was, that the provisions for bunkering foreign vessels furnished a storage capacity which assisted in keeping mines continuously in operation.

Mr. Ludlow, before adjournment, proposed that a committee be appointed by H. C. Hoover to investigate the present coal situation; that committee to consist of the Coal and Coke Committee of the Institute with 15 other members, including coal operators, mine workers, the Government and the public. With the passage of this resolution the meeting adjourned.

The freight rates to northern European ports, he said, now ran at \$22.50 a ton, whereas the freight rate to Mediterranean ports was \$26.50. There is practically no return cargo, and that is what is making the shipment of coal so expensive. He said that the rates for the first ten days in January from Baltimore and Hampton Roads were within \$1 of the Shipping Board rates. These rates were not excessive because it was necessary under present conditions to use boats that were not really suited to the work.

# New Tidewater Pooling Association Formed

Tidewater Transshippers Association will Replace Tidewater Coal Exchange  
—Tonnage of New Association Already 5,000,000 and  
Will Probably Reach Twice That Figure

A MEETING was held at the Whitehall Club, Tuesday, Feb. 17, at 3 p. m. at which was formed the Tidewater Transshippers Association. C. Andrade, Jr., Esq., president of The Wholesale Coal Trade Association of New York, Inc., in the absence of Charles A. Owen, chairman of the Organization Committee, presided at the meeting.

The chairman stated that the purpose of the meeting was to adopt the plan for the formation of the Tidewater Transshippers Association and to approve the proposed by-laws and rules to govern the conduct of the same. Upon a request from the Chair for criticism of, or suggestions for changes in, the plans and rules proposed, Major Coyle, of Weston, Dodson & Co., suggested certain changes. Mr. Baker, the counsel for the association, explained the legal reasons for not adopting one of the suggestions made and as the remainder were matters having to do with the administrative functions of the Board of Directors, they were referred to that body for consideration.

## LARGE NUMBER OF RESPONSIBLE FIRMS PRESENT

The following members of the trade were present and represented:

Alden Coal Mining Co., Austen Coal and Coke Co., Bertha Coal Co., Big Bend Coal Mining Co., W. H. Bradford & Co., Clark Brothers Coal Mining Co., Coale & Co., Emerson & Morgan Coal Mining Corporation, Emmons Coal Mining Co., Eyre Fuel Co., Ft. Dearborn Coal & Export Co., Garfield & Proctor Coal Co., Gorman-Leonard Coal Co., Gauley Coal Mining Co., Hall Bros. & Co., Imperial Coal Corporation, Industrial Coal & Coke Corporation, Johnstown Coal and Coke Co., The Arch, McNeil & Sons Co., W. A. Marshall & Co., Matlack Coal & Iron Corporation, B. Nicoll & Co., E. Russell Norton, Pan Handle Coal Co., Punxsutawney Coal Mining Co., Pilling & Crane, Producers Fuel Co., Quemahoning Creek Coal Co., Thorne, Neale & Co., E. A. Ward & Co., J. S. Wentz & Co., Weston Dodson & Co., Shawnee Fuel Co., Wm. Cory-Mann George Corporation, Borden & Lovell, Williams Run Coal Co., Clearfield County Coal Co., Virginia Smokeless Coal Co., Wright-Gibson Co.

Mr. Thompson, of the Imperial Coal Corporation, raised the question of the desirability of continuing the name "The Tidewater Coal Exchange." The reason for adopting the new name was explained; first that it was more descriptive of the actual functions of the association, and second, that there would unquestionably be an overlapping of arrival of shipments at tidewater after the date of the official discontinuance of the old organization and the beginning of the new and if the old name were retained, would result in great confusion in the handling of the business of the new organization and might result in so handicapping it at the outset as to reflect seriously upon its future usefulness.

Mr. Thompson also proposed a form of boat bill of lading which should contain information of the pool numbers, etc., for the cargo. This was referred to the Board of Directors with a recommendation from the meeting for favorable consideration.

Mr. Marshall, of W. A. Marshall & Co., then presented a tentative set of principles for the classification of coal and basis for inspection, as follows:

First. The basis of classification shall be that set forth in Rule 6 of the rules of the Association:

*Classification 6.* All bituminous coal for transshipment at tidewater ports shall be graded and classified in designated pools by a Classified Committee appointed by and under the direction of the Executive Committee.

"The principles of classification shall be just, uniform and nondiscriminatory and it is to be the purpose to improve the classification of coals at all times, and matters of dissatisfaction with classification may be ap-

pealed, as provided for in the resolution of the Board of Directors appointing the Executive Committee, dated February\*, 1920."

Second. Protection as to quality shall be that provided for in Rules 7 and 8 of the rules of the association:

*Inspection—7.* The Commissioner and Deputy Commissioners shall at all times protect the quality of coal shipped to the association, through a system of inspection, and analysis, if necessary in their opinion, and they may at any time suspend shipments into any pool when, in their judgment, the quality or preparation of such coal is below the proper standard. Appeal from such action shall take the same course as in the matter of classification."

*Rejections—8.* Cars containing coal which are, by the inspectors of the Association, rejected from any particular pool, shall be designated as "unclassified" and, upon notice mailed to the registered address of the member, shall be eliminated from the records of the Association. Responsibility for disposition of such coal shall revert, with all charges, from the day following date notice is so mailed, to the member for whose account the cars were shipped."

Third. Classification shall be made upon the basis of analysis for volatile, ash and sulphur, as to steam coals; volatile, ash and sulphur, yield of gas per pound and illuminating power, for gas coals, with such variations as shall be determined by the executive committee upon recommendations to it by the Classification Committee, such variations to be governed by such change in conditions as may arise from time to time making a change important or necessary.

Fourth. A preliminary classification shall be given a mine by the Classification Committee, following application, as provided in Rule 12 of the rules of the Association, based upon such general knowledge as

Realizing that pooling of coal makes for economy, the Tidewater Transshippers' Association is formed. It will make a new classification of mines for pooling purposes. Steam coals will be classified under volatile matter, ash and sulphur, and gas coal under these headings, and on the gas yield and the illuminating power of the gas formed. Analysis of coal in the seam will not be made.

\*Meeting not held before going to press.

may be had or can be made available on short notice. As soon thereafter as possible there shall be taken at least three samples of the coal, as commercially shipped from said mine, by a duly accredited inspector of the association, same to be taken in accordance with the principle set forth in "Bulletin 4" by E. G. Baily of Boston, Mass., entitled "How To Sample Coal and Coke."

"Application for Classification—12. The shipper of any coal not so classified may make application on forms Nos. 24 and 25, when prompt investigation will be made and the mine added to the classification by supplement and orders issued to allow the coal to go forward."

Fifth. The sample so taken shall be analyzed by a duly acceptable chemist to the association, in accordance with the principles of analysis set forth in Technical Paper 76 of the Bureau of Mines, entitled "Notes on the Sampling and Analysis of Coal."

#### MINE SHALL BE RATED FROM THREE ANALYSES

Sixth. The average analysis of the said three samples shall establish the basis for an adjustment in the classification of the said mine, and the preliminary classification shall, if necessary, be changed in accordance with the said finding.

Seventh. Further samples from said mine may be taken and analyzed, from time to time, either at the request of the operator or at the option of the Association, in the manner provided for above and the average of all analyses of the coal from said mine, taken officially by the Association, as heretofore provided, shall be used as the basis for correction, from time to time, of the classification, except that in the event that the coal shall show a marked change in quality from its previous standard special consideration will be given to such a mine by the classification committee and, after a thorough investigation, the Classification Committee shall have the right to immediately correct the classification of such coal.

#### SEAM ANALYSES ARE TO BE BANNED HEREAFTER

Eighth. Samples shall only be taken for the purpose of classification by an inspector who has been duly authorized by the Classification Committee and who shall have shown ability to sample satisfactorily in accordance with the principles set forth in Bulletin 4, by E. G. Baily, entitled, "How to Sample Coal and Coke." Sampling shall be restricted to the following: (a) Coal from any storage. (b) Coal from cargo. (c) Coal from railroad cars. (d) Coal from mine cars. (e) From chute of tipple or from conveyors at any point. Seam sections will not be used for the basis of ultimate classification.

Ninth. Samples shall only be analyzed for the purpose of classification by chemists having the authority of the Classification Committee and who shall have shown ability to check within — per cent † in this work with a board of acceptable chemists, selected by the Classification Committee, who shall adopt rules conforming to the foregoing, to be followed for the purpose of creating uniform practice in order to gain uniform results in accordance with the aforementioned Technical Paper 76 of the Bureau of Mines, entitled "Notes on the Sampling and Analysis of Coal."

Upon motion, duly seconded, the foregoing tentative principles were adopted, only one vote in the negative being recorded.

Thereupon the Chair asked for an expression on the

†Percentage not yet determined.

proposition of whether those present would become members of the Tidewater Transshippers Association, in accordance with the plans and rules submitted, and the following indicated their intention to become members and authorized the statement of tonnage to be annually shipped through the Association as set opposite their names:

#### PARTICIPANTS AND THEIR SHIPPING CAPACITY

Shipper	Thousands of Tons Shipped
Dexter & Carpenter.....	1,000
Coale & Co.....	750
C. W. Hendley & Co.....	750
Chawnee Fuel Co.....	400
Bertha Coal Co.....	300
William Cory-Mann George Corporation.....	300
Matlack Coal & Iron Corporation.....	300
Weston Dodson & Co.....	300
W. A. Marshall & Co.....	250
Alden Coal Mining Co.....	200
A. W. Hillebrand Co.....	200
Anita Coal Mining Co.....	
Punxsutawney Coal Mining Co. }.....	150
Williams Run Coal Co }.....	
Gauley Coal Mining Co.....	100
Clearfield County Coal Co.....	100
Emerson & Morgan Coal Mining Co.....	100
Hall Bros. & Co.....	90
Imperial Coal Corporation.....	50
	5,340

This does not cover all who were present because some who attended were not prepared to pledge their companies.

The following indicated the intention to become members but were not able to give tonnage figures:

Borden & Lovell, Wentz Co., Lewis Fuel Co., Inland Coal Co., Keystone Coal & Coke Co., Latrobe-Connellsville Coal & Coke Co., Mountain Coal Co., Argyle Coal Co., E. Russell Norton, Gorman-Leonard Coal Co., Garfield & Proctor Coal Co.

The total tonnage indicated at the meeting was 2,200,000 tons, and upon this basis, with the statement from Mr. Kirchner, of Hall Bros. & Co., of Baltimore, that many of the Baltimore transshippers would become members, and also upon the assurance of Mr. James, of the Pan Handle Coal Co., of Norfolk, Va., that the shippers at that port would probably desire to join the plan, upon motion, duly seconded, the Organization Committee was authorized to proceed with the plan and to perfect the organization and make it ready for business at the earliest possible moment. There being no further business before the meeting, it was adjourned, subject to the call of the Chair.

#### DEPOSIT OF \$300 OR OVER FROM EACH MEMBER

Members will be required to pay on demand the actual cost of conducting the affairs of the association at each port on the basis of the tonnage shipped, that figure to be determined monthly and to be assessed by the Executive Committee, the dues including, however, a sufficient sum to meet the general overhead expenses of the association computed in like manner.

An initial deposit must be made pending the assessment and collection of dues, as above provided. It will not be regarded as dues but as working capital, the deposit being 1½c. per net ton on all tonnage handled by the member at Tidewater ports during 1919. The deposit shall not be less than \$300, and shall be subject to revision Jan. 1 and July 1 of each year based on the member's shipments in the preceding 12 months or at more frequent intervals as the Executive Committee shall provide.

The deposit will be returned on withdrawal from the association. Members must file a satisfactory bond or undertaking with the association to guarantee the credits extended from time to time and conditioned also on the handling of the coal by the member in conformity with rules and regulations of the administration.

## Mining Fatality Roll

**D**OUBTLESS the fatality roll in the mines is long enough and sad enough to fill us with self-searching regrets, but after all the United States reports of mortality from all causes make us realize why mine workers take the deaths from mine accidents with a large degree of resignation.

In 1918 the number of deaths per thousand in the United States as just published was 18.0, while the number of fatal accidents in the mines was 3.39 per thousand. Thus the general mortality is 5.31 times as great as the fatality risk in the mines. As there are probably

five persons to every mine worker in every mining town the loss per inhabitant is only one-fifth as large, and there are probably twenty-five funerals due to natural causes to one due to a mine accident, even in towns that have absolutely no business but that of mining. In 1918, 1,523 persons died from organic diseases of the heart per thousand of population and 1,491 from tuberculosis. Hence the number per thousand of population who die from heart diseases and tuberculosis combined is about the same as the number per thousand of the mine workers who die from accident. No one wishes to do anything to hamper the steady development of the safety movement and certainly

no one would regard with indifference the passing of such legislation as will make mines safer, but it is a mistake to regard the mining hazard which the mine worker alone faces as far overshadowing the health hazards to which everyone is exposed.

## What Other Earnings Do Miners Make?

**M**UCH HAS been made by the miners appearing before the Federal Coal Commission of the fact that the mine workers were not able last year to secure employment more than 150, 200 or 225 days per year, the number of days varying in different districts. Naturally one does not expect the earnings of a man who is employed only 150 days a year to be as great as one who works 300 days. But it seems that those appearing

before the Commission have altogether neglected to take into account the additional amount which these workers can secure from other employment and duties, when not engaged in the mine.

Providence certainly must have considered the welfare of the miner when it arranged that those fields where mining is practically the only occupation available to a man would be those from which the coal is mined during a large proportion of the total working year. On the other hand in the Middle West where certain coals are of a nature to prevent mining and storage during slack seasons, because of the likelihood of spontaneous combustion or of other deterioration of the coal, the miner, in agricultural districts, finds in slack mining seasons, opportunity all about him for employment at seeding and cultivating the arable land and harvesting therefrom the annual crop. *Coal Age* does not understand why these points appear to have been altogether ignored by the operators in their arguments before the Commission. *Coal Age* does not hesitate to declare its policy that every honest worker who is willing to labor diligently when opportunity is afforded

him can and therefore should be given a generous wage. The product of the country will afford more than a bare existence and hence "the bread of carefulness" is not enough. However, in determining what this wage shall be, the employer should take into account the total earning power of the man throughout an entire year and cannot be expected to provide for 12 months living on six months working, when the other half of the time can well be employed in other work readily available to the miner if he will accept it. We must insist, therefore, that it is the total earning capacity of the mine workers that should be taken into account in determining whether working

conditions and wage afford a reasonable opportunity to the men employed in the bituminous coal mines.

## Co-operative Service

**T**HIS IS a day of co-operation—big things that cannot be done by one man or one company alone can be accomplished through united effort. Moreover, it is a day of service. More and more we are coming to a realization that for permanent success the sale of commodities must be made on the basis of genuine service to the purchaser. All of which leads us to ask why not combine these two ideas into one—co-operative service?

A splendid opportunity to accomplish this is just now available to the coal men of the country. Definite

means are also at hand. The way to put this thought into operation at once is by placing a service engineer on the staff of one of the larger coal dealers' associations. Such a man would be made available to the member companies, and he could assist them in solving their own and their customers' problems.

The American Gas Association has followed such a plan as this most successfully. Its scheme provides for an engineer of large experience and ability who, on request, goes about the country to aid the various local gas companies in handling the large or particularly difficult special problems that are involved in the utilization of gas. This engineer also makes general surveys of local conditions in order to develop industrial gas-fuel prospects. The gas company desiring the services of this engineer pays the association for his time and expenses, and the engineer is paid by the association on a straight salary basis. Thus the cost is distributed among those companies which get the benefits and no one is taxed beyond his own desires. Best of all this plan makes available a higher-grade man than any of the separate companies alone could afford to hire, and, at the same time, when he is not engaged in outside work the engineer can give the association valuable assistance in solving its problems at an annual cost that is almost nominal.

In the coal trade today the idea is becoming more and more prevalent that the coal dealer, whether the sales department of a mining company or a jobber or a wholesaler, must assist the user of the coal in the adoption of efficient methods. This policy will form a basis for secure and happy business relationships with the large users of coal; and the policy of co-operating in such a plan certainly gives great promise of success.

To teach a user of coal how to make two tons do the work of three, or even four, may seem a shortsighted sales policy, as it will reduce the tonnage which can be delivered to that fuel purchaser. However, if the user is not thus assisted by the dealer, someone else will supply the help or he himself will provide it; and even looking at the matter from a purely selfish point of view one should recognize that the man who does the teaching is the one who is going to get that user's future business.

The large service to the public involved in the teaching of fuel efficiency should not be overlooked. Anything which develops more economical utilization of our fuel supplies contributes to the general good of the country. Everyone gets the benefit of this. But those

will profit first who are most intimately associated with that part of the industry which does the good work.

COAL AGE proposes and would urge this plan. It is an innovation in the coal business, but has been proved to be a policy of great advantage in other fields. Coal is a public necessity and one ever being more regarded as a public utility, and for this reason the coal industry must endeavor to advance in public service.

### Storm Prices for Retailed Coal

Too often is it customary for the retailer to put five horses on a wagon or have his motor truck stalled for several hours in a snowdrift or in a street jam and pocket the loss that such conditions make necessary, hoping that he will be able to make good that deficit by charging more than a fair price to the customer who buys early and so gives him less trouble.

That customer who provides storage facilities at much cost is well worthy of more kindly consideration. Great is the need to make the man whose motto is always "Better late than never" change it to "Better never late." Coddling the indifferent makes the careless survive in place of the fittest. So often have we taken care of the laggard that he tends to remain doless and self-indulgent. He believes that civilization should be organized to take care of him.

The retailers have made up their minds to require henceforth that the high cost of storms be paid by those who will not provide for coal delivery before the wind begins to whistle and the snow to drift. The cost of this year's snow to the retail coal merchants of

Manhattan and the Bronx is said to have been no less than a quarter of a million dollars. On their stationery will hereafter appear a statement that the customer will have to pay more for coal delivered during a snow storm, a storm signal that the buying public will do well to heed.

Recent experience has shown that it is rarely safe to relieve the public of the consequences of its acts or failures to act. If what is wanted can be obtained without provision, why provide? If errors committed can be escaped, why avoid errors? If follies are forgotten and forgiven, why be wise? If prudent foresight does not bring a reward, why be prudent? If an expenditure for the public is money out of pocket, why not keep the money? We have not arrived at such a degree of social excellence that we can henceforth avoid the necessity of providing rewards to the good and of allowing well-merited misfortunes to fall on the indifferent.

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Shifting the Worker

*Letter No. 1*—I have been reading with much interest the experience described in the inquiry of "A. H." entitled "Shifting the Worker," *Coal Age*, Feb. 12, p. 327, and it strikes me that there may be two sides to this question. In the first place, the fact that the electrician offered our friend a change from the substation to the bonding gang would indicate that the mine was not under one head; or, if it was, the superintendent was not IT.

From the tone of the letter, it would seem to me that the superintendent had charge of the substation and its attendant, while the electrician was in charge of the bonding gang. If that was the case perhaps it was not the first time the superintendent had been up against this same proposition. If it was not the case, I think the electrician was very much out of order in offering the man at the substation a change without first consulting the superintendent. Either way we look at it, however, the superintendent if naturally quick-tempered, can be excused for going up in the air when approached in the manner mentioned.

It does not seem to me possible that if the superintendent was, as he should be, the head of the company's operations, the electrician would have had the nerve to go over his head. This may be the real reason that our friend received such a warm reception from his superior officer. In my experience I have seen just such cases as this. In one instance, a mechanic was sent out by the city office, and presumed a great deal on that fact, asserting his authority and taking every occasion to show the superintendent that he did not consider him as his superior. Take it from me, I can think of nothing that will make more dissension and hard feeling than this.

#### KIND TREATMENT AND SHIFTING EFFICIENT WORKERS BRING BIG RETURNS

It is not my meaning that I approve of the way the superintendent handled this case, for I do not. I have filled the position of superintendent of mines for twelve years and I know it is the wrong way to meet a man who is seeking to better his condition. It costs nothing to be polite and often brings big returns. My experience is that it pays to treat all your men more as if you were their guardian and was looking after them, rather than as a boss who was there to get work out of them.

As for changing men, I have often found it most beneficial, all around, to change a man from one place to another. I would do almost anything to keep a man if he was of any account. I figure that a man you know is an asset, while a man you do not know is a liability. I have, at times, taken a man from one assistant and persuaded another to give him a trial and, by so doing have made a good man out of a former trouble-

maker and kicker. It proved that the first assistant let his personal feelings govern him.

On other occasions, I have taken a man from one mine where he could not get along with the boss and put him at another mine and found him a first-class man; and have reversed the operation with the same two bosses and got the same results. When a man comes to me in a respectful way and asks for a change and I can accommodate him without lowering the efficiency of the plant or creating friction, I make the change. Should that, for any reason, not be advisable I tell him so, stating the reason.

My policy has always been to treat the men who are under me as I would like to be treated if our positions were reversed. I make no promises that I may not be able to keep. It is often possible to keep one's men in a good humor and get better results, by talking to them and explaining to them just how certain changes would effect them and yourself, rather than to refuse a request and give no explanation. No man expects you to injure yourself in order to help him. It is my earnest hope that we will all understand each other better some day, and the boss and his men will co-operate more fully.

SUPERINTENDENT.

### Roller Bearings for Mine Cars

*Letter No. 6*—Referring to the letter of W. H. Noone, *Coal Age*, Jan. 15, p. 148, it is pleasing to note that everyone is not of the same opinion regarding mine-car equipment, and some are to be found to argue the merits of plain bearings in comparison with roller bearings. Difference of opinion invites a discussion that cannot fail to benefit all connected with the coal industry.

Personally, I take an entirely different view of the relative merits of plain and roller bearings as applied to mine-car equipment, than the opinion expressed by Mr. Noone, and I will try to answer some of the questions suggested by his remarks.

Mr. Noone assumes that the large majority of coal mines still have cars equipped with plain bearings. This is probably true; but they are mostly all changing over to roller bearings as fast as they can. In Illinois and Indiana, where the largest mines in the world are located, only the smaller mines, putting out somewhere around 100,000 tons of coal a year, are equipped with plain-bearing mine cars, and many of these smaller mines are changing over to roller-bearing equipment, where the life of the mine is long enough to warrant the investment.

I believe there are few large operators who have made a study of mining equipment and are not convinced that roller-bearing trucks are more efficient, viewed from any angle, than are plain-bearing trucks. This statement is borne out by the fact that the majority of the large producing operations are using roller-bearings.

At the recent meeting of the American Mining Congress, held at St. Louis, Mo., a large roller-bearing manufacturer had a sign on his exhibit, showing that they had done more business in their mine-car department, in 4½ months of 1919, than they had done during the fiscal years of 1914 and 1915. This is a good indication of the popularity of roller-bearing mine cars.

#### SAVES POWER AND COST OF LUBRICATING CARS

Speaking of the saving of power, we all know that a wagon with its wheels free to revolve will run far more easily than the same wagon with its wheels chained to the wagon bed or spragged. If this is not the case, why does the driver of a wagon chain his wheels before going downhill? The fact of his doing this proves that rolling friction is less than sliding friction, and it makes no difference whether the friction is in the wheel hub or the wheel tread.

Again, the saving effected in the cost of lubrication is, to my mind, one of the greatest arguments in favor of roller-bearing equipment. When it is necessary to pay greasers \$5 a day for squirting grease at the car wheels, as the cars come out of the mine, it is clear that whatever can be done to eliminate this wasteful practice should receive careful attention. To prove that there is a saving in the use of roller bearings on mine cars, in place of plain bearings, allow me to make a comparative estimate of these two styles of equipment.

#### COMPARATIVE COSTS PLAIN AND ROLLER BEARINGS

A plain-bearing truck requires the application of a lubricant at least four times a week when the mine is running. A mine using 700 plain-bearing cars will require the services of two greasers at \$5 a day, making the labor cost for lubricating the cars \$10 a day. Allowing that the mine runs but 200 days in the year, this item amounts to \$2,000 in that time. Then, estimating the lubricant used at the low figure of 10c. a gallon, we will assume a quart is used on each car, each time it is greased, or one gallon, per car, per week. We have assumed that the mine runs  $200 \div 6 =$  say 34 weeks, which makes the cost for lubricant,  $34(700 \times 0.10) =$  \$2,380 expended for lubricant each year. Adding to this the cost of labor for greasing gives a total of \$4,380 a year for lubricating 700 mine cars equipped with plain bearings.

Now, on the other hand, flexible roller-bearing mine cars should be lubricated every three or four months, depending on conditions in the mine and the use made of the cars. Estimating a car as lubricated, say four times a year, and allowing 4 lb. of grease, per car, each time the lubricant is applied, or 16 lb., per car, per year, gives the total cost for lubricant, in that time  $700(16 \times 0.10) =$  \$1,120.

Now, the cost of labor for greasing cars, as taken from our records at the mine, is 40c., per car, per year. On this basis, the cost of greasing 700 cars four times a year would be  $700 \times 0.40 =$  \$280, which, added to the cost of the lubricant, makes the total cost of lubricating 700 roller-bearing cars, \$1,400 a year. This estimate shows a saving, in favor of roller-bearing cars, of  $4,380 - 1,400 =$  \$2,980, which is no insignificant item on the yearly cost-sheet of a mine. It will be observed that our estimate is based on minimum figures for plain-bearing and maximum figures for roller-bearing cars.

Lubrication is not the only item of saving, however. In the use of flexible roller bearings, we have elimi-

nated the wearing out of the car wheels in the hub, so common with plain-bearing wheels. In our experience, the only wheels bought are those required for new cars, or to replace broken wheels, the latter being seldom required. Mr. Noone claims that the greatest disadvantage of roller bearings is in the bearings themselves, owing to their intricate mechanism, which he says makes it expensive to replace a broken wheel. When we break a wheel, the roller bearing is taken out of the hub of that wheel and inserted at once, with no trouble, in a new wheel secured from the stockroom, but this necessity seldom occurs.

Wrecks will happen in mines, at times; but this is no argument in favor of plain bearings. New wheels must be bought to replace the broken ones; and the roller bearings are then removed from the broken wheels and placed in the new ones with little trouble. There must be some types of roller-bearing wheels where this cannot be done, but we have not had this trouble. In my opinion, less than 5 per cent of the wheels broken in mines are the result of wrecks, the large majority being due to worn-out wheel hubs and axles, which a roller bearing reduces to a minimum.

#### TESTS DEMONSTRATING THE SAVING OF POWER

Referring to Mr. Noone's claim that the saving of power, in the use of roller-bearings, would have to reach 50 per cent to offset the increased cost of maintenance and admitting, for the sake of argument, that there is some increase, I want to refer him to the test conducted by P. B. Lieberman, at the Greensberg Coal Company's mine. At that test, the H. C. Frick Coke Co. was represented by the chief mechanical engineer, C. E. Hutelmaier.

The Greensberg test showed a saving, in favor of roller-bearing cars, of 47.25 per cent, by the reading of the dynamometer. At another test made at Carbondale, Pa., the average drawbar pull for plain-bearing cars was 32 lb., per ton, as compared with 13 lb., per ton for cars equipped with flexible roller bearings. This test also developed the interesting fact that it takes twice as much power to start plain-bearing cars as is required for those mounted on roller bearings.

The reference made in the last paragraph of Mr. Noone's letter, regarding the fact that roller bearings are not used on surface railroads, has little application to their use on mine cars. It is well known that roller bearings, like other machinery, have load limits. The fact that they are not used by railroads is due to the enormous tonnage carried on those cars. It is clear that the bearing would have to be very large to stand up under that service, and this fact bars their use on railroads. Moreover, speed is another point to be considered.

RICHARD W. HARRIS.

St. Louis, Mo.

## Entering Mine with Open Light

*Letter No. 2*—It is with much surprise that I read the recent account of two deaths from blackdamp, and the comments thereon by a Pittsburgh writer. It is the old story of men who, through reckless daring or ignorance, rush into an abandoned place that has been standing idle and without ventilation, for a considerable time.

The account to which I refer states that three men entered an old slope, carrying nothing but a small

flashlight to dispel the darkness. The result was that two of the men were overcome by an atmosphere deficient in oxygen and probably containing deadly gases, and died before they could be rescued. The third man following the other two and seeing them fall managed to escape to the surface and give the alarm.

This accident occurred in No. 5 manway, of the Piney Run mine, which is located three quarters of a mile north of Blaine City, in Clearfield County, Pa. The comments of the writer at the close of the article, which show clearly that he had little practical mining experience in mines generating explosive or poisonous gases, should not be allowed to pass without correction.

#### STRANGE ADVICE FOR A MINING MAN TO GIVE

After taking the precaution to remark that "certain primary considerations should govern the investigation or entry of working places that have not been subjected to ventilation for any considerable time," he adds, "The following, well known but often forgotten, will serve as a basis: In entering an abandoned slope or shaft, an open lamp should be held in advance and at a level lower than the head. In entering an old working place, a mine safety lamp should comprise part of the equipment for the detection of any gas that may be present."

The strangeness of these remarks is that anyone, conscious of the need of "primary considerations" being necessary in respect to the entry of working places that are unventilated, should advise the use of both an open light and a mine safety lamp. Such advice is unthinkable as coming from a man of any practical mining experience in poisonous and explosive gases.

The most limited knowledge of these gases would have led this writer to have stated that the investigation of old abandoned and probably unventilated workings is a hazardous undertaking and should be done by competent, qualified men in an approved manner and with proper equipment. The carrying of an open light with a safety lamp into such a place is simply a call for the U. S. Bureau of Mines rescue car and the services of an undertaker.

W. G. DUNCAN.

Connellsville, Pa.

## Seasons in Coal Mining

*Letter No. 1*—A recent editorial that appeared in *Coal Age*, Nov. 6, p. 754, drew attention to the seasonal character of different industries, including that of coal mining, and the effect produced on the employment of labor, because of the unsteady work afforded, in the dull season, by reason of the inclemency of the weather or other conditions that lessen the demand for the article produced.

There is no doubt but that the change of the seasons is responsible for the irregular employment of labor in many branches of industry. This is particularly true in farming, carpentering, bricklaying and other outdoor employments. The gathering of ice can only be done in the ice season, just as the harvesting of the fields can only be performed as the crops mature.

As far as the mining of coal is concerned, the work can be performed with equal advantage in every season of the year. Considered in this light, coal mining is not a seasonable industry, though it cannot be denied that the operation of coal mines is determined and controlled by the demand for coal, which is always greater

in the winter season than in the summertime. The coal industry is subject, therefore, to the law of supply and demand. In summer, the limited demand for coal quickly overstocks the market; and, for a time after the demand has increased, the supply of coal held in storage is sufficient to meet all requirements, and the mines continue idle for an indefinite time, owing to this oversupply.

In seeking a remedy for these conditions, the operator cannot be expected to lower the selling price of coal, in order to stimulate its movement in the market, any more than the miner can be expected to work for less wages during that season. The success of the industry demands a uniform price for coal and a uniform demand to insure uniform production.

The disintegrating nature of coal, especially soft coal, the lack of storage facilities and the additional cost of reloading the coal for shipment, make it impracticable or impossible to look to this source for remedy. Neither can the railroads be asked to establish a system of freight differentials, in order to stimulate the purchase of coal supplies during the dull summer season. This would throw the burden on the railroads, which have their own operating expenses to meet.

The coal industry is face to face with the problem of a maximum demand in the winter season, and a minimum demand in the summer time. What is to be done to equalize this demand throughout the year and make it possible to keep the mines running uniformly and regularly? In my opinion, the answer to this question is to inaugurate an energetic campaign that will urge the public to lay in their winter supply of domestic coal during the summer months, instead of waiting till cold weather sets in when everybody wants their coal delivered at once.

#### CAMPAIGN FOR UNIFORM MARKET CONDITIONS

We must patiently hammer away at this problem to create a uniform market and demand for coal. Large dealers of coal, having ample storage facilities, should be urged to fill their bins during the summer, in readiness for the fall demand. This would have a good effect by helping to create a more uniform demand, for every month of the year. The consumer, however, should place himself in a receptive mood that will enable him to understand the need of his co-operation in this regard, which will go far toward solving the problem.

In the past, the public has not taken seriously the warning, "buy your coal in the summer," and the result has been an unavoidable shortage of coal during the last three winters. Coal consumers are not awake to their responsibilities in this matter. The handling and transportation of coal from the mine to the consumer is subject to less difficulties in summer than in winter, and this fact is worthy of careful consideration.

Before closing, let me suggest that the United Mine Workers of America might profitably take off their coats and jump right into the ring on this campaign. As mine workers, they are in a position to take an earnest stand for the purchase of coal, by the domestic consumer and by dealers in the summer months. The organization has able speakers, thinkers, writers and workers; they are live wires and it is to their interests, particularly, that good results should be accomplished in securing a uniform demand that will insure a uniform production of coal throughout the year.

Thomas. W. Va.

LOYAL MINE WORKER.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Miscellaneous Questions

(Answered by Request)

*Ques.*—A main entry is driven due north 1,925 ft. from the shaft bottom. A pair of cross-entries is started 350 ft. south of the face of the main entry and driven due east, a distance of 2,322 ft. All the entries are 8.25 ft. wide and 5.55 ft. high. The velocity of the air current is 492 ft. per min. and the air has a temperature of 56 deg. F. A door is placed on the main entry between the two cross-entries. The size of the door is 4.5 x 6.5 ft. Find the pressure per square foot on the door, also the total pressure.

*Ans.*—The pressure acting to close the door is the difference of pressure between the intake and return sides of the door. This difference of pressure, expressed in pounds per square foot, is equal to the unit of resistance for the pair of cross-entries, or the unit pressure due to the circulation in the cross-entries only. The total length of the cross-entry and air-course is  $2 \times 2,322 = 4,644$  ft. The perimeter of the airway is  $2(5.55 + 8.25) = 27.6$  ft., and the sectional area  $5.55 \times 8.25 = 45.79$  sq.ft. For a velocity of 492 ft. per min., the unit pressure producing the circulation in the cross-entries is, therefore,

$$p = \frac{klv^2}{a} = \frac{0.00000001 \times 4644 \times 27.6 \times 492^2}{45.79} = 6.776 + \text{lb. per sq.ft.}$$

The area of the door being  $4.5 \times 6.5 = 29.25$  sq.ft., the pressure acting to close the door is  $29.25 \times 6.776 = 198.2$ , say 200 lb.

*Ques.*—The barometer at the top of a shaft is 30.2 in. and the temperature of the air, 64 deg. F. The depth of the shaft is 1,100 ft. and the thermometer at the shaft bottom reads 75 deg. F. Calculate the difference of pressure on the air between the top and bottom of the shaft, and the difference in the readings of the barometer at these two points.

*Ans.*—This is a question that cannot be answered with any degree of accuracy, except by the use of a logarithmic equation, and, for that reason, it should not be asked at a mine examination. It is evident that the difference of pressure between the top and the bottom of a shaft is due to the weight of the air column in the shaft. But, since the density of the air increases with the depth of the shaft, it is necessary to know the average density, or weight per cubic foot, of this air, before the weight of the shaft column can be found. Some will assume that the average density of the air is equal to half the sum of the densities at the top and bottom of the shaft, which is not even approximately true. That assumption would increase the pressure from  $30.2 \times 0.49 = 14.8$  lb. per sq.in., at the top of the shaft, to 18.2 lb. per sq.in. at the bottom; and give a barometric reading, at that point, of  $18.2 \div 0.49 = 37.1$  in., making the increase of barometer  $37.1 - 30.2 = 6.9$  in.

As a matter of fact, however, the pressure is increased from 14.8 lb. per sq.in., at the top of the shaft, to 16.2 lb. per sq.in. at the bottom, making the barometric reading at the shaft bottom,  $16.2 \div 0.49 = 33.0$  in., which shows an increase of barometer of  $33.0 - 30.2 = 2.8$  in.

It is well to remember, in this connection, that the approximate rule of allowing 1-in. change in barometer to every 900 ft. of depth of shaft is based on the assumption of the density of the air being 0.0766 lb. per cu.ft. and takes no account of change in density due to changes in the pressure and temperature of the air.

*Ques.*—What would be the weight of 100 cu.ft. of carbon dioxide ( $\text{CO}_2$ ), when the barometer reading is 28 in. and the temperature 60 deg. F.?

*Ans.*—The weight of 1 cu.ft. of air at the given barometric pressure and temperature is

$$w = \frac{1.3273 \times 28}{460 + 60} = 0.07147 \text{ lb.}$$

Since the specific gravity of carbon dioxide is 1.529, the weight of 100 cu.ft. of this gas, at the given temperature and pressure, is  $100 \times 1.529 \times 0.07147 = 10.7$  lb.

*Ques.*—What pressure will be required to force 20,000 cu.ft. of air per minute through an airway 14 ft. wide, 6 ft. high and 3,000 ft. long?

*Ans.*—The perimeter of this airway is  $2(6 + 14) = 40$  ft., and its area  $6 \times 14 = 84$  sq.ft. For a circulation of 20,000 cu.ft. per min., the velocity of the air current is  $20,000 \div 84 =$  say 238 ft. per min. The rubbing surface of this airway is  $3,000 \times 40 = 120,000$  sq.ft. The unit pressure required is, therefore,

$$p = \frac{ksv^2}{a} = \frac{0.00000001 \times 120,000 \times 238^2}{84} = 0.8 \text{ lb. per sq.ft.}$$

*Ques.*—If 10,000 cu.ft. of air pass each minute through an entry having a sectional area of 49 sq.ft., how much air will pass per minute through an airway having an area of 12 sq.ft., the length of the airways and the power being the same in each case?

*Ans.*—For the same length of airway, the quantity of air circulated by the same power will vary directly as the sectional area and inversely as the cube root of the perimeter. Without knowing the shape or the dimensions of these airways, it is not possible to determine their perimeters, which must be known before the question can be solved.

Assuming that the airways are square, however, the quantity of air circulated by the same power will vary as the cube root of the fifth power of a side of such airway. In this case, the side of a square airway whose area is 49 sq.ft. is  $\sqrt{49} = 7$  ft.; and that of a square airway having an area of 12 sq.ft. is  $\sqrt{12} = 3.464$  ft. Then, the quantity ratio being equal to the cube root of the fifth power of the ratio of the sides and calling the required quantity  $x$ , we have,

$$\frac{x}{10,000} = \sqrt[3]{\left(\frac{3.464}{7}\right)^5} = \sqrt[3]{0.4948^5} = 0.3096$$

$$x = 10,000 \times 0.3096 = \text{say } 3,100 \text{ cu.ft. per min.}$$

## Retail Coal Dealers Review Timely Problems

**Coal Dealers Discuss Insurance—Assert That  
Railroad Administration Made Unnecessary—  
Confiscations—Bonus System Urged**

AT THE Pennsylvania Hotel in New York City on Thursday, Feb. 26, the second annual regional meeting of the New York State Retail Coal Merchants Association, was held. The meeting brought out a very large attendance of coal men from what is termed the Metropolitan district, which includes dealers from Long Island, Staten Island, Westchester County, and Greater New York. Richard J. Wulff, second vice president of the association, presided at the morning and afternoon sessions.

G. W. F. Woodside spoke at the forenoon session on industrial insurance, and told of the great success that has attended the Coal Dealers' Mutual Insurance Association, organized several years ago to provide a reasonable form of insurance for the coal dealers of New York State, as required by the compensation act. While the rates are the same as provided by the old line companies, or the State Insurance Fund, Mr. Woodside stated that the Coal Dealers Association had been able to remit to the insurers annual dividends in good amount and, in addition, had created a very formidable surplus after reserves.

Open discussion followed, in which a number of dealers testified as to their experience with the coal dealers' insurance, and the amounts saved, as compared with old line companies. "Cost and Cost Accounting" was a subject that was discussed by Paul K. Randall of Scarsdale Supply Co., and Roderick Stephens of Stephens Fuel Co.

### GOVERNMENT ONLY MUDDLES DISTRIBUTION

About the most interesting paper read during the sessions was that of Ellery B. Gordon, now secretary and manager of the National Retail Coal Merchants Association. His subject was "Coal Service and the Government." The gist of his paper was that relief could only come to the coal trade when the task of distribution is taken from incompetent Government appointees and returned to practical coal men. The Railroad Administration, he held, was incompetent to handle the coal industry, and that there had been unnecessary confiscation and diversion of coal which had resulted in heavy losses to retailers and higher costs to consumers.

"The legitimate relation of Government to industry does not mean the infliction of intolerable conditions to perpetuate the jobs of certain bureaucrats in Washington," he said. "It does not mean paternalism for the benefit of politicians with socialistic tendencies, nor does it mean subsidizing the entire industry for the benefit of a minority, even though that minority be a labor organization with thousands of votes, nor does it involve authority to completely upset the established machinery by bungling efforts and inexcusable interference with production, transportation and marketing."

At the afternoon session three papers were read on "profit-sharing and bonus systems." Frederick Ruby of the Middle Lehigh Coal Co. of Brooklyn, told how his company gets good results from its employees due to its bonus system. Hugh McDonald of the Scarsdale

Supply Co., stated that his company uses the profit-sharing basis in order to get the fullest measure of co-operation from its employees.

Harold B. Weaver, vice president of the Chicago Motor Bus Co., told of the experiences of various corporations with which he has been associated, and was a warm advocate of the profit-sharing plan. His description of the plan followed by the Yellow Taxi-Cab Co. of Chicago, which he stated had been most successful, was listened to with interest on the part of the dealers.

"Here, said Mr. Weaver, the taxi-cab company with about the worst type of labor, had been able to secure the most hearty co-operation of its employees, and while pursuing an open-shop policy in defiance to the American Federation of Labor, had built up a paying service which was second to none in the United States."

## Lambie, New Head of West Virginia's Mining Department

R. M. Lambie, whose likeness appears herewith, was, on Feb. 14, commissioned as the new chief of the West Virginia Department of Mines, succeeding W. J. Hea-

R. M. LAMBIE

therman, who had most acceptably filled that post for a period of two years, the retiring chief becoming general manager of the mines of the Cleveland Cliffs Iron Co. in Ethel, Logan County, W. Va.

Mr. Lambie is from Mount Hope, W. Va. Since he came to this country from Scotland in 1904, he has worked in all the positions around the mines, both as a miner and as an executive, most of his career having been with the New River Co. and the McKell Coal & Coke Co., both in Fayette County. Until within a short time before his appointment he had been a district inspector, having been appointed to that position Jan. 15, 1918. He resigned during the latter part of 1919 to become assistant to the general manager of the New River Co., but soon thereafter was tendered the appointment as head of the West Virginia Department of Mines.

Thus will it be seen that not only by virtue of his varied mining experience but also through his duties as a district inspector he is in possession of a thorough knowledge of the mines of the state and in a position to fill the duties of the department with efficiency.

# NEWS FROM THE CAPITOL

BY PAUL WOOTON

## Hines Seeks to Excuse His Confiscatory Policies

ON Feb. 26 the Director General of Railroads submitted to the Senate the following report, in response to a recent resolution by Senator Frelinghuysen, N. J., as to the authority of the Administration over the distribution and export of coal:

The authority, powers and duties with respect to shipment, distribution, apportionment and storage of coal and coke, delegated to the Director General of Railroads by the Fuel Administrator, are contained in Executive Order of Oct. 30, 1919.

In anticipation of the strike of bituminous coal miners, expected to commence Nov. 1, 1919, the President on Oct. 30, 1919, issued an executive order revoking orders of the Fuel Administrator dated Jan. 31, 1919, and Feb. 20, 1919, to the extent necessary to restore all of the rules, regulations, orders and proclamations therein suspended concerning fixing prices of lignite and bituminous coal at the mines; fixing or regulating commissions of persons and agencies performing the functions of middlemen dealing in bituminous and lignite coal; fixing or regulating gross margins of profits of wholesale and retail dealers in bituminous and lignite coal.

### Delegates Powers to Hines

Thereafter the Fuel Administrator designated by order dated Oct. 31, 1919, the Director General of Railroads and his representatives to carry into effect the restored order of the Fuel Administrator of Jan. 14, 1918, and to make such diversions of coal in the possession as common carriers, of railroads under his direction as might be necessary in the emergency to provide for the requirements of the country in the order of priority set out in the preference list of the order of the Fuel Administrator dated May 25, 1918, which was as follows:

Railroads; army and navy together with other departments of the government; state and county departments and institutions; public utilities; retail dealers; manufacturing plants on war industries boards preference lists; manufacturing plants not on war industries board's preference lists; jobbers, lake and tide-water.

On Nov. 5, 1919, the President issued a second executive order directing the fuel Administrator as occasion may require to restore, change, or make such rules, regulations, orders and proclamations fixing the price or regulating the production, sale,

shipment, distribution, apportionment, storage or use of all coal or coke as in his judgement might be necessary.

The Director General of Railroads on Oct. 31, 1919 took control of all bituminous coal then on wheels or otherwise held in the possession as common carriers of railroads under Federal control, and also subsequently of all coal loaded in railroad cars during the strike, for the purpose of carrying into effect the powers delegated to him by the Fuel Administrator.

The exercise of these powers by the Director General of Railroads has been in pursuance of the orders above referred to and of the following additional orders subsequently issued by the U. S. Fuel Administrator:

Order of Nov. 12, 1919, providing that the executive order dated Oct. 30, 1919, restoring certain rules, regulations, orders and proclamations relating to the prices of bituminous and lignite coal should not be applicable to bituminous coal shipped on and after Nov. 13, 1919 under a bona fide contract enforceable at will entered into prior to Oct. 30, 1919, and that coal shipped under any such contract and diverted in transit should be paid for by the party receiving same at the price to which the shipper would be entitled to bill same to the original consignee thereof.

Order of Nov. 21, 1920, providing that no anthracite coal produced in the United States should be sold, shipped or distributed except to dealers or consumers and for use and consumption within the United States, its insular possessions and Canada.

Order of Nov. 22, 1919, providing that coal dumped into barges, scows, boats or other vessels on lakes, rivers and other inland waterways should be subject to diversion in like manner and to the same extent as bituminous coal loaded in cars of a common carrier under the orders of the Fuel Administrator in effect Nov. 22, 1919, relating to the diversion of coal in transit; that coal diverted under authority of the order should be paid for by the party receiving the same in accordance with the provision relating to payment for diverted coal contained in the order dated Nov. 12, 1919; and authorizing the Director General of Railroads and his representatives to make such diversions as may from time to time be necessary in the order of the priority set out in the order of the Fuel Administrator dated Oct. 31, 1919.

Order of Nov. 22, 1919, authorizing the Director General and his representatives to make such rules, regulations and orders restricting or prohibiting the use or consumption of bituminous coal for the purpose of producing or manufacturing coke in beehive ovens as may from time to time be necessary.

Order of Nov. 29, 1919, providing that the regulations of the Fuel Administrator permitting a haulage charge to be made in the case of coal from wagon mines when shipped in box cars to be suspended, to include such coal when shipped in open top cars.

Order of Dec. 6, 1919, authorizing the Director-General of Railroads and his representatives to make such diversions of coke in transit as may be necessary in the emergency.

Order of Dec. 8, 1919, authorizing the Director General and his representatives to make and prescribe such local and general regulations restricting the delivery, use and consumption of coal, coke or other fuel or power generated or produced by the use or consumption of coal and other fuel as may from time to time be necessary in the emergency.

The authority delegated to the Director General has, since the original delegation, not been curtailed by the President or the Fuel Administrator,

except as it may have been affected by the above mentioned order of Nov. 12, 1919, which provides for the payment for diverted coal by the person receiving same at contract instead of Government price. The authority of the Director General has been enlarged from time to time and to the extent indicated in the orders above described. Response to inquiry as to the extent the delegated powers are now being exercised by the Director General can be better made in the answer to paragraph 4 of the resolution and will be included therein. All papers, documents, etc., referred to in paragraph 3 of the resolution have been above described and copies thereof are attached hereto as requested.

### Coal Committees Formed

The existing agency through which the Director General is exercising the powers delegated to him are substantially the same as those issued on Oct. 31, 1919, immediately upon his assumption of the duties imposed by the order of the Fuel Administrator of the same date, with such enlargements as the increasing difficulties of the situation demanded. The organization at first consisted of the Central Coal Committee and Regional Coal Committees. Subsequently various district and local coal committees were formed as occasion demanded and each of such regional, district or coal committees included in its membership a representative appointed by the Fuel Administrator. Such representation was in each case a practical coal man and in almost all instances one formerly connected with the Fuel Administration. The Central Coal Committee exercised general supervision over the other committees, kept fully informed by daily telegraphic reports as to the daily coal supply and needs of the country and directed through the other committees the distribution of coal in conformity with the priority list established by the Fuel Administrator and the needs in the various parts of the country. A full description of these agencies and the work accomplished is contained in the report of the Director General for 1919, a copy of which is hereto attached.

As was expected, bituminous coal production during the period of the strike from Nov. 1 to Dec. 13, 1919, fell off tremendously and for the entire period aggregated but 36.2 per cent of the normal production. Of the coal actually loaded during this period, by far the greater portion, in fact almost

70 per cent, was loaded in the Allegheny and Pocahontas regions in the States of Pennsylvania, Maryland and West Virginia. Practically no coal was produced in the territory west of Pennsylvania to the Rocky Mountains. In addition to this there was independently of the coal strike an extraordinarily large demand for coal by reason of the fact that much less coal than usual had been bought in the early part of the year. In these circumstances consumers' stocks early during the strike began to show signs of depletion and it became necessary to route large quantities of coal over most abnormal and unforeseen routes from producing fields in Pennsylvania, Maryland, Kentucky and West Virginia to the Central West and beyond. This action was indispensable if a coal famine was to be avoided in that consuming territory and by the termination of the strike approximately 40 per cent of the total production in the Allegheny and Pocahontas regions, about 4,000 cars per day, was thus being moved West.

#### Long Hauls Reduced Car Supply

Simultaneously, in order to avoid loss of market for extraordinary production in the Pocahontas region, which was not readily susceptible to all-rail movement, unusual measures were taken to move such coal by water from Hampton Roads to New England and other North Atlantic destinations.

All of this resulted in an extraordinary disruption of the coal transportation facilities of the country, since it was necessary to divert great numbers of coal cars from their usual routes to distant destinations in the West. This longer haul of course greatly increased the average time of car use per load and therefore correspondingly reduced the coal-car supply. Furthermore the character of coal car used in the East was not well adapted either as to size or construction to the usual requirements of the West, and this caused additional delays in the car movement.

Unfortunately during the strike period and down to the present time there has been a succession of severe storms and cold spells, coupled with depletion of train and yard employees on account of the influenza epidemic, which has further seriously interfered with the handling of coal and all other commodities. Notwithstanding all of these difficulties and the abnormal demand for transportation of every character, the amount of coal produced per week greatly exceeded the weekly production during the winter in the past.

On account of the strike and these extraordinary conditions it has been impossible since the strike to supply coal in sufficiently large quantities to meet the extraordinary demands growing out of the depletion of stocks during the strike. This is true despite the fact that the total bituminous coal produced in January has been considerably above normal for that period.

It has therefore been found neces-

sary up to the present time to continue in slight measure the control over distribution which was exercised by the Fuel Administration during the strike. Every effort has been made to reduce to a minimum this interference with the normal distribution by shippers and the Railroad Administration has constantly followed the policy of caring only for emergency needs and those of essential consumers in the higher priority classes. While the railroads made contracts for enough fuel for their operation, the coal operators have insisted that the policy adopted at their instance by the Railroad Administration not to place cars preferentially for railroad fuel be adhered to. The result is that in times of car shortage the railroads have not been able to get their contracts completely supplied and hence another reason for the continued necessity of diversion has been the need of caring for fuel supply of the railroads to the extent that the railroad contracts were not fulfilled.

I might also point out that upon the earnest insistence of the operators that their contracts made prior to Oct. 30, 1919, be protected, the Fuel Administration order of Nov. 12, 1919, was issued with the result that in many parts of the country operators have shipped only on such contracts, hence people who had not such contracts were unable to buy coal, particularly in the East, where under the Government price program the higher price was permitted for export coal than for coal sold domestically. In other words, a condition was reached where there was practically no spot coal available and in consequence a number of essential consumers have been unable to get coal except as a result of diversion. These factors have contributed materially to the necessity for continuing the exercise of the power of diversion despite the fact that the policy of the Central Coal Committee has been to cut export to a minimum.

#### Embargo Laid on Exports

At present an embargo on the movement of all coal for shipment overseas is being maintained at all Atlantic Coast ports and no coal is permitted to be exported except on application by shippers, recommended by the Regional Committee having jurisdiction and approved by the Central Coal Committee and representatives of the Shipping Board and State Department who are sitting with it. On account of the present serious shortage of coal in the Northeastern section of the country no export permits are being issued for coal from ports north of Norfolk and only such coal is permitted to be exported through Norfolk as is not required for consumption in this country or cannot be transported to destinations in this country by available boats in the coastwise trade. Export permits for such coal are issued in order that the coal may be promptly unloaded and the cars returned to the mines for further loading. Care is

exercised in the issue of export permits to insure an equitable distribution of them among applicants.

#### Coal Is Non Free To Move

With the exception of the embargo on export coal all restrictions placed on the distribution of coal in the United States and Canada during the strike by the various coal committees have been removed and the normal distribution of coal is interfered with only where emergencies arise which necessitate diverting to railroads, Government and state departments and institutions, public utilities and other essential consumers. In making such diversions the coal committees having jurisdiction select as far as practicable coal moving to consumers of less essential character and occupying a lower position on the Fuel Administration preference list. Such diversions are necessitated by the inability of some essential consumers to secure by purchase the additional coal they require, there being practically no coal available for sale in the Northeastern section of the country at the price fixed by the Fuel Administrator. Such diversions are made only after the committee having jurisdiction is assured by the applicant of his actual necessity as required by the regulations established at the beginning of the strike.

For the purpose of continuing this present control over the distribution of bituminous coal the Central Coal Committee continues to function and with respect to the export situation operates through a subcommittee on which the State Department and the Shipping Board have representatives. In so far as diversion of coal is necessary for the protection of consumers within the United States, the Central Coal Committee relies upon the regional organizations which for this purpose have maintained in part the regional coal committees.

#### To Advance R. R. Fuel

The Interstate Commerce Commission and the Department of Justice have been advised formally by J. D. A. Morrow, vice-president of the National Coal Association that if the individual railroads return to the practice of assigning cars to mines that there should be an immediate advance in the price of railroad fuel of 10c. a ton. It will be recalled that with the abolition of assigned cars the operators were required to deduct 10c. from the Government price.

An attempt to stop diversions of coal by legal action has been made by the New Haven Utility Corporation of New Haven, Connecticut. An injunction has been sought in the Supreme Court of the District of Columbia alleging that the company is being deprived of its property without due process of law.

## President Orders New Fuel Control

### Names Board of Four to Take Over Shipping and Export Administration

Coincident with the signing of the Railroad bill tonight, President Wilson issued executive orders providing for continuation of the powers of the Fuel Administration, but dividing them between the Director General of Railroads and a commission of four. Director-General Hines will retain jurisdiction over domestic distribution, while the commission will handle bunker and export coal matters.

The commission will be composed of A. W. Howe, Rembrandt Peale, F. M. Whittaker and J. F. Fisher. It will function through the Tidewater Coal Exchange, which had been suspended before the resignation of Dr. Garfield as Fuel Administrator.

The order creating the commission is effective until April 30 next. The order said the action was taken "because of the present emergency and in order to insure an adequate supply and equitable distribution, and to facilitate the movement, and to prevent, locally or generally, scarcity of coal."

It directs specifically that the order issued by the U. S. Fuel Administration Nov. 6, 1917, relative to tidewater transshipment of coal at Hampton Roads, Baltimore, Philadelphia and New York, and for the employment of and co-operation with the Tidewater Coal Exchange, as a common agency to facilitate transshipment and to reduce delays in the use of coal cars and coal-carrying vessels," suspended by Dr. Garfield on Feb. 20, 1919, be reinstated.

A second order, investing Mr. Hines with the powers of Fuel Administrator so far as domestic distribution is concerned, said doubt had arisen as to whether he could continue to exercise those powers after the return of the railroads to private control. A new order was therefore issued extending Mr. Hines' authority beyond the date of the return.

## Railroads' Coal Confiscation Illegal

### National Coal Association Says Victims of Confiscation Can Recover

Rush C. Butler, the general counsel of the National Coal Association, declares that all confiscations and diversions of coal by the Railroad Administration made subsequent to Dec. 13, 1919, the date of Dr. Garfield's resignation as Fuel Administrator, are invalid and unlawful, subjecting not only the Administration itself but the individuals to liability for any damage attendant on such action.

Mr. Butler holds:

1. That the Railroad Administration's authority to divert coal under Dr. Garfield's order of Oct. 31, 1919, expired when Dr. Garfield's resignation was accepted by the President, Dec. 13, 1919.
2. That every carload of coal so diverted by the Railroad Administration since Dec. 13, 1919, was diverted without authority of law.
3. That confiscation of coal by the railroads is "unlawful conversion" and that the owners of the coal are entitled to damages to compensate them for the loss.
4. That where the Railroad Administration has confiscated at less than Government prices, coal moving on

contracts, the owners of such coal can recover the difference between the contract price and the Government price. 5. That not only are the carriers involved responsible for losses in the foregoing, but that the officials of the Railroad Administration concerned are personally liable for the amount of damages and may be sued therefor.

## Coal and Oil-Land Leasing Bill Becomes Law

### President Signs the Measure Which Will Throw Open Over 6,700,000 Acres

At Washington on Feb. 25 President Wilson signed the oil-land leasing bill. The total area of oil lands thus thrown open for lease is estimated at more than 6,700,000 acres, while proved coal lands under Government withdrawal total approximately 30,000,000 acres, with 39,000,000 acres still to be classified. Phosphate lands are estimated at 2,700,000 acres, with sodium and other mineral deposits equally as extensive.

In withdrawn coal lands North Dakota leads the other twelve states with more than 11,000,000 acres, although its deposits are not considered as valuable as those contained in the 2,800,000 acres of Colorado, which are appraised by the Government at an average of \$75 an acre, the highest valuation for Government coal lands in any state.

The 7,238,515 acres in Wyoming get the next highest appraisal of \$53 an acre, the total valuation of nearly \$400,000,000 being the highest for any state. Other states with extensive coal lands are Utah, with 1,069,600 acres; Montana, with 5,782,216 acres, and New Mexico, with 665,565 acres.

### IDAHO RANKS FIRST IN PHOSPHATE LAND

Idaho ranks first in Government phosphate lands, with a little more than 1,000,000 acres, and Wyoming second, with 900,000 acres, these deposits also being considered the richest. The areas in Florida, Montana and Utah range from 100,000 to 300,000 acres.

Authority for the administration of the oil-leasing law is placed with the Secretary of the Interior. On oil lands the leasing rate will be 5 per cent. of the oil produced, and this may be demanded in oil or cash, as the Government may elect. For this year at least the Government is expected to collect its royalties in oil.

John Barton Payne, chairman of the Shipping Board, who soon is to become Secretary of the Interior, recommended recently this course to the Interior Department so the Shipping Board would be assured of an oil supply at fair prices. When he takes over the Interior Department Mr. Payne is expected to carry out his own recommendation in the matter.

## A. H. Fay Enters Private Employment

The departure of A. H. Fay from the service of the Bureau of Mines to enter private employment was marked by a bit of ceremony during which J. W. Thompson, the law examiner of the Bureau, made an address in which he set forth the things of value which had been contributed to the Bureau's work by Mr. Fay. Incidentally Mr. Fay will go into private employment with the best brief case that could be bought in Washington.

# THE LABOR SITUATION

## Public Utility Associations Protest Against Increased Cost of Coal

Representatives of Public Utility Associations appeared before the President's Coal Commission Feb. 17. Vigorous protests were registered against the passing on of the 14 per cent advance by the operators. It is stated that of the 50,000 tons of coal used annually by the public utility companies, 98 per cent of it is contract coal, which is causing the public utility consumers to pay the wage advance which they contend should be paid by the operator regardless of contract provision.

The commission was acquainted with the serious situation confronting the public utilities, making it almost impossible for them to meet the increased coal cost. Representatives of traction lines declared that the point had been reached where it is impossible to add to receipts by increasing fares. Further increases will result in decreased revenues, it was declared.

Objection also was made to the manner in which coal is being confiscated and diverted. While the public utility men testified that they are anxious to have governmental control of coal continued, they prefer some other agency than the Railroad Administration as the distributors.

Chairman Robinson asked one of the witnesses if it were not the duty of large consumers of coal to store as much as practicable of their winter supply during the spring and summer months. This was answered in the affirmative, but the request was made that others who would be benefited by the policy should make reductions in prices so as to offset rehandling and other expenses.

## Failure of Adequate Car Supply Affects Price of Coal

Appearing before the Bituminous Coal Commission, T. H. Watkins, president of the Pennsylvania Coal & Coke Co., in the operation of soft coal mines in central Pennsylvania, charged that the Railroad Administration had put into effect a "tyrannical system" of coal-car distribution by which coal operators were deliberately discriminated against.

Under this method, open top cars were arbitrarily offered to operators by the purchasing department of the Railroad Administration under an arrangement by which operators would charge the Railroad Administration a lower price for coal than that offered the consumer. Operators who accepted this arrangement, he said, were able to get three times the car allotment originally apportioned to them by the Railroad Administration, while those who declined to accept it suffered for lack of cars, many of them not having one-third of the supply promised them. Failure of adequate car supply, Mr. Watkins said, was an important factor in the price of coal in the market. Because of their inability to get cars when needed, he pointed out, many operators have been forced to run their mines at huge cost, while not getting coal to the market.

At the end of the day's hearing, Chairman Robinson announced that no further hearings would be held. The commission would consider the evidence submitted, he said, and endeavor to "reach a unanimous agreement as soon as possible." "It is a matter of record," said Mr. Watkins, in appearing before the commission, "that the purchasing department of the Railroad Administration, under charge of John Skelton Williams, not only resorted to the practice of assigned cars, but had the audacity to call some of the

leading coal operators of the United States to Washington, while Dr. Garfield was at the head of the Fuel Administration and made to them a definite proposition as to a guaranteed car supply to get cheap fuel.

"The Railroad Administration not only made this offer, but defended it and accused operators who resented and protested against its continuance of a lack of patriotism—operators who were not only trying to protect their customers, and who had vision and experience enough to know the final evil effects in reduced production through strikes and unrest." Mr. Watkins went on to say that this "unfair method of distribution," as he called it, had worked tremendous hardship to various mine operators. He submitted records to show that from March 1 to March 23, 1918, while some mines were able to get cars to carry the product of 160 working hours, others got enough cars to work only 27 hours.

### WHY DIDN'T McADOO BECOME AN OPERATOR?

"It is possible under this system for a railroad purchasing agent, if he so desires, to put an operator or a district out of business," said Mr. Watkins. "The miner who has suffered from this, the operator who has suffered from it, may be excused if he uses emphatic and violent language in protesting. And the general public, what have they to say? Unfortunately, the public is not fully aware of the conditions. To the general public mind, the operator is a bandit, a robber, a man without any sympathy or feeling. He is pictured as sitting by gloating over his ill-gotten gain.

"We have an ex-Secretary of the Treasury, Mr. McAdoo, going on record with the most absurd and exaggerated statements of the profits of coal operators, coloring statistics, picking out isolated cases of enormous profits of operators. Dr. Garfield's statement, showing that the average margin of profit was 46c. a ton in 1917, of which the Government took 30c. a ton in the way of excess profit taxes, was ignored. If Mr. McAdoo believed his own statement of 2,000 per cent profits in this industry, one can be pardoned for wondering why, when he resigned from public life to make more money, he did not engage in the coal business, instead of the moving pictures—unless possibly he had in mind that the rap at the coal operators would some day make useful political capital.

"It is hard to chase down a lie, and it is a lie to pick one or two corporations out of the thousands that there are and accuse all the operators in the United States of being profiteers. It was under Mr. McAdoo's administration that the vicious practice of allowing assigned cars to certain operators to secure coal for less than a fair price as fixed by the Fuel Administration was practiced. If there were excessive profits in isolated cases, it was probable that they were due to Mr. McAdoo's own methods.

"And it was not until Dr. Garfield's attention was called to the policies of Mr. McAdoo's administration, as pursued by John Skelton Williams, followed up by Henry Spencer, that there was the slightest check put upon the Railroad Administration, and it then took an appeal to the President of the United States to temporarily check the unfair distribution of handling the coal car equipment of the United States. Contrary to the principles of this order, Mr. Watkins said, railroads now propose to continue the practice when the Lever Law passes out of existence. Unless there is some definite policy adopted by the Government that will prevent preferential car service, I fear it will continue to the point where it of itself will cause a great national strike, without the question of wages or other working conditions entering into it."

Late in the day Mr. A. G. Guthcim, assistant manager of the Car Service Section of the Railroad Administration, defended the practice of preferred car assignment, saying that it was justified by economic and commercial conditions. The commission today heard representatives of the public in the bituminous-coal controversy, going, among other things, into the manner in which the 14 per cent wage advance to the miners had been applied by the operators.

Chairman Robinson announced that Dr. Garfield, the former Fuel Administrator who had recommended the 14 per cent wage advance, this to be absorbed by the operators, had been invited to appear before the commission, but that no reply had come from him. George W. Elliott, representing the National Committee on Gas and Electric Service, which, he explained, represents public utility industries in affairs between themselves and the Federal Government, protested against utility corporations having to meet any increase in wages, through an advance in the price of coal. The utility corporations, he said, had understood that the 14 per cent advance was to be met by the operators entirely, without an increase in price to the consuming public. This, he said, was the inference drawn from statements made by Dr. Garfield, who suggested the 14 per cent advance as a basis of settlement of the coal strike.

#### PUBLIC UTILITIES HAVE TO PAY 14 PER CENT

The National Committee on Gas and Electric Service, he said, had been informed that the 14 per cent advance had been absorbed by the operators as to contracts which had been made by them prior to the strike of last November. On these contracts, he was informed, he said, that the 14 per cent advance had been passed along. The matter had been taken up with the Attorney General, he explained, Mr. Palmer informing the public utility corporations that under the contracts prior to Nov. 1, the operators were privileged to raise the contract price to meet any increase in the cost of labor.

Ralph Crews, of New York, attorney for the operators, explained that the 14 per cent had been absorbed by the operators in all sales of coal except those under specific contract made before Nov. 1. "I am glad to hear that explanation," said Mr. Elliott. A. W. Brady, president of the National Traction Co., of Indianapolis; Charles L. Edgar, president of the Edison Electric Illuminating Co. of Boston; Paul Thompson, representing the Boston United Gas Improvement Co., of Philadelphia; and M. H. Aylesworth, of the National Electric Light Association of New York, all emphasized the point that if there is to be any increase fixed by the commission it will have to be passed on to the public.

### Expected Price Advance Investigated Still Further

How any advance in the price of coal may be applied, as an outcome of the hearings before the Bituminous Coal Commission appointed by the President, has become one of the perplexing phases of the commission's inquiry. While the commission has not indicated that there is to be any advance in wages beyond the 14 per cent given the miners in December, or even that the 14 per cent advance is to remain, the coal operators have insisted that, even if the 14 per cent advance stands, something must be done to enable them to meet it.

Briefs filed with the commission by representatives of public utilities corporations in the Middle West and East emphasize the point that the "general understanding" has been that the 14 per cent advance was to have been entirely absorbed by the operators, so that no rise in the price of coal, due to the increase in miners' wages, would fall upon the public.

George W. Elliott, of Washington, D. C., representing the National Committee on Gas and Electric Service, has stressed the point that if there is any increase in wages, resulting in a higher price in coal to utilities corporations, the public will have to pay for it.

In their arguments before the commission the public

utilities representatives from New York, Boston, Philadelphia and Indianapolis have stated that investigation develops that the 14 per cent wage advance has been passed on to the public by the coal operators on contracts entered into before the strike, which began on Nov. 1.

These contracts carried a provision, he explained, that any increase in the cost of labor would be met by an increase in the price of coal. Approximately 85 per cent of the coal output since the 14 per cent advance went into effect, Mr. Elliott said, had been sold under these contracts, the price being increased to cover it. Only on the remaining 15 per cent of the coal consumed, he said, was the 14 per cent absorbed by the operators.

#### PALMER SAID CONTRACTS WERE INVIOABLE

Attorney-General Palmer was quoted by Mr. Elliott as justifying the action of the coal operators in applying the 14 per cent advance on coal delivered under contracts entered into prior to Nov. 1. The Attorney General maintained that the matter of putting the 14 per cent advance on the contract price of coal was entirely between the contracting parties.

Chairman Robinson has indicated that the question of how the 14 per cent ought to be applied is seriously engaging the commission, and that it will endeavor to arrive at some adjustment that will be satisfactory. The problem of the inability of coal operators to get an adequate supply of cars by which coal can be run to the markets has become another serious point of inquiry by the commission. Failure of the operators to get enough cars to ship coal has been argued by the operators as being one of the potent factors in the high cost of production of coal. While obliged to run the mines and keep up with the public demand for coal, the operators have pointed out that this necessitates keeping heavy forces at work, and large quantities of coal have been banked up at the mines with no way to get it to the public.

#### HOW CAR SHORTAGE HAS HELD DOWN OUTPUT

Through figures submitted by operators representing the Central Competitive field, which embraces two-thirds of the bituminous industry, it has been shown that the full time output of the mines has suffered greatly on account of car shortage. The percentage of output of coal that could not be sent to the market because of this car shortage was shown before the commission last week, as follows:

District	Per Cent
Western Pennsylvania.....	24.7
Ohio, Southern Field.....	32
Pittsburgh, No. 8.....	38.2
Illinois.....	26.8
Indiana.....	25.7

The average of output lost on account of car shortage since the week of Jan. 17 has greatly increased, the operators have shown, in the different fields. Chairman Robinson has asked for complete figures as to the effect of the car shortage upon the output of the mines and upon the irregularity of employment of the miners. In this connection Mr. Robinson has asked representatives of the public utilities corporations to submit their opinion on a proposal for storing coal during the summer months, so that it may be available during the periods when there is the heaviest demand.

### Ohio Mine Workers Complain That Commodity Prices Are Too High

Flagrant profiteering is alleged by the coal miners of Belmont County, Ohio, who meet Prosecuting-Attorney William Dixon during the last week of the month when they will present their claims to him. Miners declare they will appeal their case to Governor Cox of Ohio in case the prosecuting attorney fails to act. The Belmont miners state they have been investigating prices for some time and that their investigations show they are being gouged and that advantage is being taken of them because they are unable to buy in the larger markets.

## Congress Urged to Enact Legislation Making Labor Contracts Legal

Miners' Contracts Are Mere "Scraps of Paper"—  
Figures Presented Showing Losses Due to  
Violation of Wage Agreements

The President's Bituminous Coal Commission was strongly urged on Feb. 28 by the operators of the Central Competitive Field to recommend to Congress the enactment of legislation which will make organizations of employees which enter into contracts of employment with employers legally responsible for the fulfillment of their agreements.

During the hearings before the commission the operators testified that the miners had shown an utter disregard for their contracts, so as to render them mere "scraps of paper." In spite of "strike-proof" contracts the number of strikes foisted upon the coal industry during 1918 and 1919 ranged from 102 to 140 in various states affected.

### HIGH COST OF FREQUENT STRIKING

Violations of the so-called Washington wage agreement of 1917, the operators have shown, resulted in losses in the production of coal running up into hundreds of thousands of tons, besides the heavy losses in wages to the men who went out on strike contrary to the contracts made by their official organizations. The loss in wages during the period of the recent strike alone, it is shown, approximated \$100,000,000.

In briefs filed before the commission, the operators urge that the "future well-being of the coal industry and its usefulness to the American public" depend primarily upon the observance of contracts by the miners. For this reason, they say, they have formally asked the commission to give the matter consideration in its final adjustment of the controversy.

Amazing figures as to the number of strikes in violation of explicit contract have been put on record before the commission. The disregard of the mine workers' organization for these contracts impelled Philip H. Penna, of the Indiana operators, to tell the commission that, although he had been an advocate of collective bargaining, he would break with the unions and run non-union mines if he were able to do so. Mr. Penna spoke of the operators as having "no redress" against mine unions violating their contracts and urged that the matter was of sufficient gravity for Congress to take up.

### A FEW OF THE MINERS' SELF-INFLICTED LOSSES

In the State of Indiana alone, during the year 1918, there were 140 strikes, a brief filed by the Indiana operators shows, resulting in a loss of 248,534 tons of coal which otherwise could have been produced. In 1919, the number of strikes was 105, with a loss in days of 318 and in tonnage of 291,535. These strikes cost the miners in wages over \$640,000.

C. E. Maurer, an Ohio operator, has informed the commission that in the district of eastern Ohio there have been 102 strikes since the Washington agreement went into effect, involving 70 mines. This does not include the general strike of last November. The number of days lost by the men in these 102 strikes was 258 and the tonnage lost by these strikes was 329,700. In southern Ohio during the year 1919 the total hours' loss by reason of strikes was 20,088, while the tonnage loss was 109,207. Including the November strike, the loss in coal production for Ohio since April 1, 1917, Mr. Maurer has shown, was 2,687,132 tons.

The extent to which contracts have been violated in Illinois during 1918 and 1919 is shown in a brief filed by Dr. F. C. Honnold. In 1918 thirty-five mines of the Coal Operators' Association, Districts 5 and 9 were affected by strikes for 130 days; two mines of the Central Illinois Association had strikes for 8 days, and forty-four mines of the Illinois Coal Operators' Association encountered

strikes for 79 days. The aggregate number of days lost by the men on strike in the three fields was 60,175.

During the first ten months of 1919 seventy-six mines in one district of Illinois, fourteen in another, and twenty-three mines in a third district had to struggle with strikes called contrary to agreements, with a consequent loss in days for all men out of 431,481. The general strike which began in November caused 35 days of idleness in the Illinois mines, stated Dr. Honnold, and was equivalent to 3,150,000 men being idle one day.

While mine workers' representatives before the Coal Commission have urged that what is known as the automatic penalty clause (or the docking clause—for failure of the mine workers to keep their agreements) be abolished, the operators, in their brief, say that it forms the only slight safeguard that now exists. The operators urge that, if anything, it be made even more stringent.

### WANTED: AN UNBREAKABLE WAGE CONTRACT

"There is nothing that this commission can do of so much importance to the coal industry, present and future," says Mr. Penna in his argument, "as to make a contract that is a contract, a contract that the willingly disposed will respect and that other people will be compelled to respect."

Ralph Crews, of New York, attorney for the operators, in an argument before the commission, has pointed out that the so-called "check-off" system—which was originated at the instance of the miners' representatives and under which the operators deduct from the miners' pay envelopes an assessment that is sent on to the United Mine Workers of America—has utterly failed of the purpose for which it was intended—to enforce contracts. The operators ask that this system, through which the miners pay an aggregate of approximately \$2,000,000 a year into the United Mine Workers of America coffers, out of their weekly wage, be abolished, as one of the acts of the commission.

The operators have seriously urged upon the commission that, if something is not done toward making contracts enforceable, the work of the commission, no matter what its verdict, is likely to come to naught, with nothing accomplished toward stabilizing the bituminous-coal industry. If any new contract that may be made, they point out, is to be broken at the whim of the unions, the operators will be at the "mercy of the miners," with disastrous results to the industry and a consequent disruption of coal supply to the consumer.

## New River Miners No Longer Feel They Have A Grievance

The most important action taken by the miners of District 29, United Mine Workers, in their recent second annual convention at Beckley was a revision of the constitution for the district, by which it was hoped that it might be made a more workable instrument. The constitution was almost completely rewritten. The new constitution makes provision for a district-board membership of six instead of seven members, all to be selected through a popular vote. Under the old constitution two board members were elected at conventions and the balance by a popular vote. Hereafter, also, under the new constitution the biennial convention will be held on the second Tuesday in October instead of on the second Tuesday of February.

Though representatives of District 29 appeared before the U. S. Bituminous Coal Commission at Washington during the sessions of the biennial convention of District 29, they had no grievance to present in view of the recent restoration by the operators of the contract of Sept. 1 with its check-off feature. It was stated during the sessions of the convention that the relations between the miners and operators of District 29 are now on a satisfactory basis.

The contract of Sept. 1 now in force in District 29 provides that any increase which shall become effective in the Central Competitive field shall also automatically become effective in District 29. Consequently miners in District 29 are anxiously awaiting a report of the U. S. Coal Commission's findings.

## What Miners and Operators Claim Bituminous Coal Commission Should Rule

President Lewis of the United Mine Workers, in summing up his final argument before the Commission, made the following points:

"1. All wage increases which the miner has received during the war period, including the 14 per cent increase fixed in the Indianapolis agreement, do not equal the increase in the cost of living, and the present wage of the miners is even more inadequate than the pre-war wage.

"2. The miners did not receive an adequate wage prior to the war and an increase proportionate to the increased cost of living would not place them on a just economic basis today.

"3. Increases of miners' wages have not kept pace with increases in other industries.

"4. The miners are entitled to a living wage, the principle that was enunciated by the National War Labor Board, proclaimed by President Wilson and affirmed by the laborers' guarantees of the Peace Treaty, a principle that is fundamentally just and that is universally sanctioned, not only by the enlightened opinion of our own country but by the civilized world.

"5. Regularity and continuity of employment constitute an economic right of the miners. A practical application of that principle can be secured by a shortening of the work day.

"6. Punitive overtime wage rates will tend to a more strict observance of the standard work day and the opportunity for more uniform employment.

"7. Increases in the cost of coal to the consumer have not been due to increased labor cost growing out of wage advances allowed to miners, but have been caused by excessive profits demanded and taken by the operators, and by the wholesale and by the retail coal dealers.

"8. Earnings and profits of the operators have been grossly out of proportion to the increased cost of production and the operators have not absorbed the 14 per cent wage increase fixed in the Indianapolis agreement but instead have passed it on to the public.

"9. Earnings of mine workers have been overstated and misrepresented by operators by citing exceptional cases."

### LEWIS SAYS COAL HAS BEEN SOLD TOO CHEAP

Mr. Lewis was assisted in his summing up by Secretary Green of the United Mine Workers. One of the points made by Mr. Green was expressed as follows:

"The trouble has been, in the mining of bituminous coal, that everyone, even the operators themselves, have regarded it as a cheap industry. They have felt that they must produce coal at such a ridiculously low figure and sell it at such a ridiculously low figure, so that the mines could be kept in operation. The selling price of coal now runs from \$2.35@ \$2.45. In my judgment the American public and the coal-consuming public must be educated to the fact that this is a very small price for bituminous coal at the mine and that in all probability as the years go by in order to conserve the coal supply the selling price of coal will increase.

"The checkoffs, the installation of time clocks, and other like innovations would disturb the mining industry more than anything else. There are traditions that have grown up with the industry. There are rules and customs. If you attempt to change them you are introducing chaos, a condition which tends to lower production. It would be the same as to attempt to make an Irish Catholic embrace the Hebrew faith."

Mr. Guthrie, for the operators, introduced as a part of the record a statement showing savings and bank deposits in 28 mining towns. The statement, he held, reflects the financial condition of the community in which they are located. In referring to the claims of the miners as to the unhealthy character of their occupation, Mr. Guthrie said: "I heard Secretary Wilson say that he had swung a pick in a coal mine for 23 years. I am surprised that the mine workers do not use him as an illustration of the serious effect which it has on the physical condition of a man. I

never have seen a more rugged, intellectual, vigorous man than Secretary Wilson."

A portion of the summing up for the operators was done by P. H. Penna. "I do not stand before this commission as any special pleader for the coal operators. I appear before you as a pleader for the coal industry of this nation, especially that of the Central Competitive Field.

"Regularity of employment is not a guaranteed right, and there can be no reason urged why the concession of such a right to the mine workers could not be advanced as a reason for granting the same to any other class of people in America, which is to claim that we are all entitled to regular employment whether the people require our product or not. We cannot make the mines run steadily, for the American people are going to have their fuel supply and have it when they want it.

"Reducing the hours of labor is not going to change our occupation from a seasonal one to a regular and persistent one. If that reduction be effected and we continue to meet the wants of the people, it does not mean the elimination of the seasonal feature of our industry. It means more mines, larger investments, more men, and it means nothing else. Hence our output will be produced at a higher cost. The last analysis of the mine workers' demand is more money for less work. During January there were 21 strikes in 85 mines. Think of it, in the face of a contract that is strike-proof. In the part of December that we worked there were 18 strikes with a contract that is strike-proof. The mine workers have become special pleaders for the violation of contracts. I hope that this commission, if it does nothing else, will make contracts enforceable, force the parties to the contract to respect it. If any good has developed from the relationship which is known as 'collective bargaining' it is due to the fact that there was a period when contracts were sacred."

Ralph Crews made the principal summing-up speech on behalf of the operators, the following being the high lights in his discourse:

"Mr. Lewis states that the average earnings of the members of the United Mine Workers of America for a five-year period is some eight hundred odd dollars. This commission, I think, is interested in the average only to the extent that the average fairly and truly typifies the industrious miner. Mr. Lewis' figure is unimportant if that average to a material degree is affected by the presence on the payroll of men who for any reason, other than certain definite ones, do not work whenever the opportunity presents itself.

"The mine workers' organization can justify itself if it will get back to the men at the mines the realization of the fact that because there is work to do today there is no certainty that they will have work next week. If, to the best of their normal ability, they will do today's work utilizing the opportunity for labor as it presents itself, as men do in other industries, as men who succeed have done from the beginning of time, a suitable living can be secured."

S. D. Warriner, of the Anthracite Board of Conciliation, informs us that on March 9 the wage conference between anthracite operators and mine workers will take place at the Hotel Pennsylvania. The conference will decide on a scale to become operative on April 1. It may be recalled that on Aug. 22, 1919, the Tridistrict Convention called for a two-year contract, 60-per cent wage increase, a uniform wage scale, 6-hour day bank to bank, five-day week, time and a half for overtime, double time for Sunday, closed shop, payment for all work incidental to mining, employment while awaiting supplies, elimination of dockage and other concessions.

# COAL AND COKE NEWS

## What Happened in January

[The bracketed figures in the text refer to the number and the page of the volume in which references to the matter noted may be found and should the reader desire further information he can obtain it in the place indicated.]

