*Ques.*—A slope is sunk, in a vein 6 ft. thick and pitching 30 deg., to the second lift. The east gangway is driven 1,000 ft. and the west gangway 2,000 ft. from the center of the slope, both on an ascending grade of 6 in. per 100 ft. Both gangways are 8 ft. wide at top, 12 ft. at bottom, and  $7\frac{1}{2}$  ft. high. There is a tunnel 12 ft. wide, 8 ft. high, on center line of slope, driven level to overlying veins in which there is a brick dam 150 ft. from top slate of slope vein. The slope is filled with water to a point 288 ft. on the pitch above foot of the slope. What is the total pressure on the face of the dam, and how much water is in the slope, assuming 45 per cent of the vein has been mined?

*Ans.*—It is difficult to understand the meaning of the statement at the close of this question; namely, "45 per cent of the vein has been mined." If this statement means that 45 per cent of the coal in each lift has been taken out, the distance between the lifts or the distance the coal is worked out above each gangway should be given. Even then, it could hardly be supposed that the space left by the extraction of the coal would remain open and be filled with water to the level indicated by the head of water in the slope. Though the question does not so state, it may be assumed that the two gangways and the tunnel mentioned start from the foot of the slope at the second lift. The width of the slope is not given.

It is a simple matter to calculate the cubic contents of the slope, assuming its width to be the same as that of the tunnel, and to make the same calculation for the tunnel and the two gangway levels at the second lift, taking the height of the tunnel as 8 ft. while the height of the slope is supposed to be the thickness of the vein, or 6 ft.

Since the distance of the dam is measured from the top slate of the slope vein, the roof line extended to intersect the floor of the slope would increase this distance 12 ft., since  $\sin 30$  deg. is 0.5, and  $6 \div 0.5 = 12$ . Again, the distance from this intersection to the

foot of the slope is  $8 \div 0.5 = 16$  ft. Then, since  $\cos 30$  deg. is 0.866, we have  $\frac{1}{2}(16 \times 0.866) = 6.9$  ft.; and  $150 + 12 - 6.9 = 155.1$  ft., which is the mean measurement of the water in the tunnel extended to its level in the slope.

Now, since the water rises in the slope to a distance of 238 ft., measured on the pitch from the foot of the slope, we have  $288 - 16 = 272$  ft. of slope distance filled with water. The length of the two gangways, east and west, less the width of the slope is  $1,000 + 2,000 - 12 = 2,988$  ft.

The sectional area of the tunnel is  $8 \times 12 = 96$  sq.ft.; that of the slope,  $6 \times 12 = 72$  sq.ft.; and that of the gangways  $\frac{1}{2}(8 + 12)7\frac{1}{2} = 75$  sq.ft. The volume of water in these openings is, therefor,

Tunnel,	$155 \times 96 =$	14,880
Slope,	$272 \times 72 =$	19,584
Gangways,	$2,988 \times 75 =$	224,100
Total		258,564

The head of water above the center of the dam is  $0.5 \times 727 + \frac{1}{2}(8) = 140$  ft. The total pressure on the face of the dam, under this head, is  $(140 \div 62.5 \times 96) \div 2,000 = 420$  tons.

*Ques.*—What is the total ventilating pressure required to pass 22,400 cu.ft. of air per minute through an 8 x 8 ft. airway 5,000 ft. long?

*Ans.*—The rubbing surface of this airway is  $s = 2(8 + 8)5,000 = 160,000$  sq.ft. and its sectional area,  $a = 8 \times 8 = 64$  sq.ft. The pressure required to pass the given quantity of air is, therefore,

$$p = \frac{k s q^2}{a^3} = \frac{0.00000002 \times 160,000 \times 22,400^2}{64^3} = 6\frac{1}{2} \text{ lb. per sq.ft.}$$

*Ques.*—Of two airways under the same pressure, one 6 ft. wide, 6 ft. high, 5,000 ft. long; the other 8 ft. wide,  $4\frac{1}{2}$  ft. high, 5,000 ft. long; which will pass the greater quantity of air and why?

*Ans.*—The sectional area of the first airway is  $6 \times 6 = 36$  sq.ft.; and that of the second,  $8 \times 4\frac{1}{2} = 36$  sq.ft. Since these airways have the same sectional area and are of the same length, the quantity of air each will pass, under the same pressure, will vary inversely as the square root of the perimeter. The perimeter of the first airway is  $2(6 + 6) = 24$  ft.; and that of the second,  $2(8 + 4\frac{1}{2}) = 25$  ft. The first airway having the shorter perimeter has a less amount of rubbing surface and offers less resistance to the passage of the air, on which account it will pass a larger quantity of air, under the same pressure, than the second airway, the ratio being  $\sqrt{25}:\sqrt{24}$ , or 5:4.9. In other words, when the first airway is passing 50,000 cu.ft. per minute, the second airway will pass only 49,000 cu.ft., under the same pressure.

# Foreign Markets and Export News

## Switzerland Will Rely Chiefly on United States for Coal

Since the time of the armistice, according to a report by the Secretary General of the Swiss Department of Economy, transmitted by Consul General Leo J. Kenna, Zurich, Switzerland has had to look out more and more for new sources of coal supply. Since the middle of 1919 England has helped out with certain quantities, but this amounted to less than 20,000 tons monthly. The United States, however, has made substantial shipments of coal and thus saved the country from a catastrophe. As, apparently, shipments from England during the coming months will be restricted, Switzerland is depending chiefly on the United States.

Swiss requirements of American coal in the near future will be about from 120,000 to 150,000 tons monthly, and authorities earnestly hope that the United States will be able to supply this quantity. A purchasing department has been added to the Swiss Legation at Washington by the Swiss Coal Association at Basel, which is charged

with the purchase and shipping (securing freight space) of the coal.

The impossibility of obtaining the above-mentioned monthly quota from the United States would create a most difficult situation for the economic life of Switzerland, since the quantities expected from America can apparently not be supplied by European production.

It is already evident to what degree Switzerland is dependent upon shipments from the United States, as especially industry and the railways see their supplies steadily decreasing in consequence of the continuance of miners' strikes and the enforced limitation of exportation.

## France Imports from Germany Coal Valued at 407,446,000 f.

Coal, coke and briquets composed the most important class of imports by France from Germany in 1919, the value of the imports of these commodities amounting to 407,446,000 francs, or 69 per cent of the total for all imports from Germany. In 1913 the

value of the imports of coal, coke and briquets from Germany was 164,958,000 francs, or 15 per cent of the total imports from Germany.

While the value of the imports of coal has increased 147 per cent compared with 1913, the quantity has decreased from 6,071,307 metric tons in 1913 to 3,165,532 metric tons in 1919, a loss of 48 per cent.

## Coal Shortage an Obstacle to Belgian Rehabilitation

One of the chief stumbling blocks in the way of Belgium's industrial rehabilitation, Vice Consul Charles W. Drew, Jr., Brussels, reports, is shortage of coal. This factor tends to limit production and increase living costs, and so lies at the root of the constant demand for higher wages by the laboring classes.

The shortage of coal has been so acute that many factories have been forced to close or operate on part time. This has necessitated an indefinite continuance of Government assistance to the unemployed.

# Production and the Market

## Weekly Review

*Railroad Strike Continues to Affect Coal Production—Situation Desperate in Some Sections of the East—Early Improvement Will Still Leave a Large Deficit That Will Keep the Market Strong the Remainder of the Summer—Prospects for Coal to Meet Lake Program Very Poor.*

**W**ORSE conditions than during the strike last November now confront the bituminous coal trade. At that time the country was well stocked and there were millions of tons of coal on the rails, a supply that lasted for many weeks even with the cold weather. Today, in the grip of the outlaw railroad strike, without reserve supplies, consumers are helpless and producers are able to assist them but little.

Because the railroads are unable to move the empties back to the mines or the loads from the coal fields except to a very limited extent, many mines are idle and the remainder are working irregularly. East of Chicago industrial plants are forced to work part time, and in some instances, to close entirely.

Among the plants which have been obliged to shut down owing to lack of coal are those of Cluett, Peabody and Co., at Troy, N. Y., the Eastern Malleable Iron Co., at New Britain,

Conn., and at some other points, the Hunt-Spiller Co. at Boston, the Chevrolet Motor Co. at Tarrytown, N. Y., and the MacEwen Bros. paper mill at Whippany, N. J. There are many companies both in New England and in New York who are finding it impossible to run because of the lack of coal. MacEwen Bros. had twenty-five of their cars confiscated in one week, the railroads taking high-grade low-sulphur coal and using it for engine fuel. The Pennsylvania R.R. is reported to be confiscating coal quite indiscriminately, having no regard to its character or suitability for locomotive use.

In the East the situation in the coal fields is particularly acute—for example, the Monongahela Ry. has five-thousand loaded cars on its line which have been standing for nine days, and practically no empties have been put in at the mines. The authorities at Pittsburgh demand permits for the shipment of cars, but when inquiry is made

for permits at the headquarters of the railroads they respond by saying that none is required.

From Brownsville, Pa., to Fairmont, W. Va., the mines as an aggregate, received only thirty-five cars last Friday, and the operators were allowed to consign these only west. The Pennsylvania R.R. is moving cars which were weighed before the strike, but is unwilling to take care of any coal which was loaded since that time. The Baltimore & Ohio is running about 40 per cent., but no coal is allowed to go off its lines. In consequence a large amount of coal is moving to Curtis Bay, the shippers not having opportunity to deliver it elsewhere.

It is needless to say anything about prices because nobody has any coal to sell. It is true that some coal has been sold from storage, but the volume of sale is so small that no reliable inferences can be drawn from the price for which it is sold.

Average Daily Production of Bituminous Coal\*

\*From weekly report of Geological Survey.

## Reports From the Market Centers

### New England

#### BOSTON

*Market Firm—Spot Prices Soaring—Traffic Troubles Unravelling Slowly—Few New York Piers in Operation—Hampton Roads Despatch about Normal, but Light Dumpings for New England—Distributors Inland Have Little Coal Available and Command High Prices—Anthracite Domestic Sizes Coming Forward Slowly—Steam Sizes Quiet.*

**Bituminous**—The market here shows great strength. Buyers find it extremely difficult to arrange purchases with reliable shippers, for the reason that labor and other conditions at the mines are so unsettled. Most operators have sold a large proportion of current output, and some steam-users are in desperate straits to secure spot coal. Most manufacturers have so many orders for their goods that they do not quibble about price and spot coal sales are made at higher and higher prices—the better grades at figures well in excess of \$5 per net ton.

New York piers being out of commission, because of yardmen's and longshoremen's strikes, has led to an extra volume available for destinations all-rail; some shippers selling at quite remunerative prices, others confining themselves to making better deliveries on contract. When the tidewater piers reopen it is probable there will be quite light shipments all-rail for a considerable period.

#### Bunker and Export Trade Is Attractive

Bunker and export trade is attractive for low volatiles, high-grade Pennsylvania coal being quoted here at \$5.50 per net ton, but this does not seem representative. The trend is upward, and there is likely to be a further swing to higher levels in the course of the next fortnight.

The New York Central embargo against the Boston & Albany and the Boston & Maine was lifted on April 16, and shipments are moving toward New England. The railroads are quite short, especially the New Haven, and consignees expect that a heavy percentage of coal will be confiscated for railroad use. Car-supply is improving quite gradually, but motive power is short throughout this territory.

An attempt to move coal by the rail route occasions tie-ups and embargoes. Reserves cannot be piled up under anything like present conditions. Traffic is in an extremely bad way. The switchmen's strike did not break out in New England but the results of the strike

elsewhere were acutely felt here in the non-arrival of all kinds of freight, including coal.

Only two of the New York piers have been in operation the past fortnight. Enough pier space has been available for bunkering important steamers, and most of the railroads have embargoed coal for these piers. The Philadelphia piers resumed loading on April 19. In view of all this there has been a tendency here among coal factors to send to Philadelphia, barges that ordinarily would load at the New York piers. This has been particularly true of gas coal.

At the Virginia terminals—Norfolk and Newport News—steamers are now receiving customary despatch. To piece out cargoes some high prices have been paid for spot delivery, \$9 having been reported for high grade Pocahontas. Heavy tonnages are being loaded for overseas and for Government requirements, but loadings for New England are much restricted. Practically no spot coal is heard of here in the open market. What Pocahontas and New River comes forward is moving in customary channels, but undeniably there is less coming to this section on contract than was the case in 1919, a year of extremely low tonnages.

High prices continue to be charged for prompt coal at the various re-handling points for shipment inland; \$11 on cars Providence and \$12 at Portsmouth and Portland are again reported. This level is justified by the heavy demurrage charges that accrued at the loading ports a fortnight ago.

Current quotations on bituminous at wholesale range about as follows:

F. o. b. mines, net tons—Clearfields, \$4.00@4.75; Cambrias and Somersets, \$4.35@5.15. F.o.b. Philadelphia, gross tons—Clearfields, \$6.35@7.18; Cambrias and Somersets, \$6.72@7.62. F.o.b. New York, gross tons—Clearfields, \$6.70@7.55; Cambrias and Somersets, \$7.10@8.00.

Pocahontas and New River are quoted at \$4 per net ton f.o.b. mines for contract, and up to \$6 per net ton for spot coal. This would mean \$6.54@8.66 f.o.b. vessel.

**Anthracite**—There is increasing uneasiness over the extreme slowness with which domestic sizes are coming forward. Embargoes are still the rule on most of the all-rail routes and the tie-up of the New York piers has accentuated the serious outlook for the coming season. A strike among marine workers is said to be brewing for May 1, and that with an anthracite strike would bring the movement of hard coal to a standstill.

Prices on stove and chestnut are soaring, due to the reported tactics of

some operators. As high as \$10.25 has been heard of for spot coal. Grand Jury proceedings have been instituted in the Federal Court here with a view to investigating the recent advance of \$1 per net ton in the retail price in Boston.

Steam sizes are remarkably quiet. The same embargoes that prevent the shipment of domestic sizes are applicable against the buckwheats also, but industrially there is not the anxiety for bituminous substitutes that was the case a few weeks ago before the cold weather had gone.

### Tidewater

#### NEW YORK

*Anthracite Situation in Bad Shape—Rail Strike Delays Shipments—Poor Car Supply Hinders Production—Conferences Over Miners' Wages Continue—Local Trade Needs Coal—Bituminous Shipments Slow—Few Cars to Load and Mines Idle—Railroads Take Coal—Export and Bunker Demands Heavy.*

**Anthracite**—Continuance of the out-law railroad strike and the practical suspension of shipments to tidewater have caused a serious shortage of coal here. The local market is practically without activity. Receipts at the loading piers have been far below normal and actual needs, but there have been no serious complaints from consumers because of the stocks in storage previous to the railroad difficulties.

#### Trade Is Impatient

The trade is becoming impatient at the delay of the operators' and mine-workers' representatives in deciding upon a new working agreement. So far no inkling has come from the conference as to what action the operators will take on the demands of the miners. As the new agreement will be retroactive as of April 1, shippers are postponing billing their sales until the new prices are announced.

Conditions at the mines are not favorable to heavy shipments. The workers are restless because of the long conferences and the car supply is bad. Union leaders have consented to a continuance of work but the men look upon the prolonged discussions as unnecessary and already have shown signs of jumping the traces.

Current quotations for company coal per gross ton at the mine and f.o.b., tidewater at the lower ports are as follows:

	Mine	Tidewater
Broken.....	\$5 95	\$7 80
Eggs .....	6 35	8 20
Stove .....	6 60	8 45
Chestnut.....	6 70	8 55
Pea .....	5 30	7 05
Buckwheat .....	\$3 40@3 75	\$5 15@5 50
Rice .....	2 75@3 25	4 50@5 00
Barley .....	2 25@2 50	4.00@4 25
Boiler fuel .....	2 50	4 25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Most of the coal now being produced is going to the West and New England, where supplies are low and consumers are anxious to fill their bins for next winter. The smaller sizes are in constant demand here with supplies way down. Owing to curtailed mining, most of these coals are being used in the boiler rooms at the mines.

**Bituminous**—Non-arrival of coal during the past week has caused many manufacturing plants to be on the verge of stopping operations. Tide-water receipts have been low, the railroads confiscating most of the coal on its way to this market. Contract coal does not move as easily as a week back.

Spot trading was almost unknown last week. There was no coal available and shippers who were fortunate enough to get some dumped saw that their contracts were taken care of.

Many of the harbor boatmen are still at odds with their employers, while those who are willing to work ask from 50¢ to \$1 per ton towing charge. There are nearly 100 boats anchored near the leading piers waiting for coal.

The miners are exhibiting considerable uneasiness because of the poor car supply. Nearly 50 per cent of the mines were said to be idle on April 23 through the failure of the railroads to provide cars. The Pennsylvania R.R. has issued instructions that cars for fuel coal only be placed at some mines.

Confiscation of coal by the railroads continues, resulting in considerable trouble to the consignor who must endeavor to secure other fuel for his customer. Payment for coal so taken by the railroads is slow, but the trade expects that it will be at the full price at which the coal was billed originally.

Demand for coal for export is active. Freight rates have advanced in the neighborhood of \$2 per ton, but shipments are said to be strong. Considerable more bunker coal could be used here were it available. The West is reported as receiving a large proportion of the present production. Heavy tonnages are also going into New England via all rail. Good gas coal is in heavy demand, but operators are so tied up with unfilled orders that they refuse to give quotations. Shippers have for the most part let contract holders know what additional cost they will be expected to pay for their coal because of the 27-per cent increase granted the mine workers. Where the contract provides for the change, the manufacturers will pay the increase.

Quotations for immediate delivery were hard to get here during the week ended April 24. Good coals were quoted from \$3.75 to \$4.50 f.o.b. mines, while loaded boats were held at from \$10 to \$12. No questions were asked concerning the quality or grade. Car supply on the Pennsylvania, Baltimore & Ohio and Western Maryland lines was about 50 per cent, while on the New York Central it was about 60 per cent.

Quotations for coal at the mines ranged from \$4.50 to \$4.75 for Shawmut; \$4.75 for Buffalo, Rochester &

Pittsburgh grades; while along the New York Central lines Pool Nos. 10 and 11 were being held at around \$5, and Pool No. 18 around \$4.50. Central Pennsylvania coals were being quoted around \$4.50.

#### PHILADELPHIA

*Anthracite Dealers Flooded with Coal—Embargo on Foreign Roads the Cause—Not Expected to Last Long—Dealers Stock to the Limit—Consumers Anxious for Delivery—Stove and Nut in Chief Demand, but Strong Call for Egg and Pea—Growing Trade in Buckwheat—Steam Sizes All Taken—Bituminous Does Not Improve—Light Tonnage Comes In—Spot Coal Runs from \$5 to \$5.70 at Mines—Light Contract Deliveries.*

**Anthracite**—The unexpected has happened in the anthracite retail trade—the dealers have more coal than they know what to do with. This unusual condition is accounted for by reason of the connecting lines refusing to take any freight from the anthracite roads. To move their product, the smaller shippers solicited orders from retailers along the line; this was not difficult until the big companies began to make consignments, regardless of orders, to their regular customers, then the dealers had to cry quits. Many of the dealers ran up heavy car demurrage bills rather than miss the chance of storing a heavy tonnage at this time. But there was difficulty in securing the necessary labor to unload the coal and the consignees had to have shipments held up.

Delivery equipment has been kept active and it will not be long before the stocks in the yards again vanish. All see that the time is not far off when the deliveries from the mines will be extremely small—just the moment that the foreign lines are open for consignments. Due to the embargo against the city proper, the outside points at first received much heavier shipments, but later many cars that had been refused along the line were diverted to local dealers.

Fortunately the weather for the first time this season is quite summery, there is but little demand for current consumption and the dealers are enabled to put their full energy into filling the summer orders.

The question of price concerns all. The big companies still ship at the April figures, but subject to whatever wage arrangement is made with the miners. One independent is said to be pricing coal at \$9.25 at mines for egg, stove and nut, and retailers are making a retail price based approximately upon this figure. Others are making deliveries to the trade well known to them, with the understanding that bills are to be rendered later, after the wage matter is concluded.

The great preference of the consumer continues to be for stove and nut, although pea coal is being called for in an amount almost unheard of at this time of the year. Usually pea is not

heavily stored, but the consumers are taking advantage of the opportunity to get as much of this size in as possible, thinking there will be little pea coal to be had after a short time. Egg coal is also being called for in heavy quantity, as the adoption of hot-air furnaces in the last few years has greatly increased the demand for this size.

There is an increasing demand for buckwheat coal from the domestic trade, and the gradual increase from year to year indicates that in a short time most dealers will be carrying this size for house heaters, particularly if pea coal is eliminated as a domestic size.

There is a good supply of buckwheat coming into the market, principally to manufacturers, and they are taking full advantage of the situation to stock to the limit, as they realize that the company price of \$3.75 at the mines will not long remain in effect. The same can also be said about rice and barley, especially since the companies have as yet been unable to resume shipment from the storage yards, due to lack of empties for loading.

**Bituminous**—The bituminous situation is discouraging, to say the least, as quite a limited tonnage is coming in. The demand from all quarters is strong, which is borne out by the fact that numerous industries are closed down for the lack of fuel. The iron trade has been particularly affected, there being an almost complete dearth of gas coal.

The spot market price for Fairmont and Westmoreland is about on a level, ranging from \$5.25 to \$5.70 for the 3-in. lump, with mine-run from \$5 to \$5.20 these prices f.o.b. mines. In the steam coals those produced in Pennsylvania are selling on the market from \$5 to \$5.50, and with little to be had at such figures.

There is quite a little feeling shown by the concerns having contracts, at the very limited quantity of coal received, even under present conditions. The fact that coal can be had on the spot market at fancy prices annoys them. In addition, often when coal is consigned it is confiscated by the railroads for engine fuel.

#### BALTIMORE

*Expected Relief Fails to Materialize—Bituminous Mines Closing Down—Spot Prices High—Contracts Delayed—Exports Continue Heavy—Anthracite Situation, a Waiting Game.*

**Bituminous**—Coal men and consumers hoped that there would be a fairly quick recovery as to car movement, following the end of the railroad strike, but it failed to materialize. Starting the week with a little more than 50 per cent car supply on the Baltimore & Ohio, of around 70 per cent on the Western Maryland, and the Pennsylvania reporting a fair run, the supply on all lines has dwindled until it is now not much more than around 30 to 35 per cent.

A number of mines in the Georges

Creek and Upper Potomac regions report closing down as a result of lack of cars, the same with the Somerset and Fairmont sections. Coal men here are forced to use considerable discretion in distribution in order to prevent real trouble at local plants.

The usual stocking-up time is now entered with no immediate chance of using it to advantage. Meanwhile spot prices remain high. The good to best coals on immediate sale are now bringing (in this territory) around \$5 to \$5.50 f.o.b. mines.

Grades are not counting as the consumers are merely seeking coal to tide over an emergency. Contracting is still delayed by many coal firms. Others are entering contracts all the way from \$3.75 to \$4.50 f.o.b. mines.

The export movement goes on briskly. For the first half of the month the cargo loading here for foreign account ran close to 150,000 tons, and the month's total for export coal leading may run to close 400,000 tons.

**Anthracite**—The hard-coal situation here has resolved itself largely into a waiting game. Of deliveries of coal for immediate use the sales are being made strictly on existing schedule since last October.

For storage for future burning, the trade is merely taking orders on the basis of pay at the schedule to be set for the time of delivery. Some few dealers have accepted payment in advance at around 50c. a ton above present schedule from old customers, but the majority look for nothing less than a dollar advance over the present wholesale schedule.

## Lake

### BUFFALO

*Coal Coming in Better, But Uncertain—Much Goes to Canada—Miners Not All at Work Yet—Anthracite Demand and Loading to the Lakes.*

**Bituminous**—Improvement is so slow that the trade is wondering what will overtake it next. It will be some weeks before the movement is regular. The shortage in Canada has not been as severe at any time as it was here; at the worst only a few concerns had to shut down.

The shortage is as yet mostly on account of the failure of a good many miners to go back to work, claiming they are waiting for wage adjustment. The Allegheny Valley men are working much more generally than those further south, quite a good many in the Pittsburgh district still being idle. And now comes the Lake opening, which will draw much coal away from the rail route through this market.

The ice off this harbor gave way sooner than was expected, so that vessels go through it freely; boats are now

going out light to load coal at Ohio ports. Business generally starts up slowly, mostly on account of there being no accumulation of coal at the Lake ports to load. The need of fuel on the upper Lakes will hurry it forward.

Bituminous prices are still unsteady, but not much is heard of big charges as was the case when the Government prices were thrown off. The trade will need to act with caution, for if the efforts of the railroads to increase the car supply succeed then it will weaken the market at once. Quotations must yet be regarded as mostly nominal at \$5.75@6 for Allegheny Valley mine-run (no other size made), \$6.25@6.50 for Pittsburgh and No. 8 lump and three-quarter, \$6.25 for mine-run and \$6 for slack, with some Youghiogheny gas at \$6.75, all per net ton f.o.b. Buffalo.

**Anthracite**—Only good about the situation is that somehow the supply did not give out during the switchmen's strike. Anthracite was in better supply on track than bituminous when the strike ended. The demand is now mostly for next winter's use, in the hope of setting it before the prices go up.

The Lake coal trade is bound to be slow for awhile. Only one company has any coal to load into vessels; other companies have no notice of shipments for Lake loading yet. Summer shipments in the Lake trade will need to be heavy to insure a full winter's supply. It will take a big summer movement to satisfy the upper Lake trade.

### CLEVELAND

*Many Local Plants Working on Part Time—Months Before Return to Normal—No. 8 Coal Advances—Anthracite and Pocahontas Unchanged—Lake Trade Outlook Worst in Years.*

**Bituminous**—Though coal roads into Cleveland—the Baltimore & Ohio and Wheeling & Lake Erie—still are the hardest hit by the railroad strike, receipts are increasing daily. Many of the local plants are on part time or have closed certain departments. That this condition will continue indefinitely is greatly feared. Even with strikers returning daily, conditions are little improved, and it will take months for the railroads to get back to normal. Comparatively little stocking will be possible this spring and early summer, and operators look for prices to stiffen up considerably. It is hoped that the government will intervene and thus cause the prices to become more uniform, which will help the trade in general.

A good-sized block of No. 8 slack has been closed at \$3.75 f.o.b. mines, an advance of 50c. over the point where more conservative operators hoped to hold contracts. For spot No. 8 slack and mine-run retail dealers are forced to pay \$4.25@4.50 f.o.b. mines, against \$4 recently. The entire bituminous outlook is for higher prices, with steam-coal users seeking probably 50 per cent more than will be available

all summer long. Some No. 8 mines have not operated for two weeks. The average for the district is not over 15 per cent.

**Anthracite and Pocahontas**—Prices on both grades have been unchanged. Demand has increased slightly, the railroad strike impressing upon domestic consumers the need for early buying. The expected advance in anthracite prices has not yet materialized.

### Lake Season to Open Soon

Although the first bituminous coal cargo of the season has been taken to Lake Michigan ports, the first coal of the season probably will not get to the head of the Lakes before May 1. So acute is the shortage of fuel at upper Lake ports that tugs can scarcely be bunkered. What little coal is moving to Lake Erie ports is being confiscated by the railroads. Not in years have the prospects of the Lake trade been so poor, and a 20,000,000-ton season appears more probable than a 30,000,000-ton one.

Prices of leading grades of coal, per net ton delivered in Cleveland, by dealers follow: Anthracite—Egg and grate, \$12.20 @ \$12.40; chestnut, \$12.50 @ \$12.70; and stove, \$12.50. Pocahontas—Shoveled lump, \$10.50, and mine-run, \$9.25. Domestic bituminous—West Virginia splint, \$8.75; No. 8 Pittsburgh, \$7.75; Millfield lump, \$8.50, and canal lump, \$11. Steam coal—No. 6 and No. 8 slack, \$7.75; No. 6 and No. 8 mine-run, \$7.75; and No. 8 3-in. lump, \$8.

### MILWAUKEE

*First Coal Cargoes of Season Arrive—Weather Milder—Coal Situation Relieved—Coke Scarce—Prices Unchanged.*

The arrival of two cargoes of coal—one of 9,000 tons of anthracite and the other of about 7,000 tons of soft coal—together with a spell of milder weather, relieved the Milwaukee coal market of some of its tenseness, and from now on the situation promises to grow constantly easier.

Dealers had been unable to secure either coal or coke to supply an urgent demand, and steamers which were ready to sail could not secure bunker coal. Pea coke was the only fuel available before the new cargoes arrived. A strike of coal handlers complicated the situation at the yards, but unloading operations were not entirely blocked. The rail supply was held down to a minimum by the railway tie-up. Prices continue unchanged.

Continued cold weather keeps the Milwaukee coal market in quite an unsatisfactory condition. Supplies of all kinds are scarce and dealers are unable to keep pace with their orders. Some consumers have been compelled to resort to wood for their furnaces.

A cargo of 9,000 tons of anthracite, which arrived since last week's report, remains in the hold of the steamer because of a strike of coal handlers. The cargo was due last December, but the steamer was forced to winter in the

Straits of Mackinac. Some coal is coming by rail, but this supply is spasmodic and uncertain on account of the railway strike.

**No Changes in Price**

The following price list is maintained at all Milwaukee yards and docks. These prices represent the cost to the consumer in the wagon at the curb, or at points where coal can be dumped into chutes. When coal has to be carried into the bins an extra charge of 75c. per ton is made. An extra charge of 25c. per ton is also made in the case of less than ton orders. Coke is delivered in bags, hence there is no charge for carrying in.

**Inland West**

**COLUMBUS**

*Outlaw Railroad Strike Cripples Traffic—Reduces Coal Output to Low Point—Railroad Fuel 60 Per Cent—Factories Closing Down—Reserve Stocks Exhausted—Demand Strong and Prices Firm.*

With the switchmen's strike still on, little coal is being produced in the Buckeye State. Some cars are being furnished and moved to users located on the originating lines. Demand for all grades is strong and prices are firm.

**Railroad Traffic Still Crippled**

While the strike of switchmen appears to be slowly disintegrating, still enough of the workers are out to seriously cripple railroad traffic in almost all sections. This is affecting the coal trade to a large extent and has reduced production to a low point. Empties are slow in being returned and loaded cars are held on side tracks awaiting movement to destination.

The longer the strike continues the worse conditions are, with railroads hopelessly congested at various points.

The encouraging indication is that strikers will soon return to work to await action on the part of the new Wage Board.

While the railroads are not using as much fuel as customary, still a considerable tonnage is required to take care of passenger traffic. It is estimated that out of the total production in Ohio, railroad fuel is fully 60 per cent.

Factories are closing down in every locality and industry is seriously affected on all sides. This applies more particularly to northern Ohio and to Michigan industrial centers. In central Ohio industry has not suffered to any great extent.

The price question is still unsettled, and until costs are thoroughly gone over and prices in the open market are adjusted, little contracting is anticipated, either for commercial tonnage or Lake shipment. Steam users, whose contracts expired around April 1, are buying on the market and most railroads are doing the same. Some Lake tonnage is being loaded but prices have not been settled, and the loading is usually for permanent connections or for docks controlled by the producing company. Lake shippers are anxious for tonnage agreements.

Domestic trade is active, although stocks are light and dealers are now delivering only small orders so as to take care of all customers. Practically all reserve stocks are exhausted and dealers are operating from hand to mouth. Some few cars are being received which relieves the situation. Much coal is in Columbus, but can not be switched to dealers' yards because of the strike.

Retail prices are firm at the levels which have prevailed for several weeks. Hocking lump is firm at \$7.50 and mine-run at \$7.25, delivered; Pomeroy lump and mine-run are quoted about the same. West Virginia splints sell at \$8.50 for lump and \$8.25 for mine-run, while Pocahontas, which is quite scarce, retails at \$10 to \$10.50.

Prices for coals sold in Ohio, f. o. b. mines, are:

Hocking lump, \$3.75; Hocking mine-run, \$3.50; Hocking screenings, \$3.25; Pomeroy lump, \$4; Pomeroy mine-run, \$3.75; Pomeroy screenings, \$3.50; West Virginia splints, lump, \$4.50; West Virginia splints, mine-run, \$4.25; West Virginia splints, screenings, \$4; Pocahontas lump, \$6; Pocahontas mine-run, \$5.50; Pocahontas egg, \$5.25.

**CINCINNATI**

*Little Coal Coming in from Points South—Lack of Cars—Car Distribution in Kentucky Fields—Cincinnati Receives Coal by Water—Brisk Coal Demand.*

Conditions in the Cincinnati district continue abnormal. The rail strike is mainly responsible for this, aggravating, as it does, the shortage of cars at this gateway.

The transportation of coal seems to be the "thorn on the rose" as regards the rail strike in this section. Except

for coal, it is reported that nothing approaching real inconvenience is being experienced in the Cincinnati terminals because of the strike.

Practically no coal is coming in over the Norfolk & Western and the Chesapeake & Ohio railroads, while it is reported that the Louisville & Nashville is confiscating coal for railroad use, although there is some coal being brought to Cincinnati by that road. Some of the industries up the state are reported to be in desperate need of coal.

The chief trouble at the mines is the lack of cars. This condition, the operators have been assured, will be relieved at least to the extent of 20 per cent, once the congestion caused by the switchmen's strike is lifted.

The railroads operating through the Kentucky fields, have not been receiving an equal number of empty cars in return for the loaded cars they turn over to connecting lines through the Cincinnati gateway.

In many instances where a road was found to have more cars on its tracks than its quota, that line was directed to forward a certain number of empties to one or another of the "south bank" roads, which are said to be short about 40 per cent of their original number of coal cars.

The Ohio River again has stood by the Queen City district in the time of need. While the river has risen in the Cincinnati district to a flood stage, the high-water has not been so pronounced in the upper valley, and consequently Cincinnati has been able to get its full share of coal from the West Virginia fields.

Never before in the history of the city have so many domestic users placed coal in their cellars so early in the season as they are doing at this time. The demand for all kinds of domestic as well as fuel for industrial purposes continues brisk, with many dealers unable to keep up with the demand.

**ST. LOUIS**

*Mild Weather Eases Demand—Coal Hauled from Mines by Truck—Country West of River Suffers—Little More Than Railroad Fuel Mined.*

The local situation, while it is trying, is much easier on account of the mild weather, for there is little domestic call. There were about 400 or 500 cars of coal in St. Louis when the strike started and this is gradually being delivered, as the few crews at work get cars unloaded.

The bulk of the coal for St. Louis and East St. Louis is, however, brought over from nearby Illinois mines in trucks at a hauling expense of \$1.75 to \$2.50 per ton.

Coal at East St. Louis is selling f.o.b. track for about \$2.50@3, for screenings, \$3@3.50 for mine-run and \$3.75@4.50 for lump. This is Standard and Mt. Olive grades. Carterville coal, such as can be brought into East St. Louis for delivery, is worth \$4@4.50 a ton at the mine. A few mines on

the Mobile & Ohio and Illinois Central have been working about 1½ days during the week, ended April 24, loading chiefly railroad coal, which has moved south. A little domestic coal has been loaded for movement north to points where coal could go without passing through the terminals. The country west of the river is suffering for coal, especially steam and municipal plants; however, the railroads are relieving the situation somewhat. The Alton & Southern line at East St. Louis (connected with all the trunk lines) is open and delivering coal to the Missouri Pacific, at Dupon, which operates the ferry to St. Louis. The Missouri Pacific is thus enabled to deliver to connecting lines at St. Louis on railroad emergency coal only.

The railroad tonnage is sufficiently good to keep the roads fairly well supplied. Mines in the Mt. Olive field are practically idle, excepting on railroad coal one or two days a week. In the Carterville field the mines are working the same length of time on railroad coal and domestic tonnage that moves to points without going through terminals.

No mine prices are quoted, inasmuch as the tonnage is sold up for a month or two after the mines resume operations.

## DETROIT

*Bituminous Coal Supplies Diminishing—No Hope of Early Relief—Power and Light Companies Greatly Curtail Service—Anthracite Stocks Small—Weather More Springlike—Little Coal Movement on Lakes.*

**Bituminous**—With only a small amount of coal arriving while the supply at hand is steadily diminishing, the situation in the Detroit market continues quite unsatisfactory both for dealers and consumers. Neither the railroads nor officials of the Detroit Edison Co. are able to give any hope for early relief.

The railroads, with the assistance of volunteer switching crews, recruited from the ranks of idle factory workers, are attempting to handle cars on the local terminal tracks; they are making a special effort to move coal in various railroad yards, to points where it will be accessible to the Detroit Edison Co. and the Detroit City Gas Co. While the amount thus made available is not great, it has enabled the Edison company to restore power service to its customers to the extent of 40 per cent of their normal requirements.

Leaders among the striking switchmen agreed that anyone desiring to do so might return to work but none of the strikers took advantage of this privilege.

**Anthracite**—Supplies of anthracite in the yards of retail dealers are quite small, and with almost no receipts the situation would be full of hardship for many household consumers were it not that temperatures are more springlike. Some of the dealers are reported as

placing orders for anthracite, without knowing at what price shipments will be charged to them.

**Lake Trade**—Because of the strike on the railroads and the urgent demand for coal at lower Lake markets, there has been little coal sent to the Lakes for shipment to the northwest. In fact, the movement of coal from the mines is so light that few of the freighters have been able to get fuel for their opening trip.

## South

### LOUISVILLE

*Better Car Supply Before Conditions Improve—Big Demand for All Grades—Prices Advancing Steadily—No Market—Operators Still Filling Contracts—Reduction in Rate to Ohio River.*

Car shortage is resulting in average of less than two days at mines in this section, while prices are showing steady advance on better grades and by-product coal.

No betterment of the general situation is possible without an improvement in the coal car supply, and although numerous efforts are being made to secure relief, they have not increased the car supply as yet. The Commission on Car Service on March 20 issued orders for connecting lines to deliver daily to the Louisville & Nashville R.R. 245 more cars than were shipped; but the orders were not obeyed, and during the first week of the order it is reported the Louisville & Nashville was due 4,619 cars under this order.

#### Demand is in Excess of Supply

Demand for all grades of coal continues far in excess of supply, and car shortage is the dominating factor in curtailing production. Contracts should be coming in, but under existing price conditions, the consumer will not contract, nor will the operator accept contracts.

Many operators in the Kentucky fields predicted that upon the return of the railroads to private ownership car supply would improve, but this has not proved to be the case. Equipment has been badly scattered, the strikes have made it impossible to get it back promptly to owning roads, carriers are not co-operating with one another and sufficient new cars and locomotives have not been built to offset the number worn out and discarded. Such equipment as remains is in poor condition, with the result that no real improvement is looked forward to. Embargoes at present are checking a movement of empties back to the mines and loaded cars can only move into certain sections.

There is no such thing as a market today, as operators are still filling contract orders, which are taking practically all of the present small production, and any small surplus stocks mined are in such demand as to sell at fancy prices. It is reported that mines

in the eastern Kentucky fields are getting over \$6 a ton in many instances for run-of-mine.

## BIRMINGHAM

*Good Local Market—Railroads About to Close Yearly Contracts—Car Supply and Output Improve Somewhat.*

There is a good steady demand for coal in this market, inquiry for steam being confined for the most part to spot business, contracting by steam users not having reached any material proportions as yet. The two railroads—Louisville & Nashville and Frisco Lines—which sent out specifications of requirements for bids, prior to April 1, have not yet closed contracts for the current year, but are expected to do so quite shortly.

Fuel requirements now being taken are subject to price adjustment when agreements are executed as of April 1. Quotations are reported to have averaged 50c. per ton above Government prices for the respective grades. Contracting for domestic coal has begun and considerable tonnage has been sold to dealers in this territory.

#### Few Price Changes Noted

Prices for steam and domestic sizes for April have not changed materially from quotations of a week ago. The movement of both grades is somewhat better with a slight improvement in car supply, efforts to speed up production and delivery to consumers now receiving the close attention of operators and distributors.

The output for the week ended April 10 (latest figures available) show a production of 323,152 net tons, an increase of about 45,000 tons over the previous week. Labor is somewhat short and not disposed to work full time, but working conditions otherwise are satisfactory.

## West

### SAN FRANCISCO

*Rail Strike Hardly Affects Coast—Steamers Coaled as Usual.*

The railroad strike has not affected the coal trade materially on the coast, although shipments from Utah and Wyoming have been suspended for awhile. With the strikers apparently losing out, normal conditions will be restored shortly, according to all indications.

No hardship has been worked on the big fleet of steamships calling at this port for coal for their bunkers, as the King Coal Co. has an immense reserve stock. Steamships have been coming here from the Orient and from Atlantic ports for fuel just as in the days before the strike and have been furnished all the coal wanted.

The bituminous prices, f.o.b. mines, wholesale, Utah and Wyoming, per net ton, are as follows: Stove, \$4.00; lump, \$4.00. The bunker price is \$13.55.

# News From the Coal Fields

## Anthracite

### WILKES-BARRE

*Outlaw Strike Affects Anthracite Output—Many Northern-Field Mines Shut Down—Situation Elsewhere.*

Railroad difficulties were rather disturbing to the anthracite companies during the week ended April 17. The outlaw railroad strike had quite a bad effect on the production of coal, the Wyoming Valley in particular. The Delaware, Lackawanna & Western R.R. ceased moving any freight as all of the switchmen and a large part of the firemen went out on strike. This meant that the coal department of the same company had to cease operations entirely, throwing out of employment about 20,000 men. Not only has the freight handling been disrupted but the passenger service has been hurt to a large extent.

Next to the Lackawanna the Erie R.R. has been the most affected, and for the greater part of the week no freight was handled. This meant that the Pennsylvania and the Hillside coal companies were forced to shut down, throwing 15,000 more men out of work. A total of 35,000 men were idle in the anthracite fields, and at the present writing there seems to be no probability of improvement in the near future.

Owing to the outlaw strike on the Central R.R. of N. J., the Lehigh & Wilkes-Barre Coal Co. has had to cease operations at all but two of its operations. No estimate has been made as to the number of men idle at the plants of this company.

### PITTSBURGH

*Shipping Conditions Improved Only Slightly—Monongahela River Proves Useful—Contract Negotiations Continue—Shipments Forwarded Without Price Attached.*

While transportation conditions, in connection with the rail strike, have improved greatly at so many points, the betterment, as affecting the movement of coal from the Pittsburgh district, has been quite slight. The Conway yard of the Pennsylvania R.R. remains virtually out of commission, the Pittsburgh & Lake Erie is moving little freight outside of perishables and foodstuffs, and the Baltimore & Ohio is doing but little better.

One or two devious routes to seaboard have been discovered. A little movement is possible to Youngstown from some steam-coal mines of the Pittsburgh district, but nothing from any gas-coal mines, and nearly all the

steel works of the Youngstown district are closed tightly.

### CONNELLSVILLE

*Coke Accumulating at Ovens—Fair Coke Movement by Water—Market Nominal and Prices Unchanged.*

Practically the only business done in Connellsville coke since the rail strike tied up most of the movement more than a fortnight ago has been between parties separated by the rail strike from those with whom they usually do business. In such cases the business was done at practically the prompt market, or \$11@12 for furnace grade.

## Northern Appalachian

**Columbus**—Columbus city officials are considering the proposition of purchasing a 200,000-ton pile of slack, stored at New Straitsville, for use by the various city departments, including the water works and the municipal light plant. Officials have visited the pile and have taken samples for analysis. In case the purchase is made, the supply will last approximately five years. Officials claim it will work quite a saving in the fuel bills of the city.

**Columbus**—Bituminous coal mines in Ohio are nearly all closed because of the railroad strike and thousands of coal miners have been forced out of work. A few mines in scattered dis-

tricts have been reported as still working, but all of the big mines have been closed, as the inability of operators to secure cars makes mining almost impossible. Public utilities all over the state are appealing for coal, and most of them have declared that unless an immediate supply of fuel is forthcoming many of them will be forced to suspend.

**Columbus**—The annual stockholders' meeting of the Sunday Creek Coal Co was held April 7 at the offices of the company, when the former board of directors and officers were re-elected. The year, which dates from May 1, 1919, when the company was organized under the present name, was generally satisfactory, although there were a number of bad conditions in the coal trade to face. The board of directors consists of John S. Jones, H. B. Arnold, John H. Winder, C. C. Cook and George K. Smith. John S. Jones is chairman of the board; H. B. Arnold, president; George K. Smith, secretary, and C. C. Cook, treasurer. No vice-president was named to fill the vacancy caused by the resignation of I. A. Coen. O. S. Newton has been named general manager of the physical properties. J. R. Fitzer continues as sales manager and is given wider authority.

**Cambridge**—A record is reported in the production of coal in the Guernsey County fields for an eight-hour shift recently at the Forsythe mine, when two loaders mined and loaded 58½ tons of coal. The men were paid 80c. a ton and their aggregate earnings amounted to \$4,680, or \$2,340 each.

**Cambridge**—Of about 3,000 foreign-born miners in the Cambridge coal mining district of Ohio, practically every one has taken steps to become an American citizen. That is the statement of William C. Thompson, president of the sub-district United Mine

### ESTIMATED UNITED STATES PRODUCTION OF ANTHRACITE (IN NET TONS)

	1920		1919	
	Week	Calendar year to date	Week	Calendar year to date
April 3.....	1,278,000	27,570,000	1,044,000	18,571,000
April 10a.....	1,488,000	23,058,000	1,792,000	20,363,000
April 17b.....	1,280,000	24,338,000	1,603,000	21,966,000

a Revised from last report. b Subject to revision.

### ESTIMATED PRODUCTION OF BEEHIVE COKE (IN NET TONS)

	Week ended			1920 to date	1919 to date
	April 17, 1920	April 10, 1920	April 19, 1919		
United States total.....	244,000	477,000	295,000	6,671,000	6,849,000

(a) Less one day's production during New Year's week to equalize number of days covered for the two years.  
(b) Subject to revision.

Workers' organization, to show the Americanization work which is now going forward. He reports that before the world war at least 65 per cent of the miners in the district were not American citizens and many had been residents of the country for 20 years or more. With the coming of war, union officials realized that those conditions could not continue and an amendment was made to the constitution of the state organization requiring all members to be citizens of America or at least declare their intentions of doing so. The result was little less than startling. Americanization classes sprang up in every locality, and American miners, who worked by the side of Hungarian, Slav and Pole workers, begun to teach them the English language. Principles of the American Government were also taught to the foreigners. Union officials were at the head of the Americanization work and many taught classes in the evenings. Union officials are quite proud of the record in the Cambridge district.

#### FAIRMONT

*Complete Stagnation in Northern Fields—Mines Shut Off from Outside World—Assigned Car Practice Revived.*

Complete stagnation of coal production in the Fairmont region and in certain other northern West Virginia regions during the week ended April 17, followed in the wake of the switchmen's strike. Cars were plentiful in the Fairmont and adjacent districts on Monday and coal still moved despite the strike on a number of roads; mines in northern West Virginia continued to mine and ship coal.

However, one outlet for northern West Virginia coal was cut off, when the Monongahela R.R. declared an embargo on all shipments north of Brownsville, Pa. By Tuesday 2,000 car loads of coal and coke had accumulated in the Brownsville yards and by Friday there were 2,600 loaded cars in those yards awaiting movement.

While embargoes debarring northern West Virginia coal from all tidewater piers had been imposed on Monday, there was still some coal moving eastward from this section during the first of the week. On Tuesday, however, switchmen and yardmen at the Keyser, W. Va., and Cumberland, Md., yards of the Baltimore & Ohio joined the strikers, when eastern movement of coal ceased.

Western movement was also affected to some extent even by Tuesday, through a walk-out of switchmen at Benwood, but there still remained an outlet through Holloway to the Lakes. By Thursday, the fifteenth, there was almost complete paralysis of mining operations in the Fairmont and other northern West Virginia mining regions, the outlaw strikes having shut off northern West Virginia mines from the outside world. Few if any mines were actually in operation.

Taking advantage of the assigne-

car decision of the Interstate Commerce Commission, under the plea of an emergency, it became apparent that the Baltimore & Ohio and other roads in northern West Virginia were bent upon working the old system for all it was worth, not only to secure an immediate supply but a future one also. During the week ended the seventeenth, most of the fuel loaded was that at mines under contract to furnish railroad fuel, and it was reliably reported that the Baltimore & Ohio was trying to induce operators to accept \$3.00 a ton in order to secure a better car supply and an immediate market for fuel during the strike. It was predicted that if the fuel thus secured by the railroad during the strike were stored, it would be a contributing factor in a car shortage.

## Middle Appalachian

### CHARLESTON

*Western Markets Closed to Mines Here—Coal Goes to Tide—Many Mines Idle—Much Coal Under Contract*

Mining operations in this section were quite perceptibly affected by the "outlaw" strike of switchmen, owing to the marked curtailment of the car supply which followed in the wake of the strike, the supply of equipment from the West being totally suspended during the greater part of the week ended April 17. While mines in this area were able to secure cars from eastern sources this supply was insufficient to take care of the increased territory from which the usual number of cars had been cut off. The shortage of equipment grew more marked as the week progressed and by the end of the period mines were securing only about a 25 per cent quota of empties.

### Conditions Still Bad on K. & M. R. R.

Conditions were even worse as to mines on the Kanawha & Michigan R.R. Cut off from the western sources of supply, mines in West Virginia on the road named were forced to get along with five or six cars a day. Of course all movement of coal to the westward was cut off from the very beginning of the week, both as to the Chesapeake & Ohio and the Kanawha & Michigan, there being an embargo on all shipments west of Russell, Ky. When strike trouble broke out at Russell on the thirteenth, that only aggravated matters.

With western outlets closed, all coal from eastern Kentucky and from West Virginia mines reached by the Chesapeake & Ohio was being shipped to tidewater, and at the end of the week there was grave danger of an embargo even on tidewater shipments, owing to the fact that coal was pouring in on tidewater points faster than it could be dumped. As a result of conditions created by the strike of switchmen much idleness at the mines ensued.

The strike, insofar as it affected conditions in this part of the state, came at a most inopportune time because it

was impossible to begin deliveries of coal to Lake ports. The week ended the seventeenth was supposed to have marked the opening of the Lake season but comparatively little coal was moved from this part of the state to the Lakes.

A large proportion of the 1920 coal year output of the mines in this section has been placed under contract, the bigger companies assuming the lead. Exports were holding up well and were naturally somewhat stimulated by the heavy eastern movement of coal.

Production was steadily on the downgrade in the Kanawha region, during the week ended the seventeenth, as a result of the switchmen's strike and its tie-up of western connections. As showing just how seriously the output was affected in the Kanawha, Cabin Creek and Coal River fields, production dropped from 26,650 tons for the Kanawha field and 13,250 tons for the Coal River field on Monday, to about 10,000 tons for the Kanawha field on Friday and only 5,000 tons for the Coal River field. Taking the week as a whole it is believed that the output was not more than 30 per cent of normal. All Kanawha coal during the week was shipped to eastern markets, principally to tidewater, western markets being entirely closed to the Kanawha producers.

The New River field had, during the week ended the seventeenth, just two days in which the run of cars was at all adequate, so that there was much idleness at the mines in this field. Aside from Monday and one other day there was not more than a 30 per cent run of cars for the entire New River field, all because of the strike of switchmen. No coal whatsoever was shipped to western centers during the week, the entire output of the field moving to tidewater.

The most serious effect of the strike however, was largely to cut off the shipment of coke, since the greater part of the output of the New River oven is sold in western markets. Export shipments continued on the up-grade during the week. Also it was estimated by operators that fully 60 or 70 per cent of the year's output of the New River region was under contract by the fifteenth.

### BLUEFIELD

*Embargo on Western Shipments—Big Surplus of Coal at Tide—Relief Soon or Shut-down of Mines.*

A survey of the situation existing at mines dependent upon the Norfolk & Western R.R. for transportation facilities, reflected quite a serious condition of affairs, for which the "outlaw" strike was largely responsible. As early as April 10 the strike had necessitated an embargo on all western shipments, so that by the thirteenth absolutely no equipment was coming through the western gateway for use at Norfolk & Western mines. Hence mines were dependent upon eastern sources for a supply of empties.

There was just about half as many cars available as there had been during previous weeks, with the result that

most mines were not able to work more than one or two full days out of the six. No coal whatsoever went to western markets, all fuel being diverted to eastern points—principally to tidewater.

The outlaw strike seriously interfered with the car supply in the Winding Gulf field during the week ended the seventeenth. No coal was moving west from that field, the entire output being shipped to tide, a part of it over the Chesapeake & Ohio. According to reports there were 600,000 tons more coal at tidewater piers than there were vessels chartered, leading operators to believe that there would soon be an embargo on everything to Hampton Roads unless the situation was relieved in the West. Of course, in such a contingency, it would mean practically a shut-down of all mines in the Gulf district.

#### Pocahontas Production Slumped

Pocahontas production slumped quite appreciably during the week ended April 17 as the result of strike conditions, the output being not more than from 40 to 50 per cent, principally because of the difficulty in securing cars. As all coal was moving to the East, it was hard to return empties with as much celerity as is usually the case.

It was possible during the previous week to use cars from the western gateway and cars coming out of shops in the Thacker field; the cars from the East went to the Pocahontas and Tug River fields; but as soon as such temporary relief was exhausted, the car supply dwindled quite perceptibly.

The heavy demand to tide resulted in an embargo, at least as to certain pools, about April 19. Coal coked during the week amounted to 12,632 tons. Cars furnished were equal to only about 40 per cent of requirements.

Tug River operators and railroad officials expressed the opinion, early in the week beginning the nineteenth, that there would be little coal loaded after the middle of that week. Western gateways, from the Tug River field, were entirely closed during the week ended the seventeenth both as to shipment of loads and the supply of empties.

#### HUNTINGTON

*Guyan Output at Low Mark—Big Logan Decrease—Cars Scarce—Western and Northern Gateways Closed.*

At no time in recent months has production in the Guyan field been at a lower ebb than was the case during the week ended April 17, that being one of the effects of the strike which seriously curtailed the car supply. The shortage of cars was due to the fact that no empties to speak of were received from the West at all during the week, all equipment coming from eastern points.

#### No Improvement in Car Shortage

As a result of such transportation conditions, the output for the entire week was little more than 150,000 tons, with car-shortage losses aggregating

about 225,000 tons. As all western markets were cut off, the entire output of the field was shipped to tidewater. The demand was sufficient to absorb the greatly increased tidewater tonnage, but the sudden concentration of the entire output of southern West Virginia fields resulted on the nineteenth in an embargo on high-volatile coals at Newport News.

With Western and Northern gateways closed, there was no coal shipped to the Lakes, although the season was to have been opened and Logan operators had made arrangements to ship quite a considerable tonnage to such ports. Prices were still buoyant. As far as could be learned, much additional tonnage, covering the year's output, had been put under contract.

The switchmen's strike affected production on the Chesapeake & Ohio system to the extent of 100,050 tons. Whereas there had been a movement of 11,037 cars of coal over the Chesapeake & Ohio during the week ending the tenth, the equivalent of 551,850 tons, there were only 8,996 cars of coal handled during the following week, representing 449,800 tons, so that there was a decrease of 2,041 cars, or 102,050 tons. There was a decrease of 12,650 tons in the Logan field alone.

Morgantown—Announcement was recently made that the eighth annual short course in coal mining at the West Virginia University will open on June 21, and continue until July 31. This course gives mining men an opportunity to thoroughly prepare for the examination for mine foreman and fireboss certificates which will be held later by the State Department of Mines. There were but four men enrolled in this course in 1917, 23 in 1918, and last year there were 57 men in attendance. It is expected that at least 125 will attend the short course this summer. A report just received from Raleigh County indicates that there will be more than 25 men from that county alone. An announcement of this course is being mailed to all postmasters of coal mining towns, as well as to the officials of all the coal companies in the state. This poster gives full information of the various classes and subjects. Additional copies of this poster can be obtained from Prof. A. C. Callon, Morgantown, who will be in charge of the course.

Ivanton, W. Va.—Ivy Branch Coal Co., Ivanton, W. Va., is preparing to increase production of Block coal, by laying an additional siding, installing snaker screens and constructing a number of new miners' houses. The company expects to have a daily production of not less than 500 to 600 tons before June 1. Leo F. Moore is superintendent.

#### Southern Appalachian

Birmingham—The Sloss-Sheffield Steel & Iron Co. has placed in commission 60 of the 120 Semet-Solvay by-product coke ovens at its new \$6,000,000

plant at North Birmingham. The other batteries will be in operation within a few weeks. The Sloss-Sheffield company will shortly abandon the four batteries of bee-hive ovens, at its City Furnace plant, which were built in 1882, and have been in almost constant operation for the past 38 years, being an old landmark of the city.

Morris W. Bush, who is president of the Alabama By-Products Corporation, and also of the Birmingham Coke & By-Products Corporation, made the following announcement of the transfer of the property: "The Alabama By-Products Corporation has acquired the property and business of the Birmingham Coke & By-Products Co. The Alabama By-Products Corporation will make coke, ammonium sulphate, tar and benzol, using the recently completed plant of 50 Koppers ovens of the Birmingham company. It will also engage in other lines of industry from time to time as may seem desirable."

These Koppers ovens were put in operation about two weeks ago. The work of constructing them began in the fall of 1918, but on account of the delays in the delivery of materials and machinery they have only just been completed.

The plant represents an investment of over \$5,000,000.

#### Middle Western

##### Midwest Review

*Contrary to general opinion, the car supply in southern Illinois coal fields has been much better this week (ended April 24) than last; the mines here probably operating on a 20 to 30 per cent basis, as the average for the week. This is an improvement, however, as the car supply for the week before was only 15 per cent or thereabouts.*

##### All Terminals Embargoed

Practically all of the large terminals here are embargoed. It was rumored during the middle of the week that the strike of the rebel switchmen had been settled, but this rumor proved a little previous as the deadlock is, at this writing, as tight as ever. Operators, of course, cannot ship their coal to Chicago, Peoria or any other distribution point, but as they have a big market for their coal in the West and South and in a great many rural districts, they are having absolutely no trouble in placing the meager tonnage they are able to produce. What seriously affects the coal industry more than anything else, is that practically all of the terminals are clogged with coal cars, which have been unloaded but cannot be returned to the mines on account of the strike.

Market conditions in the entire Middle West are quite strenuous, and we believe it is no exaggeration to say that coal is harder to get, anywhere in this territory, than it was during the war and when war-time conditions pre-

vailed. The only coal being offered is more or less off-grade stuff, which is practically unsalable in ordinary times when ordinary competition prevails. This coal, by the way, is selling at prices in excess of Franklin County rates.

**Duquoin**—A new mine is being sunk 11 miles west of here near Cutler, located on the Wabash, Chester & Western R.R., by a company from Mt. Vernon, known as A. Wilson & Sons. The mine will be equipped with modern and up-to-date machinery, including electric mining machines. A new steel tippie will be erected over the main shaft. The mine is to be a large producer, having a capacity of 3,000 tons when fully developed. The Wabash, Chester & Western R.R., which will serve the mine, was recently sold to the Southern Gem Coal Co., and will be put in shape, as it is said that the owners intend to make it one of the foremost coal carriers in southern Illinois.

The Sunnyside mine near Herrin, southeast of here, was completely destroyed recently, following closely on the big disaster two weeks ago which burned the Jackson Coal Co.'s mine at Hallidayboro. However, the Sunnyside fire loss was estimated at \$200,000, whereas the Jackson mine fire was only half of this amount. This takes two of the oldest mines in southern Illinois from the list of producers. The origin of the Sunnyside fire is unknown as in the case of the Hallidayboro disaster, and over 500 men are thrown out of work. Close by the tippie were several other buildings, including a large washer, all of which were burned to the ground.

**Granite City, Ill.**—The first unit of the St. Louis Coke & Chemical Co. plant at this place, comprising 80 coke ovens and one blast furnace, will be in operation about the middle of July, if there is no unexpected delay in the delivery of equipment. The blast furnace (says *Iron Age*) will have the capacity of 500 tons of pig iron per day. The coke plant will handle 2,000 tons of coal per day, and will produce about 1,500 tons of metallurgical coke from 100 per cent Illinois coal. Part of the coke output will be used in the company's own blast furnace.

**Springfield**—Approximately half of the coal mines in Illinois were reported idle recently and 45,000 miners have been forced out of employment by the strike of railroad switchmen, according to Frank H. Farrington, president of Illinois miners.

**Clinton**—The Vermillion Coal Co., operating a mine in the Clinton field, has leased 1,700 acres of fifth seam coal land from the United States Steel Corporation, and will sink a mine southwest of Clinton, on the Chicago & Eastern Illinois railroad switch. Bricks for the boiler house are here and steel and boilers are being shipped to the mine site. The Steel Corporation operates the Bunsen mines at Uni-

versal, and is retaining a large acreage of its own adjoining the leased tract.

**Terre Haute**—More Indiana coal mines were reported closed recently because of car shortage than ever before in the history of the Indiana Coal Trade Bureau, which has its headquarters in Indianapolis. There were 101 mines idle in the state. Operators stated that the railroad yardmen's strike was directly responsible for the increase in the car shortage, which has prevailed for several months. Thirty-seven of the closed mines are on the Pennsylvania R.R., 28 on the Chicago, Terre Haute & Southwestern, 16 on the Monon, 15 on the Chicago & Eastern Illinois, and five on the Big Four.

**Johnston City**—A deal has been consummated in Williamson County whereby the Old Ben Coal Corporation becomes the owner of the Johnston City mine of the Big Muddy Coal Co., known as the P. H. Holland mine. The mine lies adjoining this city and the property includes several hundred acres of coal lands. With the acquisition of this plant, the Old Ben company now has 15 operating mines in the Illinois field, and owns more than 60,000 acres of coal land.

**Chicago**—The coal industry throughout Illinois has felt the effect of the switchmen's strike on the railroads in no small degree. Due to the fact that the railroads are unable to get shipments through or around the city, the result is that the coal contracted for by firms in and beyond Chicago is held up seemingly indefinitely. This not only ties up cars, of which there is a shortage, but produces a great demand for coal with only feeble means of filling it. Coal men have been able to reute but a small portion of their shipments around Chicago, but the pressure caused the following mines in the Springfield district to remain idle a few days: Auburn, Peabody, West, Selbytown, New North and Devereau. The fact that one of the loop belts in Chicago is able to run a small number of regular trains has been the only saving feature in the situation.

---

## Missouri Valley

---

**Des Moines**—A number of prominent coal men of this place are interested in the newly organized Consumers' Consolidated Coal Co. This concern is capitalized at \$100,000 and took over both the Consumers' Fuel Co. and the Park Coal Co. The following are the officers of the new company: President, F. H. Zook; vice president, E. L. Lloyd; secretary, Ellsworth Lloyd; treasurer, K. G. Carney.

**Pittsburg**—An almost complete paralysis of the Kansas coal industry is reported. An announcement at the headquarters of the coal operators as to mining operations said that only four steam shovels are at work. No deep mines are working. The report further shows that not more than 300

miners out of 12,000 or more in Kansas are at work. Coal operators stated that the suspension of operations was in protest against the sentencing to jail of Alexander M. Howat, president of the Kansas mine workers, and his colleagues. Union officials neither confirmed nor denied the statement.

**Eagle Pass, Tex.**—The International Coal Co. of this place announces that it expects to begin the shipment of coal within the next 60 days, or by the first of June. The work of overhauling the plant has been under way for several months, beginning when the mines changed hands. When this development work is completed the property will operate to full capacity. A railroad spur has been built from the Southern Pacific main line to the mines and cars will be loaded direct. Under the old arrangement the coal had been hauled overland from the plant to the railroad. New machinery for handling the coal at the mines has been installed and the plant will be thoroughly modern when this work is completed.

**McAlester**—Coal miners and operators of District 21, United Mine Workers of America, will meet at this place next week to settle differences growing out of working agreements. A new working agreement covering this district will be negotiated. District 21 embraces Texas, Arkansas and Oklahoma miners. The conference will apply the Washington Coal Commission's awards to the Southwestern fields. The new wage increase of 27 per cent is already being paid.

---

## Western Fields

---

**Gunnison, Col.**—Opening of the Muncey hard-coal deposits in the Ragged mountains of western Gunnison County is announced here as one of many development projects to be undertaken in this county this summer. Coal of the same quality has been worked for 40 years in the Smith anthracite mine, and in the Peanut mine at the Buttes. It will be opened at another point there this summer through the General Pershing mine of the Colorado Fuel & Iron Co. The Ruby anthracite mine near Crested Butte has also been worked for many years, but the larger deposits, known as the Muncey banks in the depths of Dark canyon and on the western fringe of the Ragged mountains, has never been carried farther than the prospecting stage. In the early 80's parties patented hard-coal claims here.

Billy Muncey, a character of early days in western Colorado, who had been an express rider in and out of Salt Lake City, made the first discoveries in Muncey basin in 1880. Here he patented 320 acres and later acquired the Tuscarora claims of 640 acres, several miles west, near the McClure Pass between Somerset and Marble.

# COAL AGE

The Weekly Journal of the Coal and Coke Industries

Volume 17

NEW YORK, THURSDAY, MAY 6, 1920

Number 19

## *Only Greater Efficiency*

### *Will Retard Mounting Costs*

TRANSPORTATION limitations, uncertainties of legislation and labor unrest are the questions that are foremost in the minds of coal men today. Efforts to get more cars from the railroads, proceedings to forestall further government control of the coal business and joint conferences with the miners consume the time of the active coal operator and the officers of the representative associations. But in these daily struggles to maintain existence as an industry of individual effort do not lose sight of the ever-increasing necessity of greater engineering efficiency in production as a means of retarding the rise in the cost of production. Every element of cost—labor, supplies, general overhead and taxes—is mounting. The only hope of even retarding this rise is in increased efficiency of operation.

When prices of coal began to go up (in 1917) and all through 1918 coal companies generally took advantage of greater net income to modernize equipment. The process of putting the mines on a thoroughly modern basis was far from complete when the slump in the market took place in November, 1918. Business was slack and conditions uncertain last year, but there is no lack of orders in sight now and prices are good. The coal operator who did not put his mine equipment in down-to-date order during the war, because perhaps he did not see how he could ever amortize the inflated cost, was at a disadvantage last year when demand was so slack that the lowest bidder got the business. A year or two from now he will be in the same position.

Increased efficiency is not necessarily a corollary of the installation of modern machines. These machines must be properly used. In how many coal mines is underground traffic handled with such regard to its possibilities as is traffic on the Harlem River division of the New York Central? How many of the laborious operations required to get coal from the face to the tipples have been made the subject of studies such as have put our systems of factory management in the forefront in the world of industry? Use engineers more as well as equip your mines with the best the mechanical industry has to offer.

Increased output means lower unit cost. Inadequate car supply limits the day's production of most mines. Comparatively few mines are so situated that they can load coal directly onto waterways. However, a larger percentage than most realize can dispose of coal by motor truck. Driven to necessity by the strike of railroad labor, consumers in St. Louis have been hauling coal from the mines to their plants by motor truck. The idea is spreading.

It will be remembered that in 1918 F. C. Honnold, the district representative of the Fuel Administration in Illinois, discovered that coal was being hauled into coal mining towns from other camps. In conjunction with the State Fuel Administrator this practice was

prohibited and local communities were compelled to use their own coal, hauled by truck direct from the mine. An increase in production was thus obtained and precious railroad transportation was saved. According to the Geological Survey, 21,890,000 net tons of coal, or nearly 3.5 per cent of the total production, was sold locally or used by employees and not loaded into railroad cars, nor coked or consumed as mine fuel.

## *Motor Trucks as Open-Top Equipment Offer Possibilities*

WE are told on good authority that the shortage of open-top equipment on the railroads will continue for several years. Why not push the use of open-top equipment that does not travel on steel rails? The opportunity obviously is limited but nevertheless it is of large proportions. Production now moves in the United States over 15,000 miles of canals and inland waterways, 250,000 miles of railways, 2,753,334 miles of highways, according to a statement by George M. Graham, general sales manager, Pierce-Arrow Motor Car Co., at the Increased Production Convention of the United States Chamber of Commerce at Atlantic City last week.

Ships, railroads and motor trucks, Mr. Graham holds, constitute the great transportation trinity which distribute production, each having an equally important place in the general transportation scheme. This authority sums up the relation of all three factors in respect to production as: First, our waterways are determined by nature's laws; for transportation with the outer world the merchant marine is supreme; second, the steel rail has ever been the herald of development, but locomotives and cars cannot travel beyond its bounds; third, the highways offer an infinite possibility of communication with points not to be reached by railway or ship.

Increasing production rests largely on the development of highway transportation. It is estimated that on the Great Lakes and the Mississippi in 1918 90,000,000 tons of freight were carried. In the same year 1,200,000,000 tons were moved by motor truck, and 2,504,000,000 by rail. Much of this motor truck tonnage was haulage to railroad freight stations. Highways have fallen short of carrying their share because it is only within the last decade that a proper medium has been developed. Temporarily our railroads have reached the limit of their capacity. They can have no greater volume. *Railway Age* says they need 712,400 more freight cars, and only 300,000 can be built yearly. There is an estimated shortage of 50 per cent in locomotives. Five years is suggested as the minimum time in which railroad facilities can be brought to normal.

The railroad officials are at this time naturally more anxious than ever to meet the demands upon them, according to George F. Post, chairman of the Railroad committee of the United States Chamber of Commerce. Even if they had the money now, which they have not

it would be some time before they could add substantially to their equipment. Some of the strong roads have already contracted for new cars and locomotives, but not for more than half of what they need, because of the restricted market and high cost for borrowings.

### *Conservatism in Regard to Machinery*

CONSIDERING that to the operator coal is reasonably cheap, not being loaded down with heavy transportation charges, it seems strange how many there are in the coal industry who have shown little willingness to accept mechanical development. Much of the work around some tipples continues to be done uncertainly and inefficiently by gravity, "beef and brawn." Take for instance, the infrequent use of the coal haul. In many cases there is fall enough to bring the cars to the tipple, and all that is necessary is to lift a brake or remove a sprag and cars will run into the dump. But the use of gravity usually wastes much labor and time because of the necessity of going back for cars or having some one stationed to let the cars into the tipple. This also slows down dumping considerably.

But this is the least of its shortcomings, for the loss of elevation at the cross-over dump and the long, steady downgrade on the load tracks, with the further loss of elevation in the empty pit, puts the lowest point in that pit several feet below the elevation of the switch where empty and load tracks join. Consequently the empties have to be hauled up an unreasonably steep grade that limits the number of cars that the locomotive can start from the pit bottom.

In consequence the locomotive in starting toward the mine is heavily handicapped, and the length of trip both for loads and empties is cut down unless the grade on the main track is exceptionally heavy. Moreover, the necessity for getting a suitable grade for the loads on the load track will, in most cases, cause either undue steepness or undue flatness in the main track, both of which are undesirable.

One meets with places where to adjust the grade for the delivery of loads by gravity to the tipple the grade of the main track has been made level or unduly flat, and other cases less frequent where it has been made excessively steep. Had a car haul been introduced the grade on the main track from the empty switch to the drift mouth might have been made nearer the ideal, which is about six-tenths of one per cent, this being the grade which provides from the locomotive an equal tractive effort for loads and empties. Furthermore, the cars would have been saved from much deterioration, for many are the bolt holes that are enlarged by the bumping which the cars receive in the empty pit.

The car haul is part of the natural order of things, a mechanical aid to dumping almost as essential as the cross-over or the rotary dump, and its installation should

not be avoided on the plea that it can be dispensed with.

Below the tipple it seems essential that the railroad cars should not rely on gravity, which is either inadequate in cold weather or only too greatly accelerating in warmer seasons. Gravity is at the mercy of snow or rain. One day the cars move too easily, another they respond with difficulty to the pinch bar, the trimmer's shoulder or to the jolting he gives by jumping on the car end. Speaking loosely, the response of gravity is slow and uncertain because the resistance of standing bodies is so much greater than the resistance of those that are moving. Machinery can be arranged to be adequate, whereas gravity cannot meet successfully the

change of resistance which varying conditions inevitably create. Space does not permit calling attention to the unsuccessful way in which the coal passes over pans and screens when gravity is solely relied on to provide for its movement. Stoppage and excessive speed alternate with each other and break the coal into dust.

The future will see a growing disposition on the part of the mine engineer to limit his dependence on the force of gravity and to rely on power as a more

certain and controllable means of operation. The art of making gravity do the work has been pursued with such abandon that it has created almost an obsession and made us too often overlook the fact that only with machinery can a delicate adjustment be obtained such as is well typified by the steam hammer that cracks a watch crystal and leaves the delicate mechanism intact.

### *Tendencies Easily Discernible*

THIS is the annual Equipment Number of *Coal Age*. In it an attempt has been made to describe some of the equipment that has been and is being used from day to day in the mines in order to render the production of coal easier, and more speedy and also more profitable to the operator as well as cheaper to the consumer. No effort has, however, been made to enumerate all of the devices of this nature. Any such attempt would require vastly more time and space than this or any other periodical could possibly devote to the task.

It is interesting at such times as this, however, to indulge in a short retrospect, discover what, if any, are the trends in the industry and then take a short glance at or into the future.

For many years there has been a pronounced tendency toward electrification. The last year has been no exception to the rule established by its predecessors and has witnessed the alteration of many coal plants from steam to electric energy. This change has possibly not been quite as rapid during the twelve months past as it has been during some similar periods in the past. This unquestionably arises from the constantly rising prices with which the last year has been afflicted. While accomplishment has been admittedly slow, the direction

of the movement has been none the less pronounced.

For many years also there has existed a steady movement away from all forms of animal haulage toward mechanical haulage, usually in the form of electric locomotives, either storage-battery or trolley. The last year has seen no change from this course. The problem of tonnage movement in a coal mine is an extremely vital one on account of the vastness of the production. Mechanical haulage is not only cheaper than animal in most cases but what is, in the majority of instances, much more important, it is more reliable.

The electrically driven centrifugal pumps for installation both above and below ground appears to be gaining in favor. The old objection to these machines for use in the mines, namely, that foreign substances such as chips, small pieces of coal, rocks, slate and the like were liable to lodge in the impellers and thus not only cut down the efficiency but throw the machine out of balance, seems in large measure to have lost its force. This is doubtless due in part to improved design and in part to greater care in installation. In this connection it should in truth be said that the electrically driven multiplex plunger pump is running the centrifugal machine a close second in popularity for use underground.

Rotary dumping and skip hoisting have made great strides in the recent past. Some of the largest shaft mines in the world are now fitted with these devices. Wherever extreme outputs are necessary the skip takes the place of the multiple-decked cage, saving time at both top and bottom while introducing no caging problem whatever. It furthermore permits continuous dumping and lessens both the rope speed and the power consumed as compared with the usual single-decked cage. Probably the most vexing problem with which the coal operator has to deal is that of labor. The greatest labor problem of the mine is that of loading the coal into the mine car. A successful mechanical loader thus presents the greatest improvement that could possibly be made in the process of coal production. In the past many devices have been tried with more or less success, but there are now on the market several machines, that have become articles of commerce, that will load cars successfully. As a rule, however, they have not yet attained the pre-eminence and universal adoption that either their inventors or the rank and file of operators might wish and for which all sincerely hope in the future.

Of all the many reasons for this lack of general adoption, two stand out prominently. First, most of these machines are large, therefore heavy, and consequent upon this their cost is not only high but they

must secure a high rate of production in order to show a saving over present methods. This immediately introduces a factor, foreign to the machine itself but highly pertinent thereto—namely, keeping the machine supplied with cars. This has been partially solved in some models by a storage device on the machine itself.

The second shortcoming of any and all mechanical loaders lies in the fact that no machine, be it ever so skillfully designed and constructed, can be made to think. It will as a consequence pick up and load a piece of slate or rock as readily and quickly as it will a lump of coal. Of course this is by no means insurmountable. It, however, transfers the problem of slate removal from the working face to the tippel—from where it belongs to where it does not belong. This in turn introduces a rock-disposal problem that should be avoided if possible.

What is apparently wanted is a comparatively light machine, one that one or at most two men can handle and operate, the movements of which one man can control with ease and precision. The trend of invention along this line is in the right direction.

### Trucks Relieve the Coal Shortage

COAL has determined the location of many modern cities. Some of the larger metropolises have centered about points where transportation by rail and by water brought large congeries of people and created accordingly many prosperous industries. Such cities are New York, Chicago, Boston, Buffalo, Cleveland, Seattle, Tacoma, San Francisco and New Orleans. But other cities have built themselves upon the basis of both transportation and coal. Such cities are Pittsburgh, St. Louis, East St. Louis, Birmingham, Cincinnati, Columbus, Terre Haute. They grew great first because of communication facilities, second, because of cheap coal and thirdly because the availability of coal made railroads through them important. These cities are so near the railroads that they can receive coal by truck. Their industries need not be paralyzed by a railroad strike if only the ship-by-truck possi-

bilities are used as they were in Great Britain during the great strike of her railroad systems. It is stated that most of the coal now received in that central ganglion of the United States—St. Louis, East St. Louis, Venice and Granite City—is coming in by interurban railway service and by truck. True, about 20,000 men in the southern Illinois fields are idle, but much of the idleness in St. Clair, Madison and other counties could be cured if truck service to St. Louis and the river at that port were properly organized.

MACHINERY (SPEAKING): "Durned Hard Work, Isn't It? Let Me Take a Hand."

# Designing an Electric Hoist to Meet Needs of a Long Mine Slope

Rapid Increase in Speed and Prompt Slowing Down Are Not so Necessary in a Slope as in a Shaft Hoist—Special Arrangement Provided for Passing Slowly Over Long Curve—Strange Rhythmic Pulsation in Current Is Noted

BY GRAHAM BRIGHT  
East Pittsburgh, Pa.

**M**UCH that has been written on the subject of hoisting systems for coal mines has dealt particularly with the vertical type of hoist. As the vertical hoist involves short cycles with short acceleration and retardation periods, the capacity of the equipment in many cases is largely determined by these periods. The large slope hoist, however, must meet a

incoming line panel are placed in a separate room. The primary reversing switches are of a new type, designed for a maximum potential of 6,600 volts and a capacity of 500 amp.

Part of the coal to be hoisted is obtained from a level about half way down the slope and known as the River or Heading Road. It is here necessary to start the loaded trip slowly around a sharp curve until all the cars are on the straight track, when acceleration to full speed can take place. Equipment to safely accomplish this result with a low expenditure of power has

FIG. 1. BACK GEARS AND CLUTCH

The hoist may be driven at full speed through pinion A or at half speed through all the small gears shown, pinion A then operating as an idler.

different set of conditions. The accelerating and restarting periods can then be readily lengthened, but they have little influence in determining the capacity of the equipment. A study of the operating conditions under which a hoist of this nature was recently installed at the Footdale mine of the H. C. Frick Coke Co. illustrates this point.

The service data upon which this hoisting equipment was designed are shown in Table I. The hoist consists of a single cylindrical drum 9 ft. in diameter, having an ultimate capacity of about 13,000 ft. of 1½-in. cable. This drum is geared to an 800-hp., 2,200-volt, three-phase, 60-cycle, 24-pole, pedestal-type, wound rotor, induction motor. This motor is controlled by a magnetic type of controller which is full automatic and is operated by means of a small master controller located on the hoist platform. The main control and

Last 300 ft. is on 4 per cent grade		No. trips per 8-hr. day . . . . .	25

been worked out and furnished by the Vulcan Iron Works. This device, shown in Fig. 1, consists of two sets of herringbone gears, so arranged that by means of air-operated clutches either full speed or half speed can be obtained on the main drum.

This gear and clutch arrangement is quite simple, its operation (see Fig. 1) being as follows: For full-speed operation the pinion A drives the hoist gear directly, while the pinion D on the auxiliary shaft runs free. When half speed is desired, pinion A is allowed to run free on its shaft, and the drive is made through pinion B to gear C and from pinion D to the hoist gear, pinion A acting as an idler.

The power necessary to pull the trip around the

This view shows the brake and the device for preventing operation when the brake becomes worn.

FIG. 3. SAFETY SPEED AND OVERWIND GOVERNOR  
This device also embodies a mechanism for graduating the brake release.

curve is thus halved. This greatly reduces the demand upon the electrical system, and in turn decreases the power bill by cutting down the maximum demand peak. Unless full capacity is required, such a hoist as this can be operated continuously at the reduced speed with a large saving in the power bill.

The trip is delivered at the ground surface, where it is taken care of by a storage-battery locomotive that switches the cars to a slow-moving, continuous type of incline hoist. This hoist delivers the cars one at a

time at the top of the tippie, where the coal is dumped.

The hoist lets the trip of empty cars down the main slope at the same speed that the loads were brought up. In order to keep the hoist motor from attempting to push on the rope, the trip of empty cars is allowed to come up to speed by gravity, but when the speed meter shows that the drum is revolving at 300 r.p.m. the control is moved quickly to the full "on" position, driving the hoist in the direction in which it is already running. The speed will increase to slightly above synchronism, at which point the motor holds it constant and returns a small amount of energy to the power system. This method prevents any tendency to over-speed during lowering, increases the cooling of the motor on account of fairly high-speed operation at light load, and saves wear and tear on the brake system.

In Fig. 4 may be seen the flexible coupling and safety device. This view illustrates the value of the pedestal type of bearing for a large hoist motor. Fig. 5 is a view of the hoist from the opposite side and illustrates in detail the type of wiring around the hoist platform. All main and control conductors are installed in conduit, large sizes being necessary because the insulation of all control wiring was specified for 2,500 volts. This view also shows the small magneto generator belted to the motor shaft and connected to one of the meters on the hoist platform and calibrated in r.p.m. It also shows the master controller, emergency switch and air-brake handle on the hoist platform, in addition the dial indicating the location of the trip will be noted. The large index rotates three times during the complete trip, so that the exact position of the trip can be noted from the position of the small pointer on the dial.

The hoist platform is provided with meters which at all times indicate the current and speed of the hoist,

FIG. 4 FRONT VIEW OF THE DRIVING MOTOR AND OPERATOR'S PLATFORM

FIG. 5. MOTOR END OF HOIST, SHOWING OPERATOR'S PLATFORM AND POSITION-INDICATING DIAL

This view also shows a magreto belted to the hoist shaft. This machine is connected to a meter on the operator's platform and is calibrated in revolutions per minute.

with a safety switch to open the oil circuit breaker and stop the hoist in case of emergency, with a maximum-torque push button to cut out the automatic accelerating relays so as to enable the operator to obtain large torques in case of emergency, with a back-out switch to enable the operator to back out of an overwind, with a main control lever, a small air-brake lever, a small lever for the clutches and a telephone for communicating with points inside of the mine.

The main brake is of the post type operated by a weight and released by an air cylinder. It is controlled by a small air-brake lever on the hoist platform through a cataract system. A slack adjustment is furnished on the brake system, which automatically shuts down the hoist in case the brake wear becomes excessive. This insures the brake system being in first-class condition at all times. A Webb-type recorder is provided, which gives a graphic record of each trip and also records all signals. Fig. 2 illustrates the mechanical parts of the hoist and shows the type of brake system, including the countershaft brake, the bedplate for the motor and the hoist platform. In this figure also can be seen the brake magnet, cataract system, device for taking care of brake wear, the rear of the back-out switch and the telephone.

An auxiliary band brake is furnished on the pinion shaft. This operates in conjunction with the main brake and can be so adjusted that it takes care of the inertia effect of the motor rotor, thus relieving the main brakes and gears from unnecessary stress and wear.

The safety device furnished by the Vulcan Iron Works consists of a fly-ball type of governor and a traveling-nut type of overwinding device. This apparatus prevents overspeed during any part of the cycle and will shut off the power supply and apply the brakes if the hoist operator does not retard the trip at the

proper time. In case of overwind the power is cut off and the brakes applied. It is not possible to operate the hoist again until the back-out switch is thrown to the proper position and then movement can take place only in the proper direction.

A valuable feature has been added to this safety device. In case of overspeed or failure of power during the high-speed portion of the cycle it would be dangerous to apply the brakes suddenly because in such a case the hoist would stop quickly, while the trip would drift ahead and stop gradually, producing slack cable. The trip would then run back and cause serious damage by breaking the cable or bending the drum shaft. The safety device is so arranged that the brakes are gradually applied at any but the overwind position, in which case they are applied promptly.

Fig. 3 illustrates the safety device and shows the

FIG. 6. CIRCUIT BREAKER AND SWITCHBOARD PANELS

The switches are designed for a maximum potential of 6,600 volts. They are arranged in groups of two each and sometimes operate several times per minute.

FIGS. 7 and 8. GRAPHIC WATTMETER RECORD OF HAULING CARS FROM RIVER HEADING  
The start was begun at half speed and after straight track was reached the hoist was continued at full speed.

FIGS. 9 AND 10. RECORD OF HOISTING 24 LOADED CARS FROM THE BOTTOM

In this case the cars were pulled around the curve onto the straight track and there stopped. The controller was then thrown to the full "on" position and the record here shown made.

solenoid on the end next to the governor for the purpose of half-speed operation. In addition the overwind switches and the device for graduating the brake release according to the position of the trip can be seen.

The various safety devices on this hoist provide the following features:

- (1) The hoist cannot over-travel in either direction.
- (2) It is impossible for the hoist operator to start the machine in the wrong direction at either limit of travel.
- (3) Protection is provided against overspeed arising from any cause whatever during any part of the cycle.
- (4) Excessive peaks cannot be imposed on the power system because of careless handling of the controller. The power input to the hoist is held below certain predetermined limits through the use of automatic relays in the control system.
- (5) Power will be interrupted and the brakes applied if the operator fails to retard the hoist at the proper time.
- (6) The hoist cannot be started upon return of power or after the safety devices have acted until the operator has returned the control lever to the "off" position.
- (7) If the operator fails to keep the brake system in proper adjustment, power will be interrupted and the brakes applied, and further operation cannot take place until proper adjustments have been made.
- (8) There will be no delay in operation because of the functioning of any of the safety features. It will not be necessary for the operator to call for assist-

ance in case of an emergency stop, over-travel or other contingency.

(9) Operation of the safety devices does not cause a movement of any of the levers on the hoist platform, that may endanger the operator.

(10) No safety feature depends upon the will of the operator.

(11) All electrical safety devices depend upon opening of electric circuits, not the closing of them.

(12) A safety switch is provided on the hoist platform to enable the operator to stop the machine at any time.

(13) The various safety devices give the operator complete confidence in his ability to control the hoist, thereby permitting him to run to its greatest output.

Fig. 6 shows the high-tension primary switches in the foreground. These switches are designed for a maximum voltage of 6,600 and a current capacity of 500 amp. They sometimes operate several times during each cycle, and are much superior to any oil-immersed switch for such service. They are operated in three groups of two each. The individual switches are mounted on heavy channel iron frames and have porcelain insulators. Magnetic blow-outs and divided arc chutes are provided to protect the operator in opening heavy currents at high voltage.

A number of graphic wattmeter tests have been made with the hoist operating at half speed, the substation as yet not having sufficient capacity for full-speed operation. These tests show clearly the various resistance steps and illustrate the low starting torque necessary

for this slope hoist. Because slack cable must be taken up and slow starts must be made the resistance is proportioned to give a low starting torque on the first notch. This low value is economically obtained by leaving one of the phases in the secondary of the motor open. The second notch simply closes the open phase. The resistance must have considerable carrying capacity in order to take care of pulling the entire trip at a slow speed around the curve at the bottom. The passage of the trip around the curve absorbs from sixty to eighty seconds of the hoisting time.

In Fig. 7 is shown a graphic wattmeter test, when handling a trip of twenty-four loaded cars from the River Heading at half speed. This curve shows that the first notch is used to take up the slack cable and then three more notches are employed to pull the trip slowly around the curve to the straight track. The finish of this haul is shown in Fig. 8, indicating that the trip reached the straight part of the track in about seventy-eight seconds, at which time the control lever was moved to the full "on" position and acceleration to full speed took place, the ninth notch coming in at eighty-six seconds.

#### DOES THE WHOLE TRIP VIBRATE RHYTHMICALLY?

This curve shows in an exaggerated form a pulsation that was noticed in all of the tests. It was thought at first that a rhythmic change in frequency might be the cause of this pulsation. From examination of the various tests it is now believed that the pulsation probably is due to a vibration of the entire trip caused by the large mass and great length of cable. A vibration of this kind is often noticed when using a first-motion steam engine, due to the pulsating tractive effort of the engine itself. In most of the other tests the vibration was much smaller.

The results of starting a trip from the bottom after it had been pulled around the curve into the straight track and there stopped is shown in Fig. 9. The controller was moved to the full "on" position from rest. The illustration shows that the first four notches came in promptly, after which the accelerating relays took care of the following notches. The last notch indicates that slightly too much resistance is cut out, and this can be readily adjusted. The same rhythmic vibration takes place as shown in Fig. 7, but to a much smaller degree. The time element is a little larger, probably because of the greater distance from the top.

In Fig. 10 is shown the finish of the trip started in Fig. 9. The time interval of vibration is lessened considerably because of the shorter length of cable. Tests of this kind show clearly the effect of varying grades and curves and provide a valuable check on the capacity of the electrical equipment.

The ultimate duty of this hoist will consist of lowering the loaded trips about 13,000 ft. to a point where the cars will be transported by rail to the Monongahela River, at which point the coal will be dumped into barges for river transportation to the large byproduct coke plant at Clairton.

#### Morrow Makes Mid-West Circuit

J. D. A. Morrow, managing director of the National Coal Association, is attending this week's meetings of operators at Terre Haute, Ind.; Evansville, Ind.; St. Louis, Mo., and Louisville, Ky.

## Union Attacks Alabama Industrial Relations Committee Plan

A BITTER attack, impugning the motives and fairness of Federal Judge W. I. Grubb, in the appointment of umpires to settle differences between operators and coal miners in Alabama, has been launched here by William L. Harrison, international organizer of the United Mine Workers of America.

In a lengthy statement Organizer Harrison vigorously denounced the plan of the industrial relations committee which was put into effect by Alabama coal operators on April 1. He termed it "the most autocratic and undemocratic program that was ever inaugurated by employers to stamp out in this country a legitimate trade-union movement and to make impossible collective bargaining between employees and employers."

Judge Grubb was appointed by the Fuel Administration during the war and up to March 31 when the Garfield agreement expired, named the umpires in the Alabama coal fields. Organizer Harrison declares in his statement that no fairness may be expected by the miners from Judge Grubb on the grounds that Judge Grubb's three appointments of umpires have all been unsatisfactory to them and that Judge Grubb, himself, is a coal operator. When asked about this Judge Grubb stated that the facts of his ownership of coal stock had been communicated to the miners in each instance and that the miners, themselves, specifically waived such alleged incompetency to act. Judge Grubb, under the provisions of the new industrial relations committee, will appoint the umpires who, in disputed cases, will have the last word.

Organizer Harrison also brings out the long-standing fight in Alabama between operators and miners over recognition of the union. The miners want the union recognized, as a union, and demand that any settlement made to be in the form of a contract drawn up jointly by operators and unions in which the union shall be recognized.

#### HARRISON RAISES SIX POINTS AGAINST GRUBB

Mr. Harrison objected to the plan on the following specific grounds:

1. That the proposal is patterned after the Rockefeller plan in operation in Colorado with the exception that the Rockefeller plan grants the right to organize "for protection" and this is denied in Alabama.
2. That there is no provision for a joint meeting of miners and operators as provided by the report of the Bituminous Coal Commission.
3. That the proposition is designed to destroy the United Mine Workers of America in Alabama and prevent the men from organizing.
4. That the increase in wages granted is not in accord with the recommendations of the coal commission in that day labor was increased only 69c. per day in the case of drivers and 60c. per day for tipplesmen, instead of \$1 per day for both.
5. That the election of representatives of the mine workers on the industrial committee will be completely under the influence or domination of the superintendents and foremen of the representative mines.
6. That Judge W. I. Grubb, of the federal court, is not satisfactory to the miners as the man to name the umpire who will finally settle all disputes that may occur hereafter between the mine workers and operating companies.

# Gathering Locomotive with New Features To Lengthen Life and Save Power

Electric Braking, an Outside Frame with High Track Clearance, Leaf-Type Springs, an Improved Cable Reel and Demountable Tires Are the Chief New Features Embodied in the Construction of This Machine

BY JOHN LISTON  
Schenectady, N. Y.

**T**HE new type of gathering locomotive here described and illustrated combines in a single two-motor unit five new features, all of which have successfully withstood such severe and long-continued tests in practical coal-mine service as to demonstrate fully their general utility.

By means of a new type of controller positive and graduated electric braking is secured. Heretofore much more effort has been expended in operating the brakes in gathering work than in handling heavy haulage locomotives. The haulage locomotive, as a rule, starts from some given point and stops only when it reaches the tippie or shaft bottom, a considerable distance away. En route there are few if any stops, and the motorman is therefore seldom required to operate the brakes on the way.

In gathering work the locomotive ordinarily starts and stops many times while the switches at the room necks are thrown and while couplings are made to each car individually. Consequently, while the gathering locomotive is lighter than the main-haulage machine

the sum total of braking effort expended by the motorman is considerably greater.

The new controller was designed with a view to relieving the motorman of a large part of this braking and it operates so that the locomotive is stopped by its own momentum. This is accomplished by providing on the controller reverse cylinder a set of connections that turn the motors into self-excited generators, and the energy developed by them is absorbed in the main resistors. The amount of this energy, and consequently the degree of braking effort, is governed by the main cylinder of the controller. The more the resistance that is cut out of circuit, the more quickly will the stop be made.

The reverse cylinder of the controller is provided with four points, two for each direction of motion. For the first of these points the motors are connected in the regular motoring position. When it is desired to stop, the main cylinder is thrown off in the usual way and the reverse cylinder is through to the second, or braking point. The main cylinder is then turned on again and

FIG. 1. SIDE VIEW OF THE NEW LOCOMOTIVE

FIG. 2. REEL MOTOR AND BOTTOM OF CABLE REEL  
The large size of the supporting ball bearing is one of the improvements in reel design.

the motors (or generators, as they now are) begin to retard the locomotive.

The degree of braking is under the motorman's control at all times, for if he finds that he is stopping too quickly, he merely has to throw off the main cylinder and permit the locomotive to coast. In numerous tests it has been demonstrated that with the trolley disconnected the residual magnetism of the motors, when acting as generators, is sufficient to insure as quick a trip stop as when the trolley is connected. This is an important factor in estimating the all-around serviceability of electric braking in gathering work.

On a level track the motorman can bring his train to a dead stop without using the ordinary hand brake at all. He also can bring it to a stop on a grade, but as there is no energy developed when the wheels have stopped turning, the locomotive will stop and start again, stop and start again unless the hand brakes are set. A runaway, however, is impossible so long as the train weight and grade are within the braking capacity of the locomotive.

With electric braking, therefore, the hand brakes need to be used very little, and as a result there is a great reduction in the wear on brake shoes and wheel treads as compared with hand braking. Furthermore, with electric braking, since the retarding effect is zero as soon as the wheels have stopped rotating, there is practically no skidding of the wheels, and consequently there will be few, if any, flat spots developed from this cause.

There is another incidental benefit with this type of controller. With the ordinary controller careless or indifferent motormen do not always use the hand brakes when they want to stop. In many mines it is a rather too frequent practice for the motorman to save effort

by reversing the motors when a stop is to be made. When stopped in this way, the motors sustain a heavy rush of current and the gearing and other parts of the mechanical equipment receive severe shocks, all of which tend to shorten the life of the various parts and run up the maintenance costs.

This controller is different in another way from that employed upon the ordinary mine locomotive. Most controllers at present are arranged so that the locomotive will start with the motors either in series or in parallel. Here again the indifferent motorman will not use the series position when running slow. Instead he will leave the reverse cylinder in the parallel position and get slow speed by running on resistance. This increases maintenance costs of resistors and while on slow speed consumes twice as much current as if the motors were in series.

This question of additional current consumption may not in many cases represent a serious economic loss when one locomotive only is considered, but when a number of gathering machines are used the total amount of energy wasted in this way in a year is always a matter of serious consideration to the mine engineer who is desirous of maintaining a high over-all efficiency for the electric system of the mine.

The electric braking controller is a positive insurance against this particular form of waste as it is of the series-parallel type similar to that used on the ordinary street car and the first point is always "series-motors." Consequently the motorman cannot get to parallel operation until he has gone through all the series points.

In Fig. 4 the controller is shown with the arc chutes

FIG. 3. DETACHABLE TIRE DRIVER  
Tread is not shrunk on but held in place by two V'd rings drawn tight with bolts. Two men with wrenches can replace a worn tire in fifteen minutes ready for immediate service.

FIGS. 4, 5 AND 6. SOME DETAILS OF THE CONTROLLER

The construction of this controller is radically different from that of the ordinary type. The reverse cylinder is provided with four operating points and a neutral, and the arc-chute apertures are comparatively restricted.

in normal operating position. It will be noted that the apertures are greatly restricted as compared with ordinary controller construction. This arrangement was adopted after exhaustive tests had demonstrated that by this means the arc could be extinguished in about one-third of the time required with the more open form of arc chute.

This detail insures longer life for the contacts since for all practical purposes their length of service is inversely proportional to the time of duration of the arc.

The outside frame construction adopted for the new locomotive is decidedly substantial. The side frames are cut from solid rolled steel plates, while the end frames are built up from structural steel channels, rolled slabs and wood bumpers protected by heavy face plates.

The outside frame in this case differs from the usual machine of this type in that the clearance between the rail head and lower edge of the side frame is high. Ordinarily an outside-frame machine would clear the rail head at this point by 3 or 4 in. When the locomotive is derailed, the frame settles down to about the level of the rails and prevents all access to the wheels. With this new construction the high clearance of the frame permits access to the lower part of the wheel so that blocking or other re-railing devices may be put into position, and the locomotive gotten back on the track practically as quickly as if the wheels were outside of the frame.

#### OUTSIDE FRAMES MECHANICALLY ADVANTAGEOUS

There are, of course, some mines where side clearance will not permit the extra width of the outside-frame type machine, but as a rule the main objection to this type of construction has been the difficulty of getting it back on the track in case of derailment. The high-clearance feature should remove this objection.

On the other hand, the outside-frame construction permits the use of a better journal box, one that is entirely inclosed at one end, while the other end can be fitted with a dust guard. With an inside frame both ends of the box must be open and bearings must also be made in two halves. This is not as good construction as the closed-end box either theoretically or practically. With the outside frame the greater space between the side frames allows more room for the equipment and permits the use of a liberal amount of space for the motor-man's cab.

Heretofore practically all two-motor locomotives have been equipped with the round wire-coil type of journal spring, whereas the heavier three-motor machines were

provided with leaf-type springs. These insured smoother running and better distribution of the weight on the drivers when operating on rough and uneven tracks.

As the result of operating experience gained with the three-motor units, the new locomotive was provided with a semi-elliptic leaf-type spring having an equalizing bar between the two journal springs on each side. Because of the limited space in the over-all dimensions of mine locomotives, the leaf springs can be designed with a much greater margin, that is, with much less of an approach to the elastic limits of the material used, than is the case with helical spring design. Consequently the leaf springs are mechanically stronger and less liable to breakage.

#### LEAF SPRINGS PERMIT WHEELS TO ACCOMMODATE THEMSELVES TO TRACK INEQUALITIES

By using leaf springs and equalizers the two-motor four-wheel locomotives will accommodate themselves to inequalities in track levels for the reason that any change in wheel load is transmitted through the equalizing levers to the other wheels, thereby practically evening up the weight on the drivers. Incidentally, the equalizing lever greatly increases the range of spring action and any tendency toward derailment is thereby minimized. Finally, the improved riding qualities of the locomotive tend to reduce the wear and tear on the track and roadbed.

The cable reel on this machine is an improved form of the vertical-axis motor-driven type that has been used successfully for a number of years. No change has been made in the ball-bearing motor but the bearing mechanism of the reel itself has been modified so as to secure greater stability and better wearing qualities. Instead of a large diameter of bearing made up of a considerable number of small balls, the reel now rotates on a heavy-duty type combination thrust and step ball bearing mounted at the center of the reel disk. The double-reduction driving train is made up entirely of forged-steel gears and heat-treated pinions.

The construction of the demountable tires is extremely simple, consisting merely of two wedge-shaped steel rings drawn together at suitable intervals by bolts. In drawing these rings into position the tire is forced to take its proper alignment with respect to the wheel hub and gage line, while the wedging action of the rings locks it securely in place.

It will be appreciated that the renewal of this tire is a much shorter job than is the case with the ordinary shrunk-on type. Socket wrenches are the only tools

required, and the change can be made in the locomotive barn. With outside-frame locomotives it is only necessary to drop the axles, and with inside-frame machines the change can be made without taking the axle out of the frame.

The advantages of these demountable tires will be appreciated by anyone who has had to replace a shrunk-on tire. The complete replacement of the new tire can be effected by two men in about 15 min. for each wheel.

With the co-operation of W. A. Chandler, electrical engineer of the H. C. Frick Coke Co., a 6-ton gathering locomotive with an experimental braking equipment of

the type here described was placed in service at the above-named company's coal mines near Uniontown, Pa. This has been in successful operation for the past two years, during which time the necessary refinements were worked out under actual service conditions.

A 20-ton main-haulage locomotive with similar braking control has been handling loaded trains on a 4,000-ft. line with 4 to 5 per cent grades for about one year. It is therefore evident that the principles embodied in the new gathering locomotive have fully demonstrated their value in actual service. The locomotive here described was designed by engineers of the General Electric Co.

## Meeting Difficulties of Centrifugal Pumping By Suitable Construction

End Thrust is Met by Hydraulic Balancing—Diffusion Rings Are Omitted—Wearing Rings Reduced from Four to Two—Internal Parts Made Readily Accessible—Centrifugal Pumps Have Large Capacity

**M**ANY mining engineers hesitate to install centrifugal pumps for handling mine water for two reasons—the high upkeep cost and the tendency of the machine to break down when most needed. Pumps designed for handling fresh water give poor service in mine drainage, even if made entirely of bronze. Quite satisfactory results can be obtained, however, with pumps especially built for the mines. Wear on the rotating parts in contact with the water cannot be avoided. A mine pump should, therefore, have few wearing parts in order to minimize the upkeep expense. Furthermore, the pump should be hydraulically balanced, since most shutdowns arise from end thrust.

Single-suction multi-stage pumps are particularly inclined to "shove." What causes the end thrust is sometimes hard to determine, especially when the impellers are surrounded by diffusion rings, that hamper inspection. It may be caused by blocked impellers or excessive wear of the impeller seal rings. Again the impellers may not be in line with the diffusion rings, or other slight imperfections or maladjustments may exist.

As is well known, single-stage, double-suction, volute pumps give excellent service in the mines because they have few parts and are hydraulically balanced. They are absolutely reliable if equipped with a bearing that will take care of end thrust. (Fig. 1) The Hazleton two-stage volute pumps are built along the same lines as the double-suction volute machines. The water enters the impellers from both sides (Fig. 2), but there are two volutes combined into one casting, the discharge from the first passing under the second volute and up into the eye of the second impeller, so that the volutes work in series and produce twice the head obtained in a single-stage pump. This arrangement obviates the necessity for diffusion rings, commonly used in two-stage pumps, and reduces the number of wearing rings from four to two. This not only means less upkeep cost but also less internal leakage and in consequence a much longer maintenance of the original efficiency than diffusion-ring pumps can show.

The absence of diffusion rings makes inspection easy, as all internal parts are readily accessible. The water is led from the first volute into the suction head of the

HYDRAULICALLY-BALANCED, ELECTRICALLY-DRIVEN PUMP  
Discharge from one section of this unit is made to the suction of the other, thus compounding the effort.

second through a carefully designed passage, so that good efficiency and a compact casing are obtained. This design is covered by patent. The pump is balanced like a double-suction machine. If two two-stage pumps are connected in series, a four-stage pump is obtained in which the impellers are mounted alternately opposed on the shaft, so that the first impeller balances the second

ments that have to be made in diffusion-ring pumps are not necessary. A four-stage pump has only four impeller sealing rings and the upkeep cost is low. The casing is fitted with removable casing rings. A rubber gasket is inserted outside of these rings, the rubber projecting slightly above the surface and preventing any leakage between casing and ring. The rings are so heavy that

ABOVE—HALF SECTION OF A SIMPLE UNIT  
Suction is made from both sides of the impeller, thus securing balance.

BELOW—HALF SECTION OF A DOUBLE UNIT  
The direction of suction of the two impellers is here opposite, thus tending to secure balance.

and the third balances the fourth. Heavy end thrust is, therefore, not likely to develop, but should it do so the cause can easily be detected, as the casing "top halves" are comparatively light and can quickly be removed. The advantage of this construction is still more apparent in an eight-stage pump. Two men without the use of a hoist can easily lift off the top halves of a 500-gal.-per-minute machine of this type and four men the top halves of a 1,000-gal.-per-minute pump. A spare motor can be installed in a short time, and as the impellers have liberal clearance in the casings, fine lateral adjust-

they will stand reboring, so that they will last twice as long as those commonly used.

Not only the internal, but also the external parts of the pump are specially designed for mine service. The thrust bearing is self-oiling and water-cooled. The cooling water is not under pressure and cannot leak into the bearing. The water jacket is open and can easily be cleaned, as water containing "yellow boy" soon clogs narrow passages. The cooling water valves and flanges are made of acid-resisting bronze, while the piping is of copper.

ELECTRICALLY-DRIVEN FOUR-STAGE PUMP

The various elements or stages of this machine are compounded thus securing a high working pressure, while the arrangement is such as to secure hydraulic balance.

## Coal Loader Based on a New Principle

Increased Production, Decreased Labor and Reduced Overhead Expense Are Goals of Operation—A Loading Machine with 100 Tons Per Day Capacity May Do Much to Attain Them

ONE of the devices developed during the war for the purpose of stimulating coal production was the Joy loading machine. This has only recently been perfected and is now offered to the industry. The inventor, J. F. Joy, is at the head of the Joy Machine Co., with main office in the Union Arcade Building, Pittsburgh, Pa. Development of the machine was fostered by the Pittsburgh Coal Co., and most of the tests necessary in perfecting the mechanical principles involved in the construction were made at the Somers No. 2 mine of this company. This operation, which is used principally as an experimental one, is located at Belle Vernon, about 42 miles south of Pittsburgh.

It is the dream of every operator to increase production, decrease labor and at the same time be able to reduce overhead expenses. Several factors of high economic importance may be effected by a loading machine. The most important of these is the fact that it would be possible to mine a given output from an area about  $\frac{1}{4}$  as great as where hand loading is employed.

The benefits to be derived from mining coal in a restricted area are obvious. There will be less track work to be done, fewer mine cars to be used, fewer haulage units necessary, more concentrated supervision of the mine and a more simple drainage and ventilation problem. In mines where a friable roof is encountered, machine loading permits of a more rapid advance of rooms and entries, with a consequent earlier drawing of pillars.

It was hoped that the new loading machine would be able to realize by practical results the theories mentioned in the above paragraph. From a series of tests conducted under severe mining conditions in the Pittsburgh bed, the outlook is indeed encouraging. Results of some of these tests, which were made at the Somers No. 2 mine, have been put into the form of tables and accompany this article. The data contained in them

are indicative of the high efficiency of machine loading.

A short description of mining conditions encountered in the Somers No. 2 mine will show that this operation is no different from many others in which the Pittsburgh bed of coal is being developed. This bed carries a uniform thickness of 70 to 72 in., and with the exception of a few local swamps is practically level. At no place are grades encountered that exceed 7 per cent. The coal rests on a firm limestone floor but the roof is composed of draw slate which varies from a few inches to as much as 4 ft. in thickness. Considerable trouble is experienced with it as it usually falls as soon as the coal is shot down. In cases where this does not occur the roof is disturbed to such a degree as to make working extremely dangerous. Above the draw slate the roof is fairly strong and permits posting to be kept from 10 to 15 ft. in rear of the face.

The room-and-pillar method of developing the coal is employed. Entries 9 ft. wide are driven in pairs on 50-ft. centers. Rooms on 39-ft. centers are driven off these to a distance of 250 ft. The room necks are 9 ft. wide and 21 ft. long, after which the room is widened to from 21 to 24 ft., the actual room width depending, of course, upon the thickness of cover. The room pillars, which are from 15 to 16 ft. in width, are drawn after the room has been advanced to its full length of 250 ft. The track in each room is carried along one side and at a distance of 6 ft. from the rib. As the draw slate is brought down it is gobbled between the track and the opposite rib. Twenty-five-pound steel rails are used in the room track, which is laid to a 42-in. gage on wooden ties, spaced 2 ft. apart.

The coal was undercut to a depth of about 7 ft. by means of Sullivan shortwall mining machines and shot down in the usual manner with black powder. The Joy loading machine was then employed to supplant the common method of hand loading.

A brief sketch of the machine was published in the Nov. 27 and Dec. 4 issue of *Coal Age*, covering one of the machines in operation on the surface. Coal was reloaded from a stock pile at the Montour No. 10 Mine

speed of eight miles per hour, the speed of travel being at all times under the control of the operator.

As shown in the accompanying illustrations, two conveyors are embraced in the construction. One of these reaches from the gathering mechanism to a storage hopper that constitutes the body of the machine. A second conveyor is utilized to discharge the coal from the hopper into the mine car, which is located to the rear of the machine. Both conveyors are flexibly mounted on the supporting truck and may be swung to nearly any angle. This feature of construction permits the machine to traverse short-radius curves such as those at room entrances.

The gathering mechanism is placed at the forward end of the loading conveyor. Briefly, it consists of a pair of geared fingers that are arranged so as to be positively driven in a fixed orbital path. The initial movement of the fingers is forward into the coal, after which there is a raking motion across the coal face and then a rearward movement toward the loading conveyor. From this point the movement is a return to the starting position. The path of the finger tips is shown in Fig. 3.

After the machine has been brought into the room where it is desired to load the coal, the loading conveyor is lowered so as to bring the gathering mechanism at the front end into contact with the floor. The machine is then propelled forward until the gathering mechanism is in close proximity to the loosened coal, after which it is set in motion and the machine bodily moved forward on the track until the fingers in their orbital movement engage the coal and gather it onto the loading conveyor.

The gathering mechanism is of simple but rugged construction and with its undermining action is capable of loosening the coal from a semi-undisturbed state. Safety measures in the form of friction clutches are provided so as to prevent destruction of the gathering mechanism when the fingers encounter relatively immovable lumps of coal.

of the Pittsburgh Coal Co. The details of operation at that mine will again be touched on and when perused in connection with the accompanying illustrations will show some of the mechanical innovations embodied in the machine's construction.

The machine, which weighs about nine tons, is electrically driven and is 29½ ft. long, 5 ft. wide and 5 ft. high. It is moved under its own power at a maximum

JOY LOADING MACHINE IN OPERATING POSITION

The forward conveyor is swung to one side and the gathering head lowered. The fingers working alternately from either side gather the coal to this conveyor. This discharges to a hopper feeding the second or rear conveyor, which loads the cars.

The principles involved in the construction of the machine are departures from any other attempts that have been made along this line. In the first place the gathering mechanism with its horizontal, penetrating, undermining action is effectual in winning coal from a semi-undisturbed state. This allows for a fairly conservative use of explosives. The storage hopper goes a long way in solving the transportation problem since it makes possible the changing of cars without interrupting the operation of gathering the coal from the floor.

The new loading machine was first placed in service on Dec. 1, 1917, and has been operated continuously ever since. Several of the machines are now in operation, each of which is capable of maintaining an average daily production of 100 tons. This is really a highly conservative figure for an eight-hour day.

The machine crew consists of an operator, a helper

TABLE III. RECAPITULATION DECEMBER, 1917, AND JANUARY, 1918

and to oversee and assist with the cleaning of the coal as it passes up the loading conveyor and into the storage hopper. In this respect the loading conveyor is not unlike a small picking table, and with ordinary care exercised in the cleaning there should not be any further need for picking on the surface.

The duties of the helper are to clean up the coal fragments that may be left by the machine in the cor-

Plan of the Low Model Machine

The paths of the fingers are here plainly shown. In this low model the second conveyor serves for a temporary storage in place of the hopper used on the higher machine. This will carry when full a sufficient amount of coal to appreciably shorten the time necessary to fill a car upon the track behind the machine.

and a car pusher. The operator's duty is to supervise the handling of the machine in its various operations

Tons	3,188
Hours delayed	62
Hours delayed due to machine failure	10 5

ners of the room and to assist in separating the draw slate. He may also place such temporary timbers as may be necessary. The car pusher's duty is to place the empty car under the lip of the discharging conveyor after the loaded car has been removed by the driver. He also oversees the filling of the car by operating the secondary or discharging conveyor.

In considering the production figures shown in the accompanying tables it must be remembered that the machine crew had to handle from 40 to 60 tons of draw slate in loading 100 tons of coal. In this respect the draw slate was a serious handicap in establishing any kind of a record. However, the tables are really of more practical value than if the machine had been allowed to work under ideal conditions and records made that would not convey any idea of operation under actual mining conditions. It is quite probable that if the machine had been operating in a bed free from troublesome draw slate the production would have been nearly if not quite doubled.

A machine for use in thin beds is being manufactured although at present there are none of this type in operation. The mechanical principles of construction, however, are the same. This machine will be but 30 in. high. It differs from the type that has been described in that it is provided with a caterpillar tread. Construction details of this type are shown.

# Avoidance of Clinker When Burning Coal With Low-Fusing Ash

Under Ordinary Conditions Coal with a High-Fusing Ash  
Has a Marked Advantage Over a Fuel with a Low-Fusing  
Ash—This Superiority Disappears with Suitable Stoking

BY T. A. MARSH  
East Chicago, Ind.

MUCH interest has been evinced by the entire coal-producing and coal-consuming public in the data by Mr. Selvig of the Bureau of Mines covering the fusibility of coal ash from all districts of the United States, recently published in *Coal Age*. These findings will stand as the authority on this subject for many years to come.

Some of the earliest work along these lines was carried on by the late J. W. Sparrow, chief engineer of the New York Edison Co. Mr. Sparrow observed in his boiler room operation that frequently massive clinker formations would put boilers practically out of service. He therefore began investigating analyses of the coals which caused the trouble. Finding nothing in the proximate or even in the ultimate analysis that would unerringly indicate clinkering proclivities, he began working directly with the fusion point of the ash of each of the coals employed.

This investigation of the fusion point of ash opened up a wide field of inquiry, and the result of Mr. Sparrow's investigations was that out of about twenty possible fuels, a group of only five or six was found suitable as being free from clinkering, as indicated by the high fusion temperature of the ash.

## CLINKER IS NOTHING BUT FUSED ASH

To consider the practical application of Mr. Selvig's data and the correlation of laboratory with boiler room results we must consider exactly what clinker is. Clinker is nothing more nor less than fused ash. Ash fuses when it is brought to a temperature above its melting point. With some coals the melting, or fusion, point of the ash is as low as 1,800 deg. F., while the ash from others will not fuse until it has reached a temperature of 2,200 deg. The refuse from still other coals requires as much as 2,400 deg. and among the least fusible are those that require a temperature of 2,800 deg. F. before melting occurs.

Furnace temperatures as high as 2,200 to 2,400 deg. are frequently obtained. Temperatures beyond this point are seldom reached in practice, and consequently if coal whose ash fuses at a temperature below 2,400 deg. is used in a furnace which operates at a temperature in excess of 2,400 deg. the ash will melt if brought into that part of the furnace where the high temperature occurs. If the ash requires 2,600 or 2,800 deg. F. in order to melt, bringing it into a furnace temperature of 2,100 deg. causes no clinkering.

There are therefore two possible methods of avoiding clinker in furnaces operating at high temperatures: Either keep the ash cut out of the part of the furnace where the high temperature exists, or use only

coal which has an ash fusing at a higher temperature than 2,400 deg. F. If all of the available fuels are low-fusible-ash coals, it becomes necessary to select such stoking equipment as will not bring the ash into the zone of high temperature in the furnace. If, on the other hand, a variety of high- and low-fusible-ash coals are available, it is possible to select only those which have high ash-fusion temperatures. This selection is actually being made throughout certain districts of the country, particularly in the East, where coals with high- and low-fusible ash are available in many markets. It inflicts serious handicap on the producers of coals with a low fusible ash, and is a condition which ultimately will be corrected as we learn to burn all of our fuels regardless of such characteristics as tendency to form clinker.

## HIGH TEMPERATURES ARE DESIRABLE

In those markets where high-fusible-ash coals are not available, such as in the Middle West and West, coal consumers have learned to handle the low-fusible-ash, or clinkering, coals in a way to avoid all clinker trouble. The method of doing this is not to reduce the furnace temperature, as high furnace temperatures are desirable and necessary in order to secure high efficiency. It is not to change the coal and select only those fuels whose ash will not melt in the furnace, for such coals are not available; but the method employed is to keep the ash out of the zone of high temperature in the furnace. This is not as difficult to accomplish as might be supposed. It simply involves not stirring the coal or turning it over after it is once ignited.

Comparatively few coals west of Pittsburgh have ash with a high fusion point. Moreover, the quantity of ash in such coals is high. Therefore, where Mr. Selvig's paper indicates a high percentage of ash and a low fusion point, the common expression in describing such a coal would be that it "makes clinker and lots of it." This is the general characteristic of coals of the Middle West and the West. Some are a little better than the average, many are worse.

## FUEL AGITATION MUST BE AVOIDED

To put these coals on stokers that agitate the fuel bed and which bring the ash up into the zone of high temperature is disastrous to economy, capacity and even to the continuous operation of the stoker and boiler. Practically all Western plants therefore must use stoker types which do not agitate the fire bed and which carry the fuel entirely through the furnace and continuously discharge the ash. The chain grate is an adaptable stoker in this field, and because of the charac-

teristics of the coals here produced this type is largely used. In plants equipped with chain-grate stokers the question of fusibility of ash never arises, as the ash is always on the lower side of the fuel bed and is not disturbed or thrust up into the zone of high temperature. Consequently clinkering does not occur.

The selection of the right type of stoking equipment for the fuels tributary to the plant is highly important. If the entire fuel market is available, regardless of the fusibility of the ash, certainly the purchaser is in a position to obtain his fuel to better advantage than if he is limited to certain high-class coals. Furthermore, the producer is in a better position to offer a continuous supply and a more attractive proposition if all of his coals are desirable fuels for the plant in question.

One of the worst combustion-engineering errors possible is the selection of the wrong stoker for the fuel available. For instance, when a stoker which agitates the fuel bed is selected for a low-fusible-ash coal, it is

only a question of time until live steam jets will be installed along the walls of the furnace to soften and disintegrate clinker. It is possible to accomplish this result to a marked degree, but the steam consumption is so great that it is now well known that the installation of such steam jets is a frank admission that the wrong stoker has been selected.

Coal consumers are interested in this problem as it is their business to select stoker types suitable for the fuels available. Coal producers are forced to be interested in the problem as many of them will, if they have not already done so, find their coals discriminated against because of clinkering characteristics as determined in practice and as indicated by the fusibility of the ash. From the standpoint of national economy we must certainly all work to the utilization of all of our resources in the most efficient manner possible, and the more thoroughly we understand the problem in connection with our coal characteristics, the fewer will be our mistakes.

## Machine That Cuts Coal Without Alighting From Its Carriage

**Turntable Type of Machine Cuts at Almost Any Level, Removing the Impurities Where Desired or Cutting the Coal so That a Safe and Even Roof Is Secured**

**I**N the evolution of coal cutters every one of the practical machines has attained its present status not by wholly eliminating its predecessor but by meeting mining conditions for which other types were not entirely adequate.

In manipulating the pick machine, which was the first practical coal cutter, the operator had to direct every blow and his helper was required to shovel back the cuttings as fast as they were made. When the breast machine was perfected much of this labor was saved and more coal was cut yet with less effort, but the breast machine never entirely supplanted the pick machine because it was not adaptable to all mine conditions. To load and unload the breast machine from its truck, to bar it across the face, to set the jacks and to shovel the cuttings, all took labor.

This machine was followed by the continuous coal cutter or shortwall machine. The latter accomplished

more cutting with less labor, as this machine was loaded, unloaded and moved across the face under its own power, but it likewise never completely supplanted its predecessor because conditions were encountered to which the breast machine was better suited than the shortwall type.

A number of experimental machines followed, but as they never reached commercial favor they cannot be considered as actual progressive steps in the development of coal-cutting equipment.

The turntable type of cutter of the Morgan-Gardner Electric Co. is the latest development. Here the labor of operating is further reduced, as there is neither loading nor unloading, nor yet shoveling of cuttings. Notwithstanding the fact that the field of usefulness of this machine is probably wider than that of any other type, it is likely that it will not entirely displace the shortwall machine.

TURNTABLE CUTTER AND ITS TRAILER

Really the propelling element, the trailer pulls or pushes the cutting machine from place to place.

The turntable machine is particularly suitable for such work as cutting out dirt bands, cutting in the center of thick beds or near the top, leaving coal to protect the roof from weathering or to furnish strength and also safety under what would otherwise be a bad and dangerous roof, thereby saving timbering, the handling of fallen rock and other expensive dead work.

In one field where there is a 3 ft. bed of good coking coal overlaid with a soft brash coal from 18 in. to 2 ft. thick the brash cannot be allowed to mix with the coking coal because it practically ruins the coke. The machine, cutting just above the coking coal, brings out in making the cut virtually all the stratum of brash, leaving the lower bench separate and clean, so that it can be loaded without danger of contamination.

In another field the machine has pronounced usefulness beyond making the cut. Here a 5-ft. bed is overlaid by 2 in. of "cube bone coal," which makes a bad separation from the good coal when shot with it. Accordingly the cut is made in the bone coal and overlying slate, leaving the entire bed to be shot and loaded out. The quality of the coal thus is made better both by eliminating the bone and by producing a larger percentage of lump.

In a number of mines where the roof was so bad that it was almost impractical to mine at all, this machine came to the rescue by cutting in the coal a short distance below the top, making a good, smooth coal roof. Another machine has been built and with it an attempt is about to be made in a 9-ft. bed to make a cut 92 in. above the track, leaving enough coal to form a good roof.

There is a possibility that the new turntable type of machine will prove to be highly useful in thin beds where it is necessary to take up bottom to make height. In such work the truck and propelling motor equipment remain on the track in the space excavated, while the cutting element swings over the bottom in the space left by the removal of the coal. Within certain limits the cut can be placed at the top or bottom of such a bed, as may be desired.

This machine is composed of three principal elements—the propelling device, the turntable truck and the cutting machine proper. The propelling portion, which is really a small locomotive, carries part of the weight of the turntable truck and cutting machine, while the remainder of the weight is carried on a boggy truck under the turntable. This arrangement distributes the weight on eight wheels, so that the machine can travel safely on light rails. The propelling element is equipped with a motor, trolley pole, automatic cable reel, sand boxes, seat for the operator, tool box and supports for carrying the jacks.

The turntable element is flexibly mounted on the forward truck. It is composed of two plates pivoted together, the upper plate being free to rotate on anti-friction rollers held in the lower plate. Provision is made for locking the plates together for each cutting position. To the upper plate are attached the adjustable supports for the cutting element. As this element is adjustably mounted at three points only, it can be raised and lowered to cut at various heights horizontally or to cut upward or downward through a wide angle. It can also be tilted laterally a short distance.

The machine proper is of the breast type but is designed and built for turntable requirements. This type lends itself well to the conditions encountered, as it feeds out and reaches a great distance from the

FRONT VIEW OF THE TURNTABLE MACHINE

The cutting element strongly resembles that of a breast machine. It may be raised, lowered or swung from side to side.

track, yet its frame holds it rigid when the cut is being made. The whole machine is necessarily long, and it might well be expected that difficulty would be encountered in traversing short curves and in entering narrow places, but this is entirely overcome by automatically turning the cutting machine on its turntable whenever it travels around such turns. It actually overhangs the track less than does the ordinary breast or shortwall machine designed to cut an equal depth.

As this machine is a recent production, in its construction such effective modern devices as enclosed gears and motors, ball bearings, special alloy steels and heat-treated parts are utilized. The turntable machine is the product of nearly thirty years of experience in the design and construction of successful coal cutters. It therefore will be likely to hold a high place as a coal producer until the combined cutting and loading machine reaches its final perfection.

**Violation of Statutory Safety Regulation.**—A rule embodied in the Pennsylvania Anthracite Mining Act reads: "No person shall ride upon or against any loaded car, cage or gunboat in any shaft, slope or plane in or about a mine or colliery." In the case of *Petrowsky vs. Delaware, Lackawanna & Western Railroad Co.*, 250 *Federal Reporter*, 554, the defendant unsuccessfully sought to defeat liability for injury to a boy 17 years old, sustained while riding on a loaded car in violation of this rule.

The United States Circuit Court of Appeals, Second Circuit, holds that if, as testified by plaintiff, he was riding on the car in obedience to instructions given by the driver boss of the mine, the slope runner, and the engineer in charge of the cable handling the cars, and if he had frequently ridden on the cars daily, the defendant mining company may be deemed to have been guilty of actionable negligence in exposing the plaintiff to the peril resulting in his injury. On the question of contributory negligence the court says:

"The fact that a boy of 17 by obeying an order given to him by one in authority over him violates a provision of this kind in the statute which he is not shown to have known cannot be an excuse as between him and the master, and especially is this true where the master, as in this case, did not post the rules as the act required."

Defendant also asserted that it should not be held liable in this case because the accident was shown to have resulted from a defective condition in the track, for which the mine foreman and not the company was responsible, but the court decided that the wrong in directing or permitting plaintiff to ride on the car was closely enough related to the injury suffered by him to sustain recovery of damages.

# Mechanical Coal Loading as Adapted to Room-and-Pillar Work

Cost Data with Rooms 26 Ft. Wide—Loading Cost Is Halved—Investment in Loading Machinery More Than Counterbalanced by Saving in Other Directions Such as House Construction and Mine Development

BY WILLIAM WHALEY  
Knoxville, Tenn.

FOR a number of years leading coal operators have been more or less interested in the possibility of loading coal underground mechanically. At present interest in this subject is keen, as mechanical loading appears to be the missing link in the complete mechanical equipment of modern coal mines. As Van H. Manning, director of the Bureau of Mines, pointed out in a paper before the American Institute of Mining Engineers: "The drilling and loading of coal should, as rapidly as mechanical facilities are perfected, be done by power-driven machinery, thereby reducing the number of operatives required. The ideal mine installation of the future will be one mechanically equipped throughout and the mine force should gradually evolve into one required primarily for operating and maintaining the machinery employed."

A number of manufacturers are prepared to furnish machinery for loading coal underground. Some have machines to offer for cutting, breaking down and loading all in one unit; others have scraper outfits for low-bed work; others, again, have portable conveyors, upon which the coal is placed by hand, while others offer shoveling machines which employ an automatic shovel and load the loose coal from the floor into the mine car. Each type of equipment has its well-defined limitations. This paper deals with the shoveling machine as originated and developed by the Myers-Whaley Co.

The "Myers-Whaley" is the outcome of many years of development. The initial device was built twelve years ago and the development has progressed steadily until now these machines are in use for loading almost all conceivable materials in underground mining. An example of the use of this machine is contained in the following extract from a letter written by a coal mine manager in Utah:

"We have had this machine in operation since last January with satisfactory results. Our coal varies in height from 16 to 23 ft. Rooms are driven up about 12 ft. high, the balance of the coal, until pillar extraction begins, being left to support the roof. At the present writing we are using the machine in entries, as we have had some difficulty in getting men to drive our narrow work, and while we do not get the tonnage from the machine which we secured when working in rooms, we do get the development, which at present in our case is of more importance. It is handling four to five faces, the extreme distance traveled being about 1,200 ft. When working in rooms we use this machine in a panel where we have a number of places the length of which would average 300 to 350 ft. The machine cleaned up approximately 140 to 150 tons per shift of eight hours."

An example of the use of the machine in other materials than coal is found in the shale mine of a large

PLAN AND ELEVATION OF A MYERS-WHALEY LOADER

This consists of a shoveling and a loading element. In this instance the loading conveyor serves as a temporary storage to facilitate changing cars.

manufacturer of portland cement. This mine is laid out on the room-and-pillar system. The rooms are driven on 49 ft. centers, 26 ft. wide and about 200 ft. long. The cars hold two tons. The track gage is 30 in., and power is supplied at 500 volts direct current. The first machine was installed in February, 1916. It loaded over two hundred tons of material per 8-hour shift as an average, with a big reduction in cost. The entire crew of the machine consisted of one operator, one helper and one car coupler.

The company that bought this machine has the reputation of being highly conservative in purchasing equipment, and absolute proof of the economy, reliability and desirability of the device is shown by its putting in a second machine in March, 1916, a third in the summer of 1917 and a fourth in the summer of 1919—all in the same mine. Similar satisfactory installations have been made in many other operations.

An analysis of existing conditions and results to be accomplished with these machines in coal mining is given below. This is taken from data concerning a new coal mine which is now preparing to begin operation and install shovels as initial equipment:

BED—6 ft. thick, clean coal, shoots well.  
 POWER—230 volts, direct current.  
 ROOMS—30 ft. wide, two tracks, 44-in. gage.  
 CARS—4-ton capacity, 35 in. high from rail.  
 RAIL—40-lb. on entries, 30-lb. in rooms.  
 MACHINES—No. 3 size Myers-Whaley shovels.  
 OUTPUT—1,000 tons per day.

Analysis of loading cost per day is as follows:

LABOR:			
One machine operator.....	\$5.75		
One helper .....	5.25		
Two car men at \$5.....	10.00		\$21.00
OTHER EXPENSE:			
Power .....	\$2.00		
Oil and supplies.....	.50		
Upkeep, 1½c. per ton, 210 tons.....	3.15		
Interest, \$9,000 at 6 per cent, 250 days.....	2.16		
Charge off investment, 20 per cent per annum.....	7.20		\$15.01
Shoveling costs .....		\$36.01	
SHOOTING COAL:			
Two men at \$5.....	\$10.00		
Powder .....	4.00		\$14.00
Total cost shooting and loading.....			\$50.01

Each room makes 60 tons of coal and with liberal allowance for operative delays 3½ rooms will be loaded per shift, or 210 tons, at a cost of 23.6c. per ton. The hand loading scale in this district is 55c. per ton and it would take about 20 men to load 210 tons of output.

In considering a new mine, however, the following "incidental" advantages of machine loading can be fully realized: For each machine installed the service of 14 men can be saved and a better class of men usually will be secured. Each machine will save the building of about five dwellings that would be required if hand labor were employed exclusively for the loading of coal. Thus the saving in houses will pay for the investment in machines.

With machines also the required tonnage can be reached with a much smaller development. This means that the operator will get his desired production at a much earlier date than with hand loading. Entries for development can be driven three times as fast at one-third the cost. The latter two items reduce trackage and incidental expenses. A smaller operating territory is required for a given tonnage, and mine bosses can keep closer to their work.

For the benefit of those who are not familiar with the Myers-Whaley shovel an outline drawing in plan and elevation is presented herewith. The machine is equipped with an automatic shovel supported and driven

by a crank. The shovel discharges onto the forward conveyor, which in turn delivers its load to the rear conveyor, which in turn discharges into the mine car. The shovel and front conveyor are mounted on a swinging jib, enabling the machine to shovel at a distance of 8 to 10 ft. to each side of the track center. The rear conveyor also swings laterally so that it can load cars on curves or upon a parallel track.