- Jan. 1—The Tennessee Coal, Iron & R.R. Co. does not renew contract with The Somet-Solvay Byproduct Co., at Ensley, Ala., when contract expires today [XVII, 69]—The G. B. Markle Co., of Jeddo, Pa., discontinues work at Highland No. 5, Jeddo No. 4 and Ebervale mines, while negotiating with Union Improvement Co., of Philadelphia, Pa., for renewal of lease [XVII, 153].
- Jan. 3—The State Mining Board of Arkansas upholds Governor C. H. Brough in discharging T. H. Shaw as State Mine Inspector [XVII, 155].
- Jan. 5—Thomas Lilley, millionaire coal operator, dies at his home in West Brownsville, Pa., aged 72 years [XVII, 155]—The Fayette County Mining Institute organizes at Mt. Hope, W. Va. Temporary officers are elected [XVII, 203]—E. Fred Wood, vice president International Nickel Co., dies suddenly in New York City [XVII, 292]—The American Expeditionary Force in France passes into history at midnight.
- Jan. 6—J. C. Thomas, wealthy coal operator of Bramwell, W. Va., dies at his winter home at Miami, Fla. [XVII, 155]—By vote of 1,639 to 221 the convention of United Mine Workers of America at Columbus, Ohio, endorses the action of the officials of the union in agreeing to President Wilson's settlement of the strike.
- Jan. 7—J. H. Wheelwright dies in Paris, France. One-page account of his life is given [XVII, 232]—W. P. Yeatman, coal operator of the Birmingham, Ala., district, dies at his home in Birmingham, Ala. [XVII, 203].
- Jan. 12—President Wilson's Coal Commission begins its hearings at its headquarters in Washington, D. C., with Henry M. Robinson, representing the public, as chairman; executive secretary, M. H. Shenton; technical advisor, S. A. Taylor; counsel, A. C. King; director of publicity, K. C. Adams.
- Jan. 14—The Federal Trade Commission's report on the cost of producing anthracite coal is made public [XVII, 279].
- Jan. 15—J. C. Norwood's resignation is effective today as state mine inspector. He returns to University of Kentucky as head of the Department of Mines and Metallurgy [XVII, 30]—Smokeless Coal Operators' Association of West Virginia holds important meeting at Bellevue-Stratford Hotel in Philadelphia, Pa., regarding car supply [XVII, 203].
- Jan. 19—T. W. Guthrie reviews history of miners' lamps before the President's Coal Commission at Washington, D. C. [XVII, 234]—The operators of the Central Competitive field reply to the demands of the miners, before the President's Coal Commission.
- Jan. 20—Frank Farrington testifies regarding clean coal before the President's Coal Commission at Washington, D. C. [XVII, 235].
- Jan. 23—The U. S. Senate adopts amendment to Kenyon Americanization bill requiring aliens and citizens alike between 16 and 21 years of age who are illiterate to attend classes of instruction 200 hours yearly.
- Jan. 24—All miners at mines of the New River Co., in southern West Virginia strike for "check-off" system establishment [XVII, 277].
- Jan. 26—Four hundred Kansas miners go on strike because of the passage of the

- Industrial Court bill [XVII, 236]—Thomas F. Holmes, general superintendent of the Chicago, Wilmington & Franklin Coal Co., of Illinois, dies at Springfield, Ill. [XVII, 311].
- Jan. 27—Don Rose represents the operators of the Freeport district of Pennsylvania before the President's Coal Commission [XVII, 275]—The President's Coal Commission reaches important part of its deliberations; considers statistical data [XVII, 276].
- Jan. 27 and 28—Voluminous statistical material is presented to the President's Coal Commission. Van Bittner makes extended argument in connection with this data [XVII, 277].
- Jan. 28—Officials of the United Mine Workers of America announce that conferences with anthracite operators will probably start on Feb. 15 regarding new agreement [XVII, 277].
- Jan. 30—John L. Lewis, acting president of the United Mine Workers of America, takes personal charge of the movement to unionize southern West Virginia [XVII, 317].

## Indiana, Pa.

**New office building at Indiana for Clearfield Bituminous Coal Corporation. To discontinue offices at Clearfield and Clymer. Details of new building. Prominence of the Clearfield corporation. Properties noted.**

On April 1 the Clearfield Bituminous Coal Corporation will move into its new office building at the corner of Eighth and Water Sts., Indiana, Pa., which will contain the general offices of the company. The offices and office employees at Clearfield, Pa., and Clymer, Pa., will be moved to Indiana and the offices at these two places discontinued.

The new office building is a two-story structure of brick and stone and represents an expenditure of \$80,000. On the first floor will be the offices of General Manager H. B. Douglass; General Superintendent H. J. Hinterleitner; also offices for the general purchasing agent, the superintendent of materials and supplies, two offices for private secretaries, two rooms to be occupied by the auditing department and a large pay-roll office. On the second floor are the offices of Chief Engineer Fred K. Prosser; also offices of the manager of the real estate department, the manager of the forestry department, as well as a large draughting room, which is lighted from overhead by skylights, and a modern blue-print room.

The architects of this building were Howard & Hatchin, of DuBois, Pa. The building contractors were John W. Cowper & Co., of Buffalo, N. Y. The building is to be heated by a steam plant installed by E. W. Webster & Co., of DuBois, Pa.

The Clearfield Bituminous Coal Corporation is one of the largest producing companies of central Pennsylvania, owning about 200,000 acres of coal land in Indiana, Cambria and Clearfield counties. The company operates large mines at Rossiter, Spangler, Clymer, Dixonville, Peale and Commodore. The Commodore operation is in the course of construction and when completed will be one of the most modern mines in the country.

The company has purchased several houses and lots in Indiana and will make every effort to accommodate all its men in its own properties. The new office building is a valuable addition to the many beautiful buildings in Indiana. It is planned to furnish the basement as a club room for the office employees within the next year.

## Charleston, W. Va.

**Mines on Chesapeake & Ohio operate less than three days out of six. No early improvement expected. Few cars being returned from western centers. Operators**

**believe cars are held at certain points loaded with coal. Serious operating conditions in New River field. Kanawha coal diverted for use on Pennsylvania R.R. Ban on exports.**

Limited production of coal again followed in the wake of a car shortage along the line of the Chesapeake & Ohio R.R. in this part of the state, in the weekly period ended on the twenty-first. The inability of the Chesapeake & Ohio to furnish cars cost mines in this section fully 50 per cent of potential capacity. The daily average in cars available to all mines on the system was only 1,300 cars, which, as may be imagined, did not go very far toward keeping mines supplied with enough cars to continue in operation.

Owing to poor transportation facilities, most mines were being operated less than three days out of six. No improvement in car supply is counted upon by railroad officials, who claim that weather conditions have not been such as to insure the return of any greater number of cars from western centers. There continues to be a strong belief among operators in this section, that coal cars are being purposely held at certain points loaded with coal. Exports from certain fields in this area are still shut off. It is claimed that if tidewater shipments were larger the short haul would insure a better car supply. Confiscation of coal from this section continues, and what producers are unable to understand, is why such coal should be seized for the Pennsylvania R.R., when that line has sources of supply nearer home. Such a policy has aroused indignation.

## New River Operates at a Loss

Insight into the adverse conditions, under which mines of the New River field were laboring, throughout the third week of the month, may be gained when it is stated that during the latter half of the week, the average daily production of all the mines in the New River field on the Chesapeake & Ohio was just a little above 12,000 tons a day. The limited car supply was still holding mines back to about 50 per cent production. Few of the mines in the field were operated so much as half the week.

It is said that the general illiness, resulting from the miserable car supply, has been the leading factor in making it hardly possible for most mining companies to meet expenses. In fact it is stated that many of them have been operating at a loss since January first; the strike, Government control and then a car shortage, all knocking the props out from under production, have deprived operating companies of any chance of realizing any return on their investment in recent months. While New River tonnage for bunkering continues to move in fairly large quantities, the permit system is still restricting export shipments to a great extent from the New River field. The epidemic of influenza in the field is now rapidly abating.

## Kanawha Works Half Time

While Kanawha mines found a fairly adequate supply of cars awaiting them, at the beginning of the third week of the month, being able to load 25,000 tons on the sixteenth, cars were decidedly scarce during the remainder of the week, growing less and less in number as the week grew older. Unable to secure cars, mines were forced to shut down, the average working time at most mines being about three days (or even less) out of the six. No factor other than railroad disability was responsible for a production for the field as a whole amounting to about 50 per cent of potential capacity. Even the tonnage which was produced was failing to reach the destination to which it was consigned, because the Railroad Administration was helping itself liberally to the Kanawha product, in order to furnish coal for the Pennsylvania R.R., and the very best grades at that. Kanawha coal is still under the ban as far as export shipments are concerned. Steam and gas coal from this field are at a premium.

## Bluefield, W. Va.

Average car supply for the week under 45 per cent in southern West Virginia. Hundreds of idle cars standing empty on side-tracks. West Virginia coal still diverted for Pennsylvania R.R. use. Winding Gulf feels influenza and scarcity of cars. Tug River output reaches low-water mark. Pocahontas production on down grade.

Coal companies in southern West Virginia in the third week of February suffered acutely from the lack of anything like a proper supply of equipment for loading. This period, taking the southern part of the state as a whole, was worse from a production standpoint than any other week in the month, conditions closely resembling those prevailing about the middle of January when loadings sank to such a low level. The average car supply for the week was believed to be under 45 per cent; over that mark in some fields and in others considerable under it. The effect of such a car scarcity was to materially cripple operations. Some railroads in fact were able to furnish only enough cars to keep the mines going for two days out of the week.

Southern West Virginia operators declare, from personal observation, that there are hundreds of empty cars standing idle on side-tracks west of the Ohio River. If such cars had been side-tracked for repairs, little repair work was being done on them. Operators generally strongly condemn the Railroad Administration for permitting such cars to remain idle when there is such a crying need for them.

To add to other troubles, experienced by operators in the southern part of the state, the Railroad Administration still persisted in its course of permitting confiscation and diversion of high-volatile coal for the use of the Pennsylvania R.R. hundreds of miles away. A vigorous protest was made to Washington, it was understood, against the seizure of coal for a road with bituminous coal available on its own line.

### Winding Gulf Yard Crews and Miners Being Laid Off

The car supply in the Winding Gulf region, for the week ended the twenty-first, was almost a complete failure. Mines dependent upon the Virginia Ry. for a car supply, were forced into idleness during four days out of the six. In fact cars had become so scarce that yard crews were without work and miners were also being laid off at many plants while several operations had to suspend altogether owing to the prevalence of influenza and the scarcity of cars. Railroad trainmen, commenting on the condition of rolling stock, censure the Railroad Administration for its failure to see that the rolling stock on various railroads was kept up. That transportation conditions on the Chesapeake & Ohio, in the Winding Gulf field, were little better than those on the Virginian, was shown by the fact that mines were able to work only about three days out of the six during the third week of February.

### Tug River Output on Down Grade

In the Tug River region, for the week ended the twenty-first, mines were able to load only 58,000 tons of coal, production dwindling almost to the low-water mark of Jan. 15. Throughout the week production was on the down grade, only 46 cars in the entire region being available for loading on the last day of the week, the twenty-first.

Report is made by several Tug River operators of a large number of empty cars standing in idleness on sidings west of Columbus. One operator, while going west from Columbus recently on the Pennsylvania R.R., observed several hundred empty coal cars along the side-tracks for a distance of 90 miles west of Columbus. While it was presumed that most of the empty cars observed were side-tracked for repairs, yet only two repairs were seen at work. Such a condition of affairs is held by West Virginia operators, as being largely responsible for the present unsatisfactory transportation conditions. It is taken for granted that what is true as to the empties on one road, is also true as to empties on other roads.

Production in the Pocahontas region was decidedly on the down grade during the third week of the month, due to the great dearth of cars. During this period, mines failed to receive half-enough cars. As a matter of fact the supply was just about 45 per cent, and most mines received cars sufficient to keep them busy only about three full days. Not only the car shortage but a continuance of the policy of confiscating coal at Bluefield scales for the

Pennsylvania, contributed to the rather gloomy outlook. incessant rains and snow storms had resulted during the week in high water, which was affecting operations (such as they were) to some extent. While much Pocahontas coal was going to tide-water, the permit system interposed a barrier between the mines and large foreign shipments; although a heavier demand than ever was said by operators to exist both in foreign and domestic markets, for Pocahontas coal.

## Huntington, W. Va.

Logan production 40 per cent of capacity. Miners work on holidays, with cars available. Influenza does not interfere with output. Tonnage gain on Chesapeake & Ohio lines.

With two hundred cars less in the field during the week ended Feb. 21, production slumped in the Logan field, amounting (it is estimated) to about 162,000 tons, as against 172,000 tons during the previous week. Conversely, there was an increase in the railroad-disability loss which was not far from 250,000 tons. In other words, nearly 60 per cent of the potential production of all the mines in the Guyan field was being lost, merely because of the inability of the mines to secure cars, production being little more than 40 per cent. Neither labor loss, mine-disability loss nor all other losses combined amounted to much more than one per cent. Insufficient motive power, during the third week of the month, interfered to some extent even with such shipments as it was possible to make to tidewater, and it was feared that congestion, as a result of such a power shortage, might result in an embargo.

All the mines in the field had a supply of cars on the twenty-third or at the beginning of the fourth week of the month, and consequently production was speeded up as much as possible on that date, even though it was a holiday, in order to take advantage of the empties furnished. As a matter of fact, Logan miners are paying little heed to holidays now, in their anxiety to earn as much as possible, since a full day's work is seldom possible under present transportation conditions.

There are still a good many cases of influenza among the miners of the district, but the epidemic is not so prevalent as to interfere with production.

While there was a gain in the total tonnage of coal transported by the Chesapeake & Ohio during the week ended Feb. 21, the gain was quite slight, amounting to only 190 cars or to about 9,500 tons. In the third week of February, the road handled a total of 10,215 cars of coal or approximately 510,750 tons, as against 10,025 cars or about 501,250 tons handled during the preceding week.

## Fairmont, W. Va.

Worst car shortage in the history of northern West Virginia fields. About 25 per cent car supply. Each railroad collecting its own equipment before return to owners. Nearly all northern West Virginia coal going east. Miners insist on further increase in wages.

Never in the history of the Baltimore & Ohio R.R., nor in the history of the Fairmont and other northern West Virginia regions, was there a worse supply of cars than during the week ended Feb. 21. Not even during the severe winter of 1917-18, when there was a transportation breakdown in connection with adverse weather conditions, was the supply of empties so low as it was in northern West Virginia during the third week of the month. There were one or two days during that week, in fact, on some roads when the supply disappeared altogether.

During the greater part of the week there was not over a 25 per cent car supply, and about the middle of the week the supply had dwindled to about 13 per cent. Production was practically paralyzed. Most of the mines in the northern part of the state were idle probably about two-thirds of the week, few if any mines being able to work as much as two full days. Mines fortunate enough to secure any cars at all received a supply so far below requirements that such a supply only lasted a few hours.

The third week of February ranked as probably the least productive in the history of the field. As showing how scarce cars were in some parts of northern West Virginia during the week, mines on the Monongahela R.R. on the seventeenth and twentieth were without any cars at all, and no coal trains were operated on those days.

As every road is bent upon collecting its own equipment, to the greatest extent possible, before the return of railroads, and as the Baltimore & Ohio road is sending more equipment off its line than it is receiving, therefore officials of the road fear an even larger deficiency in the car supply. Instead of any relief from the car shortage being in sight, there is a prospect of even worse shortages than have been witnessed in recent weeks.

Confiscation is still frequent in northern West Virginia and no class of coal shipment appears to be immune from the long arm of the roads, coal being seized when and where the railroads see fit to take it.

Little or no coal is being shipped to Curtis Bay and on the twenty-first an embargo on shipments both to St. George and to Arlington piers became effective, the embargo covering the period ending on the twenty-fourth. While nearly all the tonnage from northern West Virginia is being transported to the East, yet a small proportion was still being consigned to Ohio and Michigan points during the week ending the twenty-first.

Work has become so scarce in northern West Virginia mines, as a result of the car shortage, that miners are more insistent than ever for further increases in pay, to bridge them over such periods of dullness as are now being experienced in the northern part of the state.

## Ashland, Ky.

Northeast Kentucky speeds up production. Output 53 per cent of capacity. Chesapeake & Ohio plants operate 3 1/2 days in the week; Louisville & Nashville mines work only 2 1/2 out of six. Car-allotment commission making mine-rating survey. Railroad confiscation of coal works hardship.

With more cars available on the Chesapeake & Ohio and its branch lines in northeast Kentucky, the mines in that field were able to speed up production somewhat during the third week of February; although in the field as a whole, only 53 per cent of potential capacity was realized in the output of coal, potential production for the period in question being (according to railroad figures) 235,000 tons. Even with conditions somewhat improved there was still a heavy production loss—112,545 tons or 47 per cent—all but about 3,000 tons of such loss (or 109,000 tons) being attributable to a shortage of cars.

Still, mines on the Chesapeake & Ohio and its lines were able to work about 3 1/2 days during the week, a marked improvement over previous weeks; it being the third week of the year, in fact, in the northeast Kentucky territory. While Chesapeake & Ohio coal plants had a supply sufficient to keep the mines going fairly well for the period stated, on the other hand mines on the Louisville & Nashville were able to operate only about 2 1/2 days, it being the first time in recent weeks that the Chesapeake & Ohio road has surpassed the Louisville & Nashville as regards car supply.

Producers in the northeast field are still bending their energies toward securing an increased rating for mines in this territory; they believe they are entitled to this rating, owing to the extension of plants and the increased working forces available. While at first denied such an increase in rating, the Chesapeake & Ohio car-allotment commission is now making a special survey of conditions at various mines, to determine whether or not mines are entitled to an increased allotment over last year. The practice of deducting from the car supply at a time when cars are scarce for "overage," has been discontinued, it is reported, as a result of vigorous protests filed with the Railroad Administration.

Confiscation of coal produced in the northeast Kentucky territory, for the use of the Chesapeake & Ohio, is being continued at great inconvenience to producer and consignees, preventing an uninterrupted flow of coal to industries greatly in need of coal at this time. Owing to the restricted car supply, northeast Kentucky mines still found it impossible, during the week ended the twenty-first, to supply all the coal for which there was such a stiff demand, all grades being included in the demand.

## Norton, Va.

During car shortage, Virginia mines coke or store 30 per cent of output. Influenza beginning to affect production.

While production in the southwestern Virginia fields was increased about 2,000 tons during the week ended the twenty-

first, as compared with the previous week, yet on the other hand production losses were heavier, reaching 67,000 tons, or 15,000 tons in excess of losses for the week ended the fourteenth. All but about one per cent of the losses were attributable entirely to car shortage.

There would have been a much heavier production loss, in fact, if the mines had depended upon a car supply in order to get out coal. Indeed, it is estimated that if the mines had waited for empties, the production loss would have shot upward to 60 per cent of capacity. Instead of depending upon the car supply, 30 per cent of the product of the various mines was either placed in coke ovens or stored.

Although several months have elapsed since the strike ended, Virginia operators have more than \$100,000 outstanding, due them for coal diverted during the strike, and a good deal of trouble is being experienced in reducing the amount still in arrears.

The prevalence of influenza in the Virginia fields was beginning to affect production somewhat during the third week of the month. There were, at the end of that week, 3,000 cases of influenza in the field. The death rate, however, was not over one per cent.

### Benton, Ill.

**Interest in Hamilton County developments. Prominent coal concern contracts to drill very large territory in near future. To take over big acreage on satisfactory test.**

Much interest is being shown in the developments now going on in Hamilton County of this state, where options have recently been taken on quite a large acreage of coal land. No serious effort has ever been made to determine the amount and quality of coal in Hamilton County, although it is almost surrounded by some of the highest producing counties in the southern Illinois field.

H. M. Rea, a well known capitalist of Franklin County, who has done much toward securing the development of the coal industry in that section, is said to have recently closed a contract in Chicago with one of the largest coal interests in the country, by which the prospective purchaser has contracted to drill out practically the entire southern half of Hamilton County.

Drilling is to begin in this section as quickly as outfits can be placed on the ground, and will continue until a thorough test has been made. The prospective purchaser wants to buy quite a large coal acreage, and therefore intends spending a large sum so as to know positively what thickness and quality of coal underlies this territory. If the quality of the coal and the thickness of the seam are satisfactory, the company is said to have contracted to purchase not less than 25,000 acres, and will probably take over a much larger acreage.

As evidence of good faith and a guarantee that it will drill at once, the operating company has deposited \$10,000 in one of the McLeansboro banks. Under the terms of the contract the company must begin drilling at once, but it has until the first of next year to take up the options.

### Victoria, B. C.

**Settlers' Rights Act disallowed. Conflicts with terms of Order-in-Council. Controversy of importance to British Columbia coal-mining industry. Cassidy collieries in litigation. Recent Order-in-Council decides public domain taken must be promptly developed.**

The Settlers' Rights Act of 1919, passed by the Legislative Assembly early in that year, and which did not receive the signature of the Lieutenant-Governor pending advice from the Ottawa authorities, has been disallowed by the Dominion Government. The position taken by the Federal authorities is that the legislation is in conflict with the terms of the Order-in-Council, under which the Settlers' Rights Act of 1917 was vetoed. It is considered likely that the provincial Government will ask the Legislature to re-enact the measure, its stand being that nothing is proposed under its authority that is not well within provincial administrative rights.

To those interested in the coal-mining industry in British Columbia, the issue of this controversy is of importance. The Act of 1917, which was not disallowed before a number of Provincial Licenses had been issued, is responsible for the opening of the Cassidy collieries of the Granby Consolidated Mining, Smelting & Power Co.,

Ltd. These licenses, under which the Granby company is operating on Vancouver Island, now are the subject of litigation. The Settlers' Rights Act of 1919 extended the period, in which pioneer settlers within the Esquimalt & Nanaimo Ry. belt, or the descendants or legal heirs of old-time settlers, could obtain title to the coal rights within the area of their realty holdings.

The Government of British Columbia has passed an Order-in-Council reserving for the people all the unalienated coal lands within the province. This means that hereafter staking under the Coal and Petroleum Act is forbidden. Hon. T. D. Pattullo, Minister of Lands, explains that it is the definite policy of the Government to put an end to alienation in respect to coal lands as already there are coal-bearing areas, to which Crown Grants have been issued, which are being held out of production merely for speculation. He adds that it is proposed that use is to be the basis of all British Columbia alienation policies. This is taken to mean, in the case of coal for instance, that no part of the public domain may be taken up by individuals or corporations, unless satisfactory guarantees are forthcoming, that it is their intention to take immediate steps to make it productive.

### PENNSYLVANIA

#### Anthracite

**Scranton**—Building operations to reconstruct the Manville breaker of the Hudson Coal Co., at this place, have just been begun. The Manville has been idle about four years and during that time all of the former machinery has been removed and shipped to different points. It was at that time decided to run the coal from the Manville through the Dickson shaft to the Von Storch breaker for preparation, but since the recent sale of the Von Storch to the Acker-Conklin interests, it has been found necessary to make other arrangements. The Manville will now be known as a "concentration plant," in which all coal from the Manville and Dickson collieries will be prepared for market. It will be entirely modern and although the exterior will not be materially altered the interior will be changed considerably to suit the requirements of new machinery. The building is to be strengthened throughout. The company, while utilizing the Von Storch breaker for preparing coal, has found it necessary at times to ship partly prepared coal to Carbondale for final preparation, but the re-opening of the Manville will relieve this necessity and extra cost of shipping. The Manville is the only Hudson company breaker in the Green Ridge section now, the nearest to it being the Marvine says the *Scranton Times*.

#### Bituminous

**Pittsburgh**—Work has begun on extensions to the mining laboratories of the Carnegie Institute of Technology, here, which when completed, it is said, will afford the school the most thorough equipment of its kind, in the country. The tentative plans approved include the additions of a laboratory for work and research, elements of mining machinery, electrical applications in mining, coal and ore dressing, mine models and practical demonstrations. Arrangements have been made by Mr. Steidle, professor of mining engineering at the institute, whereby the equipment, in the way of mining machinery, for the new laboratories will be furnished as a loan by some of the manufacturers of this type of machinery.

### WEST VIRGINIA

**Wheeling**—The annual meeting of the stockholders of the Hanover Coal Co. was held at Bellaire recently. A board of directors was elected, which met and elected the former officers. The company has 1500 acres of coal land in Washington County, Pa., where it operates stripping mines. The company has an authorized capital stock of \$500,000 and is one of the biggest stripping mine companies in the central field.

**Bluefield**—Virtually every company in the Pocahontas field was represented at the annual meeting of the Pocahontas Operators' Association held in this city on Feb. 21, the principal business at such meeting being the election of officers. All the officers were re-elected as follows: Isaac T. Mann, president; L. E. Tierney, vice president; Jairus Collins, treasurer; W. E. Koepler, secretary. President Mann was present and presided at the meeting. The ment of the various executive committees president expects to announce the appoint-

in a short time. Aside from the election of officers, only the usual routine business was transacted although transportation problems as well as the payment for coal confiscated came in for a share of discussion.

Although at one time an important industry in the Pocahontas field, the production of coke in that region is steadily on the decline, as shown by the figures covering the output for 1919 and the years immediately preceding. Only 493,503 tons of coke were shipped from the Pocahontas district in 1919, the shipments by months being as follows: January 98,858; February 68,803; March 54,160; April 33,368; May 29,902; June 22,238; July 18,876; August 32,064; September 33,295; October 35,127; November 36,367; December 35,345. As there was a coke production of 1,272,707 tons in 1918, the 1919 production represented a 60 per cent decrease. Going back to 1917, there was then a production of 1,495,329 and in 1916 the coke shipments aggregated 1,355,646 tons. However, there appears to have been a steady decrease in coke production in the Pocahontas region ever since 1910 when 2,084,023 tons were produced.

Within a few years it is believed that little or no coke at all will be produced in the Pocahontas field, it being unprofitable to manufacture coke in that region because of the fact that the coal itself has become so valuable, although Pocahontas coke is of such a high quality as to command high prices. The bulk of the coke made in the region is produced by the United States Coal & Coke Co. and is used at western plants of the United States Steel Co.

### OHIO

**Toledo**—The congestion at the Toledo gateway which has been holding up coal transportation for months was temporarily relieved recently by the movement of a number of cars into Michigan territory. Producers and shippers in Ohio and West Virginia began to feel better over the situation but soon afterward additional embargoes were announced and the situation is now as bad as ever. Because of influenza among train crews, wide distribution of cars during the suspension and cold weather, there is little hope for immediate improvement in the Toledo situation.

**Columbus**—Steps are being taken to put into effect the recently enacted law compelling all operators in the state to provide wash houses for their employees after April 1. This law is receiving the support of operators generally, and already many have started to erect such facilities. In many cases the larger operators will provide shower baths for their men in large permanent buildings. Many of the houses will be put into service previous to the first of April.

One of the largest coal deals in central Ohio, which has taken place for some time, was consummated recently when all of the properties, which have been controlled by H. H. Heiner and George H. Barker of the Maynard Coal Co., of Columbus, were merged under that name. The properties consist of three large mines in the Pomeroy district and one in the Jackson district operated by the Maynard Coal Co.; also three large mines in eastern Kentucky operated by the Dankel Boone Coal Co. and the Superior Coal & Dock Co., of Duluth. The authorized capitalization of the company has been increased to \$2,300,000. The reason for the merger is to secure more centralization in the management of the various properties.

### INDIANA

**Terre Haute**—Mines in the Terre Haute district are working only three days on an average. In several cases of mines located on the Chicago, Terre Haute and South-eastern R.R., the car shortage has been most acute, many men not working more than one day a week for a number of weeks. The average weekly wage of those who have worked, it is said, is only \$18. Eighty-one mines were reported closed one day recently on account of car shortage. The total average daily production of the closed mines is more than 60,000 tons. The shutdown represents a considerable loss to the miners in wages.

The coal mines in Indiana produced 19,327,795 tons of coal during 1919, which was about 10,000,000 tons less than in 1918. These figures have just been compiled by the Indiana Coal Trade Bureau. The miners worked 214,753.11 hours. The miners lost 31,501 hours because of car shortage; 13,206 hours because of labor troubles; 13,525 hours because of mine disability; and 140,206

hours because of "no market." The number of mines along the various railroads and the coal tonnage produced by them in 1919, respectively, follows: Big Four, five mines, 641,380 tons; Baltimore & Ohio Southwestern, three mines, 257,992 tons; Chicago & Eastern Illinois, 47 mines, 5,517,481 tons; Chicago, Indianapolis & Western, one mine, 57,510 tons; Central Indiana, three mines, 55,528 tons; Chicago, Terre Haute & Southeastern, 38 mines, 3,632,519 tons; Evansville & Indianapolis, 14 mines, 756,486 tons; Illinois Central, six mines, 447,136 tons; Monon, 21 mines, 1,518,353 tons; Pittsburgh, Cincinnati, Chicago & St. Louis, 42 mines, 5,163,633 tons; Southern, 20 mines, 1,078,628 tons; Evansville & Eastern, two mines, 44,137 tons. The mines reporting to the Coal Trade Bureau represent about 85 per cent of the total tonnage in Indiana.

### ILLINOIS

**Carlinville**—The new tippie at the mine of the Carlinville Mining Co. has been erected and the mine is now able to supply all demands for coal. The mine did a prosperous business in 1919 and a good business is expected for 1920. The mine has been handicapped by poor roads to and from the mine but the owners of the mine hope to arouse enough public interest this year to correct this defect.

**Benton**—The car shortage continues to be serious in the entire southern Illinois field. However, those in active charge of operations at the mines state that railroad officials are holding out a promise of an early improvement. Mines in this region, since the first of the year, have not been averaging 50 per cent running time. There is still an undercurrent of dissatisfaction among the miners, but should the car supply improve sufficiently to permit of steady work, it would do much to quiet the unrest.

**Hillsboro**—A deed was filed at this place in Montgomery County, Illinois, recently, the consideration on which was \$5,849,740.13. The deed was made by Geo. C. Van Tuyl to the Indiana & Illinois Coal Corporation, and it conveys the coal mines, coal properties, etc., formerly owned in Montgomery and other counties and known as the Peabody mines. At the time the transfer was made the properties were owned by the Chicago & Eastern Illinois R.R. The mines are located at Taylor Springs, Kortkamp, Witt and Nokomis, Illinois. The Illinois & Indiana Coal Corporation owns and operates ten mines and other coal properties will probably be added to the list of holdings, according to well founded rumors.

**Springfield**—The Illinois State Utilities Commission recently authorized a bond issue of \$530,000 to be used in the construction of the Marion & Eastern R.R. from Marion to Harrisburg, or near that city. It will be a coal carrying road, and will open up the vast coal field in the eastern part of Williamson and western Saline counties for development. Some of the richest coal lands in southern Illinois are said to lie in the section which will be reached by this road. The Madison Bonding Co., of Chicago, has agreed to underwrite the bond issue, and representatives of the company were in the territory of the proposed route recently on a tour of inspection. It is not known just when actual building operations will start, but development will be pushed as rapidly as possible.

**Duquoin**—The Security Coal & Mining Co., of Chicago, operating the Security mine three miles south of here, has started the work of construction on a large re-screening plant. The work of putting in the foundations has been completed and it is expected that by April 1 the new plant will be in operation. All of the plans were made by engineers of the Link-Belt Co., of Chicago, and all shaker screens and conveyors will be constructed under their supervision. Aside from the regular five sizes which the operation now produces, the new screening plant will add No.'s 1, 2, 3, 4 and 5 nut coal to the output. The total cost of the new plant will be in the neighborhood of from \$30,000 to \$35,000.

The car proposition is most serious in this field, the mines hardly averaging 2½ days a week. The only source of car supply comes from the Illinois Central R.R. and for some reason the company seems to be unable to get cars moved around fast enough to give the mines even half running time. During the first week in February the Majestic and Security mines, two of the largest in this field, worked only 17 hours in the six days. This is said to be the worst record which has been known of in southern Illinois with the present market conditions. At present no hope of the situation improving is held out.

## Personals

**D. S. Wolfe** of Jeanesville, superintendent of the Lehigh Valley Coal Co.'s Lehigh division resigned to go with McTurk & Co., Girardville, Pa. No successor has been appointed.

**A. S. Winter**, formerly connected as advertising and sales manager for the William Powell Co., has joined the sales force of the Fairbanks Co., of Pittsburgh, Pa., and will represent them in southern Ohio.

**T. O. Sloan**, who has been with the Peabody Coal Co. for some time at mine No. 19, in Franklin County, Ill., has been made traveling auditor of the company with a territory comprising all of southern Illinois.

**Scott Stewart**, general manager of the W. J. Rainey company and vice president of the Rainey-Wood Coke Co. has been elected vice president and a member of the board of directors of the Matlack Coal & Iron Corporation.

**John Lloyd** has resigned from the position of efficiency engineer of the Lehigh Valley Coal Co., Wilkes-Barre, Pa., to accept the position of manager and efficiency engineer with the Perolin Co. of America, with headquarters in Wilkes-Barre.

**Leslie W. Sydnor**, who was formerly representative of the Eastern Coal & Export Corporation, has been appointed as assistant to E. J. Payne, president of the Lake & Export Corporation, which was recently organized at Huntington, Ill.

**A. W. White**, for the past several years superintendent of Greensburg No. 1 mine of the Keystone Coal & Coke Co., has been transferred to the Keystone shaft, Madison field, where he becomes superintendent of the Keystone shaft, Madison, Arona and Sewickley mines of that company.

**J. F. MacFarland**, for a number of years sales manager for the O'Gara coal properties, in the Harrisburg field of southern Illinois, has resigned from that company to accept a position as sales manager of the Indiana Coke & Gas Co., at Terre Haute, Ind. Mr. MacFarland is well known to the gas and coke trade in the Middle West.

**J. C. Thompson**, a mine inspector for the Consolidation Coal Co., was perhaps fatally injured recently when he fell while attempting to mount the steps of a slowly moving train at Murray to come to Fairmont, W. Va. He slipped and fell, sustaining a concussion of the brain, a broken leg and elbow, and serious injuries to his back. He is in the State hospital at Fairmont.

**Robert Medill**, formerly with the Peabody Coal Co., at Harrisburg, Ill., has been appointed to fill the vacancy of general superintendent at the large mine of the Union Colliery Co., at Dowell, Ill., known as the Kathleen mine. The vacancy was made late in January when Edward Bottemley resigned and went west to go with another company.

**Fred Hatemao**, who for the past four years has been mine foreman at the Walston No. 3 mine of the Rochester & Pittsburgh Coal & Iron Co., has been transferred to the large Adrian mine of this company located at De Lancy, Pa., where he holds a similar position. The former mine foreman at the Adrian mine has been promoted to the position of superintendent of the Walston No. 3 mine, succeeding John Rudolph resigned.

**Frank E. Pomeroy** has been employed by the Chicago Coal Shippers' Association as field secretary. Mr. Pomeroy has spent practically all of his life in the coal business. He was born in southern Illinois, and was connected with Franklin County operations; leaving this field he went to Chicago and entered the sales end of the industry. Mr. Pomeroy has had selling experience in Indiana, Michigan, and throughout the Northwest, coming in contact with all of the different kinds of coal produced, and sold, in the Middle West.

**F. M. Nourse** has joined the Charles L. Benjamin organization at Chicago. Mr. Nourse has been an engineer in the advertising department of the Cutler-Hammer Manufacturing Co., at Milwaukee, Wis., for the past two years and prior to that was associated with the Wisconsin Power, Light & Heat Co., at Portage, Wis. He is a University of Illinois graduate in electrical engineering. The Benjamin organization makes a specialty of trade and technical advertising, and Mr. Nourse's new duties will consist of preparing technical advertisements and literature for the company's clients.

**G. P. Troutman**, for six years assistant to the general manager of the G. B. Markle Co., resigned effective March 15. He goes to the Wentz allied companies as general superintendent.

**Robert D. Tonkin**, lumber and timber expert and formerly timber estimator for the Rochester & Pittsburgh Coal & Iron Co. and allied interests, has been made manager of the forestry department of the Clearfield Bituminous Coal Corporation, with headquarters at Indiana, Pa. This company owns 25,000 acres of surface lands, several thousand of which are timbered. It is the intention to plant several hundred acres of this land in new timber each year. Mr. Tonkin will have charge of all this work as well as looking after all the mine timber for the mines of this company in Indiana, Cambria, Clearfield and Center counties. He is also a member of the firm of Caldwell, Tonkin & Pealer of Indiana, Pa., mining engineers and valuation experts on mining and timber properties.

**A. H. Fay**, the mining engineer, who has been in charge of accident and certain other statistics for the Bureau of Mines, since the foundation of the bureau, has resigned to enter private employment. Mr. Fay is the author of numerous technical papers covering accidents in coal mines, metal mines, quarries, metallurgical plants and at coke ovens. For the past seven years he has prepared the material for the monthly bulletin of the Bureau of Mines on coal-mine fatalities.

## Obituary

**George F. Miller**, a prominent coal man of Lewisburg, Pa., dropped dead while bowling in the Lewisburg American Legion club rooms recently. He was a graduate of the engineering school of Bucknell University. During the war he served in the Chemical division of the army. Mr. Miller was recently interested in a large coal deal in western Pennsylvania. He was 27 years of age and is survived by his widow.

**Henry A. Porterfield**, aged 56 years, after a few days' illness, died recently in the Duquesne Club, Pittsburgh, Pa. After graduating at Lehigh University in 1883 he practiced mining engineering in the coal regions near Wilkes-Barre, Pa. From there he entered the service of the Cambria Iron Co. Later he came with the Carnegie Steel Co., organizing the chemical department of the Edgar Thomson Steel Works. For many years he has been owner and manager of the Dexter Oil Co. He was a member of the Duquesne and Union clubs. Besides his widow, he leaves one brother, Howard H. Porterfield, of Foxburg, Pa., and two married sisters.

## Trade Catalogs

**Type B Portable Belt Conveyors**, Portable Machinery Co., Passaic, N. J. Folder. Pp. 4; 6 x 9 in.; illustrated. Describes and illustrates its use.

**Crouse-Winds Imperial Handlights, Arr and Incandescent**, The Ohio Brass Co., Mansfield, Ohio. Pp. 15; 6 x 9 in.; not illustrated. Price list 206; applying to catalogs 201, 202, 202A, 203 and 205.

**The Rise of Steel Pipe**, The National Tube Co., Pittsburgh, Pa. Bulletin 24A. Pp. 7; 8½ x 11 in.; illustrated. Statistical data noting comparisons in the production of wrought and steel pipe.

**Service Engineering Company**, A bulletin published by this company. Pp. 31; 7½ x 10½ in.; illustrated. A brief synopsis of the company's engineering service of interest to manufacturers and works management.

**W-S-M Car Dumpers**, The Wellman-Seaver-Morgan Co., Cleveland, Ohio. Bulletin 49. Pp. 15; 8½ x 11 in.; illustrated. Description of this company's open-top railroad car dumper, showing some installations with working drawings of device.

**Direct Current Steel Frame Motors**, The Triumph Electric Co., Cincinnati, Ohio. Bulletin 2006 (Superseding Bulletin 491). Pp. 16; 6 x 9 in.; illustrated. A description of the motor and comment on its application to various industrial uses.

**Ampere Hour Meters**, The Sangamo Electric Co., Springfield, Ill. Bulletin 45. Pp. 31; 8 x 10½ in.; illustrated. Description of the various types of ampere-hour meters made by this company. One of the large applications of these meters is on mining locomotives.

**Small Cold Storage Rooms.** Armstrong Cork & Insulation Co., Pittsburgh, Pa. Pamphlet. Pp. 36; 5 x 7 in.; illustrated. A treatise on "Nonparel" corkboard insulation and illustrations of its use in cold-storage rooms. Details of construction of storage rooms noted.

**Jeffrey 31-B Entry Driver.** The Jeffrey Manufacturing Co., Columbus, Ohio. Catalog 269. Pp. 15; 7 1/2 x 11 in.; illustrated. Description of a machine that cuts, breaks down and loads coal at the mine face. Finely illustrated by half-tones from photographs taken of the machine at work in the mine.

**C-H Electric Space Heaters.** The Cutler-Hammer Manufacturing Co., Milwaukee, Wis. Publication 194. Six-page folder; 3 1/2 x 6 in.; illustrated. Description and illustration of use. A large broadside has been published, in which are reproduced many current advertisements on this C-H heater, and so on.

**Electrical Wires and Cables.** The Rome Wire Co., Rome, N. Y. Catalog 19. Pp. 143; 8 1/2 x 10 in.; illustrated. A description of the various wires and cables made by this company together with price lists and useful information pertaining to bare and insulated wires for electrical purposes. Contains views about the plant showing equipment.

## Coming Meetings

**American Chemical Society** will hold its annual meeting at St. Louis, Mo., April 13, 14, 15 and 16. Secretary, Dr. Charles L. Parsons, 1709 G. St., N. W., Washington, D. C.

**New England Coal Dealers' Association** will hold its annual meeting March 24 and 25, at Springfield, Mass. President, W. A. Clark, 141 Milk St., Boston, Mass.

**National Retail Coal Merchants' Association** will hold its annual meeting June 10, 11 and 12 at Detroit, Mich. Secretary-manager, Ellery Gordon, Philadelphia, Pa.

**Indiana Retail Coal Merchants' Association** will hold its annual meeting April 27, 28 and 29 at the Severin Hotel, Indianapolis, Ind. Secretary, R. R. Yeagley, Indianapolis, Ind.

## Industrial News

**Toronto, Ont.**—It is reported that the Nukol Fuel Co., of 88 Bay St., this place, plans to locate a briquetting plant in Port Arthur or Fort William.

**Washington, D. C.**—The headquarters of the Executive Committee of the Bituminous Coal Operators' Central Competitive Field, are located in Room 419, Woodward Building, 15th and H Sts., N. W., Telephone Main 9536. John B. Pratt is the secretary.

**Washington, Ind.**—The Richards Coal Co., of Terre Haute, Ind., has obtained leases on coal land northwest and southwest of Washington and expects to open three new mines soon. This property is in Daviess County in the southern part of the state.

**Glen White, W. Va.**—The E. E. White Coal Co., at Stotesbury, is preparing to erect a number of dwelling houses and other buildings early in the spring. The Stotesbury mine in 1919 produced more coal than any other mine on the Virginian and it proposes in 1920 not only to maintain that record but to increase it.

**Towson Heights, Baltimore, Md.**—The Black & Decker Mfg. Co., of this place, announces the establishment of a permanent office and show room at 1436 S. Michigan Ave., Chicago, Ill. This office will be in charge of R. C. Ames, whose territory has been extended to cover the entire Midwest. F. E. Marrion and J. N. LaBelle will assist Mr. Ames.

**Johnstown, Pa.**—Cosgrove & Co., coal operators of this place, purchased the holdings of the Sunnyside Coal Co. and the Ideal Coal Co., at a consideration of \$500,000. The two mines are fully equipped and include 1,000 acres of unmined coal and the necessary buildings for operation. Production is to be increased from 800 to 2,000 tons daily.

**Zanesville, Ohio.**—The Eastern Hocking Coal Co., chartered in Columbus, with a capital of \$100,000, which purchased a tract of 15,650 acres of coal lands just south of Zanesville, has not started development work as yet. According to H. M. Runkle, secretary-treasurer of the company, no im-

mediate plans for developing the tract have been formed. The tract is about three miles wide and 12 miles long.

**Sumerset, Pa.**—One of the largest real estate deals reported in this section for several months was consummated recently when Charles Duppsstadt, of Stonycreek Township disposed of his 163-acre farm underlaid with several seams of coal to parties of Weehawken, N. J., for \$30,000. Another deal of importance was that of the John M. Wolfersburger estate to Elizabeth P. Hocking, the consideration being \$25,000.

**Birmingham, Ala.**—A new coal mine with a capacity of 1,000 tons per day will be opened by the Tennessee Coal, Iron, & R. R. Co., near Pratt City, according to the announcement of George Gordon Crawford, president of the company. The new mine will be known as the Hamilton slope. Mr. Crawford announced that it will be located on the Mary Lee seam and will be opened to provide for the loss in production of coal due to the abandonment of worked-out mines.

**Columbus, Ohio.**—The annual stockholders meeting of the Lorain Coal & Dock Co., was held recently when the former board of directors was re-elected. Officers have been elected as follows: Edward Johnson, chairman of the board of directors; F. W. Braggins, president; A. L. R. Wildermuth, vice president and general manager; J. L. Johnson, second vice president and Ray L. Phelps, secretary-treasurer. The company operates mines in eastern Ohio, in Logan County, West Virginia, and in the Pomeroy Bend district.

**Birmingham, Ala.**—The Sloss-Sheffield Steel & Iron Co. is said to be considering the building of a modern washery and screening plant at its Bessie mines in the western part of Jefferson County to replace the equipment now in operation.

The Tennessee Coal Iron & R.R. Co. is clearing a right-of-way preparatory to laying a railroad connection to the site of its new Hamilton slope near Pratt City. This operation will be on the line of the Birmingham Southern, a company-owned railroad with connections to all the principal works of the concern in this district.

**Pittsburgh, Pa.**—The Blaw-Knox Co., of this place, announces its purchase of the C. D. Pruden Co., of Baltimore, Md., manufacturers of standardized steel buildings for industrial plants. The following appointments are noted: J. Grier Campbell, purchasing agent of the Blaw-Knox Co., has resigned to become assistant treasurer of the C. D. Pruden company. Wm. S. Boyd, formerly assistant purchasing agent of the Crucible Steel Co., and purchasing agent of the Page Steel & Wire Co., has been appointed purchasing agent of the Blaw-Knox Co.

**Charleston, W. Va.**—Development work will be begun at an early date by the Youghiogheny & Ohio Coal Co. on a tract of 7,000 acres of coal land on Little Coal River. The company expects to be able to secure a production of 4,000 tons a day as soon as plants to be erected are completed. This company is already operating in Pennsylvania and Ohio, its various plants having an aggregate production of 2,000,000 tons per year. On March 1, E. C. Berkeley will assume the duties of general superintendent of the properties of the company, his headquarters being at Madison, Boone County, W. Va.

**New York, N. Y.**—The Wyngrove Line, Inc., has been incorporated in this State, with F. LeMaistre, as president, and C. B. Wynkoop as secretary and treasurer. Mr. Wynkoop is the president of the Cosgrove & Wynkoop Coal Co. The new concern is associated with Cosgrove & Co., Johnstown operators, and was organized because of the scarcity of boats. It will have its office in the same suite as Cosgrove & Wynkoop, 149 Broadway. The Cosgrove & Wynkoop Coal Co. has announced the appointment of H. H. Schrader, formerly with P. A. Kirk & Co., as head of its export coal department, which has had a steady growth. Arthur Carlson, of Middletown, Conn., will be the New England representative of the company.

**Hamilton, Ohio.**—The Hooven, Owens, Rentschler Co., of this place, has opened two new offices; one in Philadelphia, 2129 Land Title Bldg., with C. M. Decker in charge; another office at Richmond, Va., with E. H. Fairchild as manager. This company has also made the following changes in the personnel of their other offices: E. S. Cooley, formerly with the Fall River Ship Building Co., is now connected with the New York office of the Hooven, Owens, Rentschler Co. Henry E. Baisley, formerly of the American Bridge Co., has been made manager of the Chi-

cago office. R. O. Holman, formerly with the General Electric Co., is now in charge of all blowing engines for the Hooven, Owens, Rentschler Co. This company makes the well-known Hamilton engines.

**Chicago, Ill.**—The Sullivan Machinery Co., of this place announces the following appointments: Louis R. Chadwick, hitherto branch office manager at Spokane, Wash., as manager of the company's branch at 30 Church St., New York City. Robert T. Hawks, for several years associated with the company as sales engineer at its El Paso, Tex., office, has been appointed manager at Spokane to succeed Mr. Chadwick. Arthur E. Blackwood, formerly manager of its branch office in New York City, as vice president, in charge of finance and accounting, with headquarters at Chicago. Louis R. Chadwick, for years manager of the company's office at Spokane, has been appointed manager at New York City, succeeding Mr. Blackwood.

**Belt, Mont.**—George H. Stanton of the G. W. Merkle Coal Co., contemplates an output of 1,000 tons of coal daily from the plant when completed. Those connected with the Merkle company include G. W. Merkle, of Belt; Sam Stephenson and J. R. Habbins, of Great Falls, and W. R. Wilson, of Lehigh. Machinery has been ordered for cutting and preparing the coal for market. The property to be developed comprises about 2,160 acres of coal land which it is said will give the Merkle company one of the largest coal properties in this section of the state. It is planned to have the machinery in the Merkle mine in place within a couple of months. It is expected that the Wrenn Bros., of Boston, purchasers of the East Butte coal properties a month or more ago, will also have this mine running shortly.

**Reading, Pa.**—The Reading Iron Co., of this place, announces the recent appointment of W. W. Frazier as assistant superintendent of the company's tube works. Mr. Frazier started his 20 years' experience in the iron and steel business as a draftsman, soon branching out into the engineering and later the operating side. He was successively connected with the National Tube Co., the La Belle Iron Works and the Youngstown Sheet & Tube Co. He was chief engineer of the A. M. Byers Co., left here to become assistant chief engineer of the big Government plant at Neville Island and later served in a similar capacity with the Bethlehem Steel Co., at Sparrows Point. The tube works of the Reading company, with which Mr. Frazier is now connected, is its largest plant, employing about 4,000 men, under the direction of J. H. Mathewson.

**New York, N. Y.**—The railroads returned to private ownership on March 1 and the Tidewater Coal Exchange went out of business. The latter will no doubt be succeeded by the Tidewater Transshippers' Association, Inc., formed by a committee of New York coal dealers, affiliated with The Wholesale Coal Trade Association. At a meeting held on Feb. 17 at the Whitehall Club, more than one-third of the tonnage handled by the exchange was represented and it was decided to proceed with the formation of the new association. The secretary-treasurer of the association is to be designated as the commissioner of the association and there is to be a deputy commissioner at Philadelphia and also at Baltimore. The proposed rules also provide that the executive committee of the association may provide for the pooling of anthracite coal, if it is considered advisable. Charles A. Owen is the Chairman of the Organization Committee. It is expected that nearly all of the tonnage now handled by the present exchange will be handled by the new association.

**Bluefield, W. Va.**—It is understood that a deal was consummated during the third week of February under the terms of which the Pulaski Iron Co. became the owner of the Shawnee Coal & Coke Co., one of the early operations in the Pocahontas field. The mines of the Shawnee company adjoin those of the Pulaski company at Eckman in Melbourn County. The controlling interest in the Shawnee company was owned by Lynchburg capitalists; the production for 1919 was in the neighborhood of 100,000 tons. No changes in the executive staffs of either company are contemplated for the present, it is understood. About three years ago the owns of the Shawnee Coal & Coke Co. were purchased by the Pulaski company. With the acquisition of the Shawnee mines and with another new mine (for which a shaft is now being sunk near Welch) in operation, the Pulaski iron Co. will soon become one of the large companies of the Pocahontas field. Its annual production will be in the neighborhood of 400,000 tons a year.

## Weekly Review

*Railroads Return to Private Ownership—Advance of Freight Rates Discussed—Car Supply Shows Little Improvement—Exports Continue Under "Permit System."*

**W**ITH the return of the railroads to private ownership Director-General Hines will retain jurisdiction over domestic distribution while the newly-appointed commission will handle bunker and export coal matters. This order, which became effective on March 1, did not please the operators, for it had been hoped that with the end of Government ownership of the railroads, the Fuel Administration would also be discontinued.

Demand for bituminous continues to be keen with all the sizes moving where available and the retailers willing to take almost anything they can

get. For steam grades as well, all available stocks are quickly bought up. Little complaint is heard from local traction companies and public utilities, though their reserves are at a minimum.

Discussion of an advance on the freight rates on coal and general commodities is being heard in parts of the country. A large shipper is quoted as saying: "Even flat general increases would hurt badly, as coal freights are now too high. Increases may tend to force a larger consumption of oil in those districts closer to oil and thus cause a reduced consumption of bituminous coal."

As was the case prior to the restriction on bunkering, a good proportion of coal is going to tide for bunkering purposes and the local consumer is inclined to criticize the shippers for their eagerness in selling to this trade, alleging that the additional price allowed on bunkering is the cause for the interest shown by these shippers. A fair amount of export business continues under the "permit system." Permits are only granted for business that was contracted before the embargo.

Production for the past week was far from pleasing to the miners because of the car shortage.

### WEEKLY PRODUCTION

The weekly report on the production of bituminous coal, anthracite, and beehive-coke, compiled by the Geological Survey, Department of the Interior, Feb. 28, 1920, states that the output of soft coal fell off 8.5 per cent during the week ended Feb. 21. Preliminary estimates place the total production (including lignite and coal coked) at 9,580,000 net tons, a decrease of 891,000 tons when compared with the preceding week.

The production of anthracite like that of bituminous coal fell off markedly during the week ended Feb. 21. Loadings by the nine originating carriers were 28,494 cars. This suggests a total output, including mine fuel and sales to local trade, of 1,463,000 net tons. Compared with the preceding week, this was a decrease of 310,000 tons, or 17.5 per cent. The cumulative production for the coal year beginning April 1, 1919, is now 80,906,000 net tons, a decrease of 6.3 per cent when compared with the previous coal year.

A decrease of 2,000 tons in the production of beehive coke was reported during the week ended Feb. 21. Slight increases in output in Alabama, Virginia, and Kentucky largely offset a decrease of 6,000 tons in Pennsylvania and Ohio. Production in the Connellsville region, Pennsylvania, as reported by *The Courier*, of that city, showed a decrease of 8,829 tons.

### Atlantic Seaboard

#### BOSTON

Trade recovery only gradual. Embargoes against bituminous now lifted. Movement increasing. Coal still short at New York and Philadelphia piers. "Emergency" coal arriving. Hampton Roads despatch normal. Anthracite still embargoed all-rail. Barge movement shows signs of improvement.

**Bituminous**—Railroad operating conditions are distinctly more favorable this week, although the recovery is only gradual. Another blocking snowstorm on Feb. 24 interfered with traffic in the northern part of this territory and even passenger service was again suspended except on the through lines. Several of the large manufacturing

corporations have offered men in large numbers to help the railroads clear up freight sidings and it is expected that in another ten days much of the congestion due to cars frozen to the tracks at this end will be relieved. The reports show that the Eastern roads are returning more empties to the intervening lines and should this continue it should in time very much improve car supply in the region.

The tight blanket embargo effective since Feb. 13 was lifted on Feb. 25, so far as it concerned bituminous, but current car supply is altogether too tight to permit more than 20 to 25 per cent of normal output in Central Pennsylvania. A quantity of wagon-hauled coal is again offered, but there is little of the standard grades available at the fixed price. It is probable that the great majority of operators have contract orders which will take care of all they can produce in March.

The "emergency" coal arranged for through the Coal Committee at Washington is beginning to arrive here in better volume. There is some apprehension over short car supply at various New England terminals, several ships having been already obliged to wait three to eight days. Heavy demurrage charges are accruing, and this together with the export price carried by much of the diverted coal makes the delivered cost fully as high as coal men were predicting.

Governor Coolidge telegraphed President Wilson on Feb. 28 that the fuel shortage in New England was more critical and that the district would be in a serious condition if Federal control over coal exports was permitted to lapse.

The message said:

"Fuel shortage in Massachusetts and New England is more critical than was stated in the telegram of New England Governors of Feb. 16, due to the inability of the railroads to operate through the snow. Many ships are waiting to take coal at tidewater to bring to New England. It would be a great misfortune if there should be any interval after today when there was no control over the export of bituminous coal. If such control is permitted to lapse New England will be in a most serious condition."

In more cases than one, the regular agencies have been obliged to pay demurrage on chartered ships, only to be loaded with high-priced coal, their own coal having

been seized for other requirements, either in New England or elsewhere. It is also a fact that the Regional Coal Committee has been put to it to find consignments for the coal which they represented was so urgently needed. We know of cases where cargoes have been consigned to brokers, the ultimate destination to be decided by the broker. This rather has the appearance of having cried "Wolf" too long and too loud. It will be interesting to watch further developments, for it is recognized that the great urgency is on behalf of the railroads, and not because industries are seriously in need of supply.

Hampton Roads despatch is practically normal. Steamers are now loading in one or two days, unless the flow of coal has been tampered with by the coal authorities at Washington. The trade is much interested to know what steps the government will take to enforce present regulations, now that the central railroad authority is passing out. There is a good deal of talk of contracts for the ensuing year, but most coal houses are hesitating over what policy to follow, in view of rules which are assumed to be still in effect and mandatory.

**Anthracite**—All New England is still embargoed against hard coal all-rail, except for the limited area which can be reached via Harlem River.

In Northern New England there are several communities where the prolonged cold weather is causing anxiety, but it is remarkable that the embargo against New Haven points that has been effective since Jan. 16 has called forth so little comment. In other words, much of New England is reasonably well supplied with domestic sizes.

Barges are moving much better than early in the month. A surprisingly large number has been ordered to repair-yards, largely because of ice-damage, but there are several encouraging signs that shipments during March will materially increase. At Port Richmond piers, 302 cars were dumped March 24 and this was the best day's work for several weeks. There are fewer cases of frozen coal and there are several reasons why loading should be much better the next week or two.

There is inquiry for the steam sizes, but the present embargo shuts off such ship-

ments as well as those of domestic sizes. Should the embargo be raised within a few days it is probable that there would be an active demand for rice and buckwheat.

**NEW YORK**

Seasonable weather for the past week has helped to consume considerable of current supplies of domestic sizes in consumers' hands. As indicating shortage of coal in consumers' hands, buyers have not been striking for favored sizes, but are taking gladly whatever wholesale and retail dealers have to offer.

**Anthracite**—With the thermometer just a few degrees above zero, frozen condition of coal at the various piers became more serious, reducing the dumping of cars into boats to a small fraction of normal dumpings. Loaded boats of either domestic or steam sizes are very scarce. Apartment houses were eager buyers of steam coals, taking any of the sizes that the dealers are in position to deliver.

Production has also been restricted somewhat by weather conditions and the trade is looking forward to first conferences of operators and mine workers to be held in this city on March 9 to discuss new wage scale. Present agreement expires on March 31, and so far, aside from an early presentation on the part of the miners of what they expected in the way of increased wages and reduced hours, nothing has been done. These conferences are expected to last several weeks.

Coal men are generally agreed that consumers may expect to pay higher prices for anthracite from April 1 on. They argue that not only will the operators have to pay higher wages to miners, but that other mining expenses have advanced to a point that they must be taken care of in the next price readjustment. Furthermore, railroad rates are expected to advance in line with the measures of the new railroad legislation that provides the carriers a profit of 5 1/2 per cent. Loaded boats of the steam sizes have been in good demand but these have commanded good premiums over the dock prices.

Current quotations for company coal per gross tons at mine and f.o.b., Tidewater, at the lower ports are as follows:—

	Mine	Tidewater
Broken .....	5.95	7.80
Egg .....	6.35	8.20
Stove .....	6.70	8.55
Chestnut .....	6.70	8.55
Pea .....	5.30	7.05
Buck .....	3.40	5.15
Rice .....	2.75	4.50
Barley .....	2.25	4.00
Boiler .....	2.50	4.25

**Bituminous**—Bituminous continues in small supply, with many of the public utility companies finding it a difficult matter to secure enough coal to keep them going. New England has been able to pull through only by the wholesale confiscation of coal at Hampton Roads, the Central Coal Committee commandeering upwards of 50,000 tons at the piers there to ship to New England. This has proved a serious blow to exporters who had secured and arranged for steamers accordingly.

Weather conditions have been unfavorable to the movement of coal by rail and water even after it is loaded. Mines have not worked better than fifty per cent in Eastern regions for the past two weeks, owing to small car supply. Embargoes have practically stopped all shipments of rail coal to New England. This is responsible for action of government in commandeering of tidewater supplies.

The trade generally is much chafed at continued government restrictions. Action is being taken from several sources to have all restrictions removed, as it is argued that the coal people themselves are better fitted to distribute coal than the small body of inexperienced men that have had full sway for the past four months.

Due to the uncertainty of wages, railroad freights, etc., after the first of the new coal year, nothing has so far been done in the way of contracting. Usually, at this time, perhaps one-third or one-half of the year's output would be under contract in normal years.

Stocks generally, in every section of the East, are either entirely exhausted, or at the lowest point that they have been in since the memorable winter 1917-18.

Government prices on bituminous coals at the mines, for spot shipment, are as follows:

	Mine-	Pre-	run	pared	Slack
Central Pennsylvania .....	\$2.95	2.95	2.95		
Western Pennsylvania .....	2.35	2.60	2.35		
Fairmont .....	2.50	2.75	2.25		
Georges Creek .....	2.75	3.00	2.50		

**PHILADELPHIA**

**Anthracite demand very strong.** Winter weather continues. Shortage of stove and nut begins to move pea. Consumption of all coal heaviest on record. Size change prospect more favorable. Chance of "slump" gone. Dealers anxious to stock up. Consumers show growing desire to store for next year. Steam sizes strengthen. Buckwheat all taken, and rice moves in big volume. Bituminous shows little change for better. Fewer coalitions. Embargo goes help local consumers. Commission decision anxiously awaited.

**Anthracite**—The winter continues its record of being one of the real old time kind, and while there has been no snow of any moment recently, yet the temperature has hung consistently around the freezing point, and at times during the past week dropped down to 9 deg. F. All of this means a big consumption of fuel and the dealers are busy trying to meet the calls on them for coal. It has been one of the busiest winter's on record, even eclipsing the first war winter. Consumers' stocks put in last summer are reaching a still lower ebb and consumers are extremely anxious to have more coal.

Of course the demand still is for the larger sizes—stove and nut, and if anything these sizes are scarcer than ever. Dealers are urging the shippers to give them more tonnage and are no longer willing to accept the excuse of the operators that they have filled their orders up to the proportions of previous years. The dealers point out that the consumption this year is the biggest on record and they must have more coal to meet the demand. It is believed that the larger companies are making heavier than usual consignments "down East," as the reports from that region indicate that they are in a bad way for fuel.

Naturally when a scarcity of the larger sizes exists, the consumer, when he actually must have coal, falls back on the size that he can get and this happens to be pea coal. During the past week the movement of this size from the yards has grown very much in volume and the big piles of the dealers are at last beginning to decrease in size. It takes considerable urging on the part of the retailers to induce customers to take this size, as their antipathy to it has not decreased in the least.

Of course this condition is quickly reflected in the shipping offices and more than one dealer of late has actually asked to have pea coal shipped. In addition there is a growing impression that with the probable change in sizes there will be a demand for pea coal next season from that portion of the trade which has been wedded to this size. The more progressive dealers are actually reaching the point where they are willing to store as much of this size as they can find room for. The independents still have difficulty in getting premium prices for this size, and are willing at most times on straight orders for pea to make sales at the company circular of \$5.30, although occasionally they are able to get \$5.50 for it.

**Change in Sizes to be Made**

Many stories are afloat as to the outcome of the change of size agitation. At this time circumstances seem to be shaping themselves until it cannot almost be said that the shippers are at the point where they are ready to announce that the change will be made. The call for the change from the dealers has been so widespread, coming from the surrounding states, in addition to the almost unanimous call from the Pennsylvania dealers, that as it now stands it looks as if the proposition will be acceded to.

One of the larger companies before committing itself to the proposition finally is understood to be conducting tests of the newly-sized coal in actual burning and upon the result of this experiment hinges their decision. It is believed if the change is made that it will be done with an actual change of screens at the breaker, the plan being simply to mix the coal after it has been screened in the usual way.

With the first of April fast coming on the consuming public, not to mention the dealers, is displaying considerable interest as to what the spring prices will be. Many buyers are reluctantly becoming convinced that there will be no reduction and are ordering their next winter's coal to be put in during March. It certainly looks as if March will be one of the busiest months of the entire season, especially so if the conference between the miners and operators over a new wage scale shows any signs of being prolonged.

At this time all prospects of a so-called "break" in the coal market has vanished, for even should the consumer demand fall off, there is not a dealer in this territory who would not continue during the next

four weeks to put aside every pound of prepared coal that he could possibly get hold of. It needs no particular foresight to see that any coal bought now will be a bargain later in the season.

The steam trade has picked up very nicely, until buckwheat coal of the white ash grade is becoming harder to get than it has been all winter, especially with the big shippers. Some of the special and higher priced buckwheat of the companies are a little bit slow, but are not expected to lag much longer in the face of the bituminous shortage. Rice has also increased in demand until the big companies are now moving heavy tonnages of this size from the storage yards, as the current production is not sufficient to meet the demand. Barley, however, is still difficult to sell and all companies have a big surplus of it.

The prices for the last month under the present winter schedule per gross ton f.o.b. mines for line delivery and f.o.b. Port Richmond for tide are as follows:

	Line	Tide
Broken .....	\$5.95	\$7.80
Egg .....	6.35	8.20
Stove .....	6.60	8.45
Nut .....	6.70	8.55
Pea .....	5.30	6.90
Buckwheat .....	3.40	4.45
Rice .....	2.75	3.65
Boiler .....	2.50	3.50
Barley .....	2.25	3.15

**Bituminous**—The demand for soft coal is far in excess of the amount that is reaching the city. Plants continue to lose time for the lack of fuel, although none has been idle for a long period, although a majority of them are running on close allowance at all times.

The fact that the railroads entering New England have been compelled to place embargoes against shipments to their lines on account of traffic being impeded by heavy snows, has helped the local situation. While this help is appreciated it is also realized that as soon as the roads to the Eastern country can handle additional traffic this coal will have to be paid back.

Recently there has been much protest on the part of consumers over having shipments in transit confiscated by the Railroad Administration and used to help out other industries. The method has called forth much criticism until there seems now to be a minimum of tonnage being diverted in this way. As a matter of fact consignees who had been notified that shipments had been confiscated are now actually receiving coal which they were previously told would not come forward.

**Much Improvement Expected**

Now that the railroads are back under individual control the coal trade is expecting improvement in the situation generally, and one of the first moves was to put into the trade the big number of low capacity wooden cars which had been sidetracked during the war. Quite a few of these cars are now reaching here loaded and this move has materially helped the situation. Traffic conditions have materially improved from the weather standpoint and such tonnage as has been produced has been moving to destination fairly promptly.

The scarcity of coal has once more brought into the market a fair production of coal from the wagon mines. These concerns are allowed an increase of 75c above the fixed price of \$2.95 and when sold through brokerage houses, as it usually is, an extra 15c. is added, making the delivered price \$3.85 per net ton. The brokers have their buyers in the region and there is quite a bit of competition for this coal. Some of the larger consumers are also endeavoring to get this coal first hand, but most of them have profited by their past experience that this helped the situation very little.

A good proportion of the local tonnage is going to tide for bunkers and the local consumer is inclined somewhat to criticize shippers for their eagerness in selling coal at tide, while the steady line trade is in such desperate need of fuel. However, the additional price allowed on bunkers has the same attraction as usual, and shippers claim that under the present cost of production they are barely coming out whole at that. There also continues to be a fair export business conducted under the "permit system," as the embargo against such business is still on and the understanding is that permits are only granted for business that was contracted for prior to the embargo.

The trade is anxiously awaiting the report of the Bituminous Coal Commission and the report now is that an early decision can be expected, inasmuch as they have concluded taking testimony. Both shippers and consumers are anxious to start the contract business, but nothing can be done in this direction until they are able to fix a price. Even then the fixing of a con-

tract price depends entirely upon the finding of the commission, as it is barely possible that the conditions might be such that it would not be advantageous to enter into contracts at all. However, all concerned are hoping that the question of price will be satisfactorily arrived at.

### BALTIMORE

Status of the coal trade after railroads are returned to private ownership big feature here as elsewhere. Car supply from road to worse. Exports die from all points except Newport News. Serious conditions impend.

**Bituminous**—All last week the coal trade invaded or bombarded Washington to get a little common sense and failed. All wanted to know what was to be the status of business after the railroads are returned to private ownership. With the last of the permits to load, issued before Jan. 9, about cleaned up on export business, the only satisfaction that could be gotten from the Central Coal Committee officials was that it was all up to the President but that they thought it was a good guess that no exports would be allowed from any Eastern port, except Newport News, for many weeks. How this control was to be maintained was a deep dark secret.

On prices there were many guesses as to what would happen, especially as many are now openly selling coal above the government rates, and it is like the old song "Nobody seems to care." Meanwhile coal men here predict serious conditions. Following the visit of four New England governors to Washington to complain of fuel famine, the government diverted large quantities of coal from Curtis Bay and other Eastern points, the Shipping Board allocated ships to carry 100,000 tons from Hampton Roads, and coal was seized on the road for Northern diversion.

Then coal was transhipped from as far south as Clifton Forge, Va., and from Hampton Roads all-rail to New England. The result is a fearful congestion of coal cars at terminals and all along the line that can not be promptly unloaded or moved because of weather conditions. When the weather breaks New England will be flooded with coal-carrying freight charges that consumers will not pay. The story of the strike period, when thousands of cars were sent long distances West and the coal then refused because of cost will be repeated.

Coal is still standing at Western points on this movement of months ago, and there is even talk of sending this coal all the way back to the original consignees in order to get the cars emptied. Just at present the car supply is wretched, largely because cars have been tied up North in this movement and West through shipmen's in cars that had been held for the export trade before the ban was slapped on.

At the outset of the present week the car supply on the Baltimore & Ohio and connections ran between 60 and 70 per cent. It has dwindled until at this writing the supply is only between 25 and 30 per cent and there are days when the total movement is only between 1,000 and 1,200 cars, less than one-third of normal. No wonder many consumers East are crying for coal and everybody—consumer and coal man alike—stands disgusted with the government management.

In passing it may be well to mention that the trade is still in the dark as to the pool prospects for the future, and there are many rumors afloat, including one that a move may be made to give the railroads the right to force all coal through the pool on export and bunker business.

**Anthracite**—The anthracite run continues fairly good as compared with the bituminous supply. Most of the dealers are getting some coal although all are not getting the particular sizes desired. Deliveries in the city are difficult because of the snow and ice of an unusually hard winter.

### Eastern-Inland

#### PITTSBURGH

Coal producers state that the car shortage this week is the worst in this whole period of car shortage. R. W. Gardiner, commissioner of the Pittsburgh Coal Producers' Association, states that on one day this week 35 of the 130 mines represented in the association were closed for lack of cars, and that the average car supply in the whole district on that day was only 17 per cent of the Government's rating.

One of the causes named for the fresh increase in the car shortage is the cold snap that began Sunday, Feb. 15, resulting

in many carloads of coal being frozen, although if there had been the usual quickness of dispatch the coal could probably have been unloaded without difficulty. The probability seems to be that much of the frozen coal will not be unloaded until warm weather performs the function of thawing it out.

While it has been commonly remarked in Pittsburgh shipping circles in the past few weeks that better transportation could be expected upon the return of the roads to their owners March 1, it is now being asserted in some coal circles that railroad officials are paying so much attention to details attending the transfer of control that they are not giving the usual amount of attention to the furnishing of cars.

The steel industry has not had its production curtailed of late by coal shortage, but an expansion in operations that would otherwise have occurred has been prevented, mills being able to do no more than maintain their January rate of operation, which was about 83 per cent of capacity.

There is some coal to be had in the open market, but not a great deal. The market remains quotable at Government limits: Slack, \$2.10; mine-run, \$2.35; screened, \$2.60, per net ton at mine.

#### COLUMBUS

Some improvement in car supply is reported in most of the Ohio fields and production is correspondingly increasing. The output is still far below normal figures. Demand for all grades remains strong.

The car supply is now the chief factor in the coal trade in Ohio. Producers in every section are devoting their attention to getting out as large an output as possible and seeing that the cars reach their consignees. But there are many troubles that beset the operator and as a result many are working longer hours than usual. With confiscation of coal by railroads one of the chief disturbing factors, little progress can be made toward getting the trade on a solid basis.

Production in Ohio fields has been increased to a certain extent because of a better car supply. This applies particularly to the Hocking Valley, Pomeroy Bend and Jackson districts. Reports show that the car supply in those districts has been about 45 to 50 per cent and as a result a larger tonnage is being shipped. In the eastern Ohio field the output is still around 33 per cent and little hope for improvement is seen.

#### Car Supply Only 45 Per Cent

In the Cambridge and Crooksville districts production has been about 45 to 50 per cent. The colder weather which now prevails will probably still further reduce the car supply, because of trouble in moving trains promptly. Influenza has also had its effect among the train crews.

The domestic trade is strong in every particular. Dealers are short of stocks and are clamoring for coal. Consumers have been placing orders briskly as their first stocks are exhausted, due to extra cold temperatures.

Dealers are compelled to reduce the size of orders in order to make available stocks reach to all consumers. Retail prices are firm at the levels which have been established under Federal control. Generally speaking, there has been practically no suffering in central Ohio territory among domestic users, although a marked shortage is reported.

There is a strong demand for all steam grades and all available stocks are quickly bought up. Public utilities are rather short and are operating from hand to mouth. Hospitals are fairly well supplied at present and public institutions are also in the market, and as a result there is a total lack of adequate reserves. Rubber factories have only a small surplus and the same is true of iron and steel concerns.

Retail prices in Columbus per net ton are:

Hocking Lump	.....	\$6.50
Hocking Mine-run	.....	5.75—\$6.00
West Virginia Lump	.....	7.25
West Virginia mine-run	.....	6.75
Pocahontas lump	.....	8.25
Pocahontas mine-run	.....	7.50—7.75
Pomeroy Lump	.....	6.75
Pomeroy mine-run	.....	6.00

#### CINCINNATI

Railroad confiscation and fuel committee diversions are embarrassing coal companies greatly in this vicinity. The market was flooded with buyers of all classes last week seeking spot shipments, but a lot of them went away disappointed.

The car supply has not improved in the slightest degree. Operators claim that everything hinges on the car supply, as they have the labor, and could readily operate full time in clearing all old orders, and taking care of such immediate business

as they have been turning down steadily. It is the opinion of operators here that Government restrictions will be removed at an early date and no two dealers seem to be of the same mind as to what will happen to the market. Some say prices will start up at once, due to the shortage of cars. Others feel that prices will continue at the present level or at most, a little higher for the rest of the spring. A delegation of operators left for Washington last week, to put personal pressure to bear in the hope of getting cars.

Demand for steam coal continues keen, but retailers are fairly well stocked and due to the mild weather demand is so light that the retailers are not buying block coal as freely as they were, although there is a ready market for such supplies as can be produced.

Between 8,000 and 9,000 tons of coal would still be bobbing up and down in the barges on the Kanawha River had not the Campbell Creek Coal Co. decided to send it down despite the ice in the river. The barges were loaded but the government officers would not permit the raising of the dams in the river because of the weather conditions. The coal was needed in Cincinnati and the boats were ordered to rush the barges over the dams.

This was a hazardous plan, but the boats and barges rode the flood tide in safety and reached the Ohio river. There ice was encountered and the ice-breaker D. T. Lane ran around the barge fleet or forged ahead, pushing ice out of the way of the boats and its tow as the occasion demanded and the fleet reached Cincinnati without the loss of a pound of coal. The government officers on several occasions in the past have refused to open the dams.

Dealers are urging the public to place orders for smokeless coal, anthracite or coke for next winter, because as soon as the ratification of the Peace Treaty, American coal will be placed in competition with the world and naturally will be sold to the highest bidders.

The position of Cincinnati as the gateway to the coal fields has rendered her safe from fuel famine so far, although non-essential industries and some that are essential have been deprived of fuel. Influenza is not causing much trouble in the mine districts and it is reported that the smallpox epidemic in southwestern Kentucky is less serious.

### Southern

#### LOUISVILLE

Heavy demand for domestic fuel, with car shortage such that retailers are reporting empty yards, and deliveries of only about one fifth what they need. Steam in good demand. Cold weather forcing heavier domestic consumption.

The demand for domestic fuel continues very keen, with all sizes moving, and retailers willing to take most anything they can get just now. Car shortage is showing improvements in spots, but the Kentucky fields as a whole, especially Harlan county, show no material improvement. Mine operators are having trouble in running half time, and report that labor is becoming more dissatisfied.

It is held that the operators are losing large sums daily through not being able to take advantage of a good market, which is resulting in operators in other fields with better car supply being able to divide up the business, which will mean that if production in other fields catches up with demand, operators in the Kentucky fields may get cars after there is no demand to fill.

#### No New Business Accepted

Kentucky is so steadily short of cars and unable to accept business that it is held by the operators to be injuring the fields. One operator remarked that while the Kentucky operators are reporting inability to secure cars, other districts are having very little trouble, and the Railroad Administration authorities are claiming that there is no serious shortage of cars.

Mines on the Louisville & Nashville lines are still being discriminated against, and while car supply on the Illinois Central lines in western Kentucky is worse than it has been, it is not as bad as on the Louisville & Nashville lines in the same field. Western Kentucky as a whole is somewhat better off than eastern Kentucky. The Hazard fields is doing much better than formerly, but the situation in the Harlan, Straight Creek and Jellico districts is about as bad as it has ever been.

In the Elkhorn and Northeastern districts of the state it is reported that conditions are improving and car supply is better, some sections being fed by lines that are in

the car pool, and which are having no decided difficulty in getting cars.

Movements to control prices of foodstuffs, etc., sold through commissary mines, resulting in Federal warrants being issued for a few mines recently, will probably slow down somewhat now, for in the Kentucky High Cost Commission, all but two members of the Louisville division have resigned.

Discussion of advanced freight rates on coal and general commodities after the railroads go back to private control are being heard. C. D. Boyd, traffic manager for the three leading associations of the state, in discussing this matter said: "Even flat general increases would hurt badly, as coal freights are now too high. Increases would force larger consumption of oil in districts closer to oil, and at the same time reduce consumption of bituminous."

One interesting factor in the argument between coal and oil is that oil is rapidly advancing, and even the cheaper fuel oils which do not produce much gasoline are higher. Kentucky crude oil which has been selling at \$2.60 a barrel at the well for the past year or more, is now quoted at \$3.25 a barrel, with prospects of a mid-summer price of \$3.50, which has resulted in increases in all petroleum products. Oil operators are not being governed like coal operators, and are forcing up the price through refusal to turn holdings over to pipe line companies or make shipments unless they get their price. On the last price advance in eastern Kentucky the largest runs of months were shown.

## Lake Region

### BUFFALO

**Bituminous**—There is much complaint just now of the selling of coal, especially at the mines, for considerably more than the regulation prices. To this the consumer seems to be contributing, for he finds that the jobbers cannot offer coal in much amount, so he goes to the mining districts and offers a premium. It is reported that coal, which should sell at \$2.50 at the mines, is held for \$4 and even more. The consumer supposes that he is obliged to pay these prices and so gets around the jobber entirely.

What will come out of this is not to be said now. The Government does not seem to be taking any notice of it and it may not. Buffalo jobbers are not following the practice to any extent and they may come out best in the end, but it is very discouraging to sit by and see others taking advantage of the shortage of coal in a way that one may not feel like following. At the same time the confiscation of coal by the railroads is going on much as formerly, so that when the jobber is through his day he has little to show for the effort he has made to stay in the trade.

There would be complications enough in the trade if these avoidable ones were left out of it. Cars are very scarce and will be at least till the loaded ones that have been held up by snow are unloaded and put back into regular business again. About the only reason for satisfaction is that the supply did not run down till the factories had to shut down. Nobody out of the trade will ever know how much work has been done to keep the supply up. The consumer is accused of having a way of forgetting it all just as soon as he is past the stress, but that may be a mere matter of trade. Everybody gets what he can at a price as low as possible and is ready to repeat the operation.

Everybody wonders when there will be an end of this terrible winter. Buffalo has had its share of cold weather, but the snow is not nearly as deep as it is at other points South and East. There is, though, snow here that has been with us since November and it is high time it was gone. At the same time there are predictions that as soon as the spring thaws are here the demand for coal will drop off seriously. It is a fact that few consumers have much coal ahead and most of them have very little, but they do not intend to stock up any more than they must till the trade settles down to something.

The regulation prices continue as before, no matter if some people are disregarding them. Quotations: \$4.70 for Allegheny Valley sizes; \$4.50 for Pittsburgh and No. 8 lump and three-quarter, \$4.25 for all slack, \$4.60 for smithing, and \$1.70 for smokeless, per net ton, f.o.b. Buffalo.

**Anthracite**—The supply is not good yet and it may take some time to restore the movement from the mines. The car supply is poor and the entire cutting off of the shipments during the great storm of Feb. 14 has had an effect on this market

that is anything but good. The consumers were pretty well supplied, better than for several winters, or there would have been great difficulty.

As it is the shippers and distributors are finding it hard to keep up with the needs of this market. Nobody is frightened, but if a state of panic, such as existed in recent winters, the situation would be bad. The long waiting for the severity of winter to pass has no reward yet. The month of February is much colder than was expected, in view of the cold weather earlier in the winter. It looks now as if this winter would be decidedly colder as a whole than that of two years ago. Still it cannot last much longer. Everybody sighs to see the cold days return again and again, when it would seem to be time for the stress to be over.

As soon as the sunny days of March do come the situation will change speedily, for it is always the case for the demand to drop off fast in early spring. Reports from the mines are not reassuring, for there are prospects of labor difficulties in the spring and the miner as a rule is much harder to control than he used to be, for he has a notion that he does not need to work steadily, and there is trouble if an effort is made to keep him busy.

### CLEVELAND

Receipts continue about 35 per cent of normal and with cold weather recurring, the shortage is as acute as any this winter. It is expected a price of \$3 will be sanctioned for No. 8 mine-run and slack and \$3.25 for prepared sizes, and offers to contract on this basis have been made. Anthracite receipts are good; Pocahontas bad.

**Bituminous**—Steam-coal users continue to limp along with supplies not much over one-third of normal. Some actual shut downs and curtailed operating schedules as a result of no fuel are reported. Diversion of coal to meet the needs of the largest public utility continue, the utility having only a 48-hour "rubber" in the way of slack. Were one day to pass without any coal being moved into the city a third of the industries would be compelled to close. Receipts at present are on a par with the average of the past two months, but demands because of the extreme cold weather have made the situation as serious as at any period this winter. Every steam-coal user is only about a day's supply ahead.

Some No. 8 district operators with headquarters here are predicting that when the President's Coal Commission reports it will grant miners only a small additional wage increase but will permit the f.o.b. mine-price of No. 8 slack and mine-run to be advanced to about \$3 and No. 8 prepared sizes to \$3.25. This would mean an advance of 65c a ton. At least one operator has been approached by a steam-coal user with a proposition to contract for his needs at \$3, provided that is the new price.

With the freight rate from the No. 8 field to Cleveland \$1.35, this would make slack and mine-run, delivered Cleveland, \$4.35 and prepared sizes \$4.60. Retail dealers are allowed \$2.08 additional for delivery and profit in sales to manufacturers, \$2.65 to churches and apartments and \$2.80 to dwellings. The feeling in the local trade is unanimous that prices will be advanced; the only point of speculation is how much. It is believed that new rules for car distribution will be worked out by the commission; on this point operators believe the commission will lay especial emphasis.

Cleveland operators are hopeful that the middle of March will see the car situation much improved; in fact, some are predicting it will be doubled as soon as the railroads have settled down to private operation. Opening of the lake trade in April also will work for improvement, as the additional cars made available for the iron-ore trade are used to carry coal back to Lake Erie ports.

Labor at the mines now is adequate for the car supply, but once near-normal operations are made possible the labor shortage will make itself felt, operators fear. Reports of operating losses are heard on all sides. An operator with a mine on the Pennsylvania was able to operate only 52 hours in the first three weeks of February. A mine owned by the same operator on the Wheeling & Lake Erie was operated 61 hours in the same period. Improvement in car supply on the Pennsylvania is expected to be greater than on any other road.

**Anthracite and Pocahontas**—Receipts of anthracite are reported quite good and dealers are not far behind on their deliveries. Receipts of Pocahontas are practically negligible. Domestic demand for anthracite, Pocahontas and bituminous is heavy. Dealers no longer wheel coal into cellars; dumping at the curb is the rule, with labor so short. Prices are unchanged on anthracite and Pocahontas.

**Lake Trade**—Lake shippers have changed their minds on the opening of the season; instead of a late opening, provided navigation is possible, they believe it will be fairly early. Upper lake docks, which last spring were congested, will be pretty bare by April 1. Outlook for an improved car supply is better, and it appears that more lake coal will be available late in March and early in April than appeared possible a few weeks ago.

While some lake coal has been placed, no prices have yet been named. It is believed whatever price the coal commission names will rule for the lake trade; normally, the lake price is somewhat higher than that named for the lower lake trade. The talked-of price is \$3 for mine-run, with the freight from the No. 8 field to Lake Erie ports \$1.33.

Prices of coal per net ton delivered by dealers in Cleveland are:

Anthracite—Egg, \$12.20@12.40; chestnut, \$12.50@12.70; grate, \$12.20@12.40; and stove, \$12.40@12.60

Pocahontas—Shoveled lump, \$9.00@9.25; and mine-run, \$8.00@8.25.

Domestic Bituminous—West Virginia splint, \$8.30; No. 8 Pittsburgh, \$6.85@7.00; Massillon lump, \$7.40@7.65; Cannel lump, \$11.00; and Coshocton lump, \$7.35.

Steam Coal—No. 6 slack, \$5.75@6.00; No. 8 slack, \$5.80@6.00; Youghiegheny slack, \$5.25@6.10; No. 8 3/4, \$6.35@6.60; No. 6 mine-run, \$6.30@6.85; and No. 8 mine-run, \$6.30@6.85.

### DETROIT

Obstacles attending the transportation of bituminous coal into Detroit, ranging from car shortage to embargoes, were augmented with the coming of a heavy snow-fall, Monday. To just what extent the storm will become an impediment is not yet certain.

**Bituminous**—That continuance of the power supply of many of the manufacturing plants of the city is still a matter of considerable uncertainty is made clear in a statement by J. W. Brennan, purchasing agent of the Detroit Edison Co., who says that for some time past his company's daily receipts of bituminous have averaged about 800 tons a day less than consumption.

To make good this deficit in daily supply it has been necessary for the company to use coal liberally from its stock piles, with the result that it now has, Mr. Brennan says, only about four days supply ahead. Under these conditions the delaying of shipments by the storm would be likely to create a crisis forcing suspension of power service to customers other than those that might be classed as essential industries.

Jobbers and wholesalers are still receiving reports from the mines that in many instances they are able to operate only two or three days a week because of insufficient supply of cars for loading or because of the inability of the railroads to provide locomotives for moving cars.

Complaints are also coming to the jobbers that the Railroad Administration is continuing the confiscation of shipments sent to Detroit and is diverting the coal to provide for railroad requirements.

**Anthracite**—Though anthracite is not coming into the city very freely, the situation just now seems to be occasioning little anxiety. Jobbers calculate that household consumers are in a comfortable position and that the retailers though not carrying very large stocks will be able to supply their customers.

**Lake Trade**—Reports coming to vessel owners indicate that coal is being moved rapidly from docks on the upper lakes and that there will be an active demand for vessel capacity to load coal at the opening of navigation, providing the railroads are then able to supply a sufficient number of cars to get the coal from the mines to loading docks. So far no coal has been loaded for shipment up the lakes. At this time last season several cargoes were afloat.

## Middle West

### MIDWEST REVIEW

Coal is now so scarce in the Middle West that retail dealers and purchasing agents for manufacturers appear to have moved in a body to coal centers like Chicago, Indianapolis, and Peoria, and having once arrived, proceed to besiege the offices of operators and wholesalers in the vain hope of purchasing an additional tonnage of coal.

The car shortage, which has been with us for some time past, is now beginning to make itself felt throughout the middle-west. Operators who contracted say 40 per cent of their output are now having

great difficulty in supplying their contract customers, let alone their retail and miscellaneous trade. To add to the seriousness of the situation the car supply continues to grow worse, rather than show signs of improvement.

A certain Ohio Congressman was in Chicago a few days ago, and addressed the members of the Union League Club, on the railroad question. This club has a large number of coal operators in its membership, and the address was listened to with great interest. Among other things said was that as soon as the roads were returned to private ownership approximately two hundred and fifty thousand men would be discharged. These men had been placed with the various roads through the Railroad Administration, and are now considered unnecessary help, by the private owners of the roads. This case of overemployment is only one example of the extravagance and mismanagement of the administration.

In spite of repeated promises for better service coal is still moving slowly, and it is not an uncommon thing for a car of coal from West Virginia or southeastern Kentucky to take from four to six weeks to go from the mines to some point in either Illinois or eastern Iowa. This, coupled with the car shortage we have already touched upon, is perhaps the main factor responsible for the present coal shortage.

A number of our most prominent coal men have made predictions as to business conditions during the coming season. Practically all of these opinions are very hopeful and optimistic. It is thought that the car supply will improve, perhaps slowly, but improve some, and a strong demand for coal for a number of months is taken for granted by almost everyone. These predictions for excellent market conditions are based on the fact that there is, at the present time, a coal shortage in this country which will have to be made up.

**CHICAGO**

Chicago wholesalers, as well as operators, who have mines in Illinois and Indiana, are combing the market very thoroughly in an endeavor to purchase coal. Operators are interested because they are not receiving a sufficient car supply at their mines to take care of their contract customers, let alone miscellaneous orders from retailers and steam plants.

Wholesalers are buying because they are not getting nearly enough coal from their regular source of supply. Chicago retail trade is coming into the market strong, and are now very grateful to receive mine-run, even of the poor grades, whereas a couple of weeks ago they were rather particular if their lump coal was not prepared up to standard.

But little anthracite is being received in Chicago of late, and retailers are pretty generally complaining about the preparation of the anthracite which does arrive. It is claimed that the preparation is very poor and that there is an inordinate amount of slate in practically every shipment. Complaints made to the shippers, on this account, always result in the same thing—namely, labor at the mines is so independent and careless that little can be done in the immediate future towards betterment.

It is believed that within two hours Chicago could hold an impromptu convention of the majority of coal purchasers in the Middle West. Various factories tired of waiting for coal salesmen to call upon them, have sent their purchasing agents here to Chicago, and this, combined with the large number of retail dealers here looking for coal, has resulted in a demand for fuel about three or four times in excess of the present supply.

**ST. LOUIS**

Market in a critical condition account shortage of coal. Mines averaging less than two days per week. City supplied but country districts without fuel with cold weather and future prospects bad. Miners dissatisfied.

The situation instead of showing improvement has been getting worse. Miners in the Standard and Mt. Olive districts are averaging less than two days work per week on commercial coal. The past week has been worse than any other. On the Mobile & Ohio RR practically no commercial coal has been shipped. Everything being mined is taken for company fuel.

There is much dissatisfaction among the miners in both of these fields over the amount of working time they get, contending they cannot live on the money they are getting if this is to continue. Many of the miners are in debt to the merchants in their towns with no hope of getting out

before spring, and then they do not know whether there will be steady work at that time, even if there are plenty of cars.

With the miners in this condition, there is evidently trouble ahead for the operator in the matter of wage scale. Everything produced finds a waiting market and were it not for government prices, there is no telling what coal would be bringing in the St. Louis territory right now.

Locally there is a shortage of fuel, but everything is kept going. However, outside of St. Louis proper many steam plants have been obliged to shut down and many towns have been without domestic fuel for several weeks. The places that are hit hardest are the local stations on the Iron Mountain line south that carry rates only from the Iron Mountain lines in Illinois.

Throughout the Carterville field of Williamson and Franklin County conditions seem to grow worse, although they are not as bad, generally speaking, as in the Standard and Mt. Olive districts. Most of these mines are on two or more roads and they get a pretty fair car supply, whereas in the Standard and Mt. Olive fields nearly all mines are on one road. That gives the mines in the Carterville fields about three days car supply a week, but the railroads draw heavily.

In the Mt. Olive and Standard districts the railroads are taking about half of the coal produced. On the Missouri Pacific R.R. the mines are prohibited from loading any commercial coal because the amount of cars furnished are insufficient to give the Missouri Pacific its tonnage of railroad fuel. An order went out one day this week to confiscate fifty cars of coal. The best they could find on road was thirty eight cars and then they began confiscating coal in the St. Louis terminals that came from other fields.

A check up showed at that time that there was 105 per cent of coal equipment on the Missouri Pacific rail and an investigation developed that this equipment instead of being held for coal carrying is permitted to be loaded with logs to make automobile wheels and spokes and kindred luxuries, and the equipment is shipped to all parts of the country. On account of the shortage of box cars it is used for commodities that until the last year were never shipped in coal cars before. It is not a question of shortage of equipment. It is a question of incompetent railroad-ing.

The weather is cold throughout the Middle West. The movement of everything is slow and the shortage of fuel continues to increase. It is possible that when the railroads pass into private ownership after the first of March that there will be a difference in everything.

The papers in the Middle West accuse the railroads of laying down on the job right now to show up a better contrast under their own supervision after March 1. There is practically no anthracite moving into St. Louis and no smokeless at all. The movement of coke to outside points is good. There is practically no Franklin County coal coming in and all prices are the same as last week.

**MILWAUKEE**

Coal in brisk demand. Supply depends solely upon rail facilities at present. Prices remain unchanged, but an advance is seemingly in prospect.

The coal market at Milwaukee is maintaining an even balance, despite an unceasing demand upon sources of supply which are about as uncertain as the weather. Everything depends upon the inflow by rail at the present time. This movement is slow enough under normal circumstances, but the least obstruction to traffic pinches the market.

Prices continue unchanged simply because dealers shrink from becoming involved in the popular slenching into high costs, which has reached the stage of local committee investigations; but a rise all around seems to be impending unless the situation changes materially. Rail service is poor and the outward movement of stocks held to protect contracts is slow. Milwaukee could handle twice as much coal as it does at present if rail facilities were equal to demands upon them.

**Coke**

**CONNELLSVILLE**

The coke situation shows no material change. Car supplies in the Connellyville region were somewhat poorer last week than previously, but there has been a corresponding improvement this week.

Production on the whole has been remarkably steady since the first of the

year, but with increasing demands on the part of the blast furnace industry, made up only in part by increased production of byproduct coke, the apparent shortage is as great as ever. Several furnace interests would willingly pay considerably more for prompt coke, if permitted.

It is now generally thought that as long as winter weather obtains the railroads will not be able to increase their car supplies to the Connellyville coke industry, but it is likewise felt that the advent of mild weather, which is unduly postponed, will automatically bring prompt relief. As has often been the case in the Connellyville coke industry the change in the attitude of furnaces as to coke supplies may be spectacular.

Often it has occurred that at one time the furnaces would be bidding higher and higher prices for spot coke and a fortnight later would be instructing shippers to suspend shipments on contracts. A sharp improvement in transportation conditions would bring about three things a reduction in the quantity of coke in transit, resulting in correspondingly heavier receipts at furnaces, an increase in the amount produced and shipped, and the picking up of the considerable tonnages of coke that the old fashioned ovens have stocked in the past few weeks. The modern push-ovens cannot stock coke. There is scarcely any coke obtainable in the open market except off grades, which command the full Government limit. The market is quotable at Government limits: Furnace, \$6; foundry, \$7; crushed, over 3-in., \$7.30, per net ton at ovens.

The Courier reports production in the Connellyville and Lower Connellyville region in the week ended Feb. 21 at 235,157 tons, a decrease of 8,829 tons.

**BUFFALO**

There is report of profiteering in the coke trade as well as in coal, so that the regular price of \$9.60 for 72-lb. Connellyville foundry is often up \$1 or more, so far as the asking price is concerned.

Furnace is also held for more, though it mostly goes for \$8.60 on contract, with off grades \$7. Domestic sizes sell well at \$7.75 and breeze less actively at \$5. The prospect of a heavy smelting year is good. Already there is enough iron ore sold to insure the bringing down of 60,000,000 tons by lake. Buffalo will as usual supply a number of furnaces East of here, some of which have already bought liberally. No vessel chartering has been done yet, but it is expected that the 1918 rate of \$1 per ton from Lake Superior will be paid.

## Assigned Cars for Railroad Fuel

THEY never come back." Well-proved words that are rightly applied to many a dethroned champion who tried. Nevertheless, they do try, for it is hard to realize that the old order is gone. Report has it that another of the dethroned will try to stage a come-back. This ex-hero is the notorious assigned car for railroad fuel.

He used to be the champion bruiser for the purchasing agents of the railroads when they went out to buy coal. The coal producer was a jelly when old A. C. finished with him. Prices were wrecked, profits abandoned. Discrimination was the established practice. Some mines ran overtime on unprofitable railroad orders; other mines worked only odd days or parts of days for lack of cars. In consequence the public paid more for its coal; miners were idle; they got in debt; they and their families starved; they were ripe for strikes and revolution against such conditions.

The whole system was viciously unfair and unjust. But it meant cheap railroad fuel and had never been decided illegal. Therefore, the purchasing agent and the railroad president

were satisfied and happy. Bankrupt coal operators, idle mine workers, hungry women and babies, festering revolt in the coal fields never troubled their bland serenity. Nor did any unwelcome ideas of fair play and justice ever disturb their case-hardened consciences.

Then came the war and the Railroad Administration. John Skelton Williams, head of the Railroad Administration's purchases, had in his hands the purchase of 150,000,000 tons of coal for railroad fuel. He also had the use of the entire railroad transportation system of the country. He likewise had the full authority of the government. No man in the history of the world ever had such power in any market. And he announced his intention to use all that economic and legal power to the limit in order to buy coal cheap.

He proposed to use the assigned car as his main weapon and to disregard government prices, government plans for the war distribution of coal, the production of ships, munitions, or other war supplies, principles of fair dealing and any other trifling objections that might be urged against his high and mighty purposes. Director General McAdoo

found it easy to support him while the fawning satellites under him walked softly in his august presence and made ready to execute his unholy plans in reverent admiration, for what he proposed went far beyond anything that any mere human purchasing agent had ever dreamed of accomplishing.

But the coal men in the Fuel Administration condemned the whole scheme unreservedly. They insisted that the Railroad Administration should buy its coal like any other purchaser and should distribute the cars equally to all mines. They appealed to the Fuel Administrator. Dr. Garfield took one good look at Mr. Williams' scheme, saw its utter iniquity, and when he was unable to persuade McAdoo to kill it, went to the President. The President also got his feet down on the solid ground of right and justice and gave orders that there should be no assigned cars under the United States Railroad Administration but that the distribution of cars should be equal among all mines. The benefit to the public was made instantly apparent in a \$50,000,000 reduction in the nation's coal bill.

Now that the roads are returned to private management, it is reported that some of them will again use assigned cars in the purchase of their railroad coal; in other words, pay for the coal partly in money and partly in cars for the loading of coal. Meantime, the new railroad bill says that in times of car shortage every car furnished must be counted against the mine, and the failure to so count every car is penalized. Railroad men may try to twist that language into something else, but evidently Congress has meant to end discriminatory distribution of coal cars.

The wise railroad president will heed the plain public condemnation of an old evil and abuse and will not even waste time speculating on whether he can somehow evade the statute and still avoid heavy penalties and damages. The unwise may try it, but the finish of his effort will be certain. In an emergency there may be some ground for the special placing of some cars for fuel loading at available mines for a day or two, but there is neither reason, excuse nor legal warrant any longer for going out and deliberately making discriminatory car supply a consideration in a contract providing for fuel deliveries throughout a whole year.

The coal producer has as much need of taking to heart the lesson of the President's decision as has the railroad man. The coal operator also knows now that the assigned car is a branded convict. The disapproval and condemnation of the industry will rightfully fall upon the producer or jobber who becomes a party to any railroad business carrying assigned cars with it. Moreover, the public will not placidly submit to the added cost of its coal which the re-establishment of the old practice would entail.

In brief, it will be far better for all concerned to recognize the fact that this old abuse is done for. Neither the coal industry nor the public will tolerate its return. They will rub the old truth into avaricious doubters good and hard that "they never come back," if said doubters go ahead with their plans to try turning the moral and economic progress of America backward.

# Simultaneously Working the Superimposed Coal Beds of Virginia

BY DONALD J. BAKER  
Pittsburgh, Pa.

**V**IRGINIA as a state has more to boast of than merely being the "Mother of Presidents," producing the largest peanut crop and being second in tobacco growing. In Wise County the Cumberland Mountains attain their greatest height and contain the most valuable and numerous coal deposits found within the state borders. It is little wonder that Wise County has become the scene of numerous coal operations. Mining conditions here exact a greater exercise of engineering skill than is commonly necessary in districts farther north. The compensating feature, however, is that the coal beds are relatively thick. Furthermore, the coal is clean, requires no extensive preparation and is nearly free from gas. The roof is usually a firm sandstone that resists the disintegrating action of the air.

One of the leading operators of Wise County is the Blackwood Coal & Coke Co., whose main offices are at Blackwood about 5 miles west of Norton. This company was organized in 1903 and operations were started the same year. The mines of the company are located at Blackwood, Pardee and Roaring Fork, all of which are within a radius of 12 miles of each other and located in Big Black Mountain; one of the highest and most impressive elevations of the Cumberland chain. The mountain itself is the dividing line between Virginia and Kentucky and is in truth a fitting monument to separate two states whose picturesque scenery must be seen to be appreciated.

The coal deposit that is receiving the most attention in the development work of the Blackwood Coal & Coke Co. is the Parsons. This is sometimes known as the Pardee or Cornett bed. It is 2,740 ft. above sea level

and is perhaps the thickest known bed of hard, i.e., non-friable bituminous coal in the world. A general thickness of 10 ft. 4 in. is averaged throughout the properties of the Blackwood company. The coal is practically free from impurities and contains no binders.

An analysis will show the following constituents: moisture, 0.87 per cent; volatile matter, 38.92; fixed carbon, 56.41; ash, 4.67; sulphur, 0.716 per cent. The heat content is 14,907 and the fusion point of the

ash is high averaging approximately 2,710 deg. F.

The mines at Pardee are most picturesque and interesting because they are so entirely different from the ordinary. In the first place, the coal is unusually thick and maintains its height so evenly that the mine is inspected on horseback. The mountain roads are so steep and rocky that they forbid the use of an automobile in gaining access to the drift mouth. Accordingly C. J. Creveling, general superintendent of the Blackwood company, when he would inspect the mine in the Parsons bed, vaults into the saddle and never has occasion to withdraw his feet from the stirrups until he has visited the last room.

The mine is developed on the room-and-pillar system and certain inspectors of, say, the Miller bed mines of Somerset County, Pa., would indeed think they had reached the ultimate—the Utopian coal mines—if they could make their rounds of inspection on horseback. The same methods are employed by the firebosses making their early morning tours. They are indeed "Knights of the Black Diamond" in every sense of the phrase.

This pleasing and alluring feature is, however, partially eclipsed by reason of the mine being in the nearly inaccessible portion of the Cumberland Mountain region.

**Output from four operations in as many different beds is fed to one conveyor and prepared in one tipple. One of these mines is regularly inspected on horseback.**

While a few labor problems have to be met in the Blackwood mines this freedom is largely offset by most difficult transportation problems which make the question of how to handle the coal after it is brought to the surface not easily solvable. This alone keeps the operator's path from being a velvety one. During the recent nation-wide strike of miners, the Blackwood company never lost a day. Wise miners in this mine of Wise County knew when they were well taken care of. Miners to work this thick bed are easy to secure. Getting men

worked at practically headhouse height. Furthermore, the drift entrances are so located that the above arrangement was considered the most practical.

The development in the Parsons bed is 700 ft. vertically above the tippie. This fact is unfortunately not brought out in any of the accompanying illustrations. The mine cars, which are of 120-cu.ft. capacity, are dropped down a 1,500-ft. incline in trips of three by means of a 1½-in. wire rope. Upon reaching the bottom, the cars are gathered by a 14-ton Jeffrey "armorplate" locomotive and hauled to the lower headhouse. At this point the cars pass over a crossover dump, from which the coal enters a receiving hopper and is finally dis-

LOOKING FROM BELOW

Cars are here as usual dropped through the tippie by gravity.

to strike who work in a non-gaseous mine where the coal is over 10 ft. high and the roof so sound that posting is seldom needed, is no easier than it sounds.

The tippie at Pardee receives the coal from four separate beds from a retarding conveyor 588 ft. long having a capacity of 300 tons per hr. The output from the Taggart or "C," the Low Splint, the Parsons and the High Splint beds all enter the one conveyor leading to the main tippie. These beds lie above each other in the order given. Two headhouses discharge the coal after it is dumped onto the conveyor. The lower headhouse collects the coal from the High Splint and Par-

COAL ON THE SHAKING SCREEN

Slotted lump screen is here employed instead of the common perforated plate.

sons beds while the upper headhouse receives the outputs from the "C" and Low Splint beds.

At first thought it might appear that this statement is incorrect, as the Parsons and High Splint beds lie above the other two; however, the two lower beds are

LUMP AND EGG COAL ON CARS  
Loading booms are employed for both these sizes

tributed upon the retarding conveyor by a reciprocating feeder, which insures a uniform supply. This is an advantageous method.

The conveyor is of the chain-and-scraper type and is operated by two motors—a 40-hp. machine at the upper headhouse and a 5-hp. at the lower. The upper headhouse is equipped with a kickback dump, receiving hopper and reciprocating feeder. Both headhouses as well as the tippie are of wooden construction. The tippie and retarding conveyor at Pardee were fully described in the May 1, 1919, issue of *Coal Age*.

The room-and-pillar method of working is employed in the thick bed. Main entries are driven in pairs 1350 ft. apart; each is 12 ft. wide. One is double tracked and used as a haulageway while the other is utilized as an air course. The distance between the two is 72 ft., which gives a 60-ft. pillar. Room entries are turned directly off the mains every 250 ft., this distance being the length of the rooms. The coal is then developed by the panel system with 15 rooms to the panel each located on 60-ft. centers. This allows for a pillar approximately 35 ft. thick between the rooms, which are widened from 20 to 25 ft.

The coal is undercut by 28-A Jeffrey shortwall mining machines and shot down with black powder. A knife-blade parting runs through the Parsons bed and with a conservative use of explosives, the coal will separate at this line and only half will fall. As may be seen in one of the illustrations, the upper undisturbed portion of the bed is allowed to remain in position until the lower bench has been removed for a distance of from 40 to 50 ft. The upper bench may then be brought to the floor by a small quantity of black powder.

PLAYGROUND AND PART OF THE TOWN  
 "Growing things," both animal and vegetable, are conspicuous

The coal is harder than ordinary bituminous but is not an anthracite. Posts are seldom employed in driving a room and find only a limited use in holding up the upper portion of the bed while the lower is being removed. The room pillars are split and removed in retreat after all the rooms have been carried to their full length.

Intervals of at least 250 ft. exist between the Parsons, the Low Splint and the "C" beds. Accordingly operations in these measures may be carried on irrespective of each other, as it is considered that there is sufficient cover to protect the overlying workings. However, this does not hold true with respect to the interval between the High Splint and the Parsons beds and these are therefore worked in conjunction with each other, lest in robbing the pillars of the lower bed, operations in the upper should be interfered with and become unsafe.

This double development, as it might be called, is carried out without difficulty. The High Splint coal, which averages 5 ft. in thickness, is only found on the highest ridges of Black Mountain. This bed is practically level and approximately 2,990 ft. above sea level. As the highest point on Black Mountain in this region is at an altitude of 3,800 ft., there is no large unbroken tract of this bed as might at first be imagined. Outcrops are numerous and the bed overlies the Parsons only in restricted areas. Accurate surveys have been made of the mines in the two beds and the development work in both is shown on the same map.

As a result, the progress of development in the lower, as regards those sections that underlie the upper, is curtailed until such a time as the room pillars in the upper bed have been removed. It is then safe to pull the pillars in the lower or underlying bed.

PARSONS COAL BED MAY BE WORKED IN BENCHES  
 The lower bench has here been removed for some distance leaving the upper one which stands without support

This method of working the two beds simultaneously, which is probably the only one that could be used, has one drawback, namely, that water encountered in the upper mine eventually finds its way into the lower. Thus while the drainage problems in the High Splint

I was shown a block near the company's office at Blackwood which had been exposed for several years and still appeared to be in the same condition as when mined. This is a big factor in the development of these mines whose crop limits are so closely defined and relatively

near each other. The coal is firm right up to the very outcrop. A small quantity of gas is encountered, however, as the outcrops are approached. Black powder is then displaced by permissible explosives when the coal is shot down.

Power for operating all of the company's mines is purchased from the Old Dominion Power Co., whose central station is located at Dorchester, Va. Substations are provided near all the mines.

Much has been accomplished by the Blackwood Coal & Coke Co. in community and welfare work. This section of country, which is naturally bleak and dreary to the eye, lends itself readily to any efforts that are made to relieve the monotonous outlines of the hills. Artificial beautification when applied in the form of transplanted trees and scenic playgrounds, is even more noticeable and gives a more pleasing impression than

where the same scheme has been used in a district that lacks the impressive mountainous scenery for a background.

The miners' homes are substantially constructed, but they are of a design that is all too often encountered. However, Blackwood is a relatively old town. It is not the design of the houses that here creates a favorable impression. It is the careful consideration that has been conscientiously applied in the matter of making the most of a mediocre or even bad situation. Each house is neatly fenced and provided with a lawn, while vines drape the porches.

One thing is paramount in the problem of civic beautification. In the older mining towns that were perhaps hastily constructed and where it is now impossible to change the design of the houses, they may be made less bleak in appearance by camouflaging the exterior defects in design. If the men can be interested in their homes, there will soon be built up a friendly competition that needs no further attention, as it is self-sustaining. This has been carried out at Blackwood to a degree and with a result that might well influence other towns farther north to "go and do likewise."

### What Happens to Pyrite Under Heat

Carbonization tests of a mixture of coal and pyrite at 1,000 deg. C. showed the formation of some free sulphur, that some sulphur was absorbed by the coal substance and that a larger amount of sulphide than one-half the pyrite sulphur remained, showing a secondary reaction in carbonization. A. R. Powell made the tests for the U. S. Bureau of Mines.

HEIGHT IN THE HILLS, NARROW COAL AREAS AND IRREGULAR OUTCROP ARE CHARACTERISTICS OF THE BLACKWOOD OPERATION

bed are automatically solved, the Parsons is compelled to bear the brunt of the dewatering for both measures. Fortunately, this bed is practically self-draining as it dips about 3 per cent and development has been made against the dip.

The only places where pumps are required are in those local "swags" that may be encountered in any mine. Taken all in all, therefore, topographical conditions are about as near ideal as could be hoped for when there is not sufficient cover to guarantee one bed being developed independent of any other. Other operations in the same beds may not encounter the same happy combinations that the Blackwood people enjoy.

As will be noticed in the accompanying illustration showing a projection of the mine in the Parsons bed, the outcrop line which corresponds fairly closely to the 2,740-ft. contour line on Black Mountain, limits the field of production. The distance from outcrop to outcrop is highly irregular, although fairly uniform near the location of the present workings. The High Splint field lying above is, of course, even more restricted, while the Imboden bed at the foot of the mountain has the largest unbroken area of any of these several measures. However, this bed, which averages about 6 ft. in thickness, has not been developed to date except at the Roaring Fork mines of the company. These are located 12 miles from Blackwood.

Both the Parsons and the High Splint coals show practically no tendency to weather. This statement is particularly true of coal from the Parsons bed, specimens from which have been exposed to the elements as long as 13 years without showing any visible effects.

# How an Anthracite Breaker Was Remodeled—1

The Old Forge Breaker Was Remodeled During Operation. Concrete Being Largely Substituted for Wood—Rebuilding the Supports Under Load Was a Delicate Process Requiring Great Skill and Care

BY DEVER C. ASHMEAD  
Tarrytown, N. Y.

**A**BOUT three years ago the Pennsylvania Coal Co. of Scranton, Pa. decided that it was necessary either to remodel the old structure or build a new breaker at its Old Forge colliery. There were three reasons for this decision; first the cost of preparation was entirely too high as it involved the employment of 156 men; second, the methods of preparation were out

of operation of the breaker could be reduced but that of handling the output would have been greatly increased. Consequently no material reduction in total cost of production would have resulted.

These conditions made it necessary to come to one of two decisions—either to abandon reconstruction of the breaker or else to remodel it while in operation. After

FIG. 1. SIDE PLAN OF THE OLD BREAKER. NOTE INTRICATE AND COMPLICATED MECHANICAL ARRANGEMENT

of date and therefore the quality of the product was undergrade, and third, the foundations of the breaker were showing signs of decay and the cost of maintenance was high.

It would have been a simple matter to have torn down the breaker and built a new one on the old site or to have built a new breaker on another site but both of these methods were out of the question because of the fact that the country was at war and every pound of coal that could be produced was absolutely necessary for the proper conduct of hostilities. This made it impossible to tear down the old structure in order to build a new one as it was necessary to operate the old breaker continuously. Furthermore, a new breaker could not be built on any other site without negating the idea of cutting down the cost of production. The expense

of construction and the results obtainable because of improved output and lessened cost of production, it was decided to go ahead with the work of reconstruction immediately.

Having decided to start the work the next step was to decide upon the material to be used. Owing to the great demand for steel it was found impossible to secure this material on anything like advantageous deliveries so that the idea of steel construction, although the most favored, was abandoned. Wood was next traversed but, when the future life and cost of upkeep was considered, given up as costing entirely too much. It was found possible, however, to secure sufficient steel for reinforced concrete and therefore as the cement could be secured with comparative ease it was decided

that these materials should be used for the construction. The old breaker consisted of two buildings, one the main dry breaker proper and the other the washery. Both of these buildings were entirely of wood construction. It was planned that the dry breaker should be replaced to a height of 42 ft. above the railroad tracks with reinforced concrete. This included the pockets. The washery upon the completion of the reconstruction work was to be torn down.

Reese D. Isaacs & Son of Wilkes Barre, Pa., received the contract for the construction work and took two years to perform it. With the exception of two months,

FIG. 3. SIDE VIEW OF RECONSTRUCTED BREAKER

ter as nothing had to be supported. As soon as these pockets were completed and had set, the egg coal was then transferred from the washery side of the breaker

FIG. 2. NEW ELEVATOR BRINGING COAL TO THE BREAKER

A car haul was used on the old breaker but this required too many men to operate it and it was desirable to reduce the number of men employed.

January and February, 1918, the work was continuous until its completion in the summer of 1919. The original contract called for the construction of the breaker up to a height of 42 ft. above the railroad tracks. The contract

was further extended to include the construction of the breaker engine room and a rock pocket in the rear of the engine room; both can be seen in Fig. 3

In planning the method of handling the construction work it was necessary to take into consideration the necessity of continuing operation uninterrupted. Accordingly the first step in the construction work was to transfer from the main breaker all operations on any coal below the size of egg that had to be treated where the construction work was going on. These operations were crowded into the washery. The egg coal was accordingly shunted from the side of the breaker farthest from the washery to the side nearest to it.

The pockets on this vacant side were then torn out completely as well as all the superstructure directly above them. This made the construction of the pockets on this side of the breaker a comparatively simple mat-

FIG. 4. ANOTHER VIEW OF THE REBUILT STRUCTURE

to the completed pockets. Next the old pockets were removed together with their superstructure and rebuilt. The wood structure above the old pockets had been taken down carefully so that it was possible to reassemble it upon the completion of the concrete pockets with a minimum loss of material.

While the construction work was proceeding, the changes in the preparation process carried on in the upper part of the breaker were being made. These included changing the types of screen and of subsequent treatment. The entire process was altered from dry to wet.

Having completed the pockets in the breaker, all chutes were put in proper place and the coal was then run directly into the pockets in the breaker itself and the washery was abandoned. It then became necessary to replace the foundations and the columns supporting the balance of the breaker. This had to be done carefully so that the building would not be placed in danger. The operation of coal preparation had also to proceed uninterruptedly.

The plan adopted was to replace one or two columns in one locality, then move to another part of the breaker and replace one or two more columns. This would permit plenty of time for the columns to set before placing their loads upon them. When replacing supports in the center of the building, that is in the central three rows of columns, only one at a time was rebuilt as the greatest load in the breaker rests upon these supports. When working on the outer three rows it was possible to replace two of the columns simultaneously. The methods for supporting the superstructure, when replacing either one or two columns, although simple, was strong. The wooden posts that were to be removed were 12 x 12 in. hemlock on

will be readily understood. For the replacement of one column at a time, four posts were set about 36 in. from column to be removed, two cap pieces were placed as shown in Fig. 6 and the posts were diagonally braced in both directions. Next the main column whose lower part was to be replaced with concrete was cross braced in four different directions at a point immediately above the cut, thus transferring a part of the weight onto the four adjoining columns besides the support given by the four auxiliary posts as previously described.

FIG. 5. ARRANGEMENT OF MACHINERY IN OLD WASHER

Washery was abandoned and torn down on completion of the remodeling of the old breaker, the washing being transferred to the new building, all the work being done under one cover. In consequence the handling of coal was much simplified and degradation was reduced.

Fig. 6

Fig. 7

METHOD OF SUPPORT EMPLOYED WHEN REMOVING ONE OR TWO COLUMNS WHILE UNDER LOAD

the three outer rows of columns on each side of the building while in the central three rows they were 14 x 14 in. white oak.

By referring to Figs. 6 and 7 the simple method used

This made the supported column really stronger after than before its lower part was removed.

For the distribution of the concrete the contractors erected at the corner of the breaker nearest the railroad and farthest from the washery a tower 80 ft. high. This tower was sufficiently high to permit all the work in the main part of the breaker to be accomplished, but was not high enough to accommodate the construction of the engine room and the rock pockets which were added later to the contract. This extra concrete work necessitated the erection of another tower at the rear end of the breaker. The concrete was delivered by the first tower to the foot of the second and from this tower to the job.

The new reinforced concrete work is much heavier in construction than the old building. The main columns are 24 x 24 in. and the outer columns are 20 x 20 in. The concrete floors are 6 in. thick. The bottom of the pockets are of 9 in. concrete as are the walls. Twenty-

FIG. 8. RECONSTRUCTED BREAKER

The old car-haul trestle may be seen in the rear. Many new windows have been added so that adequate lighting is assured.

men steel I-beams support the bottom of the pockets. There are two large pockets of 150 tons capacity each and 6 small ones of 75 tons capacity each. The large pockets have 3 gates while the small ones have only one.

There are two loading tracks at the breaker—one for

open cars and one for the accommodation of box cars. The company up to the present time has not purchased a box-car loader as the original plans called for.

Upon the completion of the change from dry to wet preparation the old washery was dismantled and torn down. The stone from the foundation of this building and also from that of the breaker itself was removed and used in building a series of retaining walls on the outside of the breaker. These have been filled in and some good soil placed on top of the fill and grass planted thereon. As a result there is a pretty series of terraces at the side of the breaker.

The entire construction work is not as yet finished as the old car haul which carries the loaded cars to the top of the breaker has not as yet been replaced with the new drag-scraper line that is about to be installed. When the new scraper line is finished the coal will enter the breaker at a point about 14 ft. lower than the present car dump and the long unsightly trestle that now makes the approach to the breaker will be removed and in its place will be the new steel trestle of the scraper line.

The whole of the breaker above the concrete portion has been covered with new siding and the number of windows has been greatly increased. The breaker is thoroughly heated by exhaust steam making it very comfortable for the men when working in cold weather.

## Stabilization of the Bituminous-Coal Industry\*

Overdevelopment, Short Working Time, Absenteeism, Seasonal Demand, and Transportation Difficulties, Wages, the Use of Machinery and a Fluctuating Load Curve Are Some of the Problems Confronting the Industry

BY EUGENE MCAULIFFE

St. Louis, Mo.

**I**MPORTANCE of the coal-mining industry has never been realized fully in the United States. Since the last quarter of 1917, however, the problem of the coal supply has thrust itself into every phase of our national life. For 28 months disaster in one form or another has confronted the industry as a whole and famine has actually threatened the workers.

Secretary Lane in speaking of the coal industry said: "It should be treated with profound respect, because we know from Paris that sacred treaties and national boundaries turn on its presence. The world wants our coal, envies us for having it, fears us because of it." Again, as was well said by Secretary Lane, "The public must accept responsibility for the coal industry and pay for carrying it on, the year round. Mine operators and mine workers of whatever mines are necessary to meet the needs of the country must be paid for a year's work." The 105,253,300 people who use coal, who depend on it for life, health and comfort, must sense the problems that confront the industry; it is of too vital importance to be longer let run adrift.

In 1870, five years after the close of the Civil War, our annual coal production of all grades was 0.857 tons per capita, while in 1918, less than half a century later, it had increased to 6.44 tons per capita. To this extent and in this ratio, has coal grown into our national life. Any interference with its production, however occasioned, is reflected immediately in the earnings and activities of the thousand lines of endeavor dependent on the coal industry. When a cessation of production is anticipated the merchant ceases buying, and when the mines close the open store door yields to bars and shutters, and privation frequently begins for the mine worker's wife and children.

Post mortems are frequently only perfunctory ceremonies, but it is customary to try to fix the causes that led up to an accident after it has occurred. The bituminous-coal strike that began on Nov. 1, 1919, led our whole industrial and social system to the brink of disaster. The responsibility for this national calamity—to some extent international in its effects—should properly be laid at the door of the coal consumer.

Early in 1919 a careful survey of the coal requirements of the nation was made by the United Fuel Administration, and it was estimated that the 1919

\*Paper delivered before the meeting of the American Institute of Mining and Metallurgical Engineers, New York, February 18, 1920.

requirements of bituminous coal would total 500 million tons. The normal monthly requirements of the nation, with the tonnage produced and marketed, together with the excess tonnage produced or the shortage by months as set forth below, presents the conclusive evidence of the nation's responsibility for the strike of Nov. 1.

MILLIONS OF TONS WHICH WERE AND WHICH SHOULD HAVE BEEN PRODUCED IN 1919

	Normal Monthly Requirement	Monthly Production	Production in Excess of Normal Requirement	Production Below Normal Monthly Requirement
January...	40	41 487	1 487	
February...	40	31 566		8 434
March.....	42	33 719		8 281
April.....	42	32 164		9 836
May.....	42	37 547		4 453
June.....	42	37 054		5 446
July.....	42	42 698	1 98	
August.....	42	42 883	3 83	
September..	42	47 402	4 902	
October....	43	56 243		24 312
November...	43	18 688		1 388
December..	38	36 612		
Total.....	500	458 063		41 937

I have no hesitation in saying that if the 36,450,000 tons of bituminous coal not produced and, therefore, not transported and marketed in the five months February to June conclusive, had been so produced, transported and placed in storage for subsequent consumption, this strike would not have occurred with all the resultant losses occasioned thereby. In my opinion, if the bituminous-coal consumers of the nation had purchased the coal necessary to overcome the underproduction that occurred in the five months above mentioned, the nation's fuel bill would not have been seriously augmented during this five months' period, and, on the other hand, the domestic and foreign demands for fuel would have been sufficient to lift the annual production to the estimated 500 million tons.

During the early part of 1919 the coal transportation facilities made available by the Railroad Administration exceeded the demand. During this period, however, the market for bituminous coal was limited, and in many districts, mines were operated only 24 hr. per week. In certain districts where the quality of the coal, was relatively poor, individual mines work one day per week, one day in two weeks, and

in some instances were closed for a period of from three to five months. There is no other industry in the world that would even attempt to live under these conditions, and the price paid by the coal-consuming public on account of this condition represents a sum that is hard to even approximate.

Late in July, 1919, a crisis developed rapidly and since that time there have been periods when the operator, the mine worker, and the consumer either in turn or simultaneously have suffered greatly from the inevitable results of the conditions that controlled the industry earlier in the year. The demand for cars could not be met by the railroads; the miners demanded shorter hours and a rate of pay which they hoped would relieve the situation; and, in the meantime, the 105,000,000 users of coal, after previous experiences of a somewhat similar nature, accept the situation as apparently inevitable, not realizing that a comparatively easy and probably the only practical remedy lies in their own hands if they will but apply it. While we cannot measure the full extent of the losses flowing from the strike begun Nov. 1, 1919, certain compelling conditions are deserving of more than passing notice, for example:

(1) Debts Contracted by Workers. Thousands of

SHOWING WHAT TONNAGE SHOULD BE PRODUCED EACH MONTH IF WORK IS TO BE STEADY AND WHAT TONNAGE WAS ACTUALLY PRODUCED IN 1919

An underproduction of over 36 million tons signalized February to June of last year. In September and October the tonnage produced exceeded the average figures by over 18 million tons. In November the strike was staged, and nearly 26 million tons less than average production was mined, and as a result the year ended with a shortage of nearly 42 million tons

mine workers and industrial operatives will struggle for months to come in order to pay off the debts incurred during that period of idleness.

(2) Losses Sustained by Railroad Administration. The U. S. Railroad Administration, through losses sustained in the form of reduced earnings and in-

creased operating costs, was compelled to pass to the taxpayers a further deficit totalling many millions of dollars.

(3) **Interruption of Industry.** Because of the interruption to industry during the strike consumers are now paying a premium for basic necessities because of a scarcity of raw and finished material.

(4) **Marketing of Inferior Coal.** Reputable engineers allege that the product of many permanent mines showed an increase in ash content of 5 per cent above normal during the period of panicky demand felt in 1917. It is difficult to measure the extent of a

activity of the American people and the experiences suffered in the past two years should be sufficient to warrant the nation in lifting the industry as a whole to a plane upon which commercial stability may be possible. Briefly the essential problems which confront the industry are as follows:

**1. Overdevelopment.** There is, if properly employed, an overdevelopment of the bituminous-coal mine industry, and too many mine workers are now depending on the industry for a livelihood. At the time the survey of the nation's fuel requirements for 1919 was made, a similar careful survey of the industry

developed the fact there is a potential annual producing capacity in excess of 700 million tons, or a surplus stand-by investment equivalent to 40 per cent of the normal amount of capital required.

This, however, is merely the first of the serious losses incurred; for example, the transportation and coal industries of the country have not, except in a few instances, realized the close and vitally dependent relation that exists between them. Where this relation was recognized in the past, unholy alliances were unfortunately frequently created for selfish purposes, the general

permanent welfare of the two inter-related industries being substantially ignored.

When I say that 40 per cent of excess capital is invested in coal mines, mining machinery and equipment, it should be remembered that an equivalent excess investment is likewise carried by the transportation companies in the way of railroad tracks, locomotives and cars. A similar excess investment in mine labor, and to a lesser extent in railroad transportation labor, also obtains; and the loss does not stop here, but extends on down through the various individual lines of business that have been developed and which are maintained in the vicinity of the mines.

**2. Short Working Time.** The miner's year contains too few working days: frequently these days are of short duration, resulting in extraordinary and unwarranted social and economic losses.

**3. Absenteeism.** The voluntary absenteeism of individual mine workers, who are perforce assigned to a certain definite working place, reduces the production of the mine to the extent that the number of such absentees bears to the total number of primary producers, i.e., machine runners and loaders. Day-shift forces must necessarily be maintained, and the absence of primary producers working on the piece work basis seriously increases the unit cost. It is hard to measure the losses that flow from this extraordinary indifference to continuity of service, inasmuch as its effects extend down throughout the whole mine organization. In this connection can be mentioned disarrangement of haulage forces, the prolongation of the life of individual working places, with consequent increase in timbering and maintenance cost per ton extracted, the increased plant capacity and capital investment required, and the serious inter-

MONTHLY COAL PRODUCTION CONTRASTED WITH AVERAGE ANNUAL PRODUCTION  
Showing how the peaks and valleys of production contrast with what would be a steady annual output and how markedly one year's average differs from another

loss such as a condition of this sort occasions when carried to an ultimate conclusion. Coal of a quality that would ordinarily be rejected in any normal market was absorbed by the Railroad Administration and the public, with the result that the actual cost of coal, as measured by the results returned, frequently equalled or exceeded in the case of single carloads a sum in excess of \$25 per ton.

If any man versed in even the elementary side of fuel combustion, will vision anthracite culm placed in the hands of engine men for use in the fireboxes of locomotives drafted for Ohio, Indiana, and Illinois soft coals, and will imagine West Virginia low-volatile coal placed on the tenders of engines drafted for the product of Missouri and Iowa mines, he will understand how this loss, made up of excess mileage, wage and overtime bills, was sustained.

(5) **Opening of Inferior Mines.** Every period of hysterical demand for coal, such as occurred in the fall of 1919, is the signal for the reopening of thousands of small, incompetent, refuse-producing so-called mines. They call for railroad equipment, sometimes holding it for days, eventually shipping to the suffering and unwary a mixture approaching 50 per cent combustible and 50 per cent ash and water.

It is fair to say that both organized labor and the operators have failed signally in their efforts to improve and stabilize the business. It is true that periods of peace among the operators, mine workers, and the consumers have prevailed for a few months at a time, but the condition at such times has been one of armed neutrality rather than of good understanding.

The welfare of the bituminous-coal industry affects in a vital manner every social, industrial and economic

ference that is occasioned in the application of necessary safety measures.

The general public will perhaps be astonished to know that few mines suffer an average absenteeism of less than 10 per cent of their working forces, while in many mines voluntary absenteeism averages from 16 to 30 per cent. I have in mind one small property where the primary producers, i.e., machine men and loaders, lost 25.7 per cent of the potential working days available in October, 1919, the month immediately preceding the well-advertised strike of Nov. 1. I have said that this condition is unexplainable. Perhaps, a more dependable measure of continuous service, made possible by more uniform purchase and transportation would have a good effect on those disposed to absenteeism.

**4. Seasonal Problem of Coal Sizes.** The seasonal variation in the demand for coal of certain established sizes must be eliminated and the demand balanced. During the storage season an increased demand for the larger sizes will occur and it may prove difficult to market the smaller sizes that are less adapted for storage purposes. This difficulty can be overcome in part by large steam and railroad consumers who use mine-run coal, taking for current use during the storage period a compromise grade between screenings and mine run, while if necessary the smaller coals should be sold through a pool at not less than a normal market price, making a corresponding overcharge on the prepared sizes unnecessary and unjustifiable.

**5. Seasonal Transportation Difficulties.** The irregular seasonal demand made on the transportation resources of the railroads, including the items of railroad labor, cars, locomotives and terminal facilities, and which might be considered as largely assigned to and dependent on the transportation of coal for employment and revenue return, represents a loss which the public has looked upon in the past as the sole concern of railroad managers and stockholders. This charge, rather unfairly disposed of in the past, has now become a direct tax on the American people, and the economic losses suffered by the mining industry bear with double weight on the carriers who suffer through a premium paid on their fuel requirements, plus the revenue losses outlined.

The coal-mining industry is confronted with two distinct transportation problems: (a) its own underground transportation which is conducted under relatively difficult conditions subject to numerous dislocations, all of which must be absorbed by the industry; and, (b) super-imposed on this situation, and wholly beyond the control of the coal industry is an additional surface, steam-railroad transportation requirement, that during recurring periods frequently returns less than 50 per cent of the service required.

I will make the broad statement that no other industry suffers the transportation losses that obtain in the case of the production of bituminous coal. The consuming public must bear in mind that the owners of coal properties must pass these losses along to the customers of the commodity produced. In other words, the consumer again "pays the freight." The direct and inseparable relation that exists between the coal industry and the railroads must not only be fully recognized by both parties thereto, but a sympathetic, helpful attitude must be taken by the general

public in undertaking the solution of this part of the problem.

In order that the hopeless inadequacy of the transportation facilities now furnished bituminous mines may be appreciated, I have prepared a tabulation showing hours worked and hours lost through lack of cars—during the 30-day period ending Feb. 10, 1920.

**IDLENESS DUE TO RAILROAD INEFFICIENCY**

Mines "A" and "B" located in the Central Competitive field, and in two states ranking high as coal producers, represent a capital investment as of Dec. 31, 1919, of \$1,567,000. When it is remembered that a coal mine requires the service of a large maintenance

Hours per day, 26 days per month		4.06		4.33

Note—1 hour lost on account of mine disability

force whether working or idle, and that it must be pumped, ventilated and examined continuously throughout the 24-hr. period, the per cent of idle time chargeable to insufficient transportation should stagger those who are responsible for the conditions.

Is it unreasonable to ask those who operate iron mines, copper mines, automobile manufacturing plants, car and locomotive shops, great mercantile houses or other like lines of industry, how long their establishments would function under a condition such as that set forth above.

**6. Fair Wages for Proper Standard of Living.** The cost of producing coal must be kept within bounds, and at the same time labor must be paid a wage equal to that earned in like lines of endeavor, and which will guarantee to the worker:

(a) The full American standard of living; (b) a margin, which if conserved, will insure him against privation and want in sickness and old age; (c) the opportunity to secure in addition proper social, educational and recreational privileges for himself and his dependents.

The unfortunate, unstable condition that now surrounds the industry is costing the country not less than \$1 per ton produced, or one-half billion dollars annually.

7. **Increased Use of Machinery Underground.** The proportion of bituminous coal mined by machines reached in 1918, 55.9 per cent of the total, and electric haulage is rapidly supplanting animal haulage. The drilling and loading of coal should, as rapidly as mechanical facilities are perfected, be done by power-driven machinery, thereby reducing the number of operatives required. The ideal mine installation of the future will be one mechanically equipped throughout and the mine force should gradually evolve into one required primarily for operating and maintaining the machinery employed.

**Production, employment, wages, transportation, profit and loss all show great variations. The public seems to think that the coal industry, operator and workman, can either produce fuel or lie idle indefinitely without serious detriment to anybody.**

8. **Uniform Load Curve.** A uniform load curve must be established for the bituminous-coal industry. There is no substantial reason why the coal-famine shadow should overhang a nation which holds more than one-half of the known world's supply of this fuel, and which now mines nearly one-half of the coal produced in the entire world. Prior to the advent of existing transportation facilities, the Indian Empire suffered periods of merciless famine in one section, while food products rotted in the fields for want of a market in districts not far remote from the scene of these recurring periods of food scarcity whose toll was millions of lives.

We today have temporarily 40 per cent more mine development and mine labor than is necessary to meet the demands of the nation if such development and labor were properly employed, and the existing transportation machine would fall less short of the work of transporting the fuel requirements of the country if the consuming public, continuously menaced by famine and interference with industrial production, would do its part.

The production curve, the work-day curve, the worker's wage curve, and the profit and loss curve all show too many peaks and valleys. I have referred to the transportation losses sustained in the present indefensible administration of the coal industry. Coal tonnage now approximates 35 per cent of the freight traffic carried by the railroads, and in addition, thereto, a material collateral tonnage of mining machinery equipment and material is moved by the carriers in a direction opposite to the coal movement.

The 600,000 mine workers and their families contribute materially to passenger transportation revenues. If the bituminous-coal industry load factor is to be improved, the four parties involved in the production, transportation and consumption of fuel must recognize the importance of the industry and collectively work out a solution of the problem. The public, as the consumer, gives little concern to the industry or its troubles until the day of disaster arrives when a condition approaching panic usually appears. The country normally moves on in its self-ordered way, without more than a negligible coal

reserve. Somewhere and somehow it is presumed that the mines will produce coal and the railroads will transport it, providing it is wanted. When, however, the demand is reduced and coal is not desired, the same indifferent public feels satisfied that the mines and equipment will be maintained and the mine labor and transportation forces will remain standing at attention awaiting for the word "Forward"!

The American people have in the past invariably worked out a solution of their many recurring problems. What is lacking today is definite knowledge of the coal industry and its difficulties, and an orderly plan of remedial procedure supported by a sufficient motive.

#### ERRONEOUS REPORTS ARE CIRCULATED

There is too much said about the conditions that surround the mining of coal that is not only erroneous and unreliable, but which is actually vicious. Whenever a sensational publicist or headliner seeks opportunity for notoriety he pays his respect to coal. Too many unsupported statements regarding excessive profits, high wages paid, low wages paid, etc., are being published, all of which tends to confuse the public and cloud the situation.

It is our duty to meet the issues squarely and to consider only such remedies as will make it possible to organize and build in a permanent manner; the day for temporizing has passed. I am unalterably opposed to government operation of railroads, of coal mines, in fact any form of industry. Government operation dwarfs and stifles initiative and individual endeavor. Those who advocate government ownership and operation today seek a preferential creditorship for their class at the expense of the more numerous, but less intimately interested stockholders.

I do, however, advocate the education of all citizenship. A full knowledge of every angle of the coal industry should be gathered by the government for the use of those who operate and work the mines, and most of all, for those who pay to maintain the industry.

There can be no broader conception of governmental responsibility than that which depicts the Government putting into the hands of every citizen the knowledge and the opportunity necessary for the attainment of results, allowing the individual to work out his own prosperity and wellbeing, free from the twin scourges of oppression and paternalism.

After carefully considering the experiences of the coal-mining industry during the last 20 years and particularly during the last 5 years, I am prepared to recommend strongly the following:

1. **A General Coal Commission.** There should be created at once a permanent general coal commission consisting of seven members, one representing the mine operators, one the mine workers, two competent accredited mining engineers and three representatives of the public, each with equal voting power, with a tenure of office of 7 years, the chairmanship rotating annually.

This body should be bi-partisan, appointed by the President, paid an adequate salary and endowed with a sufficient organization and authority to gather for publication and general distribution information concerning the coal industry, including the cost of production, average monthly and annual realization, pro-

fit per ton, per cent return on the actual investment, selling expense, allowances made for depletion and depreciation, compensation paid for death and disability, the hours and days of employment afforded labor, and the per cent of working opportunity accepted by the various classes of mine employees.

It should study the social, recreational and educational privileges afforded mine workers, the progress made by the installation of mechanical labor-saving devices; and, in fact, it should investigate every feature of the mining industry and related transportation problems. The authority of the commission should cease with the promulgation of the information secured, keeping clear of all administrative entanglements.

There should be no record, whether of owners or of labor union, that is not open to this body. The results shown by the commission should be representative of the general condition; extraordinary individual wage earnings or owners' profits whether high or low never indicate the true condition. A complete survey of the industry would, on the other hand, show what the whole public pays and what is received in return.

**2. Price Fixing.** With the safeguards made possible under the complete measure of publicity regarding cost, realization and profit that would be shown by the reports of the general coal commission, the existing anti-trust laws should be so amended as to enable the industry to agree on such minimum prices as would insure not only the payment of a proper return to labor employed, but in addition thereto, provide a sufficient margin to make certain the carrying out of all necessary regulations relative to a proper conservation of the fuel supply of the country, the safety of mine employees and to improve the social, educational and economic condition of the mine worker. Coal should not be produced and sold at a loss and on the same theory extraordinary intermittent tribute should not be levied on the consumer.

#### CARRIERS CAN DO MUCH TOWARD STABILIZATION

**3. Seasonal Freight Rates.** Stabilization can be effectively carried out by the railroads through the adoption of seasonal coal rates. These can be put into effect without the passage of new or additional legislation by simply writing into the coal tariffs a provision to the effect that during the period, March to August inclusive, the rate shown in the tariff would be reduced 15 per cent; with the further provision that during the months, September to February inclusive, the rates shown in the tariff would be increased 15 per cent, making a net spread between the summer and winter rates of 30 per cent.

This provision need not involve any change in rate relationships or the measure of the freight rate paid by the consumer, providing he distributes his purchase on an approximately even basis throughout the 12 months of the year: on the other hand, the establishment of a more uniform load on the coal-mining industry would eliminate completely all periods of panic and hysteria when coal prices are frequently increased by buyers who frantically bid coal away from each other, paying in addition numerous extraordinarily high commissions to jobbers. It is a well known fact that frequently jobbers, who are without other capital than desk room and telephone service, edge in between the producer and the consumer, only

to disappear when the demand lessens and conditions are restored to normal.

I have personal knowledge of four individual commissions totalling \$1 per ton paid on coal moved during the pre-war period of 1917. Moreover, it is safe to say that an equalization of the mining load would reduce mining costs throughout the country from 25 to 50 cents per ton, a sum materially exceeding the profits that ordinarily accrue to the industry.

From a railroad-transportation standpoint, it is safe to say that the variation in the rates set forth above would tend to equalize the difference between operating costs that exist during the winter as compared with those that obtain during the summer months. The opportunity to employ a definite amount of coal equipment and track facilities continuously in coal carrying service, together with the privilege of maintaining adequate and trained car maintenance forces, represent transportation economies that cannot be well measured.

The per-cent basis of variation in seasonal coal rates would automatically force the summer movement of storage coal to the more remote points, thereby disposing of the maximum number of ton miles during the period of most favorable operating conditions.

#### PERIODS OF HIGH AND LOW FREIGHT CHARGES SHOULD BE EQUAL

The completion of the long-haul traffic during the summer months would further admit of a corresponding concentration of transportation effort in short-haul territory during the season of railroad activity, protecting that portion of the consuming public most disinclined to store coal. The period of high and low freight charges should be of equal duration insuring an equitable average rate to certain consumers who now buy in equal monthly installments. The reduction in rate should take effect on March 1, insuring the taking up of all seasonal storage stocks before the period of reduced consumption sets in, otherwise there will be a temptation to carry over stocks which would defeat the end sought.

Transportation rates should be made more nearly commensurate with the measure of service performed, that is to say, communities located in the immediate

**Make winter tariffs 15 per cent higher than a fair figure and summer tariffs 15 per cent lower, making these revisions Sept. 1 and March 1. Require better coal so as to reduce the amount of transportation demanded for escorting a British thermal unit from the tipple to the furnace bed.**

vicinity of mines should not be prevented from capitalizing their "opportunities of location." On the other hand, transportation companies overzealous to obtain traffic for limited period should not be privileged to make rates to points unduly remote on a basis approximating or below the out-of-pocket cost of the service recouping such traffic losses by charging unduly high rates on relatively short-haul business.

In other words, transportation ton miles should neither be given away nor wasted, and the existing measure of cross haul that now obtains in the case of coals of relatively like character, which evil is made possible and fostered by railway traffic managers, should be eliminated.

4. **Better Preparation of Coal.** The cost of producing coal, including the items of labor and mine material together with the transportation charge required to move the fuel from the mines to the place of consumption, has now reached that point that will justify the statement, that coal loaded at mines should be prepared invariably in such thorough manner as will result in the elimination of all removable non-combustible matter. Any excess of non-combustible matter purchased, transported and handled reduces the percentage of efficiency normally possible one and one-half or two times the amount of such removable non-combustible matter placed in the car.

Five per cent of excess ash-making material loaded with clean coal frequently reduces plant efficiency, whether stationary, locomotive or domestic, 10 per cent; and in comparing the price paid for fuel f.o.b. cars at mines, this variation in the proportion of obtainable net efficiency should be considered in determining the actual cost of fuel delivered. Every producer should seek to establish a standard of quality and preparation as high as possible. This, however, cannot and will not be done while the present intermittent demand continues. I have seen the work of months spent in building up the standard of quality go down in a day under such conditions as those occurring in October last. The railroad and industrial field inspection forces will require months to regain the ground lost in the fall of 1919.

A No. 5 shovel will hold 20 lb. of coal or one per cent of one ton; during periods of excessive demand ten times one scoopful or 10 per cent of readily removable non-combustible matter is frequently loaded with 1,800 lb. of coal. Double this loss to cover the interference suffered with combustion on the grates and figure the loss sustained on \$4, \$5, \$6, or even higher-priced coal. The cost of producing and transporting fuel is now so high as to warrant educating the public to this serious source of loss. As costs go up the problem steadily becomes a more serious one.

#### SOME MINES MUST GO TO THE WALL

5. **Temporary Elimination of Inferior Mines.** Numerous mines now producing grossly inferior coal should be eliminated until such time as the growing scarcity of marketable fuel makes possible the investment necessary to clean and make marketable this product.

6. **Central Sales Agencies.** The existing duplication of sales forces and multiplication of marketing costs should be eliminated. Central selling agencies should be established for the disposal of the product of the several mines in each field.

7. **Education of Public as to Storage Problem.** Fear has been expressed that the coal-consuming public cannot be induced to make sufficient summer purchases and to store the volume of fuel necessary to equalize the coal-production load. This is a matter of education, and supported by the information made public by the general coal commission, and aided by seasonal variation in coal freight rates, the producers and retailers of coal can in a short time create on the

part of the consuming public the habit of storing reserve stocks of coal. It is to be assumed that the railroads, public utilities and large steam consumers will be willing to bear their share of the burden of purchasing and storing during the six low-demand months their respective shares of the 50 million tons necessary to balance the coal production load.

The characteristic variations in demand as between seasons is well illustrated by the following statement of minimum and maximum production for the 4-year period immediately preceding our entrance into the world war:

MONTHS OF MINIMUM AND MAXIMUM PRODUCTION

Year	Month	Minimum		Month	Maximum	
		Thousands of Tons	Per cent of Year		Thousands of Tons	Per cent of year
1913	April	34,169	7.1	October	46,164	9.7
1914	April	23,609	5.6	March	45,455	10.8
1915	February	29,321	6.6	December	45,814	10.3
1916	April	33,628	6.7	January	46,596	9.3
Average Ratio		30,181			46,007	
		100 Per cent			152 Per cent	

In 1915 the Geological Survey undertook the compilation of monthly statistics covering the production of bituminous coal and lignite. The accompanying diagram shows the extraordinary variation in monthly production for the calendar years 1915 to 1919 inclusive. It is unfortunate that similar statistics are not available for the several coal fields as they would show an even more extraordinary range in monthly production, this condition being due to the fact that certain Eastern fields which are heavy producers of coal enjoy a relatively uniform production made possible by the summer movement of coal to New England and to the docks at the head of the Great Lakes. Progressing westward the seasonal spread widens until in the case of mines located west of the Missouri River, where industrial life is least active, this variation reaches maximum proportions.

Roughly speaking the bituminous-coal requirements of the United States, excluding the amount exported to Canada and foreign countries, but including coal used for bunkering purposes, will approximate the tonnage shown below. The distribution as between classes of consumers of the additional 50,000,000 tons which should be stored during the low demand period is also set forth in the following table:

ANNUAL CONSUMPTION OF COAL WITH ESTIMATE OF NEEDED STORAGE

Purpose for which coal is used	Millions of Tons	Per cent of total Production	Additional Storage Needed*	
			Thousands of Tons	Per cent of Total Production
Coal gas plants.	5	1.0	507	0.10
Steamship bunkering	7	1.4	Not desirable	
Electric utilities	33	6.6	3,346	0.67
By-product coke	34	6.8	3,447	0.69
Beehive coke	52	10.4	5,273	1.05
Domestic consumers	59	11.8	5,983	1.20
Railroads	130	26.0	13,182	2.64
General industries	180	36.0	18,262	3.65
Total.	500	100.0	50,000	10.00

\*Additional storage estimated as being necessary during periods of low consumption to accomplish a stabilization of the industry.

If those engaged in the coal-mining industry will unite in presenting the benefits to be secured, there is sufficient intelligence and business force behind the industries of the country to insure each line of business performing its part in the matter of storing coal during the periods of low consumption. Insofar as possible, every consumer, whether railroad, public

utility, manufacturing industry or domestic consumer, should undertake storage of sufficient coal to create a balanced monthly demand on the mines, and the domestic fuel required by consumers who are not home owners can readily be stored in the retail distributors' yards.

The capital required for the accumulation of such storage stocks can be taken care of through the medium of acceptances issued by the retail distributor, (a) to the railroads to cover freight charges, and (b) to the producer to cover mine costs. Such acceptances when protected by a proper survey and adequate fire insurance should be taken by the carriers under special authority of the Interstate Commerce Commission, and would, without doubt, in the case of those given to the mine operator, be accepted by the banks as collateral for loans.

Individual sales made to householders who accept delivery, but who seek the privilege of deferred payment could be arranged for under the terms of specially prepared customer's notes payable as of a fixed date. The matter of storage capital requirements has been well covered by Cyrus Garnsey, Jr., late assistant U. S. Fuel Administrator, who recently said: "The retail coal dealer can and will finance summer storage if he has definite assurance that there will be an increase in retail prices as the season advances sufficient to cover the cost of storage." A small modification in summer prices at the mines, together with a lower summer-season freight rate, will guarantee this requirement.

#### SEASONAL RATES REPRESENT A PAYMENT

The publication of seasonal coal rates on the part of the carriers would represent the equivalent of an immediate cash payment made to the consumer at the time storage coal was put down; this initial payment in substance being duplicated in the form of reduced fuel costs at the time the coal placed in storage is taken up for consumption. The statements now made by coal salesmen relative to low summer prices are seldom taken seriously by the consuming public. A railroad tariff, which is in substance a Governmental document, furnishing supporting proof of such reduction, would be accepted as dependable notice of a future and definite increase in the delivered cost of coal.

In considering the problems that confront us in our efforts to make the coal industry a stable one which will keep step with, and cease to harass our general industrial program, individual doubts must not be allowed to creep in. If we cannot develop at once a sufficient business to keep our deserving operations employed, then those that cannot find a market should be closed and means provided to carry the investment until a growing demand requires their re-opening. With a foreign demand for coal which we cannot fill, I have no serious fear of the existing over-development lasting long, bearing in mind that mines are worked out and abandoned continually.

Even if we have 100,000 men hanging on the fringe of an over-manned industry, there need be no fear of their suffering lack of work. With an extensive railroad construction and rehabilitation program confronting us, including the construction of thousands of cars and locomotives; with the demand for, not thousands but millions of homes, with our farms rap-

idly depopulating, the mine worker can take his choice of employment. Certainly no greater loss can occur to a nation than to have a material portion of its man power in partial idleness and bitter discontent.

I have sketched the bituminous-coal industry and the work of stabilizing it from the broad premise that every owner and operator of coal mines, every mine worker and every consumer of bituminous coal will be willing to contribute his part toward curing the evils that surround the industry and which have grown of late to such proportions as not only to menace our whole economic structure and wellbeing, but to actually threaten the foundation of our government.

#### SUGGESTED MEASURES CAN BE SECURED

With a general coal commission, such as is suggested above, to secure all of the facts regarding coal production and consumption, and with the active co-operation of the several business associations of the country, including the American Railway Association, the National Chamber of Commerce, the several local chambers of commerce, boards of trade, manufacturers' associations in the various trade centers, the American Bankers' Association, the National Industrial Traffic League, the National Association of Public Utilities, the National Coal Association, the National Associations of Wholesale and Retail Coal Dealers and other business and trade bodies, there should be no difficulty in doing what is necessary to insure the informative, regulatory and remedial measures outlined above.

With the possession of all or the facts, there should be no room for controversy between mine owners and mine workers, and, on the other hand, all differences should be capable of prompt and fair adjudication between the parties at issue without the intervention of a governmental body. When, however, difficulties arise that cannot be amicably and properly adjusted, and which threaten the continuity of production, a separate mediative board should be empowered to determine a finding which should be based on the information made available by the general coal commission.

### Working Model of a Welsh Mine

BY MARK MEREDITH  
Liverpool, England

Samuel Mead, has now on exhibition in Merthyr (Wales) a working model of one of the big collieries in the Rhondda Valley at which he was employed. He gave all his spare time during a period of seven years to its production, and experts state that his ingenuity and perseverance have resulted in a great achievement.

The model weighs one ton, and is three yards in length. It affords a full representation of the mine at work as well as engine-house and other necessary structures on the surface. Groups of miniature men, 70 in all, go through all stages of pit work, and to complete the picture an ambulance party attends to a man who has met with an accident.

Coal when cut is placed in conveyors and cars and drawn along rails by a model winding engine to the bottom of a shaft—a deep one—and there hoisted by the surface engine. The lighting of the colliery is by electricity, and the whole of the evolutions constitute an exact replica of the routine of the miner's daily occupation.

## NEW APPARATUS AND EQUIPMENT

### A New "Jackhammer"

The Ingersoll-Rand Co. has developed, and is now offering for sale, a new member of the "Jackhammer" group of hand hammer drills. This machine, known as the BAR-33, is smaller and lighter than the other machines of a similar construction. It fulfills a long-existing need for a light self-rotating hammer drill. Its weight, of 21½ lb., should be a welcome feature as it permits the use of a drill in locations and positions not accessible to heavier machines.

NEW BAR-33 JACKHAMMER

The manufacturer recommends this light drill for work in soft limestone quarries; for trimming in metal and coal mines, and for pop-hole work in quarries and open-pit mines. In addition to the above the machine may be conveniently used for drilling holes in concrete and masonry foundations. This type of machine is not recommended for drilling deep holes or for use in hard rock, but for drilling where a machine of extremely light weight is necessary. The BAR-33 is the fourth type of "Jackhammer" placed on the market. Machines of this type are now available of the following weights: 21½, 35, 41, and 70 lb.

### Storage-Battery Cell Cover Remover

It is frequently necessary to clean storage batteries when they have become excessively dirty. This is best accomplished by means of steam, as all dirt and grease readily yield to it.

To replace broken cells, the top covers can be removed by steaming them open. A new and quicker way than the old time steam box has been introduced by the Hauck Manufacturing Co. of Brooklyn, N. Y. This firm has placed on the market a battery steamer that generates steam in four minutes, and which is now used by many charging stations.

This storage-battery opener is operated either by kerosene or with a gas burner and the steam is conducted to the battery by means of hose. The method

of operation is to insert the composition hose tips into the vent hole of the cell. The sealing compound softens almost instantly, and the plate may be lifted out. The average repair man opens a battery and has it dismantled, in from three to six minutes which is decidedly faster than is usually the case.

The steam generator is of 3 gal. capacity, and is equipped with a safety valve which releases pressure at 10 lb., although 3 lb. of steam is sufficient to work with. The steam gage registers 30 lb. pressure. Where desired, a water gage is supplied. The manifold is equipped with six 20-in. lengths of steam hose having composition hose tips not affected by acid. The manifold is further supplied with three steam-control cocks. Any size of battery can be opened without loss of steam and in a short interval of time.

Furthermore, the manufacturer states that it manu-

OUTFIT FOR STEAMING OFF BATTERY-CELL COVERS

Steam may be passed through any number of nozzles up to six. This will accommodate any ordinary battery.

factures a lead burner which operates with compressed air and oxygen, or gas and air, to be used for fusing battery-terminal straps or connections, and for similar work. Either or both of these machines find employment at charging stations and elsewhere where storage batteries are cleaned, charged or repaired.

# Coal Has Technical Session in New York Section of Mining Institute

Coal Preparation Should Follow Ore Dressing Methods, But Not Too Closely, Says Holbrook  
—Meissner Relates Progress in Coke Making—Ludlow Summarizes Problems of  
Irregularity in Mine Operation—Ransom Gives Results of New James  
Fine-Coal Jig—Wendell Describes Progress in Centrifugal Drying

BY R. DAWSON HALL

AT THE Wednesday, March 3, meeting of the New York Section of the American Institute of Mining and Metallurgical Engineers, E. A. Holbrook, chief engineer of the Pittsburgh station of the U. S. Bureau of Mines, speaking on Coal Versus Ore Concentration, stated that the preparation of coal had suffered from the fact that the subject had not had a sufficient degree of publicity and co-ordination such as the great work of Prof. R. H. Richards on "Ore Dressing" had afforded the metal industry. Much was known about coal preparation, but the information possessed by individuals had not been made available to others. The condition of the subject resembled that which obtained in relation to ore dressing in the earlier days.

Mr. Holbrook added that the low value of a ton of coal had made it difficult to approach the question of preparation with a readiness to spend money which was exhibited by those who attacked the problem of the successful and economical dressing of ore. With coal selling at \$1 per ton, how could any large amount of money be spent in its beneficiation? This was true, even though the problem of shipping the coal made the presence of ash not only undesirable in use but also extravagant of transportation.

## PROGRESS IS ANTICIPATED

Prices are now higher, Mr. Holbrook stated, and in consequence progress in preparation methods may well be anticipated. Another reason for expecting progress is that the good coal with a low percentage of sulphur is fast being used up. When we seek a coal for metallurgical processes, we are limited to fuels having less than one per cent sulphur. So, also, in our domestic and producer-gas installations we need low-sulphur coals, and the reduction in the area of such deposits by continued extraction is making us wonder how we may succeed in beneficiating coals, which in the bed are unduly sulphur-ridden.

Mr. Holbrook declared that we had been unduly governed by European practices. We had naturalized these without having exact counterparts of European conditions. He added that he was of the opinion that, as ore which would pass over a 30- or 40-mesh screen was jigged while all finer than that was passed over a table, he expected that having regard to specific gravities it

would be found best to pass the half-inch coal to tables and wash larger coal in jigs.

The need for a difference between the treatment of ore and coal arises from the fact that with coal it was essential only that a degree of beneficiation such as would make the coal pass the required specifications should be attempted. Any further rejection of impurity would result in the lowering of the speed of preparation, always an important matter with raw material of low value, and would cause a loss of fuel which had a distinct and valuable place in the fuel market.

Mr. Holbrook painted a vivid picture of a visit to a washery where he found a workman standing on a table, rake in hand, dragging over the coal on another table. The foreman explained that the table was rated to treat 8 tons per hour, but with the kindly help of the rake it was doing 18 tons every 60 min. When the audience laughed Mr. Holbrook denied that this story was in any way one rightly calling for merriment. He said that the table was clearing its 18 tons in a manner that enabled it to comply with specifications and that without the rake it would waste excessive amounts of suitable fuel. In the metal industry there is no similar desire to wash to a given limit and no further.

He stated that little had been done in the coal industry to develop a good centrifugal drier till Carl A. Wendell invented his machine. Mr. Holbrook contended, however, that there was still a field in the preparation of sludge coal waiting to be developed and that dry concentration methods may well be successful.

The speaker then introduced the new Trent process of coal purification discovered by a member of that Trent family which invented some years past certain great improvements in the cyaniding process. Mr. Holbrook declared that a coal of 12,000 B.t.u. had been so completely cleaned that it showed 15,000 B.t.u., the ash running about 5 per cent carbon.

Carl A. Meissner, coke expert of the United States Steel Corporation, stated that his company had done much to advance conservation by its experiments and developments in the matter of byproduct coking. The first plant established was at Joliet, and, after its successful operation had been proved, orders were sent out that no more beehive ovens should be built.

The coking of Pocahontas coal with its 18 per cent

Holbrook declares that lack of publicity regarding preparation is leaving the coal-mining industry floundering in uncertainty. He advocates the use of tables on all coal passing through a half-inch screen. Meissner gives details of Steel Corporation's fight to lift the coke industry from its wasteful habits and set it on a high conservational level.

of volatile matter gave at first an immense amount of trouble. Even in the making of beehive coke it was found necessary, in order to avoid the formation of granular coke, to grind it extremely fine, so fine that 60 per cent would pass through an 80-mesh screen. The trouble with coking of Pocahontas coal in beehive ovens is that it gives only about a 55 per cent yield. When first used in byproduct ovens it was charged without mixing and it swelled so much that it could hardly be removed from the oven.

Edwin Ludlow read a paper which will be printed in a future issue, for it is a remarkable exposition of the conditions in which the coal industry finds itself in face of the problems of 1920. He said that nowadays it was possible to jig everything, down even to the finest dust. No. 3 buckwheat, the smallest size listed, goes over a  $\frac{3}{16}$ -in. mesh screen, but there are about 1,000,000 tons of dust produced in the anthracite region which will pass through holes of that size; and the problem is, what can be done with them?

Donald Markle, in making experiments for the purpose of writing his graduation thesis mixed extremely fine anthracite with tar and tried to find out what would happen when the mixture thus made was carbonized. He discovered that a useful product could be derived from these operations, and the material obtained is known as anthracoke. Mr. Blauvelt of the Semet-Solvay Co. became interested in this experiment, and the Hudson Coal Co. has made an appropriation of \$100,000 for experiments which will determine satisfactorily what is the future of this new development.

When Mr. Ludlow was in Belgium he found that the coke men believed the best byproduct coke was made when the volatile matter in the mixture ran about 22 per cent. In order to produce uniform results they made a practice of mixing coals so that the 22 per cent. figure was invariably reached. When high-volatile coal was used it was their custom to compress the coal before it was put in the ovens and charge it in the oven so that it did not pack on the sides, making it possible for the expansion on coking to take place without crowding the sides of the ovens.

#### RANSOM SPEAKS ON NEW JAMES JIG

R. S. Ransom, of the James Ore Concentrator Co., was the next speaker introduced, and he said that he and his company believed when they first began to make experiments in the preparation of anthracite coal that the jig was not suited for the preparation of the finer grades of coal, but that the table should be given the preference. Now he is of the opinion that No. 3 buckwheat or barley, which passes over a  $\frac{3}{16}$ -in. mesh, but passes through a  $\frac{3}{32}$ -in. mesh can be satisfactorily jigged, if the right equipment is used. He said that in his experiments with the James table excellent results were obtained from the point of view of perfect separation. The table that the company had installed separated the slate from the coal most satisfactorily, but unfortunately the capacity was small, and if such tables were to be used extensively the floor space provided for such preparation would be wholly inadequate. Besides, the tables use considerable water, and the product depends upon a uniformity of feed, such as can rarely be provided in a breaker. It would be necessary to have a feeder to regulate the delivery of coal to the table.

Last December a new James jig was run at a rate of 7½ tons per hour, the coal having 24.312 per cent ash, and the percentage of ash was reduced to 15.6 on leav-

ing the machine. There were nine tons of coal in the bin and 2,056 lb. of slate were removed. It was decided to try to see if the machine could be speeded up with satisfaction, and the nine tons of coal in the bin were passed through in this instance in 38 min., as against 1 hr. and 25 min. in the previous experiment. The rate was 14.3 tons per hour. The raw coal in this case was somewhat better and ran 21 per cent ash, there being 13 per cent ash in the material leaving the machine. A further check showed 14 per cent, while another check placed the figure at 13½ per cent, this being about an average.

The speed was again increased to 19.1 tons per hour, and coal having an ash percentage of 24 left the machine with only 17 per cent of ash. With 13 tons per hour it was found possible to reduce the ash to 13 per cent. It was finally decided to make the speed from 16 to 17 tons per hour, and under those conditions coal with an ash percentage of 28 leaves the machine with 15.6 per cent of ash.

#### ONLY A FEW PARTS IN JIG

In general, according to Mr. McNally, the maximum capacity at which the machine is run is 16 tons per hour and the coal rarely runs over 15 per cent ash, and on leaving the machine; the average result is more nearly 14 per cent. The jig has the advantage of having only few parts. Another advantage is that in using the jig the question does not arise as to how to take care of the middlings, as is the case with the table. Variable feed both as to quality and quantity obtains at Locust Mountain washery as in other places, but it is taken care of without any adjustment. No change need be made in the adjustments if the percentage of refuse changes. Sometimes the strippings are alone delivering coal, and then the impurity may rise to 40 per cent. At other times all the coal comes from the mines and then runs from 12 to 14 per cent ash. The only matters which must be watched are that the water is kept reasonably level, 3 or 4 in. from the coal bed, and that the machine is properly slushed out.

Carl A. Wendell, the next speaker, stated that in his belief good preparation was just as possible a few years ago as it is today, because the high price of coal is largely illusory, the money that is received for the product going no further in paying for labor and machinery than it did at an earlier date. Mr. Wendell said that \$18,000 would buy as much silica brick a few years ago as would \$40,000 now.

#### COKING COAL SHOULD BE DRY

The presence of water in the coal fed into the coke oven caused the silica bricks which lined the oven to crack and spall and, therefore, it was extremely important that the coal should be as dry as it could be made. Mr. Wendell is the engineer who developed the centrifugal drier, which is now being sold by the Link-Belt Co., the experience of Mr. Wendell being obtained with the United States Steel Corporation.

Following Mr. Wendell, John Griffin of the Dorr Co. made some remarks on coal preparation in the anthracite region, which perhaps it would hardly be necessary for us to report here, because he has recently expressed his ideas at length in a paper entitled "Slush, Breaker and Mine-Water Problems," which was published in *Coal Age*, Feb. 19, pp. 349-353. Mr. Edwin Ludlow made some further remarks, and the meeting came to a close.

# COAL AGE

PUBLISHED BY MCGRAW-HILL COMPANY, INC.  
TENTH AVE. AT 36TH ST., NEW YORK  
Address all communications to COAL AGE

Volume 17

March 11, 1920

Number 11

## Do As You Would Be Done By

A FEW DAYS back the public-service corporations went to Washington and told the Bituminous Coal Commission that the wage-paying operator should bear the cost of the increased wage. Fateful folly! Shall it not be said to them hereafter and with all the justice of retribution that the wage-paying public-service corporation shall also bear the cost of its increased wages and pay all the increase in material prices out of its past earnings?

Is this, in fact, not now being already said? Thus have the helots in the essential service of the public turned on one another saying to their masters, the useless and less useful industries, that they individually will support the masters in their injustices if thereby a little measure of relief may be obtained from an intolerable helotry?

## Byproduct Coke Predominates

THE GOVERNMENT returns, as C. J. Ramsburg intimated in our Annual Review and Forecast Number, show that for the first time in the history of the country, the output of the byproduct oven exceeds, and quite notably, the product of the beehive oven. It is clear that one reason for that reversal of conditions in 1919 was that the demand for coke was far lower than the capacity of the ovens, and the beehives suffered the bulk of the contraction.

Whereas the byproduct-oven output fell off 997,000 tons, or 3.8 per cent, the beehive-oven product dropped no less than 10,831,000 tons, or 35.5 per cent. The decline in the output of the beehive oven was about 11 times as great as that of the byproduct oven.

Clearly the waste caused by the beehive ovens of the country may soon come to an end, for the growth in the number of ovens of all kinds makes certain that the beehive-oven industry will not long continue to be one of our nation's leading wastes. E. W. Parker some time ago ascertained that the loss in the operation of the coke ovens of the country would supply twice the amount of coal that would be needed to run all the trains of the Pennsylvania between Pittsburgh and Harrisburg. A few years have corrected that condition materially.

In 1918, when the byproduct ovens in commission ranged between 8,904 on Jan. 1, 1918, and 9,279 on Jan. 1, 1919, or on a rough average 9,091 ovens, the output was 25,997,000 tons, or 2,860 tons per oven. There were 853 ovens in building on Jan. 1, 1920, and 1,100 built in 1919, so these alone should produce, if the demand continues, 5,585,580 tons in 1920, which added to the output of 1918 should be 31,582,580 tons. Assuming that 1920 shows as much aggregate activity in coke making as 1918 and produces 56,478,000 tons as in that year, the tonnage of byproduct coke should be 31,582,580 tons, at least, and of beehive coke

21,895,440 tons, and byproduct coke should constitute 55.9 per cent of the whole output, showing that the gain of the byproduct oven on the beehive will still keep it well ahead of the beehive oven, of which the days are clearly numbered.