The jib and rear conveyor are pivoted upon a main frame carrying the motor and propelling mechanism. This main frame is supported by four track wheels solid on their axles and mounted in adjusting pedestal boxes to allow for any inequalities of the track. The machine is moved forward and backward under its own power and uses no jacks or clamps. It is as portable as a mine locomotive and travels readily from room to room. The operator is provided with a seat on the jib where he can see and direct the shovel to its work. These machines are standardized and the component parts are interchangeable.

## Separate Trapdoors for Men and "Motors" Obviate Accidents

BY G. E. DAUGHERTY  
 Pikeville, Ky.

TRAPDOORS are not the best means of distributing the ventilating current; but we find conditions where they are satisfactory and others where they cannot be avoided. An old saying that is particularly applicable to the hanging of doors and brattice cloth in mines is "Anything that is worth doing at all is worth doing well".

This point has not been lost sight of by the Northeast Coal Co., which operates a mine at Auxier, Ky., and which provides a small man-door in the same frame as the haulage door, but on the opposite side from the trolley wire. Ample clearance is left for a path along the roadway, which is kept clean, so as to make it more convenient for workmen to pass through the small door.

In this manner the company hopes to avoid, to a great extent, the possibility of accidents occurring, through men letting the main door stand open, or coming in contact with the trolley wire when passing through the door. The small door is pulled shut by a spring.

TRAP- AND MAN-DOOR IN ONE FRAME  
 Door for passage of men is placed at one side of the main door and is closed with a spring.  
 A good walkway leads through this door.

# Designing and Building Track to Avoid Trouble and Increase Capacity

Of the Great Multiplicity of Rail Sections, Fishing, etc., Only a Few Are in General Mine Use— Properly Designed and Fabricated Special Trackage in Many Instances Does Much to Aid Efficient Transportation

BY IRA DYE  
Hamilton, Ohio

**T**HROUGHOUT their entire contact with modern civilization, coal and transportation are inseparably linked. So self-evident a fact would seem to require no elaboration, but the experiences of the past two years, both with coal and indeed with the problem of transportation in general, seem to indicate that the correlation is imperfectly understood.

The fuel producer depends on rail transportation for his supply of machinery, materials, tools and men required to operate his mine. Locally, in and about the works, he relies on rail transportation to move supplies, tools, men, coal and the waste material. Rail transportation carries the mine product to the consumer.

A chance is thus presented to make a careful study of conditions and so to perfect transportation at the mine itself, at least, that maximum production and minimum labor may go hand in hand. The whole history of American industry proves that it pays to provide equipment when such equipment will save labor. To remove drudgery from work and reduce the percent-

age which human muscular energy bears to the total energy expended has always meant progress, production and profit.

This article is concerned with the track structure upon which the car wheels roll, especially those parts controlling movements from one track to others. Practically all track plans are combinations of switches, switch stands, frogs, guard rails, crossings and curved and straight rails.

Various designs and types of these track specialties have been worked out to meet the conditions encountered in coal mining. Room turnouts, branches, sidings, main-line cross-overs, automatic switches, yard layouts, repair tracks, tipple and loader tracks, gravity switching layouts—each offers its peculiar problem, different, and yet similar, in each mine. Frequently the manufacturers of special track work, by reason of familiarity with the possible designs and with manufacturing problems, can save delay, expense and operating trouble if given a free hand in meeting a specific mine-trackage problem.

FIG. 1. TIPPLE TRACKS AT MONTOUR MINE NO. 10

This somewhat complicated layout was completely fabricated in the factory and erected on the job.

In beginning a track design the engineer or mine operator is confronted by the question of rail sections. These are in common use in the United States alone about 60 different non-interchangeable sections of rail. These vary in weight from 8 to 130 lb. per yard. Six different sections, properly designed for different conditions would meet every conceivable requirement, thus obviating an economic loss involved in the existing multiplicity of rail sizes which runs into millions annually.

Having decided on a rail section, the selection of connectons at the rail joints must be made. There are about 276 different combinations of holes for rail joints, varying from 2 to 12 in number per joint and making use of from  $\frac{1}{2}$  in. to  $1\frac{1}{4}$  in. joint bolts. In mining work only four styles of "fishing," or joint drilling, are common. There is no advantage whatever in using more than six for classes of rail and service. The remaining 270 styles are the result of experiments, accidents and differences of opinion.

Local conditions and the rolling stock available determine the gage of track. There are many variations, ranging all the way from 20 to 66 in. but the tendency is to standardize on the gages recommended by manufacturers of locomotives and cars in so far as conditions will permit.

In a general way the type of construction of frogs and crossings is determined by the rail section. It is not possible to secure a satisfactory flangeway depth on rails less than 3 in. high by using fillers between rails, and even on those over 4 in. high the riveted base plate seldom is as strong as the rail. Between 3-in. and 4-in. heights either filled-and-bolted or riveted-plate construction is satisfactory. The riveted construction is somewhat cheaper and the filled-and-bolted more rigid and durable.

For room turnouts of short radius with light rails, where falls of slate or other causes may make it necessary to abandon a piece of track, a frog of semi-steel cast in one piece has been found to be convenient and economical. When buried by debris or worn out, less expense is involved in leaving the frog buried than in digging it out. The cast frog has inherent weaknesses due to its form and is of doubtful economy on light rail work in the alloy or manganese-steel types, because these alloys are costly and of low salvage value.

A combination of frogs, switches, guard rails and curved rails designed and fabricated by the American Frog & Switch Co. for the Pittsburgh Coal Co. is here presented (see Fig. 1) as illustrating the uses of track work at the tippie of the Montour Mine No. 10. The various turnouts and vertical curves were assembled

FIG. 3. ANOTHER LAYOUT FOR INDUSTRIAL TRACKS. Guard rails are used on all curves in this as well as the preceding track plan. Their utility is well worth their cost of installation.

complete at the factory and afterward shipped and reassembled at the mine. Both 40- and 60-lb. rails were used while all frogs are of riveted-plate construction.

Several switches are self-closing by springs in order to confine operation of facing-point traffic to one track, while trailing-point traffic may come through at full speed without a switchman. The double guard rails at each frog are essential to prevent derailment, but are replaced by a double-pointed frog in the automatic gravity switchback between "loaded" and "empty" tracks.

A combination of solid bolted crossings, special frogs and switches made by the same manufacturer that furnished the equipment mentioned above, but designed for the charging floor at the United Verde Copper Co.'s smelter at Clarkdale, Ariz., is shown in Fig. 2, illustrating the solution of a track problem in heavy rail. Here the sharp curves are protected by continuous guard rails and the crossings are guarded throughout. The special frog with three points gives rigidity and provides clear flangeways on all tracks.

While a special, complicated layout or crossing is frequently necessary, the great majority of problems are solved by frogs and switches. The manufacturer, if furnished with data on rail, fishing, gage and type of construction, and information as to clearances and special conditions, can meet many a complex track difficulty and provide simple and wreckproof layouts. The mining engineer, if he calls on the designing engineer for suggestions, may save considerable in delays, shop expense and operating troubles. And whoever, by invention or handicraft, permits one man to do what two or more men formerly did, and do it better and more easily, has beyond doubt contributed toward progress, production, profits and industrial peace.

FIG. 2. INTERESTING INDUSTRIAL TRACK LAYOUT. A three-point frog is decidedly unusual yet this layout embodies one, as well as two curved crossovers.

**Shares in Illinois Corporations.**—A coal or other business corporation may take property appropriated to the corporate objects in payment for shares of stock issued. But payment with property for capital stock is no payment except to the extent of the true value of the property, and if property is taken at an overvaluation the stockholders are liable to make up the deficiency.

Capital stock of a corporation is a trust fund for the security of the company's creditors. (*Illinois Supreme Court, William E. Dee Co. vs. Proviso Coal Co., 125 Northeastern Reporter, 24.*)

## Industrial Alcohol Can Be Made, From Coke-Oven Gases

Ethylene from the Ovens Can Be Absorbed by Fuming Sulphuric Acid and the Product Hydrolyzed by Water, Liberating Alcohol

THE enormous expansion of the automotive industry in recent years has resulted in an unprecedented consumption of gasoline. In spite of vast increases in crude-oil production, it has been necessary to withdraw millions of barrels of petroleum from reserve stocks. In view of even further increases in consumption of gasoline and the consequent exhaustion of the crude-oil supply, new sources of motor fuel must be found.

In filling the need created by the rapidly depleting motor-fuel supply one can hardly overestimate the importance of motor benzol that may be, and is being, extracted from byproduct coke-oven gas. There is, however, another possible source of motor fuel in which coal men are much interested—alcohol. Its efficiency as a motor fuel has long been known, but not until recently has coal been considered a possible source of that valuable industrial product. Experimentation, in this country and abroad, seems to indicate that a portion of the so-called illuminants of byproduct coke-oven gas may be converted into alcohol. This alcohol may then be mixed with suitable quantities of motor benzol and gasoline, thus decreasing gasoline requirements.

Ethylene and acetylene are the principal illuminating gases in byproduct coke-oven gas that we can convert into alcohol. About 2 per cent of the former is present but only 0.1 per cent of the latter. For this reason the conversion of acetylene into alcohol will not be considered.

The process of recovering alcohol from ethylene is somewhat similar to the present method of extracting benzol. The most satisfactory absorbent for the gas is fuming sulphuric acid or 95 per cent sulphuric acid heated to a temperature of from 60 deg. to 80 deg. C. The ethyl hydrogen sulphate formed in the reaction is hydrolyzed by water, liberating alcohol. The latter is then distilled off by a superheated steam.

The above process will require enormous quantities of sulphuric acid. It is proposed, however, to concentrate the used acid and also to recover the sulphur dioxide lost in the process as well as possibly the sulphur in the hydrogen sulphide of the gas. The recovered sulphur will then be utilized in the manufacture of sulphuric acid.

Sulphuric acid will be needed for the alcohol-making cycle and part of what is used will be lost, but it appears likely that sulphuric acid will for many years be reasonably cheap and readily obtainable.

Assuming a 70-per cent absorption of ethylene and a 70-per cent conversion to alcohol, a yield of 1.5 gal. of absolute alcohol per ton of coal may be obtained. The annual carbonization in byproduct coke ovens of, say, sixty million tons of coal in this country, therefore, will produce ninety million gallons of alcohol, quite a fair sized product to be reckoned with.

This project is quite feasible, although it may not seem so at present. It may be compared, however, with benzol recovery in America, which was practically unknown less than ten years ago. It brings home forcibly the profligate waste of the valuable ingredients of coal, which should be checked at once. Our petroleum resources will be gone long before our coal, and sooner

or later we will have to save all the hundreds of valuable constituents from the coal that we use.

## Makes Boiler-Feed Water Pure By Distillation

Heat Used in Distillation Is Returned to the System—  
Eliminates Boiler Scale and Saves Blow-off  
and Other Heat Losses

A LOCOMOTIVE taking water from a tank, as it has to do every hundred miles or so, is a familiar sight. This replenishing of water is necessary also on ocean-going steamers, but there are no friendly fresh-water tanks located at intervals in the ocean at which a ship can call and receive the necessary supply of water. Sea water cannot safely be used in boilers, so every ocean-going ship carries apparatus that purifies the salt water and makes it suitable for steaming purposes.

This necessity led to the development of evaporators. The type of apparatus at first used was extremely crude, but constant improvement has been made in the art until today we have devices of this kind that not only provide a constant pure supply of boiler feed but also furnish water for drinking purposes. The difficulty with the earlier types of evaporators arose from the scaling of the evaporating surfaces, but the submerged type of evaporator, now frequently employed, is actually self-scaling. This is a long step forward.

For over fifty years feed water has been distilled at sea, but stationary power plants did not use distillation to any extent till about five years ago. Many great power-plant advances have been initiated and fostered in marine work because marine conditions demand high-grade equipment, minimum shutdowns and maximum ease of repair.

A ship at sea is its own repair shop and the repairs must be minimized in order to insure constant operation of the ship's equipment. However, from time to time some of these marine products have been adopted in sta-

WATER EVAPORATOR WITH COVER REMOVED  
One sure and positive method exists for purifying boiler feed water—distill it. This device accomplishes that result.

tionary power plant practice, and the past five years has seen the introduction of Reilly evaporators for purification of boiler-feed make-up in large central-station plants, as well as in plants of various sizes—even some extremely small ones.

This purification is accomplished in a similar manner to the established ship-board procedure with the exception that the refinements of operation are even greater, and plants are so arranged that practically all of the heat used in the evaporation of the water by the use of steam is returned to the system. In the actual operation, high-pressure steam is supplied to the coils of the evaporator, and in condensing these coils evaporates the body of water in the shell surrounding them.

This purified vapor is in turn condensed and is ready for boiler feed. This is descriptive only of the basic feature of the plant, and it is the plan of utilizing the contents of the hot-well as the condensing water and other features which make the system not only a valuable means of purification but also permit the apparatus to pay for itself in actual saving in from six months to one year.

The pioneers of the development of evaporators for marine service were the Griscom-Russell Co., of 90 West St., New York. This firm has been manufacturing this type of equipment for more than fifty years, and was also a pioneer in the development of the "high-heat level evaporator plant" for stationary power houses. This latter development, even though a revolutionary one, has come to stay. The particular features which commend it to the plant owner are that it provides pure water, eliminates scaling in the boiler tubes, eliminates the necessity of blowing down the boilers, and that it actually pays for itself in a short time through the heat saved.

## A Regulator for Motors on Pressure Systems

Provides Automatic Means of Controlling Pilot Circuits of Starters for Pump or Compressor Motors

TO REPLACE its former types of alternating and direct-current gage-type regulators the Cutler-Hammer Mfg. Co., of Milwaukee, Wis., is manufacturing a new type of pressure regulator. The new device consists of a pressure gage and relay mounted on a slate panel carried on a wall-type frame, and may be used on either direct or alternating circuits. The manufacturer claims that it is more durable and cheaper than the former types of regulators. This device is used as an automatic starter employed with motors operating pumps, compressors and the like. It can also be used on pressure systems above or below atmosphere. As the pressure falls or rises the needle indicator in the pressure gage makes contact with one of

PRESSURE REGULATOR AND RELAY

A simple device to so regulate the motor as to automatically hold the pressure (or vacuum) on any system between predetermined limits.

two adjustable contact points, thereby starting or stopping the motor. The two contact points can be set as close as 5 per cent of the total reading shown on the gage, and yet give practical results. They are accessible for adjustment through unscrewing the glass cover of the dial.

The pressure inlet hole in the gage cover is tapped for  $\frac{3}{8}$ -in. pipe. The gage can be supplied with dials reading in various capacities. Gages for ammonia service are of material that resists ammonia fumes.

The relay used in connection with the gage has solid copper contacts and will operate on either direct or alternating circuits. The relay provides low-voltage release and will operate to start the motor when the voltage returns.

Pressure regulators of this type must always be mounted in a vertical position and should be connected to an independent pipe from the pressure tank or else to the discharge line from the pump, with an air chamber interposed between to prevent the fluctuation in pressure reduced at each stroke of the pump from seriously affecting the gage needle.

## New Drill-Steel Sharpener Has 200 Uses

Will Forge Bolt Heads, Pins and Stanchions and Sharpen Drill Steel of Many Sizes and Shapes

A NEW compressed-air-operated drill-steel sharpening machine known as the I-R No. 50 sharpener has been developed by the Ingersoll-Rand Co., 11 Broadway, New York. This machine was designed primarily to rapidly and accurately sharpen and shank drill steel such as: Cruciform steel up to 2 in. in diameter, or round, hexagon, octagon, quarter-octagon auger or spiral steel up to  $1\frac{1}{2}$  in. in diameter. However, it has performed so many other tasks that the name "drill-steel sharpener" is almost a misnomer. When fitted with special devices it will force bolt-heads, pins, stanchions, etc.; in fact, nearly two hundred different products have been made by this machine.

The single lever which controls all of the operations of the machine is fitted with a safety locking device. This prevents accidents because of the impossibility of operating the machine unless the lock is released. The throttle valve, which is of the balanced spool type, operates easily and quickly and is positive and instantaneous in its action.

The hammer cylinder is an improved valveless type of hammer-drill cylinder. This construction permits the free-moving hammer to deliver exceedingly rapid and powerful blows against the end of the dolly, upsetting the steel, thus forming the bits and shanks with extreme rapidity. This may be more easily understood when it is stated that its capacity is about 20 per cent greater than the Leyner No. 5 sharpener.

The base must have sufficient strength to withstand the severe stresses and shocks met with in everyday work. Sufficient attention has not been given to this in the past, with the result that base breakage—while not usual—was all too common. A glance at the accompanying illustration will show how substantial and rigid the base of this machine has been made. It needs no foundation with the exception of a few planks to level it properly and need not even be bolted rigidly to them.

IMPROVED DRILL SHARPENER

In addition to sharpening drills this machine may be employed for heading bolts, making machine bits and for many other purposes.

Poor lubrication in the case of sharpeners is due most frequently to the ordinary exposed sight-feed lubricator being accidentally damaged or broken. The No. 50 sharpener has no sight-feed or other exposed devices of this kind. Efficient and positive lubrication is provided for the entire machine by the Ingersoll-Rand "Heart-beat" lubricator. This is embodied in the throttle valve chest casting and works automatically whenever the machine is in action. It is provided with adjustment for regulating the quantity of oil desired.

Every part of this machine is made for long, hard, continuous service. An example of this is the absolute elimination of all cup leathers; only accurately machined snap piston rings are used. This means much to the man who has used a sharpener.

### E. J. Mehren to Investigate European Conditions

E. J. Mehren, editor of *Engineering News-Record*, sailed for Europe on the "Adriatic," April 24. He will study conditions in the civil engineering field in England, France and Germany and will be abroad until the latter part of August.

Mr. Mehren has also been appointed special agent for the U. S. Bureau of Public Roads, in order to secure certain information while abroad for that organization. Mr. Mehren in his travels will keep in mind the interests of *Coal Age* readers in the export of coal, and on his return will give the editors of this publication the benefit of his observations.

## Dump Cars and Dump Wagons as Aids in Coal Stripping

Where Stripping Coal Is Loaded Direct into Railroad Cars Sidedump Equipment Can Be Used for Clearing Up Shovel Wastes

AN acute labor situation and the need for increased unit production present the coal operator with a problem that must largely be solved by machinery and equipment. Where coal stripping is practicable this problem is at least partially so solved. In the Pittsburgh-Hanover operation at Hanlin Station, Pa., for example, thirty-seven men with steam shovels have been getting out as much coal as 300 men ordinarily would mine by undercutting. At this operation some 9,000 cu.yd. of spoil is handled, and about 2,400 tons of coal is loaded each day in two working shifts.

It is the purpose of this article to describe two somewhat novel applications of equipment to the coal operator's problem—one for the elimination of waste and the other for the increase of production. The device for the conservation of coal seems to have originated at the Parlette stripping of the Wayne Coal Co., and it has since been adopted by the Pittsburgh-Hanover people; possibly by others. In steam-shovel loading scattered heaps and chunks of coal unavoidably are left by the dipper—to be covered, in ordinary operation, by the stripping shovel in making its next cut.

At Parlette the experiment was tried of picking up this scattered coal by hand, throwing it into Western dump wagons and then trap-loading the salvaged fuel into railroad cars. The experiment proved so satisfactory that in a single year 700 cars were thus loaded with coal that otherwise would have been wasted. This was accomplished at a cost of 75c. per ton. Moreover the salvaged material was hand-picked coal, commanding the highest market price.

An installation designed for obtaining maximum production and saving labor is that of the R. L. Culbertson Coal Co. at Cadiz, Ohio. A few equipment details may prove interesting.

A well-constructed 36-in. gage track of 90-lb. steel comes out of the strip pit, curves on a 100-ft. radius and continues on a 3-per cent grade through a dumping shed. Here is installed a rotary dump that tips a loaded

COAL CAR IN ROTARY DUMP

With swivelling couplings, car after car of a trip may be discharged without uncoupling.

TRESTLE TO PERMIT CAR LOADING

Odds and ends of coal pushed to one side by the loading shovel are loaded by hand and discharged to the car from dump wagons.

car upside down and spills the coal into a bin holding about 40 tons. The objection to the rotary dump as a substitute for side-dump cars, of course, is the cost of moving the extra weight involved. It is claimed in this case that the speed gained makes the rotary dump profitable and that there is less breakage of coal.

The cars used are of 5-cu.yd. capacity, specially built by the Western Wheeled Scraper Co., without the side-dump feature. The cars are so low in consequence that when loaded the crown of the coal stands even with the box of a standard 5-cu.yd. dump car. The loads, in two trips of eight cars each, are pushed up the 3-per cent grade and through the dumping shed. The small locomotive is then detached and the cars are permitted to roll back by gravity through the rotary dump. Each car in turn is spotted in the revolving cage and held there long enough for it to be inverted and righted again. The cars are fitted with swiveled couplers and in this way an entire trip can be dumped quite rapidly, one car at a time, without uncoupling.

The maximum haul is one-half mile and the average is about a half of the distance. The two small locomotives are supplied with coal from improvised tenders made from standard 5-cu.yd. dump cars. From the bin under the rotary dump the coal is fed by a reciprocating feeder onto a 48-in. conveying belt and picking table, 181 ft. long. This travels at the rate of 100 ft. per minute.

As the coal passes along six or eight men pick out the foreign material and throw it down a chute. By suitable arrangements at the tipple, coal can be loaded into railroad cars below as slack,  $\frac{3}{4}$ -in. and 2-in. coal, or the whole output can be switched to another belt, sent through a crusher and reduced to the required size at the rate of 250 tons per hour.

## Small Portable Electric Hoist With New Features

Machine Is Simple in Design, Economical, Easy to Control, Readily Lubricated and Effectually Safeguarded

CONSTANTLY increasing use of electricity in coal mining has resulted within the last few years in the development of small portable electrically-driven hoists for moving mine cars in rooms, headings, etc., with greater ease and economy than could be done by man or mule power. Many of the machines that have been marketed for this work are reproductions on a small scale of larger hoists. Few attempts have apparently been made to design these machines for the particular requirements they are expected to meet.

In room hoists of this kind double-reduction spur gearing has been commonly employed in conjunction with a simple form of positive clutch. The Cherry Tree Machine Co., among other manufacturers, had been building a hoist of this type for a number of years, but, realizing the limitations of this design, recently perfected what it has called the "Brownie" room hoist, embodying entirely new working principles. In designing this hoist the manufacturers were guided not only by their experience in this field but by the recommendations of many practical mining men who were consulted as to the requirements of an ideal machine of this character.

Because of the nature of the work it performs and the conditions under which it operates, a room hoist must fulfill the following requirements:

It must be light in weight, so that it may be easily moved from place to place; it must be small and compact, in order that it may be located where desired without requiring extra space; it must be rugged in design and construction and capable of operating satisfactorily under all conditions; its control and manipulation must be simple and effective, so that it may be successfully operated by unskilled workmen, and it must be possible for the operator to vary the rope speed at will. These requirements have all been completely satisfied in the design of the "Brownie" hoist, while in addition special attention has been given to lubrication and the safeguarding of the working parts.

The most important feature of this hoist is the patented type of transmission and control utilized. This control makes possible variable rope speeds, ranging

OPPOSITE QUARTERING VIEWS OF THE ROOM HOIST

Two levers, seen in both cuts completely control all movements of the machine.

between zero and the maximum attainable at the will of the operator, the motion of the rope drum being under absolute control at all times. One advantage of this type of control is that the motor is never started or stopped under load. As a consequence any self-starting motor may be used, a high starting torque being unnecessary. A safety-inclosed switch fully meets all requirements for starting and stopping the machine, thus obviating the necessity of a controller. The compactness of the gearing used in this hoist permits the weight and over-all dimensions to be held to a minimum.

The rope drum is driven by means of a gear train, two members of which are internal spur gears having smooth flanged exterior surfaces arranged to be gripped by friction bands. One of these friction bands may be used as a brake to retard the motion of the rope drum as desired while the other is used as a clutch. The speed of rotation of the rope drum depends upon the degree to which the clutch band is tightened.

The rope-drum speed will be maximum when this clutch gear is held stationary. The brake and clutch bands are each connected to a handle pivoted to the base of the hoist. They thus become the brake and clutch handles respectively, and by their manipulation the rotation of the rope drum is controlled.

Effective lubrication has been particularly considered in designing this hoist, as oiling is one detail in the care of machinery that is frequently neglected in mines. All the principal moving parts of this hoist rotate on the drum shaft, and by making this hollow the lubrication of these parts is effected from one point.

The rope guard employed on this machine is another excellent feature. This guard makes it impossible for the rope to get off the drum, foul, or to cause injury to the operator in case of breakage.

The base and side frames of the hoist are all included in a single grey-iron casting, so shaped as to permit the machine to be easily skidded from place to place and anchored where desired. All parts have been designed with an ample factor of safety; all gears have cut teeth and are guarded to industrial safety committees' standards.

The manufacturers of the "Brownie" hoist recommend it for a maximum duty of 1,500-lb. rope pull, such as would be required, for instance, to haul a total load of 6 tons up a 10-per cent grade. Many of these machines have been placed in service within the last year, and the favorable comments of those using them.

### Railways Would Replenish Equipment from Revolving Fund

**T**O CONSIDER recommendations for the use of the \$300,000,000 fund provided in the Transportation Act the Revolving Fund Committee of the Association of Railway Executives held a meeting recently. The Interstate Commerce Commission requested the association to send queries to its members, and the report will be forwarded to the commission soon.

Many railroads lacking large reserve funds are having trouble in financing their equipment needs. Much equipment business is being held back because roads cannot see their way clear to finance orders which should have been placed months ago. Many of the managers hope that the commission will approve spending the bulk of the \$300,000,000 for equipment for those carriers.

## Ball-Bearing Mine Locomotives Need Few Repairs

Reliability Under Hard Service, Minimum Lubrication and Little Attention Required Are Material Aids to Heavy Production

**I**NCREASING use of mechanical equipment in mines arises from the necessity of greater production of coal. The steady demand for more coal and the high cost of labor have made it imperative that machinery shall be used whenever possible. To be of real value, however, such equipment must be efficient and reliable.

Systematic and adequate haulage is recognized as one of the most important factors in coal-mine operation. Furthermore, mechanical haulage has greatly increased coal production and improved working conditions. The production possible through the use of mechanical haulage can be appreciated when it is realized that a large locomotive can haul loads up to or even exceeding 400 tons in weight on the level.

The outstanding feature of mechanical haulage, of course, is the use of electric and gasoline locomotives instead of mules, with a resultant saving of around 60 per cent in haulage costs in addition to other advantages. By promoting uninterrupted service, however, the extensive use of anti-friction bearings on mine locomotives has greatly increased their haulage capacity. Electric locomotives are the more popular for mine work, although under certain conditions the gasoline locomotive is extremely useful. Electric locomotives as a rule are provided with two motors, as better results have been obtained with this arrangement than with single-motor machines. In some makes of mine locomotive motors ball bearings have been standard for several years and have been installed on the heavier as well as the lighter machines, for past performance has demonstrated that ball bearings will withstand heavy loads and shocks, that they are reliable under severe conditions and that they require a minimum amount of attention. Mine locomotives being subject to hard service, which imposes severe stresses upon the motor and its bearings, particular attention must be paid to these parts in order to insure freedom from breakdown.

An important feature of ball-bearing motors is the maintenance of a uniform air gap between armature

CENTRIFUGAL COAL DRIERS

The use and advantages of ball bearings are by no means confined to the mine rolling stock.

and poles, which insures uniform commutation. The armature never rubs on the pole pieces, and the armature bands and coils are therefore never injured. The proper centers are always maintained, which insures longer life to the gears, as they are always held continuously in proper mesh, as well as higher efficiency.

Plain bearings are subject to a continuous rubbing action, which causes wear on the bearing surfaces, frequently allowing the shaft to settle out of the true magnetic field. This calls for frequent inspection and gaging and constant renewal of the bearing brasses. Repairs of this nature mean extra expense, while the delay involved reduces the earning capacity of the locomotive. Locomotives with ball-bearing motors are rarely out of commission. The output of coal therefore is more nearly continuous, which insures high pro-

A LOCOMOTIVE ARMATURE AND ONE OF ITS BEARINGS  
Ball bearings have done much to reduce armature repairs.

duction. Furthermore the cost of repairs arising from worn-out armature bearings is eliminated.

As ball bearings are almost frictionless they are subject to practically no wear, which accounts for the maintenance of the uniform air gap. Balls and races are of course made of hardened steel and rolling action is substituted for rubbing. Ball bearings at both ends of the armature shaft carry it in perfect alignment and allow it to accept sudden changes of load without binding and consequent heating. The self-aligning bearing insures the best possible load distribution on the balls.

This type of bearing has the inner surface of the outer race ground in the form of a hollow sphere, whose center is in the axis of rotation. Thus all points on this surface are equidistant from the center of the bearing. The balls and inner race are free to rotate at any angle within the spherical outer race without being subjected to undue stresses. The bearing therefore will take care of any spring or deflection that may be found in the armature shaft.

Another important feature of ball-bearing motors in mine locomotives is the saving they insure in lubrication and attention. Ball bearings require little lubricant as they need to be oiled only three or four times a year, the housing being designed to retain an ample supply of lubricant. The end caps are provided with sealing grooves which prevent the oil from leaking out and getting onto the commutator and windings. These parts are thus kept clean and short circuits or grounds are greatly reduced in number. With a clean commutator dust will not accumulate and cause bad commutation.

## Car Handling at Valley View Plane

Mine Wagons of 9,000 lb. Weight Are Handled from Head of Plane to Locomotive by Rope and by Barney

BY E. G. MARKLEY  
Bangor, Pa.

AN INTERESTING feature of the Philadelphia & Reading Coal & Iron Co.'s plant at Valley View, near Good Springs, Pa., is the unusual method of transferring or handling cars at the head and foot of the new plane. The plane is 2,700 ft. long. On each trip three loaded cars, weighing each 9,000 lb., are hoisted

FOOT OF VALLEY VIEW PLANE  
The barney used for moving cars to and from the incline may be clearly seen in the central foreground.

and three empties lowered by a 400-hp. electric winding engine at a speed of about 700 ft. per minute. The cars are transferred to and from the head and foot of the plane by four-drum electric hoists.

The breaker is located about three miles from the top of the plane. Empties are brought to the siding and loads taken from it to the breaker by a steam locomotive at the rate of about thirty cars per trip. When a trip of loaded cars reaches the head of the plane an attendant attaches a grip or, as it is here called, a "sling" to one of the cars and also to the endless rope running from the transfer hoist. The cars are then pulled away from the head of the plane to a point just beyond the transfer barney. Here the barney "picks up" the loads and moves them ahead about 150 ft. into position for being coupled onto the locomotive.

TOP OF THE PLANE  
The barney, its rope and track here also may be readily seen.

The empties are brought forward by the same barney upon its return trip, to be transferred to the head of the plane by the transfer rope. As the loads come up and the empties go down the plane upon either side alternately, a crossover switch is necessary. The loaded cars are generally placed on the right-hand switch track ready for removal to the breaker, with the empties on the left for delivery to the plane for lowering.

The barneys travel on auxiliary tracks laid inside of the turnout tracks. They are controlled by friction drums on the transfer hoist. A rope is attached to each barney and they are connected by a rope which passes over guide sheaves. The whole forms a positive reversing mechanism. Throwing one drum into friction, the barney connected to it moves forward and the connecting rope pulls the other barney in the opposite direction, thereby giving the operator any movement desired on the track. A weighted brake on the drums prevents the ropes from running off too freely on the reverse movement.

The endless rope for the transfer of cars to the plane from the barney is operated in practically the same manner, the grip in this case taking the place of the barney. Rings are provided in this rope by means of which the sling, with a hook at one end and a ring at the other, is attached. The ring on the sling is larger than that provided on the transfer rope and consequently will not pass through it. In both cases the

two ends of each rope are connected to separate drums on the hoist, making the movement of the rope positive.

Two men—one to operate the hoist and the other to handle the car sling—receive and deliver all the cars to and from the plane. The operation at the foot of the plane is practically the same as that described as taking place at its head and the same kind of hoist is used. These four-drum electric hoists were furnished by the S. Flory Manufacturing Co. Similar machines and equipment are in use by the Lehigh Coal & Navigation Co. and the Alliance Coal Co., and the transfer of cars is made at their operations in practically the same manner.

## Centrifugal Pumps of Value as Auxiliaries to Meet Emergency

BY W. H. LESSER\*  
Frackville, Pa.

RECENTLY the operating departments of the anthracite coal mines have been called upon to cope with an influx of water in volume and stubbornness seldom, if ever, exceeded. The comparatively few serious suspensions for this cause that took place in producing mines speak well for the installed pumping equipment as well as the machines hastily put in place to meet the emergency.

No doubt all the men in direct touch with the mechanical or electrical department of the mines have been called upon to quickly install pumps in order to prevent some slope or shaft from "drowning out" or to save the main pumping plant. An experience of my own may be of interest and perhaps of some help to others under similar conditions.

Two electrically-driven reciprocating pumps with a total capacity of 2,000 gal. per minute against a head of 800 ft. were unable to handle the water produced in a certain mine, and it became necessary to install an emergency pumping plant. This consisted of two electrically-driven pumps with a total capacity of 2,500 gal. per minute placed on the slope and a pump of the same type in a narrow breast containing the discharge pipe lines from the main pumping plant. This equipment soon "held the water" and prevented a complete inundation of the mine.

When it is stated that the slope was 12 ft. wide and 7 ft. high it will be realized that no other type of steam- or electrically-driven pump with a similar capacity could have been placed in it with the same amount of labor. For emergency pumping in times of high water experience has demonstrated that centrifugal pumps are certainly to be preferred to reciprocating machines.

As to the advisability of using centrifugal pumps for continuous service throughout the year there seems to be some doubt. Few authentic figures are available regarding the relative cost of pumping acidulous mine water by the modern steam-driven, compound, condensing, reciprocating pump, the electrically-driven reciprocating machine or the electrically-driven centrifugal pump. Data regarding these matters, I am sure, will be appreciated by those engineers who are held responsible for the installation and operation of the large dewatering plants common in the anthracite region.

VIEW UP THE PLANE FROM ITS FOOT

This plane is 2700 ft. long, and three loaded cars weighing 9,000 lb. are hoisted at each trip. One of the plane barneys is shown in pit.

\*Mechanical Engineer, Harleigh-Brookwood Coal Co.

# Features in Track Planning That Will Aid In Securing and Increasing Output

Entries and Air Courses Are Carefully Planned, but the Haulage System Is Often Neglected—Transportation in Most Instances Is the Neck of the Bottle That Determines the Volume of the Output.

BY CHARLES H. PARTINGTON  
Cincinnati, Ohio

**B**EFORE track is laid insufficient thought is too often given to its proper planning, and frequently after it is put in place the track is grievously neglected. Some people seem to think that anything is good enough to pull cars over. The fact is that speedy uninterrupted dispatch of loaded cars to the cage, as well as a prompt return of empties, is the main factor in securing large production. Strange it is then that little or no attention is given to the perfection of the haulage system, the track equipment and its design. To illustrate this the following data are offered, which I hope will prove of interest and assistance to mine operators, superintendents, foremen, trackmen and the like.

Before a shaft is sunk one of the important items to be considered is how coal can best be brought to it in large tonnage after the main entries, cross entries and air courses have been driven. Until development has made some progress, the amount of coal taken from the rooms is, of course, small, and the meager tonnage of coal produced can readily, and is generally, hauled upon temporary track. This makeshift arrangement is usually followed after a short while by the installation of heavier trackwork, quite usually, however, without proper thought being given as to how the cars are going to be handled. As a consequence at many a mine improperly located cross entries and intersections are revealed having branch-offs interfering with proper placing of turnouts, crossovers, etc. This results in cramped installations of trackwork, short radii for curves, inefficiency in trip making and dilatory placing of cars for caging and an ineffective distribution of empties.

Proposed mine development usually is carefully plotted and planned, but it is seldom that the haulage system is considered at the same time. An illustration of how a layout was actually made and how it should have been constructed, if proper consideration had been given the

problem before construction was commenced, is shown by Figs. 1 and 2. In making such a design the trackwork must be plotted to a small scale because of the large area to be covered, and consequently such drawings are not carried farther than the beginning of the development of the rooms. Much can be done to handle

FIG. 1. POORLY-PLANNED SHAFT BOTTOM

Track facilities are so congested as not to afford adequate means for switching the locomotive.

cars effectively beyond the points shown, but, owing to the lack of space, the plans for such additional track must be omitted.

Fig. 1 is a map showing a development planned without any consideration of the track layout. True the method of handling cars to and from the cage was predetermined but no consideration was given to the problems involved in the installation of track, especially with regard to the space which the track facilities would require. This resulted in the unavoidable installation of short curves, short-lead turnouts and jammed crossovers. Cross passages between main and side entries were driven without any regard to the position they should properly occupy for the effective placing of track and handling of cars.

FIG. 2. CAREFULLY-PLANNED SHAFT BOTTOM

Adequate provision has here been made for loads, empties, and for the necessary movement of the locomotive.

Beginning our investigation at the foot of the shaft we see that the loads are delivered to the cage from the west side. It is obvious at once that the first cross entries, "A" and "B," were located too close to the shaft. Turnouts installed at the intersection choke off the space available for the double crossover, which not only necessitates that this be built with curves of small radius but leaves no room for passing the locomotive to a free space between the crossover and the cage.

Short radius in a cross-over means improper construction, short switch points and the binding of car wheels, and this results in the use of extra power and retards the movement of cars to the cage. As the main function of the cross-over is the delivery of loaded cars either to the right or the left cage, as desired, a space should be provided to enable the locomotive to pass beyond the cross-over switch and return by way of the opposite track without difficulty or loss of time. Placing the cross-entry switches improperly gives the motor-man little chance to return the locomotive to the rooms for another trip, and that spells delay.

The double-track system in the main lead greatly tends, of course, to prevent congestion, but if too much is expected of this arrangement and the double track is not laid out properly, it will prove useless. A common cause for failure in this particular is the provision of an insufficient length of double track. The double road changes too soon to a single track or the handling of cars may be crippled by inadequate space being left between cross entries. The cramped space resulting leaves no room for placing a number of loaded cars on either track, hence there is difficulty in keeping the cages moving. Shifting the loaded cars is practically impossible, as there is little or no room to accommodate an extra crossover.

The angle at which the cross entries are driven is often responsible for lack of space. If the direction of the cross headings in which track is to be placed is given proper consideration an important gain in space will be made where they intersect the main leads and this will be secured even without changing the position of their starting points in the side leads. With a distance of even 30 ft. between the leads and with cross entries cut at 45 deg. it can readily be seen that a gain of 60 ft. is possible if the angle of the cut is modified. Thus more cars can be placed in line and continuous cage feeding secured.

Ten or twelve cars in a string may be sufficient to meet the needs during early development but when the mine has reached such a size that cars are being assembled from a large number of rooms additional space is demanded because several loads will have to be accommodated on the landing. With no space available, caging is slow, and the only alternative remaining is a re-arrangement of the track. This may work out to some advantage, but in most cases it proves only a makeshift in comparison with the efficient haulage system that might have been planned in the first instance before the possibilities of design were limited by the work already injudiciously performed.

When the transportation system is poorly planned locomotives are held idle on sidings or on passing tracks. In many instances this hold-up is considered a necessary condition, with the result that more locomotives are installed to relieve the idle ones, only to reveal later that this extra expenditure helps but little. Two and even three locomotives are not infrequently required to do

the work that could be accomplished by one if due attention had been given in the beginning to the gathering and placing of loaded cars and to means whereby locomotives could be enabled to go back without delay for other trips.

Not only may the track system cause trouble but the track itself may be of poor design and delays will be experienced because of the binding on curves of cars and locomotives, the frequency of derailments, and other like difficulties. Short switch points, lack of alignment, absence of guard rails or their wrong position all contribute to the difficulty in keeping things moving. Short-radius curves and especially those with reverses put an extra load on the locomotive, which, although capable of pulling fifteen cars on a straight track, may be held down to four or five when bad curvature is encountered. The strain thus placed on the locomotive and the added number of trips that this strain entails mean waste of power and loss of time.

Careful consideration of the tonnage to be handled will enable us to avoid troubles of this sort. The larger the output we desire to attain, the more space it is necessary to provide for the stringing of loads and empties, for locomotive returns, for passing tracks, and for other purposes, and in this connection reference to Fig. 2 should be made.

As already stated, the first consideration in laying out the tracks for loads is to provide a space between the crossover and shaft sufficient to accommodate the locomotive and allow the switch to be thrown for its transfer to the opposite track. The cross-over should have curves of large radius so as to allow the locomotive to pass over it easily and to permit of the pushing of cars by hand. Sufficient distance should also be provided to turnouts Nos. 2 and 3 to allow cars that are being pushed into the main leads to straighten before entering the switches. The angle of cross entries "A" and "B" should be in the direction shown, for if cut in the opposite manner it would be necessary for the locomotive after passing over the turnout to back-track in order to get to the side leads.

#### LAYOUT IS ADAPTED TO ALL CONDITIONS

A string of nine loads is shown, but this number can be increased by arranging in the beginning for a greater distance from turnouts Nos. 2 and 3 to crossover No. 6. The limits of the diagram prevent showing a larger trip.

This trip is left standing on a straight track, the grade of which assists in the delivering of cars to the cage, while the locomotive has room, if necessary, to return over the crossover and through cross entry "B." As shown, however, it would only be necessary to pass over turnout No. 3, then back through entry "A" and pick up empties where shown. These empties can then be hauled straight ahead through turnout No. 13 and along entry "E" to rooms, or by passing through "C" and over turnouts Nos. 11 and 12, delivery can be made to entry "F."

Crossover No. 1 not only serves for the return of the locomotive but is useful in sending loads alternately to the left or right cage from either of the straight storage tracks beyond crossover No. 6. The latter serves the purpose of splitting trips to load both tracks for delivery to the cage. Should it be necessary to get the locomotive to a point behind the loads, crossover No. 6 again comes in handy.

If there is no question as to placing the loads for the

cage, the proper track is easily approached by means of turnout No. 11. Turnouts Nos. 9 and 10 should be placed at such a point as to allow the laying of a straight section of track similar to that which has been planned and provided in the case of turnouts Nos. 2 and 3. This provision should be made at any point where curves precede the beginning of a turnout. Care also should be taken to give sufficient room at the rear of frogs to insure that the joints will be kept clear of switch points.

The above explanation and description of the simple haulage system illustrated could be greatly lengthened, but with the salient features set forth there should be little or no trouble in planning the methods to be followed in meeting similar problems. After a little study of the diagram, numerous possibilities in the handling of imaginary trips of loads, caging, returning the locomotive, replacing, gathering empties, etc., will be revealed. No claim is made that such a layout as this will be ideal or meet all conditions, but as a sample case I hope it will prove helpful to those contemplating the installation of new haulage systems or the replacement of old ones. Cross-overs and turnouts can be shifted, taken out or put in, as may be necessary to suit individual needs.

The portion of the diagram showing the delivery side of the shaft and the return of empties deserves consideration also, as conditions here are not the same as those governing loads.

The first cross-over, No. 18, serves the purpose of delivery to either track and as no locomotive is required here, extra space near the shaft for a locomotive cross-over is not required. The importance of large radii

applies here for the reason that most of the transferring is done by man power, and the binding resulting from the use of short curves must be avoided. The width of radii for turnouts Nos. 20 and 21 also should be controlled by the same consideration, as it may be necessary to direct the empties to the side leads by man power also.

The other turnouts shown may be utilized to take care of the locomotive transfers, the collection of empties and the distribution of loads from the return side to the caging side.

Application of the main principles involved in the diagram shown will form an excellent foundation for any haulage system. The initial work should be preceded by proper consideration of each detail, and the time spent in planning as well as the cost of the track equipment will prove well worth while. Detail work is absolutely essential and drawings must be made accurately to scale, for if dependence is placed on sketches trouble is sure to result.

The size of cars and locomotives as well as the dimensions of wheels, wheelbase, etc., all enter into the solution if distances and curves are to be properly provided for. The engineering department of the firm\* with which I am connected has had much experience with both large and small systems, new and redesigned, and is therefore thoroughly familiar with the details involved. Special attention is given to the design and construction of mine track. Proper consideration of mine haulage seldom fails to yield gratifying results.

\*The Cincinnati Frog & Switch Co.

## Effective Hot-Process Water Softener

Most Chemical Reactions Proceed Much More Rapidly at High Than at Low Temperatures—The Hot-Process Softener Thus Accomplishes Results Much More Rapidly Than Cold-Process Systems

**I**N ITS present form the hot-process softener is a recent development. By taking advantage of the fact that chemical reactions are more rapid and complete in hot water than in cold it claims to secure a more efficient removal of the scale- and sludge-forming substances in water than is otherwise obtainable. The apparatus performs the functions of the open feed-water heater usually found in boiler plants, in addition to those of a softener. Less space, lighter foundations, less housing, less piping and fewer fittings are thus required than for a cold-process softener, with which an independent heater is necessary.

There are several reasons why scale-forming matter is more completely removed from hot water than from cold. In most instances chemical reactions are much accelerated by heat. This is a well-known and generally recognized fact, and was taken advantage of in households for ages before it assumed the dignity of a law of chemistry. Everyone knows that dishes and clothes are washed more rapidly and thoroughly in hot water than in cold.

The exact law connecting temperature and rapidity of chemical reaction has never been determined accurately, some chemists stating that the speed of reaction doubles for each 10 deg. C. added to the

temperature, and others that chemical reactions are speeded up approximately as the 20th power of the absolute temperature. These formulas are not in agreement, but everyone concedes that there is as a rule an appreciable increase in speed of reaction with a rise in temperature.

Some years ago experiments were made in the chemical laboratory of the Harrison Safety Boiler Works to determine the effect of temperature upon the reactions which take place between softening reagents and scale-forming matter in boiler-feed water. The results are shown graphically in Fig. 1.

It will be seen that the reduction in hardness—that is, in content of calcium and magnesium salts—is much greater at the end of 10 min. in water at 210 deg. F. than at the end of 5 hr. in water at 50 deg. F., in fact, a 24-hr. treatment in cold water does not bring the scale-forming matter down as much as does a 10-min. treatment in hot water. Subsequent heating to the boiling point of the sample which had stood at 50 deg. F. for 5 hr. reduced the magnesium hydrate to less than one grain per gallon, but the same result was obtained in hot water in 10 min. In performing these experiments only a sufficient quantity of softening chemical was added to completely combine with

FIG. 1. ACTION OF HEAT ON THE SOFTENING PROCESS Ten minutes in hot water is more effective than five hours in cold.

the scale-forming substances. In practice a slight excess is used, which reduces the hardness to still lower figures.

The effect of heat upon chemical reactions can be verified in a rough way by performing the following experiment: Place one pint of cold, untreated boiler-fed water in each of two beakers; bring one of them up to the boiling point, but allow the other to remain cold. Add to each the amount of reagent theoretically required for transforming the scale-forming substances. Stir thoroughly the contents of each beaker and note results. The reaction and sedimentation in the hot water will be much more prompt than in the cold water.

After precipitation has ceased in the cold water, decant the clear liquid and heat it to the boiling point. A marked after-precipitation will result, showing that the reaction in cold water was not complete. Do the same with the clear liquid from the hot-water beaker. No after-precipitation will occur. It is thus conclusively shown that the reaction is not only more rapid in the hot water but is also more complete.

The substances which result from the transformation of scale-forming matter are more nearly insoluble in alkaline hot water than in cold water, hence less of these substances are carried into the boilers in solution by water which has been softened hot.

The precipitates resulting from the transformation of scale-forming substances settle more rapidly and completely from hot water than from cold. Solid particles suspended in water settle to the bottom if their density is greater than that of the water; they rise to the top if their density is less than that of the water. The force tending to draw a particle downward is its weight less the weight of water displaced, and the force by which this descent is resisted depends upon the extent of the surface of the particle, the viscosity of the fluid in which the particle is suspended and the velocity of fall. Of course, a velocity is soon attained such that the force resisting the fall is built up till it prohibits further acceleration, and a uniform rate of settling results.

At the freezing point the viscosity of water is over six times as great as at the boiling point, and the velocity of fall at 212 deg. F. will be four times as great as the velocity at 68 deg. F.

Now consider how this applies to what takes place in a water softener. Suppose we have a large tank full of absolutely quiet water. A particle of any given size will descend four times as far in an hour in hot water as it will in cold water.

Next, suppose we have a continuous softener in which the water is constantly flowing through the sedimentation tank. In a hot-process softener a rate of flow can be allowed which is four times as great as is permissible in a cold-process softener without particles of a given size being carried to the pump supply pipe. Or, to put it in still another way, with a given rate of flow through the settling chamber much smaller particles can be separated from the water in the hot-process than in the cold-process softener. The further fact that the particles formed in a hot-process softener are larger than those formed in a cold-process softener renders the advantage of the hot process still greater, since the velocity of fall increases as the square of the radius of the particles.

It is therefore plain why the preliminary heating of the water, a feature peculiar to the hot-process softener, gives more complete chemical reactions and more thorough removal of the resulting precipitates.

The completeness with which scale-forming matter is removed from water treated in the hot-process softener may be shown by the following analyses of water before and after treatment in a commercial installation. In considering these results it should be borne in mind that a grain is  $\frac{1}{7000}$  of a pound, or  $\frac{1}{58,115}$  of the weight of a gallon of water. The small amount of solids remaining in the treated water coming from a hot-process softener does not form scale in the boiler, but gathers as sludge, which is easily blown out:

	Grains Per U. S. Gallon Before Softening	After Softening

Free carbonic acid.....	2.45	.....

FIG. 2. CHEMICAL PROPORTIONER This device, accurately, automatically and in proper proportions, feeds chemicals to the softening apparatus.

The chemical reagents must be fed to a softener in accurate proportion to the amount of water and to the impurities contained therein, so that the treated water may not deposit scale on the one hand or contain an excess of the unused reagents on the other. For proportioning the reagents to the raw-water supply various mechanical arrangements have been devised.

In some softeners the raw water flowing to the softener turns a wheel or operates a tilting bucket, which in turn operates dippers by which the reagents are ladled out to be mixed with the raw water. Such appliances, widely used with cold-process softeners, are usually located above the reaction chamber of the softener, involving the lifting or hoisting of the reagents 15 or 20 ft. or more above the ground level.

In other softeners a certain portion of the water, divided from the main supply by means of orifices or weirs, flows through chambers containing the reagents. In such a proportioner the water in flowing through the reagent tank becomes saturated. This method is faulty, however, since solubility varies greatly with temperature.

In another form the water displaces the reagent from a tank, at the same time diluting that which remains. Elaborate means for adjusting the orifices progressively as the reagents become more and more diluted are therefore required.

None of those methods is well adapted for feeding chemicals to a hot-process softener, which should be

designed for operation under a slight pressure, since it is necessary to carry a few pounds back pressure upon the exhaust steam, in order to insure a temperature of at least 205 deg. F. in the treated water at all times. With the methods just mentioned it is necessary either that the chemical-feeding equipment be inclosed within the steam space or else that the chemical and raw water, after being proportioned, be pumped into the softener against the back pressure.

If the water wheel or the tilting bucket is inclosed so that the reagents can flow by gravity directly to the reaction chamber, steam finds its way into the chemical tank, where it condenses, diluting the reagents and rendering the feed inaccurate. The divided-flow method involves an additional pumping of both the raw water and the reagent, and is therefore complicated and expensive.

In another arrangement the raw water is passed through a hydraulic motor, of either the reciprocating or the rotary type, and this drives a small chemical pump. This method is defective because it is practically impossible to prevent slippage past the valves and packings of such motors and pumps, which renders the proportioning inaccurate.

The chemical proportioner used in the Sorge-Cochrane hot-process softener to regulate the feed of chemicals in proportion to the flow of raw water is a true flow proportioner. The chemical to be fed to the softener is forced through an orifice by a pressure just equal

FIG. 3. SORGE-COCHRANE HOT-PROCESS WATER SOFTENER COMPLETE

This apparatus consists of a chemical-reagent tank, together with its pump and reagent proportioner, the softener proper and a sand filter.

to the differential pressure set up by the flow of the raw water through an orifice in the supply pipe.

To understand how the device works reference may be made to Fig. 2. Between two flanges in the pipe through which the raw water flows to the heater at the top of the softener is placed a thin orifice disk. From the two sides of this orifice small pipes lead to the opposite ends of a cylinder containing a piston. The piston is thus acted upon by the differential pressure set up by the flow of water through the orifice.

The vertical piston rod extends through water glands at each end of the cylinder. On the lower end of the rod is a valve disk, which closes over an opening through which a fluid mixture of the reagents is constantly being forced by a centrifugal circulating pump. The weight of the piston, rod and valve disk is counter-balanced.

The differential pressure acting upon the piston pushes the disk down upon and tends to close the opening, while a pressure builds up underneath just sufficient to balance the differential pressure. The pressure of the chemical solution is therefore directly controlled by the differential pressure resulting from the flow of water through the orifice in the raw-water pipe. Through a simple pipe connection, this pressure acts directly at the chemical orifice, insuring an effective pressure thereon at all times equal to the differential pressure on the raw-water orifice.

Most of the chemical solution supplied by the circulating pump flows out from under the disk, through a strainer and thence back into the chemical-solution tank. The proportioned chemical flows through the chemical orifice into a funnel from which it is taken by a chemical feed pump, lifted to the softener and forced in against any back pressure that may exist therein. The back pressure in the softener thus does not affect the proportioning.

As the chemical before escaping through the small

orifice is not in contact with air, no incrustation occurs upon it, but to provide for dislodging any obstruction a cleaning needle is so arranged that it can at any time be forced through the orifice by the pressure of the hand.

Besides being accurate this arrangement has these additional advantages: Only one chemical-solution tank is required, which is at the ground level, where it can be charged without hoisting of chemicals or inspected without climbing a ladder.

The motor which drives the circulating pump also drives agitating paddles in the tank. Milk of lime can thus be kept in suspension and fed as well as purely fluid reagents. The large saturator tanks necessary where lime water is used are eliminated and the difficulty due to the fact that lime water varies in strength according to temperature is avoided.

Solutions of caustic soda or sodium carbonate, lime water, milk of lime or any mixtures are all handled equally well and fed accurately. The accuracy with which the solution is fed is well within 2 per cent, which is closer than attendants will measure out chemicals into the chemical tank. Representative test results are shown in the following table:

Rate of flow of raw water— gallons per hour	Rate of flow of chemical, gallons per hour	Chemical per gallon of water	Variation, percent
1740	134.6	0.0773	0.28
1590	122.2	0.0769	0.22
1410	108.4	0.0769	0.22
1160	88.8	0.0766	0.71
710	54.6	0.0769	0.22
411	31.8	0.0773	0.28
290	22.4	0.0773	0.28
290	22.5	0.0775	0.52
184	14.3	0.0771	0.03

The chemical treatment is controlled by drawing off a sample of the treated water from time to time and titrating with a standardized solution, the whole operation requiring about 10 min. By locating the titration readings thus obtained upon a chart the operator sees

FIG. 4. HORIZONTAL SAND FILTER

This filter is so arranged that the sand bed may be stirred up at suitable intervals by means of air or water under pressure. This permits effective operation over long periods without actual cleaning or renewal of the filtering materials.

at a glance what change, if any, is required in the amounts of the chemicals.

This apparatus, as may be seen, is quite simple and compact. The open heater, with an oil separator attached for purifying the exhaust steam which is used for heating the water, is mounted directly over the reaction and sedimentation chamber. The water is heated to steam temperature by spraying it over trays.

The precipitated matter deposits in the conical bottom of the sedimentation chamber. From there it can be quickly washed out by the opening of a single valve. In order to eliminate convection currents the hot water and the softening reagents are delivered at the top, and travel slowly to the bottom, whence the clarified water is drawn off by an inverted funnel. The precipitates formed when the water is first mixed with the chemical settle through the water below, thus securing a screening effect and a gathering together of the smaller particles.

The removal of scale-forming matter at high temperature by sedimentation is so effective that for many waters and plant conditions it is entirely practicable to dispense with filters. Many softeners are accordingly installed without such devices and are successfully protecting the boilers from scale and corrosion, even though the softened water contains a small amount of suspended matter.

## Arc-Welded Bonds Eliminate Moisture and Defy Corrosion

Bonds Can Be Arc-Welded Without Disturbing Traffic and Equipment Is Available for Other Arc-Welding Such as Every Shop Demands

BY W. P. BOVARD,  
Mansfield, Ohio

SEVERAL methods of mechanically joining metals, such as clamping and riveting, have been used since the inception of track bonding as a means of electrically and mechanically connecting copper bonds to track rails in order to insure an electrically continuous return path for the haulage current. From the mechanical standpoint the clamping of the channel pin and the riveting secured by the terminal compressor or the expansion pin appeared to be satisfactory. From the electrical standpoint, however, these methods have not always proved entirely desirable because of irregularities and carelessness in installation.

The channel-pin method of bonding never proved adequate electrically because of the impossibility of excluding moisture from the contact. The compressed and pin-expanded copper terminals show less tendency to deteriorate, but under the strong corrosive agencies encountered in mine service it is difficult to maintain a perfect contact between bond terminal and rail.

One of the many successful applications of electric arc welding of much service to industry has been in the construction of tanks and boilers. Welding of seams is rapidly superseding riveting because of the greater ability of the welded seam to withstand corrosion and pressure. It is just as obvious that the welded contact should supersede the mechanical in the track bonding of mines. The metallic electric arc has proved itself the most adaptable means to this end.

In mine service it is desirable that track bonds should

ARC-WELDING TERMINAL WITH ELECTRODE IN PLACE

be of such design as to be able to withstand the severe conditions imposed by frequent derailments. The accompanying illustration shows a type of rail bond which has been widely used, being designed for application to the base of the rail. This bond is provided with steel terminals which are welded to the rail by the aid of a soft-steel electrode, thus insuring a permanent con-

BOND WELDED IN POSITION

The copper cable spans the rail joint below the heads of the joint bolts. It is thus in a degree protected by them.

nection of low resistance. Being placed, as shown, low on the rail and underneath the joint bolts the bond receives maximum protection. Installation is made without removing the joint plates or disturbing the ties. Consequently the cost of the work is reduced to a minimum.

Owing to the limited space available underground, it is advantageous to use welding apparatus for the work, and this may be handled by the bonding crew without interference with traffic. A type of resistance welding apparatus which has met the bonding requirements of mine service satisfactorily has control features which insure ample welding current under the varying voltage and also furnishes the operatives with full protection from electrical shock. This latter feature is secured by means of a remote magnetic switch under control of the operative.

**Corporation President's Powers.**—The president of a business corporation has no power to bind the company by executing notes in its name without the consent of, or consultation with, the board of directors. The circumstance that the president may own nearly all the stock does not affect the case. A corporation is a distinct entity under the control of its directors, and the president may not exercise the authority of executing promissory notes thereof on his own motion or otherwise than as empowered in the articles or by-laws or by the managing directors of the company. (*Iowa Supreme Court, Goodman Manufacturing Co. vs. Mammoth Vein Coal Co., 168 Northwestern Reporter, 912.*)

## This Electric Drill Will Quickly Cut Holes in Hard Mine Roofs

Has a Capacity of from Six to Twenty Holes in Hard Rock—Adjustable for Roof Heights of from Five to Six Feet

BY E. M. BACKIE  
Syracuse, N. Y.

**D**RILLING holes in entry roofs for trolley-wire hangers, feed-wire insulators or trolley-guard boards is an awkward and expensive operation even under favorable conditions. In soft-rock top or slate the holes can be drilled with a hand auger, but when the top is composed of a hard-rock formation this work has to be done by other means, as the auger has its limitations.

A machine electrically operated and of light weight, designed and built a few years ago, does this work rapidly and cheaply. It was tested for several months in different mines and under severe conditions. The result of these tests was a reconstructed machine, which has been made in large numbers and is now operated in many mines throughout the coal fields with quite satisfactory results.

This machine is a simple mechanical device operated by an electric motor. It is easily handled and operated by one man or a man and helper, while its drilling capacity is large. In average hard-rock mine roof 10 to 20 holes  $1\frac{1}{4}$  in. in diameter, 5 in. in depth, have been drilled in one hour. In the hardest kind of rock six to ten holes have been drilled in the same time.

**PORTABLE ELECTRIC DRILL FOR WORK IN THE ROOF**  
This drill and its mounting may be easily carried about the mine. Mounting may be made to suit the height of roof encountered.

The accompanying illustration shows the machine as it has been developed and is now used in many coal mines throughout the country. The outfit consists of the drill proper and its mounting. The weight of the drill is 55 lb. It is separable from the mounting to afford an easy carry. The mounting consists of a fork-shaped yoke and a feed screw which telescopes into a pipe support. This pipe can be made of any length, but the standard adopted is suitable for roof heights of from 5 to 6 ft.

The drill bit is made from a 1-in. round bar of rock-drill steel. One end is forged square  $\frac{7}{8} \times \frac{7}{8}$  in. to fit the chuck. The other end is the regular six-point rock-drill bit, which is readily shaped by the mine blacksmith with the aid of a forming tool furnished by the maker as part of the equipment.

When the machine is in drilling position a canvas hood or jacket protects it from the dust which drops from the drill hole. The power consumption is only 600 watts, or less than one electrical horsepower. The Pneumatic Machine Co., of Syracuse, N. Y., the builder of this tool, has placed it on the market under the name of "Pluggger."

## Portable Gasoline Air Compressor Suited to Scattered Work

Driven by a Four-Cylinder, Four-Cycle Gasoline Engine—Cooling of Cylinders is Secured by Open-Hopper Jacket

**W**IDESPREAD application of compressed air to industrial purposes has increased the demand for a portable air compressor—an independent, easily movable unit. Such a compressor has proved highly useful for the operation of drilling tools for rock or other minerals wherever the work is scattered and too small in quantity to warrant a fixed compressor and drill plant at any one point. Of course, such a portable unit can in many instances be used advantageously for riveting, in the construction of steel tipples, trestles or buildings, or for driving wood augers and other construction tools and appliances.

The portable outfit here illustrated, made by the Sullivan Machinery Co., of Chicago, is an entirely new development, based on the company's experience with similar outfits during the last eight or ten years. This rig includes a specially designed two-cylinder vertical air compressor, driven by a Buda four-cylinder four-cycle, heavy-duty tractor gasoline engine, through a gear and pinion.

The compressor and engine, together with a vertical air receiver, gasoline supply tanks, radiator and fan, are mounted on a truck body made up of heavy channel irons, strongly braced. The truck body is mounted on heavy steel wheels or, if desired, the entire rig can be set on a flat car or other more substantial mounting. The outfit is protected from the weather by a steel canopy top which is provided with canvas curtains.

The air compressor employed has a displacement of 150 cu.ft. of free air per minute, and requires 32 hp. for operation against 100 lb. pressure. The air is admitted and discharged from the cylinder by means of Sullivan improved wafer valves. These valves are placed radially with respect to the axis of the cylinder and close to its upper end. They are held in place by flat circular leaf springs. Both valves and springs

PORTABLE COMPRESSOR AND ITS TRUCK

Compressor, receiver, engine, fuel tank and radiator are all mounted on a truck that can be hauled readily from place to place.

are made of the finest tempered steel and the valves open against specially-designed guard plates intended to give a wide port opening with small clearance loss.

Cylinder cooling is secured by an open-hopper jacket into which water can be poured from a bucket or through a hose. This type of cylinder cooling has proved particularly effective on portable compressors for many years and does away with the complication of a circulating pump and piping.

Power economy is effected when air is not required by an unloading device and pilot valve connected with the air receiver. This raises the inlet valves from their seats when the demand for air temporarily ceases. Lubrication is secured by a force-feed oil pump inclosed in the crankcase and delivering oil under pressure to all bearings. Baffles and wiper rings prevent an excess of oil from working up past the piston and collecting on the valves and seats, with danger of carbonization.

The drive, as stated above, is by gear and pinion. A heavy-g geared flywheel with cut internal teeth is mounted on the compressor shaft and engaged by a pinion on the engine shaft. A disk clutch placed on the shaft between the pinion and the engine is thrown out when starting until the engine is up to speed.

The engine adopted for driving this compressor is of an extremely rugged and reliable type. The cylinders are cast *en bloc* and provided with a removable head. The machine has three-point suspension and all mechanism is inclosed and adjustable. The camshaft is hardened and ground. The crankshaft is of special design, securing accurate running balance, and is supported by three babbitt-lined bronze bearings. The accessories, such as the magneto, impulse starter, carburetor, speed governor, starting switch, spark control and hand throttle, all combine simplicity with effectiveness and reliability. The gasoline supply tank will hold 23 gal., which is sufficient for a day's run.

**Contributory Negligence of Injured Miner.**—The provision of the mine safety laws of Iowa, requiring miners to examine their working places and to make the same safe before commencing work, extends to an employee engaged in reconstructing an entryway to a mine. An operator need not warn an employee of dangers that are as obvious to the latter as to him. (*Iowa Supreme Court, Holmes vs. Bloomfield Coal & Mining Co., 162 Northwestern Reporter, 820.*)

## Roller-Bearing Wheels Ease the Way from Face to Tipple

Modern Car Wheels Effect Savings in Lubrication, Power, Time and Length of Service — Anti-friction Bearings Save 58 Per Cent of the Power

BY D. B. TURNER  
Knoxville, Tenn.

**M**OST coal men are familiar with the old solid-hub wheel having a lynch pin that passed through the axle and held the wheel in place. In order to secure proper lubrication this wheel required oiling at frequent intervals. This device was soon supplanted by a type of wheel provided with a hollow hub forming an oil reservoir with passages leading to the journal. When properly fitted and equipped with felt washers this type of wheel would operate for several weeks with one charge of lubricant.

Numerous attempts were made to improve upon this general scheme and in 1908 the Sanford-Day Iron Works of Knoxville, Tenn., brought out what it now terms its old style Whitney roller-bearing wheel. This was familiarly known as the "R-B" and is shown in cross section in Fig. 1. The hub of the wheel was lined with a special grade of steel and the rollers operated between this lining and the axle.

A cage held the rollers in their correct position while a thrust washer, interposed between the pedestal box and the inner end of the wheel hub, served as a buffer and took up wear. Felt packing made the joints tight and permitted lubrication with oil. The wheel was held on the axle by locking rivets or bolts that passed through the pedestal box on either side of the axle and engaged in a groove in the wheel hub. The wheel was oiled through a hole at the end of the hub and a sizable oil reservoir was provided. A plug closed the oil hole.

FIG. 1. OLD-STYLE WHEEL AND BEARING  
This bearing was felt packed and showed a decided improvement in service over previous journals.

This wheel gave much satisfaction and it was found that it might be operated six months on one lubrication. Instances are known where these wheels were run on one oiling for two years or more without appreciable wear of any of the parts. They can be run under water without danger of sediment or grit finding its way into the bearing.

In the quest for further simplification, the Whitney Wonder roller bearing was placed upon the market in

FIG. 2. NEW WHITNEY WONDER WHEEL

This journal retains the good features of its predecessors as well as certain later improvements.

1913. This wheel is shown in cross section in Fig. 2. As is evident upon inspection, this wheel is extremely simple and efficient.

The method employed for holding the old-style wheel to the axle as well as the hub lining is retained in this model. The outer end of the wheel hub, however, is made solid and arched to receive the thrust of the axle. The rollers are fitted on the ends with projections which fit into the arch of the hub on one end and into a steel stamping on the other. This latter is lightly riveted inside of the wheel hub, holding the rollers in place when the wheel is removed from the axle.

This steel stamping or cup washer acts as a dam, forming a reservoir for the retention of whatever lubricant is employed. A collar upon the axle transmits side thrust to the arched end of the wheel hub. Grease is introduced by means of a gun through a hole in the side of the hub until it starts to come out at the point "C." This signifies that the internal portion of the wheel is completely filled. If of the proper consistency this grease acts as a packing, preventing dirt or grit from working into the bearing. About 1 lb. of grease is required at each filling.

In one instance four trucks provided with these wheels operated for two and one-half years under hard service on grease which was in the wheels when they left the factory. Upon examination at the end of this period no appreciable wear was apparent upon the rollers.

The savings arising from the use of anti-friction bearings accrue from four different sources—lubrica-

tion, power, time and length of service. The cost of lubrication is an important item. This expense is variously estimated at from \$6 to \$15 per car year, according to the cost of lubricant and the type of plain-bearing wheel with which the wheel is compared. With the price of oil high this saving of course is proportionally large, while if a car greaser is employed this man may be cut off the payroll when the change is made to the roller-bearing equipment.

Actual tests have shown a saving of as much as 58 per cent on the power consumed in haulage as the result of substituting anti-friction for plain bearings. This means that three cars with improved bearings can be hauled with less effort than two plain-bearing cars. Each operator can figure what this means to him in dollars and cents. Of course, the saving effected in power consumption varies widely with conditions, but there is always a big margin in favor of the roller-bearing wheel.

#### TIME IS SAVED BY ROLLER-BEARING CARS

The saving in time is almost a direct result of the saving in power. As the result of such power conservation a locomotive can move more cars per shift, while the ease with which these cars can be pushed to the face gives the miners more time to load coal or to perform other duties. For a given output this of course results in having fewer men on the payroll.

A roller-bearing wheel if properly designed and constructed should outlast, under normal conditions, at least two plain-bearing wheels. The plain-bearing wheel usually finds its way to the scrap heap because of a worn hub, when the tread might be good for many years of additional service. If the roller-bearing wheel is kept properly lubricated the tread determines the life of the wheel. Any damage occurring to the bearing may be repaired through replacement of damaged parts at a trifling expense.

With most operators seeing is believing. Most of them also are "from Missouri." Such operators may well secure a sample set of roller-bearing trucks and conduct their own experiments.

**Limits of Switching Service.**—The following language used by the Minnesota Supreme Court the other day in the case of *Commercial Club of Duluth vs. Northern Pacific Railway Co.*, 165 *Northwestern Reporter*, 270, throws some light on the question as to how the line is to be drawn between switching service and actual transportation carrying a distance tariff, in the movement of shipments between a city and one of its suburbs: "The limits of a shipping point are not necessarily coincident with the limits of a city. They may be more extensive. Perhaps they may be less extensive, but usually not.

"The important question is whether the district is a single industrial center. This is usually a question of fact. \* \* \* In determining that question, the extent of the district, the industrial relation of one part to another, the nature of the traffic are things to be considered. Whether the traffic is handled by train crews or switching crews, and whether on way bills or switching orders, are matters to be considered, but the manner of handling is not decisive. The fact that the railroad and the public have acquiesced in applying a switching tariff is important when that fact appears, as it does here."

# Gasoline Mine Locomotive Operates with Efficiency Despite Heavy Grade

Provides Transportation on a 5-Per Cent Grade—Delivering Five to Eight Cars Per Trip, the Return Trip Being Roughly a Mile Long

By A. C. PAUL  
Milwaukee, Wis.

**N**OT only are gasoline locomotives rapidly replacing other forms of haulage for surface work but they are also meeting many of the problems of mine haulage, for, being self-contained units, none of the complications inhere to their installation that are found when introducing for the first time electrical, steam or compressed-air locomotives. Gasoline is not always the correct solution of haulage problems, and conditions sometimes present themselves where some other form of motive power would be more advantageous.

A good example of the efficiency of the gasoline locomotive may be found in the No. 2 coal mine of the Stewart Iron Co., Ltd., located at Coolspring, near Uniontown, Pa. This is a shaft mine tapping a field of 120 acres of 5-ft. Sewickley coal. While classed as one of the smaller operations, its production attained such proportions some time ago as to demand a more modern and economical method of haulage than that furnished by mules. Furthermore, a grade of nearly 5 per cent against the loads required the installation of a system of sufficient power to overcome such adverse conditions. On the other hand, the comparatively small acreage forced a careful scrutiny of the first cost as well as of the probable upkeep of the prospective transportation system.

Superintendent Thomas W. Keighley spent considerable time in detailed study of this haulage problem, as

well as in careful analysis of the merits of the various systems available. He finally selected a type "L-30" 6-ton gasoline locomotive manufactured by the Milwaukee Locomotive Manufacturing Co. This was installed Dec. 15, 1918, and an inspection of the Stewart mine on April 8, 1920, found the motor doing more than had been expected of it and showing for sixteen months' service a highly satisfactory record for reliability and upkeep.

This locomotive is in constant service six days a week, and up to April 8 of the present year there had been no occasion for any delay. The daily tonnage is hauled in trips of from five to eight cars, weighing with load from twelve to nineteen tons. The length of one-way haul is 2,400 ft., and the grade on about 1,000 ft. of this distance is approximately 5 per cent.

In operation this locomotive has proved itself economical and represents a notable saving in time and money over the old haulage system. In addition to this there has been a marked improvement in working conditions, as the old delay in the placing of empties has been avoided and the loaded cars have been moved more promptly. This has resulted in a general speeding up of the mining operation and in bringing about a bigger tonnage as well as a shorter day.

When questioned regarding his opinion of the service rendered by the gasoline locomotive, Superintendent

GASOLINE LOCOMOTIVE AND ITS TRIP

Installation of this machine greatly facilitated operation, because of the increased reliability in car placements.

Keighley was enthusiastic. "I am thoroughly converted to the gasoline motor for mine haulage. Our machine was installed only after considerable debate and investigation, and was chosen largely on account of its economy. Its first cost was less than half that of an electric haulage system, and its maintenance has been extremely satisfactory. I thought when we bought it that it would do the work, and now after a year's test, and under operating conditions that are about as hard as can be found, I am an enthusiastic booster for this machine. We would not now consider its replacement with any other form of mechanical haulage. It represents the most simplified form of power. There are no trolley wires to string and watch, no rails to bond, and the motor itself is so free from mechanical adjustments that we consider it 'fool-proof.' Best of all is the effect on the men. They regard the locomotive as their best friend and if the substitution of another form of haulage were suggested, I know they would vote it down if they were permitted to express themselves."

## Extended Air Lines Giving Way To Portable Compressors

Which "Make Air Where It Is Used"—A Drill That  
Can Be Suited to the Work Regardless of  
the Hardness of the Materials

BY D. E. DUNN  
New York, N. Y.

A PROGRESSIVE step in the coal-mining industry was the linking of the motor, compressor and percussive drill into practically one compact, portable unit. This was accomplished by the Ingersoll-Rand Co. when it perfected the portable mine-car compressor and the mounted or unmounted jackhammer that could be used with either hollow hexagon or twisted concave auger steel.

Previous to the introduction of this apparatus the work now performed by it was accomplished by means

of cumbersome, specialized machinery. This was costly, slow in operation and not easily adapted to local conditions. It was deceptive, too, in that despite its sturdy appearance it was easily and frequently put out of working condition.

The term "specialized" employed above is used advisedly because the machine that did the entry cutting through hard rock was seldom adapted to the general work of mining coal. Hence another special machine had to be purchased.

To operate the old type of machines an elaborate surface plant and extensive underground pipe lines were needed. This meant large initial cost and high operating expense. Poorly-proportioned and leaky pipe lines alone have in a number of instances caused an outlay by operating companies of sums of money running into several figures. The additional expense of the greater numbers of skilled men employed on the old-fashioned machines need hardly be mentioned.

The mine-car compressor is a self-contained unit, consisting of a compressor with automatic unloading device, an air receiver with pressure gage, a safety valve, drain cock and service valve, electric motor with complete control, and herringbone gear drive. All this equipment is mounted on a cast-steel frame with steel wheels and axles. It is fully equipped and needs only to be connected to a source of electric power.

The jackhammer is built in five sizes, the one used most frequently in coal mining being a 35-lb. machine. In entry cutting through hard rock or in picking out rock bands a hollow hexagon steel is employed. For drilling coal concave auger steel has been found more satisfactory.

The combination of these two machines forms what might be termed a universal coal-mining unit. Were it not that one man is required to run it, it might be called an automatic unit. However, one man can and does operate the outfit. The saving it has effected both in initial cost and expense of upkeep as well as the advantage secured through "making the air where it is used" has been greatly appreciated by progressive coal-mining men.

MINE-CAR COMPRESSOR AND JACKHAMMER IN OPERATION

This compressor is highly portable. It may be taken anywhere in the mine connected to the current supply and put to work. Pipe-line losses are thus avoided.

# Toronto Is Briquetting River Anthracite

Great Care Is Taken to Thoroughly Mix Coal and Binder; a Mixer, Malaxeur and Masticator in Turn Working to Secure Complete Intercompounding of the Materials—Water Cooling Prevents Adherence of New-Made Product

BY A. L. STILLMAN  
New York City

**P**ROFOUNDLY concerned over the recent and long-continued shortage in domestic sizes of anthracite fuel, official and financial Canada, as well as "the man in the street" have been seeking some substitute for hard coal. Being "the most distant market, and the last applicant at the source of the fuel . . . Canada can only ask for consideration. She has no voice in any proposals for developing or conserving production for her future necessities; no control over efforts to expand this industry; no means to compel

on Canadian hard coal, but it remained for the enterprise of a private citizen, H. F. Slater, of Toronto, to provide a means for obtaining a coal supply for populous Ontario.

Early in 1919 Mr. Slater conceived the idea of producing better fuel for less money. Hardly less important was the companion idea of securing the co-operation of the people in financing his manufacture and selling his output. The Nukol Fuel Co., then organized, began an active campaign to secure that

FIG. 2. DRIER INSTALLATION. ONE OF THE ROTARY SINGLE-SHELL DRIERS CAN BE SEEN IN REAR

Driers are 4 ft. in diameter and 45 ft. long and revolve ten times every minute, the terminal temperature being about 250 deg. F. A blower forces gases through the drier in the opposite direction to that taken by the wet coal, so that heating is progressively increased. Two per cent of moisture is allowed to remain.

FIG. 1. TANKS IN WHICH THE OIL BINDER FOR THE BRIQUETTES IS STORED

A good grade of binder, which will not run in warm weather, is used. Each tank holds 20,000 gal. A 2-in. steam coil carries live steam which keeps the oil from hardening into a solid. The pump which fills the tanks from tank cars also delivers the oil to the device where it is mixed with the coal.

any change in policy, and no authority to enforce her needs."\*

The Canadian government is actively investigating the fuel resources of Canada, is vigorously planning the utilization of the Eastern and Western coal fields, and through the Lignite Utilization Board, is contriving how she may commercially, from the great lignite fields of Saskatchewan, obtain byproducts and then make briquettes of the residual carbon. The Canadian Pacific R.R. has for the last few years maintained a commercial briquetting plant at Bankhead, in Alberta, working

co-operation. To bring the proposal before the people the methods of the popular War Loan were adopted. It was realized that a new product appearing on the market needed a host of friends and "boosters." Many shareholders meant many users. Fuel production, to an extent at least, was to be placed in the hands of fuel users—a working out of modern ideas in industrial co-operation.

The product—yet to be made—was christened "Nukol." A survey of the fields of artificial fuel revealed the fact that the boulet plant of the Lehigh Coal & Navigation Co. was at that time being enlarged

\*The Canadian Mining Journal, April, 2, 1920.

from 200 to 1,000 tons per day capacity after two successful years. There was no time or opportunity to experiment. The Nukol company needed a proven process to start immediate advertising with a reasonable guarantee of a successful issue. No time was lost in acquiring a license to work under the Dutch process of fuel briquetting (the process used by the Lehigh Coal & Navigation Co.). The General Briquetting Co. of New York was engaged to design a briquetting plant, and put it into successful operation. The work was assigned to J. B. McGraw, fuel briquetting engineer of that company.

Pending the successful outcome of experiments in byproduct production from the various fuel sources of Canada (which in time will presumably yield quantities of residual carbon ideal for briquetting purposes) the Nukol company obtained contracts and options on large supplies of Pennsylvania river coal, a low ash product and one excellent for the purpose. Shipments were begun immediately to the company's site at Toronto, and continued throughout the summer of 1919. The analysis of the river coal secured was as follows: Moisture, 2.18; fixed carbon, 76.30; volatile, 6.76; ash, 14.76; B.t.u., 12,329.

An advertising campaign unique to the fuel industry in its scope and character was inaugurated. Full-page advertisements in the newspapers began it. A house organ, "Nukol Nuggets," followed periodically, and incidentally was distributed by aeroplanes to the crowds assembled at the county fairs in Ontario. The trade character "Nukol Ned," a blackamoor of amusing characteristics, became a familiar figure in advertising cartoons. A song, "Nukol Sparks," was widely distributed. In short the advertising methods of the patent food product were successfully applied for the first time to artificial fuel. The appeal "Nukol is made in Canada, by Canadian labor and Canadian dollars," proved successful. Popular subscription financed the construction and ere long the multitude of shareholders were clamoring for their fuel allotment.

The selection of a site involved careful thought and the inspection of a great many offerings. Accessibility to transportation facilities and fairly large storage capacity for raw material were of prime importance. It was contemplated that a large part of the winter supply of raw fine fuel would be delivered to the plant by water during the summer months. Upon the close of navigation the

heavy season for the briquetting industry begins, and certainty of rail communication was vital. The plant of the Toronto Shipbuilding Co., Ltd.—Cherry and Villier Streets—finally was purchased, fulfilling most completely all desirable requirements. This plant has a private wharf. Upon the ground adjacent thereto there is available open storage for between 20,000 and 30,000 tons of coal fines. Distant about 80 ft. from the water is a railroad siding, and just beyond that the mill building, 85 x 65 ft. Another railroad siding runs between this building and Villier St. The property has, in addition, smaller buildings adaptable to offices, machine shop and power plant.

It was expected that the machinery would be installed and the plant would be ready for operation on Sept. 1, 1919. It is needless to detail the various troubles experienced in obtaining shipments of machinery and parts during that summer. The plant was finally ready in December. It had a capacity of 15 tons 7-oz. size egg-shaped briquettes per hour.

The process of manufacture may be divided under the following headings: Drying and screening raw material, handling of binder, mixing of the coal and the binder, mastication of the mixture, pressing, final screenings, cooling.

The coal is quite wet, containing sometimes as high as 17 per cent moisture. That is the amount that coal of this size will hold hygroscopically. The culm may be taken directly from cars or boats as received, or from the stockpile. It is handled by a locomotive crane and dumped into a hopper, from which it is carried in a bucket elevator to a large bin, and from that conveyed to the apparatus for moisture removal (Fig. 2). The removal is accomplished by two rotary single-shell type driers, 4 ft. in diameter and 45 ft. long, operating at 10 r.p.m. (Fig. 3). The temperature at the end of the drum is about 250 deg. F.

An extremely fine size of coal is burned in the drier furnace and the gases are forced through the shell by the action of the blower, the speed of which can be varied in accordance with the varying moisture in the coal. The wet coal enters at the cool end, and is dried by coming in contact with gases at increasing temperatures while passing through the shell. With the process used it is not essential to dry the coal absolutely, and 2 per cent of moisture is allowed to remain.

Economically speaking, this is a great advantage, as the final 2 per

FIG. 3. AUTOMATIC DEVICE FOR REGULATING OIL-BINDER FEED

This apparatus also records automatically the operation of the press

FIG. 4. FEEDING BINS AND PROPORTIONING TABLES

Here the coal is sent in measured flow to the paddle mixer. Between the bins can be seen the binder feed line delivering the requisite oil to the paddle mixer.

cent of moisture is by far the most difficult to remove, and its retention obviates any risk of overheating in the drying operation. The arrangement whereby the gases at their highest heat come into contact with the coal nearest to dryness and successively meet wetter coal as it proceeds through the drier tubes, insures a maximum efficiency of operation, the gases being discharged to the atmosphere in a saturated condition.

From the drier the coal is carried on a 12-in. steel-encased bucket elevator to a trommel screen, which removes all oversize ( $\frac{3}{4}$  in. and over). Practically all foreign material in the dust is over the size passed by this screen, so the screening at this point may be considered a cleansing operation.

The final coal, dried and screened, is carried to the feeder bins (Fig. 4), so called because from them are fed the tables whereon the proper quantity of coal is measured for mixing. These are storage bins built of steel plate and designed to hold ten tons each. It is desirable that these bins be kept full to secure a proper flow through the measuring device at their base, where there is an adjustable gate set at the will of the operator to provide a given quantity of coal per hour. The coal is fed from each bin to a revolving table, thence to the horizontal mixer, where it meets the oil binder. The oil binder is delivered to the plant by tank cars which are equipped with steam coils for melting down the contents, which are solid at ordinary temperatures.

The oil is an asphaltic residuum, commonly known as oil pitch, manufactured by the Imperial Oil Co. at its Montreal refinery. The tank cars delivering the oil each contain about thirty tons. A belt-driven 2-hp. Kinney pump is installed on the oil line in such a way that it can be used to pump the oil from the cars to the oil tanks, and from the tanks to the mixing device, where it is fluxed with the coal.

The capacity of each of the oil tanks is 20,000 gal. (Fig. 1). At the base of the tanks a 2-in. steam coil is installed, carrying live steam to keep the oil in the tank liquid. The filling of the tanks from the cars is done on overtime, when the plant is not running. Before entering the pump the oil is carefully strained

through a steam-jacketed strainer. Over the mixing device is placed a small horizontal feed tank, fed from the large tanks by the same Kinney pump as is used to unload the cars. This tank is kept full, and the overflow sent back to the storage tanks by a return pipe.

This circulation contributes to the continued homogeneity of the oil. With each oil pipe is carried a  $\frac{7}{8}$ -in. steam pipe, the two being wrapped together in a magnesia insulation material to prevent the oil from solidifying in the pipes. From the small feeder tank the pipe line runs to the mixing device, where it is delivered at about the same point as the coal. The melted oil is delivered in a fine stream, the rate of flow under present practice being adjustable by a valve. The operator sets this valve and adjusts the gate over the tables admitting the coal in such a way as to give a mixture of 95 per cent coal and 5 per cent oil.

An automatic adjustment for the binder feed is in course of installation (Fig. 3). A pointer is set on a scale adjusted to run by clockwork parallel to the decreasing surface of the oil in the binder tank. The speed of the descending pointer is set at the rate at which the proper binder proportion is to be fed. A salt-water column is placed parallel to the pointer showing the actual level of the binder in the tank.

As long as the salt-water column and the pointer descend at equal speeds and maintain their relation unchanged it is known that the proper binder percentage is being carried to the mixer. If the oil is fed too rapidly or if the pipe is clogged a disparity between the two rates of speed occurs immediately. An electro-magnet is set so as to close a circuit the instant this condition occurs, and an alarm is automatically rung, so that a correction can be made immediately.

This is of extreme importance, for a variation in the binder percentage either way is fatal to the quality of the final product. Too much binder, aside from being wasteful, gives a soggy and smoky briquette; too little binder gives briquettes incapable of shipment without disintegration. In addition to the regulation of binder feed this apparatus carries a traveling-time sheet, which records automatically the hours of press operation.

J. B. MCGRAW  
Designer of the Toronto plant

FIG. 5. ONE OF THE ROLLERS OF THE EGGETTE  
Note the egg-like depressions in the rollers by which the briquettes are formed.

FIG. 6. MASTICATOR AND EGGETTE PRESS

The masticator weighs  $47\frac{1}{2}$  tons and its operation requires 55 hp. It receives its feed from the malaxeur. The movement of the rolls completely incorporates the coal with the binder. In the press this mix is subjected to a pressure of from  $1\frac{1}{2}$  tons to 2 tons per sq.in.—a pressure equalling 200 or 250 atmospheres. No wonder adherence is secured.

The dried culm and the binder properly proportioned meet at the head of a 15-ft. paddle mixer (Fig. 4). The function of this machine is the thorough mechanical mixing of the two ingredients. Seventeen sets of paddles revolving in a horizontal trough force the mixture forward, at the same time imparting a thorough agitating and mixing effect. The viscosity is preserved and improved by the injection of a supply of live steam throughout the operation.

To complete the mechanical mixing the coal-oil mixture which, for the sake of convenience, may be designated a flux, is delivered into a vertical, cylindrical malaxeur. Again steam is injected into the mass, which is kept in constant agitation by a revolving shaft carrying radial arms. Now the flux is ready for mastication.

In the briquetting of fine coals or other comminuted material, the most important factor in the entire operation is proper intercompounding of the binder. The developed theory has been that a coating of the minute particles with a thin film of the binding substance was sufficient, and various types of mixing machines—usually having some arrangement of moving arms—have been brought out to perform the work. This method, however, has never been entirely satisfactory, because it requires an excessive percentage of binder.

The originators of the Dutch process devised a machine to overcome these difficulties. This machine is known as a masticator (Fig. 7). It is not only a most efficient mixing device but is really something more, because by its action it causes a remarkable intercompounding of the coal and binder. The masticator at the Nukol plant is a ponderous machine consisting of a stationary bed 10 ft. in diameter, upon which two heavy rolls rotate at 18 r.p.m.

The base or bed is cast in one piece and is liberally reinforced by substantial ribs on the under side. It is set upon six pedestals bolted to the concrete foundation. Renewable wearing plates of cast hard white iron are provided and held in place with bolts that are easily accessible. A step bearing supported by radial ribs is cast in the center of the bed. It is lined with high-grade babbitt and carries the upright shaft. The driving gear is located beneath the working bed.

The vertical shaft is a hammered steel forging of ample diameter accurately turned and finished. The cranks and roll shafts are forged in one piece. The ends are threaded and provided with heavy nuts which secure them in the driving hub and also serve to hold the rolls in place against the centrifugal force generated by their rotation. The horizontal drive shaft and countershaft

are cold-rolled steel. The driving head to which the cranks are connected is cast in three pieces to facilitate assembling. These pieces are securely held together by four steel bolts.

The rolls are of 60 in. diameter and 36 in. wide. The weight of each roll is 22,000 lb. The body or core of the rolls is of ordinary gray cast iron. The rims or tires are a special mixture hard white iron of great wear-resisting quality. The roll bearings are cast-iron bushings lined with high-grade babbitt. They are held in place with bolts and can be readily withdrawn for re-babbiting when necessary. Lubrication is provided by grease or oil forced through a channel cut longitudinally through the center of the shaft.

The masticator is compound-g geared. The crown gear and bevel pinion are cast iron with molded teeth of heavy pitch and designed to transmit safely the required horsepower. The intermediate gears are cast steel with cut teeth. The machine weighs 95,000 lb. and its operation requires 55 hp. The flux is fed into it continuously from the malaxeur, and is thoroughly kneaded and masticated by the revolving action of the rolls. Adjustable plows or scrapers carried on a supporting arm follow each roll, continuously stirring up the material so that the mastication is complete. At the same time the material is gradually forced to the center of the bed, where it is automatically discharged into an elevator, which delivers it to the feed box of the press.

This treatment causes an intimate intercompounding of the coal and binder to such an extent that, speaking practically, a homogeneous compound is created. The binder no longer exists as a mere glue on the surface of the minute particles, but by partial absorption has been incorporated into the material that forms the briquette, which in consequence, for hardness and strength is equal to the original lump coal.

The highest possible binding efficiency is thus obtained, with a saving of 2 or 3 per cent in binder, with a corresponding reduction in manufacturing cost. The extent of intercompounding in the briquette is proportionate to the viscosity of the binder and the length of time the mixture is subject to mastication. In all cases the masticator is adjusted so that the flow of material through it is continuous. It is essential that pressing follow mastication without delay.

From the masticator the flux is elevated directly to the feed box of the press. The feed box consists of a vertical cylinder with openings in the bottom over which feeding arms rotate. These arms deliver the flux

FIG. 7. ANOTHER VIEW OF MASTICATOR

The rolls rotate 18 times a minute and traverse a bed 10 ft. in diameter, the bed being cast in one piece and liberally reinforced on the underside with substantial ribs.

to the press in proper quantity and incidentally break up any caking developed in any of the masticated material.

The press (Fig. 5) proper is of the Belgian roll-eggette type. The rolls are duplex, with the driving-gear wheel between them. The diameter is 33½ in.; the width of each roll 14½ in. Each roll contains four rows of molds, staggered to afford the minimum of wasted space (which also means wasted power). The pressure at which the briquette is made is between 3,000 and 4,000 lb. per square inch. The pressing operation is, speaking generally, entirely in line with former briquetting practice, the changes and improvements being minor in importance.

For the highest efficiency in the pressing operation the rolls are set an appreciable distance apart. The flux falling between the molds cannot form part of the "egg," which is the real briquette, but becomes a "fin" at the sides, which from the standpoint of appearance at least is objectionable. Accordingly, the briquettes, coming from the press in a bucket elevator, are delivered to a revolving screen. The tumbling of the briquettes in the screen removes all "fins." The waste thus formed is delivered back to the masticator.

The briquettes as they come from the press are hard but still warm. Under ordinary circumstances passing over a cooling belt 30 ft. long at the rate of 30 ft. per minute is sufficient to provide ample cooling. The briquettes set and are hard enough for the usual subsequent handling. For extraordinary circumstances (such as exist in extremely hot weather) provision has been made to pass the briquettes through a water-cooling system. This system consists essentially of a water tank divided by a partition into down-flow and up-take compartments.

The briquettes drop into the down-take, sinking through the water, their path being lengthened by a series of inclined baffle plates. The base of this compartment is, in effect, a small bin with floor inclined at 45 deg. so that briquettes can feed by gravity through a gate to an elevator operating slowly in the up-take. The up-take elevator delivers to a storage bin. When this system is used the briquettes are cooled so thoroughly that by no possibility can they "run together" in the bins, as will uncooled briquettes through the softening of the binder caused by excessive interior heat.

So far the briquettes at the Toronto plant have been made in the 7-oz. size only, a size that parallels common egg coal. It has been planned to install a second press that will give the more familiar 2-oz. size, the equivalent of stove and nut. However, the 7-oz. briquette has, in the domestic market, proven entirely satisfactory in replacing all three sizes, and the proposed addition may prove unnecessary.

The cost of manufacture is well below the acceptable market price of the briquettes (between \$11 and \$12 per ton delivered). To provide an excellent binder of low penetrability, high melting point and one that will make a minimum of smoke involves a large expenditure of money, but the manufacturer actuated by a desire for more than mere cheapness feels well repaid for the size of this item of cost. The product has proven adaptable to practically all classes of domestic consumption, furnaces, cooking ranges, heaters and stoves. A portion of the factory is devoted to bagging, and a large bag trade has been built up.

## Welded Bond That Resists Violence

Can, However, Be So Welded That It Can Readily Be Removed by a Chisel and Used Elsewhere

THOSE who pay for the loss of power, the repairs to equipment and sustain the other losses caused by inefficient track bonding, as well as those whose duty it is to install and keep rail bonds in repair, will be interested in the "Everlast" bond recently perfected and placed on the market by the Flood City Manufacturing Co., of Johnstown, Pa. This bond embodies certain details that tend to give it exceptionally long life.

Ever since the introduction of a practical arc-welding outfit embodying a portable bank of resistance it has become practical to weld bonds to mine track. This now can be done easily without in any way interfering with the operation of the haulage equipment. By welding, the metal of rail and terminal blend together and at the contact amalgamate as one. If the welding is properly done, therefore, there is no possible chance for the joint to become loose or for corrosion to occur between the surfaces in contact.

This advantage is common to all welded terminal bonds. It remained, however, for some one to perfect a means, without sacrificing other advantages, whereby bonds might be protected from injury after their installation. This, it is claimed, has been accomplished in the new bond, while certain features have been incorporated that make it easy to weld to the rail.

The bond is made up of a flexible cable with terminals welded to either end. These terminals are so designed that they can be driven tightly onto the edge of the base of any size of rail. The terminals may then be welded to the rail without the use of a holder of any kind. The welding is performed upon the top of the rail base, this being the point where this operation may be most easily performed.

Since the terminals are of generous proportions and the weld to the rail is well removed from the weld of terminal and cable there is no danger of loosening how the cable weld in making the rail weld, no matter how inexperienced may be the operator of the arc-welding

TERMINAL FITS OVER FLANGE OF RAIL  
It is easily put on, readily welded and of rugged construction.

machine. It will thus be seen that the copper cable is under the base of the rail and consequently well protected. The exposed portion of the terminal is in a measure protected by both the ball of the rail and the fishplate.

In installing this bond where a tie is placed under the rail joint this tie is moved slightly endwise until a notch to receive the bond cable may be cut in its top. The cable is then placed in this notch and the tie slipped back into place. The terminals are then driven onto the base of the rail and welded. This greatly increases the safety of the bond as the cable is held close under the base of the rail throughout its entire length.

In manufacture the terminals are first drilled to a snug fit on the cable. The corner at one end of the hole is then rounded off, the other end is counterbored for about half the length of the terminal and the cable is inserted and welded into place. This makes a strong permanent connection between cable and terminal.

After the terminal is welded to the base of the rail little short of a sledge and chisel will ever remove it. The conductivity, therefore, always remains high and there is no reason why the bonds should not last as long as the rails they join.

Where track is of a temporary nature the terminals may be lightly welded along the long side only. This makes a good contact that will last indefinitely but which may be removed by cutting off the edge of the terminal just back of the weld. The bonds may thus be installed again and again. In this way the bond may be used repeatedly.

The makers believe that, considering the durability of this bond, the trade name—Everlast—under which they have chosen to introduce and market it is both descriptive and appropriate.

## Fuel, Heat and Light Advance Least Among Living Costs

National Industrial Conference Board Shows That Cost of Living Has Increased 95 Per Cent Since July, 1914

EXPENDITURES for fuel, heat and light form an interesting feature of a preliminary announcement by the National Industrial Conference Board on the increased cost of living for American wage earners. The average cost of living rose 7 per cent between November, 1919, and March, 1920. This marks a total increase of about 95 per cent since July, 1914, and an increase of 21 per cent within the last year. These figures are the result of the board's sixth survey of changes in the cost of living in the United States, a complete report of which will be available within a few weeks.

Increases between July, 1914, and March, 1920, in the cost of each of the five major items making up the family budget were as follows:

All items	94.8%
Food	100%
Shelter	49%
Clothing	177%
Fuel, heat and light	49%

Increases in the last four months, since November, 1919, were as follows:

Sundries	83%
Clothing	17.9%
Fuel, heat and light	7%
Sundries	4.6%

A number of reliable investigations, including some by the United States Bureau of Labor Statistics, have shown that before the war annual expenditures were apportioned approximately as follows: for food, 43 per cent of the total; for shelter, 18 per cent; for clothing, 13 per cent; for fuel, heat and light, 5 per cent; and for sundries, 20 per cent. These weights were used by the board in estimating increases in the cost of living since 1914.

While families differ somewhat as to the proportion of their incomes spent for the several items in the budget, any reasonable distribution of the income based on pre-war standards would show practically the same percentage of increase for the budget as a whole as that here given. Conditions in any specific locality, however, may in some instances be slightly unrepresentative, as, for example, in communities where very large or very small rent increases have occurred. Local rates for coal and light, street car fares, and the cost of other sundries items differ also, but in combining them in the total budget such discrepancies tend to disappear unless they are very unusual.

The combined cost of fuel, heat and light advanced less than one per cent between November, 1919, and March, 1920, although the total average cost was 49 per cent higher than in July, 1914, and 5 per cent higher than in March, 1919.

Coal prices were secured from 121 dealers in forty-four cities representing all sections of the country. The largest increases for anthracite were in the cities of the East, where advances in the neighborhood of 60 per cent since November, 1919, were reported from Providence, Bridgeport and Boston. Baltimore, Buffalo and Pittsburgh, on the other hand, had not raised prices.

In the Middle West the average increase for anthracite was less than one per cent, due to the fact that there had been no advance whatever in Cincinnati, Detroit, Duluth, Indianapolis, Louisville, Milwaukee, Minneapolis, Omaha, St. Louis or St. Paul. In Louisville, Columbus and Cleveland, as well as in Memphis, Little Rock and Seattle, the price of bituminous coal had fallen since November, 1919.

Less complete information regarding rates for gas and electricity indicated that the advance for these items since November, 1919, had been very small.

A summary of changes in the cost of living as estimated in the six studies thus far made by the board is given below:

INCREASE IN THE COST OF LIVING FOR WAGE-EARNERS IN AVERAGE AMERICAN COMMUNITIES BETWEEN JULY, 1914, AND MARCH, 1920, BY SEPARATE BUDGET ITEMS  
(National Industrial Conference Board)

Budget item	July, 1914, to June, 1918	July, 1914, to Nov., 1918	July, 1914, to March, 1919	July, 1914, to July, 1919	July, 1914, to Nov., 1919	July, 1914, to March, 1920
All items	52.2%	65.0%	60.5%	72.2%	82.2%	94.8%
Food	62%	83%	75%	90%	92%	100%
Shelter	15%	20%	22%	28%	38%	49%
Clothing	77%	93%	81%	100%	135%	177%
Fuel, heat and light	35%	40%	42%	42%	48%	49%
Sundries	50%	55%	55%	63%	75%	83%

## To Demonstrate Advantages of Hauling By Motor

FOR the purpose of demonstrating to the people of Massachusetts the possibilities of motor trucks for the movement of all sorts of commodities through various stages from producer to consumer, Ship-by-Truck Week is to be observed in that state from May 17 to 22.

# Successive Stages in the Development of the Storage-Battery Locomotive

Several Steps in the Improvement of the Accumulator Locomotive Have Been Made in the Last Few Years—They Probably Fore-shadow Still Further Developments in the Immediate Future

BY J. APPLETON  
Ironton, Ohio

**D**EVELOPMENT of the storage-battery locomotive during the last five years has been rapid and marked by enduring improvement. This applies not only to the locomotives themselves, which have been bettered in design and broadened in facilities for operation, but also to the methods of applying them to the gathering and hauling of coal in the mines. Consequently operators have come to look upon these machines in a different light from that which they formerly entertained and have enough confidence in them to consider their employment well worth investigation when any extension or development is contemplated. The early mistake of applying these locomotives to uses for which they were not suited has been corrected, and valuable lessons have been learned from this experience.

Those who desire to keep up to date concerning modern practice in gathering and hauling coal should find much to interest them in a brief story of this development as shown by the experience of one of the several manufacturers in this line. From this can be obtained a good idea of the present and future status of the storage-battery locomotive in coal-mine service.

The storage-battery locomotive carries its own supply of power into the rooms and entries where no other source of energy is available. As the amount of energy that can thus be carried around is necessarily limited by the weight and chiefly by the space available, that is by the over-all dimensions of the vehicle, this machine must be so designed as to obtain the maximum results

from this limited supply of power. Hence combined efficiency, mechanical and electrical, is of the utmost importance.

Operating where trolley wire cannot be strung or where the expense of its installation is prohibitive, the storage-battery locomotive replaces mules to great advantage. In some cases an additional saving is secured through not having to take down top or lift bottom to give the necessary height for these animals and their drivers.

For the purpose of this article the development of the "Ironton" storage-battery locomotive will be considered typical of what has been accomplished by manufacturers during recent years in perfecting this means of applying electric haulage to the transportation of coal.

Fig. 1 shows two of the first Ironton machines of the storage-battery type. They were built in 1915 and are still in daily use and

giving as good service as when they were installed. Of course, the batteries, which were of the lead type, have been renewed. This picture shows both the low and the high machines. Both are chain-driven but are without the later improvements that eliminated from this drive the difficulties and objection arising from lack of uniformity in the tension on the chain.

This difficulty existed whenever the locomotive was traveling over uneven track and other irregularities, for the warping of the support caused the distance between centers of the sprockets to vary. These latter refinements also provided an easy and rapid method of taking

FIG. 1. TWO EARLY STORAGE-BATTERY LOCOMOTIVES  
After nearly five years of operation these machines are still giving good daily service.

FIGS. 2 AND 3. LOW AND HIGH TYPES OF MACHINE

These machines are equipped with radial housings and chain adjustment to compensate for wear.

FIG. 4. NARROW LOCOMOTIVE FOR USE IN RESTRICTED PASSAGES

The outside driver is also advantageous whenever it becomes necessary to remove a wheel.

up the slack as the chain gradually stretched from use and wear. These improved features are illustrated in Figs. 2 and 3. Both the low and high type of machine are again shown. The radial housings for the axle bearings and the eccentric adjustment for chain tightening are quite noticeable.

With increasing use of the storage-battery locomotive in gathering work, conditions were met which called for a type of machine that could be used in narrow entries or where timbers had been placed close to the track. The outside-wheel design met this situation admirably. It is shown in Fig. 4. The total width of this type is only a few inches greater than the track gage.

Where the height will permit its use the outside-wheel type has become popular largely on account of the greater facilities for removing the wheels from the axles when such removal becomes necessary. Fig. 5 shows a type of storage-battery locomotive which intro-

FIG. 5. TROLLEY-RECHARGING STORAGE-BATTERY LOCOMOTIVE

This is not a combination machine but operates continuously on the battery even though drawing current from the trolley.

duced an entirely new feature—that of enabling the battery to be recharged while the locomotive is operating in an entry where trolley wire is strung. This type of machine must not be confused with what is usually termed a combination locomotive, wherein a 250-volt trolley-type motor is used, both when the machine is operating with current from the trolley and when running on the battery.

In the type illustrated a trolley-charging attachment is added to the storage-battery machine. This enables the battery to be replenished while running under a trolley. There are two advantages in this type of locomotive. Besides being able to do a limited amount of work on the trolley its scope as a straight accumulator machine is increased because of the additional battery capacity which is available.

This type of locomotive meets conditions under which

the work is beyond the capacity of a gathering locomotive and yet is not of sufficient amount to warrant the installation of main-line trolley locomotive. There also is the advantage of being able to charge the battery to some extent during working hours, thus reducing the time required to charge it afterward.

Another type of storage-battery locomotive which was designed to meet the requirements of haulage rather than gathering is shown in Fig. 6. This machine has two motors, each axle being driven by a separate motor through spur gearing. Large battery capacity is available as the over-all dimensions have not been restricted to suit low coal or narrow entries. Accumulator locomotives in which the axles are driven individually by separate motors do not develop the drawbar pull or tractive effort that can be obtained from machines

FIG. 6. A TWO-MOTOR STORAGE-BATTERY LOCOMOTIVE  
Each pair of drivers is actuated by its own motor.

wherein the axles are connected and all four wheels are driven simultaneously.

Under unfavorable conditions individually operated motors do not divide the load equally, and yet it is under just such circumstances that the maximum tractive effort is desired. Experience having demonstrated the superiority of the connected four-wheel drive, the problem of designing a one- or two-motor type of storage-battery locomotive for entry hauling and gathering was taken up. The result is shown in Fig. 7. In this locomotive either one or two motors can be used, but as the axles are connected by gearing, the power is applied simultaneously on all four drivers. The result is a provision of maximum tractive effort under all conditions.

It is not expected that this type of machine will supplant the chain-driven gathering type, which has been quite generally adopted. It will, however, be used in service where the chain drive is not as suitable as is the gear drive and in larger sizes where two motors are necessary. This type of locomotive is a notable advance in design and will undoubtedly open the field to still further improvement.

FIG. 7. A LOCOMOTIVE THAT USES EITHER ONE OR TWO MOTORS

The drivers are connected by means of gearing so that all four operate together.

# Steam Shovel Has Rendered Operable Many Properties Not Hitherto Worked

Three Large Bituminous Stripping Areas as Well as Many Smaller Ones Now Exist—Steam and Electric Shovels of Special Pattern Have Done Much to Render Profitable Stripping Possible

By F. H. KING  
Cleveland, Ohio

**M**ORE than 50 years ago a famous English coal-mining authority said, "Our industry will certainly last and grow until our mines are sunk 2,000 or even 4,000 ft. deep. But when that time comes the states of North America will be working in the light of day, quarrying coal along the banks of the Ohio and running it into boats alongside."

Many foreign mines have now been sunk to a depth of 3,500 ft. or more and are approaching the limit of profitable operation. And the fact that coal is now being "quarried" on the banks of the Ohio bears out the prediction above quoted.

Even now the industry of quarrying or coal stripping is still in its infancy. The introduction of modern methods and machinery into coal-stripping, or open-pit mining, however, combined with the natural advantages of this process over underground mining, is advancing this industry by leaps and bounds.

The history of the development of coal-stripping in this country parallels that of modern labor-saving machinery. Almost since the days of the early settlers stripping has been practiced in a primitive, limited way. Gradually, as the country has become more thickly set-

tled and machinery has been developed from one stage to another various devices have been employed in an effort to make commercial coal-stripping practical and profitable.

During the past twenty-five years scores of methods for removing the overburden from coal have been tried. Among others were aerial tramways, machine scrapers, land dredges and orange-peel excavators. These devices, however, proved so slow and expensive as to afford little real progress toward large-scale production.

Not until the spring of 1911 was a really successful coal-stripping machine built. This was a model 250 Marion steam shovel that was shipped to Patterson & Hartshorn of Oakwood, Ill. This machine had a 65-ft. boom and carried a 3½ cu.yd. dipper on a 36-ft. dipper handle.

Stripping operators were greatly interested in the "experiment" with this machine. The news that really "did the work" spread rapidly, and coal stripping methods soon underwent a complete change. The steam shovel thus made hundreds of thousands of acres of coal land available for profitable mining.

A MODERN ELECTRIC STRIPPER IN OPERATION

Electricity where available has many advantages over steam for actuating stripping shovels. The electric shovel requires a much smaller crew for its operation than does a steam machine of equal size and capacity.

TWO SHOVELS AT WORK IN A PIT

This combination, a stripper and a loader, is advantageously employed in many operations. In many cases the big shovel has some difficulty in keeping ahead of the small machine.

Today, coal operators everywhere are studying open-pit mining, and "strip" properties have been developed in districts where a few years ago such possibilities would have been scarcely considered. Numerous concerns are centering their efforts in this field, with the result that many operators have acquired stripping territory for immediate or future development.

As a rule, of course, coal mined from shafts or drifts is too deep for profitable stripping, though interesting exceptions have been noted. For example, one company plans to strip a large abandoned mine, estimating that enough coal can be salvaged from the old pillars to pay a profit.

Coal stripping or open-pit mining is coming increasingly into favor wherever conditions encourage its practice, because:

- (1) The strip mine yields large production much earlier than does the shaft or drift.
- (2) Hour for hour, more coal is produced by open-pit mining than by any other method.
- (3) Practically all of the coal deposit is recovered.
- (4) Much better supervision of the work is made possible.
- (5) Since no ventilation or underground drainage systems are required strip-mining saves large sums otherwise needed for purchase and maintenance of such equipment.
- (6) No danger is incurred from underground explosions, fires, falls of roof or ribs or haulage accidents. The explosives hazard is extremely low in strip properties by comparison with underground operation.
- (7) Shutdown, when necessary can be made with minimum expense.

Coal-stripping operations, while requiring good organization and business methods, depend largely for their success on the size of the shovels used to remove the overburden. The larger the shovel the quicker the stripping is performed and the sooner the coal is moving to market.

One Indiana operator employs the following equipment in his plant, which has a capacity of 18 to 24 standard railroad cars per day—the tract worked covers 200 acres and the coal bed, averaging 6 ft. in thickness, lies beneath overburden ranging from 8 or 10 to 30 ft. deep:

One Marion shovel of the large revolving type for removing overburden; one small revolving Marion shovel for loading coal; one portable Ingersoll-Rand electric air compressor to operate the drills for sinking

holes to shoot the coal; one mile of track and two dinky locomotives with trains of pit cars are installed for bringing coal to the incline; a feed-water pumping plant supplies the boilers, locomotives and shovels; the gravity incline has two 10-ton cylindrical gunboats or monitors for receiving the coal from the pit cars and delivering it to the tippie, which is electrically operated. High tension 3-phase electric power is available from public-service lines extending along the Ohio River. Approximately fifty men are employed in the operation of the plant.

In addition to steam shovels, electric shovels are meeting with favor among coal-stripping operators. Conditions determine which of the two types is the more advantageous to employ.

As to initial price, the electric type is, of course, the more costly. However, this is largely offset by greater production under favorable conditions and a smaller labor crew. A large electric shovel requires a crew consisting of one operator, one oiler and four or five ground men, making 6 or 7 in all. The same model and size of steam shovel needs as crew one operator, one crane-man, one oiler, one fireman, two coal handlers, four or five ground men and one water-supply man, making a total of 11 to 12 men.

The two chief drawbacks to coal-stripping are: Lay-offs necessitated by bad weather and destruction of land for farming. The first objection is overcome largely by good planning and by shovels mounted on crawling, or caterpillar, trucks which enable them to work readily on a yielding footing. The second objection is met, partly, by the fact that, in some sections, farms had been about completely worked out before mining operations were begun. Still other properties are located in the hills where grades are so steep that equipment has to be dismantled and taken up piecemeal. Here, of course, the question of the destruction of productive farm land does not enter seriously.

#### NATURE WILL HIDE LANDSCAPE DISFIGUREMENT

While the strip-coal operator does not take pride in disfiguring the landscape, he senses a justification for it that he feels the public at large should share. The world needs to be warmed as well as fed. The unsightliness of a scarred landscape is but temporary, since Nature will soon cover many of the cuts with her mantle of living green. Meanwhile, the owner has received a good price for a property that still retains a certain value for other uses. This, argues the strip operator, is real conservation.

At present there are three distinct bituminous fields in which open-pit mining predominates: (a) The Kansas-Missouri field lying in the vicinity of Pittsburg, Kan., and Joplin, Mo.; (b) the Illinois-Indiana field, reaching from Danville, Ill., to Terre Haute and Brazil, Ind.; (c) the Ohio-Pennsylvania field between Pittsburg, Pa., and Steubenville, Ohio, and extending as far west as Zanesville, Ohio.

**Contracts for Sale of Coal.**—Where a contract to sell coal provides for delivery upon the buyer's order within a certain period, time is presumed to be mutually intended as a vital condition of the contract; and if the buyer refuses to order delivery within the stipulated time, the seller will be under no obligation to make delivery on a belated order. (*Georgia Court of Appeals, Lee Bros. vs. Bewley-Darst Coal Co., 97 Southeastern Reporter, 99.*)

# Machinery as an Aid to Labor Conservation and Increased Production\*

Relief of Conditions Due to High Prices, Labor Shortage and Curtailing of Working Hours Can Only Be Accomplished by Devices That Will Emancipate Labor

BY RUMSEY W. SCOTT

**A**MERICA has never been found wanting in an emergency. The opportunity for progress in business is as great as at any other time in the history of the country. Resourcefulness, adaptability and the ability to organize and carry on in spite of any difficulties, at any time, have placed America in the forefront of world affairs.

While we have for several years enjoyed unprecedented prosperity, there are many indications that give cause for apprehension as to the near future. The reaction after every great war has brought higher prices of commodities, and in an endeavor to meet the cost increase there has been an advance in wages. It is not in the least surprising that after the greatest of all wars—the most destructive to both life and property—there should be a shortage of both the products of labor and of the hands required to do the world's work. The greatest shortage is in unskilled labor.

## TREMENDOUS LABOR SHORTAGE TO BE MADE UP

In a recent statement, William H. Burr, president of the Inter-racial Council, said that there is at present a shortage of four million to five million unskilled workers in this country. He said that the average reduction of the workday from ten to eight hours has resulted in an approximate loss in "production hours" representing the labor of from one million to two million foreign-born workers. Only a comparatively small part of this is likely to be compensated for by an increase in immigration, and the loss must therefore be made up in some other way, or there will follow a slowing down of industry with its consequent hardships.

It is patent therefore that the output per worker must in some way be increased. There has no doubt been a slackening of effort on the part of some workers since the war, but this, I think, is true more of the unskilled than the skilled worker. I have great respect for the intelligence and capability of the skilled American workman, and an unbounded confidence in the resourcefulness and ability of the American employer of labor. There has been, especially in the last few months, an awakening to their responsibility by the employer and the worker, and I am not in doubt as to the successful solution of our great industrial problems through concerted effort and co-operation.

The rapid growth of our country is largely due to the introduction of machinery as an aid to labor in the development of the natural resources with which the United States is so richly endowed. It has been estimated that the use of power and machinery has multiplied the productive capacity per man ten times. It would be difficult to conceive of our not having the railways, the steamship, the electric motor and the

dynamo, the telephone, the electric light and the automobile, and the hundreds of mechanical agencies that today contribute to our commerce and comfort. Their use has become commonplace. The widespread use of machinery has completely changed our human relations, and it is my belief that science and invention will play a most important part in the solution of our present and future problems.

## RECONSTRUCTION HASTENED BY MACHINERY

After the Civil War the Southern States possessed far less machinery than the North and a superabundance of cheap labor. The trials of the South during the reconstruction period of many years were great, and rehabilitation was much slower than in the North, largely due not only to the insufficiency of capital but also to the lack of efficient machinery. Modern inventions have almost annihilated time and space in the matter of communication.

Transportation has been revolutionized. While machinery has advanced civilization, it has brought greater individual responsibilities and while it has probably made possible causes for disagreement and dissension, it has also made possible what to us now is most important—means for quick and certain readjustment. It is not only necessary in the present emergency to employ agencies that will rehabilitate industry but ones that will as soon as possible overcome the labor shortage and increase unit production, and in addition enable labor at all times to receive equitable return for its effort.

It is very fortunate that labor in general no longer displays the opposition to the use of machinery that was so evident when the first so-called labor-saving machinery was introduced. Even now we occasionally hear of labor opposing the introduction of machinery and in a few cases causing its destruction, but such cases are now rare and solely due to ignorance, and the opposition is usually from unskilled foreign labor.

## LABOR UNIONS FAVOR LABOR-SAVING DEVICES

The following is quoted from a statement made by Samuel Gompers, president of the American Federation of Labor, in an interview with Samuel Crowther, recently published in *System*: "There is an impression that the unions are against machinery and against better ways of doing business, and against scientific management, and in favor of stringing out every job to the greatest possible extent. That, it is true, was the attitude of the old country. It is not the attitude of the American labor movement. The unions at one time opposed the introduction of machinery because both the workers and the employers saw labor-saving machinery not as an aid to production but simply as a substitute for men.

\*Address delivered at the meeting of the Chamber of Commerce of the United States at Atlantic City, N. J., Wednesday, April 23, 1920.

"I am in favor of every possible mechanical device that can substitute for human labor, but if the employer looks at the machine solely as an instrument to take employment from men he is bound to fail, just as are workers who oppose machinery because it is going to cost them their jobs. This is the short-sighted view. The workers can break the machines and they can destroy the blueprints, but the idea remains, and if it is a good idea it will be put into force. Otherwise we bar the economic progress of the world and encourage instead of prevent waste."

This statement, coming from the recognized head of the better element of American labor, is of great importance. To hold to any other view would point to retrogression and decadence.

In my opinion it is a mistake, especially at this time, to use the time-worn phrase "labor-saving machinery." The labor we have should be conserved and released for the work that only human hands can perform, and to direct the machine that has not "saved" but emancipated labor.

#### INTERCHANGEABILITY AN AID TO PRODUCTION

In every manufacturing industry there has been a great development in the construction of machines to aid labor and increase productivity. The making of tools for the building of accurate machinery led to the system of "interchangeability," and this marked a great advance in the increase in output of the individual and a lowering of the cost of production. The manufacturers in the United States were the first to establish this practice, one which other countries have not been slow to adopt.

The next important advance came in certain lines where it was practicable to standardize the product. Probably in no field is this so successful as in the manufacture of motor cars. Following standardization came the use of one-purpose tools and automatic machinery. This has greatly speeded up production and reduced costs, and has enabled labor attending these machines to soon become skilled in their operation, and at much higher rates of wages.

In the last few years manufacturers and employers of labor have recognized the necessity of devoting thought and attention not only to the perfection of methods and machinery, but to the welfare and development of men. Probably no element of business is now receiving—certainly there is none that should receive—more careful attention and thought than the satisfactory relation of employer and employee. This is a subject so fertile and vast in its scope that the time at my disposal does not permit of its discussion.

#### ECONOMY OF PROGRESSIVE PRODUCTION

Attention has thus far been principally directed to the aid of the machine in the conservation of labor and increased production. May I now ask your attention to an element in manufacturing which offers great opportunity for improvement and economy?

A new phrase of comparatively recent origin is descriptive—"progressive production." This has been highly developed in certain industries, such as paper making, the manufacture of automobiles, of machinery, the steel industry, packing industry, etc. This involves not only the placing of the different processes of manufacture and the machines in their proper relation but the proper routing of materials and the employment of efficient means for their transference. The greater the possi-

bilities of standardization of product, the more readily adaptable is the system to use.

Machines for the conservation of labor in the transfer of materials are of many types and have been highly developed. Many of them have dispensed with large numbers of laborers. Machinery of this type relieves labor of its drudgery, and its use is almost indispensable.

The handling of bulk materials has been perfected to a remarkable degree. Huge machines which are capable of automatically raising and dumping 110 tons of ore from railroad cars into steamers are operating at the amazing low cost of from  $\frac{1}{2}$  to  $1\frac{1}{2}$  c. per ton. Machines operating scoops holding seventeen tons are now removing ore from steamers and unloading it into freight cars at the rate of 520 tons per hour at a cost of approximately 2.4 c. per gross ton.

Coal conveyors are in use in great numbers at terminals, at public utility plants and at manufacturing plants, and are remarkably efficient. At a number of plants coal is now being loaded into colliers by car unloading machinery which automatically lifts, overturns and dumps a car of 110 tons of coal. Automatic machinery is used in coaling ships, almost entirely eliminating labor. Each machine is capable of delivering 100 to 150 tons per hour from a lighter to the ship, making it possible to coal the Leviathan in a single day.

Cranes and hoists are built for almost every purpose. The traveling shop crane is indispensable in plants where heavy loads are to be handled. There was recently completed at the Philadelphia Navy Yard a lifting crane of the tower type capable of lifting 350 gross tons. Electric hoists swift in motion are used for hoisting and transferring machines and materials in plants. Electric cranes and hoists of many types are used in economically and quickly loading and unloading ships and railroad cars.

#### ELECTRIC TRUCK REDUCES TRANSFER COSTS

The electric industrial truck has come into very general use at railroad stations, terminals and in industrial plants, and with its aid the opportunity for speeding up and reducing the cost of transferring goods is very great. Trucks are now made which not only carry the load but elevate the goods so as to permit of stacking, which reduces labor and increases the storage capacity of the floor. The industrial truck used as a tractor in connection with a train of four wheel trucks provides an excellent means for the handling of materials and commodities. It is a system that gives flexibility and has the advantage that trucks can operate over an area and are not restricted to a line, as in the case of continuous conveying devices.

Only a few of the more important of material handling machines have been referred to to show the possibilities in this field alone in increasing production and conserving labor. Machinery is now available to perform almost every duty now performed by human hands. Machinery will be constantly perfected to meet new requirements. The possibilities are almost without limit. Economic necessity absolutely demands the use of machinery wherever possible.

By contact we learn of what others are doing and what may be accomplished. By confidence we learn better understanding and a greater respect for the viewpoint of others. By co-operation we learn how to plan and work together and bring about mutual understanding. In closing may I leave the thought expressed by these three words: contact, confidence and co-operation.

# Cagers at Shafts Facilitate Hoisting

Cagers, Both with Single and with Double Pairs of Horns, by Feeding Cars Regularly to the Hoisting Cage, Tend to Make Mine Operation Steady and to Reduce Labor Cost

BY N. L. HARMON  
Bowerston, Ohio

**I**N order to cope successfully with the larger outside difficulties in the market, operators must be freed from unnecessary annoyances at the mines. If they can produce more coal, lessen the cost of production and avoid delays and wrecks by wider use of labor-saving machinery, granted only that they have railroad cars on the switch, they can be assured of meeting advantageously all the problems of distribution. Among devices

ton, of which B. O. Rook is general manager. Mr. Rook was the first to install this type of cager at a shaft bottom, though it must be admitted the Johnston City Coal Co., in the town of Johnston City, had given the matter of installing the cager earlier consideration and had placed the order a day before Mr. Rook. The delay of that company arose solely from the fact that it was not ready to install its cager as soon as it arrived.

FIG. 1. SHAFT BOTTOM OF THE COAL RIDGE MINING CO., LINTON, IND.

The left hand cage is down and a loaded car is in place upon it, ready for hoisting.

FIG. 2. ANOTHER VIEW OF THE SAME INSTALLATION

Note the cager horns on both tracks, the one pair open for decaging and the other closed against the passage of cars.

that are being installed to increase production and lessen cost may be mentioned the automatic safety mine-car cager invented by James A. Nolan, manager of the Mining Safety Device Co., of Bowerston, Ohio.

While this cager is developed along the lines of others of the same firm, yet in many respects it is a departure in that class of construction. Fig. 1. shows the equipment at the mine of the Coal Ridge Mining Co., of Lin-

Several details of this machine which distinguish it from others assist in the solution of the problems of automatic caging. Instead of a round rocker shaft with bell cranks keyed and pinned to it, the rocker shaft in this case is square and the bell crank is made with a square hole to slide on the shaft, carrying the turn-buckles with it.

Long buffer springs are used to cushion the horns

FIG. 3. UPPER WORKS OF THE ORIENT MINE OF THE CHICAGO, WILMINGTON & FRANKLIN COAL CO. This operation holds the record of 6,777 tons in eight hours. The shaft bottom is shown in Fig. 5.

and absorb the impact of the loaded cars. At some mines the car axles are weak, but even the weakest of axles cannot be bent by coming in contact with the horns of this cager. Neither is it possible for the cars to climb the horns or telescope bumpers. The cager is operated both by the cage and the car. The descending cage opens the horns by depressing the trip crank attached to the rocker shaft. The loaded car passes to the cage and in so doing moves the reset block from the rail, revolving the rocker shaft and closing the horns just back of the next advancing loaded car. In order to close the horns be-

FIG. 4. ROTARY DUMP INSTALLED AT CASSIDY'S SIDING, VANCOUVER ISLAND  
Horns of the cager in the foreground, admit cars to the dump or prohibit them from entering.

fore the cage leaves the landing, a novel feature is employed, namely, a two-piece trip crank, instead of the usual one-piece crank. A pin on the cage depresses the trip crank and then passes beyond it. The closing horns bring the trip crank back into place and when the cage rises the two portions of the crank separate and allow the pin on the cage to pass by. The double-acting tension spring attached to the rear of the rocker shaft assists in throwing the shaft into either of its operative positions. Moreover, it carries the trip crank past the point where it is released by the pin on the cage

FIG. 5. SHAFT BOTTOM OF THE ORIENT MINE  
Everything must be "shipshape" and automatic to enable a mine to secure and hold the world's holder record. The cager horns on the right having permitted the passage of one car are now set against the approach of another.

# At Last, Heavy-Duty Quintuplex Mine Pump Driven by Condensing Steam Turbine

Will Raise 2,100 Gal. of Water Per Minute in Kingston Coal Co's Shaft—Lift Will Be 700 Ft.—Steam Consumption Under 14.7 Lb. Per Horsepower Hour Guaranteed—Large Saving in Room Required

By ERSKINE L. SOLOMON  
Kingston, Pa.

IN THE never-ending quest of economy a number of coal companies decided a few years ago to replace wasteful pumping and generating units with more modern equipment. In some cases, however, ease of installation appears to have been sought rather than economy, for in few of the pumping stations have the best results been obtained.

High-duty pumping engines of the corliss or poppet-valve type operating condensing are ideal from an economical point of view, but the space required for their installation renders them unfitted for use in the mines. Steam turbines, on the other hand, require but a small amount of space as compared with corliss engines of the same horsepower, which with a guaranteed low steam consumption presents a combination that no other prime mover can match.

To apply a machine of this type to a mine pumping unit was a radical departure from usual practice, and the combination for a time could not be effected because of the high speed at which turbines operate. With increased perfection in reducing gear, however, means were provided whereby steam turbines could be attached to certain types of pumps, whereupon the Aldrich Pump Co. was requested to furnish a quintuplex pump arranged for steam-turbine drive.

A satisfactory arrangement finally was devised and a unit ordered, but the delivery of this kind was delayed because all equipment of this kind was taken by the Government during the war. As a result the complete unit was not delivered until a few months ago. Recently this combination operating condensing was placed at work in the No. 4 shaft of the Kingston Coal Co. in the Red Ash bed at Kingston, Pa.

The pumping unit consists of an 11 x 18-in. Aldrich vertical, quintuplex, outside packed plunger unit, of the pot-chamber, water-end type. Its capacity is 2,100 gal. per minute against a 700-ft. head. This pump is driven through Falk herringbone gears and an Aldrich flexible coupling, by a 500-hp. Kerr economy, horizontal, multi-pressure stage, steam turbine operating at 4,800 r.p.m. This machine has horizontally split casing, diaphragms and bearings.

The turbine is equipped with a standard governor of the latest type, an oil pilot control for operating the governing valve, also an overspeed governor, and quick-closing trip and throttle valve. A hand-operated overload valve for non-condensing operation is provided as well as a speed-changing device that permits varying the speed 10 per cent while the machine is in operation.

The turbine is connected through a flexible coupling

PLAN AND ELEVATION OF PUMP CONNECTIONS

In the discharge line "dutchmen" have been used to secure small changes in direction

PUMP AND ITS DRIVING TURBINE

Compare the diminutive size of the prime mover with the bulkiness of the machine it drives.

of the pin-and-bushing type to double helical herringbone reduction gears that reduce the speed from 4,800 to 600 r.p.m. The entire unit is lubricated under pressure, the oil being pumped to all main bearings, gears, etc. Guarantees has been given that the steam consumption, including gear losses, will not exceed 14.7 lb. per horsepower-hour.

The condensing equipment consists of a 20-in. Eynon & Evans barometric condenser with iron body and white-metal water combining and discharge tubes. These parts are made of a special metal so as to resist the acidulous action of the mine water used for condensing. The condenser is supplied with water through an 8-in. bore hole from the coal bed above. An automatic balance valve is provided for free exhaust.

### Illinois Mines and Minerals Director Dies

JOSEPH C. THOMPSON, director of the State Department of Mines and Minerals, of Illinois, died recently at the home of his son, Fred Thompson, at Ward, Jackson County, Ill. He was ill only a short time and his death was attributed to heart failure. He made his headquarters in Springfield since becoming director of mines and minerals.

Mr. Thompson was one of the mine experts of the Illinois coal fields. At one time he was mine manager of the Majestic mine at Duquoin, owned by the Equitable Coal & Coke Co., of Chicago; later he became general superintendent of the Jackson Coal Co., at Hallidayboro. Resigning the position of general superintendent, he was appointed as state mine inspector and established headquarters at Murphysboro; he remained there until he was appointed successor to Evan D. John, who was then director of mines and minerals.

Mr. Thompson was an expert on mine gases and methods of handling them and in this work he probably had no superior in the state. He was 65 years of age at the time of his death.

In view of the difficulties being experienced by the Government fuel yards in obtaining coal supplies, J. D. A. Morrow has arranged with members of the National Coal Association to give priority to sufficient consignments to take care of the Government requirements in that respect.

### Export Association Discusses Foreign-Trade Prospects

SPeAKING for a group representing manufacturers of coal and oil, H. M. Payne, assistant to the president, Bertha Coal Co., at the "Commodity-Group Luncheon" of the American Manufacturers' Export Association held at the Hotel Pennsylvania, on April 21, replied to seven questions which had been presented to each group that the consensus of its opinion might be secured. The coal-and-oil group consisted of seven coal men and four oil men. In answer to the first question: "Have the foreign exports in your line been absolutely or materially curtailed by the present condition of foreign exchange?" Dr. Payne replied that the unfortunate condition of foreign exchange has not materially curtailed the coal-export trade. The countries take whatever they need and are able to get.

As to the second question, to wit, whether any anticipation existed in the mind of the committee that foreign exports will be stopped or materially reduced in the next six months, the answer of the coal group was that the demand is so great that the exportations of coal are limited solely by the capacity of the piers over which the coal is loaded. The committee declared that it confidently expected that the coal men would be operating at the maximum capacity of the tidewater piers within the next year.