Of the byproduct-oven plants completed and put in operation in 1919 four were in coal districts, but two of these, that of the Jones & Laughlin Steel Co., at Pittsburgh, Pa., and of the Carnegie Steel Co., at Clairton, Pa., were located at steel plants, and two others, that of the Citizens' Gas Co., at Indianapolis, Ind., and that of the Indiana Coke and Gas Co., at Terre Haute, Ind., were obviously intended for gas supply.

Of the plants now under construction, two are in Birmingham, Ala., one at the steel works of the Cambria Steel Co., at Johnstown, Pa., and one at the Jones and Laughlin Steel Co.'s plant, at Pittsburgh, Pa. All the plants therefore now being built are either at large municipal centers or at steel works or at both. The coal people have not yet learned to use the gas from byproduct ovens and the general mixing of coals makes it usual to put plants convenient, not so much to one mine, as to two totally different fields.

## Curing One Malady By Taking Another

MALADJUSTMENTS, whether of the human body or of the social order, frequently result in other unforeseen maladjustments. The oyster finds a piece of grit in its shell that it cannot remove and it covers it with nacre, which in itself is a body that must cramp the shell, but is more easily endured by the sensitive organism than the uncovered grit.

In like manner the coal operator finds in his industry an annoying interference—the car shortage—which he cannot remove. He tries to find some means by which he can get a car apportionment equal to his needs. He learns that the cars are apportioned according to mine capacity and so he builds up the equipment and personnel of his mine beyond his needs so that the inadequate apportionment will come somewhat near accommodating his necessities.

The railroads have been saving the expenditure of capital by permitting a shortage of cars, and President L. F. Loree of the Delaware & Hudson R.R. recommends that the practice be continued and that every industry "reservoir" its output and pour it gently into the railroad channels as opportunity presents. What then will be the result? A loss due to output being held out of use, a cost for storage and rehandling and above all an unnecessary increase of equipment on the part of the producer such as will give him an apportionment of cars sufficiently large to meet his needs.

As regards President Loree, however, we must keep in mind that the Delaware & Hudson R.R. is well equipped and that therefore the call for larger provision is not addressed to his road and to the other anthracite-carrying roads but to those handling, in the main, bituminous coal or lumber.

As car shortage causes the producer to have additional equipment and excess of men, as it makes storage necessary and the large financial ability that must accompany storage, the idle capital and the idle men in industry are each far greater than the idle capital and labor on the railroads would be if the roads were properly equipped.

C. Andrade, Jr., speaking at the American Institute of Mining and Metallurgical Engineers, said that stor-

age was a heavy charge on finances and should be saved. But someone must stand such a charge in any event—the idle workman or the idle railroad. Someone must provide the excess equipment, mines and houses, and these are a heavy drain on finances. Hence it would be well that we have either more storage room or more railroad equipment. Better it is to lose the interest on property, than property itself. Labor is the property of the workman, he cannot afford to lose that property, and the nation as a whole cannot afford to lose it as well as it can afford to lose the interest on the premature investment.

Perhaps nothing was more illuminating in the whole Stabilization Conference than the remarks of H. M. Chance. He said he was one of the children of reprobation who were opening up more mines and seeking more men when more mines and more men were not needed. He was a consulting engineer, he added, for a public-service corporation that was tired of having its operations hampered and their continuance jeopardized by the coal shortage. They viewed the prospect of the exhaustion of the best deposits of coal as near enough to make investment desirable. So they had bought a tract of good coal and had instructed him to lay out a mine that would give an output of 1,000 tons a day. He had assured them that if they wanted such

a tonnage it was necessary to prepare the ground for 2,000 tons, for only with such a capacity could a car apportionment equal to caring for 1,000 tons a day be unqualifiedly promised them.

So long as cars are kept in all difficult times 50 per cent below call, so long will mines tend to be kept 100 per cent above needs. The excess equipment in the mine is a defense against the inadequate equipment on the railroad.

But not only must there be miles of underground road and working places by the score, tipples fitted for large capacity, mine locomotives in number and mine cars by the hundred, but there must be men in plenty, not to fill the cars when delivered, but to satisfy the railroad that the excess capacity is in man power as well as in machine power and development. If the men are in short measure, the capacity becomes regulated to suit.

Consequently, said Mr. Chance, if we want the railroad cars to haul away the tonnage we must have more men than the work will justify, and despite the unsteady

work we must hold them and that can only be done by systems of welfare. This much, at least, the workman gains from an evil condition. According to Mr. Chance, much of the interest put into welfare work had its origin in the hope of inducing men to migrate to mines where an equipment for tonnage double their needs had been provided.

All this applies only to the bituminous coal industry and probably to the United States alone. In the anthracite industry, the railroads have cars enough, and the mines can scarcely fill their orders in normal years except as to the small sizes. It does not apply to Great Britain or to France because, in both, output is barely equal in ordinary years to meet the need and just now is hopelessly inadequate to fill orders. It does, however, apply

to the bituminous industry of the United States almost wherever bituminous coal is mined, though New Mexico may be a partial exception. It is a deplorable condition to be best met by bringing the railroads more nearly to an adequate standard of equipment or by relieving the railroads by furnishing electricity from power stations at the mines.

A call for the stabilization of the coal industry is not made primarily to remove the losses resulting from the equipment and development, unused and closed mines. Idle machinery and dormant mine workings only involve losses from

interest and depreciation, whereas, on the other hand, idle men cause a loss of real capital, for, indeed, the work of the artisan is nothing other than capital. Interest is important and too often forgotten, but the loss that comes from folded arms is one compared with which a loss of interest is negligible. A period of idle time is as disastrous as a fire. A conflagration wipes out something of value, while by reason of an idle spell the thing of real value never reaches the point of creation.

Still it must be remembered that the haltings of industry are, in many cases, highly important operations of economic law and such as cannot be suspended with entire impunity. When a man is idle it is in obedience to some law. Perhaps there has been an excess of production, and economic law is trying to urge him to embrace another industry where he is more greatly needed. When the time of perfect regulation comes, when work is always assured to the artisan, we shall find a lot of product made for which there is no use and at a time of year when other industries are, perhaps, clamoring

## McKinney Says Coal Industry Is Robbed of Railroad Cars

Declares That Cars Bought for Coal Delivery Are Kept for Other Uses and Prophesies That Good Roads Movement Will Corral Car Supply

THE "coal" situation is the "car" situation, states W. D. McKinney, secretary of the Southern Ohio Coal Exchange, Columbus, Ohio in a letter addressed to Chairman Freylinghuysen of the Senate Investigating Committee. He goes on to say that the supply of coal is inexhaustible, insofar as this and a few succeeding generations are concerned.

There is enough labor at the mines, working a reasonable time, as in other industries, to produce fifty per cent more coal than we now require. Transportation only is lacking to give the public all the coal that it can consume and at a price fixed by the consumer. This lack of cars and transportation has been brought about largely by the rulings of the Interstate Commission prior to the great war.

It has caused the necessity of a Fuel Administration, and the necessity for the investigations of your committee. It has caused also investigations by the Federal Trade Commission, and the investigation now going on at Washington with the Coal Commission. It will continue to be the cause of investigations and the appointment of tribunals as long as the conditions are permitted to exist.

At one time, in 1916, one hundred and twenty-five cars of Toledo & Ohio Central R.R. were loaded with pipe at Zanesville for Oklahoma and were over one year getting back to the initial line. This deprived the railroad and the consumers of not less than fifteen hundred car-loads of coal. This is but one instance for an illustration. These conditions have grown to such an extent that instead of coal receiving the primary use of the equipment purchased for its transportation, it simply gets the residue, a complete reversal of the original intent.

### AGENTS TRY TO KEEP CARS FROM MINES

This came about naturally under the Interstate Commerce rulings, for every agent on every railroad of the United States is or should be energetic to get as much business as possible for his line. He is anxious to get the kind of equipment that his customer needs. If there is an empty car on his siding, he wants it and all the persuasive power and influence is used that he and his shippers can bring to bear to obtain that car.

An additional word on this subject as to 1920: the states of New York, Pennsylvania, Ohio, Indiana, Illinois and Michigan have a good-roads program calling for the expenditure of over fifty million dollars during 1920. Practically all of the materials used for these good roads must be hauled in coal cars and not only must the material be hauled in coal cars but every agency, political and otherwise, will be used to see that cars are secured for this good-roads material.

The Governor of each of these states, the representative in Congress, the County Commissioners of every county, Township Trustees and the citizens who use the roads generally will bring every pressure to bear to secure cars for the good-roads movement and, mind you, the shippers of the materials for these good roads are not on a percentage basis. They will get all of

the cars they need. This will mean just that many fewer cars for coal, and these cars will run to and from quarries, gravel banks, brick yards, cement plants, etc., and not to and from coal mines.

## Retipping the Teeth of Crushing Rolls

D. C. ASHMEAD  
Tarrytown, N. Y.

TWO years ago the U. S. Fuel Administration objected to the preparation of the coal made by the Treverton Colliery Co. at the Katherine Colliery, near Shamokin, Pa. This objection was based on excessive degradation arising from the worn-out condition of the teeth of the rolls.

It became necessary therefore to either purchase and install a new set of rolls or in some way to repair the old ones. As these rolls were of the solid and not the sectional type this meant the purchase of an entirely new set of rolls instead of the replacement of a few segments.

The company made inquiries as to the cost and delivery of a new set and found that the best delivery possible was at least six months with probably a longer delay. The cost, including the purchase price, installation expense and time lost was calculated to be about \$5,000. This cost as well as the poor delivery made it highly advantageous to devise some method whereby either the expense or delay might be lessened, preferably both, but at least the delay.

### MUCH TIME LOST INSTALLING NEW ROLLS

The time lost in installing a new set of rolls it was estimated, would have amounted to nine shifts and this meant that the breakers would be shut down for that period. This in itself was prohibitive because of the demand for fuel.

The surface foreman of the coal mine thought that it might be possible to replace the old teeth with new ones but this was found to be impossible because of the difficulty of access to the machine and the condition of the teeth themselves. This investigation, however, led to good results for it was suggested that the teeth be retipped by welding. This was immediately tried, as the company owned an oxy-acetylene welding outfit, and excellent results were obtained. It was unnecessary to remove any part of the rolls and the welding outfit was used on the spot.

It took one man 12 shifts to make the repairs, but the work was prosecuted at night and did not interfere in any way with the operation of the breaker. The cost of the materials, including the gas, was less than \$10, and the cost of labor was \$54.28, or at the rate of \$4.54 per shift. This made the total cost \$64.28 as against \$5,000 for a new set of rolls.

### ROLLS ARE EXAMINED SEMI-ANNUALLY

The company now has the rolls examined every six months and any teeth that show excessive wear are promptly retipped. The rolls thus repaired, the company now believes, give every bit as good service as a new set would have afforded and they are now kept in perfect condition.

This method of retipping roll teeth can be successfully used on rolls made up of segments. The work in this case, however, can be done in the shops.

# Survival of the Fittest—

Only One Escape Remains If Wages to Remain Stationary, Namely, More We Must Pool Our Equipment Infor

**M**IRACLES of efficiency wrought in trades having peculiar adaptability to the economies of multiple production have led the public to expect that all wage increases shall be met by elimination of waste and the introduction of machinery. Fortunate indeed is the industry that can secure an efficiency of operation such as can be attained in the punching and shaping of plates or in the making of watch parts.

Such developments will probably never come to mining, transportation or farming, yet there are large possibilities that with more and better equipment and more intensive methods a great development may take place though not equal to that which manufacturing processes have secured.

\* \* \*

**T**HE marvel has always been that the small mine without equipment has been able to continue in existence alongside of the big operation with large facilities. The explanation is simple; the small mine for a while has no inside transportation problems, for its work is not extensive; it is not started if there are any large surface difficulties to be met. If the small mine hopes to continue more than a year or so in operation it must lay plans for equipment to haul and cut coal and thus reduce the large expense that accompanies the operation of an extensive underground working.

\* \* \*

**R**EDUCTIONS of 50 per cent or over in the cost of operation may some day be made in the very best of mines and even to-day a 25 per cent reduction in cost is quite possible. The main difficulty in securing such a result is to be found in the attitude of the workman who wants its pay to be based wholly on output rather than on the labor or the time involved in producing the product.

There are many mines, however, that are working with antiquated equipment, using mule power, wasting steam, consuming electricity in useless resistance, using human effort where electrical energy would be less expensive, consuming ventilating power in eddy currents, wasting its output in broken, poorly-gated cars. Friction and flat wheels are consuming energy needlessly and much good coal is being prodigally thrown away at the tippie. In like manner the labor of unloading rock is nearly always excessive.

Progress is being made in removing these difficulties—now in one part of the country, now in another. *Coal Age* with contributors in every coal-mining state and province of North America and many overseas countries is the natural medium of exchange for all these many developments. The coal industry will never advance unless it progresses on the myriad feet of the whole mining public. Now one man or one establishment makes progress and now another, but unless the advance thus made is communicated to the whole body the advantage is lost.

\* \* \*

**M**ANY companies are publishing house-organs to give their employees a sense of the good work they are doing, to "sell the job" to the employee. *Coal Age* is doing that good work for every wide-awake coal company. It gives not only intercompany publicity, but publicity of a national and even of an international character. It kindles the right kind and largest kind of pride in the minds of the biggest as well as the most subordinate of company officials and makes the job worth while to them all. It lifts their daily work from a drudgery in a forgotten "neck of woods" into a proud and prominent endeavor of such merit as to be worthy of publication in a metropolitan weekly, read by all the world and copied

# An Equipment Problem

Are to Be Raised and Prices Are  
Equipment and Greater Efficiency.  
Information So As to Meet Rising Costs.

broadcast the world over. In these days when "pride of achievement" is the watchword, *Coal Age* stands as the medium by which that pride can be created.

\* \* \*

**W**EARIED by the dull glare of a tropical sun, drenched by the rains that wetted him to the skin, discouraged by the slides and bottom uplifts of the canal excavation, the man who worked at Panama longed for home but kept proud of his job, happy in its execution, strong in his morale, because every newspaper and every magazine of the country told of the importance of the work and discussed its details. He felt it was worth while even if it cost much. In like manner the man who went "over the top" was thrilled with the immense importance of the work on hand and vibrated in accord with the public sentiment as reflected in the newspapers and magazines.

So in like degree—let us concede at once that it is a lesser degree—the man whose plant, whose work, whose thought has record in a national publication is moved forward by that fact. In it every man who has achieved may read what he has done and many may profit by his thought and act. He has had a part in the World's Work, he has forged a link in the chain-binding nature; he has helped to bridge the chasm between things as they are and as they might be; and his work is known!

Publicity of the mechanical achievements at any plant is good therefore for the industry and for the contributor. His vision is cleared by writing—that alone is worth while—but his enthusiasm is also stimulated. It has been said that laziness in thought is more common than laziness in action and everyone knows it is so who has had to deal with men—and with himself. Many things, in fact, most things, are

taken for granted; but given a great enthusiasm, a feeling that this is a period of big things and that one is in the thick of them and how largely will the imagination and the thinking, conceiving, and planning faculty be quickened?

\* \* \*

**T**HIS is a long and dreary preface, the reader will say, to a request that he will send to *Coal Age* some information on what he is doing or on what is being done at the plant where he is employed. *Coal Age* wants to know something about the savings resulting from improvements installed, how certain difficulties were overcome by the use of improved equipment, how his haulage, ventilating, pumping, coal-cutting or mine-car placing problems were satisfactorily solved.

But equipment is not all underground; there are stokers and boilers, dynamos and engines, turbines and air compressors, lathes and drills, hammers and forges, there are large mines and small, big problems and little ones. All problems call for solution, all mines have their difficulties. We would like to receive information regarding the way in which, any and all, large and small, were solved to the satisfaction of the writer.

\* \* \*

**O**N May 6 we will publish our annual Equipment Issue to which our readers are invited to contribute. All articles having line illustrations should arrive before April 6 and all others should be received before April 20, so as to leave ample time for the preparation of this important issue. The work of enlightening the coal industry will not be without its compensation; *Coal Age* will see that an adequate check shall reward the effort of every accepted contribution.

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Setting Return-Tubular Boilers

*Letter No. 1*—I have been greatly interested in reading the article of C. R. Weihe, *Coal Age*, Feb. 12, p. 308, in which he describes the resetting of a horizontal, return-tubular boiler and draws attention to many practical points.

In my practice, I have adopted the same methods outlined in that article, with the exception that our boilers are set 4 ft. above the grates. While I agree with Mr. Weihe regarding all the good features of this setting, I wish to state that he has only mentioned some of the good features about a setting of this kind and I will describe a few more obtained in a setting recently installed under our boilers.

First, by setting a horizontal return-tubular boiler, 4 ft. above the grates and with a moderately high bridge, say the top 22 in. below the shell of the boiler, with moderate care, it makes no difference how bad the water may be, there is absolutely no danger of bagging the sheets. Seldom will you see a leaky girth seam, which is often observed in boilers having a low setting.

#### LARGE COMBUSTION CHAMBER BURNS SMOKE

Another feature, and one to be appreciated, is the good effect of the large combustion chamber in which the smoke is completely burned. The tubes then have clean hot gases passing through them, in place of black smoke, which always deposits soot in the tubes and coats them with an insulating scale that results in a wonderful waste of fuel.

In practice, this condition will cause a continual growl between the dayman and the nightman, on account of the nightman neglecting to clean the tubes; or because he cleans them too early in the night and they are dirty again before morning.

Another feature resulting from setting a boiler high above the grates is that the arrangement admits more air to the furnace and it is possible and economical to use the refuse fine coal that accumulates around the mine. With the old style setting it was necessary to use either lump coal or mine run. The work of firing is now a pleasure instead of a curse. As an illustration of the advantage gained by setting boilers in the above style I will cite an example of such a setting.

#### GOOD SERVICE IN STEAM POWER PLANT

We have at our plant two horizontal return-tubular boilers, 72 in. x 16 ft., rated at 125 hp., each, making a total of 250 hp. With these two boilers we are running one 168-hp. engine; one 50-hp. engine; two hoisting engines, 16 x 36 in., for hoisting coal out of a shaft 160 ft. deep, weight of car 2,500 lb., coal 4,500 lb.; one pump 14 x 16 in. All of these are running almost continually, and we are firing with slack and refuse from around the mine. I notice that these boilers are popping off more than half the time. In case of the regu-

lar fireman laying off we have to pick up anyone who can shovel coal, to fire them; but we always have steam. There is not a swab on the place, and our tubes are never dirty, because we are burning all the soot out of the gases before they enter the tubes, and there is nothing left to be deposited in the tubes.

#### PROTECTING THE BLOWOFF PIPE

There is one thing brought out in Mr. Weihe's article regarding which I do not agree with him. I refer to the method he uses in taking care of the blowoff pipe on his boiler. I consider the blowoff pipe one of the most dangerous places about a boiler, and one that can cause a lot of trouble if it is not properly managed. With the method of protection described, it is not possible to inspect this pipe as often as that should be done, and the chances are that it will be neglected and, consequently, give out some day when it is most needed, making it necessary to shut the boiler down.

My method of caring for the blowoff pipe, on the setting I have described, is to simply wrap it with a 1-in. asbestos rope, which gives a very good protection, though not as good as the brick covering mentioned by Mr. Weihe; or a V-shaped brick pier can be used, which is also very good. However, a solid covering around a pipe prevents its inspection and I therefore condemn its use. A V-shaped brick pier built around a pipe makes a very effective covering, under low-set boilers; but, owing to the liability of its tumbling down, under a high set boiler, I would condemn its use. The only effective covering, in my judgment, is the asbestos rope I have mentioned, as it can be removed at different places and allow the pipe to be examined every time the boiler is down. These places can then be patched with a new piece of rope.

### Electric Mine Haulage

*Letter No. 7*—The discussion in *Coal Age*, regarding the trouble so frequently experienced in electric haulage in mines, has interested me greatly, as it has been my fortune to be troubled in the same manner on different occasions. In one case in particular, it was necessary to abandon the attempt to use the locomotive that had been installed and secure a heavier one if we were to maintain the output of the mine at its regular standard.

It having been decided to install electric haulage in that mine, the question was put up to me by the general manager, who asked what size of locomotive would be required to haul the coal. After some little calculation, I reported that, in order to maintain the present output it would be necessary to haul trips of 20 cars. The grades on the main haulage road were 2 and 3 per cent. for distances of 600 ft. and 1,000 ft., respectively. I

stated that this would require a 14-ton General Electric locomotive, on the main haulage road. At the same time, I recommended getting a 10-ton, storage-battery locomotive, for use on the gathering haul in bringing the cars from the working faces to the sidetrack where the trips were made up to be hauled out of the mine.

#### LOCOMOTIVES TOO LIGHT FOR SERVICE INTENDED

My report was taken under consideration by the general manager, who decided a little later that a 10-ton locomotive would do the work on the main haulage road. He also thought that a 6-ton, storage-battery locomotive would do all that was required on the gathering haul. Accordingly, these locomotives were ordered and shipped to the mine. After the necessary electrical work was completed, the locomotives were taken into the mine and the installation was ready for service.

It was the second day after when, believing that everything should be working satisfactorily, I went into the mine to see if all was going right. I found the 10-ton locomotive hauling a 20-car trip up the 2½ per cent grade. The cars had a capacity of 3 tons each, making the weight of coal hauled, per trip, 60 tons. When I arrived the motorman was having trouble with his motor, and, there being 4 ft. of space between the track and the rib, I decided to follow the trip to observe the action of the locomotive and, if possible, locate the trouble. I soon noticed that the front wheels of the machine were being lifted sufficiently to let them slip.

As the trip reached the 3 per cent grade, the trouble grew worse. Soon the weight of the loaded trip acted to lift the front wheels of the locomotive clear of the rails. The motorman at once shut off his power; but a broken bumper on the car next to the locomotive allowed the latter to swing to one side and the front wheels dropped onto the ties. The motorman stated that he had had much the same trouble the day previous, but did not like to mention it, hoping to overcome the difficulty. I ordered him to haul 12 to 14 cars on a trip and, while this overcame the trouble, it reduced the output of the mine.

#### LIKE TROUBLE ON THE GATHERING HAUL REDUCES DAILY TONNAGE OF MINE

Proceeding into the mine, I found the same difficulty was experienced with the storage-battery locomotive, which was at work gathering the cars and hauling them to the sidetrack. The front wheels of this machine acted in the same manner as I had just observed when watching the larger machine on the main haulage road; and I was obliged to give orders here also to reduce the load and haul only six or eight cars instead of twelve or fourteen, as he had attempted. By thus reducing the number of cars hauled, the trouble was overcome here also.

It was not long, however, before the falling off in the daily tonnage started an investigation by the general manager, who accompanied me into the mine to observe for himself. By his direction, the 10-ton locomotive was hitched to a trip of 20 cars and started on the upgrade out of the mine, with the result previously observed. Likewise, the 6-ton, storage-battery locomotive was made to haul a 10-car trip, with similar results.

The mine electrician was then ordered to make a close examination of each machine and reported that he found everything correct. As a last resort, the general manager had the front end of the 10-ton machine weighted

for the purpose of holding the wheels down to the rails. I claimed that the extra weight on the locomotive would cause the overheating of the armatures, which proved to be the case. He then had the machine reversed, but with no better results.

For two months we persevered in our attempts to make these machines perform the required service, and then a 14-ton locomotive was ordered for the main haulage road. The 10-ton locomotive was made to help out the 6-ton gathering machine, by hauling the cars onto the sidetrack. By this means, we were able to reach the required daily tonnage in the mine.

I heartily agree with the statement of W. H. Noone, *Coal Age*, Feb. 5, p. 282, that there are many mines experiencing the same difficulty, which I found to be the case in mines in West Virginia and Pennsylvania.

JOHN J. CLARK,  
Mahaffey, Pa.

Mine Superintendent.

## The Vicious Circle

*Letter No. 2*—In his interesting letter on the so-called "Vicious Circle," *Coal Age*, Jan. 1, p. 22, Mack Williams appears to suggest two remedies or means of counteracting the present high cost of living. If I understand his meaning, he would have the government fix the price of coal and other important commodities and devise some measures to eliminate strikes. My own thought is somewhat at variance with these suggestions.

Allow me to express the opinion that if the government should adopt the policy of price fixing in order to fight profiteers the cure would be much worse than the ailment. If the price was fixed high enough to let some plants earn a living profit, others more favorably situated would reap profiteer's profits; and if the price were fixed low enough to prevent the better situated plants from making more than a reasonable profit, the low-grade plants would be driven out of business.

An open market where the law of supply and demand has free play is the only equitable and just method of price fixing. In such a market, the supply being regulated by the demand, the market price does not take long to adjust itself to a fair and satisfactory basis.

#### THE STRIKE PROBLEM A DIFFICULT ONE

The problem of doing away with strikes is a deep and difficult one. To arbitrarily and forcibly repress them is autocratic and un-American, and to overcome the wage earner's desire for striking, by increasing his pay and bettering his living conditions until he is satisfied, is unpractical. The golden mean lies somewhere between, and we must hope and believe that it is obtainable and will be realized eventually.

The uninterrupted industrial production, in the United States during the war, was one of the largest contributing factors to the military success of the Allies. Comparative freedom from strikes was largely due to the patriotism of both wage earners and employers, in conjunction with certain mediating and arbitrating machinery that the government set up and operated, under the direction of ex-president Taft and Frank A. Walsh. If no better and more practicable means for preventing strikes can be discovered and put into operation soon, some scheme based on the experience of the National War Labor Board should be worked out and made effective.

It would scarcely be wise to make strikes unlawful, except in the case of certain public service occupations, as policemen, firemen, etc. Any man or group of men has an inherent right to refuse to do particular work, unless the safety of the government or the public is endangered thereby. When a group of men causes the whole consuming public to suffer through a general strike, intended to force their employers to grant them better wages or more comfortable working and living conditions, it is undertaking a grave responsibility. The people have everything to lose and nothing to gain by such a strike, which encroaches on the rights of the public. The answer of the labor leaders that "Might makes right" has had no standing since the signing of the armistice, Nov. 11, 1918.

#### RESPONSIBILITY OF LABOR ORGANIZATIONS

Labor organizations should be made more responsible, certainly to the extent of incorporation under charters from the Federal Government. At present, the autocracy of labor is more to be feared than the autocracy of capital. Capital is now fairly amendable to control; but labor is running wild, judging from the number of wild-cat strikes unauthorized by labor leaders and often in full operation before employers are apprised of the reason of their men for striking.

Contrary to the claim of Mr. Williams, labor leaders deny that labor is a commodity; and many men of affairs like Mr. Vanderlip, president of the largest bank in the country, are in accord with this view. At any rate, it is not a commodity like salt or nails, which can be bought and stored until required for use. Labor is human and has human rights, the right to a decent standard of living.

In an industry like coal mining where steady employment is dependent on a steady car supply, steady demand for coal and many other factors beyond the control of the operator, the wage earner is necessarily idle a part of the time. This is because the great mass of the people wait until winter is upon them before ordering their supply of domestic coal. The wage earner registers a kick against the operator because of his enforced idleness for which the operator is not to blame. His plant is just as idle as the wage earner. The loss rests as heavily on the employer as on the men whose daily wages are cut off by the enforced idleness. There are no profits, but expense and loss instead.

#### PROFITS AND PROFIT SHARING

Profits in business are the surplus remaining after labor is paid a decent standard of living, and capital has had a fair return on its investment. The wage earner, who faces the liability of a period of idleness, cannot in fairness and justice to his employer contend against assuming this risk and, at the same time, demand profit sharing. Unless he shares the losses, he is not entitled to share the profits of the business. The operator risks the failure to receive a due return on his capital, or even the loss of a part or the whole of his investment.

Profit sharing is a comparatively recent idea and will doubtless be worked out satisfactorily to all concerned if the rank and file of labor do not allow themselves to be led into unwise action by visionary and irresponsible agitators. Better and more lasting results can be accomplished by American methods of law and order, through responsible and trustworthy leaders.

One of the best methods of profit sharing, I believe, is for the employee to acquire stock in the company. Some of the more progressive companies are putting out a special stock issue designed for that purpose. Such an issue should be: (1) Safe (preferred stock); (2) paid for by installments if desired; (3) offer a good return on the money invested by the employee; and (4) be non-negotiable and redeemable by the company, to prevent its falling into the hands of outsiders. Such a scheme encourages thrift and builds up a bond of loyalty and sympathy between the company and its employees that will be a tower of strength to both in working out their mutual industrial relations.

By making the wage earner consciously a capitalist, even if only in a small way, he comes to acquire a sympathetic and concrete idea of capital, which has always been to him an abstract thought. After all, capital is merely stored-up earning power; and a wage earner who wishes to provide for his wife and children against the inevitable time when he shall no longer be able to earn a wage, by reason of death, old age or disability, must have recourse to "capital." Thus capital is humanly entitled to a return upon its investment.

#### PRODUCTION AND THRIFT THE SOLUTION

The first step toward the solution of the so-called "vicious circle" is undoubtedly *production and thrift*. During the present period of restlessness, the employee should work hard; he should lay by instead of laying off. He should take a fair-minded view of the problems of his employer and the rights of the public, as well as his own. The employer should recognize, in everyway proper, the very human desire of the employee to participate in the management of the industry and the determination of his living conditions.

As for governmental machinery for avoiding strikes by mediation and arbitration, that will doubtless come as soon as the industrial and labor leaders and experts can effect it. Its design is indeed a knotty problem and calls for the best informed and fairest minded thought America possesses.

WALTER H. DUNLAP.  
Kingston, W. Va.

## Shifting the Workers

*Letter No. 2*—The view that I take of the incident narrated by "A. H.," in his letter, *Coal Age*, Feb. 12, p. 327, is that the electrician did wrong, by going to a man employed at other work and offering him another position, requesting him to report on the job a certain morning.

The electrician should have taken the matter up with the superintendent or the mine foreman, to learn if there was a man to take the place of the one at the substation, before trying to get him away from his job.

Again, we must consider that, in taking this man and placing him on the job of rail bonding, it is well to know whether the position of bonding was made vacant by some one leaving, or whether he was being put on as an extra hand and expected to remain. If the work of bonding the rails was an extra job and not necessary the electrician was adding to the daily cost of his department. At the substation, the man had been receiving \$110 per month. He was to receive \$30 more in his new place, making \$140 per month; at the same time, another man was to attend to the job he left, at the same pay, \$110 per month.

In my opinion, any official is doing wrong when he increases cost without first taking the matter up with the superintendent. It is a well known fact that whenever the cost-sheet at a plant is increased it is the superintendent that must give an account of it and be able to explain where and why it was done, when the general manager goes over the cost-sheet.

At each and every mine, no one official knows it all; and, for that reason, it is important that the superintendent, mine foreman, electrician and master mechanic, all have a thorough understanding with each other. In fact, mine officials should never fail to co-operate and work together. Then such actions as that which occurred in the narration of "A. H." would not be so liable to occur.

Frequent consultation between mine officials on general matters concerning the mine, and the giving to each other their candid opinions, will often overcome many difficulties and reduce the cost of operation. Having been both mine foreman and superintendent, my own practical experience leads me to say that the action of this superintendent toward one of his employees shows plainly his lack of experience and ability to handle men employed in and around a coal mine.

Often has the mine electrician reported to me that a certain person would suit him, either for work as a wireman, bondsman or even as his assistant. I could not and never did, reply with such a remark, as "I will not do any such d— thing." On the contrary, I would help the electrician, knowing that if he had the right helper it would be to my benefit.

Again, I have often had to use young men from off the coal, as extra spraggers, tracklayers' helpers, pumpmen and drivers, and have always been willing and glad to assist any who proved worthy of assistance and were interested in the work or job they desired. As a result, I have been fully recompensed by having satisfactory men on the job.

When a mine superintendent will not assist his workmen to better their conditions, when he knows that they are worthy of such assistance, and will not co-operate with his men or manifest a kindly regard for them, he cannot gain or hold their respect and will surely be the means of his company losing money.

— Pa.

Mine Superintendent.

## Supporting Mine Roof

*Letter No. 1*—The inquiry regarding the supporting of roof in the Pittsburgh seam, which appeared in *Coal Age*, Feb. 12, p. 327, leads me to offer a few suggestions in reference to what is necessary, in the early planning and laying out of a mine, in order to reduce to a minimum the difficulties experienced by bad top.

Although this inquiry had particular reference to the scarcity of timber and the growing need of considering other means of support for the roof, I will not go further than to speak of those points, which if considered in the early development of a mine, will greatly reduce the quantity of timber required. First, let me say that, before we can hope to make a success in the extraction of coal with a minimum amount of timber and a maximum degree of safety, it is necessary to study the conditions existing in the strata overlying the seam and give particular heed to the character of the roof slate or rock immediately above the coal.

Examining the blueprints or mine plans, and observing the area of abandoned workings and the disposition of the working faces in the mine, we do not have to go far or look very close to discover evidence of the fact that little attempt has been made, in the past, to leave ample pillars for the support of the roof. The natural result is that a great supply of timber is necessary to safeguard the lives of the workmen, particularly where they are engaged in the hazardous work of drawing back the pillars.

### SUGGESTS THE LONGWALL RETREATING SYSTEM

In the mining of the 6 and 9-ft. seams mentioned in the inquiry, I would suggest that, perhaps, the surest plan would be to work these seams on the longwall-retreating system, driving the main headings in the center of the tract, not exceeding 12 ft. in width and reaching to the boundary. The chances are, if the top bench of coal is arched a little, less timber will be required to secure the roof.

When the main and cross-entries have been driven to their limit, a longwall face is started at the inby end. My preference is to keep the longwall face in a straight line so as to distribute the weight of the roof more evenly over the packwalls, which must be well built and kept within 10 or 12 ft. of the working face. If there is a scarcity of building material, it will be necessary to bring rock from the surface or from other seams. I observed, in South Wales, rock brought from a stone quarry half a mile away and taken into the mine to build packwalls. The chocks in that mine were built in the form of a triangle, with one side parallel to the coal.

It is worthy of note that, in the retreating system, the haulage roads are always driven in solid coal, which reduces the cost of maintenance by avoiding the necessity of brushing roof or lifting bottom to maintain the necessary headroom on the roads. It cannot be denied that the work of development, in the retreating system, is costly, but there is a great saving in the outlay for timber and deadwork.

### MINE LABOR THE PROBLEM OF THE FUTURE

Speaking of the future needs in coal mining, the labor problem will demand consideration; and mechanical coal cutters and coal loaders will be required to take the place of strong arms and muscle. If operators would give more attention in this regard, a far greater percentage of coal could be mined and loaded mechanically than is done at present. Generally, however, the majority of operators seem to tackle the problem by way of making the machine conform to the layout of the workings, instead of planning the work to suit the machine.

In my experience I have seen machines installed in mines where they were as much out of place as a butcher in a drug store. Before making changes or installing machines, let us study carefully the conditions and not go it blind. It would seem that it is the natural tendency of some superintendents and foremen to be constantly making changes, which in the end are of little avail for economical operation. In this manner, thousands of dollars are wasted annually.

Let me say, in closing, that it is my belief that there is a great need, in the development of the Pittsburgh seam, to give the same thought and consideration to the mechanical mining and loading of the coal as in reference to the support of the roof without timber.

West Pittston, Pa.

RICHARD BOWEN.

# INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

## Trolley-Wire Guards

I want to ask the opinion of *Coal Age* readers on the requirement of compensation-insurance regulations making the standard width, between the guard boards of a trolley wire, 5 inches. Taking the wire as  $\frac{1}{2}$  in. in diameter leaves but  $2\frac{1}{2}$  in. of clear space between the boards and wire. Would not danger arise when, as frequently happens, the trolley jumps the wire. The axle of the trolley wheel is practically 3 in. in length, and the result would be that the wheel would become wedged in this narrow space and either break the board or possibly pull down the wire when the attempt is made to adjust the trolley pole. I want to ask if it would not be better to require a space of  $5\frac{1}{2}$  inches between the guard boards.

Chambersville, Pa.

Triprider

We willingly submit this question to the readers of *Coal Age* for an expression of their opinion. Assuming, however, that the trolley wheel and axle requires a clear space of 3 in. it might be safer to make the width of the boards, say  $3\frac{1}{2}$  in. and reduce the chance of the trolley jumping the wire.

## Kerosene or Steam?

We are about to install a coal puncher of the Pneum-electric Machine Co's type, Syracuse, N. Y., in our mine and will probably want to operate one or two small pumps on the same power line. The coal puncher it is claimed will require a maximum of  $7\frac{1}{2}$  horsepower for its operation. Estimating that the pumps will not consume to exceed  $1\frac{1}{2}$  horsepower, I am thinking of installing a 10 horsepower engine to drive the generator.

To operate this outfit I am told that a kerosene engine will be much cheaper than a steam plant and will require far less attention. Not having had any previous experience in the operation of this class of machinery, I want to ask if the kerosene engine will give satisfactory service. Also, kindly advise what sort of current should be used. The maximum distance of the power transmission will not exceed 3,000 feet.

Using a kerosene engine to operate the generator, can it be so adjusted as to require little or no attention after it is started?

ROBERT H. DAUGHERTY

Coshocton, R. F. D. No. 6, Ohio.

Replying to this inquiry, we say without hesitation that a kerosene engine can be operated, in this case, with far less expense and attention than would be required by a steam plant. We would recommend, however, installing a larger unit than the one mentioned, as it is always safe to allow a good margin over the horsepower required. For this layout, we would use direct current, at 250 volts, owing to the difficulties involved

with alternating current on account of the poor speed regulation obtained with the kerosene engine.

With regard to the transmission of electrical power a maximum distance of 3,000 feet, for the operation of two or more machines in the mines, it would not be advisable to generate alternating current in order to reduce the cost of copper. The increased cost of copper, for direct-current transmission, would be less than the cost of installing step-up and step-down transformers and a rotary converter when using alternating current.

## Construction Work

Being in charge of construction work as foreman at our mine, I desire to ask two questions, as follows:

1. Should a furnace be built larger at the bottom and smaller at the top, in order to make it draw better?

2. When building an overcast in a mine, if the walls are not sloped down on each side of the main road will there be any increase in friction caused by the air current striking against the vertical sides of the main road, which has been bratticed off to deflect the current so that it will pass over the air bridge?

\_\_\_\_\_ , Ky.

L. E. R.

In answer to the first question asked, we would say that it is common practice, in furnace construction, to make the area at the top of the furnace smaller than the area at the firebed. These areas, however, have nothing to do with increasing or decreasing the draft, assuming that the furnace is properly built so that the draft is not choked.

The draft of a furnace is determined by the effective air column in the stack, which depends on the height of the stack and the relative temperatures of the gases passing up the stack and the outside atmosphere. The contraction of the area of the furnace above the grate makes suitable allowance for the contraction of the ascending gases, as they cool in rising from the fire.

Replying to the second question, it is always better, in constructing an overcast in a mine, to start the work by blowing down the top over the main road where the crossing is to be made. An uprise is then started a short distance back in the cross-entry and driven upward on an angle of about 45 deg., and connection made with the opening already formed above the roadway. In like manner, a similar uprise is started in the parallel main heading or air-course and driven to connect with the same opening over the road.

In this arrangement, the air current will be deflected easily on the slope and over the air bridge, and there will be less frictional resistance than when the air current is made to strike against the vertical wall dividing the main road from the cross-entry. There is also the advantage that there is less chance for leakage of air when the approach to the air bridge is sloped upward in the solid coal.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Indiana Mine Boss Examination, Indianapolis, Indiana

(Selected Questions)

*Ques.*—Discuss the subject of mine ventilation, setting forth the purposes; mechanical devices and their uses; quality of air required and how determined; quantity of air and how determined; humidity and temperature and how determined; mine gases, how detected; their danger and how prevented; and give the law respecting mine ventilation.

*Ans.*—The purpose of ventilation in mines is to supply a sufficient quantity of pure air to make the mine workings healthy and safe. The mechanical devices employed are, a ventilating fan to create the air current; and doors, stoppings, air bridges and brattices to conduct the air through the mine and make it sweep the working faces. The quality of the air must be such that it is pure, free from dust and contains the normal percentage of oxygen, as determined by actual test. The quantity of air circulated must comply with the requirements of the law and be sufficient to create the necessary velocity to sweep the gases from their lurking places in the mine. The velocity of the air, as measured by the anemometer, multiplied by the sectional area of the airway determines the quantity of air passing. The humidity of the air is ascertained by the wet-and-dry bulb thermometer, which also gives the temperature.

The important mine gases are methane, which is detected by observing the height of flame cap formed in the safety lamp when this gas is present; carbon dioxide, detected by the dim burning of the lamps or their extinction; carbon monoxide, detected by observing its effect on small animals, as birds and mice; hydrogen sulphide, detected by its smell. Methane, carbon monoxide and hydrogen sulphide are inflammable and form explosive mixtures with air, the last two gases named being also poisonous. Carbon dioxide produces a toxic effect on the human system, causing headache, nausea, suffocation and death. These dangers must be prevented by an adequate supply of air and its proper distribution in the mine. The Indiana mine law requires the circulation of 100 cu.ft. of air per minute for each man and 300 cu.ft. for each mule employed in the mine, and as much more as conditions may require. The air current must be conducted through the entries and made to sweep the working faces clear of standing gas.

*Ques.*—Discuss haulage tracks in mines, with respect to bed, gage, weight of rail, ties, fishplates, curves, grades, switches, ballast, drainage and the law respecting wide entry and refuge holes.

*Ans.*—Mine tracks must be laid on a solid roadbed. The gage commonly varies from 30 to 42 in., depending on the size and weight of mine cars in use. Likewise the weight of rail, ties, fishplates, etc., will depend

on the tonnage hauled and the kind of power employed. The weight of rail varies from 8 and 10 lb. per yd., in mule haulage with light cars having a capacity of 800 to 1,000 lb., to 30 and 40 lb. per yd., in rope and motor haulage. The size of ties varies from 4 to 8 in. in width and 3 to 6 in. in depth, depending on the same conditions. Mine curves and grades should be as light as conditions will permit and are limited by the kind of haulage employed. Mine switches commonly use a No. 3 or No. 4 frog. All tracks should be rock ballasted and thoroughly drained. The Indiana mine law requires a clearance space of two feet on one or both sides of the haulage road and this must be kept free from timber, slate or other obstructing material.

*Ques.*—Give five safety precautions that a miner should observe on going to his working place at the face.

*Ans.*—1. Observe the fireboss' mark and date at the face of the coal. 2. Examine carefully roof and coal to detect any dangerous top or loose coal that is liable to fall. 3. Set what timber is needed to secure the roof, before proceeding to load coal or do other work. 4. Take down any loose rock or coal. 5. Test the place for gas before proceeding to work.

*Ques.*—What is the best and safest way to detect the condition of the roof?

*Ans.*—The common practice of sounding the roof with a pick or hammer is not sufficient to insure its safe condition. Mine roof must be carefully examined at frequent intervals, in order to detect any loose top, slips or faults in the measures, boulders, "pot-bottoms" or other dangerous conditions that may develop in the extraction of the coal.

*Ques.*—Give five causes of accidents that occur on haulageways and the methods to prevent them.

*Ans.*—1. The practice of using haulage roads as travelingways; prevented by providing separate roads for the men to travel to and from their work. 2. Doors on haulage roads; prevented by building air bridges, as early as the development will permit. 3. Derailment of cars; prevented by providing well ballasted tracks, which must be kept in good condition and inspected regularly. 4. Roof falls on haulage roads; prevented by good timbering and frequent inspection and the replacing of old or broken timbers. 5. Cars standing on switches at the mouths of rooms or left on sidetracks, without protection; prevented by strict regulations regarding the handling and movement of cars.

*Ques.*—In what way would you provide for the protection of the men from falling roof?

*Ans.*—Adopt a systematic method of timbering the working places and insist on the frequent and careful inspection of each place, to see that these regulations are obeyed. Frequent inspection at regular intervals and strict discipline are the chief requirements in preventing accidents from falling roof. This applies alike on all roads and all working places in the mine.

# NEWS FROM THE CAPITOL

BY PAUL WOOTON

## Tidewater Coal Exchange Is To Be Continued For Sixty Days

Shipments To Exchange Ordered Compulsory—Order Remains In Force Till May 1, 1920—Fuel Administration To Exercise All Powers of Former Order of Nov. 6, 1917

The executive order signed by the President on Feb. 28, continuing the Tidewater Coal Exchange and making shipments to the same compulsory, is as follows:

By virtue of the power conferred upon me under the Act of Congress approved Aug. 10, 1917, entitled "An Act, etc.," and because of the present emergency, and in order to assure an adequate supply and equitable distribution and to facilitate the movement and to prevent locally or generally, scarcity of coal, I, Woodrow Wilson, President of the United States, do hereby order and direct that the order issued by the U. S. Fuel Administrator, dated Nov. 6, 1917, and entitled "Order, etc.," which was suspended by order of the U. S. Fuel Administrator dated Feb. 20, 1919, be and the same is hereby reinstated from and after this date.

### OFFICIALS OF COAL EXCHANGE

It is further ordered that J. W. Howe, at present commissioner of said Tidewater Coal Exchange, Rembrandt Peale, F. M. Whitaker, and J. F. Fisher, are hereby designated and appointed as my representatives to carry out the provisions of this order, they may exercise the powers reserved to the U. S. Fuel Administrator by said order of Nov. 6, 1917, and they are further from and after 12:01 o'clock A.M., on March 1, 1920, vested with the authority now vested in the Director General of Railroads, relative to the export of coal from the United States.

This order shall remain in force and effect until midnight of the thirtieth day of April, 1920, at which time, unless otherwise ordered, it shall cease to be operative. The order was signed by the President.

The order of Nov. 6, 1917, is quoted as follows: "Order relative to tidewater transshipment of coal at Hampton Roads, Baltimore, Philadelphia, and New York, and for the employment of and co-operation with the Tidewater Coal Exchange, so called, as a common agency to facilitate such transshipment and to reduce delays in the use of coal cars and coal-carrying vessels."

It appears to the U. S. Fuel Ad-

ministrator that the production of coal intended for transshipment at the Tidewater ports of Hampton Roads, Baltimore, Philadelphia and New York and ports near or usually considered as tributary to said ports is being restricted, and that the loading of coal-carrying vessels and the unloading of coal cars at such ports and the movement, arrival and return of such vessels and cars at and from such ports are congested and delayed, and that the shipment of coal from such ports is reduced in quantity, and that the distribution of coal to consumers in the territory tributary to the ports to which such coal is destined is less efficient, prompt, and reasonable than is necessary for the efficient prosecution of the war, and that delay is occasioned in the delivery of coal for vessels of the navy and transports of the army, by reason of the continuance of individual shipments of coal by various producers upon the lines of coal-carrying roads having terminal at the ports aforesaid, and of individual and distinct shipments of such coal at such ports only to coal-carrying vessels specially chartered or designated for the transshipment thereof of such individual shipments. The objectionable conditions aforesaid can be largely eliminated and the production, shipment, and distribution of coal from said ports both for the army and navy and for consumers in the territories aforesaid can be hastened and improved by the employment of and co-operation with a common agency at each transshipment port in the manner and with the powers hereinafter provided, and that such employment of and co-operation with a common agency is essential to the national security and defense, for the successful prosecution of the war, and for the support and maintenance of the army and navy, and to assure an adequate supply and equitable distribution, and to facilitate the movement, and to prevent locally or generally scarcity of coal.

The U. S. Fuel Administrator, acting under authority of an Executive Order of the President of the United States, dated Aug. 23, 1917, appoint-

ing said Administrator, and in furtherance of the purpose of said order and of the Act of Congress therein referred to and approved Aug. 10, 1917, hereby orders and directs that, until further or other order of the U. S. Fuel Administrator and subject to modification hereafter by him at any time and from time to time, the following rules are established for the regulation, to the extent hereinafter provided, of the method of production, sale, shipment, distribution, apportionment, and storage of bituminous coal for transshipment at the ports aforesaid.

### TRANSHIP COAL MUST GO TO EXCHANGE

(1) Every shipper of bituminous coal for transshipment at any one of the ports at Hampton Roads, Baltimore, Philadelphia, and New York and ports near or usually considered as tributary to said ports, shall on and after Nov. 11, 1917, consign all such shipments of coal to the Tidewater Coal Exchange, so called, of which Rembrandt Peale is the commissioner. Such shipments and consignments shall be made by each such shipper in accordance with and subject to the provisions of the existing Tidewater Coal Exchange rules in the same way to the same extent and with the same rights and liabilities respecting such shipments and the transshipment and delivery of the coal included therein, as under the terms of said rules apply to members of said Tidewater Coal Exchange but no such shipper subject to this order shall be required by reason of anything herein to become a member of said Tidewater Coal Exchange.

A copy of said rules is annexed to this order and hereby referred to. Wherever said rules refer or mention a "member" or "members" of said Tidewater Coal Exchange, said terms shall with respect to this order and shippers subject hereto be deemed to mean a shipper or shippers of coal who are subject to this order; and wherever the "effective date" of the Exchange or of said rules is referred to therein, such reference shall be deemed, with respect hereto and to the shippers subject hereto, to refer to the effective date of this order.

(2) Bituminous coal consigned under the provisions of this order shall be graded and classified in accordance with "Exhibit B" Consigning Pool Numbers, referred to in said rules of the Tidewater Coal Exchange, as modified, cancelled or superseded by the pro-

## Hines Outlines New Distribution Policy

Coal To Be Diverted Only When Urgent—New Regional Committees Appointed—New England Receives Immediate Attention

**C**OAL is to be diverted in the future only in cases of the most absolute necessity. New committees have been appointed by the Director General of Railroads to look after the diversions in the different regions. The Central Coal Committee at Washington is simply to continue its supervision over the general control of fuel movements through the regional committees.

Director General Hines outlined the new policy in a statement issued March 5. It is as follows: I am advised that in the Eastern section of the country and in New England particularly the severe weather conditions continue to interfere to a large extent with railroad operations, which is materially affecting the movement of coal from the producing sections to the consumers. The coal strike in November and December resulted in a shortage of approximately 50 million tons of bituminous coal. Although during the week ended Feb. 28, 1920, 10,250,000 tons of bituminous coal was produced and transported and although the production and movement of bituminous coal so far in 1920 has considerably exceeded the production and movement in the same period in the three preceding years, it is a fact that demand is still considerably in excess of the supply.

### To Give New England Attention

As a result the Director General has received representations from a number of Public Utilities, schools, domestic consumers and industries that they are unable to purchase coal to meet their urgent needs, and that they will have to cease operations unless they promptly secure coal. To assist the New England situation and because weather conditions have made it impossible to move much coal to New England by rail, a large amount of coal has been diverted to New England by water. This movement will be continued.

In Executive Orders dated Feb. 28 and March 5 the President, in order to meet this situation, has continued in the Director General of Railroads authority to direct the distribution of coal to the extent necessary to meet the urgent needs of public utilities, railroads and other domestic consumers. Acting on the authority thus continued, the Director General has today sent out instructions to Regional Coal Committees under his authority in the Eastern section of the country for the purpose of effecting the absolutely necessary diversions of coal.

These committees have been instructed that diversions of coal under this authority be kept at an absolute minimum and cease entirely as soon as possible. All applicants for coal should

exhaust all possible means for securing coal through the normal channels since the power to divert will only be exercised to meet emergencies. The instructions of the Director General places authority in the hands of the designated committees to make the necessary diversions. While the Regional Committees will continue to work under the general directions of the Central Coal Committee, Railroad Administration, Washington, D. C., applications for diversions of coal will not be forwarded to the Central Coal Committee but will be dealt with directly by the Regional Coal Committees.

### New Regional Committees

The territory over which the regional committees will have jurisdiction and the chairmen of the different committees are as follows: Eastern Regional Coal Committee with headquarters in New York, with jurisdiction on the lines of the railroads which comprised the Eastern Region of the U. S. Railroad Administration, G. N. Snider, chairman.

New England District Coal Committee, with headquarters in Boston, Mass., with jurisdiction on the lines of the railroads which comprised the New England District of the Eastern Region of the U. S. Railroad Administration, W. T. Lamoure, chairman, and James J. Storrow, vice-chairman.

Ohio and Indiana District Coal Committee, with headquarters at Cincinnati, Ohio, with jurisdiction on the lines of the railroads which comprised the Ohio and Indiana District of the Eastern Region of the U. S. Railroad Administration, H. A. Worcester, chairman.

Detroit Committee, with headquarters at Detroit, Michigan, with jurisdiction over Detroit and Toledo Terminals and in the state of Michigan, P. G. Findlay, chairman.

Cleveland Committee, with headquarters at Cleveland, Ohio, with jurisdiction over Cleveland and Terminals, E. R. Bissell, chairman.

Allegheny Regional Coal Committee, with headquarters at Philadelphia, Pa., with jurisdiction on the railroads which comprised the Allegheny Region of the U. S. Railroad Administration, Samuel Porcher, chairman.

Pocahontas Regional Coal Committee, with headquarters at Roanoke, Virginia, with jurisdiction on the railroads which comprised the Pocahontas Region of the U. S. Railroad Administration, D. E. Spengler, chairman.

H. B. Spencer, who was Director of the Division of Purchases of the Railroad Administration, has accepted a position as head of the Washington office of a private concern which is operating a refrigerator-car line.

visions of Classification C, dated July 15, 1917, Classification D, dated July 17, 1917, Classification E, dated July 19, 1917, and Classification F, dated July 27, 1917, and in accordance with the provisions of said Classifications C to F inclusive, wherever applicable, copies of which and of said "Exhibit B" are on file with this order in the office of the U. S. Fuel Administrator for inspection by any shipper subject hereto.

### Changes May Be Made

Changes in said classifications shall not be made against the objection of any shipper subject hereto except after approval of such changes by the U. S. Fuel Administrator. Upon application from any shipper subject hereto, the representative of the U. S. Fuel Administrator appointed under the provisions of paragraph (3) of this order is directed to furnish copies of said "Exhibit B" and said Classifications C to F to such shipper.

(3) Said Rembrandt Peale, commissioner of said Tidewater Exchange, is hereby designated and appointed as the representative of the Fuel Administrator to carry out the provisions of this order with power to appoint deputies representing him as such representative of the U. S. Fuel Administrator at any one or all of the ports aforesaid; and in case of any disagreement or controversy between any shipper subject to the provisions hereof and said commissioner with respect to any shipment or transshipment of coal or other matter arising under this order, or if any decision under rule 15 of the said Tidewater Coal Exchange Rules hereto annexed, which would be final as to any member of said Exchange, is unsatisfactory to any shipper subject to the provisions hereof, such shipper may appeal to the U. S. Fuel Administrator.

(5) No change shall be made in the membership of the Executive Committee of said Tidewater Exchange except with the approval of the U. S. Fuel Administrator so long as this order is in effect.

### May Apply for Suspension of Order

(6) Any shipper subject to the provisions of this order may at any time apply to the U. S. Fuel Administrator for suspension or termination of this order upon the ground that its continuance is no longer essential to the national security and defense and for the successful prosecution of the war in which the United States is at present engaged.

(7) A copy hereof shall be served upon each of the railroad or railway companies and upon each of the producers of bituminous coal named in the list marked "Exhibit 1 to the Tidewater Coal Exchange Transshipment Order of the U. S. Fuel Administrator, dated Nov. 6, 1917."

The order was signed by H. A. Garfield, who was then U. S. Fuel Administrator.

## Wholesalers Seek Injunction Against Railroad Administration

### Cushing Criticizes Government Control—Fuel Control Redelegated Too Many Times— Unintelligent Diversions Made

**A**N injunction is being sought by the American Wholesale Coal Association against the Director General of Railroads in the matter of diversion of coal. The case is brought in the name of Swayne & Co., Noah H. Swayne 2d, of Philadelphia, who trades as Swayne & Co. He is the president of the American Wholesale Coal Association.

George H. Cushing, the managing director of the American Wholesale Coal Association, in analyzing the case, states that one allegation in the bill is that the President's control over coal, as granted by the Lever law, has been delegated and redelegated too many times and that the coal industry is no longer regulated by the Government in the public interest.

Instead, anyone who uses coal and wants to confiscate what he wants, can get and use the President's powers under the Lever law. Specifically, it is and will be shown the President delegated his authority to Dr. H. A. Garfield; Dr. Garfield redelegated it to the Director General of Railroads; the Director General of Railroads gave it to the Central Coal Committee; the Central Coal Committee passed it on to Regional Committees. The Regional Committees transferred it to Federal Managers, the Federal Managers allotted it to their fuel agents; and the fuel agents used this authority to get coal for some of their friends along the railroad. The bill questions the legality of such frequent delegations of the President's power.

#### DIVERTEE PAID ONLY PRODUCTION COST

A second allegation is that those who thus regulated coal in their own interest assumed still in their own interest to divest the owners of coal of their title to it. The owner of the coal who had paid cash for it had his property taken away and the title went back to the person who produced it. This eliminated, contrary to the constitution, the title and right of the retailer and wholesaler. It left the divertee—mainly the Railroad Administration—to pay only the production cost of that coal.

The allegation in the bill is that such divestment of title is unconstitutional since the courts have held frequently that when a man's property is taken, he must, under law, be put in the same position as though his property had not been taken.

The third allegation is that an organization—the Central Coal Committee—consisting of three men and two clerks, has tried to distribute about two million tons of coal per day. They had no force adequate to investigate either the truthfulness of statements of coal users or to determine whether the man, whose coal was taken, needed it as badly as the man to whom it was being given. In practice, this unintelligent interference set up a system of robbing Peter to favor Paul. When that had been done it was necessary to rob John to save Peter, and to rob Samuel to reinstate John in his rights. One unintelligent diversion gave rise in time and necessarily to ten unintelligent diversions and the result has been to create the impression of a coal famine, when

production daily, weekly and monthly was, and is adequate.

The fourth allegation is that, under this system, men who have spent their money to finance the coal mines during the recent strike had to sit by while their funds were tied up by the Railroad Administration which worked under rules that made it impossible for them to recover what they actually had spent for coal, to say nothing of collecting enough additional to pay their cost of doing business.

At the end of the petition, the plaintiff requests that the court establish a commission to settle claims between the owners of the coal and the divertees. They also ask that the Director General of Railroads be ordered to show cause why an order should not be issued restraining him from further illegal interference with their business.

While this suit is filed in the name of Swayne & Co., it is specified in the bill that it is in behalf of the 600 members of the American Wholesale Coal Association. It requests the Supreme Court of the District of Columbia to consider this as a test case and to allow the wholesalers to intervene as individuals to establish their rights.

The real purpose of the suit is to compel the Director General of Railroads and his agents to allow those who buy coal to actually get the coal they have bought and paid for. As the matter now stands, it is impossible for any coal man to make a sale to a retail dealer, a public utility company or to a factory and guarantee that that coal will be delivered.

Another purpose of the suit is to stop practices such as the following:

#### ENDLESS CHAINS DEVELOPED

(1) Some time ago the Central Coal Committee was asked to divert 75,000 tons of coal to the New York Edison Co. and the Interboro Rapid Transit Co. of New York. The request was granted without an investigation. It developed later that 60,000 tons of this coal was moving, when seized, to the Boston Edison Co.

To allow the Boston Edison Co. to get its coal, the Central Coal Committee then seized 60,000 tons from other wholesalers. It later developed that this 60,000 tons of coal was moving to other utilities companies located up and down the Atlantic Coast, and it became necessary to divert to these concerns 60,000 tons of coal moving to other wholesalers—an unending chain.

(2) The Fuel Administrator for Canada petitioned for 50,000 tons of coal. That quantity was seized while standing in the railroad yards of Buffalo, N. Y. After it had been shipped into Canada, it was found that it was all a high grade of gas coal moving to the gas plant at Buffalo. To satisfy the Buffalo Gas Plant, it was necessary to seize and divert 50,000 tons of other coal, but the coal actually seized was not fit for gas making.

(3) The Newberry Plant of the American Steel & Wire Co. at Cleveland, Ohio, petitioned for coal and got it, but it was found that after this coal was diverted it was taken away from the Wickwire Steel Co. of Buffalo, N. Y., the immediate competitor of the American Steel & Wire Co. of Cleveland.

(4) Within the last two weeks, coal that was moving to retail dealers in northern Ohio and Michigan, to satisfy household demands, was diverted to the McKinney Steel Co. at Cleveland.

(5) As showing the business difficulty confronting the petitioners, documentary evidence will be submitted to the court showing that the Chicago, Rock Island & Pacific R.R. received and used 3,630 cars of coal. Three months later it was still unable to find who produced or owned that coal, and hence who to pay for it. Also, the Illinois Central received and used 3,000 cars of coal under exactly similar conditions. These two railroads found it necessary to print and circulate among the members of the coal trade, lists of these cars asking coal men to come forward and prove ownership of the coal.

There was involved in these two instances alone at least 325,000 tons of coal, valued, at least at one million dollars. Yet, the railroad had burned the coal but did not know three months afterward who should be paid for it. The petitioners believe they are justified in asking the court to relieve them at once from the burden of such unintelligent and illegal interference with their business.

## Colorado Operators Mine at a Great Loss Under Present Conditions

**F**OLLOWING a short hearing for the consideration of the anthracite situation the Frelinghuysen Coal Investigating Committee will make its report to Congress. Senator Frelinghuysen states that he is going to do all within his power to submit the report at the earliest possible date.

E. H. Weitzel, manager of the Fuel Department of the Colorado Fuel and Iron Co., was the last witness to appear before the Frelinghuysen Committee. He submitted extensive data with regard to the situation in Colorado, but placed most of his emphasis on matters relating to the price of coal and to wages. He declared that the operators in Colorado can not sell coal at the present government price without very great loss. He also attempted to demonstrate that coal miners in Colorado are able to live up to American standards without the fourteen per cent increase.

Mr. Weitzel explained that the mines of his company are maintained on open-shop basis and that the industrial representation plan which has been adopted by the company and the employees is operating satisfactorily. To demonstrate that he presented a resolution adopted by the employees of the Colorado Fuel and Iron Co. just prior to the Central Competitive strike, in which they announce their intention to continue with the industrial representation plan and denounce the strike order as being unfair. It was stated that only seven men refused to sign the resolution, and that the employees themselves ejected these seven from their camps.

Mr. Weitzel explained that in addition to supplying Colorado, Nebraska, Kansas, Oklahoma, and Texas are dependent to a considerable extent upon Colorado coal. He called attention to the inability of his company to continue to supply coal at government prices when, with the present wage scale an average loss of 31.7c. per ton is being suffered. In that connection Mr. Weitzel said:

"Our cost of production in the coking and steam mines in 1919 was exactly the government price of \$2.70. The profits on domestic mines averaged 9.7c. per ton in 1919. With the increase of 14 per cent in labor costs and selling at the government price for lump, nut, and slack we will have a loss in 1920 of 16.8c. per ton on the domestic coal. Our total labor bill was \$5,944,491.45 for

1919. An increase of 14 per cent on that will show what the extra burden is. It means an additional charge on the consumer of at least 40c a ton."

To show that the mine workers in Colorado have a comfortable living wage Mr. Weitzel pointed to the large percentage of them who own automobiles.

## Mine Rating and Car-Distribution Rules To Be Continued

**U**NIFORM mine rating and car distribution rules established by the Railroad Administration are to be continued unless some carrier should do the unexpected thing and challenge the following suggestion which has been promulgated by the Interstate Commerce Commission.

The supply of cars available for the transportation of coal is insufficient to meet the demand. Unusual movements incident upon the strike of coal miners has brought about an abnormal location of cars. It is desirable that the proper relocation of cars shall be brought about as rapidly and with as little confusion as is possible. Critical situations still exist in which fuel for essential industries and purposes must be provided.

To the end that conflicting and contradictory rules on different roads and in different fields may be avoided in the unusual conditions which now exist in the industries and on the roads, the Commission recommends that until experiences and careful study demonstrate that other rules will be more effective and beneficial and especially during the remainder of the early spring the uniform rules as contained in the Railroad Administration's Car Service Circular CS-31 (Revised) be continued in effect.

## Fuel-Briquetting Industry Also Affected in 1919

Like the entire coal-mining industry, the manufacture of fuel briquets was adversely affected by the period of readjustment which followed the armistice. The total production of fuel briquets in 1919 was 296,000 net tons, a decrease of 182,000 tons, or 38 per cent, when compared with the preceding year. In fact, the output fell far below even that of 1917, reaching almost exactly the level of the pre-war year, 1916.

The value of the briquets produced in 1919 was \$2,301,000. In 1918 the value was \$3,213,000, and in 1917, \$2,234,000. Twelve plants operated during the year, five in the Eastern States, four in the Central States, and three on the Pacific Coast. The fuels used included 104,000 tons of anthracite culm and fine sizes, 112,000 tons of semianthracite and bituminous coal, and 80,000 tons of lignite and petroleum residues.

## Repeal of Lever Act Sought

Sentiment in Congress for the repeal of the fuel provisions of the Lever act has become sufficiently strong that it is probable that serious consideration will be given in the near future to legislation looking to the repeal of the fuel provisions.

Representative Tilson of Connecticut has taken the lead in the matter. He is a member of the Ways and Means Committee and is in a position to exert considerable influence on behalf of his proposal.

# FOREIGN MARKETS AND EXPORT NEWS

## Coal Concession Granted by China

More details of the concession from the Chinese Government granted to the Chinese Engineering and Mining Co. have been given at the recent stockholders' meeting. Chairman W. F. Turner said in a statement made in *The Sun and New York Herald* of Feb. 11:

"You may have seen in the newspapers a cablegram from China stating that a preliminary agreement has been entered into by the Kailan Mining Administration with the Shansi government for the working of mines in the province of Shansi. The agreement in question refers to the Tatung coal field. It is essentially of a preliminary character, and the effect of it is that, in the first instance, a careful investigation will be made of the character and resources of the field, and everything will depend upon the results of that investigation.

"The position of the field is good; it is situated to the west of Kalgan and close to Peking-Kalgan-Suiyuan Ry., which is approximately several hundred miles to the west of Peking. The coal is said to be of good quality and to exist in large quantities. It is too early to say more on this subject, but there would appear to be large possibilities involved. There are other matters under consideration which are not sufficiently advanced for discussion; I have dealt with those which are of most immediate interest.

"You will have realized that we have entered on a period of great expansion, and that the future of the business controlled by the Kailan Mining Administration is not only of interest to ourselves and our associates, but is becoming a considerable factor in the industrial development of China."

## Vast Coal and Iron Resources in New South Wales

New South Wales has large deposits of iron ore (53,000,000 tons awaiting treatment) in close proximity to vast beds of a superior coal, states the New South Wales Information Bureau of New York City. Both classes of deposits are being worked more extensively each year. In 1917 the coal mined amounted to 8,292,867 tons, of which 5,000,000 tons were used within the state—almost exclusively for industrial purposes, as the mild climate of Australia requires very little fuel to be employed for the heating of buildings.

The coal beds of New South Wales cover about 16,550 square miles—in three districts—Northern, Southern and Western. The main lines of railways pass through the districts where the deposits are most easily worked. Newcastle, famous throughout the world, is a port near Sydney, and at the heart of the Northern coal district, which furnishes sixty-five per cent of the coal that is mined in the state.

Two hundred and forty-four million tons of coal, valued at \$480,000,000, have been mined to date in New South Wales.

It is conservatively estimated that there are over 115,500,000,000 tons of coal still available to be mined in New South Wales. This represents an asset to the State of New South Wales of over \$175,000,000,000.

## Danzig Received Two-Fifths of Its Coal By Sea

Before the war Danzig received about two-fifths of its coal supply by sea and the remainder by rail, states *Commerce Reports*. During the war the sea supply was largely cut off, but there was an in-

crease in incoming rail shipments, as is shown by the following figures for incoming and outgoing shipments in 1913 and 1918:

Items	1913		1918	
	Metric Tons		Metric Tons	
Incoming by sea from				
United Kingdom	130,348			
America	510			
Dutch and Belgian ports	33,536			
German North Sea ports	22,790		52,238	
Rhine region	29,284			
Baltic ports	2			
Total by sea	216,470		52,238	
Incoming by rail (chiefly Silesian coal)	339,678		505,480	
Shipped out:				
By river	79,320		113,241	
By rail (chiefly to East and West Prussia)	81,344		48,241	

The foregoing figures do not include coke or briquets.

According to customs returns, incoming shipments of petroleum by the sea route amounted in 1913 to 45,068 metric tons, of which 23,263 tons came from the United States and 15,517 tons from Russia. No petroleum appears as received in 1918.

## Ruhr Daily Output Slightly Improved

During the 241 working days in December, states the *Colliery Guardian*, the Ruhr coal output amounted to 6,471,130 tons, as compared with 6,172,248 tons in the 231 days of the previous month, and 9,075,000 tons in December, 1913, the decrease in comparison with the latter being 28.7 per cent.

The output for the whole year was about 70 million tons, against 95.97 million tons in 1918, and 114.56 million tons in 1913, a decrease of over 44 million tons, or 48.6 per cent, although the number of miners

has increased by 50,000. The output per diem is, however, improving slightly, being 257,256 tons in October last, 265,473 tons in November, and 266,850 tons in December.

Distribution was fairly good in the existing state of affairs, and towards the end of the month the wagon shortage had practically disappeared, this, however, being partly due to the fact that many works extended the holidays in consequence of the short supply of coal in hand and thus required fewer wagons for the time being. The favorable state of the river previous to the recent overflow also facilitated coal traffic to South Germany.

The new year has opened badly for the local coal industry, and the combined effects of the floods and the railway strike will long be felt. Still worse will be the result of the six-hour day, which is to come into operation on Feb. 1, and is calculated to give the finishing touch to the economic existence of the nation.

## Boring Operations Begun in Brisbane

Boring operations for coal were recently begun on Crown lands between Torbanlea and Colton, in the Howard district, and so satisfactory was the result that a start has been made at sinking a shaft.

It is intended that the State of Queensland have its coal mines in three sections of the state, so that it may become independent of private enterprises.

## Would Cancel Norwegian Coal Bids

The shipowners organization of Christiania, Norway, has asked the Norwegian Government to make an effort to cancel the American coal contracts, which call for 35,000 tons monthly.

The cancellation is desired in order to ease the heavy demand upon tonnage.

## Tidewater Shipments, By Ports, 1918 and 1919

Through the courtesy of the Tidewater Coal Exchange the Geological Survey is able to publish the following summary of bituminous shipments to the principal North Atlantic ports in 1919. The striking features of the year were the increase in the tonnage of foreign export and bunker, and the decrease in the movement to New England. The total movement to tide-

declined from 42,908,522 net tons in 1918 to 37,061,817 tons in 1919. Two of the ports, Charleston and Philadelphia, increased their tonnages; at the other three a decline occurred. Hampton Roads remains the greatest coal port of the country, with New York second. Philadelphia passed Baltimore during the year, and is now third in rank.

TIDEWATER SHIPMENTS TO NORTH ATLANTIC PORTS, 1918 AND 1919(a)  
(Net Tons)

Harbor	Inside Capes and Bunker	New England	Foreign	Bunker	Other(b)	Total
New York:						
1918		3,946,368	28,222	2,573,443	10,542,700	17,090,736
1919		2,510,497	10,348	2,659,030	9,054,362	14,234,237
Philadelphia:						
1918	2,006,025	548,014	90,570	420,057	56,290	3,120,956
1919	2,069,043	492,405	1,140,077	677,498	31,882	4,410,905
Baltimore:						
1918	1,108,532	1,991,184	112,376	387,927	41,446	3,641,464
1919	775,552	129,311	1,771,562	610,335	180,510	3,467,270
Hampton Roads:						
1918	1,358,591	8,756,011	1,499,579	2,648,634	2,713,861	18,976,676
1919	584,912	5,233,612	5,183,712	2,837,007	789,889	14,629,132
Charleston:						
1918	2,584	6,552	10,003	32,938	26,613	78,690
1919	8,346	19,557	186,715	90,049	15,605	320,273
Total:						
1918	4,475,732	15,248,129	3,740,750	6,062,999	13,380,910	42,908,522
1919	3,437,853	8,385,382	8,292,414	6,873,919	10,072,248	37,061,817

(a) As reported by the Tidewater Coal Exchange.

(b) Consists, for New York, of water shipments to New York and New Jersey points located around New York Harbor, plus a small tonnage for Army and Navy; for other ports consists largely of coal for Army and Navy.

### Belgian Coal Production

Consul General Henry H. Morgan, Brussels, on Dec. 23, 1919, states that coal production in Belgium for October, 1919, increased in all mining districts compared with the month of September. It is to be noted that October included one more day of work than the month of September. For the whole region the increase was 11.8 per cent of the production for September; for the Mons fields it was 11.7 per cent; for the Centre, 13.7 per cent; Charleroi, 12.3 per cent; Namur, 5.9 per cent; Liege, 9.4 per cent; and Campine, 46.5 per cent. In the latter field there was a strike in September. The production in the Campine

was 13,540 tons in August and in September 11,870 tons. The total number of surface and pit miners was 148,842 in October, compared with 144,922 in September, an increase of 3,920, or 3.4 per cent. Stock during October decreased 167,145 tons. The following table gives the October, 1919, net production of coal (including that consumed in the pits), the stocks at the end of the month, as well as the average number of employees, surface and pit, for each of the coal districts, and for all the coal mines of the country. Production for the kingdom was 1,881,710 tons.

Coal Basins and Fields	Production Net Tons	Stocks at End of October Tons	Average Number of Miners Employed On		
			At Pit	Surface	Total
Hainaut: Fields—					
Mons	421,610	104,570	25,066	10,257	35,323
Centre	318,155	50,481	17,650	7,282	24,932
Charleroi	640,695	414,704	31,384	16,339	47,723
Namur	50,200	37,100	2,743	1,272	4,015
Liege	436,720	58,300	25,553	10,637	36,130
Limbourg	17,360	1,380	1,004	655	1,669
Kingdom	1,884,740	666,535	103,400	46,442	149,842

The following table gives the coal production for the normal year 1913, compared with the 1919 production:

Coal Basins and Fields	Average Monthly Production in 1913 Tons	Production in October, 1919 Net Tons	Production in October, 1919, Compared with the 1913 Monthly Average Per Cent	
			Net Tons	Per Cent
Hainaut: Fields—				
Mons	364,200	421,610	115.0	
Centre	303,830	318,155	104.0	
Charleroi	679,000	640,695	94.3	
Namur	65,420	50,200	76.7	
Liege	498,260	436,720	89.6	
Limbourg	17,360	17,360	100.0	
Kingdom	1,910,710	1,884,740	98.6	

### Lianelly Coal Market Maintains Its Firm Tone

A recent issue of the *Colliery Guardian* states that the local market maintains its firm tone, and collieries are very busy coping with the heavy demand. Pits are working good time on the whole, although in some cases idle days are reported through shortage of wagons. Shipping is very busy, and a good number of vessels are waiting loading turns.

Inland deliveries are also being well maintained, but the demand is heavy. All anthracite coals are well placed, with more orders offering than collieries can accept. Large kinds are very difficult to secure, and the machine-made grades very scarce. Cull and duff are strong, with a good demand ruling.

Steam coals are also very firm, and outputs well stemmed ahead. Large and through are scarce, and smalls well enquired for, particularly the better grades.

### Swansea Coal Trade Unsatisfactory

The trade of the port during the past week was by no means good, only 42,176 tons of coal and patent fuel being exported, states the *Colliery Guardian*. A good attendance assembled on Change today, and all classes of coal were in very pressing demand, but, as has been the case for the past few weeks, little business seemed to be possible, owing to the already heavy bookings.

The market, generally speaking, is very firm and difficult, owing to the continued falling out of position of tonnage through bad weather, and at the same time there is a heavy list of boats in the port, caused by congestion on the railways, and in consequence very slow at the tips.

### No Marked Change in Nottingham

There is no marked change in the condition of the trade in this county, states the *Colliery Guardian*. Despite the fact that the output shows some improvement, the general demand is active. There is every indication that the shortage in the house-coal section so far as local merchants' supplies are concerned, will be abated to some extent shortly, and already supplies are coming to hand rather more freely.

The position in this respect was becoming acute, many householders, being without fuel, having to get permits to obtain small allowances from the fuel overseer. Steams continue in active demand, and collieries readily dispose of all available supplies.

### Foreign Freight Rates

From W. W. Battle & Co's coal trade freight report of Feb. 19, 1920, the Shipping Board's rates by steam are as follows:

	Rate	Tons Displaced
Genoa/Leghorn	\$26 50	1,000
Spezia/Savona	26 50	1,000
Piraeus	28 50	1,000
Trieste/Venice	31 00	800
Algiers	26 00	800
Cadiz Bilbao	23 50	1,000
Barcelona	26 00	1,000
Antwerp, Rotterdam	22 50	1,000
Lisbon	22 50	1,000
Gothenburg	24 00	1,000
Marseilles	26 00	1,000
Stockholm	26 00	800
Hamburg	25 00	1,000
Rouen	23 00	1,000
Malmö	25 00	800
Pernambuco	16 00	500
Bahia	16 00	500
Rio	17 00	1,000
Santos	18 50	600
Rio Grande do Sul	19 50	500
Buenos Aires or La Plata or Montevideo	16 00	1,000
Rosario	17 50	750
Bahia Blanca	17 50	1,000
To Nitrate Range	12 00	1,000
Havana	7 50	600
Sagua or Cardenas	9 00	300
Cienfuegos	9 00	500
Caibarien	9 50	300
Guantanamo	9 50	300
Guantanamo	9 00	400
Manzanillo	9 50	300
Bermuda	9 00	300
Bermuda port and dis. free		
Kingston	9 50	400
St. Lucia	11 00	500
Barbados	11 00	500
Santiago	8 50	500
	9 00	400
Port of Spain, Trin	11 00	500
Curacao	10 50	500
Free p.c. Curacao		
Demerara	13 00	400
St. Thomas	10 00	500

All above rates gross from charter

### Coal and Coke Exports During December, 1919

Coal and coke exports for December, 1919, as reported by the Department of Commerce by countries and customs districts are as follows:

Countries	Coal		Coke 174 Tons
	Anthracite 172 Tons	Bituminous 173 Tons	
Austria-Hungary	5		
Denmark		30	
France	30	2,910	
Germany	20	3	
Italy	318	11,040	500
Portugal	25		
Canada	338,828	208,691	26,695
Guatemala		5	
Honduras	801	500	4
Panama		16,310	
Mexico	418	8,409	15,826
Newfoundland and Labrador	315	5,511	
Trinidad and Tobago		7,310	
Cuba	3,168	57,478	1,259
Danish West Indies		5,110	2
Dutch West Indies		7,015	
Dominican Republic	1,424	110	
Argentina			1
Brazil		4,510	20
Chile	50	4,226	
Colombia		150	
Peru			11
Egypt		1,500	
Total	345,462	341,064	43,320

Customs Districts	Coal		Coke 174 Tons
	Anthracite 172 Tons	Bituminous 173 Tons	
Maine and New Hampshire	258	39	304
Vermont	1,841	330	
Massachusetts	410	4	
St. Lawrence	100,694	43,595	3,175
Rochester	6,003	15,933	1,000
Buffalo	223,926	58,722	15,016
New York	4,871	3,501	524
Philadelphia	2,041	2,273	
Maryland		2,231	
Virginia		92,676	
South Carolina	1,458	21,318	
Florida		810	
Mobile			1,259
New Orleans	838	505	54
Sabine			37
San Antonio	215	403	
El Paso	187	1,705	4,124
Arizona		6,349	10,623
Southern California	3	1	
San Francisco			2
Washington	1	71	
Alaska		1	
Dakota	381	2,637	251
Duluth and Superior	2,225	7,005	69
Michigan	50	47,765	6,799
Ohio		32,593	301
Porto Rico		110	2
Total	345,462	341,064	43,320

### BUNKER COAL

Customs Districts	Tons
Maryland	28,338
New York	220,178
Philadelphia	32,967
Virginia	90,175

### Chesterfield Coal Pits Working Steadily

All the pits of the district are working steadily and the output of coal shows an upward tendency which, states the *Colliery Guardian*, is encouraging as far as it goes. The increase is, however, very slight, and has no appreciable effect upon the quantity available for distribution. The demand continues strong, but supplies continue far below the requirements of the country. The pressure for coal for household purposes is great and orders for this class of fuel are considerably in arrears.

The scarcity of railway wagons is serious and is interfering very much with colliery operations. There is an active demand for coal for manufacturing purposes, which is difficult to meet, particularly in respect of cobbles and nuts for gas producers. Slack for steam raising is also in great request. The pressure for gas coal and locomotive fuel is very great.

Much attention is being given to the export trade. As soon as the car distribution is in a better condition, operators in this district will find a good market for their entire output.

# COAL AND COKE NEWS

## What Happened in February

[The bracketed figures in the text refer to the number and page of the volume in which references to the matter noted may be found and should the reader desire further information he can obtain it in the place indicated.]