In reference to the question—In which countries do your customers show evidence of financial recuperation? the committee replied that both the groups were unanimous in the opinion that England has recuperated most, but there is a difference of opinion as to whether Belgium or Italy should take second place and France third.

When considering the problem of whether it is advisable to accept deposits abroad against invoices, the committee replied unanimously that it was not advisable. The fifth inquiry—Do you require, or are you advising your foreign customers to purchase "future" of exchange? was also unanimously answered in the negative, the committee saying that it was purely a question of credit, whether business is done or not.

The attitude of the coal and oil groups is best expressed by the words: "You may take it or leave it. We have the oil or the coal. If you want to pay it in established New York credit, all right; if not, we do not care whether you establish credits or not."

In reply to the inquiry—Do you anticipate any general increase on duties or embargoes against your products to foreign countries? the answer was No, and when the committee was asked, Has your company allocated to its foreign business a definite percentage of its established total products? that question was also answered by a negative.

### Must Prepay Freight Charges on Coal For Canada

G. N. Snider, coal traffic manager of the New York Central lines, has issued the following notice to agents in that company's coal traffic department:

"Because of the existing rate of exchange, on and after May 1, 1920, freight charges (including advance charges if any) must be prepaid on all freight shipments destined to points in Canada originating in the United States."

# Outlaws and Profiteers Have No Place In Retail Coal Trade\*

Favoring a House Cleaning by Retail Coal Merchants, Officer of Association Would Welcome Accurate Definition of What Constitutes Profiteering—Merits of Each Case Should Be Considered

BY ELLERY B. GORDON†  
Philadelphia, Pa.

THE Attorney-General of the United States, A. Mitchell Palmer, had an article in the October, 1919, number of *The Nation's Business*, in which, after making the statement that "profiteering probably has existed since the beginning of commerce," he attempted to give his idea of what profiteering is.

He admitted that the term as commonly used is not susceptible of exact definition. It cannot be said that a man who makes 10 per cent, 20 per cent, or 30 per cent, or more profit is profiteering. "Anyone who makes more than a just and reasonable profit is a profiteer. Whether he does this must be separately determined in each case, taking into consideration the conditions in the locality, the nature of the commodity, and the other facts relating to the particular transaction." Aside from the difficulty raised by the use of the word reasonable, we believe this is a very "reasonable definition."

A United States Senator recently stated in a committee hearing that anyone is a profiteer who makes more than 6 per cent if his business involves no risk, and 10 per cent if it does involve a risk. He meant "on the turnover." As a matter of fact, however, there are many operators and retailers who would like to approach even half way to this limit.

The retail coal merchant has been interested in this question as to what a reasonable profit is perhaps more than in any other one point. While the Fuel Administration was controlling retail prices the state fuel administrators exhibited almost as many opinions regarding profits as there were administrators.

## LEGITIMATE BUSINESS ENTITLED TO FAIR PROFIT

Without going too much into past history let me cite the practice in New York State. The Fuel Administrator at the start was a business man and most of his county and local administrators were business men. They recognized the fact that legitimate business enterprises were entitled to a fair profit.

It was urged upon the state administration that 50c. per ton was a fair profit. Offhand this sounds reasonable. As a matter of fact, however, it was only on tonnages of medium size that this profit was permitted, while in large communities, where the average retailer handled a large annual tonnage, the net profit aimed at was about 25c. to 30c. per ton. In small towns, the other extreme, where the dealer is just as necessary, even 50c. a ton would not have been a fair return.

But that was two years and more ago. The current capital necessary to conduct a retail business today has increased over two years ago by 20 per cent to 30 per cent. Mine prices advanced under the Fuel Administration and freight rates advanced under Mr. McAdoo, and yet we are still talking of 50c. and 25c. Let us

right now recognize the general price advance—it is but fair; where 50c. was a fair profit two years ago, 60c. is certainly no more than fair now.

Of course, the question of the return on investment was taken into consideration in the case of the medium and large sized tonnages. The very small merchant, however, who must at least make a living, must not be held to a small percentage return on his investment. If he handles 2,000 tons a year or 3,000 or 4,000 tons a year, his investment may be so small that even 100 per cent return on it would not mean living wages. Return on investment must, therefore, be ignored in many cases. A 2,000-ton annual business means, in dollars, probably upward of \$20,000. A 10-per cent profit on sales would be less than present wages.

## COAL BUSINESS IS ONE INVOLVING RISK

While we are speaking of profits in concrete terms it is to be remembered that the figures mentioned may be called "paper profits." They represent the amounts that were added to the ascertained cost of doing business for a past period of six months or a year; but they didn't actually pan out. For instance, with gross margins fixed to produce a net profit of 50c. per ton on domestic sizes, and 25c. on small sizes, with the intention of averaging about 35c. per ton net profit, the result at the end of the year during which this order was in force was a net profit of only about 18c. per ton in a representative case.

To say that the retail coal business involves no risk is not true. While an investment in equipment, storage facilities, etc., is essential, an additional capital is needed to handle accounts receivable, which in some cases known to the writer amount to an average of over one dollar per ton of annual business the year round. There is the same business risk that other retail merchants are exposed to. Unquestionably there is not as great a risk as mining involves. On the other hand, most mining operations result in a business of tens of thousands of tons, while the average retail coal business is less than 7,500 tons per annum. The factor of volume cannot be overlooked in considering profits.

## WHAT IS A FAIR PROFIT PER TON?

The question has been asked repeatedly in conventions of retail merchants, "What is a fair profit per ton?" Some have been assumed to answer the question with a flat figure such as 50c. or \$1. This makes me think of the remark of a railroad president regarding some rules that had been worked out and presented to him for approval. After looking them over he said, "Yes, very good. I have only one thing to say. Rules must be flexible to succeed." No rule for profit-fixing can be successfully applied everywhere.

Under the Fuel Administration in Massachusetts, according to a statement made in conference by the New

\*Address delivered at the annual convention of the Indiana Retail Coal Merchants' Association, at Indianapolis, April 28 and 29.  
†Secretary-Manager Retail Coal Merchants Association.

England Fuel Administrator, the retailers were permitted just enough to "keep body and soul together." The Chicago gross margins were based on an intended net profit of 25c. to 35c. per ton. The New York basis is outlined above. Nothing like excessive profits were permitted under the fuel administration, generally speaking. In fact not even war profits were permitted. Here in Indiana, I understand, net profit was considered entirely unnecessary!

The retail coal merchants generally did not increase their margins during 1919. In many cases of which I have detailed record the margins decreased slightly and in other cases where margins were increased they did not keep pace with the increase in cost and profits. In some instances they decreased or even disappeared.

#### RETAILER FORCED TO INCREASE MARGIN

The retailer therefore in the beginning of the new year, facing additional wage increases in nearly all parts of the country, has been obliged to increase his margin. No fair-minded person would ask him to do otherwise. We have run into a perfectly natural temporary upheaval or disturbance in the coal market due to the removal of restrictions that have been in force practically during the last three years. The situation is not nearly as alarming as a great many calamity howlers would like to have us think. The only alarming feature of it is the fact that there is a small percentage of the trade, including the operators, the jobbers, and the retailers, who are not only their own worst enemies but are enemies of the entire coal trade.

We are in a way on trial. There is no question about it. We have hanging over us now very drastic legislation. Let us not deceive ourselves into thinking that it is so drastic that it cannot possibly pass. It can very easily be revised and passed, unless during the next few weeks and months the coal trade itself shows that it does not need such regulation.

I want to make a few very plain statements of opinion.

First. I know that 95 per cent of the retail trade is honest and fair and wants to take no advantage whatever of market conditions. Ninety-five per cent of the trade is convinced that it is entitled to a fair profit and that is all they are going to take. I believe the same is true of an overwhelming percentage of the operators and of a large percentage of the wholesalers. It is the other 5 per cent that worries us.

#### FAVORS HOUSE CLEANING BY COAL MEN

That 5 per cent among the operators, who because the demand is heavy sit back and say "I can get \$5 for my \$3.50 coal and I won't sell it for any less," and the wholesaler who knows that from certain buyers who are overexcited he can get \$10 at the mines for his \$7.50 anthracite coal; and that retailer who because his consumers are alarmed asks \$1 gross margin when \$3 or \$3.25 is a fair margin; all these are outlaws. They are just as much enemies of the coal trade and of the public as are any other profiteers.

Let us clean house!

Let us make it understood in no uncertain manner that we as organized coal merchants do not condone or tolerate speculative coal prices on the part of the operator and wholesaler, nor profiteering upon the part of the retailer. There is more than one way of being a profiteer. The retailer who allows himself to be stampeded

into encouraging high mine prices by bidding against the market, and the operator who permits himself to accept these bids simply because they are offered, are just as guilty as those who deliberately figure that now is the time to make a killing and set about doing it.

Now is the time to keep our heads!

Let those who have the high-priced coal to sell keep it. Let the consumers who are overexcited wait. Explain to them as well as possible. Let the man who sees fit to buy his high-priced coal sell it at excessive prices. But let him be the only one in your market who is doing it. Then if a crash comes those who are to blame will be easy to find.

I said, "Let us clean house!" I meant let us clean our own houses. I didn't mean to invite the operators to come and clean our houses for us. It has become a great game this "passing of the buck" on account of the high prices, and the coal trade, which is notorious for a lack of unity and co-operation, is dividing itself again in the same way. Let us all recognize that all but 3 per cent or 4 per cent or 5 per cent of all branches of the trade are honest and fair. Let us not make general accusations. If we know of specific instances let each branch take care of its own troubles.

I have in mind a warning to coal retailers which I saw in the *West Virginia Mining News* about two weeks ago. It said that "Evidence is before us that some retailers of coal are charging more than is justified by the price at the mines, plus freight and expense of handling and a fair profit. If this practice is continued this paper will publish the names of those doing so, and all facts in connection; then will circulate bulletins in the communities where such retailers do business, exposing their methods. In other words, retailers are not going to 'get by' with laying the blame for high coal prices on the mine operators—not this year." The editor of the *West Virginia Mining News* is Mr. Wightman D. Roberts and its office is at Charleston, W. Va.

#### OPERATOR IGNORANT OF FAIR RETAILING PROFIT

In the first place, Mr. Roberts may know mining but I doubt very much if he has any idea what a fair profit for retailing is. I am sorry I am not personally acquainted with him. Anyway, if he knows of any retailers who are getting more than a fair profit, we should be just as glad to have them exposed as anybody else. If he should publish any names, however, we should be obliged to see that the invoiced prices for the coal which they bought, together with the names of the shippers, also were published. If there is going to be any exposure it will have to be complete.

Now I may have used some pretty strong language, but it is time that the coal trade took itself in hand and stopped kicking about conditions when a considerable part of the blame, for the price conditions at any rate, is strictly up to the trade itself. It is time that we settled down to manage our own business in a business-like way, and let those whom the profiteering coat fits put it on.

As long ago as last September I tried to impress the retail branch of the trade particularly, but it applies also to the entire coal trade, with the fact that our destiny is in our own hands. I remember telling a story that illustrated what I have in mind, and it is worth repeating.

I stated at that time that we cannot afford to be like the man in the grocery store who was approached by an

old gentleman with a stick in his hand, with the following question:

"Did you drive up here in a cart?"

"Yes, I did," was the answer.

"Was it an old white horse?"

"Yes."

"And an old woman on the seat?"

"Yes."

"And can she manage that horse?"

"I should think she can."

"Then it's all right," said the man with the stick. "The old horse is running away and the old woman is hanging to the tailboard, shouting 'Murder!' with all her might; but if she can manage it there is no use of anybody getting excited over it."

We are trying to be sure that the old horse does not run away and get us into trouble.

### Central Pennsylvania Decides On Wage Scale for 1920-1922

AFTER sessions continuing over a period of three weeks and held in Philadelphia, representatives of the Central Pennsylvania bituminous operators and mine workers agreed upon and signed a wage agreement on April 27. The contract is for a period of two years, from April 1, 1920 to March 31, 1922, and runs as follows:

OUTSIDE DAY-WAGE SCALE.	
Occupation	Rate per Day
Car cleaners.....	\$5.10
Pushers.....	5.18
Trimmers.....	5.36
Dumpers.....	5.42
Ram operators and Firemen now working on change shifts of eight hours each.....	5.60

INSIDE DAY-WAGE SCALE.	
Occupation	Rate per Day
Trappers.....	\$3.18
Wiremen's and Tracklayers' helpers.....	5.77
Scrapers.....	5.85
Pipemen.....	5.92
Spraggers, Skilled wiremen in charge of work, Tracklayers, Bottom cagers, Drivers, Trip riders, Water and Machine Handlers, Timbermen.....	6.00
Motormen.....	6.10
All other inside day labor.....	5.77

TONNAGE RATES.	
Work Performed	Rate
Pick mining per gross ton.....	\$1.2428
Pick mining per net ton.....	1.1096
Machine loading per gross ton.....	0.8434
Machine loading per net ton.....	0.7531

#### INCREASES IN TONNAGE RATES OVER PRICES IN EFFECT OCTOBER 31, 1919.

(Less 5 per cent bonus on 1916 contract prices).

Work performed	Advance in rate
Cutting, scraping and loading per gross ton.....	\$0.2688
Cutting, scraping and loading per net ton.....	0.2400
Cutting and scraping per gross ton.....	0.0511
Cutting and scraping per net ton.....	0.0456

All rates on deadwork and yardage in effect Oct. 31, 1919, shall be reduced by the amount of the 5 per cent bonus granted in the 1916 contract prices and then shall be increased 20 per cent.

All other outside able-bodied day labor, excepting the men herein above mentioned, shall work the same hours and at the same rates as at present, plus an advance of \$1 per day over the prices in effect Oct. 31, 1919, based on the present standard number of hours now constituting a day's work under such employment at each operation.

All boys under eighteen years of age receiving on Oct. 31, 1919, less than a man's wages, shall be advanced 53c. per day based on the present standard number of hours now constituting a day's work under

such employments at each operation. All monthly men shall be advanced \$1 per day over the prices in effect Oct. 31, 1919, based on the present standard number of days and hours constituting a month's and a day's work under such employments at each operation; provided, however, that this clause shall not apply to mine foremen, assistant mine foremen, firebosses or bosses in charge of any class of labor inside or outside the mine, or to coal inspectors or weigh bosses.

All labor engaged in the manufacture of coke shall be advanced at the rate of \$1 over and above the prices in effect Oct. 31, 1919, with the exception of boys under the age of eighteen years, who shall be advanced to a minimum wage of \$3.53 per day. The application of said advance in both cases mentioned in this paragraph to be based on the present standard number of hours, average ovens drawn, and average cars loaded per man, now constituting a day's work in such employments at each operation.

The advance in the price of all house coal shall be 27 per cent. At all mines where cars are pushed both ways by the miner, the operator shall pay for this work the sum of 5c. per gross ton or its equivalent net. Whether the operator reduces the car pushing work to a one-way push, the direction being at the choice of the miner, the compensation shall cease. This clause shall not be taken to authorize an adverse charge where cars are now being handled by the company one or both ways.

### Want a Seven Per Cent Advance

DRIVERS in a number of East-Side coal mines near East St. Louis are seeking by a strike to obtain a 27-per cent increase in wage in place of the 20 per cent increase which was granted them by the Bituminous Coal Commission. It is an old practice of union men to play up the wrongs of a certain class of men who have profited least by past wage increases and then seek to extend their advances over the whole body of workmen regardless of the fact that in the recent past most of them have received larger increases than those that have been complained of. Thus it was the hope of the union that the wages of all union men would be increased considerably because the pick miner, and only he, could make just claims to such an increase.

The day workers would have by-gones be by-gones and have their wages as generously advanced as those of the miners. The union has given its approval to the decision of the commission and cannot therefore allow the drivers to demand more than the commission awarded. It is, therefore, prepared to take away the union cards from the drivers who have left their work, laying the mines and their co-workers idle. An increase of \$1 per day is all to which they can lay claim and they have no right to demand more nor, by refusing to perform their accustomed work, to lay off thousands of miners in Madison, Macoupin and St. Clair counties.

### Company Gets \$300,000 Damages

AS THE RESULT of a suit charging a violation of the Sherman Act, the Pennsylvania Mining Co. has obtained a verdict at Fort Smith, Ark., for \$300,000 as against District No. 21 of the United Mine Workers.

# Seasonal Coal Freight Rates Supported by Government Officials

Hearings on Frelinghuysen Bills Have Developed Support of Operators in Middle West and of Federal Officials, But Have Shown Opposition of Eastern and Far Western Operators and Railroads

**H**EARING on the seasonal freight rate and the Coal Commissioner bill were concluded, as far as bituminous coal is concerned, by Senator Frelinghuysen on Thursday, April 29, after two days' hearings at which further testimony opposing the bill was introduced. The strongest proponents of these measures to stabilize the coal industry heard last week were Chairman Clark of the Interstate Commerce Commission and Director Smith of the Geological Survey.

Chairman Clark put the entire Interstate Commerce Commission on record as unqualifiedly in favor of immediate legislation providing for seasonal freight rates on coal and he appeared in favor of the engineers' bill. His testimony was mainly directed against the objections of the Lake dock operators, who the week before presented strong objections to any measure that does not provide reductions on lake coal moving to Lake Erie ports. Mr. Clark does not believe that Illinois coal will make any large inroads on the market territory of the dock men in the Northwest as a result of seasonal rates.

He pointed out that no new measure can be undertaken or progress made that does not in the beginning tread on the toes of some people. There is so much competition in the coal industry that any change that affects delivered prices will certainly meet with disfavor on some side. He made the interesting statement that two years will be required for equipment builders to make up the war losses and current obsolescence in open-top cars, if the building program is not speeded up.

Iowa coal operators are very much opposed to the seasonal rate, George Heaps of the Iowa Coal Operators' Association told the Frelinghuysen committee on April 28. He expressed the opinion that the low summer rates would give practically all of the coal business in Iowa to Illinois. This would necessitate the closing of the Iowa mines in the summer, he declared.

## IOWA OPERATORS WILL SUFFER NO LOSS

On account of the poor roof and soft bottom Iowa mines must be kept going, Mr. Heaps testified. To close them during the summer virtually would mean that the Iowa industry, which already has a hard time to keep its head above water, would be killed, in the opinion of Iowa operators. It would be impossible, it was pointed out, to compete with Illinois in providing coal for storage since it has been demonstrated that Iowa coal, on account of its sulphur content, cannot be stored. Spontaneous combustion often results before the coal has been in the pile for a week.

Senator Frelinghuysen told Mr. Heaps that he was not at all convinced that seasonal rates would put the Iowa operators out of business, but he asked if it would not be justifiable in the interest of the general welfare, to close some of the mines producing inferior coals under great difficulties. Mr. Heaps explained that his testimony was intended only to point out just what would happen to the Iowa industry and he made no attempt to say what would be the best national policy.

George H. Cushing, the managing director of the American Wholesale Coal Association, concluded his testimony with the following recommendations:

That no attempt be made to regulate this complex situation by any statute.

That, seeing the need is more for men and leadership than for the passage of any new laws, the sub-committee on Interstate Commerce of the United States Senate undertake, during the summer and fall, to stimulate production, as it did in 1919, by gathering facts from producers, wholesalers and retailers and then by trying to get cars to move the coal, and to get the consumers in the backward districts to buy and store coal.

## LINE HAUL AND INTERLINE HAUL CARS TO BE GROUPED

That an effort be made to divide the coal cars of all originating roads into two groups—those allotted to the line haul and those allotted to the interline haul—to the end that each group of consumers may be independent of the bad practices of the other group.

Other points in favor of eliminating seasonal coal traffic made by Mr. Cushing were as follows:

First—One-third idle time at the mines doubles the necessary investment in mining property and results in a great financial loss to the nation.

Second—No business in summer and periods of boom in the fall result in giving the coal industry a highly speculative character, which always serves to invite into the industry the worst element in any business.

Third—Allowing mines to lie idle for one period, but always in expectation of being called upon to produce, serves to attach to the mines an unnecessarily large working force and to cause, due to the uncertainty of the working time, a dangerously large labor turn-over. Specifically, in the prewar period it subtracted annually sixty thousand workers from our total immigration to supply the demands of the mines. Today it is keeping tied to the mines fully one hundred thousand workers who should be released from the bituminous coal industry to other industries which need workers.

Mr. Cushing also advanced the idea that the stabilization of coal prices could result only in either universal bankruptcy for the coal mines—which would defeat the purpose of the reform—or universal prosperity for the coal business—which would also defeat the purpose of the reform by inviting an increasing flood of new producers into the field. In a word, the business cannot be stabilized unless and until there is control of the coal land itself in some such way as will make it possible for someone to say when and where new mines may be opened.

## DIRECTOR SMITH SUMS UP

Director Smith of the U. S. Geological Survey reviewed the facts upon which the proposed relief was predicated. The seasonal fluctuation in coal output comes from a seasonal fluctuation in demand. The consumer must be hitched on to the problem of giving the mines more orders for the spring and early summer

months and of relieving both mines and railroads of their extra heavy burden in the fall and winter months. In a normal year the country over this seasonal inequality of demand calls for 35 per cent to 60 per cent more coal being mined in November, the peak-load month, than in April, the usual month of greatest slump in mine operation.

In Eastern coal fields the difference is less than this average and in Western fields much worse. Uneven demand thus requires more mines and more miners, both working a 75 per cent year, and conditions of unequal seasonal demand are also bad for the railroads, especially when combined with crop movements and winter interference with traffic.

The legislation proposed seeks to induce summer buying of coal by freight reductions in the spring months and increases in the fall and winter months. What statistics are available indicate that the rate differentials proposed by the committee of mining engineers are timed to influence buying in what are now the months of lowest production, yet taking some of the Appalachian fields, provision might well be made for some adjustment by the Interstate Commerce Commission. In fact, the principle of the remedy seems correct, but discretion may be required in its application.

It must be admitted, moreover, that this legislation is not a cureall and may be expected to make conditions even worse locally, but on the whole the coal business will be helped and miners, operators, and consumers eventually benefited by surer supplies of cheaper coal. To allow present conditions to continue is to invite an industrial paralysis, which has been averted rather narrowly several times in the past few years.

#### PUBLIC UTILITIES ARE SEASONAL CONSUMERS

Public utilities and factories use much less coal in the summer than they do in the cold winter months. Recent power statistics regarding public-utility power plants of the United States, having a total annual consumption of 35,000,000 net tons, show that the daily production of electricity by these plants depends quite markedly on the season of the year, the consumption of electricity during the spring and summer being quite strongly contrasted with that of the winter. The daily output of electricity from April to July is about 100,000,000 kw.-hr., whereas it reaches nearly 13,000,000 kw.-hr. in the month of January.

C. E. Leshner, editor of *Coal Age*, formerly in charge of mineral-fuel statistics of the Geological Survey, while agreeing that it was desirable to equalize coal production and distribution throughout the year, doubted whether seasonal rates alone would accomplish this purpose. Three things were needed to stabilize the coal industry: even rate of production, price policy which would prevent fluctuations, and a steady and satisfactory labor supply. He instanced steel as a stabilized industry, evidenced by the fact that for years prices on steel rails have been even. The anthracite industry is more stabilized than the bituminous because the former has been able to produce a summer as well as a winter demand.

The steel industry is stable because it is in large units—not caused by legislation—and can control the situation. Larger companies in the coal fields would benefit the industry, as small producers starting operations when prices are high tend to upset business in

### Senator Frelinghuysen Warns Coal Operators

No harm can come to the coal trade or the operators if they will only co-operate in an effort to equalize distribution, and you are losing sight of the fact that coal prices are advancing instead of declining, and they are advancing at the present time because the operators and the railroads cannot supply the needs. That is all, and the public do not propose to stand it any longer. Something is going to be done and all the theories in the world will not cure the situation, and if it is not applied in a mild and ministerial way it will be applied in a drastic control by the Government, and it is arising very rapidly; and I think it is a very poor policy to furnish nothing but criticisms and not make some effort to do something constructive.

winter. Seasonal rates would benefit some fields and injure others. Some bituminous sections require no stimulus for summer production. Movement of bunker and tidewater coal is independent of rates being regulated by world prices. He thought seasonal rates would simply transfer car shortage and high prices from winter to summer in some Eastern fields.

### Industrial Leaders Make Move for Amendment of Tax Laws

WITH the endorsement of the American Petroleum Institute and the American Mining Congress, the National Industrial Conference, composed of thirty national and state manufacturers' organizations, called a national conference of business organizations in the Blackstone Hotel, Chicago, Friday, April 16, for the consideration of a plan for readjustment of the revenue laws, which as now existent have become burdensome and in a sense impossible of administration.

There were present 150 representatives of sixty organizations and the entire day was given to discussion of proposals to eliminate the excess profits tax, readjust the clauses based upon the high brackets of the surtax, simplify the general income provisions, establish a more workable and equitable scheme of direct tax through either a consumption or sales tax, etc. The coal industry was represented by Rush Butler, general counsel of the National Coal Association.

The National Industrial Conference as a research organization had worked out and presented for consideration certain proposed amendments to the present law based upon suggestions of Dr. Adams and Secretary Houston, but the conference voted to refer all resolutions to the Taxation Committee composed of five members of the National Industrial Conference and eleven members to be elected by the non-member organizations represented in the meeting.

A general committee which was named was authorized to meet in two weeks, consider the advisability of adding needed members and act upon amendments presented to the conference.

# NEWS FROM

# THE CAPITOL

BY PAUL

WOOTON

## National Coal Association Will Resume Issuance of Price Reports

**D**URING 1919, from April until November, the National Coal Association published weekly summaries of prices of bituminous coal as reported in closed and past transactions. These reports were very valuable records of the level and course of current coal prices. They did not, however, give any information concerning the effect on price averages of considerable volumes of coal moving on long-term contracts.

During the present year it is planned to publish weekly averages based on weekly reports of the prices realized by the operators from total shipments each week, including both current sales and shipments on old orders and contracts, as called for by the new form of the Bureau of Coal Economics. Reports for the first few weeks in April have already been received from three associations in the Middle West fields, and several associations in the Eastern territory have begun to collect the information from the operators on the new form.

Index figures on coal prices derived from these weekly reports will be published by the National Coal Association as soon as a sufficient number of associations have furnished the information on the new form.

## Will Investigate Super Power Project

**W**HILE only one-half of the amount of the estimate was carried in the Sundry Civil Appropriation Bill, just reported, for a survey of power production and distribution, the item is regarded as being of especial importance in that the committee recognizes, in this period of retrenchment, the need for such an investigation. The cut in the appropriation is not vital because the bill permits contributions from private concerns interested. There is a marked tendency on Capitol Hill to congratulate the Appropriations Committee in bringing out this bit of far-seeing, constructive legislation. It indicates that Congress is thoroughly interested, that this engineering investigation is a wise step in the effort to keep the United States equipped adequately for its future industrial needs.

The need for such an investigation became all the clearer when during the past winter the peak of electrical output was 10 per cent higher than during the war period. As explained by George Otis Smith, director of the U. S. Geological Survey, which will be in charge of the work, the investigation will cover the possibilities of power production at the mouth of coal mines, linking with those the water powers that are available.

There are certain places with water power available in the East, but they cannot stand alone, Dr. Smith

points out. "They must be hitched up with the steam plants," he says. "Some of those steam plants must be put in at tidewater and some up near the mines. We will study the power requirements of the different parts of the Washington-Boston industrial area with the idea of distributing the new sources of power supply in terms of the demands. Probably half of the coal that is used for power generation will be saved.

"The small plant oftentimes has only one-third or one-fourth of the efficiency of one of these big modern plants. Then, of course, there is the application of electricity to our railroads. The big consumption of coal in the East is by the railroads. By electrifying them one ton of coal can be made to haul a train twice as far as it can if used in a locomotive. In addition, railroads would be relieved of a back-crushing load. Coal is the poorest freight they have. It is the most burdensome."

## President Nominates New Commerce Commissioners

**H**ENRY JONES FORD, Professor of Politics at Princeton University, and James Duncan, of Quincy, Mass., a vice-president of the American Federation of Labor, have been nominated by President Wilson as members of the Interstate Commerce Commission. A third new member has been selected and his name will be sent to the Senate as soon as he consents to serve.

Mr. Ford was nominated to succeed Commissioner James S. Harlan, and his term would expire on Dec. 31, 1925, Mr. Harlan's term having ended on Dec. 31, 1918. Mr. Duncan was appointed to one of the two new positions on the Commission resulting from its enlargement to nine members by the Transportation act. His term would end on Dec. 31, 1924, and that of the member yet to be appointed expires on Dec. 31, 1923.

Prof. Ford is a graduate of Baltimore City College. He has been professor of politics at Princeton since 1908 and has written a number of books on political science and related subjects.

Mr. Duncan was born in Scotland, was educated at Aberdeen and for many years worked as a statue granite cutter. He was editor of the *Granite Cutters' Journal*, served successively as secretary and president of the Granite Cutters' International Association and was a member of the commission sent to Russia in 1917 by President Wilson.

## Director of Bureau of Mines Resigns

**V**AN H. MANNING, director of the U. S. Bureau of Mines, at Washington, has resigned, effective June 30. He will become director of research of the newly organized American Petroleum Institute, composed of the leading petroleum producers of the country.

## New Cargo-Coal Provisions Made at Hampton Roads

AS the Tidewater Exchange, Inc., will operate only at the ports of New York, Philadelphia and Baltimore, steps have been taken to provide for the proper handling of coal through Hampton Roads, at which point the volume of business is greater than at any two of the other ports mentioned. The plan whereby coal was borrowed and loaned as before the war has been restored on the Norfolk & Western Ry. That railroad has issued an embargo, which became effective on May 1, against all tidewater coal except such as is duly authorized by a numbered permit issued by E. S. Moore.

Application for the permit must show the name and tonnage of the vessel to be loaded, the date when its arrival at Lamberts Point is expected, the amount of the tonnage that will be shipped from the mines daily, the name of the mines shipping, as also the names of the consignees under which the coal will be shipped if the source of the coal is not already arranged.

Permits will not be issued where the volume of shipment from the mines will not provide for a reasonably prompt accumulation of the coal for cargo, for car equipment will be delayed if the shipment has to be made more than ten days in advance of the date of the expected arrival of the vessel. Clearly in such a case it will begin to cumber the port before coal shipped for another cargo or cargoes has been unloaded if a vessel should fail to arrive in time or if road, pier or yard capacity or other conditions will not admit of prompt handling. It is understood that the Norfolk & Western officials are negotiating with coal operators for a permanent arrangement.

At Sewalls Point the Virginian Railway will have no pool whatsoever, but will continue to handle tidewater coal. More or less borrowing and loaning will be sure to take place, but no arrangement has been made for absorption of demurrage.

The Chesapeake & Ohio Co. has announced the establishment of the Newport News Coal Exchange. The pooling of coal will be continued during May under railway management and expense. The exchange will be operated under the supervision of E. I. Ford.

## Kentucky Managers Will Gather in Lexington on June 4 and 5

ADMIRABLE is the program that H. M. Ernst, the president, and C. W. Strickland, the secretary-treasurer, have prepared for the members of the Kentucky Mining Institute, which will meet in the State University at Lexington on June 4 and 5 and be addressed by the most interesting of speakers.

George Eshrick, Jr., fuel engineer of the International Coal Products Corporation of New York, will describe the carbocoal process in an article on "The Future for Bituminous Coal." The company has a plant at Irvington, N. J., and is constructing, at the instance of the Government, an extensive plant at Kiser, Va.

"The Present Economic Situation" will be discussed by Charles H. Chase, research expert, Council of National Defense, Washington, D. C. To George H. Cushing, who will be toastmaster at the banquet, has been entrusted the subject "History of the Coal Industry." There is but one Cushing in the coal trade, namely the managing director of the American Wholesale Coal Association, Washington, D. C.

## Seeks to End Car Shortage

Chairman Clark of the Interstate Commerce Commission on May 1 requested R. H. Aishton, president of the American Railroad Association, and Guy M. Freer, executive secretary of the National Industrial Traffic League, to appoint committees from their respective organizations to meet as a joint committee to devise means of reducing car shortage and congestion.

Chairman Clark also addressed a notice to all carriers and shippers asserting that individual and concerted action was needed for prompt restoration of better operating conditions and that only the greatest efficiency in transportation could prevent widespread economic loss.

John Callahan, traffic secretary of the National Coal Association, Washington, D. C., will discuss "The New Transportation Act—The Cummins-Esch Bill." C. E. Leshner, editor *Coal Age*, will throw new light on "Wage Problems," while J. B. Hicks, assistant superintendent power and mechanical department, Consolidation Coal Co., Jenkins, Ky., will further amplify the article presented by General Manager Appleton of the Ironton Engine Co. at the midyear session of the institute. His address will be entitled "Practical Use of Storage-Battery Locomotives in Coal Mines."

Colonel Warren R. Roberts, who is chairman of the Committee on Standardization of Mining Equipment of the American Mining Congress, Chicago, Ill., will present the subject "Standardization of Mining Equipment," and the important problem of "The Rehabilitation of Industrial Cripples" will be presented by W. C. McMurtrie, the director of the Red Cross Institute for Crippled and Disabled Men, New York.

Another paper to be presented is that by Herbert M. Wilson, director department of inspection and safety of the Associated Companies, Pittsburgh, Pa., the subject being "The Practical Operation of Coal-Mine Compensation Insurance under the Kentucky Law."

The banquet in the evening of Friday, June 4, will be addressed by Henry Laviers of the Paintsville district; John G. Smyth, of the Elkhorn district; K. U. Meguire, of the Harlan district; Alex Bonnymen, of the Hazard district, T. E. Jenkins, of the western Kentucky district, and J. E. Butler, of the Stearns district, the subject for discussion being the effect of the labor report of the Bituminous Coal Commission on the respective fields represented. A first-aid contest will take place on June 5.

## Denver to Hold Concurrently Four Mine Conventions and a Contest

AS IF to save editors from excessive dining—their awining troubles are already ended by the Volstead Act and by certain changes in the Constitution—the Rocky Mountain Institute, the Colorado Metal Mining Association and the local chapters of the American Mining Congress and the American Institute of Mining and Metallurgical Engineers will hold their conventions at Denver on Sept. 9, 10 and 11 at the same time as the International First-Aid and Mine-Rescue Contest is held.

# The Labor Situation

Edited by  
R. Dawson Hall

## Anthracite Conference Moves to Washington, D. C.

Operators and Mine Workers Are Still at Capitol City  
Trying to Bridge the Gap Between Them—  
Operators Reported to Have Made Offer  
of From 12 to 15 Per Cent

AT LAST something is stirring in the scale sub-committee for the anthracite region. The operators have offered a rate of increase ranging between 12 and 15 per cent and the mine workers have rejected it. As a consequence the operators and mine workers have been called by the Secretary of Labor to Washington to confer with him and have accepted the invitation. The sub-committee is still in the Capitol City.

On April 27 the operators made their counter-proposal to the sub-committee. What this was is not known exactly, but it is understood that it lay between 12 and 15 per cent. The official statement issued at the conclusion of the session read:

"The operators' representatives on the sub-committee of anthracite operators and mine workers have presented to the mine workers' representatives a written answer to the demands of the miners which the mine workers' representatives have now under consideration and which will not be made public until after the meeting of the sub-committee tomorrow night. The committee will meet at 7 p.m. tomorrow."

The promise to the press was, however, not fulfilled and even today just what the anthracite operators offered is not known.

On the next day the offer of the operators was considered by the full wage-scale committee of the mine workers at their headquarters in the Continental Hotel and they decided to reject it. This action was reported to the sub-committee of operators and mine workers that evening (April 28) and after a session lasting four hours this statement was handed out:

"The sub-committee of miners and operators met tonight. The mine workers replied to the operators' proposals as to the increase in wages and in reference to arbitration and declined to accept them. Pending further meetings of the conference, statements of both parties are withheld. The committee will meet tomorrow at 12:30 p.m."

Later in the evening the resolution offered by the operators, which called for arbitration of the differences by a commission of three representatives of the general public to be appointed by President Wilson, was given to the press. It ran as follows:

"Whereas, under date of March 9, 1920, at a general conference of anthracite operators and anthracite mine workers the workers presented to the operators certain specific demands covering wages and working conditions in the anthracite industry upon the expiration of

the contract of May 5, 1916, and at that general conference four representatives of each party were appointed a committee to take under consideration the demands presented by the mine workers and to negotiate a new contract, and whereas, during the session of the said committee the mine workers modified two of their demands, to wit: the demand covering wages and the demand covering hours per day and days per week, and whereas, the committee after several weeks of earnest effort has been unable to reach an agreement, and whereas, it is to the public interest that there be no cessation of work and that anthracite coal shall be supplied to the consumer without interruption,

"Therefore be it resolved: That the President of the United States be requested to appoint three men unaffiliated with any anthracite operation or with any labor organization and representatives of the public who shall sit as arbitrators with this committee and decide all questions at issue based on the demands before the conference, the decision of the arbitrators to be final and binding on the parties to this submission."

While no official statement came from the mine-workers officials it was understood that John L. Lewis, International President of the United Mine Workers, had been in telephonic communication during the week with Secretary of Labor Wilson and it was said that the latter had been kept informed of the progress being made by the sub-committee.

That nothing was accomplished at the session held on April 29 toward conciliating the differences between the operators and miners was made known at the conclusion of the session. The official statement reads:

"In recognition of the request of the Secretary of Labor, Hon. W. B. Wilson, the sub-committee of anthracite operators and mine workers will hold its next meeting in Washington, D. C., on Saturday morning at the office of the Secretary of Labor."

## Must Pay "Check-Off" or Be Idle

SOME trouble has been experienced of late in the coal fields of the Province of Alberta because of the government's ruling that only miners acquiescing in the "check-off" for payment of dues to the United Mine Workers of America shall be permitted to work. This order was issued last January, but at first was not strictly enforced by the operators. Recently, however, the Minister of Labor agreed to accept responsibility for the regulation. This brought about an effort at its enforcement, with the result that the miners left work at two camps at Coleman, Alta., and at Blairmore and Canmore in the same province.

Thus are workingmen compelled by the Government to take part in conspiracies against the public whether they are or are not willing.

## Texas Tonnage Rate So High That Increase Is Forty Cents Per Ton

TENTATIVE agreements affecting the wages of coal miners in Texas, except as to the apportionment of pay to machine crews, were reached at a conference of representatives of the coal miners with coal operators at Fort Worth, Texas, last week. The question of pay for machine crews was left for a conference on May 3.

The changes on which agreement has been reached will be effective for two years, and will include:

An advance to all day and monthly men of \$1 a day, except trappers and boys receiving less than men's wages, who shall be advanced 53c. a day; an increase in pick-mining rates of 40c. a ton, and in yardage, dead-work and room-turning of 20 per cent. These advances are added to the scale in effect on Oct. 31, 1919, and to be effective from April 1, 1920.

Among the coal operators present were: Gomer Gower, Ed. Britton, Judge E. B. Richey, Mier C. Johnson, W. H. John, A. J. Clendennin and W. F. Nance. Representatives of the miners were: John P. White, Cleveland, Ohio, appointee of President Wilson on the Bituminous Coal Commission; John Wilkinson, Muskogee, Okla., president of the United Mine Workers of District 21, embracing Texas, Oklahoma and Arkansas; G. H. Sparling of Gordon, Texas, board member of the United Mine Workers; Ed. Autry, Mat Rossato, Ed. Tidwell, Lawrence Santi, Joe Vietti and O. James, all of Thurber, Texas.

All points in the two-year working agreement between the coal miners and operators of District 21, United Mine Workers of America, which comprises Oklahoma, Texas and Arkansas, have been settled in accord with the recent award of President Wilson's commission, and harmony rules between miners and operators.

## Wage Scale Granted Mine Workers of Northern West Virginia

IN Monongalia, Marion, Harrison, Preston, Taylor, Barbour, Randolph, Upshur, Lewis, Gilmer, Braxton and Webster counties and in the portion of Nicholas county containing coal or coal mines being operated along the line of the Baltimore & Ohio R.R. a new wage scale was granted to the mine workers on April 20, which is to be effective until March 31, 1922. It has been accepted by fully empowered representatives of the United Mine Workers of America and by the scale committee members of the Northern West Virginia Coal Operators of America, who were given power by the several operators of that area to make an agreement.

The International Union, the district officers and those of the subdistricts in the counties and the half county named guarantee the "fulfillment of this agreement . . . both in letter and spirit. The memorandum declares:

"Free rent, free powder, free coal, free light or any extra compensation paid in time or money, or otherwise, is hereby mutually construed as a bonus and is condemned, and it will therefore be assumed in operation under this contract and for future joint conferences convened for scale-making purposes that all such bonuses or advances in excess of wages provided in this contract were paid because of physical conditions in or around mines where such methods are practiced and the

bonuses and wages as paid in whatever form shall constitute a part of the basic rates for such mines.

"The mining rate for entries shall be applied to all headings not more than 12 ft. wide and not less than 8½ ft. wide and to all cross-cuts not more than 14 ft. wide."

### OUTSIDE DAY LABOR RATES.

Occupation	Cents per Hour	Dollars per Day
Picking-table boys (where employed)	48½	3 90
Substation operators and Fan tenders.	50	4 00
Timplemen, excluding Dumpers but including Car cleaners and Car handlers; Greasers, Blacksmith's helpers, Machinist's helpers (outside)	63½	5 05
Firemen (hand firing)	66½	5 35
Dumpers, Combination firemen, substation and fan men	67½	5 40
Car repairmen (helpers)	68½	5 48
Water tenders	68½	5 50
Blacksmiths (second class), Car repairmen, Machinists (second class), Engineers, Combination engineers and firemen	72½	5 80
Electric coal-hoist Engineers (shaft)	81½	6 50
Machinists (first class)	85	6 80

### INSIDE DAY-LABOR RATES.

Occupation	Dollars per Day	
	Open Lights	Closed Lights
Trappers	3 53	3 61
Machinists helpers (inside) 65c hourly	5 20	5 20
Timbermen helpers, Wiremen helpers, Pumpers, Bratticemen helpers, Greasers	5 24	5 32
Cager's couplers	5 28	5 32
Cager's helpers	5 44	5 53
Trackmen helpers	5 56	5 64
Pipemen	5 68	5 76
Drivers, Gathering-locomotive helpers, Tripmen, Ordinary trackmen, Slatemen, Timbermen, Wiremen, Bratticemen	5 76	5 84
Motormen, all classes, Motormen helpers, Gathering-locomotive men, Main-line trackmen	5 86	5 94
Shotbrers, Cagers	5 92	6 00

### RATES FOR MINING PER NET TON COAL FIVE FEET OR OVER

Type of Work	Open Lights	Closed Lights
Pick Mining:		
Room and pillar	\$0 8760	\$0 890
Entries	0 9360	0 950
Electric Machine Work:		
Loading, hand drilling, in entries	0 6470	0 660
Cutting, without drilling, in entries	0 1690	0 175
Loading, hand drilling, in rooms	0 6270	0 640
Cutting, without drilling, in rooms	0 1523	0 155
Loading, machine drilling, in entries	0 6270	0 640
Cutting, electric chain-machine drilling, in entries	0 1790	0 185
Loading, machine drilling, in rooms	0 6070	0 620
Cutting, electric chain-machine drilling, in rooms	0 1623	0 165

### RATES FOR MINING PER NET TON COAL UNDER FIVE FEET.

Type of Work	Open Lights	Closed Lights
Pick Work:		
Hand drilling, in room and pillar	\$0 9500	\$0 9640
Hand drilling, in entries	1 0650	1 0790
Loading, hand drilling, in entries	0 7575	0 770
Cutting, hand drilling, in entries	0 1948	0 2008
Loading, hand drilling, in rooms	0 7000	0 7130
Cutting, hand drilling, in rooms	0 1583	0 1610
Loading, machine drilling, in entries	0 7375	0 7500
Cutting, machine drilling, in entries	0 2048	0 2108
Loading, machine drilling, in rooms	0 6800	0 6930
Cutting, machine drilling, in rooms	0 1683	0 1710

## Mine-Run Base and Pay for Slate Cause Break in Eastern Ohio

AFTER being in session three days at Wheeling, W. Va., the joint conference between about forty operators representing all sections of eastern Ohio and the official of sub-district No 5, United Mine Workers of America, adjourned on Wednesday, April 21, without any agreement being reached.

Because of the inability of the miners and operators to agree on the forty-one different points of contention it was decided to appoint a special scale committee of ten operators and ten miners to consider the various demands presented, that committee beginning its sessions on Thursday, April 22. The two most important demands of the miners were: Payment for all coal on mine-run basis, and payment for all stone moved.

# Kansas Industrial Relations Court Held Constitutional in District Tribunal

Judge Curran Declares Divine Right to Strike Is Like the Divine Right of Kings, as Dangerous as It Is Untrue and That the Court to Limit It Was Formed in Lawful Exercise of Legislative Authority

JUDGE ANDREW J. CURRAN declared the new Kansas Court of Industrial Relations to be constitutional in a decision announced in the Crawford County District Court, April 30.

Judge Curran then granted a temporary injunction forbidding Alexander Howat and other district and local union officials of the Kansas district of the United Mine Workers from calling a strike.

The decision was rendered on a demurrer offered by the defense to the application of the State. He quoted legal authority from Blackstone to Chief Justice White in support of the broad police power of the State.

"I am not concerned with the wisdom of the Legislature in passing this law," Judge Curran said. "Whether the law is economically wise or unwise is not for the court to say. The one question to be considered by me is whether the law is in conflict with the Bill of Rights, the Constitution of the United States or with the Constitution of the State of Kansas."

Judge Curran said he did not believe that the Fourteenth Federal Amendment curtails the police power of the State or that the State has ever surrendered any part of that power to safeguard the health, morals and general welfare of its citizens.

He declared that the State was paralyzed by the mining strike last December; that cities were dark, schools were closed, the sick and afflicted in institutions threatened with freezing, and the means of moving food interfered with.

"If the State should stand by and not correct such conditions it would be a reproach to organized government and to civilization," the Judge asserted.

"The conditions that prevailed last December give an idea of the purposes and intent of the Legislature in enacting this law, and of the object sought by our State through this legislation.

## RIGHT TO WORK AS SACRED AS RIGHT TO QUIT

"A great deal has been said of the divine right to strike and the divine right to quit work," Judge Curran said. "In stressing the divine right to strike, the divine right to work, the right of the man to have employment so he can provide for his wife and children has been sadly overlooked. The divine right to strike, where it affects the health and welfare of the public, must be relegated to the realm where the divine right of kings has been sent."

As the workers in the Kansas mines are now largely at work, Judge Curran did not make the injunction mandatory, as the State had asked. He said that he would make the injunction mandatory if a showing were made during the life of the injunction that the mines were idle. The temporary injunction will be in effect until May 12, when the application of the State to make it permanent is set for hearing.

As already stated, when the district leaders of the United Mine Workers of America were summoned to appear before the Court of Industrial Relations of

Kansas, which is comprised of George H. Wark, a lawyer, Clyde M. Reed, a newspaper publisher, and Mr. Huggins, by whom the law for the establishment of the court was framed, they refused to appear and were committed to jail. Whereupon the mine workers of Kansas went on strike to force the hands of the court by which their leaders were committed.

Judge Curran, of the Crawford County district court, on April 15, overruled a motion for a retrial, which was asked by Alexander Howat, Thomas Harvey, August Dorchy and R. B. Foster. Phil H. Callery, the attorney for the arrested men, questioned whether to appeal the matter to the Supreme Court, seek a release of the men under a habeas corpus action or give bail. The last consideration won, but meanwhile the attorneys for the prosecution prepared for a new move.

They made, late on April 16, a motion to amend the injunction suit so that the petition would require "the defendants, who are members of the district board of the United Mine Workers of America of District 14, to issue an order legally and properly signed and to publish the same in accordance with the rules and practice of said labor union, directing all members and workers to return to work in said mines and to continue to perform labor therein in the manner reasonably necessary to enable the owners to continue the normal productions during the pendency of such litigation."

Despite the protests of the counsel for the mine workers, who argued that the hearing in this new phase in the case could just as well be left till April 27, when the whole matter was to be heard, the court made its decision on the following day, April 17, ordering Alexander Howat and other officials of the Kansas district union to instruct the mine workers to go back to work, informing them in his decision that if they did not heed his instructions they must be prepared to show cause on April 27.

At that time all the mines in the state, except one shaft and three steam-shovel pits, were idle. In fact, it is estimated that 11,700 mine workers were "taking a vacation."

Much of the friction was removed, however, that same day, for bonds were presented to Judge Curran for the union officials and were accepted by him, orders being given by the court that the men be released from prison. A. B. Kellar, county attorney, immediately notified the sheriffs at Ottawa and Iola that they should not only release the men but offer them transportation to Pittsburg, Kan.

The district officers sent out orders, on April 19, requiring the men to go back to work. Some did, but thirty mines did not. In the Franklin region all the mines remained closed. Mines in other regions also remained idle, but volunteered the explanation that they were on strike because the price of explosives was too high and not because they desired to make trouble for the Court of Industrial Relations and for Judge Curran,

## Proper Methods of Erecting Trolley-Wire Guards in Mines

Referring to the inquiry, *Coal Age*, Mar. 11, p. 506, as to the requirement, in compensation-insurance regulations specifying a width of 5 in. between the guard-boards protecting a trolley wire, in a mine, permit me to say that my experience is that the boards or guards protecting the trolley wire should be wide enough apart for the trolley-wheel and harp to have ample room when the wheel happens to jump the wire.

The reply to this inquiry said that reducing the width between the boards will give less opportunity for the trolley to jump the wire. My experience is that there is more danger in having the boards too close together, than when they are spaced further apart. The narrow space within the boards is more liable to cause an accident to the trolley.

In practice, I have seen a trolley jump the wire just as it was entering the guard-boards, with the result that the boards were torn out by the trolley-wheel and its harp striking the ends of the boards and failing to enter the narrow space between them. In another instance I witnessed, the harp was pulled off the trolley-pole, and the pole broken, because the space was too narrow.

Therefore, I prefer spacing the boards a sufficient distance apart to leave ample room for the trolley between the boards and the wire. In my opinion, this very much reduces the chance of an accident.

Oak Hill, W. Va.                      WILLIAM DICKINSON, SR.

## An Unpractical Mine-Rescue Searchlight

Kindly allow me the privilege of referring to the brief article that appeared in *Coal Age*, in the department Ideas and Suggestions, March 4, p. 429, describing what appears to be a home-made contrivance that the designer claims to believe would provide an effective searchlight to be carried into a mine by a rescue party. The statement is made that "ordinary safety lamps or the small electric flashlights are or may be inadequate for the purpose intended."

The proposed device or apparatus, as illustrated, consists of a half-dozen drycells or batteries connected in series with an automobile spotlight. The cells are set in a rough wooden box to the end of which the spotlight is attached. A bail is attached as a handle for carrying the box. It is stated that this device will furnish "a portable light of high power that can be safely used in a gaseous or dust-filled atmosphere."

No one will deny that the most important work of a rescue party when entering a mine after a disaster is to take every precaution to avoid further danger or injury to themselves or to those who may have survived and are still alive in the mine. No one who would suggest carrying such a device as this into an atmosphere supposed to

be explosive and dangerous could be accused of applying even the first principles of "safety first."

Exploring a mine after an explosion is not only hazardous work but requires strenuous exertion where the explorers must crawl over high falls, squeeze through timbers and drag themselves through narrow holes, all of which calls for the most simple and reliable equipment possible both to light their way and enable them to breathe a supply of pure air when surrounded by poisonous gases that may also be explosive.

### WHY THE DEVICE SHOULD BE CONDEMNED

One can easily imagine what would happen to this collection of drycells contained in a bulky wooden box, which would with the greatest difficulty be carried through entries filled with debris and fallen timber. A loose wire or connection and a spark across the gap would cause the ignition of gas and a second explosion that would kill the rescuers and any possible survivors of the first disaster.

It is to be hoped that there are no mine owners or superintendents living who are so far behind present mining practice as to fail to provide apparatus that is essential to safety when the work of rescue must be performed, following a disaster in the mine. Such equipment includes not only the necessary breathing apparatus to permit the rescuers to enter and work in a poisonous atmosphere, but modern electric mine lamps that have been tested and approved by the Bureau of Mines for such work.

Surely, no one familiar with conditions following a mine disaster will hesitate, for a moment, to condemn such a suicidal apparatus as illustrated and described in the short article to which I have referred. The description of such a device in a standard publication like *Coal Age* is sufficient, in itself, to cause some men to try it without considering its dangerous possibilities. I want to ask, would not a censorship be justified?

Victoria, B. C., Canada.

JAMES DIXON.

## Avoidable Degradation of Coal

*Letter No. 4*—In order that the operator may obtain the largest possible percentage of lump coal, with the least admixture of dirt and slack, both in the anthracite and the bituminous districts, he must make every effort to plan out his scheme of mining to that end.

The mine must be equipped with modern appliances for the transportation, handling, conveying, cleaning, washing and preparation of the coal. In the equipment of the mine, the chief aim of the operator is to secure the largest possible yield of high-priced marketable coal, from the product loaded into the car by the miner. Bearing this in mind let us study briefly some of the conditions affecting these desired results.

We will start with a solid face of coal in the mine chamber. The coal may have laminated seams of slate

or bone interstratified with the coal. In some cases, the slate is thick enough and so situated in relation to the coal that its separation therefrom is easily made. At other times, the refuse is in thin slabs that adhere to the coal and which are difficult of separation. Still again, there is a solid face of clean coal.

As the coal lies in its bed, there is 100 per cent of lump coal. The physical conditions just mentioned, and the skill of the miner coupled with his desire to produce a car of coal of the highest value are the chief factors that determine the maximum yield of lump and other marketable sizes of the coal. But, while it is true that the physical conditions existing in the seam cannot be changed, it is possible to so plan the mining of the coal as to take advantage of the peculiarities present.

CONSIDERATIONS THAT MUST BE TAKEN INTO ACCOUNT WHEN LAYING OUT A MINE

Efforts in this direction must begin with the laying out of the mine; determining the proper direction of driving the entries and rooms; deciding the correct width of pillar and opening; and adopting a suitable method of extracting the coal, at the working face. All of these bear directly on the ease with which the coal is broken down and the percentage of coal that can be recovered in a marketable condition from the pillars, which must be of sufficient size to prevent the coal from being crushed by excessive roof pressure, before it can be properly mined.

In my experience, it is possible to teach the miner to use more judgment and skill in the performance of his work. This can be done by employing mining instructors for that purpose. Better results, however, are obtained by employing high-class assistant foremen, each of whom should have charge over a limited number of men. Instances have come under my observation where good results have been obtained through instructing the miner in the proper use of explosives, topping their cars and shooting the coal. Not only is the coal mined in better shape, but the labor of breaking up the lumps and loading them into the cars is made much easier where the work is performed according to the instructions given.

It is quite evident that the majority of miners do not exercise their best efforts in the production of a clean car of lump coal. This is not from lack of skill, but from a want of desire on their part. In other words, like the most of mankind, the miner gets away with all he can, not realizing that his neglect injures his own interests as it does those of his employer.

EFFECT OF THE CONTRACT SYSTEM IN MINING

I cannot agree with William Wesledge, *Coal Age*, Feb. 26, p. 416, that the contract system is so largely responsible for the loading of inferior coal. It is true that the contract system puts a premium on quantity rather than on quality of production. However, we have found, in Pennsylvania, that it is practically impossible to get a day's work from a miner in cases where he is paid by the day.

In some sections of Alberta, and possibly the same may be true in British Columbia, the day-wage system has proven not only popular but productive of good results. In my opinion, this situation is covered very well by the present system of testing cars for refuse, and docking the miner for loading slate and bone with his coal or where his car is not up to the standard. This

system, however, has its weak points and by no means solves the problem.

In my opinion, a policy of co-operation on the part of the management, combined with some profit-sharing scheme, would go a long way toward affording a practical solution. Such a scheme would eliminate many other difficulties besides, in the mining game. It appears to me that the hearty co-operation of employers with their men, and a well-thought-out scheme of profit sharing are the determining factors in securing desired results.

The amount of money involved in the payment of bonuses would be well invested. Some individual coal companies have worked out a scheme of bonuses by contract system, while others have tried to accomplish the same results by encouraging competition between sectional foremen in charge of different sections of the mine. However, this scheme has not been given as fair a trial in the mines as in some manufacturing establishments. I am confident if the right man—one who was trusted and had the confidence of his men—started such a scheme, the result would be encouraging.

Scranton, Pa.

MINE SUPERINTENDENT.

Working Kanawha River Coal

Letter No. 5—Referring to the problem presented in the inquiry of Arthur L. Sheldon, *Coal Age*, Feb. 26, p. 419, regarding the extraction of the coal from three overlying seams in the Kanawha River District, permit me to commend the good judgment shown by Mr. Sheldon in desiring to secure the practical views of others regarding the best method to adopt in the working of that coal. It is with pleasure that I offer the following suggestions, hoping that they may be of some benefit to him and assist the solution of his problems.

For the ventilation of the subsequent workings, I would sink a shaft that would penetrate all three of

MINING THE COAL ON THE RETREATING PLAN

the seams. This shaft would be used solely for ventilation, and the coal would be taken out through a slope as I have indicated in the sketch submitted herewith. The mine should be opened by sinking a slope having a grade of about 25 per cent. The slope should be started from a point convenient for loading and shipping the coal, say somewhere between the railroad and the base of the mountain. It should be driven in the direction of the hills and away from the river. Not knowing the points of the compass in this Cedar Grove locality, I will call the direction of driving the slope

north, and assume that the river runs east and west, which will enable me to more clearly explain my method of working.

Assuming that the slope and its air-course have been driven to the lower seam, starting at the top, main headings should be driven, three abreast in each seam, thus dividing the mine into two sections or sides, in each seam or lift. As these main headings are advanced, cross- or butt-headings are driven to the right and left. These are driven two abreast on 400-ft. centers. Again, as the butt-headings are advanced, -10 ft. stalls are driven north and south off the butts. The stalls are driven in pairs with 20-ft. pillars between them, and leaving 100 ft. of solid coal between each pair of stalls. As the stalls from consecutive pairs of butts are driven up they hole into each other. Cross-cuts are driven in the 20-ft. pillars, on 40-ft. centers, which provides for the good ventilation of the stalls.

#### EXTRACTION OF THE COAL IS STARTED AT THE BOUNDARY ON THE RETREATING PLAN

When the stalls have been completed in the first and second butt-headings, the work of drawing back the 100-ft. and the 20-ft. pillars of coal, between these headings, is started by cutting across the 100 ft. pillars separating the several pairs of stalls. These pillars are worked out on the retreating plan, the extraction being started at the extreme east and west ends of the butts. Starting at the north end of a 100-ft. pillar, it is possible to work 4 or 5 men, and to stand from 8 to 10 cars on that face.

This plan of working possesses a positive advantage over the room-and-pillar method of working. The motor is able to pull out a trip of 8 or 10 cars from this face in almost the same time that it would take to pull a single car from the face of a room. Such being the case, it will be readily seen that from six to seven times more coal can be put out by this method than is possible in the room-and-pillar plan of working.

In respect to the system of haulage on the main slope, I very much prefer rope haulage to any conveyor system. A good rope haulage in a slope is better, in my opinion, than hoisting the coal in a shaft. I do not approve of dumping coal in the mine and, for that reason, would not use either skips or conveyors as was suggested by Mr. Sheldon, in his inquiry.

#### CONNECTING THE SLOPE WITH THE MAIN HAULAGE ROAD IN EACH SEAM

In order to make sure of a good connection where the slope passes through each seam, I would start a sufficient distance back on the slope and widen out so as to provide sufficient clearance for a second track leading into the seam. The work should be secured by a concrete arch over the haulage slope and further supported by a concrete base for the sidetrack leading to the seam. This arrangement would enable me to pull coal from any one of the three seams, by means of the haulage rope in the main slope.

Regarding the order of working these seams, it is my experience that the work, in each overlying seam, should be kept about 200 ft. in advance of that in the seam next below. This plan should be followed, until the extraction is complete up to the main barrier pillars protecting the main slope and air-courses. The extraction of the coal in the barrier pillars and the slope pillars should not be undertaken until the last, and when these pillars have been drawn back, the mine will be abandoned. In my opinion, the plan I have suggested

will insure a greater daily tonnage than what is mentioned in the inquiry as being desired. I believe this method is not as expensive a one to install and equip, as would be a shaft, or a skip-hoist. C. W. ATKINS.

Switchback, W. Va.

### Present-Day Industrial Democracy Compared with That of Former Times

Many interesting articles have appeared in *Coal Age*, on Industrial Democracy, Co-operation, Co-ordination and kindred themes relating to the mining industry; but I consider that the editor has given what is by far the most graphic illustration of them all in his Foreword, in the issue of February 26, which to my mind explains clearly the present-day situation that confronts all classes. I fear that the article was passed over by many who may have failed to grasp the true thought expressed. If so, I hope such will turn back and read the article for the good of their fellowmen.

We need not go back many years to recall the pleasant understandings that existed between the bosses and the workmen and the extreme cordiality that was manifest between all classes. As the editor states "the workmen discussed matters with the Boss" and many questions concerning the work itself were handled by the workers. It is needless to mention that workmen were trusted by their bosses and vice versa. A knowing confidence existed between the men that engendered that spirit of reliance on each other and naturally their problems were readily handled. But today, that confidence is somewhat wanting. Work is placed before the men with definite plans for each little detail, and originality and individual instinct is left out. Plainly, it is all mechanical. We truly need some of the old time-honored co-operation.

#### CONTRASTING THE PRESENT WITH FORMER TIMES

A few years ago, a boss when making his rounds would invariably talk over the problems of the day with his men, and his meaning was more clearly understood than is possible in the rush of today. In those days, the boss did not have so much "red tape" to carry around in his pockets and to overtax his brain. He was care-free, in many respects, and able to follow his work more closely—a man of the hour and always on the job. While the present-day boss must keep busy and be ever on the job, yet his accomplishments do not seem to be as great as in the old time. The reason is, I believe, because he has too many "straight-line" methods to follow and is not given enough freedom. I do not wish to be misunderstood, as I am speaking from a practical standpoint and for the good of all concerned.

The "mutual understanding" referred to by the editor, which existed in the olden days was undeniably the rock upon which success was founded. There was plenty of work and everybody was busy. The work was accomplished with more ease than seems possible today and there was less grumbling. Patience was a manifest element. The boss listened attentively to community and industrial matters alike, giving his opinion whenever asked and for the best interests of all. He was always clearly understood, as he talked in a language familiar to the men.

Again, I remember the days when the bosses would get together and talk over their problems with the general boss. At these meetings, he could show a boss what his haulage, pumping, tipple or other work was

costing, and compare the same with previous work. He would help to figure out a possible way in any difficulty. The general boss, on his part, would ask for opinions and weigh them carefully. Thus they compared everyday problems and worked out a method for all to adopt; or, at least, give to each a general idea, leaving the details to be worked out to suit the different conditions.

This plan increased the efficiency at the different mines, and a particular scheme was not adopted for all the mines, regardless of conditions, as is so general at present.

It is too true that many orders given today do not suit the conditions in a particular mine. The order, no doubt, has been successfully adopted at one mine; but that does not mean it will be equally successful at another. To thus force an impractical plan onto the shoulders of men who know by experience a better way will naturally cause dissatisfaction. To have this occur often only increases the resentment on the part of all concerned, which retards production in the mine. Then, what happens? Simply, the management wants to know why! The man gets a notice, "Please explain," and he is fortunate if he can do so with satisfaction.

#### FRIENDLINESS IN MINE MANAGEMENT

I am a firm believer in friendliness and personality, as suggested by the editor. I pity a man without a friend and, to have friends, one must be a friend himself. To my mind, discipline should be founded upon friendliness, at least to a great extent, as discipline will surely fail of actual worth, unless friendliness is upheld. What man will listen to discipline and be satisfied, in body and mind, unless a friendly attitude is also extended. Therefore, I do not feel that friendliness undermines discipline, but I do know that discipline will undermine friendliness, if it is not properly used. To such an extent will this be true that the industrial activity of a mine or plant will be materially lessened; and unless friendliness is engendered there will ever be a charge on the hands of the employers.

But the old personal touch with the old friendly characters will do more to take up the lost motion that now exists, than any method I know. Industries seem to be built around too much "young blood," who have too many new and "castle" ideas. Some of the old stock should be added to this young blood to hold them down. Not the old ways of doing things at the mines, but the new and efficient methods, with the old tried-and-true Industrial Democracy, as it is termed today. "BEN."

W. Va.

### Shifting the Worker

*Letter No. 6*—The incident cited in the inquiry signed "A. H." *Coal Age*, Feb. 12, p. 327, makes me wonder that a superintendent could treat a fellow workman with such contempt and with so little consideration for the man's well being. I hope that this type of superintendent is in the great minority.

In my opinion, it would have paid that mine official far better if he had taken a few moments to look over the circumstances and had regarded the matter from an unselfish standpoint. A man must put himself in the other fellow's place before he can appreciate his position. Had this superintendent done so, he would not have lost a good man, who had probably performed faithful service but who was compelled to move by reason of the treatment accorded him.

Having filled every kind of position about the mine, both above and underground, my experience compels me to think that "A. H." did not receive fair treatment. He would probably have been glad to have continued his duties at the substation, until the superintendent could find a man for the place. In my judgment, the language used by the man's superior was uncalled for and showed bad taste on the latter's part.

There is little wonder that there is so much unrest among mine workers at the present time, when they receive so little consideration in the struggle to better their condition. A superintendent who will treat his men in the manner described can never hope to get from them anything better than eye service.

It may be that the superintendent in question was born with a silver spoon in his mouth; but, unless that is the case, he could hardly look back on his own career without recalling a time when some one gave him an opportunity for stepping higher, such as he refused to the man in his employ.

It would be well for ourselves and those we employ if we could, periodically, take account of stock in ourselves, so to speak, consider our manner of dealing with our men and its results. There would be better feeling all around and, at the same time, better service would be given. It goes without saying that treatment such as this man received can never do otherwise than breed dissatisfaction among workers.

#### EXPERIENCE OF AN EFFICIENT TRACK BOSS

Speaking of ill treatment of men, I recall an experience that was my own some 27 years ago. At that time, being in charge of the tracks on the main haulage road in a mine, I drew the mine foreman's attention, one day, to a bad section of roof over a switch, and asked him to have the place timbered, at night, as it was impossible to do the work in the day when the mine was running. The foreman neglected to do this, however, and I was not surprised when coming out of the mine, a few days later, and approaching the place, I was suddenly halted by a heavy roof fall, while the man a little ahead of me narrowly escaped being killed.

Finding the mine superintendent and foreman at the bottom, I reported the circumstance to the former, only to be told that I was to blame in the matter. I informed the superintendent that I had reported the bad condition of the roof to the foreman a few days previous. In reply, I was told to study the mining law, a thing with which I was already familiar, having studied it carefully, in preparation for examination.

My surprise can easily be imagined when, the next day, I was instructed to call at the office where the payclerk gave me my money and told me I was "fired." He could give no reason for the act. However, as the result proved, it was the best thing that could have happened to me. Like "A. H.," I found a better place, with another company, where I received good treatment and a year later was made superintendent at the mine, which adjoined the one where I formerly worked.

In the course of time, I accidentally met the superintendent who succeeded the one who fired me. In the course of the conversation that followed our meeting, he told me the reason I was fired was that I knew too much to suit the former superintendent, who blamed me for reporting things to the mine inspector, because that official found much in the mine that needed attention.

# Inquiries of General Interest

Answered by  
James T. Beard

## Contract System of Mining Coal

We are desirous of obtaining some information regarding the contract system, which we understand is in use in some Pennsylvania mines. Can *Coal Age* or any of its readers explain who has supervision over the work, and what is the basis of settlement. Is the coal mined paid for on a tonnage or a yardage basis? How large a portion or section of the mine is let out on contract, and who furnishes the mules or other means of haulage, and supplies the timber, trackage, etc.?

Akron, Ohio.

MINE SUPERINTENDENT.

This question was submitted to a practical mining man who has had much experience in that class of work, and the following reply was received:

Prior to the advent of the United Mine Workers organization, in the anthracite coal fields, some of the coal companies made a practice of letting a contract to a miner to mine the coal in certain sections of the mine, or in a certain number of working places. For example, a miner would take a contract for mining the coal in all the places on a certain gangway. He hired his own miners and laborers, and in a few instances employed the drivers, car-runners and door-tenders working in his own section or gangway.

The contract system of mining proved very satisfactory and developed a high efficiency, per man. I wish to emphasize what may seem a peculiar fact; namely: greater results are obtained, per man, where the work is in charge of a contractor, or the mine is worked by a small individual operator, as compared with a large corporation. This fact was clearly proved by the results of the contract system where the work was closely supervised by the man most deeply interested.

The advantage peculiar to the contract system is that the contractor is in a better position to control all matters affecting the cost of production. In this respect, he has the advantage of the most capable mine foreman, whose authority is largely handicapped by his superiors in office, and who cannot, therefore, exercise the same control over the many details that affect the cost-sheet. On the other hand, the contractor can arrange the work and move his men from place to place as conditions may require. He is also able to secure a greater recovery of coal and protect his men from danger to a greater extent than would be possible if he were acting as foreman of the mine.

The contract system, however, is not without its objectionable features. A large contractor frequently becomes prosperous and exercises an overbearing manner toward his men, thereby breeding a jealous contempt among them. The contractor is also generally favored by the company in their distribution of cars. In a slack time, the contract miner will be given steadier work and have fewer idle days than the company miner, which increases his earning capacity.

This manifest favoritism of the company toward the contract miner, aroused much opposition when the

miners' union became fairly well established in the region; and the result was that at the termination of an agreement between the miners and operators, the demand was made by the union that no miner be permitted to work more than one place or employ more than two laborers. This grievance has been repeatedly presented to the Board of Conciliation, and it is my impression that the decision has finally been reached that all miners are entitled to an equal distribution of cars. The fixed award of the Anthracite Coal Strike Commission reads as follows:

That mine cars shall be distributed among miners, who are at work, as uniformly and as equitably as possible; and that there shall be no concerted effort on the part of the miners or mine workers of any colliery or collieries, to limit the output of the mines, or to detract from the quality of the work performed; unless such limitation of output be in conformity to an agreement between an operator or operators and an organization representing a majority of said miners in his or their employ.

At the present time, the mine foreman has general charge of all persons employed in the anthracite mines of Pennsylvania. The individual miner is considered a "contractor." He cuts and loads the coal for which he is paid on a stipulated basis, per car, or per yard, as the case may be. In the comparatively flat fields of the Lackawanna and Wyoming Valleys, the miner is paid by the car and he, in turn, pays his laborer one-third of the price for loading. In fairly big good coal, six or seven cars, containing from 80 to 100 cu.ft. is generally considered a shift.

Recently, the laborer has taken advantage of the miner and has insisted on the payment of a full shift for each day that he goes into the mine, regardless of the number of cars loaded. This has naturally worked a hardship on the miner who is frequently obliged to load his own coal, and the physical condition of many of the older miners is not equal to the task. It will be readily seen that miners working in the thinner seams can better afford to meet this condition and pay the laborer a full shift, because if he fails to get cars he can arrange to take up bottom or blow down his roof, as the case may be.

In the Lower Valley, the coal lies at a much greater angle or pitch and is generally mined by the yard and loaded from chutes by company loaders. The miners usually work as partners and divide their earnings on a 50:50 basis. The gangway miners, in this field, also drive the airways or what are known as "chutes" and "headings." This is essential to the safety and efficiency of the operation. Both in the upper and lower fields, the miner is paid for lifting bottom, blasting down roof standing timber and building brattice.

The work is supervised by the mine foreman and his assistants, each assistant being given a certain section, the size of which depends on conditions. Each miner furnishes his own supplies of powder, oil and tools, for himself and his laborer. All other material is furnished by the company. Under favorable conditions in these valleys, the chamber or breasts are driven on 60-ft. centers and opened to a width of 30 feet.

# Examination Questions

Answered by  
James T. Beard

## Mine Inspectors' Examination. Held at Pottsville, Pa., March 30, 31, 1920

(Selected Questions.)

**Ques.**—Explain what is meant by the capacity of an air compressor.

**Ans.**—The capacity of an air compressor is expressed by the quantity of free air it can deliver each minute, and is equal to the piston displacement, in cubic feet per minute. This is the theoretical capacity of the compressor and is approximated but never actually attained by any compressor in operation.

**Ques.**—Describe the anemometer and state its use in relation to mine ventilation.

**Ans.**—The usual form of the Biram anemometer is shown in the accompanying figure. It consists of the revolving vane having its blades inclined to the plane of revolution. The inclination of the blades is such that an air current, moving with a velocity of one foot a minute, will produce one revolution of the vane in that time. In other words, a single revolution of the vane corresponds to one foot of air travel. The vane is connected, through a series of gears, to a recording dial that

THE BIRAM ANEMOMETER

indicates the number of revolutions of the vane. The instrument is used to ascertain the velocity of the air current in an airway in a mine. The number of revolutions shown by the reading of the dial divided by the number of minutes the instrument is exposed to the current gives the velocity of the air in feet per minute. The measurement of velocity by the anemometer is merely approximate, but it is much used in mining practice.

**Ques.**—Describe a rescue apparatus with which you are familiar.

**Ans.**—Without referring to any particular type of breathing apparatus, all of which involve the same principles of construction, it may be said in reply to this question that the principal features of breathing apparatus are an oxygen cylinder equipped with a reducing valve by which the high pressure to which the oxygen is compressed (120 atmospheres) is reduced to a normal pressure for breathing. A breathing bag with inhaling and exhaling divisions is connected by tubes with a mouthpiece or helmet worn by the operator. A mouthpiece and nose clip are generally preferred to the helmet,

as the latter is too bulky for use in the mine. The apparatus contains a regenerator holding caustic soda, which absorbs the carbon dioxide from the exhaled air, making the air again respirable. In use the breathing bag is first filled with pure air. As this air is inhaled by the effort of breathing and again exhaled, it passes into the exhalation side of the breathing bag, where it comes in contact with the caustic soda, which removes the carbon dioxide from the air. The air, slightly depleted of its oxygen, then passes into the inhaling division, where it is mixed with fresh oxygen from the oxygen cylinder. The oxygen is delivered at the rate of two liters per minute, which is the estimated supply needful to restore the air, which has lost some of its oxygen through absorption by the blood in the act of breathing.

Other parts of the apparatus are a pressure gage for indicating the quantity of oxygen remaining in the cylinder, an emergency bypass and valve that provides for the filling of the breathing bag with oxygen, in case the reducing valve fails; a saliva trap to prevent the saliva from the mouth entering the breathing bag; an inspiratory and expiratory valve for regulating the flow of the air to and from the breathing bag to suit the requirements of the wearer.

**Ques.**—A volume of 200,000 cu. ft. of air enters a mine at a temperature of 40 deg. F.; what is the volume at the outlet, the temperature being 70 deg. F.?

**Ans.**—Assuming there is no increase of volume due to the presence of mine gases in the return, and ignoring the effect of the decrease of ventilating pressure in the return airway, the volume of air passing varies directly as the absolute temperature. In other words, the volume ratio is equal to the absolute-temperature ratio. Therefore, calling the required volume of air in the return airway  $x$  we have

$$\frac{x}{200,000} = \frac{460 + 70}{460 + 40} = \frac{530}{500}$$

$$x = \frac{200,000 \times 530}{500} = 212,000 \text{ cu. ft.}$$

**Ques.**—If 10,000 cu. ft. of air passes per minute through an airway 12 ft. in diameter, how many cubic feet per minute will pass through an airway 6 ft. in diameter, the length and pressure being the same in both cases?

**Ans.**—For circular airways of equal length, the quantity of air circulated by the same pressure is directly proportional to the square root of the fifth power of the diameter. In other words, the quantity ratio is equal to the square root of the fifth power of the diameter ratio. Therefore, in this case, calling the required quantity of air  $x$ , we have

$$x = \frac{10,000}{1.32} = \frac{10,000}{5.657} = 1,757 \text{ cu. ft. per minute.}$$

# Foreign Markets and Export News

## Bulgaria's Coal Resources Are in Need of Development

Only One of the Country's Mining Regions Has Been Extensively Developed, Twenty-three Miles From Sofia—Greater Part of the Coal Produced Is a Fair Quality of Soft Brown Lignite

As the production of coal in Bulgaria is insufficient for the needs of the country, Consul Graham H. Kemper, Sofia, reports, under normal conditions coal must be imported. Coal mining has not reached an advanced stage, nor is the coal produced of a very high grade. The conditions under which it is mined are such that the average output per man is very low, now approximately one-third of a ton per day.

Only one of the numerous coal-mining regions in Bulgaria has been extensively developed, the Pernik region, lying about twenty-three miles southwest of Sofia. The mines there are owned by the State and supply the greater part of the coal mined in Bulgaria. The productive area of these mines is said to be about twenty-three square miles. The State mine Bobov-Dol, situated about fifteen miles south of the Pernik mines, is the second in importance. The region covers a greater area than the Pernik region, but its productive area is smaller.

Other deposits, not yet extensively developed, are found in the Balkan Mountains between the towns of Gabrovo on the north and Sliven on the south; in the region north of the Maritza River, not far from Stara-Zagora; and in the territory around the Black Sea port of Burgas. Some of the mines in these regions are owned by the State; other mines and concessions are privately owned.

The greater part of the coal produced in Bulgaria is a fair quality of soft, brown lignite. Black coal, however, is found in the Stara Plaina or Balkan Mountain region.

The following table shows the annual production of coal in Bulgaria during the years 1911-1919 (metric ton = 2,204.6 pounds):

	Lignite, Metric Tons	Black Coal, Metric Tons
1911.....	260,540	8,064
1912.....	306,488	7,055
1913.....	347,525	10,220
1914.....	408,620	12,551
1915.....	515,263	18,502
1916.....	623,681	16,132
1917.....	742,221	19,052
1918.....	646,602	26,272
1919 <sup>a</sup> .....	550,000	20,000

<sup>a</sup> Estimated.

No coal was imported into Bulgaria during 1918 and 1919, and very little since 1914. The quantity and value of

coal and coke imported each year from 1911 to 1917, inclusive, was as follows:

Year	Coal		Coke	
	Metric Tons	Value	Metric Tons	Value
1911.....	184,070	\$953,704	4,930	\$37,320
1912.....	153,284	878,331	4,448	31,003
1913.....	106,951	835,970	1,003	10,625
1914.....	213,109	1,403,954	5,460	42,943
1915.....	375	3,474	...	...
1916.....	360	...	...	...
1917.....	54,207	966,480	1,902	47,821

The greater part of the coal imported before the war came from England and Turkey. The English coal entered at Varna, Bourgas, and Dedeagatch, and the Turkish coal at Varna and Bourgas. The imported coal was consumed almost entirely in the eastern part of the country. The western part, including the capital, Sofia, used only Bulgarian coal mined in that region. The English coal, being far superior to Bulgarian or Turkey coal, was reserved almost exclusively for the railroads. A very small quantity of Serbian coal (from the Vrushka Tohouka mines) was imported at certain ports on the Danube for local use.

No coke is produced in Bulgaria, but it was formerly imported from England, Germany, Austria and Belgium. Before the war it was purchased for 60 leva (\$11.58) per ton. The present price is said to be prohibitive. There is coal in Bulgaria from which coke could be produced, but the manufacture of coke has not been undertaken.

No coal is exported from Bulgaria. The demand has always exceeded the domestic supply, and at the present time there is a serious shortage.

While at present the high cost of coal, together with the fall in the exchange value of Bulgarian currency, prevents the importation of foreign coal, it is believed that in a short time the demands for more coal must be filled if the country is to continue the industrial development of the years prior to the war. It is not believed that such a demand can be satisfied by the coal mines of Bulgaria.

A congressional committee which recently visited the Virgin Islands declared that facilities for bunkering American vessels at St. Thomas are superior to those at Barbados and recommends that American vessels be bunkered and fueled at St. Thomas.

## Oil Engines Favored by Swedish Shipbuilders

About 75 per cent of the steamers now under construction in England, it is stated, will be equipped for both oil and coal fuel. In this connection it is of interest to note that 70 per cent of all ships now building in Sweden will be equipped with Diesel motor engines. The opinion in Sweden is that the oil engine is decidedly superior to the combined oil and coal burners, and this opinion is supported by the testimony of the large Swedish shipping companies that have used the Diesel-motor ships for many years.

As the Diesel-engine steamer seems to be the prevailing type in the Swedish mercantile marine, several of the largest shipyards have changed their equipment in order to be prepared to build the new type exclusively. The largest shipyard in the country, Gotaverken A/B, at Goteborg, has enlarged and altered its docks and workshops with a view to using the new type, and other large yards are expected to follow this example.

At present there are being constructed at Gotaverken four Diesel-engine steamers of a combined tonnage of 37,000 and one steamer of 7,500 tons. At Lindholmen A/B, Goteborg, there are now being built three ships of the combined oil and coal-burning type with a total tonnage of 24,000; at Koekums A/B, Malmo, a Diesel-engine ship of 8,000 tons is under way; and at the shipyard of the Oscarshamn Shipbuilding Co. there are in an advanced state of construction four ships for oil burning.

## Japanese Coal Production Increases 10 Per Cent

According to Commerce Reports of the Department of Commerce, in spite of pessimistic reports made from time to time of the gradual exhaustion of the mines, *Shipping and Engineering* note with interest that the output of coal in Japan during the first eleven months of 1919 was put at 25,825,000 tons, showing an increase of 2,740,000 tons, or about 10 per cent, as compared with the corresponding period of the previous year.

The larger output is attributed to the revival of old mines and the increase in the number of new mines, owing to the profitable prices obtaining, although the output in Kyushu, which constitutes approximately 60 per cent of the total production, did not materially change.

# Production and the Market

## Weekly Review

*Production Gains with Better Car Supply and Some Relief Is Experienced in the West and Middle West—Conditions Still Acute in the East—Export Movement Gains—Lake Situation Worries Shippers—Anthracite Advances Reported.*

**B**ETTER movement of loads and empties is the general reason for the upward trend in production reported by the Geological Survey for last week. Consumers everywhere complain, however, that cars are not being received, and reports of plants forced to close or curtail operations for lack of fuel continue to come in.

As the railroads slowly work off the accumulations in yards with such limited labor supply as they can muster some coal is getting through. At the mines the lack of empties is almost as serious now as it was two weeks ago, but every day shows a little improvement and a production in excess of 9,000,000 tons is estimated for the last week of April.

Export movement continues heavy with demand in excess of the supply. The passing of the Federal Tidewater Coal Exchange is expected to expedite movement by removing all restrictions. Western embargoes on the Chesapeake & Ohio and the Norfolk & Western last week forced a heavy movement to Hampton Roads, so much as to seriously congest the port. New high levels in smokeless prices are reported from the roads, \$11 at

terminal being reported in one instance. Boston reports heavy clearances for New England from this port with prices gaining over previous levels.

Improvement in railroad conditions is reported from such Western centers as St. Louis, Columbus and Cleveland, but with the supply still limited as it is, prices are high and going up. From Pittsburgh comes the word that both buyers and shippers are discounting the return to less troubled times and that buying is light with a break in prices expected in a short time.

Assigned cars are in use and the roads have found it necessary to confiscate less coal for their own uses as a result. Complaint is made that mines with assigned cars are getting the labor away from the commercial shippers and that cars in excess of ability to load are being left at railroad fuel mines to the serious detriment of the other operations.

Anthracite is in an uncertain period. While waiting for the wage decision some companies have advanced prices as much as a dollar a ton. Deliveries have been delayed by strikes and cold weather has kept demand strong.

Average Daily Production of Bituminous Coal\*

\*From weekly report of Geological Survey.

## Reports From the Market Centers

### New England

#### BOSTON

*Traffic Conditions Improve Slightly—Railroads Continue Seizures—Assigned Cars Expected to Cause Complications—Prices Strong—Heavy Clearances at Hampton Roads—New High Levels on Smokeless—Anthracite Advance Foreshadowed.*

**Bituminous**—Traffic conditions show a slight improvement from week to week. The Boston & Maine has somewhat increased the number of cars taken daily from connecting lines, and the flow of west-bound empties is greater. The Boston & Albany and the Maine Central have about resumed normal service, although the latter is largely dependent upon the Boston & Maine. The New Haven road is still unable to function in any adequate degree, having maintained an embargo against anthracite for about four months.

Commercial coal is being taken freely for railroad requirements. Commercial and other consumers' coal, which was shipped at Government fixed price, has been confiscated by the railroads and must now be replaced to the consumers at an extra cost of something over \$2 per ton. The railroads may either have to replace the coal taken, or pay the going price in the current market for coal yet to be shipped. It is understood that one New England road, alone, has confiscated 200,000 tons within a short period.

Assigned cars will not solve the problem of railroad fuel. Certain mines will have cars; others will not, and labor will be certain to take umbrage. Consumers who bought their supplies early, at lower prices, may find that assigned cars are carrying off the entire output of individual mines.

Car-supply, generally, is reported to be better, especially in central Pennsylvania, and contract shipments may soon begin to increase. For several days the all-rail requirements may suffer somewhat, because of the great dearth of bunker and other steam coal in New York Harbor.

All quotations on steam and gas grades are quite firm. Despatch at Hampton Roads is practically normal. The volume of coal is sufficient now to keep the terminals up to capacity, and there is no lack of bottoms to load. New England clearances are still small compared with the tonnage that came here two years ago, but this territory is fast disappearing from all calculations of shippers from the smokeless fields.

High rates by water have led consumers here to turn to all-rail channels,

and the average buyer favors getting coal from central Pennsylvania all-rail.

Prices on Pocahontas and New River, especially for bunker purposes and to piece out cargoes, have gone soaring recently—\$9 f.o.b. vessel. Large and wealthy concerns are offering the most extravagant inducements, and a few operators are yielding. Except among the most conservative the contract figure of \$4 per net ton has been entirely lost sight of.

At this end the smokeless coals are easily commanding \$12 and more on the cars at Providence, Boston or Portland, and a much increased tonnage might be absorbed as spot fuel at remunerative figures.

Quotations at wholesale, for spot shipment, range about as follows:

	Cambrias and Somersets	Clearfields
F.o.b. mines, net tons	\$4.50 @ 5.25	\$4.15 @ 5.00
F.o.b. Philadelphia, gross tons	7.25 @ 8.10	6.55 @ 7.45
F.o.b. New York, gross tons	7.60 @ 8.45	6.90 @ 7.80

**Anthracite**—Definite signs of the company program have now appeared. An announcement has been made by one company of the advancement of circular prices of \$1 per ton on broken, egg, and stove; 90c. on chestnut, and about 75c. on pea. This probably foreshadows similar action on the part of other companies and may mean \$7.35 for broken and egg, \$7.70 for stove and chestnut, and \$6.00 for pea, all f.o.b. mines per gross ton.

Retail distributors continue to be most apprehensive. Shipments are extremely slow in every direction. Both by water routes and all-rail receipts are quite light.

### Tidewater

#### NEW YORK

*Anthracite Prices Advanced by Large Company—Some Piers Resume Loading—Unsettled Labor Conditions at Mines and at Tide—Demand Heavy With All Coal Supplies Short—Bituminous Quotations Show Slight Changes.*

**Anthracite**—Without waiting for the operators and miners to end their wage conferences, at least one of the large operating companies advanced mine prices for domestic coal \$1 per ton beginning May 1. It would not be surprising to the trade in general if similar increases would be made shortly by the remaining companies.

The court order dissolving the Reading Company has caused some prominent members of the trade to predict

a free-for-all market, the quotations fluctuating similar to every other commodity when the subsidiary companies of the Reading are segregated.

Conditions in this market show a slight improvement. Loading at the piers has been resumed in part, due to the partial ending of the railroad strike and an improvement in transportation problems. Shipments from the lower ports are not as prompt as from the upper ones, due to a continuance of the harbor labor difficulties. None of the piers is on a normal basis.

Production has shown gradual improvement, the miners expecting shortly to know the result of the wage conference. But with the members of the subcommittee deadlocked and the Federal authorities appealed to, conditions are not so favorable for continuance of work at the mines.

There is much dissatisfaction at the delay in reaching a wage agreement and the union leaders are having some difficulty in keeping the mines open.

Local conditions are serious. Retail yards are running low of supplies and dealers are cutting down deliveries to one- or two-ton lots. Dealers report a heavy booking of orders for next winter's fuel. Buckwheat is in heavy demand. Because of weather conditions, most of the big office buildings are using almost normal quantities. Rice and barley are in good demand but, as in the case of buckwheat, the stocks are short. Current quotations for company coal per gross ton at mine and f.o.b. tidewater, at the lower ports are as follows:

Broken, mine \$5.95; egg, \$6.35 @ \$7.35, tidewater \$8.20 @ \$9.20; stove, mine \$6.60 @ \$7.60, tidewater \$8.45 @ \$9.45; chestnut, mine \$6.70 @ \$7.70, tidewater \$8.55 @ \$9.55; pea, mine \$5.30, tidewater \$7.05; buckwheat, mine \$3.40 @ \$3.75, tidewater \$5.15 @ \$5.50; rice, mine \$2.75 @ \$3.25, tidewater \$4.50 @ \$5; barley, mine \$2.25 @ \$2.50, tidewater \$4 @ \$4.25; boiler fuel, mine \$2.50, tidewater \$4.25.

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

**Bituminous**—The local market shows considerable strength so far as demand goes, but there is much delay in shipments. Deliveries are as important as prices, and some dealers are said to pay an extra price if assured the coal will be shipped promptly.

Coal is coming here in better shape, but nothing like normal. The various piers are loading better but harbor difficulties make towing difficult, and there were rumors of additional trouble. Lack of fuel has caused many factories here to discontinue operation, throwing many employees out of work.

Uneasiness continues in the mining fields because of slack work, chiefly on account of the shortage of cars. A continuance of these conditions may drive many of the mine employees into other fields of activity. The railroads continue to confiscate large quantities of

fuel and the consignor is put to much trouble to replace it.

Towing is a big factor in the price of coal. These charges continue to range from 50c. to \$1 a ton and some individuals report higher quotations.

With the Government controlled Tidewater Coal Exchange out of existence, handlers of coal for export look for added strength to that market. It is not expected that the issuance of export licenses will be continued by another branch of the Federal Government.

Quotations showed slight changes from last week, many shippers withholding prices because it was impossible to promise prompt deliveries. Producers of Shawmut were quoting around \$4.75, with Pool 11 being quoted at about \$5.25. Pool 10 was held by some shippers at from \$5.50 to \$5.75, the latter being the top price. Quotations for loaded boats ranged from \$10 to \$12, with an occasional higher figure demanded.

### PHILADELPHIA

*Anthracite Domestic Increases \$1 a Ton at Mines—Some Steam Sizes Go Up, Others Down—Retail Prices Increase and Delivery Heavy—Bituminous Scarce with Demand Strong—Spot \$6 at Mines.*

**Anthracite**—For the first time probably within the past twenty-five years, the individual shippers set the pace as to the price of coal to be shipped during the month of May. One prominent independent announced a flat price of \$9.75 for egg, stove and nut, with \$7 for pea, f.o.b. mine. Shortly afterward the largest independent shipper announced the following prices: Egg, \$7.55; stove, \$7.85; nut, \$7.95, and pea, \$5.80, at mines. Next one of the largest companies quoted \$7.35 for broken and egg, \$7.70 for stove and nut, and \$6 for pea, practically an increase of \$1 per gross ton in the mines prices. Finally most of the independent houses gave out figures approximately 75c. higher than the last named.

The steam coals have been quoted as follows: Buckwheat, \$4; rice, \$3; boiler fuel, \$2.25, and barley, \$1.25—an increase of 25c. for buckwheat, a decrease of 25c. for boiler and of \$1 for barley. The last size has been a drag on the market.

The change-of-size proposition seems to have been entirely lost sight of in the turmoil of price fixing. The dealer has passed the increase on to the consumer, adding something to cover the increase of capital needed in business, together with gradually increasing delivery costs.

All city yards have fairly large stocks, but they are quickly cleaned up, and the dealers are beginning to ask for more coal, expecting nothing but moderate shipments for some weeks. There is the possibility of the miners stopping work.

The steam trade is extremely active, especially on buckwheat and

rice, reflecting the shortage of bituminous coal in this market.

**Bituminous**—There is quite a strong demand for bituminous throughout this district. The iron industry is in urgent need of fuel. The great need is for gas coal, with a car supply running from 13 to 35 per cent. Contract customers receive 40 per cent of the amount called for, with utility plants doing a little better on steam coals.

In the spot market gas coals are offered around \$5.75 to \$5.85, f.o.b. mines, for Fairmont mine-run, with Pennsylvania gas coals at about the same quotation. Quotations on Pennsylvania steam coals from pools 10 and 11 are from \$5.50 to \$6. However, some consumers needing coal frankly said they could not pay anything like these prices and continue in business.

Some of the larger manufacturers are going direct to the mines and bidding for the coal, resulting in increasing the spot figures.

The railroads are willing to pay about \$3.25 at mines for Pennsylvania coal and \$3 for the Fairmont grades for their own use. Producers mostly insist that such prices are simply impossible and are less than cost of production, although some shippers feel that they might thus be able to get cars and make up the difference by having a greater tonnage for the spot market. The roads are not getting enough fuel in this manner and confiscation is far from unusual.

In regard to another strike of the railroad men, the various brotherhoods have been holding conferences ever since the last outbreak, and the spirit of unrest is far from quieted; many crews are idle in this territory on account of a continuance of strike conditions at New York tide piers.

### BALTIMORE

*Spot Market Moves Upward with Reserves Light—Embargoes and Coal Trimmers' Strike Features in Connection with Heavy Export Movement—Hard Coal Demand Dead as Trade Awaits Schedules.*

**Bituminous**—In the face of a lessening urgent demand on the part of consumers, due to the belief that a break in the present exceptionally high market is sure to come, the operating and sales end of the coal industry continue firm in their demands. During the past week the spot market moved upward, and it is now almost impossible to get any quantity of Pools 9 and 71 coal without paying around \$6 f.o.b. mines.

Good coals are readily sold all the way from \$5.25 to \$5.75 at the mines, and run-of-mine Fairmont gas coals, with a differential of 25c. a ton against them, have sold here the past week as high as \$5.25. It is now rare to hear of \$5 spot coals, f.o.b. mines, and probably nothing is being sold below that figure.

Both consumers and sellers are generally holding back from contracting. There is a disposition to take no chance

of losing any rise that may come. The new tidewater pool arrangement has gone into effect here without complication.

But an embargo has been put on some of the pools that are crowded, and a coal trimmers' strike has slowed up loading, so that a general embargo may be necessary for a time at Curtis Bay. The reserve at Curtis Bay is now around 1,800 cars per day or about 40 per cent of normal. The loadings here in April have been quite heavy for export coal, and the total for the month, of coal placed aboard foreign-bound coal cargo carriers, will run around 400,000 tons.

**Anthracite**—The hard coal situation still awaits the action of the miners and operators and the establishment of a wholesale schedule thereafter. The dealers here do not take orders except on a basis for price at time of delivery. Many will only deliver for immediate domestic use and will not put coal in for storage. Some few dealers are selling the coal they receive at 50c. above schedule rates, but most of the coal merchants here are sticking strictly to schedule.

## Lake

### BUFFALO

*Bituminous Coal Moving Slowly—Pittsburgh District Still Tied Up by Strikes—Canada Stocked Up But New Freight Arrangement Unpopular—Anthracite Situation Much Improved.*

**Bituminous**—The situation here is not much improved; the Pittsburgh district still being tied up by switchmen's strikes. The slow coal movement is not all due to a car shortage; the railroads are doing what they can to increase the supply, but they can make but little headway. Notices of shipment are quite irregular, so that dealers do not know whether to push sales or not.

At the same time the demand is not large. Consumers expect prices to drop as soon as the strikes are out of the way and some shippers agree with them. For this reason consumers are not buying any more than for present needs. Canada seems to be pretty well stocked up, and now, with a new order out requiring absolute prepayment of all freight on coal to Canada, some new arrangement has to be made. Some shippers do not plan to pay freight on contract coal sold at mine prices, but others say that the shipper cannot escape these payments. It is a great burden on them.

Buffalo harbor is about as badly tied up as it well could be. Practically all the men concerned are on strike and refuse to sign up for the opening of the season. No coal is coming in and the fleet cannot sail except on fuel left over last fall.

The price of bituminous is little changed and the consumer pays it un-

willingly. Allegheny Valley mine-run has been marked up to \$6 to \$6.35, with Youghiogheny gas \$6.75; Pittsburgh and No. 8 lump and three-quarter, \$6.25 to \$6.50; mine-run and slack, \$6 to \$6.25; Pennsylvania smithing and smokeless, \$6.50 to \$6.75, all per net ton, f.o.b. Buffalo.

**Anthracite**—The situation is much improved from last week. One of the leading companies is delivering coal at such a good rate for several days that the complaint of scarcity has about disappeared. At the same time the demand keeps up, for everybody wants to get winter coal at present prices. If the shippers have the coal it goes out freely. The fear of further difficulty at the mines is not so great as it was.

The loading of water coal is as yet confined to one company, which now has about 50,000 tons afloat. With no fuel, no rate and no crews, in some cases, the future does not look very rosy.

Much more anthracite has been burned in the city this spring than usual on account of the shortage of natural gas. Many people, who restored the gas service, had to put in coal again, as the gas went out.

**Coke**—Coke consumers are not buying any more than they must of local shippers, it being apparent that the current prices are much higher than their contracts. The supply has been badly reduced by car shortage and other difficulties, so that it was often necessary to get coke wherever it was to be found. Shippers were not always able to get any sort of a supply, so that prices are as high as ever, with low grades about out of the market. Quotations are as follows: \$12 for 72-hr. foundry, \$10.50 for 48-hr. furnace, and \$7 for domestic sizes, to which must be added \$2.60 freight for the net-ton, f.o.b. prices here.

CLEVELAND

*One-third Normal Coal Supply Moving into Cleveland—Prices Continue Firm—Lake Trade Quite Small and Outlook Poor.*

**Bituminous**—Though more striking switchmen are reported to have returned, the improvement in the railroad situation is confined to newspaper reports. Coal is moving into Cleveland in sold trainloads, to the extent of 35 to 40 per cent of normal supply. Plant activity is slightly better, though all are operating on a coal supply of a day or two. Operators fear any perceptible relief in car supply is 45 to 60 days distant. Steam-coal users continue ready to take easily twice the tonnage that operators could supply under normal conditions. Average stocking facilities in Cleveland are not over a 30-day supply, and it is feared it will take half the summer for most steam-coal users to stock up.

No more sizable contracting is reported, as operators are unwilling to

commit themselves further until conditions become more normal. The contract market seems to be \$3.75, f.o.b. mine, for No. 8 slack and mine-run and \$4, f.o.b. mine, for lump. Retail dealers are paying from \$4.25 to \$4.50 f.o.b. mine, for spot supplies of No. 8 and No. 6 steam coal.

**Anthracite and Pocahontas**.—The usual spring dullness grips both grades, and sales are light, though not abnormally so for the season. Prices remain unchanged.

**Lake trade**—The close of April finds the Lake trade a good million tons behind last year to this date. May's beginning is most inauspicious, as the movement to the Lake front is light. Unless summer and fall shipments break all records, the 1920 movement will be far under the 30,000,000 tons planned.

Lake shippers fear the Frelinghuysen bills, providing seasonal freight rates on coal, will divert cars from the Lake trade. It is announced that Lake bunker coal from lighters will cost \$6 a ton, and at Sandwich and Line island docks, \$7. Fifty-five cents to Lake Michigan ports other than Milwaukee, with 60c. to Milwaukee, are the freight rates named in a recent large contract.

Prices of coal per net ton delivered in Cleveland by retail dealers are:

Anthracite—Egg and grate, \$12.20@12.40; chestnut, \$12.50@12.70; and stove, \$12.50.

Pocahontas—Shoveled lump, \$10.50; and mine-run, \$9.25.

Domestic Bituminous—West Virginia splint, \$8.75; No. 8 Pittsburgh, \$7.75; Millfield lump, \$8.50; and cannel lump, \$11.00.

Steam Coal—No. 6 and No. 8 slack, and No. 6 and No. 8 mine-run, \$7.75; and No. 8 3-in. lump, \$8.00.

MILWAUKEE

*Soft Coal Famine Imperils Industries—Coal Dealers Call a Halt and Restrict Deliveries—No Relief Expected Until Receipts by Lake Improve.*

The last week in April finds the Milwaukee coal market in a chaotic condition, due to a shortage of soft coal and inability of dealers to obtain new supplies. The Milwaukee-Western Fuel Co., which handles 50 per cent of the coal received at Milwaukee, makes public an announcement that it has exhausted every effort to secure coal, and that after April 30 it will not be able to supply soft coal to consumers until the embargoes at the eastern and western coal fields are lifted.

Deliveries will be limited to water works and other public utility food-product plants, hospitals and homes. No coal will be allowed to go to non-essential industries. The switchmen's strike and the refusal of eastern railroads to accept coal, prevents supplies from reaching Lake ports from the mines. Lake shipping is at a standstill in consequence.

Householders are able to secure hard

coal, owing to the fact that a cargo of 9,500 tons was received April 16. A cargo of 7,500 tons of soft coal was also received. These two cargoes represent the April Lake business thus far. A general advance in coal prices is slated for May.

Inland West

COLUMBUS

*Better Transportation Aids Production—Good Demand for All Grades—Manufacturing Handicapped by Fuel Scarcity—Mine Output One-third Normal*

The best feature of the coal trade in Ohio is the return to work of a large number of strikers; this aids the train movement and the car supply at the mines is growing better. As a consequence the output is better in all of the mining sections of the state. While embargoes are still in force, a fair tonnage is being shipped and some sections are being relieved of a fuel shortage, but conditions are far from normal.

Demand for steam sizes is probably the strongest feature of the trade. Many factories are still on half time or closed down entirely and reserves are fast disappearing. However, general manufacturing is going on in a way. Public service concerns are now being supplied and the same is true of most public institutions. Railroads are taking a larger tonnage as their freight movement increases.

The domestic demand is also strong and dealers are quite short of supplies, small lots only being delivered. Coal purchased often cannot be delivered; should it arrive it cannot be set on the switch for unloading, and trucks are used to relieve the situation.

Retail prices are firm. Hocking lump sells at \$7.50 and mine-run at \$7.25, delivered. Pomeroy lump and mine-run are about 25c. higher. Pocahontas is scarce and new stocks are arriving. West Virginia splints (prepared sizes) retail for about \$8.50.

Production is now about 30 per cent of normal in most of the Ohio districts. In eastern Ohio the output is quite low because of strike conditions at junction points. The Hocking Valley and Pomeroy Bend districts are producing about 35 per cent of normal. A small amount of coal is being loaded for Lake shipment with producers loath to enter into agreements under present conditions.

Prices at the mines, of coal used in Columbus territory, are as follows:

Hocking lump	.....	\$3.75	@	\$ 00
Hocking mine-run	.....	3.50	@	3.75
Hocking screenings	.....	3.25	@	3.50
Pomeroy lump	.....	4.00	@	4.25
Pomeroy mine-run	.....	3.75	@	4.00
Pomeroy screenings	.....	3.50	@	3.75
West Virginia splints, lump	.....	4.50	@	4.75
West Virginia splints, mine-run	.....	1.25	@	4.50
West Virginia splints, screenings	.....	1.00	@	4.25
Pocahontas lump	.....	6.00		
Pocahontas mine-run	.....	5.50		
Pocahontas screenings	.....	5.25		

## CINCINNATI

*River Shipments Prevent Serious Shortage—Laurcad Strike Clearing Up—Demand Strong and Prices Firm.*

The "outlaw" switchmen's strike is being felt by the coal interests here. The production in the fields in West Virginia and Kentucky, which supply most of the coal to this market, has been comparatively large, but the car supply has been quite short, consequently in many quarters the pinch is being felt severely.

The Ohio River has again stood by in the hour of need, Cincinnati being spared a serious shortage through the medium of this waterway, great quantities of coal coming down at times when they were most needed.

The strike of yardmen on the Chesapeake & Ohio at Russel, Ky., is clearing up, and all that is required to approach normal on that line is for conditions to better themselves in other places, so that empties might be returned. Little coal has come down from West Virginia by rail in the past week because of washouts.

The demand for coal is strong here and prices are firm, but it is extremely difficult to gage prices at the present time. Local retailers are supplying their customers' immediate demands, but industrial firms have difficulty in getting a supply ahead.

## ST. LOUIS

*Slight Improvement in Railroad Conditions—Shortage of Steam and Domestic Coal—Country Districts Suffer—Situation in Various Mining Fields.*

The local situation, although there is an acute shortage of steam coal, is showing a little improvement. A few switching crews have gone to work. At times a trainload of 15 to 20 cars will come in to one of the yards of the larger dealers, but the small ones are getting no coal. A few steam plants get a car now and then.

More than half of the present requirements of St. Louis, outside of the storage supply, is coming in via trucks and wagons from East St. Louis. The domestic demand is easy on account of the weather.

In the country, however, both steam and domestic are short, and many plants are on the verge of shutting down. In the southwest the conditions are somewhat easier than at points that must be reached through the terminals in the larger places.

In the Carterville field cars are furnished a couple of days a week on the Missouri Pacific and Illinois Central railroads to mines that load railroad coal and a little domestic fuel. The Chicago & Eastern Illinois is tied up tight. The Burlington is doing better than the rest, with about three or four days a week.

In the Mt. Olive and Standard fields, the mines get one or two days a week, mostly railroad coal; little of it moving into East St. Louis.

In the Carterville and Mt. Olive

fields the operators are maintaining their regular circular prices, but in the Standard field operators ask \$3.25 for screenings, \$3.50 for mine-run, and all they can get for domestic sizes.

There is nothing to indicate that conditions will be any easier. Coal in St. Louis is retailing (any kind obtainable) for from \$7 to \$8. No anthracite coal is moving in and no smokeless, and nothing from Arkansas. The coke supply is about exhausted.

## DETROIT

*Coal Traffic Manager Appointed—Federal Authorities Expedite Shipments to Gas and Electric Companies—Lake Trade Crippled.*

**Bituminous**—Efforts to get coal into Detroit and Michigan, before the gas and electric companies of the state are compelled to close down for lack of fuel, appear to be making some headway. Following a conference in Lansing, between all parties concerned, an appeal for assistance was made to the U. S. Interstate Commerce Commission.

As a result, Frank H. Alfred, president of the Pere Marquette R.R., has been appointed coal traffic manager for Michigan, and he has delegated the work to E. C. Campbell, president of the Michigan Gas Association, to collect information on the coal requirements of the gas and electric companies.

A list will be forwarded to the coal committee in Washington, of the gas and electric companies, with a report of the number of days' supply of coal each has.

The Federal authorities expect to expedite coal shipments to the companies in most urgent need, and Mr. Alfred gives assurance that shipments will be dispatched after their arrival in Michigan.

Many of the gas and electric companies have not more than a three or four days' supply of fuel. Detroit has been almost wholly dependent on coal in local railroad yards and shipments coming in in small allotments. Most of this supply has now been exhausted.

**Lake Trade**—Owing to the railroad strike and the urgent demand for coal in lower Lake markets, little stock is available for shipment up the Lakes. The supply arriving at lower Lake ports is so scanty that few of the Lake freighters have been able to begin operations. In some instances motor trucks have been used to get coal to vessels requiring fuel. In other cases freighters have been shifted to other ports where coal might be had.

## CHICAGO

*Railroad Situation Better and Strike May Soon Be Over—Dealers Placing Smokeless Contracts at Fair Prices.*

The situation in Chicago is a trifle better than it was last week. Considerable coal is coming in and the railways are making a strong effort to rush steam sizes through to various factories in order to keep them from clos-

ing down. The retail yards, too, are in better shape, especially on the north and northwest sides, where last week there was quite a serious coal shortage. It is freely predicted that if the railroads continue their aggressive plans and keep on replacing the striking switchmen, the strike will soon be broken and the situation will once more be normal.

It was heard this week that several of the retail dealers here had succeeded in placing contracts for a substantial tonnage of Pocahontas and other smokeless coal. The contracts, of course, were made with firms who took care of these retailers during past years. We are advised that the prices named on the various contracts closed were quite fair, considering the general situation. West Virginia and Kentucky coals are still very scarce, and the retail trade is not counting on a very heavy tonnage moving west this year.

## MIDWEST REVIEW

*Output of Illinois Districts Purchased—Product Not Oversold—Coal Sold at April Prices—Car Supply Improving but Still Bad—Strike to be Broken Soon.*

There is no coal market in Chicago this week because no one has any coal for sale. The output of the southern Illinois mines was removed from the market first, and the production of other districts was purchased soon afterward, in the order of excellence. Operators are showing decided tendencies not to oversell their product, and everybody out here in the coal business is going exceedingly slow.

The whole trade has been badly disorganized on account of the switchmen's strike. Coal has been taken out of its accustomed channels, forced through others, and many temporary changes are the result. Manufacturers and retailers in the country are benefiting largely, as, on account of the embargoes at the big industrial centers, all coal is moving to outlying districts and towns, thus giving some manufacturers and retailers a little coal for storage purposes.

Car supply continues bad, although it has been considerably better than last week. The strike breakers on duty at the various terminals have returned a large number of empty coal cars, which were held in the Chicago switching district, and at Peoria and St. Louis. The market continues to be flooded with anxious purchasing agents, but the distributors and operators in the Middle West are refusing to sell their coal at premiums over the market prices published early in April.

The switchmen's strike is still interfering with industries here and a large number of plants have been forced to close down both on account of lack of fuel and the fact that they are unable to get cars in which to ship their finished products. The railroads in and about Chicago are bending every effort

to clean up their yards without the aid of the strikers and they are making excellent progress. It is believed the strike will be completely broken within the course of another week.

## South

### LOUISVILLE

*Little Coal Contracting on High and Uncertain Market — Better Tonnage Expected to East, North and Northwest—South in Fair Shape.*

Coal production too short for summer stocking at present time. Car shortage in April worst ever known. Prices high and contracting light.

A few coal contracts are coming in for Lake movement and from sections of the North and Northwest, but as a whole little coal contracting is being done on the present high and uncertain market; buyers hope for a lower market, and producers are not anxious to tie up production.

If car supply shows reasonable increase, and promise of becoming at all steady, contracts should be taken freely. Northwest coal men are beginning to order early regardless of high prices.

The embargo situation has opened up somewhat, and far better tonnage movements to the East, North and Northwest should result. The movement for the past few weeks has been largely south. Railroads are asking for coal and seizing a considerable amount while the gas and byproduct plants are also clamoring.

A big contract has been made between the Hazard field operators and M. A. Hanna & Co., and other Lake operators, for a shipment of about one-half of last year's tonnage at a price of \$4.25 a ton for 1½-in. lump, to move through Toledo to the Northwest by Lake.

Gas coal and domestic are in good demand, with a fair demand for steam

coal. It is estimated that car supply of the Louisville & Nashville in Kentucky is only 30 per cent of requirements for April, this being by far the worst month in the history of the field.

Hazard fields are quoting a price of \$4.50 for mine-run at mine, prices not being available on screenings or domestic, none being sold.

The Harlan field is quoting prices at mine as follows: Domestic, \$4.50@ \$6; mine-run, \$5.50@ \$6; screenings, \$4@ \$4.50. High-grade gas coal is in big demand and operators can get top prices for output.

Western Kentucky is quoting lump at \$3.25@ \$3.40; mine-run, \$2.85@ \$3; nut and slack, \$2.50@ \$2.60; pea and slack, \$2.25@ \$2.35, at mine.

Smokeless, anthracite and eastern Kentucky coal are quite scarce in the Louisville market. There is little demand of any kind, as the coal is not available.

### BIRMINGHAM

*Demand Strong, Spot Buying Brisk and Contracting Progressing—Operators to Protest Preferential Car Supply.*

With a strong and continuing demand for all coal that can be produced in this field, conditions are in more satisfactory shape than for many months. Spot buying is brisk and contracting by steam users has made good headway. The Atlantic Coast Line and the Louisville & Nashville closed contracts during the week for fuel coal for the next twelve months, and agreements with the Frisco and other lines will be signed during the week.

There is a heavy demand for bunkerage coal at the ports of Mobile, New Orleans and Pensacola, and the amount of this business booked is only limited by coal supply and equipment for this movement.

No improvement is reported in equipment supply for the mines in the district, the average furnished in the field ranging from 65 to 70 per cent. A dele-

gation of coal men will protest the order of the Interstate Commerce Commission, authorizing preferential car supply to mines furnishing fuel coal for the railroads.

Domestic coal has been contracted for extensively, and retailers are slowly stocking, the supply of this grade of fuel being much short of needs.

Quotations on steam coal have fluctuated little the past week and are as follows per net ton mines:

	Lump	Prepared
Big Seam	\$2.95 @ 3.35	\$3.45
Black Creek	4.00	4.15 @ 4.50
Cahaba	1.00 @ 1.35	1.35 @ 1.50
Carbon Hill	3.35 @ 3.50	3.50
Nickel Plate	3.35 @ 3.50	

Domestic grades are quoted as follows per net ton mines:

	Lump
Big Seam	\$3.50 @ 3.60
Black Creek	5.00 @ 5.75
Cahaba	1.60 @ 6.00
Carbon Hill	3.60 @ 3.85
Montevallo	7.15
Corona	4.65
Straven (Montevallo)	6.75

## West

### TORONTO

*Anthracite Situation Shows Improvement—Bituminous Remains Unchanged.*

Conditions as regards supplies of anthracite show improvement, and a fair amount is now coming forward. On account of continued cold weather and the general desire of large consumers to lay in stocks early in the season, dealers have large orders on their books and new orders are generally being refused. The bituminous situation remains practically unchanged. Very little is being received and industrial plants are only kept running from day to day. Dealers are not quoting wholesale prices.

Quotations for short (retail) tons are as follows:

Anthracite egg, stove, nut and grate, \$14; pea, \$12.50; bituminous steam, \$11; domestic lump, \$12.50; cannel, \$14.

## COAL-TAX LEGISLATION

*Legislative Action on Coal-Tax Matter—Governor Morrow Favors Plan—Conference Suggested of Governors of All Competing States—Replies Received.*

During the recent session of the Kentucky Legislature, coal bill after coal bill placing tonnage tax on production was killed. The *Louisville Times* suggested editorially that as operators claimed such action was impossible, due to lack of similar laws in other states, thus working a discrimination against Kentucky operators, the various states appoint committees and get together on the matter.

This suggestion has borne fruit. As early as Jan. 20, 1920, Lieutenant-Governor Ballard corresponded with the governors of other states as to the possibility of placing coal-tonnage taxes

on an equitable and uniform basis in all the bituminous coal-producing states.

During the legislative session, bill introduced were hurriedly thrown together without regard for low and high-grade coals, necessary differentials and conditions in non-taxing states, which would have an advantage over Kentucky.

Governor Morrow is said to favor the drafting of a uniform bill that can be used in Kentucky and other states, to become effective in all the states of the central competitive field at the same time.

It has been suggested that a conference of the governors of the states of the central competitive field be held in midsummer, probably at Louisville, in order to discuss the plan. Noncommittal replies are said to have been received from Governor Lowden, of Illinois; Governor Cornwell, of West Vir-

ginia, and Governor Davis, of Virginia, all of whom favored the conference.

Governor Sproul, of Pennsylvania, stated that a tax on anthracite was held unconstitutional if bituminous coals were not included. Governor Cox, of Ohio, in his reply referred to action of the Legislature of his state in turning down such a bill. Governor Goodrich, of Indiana, said that Indiana could not act without other states coming in.

Governor Gardner, of Missouri, is reported as approving the plan, and referring to such a tax in Oklahoma. Governor Roberts, of Tennessee, feared that such a tax would be unconstitutional. Charles H. Brough, Governor of Arkansas, enthusiastically supported the plan.

If the conference is arranged, it is believed that all the governors will attend, and that the matter will be thrashed out. The movement is attracting much public attention.

## Northern Appalachian

### PITTSBURGH

*Heavy River Shipments—Rail Shipments Little Improved—Market Quiet.*

Railroad conditions, as affected by the strikes of switchmen, have not improved much. Most of the yards in the Pittsburgh district and for some distance west of here are tied up almost as badly as at any time, and it is still difficult to make coal shipments in normal manner.

Considerable coal is being moved, partly by increased use of the Monongahela River and also through the sending of through trains. The river shipments are chiefly to points in the immediate Pittsburgh district, and even the trainloads do not go far. There is some loading of cars that either remain on coal company sidings or move to railroad sidings not far from the mines.

Many mines are equipped for both rail and river shipment. Week before last coal shipments by mines that have river facilities only amounted to 24,000 tons, while mines having both rail and river facilities shipped about 80,000 tons by river. Including trainload coal and other loadings that may not have gone far, the total of loadings and actual shipments was about 30 per cent of the Pittsburgh district's normal.

The coal market in general is very quiet. The market is quotable, generally, at \$3.50@\$4 for contracts and \$4@\$4.50 for prompt lots, per net ton at mine, Pittsburgh district.

### CONNELLSVILLE

*Coke Yards Congested—Transportation Little Improved—Varied Byproduct Situation.*

Movement of Connellsville coke is somewhat improved, but is still only between 60 and 70 per cent of the rate obtaining prior to the rail strike. Little coke is moved through the regular channels. There is a heavy coke movement by water and also by solid trainload requiring little or no switching or yard service.

Railroad yards in and near the region are reported congested with loaded coke, and there are also piles at the hand-drawn ovens, but it being hardly feasible to pile coke at machine-drawing operations.

The byproduct ovens are having various experiences. The Cleveland plants are doing relatively little and those at Youngstown practically nothing. Lorain and Benwood are operating practically normal. In the immediate Pittsburgh district both the

byproduct and the beehive ovens are operating normal, their regular source of coal supply being by river.

The market is quiet, with sales possible only to a small fraction of the total number of consumers. Such sales are made at prices obtaining before the rail strike began—\$11@\$12 for furnace and \$12@\$13 for foundry, per net ton at ovens, Connellsville region.

Coke movement slightly improved, at 60 to 70 per cent of rate before rail strike. Byproduct ovens have various experiences.

### EASTERN OHIO

*Mines Returning to Normal—Lake Coal Begins to Move—Outlaw Strikers Reporting for Work.*

After the first few days of the weekly period ended April 24, mines in the northern Pan Handle of West Virginia and in eastern Ohio began to show signs of returning to normal. Striking yardmen on the Pennsylvania at Wheeling voted to return to work on April 20 and had reported for duty to some extent on the twenty-first.

Suspension of the coal movement through Holloway, caused by a strike of Baltimore & Ohio yardmen at that point, was ended when the strikers there returned to work by the middle of the week and Lake coal began to move. The Baltimore & Ohio reported a freight business 55 per cent of normal on the nineteenth and it was estimated that the freight runs of April 20 amounted to 75 per cent of normal.

Yardmen and brakemen on the Cleveland & Pittsburgh R.R. were obstinate about returning to work, and hence coal production was retarded in Ohio. Striking yardmen of the Wheeling & Lake Erie at Wheeling were the last to report for work, but trains of coal were beginning to be moved.

### FAIRMONT

*Little Commercial Coal Shipped—Assigned Cars Deprive Many Mines of Tonnage—Tidewater Embargo Lifted*

With the railroads in northern West Virginia working overtime in furnishing assigned cars and with cars extremely limited at best, comparatively little commercial coal was produced and shipped from various fields here during the week ended April 24. When the car shortage became most pronounced at the end of the week, operators were informed that there were only enough cars for railroad fuel, and mines not loading such fuel were compelled to go without cars.

While transportation conditions were somewhat improved in northern West Virginia fields, there had not been a full recovery from the effects of the rail strike. However, producers were able to consign coal to certain points closed during the previous week, as for instance to the Lakes via Holloway, but in general the movement of coal from the mines and yards was retarded.

The tidewater embargo as far as Curtis Bay was concerned was lifted. Owing to a congestion at the Brownsville, Pa., yards of the Monongahela R.R., it was several days before Monongahela and Morgantown & Wheeling mines were able to operate.

The car shortage was still making itself felt in the northern regions of the state throughout the week, the daily supply not averaging more than

600 cars for the Fairmont region, for instance. Owing to the fact that so little commercial coal was being produced, prices were advancing quite materially in the Fairmont and other northern West Virginia regions as the month drew to a close.

## Middle Appalachian

### POCAHONTAS AND TUG RIVER

*Little Coal Goes West—Heavy Eastern Tonnage—But Mines Work Only Day or So During Week—Car Supply 40 Per Cent for the Field.*

With yardmen and switchmen of the Norfolk & Western still on strike during the greater part of the week ended April 24 at Kenova, Ashland, Portsmouth and Columbus, western service on this road was still so greatly impaired that little coal from the Pocahontas, Tug River and Kenova-Thacker fields was being shipped westward. For the same reason no cars were being obtained from western points.

The only coal handled by the road to western points was that in solid trainloads not requiring any switching. Production was at a lower ebb than during the previous week. In many instances mines were unable to work more than a day or so during the entire week.

There was a heavy eastern movement of coal from Norfolk & Western mines, more especially to tidewater. Dumping was on such a large scale that most of the coal arriving was speedily unloaded.

Conditions in the Pocahontas field were similar to those during the previous week, production losses being sustained through seriously impaired transportation facilities. Few cars being supplied from the West and no shipments in that direction.

There continued to be quite a heavy demand for export coal and much of the product of the Pocahontas field was being so consigned. With a 40 per cent car supply many mines found it difficult to operate after the first day or so of the week. Had there not been a good many bottoms at tidewater, it is believed congestion would have been inevitable.

Production in the Tug River field was 68,000 tons for the week ended April 24, exceeding even the output for the week ended April 3. But idleness at many mines was the rule rather than the exception. Coal held at Portsmouth, during the yardmen's strike, had begun to be weighed and moved, but the movement westward was rather light in volume, and the bulk of the cars for the field was still coming from the East. Speculators were receiving no encouragement in endeavoring to secure a large tonnage in the field, with a view to increasing prices. Pools Nos. 41, 42 and 43, at the tidewater terminal of the Norfolk & Western, were embargoed on April 26. That affected the shipment of the lower grades of coal from this field.

### NEW RIVER

*Shortage of Cars—Heavy Demand at Tide and Many Vessels to Load—Big Prices Offered.*

The principal obstacle to large production in the New River field during the week ended April 24 was a shortage of cars. There was not more than a 40 per cent supply in that field, averaging the week as a whole, total production reaching only about 117,000 tons. While shipments of New River smokeless were not affected by an embargo, as was the case with high-volatile coal, nevertheless it was regarded as certain that such embargoes would indirectly affect the field inasmuch as equipment could not be released promptly.

There was an unusually heavy demand at tidewater for the New River product, with an ample number of vessels available for loading. Big prices offered by speculators, running as high as \$11 a ton at tidewater, were frowned upon by producers. No New River coal, or coke either for that matter, was shipped to western points owing to a continuance of the strike at Russell, Ky., and sub-normal transportation conditions existing elsewhere.

During the week ended April 24, in the Winding Gulf field, there was a 60 per cent car supply on the Virginian and a 40 per cent car supply on the Chesapeake & Ohio. There was quite a stiff demand for smokeless coal at tidewater. Operators believe that there will be no betterment in the car supply in the Winding Gulf field for several weeks.

The Virginian Ry. is furnishing the mines on its line with blueprints showing the dimensions of the road's new 120-ton car so that operators could make any necessary adjustments to their tipples in order to take care of the new type of gondola. One thousand have been purchased, delivery to be made starting July 1 at the rate of from 15 to 20 cars a day.

### KANAWHA

*Mines Close Due to Rail Strikes in the East and Congestion at Tide—Slides and Washouts Keep Down Production.*

Mines in the Kanawha district fared worse from a transportation standpoint than mines in the New River field, for several reasons. Not only was the car supply running shorter, but Kanawha mines were embargoed both east and west. The western outlets were closed, due to the failure of striking yardmen to return to work at Russell, Ky., while tidewater terminals were closed owing to a congestion growing out of the greatly increased shipments made during the previous week. In fact shipments were permitted only to inland points throughout the week.

With Kanawha & Michigan bridges washed out in Ohio, and with no cars obtainable from the East, all the mines on the north side of the Kanawha River in the Kanawha field were closed down,

only 65 cars being loaded during the entire week, a total of 3,250 tons.

On April 23 not a single ton of coal was loaded either on the Kanawha & Michigan or the Kanawha & West Virginia, a subsidiary. Production would have been light even had there been no washout, owing to the fact that rail conditions were not normal either at Columbus, Toledo or other points. Owing to numerous embargoes, of course, it was still impossible to begin Lake shipments.

According to many operators, the assigned-car evil was fast becoming intolerable. Instances were numerous where mines furnishing railroad fuel had as many as 40 and 45 assigned cars over and above their regular allotment even had empties left over—while other mines were forced to go without cars. This was affecting commercial coal mines because it was leading miners to desert commercial mines and seek work at railroad-fuel mines.

### LOGAN

*Bad Conditions in Logan Field—Car Shortage and Slides—Coal Goes to Inland East—Big Demand for Logan Coal.*

Conditions were worse in the Logan field from every standpoint than at any time in recent months, during the period ended April 24, with car-shortage losses approximating 275,000 tons. The total production was not over 120,000 tons for the week, a decrease of 35,000 tons as compared with the previous week.

There was an actual shortage of cars and at least twice during the weekly period; slides made it impossible to reach the mines with empties, the result being general idleness at most mines during the greater part of the period ended April 24.

With a strike still in force at Russell, Ky., and with other western markets closed, the only outlet for Logan fuel (aside from that supplied the railroads) was to inland East points, since all high-volatile shipments to tidewater via the Chesapeake & Ohio were prohibited under an embargo. With a large number of cars at tide still unloaded and with Eastern points only furnishing empties, it was not strange that cars were so scarce.

### NORTHEASTERN KENTUCKY

*Slight Gain in Output—But Mines Work Only One to Two Days a Week—Poor Showing for April—Spot Prices Unsatisfactory.*

Only 90,575 tons, or 33 per cent of full time capacity (276,670 tons), were produced in the northeast Kentucky field during the week ended April 24, that leaving a loss of 186,095 tons or 67 per cent; the car shortage being responsible for a loss of 64 per cent. There was a gain over the previous week of approximately 10,000 tons, all being at Chesapeake & Ohio mines.

due to the district's tidewater outlet at Charleston, S. C., and the running of solid trains from the district to points in the Middle West, eliminating switching, weighing and classifying at the Russell scales, where the switchmen still are on strike.

The situation at Louisville & Nashville mines was worse than it had been during the previous week, mines here working one full day during the week, with mines on the Chesapeake & Ohio working two days.

Production for the month, including April 24, had amounted to only about 400,000 tons, or 25 per cent less than for the same period in March, and with little prospect of the strike's conclusion. It was estimated that the month of April would show a falling off as compared with March of easily 200,000 tons. The total losses in production in April (barring the last week) had aggregated 575,000 tons, out of a total potential capacity of about 900,000 tons. This made the average working time until the twenty-fourth for the month 39 per cent. Production for the same period of 1919 had been 101,570 tons.

Prices quoted on spot shipments in the northeast Kentucky field did not reach anything like the level which might have been expected, although the previous disparity between export and domestic prices had been wiped out.

---

## Middle Western

---

### INDIANA

The mines in Indiana, the last week of April, were averaging between two and three days a week, the car shortage being responsible for losses of about 43 per cent of full time, labor trouble for 6 per cent and mine disability 6.3 per cent. The Terre Haute & Southeastern and the Southern railroads made the poorest showing on car supply, the Big Four and the Chicago & Eastern Illinois, among the larger railroads, furnishing the best supply. This was an improvement over the week ending April 17, when the mines averaged barely two days a week. Production increased from 276,000 to 369,600 tons for the week ending April 24.

The market continued strong, with spot prices averaging about 50c. above the old Government prices. The adjustments of some old contracts to cover the wage advance of April 1 have been as low as 30c. per ton, but in general \$2.85 mine-run f.o.b. mines represents the starting point for price quotations.

---

### DUQUOIN

Production of coal in Southern Illinois has been reduced practically to a minimum mainly on account of the continued strike of the switchmen in Chicago. Most mines through southern Illinois have now fallen below 20 per

cent of the average production, and no immediate prospect is in sight for a change even when the striking railroaders return to work. In the Franklin and Williamson county districts the percentage has been better, probably because these two counties are served with more roads than others. Coal officials have predicted that the mines will have trouble getting enough cars for capacity loading, far into the summer, owing to the congested conditions of the terminals.

A deal of importance was recently consummated in the purchase of two mines in Williamson County by the Big Ben Coal Co. The mines were owned by the Johnston City Coal Co., of Chicago. The Big Ben will add, by this purchase, 1,250,000 tons of coal annually to its already large production in southern Illinois. The new owners state that the main reason for purchasing these two large mines was due to the fact that the coal land purchased lay in such a position that the company could mine the coal from some of the original Old Ben mines, which otherwise could not have been easily reached.

The operators of the Hallidayboro mine, nine miles south of here, are rushing the work on the erection of the new steel tippie, which is to replace the large wooden one recently destroyed by fire. The mine is controlled by the Jackson Coal Co., of Chicago, and was said to be the largest producer in Jackson County. It is planned to have the mine in operation again within 60 days.

Drilling is being done in Jackson County, southwest of here, by the Big Muddy Coal & Iron Co., and it is expected that work will be started at once on the sinking of one or more mines in this district. The drillers found a seam about 4½ ft. thick and are drilling further to reach a lower seam said to be about 400 ft. deep. The company now owns three producing mines in the neighborhood and this new plant will make a large addition to the annual output of the concern. The mines will be served by the Illinois Central R.R., the Carbondale & Murphysboro Traction Co., and probably the Iron Mountain and the Mobile & Ohio railroad.

The large rescreening plant, which was built by the Rutledge & Taylor Coal Co. at its mine three miles south of this city, is about in running order. The plant was designed by the Link Belt Co., Chicago, and was started in January.

---

## Canada

---

The Lignite Utilization Board of Canada is expected to make important advances this year in the development of the Saskatchewan lignite coal fields and the furnishing of the people of the prairie provinces of the Dominion with cheaper and better fuel. One of its

definite objects is to place the briquetting business on a commercial basis. For the use of the board there has been appropriated the sum of \$400,000 by the Dominion, Manitoba and Saskatchewan governments. The former is to contribute one-half of the amount and the two latter one-quarter each.

Nanaimo, B. C.—Coal lands situated close to this town are being developed. A shaft is being sunk and it is expected that coal will be taken out in a short time. The new company has purchased the machinery of an old adjacent mine to use in its development operations.

There is a dispute as to the title to some 1,222 acres of Vancouver Island coal lands. This property at present is held by the Canadian Collieries, Ltd.

It originally belonged to the old Baynes Sound Coal Mining Co. and attained a considerable development. In 1904, when the Provincial Government reached an understanding with the Esquimalt & Nanaimo Ry. Co., by which coal rights within the island railway belt were secured for a number of old-time settlers, in return for which the railway company was granted further lands in the northeastern section of the island, operations had ceased at the Baynes Sound collieries.

The property of the Baynes Sound company came within the limits of the supplementary railway land grant. It was found, however, that the railway company did not obtain possession of the Baynes Sound holdings. However, certain other property, in the northeastern section, was staked out by the railway company, later transferred to the Wellington Colliery Co. and thence to the Canadian Collieries, Ltd.

Messrs. E. T., C. H. F. and E. A. Carew-Gibson and E. Priest contend that the railway company did not stake the land accurately, and that they are the only ones who complied fully with the law, following the lapse of the Baynes Sound Coal Co.'s leases. On this ground they are asking for possession. This demand being refused by the committee of the Legislative Assembly, the claimants assert that they will carry their case to the courts.

Huntington, W. Va.—Members of the Logan Operators' Association, at a meeting held in this city, went on record as being opposed to the assigned-car system on the present basis of distribution. The subject was raised by the decision of the Interstate Commerce Commission, announced on April 15. The matter was referred to the executive committee for further action.

Illinois and Wisconsin Retail Coal Dealers' Association will hold its annual convention Aug. 4 and 5 at Milwaukee, Wis. Secretary, I. L. Runyan, Chicago, Ill.

The Industrial Relations Association of America will hold its second annual convention at the Auditorium Theatre, Chicago, Ill., May 19, 20 and 21. Assistant Secretary, E. A. Shay, Orange, N. J.

# Mine and Company News

## ALABAMA

**Birmingham**—One battery of 60 ovens of the Sloss-Sheffield Steel & Iron Co.'s new \$6,000,000 byproduct plant at North Birmingham began operation recently. Construction of the new plant is nearing completion, and Vice President Hugh Morrow states that fires under the second battery will be started at an early date.

The plant has two batteries of 60 Semet-Solvay ovens each, with a coking capacity of 2,500 tons of raw coal every 24 hours. The coke will be used by the furnaces of the company and the breeze and screenings for boiler fuel. The tar produced will be marketed as a crude product at present. No tar-refining equipment has been installed and such refining is not contemplated during the initial operation of the plant.

Equipment for the ammonia distillates is being installed. The light oil will be refined and the products marketed.

Tests made of the coal which will be supplied to the plant indicate a 24-hr. production of the following byproducts: About 20,000 gal. crude tar; 60,000 pounds ammonium sulphate, or equivalent in liquor, 17,000 gal. light oil, or equivalent in fractionated products and 1,800 tons of coke. The products noted will result from the operation of the two blocks of ovens.

The fuel-gas surplus has not been accurately determined, as the boiler plant of 4,800 rated h.p. will consume a large amount. The boilers will furnish, in addition to the plant needs, steam for an electric-power station, distributing to the company's various mines, quarries and furnaces. It is estimated, however, that 7,000,000,000 cu.ft. of gas will be available every 24 hours for market purposes.

## ILLINOIS

**Carlinville**—Macoupin County coal records were broken when mine No. 2 of the Superior Coal Co. hoisted 5,382 tons of coal in eight hours. A total of 1,537 mine cars were required to get the fuel to the top and 107 railroad cars to haul it away.

**Chicago**—The Ayrshire Coal Co., of Oakland City, Ind., has placed a contract with The Krehbiel Co., of Chicago, for a new steel tippel to be equipped with Jacobsen horizontal screens and picking tables, for its new mine at Oakland City.

**Collinsville**—The office and engine rooms of mine No. 17 of the Con-

solidated Coal Co., about two miles northeast of here, were destroyed by fire, which made a total loss said to be between \$25,000 and \$30,000. No one was injured. Because of the switchmen's strike, the mine has cut down its force and only 15 men were at work when the fire was discovered. They reached the surface safely. At least two weeks will elapse before the machinery can be replaced and the plant put in working order again. Kingdon Gould, of New York, a son of George J. Gould, is president of the Consolidated company.

**Herrin**—A temporary wooden tippel is being erected at the Sunnyside mine, near here, in Williamson County, Ill., the tippel and washer having been destroyed by fire on April 11. President Warden, of Chicago, visited the mine recently and announced definite plans relative to rebuilding. The temporary structure will be replaced by a steel tippel as soon as materials and labor can be secured. It is likely that the washer will not be rebuilt, but a modern re-screening plant will be constructed instead. It is said the mine began hoisting coal May 1, thus giving employment to about 450 miners.

The Sunnyside mine of the Sunnyside Coal Co., at this place, lost the tippel and washery by fire on April 11. The hoist and boiler house were saved. The origin of the fire is supposed to be defective wiring, and the loss is estimated at \$100,000. Plans are being made to erect a modern steel tippel and the mine is expected to be working full time again within three months. A number of mines were closed down for a few days, in this section, on account of the drivers refusing to accept the raise in wages but all mines are now working again.

**Harrisburg**—According to reports, the Harco mine, near this place, in Williamson County, Ill., has recently closed a contract with the New York Central R.R., which calls for a shipment of 35 cars daily. The railroad company has agreed to furnish the cars. This means that the Harco shaft will be running steadily during the summer, when ordinarily two days a week is about the average running time.

**Springfield**—The Illinois Supreme Court has placed its stamp of approval on the use of connecting mines as escapements, in the case of R. R. Fowler, state's attorney of Williamson County, Ill., against the Johnson City & Big Muddy Coal Co. The decision reverses the Williamson County Cir-

cuit Court, which enjoined the company from using one of its mines as an escapement for a connecting mine. The objection to the escapement was made because it is more than two thousand feet from the hoisting shaft.

## INDIANA

**Clinton**—Vermilion Coal Co., operating a mine in the Clinton field, has leased 1,700 acres of fifth-seam coal land from the United States Steel Corporation, and will sink a mine southwest of Clinton, on the Chicago & Eastern Illinois R.R. switch. Bricks for the boiler house are here and steel and boilers are being shipped to the mine site. The steel corporation operates the Bunsen mines at Universal, and is retaining a large acreage of its own adjoining the leased tract.

## KENTUCKY

**Madisonville**—Equipment of the Sunlight Mining Co. of Hopkins County is being shipped from Birmingham, Ala., to this city which should enable the company to operate its mine within 90 days. Grading will commence at once and the construction of a tippel will also begin in a short time. The company will use its steam shovel for grading purposes and will also strip coal which lies near the surface. In places the coal is covered with only ten feet of earth, while at other points it is 60 ft. beneath the ground. The company will operate a drift mine after stripping the available coal. Both No. 11 and No. 12 seams of coal will be mined. J. S. Morrow, general manager, says that the company has 600 acres of mining rights situated on the Louisville & Nashville cut-off and the mine will be three miles southwest of this city.

**Smalley**—The Bucks Branch Coal Co. has recently increased its capitalization to \$100,000, to provide for general business expansion.

**Type**—The Mitchell-Willis Coal Co. is arranging plans for extensive improvements at its plant to provide for increased operations. It is proposed to open additional mines to provide increased output, and the company's plans call for the construction of about 25 houses for miners' service.

**Sergent**—The Acme By-Products Coal Co., Fleming, Ky., is understood to be arranging plans for the immediate construction of a new tippel at its local mining operations. Plans will also be made for the construction

of about 50 new dwellings to be used by miners.

### MARYLAND

**Cumberland**—To arrange for increased coal transportation over its system, the Morgantown & Kingwood R.R., a subsidiary organization of the Baltimore & Ohio R.R., has purchased a total of 1,000 additional coal cars from the Lehigh Valley R.R. Approximately 35 mining operations are conducted along the lines of the company, with production averaging about 100 to 125 loads of coal daily.

For the proposed development of extensive coal properties in the Meadow Creek district, contract has been awarded to Boxley Brothers, Huntington, W. Va., by the Greenbrier & Eastern Ry. Co., recently incorporated, for the construction of a new steam-operated railway, estimated to cost in excess of \$1,500,000 for initial work.

**Spruce Bridge**—The Consolidation Coal Co., Fairmont, W. Va., is understood to be arranging plans for the installation of machinery and equipment for the immediate development of a total of about 12,000 acres of coal lands in the vicinity of Spruce Bridge.

### NEW YORK

**New York**—On May 1 many of the occupants of the Washington Building, No. 1 Broadway, left this old building, which has been the headquarters of the coal industry for many years. The building is now the property of the International Mercantile Marine Co. and will be altered to meet its purposes. Some coal firms now located in the building have been provided with offices on other floors. These firms that recently removed to other quarters, in New York City, are the following:

Alden Coal Mining Co., Grand Central Inc. . . . .	Palace
American Coal Co. . . . .	111 Broadway
American Coal Exporting Co. . . . .	154 Nassau St.
Coaldale Mining Co. . . . .	350 Broadway
Emmons Coal Mining Co. . . . .	149 Broadway
Eyre Fuel Co. . . . .	80 Broadway
Frame, Friend & Stineman, Grand Central Inc. . . . .	Terminal

**New York**—W. A. Marshall & Co., of 22 Beaver St., this city, will hereafter have a Canadian organization to be known as W. A. Marshall & Co. of Canada, Ltd. The officers will be W. A. Marshall, president; Raymond Havemeyer, vice president; David L. Morrison, secretary-treasurer;

and R. R. Boon, managing director. The headquarters will be at 58 St. Francis Xavier St., Montreal. Mr. Boon is well known in Canadian coal circles and until recently was identified with the Canadian Import Co.

**Brooklyn**—Six long established coal companies in Brooklyn announced recently that they had completed a merger and henceforth will do business under the name of the Commonwealth Coal Co., Inc., with a capital of \$3,500,000. The combination, it was said, will save \$400,000 a year in overhead charges. Officers of the new concern are Richard J. Wulff, president; Rudolph Reimer, Jr., first vice president; Justin J. Rathjen, second vice president, and Walter H. Nelson, treasurer. Frank D. Tuttle is chairman of the board of directors. The firms participating in the merger are: John F. Schmadeke, Inc.; S. Tuttle Sons & Co.; Z. O. Nelson & Son; Rudolph Reimer; Jurgen Rathjen Co., and Harry Blinn Coal Co.

### OHIO

**Columbus**—The Queen Shoals Collieries Co., incorporated under Ohio laws recently for the purpose of developing a tract of 2,000 acres of coal lands at Queens Shoals, W. Va., will probably change to a West Virginia corporation before organizing. Clyde H. Hoyt, of the Clyde H. Hoyt Coal Co., of Toledo, is the moving factor in the enterprise. D. H. Armstrong, of Columbus, is also interested. The tract has an operating mine which will be enlarged to produce 1,000 tons daily. The product will be sold through the Clyde H. Hoyt Coal Co., of Toledo.

**Steubenville**—J. W. Blower, president; E. W. Blower, secretary; D. C. Thomas, vice-president, and E. M. Blower, all connected with the Panhandle Collieries Co., which is operating a large mine on the Pennsylvania R.R., near here, were on the property recently inspecting progress. The announcement is made that the mine, which will have a capacity of approximately 1,000 tons daily, will be opened by the middle of the summer. The mine is a shaft operation and will be modern in every respect.

### PENNSYLVANIA

**Pittsburgh**—C. B. Turner, and associates, are understood to have completed negotiations for the acquirement of a total of about 1,000 acres of coal properties located in the vicinity of Fairmont, W. Va., and plans are being arranged for immediate development of the field and the installation of machinery.

The Kresage Coal & Mining Co., a Delaware corporation, has recently increased its capital from \$1,000,000 to \$2,000,000 for general business expansion.

**Scranton**—It is stated that heavy damage has been caused by a fire raging in the upper seam workings of the

Continental mine of the Delaware, Lackawanna & Western Coal Co. on the West Scranton mountains. The company is maintaining a day and night fire-fighting force in its effort to conquer the fire. The first is said to have started several weeks ago, but is confined to a small area. At first the company officials tried to fight the flames with ordinary means, but, failing to make headway, they concluded to seal up this section of the workings and then flush with culm.

**Uniontown**—The sale is announced of 1,450 acres of virgin Pittsburgh coal land in Clay Township, Monongalia County, West Virginia. The price ranges from \$250 to \$300 an acre, the total consideration being approximately \$500,000. The coal lies up Dunkard Creek, and is pierced by the Morgantown & Wheeling R.R. The sale was made by E. D. Patterson, of Waynesburg, for the owners, to the Monongahela Development Co., a holding concern composed of Morgantown, W. Va., men. Identity of interests back of the purchase has not been disclosed, but this sale is understood to be a forerunner of other deals by large industrial concerns to insure adequate fuel supply for the future.

**Waynesburg**—Seven hundred dollars an acre was the price paid for 1,700 acres of coal lands in Cumberland Township, Greene County, according to a deed filed here. The land was sold by the Prospect Coal & Coke Co., of Uniontown, and others, to the Buckeye Coal Co.

Another, but smaller, tract of coal land has been purchased by the Greene Improvement Co., which recently completed a series of transactions involving large acreage in eastern and southern Greene County. In the latest deal 53 acres in Cumberland Township was purchased by the company from Mrs. Lucretia E. Garrettson, of Knexville, for \$26,760, or approximately \$500 an acre.

### VIRGINIA

**Lynchburg**—The Banner Fork Coal Co. has increased its capitalization from \$1,000,000 to \$1,200,000, to provide for general business expansion. S. D. Ferguson is president.

**Richmond**—The Richmond Collieries Co. has been incorporated with a capital of \$500,000 to engage in general coal mining operations in the Richmond district. William Job is president, and L. M. Johns, secretary.

### WEST VIRGINIA

**Cecil**—The Sterling Coal Company is understood to be arranging plans for the immediate rebuilding of the electric power plant and tippie at its local operation recently destroyed by fire with a loss estimated at about \$50,000.

**Charleston**—A material increase in the capital stock of the Carbon Fuel Co., of Cabin Creek, in the Kanawha field, has been decided upon and authorized by the Secretary of

State. From \$1,000,000, the capital stock has been increased to 1,250,000. J. R. Thomas, of this city, is the president of the company.

**Charleston, W. Va.**—The Stover Coal Co. has acquired the Brown Coal Co., with extensive holdings and operations at Nuttall in the New River field. The acquisition of the Brown company holdings, the purchase of new equipment and the construction of many new houses will involve an expenditure of about \$700,000 or \$800,000. The Stover Coal Co. has been organized with Holly Stover, of Chicago, president. He is also president of the Holly Stover Co., with headquarters in Chicago, the company operating in the Illinois field. Mr. Stover is also largely interested in the Stover Elkhorn Coal Co., operating in Kentucky, and in the Eclipse Pocahontas Coal Co., operating in the smokeless fields of West Virginia.

**Fairmont, W. Va.**—The Chesapeake Coal Co., with headquarters at Wheeling, W. Va., having recently materially increased its total capitalization, has entered the Marion County, W. Va., field. The Chesapeake company secured from the Fairmont & Monongahela Coal Co. 750 acres of Sewickley coal, on the waters of Buffalo Creek, near Barrackville in Marion County. The purchase price was reported to be about \$250,000. The company plans immediate development, contracts covering the sinking of two shafts having already been closed. T. H. Johnson, of Bellaire, is the president of the Chesapeake company, being also an eastern Ohio operator. The vice-president is J. A. Paisley and the secretary-treasurer, C. H. Eberts, of Wheeling, W. Va.

**Gilbert, W. Va.**—The Guyan Collieries Corporation recently organized with a capital of \$2,000,000, is arranging for the immediate development of about 11,000 acres of coal lands in the vicinity of Gilbert. It is understood that this property contains six workable coal seams.

**Logan, W. Va.**—Protest against the proposed rate increase in electric power applied for by the Kentucky & West Virginia Power Co. was made on April 21 by a delegation of 15 coal operators of the Logan field, headed by J. J. Ross, president of the Logan Operators' Association. The power company is asking for a 42 per cent increase, as well as a new form of con-

tract, both of which are opposed by the operators.

**Norwood, W. Va.**—The Peacock Coal Co., of Clarksburg, W. Va., which recently incorporated with a capital of \$150,000, has perfected its organization, with Olandus West, president; J. Horner Davis, vice-president; E. B. Templeman, secretary; and P. M. Robinson, treasurer. The company has completed negotiations for coal properties in the vicinity of Norwood, and is planning for the installation of machinery and for the development of the operation. Carl Hornor is general manager.

**Wheeling, W. Va.**—The Chesapeake Coal Co. has completed negotiations for the purchase of about 750 acres of the coal property holdings of the Monongah Coal Co. T. H. Johnson, Bellaire, Ohio, is president of the company, and C. H. Eberts, Wheeling, is secretary-treasurer. The company has already awarded a contract for the sinking of two shafts on the property in connection with proposed development plans.

#### WESTERN STATES

**Clarksville, Ark.**—The Nichols-King Coal Co. is understood to be having plans prepared for the sinking of an additional mine at its local operation, to provide for increased output. J. E. Nichols heads the company.

**Jefferson City, Mo.**—The Millbrook Coal Co., Exchange Bank Building, recently organized, is planning for the development of extensive coal properties in Moniteau County, Mo., recently acquired under lease. Machinery and equipment will be installed, while electrically operated apparatus will be utilized wherever possible. A. L. McCawley, of Jefferson City; W. P. Grishorn and Raymond A. Becker, both of Kansas City, head the new organization.

**St. Joseph, Mo.**—The Black Diamond Coal Co. has been incorporated with a capital of \$150,000 to engage in general coal-mining operations. The company has completed negotiations for the acquirement under lease of about 1,200 acres of coal properties in the vicinity of Mendota, Mo., and plans are now being arranged for immediate development. T. L. Greenleaf, P. A. Hilderbran, both of the St. Joseph, and W. S. Fleming, Kansas City, are the incorporators.

**Eagle Pass, Tex.**—The International Coal Mines Co. is having plans prepared for the installation of coal mining machinery and equipment for all features of operation in connection with the proposed development of about 2,880 acres in the Eagle Pass district. It is planned to have an initial capacity of about 250 tons daily. D. H. Echols is manager.

**Spokane, Wash.**—Four months after incorporation, the Harvard Coal Co., operating at Princeton, B. C., is ready to start shipments according to F. M. Goodwin, secretary-treasurer of the company, who has his headquarters in the Old National Bank Bldg. in this city. The company is planning extensive development work according to Mr. Goodwin.

**Roanoke Rapids, N. C.**—The Rosemary Mfg. Co. is planning for the installation of new coal-handling apparatus at its plant, in connection with other extensions and improvements. Arrangements for the entire work have been completed.

**Flint, Mich.**—Coal operations will be started here within a few weeks by the West Side Coal Co., composed of Cleveland and Chicago operators, who have taken over leases near the west end of the town, formerly held by the What Cheer Mining Co. This property includes a square mile of territory which is estimated to contain 4,000,000 tons of coal. The site of the plant is in Genesee County.

**Omaha, Neb.**—It was announced recently that orders have been placed for 2,000 steel coal cars for summer delivery to the Union Pacific R.R. They will cost more than \$2,000,000.

**Auburn, N. Y.**—The Columbian Rope Co., of this place, manufactures hemp rope of various sizes, and to make it more difficult for others to counterfeit, a paper ribbon is inserted in one of the strands during manufacture. On this ribbon is stamped the name of the manufacturer, the address and the date of the patent. The advantages of this method of protection are obvious. A trade mark placed on the outside of the rope readily could be counterfeited by others. But a strand woven into the rope, at the time of its manufacture, or as in this case a ribbon of distinctive type, adds security.

## Coming Meetings

The Rocky Mountain Coal Mining Institute will hold its annual meeting in Denver, Col., in conjunction with the National First Aid Meet. on Aug. 20 and 21. Secretary, F. W. Whiteside, Denver, Col.

M. O. I. Coal Association will hold its annual convention June 16, 17 and 18 at Cedar Point, Ohio. Secretary, B. F. Nigh, Columbus, Ohio.

National Retail Coal Merchants' Association will hold its annual meeting June 10, White Sulphur Springs, W. Va. Secretary-manager, Ellery Gordon, Philadelphia, Pa.

Kentucky Mining Institute will hold its annual meeting June 4 and 5 at Lexington,

Ky. Secretary, C. W. Strickland, Huntington, W. Va.

American Society of Mechanical Engineers will hold its spring meeting May 24, 25, 26 and 27 at St. Louis, Mo. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

West Virginia Coal Mining Institute will hold its annual meeting June 7 and 8, at White Sulphur Springs, W. Va. Secretary, R. E. Sherwood, Charleston, W. Va.

American Wholesale Coal Association will hold its annual meeting June 1 and 2 at Pittsburgh, Pa. Secretary, G. H. Merryweather, Washington, D. C.

The Colorado Retail Coal Dealers' Association will hold its annual meeting June 8, at Colorado Springs, Col. Secretary, E. Hopper, Denver, Col.

West Virginia Freeport Coal Operators' Association will hold its annual meeting June 3 at Kingwood, W. Va. Secretary, A. T. Carnahan, Akron, Ohio.

International Railway Fuel Association will hold its annual meeting May 24, 25, 26 and 27 at the Hotel Sherman, Chicago, Ill. Secretary, J. G. Crawford, Chicago, Ill.

American Institute of Electrical Engineers will hold its annual convention at Sulphur Springs, W. Va., June 29 to July 2. Secretary, F. L. Hutchinson, New York, N. Y.

National Coal Association will hold its annual meeting May 25, 26 and 27 at the Traymore Hotel, Atlantic City, N. J. Secretary, W. B. Reed, Commercial Bank Building, Washington, D. C.

The American Association of Engineers will hold its annual convention at the Planters Hotel, St. Louis, Mo., May 10 and 11. C. E. Drayer, secretary, Chicago, Ill.

## Obituary

George Strehel for many years superintendent of mining properties, in Belleville, Ill., and Edwardsville, Ill., died recently at Springfield, Ill., following a stroke of paralysis. He was 67 years old and a native of Switzerland. He is survived by his wife and five daughters.

William A. Hunt, assistant superintendent of the Pursglove mine, of the Pursglove Maher Coal Co., at Stewartsville, Ohio, was accidentally electrocuted by coming in contact with a 66,000-volt current. He was handling a switch at the entrance of the mine at the time of the accident. Mr. Hunt was 29 years of age and had been with the Pursglove Maher Co. for the last ten years.

I. W. Seamans, a prominent Fayette County, Pa., coal and coke operator, died recently at his home in Uniontown, Pa., following an illness which has its origin two years ago. Mr. Seamans never regained his health following an operation in Philadelphia, in August, 1917. At one time he was a power in the coal and coke development in the Connellsville region, being identified with a number of operations. Mr. Seamans was associated with J. V. Thompson at one time in some of his big deals. His widow and five children survive him.

William A. Hunt, superintendent of the Pursglove mines at Stewartsville, Ohio, was instantly killed on April 7 while attempting to adjust a high-tension switch at the entrance to a mine, 66,000 volts electrocuting him. Mr. Hunt was quite well known in mining circles throughout eastern Ohio. He was in his twenty-ninth year and had been closely identified with the Stewartsville operation for several years, being a relative of the owners of the plant. He leaves a wife and two brothers and two sisters.

Harry Haskell Small, sales manager of the Goodman Manufacturing Co., Chicago, died April 4, of heart failure, after quite a brief illness. He was born Oct. 7, 1862, at Portland, Me., and received his theoretical training at Worcester Polytechnic Institute. After connection with other industries he came to the Goodman Manufacturing Co. in 1901, as manager of the contract department, and the following year he was made sales manager. It is said that the efficiency of the Goodman Co.'s sales department is due in great measure to Mr. Small's forcefulness, his methodical attention to business, his judgment in commercial matters and his intimate knowledge of mining machinery manufacture and use. He had a wide acquaintance throughout the mining industry.

James H. McClelland, aged 60, died of blood poisoning at his home in Brazil, Ind., following a recent operation. He was one of the pioneer operators in the Brazil block coal field and for many years was head of the Brazil Block Coal Co., which at one time was the largest producer of coal in Indiana. After the exhaustion of the Brazil mine he operated bituminous mines at West Terre Haute and recently purchased a large holding south of that city. Mr. McClelland was on many committees for the settlement of differences between miners and operators and represented the block coal fields in many national conventions. He was interested in the Citizens National Bank of Brazil, the Central Iron & Steel Co., and several industries. Mr. McClelland was chairman of the United War Work campaign which raised more than \$35,000 in Clay County, Ind.

## Personals

John Lloyd, efficiency engineer of the Lehigh Valley Coal Co., has resigned to take the position of local manager of the Perollin Co. of America.

S. W. Inns, of Philadelphia, Pa., has been appointed sales manager for Devoe & Kuhn Coal & Coke Co., to succeed E. G. Ridgeway, resigned.

David Fleming, formerly general manager of the mines of the Ebensburg Coal Co., at Colver, Cambria County, Pa., has resigned his position and will take up his residence at Greensburg.

L. C. Thomas has resigned his position in charge of the St. Louis office of the Hockett Coal Co. to accept service in fuel conservation with the Missouri Pacific R. R. He is succeeded by M. D. Joyce.

F. W. Holderman, formerly assistant division engineer of the Hazleton division (Luzerne County, Pa.) of the Lehigh Valley Coal Co., has been appointed division engineer of the Lehigh division of the same company, in place of G. R. Wood, promoted.

James S. Burgess, who was formerly division engineer of the Snowshoe division (Center County, Pa.) of the Lehigh Valley Coal Co., has resigned to accept the position of superintendent of the Evans Colliery Co., at Beaver Meadow, Carbon County, Pa.

L. A. S. Wood, prominent in illumination engineering circles both in this country and in Europe, has been made manager of the illuminating section of the supply department of the Westinghouse Electric & Manufacturing Co., with headquarters

Paul Jocelet, for many years sales manager of the Berry-Bergs Coal Co., of St. Louis, has resigned to go with the Union Fuel & Ice Co.

N. F. Lefavor has been appointed Southwestern Sales Agent for the Illinois & Indiana Coal Corporation, succeeding F. M. Johnson, who goes with the St. Louis Coke & Chemical Co.

L. G. McCarty, of Solvay Collieries Co., Hemphill, W. Va., has accepted a position as superintendent with the J. C. Sullivan interests, at their Bartlett's Creek Plant, Wyoming County, near Mullins, W. Va., effective April 16.

W. L. Luce, formerly general manager of the mines of the Ellsworth Collieries Co., at Ellsworth, Washington County, Pa., has resigned his position. Mr. Luce was recently tendered a farewell banquet by officials of the company at Ellsworth.

H. I. Smith, formerly assistant general superintendent of the Vandalia Coal Co., of Sullivan, Ind., is now with the American Mining Commission at Belgrade, Serbia, where an investigation is being conducted to determine the possibilities of coal mining in the Balkan States.

W. A. Luce, of Sewickley, Pa., recently resigned as general superintendent of the Ellsworth Collieries Co., a subsidiary of the Lackawanna Steel Co., a position which he has filled for several years. His resignation becomes effective May 1. The operations consist of several large well-equipped mines on the Ellsworth branch of the Monongahela division of the Pennsylvania R.R.

M. A. Buehler, formerly sales manager of the Western Electric Co. at its Omaha house, has been made sales manager at the Minneapolis office. Mr. Buehler joined the Western Electric Co.'s organization in the early part of 1915 and became sales manager at Omaha during the fall of 1917.

Eliot Lum has been promoted to the position of sales manager at the Omaha office of the Western Electric Co., to succeed Mr. Buehler. Mr. Lum entered the employ of the Western Electric Co. as a student in the educational courses in 1905, directly after his graduation from college. In 1907 he became a member of the telephone engineering department at Chicago, and in 1909 was transferred to the sales department of the Minneapolis house, joining the Omaha organization in the same capacity in the winter of 1912.

Edward L. Haas, who has been employed by the Union Collieries Coal Co., at Penton, Pa., as coal inspector, has been promoted to the position of safety inspector with the same company, over its five mines and will hold both positions for the present. Mr. Haas is president of the Renton Athletic Association and takes an active interest in community welfare work. He was formerly employed by the Equitable Coke Co., at its Harwick mine as assistant mine foreman.

P. A. Coen, formerly vice president of the Sunday Creek Coal Co., has been made vice president of the Philadelphia & Cleveland Coal Co., of Cleveland, which has opened an office at Columbus, Ohio. The Cleveland Company is now one of the important factors in the coal business in Ohio. In addition to the Columbus office the company maintains a branch in Wheeling, W. Va. Mr. Coen will spend his time between the Columbus and Cleveland office and in the field, and will specialize on Hocking coals.

James Dalrymple, state coal mine inspector of Colorado, recently won a decision in the Supreme Court sustaining his right to an increase of \$400 a year in salary, allowed by the last legislature. State Auditor Strong had refused to issue a warrant covering the raise on the ground that the inspector's salary, under the constitution could neither be raised nor lowered during his term of office. Mr. Dalrymple contended that the constitutional bar was removed when his office was brought under civil service.

Arthur F. Martin, auditor for more than 12 years for the Davis Colliery Co. and the West Virginia Coal & Coke Co., Elkins, W. Va., and associated with the W. H. Green Coal Co. as sales manager since Jan. 1, 1920, has resigned the latter position to become associated with the Boone County Coal Corporation, at Sharples, W. Va., as auditor. Harry B. Martin, his brother, will be his successor.

C. H. Nesbitt, chief mine inspector for Alabama, has been re-appointed for another term by Governor Kilby. Mr. Nesbitt has had supervision over the coal mines, in the capacity of chief inspector, for a number of years, having served under three state administrations. Prior to his initial appointment he was connected with some of the larger coal-mining companies in an engineering capacity, and is well posted on mining conditions and problems in this field. J. B. Corlin has been appointed an assistant inspector to succeed Hugh Lynch, who resigned some weeks ago.

Joseph G. Bradley, president of the Elk River Coal & Lumber Co., has been elected president of the Gauley Coal Land Co., to succeed the late Colonel Higginson, of Boston. The Gauley company owns what is said to be one of the largest, if not the largest, acreages of coal and timber in West Virginia, much of the company's holdings in Greenbrier County having been leased within the last year or so. Mr. Bradley, new president of this company, is a director of the National Coal Association and president of the West Virginia Coal Association. He is also a trustee of the Cameron estate and of the Bradley estate.

Eugene McAuliffe, president and general manager of the Union Colliery Co., in an address before the St. Louis Railway Club, advocated coal storage during the low-consumption season. His subject was "The Bituminous Coal Industry and the Public." "During the period of low consumption," he said, "the excess coal should go into storage, and from this storage should be taken the monthly deficit occasioned by the season of high consumption. With a duty due to the thousands, who from force of circumstances cannot store coal during the summer season, the working class in particular, the operators and dealers should unite in their efforts to provide the proper storage for the coal, which becomes so essential during the long and especially hard winter."

Carl Scholz, a well known Chicago mining engineer, made his first trip by airplane from Charleston to Wyoming, both in W. Va., where he is superintending the opening of large coal mines. The trip did not result disastrously, nevertheless he did not make it unscathed, since when near his destination Mr. Scholz and his pilot were forced to land and the machine in which they were riding struck the branch of a tree in a ravine. Mr. Scholz had chosen the aircraft as solving the problem of getting to the Wyoming mines without the loss of a day's time on the railroad and succeeded in interesting other operators in the project. Where it formerly took him a day to reach the property the aircraft made the trip in 40 minutes. While Mr. Scholz sustained a number of cuts and bruises when the airship was forced to land, he has not abandoned his plan of using the air route as a quick way of getting to and from the operation in which he is interested.

O. C. Straight and Fred B. McClure, civil and mining engineers, successors to the Fairmont Engineering Co., have opened offices in the American Building, Fairmont, W. Va. This firm is equipped to do all kinds of engineering, both members of the firm having had considerable experience in the examination and making of reports on coal properties, in constructing mining plants and in building highways. Messrs. Straight and McClure bought out the Fairmont Engineering Co. March 20, and are now doing the engineering work for about 20 coal mining companies. O. C. Straight has had ten years' experience in mining engineering. He was with the Hope Gas Co. for three years. He has located many wells in West Virginia and in Pennsylvania. For two years he was assistant chief engineer of the Bethlehem Coal Co. His experience in highway construction consists of eighteen months' work in France with the A. E. F. For a time he was connected with the Fairmont Engineering Co.

Fred B. McClure has had four years' experience in mining engineering, during which time he was in charge of the mining operations (as engineer) of the Fairmont & Lowesville Coal Co. He engineered the construction and installation of the new plant of the company. He was also connected with the Fairmont Engineering Co. at South Bend, Ind.

# COAL AGE

The Weekly Journal of the Coal and Coke Industries

Volume 17

NEW YORK, THURSDAY, MAY 13, 1920

Number 20

## *The Vanishing Point*

PROFIT can be taken from a business in such a degree that it affords to the operator a maximum benefit without upsetting price levels generally. A few of the larger coal companies have deliberately set their prices at a point that will render them a maximum net profit for the year with a minimum payment of Federal taxes. If all coal companies would follow the same practice the income of the Government would be seriously decreased and Congress forced to adopt other and better avenues of taxation than the present excess profit system.

Taking all the market will bear under present conditions nets the producer little but ill-will on the part of the consumer and piles up the storm of wrath to come, for beyond a certain point taxes take the bulk of the receipts. Figure it out for yourself and put a stop order on the price.

## *Educate the Public with Facts*

THE National Coal Association has recently entered upon a program of publicity that contemplates the organization of speakers' bureaus in the local associations and widespread publicity by word of mouth and through the press. The new work of the national association along these lines is described as an effort to lay a ground work for the character of public declaration that will tell exactly what the problems of the industry are and in doing so form the basis for a better understanding on the part of the public. We are told that to do this "the public must be taken into the operator's confidence and be frankly and unhesitatingly told the operator's viewpoint." A very laudable program and one in the furtherance of which the coal trade press will gladly assist. But it is not sufficient to tell the public the viewpoint of the operator—tell the operator the viewpoint of the public if you would win public approval.

Accept first the fact that the public is now interested first in price—price of mine labor and of coal—and after that in profit, both of labor and operator. Get the facts and lay them before the public. The industry today, as an industry, is without the assembled information to properly convince the skeptical, and such data as are available are closely held.

If the producers of half the bituminous coal in the United States, the members of the national association, really desire to let the public in on the condition of their business, and we believe they have nothing to lose by so doing and nothing to hide, let them assemble the facts and give them to the public. We can do no better than quote a paragraph from the address of Dr. Garfield a year ago to the operators assembled in Chicago at the second annual meeting of the National Coal Association:

"Now, the public has much to learn. The public is

waiting to be informed concerning many of these vital questions which are pressing upon you and upon the officers of the government. The public is ready to pay for what it ought to pay for. But the public demands the right to know whether what is being charged is just or not. You and I haven't any right to ask that they close their eyes and pay. Just as it is important for you to know the cost of production so it is important, if not imperative, that the public know what the cost of consumption is. In other words, gentlemen, they have a right to know in a general way, at any rate, what profits you are making, whether excessive or not."

## *Apply the Golden Rule*

LABOR gets an increase, costs of production go up, L profits figured on the percentage basis are added on, the cost of commodities and of living mount and labor demands another increase, in the ordinary everyday routine of today. Each, labor and producer, blames the other. Everyone is the innocent bystander now and the loudest protests and most radical statements are coming from the supposedly staunch element of our people—bankers, who have to pay thirty cents for a collar; lawyers and doctors, who are asked fifteen dollars for a pair of shoes.

If the buying public were but organized we would today witness a strike of far greater moment than any heretofore—a strike of buyers of the ordinary conveniences of life. Far-sighted leaders in business today point the way to start the line of prices downward without a wreck. Let every seller reduce his profit to the vanishing point or lower, taking a loss if necessary for a time. Thus the first step in the "Do unto others" policy would lead to the next, for our faith in the common honesty and fair mindedness of American labor is such that we believe that the coal operator once having proven good faith by lowering prices and profits, could ask and would receive concessions in wages from his employees.

## *Cottrell Director of Mines*

MINING men will be pleased at the selection by the Secretary of the Interior of Dr. F. G. Cottrell as the new director of the Bureau of Mines. Although not a mining man by training or experience, Dr. Cottrell is a thoroughgoing scientist, a man of broad thought and very human sympathies.

Under his direction the bureau will find new inspiration for scientific research and the mining industries a new technical leader. The Bureau of Mines may be considered to have passed through the promotional stage and now, firmly established with the mining public and under the impetus of new leadership, to be entering upon a period of greater opportunity and usefulness.

### *Action Begins on the Indictments*

NO SURPRISE was occasioned by the action of the defendants in the Indianapolis indictments when they last week filed bills in the various States in which they reside, asking that the Attorney General and various and sundry other legal lights of the Government be enjoined from putting them on trial before Judge Anderson.

The defendants are first of all interested in keeping out of Federal jails, and the indictment of last March was a trap for the unwary. It is understood to be the opinion of some counsel that should those indicted appear before Judge Anderson, and should a single overt act by any one of the accused be proven, all would be liable, so broad and hazy is the indictment.

Of course, what both operators and miners desire is to separate the charges and have each accused told what he is accused of having done, in order that he may proceed to defend himself. Perhaps the present proceeding will force the Government to come out in the open and most certainly will give us a new set of interpretations of the validity of the Lever Act.

### *Boiler Room as the Manager's After-Thought*

IN the boiler rooms of too many of our coal mines the fact is clearly attested that the real business of the coal industry is not running a power plant but operating a coal mine. There is no need to ask if the man at the head of the whole operation is a mechanical engineer. It is evident he is not or he would not have stood so long by the locomotive boiler and hand firing and resisted so determinedly the pleading of his mechanical engineers for equipment better calculated to give results and save fuel. He would have known that the only kind of coal to use under an old-style boiler with the old-style grate is the expensive lump and nut fuel that was used when old-style boilers and grates had their day.

He should remember—none more readily—that in the early years of coal mining slack was not sold but shoveled to one side. Coal was picked up with forks and the slack was left in the mines, or if brought to the surfaces was piled outside in the tippie yard. No one could afford to use slack with the old type of grate, for it wouldn't raise steam and went through the grate openings to be wheeled to a dump, where to the despair and chagrin of the whole neighborhood it usually completed its combustion and filled the air with the aroma of sulphur fumes.

It was only when automatic stokers were introduced that slack became salable. At first it barely paid freight, then it began to pay a part of the mining cost and finally in a few isolated cases in times of shortage it sold a little higher than lump because the large coal had to be crushed and appliances for that purpose were not available.

It may be said and thought that slack having become of value, Why not go on using lump or nut in the field? It has been done before when these sizes were expensive or exclusively salable; why not go on doing it now that the smaller sizes are marketable at a more reasonable figure? Why make a change now when the argument for change is a little weaker rather than a little stronger than before?

The answer is this: The difference in price between

slack and larger sizes still warrants the greater use of slack; dirty coal can be used on the newer-style grates and cannot be burned on older types; good grates save coal while others only waste it. The argument is strong enough to eliminate the need for any hesitation. The only reason why such a change does not come quicker is because the mining man sees all his problems from the working face of his mines. He rarely looks in the boiler room unless a flue is leaking or a grate, a fire door or an arch has fallen. Any boiler is good enough for him, for he doesn't understand the steam-making business.

More and more is coal sold on specifications. Quality is taking the place of quantity as the great desideratum. The only way to provide all the quality of which a coal is capable to cast out all the inferior material and to do this in the most liberal manner. Where the choice is between the market or the rock dump, care in selection must be exercised, but where the choice is between one's own boiler plant and the boiler plant of the customer the coal operator can afford to eliminate much coal that is merely dubious. At times he may even have to add some clean slack to the waste. Only a picking table and a mechanical stoker at the mine can give the essential letters of introduction for any coal that seeks admission to the best type of boiler installation in a distant city.

The time is coming when the boiler room will cease to be the manager's after-thought or his bad guess. The mining engineer, regular or consultant, will not have anything to do with its design or construction. The mechanical engineer will be left untrammelled in its planning and his mining *confrère* will then cease to be troubled with the high cost of steam raising or with the difficulties arising from frequent boiler breakdowns.

### *Look Far Afield*

NOTHING does more to develop industry than the disadvantages under which some portions of it labor. Out of the perplexities of certain regions come developments that more favored localities might never discover and initiate.

Thus we look to the Pacific Coast for progress in the pulverization of coal, its distribution and use and to Brazil to gain information as to the use of that product by railroads. To California we may direct our attention, for its low-grade fuel and the needs of the war have made experiments in pulverization profitable.

Briquetting may possibly make its largest progress away from the coal regions, notably in Ontario. The advances made will, however, soon react on the coal field, which, it is true, has long had quite a few briquetting plants. The Dakotas are going to show us something about carbonizing and briquetting low-grade coals, and Saskatchewan will soon indicate ways in which the work may be done. In those sections only lignites are now being, or are to be, beneficiated, but the work will undoubtedly add to the methods already tried and available in the treatment of low- and high-volatile bituminous coals.

Many are the problems bearing on operation in normal coal fields, but they find their first and most phenomenally successful solution where difficulties are greatest. Proved there, they gradually spread to mines that are more normal. The far-afield becomes close up as the year pass by.

# Representative Garland Is House Authority On Mining Affairs\*

As Chairman of the Committee on Mines and Mining Pennsylvania Representative at Large Has Made a Close Study of Mineral Production—Was at One Time Vice-President of Federation of Labor

BY PAUL WOOTON

WHEN Mahlon M. Garland, now Representative at large from Pennsylvania and chairman of the Committee on Mines and Mining of the House of Representatives, was a younger man an incident occurred at the collar of the shaft of a Pennsylvania coal mine which has since stood him in good stead in analyzing political and legislative propaganda. At that particular mine it was customary to keep the mules underground all the time unless it became necessary to shut down the mine for a considerable period. Such a shutdown having become necessary, the mules were brought to the surface after they had been underground many months. He saw them brought to the surface with their eyes carefully bandaged, and noted the safeguards taken to prevent their too sudden exposure to the light of day.

For weeks thereafter these mules revelled in a pasture. Then it came time to start working the mine again, and the mules were led up to the cage pre-

paratory to being lowered for another long sojourn underground. They were keenly conscious of the fact that they were about to be returned to surroundings less to their liking, showing all the obstinate determination for which they are noted, and declined to be led or driven onto the cage. Every expedient tried was unsuccessful until the foreman conceived the idea of leading a blind mule onto the cage first. Despite the disposition they had previously shown, the mules, like sheep, followed their superannuated companion onto the cage, and soon were at their old task of providing traction in the darkness of the workings.

This incident was regarded by Mr. Garland as typical of human conduct in many instances. Despite the good sense of individuals, they frequently defeat their own desires for betterment through following improper leadership. In his long experience in adjusting differences between employers and employees, and during his career as a politician and statesman, Mr. Garland has found frequent use for the story of the mules as an illustration of the consequences of blind leadership.

Through his life-long association with the coal industry Mr. Garland has followed closely developments in other lines of mineral production. He has given much attention to mining legislation and has just conducted a thorough investigation of the war-minerals situation. He is particularly interested in the relationships between capital and labor in the mining industry. Mr. Garland formerly worked as a laborer in iron and steel mills and has been prominently connected with the union labor movement. He at one time was the president of the Amalgamated Association of Iron, Steel and Tin Workers, and served two terms as vice-president of the American Federation of Labor.

As a labor leader who also enjoyed the confidence of employers he has frequently been called upon to advise labor and capital in industrial troubles. During the anthracite strike Mr. Garland took an important part, and was selected by John Mitchell as labor's member of the arbitration commission, which, however, did not function, as an agreement was reached without referring the matter to an arbitration board.

Mr. Garland was born in Pittsburgh in 1856. After twenty years' work as a laborer in the steel mills he embarked in politics, and served for many years as Collector of Customs at Pittsburgh. He has served as a member of the City Council of Pittsburgh and as a member of the School Board. He has been prominent also in the affairs of the Loyal Order of Moose.

As chairman of the House Committee on Mines and Mining, Mr. Garland is confronted with a variety of legislation which has an important bearing on mining affairs.

# Mine Layout Arranged for Large Tonnage and Minimum Handling Cost

While Not a Deep Seam, Care Has Been Taken to Leave Adequate Side Pillars on All Headings and a Large Area of Coal Round the Shafts, Both of Which Are To Be Used for Hoisting—A Natural Grade of 1.5 Per Cent Facilitates Caging

BY JAMES R. ELLIOTT  
Pittsburgh, Pa.

ONE OF the most important points in the transportation system of any mine is the shaft bottom. No matter what the facilities for handling coal on the surface or how elaborate the arrangements for dispatching the trips within the mine may be, ease and efficiency of operation at these points go for naught if the coal moves slowly at the foot of the shaft. The loaded and empty cars as they enter and leave the cages must be handled quickly and effectually.

The method by which the coal is to be developed exerts a strong influence upon the bottom layout. Furthermore the lay of the bed must be considered, as well as the general dimensions of the tract to be mined. Sometimes much advantage may be taken of the natural dip of the coal. At the Mather Collieries,<sup>1</sup> located at Mather, near Jefferson, in Greene County, Pennsylvania, can be found a bottom layout that is highly effective and yet notable for the absence of machinery. This plant is served by a branch of the Chartiers Southern R.R. which runs along the south branch of Ten Mile Creek, and connects with the Monongahela division of the Pennsylvania R.R. at Millsboro, Pa.

The company owns about four thousand five hundred

acres of the Pittsburgh bed of coal, which averages from 6 ft. to 6 ft. 9 in. in thickness throughout the tract. Overlying the coal is a drawslate about 1 ft. in thickness. The plant is situated in the southeast central part of the field and near the lowest elevation of the bed. Two concrete-lined shafts have been sunk to the coal, which lies at this point about 350 ft. below the surface. These shafts are 850 ft. apart. Both shafts eventually will be utilized for hoisting the coal, although at present the whole output is removed through the No. 1 shaft. Shaft No. 2 is employed for hoisting men and materials. The fan which normally exhausts air from the mine is situated at the No. 2 shaft. The direction of the air currents is shown in Fig. 2.

The map, which covers only a small portion of the property, was prepared as a projection for the current year's operation and shows in detail the method of mining. The landings for loads above each shaft are double tracked for a distance of 1,000 ft. and will ultimately be extended the same distance below for the empties. The grade is in favor of the loads, averaging 1.5 per cent and over, so that the handling of cars is entirely by gravity. This has been made possible by sinking the shaft square with the general dip of the bed, thus utilizing to a large degree a natural grade.

<sup>1</sup>The surface plant of this operation was fully described in Vol. 16, pp. 783-786.

FIG. 1. PLAN OF PART OF THE MATHER MINE SHOWING METHOD OF PROVIDING FOR LARGE TONNAGE WITHOUT CONFLICT OF TRANSPORTATION UNITS

Self-dumping cages are employed. After leaving the cage the empty cars drop by gravity to a double-tracked landing below the shafts. Thence they may be made up into trips and hauled away by locomotives over empty tracks located on either side of the loaded-car landing and 40 ft. distant from it.

All main entries in the mine have been laid out on 50-ft. centers, one heading for the loads and one for the empties paralleling it. Manways have been provided and outside entries are used for the return air. It is the intention to bring the tonnage through shaft No. 1 up to 4,000 tons in eight hours, and in order to facilitate underground transportation it was deemed advisable to provide ample empty and load trackage.

The concentrated panel system of development has been adopted, the lengths between face entries being about 1,200 ft., with 300-ft. rooms. These chambers are driven on 100-ft. centers with breakthroughs every ninety feet. The shaded portion of the map indicates where it is intended to commence drawing the rib section.

The coal is cut with Jeffrey shortwall machines and the loaded cars are gathered at the main entries by storage-battery locomotives. From this point the trips are hauled to the shaft bottom by trolley locomotives. At the present time six 6-ton storage-battery machines and one 13-ton trolley locomotive are in use.

Sixty-pound rail is used on the landings; 40-lb. on all haulage entries and 20-lb. sections in the rooms.

Fig. 3 shows the shaft bottom and landings at the No. 1 shaft; the arrangement at the No. 2 shaft is an exact duplicate. The track gage is 44 in. while cars of 2½-ton capacity are used. This illustration is practically self-explanatory, showing in detail the type of construction around the bottom as well as the arrangement of the tracks better than any descriptive matter

FIG. 2. LAYOUT OF SHAFT BOTTOM  
With such large pillars and a seam only 350 ft. deep no movement of any kind should trouble the shafts

that could be written. The plant at Mather was designed by Baton & Elliott, of Pittsburgh, Pa., who also supervised its construction.

FIG. 3. DETAILS OF THE SHAFT BOTTOM AND TRACKAGE LAYOUT

Convenience and capacity characterizes this gravity-operated bottom layout. Steel timbering and concrete provide for the permanency of the installation. Few, if any, mine problems exceed in importance that of the layout of the landing of a shaft.

# What Belt Should Be Selected and What Treatment It Should Receive

Belting Should Be Fitted to the Conditions Existing, Though a Lengthening of Pulley Centers, an Increase in Pulley Width and Other Changes May Lessen Wear—Improper Lacing May Cause an Otherwise Good and Suitable Belt to Fail

By E. K. BLACK  
Akron, Ohio

**T**RANSMISSION belts, like delicate machinery, must be given proper care if the user expects them to render adequate service. This is such a self-evident truism that it seems hardly worth repeating and yet it is frequently overlooked. Belts that should be good for years of continued service are in many cases subjected to abuses which soon render them useless. The manufacturer often is blamed for having put out a defective product when in reality the belt itself was faultless.

Unjustified claims for adjustments on injured belts are made frequently by disgruntled users. Every manufacturer can cite dozens of such cases. The Diamond Rubber Co., for instance, recently was asked to make an adjustment on a belt that had been torn along its length for several yards at either end. The user was vehement in asserting that the belt was defective, but when an examination was made it was clearly shown that the only cause for injury was improper lacing. The lace holes had been punched haphazardly and with no regard to the necessity for providing that the stress would be across the width of the belt. The result was that when put in use the belt ripped and was practically ruined.

Improper lacing probably is the most common mistake made by users, and yet it is the one that causes the most serious trouble, often completely nullifying all the knowledge and skill that the manufacturer used in making the belt. There is no excuse for ruining a good belt in this way. By observing the following simple rules the belt will give the best service of which it is capable:

(1) Cut the ends of the belt absolutely square. Do not depend upon your eye or use an ordinary ruler. If the end is slanted in the least degree the pull will come all upon one side of the belt, and the consequences are likely to be disastrous.

(2) Make the holes as small as practicable. Whenever possible use an awl rather than a punch.

(3) Leave a sufficient margin at the edge of the belt beyond the holes, so as not to impair its strength. In belts 2 to 6 in. wide, the holes should not be nearer to the edge than  $\frac{1}{2}$  in.; in belts 6 to 12 in. wide not closer than  $\frac{2}{3}$  in., and in belts 12 to 18 in. wide not closer than  $\frac{3}{4}$  in.

(4) Make two rows of holes on parallel lines straight across the width of the belt. These should be staggered so that the stress will be equal upon different portions of the belt.

(5) Be sure that the holes in the two ends to be joined match exactly. Otherwise there will be a "jog" in the belt, and this is likely to result in tearing it lengthwise.

(6) Use flexible lacing, being careful to have it of a size proportionate to the size of the belt. A heavy lacing is likely to cause trouble.

(7) In lacing the belt make the pulley side as smooth as possible. Rough places should be avoided and ends should be pulled through away from the pulley.

(8) In using metal fasteners select those that put the tension stress on the lengthwise strands of the belt. The crosswise strands are not as strong as those which run lengthwise.

Besides improper lacing, there are many other abuses that cut down the life of belts. Shafting that is out of

**CORRECT AND INCORRECT METHODS OF LACING A BELT**  
The upper and lower figures show respectively the outside and pulley side of a properly laced belt. The middle figure shows a poorly laced belt—one that will sooner or later give trouble.

fibers in each ply, each time the belt rounds the pulleys. A high-grade "rubber friction" (an elastic rubber film between fibers) is the best possible protection against this internal wear, because it protects each fiber with an elastic coating that remains uninjured and which indeed retains its life and elasticity longer when in use than when lying idle.

In this connection it should never be forgotten that the value of a particular rubber friction cannot be determined merely by the test showing "pounds pull." If the plies were fastened together with glue, this test would still show a high-grade belt. Everyone knows, however, that such a belt could not give service. The most valuable property of rubber friction is that intangible quality called "life." There is no known test for this but length of service.

In specifying the proper ply of rubber belt for a given installation the determining factors are the size of the pulleys, width of the belt, speed and horsepower to be delivered. The belt itself should be at least 1 in. less in width than the face of the pulley. With this in mind, the proper ply can be determined by consulting the accompanying table of horsepower and plies. To illustrate, assume a pulley whose face is 13 in. wide, operated at a speed of 4,000 ft. per minute, with a maximum load of 100 hp. It will be found by referring to the table that a 12 in. 5-ply belt operating at 4,000 ft. per minute will transmit 109 hp. Specification will be made accordingly. In specifying the ply it must also be remembered that the greatest number of plies to be used on a 12-in. pulley is four, on a 18-in. pulley five, on a 30-in. pulley six, on a 40-in. pulley seven and on a 48-in. pulley eight.

### Carbonization of Lignite To Be Tried in North Dakota

NEW SALEM, North Dakota, has been selected by the Bureau of Mines as the place at which it will conduct its experiments in the carbonization of lignite. Congress has appropriated \$100,000 for this work and an additional \$200,000 is to be furnished by private interests who are co-operating in the work.

Immediately following the appropriation of the funds O. P. Hood, the chief mechanical engineer of the bureau, was assigned to the task of finding a suitable location for the conduct of the experiments. Extensive lignite deposits of a promising character exist in North Dakota and in Texas. Early investigations led to the conclusion that it would be advisable to locate the plant in Texas, because at that time there were a number of places in close proximity to the lignite deposits where there would be a ready sale for the gas.

After a site for the plant practically had been agreed upon extensive oil fields were developed in the same general region, which did much to solve, temporarily at least, the Texas fuel problem, and there was no hope of competing with the low-priced natural gas which suddenly became available. With this change in the situation North Dakota became the more promising location for the work, but it has been necessary to devote considerable time to making arrangements for the co-operative work. A contract has now been signed by the Bureau of Mines with John B. Adams and Fred Bremier, who will form a subsidiary to the Consolidated Lignite Collieries Co. The site on which the plant will be established is owned by this corporation.

It is the idea of the Bureau of Mines that as a result of the work which will be done the plant will be made commercially successful, and that it will continue in operation after the investigational fund has been expended. It is expected that publication of the results of the experiments will stimulate duplication of such plant throughout lignite areas.

The Bureau of Mines has assumed the responsibility of planning, erecting and operating the plant which is to carbonize lignite and will also undertake the same obligation with regard to the briquetting plant. The bureau also is to maintain active general supervision over the construction and operation of the entire activity during the period of the investigation. The co-operating company has agreed to furnish the site; to provide \$200,000 for construction and installation of equipment; to install certain specified portions of the equipment; to furnish all lignite coal and other raw materials; to conduct the business operations of the enterprise, including the selling of the products; to furnish all labor and keep all necessary books and operating records. The equipment of the plant is to include special machinery which has been developed by the work of S. M. Darling, who will be in immediate charge of the experimental plant.

Immense quantities of lignite are available in Texas, North Dakota and other Western states. This fuel is fully equal to much of the fuel on which European countries depend for industrial development, but this country has such quantities of higher-grade fuel that the shortcomings of lignite have confined its use to relatively small quantities in narrow fields.

The fact that the fuel disintegrates on drying or when placed on a hot fire makes it less desirable than good bituminous coal. There are ways, however, of benefiting this fuel which looks very promising. By heating the lignite sufficiently to drive off the moisture and a part of the volatile matter, a char is obtained which, in heating value and analysis, closely approximates anthracite coal. Its physical condition is, however, comparable to the finer sizes of buckwheat anthracite, which are not used as domestic fuel but can, however, be briquetted and made into a satisfactory household fuel.

In driving off the volatile matter, numerous by-products are made available which may be made into salable products. There have been no commercial installations combining carbonizing, briquetting, and recovery of byproducts in one plant, although considerable experimental work has been done in each of these fields and some attempts have been made to combine them.

It is believed that under present conditions a successful plant can be assembled. The government fund will be used in providing those parts of the plant that are unusual and special, and in making a thorough investigation of the process and of the quantities produced so that a report for public use will be available for those desiring to enter this field.

In our issue of April 22, p. 790, in an article entitled "Self-Closing Gates" credit was given to the blacksmith at the Silver Creek Colliery for inventing the device described. He is indeed to be credited with the construction of the Silver Creek turnstile, but Cornelius Walters, outside foreman at Eagle Hill Colliery, actually devised the mechanism and with co-operation of the blacksmith at that mine worked out his ideas, erecting at that operation the first gate of that type.

# Cutting Power Costs at an Anthracite Mine By Utilizing Exhaust Steam

For Years Power Has Been Purchased and Steam from Several Engines Exhausted Into the Atmosphere — Utilization of This Exhaust in Low-Pressure Turbines Will Result in Large Savings — Other Important Incidental Economies

BY DEVER C. ASHMEAD  
Tarrytown, N. Y.

FOR a number of years the Price-Pancoast Coal Co., of Scranton, Pa., has been purchasing its electric power, although it has been necessary to generate steam to the amount of 2,200 b.hp. to operate the hoisting, breaker and various other engines at the mines. For many years these engines have been exhausting into the air and consequently wasting an enormous amount of power that might have been utilized.

Moreover, the money spent in the past for electric current probably would have paid many times over for the construction of the contemplated new power plant. Realizing this tremendous waste, the coal company thoroughly investigated the subject of using its waste heat for the production of useful energy. As a result of this investigation it was decided to install exhaust-

steam turbines for the generation of electric current and to remodel the boiler plant simultaneously.

The old boiler installation consisted of six 300-hp. Stirling and two locomotive boilers. The short stacks seen in Fig. 2 are those from the boilers of this last-named type. The plant will not be enlarged; in fact when the improvements are completed it will be smaller than before, for the two locomotive boilers will be discarded and the space now occupied by them will be used for the blower fans and the boiler-feed pumps.

Dutch ovens have been added to the boilers and Coxe stokers have been installed. An overhead coal bunker having a capacity of 900 tons has been constructed. As it was necessary to carry on construction work while the plant was being operated, it was possible to install

FIG. 1. PLAN OF THE PRICE-PANCOAST POWER HOUSE, SHOWING ARRANGEMENT OF MACHINERY  
Balance in the arrangement of this plant is immediately apparent. The main header runs completely through the building and brings steam from both directions.

FIG. 2

### General View of the Plant

Long steam transmission lines, characteristic of the anthracite region, and which this plant is designed to render unnecessary, appear prominently in the foreground.

only one stoker at a time. Temporarily separate blowers are being used for each boiler. When all the stokers are in place so that the old locomotive boilers can be disposed of blower fans will take care of all the air requirements simultaneously. The stokers are driven by a temporary engine, but this will be replaced by electric drive as soon as the power plant is in operation. There is no separate control for the stokers as they are driven by a line shaft. At present their rate of speed is from  $1\frac{1}{2}$  to 2 in. per minute. A large Cochrane feed-water heater is located in the boiler room.

By reference to Fig. 6 it will be seen that the coal is brought from the breaker to the boiler plant by means of a dragline scraper which discharges into a conveyor which, in turn, delivers the coal to the distributing conveyor in the boiler house. These conveyors have a speed of 98 ft. per minute. As for some reason the coal bunkers may be full provision has been made for a storage pile outside the boiler plant and breaker. This pile furnishes a place for coal whenever the coal bunkers are completely filled. It saves the breaker from having to take care of any boiler-fuel surplus.

At the present time the boiler plant is using a mixture of equal proportions of buckwheat, rice and barley coals, but the company hopes that it will be able to use

only rice and barley coals when the new boiler plant is completely finished. The ashes from the boilers are discharged into a dragline scraper that conveys them to the ash dump.

From the preceding description it can be seen that the new boiler plant when entirely completed will be, as far as possible, mechanically operated, whereas in the old plant everything was done by manual labor.

At present the boiler plant furnishes steam to the main hoisting engine, the hoist for the main shaft, the breaker engine, the shop engine, three fan engines, a number of pumps in the mine, two air compressors and five underground steam hoists.

Close to the boiler house is the new power plant. This building is of brick with steel roof trusses and concrete floors. It houses two General Electric Curtis steam turbines operating at 3,600 r.p.m. The generator is a 1,250-kva. machine working at 2,300 volts. Both steam- and motor-driven exciters are furnished with these outfits while a 12-panel General Electric switchboard is provided for the proper distribution of the current. The vacuum pumps for the turbo generators are 8 x 12 and 20 x 12. Besides the electric units in the power house there are two large Ingersoll-Rand two-stage air compressors, with the steam ends 18 and 29 x 20 and the

FIG. 3

### Looking Toward the Spray Pond

The fuel-supply scraper line as well as some of the old steam lines may here be plainly seen. The spray pond is visible near the rear ground at left center.

air cylinders 16 and 26 x 20. These compressors furnish air at from 90 to 100-lb. pressure. A 5-ton traveling hand-operated crane is provided for handling the larger units in the power house.

The turbines are of the low-pressure type with a regulator permitting the use of high-pressure steam should the amount of exhaust be insufficient. The exhaust steam from the main-shaft hoisting engine will be delivered to the power plant by a 6-in. line. A 10-in. line will deliver the steam from the main-hoisting engine, while an 8-in. line will bring the exhaust steam from the breaker and a 6-in. line from the 21-ft. Guibal fan. This exhaust steam will be delivered to a main of 24-in. diameter and about 100 ft. long located in the power plant. Besides this steam that is furnished to the power plant, the exhaust from the vacuum pumps, from the two compressors and from the water-circulating pumps will be discharged into the 24-in. main. One end of this main will have a homemade flap valve to regulate the pressure of the exhaust steam.

The turbines will be fed with the exhaust steam from the 24-in. main through 16-in. pipes which will be reduced to 14 in. on entering the machines. The exhaust will pass from the turbines to barometric condensers through a 36-in. main. The water from the condensers is pumped to a spray pond designed by the Spray Engineering Co. which is equipped with 170 No. 11A nozzles. The water-circulating pipes are 10 in. in diameter.

FIG. 5. PLAN AND CROSS-SECTION OF THE SPRAY POND  
This spray pond performs the same function as a cooling tower. The fine sprays of warm water give up their heat to the air, cooling the water and permitting it to be used again.

FIG. 4. CROSS-SECTION OF THE POWER PLANT  
This shows the arrangement of piping and condensers. Most of the piping is carried below the floor line and is thus out of the way.

Live steam is delivered from a 20-in. header in the boiler plant to a 12-in. header in the power plant and to a 10-in. main for transmission to the mines for use in hoisting, breaker and fan engines.

Great advantages and economies will accrue to the coal company upon the completion of these improvements. All use of steam underground can be dispensed with and electricity used instead. This means that all the pumps and the five hoists previously mentioned will be electrified. All loss arising from the condensation of steam which hitherto was carried long distances will now be prevented, and the more economical method of distribution of power by electricity will be employed. On the surface one fan engine which is about a quarter of a mile from the power house will be electrified, and thus a further saving of power will be made, for at present a long pipe line furnishes steam to this engine.

It is believed that the plant when completed, by utilizing the full power generated in the power house and not wasting it, will enable the company to discontinue the use of the two locomotive boilers and save the coal that they are now consuming. Furthermore, by using the exhaust steam which until now has been wasted, sufficient power will be provided to furnish the mine with all the current it may require and consequently it may be possible to discontinue the purchase of power from outside.

Ultimately savings will come from four sources: First, that due to the burning of finer-sized coals in the boiler plant; second, that due to the discontinuance of long steam lines on the surface and underground, now causing heavy losses because of the condensation of the steam; third, that due to the utilization of steam which was formerly exhausted into the atmosphere, thus wasting heat; fourth, that resulting from dispensing with the employment of unnecessary labor, required because of the failure to provide suitable mechanical equipment.

From these economies the company will make a de-

## French May Erect Coke Ovens in Lorraine

Desire to Free the Iron and Steel Industry of the Province from Entire Dependence on Germany for Coke

**R**EHABILITATION of the iron and steel plants of Lorraine by France is a perplexing problem owing to fuel difficulties. When the French took over the plants, according to the report of Trade Commissioner J. F. Butler, many were found to be in a run-down state, due to intensive exploitation and lack of upkeep during the latter period of the war. In many cases damage was deliberately done to the machinery by the Germans. During the past year a very large part of this damage has been repaired, and the majority of the plants now are in very fair condition.

At the present time the Lorraine plants are turning out only about one-third of their pre-war production. This is due principally to the lack of coke for the blast furnaces. Before the war France consumed about 12,500,000 tons of coke, of which it produced only about 6,200,000 tons. The resulting deficit is augmented to the extent of 4,900,000 tons by the annexation of Lorraine, of which the production is slight, making a total deficit of 11,100,000 tons.

It is true that the French acquisition of the Saar opens to them rich sources of coal supplies. Unfortunately the coke produced from this coal is of such a friable nature that it can be used only in small or medium-sized blast furnaces, being quite unsuitable for the large blast furnaces of Lorraine. Coke could be imported from England, but the cost of transport renders supplies from this source practically prohibitive. A similar objection applies in a smaller degree to coke from Belgium, which moreover is available only in limited quantities and is of inferior quality compared with German coke. The Lorraine blast furnaces must continue, therefore, to find their coke in Germany.

By the terms of the armistice Germany was supposed to furnish France 11,000 tons of coke daily. This contract was not adhered to, the Germans alleging various reasons for the non-delivery of coke in the stipulated quantities, especially strikes in the Westphalian coal regions and lack of transports. On May 7 an agreement was reached whereby Germany was to receive 1½ tons of iron ore for each ton of coke sent to Lorraine, Luxemburg, Saar, or Meurthe-et-Moselle.

Germany should now furnish France with coke to the extent of 13,000 tons a day. Although the amounts received during the latter part of 1919 were far greater than those of preceding months, they did not exceed one-half the quantity stipulated. This is a source of much embarrassment to the Lorraine industry, which hesitates to contemplate a future of entire dependence on Germany for coke.

In this connection it is interesting to note one of the conclusions made in a report on the iron and steel works in Lorraine by a commission appointed by the British Ministry of Munitions. According to the report, the French are said to be considering the erection of coke ovens in Lorraine and the importation of Durham coal to mix with their Saar coal. In exchange for the British coal they would ship basic pig iron to Great Britain. As matters stand, the French feel that their steel industry is too greatly at the mercy of Germany.

### Uniform Curve on Trolley Wire

By G. E. DAUGHERTY, Pikeville, Ky.

**T**O INSURE a uniform curve on trolley wire at places in the mine entry where the necessary supports cannot be conveniently placed, the following plan may be of value

The Pond Creek Coal Co., at Stone, Ky., takes a one-and-one-half inch pipe, bends it to suit the purpose, drills

METHOD OF HANGING WIRE ON CURVES

holes through it spaced three and one half feet apart for bolts to hold the insulators.

The pipe is supported at each end and in the middle by wedge bolts driven into holes drilled in the roof; the bolts are sunk into convenient collar beams supporting the roof.

This arrangement prevents the trolley pole from leaving the wire, saves the pole from possible injury and prevents accidents.

# Management Methods That Will Secure Results in Mine Construction

Organizations for Mine Operating Are Seldom Adapted to Construction Work—To Employ Them for Such a Purpose Usually Is a Mistake—Building Procedure Should Be Planned as Carefully as the Plant Design Itself

BY CHARLES GOTTSCHALK\*  
Bethlehem, Pa.

**T**O CARRY on simultaneously the various operations involved in constructing the surface layout and in developing the underground nucleus for a modern coal mine of large capacity requires the highest type of organization. Some such provision is necessary if the many forms of leaks and delays are to be kept down to a minimum.

Many glaring examples might be cited where large financial interests have carried work of this nature through to conclusion with organizations absolutely out of harmony and unfitted for their responsibilities. The sums thus dissipated and the valuable time thus lost cannot be accurately estimated, but it requires neither deep reasoning nor close observation to perceive that the possibilities for savings are worthy of the expenditure of considerable effort.

Not long ago a prominent mining man made the remark that a great many of the new coal mines erected with large production in view with which he was acquainted had undergone a complete turnover in the personnel of their local managements after the high officials had patiently waited and failed to realize promised results. This is often the outcome of choosing an organization adapted only to operating a mine and of expecting it to be able to build one rapidly and economically. The consequence is a failure to keep the ever-increasing details of construction under control. The workmen are first to sense the confusion, and matters go from bad to worse.

When the construction work finally is finished it is then too late to re-establish confidence in the ability of the management, although the work has now progressed to the point for which the men in charge were really selected. When, by reason of the financial strain, those who are providing the capital are forced to investigate, a turnover with its attendant disadvantages appears to be the only solution of the difficulty.

Companies exercising better judgment avoid from the beginning such a catastrophe by starting to build the plant with an organization experienced in the kind of work in hand and with full knowledge that it must "make good" from the start. Such an organization is

not in a position to excuse its shortcomings in construction work with the hope of accomplishing big things later on.

Naturally the success and progress of the work depend more upon a harmonious organization working in accordance with a well-defined plan than upon any other consideration.

Everyone has observed that average methods with concerted push behind them accomplish more than much mechanical equipment and original ideas handled in a disconcerted or confused manner. In the latter case problems in methods of construction which are worthy of much preliminary study appear unan-

nounced and must be hastily decided, snap judgment often resulting. Some of these experiments will surely prove costly and embarrassing.

Jobs begun in this manner are seldom completed along the lines that were planned when the work started, but are likely to be rushed through in a slipshod manner in order to make up for the time lost in trying out each pet notion suggested. Later the job proves a failure and the design, rather than the poor method of construction, receives the blame, while high maintenance or operating costs absorb the loss. It is therefore highly essential to provide from the very start for teamwork and systematized planning.

Most of the problems encountered fall logically within the province of an experienced and resourceful engineer. This individual should be not merely a transit man or an inexperienced graduate but a field engineer big enough to secure a thorough grasp of the many units both individually and collectively. It is just as essential to have a first-class engineer work up and execute the plan of construction as it is to employ a reputable firm of specialists to draw tippie and surface building plans and design coal-handling machinery. In many instances, however, the actual work of constructing a mine is prosecuted without co-operation or system, whereas a plan of the work and methods to be employed could be made to afford a degree of assistance equal to that derived from plans of design.

If, as previously observed, the superintendent has been selected by virtue of his former connection with a successful operation, there is a probability that the construction side of a large modern mine continued

**Construction and operation may be kindred arts but ability to succeed in both rarely resides in the same man. The two principal men in mine construction are the engineer and the chief clerk, the business of the latter being much more trying than in operation and requiring ability to prevent misuse and loss of material and keep track of costs.**

\*Formerly in charge of construction of the Kathleen mine, Duquoin, Ill.; at present on special work with the Dodson Bituminous Coal Co., Bethlehem, Pa.

over a long period will prove highly distasteful to him long before the work is completed. He cannot under such circumstances round his organization of coal getters into shape and rest easy, as he may have been able to do formerly. In construction work the scene changes rapidly and the mechanics required to-day must be replaced by those of another trade next week, and so on to the end. The successful superintendent of construction must be a tireless worker who is ever on the alert.

#### EXECUTIVE ABILITY AS GOOD AS KNOWLEDGE

Complicated blueprints reveal but little in detail except those experienced in the art of reading them, and even then much care and study are sometimes required if all the essentials are to be grasped. A man handicapped by a lack of this technical experience cannot fairly be charged with the responsibility of planning an effective construction campaign because he cannot grasp the details of design until the jobs are well under way and must likewise reserve any unprejudiced criticism until so late that the errors cannot be rectified without more or less additional cost or delay. By the same token the methods of doing the work cannot be planned ahead and the proper tools and equipment provided and estimates of the time required cannot be furnished to the greatest advantage. Some mine superintendents not technically inclined are nevertheless broad enough to recognize their own limitations and have the executive ability to develop the best in their subordinates by not being jealous of the superior specialized knowledge of various department heads. Men of this caliber, however, are sadly in the minority around the coal mines.

In any event there should be no division of authority between the engineer and the superintendent. The entire responsibility for construction methods and progress should be placed upon the shoulders of the man who has been selected for the work because of his individual fitness to handle it. Even though the prospective mine superintendent is not qualified for the management of the construction work, he still has this field of usefulness that he can lay the foundation for a successful operating organization which will be ready to undertake the work of operation as soon as construction approaches its end. By accomplishing this important work he will establish his company on a basis that will thereafter reflect credit on himself.

#### CHIEF CLERK SHOULD BE CAREFULLY CHOSEN

The executive in charge having been carefully selected, the matter of choosing a chief clerk should receive similar consideration. The scope of the clerk's duties are likely to be underestimated unless it is remembered that several hundred carloads of miscellaneous material are required for the job, with the possibility that many shipments may be delayed in transit or be lost or may arrive with shortages. These items must all be checked and followed up until shipments are complete. Materials arriving are sometimes stored and later charged out to the various jobs.

The constant movement of the labor gang from one job to another adds greatly to the clerical work, and the distribution of the charges to the proper accounts must be tabulated promptly and intelligently in the field in order that the local management may study the unit costs as the work progresses and detect any abnormal outlay in time to calk the leak.

Furthermore most of the small business transactions within the organization and many without it are handled personally by the clerks, and upon their conduct largely depends the reputation which the company acquires regarding its policies and business integrity.

In one instance a certain chief clerk possessed of the necessary intelligence and capacity for work abused his position when dealing with those to whom he felt no responsibility for his actions. As the result of an oversight on his part which could have been disposed of by a simple explanation he became insulting to a foreman many years his senior in age. The foreman left the office bent upon quitting. When the clerk was informed of his blunder, he responded, "To hell with him; let him quit if he wants to."

The foreman was one of the most valuable men in the organization and especially hard to replace at that particular time. Others were constantly receiving the same lack of consideration while endeavoring to get information necessary to the best interests of the company.

Possibly much of this indifference arises from a lack of knowledge of its possible harmful effects. If so, it is time to present the matter to the offenders in a light that will give them a keener insight into their duties to the company. Otherwise discord is likely to spread and an owner or general manager of a property desirous of giving everyone a square deal will unknowingly have his policies toward others entirely misconstrued because of their faulty execution by the officials in whom he has reposed his confidence. To avoid the development of such a condition the importance of carefully selecting the superintendent and chief clerk should be thoroughly appreciated.

#### OFFICIALS SHOULD RESPECT THE MANAGEMENT

Here let me digress. Some long-experienced officials never seem to be able to learn the fact that their own work is made much lighter by always referring to the management above them in respectful terms. They try to excuse their own acts of indiscretion by confidentially telling various employees that the orders to which exception is made came from the "Big Boss." Disintegration of the organization must surely follow such a policy, because the best tone in any organization is secured when the bosses and the men alike feel that the president of the company is a genuine fellow. This sort of respect generates an influence for good in every employee of the company. And yet the possibilities thereby to be secured are ignored by many superintendents.

Assuming, however, that from the start two men of large caliber have been chosen the *esprit de corps* will be whatever these two heads insist upon maintaining, even though only reasonable care is exercised in the selection and instruction of the remaining officials and workers.

Before, or at least as soon as, the actual work of construction begins a complete and accurate contour map should be available. To this should be added the final location of the railroad spur, shafts, buildings both temporary and permanent, and any other improvements contemplated.

It is highly probable that no good roads will be found already constructed up to the building site. It is important therefore that a permanent wagon road be built to the mine and put into shape before much hauling of material becomes necessary. A temporary

water supply is often secured by damming a small natural drain and depending upon the rainfall. Immediately following a heavy precipitation such streams become extremely destructive and unless the dam has been well designed it will become ineffective.

All temporary structures should be plotted on the map or general layout plan upon which the permanent improvements have been located. Thought should be given as to where it will be desirable to unload building materials and place equipment. In this connection the location and design of the temporary office and storeroom may greatly facilitate the work of the entire organization. The temporary building should be of sufficient dimensions to permit of several partitions. The largest section should be large enough to contain the current supply of cement, lime and other perishable building materials.

The room adjoining this should accommodate the clerks. The partition separating the two should be provided with a sliding window with a ledge opening into the large room so that anyone getting materials can conveniently sign a receipt showing the proper distribution. By this arrangement it will be possible to keep stocks under lock and key in practice as well as in theory without too much red tape.

#### MATERIAL CARDS ARE A CONVENIENCE

On a big installation several thousand bags of cement will be required and they will be used on a large number of different jobs. At the beginning a card may be ruled up for each job, on which the estimated amount of cement needed may be shown. Thereafter whenever cement is taken from the warehouse an entry can be made directly on the proper card. This will eliminate much unsatisfactory guess work when accounting for the material used. It also will be possible at a glance to check the quantities used as against the estimated requirements.

The room occupied by the clerks should be equipped with a large number of shelves and bins similar to those in a permanent storeroom. An additional room or two may serve to accommodate the superintendent and engineers. This may appear to be a rather elaborate layout for a temporary structure, but it need not be expensively built, and at a later date the lumber can all be re-used without loss.

Failure to provide from the beginning for handling incoming materials of small sizes, checking each article received against the original order, and then storing in groups properly labeled will lead to all kinds of trouble and delay. If materials and supplies intended for a certain place are thrown into a general store for indiscriminate requisitioning many pieces will be used on odd jobs as the emergency arises, with no charge made for them. For this reason no order for the replenishment of such supplies will probably be made until occasion rises for the use of such duplicates. With such a lack of method unnecessary delay or expensive substitution is sure to follow.

As an aid to keeping track of materials ordered and received for the various jobs a graphic chart will prove most valuable. This may be arranged with a long horizontal series of items, one for each division of the work, such as tipple, hoist house, sub-station, etc., each column to be subdivided into spaces. Coloring in these smaller divisions with crayon to correspond to an adopted legend will show at a glance whether the order has been received completely or partially, in good or

bad order, or otherwise. This chart may be hung on the wall of the office and it will act as a daily reminder of the orders which require special attention if a delay in delivery is to be avoided.

#### STORING AND CHECKING SHOULD BE SYSTEMATIC

Before deciding on the method to be followed in unloading and storing heavy materials or those requiring considerable space, reference should again be made to the general layout plan showing all improvements, temporary and permanent. When the most advantageous point for unloading and storing of each item or shipment has been selected the corresponding order number should be placed on the material or on a stake driven near the object unless its nature and use are self-evident from the class of material. In this connection the material should always be unloaded or piled so as to be readily checked. A pile so stacked generally occupies less space than if piled haphazard and is less likely to become damaged. Material should not be checked simply according to the kind and number of items on the bill of lading, but also in accordance with the required dimensions shown on the plans and specifications. This will require close co-operation between the chief clerk and engineer.

As previously mentioned, each development should be studied individually, the best method of handling it determined and estimates of the time required based thereon. All the work may then be viewed as a whole and the different items scheduled in the most logical order. This plan should then be consulted from day to day in connection with the graphic material chart.

It is not to be presumed that any such schedule can be followed out precisely as originally planned, as it inevitably will require weekly revision. Nevertheless, such a plan will form a continuous objective to be constantly sought, while it also serves as a stimulus to results. Furthermore, the analysis required for the drawing up of a schedule will be of great value in the selection of the most practical equipment, as the methods of doing the work must be given thoughtful consideration before any estimate can be made of the time required to complete it.

#### PROBLEMS EASILY SOLVED IN WELL-PLANNED WORK

Detailed sketches and methods which have been employed on various installation projects might now prove interesting, but the object of this paper has been to emphasize the policies to be inaugurated before getting deeply into the work. The problems that follow are more or less local and are quite sure to be solved efficiently if the organization is the result of a studied effort and when the field work is systematized, and the details are not left to take care of themselves.

One of the most famous of artists and architects the world has ever produced has said: "Trifles make perfection, and perfection is no trifle."

#### Strike to Release Winnipeg Reds

**B**ECAUSE the leaders in the strike which deprived Winnipeg, Man., of all communication with the outside world, paralyzed industry within the city and seriously threatened the food supply, bringing sovietism almost within sight, have not been released on bail, pending a hearing in the higher courts, 15,000 Nova Scotia coal-mine workers struck on May 1, as a one-day protest against the alleged injustice.

# Many Solid Fuels Can Be Mixed With Oils To Form Liquids or Jellies

Anthracite, Bituminous Coal, Lignites and Peats, Gas Coke, Charcoal, Wood, Sawdust and Industrial Carbonaceous Wastes Can Be Combined with Oil Colloidally

**L**INDELL T. BATES in a book entitled "American Fuels" to be published shortly by the Mc-Graw-Hill Co., Inc., gives the following information regarding the colloidal fuel which Lincoln W. Bates is manufacturing on a small scale. What follows is taken from the book in question, which volume is prepared for publication by Bacon and Hamor.

"The coal particles [for the colloidal fuel] should be finely divided in order that the mixture may be stored, handled and atomized in the same manner as any other liquid fuel. Tests show that Bates colloidal fuel is filled with particles which have the Brownian movement and that the majority of the particles are about 0.0001 inch in diameter. Some portions of the coal are actually soluble in mineral oils, and the others, being so finely divided, are held in suspension for weeks and even months with hardly any appreciable settlement. The significance of this in connection with the storage and distribution for the fuel will be readily appreciated.

## COLLOIDAL FUEL IS CONCENTRATED HEAT

"Unless special measures be taken [to comminute the coal] the rate of settlement is as a rule too rapid to allow the composite body to be used as a fuel. The particles are normally stable if sufficiently within colloidal limits of size, and precipitation by electrolytes may be prevented by the use of such 'protective colloids' as gelatine, sodium cleate, dextrin, silicic acid, etc. Bates fuel saves oil and yet makes it possible to store more potential heat in any given space than can be stored where pulverized coal alone is used. The process utilizes substances which have the property of stabilizing, in liquid form, carbonaceous particles up to 40 per cent by weight, many of which are above colloidal size. It is found that coal and similar carbonaceous substances may be simultaneously stabilized and peptized (i.e., some dissolving takes place, and also the particles take up part of the liquid). When peptized, the material becomes spongy in texture, thus reducing the apparent specific gravity and the tendency to settle; the peptizing agent has also a marked stabilizing effect.

"Colloidal fuel may be manufactured in liquid form, in which event it contains 40 per cent by weight of pulverized carbonaceous matter or less, or it may be made in the form of mobile pastes carrying about 75 per cent of particles. Mobile gels may be made from liquids or pastes. Many combinations of these forms may be used, and all comply with the requirements that the fuel be atomizable and that the components be simultaneously combustible. The composite is in three stages of dispersion, viz., solution, colloidization and suspension.

"All carbonaceous substances capable of being reduced to particles by pulverizing or otherwise may be combined with liquid hydrocarbons to form colloidal fuel.

Materials which can be used for making the fuel include practically all grades of anthracite, bituminous coal, lignites and peat (even including grades relatively high in ash and sulphur content); pressure-still, smelting and gas coke, charcoals, woods and such byproducts as waste from starch, corn and flour factories, wood pulp, sawdust, etc. The carbonaceous substance should be ground so fine that 95 per cent passes through a 100-mesh screen. Finer reduction is advantageous but not essential. An ordinary coal-pulverizing ball or tube mill is the most economical means of reducing the material to size.

## MANY SUBSTANCES MAY SERVE AS DISPERSION MEDIA

"Oils, tars and pitches have all been used successfully as the dispersion medium for the carbonaceous particles and there is no reason why such liquids as molasses should not be used. Various blends of liquids may be used either for the purpose of utilizing what supplies may be available or to lower the average sulphur and water content, or to obtain a suitable viscosity. The colloidal fuel is not unduly sensitive as regards composition, and precipitation is not so rapid as to jeopardize its passage through pipes, etc., even where high pre-heat temperatures are employed.

"The apparatus needed in the manufacture of colloidal fuel is simple, comparatively inexpensive, and occupies small space. Up to the pre-heater stage colloidal fuel carrying up to 40 per cent carbonaceous particles can be handled as well as heavy crude oil. The viscosity at 20 deg. C. is rarely below 65 deg. Engler, and is generally between 160 deg. and 350 deg., depending upon the composition. At higher temperatures, such as those of the pre-heater, the fuel resembles the lighter of fuel oils. No material change in oil-burning equipment is needed to burn liquid colloidal fuel, but slight modifications and increased pressure may be needed if pastes be used. Increase in pressure alone is sufficient in the case of a gel which is broken up by pumping or which liquefies in the pre-heater.

## COLLOIDAL FUEL IS SUPERIOR TO OIL

"The specific gravity of liquid colloidal fuel is usually between 1.03 and 1.32, the flash point about 190 deg. F. and the fire point over 250 deg. F. The thermal value of colloidal fuel is higher than that of oil, and about 5 per cent greater efficiency of combustion has been observed compared with oil under the same conditions. At the moment of ignition the rending action of the oil in the pores of the carbonaceous particles makes extremely efficient combustion certain.

"A paste containing 60 per cent coke and 40 per cent oil yields about 198,000 B.t.u. per gallon, compared with 145,500 B.t.u. per gallon for oil. For metallurgical purposes the character of the flame may be varied over a wide range by varying the composition of the fuel.

# Standard Washhouse Design of Reading Co.

Washhouses Are a Great Aid to Cleanliness—They Relieve Miners' Wives of Much Unnecessary Work at Home—A Building That Is Artistic and Efficient and Also Fireproof

ONE of the greatest of aids in securing a state of satisfaction and good feeling among the miners is the washhouse. This feeling is fostered by the fact that the man goes home to his family clean; he does not carry into the house the amount of dirt upon his clothes and his person that he otherwise would. As a result of this it is not necessary for his wife to have hot water ready upon his return and there is no dirt to clean up; no dirty, wet clothes to hang up to dry which when dry will shed their dirt and dust to the floor, necessitating another cleaning operation.

Many washhouse designs, some excellent, others poor, have been made. One of the best of these is that prepared by the Philadelphia & Reading Coal & Iron Co. at Pottsville, Pa. For a number of years this firm has been experimenting with different types and designs of washhouses, with the result that the one described below has been adopted as a standard.

This house is extremely efficient and convenient in design, is readily cleaned, easily heated and comfortable for the men. The building is architecturally attractive and when placed in well-kept grounds makes a pleasing appearance at the mine. The building is either entirely of brick or to a height of 8 ft. is of concrete, surmounted by stucco. The roof is supported by wooden trusses and is covered by asbestos shingles.

The new washhouse at the Eagle Hill Colliery is probably the best that the company has erected up to the present time. The main part of the building is

28 x 70 ft. 6 in., and has accommodations for 348 men. This portion is used as a change and clothes room. The washroom is 16 x 25 ft. and is furnished with 16 showers arranged on three sides of the room. Across the doorway a screen is built to protect the men from cold drafts that might come through the door. The entrance to the building is into the main or change room through a small vestibule which is used to prevent cold air and gusts of wind from entering the building. The inside door is so arranged that it shuts automatically.

During the day light is now furnished by means of a row of windows that extend completely around the building. These windows are 20 x 21 in. and have six panes of glass. They open outward and are regulated from the inside. The arrangement of these windows is shown in the accompanying drawing. The house at night is lighted by twenty 100-watt electric lights. The building is heated by steam. There are four radiators in the dressing room and two radiators in the shower room. They are made of 2-in. pipe, extend completely along each side of the room, live steam being used as the heating agent. The temperature of the washhouse is kept at 90 deg. F.

The water for the showers is heated in the washhouse and a heater employed consists of a 12-in. pipe carrying water, inside of which is placed a 3-in. pipe carrying steam. The total length of the heating apparatus is 20 ft.

## SCHEDULE OF MATERIAL USED IN THE CONSTRUCTION OF THE WASHHOUSE

1 6-in. door lock with knobs.	No. 15—2 rafters (valley), 2x6 in. by 22 ft. long.
2 3x3-in. loose-pin butt hinges.	No. 16—6 studs, 3x6 in. by 8 ft. long.
116 2 1/2x2 1/2-in. loose-pin butt hinges.	No. 17—2 sills, 3x6 in. by 6 ft. long.
1 Pair of R-W 20 gem trolley roller bearing barn.	No. 18—2 caps 3x6 in. by 7 ft. long.
Door hangers complete.	No. 19—2 ties, 3x6 in. by 7 ft. long.
1 Piece of No. 31 trolley track 8 ft. long.	No. 20—84 window studs, 3x6 in. by 4 ft. long.
1 No. 68 sliding-door stay roller.	No. 21—20 nailers, 3x6 in. by 12 ft. long.
1 No. 70 flush door pull; 1 No. 71 handle door pull.	No. 22—50 nailers, 2x4 in. by 12 ft. long.
3 1 1/8-in. dia. Swartwout galvanized-iron rotary ventilators.	25 2-in. W.P. plank, 10 in. wide, 12 ft. long.
(To fit on ridge of shingle roof, having 6 to 12-in. pitch on each side.)	Surfaced on inside
200 ft. 4-in. terra cotta sewer pipe.	1,600 ft. 1-in. W.P. barn boards, 12 in. wide, 10 and 12 ft. long.
8 4-in. terra cotta sewer pipe elbows.	1,600 lin. ft., 1x3-in. W.P. battens.
12 4-in. terra cotta sewer pipe, single "T" branch 2 ft. long.	1 W.P. 4-panel door, 1 1/2-in. thick, 3 ft. 0 in. wide, 6 ft. 8 in. high.
2 4-in. terra cotta sewer pipe, double "T" branch, 2 ft. long.	1 W.P. 6-panel door, 1 1/2 in. thick, 4 ft. 0 in. wide, 7 ft. 0 in. high.
324 2-in. dia. hothouse pulleys with arcwre.	60 Single window sash 1 1/2 in. thick, 2 in. top rail, 2 1/2 in. bottom rail, 6 lights each,
324 2-in. dia. galvanized wrought rings made of 3/8-in. round iron.	9x12-in. glass, P.&G.
7,600 ft. 1/2-in. sash cord.	1 Keg of 10d. cut nails; 1 Keg of 40d. cut nails.
1,280 ft. 1 1/2-in. dia. galvanized-iron pipe (for railing).	36 1-in. head bolts, 9 in. long.
65 1 1/2-in. galvanized floor flanges (for pipe railing).	26 1-in. head bolts, 12 in. long.
28 1 1/2-in. galvanized wall flanges (for pipe railing).	26 1-in. head bolts, 15 in. long.
1 1 1/2-in. galvanized ella (for pipe railing).	600 bags cement; 80 tons sand; 130 tons broken stone.
37 1 1/2-in. galvanized tees (for pipe railing).	9 NT-23 truss castings.
27 1 1/2-in. galvanized side outlet ella (for pipe railing).	9 NT-42 truss castings.
28 1 1/2-in. galvanized side outlet tees (for pipe railing).	18 NB-64 angle brackets.
37 1 1/2-in. galvanized side outlet crosses (for pipe railing).	9 1-in. dia. truss bolts, 7 ft long.
275 ft. 1/2-in. round iron.	140 1-in. round cast washers.
16 8-in. dia. nozzle caps for shower heads, for 1/2-in. iron pipe.	324 clothes hooks.
16 shower nozzles with brass handles, for 1/2-in. iron pipe.	5 Sash operating shafts, 3-in. dia. by 6 ft. 1 1/2 in. long.
4 Brass tees with 1 1/2-in. handles, for 1/2-in. iron pipe.	14 Sash operating shafts, 1/2-in. dia. 9 ft. 0 in. long.
1 Brass side wall "T" angle, for 1 1/2-in. iron pipe.	2 Sash operating shafts, 2-in. dia., by 11 ft. 0 in. long.
16 Brass long pipe caps, for 1/2-in. iron pipe.	81 Clamps for the above.
2 Brass compression nuts, for 1/2-in. iron pipe.	21 Counterweights 3-in. dia. by 5 in. long.
Hemlock	21 Levers "A."
No. 1—2 sills, 6x10 in. by 16 ft. long.	18 Reach rods, 2 ft. 9 in. long.
No. 2—16 plates, 3x8 in. by 16 ft. long.	3 Reach rods, 7 ft. 6 in. long.
No. 3—18 posts, 6x6 in. by 16 ft. long.	54 Links "B;" 54 Fulcrums.
No. 4—18 rafters, 6x6 in. by 16 ft. long.	For Asbestos Cement Shingle Roof:
No. 5—9 ties, 6x6 in. by 26 ft. long.	3,500 ft. 1-in. Hemlock flooring.
No. 6—18 braces, 4x6 in. by 6 ft. long.	1/2 keg 8d. wire nails.

No. 14—96 rafters, 2x6 in. by 16 ft. long.	Fasteners for the above ridge roll.

In the change room there are eight rows of benches for the men to sit on while changing their clothes. These benches are made of galvanized-iron pipe with portable wooden seats. The floor of the whole building is concrete. Portable wooden walkways or duck walks are placed between all benches and on all aisles. In the

bathroom there are other wooden duck walks for the men to stand on while taking their showers. In the washhouse these are made of the best oak. The idea is to have everything in the washhouse easily cleanable. The building is scrubbed out every day and a man is kept constantly in attendance.

FLOOR PLAN, VARIOUS CROSS-SECTIONS AND SOME DETAILS OF THE WASHHOUSE

INTERIOR OF WASHHOUSE

Note the lines leading from the back of the benches. These lead to the clothes hangers suspended from the roof.

The Philadelphia & Reading Coal & Iron Co. is now combining the washhouse for the bosses with that for the men. The bosses' washhouse is built as an extension to the washroom of the men's house, but there is no connection between them. It accommodates 20 men and has two showers. The advantage is that the same attendant can take care of both houses and the same hot-water heater can be used. The clothes, both in the foremen's and the men's washhouses, are hoisted to the ceiling for drying.

## Behavior of Various Sulphur Compounds in Coking\*

Many Coals Contain Organic Sulphur—Sulphur Reactions Mostly Occur Below 500 Deg. C., but Hydrogen Lowers Decomposition Temperature of Pyrite

BY ALFRED R. POWELL†

**A**N INVESTIGATION has been made to determine whether the Powell and Parr method of analysis for the forms of sulphur in coal should be applied to a variety of coals other than those from Illinois on which the Powell and Parr tests were made. A complete study was made of the sulphur in the following coals: Upper Freeport bed of Pennsylvania; the Pittsburgh bed of the same state; the Pocahontas No. 3 bed of West Virginia; the coals from Letcher County, Kentucky; Morgan County, Tennessee, and Cherokee County, Kansas.

The method of analysis gave excellent results when applied to these coals. In the determination of pyrite the iron-sulphur ratio checked in every case with the theoretical. After the extraction of the pyrite and sulphates the remaining sulphur was proved to be of an organic nature.

This work indicated that sulphur exists in coal in three typical forms: (1) Pyrite or marcasite, (2) sulphates, and (3) organic sulphur. A study of the changes which these forms undergo during coking has been made on a

\*Article entitled "Sulphur in Coal and Coke," published as one of the Monthly Reports of Investigations of the U. S. Bureau of Mines.

†Physical organic chemist, U. S. Bureau of Mines.

variety of coals, and the following five classes of reactions established:

1. Complete decomposition of the pyrite and marcasite to ferrous sulphide pyrrhotite and hydrogen sulphide. This reaction begins at 300 deg. C., is complete at 600 deg. C., and generally reaches its maximum between 400 and 500 deg. C.

2. Reduction of sulphates to sulphides. This reaction is complete at 500 deg. C.

3. Decomposition of the organic sulphur to form hydrogen sulphide. In the primary decomposition from one-quarter to one-third of the organic sulphur is thus affected, but the byproduct gases traveling through the coking mass increase this reaction to as much as one-half of the organic sulphur present. Primary decomposition is most active below 500 deg. C.

4. Decomposition of a small part of the organic sulphur to form volatile organic sulphur compounds. The greater portion of these find their way into the tar. This decomposition occurs at the lower temperatures of the coking process.

5. Disappearance of a portion of the ferrous sulphide and pyrrhotite, the sulphur apparently entering into combination with the carbon. This reaction seems to be most active in the neighborhood of 500 deg. C. and higher.

### ORGANIC SULPHUR CHANGES ITS CHARACTER

The organic sulphur not accounted for by the above reactions undergoes a decided change in character between 400 deg. and 500 deg. C., and shows none of the properties of the original coal sulphur. From these experiments it would not seem that the relative amounts of pyrite and organic sulphur in the coal have much effect on sulphur distribution during coking.

Methods for changing the sulphur distribution were studied so that the minimum amount of sulphur would be retained in the coke. A complete study was made of the efficiency as desulphurizing agents of hydrogen and of gases containing hydrogen when passed through coal in the process of coking.

The effect of the hydrogen on the removal of sulphur from coke was very noticeable, in some cases nearly all of the sulphur being removed as hydrogen sulphide during a period of three hours. The ordinary sulphur coking reactions were affected in two ways by the passage of hydrogen through the coking mass: (1) the pyrite was caused to decompose at a much lower temperature; (2) the coke sulphur, which is presumably in combination with carbon, was eliminated at an almost constant rate at the higher temperatures of the coking process.

The size of the particles of coal did not seem to affect the rate of evolution of hydrogen sulphide. For gases containing hydrogen, the desulphurizing efficiency seemed to be proportional to the partial pressure of the hydrogen.

### King Would Make Sherman Law More Drastic

**S**TATING that he believed that Supreme Court decisions had made the Sherman Law of doubtful efficacy in curbing combinations in restraint of trade, Senator King, of Utah, introduced a resolution, May 1, asking that Congress make a study to determine if supplemental legislation is needed to restrain the formation of trusts and monopolies.

### Summer Season Is Best for Coal Shipment in Eastern Ohio

THE accompanying diagram shows in very striking manner why the coal operators in Ohio are not in favor of the seasonal coal rates proposed by Senator Frelinghuysen and others. This diagram, taken from one prepared by D. F. Hurd, secretary of the Pittsburgh Vein Operators Association, and presented as evidence before the Senate committee hearing on the bill to authorize summer reductions in coal freight rates, shows that in this field at least the greater movement of coal is in the summer and that any change in rates tending to increase summer traffic to markets other than the Lakes will only tend to make it more difficult to meet ordinary demands.

The report of the Geological Survey for 1917 shows that nearly 5,000,000 tons of coal were shipped up the Lakes that year from the coal fields in northern Ohio, that this quantity represented 18 per cent of the total production and that of the total Lake movement 94 per cent was in the six months May to October inclusive. It is evident therefore that it is the Lake business that gives the hump in the summer time to the production curve for this field. Other fields have the same

conditions, and these fields are the ones to which the seasonal rates do not appeal.

### Bituminous Coal Movement to Tidewater During March

SHIPMENTS of bituminous coal to tidewater during March, according to the Geological Survey, established a new high record for that month. The total quantity of bituminous coal dumped into vessels at North Atlantic ports was 3,965,000 net tons. This

BITUMINOUS COAL SHIPPED TO TIDEWATER (Net Tons)

	Coal Year 1919-20	Coal Year 1918-19
January	3,185,000	2,954,000
February	2,899,000	2,537,000
March	3,965,000	1,962,000
Coal year total	39,657,000	41,763,000

was an increase over February of 1,066,000 tons, or 38 per cent, and exceeded by 199,000 tons the record of March, 1918, which had hitherto been the largest for that month. The total amount dumped during the coal year 1919-1920 was 39,657,000 net tons.

Coastwise shipments to New England during March were the largest in any month since the armistice.

SEASONAL FLUCTUATIONS IN COAL PRODUCTION IN THE PITTSBURGH NO. 8 FIELD OF OHIO

The production by months is shown for the period January, 1917, to date in terms of percentages above or below the average monthly production for the three years 1917, 1918, 1919 (971,122 net tons).

The total quantity—954,000 net tons—was 20 per cent greater than that of February and nearly twice as great as during the corresponding month last year. The coal year, however, closed with the cumulative shipments far behind those of the preceding year. The total for the year ended March 31, 1920, was 9,172,000 net tons, as against 14,373,000 tons the year before. The decrease was 5,201,000 tons, or 36 per cent.

BITUMINOUS COAL SHIPPED TO NEW ENGLAND VIA TIDEWATER (Net Tons)		
	Coal Year 1919-20	Coal Year 1918-19
January.....	804,000	721,000
February.....	793,000	554,000
March.....	954,000	490,000
Coal year total.....	9,172,000	14,373,000

Overseas exports during March were 1,033,000 tons, or at the rate of 12,396,000 net tons per year; February exports were 718,000 tons.

### EXPORTS FOR JANUARY, FEBRUARY AND MARCH COMPARED

	January, Tons	February, Tons	March, Tons
New York.....			
Philadelphia.....	103,000	43,000	34,000
Baltimore.....	174,000	58,000	83,000
Hampton Roads.....	591,000	553,000	858,000
Charleston.....	29,000	64,000	58,000
Total.....	897,000	718,000	1,033,000

Compared with February, this was an increase of 315,000 tons. Exports fell off at Philadelphia and Charleston but increased sharply at Hampton Roads.

### Railroad Shipments for January

SHIPMENTS of coal and coke carried over fourteen leading railroads during January, 1919 and 1920, compiled by the U. S. Department of Commerce from reports furnished by the roads, are as follows:

# Though Silent, Holland Has Acute Need of Coal

By M. MEREDITH  
Liverpool, England

**M**OST people who are not intimately acquainted with the coal trade in Holland are apt to consider the position of that country as fairly satisfactory. This belief has apparently been confirmed by the silence of Holland on this point while most other countries have been crying out their needs as loudly as possible.

Before the war the quantity of coal consumed in Holland amounted to about 10,000,000 tons annually, and of this quantity only 636,924 tons were supplied by the domestic collieries. Apart from the supply of Dutch consumers a large transit trade was carried on, the figures for 1913 being as follows:

**HOLLAND'S COAL SUPPLY IN TONS DURING 1913**

Imports from Germany .....	17,920,274
Imports from England .....	1,958,698
Imports from other countries .....	511,692
Total production of Dutch Coal .....	1,774,140
	22,164,804

**EXPORTS OF COAL IN TONS FROM HOLLAND IN 1913**

Exports to Belgium .....	7,355,109
Exports to other countries .....	4,662,251
	12,017,360

**HOLLAND'S COAL CONSUMPTION IN TONS IN 1913**

Consumption of coal in Holland .....	10,147,444
Foreign coal .....	9,510,520
Dutch coal .....	636,924

After the close of war it was hoped larger supplies of foreign coal could be secured, but such supplies were not so large as might have been expected. No definite figures are yet available, but the total quantity imported in 1919 is estimated to be under 2,500,000 tons, and this figure was favorably influenced by the importation from Belgium of about 900,000 tons during the first half of the year. The Belgian authorities thereupon prohibited the export of coal to Holland, and no further supplies were received from that country. The imports from Germany remained stationary, and a limited quantity was again imported from England, while during the last few months of the year American coals also were imported.

The output of the Dutch collieries could not be further increased in 1919, 3,600,000 tons being produced by them, bringing the total supply to just over 60 per cent of pre-war consumption. The Government Coal Office, on the other hand, had estimated the following quantities to be the minima required to cover only the barest needs:

**ESTIMATED COAL REQUIREMENTS IN TONS**

Domestic purposes .....	2,100,000
Industry .....	4,100,000
Railways .....	900,000
Shipping .....	600,000
	7,700,000

It will be observed that Germany occupied first place, outdistancing all other countries in supplying Holland with fuel. The imports from that country, furthermore, were rapidly rising; while, on the other hand, imports from England were steadily decreasing.

After the outbreak of war foreign supplies quickly dropped, and though the production of Dutch collieries was increased and the export of coal prohibited during 1915, it became evident more stringent measures were required, since the normal demand could no longer be met. In the early part of 1916 a Government Coal Office was instituted to distribute the available supply and to take measures to increase it. No expense was spared to increase the output of Dutch collieries, the largest and most important of these being state-owned and managed. The output during that year reached 2,600,000 tons, or an increase of over 50 per cent compared with the highest pre-war production. Only 5,500,000 tons were imported, bringing the total supplies during the year to about 80 per cent of pre-war consumption.

In 1917 the position became decidedly worse. The output of the Dutch collieries increased to over 3,000,000 tons, but the imports fell to 3,000,000 tons, leaving a shortage compared with pre-war consumption of 4,000,000 tons.

It should not be overlooked that prior to the war the consumption of low-grade fuel such as peat was already fairly important, and that the average quality of the coal was superior to that used at present. A large percentage of the output of the Dutch collieries is meagre coals or those of low heat content, and the average calorific value is considerably lower than that of the foreign coal used formerly.

Prospects for the near future are anything but hopeful. The output of the Dutch collieries cannot be increased further to any considerable extent during the next few months, and it is feared that the quantity of foreign coal that can be

**Pre-war coal consumption by Holland was approximately 10,000,000 tons annually, of which only 636,924 tons were produced by domestic collieries. Exports were about 12,000,000 tons. With the approval of the Entente governments Germany will supply 2,250,000 tons this year. Prospects for the immediate future are anything but hopeful.**

imported will not be much larger than it was in 1919.

Subject to approval by the Entente, an arrangement probably will be entered into with the German government, insuring for Holland a supply of about 1,000,000 tons from the Ruhr Valley and 1,250,000 tons from the coal fields in Germany adjoining the Dutch frontier, which are owned and worked by a Dutch concern. Including these quantities about 6,000,000 tons will be available, leaving a shortage of 4,000,000 tons compared with pre-war consumption, or, taking the estimate of the Government Coal Office as a basis, at least 2,000,000 tons will be required for the barest needs of Holland, and the only countries she can look to for any further supplies are England and the United States.

It is important for the reader to bear in mind that the statistics quoted by Mr. Meredith are from official reports and that the Netherlands records any coal passing through the country, such as coal from Germany or Belgium, as imports and as it leaves

the borders of the country, the same coal is reported as exports. The result is a showing of exports far in excess of domestic production or even of domestic consumption. This duplication should be clearly kept in mind.—EDITOR.

## Coal Operators Question Good Faith of Trade Commission

Action Requiring Monthly Cost Reports After Adverse Decision by Justice Bailey Surprise to National Coal Association

WHILE no announcement has been made as to whether the Federal Trade Commission will issue default notices in case coal producing companies, other than the Maynard Coal Co., fail to make monthly reports to the commission, it is the inference from the letter of April 26 and the attitude of the commission, that default notices will be issued. A very general opinion among operators is that the issuance of default notices would violate the understanding as to a friendly test suit and many regard the letter of April 26 as being distinctly at variance with the idea that the entire question be left to a test case. The letter of April 26 was printed on p. 838 of the last issue of *Coal Age*. Its purport simply is that the commission will continue to require monthly reports from all producers, other than the Maynard Company. In that connection Rush Butler, the general counsellor of the National Coal Association, analyzes the situation as follows:

It should be understood that this circular letter is not a formal notice of default which subjects operators to penalties for failure to send in the reports referred to. If such default notice is subsequently served on operators who do not wish to comply with the commission's request and do not send in their reports, then those operators will still have 30 days in which to file reports if they see fit to do so.

In this connection, coal operators will be interested to know that the order of injunction entered by Mr. Justice Bailey provides:

"It is hereby ordered, adjudged and decreed that a temporary injunction be and is hereby issued pursuant to the prayer of said bill of complaint, suspending the said order of said defendant."

The order referred to is the order of Jan. 31, 1920, which was the amended order requiring the filing of monthly reports. The order of injunction then goes on to provide that the injunction be entered "restraining said defendant, the Federal Trade Commission, its members, agents, assistants, deputies and employees, from taking any steps or instituting or causing to be instituted any proceedings to enforce said order or to require the plaintiff to fill out and file the prescribed form of report."

While it may be contended that technically the last part of the above order of injunction refers only to the Maynard Coal Co., the plaintiff in the case, nevertheless the first portion of the injunction clearly suspends the commission's order requiring the filing of monthly reports, and it seems improbable that the Federal Trade Commission would undertake to prosecute any proceedings based upon an order which is suspended by an injunction of the Supreme Court of the District of Columbia.

The written opinion of Justice Bailey, filed in the case, is clearly based upon broad fundamental principles that apply to all coal operating companies equally with the plaintiff in the test case. While the institution of proceedings against a coal operating company other than the plaintiff perhaps might not be a technical

violation of the injunction, it would clearly be a disregard of the court's announced decision on the fundamental questions of law involved.

There can, of course, be no objection to companies filing the reports with the commission if they desire to do so. On the other hand, no company need file such reports until a notice of default has been served upon it, and even then, in view of the decision of Justice Bailey, there would seem no doubt that the commission's actions to require the filing of such reports could be promptly enjoined. Until the injunction order has been set aside by further order of the court or on appeal, the decision of the Supreme Court of the District of Columbia stands as the law of the land. It is our belief that the Federal Trade Commission will so recognize it and will not take any steps to cause penalties to accrue unless the injunction order is reversed on appeal.

The penalty section of the Federal Trade Commission Act, which covers these reports, reads as follows:

If any corporation required by this Act to file any annual or special report shall fail so to do within the time fixed by the commission for filing the same, and such failure shall continue for thirty days after notice of such default, the corporation shall forfeit to the United States the sum of \$100 for each and every day of the continuance of such failure, which forfeiture shall be payable into the Treasury of the United States, and shall be recoverable in a civil suit in the name of the United States brought in the district where the corporation has its principal office or in any district in which it shall do business. It shall be the duty of the various district attorneys, under the direction of the Attorney General of the United States, to prosecute for the recovery of forfeitures. The costs and expenses of such prosecution shall be paid out of the appropriation for the expenses of the courts of the United States.

### Denies That Coal Property Assets Will Be Distributed

CONTRADICTING reports current in financial circles, W. H. Coverdale, chairman of the Board of Directors of the Pittsburgh & West Virginia Railway, says the company is not contemplating a distribution of its coal property assets vested in the Pittsburgh Terminal Railroad & Coal Co.

The decision of the U. S. Supreme Court in the Reading Company case created the impression that the Pittsburgh & West Virginia would voluntarily segregate its coal company from the railroad so that stockholders of the latter would reap the benefit.

In some quarters, however, it is believed that the three companies comprising the Pittsburgh & West Virginia system will be consolidated as a result of a special meeting of the stockholders to be held following the regular annual meeting in Pittsburgh this week.

Counsel for the company is reported to have informed officials of the system that the company has not been in conflict with the provisions of the Sherman Anti-Trust Act nor will it offer grounds for a Government suit after the new plan becomes operative.

In addition to the railroad and the coal company there is the West Side Belt Railroad, which is controlled by the coal company. The Pittsburgh & West Virginia is the successor of the old Wabash-Pittsburgh Terminal Railway, which was reorganized in 1916.

## Deadlock Continues in Washington Anthracite Wage Negotiations

**B**ELIEVING that with the steady work they have had year after year (broken only, yet not greatly, in the last year) the anthracite mine workers were not entitled to all that was conceded to the soft-coal employees by the Bituminous Coal Commission, the anthracite operators offered only a 15-per cent increase, or thereabout, as has already been stated. The mine workers rejected the offer. The situation seemed ominous, John Lewis having been reported to have said to Secretary of Labor Wilson over the telephone that "the break in negotiations is near."

The anthracite operators offered, it is stated, to arbitrate the matter, but the mine workers were opposed to any such action. The parties were invited to Washington and spent three days with Secretary Wilson presenting their respective claims. After that, May 4, a recess was taken till May 11, Secretary Wilson desiring time to consider the contentions submitted and President Lewis of the United Mine Workers being obliged to go to Indianapolis in connection with his prosecution in the Federal courts for a breach of the Lever Act, for which he and 124 mine workers' leaders and operators have been indicted.

## West Virginia Operators Appeal for Cars, Alleging Discrimination

**A**SKING that relief and reparation be granted as a result of their failure to furnish one hundred per cent of the orders for cars placed by the Monongahela Ry., the Northern West Virginia Coal Operators' Association has brought action before the Interstate Commerce Commission against various carriers. It is pointed out that during the period from July 1, 1919, to March 1, 1920, the Monongahela Ry. was compelled to look to the Pennsylvania R.R. and the Pittsburgh & Lake Erie R.R. for its supply of empty coal cars. Similarly the Morgantown & Wheeling Ry. was compelled to look to the Monongahela Ry. for its supply of cars for coal loading.

Neither line owns any coal-carrying equipment. The capital stock of the Monongahela Ry. is owned jointly by the Pennsylvania and the Pittsburgh & Lake Erie. As a result operators of mines on the Monongahela and Morgantown lines were dependent upon the same sources of coal-car supply as were operators with mines on the Pennsylvania and Pittsburgh & Lake Erie lines.

Attention was called to the fact that the dependent carriers were parties to the "Uniform Mine Rating and Car Distribution Rules." Under these rules the operators on the Monongahela and Morgantown lines were entitled to their pro rata share of cars. Figures are

given showing that they received only 72.2 per cent of the cars ordered, whereas shippers on the Pennsylvania and Pittsburgh & Lake Erie received 83.7 per cent car supply.

This complaint is regarded as unusually important because the opinion which will be handed down will establish a precedent. In that connection it may be stated that complaints of car shortage have increased very greatly since the period covered in the plea of the West Virginia operators. It is declared that for the last twenty-two days not an empty car has been placed by the Pennsylvania in No. 8 Ohio district. Many mines on other roads are working only a few hours a week because of car shortage. That this is one of the contributing causes to the abnormally high prices being asked for coal may be seen from the result of a study made in 1917 by Messrs. Garnsey, Norris and Allport, the engineer committee of the Fuel Administration. The study was made in the New River district and was for a twelve-months' period. It shows:

When Car Supply Is Below Normal by This Percentage	Coal Cost Is Above Normal by This Percentage
5	3.0
10	6.0
15	9.0
20	12.0
25	13.5
30	19.5
35	24.0
40	29.0
43	34.5
50	40.5
55	47.0
60	54.5
65	64.0
70	74.0
73	85.0
80	98.0
85	113.0
90	136.0
92	156.0

## Filibuster on Water-Power Bill

Just when it was being taken for granted that the Water-Power bill soon would become a law, a formidable filibuster against it was organized in the Senate. At this writing it appears that the bill is in serious danger unless the conferees will consent to modify it materially.

After the passage of the bill by both houses considerable delay resulted in conference due to the inability of the conferees to agree on several points, one of which was the definition of "navigable waters." After a definition was agreed upon the conference report was accepted by the House with only 30 votes against it.

The filibuster in the Senate will be led by New England Senators who object to what they term Federal control of business. Under the definition "navigable waters" as provided in the conference report, it was declared that no one will be able without getting a license from the Federal agency to build a dam for any purpose in any creek or small stream which empties into a river held to be navigable.

# Middle-West Consumers Support Seasonal Freight Rates

Declaring That the Opposition to the Idea Comes from Those with Only Selfish Motives, Representative of Iowa Consumers Declares That Seasonal Rates Will Work Great Relief to Coal Situation in the Middle West

THAT the consumers of coal in Iowa are displaying the greatest interest in the seasonal freight rate in the hope that it will become an actuality was brought out with particular clearness at the May 5 meeting of the Frelinghuysen sub-committee. J. P. Haynes, commissioner of the Traffic Bureau of Sioux City, Iowa, and H. F. Sundberg, traffic manager to the Chamber of Commerce of Cedar Rapids, testified at that hearing. Each came well prepared and in the opinion of Senator Frelinghuysen added very materially to the value of the record which is being built up.

Mr. Haynes pointed out that 90 per cent of the coal consumed in western Iowa moves all-rail from southern Illinois mines, an average distance of 800 miles through Mississippi River crossings, where the traffic density is great. As a result each winter sees a great amount of public inconvenience as well as suffering.

Mr. Haynes was a member of a conference committee which made a study of the situation in the Middle West in February. At the conference were five shippers' representatives, five coal operators and five railroad representatives. The railroad men represented twenty of the leading railroads of the Middle Western and Northwestern States. At that conference it was decided that means of increasing the seasonal spread between rates must be resorted to if the general public in those sections of the country were to be properly safeguarded. Mr. Haynes presented other resolutions and communications showing that sentiment in the West and the Northwest is overwhelmingly for the seasonal rates.

By permission of the chairman, George H. Cushing asked Mr. Haynes the following question: "Is it not true that in the past in the territory which you describe there has been a very much larger annual fluctuation in the price of coal than is now contemplated in the rate of freight? Is it not true that this wide fluctuation of 75c. to \$1 per ton failed to induce any general buying of coal for storage?"

To this Mr. Haynes replied: "No, the spread in the summer-delivered price and the winter-delivered price, due to the fluctuation, if any, at the mines, has not been of such importance as to encourage the summer movement."

This led Senator Frelinghuysen to ask: "Is it not also true that the consumer has no assurance that the price in the winter will not be just as low as in the summer? Is he not always looking and hoping that the price will be less in the future? Do you not believe that if the consumer were assured that he would have a 50c. differential in his rate, that would induce the buying and storing of coal, particularly after the experience of the past winter?"

To this Mr. Haynes answered in the affirmative, and added: "It is an absolute necessity to show consumers that it is a matter of money to them. When they know they will profit, large amounts will be expended for storage facilities."

Mr. Cushing then declared that after an intimate

experience of fifteen years in the very territory under discussion every inducement had been held out to stimulate the summer buying of coal. A profit of from 12 to 25 per cent on money so invested was assured but no summer movement of coal resulted.

Mr. Haynes introduced evidence showing that Indiana and Illinois coal has and is being successfully stored. Some Iowa coal also is being stored under water, he pointed out.

At another point in his testimony Mr. Haynes said: "I have sat with the railroads of the Central West, the operators of Central West, and the consumers in that territory, which includes Chicago, the Twin Cities, and other large centers. All are in accord in advocating seasonal coal freight rates. At a meeting yesterday in New York, which I attended as a member of the Executive Committee of the National Industrial Traffic League, at the suggestion of Chairman Clark of the Interstate Commerce Commission, the question came up as to how the shippers and the railroads can get together at this time to bring about some relief in the pressure on transportation.

"The chairman of that meeting, Mr. Pearson, president of the New Haven road, and Mr. Wright, freight traffic manager of the Pennsylvania R.R., said, 'Let us pass that question because it is very well taken up in the existing bill before the Senate. We will not try to do anything until that is passed.' I feel that that was an expressed approval of this measure, with the added reason that the railroads played a prominent part in drawing up a recent resolution at a meeting in New York City in February of the coal and coke section of the American Institute of Mining and Metallurgical Engineers, of which Herbert Hoover was chairman, and the committee from the American Railroad Association.

"The committee which indorsed this as one of the fundamentals in stabilizing the coal industry consisted of Samuel Rea, president of the Pennsylvania system; F. D. Underwood, president of the Erie R.R.; A. F. Tice, president of the Philadelphia & Reading R.R.; E. J. Pearson, president of the New York, New Haven & Hartford R.R., and J. F. Porterfield, representing C. H. Markham, president of the Illinois Central R.R."

With reference to this Senator Frelinghuysen said that the statement just quoted is a very valuable contribution to the record since it shows that these railroad leaders are committed to the principle involved in the Senate bill.

Mr. Sundberg stated that concrete storage bins, in which the coal is submerged in water, have been in successful operation in Cedar Rapids for several years. Both Iowa and Illinois coal is stored in that manner. He said no difficulty was experienced due to freezing, as the coal was extracted from the bins with clam-shell buckets. He declared that Eastern opposition to the seasonal freight rate is "prompted by selfish reasons and a desire to ignore the rest of the country."

"The interest of the public," said Mr. Sundberg, "is so great that the selfish interests of the few should be

lightly considered. Opposition from the sources from which it has come proves the wisdom of the plan.

"My idea of exempting certain minimum rates from the provisions of the bill is that very few rates would be affected. Any rate of 75c. and under is in effect for a very short haul, probably five to ten miles to the consuming point. There would not be much advantage in storing coal for that short haul since the coal equipment used in that traffic works like a shuttle. It is usually a switch movement. The cars are unloaded promptly and they are back at the mine in a day."

### Move to Quash Indictments

ILLINOIS coal operators who were indicted at Indianapolis a few weeks ago for violating the Lever Act, brought individual suits on May 5 in Chicago, asking that the United States Government, through its officials, be restrained from prosecuting them further. Among those who took this action were G. B. Harrington, F. C. Honnold, J. K. Dering, C. M. Moderwell, R. C. Whitsett, R. E. Lee, R. W. Couffer, John T. Connery, E. C. Searles, T. C. Keller, Walter Bogle and H. A. Huskey.

These petitions for injunction are construed as another attack on the constitutionality of the Lever Act, and in this attack a number of Federal officials are named as defendants, among them being Attorney General Palmer, Washington; Assistant Attorneys General L. E. Slack and D. W. Sims, District Attorney F. Van Nuys, all of Indianapolis, as well as District Attorney C. F. Clyne and others of Chicago.

In the petition for injunction a full history since 1916 of wage scale negotiations with the United Mine Workers of America is given, and special emphasis is laid upon the situation which confronted the coal operators at the time of the strike last November. It is charged that the prosecutions resulting from the Indianapolis indictment were an attempt to interfere with the relations between the operators and the United Mine Workers, which relations were entered into at the request of the U. S. Fuel Administration, and with the full knowledge and consent of the Department of Justice. The petition further declares that the charges of the Government, accusing the operators of collecting excessive prices for coal, were made in an indefinite manner, and that the coal industry has suffered great damage because of the resulting inability of the operators to decide what prices would be considered exorbitant and what prices would be considered fair.

The Lever Act comes in for special attention, as the petition states relative to certain provisions of the act that "These provisions are so vague, indefinite and uncertain that they cannot have the force or effect of law within the meaning of the Constitution of the United States, particularly the fifth amendment, and that any penalties exacted under that statute would constitute the taking of property or the deprivation of liberty without due process of law." The petition goes on to protest very strongly against the Government charge that the operators conspired to limit the production and transportation of coal.

These injunction suits will be argued before Federal Judge Carpenter this week and it is believed that if the petitions for injunction are granted, the cases against the coal operators will be dropped.

In the meantime at Indianapolis the operators of

Indiana and the officials of the United Mine Workers appeared before Judge Anderson to answer to the indictments of the grand jury. The answer was a series of motions to quash the indictments on the ground that the Lever Law, under which they were made, is unconstitutional, that the President exceeded his authority under the act, and the insufficiency of the indictment. Charles Evans Hughes appeared for the miners and S. D. Miller and James A. Bingham as counsel for the operators. The defense argued that, aside from the fact that the Lever Act was "hopelessly vague and indefinite," it could not be applied, if valid, to sustain the indictment against the coal men in view of the authority given the President to control the industry.

"We shall insist," said Mr. Hughes, "that Congress, no more in time of war than in time of peace, can take away constitutional rights. There is no authority of Congress to maintain a law of this kind."

He particularly directed attention to the portions of the indictment drawn under provisions of the act providing for the prosecution of conspiracies to charge excessive prices, declaring this act is outside every known category of the law.

Simultaneously injunctions were asked by Ohio operators in the Cleveland courts and certain other Illinois operators in St. Louis, to restrain the court from requiring their appearance at Indianapolis.

### Non-User Does Not Lose His Rights

THE rule of law under which a mining privilege is sometimes regarded as being a mere license, which may be lost by non-user, is confined to cases where the privilege is limited and no exclusive right in the minerals themselves is granted.

The rule does not apply to a conveyance of "all of the mineral right and coal privileges and rights of way to and from said minerals and coal privileges; also the right to search for all undiscovered minerals and coals upon the land hereinafter described"; and warranting "the above-described privileges unto the grantee forever, free from me, my heirs, and assigns," etc.

This conveyance shows a clear intention to convey to the grantee the perpetual and exclusive right to all the minerals, thereby investing him with title to the minerals themselves. Since there is a severance of the mineral estate from the surface estate, the owner of the minerals does not lose his right or his possession by any length of non-user, nor does the owner of the surface acquire title by adverse possession to the minerals by his exclusive and continued occupancy and enjoyment of the surface merely.

The above-mentioned conveyance includes oil and gas that may be found underlying the land. (*Kentucky Court of Appeals, Scott vs. Laws, 215 Southwestern Reporter, 81.*)

### Crowsnest Miners Back to Work

SINCE early in March the Crowsnest mine workers have been idle, but on April 27 the Director of Coal Operations was able to announce that the strike was at an end. It is stated that the United Mine Workers gained a complete victory and that it is now preparing to get a new settlement in accord with the wage agreement in the United States, which will mean an increase of about 11 per cent on the present wage.

## U. S. Steel Earnings Greater Than in 1919

IN ITS report for the first quarter of this year the U. S. Steel Corporation shows net earnings of \$42,089,019, a total greater than for any quarter of 1919. Not since the third quarter for 1918 has the corporation been able to present such an excellent record. After charges, depreciation and provision for preferred dividends, there was a balance of \$19,726,866 for the common stock, which was equivalent to \$3.88 a share. Against this amount there was nothing other than the regular dividend declaration of \$1.25 a share, so that \$2.63 a share was carried to surplus. On the basis of \$3.88 a share for the first quarter of the year, the full year's earnings on the common stock would amount to \$15.52 a share, as compared with a normal dividend rate of \$5 a share.

The chief figures in the statement and a comparison with other quarters are shown in the following table:

INCOME ACCOUNT			
	Quarter Ending Mar. 31, 1920	Quarter Ending Dec. 31, 1919	Quarter Ending Mar. 31, 1919
Net earnings.....	\$42,089,019	\$35,791,302	\$33,513,384
Dep. s. f. etc.....	10,765,318	12,751,027	10,638,955
Net income.....	31,323,701	23,040,275	22,374,429
Interest on bonds.....	5,291,916	5,344,979	5,393,413
Balance.....	26,031,785	17,695,296	17,481,016
Addition to balance.....		185,694	
Dividends, preferred.....	6,304,919	6,304,920	6,304,919
Dividends, common.....	6,353,781	6,353,782	6,353,781
Surplus for quarter.....	14,373,085	5,222,288	4,822,316

NET EARNINGS BY MONTHS			
	1920	1919	1918
January.....	\$13,503,209	\$12,240,167	\$13,176,237
February.....	12,880,910	11,883,027	17,313,883
March.....	15,704,900	9,390,190	26,471,304
First quarter.....	\$42,089,019	\$33,513,384	\$56,961,424

The present statement conforms in style to that issued last year. No mention is made of the amount set aside to cover Federal taxes. The statement merely says that net income had been computed after making allowance for such requirements.

## American Woolen Co. Report Shows 1919 Best Year in Its History

THE annual report of the American Woolen Co. for 1919 was the best in the company's history, the net profits amounting to \$15,513,415 after making provision for Federal taxes. In 1918 the net profits were \$12,324,084. The net profits of 1918 were slightly higher than those reported in the present statement, but in that year no allowance was made for Federal taxes.

After all charges there was a surplus available for dividends last year of \$10,779,804, or the equivalent of \$39.89 a share on the common stock, after making allowance for the preferred distribution. In the preceding year the amount available for dividends was \$5,572,527, or \$13.86 a share on the common. The surplus for the year after dividends was \$4,770,804. The report shows that \$14,500,000 was restored to surplus from reserve, and that \$7,250,000 was set aside as a reserve against a possible diminution in inventory value.

The balance sheet shows no holdings of Liberty bonds, whereas the 1918 report indicated \$3,306,400 in such assets. The inventory is the highest ever recorded, totalling \$52,990,116, an increase of nearly \$15,500,000 over the preceding year. The surplus of the company now stands at \$31,754,427.

William M. Wood, president of the company, in his remarks to stockholders, says in part:

"We have been able to increase our foreign deliveries

for the year 1919 approximately 100 per cent. Total deliveries amounted to about \$4,500,000, unfilled orders \$4,800,000, orders which we refused to accept \$13,000,000. The volume of foreign orders was so great that we were obliged to cancel many of them, as your mills were unable to fill these orders on account of their sold-out condition or inability to manufacture for deliveries within the time required by customers."

## Remedies for Labor Shortage Proposed At Immigration Conferences

PRACTICAL measures to relieve the present labor shortage were proposed by the National Immigration Conference held April 7 in New York City. This gathering included leaders in finance, industry and agriculture, together with labor men and representatives of foreign-born groups in America. The conference was called by the Inter-racial Council, 120 Broadway.

The common interest which drew these varied elements together is the need of greater production, more stable labor conditions and a better understanding between the different races living in America. In other words, better team work is essential. Americans and immigrants should pull together for the benefit of all.

Among the measures proposed were greater protection for the immigrant against fraud, extortion and violence. A Federal assimilation bureau should be established to look after the welfare of the immigrant, help him learn our language and place him where he can work to the best advantage to himself and to the nation. Standards for citizenship should be high, but useless hindrances and red tape should be done away with. An advanced immigration policy was advocated as a remedy for the present labor shortage, including the selection of industrious and thrifty men and women of good character, and their distribution to points where they can do the work for which they are fitted.

As an immigrant may be of great value to the country as an unskilled laborer, regardless of his inability to read, it was urged that the present literacy test be eliminated, which would open the gates to unskilled workers in agriculture and industry, construction, railroads and domestic service, where there is a great need for help at this time. Our present labor shortage is estimated at between four million and five million, and this would be relieved by a policy of admitting immigrants without book learning but of good character, sound body and mind and Old World habits of frugality and industry.

Among the industrial concerns represented at the conference was one coal mining company—the Berwind-White Co., of Philadelphia.

It is stated at the Federal Trade Commission that a very large number of requests is being received from operators asking that the cost reports of the Commission be continued.

Judging from letters and telegrams being received in Washington a rumor has gained wide currency that Senator Lodge intended to press legislation looking to the restoration of price control on coal. Senator Lodge states positively that he has no such plan and it is believed highly improbable that Congress would give, at this time, any serious consideration to a return to price control on coal.

## Conferees Reach Agreement on Water-Power Bill

Measure Is Reported Out Which Provides for a Commission to Have Authority Over Development of Water Powers

SENATE and House conferees on the Water-Power Bill, after protracted sessions, reached an agreement on April 30. The bill reported out on that date by the Conference Committee of the Senate and House creates a Federal Power Commission to be composed of the Secretaries of War, Interior and Agriculture, to which is delegated authority over all matters pertaining to the development of water powers in which the Federal Government has jurisdiction or in which it is interested as owner of lands or other property necessary to such projects.

The commission may issue preliminary permits allowing applicants three years in which to make examinations of water power projects, to prepare plans and to make financial arrangements. It also may issue licenses for a period of fifty years from the expiration of preliminary permits. The commission may reserve such projects the development of which in its opinion should be undertaken by the United States itself, and must give preference to states and municipalities, provided the commission deems the plans for same are equally adapted to utilize the water resources of the region.

The bill encourages the building of headwater storage reservoirs with a view to equalizing power production, preventing floods, and in arid states the use of the water for irrigation purposes on the lowlands after the water has been utilized for the generation of power. Provision also is made for the construction of locks in power dams in navigable streams with a view to extending navigation into the upper reaches of rivers. At the expiration of the fifty-year license the government is given the option of purchasing the hydro-electric plants by paying the licensee his net investment in same, or it may issue a new license to the original licensee upon reasonable terms, or to a new licensee who shall in that event pay the original owner his net investment in the plant.

Under the terms of the bill the United States may take over and operate any water-power plant under license in time of war for manufacture of explosives or for any purpose involving the safety of the country. The commission is authorized to make reasonable charges to cover the administration of the act and for the use of government lands and property, and to absorb excessive profits that cannot be prevented by regulation. Licenses are placed under supervision of state public service commissions as to rates to be charged to consumers for power, and also as to regulation of service. Severe penalties are provided for non-compliance with the terms of the act.

This bill is the result of years of work by committees of Congress, and if made a law will be one of the greatest pieces of constructive legislation ever enacted by the Federal Government. Some think its terms are too restrictive to be inviting to capital, especially in view of the fact that great efforts are being made and great inducements offered by foreign countries to secure American capital for development of their water powers. However, practical water-power men consider the terms of the bill reasonably fair. Senator Jones,

of Washington, chairman of the Commerce Committee of the Senate and chairman of the Water-Power Conference Committee, in commenting on the necessity for utilization of the energy contained in our falling waters said:

"Through failure of Congress to pass water-power laws under which money could be safely invested with prospect of a fair return, water powers now wasting have been held back for years from development in at least twenty-two states of the Union. I am informed that actual water-power developments are projected to be undertaken upon enactment of this bill having a total capacity of over 4,000,000 horsepower.