- Feb. 2—Attorney Crews, of New York, submits data to the President's Coal Commission on behalf of the coal operators.
- Feb. 3—Representatives of the miners and operators sum up the points in controversy in the investigation by the President's Coal Commission [XVII, 318].
- Feb. 4—New River Operators' Association decides to restore the "check-off" system, at a meeting at Charleston, W. Va. When this decision is reached, representatives of miners of district 29 of United Mine Workers of America are called in and a joint meeting is held. An agreement is adopted which ends New River strike [XVII, 358].
- Feb. 6—Governor John J. Cornwell, of West Virginia, delivers an address at Bluefield, W. Va., on the subject of past and possible future coal strikes. In connection with an attempt to unionize West Virginia, he said his duty was to see that peace was preserved and the rights of the public respected.
- Feb. 6—The International Executive Board of the United Mine Workers of America accepts the resignation of Frank J. Hayes, as president of the union. Acting president John L. Lewis is put in his place [XVII, 316].
- Feb. 9—The President's Coal Commission enquires into conditions in the bituminous mountain districts of Colorado, Wyoming, Montana and Washington [XVII, 359].
- Feb. 10—President's Coal Commission names committee of five to consider question of price to charge for coal, as follows: John P. Cameron, central Pennsylvania operator, chairman; C. E. Leshner, director statistics, National Coal Association; Percy Tetlow, statistician United Mine Workers; P. M. Reynolds and Paul White.
- Feb. 11—James D. Simpson, general superintendent of Berwind-White Coal Co., dies at his residence in Windber, Pa. [XVII, 423].
- Feb. 14—R. M. Lambie succeeds W. J. Heatherman as Chief of the Department of Mines of West Virginia [XVII, 459].
- Feb. 17—Van H. Manning addresses American Institute of Mining and Metallurgical Engineers, on subject of "Problems of the Coal Industry," at New York meeting [XVII, 396, 397, 398].—George Otis Smith delivers address, prepared by him in collaboration with F. W. Tyrone, on subject of "Fluctuations in Coal Production—Their Extent and Causes." Delivered before American Institute of Mining and Metallurgical Engineers at the New York meeting. Discussion follows. [XVII, 399 to 407 inclusive].—A meeting is held at New York, at which is formed the Tidewater Transshippers' Association. It will replace the Tidewater Coal Exchange. A tentative set of principles is presented and adopted [XVII, 451, 452].—Representatives of Public Utility Associations appear before the President's Coal Commission [XVII, 463].—The President's Coal Commission begins hearings of the public's side of the coal situation being investigated [XVII, 358].
- Feb. 17 and 18—The American Institute of Mining and Metallurgical Engineers holds session at the Engineering Societies Building, New York City. H. C. Hoover is elected president of the Institute [XVII, 408 to 411 inclusive].
- Feb. 18—American Institute of Mining and Metallurgical Engineers, the New York meeting; Edwin Ludlow reads a paper on "To Conserve Coal for Future Generations." Discussion follows [XVII, 442, 443, 444].—Eugene McAuliffe reads a paper on, "Stabilizing the Market."—Prof. H. H. Stoek reads paper on, "Coal Storage." Discussion follows.
- Feb. 21—Pocahontas Operators' Association holds its annual meeting at Bluefield, W. Va. Officers are elected [XVII, 469].
- Feb. 25—President Wilson signs coal and oil-land leasing bill, which throws open 6,700,000 acres of oil lands and 30,000,000 acres of coal lands with 39,000,000 acres of coal lands still to be classified [XVII, 462].
- Feb. 26—Director General of Railroads submits report to U. S. Senate, in response to recent resolution by Senator Prelinghuysen, as to authority of the Administration over the distribution and export of coal [XVII, 460, 461].
- Feb. 28—Operators urge the President's Coal Commission to recommend to Congress enactment of legislation making labor contracts legal [XVII, 465].—President Wilson provides for continuation of power of Fuel Administration as follows: Director General Hines of the Railroad Administration retains jurisdiction over domestic distribution. A commission will handle bunker and export coal matters. Commission includes: A. W. Howe, Rembrandt Peale, F. M. Whitaker and J. F. Fisher; commission will function through the Tidewater Coal Exchange, which is restored for that purpose. The order is effective until April 30, 1920. Mr. Hines' authority is extended beyond the date of the return of the railroads—Cummins-Esch railroad bill becomes law on the signing of the act by President Wilson.

## Scranton, Pa.

Persistent effort being made to solve the mine-cave problem. Brief sketch of action taken during the last six months. One committee conferring with the operators. Another to bring about legislative action if necessary. Scranton citizens aroused. Results attained. Authority on constitutional law drafts bill to regulate future mining. Authority of Mayor to deal with mine-cave questions is outlined.

The mine-cave question has been an active one for years in this section, and while the agreement entered into between the corporations mining coal here and a body representing the citizens of Scranton met some of the requirements of an adjustment of the matter, it was not considered to be an entirely satisfactory solution of the mine-cave problem. Within a year after the signing of this agreement, the situation reached an acute stage when the Warburton boy was killed in a mine cave at Scranton last August. This matter was commented upon in the Aug. 21, 1919, issue of *Coal Age* in the "News" department. Action was demanded of local and state authorities. A grand jury returned an indictment to court charging involuntary manslaughter against certain coal-company officials. It is said that this is the first time that criminal action, commenced as the result of a death caused by alleged reckless mining, has resulted in an indictment.

A brief review of further action taken by Scranton citizens will give a clearer idea of the latest developments in the mine-cave controversy, from which tangible results are confidently expected. Following the demand for action, civic associations took up the matter with more deliberation, and at a meeting of representative men of this section in the Board of Trade rooms, an organization was formed uniting all civic bodies in a fight for elimination of the mine-cave menace. It was recognized that the agreement in effect between the Board of Trade and the coal companies did not solve the mine-cave problem entirely; while it

was a step in the right direction, it must be broadened; failing in this, remedial legislation must be sought.

Committees were appointed at the Board of Trade conference of representatives of the various interests of the city and section. These committees are a part of the permanent organization effected to move in the mine-cave matter. A plea was made for united action and unanimity of purpose. An earnest effort was made to decide just what was wanted by the people, and to work out the details of a plan which would bring a practical solution. Among the committees formed was first a citizens' general committee; this body appointed two other committees as follows: A conference committee to carry on negotiations with the operators; and another committee to prepare bills for presentation at Harrisburg, should the expected conference with the operators prove fruitless.

In furtherance of better relations, last October an agreement was made with the officials of Scranton by the Delaware, Lackawanna & Western company in regard to damage done to property through mining operations. It provided for three men, appointed by the city and paid by the mining company, to act as guards in areas where disturbances are expected. Tenants of houses, which may be damaged by cave-ins, are to be notified of their danger, moved at the company's expense, their rent paid and their houses rebuilt for them in case they are destroyed as a result of mining operations.

In the last few months the conference committee appointed by the citizens' general committee, met the heads of the big anthracite mining corporations in New York City, at which time the whole situation was gone over thoroughly. As a result of these conferences, plans were formulated and the conference committee has held meetings with the local operating heads of the various mining corporations. Furthermore, a series of meetings have been held by the conference committee with members of the Scranton mine-cave commission, the purpose being to pick possible flaws in the present mine-cave agreement and to suggest to the operators signatory to it changes which would make it more satisfactory. These meetings tended to the development of a better understanding of the agreement in force; in addition several changes were unanimously agreed upon. The agreement should be enlarged, it is thought, to include any and all properties in its provisions; that the Delaware & Hudson Company be made a party to it, and that mining shall cease at once beneath the cemeteries.

Among the latest acts on the part of the citizens of Scranton in the mine-cave matter was the service rendered the community by the Scranton Surface Protective Association, in bringing William Draper Lewis to the city. He was formerly dean of the law school of the University of Pennsylvania and an authority on constitutional law. Mr. Lewis participated in a conference with the Mayor and the Mayor's cabinet. The Mayor's powers were outlined by Mr. Lewis in connection with his authority to act in meeting mine-cave questions. Mr. Lewis will also work on a local ordinance to regulate future mining, in the shape of a bill that will stand a constitutional test.

Interest also centers here on a quite recent request of the Mayor of Scranton, for an appropriation by the city council of \$10,000, to be used in the employment of mining engineers, to make an examination of the mine workings underneath the city. This examination is to determine definitely just what mining is being done that is dangerous to the people of Scranton.

## Pittston, Pa.

Pennsylvania Coal Co. plans to improve its Ewea and No. 11 collieries in South Pittston district. Cost \$1,000,000. To sink new shaft. No. 7 shaft improved. To build modern steel and concrete breaker at No. 14 colliery.

The Pennsylvania Coal Co. is said to have completed plans for improvements at two of its collieries in the South Pittston district, that will cost \$1,000,000. This development work when completed will expedite the handling of coal between the mine and the breaker, and will extend the life of the collieries.

The plans adopted for the Ewen colliery, in South Pittston, where a modern breaker was constructed last year, call for the sinking of a new shaft for the development of all the seams of the territory tributary to this colliery. The proposed shaft will be so located as to permit of the handling of mine cars by gravity to the breaker, and also avoiding long and expensive outside haulage. On completion of the new opening, the old Hoyt shaft will be discontinued as regards the hoisting of coal, but will be maintained for hoisting men and handling material and supplies.

Old No. 4 shaft will also be abandoned as an opening through which coal is hoisted, and the coal will be hauled underground to No. 7 shaft, which has only recently been sunk to a lower level and provided with modern hoisting equipment. When the contemplated improvements are completed, all coal from the various workings of the Ewen colliery will be hoisted through the two modern shafts. It is expected that the improvements will expedite the handling of coal and reduce haulage expense.

At the No. 14 colliery of the Pennsylvania Coal Co., at Port Blanchard, which is also in the South Pittston district, a new steel and concrete breaker will be erected at a cost of \$750,000. This modern structure will replace the old wooden breaker which has been in use for 15 years. However, the machinery in the old plant is modern and will be used in the new breaker, which will prepare the coal from the six mine openings adjacent to this colliery. The construction of an electric power house to furnish current for the operation of the Ewen and the No. 14 collieries is said to be under consideration.

## Charleston, W. Va.

Car supply 40 per cent of requirements, however conditions bad. Influenza also lowers production. High-volatile coal still being confiscated. Kanawha production half of normal, due largely to car shortage. However, influenza also influences output. New River works three or four days out of six. Heavy tidewater tonnage goes to New England.

During the week ended Feb. 28, the mines in this area produced not more than half their potential output, although at the outset of the week there was a somewhat larger supply of cars than usual. Averaging the week as a whole, aside from the Monday supply, the service reached only about 40 per cent of requirements. The car shortage was of course the chief factor in holding back production, as it had been throughout the month.

Weather conditions were anything but ideal for satisfactory mining operations, inclement weather tending to reduce the number of men reporting for work outside the mines. The same factor was also potent in holding back the movement of trains and even the distribution of empties, especially in view of the fact that motive power was deficient.

Another element contributing toward a lowered production was the influenza, which toward the latter part of the month was just beginning to reach mining centers in this section. While the percentage of deaths was small, nevertheless the malady had reduced working forces at many mines, the principal effect of which was felt of course when enough cars were furnished to make work possible.

Much high-volatile coal produced in this part of the state was still being subjected to confiscation, though probably not to as great an extent as during previous weeks, yet a large tonnage was being secured by the Chesapeake & Ohio, Baltimore & Ohio, Michigan Central, the Pennsylvania and other roads. Tidewater shipments were much lighter in volume than would have been the case had not the permit system still been in effect. The belief existed in some quarters that all roads were holding on to their own cars as much as possible, during the last few days before the roads went back to private ownership, owing to the higher per diem rates which would prevail after March first.

With the coal output of the Kanawha region still subject to confiscation, and with production not more than half of normal during the week ending the twenty-eighth, it was impossible for producers to keep up with the strong demand from all quarters.

Not only were the railroads securing a large tonnage of coal on contract, but confiscation was frequent and consequently a large proportion of the output was going to the railroads. A shortage of cars of course played the most important part in limiting the supply available. The average output of mines during the last week of the month was about 50 per cent. The weather was far from being satisfactory not only as it affected mining operations but also in its effect on the operation of trains, the coal movement in consequence being extremely slow. The influenza still has a tenacious hold in a number of mining communities and is preventing mines from producing as much coal as would otherwise be the case.

### Conditions Against New River

The car supply for the New River field during the last week of February hovered around 40 per cent just as it had during the earlier part of the month and production was, therefore, less than half of the potential capacity of the district as a whole; the car shortage figured as the chief factor in restricting production and in holding mines down to about three or four full working days during the final week of the month. Even the weather conspired with the car shortage to put a damper on production, a heavy snow falling throughout nearly the entire week. Also influenza was reducing the complement of miners at various operations to a greater extent than had been the case during previous weeks. While tidewater shipments were rather heavy, not much of such tonnage was being exported. It was being sent for the most part to New England and was also used in the coastwise trade.

## Bluefield, W. Va.

Most serious car shortage for more than a year past. Small operators may have to suspend entirely. Causes large labor movement. Adverse weather conditions and insufficient motive power hamper transportation. Winding Gulf operates two or three days out of six. Pocahontas output lowest of recent months. Car famine in Tug River region.

At no time during the last 14 months has there been such a serious shortage of cars as was the case during the last week of February. The supply was slim enough during the week ended Feb. 21, throughout the regions in the southern part of the state. It was infinitely worse during the last week of the month. On the Norfolk & Western R.R., the car supply was not equal to more than 40 per cent of requirements; whether because of the fact that the road was holding cars, or because the road could not secure cars from connections, it is not known. Be that as it may the transportation problem was critical.

This shortage had quite a grave effect on small operations and it is stated that unless there is immediate relief, which is not regarded as being in sight, many small companies will be forced to suspend operations entirely. Larger companies also are suffering serious losses; even when cars were furnished, the larger companies were hardly justified in attempting to operate, because of the exceedingly small number of cars furnished.

### Car Shortage Brings Labor Troubles

The continued car shortage has been responsible for a large labor movement from one mine to another, especially noticeable during the last week of the month. Miners have deserted the smaller operations for the larger ones in the hope of securing more regular work. Because of this shifting about from mine to mine some of the smaller operations have almost been deserted. The continued shortage of cars is demoralizing the mining industry almost completely in the southern part of the state. Few mines here worked more than two full days during the week, or three days at the most.

Weather conditions were so unfavorable that railroad operations were carried on under difficulty. Furthermore with motive power not up to the requirements, neither the distribution of empties nor the movement of loads was very satisfactory.

There was a slight improvement in the car situation in the Winding Gulf district during the last week of February, some mines securing as much as a 60 per cent supply of cars, thus being able to work about four days out of the six. During the preceding week mines were being operated about two or three days out of the six.

While there is still much sickness among the miners in this field, yet it is not now

seriously affecting the output, the largest part of which is being consigned to tidewater, although little of it is being shipped to foreign markets. The demand however, for Winding Gulf coal at the present time is unlimited.

Production sank to a lower level in the Pocahontas region, during the last week of February, than at any time in recent months, the car supply not amounting to more than 40 per cent of requirements. In fact the shortage of cars threatened to be of quite grave consequence to operations, especially to the smaller companies. If this shortage is long continued, it will force the smaller producing companies to suspend operations entirely.

During the last week of the month, operations both large and small were unable to work more than two days out of the week. The supply was so meagre that companies hardly felt warranted in resuming operations just to load the few cars furnished. It was most apparent on the line of the Norfolk & Western, that railroads in the West were holding on to just as many cars as possible. No improvements from a car-supply standpoint was in sight at the outset of March. Confiscation of coal on a wholesale scale was still being continued as February drew to a close, and furthermore it was believed it was being increased.

### Car Famine on Norfolk & Western

Coal loading in the Tug River field, for the week ended Feb. 28, totalled 61,150 net tons; production, therefore, being slightly better than during the previous week but way below that of other weeks of February. Indeed, a number of the Tug River operators had less than one day's full run during the last week of the month, and at the beginning of March the outlook was extremely discouraging.

Thus on March 2 at Williamson where empties are assembled for distribution to the Tug River and Thacker fields, there were only 75 cars of all classes on hand (including coke cars) whereas the normal number for distribution per day is from 1,200 to 1,600 cars. The situation has become critical, the car shortage is approaching an actual famine.

Shipments for export are still rigidly curtailed to provide for domestic consumption; shipments under license for export were (at the end of February) being heavily confiscated. Though shipped under license for export, the export price could not apply because of the fact that confiscation occurred while the coal was under transit or even in the pools. Small shippers found it almost impossible to get a cargo assembled under such conditions.

## Huntington, W. Va.

Losses outweigh output in Guyan fields. Production far below that of strike period. Near return of railroads to owners influences official announcement of new regulations.

With almost 490 more cars available during the wind-up week of February, than was the case during the previous week, mines of Guyan field were able to increase production to the extent of about 25,000 tons, the output running to about 186,000 tons. That was far below the level maintained during the strike period, however, and consequently losses were still outweighing production, exceeding 200,000 tons or something over 50 per cent of the potential capacity of the mines. Despite the gain in production, the car shortage is still seriously retarding production in the Logan field, and operators in that field look for little relief in the near future.

Confiscation of Logan coal seemed to be somewhat less general than it had been in previous weeks, owing perhaps to the fact that the Government control over the mines and railroads was not quite so complete on the eve of the return of the railroads to individual ownership.

### New Railroad Regulations

New regulations promulgated just before the end of the month, had not been felt to any material extent in the field, although it was believed the continuance of Government control over prices would cause some resentment among operators. Cancellation of all export licenses, with the requirement that such licenses must be renewed, proved to be highly disconcerting and caused a good deal of confusion at the end of the month among operators who had coal ready for export.

Coal movement over the Chesapeake & Ohio system as a whole, during the final

week of January, was larger by 35,200 tons than it had been during the week ended Feb. 28. During the last week of January, 10,215 cars of coal, equivalent to 510,750 tons, had been handled; but during the last week of February a total of 10,919 cars or 545,950 tons were handled, the increase in the number of loads moved being 704.

### Fairmont, W. Va.

Improvement but output still far below normal. About 400 to 600 cars available, 1,600 needed. Influenza spreads and curtails production. Coal goes West. Railroads absorb one-third of output of northern West Virginia fields.

The final week of February showed improvement over the previous week, from the standpoint of car supply, but there was still much to be desired by the mines in northern West Virginia. Production was still running far below normal. At no time during the final week of the month, however, were there as many mines idle as had been the case during the previous week.

There was a supply of about 1,100 cars on the Monongah division of the Baltimore & Ohio on Monday. During the remainder of the week the supply averaged from 400 to 600 cars. On other roads, however, even on Monday, the supply was below 50 per cent. Idleness at the mines reached its maximum on Tuesday in the Fairmont region when 135 mines were forced to suspend work because of absence of cars. From that time until Friday there were never less than 100 mines out of commission in the Fairmont field alone. It had been hoped to secure more cars on the Monongahela R.R. during the week by unloading slag, but few operators appeared to be anxious to enter into any such arrangement, two companies only co-operating.

Operations were curtailed in the last week of February to a larger extent than during recent weeks through the spread of the influenza. It had not assumed the proportions of an epidemic, but the malady had made its appearance during the week at a larger number of mines than during the earlier weeks of the month and had put many miners out of commission.

Considering the limited output, there was a fairly large movement of northern West Virginia coal to western points, particularly to Ohio and Michigan markets. On the other hand the tonnage destined for tide-water was rather light in volume. Virtually a third of the production of some of the northern West Virginia fields, however, was being absorbed by the railroads, particularly by the Baltimore & Ohio R.R. Northern West Virginia coal was being exported but in extremely limited quantities. By the time the railroads had secured enough coal to meet their requirements, there was a comparatively limited supply left for distribution to other consumers.

### Birmingham, Ala.

Interesting test case in coal and iron ore tonnage tax matter. Suit against Republic Iron & Steel Co. Coal and iron ore not property until mined. Should not tax property twice. Tax arbitrarily discriminates between commercial and wagon mines.

Following a suit brought against the Republic Iron & Steel Co., by the state of Alabama last fall as a test case, pending the determination of which all tax payments were made under the coal and iron ore tonnage tax enacted by the legislature last summer, a brief has been filed in the supreme court which sets out a number of grounds for reversal, based solely on questions of law. The facts were agreed upon in the trial court and the only question to be decided is the constitutionality of the tax.

In the argument filed by attorneys for the Republic company they contend that: Until they are mined, coal and iron ore are property only in a theoretical sense. Being in the state of nature until they are mined, they do not become property until they are made a thing through mining, whether they be mined now or a thousand years hence. The tax, being not only measured by but predicated on the net of converting minerals as they lay in the ground into usable property, is inevitably on property. The tax is on nothing by the act of conversion, making personality realty.

"The right to own things without the right to use them is a conception unknown to and therefore without name in law. The word property includes not only the thing but the right to use and enjoy the thing.

"Coal and ore in place, whether owned

separately from the fee or as part of it have been the subject of property taxes in this state since 1887 or earlier. To tax minerals through the years as they lay in the ground and then tax the act of taking them out, is to tax them twice."

"Furthermore, a discriminatory excise tax is offensive both to the state and federal constitutions. Thus, in levying the tax on those who mine coal and load it into railroad cars and not on those who mine coal and load it into wagons, is arbitrary and destroys the tax under schedule 66.

The attorneys also claim that, "the mining of its own coal and ore by the defendant, for use in its business of making and selling pig iron, is not an occupation or business. Not more so than is the defendant's transportation of these raw materials to the furnace, nor more so than any of its furnace operations."

### Ashland, Ky.

Northeast Kentucky production little over half of capacity, due to car shortage. Chesapeake & Ohio mines lose tonnage; Louisville & Nashville mines gain. Return of railroads to owners and also return of equipment to proper lines, disturbs car supply. "Moonlight-schools" bill interests operators.

Mines in the northeast Kentucky field succeeded in making a net gain of 8,300 tons in production during the last week of February, the output reaching 135,990 tons or about 55 per cent of full potential capacity (249,000 tons), the total production loss being 113,405 tons. The car shortage represented 107,925 tons or 43 per cent of capacity. Mine disability and labor-shortage losses amounted to only 2 per cent. Mines on the Chesapeake & Ohio and branch lines produced a smaller tonnage of coal than during the week ended the twenty-first, the decrease being 4,000 tons; while on the other hand, the mines on the Louisville & Nashville worked during a much higher percentage of time, gaining 12,000 tons as compared with the previous week. During the corresponding period of 1919, the production was 99,133 tons or about a 50 per cent production losses at that time represented by "no market."

Operators in the northeast Kentucky field viewed with considerable apprehension, the return of the railroads to their owners. While it was true that the car pool was to be continued in a modified form, yet it was also true that the Chesapeake & Ohio was benefited by the use of foreign equipment under the pooling arrangement. Advice has been received that certain railroads, which own a relatively greater percentage of equipment than that which is furnished through the pool, are taking aggressive action toward the point of having the pool abolished, or at least to permit them to receive from the pool their proportion of the cars contributed to the pool.

It is also anticipated that in the return of the equipment to their owners, the Chesapeake & Ohio railroad finds itself at a distinct disadvantage, due to the great dislocation of shipments during the strike, when so much of its equipment was diverted far afield and has not yet been returned. On the other hand a great percentage of foreign equipment, that the Chesapeake & Ohio is now using, is claimed by railroads which connect directly with this system, over which a large proportion of the coal shipments are directed, so that these connecting lines will have an excellent opportunity to hold their individual equipment as soon as it is moved to their new lines.

The ultimate result will probably show a net loss to the Chesapeake & Ohio in available equipment and a corresponding loss in car supply to its mines. The only possible means of relief lies in the ability of the Chesapeake & Ohio, either to improve its transportation conditions, or to purchase the necessary additional equipment, the need of which the coal operators have brought to the attention of the railroad officials.

The car supply on the Chesapeake & Ohio during the last week of February, was such as to enable certain mines to demonstrate, by consecutive days' operations, their merits for proper increases in mine ratings; in certain instances some mines were able to show an ability to load, in three consecutive days, a 25 per cent greater supply than their rating provided.

During the months of January and February, there was a total production of about 1,000,000 tons and a total loss of about 1,000,000 tons. Of the coal loss the car

shortage was responsible for about 95 per cent or 950,000 tons.

Operators of the northeast Kentucky field are quite interested in the bill, recently presented at Frankfort, proposing to appropriate \$75,000 a year for the next two years for the continuance of the "moonlight schools," which have been conducted throughout the mountain sections of the state during the last few years. The coal industry of Kentucky, almost to a man, supports the bill.

### PENNSYLVANIA

#### Bituminous

Elmersburg—One of the largest coal deals closed in Clarion County for some time was consummated this week, when Colonel Lloyd C. McCrum, Robert E. Beerits, John H. Beerits and Harry Sicht of Somerset, Pa., acquired the property of the Cherry Run Mining Co. located at Huey, on the Sligo branch of the Pennsylvania R.R., about three miles from here. The property consists of about 500 acres of coal land besides the mine and equipment. The Lower Kittanning seam is being worked and the annual production is 100,000 tons.

Brookville—Mines and coal-land holdings, the property of the Corbett Coal Co. in Porter Township, Jefferson County, have been sold to the Mill Supply Co., a subsidiary company of the New York World and the Joseph Pulitzer estate, the consideration being close to \$1,000,000. The present output of the mines is about 1,000 tons per day and the acreage is, roughly, 1,000. The coal will be used for power at the mills manufacturing paper for use in the plant of the New York World.

### WEST VIRGINIA

Welch—L. C. Long, mine inspector, H. R. Sloan, mine foreman, and J. H. Blankenship, bratticeman, employees of the United States Coal & Coke Co., were suffocated in the No. 2 mine of this company at Gary, near here, according to information received by R. M. Lambie, chief of the State Department of Mines. The mine was closed on account of shortage of cars, but these men, to perform their usual duties, entered an old drainage heading not in use since 1918. There they encountered a small body of gas which caused an explosion. The men were overcome and died before assistance reached them. The explosion was slight, and no damage was done to the mine.

Elkins—The Inter-Mountain Superintendents' Mine Foremen's and Fire Bosses' Mining Institute has been organized here by officials connected with the mines in Barbour and Randolph counties, with a view to closer co-operation between mine officials and the State Department of Mines. The roster of officials of the Institute include: C. A. Hakeslee, of the Davis Coal & Coke Co., at Dartmoor, president; John T. Fallon, superintendent of the West Virginia Coal & Coke Co., secretary and treasurer; vice presidents—Thomas Davis, Mable, Andie Huatt, Norton, Va.; N. A. Ford, Coalton, James Wilt, of Mable, J. W. Bischoff, general superintendent of the Davis Coal & Coke Co., was the host to the visiting mine officials after the organization meeting.

Glen White—General discussion of mining problems, such as the cutting and shooting of coal, welfare conditions and numerous other phases of mining, featured the regular monthly meeting of the Glen White Mining Institute held recently at this place. Virtually all the officers and most of the employees of the E. E. White Co. attended the meeting of the institute held in the large auditorium in this community. One activity suggested by a miner of Italian birth was the teaching of English to foreigners. E. E. White, president of the E. E. White Co., was one of the speakers at the institute; Mr. White urged employees to take advantage of the numerous educational facilities provided by the institute as a means of fitting themselves for better positions.

Fayetteville—Another mining institute has been formed in Fayette County, to be known as Auxiliary No. 1 of the Fayette County Mining Institute, the auxiliary having been launched at a meeting of mine superintendents, mine foremen and fire bosses to the number of about 60. Officers elected at the first meeting of the auxiliary institute were: John McElhiney, of Summerslee, president; Thomas Donagan, first vice president; William Ward, Harvey, second vice president; John Robinson, Minden, third vice president; Jno. S. Mason, Dunlop secretary and treasurer; C. C. Wood, Kilsyth, and Frederick Chaoman, Sun,

members of the executive board. At the initial meeting the following papers were read: A paper on "Mine Management as Based on Three Essentials," by R. M. Lumble, Chief of the Department of Mines, and a paper by District Inspector Nicholson, on "The Recovery of Coal."

**Thomas**—S. E. Hawkshaw, district mine inspector, has been elected the first president of the Upper Potomac Mining Institute, organized here recently at the instance of the West Virginia Department of Mines in order to insure closer co-operation between the department and those engaged in mining.

At the organization meeting, H. H. Pierce, superintendent of the Pierce operation of the Davis Coal & Coke Co., acted as temporary chairman. At the organization meeting, superintendents, mine foremen, firebosses and others engaged in mining were present; district inspectors Riggleman and Hawkshaw were also at the meeting. Other officers elected in addition to president Hawkshaw were: H. H. Harrison, Pierce, first vice president; Matthew Blair, Thomas, second vice president; J. J. Bobbie, Albert, third vice president; E. P. Frennen, of Thomas fourth vice president; Clyde A. McDowell, secretary and treasurer.

**OHIO**

**Columbus**—Among the first actions taken by railroad managements after the return of the roads to their owners was the announcement, in Ohio at least, that there would be no further confiscation of coal at the mines by railroads. Coal may be confiscated while en transit but the operator will have the satisfaction of knowing that the coal will be consigned to some buyer who is anxious for it. The other action was the order that all cars should be returned to their own lines as soon as practicable. This is expected to help the car supply in time.

Officials of the Ohio Industrial Commission and miners officials believe that one of the most important laws, for the protection of miners, was enacted at the close of the recent session of the Ohio General Assembly, which provides for the establishment and maintenance of five mine-rescue stations located in the important mining regions of the state. Each station is to be fully equipped with the latest devices for resuscitating asphyxiated miners; also oxygen outfits, breathing devices for entering dangerous mines, safety lamps, fire hose and first-aid supplies. Each of the stations is to be continuously in charge of a superintendent appointed by the Ohio Industrial Commission. The superintendent is to be under the immediate supervision of the district mine inspector.

**ILLINOIS**

**Murphysboro**—The Lincoln Coal Co., a Chicago corporation, is preparing to enter this Illinois mining field, according to reports from Murphysboro. This company has an option on the West Virginia coal mine on the Missouri Pacific, near that city, and some big developments in the vicinity are expected in the early spring. This is in the famous "Big Muddy" region, where the coal has proved to be of excellent quality and has an established reputation.

**Benton**—Both Benton, of Franklin County, and Harrisburg, of Saline County, are talking of erecting hospitals. The cost of the Benton hospital is estimated at \$100,000, and the Harrisburg hospital at \$150,000. Both towns are the centers of big mining districts and have need of hospitals. One of the plans for financing these undertakings is to secure help from the miners' locals of the two counties.

The No. 8 mine of the Old Ben Coal Corporation, at West Frankfort, has again broken its own hoisting record. One day recently this mine hoisted 5461 tons and made 1346 dumps in 7 1/2 hours. Twenty-five minutes were lost during the day.

**Duquoin**—The Southern Gem Coal Co., of Chicago, having extensive operations throughout this district, has begun the opening of a new field which is located about ten miles north of here, due east of Tamaroa, near where they recently purchased an operating mine. The concern owns thousands of acres of coal lands in the vicinity of its new drilling, in Perry, Jefferson and Franklin counties. The company recently purchased large tracts south of here near the Union Colliery Co.'s land and expects to sink mines in that vicinity also. At the present rate of speed which this company is making in the way of new developments in the mining industry, it is very evident that it will be only a matter of time until it will have become one of the large producers in southern Illinois.

Recent transactions by the West Virginia Coal Co., of St. Louis, include the

purchase of the International Coal Co. and the Taylor Coal Co. with mines near Breesee, north of here, located on the Baltimore & Ohio R.R. The consideration in the deal has not been made public but both the mines rank with the larger ones of the state. Other leases on coal tracts have been made during the past three weeks by President John Henderson of the West Virginia Coal Co. in Franklin County within five miles of the famous Old Ben collieries.

Reports reaching throughout the state indicate the sale of the mine owned by the Peabody Coal Co., of Chicago, located at DeSoto, 13 miles south of here, to Chicago capitalists. Details of the deal have not been given out in full, but it is understood that, on taking possession of the property, the new owners intend to make many improvements to increase the output of the mine.

The Lincoln Coal Co., of Chicago, has negotiations pending with the West Virginia Coal Co., of St. Louis, for the purchase of the Blair mine near Murphysboro, Jackson County. It seems that the Chicago concern already has an option for the purchase of the mine but the deal has not actually been closed. Other new developments in the near vicinity include a new mine which has been planned by the Big Muddy Coal and Iron Co., a concern having two mines in operation near Murphysboro.

A new scale, said to be the largest track scale in southern Illinois, has been purchased by the Moffat Coal Co., from the Fairbanks-Morse Co., and will be installed at the Moffat mine near Sparta. The scale which is of 150 tons capacity, will be put in just as soon as the weather permits the excavating of the large pit which it requires.

**Personals**

**A. T. Shurick**, who has been identified with the coal industry in both an editorial and engineering capacity for the past 20 years, has been elected to the vice presidency of the F. C. Thornley & Co., Inc., consulting and constructing engineers, specializing in coal-handling equipment. He will devote his attention particularly to the mining and distributing problems of the company.

Mr. Shurick received his engineering training at the Virginia Polytechnic Institute, and was engaged in the active practice of his profession for ten years as follows: He was with Rock Island Coal Co., the Mexican Coal & Coke Co., and was engi-

A. T. SHURICK

neer of coal properties for the Anaconda Copper Mining Co. His work in these fields was of a varied nature, involving a multiplicity of mining systems, including many unusual problems.

Mr. Shurick joined the editorial staff of *Coal Age* when that journal was started in 1911; he was identified with its development up to the time of the war, when he entered the army where he served as a captain with the 209th Engineers. For the past year he has been, first, technical editor, and later business manager of the *Coal Trade Journal*.

F. C. Thornley & Co. are specialists in the development and construction of mech-

anical labor-saving methods as applied to transfer terminals, distributing and storage yards, industrial plants, locomotive coaling stations, etc. The company designs, erects and organizes for operation large or small-capacity installations of the character noted. The Thornley Co. has just moved into its new offices at 31 West 134 St., New York City.

James McEwan, of Arcadia, Indiana County, Pa., has been named superintendent of the Pennsylvania Coal & Coke Corporation, at Beavertdale, succeeding E. H. Gray.

Robert Bourr, for the past five years superintendent of the Pacific Coast Coal Co., at South Wellington, has left for Mabel, B.C., where he will make his home.

Emmett H. Erwin, for many years connected with various coal activities in southern Illinois in Williamson and Saline counties, has been appointed general sales manager of the O'Gara Coal Co., of Chicago, filling the vacancy of J. E. MacFarland, who resigned to become general sales manager of the Indiana Coal & Coke Co., of Terre Haute. Mr. Erwin in 1906 became associated with mining men at Marion, Ill., and later formed the Consumers' Coal Mining Co., which owned and operated two mines near there and of which he was secretary and sales manager.

**Obituary**

**Robert J. Parks**, of St. Louis, recently died at his home after many years of service as secretary for the Mt. Olive & Staunton Coal Co., of St. Louis.

**William Fresh, Sr.**, treasurer of the Golden Rule Co., which operates the Senior mine near Lenzburg, Ill., died recently at his home in Lenzburg. He worked up to his position from the bottom of the ladder, having at one time been a practical miner and helped sink the shaft for the mine of which he was an official.

**John Hale**, aged 88, a pioneer in the coal industry in the anthracite field, died recently at his home at Scranton, Pa. He was born in Trowbridge, England, coming to this country when a young man. In 1857 Mr. Hale entered the employ of the Delaware, Lackawanna & Western company and continued with this corporation until 1903, when he was retired on pension. He was superintendent of the Bellevue mine for 46 years.

**Richard Henry Brown**, one of the oldest mining engineers in Canada, died recently at the age of 82 years. In 1864 he succeeded his father, Richard Brown, as manager of the General Mining Association, of Sydney, a position which he retained until 1900, when the properties of the association passed into the hands of the Nova Scotia Steel & Coal Co. After one year's service as manager of the Nova Scotia company, he retired from active work in the mining field. As a tribute to his professional standing and work in promoting the coal mining industry, he was made an honorary member of the Mining Society of Nova Scotia. Mr. Brown is survived by three daughters.

**Donnelley's Red Book.** Published by The Reuben H. Donnelley Corporation, 652 So. State St., Chicago, Ill. January, 1920, edition (published semi-annually). Illustrated; pp. 1,716; 8 1/2 x 11 1/2 in. A national buyer's guide and sales catalogue. The service is offered in two phases—first, the book, and second, the service stations.

**Report of the Distribution Division—1918-1919.** Part I. The Distribution of Coal and Coke. By C. E. Lisher, U. S. Fuel Administration, Distribution Division. Illustrated; pp. 143; 9 x 11 1/2 in. The report notes the requirements for coal in 1918; ability to meet requirements, and the organization, policy and work of the bureau of distribution division.

**Conservation Through Engineering.** By Franklin K. Lane, Department of the Interior, United States Geological Survey. Bulletin 705. Not illustrated; pp. 35; 6 1/2 x 9 1/2 in. Extract from the Annual Report of the Secretary of the Interior for the fiscal year ended June 30, 1919. A plea for constructive policies on the part of those developing the power resources of the country.

**Panel System of Coal Mining, a Graphical Study of Percentage of Extraction.** By C. M. Young. Bulletin 113. Engineering Experiment Station, University of Illinois, Urbana, Ill. Illustrated; pp. 76; 6 x 9 in. The conclusions reached in the investigation of mining methods in Illinois in 1917, led to the study of the panel system, here described.

**Coal Resources of District V—(Saline and Gathlin Counties).** By Gilbert H. Cady. Bulletin 19. State of Illinois, Department of Registration and Education, Division of the State Geological Survey. Co-operative Mining Series. Illustrated; pp. 135; 6 x 9 in. A district in the southern part of Illinois, adjacent to the well known Franklin and Williamson county field.

**Concrete Engineers' Handbook.** By George A. Hool and Nathan C. Johnson; assisted by S. C. Hollister; with Chapters by others. Illustrated; pp. 885; 6 x 9 in. Published by the McGraw-Hill Co., Inc., 239 W. 39th St., New York, N. Y. This book was prepared to give concise knowledge about concrete and reinforced concrete, including complete data, details and tables. The book is intended as a working manual for the engineer.

**Removal of the Lighter Hydrocarbons from Petroleum by Continuous Distillation.** With especial reference to plants in California. By J. M. Wadsworth, Department of the Interior, Bureau of Mines. Bulletin 162. Petroleum Technology 45. Illustrated; pp. 162; 6 x 9 in. Description of the methods of construction and operation of representative types of plants in the U. S. for removing the light hydrocarbons from petroleum by continuous distillation.

## Coming Meetings

The American Association of Engineers will hold its annual convention at the Planters Hotel, St. Louis, Mo., May 10 and 11. C. E. Drayer, secretary, Chicago, Ill.

National Foreign Trade Convention to be held in San Francisco, Cal., May 12, 13, 14 and 15.

Chicago Coal Merchants will hold its annual meeting April 13, at Chicago, Ill. Secretary, A. H. Kendall, Chicago, Ill.

American Chemical Society will hold its annual meeting at St. Louis, Mo., April 13, 14, 15 and 16. Secretary, Dr. Charles L. Parsons, 1709 G St., N. W., Washington, D. C.

New England Coal Dealers' Association will hold its annual meeting March 21 and

25, at Springfield, Mass. President, W. A. Clark, 141 Milk St., Boston, Mass.

National Retail Coal Merchants' Association will hold its annual meeting June 10, 11 and 12 at Detroit, Mich. Secretary-manager, Ellery Gordon, Philadelphia, Pa.

Indiana Retail Coal Merchants' Association will hold its annual meeting April 27, 28 and 29 at the Severin Hotel, Indianapolis, Ind. Secretary, R. R. Yeagley, Indianapolis, Ind.

## Industrial News

**Hard Burley, Ky.**—The Hardy-Burlingham Coal Co. will build a new coal tippie at its plant for increased operations. Plans for the structure are said to be under way.

**Blacky, Ky.**—The Rockhouse Coal Co. is having plans prepared for the construction of a new tippie at its local development, for increased operations.

**Barlan, Ky.**—The Black Mountain Coal Corporation, operating in the Black Mountain district, has had plans prepared for the construction of a new coal bin at its plant to have a capacity of about 100,000 tons.

**Renton, Pa.**—The Union Collieries Co. has awarded a contract to the J. G. Fullman Co., Pittsburgh, Pa., for the construction of about thirty new dwellings for miners' service. The buildings will cost approximately \$4,000 each.

**Birmingham, Ala.**—Henry Neny and Leo Sossong, Carnegie, Pa., are understood to be arranging for the installation of complete mining equipment and machinery for the development of coal properties located in the Cahaba field in the vicinity of Birmingham.

**Charleston, W. Va.**—Stockholders of the Kanawha & Hocking Coal & Coke Co. have authorized a material increase in the capitalization of the company, which has been increased from \$3,500,000 to \$5,000,000. This company has large operations in the Kanawha field, although its general offices are at Cleveland, Ohio. Richard Inglis is the president of the company.

**Bluefield, W. Va.**—It seems to be pretty well understood, now that the railroads have been returned to private ownership, that the work of electrifying the Tug Fork division of the Norfolk & Western R. R., which was discontinued during the summer of 1919, because of lack of funds, will be resumed. If such is the case it will mean a better movement of coal on this railroad.

**Pineville, Ky.**—In the notice about the development of the Kentucky Collieries Corporation, which appeared in the Jan. 1, 1920, issue of *Coal Age*, it was stated that the initial capacity of this plant was to be about 400 tons per day. This company announces that it is running over 400 tons daily at present and it is proposed to ultimately have an output of about 4,000 tons in eight hours.

**Beckley, W. Va.**—Chicago people are largely interested in the Dearborn Coal Co., which proposes to operate mines in Town district of Raleigh County, near Stone-wall, W. Va. This company has a capital of \$125,000. In addition to J. W. Bell, of Bellewood, those who had an active part in the organization of the new company were: H. M. Hall, G. F. Stahmer, Edward Klineberg, W. W. Robson, of Chicago.

**Oakland, Md.**—The Penn-Mary Coal Co. is arranging for the purchase of about 1,000 new coal hoppers to be used for the transportation of coal from its mines to eastern districts. The company operates extensive holdings in Preston County, W. Va., and is affiliated with the Bethlehem Steel Corporation. The company also recently completed negotiations for the purchase of property from the Davis Coal Co.

**Blacky, Ky.**—The Blacky Coal Co., which recently increased its capitalization from \$40,000 to \$75,000 to provide for expansion, is having plans prepared for the installation of mining machinery, equipment, etc., for the development of a total of about 500 acres of coal properties in the Blacky district. It is proposed to have a capacity of about 200 tons daily for initial operations. H. E. Taylor is secretary.

**Huntington, W. Va.**—The Hooper-Mankin Fuel Co. has been organized for the purpose of buying and selling high-grade bituminous coal. T. H. Hooper, of this company, formerly treasurer of the Amherst Fuel Co., and affiliated companies, has been made president; Robert Mankin, of the firm of R. Mankin & Co., has been made vice president; T. W. Wyatt has been made secretary and treasurer.

**Buckhannon, W. Va.**—Preparations are being made by the Buckhannon River Coal Co. to open another mine in Adrian, in Upshur County. In connection with this development, the company plans to build about 150 dwellings for miners. This concern now produces about 1,250 tons a day, employing about 300 miners at its various mines. The company has also resumed the manufacture of coke after its ovens had been in idleness for a period of about two years.

**Welch, W. Va.**—Development work on a large scale will follow the purchase of about 2,000 acres of smokeless coal land on the waters of Dry Fork in McDowell County, W. Va., by the United States Coal & Oil Co., of Holden, W. Va. This company also owns the Island Creek Coal Co., and the Pond Creek company, but it is now evident that the corporation plans to produce smokeless as well as high-volatile coal. It is understood that the company will soon sink a shaft near English, McDowell County, where the property is located.

**Charleston, W. Va.**—During the second week of February three West Virginia companies increased their capital stock as follows: The U. S. Block Coal Co., of Huntington, whose capital was increased from \$50,000 to \$75,000; the West Virginia Eagle Coal Co., operating at Boomer, W. Va., increasing its total capital from \$100,000 to \$150,000. W. G. Conley, of Charleston, president of the company; the Lewiston Block Coal Co., of which H. H. Weiske, of Charleston, is president, increasing its capital stock from \$100,000 to \$150,000.

**Fairmont, W. Va.**—A. Brooks Fleming, Jr., assistant to the president of the Consolidation Coal Co., will head the Northern West Virginian Operators' Association, having been elected as the successor of C. H. Jenkins, at the annual meeting of the association held in this city on Feb. 27. A. Lyle White, of Clarksburg, was elected treasurer and G. T. Bell, of Fairmont, secretary and executive vice president. President Fleming is a son of former Governor A. B. Fleming. During the war he acted as production manager for northern West Virginia.

**Bellingham, Wash.**—Otho Williams, coast manager of the Pacific Coast Atomized Fuel Co. and organizer of the Bellingham Atomized Fuel Co., will erect a \$100,000 assembling plant and laboratory here. Mr. Williams plans to make Bellingham headquarters for the network of probably 15 plants on the coast and in British Columbia, forming a branch of the McLaughlin Atomized Fuel Co. of the Eastern states. A single-unit plant will be built here, capable of manufacturing 50 tons of pulverized coal every ten hours. The waste coal of the Bellingham coal mines, Glacier mines, Northern Island mines and other mines in the vicinity of Whatcom County will be utilized in the proposed plant.

**Rome, N. Y.**—The stockholders of the Rome Wire Co., of this place, have recently authorized an increase in the capital stock of this company to \$4,000,000 (7 per cent) first preferred and \$5,650,000 common, the shares in each issue being \$100 par value. The company's main plant is located at Rome, N. Y., on the New York Central R.R. and on the New York State barge canal. The land comprises 22 acres with 348,000 sq. ft. of modern factory buildings, fully protected by sprinkler equipment. All of the buildings have been constructed since 1905 and the larger part of them since 1914. The equipment is all modern and first class in every particular. The Buffalo plant consists of 11 acres of land in the northeastern part of Buffalo, N. Y., on the D. L. & W. R.R., with excellent trackage facilities and well constructed buildings adapted to the manufacture of electrical wires and cables. A large addition is under construction at this branch, the J. W. Cowper Co., Buffalo, N. Y., being the contractors.

**Huntington, W. Va.**—W. E. Deegans, the prominent operator of southern West Virginia, recently organized the W. E. Deegans Consolidated Coal Co. with a capitalization of \$5,000,000, fully subscribed. It is announced that this company has based about 15,000 acres of coal land in both Kentucky and West Virginia; the coal acreage leased being on the Norfolk & Western, on the Louisville & Nashville and on the Greenbrier & Eastern railroads. The coal land on the last named road being in Greenbrier County, W. Va. The company plans to begin development work in the quite near future and to prepare for operations at ten different mines. When the operations are fully developed, the company counts on an annual production of 1,000,000 tons. Officers of the new company have not so far been chosen.

## Weekly Review

*Car Supply Shows Little Improvement—More Mines Forced to Shut Down—Tidewater Exchange Continued—New England Suffers Because of Successive Snowstorms.*

SOME improvement has been noticed in the distribution of cars during the past week, but no great change is expected for at least a month. To the operator, the attitude of the railroad employees as regards wages, etc., is not pleasing for it is assumed that more attention will be given to the railroads internally than will be given to troubles outside.

Though domestic demand has eased off considerably, public utilities and large manufacturing plants are being pinched more and more, and so long as the weather continues to be cold, the situation will not show any change. Successive snowstorms through the week have contributed toward retarding railroad deliveries and consequently the dumpings have been far below normal.

On account of inadequate car supply forcing many mines to close, some districts are looking for their require-

ments from other sources where coal is available, and operators in those regions are now finding a market for their output where previously little attention had been given. For instance—Indiana coal is moving into Ohio, while Illinois coal is going into Michigan, as well as to points in the Northwest, such as North Dakota. These latter-named regions are usually served from other sources.

The situation at Hampton Roads is much easier and coal is moving from the mines in better volume. A large tonnage is again moving on export business. Now that the Shipping Board has withdrawn control of coastwise rates and so long as the use of the Tidewater Coal Exchange is made compulsory, it remains to be seen just how this will affect current shipments.

Some of the big users of anthracite steam sizes are still in the market. This is almost the end of the season,

for in former years this business was closed long before March 15. Retail dealers have received rather meagre shipments of domestic sizes of anthracite, especially in New England, where great difficulty is encountered in clearing snowbound tracks.

Production of coke in the Connellsville region continues to increase slowly with occasional backsets. However, with adequate transportation, the present 85 per cent production can soon be increased to normal.

Much interest is being given to the coming week, for it has been rumored that the commission now investigating the bituminous-coal industry will make its decision public on or about March 10. Then, too, there is a possibility of a new wage agreement between the anthracite operators and miners. They are to meet in New York City on March 9. An increase in the price of anthracite is expected.

### WEEKLY PRODUCTION

The weekly report on the production of bituminous coal, anthracite, and beehive coke, compiled by the Geological Survey, Department of the Interior, March 6, 1920, states that a partial recovery from the decline of the preceding week is indicated by reports of coal loaded by the principal carriers during the week ended Feb. 28. Because of changes in organization attending the transfer of the railroads to private operation, no reports for the week have yet been received from many important carriers. Any estimates of production are, therefore, necessarily subject to revision. The returns so far received point to a total output for the week of Feb. 28 amounting to approximately 10,230,000 net tons. Compared with the 9,511,000 tons produced during the preceding week (Feb. 15 to 21), this was an increase of 719,000 tons, or 7.6 per cent.

Material improvement was also reported by the anthracite industry. Loadings for the week ended Feb. 28 (in part estimated) are placed at 33,079 cars. This suggests a total output of 1,699,000 net tons, an increase of 236,000 tons, or 16.1 per cent, over the preceding week. Compared with the corresponding week last year when the demand reacted unfavorably upon demand, the current week showed an even greater increase, amounting to 597,000 tons.

The weekly statistics of production of beehive coke published by the Geological Survey are estimates, based on reports of cars of coke loaded by the 26 principal coke-originating roads. In 1917 these roads originated 97 per cent of the total rail shipments of beehive coke.

On this basis production during the week ended Feb. 28 is placed at 433,000 tons, an increase of 6,000 tons, or 1.4 per cent, over the preceding week. Cumulative produc-

tion during the first 51 working days of 1920 was 3,707,000 tons, a decrease of 12.7 per cent when compared with last year.

### Atlantic Seaboard

#### BOSTON

Contract activity. Milder weather improves outlook. Movement increases very gradually. "Emergency" coal received only in light volume. Railroad requirements the chief factor. Hampton Roads situation easier. Receipts at Philadelphia and New York piers.

Bituminous—The withdrawal of the restricted price is being much discounted. Most of the Pennsylvania shippers are very active soliciting contracts for the year beginning April 1. There is a wide range of quotations, depending upon the grade, but it grows increasingly evident that coals available for export or bunker use are to be in strongest demand.

In other words, steam users here are trying to cover on the better grades while there is still opportunity, although at the same time there is a disposition to wait before buying coals that are only of fair quality. Taking into account all charges, the relative cost of the better coals does not show a very wide margin over those of poor quality. It is quite natural therefore that there should now be a vigorous effort to secure the quality coals from Cambria and Somerset.

The milder weather has already changed the immediate outlook. When zero temperatures were prevailing a week ago there was much in the press about the serious situation confronting New England indus-

tries. It is of course true that stocks are being depleted, but the fact that the all-rail gateways are now open and that the thousands of cars frozen to the tracks are gradually being moved argues for much less apprehension than prevailed a fortnight ago. The Maine Central and the Boston & Maine are making great efforts to clear their sidings and when we consider the very large number of cars now under load it is clear that this section faces no immediate distress.

Movement has increased so gradually that even now only one of the gateways has been opened to anthracite. The New England roads are still unable to take from the intervening lines as many cars as are daily received, but a marked improvement is looked for during the next ten days. A large tonnage that left the mines a month ago has not yet reached the transfer points allowing for very heavy confiscations. Coal has been seized since Feb. 28, but in nothing like the volume that was taken previously. For real emergencies, on their own lines, certain of the railroads are commandeering, but expected arrivals of water coal will soon remedy this situation.

"Emergency" cargoes are arriving only slowly. Several of the ships specially allocated are still on the high seas with inbound cargoes. That this is true is rather fortunate for would-be purchasers. Certain ships that have arrived have met with extremely slow despatch, due to short car supply, and general lack of facilities. There have been cases where demurrage had accrued to more than a dollar a ton and these charges together with the export price have made the delivered cost very high. There is reason to think that any very considerable tonnage would not have been absorbed except with great difficulty, for it becomes more and more apparent

that the only urgent requirements were those of the railroads.

Much of our troubles can be laid at the door of the Railroad Administration. The effort to secure a very large proportion of engine supply by the all-rail, or cheaper, route resulted in a breakdown on the part of many of the contractors. What seemed the desirable move for the railroads was also desirable for consumers generally and the net result was the sheer inability of Pennsylvania operators to live up to the heavy obligations they had undertaken.

The situation at Hampton Roads is much easier. The coal is moving from the mines in better volume and despatch is now seldom more than two days. The real delays have come at this end where it was not possible to make any real preparations for receiving coal in such volume. A large tonnage is again moving on export business and the agencies here are not counting upon very much tonnage for New England.

The Shipping Board has now withdrawn control of coastwise rates and it is not to be expected that sales will be very heavy in this market so long as there appears a chance of getting liberal shipments during the season from Central Pennsylvania. Receipts at the New York and Philadelphia piers continue very light.

Use of the Tidewater Coal Exchange is again made mandatory and it remains to be seen what will be the result upon current shipments. Those Pennsylvania operators in position to sell for export are keenly alive to the heavy tonnages being moved from Hampton Roads and there is apparent a real anxiety over the prospect for placing the better Cambria coals overseas.

**Anthracite**—Demand continues very strong for prepared sizes. Egg, as well as stove and chestnut, is now in good request and retailers are making every effort to get coal forward. Water movement is improving slowly, but all-rail only the Boston & Albany is open. The embargoes against the New Haven and the Boston and Maine are expected to be lifted early next week, if not before, and we may then look for a very heavy movement all-rail.

Notwithstanding all the publicity given the dire need of industries here for steam coal, there has been no appreciable increase in the demand for steam anthracite. The market for these sizes is, in fact, almost druggily although it is possible that later in the month they will be in better request.

#### NEW YORK

Anthracite demand active. Consumers are placing orders for next winter's coal supply. Law of supply and demand controls the situation. Steam sizes are in good call with prices strong. Bituminous in steady call.

**Anthracite**—Continuance of good coal consuming temperatures and the belief that price will advance on or soon after April 1 has kept the market on its toes. Usually dealers are taking life easy during March but because of the past few months of low temperatures resulting in bins being nearly emptied and the reasons stated previously they are busily occupied.

Consumers are not letting go unnoticed the warnings printed in the daily newspapers that coal prices are likely to advance, that the working agreement between the operators and their employers expire on March 31 and that the new demand of the mine workers ask for a 60 per cent increase in pay. Because of all this many have already placed orders for next winter's fuel supply to be delivered this month.

Supplies are not in oversupply either with the wholesale or retail dealer. The trade is ordering freely and are willing to have their bins filled when the new coal year begins. Most wholesale houses have sufficient orders on their books to take care of this month's output and the orders continue to come in.

All domestic sizes are in good demand. In some quarters egg is the shortest while other houses say they have the heaviest call for stove. Producers and shippers of independent product have no difficulty in obtaining the 75c. differential on their output.

A good call continues to be received from New England and northern part of this state, it being accompanied by requests for quick shipments. The few days of moderate weather conditions last week aided the dumpers at the piers and resulted in the frozen release of many cars of coal.

There is much activity in steam sizes due to the continued lack of bituminous coals. No. 1 Buckwheat is in unusually heavy demand and independent product is bringing in some instances from 25c. to 50c. above the company circulars, with loaded boats bringing higher prices. Rice is in fair demand and in some cases is being held at

25c. above regular circulars. The supply of barley is not large due to frozen coal and the lack of washery product. Still it can hardly be had at concessions. Current quotations for company coal per gross tons at mine and f.o.b., Tidewater, at the lower ports are as follows:

	Tide-		Tide-	
	Mine, water	Pea, . . . .	Mine, water	Boiler . . . .
Broken . . . .	\$5.95	\$7.80	\$5.30	\$7.05
Egg . . . . .	6.35	8.20	3.40	5.15
Stove . . . . .	6.60	8.45	2.75	4.50
Chestnut . . . .	6.70	8.55	2.25	4.00
			2.50	4.25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

**Bituminous**—There is much optimism among the trade. While the situation has been anything but encouraging the past few weeks bright spots are now appearing to most of the trade and it is thought the worst is over. It is hoped that the next few weeks will see an improvement.

The trade here was interested in the newspaper report that the Bituminous Wage Commission had decided upon a 16 per cent increase for the miners, but would make no comment. They are anxiously awaiting the formal report which they expect will soon be made. Poor car supply continues to be a factor in low stocks, reports from the mines not showing anything like normal figures.

Buyers from New England are daily visitors to the local offices, but interruption of transportation due to the heavy snows prevents shipments. Meantime reports received from those states show that many factories are on the verge of closing down because of the lack of fuel. The raising of the embargoes on the railroads entering the New England States has helped deliveries but considerable coal is needed to relieve the situation.

The reported resumption of shipments through the Cape Cod Canal will help considerably in aiding the situation in and around Boston. The canal had been closed since the Railroad Administration relinquished control. New complaints are heard daily of the failure of the railroads to make deliveries, although the coal has been on the road for several weeks.

Higher water freight rates are looked for now because of another increase in wages granted the workers on the tugboats in the harbor and which is retroactive to March 1. Receipts at the piers are improving under private operation of the railroads. Local dealers are obtaining a fair share of their requirements and the bins of the various public utility corporations are being rapidly replenished.

#### PHILADELPHIA

Anthracite continues in active demand. Milder weather decreases consumption, but consumer wants coal despite it. Higher prices probable. Stove and not in chief demand, although good tonnage of pea moved. Egg well cared for. Receipts below normal need.

**Anthracite**—With mild weather prevailing for most of the week the calls for coal by the consumer were not so insistent, but it must not be taken from this that the dealers are not busy, for that is far from true. Everybody has plenty of orders on the books and most of this is filling in of depleted stores. With the weather again turning cold toward the end of the week, with some snow, there was also a good current demand for fuel.

As has been the case all winter long the demand continues to be centered on stove and nut sizes and despite all efforts of the dealers to turn the customers on pea, they are met with the reply that pea is too small. As a matter of fact the dealers knew this to be a fact and in the event that the operators do not consent to the changing of the sizes it is more than likely that they will be called upon to bring pea up to the standard, and in addition make the margin in prices such as will be attractive to the old-time consumer of this size.

Yet with the reluctance of the consumer to take pea it is a fact that the dealers are moving a fair-sized tonnage of this size. It is simply a case with the small consumer of taking this size or doing without, as there is not near enough of the large sizes to go around. The companies report that they are moving all the pea they make without any difficulty, but the individuals have nearly all dropped from their premium price and are making sales at the company figure of \$5.30 or close to it. Some of the strictly brokerage houses have independent pea coal for sale and are asking from \$5.40 to \$5.50 a ton for it.

Of the large sizes egg is the only one that is not eagerly sought for by the dealers, although they are also putting out a good tonnage of this size. However, the producers are having but little trouble to

dispose of this size, as the gas making plants in this territory are in the market for large anthracite sizes since there has been such a shortage of bituminous-gas coals.

The consuming public is becoming stirred up over the coming wage conference, especially since the miners demands are being given considerable newspaper publicity. It is readily believed that 50 per cent of the calls upon the dealers these days can be traced to that fact, as the consumers are anxious to get in next winter's coal before another increase in price becomes effective.

#### Activity in Buckwheat

There is a fair amount of activity in the steam trade, particularly in buckwheat. The regular users of this size are calling on their shippers for increased deliveries of buckwheat, and it looks as if they were trying to stock up in the face of a probable price increase. In addition there has been quite a demand from new trade on this size, anxious to help out depleted stocks of bituminous coal. The boom, though, if it can be called that, has not affected the individual shippers to the point that they can get premiums, as most of them are still figuring to move all the produce at \$3.40 figure.

Naturally when buckwheat is all taken the demand for rice becomes stronger, and while the independents are still willing to shade the \$2.75 price, some sales being made around \$2.40 to \$2.50, even then they are not moving it as rapidly as they would like to. The big companies are picking up heavy tonnages of rice from the storage yards, although little of this is going to line trade, most of it being intended for the piers. Barley, the smallest size, still lags and there is little call for it.

Some of the big users of anthracite steam sizes are making inquiries for contract prices, as this is the time of year when this business is ordinarily closed. So far as the shippers are concerned they show no inclination whatever to make a figure, as in the face of the conditions at the mines they have nothing on which the base a price.

In any event it is figured out that buckwheat will be able to command a good price in the market this coming year, as for the past several years the companies have been just able to meet the demand for it. With rice and barley it is a different story and in the case of extremely large users of these sizes it would not be surprising to hear of some concerns taking a chance on the price and closing business at this time.

The local dealers have received rather meagre shipments of family coal lately and it is reported that with the New England roads finally clearing their tracks and with the embargoes lifted a heavy tonnage of these sizes is going forward there all rail and it is feared that the local market will feel the effect of this for some time to come.

**Bituminous**—The most that can be said about bituminous is that it has not grown worse. It is believed that most plants hereabouts have been able to resume and are running with very little ahead of them. Most of them have always had a fair amount of coal under way, but suffered severely from the policy of the administration in diverting coal. Lately there has been very little coal diverted, although a rumor was broadcast and had considerable currency that there would again be wholesale confiscations to help out needy points to the North.

#### Little Car Improvement

We have been unable to find any shipper who was willing to admit that the car situation had improved, although the various road managements have assured them that now with the lines cleared of snow there should be a very decided improvement from this time onward, barring, of course, any severe snow storms such as the month of March has been known to produce.

Consumers are very anxious as to contracts for the coming season and the inquiries in this direction have increased very considerably of late. All of the anxiety in this direction is not on the part of the buyer, either, as more than one operator is quietly sounding the market to find out if his competitor is making a price and thus give some basis for setting a figure.

It is rumored that one of the largest shippers has closed some business at a figure close to \$3.60 at the mines. The story persists in such a way as to make one believe that there is some element of truth in it, but even at that it is believed that in the event of a wage increase that would make this price unprofitable, the figure will be changed to conform thereto.

Coal cars continue to be used for every other purpose than coal, and the demand for them for other uses seems to get the preference.

**BALTIMORE**

Coal trade as a whole far from satisfied by failure to remove uncertainty with passing of government railroad control. Hand of regulation heavier than ever. Car supply and general run of coal wretched. Exports at an end. Hard coal dealers think of spring.

**Bituminous**—The feeling of disappointment is paramount in the Baltimore coal trade, which finds uncertainty still hanging heavily over business with the passing of government control of the railroads. The action of the president in re-affirming orders of October and December by which the Central Coal Committee through regional directors still holds control of distribution, etc., and the creation of a special committee on exports and bunkers which has let it be known that the foreign trade is for the "dim future" means that the hand of control is heavier than ever.

There is wide talk of action through the American Wholesale Coal Association and individual agencies of a test of the law of control, but the length of time that would be required is a discouraging feature. Meanwhile the car supply and fuel supply has gone from bad to worse. Starting with the early part of last week with a 71 per cent car supply on all the Baltimore & Ohio System and a daily car loading of 3,323 cars, the fall was sure until the closing days of the week saw the supply running between 30 and 40 per cent and the daily car movement decreased to around 1,800 to 2,000 cars. At the piers here the supply was wretched.

The Baltimore & Ohio supply at tide ran at times as low as 100 cars and seldom over 200. One ship took all week to load with recently at Curtis Bay, taking on around 7,500 tons, while another has sailed away from the Canton pier of the Pennsylvania with 3,609 tons of cargo and 1,200 tons of bunker coal, both coastwise.

**Anthracite**—Hard coal men are looking toward spring and in the meantime not forgetting that they have some immediate problems. One of those at present is to head off some "fool" legislation before the Maryland General Assembly which would allow almost "any Tom, Dick or Henry" to stop coal cars on the street and order them to be weighed, and allow only a 1 1/2 per cent margin for underweight before a fine was imposed.

As to spring the coal men are already discussing the idea that they must "sell as they buy." In other words it may be no surprise if it is decided to make the price that of time of delivery, the coal men assuming no responsibility for traffic breakdown, strikes, etc. This would mean that a big part of the Baltimore business which has been done on the plan of payment at the time of order, coal to be dumped at any time over summer or fall, must be revised.

The method of the mines at present for monthly payments has forced this issue to prevent serious loss by retailers. The supply of coal just now is fairly good, except for the fact that many dealers would like to have more of the nut and stove sizes.

**Eastern-Inland**

**PITTSBURGH**

Steel-mill operations affected by coal shortage. Coal operators pleased at railroad officials again being in authority. Robinson Commission expected to authorize higher coal prices.

Coal shortage affected operation of steel mills more last week than for several weeks. The Youngstown Sheet & Tube Co. had to close several finishing departments for the last two days of the week, while the Republic Iron & Steel Co. had its entire Bessemer department, including the finishing mills, idle for three days. This week receipts of coal at Youngstown have been somewhat better, but coal operators do not report any general improvement in the car-supply situation.

Practically the unanimous opinion in the coal trade is that improvement in transportation conditions will come chiefly if not wholly from improvement in weather conditions. While shippers are pleased that the railroads have been returned to their owners they do not expect the transfer to work much improvement in the actual movement. Much satisfaction is expressed on one point, that shippers can now approach railroad officials and ask to know precisely what the officials expect to be able to do, whereas during Government control the railroad officials were much disposed to place the responsibility for everything upon Washington.

No definite opinion is expressed as to what finding the Robinson Commission will

make in the matter of wage rates, but the finding is expected to be made within a fortnight. It is regarded as altogether probable that even with a settlement on the 11 per cent basis a higher schedule of coal prices will be permitted, to run to April 30.

There are more rumors of coal transactions at above the Government limit, but such sides if made are put through secretly. The market remains quotable at the Government limits: Slack, \$2.10; mine-run, \$2.35; screened, \$2.60, per net ton at mines, Pittsburgh district.

**COLUMBUS**

While the domestic demand is not quite so pressing as formerly, still the situation in Ohio is rather complicated. Steam demands are growing stronger and many sections are extremely short of fuel. Production is still at a low point.

**Bituminous**—With production still restricted below the 50 per cent mark in all Ohio producing fields, there is an increasing demand for fuel among large steam users. Reserves are being gradually depleted to a point where many of the public utilities and iron and steel concerns have no reserves to speak of. They are operating from hand to mouth, as it were, with little hopes of improvement in the fuel situation.

Rubber plants are rather short on reserves although the situation in that field is not serious. General manufacturing plants, especially in the northern part of the state are low and in some instances they are compelled to restrict operations in order to conserve coal. The worst situation appears among the lighting plants where fuel is being conserved.

In some northern Ohio cities reserves are exhausted and only a few hours supply of fuel is available. Schools and hospitals have been supplied by taking away from commercial purchasers.

Domestic demand is strong in every particular. Retail stocks are low and dealers are making strenuous efforts to secure shipments. Some dealers are entirely out of stocks while others are dividing up the available supply in order that they can give all purchasers a portion of their orders. In Michigan the situation is bad and some sections are entirely out of coal. Retail prices are firm at the levels which have prevailed for some time. Some difference is noted because of the different prices at which the coal was purchased. A margin of \$2 per ton, over and above the cost of the coal at the mines and freight charges is allowed the dealer.

Car supply in the Hocking Valley field during the past week has been slightly improved and is estimated at about 45 per cent. Crooksville and Cambridge districts had about 40 per cent supply. In the Pomeroy Bend field the supply was about 50 per cent which is an improvement over the previous week. In the eastern Ohio field there is little improvement noted and reports show that cars have totalled about 35 per cent of requirements. This is restricting operations in that field to about one-third of the usual tonnage.

**CINCINNATI**

Trade suffered somewhat the past week from the lack of tonnage, although there is not a famine in this section of the country, there is a famine in spots.

The demand is many times as great as the present output, and many jobbers are "up a tree" as to how they are going to fulfill orders taken last summer and fall. Collections from confiscated and diverted tonnage are improving weekly and it is the opinion of many operators that this end of the business will be cleaned up before the warm weather sets in.

Car supply continues to be erratic and no general confidence may be placed in it. It is the opinion of many operators that the biggest task now faced by the railroads since their return to private ownership is that of locating their own cars. For as conditions now exist one road may be unable to furnish cars to any great extent, while another road will have no trouble in meeting its demand with cars which rightfully belong to the road that is unable to furnish transportation equipment.

The market of course hinges on the car supply, and this has failed to improve, running from 39 to 45 per cent of normal. Reports from the country districts assert that the people are going back to burn wood as they did during the coal strike. Free coal is extremely scarce and very little smokeless is arriving at this end. It is not expected that any amount of free coal will be available until next month. Steam demand is continuing strong and there have been many concerns outside of this territory trying to place orders on the local market. From the present outlook it is thought that

the supply of nut and stove sizes will be completely exhausted within two weeks, unless something unforeseen occurs.

Most of the trouble in domestic delivery is the confiscation of coal en route by railroads leaving coal operators and distributors struggling still to get fuel to points where there is real distress. Locally some of the industries are living from hand to mouth.

There is little talk of a price list now. Most of the representative handlers are sticking to government prices on the little coal moving not under higher contracts, although there is no doubt that other prices are being asked and paid at times. Receipts by river were fairly good, but they are still hampered by inadequate transportation facilities.

**Lake Region**

**BUFFALO**

Terrible car shortage. Chief reason for difficulty in trade. Affects anthracite as well as bituminous. Situation grows worse.

**Bituminous**—The shortage of cars is becoming so distressing that the shippers do not talk of much else, for they believe that if cars should become reasonably plentiful the difficulties in the trade would mostly be over. It is no use to own a mine if there are no cars to carry the coal. Day after day the mines are obliged to close because there are no cars, or merely a small supply.

The shippers sit and wait and when a car that is to keep a customer from shutting down is finally started and it then is confiscated by the road the case seems about hopeless. Such is the situation here and it appears to be the case everywhere. Shippers go to Pittsburgh and bring back the same report of the situation there. Mines are running in this hand-to-mouth way mostly in the hope that something better will take place before long. And all the time things grow worse.

Shippers are saying that it is about time they took matters in their hands and at least put the Government out of control of the bituminous movement. One of them said this week that the report is of increased output, so the difficulty must be in the transportation. If that gets much worse the trade will go to smash. The report is general that cars are scarcer than they were in the worst of the war shortage and they are growing scarcer steadily. If the private ownership of the roads is to be assumed in full now the thing to do first of all is to see that cars are to be had.

There is another complaint against the roads. They are using the coal supply just as if it was their own private property. Sometimes they promise not to confiscate this or that shipment, as it covers an emergency case, but they seldom keep their promises according to shippers, and they are accused of taking coal and turning it over to private concerns, as for instance the Standard Oil Co., and occasionally of even stocking it. Whether such reports are authentic or not, the abuse is such that the shippers ought to keep up their opposition to all confiscation till the roads are made to buy coal as other consumers do and pay for it in the same way.

It is enough to drive a small shipper out of business, to rob him in this way of coal he has bought and pay him when one gets ready. As to prices, all that can be said is that some shippers are adhering to government figures: \$4.70 for Allegheny Valley sizes, \$4.50 for Pittsburgh and No. 8 lump and three-quarter, and \$4.25 for all mine-run and slack, per net ton, f.o.b. Buffalo. Even some of the heavy operators say they cannot run long on these prices and will shut down if no relief is afforded before long.

**Anthracite**—The situation is pretty acute at present, for the cars have been so hard to get that the supply has not been up to the demand since the big storm of the middle of February and the local distributors and retailers are entirely unable to meet the requirements. Consumers have become alarmed, and though they know the winter is about over they are asking for coal in a way that makes it necessary to distribute it in one or two ton lots sometimes.

The arrival of warm sunny days now has been welcomed by the very shippers who used to dread the cancellation of orders that spring days brought on. It is not likely that the difficulty will last many days, for it is car shortage that is to blame for it all and it is now reported that empty cars are coming across the Niagara River from Canada at a good rate. It appears that they have just been dug out of the snow over in Canada and released.

Some anthracite consumers are trying

to buy coal against a possible labor stoppage on April 1, but they cannot get it now and possibly the scare will be over before coal is again plenty. It is next to impossible to buy independent coal now and the car movement is so light that it would not help in this emergency to do so. There is no talk of change of price now, as other difficulties seem to take up everybody's attention. Another week may see everything straightened out.

#### TORONTO

Shipments coming in slowly. Local deliveries much behind. Bituminous very scarce. Further shortage feared. Prices rise with rate of exchange.

Shipments of coal have been much delayed by car shortage and snow blockades and the supplies received are by no means equal to the demand. The yards are empty and the coal is being delivered from the cars.

Local deliveries are much hampered by labor shortage, partly due to the prevalence of influenza and other sickness. Bituminous is very scarce, and the demand for industrial purposes increases, plants having no stocks on hand as a rule and buying from hand to mouth.

Dealers are apprehensive that labor troubles in connection with the termination of the anthracite miners agreement on April 1 may lead to a serious curtailment of the supply.

Prices are advancing and fluctuating with the rate of exchange. Quotations for short tons are as follows:

Retail—	
Anthracite egg, stove, nut and grate.	\$13.50
Pea	12.00
Bituminous steam	11.00
Slack	9.00
Domestic lump	10.00
Cannel	13.00
Wholesale f.o.b. cars at destination—	
Three-quarter lump	9.00
Slack	8.00

#### CLEVELAND

Domestic demand has eased off considerably, but public schools and factories are being pinched harder than at any time this winter. Dealers' supplies have grown. Plenty of anthracite but little Pocahontas is being received.

Bituminous—Perhaps a score of plants in the Cleveland district have been forced to close an hour or two earlier in the evening and suspend Saturday operations altogether, while ten or twelve public schools have been closed for periods ranging from one to four days because of a shortage of coal. Warmer weather has greatly lessened domestic demand, but shipments from southern and eastern Ohio mines have decreased slightly, and the situation is tighter than at any time this winter.

Anthracite and Pocahontas—Receipts of Pocahontas are so small as to be practically negligible. Anthracite continues coming through in good shape, perhaps 70 per cent of normal for this period of the year. For the past few weeks demand for anthracite has been abnormal for this time of the year, but mild weather has cut heavily into the trade. Prices continue unchanged, with the bottom of the spread ruling.

Lake Trade—It now appears that heavy lee in Lake Erie harbors will be the chief obstacle to be overcome in opening the 1920 season. Some predictions say navigation will not be possible until late in April. Some starts have been made late in March, while mid-April is the usual date. Considerable lake coal has been placed, but so far as can be learned price has not yet been taken up.

#### DETROIT

Nether steam nor domestic sizes of bituminous are plentiful, while there is an active demand for each. Restoration of the railroads to private control has worked no miraculous change.

Bituminous—Wholesalers and jobbers are hopeful that improvement of the transportation facilities will be a development of the near future, when the railroads achieve a more efficient basis of operation. Meantime bituminous coal is coming into Detroit very slowly. As nearly all of the stock is sold before it leaves the mines, there is almost no free coal to be found on tracks. This shortage of supply has resulted in considerable inconvenience for manufacturing plants that were accustomed to rely on their ability to supply current needs by day to day purchases of coal on the tracks around town.

In a number of instances industrial plants have been obliged to make purchases from yards of local retailers to fill out intervals when no other supply was available. One of the results of this method of buying is a reduction in the amount of bituminous

available for requirements of the household consumers, while the industrial plants are not materially benefited.

Successive snowstorms through the week have contributed in retarding railroad deliveries, while car shortage and shortage of locomotives on roads handling the coal continue to curtail shipments and prevent operation of the mines on anything like a capacity production. A recent survey conducted under the direction of the Detroit Board of Commerce disclosed that virtually all the manufacturing plants investigated are dependent on day-to-day receipts to continue in operation.

Anthracite—Household demand for anthracite has been maintained on an active scale by the long period of low temperature since Jan. 1. Though not much anthracite is being brought into the city, nearly all the retail yards have a small supply on hand.

Lake Trade—Vessel owners are inclined to the belief that it will depend on ability of the railroads to move lake coal, if shipments attain large volume early in the season. So far no coal is reported loaded for lake shipment, though at this time last season a number of cargoes were on shipboard awaiting navigation's opening.

## Middle West

### MIDWEST REVIEW

Very strong demand for all kinds and grades of coal. However, in spite of this, the coal market has a certain listless air, which to an outsider, is hard to understand.

Jobbers feel that there is but little inducement to them to do business on a 15c. retail market, and operators are still engaged on old orders, there being practically no tonnage of free coal offered. Purchasing agents from different parts of the Middle West continue to arrive in Chicago, in an attempt to place orders, and so far, they have been able to get better results from jobbers, than operators, as some jobbers have coal to offer which was purchased before Oct. 30, and which is still being shipped.

To date, this week, the car situation at Indiana and Illinois mines has been about the same, with little, if any, improvement. Operators are watching very closely to see what the private owners of the roads will do, now that the railroads are back under their control. It is expected, and hoped, that conditions will improve from now on.

Not much improvement is expected this week, nor will it be expected next week. Some improvement in the service from the railroads is, and can logically be hoped for, within the next thirty or sixty days. When the railroads went back to private ownership the morale of the railroad employees was at a very low ebb, but I understand the railroads are taking steps to revive the old spirit in their men.

#### CHICAGO

Chicago wholesalers and operators are planning to take steps against what is left of the U. S. Railroad and Fuel Administration. Claim that in a great many cases their coal has been diverted without proper knowledge.

The center of complaint seems to be with a railroad official, at Cincinnati, who has been diverting coal destined to Chicago and this territory from mines in southeastern Kentucky, to a certain large steel company in Ohio. It is said Chicago wholesalers claim political influence has been brought to bear, and is responsible for these diversions. It is no exaggeration to say that the entire coal industry in the Middle West, as represented in Chicago, is sick and disgusted with the present administration.

#### ST. LOUIS

Car shortage continues in spite of change in railroad ownership. Railroads claim nearly all coal mined for company fuel. Winter weather prevailing.

Local situation is fairly good, everything considered, although there is a good demand for all kinds of coal, especially steam. The domestic demand has not been very heavy and will not continue to be, but it will be an even demand for sometime to come.

Trouble in the Standard and Mt. Olive fields seems to be that the railroads are able to take the tonnage mined leaving practically nothing for commercial shipments. The mines average about two days a week, some of them getting not more than a day and a half a week.

A better tonnage per man in this field is being produced with the passing away of the influenza epidemic. Prices are the same as last week.

#### MILWAUKEE

Coal in brisk demand, with an inadequate supply. Prices unchanged. An upward revision expected in the spring. Dealers claim coal has not kept pace with other necessities.

Anthracite coal is being doled out by the dock companies in small quantities in an effort to weather a period of extreme shortage. Even the soft-coal supply is threatened with stringency. Existing conditions in the coal market are attributed to congested freight service, unusually cold weather during the winter and decreased production at the mines.

Prices continue unchanged, but dealers agree that a rise is inevitable. A prediction was advanced that anthracite would command \$15 per ton on April 1, but the president of the Dominant Dock Co. extends the assurance that there will be no undue change in the price list before the opening of lake navigation.

He says: "A change in prices is expected after the findings of the presidential commission investigation are made public. Coal will undoubtedly be higher next year. Return of the railroads to private ownership, higher freight rates, release of government restrictions on coal and lack of production at the mines, all tend to higher prices."

Coal dealers generally insist that coal has not kept pace with other necessities of life, which have jumped from 100 to 300 per cent, while coal has been restricted to 50 per cent.

#### CONNELLSVILLE

Coke production increases slowly, as attested by pig-iron production reports. Consumers lose interest in negotiations for second half coke.

Production of coke by the byproduct ovens continues to increase slowly, with occasional backsets, through there being somewhat heavier receipts of coal. After one week in which it fell behind the January and early February rate of output the Connelville region has had a week showing the largest production for months.

During January and February there was loud complaint of coke shortage, and one would have inferred that the shortage was reducing the output of pig iron. Actual reports show, however, that pig iron was produced at 15 per cent greater rate in January than in December, that February showed a rate 6 per cent above the January rate, and that the rate March 1 was slightly above the February average.

The present rate of pig-iron production in the United States is 85 or 90 per cent of capacity, depending upon whether capacity is estimated on a conservative or on a fairly liberal basis. Production of beehive and byproduct coke combined is much less than 85 per cent of capacity, hence it is clear that with adequate transportation and labor supplies there will be no difficulty in making all the coke that can be consumed.

There is less talk now about second-half contracts for Connelville coke, after coke operators had referred to \$8 to \$10 as probable prices for furnace coke. Blast furnaces are finding their pig-iron market very sluggish, with possibilities of prices declining, and are quite indisposed to enter into negotiations for second-half coke at what they consider fancy prices in view of the new circumstances.

There is no Connelville coke to be had in the open market, at least at Government limits, except off grades, which readily bring the full price. The market remains quotable at Government limits, which are likely to come off April 30: Furnace, \$6; foundry, \$7; crushed, over 3-in., \$7.30, per net ton at ovens.

The Courier reports production in the Connelville and Lower Connelville region in the week ended Feb. 28 at 243,035 tons, an increase of 12,878 tons.

#### BUFFALO

Situation is unchanged. It was hoped that the ore rates would be made by this time, so that the season's operations would be under way somewhat, but the shippers have not done anything yet.

The rates of 1918 seem to be assured, though, in fact, the vessel owners would not accept less. Coal has been rather scarcer than ore and between the two the Rogers-Brown furnace at Tonawanda is reported shut down. It is the only one that has had to close here, though some others came very near it. Coke prices remain on the basis of \$9.60 for 72-hr. Connelville foundry, \$8.60 for 48-hr. furnace, \$7 for off grade, \$7.75 for domestic sizes and \$5 for breeze, all per net ton, f.o.b. Buffalo. A better condition is expected real soon after March 15.

**STRUCTURAL MATERIAL**—The following are the base prices, f.o.b. mill, Pittsburgh, together with the quotations per 100 lb. from warehouses at the places named:

	—New York—			
	Mill Pittsburgh	Current	One Year Ago	St. Louis
Beams, 3 to 15 in.	\$2.45	\$3.97	\$4.07	\$4.04
Channels, 3 to 15 in.	2.45	3.97	4.07	4.04
Angles, 3 to 6 in., ½ in. thick.	2.45	3.97	4.07	4.04
Tees, 3 in. and larger	2.45	4.02	4.12	4.04
Plates	2.65	4.17	4.27	4.24

**BAR IRON**—Prices in cents per pound at cities named are as follows:

	Pittsburgh	Cincinnati	St. Louis	Birmingham
	4.00	3.50	3.44	4.25

**NAILS**—Prices per keg from warehouse in cities named:

	—New York—				
	Mill Pittsburgh	St. Louis	Chicago	Birmingham	San Francisco
Wire	\$4.50	\$4.50	\$4.15	\$5.75	\$5.50
Cut	4.925	5.40	7.00	.....	6.90

**TRACK SUPPLIES**—The following prices are base per 100 lb. f.o.b. Pittsburgh for carload lots, together with the warehouse prices at the places named:

	—New York—				
	Pittsburgh	Chicago	St. Louis	San Francisco	Birmingham
Standard railroad spikes ½-in. and larger	\$3.35	\$3.62	\$4.44	\$5.65	\$4.75
Track bolts	4.90-5.00	4.62	Prem.	6.65	7.00
Standard section angle bars	2.75	2.75	3.44	4.60	.....

**COLD FINISHED STEEL**—Warehouse prices are as follows:

	—New York—			
	Mill Pittsburgh	Chicago	Cleveland	St. Louis
Round shafting or screw stock, per 100 lb. base	\$5.50	\$5.40	\$5.50	\$5.00
Flats, squares and hexagons, per 100 lb. base	6.00	5.90	5.50-6.00	5.50

**HORSE AND MULE SHOES**—Warehouse prices per 100 lb. in cities named:

	—New York—				
	Mill Pittsburgh	Cincinnati	Chicago	St. Louis	Birmingham
Straight	\$5.75	\$7.50	\$7.00	\$7.25	\$7.00
Assorted	5.85	7.50	7.15	7.50	7.25

Cincinnati—Horseshoe nails sell for \$4.50 to \$5 per 25-lb. box.

**CAST-IRON PIPE**—The following are prices per net ton for carload lots:

	—New York—				
	Current	One Month Ago	Year Ago	Chicago	St. Louis
4 in.	\$70.30	\$70.30	\$65.70	\$75.80	\$71.00
6 in. and over	67.30	67.30	62.70	72.80	68.00

San Francisco \$92.55, Dallas \$70.30. Gas pipe and 16-ft. lengths are \$1 per ton extra.