"The completion of these projects would open over 4,000 miles of the upper reaches of our streams and rivers to navigation. It means the extension of navigation for an aggregate of 4,000 miles in thirty-five rivers, traversing twenty states. In this way cheap water transportation will be afforded to districts now sparsely settled and congestion of traffic will be relieved in thickly populated centers through the investment of private capital instead of through river and harbor appropriations by Congress.

"Coal shortage brings up again the folly of leaving unused the nation's vast resources of water power. The more these are developed the less desperate will be the fuel stringency. The waste is not alone one of money. It extends in its final direct results to public health and life itself, as these are affected by inability to get coal for heating and for the production of the necessities of life. It is estimated that \$5,000,000,000 of potential water power is lost in the United States every year. This may or may not be accurate, but the simplest reasoning shows that the amount lost is enormous.

"Sweden is paying \$46 per ton for coal, which she has to obtain from England, and therefore is proceeding with the work of developing as far as possible the entire 5,000,000 water horsepower contained within its boundaries. The United States must not fall behind European countries in conserving its coal deposits and in developing the vast amount of cheap electric energy contained in its wasting water powers.

"All the available water power should be developed, and in the quickest time possible, in the interest of the economic uplift of the country, of its social regeneration, of its wealth, and in order to permit it to secure its share of the markets of the world. Hydro-electric energy gives us the means of saving our coal, enables us to obtain electricity at a low price, to lower in many cases our industrial costs of production, and to improve our agriculture. It will become the surest weapon in the economic struggle which faces us."

While some objection arose on the floor of the House to the \$125,000 item in the Sundry Civil Appropriation Bill for the survey of power distribution in the Boston-Washington industrial area, the item was approved by the House. The objection was made on the ground that this expense should be borne by industry and that it is not a proper activity for the Federal Government. The claim also was made that so long as the House had just objected to allowing the Federal Government to have a hand in the distribution of water power, holding that it was a proper activity only for the States, it would be improper for the Federal Government to meddle in the matter of distributing any other kind of power. In advancing an argument for the item the

chairman of the Appropriations Committee, Representative Good, said in part:

"We are appropriating \$125,000 and permitting contributions of a sufficient amount to finish the work, of making a survey of all the power plants, not simply water power but all the power plants within the territory, which is an enormous undertaking. Mr. Murray, the man whose genius put into operation the plan of electrifying the New York, New Haven & Hartford R.R., believes that as a result of this survey not only will the commercial and industrial institutions in this territory be benefited but every farmer along the line who now has a little gasoline engine to churn his butter and grind his grist and things of that kind will be benefited by being furnished power. When the supply of oil disappears he must turn to some other source.

"We may smile at this proposition. We may laugh it out of Congress just as we did by ridicule the proposition of Mr. Langley in regard to the aeroplane. I say to you that it has within it the very things we must adopt to utilize these forces and to make a greater use of coal at the mouth of the mine and at tidewater. It was the testimony of Mr. Murray; it was the testimony of Dr. Smith, director of the Geological Survey; it was the testimony of the director of the Bureau of Mines, that by utilization of the coal in this way, the utilization of the surplus power of the great industrial plant and the public-utility plants, by utilizing their surplus, more than \$30,000,000 would be saved every year. At the same time it would open up a plan whereby private capital, not Government appropriation, would be used.

"I would not be in favor of appropriating a single dollar for the Government to go into that kind of a scheme. Private capital should do that. When there is so much of wildcat and watered stocks being circulated and sold, how far would you get in promoting a company of this kind that had back of it only the estimate of some private individual or company? It is intended to have a Government survey and a report, something that would have the stamp of the Government officials on it that the plan was feasible and practicable, and if the supply of oil is to give out within the time specified, we may well stop and consider if we should not study the question where we can get a substitute."

### Railroads Ask the Government to Advance Half Billion More for Equipment

**I**N addition to the \$300,000,000 revolving fund that has been provided by railroad legislation, leading railroad executives have informed the Senate Committee on Interstate Commerce that the immediate financial necessities of the railroads demand an advance of \$500,000,000 from the Government this year.

The roads need the money to provide new freight and passenger cars and locomotives. These are absolutely necessary for the movement of the year's crops, the executives declared, and if they are not forthcoming there will be during the year the most serious congestion ever known.

The railway executives' representatives who appeared before the Senate committee included President Edward E. Brown of the Pere Marquette road, chairman; L. F. Loree, of the Delaware & Hudson; Henry Walters, of the Atlantic Coast Line; A. H. Smith, of the New York Central; C. H. Markham, of the Illinois Central; E. J.

Pearson, of the New Haven, and Samuel Rea, of the Pennsylvania.

When the Cummins-Esch railroad bill passed it provided a revolving fund of \$300,000,000 to finance various railroad betterments and expansions. A committee of railway executives undertook the distribution of the fund, and found that from \$125,000,000 to \$175,000,000 would be available for new locomotives and cars. The railroad heads told the Senate committee, however, that a survey of the needs of the roads shows they should have 226,000 new freight cars, 9,500 passenger cars and 3,000 locomotives, costing \$1,600,000,000.

This is far more than could be produced in the next year they said, but since January 1 orders have been placed for 27,776 freight cars and 518 locomotives. Even this will absorb more than the amount available in the revolving fund, they declared, making it necessary to issue equipment trust certificates for the balance.

### Freight Movement, 1917 to 1919, Inclusive

**C**AR service statistics of class 1 railroads of the United States, 1917 to 1919, inclusive, as prepared by Charles E. Lee, of New York, are as follows:

	Year Ended		
	Dec. 31, 1917	Dec. 31, 1918	Dec. 31, 1919
Total revenue freight tonnage	\$2,177,247,081	\$2,270,035,053	\$2,305,868,245
Originating freight tonnage...	1,202,000,067	1,264,015,725	1,263,265,890
Avg. daily originating tonnage	3,293,151	3,463,056	3,461,002
Revenue freight cars owned	2,253,111	2,301,947	2,323,262
Total revenue freight ton miles	362,444,397,129	394,465,400,493	400,379,284,206
Loaded freight car miles	15,879,370,777	15,932,049,759	15,028,393,450
Total freight car miles	22,639,356,927	22,695,744,503	22,191,586,263
Number of cars used daily to move originating freight	144,437	140,204	130,112
Tons originating freight handled for each car owned	533.5	549.1	548.0
Number of cars owned to each car required to move originating freight	15.6	16.4	17.8
Ton-miles per car per day	440.7	469.5	472.1
Tons per loaded car	22.8	24.7	26.6
Times necessary to load each car	23.4	22.2	20.6
Avg. number of days between loading	15.6	16.4	17.8

### Railroads Seek Raise in Freight Rates to Increase Revenues a Billion Dollars

**T**O MEET increased cost of operation and to adjust their income to the 6 per cent basis provided in the new Transportation Act, the railroads of the country have submitted to the Interstate Commerce Commission statements showing the need of an increase in revenue amounting to more than a billion dollars a year.

The roads show that while operating expenses have advanced about 100 per cent because of higher wages and increased prices of material and fuel, their revenue has increased less than 40 per cent and they assert that it will now require an increase of 20 per cent to restore the proper relation between revenues and expenses.

The companies suggest to the commission that the additional revenue be gained from freight traffic, leaving passenger rates at the present level. To provide these increases to total revenues without disturbing passenger rates the carriers estimate they will require an average increase in freight rates of about 28 per cent.

According to a report of the State Inspector of Coal Mines, Colorado's output of coal during 1919 was 10,406,543 tons, a decrease of 2,251,512 tons as compared with the previous year. Of 12,799 men employed in and about the mines in 1919, 11,874 men worked an average of 221.4 days. Only 925 men worked a smaller average number of days. These were mostly employed in wagon mines which operated only during the winter months.

## Big Program Announced for Denver's Four-in-One Convention

AS announced last week, the Rocky Mountain Coal Mining Institute has clubbed its interests with three other mining societies and will hold a grand four-in-one convention that will draw visitors from all over the West. All who intend to be present would do well to pick their hotel and write immediately for accommodation as Denver grows so fast that the present stopping places fail to meet its many needs. The tentative program is as follows:

*Sept. 9 (Thursday)*—Forenoon: Sessions of the Rocky Mountain Coal Mining Institute, probably at the Albany Hotel, and sessions of the Colorado Metal Mining Association and of the Colorado Chapter of the American Mining Congress at the Brown Hotel.

Afternoon: Mine-rescue contests and coal-mine explosion demonstration at Overland Park.

Evening: Informal banquet at Brown or Albany Hotel to be attended by all mining organizations and be addressed by the Governor of Colorado, Mayor of Denver and prominent mining men.

*Sept. 10 (Friday)*—Forenoon: Sessions of Rocky Mountain Coal Mining Institute. Sessions of Colorado Metal Mining Association and of Colorado Chapter of American Mining Congress.

Afternoon: First day of the First-Aid Contest at the Denver Auditorium, all teams present competing.

Evening: Opening meeting of all mining organizations at the Auditorium, to be addressed by speakers of national reputation. Program to be arranged by American Mining Congress.

*Sept. 11 (Saturday)*—Forenoon: Sessions of Rocky Mountain Coal Mining Institute.

Afternoon: Second and final day of the First-Aid Contest at the Denver Auditorium, all teams present competing.

Evening: Award of contest prizes, probably at Lakeside (Denver's main pleasure resort), and after the award some good speakers may address the crowd, or dancing, boating, etc., may be indulged in.

## Will Contract For No More Coal Than Can Be Supplied

OWING to the shortage of open-top car equipment and a lack of locomotives to haul the cars, operators who take contracts promising to deliver all the coal that they would mine if they had the car supply which their rating entitles them to, never can by any possibility fill their contracts. Knowing that this is a fact the purchaser who would secure himself makes contracts with several concerns expecting a minimum fulfillment. This gives a false impression among producers that a large demand exists, whereas the amount of coal really needed is far below what is being contracted for.

In order to make contracts that have value the Bertha Coal Co. is basing its agreements to supply coal not on 100 per cent of railroad performance but on 50 per cent. If the railroad gives 40 per cent of the rating then the coal company fills only 80 per cent of its orders whereas under the old contracts it agreed to deliver only 40 per cent.

A clause has been inserted, however, that puts the buyer under a similar obligation. It reads: "It is mutually understood and agreed that the shipments of

coal to the buyer for and during each month shall constitute the fulfillment of a corresponding proportion of this contract and that tonnage shall not be cumulative. The buyer agrees at all times to receive coal under this contract before accepting coal from other shippers, and the seller agrees to ship 100 per cent on contract prior to accepting orders for coal not covered by this and other similar contracts."

## Federal Trade Commission Issues Modified Cost Form

IN RESPONSE to representations made by some of the anthracite operators regarding the tentative form recently issued for reporting anthracite costs, income and tonnage to the Federal Trade Commission an "optional" form is being prepared, which operators may use, if they so prefer, in place of the form already sent them, in reporting their monthly costs for January, February and March. A conference will be held at the office of the Commission, on May 18, 1920, to decide what form of report should be required for April and subsequent months. To this conference, the "Independent" operators will be invited to send three representatives, and the "Railroad Coal Companies," three representatives.

The Commission states that in making returns on the form already sent out (form C-52), operators may, if they prefer, combine lines 2 and 3 in one return, and show it as "Mining and loading." Operators, in certifying to the balance sheet, may if necessary insert the words "subject to adjustments made in accordance with the rulings of the Internal Revenue Department," following the statement "Certified correct and in accordance with the books."

## Foreign Trade Convention To Be Held at San Francisco May 12-15

UNDER the auspices of the National Foreign Trade Council the Seventh National Foreign Trade Convention will be held in San Francisco from May 12 to 15 inclusive. The general theme of the convention will be "The Effect of Being a Creditor Nation."

The council will hold a reception for the visiting delegations of foreign business men and convention delegates in the Palace Hotel on May 11 at 8 p. m. This will be followed by an exhibition of industrial films.

The regular sessions of the conference will be held in the Civic Auditorium each day at 10 a. m., 2 p. m. and 8 p. m. A large number of speakers are listed for addresses and in addition distinguished foreign business representatives will discuss trade opportunities in their respective countries.

## Proposes Committee to Investigate Mining Conditions Near Scranton

A COMMITTEE to be composed of five members of the House to investigate the safety of mining and operating conditions in Lackawanna County, Pennsylvania, is proposed in a House resolution introduced by Representative McLane of Pennsylvania. The resolution directs the Bureau of Mines to co-operate with the authorities of Lackawanna County and of the City of Scranton in recommending plans for the solution of the mine-cave problem.

# Scale in Pittsburgh Field Waits on House-Rent Decision

Pick-Mining Wage Is \$1.11 Per Ton in Thick-Vein and \$1.03 in Thin-Vein Coal—Room Turning Is Now \$5.40 for a Seven-Yard Neck—Only Machine Differentials Allowed Are Those Between Punchers and Electric Machines—None Is Made Between Breast and Shortwall Cutters

**B**ECAUSE the Pittsburgh Coal Operators' Association wanted to incorporate in the wage scale of that district a rent increase of \$27.50 per year, or about \$2.30 a month, no decision was reached as to that matter, but all other questions were settled. The contract was signed, however, in the Freeport Field.

It is claimed by the mine workers that one company has five thousand houses and that the increase would mean \$137,000 a year. This probably is quite true, but the increase in the repair and replacement costs of that company have been many times that figure. The mine worker is always figuring that the increase means only so much to each man—a mere trifle not to be denied. When the increase is granted it is summed by the mine workers' leaders and the union boasts of the aggregate. When the operator tries to get a small and fair increase on rents the aggregate is emphasized and the small amount per man is overlooked.

This is the new wage scale:

### PICK MINING

Thin vein, mine-run, per ton.....	\$1.1164
Thick vein, mine-run, per ton.....	1.0311
All clay veins, 6 in. and less than 12 in.....	3.98
Anything over 12 in. in all places, all the rate per foot.....	3.98
When clay veins run at an angle there shall be paid in all places while it continues, per yard.....	0.98
Anything 6 in. or less shall be considered a spar, for which shall be paid in all places.....	1.99
When the spar runs at an angle there shall be paid additional, per yard, in all places.....	0.52
Room turning, neck not to exceed 7 yards.....	5.40
Entry, single shift, per yard.....	2.95
Entry, double shift, per yard.....	3.50
Entry, treble shift, per yard.....	4.06
For 12-ft. places per yard.....	2.21
Breakthroughs between rooms, per yard.....	2.09
Breakthroughs between entries where slate is taken down, or comes down, and has to be removed, per yard.....	2.95
Breakthroughs between entries where slate is not taken down, per yard.....	2.09
Cutting drains, per yard, in entries.....	0.24
Ripping roof, per yard, in entries.....	0.31
Pick sharpening per dollar earned.....	0.0075

Ripping roof and cutting drain in any place to be paid at above price.

### MACHINE MINING

(Harrison, Ingersoll, Sullivan, or any other punching machine)

	Mine Run	
	Thin Vein	Thick Vein
For undercutting in wide work, per ton....	\$0.2525	\$0.2205
For drilling by hand and loading in wide work, per ton.....	0.7175	0.6857
For undercutting in all narrow work, per ton.....	0.2525	0.2205
And per yard additional.....	0.4532	0.4709
For drilling by hand and loading in all narrow work, per ton.....	0.7175	0.6857
And per yard additional.....	0.8934	0.9542

For loading and cutting in room turning entry price shall be paid.  
Pick sharpening, loading after machines, 0.0075 on dollar; both thick and thin vein.  
Loaders to receive 17.39c. per yard in addition to above prices when driving entries double shift.

### MACHINE MINING

(Jeffrey, Link-Belt, Morgan-Gardner, or any other chain machine)

	Mine Run	
	Thin Vein	Thick Vein
For undercutting in wide work, per ton....	\$0.1692	\$0.1494
For drilling by hand and loading in wide work, per ton.....	0.7708	0.7337
For undercutting in all narrow work, per ton.....	0.1692	0.1494
And per yard additional.....	0.2100	0.2468
For drilling by hand and loading in all narrow work, per ton.....	0.7708	0.7337
And per yard additional.....	0.9744	1.0346

For loading and cutting in room turning entry price shall be paid.  
Pick sharpening, loading after machines, 0.0075 on dollar, thick and thin vein.  
Loader to receive 17.39c. per yard in addition to above price when driving entries double shift.

### MACHINE DEAD WORK

Thick and Thin Vein

(With Harrison, Ingersoll, Sullivan or any other punching machine)	
Clay vein 6 in. and less than 12 in.....	\$2.93
Anything 12 in. or over, per foot.....	2.93
(Of which the cutter receives 73c. and the loader \$2.20)	
When clay veins run at an angle across the room, per yard (Of which the cutter receives 15c. and the loader 56c.)	0.71
Anything 6 in. or less shall be considered a spar, for which shall be paid.....	1.45
(Of which the cutter receives 35c. and the loader \$1.10)	
When the spar runs at an angle there shall be paid additional, per yard.....	0.37
(Of which the cutter receives 9c. and the loader 28c.)	
(Jeffrey, Link-Belt, Morgan-Gardner or any other chain machine)	
Clay veins 6 in. and less than 12 in.....	\$2.68
(Of which the cutter receives 47c. and the loader \$2.21)	
Anything 12 in. or over, per foot.....	2.68
(Of which the cutter receives 47c. and the loader \$2.21)	
When clay veins run at an angle across the room, per yard (Of which the cutter receives 9c. and the loader 55c.)	0.64
Anything 6 in. or less shall be considered spar, for which shall be paid.....	1.31
(Of which the cutter receives 24c. and the loader \$1.07)	
When the spar runs at an angle there shall be paid additional, per yard.....	0.31
(Of which the cutter receives 7c. and the loader 24c.)	

All prices for narrow work and dead work in the thin vein shall apply to similar work in the thick vein.

### INSIDE DAY-WAGE SCALE

Motormen.....	\$6.10
Motormen helpers (by whatever name known), skilled wiremen in charge of work, track layers, bottom eagers, drivers, trip riders, water and machine haulers and timbermen, where such are employed.....	6.00
Pipemen for compressed-air plants.....	5.92
Tracklayer's helpers, wiremen's helpers and unclassified inside day labor.....	5.75
Trappers.....	3.18

### OUTSIDE DAY-WAGE SCALE

Ram operators.....	\$5.60	Pushers.....	\$5.18
Dumpers.....	5.42	Car cleaners.....	5.10
Trimmers.....	5.36		

## Union Tries to Work Its Way Into Thacker Field of West Virginia

**T**ROUBLE seems to be brewing in the Thacker field of West Virginia, where an apparently determined effort is being made by the miners to organize. So far the miners do not seem to have made much headway, as the operators are opposed to the organization of the mines in Mingo county and will not, it is believed, submit to the organization of the mines without a struggle.

## Would Not Load Railroad Cars Placed by Non-Union Brakemen

**A**LLEGING that non-union brakemen helped to switch empty coal cars into a railroad siding, 350 coal mine workers employed by the Kirk Dunn Coal Co., at West Point, near East Liverpool, Ohio, went on strike May 3, the strike to last till union brakemen provided other cars for the work.

## To Make Survey of Tennessee Coal Beds

**D**AVID WHITE, Chief Geologist of the U. S. Geological Survey, is making a tour of Tennessee in company with State Geologist W. A. Nelson and Dr. L. C. Glenn, of Vanderbilt University, for the purpose of correlating the coal beds of the state.

## Dr. F. G. Cottrell Will Head Mines Bureau

Well-Known Chemist and Metallurgist Selected to Succeed Dr. Van H. Manning—Inventor of the Cottrell Process of Electrical Precipitation of Fumes Has Been with the Bureau Since 1911

**D**R. FREDERICK G. COTTRELL unquestionably will succeed Dr. Van H. Manning as director of the Bureau of Mines. He was recommended for the place by the Secretary of the Interior. The President acted favorably on the recommendation almost immediately, and sent the nomination to the Senate. Confirmation has been delayed because no executive sessions of the Senate have been held. It is known definitely that there will be no objections to his confirmation.

The selection of an assistant director is now being considered. Since it is understood that Dr. Cottrell is not disposed to retain the office for more than a limited period, great care is being exercised in the selection of an assistant director, who would be the logical successor to the directorship.

Despite the fact that Dr. Cottrell is not a mining engineer, his appointment has general approval in the mining industry, although some continue to insist that the place should go to a mining engineer. Dr. Cottrell has been closely associated with mining problems for many years, however.

Dr. Cottrell was born in Oakland, Cal., Jan. 10, 1877. He attended school in Oakland and was matriculated at the University of California in 1893. As a university student he gave especial attention to science, particularly chemistry. After graduation in 1896, with the degree of Bachelor of Science, he was a Le Conte fellow at the university in 1896-7 and taught chemistry at the Oakland High School in 1897-1900. Then he went to Europe, where in 1901 and 1902 he studied at the University of Berlin and the University of Leipzig, receiving from the latter the degrees of Master of Arts and Doctor of Philosophy, 1902.

On his return to this country in 1902 he was appointed instructor in physical chemistry at the University of California, and in 1906 was appointed assistant professor, holding this position until 1911. While at the university Dr. Cottrell's chief contributions to science were researches relating to the electrical precipitation of fume and fine particles suspended in the gases of smelter, blast furnace or cement works flues, and he finally evolved what is known as the Cottrell process for this purpose. This invention was first utilized at the Selby smelter in California for removing fumes from the waste gases of a sulphuric-acid plant at the smelter, thereby abating a nuisance that threatened to necessitate shutting down the works.

Subsequently this electrical precipitation process was installed at other smelters to remove fume and solid particles contained in the escaping gases, and it was successfully used also at cement plants, notably near Riverside, Cal., to prevent the dust from calcining kilns from damaging nearby orange groves and vegetation. Today the Cottrell process of fume and dust removal is in worldwide use, and is recovering materials valued at many thousands of dollars heretofore wasted.

One of the latest installations is at a large smelting plant in Japan, while the largest installation is at the Anaconda smelter, Anaconda, Mont. Dr. Cottrell in a desire to encourage scientific research turned over his extensive patent rights to a non-dividend paying corporation, known at the Research Corporation, a body formed for that purpose. A fundamental provision in the incorporation is that all net profits shall be devoted to the interests of scientific research.

In 1911, when Dr. J. A. Holmes, the first director of the Bureau of Mines, was serving as a member of commissions appointed by the Government to study alleged damages from smoke and fumes from the Selby and the Anaconda smelters, and the Bureau of Mines was investigating at length the smelter-smoke problem, Dr. Cottrell, because of his scientific attainments and his special knowledge of metallurgical problems, was appointed chief physical chemist in the bureau. In 1914 he was appointed chief chemist; in 1916, chief metallurgist, and in 1919, assistant director.

Aside from his work on smelter smoke Dr. Cottrell has been deeply interested in and intimately connected with work on the separation and purification of gases by liquefaction and fractional distillation. During the world war and subsequently thereto the development of the Norton or Bureau of Mines process for the recovery of helium from natural gas has been his special care, and it was chiefly through his efforts that a plant for recovering helium—a rare non-inflammable gas—on a large scale for military aeronautics was erected near Petrolia, Texas.

Dr. Cottrell is a member of the American Chemical Society, Mining and Metallurgical Society of America, the American Electro-chemical Society and the American Institute of Mining and Metallurgical Engineers. He was awarded the Perkin medal by the New York Section

of the Society of Chemical Industry in 1919 in recognition of his work on electrical precipitation.

Dr. Cottrell is the holder of the following United States patents:

Patent	Patent No.	Date
Manufacture of Sulphuric Acid.....	\$66,813	Sept. 24, 1907
Apparatus for Separating Sulphuric Acid .....	\$66,811	Sept. 24, 1907
Art of Separating Suspended Particles from Gaseous Bodies .....	\$95,729	Aug. 11, 1908
Effecting Interchange of Electric Charges Between Solid Conductors and Gases .....	\$45,917	Jan. 11, 1910
*Process for Separating and Collecting Particles of One Liquid Suspended in Another Liquid .....	\$87,114	March 21, 1911
*Separating and Collecting Particles of One Liquid Suspended in Another Liquid (Co-patentee with James Buckner Speed) .....	\$87,115	March 21, 1911
*Apparatus for Separating and Collecting Particles of one Liquid Suspended in Another Liquid.....	\$87,116	March 21, 1911
(Co-patentee with James Buckner Speed)		
*Separating and Collecting Particles of One Liquid Suspended in Another Liquid (Co-patentee with Allen Cheever Wright) .....	\$87,117	March 21, 1911
Purification of Gases .....	1,016,476	Feb. 6, 1912
Apparatus for Separation of Suspended Particles, etc. ....	1,035,422	Aug. 13, 1912
(Co-patentee with Burns)		
Filtering Media, Etc. ....	1,060,065	Apr. 29, 1913
Improvement in Method of Discharging Electricity into Gases .....	1,067,974	July 22, 1913
Synchronous Electrical Contact-Maker. ....	1,143,175	June 15, 1915

\*Owned and controlled by Petroleum Rectifying Co., 350 California St., San Francisco, Cal. (patents deal primarily with oil de-emulsifications.)

### British Columbia Coal Production

Coal production of British Columbia collieries for the month of March follows:

CROW'S NEST PASS		Tons
Crow's Nest Pass Coal Co., Coal Creek .....		27,090
Crow's Nest Pass Coal Co., Michel .....		21,529
Corbin Coal & Coke Co., Corbin .....		10,116
Total .....		58,735
NICOLA-PRINCETON		Tons
Fleming Coal Co., Merritt .....		3,344
Coalmont Collieries, Coalmont .....		81
Princeton Coal Co., Princeton.....		993
Total .....		4,418
VANCOUVER ISLAND		Tons
Canadian Western Fuel Co., Nanaimo .....		55,769
Canadian Collieries (D) Ltd., Comox .....		32,587
Canadian Collieries (D) Ltd., Extension .....		19,277
Canadian Collieries (D) Ltd., South Wellington .....		7,219
Pacific Coast Coal Mines, Ltd., South Wellington .....		10,338
Nanoose Collieries, Nanoose Bay .....		1,849
Granby Consolidated Mng. & Smltg. Co., Cassidy .....		17,566
Total .....		144,595
NORTHERN BRITISH COLUMBIA		Tons
Telkwa Collieries, near Prince Rupert .....		200

### Mark W. Potter Nominated to Interstate Commerce Commission

PRESIDENT WILSON has nominated Mark W. Potter, New York lawyer and railroad man, to the Interstate Commerce Commission. Mr. Potter fills the last of three vacancies that existed for several weeks, two other nominations having been made a few days ago.

Mark Winslow Potter is a member of the New York law firm of Hornblower, Miller, Garrison & Potter. He was born in Kaneville, Ill., 54 years ago, and was graduated from New York University in 1888, entering law practice here.

He is president of the Carolina, Clinchfield & Ohio Railway, and of the Cumberland Corporation. He is a member of the city, county and State bar associations.

### Ruhr Coal Field Has Housing for 560,077

AN investigation has recently been carried out, *The Colliery Guardian* states, covering 95 per cent of the mines in the basin and 393,067 workmen, into the state of housing in the Ruhr district. According to the report, there were 36,592 dwellings available for the accommodation of these workmen, excluding houses for officials.

Of the total, 35,184, containing 106,889 tenements, were owned by the mines, and 1,408, containing 5,937 tenements, were rented. These 112,826 tenements sheltered on June 1, 1919, 560,077 persons, of whom 151,850 were workers in the mines, comprising 138,042 heads of family or boys and 13,808 lodgers. The following table of housing statistics for the Ruhr district is not without interest:

Containing—	Average monthly rent (marks).			No. of residents	No. of persons per room
	Miners	Other householders	No. of tenements		
One room .....	5 54	9 49	65	76	1 16
Two rooms .....	10 47	19 15	5,673	18,613	1 64
Three rooms .....	14 51	26 59	40,523	176,611	1 45
Four rooms .....	17 61	35 42	57,671	306,345	1 33
Five rooms .....	21 09	45 24	6,850	43,975	1 28
Six rooms .....	24 87	56 83	2,044	14,459	1 18

In addition, the mines owned at the same date 134 hotels, accommodating 7,401 workmen, in which room was available for 12,000 persons beyond this figure.

### Gompers and Allen to Debate Kansas Industrial Court on May 28

GOVERNOR HENRY J. ALLEN of Kansas and Samuel Gompers, president of the American Federation of Labor, will meet May 28 to debate the Kansas Industrial Relations Court. The debate will be held in Carnegie Hall, New York.

Under the rules prescribed, each debater is privileged to appoint a committee of fifty to act as judges.

Previous to accepting the challenge of Mr. Gompers, Governor Allen is reported to have declined to meet Clarence Darrow, the well-known lawyer, in a discussion of the new industrial tribunal.

### Railroad Managers Plan Better Use of Cars To Avert Coal Shortage

OHIO railroad managers are taking initial steps to avert another coal shortage next winter. They have asked concerted action on the part of railroads in the territory east of the Rocky Mountains for the conservation of open-top cars for the carrying of coal. It is asserted that unless there is some definite action taken, there will be a worse coal shortage next winter than was ever known, due to the switchmen's strike and other causes which have held up production to a large degree.

In a general way the plan is to limit the use of open-top cars until coal mines are supplied 100 per cent. Eastern railroad officials are quoted as being favorable to this plan and it is planned to have a special committee of railroad officials to confer with the Interstate Commerce Commission, in order to get certain rules promulgated to bring about the conservation of open-top cars for coal movement exclusively.

James T. Beard

## Let Us Deal Fairly and Squarely With The Miner

Not long since I read the letter of Sim C. Reynolds, urging the fair and square treatment of miners, and was deeply interested in his presentation of a few of the difficulties that obstruct the path of the coal miner, *Coal Age*, Mar 18, p. 553. Let me say that this question can be discussed from many angles and I will refer briefly to one of them.

It is quite true, as Mr. Reynolds remarks, that miners are often radical and irrational in their demands, but, as he frankly admits, employers often show the same unreasonableness in their attitude toward the miner.

Not long since, the miners through their officials in the Union asked for an increase of 60 per cent in their pay and shorter hours. People in general expressed their disapproval of these demands. We were told that the miner always demands more than he expects to get. It was argued that the cost of living has not increased in proportion to the increase asked by the miner. These statements, however, come very largely from people living outside of mining districts. Their remarks might be true if the conditions in mining communities were the same as in large towns. It is safe to say that if such was the case the majority of the miners would be satisfied with a smaller increase in their earnings.

To my knowledge, the company where I am employed are trying to deal fairly with their employees and, at the present time, are working on a plan that will greatly relieve the hardships of their workers. Realizing from his own experience, the difficulties that beset the miner's path, Mr. Reynolds shows by his remarks that his heart is with the miner in everything that is right, which is true of every fair-minded person.

### PROFITEERING IS COMMON IN ISOLATED MINING CAMPS

Just here, let me refer to a conversation that I overheard and which took place between a triprider and the owner of a small grocery store, in a mining town. They were speaking of the profiteering of merchants and other dealers in supplies. The triprider asked why it was that he could save \$20 by making his purchases in adjoining towns. He stated that he could buy the same goods for \$30, in another town, which would cost him \$50 at home.

The reply of the storekeeper was to the effect that if a person came into his store from out of town and offered him 17c. for an article costing between 15c. and 16c., he would not refuse the offer, knowing that he would lose the money if he did not accept the price named by the purchaser. At the same time, he did not hesitate to say that he would charge a regular customer 25c. for the same article, claiming that the people living in the town had to have the stuff regardless of the price asked.

Fish that cost this storekeeper 15c. per pound delivered, he would sell for 35c. and 38c. a lb.; and oysters that cost \$2 a gallon sold for \$1 a quart. Conditions such as these are not known or realized by people living in other communities; and the miner, isolated as he is from the great world outside, is expected to accept these hardships and burdens as a part of his lot. There is plenty of opportunity for our government to investigate profiteering in small mining districts and isolated communities where there is little or no competition in trade.

## Short-Circuiting or Obstructing the Air Current in Fan Ventilation

Some time ago, I recall that, in making an air-inspection report on a mine in Pennsylvania, at a time when air measurements and water-gage readings were being taken, the following test was made in short-circuiting the air: The fan at this mine was of steel construction and exhausting 240,000 cu.ft. of air per minute from the mine under a 42-in. water gage.

In order to short-circuit the air a 5 x 7 ft. trapdoor was opened, at approximately 300 ft. from the upcast shaft, which had an area of only about 80 sq.ft. When this door was opened the air current made a circuit of not more than 1,000 ft., taking into consideration both the intake and the fan shafts, which were each 180 ft. in depth.

### EFFECT OF CONTRACTED AREA OF THE UPCAST SHAFT

After making this short-circuit, we found that the water gage did not show any appreciable change. The water gage was, I believe, of the Bristol recording type. It might be of interest to say, here, that practically one-half of the mine water gage was created by the air going up the small fan shaft.

At a distance of 250 ft. from the fan-shaft bottom, when the air was going around through the mine, the water gage was 1.5 in., while it showed only 0.5 in. when we short-circuited the air. The fan was belt-driven, by an alternating-current induction motor.

As to an obstruction in the air-course, I will relate an actual incident that occurred in West Virginia, at a mine over which I had charge. The fan was a Lepley reversible, 23 x 8 ft. and used as a blower. It was producing 125,000 cu.ft. of air per minute, with a 1.4 in. water gage. This fan was direct connected to a steam engine known as the Lepley type of engine.

One morning at 2:30 a.m. the night mine foreman woke me, saying that something unusual had happened to the air current. In fact, instead of the air going up the "B" shaft, it was, if anything, coming down that shaft. In other words, the air current was almost at a standstill. I said, "Did you look at the fan?" He replied, "Yes, and its making the usual number of

revolutions, and both the Bristol and the ordinary water gage register 1.4 in." When asked if the fan wheel was turning, as well as the fan shaft, he replied, "Yes."

Rising, I went down to the fan-house and found all of his statements were true. From there, we got on the cage and went to the foot of the downcast shaft and found the opening at the foot of that shaft frozen shut with soft ice, so that the area of the opening was not more than one-half a square foot, if it was that. After we broke down the ice, the air circulated as usual with the regular quantity passing and with the usual 1.4 in. of water gage.

The following day the night mine foreman, whom I wish to say was not only a good technical man, but an A No. 1 practical man, said to me, "Why didn't either one of those water gages show us that the shaft was frozen shut and the air could not get down?" This man is at present a state mine inspector, which shows further he was and is a man of exceptional mining knowledge and ability.

MINE BOSS.

Greensburg, Pa.

### Tamping a Charge of Dynamite Is the Safest Method

This subject has been running in my head since the discussion began. It has taken me back some 35 or 40 years, when I used to stick the jumper or tamping bar into the hole, to act as stemming; then, light the squib in the blasting barrel and rush for safety, crouching behind a mine car that I kept standing at what seemed to be a safe distance away.

I practiced this daredevil scheme until one time the shot blew the blasting barrel my way, with the result that it was imbedded in the end of the car and crumpled up under the force of its impact. Then and there I quit that game and followed a safer method in my blasting operations.

#### BETTER RESULTS OBTAINED BY GOOD TAMPING

Without getting into any controversy with others of a different faith, I claim that far better results are obtained when a dynamite charge is tamped fully to the mouth of the hole. Having used, I might say, thousands of pounds of dynamite ranging from a 40 to an 85 per cent grade, my belief in well tamped shots is based on actual experience, which is always the best teacher.

A few years ago, when sinking a shaft and drilling what are termed "wallside" holes, which are holes driven straight down so close to the side of the shaft that the fingers would just clear when handling the drill, I got good results, with 85 per cent dynamite (gelatin), in holes where the water would shoot from the gullets or cracks in the strata to a height of 8 or 10 ft. when the blast went off. The charge was carefully forced down to the bottom of the hole below the gullet and the water made an air-tight stemming.

However, today, in shooting coal, particularly with permissible explosives, which are considerably slower than dynamite, and when the market demands lump coal, all holes should be stemmed as hard as reasonable, in the judgment of the shotfirer.

Today, in company with a mine inspector, I went into a place that was already shot down. A shot had been placed on each side of the breast, which under ordinary conditions would do good work. We noticed that the

right-side hole was still plainly visible, the shot having only cracked the coal downward. There was no coloring of clay on the sides of the hole; but, on the contrary, it was blue black, which indicated that the shot had spent most of its force in the direction of the mouth of the hole. We use AA Aetna powder.

#### INSUFFICIENT STEMMING CAUSES A BLOWNOUT SHOT

After examining the place, our conclusion was that the hole had not been properly stemmed. However, the place being very wet, it is possible that the clay used in stemming was in too moist a condition to offer much resistance, with the result that the shot blew its tamping. This incident again leads us to think that all holes charged with any grade of permissible explosive must be securely tamped from the charge to the mouth of the hole. Reflecting, for a moment, on what a blown-out shot has done and what it is liable to do again and the serious consequences that are sure to follow, cannot fail to impress us with the necessity of good solid tamping.

In the interest of safe mining, let us insist on the employment of honest shotfirers who will listen to admonition and regard their own safety. If we err let it be on the right side; but let us not invite trouble by doing what is liable at any time to produce another Naomi explosion as the result of such unsafe practices in blasting.

Our local and general safety committees will, I am sure, bear me out in insisting that all shotholes must be fully tamped. The manufacturers of explosives ask the same; and why should not we, who are in direct contact with and in control of the work, use every precaution to insure safety, instead of giving way to the whims of a few shotfirers who think they have too much work to do to permit of more than half-tamping the holes.

### Mystery In Mine Explosions Results from Our Lack of Knowledge

Reading the several letters discussing the mysterious explosion that occurred in the Buffalo mine, in Ohio, the account of which was given in *Coal Age*, Jan. 22, p. 197, impresses even the miner with the thought that he is continually surrounded by hidden dangers of which he has little knowledge. In recent years there have been many occurrences in mines that have been placed in the catalog of "unaccountable accidents."

While we frequently fail to account satisfactorily for these occurrences and are forced to the conclusion that the science of mining has not made the progress that we could wish, we have escaped from that atmosphere of mystery that surrounded our forefathers, who were wont to explain such accidents as the work of spooks, fairies or evil demons. Today we do not accept such theories, even though we fail to grasp the meaning of the many expert opinions that are given in explanation of the occurrence.

#### WE NEED TO STUDY CAREFULLY ALL THE CONDITIONS

The fact that the Buffalo mine had been examined and reported "safe" by the fireboss, only a short time before the explosion occurred, leads one to believe that either there was a great mystery in the affair or the fireboss failed to report the true condition of the place. In

our practical experience in coal mining, we often meet with peculiar conditions that require a close study of the geology of coal and its formation with the occlusion of gas in the strata, which makes possible the sudden outbursts of gas that occur, from time to time, in our mines. Without the knowledge derived from this study, occurrences such as these are a mystery.

I recall a mysterious explosion that occurred some years ago in a mine in England, at a time when no one was in the mine. Different theories were advanced as to the cause, one being that gas had been ignited by sparks struck by a hard flinty rock falling from the roof upon a similarly hard substance. There were those who scoffed at this idea, as men are generally slow to accept a new principle or theory.

In recent years, the extensive use of natural gas for industrial purposes, made possible through deep boring, shows the existence of immense quantities of gas stored beneath the earth's surface. Our mining experience tells us that this gas finds its way through numerous faults and slips in the strata and makes its appearance in the mine workings, often quite suddenly and when we least expect. This proves the possibility of accumulations of gas forming at any time in a mine supposed to be free from gas and safe. Reports of explosions frequently add that "the mine was never known to generate gas."

In reference to gas being generated in the floor of a mine, many are adverse to such an opinion. That was my condition a few years ago; but, on one occasion when making my rounds of the mine where I was employed and where gas was rarely seen, I had just passed through a room where the coal was being cut by machines, when the men called me back to show me that they had lit some gas given off in the mining at the bottom of the seam. It was a new experience to them and to myself as well.

There being no old works near the place led me to study the situation, and my conclusion has been that gas often issues from crevices in the floor and from faults in the formation, which may reasonably be expected, instead of supposing the gas must always come from the roof.

#### DANGER LURKS IN THE DUST-LADEN AIR IN MACHINE MINING AND IN OUTBURSTS OF GAS

We all know that fine coal dust is a great source of danger in mines, and that the danger is increased when gas is present. Anyone who has gone into a room where a machine was at work mining the coal will testify as to the density of the clouds of dust floating in the air. I have even known it to sparkle on the lamps. This condition would make a place dangerous where the amount of gas present was not sufficient to cause alarm.

Speaking of sudden outbursts of gas, there is an account, in Pameley's book on mining, of a mine where gas accumulated during the night to such an extent as to fill the shaft. The gas was ignited in the engine room at the shafthead and a volume of flame shot up 150 ft. into the air. Fortunately, no one was in the mine at the time.

To sum up, my conclusion is that mine workings are subject to such outflows of gas from great reservoirs beneath the strata. This fact, together with the possibility of the gas being ignited by the light of an unsuspecting miner, or the breaking of an incandescent

lamp bulb, or other cause, makes it necessary to be always on the watch and observe every possible precaution to avoid danger.

W. M. CHAMBERS.

Staunton, Ill.

### Superintendent's Plans Disrupted by a Worker's Request for a Change

The question of shifting a worker is a problem with which mine officials are frequently confronted and one that often proves very annoying. About the time a superintendent has completed his organization and is beginning to think that everything will move along smoothly, he is suddenly brought face to face with a request from a man, holding a subordinate but important position, who asks to be transferred to another place. The change is not often easily adjusted.

How often has a mine official gone from his office to his home and perhaps to bed; and, before closing his eyes for the night, has gone over the whole situation and completed his plans by which he hoped to strengthen the whole organization. Every man on the force is known to him; he has studied each man's capability and fitness for the position contemplated. The arrangement is made in the best interests of all concerned. Then, before this could be put into effect, in comes some one with a special request for a position other than what the superintendent has planned for him.

The change will disrupt his plans and necessitate making other changes not in the program. Some one asks, "Should the superintendent curse and swear?" There are times, no doubt, when something should be said; and this may be true in the case cited in the inquiry that started this discussion, *Coal Age*, Feb. 12, p. 327. No doubt, the superintendent in that instance, thought he had this particular man placed in a position best suited to him and where he could use his knowledge and experience, as an electrician, to the best advantage. But, here, the mine electrician has offered the man a job of bonding rails in the mine, with more pay than what he was getting at the substation.

#### THERE ARE FREQUENTLY GOOD REASONS FOR A WORKER SEEKING A CHANGE

The instance cited, reminds me of a restless fellow whom I happen to know. He is a good fellow; will do almost anything; but, like the Irishman's flea, when you think you have him located, he is gone. The case in hand may be a similar one. In asking for the change desired, the man may have been wholly within his rights. It is quite clear that he has not stated all his reasons, which if we knew might alter our judgment. The work at the substation, while tiresome to an active man, would suit an older man better.

However, the superintendent showed a weakness in that he did not control his feelings and restrain his temper. If one must swear it is better to wait until he is alone by himself. Then, if he is still of the same mind he can let it out and it will do no one harm but himself. How can a man control a body of men if he fails to control himself?

"Millions for defense; not one cent for tribute" was the terse reply of our representative to the threats of the agents of France (1798). There are times when an emphatic answer must be given; but, under no consideration, should a man lose control of himself, whatever his provocation.

In my earlier experience, I have worked for mine officials who seemed to lack the least sense of courtesy. Such was their manner that I would shudder to see them coming, fearing a storm of abuse and fault-finding. As mine officials we need to extend the same courtesy and respect to our employees that we expect to receive from them, thus setting them the example.

Osceola Mills, Pa.

S. D. HAINLEY.

## Build an Up-To-Date Plant and Electrify the Mine

The inquiry of Arthur L. Sheldon of Charleston, W. Va., which appeared in *Coal Age*, Feb. 26, p. 419, relative to the best and cheapest method of working three seams of coal, has naturally aroused an interesting and profitable discussion. Different plans have already been submitted and others will be forthcoming from which Mr. Sheldon will be able to extract many excellent points that will be helpful.

The first consideration is the statement that a daily output of 1,000 tons is desired, and we may infer from this that the company have a sufficient acreage to maintain this tonnage for many years. In that case it would be desirable to build an efficient plant second to none in the state. In the plans I am about to submit, the cost of installation must not be considered as excessive, inasmuch as the cost of production and upkeep, per ton of coal mined, will be materially lessened as advancement is made in the mine, from year to year. It should be understood that I am writing from a general standpoint of economy and safety, and do not forget the increase that will be effected in time.

### MAKE AMPLE PROVISION FOR THE FUTURE IN THE LAYING OUT OF THE MINE

The three seams lie at depths, approximating 50, 100 and 160 feet, respectively, below the river bottom. They will be known, in what follows, as Seams Nos. 1, 2 and 3, respectively. Mr. Sheldon is right in proposing to sink two shafts, 300 feet apart, as required by law; but I would suggest that, as soon as the location for the plant has been determined, he proceed to open a slope to No. 1 seam. This should be done as rapidly as possible while erecting a temporary tippel that will later form a part of the permanent equipment. This being accomplished, work No. 1 seam as rapidly as possible and market the coal, thereby gaining the advantage of an income to help offset the first-cost of an up-to-date plant.

It is now time to sink the two shafts to No. 2 seam; and when Seam No. 1 is reached in sinking connect the shafts at once with that seam, for safety and air conditions. By the time Seam No. 2 is reached by the shafts, Seam No. 1 will be well advanced, and underground conditions, as to water, haulage, roof and bottom, can be studied to advantage for the purpose of improving the plans for laying out the mine in No. 2 seam. Any slight errors that are apt to occur can be thus eliminated.

### PLAN FOR SAFETY AND ECONOMY IN THE EQUIPMENT

Electrify the plant in every phase of economy, safety and convenience. Build a steel headframe and a concrete storage bin, having a capacity of from 700 to 1,000 tons and divide it into at least two connecting

compartments with a fly-pan just below the receiving chute, so arranged that the coal from either seam can be separated if necessary because of market conditions. This arrangement will naturally mean self-dumping cages. My advice is to equip the plant with electric hoists.

By the time the shafts to No. 2 seam are completed and coal is being brought to the surface, the development in Seam No. 1 will determine whether or not it is advisable to bring No. 1 coal up the shaft or to continue to haul it up the slope. In any event, however, the temporary tippel at Seam No. 1 should be so constructed that any slate and rock from the three seams that must be brought to the surface can be dumped over a pan, dropped for that purpose, and allowed to slide down a chute into a lorry or car waiting to convey it to the rockdump. The temporary tippel should be erected alongside of the storage bin so that the one crew can attend to all.

The mine cars should be so constructed, as to size and durability, that with slight changes they can be adapted for use in No. 3 seam, later. Equip each seam with storage-battery locomotives and charging stations. Weigh the coal on the inside. It is understood that the equipment used in the first two seams can be used, later, in the lower seam, at least in a general way.

### COMPLETE EXTRACTION OF COAL DEPENDS ON ORDER OF WORKING THE SEAMS

Working from the standpoint of a complete recovery of coal, it will be advisable to work No. 1 seam in advance of No. 2, and No. 2 in advance of No. 3. But, to maintain the desired tonnage (1,000 tons per day), it would seem that the coal from No. 1 or at the most some from No. 2 would be sufficient. This would concentrate the working forces and not demand such an elaborate system of upkeep on each seam.

About the time No. 1 seam is exhausted, the shafts should be sunk to No. 3 and that seam made ready for production to offset the loss of No. 1. The material taken from No. 1 can generally be used in No. 3 seam. Also, as the biggest operation, in later years, will be from Seam No. 3, the material from No. 2 can be transferred when that seam is worked out.

It should be born in mind that similar working plans should be used in all these seams. The pillars left in the first two seams should be directly over those in the lower seam, and when pillars are to be drawn, particular attention should be given to draw the upper ones first. More especially is this true if any working places have been driven under the river. Such workings should never be attempted if possible to avoid them.

It is difficult to determine the best plan to adopt in working these seams. Mr. Sheldon states that the mountain rises 1,000 ft. above the railroad; and, considering the general geological conditions, we might assume that the top over the coal would be fairly good. But, the working of Seam No. 1 in advance of the lower ones will afford an advantage in determining the right procedure for the other two. I should think, moreover, that the core taken from the two test holes and the knowledge at hand as to acreage and possibilities would be of considerable help in determining the number and width of the entries, and the width of the pillars and rooms, in order to secure the most economical and safe system of working these three overlying seams.

Thomas, W. Va.

# Inquiries of General Interest

Answered by  
James T. Beard

## Removing Gas From Rise Workings

A question asked at a recent mine foremen's examination was brought up a little later at a night school where I attend, with the result that no satisfactory conclusion was reached. The question is as follows:

Suppose you had charge of a mine where there was a gob area extending 200 ft. to the rise of the ventilating shaft and, during periods of falling barometer, gas issued from the gob in such quantities as to foul the air in all the adjacent upgrade workings. Suppose, also, that the mine's resistance is so low that a water gage of one-half inch produces sufficient ventilation for the rest of the mine; but this pressure is not sufficient to drive the gas from the rise workings. The question is, what can be done to remove the gas on the rise side of the mine, without increasing the quantity of air circulating in the other workings? A NEWBURY.

Nanaimo, B. C., Canada.

This is an instance of the lack of the proper regulation of the air passing into the mine. The air current should be split at the foot of the downcast shaft. A regulator should be placed, at that point, on the air-course leading to the dip workings. The opening in this regulator should be so adjusted as to increase the pressure leading to the rise side of the mine sufficiently to produce the desired results.

The quantity of air passing into the dip workings is controlled by the adjustment of the regulator to suit the conditions. It is simply a matter of the proper distribution of the air entering the mine and involves supplying a sufficient ventilating power to produce the required pressure in the rise workings. The ventilating pressure in the main drift will, of course, be raised by the presence of the regulator at the foot of the shaft.

## Shortening a Hoisting Rope

A question that has caused considerable argument hereabout, is one relating to the shortening of a hoisting rope on one side of a double-compartment shaft. For the purpose of securing a better grade and expediting the movement of the cars on the shaft bottom, it was proposed to raise the sump logs on one side of the shaft 8 in., and to shorten the hoisting rope on that side the same amount. Formerly, the sump logs on both sides of the shaft were at the same level and the two ropes, which were attached to the same drum, were of equal length.

It was argued that when the cage attached to the long rope is at the upper landing, the other cage will rest on the sump logs, after the rope has been shortened and the logs raised 8 inches.

In discussing this question, I contended that when the two ropes are made of unequal length the ascending cage attached to the shorter rope will reach the upper landing when the descending cage on the long rope is within 8 in. of the sump logs on that side of the shaft.

Or, again, even assuming that one of the ropes is changed on the drum, so as to permit the cage attached to the long rope to rest on the bottom when the other cage is at the upper landing, I claim that the descending cage attached to the short rope, would then reach the sump logs, raised 8 in., before the other cage has risen to the upper landing.

Some of the men think that it will make no difference, and that we can hoist just the same when one rope is shorter than the other, provided the sump logs are raised so as to correspond to the shortening of the rope. Please answer this question in the columns of *Coal Age* and settle our dispute.

Toluca, Illinois.

LARRY MCGONNIGAL,  
Mine Mgr.

Assuming that the two ropes, in a double-compartment shaft, are attached to the same drum and the diameter of the drum is the same throughout, it follows that any given number of turns or revolutions of the drum will raise one cage the same distance that the other is lowered. By raising the sump logs 8 in. on one side of the shaft, the depth of hoist, on that side, is shortened the same amount. As a result, the hoist from those sump logs to the upper landing, will be completed when the drop on the other side of the shaft lacks 8 in. of completion. This is true which ever cage is being hoisted or lowered, the shorter side will complete the trip between the upper and lower landings when the longer side lacks 8 in. of reaching its level.

## Economy in the Firing and Care of Steam Boilers

How is it possible to fire steam boilers to get the best results, and what care is needed in their use?

La Salle, Ill.

ASST. FIREMAN.

Steam boilers should always be fired at regular short intervals, by placing the fresh coal at the front of the fire and allowing it to remain there until it has become partly ignited when it is spread quickly and evenly over the fire. This process is called the "coking method" of firing. It has the advantage of maintaining a constant and uniform heat beneath the boiler which is very important in the production of steam.

In order to secure the best results, steam boilers require thorough cleaning at regular intervals, when any scale accumulated on the inner surface of the boiler and tubes must be removed. In order to prevent, as far as possible, the formation of scale in the boiler, the purest possible feedwater should be used. When feedwater contains lime, magnesia, or other impurities, in the form of carbonates or sulphates, some reliable method of treatment must be adopted to remove these impurities before the water is introduced into the boiler. The boiler should also be partly blown off at frequent regular intervals to remove any accumulation of sediment and to keep the boiler clear.

# Examination Questions

Answered by  
James T. Beard

## Miscellaneous Questions

(Answered by Request.)

*Ques.*—What causes a dust explosion; and what method would you adopt to prevent the occurrence of such an explosion?

*Ans.*—A dust explosion results from the ignition of a cloud of dust, which has been thrown into the air by the concussion produced by a windy or a blownout shot, or by the disturbance incident to the various operations going on in the mine. This is liable to occur wherever any undue accumulations of fine coal or dust is permitted in the working places and on the roads and travelingways in the mine.

The best means of preventing dust explosions is to adopt plans that will avoid undue accumulations of dust at the working faces and on the roads. Strict rules and regulations should be enforced regarding the blasting of coal, so as to reduce to a minimum the production of fine coal and dust. The working face must be kept clean and all "fines" loaded out with the coal. Dust-proof cars should be used and these should not be loaded so as to cause lumps of coal to fall from the cars in transit. All roads and travelingways should be thoroughly cleaned at regular intervals. It may be necessary to install an effective sprinkling system in the mine. At the working face, a soft friable coal should never be blasted off the solid; and every shot should be well mined so that the charge can properly perform its work.

*Ques.*—The center props, in a slope of 63 deg. pitch, are set 5 deg. up the pitch. What is the pitch of the prop?

*Ans.*—A slope pitching 63 deg. makes that angle with the horizontal and, as shown in the accompanying figure, a normal line in this seam will make an angle of 27 deg. with the horizontal. Then, since the post is "underset"

5 deg., the pitch of the post, or the angle it makes with the horizontal, is  $27 + 5 = 32$  deg., as indicated in the figure.

*Ques.*—Give the principal causes of personal accidents in mines.

*Ans.*—The chief causes of personal accidents are the following: Failure to examine one's working place and properly secure the roof and coal and reset any discharged timbers, before proceeding to work; lack of judgment and skill in the placing of shots, charging, tamping and firing of holes; carelessness and recklessness in the handling of powder when making up a cartridge; violation of mining laws or mine regulations and disobedience of orders; and, finally, undue haste and neglect to take necessary precautions and act on safety-first principles when at work at the face, or in going to and from work in the mine.

*Ques.*—In a certain mine, what should be the diameter of a 14-ft. collar beam if 6-in. timber is used where the collars are 8 ft. long?

*Ans.*—Assuming the unit load, or load per foot of length, of the collar is the same in each case, the diameter of the collar will vary as the cube root of the square of its length or the distance between notches. In other words, the cube of the diameter ratio is equal to the square of the length ratio. Therefore, calling the required diameter of the 14-ft. collar  $x$ , we have:

$$\left(\frac{x}{6}\right)^3 = \left(\frac{14}{8}\right)^2 = 1.75^2 = 3.0625$$

$$x = 6 \sqrt[3]{3.0625} = 8.71, \text{ say } 9 \text{ in.}$$

*Ques.*—Three airways are passing 100,000 cu.ft. of air per minute. Airway A is 5 x 6 ft., 14,000 ft. long; airway B is 6 x 6 ft., 17,000 ft. long; airway C is 5 x 7 ft., 3,000 ft. long. What volume of air will pass in each airway?

*Ans.*—The sectional areas, perimeters, and lengths of these airways are as follows:

$$A, a = 5 \times 6 = 30 \text{ sq.ft.}; o = 2(5 + 6) = 22 \text{ ft.}; l = 14,000 \text{ ft.}$$

$$B, a = 6 \times 6 = 36 \text{ sq.ft.}; o = 2(6 + 6) = 24 \text{ ft.}; l = 17,000 \text{ ft.}$$

$$C, a = 5 \times 7 = 35 \text{ sq.ft.}; o = 2(5 + 7) = 24 \text{ ft.}; l = 3,000 \text{ ft.}$$

The quantity of air passing in each airway, in natural division, is proportional to the pressure potential for that airway. Therefore, it is necessary to calculate the value of the potential for each split. The work is much simplified by taking the lowest relative values of the areas, perimeters and lengths. The areas are, as given, 30, 36, 35. The lowest relative perimeters are 11, 12, 12; and the lowest relative lengths, 14, 17, 3. The potential values for these three splits are as follows:

$$A, X_a = a \sqrt{\frac{a}{lo}} = 30 \sqrt{\frac{30}{14 \times 11}} = 30 \sqrt{0.1948} = 13.24$$

$$B, X_b = 36 \sqrt{\frac{36}{17 \times 12}} = 36 \sqrt{0.1765} = 15.12$$

$$C, X_c = 35 \sqrt{\frac{35}{3 \times 12}} = 35 \sqrt{0.9723} = 34.51$$

Sum of potentials 62.87

The quantity of air passing in each split is then found as follows:

$$A, Q_a = \frac{13.24}{62.87} \times 100,000 = 21,060 \text{ cu.ft. per min.}$$

$$B, Q_b = \frac{15.12}{62.87} \times 100,000 = 24,050 \text{ cu.ft. per min.}$$

$$C, Q_c = \frac{34.51}{62.87} \times 100,000 = 54,890 \text{ cu.ft. per min.}$$

# The Labor Situation

Edited by  
R. Dawson Hall

## Eastern Kentucky and Tennessee Agreement Made

A WAGE and working-condition agreement has been successfully negotiated in District 19, which includes parts of eastern Kentucky and Tennessee. The Harlan field of Kentucky is not included in the contract. This agreement gives the union recognition but does not provide a check-off, which has never yet been in effect in that district.

The 8-hour day is adopted; house rent is not to be raised more than 50c. per month and house coal is to be supplied at \$2.50 per month per house. The tonnage rates are increased 24c. a ton for both pick and machine mining, while the rate for daymen is increased \$1 per day, giving the following day-wage scale:

Machine runners .....	\$5.10
Motormen, blacksmiths and drum men .....	5.00
Spike-team drivers and boss drivers, head trackmen, head timbermen, bratticemen, engineers and carpenters.....	4.81
Blacksmiths' helpers .....	4.64
Carpenters' helpers .....	4.60
Machine runners' helpers, couplers, single-mule drivers, track helpers, wiremen and pipemen, pumpmen and timbermen's helpers .....	4.44
Unclassified inside labor, tippers and trimmers.....	4.20
Firemen .....	4.01
Teamsters and inexperienced coal loaders .....	3.80
Unclassified outside labor .....	3.72
Sand men, greasers and yard couplers.....	3.64
Trappers and boys .....	2.53

## Nova Scotia Mine Troubles Still In an Unsettled State

GREAT dissatisfaction has been felt in Nova Scotia with the Patterson and MacKinnon awards, the latter having been accepted by the employees of the Dominion Coal Co., Ltd. At a mass meeting held in St. Mary's Hall, Sydney Mines, N. S., on Tuesday April 27, President Baxter and Board Member MacPhee were busy for three hours answering questions propounded by the many malcontents who had denounced the awards as being inadequate and unsatisfactory. The meeting filled the hall and flooded the sidewalk.

In the end the leaders won the day but they declared their intention to demand in the near future the increase of 27 per cent in contract rates and \$1 per day to day men ("datal hands") that has been granted in the United States by the Bituminous Coal Commission. A motion was put to refer the matter back to the locals, but it was voted down and an amendment to accept the Patterson award carried by a large majority.

About May 1 the operators of the mines which are located at Joggins, Inverness and Little Bras d'Or agreed to meet the wage-scale committee of district 26, thus taking the initiative from the Dominion Coal Co., Ltd., the Nova Scotia Steel & Coal Co., Ltd. and the Acadia Coal Co., which, being the big companies of the province, usually lead the rest. Of course, nothing can be done till these larger companies also consent to meet the representatives of the district.

Nova Scotia mine workers have in recent months accepted membership in the United Mine Workers of America. Formerly they had their own provincial union. Since their amalgamation with the international body they have reacted immediately to all wage changes taking place in the United States.

## Montana Completes Its Wage Scale

JOINT conferees of the Montana Coal Operators' Association and the United Mine Workers reached an agreement as to wages on April 21. It will be effective from March 31. The instrument gives the miners a 27-per cent increase and advances the day men a dollar a day. Boy workers will receive 53c. more for each day's work. Monthly men get \$30 more per month based on a 30-day month. The increase for both pick and machine miners is 24c. per ton. Yardage and dead work are increased 20 per cent. House coal is raised from \$3.20 per ton to \$4.40, and powder is advanced 60c. per keg.

## Would Fix Their Own Rate of Pay

SELF-DETERMINATION seems to be the slogan in the old mining village of Stoneboro, near Sharon, Pa., where 350 coal-mine workers want nine hours' pay for eight hours' work. These men apparently like the increases that were awarded by the Bituminous Coal Commission and accepted by the International Union, to which 60 per cent of the men belong, and by the operators in general and their own operators in particular. They like the increases but believe they could improve on them and in fact do 12.5 per cent better. So 350 mine workers were on April 2 engaged in a strike to enforce the nine-hour pay for the eight-hour day with the Bituminous Coal Commission's award in addition. The dissatisfaction appears likely to be enduring, for ten days earlier the men walked out to enforce the same demand, but they were ultimately induced to return.

## Motormen Quit in Support of Discharged Fellow Workman

BECAUSE a motorman was discharged by the officials of the Delaware, Lackawanna & Western R.R. coal department at the Archbald colliery all the electric-locomotive drivers at the mine went on strike on April 28. The sanction of the union was not obtained for the strike.

Men in the anthracite region are now not indisposed to make trouble because they hope by such means to aid in a more rapid agreement of the scale sub-committee and one that will give the mine workers a larger increase in pay than negotiations will provide. Around Mahanoy City several are said to have laid down their tools already.

# Wage-Scale Agreement for Central Pennsylvania

House Rent Unchanged Except Where Improvements Are Made—Allowance for Pushing Where Miner Pushes Both Ways—Coal To Be Charged at Last Government Price Plus 27 Per Cent Plus Cost of Delivery—Powder To Be Sold at Cost Including Handling, Transportation and Insurance

**M**ANY details were omitted in the scale agreement of the central Pennsylvania district, No. 2, in last week's account and some errors were made in reporting the scale. It is here given in full:

This agreement, made April 26, 1920, by and between the Association of Bituminous Coal Operators of Central Pennsylvania, hereinafter called the operators, for and on behalf of each of its members, party of the first part, and the United Mine Workers of America of district No. 2, hereinafter called the mine workers, party of the second part.

Witnesseth, it is hereby agreed that this agreement shall take effect as of the date of April 1, 1920, and continue in force until April 1, 1922. Each of the parties agrees that, during the term of this agreement, the following scale of wages, rules and conditions shall be observed and govern at all collieries owned or controlled by the operators and wherein a majority of the employees are members of the mine workers.

## TONNAGE WAGE SCALE

Pick mining, per gross ton.....	\$1.2803
Pick mining, per net ton.....	1.1431
Machine loading, per gross ton.....	0.6656
Machine loading, per net ton.....	0.7729

Machine mining per ton (machine mining to cover cutting, scraping and loading on a tonnage basis) shall be advanced 26.88c. per gross ton or 24c. per net ton.

## ADVANCE NOT TO BE COMPUTED ON BONUS

Cutting and scraping by any other method than day or ton shall be advanced 27 per cent but this advance shall not be computed or applied on any part of the 5 per cent concession or bonus in the scale agreement of April 30, 1917.

Cutting and scraping per ton shall be advanced 5.11c. per gross ton or its equivalent 4.56c. per net ton.

All deadwork and yardage shall be advanced 20 per cent over prices in effect Oct. 31, 1919, provided that this advance shall not be computed or applied on any part of the 5 per cent concession or bonus in the scale agreement of April 30, 1917.

It is hereby distinctly understood and agreed that all of the hereinbefore-mentioned rates have included therein a 5 per cent bonus or concession granted on the 1916 scale prices as specifically set forth in the supplemental agreement of April 30, 1917. It is now positively agreed between the parties hereto that the said 5 per cent bonus or concession shall be deducted from or taken off the hereinbefore stated rates on April 1, 1922.

In the Miller Vein on the main line of the Pennsylvania R.R. where any bottom is taken up or where rolls are being cut in the bottom, 69c. per yard shall be paid for farm work. The main line includes only operations at Dunlo, Portage Branch, Lanfair, South Fork, Beaverdale, Ehrenfeld, Portage, Sonman, Bens Creek, Lilly, Cassandra, Cresson, Gallitzin and Bennington, and shall not include any other points than those above named.

## INSIDE DAY-WAGE SCALE

Occupation	Rate per Day	Occupation	Rate per Day
Motormen .....	\$6.10	Trip riders .....	\$6.00
Spraggers .....	6.00	Water and machine haulers .....	6.00
Skilled wiremen in charge of work being done.....	6.00	Timbermen .....	6.00
Wiremen's helpers.....	5.77	Pipe men .....	5.92
Track layers .....	6.00	Trappers .....	3.18
Track layers' helpers.....	5.77	Cutters .....	6.10
Bottom Cagers .....	6.00	Scrapers .....	5.85
Drivers .....	6.00	All other inside day labor not herein specified....	5.77

## OUTSIDE DAY-WAGE SCALE

Occupation	Rate per Day	Occupation	Rate per Day
Dumpers .....	\$5.42	Trimmers .....	\$5.36
Ram operators .....	5.60	Car cleaners .....	5.10
Pushers .....	5.18	Firemen now working on change shifts of eight hours each .....	5.60

All other firemen to receive \$1 per day advance over the contract prices in effect Oct. 31, 1919, based on the present standard number of hours now constituting a day's work under such employment at each operation.

All main hoisting steam-plant engineers working on changing shifts of eight hours each shall be paid not less than \$5.65 per day nor more than \$6 per day; provided, however, that where any engineer is paid more than the maximum rate, he shall have the option of continuing his present hours, conditions and rates or accept a rate not greater than the maximum rate hereinbefore provided for eight hours' work.

All sub-station engineers and attendants shall continue work on and under the present customs and conditions at \$1 per day increase over prices in effect Oct. 31, 1919, based on the present standard number of hours now constituting a day's work under such employment at each operation.

## OTHER ENGINEERS' HOURS REMAIN UNCHANGED

All other engineers, excepting those herein above mentioned, shall work the same hours and at the same rates as at present plus an advance of \$1 per day over the prices in effect Oct. 31, 1919, based on the present standard number of hours now constituting a day's work under such employments at each operation.

All boys under eighteen years of age receiving on Oct. 31, 1919, not more than \$2.65 per day shall be advanced 53c. per day; and all boys on Oct. 31, 1919, getting more than \$2.65 per day and less than man's wages shall be advanced 53c per day based in both of the above-mentioned cases on the present standard number of hours now constituting a day's work under such employment at each operation. The provisions as to eight hours for firemen and engineers are subject to the usual exceptions in cases of emergency.

All other outside able-bodied day labor, except coke men, to be advanced \$1 per day over the prices in effect Oct. 31, 1919, based on the present standard number of hours now constituting a day's work under such employments at each operation; but the total wage shall not be less than \$5 per day.

All monthly men shall be advanced \$1 per day over

the prices in effect Oct. 31, 1919, based on the present standard number of hours and days now constituting a month's and a day's work under such employments at each operation; provided, however, that this clause shall not apply to mine foremen, assistant mine foremen, fire bosses or bosses in charge of any class of labor inside or outside the mine, or coal inspectors or weigh bosses.

All labor engaged in the manufacture of coke shall be advanced at the rate of \$1 per day over and above the prices in effect Oct. 31, 1919, with the exception of boys under the age of eighteen years, who shall be advanced to a minimum wage of \$3.50 per day. The application of said advance in both cases mentioned in this paragraph shall be based on the present standard number of hours, average ovens drawn and average cars loaded per man, now constituting a day's work in such employment at each operation.

The charge for blacksmithing shall be 0.75c. per ton for pick mining, and 0.5c. per ton for machine mining. The operators agree to use every reasonable effort to have the miners' tools repaired and sharpened with as little delay as practicable.

All differentials in tonnage and yardage rates existing under the 1914 scale agreement shall be continued and remain in force during the life of this agreement, or until April 1, 1922.

The practice of voluntarily paying more than the contract price, either by bonuses or otherwise, which is done ordinarily for the purpose of enticing employees from other mines, and thereby creating discord and disorder in the coal industry, is condemned. It will therefore be assumed in any future joint conferences convened for scale-making purposes that all voluntary bonuses or advances in excess of wages provided in contract were paid because of physical conditions in or around the mines where such methods

are practiced, and the wages so paid shall be considered the base price for such mines.

All the customs, conditions and provisions existing under the 1914 scale agreement shall remain unchanged during the period covered by this agreement, except as modified or changed by the following rules and regulation.:

Rule 23—House rent shall be the same as during the period expiring March 31, 1920, plus an adjustment for substantial improvements if and when made or added, after March 31, 1920. In case of dispute as to increased rent, the same shall be settled under Rules 12 and 13.

Rule 34—That the pushing of cars, loaded or empty, by the mine workers is natural to the industry and is an integral part of the day's work, and that through the negotiations of thirty years this work, where practiced, has been paid for in the general tonnage rates; but in this district at all mines where cars are pushed both ways by the miner the operator shall pay for this work the sum of 6c. per gross ton, or its equivalent net. Whenever the operator reduces the car-pushing work to a one-way push in the direction at the choice of the miner, the compensation shall cease. This clause shall not be taken to authorize an adverse change in conditions at mines as to the handling of cars where they are now handled one or both ways.

Rule 35—That the price at which house coal shall be furnished the mine workers at the tipple shall be determined by adding to the price in effect on Oct. 31, 1919, the average percentage allowed as an increase on the wage scale, to wit, 27 per cent, and that when coal is delivered to the miners' houses by the operator the actual cost of delivery shall be added.

Rule 36—That explosives shall be furnished the miners at cost, which is to include handling, transportation and insurance.

## Eastern Ohio Miners Concede a Fair Scale

After Naming a Lot of Concessions That Would Have Put Eastern Ohio as a Mining District off the Map for Some Years, Leaders of Mine Workers Assent to a More Reasonable Settlement

**A** WAGE-SCALE agreement was reached Tuesday, May 4, at Cleveland between the scale committees representing the miners and operators of the eastern Ohio field. The agreement follows a deadlock of two weeks. Consideration of the scale was taken up first at a joint convention of miners and operators held at Odd Fellows' Hall, in Wheeling, W. Va., beginning April 19. After a disagreement the scale was referred to joint scale committees, who remained in session there until April 22, and adjourned to Cleveland. The joint committees remained in session until May 4, when the agreement was reached which will mean continuous operation of mines until April 21, 1922, when a new scale must be framed.

The miners' committee was headed by W. T. Roberts, as chairman; Edward Reibold, Joseph O'Grady, Ettore Del Guzzi, William R. Truax, Alex. Felczan, Ira Kimes, James Kunik, Jack Bell and Leibold Zearott, elected at the Bellaire convention.

The operators' committee consisted of S. H. Robbins,

as chairman; W. L. Robinson, Michael Gallagher, C. E. Maurer, H. E. Willard, E. L. Thoner and T. K. Maher, all of Cleveland; T. H. Johnson, of Bellaire; Joseph Meister, of Bridgeport, and R. L. Wildermuth, of Columbus.

Under the new agreement the tonnage scale was increased 34c. and day labor and dead work 20 per cent. The miners will receive 3c. an inch for the removal of the first 12 in. of "draw slate." The old contract called for payment only for slate in excess of 12 in. in thickness, the rate being 9c. an inch.

The original demands numbered forty-one, and it is interesting to record them at length, though probably no one seriously thought that everything asked for would be granted. They included: (1) Payment on mine-run basis; (2) No discrimination in hiring of men, the men being employed in the order in which they present themselves, men with good union cards being given preference; (3) Payment of all day men for actual time worked with time and a half for overtime and double

time for Sundays and half holidays; (4) Entire elimination of Rule 4; (5) Free tools and free house coal to all workers in and around the mines; (6) Pay for all stone; (7) Delivery of all cars to face of working place; (8) Company to do all track laying, using iron rails exclusively.

#### NOT MUCH OVERLOOKED IN DEMANDS

Other demands are: (9) Placing of all weigh houses so that the check weighman can see the scales; (10) Better sanitary conditions in mining communities; (11) Washhouses large enough to accommodate all the mine workers employed; (12) Daymen to receive the same percentage increase as the tonnage men; (13) Payment of \$2.50 for each crossbar set or erection of crossbars by company men; (14) Elimination of Rule 17; (15) Payment for the amount of coal lifted and for restoring a place to normal conditions wherever a miner has to take up an excessive thickness of bottom in coming to, or going over, a roll, this being in addition to the regular payment in accord with the roll rule; (16) Payment to machine men for actual time consumed in moving a machine from entry to entry; (17) The leaving of all "bottoms" in place.

The mine workers also ask for: (18) Payment to all machine men for setting and resetting posts; (19) The right of all daymen who are not satisfied with the wages under this scale to receive an average place in the mine; (20) Payment to machine men for cutting-over tracks; (21) Payment of 15c per ton extra for all butt work and for all places driven on an angle off the face; (22) Elimination of double shift and night shift; (23) Introduction of the section check system; (24) Payment to be made to loaders in rooms for all wet yardage, the rate being the same as in entries.

In addition the mine workers are seeking: (25) Payment of the maximum inside day wage where men have to go home because of some fault in the company management; (26) Payment to machine men for "crush coal"; (27) Itemized report to be made to local secretaries of the union of the money checked off the rolls for union purposes; (28) Delivery of all supplies to the face of each room and the unloading of these supplies by daymen; (30) Elimination of Rule 7; (31) Uniform day wage for all inside and outside day labor, the maximum inside day wage being made the basis for the rectification; (32) Hauling of all men in and out of the mine at company expense.

Other demands are: (33) Elimination of the figures \$25 from Rule 26, second paragraph, sixth line; (34) Delivery of powder to the working place; (35) Extra compensation to loader for any double shoveling made necessary by excessive width of working place; (36) Posts to be delivered in half-foot lengths and to the working place; (37) Insertion of all interpretations of the contract in the contract; (38) May 1 as an additional holiday; (39) Elimination of Rule 28; (40) Fixing of pay day on every Saturday beginning at 12 noon; (41) Setting payment of loader at 79c per ton and of machine man at 15c per ton.

#### KEEN COMPETITION AFFECTS SCALE

The sub-district covered by the contract includes that district of eastern Ohio which mines the No. 8, or Pittsburgh, bed and the West Virginia Pan Handle mines. Severe competition requires a scale in line with those provided for adjacent districts.

## Renton Coal Mines, of Washington, To Be Flooded and Abandoned

With an Output of 116,000 Tons in 1919 the Company Operating the Mines  
Lost \$126,000

THE Renton coal mines, the oldest and best known in the State of Washington, are to be flooded and abandoned. Orders have been issued to remove the equipment, take out the pumps and let the mines fill with water, with the announced purpose of making no further attempts to mine any of the remaining four million tons of coal still in the lower levels of the property. According to the company's surveys, there is enough coal in the veins to give a further life of thirty years to the mines, based on the productive capacity of the properties in the past. In addition to abandoning these mines the company is also surrendering to the Renton Coal Co. leases from the Northwest Improvement Co. which still have eighteen years to run.

The reasons given tell a tale of losses and discouragement that left no other alternative. Briefly, they state that with an output of 116,000 tons in 1919 there was a total loss of \$126,000, or that every ton mined cost \$1.09 per ton more than the company received for it. Coal at the surface exceeded in cost \$6.50 per ton.

Labor at the mine received a fraction more than 92 per cent of all the gross revenues, leaving less than 8 per cent of the total receipts for all other costs, such as timbering, supplies, power, maintenance, taxes and interest.

"If the mine could not operate under the wage schedules in force Nov. 1, last," said Manager W. J. Grambs, "the new schedules, carrying an increase of 14 per cent, granted under the order of President Wilson, are out of the question. We can't meet them. When there was a shortage of coal last summer the Renton Coal Co. undertook to increase its output.

"At the same time the Northwest was facing a shortage in water power. This meant more coal would be required for power purposes, as steam must supplant hydro-electric power whenever there is a water shortage. The Puget Sound Power & Light Co., from whom the Renton Coal Co. leased the mines, was asking for 140,000 tons of coal for its steam plants. Orders were issued, therefore, to speed up, and in place of working two shifts at the mine we increased the working force to three shifts.

"The output dropped alarmingly instead of increasing in proportion to the increase in the working force, and the three shifts mined only a little more than half as much coal as had been mined previously by the two shifts. Our output should have increased 50 per cent. Instead, it decreased nearly 50 per cent. So on Sept. 25 we ceased mining and closed the mines."

There is a record of coal shipped into Seattle in 1869, but it was not until the early '70's that these mines entered upon the career that made them historic.

The Seattle Electric Co. acquired the mines in 1900. They are now owned by the Puget Sound Power & Light Co. and are under lease to the Renton Coal Co., a subsidiary corporation, of which W. J. Grambs is manager. These mines yielded 3.8 per cent of the coal mined in the State last year and about 2,400,000 tons since 1900.

# Foreign Markets and Export News

## New Zealand's Coal Production Declines

The coal situation in New Zealand at this time, Consul General Alfred A. Winslow, Auckland, reports, is far from normal, and the outlook is not very promising, notwithstanding the fact that there is an abundance of a fairly good quality of bituminous, steam, and house coal in sight of the Dominion. Coal production in New Zealand has been declining since 1917, despite the fact that the demand for fuel has been increasing. This shortage has interfered quite seriously with certain developments that were under consideration, as well as limited the output of certain industries in the Dominion.

The output of the coal mines of the Dominion in 1913 was 1,888,005 long tons; in 1914, 2,275,614 tons; in 1915, 2,208,624 tons; in 1916, 2,257,135 tons; in 1917, 2,068,419 tons; and in 1918, 2,034,250 long tons; with 145,069 long tons as the output for the first seven months of 1919. Some 200,000 tons of this yearly output are lignite. The two State-operated mines produce from 200,000 to 280,000 long tons annually.

The coal resources of the Dominion have been estimated at 2,358,000,000 long tons, with an estimated 896,000,000 tons in proved deposits, made up of the following items:

Kind of Coal	Proved Tons	Probable Tons
Anthracite ..	Very little	Very little
Bituminous ..	269,000,000	450,000,000
Semi-bituminous ..	114,000,000	341,000,000
Brown ..	234,500,000	728,000,000
Lignite ..	278,500,000	839,000,000
<b>Total</b> ..	<b>896,000,000</b>	<b>2,358,000,000</b>

The annual consumption of coal in New Zealand in normal times is about 2,500,000 long tons, of which approximately 15 per cent is imported; but during the last three or four years the consumption has fallen, for the reason that the domestic output has fallen off and it has been difficult to secure the necessary imports. The large consumers of New Zealand coal are the State railways, the several gas works

and electric light plants of the Dominion, shipping interests, and the different industrial interests.

## Coal Mines of China Report Increased Production

Consul Douglas Jenkins reports that coal continues to be produced in the Kailan mines in increasing quantities. The average daily output in 1918 was about 10,000 tons. Over one-half of this coal was sent to Shanghai and other Chinese ports. Of the amount shipped to foreign countries about one-half went to Japan and the remainder chiefly to Hongkong, the Philippine Islands and Chosen.

The daily production in 1918 of the two other principal coal mines of this district, the Ching-Hsing and the Fu Chung Corporation, was 1,000 tons and 4,000 tons, respectively. The cost of coal on the local market showed no material change as compared with previous years, and its advance elsewhere was entirely due to high freights and attendant charges.

There was also an advance in the production of coke, which is needed for foundries and dockyard work in Japan, Shanghai, and Hongkong. The supply was not equal to the demand.

The quantity and value of the coal exports from Tientsin during 1917 and 1918 were as follows:

Articles	1917		1918	
	Tons	Value	Tons	Value
Kailan ..	26,150	\$106,697	28,121	\$142,580
Ching-Hsing ..	1,015	4,659	4,816	31,500
Shansi ..	54,417	222,021	50,923	258,193
Bunker ..				

## Great Britain Expend \$32,200,000 in Coal Subsidy

Lincoln Hutchinson, commercial attaché, London, reports that the British Chancellor of the Exchequer, in giving particulars in the House of Commons on Feb. 17 as to the expenditure to date and the estimate total expenditure for the current fiscal year (ending March 31, 1920) on account of the coal subsidy, said the figures were £22,631,000 to date; £32,200,000 for the year.

## Chinese and Japanese Are Mining Coal in Manchuria

The mining possibilities in Manchuria, Consul General E. Carleton Baker, Mukden, reports, are generally assumed to be enormous, but the present developments are of a limited character. Coal is already being extensively mined both by Japanese and Chinese. The former are working large deposits with modern machinery, while the latter are still using crude native methods. The Chinese are planning, however, to obtain modern mining equipment, and it is expected that there will soon be a considerable demand for American machinery.

## Australian Coal Mined During March

Coal mined in Australia during March, according to a cablegram from the American consulate at Newcastle, Australia, totaled 400,000 tons. Of that amount 93,113 tons were exported, 43,000 tons were used to supply bunker coal for foreign vessels, while the remainder was consumed locally. The rate of freight to the western coast is \$18 United States currency, while the rate to Honolulu is \$10. Coal is being carried to Manila by Japanese vessels.

## Canada Imports 21,411,813 Tons of Coal from United States

According to figures recently issued by the Canadian Bureau of Statistics, Ottawa, Canada purchased from United States last year 21,411,813 tons of coal, valued at \$70,603,005. Total exports of coal from Canada were valued at \$10,380,186 and her total production in 1919 was 13,676,300 tons, of which 73,893 tons were anthracite.

## Coal Imports at Harbin

Imports of coal into the Harbin consular district through the custom houses at Harbin, Manchouli, Suifenhö, Aigun, and Sansing in 1918 were valued at \$301,586, compared with \$172,437 in 1917 and \$115,303 in 1916.

## Quarterly Imports of Coal and Coke During 1919\*

Coal—	Jan. 1 to Mar. 31, 1919		Apr. 1 to June 30, 1919		July 1 to Sept. 30, 1919		Oct. 1 to Dec. 31, 1919	
	Tons	Value	Tons	Value	Tons	Value	Tons	Value
Anthracite.....	23,995	\$175,837	5,737	\$40,765	9,026	\$63,272	35,187	\$242,545
Bituminous and shale.....	205,065	1,127,994	173,227	979,826	159,346	909,017	354,178	1,875,859

### Demand for Tonnage to Europe Is Less Urgent

W. W. Battie & Co.'s coal trade freight report announces numerous charters of steamers for single voyages, consecutive voyages and transportation contracts to Europe, and although the demand for tonnage still continues it is not quite as urgent as it was. The demand for tonnage to South America and the West Indies still continues and rates are a little firmer than a week ago.

Rates for May loading are as follows:

	Rate	Tons Displaced
Copenhagen	23 50/24 00	1,000
Stockholm	24 00/25 00	800
Gothenburg	23 00/24 00	1,000
Antwerp Rotterdam	About 19 50	1,000
Hamburg	21 50/22 00	1,000
French Atlantic, excluding Rouen	About 20 00	700
Barcelona	About 23 00	1,000
Algiers	23 00/23 50	800
Genoa/Leghorn	About 23 00	1,000
Spezia/Savona	About 23 00	1,000
Piraeus	26 00/26 50	1,000
Trieste/Venice	26 00/26 50	1,000
Port Said	About 26 00	1,000
Constantinople	26 00/27 00	500
Pernambuco	14 50/15 00	500
Bahia	14 50/15 00	500
Rio	About 14 50	1,000
Santos	15 00/15 50	600
Buenos Aires or La Plata or Montevideo	About 13 50	1,000
Para	About 14 50	500
Rosario	About 15 00	750
Bahia Blanca	About 15 50	1,000
To Nitrate Range	9 00/10 00	750
Havana	6 50/6 75	600
Sagua or Cardenas	About 8 50	300
Cienfuegos	8 00/8 25	500
Cubaicari	About 8 50	300
Guantanamo	8 00/8 25	500
Manzanillo	About 9 00	300
Bermuda	7 00/7 50	300
Bermuda p.c. and dis free Kingston	About 9 00	400
St. Lucia	About 10 00	500
Barbados	About 10 00	500
Santiago	8 00/8 25	500
Port of Spain, Trin.	About 10 00	500
Curacao	9 00/9 50	500
Free p.c. Curacao Demerara	13 00	400
St. Thomas	About 9 00	500

All above rates, gross form charter.

### Coal Imports by the Straits Settlements

Consul General Edwin N. Gunsaulus, Singapore, reports that a table compiled by the local chamber of commerce shows the following imports of coal into the Straits Settlements for the month of January, 1920, with the countries of origin:

	Tons
Japan	17,872
Borneo	510
India	16,609
Elsewhere	336

### Belgian Miners Demand 15 Per Cent Increase

At a meeting of the Belgian National Federation of Coal Miners held in Brussels March 14, Trade Commissioner C. E. Herring, Brussels, reports a general increase in wages of 15 per cent, effective March 1, was demanded. The federation also adopted resolutions calling upon the Belgian government to equalize and establish a maximum of profits for coal mines, to establish national selling agencies under government direction, and to use the excess profits resulting from new price regulation for the creation of a fund

to provide for the assistance of needy workmen. The latter measures should become operative by July 11, according to the federation.

The membership of the federation showed a remarkable increase of strength during the past year. On March 31 there were 52,000 members in Belgium; on June 30, 73,000; at the end of September, 92,000, and at the end of 1919, 123,000 or about 85 per cent of the miners of the country. The funds at the disposal of the central and regional federations totaled 3,140,000 fr.

### Report of Lake Coal Traffic

West bound traffic through canals at Sault Ste. Marie, Michigan and Ontario for the month of April, 1920, as reported by L. C. Sabin, general superintendent, St. Marys Falls Canal, Michigan, was as follows:

	U. S. Canal	Can. Canal	Total
Coal, soft, short tons	42,831	8,000	50,831
Coal, hard, short tons	10,000		10,000
Stone, short tons	6,247		6,247
General merchandise, short tons	12,500	2,905	15,405

### Mesopotamia Increases Imports of Coal

According to a report by Consul Oscar S. Heizer, Bagdad, imports by Mesopotamia through the port of Basorah of coal, coke and patent fuel during the period May-December, 1918, from India were valued at \$108,425 and from Persia \$3,660. The total 1918 imports of coal, coke and patent fuel amounted to \$231,290; for 1917, \$76,867.

### Belgian Coal Production Increases, but Output Per Man Is Less

Trade Commissioner C. E. Herring, Brussels, reports that the need of increasing coal production in Belgium is urgent, as exports of non-industrial coal are a very important item in decreasing Belgium's large adverse trade balance. The necessity for increasing the output of coking coal is perhaps even greater, because of difficulty in obtaining adequate deliveries from Alsace-Lorraine and Germany.

The output for the entire year 1919 was 18,487,230 tons, compared with 13,887,600 tons for 1918.

### Exports from Seattle Over \$2,000,000

The domestic and foreign imports and exports of coal through Seattle last year, according to figures just made public by U. S. Collector of Customs R. H. Drumbheller, totalled 373,596 tons, valued at \$2,536,921, of which 344,086 tons, valued at \$2,334,171, were imported.

By far the largest share of this trade came from Canada, divided as follows—65,605 tons of anthracite, valued at \$494,367, and 257 tons of bituminous coal, valued at \$1,716,877.

Seattle's exports of coal to Canada were but 62 tons, worth \$1,337. Other exports were 30,437 tons to Alaska, valued at \$201,131, and 11 tons (worth \$282) to the Hawaiian Islands. During the year 18,076 tons were brought to Seattle from the Atlantic Coast and 1,879 from California, valued at \$111,476 and \$11,274, respectively.

### New Zealand Coal Imports Increase; Exports Decrease

Coal imports by New Zealand during 1919, according to commerce reports issued by the U. S. Bureau of Foreign and Domestic Commerce, were valued at £382,016, compared with £202,102 in 1918, £214,152 in 1917 and £189,526 in 1916.

Exports of coal during the same period were: £201,383 in 1919; £227,228 in 1918; £236,063 in 1917, and £326,563 in 1916.

Owing to unsettled rates of exchange values are not given in dollars.

The following table gives the Belgian production of coal in 1918 and 1919. The comparative decrease in output in relation to the number of operatives is largely due to the general introduction of the eight-hour day in Belgian mines. According to statistics prepared by the Mine Workers' Syndicate, the average output of miners steadily increased during the past year, having been 54 kilos (120 pounds) per day more in November than in January.

The output for the first and second half of 1919, by districts, follows:

District.	Net production.		Stocks on hand.	Workmen.
	Tons.	Tons.		
Jan.-June, 1919:				
Couchant de Mons	1,802,660	219,840	32,463	
Center	1,402,680	167,510	23,465	
Charleroi	2,958,860	818,860	42,377	
Namur	232,610	72,890	3,630	
Liege-Seraing	1,611,320	176,370	27,485	
Plateau de Herve	382,790	27,970	4,904	
Limbourg	52,160	2,350	1,077	
Total, Jan.-June, 1919	8,443,080	1,485,790	135,401	
Total, Jan.-June, 1918	7,562,960	625,040	117,450	
Gain in 1919	880,120	860,750	17,951	
July-Dec., 1919:				
Couchant de Mons	2,244,820	93,380	34,724	
Center	1,711,100	42,070	25,329	
Charleroi	3,310,280	324,250	47,576	
Namur	278,080	27,820	3,955	
Liege-Seraing	1,933,010	54,370	30,803	
Plateau de Herve	479,090	1,810	5,713	
Limbourg	87,770	3,000	1,562	
Total, July-Dec., 1919	10,044,150	546,700	149,662	
Total, July-Dec., 1918	6,324,640	1,295,130	110,922	
Gain in 1919	3,719,510	748,430	38,740	
Loss in 1919				

# Production and the Market

## Weekly Review

*More Hopeful Outlook for Car Supply at the Mines—Consumers Are Waiting for Coal that Has Been Shipped and Is Tied Up in Railroad Yards—Anthracite Production Keeps Up, but the Market is Upset in the Absence of May Circulars.*

**M**ORE coal and easier conditions are reported generally in all centers during the past week. The Geological Survey reports a gradual improvement in production the past three weeks with an output of 8,898,000 tons of bituminous and 1,792,000 net tons of anthracite in the week ended May 1. The week of May 8 will show still further gains, but not until the railroad labor is all back at work and the innumerable tangles in traffic have been straightened out will production again reach the 11,000,000 tons a week toward which efforts were being set when the switchmen's strike upset calculations.

There is no let-up in the demand for steam coal, and the cold weather that has extended into May has called for more than normal quantities of domestic sizes. The market is reported exceptionally strong in the South, with car shortage of more than usual extent in the Birmingham district. The condition of stocks is such that in nearly every industrial center some consumers are really suffering for lack of fuel, and in Milwaukee

rationing of what little coal was getting through was seriously considered last week.

Prices are holding firm, with the bulk of the coal, however, going forward on contract at prices below the present spot price level. Sentiment among coal shippers is strongly in favor of moderate charges, but there are enough who cannot resist temptation to furnish material for those who see only bad in the industry.

Anthracite production has been maintained at a higher rate this spring than last, despite the difficulties interposed by the railroad strike. Deliveries have not fared so well and numerous communities are registering complaints of anthracite shortage when the coal they want is perhaps tied up in a railroad yard but a short distance away. Anthracite prices are as yet uncertain. In New York the April circular is reported in effect, whereas in Philadelphia no mine prices are quoted and retailers have increased prices to the consumer. This state of uncertainty is bound to persist until the wage question is finally settled and operators can figure costs on the new scale.

Average Daily Production of Bituminous Coal\*

\*From weekly report of Geological Survey.

## Reports From the Market Centers

### New England

#### BOSTON

*Buyers Active in the Region—Car-Supply Shows Only Moderate Improvement—Output Further Curtailed by Floods—Rail Movement Somewhat Better—Strong Demand in Every Direction—Dumping at New York Piers Increases—Norfolk and Newport News Despatch About Normal—Prices Rule High—Anthracite Unchanged—Domestic Sizes Come Forward Very Slowly.*

**Bituminous**—Active and insistent buying is the main feature of the current market. Representatives of large corporations are in practically all the districts of Central Pennsylvania, as well as in West Virginia, and they are on the spot with cash for prompt coal. There is much less quick coal offering than was the case a fortnight ago and there are rumors of more than \$6 per net ton being offered for coal of only indifferent grade. It is to be hoped, however, that operators will hold quotations down within reasonable limits.

There are signs of better car-supply. The New England roads are making better returns of empties, and from other lines there are also hopeful developments. On the New Haven road consumers are in constant distress for coal, due to the heavy volume seized for locomotive supply. The Harlem River gateway has been prostrated for several weeks on account of strikes in New York harbor.

Receipts at the all-rail gateways reflect the gradual improvement in car-supply, other than on the New Haven. The Boston & Maine is steadily increasing the number of cars taken daily from the Delaware & Hudson and from the New York Central. The Boston & Albany is back to almost normal movement of coal, and confiscations have practically ceased, except where company coal taken by intervening lines has made replacement necessary.

There is no gainsaying the strength of demand from every quarter. All kinds of buyers are actively in the market, although here it is noticed that purchasers are generally confining their operations to their accustomed sources of supply. Distinctly there is less "wild" buying than might have been anticipated.

Despatch at the Virginia terminals continues about normal. The increasing use of much larger cars has a favorable effect upon movement, and for several weeks now the piers have been supplied with all the coal that could be dumped. Receipts in New England are still light and less and less is heard in the open market with regard

to Pocahontas and New River. At least one large contract, made in 1915 for 5 years, is to expire this season, and it will be of much interest to see what new contract offerings will be around July 1.

Quotations at wholesale range about as follows:

	Cambrias and Somersets	Clearfields
F.o.b. mines, net tons . . . . .	\$4.75@5.50	\$4.50@5.25
F.o.b. Philadelphia, gross tons . . . .	7.15@ 7.95	6.95@ 7.50
F.o.b. New York, gross tons . . . .	7.50@ 8.50	7.50@ 8.00

Pocahontas and New River contract prices from April 1 have ranged from \$6.54@7.50 f.o.b. Hampton Roads. Spot prices at the same piers are from \$8.50 @ \$9.50. On cars Boston or Providence prices are \$10.75@12 per gross ton.

**Anthracite**—No further developments in anthracite have come to light at this writing. Embargoes are still in effect against large parts of New England, and by water it will take several weeks to begin to make up for the suspension of dumping at the piers. Tows are moving with fair regularity, and if strikes and other obstructions can be avoided, there should be a reasonably good tonnage moved forward during May, June and July. If maximum movement is not attained during those months the future will indeed look dark for this territory.

### Tidewater

#### NEW YORK

*April Anthracite Prices Mainly in Force—Dumping of Coal Gaining—Trade Uncertainty Due to No Mine Wage Agreement—Bituminous Situation Serious—Receipts Low.*

**Anthracite**—The lead set by the Lehigh Coal & Navigation Co. last week in advancing the price of domestic anthracite \$1 per ton has not yet been generally followed by the large producers but some of the independent operators have accepted the prices and have added the 75c. differential to the new prices. The large producers state that no change from the April prices had been ordered.

More coal is coming forward but it is soon absorbed by the local trade. Shipments both from the mines and from the local tidewater docks continue to be interfered with because of the railroad and local marine troubles. With the men gradually drifting back to work the dumping of coal is slowly gaining and a larger tonnage is being moved.

The trade is in a state of uncertainty because of the failure of the

operators and miners to decide on a new wage agreement. However the Washington conferences may at any time have a happy termination.

It is difficult to get fuel to tidewater and to the Great Lakes and one big producer has begun to dump coal at one of its storage plants, while other railroads are reported to have placed embargoes on shipments to Buffalo.

The local retail yards are short of coal and deliveries being made subject to the prices to be set by the producers when the wage conferences are ended. Coal is being delivered in one or two-ton lots to those who need it most.

The demand for the smaller sizes is strong but the supply inadequate to meet the demand. Buckwheat for spot delivery is being quoted at from \$4.25 to \$4.75; rice around \$3.25 and barley around \$2.

Current quotations for company coal per gross ton at mine and f.o.b. tidewater at the lower ports are as follows:

	Mine	Tidewater
Broken . . . . .	\$5.95	\$7.80
Egg . . . . .	6.35@7.35	8.20@9.20
Stove . . . . .	6.60@7.70	8.45@9.55
Chestnut . . . . .	6.70@7.70	8.55@9.55
Pea . . . . .	5.30	7.05
Buckwheat . . . . .	3.40@3.75	5.15@5.50
Rice . . . . .	2.75@3.25	4.50@5.00
Barley . . . . .	2.25@2.50	4.00@4.25
Boiler fuel . . . . .	2.50	4.25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

**Bituminous**—There is little coal at the docks. The railroad trouble is not completely ended and, while most of the men have returned to their work, some difficulty is met in moving the boats when they are loaded. The railroads continue to take coal intended for commercial use, which must be replaced by the shippers.

The situation here has become serious. One of the trolley lines operating on Long Island was compelled to suspend operations one day last week because of its inability to obtain coal. Several city departments were able to operate only because of the work of policemen in bringing coal to the city from the lower ports.

Car supply is ragged, many mines not getting more than one-third of their quota of cars. With the railroads taking coal, commercial users will have difficulty in getting prompt shipments. Very little quoting is being done for local delivery. There is much difficulty in keeping bunkers supplied and on this account steamers are frequently delayed in leaving this port.

Quotations for some of the pools are not always available. Early this week Pools 1 and 9 were being quoted at \$6.25 to \$6.50 per net ton, mines; Pool 10, \$6 to \$6.25; Pool 11, \$5.50 to \$5.75, and Pool 18, \$5 to \$5.50. Gas coal was quoted around \$6.50. Quotations for loaded boats in the harbor ranged from \$10 to \$12. Towing charges ranged from \$1 to \$1.25 per ton.

PHILADELPHIA

*Anthracite Prices Unsettled—Final Circulars Due When Wage Dispute Is Cleared—Retailers Increase Prices—Heavy Premiums on Popular Sizes—Steam Trade Active, Especially in Buckwheat—Bituminous Continues Scarce with Light Receipts.*

**Anthracite**—The price situation is quite complicated; most of the big producing companies having announced a schedule for current shipments—subject to change without notice. The chief cause of disturbance is that shipments will be made subject to prices to be fixed for the coal at a later date. That is at such time as an agreement is reached with the miners on a new-wage scale. Thus the dealers are compelled to take a chance in fixing their retail prices.

An increase of \$1 a ton on the prepared sizes has been announced, but it is believed that the increase to be allowed the miners will mean an even higher advance in the wholesale rates. Retail prices on the various family sizes are as follows: Egg from \$12 to \$12.75, stove and nut from \$12.75 to \$13.25, and pea \$9.75 to \$10.50. This is for a gross ton of 2,240 lb. Dealers are mostly quoting only on such coal as they have in their yards for delivery.

It is almost certain that the range of retail prices as given above cannot continue long, as the dealers have allowed themselves little increased margin over the wholesale price. It is believed when the price policy is settled for the year by the big companies the retail increases occasioned thereby will be such as to cause much comment.

The shipments into the city have been extremely light during the past ten days and the trade expects light shipments all summer long. The consuming public still insists on its preference for stove and nut and as a result of this some of the independent houses are asking prices well above \$9 for these sizes.

In New England there is ample opportunity to move the coal at heavy premiums, and if it were not for frequent embargoes both rail and tide, there would be even a greater tonnage moving in that direction at top prices.

Using the circular of one of the big producing companies as a basis the anthracite prices per gross ton at mines for line delivery and f.o.b. Port Richmond for tide are about as follows:

	Line	Tide
Broken	\$7 35	\$9 20
Egg	7 35	9 20
Stove	7 70	9 55
Nut	7 70	9 35
Pea	6 00	7 60
Buckwheat	4 00	5 05
Rice	3 00	3 90
Boiler	2 50	3 50
Barley	2 25	3 15

**Bituminous**—The situation is still impeded by the light car supply. Only a light tonnage of coal is reaching this market. The heaviest tonnages are being received by the public utilities. The manufacturing plants, however, are going along on the narrowest kind of a margin, some of them even being on reduced production. The steel mills

have never been able to catch up since the rail strike.

Contract customers are receiving only meager deliveries, while spot coal has in some instances touched the \$6.25 mark for the highest-grade fuels. Were it not for the fact that tide shipments are frequently embargoed, thus throwing more or less tonnage on the line trade, still higher prices would prevail. The railroads are in constant need of fuel and they confiscate commercial shipments.

Recent quotations have been: Pools 9, 10 and 11, \$6, with occasionally \$6.25 asked for strictly Pool 9. Pool 18, \$5.50 to \$5.75; these are for coals originating on the Pennsylvania R.R. For Baltimore & Ohio, Pool 9, 10 and 11 coal has been quoted at \$5.50 to \$6, with Pool 18 around \$5. These prices are for the net ton f.o.b. mines. For coke there is a steady demand for foundry from \$10.25 to \$12, with furnace around \$9.75. Domestic byproduct stove and nut is selling for \$7. These prices are per net ton at ovens.

BALTIMORE

*Prices keep climbing despite some breaks northward and \$6 to \$6.50 coal at the mines is more the rule than the exception. Foreign buyers eager to get coal at any price and export movement holds well despite embargo on all but shipments under railroad permits. Hard coal men raise prices.*

**Bituminous**—The top notch for bituminous prices does not seem to have been reached. Despite predictions that the six-dollar mark per net ton as reached at the mines was the limit of the present rise, and the fact that there have been some signs of a break at northern points, because consumers are unwilling to take any coal except for immediate needs at that price, the rise has continued here.

At present the run is equal that of last month, about 70,000 tons of cargo coal having been handled the current week as export cargo fuel, and the expectation being that better than 300,000 tons will be loaded on this account during May.

The prices at tide here for best grades such as Pools 71 and 9 are all the way from \$6.25 to \$6.50 per net ton f.o.b. mines, while medium-value coals are selling at from \$5.75 to \$6. The lowest sales, those of Pool 18, are at from \$5 to \$5.25. Gas coals hold up well also, screened fuels commanding readily from \$5.50 to \$6, f.o.b. mines.

**Anthracite**—The definite hard-coal situation naturally waits upon the results to come from adjustments following the end of the Washington conference. Meanwhile the premiums paid by dealers here on any coal they can get through at this time are growing, and usually running between \$1.25 to \$1.50 above the old winter schedule. The result is that dealers are forced to sell at an advance over the old rates, and for the most part are charging a dollar a ton more than they did during the

winter. This schedule is as follows: White ash—No. 1 (broken) \$13.50; No. 2 (egg) \$13.50; No. 3 (stove) \$13.75; No. 4 (chestnut) \$13.85, and pea, \$11.25. Lykens Valley—No. 2, \$14.20; No. 3, \$14.60.

Lake

BUFFALO

*Strike Cuts Out Coal Again—Conditions About as Bad as Formerly—Some Allegheny Valley Coal Gets In—No Steamboat Fuel—Anthracite Arriving Slowly—No Coke Market.*

**Bituminous**—The old situation that prevailed during the first switchmen's strike is back again. Some effort has been made to get outside men to throw switches but it is a chance if any coal comes through. Somehow the supply seems to be sufficient, though nobody knows how it comes about.

One of the worst conditions is the lack of fuel for the Lake steamers. Some of them are able to manage temporarily by various expedients. But the business offering by Lake is small; so the owners have in many instances discharged their crews.

The ear supply is anything but good. The Allegheny Valley mines had been furnishing most of the coal used here. From the time of the first switchmen's strike, and they would have continued if the ears had not run short. It is, of course, just as difficult to get an empty car out of a yard as it is to get a loaded one in.

It is next to impossible to get any price quotations, some shippers saying they are selling at any price they can get and others refusing to discuss the situation at all. The list, as given by one shipper, is \$6.10 to \$6.35 for Allegheny Valley, all sizes; \$6.25 to \$6.50 for Pittsburgh, No. 8 lump and three-quarter, and \$6 to \$6.50 for all slack, per net ton, f. o. b. Buffalo.

**Anthracite**—The anthracite trade is about as badly hampered as bituminous, though some of the roads have been able to marshal some forces to assist in getting the trains through the yards and to keep up a supply of coal. The demand is not very urgent; some distributors having a supply of buckwheat coal, for example, which does not move out.

Only one of the shipping agents has any water coal yet. The others do not now look for any right away, for it will take weeks to get into shape again after the strike is over. Something like 100,000 tons is now afloat, and a few cargoes have made their way through the ice that is still heavy in front of the harbor. Fuel is now becoming scarcer rather than more plentiful.

**Coke**—The coke situation is the same as that of bituminous coal. Cars do not move and there is no other way of getting a supply. There is really no coke market, prices being nominal on the basis of \$12 for 72-hr. Connells-

ville foundry and \$10.50 for 49-hr. furnace. With a little chestnut for domestic use at \$7, adding to this the \$2.60 freight gives the f.o.b. Buffalo price per net ton. The future of the trade for the season is uncertain. Some of the vessels are discharging their crews and tying up until the business shows a disposition to move.

CLEVELAND

Pooling of all coal receipts under direction of the Cleveland Chamber of Commerce is the latest plan to keep as many plants as possible operating. Receipts, while slowly increasing, are not over 25 per cent of normal for the season. Spot No. 8 mine-run and slack hold at \$4.75 to \$5, mines.

**Bituminous**—The crux of the entire fuel situation, so far as Cleveland steam-coal users are concerned, continues in the inability of railroads to place empties at the mines. At some No. 8 district mines not a pound of coal has been taken out for three weeks. The average operation does not work over 35 per cent, and a good share of this output is going to the railroads.

There is scarcely a plant in Cleveland that does not suffer from lack of fuel. A Chamber of Commerce bureau is pooling all receipts. Operators continue to avoid making contracts, with operating and shipping conditions so uncertain. Spot No. 8 mine-run and slack are commanding \$4.75 to \$5, f.o.b. mines, and operators foresee no change that will lower this level in the near future.

Demand, of course, continues several times the supply of all grades except domestic bituminous. Retail dealers' prices on No. 6 and No. 8 mine-run and slack are around \$8.50, delivered, an increase of 75 cents. West Virginia splint, for domestic use, has been advanced to \$9.50.

**Anthracite and Pocahontas**—Most dealers have continued their old prices on anthracite, but demand is seasonably light. Deliveries on Pocahontas are more deferred, and some dealers are entirely out.

**Lake Trade**—Lake Erie docks in April dumped 307,000 tons of bituminous coal, compared with 1,082,183 tons in April, 1919. Loading so far in May also has been light, and June 1 will probably see the Lake trade 2,000,000 tons behind last year.

Retail prices of coal per net ton delivered by dealers in Cleveland are:

Anthracite, and grate, \$12.20@12.40; chestnut, \$12.50@12.70; and stove, \$12.50.

Pocahontas, shoveled lump, \$10.50; and mine-run, \$9.25.

Domestic bituminous, West Virginia splint, \$9.50; No. 8 Pittsburgh, \$7.75; Millfield lump, \$8.50; and tunnel lump, \$11.

Steam coal, No. 6 and No. 8 slack, \$8.50; No. 6 and No. 8 mine-run, \$8.50; and No. 8 3-in.lump, \$8.75.

MILWAUKEE

*United Action Taken on Near Exhaustion of Coal—Emergency Committee Secures Temporary Relief—Rationing Postponed.*

Milwaukee had a week of hysterics following the announcement by the leading dock company that it could not promise any more deliveries of coal. The panic increased when it became known that ships were lying at the docks because they were unable to obtain fuel and that one steamer had to pay \$9 per ton to fill her bunkers.

The Governor of the state, the Mayor of the city and representatives of various civic organizations got together, appointed an emergency committee and appealed to Senator Lenroot to petition the Interstate Commerce Commission to speed the movement of coal cars in order to avert a financial and industrial crisis in the Northwest. As a result, 419 carloads of coal reached the city inside of three days. No rationing will now be undertaken for the next two weeks.

Eugene McAuliffe, of St. Louis, states that the entire nation will be confronted with a serious fuel situation next winter. He urged Milwaukee dealers to lay plans at once if they wanted to avert a shortage. The May advance in prices did not materialize here as yet, notwithstanding the scarcity of coal.

Thus far this season 25,221 tons of hard coal and 18,500 tons of soft coal have come by Lake, against 105,303 tons of hard and 181,032 tons of soft coal during the same period last year. At this time last year the docks held about 400,000 tons of coal, which had been carried over on account of the mild winter of 1918-19.

Inland West

COLUMBUS

*Strike Slowly Breaking Up—Increased Output of Ohio Mines—Embargoes Still in Force—Demand for Steam Grades Especially Strong and Prices Higher.*

Reserve stocks have been reduced to a low point in every line of manufacturing. Public service concerns and public institutions have been supplied for the time being. Extreme high prices are expected to prevail for some time.

Domestic demand is still strong. Retail stocks are light and in many cases exhausted. Retail prices are firm and show a tendency to advance in sympathy with higher quotations at the mines.

Pocahontas is quite scarce and little is available in this territory. West Virginia splints are also reaching this market in limited quantities. Hocking lump retails at \$7.50 and higher, while West Virginia lump is selling at \$8.50. Pocahontas when obtainable retails around \$10.50 to \$11.

Steam trade is active as railroads are now good purchasers and most other industries are in the market. In the Michigan industrial centers fuel is scarce and many of the plants were compelled to close down. Prices soared as a result. Quotations of \$5.75 for Kanawha slack were heard of in the local market.

The Lake trade is assuming more importance. Some cargoes have been moved to the upper Lake region, but embargoes have largely prevented shipments to the lower Lake ports. The tonnage moving to the docks is under the control of the producing companies.

Prices at the mines for the principal coals used in Ohio are:

Hocking, lump.....	\$3 75@	\$4 25
Hocking, mine-run.....	3 50@	4 00
Hocking, screenings.....	3 25@	3 75
Pomeroy, lump.....	4 00@	4 50
Pomeroy, mine-run.....	3 75@	4 00
Pomeroy, screenings.....	3 50@	4 00
W. Va. splints, lump.....	5 00@	5 50
W. Va., mine-run.....	4 50@	5 00
W. Va., screenings.....	4 50@	5 00
Pocahontas, lump.....		8 00
Pocahontas, mine-run.....	7.50@	7 75

CINCINNATI

*Movement of Cars Increasing—Demand Is Strong for Both Industrial and Domestic Fuel—Much Coal Moving by River—General Outlook Encouraging and Prices Are Firm.*

With strike conditions on the railroads being rectified somewhat, operators here see no reason why the coal situation in this district should not clear up in a similar manner. It is quite evident, they say, that more empties are going to the mines and consequently the production will be larger in the near future, and with embargoes in general removed, conditions should brighten up to a considerable extent.

Shipments into the Cincinnati district from West Virginia have increased in the past week and many industries that were low on their supplies were able to stock up a bit.

Prices for all kinds of fuel remain firm in the Cincinnati market. Everybody is buying coal. There are no coal users who are going to be found without their usual winter supply next November.

Dealers in Cincinnati state that never before has there been such a demand for coal from the householder. With no places to move to, even if they desired, there is nothing to do but order the winter coal and have it stowed away. That is exactly what the Cincinnati householders are doing.

Considerable coal is moving down the Ohio River. Except for this great waterway Cincinnati would have been in a pretty fix during the rail strike. There were many industries that were supplied with coal that came down the river which otherwise would have seriously felt the pinch.

Coal men in general are of the opinion that there should be only messages of optimism going the rounds of the trade at this time and that whatever gloom may appear above the horizon should quickly be dispelled.

## ST. LOUIS

*Railroad Conditions Improving — Some Coal Coming in Train Loads — Mines Slowly Resuming Operations — Local Situation Fairly Good — Country Demand Strong.*

The local situation is easing up gradually. The trunk roads have for the most part their full crews at work, but the terminal is tied up and coal is coming over in train loads principally to the main unloading points. The mines are working two to three days per week on most of the roads.

The local situation in steam coal is in fairly good shape. Conditions in the country west of the river are still bad, but a little coal is gradually getting through. In the Standard field prices are as high as \$4 for lump, \$3.75 for mine-run, and \$3.25 for screenings. In the Mt. Olive field the conditions are about the same, with the exception that prices are about \$3.25 for domestic sizes of \$3.50, with practically no steam coal quoted. On the Missouri Pacific nearly all coal loaded is promptly taken by the railroad for company use, and this road is buying several hundred cars in the Standard field.

The fact that there is a contemplated merger of about 70 mines in the Standard field became public for the first time this week. It involved between \$9,000,000 and \$10,000,000 and takes up about 50,000 to 70,000 tons per day of coal.

## DETROIT

*Though Little Coal Remains in the State, the Outlook for Moving Shipments Is Reported Brightening.*

**Bituminous**—With the announcement that freight congestion is diminishing in Toledo and at other junction points, the outlook for moving coal into Detroit and Michigan is said to be improving. Under direction of the Michigan Public Utilities Commission, two traffic men have been dispatched to work on the problem, one in Columbus, the other in Cincinnati. They will try to get coal consigned to public utilities of the state, moving to its delivery point.

In many of the cities of the state, gas and electric companies have only three or four days' supply of coal and for some time to come, probably, will be dependent on receipts from day to day to continue in operation. The Ionia State hospital, which was without coal, has succeeded in getting a small supply. Shipments are reported on the way to Pontiac and Bay City, where public utilities are in urgent need of coal. The gas plant serving Plainwell, Otsego and Allegan, it was recently announced, would be obliged to close.

While the state is struggling with the problem of getting fuel, the coal mines in Michigan have closed. The miners are demanding that the new wage scale, which has been discussed for a month past, provide for the 10 cents a ton advance in wages, which they say should have been given them during the war.

## MIDWEST REVIEW

There is little market news to report as there has been practically no change in the situation here during the past three or four weeks. Coal can be purchased, but in such small quantities that it cannot begin to take care of the demand, which continues quite strong. The big terminals are all embargoed and as a result operators and producers are routing coal to other points which can be reached without going through Chicago, Peoria, or East St. Louis.

Railroad authorities report that they are getting the situation well in hand, and that they are replacing the striking switchmen fast. The traffic congestion may be straightened out within the course of the next two weeks and from now on conditions may take a turn for the better.

The better grade of coals, as per May 1 announcement, is selling at ten cents over and above the April prices. In other words, southern Illinois coal which in April was selling at \$3.40 per ton, is now \$3.50. This ten cent per ton increase will continue monthly until October. As it is understood, no price has been decided upon beyond October.

This sliding scale of prices is quite popular with the retail trade, as it furnishes them an incentive to purchase their coal early, and at the same time gives them an idea as to operating costs for the spring and summer months. There is some coal sold at prices in excess of \$3.50 for the prepared sizes, but paradoxically about all the coal that is moving at fancy prices is said to be off-grade stuff not readily sold on contract. The methods of those selling at exorbitant prices are frowned upon by the more responsible operators and by the public in general. Luckily these operators are decidedly in the minority.

## South

## LOUISVILLE

*Demand Strong with Run-of-Mine Selling Better Than Block—Embargo Situation Bad—Heavy Movement South with Northern Demand Starting.*

The demand for all grades of coal is strong, and increasing as steam stocks run low, and as byproduct and gas plants begin getting worried about supplies. Railroads are buying coal, and paying good prices. Retailers are meeting with a larger spring stocking demand than had been anticipated on the present high market, and are glad to accept lumpy run-of-mine, where block is not available.

Comparatively little block coal is being produced, as the operators will not take chances of screening coal, having cars held over night and losing them from the net day's allotment, which is not much better than two days a week at the most. Again mine-run is selling at as good or better prices than block coal.

The embargo situation is still bad, and the Cincinnati gateway is slower

in opening than had been anticipated. This is resulting in larger movement South. Northern demand is starting, although shipments are quite light.

There is an especially heavy demand for gas and byproduct coals, such as Harlan No. 4, Hazard, Elkhorn and Straight Creek. There is hardly any such thing as a market on such coals, as they are all going at prices ranging from \$4.50 to \$6.25 a ton.

Byproduct coals are quoted from eastern and southeastern Kentucky with run-of-mine firm at \$6@6.25. Operators in many instances refusing to charge more than \$4.50 for block, but much of this grade is selling at around \$6. Nut and slack are scarce, the price ranges from \$5.25 a ton upward at mine.

In the Hazard field block sells at around \$5.50@6 per ton; mine-run, \$4.50@5 and up to \$6 a ton; nut and slack, \$4.75@5.25.

Western Kentucky prices are firm, with block selling at \$3.25@3.40; mine-run, \$2.85@3.10; nut and slack, \$2.50@2.60; and pea and slack, \$2.25@2.40.

## BIRMINGHAM

*Car Shortage More Acute the Past Week Curtails Production—Industrial Demand Heavy and Bunkerage Trade Active.*

The car supply for this field the past week was somewhat below that for the previous period, the production of coal was hampered and deliveries to consumers were quite unsatisfactory. As there are practically no stocks in the hands of steam users any interference with daily receipts seriously menaces the business of the consumer.

There is a demand here for every grade of coal, much in excess of the tonnage to be had. Spot and contract inquiry is strong, and a great deal of the offering has to be turned down or accepted with limitations both as to tonnage and delivery. Much steam coal has been contracted through June 30, 1921, but there are a number of mines which have not yet made any contract agreements; most all operators making a reasonable tonnage reservation for the spot trade and to care for contingencies which may affect production.

There is a better demand for bunkerage coal than has existed heretofore, and the amount of this business taken on now is only limited by the supply which can reasonably be promised under present transportation conditions.

Inquiries for export coal to France and Italy have also been received in this district, a shipment having gone forward to the latter country recently.

Excessive rains which have continued through several weeks past have interrupted production at some mines by flooding the workings. Labor is delinquent, and there is also a shortage in the field as a whole, but shortage of equipment is the principal factor in holding production below the trade needs of the territory.

## News From the Coal Fields

### Northern Appalachian

#### FAIRMONT

*Erratic Transportation in Northern Fields—Midwest, Lake and Other Markets Opening Up—Railroad Fuel Shipments Large.*

The final week of April was a week of contrasts in northern West Virginia fields from a transportation standpoint, the supply of cars reaching the maximum and then dropping to the minimum production following. In the Fairmont region on the first day of the week there were 1,983 cars and all previous leading records were broken.

On Wednesday only 307 cars were furnished for all the mines on the Monongah division of the Baltimore & Ohio. Since a large number of the cars furnished were used for railroad fuel it will be seen that a comparatively small amount of commercial coal was loaded. After Wednesday between 500 and 600 cars a day were supplied.

Cars were somewhat more plentiful on the Monongahela R.R. than during the previous week but only for a day or so, as the Pittsburgh & Lake Erie was unable to move any freight from Brownsville, Pa., during the week, the Pennsylvania following suit. On the last day of the month there were about 2,000 cars of coal at Brownsville, Pa.

During the first few days of the week there was only a limited movement of coal to the Lakes owing to an embargo. Cincinnati for several days was the westernmost point to which much northern West Virginia coal could be shipped. It was possible to ship, during the last few days of April, to points on the Philadelphia & Reading. Staten Islands points were also opened.

By the middle of the week the Pennsylvania was forced to impose an embargo on coal shipments from northern West Virginia except under permit, railroad fuel and fuel for public utilities excepted. By Wednesday Pools 44, 11, 34 and 38 at Curtis Bay were under embargo again. By the end of the week no coal could be shipped to Curtis Bay, Locust Point and Baltimore coal piers, owing to an embargo, except under special permit.

Railroad shipments were rather large during the week, the railroads in fact securing the bulk of the coal. In some quarters it was said that the railroads had declared embargoes with a view to securing fuel.

There was produced at mines on the Monongah division of the Baltimore & Ohio during April 944,600 tons of coal, or 252,550 tons more than had been produced during April, 1919. Total production at mines supplied by the

Monongahela R.R. during April reached 178,600 tons.

Use of assigned cars by railroads in northern West Virginia during the last few days of April continued to provoke much discussion. Reports were also received of coal from northern West Virginia being confiscated.

#### PITTSBURGH

*Car Supplies Continue to Improve—Operations Are Only About 40 Per Cent of Capacity—Lake Shipments Light.*

Car supplies in the Pittsburgh district increased more in the past week than in the preceding one, but left quite an unsatisfactory situation nevertheless. Except for the solid-trainload and the river shipment, the movement of coal actually to consumers is extremely light. The condition as to line supplies is mitigated materially by there being scarcely any movement for the Lake trade, and it will require quite heavy shipping later on to make up the deficit, as Lake shipments are already a million tons behind schedule.

Taking the district as a whole, mining operations are now at about 40 per cent of rated capacity. Some consumers are getting practically a full supply while others get no coal at all. On account of decreased consumptive demand and the small Lake shipments, the supplies in general are probably equal to about

60 per cent of normal requirements. The market continues rather quiet, with prices irregular on account of there being so much more difficulty in shipping to some points than to others. Generally speaking prices may be quoted the same as a week ago: Prompt, \$4@4.50; contract, \$3.50@4, per net ton at mine. Pittsburgh district.

#### CONNELLSVILLE

*Car Supplies Irregular, with No General Improvement—Byproduct Ovens Doing Better—Connellsville Market Stiffens.*

Last week opened with poorer car supplies in the Connellsville region than the previous period, but conditions improved later in the week, though hardly enough to permit any further gain in production. The solid-trainload movement is working quite well as to certain points, and the trainloads of empties generally get back in good time. The river movement has increased somewhat and is now of relatively large proportions.

The byproduct coke ovens are doing better; in the near-by Youngstown district, which was hardest hit by the rail strike, the operations are hardly much more than 50 per cent of normal. The operations have no stocks to draw upon, and their supplies are coming only by trainload movements, naturally somewhat irregular.

The Connellsville market for spot coke, both furnace and foundry, has stiffened about a dollar a ton, this being due to the larger number of consumers to whom shipments can be made, rather than to any decrease in the offerings. The spot market is now quotable at \$12 for furnace coke and \$13 for foundry coke, per net ton at ovens.

## Middle Appalachian

### POCAHONTAS AND TUG RIVER

*Output Curtailed in Last Week of April—Most Coal Goes East—Mines Work One to Two Days a Week.*

The final week of April witnessed a more serious curtailment of production in fields supplied by the Norfolk & Western than at any time during the month, the full effects of the strike not being evident until a semblance of order had been restored on western lines. While men had returned to work at Kenova and Ironton on April 29, and while the weighing of coal at Portsmouth had become possible, it was still difficult to handle coal to western points on the Norfolk & Western.

Coal produced was moved to eastern points during the strike. Coal forwarded to points west of Williamson was shipped in solid trains so as to avoid switching in moving such coal through western terminals. Such solid train loads of coal moved were consigned to large consumers in Indiana and elsewhere.

The supply of cars from western sources was negligible. Virtually all the product of the Thacker, Pocahontas and Tug River mines was being sent eastward. Cars were not being returned promptly owing to the large amount of coal on hand at tidewater.

No coal was being shipped to the Lakes from Norfolk & Western originating points. Even tidewater was embargoed in certain instances, pools 41, 42 and 43 being affected in that respect. Thus Inland East markets afforded the only outlet.

Cars were so scarce that few mines were able to operate more than one or two days during the week. The bulk of Pocahontas production was flowing to tidewater. However the lower grades of coal from the Pocahontas field were embargoed to some extent. Lake ports were still closed to Pocahontas mines, so that virtually no coal has been shipped to Lake points from the Pocahontas field during the present season.

Transportation conditions were worse in the Tug River field during the final week of April than ever before. Cars were so scarce that mines were able to work only from one to two days during the entire week.

Only solid train loads were shipped to western markets, the great bulk of Tug River coal moving to tidewater terminals. It was impossible to ship any coal to the Lakes owing to conditions at Columbus, Portsmouth and other weighing points. During the latter part of the week conditions were more nearly normal.

### NEW RIVER

*Cars Scarce in New River—Shipments at Low Ebb East and West—Gulf Mines on Virginian Ry. Able to Work.*

A shortage of cars continued to interfere with production in the New

River field during the last weekly working period in April. While the backbone of the yardmen's and switchmen's strike may have been broken, that brought no relief to mines in the New River section of West Virginia. Instead conditions had undergone a change for the worse, cars being much more scarce than during the strike. The maximum car supply for the week was little more than 50 per cent.

One reason for the pronounced shortage lay in the fact that extremely few cars were being received from Western connections, and that so much coal was still under load at tidewater; there was only a comparatively small number of empties in the shuttle movement between tidewater and the mines. Western shipments of coal and coke from the New River field were at low ebb, although embargoes had been removed on a number of western points.

Winding Gulf mines able to ship over the Virginian Ry. during the week ended May 1 enjoyed somewhat of an advantage over mines in other fields, owing to the more liberal car supply on the road mentioned; mines on that road being able to work about four days out of the six.

While Virginian mines fared better than mines in other regions, that was not true as to mines dependent upon the Chesapeake & Ohio, since that road furnished only enough cars to keep its mines going for about two and a half days out of the six. There was a very strong demand at tidewater for Winding Gulf coal.

### KANAWHA

*Poor Car Supply Limits Production—Kanawha Coal Goes to Tide—Limited Western and Lake Shipments.*

Less coal was produced in the Kanawha field during the final week of April than at any time during the month, owing to the poor car supply. With cars so scarce it was not possible for Kanawha mines to work more than three full days out of the six. The only part of the Kanawha field in which there was any improvement in fact was that supplied by the Kanawha & Michigan R.R. The mines on this road had virtually a full supply throughout the week.

By far the largest part of the high volatile production of the Kanawha field was going to tidewater. Western and Lake shipments were still quite materially limited, despite the fact that embargoes had been removed as to Russell shipments and shipments to points west of Russell. Cars could be obtained from the East alone, and as much coal was still held in cars there, the supply of empties was necessarily limited.

### LOGAN

*Guyan Output Increases but Car Shortages Cause Frequent Shutdowns—Embargoes on High Volatile to Tide Lifted.*

Production was increased in the Guyan field during the last week of

April to the extent of about 37,000 tons as compared with that of the week ended April 24; mines had approximately 750 more cars than during the previous week although the field got away to quite a poor start. Total production for the week ended May 1 was about 155,000 tons as against only 117,000 tons for the previous week.

Production was far below normal, car-shortage losses still running well over 225,000 tons, necessitating frequent shutdowns. As mines of the field were mainly dependent upon the East for a car supply, they were forced to wait until cars could be unloaded at tidewater; comparatively few cars were being received from the West, at least during the early part of the weekly working period.

While there had been an increase in production in the Logan field, such an increase was not general insofar as the mines on the Chesapeake & Ohio system as a whole were concerned. There were decreases in every district except in the Guyan and at the mines on the Sandy Valley & Elkhorn and the Long Fork; only 8,109 cars or 420,450 tons being transported, as against 9,149 cars or 457,450 tons during the previous week.

### NORTHEASTERN KENTUCKY

*Output One-third Normal—Conditions Slowly Improving—Contracts Filled at Prices Much Below Market.*

Production in the northeast Kentucky field underwent a slight increase in the final week of April, advancing from 90,000 tons to 100,000 tons, or from 33 to 37 per cent, still leaving, however, a total production loss of 63 per cent and a car-shortage loss of 167,120 tons. The increase was due to an improvement in conditions on the Louisville & Nashville R.R.

Transportation conditions on the Chesapeake & Ohio were just about the same as they had been during the preceding week, with mines working about 38 per cent of full time; mines on the Louisville & Nashville being able to work about two days out of the six.

At Russell conditions were improving from day to day and operations in the yard there were just about 50 per cent of normal. However, an arrangement whereby solid trains of coal could be shipped was all that prevented the strike and its after-effects from closing more mines.

The April output of coal in the northeast Kentucky field fell about 150,000 tons behind that for March, due to the strike. The car supply for May might reach about 60 per cent of normal unless something (now unforeseen) occurs to impair transportation facilities.

High prices were being offered for coal in the northeast Kentucky field during the last week of the month, but operators generally declined to part with their coal at such high prices, continuing to supply customers (holding contracts) at prices much below current market quotations. This condition will prevail for some time.

# Mine and Company News

## ILLINOIS

**Springfield**—Several mining men of Illinois who have been suggested to fill the vacancy of Joseph C. Thompson, the late State Director of Department of Mines and Minerals of Illinois, are: Robert Medill and William Hutton, both of Duquoin; James Taylor, of Peoria, and Martin Bolt, of Springfield, William Hutton is a member of the Illinois Miners' Executive Board, the Illinois State Mining Board and has the indorsement of many prominent mining leaders throughout the state, including Frank Farrington, president of the Illinois Miners' Organization. Robert Medill was for several years with the Deering interests in Southern Illinois, also the O'Gara Coal & Mining Co.; at the present time he is general superintendent for the Union Colliery Co., of St. Louis, at its large Kathleen mine at Dowell, Ill. James Taylor, now of Peoria, was formerly State Mine Inspector of Illinois, and has held other prominent positions throughout the state. Martin Bolt has been Assistant Director of Mines and Minerals for several years, having served under Evan D. John who died three years ago.

Illinois is a great mining state, crowding West Virginia for second place among this country's bituminous coal producers.

## INDIANA

**Terre Haute**—The Vermilion Coal Co., of Clinton, Ind., has filed a deed conveying to it from Aaron Koonce, the coal rights of 130 acres of land in Fayette Township for a consideration of \$24,000. The deed conveys to the coal company outright sufficient land for the erection of tipples and switches for the operation of any mines which may be sunk. The Vermilion company has just acquired from the United States Steel Corporation the coal rights to 1,700 acres of land in Fayette Township, near Shirkieville, and material is now being delivered on the ground for the opening of a new mine. The company owns and operates another mine in the Clinton field. A. H. Spears, of the Ferguson-Spears Coal Co., which operates the Submarine mine, near Tecumsch, is at the head of the company, and other capitalists of Clinton are principally interested.

**Petersburg**—The Oliphant-Johnson Coal Co., after making a number of tests east of this city, has transferred its drilling rigs across White River, in Knox County, where several thousand acres of coal land are being drilled.

During the last few weeks, 10,000 acres of coal land in southern Pike County have been leased by coal companies. West of this city half a dozen different coal companies are leasing coal land. The Pike County Coal Co. paid \$15,000 to David Grubb for coal on his farm.

## KENTUCKY

**Middlesboro**—The Low Ash Mining Co. has increased its capitalization from \$10,000 to \$100,000, to provide for general business expansion.

## MARYLAND

**Cumberland**—The Manor Coal Co., of this place has been incorporated with a capital of \$300,000 to engage in general coal-mining operations. Edward J. Ryan, Albert A. Doub, and John L. Wellington, are the incorporators.

## OHIO

**Columbus**—The Southern Ohio Coal Exchange planned to meet on May 11 to consider the law pending in Congress providing for the appointment of a fuel commissioner to investigate every phase of the coal industry and report his findings to Congress. On the face of the bill it appears like a good move and may receive the support of the association. Another question to be considered at the meeting is that of the assignment of cars at mines where fuel is furnished to railroads. The exchange believes that the distribution of cars should be carried out without favor to mines supplying railroad fuel.

## OKLAHOMA

**Henryetta, Okla.**—The Wise-Buchanan Coal Co. has been organized at this place, and charter filed with the Secretary of State at Oklahoma City. The company is capitalized at \$400,000, and it will do a general mining and coal distributing business. The incorporators are: H. E. Wise, of Henryetta; D. C. Wise and L. P. Buchanan, of Joplin, Mo.

## PENNSYLVANIA

**Scranton**—The report of the Delaware & Hudson Co. for the year ended Dec. 31, 1919, shows that the Coal Department of the company produced during the year (including the product of washeries) 8,205,495 long tons, a decrease of 853,733 tons, or 9.42 per cent below 1918. The year's output was 12.27 per cent of the total output of Pennsylvania mines and washeries (or 66,855,311 long tons) or 12.78 per cent

below 1918. The decrease in production, says the report, compared with 1918, was almost entirely in the output of the washeries. Demand for steam sizes was much below 1918 and, as these sizes make up nearly all the coal recovered from the culm banks and prepared in the washeries, their operation was necessarily less constant and extensive than the previous year.

**Wilkes-Barre**—E. R. Pettebone and J. M. Humphrey, mining engineers on the Mine Inspectors' Examining Board, have withdrawn from the sessions, objecting to the decision of the miners' representatives of the board, who refused to reveal to them the question which they (the miners' representatives) would present to the candidates. The miners' appointees were willing to let the engineers submit questions without revealing them to the board, but demanded secrecy for their own inquiries. The validity of the examinations may be affected by the engineers' withdrawal.

## WEST VIRGINIA

**Fairmont**—The Delmar Coal Co., of this city, headed by John T. Phillips, has tripled its capital. The capitalization was originally \$300,000. It has been increased to \$1,000,000. Another company whose capital has just been increased is the Ashford Coal & Coke Co., of Charleston, the increase being from \$25,000 to \$50,000.

**Huntington**—All coal-producing districts on the Chesapeake & Ohio R.R. were represented at a meeting held in this city recently. Operators of the various fields, including the Kanawha, Coal River, New River, Winding Gulf, Logan and Big Sandy, met to discuss the car shortage, which has become so pronounced as to seriously curtail production in all fields. Steps were taken for co-ordinated action in seeking to overcome the serious transportation handicap. While the matter has been vigorously presented to officials of the Chesapeake & Ohio since the first of the year, nothing tangible has so far been done toward relieving shortage.

**Welch**—The Iaeger estate in southern West Virginia will be incorporated as the Iaeger Foundation, and in connection with such a plan it is also proposed to sub-divide the Iaeger holdings of 25,000 acres into smaller parcels of land in order to encourage development of the property. The land will be leased on favorable terms so that men who have been employees will be in a position to become operators.

**Charleston**—If the Public Service Commission of West Virginia grants the 42 per cent increase in rates for power, applied for by the Kentucky & West Virginia Power Co., it will be over the protest of the operators of the Logan field. A delegation of 15 operators, headed by J. J. Ross, president of the Logan Operators' Association, recently attended the public hearing on the power company's application. In opposing the proposed increase in rates, the Logan operators also voiced their opposition to the proposed new form of contract.

Prominent Charleston capitalists have organized companies to operate in the smokeless field of Fayette County. One of the companies is the Old Colony Smokeless Coal Co., which is capitalized at \$100,000. The other new company is the Nay Aug Smokeless Fuel Co., which will also operate in Fayette County, this company having a capital of \$150,000. Those responsible for the organization of both companies were: J. A. Thayer, T. C. Beury, A. S. Guthrie, E. H. McNeil and John W. Fry, all of Charleston.

It is stated that the Winding Gulf Colliery Co., of Charleston, W. Va., is making improvements and extensions at its local operations, for increased capacity. At the present time the company is developing approximately 3,000 acres, with a daily capacity of about 2,000 tons. This company has recently increased its capital stock from \$500,000 to \$1,000,000, for proposed expansion. L. Epperly is local manager.

It is said the following West Virginia companies have increased their capital stock: The Morgantown Coal Co., of Morgantown, of which G. B. Hartley is president, from \$25,000 to \$100,000; and the Lewiston Block Coal Co., from \$100,000 to \$150,000.

It is recorded that 17 new resident coal corporations were formed in West Virginia in March, in addition to one non-resident corporation. The combined capital of these companies was \$3,350,000. The larger of these new companies were: Guyan Collieries Corporation, Beckley, \$2,000,000; McCall Coal Co., Logan, \$200,000; Peacock Coal Co., Clarksburg, \$150,000; Forest Coal Co., Fairmont, \$200,000; Shanrock Fuel Co., Morgantown, \$125,000; Glendale Gas Coal Co., of Cleveland, non-resident, \$100,000.

Last week three coal-handling companies were organized by E. L. Bailey, of Williamson, and E. H. Sudduth, of Welch. The new companies are the Bailey Fuel Co., of Charleston, capitalized at \$100,000; the Sudduth Fuel Co., capitalized at \$100,000; the Williamson Fuel Co., of Charleston, capitalized at \$100,000. The output of companies in Pike County, Ky., and in Mingo County, W. Va., will be handled by these three companies.

**Queen Shoals**—Organization of the Rex Colliery Co., with a capitalization of \$150,000, presages extensive development on the part of that company in Clay and Kanawha counties

on the line of the Coal & Coke division of the Baltimore & Ohio R.R. Among those active in the launching of the new company were: C. H. Hoyt, of Toledo, Ohio; J. B. Ramage, of Queen Shoals; W. T. Lively, F. M. Stambaugh and I. S. Adams, of Charleston, W. Va.

#### ALBERTA, CANADA

**Edmonton**—The Red Deer Valley Coal Operators' Association, including all the mines in the Drumheller field, has decided upon a summer discount on the price of coal, in order to induce dealers and consumers to put in a stock during the spring and summer. On shipments made during April, a discount of 5 per cent was allowed, and for the subsequent months a sliding scale has been adopted—4 per cent for May, 3 per cent for June and 2 per cent for July. The good effect has already been noticeable and large orders are being received, mostly from Manitoba.

### Association Activities

#### Texas Coal Dealers' Association

The Texas Retail Coal Dealers' Association held its annual convention at McAlester, Okla., the meeting being held outside the state at the invitation of the McAlester Fuel Co., which operates large coal mines near here. An opportunity thus was given to those attending the convention to inspect the mines from which comes some of the coal burned in Texas.

The convention lasted two days, at the close of which officers were elected as follows: C. H. Lilley, Fort Worth, president; W. C. Kenyon, Amarillo, vice president; W. D. Lacy, Jr., Waco, second vice president; C. R. Goldman, Dallas, secretary and treasurer.

For the next convention, Dallas, Galveston, Fort Worth and Trinidad, Col., were bidders, and it was voted to decide the next meeting place by post-card vote of the entire membership.

More than 350 Texas retail coal dealers as well as many dealers from Oklahoma attended the convention, and at the close of the two-day meeting the coal men visited the workings of the McAlester Fuel Co.'s mines.

The keynote of the meeting was the necessity for early purchase of coal by the public for next winter's use. The secretary was instructed to write urgent letters to all members of the association, stressing the importance of conducting campaigns in their respective localities, urging the public to buy coal now for next winter's use. Liberal use of advertising was urged in furtherance of this campaign.

The convention in many respects was regarded as unusual. At the banquet on the first night there were present among others the following notables; John P. White, former international president of the United Mine Workers of America; John H. Wilkinson, pres-

ident of the Mine Workers of Oklahoma; J. G. Puterbaugh, head of the McAlester Fuel Co., one of the largest wholesale coal distributors in Oklahoma; Ellery B. Gordon, secretary-manager of the National Retail Coal Dealers' Association, Philadelphia, Pa. T. Percy Ryan, executive committeeman of the National Retail Coal Dealers' Association, Kansas City, Mo.

#### Raleigh & Wyoming Institute

Finishing touches were put on the organization of the Raleigh & Wyoming Mining Institute, when a large number of mine executives assembled here recently. The institute elected as its first officers, John F. Absalom, as president and J. H. McLaughlin, secretary and treasurer. The meeting was called by V. E. Sullivan, one of the district inspectors, who presided over its deliberations. Talks were made by Messrs. Lilly and Stockdale (district inspectors), a Mr. Craven and by the Chief of the Department of Mines, R. M. Lambie. The Mine Chief emphasized the fact that the mining institutes of the state were not being formed as organizations to increase the pay of members, but to help members to so increase their usefulness that they would become invaluable to their companies.

#### Glen White Mining Institute

E. E. White, worthy president of the E. E. White Coal Co. was the principal speaker at the recent monthly meeting of the Glen White Mining Institute. Mr. White gave a plain old-fashioned heart-to-heart talk to the members of the institute. He said it was not how much in wages a man received under present conditions, but how far his wages went and how much he was able to save. The recent war, Mr. White said, among other things, had taught the people of the country how to save, yet he found a disposition on the part of many to forget that lesson and to sell their war investments below par. He pointed out that there are many forms of investment at satisfactory rates of interest, and tendered his personal service in aiding employees to make safe and judicious investments.

#### West Virginia Coal Association

A meeting of the executive committee of the West Virginia Coal Association was held in conjunction with representatives of various district associations of the state at Washington recently. The meeting was called especially to consider the car shortage, and it was decided to let the operators on a particular road handle the matter instead of attempting to deal with it as an association. The seasonal freight-rate bill was also under discussion. The general expression among the members was that the Frelinghuysen bills, now pending in Congress and which propose Federal control over the coal industry, are not necessary. The present source of trouble is the transportation situation alone.

## Recent Patents

**Apparatus for the Recuperation of Waste Fuel.** Frank Lioud, St. Etienne, France, assignor to La Societe Le Coke Industriel (Societe Anonyme), St. Etienne, France, a company of France, 1,334,765. March 23, 1920. Filed Nov. 15, 1919. Serial No. 338,358.

**Apparatus for and Method of Mining.** Lewis H. Eichelberger, Plainfield, N. J., and Raymond A. Walter, Frostburg, Md., assignors to Ransome Concrete Machinery Co., New York, N. Y., a corporation of New York, 1,334,894. March 23, 1920. Filed Oct. 27, 1916. Serial No. 128,019.

**Dumping Hopper.** Albert P. Lee, Chicago, Ill., assignor to Lee Loader & Body Co., Chicago, Ill., 1,334,913. March 23, 1920. Filed Oct. 31, 1918. Serial No. 260,741.

**Fuse.** Alfred L. Eustice, Chicago, Ill., 1,335,229. March 30, 1920. Filed May 4, 1918. Serial No. 232,484.

**Mine Door.** Charles H. Payne, Soddy, Tenn., assignor of one-third to John J. Clift, Soddy, Tenn., 1,335,255. March 30, 1920. Filed Oct. 11, 1919. Serial No. 329,902.

**Pipe Wrench.** Charles G. Martindale, Scotia, Cal., 1,335,252. March 30, 1920. Filed Jan. 15, 1919. Serial No. 271,245.

**Coal-Handling Plant.** Hobson S. Shimizu, Chicago, Ill., assignor to the Roberis & Schaefer Co., Chicago, Ill., 1,335,531. March 30, 1920. Filed May 18, 1918. Serial No. 235,234.

**Rotary Pump.** George Handley, Palmers Green, Eng., assignor of one-half to Percy Williams Bullock, London, Eng., 1,335,577. March 30, 1920. Filed Oct. 24, 1919. Serial No. 333,023.

**Pump Jack.** Arthur S. D. French, Bixby, Okla., 1,335,960. April 6, 1920. Filed June 3, 1919. Serial No. 301,394.

**Coal-Mining Machine.** George McCarter, Denver, Col., 1,336,039. April 6, 1920. Filed Dec. 2, 1918. Serial No. 265,027.

**Apparatus for Treating Fuel.** Wilson L. McLaughlin, Decatur, Ill., 1,336,364. April 6, 1920. Filed Sept. 25, 1918. Serial No. 255,618.

[U. S. patent specifications may be obtained from the Patent Office, Washington, D. C., at 10c. each.]

## Trade Catalogs

**Quick Concrete Mixing.** The Standard Scale & Supply Co., Pittsburgh, Pa. Catalog V 190. Pp. 24; 8 1/2 x 11 in.; illustrated. Description of machines and apparatus made by the Standard company.

**The Way to Increased Production.** Du Pont Chemical Co., Inc., Wilmington, Del. Booklet. Pp. 15; 3 1/2 x 6 1/2 in.; not illustrated. Facts in regard to the company's sale of war surplus material.

**Blawfrogs for Roads and Streets.** Blaw-Knox Co., Pittsburgh, Pa. Catalog 9. Description of steel forms used in the construction of roads, curbs, gutters and pavements. Pp. 44; 6 x 9 in.; well illustrated.

**Electric Hoists, Chain Blocks, Cranes and Trolleys.** The Franklin Moore Co., Windsor Conn. Catalog. Pp. 8; 3 1/2 x 6 in.; illustrated. Descriptive, with price list.

**Pneumatic Conveying Dust and Fume Recovery.** The Dust Recovering & Conveying Co., Cleveland, Ohio. Bulletin 1. Pp. 34; 8 1/2 x 11 1/2 in.; illustrated. Description of special apparatus and its application to industry.

**Short Course in Coal Mining.** College of Engineering, West Virginia University, Morgantown, W. Va. Folder. Pp. 8; 6 x 9 in.; illustrated. Announcement of course to be given from June 21 to July 31; unfolding to one sheet for wall display.

**Sullivan Drill Steel Furnace.** The Sullivan Machinery Co., Chicago, Ill. Bulletin 74. Pp. 12; 6 x 9 in.; illustrated. Description of furnace or forge operated by fuel oil or gas for the heating of rock-drill and hammer-drill steel.

**Dingoal Deck Concentrating Tables.** The Deister Concentrator Co., Fort Wayne, Ind. Bulletin 5. Pp. 23; 9 x 6 in.; illustrated. Description of the Deister-Overstrom type of table, calling attention to changes and improvements made.

**American Trolley Carrier.** The American Steam Conveyor Corporation, Chicago, Ill. Bulletin. Pp. 24; 7 1/2 x 10 1/2 in.; illustrated. Description of a one-man mechanical method of handling coal ashes, etc.

**Multihwhirl Cooler.** The Griscorn-Russell Co., 90 West St., New York, N. Y. Bulletin 902. Pp. 11; 6 x 9 in.; illustrated. Description of device for cooling lubricating and quenching oils in the heat treatment of steel.

## Industrial News

**New York, N. Y.**—The Hyatt Roller Bearing Co. announces the removal of the office of its Industrial Bearing division to a new building at 100 W. 41st St., New York City, where larger quarters have been secured for the advertising, sales and engineering departments of the division. D. Gleisen is the manager of the division.

**East Pittsburgh, Pa.**—The Westinghouse Electric & Manufacturing Co. has appointed A. E. Hitchner assistant to the manager, of the Industrial Department, in charge of mining and chemical industries. In 1906 Mr. Hitchner became engaged in the installation of coal-handling machinery for the Link-Belt Co. In 1912 he was appointed manager of the Wilkes-Barre sub-office of the Westinghouse company.

## Personals

Among the changes in the personnel of the plant management of some of the Solvay collieries in the northeastern coal fields of Kentucky are the following: **C. A. Warden**, who has been general superintendent over the Coaldale, Henry Clay, Big Branch and Lookout mines, in Pike County, for the past four years, goes to Huntington to assume the duties of assistant to A. B. Rawn, general manager of the Solvay Collieries Co. **Thomas DeVenny** succeeds Mr. Warden as general superintendent of the Edgewater properties. Mr. DeVenny has been superintendent of the Freeburn plant of The Portsmouth-Solvay Coke Co. for nearly four years, dating back to the time when that property was acquired from The Turkey Gap Coal & Coke Co. The normal production at that time was about 100,000 tons per annum. During Mr. DeVenny's superintendency, much development work took place including several mine openings, an additional tipples, the erection of a modern machine shop, a second company store, more than 100 additional dwellings, and the institution of various amusement and community service buildings. The normal production of coal now approximates 400,000 tons a year. Mr. DeVenny is widely known in the Tug River mining circles. **E. L. Bailey**, another well known mining man of the Williamson field, who has been superintendent of the Solvay operation at Tolland, on Pond Creek, since the installation of that plant, has taken the position as superintendent at Freeburn. Mr. Bailey made a record in the physical development of the Tolland plant and in the production of coal. The new superintendent at Tolland is **E. W. Price**, formerly with the Burnwell Coal Co. at Sprigg, W. Va.

**John Jeremiah Jr.**, has been appointed general superintendent over the six mines of the Willisville Coal & Mining Co., in Perry County, Ill., succeeding his uncle Thomas Jeremiah, who recently died. Mr. Jeremiah had been superintendent of one of the company's mines at Willisville for several years.

**James Rollo** has resigned his position with the American Railway and Mine Supply Co. of Chicago to accept one representing the Egyptian Powder Co., with headquarters in Marion, Ill.

**E. P. Moritz**, vice president in charge of sales of the Combustion Engineering Corporation, has resigned and expects to retire from active business indefinitely on account of poor health. He had been ill for some time previous to his resignation. No successor to Mr. Moritz has been named by the company, which has offices at 11 Broadway, New York, N. Y.

**F. A. Fitzgerald**, formerly with the Sangamon County Mining Co., has been appointed manager of the Illinois and Indiana coal mines of W. H. Harris, Inc., of Chicago.

**Edwin Ludlow** has been elected president of the Alumni Association of the School of Mines, Engineering and Chemistry, of

Columbia University, New York City. Other officers elected were: Alonzo B. Bradley, vice president; George C. Stone, secretary; John Sheafe Douglas, treasurer; and S. A. Goldschmidt, Henry C. Pelton, William W. Lightpipe and George E. Strehan, managers.

**Arthur F. Martin**, formerly with the West Virginia Coal & Coke Co. as auditor, is now auditor of the Boone County Coal Corporation, with headquarters at Sharples, W. Va. Mr. Martin has been connected with the Davis Colliery Co. and its successor the West Virginia Coal & Coke Co. for a period of 12 years prior to Jan. 1, 1920, when he became the sales manager for the Green Coal Co., operating at Adrian and Strader, W. Va.

**J. H. Lewis** is the new Western district manager of the West Virginia Coal Co., a large exporting concern with headquarters at Richmond, Va. Mr. Lewis will establish his headquarters at Huntington, W. Va. For a time he represented the Eastern Coal and Export Co. in West Virginia.

**E. F. Wilson**, formerly chief chemist for the Westmoreland Coal Co., stationed at Irwin, Pa., has opened a commercial testing laboratory and consulting office at 222 South Third St., Philadelphia, Pa., where he will engage in private practice, specializing in fuels, industrial waters, and so on.

**H. E. Brockman**, chief clerk for the Taylor Coal Co., at Herrin, Ill., recently resigned to accept a position as cashier for the Carney-Cherokee Coal Co., at Mulberry, Kan.

**George Hudson**, formerly mining engineer of the Old Ben Coal Corporation, at its West Frankfort, Ill., mines, has accepted a position with the Sabine County Coal Co., at mine No. 6, Herrin, Ill.

## Coming Meetings

**Mine Inspectors' Institute of America** will hold its annual meeting May 13, 14 and 15 at Cleveland, Ohio. Secretary, J. W. Paul, Pittsburgh, Pa.

**Pennsylvania Retail Coal Merchants Association** will hold its annual meeting June 23, 24 and 25 at Reading, Pa. Secretary, W. M. Bertolet, Reading, Pa.

**The Rocky Mountain Coal Mining Institute** will hold its annual meeting in Denver, Col., in conjunction with the National First Aid Meet on Aug. 20 and 21. Secretary, F. W. Whiteside, Denver, Col.

**M. O. I. Coal Association** will hold its annual convention June 16, 17 and 18 at Cedar Point, Ohio. Secretary, B. F. Nigh, Columbus, Ohio.

**National Retail Coal Merchants' Association** will hold its annual meeting June 10, White Sulphur Springs, W. Va. Secretary-manager, Ellery Gordon, Philadelphia, Pa.

**Kentucky Mining Institute** will hold its annual meeting June 4 and 5 at Lexington, Ky. Secretary, C. W. Strickland, Huntington, W. Va.

**American Society of Mechanical Engineers** will hold its spring meeting May 21, 25, 26 and 27 at St. Louis, Mo. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

**West Virginia Coal Mining Institute** will hold its annual meeting June 7 and 8, at White Sulphur Springs, W. Va. Secretary, R. E. Sherwood, Charleston, W. Va.

**American Wholesale Coal Association** will hold its annual meeting June 1 and 2 at Pittsburgh, Pa. Secretary, G. H. Merryweather, Washington, D. C.

**The Colorado Retail Coal Dealers' Association** will hold its annual meeting June 8, at Colorado Springs, Col. Secretary, E. Hopper, Denver, Col.

**West Virginia Freepool Coal Operators' Association** will hold its annual meeting June 3 at Kingwood, W. Va. Secretary, A. T. Carnahan, Akron, Ohio.

**International Railway Fuel Association** will hold its annual meeting May 24, 25, 26 and 27 at the Hotel Sherman, Chicago, Ill. Secretary, J. G. Crawford, Chicago, Ill.

**American Institute of Electrical Engineers** holds annual convention at White Sulphur Springs, W. Va., June 29 to July 2. Secretary, F. L. Hutchinson, New York, N. Y.

**National Coal Association** will hold its annual meeting May 25, 26 and 27 at the Traymore Hotel, Atlantic City, N. J. Secretary, W. B. Reed, Commercial Bank Building, Washington, D. C.

# COAL AGE

The Weekly Journal of the Coal and Coke Industries

Volume 17

NEW YORK, THURSDAY, MAY 20, 1920

Number 21

## *Sympathy for the Railroads*

NO fair minded coal man will raise a voice against the plea of the railroads for a substantial increase in rates. Only recently the coal industry went before the tribunal of the government, the Bituminous Coal Commission, asking for relief from oppressively low prices. The remembrance of those times and the spectacle of the railroads with hands tied make the coal industry halt before it sanctions any move on the part of Congress that may lead to putting their business in the same kind of harness. Senator Frelinghuysen's Coal Commissioner bill is harmless in this respect and it has many excellent provisions, but it is meeting with objection because it is seen as an opening wedge for permanent government control of the coal business.

## *Fair Prices for All*

THIS coal industry of ours has never faced a more critical situation than that which confronts our business today. A coal operator from Chicago writes us further along this line and so well does he put it that we quote his letter. He adds, "The public is watching closely and we must see to it that the price we ask for our coal is just to all concerned. The time is here when no industry, however important or necessary, can be successful without the backing of public opinion. If we are going to sell our coal at reasonable prices and allow our sales organizations and distributors to exploit the public by asking exorbitant prices for our coal, we are going to fail lamentably in perhaps the greatest crisis the present generation of coal men will be called upon to experience.

"Let those of us who market our coal through wholesalers be very sure that these wholesalers are of the right kind, so that we shall know that our coal reaches the ultimate consumer with only a fair and reasonable margin added for selling commissions. Let us see to it that our coal does not pass through three or four hands before it is finally sold to the consumer. It is our duty to watch these things and thus curtail at least one probable source of profiteering. It must be borne in mind that we are the ones who will suffer if the coal industry is put back under Government control.

"It is well known that the coal industry in years past has been looked upon with suspicion, although whether or not this suspicion was justified does not enter into the present situation. It remains, however, that our sales organizations are the individual points of contact we have with the public. Therefore it is entirely up to us what kind of an impression we make with the public from now on.

"The future of the coal industry is in our hands, and it is entirely up to us to decide by our own actions whether we are to manage our business ourselves or whether we are to be supervised once more by some

form of Government control. Let the motto of the coal industry be, 'Fair prices for all.'"

## *Freight Jam May Affect Coal Market*

COAL operators will get small consolation from the fact that car shortage and freight delays are crippling industries other than coal. Protests lodged at Washington with the Interstate Commerce Commission and other bodies against present transportation conditions mean that others than coal shippers are feeling the pinch. The term car shortage will have a new meaning to people hereafter and other business will better appreciate the position and the complaints of the coal man when lack of cars and freight blockades cause non-delivery of needed fuel and are made the basis for higher prices because of increasing costs.

One aspect of the present situation should be kept before the coal shipper. With industry slackened by lack of transportation to handle in- and out-bound freight, and with coal a deferred class of movement, a prolongation of present conditions may cause a slump in the stringency in demand. Whether such a slump will materialize and, if it comes, whether it will be of significant proportions, depends on the relative size of stocks of fuel and of other raw materials in the hands of manufacturers.

## *Our American Industries*

SPEAKING generally the basal industries of the country are in the control of Americans. Perhaps that is why their regulation has been so easy and so little resisted. All through the war it was the essential industries of the country which had to bear the brunt of regulation and often it seemed as if the purpose was to make easier the operation of those not so essential. Never did the basal industries fail to respond. Laws of doubtful constitutionality, contravening all former practice, were accepted patiently and without litigation, in the hope that the war might be thereby more speedily and completely won. Concessions equally great were made without legal compulsion or even semblance of it.

The coal industry in North America is directed almost wholly by Americans and former citizens of the British Isles. It accepted every kind of regulation—a control almost equivalent to Government ownership. It made an average profit of 10 per cent, with which compare the profit of the Federal Reserve Bank, which was ten times as great. Hardly any business made as little during the period of the war as did the coal industry. The capital of one luxury-manufacturing corporation has just been increased from \$3,000,000 to \$100,000,000 without taking in new investors. Probably there is a little water in the stock, but what a large quantity of ploughed-in profits must be represented by that huge capitalization!

### *Water-Power Legislation and Coal*

PERHAPS the so-called "super-power" project to study which the sum of \$125,000 is to be allotted by Congress is as yet too much of a dream to excite the active interest of coal men. Coupled with water-power legislation now pending in Washington this measure would reorganize power production and distribution and transportation on the Atlantic seaboard and thereby reduce by one-half the steam coal used in this area, in which it is said 40 per cent of the bituminous coal produced in the country is consumed.

The water-power bill is designed to permit the general development of latent water power by private capital. In sections such as the South and West, where water power has been exploited, coal has lost markets and the further use of water to run the wheels of industry will still further reduce the demand for coal.

The prospect is not one, however, to frighten the coal producer, for it is inevitable that use creates new uses, and power, whether from coal, water or oil, will be demanded in ever-increasing quantity as time goes on. A single feature of the dream of the super-power project, the electrification of the railroads in the East, will so increase the effectiveness of our transportation system in this sadly congested area that new high limits on tidewater shipments can be reached.

---

### *Assigned Cars*

OBJECTION to assigned cars was crystallized during the war by the extension of the practice to include commercial shipments in addition to railroad fuel. Prior to the summer and fall of 1917 the common practice was for railroads to make contracts with producers of bituminous coal guaranteeing a full car supply and often, if not usually, providing a minimum delivery that furnished the mine steady running time. The advantage of steady operation in reducing costs was as well known then as now, though not so scientifically expressed as by the Engineers Committee of the Fuel Administration. No such objection to such contracts were then made as are now voiced. Some operators regularly engaged in the business of supplying railroad fuel while others preferred to ship commercial coal. The producer who elected to tie up with the railroads was planning to take a smaller profit per ton on his product but a surer one—the operator who held his coal for the spot market was playing for larger profit.

The industry was on this basis for years, with sharp controversies each spring when the question of price came up for discussion between the operators and the fuel purchasing agents of the roads. Meetings were held at which the producers were told what price would be paid for coal that year and they usually had no choice but to accept if they desired railroad business. The certainty of a minimum of business in the dull summer time and of a full car supply in the winter if there should be a car shortage, was weighed against the low price, for beyond question the railroads used the power of the assigned car to secure a low price. The operators were unorganized, their objections were without weight and the railroads got their coal at their own figures.

A new era in the coal industry began with the contract season of April, 1917. Demand was without parallel and prices were higher than ever before recorded. The railroads were in financial straights and

were trying to save on their coal bills by holding down the prices. The market for bituminous coal was so strong that assigned cars ceased to hold the lure of the past and many roads were unable to contract for their requirements, because they would not pay the going price. Such was the condition when in September, 1917, the Fuel Administration began its work. One of the first obligations assumed by the organization was the provision of coal for the railroads and certain essential industries that had failed to cover their requirements by contract. Priority orders for the roads were issued requiring shippers to give preference to engine fuel contracts. The Fuel Administration, acting with the Car Service Commission of the American Railway Association, assigned cars for industrial consumers and needy and negligent public utilities. This system of distribution failed utterly to meet the situation and was particularly obnoxious to the producers because in the stormy months in the winter of 1917-18 the assigned cars absorbed the available supply throughout the East and nothing was left for commercial customers not favored as war essentials.

After a bitter fight lasting more than a month between the Railroad Administration on one side and the operators backed by the Fuel Administrator on the other, assigned cars were, in May, 1918, forbidden by order of the President. The conditions under which they were abolished are important to bear in mind at this time. Government prices were in effect—one price for all. The railroads could not buy coal with cars. Price was eliminated from the equation. Distribution was absolutely in the hands of the Government and the roads could be and were assured of the proper share of the coal, in fact their requirements were given first preference. With the President maintaining his policy of the same price to all and the supply assured, the railroads did not need assigned cars.

In the spring of 1919, when contracts for the ensuing coal year were made, the roads were yet under Government supervision and the ban on assigned cars was still in effect. The demand for coal was so light, however, that no difficulty was experienced in making fuel contracts, although the matter of price was the subject of bitter controversy and sharp recriminations. The operators were better organized than before the war and better knew how to secure fair prices for their product. They had learned their costs and were disposed to hold prices above those costs. Government control of the railroads ceased on March 1, 1920, and on April 16 the Interstate Commerce Commission removed the restrictions on assigned cars.

Honest efforts were made by the representatives of the roads and the National Coal Association to get together on a program that would give assurance of an adequate fuel coal supply without the use of assigned cars. The effort failed, and failed because the operators are without legal power to collectively talk prices. Furthermore, the operators' associations are without power to allocate orders for coal among their members for any purpose and to insist upon and require the fulfillment of the orders. In other words, the two conditions that obtained during the period of Government control, assurance of price and of supply, are no longer in effect. The purchasers of fuel coal see in assigned cars a means to secure both, and until some plan is evolved the practice will be followed. The next move is up to the operators. Some new plan must be brought forth.

# Seasonal Freight Rates Will Affect Coal Fields in Varying Degrees\*

Differentials Recommended by the Engineers Greatly Increase the Incentive to Summer Buying—The Maximum Discount Proposed Is More Than Three Times the Normal Drop in Spot Prices in the Pittsburgh District

By F. G. TRYON

**H**EARINGS on the seasonal coal freight rate bills have developed sharp differences of opinion as to the wisdom of the proposed legislation. Support of the measure has been confined largely to the fields of the Middle West, whereas the testimony presented by representatives of the Appalachian operators was generally adverse. Into this controversy it is not my place to enter. As I see it, the business of the coal statistician of the Geological Survey is to publish facts and leave the task of taking action on the basis of the facts to others. This article is therefore limited to a brief presentation of certain facts which may help to clarify the discussion. It might have been expected that the universal application of any change in the existing rate structure would produce a whole crop of unexpected developments. This has been clearly brought out by the testimony at the hearing of the Senate committee considering the bill.

Two bills are now before the committee, the original bill, introduced by Senator Frelinghuysen (S. 4,087), and a substitute bill (S. 4,278), proposed by a committee of the American Institute of Mining and Metallurgical Engineers, headed by Eugene McAuliffe. The first bill provides for a decrease of 15 per cent in all coal freight rates during the months from April to August, inclusive, of each year, and a corresponding increase of 15 per cent over the base rate during the remaining months of the year.

The substitute bill, introduced by the engineers, proposes three modifications of this plan: Fixed differentials in cents per ton are substituted for the percentage differentials; the differentials are graduated from month to month; the period of discount is from February to July instead of from April to August. At the hearings preference was generally expressed for the substitute bill, as far, at least, as the differentials were concerned.

Now what do these differentials proposed in the engineers' bill mean in terms of the average freight rate on coal? The differentials vary from minus 25 cents in March, April and May to plus 25 cents in October, November and December. According to the Bureau of Railway Economics, the average freight rate

on coal is about \$1.56 for bituminous and \$2.28 for anthracite, both per net ton. These were the figures prevailing in 1919. They represent the average revenue per ton of revenue coal hauled by all roads in that year. The weighted average for anthracite and bituminous would be about \$1.68 per net ton. In terms of this average freight rate the engineers' differentials would therefore vary from minus 15 per cent to plus 15 per cent. Table I gives the differential for each month, first in cents per ton, and then in per cent of the average freight rate. In the last column of the table the modified freight rate is expressed as an index number. Thus if the average for the year be taken as 100, the January rate will

At the hearings on the seasonal coal freight rate bill, Senator Frelinghuysen asked Director Smith, of the Geological Survey, for his opinion of the proposed legislation. In his testimony, Doctor Smith introduced facts which it is believed should be made available to the coal fraternity while the subject is under discussion. COAL AGE has requested F. G. Tryon, in charge of coal statistics for the Geological Survey, who prepared the exhibits, to summarize these new data.

be 106; the rate in February, 95; in March, 85, etc.

Having reduced the freight rate, as it would be modified by the engineers' bill, to index numbers, we can now compare it with index numbers of the monthly changes in production. This is done in Table II. The first column represents points above or below the average freight rate, assuming the engineers' differentials to be applied. In the last three columns the production figures are shown in the same way.

The year chosen is 1913, the latest normal year. Thus in the month of April the engineers' differentials provide a discount of minus 15 points. The United States production in the same month of 1913 was 16 points below the average. Production in the Appalachian region was 15 points below, and in the Western States 17 points below.

TABLE I.  
WHAT THE DIFFERENTIALS PROPOSED IN THE ENGINEERS' BILL (S. 4,278) MEAN IN PER CENT OF AN AVERAGE COAL FREIGHT RATE

Months	Average Freight Rate Per Net Ton	Differentials Proposed in Engineers' Bill (S. 4,278)	Differentials Expressed in Per Cent of Average Freight Rate	Index Number of the Modified Freight Rate (\$1.68 = 100)
January	\$1.68	+10c	+6%	106
February	1.68	-10c	-6%	94
March	1.68	-25c	-15%	85
April	1.68	-25c	-15%	85
May	1.68	-25c	-15%	85
June	1.68	-15c	-9%	91
July	1.68	-5c	-3%	97
August	1.68	+5c	+3%	103
September	1.68	+15c	+9%	109
October	1.68	+25c	+15%	115
November	1.68	+25c	+15%	115
December	1.68	+25c	+15%	115

\*Published by permission of the Director of the Geological Survey.

\*Average revenue per ton of revenue coal (both anthracite and bituminous) hauled by all roads in 1919.

Fig. 1. Seasonal Rates Compared with Production

In this diagram the monthly differentials in freight rates on coal, proposed by the engineers' bill, are expressed as discounts below the maximum rate. These discounts are then superimposed on the diagrams of production of a normal year of the Eastern fields, the Western fields, and of the United States. The differentials are too great for the East, not sufficient for the West, but about fit the average of the whole country.

Fig. 2. How Proposed Rates Would Affect Leading Coal-Carrying Roads

The discounts below maximum shown in Fig. 1 are here shown applied to four of the leading coal-carrying railroads. The system appears more nearly to meet the seasonal lag in production on the Pennsylvania than on the other roads. The discounts should be shifted several months to suit the Norfolk & Western, where the maximum rate of production is in August to October, rather than in the winter.

Examination of the table will show that the engineers' differentials are well in step with the fluctuations in the production of the United States as a whole, but not so well in step with either the West or the Appalachian region, if taken separately. This is because the prevailing seasonal swing in the Appalachians is different from that in the West. The high months in the West are from September to February. In the Appalachians they are, generally speaking, from June to November.

TABLE II.

COMPARISON OF THE DIFFERENTIALS PROPOSED IN THE ENGINEER'S BILL (S. 4,278) WITH MONTHLY FLUCTUATIONS IN PRODUCTION—1913.

Months	Engineers' Differentials	United States Production	Appalachian Region Production	Western States Production
January.....	+ 6	- 4	- 0	+17
February.....	- 6	- 1	- 3	- 4
March.....	-15	- 8	- 9	- 3
April.....	-15	16	15	-17
May.....	-15	-11	- 5	-26
June.....	- 9	- 4	+ 3	21
July.....	- 3	- 4	+ 1	-15
August.....	+ 3	+ 3	+ 8	- 6
September.....	+ 9	+ 7	+ 6	+ 7
October.....	+15	+10	+ 6	+29
November.....	+15	+15	+10	+29
December.....	+15	+ 3	- 2	+14

(For comparison the monthly production statistics have also been converted to index numbers in which the average for the year equals 100. The figures given here are points above or below the average.)

To bring out these differences more clearly Diagram 1 has been prepared. The purpose of the differentials is, of course, to fill up the hollow between the peaks in the annual production curve. To visualize the ef-

fectiveness of the discounts proposed, we may draw a picture of them and then apply the picture to pictures of the monthly production drawn to the same scale. The differentials are shown in the upper left-hand corner of the diagram as a series of inverted columns each one of which represents a total discount below the maximum rate. They provide in January for a total discount of 9 points, or 9 per cent of the average. In February the discount becomes 21 points; in March, April and May, 30 points; in June it recedes to 24 points; in July, to 18 points; in August, to 12 points; in September, to 6 points, and in the months of October, November and December, when the maximum rate is in effect, there is no discount.

Now suppose we imagine this picture of the discounts lifted up bodily and placed on top of a picture of the monthly production of coal drawn to the same scale (upper right-hand corner). We can shift the discount picture up and down until the maximum line comes to rest at the top of the black column of maximum production, which happens to be in November. The position it would occupy is shown by the shaded overprint. If the differentials were perfectly adjusted the discount columns would supplement the heights of the production columns and fill the hollow in the production diagram, and they do so supplement very neatly the 1913 production for the country as a whole. But when we come to apply the discount diagram to the hollow in the production diagram for the Western

Fig. 3. Seasonal Rates Compared with Spot Prices

This diagram compares the differentials proposed by the engineers' bill, expressed as discounts below the maximum, with the range of spot prices for bituminous coal in the United States in several important fields. The discounts are plainly sufficient to encourage buying in the summer, being well below the normal summer level in spot prices.

**Fig. 4. Seasonal Rates Compared with Spot Prices**

In three of the fields shown in this diagram the discounts offered by seasonal rates offer greater incentive to summer buying than have the drops in spot prices in the summer of a normal year. In eastern Kentucky the discounts in 1913 would not have equaled the drop in spot prices.

states, taken by themselves, the fit is not so satisfactory. It is even less satisfactory when the discounts are applied to the production diagram of the Appalachian region.

In the same way Diagram II shows the proposed discounts applied to shipments over four of the principal carriers in the Appalachian region. The discounts fit fairly well on the Pennsylvania and Virginian diagrams, but are somewhat out of place on the Baltimore & Ohio and Norfolk & Western. These examples might of course be multiplied, but they will suffice to show that there are wide variations from district to district, and that no single set of discounts can be devised to fit all cases.

It has been argued that a differential in freight rate would not be a more powerful inducement to storage in the summer than the natural slump in the market price of coal which normally occurs in the summer. To test this statement Table III was prepared. The year 1913 was one of active business in which the range of prices from winter to summer was apparently as great as may ordinarily be expected—much greater, for instance, than that in either 1914 or 1915.

The average spot price f.o.b. mine of all grades and sizes of bituminous coal in January, 1913, was \$1.47 per net ton. January was the maximum month for that year. The lowest average price in any month was

\$1.23, in May. In other words, the maximum discount offered to the average purchaser of bituminous coal by the range of market prices was 24 cents for that year. In comparison with this figure the maximum discount offered by the engineers' differentials—50 cents per ton—appears very considerable.

**TABLE III. COMPARATIVE INDUCEMENT TO STORAGE OFFERED BY PROPOSED SEASONAL RATES AND BY THE 1913 SUMMER SLUMP IN MINE PRICES**

Months	Discount Below Freight Rate Maximum Month Under Engineers' Bill (\$ 4,278)	Discount Below Average Spot F.o.b. Mine Price Maximum Month*
January	\$0 15	0—Maximum month
February	35	\$0 18
March	50	22
April	50	23
May	50	24
June	40	24
July	30	22
August	20	19
September	10	18
October	0	14
November	0	Maximum months 12
December	0	19

\* Taken from Prices of Coal and Coke, 1913-1918, by C. E. Leshner. In 1913 the month of maximum price was January, when the weighted average spot price of all bituminous coals, all sizes, was \$1.47 per net ton. In February the average was 18c. less, in March, 22c. less, etc.

To visualize the magnitude of the engineers' discounts alongside the range in spot prices Diagrams III and IV have been prepared. The scheme of presentation is the same as that used in the preceding diagrams. In this

case, however, the differentials are expressed in cents per ton rather than in per cent of the average rate. The shaded overprint of the engineers' discount, it will be seen, overlaps the columns of average price in the majority of instances. Thus in the Pittsburgh district the market price at no time fell more than 15 cents below the maximum, a figure less than one-third of the discount afforded by the engineers' bill. The only one of the six districts shown in which the range of market spot quotations exceeded the engineers' discount was eastern Kentucky.

The diagrams would appear to indicate that the proposed differentials constitute a much larger incentive to store than do the ordinary fluctuations in market prices. Especially does this appear probable when it is remembered that the buyer can count upon the freight differential but has no guarantee as to what the future market price may be. The price usually goes up in the fall, but it does not always do so, and in any case there is no means of predicting how much the rise will be.

The testimony at the hearings brought out the fact that the engineers' bill as drawn was not intended to apply to intrastate rates. This is a matter of great im-

TABLE IV—DISTRIBUTION OF BITUMINOUS COAL PRODUCED IN THE UNITED STATES, 1917 AND 1918, BY ROUTES AND DESTINATIONS (a)

	1917		1918	
	Net Tons	Per Cent	Net Tons	Per Cent
Used within the State	201,000,000	37	209,000,000	36
Shipped to other States	129,000,000	23	137,000,000	24
Used by railroads	146,000,000	26	149,000,000	26
Exported by rail	9,000,000	2	11,000,000	2
Shipped to tidewater	39,000,000	7	45,000,000	8
Shipped to Great Lakes for cargo	28,000,000	5	28,000,000	5
Total production	552,000,000	100	579,000,000	100

(a) This statement does not include the tonnage re-shipped from Lake Superior and Lake Michigan docks.

portance, as the strictly intrastate business, exclusive of shipments to tide and to the Lakes, and of railroad fuel is about 37 per cent of the total production.

Table IV summarizes the statistics of coal distribution in 1917 and 1918.

If the Lake and tidewater business is to be excepted from the application of the seasonal rate, the tonnage to which the plan would be applicable is restricted to the 23 or 24 per cent shipped by rail from one state to another, plus whatever part of the 26 per cent used by the railroads is revenue coal in interstate business.

## Federal Trade Commission Takes Issue with National Coal Association

IN answer to the assertion of the National Coal Association that, according to the rules of the game, the Federal Trade Commission should cease to ask for monthly cost reports because the first round of the fight in the Maynard Coal Co. case went against them, Commissioner Gaskill has just sent a letter to coal operators.

Mr. Gaskill says the commission did not agree to be bound by the result of one suit. In fact, pointing out some of the advantages of monthly coal cost reports, he asks support of operators in making them a success. Many reports, he says, continue to be received. The letter is as follows:

"I am writing to acknowledge the receipt of your letter, advising the commission that your Company deems it inadvisable to furnish monthly cost reports pending final adjudication by the courts of the power of the Federal Trade Commission to require such reports from coal mining companies.

"We note your statement that this position is, as you understand it, in harmony with arrangements made with the attorneys representing the commission with relation to the suit brought by the Maynard Coal Company.

"We fear that in some way a misunderstanding with reference to the attitude taken by the commission in this regard has arisen, and for this reason desire to make it clear to you that, following suggestions made to us that it would be advisable to test the constitutionality of the statute by which the production of these reports was authorized, we consented to co-operate in the early presentation of a series of actions, but we did not agree that, in event of a decision in one of these cases adverse to the exercise of the statutory power, the commission should be bound thereby with respect to other companies not parties to the action.

"If it has been represented to you that the commission agreed to accept an adverse finding in one of these cases as conclusive as to all companies pending a final adjudication, we regret to say that the attitude of the

commission has not been properly understood or interpreted to you.

"The purpose which the commission is endeavoring to serve by the collection of these cost reports, and the issue of monthly bulletins based thereon, was deemed by Congress to be in the public interest, and the commission does not believe that it should regard this determination of public interest as dispelled by the single decision recently pronounced.

"We find that a very large number of coal operators are sufficiently impressed by the value of having on record with a disinterested body the actual facts connected with their coal production as to lead them to waive any question arising out of this decision, and not only to furnish the reports but to urge that the commission to continue this collection and publication of its monthly bulletins. The existence of this body of facts and figures is valuable both to the operators and to the general public; to the former because it is their protection against suspicion and to the latter because it affords a proper basis from which to draw conclusions.

"The commission earnestly desires to obtain the results contemplated by the statute without resort to penalty proceedings, and in view of the fact that so large a proportion of the coal operators realize the value of these reports, the commission entertains the hope that irrespective of the Maynard decision it will continue to receive through the co-operation of the operators the facts which will serve as a basis of cost ascertainment.

"The commission submits to those operators who are not now within the scope of the Maynard decision, but who are inclined to take the effect thereof to themselves, that they consider this question in the long view whether it is not to their interests as well as to those of the general public whom they serve, to record the actual facts connected with their industry."

On May 8 President Wilson issued an executive order directing the Council of National Defense to take over the records of the War Labor Board and complete any unfinished business.

A new suggestion for handling the problem of seasonal movement of coal is contained in the suggestion of prominent coal operators that in the summer months a drawback on the freight charges be allowed for coal that is put into storage, thus encouraging the very thing for which the seasonal rates are devised. What do you think of the proposal?

### Seasonal Rate Bill Reported by Committee

A SEASONAL coal freight rate bill has been agreed upon by the Frelinghuysen sub-committee and reported favorably to the full Senate Interstate Commerce Committee, of which Senator Cummins of Iowa is chairman. The bill as reported embodies the rates and the months proposed in the engineers' bill. No exemptions are made for shipments to tidewater or on coal intended for transshipment over the Great Lakes. When the rate is seventy-five cents or less it is excluded from the provisions of the bill. The Interstate Commerce Commission is given more latitude than in either of the bills which had been proposed. The scope of the bill has been extended somewhat and includes anthracite and bituminous coal, coke, lignite, briquets, boulets and petroleum coke.

Since Congress apparently is determined to have some form of seasonal coal rate legislation, operators are discussing an alternative proposition. It is suggested that a form of drawback be arranged on coal actually stored. Such an arrangement, it is pointed out, would not reward the purchaser who accepts the freight reduction but who does not store the coal. Since the avowed object of the bill is to promote storage, several prominent operators, at least, are of the opinion that the drawback proposition would do more to insure storage than a blanket reduction in rates. It is their belief that such a proposition is feasible and that it could be carried out as easily as are the milling-in-transit rates and other such tariff arrangements.

In its unanimous report to the full committee the sub-committee report itemizes the beneficial results which may be expected from the seasonal rate, as well as the principal objections which are raised against such rates. Reasons are advanced in an effort to show that these objections are untenable. These analyses are those which were announced by Senator Frelinghuysen several months ago in the course of one of his speeches on the subject in the Senate. As they have been published widely, they will not be repeated here. Extracts from the report of the committee are as follows:

"The Interstate Commerce Commission, to whom was referred the bill (S. 4278) to further amend the Interstate Commerce Act, as amended, having had the same under consideration, having conducted extended hearings respecting both bills, and having heard the testimony of numerous coal operators, coal dealers and representatives of chambers of commerce and other local business associations, in addition to the testimony of the director of the United States Geological Survey, the chairman of the Interstate Commerce Commission, and a representative of the railroads, reports thereon with the recommendation that the bill be passed with amendments.

"This bill incorporates amendments suggested by Chairman Edge E. Clark, of the Interstate Commerce Commission. It has the unqualified and unanimous approval of the members of that commission. The bill S. 4087 proposed that rates on coal should be 15 per cent less than the tariff rate from April 1 to Aug. 31 in each year, and 15 per cent above the tariff rate for the remainder of the year.

"While a considerable number of coal operators appeared at the hearings and testified against the proposed legislation, the opposition of the operators was by no means unanimous. One of the most earnest advocates of this legislation is Eugene McAuliffe, of St. Louis, Mo., a gentleman who has had many years of experience in connection with the operation of railroads.

"Most of the operators who opposed the legislation founded their objections on local consideration peculiar to their own properties in relation to the changes in rates proposed in this legislation. For example, certain operators whose coal is of such inferior quality that it will not store satisfactorily feared the introduction of rates which would encourage the storage of the coal produced by their competitors. The sub-committee feels, however, that legislation which will result in incalculable benefit for the whole public and which will entail but slight disadvantages for the great majority of mine operators, should not be denied approval because it may be injurious to the interests of isolated coal operators.

"Some of the criticism aimed at the proposed legislation was based on the fact that it affected coal moving to Lake Erie points for transshipment by water to upper Lake ports and coal moving to tidewater, as well as coal moving but a short distance. This bill remedies the latter objection by specifically excluding from its operation coal moving on rates of 75 c. or less. It also confers on the Interstate Commerce Commission the broadest discretion to alter or modify the prescribed differentials where their enforcement might result in unreasonable hardship to individuals, communities or carriers, thus permitting the commission to examine carefully and to remedy peculiar local situations.

### SUMMER STORAGE IS THE SOLUTION

"The committee realizes, of course, that the feasibility and effectiveness of the proposed legislation depend very largely upon the practicability of storing coal in large and small quantities. It therefore solicited and received a large amount of testimony from such experts as George Otis Smith, director of the U. S. Geological Survey, various coal operators and from coal dealers on this point. As a result of this testimony and from information secured from correspondence, the committee entertains no doubt whatever that practically every kind of coal mined in the United States can be stored safely, conveniently and cheaply.

"The tonnage of coal produced which cannot be stored satisfactorily is almost negligible. The committee is of the opinion that most of the testimony advanced to cast a doubt on the feasibility of storing coal is based almost uniformly on a disinclination to change the present hand-to-mouth policy under which the country now obtains its coal, scarcely knowing one day whether the next day's supply of coal will be available or not. It feels that this ultraconservative attitude, in the face of constantly recurring coal famines, bringing unemployment and possible starvation in their wake, is entirely unwarranted."

FIG. 1. CROSS-SECTION OF THE ROCK-SEPARATOR HOUSE AND BREAKER

Much of the rock is separated from the coal before it goes to the breaker proper. This simplifies the problem of breaker preparation and saves much wear and tear on the breaker machinery.

# An Anthracite Breaker That Is Different

Four Important Details, Differing from Ordinary Practice, Have Been Incorporated in the Design of This Breaker—These Innovations Have Been Tested and Found Satisfactory in Operation

BY DEVER C. ASHMEAD  
Tarrytown, N. Y.

**D**URING the past few years breaker construction has been revolutionized. Probably the most advanced structure of this kind of all those built or rebuilt is the No. 11 breaker of the Lehigh Coal and Navigation Co., near Coaldale, Pa. This breaker has now been in operation less than a year, but the new features that were installed have been thoroughly tried out and have proved successful.

Four important details have been incorporated in the design of this breaker that are either entirely new or have been used only to a limited extent in plants previously built. Never before have all these features been combined in one breaker.

The new features, which will be described and discussed in the order named, are as follows: The rock-separator house, a different type of shaker screen from that usually employed, a combination of mechanical pickers and jigs and a system of motor drive controlled from one central point.

## ROCK IS SEPARATED OUTSIDE MAIN BREAKER

Two main divisions are made in the preparation of the coal at this breaker. These are: The rock-separator house and the regular breaker. The function of the rock-separator house is indicated by its name. All that is done in this building is to remove the large rock from the coal and crush the large coal to its proper size for treatment in the breaker.

Although scarcely new this system is not common. It has been employed elsewhere chiefly, however.

The rock house is part of the original breaker and is constructed mainly of wood. The new breaker, however, is of the latest type of steel construction. The floors are of steel and concrete and no wood is used except where necessary in the machinery for the preparation of the coal. The motor houses, which will be referred to later are of concrete, while the transformer house is of brick.

## BREAKER IS LOCATED HALF MILE FROM MINE

Steam locomotives haul the coal from the mines, which are about a half mile away, to the yard tracks. Thence the cars are transferred to the dump by means of a "godevil" or barney. A Lansford dump built by the coal company at its own shops is used to discharge the coal from the cars. This type of dump is operated by compressed air. It has an hourly capacity of 150 cars, each of three tons, making a total of 450 tons that can be handled every hour if necessary.

The accompanying illustrations show a cross section of the breaker and plans of the rock-separator house. All numbers used in the text to indicate the different pieces of machinery will be found to refer directly to the plans and elevation of the rock house and the breaker as well as to the flow sheet.

FIG. 2. PLAN AND CROSS-SECTION OF THE ROCK-SEPARATOR HOUSE, WITH SECTION OF THE BREAKER Showing the arrangement of machinery in both buildings. The jig and shaker drives are at right angles to each other.

After being dumped the coal passes over the "bull shakers" (2), on which two sizes are made. Coal six inches and larger passes over these shakers while that under six inches passes through them. The large-size coal then goes over a picking chute (3), where the rock is separated and is sent direct to the rock pocket (5), while the coal passes through a set of rolls (6). Coal that passes through the bull shakers (2) goes over another set of shakers (4), on which two sizes are made, coal of steamboat size and larger, and coal smaller than steamboat. The larger size is picked on Ayres pickers, and the coal is passed to a set of rolls (8), while the rock is sent to the rock pocket (5). The size under steamboat coal from shaker (4) goes to the conveyor leading to the new breaker, as does the coal from the rolls (6) and (8) as shown in Fig. 4.

This conveyor delivers the coal into a hopper (10) at the top of the new breaker, from which it is delivered by three feeders to three sets of shaking screens (11). On these shakers only two separations are made—over pea in size, and pea and under.

The over-pea size passes directly from the shakers (11) to the long shakers (12). As is rather unusual in the anthracite field, these long shakers have only one deck each but make four separations, namely, grate, egg, stove and chestnut coals. These shakers are thirty feet long; on the first twelve feet chestnut passes through, on the next nine feet stove coal passes through, on the last nine feet egg goes through, while the grate coal passes over. This grate coal then goes to three anthracite spiral coal pickers (14), on which the coal, bone and slate are separated. The coal is then hand picked and passes to the grate pocket, while the rock goes to the rock conveyor. The bone coal goes to a set of rolls (16), and from thence to the condemned coal conveyor (31). The rock from the spiral pickers (14) is hand picked and the coal recovered is sent to the grate pocket, while the rock is sent to the rock conveyor.

Egg coal from the long shakers (12) passes to a hopper (18) directly behind the egg jigs (21), of which there are three. They are of the double type, and the coal is fed to them uniformly from the hopper. The hopper is installed for the purpose of providing a constant and steady flow rather than an intermittent one. The hopper prevents the coal from entering the jigs so rapidly as to clog them. Consequently it tends to aid the jigs to prepare the coal more thoroughly.

FIG. 3. PLAN OF THE BREAKER SURROUNDINGS Showing the relation of the yard tracks to the breaker, and the tracks by which buildings, tracks, roads, rock and the like is disposed of and timber and fuel delivered.

The coal which has been delivered to the condemned coal conveyor (31) is carried to the shaking screens (11) for retreatment. The rock which has been sent to the rock conveyor (32) is taken to the rock pocket and from here hauled to the rock bank.

#### LOSSES OF COAL TO SLATE PILE ARE LOW

Some interesting results are obtained at this breaker and these may be of interest. The breaker itself has a capacity of approximately 2,000 tons in eight hours. The percentage of the different sizes of coal made, the amount of slate in the coal and also the percentage of the coal in the refuse slate are given in the following table:

Size of Coal	Per Cent of Size Made	Per Cent of Slate in Coal	Per Cent of Coal in Slate Refuse
Broken	3.8	...	2.0
Egg	7.8	2.0	2.0
Stove	9.7	3.5	2.8
Nut	17.2	5.0	3.1
Pea	10.6	8.0	3.5
Buckwheat	12.2	10.0	4.1
Rice	15.5	...	...
Barley	20.2	...	...
Barley No. 2	3.0	...	2.2

The domestic sizes of coal make 38.5 per cent of the total produced, while the fuel sizes amount to the large proportion of 61.5 per cent.

It will be noticed that thus far attention has been called to three of the reasons why this breaker is "different," but probably the most important reason is the fourth and last, which has to do with the drive and control.

Three main and two minor drives are employed in this breaker. One of the main drives operates the machinery of the rock-separator house, another runs the jigs and a third the shakers. A separate motor is used in each case, the jigs requiring a 400-hp. machine and the shakers one of 500 hp. Allis-Chalmers motors are used for both shaker and jig drives, being connected to the main shafts by 36-in. belts with pulleys on 50 ft. centers.

#### SHAKER AND JIG SHAFTS AT RIGHT ANGLES

One unusual feature in the main drives in the breaker is the fact that the shaker and the jig shafts are at right angles to each other. Besides the three main drives there are lesser ones—that required for the compressor and that necessary for the conveyor line from the rock-separator house to the breaker. This last drive requires a 250-hp. motor.

Alternating current is utilized at this breaker. It is received at 11,000 volts and is stepped down to 440 volts. The transformers used are Westinghouse 500-kva. instruments, which are housed in a separate building.

The most unusual feature of this breaker is the control. All the machinery can be started or stopped from a single control room in the breaker. This room is in telephonic communication with all parts of the building and as a result in case of accident the plant can be quickly shut down.

### Morrow Returns to Washington From Western Trip

J. D. A. MORROW, the vice-president of the National Coal Association, returned to Washington Monday, May 10, 1920, after attending operators' meetings at several points in the Middle West.

## Alcohol Is Already Being Produced From Coal on a Commercial Scale

ETHYL alcohol and its derivatives have been extracted successfully and on a commercial scale from coke-oven gas by Ernest Bury, of the Skinningrove Iron and Steel Works, in Great Britain. A perfect motor fuel has been produced and, as the adoption of the internal-combustion engine is rapidly extending, the importance of this development is apparent. The liquid-fuel resources of the world are strictly limited, but the consumption of these fuels is growing by leaps and bounds.

The practical working of Mr. Bury's process at the Skinningrove works, where 5,800 tons of coal are carbonized per week, has revealed an average yield of 1.6 gal. of alcohol per ton of coal carbonized, and as the total weight of coal which was reduced to coke in Great Britain in 1918 was 14,635,000 tons, the application of this process to the whole of this coal would yield 23,416,640 gal. of alcohol, representing at 2s. per gallon a sum of £2,341,664.

Having regard to the scarcity of liquid fuel that production in itself is important. It is national suicide for Great Britain or any other country to continue to burn any substance which might be converted into liquid fuel. The recovery of alcohol at the gas works of Great Britain would yield a further 27,000,000 gal., or taking alcohol and benzol together, the total quantity of liquid fuel available for extraction through the carbonizing of coal would be 114,000,000 gal., as against a present total consumption of 160,000,000 gal. per annum.

The process of extraction by contact with sulphuric acid is not a new discovery, but Mr. Bury was the first to establish it as a commercial proposition. The best results are achieved at a temperature of 60 to 80 deg. C., and in his process Mr. Bury carried utilization of the heat from the coke-oven plant to the utmost limit. Ether, chloroform, iodoform, acetic acid and acetone are among the derivatives which were obtained from this coke-oven gas after the benzol had been extracted.

Skinningrove was the only ironworks in Great Britain which during the war produced trinitrotoluol for the Ministry of Munitions and produced it on a prodigious scale. It was bombed by German aircraft on several occasions; possibly because work of this character was known to be carried on there.

## Senate Sub-Committee Reports Favorably on Bill to Prevent Railroad Strikes

A SUB-COMMITTEE of the Senate Interstate Commerce Committee on May 13 reported favorably the Poindexter anti-strike bill for railroads.

Senator Poindexter, chairman of the sub-committee, said minor amendments would be attached which will not in any way invalidate or impair the efficacy of the measure, and added that the bill was designed "to prevent the tying up of interstate transportation on railroads of the country."

The bill will go back to the full committee, the Senator said, within a few days.

On May 12 the sub-committee favorably reported the Frelinghuysen bill to establish seasonal coal transportation rates, but action by the full committee was deferred.

# Property Owners Try to Control a City Mine Fire by Strip Pit and Clay Bank

A Mine Fire of Unknown Origin Is Burning Under One of Pittsburgh's Most Exclusive Districts — It Has Already Destroyed Much Coal and Surface and Jumped a Clay Barrier

By DONALD J. BAKER  
Pittsburgh, Pa.

PITTSBURGH and its immediate vicinity has been the scene of many mine fires. A number of these have been of an incipient nature, being early "nipped in the bud," while others have been more or less chronic and have caused to property owners and the city losses running into thousands of dollars. The

and in a haphazard manner. The fact that the ground was undermined did tend in a small degree to make purchasers careful, but, with the proofs visible today of the disadvantages of this undermining it is safe to assume that, had the buyers foreseen the future, few if any of the lots would have commanded the fancy figures that were paid for them.

One of the latest fires that the city officials as well as the property owners have had to contend with has been in a portion of the Squirrel Hill district, which is considered one of the most exclusive residential sections of the city. Squirrel Hill, so called, lies adjacent to the Schenley Farms area of the East End, which in the last twenty years has been the scene of considerable building activity.

The section of this district which has been affected by the fire lies on a small hill, twenty acres of which are underlaid with coal averaging six feet in thickness. About forty years ago some of the coal was mined, but only to a limited extent. From appearances where the exposed portions of the mine can be seen it is safe to assume that it was developed quite crudely. The main entries are narrow, which indicates that the wheelbarrow probably was the chief means of transportation.

There is little evidence of posting having been employed in the development work while the pillars are large and in most cases untouched, though little assurance can be felt as to the manner in which the now burned-out area of the mine was worked. There is always a fire hazard present on those properties where coal crops out or where old workings have been driven.

FIG. 1. MAP OF AREA WHERE FIRE IS BURNING

This shows a portion of the outcrop, the clay barrier that the fire has crossed and the property and street lines

stage for these fires has been set by topographical conditions, the number of hills within the city limits making a large area of cropping and lightly buried coal which does not underlie the entire city but is found only in the hilly regions, where it is fairly easy to trace its contour lines.

Furthermore, the early history of the city shows that numerous small mines were opened and worked at intermittent periods, only to be finally abandoned. These make possible a rapid progress of any fires which may get started. The mines at the time of their operation were utilized exclusively for supplying the domestic needs of the suburban area adjacent.

In the eastern end of the city, which has been the section built up most rapidly in the last twenty years, there are many areas that are underlaid with coal. This particular section was mined during the early days

FIG. 2. ONE OF THE ENTRY OPENINGS

Eighteen inches of coal was left in the roof, evidently to protect the roof rock from weathering. This entry extends northward toward Beacon St

FIGS. 3 AND 4. PRESENT RUINS OF WHAT WAS ONCE AN IMPROVED CITY STREET

This shows what is left of Hobart St.—a mass of asphalt, paving bricks and baked clay. In some places the ground and debris are too hot to walk upon.

As a result, great care must be exercised at all times in the building of bonfires. It is not known how the fire which has recently caused so much concern originated, but it is believed to have started from the promiscuous building of fires when the land was being cleared.

In 1914 the city constructed an asphalt pavement on Hobart Street, which lies between Murray and Wightman streets. It was only a short time after the construction of this street that the fire broke out on the property south of Hobart (see Fig. 1). The coal outcrops on this property between Wightman and Murray streets and does not come to the surface again until Beacon Street is reached on the north. Thus the section of land bounded by Murray, Beacon and Wightman streets is a small hill.

The fire made such headway after the new street (Hobart) had been built that it was necessary for the city to take some action that same year. The coal burned toward Murray Street, roughly in a northwesterly direction from its point of origin. An excavation was made by the city from the outcrop line near Murray Street and extending across Hobart Street. A 3-ft. wall of clay was built as a barrier and it was believed at that time that the fire was under control and would soon burn itself out. At the points where the wall was constructed the coal is quite near the surface, having scarcely more than eight feet of cover.

However, the fire took a different course before the efficiency of the clay wall could be tested and burned so rapidly that it was soon under Hobart Street itself. By this time the property owners on the north had become alarmed lest the fire spread under the hill toward Beacon Street, where it would have been extremely difficult to control because at that point about forty feet of cover protected the bed. The city again came to the aid of the property owners in the spring of 1917 and extended the clay wall through to the outcrop line near Wightman Street. By this time the newly-built Hobart Street had been ruined and traffic over it was impossible.

It was again believed that the fire was under control and that while it would continue to burn for some time, it would eventually burn itself out and no further damage to property would result. About this time the property owners on the north realized that at some future time a new street would have to be constructed and that it would be approximately fifteen feet lower than the original. They feared that the properties still undamaged by the fire would decrease in value by reason of the new grade and they dreaded the possibility

that the fire might start up again and continue its destruction throughout the section. Therefore, in an attempt to again bring the land back to its previous value, a contract was let to strip the coal from the line of the street about 200 ft. northward.

It was believed that the coal stripped when sold would defray the expense of the operation and would at the same time give the desired grade. The shaded area in Fig. 1 shows the extent of the stripping operation to date. In the removal of the underlying coal the clay wall built by the city was broken at several places, one strip for a distance of over two hundred feet being entirely destroyed. However, this incident was of little account, as the area of the burning coal was limited by the fact that the bed had been cut. In the process of stripping, the glowing coals had been approached at several points, but never near enough to cause any delay.

The coal was stripped in a general east and west direction, which was parallel with the line of the fire. The idea was to first assure a barrier before stripping the cover from the coal on the long side of the properties. The stripping progressed without incident until a point had been reached where the clay wall crossed Hobart Street. At this point either one of two things happened, the city claiming one and the property owners the other. Either the steam shovel came into too close contact with the burning coal or the clay wall was not of sufficient thickness to arrest the progress of the fire, for it jumped across the barrier and is at present burning in the area shown in black in Fig. 1.

It can be seen that the entire unburned area is menaced by this small burning patch. Unless this portion is either stripped out at once or a barrier built around

FIG. 5. STRIPPING OVERBURDEN FROM THE COAL  
Stripped coal is sold to neighboring householders and other buyers at \$1 per ton

FIG. 7. PLEASING SCENE ONLY THREE HUNDRED FEET AWAY FROM THE FIRE  
General view along Wightman St., showing the type of residences in the vicinity of the burning coal seam. These also will be in danger should the fire extend.

it, the coal as far as the outcrop line on Beacon Street is liable to fire through an encircling movement. It is difficult to say whether or not live coals were thrown by the steam shovel on the opposite side of the barrier at the now burning point. There are arguments and possibilities on both sides.

It is entirely possible that the clay wall built by the city did not serve its purpose. It has often been proved in large mine fires that a barrier of this thickness is of little assistance, and especially might this apply here where the coal was burning near the surface and could receive plenty of oxygen.

While the first has cost both the city and the property owners thousands of dollars, it has not been without its compensating features, small as they are. For instance, there is no project on foot at present to rebuild Hobart Street, but there undoubtedly will be some time, and when that time arrives the grade that will be given this street will correspond more closely to that of the adjoining thoroughfares than the original.

The illustrations accompanying this article show quite clearly the amount of excavation that has been done as a direct result of the fire and emphasize the importance of care being taken when fires are started on properties that are underlain with coal at a shallow depth or on those that are undermined. It is needless to say that this entire district has suffered as a result of the fire, and that building and general construction have been retarded to a marked degree.

Where coal underlies city properties at shallow depths it seems desirable that it be mined away by stripping. In many cases the expenditure will be more than an insurance; it will be a directly profitable outlay. The market for the coal will be found in the surrounding city. Where the depths at which the coal is found are greater than usual it nevertheless may be financially possible to follow the coal because fear of earlier undermining or future fires may well render the land unsalable.

Those who have noted the surface caves in the anthracite region and the fire area at Carbondale will realize what a loss to property can be caused when the underpinning is removed by excavation or a fire, especially the latter.

Extensive use of steam shovels where towns are underlain with coal beds would do much to insure them against future trouble. The damage done to the property by a burning coal bed is not merely local, for the sul-

phur gases spread their pungent odors over the surrounding district, subjecting the town in which they are present to the criticism of every visiting stranger.

### Labor Unrest Manifested in the Belgian Coal Industry

A REVIEW of the Belgian coal industry for 1919, published in the *Board of Trade Journal* (London) for Feb. 19, 1920, according to the *Monthly Labor Review*, issued by the U. S. Department of Labor, reveals the existence of a considerable amount of industrial unrest. During the first half of the year thirty-six strikes involving seventy pits and 16,000 workers occurred. To deal with this unrest *Commissions de Conciliation* were established in various mining localities and *Commissions Régionales Mixtes* for larger districts.

These commissions, consisting of representatives of operators and men, in an effort to settle existing disputes, established the principle of an 8½-hour day from June 1, 1919, and an 8-hour day from Dec. 1, 1919, for pit workers, and a 9-hour day from June 1, 1919, for surface workers, and endeavored to settle other minor trouble-producing matters.

Notwithstanding their efforts, however, a serious strike occurred at Charleroi Dec. 15, 1919. The strike, which was declared contrary to the advice of the labor leaders, was due to two causes: (1) The enormous profits of the colliery owners, from which the workers felt that they had not correspondingly benefited; (2) the unsatisfactory operation of the *Commissions Mixtes* due to "the procrastinating attitude of the miners' representatives and the absence of legal sanction of the decision of the commissions."

The men claimed (1) either a wage increase or control of owners' profits; (2) a definite 8-hour day for pit workers and an 8½-hour day for surface workers, which should include time spent in descending and ascending, meals, etc.; (3) a pension of 2 fr. (38.6c., par) per day; (4) an improved system of health insurance.

Through the intervention of the Ministry of Industry a settlement was reached Dec. 20, 1919, in which the miners were guaranteed ("under protest from the owners") a wage increase of 2.50 fr. (48.3c., par) per day, the other disputed questions being left to further discussion by the commissions and final settlement through proper legislation.

# Revolving Kiln for Making Lignite Into Made-to-Order Fuel

Thirty Per Cent of the United States Coal Is Lignite and Most of It Is Found in States Having Cold Climates—Experiments Appear to Show That a Revolving Kiln Can Be So Regulated as to Deliver Any Given Type of Fuel at the Pleasure of the Manipulator

BY E. L. BROOME \*  
49 Wall St., New York City

IT IS stated upon the highest authority<sup>1</sup> that the minable coal resources of the United States amount to over 3½ trillion short tons, of which 30 per cent is lignite. Of this lignite over 90 per cent is in North and South Dakota and Montana. Into the territory surrounding the Dakota lignite deposits there are shipped annually over two million tons of bituminous coal and over one million tons of anthracite. During the year 1917 less than 650,000 tons of lignite were mined in North and South Dakota.<sup>2</sup>

The utilization of lignite to supply the fuel requirements of the sections adjacent to the deposits would result in a saving of over \$10,000,000 per year, estimated on the conservative differential of \$4 per equivalent fuel ton. Furthermore, "an annual saving would be effected of \$4,800,000 in freight charges alone . . . also . . . the travel of 50,000 cars and 1,200 engines and crews a distance of 600 miles."<sup>3</sup>

In view of the existing fuel stringency and the unprecedented shortage of the means of transportation, it seems reprehensible indifference on the part of the authorities of the states affected, if not on the part of the National Government, that means have not been found for meeting the fuel requirements of the lignite territories by commercial development of their underlying fuel deposits.

It must be admitted that prior to the outbreak of the Great War there was no considerable incentive to the exploitation of lignite as a substitute for other industrial and domestic fuels. On a thermal-cost basis lignite as available did not compare favorably with fuels brought in from the outside.

Lignite as mined is a poor fuel, averaging 7,500 B.t.u. per pound in thermal value. The moisture content is high, in some samples over 35 per cent, and in the Dakota deposits it will average over 25 per cent.

Owing to its high volatile content, lignite when thoroughly dried and pulverized makes a powdered fuel that compares favorably with bituminous coal. It also can be mixed to a proportion of 30 per cent with fuel oil. The cost of drying and pulverizing is at present large and this fact offsets in great degree the value

of powdered lignite as fuel except when it is used on a large scale at the collieries.

To some extent raw lignite is used on traveling chain grates for power purposes. It has found some application in producers for internal combustion engines and furnace work<sup>4</sup> and also for domestic purposes in special forms of furnaces or stoves,<sup>5</sup> but owing to the expense of transporting the moisture, it will not in its raw state be a formidable competitor of other fuels for some time to come except in the vicinity of the place where it is mined.

At the present time the most promising method of popularizing the immense lignite resources is by a large scale manufacture of briquets in plants located at the collieries. The manufacture of briquets from lignite has passed the experimental stage. Perfectly sound briquets can be made, that will stand handling and transportation well and are practically equal in thermal value to anthracite coal.<sup>6</sup>

During the years 1913 and 1914 a series of experiments were conducted on a commercial scale under my observation with a novel type of continuous rotary gas producer. These experiments, which were interrupted by conditions arising from the advent of the war, have been revived since and it is hoped that the results will soon be ready for publication. The principal object of the experiments was the development of a producer for the utilization of low-grade fuels and waste material such as waste wood and sawdust, peat, lignite, bituminous screenings, anthracite washery waste and bone, etc.

About the time these experiments were going on, attention was called to Dr. Babcock's report<sup>7</sup> on his investigations of lignite for briquetting, with the result that an experiment was made on this substance. This trial was unfortunately short because of a lack of sufficient fuel. It had as its major object the recovery from lignite of a residue suitable for making up into briquets, also incidentally fuel gas and by-products.

Gas containing 13 per cent hydrogen and 11.6 per cent carbon monoxide is formed while volatile matter is reduced to 11.3 per cent. By varying speed of rotation, fuel feed, steam-air ratio and proportions to coal, the product can be modified to suit market for semi-coke, gas and byproducts. A percentage of the ash passes off as flue dust.

LOG OF TEST

Length of test,	9 hr.
Fuel per hour, as fired,	1,096 lb.
Fuel per hour, moisture free,	804 30 lb.
Gas per hour,	18,000 cu ft.
Gas per hour per lb. of fuel as fired,	16.50 cu.ft.
Thermal value of gas per cu.ft. (calculated from analysis)	145 B.t.u.
Product per hour, moisture free,	310 lb.

AVERAGE ANALYSIS OF GAS

Gas	Percentage	Gas	Percentage
Carbon Dioxide	10.6	Carried forward	25.7
Ethylene	0.3	Methane	5.2
Oxygen	3.2	Hydrogen	13.0
Carbon Monoxide	11.6	Nitrogen	56.1
			100.0

PROXIMATE ANALYSES

Original Condition	Product	Moisture Free	Product
Lignite	Lignite	Lignite	Lignite
26.2 per cent	26.8 per cent*	Moisture	per cent
30.8 per cent	8.3 per cent	Volatile matter	41.8 per cent
28.4 per cent	46.6 per cent	Fixed carbon	38.50 per cent
14.6 per cent	18.3 per cent	Ash	19.70 per cent
7665	7785	B.t.u.	10,387
			10,635

\* Product collected in water tank.

HEAT BALANCE

Heat in fuel as fired per hour	$1,090 \times 7,665$ B.t.u.	= 8,354,850 B.t.u.
Heat residue per hour	$310 \times 10,635$ B.t.u.	= 3,296,850 B.t.u.
Heat gas per hour	$18,000 \times 145$ B.t.u.	= 2,650,000 B.t.u.
Heat used in process and lost,		2,448,000 B.t.u.

The apparatus used in all the experimental work is shown diagrammatically in the accompanying illustration. It consisted briefly of a slightly inclined drum, revolving upon rollers and driven through gearing. The drum was lined with fire brick. The fuel treated was fed through the screw conveyor at the left and fell freely upon the interior surface of the firebrick-lined drum. Thence, because of the inclination and revolution, it was slowly transported to the right until it reached the zone of gasification, where it came into contact with a mixture of air and steam introduced through the tuyere shown at the right. During this movement the fuel was slowly heated, deprived successively of its moisture and the lighter and heavier volatile byproducts, each at its critical temperature; finally after a portion of the carbon content had been completely gasified to furnish the heat required for distillation and losses, it was discharged, a determined amount at each revolution in the form of a finely comminuted product composed of carbon and ash and a small content of volatile matter. It will be understood that the plan is merely diagrammatic, the details of the apparatus being somewhat different from that shown in the illustration.

KILN IN WHICH LIGNITE IS CHARRED

Note the resemblance of this apparatus to the ordinary cement kiln. The arrangement of tuyere, feed, and gas exit are here shown.

The gas produced was taken off at the left and passed through a condenser and scrubber and to get rid of it was finally burned. There were no means of determining the quantity or the composition of the condensate. It consisted principally of a copious, dark greenish black tar of a consistency resembling heavy cream. I wish to merely assert my belief that the gradual method of heating and the low temperature of the offgoing gas should assure a maximum of recoverable ammonia compounds, oils and tar; much more dilute, of course, than

would be the case in the strict distillation method and requiring more condenser capacity.

It is not claimed that the data given are exact; the short period of time covered by the recorded observation precludes accuracy. The case is cited and the figures given in the hope that they will provoke discussion and inquiry and thereby bring out the experience of other more thorough investigators.

The fuel used was furnished through the courtesy of the Sheridan Coal Co., of Omaha, Neb., and came from its Dietz (Wyo.) No. 4 mine. It was of the grade known as slack or screenings and was quoted in 1914 at 25c. or less per ton f.o.b. mines.

The fuel used was higher in ash than would be employed for the production of briquets. This grade might be used in a producer to furnish gas for the process. It may be remarked that the quantity of ash in the original fuel is not accounted for in the residue. While this is accidental, it was found that a considerable portion of the ash was carried out as dust with the gas; as well as some of the combustible. How much of either thus escaped is not known, but a sample of flue dust analyzed as follows:— Moisture 2 per cent, volatile 15.3 per cent, fixed carbon 44 and ash 38.7 per cent.

Evidently more carbon was burned and more non-condensable gas was produced than necessary or permissible if the carbonized product were the principal object. It should be noted that a device of this character has *per se* a number of ready variables—the speed of rotation, the quantity of fuel fed, the quantity and relative proportions of steam and air, while within certain limits the temperatures are controllable and, perhaps what is more important, the process is continuous.

Let us suppose that the original fuel available for a test was equal to the average of North Dakota lignites, viz.: Moisture, 27.13 per cent; volatile, 29.11; fixed carbon, 36.16; ash, 7.6. Figuring the reduction ratios as demonstrated, from 2,000 lb. of raw lignite we should have recovered 600 lb. of product of about the following proximate analysis: Volatile 10.17 per cent, fixed carbon 77.2, ash 12.67 and having a thermal value probably of more than 12,500 B.t.u. per pound.

For comparison, Babcock's reports with his modified beehive ovens an average recovery in products of 47.3 per cent by weight with an average analysis of:— volatile 16.66 per cent, fixed carbon 73.73 per cent, ash 9.61 per cent, and a calorific value per pound of 12,749 B.t.u.

An apparatus of the type illustrated may be readily adapted to meet the demands of market changes with practically no alteration or delay. If the market for fuel gas was strong in a particular locality the fuel could be completely gasified with the recovery of byproducts as is done in the Mond process. If the gas demand was variable, residue for briquets could be produced and stored during periods of low demand for gas. If there was no local market for gas it could be used to furnish heat for the carbonizing process and probably very little, if any carbon would be burned.

Without question in the near future, the decreasing supply of anthracite coal will be so restricted that the price will be prohibitive for power or domestic purposes. The only practical relief will be the artificial prepara-

<sup>1</sup>Darling: "Notes on Lignite"; p. 2.

<sup>2</sup>Babcock: "Economic Method of Utilizing Western Lignite," p. 44.

<sup>3</sup>The apparatus has since been perfected as a producer to discharge ash containing less than 5 per cent combustible.

tion of fuel from high-volatile coals. The German Government has imposed a surtax of 20 per cent ad valorem upon all coal which is not distilled or treated for its byproducts.<sup>10</sup>

"It is not beyond the bounds of reason to foresee a condition whereby a householder in the place of his ton of anthracite which he now welcomes for \$11, will receive a ton of smokeless coal without slate, a month's supply of cooking gas, 40 miles of motor fuel, enough fertilizer to start a small garden, and tar sufficient to allay the dust in front of his house—all for far less money than he now pays for inferior coal."<sup>11</sup>

## Worldwide British Oil Bunkering Stations To Be Established\*

Conversion of Shipping to Oil Fuel Has Created a Problem of How to Keep Ships Supplied with Bunkers. Here is the British Answer

A LARGE British oil bunkering company, backed by powerful interests, is being formed to supply fuel to oil-burning ships at bunkering stations throughout the world.

The chairman of the new company will be Lord Inchape, who is a director of the Anglo-Persian Oil Co. The board also will include Sir Charles Greenway, chairman of the Anglo-Persian Oil Company, and Sir Frederick Black, who acted for the British Government in the United States during the war in connection with oil. Messrs. William Cory & Son, Ltd., will act as selling agents, and will be in a favorable position to prepare for the supply of oil fuel to ships at stations throughout the world, through its own organization and the arrangements of the coaling firms it controls.

While the reduction in the price of British bunker coals has brought a certain amount of relief to shippers, the problem of securing a sufficient supply of oil fuel for British ships has become acute, and is likely to become more so as vessels fitted for burning oil fuel leave the builders' yards in increasing numbers. In many important ports in the East supplies of oil fuel are reported to be unprocurable.

From the British point of view, the position is rendered still more serious by the merchant marine of the United States, which, being largely oil-driven, will be a heavy user of existing supplies. It is reported that highly efficient arrangements have been made for the American ships, as a result of which they have been able to obtain supplies at Rotterdam at a price equivalent to 56s. a ton, whereas British ships were quoted a price of 200s. a ton.

The new British company is said to be assured of supplies of oil in the East, and will, no doubt, be able to strengthen its position in other directions. The capital will be £1,200,000, but no public issue is expected, the necessary funds being found by the interests forming the company.

The Anglo-Persian Oil Co. is erecting large oil refineries and storage tanks near Swansea, with the object of making this the distributing center for the West of England.

The crude oil will arrive at Swansea port from the Persian oil ports in the tank steamers of the company, will be pumped direct by means of pipe lines laid from the steamer holds to the refineries, and thence back again for distribution after treatment. The oil will not be touched by hand throughout the whole process.

The site covers 400 acres of what was formerly waste land and an entirely new community will be built up.

All the principal ports are now giving special attention to the question of oil storage and facilities for bunkering ships with liquid fuel, for the use of which so many vessels are now being fitted. At Liverpool a large area of land at the extreme south end of the dock estate is being allocated for this purpose and loading and discharging jetties are being built and pipe lines laid.

At Bristol, too, the Corporation, which owns the docks is extending the oil basin at Avonmouth at a cost of £150,000, which will result in an additional 500 feet of quay space being available.

Incessant chaos in the coal industry is one of the chief factors turning the thoughts of shippers to ways and means of dispensing with coal, and for this reason the transfer to oil fuel is receiving great impetus.

On March 20 it was announced that, by agreement between the South Wales Coalowners' Association and the Government, the price of bunker coal would be reduced on and after April 1 from 100s.-115s. to 75s per ton. The reduction, however, came too late to forestall the increase in outward freights, which it was known several British shipping lines had been contemplating.

The Booth Steamship Co., in addition, has since issued a circular to shippers to the effect that it is compelled to increase the existing surcharge of 33½ per cent to 50 per cent on outward freights to North Brazil and Iquitos.

The Booth line, the position of which is typical of many others, has suffered severely by the loss of passenger vessels during the war, and has now only two passenger ships left in the service. It has also been seriously affected by the decline in coal exports, as before the war the cargo vessels of the line carried large cargos of coal to Brazil. At the present time practically two out of every three of its steamers leave Great Britain in ballast.

## British Labor Leaders to Take Action To Reduce Costs

ACCORDING to a cablegram from London May 7, *The Commercial and Financial Chronicle* states, British labor leaders are gradually coming to a realization that by demanding continued advances in wages and concessions in working conditions they are in reality bringing disaster upon themselves.

The statement was made that the "Executive of the 'Triple Alliance' of the miners and transport workers, which is now in session in London, has embarked upon a determined effort to break the vicious circle of wages and increases in the cost of living." It was added that members of the Alliance discussed this question and that "they will meet again at an early date to receive the report of the joint body, and their views will be submitted to the Government with a view to the latter taking 'such action as will substantially reduce present high costs.'"

# Coal Is Saved by Automatic Regulation of Fire to Accord with Steam Used

To Secure Efficient Combustion of Coal the Amount of Air Admitted and Coal Supplied Should Be So Regulated Automatically That They May Be in Proper Proportion to Each Other and to the Amount of Steam Used, the Steam Pressure and the Depth of Fuel Bed

By T. A. PEEBLES\*  
Pittsburgh, Pa.

**E**VEN for the mine operator and manager the efficient combustion of fuel is an important problem. The cost of producing coal is high and there are indications that the limit has not yet been reached. It is true, transportation and labor conditions rarely restrict coal supply at mines, yet it is more necessary than ever to reduce the consumption of coal, for all the coal produced, large or small, can now be disposed of at a good figure, and the good coal used at the mine reduces by that amount the part of the output that can be sold, while the miner has to be paid for what he has mined whether the coal be consumed at the plant or shipped to the market.

The requirements for efficient combustion are so well known that they need not be repeated here. Automatic apparatus has been developed for mechanically supplying fuel to various types of furnaces and the labor involved has been reduced to a small fraction of that required for hand firing. The method of introducing both fuel and air to the furnace also has been materially improved, so that it is possible to insure that the proper quantities of both will be introduced continuously. This is a condition highly desirable from the standpoint of efficient combustion.

In order to meet changing load conditions it is necessary to regulate the fuel and air supply in accordance with the demand. Since it is absolutely indispensable to the highest efficiency that the correct relation between the fuel and air supply be continuously secured it is important that simple and effective means be provided whereby this relation may be established and maintained. Unfortunately for the development of fuel-burning apparatus, whether it be stokers for use with coal, oil burners or gas burners, the means for properly regulating the fuel and air supply has not been considered a part of the fuel-burning apparatus itself. It is, therefore, necessary that the control of fuel and air supply be effected manually or by means of some device that is not an integral part of the firing apparatus.

Since the amount of fuel and air that must be supplied depends upon the weight of the load being carried, it is apparent that the ideal method of control would consist of apparatus that would automatically control the influx of fuel and air in accordance with the demand. This would be determined by the amount of steam being used rather than by the pressure at which it was gen-

erated. In boiler plants where a careful study of combustion control has been made a method has been developed whereby regulation in accordance with the demand on the boilers is working satisfactorily.

The damper-operating levers, and the fan- and stoker-controlling devices are located at a convenient point,

with the steam-flow meters and draft gages so mounted that the fireman can observe from these instruments the effect of each adjustment made. By observing the flow meter the fireman is able to determine the demand on the boiler, and by means of a large pilot gage he is informed immediately of any change in steam pressure. He is

Provision can be made that just as soon as the quantity of steam used is increased more air will be admitted and the fire briskened, while the grate will take on more fuel. Low pressure will have the same effect. As a result coal will not be wasted at the safety valve, nor will the pressure fall below what is needed.

therefore able to make the necessary adjustments to meet the demand for steam and maintain a practically uniform pressure.

Draft gages and gas-analysis instruments enable him to determine whether or not the relation of air to fuel supply is being maintained correctly. With this equipment at his command the intelligent fireman can secure results which closely approximate test efficiencies. The difficulty of building up and maintaining an organization capable of doing this, however, is demonstrated by the small number of plants that are actually securing such results in daily operation. It is, therefore, important that automatic apparatus be developed which will actually make the necessary adjustments to maintain correct conditions.

An objection to controlling combustion automatically in accordance with steam flow is sometimes made on the ground that there will be a lag between any adjustment in fuel and air supply, and a resultant change in rate of steam generation. A simple calculation, however, will show that this lag is exceedingly small. At ratings commonly developed the gas velocity through the boiler passes is from 30 to 40 ft. per second, and the total length of gas passage from the fuel bed to the boiler damper varies from 40 to 80 ft., depending upon the type of boiler and the height of the setting.

It is apparent, therefore, that a particle of air will pass through the fuel bed, its oxygen will combine with the combustible in the fuel and the resultant gas pass out through the boiler damper in less than two seconds. Since about 80 per cent of the work of the average boiler is done in the first pass, it is only a fraction of a second from the time the particle of air enters the fuel bed until its temperature has been

\*Combustion Engineering Corporation.

increased to that of the furnace and the gas has traveled through the first pass of the boiler, giving up four-fifths of all the heat it will deliver. A change in the rate of air flow will follow immediately upon the adjustment of a damper; it is, therefore, evident that a boiler will respond almost instantly to an adjustment in air supply. This quick response of a boiler makes it possible to control combustion by variations in the rates of steam flow. The primary cause of variation in steam pressure is thus eliminated. With the varying fuel and furnace conditions that exist in the average plant, it is, of course, impossible to secure adjustments that will be absolutely correct at all times. It is therefore necessary that an automatic regulating apparatus, actuated primarily by changes in the rate of steam flow, shall also be sensitive to pressure variations. While it develops in practice that control from flow will eliminate most of the tendency for pressure fluctuations, there will be times when pressure variations occur, and if the regulator is sensitive to these changes, the correct pressure will be maintained within narrow limits. The application of automatic regulating devices to any plant must depend upon the type of fuel-burning apparatus employed, the method of

**Automatic Master Controller**

This instrument is strong and rugged in construction yet delicate in operation. It governs both the stoking and draft in such a manner that when the demand on the boiler increases more coal is fired and sufficient air supplied to burn it completely.

producing draft and the local conditions as to load and fuel. The personnel and organization of the plant force also are important. In large installations, where a well-trained operating organization is available, it is desirable to consider each boiler as an individual unit and equip it completely with its own automatic control, including that of fuel and air supply and the discharge of the products of combustion. With an arrangement of this kind the apparatus can be made responsive not only to steam-demand and pressure variations but also to the condition of the individual fuel bed, and no hand adjustment or manipulation will be necessary. This type of control will give the best possible results, but is not always the most adaptable to the smaller installations, where a simpler arrangement would be preferable.

Such an arrangement would automatically control the supply of fuel and air in accordance with the variations in steam flow and pressure, all boilers in service being governed from one main regulator.

If a large number of small units are in operation, it may be desirable for the purpose of control to divide the plant into two or more groups and install a separate regulator on each group. With this arrangement each

boiler of a given group will receive the same fuel and air supply as each of the other units, and there will be no tendency for the fires to become too heavy under some boilers and too light under others, except when variations in fuel occur. This happens at times, but it is not a serious matter, and can be corrected by simple hand adjustment when necessary. Control of this kind will give results closely approximating those secured from the more complete system. It has the advantage, in many plants, of simplicity and low cost of operation.

Plant operators are confronted with the fact that it is impossible to secure the right kind of labor to operate a boiler plant efficiently by hand methods, and are coming to realize the necessity of a correct system of automatic regulation. The problem must be carefully studied, due attention being paid to equipment and local conditions as well as the type of control selected, which should be best suited to the existing conditions.

F. H. Crawford, a mining engineer, who has been specializing in coal problems for the Bureau of Mines, has resigned to enter private employment.

ARRANGEMENT OF CONTROL WHEN FITTED TO A STIRLING BOILER

The master controller governs the draft and stack dampers as well as the steam supply to the fan turbine and the stoker.

# Labor-Saving Methods of Handling Cars At Anthracite Shaft Stations

Two Types of Shaft Stations at One Shaft, One Operated in Part Mechanically and the Other Wholly by Gravity—Only Two Men Required to Handle the Cars—Simple Arrangement of Dogs to Prevent Cars from Running Away

BY DEVER C. ASHMEAD  
Tarrytown, N. Y.

AT THE main hoisting shaft of the Silver Creek colliery of the Philadelphia & Reading Coal & Iron Co., near New Philadelphia, Pa., are two shaft stations of simple design that really require only two men to operate them. They are of entirely different design, one being mechanically operated while the other operates entirely by gravity.

The plan of the first or mechanically-operated shaft station is shown in Fig. 1. At this point both of the tunnels and the shaft itself are entirely in rock. Mine locomotives which in this case happen to be of the compressed-air type place the loaded mine cars on the loaded track so that the first car of the trip can be reached by the pusher. This loaded track is, as stated, in a rock tunnel and is 323 ft. long and perfectly level. If some of the cars from the previous trip have not

been sent to the surface and are standing on the loaded track, then the new trip of loaded cars is coupled to those remaining.

The pusher is nothing but a long cylinder and piston operated by compressed air. It can be seen in Fig. 2 pushing a mine car. The end of the piston rod of the pusher is so arranged that it will engage the axle of the mine car and when the air is admitted to the cylinder the piston will be pushed out, driving the cars forward. The travel of the pusher is 12 ft. It causes a forward movement of the trip of equal length. It is so located that when the cars are pushed forward to their maximum distance, the first car stands on a grade of 3 per cent and is at a distance of 30 ft. from the shaft.

When it is desired to load one of the mine cars on the

FIG. 1. PLAN AND PROFILE OF MECHANICALLY-OPERATED BOTTOM AT SILVER CREEK COLLIERY

Only two men are required to operate this bottom, one at each car pusher. Two compartments of the shaft are used for hoisting coal while the other two are employed for hoisting water.

FIG. 2

Compressed-Air Car Pusher

The cylinder is 12 ft. long and the device handles the empty cars as they come from the kick-back. The control apparatus, governing the movement of the piston in the cylinder, may be plainly seen in the air pipe near the right-hand rib.

cage the first and second car are uncoupled from each other and in consequence the first car, which is standing on a 3-per cent grade, moves forward by gravity and runs onto the cage, kicking off the empty mine car which is standing there. The empty car then passes down a 4.36-per cent grade to a kick-back, which throws the car onto the empty-car track. For a distance of 36 ft. this track is on a down grade of 1.9 per cent, but it changes at the end of that distance to a 1.29-per cent grade against the empties. After rising on this grade for 272 ft. it joins with the loaded track.

Sufficient speed is given to the car when it leaves the kick-back to carry the car past the end of a pusher for empty cars located at the point of changed grade. Fig. 2 is really a photograph of this pusher, but the one pusher which moves the loaded cars is of exactly the same construction. As soon as the car reaches the end of the pusher it is pushed up the slight grade until it is close enough to couple it with the preceding car. A sufficient number of empty cars are spragged to prevent the empty cars from running back down the grade. As the cars are coupled to one another as fast

FIG. 3. PLAN AND PROFILE OF THE GRAVITY-OPERATED SHAFT BOTTOM, ALSO AT SILVER CREEK MINE

This bottom, like that illustrated, is operated by two men. The bottom is so laid out that the cars travel by gravity only, without the aid of any mechanical equipment whatever.

FIG. 4. CAGE-OPERATED CAR STOP OR DOG

as they arrive they are ready for coupling to the mine locomotive. Hence they can be hauled to the mine workings without further delay. Just enough sprags are used to keep the cars from moving back by gravity, but not enough to have any great effect on the pusher.

Two men are all that are necessary to operate this shaft station. One of these is located at the pusher on the loaded side of the shaft. He operates the pusher by a lever and uncouples the cars, releasing them one by one so that they can pass by gravity to the cage. He also operates the switch which turns the cars to the different compartments of the shaft. Another man is required on the empty side of the shaft. He operates the pusher at this point and also couples and sprags the mine cars. Although only two men are required to operate this shaft station the coal company uses four, as the shaft station on the bottom level is not as easily operated and requires the extra men, the same crew operating all of the stations in the shaft.

The second type of shaft station is at the No. 3 plane level of the same shaft. This shaft station is operated entirely by gravity and is entirely different from the one that has just been described. Instead of using separate tunnels for the loaded and the empty tracks both are here in one tunnel which has a double

instead of a single track. A single track comes off the main haulage road for a distance of 58 ft. to the point of frog where the double track begins. The loaded track has a grade for the first 127.55 ft. of 0.834 per cent in favor of the loads. This grade then increases and, for the next 125 ft., is 2.5 per cent in favor of the loads. This carries the cars to within 15 ft. of the shaft. The last 15 ft. is a down grade of 2 per cent. This heavy inclination at the end of the loaded track near the cage is planned so as to give the cars sufficient force to kick off the empty car that is standing on the cage.

A compressed-air locomotive delivers the cars to the loaded track and pushes them to a point near the switch to the two cages. A sufficient number of sprags are placed in the wheels to prevent the cars from moving forward by gravity. When it is desired to place a mine car on the cage that car is uncoupled from the trip and the sprag removed and the car is allowed to drop by gravity to the cage on which it is to be loaded. As soon as the empty car has been kicked off the cage by the loaded car it runs down a very steep grade of 4.42 per cent for a distance of 20 ft. and then to a kick-back that has a grade of 5 per cent against the car. This sends the empty car to the empty track, which has, for a distance of 55 ft., a down grade in favor of the empties of 1.28 per cent and for the next 75 ft. a grade of 1 per cent. The next 172.55 ft. of the empty track has a grade of 3 per cent against the empties.

As in the previous case, only two men are required to operate this shaft station. One man tends to the loaded cars, unspragging them and throwing the switch to the cages, while the other man couples the empty cars for the locomotive.

There is a concrete wall between the empty and loaded tracks. The double-track tunnel is 16 ft. wide, whereas the single-track tunnels in the station previ-

FIG. 5

Details of Shaft Keeps

By a system of signal lights in the hoisting room the enginemen can tell whether or not the keeps are in place.

ously described are only 10 ft. wide. Fig. 3 shows the plans of this shaft station in detail.

There are two other features of considerable interest in both these shaft stations. These are the dogs which prevent the mine cars from running away and falling down the shaft, the other is the method in which the keeps are operated. Fig. 4 shows how the dogs are put in and out of commission. When the cage descends it hits the lever marked A and this causes the dogs to drop out of sight and allows the car to pass over them and onto the cage.

Fig. 5 shows in detail the construction and the operation of the keeps. These keeps are operated by a lever which is thrown by the station tenders, and when in place for use a light is lit in the hoisting engine room indicating that everything is ready for hoisting.

### U. S. Chamber of Commerce Will Study Production Data

**S**OUND business is evidenced in the new program of the U. S. Chamber of Commerce that calls for the organization of an industrial department to study the problems of the manufacturer with particular reference to raw materials production and the output of fabricated commodities.

This new department will study many of the problems of the manufacturer and will deal with selection and education of employees along efficiency and safety lines, wage or compensation plans, housing, workman's insurance, benefits and pensions, alien labor, Americanization, standardization of products, etc.

E. W. McCullough who has been selected to head the new department, points out that there is a great need of more definite and accurate information as to our resources of basic materials, natural and developed, and also as to the resources of the country—not mere data, but data organized and visualized to meet the needs of the average producer. The same treatment should be given partly fabricated materials, which in many instances are the raw materials of other industries.

In production, according to Mr. McCullough, much benefit of good equipment is lost unless production schedules and accurate cost reckoning are made part of the system. Too much of our industrial output is figured on a gambling basis. The day of estimating and cost-plus methods went with the war; these have been supplanted by competition which measures profits based on cost facts.

The new manager holds there is as great need in most lines for reliable production figures as there is for information concerning markets. An unnecessary surplus in production is an injury to producer and consumer alike; is, in fact, economic waste. Under-production causes starvation and suffering. Both may be avoided as far as manufactured products are concerned, except in times of stress, through the availability of accurate production data.

The majority of industries neither gather nor make statements of correct production, while that furnished annually to the Federal Census Bureau is valuable only for comparison. Up to this time defective records, or total absence of records, together with reluctance, because of competitive reasons, have prevented the gathering of figures which would be the most valuable guide to intelligent production.

The National Chamber offers to business the service of this department together with that of other new departments recently created to help solve its problems.

### Commerce Commission Orders Anthracite Roads to Pay Heavy Damages

**O**N APRIL 6 the Interstate Commerce Commission issued an order directing the Lehigh Valley Railroad Co. to pay G. B. Markle Co. \$101,200.60, with interest amounting to \$13,538.91, as damages for unreasonable freight charges for carload shipments of anthracite coal from the coal company's collieries since April 1, 1916.

On a similar charge the Lehigh Valley was ordered to pay Pardee Bros. & Co. \$30,146.30 with interest amounting to \$3,399.79, and to the firm of Charles M. Dodson & Co. \$32,509.77 with interest amounting to \$3,596.39.

At the same session the commission directed the Central Railroad of New Jersey to pay the Dodson company \$7,213.24, as reparation for unreasonable freight charges on anthracite coal shipments.

### Winter Wheat Condition Improves

**E**STIMATES on winter wheat issued by the Bureau of Crop Estimates May 8 state that on May 1 the area of winter wheat to be harvested was about 34,165,000 acres, or 4,605,000 acres (11.9 per cent) less than the acreage planted last autumn and 15,740,000 acres (31.5 per cent) less than the acreage harvested last year. The ten-year average per cent of abandonment of planted acreage is 11.2. The average condition of winter wheat on May 1 was 79.1, compared with 75.6 on April 1, 100.5 on May 1, 1919, and 87.1, the average for past ten years on May 1.

### British Miners Want Share of Increase In Price of Coal

**F**OLLOWING closely on the announcement of an increase in the price of coal in London from \$10 to \$13 a ton the coal miners' executive committee called a meeting to discuss the new prices and their relation to mine workers' wages.

When approached on the subject Vernon Hartshorn, labor member of Parliament, said "If prices are going up, the miners' wages are going up as well."

### Steel Rail Production for 1919 Showed Decline

**S**TEEL rail production in United States in 1919, according to *The Wall Street Journal*, was 2,203,843 tons as against 2,540,892 tons in 1918, 2,944,161 tons in 1917, 2,854,518 tons in 1916, 2,204,203 in 1915 and 1,945,095 tons in 1914. Since 1903 the largest production in any year was in 1906, when the output was 3,977,887 tons.

### Foreign Trade Shows Three Billion Balance In Nine Months

**I**MPORTS brought into the United States during the nine months ending with March were of a total value of \$6,051,000,000, leaving a trade balance for the nine months of \$3,332,000,000.

# NEWS FROM

# THE CAPITOL

BY PAUL

WOOTON

## Canadian Exchange Rates Bother Coal Shippers

**I**N the near future the Interstate Commerce Commission is expected to announce that the carriers, on their own responsibility, may place a footnote on their Canadian coal tariffs to the effect that if the American proportion of through charges is not paid in the United States currency, exchange should be considered in making payment. The American Wholesale Coal Association requested the Interstate Commerce Commission to issue a ruling to that effect.

The commission is unwilling to authorize such a footnote itself, but it has no objection to the individual carriers taking that action on their own responsibility. It was pointed out that immediate action was imperative on coal, which must move a maximum volume at this season of the year, whereas the same question with regard to general merchandise could be threshed out later.

## Private Coal Depots Will Not Be Permitted at Panama Canal

**F**ACILITIES for the storage and handling of coal at the Panama Canal are such that private plants for such purposes will not be permitted. Adequate service for supplying shipping passing through the canal can be had only by obtaining the maximum capacity of Government plants. For that reason Chester Harding, Governor of the Canal Zone, has issued, with the approval of Newton D. Baker, Secretary of War, circular No. 704-3, as follows:

1. Circular No. 703, of July 30, 1915, announced the policy of the Panama Canal, as approved by the Secretary of War, with regard to the establishment of private coal and fuel oil depots on the Isthmus for the supply of shipping passing through the Panama Canal.

2. Pursuant thereto private fuel oil depots have been established and are in operation. Similar action has not, however, been effected in connection with the storage of coal.

3. Experience to date is now accepted as demonstrating the necessity of reversing previous policy with regard to the establishment of private coal deposits. As indicated in Circular No. 703, private wharfage and private utilities for the handling of fuel have, from the first, been recognized as undesirable. This establishment has not at any time been contemplated. So far as concerns fuel oil, the use of existing Government utilities in common connection with both Government and private storage has proved practicable, at least to the extent of justifying further trial. Similar duplicate use of utilities for storage and handling of coal cannot, however, be applied without substantial reduction in

the total quantity of coal that can be stored, or without serious interference with the operation of handling. It has been found that proper service demands the maximum capacity of existing plants, and that the factors involved apply with equal force to whatever extensions may hereafter be developed.

4. It is accordingly now announced that, with the approval of the Secretary of War, the policy of the Panama Canal no longer contemplates the establishment of private coal depots in the Canal Zone.

## Coal Operators Ask Help for Roads

**R**EPRESENTATIVE ESCH, chairman of the Committee on Interstate and Foreign Commerce of the House, is receiving numerous appeals, many of them from coal operators, urging that an extension of time be granted the railroads for repayment of the amounts due the government.

Under existing conditions the proportion of the carriers' earnings available for repairs and extensions is insufficient to take care of these accounts. As a result the coal industry and other commercial activities are being handicapped because of low car efficiency and inability to secure new sidings and trackage facilities. The hard usage to which all equipment was subjected during the war has caused the proportion of cars in poor condition to be much higher than normal.

## Will Divert Coal from Congested Centers

**B**ECAUSE of congestion at tidewater ports and at large railroad centers the Interstate Commerce Commission is considering plans which will tend to divert coal to points where it can be unloaded promptly. Delays to cars resulting from congestion at tidewater and in the large city yards is regarded as an important contributing cause to the car shortage, with a consequent decrease in production. It is stated that too much coal is being loaded to points where it cannot be handled promptly, whereas small towns and the smaller industries could absorb this coal to great advantage and return the cars promptly.

## Revenue Officer Addresses Operators on Coal Taxes

**I**NTERNAL Revenue officials are very much pleased with the success of the recent trip of A. W. Gaumer, of that bureau, during which he talked on coal tax matters at a number of meetings of operators. After each address Mr. Gaumer invited those present to ask questions and to point out any inequities in connection with the operation of the revenue laws.

## National Coal Association Announces Tentative Program for Convention

**A**TENTATIVE program for the annual convention of the National Coal Association, which will be held in Atlantic City May 25 to May 27, has been announced.

Tuesday, 10 a.m.—Roll call and reports of officials and committees. Governor J. J. Cornwell of West Virginia will address the convention in the afternoon, after which there will be reports of committees and the election of directors at large. This should be a lively session as a discussion of assigned cars will follow the report of the committee on railroad relations. The special committee on railroad fuel is expected to spring a new scheme for the solution of this problem.

Wednesday morning will be given over to business and an address by Governor Harding of the Federal Reserve Board. Dr. Eaton and A. H. Smith, of the New York Central, will talk on Thursday morning.

### Taft Will Be Guest of Coal Jobbers

**F**ORMER President William H. Taft has been invited to be the guest of honor at the banquet which will be a part of the annual convention of the American Wholesale Coal Association to be held in Pittsburgh June 1 and 2. The complete program for the convention has not been completed at this writing, but the following features have been definitely arranged:

William B. Colver, of the Federal Trade Commission, will discuss the function of wholesaling; C. B. Hurrey, of the Bureau of Internal Revenue, will talk on tax matters; Charles A. Owen will discuss the tidewater situation; George D. McElvane, Secretary of the National Tin Plate Association, will deliver an address on the work of commercial and trade associations; Vice-

President Kane of the American Short-Line Railway Association will talk on "Transportation After 1920"; E. J. McVann will talk on the smokeless situation so far as experts are concerned; Milton C. Elliott will address the convention on the legal phases of control; Charles A. Allen, secretary of the Wholesale Coal Trade Association of New York, will discuss demurrage; and George H. Cushing, managing director of the American Wholesale Coal Association, has taken "Legislation" as his subject. In addition there will be talks by members of local associations on traffic subjects. The speakers at the banquet will be Former President Taft, Noah H. Swayne, 2nd, Governor Cornwell of West Virginia, and Judge Elliott.

### Coal Operators Are Severely Condemned By Brotherhood Official

**"C**OAL BARONS" and "Petroleum Pirates" came in for denunciation by Timothy Shea, assistant president of the Brotherhood of Locomotive Firemen, in the course of his final argument before the Railroad Labor Board. He said in part:

"In this connection, the public should understand that if it were not for the profiteers railroad workers could be given a square deal and a living wage without any increase in railroad rates. Next to wage earners and salaried people the railroads are the greatest victims of the profiteers. Railway equipment corporations, the steel trust, the coal barons and the petroleum pirates have grown fat on the excessive and unjustifiable profits they have exacted from the railroads, and unless some means is found to curb their greed they will gobble up the greater part of the billions which the railroads must spend for new equipment, betterments and materials of all kinds during the next few years."

# Company Housing in the Bituminous Coal Fields Tends to Uniformity\*

Isolation of Mining Towns, Dependence on One Industry and Shifting Character of Labor Force Compel Owners to Assume Responsibility—Houses Lack Ordinary Interior Conveniences — Streets Usually Are Dirt Roads — Sidewalks Rare

BY LEIFUR MAGNUSSON

**I**N THE latter part of 1916 the Bureau of Labor Statistics completed a comprehensive survey of housing by employers in the United States. This investigation comprised communities maintained by coal mining companies in western Pennsylvania, West Virginia, Ohio, Indiana, Kentucky, Tennessee, Alabama, Colorado and Wyoming, and included almost exclusively the better types of communities. Certain facts stand out as a result of this study.

1. The responsibility for the housing of a large proportion of the miners has been undertaken by the mine operators. The isolation of the average mining town, its dependence upon the one industry of mining, and frequently its impermanence and almost universal lack

of local self-government, as well as the shifting character of the labor force, have compelled the mine owner to assume that responsibility.

2. The average company mining town has few of the amenities of ordinary community life. There is a dull uniformity in the appearance of the houses and an absence of trees and natural vegetation. Streets and alleys are open dirt roads almost without exception. Sidewalks are very rare.

3. The miner's house is without the ordinary inside conveniences found in the house of the city worker. Less than 2 per cent of the homes in the bituminous coal regions have inside toilets, and running water is rare. Stoves and grates are depended upon for heating.

4. The average house of the miner includes about four rooms, in which he must accommodate a family

\*Reprinted from the Monthly Labor Review of the U. S. Department of Labor, April, 1920.

and frequently take in boarders when there is a housing shortage.

5. The rents of the miner's houses are comparatively low, most of them (12,343 out of 18,877, or 65.4 per cent) renting in 1916 for less than \$8 per month. The rent in some instances probably constitutes a subsidy to the wages of the miner who lives in a company house. (What proportion of all bituminous coal miners live in company houses is not known.)

#### SCOPE OF THE HOUSING SURVEY

The survey was in no sense a census of the coal companies with respect to their practice in housing their employees. Observation, however, convinced the investigator that the practice of company housing was very widespread and uniform among the coal-mining companies.

The scope of the survey in the bituminous-coal region is indicated in Table 1.

TABLE 1 SCOPE OF THE HOUSING INVESTIGATION IN THE BITUMINOUS COAL FIELDS

District	Number of Companies	Number of Communities	Number of Employees	Number of Employees Housed	Percentage of Employees Housed
Pennsylvania and W. Virginia	32	114	78,218	43,877	56.1
Ohio and Indiana	3	4	1,287	688	53.5
Alabama	24	29	18,694	15,035	80.4
Colorado and Wyoming	5	16	4,644	3,148	67.8
Totals	64	163	102,843	62,748	61.0

<sup>1</sup> One company did not report number of establishments.

<sup>2</sup> Not including one company with 500 employees; number housed was not reported.

The chief characteristic of every company mining town is its uniformity, due to a tendency to erect houses of similar plan and type and to arrange them along rectangular lines of survey. Another feature of the mining town has been its disregard of the advantages of planting trees, grass and shrubbery as beautifying elements.

On the other hand, the mining town is characterized by relatively wide streets and ample lots. The streets are usually unpaved, open dirt roads. Sidewalks are extremely infrequent and only in the better parts of the community is there evidence of fenced and grassed courts.

The desirability of locating the houses near to the mines has frequently been secured at the sacrifice of conditions of health and comfort; thus in the coking region the houses are found placed on neighboring hill-sides which have been rendered barren by the noxious gases of the beehive ovens. Frequently the towns were found placed not only immediately adjoining the ovens but with no consideration as to the prevailing winds in the region. With the prevailing winds from the west, houses to the east would be constantly enveloped in smoke. Consequently conditions of dreariness and desolation were quite common in the region. On the other hand, some operators pointed out that because of improved means of communication nearness to the mines is not as essential now as it was formerly. This is particularly true in the bituminous region of Pennsylvania, where the district is fairly closely settled. Workers in the bituminous-coal region of Pennsylvania commute from neighboring cities as far as seven miles away. Isolated "patches" in the region still exist by reason of pure inertia, as one of the more far-seeing managers remarked. It is unfortunate that the scattered locations of formerly individually owned mines

were not consolidated into a single town with developed community life at the same time that the mines came under a single corporation control.

There are two prevailing types of houses found in the bituminous coal regions, the single or detached house and the double or semi-detached house, though a few row houses are found in the Pennsylvania and West Virginia and the Colorado and Wyoming districts.

The prevailing plan of house in the Birmingham district is a hip-roofed cottage about twenty-eight feet square with a chimney in the center of the roof, a front porch running the full length of the house, and a small porch at the rear. The houses are generally raised from the ground by brick piers four or five feet high, the area under the house being usually *uninclosed*. In the Tennessee and Kentucky coal fields small gable-roof cottages prevail. These, too, are generally without cellars; front and rear porches are common.

A type of house more or less peculiar to all small southern towns is the so-called "shotgun" house, shaped like an oblong box and divided into three rooms in a row and frequently with the doors connecting the rooms in alignment.

A feature of the mining towns, particularly of the Pennsylvania, West Virginia and Alabama districts, is the monotony of color in the painting of the houses, all of the dwellings in many towns being exactly alike in this respect. Often, too, they need paint badly.

Considerable variations exist as between the different industry groups and the different sections of the country. The prevailing size of dwelling for a family in the Pennsylvania and West Virginia bituminous coal region is either three or four rooms; in the Ohio and Indiana coal region, four rooms; in Alabama, Tennessee and Kentucky, three or four rooms; and in the coal towns of Colorado and Wyoming, four rooms. A considerable proportion of two-room houses is found in the bituminous coal regions of Alabama, Tennessee and Kentucky.

Sanitary conveniences are rarely found in mining towns. Thus in the soft-coal regions only 312 dwellings, or 1.9 per cent, of the 16,896 reported, have inside toilets, while 16,584, or 89.1 per cent, have outside toilets. In the more thickly settled anthracite region 19.5 per cent have inside toilets and 80.5 per cent outside.

#### Railroad Strike Makes Mines Idle

FIFTY-FOUR men forming freight-train crews on the Morgantown & Kingwood R.R., a coal carrier in northern West Virginia, went on strike on Tuesday, May 4, and refused to work for nearly an entire week because the general management of the Baltimore & Ohio R.R., which operates the Morgantown & Kingwood R.R., had not acceded to their demand for an 8-hour day with ten hours' pay, the freight trainmen on April 30, having served notice on the railroad officials that ten days would be given them to meet the demands.

For a time during the strike it seemed certain that the striking trainmen would be dismissed from the service, the management of the Baltimore & Ohio refusing to treat with the men unless they returned to work. This they were finally induced to do by officials of the Brotherhood of Railway Trainmen under assurances that their demands would be given early consideration by the railroad labor board and that they would not lose their seniority rights.

# The Labor Situation

Edited by  
R. Dawson Hall

## Union Would Organize Mingo Field

Labor Leaders Seek to Surround Logan Field with  
Union Territory and Compel Surrender—  
Would Elect Sam. Montgomery

**M**OVES made by the United Mine Workers to organize the Mingo County mines are believed to presage a general movement to organize all the non-union mines in southern West Virginia, a movement which the operators in the section mentioned made plain some time ago would be greatly resented. It will be recalled that during the latter part of January John L. Lewis, president of the United Mine Workers, appeared in Bluefield and at that time announced that a determined effort would be made to organize the Pocahontas and other non-union fields.

Mingo County is directly west of Logan County, where an effort was made last year by the United Mine Workers to force unionization on the miners of the Guyan region, although no sentiment for organization existed among the miners in that field. The effort to organize the Mingo field is construed as part of a strategic move to surround the Logan field with a belt of organized miners.

To the southeast of the Logan field lie McDowell, Mercer and Wyoming counties, and these comprise that part of the Pocahontas field which is in West Virginia. As stated, the efforts of the union to organize the Pocahontas field have been quite active. The attempt to organize the miners in Mingo County is regarded in many quarters not only as industrially significant but also as having political significance in connection with the effort of the United Mine Workers' organization to nominate S. B. Montgomery in the Republican primaries as an out-and-out labor candidate.

The movement now on foot among the United Mine Workers to organize the Mingo and other non-union fields in southern West Virginia is closely interwoven with the political move to nominate Samuel B. Montgomery as the Republican candidate for Governor, Montgomery having been endorsed by the non-partisan labor organization in this state, dominated largely by the United Mine Workers. Little doubt as to this being the relation between the two drives remained after a meeting held at Matewan, in the heart of the Mingo County field, on May 7, at which mine workers were urged to join the union and to support Montgomery.

On the date already given Fred Mooney, secretary of district 17, United Mine Workers, and W. M. Blizzard, president of sub-district No. 2, were at Matewan directing the organizers in their attempt to organize the Thacker field.

Claims are made by Mooney and others that eleven local unions have been organized in Mingo County, the total membership being 2,000. This is denied by the operators of the field, who say that so far the United Mine Workers have failed to make any material head-

way in inducing miners in Mingo County to join the United Mine Workers. They claim that the miners see that there is nothing to be gained by affiliating with the union. However, organizers have been, and are still at work, so far as can be learned, and if reports be true the principal argument they are using is that if the field is organized the Government will see that a better car supply is furnished, conveying the impression that mines in the organized fields are receiving a full car supply. From this it will be seen that the shortage of cars is being used to strengthen the hands of the organizers.

Not only are mine organizers circulating propoganda in the Mingo field but a representative of the Department of Labor at Washington named McRoberts spoke at Williamson during the first week of May advocating the "Plumb Plan."

## Deadwork Still a Lively Issue

**A**S the scales for deadwork in northern West Virginia were left by the Baltimore conference in their entirety to the operators and mine workers of the various local fields a meeting was held at Fairmont on May 7 to consider these matters.

The operators at the Fairmont conference were represented by J. W. Bischoff, of Elkins Coal & Coke Co.; C. H. Tarleton, of Fairmont, manager of the West Virginia division of the Consolidation Coal Co.; A. Lisle White, Clarksburg, W. Va.; Samuel D. Brady of Fairmont; George T. Bell, executive vice-president of the Northern West Virginia Coal Operators' Association, and E. S. McCullough, Fairmont commissioner of the same association.

Representatives of the miners were, C. F. Keeney, Charleston, president of district 17, United Mine Workers; William Petry, vice-president, district 17; W. F. Ray, A. C. Porter, Nick Aiello, Scott Reese, David Ware and Ira Marks, district board members.

## Kansas Miners Allege That State and Court Conspired Against Them

**W**HEN, on May 15, the time came for the Crawford County District Court in Kansas to consider the application made by the officials of that state that the injunction issued against the calling of a strike of mine employees be made permanent, the United Mine Workers' counsel alleged that the plea should not be granted because the Kansas Industrial Relations Court, R. J. Hopkins, State Attorney General, and A. B. Keller, County Attorney, had conspired to create strife in the coal fields of the state with purpose of using the idleness as a reason for asking an injunction or for taking criminal action against the mine workers. The mine workers denied that President Howat or the 250 union officials had conspired in any way to bring about a cessation of work.

## Gompers Wins Preliminary Advantage In Debate with Governor Allen

IN the debate on the Kansas Industrial Relations Court to be held May 29 by Samuel Gompers and Governor Allen of Kansas, Mr. Gompers will have the choice of opening or closing the debate. Governor Allen has been informed by telegram that in the drawing of straws luck favored the American Federation of Labor president.

Practically all the details have been arranged. Governor Allen is writing his speech. Each debater will be allowed an hour and a half to present his argument and fifteen minutes to close.

Kansas labor unions are making arrangements to send a large delegation of labor leaders to root for Gompers.

## Miners Fear Public May Learn How Much Can Be Mined in a Day

TWO miner members of the British Parliament made a \$250 wager on the amount of coal they could mine in two hours. The contest to determine the bet is to take place May 24. As soon as the report of the wager reached the newspapers there was a protest on the part of the miners and 2,000 threatened to strike. It would never do to let the public know just how much coal could be produced by conscientious work.

The two members of parliament who have raised this bad feeling by their reckless wagering are Allen Clement Edwards, from the South Division of East Ham, and John Walton, from the Don Valley Division of Yorkshire. They have already selected the Yorkshire colliery, where, surrounded by admiring (or by unfriendly) spectators they intend, for two hours apiece, to demonstrate how they can make the coal fly.

Two other miners, also M. P.'s, seem to have become "peevish" over the way in which Edwards has boasted his ability to roll out coal. They are Major David Watts Morgan, from the East Division of Rhondda, who holds the Distinguished Service Order, and Charles Butt Stanton, from the Aberdare Division of Merthyr Tydvil. "Who is this Yorkshire man, Edwards, anyway?" they seem to say. Surely there are better miners in Wales than can be found in Yorkshire" and they have challenged him to a contest similar to that he has agreed to enter into with Walton.

## Dan Harrington To Be Fifth Member of Wage Board in Washington State

DANIEL HARRINGTON, who is the district engineer of the Bureau of Mines station at Golden, Col., has been agreed upon by the representatives of the United Mine Workers of district No. 10, of the State of Washington, and by the representative of the Washington Coal Producers' Association as the fifth member of the committee which is to determine the wage scale in Washington coal mines.

## Domestic Coinage in April

DURING the month of April, the Treasury Department announces domestic coinage totaled \$2,348,990, in 14,742,000 pieces.

## Michigan Miners Want to Keep Their Dime Differential

MINERS in Michigan refuse to work unless the new scale assures them of the dime a ton increase that was promised them during the war, which they say they did not receive. President William Stevenson came to New York to ascertain the attitude of President John L. Lewis to the demands of the Michigan men. The Michigan mine leader says that Lewis favored the demands of the Michiganders.

The demand was not made before the Bituminous Coal Commission, but William Stevenson justifies that omission by saying that the matter was not arbitrable. The operators through their representative, H. C. O'Brien, declare that the change in scale was merely a war-time measure, and that as it was one which placed the Michigan operators at a disadvantage it should not be regarded as a permanent provision to be operative when coal is sold under co-operative conditions.

Mr. O'Brien says that the differential has been paid and probably will be till peace is formally declared, but the operators do not want the provision to be saddled on the Michigan operators till April 11, 1922. They are willing, and have offered, to submit to the decision of these arbitrators, whatever it may be, but they demand of the miners that they promise to do likewise, whether the decision be favorable or not.

## Eastern Ohio Locals Reluctantly Confirm New Contract

AFTER the scale committee of the United Mine Workers of subdistrict No. 5—Eastern Ohio—had agreed to a contract with the operators of that area it was necessary to have the document approved by the delegates of the various locals. They met at Wheeling, W. Va., on May 4 and finally accepted the agreement though not without prolonged debate.

The mine workers had constructed a marvelous document, containing forty-one demands, all more or less radical. They were displeased to see most of them discarded when the contract was finally put in shape for signature. The increase granted under the new agreement will average about 27 per cent. There will be an advance of 34.8 per cent in the tonnage scale and a 20-per cent increase in the scale for day labor and dead-work. Approximately fifteen thousand miners will be affected by the new scale. A number of miners had refused to work pending the completion of the contract. Now that an agreement has been reached, it is believed that all miners will report for duty.

## Fusion of Geological Survey and Bureau of Mines Is Proposed

FUSION of Geological Survey and the Bureau of Mines into a new type of bureau to be known as a division of the Interior Department is proposed in a bill which has been introduced by Senator Henderson. The division is to be under the immediate control and direction of an assistant secretary, who "shall be technically qualified by experience and education to exercise the powers and duties imposed." He is to be appointed by the President and it to receive a salary of \$10,000 a year. This is regarded as a step toward attaining a separate department of mines.

## Working Three Seams of Coal That Extend Under a River

Referring to the question regarding the best method of working three seams that overlie each other in the Kanawha River district, as described in *Coal Age*, Feb. 26, p. 419, allow me to submit the following plan of working, which has been derived from my own experience under similar conditions.

For the purpose of securing the most complete extraction of the coal, I would open and work the upper one of these three seams first. Owing to the thinness of the coal in the two upper seams, I would use the longwall method of working each of these. In that method, as is well known, all of the coal is taken out in the first working, while the roof settles firmly on the packs that are built to keep the roads open.

In Fig. 1 is shown a general plan of the longwall advancing method. Starting from the foot of the downcast and upcast shafts, marked respectively D and U in

GENERAL PLAN AND DETAILS OF LONGWALL WORK

the figure, a main haulage road and return air-course are driven in the seam. These roads are 10 ft. in width, and enough roof is taken down to give a clear height of 7 ft. at the start. The material taken from the roof is used for building packwalls on each side of the roads. These roadpacks should be from 10 to 12 ft. in width and well built.

As shown in the figure, branch motor roads are driven to the right and left of the main haulage road and at right angles to it, starting at a distance of from 700 to 800 ft. from the downcast shaft. A longwall face is now started on the inside rib of the inner of these entries. As the face is advanced, packwalls are built to keep open the gateroads, which are turned on 40 or 42 ft. centers, as indicated by the dotted lines in the figure. These roads or "gates," as they are called, are cut off by diagonal or slant roads, which are driven from the main haulage road about every 200 ft. apart. As each place is cut off in this manner, the coal is taken out by the slant road and the remaining portion of the old road is abandoned.

In Fig. 2 is shown a detailed section of the work at the coal face. As indicated in this figure, wooden cribs are built at the corners of the roadpacks, where a permanent road intersects a gateroad. The cribs are made of old wooden props laid across each other, the space between them being filled with loose slate. This reinforces the packwall at the point where the greatest pressure comes and helps to keep the road open while the roof settles down on the packs.

For building cribs, old timbers are more springy and yield better to the settling roof than fresh live timber, which offers greater resistance and may cause the roof to break over the road. This is a feature that must be avoided always in longwall work.

### AT THE WORKING FACE

As further shown in Fig. 2, one or more rows of props are set on some systematic plan of timbering, along the face of the coal. Good cap-pieces are placed over each post, care being taken to range the caps at right angles to any joint or slip in the roof. The caps are of soft wood, 18 in. long, 6 in. wide and 2 or 3 in. thick. Each man's working face is about 42 ft. long, equally divided on either side of the gateway, which requires the handling of the coal a distance not exceeding 5 or 6 yd.

In working the middle seam, I would use a modified longwall system, such as shown in Fig. 3. In this system butt headings are driven off the main road, on centers of about 500 ft., and stalls or roads are turned off these butts, in pairs, on 300-ft. centers, after leaving a 100-ft. pillar between the main road and the first gateroad, for the purpose of protecting the main haulage road.

In Fig. 4, I have tried to illustrate the effect produced on the packs by the settlement of the roof or overburden. When the packs are well built the amount they will be compressed will range from 50 to 60 or 65 per

FIG. 4. SHOWING EFFECT OF TAKING OUT THE COAL

cent, depending on the character of the roofrock and depth of cover. In the figure, the original height of the packs was 3 ft. and this is shown as reduced to 14 in. by the settlement of the roof, following the extraction of the coal.

As shown in Fig. 3, the first gateroad is driven through to the next butt heading or airway. As the gateroads are driven up to within 25 ft. of the airway on the next pair of butts, No. 2 gateroad is connected with No. 3 gateroad by driving a cross-heading through the solid coal.

The work of extraction is now commenced and the coal worked out, in each panel, on the retreating plan,

keeping the face in one panel a few yards in advance of that in the next panel adjoining. Three rows of posts are kept behind each working face, the posts in each row being staggered, as shown in the figure. The 25-ft. pillar protecting the air-course on the next butt heading, and the entry pillars, are drawn back as those headings are finished.

#### SYSTEM IN TIMBERING

Throughout the entire work I would adopt a systematic method of timbering, setting the posts 4 ft. apart, center to center, and keeping three rows of posts behind the track or face conveyor, if that is used. The back timbers are drawn and reset as the face is advanced, the posts being used over and over again.

When the work has been well advanced in the two upper seams I would start to work the lower seam on the room-and-pillar system, taking care to leave pillars of ample size to avoid the possibility of a squeeze occurring in the workings. In my opinion, a good rule to determine the width of the pillars is the following: Make the area of pillars, in square yards, equal to the depth of cover in fathoms, multiplied by twice the thickness of the seam, in feet.

WILLIAM DICKINSON, SR.

Oak Hill, W. Va.

### Utilizing a Water Supply Struck in Sinking a Shaft

A recent reference to this subject, in *Coal Age*, has reminded me of an incident that may be of interest. It occurred in the sinking of two shafts for an operating company. The circumstances were about as follows:

In the process of sinking one of these shaft, between the Sewickly and the Pittsburgh seams, we had been in hard sandrock for a distance of 35 ft. when, on firing a sump round, we struck a stream of water that caused us to put in a pump of greater capacity. A little later, when the shaft was squared up, we found that the water was coming from the hillside, and this opinion was confirmed by the fact that some few days after, several people residing in the neighborhood reported that their wells were running dry.

At this time, the men working in the shaft were drinking the water and said it was the best they had tasted in that vicinity. Also, people came from a distance around bringing their water pails and sending them down the shaft for water. Simply as a matter of precaution, I sent a sample of the water to the laboratory for analysis.

#### WATER REPORTED UNFIT FOR USE

I had a plan to excavate a lodgment in the side of the shaft, that would have sufficient capacity to serve as a reservoir to collect and hold the water, which I contemplated pumping to a tank on the hill. This I thought would serve the purpose of providing a good water supply for domestic use. The management agreed to the plan; but, a few days later, a report came from the laboratory stating that the water was not sufficiently pure for domestic use and the plan was abandoned until a further investigation could be made.

That settled the question, as far as the shaft was concerned, and now it became necessary to make some provision for taking care of the water, before continuing the sinking of the shaft. In this, I was

guided by two considerations: First, I knew that the flow of this water into the shaft would seriously impede the work of concreting when the bottom of the shaft was reached. Second, I was skeptical in regard to the water being unfit for use, and felt that this opinion might be changed when a further test of the water had been made. It was my purpose, therefore, to save this supply of water for future use if needed.

Having made a jackhammer bit of the right size, I drilled three 18-in. holes, horizontally, into the side-wall of the shaft where the water was coming. Into each hole, I drove a 2-in. pipe or nipple, 2 ft. in length. After corking around the pipes so as to prevent the flow of water into the shaft, the three pipes were connected with a column pipe or leader extending downward. This was provided with a valve to shut off the water and the scheme proved a practical success.

#### THE PLAN A WISE PROVISION

When the shaft reached the coal, an excavation was made in the seam and a large sump provided as a lodgment for the water. The standpipe was then extended to the bottom of the shaft. This 3-in. line had been carried down the shaft inside of the forms that were being placed in position for concreting the shaft from the bottom up. The 3-in. pipe terminated below the arch, on the side of the shaft near the wall, and a valve was provided at the end of the pipe to control the flow of water into the sump.