**STEEL RAILS**—The following quotations are per ton f.o.b. Pittsburgh and Chicago for carload or larger lots. For less than carload lots 5c. per 100 lb. is charged extra:

	—Pittsburgh—		—Chicago—	
	Current	One Year Ago	Current	One Year Ago
Standard Bessemer rails	\$45.00	\$55.00	\$45.00	\$65.00
Standard openhearth rails	47.00	57.00	47.00	67.00
Light rails, 8 to 10 lb.	2.585*	3.135*	2.585*	3.135*
Light rails, 12 to 14 lb.	2.54*	3.09*	2.54*	3.09*
Light rails, 25 to 45 lb.	2.45*	3.00*	2.45*	3.00*

\* Per 100 lb.

**OLD MATERIAL**—The prices following are per gross ton paid to dealers and producers in New York. In Chicago and St. Louis the quotations are per net ton and cover delivery at the buyer's works, including freight transfer charges:

	New York	Chicago	St. Louis
No. 1 railroad wrought	\$28.00	\$26.00	\$28.50
Stove plate	25.00	31.00	34.00
No. 1 machinery cast	32.00	38.75	39.00
Machine shop turnings	15.00	13.85	16.50
Cast borage	18.00	14.25	16.50
Railroad malleable cast	25.00	30.00	28.50
Rolling rails	33.00	32.00	32.50
Relaying rails	50.00	40.00-50.00	45.00-50.00

**COAL BIT STEEL**—Warehouse price per pound is as follows:

	New York	Cincinnati	Birmingham	St. Louis	Chicago
	\$0.10	\$0.16½	\$0.18	\$0.11	\$0.15

**DRILL STEEL**—Warehouse price per pound:

	New York	St. Louis	Birmingham
Solid	14c.	13c.	15c.
Hollow	16c.	.....	.....

**PIPE**—The following discounts are to jobbers for carload lots on the Pittsburgh basing card, discounts on steel pipe, applying as from January 14, 1920, and on iron pipe from January 7, 1920:

BUTT WELD					
Inches	Steel Black	Galv.	Inches	Iron Black	Galv
½, ¾ and 1	47	20½	1 to 1½	34½	18½
1½	51	36			
2 to 3	54	41			
2	47	34	2	28½	14½
2½ to 6	50	37	2½ to 6	30	17½
BUTT WELD, EXTRA STRONG PLAIN ENDS					
½, ¾ and 1	43	25	1 to 1½	34	19½
1½	48	35			
2 to 3	52	39			
LAP WELD, EXTRA STRONG PLAIN ENDS					
2	45	33	2	29½	16½
2½ to 4	48	36	2½ to 4	31	19½
4½ to 6	47	35	4½ to 6	30	18½

Stocks discounts in cities named are as follows:

	—New York—		—Cleveland—		—Chicago—	
	Black	Galvanized	Black	Galvanized	Black	Galvanized
½ to 3 in. steel butt welded	40%	24%	40%	31%	54%	40½%
¾ to 3 in. steel lap welded	35%	20%	42%	27%	50%	37½%

Malleable fittings. Class B and C, from New York stock sell at list + 23%. Cast iron, standard sizes, net.

**WIRE ROPE**—Discounts from list price on regular grades of bright and galvanized are as follows:

	New York	St. Louis
Hercules red stand, all constructions	20%	20%
Patent flattened strand, spiral and cast steel	20%	20%
Patent flattened strand, iron rope	5%	5%
Plow steel round strand rope	35%	35%
Special steel round strand rope	30%-10%	and 5%
Cast steel round strand rope	22½%	22½%
Iron strand and iron tiller	5%	5%
Galvanized iron rigging and guy rope	+12%	+12%

San Francisco: Galvanized, less 5%, bright less 25%. Chicago, +12½ on galvanized, 30 off on bright.

## Penalties of Usefulness

By R. DAWSON HALL

LOOKING at the new Cummins-Esch railroad bill, we come upon unmistakable evidence of the fact that railroads are, or at least have been, of great public utility. If they had not been, what occasion would there have been for making the income of the railroads matters of close control by the Interstate Commerce Commission?

If the railroads had not been so essential, we would not have arranged that if they earn over 6 per cent, one-half of the excess is to go to the reserve fund of the road and the other half to the General Railroad Contingent Fund. The road can divide with its stockholders and bondholders nothing that is earned over 5½ per cent. The next half per cent earned is to make provision for improvements, betterments or equipment and all the excess above that percentage is to be either laid away for a rainy day or to be placed in the General Railway Contingent Fund to be lent to the railroads at 6 per cent.

This is the stigma and these are the penalties of usefulness—a mark of Cain and a consignment to penury. It will not be for long, however, for if it is continued such treatment is sure to make our railroads less and less useful year by year. A hobbled horse draws no load and competing with him there are still unfettered steeds. There is the auto truck which uses, without pay or with inadequate pay, the public roads, the public bridges, the city streets—that “flexible” unit which the automotive press so eloquently praises. Its profits are suffered to be as flexible as its services.

The auto truck and the electric wire will take the place of the railroad but they will be unquestionably regulated in their turn. In time the former will find that the public has put a brake on its axles, a skid under its wheels and a chain between its spokes. The automobile, gay and debonnair, richly painted and upholstered, may largely escape so long as privately owned because its usefulness is not so evident. But the auto truck and the taxicab will find the penalties of usefulness eventually crippling their prospects. Till that time, till auto trucks are numerous enough to satisfy the public, rates will be at the owner's whim and profits unregulated, and the railroads will suffer.

The utilities corporation newly seeking a franchise may find conditions favorable, while old utilities long ago established and having served the public for years will be required to give service without chance of a return equal to that granted less valuable servants. For a while we must pamper the auto truck, motor bus and power line, for we wish to encourage them to enter the battle of industrial life, but once established the iron heel of regulation will press out their life as it has already pressed out the life of the railroads.

Some day, perhaps the “iron horse” will be so crippled as to be useless and not useful. It is finding it hard today to haul enough coal to keep running. When it fails utterly we shall begin to realize that we still need it as we did in the days before and just after the civil war, when we prodigally offered anything and everything if the railroads would consent to come and serve us.

# IDEAS AND SUGGESTIONS

PRACTICAL SCHEMES THAT MAKE THE DAY'S WORK EASIER

## Drill Holder for Drill Press

On the drill press in the machine shop of the Burnside Colliery of the Philadelphia & Reading Coal & Iron Co. near Shamokin, Pa., there is installed a rather interesting stand for holding different-sized drills.

DRILL HOLDER AND PRESS

This holder is a double-deck affair consisting of two sets or pairs of circular disks as shown in the accompanying illustration. These disks have corresponding holes of various sizes in the upper and lower plates to hold the drills. The larger drills and therefore the larger holes are placed near the center while the smaller ones are at the edge. This allows the operator to select any drill he desires by simply glancing at the drill holder. Each pair of disks is arranged so that it can be rotated. It is extremely easy to increase the capacity of one of these drill holders, as all that is necessary to do is to increase the diameter of the plates which will permit more holes and therefore more drills. It is also possible to increase the capacity by having more sets of the horizontal plates.

## Arrangement for Closing Mine Doors

At the Burnside Colliery of the Philadelphia & Reading Coal & Iron Co. near Shamokin, Pa., a small portable pulley for use in closing a mine door has been designed.

This pulley is provided with a hook so that it can be

DOOR PULLEY AND BRACKET

hung over the lagging at any point desired. Over the pulley at the extremity of the hook a chain passes, one end of which is attached to the door, while a weight is fastened to the other.

The advantage of having this pulley adjustable is that it can be placed easily in any desired position and adjusted from time to time, thereby allowing the door to work to the best possible advantage.

## Safety Stop for Drag-Line Scrapers

The St. Clair Coal Co. at St. Clair, Pennsylvania, has installed a safety device designed by one of its em-

DRAG-LINE STOP IN PLACE ON CONVEYOR

ployees, John Bound. This prevents the drag line scraper from sliding back down the trough in case of a breakdown to any portion of the driving machinery.

## Fastener for Double Doors

A home-made door fastener for double doors has been made at the Burnside Colliery of the Philadelphia & Reading Coal & Iron Co. near Shamokin, Pa. This con-

FASTENER FOR DOUBLE DOORS

sists of a steel disk  $\frac{1}{4}$  in. thick with a handle attached. This disk is pivoted in the center and provided with two circular slots about  $\frac{1}{2}$  in. wide on opposite sides.

Two pieces of bar steel  $1 \times 1 \frac{1}{2}$  in. are fastened by means of bolts at the end through the slots. The upper end of these bars engage in the casing of the door at top and bottom. By moving the lever on the disk the bars raise or lower, locking or unlocking the door.

# A War-Time Plant in the Pittsburgh Field

A Plant Built During the Strenuous War Period Embodies Many Elements Tending Toward Reliability—Power Is Purchased. But a Gasoline Engine Driven Unit Is Provided as a Standby

BY DONALD J. BAKER  
Pittsburgh, Pa

**D**EVELOPMENT booms began in the Pittsburgh district during the early months of 1917 when operators, while sure that victory would rest with the Allied Powers, believed that the struggle would be long drawn out. Many of the new plants upon which construction work was started in the early months of the war are only now being completed. Con-

the background of the older operations by reason of their sturdier and more complete equipment. They are now assuming the leading role as the greatest single producers in their fields.

With few exceptions, the design and general layout of the surface buildings has been made with but one end in view. That goal was to produce a maximum

VIEWS IN AND ABOUT LINCOLN HILL

(1) General view of the tipple and surroundings. (2) Types of dwelling houses. (3) Blacksmith, carpenter and machine shop. The saw-tooth roof affords excellent lighting. (4) Company store. (5) The material-storage or warehouse building.

struction of many of these developments began in April, May or June of 1917. Quite a few of the estimates made by competent military men then placed the duration of the war from three to five years. This fact undoubtedly bore considerable weight with the operators.

The wholehearted co-operation that was manifested by the coal industry in winning the war is now history. Although these plants were not subjected to the strenuous days for which they were designed, we find them today standing out in bold relief against

amount of coal under the exacting stress of war time and its resultant conditions. There is precious little time afforded for general upkeep or repairs in a period that cries for coal and more coal and if the mine is to be kept operating at full speed the original equipment must not only be made of the finest materials obtainable for the purpose in hand but the design, must be compact and convenient

These new operations around Pittsburgh reflect high credit upon their owners and will stand throughout

their periods of operation as monuments of their projectors' patriotism. When the war ended, the coal industry was just becoming organized. Had hostilities continued for two more years, the organization would have been nearly complete.

War caused these plants to be constructed as they have been, and in this respect the overt acts of the present Holland wood-cutter have placed the industry on a new level. In the younger days of the industry, a plant grew up over night. The surface buildings of the mine were constructed of the cheapest materials available and in the quickest possible manner. The houses of the workers were "thrown together" quickly and conveniences in them were overlooked. This fact has doubtless retarded the Americanization of the mining population—which is largely a foreign one—more than anything else; for to encourage interest in a house that is not a home is nearly impossible, or at best is accomplished under many difficulties.

#### HOUSES CAN BE MADE HOMES

We are told by psychologists that the base of real Americanism is the hearthstone. How can we then expect to lay a firm foundation against radicalism where there are no hearthstones? In the early days of the industry, the human element was cast aside when the mines were opened, and today we are in many respects to blame for the fact that "Soviet Arks" are plying between our shores and Russia.

Fortunately times have changed and today the industry is on a more solid footing, at least from the engineering and sociological standpoint. It is a pleasure to visit the new operations. An impression is gained that is refreshing, for the conviction is forced upon us that here is a business and not merely a venture. In the long run, the original capital invested will be returned much quicker than at those plants that had a mushroom growth, for there is a greater ease in handling the output and repairs are few and far between. It took the war to impress upon us some of our own shortcomings—things that should have been widely known and recognized long ago.

One of the plants that dated its growth from the month when war was declared is that of the Lincoln Gas Coal Co., which is situated at Lincoln Hill in Washington County about 3 miles west of Washington on the pike to Wheeling, W. Va. This operation is a subsidiary of the Pressed Steel Car Co. of Allegheny and McKees Rocks, Pa., and is allied with the Hill-

man Coal & Coke Co. of Pittsburgh—a company that has an annual production of 10,000,000 tons of coal. Twenty-two hundred acres of coal are embraced in the tract that will be developed. The coal is that of the Pittsburgh bed and averages 6 ft. in thickness.

The first stone in the construction of the plant buildings was turned on April 6, 1917 and on Aug. 26, 1918 coal was run over the tippie. This is a relatively short period of time and seems even shorter when the labor difficulties of that period are recalled. The labor problem was fraught with uncertainty, for the draft boards were in full session and men knew not when they must answer their country's summons. Furthermore, the railroads were decidedly unreliable by reason of war-time restrictions that included many embargoes on highly needed materials.

George Wilson, superintendent at Lincoln Hill, has been in charge of the property for the past two years or more. Baton & Elliott, mining engineers of Pittsburgh, designed and supervised the construction of the plant buildings as well as the underground layout. The Mather operation which was described in the Nov. 13 and 20, 1919 issue of *Coal Age* was also designed by the same firm as was the community amusement building of the Hillman Coal & Coke Co., at Hillcoke, Pa., a description of which appeared in the Oct. 9 issue of the same year.

#### BOTH SHAFTS ARE CONCRETE LINED

Two shafts have been sunk at Lincoln Hill, one 452 ft., and the other 469 ft. in depth. The latter is the main-hoisting shaft. It is concrete-lined and is 32 x 11 ft. in dimensions. It is divided into three main compartments, two of which are utilized in hoisting, while the other is an air compartment, 11 x 9 ft. in size. There is also a pipe compartment. Vertical ladders have been constructed that lead to a platform landing every 18 feet.

The air and material shaft is likewise concrete lined and is a duplicate of the hoist shaft in general overall dimensions. It contains two hoist compartments as well as one for the unobstructed passage of air. A vertical ladder in this shaft leads to a platform at a depth of 60 ft. where a pump has been installed. Both shafts are equipped with Connellsville Manufacturing & Mine Supply Co. cages; the self-dumping type being installed for coal hoisting.

The main tippie is of wood construction with corrugated asbestos siding. Keasby & Mattison of Pittsburgh supplied this latter material. The headframe

One compartment of the shaft is an upcast connected to the fan located a short distance away. A second compartment is used for hoisting and lowering men and materials.

here is of steel, 115 ft. high with 10-ft. sheaves. Both tippie and headframe were erected by John Eichleay & Sons of Pittsburgh. Within the tippie there is a weigh basket, gravity screens and car retarders, all manufactured by the Phillips Mine & Mill Supply Co.

The coal is not hand picked and considerable of the output will be loaded as mine-run, although some will be sized. All apparatus has been installed in such manner as to insure the least amount of labor being employed on the tippie. The cars dump into a receiving hopper that feeds by gravity to the screens from the weigh basket. From the screens there is an unrestricted run to the railroad cars beneath. Loading booms have been provided for the lump sizes. Rock is dumped into a special bin and later removed to the rear of the building by trolley-type slate larries.

**ROCK DISPOSAL IS AN IMPORTANT PROBLEM**

Much rock and refuse have been encountered inside the mine and the rapid handling of this material on the surface had to be provided for in the design of the tippie. The hoisting apparatus has been laid out to accommodate 3,000 tons of material in 8 hr. but is is doubtful if that amount of coal will ever be run over the tippie because of the rock that must be moved during development work.

There is a decided contrast between this tippie, which is practically mechanical in its operation, and others that are more commonly seen, and which employ from 10 to 20 men.

The air-shaft tippie is a temporary wooden structure that is at present used for supplying domestic coal needs. This tippie is equipped with one hand-operated dump. It will be merely mentioned here as it is not one of the main plant units. A substantial wooden headframe is situated over the air and material shaft.

A combination lamphouse, hospital and mine-foreman's office is located near the air-and-material shaft and is of brick construction with tile roof and cement flooring. The location of this building is nearly ideal. It is in a direct line with the route taken by the men in going to and from work. The hospital entrance

gerous diversions of air currents that sometimes occur through door sets being carelessly left open will be indicated on the water gage and show that something is wrong with the circulation. In the efficient and intelligent supervision of a mine, the water gage plays an important part and should be under surveillance at all times.

The hospital comprises one room which is adjacent to the mine-foreman's office. In it are contained four sets of Draeger breathing apparatus and a Draeger recharging oxygen unit. A lungmotor, manufactured by the Life Saving Services Co. is also part of the

**A STANDBY GENERATING UNIT**

In case of power failure this gasoline engine-driven generator may be put to use operating the plant and feeding any excess energy into the transmission line.

equipment. The room is fitted with table, desk, medicine cabinet and lavatory. The nearness of the building to the shaft is an important first-aid factor.

The secondary hoisthouse is divided by a brick partition so as to bring the substation under the same roof. This building, 72 x 32 ft. in dimensions, is of the same characteristic construction as the rest of the plant units; viz., cement floor, brick walls, tile roofing, carried on steel roof trusses. Power for the operation of the mine is purchased from the West Penn Power Co.

The reduction of the high-tension line of 22,000 to 2,200 volts, is made at an outdoor transformer station that is located in the rear of the building.

Two Westinghouse 200-kw. 60-cycle transformers are employed in stepping down the current. From the transformers, the 2,200-volt lines pass to two 290-hp. Westinghouse motors driving two Westinghouse 200-kw. 250-volt direct-current generators. These machines operate at 900 r.p.m.

One unit in the substation that has not been generally installed elsewhere is a Van Blerc high speed marine gasoline engine direct-connected to a 100-kva. 2,400-volt Westinghouse alternating-current generator. This unit is equipped with a Leece-Neville automatic circuit-breaker. This auxiliary power plant will only be operated during such times as the service over the high-tension lines is below par.

The idea of driving an alternating-current generator by a gasoline engine is not a new one but it is a practice that might well be more generally followed. The arrangement is highly compact, a fact that in

**TIPPIE AND HOISTHOUSE**

This equipment has been designed to hoist and prepare 3,000 tons of coal daily. The tippie is practically mechanical in its operation throughout.

faces the shaft. The main portion of the building houses 400 Edison safety lamps which are shelved and recharged through rheostats. There is an electrically operated Rochlitz water-still in this room.

The mine-foreman's office adjoins the lamp room and contains the water-gage register. This little detail of arrangement might well be more generally followed, instead of having the location in the fanhouse. Dan-

itself is an influential one where minimum space is desired in housing the auxiliary power plant. However, the boiler house has its advantages, especially in those regions where the high-tension lines are liable to be out of commission for any appreciable length of time.

Gasoline consumption is an important cost item if the engine must be operated over long periods. A large slate-panel switch-board completes the equipment in the substation. All of the electrical installations at Lincoln Hill are of Westinghouse manufacture.

A wing of the substation is utilized as a pump room and contains a 5 x 7 in. electrically-driven horizontal Scranton pump. This stands directly over a 19,000-gal. concrete reservoir which provides the water for town and plant consumption. The water is pumped from this point to a 57,000-gal. tank on one of the adjacent hillsides. From here it flows by gravity to the town through 4-in. cast iron pipe.

As has been already mentioned, the secondary hoist-house adjoins the substation. Equipment here consists principally of a Vulcan hoisting engine with a 6-ft. drum which is direct connected to a 300-hp. motor. A cable 1 $\frac{3}{8}$  in. in diameter is used.

The main hoisthouse is 43 x 38 ft. in dimensions, and contains a Vulcan hoisting engine with a conical drum that ranges from 7 $\frac{1}{2}$  to 10 $\frac{1}{2}$  ft. in diameter. This hoist employs a 1 $\frac{3}{8}$ -in. cable and is geared to a 1,000-hp. Westinghouse motor. Both hoists are equipped with automatic safety appliances for regulating the speed of the drum, length of cable payed out, etc.

Another of the main buildings of the surface plant is a combined blacksmith, machine, and carpenter shop. As can be noticed in one of the accompanying illustrations, the design of this building is unique, in that the separate rooms are practically distinct buildings. The blacksmith shop is equipped with forges, and electrically-driven blower fans.

The carpenter shop contains an electric saw, shaper, etc., while the machine shop is provided with a power driven hack saw, pipe machine, lathe, and drill press. Equipment within the building as a whole is not complete as yet. The general design was primarily influenced by the desire to obtain as much natural light as possible. Work carried on inside these shops is thus made easy and effective.

#### VENTILATION PROBLEM IS SIMPLE AS YET

The fanhouse, which is 34 x 18.5 ft. in dimensions, contains a 5 x 14-ft. double-inlet, reversible Jeffrey fan. This is connected by belt to a 30 hp. Westinghouse motor. The ventilation problem is comparatively simple so far, since the main entries have been driven scarcely 1,000 ft. and development of the coal is still in the primary stages. In this respect the construction of the surface buildings has been keeping ahead of the underground work.

A supply house, 70 x 61 ft., is utilized for storing spare parts and various materials. Three other buildings might be mentioned, although these are not directly as important as the ones already described. One of these is a magazine, 20 x 14 ft., which is constructed entirely of concrete. It is, of course, located some little distance from the plant proper. An explosive cap or detonator house, 7 x 5 ft., is of brick and concrete construction while the other building is utilized for the storage of such materials as oil, sand and cement.

A spur is now under construction to this building and these materials will be unloaded as far as possible by mechanical means. Another track from the building to the air and material shaft will minimize the amount of labor required in handling these materials and at the same time bring them within easy access of the shaft. The rapid rehandling of all supplies regardless of their nature is a necessity if steady production is to be maintained. This can readily be seen.

Arrangements at the shaft bottom are rather elaborate. The main haulageways are 19 ft. wide, arched and concreted for a distance of 150 ft. on either side. The loaded cars on one side of the bottom are engaged by a car-feeder and are pulled nearly to the shaft. They then run a short distance by gravity and are caged. The empty cars as they come off the cage, run by gravity to a kickback after passing which they are engaged by a car haul and are pulled up a short incline to enter the storage tracks.

The mine cars are of 2 $\frac{1}{2}$  ton capacity and constructed with steel sides and wooden bottoms. They were supplied by the Pressed Steel Car Co. A track gage of 44 in. is employed with 60-lb. rails on the main haulageways. Four 6-ton Jeffrey locomotives are in use at present. Heavier machines have not been purchased thus far as the development work has not reached a stage that necessitates their use. Other equipment underground includes two 7 $\frac{1}{2}$ -ft. breast machines and six Goodman shortwall gasproof mining machines. A cement gun has been purchased and is finding considerable use in the work of driving entries which are gunited as soon as completed.

#### DRAINAGE WATER WILL BE PUMPED

The water from the mine will be directed to one main pump and thence voided to the surface through a 4-in. discharge line by two 5 x 7-in. horizontal Scranton pumps. Other pump units probably will be portable ones. At present one 3 x 5-in. Austin field pump with a 2-in. discharge line is in use. However, it is a little hard to prophesy now, just how extensive the final pumping arrangements will be, as the mine is not yet in a stage of development that would justify an approximation of the amount of water that will eventually be encountered. From indications, however, there will be plenty.

Railroad connections are with both the Baltimore & Ohio and the Pittsburgh, Cincinnati, Chicago & St. Louis lines. A storage yard wherein 85 empty cars may be accommodated has been constructed as well as one with a like capacity for loaded cars. In less serious vein, this appears to have been the only "slip-up" in the surface layout. Where the cars are coming from to fill this yard is a secret that others would like to share. One answer to this question might be found by consulting either the ouija board or the gypsy dream book.

**Duty to Keep Mine Premises in Reasonably Safe Condition.**—Where a coal mining company's employee's duties in spragging tram cars diverted his attention from a runway along which he was required to move, the company is liable for injuries sustained by him through stumbling over an obstruction negligently permitted by the company to remain in the runway. (*New Mexico Supreme Court, Leyba vs. Albuquerque & Cerrillos Coal Co., 164 Pacific Reporter, 823.*)

# How An Anthracite Breaker Was Remodeled—II

Imperfect Preparation Made Necessary the Remodeling of the Breaker, but the Change Paid Well, for the Payroll Also Was Cut \$140,000 a Year—Wet Preparation Adopted Is Much Simpler and More Efficient Than Dry

BY DEVER C. ASHMEAD  
Tarrytown, N. Y.

IN remodeling the Old Forge breaker the first and probably the most important reason lay in the character of the coal itself since it did not lend itself well to the old method of preparation. The second reason was the fact that too much labor was employed and during the war every man's help counted. The third reason was that the cost of operation of the breaker had become too high; since the average pay roll for every man and boy was \$1,000 a year, a reduction in the number of

the cross-section of the new breaker as shown on p. 534, and when this movement is compared with that in the old breaker, as shown in the first part of this article in the issue of *Coal Age* on March 11, 1920, p. 483.

In the old breaker the coal was brought in mine cars to the top of the building by means of a car haul, and there dumped. A rotary feeder discharged coal to grizzleys where the lump and steamboat were removed and delivered to a traveling table where bone and slate

FLOW SHEET OF THE OLD FORGE BREAKER BEFORE REMODELING

This flow sheet shows how the coal in the Old Forge Breaker was treated before being remodeled. By referring to the new flow sheet it will be seen what a vast difference there is between the two methods.

men from 156 to 16 made a considerable saving and warranted a large capital investment. The fourth reason was that the old structure showed signs of weakening after 18 years of continuous use and the foundations were rotting. It can be easily seen that the above four reasons were sufficient to warrant the cost involved in remodeling this breaker.

The old structure was a dry breaker and an interesting comparison can be made between the old and new flow sheets as shown in the article. Furthermore, the movement of the material readily can be traced in

were picked out. The coal then went to a set of rolls and was crushed to the sizes of grate and egg. If it was not desired to make grate coal, this size was again crushed to egg in another set of rolls. If grate coal was to be made this size was run through an Emery picker and the refuse separated from the coal which went direct to a pocket. The refuse passed to a set of rolls and was crushed, then went over a shaker and the egg size passed through an Emery picker which separated the coal from the refuse. The coal went direct to the egg pocket and the refuse to the rock conveyor

which took it to the rock dump. The fine refuse that passed through the shaker went to the condemned coal conveyor and was given retreatment.

The egg coal from the lump rolls received the same treatment that has just been described, except that when there were insufficient orders for the egg or grate coal these sizes were passed through a set of rolls and crushed, then passed over a shaker, the egg and stove removed, and the fine coal sent over another shaker separating the chestnut and the pea. The fine coal from this shaker was taken by a conveyor to the washery for fur-

ers where the stove and chestnut sizes were removed from the fine material which was sent to the washery by conveyor for retreatment. The grate, egg, stove and chestnut were treated exactly the same as the grate coal and the refuse was handled in the same manner.

The washery had been remodeled since its original construction and the coal was carried from the breaker by means of a conveyor. This is discharged into an elevator leading to the top of the washery. Here the coal was passed over a wet shaker and the large rock,

FLOW SHEET OF THE REMODELED OLD FORGE BREAKER

A great difference is shown between the two flow sheets, the old breaker was a dry one, while the new breaker is wet. The change in the method of handling the coal made a difference of 140 men. The old breaker required 156 men to operate while the new breaker requires only 16 men.

ther treatment. Each of the above sizes—egg, stove, chestnut and pea—received the same treatment that the grate coal received, as previously described. The clean coal went to the pockets, the first refuse produced to the condemned coal conveyor and the final refuse to the rock conveyor.

The coal that passed through the lump and steam-boat bar screens was sent to an old-fashioned revolving screen and the grate and egg coal separated. The coal going through this screen passed to a set of shak-

ers where the stove and chestnut sizes were removed from the fine material which was sent to the washery by conveyor for retreatment. The grate, egg, stove and chestnut were treated exactly the same as the grate coal and the refuse was handled in the same manner. The chestnut and pea were separated from the fines. The rock, when picked from the coal, went directly to the rock dump. The chestnut and pea passed to jigs, and from thence to the pockets. The refuse was sent to rolls where it was recrushed and sent back to the main shaker. The fine coal from the first shaker was passed over another shaker and the buckwheat, rice, barley and culm separated. The buckwheat, rice and barley went to their respective pockets while the culm went to the culm bank.

In the main breaker there was a double set of pockets that would accommodate the grate, egg, stove, chestnut, and pea, while in the washery there were 5 pockets, one each for the following sizes—chestnut, pea, buckwheat, rice and barley. The rock was all carried to a rock pocket at the rear of the breaker from which it was loaded into cars and hauled to the rock dump by a steam locomotive.

The method of treatment in the new breaker is entirely different from that employed in the old one. It is a wet method from start to finish whereas almost the whole treatment in the old breaker was dry, with the exception of that given the fine coals at the end.

At the present time the coal is brought to the top of the breaker on the old car haul but in the spring this will be changed as the Pennsylvania Coal Co. is making arrangements to install a drag-line scraper to convey the coal to this point.

The coal will then be fed to a rotary feeder as in the old breaker but at this point an entire change in the

treatment begins. The coal from the feeder passes to a triple-deck shaking screen on which the lump, grate and egg are sized and the fine coal passes through. The lump coal passes over a picking table where the rock is separated and sent to the rock conveyor. The lump coal itself goes to a set of rolls where it is crushed to grate and smaller and then passes to a double-deck shaker on which egg, stove, chestnut and fine coal are made. The egg coal goes to the egg jig and the clean coal from the jig goes to the egg-coal pocket; the bone and rock from the jig are hand-picked and the rock is sent to the rock conveyor while the bone is taken to the bone rolls and is crushed and then sent to the condemned coal conveyor.

TREATMENT OF STOVE COAL

The stove coal from the egg, stove and chestnut shaker goes direct to the stove-coal jig where it is given exactly the same treatment that the egg coal received. The chestnut coal goes from the same shaker to the

LONGITUDINAL ELEVATION OF THE OLD FORGE BREAKER

As will be seen by comparison with the elevation of the old breaker as shown in the first half of this article, which appeared last week in Coal Age, Fig. 1, p. 483, there has been a vast improvement in the arrangements of the breaker.

chestnut jig and the clean product goes to the chestnut coal pocket while the bone and rock are passed over a shaker and the fine material goes to the bone coal conveyor while the large pieces go to the waste rock conveyor.

Now going back to the grate coal made on the first screen, this is sent to the grate jig and the rock is removed and goes to the rock conveyor, the coal and bone passes on to a roll and from thence to a shaker of 4 decks on which egg, stove, chestnut, pea and fine coal is made. The egg coal from the lump shaker as well as that from the grate shaker unite and go to the egg jigs for treatment. The stove coal goes to the stove jig, the chestnut to the chestnut jigs and the pea to the pea jigs. The fine coal from the lump shaker unites with that from the grate shaker and the fine coal from the grate shaker unites with that from the lump roll shaker and that from the first grate roll shaker and the whole combination passes to a shaker having 4 decks on which pea, buckwheat, rice, barley and culm are made. The pea coal goes to the pea jig for treatment but the buckwheat, rice and barley go to their proper pockets while the culm passes to the culm conveyor.

The coal from the lip screens, from the various jig screens, and from the bone coal rolls is taken by an elevator to the second grate roll shaker for retreatment. The rock from the rock conveyor is transported to a concrete pocket in the rear of the building and from there hauled by locomotive to the rock dump.

## Are All Men Equal?

BY THOMAS HOGARTH  
McIntyre, Pa.

WE ARE reading in the papers a good deal about Bolshevism, communism and a lot of other "isms" that claim they are *it*. No one can deny that as far as human nature is concerned, we all come into existence in the same way. We are all on an equal footing at that stage of life, and up to a certain age remain so. But from the time when we commence to think for ourselves, we become individuals, and from then on it is next to impossible to find two persons either in temperament or personality identical. What gives one pleasure or satisfaction may be a bore to the other.

Some people tell us that the only true way to live is to be all on an equal footing. Communism as I understand it, is life as one community, all sharing alike; the farmer, tilling the ground and raising enough food to supply the other workers, the miner producing the coal for the farmers and other industries; the other industries producing their different goods, and pooling them each individual taking enough food and clothing for his needs. In such a state of society no money will be needed.

This looks beautiful on paper, and I expect to reach this state of existence in the next world, but not while we are living on the surface of this old earth as human beings.

Let us just look squarely at life. Take the farmer and any other individual. For about six months in the year the farmer is working all the hours that he can see and feeds his stock by lantern light. Then after he has all his crops gathered in, and the weather is too bad for him to work in the fields, he has a comparatively easy time of it, and his life is fairly worth living. Some farmers, however, that live near a mine or some indus-

trial establishment and are anxious to make a little extra money, will go and work in, we will say, the mine, until the weather will permit their getting onto the land again.

### CONSIDER THE MINER

Now consider the miner under a communistic regime. He works, we will say, normally, six days a week, and eight hours a day. If he (for any reason) desires a day off he will have to state his case to the soviet and if it can find that he has a good excuse he can go, but he must be back for the next day, or there will be nothing for him to eat. The miner will then find fault with the farmer, and say he has no business to be away from his business during the winter and will not want him to take food out of the pool during the days he cannot work.

What will become of the output? The men will go to work at say seven in the morning. It may be that each man will have to produce a certain amount of coal for his day's work. One man is a good miner and an efficient worker. He produces his stint in three or four hours. The man in the next place takes eight or nine to secure the same tonnage. Those two are not going to be friends very long.

Then there are some wet places to be worked. One man will say, "I am not going to work there. I want a dry place." There will be no boss. How can there be any boss when all are equal? Furthermore, some men will not be willing to load coal and receive the same pay as the man who runs the motor. All of these are fruitful sources of misunderstanding, contention and strife.

Then coming right down to equality, some men have a natural gift for music, some for painting, and still others for breaking in horses. What man will spend ten or more years of hard study and then receive the same consideration as the man who is digging ditches? It is not human nature. Some men are constantly scheming to do something bad; others spend their time in doing all the good they can. Some men delight in war and fighting; others take pleasure in nothing but peace.

I have had a long mining experience and I have always found that it was possible for two men to work together and agree. But it is next to an impossibility to keep four or more men working in the same place and have all satisfied to share and share alike.

Those people who profess to advocate all this communistic tommyrot know well that what they are preaching is an utter impossibility and that it is through selfish motives that they preach it. Communism may come when we step over that line called death—but not before. It may be immortal but it is not mortal. To obtain such a state of existence will be to attain a beautiful heaven. And this cannot be on this side of the grave. How is it that so many believe these impossible theories? It must be through ignorance.

**Damages for Conversion of Coal.**—Where a railway company appropriates to its own use coal entrusted to it for transportation to the shipper's customer the measure of compensatory damages recoverable against the company is the market value of the coal at the point of destination, less the cost of transportation.

The motive which controlled the railroad in the conversion of the coal is no defense, although it may be shown where exemplary, as well as compensatory, damages are claimed by plaintiff. (*Tennessee Supreme Court, Roth Coal Co. vs. Louisville & Nashville Railroad Co., 215 Southwestern Reporter, 404.*)

# How Bituminous Coal Can Be Safely Stored\*

Almost Any Coal Can Be Successfully Stored if Only Adequate Precautions Are Taken in the Storing Process—Methods by Which Coal Can Be Safely Stored With Costs of Such Storage

BY H. H. STOEK†  
Urbana, Ill.

**A**LTHOUGH the necessity for storing coal was brought prominently to the attention of every one by the coal shortage during the winter of 1917-18, this was considered merely as one of the incidents of the world war and the lesson was promptly forgotten. When on Nov. 1, 1919, only about 70 per cent of the bituminous-coal output was stopped by a strike, the lack of coal on which to draw soon made it necessary to impose many of the war-time restrictions, thus demonstrating that in peace as well as in war times, the coal supply of the country is being furnished on a hand-to-mouth basis with a small reserve for emergencies. In this connection, Secretary of the Interior Lane in his annual report says:

The coal strike has brought concretely before us the disturbing fact that modern society is so involved that we live virtually by unanimous consent. Less than one-half of 1 per cent of our

population quit their work of digging coal and we are threatened with the combined horrors of pestilence and famine. It did not take many hours after it was realized that the coal miners were in earnest for the American imagination to conceive what might be the state of the country in, perhaps, another 30 days. Industries closed, railroads stopped, streets dark, food cut off, houses freezing, idle men by the million hungry and in the dark—this was the picture, and not a very pleasant one to contemplate. There was an immediate demand for facts.

Among the facts mentioned by Secretary Lane are: "Who is to blame that so small a supply is on the surface?" "Why should we live from day to day in so vital a matter as a fuel supply?" Recently, when re-reading the Presidential address of Abram S. Hewitt for the Institute at the Centennial meeting in 1876, I was struck by the following, which shows that regulation of the coal business is by no means a new problem:

And besides economy in mining and care in preserving, there must be regularity and stability in the operation of the mine. There can be no real profit where these operations are subject to constant interruption, caused by strikes or other artificial impediments. The loss of interest on the plant at the mines and in the lines of transportation, caused by any serious stoppage to the works, would, of itself, be sufficient to render investments of this kind unprofitable. Hence, the output must be regulated

\*Paper presented before the February meeting of the American Institute of Mining and Metallurgical Engineers, New York.  
†Professor of Mining Engineering, University of Illinois.

MANY THOUSANDS OF TONS OF COAL IN A BIG STORAGE YARD

One of the most flexible units yet devised for handling coal to and from storage is the locomotive crane equipped with a grab bucket. No less than three of these machines may be seen in this picture.

and proportioned to the wants of the market. But this regulation must be continuous and not spasmodic. To enable this to be done, large stocks of coal must necessarily be kept on hand, in order that any sudden demand may be properly met without any serious increase in price; and in dull times, the accumulation and restoration of the stocks will give ready employment to the miners to whose families the cessation of work is a calamity of the most serious character.

The solution of this part of the coal problem is of vital interest to the miner and operator who furnish the coal; to the railroads that transport it, to the wholesale and retail dealers who distribute it, and to all who use it for domestic or industrial purposes.

The storage of 5 to 10 per cent of the total yearly output of anthracite at the upper Great Lakes ports,

the industry which will greatly help the present just complaint of miners, operators and railroads due to slack working of the mines during the summer months.

The seasonal nature of the demand for coal and the unequal distribution of working time throughout the year and similar statistics have been forcibly presented by Doctor Smith and others.

The reason for the purchase of greater amounts of coal during the spring and summer months than are needed for current consumption and for the storage of the excess are briefly as follows:

- (1) To assure the consumer an adequate supply which

THIS CRANE SUCCESSFULLY "PUTS IT OVER"

To the left a locomotive crane provided with a special bent boom is shown in the act of discharging a bucket of coal that has been taken from the storage pile.

RIFLES A COAL PILE AS NEATLY AS A "TRANSOM JUMPER" ENTERS A STORE

At the right the crane is digging coal from the opposite side of the trestle. The special boom, with which this machine is fitted, permits this operation to be successfully accomplished.

SPECIAL MACHINES ARE SOMETIMES BUILT FOR STORING AND RECLAIMING COAL

to take advantage of water transportation during the summer and near the seaboard and even near the mines, together with the increased summer buying for domestic use, has done much toward equalizing the monthly production of that field and has actually caused greater monthly production during the summer than during the winter months.

The storage of anthracite and the storage of bituminous coals are by no means parallel problems; and certain difficulties must be overcome in connection with bituminous-coal storage that do not apply to anthracite. However, I believe that, although the problem is more difficult, it is feasible to store bituminous coal in large amounts so as to provide an adequate safety valve for

protects him against strikes, other labor disturbances, and uncertain railroad deliveries.

- (2) To take advantage of water transportation and low freight rates.
- (3) To secure the advantages of low prices.
- (4) To equalize the prices on different sizes of coal.
- (5) To avoid the maintenance by the railroads of equipment that is used for only part of the year.
- (6) To maintain a uniform rate of production at the mines.

These reasons and advantages are axiomatic to engineers and need no further comment. Assuming then that spring and summer purchase and storage of coal are advisable, the following questions naturally arise:

1. Where and by whom should coal be stored? The storage should be as near as possible and practicable to the point of actual consumption so as to insure to the user a steady supply and to avoid the extra cost and extra breakage incident to each rehandling and, also, so as best to utilize the transportation facilities. Storage at the point of actual consumption is, of course, frequently out of the question, for many householders have not adequate space in their cellars, since in the planning of houses sufficient attention is not given to the placing of the fuel supply. In the congested business districts of cities, space is too valuable for renting purposes to permit its use for storage; in such cases storage in any quantity at the point where the fuel is to be used is impracticable.

Many of the large users of coal provide a storage supply on the outskirts of the city or outside of the city limits, within the range of suburban railroad service or even motor-truck hauling distance. A striking example of this is the Commonwealth Edison Co., of

The large wholesale dealers, notably those who distribute water-borne coal from the upper Lake ports, must store hundreds of thousands of tons of coal throughout the summer and fall for distribution throughout the Northwest during the winter season. Municipal storage has been suggested, but the nearest approach to such a scheme is the storage yards of the U. S. Government in Washington, D. C., administered under the Bureau of Mines.

The railroads are interested in storage, not only as a transportation problem, but because they are the largest users of coal, using 25 to 30 per cent of the entire output. The coal-mine operator is interested in storing as an operating proposition that will enable him to run his mine more days per year and per week than he is able to do under present conditions. The car supply at the mine during the early part is usually better than during the latter part of the week, and by placing coal in storage he can take advantage of any extra cars that may thus be on hand. The demand for the

TRANSFERRING COAL  
FROM A CAR TO  
STORAGE

Flat-bottomed or gondola cars are particularly adapted to unloading by means of a grab bucket. Hopper-bottomed cars may be discharged from a trestle or into a pit and the coal picked up afterward.

Chicago, which in addition to storage piles at each of its power houses within the city keeps a supply of several hundred-thousand tons just outside the city limits. Some of this coal has been in storage for about 10 years; the supply is kept mostly for emergency purposes and is not drawn on for current uses. Most of the stored material is the ordinary central Illinois product from which all of the fine coal below  $1\frac{1}{4}$  in. has been removed. There has been practically no trouble from spontaneous combustion. During the strike of 1919, this storage supply was reduced to about 15,000 tons. Public-utility companies, byproduct coke ovens, and other metallurgical industries must store to insure continuous operation of their plants.

The ordinary coal dealer handles a comparatively small amount of coal, frequently not over 5,000 to 7,000 tons per year. This means that he cannot install expensive storage appliances unless he combines with a number of competitors. I do not know of any such combination storage among retailers. One company in Rock Island, Ill., has a number of storage bins, which it rents to retail dealers.

different sizes of coal varies with the seasons, and by having a storage pile he is able to supply this demand to better advantage. With storage facilities he can also fill out a day, even though the car supply may be short at the beginning or end of that period.

Since the problem concerns the producer, the transportation company, the distributor, and the consumer of coal, the benefits and the burdens arising from the storage of coal should be shared by all concerned. In ordinary times, the householder and the power-plant user are interested in storage merely as a matter of personal insurance against lack of supply; they are not interested in the economic advantages that may accrue to the mining companies and the railroad. Their interest must be stimulated by a share in any economic advantage that may come from storage. It is, therefore, advisable, and under normal conditions necessary, that a reduction in price be made during the spring and summer months to stimulate storage by the user. Many cannot pay the winter coal bill in a lump sum, and to provide for deferred payments the coal dealer usually adds 25c. per ton, which nets him about 6 per cent on

coal sold at \$5 per ton. During the war certain banks and municipalities proposed the loan of money with stored coal as security.

If the mine operator is to be benefited by storage through the more steady operation of the mines, he should expect to pay for this benefit by a slightly lower price during the summer and spring. If the railroad is to benefit, it should be allowed to differentiate in freight rates during the spring and summer. Also, where storage can be made only part way between the mine and the market, a through freight rate should be granted, permitting storage at the intermediate point without losing the advantage of the through rate to the normal market.

A shifting of only 50,000,000 tons from winter to summer will cause the production curve to be more evenly distributed, and this 10 per cent of the total production should be easily transferred from the winter to the summer months and be absorbed by the various industries that will be benefited.

2. Are all kinds and sizes of bituminous coal equally adapted to storage? All of the evidence available seems to show that the size of the coal, its freedom from dust, and the way in which it is piled are much more important elements in avoiding the inconvenience, and sometimes loss from fire, due to spontaneous combustion, than the choice coal from a certain mine or mining district.

All varieties of bituminous coal have been stored without spontaneous combustion resulting, and it is equally true that all varieties of coal have fired when stored, except possibly anthracite. This does not mean that all coals store equally well, as there is undoubtedly a difference in storage qualities in coal from different districts and even from mines in the same district. The kind of coal that is to be stored should be inquired into and, when possible, coals that are known to be particularly liable to spontaneous combustion should not be selected.

#### ORIGIN DOES NOT DETERMINE STORING QUALITIES

There is an erroneous, misleading, but widespread opinion that the locality from which the coal comes determines whether or not it can be stored. One frequently hears such remarks as "Eastern coals (meaning those from Pennsylvania and West Virginia) can be easily stored, but Western coals (meaning those from Illinois and Indiana) cannot as they are much more liable to spontaneous combustion." Both parts of this statement are too broad, for scientific research and the experience of those storing coal, as shown by the questionnaire sent out by myself, agree that while there are undoubtedly differences in different coals that affect their liability to spontaneous combustion and also to degradation, these differences are of less importance than the size of the coal stored, the care with which it has been prepared, and the way in which it is placed in storage. The answers to the questionnaire indicate that any coal can be stored, if it is properly piled, and that any coal improperly stored will heat and may fire.

There are not sufficient data available at this time to classify coals as to their liability to spontaneous combustion and it is doubtful if this ever can be secured, because liability to spontaneous combustion does not seem to be an inherent quality of the coal from any given seam, district, or mine; it seems to depend more on the size of the coal, its freedom from dust, to a less

extent the amount of pyrite (sulphur) present and to a great extent upon the way in which it is piled.

The spontaneous combustion of coal arises largely from the oxidation of the fine material and dust and the confining of the resulting heat; consequently, the liability to spontaneous combustion in stored coal is greatly reduced and in many cases eliminated, if dust and fine coal can be kept out of the pile; if the coal is of such size and is so piled that there is a sufficient air-current throughout the pile to carry off the heat due to the oxidation that goes on, so that the material is not heated at any point to the ignition point; if the coal is so closely packed that sufficient air cannot come in contact with the fine coal to cause oxidation. It should not be forgotten that for every case of spontaneous combustion in a coal pile many instances can be cited where no heating has occurred.

Many consumers are afraid of spontaneous combustion, or of deterioration in the value of coal. For such amounts as are required by the ordinary householder, say from 10 to 20 tons per year, it can be stated positively that there is little or no likelihood of spontaneous combustion. Even if the coal heats slightly, this can be detected readily and the coal moved and cooled off without danger of setting fire to the building in which it is stored. Coal usually heats slowly, and there is little fire risk to the building in which the coal is stored, even in amounts up to 500 or 1,000 tons. The heating is easily detected by the odor given off from the pile a considerable time before there is any danger of actual combustion.

Clean-screened coal of a uniform size should be chosen for storage if possible. The larger and more uniform the lumps the better, so as to give an open-texture pile. Coal of one size is, therefore, better than a mixture of sizes. Sized coal should not be stored upon a foundation of fine coal.

The coal should be handled in such a way as to prevent breakage as much as possible. If there is a choice of coals for storage, the least friable should be chosen and the one in which there is the least fine material. Breakage not only produces dust but the fresh surfaces of coal oxidize more readily than the weathered ones. Coal should not be dropped upon a pile from a height, but the bucket or other receptacle should be lowered to the pile before being dumped. In every case of a fire in so-called lump coal investigated, it was found that the coal had been dropped through a considerable height, so that coal on the pile was far from being lump coal and contained a large amount of dust.

#### SIZE SEGREGATION MUST BE PREVENTED

While many varieties of mine-run coal cannot be stored under ordinary conditions, because of the presence of fine material and dust, such coal has been successfully stored in small low piles. In storing, mine-run coal should be piled in uniform layers and segregation of the sizes prevented. The piles should be as low as space will permit, carefully watched, and provision made to move the coal quickly if heating occurs.

In general, fine coal or slack is more liable to spontaneous combustion than clean-sized coal or, usually, run-of-mine. If stored, it should be carefully watched to detect evidences of heating. If practicable, a slack pile should be rolled with a roller so as to compact it as much as possible, and thus exclude the air, so as to give, as nearly as attainable, storage under water conditions.

Fine clean coal and slack have been successfully stored, particularly where closely packed, but the only absolutely safe way to store slack is under water.

#### OXIDATION PRODUCES HEAT AND BREAKS COAL

Although experimentation has shown that the sulphur contained in coal in the form of pyrite is not the chief cause of spontaneous combustion, as was formerly supposed, the oxidation of the sulphur in the coal not only produces heat but also assists in breaking up the lumps, and thus increases the amount of fine coal in the pile. Any considerable rise in temperature, either from external or internal sources, promotes the oxidation of the iron pyrites and produces heat, and thus increases the liability of the coal to spontaneous combustion. It is wise to select low-sulphur coals for storage, if obtainable, but it must not be taken for granted that a low-sulphur coal will necessarily store well or that a high-sulphur coal will fire in storage.

3. What precautions should be taken in storing coal? It seems to make little difference in the liability to spontaneous combustion whether the coal is stored under cover or in the open, but under cover there is less degradation and weathering. Storage under cover is, of course, impracticable for large amounts. If possible, a place should be chosen that is dry and well-drained; or, if not drained naturally, drains should be provided about the storage pile, not underneath it, as a drain beneath a pile may admit air-currents sufficient to produce oxidation but not enough to keep down the temperature.

#### STORAGE SHOULD BE ON CLEAN GROUND

Coal should not be dumped on ground covered with ashes or refuse of any kind because, in addition to furnishing flues for the admission of an inadequate air supply to the coal pile, such refuse often contains material that will assist spontaneous combustion. Furthermore, it is likely to become mixed with the coal and, when it is reclaimed from storage, the value of the coal is thus depreciated. If possible, the ground should be cleared of vegetation and leveled off, so that the reclaiming of the coal may be done as easily as possible and so that dirt and refuse will not be taken up by the shovel or other devices used in reclaiming. Some of the objections of firemen to using coal that has been stored are justified because of the dirt and other refuse that has been mixed with the fuel in taking it from the storage pile. A hard clay bottom thoroughly drained is desirable, if a concrete floor is too expensive. If possible, adequate space should be provided so that the coal can be moved to another place, if heating occurs.

Coal should not be piled around hot pipes, against a boiler or hot walls, around a chimney, nor in any place where it will be subjected to outside heat, because the liability to spontaneous combustion increases rapidly with a rise in temperature. Coal should not be stored above flues that permit small amounts of air to enter the coal; hot air, such as that from a sewer, is particularly to be avoided.

Coal should be so piled for storage that any part of the pile can be moved promptly if necessary. Coal should either be so piled that air may circulate freely through it and thus carry off any heat generated in the pile by oxidation, or else it should be so closely packed that air cannot enter the pile; i.e., approximate as nearly as possible underwater-storage condition. Slack has been

successfully stored in piles 10 ft. high by packing the coal as it was placed in storage by rolling, or by running a heavy truck over the pile.

Stratification or the segregation of the fine and lump coal into layers should be avoided, since an open stratum of coarse lumps provides a passage for air to reach and oxidize the fine coal, and the stratum of fine coal does not permit the heated air to pass off rapidly enough to keep down the temperature of the pile below the point of combustion.

#### DUMPING AT ONE POINT IS DANGEROUS

Coal should not be dumped at one point at the top of a conical pile, since then the fine material stays in the center at the top of the pile and the lumps roll to the bottom. Many fires start near the top of the pile, where the fine coal has prevented the escape of the heated gases rising through the pile. In placing coal in a cellar or bin, the same precaution should be observed, for many fires are known to have started in the fine coal near the top of a sloping cellar pile and just below the window through which the coal was shoveled into the bin.

The depth and area of storage piles will be determined largely by the storage space available and the mechanical appliances to be used for storing and reclaiming the coal. Other conditions being equal, the deeper the pile and the greater its area, the greater is the difficulty of inspecting it and moving it quickly, if necessary. Hence a number of small piles, if practicable, are better than one large pile. Lack of space, however, usually prevents such spreading out of coal. It is impossible to advise exact heights, as much depends on the kind and size of coal and the local conditions, but the lower the pile the better.

Inflammable material, such as waste, paper, rags, wood, rosin, oil, and tar in a coal pile, often form a starting point for a fire; every effort should be made to keep such material from the coal as it is being placed in storage. Timbers extending to the outside of the pile may permit the entrance of air. The admission of air into a coal pile around the legs of a trestle, through a porous bottom such as coarse cinders, or cracks between boards, etc., should be avoided. Coal should not be piled about timber posts.

#### IS VENTILATION ADVISABLE?

The effect of ventilating coal piles is a disputed point, but the weight of evidence in the United States seems to be against the practice. This may possibly be due to the fact that ventilation has been inadequately provided. Imperfect ventilation, such as is generally attempted in the United States, is certainly disadvantageous. Reports from Canadian practice favor ventilation by pipes placed close together in the coal pile.

4. Is coal that has been in storage inferior to freshly-mined coal? The heating value of coal, as expressed in B.t.u., has been shown, by the experiments of the U. S. Bureau of Mines and by Professor Parr at the University of Illinois, to be little decreased by storage and practically not at all with underwater storage. The opinion is widespread, however, but by no means universally held, that storage coal burns less freely than fresh coal. It must be remembered that sometimes the apparent deterioration is due not to any change in the coal but to the fact that the clam shell, or other reclaiming device, digs into the soil under the coal pile and mixes soil or refuse with the reclaimed fuel.

Experiments at the University of Illinois indicate that storage coal may be burned as readily as fresh coal in a stationary plant if a thinner bed is kept and the draft regulated properly. Some of the prejudice against storage coal is due to the weathered condition of the outside of the pile. The amount of degradation due to storage depends on the kind of coal stored and the way in which it is handled. The coking properties of some roads seem to decrease after storage and also the gas-making qualities, but coals vary greatly in these respects.

PUTTING COAL INTO STORAGE

The long boom on the crane together with its full-revolution sweep permits a large amount of coal to be stored from one point.

5. What does it cost to store coal? Like all cost data, the expense of storing coal has been difficult to obtain. In the preparation of a Circular 6, I attempted to gather cost figures under the following heads:

	Cost of	Storing	Reclaiming
Overhead			
Labor			
Supplies			
Depreciation on mechanical equipment			
Interest on investment			
Rental on land on which coal is stored			
Insurance on equipment			
Insurance on coal			
Totals			

Not one of the many questionnaires sent out brought such itemized costs and, in most instances, the cost of storage and reclaiming were not differentiated. Most of the costs furnished included only labor and, sometimes, supplies, with no account of truckage, rentals, and other overhead and capital items.

The figures collected in 1917-18 showed a variation of from 1.5c. to 34c. per ton for storage and 2c. to 20c. per ton for reclaiming and a total variation for storing and reclaiming of from 4c. to 54c. The cost for storage and reclaiming by steam shovel or locomotive crane averages from 10c. to 20c. for labor and materials.

The Great Lakes Dredge & Dock Co. gave the cost of an underwater pit to hold 10,000 tons of slack built for the Standard Oil Co. of Whiting, Ind., as \$3.30 per ton. The same company estimates the cost of unloading cars with a locomotive crane as 10c. per ton and the cost of reclaiming from the pit with the crane as 10c. per ton. At this particular plant, there is adequate track room so that the train of coal cars can be quickly unloaded; and in any storage scheme a saving in car demurrage should be considered as one of the items to offset any additional cost of storage.

Heretofore, probably the commonest type of storage and reclaiming device has been the locomotive crane; but with the newer type of hopper-shaped "battleship"

coal cars, there are so many rods and braces that a clam-shell bucket cannot be used. One utility company that has previously used the clam-shell bucket for storing and reclaiming large amounts of coal says, "Very soon some other form of unloading device must be adopted where the coal is delivered in battleship cars." A Byers autocrane costing \$6,000, with a capacity of 300 tons per day, is said to handle coal for 8c. per ton.

In 1917, the cost of storing and reclaiming with the locomotive crane was reported, by the Atlantic Coast Line, as 4c. to 5c. per ton; the same company reports that at present the cost with the same apparatus is 8c. These costs are below those generally reported, which varied from 5c. to 10c. per ton for labor and materials for unloading and a like amount for reclaiming. The Atlantic Coast Line reports the present cost of storing when the pile is gradually built up from a track laid on top of the coal as 40c. per ton. The cost of storage in the government fuel yards at Washington is given as 27.8c. per ton.

A Barber-Green type of storage plant of combined fixed and portable conveyors at Mooseheart, Ill., cost \$4,600; the cost of storing and reclaiming is estimated to be 20c. per ton.

The Macdonald Engineering Co. of Chicago reports that four concrete silos with a capacity of from 1,000 to 4,000 tons each cost \$10 per ton of coal for erection; that the labor costs of unloading is only 1/2c. per ton; and the cost of reclaiming even less than this amount. This company has a new type of rectangular concrete bin, which it claims can be built for \$4 per ton.

The Creamery Package Manufacturing Co. estimates, for round silo storage bins of not less than 1,000 tons capacity, a cost per ton of coal: \$3.50 for building the main structure; \$1 for a roof and machinery house on top of the silo; \$1 to \$3 for foundation and track hopper; and \$1 to \$3 for elevating and conveying machinery; a total of \$6.50 to \$10.50 per ton of capacity. The company estimates \$10 per ton as probably a fair price at the present time.

J. L. Pipe, of Quincy, Ill., in *Black Diamond*, for Jan. 31, 1920, gives the following costs for handling 15,000 tons per annum through a concrete silo pocket holding 400 tons. This silo is divided into four compart-

A TRACK HOPPER OR PIT IN A STORAGE PLANT

Hopper-bottomed cars may be discharged to the pit under the tracks, and from here transferred to storage. Such a pit has some advantages over a trestle.

ments and a 50-ton car can be unloaded into it in 45 min. at a labor cost of 78c. as compared with 45c. in 1918. In 1918, electric power for operating the plant cost 30c. per car as compared with 40c. in 1919. The pocket cost \$3,600 in 1916; at present, the price would be \$6,000. The machinery, in 1917, cost \$976; the cost today would be \$1,700. The total cost, in 1916, was \$5,035; the present cost would be \$8,000.

In the same issue of *Black Diamond*, the storage plant of F. Schroeder of Mishawaka, Ind., is described. The plant consists of four concrete stave-construction silos, each holding 300 tons and each costing \$1,200 for construction. The coal is handled by a Godfrey monorail bucket and the entire plant cost \$3,300, the estimated cost for handling being from ½c. to 3c. per ton unloaded.

C. A. Pennock, chief engineer, Western Electric Co., gives the cost of storage at 8c. in 1919, as against 5c. in 1917; the cost of reclaiming as 9c. as against 4c. in 1917, a total of 17c. against 9c. two years ago.

The Brown Portable Conveying Machinery Co. quotes prices for a portable machine that would elevate to a maximum height of 12 ft., equipped with an electric motor, \$729; or, equipped with a gasoline motor, \$779. To elevate 9 ft., the prices are \$600 and \$663, respectively; and to elevate 6 ft. \$487 and \$558, respectively. All of these machines have a 16-in. belt suitable for handling run-of-mine coal. The Godfrey Conveyor Co. quotes the cost as being 5c. per ton for unloading coal from cars to storage and from 8c. to 10c. for reclaiming from storage point to point of consumption. The Brown Hoisting Machinery Co. gives the following capacities and operating costs for locomotive cranes:

OPERATING COSTS FOR LOCOMOTIVE CRANES

Size, Tons	Boom Ft.	Maxi- mum Capac- ity Cu.Ft.	Radius, Ft.	Price	Cost of Oper- ation, Daily	Hourly Capacity Coal Reclaim- ing from Pit or Flat Bottom Cars, Tonsz	Cost per Ton Un- load- ing, Cents	Re- claim- ing, Cents	
									Hourly Capacity Coal Reclaim- ing from Pit or Flat Bottom Cars, Tonsz
30-40	50	70	45	\$26,000	\$25	75-125	100-150	3.1	2.5
15	44½	54	40-45	16,000	20	50-100	75-125	3.3	2.5
10	40	40	35	12,000	15	40-80	60-100	3.1	2.3

<sup>a</sup> Includes wages of operator, fuel, oil, waste, etc., 6 per cent. interest on investment, and 10 per cent. depreciation.

<sup>b</sup> These figures are probably based on continuous operation and are seldom obtained in the actual practice of storing coal.

The method of storing coal may be included under the following general headings: Hand operated, wheelbarrows, etc., by motor trucks, side hill without a trestle, trestle storage, locomotive-crane storage, circular storage, combined trestle-and-crane system, mast and gaff, steeple towers, movable bridges, buckets moving on monorail or cableway, silo storage, conveyor belts, portable and semi-portable conveyors and underwater storage.

For the illustrations contained in this article *Coal Age* is indebted to the Link-Belt Co. of Chicago.

The photographs used herein show the equipment of that concern. Editor.

**Liability for Contract Interference.**—One who by himself or conspiring with others induces another to break his contract of employment with a third person, to the injury of that person, is liable in damages for the injury sustained by him, whether the injury done was for the benefit of the wrongdoer or not.

Hence, if a coal company's officer, acting within the scope of his employment, wrongfully induced another company to discharge plaintiff from its employment, the coal company is liable to damages. *West Virginia Supreme Court of Appeals, Carter vs. United States Coal & Coke Co., 100 Southeastern Reporter, 405.*

## How Much Coal Does Ireland Have?

Needs Are Estimated To Be Five Million Tons Annually—No Coke Is Imported—Irish Coal Is Mostly Semibituminous

Consul F. T. F. Dumont, Dublin, Jan. 30, states that the coal production of Irish mines in 1919 was estimated at 95,000 long tons, the Castlecomer mines (Kilkenny) furnishing 60,000 tons, the Wolfhill mines (Queens) 14,000 tons, the Arigna mines (Roscommon) 17,000 tons, and the Slieveardagh mines (Tipperary), 4,000 tons. This is said to be the average production for some years. All of these mines, except the last-named, are in the Dublin consular district. Small deposits of lignite are reported to exist in Lough Neagh in the Province of Ulster and at Ballycastle in County Mayo. In addition, extensive peat beds exist throughout Ireland and a considerable amount of peat is cut for domestic use each year, but no estimate of the quantity produced is obtainable. To stimulate the mining of coal, a small grant was made by the Government a short time back, but no gain has been recorded as yet.

For the cheaper and better distribution of the coal mined an extension of 9 miles of railway from Athy to Wolfhill was completed during the past year, and there is under construction from Dunmore West Station, on a branch of the Great Southern & Western Ry., a 10-mi. railway to the Castlecomer mine. Enthusiasts predict that when these two railways are completed a great increase in output may be looked for from these mines. Various estimates, running as high as 300,000,000 tons, are made of Irish coal deposits that can be made commercially available. The coal is mostly of the English "anthracite" type.

### IMPORTS AND CONSUMPTION

Irish needs in the way of imported coal are estimated to be nearly 5,000,000 tons a year. That this estimate is about correct is shown by the figures of imports for 1914 and 1915, which were officially reported at 4,470,833 and 4,578,627 tons, respectively. Official figures show that Belfast imported 1,321,434 tons in 1917 and 1,368,248 tons in 1918. Dublin imported 1,146,916 tons in 1916 and 1,217,516 tons in 1917. Outside of these two, Londonderry, Queenstown, Waterford, and Dundalk import considerable quantities, while Drogheda, Sligo, Galway, and Limerick are of minor importance in the trade.

The consumption of coal in Ireland is distributed as follows: Domestic use, 2,115,000 to 2,615,000 tons; industrial works, 1,400,000 tons; railways, 460,000 tons; gas works, 400,000 tons; miscellaneous, 125,000 tons. The item "Miscellaneous" includes electric-light plants. No coke is imported, but coke from gas plants is sold in the big cities. Peat is in use everywhere throughout the country districts. All of the coal imported is from Great Britain and is carried in English bottoms. Most of the steamers engaged in the trade are of small tonnage and carry no other cargo. Within the next year it is hoped that larger steamers will be available.

Both Belfast and Dublin quays are equipped with electric and hydraulic cranes ample in capacity to unload 150 tons per hour from each ship into railway cars alongside. Dublin has 12 electric cranes in operation, each of 50 tons per hour capacity, ranged three to each ship of any size, besides eight hydraulic cranes.

# Canada's Coal Production Declines\*

Decrease in Coal Output in 1919 Is 9.3 Per Cent, the Value Dropping 2.1 Per Cent—  
Canada Makes 8.9 Tons of Byproduct Coke to 1.1 Tons of Beehive as Against  
5.4 Tons of the Former to 4.6 Tons of the Latter in the United States

**E**ARLY estimates of the coal production during 1919 made in December underestimated the production during the last two months of the year. In the Province of Alberta there had been practically no production of bituminous coal during June and July and only a small production of lignite. These operations were but slowly resumed late in August, but during October, November and December, the production in this province exceeded the highest monthly rate previously reached. The total production of marketable coal during 1919 (comprising sales, colliery consumption and coal used in making coke, or used otherwise by colliery operators) was 13,586,300 short tons valued at \$54,051,720, or an average of \$3.98 per ton and was, with the exception of 1915, the lowest tonnage production recorded since 1911. The total value, however, on account of higher prices was but little less than that of the previous year, which had been the highest recorded.

The total production in 1918 was 14,977,926 tons valued at \$55,192,896, compared with which the 1919 production shows a decrease of 1,391,626 tons, or 9.3 per cent, and \$1,141,176, or 2.1 per cent in value. The total output of coal, including waste and unmarketable slack in 1919, was 14,041,655 tons, as against 15,460,385 tons in 1918. The 1919 production included 73,893 tons of anthracite, all from one mine in Alberta, 10,629,697 tons of bituminous coal, and 2,882,710 tons of lignite. The production in 1918 included 115,405 tons of anthracite; 11,636,190 tons of bituminous and 3,226,331 tons of lignite.

In Saskatchewan only has an increased production been shown in 1919. The largest decrease in tonnage

Ontario, with no mines, produced two-thirds of a million tons of coke, an increase of nearly a quarter-million of tons. British Columbia's coke output declined over 52 per cent while Alberta made no coke at all, yet these are coal provinces. The gas from the coke ovens was equivalent to over one-third of the total production of natural gas in Canada.

was in Alberta, but the heaviest percentage decrease was in New Brunswick. The Nova Scotia production fell off by 116,246 tons or less than 2 per cent and has been exceeded in twelve out of the thirteen preceding years. New Brunswick's output decreased by 90,236 tons, or 33.6 per cent, though the 1919 production has been exceeded in the two preceding years only. Saskatchewan's production increased by 35,120 tons, or 10 per cent, and was the highest that has been reached in this province.

Although Alberta fell off 1,079,086 tons, or 18 per cent, the production was notwithstanding, higher than that of any previous year with the exception of 1918. The production during December, 1919, in this province was 742,482 tons, including 458,223 tons of lignite and 284,259 tons of bituminous and anthracite. British Columbia's production was less by 139,378 tons, or 5.4 per cent, and has been exceeded seven times in the past ten years.

The exports of coal in 1919 were 2,070,050 tons, valued at \$12,438,885, or an average of \$6 per ton, as against exports in 1918 of 1,817,195 tons, valued at \$9,405,423, or an average of \$5.17 per ton, showing an increase of 252,855 tons, or 13.9 per cent in quantity.

The total imports of coal of all classes in 1919, "entered for consumption" as recorded by the Department of Customs, were 17,308,837 tons valued at \$61,160,799, as against imports in 1918 of 21,678,587 tons valued at \$71,650,584. The record shows a slight increase in the imports of anthracite coal, but a decrease in the imports of bituminous coal.

The estimated consumption of coal based on production, exports and coal imported as "entered for consumption" amounted in 1919 to 28,768,099 tons, as compared with a corresponding consumption in 1918 of 34,771,832 tons.

The 1919 consumption included approximately 5,026,568 tons of anthracite; 20,858,821 tons of bitu-

OUTPUT<sup>1</sup> AND PRODUCTION<sup>2</sup> OF COAL IN SHORT TONS, 1918 AND 1919

	1918				1919			
	Output	Production	Value of Production	Average per Ton	Output	Production	Value of Production	Average per Ton
Nova Scotia	5,836,370	5,818,562	\$21,095,470	\$3.63	5,785,929	5,702,316	\$21,920,047	\$3.84

<sup>1</sup>Output includes waste and unmarketable slack. <sup>2</sup>Production includes sales, colliery consumption, coal consumed by operators in making coke, or for other uses

IMPORTS OF COAL INTO CANADA, 1918 AND 1919

	1918			1919		
	Tons	Value	Ave.	Tons	Value	Ave.
Bituminous, round and run-of-mine	13,656,360	\$37,291,057	\$2 73	10,127,965	\$24,750,717	\$2 44
Bituminous slack	3,237,067	8,351,639	2 58	2,228,197	4,814,388	2 16
Anthracite coal and dust	4,785,160	26,007,888	5 44	4,952,675	31,595,694	6 38
Total	21,678,587	\$71,650,685	\$3 30	17,308,837	\$61,160,799	\$3 53

minous and 2,882,710 tons of lignite. The 1918 consumption included 4,900,565 tons of anthracite; 26,544,936 tons of bituminous and 3,226,331 tons of lignite.

The total output of oven coke during 1919 was 1,160,470 short tons made from 1,880,541 tons of coal of which 854,835 tons were of domestic origin and 1,025,706 tons imported. The output thus averaged 0.617 tons of coke per tons of coal charged. The total coke used or sold by producers during the year was 1,133,680 tons (941,111 tons used by the producers and 192,569 tons sold) valued at \$9,775,748 (partly estimated), or an average of \$8.62 per ton. Of the total output 1,036,229 tons, or 89.3 per cent was byproduct oven coke and 124,241 tons beehive coke.

In 1918 the total output was 1,258,284 short tons made from 1,983,242 tons of coal of which 1,348,232 tons were of domestic origin and 635,010 tons imported, the output averaging 0.634 tons of coke per ton of coal charged. The coke used or sold by producers during the year was 1,250,744 tons valued at \$11,035,195 or an average of \$8.82 per ton. Of the total output 879,066, or 70 per cent was byproduct coke and 379,218 tons beehive coke.

#### PRODUCTION BY PROVINCES

By provinces the production was: Nova Scotia 580,433 tons; a decrease of 197,180 tons; Ontario 649,506 tons, an increase of 224,419 tons, due to the operation of the new ovens at Hamilton; British Columbia 100,356 tons, a decrease of 112,214 tons; no ovens were operated in Alberta, though a few hundred tons were sold from stock pile.

The ovens operated during the year were those at Sydney and North Sydney, N.S., Hamilton and Sault Ste. Marie, Ont., Fernie, Michel, Union Bay and Anyox, B. C. At the close of the year 587 ovens were in operation and 2,209 were idle. There were completed during the year 60 Koppers ovens at Sydney; 25 Williputte ovens at Sault Ste. Marie, and 30 Lomax regenerative ovens at Anyox, B. C. Of the total number of ovens 2,796 listed as operating and idle, 1,010 were of the byproduct type and 1,786 Beehive, Bauer and Bernard.

The exports of coke in 1919 were 14,809 tons valued at \$129,703, or an average of \$8.75 per ton, as against exports in 1918 of 29,612 tons valued at \$223,629, or an average of \$7.55 per ton. The imports of coke in 1919 were 383,374 tons valued at \$2,405,740 or an average of \$6.27 per ton as against imports in 1918 of 1,165,590 tons valued at \$8,975,445, or an average of \$7.70 per ton. The estimated consumption of oven coke in 1919 was 1,502,245 tons as compared with 2,386,722 tons in 1918 and 2,192,373 tons in 1917.

The recovery of byproducts at Sydney, N. S.; Hamilton, Sault Ste. Marie, Ont., and Anyox, B. C., included: Sulphate of ammonia, 11,765 short tons and tar 12,394,249 gal. as compared with 10,825 tons of sulphate of ammonia and 8,009,327 gal. of tar in 1918. The quantity of gas recovered in 1919 was 9,340 million cu.ft., or equivalent to over one-third the total production of natural gas in Canada.

## British Labor Votes Against Direct Action

Decides, 3,870,000 to 1,050,000, Not to Call General Strike to Force Nationalization of Mines

ARTHUR S. DRAPER of the New York *Tribune's* European Bureau states that on March 11 the moderate forces in British labor won a decisive and highly important victory when the Trades Union Congress decided by a vote of 3,870,000 to 1,050,000 against the use of direct action or a general strike to force the nationalization of the coal mines.

Few labor organizations outside of the miners themselves supported the proposition to use force as a means of compelling the government to take over the mines. After the congress the leaders of the different unions said they were sure the minority would accept the decision and that there would be no break in the ranks of organized labor.

The decision is considered of profound importance because it means there will be no decrease in production in the British Isles through the cessation of work.

Two arguments against direct action which carried weight with the delegates were developed by J. R. Clynes, former Food Controller. He said that a general strike would be welcomed by Premier Lloyd George because he would then call a general election and the country would support the Premier. His other point was that direct action would be unconstitutional and political labor couldn't afford to take any unconstitutional action if it hoped to govern the country later.

Clynes thought the abandonment of direct action might mean delay in attaining the political objective of the Labor party, but it was much wiser, he thought, to progress along orderly, constitutional lines.

The decision means that the Labor politicians are in control of the situation, and that henceforth labor will fight at the polls and in Parliament. A moderate labor policy is bound to win many recruits here, they believe, because of the widespread dissatisfaction with both the Liberal and Coalition parties.

The supporters of direct action, notably Tom Mann, contended that it was merely industrial organization under a new name, and that everything labor had won had been through the use of the strike weapon or a threat to use it. He upheld political action, but said it was only supplementary to industrial organization.

Intensified political propaganda, therefore, will be labor's substitute for force. The organization of the Labor party is to be strengthened financially and plans developed for contesting the majority of the seats in Parliament at the next general election.

As there are nearly 6,000,000 organized workers—the largest number in any country except Germany—whatever they decide carries great weight with labor all over Europe. The decision emphasizes the point that there is little Bolshevism in the British labor movement, and that it is fundamentally moderate in spirit. Had the congress accepted the principle of direct action the whole country would have been thrown into confusion, and now there is a feeling of relief and optimism.

A decision in the matter of the injunction asked by the American Wholesale Coal Association in its case against the Railroad Administration has been postponed by agreement until March 19. It is hoped on that date to have all briefs ready for submission.

# Canadian Mine Experts Discuss Problem of Industrial Independence

With Coal in the West and in the East, but with no Coal in the Central Provinces and Only Low-Grade Fuel Deposits in Manitoba and Saskatchewan, Canada Is Trying To Find a Way of Rendering Herself Independent of Coal from the United States

BY R. DAWSON HALL

CANADA is considering her resources today much as the United States did during the war. She is thinking, that is, not so much how the well-recognized mineral riches can be produced most economically, most numerous and most conservationally, but rather how some makeshifts can be adopted such as will make Canada independent of her southern neighbors. With a growing friendliness on both sides of the international border one would imagine that the readiness to accept international interdependence without uneasiness or jealousy would make rapid growth, but war is apt to suggest to any nation that friendships and mutual forbearances, however long continued, are apt at some time and for some mysterious reason to be severed incontinently. This is how Canada views the situation and the United States' War Industry Board exhibits the fact that the people in the United States are thinking along similar lines.

Furthermore, during the war the supply of coal in the central provinces of Canada depended wholly on the willingness of the citizens of the United States to deprive themselves of needed fuel in order to keep the people of Canada from a complete industrial breakdown and extreme domestic distress. The United States shared its fuel readily, as did Canada its other less necessary resources, but there was a constant feeling of dread and uncertainty as to whether the people on the southern side of the border and their Fuel Administrator would recognize their duty and fully perform it.

Canada is not without gratitude for the accommodation that was afforded, even though it was one that might fully have been expected of a good neighbor, a merchant with whom business had been done for many years, a co-belligerent and a blood relative. And yet Canada is still wondering if it comports with her dignity and her necessity to be so completely dependent on the friendliness and courtesy of her neighbor.

What will interest the mining people of Pennsylvania, West Virginia, Ohio and Illinois is that Ontario is in a measure actually solving the problem of peat utilization and that Saskatchewan and Manitoba are hopeful that they will be able to carbonize and briquet their lignite. If that can be done the domestic needs of Canada will be solved.

Whether the open-hearth and gas needs will be thus served depends on the sulphur percentage of these fuels

while their employment for manufacturing purposes will depend largely on the temperature at which the ash contained will fuse. Inquiry does not seem to be directed into these channels. For the present domestic needs seem to provoke most comment.

The Canadian Mining Institute's Twenty-Second Annual General Meeting, which is the subject of this article, assembled at the King Edward Hotel, Toronto, Canada, March 8 and continued in session on the two following days completing its proceedings with an interesting visit to the works of the International Nickel Co. at Port Colborne on March 11.

It is perhaps best for *Coal Age* as usual not to

wear its readers with the details of the metalliferous discussions but to pass them by as if they had not been introduced or considered. The president of the institute, D. H. McDougall, president of the Nova Scotia Steel & Coal Co., made the opening address and acted as chairman of the first session. He laid stress on the unfortunate situation in Canada in regard to the salaries of departmental officials which have not advanced with the increased cost of living. The services of such officials are getting to be almost gratuities to the public.

Nothing but *esprit de corps* and a spirit of social service, keeps these men doing their valuable work with such inadequate pay. The progress of industry, its contributions to the welfare of mankind, depend not only on the activity of business men but on the discriminating judgment and patient labor of those individuals who interpret pure science to the needs of industry. Without their help progress will be slow and haphazard. Yet the public cannot expect them to go on serving well without larger remuneration.

The staffs of the Canadian departments comprise men of large intelligence and high public ideals and it is a shame to make them suffer because of their devotion to the public weal. The public would recognize their services and reward them better in all probability were they less modest and less conservative in self appraisal, but if they spread their wares more ostentatiously, the wares would suffer though the public might buy more readily.

The Department of Mines had prepared a "Preliminary Report of the Mineral Production of Canada During the Calendar Year 1919," ready for the present session. In fact the meeting of the Canadian Mining

**Need for a greater recognition of the financial straits overwhelming departmental officials as a result of increased living costs. Coal easily leads in Canadian output, having a value exceeding that of the combined product of nickel, silver, gold and zinc. Coal occupies an unhappy position in the eyes of all Federal Departments of Mines.**

Institute is to be credited with hurrying this valuable governmental report and making it available to the public at an earlier date than otherwise would have been attained. In another part of this issue will appear that portion of the report relating to coal.

The author of the statistical report, John McLeish, chief of the Division of Mineral Resources and Statistics, did not point out the relative importance of coal to other minerals. Perhaps the following rearrangement of his table will give an idea how coal dominates in Canada all other minerals as it does in all well-favored mineral-producing countries.

PRODUCTION OF MORE IMPORTANT MINERALS  
IN CANADA 1919\*

	Quantity	Value
(1) Coal, short tons.....	13,586,300	\$54,051,720
(2) Nickel, pounds.....	44,542,953	17,817,181
(3) Silver, ounces.....	15,675,134	17,418,522
(4) Gold, ounces.....	767,167	15,858,749
(5) Copper, pounds.....	75,124,653	14,041,549
(6) Asbestos, short tons.....	136,199	10,658,946
(7) Lead, pounds.....	43,895,888	3,057,788
(8) Zinc, pounds.....	31,738,859	2,328,998
(9) Salt, short tons.....	148,302	1,398,968
(10) Gypsum, short tons.....	306,947	1,217,345
(11) Pig iron from Canadian ore, short tons.....	38,457	899,406
(12) Cobalt, pounds.....	336,185	840,463
(13) Petroleum, barrels.....	240,970	744,677
(14) Pyrites, short tons.....	177,487	522,704
(15) Arsenic, white iron ore, short tons.....	3,192	408,770

\*From this table mineral waters, structural materials and clay products have been omitted.

Unfortunately for coal it finds itself always classed with non-metallic minerals and must take a place inferior to the metallic minerals which happen to have the benefit of a classification under a positive and not under a negative grouping. If we could have a classification by fuel minerals and non-fuel minerals, coal would stand easily and rightfully at the head of the list. Speaking politically coal might be unenviably placed at the head as a politically regulable mineral and all the rest as minerals which apparently can profiteer to their hearts' content, though during the war even these came into the regulated class.

These remarks are not, of course, a brief of Mr. McLeish's interesting observations. His summary of coal, it may be said, was important as it shows that the department's earlier estimates, those of Jan. 1, for the whole mineral production of Canada were in error about 3.6 per cent. Such errors are bound to occur.

To quote Mr. McLeish: "Sufficient allowance had not been made" in those figures "for the increased production and increased value of cement, clay, quarry and other similar structural material products. The coal-mining industry too, during the last three months of the year, responded quickly and extensively, particularly in the Province of Alberta, to the heavy demand for fuel."

Returning to the table of the "Production of More Important Minerals in Canada in 1919" it will be seen that the value of the coal produced exceeds the combined value of the output of nickel, silver, gold and zinc—nickel, silver and gold being respectively first, second and third in the list, and zinc being eighth.

The meeting of the afternoon of Monday was devoted to papers which had exclusive reference to iron and steel. In the evening illustrated addresses were given on "Mining and Smelting Operations of the International Nickel Co. of Canada," "Mining at Cobalt" and "Operations at the Alfred Peat Bog," the last being by

A. A. Cole. J. C. Nicholl, general superintendent of the mining and smelting division, presented the first address named, describing the mines at Creighton, Ont., and the smelter at Copper Cliff. Interesting features emphasized were the covered way from the change house to the shaft and the heated room in which the men congregate before entering the cage. This provision protects them against the severities of the climate.

The tonnage per man at this mine is about 6 or 7 tons per shift. The methods of mining (shrinkage stoping) and the provisions for passing the mineral down to one of two levels, through a crooked shaft in the footwall, which lies at about 45 deg. to the vertical, were also described. When the ore reaches the level from which it is to be hoisted it falls into a large concreted chamber from which it goes to a measuring pocket and is dumped into a skip. The loading of the skip and its belling away takes only about 10 seconds.

In view of this address and the trip to Port Colbourne on the Wednesday following, it may be noted that the International Nickel Co. is the manufacturer of the well-known Monel metal, a natural alloy of copper (28 per cent) nickel (67 per cent) and other metals (5 per cent) made by direct smelting from Sudbury ores. Monel metal has the strength of steel and non-rusting qualities with maximum resistance to corrosion by acid and alkali and superheated steam. It furthermore takes and retains a high nickel polish, being used in mines and mills for screens, filter cloths, pump shafts and liners, signal wires and light wire ropes, also in power uses for water wheels, turbine impellers and blading, for feed-water pumps, valves and fittings on superheated steam lines. Consequently the interest in the plant is not confined to metal producers but is of direct interest to users of non-corrosive metals.

#### TWO PLANTS MAKE CHEAP PEAT BRICKS

Instructive and entertaining as the other papers proved, that of A. A. Cole on the "Alfred Peat Bog" was to coal men the interesting feature of the occasion. The Ontario Government, canvassing the coal shortage of the province, almost decided to build an Anrep plant for making use of the peat resources of Ontario. About that time, it discovered that the Federal Government had in mind experiments on a new plan proposed by E. V. Moore of Montreal. As a result the federal and provincial governments agreed to pool their experiments and divide the cost equally between them.

They proposed to make a thorough test of the older Anrep plant and of the untried Moore plan. R. A. Ross of Montreal, B. F. Haanel of the Mines Branch, Ottawa, were the authorities put in charge by the Federal Government, while R. C. Harris of Toronto, and A. A. Cole were given concurrent authority on behalf of the provincial government. E. V. Moore was appointed the engineer.

The plans tried are one of many "wet processes," the product being air-dried machine peat. Only the wet processes have attained success. They have been employed in Europe for the manufacture of millions of tons of peat. Their economy consists in letting the sun do the drying.

If the peat is dried by artificial means the expense of expelling the water turns peat drying into an unprofitable operation. The wet process consists of three operations—excavation, maceration and spreading. The peat bog is quite soft and spongy, an iron rod being easily pushed down in it for a depth of 6 or 8 ft.

and being quite readily drawn therefrom. There is about 88 per cent of water in the peaty mass, and this helps the process. Were it lacking, the water would have to be added; at least the addition of water would be advantageous.

The amount of maceration given to the peat determines the quality of the fuel produced, for the action increases the density of the finished product and hence its value. Unmacerated peat is a sponge-like body, whereas the peat made by maceration will have a specific gravity of 1.1.

#### ANREP PEAT MACHINE IS NOW SELF-MOVING

The peat is spread over the surface of the ground, being placed on areas as yet not excavated. It will dry in from two to four weeks. Near the end of the drying period it is turned over and piled in hollow piles so arranged that the air is drawn up through the center of the rough pile thus accelerating drying, which, however, is still not complete when the product is marketed. About 25 per cent of water in terms of the completed peat block remains. This means that 96 $\frac{2}{3}$  per cent of the water is removed.

The Aleph Anrep Sr. machine has been bettered from the old construction by mounting it on caterpillars such as are in use for general farm-tractor purposes. The peat is cut by an Anrep bucket excavator working along the side of a ditch, which side is on a slope of 45 deg. When the material is excavated it goes to an Anrep macerator mounted on the same platform. This machine works much like a clay pug mill, the knives cutting up the excavated material and passing it along to a car from which it is taken by an endless-cable haulage system to the spreader on the spreading field. As soon as the car reaches the spreader it is stopped and discharged. After being re-engaged to the cable system which brought it to the spreader it is taken back round a track laid out in square form. Thus the cars arriving and returning are kept from interfering with one another.

The spreader lays down the macerated peat in about a four-inch layer and then with revolving discs cuts this mass into long narrow rows. The spreader is operated as a separate unit and in time it completes laying its section along the peat-spreading side of the square, that side being at right angles to the line of the ditch being excavated. As soon as the spreader has completed this work the rails are moved over and a new "spread" is started.

#### MOORE'S MACHINE CUTS MAN POWER 50 PER CENT

There is a considerable resemblance between the Moore plant and the Anrep plant just described, the difference consisting largely in the concentration of operations, the spreading and the loading being done with the same power unit. With the Moore machine, on leaving the macerator the peat is carried by an endless conveyor belt running on an arm of fabricated steel 150 ft. long which extends from the plant platform proper across the spreading ground and is located on the opposite side of the excavator from the ditch and runs at right angles to the line of the ditch. The plant itself travels on caterpillars, and the belt-conveyor arm, which of course needs additional support, is carried by a third caterpillar placed 100 ft. from the platform proper.

The spreader is operated by a chain-belt drive which runs through the belt-conveyor arm to which the spreader is attached. The same driver also operates

the third caterpillar. The spreading in this case is in line with the ditch, for the spreading arm is at right angles thereto. As the arm is 150 ft. long the spreading field is just as long as the ditch and slightly under 150 ft. wide. To work to the best advantage, it is necessary that the ditch should be of sufficient length so that when the field is completely covered the first row spread will be ready for harvesting.

Much of this first row will already have been used in operating the plant so that the rest can easily be removed and the spreading of the first row started once more. While this is being done the remainder of the

D. H. McDOUGALL

President, Canadian Mining Institute for 1919, president Nova Scotia Steel & Coal Co. Mr. McDougall makes a pleasing address, is an extremely popular man and has done much to add action and purpose to an institution which formerly was devoted mainly to a study of mineral resources.

belt conveyor can be used to convey the peat from row No. 2 to the permanent track at the end of the conveyor, where it is delivered into small open cars and run in trains to the shipping platform.

Mr. Moore's idea in this method of manufacturing peat is to make the handling of the material as far as possible mechanical, and in this he has succeeded to a marked degree. Thus the labor force required to run the old Anrep plant, which was in itself quite revolutionary in the substitution of mechanical operation for human labor, is from 13 to 15 men, while the Moore plant requires only seven. The obvious disadvantage of the latter is that it requires a long ditch to keep it operating continuously, but this, on the other hand will be overcome as the length of the arm is increased. The capacity of each plant is approximately six tons per hour and can be operated to best advantage two shifts per day.

In what has already been said no reference has been made to the cutting of the peat into blocks. The reader would judge from the description given that the material was in long strips the full length of the spreading field. It has been found possible by the use of a deeply grooved roller, which is propelled by two men along the spreading row, to cut the peat strips into blocks. The work only takes a few minutes and is most satisfactorily done. It leaves the peat in blocks of equal width.

The Alfred peat bog is situated on the main line of the Canadian Pacific R.R. between Ottawa and Montreal. While it is quite large, there are many others which could be advantageously used for the production of peat bricks. It was chosen because it had already one working face prepared and because the drying fields were already drained.

An analysis of the peat contained in a portion of the bog being worked when all the water has been driven off is: Volatile matter, 69 per cent.; fixed carbon, 24 per cent.; ash, 7 per cent., which the reader will notice totals up to 100 per cent. The heating value per pound is 9,300 and 9,500 B.t.u. As has been stated, the peat actually contains, as delivered to the consumer, about 25 per cent of moisture. Unfortunately the water in the peat is largely of a colloidal nature, and it would be hard, if not impossible, to squeeze the peat dry in a filter press.

#### THIS SURELY IS A SEASONAL INDUSTRY

The amount of peat which can be produced in a year depends upon the length of time during which the drying operations can be carried on. The season at Alfred, which is similar to that of southern Ontario, is from 100 to 120 days long. The peat is being sold f.o.b. cars at the Alfred station in carload lots at \$3.50 per ton, the price allowing a reasonable commercial profit over and above the cost of production, and including an allowance of 10 per cent. for depreciation, and an equal provision for amortization.

It was interesting to note that when it was known that this peat was available for sale, there was a considerable demand for it by dealers in nearby towns, who had become acquainted with the merits of the peat manufactured in prior experiments. A ready market was obtainable in Ottawa and Montreal for many such machines as those built for the peat committee.

It is not supposed that peat fuel will entirely replace coal even where the bogs are most plentiful, but there are certain uses in which it has advantages over coal, and if it is used for these purposes, it will materially help the fuel situation. Peat can be used to advantage for open grates in cooking ranges, but is not recommended for use in domestic furnaces except in the fall and spring, when light fires are needed, or in conjunction with coal when a coal fire has to be hurried.

#### WILL TRY OUT A SMALL THREE-MAN MACHINE

The program laid out for the coming season is to work both plants to capacity, marketing the product and showing thereby what can be done on a commercial basis. It is also proposed to test out a small three-man machine which is now being built and which it is hoped will make available a great many small bogs of comparatively shallow depth throughout Ontario and Quebec that would be too small to endeavor to work with the larger machines.

Coal mining interests filled the entire morning session of Tuesday, March 9, the session opening with the suggestion that a coal section of the institution be formed. The failure of the iron and steel section to presage a strong self-perpetuating body made the forming of a coal section seem to most of those present an undesirable development, and the question was left for settlement at some later period. The Canadian Mining Institute army does not seem sufficiently large to divide itself into battalions.

Following this somewhat listless discussion J. T. Stirling's paper was read by Mr. McEvoy in the absence of the author. With the title of the "Coal Mining Industry in the Province of Alberta" it gave a general account of the coal operations which are the hope of the province and are already the quickener of its activities. With a trillion tons of coal and other bituminous minerals below the soil (1,059,975,000,000 tons to be exact) Alberta does not expect soon to be at an end of her wonderful resources. This is what Alberta did with her coal in 1918 and 1919:

Tons Sold in	1918	1919
Alberta .....	3,440,154	2,991,110
British Columbia .....	101,189	95,461
Saskatchewan .....	1,372,439	1,115,329
Manitoba .....	511,168	314,290
Ontario .....	629	308
United States .....	133,276	121,212
Total .....	5,558,855	4,637,710
Produced .....	6,148,620	5,022,412

It was stated that Manitoba and Saskatchewan were not favorably inclined toward Alberta coals, as the freight rates were high, especially in Manitoba, which is easily reached from the United States owing to the propinquity of the Great Lakes.

In 15 years 500 mines had been opened, 324 of which have been abandoned, the near-band coal having been mined out. A 64 per cent death rate in so short a period of time is quite large. W. J. Dick not being present, his article on "Fuel Problems of Western Canada" was not presented. F. W. Gray, editor of the *Canadian Mining Journal*, read his paper on the "Coal Supply of Canada." Mr. Gray is strongly of the opinion that Canada should arrange to make use of none but Canada-mined fuel. A synopsis of his paper will appear later.

A. McLean read an article on "Lignite in Saskatchewan" and was followed by E. Stansfield with an address on the "Principles and Practice of Fuel Briquetting." Mr. Stansfield is making preparations to briquet lignite in the Estevan district of Saskatchewan, possibly near the town of Bienfait. He has made a most careful investigation of the briquet factories of the United States and finds that it is impossible to reconcile the many different theories as to the right process of briquetting to be adopted.

He found that about half the United States factories were using asphalt as a binder, while about another half were utilizing coal tar for that purpose. Sulphite pitch needs drying and does not make a waterproof briquet. It has the advantage, however, that it does not create a smoky fuel if used to bind a fuel that is smokeless.

The Saskatchewan lignite will be carbonized and so will give no smoke. It would be preferable not to bind it with anything that would make the fuel smoky. It is unfortunately the fact that a carbonized body like coke is full of cell spaces and has, therefore, an abnormal thirst for binder. This insatiable thirst is expensive and results in obtaining a fuel as objectionable as a soft coal.

Not only is there a division of opinion as to the right binder to use but there are many other strong differences among experts. Some would have small rolls and some big. The small rolls are opposed because they have a rubbing action and the large rolls are favored because they give a longer period of contact. The question is not settled, any more than is the one as to the advantage of adding steam or water to the

mix. Some say that steam makes a better briquet, but it is answered that a briquet containing water is apt to be porous and drink up water if exposed to the air after it has been dried out. Mr. Stansfield was not disposed to act as arbiter on the questions raised regarding the proper course to pursue in briquetting coal or coke.

He said that the largest briquets made in America weighed 16 oz. and were fabricated for Italian consumption, work on such fuels being stopped during the war. The largest briquets made for use on the continent of America weighed only 13 to 14 oz. It must be remembered that wear makes a great deal of difference in the size of the briquet the rolls will make. As the rolls wear, the "fin" around the egg briquets gets larger, and the roll has to be turned down, thus lowering the capacity of the recess in which the fuel is compressed. Eventually the roll has to be scrapped and a new roll substituted, but prior to that time the briquets are below standard size and weight.

The "fin" around the egg is knocked off and can be turned back into the mixer but, of course, it is desirable that the fin be reduced to its minimum dimensions.

Briquets made from the fine coal screened from the lump piles at storage yards make an excellent product, for there is 20 per cent less ash in such abraded material than in the lump coal, the abraded particles being from the purer part of the coal. Briquets, however, made from the fine coal produced at the mines are high in ash as the slack or sludge is dirtier than the lump coal.

#### WHY NOT USE MORE SULPHURY COALS FOR GAS?

Dr. Henry Mace Payne, in the short discussion that followed, stated that the tendency was to demand the best coal for any given purpose rather than to choose a somewhat cheaper coal that would suit the need if correct handling were provided. Coal having 1 per cent sulphur or less is getting quite scarce, and gas plants should be willing to accept coal having 1½ per cent sulphur or even ¾ per cent, which can be utilized quite readily, provided proper purification plants are installed. In fact Dr. Payne declared that if the sulphur was of the right kind even 2 per cent was not too large a percentage for use in gas manufacture.

For lack of time M. A. McInnis' paper on "Coal Transportation" was delayed till the afternoon session. At the luncheon tendered to the visiting members Mayor Church, President McDougall and Bradley Stoughton of the American Institute of Mining and Metallurgical Engineers spoke, the latter felicitously comparing the balmy air and snowless streets of Toronto with the bleakness of New York City, where, as he put it, first-floor residents were unable to enter their apartments by reason of the snow.

In the afternoon a number went to the new plant of the Goodyear Tire & Rubber Co., while others attended the oil session, the patient coal men who participated being privileged to hear the paper of M. A. McInnis, which in part was as follows:

"The transportation of coal into Canada is such a large factor in its cost to the consumer that our facilities for handling and the future adjustments of freight rates will largely govern the distribution of this commodity and its cost.

"We in Canada are entirely dependent on the United States for anthracite. Our consumption of hard coal last year reached 4,782,000 tons. We are dependent

on the United States for a bituminous coal supply of 17,275,000 tons, or over one-half of our requirements. At the present rate of importation of anthracite and bituminous coal combined, totaling 22,000,000 tons yearly, or 60,000 tons daily, it is to be expected that from time to time we shall have to deal with abnormal conditions, and for these and the ordinary increase in population and consequent increased coal consumption, we should be prepared.

#### GREAT GROWTH OF CANADA AS COAL MARKET

"The total coal consumption in Canada last year was 25,000,000 tons, or about 4½ tons per capita. When our population reaches 10,000,000—a number we may expect by 1925—our consumption will have increased by 9,000,000, making a total of 44,000,000 tons yearly. Unless our home production can be increased materially in the meantime, we will be forced to import about 27,000,000 tons yearly by 1925, or 74,000 tons daily. Of our total coal imports 42 per cent is water-borne, 46 per cent carried by rail, and 12 per cent by ferries."

Mr. McInnes said that there were 123 storage plants for coal on the St. Lawrence and Great Lakes, capable of handling millions of tons a year. He added:

"Saskatchewan, Alberta and British Columbia do not have to import fuel to any extent, the total imports from the United States being less than 25,000 tons yearly. The mine outputs of these provinces total nearly 8,000,000 tons. British Columbia exports about a million tons of its product each year. The enormous coal resources of this trio of provinces is estimated at about twelve hundred billion tons, and their value is just beginning to be realized.

"The territory at the head of the lakes, including Manitoba, imports 3,000,000 tons a year, of which 2,000,000 tons are taken by the railways. The greater part of this coal is carried by rail from the Pennsylvania mines to Buffalo and other lake ports, then by water to Fort William and Port Arthur—where the Canadian Pacific R.R. and the Canadian Northern R.R. have large storage and discharging plants.

#### WATER HAULS MAKE COAL INEXPENSIVE

"It is here loaded into cars and shipped as far west as Winnipeg and other points in Manitoba. Although this territory is about 1,500 miles removed from the mines, the water haul, with its comparatively low freight rates, keeps the price of coal in Winnipeg within \$1.50 a ton of the price in Ontario and Quebec.

"Our greater difficulty in importing coal by rail is at Niagara, or what is known as the 'Niagara gateway.' The Canadian roads at this point are unable to accept as much freight as the United States roads can deliver. For the greater part of the year our roads can handle but 100 cars a day. Owing to the comparatively short haul from the Pennsylvania mines to the cities and towns of southwestern Ontario, or the territory bounded by a line drawn from Niagara to Toronto, and west to the shores of Lake Huron, these points have depended on rail coal rather than on the development of water facilities on Lake Erie and Lake Ontario. Toronto, Hamilton and other points in this area should eventually take more coal by water, for which adequate unloading and storage facilities will have to be provided. Last year central Ontario imported 10,000,000 tons of coal of which the railways consumed 6,000,000 tons."

The speaker said that the maritime provinces had no

serious difficulty in providing themselves with coal. Last year Nova Scotia, New Brunswick and Prince Edward Island imported 175,000 tons of anthracite from the United States, nearly all by water. These provinces produce 6,000,000 tons of coal yearly.

As a means of successfully meeting the coal problem the speaker suggested: "Let the bituminous coal operator give some concessions to the early buyer as the anthracite operators do. The railways quote lower freight rates in summer, and if a price differential is provided the consumer will be quick to take advantage of it, and will provide storage room at points where the coal is used, thus reducing the cost of rehandling. Educate coal users to buy early."

#### "THERE ARE MINES THAT MAKE US HAPPY"

Tuesday evening, under the shepherding of Col. J. J. Penhale, most genial of presiding officers, was held the annual smoker. With him was to have been associated G. G. S. Lindsey, but much to the regret of the assemblage he did not feel it was safe to be present as he was none too fully recovered from a surgical operation. The song sheet had a parody on "Smiles That Make Us Happy" which was sung with gusto and which ran:

"There are mines that make us happy,  
There are mines that make us blue,  
There are mines that steal away the tear-drops  
As the sunbeams steal away the dew;  
There are mines that have the ore-shoot faulted,  
Where the ore's forever lost to view;  
But the mines that fill my heart with sunshine  
Are the mines that I sold to you!"

"Foghorn" McDonald, beloved of the North County, in stentorian voice rendered "Drill, Ye Tarriers, Drill" to the chorused accompaniment of all present. Eddie Collins, of Cobalt, after many calls, narrated some French-Canadian stories in inimitable manner while songs and the cries of the three colleges represented filled in the interstices in the program.

#### A METAL DAY FOLLOWED BY PLEASING BANQUET

Wednesday morning's session covered the problems of mine assessment for taxation purposes, prospecting especially in Manitoba, Saskatchewan and Alberta, particularly in the first-mentioned province, the sources of cyanide and "Engineering Standardization, with Special Reference to Standardization in the Mining Industry"—this last by J. B. Porter.

In the afternoon the subjects treated were the Quebec asbestos deposits, nickel coinage, lost placers of Ontario, methods of mining and milling in the Cobalt, Gowganda and Kirkland Lake districts, the geology of Silver Islet and vicinity and the minerals of eastern Ontario.

The banquet in the Pompeian room of the King Edward Hotel lasted till a late hour, there being an unusually long list of speakers, including the Lieutenant Governor of the Province, Harry Mills, who is Ontario's new Minister of Mines; E. P. Mathewson, Henry M. Payne, Bradley Stoughton, D. H. McDougall, O. E. S. Whiteside, R. Dawson Hall and F. W. Gray. That does not entirely exhaust the long list. E. A. Collins recited; many furnished songs; so it was at a late hour that the goodly company retired.

The United States contingent divided among them the subject of the possibilities of the Canadian Mining Institute filling at Ottawa the functions which are being

performed by the American Mining Congress at Washington, and in lesser degree by the American Institute of Mining and Metallurgical Engineers at the capital and in New York. The Institute, according to the United States visitors, could give a composite view of the mining industry's opinion to the legislators at Ottawa who do not understand mining and are quite willing to receive information from a reliable source.

The Canadian Mining Institute has ventured only a little way into the waters of political relations. It has regarded the political mess as a dirty matter to mix in. So was the war—a mess from which we may pray ever to be delivered. But the good citizen believed that just there his duty lay, pleasant or unpleasant, and he did his duty as he saw it. So with legislation. It is a duty of the good citizen to take part in its direction and his entry into legislative matters will purify it as does the entry of good citizens into the ranks of the army. Politics will always be unworthy, if worthy men stay out, as an army will not be reputable if honorable men fail to accept service in it. Strange to say, we do not see the army with just the same eyes that we do politics.

The Canadian Mining Institute is beginning to take views on political subjects, as is evidenced by the vote on introducing a pure 5c. and 10c. nickel coinage, the paper on legislation relative to the certification of engineers and the address on the need for mining laws and the abolishment of mining regulations in the Prairie Provinces and on the assistance to be extended by the government to prospectors.

#### SOME OF POLITICAL SUBJECTS DISCUSSED

One might also refer to the plea for the free admission of mining machinery, especially for such as would make oil-shale distillation feasible, and to the article relating to assessment of mines for taxation. The salary question in the mining department repeatedly recurred. The institute is chatting politics almost as often and as glibly as geology, but not at Ottawa. It is today gossiping politics at Toronto, Vancouver, Montreal and, let us add, Fort William. Shortly, it may be predicted, it will be speaking so as to be heard in Ottawa.

It will not be lobbying but rather counselling. It will forbear to threaten or cajole, but it will advise and instruct, and who shall say that its voice will not be heard with respect? Politics is like sickness or war. We cannot avoid anyone of the three. They are inevitable. We may regret them, but we must meet them nevertheless, and may we meet them like men!

The British precedent which restricts the activities of technical institutes solely to inquiry into matters of scientific concern has been long followed in the United States and Canada. The march of events has almost compelled in the Republic a revision of former standards. It is not unlikely that it will have the same effect in the Dominion, and if the Canadian Mining Institute does not lead, another body must undertake that function.

The trip to Port Colborne drew about 98 participants. The International Nickel Co. here receives nickel-copper matter and transforms it into nickel shot, blister copper and nickel oxide by various processes, in which roasters, converters, openhearth, filter presses and bleaching tanks all figure. The plant is built in a peat bog which is, however, only one to two and a half feet thick. Ontario has large peaty areas, and if the peat can be briquetted cheaply, there are great possibilities to be found in this low-grade fuel.

## Where Angels Fear to Tread!

The Tidewater Transshippers' Association is undertaking a serious problem when it proposes to classify the coal handled at Tidewater, and we venture a word of warning against any too confident application of the principles which we understand have been adopted as a basis for this assignment of coals to the pools which it will control.

It is reported that "classification shall be made upon the basis of analysis for volatile, ash and sulphur, as to steam coals; volatile, ash and sulphur, yield of gas per pound and illuminating power, for gas coals, *with such variations as shall be determined by the executive committee*." The italics are ours; we use them because this part seems to us the most important part of the whole quotation. In fact, unless the committee determines on important variations, and that right at the start, we venture the prophecy of dark and troublous days ahead for the new Association.

First let us consider the case of steam coal. Has it occurred to the Classification Committee that the character of the volatile matter may be vastly more important than the percentage? Have they realized that 15 per cent of ash, if of reasonably high fusing temperature, may actually cause less loss than half that much ash which clinkers badly? Have they altogether forgotten that heating value, other things being equal, is what we want under the boiler and that sulphur, though important at times, is of far less significance?

In other words, does anyone for a minute seriously believe that the percentages of volatile, sulphur and ash are a satisfactory basis on which to classify steam coals? If he does, we seriously doubt the value of his work.

And again, consider the gas-coal proposal. The same points we make for volatile and ash in steam coal apply here also. Especially is the character of the volatile matter of great consequence; and "the yield of gas per pound and illuminating power" are a feeble reed on

which to lean for support if one is to bear the weight of righteous indignation which the gas men will heap on him who makes this classification.

By what standard system does the Committee propose to fix upon this "yield of gas" and its "illuminating power?" We can refer them to methods, yes, a dozen of them; and we'll guarantee, too, that any one of the dozen will give a wide range of results for "yield" and of "illuminating power." These results depend upon temperature, and rate of heating, and length of heating, and pressure in the retort, the barometer, and the direction of the wind. And sometimes we even get to think that the day of the week and the color of the hair and height of the last man we met before we got to the office that morning are factors. In any event a multitude of factors beside the coal sample enter to render such tests of little or no value for a basis in pooling.

We fail to find any mention of the coking characteristics of this gas coal, but we assume this will be one of the "variations." Perhaps also the British thermal units in the total volatile matter may be noted after a

time when the Committee learns from the gas men that only about a dozen places in the United States, and practically none in foreign countries, any longer worry themselves about the illuminating power of the gas. And moreover where illuminating power is required by law or rule it is water gas, not coal gas made from bituminous coal, which is used to meet this standard. We noted in *Coal Age* of March 4 that these tentative principles were adopted, "only one vote in the negative being recorded." We wish to extend our congratulations to him, whoever he may be, who saw the weakness of this system. We trust

### Are Our Public Utilities to Serve As Flunkies to Luxury?

When we are told that the public cannot stand to pay a fair price for coal, or an adequate transportation rate, we naturally ask if the public utilities are to continue to stand in deference to the comfortably seated luxury industries

that his counsel will prevail before the classification committee in order that the new Association may not start out with the handicap of a poor system for assignments to its pools. In this connection we would suggest a careful reading of the opinions reported by our correspondent in the issue of *Coal Age* of March 4 pages 446-50.

## For Coal Mining Is Relatively Stable

SEASONALITY is a misfortune of the farming industry, and the lumber trade partakes of the same infirmity. For this reason from the first the farmer and the woodsman have been attracted to the coal industry as being more stable than the one to which they belonged. It would be hard to tell the farmer that mining is a seasonal occupation. Its summer idleness

does not begin to compare with the long winter slackness of the farm. In sowing time and in harvest the farmer is busy, the rest of the year he often merely cuts wood for his fire, takes milk, eggs and potatoes to market, beds down and feeds the cattle and horses and perhaps butchers some hogs.

Many farmers manage, by working in other trades, to make the year show a favorable balance in the profit and loss account. Nearly all help to maintain the township highways; many haul lumber, logs and stone; some work in small mines located on their own farms. But on the whole things around the farm usually drag along so slowly (at least they did before the war) that the banker who holds the mortgage wonders how soon he will have to foreclose. When the mines are opened, the farm laborer sees his first opportunity to have reasonably steady work. If he combines farming with mining he can make the whole year productive but even if he does not, mining work will give him bigger wages and steadier time than the work of the farmer.

The lumber jack in recent years has worked more steadily than before. Formerly no hauling was done except in the winter. If not located on a large stream, the mill was idle in the summer unless a freshet made it possible to float down logs. In the depth of winter, the logpond froze, and the mill was shut down though the woods might be busy. The sap only ran for a few weeks, and such timber as had to be spudded could only be cut during that short season. The railroad has improved the transportation problems; the thawing of the logpond by steam has helped to make winter milling regular while the decrease in the woods that are used for tanning has made cutting less seasonal. Nevertheless there is still a degree of irregularity from many causes, for there is still inequality of demand and seasonal difficulties such as those arising from high-water, excessive snows and rains. Under the old conditions there was a bad-load factor, as George Otis Smith would term it, in the lumber industry, and the workmen quite often gave up the lumber camp for the coal mine just because mining was more stable.

In fact mining is about as stable as most country employments. All have their slack times and their times of activity. The clay works, for instance, find the fall is a period quite usually accompanied by slack work.

The study of stabilization is a large one. Perhaps it is well that the experiment is first being tried on an industry that is comparatively stable—namely coal mining. It is questionable whether it should be made wholly stable, whether farming and coal digging should not be made the two balls on the governor whereby the engine is kept in uniform rotation. If the railroad problem of transporting to market did not rise to the

mind one would be inclined to urge that the mines might advisedly close entirely in the summer for say two or three months giving the farms the full benefit of the labor of the mine worker.

Certain it is that when he is growing wheat, grain and potatoes he is not subjecting the country to a financial drain as he is when he is idle. What would mine workers say to this proposition? This; that the pay obtainable on the farm would hardly meet with their ready acceptance. The miner may deplore that the bright skies and open air of the farmer are not a part of his lot, but he does not want the farmer's pay. If it had not been for the frugality of the farmer in most coal regions that worthy would not have been able to live at all through the unprofitable years that preceded the war.

### A Good Precedent

ONE OF THE most successful, hardworking technical societies of this country is the American Society for Testing Materials. Practically all of its activities are carried on through committees, and these committees are organized in a way that affords a splendid precedent for the consideration of the coal man. It is provided by this society that any committee dealing with a subject having a commercial bearing must be made up with either an equal number of representatives of the producing and the consuming interests, or that the consuming interests shall predominate in numbers, always, however, with the consent of the producing interests. The result of this policy has been that specifications for materials and proposed standards adopted by this society find wide acceptance as the basis for commercial work. It is proposed by the American Institute of Mining and Metallurgical Engineers that a committee be

organized to strive for stabilization of the coal business. The basis upon which this committee should work has, of course, not yet been developed, but we believe that any measure of success which will be attained by it can only come after it clearly recognizes that a co-operation of the coal-producing and large coal-using interests of the country is essential if any recommendations are to secure general agreement and adoption.

We see no reason why the coal man should not welcome a frank study of these problems of the seasonal aspects of the industry. We do not agree that the coal business is more largely seasonal than many others, but anything that will reduce the seasonal variations should be welcome. We trust that the American Institute of Mining Engineers will properly constitute its committee so that all aspects of this important commercial problem will be represented. So constituted a real improvement in conditions may be confidently expected.

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Shifting the Worker

*Letter No. 3*—I am glad of the opportunity to express my view in regard to the situation presented by the letter of A. H., *Coal Age*, Feb. 12, p. 327, regarding his failure to secure the transfer he wanted to another position that would give him more pay and be better to his liking. At first sight, it would seem rather hard that the request of this worker to be transferred could not be granted; but we must defer judgment until we hear the other side.

It frequently happens that workmen try the patience of their foremen and superintendents, to the limit of endurance, and cause them to say and do things that seem unfair. It's all right for an outsider to say what a superintendent should do and what he should not do; but, believe me, a brief visit to the superintendent's office will often give one a different opinion on this matter.

Workers are not all alike; they differ in many respects. In my experience, the man who tries to make his foreman or superintendent believe that his services are being solicited by some other company rarely impresses either of them with the value of his services to themselves. On the other hand, the man who moves about is generally able to pick up better jobs, and secures more speedily the kind of work he desires. As a matter of fact, I would rather see the mine shut down than to depend on the services of a dissatisfied lot of men.

#### TRUE ATTITUDE OF SUCCESSFUL SUPERINTENDENT

As superintendent, I believe in throwing in my lot with that of the men in my charge, and making it as cheerful for them as conditions will permit. However, it is true that there are workers who will take a mean advantage of a foreman or superintendent thus minded, and impose on his good nature, unless they are suitably checked. The average mine worker always looks at his own interests. While it is true that a man should not allow his family to suffer, in order to please a whim of his foreman or superintendent, it is too often the case that the worker himself is selfish. It is human nature to be selfish. Indeed, every thought and every action terminates in that one idea of self. We all worship and bow down to the God of Self.

In the case before us, the worker states he had only been at the substation a short time. The chances are that the superintendent had to put a man with him for a couple of days to show the newcomer his duties. Then, this being done, the superintendent thinking all is moving smooth again, is suddenly confronted with the request for "another job." So it goes, when a new man is broken in and finds his job a little harder than he had supposed, he either threatens to quit, or else he stays at home when he is most needed at his post and his absence delays the work.

Speaking of selfishness, there are no doubt selfish superintendents and selfish foremen; but this kind do not last long and never meet with much success in the handling of their men. It hurts none of us to give the helping hand to a fellow worker, providing it is done in an honest and whole-hearted way. In the present instance, however, it would be unjust to pass an opinion on the action of this superintendent in refusing the request of his man to be transferred from the substation into the mine where he was wanted to bond rails. Before passing judgment, let us wait to hear from the superintendent, who, if he is the man we may suppose, will not permit this worker to get away without letting *Coal Age* readers know the exact conditions in the case.

RICHARD BOWEN.

West Pittston, Pa.

### Deal Squarely with the Miner

*Letter No. 1*—Having been a constant reader of *Coal Age* for eight years past, or since its first issue came off the press, my feelings for the miner have been frequently stirred by the attitude assumed by different writers toward the unionized miner. The reading of the article, "Deal Squarely with the Railroads," *Coal Age*, Feb. 5, p. 274, leads me to make a similar appeal for the workers underground, and for that purpose I have chosen the same heading with the change of but a single word.

While some years have past since I could be classed, strictly speaking, as a miner, my whole anatomy is so impregnated with the mine atmosphere through continuous contact with my former associates, by reason of my calling, I naturally feel hurt when I hear the miners' union unjustly condemned.

There is little question in my mind that many other readers who, like myself, were formerly miners at the face, have the same feelings aroused in them by the aggressive attitude of the press toward the union miner. Personally, I am at a loss to know why this attitude is so prevalent. Unless, like the old rhyme I read somewhere, a time ago, which runs:

"I do not love thee, Doctor Snell,

The reason why, I cannot tell,

But this I know and know full well

I do not love thee, Doctor Snell."

Certainly, I know that the miner is often radical, irrational in his demands and not infrequently tyrannical when the opportunity is presented. But, after all, is that not human nature and can we blame the miner for being human like ourselves? Many of us there are who have, during our lives, shown the same unreasonable vindictiveness, either as employer or employees.

Twenty years is not so long a period to look back upon and yet, in my experience as a miner during such time, it has been my lot to feel the severity, if not the

tyranny, of an employer when, with a few fellow workers, I dared to join a miners' organization in the valley, not 40 mi. from Pittsburgh. The purpose of the organization was to protect the interests of the men who toiled, for 10 and 12 hr. out of the 24, exposed to all the hazards and dangers of coal mining. The employer's attitude was: "The mines are mine; take what I give or leave; but you cannot organize." Will not the readers of *Coal Age* feel, with me, that such an attitude was unjustified and tyrannical?

#### UNION MINER BECOMING A SUPERINTENDENT REALIZES THE TYRANNY OF LABOR

Later, as manager of mines in an organized district a few miles outside of Pennsylvania, I have experienced the same *tyranny of labor*, until I almost prayed for the destruction of the very principle of unionism. But, after all, something tells me that, between these two extremes, there is or ought to be a happy medium where employer and employed can meet and confer on equal terms in respect to their common interests.

Viewed from a safe distance, the observer recognizes that organized labor always demands more than it really expects to get, just as organized capital contends for more than what is its just due. Notwithstanding all that has been said respecting the radical demands of the miner and the exorbitant wages he is paid, we who are closely associated with his work and know by experience the conditions under which it is performed, his hours of enforced idleness and the dangers to which he is exposed, know that he earns all that he receives.

#### LACK OF SYMPATHY AMONG WORKERS IN DIFFERENT, ASSOCIATED INDUSTRIES

Unfortunately, there is a lack of sympathy, in this world, between workers and individuals of different classes. Too frequently, we refuse to look at the situation from any angle but our own, with the result that we do the other fellow an injustice. A few days ago, sitting behind two sheet-steel workers, in a trolley car, I overheard their remarks on the mining situation. The "roller" was speaking: "That's Bolshevism in this country, a demand for 60 per cent. increase and a 6-hr. day; and they tell me the miner makes from \$10 to \$12 a day. The Government ought to put guards at the mines and keep those fellows digging coal."

Then their conversation drifted to their own work. There had been trouble at the rolling mill, the previous night; a roll had broken and the men had to quit. Again the "roller" spoke: "A d—— bad shift; I figured my tonnage and found I made but \$24.40, the whole d—— night." Yet, by this man's estimate, the miner he quoted as earning half that amount, in a longer shift in the mine, was a "Bolshevik," because he was demanding an increase in wages and shorter hours.

Knowing something of the work of the two men here mentioned, I can say that \$24.40 is a very low figure for a shift of 8 hr. in the rolling mill. In my opinion, the man is no more entitled to that pay for a "d—— poor shift," by reason of his skill and intelligence, than any intelligent, practical miner employed in our mines today, who would consider the amount named was a d—— good night's wages, in return for his skill and experience in the mining of coal. It's a case of "Whose ox is being gored?" Let us hope and ask for a square deal for the coal miner in the near future.

Houston, Pa.

SIM. C. REYNOLDS.

## Markers on Mine Trips

*Letter No. 6*—Having always believed in the value of the practical discussion of mining problems and questions, it is with some degree of satisfaction that I cite the following incident to show the value of this department to the readers of *Coal Age*:

For some time back we had been unable to find a lamp that was at all satisfactory for use in the mine as a trip-marker, when our interest in this matter was suddenly aroused by the inquiry of J. J. S., *Coal Age*, Aug. 28, p. 397, giving a similar experience to our own. I was led to take part in the discussion that followed this inquiry, and my remarks in Letter No. 5, Oct. 23, p. 693, drew the attention of the Wolf Safety Lamp Co., with the result that we now have a satisfactory trip-marker. This lamp is a Wolf acetylene handlamp, No. 856, with a No. 860 reflector. It has now been in use as a trip-marker, in our mine, for over a month, and the results are entirely satisfactory.

One of the strong points of this lamp when used for that purpose is that it will hold a charge lasting the entire working day and, therefore, requires little or no attention from the triprider. The lamp gives a strong, bright light, which is thrown well in advance of the trip and makes the road plainly visible far enough for all practical purposes. The lamp is strongly constructed and simple in operation. My opinion is that, with a few minutes' time spent each day in cleaning the lamp, it should last a long time. Knowing a good thing when its use proves its merit, I am glad to pass it along for the benefit of others.

JEROME C. WHITE, Asst. Supt.

Portage, Pa.

The Penker Coal Mining Co.

## Supporting Mine Roof

*Letter No. 2*—Supporting the roof in a mine is a timely subject for discussion. The all-absorbing topic among mining men, today, is that of ridding the mine of the tremendous expense for timber. It cannot be denied that the available timber supply is growing less each day, while the demand for timber suitable for mining purposes is rapidly increasing, owing to the opening of new mines and the extensive development of old ones. It is not surprising that these conditions have increased the cost of mine timber and it is now high time to look for substitutes.

In considering this question, numerous methods and means suggest themselves as affording a practical solution from the standpoint of economy. While some of these will apply only locally, others will prove of general application in mining. Among the more helpful and promising of these suggestions may be mentioned the following: (a) Changing the method of attacking the coal, from advancing the excavation, to the retreating method of working. (b) Adopting the plan of driving narrower openings, as rooms or stalls, and leaving larger pillars between them. (c) Using fabricated steel in place of timber supports, wherever this is practicable from the standpoint of economy and safety. (d) Using concrete reinforced props instead of timber posts. (e) Building permanent masonry supports. (f) Planting timber to replace that cut each year.

Heretofore, the timber account in mining has not proved so large an item in the cost of operation. Today, however, the rising price of timber has made it

necessary to consider the problem of its conservation as being a question of the utmost importance. Notwithstanding the fact that much thought has been given this matter, the problem is still in its infancy in this country. Even the casual observer, noticing the extra care taken in the stacking of timber at the mines, the planning of mines with larger pillars and the introduction of the so-called "steel timbering," cannot fail to realize the growing importance of the timber question to the coal-mining industry.

#### TIMBER AND COAL SAVED IN RETREATING

In the winning of coal by the retreating system much of the expense of operation will be saved, on several accounts: 1. The entries and air-courses being driven in the solid coal, less timber will be required for the support of the roof. 2. The solid coal supports inclosing, the entries insure less breakage of the posts and collars of timber sets and lessen the expense of their renewal. 3. Retreating methods of mining require less timber than advancing methods and a shorter period of service, which decreases the cost for renewals, and practically no timber is lost in the waste. 4. The extraction of the coal is more complete when retreating than when advancing, and there is less trouble caused by stumps left in the waste, which throws the weight over unto the pillars, crushing the coal and causing much loss. 5. The larger percentage of recovery, in the retreating system, is reflected in the reduced cost of production by that system.

The plan of driving narrower openings and leaving larger pillars between them saves timber on two accounts at least: 1. Less timber is required for the support of the roof in the rooms, which means less waste by decay and dry rot. 2. When drawing back the pillars, less timber per foot of coal face is needed, more timber is recoverable and there is less need for replacement of timber lost or broken.

On entries where heavy or strong timbering is needed, fabricated steel of suitable lengths, sizes and shapes are manufactured in large quantities for mine use. Much research work has been done, in recent years, by the engineers of the Carnegie Steel Co.; and experiments made, in the heart of the Pittsburgh coal fields, have proved the practicability of steel timbering.

This method of support has not come into general use, in the coal mines throughout the country, for several reasons: 1. The high first-cost of steel supports. 2. A plentiful timber supply available in certain localities. 3. More attention has been given, in steel timbering, to the question of *sets of timbers*, rather than to single props. Notwithstanding these drawbacks, it would seem that steel timbering will be, ultimately, indispensable to the mining of coal; and the manufacture of single units of suitable lengths, sizes and shapes may be expected to increase.

#### REINFORCED CONCRETE MINE TIMBERS

The use of reinforced concrete in mine work has proved successful, both for permanent construction and for single units, as posts and bars. I recall that an excellent article on the use of concrete timbering appeared in *Coal Age*, Vol. 14, p. 362. The article was entitled "Reinforced Concrete Pit Props," and set forth the methods of testing used in the Manchester University, England, besides giving the comparative strength of timber and steel supports as

used in English mines. The Manchester tests showed a large excess of strength in the reinforced concrete props, as compared with the strength of similar props of Welch larch timber.

The fire hazard is also a large factor in favor of concrete construction in mining. The strength and life of the concrete mixture is treated in an interesting article by H. W. Eldridge, which appeared in the *Contractors' Atlas*, New York, November, 1918. Speaking of concrete mixtures, the author writes:

Concrete has always been thought of as a mixture of cement, sand and pebbles or crushed stone. It has been found, recently, that we have been disregarding one of the most important constituent materials in mixing concrete, namely, the water. It has been shown by laboratory experiments that a concrete mixture with 7.5 gal. of water (1 cu.ft.) to one sack of cement, after due allowances, gave a strength of 2,900 lb. per sq.in.; using 6 gal. of water, per sack of cement, 3,000 lb. per sq.in.; and using 5.6 gal. of water, per sack of cement, 3,300 lb. per sq.in.

These results show that when a mixture of 1:2:3 is used, the water content should be from 5½ to 6 gal., per sack of cement. The data emphasize the fact that more care should be used in measuring the amount of water used.

Another excellent article entitled "Concrete in Coal Mine Service" appeared in *Coal Age*, Vol. 13, p. 916, and gives much interesting information on the use of concrete in mining.

#### EFFORTS IN CONSERVATION OF TIMBER

Speaking of planting timber to replace that cut each year, I understand that this has been started, on a small scale, by some coal companies, but am unable to give the results of their efforts. In Pennsylvania, there are forest preserves in several places, some being located in Somerset County and others in Westmoreland County, almost at the door of the Pittsburgh district mines. I believe that these timber preserves will be available for mining use later. In this regard, the commissioner of forestry, at Harrisburg, Pa., will probably be able to state more definitely.

Before closing, I want to draw attention to two interesting articles that are to be found in *Coal Age*, Vol. 13, pp. 370 and 407. These articles relate to supporting roof in coal mines and contain a fund of information along this line. In the second article (p. 407), which is a continuation of the first, is treated the preservation of timber and a list of the different preservatives is there given. I would advise a careful perusal of these articles, as forming a basis for future thought and action.

R. Z. VIRGIN,  
Assistant Professor of Coal Mining,  
Carnegie Institute of Technology.

Pittsburgh, Pa.

*Letter No. 3*—Speaking of the growing scarcity of mine timber, I quite agree with the suggestion that the time is opportune for considering the best means to adopt for supporting the roof when the timber supply fails in the vicinity of the mines.

Realizing that we are approaching this condition in Pennsylvania, we have been trying steel timbering to a limited extent. In my opinion, the best material for this use is the I-beam or double channel, sometimes called the "H-bar." In some cases, we have used heavy rails that have been so worn as to be unfit for track-work, and have found them of great advantage in securing the roof over roads and in air-courses.

For several years, I have adopted the method of using iron rails as roof supports on roadways. Where

the coal is hard, it has been my practice to make a needle hole, or hitch, in one rib near the roof; and then cut a slip-hitch in the opposite rib. Having cut the iron rail to the right length, one end is first inserted in the needle hole and the other then slipped into the hitch in the opposite rib. I frequently place a small block of wood in the back of the needle hole before inserting the rail, which gives the best satisfaction in the use of this type of timbering. In order to hold the bar in place, a hard oak wedge is driven behind it in the slip hitch.

When no longer needed, these rail bars are easily taken out and put aside for future use. Where the coal is of a friable nature, it is necessary to use a post on each side of the road to support the crossbar. When the bar is in position, suitable wedges are driven over the bar, or lagging is inserted to support the roof slate above it.

A form of telescope post made of sections of tubes that slip into each other has been used. Also, lengths of iron pipe are sometimes employed, by driving a wooden plug in the lower end and filling the pipe with sand, after which another wooden plug is driven in the other end of the pipe. These short wooden plugs are often gaged so as to give the desired length to the posts. Old broken posts come in handy for this purpose. Where the floor is soft, or where there is any possibility of the iron posts corroding, a heavy wood sill should be used on which to set the posts.

McKeesport, Pa.

ANDREW O. BAIN.

## Coal Mines in Scotland

*Letter No. 3*—Looking over a recent issue of *Coal Age*, Dec. 11, on page 899, I came across the excellent letter of Andrew O. Bain, discussing a previous article by an unknown writer, who may have been taking a holiday in Scotland, where he had obtained some curious ideas of the coal mines in that country.

Now, Scotland is famous for a celebrated brew known as "Scotch Whiskey," and it appears to me that our friend, while sojourning in that hospitable country, had partaken too freely of the beverage, which would account for his wrong conclusions in regard to the coal mining he attempted to describe.

Fearing that a wrong impression may be conveyed in respect to coal mining in Scotland, should the said article be taken seriously, I desire to add my little to the testimony of Mr. Bain and that of a previous writer, John A. Douglas, Oct. 2, p. 586, regarding the conditions existing in and around the coal mines of Scotland at the present time, as compared with conditions elsewhere.

The majority of coal seams mined in Scotland are thin, at times not exceeding 2 ft. in thickness. These lie at a considerable depth below the surface. The mining of the coal in the deep thin seams suggests innumerable difficulties that can only be met by mine managers (foremen) who are highly qualified for their position. So different are these conditions from those relating to coal mining in the United States and Canada, that it is impossible for any writer to give a true picture of Scotch coal mining, except he is able to view the subject through Scotch eyes.

Certainly the article of our friend is ridiculously amusing. His reference to securing a mine manager's certificate in that country is absurd, when it is known

that the holder of such a certificate has obtained it through his own individual effort. The Scotch certificate cannot be obtained through family connection or political pull. Reflecting on the serious situation of coal mining in Scotland, where it is necessary to conserve every atom of coal, one will realize the impossibility of running a bluff and getting away with it, in an effort to secure a certificate. I regret that the same cannot be said of some other countries.

### COMPLETE EXTRACTION OF COAL NEEDFUL

Regarding the extraction of coal in Scotch mines, it can be said that every possible ton of coal is taken out. The prevailing practice there is that the content of the coal area worked is carefully computed and all the coal must be paid for on the basis of that computation, whether it is mined or not. The result is that the complete extraction necessitated is a fair test of the mine manager's ability.

In sharp contrast with this condition is that prevailing here today. No one will deny that obstacles to the complete extraction of coal, in American mines, generally result in the abandonment of the territory; and thousands of tons of coal are thus lost beyond recovery, the chief object of the coal operator, in this country, being to show a good cost-sheet. It will be readily granted that such conditions afford no real test of the ability of the foreman in charge. I admit that the conditions in Scotch mines are not favorable to a low cost-sheet. Neither will the production, per capita, in that country, compare with the same in the mines of other countries where it is possible to introduce modern coal-cutting machines.

These conditions, however, are no reflection on coal mining in Scotland. They even make it possible to ship soft coal across the Atlantic, in competition with the output of Scotch mines. Only recently it came to my notice that an American firm had secured a contract to deliver several thousand tons of soft coal, in Ireland, at a figure far below the cost of production in Britain, which is due solely to natural conditions.

### SCOTCH vs. AMERICAN MINING

While it is not my meaning that the Scotch mine manager (foreman) is the last word in efficiency, I firmly believe that a just comparison of the results of the extraction of coal, in Scotch mines, with the same item in the mines of this country, would give a superior rating in favor of the former. The comparison would undoubtedly show that many of the certificates held by American mine foremen are relatively worthless.

Running a coal mine is no one-man's job. The successful mine foreman, in any country, must be a man with a true sense of proportion. His knowledge of coal mining, however good, will not offset the lack of skill in the handling of men. He must be an organizer, a student of human nature, a leader and not a driver, as the bully type of foreman is passing today. I am not a prophet or the son of a prophet; but it is far from a wild guess to say that the time is not long when it will be necessary to mine 2-ft. coal, in this country. It will then be possible to make a just comparison of the ability of foremen here with that of Scotch mine managers. However, our friend may not then be available that we may convince him of his errors of judgment.

J. H. McMILLAN, Supt.,

Pocahontas, Alta., Canada.

Peabody Coal Co.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Indiana Mine Bosses' Examination. Indianapolis, Indiana

(Selected Questions)

*Ques.*—What are the causes of dust explosions in a mine, and what is the best known method to prevent them?

*Ans.*—Dust explosions result from the undue accumulation of fine coal and slack in the working places and on the roads and travelingways in a mine. The danger is much increased where the coal is blasted off the solid, or by the excessive use of powder, insufficient tamping or other causes that may produce a blowout or windy shot. The best method of preventing dust explosions from occurring in a mine is to remove all accumulations of fine dust regularly from the mine roads and working places. Where blasting is performed strict regulations should be enforced limiting the weight of charge and the number of holes fired at one time. The safest plan, in blasting, is to employ competent shotfirers to charge and fire all shots that in their judgment are safe. In a gassy mine where the coal is highly inflammable and forms much dust, no shots should be fired before the place is examined and found free from gas.

*Ques.*—What is the danger arising from working a mine adjoining an abandoned mine? What is the law regarding the method of approaching abandoned mines?

*Ans.*—The workings of the abandoned mine may be filled with explosive or poisonous gases that would enter the live workings when an opening is made. Or the abandoned mine may contain a dangerous accumulation of water that would burst the barrier pillar and flood the live workings.

Section 14 of the Mining Laws of Indiana requires that excavations "approaching abandoned workings which are supposed to contain dangerous accumulations of water or gases . . . shall not exceed eight feet in width, and there shall be constantly kept, at a sufficient distance (not less than three yards in advance) one borehole near the center of the workings and sufficient flank boreholes on each side."

*Ques.*—What are the causes of mine fires? How would you proceed in case of a fire in a mine of which you had charge? Give full details.

*Ans.*—The causes of mine fires are numerous. Among the more common causes may be mentioned the following: The careless handling of open lights or use of matches in proximity to combustible materials, such as hay, powder, waste, canvas or board brattice, etc.; careless shooting in presence of gas; ignition of gas feeders; improper wiring and installation of electrical equipment; spontaneous combustion of fine coal and slack in the gob or abandoned workings, or from accumulations of oily waste in pumphrooms and shanties; sparking of electric wires and brushes or blowing of fuses.

The manner of dealing with a mine fire must always be determined by the conditions regarding its location in respect to the air current and proximity to shafts or any combustible construction or material; and the headway gained by the fire when discovered; also, the means available for fighting the fire.

In any event, notify the men working in the mine, instructing them to withdraw at once and directing them by the shortest and safest route to escape to the surface. At the same time, summon help and lose no time in getting water to the fire. If the fire is on the intake and has gained some headway it may be possible to short-circuit the air so as to prevent the smoke and gases from being carried into the workings and suffocating the men before they have opportunity to escape.

*Ques.*—Give method of procedure in case an explosion occurred at a mine of which you had charge, by which the ventilating devices had been injured, and there were men to be rescued.

*Ans.*—The fact that the ventilating apparatus has been injured suggests the force of the explosion was considerable and makes it probable that much damage has resulted in the mine whereby the circulation will be cut off from reaching the workings, even when the apparatus is repaired and the air current restored. While immediate efforts must be made to effect temporary repairs to again put the ventilating machinery in commission, no time must be lost in organizing and equipping a rescue party for entering the mine and rendering any possible aid to the men in the mine.

Rescuers must be equipped with reliable breathing apparatus and approved safety lamps, without which no advance can be made ahead of the air entering the mine. The lack of available breathing apparatus will mean much delay in reaching the men, as the air current must then be established at the entrance of the mine, and the work of erecting brattices, building stoppings and repairing air bridges be started and carried forward as the rescuers advance.

No lights other than approved safety lamps can be used and the lamps must be closely watched to detect the presence of explosive gas. The rescuers must also carry with them one or more caged birds or mice as a means of detecting the presence of the deadly carbon monoxide, which is very liable to be present in dangerous quantity.

*Ques.*—How would you proceed to rescue a person caught by a fall of roof?

*Ans.*—Summon quickly what help is available nearby. Do not delay; but approach the place with caution, noting the condition of the roof above and around the fall and the position of the victim. Make no attempt to disturb the roof by setting timber, or removing loose pieces of slate that seem ready to fall. Instead, give immediate attention to releasing the man, by cautiously and expeditiously dragging him from beneath the debris if this can be done without further injury to the victim. Notify surface and foreman, and summon first-aiders.

# INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

## Save Fuel by Heating Feedwater

Kindly permit me to ask two questions, which are as follows: (a) What percentage of fuel will be saved by heating the feedwater to 150 deg. F., by means of the exhaust steam, before introducing it into the boiler, instead of feeding the water to the boiler at a temperature of 50 deg. F., taking the total heat of vaporization or the heat above 32 deg. F., for a boiler pressure of 100 lb. per sq.in., at sea level, as 1185 B.t.u.? (b) Assuming this percentage of fuel is saved, at a mine using 1200 lb. of coal per hour, what weight of coal will be saved in a day of 8 hr.?

\_\_\_\_\_, Pa.

EXAMINER.

Using the exhaust steam and heating the feedwater from 50 deg. to 150 deg. utilizes  $150 - 50 = 100$  B.t.u. per lb. of steam generated in the boiler. This heat is abstracted from the exhaust steam and would be otherwise wasted. Since the total heat, per pound of steam generated, at 100 lb. per sq. in. boiler pressure, is 1185 B.t.u., the saving in heat units is  $(100 \div 1185) 100 = 8.4$  per cent. This saving in heat units represents the percentage of fuel saved.

(b) The weight of coal burned in a day of 8 hr., in this case, is  $8 \times 1200 = 9600$  lb. Under the assumed conditions, the weight of coal saved, per day, is therefore,  $0.084 \times 9600 = 806.4$  lb.

## Fan Installation

In my trouble I am coming to my old friend, *Coal Age*, which has benefited me many times during the three years since I first made its acquaintance. What is worrying me now is the fact that the ventilation in our mine is not up to standard. While it complies with the mining law, it is quite evident that before long the present fan will be unable to furnish the volume of air that will be required in the mine.

In view of this condition, we are considering the idea of setting up a second fan to assist the circulation and bring it up to the required standard. In turning over this proposition and casting about for material, I find that we have enough scrap lying about the place to build a 4-ft. fan. The plan is to set this fan in such a position that it will act in conjunction with the present fan to force the air through the mine. By a simple arrangement of trapdoors, the two fans will work, independently, on the same current.

The dimensions of the proposed fan are about as follows: Diameter, 4 ft.; width of blade, 2 ft. 6 in.; depth of blade 14 in. This will make the diameter of the central opening of the fan  $4 \times 12 - 2 \times 14 = 20$  in. It is the intention to run this fan at a speed of 250 r.p.m., that being the speed at which our motor will drive the fan without making any alterations.

The size of the mine airway is 5 x 10 ft., in section; and the length, including the return, 4,000 ft., which gives a total rubbing surface of 120,000 sq.ft. I want to ask if *Coal Age*, or any of its readers can tell me if the dimensions of this fan are such as will give satisfactory results.

Hillside, Ky.

OSTEL BULLOCK, Supt.,  
Liberty Coal Mining Co.

The tip speed of a 4-ft. fan, operated at 250 r.p.m., is  $250 (4 \times 3.1416) =$  say, 3,140 ft. per min. The theoretical water gage corresponding to this tip speed can be calculated with close approximation by multiplying the diameter of the fan (ft.) by its speed (r.p.m.) and dividing that product by 900. The square of the quotient obtained will be the theoretical water gage in inches; thus,

$$w.g = \left(\frac{Dn}{900}\right)^2 = \left(\frac{4 \times 250}{900}\right)^2 = 1.23 \text{ in.}$$

The corresponding unit pressure is  $1.23 \times 5.2 = 6.4$  lb. per sq. ft. Then, for a rubbing surface of 120,000 sq.ft. and a sectional area of 50 sq.ft., this pressure will produce an estimated velocity of

$$v = \sqrt{\frac{p a}{k s}} = \sqrt{\frac{6.4 \times 50}{0.00000001 \times 120,000}} = 516 + \text{ft. per min.}$$

Therefore, estimating on, say a velocity of 500 ft. per min. in this airway, gives for the volume of air passing  $500 \times 50 = 25,000$  cu. ft. per min.

Again, since the tip speed of the fan is 3,140 ft. per min., the area of opening at the center of the fan may be calculated for an intake velocity of, say 3,000 ft. per min. Thus, for a single-intake fan, the area of the center opening in this case is  $25,000 \div 3,000 = 8\frac{1}{3}$  sq.ft.; and its diameter is  $d = \sqrt{8\frac{1}{3} \div 0.7854} =$  say  $3\frac{1}{2}$  ft., or 39 in., which gives for the radial depth of the fan blades  $\frac{1}{2} (4 \times 12 - 39) = 4\frac{1}{2}$  in.

This is a high-speed, multiblade fan having a large single intake area. The blades of the fan must be firmly supported by two annular disks and set a distance apart somewhat less than the radial depth of the blades. The blades should be cupped, the concave side being in the direction of motion. The lip or inner edge of the blade should make an angle of 50 or 60 deg. with the tangent to the intake circle, while the blade tip is normal to the outer circle of the fanwheel.

The power required to drive this fan at a speed of 250 r.p.m., assuming an over-all efficiency of 80 per cent, can be estimated as about 6 hp., or, say,  $4\frac{1}{2}$  kw. This power would consume a current of 18 amp., under a pressure of 250 volt.

The successful working of two fans in parallel, however, will depend much on the proper balancing of the two ventilators, which is a matter that can only be regulated by an experienced operator on the ground.

# Inside Information as to Development of Coal Transportation Problems

Hines' Authority, Lost by Return of Railroads, Restored (?) by President's Order—Tidewater Coal Exchange Orders Too General To Be Explicit—Commission on Car Service Will Not Order Immediate Homing of Railroad Cars—Dangers Seen in Yielding to "Assigned Car" Promises—Shipping Board No Longer Boosts Rates

JOHN CALLAHAN, the traffic manager of the National Coal Association, speaking of recent transportation development in Washington stated that during the past week much dispute has arisen in Washington, D. C., as to the order of the President of the United States dated Feb. 28. It re-establishes in Walker D. Hines the authority conferred on him by Dr. Garfield's order of Oct. 31, mention of which was made in the President's order reinstating Mr. Hines' power over the "delivery, use, consumption, distribution and apportionment of coal."

This order of Oct. 31 says that "I, (Dr. Garfield) designate the Director General of Railroads and his representatives to carry into effect the said order of Jan. 14, 1918 and to make such diversions of coal which the railroads under his direction may, as common carriers, have in their possession, etc., etc." It has been seriously questioned whether the Central Coal Committee members cannot be held under the law for any action they may have taken in connection with the further distribution of coal since it is clear that Mr. Hines has no "railroads under his jurisdiction." This subject was referred to the Attorney General and it is understood Mr. Palmer stated that Mr. Hines had the authority to divert coal under the order of Feb. 28. It is easily understood why Mr. Palmer should so interpret the order since he is said to have written it.

## WILSON RESTORES HINES' AUTHORITY

Nevertheless further discussion of the matter resulted in the President issuing a new order, dated March 5, 1920. This order avoids all reference to any carriers under the control of Mr. Hines and places the necessity for such an order on the present emergency and the necessity existing that provision be made for the fuel requirements of the country. It empowers the former Director General of Railroads, his successor in office and his representatives, to distribute coal in the order of priority set forth in the preference list of the United States Fuel Administrator of May 25, 1918, also to establish rules for the regulation of this distribution; and further to regulate the method of production, shipment, distribution, apportionment or storage among dealers and consumers within the United States.

Thus in an effort to make this order of March 5 really binding and productive of the desired results, the former Director General is given the powers which section 25 of the Lever Act provided the President of the United States should accord whenever and wherever in his judgment it was necessary for the efficient prosecution of the war, namely the regulation of the method of "production, sale, shipment, distribution and apportionment or storage thereof among dealers and consumers."

The order of Feb. 28 gave the former Director General and his representatives authority only in connection with the "delivery, use, consumption, distribution and apportionment of coal." There is, of course, question as to whether or not the President's order of March 5, quoting the order of Aug. 10, can give Mr. Hines powers in connection with the production of coal, for example, which were only given by the law in order to insure the efficient prosecution of the war.

## NO OUTCOME YET OF PRESIDENT'S ORDER

Owing to the uncertainty there was little, if any, diversion of coal during the week ended March 6, although there were thousands of cars of coal held up simply because the carriers could not move them to their billed destinations. These because of lack of authority and organization machinery, have been allowed to stand unmoved during the past week. Mr. Hines has now re-established the Central Coal Committee although there is a question as to just how effectively it can act since it is understood that several members of the original committee will be actively engaged in other duties.

Special attention is directed to the fact that by the instructions of the former Director General: "Producers and shippers of bituminous coal under contract to furnish fuel to consumers and dealers within the United States, shall give preference in the shipment of such coal to such consumers and dealers to the extent necessary to supply their actual current needs and in the order of precedence established by the U. S. Fuel Administrator under date of May 25, 1918." Since the railroads head this list, it is not at all difficult to sense the real occasion for the order and it is indeed unfortunate that the failure of the Purchasing Section of the Railroad Administration to provide, during the contract period in 1919 for the proper supply of coal, should result in the necessity for such arbitrary action on the part of Mr. Hines.

## DISTRIBUTION BY REGIONAL COMMITTEES

The regional Coal Committees that have been established, pursuant to the President's order, will only have authority to distribute in emergency to the first five classes of the priority list, namely railroads, army and navy, state and county institutions, public utilities and retail dealers. The new order, however, distinctly separates the powers of distribution of coal generally from the powers conferred upon the Tidewater Coal Exchange officials under the order dated Feb. 25.

The officials of the Tidewater Coal Exchange did not adequately supplement the order of Feb. 28, in relation to the Tidewater Coal Exchange, for the order under date of March 1 provides only that the exportation

of coal will be permitted when, and to the extent that, the requirements of consumers within the United States will allow. Also that all permits to export must be secured from J. W. Howe, Singer Bldg., 149 Broadway, New York, applications for permit to export to include the name of the applicant, his address, the class of coal and purpose for which it is to be used, the amount of such coal, the name of the shipper, the district from which the coal will be shipped, the port of exportation, the terminal railroad, the date of the contract, the consignee, the foreign destination, the name, dead-weight tonnage and flag of the carrying vessel, the condition and position of this vessel at the time of application and the name of the pool at which the coal is available at Tidewater.

#### SHIPPERS QUESTION STATUS OF PORTS

It is also provided that permits will only be issued when the vessel is in the harbor and the applicant has sufficient credit in the pool named to cover the request for privilege to export. Furthermore, these permits will expire by limitation on midnight of the seventh calendar day after issuance. The Tidewater Coal Exchange rules and regulations in effect Feb. 25, 1920, are to be continued operative.

Shippers at some ports much question what is the status of the tidewater pools, particularly in view of the action that has been necessary in the recent past in the way of diversion of coal. This uncertainty has made some coal shippers hesitate to ship to the pools until they have some assurance that they will be able to obtain the coal for which they establish credit in the exchange. Little difficulty is anticipated in this connection at Norfolk and less difficulty is looked for at Baltimore than at the two northern ports over which the Tidewater Coal Exchange has control, viz., New York and Philadelphia. This is because exportation from Philadelphia and New York was practically reduced to a minimum some 6 or 7 weeks ago, whereas there has been a continued movement of a considerable volume of coal through Hampton Roads. It is not necessary to add that the exportation of coal through New York has never been large.

#### CARS TO RETURN TO OWNER'S RAILS

On Wednesday, March 3, the Railroad Relations Committee of the National Coal Association conferred with President Aishton of the American Railroad Association and that association's Commission on Car Service. As a result of this conference it is understood that there is no present intention on the part of the Commission on Car Service to call on the railroads in an arbitrary manner for the return of open-top cars to home rails. On the contrary, it is the expectation of the Commission on Car Service to accomplish the return of cars to their owners' rails by a gradual transition process.

Efforts are being, and will continue to be, made to confine cars to home-line rails, and at the same time to require foreign lines to return to home lines all the cars that can be so handled, but at no time must this be done if the coal industry shall thereby be interfered with and coal loading reduced. Such liberality in the interpretation of the rules as is necessary to carry out this plan will be authorized and a maximum amount of elasticity will be provided in the new Car Service Rules.

Transportation officers of some 25 Eastern coal-loading roads will be in Washington shortly in conference

with the Commission on Car Service and will discuss just what procedure is necessary to insure that this course is followed, and it is expected that as a result of this conference an understanding will be reached which will make possible a practically universal application of the rules, thus insuring the maximum loading of coal during the troublesome transition period through which we are now passing.

#### IF CARS ARE MISHANDLED OUTPUT WILL FALL

It was clearly understood by all interested persons at the conference that while coal operators will be requested to co-operate in every way to insure that cars will be used with maximum efficiency, they will not, because of the rules, be subjected to undue or unnecessary difficulties in the transaction of their business, and that when they wish to ship cars placed under their tipples to any destination for which they have orders, their wishes are to be respected. Coal producers should, however, endeavor to load cars so that they will move in the direction of, and therefore reach, the home line with a minimum amount of delay.

It is quite probable that further instructions will be issued by the Commission on Car Service in the near future making detailed arrangements to insure the return of certain cars to their home rails where this can be done without interfering with the transportation of coal and other commodities which are to be loaded in open-top cars. Cases involving roads, the coal production of which is to a large extent delivered to destinations off the originating line, will receive special treatment.

In the event that such action is necessary, cars will be arbitrarily moved to these roads to insure a coal production comparable with that allowed generally in the district in which such railroads operate. Coal operators should keep in close touch with their railroad officials on these matters and ascertain just how they should route cars so as to insure that the best possible use may be made of them.

There was some discussion within the commission as to the status of "assigned" cars. The Commission on Car Service has addressed all the railroads suggesting that it will be desirable to continue in effect circular CS-31 of the Car Service Section of the U. S. Railroad Administration and this should be of great assistance in continuing the assigned-car matter in its present status, and it is hoped that the railroads will not at this time arbitrarily return to the use of assigned cars.

#### SIGN RAILROAD FUEL CONTRACTS WITH CAUTION

Coal operators who are approached by railroad officials in regard to signing up contracts for railroad-fuel which include provisions for the use of assigned cars should carefully consider the provisions of the new law as passed in the railroad bill, which specifically requires that carriers must maintain and apply just and reasonable ratings of coal mines and count each and every car furnished to or used by any such mine for the transportation of coal against that mine and that it is not impossible that where any concessions are made in return for the assigned cars that the carriers making such offer may find themselves unable to carry out their portion of the bargain insofar as a supply of cars to such a mine, in excess of that which other mines on the same division receive, is concerned.

The Interstate Commerce Commission has also taken action in this connection through the medium of a letter

signed by G. B. McGinty, and dated March 2, 1920. This is addressed to all carriers and shippers, and reads as follows:

The supply of cars available for the transportation of coal is insufficient to meet the demand. Unusual movements incident upon the strike of coal miners has brought about an abnormal location of cars. It is desirable that cars be properly relocated as rapidly and with as little confusion as is possible. Critical situations will still exist in which fuel for essential industries and purposes must be provided. The railroads and the coal operators have all been working under the uniform mine-rating and car distribution rules established by the Railroad Administration and these rules seem to be generally satisfactory and to meet with general approval.

To the end that conflicting and contradictory rules on different roads and in different fields may be avoided in the unusual conditions which now exist in the industries and on the roads, the commission recommends that until experience and careful study demonstrate that other rules will be more effective and beneficial and especially during the remainder of the early spring the uniform rules as contained in the Railroad Administration's Car Service Section Circular CS-31 (Revised) be continued in effect.

From this it will be seen that it is the desire of the Interstate Commerce Commission that the provisions of the mine-rating and car-distribution rules shall be continued until all the matters involved in them can be investigated.

Of interest to exporters of coal is an announcement by the Shipping Board that all its tariffs on freight rates have been cancelled. The shipping rates on ocean coal will be fixed hereafter and announced by private shipping companies managing and operating the govern-

ment merchant ships. The Shipping Board has put in force an agreement reached with private shipping companies, by which these firms will determine rates to be charged for the transportation of coal by the vessels of the Shipping Board.

The private companies operating the Shipping Board vessels will receive a fixed rate of compensation from the Shipping Board for the service of managing and operating the ships, and will also share in the profits realized above the actual cost of operation. The Shipping Board will supervise rates on coal and other commodities to prevent them from ascending above a reasonable level. In other words, the action of the Shipping Board in this instance practically amounts to the ultimate withdrawal of the government from its continued regulation of the shipping business in such a manner that open-market competition could not be met.

Shipping-Board officials are of the opinion that the removal of the government embargo on coal export, when it comes, will cause a resumption of the flow of coal from this country to foreign markets which this time will be in larger measure than before. This will probably increase the demand for ships to the extent that practically the same rates as those now in effect will obtain.

## Will the Anthracite Miner Receive an Increase?

Operators and Miners Meet at New York City on March 9—Demands Referred to a Sub-Committee—60 Per Cent Increase and 5 Day Week Urged

CONSIDERATION of a new wage agreement to become effective on April 1 between the anthracite operators and their employees began at the Hotel Pennsylvania, New York City, on March 9 and it is expected will continue, with the possible exception of week-ends, until negotiations are concluded. The demands were referred to a sub-committee of operators which consists of the following:

**Operators**—S. D. Warriner, Philadelphia, president of the Lehigh Coal & Navigation Co.; W. J. Richards, Pottsville, president of the Philadelphia & Reading Coal & Iron Co.; W. L. Connell, Scranton, president of the Enterprise Coal Co.; and C. F. Huber, Wilkes-Barre, president of the Lehigh & Wilkes-Barre Coal Co.  
**Miners**—John T. Lewis, international president of the United Mine Workers; John T. Dempsey, Scranton, president of District 1; Thomas Kennedy, Hazleton, president of District 7, and Christ J. Golden, of Shamokin, president of District 9.

Alvan A. Markle, of G. B. Markle & Co., Hazleton, Pa., independent operators, is the chairman of the sub-committee, having no vote, and James A. Gorman, also of Hazleton, is the secretary. Mr. Gorman is the secretary of the Anthracite Conciliation Board and Mr. Markle was the chairman of the sub-committee that negotiated the last working agreement between the miners and operators.

The demands presented to the operators were adopted at the Wilkes-Barre convention last August and later ratified at the National Convention held in Cleveland a month later. They consist in part, as follows:

(1) "The contract wage scales be increased 60 per cent, and that the increases secured in the supplemental agreements of 1917 and 1918 shall be included in the wage scale as the basis upon which the 60 per cent shall be added, and that all day men be granted an increase of \$2 per day.

(2) "A uniform wage scale be established so that the various occupations of like character at several collieries shall command the same wage and that shovel crews operating for coal companies shall be paid not less than the rates paid by the contractors to shovel men.

(3) "A work day of not more than six hours from bank to bank be established for all classes of inside or outside day labor, five days per week, the uniform sales to be the basis upon which the advance above demanded shall apply with double time for Sundays and holidays.

(4) "A closed-shop contract, which means full recognition of the United Mine Workers of America as a party to the agreement."

W. L. Connell, of Scranton, presided at the general meeting at the Hotel Pennsylvania on the afternoon of March 9, when the demands were formally presented. Forty-nine operators and 37 representatives of the miners were present. President Lewis and Vice-President Murray represented the international organization of the Miners' Union.

Although the meeting was executive, it was stated that Mr. Lewis and Mr. Warriner made short addresses, the former telling the operators that the miners were approaching the negotiations in the spirit of utmost fairness and sincerity. Mr. Warriner stated that the demands would be given proper and fair consideration. These demands were explained in detail by Mr. Kennedy and by Mr. Golden. It was then decided to refer the demands to a sub-committee of operators and miners.

No session was held on the following day (Wednesday) but on Thursday the conferees met at the Union League

Club, Fifth Ave. and 39th St. Mr. Lewis was absent, it being announced that he had gone to Washington to confer with John P. White, a member of the Bituminous Wage Commission, a former president of the International organization of the Miners' Union.

At the conclusion of the first session of the conference on March 9 the representatives of the mine workers gave out the following statement containing the reasons for the demands:

"The mine workers insisted that the human element should be considered as well as the financial element in reaching a decision on the question of a new contract.

"Their demand for a 60 per cent increase in wages was based largely on the tremendous increase in the cost of living. The standard of living had advanced in the last few years to such an extent that the wages which would have been sufficient for the standard of living of a few years ago were not sufficient to provide for the standard of living in 1920. This they said was the natural result of changed and changing conditions throughout the world.

"The demand for the six-hour day was more misunderstood than any other demand that had ever been made before by the coal miners of this country. The establishment of a shorter work day would not result in a curtailment of production of coal but the miners insisted that the production would be as great in a six-hour day as it has been heretofore under the longer work day. Men retain their efficiency as workmen under the shorter work-day system better than in the longer work day and are more capable of doing effective work.

"On the subject of the closed shop, the miners said that the United Mine Workers of America has served its apprenticeship in the anthracite region, and that it is no longer merely a labor organization, but that it has become in the anthracite region a real institution which has done more to stabilize the mining industry and to bring and maintain peace, tranquillity and harmony in the industry than any other single institution, therefore they said it was entitled to full and complete recognition by the operators and the public.

"Since all of the miners in the anthracite region share in the benefits which the organization has obtained they should all become members of the union and share in its burdens and responsibilities. They held that the operators ought to aid in bringing about a 100 per cent organization because of the fact that the union has done so much and is capable of doing so much more toward the stabilization of the industry.

"John L. Lewis, international president of the United Mine Workers, told the operators in the conference that the miners were ready to approach the negotiation of a new contract in the spirit of utmost fairness and sincerity, realizing that the miners, the operators and the general public are the parties in interest in the entire matter. He said that the making of a new contract should be approached in the light of present existing circumstances and conditions with the purpose on both sides to reach an agreement that would do full justice to all parties."

Following the session on March 11 it was announced that it had been decided to eliminate the demand of the miners for an agreement to supplement that of Nov. 15, 1918, under which the contract miners received a wage increase of 40c. a day while the day laborers got an increase of \$1.

The second session of the sub-committee was held at

the Union League Club on Friday, March 12, at the end of which the following statement was issued explaining the day's work: "The request of the mine workers for payment for all dead work on the consideration basis and the demand for the abolition of the dockage system was before the committee. The operators' representatives sought from the miners the interpretation the miners place upon these two demands. A general discussion of these two questions followed."

## Railroad Confiscations Declared to be Illegal

Ex-President Taft Sees No Reason for Government Price Control

CONFISCATION of coal by the Railroad Administration and the fixing of prices at which coal may be sold by the Government was recently held to be illegal in an opinion rendered to the Smokeless Coal Operators' Association by former-president William Howard Taft.

As to the question of government-fixed prices, Mr. Taft says: "In the absence of any finding of the President that these orders restoring old orders are necessary for the efficient prosecution of the war, I cannot see how authority to fix prices can continue so as to prevent coal operators from making contracts after April 1, in accordance with their usual custom, at prices mutually satisfactory to the parties and without regard to the prices fixed in the order of Oct. 30, 1919."

In regard to the right of the Railroad Administration to divert coal or issue orders or regulations for such diversion, Mr. Taft declares that the first answer holds. Further, he states that even the first order restoring the Government price on coal had no relation to the prosecution of the war.

## Repeal of Excess Profit Tax Forecast

Senator Watson Says Relief from High Cost of Living Will Be Impossible Until These Taxes Are Removed

REPEAL of the present system of excess profits taxes and the substitution in their stead of direct sales taxes has been virtually decided upon by Republican leaders in Congress, according to an announcement last week by Senator Watson, Republican, of Indiana, a leading member of the Senate Finance Committee.

"The excess profits taxes are a direct burden on the people of the country and relief from the present high cost of living will be impossible until these taxes are removed," Senator Watson declared. It is explained by those who wish the excess profits taxes removed that manufacturing concerns are unable to gauge their possible profits under such taxes until the end of the year. To cover up any possible loss under regular earnings additional charges are placed on commodities, they believe.

If the system of taxation is changed to a system of sales taxes the producer can charge the flat tax as part of production or expense and gauge his profits accordingly. A conference will be held this month at which leaders of the Senate Finance Committee and the majority members of the House Ways and Means Committee will participate, Senator Watson announced.

## Committee of Three Disagree Over Bituminous-Wage Problems

**Bituminous Committee Dissolved Without a Unanimous Decision, Thus Ignoring President's Instructions—Two of Three Advocate a 25 Per Cent Increase, but White Refuses to Agree**

**I**GNORING President Wilson's request to arrive at a unanimous decision, the coal commission after an investigation which lasted for more than two months disagreed and two of its members made a report, the commission discharging itself from its duties on March 10.

Chairman Robinson and Rembrandt Peale sent the majority report to the President, while John P. White, the former president of the United Mine Workers of America and mine workers' representative on the commission, is still working on his minority report.

Although the contents of the report are not officially known, a rumor, which has received confirmation, is to the effect that an increase of about 25 per cent was awarded to the miners in the majority report. No increase in the price of coal is recommended, but such an advance is suggested, the matter of making provision for it being left in the hands of the Fuel Administration. One hundred million dollars a year, it is estimated, is the increased figure that the public will have to pay the mine workers if the advance is granted. It is probable that this wage increase will not be retroactive and will presumably become effective after April 1. Some of the other points settled are as follows:

1. The check-off system is to be continued.
2. The question of differentials is to be left to a special commission to be appointed by the miners and operators. The report of this commission will be incorporated in the next wage agreement. Two years is given as the maximum time in which to complete this report.
3. A six-hour working day and a five-day week have been denied.

It is believed that White did not dare to conform with the majority report so long as the anthracite agreement is being investigated in New York City. Had not the anthracite negotiations been under way, White might have been willing to sign the document.

The President has requested that the commission reconsider the matter. Even if it is made unanimous the mine workers may reject the report, for they had large anticipations. White insists that the 31.6 per cent increase offered by Secretary of Labor Wilson is fair and should be granted to the miners, and he adds that the operators should be permitted to advance the price of coal in accordance therewith.

The anthracite mine workers are, of course, much interested in the decision relative to bituminous mine labor and should the bituminous men reject the decision, there is a possibility that a combined strike involving both anthracite and bituminous-coal miners will take place. This would affect about 550,000 men, 400,000 being the number of bituminous miners in union districts.

Premature publication of the salient points of the majority report caused much perturbation in Washington, as it had been intended to release both majority and minority reports simultaneously.

The commission summoned by President Wilson to

investigate conditions in the bituminous-coal industry and recommend measures for the coming wage agreement in the Central Competitive district last week agreed to disagree and filed majority and minority reports with the chief executive. Neither of these reports has been made public, but it is understood that the representatives of the public and coal operators were agreed that a wage advance aggregating slightly in excess of 25 per cent with no changes in hour of labor might be granted. The miners' representative, on the other hand, was firm in his advocacy of increases stated variously as amounting to 30 to 35 per cent and the adoption of a 7-hour day.

Thus deadlocked, the commission dissolved, rendering its separate findings as noted above. The President, however, is not satisfied with this result and has "deemed it advisable" to again summon the members into session with instructions to reach a unanimous decision if possible. While he is free to accept either of the reports already rendered he much prefers unanimity.

It should be recalled that the miners struck last fall demanding a 60 per cent increase in wages, a 6-hr. day and a 5-day week. The anthracite miners reiterate these demands in their present negotiations with the operators.

---

### Peale and Robinson Show No Bitter Feeling Against White

It is denied that there was, as reported from a few sources, a bitter altercation between Robinson and Peale on the one hand and White on the other, over the report of the Bituminous Coal Commission. It is understood that neither Peale nor Robinson is greatly exercised over White's dissent from their wage ruling.

---

### French Miners in Sympathy Strike

It was estimated by officials of the French Federation of Labor on March 13 that nearly 400,000 persons in all were on strike in France at that time. In the Department du Nord some 20,000 coal miners have struck in sympathy with the strike of an equal number in Pas-de-Calais, and this development has strengthened the hope of the radicals among the labor leaders that a general coal strike may be brought about.

---

### More Trouble for the President

There was much talk in Washington on March 12 about the President ironing out the differences between the two reports made by members of the Coal Commission. Interest is revealed in the still unpublished findings of the commission and much speculation was made as to whether President Wilson would accept or reject the majority report.

It is an open question whether Chairman Robinson, who represented the public interest, would consent to return to Washington to reconsider a decision that he believes to be in the public interest.

With the exception of the pay increase and the fixing of the working day at eight hours from bank to

bank, the miners are willing to accept the majority report. They are more insistent on a shorter working day than they are on higher pay.

## Indictments Brought Against 125 Bituminous Miners and Operators

Conspiracy to Limit Coal Production Is Charged  
—Identity of Indicted Men Not Revealed  
—Only Bituminous Operators Involved

AT INDIANAPOLIS on March 11 indictments charging 125 operators and miners with conspiracy under the Lever act to limit the production of coal, were returned by a special grand jury which has been investigating the coal industry for the past three months.

Judge Anderson of the Federal court fixed the bail at \$5,000 and \$10,000 on the men. Their names will not be disclosed until after their arrest. Punishment, if convicted, would entail a fine as high as \$10,000 and imprisonment up to two years, or both. May 4 is the day set for the arraignment of the men now under the indictment.

Nearly all the indicted are operators in the Central Competitive field, and only a small number of mine workers' officials are named.

After perhaps the longest session in the history of the Federal court in the State of Indiana, which lasted 49 days, the special grand jury in charge of U. S. District Attorney Dan W. Simms, brought charges against the largest operators in Illinois, Indiana, Ohio and Western Pennsylvania. It has been stated that several leaders of the United Mine Workers of America will be forced to stand trial. No arrests are expected for several days. Much time must be allowed to give the Government officials time to prepare 125 capiases which are to be served upon the indicted men.

## "No Large Increase—No Coal"— Say Bituminous Miners

Strike Is Eminent Unless Substantial Raise In  
Pay is Awarded

ON March 9 before the award of a 25 per cent increase was granted a statement was made by the United Mine Workers of America, whose headquarters are at Indianapolis. The statement as given to the press reads as follows:

"Nothing short of a substantial increase in wages and improved working conditions will be acceptable to the United Mine Workers of America. The miners are awaiting the decision with much anxiety. We believe the public will understand our position.