It will not seem strange that when the shaft was finished, the company decided to use this water supply and installed an electric pump at the bottom of the shaft for the purpose of pumping the water to the surface. It is clear that a greater efficiency would have been secured had the first plan been adopted of building the lodgment and installing the pump in the side of the shaft where the flow of water was struck.

The original plan would also have avoided the nuisance of a pump installed at the bottom of the shaft. Had it not been for my efforts to save this water supply, however, it would have been necessary to have made other provisions, at a considerable expense for drilling, or use other means to obtain water. The incident shows the necessity of forethought in providing for the future economical operation of the mine.

Fairmont, W. Va.

JOHN E. AMBROSE.

### Applying the Golden Rule in Industry Will Strengthen an Organization

No one of the letters that have appeared in *Coal Age* has interested me as that written by John Rose on Health and Industry, which appeared in the issue Feb. 19, p. 364, and which drew attention to the need of a more practical application of the Golden Rule in industry.

If the ideas expressed in Mr. Rose's letter and those given in another excellent article that appeared as a Foreword, entitled "Removing the Cause of Trouble," Vol. 15, p. 561, could be practiced by coal operators and mine workers alike, our labor troubles would cease and quickly become a thing of the past. Working men would realize their error in carrying on and supporting an unnecessary organization, because any differences that might arise between them and their employers would be speedily adjusted in the interests of both.

Ever since *Coal Age* came into existence, I have been greatly pleased with its policy in reference to the settlement of labor troubles by the Golden Rule. I much regret to say, however, that my experience in this country and at home, on the other side of the water, has convinced me that mine operators who practice fair and square dealing with their men are few indeed.

Not only in coal mining, but in all industries alike, there are many hypocrites who make a fair pretense at square dealing with their workers. To overcome this hypocrisy, the worker is compelled to devote a portion of his earnings, in an effort to secure his rights by building up and strengthening an organization for which there should be no necessity.

Far better would it be for both employer and employed if they would come together in a spirit that regarded the common interests of each, where the result would be a lesser sacrifice than is now being made by either party. Let us hope for a more practical application of the Golden Rule, which will mean living up to our religion instead of practicing hypocrisy.

Staunton, Ill.

HENRY BOCK.

### Numerous Unsafe Practices of Miners in Blasting Coal and Rock in Mines

In reading the letter of John Rose, *Coal Age*, Mar. 25, p. 603, I was surprised to notice that he gives an instance of a miner pounding a charge of dynamite so hard that the men working in the next place heard him. Evidently, the man must have been using a steel tamping bar, as it would be impossible to make a noise that would be heard in an adjoining place when tamping a shot with a wooden tamping bar.

We know that all miners, more or less, have different ways of doing their work. While it is my practice to use a wooden bar for tamping a shot, I have seen miners use steel bars. Sometimes these bars are tipped with copper to lessen the danger of the steel striking a spark by coming in contact with any hard substance in the coal.

#### OBSERVING THE PRACTICES OF MINERS

On some occasions, I have seen miners when using a blasting barrel insert a cap in the barrel, or when using a needle they would insert the cap in the needlehole and fire the shot with a squib. Again, I have seen miners use two kinds of powder in the same hole; that is, black powder and dynamite. At times they would put a cap into a cartridge or primer, crimping the cap to the end of the fuse with their teeth. Others would use a spike to insert the cap in the cartridge.

I have seen miners use frozen dynamite instead of taking the time to thaw it. All these practices are out of date and should be abandoned. A miner will do many things, in his haste to get away and go home, that he would not do otherwise. But the man that takes his time and works safe always accomplishes more and gets the best results.

Speaking of tamping dynamite, I recommend tamping a charge of any explosive fully to the mouth of the hole. For this purpose I use the drillings of the hole made up in small cartridges and tamped with a wooden tamping bar. It has always seemed to me that there is danger in pushing a wad of paper into the hole and forcing it down onto the charge. The time when the most care is needed is when pushing anything into

the hole on top of the charge or until there is a foot or so of tamping in the hole. I have always found that where a charge of dynamite is well confined in the hole the best results are obtained.

BENJAMIN DEEBLE.

Pittston, Pa.

[Many will disagree with this correspondent's suggestion of stemming a hole with the drillings of the hole made up in cartridges. In blasting coal, nothing is more unsafe than to tamp a hole with coal dust or fine slack. Such a practice is almost sure to result in a windy shot and makes possible a local dust explosion that may have serious results.—EDITOR.]

### To Explore a Mine with an Open Light Is Dangerous

It may be an example of either ignorance, indifference or contempt of the elementary laws taught in all textbooks treating on mine gases and ventilation, that would assume the condition of the air in an abandoned mine to be safe and such as to permit one to enter the mine either with an open light or even an electric lamp. Such must have been the attitude of mind of the two men who recently lost their lives when attempting to explore an abandoned mine, having only a small flashlight, and fell victims to their recklessness, being suffocated by the deadly blackdamp that filled the passageways.

The value of a technical education to mine foremen and firebosses, in so far as it applies to gasses and ventilation, should never be overestimated. Yet there are many who regard such a training as a burden, and do not hesitate to express for it a wholesome contempt. Others regard the need of such knowledge as a necessary evil in coal mining. Especially is that true when there are mathematical formulas to be remembered, in their practical application to the circulation of air and its distribution in the mine workings.

#### NEED OF MINING EXAMINATIONS

In view of the fact that legislators in many coal-producing states have not regarded this subject of sufficient importance to make a mining examination compulsory for mine foremen and firebosses, it is of little wonder that many mine officials are indifferent to this need. Such persons, it may be assumed, will present the same indifferent attitude in respect to maintaining safe and healthful conditions in the mines in their charge or under their supervision.

The advent and use of the electric mine lamp marks a most important advance in safe and efficient coal-mining practice. It is safe to say that the electric miner's lamp has come to stay; and yet it is neither logical nor practical to use such a lamp for the purpose of examining a mine for gas. The lamp gives no indication of the presence of explosive or poisonous gases; and the real danger when entering abandoned workings lies in the presence of either or both of these gases.

Therefore, when entering an abandoned mine, or in the examination of a mine, there is no choice but to use an approved type of safety lamp. To use an electric lamp or an open light for that purpose would be to invite disaster. To ascertain the presence of carbon monoxide, the only safe means lies in the use of caged birds or mice, the examiner being himself protected by breathing apparatus. In daily practice, however, this gas is suspected only under certain conditions, resulting from mine fires, gob fires, or the afterdamp of an

explosion. We have no right to assume that an abandoned mine does not contain dangerous gases, and risk life itself by so doing.

We all learn by experience, and although I have entered and explored some mines that have been abandoned for a considerable time with a feeling of perfect security, in recent years it has been my almost invariable practice, on such occasions, to carry a good safety lamp, instead of either an electric lamp or an open light. There are many dangers to be met in exploring an abandoned mine, such as open trapdoors, roof falls, stoppings squeezed out by the roof pressure, gob fires, all or any of which should be suspected and provision made to avoid their danger.

Let this and similar incidents, in which good men have sacrificed their lives, emphasize for us the importance of technical training and its daily application to mining practice.

W. H. NOONE.

Thomas, W. Va.

## Causes of Mine Explosions

Kindly let me refer to the account of an unexplained explosion that occurred in a coal mine working the Freeport seam, in the Cambridge district, in Ohio, and which was submitted for the consideration of *Coal Age* readers in the issue of Jan. 22, p. 197. I desire to offer a few suggestions or thoughts relating to the cause of that explosion. In the same connection, I read with interest the letter of Robert W. Lightburn, Feb. 12, p. 324, giving his view as to the probable cause of that explosion.

The inquiry fails to state clearly the exact time when the explosion occurred. It merely states that "the fireboss had examined the place about two hours before and found no gas." To my mind, the time when the examination was made would have something to do with determining the cause of the explosion. For instance, if the place was visited by the fireboss in the early morning, two hours before the men entered for work and the explosion took place, it is barely possible that the fireboss was pushed for time and made a hurried examination for gas at the most convenient point.

### WHEN A FIREBOSS IS RUSHED

Knowing that the place was generally free from gas, a fireboss who is pushed for time is quite liable to make a hurried test and assume that no gas is present. A more thorough examination, however, in the present instance, might have revealed a sufficient quantity of gas to have caused the explosion. On the other hand, if the examination was made later in the day, after the men had started to work, it is more probable that the gas that caused the trouble was liberated by reason of the heaving of the floor, which is a common occurrence in pillar workings.

Just here, I recall a remarkable instance that occurred in a mine where I was acting as fireboss at the time. The mine was being robbed out and everything had been drawn back to within 1,500 ft. of the entrance. Three men were at work drawing an entry pillar that measured about 25 x 35 ft., in area. The coal was about 3 ft. thick, underlaid with a hard rock, while the roof was a good slate. No gas had been found previously in this part of the mine; but, as may be imagined, there was a considerable open space that had been worked out behind the men and was standing on timbers.

A good current of air was passing where the men were working, mining the coal with picks and loading it into cars. Suddenly, there was heard a loud report like that of an ordinary coal shot, and a space 8 ft. in width was blown from the center of the pillar to one side, instantly killing one of the miners. The coal was crushed into fragments, the blast resembling that of a heavy charge of powder. There was no flame or smoke and no heat was felt.

Turning, again, to the inquiry before us, the fact that the loader was "holding his carbide lamp in his hand near the floor" would seem to indicate that he was suspicious that there might be gas at the roof, which is possible. His movements would naturally bring it down where it would be ignited on his lamp. If that was the case, the fireboss is probably to blame.

It does not appear to me that this was, in any way, a dust explosion, though machines were used to mine the coal. The theory of vaporized oil, to my mind, is incredible, for the reason that if there was sufficient oil seeping from the strata and vaporizing to cause an explosion, the same oily vapor would have accumulated again in a short time and caused a second explosion.

The suggestion has been offered that a heavy roof fall may have driven gas out from the waste where it had accumulated. It is stated that the pillar "was nearly all extracted," and it is probable there was a large space open behind the men. That being the case, the quantity of gas accumulated would seem to me to have been enough to have produced a disastrous explosion, much greater than what is described in the inquiry.

### EMISSION OF GAS IN MINES

In my practice as a miner and fireboss, I have observed gas escaping from the coal, roof and floor and, at times, coming from all three places at once. I regard the danger less when the gas is coming from the coal than when it issues from the roof or the floor. My reason is that gas coming from the coal has more opportunity to diffuse and be carried away in the air current; while a break in the roof or the heaving of the floor may liberate a considerable quantity of gas that would cause trouble.

My experience agrees with what Mr. Lightburn has stated in regard to gas issuing in numerous small feeders, along the ribs of places that were working, where it was possible to light these small feeders with one's lamp. I recall one instance where a gas feeder in the roof of a main entry gave much annoyance, as miners passing down the entry would forget the feeder and the gas would be ignited, exploding with quite a report, as the lamp the man carried on his head came in contact with the gas.

In closing, allow me to state that my 20 years of practice as fireboss does not agree with the idea now taught that explosive gas will frequently be found near the floor of working places, while a lamp will be extinguished, at times, near the roof. I can understand how this might be the case where the floor was liberating methane and blackdamp was coming through crevices in the roof and connecting with an overlying seam. My experience has been where the conditions were normal, explosive gas is always found at the roof of working places.

JOHN ROSE,

Dayton, Tenn.

Former State Mine Inspector.

[The Inquiry page has, unavoidably, been crowded out this week by reason of necessary changes.—EDITOR.]

# Examination Questions

Answered by  
James T. Beard

## Bituminous (17th Dist., Pa.) Mine Foremen's Examination, April 6, 1920 (Second Grade, Selected Questions.)

**Ques.**—What is the total quantity of air, in cubic feet per minute, passing through an airway 7 x 7 ft., when the velocity of the air current is 300 ft. per minute?

**Ans.**—The sectional area of this airway is:  $7 \times 7 = 49$  sq. ft. Therefore, assuming this is the clear area of passage and the average velocity of the current is 300 ft. per min., the quantity of air passing is  $300 \times 49 = 14,700$  cu. ft. per min.

**Ques.**—Show on the accompanying map how you would ventilate the same, according to the instructions given thereon, with 200 men employed in this mine; 100

men on the right and 100 men on the left of the main entries.

**Ans.**—The direction of the air current in the several splits is indicated by the arrows in the figure.

**Ques.**—State briefly the duties of a miner, driver, machine runner, and motorman.

**Ans.**—The first duty of a miner, on entering his place in the morning, or after firing a shot, is to examine the place for any roof or coal that is liable to fall. The miner must observe also the mark of the fireboss, which shows that the place has been examined that morning. He must reset any timbers that have been discharged by the shots that have been fired, and this must be done before proceeding to do other work. The miner must use every precaution to protect himself from danger and not violate any of the mine laws and regulations.

The duty of a driver is to use every precaution to avoid accident both to himself and others, when hauling out the loads or placing the empties. He must never leave a car standing where it is liable to be struck by another car passing in or out of the mine, or where it can get loose and run out onto the main track. He

must also take good care of his mule and not leave it in an unsafe place where it is liable to be injured.

A machine runner is responsible for the proper care of his machine when in use. It is his duty to cut the coal to the required depth in each place in his district. He must observe and see that his helper works in a safe manner and to the best advantage, in keeping the machine clear while cutting the coal.

A motorman is responsible for the proper use and care of the locomotive in his charge. It is his duty to inform himself in regard to the construction and operation of the machine he must handle. Like the driver, he must use every precaution to avoid accident to himself, his helper and others.

**Ques.**—What system of timbering would you adopt where the coal is undercut by mining machines: (a) In rooms; (b) in pillars; (c) in entries? Make a diagram showing the system employed in each of these cases.

**Ans.**—(a) In driving rooms, under ordinary conditions of roof and floor, a row of posts should be carried on the side of the room track opposite to and parallel to the rib along which the road is laid. At the face, a systematic method of timbering should be adopted suitable to the conditions that exist in any particular place. Ordinarily, two or more rows of posts are set parallel to the coal face, the posts being stood three or four feet apart, center to center. The rows of posts are spaced the same distance apart, and the posts in each alternate row are staggered.

(b) On the left of the accompanying figure is shown the conditions that exist when drawing back the pillars

in the different rooms. The arrangement of the posts, however, will vary according to the conditions in the seam; but it should always be remembered that there must be two or more rows of posts behind the men and between them and the waste, where the roof has fallen.

(c) When driving entries, posts should be stood on each side of the road where it appears that the roof needs to be supported. Post timbering at the head of entries will vary with the conditions of roof and floor. When driving under a hard roof slate, it will seldom be necessary to set any posts at the head of the entry. On the other hand, when driving under a drawslate, this must be supported on posts, until it is taken down or the permanent timbers put in position. On the right of the accompanying figure is shown two methods of framing the permanent timber sets in an entry.

# Foreign Markets and Export News

## American Construction Materials Needed by Brazil

Brazil offers a market for all kinds of construction materials and machinery, not only in the immediate future but for an indefinite time to come, according to Trade Commissioner W. W. Ewing, whose report on that country has just been issued by the Bureau of Foreign and Domestic Commerce, Department of Commerce.

Mr. Ewing recently returned to the United States after a tour of investigation covering all the South American republics. He is convinced that Brazil, by reason of its vast undeveloped territory and its immense resources, is rapidly increasing in importance as an export field.

Some of the goods that it will most urgently need in the next few years are coal, iron, steel, cement, caustic soda, sulphuric acid, chemical and medical products, paper, and most manufactured materials requiring skill and experience in their production, such as engines, agricultural machinery, cutlery, the finer grades of glassware, oils, paints and railway materials of all kinds.

## Coal Exports for March Show Marked Increase

Exports of coal during March, 1920, together with the revised figures for March of 1919, compiled by the Bureau of Foreign and Domestic Commerce, are as follows:

Coal and Coke	March 1919, Tons	March, 1920, Tons
Coal		
Anthracite	117,805	419,682
Bituminous	554,037	1,500,540
Exported to:		
Italy	17,197	137,833
Netherlands	26,743	100,843
Sweden	None	17,706
Switzerland	None	33,763
Canada	352,883	639,635
Panama	5,290	18,306
Mexico	5,429	15,696
British West Indies	15,196	33,298
Cuba	38,107	115,982
Other West Indies	6,352	9,422
Argentina	8,670	80,346
Brazil	60,296	65,726
Chile	6,934	7,783
Uruguay	3,660	18,695
Other countries	7,280	205,506
Coke	33,749	55,435

Imports of coal during March, 1920, were 71,126 tons. Practically all of this coal came from Canada.

The following tables show exports of domestic coal and coke from the United States by countries and by customs districts and the bunker coal supplied to vessels in the foreign trade at specified districts during March, 1920:

## EXPORTS OF U.S. COAL IN GROSS TONS

	Coal		Coke

## Exports Increase Despite Low Exchange Rates

For several months past there have been predictions of a falling off in exports, due to the unsatisfactory exchange situation. Government figures giving the value of total exports do not bear out these predictions, however. The figures for the month of February, it is true, show a decline of \$87,000,000 as compared with January, but in comparing the two months certain factors should be considered.

In the first place, in the month of February there were only twenty-two working days as against twenty-six in January. The value of the average daily exports for the former month therefore were more than \$1,000,000 in excess of those for January.

Taking the Government figures for the seven months from June, 1919, to January, 1920, inclusive, and allowing an average of twenty-five working days for each month it will be found that the average daily exports for this period were \$26,200,000, whereas the daily average for the month of February was \$29,300,000.

In analyzing the February figures it should also be remembered that that month was the worst of the entire period under review from a transportation standpoint. During almost the entire month the railroads were blocked by snow and ice and export freight was moved to seaboard with difficulty.

It is true that for some months past the steamship operators have been complaining of a dearth of cargo, but this is undoubtedly due to the fact that there is a much greater amount of ocean tonnage available than before.

In view of these facts it would seem that the export trade of this country is continuing on a very favorable basis in spite of the many discouraging reports that have gained circulation during recent months. It is true that certain lines have experienced a depression, but on the other hand, several other lines have shown steady improvement, notably steel and machinery. Certain readjustments are to be expected, but that there will be any great decrease now seems improbable.—From *The World's Markets*, published by R. G. Dun & Co.

## London Gets More Coal Than in Pre-War Times

During 1919, Alfred Nutting reports, about 2,000,000 tons of coal were brought to London by rail in excess of that so conveyed prior to the war.

# Production and the Market

## Weekly Review

*Crisis Approaching in Transportation—Switchmen's Strike More Serious Than Most Believed  
—Production of Coal Gains But Little and Prices Are Going Up on Spot Market,  
But with Little Free Coal To Be Had at Fancy Prices*

**C**ONTROL of the distribution of coal is impending, if not, at least in part, already upon us. The effect of four weeks of strikes on the railroads is now being felt by every line of business, and concerted efforts are being made to get relief on a national scale. Priority of transportation for food, fuel and "other necessities" is the answer proposed by railway men and the Commerce Commission.

From every point comes the word that consumers are each day burning more coal than they receive, if they have not already ceased burning coal at all. From the coal fields nothing but solid train movement is being attempted, for the yards and terminals present the most difficult problem to the railroad operating men.

The Interstate Commerce Commission is taking charge of the situation under the emergency clauses of the Transportation act. The National Coal Association has pointed out in detail to that body the imperative need of preferential treatment of coal. Food has already been given the right of way. From now on the big scramble will be to get priority orders and many see a return of the conglomeration of priorities and special assigned cars for commercial consumers that cluttered up the rails in the winter of 1917-1918.

Inspectors of the Government are on the road locating the traffic jams and relief is expected but slowly, so congested are the yards and gateways. Coal will be at a premium from now on and except for railroad fuel and those consumers who may obtain preferences, very little will move to inland territory until the trouble is over.

Production of both bituminous and anthracite continues to gain, but the progress is very slow. (The average daily output shown on the diagram below should read 1,511,000 tons instead of 1,615,000 for May 8.) The gain in bituminous was but 2 per cent and for anthracite but 3 per cent. West of the Mississippi River transportation appears to be about normal and the operators in Colorado, New Mexico and Washington have started buy-early campaigns. East of the river the congestion extends to the furthestmost limits of New England, but not as far as Birmingham.

Prices, of course, remain firm, even advancing at certain points. At Philadelphia \$7 coal is expected and \$5 is a common spot mine price in the Cleveland market. There is nothing in sight to help hold prices to reasonable level except the self-restraint of the producers. Consumers have forgotten price and the jobber is out to get the coal for his customers.

The movement to tide continues in good volume. It is a movement that is easy for the railroads and profitable for the shipper. Northeastern Kentucky reports heavy shipments to Hampton Roads, as does Logan. The regular tide shippers are all going strong. Lake Erie is getting little coal these days.

Anthracite is keeping up with current needs for consumption but not with demand for storage. The state of the railroads is held largely to blame for the condition. Prices are largely in abeyance, but retailers are adding on a figure to cover the expected advance.

Average Daily Production of Bituminous Coal\*

\*From weekly report of Geological Survey.

## Reports From the Market Centers

### New England

#### BOSTON

*Embargoes Resumed—Prices Soar to New Levels—Strong Demand—Railroad Confiscation of Coal General—Receipts from Hampton Roads Continue Light—Quotations Still Advancing—Anthracite Shipments Meager All-Rail, but Improve by Water.*

Bituminous—Effective April 12, the Boston & Maine laid an embargo against all commercial coal from the New York Central and the Delaware & Hudson, thereby again cutting off further supply from the largest consuming area in New England. With this embargo renewed, it is difficult to say what will be the outcome. Several large plants have taken heavy consignments of steam sizes of anthracite, but practically all the smaller users have not cared to take precautions of that kind against a possible shortage of bituminous.

The present traffic situation here seems about as bad as it could be and embargoes may be intermittent throughout the season. The lack of motive power and other equipment is notorious, and roads like the New Haven must get relief from some powerful agency. Other roads are short of locomotives, though not to the same degree.

Spot coal has advanced by leaps and bounds the past fortnight. Sales have been plentiful at \$7 and over for only medium grades, and there is continuous pressure to secure early shipments. Most of the high-grade coal is out of the market, a heavy volume having been sold on contract or for bunker or export requirements.

One effect of the embargoes against New England will be an increasing tonnage available for other markets, and it will be of interest to observe the trend of prices a week or so hence. Some feel that a more conservative market will follow. However, there is little on which to base a prediction.

It is certain that the demand is sustained and with much strength. Undeniably spot coal has been sold for more extended delivery than would normally be the case. Seven dollars is a highly remunerative figure, and producers are willing to undertake business on that basis for long periods.

With much of New England closed to all-rail delivery, water coal will be still more eagerly sought. The supply, however, is by no means adequate for the demand.

The railroads are still commandeering coal in large volume. Railroad practice is most arbitrary in this respect and it is the opinion that railroads

must share increased costs of fuel along with other steam-users.

Despatch at Hampton Roads is now practically normal, steamers being loaded within 24 to 48 hours of arrival. Movement from the mines is good and as usual the heaviest volume of coal is moving on contract. Clearances for New England continue light, with little bidding for the smokeless coals.

High prices have been paid for small lots for prompt loading, but few of these have been for cargoes destined for this market. F.o.b. Boston and Providence, quotations on Pocahontas and New River have risen to \$12.50, although sales are still reported at less.

Quotations on bituminous at wholesale now range about as follows:

	Cambridges and Somersets	Clearfields
F.o.b. mines, net tons.....	5.75 @ 7.00	5.25 @ 6.25
F.o.b. Philadelphia, gross tons.....	8.30 @ 9.70	7.75 @ 8.80
F.o.b. New York, gross tons	8.65 @ 10.15	8.10 @ 9.25

Anthracite—Receipts of domestic sizes continue extremely meager by the all-rail route. The New Haven embargo is now joined by the Boston & Maine's action against all coal from off the New York Central and the Delaware & Hudson. The congestion at the gateways is unabated.

The New Haven management is willing to accept coal only in train-load to obviate the usual switching and make-up at Maybrook and Harlem River. The result is a deadlock, with only quite light shipments coming through.

#### NEW YORK

*Anthracite Situation Grave—Receipts Care for Current Needs—No Increase in Prices—Small Sizes Are in Demand—Car Supply in Bituminous Regions Improves—Demand Forces Prices Upward.*

Anthracite—Continuation of the labor troubles among the railroad employees has resulted in a serious situation here. Receipts at the loading piers are far below requirements, although the dumpings at the upper ports for the week showed some improvement. However, the difficulty in having boats towed from the lower ports are far from over.

The failure of the operators and miners to come to an understanding regarding a new wage schedule has caused considerable uncertainty in the trade. These conferences are now being held in Washington.

Not all of the big producers have advanced their mine prices, but most of the independents have advanced their quotations \$1 per ton for egg, stove and chestnut, which includes the differential of 75c. allowed above company prices.

Some of the smaller operators are said to be able to obtain premiums on their domestic coals if they can promise prompt shipments. Embargoes on shipments to Buffalo and other Lake ports continue to be in force on some of the railroads.

Locally the conditions are serious. Retailers are receiving barely enough coal to meet necessities and much of their equipment is tied up. Prices are not being quoted, retail dealers waiting for their new mine prices to be announced by the large companies when the new wage agreement is announced.

There is a steady demand for the smaller sizes used in heating apartment houses, hotels and office buildings. The supply is running short and reserve stocks are now being used. For these coals, buckwheat was quoted at from \$4.25 to \$4.75 at the mines; rice from \$3 to \$3.50 and barley from \$2.25 to \$2.75. Loaded boats of buckwheat are in strong demand.

Current quotations for company coal per gross tons at mine and f.o.b., tidewater, at the lower ports are as follows:

	Mine	Tidewater
Broken.....	\$5.95	\$7.80
Egg.....	6.35-7.35	8.20-9.20
Stove.....	6.60-7.70	8.45-9.55
Chestnut.....	6.70-7.70	8.55-9.55
Pea.....	5.30	7.05
Buckwheat.....	3.40-3.75	5.15-5.50
Rice.....	2.75-3.25	4.50-5.00
Barley.....	2.25-2.50	4.00-4.25
Boiler.....	2.50	4.25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

Bituminous—The local situation shows no improvement. Receipts at the tidewater docks are slow, due to transportation difficulties.

In the mining regions, lack of cars is given as the crux of the situation. Mine workers are willing to work but because of the poor car supply are idle about half of the time. Improvement in car supply, however, is reported along the New York Central, Baltimore & Ohio and Western Maryland roads, while some operators along the Pennsylvania report a slight betterment.

Loading at the local piers has been slow due to the lack of help and the inexperience of those at work. In addition the scarcity of tugs does not permit of anything like capacity operations.

Lack of coal has resulted in many factories closing down in New Jersey and in New England, while a continuation of the present situation for another fortnight, will result in the closing down of many others.

Exporters of coal are forced to refuse new business if prompt shipments are required. There are bottoms enough but the poor car supply and the local demand prevent their being loaded.

Quotations for the various grades at the mine, per net ton, ranged from \$5.50 to \$6.75, according to grade. Gas coal was quoted around \$6.50. There were many inquiries for smithing coal but it was not to be had, prospective buyers being advised to substitute the coals in Pools 9 and 71.

## PHILADELPHIA

*Anthracite Shipments in Good Volume, but Price Uncertain—Stove and Nut in Demand with Pea Strong—Buckwheat Grows as Domestic Fuel—Steam Trade Centers Around Buckwheat—Rice and Barley Quiet—Bituminous Shows No Improvement—Prices Moving Toward \$7—Good Business at Tide.*

**Anthracite**—Taken from the dealers' standpoint the week has been a fairly satisfactory one, as moderately good shipments of all sizes have come in. This has been occasioned by the numerous embargoes which it has been necessary for the railroad companies to place against outside points, on account of freight congestion.

The dealers in this territory are well above their quota of tonnage, but at times this summer they may be almost flat, on account of the producers diverting coal to outside territories.

The wholesale price uncertainty continues, as the miners and operators have been unable to get together, although results may be expected at any moment.

The biggest producing company still continues to make shipments on a retroactive basis for May, and the retailers are compelled to adjust their retail figures so as to avoid any loss. On this basis the prices for stove and nut are closely grouped from \$13.50 to \$13.75 a gross ton delivered. Pea coal is running from \$10.50 to \$11.

There is a wide range of wholesale prices, shippers notifying customers that shipments are subject to prices in effect at time of shipment. The prices of one of the large companies still continue at \$7.35 for egg, \$7.70 for stove and nut and \$6.00 for pea, per gross ton mines.

Among the more conservative individual shippers the price range is from \$8.10 to \$8.55 for egg, \$8.45 to 8.80 for stove and nut, and \$6.00 to \$6.90 for pea. These prices are f.o.b. mines.

Stove and nut continue to be the most desired sizes. However pea coal continues in demand and the dealers now have little of this size on hand. There is also a growing demand for buckwheat coal for domestic consumption.

Most of the activity in the steam trade is still focused on buckwheat and the current production is rapidly absorbed. Big users of this size are storing every ton that they can get. Rice and barley are inclined to be somewhat laggard, although the companies are able to care for the production of these sizes.

One of the large producers this week added 25c. a ton to its buckwheat price, making its mines figure \$4. Some independent shippers are selling at \$4.10 and still others have advanced to \$4.25.

**Bituminous**—There is absolutely no improvement in the soft coal trade and the consumers in this territory are badly in need of further supplies. The mines are still suffering from a car shortage, with no immediate hopes of relief.

Prices for soft coal, almost regardless of grade, are fast reaching record heights. Quotations are made of \$7 per net ton at mines, although the bulk of the spot business this week has been done at figures between \$6.35 and \$6.75.

Gas coals are extremely scarce and even at quoted prices of \$6.25 to \$6.50 are hard to get. Many of the really big companies are entirely out of the market on spot business.

While prices may seem high, operators declare that when mines are operating only two days a week, the cost of production alone reaches close to \$6. In addition they report the men are unable to exist on the wages of two and three days a week and that they quickly drift into other lines.

With no promise of improvement in the rail situation, producers look forward to an extremely active summer, with the present extreme scarcity running right into fall. Some operators, who have accepted the railroad company's offer of locomotive fuel, are getting a fair supply of cars. The roads are still extremely short of motive-power fuel.

## BALTIMORE

*Poor Car Supply Continues at Mines—Record Prices Hold for Bituminous—Pool Complications Cause Slow Loading of Vessels—Big Export Tonnage Shipped—No Change in Hard-Coal Situation.*

**Bituminous**—The coal roads do not seem to be able to provide a good car supply at the mines. At the outset of the week things looked brighter with a 79 per cent general supply, an 83 per cent supply east of the Baltimore & Ohio and with both the Western Maryland and Pennsylvania reporting a better run of empties.

By the end of the week, however, there was a supply running around 40 per cent or less, with the eastern lines of the Baltimore & Ohio down as low as 32 per cent at times. With the export demand increasing, the strictly local situation had some trials, and prices for spot coal were held at a standard hitherto unknown in the bituminous trade.

Best steam coals readily command between \$6.25 and \$6.50 f.o.b. mines (the net ton), with medium to good coals selling over a range of from \$5.50 to \$6.00 and even the poorest grades of steam coal worth around \$5 to \$5.25 f.o.b. mines. Gas coals of run-of-mine character are around \$5.25 to \$5.50 and screened high-volatile fuels generally good for \$6, mine basis the net ton.

A great export business is under way, the first 15 days of May showing a total loading on export of around 250,000 tons. At this writing there are, besides four boats at the Curtis Bay and Canton piers, about 30 ships awaiting astream to load around 150,000 tons of coal for foreign delivery.

Movement over the piers has been delayed by complications of the pools, which operate against quick vessel loading and dispatch in many cases. Despite this a world record was created

the past week at the Curtis Bay pier of the Baltimore & Ohio, when the steamship Malden was loaded with 6,967 tons of bituminous coal in 2 hr. 44 min. an average of 2,548 tons an hour. The ship was cargoed for the New England Coal & Coke Co., for Boston delivery, and she received a total of 146 cars of coal in the time named.

**Anthracite**—Watchful waiting still marks the anthracite dealers' policy. A remarkably cool spring has made some unusually late small-order business. The dealers are forced to charge at least a dollar above the old winter schedule for coal they sell now, and take orders for future delivery at a price to be set at the time of delivery.

## Lake

## BUFFALO

*No Improvement in Bituminous Situation—Coal Growing Quite Scarce—Strikes Keep Cars from Mines—New Prices Quoted—Anthracite Shipments Irregular—Little Lake Business—Coke Situation Strained.*

**Bituminous**—The switchmen's strike continues and that means little movement of coal or any other freight. So far the roads have been able to organize crews and work enough coal through the yards to keep needed plants in operation.

Coal shippers consider that matters are growing worse, but it could not be much worse or all operations would have to stop. The wonder is that the effects of the strike have been withstood as long as they have.

Buffalo has been a strike center for a long time. The end must be nearer, but the worst may not have been reached. One reason why the employers hold out is that the public does not sympathize with the strikers.

As to prices the average shipper declares there are none and declines to make any quotation. Allegheny Valley, all sizes, is sometimes offered as high as \$6 at the mines, but as a rule it is taken on contract and single sales are few. The same is true of Pittsburgh coal.

**Anthracite**—The supply to the city trade is small and shipments are irregular. There is no distress and consumers are slowly getting in their winter's supply. Reports from Scranton say that the miners are uneasy and may make trouble at any time.

Some of the distributors have put up their prices \$1 a ton, but the larger companies have made no change, and do not appear likely to take any steps in that direction until it is known what the cost of mining is to be.

The Lake trade is still languishing on account of the short supply of anthracite to load into vessels and also because of the lack of steamer fuel. Twenty odd cargoes have been loaded and have mostly moved out of the harbor.

**Coke**—The situation is much strained. The big furnace companies have contracts enough practically to supply them, but the car movement is so uncertain that it is necessary to keep in close touch with the jobbers. Some furnaces are running at a slow rate and one or two have shut down; others get coal and coke by solid trains which get into the city without any switching.

Coke prices have advanced a little, being quoted in a nominal way at \$15 for 72-hr. Connellsville foundry; \$13.50 for 48-hr. furnace and \$10 for chestnut in the domestic trade.

**CLEVELAND**

*Improvement Noted, but Industries Operate on Curtailed Schedule—Spot Prices Around \$5 at Mines—Lake Trade One-third Normal.*

**Bituminous**—Steam-coal receipts in northern Ohio continue from 30 to 40 per cent of normal, apparently just enough to keep most industries operating on curtailed schedules. While the outlook still is bad, some improvement is noted, and the trade is unanimous in its belief that conditions can grow no worse on the railroads and must grow better, though gradually.

Users are pressing their demands more insistently than ever but operators continue to hold them off until the car-supply question becomes more certain. The spot coal dealers are able to pick up costs them \$4.75 to \$5, f.o.b. mines, with more at \$5 than at \$4.75, and a small tonnage reported going at \$5.25.

The tendency of the whole price structure is upward. Operators who saw a slight weakness possible late in the summer, now can see nothing but strength. Domestic bituminous demands continue nil.

**Pocahontas and Anthracite**—Anthracite demand, while seasonably low, is greater than that for Pocahontas. Anthracite prices have not yet been advanced, but dealers threaten to do this almost weekly.

**Lake Trade**—The end of May likely will see the Lake coal trade a good 2,000,000 tons behind the 1919 season at the end of May. In April and May, 1919, Lake Erie docks dumped 4,714,040 tons of bituminous. In April this year the Lake Erie docks handled only 307,000 tons, and if May loading goes much over 1,500,000 tons Lake shippers will be surprised.

Every effort is being made to get No. 8 coal through to Lake Erie docks, solid trainloads being resorted to, but even this expedient is falling short. Pre-season figures on Lake coal prices are being revised, and \$3.25, mine, likely will prove the minimum this season, against \$2.50 last year.

Prices of coal per net ton delivered in Cleveland by retail dealers are:

Anthracite — Egg, \$12.20 @ \$12.40; grate, \$12.20 @ \$12.40; chestnut, \$12.50 @ \$12.70; and stove, \$12.50.

Pocahontas—Shoveled lump, \$10.50, and mine-run, \$9.25.

**Domestic bituminous**—West Virginia splint, \$9.50; No. 8 Pittsburgh, \$7.75; Millfield lump, \$8.50; and Cannel lump, \$11.

**Steam coal**—No. 6 and No. 8 slack, \$8.50; No. 6 and No. 8 mine-run, \$8.50; and No. 8 3-in. lump, \$8.75.

**MILWAUKEE**

*Market Panicky — Water Receipts Relieve Somewhat, but Rail Conditions Not Reassuring — Coal Schedule Unchanged.*

Harsh spring weather, coupled with slow receipts, kept the coal market at Milwaukee in a panicky state during the first half of May. Manufacturers expected that they would have to close down, and public utilities, such as the gas and electric companies, urged strict economy on the part of their patrons.

The arrival of several cargoes from the lower Lakes has served to relieve the tension to some extent, but reports of rail conditions from the mines to Lake points are not reassuring.

Business men are making every effort to put the coal supply on a more satisfactory basis. Milwaukee must get coal regularly and in increasing quantities, from now on until navigation closes, if a fuel famine is to be averted next winter.

Illinois coal is now being marketed at \$7.50 for nut, \$7 for mine-run and \$6.50 for screenings, at the yards. Delivery calls for 75c. more. The general coal schedule remains unchanged.

Receipts by Lake thus far fall far short of last year's record, being 64,290 tons of hard coal and 65,331 tons of soft, against 130,237 tons of the former and 289,771 tons of the latter in 1919.

**Inland West**

**COLUMBUS**

*Congested Traffic on All Railroads—Output in Ohio Mines Reduced to Low Point—Demand for All Grades—Strong and Active Bidding—Prices Advancing to New High Levels.*

The coal-transportation situation is worse, and a further reduction in the output is reported from all mining sections. Traffic conditions are probably the worst in years. There is marked congestion at the various gateways and junction points due to the switchmen's strike.

As a result, many public utilities are about out of fuel. In the northern part of Ohio and in Michigan this condition is quite bad. Central Ohio consumers are better supplied. Efforts are being made to divert a limited amount to take care of the worst cases.

There is active bidding for Ohio and West Virginia coal. Hocking lump is being sold at much higher levels and the same is true of Pomeroy and Cambridge coals. Efforts of the larger producers to keep down quotations have proven unavailing and prices seem to have taken a sudden rampage. Many

of the coal men deprecate the tendency of prices.

Retailers are practically out of fuel. There is no Pocahontas available in this territory as all produced is going to the seaboard. West Virginia splints are also scarce and Columbus retailers have to bid actively for a small allowance. These prices have shown the greatest jumps.

The large bulk of the coal supplied to domestic users in central Ohio comes from the Hocking Valley, Pomeroy Bend and Cambridge fields. Hocking lump is retailing from \$7.50 to \$7.75 and mine-run about the same price. Pomeroy lump is strong at \$7.75 while mine-run is selling at \$7.50, delivered. West Virginia splints are retailing from \$8.50 to \$8.75.

Steam trade is strong as practically every line of consumer is in the market for stocks. The Lake trade is held back because of congestion and car shortage and only a small tonnage has been loaded to date. Loadings at the Hocking Valley docks at Toledo are only about one-twelfth of the tonnage loaded last year at this time.

Prices at the mines of coals used in central Ohio are:

Hocking lump	\$4 25 to \$4 75
Hocking mine-run	4 00 to 4 50
Hocking screenings	4 00 to 4 75
Pomeroy lump	4 25 to 5 00
Pomeroy mine-run	4 00 to 4 75
Pomeroy screenings	4 00 to 4 75
West Virginia splints, lump	5 50 to 6 00
West Virginia mine run	5 00 to 5 75
West Virginia screenings	5 00 to 5 75
Pocahontas lump	5 50 to 6 50
Pocahontas mine-run	5 50 to 6 25
Pocahontas screenings	5 50 to 6 25

**CINCINNATI**

*Improvement in Coal Receipts as Transportation Difficulties Disappear—Market Firm on All Grades of Coal—Winter's Supply Going In.*

Shipments of coal to the Cincinnati market showed an improvement the past week, owing to the gradual betterment of the car shortage as the result of the end (locally) of the switchmen's strike. As a consequence coal men are breathing easier. The market on all kinds of coal continues firm, and industrial users are finding less difficulty in obtaining their necessary supplies. There is increased production in the West Virginia fields and this situation will soon make itself felt in the local market.

Retail dealers have all the business they can handle. Domestic consumers have come to the conclusion that there is to be no letdown in prices, and consequently they are putting away their winter's supply.

The prospect of quite a serious shortage of gas for Cincinnati, forecast by the fight now on in the courts to keep the supply of natural gas going out of the state of West Virginia (from which territory Cincinnati is supplied) has proved a boon to the coal trade; wherever Cincinnatians have depended on gas for heating purposes, it is safe to say that there will be a good supply of coal on hand to offset any discomforts, should the gas give out.

ST. LOUIS

*Coal Situation Growing More Acute—Little Work at the Mines in All Fields—Railroads Short of Fuel—No Change in Retail Prices.*

The little improvement that was noted previous to a week ago was apparently temporary. In the last week conditions have been growing worse, at times have been acute and have threatened to become more so not only in St. Louis, but in the entire country adjacent.

The Southern Ry. has no crews at work at all. Most of the other trunk lines have the majority of their men back, but the terminal is tied up. The strikers have gone to work in other lines and were the strike to be settled today, there would be a shortage of men.

The Missouri Pacific is trying to force the operators to sell coal to the railroad at \$2.60 and many of the operators will shut their mines down before they will be forced into this. The result is that the Missouri Pacific is buying hundreds of cars in the Standard field.

The Chicago & Eastern Illinois has closed its contracts for mine-run at \$2.85 f.o.b. mine. Other railroads are buying in the open market, both in the Standard and Carterville fields at from \$2.75 to \$3 for mine-run.

Standard coal is selling at \$4@4.50 for lump and egg, from \$3.75@4.25 for mine-run and about \$3.25@3.50 for screenings. The Mt. Olive operators are maintaining their regular prices of about \$3@3.25 for domestic sizes and their mine-run and screenings are going on contracts.

DETROIT

*Shipments of Smokeless Small and Irregular—Little Coal Arrives from Central Competitive Field—Public Utilities in Distress—Railroads Use Coal Equipment for Other Freight—Interstate Commerce Commission Appealed To.*

**Bituminous**—With the market practically without free coal, wholesalers and jobbers find themselves in the position of meeting an active demand at high prices, without being able to provide coal. Except for shipments under contract, there is said to be almost no West Virginia or Kentucky coal arriving. The product from those districts now commands so high a price at tide-water markets, that consumers in Detroit and throughout Michigan cannot afford to meet the competition.

Coal from Ohio is arriving in small amount and a little coal is reported coming from Illinois and Indiana. For Ohio coal the nominal prices at the mines on short tons are about \$5 for lump; \$4.75 to \$5 for mine-run and \$4.75 for slack. West Virginia lump is reported selling at the mines at about \$6, to which cost of delivery in Detroit would add more than \$2.

At a conference with the Michigan Public Utilities Commission in Lansing, May 13, representatives of the utility

companies placed the blame for their failure to get coal on the use of coal equipment of the railroads for movement of other forms of freight.

**Anthracite**—Receipts of anthracite are quite small and infrequent. Stocks in the yards of most dealers are exhausted, while the continuance of cold weather creates an active inquiry from household consumers.

CHICAGO

*Little Improvement in Coal Receipts and in Strike Situation—No Eastern Coal Received on Account of Embargoes.*

Chicago has been receiving some coal lately, although in quite small quantities. The prices obtained here are about the same as those maintained elsewhere in the Middle West, as good coals are being sold at circular prices which are reasonable, while fancy prices are being obtained for off-grade stuff.

The Chicago trade has been forced to run along during the past three or four weeks without any Eastern coal, as those who were fortunate enough to contract for Eastern coal earlier in the season have been unable to get their tonnage, on account of the fact that most of the Eastern terminal points have been embargoed.

South

LOUISVILLE

*Car Supply Improves—Western Kentucky Prices Higher, Due to Strong Demand—Eastern Kentucky Well Sold Up and Prices Firm—River Shipments Quiet.*

The car supply as a whole has been better for May, with mines working at least part of three days, and car supply reported at around 45 to 50 per cent; whereas the April supply was only about 30 per cent on Louisville & Nashville lines in the state. Empties are moving back to the mines, while embargoes are holding movement to Northern points in check.

Western Kentucky prices at mines today are higher than ever before, and still advancing. Western Kentucky block coal is quoted at \$3.50@3.75 a ton; mine-run, \$3.25@3.50; nut and slack, \$2.80@2.90; and pea and slack, \$2.60@2.75. Screenings are in heavy demand at fancy prices.

Eastern Kentucky is well sold up, and has little coal to offer. Prices as a whole are firm, while there is practically no differential between steam and block, or mine-run and screenings, as all grades are in good demand. Prices on Eastern Kentucky coals average from \$5.50@6.25 a ton for all varieties.

A few mines are billing out block at not more than \$4.50 a ton, others getting full \$6.25. There is also practically no differential between Hazard non-byproduct coals and Harlan by-

product coals today. No trouble is experienced in selling good byproduct mine-run at \$6.25 a ton.

River shipments are rather quiet as a whole, although a few barges have been received during the week. River shipments for the year have been larger than during the previous two seasons.

BIRMINGHAM

*Trade Restricted Only by Transportation Facilities—Inquiry Strong for Bunkering and Export Trade—Warrior River Moves Considerable Coal.*

The local coal market is restricted only by the inability to get the necessary equipment to the mines for the movement of fuel. The supply of coal coming from the mines has to be prorated to customers and, therefore, only a limited amount of new business can be taken on.

Due to the large increase in the number of ships calling at Southern ports and boats sailing from Mobile, Pensacola and New Orleans, much bunkerage coal is now being sought in this market. Foreign interests are also in the market inquiring for a considerable tonnage.

Cars are not available for transporting export coal to shipside. But operators, whose mines are accessible to the Warrior River, are moving considerable bunker coal to Southern ports, 24,420 tons leaving the Warrior field one day the past week.

Prices as a whole are being held in check, though conditions are such as to bring about a runaway market. Quotations are practically without change since last week.

Canada

TORONTO

*Coal of All Grades Scarce—Canadian Railways Demand Prepayment of Freight—Dealers Refusing Orders.*

Little coal, either hard or soft, has been received during the present week, owing to the railroad embargo which held up shipments at Black Rock. The only consignments to come forward were a few carloads which had previously entered Canada.

The cause of the difficulty is the refusal of the Canadian railways to haul coal unless the freight is prepaid to destination in American funds, including the Canadian end of the haul.

Supplies on hand, especially of bituminous, are quite light and dealers are refusing orders. Consumers are unable to lay in supplies for the season ahead, such orders as have been booked being taken at the price prevailing at time of delivery.

Nominal quotations for short tons are as follows:

Retail (anthracite) egg, stove, nut and grate	\$14 00
Pea	12 50
Bituminous steam	11 00
Domestic lump	12 50
Cannel	14 00

## News From the Coal Fields

### Northern Appalachian

#### FAIRMONT

*Production Decreases During First Week of May—Railroads Unable To Move Coal—Assigned Cars Cut Down Commercial Fuel.*

Instead of bringing any relief from the car shortage, the first week of May witnessed a further decrease in the supply, mines faring much worse than they had during the last week of April. During the first three days of the week, the Fairmont region had only 2,630 cars as against 3,247 cars received during the first half of the week ended May 1.

Similar conditions prevailed in other fields. It was the old story of a lack of cars and it forced a suspension of operations at a number of mines scattered throughout the northern part of the state, materially reducing production.

Failure of the Monongahela mines to secure more cars was due to the fact that while the Pennsylvania had been able to move coal consigned to points on its own lines and the connection from Brownsville, on the other hand the Pittsburgh & Lake Erie was not able to move any coal during the week, there being an accumulation of about 1,300 cars at the point named throughout the week.

The large number of assigned cars used by the Baltimore & Ohio during the week quite materially reduced the number of cars available for the loading and shipments of commercial fuel. Notwithstanding the rather acute shortage, the railroads managed to secure about 25 per cent of production, leaving a small output for commercial shipment, commercial coal therefore being quite scarce.

While during the early part of the week ended May 8 Curtis Bay shipments were fairly large in volume, such shipments diminished in size during the latter part of the week partly because fuel for this port could only be shipped under permit. Port Richmond was embargoed during the greater part of the week. Western shipments increased somewhat in volume from northern West Virginia points, yet little coal was shipped to Lake points, since shipments to such points could be made only under special permit.

Little credence was given a rumor, freely circulated in northern West Virginia fields during the first week of May, that the Fuel Administration was to be resurrected and was to be given plenary powers as to prices. As far as could be learned, such a rumor was started in Philadelphia, but was be-

lieved to have been inspired for the effect it might have on prices.

#### PITTSBURGH

*Coal Movement No Better, in General—Loads Moved, but Empties Not Returned—River Shipments Heavy—Market Irregular.*

The rail strike has been waning, in general, and there are more points to which shipments can be made. On the other hand cars have grown scarcer; the net result is that there is no better coal movement than formerly—if indeed the movement is as good.

The Pennsylvania and Baltimore & Ohio are now relatively free, shipments being possible to the majority of points on these lines, though subject to delays, sometimes more or less interminable. The Pittsburgh & Lake Erie is still doing little, though there has been a slight improvement on this line. The Bessemer road has almost gone out of commission.

The car shortage is due chiefly to two influences: First much more attention is being paid by the railroads to moving loaded cars than to returning empties. Second a considerable proportion of loaded cars are stalled on sidings, thus tying up equipment completely. River shipments continue quite heavy, and Pittsburgh appreciates the Monongahela River much more than ever before.

The coal market has become quite irregular, some quite fancy prices being paid, particularly to brokers. Leading coal operators endeavor to hold the market within reasonable limits, but are not entirely successful. The market is quotable roughly at \$3.75@4 on contract and \$4.50@5 for spot, per net ton at mine, Pittsburgh district.

#### CONNELLSVILLE

*Production Rate Practically Unchanged—Spot Furnace Coke Advances \$2—Solid Trains Move Fuel—Car Supply Seant.*

Coke production in the Connellsville region is running along at about the same rate as in the past three or four weeks, or about 70 per cent of the rate obtaining before the rail strike began. There are more lines of communication open for the shipment of coke, though much territory is still shut off.

The result of the widening in the field has been to bring more possible buyers into the market, and as offerings are no heavier the market has stiffened. Furnace coke for spot shipment advanced \$2 a ton.

Foundry coke prices are, in the main, held down by the policy of leading operators who do not wish to exact profits (at this time) materially greater than were obtainable before the rail strike began; but some brokers have secured altogether unusual margins in handling single carloads of foundry coke.

The market is quotable at \$14 for spot furnace coke and \$12@14 for spot foundry, contract foundry being \$11@12, all prices per net ton at ovens. Connellsville region. Some furnaces bid only \$12 for furnace coke, preferring to bank rather than pay a higher price.

## Middle Appalachian

### POCAHONTAS AND TUG RIVER

*Idleness at U. & W. Mines Worst of Last Twelve Months—Solid Trains Going West, Empties Coming Back, but Diverted to Various Points—Tonnage Going to Tide and Inland East.*

Idleness among the mines on the Norfolk & Western was most marked during the first week of May, conditions being on a par with those of the last week of April—the poorest production week since the early spring of 1919. Owing to a scarcity of equipment, mines were limited to about a 40 per cent output.

As many points in the West were still embargoed, except as to solid train movements, it became necessary to forward the largest percentage of the Southern fields to tidewater and Inland East points. Scarcely any coal has been shipped so far this season to the Lakes from southern West Virginia fields. Coke shipments were slightly larger in volume to Western markets during the first week of the month.

Stagnation was still observed in the Pocahontas field, owing to car shortage, such losses alone far outweighing total production. It was from the East that most empties were coming. This resulted in much idleness at mines, few plants being able to work more than two days at the most during the entire weekly period.

During the first week of May, Tug River mines were still feeling the effect of the "outlaw" strike, since there were not many more cars in the region than there had been in the closing week of April. As a result there was a production not much in excess of 40 per cent at any mine. Some operations were producing coal only during two full days out of the six. Such coal as was produced, for the most part was forwarded to Eastern points, the bulk of it going to tidewater.

One factor causing heavy Eastern shipments was the higher prices offered for delivery at tidewater. The volume of coal for the Lakes from the field was not large, no shipments being permitted until May 7.

Embargoes on high-volatile shipments affected the Thacker district to some extent at the outset of May, though it was possible to ship to some pools under special permit. There was still a marked shortage of cars in the Williamson field, the output being about 50 per cent of normal.

### NEW RIVER

*Little Coal Shipped West—Many Markets Embargoed—New River Coal Sent East for Bunker and Export—Virginian Mines on Gulf Work Four Days Out of Six.*

Improvement in conditions in this area during the first week of May was so insignificant as to be negligible, all mines being short of cars throughout

the week. The shortage, which has been in evidence since the first of the year, continued to be aggravated by conditions in the West.

It was neither possible to ship much coal to Western markets nor to secure any cars to speak of from Western points; many markets were still embargoed during the greater part of the week as far as West Virginia shippers were concerned. Production in the New River field, during the first week of May, reached little more than 100,000 tons.

Coke was being consigned to Western markets from the New River field in larger quantities than had been true as to the latter part of April. The bulk of New River coal was being routed to tidewater for bunkering and export purposes, though Inland East markets were securing a limited quantity.

Mines in the Winding Gulf district were probably comparatively little affected by the car shortage in the period between May 1 and May 8, owing to the fact that the Virginian Ry. succeeded in furnishing the mines on its lines with a larger quota of cars than was the case on other railroads in southern West Virginia. Mines on the Virginian were able to operate about four days out of the week or approximately 66 per cent. Mines in the same district on the Chesapeake & Ohio, however, were not so fortunate, having only about a two-day supply, being limited therefore to about a 35 per cent output. Virtually the entire output of the Winding Gulf field was shipped to tidewater.

### LOGAN

*Tonnage Increases in Guyan Field—Mines Still Operate Below 50 Per Cent of Capacity—Western Shipments Limited, Tonnage Goes to Tide.*

With cars somewhat more plentiful in the Guyan field, there was a slight tonnage increase in the opening week of May in that region, production reaching approximately 175,000 tons, a gain of about 20,000 tons. So few cars were available, compared with the requirements of the mines, that heavy losses in production were being entailed; there being a loss due to a shortage of equipment of about 225,000 tons.

Even making allowances for the somewhat better car supply, mines were still being operated below 50 per cent of potential capacity and it was not possible to more than meet contract requirements. Hence there was little free coal available.

Of course with many Western markets embargoed, except under special permit, Western shipments were necessarily limited. But even aside from such embargoes, there was such a heavy demand at tidewater that little coal was available for Western shipment.

Effective May 6, Pools 5, 6 and 7 at Newport News were closed to high-volatile shipments from the Logan and other high-volatile fields, permits being issued only as the arrival of vessels justified. Lake buyers were still ex-

periencing difficulty in securing coal, and there was not a particularly large tonnage movement to Lake points.

During the month of April only 647,352 tons of coal were produced in the Logan field, that being only 28 per cent of potential capacity. Total losses from all causes during the same period amounted to 1,188,561 tons, or 61.8 per cent, with transportation disability being responsible for the loss of 1,149,301 tons or 58.6 per cent.

### KANAWHA

*Dearth of Cars for C. & O. Kanawha Mines—Mines on K. & M. Better Off—Output Goes East.*

There was a dearth of equipment for Kanawha mines from the very beginning of the week ended May 8, the shortage becoming more pronounced as the week grew older. In short, only 88,000 tons of coal were produced at Kanawha mines, excluding Coal River territory and Kanawha & Michigan territory, during the week ended May 8.

The major part of the output continued to be moved to Eastern markets, but tidewater shipments were somewhat under those of the previous week, owing to embargoes applying to high-volatile coal. Western shipments were increased somewhat, partly under special permission. Lake shipments were comparatively insignificant although there was strong pressure for coal at lake ports. Prices were still high but it was rather believed the crest had been reached.

### NORTHEAST KENTUCKY

*Transportation Improves and Output Increases Slightly—Mines Operate Half Time—Some Lake Trade and Much Tide and Southern Tonnage.*

Improvement was shown in transportation facilities afforded mines in northeast Kentucky during the first week of May, and consequently production in that period was somewhat larger than during the final week of April. However, the increase in the percentage of production was rather small, there being still a loss of more than 50 per cent.

Few mines were able to operate more than half the week, and in a majority of instances operations were limited to about two and a half days out of the six. More cars were available for mines on Big Sandy and on the Sandy Valley branch of the Chesapeake & Ohio. There was no further improvement, however, during the the first half of the second week of May.

It was possible to move more Lake coal than had been the case during April, since switching in yards could be avoided. Much northeast Kentucky coal, however, was still being moved to tidewater and to southern markets.

Little spot coal was available during the first week of May, since northeast Kentucky mines found it impossible to even keep pace with contract requirements, the demand in fact far outstripping the supply.

# Mine and Company News

## ILLINOIS

Chicago—The Allen & Garcia Co., of Chicago, have been employed by the American Smelting & Refining Co. as engineers for the design and construction of a thoroughly modern complete coal mining plant near Rosita, State of Coahuila, Mexico. The smelting company controls approximately 35,000 acres of coking coal land and expects to use the output of the mines for coke making in connection with their smelters. Messrs. J. A. Garcia and Andrews Allen leave shortly for Mexico to make examination of the properties and arrange for the preliminary surveys, shaft sinking, etc.

The rapid strides which the Roberts & Schaefer Construction Co., of Chicago, is making toward the completion of the new plant (including a steel tippie) at the Sunnyside mine of the T. G. Ward Co., in Williamson County, indicate that the mine will probably be able to resume operations not later than the middle of May. The new tippie, which is to replace the one destroyed in a recent fire, will have many new and modern improvements over the old one.

Rumors of one of the largest mine mergers in the history of Illinois have been circulated lately. The Union Fuel & Ice Co., of St. Louis, plans to control in the neighborhood of 85 mines located mostly in St. Clair and Madison counties. The company has lately bought out and consolidated five or six of the small fuel firms in St. Louis. It is stated that the idea is to centralize the industry in the Standard field, reduce the number of small operators and stabilize production and the marketing of coal. This can be done by buying many of the smaller mines throughout the state and controlling them under one head. John Taylor, of Belleville, formerly at the head of one of the largest and oldest coal companies in southern Illinois, is one of the preliminary promoters of the scheme.

## NEW YORK

New York—Plans are under way calling for a merger of Burns Brothers, Willtam Farrell & Sons, Inc., and the United States Distributing Company. S. M. Shatzkin, former vice-president of Burns Brothers and an organizer of both that and the Farrell company, is active in promoting the merger, which will take in a number of other smaller coal companies. Directors of the Burns and Farrell companies met on May 11 and 12, respectively, at which time the proposed merger was considered and approved.

1074

## KENTUCKY

Bulan—The Tracer Fork Coal Mining Co., Lexington, Ky., is planning for the immediate development of a tract of about 1,500 acres of coal properties in the vicinity of Bulan. It is proposed to have an initial output of approximately 200 tons, this capacity to be increased at a later date. The company recently increased its capitalization from \$30,000 to \$100,000, to provide for the proposed expansion. John R. Pates, 1304 Fayette Bank Building, Lexington, Ky., is secretary.

## OHIO

Columbus—The complete statistical report of the Ohio Industrial Commission has been made public and covers production during the year 1919. This report shows that there were 33,934,737 tons produced in 1919 as compared with 47,849,236 tons in 1918. The records of other previous years are: 41,677,986 tons in 1917; 34,526,552 tons in 1916; 22,627,046 tons in 1915; 18,736,407 tons in 1914 and 36,285,468 tons in 1913. Of the total production in 1919, 30,154,485 tons were machine mined; 2,439,975 tons were pick mined and 1,340,277 tons were stripped. Belmont County, as has been the case for several years, was the leader with a production of 9,876,953 tons. Athens County was second with 5,141,582 tons; Jefferson County was third with 4,575,054 tons and Guernsey County fourth with 3,340,815 tons. Other counties which had a production of 1,000,000 tons or more were: Harrison, 1,374,407 tons; Hocking, 1,144,963 tons; Perry, 2,477,468 tons and Tuscarawas, 1,376,164 tons.

Athens—A deal has been closed whereby the Hocking Valley Mining Co. has purchased a 2,000-acre tract, north of this place, from the Lorain Coal & Dock Co. The consideration was in the neighborhood of \$225,000. The operations were abandoned about ten years ago, but it is planned to re-open them, to build a modern tippie and employ about 300 miners.

## OKLAHOMA

Muskogee—The Southwestern Coal & Coke Co., which recently incorporated with a capital of \$250,000, has perfected its organization and is understood to be arranging plans for the development of a total of about 2,000 acres of coal properties in the vicinity of Muskogee. Machinery and equipment will be installed. John Wheeler, and E. R. Nagle, both of Muskogee; and H. A. Boyles, Wichita Falls, Tex., are connected with the company.

Carbon—The Carbon Fuel Co., which recently increased its capital from \$250,000 to \$1,250,000, for general expansion, is planning for the development of a total of about 1,500 acres of coal properties in the vicinity of Carbon. The company's plans include the construction of a large new steel tippie as well as the installation of a new conveyor system. J. R. Thomas is president; W. W. Chapman is construction engineer.

## PENNSYLVANIA

Ashland—Three miners were killed at the Bast colliery recently when the cage in which they were riding was overhoisted and they were hurled down the shaft. The victims were Harry Snyder, 35 years; Thomas Kilroy, 47; and Patrick Neary, 48. John Dombrowsky, a fourth occupant, clung to the cage and escaped injury.

The men had completed their shift in the mine and signalled the engineer to be hoisted to the surface. The cage failed to stop at the usual landing place and the engineer reversed the engine. The cage continued to ascend, however, until it reached the sheave wheels, where it stuck for an instant, and then dropped suddenly the length of the rope, which had become slack. The sudden stop threw the three men off the cage, but Dombrowsky held on.

Snyder fell to the bottom of the shaft, a distance of 1,200 ft., and Kilroy and Neary to the shaft surface landing, a distance of 50 ft. Snyder was killed instantly and Neary died while being taken to the State Hospital at Fountain Springs.

## TENNESSEE

Central City—The Gibraltar Coal Mining Co., of Memphis, Tenn., is understood to be having plans prepared for increased operations at its local mining properties. The work includes the sinking of an additional shaft, the installation of machinery and equipment, the erection of a new steel tippie, as well as the construction of a number of miners' houses. It is proposed to have a capacity of about 2,000 tons daily.

## WEST VIRGINIA

Ivaton—The Ivy Branch Coal Co., which recently increased its capital to \$100,000, is having plans prepared for extensive improvements at its plant, to provide for increased output. It is proposed to install new shaker screens, build an additional railroad siding, and erect a number of miners' houses. The daily output from this plant is to be in excess of 500 tons. Leo F. Moore is superintendent.

**Lewisburg**—The Nelson Fuel Co., recently organized, is arranging for the immediate installation of machinery and equipment in connection with the proposed development of about 2,500 acres of coal lands in the Lewisburg district. John B. Laing is president.

**Bellwood**—The Imperial Smokeless Coal Co., recently organized, is having plans arranged for the development of about 1,200 acres of coal lands in the vicinity of Bellwood. It is proposed to install machinery and equipment for a daily output of about 1,000 tons. W. S. Wood, Charleston, is president; H. H. Blackburn, Fire Creek, is vice president; and J. Wade Bell, Bellwood, is manager. Headquarters of the company are at Charleston.

passing of such a bill would tend to curtail the advertising of some manufacturers, which would cause more or less depression in business, and as the crying need of the hour is for more production, it would be unwise to interfere with business now by passing the proposed tax bill. The members of the Engineering Advertisers' Association represent about one hundred of the leading manufacturers of engineering products in the Middle West and their opinions on such an important subject should be seriously considered.

**Preston County Coal Operators' Association**

There is a move on foot among the operators of Preston County, W. Va., to have the Preston County Coal Operators' Association merged into the Northern West Virginia Coal Operators' Association, a meeting of the first mentioned organization having been held at Kingwood, during the latter part of April, for the purpose of considering the question of affiliating with the larger association. Before taking any definite action it was decided to canvass the operators of the field and learn the wishes of individual members, a committee being appointed for that purpose. Should a favorable report be submitted by the committee, it is believed the Preston operators will

join the Northern association. George T. Bell, executive vice-president of the Northern association, was present at the meeting to speak of the advantages to be derived from membership in the larger organization, of which he is an officer.

**West Virginia Freeport Coal Operators' Association**

The West Virginia Freeport Coal Operators' Association has dissolved. Resolutions to this effect were adopted and ordered at a meeting of the association held at Kingwood, W. Va., on April 29. Resolutions were also adopted by which members of the old organization were requested to join the Northern West Virginia Coal Operators' Association, with headquarters in Fairmont.

**Mine Owners' Association of Kentucky**

The Mine Owners' Association of Kentucky held its bi-annual meeting at Louisville on May 4, at which time officers were elected for a period of two years as follows: Frank D. Rash, president of the St. Bernard Mining Co., was re-elected president; J. D. Francis, of the Pond Creek Coal Co., vice-president; D. B. Cornett, of the Harlantown Coal Co., vice-president; W. H. Cunningham, of the Twin States Fuel Co., secretary-treasurer.

**Association Activities**

**Engineering Advertisers' Association**

Engineering Advertisers' Association members discussed at length the bill proposed by C. J. Thompson (Representative in Congress) to tax advertising, at its monthly meeting recently at the Great Northern Hotel, Chicago, Ill. It was unanimously agreed to enter a vigorous protest against this proposed legislation as being unsound and unfair to business. It was said that the

**What Happened in April**

April 2—In eastern Ohio, 3,000 coal-mine workers strike [XVII, 723].

April 3—Federal district attorneys are instructed by Attorney General Palmer to receive and consider complaints of profiteering in bituminous coal [XVII, 723].

April 5—Some 2,000 Kansas mine workers go on strike against wage decision [XVII, 723]—Judge T. J. McGinnis, at Beckley, W. Va., sentences Tony Stafford to serve a term in the penitentiary, as ringleader of gang shooting up mines of E. E. White Coal Co. [XVII, 759].

April 6—Attorney General Hopkins, of Kansas, summons the presidents of all the Kansas local unions of the United Mine Workers of America to appear in the new Court of Industrial Relations [XVII, 723]—Alexander Howat, president of district No. 14, United Mine Workers of America, refuses to obey summons to appear before Industrial Relations Court of Kansas [XVII, 774].

April 7—Amicable agreement is reached by scale committees of Kanawha, W. Va., field operators and miners, beginning on this date [XVII, 835]—Herbert Hoover addresses New York section of American Institute of Mining and Metallurgical Engineers [XVII, 775].

April 7 and 8—Canadian Retail Coal Association holds its Sixteenth Annual Convention at Toronto, Canada [XVII, 761].

April 8—Large flat rate increases granted in New River, W. Va., district at joint scale meeting held in Charleston [XVII, 835]—Judge Lewis of U. S. District Court, restrains U. S. attorney from presenting evidence to Grand Jury investigating charges of profiteering by Colorado Coal Co. [XVII, 836].

April 9—Alexander Howat and associates, of Kansas district United Mine Workers, are arrested and sent to jail to stay there until they consent to appear as witnesses before the Industrial Relations Court [XVII, 774].

[The bracketed figures in the text refer to the number and the page of the volume in which references to the matter noted may be found, and should the reader desire further information he can obtain it in the place indicated].

April 11—Elias Rogers, prominent coal operator of Canada, dies at his home in Toronto [XVII, 821].

April 12—Bids for coal for the Government departments in Washington, D. C., for coal year beginning April 1, 1920, are opened by the chief engineer of the Government fuel yards [XVII, 863].

April 13—Sessions of 22nd Annual Convention of United Mine Workers of America, of Fifth sub-district of Ohio, begin at Bellaire, Ohio [XVII, 836]—First meeting of joint board of coal operators and mine workers of New River, W. Va., held at Thurmond, W. Va. [XVII, 868].

April 15—Miners' Federation of Great Britain agrees to accept the Government offer of a 20 per cent increase on gross earnings [XVII, 840].

April 17—Contract is concluded between mine workers and operators of northern West Virginia fields—district 17, United Mine Workers of America [XVII, 866]—After six-day session, sub-district 5 of district 6 (Ohio) votes to bar anyone from office who had not been five years a member of the organization [XVII, 866].

April 19—Justice Bailey, of Supreme Court of District of Columbia, hands down decision, in case of Maynard Coal Co. vs. Federal Trade Commission, holding that the commission had no authority to require reports from coal operators concerning cost of production, etc. [XVII, 809].

April 20—Second annual meeting of Industrial Circ Manufacturer's Institute is held in Pittsburgh, Pa. [XVII, 869]—A new wage scale is granted to the mine workers of northern West

Virginia and accepted by representatives of the United Mine Workers of America and the scale committee of Northern West Virginia Coal Operators of America [XVII, 953].

April 21—H. M. Payne speaks for group representing manufacturers of coal and oil, at luncheon of American Manufacturers' Export Association, held at Hotel Pennsylvania, New York, N. Y. [XVII, 953].

April 22—Public hearings begin on Senator Pringle's coal bills [XVII, 834]—Because of inability of miners and operators to agree, a special scale committee of ten operators and ten miners, appointed to consider demands, begins its sessions [XVII, 953].

April 26—U. S. Supreme Court sustains the Government's charges of illegal combination against the Reading company because of its holdings in various coal companies and in roads. The combination was held to be a violation of the Sherman anti-trust act and was ordered to be dissolved [XVII, 840].

April 27—Anthracite operators' scale sub-committee makes counter proposal to mine workers' representatives [XVII, 952]—After sessions continuing over period of three weeks, representatives of Central Pennsylvania bituminous operators and mine workers agree upon and sign a wage agreement, for period of two years [XVII, 947].

April 27-29—Business men from all parts of the country gather at Atlantic City, N. J., under auspices of Chamber of Commerce, to make study of means to stimulate production in industry [XVII, 834].

April 28—Offer of operators (April 27) is rejected by wage-scale committee of the mine workers after consideration at Continental Hotel [XVII, 952].

April 30—Judge A. J. Curran, of Crawford County District Court, declares the new Kansas Court of Industrial Relations to be constitutional [XVII, 954].

## Personals

**John A. Douglas**, formerly superintendent at the Page mines for the Loup Creek Colliery Co., has accepted the position as general superintendent for the Brush Creek Coal Co. over all their mines on the big coal in Boone County.

**Everett Drennen**, of Elkins, W. Va., has been elected president of the West Virginia Coal Co., operating in West Virginia. Mr. Drennen, however, will continue to have his headquarters at Elkins, where he has been located for the last three years having been selected as vice president and general manager of the W. Va. Coal & Coke Co., when that company succeeded to the holdings of the Davis Colliery Co. Mr. Drennen has long been active in the affairs of the Northern West Virginia Coal Association, the West Virginia Coal Association and the National Coal Association.

**George H. Baker**, of Central City, Ky., for many years identified with the United Mine Workers of America, has resigned from that organization and become secretary of the Western Kentucky Coal Operators' Association. This closed 13 years of active service with the mine workers. He was elected state senator in Western Kentucky, and is now planning to run for Congress.

**W. Guy Srodes**, of Charleroi, Pa., has resigned as general superintendent of the Diamond Coal & Coke Co., of Pittsburgh, Pa., effective April 1, and was succeeded by E. A. Siemon, of Brownsville, Pa., chief engineer of the same company. As J. H. Hillman, Jr., of Pittsburgh, Pa., recently obtained control of the Diamond company and was elected chairman of the board, and Tracey W. Guthrie, president of the Hillman Coal & Coke Co., was made president, it is likely that the operating managements of the two companies will soon be merged, in fact, it is rumored that this will take place July 1.

**John A. Penton**, president of the Penton Publishing Co., was elected a director to fill the vacancy on the board of directors of the Wellman-Seaver-Morgan Co., caused by the death of Samuel T. Wellman. Mr. Penton has an intimate knowledge of the iron and steel trade and a wide acquaintance with prominent people in all lines of industry in this and many foreign countries.

**H. P. Sweeny**, who has been superintendent of the Fort Montgomery Iron Corporation mine at Fort Montgomery, N. Y., for the past four years, has resigned, effective May 1. His successor has not yet been appointed.

**T. F. Dietendorfer** has been elected secretary of the Northwestern Coal Operators' Association. This organization has its headquarters at Butler, Pa., in the county of the same name as the town, a county adjacent to and directly north of Allegheny County.

**Henry Schoch**, sales engineer of the General Briquetting Co., has been elected vice president of the Nukol Fuel Co., of Ontario, Canada, and will take up his work for that company with headquarters in Toronto on May 17. The Nukol Fuel Co. is manufacturing a high-class anthracite briquet for the Ontario market. One plant is operating in Toronto, another is in course of construction at Port Stanley, and three more are prospected within the next two years.

**E. G. Lewis**, formerly manager of the Cleveland office of the Bucyrus Co., of South Milwaukee, Wis., has been appointed central sales manager of this company, with headquarters at 622 McCormick Bldg., Chicago. He will succeed E. C. Hingson who has resigned. The Cleveland office, which was opened by the company on Sept. 1, 1919, will be continued under Mr. Lewis' jurisdiction.

**DeWitt V. D. Reiley**, formerly vice president of the Davis-Bourbonville Co., Jersey City, N. J., was elected president of the company at a recent meeting of the directors, succeeding Augustine Davis, who resigned last November. **Charles H. Wortham**, treasurer of the company since its organization, was elected vice president, and **William G. McCune**, secretary and treasurer. The directors are DeWitt V. D. Reiley, Charles H. Wortham, William G. McCune, Augustine Davis, Charles J. Mayer, Daniel E. Byarts and H. Rowntree

## Industrial News

**Philadelphia, Pa.**—The Harrison Safety Boiler Works, which has been carried on for many years as a co-partnership by Joseph S. Lovering Wharton, William S. Hallowell and John C. Jones, has been incorporated under the laws of the state of Pennsylvania as the H S B W—Cochrane Corporation with the following officers: Jos. S. Lovering Wharton, president; John C. Jones, vice president and general manager; William S. Hallowell, secretary-treasurer; Horace E. Sibson, general sales manager; Axel E. Wallen, general works manager. The new corporation takes over the entire business of the former firm.

**New York, N. Y.**—The Foundation Co., of this place on May 10, removed its offices from the Woolworth Building to its own building at 120 Liberty St., New York.

**Cleveland, Ohio**—The manufacturing sales department of The Wellman-Seaver-Morgan Co., which handles the company's sales of rubber equipment and machinery and which is in charge of L. N. Ridenour, moved on March 31 from the company's Akron office to its general offices at 7000 Central Ave., Cleveland.

**Chicago, Ill.**—The bill proposed by C. J. Thompson, representative in Congress, to tax advertising, was discussed at length by the members of the Engineering Advertisers' Association at its monthly meeting at the Great Northern Hotel, here, on April 13. It was unanimously agreed to enter a vigorous protest against this proposed legislation as being unsound and unfair to business. It was said that the passing of such a bill would tend to curtail the advertising of some manufacturers, which would cause more or less depression in business, and as the crying need of the hour is for more production, it would be unwise to interfere with business now by passing the proposed tax bill. The members of the Engineering Advertisers' Association represent about one hundred of the leading manufacturers of engineering products in the Middle West and their opinions on such an important subject should be seriously considered.

**Reading, Pa.**—The Reading Iron Co. has announced the purchase of two of the plants of the Susquehanna Iron Co., at Columbia, Pa. This is the third important acquisition in the policy of expansion adopted by the Reading company since L. E. Thomas assumed the presidency in March 1919. Through the acquisition of the Columbia and Susquehanna plants, the Reading Iron Co. will be enabled, in spite of its ever increasing production, to continue its practice of absolutely controlling the quality of all the material entering into its wrought iron pipe, the puddle bar and skelp capacity being never allowed to fall below the capacity of its tube works.

## Coming Meetings

**Mine Inspectors' Institute of America** will hold its annual meeting July 13, 14 and 15 at Cleveland, Ohio. Secretary, J. W. Paul, Pittsburgh, Pa.

**Pennsylvania Retail Coal Merchants Association** will hold its annual meeting June 23, 24 and 25 at Reading, Pa. Secretary, W. M. Bertolot, Reading, Pa.

**The Rocky Mountain Coal Mining Institute** will hold its annual meeting in Denver, Col., in conjunction with the National First Aid Meet on Aug. 20 and 21. Secretary, E. W. Whiteside, Denver, Col.

**M. O. I. Coal Association** will hold its annual convention June 16, 17 and 18 at Cedar Point, Ohio. Secretary, B. F. Nigh, Columbus, Ohio.

**National Retail Coal Merchants' Association** will hold its annual meeting June 10-12, Detroit, Mich. Secretary-manager, Ellery Gordon, Philadelphia, Pa.

**Kentucky Mining Institute** will hold its annual meeting June 4 and 5 at Lexington, Ky. Secretary, C. W. Strickland, Huntington, W. Va.

**American Institute of Mining and Metallurgical Engineers** will hold its fall meeting a little earlier this year, about Aug. 20. It is proposed to leave Buffalo by steamer and cruise through the Lakes, the first stop being at Houghton, Mich., after which the party will visit Duluth and the Iron Ranges of Minnesota, spending a day or two in Minneapolis on its return. Secretary, Bradley Stoughton, 29 West 39th St., New York City.

**Southwestern Interstate Coal Operators' Association's** annual meeting, June 8 at Kansas City, Mo. Secretary, A. L. Johnson, Kansas City, Mo.

**Illinois and Wisconsin Retail Coal Dealers' Association** will hold its annual meeting Aug. 4 and 5 at Milwaukee, Wis. Secretary, I. L. Runyan, Chicago, Ill.

**American Society of Mechanical Engineers** will hold its spring meeting May 24, 25, 26 and 27 at St. Louis, Mo. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

**West Virginia Coal Mining Institute** will hold its annual meeting June 7 and 8, at Frederick Hotel, Huntington, W. Va. Secretary, R. E. Sherwood, Charleston, W. Va.

**American Wholesale Coal Association** will hold its annual meeting June 1 and 2 at Pittsburgh, Pa. Secretary, G. H. Merryweather, Washington, D. C.

**The Colorado Retail Coal Dealers' Association** will hold its annual meeting June 8, at Colorado Springs, Col. Secretary, E. Hopper, Denver, Col.

**International Railway Fuel Association** will hold its annual meeting May 24, 25, 26 and 27 at the Hotel Sherman, Chicago, Ill. Secretary, J. G. Crawford, Chicago, Ill.

**American Institute of Electrical Engineers** holds annual convention at White Sulphur Springs, W. Va., June 29 to July 2. Secretary, F. L. Hutchinson, New York, N. Y.

**National Coal Association** will hold its annual meeting May 25, 26 and 27 at the Traymore Hotel, Atlantic City, N. J. Secretary, W. B. Reed, Commercial Bank Building, Washington, D. C.

**National Conference of Business Paper Editors** will hold its next meeting June 4 at the Congress Hotel, Chicago, Ill. Secretary, R. Dawson Hall, 36th St. and 10th Ave., New York City.

## Trade Catalogs

**Portable Air Compressors.** The Sullivan Machinery Co., Chicago, Ill. Bulletin 75 T. Pp. 8; 6 x 9 in.; illustrated. Description of gasoline-engine driven type. Class WK-31.

**Centrifugal Pumps.** The De Laval Steam Turbine Co., Trenton, N. J. Catalog B. Pp. 44; 8½ x 11 in.; illustrated. Description of centrifugal pumps of the single-stage and multi-stage types for various services.

**Water, Plenty of It for Man and Beast.** The Humphreys Manufacturing Co., Mansfield, Ohio. Bulletin. Pp. 28; 7½ x 10½ in.; illustrated. Description of methods and appliances for furnishing supply of water for various industries.

## Publications Received

**Seventh Annual Report of the State Inspector of Coal Mines, Colorado, 1919.** Clothbound book. Not illustrated; 78 pp. 6 x 9½ in. Practically all statistical data about the five state mining districts.

**Approved Explosion-Proof Coal-Cutting Equipment.** By L. C. Hisey and E. J. Glavin. Department of the Interior, Bureau of Mines. Bulletin 78. Illustrated; pp. 53. 6 x 9 in. Report on work done by electrical section of Bureau of Mines at its Pittsburgh station.

**Abstract of Current Decisions on Mines and Mining.** By J. W. Thompson. Department of the Interior, Bureau of Mines. Bulletin 183. Law Serial 20. Not illustrated; pp. 167; 6 x 9 in. Reported May-August, 1919.

## Obituary

**Eugene H. Olds**, aged 47, died at his home in Fort Wayne, Ind. He was president of the Olds Coal Co. and was also interested in other business enterprises of his home city.

**Arthur Benedict Bellows**, first vice-president of the Pittsburgh Testing Laboratory, died on April 17.

**Guy M. Freer**, the executive secretary of the National Industrial Traffic League, of Chicago, Ill., died of pneumonia, at his home in Chicago, after an illness of but 24 hours.

2		101.80				109.60
1		131.86				141.20
0		160.00				171.20
00		193.50				207.60
000		235.20				257.40
0000		288.60				306.80

FREIGHT RATES—On finished steel products in the Pittsburgh district including plates, structural shapes, merchant steel, bars, pipe fittings, plain and galvanized wire nails, rivets, spikes, flat sheets (except planished), chains, etc., the following freight rates per 1000 lb. are effective:

Boston	\$0.30	New Orleans	\$0.385
Buffalo	0.17	New York	0.27
Chicago	0.27	Philadelphia	0.245
Cincinnati	0.23	St. Louis	0.24
Cleveland	0.17	St. Paul	0.495
Kansas City	0.59	Pacific Coast (all rail)	1.25*

Note—Add 3% transportation tax. \*Minimum carload, 80,000 lb.

# COAL AGE

The Weekly Journal of the Coal and Coke Industries

Volume 17

NEW YORK, THURSDAY, MAY 27, 1920

Number 22

## *Your Help Needed*

THE country is worried about the transportation crisis. Suddenly awakening to the fact that we are running behind, with no possibility in sight of production overtaking demand, the public has demanded of the Government action and relief.

Lack of coal is one of the principal causes of complaint. You as a producer of coal are not to blame for this condition, but that is no reason why you should not voluntarily assume your share of the job of putting things to rights. There is one way above all others in which you can help, and that is by selling your meager shipments of coal where in your judgment, based on the experience of the war, that coal is needed the most. To do this requires nerve, for contracts may appear to bind you, and to do this may mean foregoing some profits. You are interested in seeing normal and healthy conditions again, in having the railroads back on their feet, in being able to ship all the coal you can load. While your co-partners in distress—the railroads—are under such handicaps, ship your coal where it is needed to keep the country in food and transportation.

Remember that it was not until the members of the coal industry, individually and collectively, joined hands with the Government that even a start was made toward fulfillment of the program "Coal Will Win the War."

## *An Opportunity Not Yet Lost*

SOME weeks ago we remarked that for its present status in regard to cost studies the Federal Trade Commission had but itself to blame. We still hold to that opinion. Mr. Reed, the able secretary of the National Coal Association, who is also pre-eminently qualified as a cost accountant, worked with the representatives of the Trade Commission in an effort to bring about harmony of ideas as to what shall be included in these self-same cost reports. On the one side was Mr. Reed, backed by the best thought and full experience of able, successful coal men; on the other the theoretical students of economics of the Trade Commission. They worked together to effect an agreement on this important problem. The Federal Trade Commission would not accede on basic points, and the test suit before Justice Bailey was the outcome and the answer of the Coal Association.

It is understood that the Trade Commission has met the desires of the anthracite operators, and that reports of costs of production will be forthcoming from that part of the industry.

If ever the bituminous industry needed the support afforded by cost figures from a Governmental source it is now. No fuel administrator stands sponsor for advancing prices, none but *ex parte* arguments and statistics are available to show the justification for higher prices in this period of unduly inflated costs.

The Trade Commission will try to get the reports from the bituminous operators, notwithstanding the adverse court decisions. The information is needed for the protection of the good name of the industry. Voluntary response to the call for monthly cost reports will show a real desire of the industry to lay its cards on the table.

## *Plight of the Postal Employees*

NO greater argument exists against state socialism with its inevitable injustices than is afforded by the plight of the Post-Office employees. But one cannot wonder at their misfortunes, for no workingmen have been as shamefully neglected as those in the Government service. Government officials have repeatedly given vent to pious ejaculations about the rights of the workingmen to join unions, to make collective bargains, to demand wages proportional to the cost of living and to have not only a living wage but workmen's compensation. They have defended labor unrest with insinuations regarding the injustice of employers, men who were nevertheless paying relatively liberal wages.

But everywhere the bureaucracy has been the slowest of any to move in the adjustment of stipends. It has failed utterly to meet the needs of those who have faithfully served the state for years. It has been hidebound in opposition to a liberalization of its policies. While the cry has ever been to give more power to the Government and allow less to the people, there has been no clear sense of the obligation of the Government to those whose services it commands. The example of the Post Office Department warns us to what a degree the Government is likely to misuse its power. It should not be allowed to extend its industrial activities. Its functions should be solely of a regulative character and not those of a super-capitalist.

The Government service tends to draw to itself men of steady habits, men of a peculiarly accommodating mold. Most of them enter the Government employ with the intention of making it a life work. The postmen of the country are a body of men uniformly courteous in their behavior. They take their work seriously. Nowhere can more accommodation be found. Their cheerful courtesies do much to soften the asperities of life and to most of them the visiting from house to house with messages of cheer or sorrow has been a pleasure that has made them continue as postmen despite the inadequacy of their pay.

The wage of regular employees in the entrance grade is only 41½c. per hour, or \$23.07 a week. The highest pay per week if there is no overtime is only \$31.73. For carriers to attain this maximum salary frequently requires ten years of service inclusive of substitution and passage through the different grades. Under the law the shortest time is four years and to this must be added the inevitable period of substitution.

As proof that the letter carrier is not paid what he deserves it may be said that the Government has provided that 60c. per hour shall be paid to temporary employees. Men without qualifying experience get that larger sum, while relatively qualified men get 18½c. less. But 60c. per hour is found to be not enough. Postmaster Patten testified to the joint Commission on Postal Salaries that he found it difficult to get men at that figure. Strikers in other industries would accept employment from the Post Office Department while the strike lasted, but after it was over they would return to trades which paid more adequate wages. The substitutes that could be obtained at 60c per hour were found lacking in industry, efficiency and honesty and several had to be removed.

A commission has been appointed by both branches of Congress to investigate salaries. For fourteen months it has made no report and brought in no bill to alleviate conditions. Let every good citizen write to his Congressman and demand that justice be done to these public servants immediately. Do it, if not for justice at least of business expediency. The postal service is slow, it is undependable and it is getting worse. Its good men are going. Many have gone. The men that remain are soured. They are apt to carry a message of discontent from house to house. They have been 100 per cent Americans in the past. Their word was inspiring and sympathetic. It will be an ill day when they and the school teachers cease to be "sold on America."

---

### *Scrapping Old Mine Cars*

RARELY is a proper degree of courage shown in the scrapping of old mine cars. Seeing that the actual life of the older type of car is short it is hardly worth while to retain an old-type inefficient car in unwilling service. It is true cars may be shown which have had twenty or thirty years of active service, but if all the parts renewed during the previous five years were available almost a new car could be constructed. The sides become worn and broken, the bolt holes enlarge in the bottom, the bumpers break off, the whole car is racked and twisted, the wheels wear flat, the axles are bent and all parts have to be replaced. Badly wrecked cars are worth repairing only if they are up to date. Oftentimes enough wrecks to repay the cost of the change will be saved by ridding the mine of twisted, worn and broken cars.

In one of the articles this week a change of this sort is recorded, and some of the hundreds of rejected cars are shown in an illustration. Here, by the introduction of a new form of dump, the haulage system was freed of breakdowns, the roads were kept clean, repairs were cut to a minimum, dumping time and labor were decreased and a saving of some \$12,000 a year is expected. Where the time of dumping had been eight minutes it was reduced to thirty seconds. The expenses of maintaining old equipment often far exceed the losses resulting from scrapping it, but as the losses in the one case are spread over some years of operation and do not openly appear on the cost sheet as "losses due to worn-out cars" while the costs arising from a change of equipment are obvious and immediate, the first form of sacrifice is preferred even though greater than the second. The secret losses from the use of obsolescent equipment are preferred to the smaller loss due to a radical discarding of antiquated material.

### *Mine Inspectors Will Meet in Cleveland*

MINE inspectors of the United States and Canada will meet this year at Cleveland, Ohio, the occasion being the eleventh annual meeting of the institute. Since the organization of the institute at Indianapolis, in 1908, interest in these annual gatherings has grown steadily, with the result that every inspector in attendance has gone home from each meeting strengthened and renewed in spirit and better fitted for more efficient performance of his duties.

The membership now includes most of the strongest and more practical men engaged in the work of mine inspection, and the discussions of the many problems confronting them have been helpful and of benefit to all. In 1915, the scope of the organization was broadened to admit inspectors of metal mines, and this has been a source of instruction to those whose associations had previously been restricted to coal mining.

It is hoped that the coming meeting to be held at Cleveland, July 13, 14, 15, will draw together large delegations from every mining state. There are important questions that will be discussed, and every inspector should be on hand to gain the benefits of the views of his fellow inspectors.

Inspectors are urged to forward papers they desire to read, or subjects they wish to have discussed, to James W. Paul, secretary of the institute, Bureau of Mines, Pittsburgh, Pa., as early as possible. A cordial invitation is extended to all inspectors of mines, coal and metal, to be present, whether members of the institute or not; all will be welcome.

It is hope of *Coal Age* that the governor of every state will see that a good delegation of the mine inspectors of the state is sent to the Cleveland meeting, and adequate provision made for the expenses of the trip.

---

### *Shall We Have Priorities Again?*

THE last resort in a desperate situation is priority orders. Surely there are enough veterans of the war in official Washington who, remembering the failure of this method of solving the transportation tie-up, will advise the administration of its futility as a remedy. Except as to causes, conditions today closely resemble those in January, 1918, when Garfield issued his famous five-day closing order. Factories now, as then, are closing through lack of fuel and raw materials and because of a lack of transportation to carry away finished products. Business is uneasy because new production must be financed at prohibitive rates of interest, or plants closed down.

The present situation is not the result of a shortage of cars and engines, but of men. What we are suffering from today is the accumulated effects of four weeks or more of the "outlaw" switchmen's strike. True, the roads need more equipment, but that which is available now would be, if in repair, scarcely less than that which carried the peak loads during the war. Freight is not moving today because railroad labor has no heart to move it.

Priority orders are but promises to pay—valueless unless the operating officials and the men below write their endorsements thereon. Will the public be satisfied with this sort of a remedy when it is realized that it produces not more transportation but better transportation for the few as against the many.

# Rope-Haulage Methods and Equipment That Have Given Success at Lethbridge, Alta.

Anyone Can Install a Rope Haulage, but Most of Such Installations Receive in Process of Time Many Improvements in Detail—Here Are Some That Helped the Lethbridge Rope Haulage to Meet the Needs of the Colliery

BY J. B. DE HART AND J. H. TURNER  
Nacmine, Alta.

ALL mining men are familiar with the general principles of endless-rope haulage. There are numerous details, however, in connection with the operation of such haulage the importance of which is appreciated only by those who have come in close contact with such installations. Any mining engineer can install an endless-rope haulage that will operate, but it will be found in most cases that many necessary details have been overlooked and that improvement has to be made from time to time to materially assist in the movement of large quantities of coal.

Endless-rope haulage has now been used at Lethbridge Colliery, Coalhurst, Alta., for five years, and during that time many small changes have been made all of which aid in making the installation efficient. This article is not a treatise on endless rope haulage in general; it is merely a short paper showing drawings of such details of a haulage system of that character which experience has suggested and to which practice has given its seal of approval. Some of these can no doubt be used to advantage in other mines where endless-rope haulage is employed, while others will be found to be unnecessary where conditions are different.

The haulages described are not by any means permanent. As a matter of fact, they might be said to be makeshifts, as they are only temporary and when permanent engines are finally installed the existing machines will be moved further inbye, where they will act as feeders to the main haulages. Nevertheless, the mine has produced 29,706 tons of coal in one month hoisting ten hours per day for twenty-four days, or at an average rate of 1,238 tons of coal per ten-hour day. The maximum day's output handled by these haulages was 1,437 tons of coal and 113 cars of rock. It will be seen, therefore, that fairly large outputs can be handled by the haulage system even as it is at present.

Three haulages are used in the mine and these are marked on the plan shown in Fig. 1. Figs. 2, 3 and 4 show the profiles of the haulage roads for Nos. 1, 2 and 3 haulages respectively. The coal bed is intersected by numerous small faults whose throw varies from almost nothing to twenty feet. In many cases it can be seen from the profiles that the grading of the roads is not yet completed, only sufficient having been done to enable the haulages to work with reasonable efficiency.

The roads are not as straight as they should be. Considerable straightening was done when the haulages were put in, but this work likewise is still incomplete. The roads were driven on sights, but when the mine was first started the economy of straight roads for rope haulage was apparently overlooked and the machinemen and miners at times were allowed to drive their places off the sights. All three haulages are similar. All are

motor-driven and use 3-in. Lang lay crucible cast-steel haulage ropes.

The No. 1 haulage machine was the first to be installed. The engine is shown in Fig. 5. It consists of a 25-hp. induction motor operating on 440 volts through gearing, shafting and a clutch. One countershaft and a No. 45 Hill clutch are used. The gear ratios are shown on the drawing; they give the fleet wheel a speed of 178 feet per minute. The details of the gearing and shafting are all shown in the figure.

On this machine the second shaft was too light and a third bearing had to be put in to reduce the span. This bearing is shown in the drawing. Details of the fleet wheel and cast-steel lagging are shown in Fig. 6.

No. 2 machine is quite similar to No. 1, except that the countershaft was made heavier so that a third bearing is unnecessary. The fleet wheel and lagging also are similar to those of No. 1 haulage engine and the rope speed is 161 feet per minute.

No. 3 machine is a composite mechanism made up partly from one which was bought second-hand and partly from some spare shafting, gears and clutches formerly used to drive the picking tables at a mine now long since abandoned. It is shown in Fig. 7. Fig.

FIGS. 2, 3 AND 4. PROFILES OF THE EMPTY AND LOADED HAULAGE ROADS

8 shows the fleet wheel and lagging. It will be noted that this is a different type of wheel with a different lagging from the others. It is constructed of cast iron and not of cast steel and is possibly more suitable to conditions in this part of the country in that new lagging when needed can be cast locally and does not require any machining. Details of the gearing are shown in Fig. 7. The rope speed is 177 feet per minute.

The engine houses are located as shown in Fig. 1, marked as No. 1 motor, No. 2 motor and No. 3 motor. Nos. 1 and 2 machines are located at the pit bottom and the two rooms are connected so that one man can attend to the two machines. No. 3 engine is located in a crosscut as shown.

The tensions for Nos. 1 and 2 ropes are on the empty rope near the engines as shown in Fig. 1. The arrangement of these tensions is shown in Fig. 9. The tension

for No. 3 machine is placed immediately behind the machine—shown in Fig. 7. This is a better arrangement, where it is possible to get sufficient room, than the Nos. 1 and 2 tensions, as it is nearer to the machine and does not make necessary so sharp a bend in the rope. The total length of each rope in the different haulages is as follows: No. 1 haulage, 5,125 ft.; No. 2, 7,500 ft.; No. 3, 7,325 ft.

The arrangements of pulleys used at No. 1 engine house and where the loads come into the pit bottom are shown in Figs. 10 and 11 respectively.

At the inside end of each haulage is an adjustable carriage to take up the slack in the rope or to loosen it for splicing. The carriage works on rails—shown in Fig. 12. Rollers are used wherever necessary to keep the rope off the ground. Three types of rollers are employed. Wooden rollers, shown in Fig. 13, are

FIGS. 11 TO 20. DETAILS OF TENSION CARRIAGE, ROLLERS, RERAILERS, STOPS, GUIDE PULLEYS, SQUEEZERS, ETC.

mounted as shown. They are made by drilling prop ends and inserting the spindle and turning in a wood lathe till smooth. The size within reasonable limits is not material. Steel rollers, as shown in Fig. 14, are used in certain places and mounted in the same manner as the wooden rollers. A second type of steel roller used is shown in Fig. 15. By fitting up the bearings with babbitt these rollers can, where necessary, be employed also as holding-down pulleys.

These narrow rollers are used only in places, such as the pit bottom, where there is no possibility of the rope jumping the rollers. The wooden rollers are used where the rope rubs only lightly. In such places they are more efficient than the steel ones as they turn more easily. In many places a wooden roller will revolve where a steel one would stick.

Where the rope dips under the track at the pit bottom special heavy home-made rollers are used. These are extra heavy plain rollers with no flange. Bottle chocks are used on the curves, as shown in Figs. 16 and 17. They are spiked to special ties. These bottle chocks on curves should be replaced by large pulleys and the rope taken around the curve under the track. This, however, would necessitate a large amount of grading in order that the cars might run around the curve by gravity, and so far this work has not been started.

Where cars run downgrade onto the rope and there is any liability to collision "squeezers" are used. These are constructed as shown in Fig. 18. On upgrades numerous stop blocks are put in to prevent cars from running back in case of a broken coupling. The stop blocks are constructed as shown in Fig. 19 and they work quite satisfactorily. The spiral spring used is an ordinary furniture spring. Rerailers are installed in places, constructed as shown in Fig. 20.

The cars are run in trips, a Smallman grip being used to attach them to the rope. This is a cast-steel grip—shown in Fig. 21. A gripper goes with each trip. The maximum trip on No. 1 haulage consists of twenty-three cars, on No. 2 twenty cars, and on No. 3 haulage twenty cars up the grades to the points A in Fig. 1, and from there on fifty cars. The cars hold approximately one and one-half tons each and have a tare weight of about 1,500 lb. The track is laid with 20-lb. rails, fishplated.

The rope is not lubricated because it was found that when the rope was lubricated more damage was done to the rope by the tearing consequent on the slipping of the grips than occurred by natural wear when the rope was run dry.

The average life of a haulage rope is between two and three years. Some of the ropes last much longer than this but it is impossible to satisfactorily splice

old rope to new and it therefore always pays to have an old rope on hand which has not been run to destruction and to use it for repairing the ropes in use. For instance, the last rope put on the No. 1 haulage was installed on July 19, 1915, and is still good for about another year. It will be run to destruction.

No. 2 haulage rope was put in place on June 13, 1916, and taken off May 24, 1918. It was in fair condition except for a number of bad spots. Two thousand three hundred feet of good rope was cut out of it to extend No. 3 rope and, the bad spots having been cut out, the rest is kept as a spare to use for repairing the ropes in service. No. 3 rope was put on March 4, 1917, and ran until Oct. 1, 1916. It was a poor rope and worn out. When all of No. 2 rope has been used for repair work another rope in fair condition will be replaced by a new one and the removed portion kept for repair work.

The cost of the three ropes above mentioned was about \$4.50 per working day. This amount is accordingly charged against operations to the haulage-rope account each day so that the changing of a rope does not show a large charge against operation in any one month, the cost being spread evenly throughout the year. This figure—\$4.50—naturally needs frequent revision because of increasing cost of rope, increasing lengths of haulages and the variable life of rope.

All around the rope roads two bare wires are strung on insulators. These are connected to a bell at the engine room, and by short circuiting the wires with a lamp or other piece of metal the bell is rung. The system of signals employed at this mine is as follows: One bell, stop rope for one minute; one bell followed of four bells, stop rope until starting signal is given. Four bells followed by two bells, start rope, this signal to be given by men who stopped rope.

TRIP SIGNALS WHEN STARTING

No. 1 rope.....	5 bells
No. 2 rope.....	5 bells
No. 3 rope.....	4 bells

The installation of such a haulage as has been described above can be accomplished without delay to the working of the mine. All the large pulleys, tension carriages and the like, engine and signal wires can be in place before the rope is installed. Rollers and bottle chocks can be put along the roads beside the tracks. It is only necessary to lead the rope around and splice it and the haulage is ready to run. The rope is best taken around by hauling the drum on skids (or on a truck if there is sufficient height) with horses, the rope unwinding as the drum moves forward. The rope is then spliced and while this is being done the bottle chocks can be put in place. The tension carriage is then lightened and the rope run so that it will come into line, when the rollers can be put in. More rollers can be added afterward.

It is best to set the wooden rollers off center so that when the rope has cut them nearly through they can be turned end for end. In this way their life is doubled. When an old rope is to be taken off it is cut close behind the engine and the end of the new rope is spliced to the end of the old rope. The engine is then started and the old rope wound on a drum as it comes off the fleet wheel while the new rope is unwound from its drum.

No. 2 haulage was installed over a week-end and where the cars were pulled by horses on Saturday the rope was operating on Monday.

FIG. 21. DETAIL OF THE SMALLMAN GRIP  
This device is employed to attach a car or trip to the rope

# Linn Mine-Car Dump Is Largest in the World

This Dump Is Nearly 300 Feet Long and Is Operated by Compressed Air—By This Machine Twenty-eight Cars in a Single Trip May Be Discharged Simultaneously — Old Bottom-Dump Cars Are Replaced by Cars with Solid Bottoms

BY RALPH W. MAYER  
California, Pa.

ALL THE coal produced by the Snowden Coke Co. at Linn, Pa., is made into coke at the mines. The charging larry runs along the top of the ovens and proceeds on a level track to a point directly under the bottom of the coal bin at the tippel.

This bin is nearly 300 ft. long and is of sufficient height to afford storage for the coal. The dump is installed upon the top of this bin and is supported by heavy steel I-beams extending across its top. This places the dump at a considerable elevation. It is reached by an incline, of such a length that the grade is slight. The dump is wired to accommodate a trolley locomotive.

The bin was built and used before the new method of dumping was introduced. In former days when a

trip of cars was run over the bin, each car was dumped separately without being uncoupled, the cars being provided with bottom doors. To make this possible the bottom of the car was cut in two crosswise in a direction at right angles to the track, the two pieces being hinged along one edge. When open these pieces swung downward, allowing the coal to fall through the bottom of the car. They were held closed by a chain attached to the free side of the door and fastened to the side of the car. The axles passed through the inside of the car box and above the bottom doors, allowing them to swing freely.

This type of car had many faults. When the doors became worn they leaked and coal was scattered along the road, necessitating the employment of a small

FIGS. 1 AND 2. SIDE AND QUARTERING VIEWS OF THE DUMP AND SUPPORTING TRESTLE

The bin in which the coal is deposited extends the entire length of the dump, as may be seen. Twenty-eight cars can be discharged simultaneously. Coal from the bin is drawn by a charging larry and conveyed to the coke ovens.

FIG. 3. LOOKING INTO THE END OF THE DUMP

Note the stops attached to the circular supporting rails. They prevent the dump from rolling too far over

FIG. 4. VIEW STRAIGHT DOWN THE DUMP

Note upper and lower car-retaining angles which hold the cars when they are being dumped

FIG. 5

### Dump at the Half Turn

The cars, the ends of which look like vertical partitions in the dump, are held securely in place by the steel plate on the top of the mechanism. Most of the coal is already discharged.

army of men in cleaning up. Frequently the doors would come open accidentally and cause wrecks and derailments. The cars were about worn out when the dump was installed, and accordingly they are discarded for cars of a more modern type.

An all-steel car was adopted. It is manufactured by the Koppel Industrial Supply Co., of Koppel, Pa. The brake with which it is equipped is provided with shoes that press against each car wheel. The body of the car has an offset on the side which extends out over the wheels. All around the top of the car the sheet steel is bent outward for three inches and then bent down, forming a 3-inch flat edge around the car top.

An ordinary harness snap is used to hold the miners' checks. This snap is fastened to the center of the side of the car by a small bolt. When the car is dumped all the coal slides out on the side of the car opposite to that on which the snap is fastened.

The cars are coupled together by a single flat link and coupling pins. They have solid bodies, and each holds fifty bushels of coal. The cars are not weighed before dumping, as the miners are paid by the car and not by the ton, that being the custom throughout the Connellsville coke field. The machine men who cut the coal are paid by the number of working places which they cut. The drillers receive 17c. for each hole drilled. The men who shoot down the coal, or "blasters," as they are called, are paid by the day.

### CAR DUMPER AND EQUIPMENT

The coal is discharged by a pneumatic rotary dump made by the Car Dumper and Equipment Co., of Chicago, Ill. This holds twenty-eight of the cars (which are almost ten feet long over all) and dumps them all at one operation. It discharges the twenty-eight cars in eight seconds. The daily output of the mine is about six hundred cars. The dump is set at a slight in-

FIG. 6

### Discarded Mine Cars

When these bottom-dump cars began to wear out it was decided that it did not pay to buy others of similar type or to rebuild them. The tracks were constantly covered with coal, wrecks were frequent and repairmen kept busy. The cars were hard to dump and as wasteful of coal as of labor.

clination so that the cars will run out of it by gravity. It is supported by ten rings made of track steel, which rest upon flanged wheels, the flange being placed on the downgrade side of the ring. Each ring rests upon two wheels, one on each side of the dump.

Four of the rings, at equal distances along the dump, are provided with narrow drums attached to their sides, around which several turns of cable are taken. This cable is firmly clamped to the drums, and an end passes down on each side of the dump, so that, by pulling on the proper cables, the dump can be made to revolve in either direction. The cables pass around sheaves, and from thence lead to a point near the middle of the dump. Here four cylinders are placed, two upon each side of the mechanism. These have long piston rods and are operated by

right position. These are shod with wood blocks so as to prevent excessive jar. Whenever they become broomed on the end they can be replaced. The dump with a loaded trip in it can be revolved so gently that it would hardly break an egg when the stops strike the stop blocks. This is accomplished by properly manipulating the air valve, so that the cables on both sides of the dump exert the proper pull.

A square steel frame runs the entire length of the dump and is supported by the ten rings. The four corners of this frame are made from angle iron, whose sides are the same width as the wheel treads. Two bottom angles serve as the track upon which the car wheels run, their outside legs keeping the wheels from leaving the track. The two upper angles barely touch each side of the car at its top. One leg of the

FIG. 8.

### New Steel Sided Car

Without gates of any kind this car, with steel sides and wood bottom, spills no coal except when loaded over the car edge. It has no bottom doors to drop down and derail the trip and is much cheaper than the more complex bottom-dump car.

compressed air. Each piston rod carries a sheave on its end.

Each piston may thus be made to exert a pull on two of the cables, the sheave around which the cables pass equalizing the pull on each. There are, as stated above, four cables on each side of the dump, and each piston pulls on the two which are on its side and nearest its end. The pistons are controlled by a two-way valve placed in the air line at the top of the dump. This valve will be later moved to the end of the dump, where its manipulation will be more convenient.

The movement of the pistons on one side of the dump pulls it over, that is, revolves it until the cars are discharged. When the pistons on the opposite side move they reverse the direction of rotation of the dump, again bringing it right side up. The mechanism is simplicity itself; there is nothing complicated or likely to get out of order. An air receiver is placed near the cylinders to insure a steady air pressure while operating the dump.

Lugs, or stops, are placed on the rings of the dump to arrest its rotation as soon as it has reached the

FIG. 7.

### Mine Car Now Replaced

With no drawbar this car soon got "wabby." Its two bottom gates leaked like the upper half of an hourglass and a force of men was kept busy gathering up coal that should never have been spilled.

angle extends over the top of the car box, while the other lies along the side. These four angle irons thus hold the cars in place while the trip is being revolved and the cars emptied.

The four angle irons are firmly held in position by x-braced crosspieces. These are placed upon three sides of the steel frame, only the top being left open for the passage of the coal in dumping. The mine car comes into contact with the dump at only four points and is held in place by the L-shaped angle irons—two under the wheels and two along the sides and top of the car.

### ROPE FROM HOIST PASSES THROUGH DUMP

An electric hoist is installed at the head of the incline to pull the cars out of the mine and its cable passes through the rotary dump. The mine is a drift operation, the coal pitching slightly away from the opening, which is at the end of a narrow valley down which a small stream flows. From the drift mouth the mine track is carried slightly up grade, along the side of this valley, until the end of the hill is reached. The track is carried from that point on a trestle to

FIG. 10. COKE-OVEN LARRY FILLED BY THE LONG STORAGE BIN SUPPLIES COAL TO 265 OVENS

The bin shown was constructed many years ago. In order to keep it completely filled with coal when using the rotary dump it was necessary either to run the dump full length of the bin or to use a short

dump with swivel connections on the mine cars and to provide machinery to carry the coal forward or back to the sections of the storage bin not provided with a rotary dump. Though the biggest dump hereto-

fore built accommodated only eighteen cars, being located at the H. C. Frick Coke Co.'s mine at Lemont, Pa., it was decided to install at this mine a 28-car dump and so avoid swivel couplings, and a conveyor system.

the dump over the bins. At the town of Braznell the valley opens out into a wide flat, allowing plenty of room for the ovens and town.

E. H. Coxe, general manager of the Snowden Coke Co., estimates that \$9,000 will be saved annually through the prevention of wrecks, the saving of labor in the cleaning of the haulageway and in the repairing of cars, and from the greater amount of coal that can be handled per hour. Under the old arrangement, in dumping twenty-eight cars of coal into the storage bins the hoist engineer, the trip rider and an extra man had been employed in removing and replacing the pins that support the bottom gates of the cars. Now the trip rider can dump all cars without uncoupling them in less than thirty seconds. From records that have been made it has been found that more coal can be dumped in eight hours than was formerly dumped in ten.

From the saving in overtime caused by handling the trips in a shorter length of time it is believed by the general manager that \$3,000 will be saved annually. This saving along with the other previously mentioned makes a total yearly saving of about \$12,000. At this rate the installation will pay for itself in less than three years.

### Operators, Railroad Men and Commission to Confer on Coal Handling at Tidewater

STEPS are being taken to arrange a conference between traffic officials of the railroads and representatives of the coal operators with members of the Interstate Commerce Commission to discuss rules for the handling of coal at tidewater. Coal consumers and operators are hopeful that an arrangement will be perfected to remedy present conditions that now exist at tidewater.

### Do You Favor a Coal Exchange At Hampton Roads?

THE Wholesale Coal Trade Association of New York has addressed a letter of inquiry to the coal trade asking shippers to get together one way or the other in reaching a decision on the advisability of continuing or abolishing the Tidewater Coal Exchange at Norfolk. The letter follows:

"Those of our members who use Hampton Roads have been concerned about the likelihood of discontinuance of the Tidewater Coal Exchange at Norfolk, the report having gained circulation that the carriers, with the possible exception of the Chesapeake & Ohio Ry., were opposed to the continuance of the exchange. We are reliably informed to the contrary, and that the Norfolk & Western and the Virginian are really in favor of an exchange, with the limitation, however, that instead of being general, involving all three carriers, there shall be a pooling arrangement effected for each individual carrier.

"While this is not so desirable as a general pool, at the same time it is much better than having none at all.

"The missing factor, apparently, is a general expression from the shippers that they desire the arrangement to be continued. To supply this you are invited to address a letter to Charles S. Allen, secretary, stating tentatively your willingness to participate in the formation of an exchange, somewhat upon the lines of the Tidewater Coal Exchange, Inc., at the Northern ports, with the modification referred to above, upon receipt of which the same will be transmitted to the carriers with a view to perfecting the more necessary details."

# Labor Held Blameless for Price Increases\*

Coal Industry Held Up as Huge Profiteer, with Other Large Businesses, by Railroad Brotherhoods in Hearings Before the U. S. Railroad Labor Board—Increased Wages Held Not Responsible for High Cost of Living

**A** CAREFUL analysis of the data bearing on the causes of high prices and the relation of cost of production to prices leads to the following specific conclusions:

1. Profiteering—by which is meant the exaction of profits greatly in excess of pre-war profits on the part of producers, middlemen and retailers—is a fundamental cause of the high prices of practically all commodities.

2. Increased wages to labor are in no way responsible for increased prices.

To cite increased wages as a cause of increased prices is to betray an ignorance of the facts. Wage advances have been an *effect* of price advances, not a *cause*. An examination of the experience of every industry shows, practically without exception, that wage increases have lagged behind price increases and usually very far behind. In a period of rapidly rising cost of living it is inevitable that wages also rise in some measure, if the great body of wage earners, living as they do at best not far above the line of poverty, is not to suffer complete degradation.

But in no way has labor been the initial influence. Prices were pushed up by factors over which the workers had no control. They have merely struggled as best they could and in the only way they could to keep their old standards of living. In this struggle they have met with only very partial success. For the great body of wage earners wages have not kept step with prices.

As a result labor as a class is now worse off than it was before the war. Almost without exception a day's wage buys less than it did in 1912 to 1914. In other words, in the distribution of the income of the country labor is receiving a smaller proportion than it did before the war, while capital—in the form of profits, interests and rent—is receiving a very much larger proportion.

It is not contended that profiteering is the sole cause for the maintenance of prices at their present level. It is contended, however, and data are submitted in proof below, that profiteering has been responsible for a very large proportion of the price increases—probably one-half. Moreover, the other possible factors are more or less intangible and perhaps not susceptible to immediate remedy. But profiteering is a perfectly tangible thing, and one which can be remedied by intelligent statesmanship. And it is only by striking at this root cause of our present troubles that permanent remedy may be obtained.

It is not possible to compute the full extent of the profiteering that has taken place and is now taking

place. The complete information is not available and probably never will be. Too many hands have dipped into the golden stream of war-time profits. Too many ways have been discovered by corporations and business men for concealing the full measure of their earnings. But, in spite of these difficulties, sufficient evidence does

exist to establish a conclusive case of "profiteering"—of profiteering on a scale that makes one almost despair of the future of the country.

The evidence referred to is of an entirely authoritative character. It includes the financial statements of corpora-

tions, the Federal income tax returns, the investigations of Governmental bodies such as the Federal Trade Commission, the Tariff Commission and the Bureau of Foreign and Domestic Commerce, and various reports, studies and statements by other official agencies and men in close touch with public and business affairs.

Perhaps the most conclusive evidence of profiteering is contained in the financial reports of the corporations themselves. In order to develop this point a careful analysis has been made, for the years 1912 to 1918, inclusive, of the financial reports of all corporations of \$1,000,000 annual income in certain lines of business in which the ordinary consumer is particularly interested. The sources used were the well-known financial manuals such as Moody's and Poor's.

The table on page 1090 summarizes the results of this study. It shows for a large number of corporations by industry groups the average annual net income and the per cent of net income to capital stock for the three pre-war years 1912-1914 in contrast with similar data for the three war years 1916-1918.

The outstanding fact in this table is simply stated. The corporations listed—including all with incomes of \$1,000,000 or over in any one year in so far as they are listed in the financial manuals—earned during the years 1916-1918 an average income of nearly \$1,250,000,000 a year, or nearly 24 per cent on their capital stock. This appears to be nearly three times the average for the pre-war years 1912-1914, and the figures for production, where these are available, show conclusively that these increased profits were not due to increased production. They were due in large measure to the fact that the corporation took a larger proportion of every dollar spent by a purchaser. This fact will be shown conclusively in another part of this study. Here it is sufficient to note that for the three years 1916-1918 the annual profits of these corporations averaged approximately \$800,000,000 more per year than during the three-year period preceding the war, 1912-1914.

This is a startling fact. Basing our calculations upon the reported net corporation income as shown in the income tax returns these corporations represent about one-sixth of the total corporate income of the

This summary from the report of Mr. Lauch is reprinted because it gives coal operators the opportunity to learn how they are being pictured to the public—by labor in particular—and also to make comparisons of the coal industry with various other businesses.

\*From report on "The Relation Between Wages and the Increased Cost of Living" presented to the U. S. Railroad Wage Board by W. Jett Lauch.

United States. If these other corporations did as well as those of which record is available, and there is reason to believe they did, then the combined corporations of the country earned approximately \$4,800,000,000 more *per year* during the three war-years 1916-1918 than during the three pre-war years 1912-1914.

A total of \$800,000,000 means \$40 per family of five throughout the nation. A total of \$4,800,000,000 means \$240 per family of five throughout the nation. Consider that each family of five paid as a toll, not to so-called legitimate profits, but to excess of war profits over pre-war profits, \$240 per year, and one gains an idea of the total burden which profiteering meant to the country. Yet it is a conservative estimate of what actually happened, and it must be remembered that this huge figure does not represent the whole profit but only the part in excess of the pre-war level.

Even such stupendous figures do not tell the whole story. For the most superficial investigations reveal the fact that during late years the companies have been resorting to numerous devices for concealing profits. Excessive deductions for depletion and depreciation reveal themselves very quickly when we turn to such basic industries as copper and coal. In other industries huge sums are found set aside for Federal Tax Reserves—sums out of all proportion to the necessities of the case.

In other words, there are very good grounds for concluding that the figures given above very much understate the real profits taken by corporations during the war years. An average of \$1,200 per family of five during the years 1916-1918 is probably a highly conservative estimate of the actual cost of corporate profiteering to the consumer.

During the three years 1916-1918 the consumer has been paying the food corporations whose reports are available over two and one-half times as large profits as were considered acceptable before the war.

In the clothing group the increase in profits was proportionally even greater, the price of clothing carrying a charge for profits nearly three times the pre-war figure.

Turning to the corporations which produce various kinds of fuel, together with certain building products, we find the profits for the war years 1916-1918 nearly two and one-half times those for the pre-war years 1912-1914. For the three years 1916-1918 the average was nearly a quarter of a billion dollars a year. The accumulation of profits for the four years 1916-1919 undoubtedly totaled more than a billion dollars. This means that during the years mentioned these corporations earned, after every possible deduction had been made, enough to replace their entire capital stock.

The profits of the basic metal industries, however, outdistance those of any other group. These industries are the ones which produce commodities—such as iron, steel and copper—which the consumer never buys directly, goods which are bought by other intermediate producers. But the cost of these basic products enters into the price paid by the consumer.

The war, with its demand for munitions, greatly increased the opportunity to profiteer in these lines. As a result the industries whose services the nation needed most more than trebled their profits. The profits taken during the war years 1916-1918 were, in fact, nearly three and one-half times those taken during the years 1912-1914—\$590,138,605 as opposed to \$172,729,195. In other words, the excess war profits amounted to over \$400,000,000, which eventually reached the consumer in the prices which he paid for the various commodities into which these basic metals entered.

For a corporation here and there to find itself in a strategic position which enabled it to make huge profits, there was precedent before the war. But for practically the entire business organization of the country, the

INCREASE IN NET INCOME AND PERCENTAGE EARNED ON CAPITAL STOCK OF CORPORATIONS IN SPECIFIED INDUSTRIES DURING THE PERIODS 1912-1914 AND 1916-1918 †

	No. of Companies	Capital Stock 1918	Average Annual Net Income for Period *		Per Cent Net Income Is of Capital Stock for Period ‡

† The average for the pre-war period was based on the net income reported for the period 1912-1914. In computing the average, entries of net income and capital stock were taken from both of these items were not given. The one or two cases in which issues of stock were shown to have been in the form of "stock divi-

dends," such issues have been ignored on the basis that nothing was added to the property investment thereby. In cases where income is reported for only one or two of the three years, either the amount for the one year or the average of the amount for the two years has been treated as an average for the period.

sum total of the corporations, to be in such a strategic position that it could hold up the public for enormous profits upon everything, no precedent can be found.

After all expenses of operation and maintenance had been paid—after all charges for replacement of capital had been set aside—in fact, after every conceivable or imaginary expense had been met—these great groups of corporations, controlling the various products essential to our life, made profits which were sufficient to replace the entire value of the capital stock within a period of slightly over four years. This is proved by their own published reports.

**INCOME TAX RETURNS DISCLOSE PROFITEERING**

Statistics compiled by the Commissioner of Internal Revenue from income tax returns show that the corporate profits of the companies listed in the financial manuals are representative of the whole tendency throughout the country's business. For the years 1912-1914 the average of net corporate income was approximately \$4,268,000,000. For the years 1916-1917 it had increased to approximately nine and three-quarter billions of dollars. In other words, the net income for the war years was more than double that for the preceding years, despite an excessive deduction of \$74,000,000,000 from gross income before net income was reached in 1917. Detailed data on this point will be found in a separate study. The significant fact is that in 1917 reported corporate income was over ten and one-half billion dollars.

As in the preceding analysis of the financial reports of corporations, so here it is found that the most extraordinary increase in profits during the war appeared in the industrial and mining group, where the corporate income returned for 1917 was approximately four times the pre-war average—\$6,500,000,000 as contrasted with \$1,669,012,000.

If from the figure given for the total net corporate income for 1917 we deduct the approximate value of the excess profits taxes, and further deduct 10 per cent on all additional capital invested to expand industry to meet war demands, the profits of corporations are still found to be over three and one-half billion dollars above the pre-war average.

Such enormous profits made at the expense of the consumer were too large to be divided all at once, especially when a large proportion of high incomes went to help the country carry the enormous expense of war. So only a part of the profits was disbursed. The remainder swelled reserves to huge proportions. Thus the consumer discovers that he has been taxed not only to pay high dividends during the war period but also in order that these same high dividends may be continued over the recession of industry which is bound to follow. Some of these reserves will find their way into stock dividends, thus creating more paper value upon which the country will be expected to pay a fair rate of profit.

**TREASURY REPORT ON CORPORATE INCOME**

The extraordinary nature of the profits of industry during the war years is manifest in so incomplete a document as that submitted to the Senate by the Treasury Department in 1919, entitled "Corporate Earnings and Government Revenue." This document purported to show the incomes of approximately 20,000 of the 31,500 corporations in the United States reporting incomes over 15 per cent on their capital stock.

Altogether these corporations earned an average return on capital stock of 33 1/2 per cent after all taxes had been deducted. In other words, with three years of such good fortune as war brought, these corporations would make profits totaling the whole value of their capital stock.

The following table shows the great increase in profits enjoyed by the leading industrial groups.

**CORPORATE EARNINGS IN 1917, BY MAIN GROUPS OF INDUSTRY**

(From "Corporate Earnings and Government Revenue"—Senate Document 259)

Industry	Per cent of net income for the year 1917		Per cent of net income for the year 1917	
	Before deducting Taxes	After deducting Taxes	To capital stock Before deducting Taxes	To invested capital After deducting Taxes
Fisheries	90 95	55 07	50 15	30 39
Banking and brokerage institutions	35 09	28 10	10 98	8 77
Business pursuits and personal services	36 56	29 01	22 28	17 68
Chemical and allied industries	52 36	41 76	34 89	22 08
Food and food preparations	41 89	33 48	31 57	23 19
Iron and steel industries	50 52	36 43	33 59	23 26
Leather and leather goods industries	33 32	26 41	23 41	18 35
Metal and metallurgical industries	28 79	22 89	22 03	16 93
Mining and mineral extraction	49 27	36 02	32 74	22 75
Paper printing, bookbinding and publishing	35 82	27 41	22 71	16 90
Special manufacturing industries	38 90	30 43	24 70	18 57
Stone, clay and glass industries	36 89	28 22	26 86	21 00
Textile industries	47 23	34 26	28 24	20 76
Timbering, logging, lumbering and woodworking industries	40 98	33 88	15 73	12 97
Trading	44 30	33 99	25 07	19 20
Transportation and public utilities	26 63	20 98	16 38	12 88
Total	44 34	33 51	25 95	19 11

There is no business group listed here with an average net income under 20 per cent. Over one-fourth of these corporations, 5,724 in number, showed net profits of over 50 per cent on capital stock. And over one-tenth of them (2,030) showed net profits of over 100 per cent. In other words, there were over 5,000 corporations which in 1917 earned over one-half the value of their capital stock and over 2,000 that earned the entire value in a single year.

Thus the statement that tremendous profits and high prices are closely associated is substantiated by data from two authoritative sources which certainly lean toward conservatism.

**Small Quantities of Arsenic Have Been Found in Samples of Coke**

CHEMISTS working in other industries than that of coal have occasionally referred to the presence of arsenic in coke. Investigation as to the occurrence of minute quantities of that substance in beer developed the fact that the malt used in brewing, when dried by direct contact with hot fuel gases derived from either coke or anthracite, absorbed or obtained by surface deposition a part of the arsenic which was volatilized during the burning of the fuel. The source of the arsenic was directly traced to the fuel, being originally derived from the iron pyrite or "brasses" which the coal contained.

Several years ago investigations in this direction were carried on at the Breslau Technical High School, in Germany, and this institution reported the following percentages of arsenic in the various samples of coke then under examination: Rhineland coke, 0.002 per cent; Westphalian coke, 0.011 per cent; Saar coke, 0.0052 per cent; American beehive coke, 0.0037 per cent.

Of course these percentages are exceedingly small and in practice would probably be lost sight of, yet the presence of the arsenic is interesting from a theoretical standpoint. Messrs. Archbutt and Jackson have formulated a satisfactory method for the determination of arsenic in coal and coke.

# Designing Furnaces to Suit High-Ash and Non-Coking Coals of Varied Volatilities\*

Making Chain-Grate Stoker Settings to Suit the Low-Grade Coals of the Southwest—Long High-Set and Steep Arches Spanning Large Percentage of Grate Best Suit High-Volatile High-Ash Coals

BY W. M. PARK†  
East Chicago, Ind.

**P**RODUCTION of coal in the Southwestern fields of the United States has not kept pace with that of Eastern fields, owing to the smaller demand. This demand is affected by the extensive oil developments of that section and by the lesser density of population and fewer manufacturing enterprises. The quality of coal in this region varies from a good grade of anthracite containing 14,000 B.t.u. to low-grade lignite of 6,000 B.t.u. The anthracite field, which is in New Mexico, is of limited area and is mentioned merely to indicate the contrast in fuel quality found in small radius. The majority of the fuels of the Southwest contain ash in excess of 15 per cent which is of a composition that fuses readily into a sticky clinker.

During the last eight years furnace design has developed beyond the experimental stage, however, and engineers can rationally design furnaces to use these fuels with the same assurance of ultimately satisfactory results that is felt when designing furnaces for Eastern coals. This article will describe a few modern settings with which creditable performance has been secured.

Fig. 1 shows a horizontal-pass boiler with a chain-grate stoker having a ratio of grate area to heating surface of 1 to 52. This grade readily comes to ignite and burns 40 lb. of coal hourly per square foot of grate area. Under test conditions it gave 72 per cent efficiency when burning a northwestern New Mexico coal of the following analysis:

Moisture, per cent . . . . .	17
Volatile, per cent . . . . .	33
Fixed carbon, per cent . . . . .	33
Ash, per cent . . . . .	17
B. t. u., commercial basis . . . . .	8,500

The higher grade coals of New Mexico are used quite extensively in El Paso, Tex., on a number of chain-grates. All these coals are rich in volatile gas and some appear to contain, either in the volatile matter or in the lighter particles of ash, some element which attacks even the best grades of firebrick if the furnaces are so designed that the gas travels past the brickwork at a high velocity.

A furnace for a vertically baffled boiler is represented in Fig. 3. The outstanding features of design are the

ample combustion chamber provided by setting the boiler 11.5 ft. under the front header, the high set and steeply sloped arch which in connection with the vertical bridge wall allows intense reflection and radiation of heat on the entering fuel, and a large opening between the arch and bridge wall to insure nominal gas velocity. This type of furnace has given highly satisfactory performance, operating continuously at averages of 15 per cent carbon dioxide and a loss due to fine coal passing through the grate openings to the ash pit of 2 per cent to 3 per cent when burning north-eastern and north central New Mexico coals which

Furnaces that will burn high-volatile coal running up to 40 per cent ash make it possible to make use of the bone from picking tables and so provide for great savings in the power bill. To this end it is necessary to secure plenty of radiant heat from the arch without introducing the disadvantage of an excessive throttling of furnace gases.

have the following proximate analysis:

Moisture, per cent . . . . .	2 87
Volatile, per cent . . . . .	34 27
Fixed carbon, per cent . . . . .	46 08
Ash, per cent . . . . .	16 78
B. t. u., commercial basis . . . . .	12,023

About sixty miles west of Fort Worth, Tex., is an isolated bituminous coal field of small area. The screened lump grades of this coal have a heating value of 12,500 B.t.u., and a large percentage of the output is used by the Texas & Pacific Ry., leaving a limited amount for domestic consumption in a territory traversed by this railroad. The screenings are burned on chain-grate stokers at several of the mine plants and at a large public service plant in Fort Worth. The better grades of screenings have a heating value of 10,500 B.t.u., while the lower grades run as low as 8,300 B.t.u. and have a proximate analysis of:

	Per Cent.
Moisture . . . . .	3 50
Volatile . . . . .	30 70
Fixed carbon . . . . .	26 24
Ash . . . . .	39 56

To burn this coal successfully it is necessary to cover approximately 90 per cent of the furnace with an arch set with a steep slope and ample height which in combination with a vertical bridge wall will cause intense reflection of heat upon the fuel bed at the entrance to the furnace. Such a furnace is shown in Fig. 4. Naturally, it is necessary also to provide unusually large grate surface to permit of burning large quantities of this low-grade fuel. Some of the stokers in operation at the mines have ratio of grate area to heating surface as low as 1 to 25.

In the western counties of Arkansas there is mined a

\*Reprint of article entitled "Burning Low-Grade Coals of the Southwest" from *Electrical World*.  
†Construction engineer, Green Engineering Co.

grade of coal known as semi-anthracite, having the following average analysis:

Moisture, per cent	3.5
Volatile, per cent	14.0
Fixed carbon, per cent	60.5
Ash, per cent	22.0
B.t.u., commercial basis	11,400

In regard to the glossy appearance of freshly broken pieces and the nature of the fracture this fuel is similar to Pocahontas coal. The percentage of volatile matter and moisture also approximates that of the latter fuel, but the different nature of the volatile content and the considerably higher percentage of ash give the coal characteristics in burning which are quite different from Pocahontas coal. When heated the tars appear to volatilize before they reach the temperature at which they would become plastic, in contrast with Eastern coking coal.

Instead of coking together in lumps, the smaller chunks disintegrate under heat so that the fuel bed is like a mass of loose sand. Because the coal has these characteristics it produces a dense fuel bed, and therefore the depth of fire must be less than that used with

coals of high volatility for corresponding drafts and combustion rates. These low-volatile coals are perhaps the most difficult fuels to burn of all encountered in this district, on account of the difficulties of ignition. Even with the furnaces designed for the most intense concentration of heat at the ignition point, semi-anthracite coals will ignite only on the surface if radiant and reflected heat alone are depended upon. The ignition of fuel in the lower part of the fuel bed can be accelerated by use of a special gate having corrugated face tile in contact with the fuel.

Fig. 2 shows an experimental design of furnace first worked out in connection with semi-anthracite coal-burning problems. It involves an expensive lot of special tile shapes, and the cost of maintenance of the brickwork is high.

Equally good results may be expected with a simpler type of arch shown in Fig. 3, though for the boiler and for the length of stoker shown in Fig. 2 the furnace projection and length of arch should be increased when the reversed arch is eliminated.

From a long series of tests of from eight hours to twenty-four hours' duration, six are presented in the accompanying table. Efficiencies as high as 78.5 per cent were obtained where unusual pains were taken to maintain steady conditions, but the list chosen does not include the maximum results. Tests typical of results readily obtainable are of greater value to the engineer, and this point was borne in mind in making the selection.