"Unless a settlement of the controversy is made on such a basis the miners will not feel that full justice has been done them. There has been a steady increase in the cost of living since the first of this year, in spite of the fact that the government represented to labor last summer that living costs would be reduced and that the government would see to it that this was done.

"Furthermore, promises of reductions in the cost of living would fall on deaf ears, as far as the coal miners are concerned, because they have had their experience with such promises in the past, all of which have gone unfulfilled."

## What "They Say" About the Coal Commission's Award

Operators Unable to Formulate Opinions—25  
Per Cent Increase Too Much For  
Mine Operators to Assume

OPERATORS and their representatives in Washington, at this writing, are unable to formulate opinions or plans based on the Coal Commission's award, because of the uncertainty as to just what the award covers. They are positive, however, that there must be an increase in the Government price or the withdrawal of control altogether, in the matter of price, if the nation's fuel requirements are to be met.

It is stated positively that an award providing an increase of 25 per cent in the wage scale cannot be absorbed by enough mines to produce the country's coal, while if a compromise should be reached on a still higher percentage of increase the situation would be worse. It is declared that even if price control is removed, it will be a serious matter for some districts, and that under such an award no commercial mines in the State of Washington could continue in operation.

In addition there are other fields where the matter of competition with other fuels is serious.

A wage increase of 25 per cent would add from 50 to 60c. a ton to the cost of producing coal. If these estimates are accurate it will mean a minimum increase in the cost of producing the country's coal, of \$250,000,000. With such a victory to its credit, many are of the opinion that there will be a higher degree of inefficiency on the part of labor, thereby adding materially to the figure just mentioned.

A large number of operators were in Washington at the time the award went to the White House. Many of them were outspoken in denouncing it as an unwarranted burden to place on the shoulders of the coal industry and of the public in general. It is practically the unanimous opinion of those operators who followed the hearings before the President's Coal Commission that the war-time wages, calculated to bring out maximum production, afforded ample compensation to industrious miners.

The award, it was claimed by some, shows how fundamentally wrong it is to place in the hands of an informally chosen Governmental body, with no machinery for appeal, a hard and fast adjustment of personal relationships. It is an attempt, some say to give the men who work the least time a comfortable living wage, and allow those who really are industrious a wage out of proportion to the earning power of this class of labor in other industries.

Such an increase in salary, as is carried in the award, it was declared, strikes a most effective blow at our chief asset in the matter of foreign trade. Our ability to compete has been due largely to our cheap power. On the whole the award is regarded as a new and most important factor in increasing still further the cost of living.

An immediate effect of the award, it was pointed out, will be to necessitate increased freights whereby the railroads may meet the higher cost of their fuel. Much objection was voiced because the award has been made on a percentage basis. A percentage basis affects each district differently and will make for great difficulties in apportioning the increases.

It is believed that no consideration was taken by the Commission of the fact that many miners have an income from work done during the hours that they do not engage in mining. Such limited facts as are available regarding the awards, lead to the very general conclusion that it is a victory for mine workers and represents a long step toward the nationalization of coal mines, which is the objective toward which the mine workers are really working, some think.

## Peale and Robinson Comment On Recent Decisions

Shortly after a decision of the Bituminous Coal Commission had been filed with the President, both Mr. Robinson and Mr. Peale, it was learned, were approached by correspondents from newspapers from all over the country, in an endeavor to hear what each had to say with reference to the outcome of the investigating committee.

Chairman Robinson, it is understood, is adamant on the conclusion that with the world in its present condition of deficient production this is no time to talk of six and seven-hour working days. The increase favored by the majority will cost the country \$100,000,000 a year, and a reduction of the working time would result, in either a shortage of coal or still higher costs to the public.

Mr. Robinson is represented as being impressed with the prospect that with a regularizing of coal production, which he considers entirely feasible, through storage by large consumers and other means, the miners can be kept steadily at work throughout the year and can easily produce enough coal for an export trade of 100,000,000 tons a year, provided they will accept an eight-hour day. With a slump in agricultural and manufactured exports as is very generally forecast, a large volume of coal exports may soon be expected.

It was authoritatively learned that Rembrandt Peale, representing the operators on the commission, was as much displeased with the majority report, which was dictated by Robinson, as White was, but as the only way of avoiding three separate reports finally acceded to Robinson's position, though he had to swallow such a bitter dose for the operators as the retention of the check-off system, which practically means that the operators must continue to be the financial medium for keeping the union mine workers of America numerically strong and plethoretically financed.

## National Coal Association Shows That Miners Make Good Wages

The accompanying tables are from the exhibit prepared by the National Coal Association for the Bituminous Coal Commission. While by no means all of the coal districts of the country are here represented, enough daily and monthly earnings are set forth to show the

general trend of conditions. If these tables show anything clearly, it is that the men who work steadily earn more per day than those who work with great irregularity.

Take, as an example, the pick miners of the Pittsburgh Thin Vein Field. Table II shows that those of these men who worked less than 25 per cent of the time earned \$5.50 per day, while those who worked from 75 to 100 per cent of full time earned \$6.62 per day.

Comparing the figures throughout the entire table, it will be seen that the men who work reliably receive on the average not only greater compensation per month but also greater wages per day.

Table I. Deductions for Smithing and Explosives Compared with Gross Earnings of Pick Miners and Loaders for 10 Months, January to October, 1919

District	Pick Miners and Loaders			Average Deductions per Month			
	Average No. Men Working per Mo.	Average Daily Earnings per Man	Average Total Earnings per Mo.	Amt. Smithing	Per cent of Earnings	Amt. Explosives	Per cent of Earnings
Pittsburgh Thick Vein	1,405	\$5 91	\$138,974	\$1,667	1 20	\$1,641	1 18

# FOREIGN MARKETS AND EXPORT NEWS

## High Coal Prices in China

As the high price of coal in Tientsin and Shanghai is an obstacle to the investment of American money in cotton mills there, counterbalancing to a considerable extent the advantages of cheap labor, a recently compiled table of prices may prove interesting, although, in view of the fact that prices constantly fluctuate, it can not be accepted as a standard price list.

Coal is sold from the yard in Tientsin at lower prices than at Taku Bar in the harbor because of the competition of mines in the vicinity of Peking which ship their coal by rail and also because the cost of light-rage over the bar must be included in the latter prices. Manufacturers say that the cost of electric power in Shanghai is lower than in any other place in the world and that the output per Chinese workman of certain articles is as great as the output per workman in the United States.

The Kailin Mining Administration quotes as follows, per long ton (A = f.o.b. steamer alongside wharf at Chinwangtao, export duty paid; B = f.o.b. steamer at Taku Bar, near Tientsin; C = for delivery ex Hotung Yard, Tientsin):

	A	B	C
Loco lump	\$9 00	\$10.00	\$9.00
First lump	7 10	8.10	7 10
No. 1 slack	6.50	7.00	6.10
No. 2 slack	5 35	6.35	5.35

## Mexico Imports 89 Per Cent of United States Coal

Consul Cornelius Ferris, Jr., Mexico City, Jan. 31, 1920, states that statistics have just been received from the Mexican Department of Commerce showing the importation of coal into Mexico for the year 1918, statistics for other years not being available. The total amount imported in 1918 was 132,209 tons. Approximately 89 per cent of this was imported at points on the United States frontier, and was for mining and smelting operations and railroad motive power; the remainder was imported at seaports for coaling vessels.

## British Export Licenses for Coal-Tar Products

Consul General Skinner has cabled from London under date of Feb. 19, 1920, that the British Board of Trade announces that export licenses for the exportation of all coal-tar products excepting finished dye-

stuffs, but including aniline oils and salts, granted before Jan. 1, 1920, are revoked. The revocation is to take effect Feb. 21, 1920. Applications for the renewal of licenses will be considered if special cause is shown.

## Heraclea Source of Coal for Italy

Commercial Attaché Alfred L. Dennis, Rome, Italy, Jan. 6, 1920, states that the high prices of English and American coal, together with transportation difficulties, have caused Italians to turn their eyes anxiously toward Asia Minor as a possible source of coal supply. There has been much in the papers as to the immense reserves of coal in the Heraclea (Eregli) basin, and emphasis has been laid upon the fact that Italian interests have been upon the ground for some time with a view to developing coal-mining concessions in that region. The carboniferous basin of Heraclea lies within the region still under Turkish sovereignty and the actual mining of coal is conducted under concessions from the Turkish Government.

The cost of getting a ton of coal from the Black Sea ports to Constantinople is 13 Turkish pounds, or 156 Italian lire, \$12 per ton at the present rates of exchange. When it is considered that American coal is transported 4,000 miles to Italy at a freight charge of \$25 a ton, the charges for this 150-mile haul are substantial, to say the least. Furthermore, the best Welsh coal can be laid down in Constantinople for around 400 lire a ton, while the prices on the inferior Heraclea coal range around 375 lire a ton. The chief factors in the high costs are the primitive methods employed in mining and transporting the coal.

### Quality of Coal

The quality of the Heraclea coal is poor in calorific energy; it averages 6,344 calories for mine-run and 7,645 for washed coal, with an average ash content of 18 per cent. A coal is judged rather inferior that does not range up to 8,000 calories. The Heraclea coal is quite friable.

## Bohemia's Coal Production

In 1917, states the *Colliery Guardian*, the Bohemian coal mines produced 3,318,277 tons of coal, as follows: Mies, 979,174 tons; Pilsen, 169,801 tons; Prague, 371,233 tons; Schlan, 1,798,069 tons. The output in 1916 was 3,779,421 tons. The number of workers, however, increased from 16,630 to 18,741, giving a production per capita of 227 and 177 respectively. The average selling price per ton was 21.7 kr. in 1917 and 15.95 kr. in 1916.

In addition, there were produced in 1917, 17,794,964 tons of brown coal, valued at 9.93 kr. per ton, as against 18,902,513 tons, valued at 6.68 kr. per ton, in 1916; 31,992 work people were employed, as against 26,641, giving an average output per head of 556 tons in 1917, as against 710 tons in 1916. In 1917, 3,685,869 tons of brown coal and 186,758 tons of coal were exported by rail, and 109,787 tons of brown coal and 166 tons of coal by water.

The rail-borne exports of brown coal were distributed as follows: Saxon State Railways, 1,908,526 tons; Bavarian State Railways, 1,381,104 tons; Prussian State Railways (including coal transferred from barges into wagons in the Elbe ports), 311,460 tons; Wurtemberg State Railways and other systems in Southern Germany and Swiss and Italian lines, 12,479 tons. The bulk of the coal was carried over the Bavarian State Railways.

## United States Coal is Sent to Ends of the Earth

Evidence that America is supplanting Great Britain in coal markets of South America and Europe is seen by the *Shipping World*, London. The paper attributes this to restrictions imposed on shipping that otherwise might be available for carrying British coal.

"The result is that traders abroad who want coal are getting it from other regions," it says; "The South American trade has fallen almost inevitably into the hands of ship owners from the United States; but more ominous still is the fact that shipments from Virginia are coming almost daily to ports of Europe.

"Gothenburg, Dunkirk, Antwerp, Rotterdam, Lisbon, Genoa and other ports of Italy are receiving American coal at freight rates which only their urgent needs can justify. Even to Port Said American coal has been shipped.

"The question arises whether this is merely a passing phase due to the present scarcity of tonnage, or whether these American ships are the pioneers of a few forms of enterprise of the Western continent which is destined to become a permanent feature of trade.

"It must not be assumed that with the increase of British shipping that will assuredly come in a year or two, the old lines of trade will so easily be regained. The River Plate trade may to a considerable extent be written off.

"The greater proximity of European ports to the United Kingdom will be an advantage to British ship owners in their endeavor to regain the continental trade, but it will be no easy task to break the trade connections that American competitors are now engaged in forming."

## Shipment of Coal in Tons to Foreign Countries and British Possessions from the Various Districts in the United Kingdom in 1919\*

\*From a report of the Department of Commerce

### England Adopts American Industrial Policies

It is estimated that the electric power industry in Great Britain is wasting 55,000,000 tons of coal annually, according to a report on British Industrial Reconstruction and Commercial Policies, just issued by the Bureau of Foreign and Domestic Commerce, Department of Commerce. The cause of this waste lies largely in lack of centralization and standardization. "In the area of London alone," says

the report, "are 70 authorities that supply electricity to the public, owning 70 generating stations, with 50 different types of systems, 10 different frequencies, and 24 different voltages."

The average generating capacity of the 600 establishments in England that sell electric current is only 5,000 horsepower each. This is about one-fourth the capacity of a generating plant of economical size. So unorganized is the whole electrical industry that "one can not purchase a simple electric bulb without specifying the particular type of socket" in which it is to be used.

### Coal Production in Venezuela Shows Decrease

Consul H. C. von Struve, La Guaira, Jan. 26, 1920, states that there has been a gradual increase in the output of coal in Venezuela, as shown by the following statistics, the quantity being in long tons of 2,240 pounds: Average of 1911-13, 6,222; 1914, 8,755; 1915, 13,551; 1916, 18,289; 1917, 19,846; 1918, 24,779. Statistics for 1919 are not yet available.

The imports of coal were as follows: Average for 1911-13, 19,676 tons; 1914, 23,280; 1915, 19,305; 1916, 20,243; 1917, 14,927; 1918, 8,746.

Years	From United States Tons	From Great Britain Tons	From Holland Tons	From Germany Tons
Average for 1911-1913	3,268	14,246	331	1,660
1914	3,982	12,573	5,840	885
1915	11,216	6,721	1,368	
1916	10,110	9,802	331	
1917	10,266	4,662		
1918	4,570	4,176		

The only exports of coal shown are 500 tons in 1916, 2,000 tons in 1917, and 340 tons in 1918. These shipments were all made to Curaçao and were doubtless due to the difficulty of obtaining coal in the United States and Great Britain during those years, owing to war conditions.

The coal produced is practically all mined at Narieual, Capiricual, and Teoropo near Barcelona and a railroad line has been built especially to transport this coal to the port of Guanta. Both mines and railroad are operated by the national government.

Coal imported at La Guaira is partly used there and partly carried by railroad to Caracas; that imported at Puerto Cabello is used principally in that town, but some of it is carried inland by a railroad line extending from Puerto Cabello to Caracas.

### New York An thracite Exports for January Increased

Compared with January of last year, there was more anthracite and coke shipped through the port of New York in January of this year. Shipment of bituminous showed decreases when compared with the corresponding month of last year.

During January anthracite was sent to eleven countries as compared with three countries in January of last year, bituminous

### Coal Situation in Vienna Becomes Acute

The coal situation in Vienna is so acute, owing to the German railway strikes, the strike of miners in the Ostrau coal field, and the discontinuance of supplies from Poland, states the *Colliery Guardian*, that the Ministry of Commerce has ordered the complete suspension of the tram service and the closing of all places of amusement, including the theatres and cinemas.

Further restrictions are also placed on the consumption of electric current for lighting purposes, and almost the entire supply of electric power for industry has been suspended, as from Feb. 16.

### Belgian Coal Owners Protest Interference by Government

The coal owners of the Charleroi have registered an emphatic protest, states the *Colliery Guardian*, against the action of M. Wauters in dispossessing them of their rights to discuss points at issue with their workmen, and asserting that the new charges upon the industry will involve an increase in cost of 10 fr. per ton on coal, 15 fr. on boulets, and 20 fr. on briquettes. It is stated, moreover, that the Minister's procedure has not given complete satisfaction in Government circles.

There is a great shortage of rolling stock, and in some cases two-thirds of the output is being placed to stock, whilst the night shift has been discontinued at the briquette factories. The Minister of Economic Affairs has now authorized an increase of 6.50 fr. per ton to compensate for the supplementary charges involved by the recent rise in wages. This is regarded, however, as a provisional adjustment, and an investigation into the cost of production and profits is to take place immediately.

As some indication of the enormous rise in prices, it may be stated that the smalls used on the State Railways will now realize 66.50 fr. as compared with 16 fr. on July 1, 1914. Thomas pig has risen from 61 fr. to 600 fr., steel bars from 116 fr. to 900 fr., and cement from 25 fr. to 135 fr.

The position in Birmingham, Eng., is difficult. Merchants complain, states the *Colliery Guardian*, that supplies are not coming through freely from the collieries. Emergency stocks are fast disappearing, and householders are on small rations. Nuts are in constant demand, but supply is short.

# COAL AND COKE NEWS

## Charleston, W. Va.

### Mines Produce 50 Per Cent of Capacity No Change in Kanawha Output Variable New River Supply —No Hope for Exports

Variation from conditions existing during February was hardly observable in this section of the state at the outset for March, the transition from Government control to private ownership appearing to make little difference, from a transportation standpoint, at the start at least. Most fields had the usual large Monday supply which lasted about one day. As far as the Chesapeake & Ohio R.R., which supplies this section, was concerned there was possibly a slight increase in the number of empties furnished, but notwithstanding that fact, shipments from some regions were somewhat under even the loadings of the previous Monday.

Lack of proper transportation facilities, pure and simple, was principally instrumental in retarding production in this area. Because of such a lack mines were still unable to produce to a point beyond 50 per cent of potential capacity. No other factors entered into the limited output to any appreciable extent. The total tonnage handled by the Chesapeake & Ohio on March 1, was 143,000 tons.

The general impression seemed to prevail that while the number of cars furnished had been somewhat larger than anticipated, nevertheless there would be a marked decrease in cars for several weeks, owing to the effort on the part of railroads to corral their own equipment and to use the equipment of other roads, especially in view of the fact that the per diem rate was not such as to hurry railroads in sending cars back to home roads.

A large part of the tonnage produced in this section of West Virginia was used in meeting the needs of the railroads. In many instances confiscation was still being resorted to in order to secure railroad fuel, though it was the general opinion that such confiscation was not quite so general as it had been under Government control. Export shippers were required to secure renewal of licenses or permits, that entailing a good deal of confusion in many quarters. Furthermore, it was stated during the first week of private ownership, that until there was a sufficient production to more than meet the domestic demand, little might be expected in the way of an increase in export shipments.

### Kanawha Output 50 Per Cent

The output of the Kanawha field, during the first week of March, was about on the same plane that it had been during the previous week; production not averaging more than about 50 per cent of normal. In other words the average daily loadings throughout the first week of the month were about 17,000 tons. A larger production than that became impossible owing to the scarcity of cars. There was a material decrease in the supply for the Kanawha field during the week, as the result first of a slide and then a freight wreck at Sandstone, Thursday night, empties not only being held up behind the wreck, but the movement of coal being interfered with quite materially.

A heavy demand is predicted in the Northwest when the Lake season is opened, and producers are of the opinion that it is going to be difficult to meet such a demand unless there is a material improvement in transportation conditions. With a limited number of cars, the shipments for one day fell as low as 12,000 tons in this field.

The end of Government control did not generally bring about a cessation of coal confiscation, since much fuel was still being seized during the first week of March, though such confiscation was believed not to have been on as large a scale as during previous weeks.

The curve of production varied to quite a material extent in the New River field at the outset of March. The first day of the week witnessed a fairly large production; for several days after that production was decidedly on the down grade, until the last day of the week when mines took a sudden spurt, owing to an increase in the car supply. Aside from the two days mentioned, production was curtailed to the extent of about one-half, solely because of an inadequate car supply, the supply in fact during the greater part of the week being just about 50 per cent.

Weather conditions were decidedly unfavorable during the greater part of the week to large shipments of coal. Traffic on the Chesapeake & Ohio was suspended in the neighborhood of Hinton on Friday, the fifth, through a slide followed by a freight wreck.

While it had been hoped that export shipments might be resumed on their former scale, such hope now has been abandoned by New River coal men, at least until there is a larger supply of coal available for this country. When the Lake season opens, the demand for all grades of coal will be increased, but operators generally feel that it will be difficult to meet the heavy demand in the Northwest owing to poor transportation facilities.

## Bluefield, W. Va.

### Decrease in Output of Smokeless Mines —Plants Work One or Two Days— Tug River Loads Frozen Solid— Pocahontas Issues S. O. S.

Mines in southern West Virginia in the smokeless area suffered to a greater extent from a car shortage than during any previous week of 1920, as a result of which production took another drop. While there was a slight improvement in other sections of the state during the first week of the month, conditions were far worse in Norfolk Western territory especially during the early part of the week. The supply of cars was so scarce at one time as to make the transportation question one of grave concern; it even became necessary to appoint a committee of operators to call on railroad executives in the hope of securing relief.

While the last week of February had been bad enough, from a transportation standpoint, the first week of March was worse. The car supply was so uncertain, so irregular and so scant that it hardly paid the larger companies to attempt to keep their mines going; while on the other hand the smaller companies were practically without cars and were unable to operate to any appreciable extent. Taking southern West Virginia as a whole, it is considered doubtful if the number of empties furnished reached more than 40 per cent of the normal supply.

While it was believed in the southern part of the state, during the first week of March, that there would be a gradual improvement after the adjustment stage of the railroads had been passed, yet the first week of the month was not conducive to any betterment of conditions, and apprehension was expressed that smaller companies might be seriously affected from a financial standpoint. With mines without number reduced to a point, where they were not able to operate more than one or two full days during the entire week, production of course was bound to undergo a marked decrease.

Highly unfavorable weather conditions prevailing throughout the entire week, only served to demoralize the transportation of coal. It was impossible either to move coal after it was loaded, with any degree of celerity, or to distribute empties with any promptness; at one stage of the week, one field in southern West Virginia was deprived of almost its full car supply.

The chronic car shortage is making for labor unrest in the southern end of the state, since miners are only able to make a fraction of their former earnings. In an

endeavor to find more work, miners are beginning to drift from one field to another, and that of course disorganizes operations to quite an appreciable extent.

Car shortage gave production a downward trend in the Tug River region during the first week of March, the output being only 57,850 net tons, the lowest since the week ended Jan. 24. The weather was unusually severe in the region and was a potent factor in making the movement of coal extremely sluggish.

### Adverse Conditions on Tug River

Tug River operators were more and more impressed at the outset of March, that a very large number of loads handled under the regime of the Railroad Administration, and passed on from one road to another during the winter months, had been exposed to the weather for so long a period, that they became frozen solid and could not be unloaded. This had been currently reported as one of the causes contributing to the shortage of empties; although Government control has been made effective to the end of April, there was in evidence at the outset of March, a rather more optimistic feeling in the industry than has been observed for some time.

Under date of March 5, a new priority list was promulgated by the Director General of Railroads; it was received in the Tug River field and provided primarily for ten classes of railroad needs and secondly for tidewater shipments. It is predicted in the region that such a priority list will just about do away with export business while the order continues in effect.

Car service in the Winding Gulf field, during the week ended March 6, was such as to enable the mines here to load a little more coal than during the previous week, although the supply of empties was far below normal. Coal movement on the Virginian was seriously hampered during the week by lack of motive power, which condition is becoming somewhat chronic. Little or no improvement in the car supply furnished by the Chesapeake & Ohio was observable. That road was badly handicapped during the first week of the month by two freight wrecks—one at Gauley Bridge, W. Va., and one at Sandstone, W. Va. Each wreck tied up freight traffic for many hours, affecting both the movement of coal and the distribution of empties.

### Car Famine in Pocahontas Field

Little or no change in conditions was observed in the Pocahontas region in the period between March 1 and March 6, the usual large supply of cars in evidence at the beginning of the week lasting for a shorter period than usual. Once it had been exhausted, mines all over the field found it necessary to shut down and were able to operate during the week only at irregular intervals. As already related the supply of cars, about the middle of the week, reached such a distressingly low point that it became necessary for a special committee of operators to send out a call to Norfolk & Western headquarters for relief.

Production and loss, as a result of inadequate transportation facilities, was about a "fifty-fifty" proposition, mine disability and labor losses having little to do with such a loss in production as was sustained. With the disappearance of the influenza from many mining communities, the labor supply when March opened was about 95 per cent of normal. Owing to the shortage of cars, however, smaller labor forces would have sufficed to load all the coal for which there was cars.

With nothing to prevent confiscation, after a compliance with certain formalities, and with priority regulations now in force, export shipments do not constitute a very large part of the coal going out from the Pocahontas region. Weather conditions during the first week of March, were not particularly conducive to efficient operation of the railroads and hence the movement of coal was slow.

## Huntington, W. Va.

### Production Losses Largely Exceed Output in Logan Field—Railroads Take Considerable Coal—Chesapeake & Ohio Moves 11,367 Loads—Gain of 448 Cars

Production slipped several cogs in the Logan field during the first week under individual ownership of the railroads, the aggregate shipments from the field being about 9,000 tons under shipments for the last week of February, or the difference between 186,000 and 177,000 tons. Just how heavy the losses continued to be in the Guyan Valley it was easy to determine when a comparison is made with an output of 250,000 tons a week during the strike.

Ever since the strike was terminated, however, production losses have been far in excess of the amount of coal it has been possible to produce, and the first week of the month proved to be no exception in that respect; the car shortage cut into production to the extent of fully 50 per cent, costing the production more than 200,000 tons.

Figures covering February production disclose the startling fact that but for a car shortage, it would have been possible to produce 929,000 or almost one million tons more than was the case, the loss for the month from a scarcity of cars running up to 56 per cent. The total production for the Logan field in fact was only about 44 per cent of capacity.

When, with almost 1,000 cars on hand at the beginning of the first week of the month, the coal mined reached almost 50,000 tons, operators thought such a large run of cars might reflect an improvement in the supply. In that respect producers were doomed to disappointment, the daily supply of cars for the rest of the week fluctuating between 400 and 500.

Not all the coal produced was by any means reaching commercial consumers, the demands of the railroads being such as to require a large portion of the Logan tonnage, though the tonnage confiscated was far less than had been the rule during previous weeks.

In its first week under private control, the Chesapeake & Ohio managed to handle a somewhat larger volume of coal than during any week of February, although the gain was nothing to boast of. During the first week of the month the Chesapeake & Ohio moved over its roads 11,367 loads of coal, or a tonnage of 568,350, as compared with a movement of 10,919 cars, or 545,950 tons, during the last week of February, so that the additional number of cars amounted to 448.

## Fairmont, W. Va.

### Improved Car Service Under Private Ownership—Car Supply About Fifty Per Cent—Output Largely Taken by Railroads—Exports Precluded

If car service furnished during the first week of March, at least on the Baltimore & Ohio in northern West Virginia, be any criterion of what may be expected under private ownership, then there has been a material improvement in northern West Virginia; for the supply of cars in that part of the state, during the first week of the month was far superior to that in evidence at the end of February. However, operations were still being seriously curtailed because of the limited supply of cars.

It should be remembered, however, that the last week of February ranked as one of the poorest in recent years, as far as the supply of empties was concerned; it being partly responsible for the poor showing made in the second month of the year when loadings fell below those for January to the extent of 5,906 cars. Nevertheless coke production and shipments during the second month outdistances those for the first month. More cars were available during the first six days of March than had been the case during the preceding weeks. Despite the improvement in the supply of empties, the middle of the week found about 91 mines idle, and on Thursday on the Monongah division of the Baltimore & Ohio less than 100 cars were furnished, 115 trains being reduced to idleness on the day in question.

Conditions described as existing in the Fairmont region, were largely true in other northern West Virginia fields. The supply for the week was about 50 per cent. Notwithstanding conditions credit was given officials of the Baltimore & Ohio for their efforts to maintain a supply at least partly

sufficient for loading. Transportation conditions on the Monongahela R.R. were not quite so favorable as on other roads during the week, the supply for this period being about 30 per cent. The Baltimore & Ohio was seriously in need of coal during the week and that might account for the unusual effort made to keep the mines supplied. At the same time the operators were willing to co-operate in order to secure cars.

The largest proportion of the output of the Fairmont and other regions was being taken by the railroads. Most of the northern West Virginia tonnage was consigned to the East during the first week of the month. Of the coal moved to the West quite a large portion was going to Ohio points as well as to Michigan markets. Curtis Bay shipments seemed to have been increased somewhat during the latter part of the week; but the necessity of taking care of the domestic markets has also precluded and will continue to preclude (in the opinion of mine owners) mines generally from shipping a very large tonnage abroad for several months to come.

## Ashland, Ky.

### Northeast Kentucky Output Shows Increase Over Preceding Week—Further Car-Shortage Relief Hoped for—More Cars or Serious Labor Turnover

Out of a total potential capacity of 245,000 tons in the northeast Kentucky field, there was produced during the first week of March, 150,125 tons of coal, or 61 per cent of potential capacity; the total production loss, on the other hand being 91,875 tons, or 39 per cent of capacity; all but 3 per cent, or 7,200 tons, having been lost through a car shortage, the loss from that source aggregating 87,675 tons. During the corresponding week of 1919 when there was no market for coal, the output was 103,790 tons.

Tonnage figures given disclose a marked increase over the preceding week; the car-shortage factor remains quite a predominant one, and unless immediate relief is secured, it can be expected that the present labor supply, greatly amplified from other union districts immediately following the recent strike, will suffer from the men seeking employment in other districts where more steady employment is offered; furthermore, the plowing season is approaching during which time large numbers of men temporarily leave the mines in some sections.

The greatly increased operating cost incident to decreasing operating time, occasioned by poor car supply and increased wages during the past two months, have made it necessary for northeast Kentucky operators to secure for their product a price in advance of the present authorized Government figure, consequently they do not feel justified in contracting at Government fixed prices for any lengthy period.

## East Liverpool, Ohio

### Coal Stripping Opposed in Columbiana County—Legislation Proposed—City Council Discusses Matter—Orchards Reclaim Lands

Plans are being developed here to prevent additional coal-stripping operations in Columbiana County. The movement is being backed in no small manner by Probate Judge Samuel W. Crawford, of Lisbon, the county seat. Lined up with Judge Crawford in this effort is the Trades and Labor Council of East Liverpool.

State Senator Charles A. White and state Representative E. M. Crosser of this district are also being interested in the opposition to coal-stripping operations, and it is strongly intimated that legislation will be attempted at the next session of the state Legislature to curb coal stripping throughout the state.

No small amount of land has been either bought or leased in Columbiana County of late for coal stripping. One large option which was permitted to expire, cannot be renewed since opposition to such operations has developed.

A second meeting of the East Liverpool Trades and Labor Council was held here recently, when the idea of fighting any additional coal-stripping plans by the injunction route was discussed.

Coal men who have been planning to operate strippings in this county, have been watching the recent trend of events with unusual interest. Some effort has been made to stay this opposition to such development, but such opposition continues

nevertheless. It has been pointed out that in Jefferson and Harrison counties, adjoining, stripped lands are being reclaimed by planting orchards and sowing the land in clover for pasture purposes, but even this scheme, it is said, is not meeting with much favor in the district.

## Cadiz, Ohio

### Wayne Coal Co. Uses Stripped Coal Land—Plants Peach Trees—Sows Land to Clover—Stocks with Cattle—Unity Coal Co. Pioneer

The Wayne Coal Co., with offices in Steubenville and also in Pittsburgh, Pa., a corporation which is conducting extensive coal-stripping operations in Harrison County and also in Jefferson County adjoining, does not propose to let farm lands so disturbed go to waste.

The method of obtaining coal by stripping has been much discussed, and at one time a bill was introduced in the Ohio Legislature to prohibit this method of obtaining coal, but it was not passed.

That the stripping proposition cuts up farm land is not denied, and to find a use for such land after the coal has been stripped, is a problem that has been talked over by farm interests since it was first introduced.

It now seems as if the Wayne Coal Co., has solved the problem. Ground that was torn up by the company, during one of its early stripping operations, is to be leveled, and 5,000 peach trees will be planted. As stripping operations proceed, more trees will be planted.

In addition to planting trees, the company will also sow these lands to clover, and then will follow the stocking of these farms with cattle, sheep and hogs. This is a matter in which the State Agricultural Station should be largely interested.

The planting of fruit trees, on land which has been stripped for coal-mining purposes, was first taken up and put into practice by the Unity Coal Co., which concerns operates stripping propositions in Harrison and Jefferson counties. The advances made along this line by the Unity company have been pronounced a success, and this fact caused the Wayne company to adopt a similar plan to reclaim stripped land for fruit growing purposes.

## Victoria, B. C.

### Settlers' Right Act May Be Re-enacted—Of Interest to Vancouver Island—Dominion and Provincial Government Issue

It has been announced by Premier Oliver, that the Settlers' Rights Act of 1919, which has been disallowed by the Dominion Government, will be re-enacted at the present session of the Provincial Legislature. The settlers within the Esquimalt & Nanaimo Ry. belt, Vancouver Island, will be given a further extension of time, in which to make application for title to the coal rights in connection with their lands. This assurance was given a delegation, representative of a large body of the claimants, which waited on members of the Government and the Legislature at the Capital City.

It is to be expected, in conformity with the policy of the Dominion Government, that if such legislation is again placed on the statute books of British Columbia, that it will be again disallowed. However, the Provincial Government expresses a determination to maintain the rights of the settlers to a fair deal, and it seems likely that the question of jurisdiction between the two administrations will come to a definite issue before long.

## PENNSYLVANIA

### Anthracite

**Gordon**—The Hillvue Coal Co. has had plans prepared for the construction of a new coal washery at its local mining operations, estimated to cost about \$25,000. Frank B. Davenport, Coal Exchange Building, Wilkes-Barre, is engineer for the company. The company's headquarters are at Scranton. F. P. McLaughlin is general manager.

**Pittston**—Production of anthracite coal during March will be materially reduced as a result of the floods and storms that swept the coal region during the early part of the month. Continuous rains for two days resulted in dozens of mines being

flooded with water. In most cases emergency pumps were able to prevent such high water as to cause suspension, but in two cases in the Pittston district shafts were completely flooded. Heidelberg No. 2 shaft, of the Lehigh Valley Coal Co., and Leadville shaft, No. 9 colliery, Pennsylvania Coal Co., are both out of service. The mine workings are completely flooded, and the water fills the bottom of the shafts, making it necessary in both cases to place steel water buckets in operation in the shafts. As soon as the water has been reduced in the level of the works, the pumps can be started and will aid in removing the flood.

**Bituminous**

**Connellsville**—Recently Colonel Lloyd G. McCrum, formerly of this place, Robert E. Beerits, John H. Beerits and Harry Siehl took over the Cherry Run Mining Co., including 500 acres, at Huey, Clarion County. Application has been made for a charter with a capital of \$260,000.

**Clarion**—The Carnegie Steel Co. is getting ready to build the final battery of ovens at its mammoth byproduct coke plant here. Just before the war the company started to construct 1,280 ovens, but the war interrupted the program after 768 had been built. Now it is planned to go on with the work. The building of the additional ovens will require also the construction of about 600 new houses for workmen. There have been about that many houses built since the plant was started.

**Masontown**—That the H. C. Frick Coke Co. is planning to make Masontown of equal rank with Scottdale as an office center for the company, with the ultimate possibility that this place will become the main headquarters of the coke corporation, is the belief in well-informed Fayette County fuel circles. It was strengthened recently when it became known that option has been secured on the New Mason Hotel, a modern brick structure, for the purpose of converting it into an office building. An option has also been given on a hotel in Smock, it became known at the same time, in which may be installed branch offices for the Redstone region.

**WEST VIRGINIA**

**Welch**—The mining men of McDowell County, on March 6, organized the McDowell County Mining Institute with a charter membership of 51. The association after being organized elected the following officers: S. P. Flannagan, president; S. E. Houston, secretary; W. P. Kearns, treasurer; a vice president for each of the various districts in the county as follows: Northfork district, J. A. Shuster; M. Hatmaker, Dry Fork district; H. T. Graham, Anawalt district; H. P. Kline, Davy district; Con Weymouth, Welch district.

**Huntington**—This city has been selected as the new headquarters of the Logan Operators' Association, announcement to that effect having been made during the first week of the month by A. J. King, who acted as a committee in securing suitable quarters for the offices of the association. A decision was tentatively reached on Feb. 26, to move the offices of the association from Logan to this city, the latter place being more centrally located and more accessible. The Huntington offices will be in charge of J. W. Colley. Associated with Mr. Colley will be a Mr. Manley who will act as traffic manager for the association, this being a newly created position. Mr. Manley before March 1 was connected with the U. S. Railroad Administration as a traffic expert. The new offices of the company will be opened March 15.

**Glen White**—The regular weekly session of the Glen White Mining Institute, held recently, was largely attended by the officials and employees of the Glen White operation. There was a general discussion on the cutting and shooting of coal, power facilities, underground haulage and hoisting. Several colored miners took the floor and made a number of good suggestions. Along the line of educational work suggested for the night school curriculum was the teaching of the English language to men of foreign birth. This suggestion was made by a young Italian miner who only came to America six years ago, and who by persistent effort has mastered the language, both oral and written. E. E. White, president and general manager of the company, gave the men a good talk. He advised all to take advantage of the educational facilities provided by the institute, so that they may become fitted for advancement in the business they have chosen.

**Wheeling**—New directors were elected by the stockholders of the Hanover Coal Company at a recent meeting held at Bellaire, Ohio. The Hanover company, with a total capitalization of \$500,000, has one of the largest if not the largest coal-stripping operations in the Washington County, Pa., field where 1,500 acres of coal land are owned. On the new board of directors are: J. B. McFadden and Hiram Teater, of Wheeling, W. Va.; W. J. Sprow and Bert D. Smith, of Sandusky, Ohio; Dr. A. C. Beetham and C. N. Wyrick, of Bellaire, Ohio.

**KENTUCKY**

**Louisville**—The Pittsburgh Fuel Co., of this place, recently formed to take over the Pittsburgh Coal Co. holdings from the Island Creek Coal Co., has announced plans for handling Island Creek coal by rail and river. The following are the officers of the new company: R. Baylor Hickman, of the Ewald Iron Co., president; Charles J. O'Connor, former Pittsburgh manager, at Louisville, vice president and general manager; Clifton Kodes, vice president; L. P. Ewald, vice president; G. O. Boomer, treasurer; B. A. Leonard, assistant treasurer; M. W. Ayles, secretary. The company is capitalized at \$100,000. The same interests have incorporated the Pittsburgh Coal & Coke Co., which will look after river and rail transportation, mining, wholesaling, etc. The Pittsburgh Fuel Co., which has a large elevator on the Ohio River, with equipment for unloading barges to the elevator, has the best river-handling facilities in Louisville. It also has rail switches, but nothing modern in the way of equipment for unloading cars. Plans are now being considered for a large pit and conveying equipment for facilitating car unloading, which is now done by hand. A locomotive crane has also been considered but the pit plan is faster.

**OHIO**

**Henryetta**—The Star Coal Co., a new corporation with a capital stock of \$30,000, has been authorized to engage in business in this field. Incorporators are: M. A. Berman and Earl Wells, of Henryetta; John Johnson, of Schuller.

**Columbus**—Confiscation of fuel by the railroad companies is causing considerable trouble between shippers and purchasers of coal. The railroad managements take the position that any coal shipped prior to March 1, is subject to confiscation by the railroads, in the same manner as previous to the return of the roads to their owners. As a result of this position taken by the railroads, a considerable amount of coal, especially from West Virginia, which was shipped some time ago, is being confiscated by railroads throughout Ohio.

**Marianna**—It is reported that the 160 coke ovens at this place are in full blast. The Union Coal & Coke Co. mines here have been in full operation for a year, with the exception of the time lost during the strike last fall. The company is planning to make these mines the best in the county, and it is stated that more than a million dollars will be spent in new equipment this year. The dwellings of the miners will be greatly improved and repaired so that the town will be the most attractive in the county as regards the permanent home of miners. Electric equipment will be installed throughout the mines of the Union company this year. The power will be secured from the West Penn Power Co.

**INDIANA**

**Indianapolis**—The Owen Coal & Oil Co. has been incorporated, with capital of \$150,000 for general mining purposes, by Alexander McKnight, Fred H. Cutting and George B. Walls.

**Petersburg**—Material for a new stripping mine, to be opened by the Globe Coal Co., at Rogers, six miles east of this city, is arriving and the stripping of coal will probably start early in the summer. A railroad switch has been built to a point near where the work will be done.

It is said that the Pike County Coal Company, operating the Atlas mine, just north of this city, has surpassed all other miners in this vicinity in the production of coal. The mine is electrically equipped and has a capacity of 4,000 tons. Though less than two years old, the Atlas mine is averaging 2,000 tons daily, with a working force of 300 men. N. C. McCleary, general superintendent, reports the recent purchase of 7,000 acres of coal land in western Pike County. The company expects to open up two more mines at once.

**Petersburg**—Aldo Johnson, a coal operator of Vincennes, has leased 3,000 acres of coal land near Alford two miles east of here; the company will bring a drilling rig to the field. Also the Indian Creek Coal Co., which owns the Blackburn mine, three miles east of this city, is leasing hundreds of acres of coal land south of Blackburn, and will increase the capacity of the Blackburn mine. Furthermore the Pike County Coal Co., is increasing its acreage.

**ILLINOIS**

**Litchfield**—The slipping of a clevis pin at the Hoosier mine here caused the cage to fall with a loaded car 300 ft. to the bottom of the shaft. The miners had begun to assemble at the foot of the shaft to be hoisted out of the mine, and if that accident had occurred a few minutes later the cage would have been loaded with men.

**Marion**—Negotiations are nearing a close for the sale of the two mines at Royalton in Franklin County, of the Franklin Coal & Coke Co.; this company is headed by J. C. Mitchell, who, until about 12 years ago, was a prominent Pennsylvania operator. The Peabody Coal Co., of Chicago, is reported to be the purchaser. The Franklin company mines have a big tonnage and several thousand acres of coal lands. They have been the scene of two great disasters resulting in the death of many miners. If this sale is made to the Peabody Coal Co., it will give this interest four mines in Franklin County; the other two are at West Frankfort.

**Johnston City**—There is apparently good grounds for believing that the reported sale of the Johnston City Coal Co.'s two mines here, to the Old Ben Mining Corporation, will go through. These mines are big operations and are in the 3,000 to 4,000-ton per day class. P. H. Holland, of Chicago, has brought them up to their present state of development. It is said that the big holdings in Franklin County are passing into the hands of the "Big Four," namely: Old Ben; Chicago, Wilmington & Franklin; Peabody; Bell & Zoller. The two big companies that are increasing their holdings in Williamson County are: Peabody Coal Co. and Cosgrove & Co.

**Murphysboro**—Arrangements have been made for further drilling on the 640 acres of the Bandy farm for the location of the proposed No. 11 mine of the Big Muddy Coal & Iron Co., of St. Louis, Mo. This deal has, it is understood, been held up by an option (which has just expired) on all of the St. Louis firm's holdings in Illinois that called for more than \$2,000,000.

The expected sale of the Gus Blair mine here from the West Virginia Coal Co., of St. Louis, to the Lincoln Coal Co., of Chicago, develops the fact that the real owner will be the Copley interests, which control several public utilities in Illinois, among them the lighting and gas plants here. This will take away the retail coal supply of the city and is the cause of much agitation.

**Moundsville**—Work is being pushed on the new shaft for the Panama mine of the Ben Franklin Coal Co., which has an operation just south of this place, the opening being 12 x 24 ft. It is practically a double shaft as the company plans to sink one side to the 4-ft. seam and the rest of it to the 6-ft. Pittsburgh seam. The shaft has already been sunk to a depth of 20 ft. and it will require about four or five months to complete the work now in progress. The shaft is to be concreted and a wall is also to be built at the top to prevent the possibility of flooding. While the shaft is being sunk, the company also has a new tippie under construction. Upon the completion of the shaft and tippie it will be necessary to rearrange the track-ways around the mines. The company is now operating just across Big Grove Creek from the point where the shaft is being sunk.

**Duquoin**—The Johnston City Coal Co., operating at Johnston City, southeast of here, recently completed the construction of a new recreening plant at its No. 2 mine. The mine at the present time has a 3,000-ton capacity. With this new improvement in operation the company expects a 6,000 tonnage daily.

Drilling has been commenced between this city and Belleville, along the right-of-way of the Southern Traction Co., of East St. Louis, which was recently purchased by C. R. Fox, president of the Aluminum Ore Co., of East St. Louis. The work is being done by engineers from Pittsburgh, and, after tests have been completed, it is expected that several mines will be sunk by the new owners of the road; the road will be operated as a coal carrier.

After being closed down for five months the Springside mine near Springfield, owned by the Smith-Lohr Coal Co., has resumed operations. The mine was forced to cease operations last August due to a fire which destroyed the entire top works of the plant. Much new machinery and modern equipment, including a new steel tippie, has been erected at the mine since last summer.

#### KANSAS

**Topeka**—The Kansas Industrial Relations Court—the first and only court of its kind in the United States—recently began an investigation of coal-mining conditions in the State of Kansas. The court will open its hearings in Pittsburgh, and Attorney General Richard J. Hopkins will present the evidence to the court and make prosecutions. The information sought includes: Working conditions with reference to hours of labor, and provisions for safety and proper sanitary conditions. Miners' incomes with relation to living costs. Plan of mine operation as to continuity of operation and production efforts to meet public demands and returns accruing to both miners and operators. Housing conditions in mining settlements, and rentals required by the companies of those living in company houses; school, church and social conditions. Complaints of miners, operators and the general public, if such complaints are made. Judge Clyde M. Reed and Judge George W. Wark are members of the court.

#### WASHINGTON

**Seattle**—Five Japanese connected with the Nitsi Bishi Coal Mining Co., of Tokyo, Japan, arrived here aboard the "Katoria Maru," on a tour of the coal mines of the United States. A. Nomi is the head of the party. The visitors after learning American methods of mining will go to England and other countries.

**Poentello**—It is stated that a resolution has been passed by the Chamber of Commerce, here, endorsing the Teton basin coal-mine proposition, located on the Driggs branch of the "Short Line" railroad. The resolution passed by the chamber stated that after investigation, it was estimated that there were 13,000,000 tons of available coal in the Teton properties, and further that indications were that when the mines started operation the coal could be put on the local market at "25c. a ton lower than Utah Coal." The coal was also stated to be high grade. The property is located in Bannock County in the extreme southeastern part of the state. Mr. Simpson, who represented the coal company at the Chamber of Commerce, is vice president of the Lincoln Trust Co., of Spokane.

#### ALASKA

**Eska**—S. S. Smith, chief mine inspector of Alaska, reports that at Eska mine No. 11, new 3,600-lb., 3-ft. gage mine cars have been constructed and the mine trucks have been changed from 2- to 3-ft. gage. At the Chickaloon mine, the installation of a small electric-light plant has been completed and 161 short tons of coal were mined.

#### CANADA

**Sydney, N. S.**—Alex Dick, sales agent of the Dominion Coal Co., states that it is impossible to forecast coal-trade conditions, as the company hesitates to contract for future deliveries until labor and wage conditions become more settled. Business that the company might obtain is being diverted to American ports, where cheaper costs of mining prevail, and coal is being produced under more favorable natural conditions. The total output for February at the Dominion Coal Co. collieries was 248,338 tons, which is several thousand tons less than the previous month's production. A number of mines were idle at different times of the month. The management has decided to put into effect the "safety-first" theme and all the shot firing in the mines will be done at night.

### Personals

**Newell G. Alford** has been chief engineer of the St. Bernard Mining Co., at Earlington, Ky. since Sept. 1, 1919.

**O. Byrd Newton** has been elected secretary and treasurer of the Old Dominion Coal, Iron & Coke Corporation, Roanoke, Va. In the place of C. W. Owen, resigned to engage in other business.

**E. J. Wallace** resigned as sales manager for the Stephan Coal Co., on March 1, 1920, to engage in the wholesale distribution of coal and coke under his own name, with headquarters in the Pierce Bldg., St. Louis, Mo.

**Fred Bateman** has been promoted from the position of mine foreman of the Wals-ton No. 3 mine of the Rochester & Pittsburgh Coal & Iron Co. to that of superintendent of the McIntyre mine of the same company.

**F. M. Sackett**, president of the Pioneer Coal Co., Louisville, Ky., and connected with the Speed interests (which operate the Byrce & Speed Coal Corporation) and several mines in the state, on March 15 sailed for London and Paris, on a combined business and pleasure trip.

**William H. Howarth** has resigned his position as chief engineer of construction with the George M. Jones interests in Ohio, and has joined the engineering department of the Hillman Coal & Coke Co., of Pittsburgh, Pa., effective March 1. His headquarters is at Brownsville, Pa.

**Edmund H. Dwyer**, referee in bankruptcy for the Northern district of Alabama, has been appointed umpire for the Fuel Administration and his appointment confirmed by Attorney General Palmer. Mr. Dwyer succeeds H. C. Selheimer, who resigned on account of ill health and recently died in California.

**E. H. Dulaeay** has been appointed coal and coke traffic agent of the Louisville & Nashville R.R., at Louisville, succeeding **C. D. Boyd**, who left some months ago to take up traffic work for the Hazard, Harlan and Southern Appalachian associations. Mr. Dulaeay has been assistant to the third vice president, and connected with the traffic department of the Louisville & Nashville for some years.

**Moroni Heiber**, vice president and general manager of the United States Fuel Co., of Salt Lake City, was in San Francisco recently. He was the guest of James B. Smith, president of the King Coal Co. The United States corporation furnishes the King interests with coal for bunkering steamships plying to all parts of the world from the Pacific port.

**J. W. Powell**, who has served in the capacity of superintendent of No. 204 and 205 mines of the Consolidated Coal Co. at Jenkins, Ky., for about 2½ years, has been promoted to the position of general superintendent of Consolidated Coal Co. mines at Jenkins, Ky. Mr. Powell had an extensive experience as superintendent and mine manager for years in the Northwest before he became connected with the Consolidation company.

**A. H. Sherrick**, engineer in charge of the Brownsville Engineering Co., has sold his interest in the company to Walter Bowser of South Brownsville, Pa. Mr. Bowser has been connected with the Tower Hill Coke Co. at Republic, Pa., as its engineer for the past six years and prior to that he was employed by the Monongahela R.R. in the engineering department. The Brownsville Engineering Co. was organized on Jan. 1, 1920, when the company purchased the engineering business of L. G. Moslener.

**James Pollack** has resigned his position with the Fall Brook Coal Co., at Antrim, Tioga County, Pa., to take effect April 1. He took charge of one of the mines of the Fall Brook company Jan. 1, 1866, at Fall Brook, Pa., and has been in active charge of some of their operations ever since. In 1882 he assumed charge of the mining operations of this company at Antrim, where he developed and equipped two large mines. Mr. Pollack was a pioneer in the introduction of compressed-air mining machinery and designed and installed, what is said to be, one of the most elaborate and successful endless wire-rope haulage systems ever introduced in the state.

### Obituary

**George Washington Clackner**, secretary of Dexter & Carpenter, Inc., coal operators of 12 Broadway, New York City, died on March 7, in the Broad Street Hospital, New York City, of peritonitis following an operation for appendicitis. He was 57 years old and lived at 350 Clermont Ave., Brooklyn. Mr. Clackner is survived by two sons and two daughters.

**William W. Watkins**, a prominent anthracite operator for many years, died at the home of his daughter, Mrs. Charles Hauenstein, Carbondale, Pa., at the age of 82 years.

**John A. Mitchell**, 76 years old and a pioneer coal prospector, died at a hospital in McAlester, Okla., recently. To Mr. Mitchell's explorations may be credited, it is said, the location of practically all the large coal-bearing seams in the McAlester territory. He was also an extensive coal operator.

**Judge H. C. Selheimer** died recently at San Diego, Cal., where he went to recuperate from an attack of influenza. Until a short time ago he acted in the capacity of umpire for the Fuel Administration, to adjudicate differences between operators and mine workers, resigning on account of ill health. Mr. Selheimer was 61 years of age and had been a resident of Birmingham, Ala., for the 35 years preceding his death. His remains were sent to Lewis-town, Pa., his former home, for interment.

**David E. Jones**, one of the best known mine-tunnel and shaft men in western Pennsylvania, died recently at his home at Duquesne Heights, Pittsburgh. He was born in Wales and came to this country when a young man, settling in Unjontown. Since that time he has been employed as superintendent of construction of mine tunnels and shafts in Montana, Idaho, Alaska and Pennsylvania and is said to have had charge of the sinking of more coal shafts in western Pennsylvania than probably any other man. Mr. Jones had resided in Pittsburgh for 15 years and was employed by the Dravo Construction Co.

**Walter Scott Harkins**, one of the best known residents of eastern Kentucky, died recently at his home in Prestonsburg, Floyd County, after an illness of but a few hours of acute pneumonia. He was known throughout Kentucky and southeastern West Virginia as a lawyer of ability and as a man of kindly humor and strength of character. He was an extensive land owner and was heavily interested in coal, timber and oil operations. He was 62 years of age. Besides the widow, four children survive. They are: Joseph, Walter S. Jr., and Josephine, of Petersburg, and Mrs. Grover Howard, of Maysville. A number of kinspeople are residents of Huntington.

**Thomas Jeremiah**, superintendent of the Willis Coal & Mining Co., Willisville, Ill., died suddenly of heart trouble March 4, aged 51 years. His wife and six children survive him. Thomas Jeremiah had a wide acquaintance among Illinois miners because of his varied activities. He began his official career as a member of the Illinois District Executive Board, later serving as national organizer in the southern states under John Mitchell. In 1901, he became associated with the Willis Coal & Mining Co., and at the time of his death was a member of the board of the Fifth and Ninth District Coal Operators' Association. In 1911, he was appointed a member of the Mining Investigation Commission of Illinois, and served as chairman of that commission four successive terms. He was also a member of the Illinois Mine Rescue Station Commission until its work was taken over by the State Department of Mines and Minerals.

### Coming Meetings

**National Coal Association** will hold its annual meeting May 25, 26 and 27 at the Traymore Hotel, Atlantic City, N. J. Secretary, W. B. Reed, Commercial Bank Building, Washington, D. C.

**The American Association of Engineers** will hold its annual convention at the Planters Hotel, St. Louis, Mo., May 10 and 11. C. E. Drayer, secretary, Chicago, Ill.

**National Foreign Trade Convention** to be held in San Francisco, Cal., May 12, 13, 14 and 15.

**Chicago Coal Merchants** will hold its annual meeting April 13, at Chicago, Ill. Secretary, A. H. Kendall, Chicago, Ill.

**American Chemical Society** will hold its annual meeting at St. Louis, Mo., April 13, 14, 15 and 16. Secretary, Dr. Charles L. Parsons, 1709 G St., N. W., Washington, D. C.

**New England Coal Dealers' Association** will hold its annual meeting March 24 and 25, at Springfield, Mass. President, W. A. Clark, 141 Milk St., Boston, Mass.

**National Retail Coal Merchants' Association** will hold its annual meeting June 10, 11 and 12 at Detroit, Mich. Secretary-manager, Ellery Gordon, Philadelphia, Pa.

**Indiana Petal Coal Merchants' Association** will hold its annual meeting April 27, 28 and 29 at the Severin Hotel, Indianapolis, Ind. Secretary, R. R. Yeagley, Indianapolis, Ind.

**American Society of Mechanical Engineers** will hold its spring meeting May 24, 25, 26 and 27, at St. Louis, Mo. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

**National Federation of Construction Industries** will hold its first annual meeting at the Hotel Sherman, Chicago, Ill., March 24 and 25. Executive secretary, John C. Frazee, Drexel Building, Philadelphia, Pa.

**Chamber of Commerce of the United States** will make its eighth annual meeting to be held at Atlantic City, N. J., April 27, 28 and 29, an Increased Production Convention.

## Trade Catalogs

**Graphic Instruments in the Field of Transportation.** The Esterline Co., Indianapolis, Ind. Folder, Pp. 4; 8 1/2 x 11 in.; illustrated. Indicates what graphic instruments are doing on various transportation lines.

**High Efficiency Centrifugal Pumps.** De Laval Steam Turbine Co., Trenton, N. J. Pamphlet, Pp. 8; 8 1/2 x 11 in.; illustrated. Description of official tests made by two municipalities upon a 20-in. and 12-in. centrifugal pump, respectively. Of interest to all who are concerned with the handling of water by electric power.

**Keystone Rivetless Chain.** The Wilmot Engineering Co., Hazleton, Pa., manufacturers. Frank W. Watts Co., sales engineers, Pennsylvania Bldg., Philadelphia, Pa. Catalogue 19. Pp. 52; 6 x 9 in.; illustrated. Details of chain for conveyors and elevators; complete description and adaptability noted for various installations.

**Sullivan Plug Drills and Air Compressors;** bulletin 70-N, pp. 4. WA-6 Air Compressor; bulletin 75-P. Valveless Stopping Drills; bulletin 70-M, DX-61, Water Hammer Drill; bulletin 70-L. Portable Air Compressors, Gasoline Engine Driven, Class WK-31; bulletin 75-T. Angle-Compound Power Driven Air Compressors; bulletin 75-S. Tandem Compound Corliss Air Compressors, Class WC; bulletin 75-U. Utility Forge Hammer; bulletin 72-D. Power-Driven Air Compressors; bulletin 75-R. These bulletins are published by the Sullivan Machinery Co., Chicago, Ill. Each bulletin in 6 x 9 in.; illustrated. Description of machines noted.

## Industrial News

**Clearfield, Pa.**—The Clearfield Bituminous Coal Corporation announces the removal, on March 1, 1920, of its general offices from Clearfield to Indiana, Pa. This change also includes the office of the general manager, general superintendent and purchasing agent.

**Chicago, Ill.**—The January, 1920, issue of *Electrical Mining* published by the Goodman Manufacturing Co., of this place, contains articles descriptive of the Goodman scraper loader and its operation in coal mines. Excellent illustrations show the device at work in various mines.

**Philadelphia, Pa.**—The Cortright Coal Co., of this place, announces that it has been appointed exclusive sales agent for the Cambria Fuel Co., which mines a low-volatile coal from the Scalp Level district of Pennsylvania. The offices of the Cortright company are in the Pennsylvania Building, Philadelphia.

**Williamson, W. Va.**—Early development of the large holdings of the United States Coal & Coke Co., on Ben Creek in the Williamson field, is presaged through the presence of several engineering parties who are making plans and surveys with a view to the beginning of early development.

**Eagle Pass, Tex.**—The International Coal Mines Co.'s property near here has been sold to Dr. R. R. James and associates of Cotton Plant, Ark., by J. D. Quinn and others. The property brought \$100,000. It is announced that the purchasers plan to continue operation of the mines, and also to make extensive improvements and enlargements.

**Charleston, W. Va.**—Among other improvements contemplated by the West Branch Mining Co., at its plant at Dry Branch in the Kanawha field, is the construction of a large number of dwellings for the accommodation of miners, the company having in view an increase in its output. Operations are under the direction of William Farrel, superintendent.

**Logan, W. Va.**—Logan lands are to be developed by the newly formed McCall Coal Co. in which Logan people are largely interested, this corporation being formed with a capital stock of \$200,000. Headquarters of the company will be maintained at Logan, W. Va. Those active in the organization of the new company were: W. R. Lilly, J. R. Slack, H. A. McAllister and W. C. McCall, all of Logan, W. Va.

**Betsy Lane, Ky.**—The Pike-Floyd Coal Co., recognized as a part of the Pittsburgh Coal interests, is making splendid progress on its large new operation near here in Floyd County. It is planned to make this operation the largest individual producer in the district and the most modern machinery is being installed; the early construction work is being done by the Dravo Construction Co., of Pittsburgh, Pa.

**Thurmond, W. Va.**—The Cadle Ridge Coal Co., which recently increased its capital to \$100,000, has perfected arrangements for the development of about 900 acres of coal property. Machinery will be installed for all features of operation, and electric equipment will be utilized wherever possible. It is proposed to have a daily capacity of about 800 tons. J. M. McVey is president and manager; Harold E. Willson, consulting engineer.

**Welch, W. Va.**—Preliminary organization of the Little War Creek Coal Co. has been completed with a capitalization of \$500,000. This company was organized by J. C. Sullivan, of Tralee, W. Va., in order to develop certain coal territory recently purchased by him near this place. The incorporators of the new company were: Duke W. Hill, Charles G. Davis, S. H. Harrison, Vena Stapleton and Arthur B. Hodges, all of Charleston, W. Va.

**Bastrop, Tex.**—The Consumers' Lignite Fuel Co., recently incorporated with a capital of \$50,000, has perfected its organization and is arranging for the development of a total of about 640 acres of property. Complete mining machinery and equipment for all features of operation will be installed. L. S. Johnson is president, H. M. Handshy, vice president and manager; J. T. Cryrup, secretary and treasurer. H. M. Handshy will also act in the capacity of construction engineer.

**Philippi, W. Va.**—A tract of coal land in the Philippi district of Barbour County is to be developed in the near future by the Tygart River Coal Co. This corporation has been organized with a capitalization of \$150,000, Pennsylvania capitalists being principally interested as follows: A. L. Gaphart, of Knoxville, Pa.; David S. Smith, of Hays, Pa.; Carl Breitweiser, of Pittsburgh, Pa.; Geo. F. Martin and R. D. Carkhuff of Westford, Pa. Headquarters of the company will be in this city.

**Ashland, Ky.**—The Marrowbone Mining Co. suffered a complete loss by fire at its power plant recently. It is hardly expected that this mine will be in shape to resume operation within three months. Plans have been quickly consummated for the replacement of adequate electrical machinery to take care of the present requirements of the company as well as the new operation of the company on which development work was recently started.

**Morgantown, W. Va.**—The offices of the Penn-Mary Coal Co. will be moved, on April 1, from Morgantown to Reedsville, Preston County, W. Va., it is announced by Samuel Steinbach, chief engineer of the company's West Virginia division. The company recently acquired the coal and other properties of the Elkins Coal & Coke Co., in Monongalia and Preston counties, and the removal of the offices is for the purpose of placing the management in closer touch with the actual operations.

**Pittsburgh, Pa.**—The Koppers Co. has nearly completed the coke-oven plant which it has under construction for the Jones & Laughlin Co., and it is expected that this works will begin operations within two months. This plant is constructed with triangular flues according to the plan which had been developed as a result of the use of oil at St. Paul, Minn., where a small battery of these ovens has been tried out for two or three years. This plant which is nearing completion is the first one to use this type of oven extensively.

**Lewisburg, W. Va.**—The Greenbrier Smokeless Coal Co., recently incorporated with a capital of \$100,000, has perfected its organization, and is arranging plans for the development of about 900 acres of coal properties in the vicinity of McClung, Greenbrier County, W. Va. Complete machinery and equipment for all features of operation will be installed. R. M. Bell is president, and W. E. Nelson, treasurer.

**Cassville, W. Va.**—The Lee R. Shriver Coal Co. has been organized for the development of coal properties in the Cassville, district. Plans are being arranged for the installation of machinery and equipment for the development of about 225 acres of coal land, the plant to have an ultimate capacity of about 1,000 tons daily. Machinery and equipment will be installed. Nat C. Burdette is president; Lee R. Shriver, vice president; Frank Shriver, treasurer; and Robert L. Brock, secretary, all of Morgantown, W. Va.

**Mullins, W. Va.**—The Mullins Light & Power Co., of this place, has recently changed hands and will be known hereafter as the Union Power Co., Inc., with the following officers: C. H. Elsom, president; F. B. Lamb, vice president; H. P. Musser, secretary; M. W. Gilliam, treasurer; S. T. Preston, general manager. This company supplies the town of Mullins and neighboring coal companies with light and power. Extensive improvements are contemplated. The main offices of the company are located in Charleston, W. Va.

**Straitsville, Ohio.**—The Straitsville Coal Co., of Columbus, has been chartered with a capital of \$5,000, which will be increased later to develop large coal areas on the Hazelton estate on the Baltimore & Ohio RR. between Straitsville and Shawnee. The incorporators are: F. H. Spencer, C. H. Gibbs, E. E. Hazelton, A. T. Seymour and E. L. Pease. F. C. Spencer will be in active charge of the development work, and offices have been established in the Columbus Savings & Trust Bldg., Columbus. A good deal of storage slack is on the property and it is planned to load this for commercial purposes.

**Scranton, Pa.**—A large contract has come from the state of Ohio for pumps for industrial purposes to the Scranton Pump Co. of this place. The Goodrich Rubber Co. has contracted for the machines. There are three of them, each 42 ft. long, 14 ft. wide and 10 ft. high and weighing 90 tons. The price to be paid for the three pumps is something less than \$100,000. Two of the mammoth pumps are to be ready for shipment within 3 1/2 months from date of contract and the third must be ready a month later. The pumps are the largest that the local concern has ever attempted to build.

**Williamson, W. Va.**—Colonel T. E. Houston, one of the largest operators in the Pocahontas field, has materially increased his coal holdings in the Williamson field having just completed a deal for the extensive properties of the Red Jacket Consolidated Coal & Coke Co., the transaction involving the sum of about \$2,000,000. The deal was consummated about the first of the month. All the Houston holdings in Mingo County, it seems to be pretty well understood, will be brought under the supervision of W. A. Wilson who for several years has been the superintendent of the Thacker Coal & Coke Co., a large producing company in the Mingo field. With the acquisition of the Red Jacket company, Mr. Houston becomes one of the largest producers in the Mingo section. Not long ago Mr. Houston became interested in a large tract of coal on Wolf Creek, Marlin County, Ky.

**Chicago, Ill.**—The Ben Franklin Coal Co., of West Virginia, has contracted with Jacobsen & Schraeder, Inc., of Chicago, for a complete new tippie to be built at its Moundsville mine. This tippie will include a Jacobson balanced horizontal screen and picking table, crushing and loading facilities for three tracks, belt conveyor and concrete storage bins.

The Tasa Coal Co., of Pittsburgh, Pa., has also contracted with this Chicago engineering and constructing firm for the design and installation of a modern tippie for its stripping operation. This tippie will include retarding conveyor, Jacobsen equipment and facilities for loading on three tracks.

Heyl & Patterson, Inc., of Pittsburgh, Pa., has awarded a contract to Jacobsen & Schraeder, Inc., engineers, Chicago, for the design and Jacobsen balanced horizontal screening equipment for the screening plant which they are constructing for the North Western Fuel Co., of St. Paul.

## Weekly Review

*Higher Prices Likely to Be Soon Effective—Car Supply Is Slightly Improved—Export Shippers Protest—Demand, Though Strong, Has Eased Off in Some Places and Grown Stronger in Others.*

SOME relief from the tightness of the coal trade has been experienced during the past week. Although car supply is still far from normal in some sections of the country, conditions have improved in a measure. Reports of confiscations of cars by the railroads are few and far between. Now that more cars are available, the demand for domestic coal, because of higher temperatures, has eased off somewhat.

The final decision of the Bituminous Coal Commission is awaited with interest if not suspense. The increase favored by Mr. White, states Chairman Robinson of the Commission, will cost the country 100 million dollars per year, and any reduction in the working time, if granted, would result in still higher costs to the public. With statements such as the above before them, consumers are beginning to realize that the discontinuance of Government control will result in an increase in prices.

There is a certainty that the price of anthracite will also increase. While it is not likely that the 60 per cent wage advance now being demanded will be conceded, it is likely that an increase similar to that likely to be received by the bituminous mine workers will fall to the anthracite men. However, the final decision of the committee now in session in New York City is not expected for some time.

Continuation of Government prices has quite seriously disturbed the routine of the bituminous-coal industry. At this time of the year negotiations for the next winter's supply are usually made, but with Government prices still in effect and the award of the President's commission not definitely settled, neither the operator nor jobber knows where he stands.

Stocks of anthracite in the Midwest are low and domestic orders in Milwaukee have been limited to one ton. Due to the scarcity of cars, no Eastern coal is being received, and the con-

sumers in that district are drawing upon Illinois and Indiana to meet their requirements. The prospects that there will be a strike of the bituminous miners, not at all an unlikely eventuality, has caused an increased demand for coal in the Midwest.

The fact that the Shipping Board has granted the right to ship coal overseas from Newport News and Charleston, and has refused export coal rights to Baltimore, Philadelphia and New York causes much complaint from shippers engaged in that trade. This, they claim, is doing permanent injury to the ports refused this right, and the Baltimore Import and Export Board of Trade has filed a complaint with the Government along that line.

Anthracite steam trade has had a healthy tone in the past week, though buckwheat is rather difficult to procure from the large companies. Once again the individual companies are in a position to demand premiums for this particular size.

### ANTHRACITE SHIPMENTS FOR FEBRUARY

Shipments of anthracite for February, 1920, as reported to the Anthracite Bureau of Information at Philadelphia were 4,913,664 tons, as compared with 5,713,319 tons in the preceding month, and with 3,871,932 tons shipped during February last year, which has the distinction of being the smallest monthly shipment of anthracite for the past eighteen years, with the exception of shipments made during the strike period.

Even with the shorter working time, February of this year would have recorded considerably more tonnage had it not been

for the exceptionally severe weather conditions which prevailed during the entire month, it being impossible at times for some of the collieries to operate, which, of course, cut down production as well as shipments.

Total shipments for the coal year or eleven months ending Feb. 29, 1920, have amounted to 63,737,213 tons as compared with 67,728,849 tons shipped during the previous coal year ending Feb. 28, 1919, a decrease of approximately 1,000,000 tons, which is made up entirely of steam sizes. Shipments in tons by carriers were as follows:

	February, 1920	February, 1919	Coal Year, 1919-1920	Coal Year, 1918-1919
Pennsylvania & Reading Railway	1,038,303	725,809	12,934,447	13,339,828
Lehigh Valley Railroad	928,208	643,551	11,628,611	12,586,368
Central Railroad of New Jersey	408,052	334,697	5,720,217	5,928,059
Delaware, Lackawanna & Western Railroad	827,172	597,604	9,871,581	10,233,528
Delaware & Hudson Co.	455,003	629,929	7,137,786	8,162,731
Pennsylvania Railroad	394,366	273,031	4,545,955	4,755,812
Eric Railroad	491,608	371,033	6,929,201	7,588,336
New York, Ontario & Western Railway	135,957	108,029	1,840,232	1,749,351
Louisville & Northeastern Railroad	234,995	188,249	3,129,183	3,384,836
<b>Total</b>	<b>4,913,664</b>	<b>3,871,932</b>	<b>63,737,213</b>	<b>67,728,849</b>

### WEEKLY PRODUCTION

The weekly report on the production of bituminous coal, anthracite and beehive coke, compiled by the Geological Survey, for the week ended March 6, 1920, states that the total output of bituminous coal (including lignite and coal coked) is estimated at 10,352,000 tons, an increase of 207,000 tons, or 2 per cent.

A 5 per cent decrease in the production of beehive coke occurred. The total out-

put for the United States is estimated on the basis of railroad shipments, at 412,000 net tons, a decline of 23,000 tons when compared with the previous week. All districts except West Virginia reported a decrease. Production in the Connellsville region, as reported by the *Connellsville Courier*, was 9,719 tons less than during the week of Feb. 28. As before, the factor limiting production was shortage of cars. No definite report from the anthracite field has as yet been reported.

## Atlantic Seaboard

### BOSTON

Better movement, especially all-rail, brisk contract demand. Fewer confiscations. Light supply at Tidewater piers, Hampton Roads despatch normal. Anthracite embargoes raised, except via Maybrook. Trade closely following developments.

Bituminous—The milder weather has very much changed the immediate outlook. The railroads have made good progress the past week in clearing up congestion, both on their own sidings and at the gateways, although Maybrook, N. Y. is still the source of much anxiety. Water power has improved also in many parts of this territory and the general thawing-out process is beginning to show results.

There are still large numbers of cars at different points awaiting motive power, and it is not at all unusual to find cars that were started in January still hundreds of miles short of destination. Coal moving inland from the various rehandling plants is also reaching destinations in better time and the trade shows a distinctly more hopeful tone than a fortnight ago.

There continues to be a lively interest in season contracts, especially on the part of those who require the better grades from Pennsylvania. As was the case last year the all-rail route has very much the preference and it will be interesting to see how the Pennsylvania shippers stand up under the pressure. Car supply has been much better the past ten days, it having been reported that the New York Central showed very nearly 100 per cent.

So keen is the desire for offshore business, whether cargo or bunker, with its probabilities of a continuing permissive premium while home buyers are not allowed to pay a competitive price, that there have been several cases lately where very desirable offers have been turned down in favor of foreign orders. On the latter there is little discussion of price; the buyer who pays a very high rate of ocean freight is not disposed to quibble over differences of 50c. or \$1. In consequence it is growing more and more difficult for the New England steamer-raisers to be assured of supply from operations that he prefers.

The rumored decision of the Wage Commission has caused very little comment thus far. On every understanding that at all approaches the status of a contract a wage increase of some sort has been discounted, and nobody here seems to care very much how much the operators are to pay. Coals of recognized efficiency are today certainly in good request, and so long as the present Government price holds there is apparently little chance of getting April and May coal without making contracts for the twelve-month period.

At the New York and Philadelphia piers there is only a scant supply. Much of the coal available is held for foreign shipping; a fair proportion is being received on contract, but the volume for the spot market is extremely light. Invoices with the wage increase added look puny beside some of the sales that are reported to the various transatlantic shipping lines. Even the authorized Government figure has been exceeded very frequently and it remains to be seen whether there will be any corrective functioning on the part of those now administering the fuel clauses of the Lever Act.

**Confiscations Continue**

Confiscations in transit have not yet ceased on the railroads, but the tonnage seized has very much decreased. There have been many cases where coal has been seized three times, the last time by the road on which it was traveling, for that road's current supply, even though the Regional Coal Committee has already commandeered it, first for the delivering railroad and then for some industrial or public service plant in distress. The various shippers feel they are earning the money through the extra burden thrown upon accounting departments.

At the Virginia terminals steamers are being loaded with customary despatch. Seldom, lately, have coastwise coal bottoms been obliged to wait for more than a day or two. Much less is being heard of "emergency" coal, and there is now an impression in the trade that much of it is quietly being released without being dumped for consignees in this section. All the publicity and heart-rending appeals that were so widely printed seem now to have amounted to very little.

**Anthracite**—The Boston & Albany and the Boston & Maine embargoes against hard coal had been lifted by March 8 and already much-needed shipments have been started for distribution via these roads. The New Haven is open via Harlem River but the large volume that usually pours through Maybrook is still shut off. Receipts all-rail will show a very heavy increase in March, as compared with April, the demand being very much accelerated by the practical certainty that prices will be advanced again when the present conferences are concluded.

By water the movement has as yet increased very little. Marine equipment suffered heavily from the extreme weather in February and recovery is only gradual. Dumping is of course much faster, and if only the tows would move a lot of coal could be got forward to New England this month. There are several communities, especially on the Maine coast, where there is practically no coal on hand. Local stocks of wood have also been much depleted.

Now that the embargoes have been lifted for most routes there is a slightly better demand for steam sizes. This trade is being actively canvassed but the resulting tonnage is light.

Retail dealers are following very closely the press reports of the scale committee conferences in New York. The impression is that the mine-workers have fewer grievances than those who are in bituminous and that a just agreement can be more readily reached.

**NEW YORK**

Moderated weather conditions permit freer coal movement. Domestic sizes in continued demand. Consumption remains heavy. Consumers place orders for next

winter's fuel and operators report heavy bookings. Free bituminous coals easily absorbed by bunkers.

**Anthracite**—Milder weather conditions have permitted a freer movement of coal, and while the dealers are anxious to receive all the supplies available they are not running short. Demand continues active and receipts are again nearing normal. The cold weather and delays in deliveries have resulted in heavy consumption and consumers are making strenuous efforts to refill their bins.

The approach of April 1 does not appear to cause any let-up in demand upon the retail dealers, households apparently feeling there will be no reduction in prices, and having read in the daily newspapers that they may expect an increase of at least \$1 a ton, many have already entered their orders for next winter's supply.

Demand is for the larger sizes, egg and stove, and these sizes are as scarce as they have been for several weeks. Chestnut is also in demand. The scarcity was increased because of the lack of production due to the severe storms of the early part of March, when many of the mines were forced to suspend operations.

The trade is closely watching the daily conferences now going on in this city looking toward a new wage agreement with the mine workers. It is conceded that whatever increase in pay will be granted the workers it will be eventually paid by the consumer.

Many buyers are going to the coal fields in an effort to close contracts, and in some instances have been successful, but railroad shipments have been slow. Moderate temperatures however are improving these conditions and operations at the piers are speeding up.

Independent operators do not have any difficulty to obtain the 75c. differential for their product, especially for the domestic size, and some report sufficient orders booked to carry them well into next month's output.

Buckwheat and rice are in good demand and easily absorbed, while barley is easier in supply and not so easily taken up. The continued lack of bituminous has not yet resulted in a let-up in demand for these coals.

Current quotations for company coal per gross tons at mine and f.o.b. tidewater, at the lower ports are as follows:

	Mine	Tidewater
Broken ..	\$5 95	\$7 80
Egg ..	6 35	8 20
Stove ..	6 60	8 45
Chestnut ..	6 70	8 55
Pea ..	\$5 30	\$7 05
Buckwheat ..	3 40	5 15
Rice ..	2 75	4 50
Barley ..	2 25	4 00
Boiler ..	2 50	4 25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

**Bituminous**—There has been no relief in the bituminous situation. The trade sees no relief in sight. Considerable confusion exists because of continued Government control, and operators and wholesale dealers believing they could handle their own affairs better.

The reports of the Bituminous Wage Commission granting the mine workers 25 per cent increase in pay, the increase to absorb the 14 per cent increase granted last November, has not helped the situation any and many of the smaller operators are wondering what the outcome will be.

Dealers have been notified that regulations have been issued requiring permits for the bunkering of vessels to foreign ports and for the exportation of cargo coal by the Tidewater Coal Exchange, and that the permits must be filed with the Collector of Customs before clearance to vessels shall be granted. This order is to remain in force until midnight of April 30.

The demand for spot coal exceeds the supply. Receipts are coming to the dock better, but with few exceptions, are ready under contracts. Buyers of free coal meet with considerable difficulty in obtaining cargo lots. Contract coals are sold more freely and there is considerable bunkering because of the vast number of vessels now entering this harbor.

Numerous inquiries are being received regarding contracts for next year's supply, but in many instances are turned down, as many of the smaller operators find they are operating their mines at loss. Others are signing up, at the Government prices until Federal control ends, after which another price will be stipulated in the contract.

These prices range from 25c. to \$1 per ton more than the present. Maximum Government price of \$2.55, the higher figure being for the high grades. Production does not improve rapidly. Cars continue to be short, some of the mines receiving not more than 10 per cent of their normal supply.

Loaded boats are in good demand. There are large numbers of empty boats lying off the loading docks, under contract and waiting for cargoes. Some of these bottoms have been there 35 days.

Government prices prevail on all coal not shipped on contract, which are as follows:

	Mine-Run	Prepared	Slack
Central Pennsylvania.....	\$2.95	\$2.95	\$2.95
Western Pennsylvania.....	2.35	2.60	2.35
Fairmont (gas) .....	2.50	2.75	2.25
Georges Creek, Upper Cumberland and Piedmont Fields ..	2.75	3.00	2.50

**PHILADELPHIA**

**Anthracite in strong position. Demand continues unabated. Despite warmer weather demand for current needs strong. Pen gas in strength. Stove and nut reach city in diminished volume. Companies cure for New England. Strike talk and price increase urge consumer to order.**

**Anthracite**—Even though the weather is the mildest since last November, the demand for anthracite continues unabated. The point has now been reached where the stocks put in by consumers during the summer have reached the vanishing point and the call upon the dealers is very strong. The dealers are simply choked up with orders and with very little prospect of being able to clear their books before the first of April.

Demand is, of course, all centered upon stove and nut, with egg just the least inclined to lag. However, no dealer is turning down egg, as even now they are receiving orders to store this coal in consumers' cellars for the next burning season. The public generally, at least those accustomed to use fore-sight, are convinced that coal will not be cheaper than it is during the present month and the retailers are being urged right along to stock up this month, but without question a large percentage of the trade will be disappointed, as the need of coal for current consumption is so strong that very little storing can be done this month.

Just at this time most dealers are shorter of the prepared sizes than they have been at almost any time all winter. Many of them have their bins entirely empty and with no shipments on the road. The shortage of tonnage is attributed to several causes, one of which has been the storms and floods in the region, especially the latter, as the collieries are having much trouble with water in the workings following the thaw of the last week. Then, again, with the lifting of the embargoes on the lines into New England, the companies have felt impelled to make extra heavy shipments there on account of the very urgent need.

Retailers in calling at the shipping offices have been very frankly told that they received much coal during the past few weeks that would have ordinarily have gone East and they must expect now to try and put up with the tonnage they are getting. As a matter of fact, it seems to be a custom of years' standing to ease off in this market at this time of the year and most dealers while needing coal, are not exactly disappointed.

**Bituminous**—The operators generally report some improvement in the car supply, but none of them are getting sufficient to reach their mines anywhere near up to capacity. One beneficial result of the situation is believed to have resulted in less confiscation of coal by the railroad companies, and many consignees who have been notified that coal would not reach them have been greatly surprised by receiving coal they did not expect. Even with this improvement it can only be said that the local situation is far from satisfactory.

There is hardly a plant that is not working on a reduced schedule on account of coal shortage, and the few that have not been affected have cut so heavily into their surplus that they are making the strongest efforts to replenish it. If anything, less coal has come into this market than for the past two weeks, as with the opening up of the Northern railroads much of the production has been rushed in that direction. In addition the bunker trade, at a better price, is also being taken care of.

With the report of the coal commission being made to the President the consumers are waking up to the fact that they are in for still higher prices. Many of them after having become accustomed to the 14 per cent increase which was added to the

contract price had a sort of feeling that the price crisis had been passed for the time being. Now with a dispute on as to a 25 per cent or 35 per cent increase, they are beginning to realize that they are likely in for a further increase.

#### BALTIMORE

Business men climb into protest against continuance of export ban at this port through action by Export and Import Board of Trade. Car supply on Baltimore & Ohio has averaged around 50 per cent for week.

**Bituminous**—Instead of relief the coal men here find that each week is apparently bringing new complications to the general fuel situation. While the wage report would indicate considerable advances in the price of coal to consumers with the 25 per cent raise to the miners, no immediate knowledge concerning the basis is expected in local circles.

The possibility of disagreements in both bituminous and anthracite fields is not adding to the general comfort of the business situation. Uncertainty also is added by the suit of prominent coal firms to test the power of the Government to further regulate the domestic coal industry. The export ban is on tight, the only movement from this port in considerable time being the clearing of one ship with 1,029 tons for Colombia on March 6.

Meanwhile business men here are stirred by the belief that the Government action in refusing export coal rights to Baltimore, Philadelphia and New York, while granting them to Newport News and Charleston, is doing permanent injury to this port through the establishment of new lines of trade, especially with South America, for the latter ports, and which the Northern ports have held in the past but may never be able to regain.

The Import and Export Board of Trade has filed a formal complaint along that line with the Government. Car supply in the coal regions of interest here has run about 50 per cent only the past week. The Baltimore & Ohio on five successive days reported for its entire system this percentage of supply—74, 43, 42, 36 and 37. The daily loadings on the system ran ordinarily between 1,900 and 2,300 cars, although on one day the total of 3,596 cars was loaded. At Curtis Bay the daily supply for the past week ran between 268 and 351 cars the high, while the daily number of cars running to the pier varied between 138 and 419. Local industries are running close but none have been forced to curtail in any way.