My experience in burning the Southwestern coals leads to the following conclusions:

1. On account of the high-ash content and fusible nature of their ash, these coals can be burned with highest efficiency and with least labor by use of a chain grate.

2. Most of the coals are of high volatile content,

ANALYSES OF SIX VARIETIES OF COAL

Name of Coal	Gallup, N. Mex.	Raton, N. Mex.	Strawn, Tex.	Dewar, Okla.	Jenny Lind, Ark.	Huntington, Ark.
Moisture	19.55	2.45	2.81	6.27	4.25	3.88

Carbon dioxide at uptake	10.0	11.7	9.7	10.0	12.9	11.6
Coal burned hourly per square foot	40.2	26.6	24.65	27.5	32.1	28.5
Per cent builder's rating developed	146	154	134	139	170	148
Combined efficiency	71.8	72.8	73.6	71.7	74.1	72.2

FIGS. 1 AND 2. TWO SETTINGS THAT SUCCESSFULLY BURN THE FUELS FOR WHICH THEY WERE DESIGNED

In Fig. 1 the tile on the lower boiler tubes aid in maintaining high temperature. Fig. 2 is an experimental setting intended for semi-anthracite

FIGS. 3 AND 4. TWO OTHER EFFICIENT SETTINGS

The first embodies a spacious combustion chamber, a high, steep arch and an ample gas outlet. In the second the high, steep arch and vertical bridge wall afford intense heat reflection.

ignite readily and burn freely if provided with long, high-set arches.

3. Semi-anthracite coal ignites least readily, but if load conditions permit maintenance of steady furnace conditions, this fuel can be burned with high efficiency. Good overload also can be secured with liberal grate area.

4. As semi-anthracite crumbles in the fire rather than cokes together it is desirable, by the use of a stoker chain with finely divided and ample air space, to reduce sifting of the fuel and resulting holes in the fire.

5. To secure high furnace efficiency at high rating a large furnace volume is desirable. This is insured by setting horizontal water-tube boilers at a front header height of 8 ft. to 10 ft. if horizontally baffled and 10 ft. to 13 ft. if vertically baffled.

6. Provision should be made for furnace draft of 0.30 in. to 0.60 in., and liberal grate area should be furnished to insure good overload capacity when burning the medium and lower grades of these coals.

### Good Blacksmithing Is Necessary to Obtain Good Drill Bits

By R. E. DUNN  
New York City

MANUFACTURERS of rock-drilling machinery can and do make good rock drills and drill-steel sharpeners. They are unable, however, to eliminate the personal equation of the blacksmith. It would seem that the least informed person would realize that success in rock drilling is almost entirely dependent on the blacksmith turning out good steels. Although the drill-steel sharpener has gone far toward improving the quality of bits, yet, even with this improved and special machine, proper steels can be made only if care and judgment are exercised by the blacksmith.

One of the large manufacturers of rock-drilling machinery not long ago received a complaint that one of its jackhammers was "falling down" on the job. In the customer's own words, "the drill didn't have any pep." One of the company's representatives investigated this case and the accompanying illustration shows the actual condition of the bits that were used in this mine. The bit shown in the center was made by this representative with the same machine that formed the other four bits shown. This demonstrates clearly that the difficulty was not the fault of the sharpening machine. Is it any wonder that the drill "didn't have any pep"?

It is found that a large number of drill complaints can be traced directly to bad blacksmithing, against which the manufacturers are waging a continual campaign of education. The photograph also illustrates the

PROPERLY AND IMPROPERLY FORGED BITS

problem with which the representatives of mining-machinery companies are frequently confronted, that is, complaints and dissatisfaction on the part of sincere but not thoroughly informed operators.

### Geological Survey Issues Supplement on Coal Mining in Alaska

AS IT is tributary to the Government railroad and because of the coal-mining developments carried on by the Department of the Interior through the Alaskan Engineering Commission, the Matanuska coal field, in Alaska, is just now of special interest. The United States Geological Survey, of the Department of the Interior, has therefore issued, in its Bulletin 712-E, a paper by Theodore Chapin entitled "Mining Developments in the Matanuska Coal Field."

Mr. Chapin is in charge of the branch office of the Geological Survey at Anchorage, Alaska, and is actively co-operating with the Alaskan Engineering Commission in the development of these mines. His report is part of the Geological Survey's regular annual account of mining in Alaska and is based on several weeks' field work done at different times in the summer and fall of 1918 and on an intimate knowledge of the mining and prospecting that were done in that year.

The report includes a brief description of the general geology of the coal field, a statement of the results of tests and analyses of the coal, a detailed account of the mining and prospecting done in 1918, and descriptions of the geologic features at the mines and maps of areas near them, as well as many sections showing the geologic relations of the coal beds. The report is supplemental to the more general accounts of the geology and coal of the Matanuska Valley that have already been published by the Geological Survey.

The same bulletin contains also a short paper by Mr. Chapin entitled "Lode Development in the Willow Creek District," which is the customary brief annual statement of the developments of the year of the gold lode mines of that district.

Bulletin 712-E can be obtained free of charge from the Director of the U. S. Geological Survey at Washington, D. C.

### Income Tax for 1919 Will Amount to \$3,500,000,000

INCOME and excess profits taxes aggregating \$908,829,172 were paid as the first installment of the tax bill for 1919. While these figures do not represent an exact one-fourth of the taxes for last year, they indicate collection for the entire year of approximately \$3,500,000,000, Treasury officials say. The State of New York paid \$214,644,232 and the Second District of New York paid \$154,505,989.

### To Report on Coal Traffic Rates

A FAVORABLE report has been made to the House on a resolution by Representative Thompson of Ohio, calling upon the Secretary of Commerce to report on the cost of transportation of coal by canals and other navigable waters as compared with costs for transporting coal by rail. The committee points out that there are wide differences in existing estimates of costs for coal carriage on both rail and water carriers.

# Costs Constitute the Only Fair Basis For Fixing Prices

In Figuring Costs, It Is Held, Allowance Should Be Made for Reasonable Wages for the Proprietors and Equitable Interest on Capital Invested—Industries Will Prosper in Proportion to Their Freedom from Artificial Restraint

BY FRANK WILBUR MAIN\*  
Pittsburgh, Pa.

AS IS sometimes pointed out, history confirms the fact that it is a trait of human nature for each generation to feel that the problems confronting it are more difficult, more unusual and more far-reaching in their effect than those that have ever been met by mankind before. It is also a universal human trait to feel that the solutions that are used in working out these problems are new and original. This is the *new* day of costs and cost accounting, so we are told, and in one way or another every business concern and every association and business man are being urged to base the selling price of their products upon the cost thereof.

This latter I, of course, subscribe to and agree with, but I am afraid that the impression is often created that the calculating of costs is something new and something peculiar to our own day and generation, and yet I believe that if we will but stop and think we must realize that in every day and every age costs were obtained, not perhaps in all of their refinement, but costs nevertheless. Some nineteen hundred years ago the Greatest Teacher of all times made a statement in a manner which indicated that the obtaining of costs was a well recognized custom of procedure even at that time: "Which of you, intending to build a tower, sitteth not down first, and counteth the cost, whether he have sufficient to finish?"

The subject of costs is a branch of the science or art of accountancy and has been developed by accountants. These gentlemen, though not then so named, were in existence at the time of Caesar and helped calculate the costs of his foreign conquests. When Columbus discovered America the profession of accountancy was well established and this presupposes a knowledge and use of costs. This is true today, for the *Encyclopedia Britannica* defines accountancy as "a science by means of which all mercantile and financial transactions, whether in money or in money's worth, including operations completed and engagements undertaken to be fulfilled at once or in a future, however remote, may be recorded; and this science comprises a knowledge of the proper methods of preparing statistics . . . and of ascertaining or estimating on cor-

rect bases the cost of any operation, whether in money, in commodities, in time, in life or in any wasting property."

Speaking generally, and, of course, recognizing individual exceptions, costs have always, and of necessity, determined selling prices. The great trouble in the past was that while you would never fail to get attention when you talked of selling prices, each man thought his cost system was either too secret to be discussed or too unimportant to require special study. The price his competitor charged was sufficient cost system for him.

Herbert Hoover in a very interesting article on "Agricultural Readjust-

ment and the High Cost of Living," in a very recent issue of *The Saturday Evening Post*, has stated that the cost of raising various farm products in this country is not the determining basis of selling prices, but that these selling prices are fixed by the impact of world wholesale prices. In other words, in respect to certain farm products which are grown the world over, the world cost rather than the United States cost is the predominating factor in this country. While with certain modifications this perhaps is true, yet it only confirms the fact that taking any product over a wide enough field, the selling price for any long-continued period cannot be less than cost.

I know that many will say that it is possible, even over a wide territory, to omit certain costs and to still continue production for a long period of time, also that it is possible for large business groups to carry on expensive side lines at the expense of more productive products. I, however, still contend that the cost of any product over a sufficiently wide area of territory, including reasonable wages for the proprietors and reasonable wage or interest return on the invested capital, is the dead level below which business or industry cannot indefinitely survive.

The instinctive struggle for life is so strong that no human being will willingly suffocate, and likewise no business will forever continue on a basis from which it cannot grow or develop. I am not speaking of unwarranted individual business enterprises; I am speaking of business trades and industries as a whole.

If cost is the basis for prices it is well to consider briefly just what is included in cost. I am not now speaking of "cost" as a technical accounting word,

Mr. Main's message, while not so intended, fits the present case of the coal operator. The impelling incentive for accurate cost keeping should come from within and not through orders with penalty provisions from a Governmental agency. Standardized fundamental methods of cost accounting are advocated. Writer believes with the coal operator that industry will prosper most when artificial restrictions are removed.

\*Senior partner in the accounting firm of Main & Co. and president of the Pennsylvania State Board of Examiners and Accountants.

which in many cases includes only part of the actual elements that determine the basis of prices, nor am I including in cost the profit which is and must be the inherent and natural reward of industry, ingenuity and genius (which profit is just as necessary for the continuation of any form of civilization as the elements of cost itself). The cost I am speaking of includes:

1. Wages and salaries.
2. Materials and supplies.
3. Overhead or burden, including administrative, general and selling expenses, depreciation, depletion, etc.
4. Remuneration of proprietors for own services.
5. Remuneration of investment for use thereof.

There can be no question as to the first three classes of expenditures. Our farming friends are just beginning to realize that their farming costs include a reasonable remuneration for the farmer and the members of his family for their own labor. This is also true in all other enterprises. The individual merchant often feels that he has made, say \$15,000 in a year, when as a matter of fact he has made only that part of \$15,000 which is in excess of a reasonable remuneration for his own services and a fair return on his capital invested.

There has been a great deal of discussion among accountants as to whether interest is or is not an item of cost. It is certain that that part of the investment in any business which is represented by borrowed capital carries an interest charge as a remuneration thereof which must be provided for. That part of the investment in excess of borrowed capital has just as much right to a fair remuneration as a farmer has for his own labor on his own farm, and unless properly rewarded capital gradually wastes away of dry-rot.

In these days when men are considering very seriously the various phases of industrial democracy and when so much emphasis has been placed upon the interest of the worker in the profit of the business, the inherent right of a return for capital on itself for its own services should always be kept in mind.

While costs are a basis of prices, I am nevertheless opposed to any attempt to place selling prices generally upon a cost plus basis. Cost plus contracts and cost plus arrangements have almost always been found, and I believe usually will be found, productive of waste, inefficiency and extravagance. I am in favor, however, of each industry, as far as possible, standardizing its fundamental methods of cost accounting procedure.

I am so certain of the economic principle that cost forms the basis of all prices, and am so opposed to *en masse* regulation, believing that the same stifles individual initiative and enterprise, whether governmental or association, that I believe that industries as a whole will prosper most naturally and effectively according to the degree that all artificial restraints are removed. Accurate knowledge by each association and by each business man of their own costs is the one un-failing safety valve.

While it probably is true that limited governmental regulation is necessary in respect to certain industries, I believe that the public could be far more protected if our Federal trade agencies were directed to the correction of abuses as the same arise, rather than to the regulation of all businesses and industries, as now seems to be attempted. I also feel that there is grave danger in individual associations attempting a regulation in their own trades which when exerted by the Govern-

ment has been found to be most unsatisfactory and which I believe will be found almost unequally unsatisfactory by whomever it may be attempted.

We are realizing that any addition to normal cost, as, for instance, unscientific excess profit taxes, automatically and unfailingly raises prices to the customer. From general comment we might be led to believe that such a result was something that could not be foreseen. Yet in 1767, 153 years ago, there appeared in the *London Magazine* the following statement:

"Every new tax does not only affect the price of the commodity on which it is laid but that of all others, whether taxed or not, and which at first sight it seems to have no manner of connection. . . .

"Taxes, like the various streams which form a general inundation, by whatever channels they separately find admission, unite at last and overwhelm the whole. . . .

"The increase of taxes must increase the price of everything, whether taxed or not, and this is one principal cause of the present extraordinary advance of provisions and all the necessaries of life."

This is not a time to discuss taxes and I am mentioning this matter only to illustrate that any unnatural addition to cost cannot do other than produce unfavorable and distressing results, whether it be unscientific taxes, expensive regulation, unwarranted profit, or any other undue addition.

From a purely selfish standpoint, I am opposed to the addition of any excessive or unusual profit and I believe that no trade association can do any more important work than to agitate against unreasonable profits. Unreasonable profits will, in the long run, and looked upon from a world viewpoint, bring untoward results just as certainly as inadequate profits, and will do just as much to upset business conditions.

### Peat, Widely Used as Fuel in Europe, is Much Used as Fertilizer in U. S.

PEAT may be utilized in numerous and varied ways. In the countries of northern Europe, a bulletin of the Geological Survey notes, it is used for fuel and as the basis for many manufacturing industries. Gas, charcoal, coke and a number of valuable byproducts are produced from it. Owing to the scarcity of raw materials in Europe peat and peat moss are employed also as substitutes for absorbent cotton in the preparation of surgical dressings, for wood, and for cotton and woolen cloth.

In the United States peat is utilized chiefly as fertilizer filler, as stable litter, and as an absorbent for the uncrystallized residues of beet and cane sugar refineries in the manufacture of stock feed.

Peat has long been used in fertilizing the soil, having been either applied as a direct fertilizer or used as a filler for commercial fertilizer. Analyses of the peats of the United States show an average nitrogen content of about 2 per cent, a proportion somewhat higher than that found in some commercial fertilizers.

The value of peat in soil fertilization is found in its nitrogen content and in the beneficial mechanical effect it produces upon certain lands. Black, thoroughly decomposed peats are most satisfactory for fertilizer, as such peats are generally heavier and more compact and contain more nitrogen and less fibrous material than the brown types.

# What Barrier Coal Has Been and Should Be Left to Protect Anthracite Mines—I

Records Several Cases Where Barrier Pillars Were Provided, What Rock Overburden and Water Pressure They Sustained, Their Thickness, Height and Character and Their Ability to Satisfactorily Function—Some Experience Is Given as to Longitudinal Draw

BY W. B. RICHARDS\*  
Hazleton, Pa.

ONE of the most important subjects connected with the laying out of a mining property is the determination of the necessary, and therefore the required, width for barrier and shaft pillars. A barrier pillar is a coal rib left in place between the workings of adjoining mines. A shaft pillar is the coal reserved on either side of a shaft to protect the surface from subsidence and the shaft from distortion and injury. A fire pillar is a coal block into which normally a breast would have been driven, but which is left unworked in order to provide a solid pillar where a dam can be con-

structed. In case of a fire, the portion of the mine controlled can be sealed off by such a dam or flooded, without the balance of the operation being affected.

If adjoining mines are owned by a single company the barrier pillars usually are established approximately midway between the main openings of the two operations, so as to divide the territory equally. If adjoining properties are owned by different companies or individuals, the land line becomes the dividing line, and the barrier pillar is established on either side of this line as a center. Sometimes barrier pillars run lengthwise with the strike of the bed, and then one mine is below the other and the pillars run in the direction of the gangways. When they run parallel with the dip, they separate two mines that are side by side. In the event of a mine fire, a barrier pillar of sufficient strength would permit of flooding the burning mine to extinguish the fire, and there would be no danger to the employees in the neighboring operation. If a mine had reached the stage where it was unprofitable to work, it could with equal safety be abandoned and allowed to fill with water.

### BARRIER PILLARS HAVE TO MEET THREE FORCES

The decisive test of a barrier pillar comes when the bed has been completely robbed on both sides of the pillar. This coal must then bear the full weight of the overlying strata, and will be affected by the lateral draw. When one mine is abandoned and allowed to fill with water, the pressure of the water also pushes against this pillar, and these three combined forces have to be resisted.

The Anthracite Mining Law of Pennsylvania, Art. 3, Sec. 10, states that it shall be obligatory on the owners of adjoining coal properties to leave, or cause to be left,

FIG. 1. SECTION THROUGH KEHLEY RUN MINE

This mine was flooded to extinguish a mine fire, the pressure of a 232-ft. head of water coming upon a pillar 40 ft. thick. This pressure was successfully sustained.

\*Consulting engineer, Cranberry Creek Coal Co.

FIG. 2

### Plan of Barrier Pillar

This pillar, 300 ft. wide, resisted, without seepage, a 455-ft. head of water for fifteen years on the side marked "A," the workings on that side being allowed to fill with water. The pillar will be maintained at that width to a depth of 570 ft.

FIG. 2

FIG. 3. VERTICAL SECTION ON THE LINE OF THE BARRIER PILLAR SHOWN IN FIG. 2  
Four beds were worked. On one side of the barrier three beds and on the other side two beds were robbed to the pillar

a pillar of coal in each seam or bed of coal worked by them along the line of the adjoining property, of such width that, taken in connection with the pillar to be left by the adjoining property owners, it will be a sufficient barrier for the safety of all employees of either mine in case the other working should be abandoned and allowed to fill with water; such width of pillar to be determined by the engineers representing the adjoining property owners, together with the inspector of the district in which the mine is situated. The surveys of the face of the workings along such pillar shall be made in duplicate and must practically agree.

The prime factors governing the determination of the width of pillar required are: (1) The depth of the bed below the surface, which is the measure of pressure; (2) the compressive strength of the coal; (3) the inclination of the bed; (4) the thickness and nature of the bed, whether the coal is soft, shelly or hard; (5) the nature of the overlying strata.

FIG. 4. LONGITUDINAL SECTION OF A BARRIER BETWEEN TWO ADJOINING MINES

Mine marked "A" was abandoned and allowed to fill with water. The pillar for year has successfully withstood the pressure of water to which it has been subjected

The following factors for determining the width of barrier pillars required have been investigated:

The squeezing and crushing strengths of anthracite coal have been tested under the auspices of the Anthracite Engineers Club of Scranton, Pa. The specific gravity and weight per cubic foot of the strata overlying the coal beds have been determined by John H. Savage, chemist of the Lehigh Coal & Navigation Co., of Lansford, Pa.

Barrier pillars have been tested under working conditions in the southern and western anthracite fields. Here pillars have been established, the mines abandoned, and allowed to fill with water, to depths ranging from 300 to 800 ft. from the surface, in coal varying from 10 to 50 ft. thick and inclined from zero to 70 deg.

By tests made on samples from the several coal fields, it has been found that a pressure of 216 tons to the square foot will cause the ordinary mine pillar to begin cracking, while a pressure about twice as great will crush it to powder. In general, other things being equal, the crushing strength of mine pillars varies inversely to the square root of the thickness of the bed. The same general rule apparently holds true for the squeezing strength in all cases where the height of the pillar is less than its width.

CRUSHING STRENGTH 3 TONS PER SQUARE INCH

In tall pillars, having a height greater than their width, the squeezing strength remains nearly constant, while the crushing strength continues to diminish with the height. The average squeezing strength of a mine pillar is about three thousand pounds to the square inch. The average crushing strength is about twice as much, or six thousand pounds to the square inch.

The pressure or weight upon a pillar varies directly as the depth from the surface, multiplied by the cosine of the angle of the dip. In general, the greater the depth, the larger must be the pillar. As the load producing the first crack in a mine pillar, that is a load such that the coal begins to scale on the outside of the block, is 216 tons to the square foot, and the weight of the overlying strata averages 163 lb. to the cubic foot, a level bed at a depth of 2,650 ft. below the surface supporting only the roof immediately below it would be under such a pressure that it would commence to squeeze. This statement is based on the assumption that the mass of strata resting on the pillar does not overhang. If the strata overhang, the pillar would commence to squeeze at a lesser depth.

The following table shows the average specific gravity and weight per cubic foot of slate, pea conglomerate, and hard gray sandstone from the mines at Lansford, Pa.:

	Specific Gravity	Weight per Cu. ft. Lb.
Slate	2.60	162
Pea conglomerate	2.65	165
Hard gray sandstone	2.68	167

The average weight of the strata overlying the Mammoth bed in the basin at Lansford is 163 lb. per cubic foot.

At the Harleigh Mines near Hazleton in the year 1877 the surface subsided, owing to the robbing of the pillars, and Black Creek broke into the mines. The barrier pillar established between the Harleigh and Ebervale mines was 45 ft. thick and the bed was 30 ft. in thickness and composed of good hard coal. The vertical

FIG. 7. LONGITUDINAL SECTION OF A BARRIER PILLAR 180 FT. WIDE  
For years this pillar has successfully withstood a 323-ft. head of water, the mine marked "Y" being abandoned

without pillar strength being considered. The question will then arise: Is the barrier pillar of sufficient strength to resist the pressure of water that will come against it?

If it is the opinion of the engineers and mine inspector that it is not safe, the owners of the mine still operating will have to go to great expense in installing additional pumps, pump house, sumps, column lines, power lines, etc. In order to protect themselves they have to tap the water by drill holes through the barrier pillar and pump it from the abandoned mine. If the necessary width of barrier pillar had been left much trouble and worry for all parties concerned would have been obviated and an unnecessary expenditure of thousands of dollars would have been avoided.

#### FORTY-FOOT PILLAR WITHSTANDS WATER-HEAD

Fig. 1 is a cross section through the Kehley Run mine at Shenandoah. It shows the Water, Middle and Lower levels. In 1880 a serious mine fire occurred in the Middle Level. On the Lower Level to the west the workings were connected with the Kohinoor mines, which were developed at lower elevation. This prevented the flooding of the Kehley Run mine. In order to prevent the water flowing westward into the Kohinoor mines, the construction of a dam was considered. This would throw a 252-ft. head of water, equivalent to 110 lb. pressure per square inch, onto the chain pillar that was left between the Middle-Level gangway and the face of the breasts that had been driven up from the Lower Level.

On line of breast No. 12, which is shown on the section, the chain pillar was only 40 ft. thick, and this was supposed to be the point of least resistance. The bed was 50 ft. in thickness and of good hard coal. It was inclined at an angle of 40 deg. On the Middle Level the breast pillars had been robbed down to the stump heading and the top rock had fallen. On the Lower Level the breasts were worked 30 ft. in height, leaving in place 20 ft. of the top of the bed. The breast was 26 ft. wide.

It was the opinion of the mine inspector and the engineers that under these conditions the chain pillar,

which was 40 ft. wide, would be of sufficient strength to hold the water. Brick dams were accordingly constructed on the Middle and Lower levels, and the mine filled with water. The chain pillar of 40 ft. width successfully held the hydraulic pressure thus imposed.

#### ANOTHER PITCHING PILLAR HOLDS BACK WATER

Packer No. 2 Colliery was flooded to extinguish a mine fire in the Mammoth Vein. The bed at this point was 37 ft. thick and was composed of good hard coal, dipping 43 deg. A chain pillar 66 ft. thick successfully resisted a head of water of 315 feet. The breast pillars were all in place. This illustrates the strength of a bed on the pitch where it is in good condition and hard.

Fig. 2 is a longitudinal section showing a barrier pillar that was established between adjoining mines. It was 300 ft. wide and was to remain that width from the surface to the basin, a depth of 570 ft. The mine marked "A" was abandoned and allowed to fill with water. The lowest gangway worked was at an elevation of 1,040 ft. above tide. The elevation of the overflow at the surface was 1,495 ft., giving a head of water of 455 ft. There were three beds mined and robbed at the pillar line—the Bottom Split 9 ft. thick, the Skidmore 10 ft. thick, and the Buck Mountain 23 ft. thick.

In the mine on the right marked "B" the Skidmore and Buck Mountain Bed had been worked and robbed to the pillar line. The latter bed from the bottom slate upward consisted of 1 ft. of dirt, 14 ft. of good coal, 8 ft. of slate, coal and dirt, and a hard sandstone top.

The width of this pillar was established by the mine inspector, although the engineers for the adjoining mines did not believe that so wide a pillar was necessary. This pillar was in existence and successfully held back the water for about fifteen years when the water was pumped out and the mine re-opened. Fig. 3 is a cross-section on the line of this pillar.

Fig. 4 is a longitudinal section showing a barrier pillar that was established between adjoining mines by the mine inspector and the engineers of the adjoining operations. Mine marked "A" was abandoned and

filled with water. The elevation of the lowest gangway was 176 ft. above tide, while that of the overflow at the surface was 821 ft., thus giving a head of water of 645 ft. The gangway was 800 ft. in depth from the surface. At this depth a barrier pillar 300 ft. thick was left. The bed was 20 ft. thick, and consisted from the bottom slate upward of 3 ft. of good coal, 1 ft. of dirt, 12 ft. of good coal, then 4 ft. of dirt, soft coal and clod; the inclination was 25 deg. The bed was completely robbed on both sides of the barrier pillar.

In the same mine, in a different bed at a gangway elevation of 432 ft. above tide and at a depth of 600 ft. from the surface, there is a head of water of 390 ft. The barrier pillar at this level is 190 ft. in width. The bed is ten feet thick and of good hard coal, inclined from 25 to 45 deg. The bed was completely robbed at the pillar line in mine marked "A". In the adjoining operation, marked "B," breasts were driven in the Skidmore bed 5 ft. thick, the bottom split 20 ft. thick and the middle split 10 ft. thick, that is in the same beds as those worked in mine marked "A," but the breast pillars have here not yet been drawn. This barrier pillar for years has resisted the pressure of water to which it has been exposed.

#### IN DEEP MINES 300-FT. RIBS HAVE BEEN LEFT

At the level located 432 ft. above tide the workings in the mine marked "A" had been driven years ago to within 40 ft. of the land line. When the mine adjoining, which was developed at a later date, approached that line, 150 ft. of pillar on its side of the line was left in place, making the barrier pillar at this level 190 ft. wide. Below this level the mine inspector and engineers of the adjoining mines decided that a pillar 300 ft. wide would be required, each mine to leave 150 ft. on its side of the land line. This pillar was established to the basin, a depth of 1,400 ft. from the surface. The bottom split of the Mammoth Vein was 1,200 ft. from the surface. Fig. 5 is a cross-section on the line of this pillar.

Longitudinal section, Fig. 6, shows a barrier pillar 200 ft. in width that was established in the Primrose bed between the workings of adjoining slopes. Both slopes were abandoned and filled with water. There were two levels, namely, the Water and Slope levels. The former was robbed completely. On the slope level the bed was robbed on both sides of the barrier pillar. This level was 450 ft. in depth from the surface, and the head of water was 205 ft. The bed was 12 ft. thick. Starting from the bottom slate it consisted of 1 ft. of shelly coal, 8 ft. of good coal and 2 ft. of dirty coal. The bed pitched 50 deg. This pillar stood the test for years. The water was finally removed from one slope, but the other is still full.

Longitudinal section Fig. 7 shows a barrier pillar 180 ft. in width. The mine marked "Y" was abandoned and allowed to fill with water, the head being 323 ft. This pillar was established to the basin, a depth of 425 ft. The Wharton Vein is 10 ft. thick, and contains 2 ft. of shelly coal. This pillar has stood for years.

#### HOW MUCH PILLAR MUST BE LEFT UNDER TUNNEL?

In a mine where a pillar 300 ft. wide was left under water-level tunnel the depth from the surface to the gangway was 500 ft., the vertical height from the gangway to the tunnel was 315 ft., the pitch distance 410 ft., and the bed was 50 ft. thick, inclining 48 deg. The

breast and gangway pillars were completely robbed on both sides of this reservation pillar, and the lateral draw did not reach to the tunnel.

In another mine where a pillar 140 ft. wide was reserved under a panel tunnel the vertical height was 270 ft., the pitch distance 400 ft., inclination 50 deg. and the bed 14 ft. thick of good coal. The bed was robbed on both sides of this pillar, and the lateral draw did not affect the tunnel. If in such a case as the above the reservation pillars had not been left wide enough, the lateral draw would have injured the tunnel, causing the rock which formed its roof to fall, and it would then have required timber for its support.

The problem of the extent to which the horizontal draw over a barrier pillar will extend when coal is extracted on either side of it is a matter demanding careful consideration and a factor of safety must be allowed to prevent the break from occurring at the tunnel which the pillar is intended to protect.

While driving a breast on line along a barrier pillar, in the top split of the Mammoth bed, which was at that point 14 ft. thick and on a 30-deg. pitch, a jump or roll in the bottom was struck, rising vertically 40 ft. The breast was driven up over the roll to the surface. When the breast pillars were being robbed, and additional weight was thrown on the barrier pillar, the coal squeezed out for 12 ft. along the roll, and weakened the pillar materially.

At another place where a barrier pillar had been established for the Buck Mountain bed, which was here 15 ft. thick and inclined 35 deg., when driving the breast along the pillar on line a slip was encountered in the bed and the coal slid out of the pillar 15 ft., thus decreasing by this much the width of the established pillar.

In many instances the miners, when driving a breast on line along a barrier pillar, encroach upon it, especially if the coal is good and they are being paid by the car. Frail coal and coal that disintegrates rapidly when exposed to the air, together with a soft bottom, require a larger pillar than when the coal is hard. If the strata overlying a barrier pillar overhangs, it throws additional weight on the pillar. This acts as a lever on the coal, crushing the pillar along its edge. Accordingly coal is often squeezed off the pillar for a depth of 10 to 15 ft. from its edge. Since barrier and shaft pillars must stand for a long time and are subject to disintegration and atmospheric effects, such conditions should be considered when determining the width of these pillars.

*(To Be Continued)*

### Geological Survey Issues Map of Coal Fields

THE U. S. Geological Survey, Department of the Interior, is now distributing a large map showing the coal fields of the United States. This map, which measures 4½ x 7 feet, shows the coal fields by a series of colors indicating the seven different kinds or grades of coal as it is classified by the Geological Survey—anthracite, semi-bituminous, high-grade bituminous, low-grade bituminous, lignite and coking coal. The map is sold by the Geological Survey for \$1, or for 60 cents each if five or more maps are ordered together. Besides the coal fields this map shows all the cities, railroads, lakes and other features usual on a map of this size.

## Coal Beds Near Panama Promise Big Coal Industry in Colombia

Engineers Agree That Exploitation for Commercial Purposes Is Practicable—Government Officials Are Anxious to Lend Encouragement

IN THE foothills of the Western Andes near Cali, Colombia, Trade Commissioner P. L. Bell reports, the general dip of the outcroppings of coal and the shape and position of the valley are generally conceded to indicate the presence of coal beds under the level floor of the valley.

The veins so far discovered extend from Guachinte, southeast of Cali, to Punta Yumbo, northwest of Cali, a distance of approximately 83 km.—on the map here-with Cali will be seen southwest of Bogota. This coal is bituminous, somewhat friable, steams easily, and will coke nicely. The following analysis indicates its quality: Volatile matter, about 23 per cent; ash, between 5.38 and 7.66 per cent; sulphur, about 0.77 per cent; and free carbon, between 68.05 and 70.58 per cent.

The importance of this coal reserve so near the Panama Canal is well understood, and it is confidently predicted that coal mining will be one of the important industries of the future. Good coal is badly needed for both rail and water transportation on the west coast of South America.

Engineers who have examined the Cali deposits agree that their exploitation for commercial purposes is entirely practicable; and the Government officials are anxious to encourage the development of the department. There is one serious drawback to the development of these reserves, namely, the limited carrying capacity of the Pacific Railway between Cali and Buenaventura.

Five or six mines are now in operation near Cali with a total monthly output of approximately 3,000 tons, but the work is not carried on steadily, and the mine equipment is antiquated. An average of from 250 to 300 men are employed at the mines, but the tonnage production per man is low and the mining costs are high. At present little coal is used locally except by the Pacific Railway, which purchases most of the output of the Cali

mines. Some coal was shipped recently to Peru and Ecuador, but the high cost of handling made it an unprofitable business. The cost of coal at Cali, delivered at railway freight sheds, is \$7 per ton.

No real development work has been undertaken by foreign interests. Some prospecting was recently started by two Americans; and the Canal Commission at one time offered to take steps toward the exploitation of the Cali coal beds, but abandoned the idea because of the excessive prices demanded by the owners of local coal lands for the purchase of their property.

Coal lands do not come under the existing mining laws, and are, therefore, not open for location of claims. Coal reserves are generally held to be the property of the Government unless the title of the owner of the land antedates the land laws of 1876. Most titles in the Cali district to antedate 1876 and therefore give the owners free right to sell or work their coal fields, but any foreign company entering the field in the future should have some arrangement with the Government before making any purchases.

## Sulphite Liquor Makes Briquet Binder and Cheap Fuel

ONE of the troublesome paper or rather pulp-mill wastes is the spent sulphite liquor, but at least four classes of useful materials are now made from this material. Of these alcohol has received the most publicity. It is secured by providing for the fermentation of the carbo-hydrates, gums, etc., in the liquor. Several such alcohol plants are in operation and in the United States the Government has been interested in a plant erected to obtain alcohol for military purposes.

If sulphite liquor is neutralized with lime and magnesia and then evaporated under vacuum, a thick syrup results, and upon carefully drying this a gum, or adhesive, is secured. It has been used successfully as a binder for fuel briquets. Some regard it as being more suitable than pitch for briquetting purposes, being cheaper and more effective. Less binder also is required. It burns completely in the ordinary fire.

In Sweden a unique method for using the lignin in the liquor for fuel purposes has been worked out and a few mills recover enough to furnish their own fuel. The process is known by the name of the inventor—Strehlenert. The solid substances in sulphite liquor are precipitated under conditions which permit of the recovery of from 60 to 90 per cent of the sulphite dioxide in the liquor, and this can be used over again, while the lignin secured, when ready to burn, has a thermal value of some 7,000 calories (12,600 B.t.u.). One hundred and fifty pounds of the finished fuel are required from each 1,000 lb. to carry on the process, leaving a net result of 850 lb. This plan of conserving fuel, while utilizing a large volume of waste, was suggested about 1913, since which time progress has been made in Norway and Sweden, where fuel conditions are favorable to such processes.

Spruce turpentine is a comparatively recent product of the sulphite process, and it has been recently shown that carvacrol may be made commercially from it. Carvacrol has been proved an efficient substitute for thymol, and thymol is much in demand for fighting the hookworm (still so prevalent in certain European mines) and for general antiseptic manufacture. The supply of thymol is far short of the demand.

MAP SHOWING THE LOCATION OF CALI, NEAR WHERE IMPORTANT COAL DEPOSITS HAVE BEEN RECENTLY DISCOVERED

## Department Seeks Operators' Help In Leasing Coal Lands

Safe, Efficient Operation of Mines Opened Under  
Leasing Act on Public Lands Assured by  
Supervision of Bureau of Mines

PREPARATORY to the issuance of final regulations to govern coal mining under the Mineral Leasing Act, a conference was held of Interior Department officials and those interested in operating regulations. Representatives of the governors of the public land states were present as well as representatives of the National Coal Association, the American Institute of Mining and Metallurgical Engineers and the American Mining Congress. The opening address of Assistant Secretary Vogelsang sets forth clearly the purposes of the meeting and the difficulties which must be met. His remarks, in part, were as follows:

"I wish to make a short preliminary statement to the effect that you, representing the coal operators of the country, have been called together by this department, and you have been named by various authorities, governors of the different states in which the Government's fuel reserves—coal reserves—are located, to confer with us with reference to the operating regulations that shall be adopted for the conduct of coal mining henceforth on the public lands of the United States.

"You realize that in the passage of what is known as the Leasing Act, on Feb. 25 last, the Government has made a very radical departure from its former conduct of the acquisition of these mineral lands. By that act the relation of landlord and tenant practically has been established, and we wish to prepare at this meeting the chart by which the operation of coal mining on the Government leases shall be conducted.

### HUMAN WELFARE INVOLVED IN COAL MINING

"That act, of course, embraces the oil reserves as well as the coal reserves, and we had a meeting [of oil operators] similar to this, much more largely attended because it appeared to be of very much greater interest, owing to disputed titles and operation already in the field on lands claimed by the Government, and these gentlemen, representing the various oil interests of the country, were called in and we passed upon and adopted a set of operating regulations governing oil mining.

"Mining of coal, I need not say, is a very different proposition. The number of men employed in coal mining is infinitely greater and the question of human welfare is more intimately associated with coal mining. The question of safety of life and methods of operation, in order that the reserves may be properly extracted, lives may be preserved, etc., is a much more vital element in this discussion than it was in that of the oil leases.

"So we want you to approach this subject with perfectly open minds and to advise us as carefully and conscientiously as possible, to the end that what we are attempting to achieve here may not hereafter need very copious amendment or change. As public landlords we are charged with the duty of achieving as best we may the most desirable result with reference to extraction of the minerals and products of mines and miners."

George S. Rice, the chief mining engineer of the Bureau of Mines, made the following statement:

"The Alaskan Leasing Act did not make the same specifications as to the welfare of the miners as called for in this present new leasing act, but the administration to a certain extent has been in the hands of the Government through the Inspector of Alaska in the Department of the Interior. In the case of public domain, the state furnished inspection regulations, but they are not always adequate, and vary from state to state. Therefore to formulate regulations which under the act must take care of the safety, health and welfare of the miners it necessarily means going carefully into details.

"I also suggest that one of the important things for a prospective lessee is to have before him specifications of all the requirements of his contract before he signs it, so that he may open a mine with the full understanding of what is expected of him. Otherwise there are bound to arise difficulties, if a Federal inspector later on tries to enforce, without specified regulations, what he considers are proper requirements for safe and efficient mining.

"The Government has been very severely criticized, in fact as recently as this last winter, by one of the most eminent coal mining engineers of the country, who has had experience on the Indian lands under supposed Government supervision. He stated that the worst mining, so far as safety and conservation are concerned, was being practiced by the Government on Indian lands. This was true, but I do not think it is true now, as the Bureau of Mines is furnishing technical advice.

"It has been an extremely difficult thing to remedy early conditions. There were no regulations of any value when those leases were undertaken, and it has been an uphill job for the representatives of the Bureau of Mines, since this organization was charged with supervision, to bring the operations under safe control and to obtain more efficient mining practices. There have been great losses of coal in the past, as well as avoidable losses of life, and it was with these thoughts in mind that these regulations were prepared."

### Transportation Act Provision To End Tie-ups

An emergency provision of the new Transportation Act under which the Interstate Commerce Commission will take steps to end freight tie-up reads: "Whenever the commission is of the opinion that shortage of equipment, congestion of traffic or other emergency requiring immediate action exists in any part of the country the commission shall have authority at once to suspend the operation of rules, regulations or practices with respect to car service; to make such directions with respect to car service without regard to ownership of locomotives, cars and other vehicles during such emergency as in its opinion will best promote service in the interests of the public; to require joint use of terminals, and to give directions for priority in transportation, embargoes or movement of traffic."

# The Labor Situation

Edited by  
R. Dawson Hall

## Men Want Alien Union Officer Ousted

ONLY the presence of a large number of deputy sheriffs of Harrison and Marion counties prevented a riot among the miners of the Consolidation Coal Co's plant at Wyatt, W. Va., on Wednesday, May 12, the trouble arising from a statement that a foreigner was holding an office in the local union. When the superintendent at the plant sought to act as peace-maker he was threatened with violence.

An official announcement was made late Wednesday afternoon at the offices of the Consolidation Coal Co. in Fairmont that the trouble had been satisfactorily settled at a meeting of company officials and officers of the United Mine Workers and that the men would return to work Thursday morning.

## Prospects of Unionism in Mingo County

OUTSIDE of the trouble at the village of Lynn, in which 11 persons were killed, conditions remain practically unchanged with reference to the organization of the Mingo (W. Va.) field, although officials of the United Mine Workers are making claims of growth in the number of miners organized, Fred Mooney, secretary of district 17, stating that 2,600 miners among fourteen different locals have joined the United Mine Workers, but that all such men have been dismissed from the service of the coal companies and were living in tents.

If such were the case it would be causing a heavy loss in production. Production reports, however, disclose only a negligible loss from labor shortage, so that little credence is given the report that any considerable number of miners have been organized. The movement to organize the field is in a sense a hybrid one because at such meetings as have been held time is divided between organization speeches and addresses urging the nomination of Samuel B. Montgomery, State Labor Commissioner, for governor, Montgomery posing as the special friend of labor.

## Fairmont Field Asks "What Is a Bonus?"

IT WAS necessary to continue throughout the second week of May the conference between the operators of the northern West Virginia fields and the officials of district 17, some difference of opinion having arisen between the miners and operators as to what had in the past constituted a bonus, this question having arisen in connection with the effort to agree on a dead-work scale. Operators advanced the claim that yardage in narrow work had always been regarded as a bonus, while, on the other hand, the miners' representative stated that payment for yardage in narrow work had always been made to correct local deficiencies in the coal seam.

As a step toward settling the matter in controversy it was decided to make an investigation of conditions

at Wendell, at the Bertha mine near Morgantown and at the Parseglove mine also in Monongalia county.

It was deemed advisable to designate a committee to visit the Galloway mine and to ascertain the labor required in connection with narrow work. On the committee so appointed were C. J. Ryan, Hepzibah; John W. Bischoff, Elkins, and George S. Brackett, of Elkins, the miners' representatives being J. F. Farnasch, Grafton; Nick Aiello, and W. F. Ray, district-board members of Fairmont.

## German Mine Workers to Open Up Spitzbergen Mines

A CHRISTIANIA firm known as A. S. Isefjord Kulkompani has been recently formed to operate the coal measures bordering on Isefjord, Storfjord, Green Harbor (west side), Advent Bay Point, and Kap Boheman in Spitzbergen. The capital of the company is German, Norwegian and Dutch. If circumstances favor the project, five hundred German mine workers will be sent out, in June next, with the necessary housing material and machinery for an immediate start.

From time to time, beginning in 1885, claims have been staked out by Nilsson and Schroeder, wire fences have been built around them and a watch set over them. They have been registered on the Norwegian Foreign Office Chart as 19 and 49, and were finally sold to the new company. The directors are Herman Jensen, chairman; Baron von Fuchs, and Henry Drysselhuys, Rotterdam, with G. Siewers as managing director.

## Indiana Strikes Against Wage Scale

ELEVEN mines in the Clinton coal field of Indiana have been closed because the shot firers refused to work under the new wage scale fixed by the operators. It provides a maximum remuneration of \$1 per hour, or \$8 per day, for that class of work. At twenty-one mines operations are suspended because the mine workers refuse to work on Saturdays, protesting against the Bituminous Coal Commission's refusal to grant a five-day week.

## Men at Anthracite Colliery Want More Pay

MINERS employed at the Evans colliery at Beaver Meadow, near Hazleton, Pa., went on strike May 17 for a wage advance of \$2.50 per car. The company has offered to grant an increase of \$2.19, but the men reject this offer.

## Three Thousand Alabama Miners Quit

FROM Birmingham, Ala., come reports that on May 19 nearly three thousand men quit work in widely separated sections of the coal mining district of Alabama. A number of mines were compelled to suspend operations because of a shortage of labor.

## Discussion by Readers

James T. Beard

### Interesting Facts Regarding the Working of Coal Under a River or the Sea

THE inquiry of Arthur L. Sheldon, *Coal Age*, Feb. 26, p. 419, interested me, as I have worked seams of coal varying from 2 ft. to 8 ft., in thickness, under conditions similar to those he has described. It may be that my experience will be of some help to our friend, Mr. Sheldon, and I give it for what it is worth.

The three seams overlying each other, in this proposition, can be worked by either a shaft or a slope opening. Judging from the data given, however, a slope driven on an inclination of 1 in 7, or 1 in 8 appeals to me as having an advantage over a shaft opening. By installing a main rope-haulage system in such a slope, it would be possible to handle any desired output at the least possible expense. In slope haulage, a trip of empties can be dropped onto the landing, in any of the three seams, and a corresponding trip of loaded cars hauled to the surface with much less delay than will generally occur in hoisting in a shaft.

My experience in the working of the room-and-pillar and longwall systems of mining coal inclines me to think that the only proper method to adopt in this field is to work No. 1 seam, lying at a depth of 50 ft. below the surface, by the longwall advancing system; and apply the longwall retreating system to the middle or No. 2 seam, lying 50 ft. lower down. Further investigation might suggest the use of the room-and-pillar system, however, in No. 2 seam, and I would use the last named system in working the lowest or No. 3 seam, which lies at a depth of 160 ft. below the surface.

#### ONLY NARROW WORK TO BE DRIVEN UNDER THE RIVER OR AN OVERLYING SEAM

In all three of these seams, only the necessary narrow places should be driven under the river, and I would recommend supporting the roof of these headings securely, with either steel girders or good timber. In addition, I would give the roof and sides of the headings a coat of gunite, to prevent the slacking of the coal on the ribs or the cutting of the roof by the air, either of which will cause much trouble later. There should also be left sufficient pillars, in all three seams, on both sides of the river, to avoid the possibility of any break extending to the river bed, whereby water would flow into the workings.

In working these seams, it is absolutely essential that nothing but narrow work must be driven in an underlying seam, until the same area in the seam above has been worked out and abandoned. This applies to the driving of narrow rooms or stalls, in a lower seam, only when the roof is good and care is taken to see that the designated width is not exceeded by the men. Thus, for any given area, the coal must have been taken out and the roads abandoned in No. 1 seam before extraction is begun in No. 2 seam. Likewise, the extraction must be complete and roads abandoned in

No. 2 seam before the same work is started in No. 3 seam below.

Working the coal in one of the lower seams in advance of the extraction in an upper seam would simply mean the ruination of that field. Judging from a long experience in the mining of coal by both of these methods, I have every confidence in saying that if the work is conducted in the manner I have indicated, the output of coal from these three seams can be maintained at the desired maximum and at a minimum cost of production. The timber supply will be reduced to a minimum and the extraction of coal will reach practically one hundred per cent.

#### DRAW NO PILLARS UNDER THE RIVER

Just a word, in closing, to sound a warning against the proposal made by one of the contributors in this discussion, who stated that it might be possible, with due care to withdraw the pillars in No. 3 seam, under the river, when finishing. Let me say that this would be a great risk and endanger the life of every man underground, from the very first day the work of drawing these pillars was started. With only 160 ft. of cover, there would be the danger of an inrush of water occurring at any moment.

When engaged in a mining operation near the Atlantic Ocean, where the workings extended two-and-one-half miles from the coast line under the sea, at this distance out we had 1,500 ft. of cover separating the seam from the bed of the ocean. In that case, the mining law required that only the necessary haulage road, airway and manway could be driven under the sea, until the thickness of strata above the seam between it and the bed of the ocean exceeded 500 ft. of solid rock strata.

In another instance, I had the experience of being in a locality where the river broke into a mine, drowning out the men. In the same district, about three miles distant, a canal flooded another mine. These experiences lead me to state that under no conditions should the pillars be drawn under the river in these seams.

### Workers Must Use Good Judgment When Asking for a Change of Work

THE incident cited in the inquiry of A. H., *Coal Age*, Feb. 12, p. 327, giving his experience and opinion regarding the treatment he received at the hands of a mine superintendent, was interesting to read. Unfortunately, there are many instances of this or a similar nature happening daily in the industrial world; and yet it is my belief that the world is growing better in respect to the treatment of workers by their employers and *vice versa*.

It may be said with much truth that complaints of the kind here mentioned are less frequently heard than

formerly, and when such a condition does come to our attention we wonder that it is possible in an up-to-date organization, today.

One can recall many instances that occurred in past years, similar to this one. Often, they were loudly exploited but seldom satisfactorily settled. Indeed, such conditions were expected to exist, at that time, between individuals or groups of men. In other words, a spirit of antagonism was natural instead of the get-together spirit of today. Now, however, it is safe to say that a case of this kind, becoming known in an organization, generally reaches the man higher up; and he, recognizing the true worth and value of men, starts a thorough investigation to ascertain the true facts.

#### CHANGE IN DISPOSITION OF WORKERS

Again, it is true that all classes of workers, from officials to common laborers, have changed in their disposition from that which prevailed but a short time ago. Requests such as the one set forth in this inquiry, asking for change in the work or the position of an employee, is handled with consideration. When necessary, diplomacy takes the place of the brusque and profane rejoinder formerly so commonly made to a man asking for a change.

However, there are many phases of this subject that require analysis. In his reply to the inquiry, the editor has truly stated, "It is up to the worker to earn his advancement." Frankly, I believe that a man, studying and striving to improve his condition and having an ambition to advance, should be shown just cause for being kept back when an opportunity is open to him.

In my opinion, a superintendent who could express himself in the manner this man is said to have assumed is not entitled to the position he holds. Today, it is unbelievable that a company would tolerate such treatment of their men. Consideration should be given to a faithful and efficient worker and he should be afforded every opportunity to advance in the line of his own inclination, provided he is capable.

#### ENCOURAGE MEN TO ADVANCE

Let me suggest, here, that all workers should be instructed in regard to the importance of advancing, and the danger of falling into a possible rut. In performing work of his choice, a man will not only be more interested, but he will prove more efficient than when attending to other duties. I am referring now to a worker whose ideals are worth considering and who is trying to follow methods that will accomplish the end he has in view. Such a man needs not to wear a placard announcing his intentions, as they will be quickly detected by any up-to-date official.

I recall an instance where an excellent miner, by hard and constant work, gained the position of mine foreman, after many years of service in the same company. His success brought him an offer, a little later, and he accepted a position in another company, although his better judgment told him he was not, as yet, qualified to fill the place. In a short time, realizing that he was not handling the work with entire satisfaction, he asked for a change and his request was met with a dismissal from the company.

The man, however, I am glad to state, now holds a position with an up-to-date company where he is doing well. The incident shows the need of prudence and the

exercise of good judgment in respect to the work and one's capability and ambition to advance. This man had proved efficient and worthy of the confidence of his employers, in his former position, which he should have retained.

It is my opinion that a company should never make a hard-and-fast rule in respect to the transfer of a worker from one department to another. I recall many instances where men were changed, with the result that more good was accomplished than had even been expected in making the change. Every such request from a worker should be properly considered, and fair and just treatment accorded the man. In this present instance, where it is stated the man had an experience of 12 years, working at various jobs in and around the mine, it is quite probable that he was a good subject for advancement and should have been given every opportunity to develop the best that was in him. BEN.

Thomas, W. Va.

### What the Bodily Health of Workers Means to Our Industries

I HEARTILY support what John Rose has said in his letter *Coal Age*, Feb. 19, p. 364, regarding the importance of good health in obtaining the greatest success in the coal industry. The discussion of this question is vital and if conducted in the proper spirit cannot fail to be profitable to all concerned.

My belief is that all this disjointedness, contention, tumult and misery can be traced directly to a disordered state of health, in the case of a large number of workers. Indeed, the same remark will apply to social as well as industrial affairs. It should be a matter of the deepest concern to us all that so much indifference is manifest in respect to the possession of good health, whatever our position in life.

Industrial prosperity depends to such a degree on health that it is idle to discuss any question of efficiency, without due regard to those conditions that affect the health of all concerned in the undertaking in hand. This truth cannot be too strongly emphasized, since health and disease are physical conditions that affect the mind and the accomplishment of every purpose. A diseased body is very apt to be the counterpart of a diseased mind and thwarts the best intentions and loftiest aims.

#### HEALTH OF WORKERS IMPORTANT

Health is to industry what the sun's heat is to all forms of life, stimulating growth and action. Healthy faculties enable us to overcome the perplexities that are ours at every turn. But in spite of all that has been written in regard to this vital force, we blindly follow our selfish inclinations and stupidly resign ourselves to conditions that encourage a morbid frame of mind, which keeps us in a constant state of uncertainty, fear and dread of the future. The result is a universal disturbance in the minds of men that is manifest in the unrest prevailing throughout the world, today.

In summing up, we are confronted with the fact that the essentials to good health are plain, wholesome food, proper clothing, pure air and comfortable sanitary living conditions. There are numerous agencies that affect the health of the miner, and these must be taken into account in considering the welfare of the coal industry. The temperament of the worker must be

regarded as a strong factor in his ability to produce. In general the miner is of a nervous temperament and readily agitated, which renders his body more susceptible to nervous disorders that seriously impede his activity and comfort.

#### CHANGE OF MIND NEEDED INDUSTRIALLY

My opinion is that a complete change of mind is required in respect to our industrial affairs, and this is a factor that cannot be measured in dollars and cents. It is important for the operator to remember that the mind of the worker must be imbued with sane ideas respecting his position and consequence as a productive unit. Every effort should be made to effect this transition in the worker, instead of permitting his mind to become poisoned and impressed with the false idea that he is only a machine guided and controlled solely by the will of his employer.

Allow me to say, in closing, that I am convinced that a sound and well balanced mind in every worker will make them, as a class, more efficient workers and less open to those influences that impair industrial operations. A sound mind in a sound body is, indeed, a great possession; and men thus endowed seek the best and loftiest aims, instead of striving for gain at another's expense. The latter can only cause a stagnation in the world's industries, for which there is no remedy, until all opinions become reconciled to a common truth, and brotherhood and differences are argued on a basis of reason and common sense.

Ladysmith, B. C., Canada. WILLIAM WESNEDGE.

#### Daily Routine of an Efficient Fireboss

**I**N all my firebossing, it has been my custom to examine the fan and observe the water gage, before going into the mine; then, to place a danger signal at the entrance or lock the gate so as to prevent anyone from entering the mine until the examination is finished and the report made.

It has always been my habit to start the examination at the intake end of the mine or section and follow the air current. The fireboss should enter the first working place with caution, and, lowering his flame, make a careful test for gas. He should wear no headlight, but depend wholly on his safety lamp. He should examine each place for any danger that may exist therein; see that all timbers are properly set and that there is no loose slate or coal that is liable to fall.

In making his rounds, the fireboss should note the condition of all doors, stoppings, overcasts and brattices. In each place examined he must mark the date on the roof, not more than five feet from the face of the coal, so that the workman can see plainly that his place has been inspected that morning. The examination should not be started more than three hours before the time when the men enter the mine for work. A fireboss must give particular attention to all places driven to the rise, to see that they are clear of gas. Such places are generally more difficult to ventilate.

Having completed his examination, the fireboss must make out a report and enter it in a book kept for that purpose, stating whatever dangers he may have found and giving their location. This done, he must remove the danger signal, at the mouth of the mine, in time for the men to enter for work. As a danger signal, I very much prefer the red light.

Every fireboss should run the abandoned workings, in the mine or section of the mine in his charge, at least once a week, or oftener if he thinks there is liable to be danger in such places. When making his second round of the mine, the fireboss must examine all falls and waste places and be particular to note any potholes or kettle-bottoms which are liable to fall without warning. It is also his duty to see that the required volume of air is circulating in the mine and the air current sweeping the face of the coal in every working place.

Where danger is discovered the fireboss must place a danger signal at each entrance to the place, so that no one will enter there without warning. He must see that there are no accumulations of fine dust, particularly where the coal is being mined with machines. A fireboss must know the properties and behavior of all kinds of gases found in the mine. He must be capable of making a careful test for gas and understand the proper use of the safety lamp, so as to be able to give any needed instructions to the men in his charge. He must be conscientious and faithful in the performance of his duty, as on his work depend the lives of all the men in the mine.

FIREBOSS.

Roda, Va.

#### Height of Flame Cap as Index of Percentage of Gas

**I**N the issue of *Coal Age*, Mar. 25, p. 587, James Ashworth, commenting on a recent report of the Minister of Mines for the province of British Columbia, quotes the following statement as taken from that report: "It was taken for granted that a half-inch gas cap was equal to 2½ per cent of gas . . . and, checking with the Burrell gas detector, it has been proved that a quarter-inch cap in the Wolf safety lamp is equivalent to 2½ per cent of gas."

In the same report, according to Mr. Ashworth, the chief inspector of mines recommends the withdrawal of the men from the mine when the lamp shows a quarter-inch cap, indicating the presence of 2½ per cent of gas. Commenting on this statement, Mr. Ashworth says, "It is with some satisfaction that I read this recommendation from the chief inspector, which follows up my own suggestion regarding the need of more exactly defining what is understood in the reports of gas by firebosses."

Now, turning over the pages of a little booklet entitled "Mine Gases and Ventilation," by J. T. Beard. I find a diagram or table (page 90), giving the percentages of gas indicated by different heights of flame caps, in different lamps. The same table is given on page 335, in a book entitled "Mine Gases and Explosions," by the same author. The table gives the height of flame cap corresponding to 2½ per cent of gas, in an unbonneted Davy lamp, as 0.22 in. (¼ in., nearly). The same table gives, for the Wolf lamp, a flame cap of 0.72 in. (¾ in., nearly), as indicating 2½ per cent of gas, while a quarter-inch flame cap would indicate less than one per cent of gas, in the same lamp.

It would appear that there is some divergence of opinion on the question of the height of flame cap indicating the presence of 2½ per cent of gas, which the chief mine inspector recommends as the "withdrawal percentage," in the mines of the province. The Wolf lamp is the only lamp I have yet seen used by firebosses in the Canadian Northwest.

Now, I think it is safe to say that nearly all men get their knowledge of gases and the general theory of mining from textbooks. How then, let me ask, is it possible to expect firebosses to give a report of the percentage of gas found that would be exact and correctly understood. Taking the table to which I have referred as correct, the withdrawal percentage ( $2\frac{1}{2}$  per cent) of gas would be indicated by practically a three-quarter-inch flame cap in the Wolf lamp used by the fireboss, instead of the quarter-inch cap mentioned in the report of the chief inspector.

#### WHAT SHOULD BE STANDARDIZED

Further, referring to the request of the chief inspector of mines that a limit be placed on the percentage of gas allowable in mines where blasting is permitted, as Mr. Ashworth remarks, "Few will agree with the views of the chief inspector on standardization, if it is his meaning that the provisions of Rules 1 and 2, part 11, of the Coal Mines Regulation Act, is not sufficiently explicit." He might have added, also, Rule 12, part 3, which limits the use of explosives except when the men have left the mine, to blasting in rock drifts or to the sinking of shafts where the return air passes directly out of the mine, provided inflammable gas issues so freely that a blue cap is formed in the lamp.

In this province, firebosses and shotfirers are responsible for the firing of shots and are equipped with Wolf safety lamps, a box of caps and a firing battery and cable. To my mind, it would be more to the point to standardize the safety lamp. Suppose, for example, firebosses or shotlighters were to use an unbonneted Davy lamp in one mine, while Wolf lamps were used in another mine for the same purpose.

Then, if the law established a limit to blasting, indicated by a quarter-inch cap, the use of the unbonneted Davy lamp would permit blasting when there was  $2\frac{1}{2}$  per cent of gas in the air, while the Wolf lamp would show the same height of flame cap when there was less than 1 per cent of gas present.

#### TEMPERATURE AND INTENSITY OF THE IGNITING FLAME PROVES A FACTOR IN EXPLOSION

Studying over this matter, I find the following reference to the explosive condition of mine air, in the booklet "Mine Gases and Ventilation," p. 90, "The intensity of the initial impulse or the higher temperature of the igniting flame, will often cause the explosion of a gaseous mixture that would burn quietly if ignited by a less intensive source of heat energy." Attention is drawn to the rapid dissipation of heat in a burning gas greatly affecting its explosion.

Reflecting on this statement, I have wondered if the naphtha flame of the Wolf lamp is a more intense source of energy than the sperm or cottonseed oil flame of the Davy lamp, and if that can be the reason of a lower percentage of gas, indicating an explosive condition in the Wolf lamp, while a like explosive condition would be shown only by a higher percentage of gas, in the use of the Davy lamp.

Most of us working in mines will be interested to know when it is safe and when it is not safe to remain in a working place when a gas cap shows on the safety lamp in use, whether this is a Wolf or a Davy lamp.

Cumberland, B. C., Canada.

COAL DIGGER.

#### Steel vs. Wood for Mine Timbering

THE question of the growing scarcity of mine timber is becoming more acute each day, and, as the supply of timber decreases, the demand increases, which greatly increases the expense of timbering. The mines in this neighborhood require a large amount of timber for the support of the roof and, as a consequence, steel I beams, channel bars and other structural shapes of special design have come into use for supporting the roof, on main entries and other roads that must be maintained for a considerable length of time.

In my opinion, the high first-cost of steel is largely offset by the necessary expense of retimbering roads and air-courses where the roof is supported by wooden timber frames. Moreover, the use of steel for this purpose gives a greater degree of safety, as it does not lose its strength by corroding, as rapidly as wood does through decay. The average life of mine timber is from 5 to 10 years, while steel used for the same purpose will last indefinitely.

Another feature that must be considered in this connection is the fact that much timber is lost when rooms or a section of the mine is abandoned. It is my belief that a gang of three laborers headed by an experienced timberman should be kept busy, in a large mine, recovering timber from places that are abandoned. Such timber should be carefully sorted, as much of it can be used again, while the rest can be sawed into short lengths and split for cap-pieces.

#### IT PAYS TO RECOVER TIMBER IN MINES

Men engaged in recovering old timber, in this way, will easily make their wages by the amount of timber saved. Also, the drawing of posts in abandoned places will have a good effect in caving the roof and thereby relieving the pressure on entry stumps and pillars. The coal mined from these pillars and stumps will be in better condition, and there will be a larger percentage of recovery, which will lower the cost of production. The work of drawing back the pillars will also be rendered less dangerous.

In my practice, I have seen millions of feet of timber practically wasted in maintaining the roof on main haulage roads where, if steel timbers had been used in the first place, this great cost of maintenance would have been eliminated. In mining low coal where headroom on the roads was limited, the use of steel rails in place of crossbars has proved a great advantage. Such timbering has lasted longer and given better support to the roof than would have been possible had wood timber frames been used. The latter would have had to be changed twice over and the roof brushed or the bottom lifted in order to give the necessary headroom. All of this was avoided in the use of the iron rails.

Another instance that came under my notice was in a mine where the wood crossbars would be broken in a few weeks and required constant changing. Later, steel I beams and rails were substituted for the wooden bars and that ended the trouble. In closing, let me say that a good crossbar is made by putting two 6-in. I beams side by side, and riveting, at each end, an angle already drilled to receive a 10-in. I beam having a plate at the top and bottom to furnish the required support.

# Inquiries of General Interest

Answered by  
James T. Beard

## Proper and Efficient Ventilation of a Slope Mine

I am sending to *Coal Age* the plan of a slope mine opened in a seam dipping about three per cent. As shown in the plan, the slope entries are driven, four abreast, on the full dip of the seam. The gangways or levels are driven to the right and left of the slope entries, with rooms turned to the rise only. It is desired to produce 2,000 tons of coal per day of eight hours in this mine; and I want to ask how such a mine should be ventilated, using as few doors as practicable. The seam generates gas in considerable quantities, but the company has the means to supply ample ventilating power.

SUPERINTENDENT.

\_\_\_\_\_, Pa.

In the accompanying figure, we have reproduced the plan submitted by this correspondent, and indicated thereon the desired circulation. As the mine generates

SHOWING THE REQUIRED PLAN OF VENTILATION

much gas it should be ventilated on the exhaust system, making the two center slope headings the intake and the two outer headings the return airways for their respective sides of the mine.

As shown in the figure, one of these two center entries is the main haulway of the mine, while the other serves as a traveling way. Each pair of cross-headings or levels is shown as ventilated by a separate split of air, which is conducted at once into the main return air-course and passes out of the mine. In order to avoid the use of doors, an overcast is built at the mouth of each pair of cross-headings, as indicated in the figure.

A regulator is placed at the mouth of the back entry, on each level except the last pair of headings, which present the greatest resistance. A regulator is also required at the crossover near where the return current enters the ventilating fan. The purpose of this regulator is to proportion the amount of air required on each side of the mine. Also, as indicated in the figure, a canvas is hung at the mouth of each room, except

the first room, on each level, and on the gangway just inby of the mouth of that room. By this means, the air is made to circulate through the rooms and keep the working places clear of gas.

The two sides of the mine being unequally developed, doors or canvas will be required on each crossover connecting the opposite side of the mine with the main haulage road. Double doors will also be required at the mouth of the air-course on the opposite side of the mine from the fan.

Inasmuch as the mine generates much gas, it would insure greater safety to provide another fan at the mouth of the air-course, at the point marked "B," in the figure. In that case, the two fans could be operated in parallel, by the proper regulating and balancing of the air, or they could be operated alternately, one fan being always held in reserve against accident to the other. If the mine is very gaseous and much dust is present, it may be advisable to operate the two sides of the mine separately, by providing two haulage roads instead of one and building substantial stoppings in the crossovers between them.

## Drift Half-Filled With Water

If a drift, in a mine, measures 6 ft. wide at the roof, 9 ft. wide at the floor and has a vertical height of 6 ft., at what depth will the water stand when the drift is half-full? In other words, how far up the timber will the water reach when the wetted area is one-half of the sectional area of the drift?

W. E. WOOD.

Alverda, Pa.

In this case, the width of the entry decreases,  $9 - 6 = 3$  ft., in a height of 6 ft.; or at the rate of one-half foot for each foot of height. Then, calling the depth of the water when the entry is half-full  $x$ , the width at the surface of the water will be less than the width at the floor and will be equal to  $9 - x/2$ . The area of the wetted section, or the cross-section of the water, being a trapezoid, is

$$\frac{1}{2}(9 + 9 - x/2)x = 9x - \frac{x^2}{4}$$

But, the form of the drift being also a trapezoid its sectional area is  $\frac{1}{2}(9 + 6)6 = 45$  sq.ft. One-half of this or the wetted area, is, therefore,  $22\frac{1}{2}$  sq.ft. Then, to find the value of  $x$ , which is the depth of the water when the entry is half-full, we write,

$$9x - \frac{x^2}{4} = 22\frac{1}{2}; \quad \text{or } x^2 - 36x = -90$$

$$x^2 - 36x + 18^2 = 18^2 - 90 = 234$$

$$x - 18 = \pm\sqrt{234} = \pm 15.3$$

$$x = 18 - 15.3 = 2.7 \text{ ft.}$$

Therefore, the depth of the water when the entry is half-full of water is 2.7 ft.

# Examination Questions

Answered by  
James T. Beard

## Bituminous (17th Dist., Pa.) Mine Foremen's Examination. April 6, 1920

(Second Grade, Selected Questions)

*Ques.*—As a mine foreman, how would you provide for the health and safety of persons employed in and about the bituminous coal mines of this state and for the protection of the property connected therewith?

*Ans.*—The first duty of the mine foreman is to see that the mine in his charge is operated in accordance with the requirements of the Bituminous Mine Law, giving particular attention to the quantity of air in circulation and its distribution in the mine; the frequent and thorough examination of the mine and inspection of each working place while the men are at work; the supply of timber of the required size and type; the prompt and proper timbering of each working place and of all roads, airways and travelingways; the safe use of explosives and the drilling, charging and firing of all shots; and, lastly, the maintenance of strict discipline in the mine and compliance with all mine regulations for health and safety.

*Ques.*—Give your reasons why mechanical ventilation is superior to furnace ventilation.

*Ans.*—Furnace ventilation cannot be employed with safety where a mine is generating gas. Moreover, mechanical ventilation, by means of an approved type of ventilating fan, is under better control at all times. Particularly is this true where there is no nightshift employed in the mines and the furnace cannot, therefore, receive the same attention after the daymen have left the mine, or during periods of idleness when the mine is not running. In case of an explosion or other accident occurring in a mine ventilated by a furnace, the only means of ventilation may be entirely shut off and rendered useless for the time. On the other hand, a good fan located on the surface is always available and under control.

*Ques.*—What dangers may arise from coal dust, in a dry and dusty mine, and what precautions would you take to guard against them?

*Ans.*—In a dry and dusty mine, the fine dust is thrown into the air by the daily operations performed in the mine, and accumulates, not only on the roads and in the passageways where it lodges on the timbers, roof, floor and sides of the entry, but also in considerable quantities at the working faces, especially if machines are used for cutting the coal. The presence of the dust in the mine air increases the explosive condition of the air, and is particularly dangerous where a small percentage of gas is present.

To guard against these dangers it may be necessary to install an efficient spraying or sprinkling system on the roads and travelingways. Strict regulations should be made and enforced in regard to blasting; and it is advisable that all shotholes should be inspected, charged,

tamped and the shots fired by competent shotfirers, after the men have left the mine. Every precaution should be taken to avoid undue accumulations of dust at the working faces and on all roads, airways and passageways in the mine. Particular attention must be given to reduce the danger of dust in pillar workings.

*Ques.*—What precautions would you take to guard against danger from the following causes: (a) Falls of roof, slate, coal and sides; (b) cars, motors and machinery; (c) use of dynamite and fuse in blasting?

*Ans.*—(a) All roads, airways and travelingways in the mine should be well timbered by competent men. A systematic method of timbering should be adopted in the working places, which should be inspected, at regular short intervals, by the mine foreman or his assistants, while the men are at work. Where the coal is undercut by hand or by machine, the mining should be carefully spragged. All miners should be instructed to reset any timbers that may have been discharged by a shot, before proceeding to do other work in the place.

(b) All rolling stock and haulage equipment of every kind should be carefully inspected, at frequent intervals, and any needed repairs promptly made. The same is true of all machines and appliances of any kind employed in and about the mine. All roads, tracking and switches should be kept in good repair. The track should be well ballasted; competent motormen should be employed; and strict regulations should be enforced to prevent men from riding on loaded cars or trips when going to and from their work.

Separate travelingways must be provided so that men will not be obliged to travel the haulage road, on their way in and out of the mine. Where this is impracticable, a good clearance space should be provided on one side of the road to allow men and animals to pass the cars without danger. Also, refuge holes must be provided at frequent short intervals, except where rooms are turned off the entry, which would serve the same purpose. All refuge holes must be whitewashed and kept free from obstructions of every kind. Finally, suitable regulations should be made in regard to the movement of all cars and trips. No cars must be left standing in the mouths of rooms, or on sidetracks, without being carefully blocked to prevent their running out onto the main track.

(c) The grade of dynamite in use in a mine should be adapted to the work in hand, and the charging, tamping and firing of the holes should be performed by competent men. No one should be permitted to use a short fuse or to crimp the cap on the end of the fuse with his teeth. No dynamite should be used in the same hole with black powder. A safe method of transporting the dynamite in the mine and distributing it to the workmen should be adopted. Care should be taken that the explosive is not frozen before being fired. If frozen, it must be thawed in a proper manner on the surface, before being carried into the mine.

# NEWS FROM

# THE CAPITOL

BY PAUL

WOOTON

## Ask Commerce Commission to Forbid Preference in Car Supply

ACCORDING to a statement signed by nearly one hundred members of the House of Representatives railroads operating in the coal-producing districts of the Middle West are interpreting recent emergency orders of the Interstate Commerce Commission in a manner which leads to serious discrimination against coal supply to the public.

A committee including Representative Israel M. Foster, Republican, of Ohio; William Green, secretary of the United Mine Workers of America, and John Moore, president of the Ohio district of the same organization, arranged to present the statement before the Interstate Commerce Commission.

The commission is requested in the statement to put in force sections of the Transportation Act which particularly forbid any preference in the supply of coal cars.

"Unless the practices are stopped and something is done to remedy the situation we will have next winter a coal shortage as bad as that of 1917," Representative Foster asserted. "The railroads, which consume about 30 per cent of all the coal mined, are moving cars in a fashion which gets only that 30 per cent mined."

Miners are joining in the plea, according to the statement of their representatives, because the failure to furnish cars has closed down many mines and left them out of employment.

## Michigan Petition for Priority on Coal Not Likely To Be Heeded

THE Michigan public utilities have petitioned the Interstate Commerce Commission for a priority on coal from mines on the Chesapeake & Ohio, Baltimore & Ohio, Louisville & Nashville, Norfolk & Western, Hocking Valley, Pittsburgh & Lake Erie, Kanawha & Michigan and Pennsylvania railroads, and state in their petition, "That if in the judgment of the Interstate Commerce Commission the coal mine operators of the country are in any degree to blame for the present shortage of coal and if in the opinion of said commission the coal mine operators and owners are profiteering to the injury of the public, then and in such case said Interstate Commerce Commission recommend to the Congress of this United States the enactment of such legislation as may be necessary in order that the coal consuming public of Michigan and every other state may purchase the coal it absolutely needs at reasonable prices."

It is pointed out that this is exactly what the Fuel Administration did early in its existence and that it resulted in a very serious situation which required

months to undo. In view of that recent lesson it is not believed that the Interstate Commerce Commission will start assigning cars to any particular consumers.

## Bituminous Commission and Industrial Cabinet Favor Zoning System

PRESIDENT Wilson's Bituminous Coal Commission apparently did not conclude its activities with the submission of its recent award. It is understood that the commission continues to advise what is known as the "industrial cabinet," which consists of the six secretaries who form the United States Council of National Defense. These are the Secretaries of War, Navy, Interior, Agriculture, Commerce and Labor. Just at this time these secretaries are taking a very active interest in the coal situation.

It is known that pressure is being brought to bear for a return to the zoning system for coal transportation. Some are of the opinion that a considerable saving of open-top equipment can be effected by this plan. There is little reason to believe, however, that any effort will be made to restore the zones, because it is believed that an injunction could be obtained almost immediately to prevent such an order going into effect.

## Uncertainty Felt Regarding Committee Action on Frelinghuysen Bill

MUCH indefiniteness surrounds the probable action of the Committee on Interstate Commerce of the Senate on the Frelinghuysen bill. Senator Townsend of Michigan is the temporary chairman of the committee. It is understood that he has been appealed to by certain members of the committee to defer action on the bill until after the convention recess. On the other hand he is being urged by Senator Frelinghuysen to consider the bill and call for a vote at the earliest possible moment. It is practically certain that a majority of the committee will vote for the bill, but it is not improbable that Northwestern Senators will insist upon certain changes in the bill, which may be agreed to.

## Dr. Cottrell Will Address American Iron and Steel Institute

DR. F. G. COTTRELL, who will become director of the Bureau of Mines June 1, has just completed an inspection visit to the helium laboratory at Petrolia, Texas. He addressed the Chicago chapter of the American Chemical Society on "International Scientific Relations" on May 21. He will address the American Iron and Steel Institute at its New York meeting May 28.

## Evictions in Williamson-Thacker Field End in Eleven Killed

Attempts to Extend Union Into Mingo County Result  
in Shooting Affray—Stories Conflict—Union Claims  
That It Has 3,000 Members in Thirteen Locals

**A**LLEGED attempts to check the progress of the union in Mingo County, West Virginia, by evicting the leaders of the newly-formed organization are said to have been the cause of a pitched battle on May 19 which resulted in the death of eleven men—seven detectives, the mayor of the village of Matewan, a union organizer, a miner and a boy. The detectives were driven off, some taking to the Tug River, which flows past the village, and some hiding in the country nearby.

Many are the stories told and only an investigation will reveal the true facts, if indeed the truth is ever known. Lynn, where the shooting fray occurred, lies three miles from Matewan, twelve miles southeast of Williamson, along the line of the Norfolk & Western R.R. and the Tug fork of the Big Sandy, or Tug River, the railroad crossing the river into Kentucky for a short distance at Matewan.

The union has been trying to get a foothold in Mingo County and it had secured at least a toehold at the mine of the Stone Mountain Coal Co. Apparently that corporation determined to prevent further unionization of its mine by the eviction of the union men and Baldwin-Felts detectives were introduced. According to reports, eight families were evicted.

### AT LEAST TWO STORIES OF SHOOTING ARE TOLD

The detectives, having completed their work, are said to have been waiting for the train when the mayor, Cabell Testerman, approached Albert Felts, the leader of the detectives, and demanded to know by what authority the detectives had acted and who empowered them to take one of the mine workers prisoner. This report declares that Felts shot the mayor from his coat pocket and that Felts in his turn was killed by "Sid" Hadfield, the chief of police of Matewan, and that then the shooting became general.

Another story is to the effect that Robert Mullens demanded of Albert Felts whether he had a warrant for his (Mullens') arrest. When Felts declared that he had and started to read the warrant he was cut short by a shot fired by Mullens. Mullens, in his turn, it is said, was killed by J. M. Ferguson, a detective, who was himself shot by an unidentified mine worker.

Whatever the originating cause, a fight to the death followed, the upshot of the shooting, first and last, being the deaths of Cabell Testerman, the mayor; Albert Felts, L. C. Felts, E. O. Powell, A. J. Booker, J. M. Ferguson, L. N. Brown and C. B. Cunningham, detectives; Robert Mullens, a union organizer; William Rohrer, a miner, and Patrick Kinsley, a boy of 17 years of age.

From other sources the statement comes that Robert Mullens was a local preacher, serving the spiritual needs of the mountaineers and miners, and that so far from being a labor organizer and the man who fired the first shot he was an innocent bystander. His office of local preacher, however, would not make it impossible for him to be a moving spirit in the union, as

earlier reports state, but rather furnish him with an opportunity to carry on his labors without interruption.

The Baldwin-Felts organization is a well known detective agency which has been active in many such labor troubles, especially in West Virginia. At the congressional investigation in 1914 Felts testified that he had been employed by coal operators for four years and had brought a machine gun from West Virginia to be used for the defense of those miners in the southern Colorado mines who desired to continue at work through the long strike.

After the affray Sheriff Blankenship commissioned 100 deputy sheriffs to guard the streets and sent word to Charleston that the state constabulary was needed to maintain order, and Col. Jackson Arnold, superintendent of the Department of Public Safety of West Virginia, assembled his entire force, which was scattered all over the state. All the men will be used to keep order in Mingo County if conditions indicate that the full force is needed. Company B left Nitro for Matewan under command of Sergeant Harvey N. Rexroad, formerly an army captain.

Secretary-Treasurer Fred S. Mooney of the United Mine Workers of America, District 17, declares that the union has thirteen or fourteen locals in Mingo County and a membership of 3,000.

"This terrible affair may prove a blessing in disguise," commented Mr. Mooney. "I firmly believe that it will mark the beginning of the end of thug rule in some of the mining counties.

"When coal companies were serving their notices, Sheriff Blankenship called together the miners who had been organized and inquired whom they preferred as the instruments of their eviction—the sheriff's office or the detectives. The workers assured the sheriff that they would interpose no obstacle to the execution of the law by Sheriff Blankenship.

"The sheriff then told the miners that he would protect them from unlawful acts of the detective agency. In making his word good, he ordered the arrest, on due complaint, I believe, of twenty-seven of the detectives for arbitrarily evicting workers in advance of the trial of their cases in court."

## Bids for Supply of Navy Coal Are Still Inadequate

**A**CTING Secretary of the Navy Roosevelt announces that on May 18 at the opening of bids for coal under schedules Nos. 5459, 5460 and 5461 seven proposals were received, aggregating a total of 319,000 tons of bituminous coal and 3,700 tons of anthracite coal. The annual requirements, as stated in the proposals, are 2,174,800 tons of bituminous coal and 38,215 tons of anthracite coal.

At the principal point of delivery—Hampton Roads, Va.—there was offered 185,000 tons of the 1,200,000 tons called for. The prices in the bids submitted range from \$4.20 to \$4.816 per gross ton f.o.b. mines. The lowest price quoted, which is on 40,000 tons, is \$0.168 per ton less than the lowest price received for the same form of delivery under an opening of bids held April 6, 1920.

The base price at present being paid by the Navy under commandeering orders for coal taken at Hampton Roads is, including allowance for the advance in wages of April 1, about \$3.70 per gross ton.

# Trade Commission Publishes Bituminous Coal Production Costs for February

Increase of Ten Cents Per Ton in Mine Cost Caused a Decrease of Operators' Margin -- Commission States That Decision in the Maynard Case Has Had Little Effect on the Number of Operators Submitting Reports

**D**ESPITE the victory of the National Coal Association in the Maynard case and its advice to members that they need not file reports, the Federal Trade Commission advises that no important percentage of operators have discontinued sending in the reports. It is also stated at the commission that the number of companies declining to send reports is decreasing.

The commission on May 24 issued the second of its bituminous coal bulletins, furnishing current information on the cost of production. In connection with its second bulletin the commission, among other things, states:

"The commission has collected considerable information on the investment necessary for operation in the various districts, in part derived from balance sheets required from operators and in part from information previously reported by them or obtained direct from their books. When such investment figures are available it then will be possible, after deduction of any sales expense and income and excess profits taxes paid, to show the relation which the remainder of the margin bears to the investment."

In the following tables are shown for the principal regions the claimed costs, sales realizations and margins of the 1,431 operators from whom complete reports for

February, 1920, have thus far been received. With these costs are also shown the costs (revised by the commission), sales realizations and margins of the 2,482 operators from whom reports were received for the entire twelve months of 1918. The 1,431 operators had a production of 18,133,477 tons of commercial coal during February, 1920, and the 2,482 operators mined 497,416,437 tons of commercial coal during 1918 (an average of 41,451,370 tons monthly). Detailed figures for each of the 74 districts and 24 States will be found in Table 5 at the end of this bulletin.

The relative change in the situation between January and February, 1920, is shown in Table II herewith, where figures for 1,372 operators are given. The increase of 10 cents per ton in the average claimed f. o. b. mine cost is primarily attributed to the decrease in output, since there was no general increase in the rate of wages paid in February over that paid in January. The table also shows the percentage which the time actually worked formed of the possible full working time each month, which in the case of January was taken as 26 days and in the case of February, 23 days. The average production per day of possible full working time for the 1,372 operators was 801,846 tons in January and 766,354 tons in February, a decrease for February of 4 per cent.

TABLE I. FEBRUARY, 1920, SALES REALIZATIONS AND CLAIMED COSTS OF 1,431 OPERATORS AND SALES REALIZATIONS AND REVISED COSTS OF 2,482 OPERATORS FOR THE YEAR 1918, BY GENERAL COMPETITIVE REGIONS

<sup>6</sup> Includes all of Colorado, New Mexico, North Dakota, Montana, Wyoming, Utah and Washington.

TABLE II. JANUARY AND FEBRUARY, 1920, SALES REALIZATIONS AND CLAIMED F.O.B. MINE COSTS PER TON OF 1,372 IDENTICAL OPERATORS, BY GENERAL COMPETITIVE REGIONS.

General Competitive Regions	January, 1920						February, 1920							
	No. of operators	Production, Tons	Per Cent of Time Worked	Sales Realization	Claimed f.o.b. Mine Cost	Margin	Production, Tons	Per Cent of Time Worked	Sales Realization	Claimed f.o.b. Mine Cost	Margin	Increase of claimed cost, Feb. over Jan.	Decrease in output per day in Feb. from Jan.	
Central competitive "Interstate"	405	9,150,136	73	\$2 43	\$2 11	\$0 32	7,945,061	70	\$2 46	\$2 18	\$0 28	\$0 07	3%	2%
Eastern adjacent	445	4,449,221	69	2 80	2 34	0 46	3,637,596	65	2 81	2 46	0 35	0 12	5%	8%
Western adjacent	79	1,170,787	79	2 82	2 33	0 49	930,709	78	2 83	2 50	0 33	0 17	7	10
Southern Appalachian	203	2,408,501	73	2 03	2 69	0 34	2,031,386	72	3 02	2 81	0 21	0 12	4	5
Southwestern "Interstate"	140	1,161,002	81	3 49	3 05	0 44	937,552	74	3 41	3 21	0 20	0 16	5	9
Rocky Mountain	95	2,508,352	92	3 07	2 48	0 59	2,134,829	91	2 98	2 56	0 42	0 08	3	4
United States	1,372	20,847,999	73	2 75	2 33	0 42	17,626,133	69	2 74	2 43	0 31	0 10	4	4

The increase of 10c. per ton in the average claimed f. o. b. mine cost of the 1,372 operators together with the decrease of 1c. per ton in their average sales realization resulted in an 11c. decrease in their margin for February as compared with January.

There is a general correspondence between the decrease in percentage of time worked and the decrease in output per working day. The closeness of this correspondence, however, is modified by changes in the number of men actually at work from day to day.

Continuing, the report says that, as compared with the year 1913, the average sales realization of the 1,090 identical operators in another table was 13c. higher in January, 1920, and 12c. higher in February.

Their average claimed cost, however, was 23c. higher in January and 33c. higher in February. As a result their average margin, which was 61c. per ton in 1918, fell to 43c. in January and to 32c. in February. The average increase of claimed f. o. b. mine cost for January, 1920, was 11 per cent over that for the year 1918, and for February was 16 per cent. This increase is attributable to two chief causes: (1) the higher wage scale put into effect in November, 1919, as a result of the Food Administrator's recommendation of 14 per cent increase in the wages of mining labor, and (2) the decrease in the monthly production for February, 1920, from the average monthly production of 1918.

## Morrow Refutes Profiteering Charges Made by Lauck and Senator Walsh

Vice President of National Coal Association Shows Unfairness of Selecting a Few Fortunate Operators as Typical Critics in Citing Prices, He States, Ignore Operating Expenses, Fixed Charges and Taxes

**P**ROFITS of coal operators again was the subject of discussion in Washington last week. In addition to the allegations made by W. Jett Lauck before the Railroad Labor Board, Senator Walsh of Massachusetts charged, on the floor of the Senate, that huge profits had been made by coal operators. This led J. D. A. Morrow, vice-president of the National Coal Association, to issue an open letter to the Massachusetts Senator, in which he attempts to refute the charges made.

Senator Walsh's remarks as to coal profiteering were as follows:

"The income-tax data compiled for the Senate by the Treasury Department showed profits for the bituminous mine operators out of all proportion to the increased wages of miners. Of the 392 bituminous coal companies cited, 334 showed net profits, after every possible deduction, of over 25 per cent. More than half the companies—218 to be exact—showed earnings of over 50 per cent on capital stock. And 118, or nearly one-third of all, showed net profits of over 100 per cent.

"The financial manuals show that the net incomes of seventeen of these companies increased from \$13,000,000 in 1914 to \$48,000,000 in 1917, and their average net profit per ton from 20 to 60c. If the average profit per ton of these companies was representative of the whole industry, then the bituminous mine operators of the United States during the four years 1916, 1917, 1918, and 1919 gathered a total profit of more than \$1,000,000,000, of which more than two-thirds was excess.

"The anthracite coal operators show still larger percentages of net profits. The average prewar incomes of four of the larger companies were \$7,000,000, which was 15 per cent on the capital stock. In 1917 this average had risen to \$16,000,000, or over 34 per cent on the capital stock. The income-tax returns show that the net income of six smaller companies, which was already 57 per cent in 1916, increased to 94½ per cent in 1917.

"The statistics presented to the Railroad Labor Board by the railroad brotherhoods tend to show how these huge profits were obtained.

"In 1914 the average cost of anthracite coal at the

mine was \$2.28 per ton, of which \$1.59 was paid for labor. Transportation to New York cost \$1.80 per ton, and the retail price was \$7.54, leaving margins totaling \$3.46 for the operator, the sales corporation and the retail dealer. In December, 1918, the cost at the mine was \$4.22, for which \$2.97 went to labor. Transportation had risen to \$2.30, and the retail price to \$11.82, leaving \$4.80 for the distributor's margin. Thus the retail price increased three times as much as the increase in miners' wages."

In his open letter to Senator Walsh, Mr. Morrow says:

"I have read your speech on profiteering with much interest, but I am constrained to deny your statements concerning the profits of the bituminous coal industry. To my mind it is necessary to refute the indiscriminate charge that the bituminous coal industry made preposterous profits during the war. Let me, therefore, direct your attention to official figures on this subject which you have either overlooked or disregarded.

"You cite Mr. McAdoo's report on corporate earnings printed as Senate document No. 259 as your chief authority. The unfairness of that report is notorious. Mr. McAdoo's letter of transmittal itself states that he selected only companies which in 1917 earned 15 per cent or more on their capital stock. In 1917 there were about seven thousand separate coal producers. His report, therefore, covers only about 6 per cent of the total number. It includes only the fortunate 392 who, because of specially favorable mining conditions, with low production costs compared with selling prices, or on account of merely nominal capitalization, made 15 per cent or more on their capital stock. It says nothing of the other 94 per cent, some 6,600 operators, who admittedly made less than 15 per cent. Even the percentages quoted for the 392 concerns are no true measure of profits, because they are based on capital stock, when the report itself shows that many of these companies had invested far more than their capitalization. Consequently, any such conclusions as yours, based on that report, are manifestly unfair and misleading.

"Further, with regard to alleged huge profits in 1917, the United States Geological Survey report on coal pro-

duction for 1917, page 958, shows that the total output of bituminous coal in 1917 was sold by the operators at an average price of only \$2.26 per ton at the mines, out of which all operating expenses, fixed charges and taxes had to be paid before any profit remained.

"Throughout 1918 prices were under control of the Government. On Nov. 19, 1919, Dr. Garfield, United States Fuel Administrator, stated publicly that the average price allowed the bituminous operators for 1918 was only \$2.61 per ton. He stated further that this permitted them an average margin of 46c per ton. Dr. Garfield was careful to explain that out of this margin Federal taxes of 30c per ton and some other deductions had to be made before the operators had any profits. Let me refer you also to the report of the United States Bituminous Coal Commission, page 41, where the tax returns to the Treasury of some 1,551 bituminous coal mining concerns are tabulated for 1918.

"These companies produce about one-third of the total output of bituminous coal, and after examination of the companies included, the United States Geological Survey advised the commission that these companies represented fairly the conditions throughout the industry. Please observe that 337 of the 1,551 operators reported losses and that after deducting taxes the average per cent of net income to invested capital for the 1,214 companies reporting profits was less than 11 per cent, and for the entire number of 1,551 companies, was only 9.72 per cent.

"In this connection I trust you will remember that coal mining is a hazardous business and cannot be judged by the standards of return which are properly applicable to safer enterprises. At the outset the operator must invest in hundreds of acres of coal land, parts of which may afterward turn out to be unworkable. He must sink his money in miles of underground tunnels and install expensive machinery far below the surface, all of which investment is subject to rapid destruction or total loss by explosions, fires, falls of slate, sulphurous mine water and other physical conditions. At any time he may encounter irregularities in the coal deposits which will run his mining costs up to prohibitive figures. No 6 per cent or 8 per cent return is adequate for capital which must encounter such risks.

"As for 1919, the evidence obtained by Senator Frelinghuysen's sub-committee of the Senate which has been inquiring into coal conditions since last August shows that, following the lifting of Fuel Administration control, prices under competition in the open market sank to less than the Fuel Administration maximum limits. The only exceptions to this general downward price movement were certain high grade coals of special value which have always commanded a premium in the open market. At the same time, on account of the additional increase in the cost of material and on account of greater lost time, mining costs advanced. It is common knowledge that in 1919 profits were less than in 1918.

"The Federal Trade Commission has recently issued two reports on costs and selling prices of bituminous coal, showing that the operators' margins in January and February, 1920, were only about half the 'margins' of 1918. The reports state that the 'margins' shown are not profit, because selling expenses, interest on investment and Federal taxes still remain to be deducted.

"The sale of a few cars of coal at high prices may be heralded broadcast as evidencing the general level of bituminous-coal prices. Nothing is ever said of the millions of tons moving currently at low prices. Some bituminous coal is doubtless being sold today at relatively high prices, but under present operating conditions high prices are inevitable.

"An acute transportation shortage, rendering mine operation very irregular and costly, has been accentuated by unfair discrimination in the distribution of empty coal cars to the mines. Under special authorization from the Interstate Commerce Commission and in the face of the most vigorous protests from the bituminous coal operators, the railroads are giving a full supply of cars to those mines supplying their locomotives with coal and are running these mines six days per week. They are scattering the remaining handful of cars among the other mines which supply the public utilities, the industrial plants and the domestic consumers of the country.

"Hundreds of mines thus discriminated against are prevented from shipping coal on more than four or five days per month, but all the expense of maintaining these mines goes on just the same. Some of them normally hoist ten, fifteen and twenty tons of water daily for every ton of coal produced. This water must be pumped regardless of whether coal is being shipped or not. The workings must be kept ventilated, tracks cleaned of falls of slate and rock and the property maintained. Such irregular operating conditions in the last few weeks have increased production costs at hundreds of mines from \$1 to \$3 per ton. Thus, at the same time that this system of discriminatory car distribution is depriving the industrial consumer and ordinary household of his coal it is doubling the cost of producing the little tonnage which is available for him.

"There can be no permanent improvement of social conditions in America proceeding from misinformation and misunderstanding of the elemental facts. I am satisfied that you are sincere in your desire for constructive betterment and therefore I am taking the time to bring this information to your attention. We shall be glad at any time to give you or any other public official the facts on conditions in this industry.

"Since your speech has been so widely quoted, I deem it only fair to make this letter public."

### Pittsburgh Wage Contract Signed at Last

**A**FTER a delay of weeks the Pittsburgh wage contract is signed, the difficulty regarding house rents being settled to the satisfaction of the mine workers. The rent clause reads:

"It is agreed that house rents shall remain as they are during the life of this agreement, except as to houses completed after April 1, 1920, it being distinctly understood that operators will be privileged to charge a reasonable rent for the same."

It will be observed that the clause sets forth very clearly what is indeed a fact, that the rent on houses completed before April 1, 1920, is less than what is reasonable. In fact mine houses are no longer a source of profit but of loss to their owner. They are built merely because without them men cannot be obtained, and with no men it is impossible to mine coal. The date of the signature of the contract is May 18, but it is operative as from April 1.

## President Wilson Forbids Strike of Men in Anthracite Mines

Will Appoint Commission to Consider Wage Increase—  
Urges the Ill Effects to National Prosperity  
of a Strike at This Time

ON May 22 President Wilson issued an ultimatum to the anthracite miners and operators through Mr. Gorman, the secretary of the Joint Scale Commission, advising both sides that, if it appears necessary, he will appoint a body similar to the Bituminous Coal Commission to take up the whole subject and demanding that the miners await its decision before going on strike. The President's letter ran as follows:

"I have watched with more than passing interest your efforts to negotiate a new wage scale for the anthracite coal fields. The arrangement to continue work at the mines after April 1, pending the adoption of a new agreement which you entered into when the previous wage scale was about to expire, was highly commendable and filled us all with hope that a new contract would be mutually worked out and the supply of anthracite coal continued without interruption.

"I have, however, been advised that there is a possibility you may not come to an agreement. I am sure I need not remind you that we have not yet recovered from the economic losses incident to the war. We need the fullest productivity to our people to restore and maintain their own economic standards and to assist in the rehabilitation of Europe.

"A strike at any time in a great basic industry like anthracite coal mining would be a very disturbing factor in our lives and industries. To have one take place now, while we are actively engaged in the problems of reconstruction, would be a serious disaster.

"I am not familiar with the technical problems affecting the making of your wage scale. You are. You should therefore be able to effect an agreement. If for any reason you are unable to do so, I shall insist that the matters in dispute be submitted to the determination of a commission to be appointed by me, the award of the commission to be retroactive to April 1, in accordance with the arrangement you have already entered into, and that work be continued at the mines pending the decision of the commission. I shall hold myself in readiness to appoint a commission similarly constituted to the one which I recently appointed in connection with the bituminous coal mining industry as soon as I learn that both sides have signified their willingness to continue at work and abide by its decision."

### Interstate Commerce Commission Acts To End Freight Tie-up

IN an effort to relieve the nationwide freight congestion and car shortage, the Interstate Commerce Commission on May 20 issued to the railroads of the country three orders relating to the hauling of freight.

Service order No. 1 suspends all rules and regulations as to car service and directs the carriers to forward traffic by the most available routes without regard to the routing thereof made by shippers or by carriers or to the ownership of cars.

Service order No. 2 suspends all car service rules and orders the relocation of open-top cars from Western territory to Eastern territory, naming the number of

cars which each carrier must send east each day. This order relates to the roads operating west of Chicago.

Service order No. 3 is similar to order No. 2, except that it applies to Eastern roads and orders the relocation of box cars from Eastern and Southeastern territory to Western territory. The order stipulates the number of cars daily that must be moved.

The second order is of most interest to the coal trade, inasmuch as it orders a number of important carriers, located principally west of the Mississippi River, to turn over a specified number of open-top cars daily to their Eastern connections. This should have the effect of increasing the coal-car supply. The reciprocal part of this arrangement is service order No. 3, which requires Eastern and Southeastern carriers to turn over to the Western lines daily a specified number of box cars.

Order No. 1 also provides for the charging of the rate of freight applicable over the route indicated in the bill of lading or shipping instructions, regardless of the fact that a higher or lower rate may be applicable via the route over which the shipment actually moves.

Service order No. 1 in full is as follows:

The subject of route of freight traffic being under consideration, and it appearing, in the opinion of the commission, that, because of shortage of equipment and congestion of traffic, an emergency exists on the lines of all carriers by railroad in the United States subject to the Interstate Commerce Act, which requires immediate action,

It is ordered that until the further order or direction of this commission all said common carriers by railroad are hereby directed to forward traffic to destination by the routes most available to expedite its movement and relieve said congestion, without regard to the routing thereof made by shippers or by carriers from which the traffic is received, or to the ownership of the cars, and that all rules, regulations and practices of said carriers with respect to car service are hereby suspended and superseded in so far only as conflicting with the directions hereby made.

It is further ordered and directed that inasmuch as such disregard of routing is deemed to be due to carriers' disability, the rates applicable to traffic so forwarded by routes other than those designated by shippers, or by carriers from which the traffic is received, shall be the rates which were applicable at date of shipment over the routes so designated.

It is further ordered and directed that in each instance where the traffic is routed or rerouted by carriers by railroad under the authority of this order the carrier responsible for such routing or rerouting shall within twenty-four hours thereafter deposit in the United States mail a notice addressed to the consignee of the traffic stating the car numbers and initials, places and dates of shipment, the routing and respective routes over which the traffic is moving, and that charges for the transportation of the traffic, including transportation, and schedules of rates, fares and charges, as those terms are defined in said act, will be the same as they would have been if such routing or rerouting had not taken place.

It is further ordered and directed that in executing the directions of the commission contained in this order the common carriers involved shall proceed without reference to contracts, agreements or arrangements now existing between them with reference to the divisions of the rate of transportation applicable to said traffic; that such divisions shall be, during the time this order remains in force, voluntarily agreed upon by and between said carriers, and that upon failure of the carriers to so agree, said divisions shall be hereafter fixed by the commission in accordance with pertinent authority conferred upon it by said act.

And it is further ordered that copies of this order and direction be served upon all carriers by railroad in the United States subject to the Interstate Commerce Act, and that notice of this order be given to the general public by depositing a copy of the order in the office of the secretary of the commission, at Washington, D. C.

# Foreign Markets and Export News

## Increase Ruhr Miners' Wages

In the Ruhr coal fields, according to *The Colliery Guardian*, an arrangement has been concluded under which, with the presumption that the price of coal will be raised to correspond, all underground workers above twenty years of age are to receive an increase of 5.50 mk. per shift from April 1, the basis price for contract workers also being advanced by 5.50 mk. Surface workers are to be paid another 90 pf. per hour. All under twenty will receive increases in proportion to their age, on the same basis of calculation.

## Alabama Coal Goes to France and Italy

Seven thousand tons of high-grade Cahaba vein coal, the *Age-Herald* (Birmingham, Ala.) states, left the port of Pensacola recently for Italy, and similar movements are to take place through that port about twice a month. Much more would move at this time but for the car shortage. France is also a taker of Alabama coal in quantities that are limited principally by car shortage.

The rate to Pensacola is \$1.60 per ton, while the ocean rate to Europe is from \$16 to \$20 per ton. Even at this high cost, Italy and France, especially Italy, must have coal. An agency in touch with this business declares that contracts for 500,000 tons for Italy could be booked any day if there were facilities for moving that amount in the time desired.

At this time last year there were few ships in Southern waters. Now, owing to allocations by the emergency fleet corporation, there is a supply ample

apparently for all current needs, but the car shortage prevents full utilization of this ocean-going transportation capacity. An expert declares that the present car shortage, as it affects the Alabama coal mines, is at least 30 per cent. Under these circumstances, and with the domestic consumer clamoring for far more than the present coal production, the export demand cannot be cared for in the measure which the operators would desire.

Both the Louisville and Nashville and the Georgia, Florida and Alabama have coal tipples at Pensacola for placing the coal on ships.

What Birmingham coal operators especially desire, and are now working hard for, is ample coal terminals at Mobile, which would prove a double advantage, because the 20 per cent rail differential for shipment down the Warrior would also be available.

Not long ago an Alabama coal company turned down a firm offer of contract for several hundred thousand tons of high-grade Alabama coal for Italy on account of lack of handling devices at Mobile.

The matter of having the government build a coal terminal with 25,000 tons capacity at Mobile, interest on the investment to be guaranteed by the Alabama coal operators, has received strong backing, but no final decision has been rendered by the authorities.

## Coal Shipped Through Panama Canal During March

Shipments of coal through the Panama Canal during March totaled 3,336 tons, while the coke carried through amounted to 4,360 tons.

## Coal Exported from New York During March

Exports of coal and coke through the Port of New York during March of this year total 16,368 tons valued at \$153,609, as compared with \$16,664 in 1919, \$61,721 in 1918, and \$132,579 in 1917. Fourteen countries received anthracite in March of this year as compared with four countries in March of last year.

## Coal Imported by Dutch East Indies

Consul Harry Campbell reports that the Soerabaya consular district, comprising the Celebes, New Guinea, the Moluccas, Bali, Lombok, Soembawa, Soemba, Flores, and all islands east of 120 deg. east longitude; all that portion of Borneo east of 112 deg.; and in Java the Residencies of Soerabaya, Madioen, Rembang, Kediri, Pasoerean, Madoera, and Besoeki, imported 31,999 tons of coal in 1918, compared with 29,124 tons in 1917.

**Scarcity of Coal Forces Down Tonnage Rates to Europe**

W. W. Battie & Co.'s coal trade freight report states that, owing to the scarcity of coal and the large number of foreign steamers that are offering freight rates to Europe have crumbled very materially. Owing to the poor outlook for homeward business, rates to South America are particularly firm. The situation in business to the West Indies is unchanged. Rates quoted are as follows:

	Rate	Tons Dis- placed
Copenhagen	About 23 00	1,000
Stockholm	About 24 00	800
Gotthenburg	About 23 00	1,000
Antwerp-Rotterdam	18 50 19 00	1,000
Hamburg	20 50 21 00	1,000

**Great Britain Builds Few New Coke Ovens**

Progress in coke oven constructional work in Great Britain during the past year, according to *The Colliery Guardian*, was not very marked. Beyond a certain number of small extensions to existing batteries which had been put in hand in 1917 and 1918 under the auspices of the Ministry of Munitions no great amount of new work was started. This, of course, is attributable to a variety of causes, but mainly to the state of the colliery and coal businesses generally, where the vacillating policy of the Government, combined with the attitude of the Miners' Federation, has caused owners and capitalists to be unwilling to go forward with schemes until the situation is clearer.

**Coal Prices Issued in Paris**

Prices of the several kinds of coal, effective from March 16, 1920, Consul General A. M. Thackeray Paris, France, reports, were issued by the préfet of the Seine for the city of Paris, as follows: Anthracite, nut, 150 francs, or \$86.85, per ton; anthracite, large, 430 francs, or \$82.99; anthracite, small, 390 francs, or \$75.25; run of the mine (tout

venant), 400 francs, or \$77.20; boulets and briquets, 425 francs, or \$82.02. Wood belonging to the municipality will be sold at a uniform price of 160 francs, or \$30.88, per ton. The conversion rate used above was \$0.193 to the franc.

**Coal Demand of Japan Exceeds Supply**

Wheelock & Co.'s coal market report issued at Shanghai, March 25, states that there is no change to report in the Japanese coal market since a fortnight previous and that there has been practically no new business done. Stocks on the spot are up to the average and deliveries to consumers are going on as usual. In Japan supplies are not nearly enough to cope with the demand and sellers are experiencing great difficulty in meeting requirements for bunker coals.

The market for Kaiping coal has

ruled quiet but firm during the past fortnight. Although coal has been taken regularly under contract there is little new business to report. Stocks are much below the average and the demand for lump and the better grades exceeds the supply.

Coal prices are quoted as follows:

JAPAN COAL			
Milke lump	ex wharf	} Contracted for	
Milke small	ex wharf		
Milke dust	ex wharf		
Kishima lump	ex wharf		Taels
Kishima dust	ex wharf	—no stock	14 00

Washed slack		10 50
No. 1 slack		9 00
No. 2 slack		8 50

**Switzerland Can No Longer Depend Upon Germany for Coal**

As Germany's Production of Coal Has Considerably Decreased and the Fatherland Has Had to Cede the Saar District to France, the Swiss Must Look Elsewhere for Fuel

Consul General Leo J. Keena, Zurich, transmits the following translation of a report made by the Secretary General of the Swiss Department of Public Economy on the Swiss coal situation:

During normal times the Swiss consumption of coal amounted to from 3,300,000 to 3,600,000 tons per year. As Switzerland has no coal mines of importance, its coal consumption is about equal to the quantities of coal imported. Coal, briquet, and coke imports during 1913-1918 were as follows (metric ton = 2,204.6 pounds):

	Metric Tons
1913	3,379,007
1914	3,197,796
1915	3,311,442
1916	3,151,521
1917	2,269,872
1918	2,141,381

On an average this import consisted of coal 60 per cent, briquets 7 per cent, and coke 33 per cent. The chief source of supply was Germany, with coal from the Saar and Ruhr regions; Belgium and, to a small extent, France also contributed.

Prior to the war the coal was consumed as follows:

	Metric Tons	Per Cent
Transportation of all kinds	720,000	20
Gas works	600,000	17
Chief Industries	1,080,000	30
Households and small Industries	1,200,000	33
Total	3,600,000	100

Germany furnished most of the coal before the war, exporting it by rail direct from the mining regions. A certain percentage of coal from the Ruhr district was shipped via the Rhine and discharged in transit in ports of the

upper Rhine, to be transported from there on by railway. This was also the case with coal from Belgium, while coal from France was transported exclusively by rail.

Up to the spring of 1919 a great many coal importers participated in the importation of coal. Since April 1, 1919, however, the importation has been centralized and is effected exclusively by the Swiss Coal Association at Basel, which is an organization of the former principal coal importers and is to be considered as of a semi-official nature.

Through the stipulations of the peace treaty, the former chief supplier to Switzerland — namely, Germany — is obliged to furnish the Allies with large quantities of coal, especially France, Belgium, and Italy. Owing to the fact that the German production of coal has considerably decreased and that Germany has had to cede to France its Saar district, which heretofore participated to no small extent in the Swiss coal supply, Germany will no longer be able to furnish Switzerland any great amount of coal.

The same thing is true of Belgium and France. For some time to come neither of those two countries will be in a position to export coal to Switzerland to a degree worth mentioning, although France is furnishing us (in an appreciable way) with a certain minimum of coal from the Saar district. However, the quantity which is actually being received here amounts to only about one-third as much as was furnished to Switzerland in peace times and during the war until the armistice.

# Production and the Market

## Weekly Review

*Output Decreases, Cost of Production Mounts and Consumers Clamor for Coal the Mines Cannot Supply—Car Shortage and Labor Troubles on Roads Precipitate the Crisis—Bituminous Prices Raised—Anthracite in Good Demand—Coke Scarce and High*

**D**ESPAIR rules the coal situation today. Production is again on the decrease, labor is dissatisfied with the short running time and lowered earnings, costs of production have mounted and consumers are calling for coal that the mines cannot ship. The cause of the trouble at the mines is car shortage, and the cause of the car shortage is labor trouble on the railroads.

The long-continued condition of lack of transportation has so increased costs that prices of bituminous coal have generally been raised from 25 to 50 cents per ton, but problems of price are of secondary consideration. It is reported that none of the large Eastern companies has been able to keep up contract shipments, with the result that buyers have offered as high as \$7.50 per ton for mine-run coal.

One of the very great difficulties now is the constant placing and raising of freight embargoes. Shippers can never offer any assurance to their customers regarding a single car of coal. Many large industries in New England have reported a suspension of opera-

tion because of lack of coal and those that have stocks see them becoming rapidly depleted, with but little source for future supply.

There is little the coal man can do today except ship his little coal and wait for the railroads to get straightened out. The pressure on the Interstate Commerce Commission during the last ten days has been terrific and that body has been able to give to the shipping public that has been doing most of the complaining very little assurance of improvement in the near future.

Shipments to tide for export are limited even at Hampton Roads and Lake movement is very light. The railroads are getting or taking the larger share of present output of bituminous coal.

Anthracite continues in good demand. New prices have been announced, even though a wage scale has not been negotiated.

Fancy prices rule for coke, with very little free coke to be had. Production here also is limited by car supply.

Average Daily Production of Bituminous Coal\*

\*From weekly report of Geological Survey

## Reports From the Market Centers

### New England

#### BOSTON

*Traffic Troubles Continue — Prices Show No Material Change — Canadian Demand Is a Factor—Federal Intervention—Hampton Roads Market Fairly Even—Anthracite Companies on a New Price Basis—Demand Strong for Domestic Sizes—Less Activity in Buckwheat.*

Bituminous—As yet there is no let-up in the deplorable traffic situation that confronts New England. The congestion at the Boston & Maine gateways, that made the embargo of May 13 necessary, is being relieved only gradually. Probably it is only a question of time when still other gateways will be clogged.

The New Haven R.R. is able to make more deliveries of empties to the intervening lines, but the block on east-bound freight continues almost unabated. Current embargoes have naturally had their effect upon the spot market. Neither buyers nor factors in the trade can see their way clear to make arrangements for prompt coal, when they know that shipments all-rail are almost an impossibility. The result is a quiet market. New England is confining itself today to getting better movement on contract purchases, rather than to spot buying.

While prices might be expected to recede slightly, the volume of buying in other directions is sustaining the quotations of a week ago. \$6.50@7 is the ruling level on the better grades from Central Pennsylvania. The lower grades are still to be had at prices ranging from \$5.50@6.25. Consumers here have practically given up buying spot coal from sections more remote.

Active buying in Canada has given a buoyancy to the current market it might not otherwise have. Thus New England is likely to have competitive buying from Canada for several weeks to come. Prices will be bid up to \$8.

The West Virginia coals are now being absorbed in the Middle West and off shore; Canadian purchasers are left with only the Pennsylvania districts to draw upon.

Anthracite—With the announcements on May 15 and May 17 of the old-line companies, that advances of 85c. to \$1 would be effective from those dates, practically every anthracite shipper is now on a new price basis. The agreement with the mine-workers, although not formally announced, has been discounted by retailers in this territory.

Pressure continue strong for the

domestic sizes. The new high price for broken indicates to the trade that this size may be restricted to special uses. This should mean an increased consumption of egg size which would help materially in distribution. Shipments by water continue to come forward with fair regularity, although the all-rail route is still under great disadvantage.

The steam sizes are only in moderate demand. Large buyers of bituminous are discriminating carefully between different grades of buckwheat and there is less active buying than prevailed 60 days ago.

#### NEW YORK

*Local Deliveries Show Slight Improvement—Retail Dealers in Need of Coal—Big Producing Company Announces Increase in Prices—Harbor Troubles Interfere with Deliveries—Bituminous Shipments Slow—Vessels Leave for Other Ports for Coal—Car Supply Improves Slightly.*

Anthracite—The local retail market situation has slightly improved, as more coal is being received, where railroads can make all-rail deliveries to yards.

The wholesale market is mixed. No wage agreement has been reached by the operators and miners. But the price situation has been clarified by the following announcement of new prices (f.o.b. mines) by the Philadelphia & Reading company retroactive from May 11; Broken, \$7.50; egg, \$7.20; stove, \$7.45; chestnut, \$7.50; pea, \$5.75; buckwheat, \$4.10; rice, \$3.00; and barley, \$2.25. The Delaware, Lackawanna & Western, Lehigh & Wilkes-Barre and the Lehigh Valley companies have not, as yet, made any changes in their schedule of prices. The variation in prices has caused much confusion among the retail dealers who have several sources of supply.

With the Federal Government taking a hand in the movement of coal and the local harbor trouble, it is thought that shipments to this harbor should show an improvement within a few days.

The companies sending their output to the upper ports in this harbor have been able to make quicker deliveries to customers than have those shipping to the lower ports.

Current quotations for company coal per gross ton at mine and f.o.b., tidewater, at the lower ports are as follows:

	Mine		Tidewater	
Broken .....	\$5 95@	\$7 50	\$7 80@	\$9 35
Egg .....	6 35@	7 35	8 20@	9 20
Stove .....	6 60@	7 70	8 45@	9 55
Chestnut .....	6 70@	7 70	8 55@	9 55
Pea .....	5 30@	5 75	7 05@	7 50
Buckwheat .....	3 40@	4 10	5 15@	5 85
Rice .....	2 75@	3 25	4 50@	5 00
Barley .....	2 25@	2 50	4 00@	4 25
Boiler .....	2 50		4 25	

Bituminous—The greater movement of coal cars, as promised by the railroads, will go a long way towards improving market conditions, but is not likely to change local conditions to any great extent unless decisive action is taken to remedy harbor conditions here.

Quotations change over-night and deliveries are uncertain. The railroads are still taking coal in large quantities for their own use, much to the detriment of shippers and their customers. Car supply is said to be better, some districts reporting a greater percentage of receipts than for several weeks back.

Local labor troubles have caused many steamers to go to the Southern ports for bunker supplies. Reserve supplies at the factories depending upon water deliveries are showing usage, while the inland plants have plenty of coal for immediate need.

Grades are little thought of by buyers these days unless it is absolutely necessary, and medium coals have been quoted at from \$6.50 to \$7 at the mines, while tidewater quotations have been firm around \$10 to \$10.50 with slight increases heard of in some instances.

#### PHILADELPHIA

*All Anthracite Companies Announce Price Schedule—Dealers Receive Light Shipments and Stocks Are Depleted—One Big Company Contracting Certain Sizes—Bituminous Trade in Bad Shape—Small Tonnage Arriving—Active Vessel Chartering.*

Anthracite—Despite the fact that the wage controversy has not yet been settled, all shippers have now announced a price schedule for the current month. The biggest stripper announced prices from May 11 as follows: Broken \$7.50, egg \$7.20, stove \$7.45, nut \$7.55, pea \$5.75, buckwheat \$4.10, allowing other sizes to remain unchanged. These are the lowest prices for any company, the nearest other big company being 15c higher on egg, 25c on stove, 15c on nut and 25c on pea. All prices quoted are f.o.b. mines per gross ton, and are subject to change without notice.

The dealers in this territory are most urgently in need of coal of all sizes. The desire of the consumer for stocking has been so strong that the supplies of all retailers have been depleted. The bulk of the production seems to be going into New England, although the West is also beginning to get a share.

The independent shippers are said to be getting quite a little advance over the circular prices announced by them in the outside markets, and there are reports of sales of egg, stove and nut around \$9.50 to \$9.75, at the mines.

The dealers received big shipments five weeks ago and they cannot expect any heavy consignments until next fall. The retail prices for stove and nut vary from \$12.75 to \$13.50. Pea is pretty generally held around \$10.50 a ton.

Using the present prices of the largest shipping company as a basis, the prices per gross ton at mines for line delivery and f.o.b. Port Richmond for tide are as follows:

	Line	Tide
Broken.....	\$7 50	\$9 35
Egg.....	7 20	9 35
Stove.....	7 45	9 30
Nut.....	7 55	9 40
Pea.....	5 75	7 35
Buckwheat.....	4 10	5 15
Rice.....	3 00	3 90
Boiler.....	2 50	3 50
Barley.....	2 25	3 15
Culm.....	1 50	2 40

**BALTIMORE**

*Great Export Demand Forces Soft-Coal Prices Up—Best Coal, \$7 at Mines—Many Ships Await Export and Coastwise Cargoes—Anthracite Prices Moving Up and Receipts Light.*

Bituminous—Soft coal prices have gone up and up under the great export demand at tide here, the steady call for coal to keep domestic plants running and the fact that the car supply is so poor.

The average range of prices here, mine basis the net ton, are as follows: Best coals, such as run to pools 9 and 71, \$7.25 to \$7.50; No. 10, \$7 to \$7.25; No. 11, \$6.75 to \$7, and No. 18, \$6.50 to \$6.75. The low level of prices is around \$6.50 for the least desirable coals at the mines the net ton.

As high as \$8.50 and \$8.60 a gross ton is being paid at the mines for best coals, and around \$7.80 a gross ton for only a fair run of coal at the mines. Gas coals are about on a par with the quotations on steam coals as above; any screened high-volatile fuel being worth around \$7; and run-of-mine around \$6.25 to \$6.50.

The great export demand continues, but conditions have combined to cause a congestion of vessels. At present there are between 30 and 40 ships astream here waiting to take on a total of about 175,000 tons.

The Curtis Bay pier of the Baltimore & Ohio has set still another world's loading record. On Thursday last a steamer was loaded with 7,222 tons in one hour and 58 min., or at rate of 3,672 tons an hour.

Anthracite—Hard coal keeps moving up in the wholesale prospect. Some of the independents are talking of \$8.50 per ton coal f.o.b. mines. Such a price would mean, with a \$2.68 freight rate (as at present) and a gross margin of profit for retailers of between \$2.50 and \$3 per ton, a cost of around \$14 or more to the consumer, with the prospect of a \$15 ton of coal for next fall. Receipts here are light, and coal men are merely booking orders at a price to be set at time of delivery.

**Lake**

**BUFFALO**

*No Improvement in Bituminous Situation—Mines North of Pittsburgh Furnish Coal—Pittsburgh Out of Local*

*Market—Lake Loading of Anthracite Active—Coke Strong but Inactive.*

Bituminous—The situation does not improve, some shippers declaring that it grows worse every day. Still the factories and public utilities keep going unless they are held up by strikes.

But for the activity of the mines this side of Pittsburgh, such as Allegheny Valley, Reynoldsville, Shawmut and Clearfield, the bituminous trade would be completely demoralized, for it is practically impossible to get Pittsburgh coal at Buffalo, the strike in the Pittsburgh district being much more general than it is further north.

No Pittsburgh coal is to be had, so it is not possible to obtain any figures of that trade; as to other coal, the prices are \$6 up at the mines for mine-run, which is about all that is offered, Clearfield being always marketed in that form. The latter does not come here in any quantity, for the freight is too high, but it can be sold to cover the eastern market of the state and New England.

Anthracite—The fixing of the price of hard coal has added 85c. a ton to the wholesale prices of the leading sizes, with a ten-cent monthly addition besides. Not all of the companies have yet adopted this advance, but they probably will do so. The supply is so short that coal consumers cannot complain much.

The Lake loading of anthracite is active, considering that only two companies have gone into it as yet this season. For the week the loading amounted to 89,400 net tons of which 11,400 tons cleared for Chicago, 18,600 tons for Milwaukee, 8,500 tons for Sheboygan, 46,900 tons for Duluth Superior, and 4,000 tons for Detroit.

Coal freights have been fixed at 50c. to Duluth and principal Lake Superior ports, 60c. to Milwaukee, 65 and 70c. to Chicago and 10c. more to minor ports.

Coke—All coke is strong, but not active at rather irregular prices, as the consumers will not buy in the open market if they can help it. Jobbers quote Connellsville foundry at \$15.10, furnace at \$13.60 and chestnut domestic at \$9.90, all per net ton, f.o.b. Buffalo.

**CLEVELAND**

*Bituminous Stocks Low—Interstate Commerce Commission Inaugurates Priorities—Price Tendency Upward—Lake Shippers Enter into Pooling Arrangement.*

Bituminous.—Stocks at industrial plants are running dangerously low, while everyday additional plants are reported either shutdown or crippled. Inauguration of priorities for coal by the Interstate Commerce Commission, which may bring mine operations and coal receipts above the present 30 to 40 per cent of normal, constitutes the only present visible ray of hope in the situation. The price tendency for most

grades of coal continues upward and dealers predict that regular monthly increases of at least 10c. a ton are probable throughout the summer.

Pocahontas and anthracite — The looked-for boost in anthracite prices has been made, egg being quoted at \$13.20; grate from \$13.20 to \$13.50, and stove \$13.50. Shoveled Pocahontas also has been advanced to \$11.75 from \$10.50. Supplies are scant, but the demand of domestic consumers, seeking to lay in next winter's supply, is growing.

Lake trade—Although the pooling arrangement entered into by Lake shippers has been undertaken in the hope of averting a famine in the Northwest, shippers say that its success depends wholly upon the car supply. Railroad men say that the best that can be hoped for is a 60 per cent car supply during the present season, and at present it is far below that figure. The pooling arrangement follows the war-time plan in effect in 1918.

Retail prices of coal per net ton delivered by dealers in Cleveland are: Anthracite — egg, \$13.20; grate, \$13.20@13.50; chestnut, \$13.50, and stove, \$13.50.

Pocahontas—shoveled lump, \$11.75; and mine-run, \$9.25.

Domestic bituminous—West Virginia splint, \$9.50; No. 8 Pittsburgh, \$7.75; Millfield lump, \$9.10, and cannel lump, \$11.50.

Steam coal—No. 6 and No. 8 slack, \$8.50; No. 6 and No. 8 mine-run, \$8.50, and No. 8 3-in. lump, \$8.

**MILWAUKEE**

*Soft-Coal Supply Uncertain—No Way Found to Relieve Situation—Domestic Anthracite Plentiful With Prices Steady.*

Uncertainty of the soft coal supply is keeping Milwaukee manufacturers anxious. It is a "hand-to-mouth" game at present, with all industries and public utilities scraping their bins daily. Any prolonged interruption of the meager supply would lead to a shut down of numerous factories.

Many conferences of business men and city officials have been held, but no way has thus far been found to relieve the situation. The railway strike must be settled and more coal cars furnished before an improvement can be expected. Receipts by Lake and rail continue much below normal.

Domestic consumers of anthracite find little difficulty in procuring supplies and deliveries of this nature are quite brisk. Prices are held steady. Consumers of steam coal demur at present prices, but are forced to accept the situation. The summer schedule of rates on coal is due and will probably be formulated before the end of May.

Cargo receipts by Lake (up to this writing) aggregate 86,890 tons of anthracite and 102,920 tons of soft coal, against 150,839 tons of the former, and 438,661 tons of the latter up to the same date last year.

## Inland West

### COLUMBUS

*Lake Priority Orders Desired—Reduced Output from Ohio Mines—Demand Strong and Prices Soaring—Railroads Taking Fair Tonnage—Hocking Valley and Pomeroy Bend Furnish Bulk of Coal.*

Shippers are trying to get priority orders for Lake movement and the Ore & Coal Exchange, at Cleveland, under the management of H. M. Griggs has been revived. So far the amount of coal loaded amounts to practically 700,000 tons, as compared with about 4,000,000 tons in previous seasons. A crisis can only be avoided by quick action. The requirements of the Northwest are placed at approximately 28,000,000 tons.

Reduced car supply resulting from the Switchmen's strike and the attending congestion here reduced the output in Ohio mining districts to about 40 per cent of normal. Eastern Ohio is probably in the worst condition with only 25 per cent operation. In the Hocking Valley field the output is about 40 per cent and possibly higher. Cambridge and Crooksville report about the same percentage. Pomeroy Bend district is having about 50 per cent run which shows up slightly better than the previous week.

Demand is increasing from all sources. In the steam field, manufacturing plants are actively bidding for free tonnage in competition with public service concerns and with state and county institutions. Quite a few manufacturing plants have been partly closed for want of fuel. Others are operating from hand to mouth without adequate reserves. Prices are consequently soaring. Railroads are taking a fair tonnage, part of which is being confiscated.

In the domestic trade retailers are out of stocks. Prices do not appear to be an object at this time but rather the ability to receive shipments promptly.

Pocahontas is practically out of the Columbus market. Some West Virginia splint is arriving but the main bulk of local supplies comes from the mines of the Hocking Valley and Pomeroy Bend. Retail prices are soaring in sympathy with quotations at mines.

Hocking lump is selling at \$7.50 to \$8 delivered, while mine-run is about 25c. lower. West Virginia splints are retailing at \$8.50 to \$8.75 for lump and practically the same for mine-run. Pomeroy lump is strong around \$8 and Pocahontas is retailing at \$10.50 to \$11.

Prices at the mines of the principal coals used in Ohio territory are

Hocking lump	4 25 to 4 75	\$4 50 to \$5 00
Hocking mine-run	4 00 to 4 75	4 25 to 4 75

### CINCINNATI

*Little Improvement in Fuel Situation—River Transportation Increased—Operators Prepare to Store at Mines—Prices Firm and Demand Excellent from Householders.*

There has been little, if any, improvement in the local fuel situation, the demand for all kinds of coal continuing intense. Every endeavor is being made to increase the volume coming down the Ohio River, as operators feel that this is about the only channel through which a somewhat like normal supply can reach Cincinnati and vicinity.

Kentucky mines are better supplied with cars than those of Ohio, West Virginia and Indiana, but on the whole, even the car supply in Kentucky is far below the adequate needs of the operators.

Practically all Cincinnati coal companies have prepared for shortage at the mines, hoping in that way to be ready, when rail conditions right themselves sufficiently, to get the coal to market. The larger companies are finding it a hard matter to stem the tide of higher prices and cannot safely take new orders. The conservative prices for smokeless coal are \$5.25 for lump and egg, and \$4.25 for run-of-mine, delivered, carrying in addition the wage increase of April.

Splint coal of the better grade is quoted by the conservatives at \$4.50 for block (lump and egg); run-of-mine, \$4.25; and nut-and-slack, \$4. Other companies are quoting \$4.50 to \$6.50 for lump, egg (block, all sizes) and nut-and-slack; run-of-mine, \$5 to 6, and in many cases \$6.50.

In the retail market the demand from the householders continues excellent. Prices are firm. The retail prices delivered are: Bituminous—lump, \$8 to \$8.25; nut, \$6.75 to \$7.50; run-of-mine, \$7.25. Smokeless—lump, \$9.25; run-of-mine, \$8.50. Anthracite sells at \$14.

### ST. LOUIS

*Railroad Conditions Still Bad, with Few Empties to Mines—Demand Good for All Coal, at Top Prices, with Little Moving—Railroads Get Most of the Coal.*

There is not much improvement in the local railroad terminals. A little coal continues to move in to St. Louis in train lots of 10 to 30 cars to central unloading points; but the switching facilities are such that cars cannot be set in at different plants. Many plants are running on reduced time on account of the lack of fuel.

On account of car shortage the price of coal continues to go up. Chicago parties are bidding in the St. Louis market as much as \$4.25 for mine-run, \$4.50 to \$4.75 for lump, egg and nut, and \$3.50 and upwards for screenings.

In the Standard field the mines are working from one to three days a week on railroad coal. In the Mt. Olive field a little better working time is given on commercial coal, perhaps two days a week. The railroad tonnage continues heavy. The prices here range from \$3.25 to \$3.50 for domestic sizes, and

\$2.75 for mine-run. Steam sizes are all contracted.

In the Cartersville field of Williamson and Franklin counties the circular is not being maintained. Working time varies from one day a week on commercial coal to five days a week on railroad coal; the mine loading railroad coal gets all the cars.

The Missouri Pacific R.R. is trying to obtain a \$2.60 price on mine-run coal for railroad use, while many other roads are paying higher. A somewhat similar condition exists on some of the trunk lines entering East St. Louis with regard to the operators on their roads. The Pennsylvania is reported to have purchased 1,000 cars of 2-in. lump at about \$3. at the mine.

Retail prices have not changed and the demand is easy. No Arkansas is moving in and nothing from the eastern smokeless fields. A little anthracite is on the way. The supply of coke is exhausted.

### DETROIT

*No Improvement in Soft-Coal Situation—Utility Companies Appeal to Interstate Commerce Commission—Little Anthracite Coming In—Pooling System for Lakes.*

Bituminous—Shipments of bituminous coal into Detroit and Michigan appear to show no substantial increase. Industrial establishments and many public utility plants throughout the state are maintaining operation on practically a day to day supply, with uncertainty as to being able to continue. Insufficient supply of railroad equipment is held to be the principal reason for deficiency in shipments.

Representatives of public utility companies of the state who visited Washington May 19, presenting their appeal for relief to the Interstate Commerce Commission, were unable to obtain any promise that coal would be supplied in more liberal amount. The suggestion that a priority order be made to apply to coal consigned to Michigan public utilities, was productive of no action along that line. The commission advised the delegation that it would be necessary for the people of Michigan to take the places of the striking railroad switchmen if the railroads were to deliver coal.

It was brought out in the hearing that a number of Michigan manufacturers have sent representatives to the mining regions, and, in the effort to get coal, prices have been bid up to as high as \$6.75 a ton at the mines for mine-run.

Anthracite—Little anthracite is coming to Detroit and yards of retail dealers are in many instances without stock. The outlook is pronounced quite unfavorable and predictions are being made that many household consumers will be unable to get a supply for next winter.

Lake Trade—In the effort to facilitate shipments of coal by Lake routes, shippers and the transportation companies have agreed to renew the pooling system, which was in effect in 1918, during the remainder of this season.

**MIDWEST REVIEW**

*Operators Have Filled Old Orders and Now Sell Spot Coal—Factories Run on Quite Short Stocks—Railroads Hold Coal on Sidings—Leading Roads Optimistic—Car Pooling Approved.*

Coal can now be purchased at a price, whereas even a week ago, steam plants and wholesalers were having difficulty in making purchases at any price. Operators have been able to fill old orders and are now holding all of their coal for current shipments.

Spot coal is bringing a premium. The better grades of coal from Illinois are still being sold at circular prices, but other grades, both from Illinois and Indiana, are being sold to the highest bidder.

The congestion caused by the switchmen's strike, and the resulting embargoes, is still hurting traffic. Practically every factory in the Middle West is running on a hand-to-mouth basis. The average householder is quite nervous and is doing everything he can to buy his winter's supply of coal during the summer months.

It is said that the railroads are holding considerable coal on their lines, considering confiscation. This rumor has caused widespread dissatisfaction among coal men.

The railroads claim they are not holding coal, but are trying to ship fuel right through to destination as quickly as possible. However, there are a number of side tracks filled with loaded cars of coal.

The Chicago & Alton claims that the movement of fuel to industries is nearly normal. The Chicago, Burlington & Quincy states that it is now loading about five hundred cars daily against a normal seven hundred. Other roads report in a like manner.

The railroads applied to the Interstate Commerce Commission for assistance and the commission is considering the pooling of cars as was done during the war. It is generally thought that the pooling system will help matters a great deal.

It is hoped that when the car-pooling system is inaugurated, Illinois and Indiana mines will be able to run at least fifty per cent of the time, as then the situation will be quite rapidly relieved.

**CHICAGO**

*Chicago Faces Fuel Famine—Critical Condition of Yards of Large Retail Dealers—All Look to Interstate Commerce Commission for Relief.*

Chicago is now face to face with a fuel famine. This shortage, of course, is a direct result of the freight congestion and lack of coal cars at the mines. Luckily, earlier in the week, the weather suddenly became warmer.

Dealers are supplying their domestic trade in half-ton lots. Steam plants are so short of coal that they are depending entirely on the railroads for prompt deliveries. If there is any delay the factory shuts down awaiting the arrival of the coal.

There is a concern in Chicago that maintains 47 retail yards. In normal times this company has approximately 150,000 tons of coal on hand. Today there are 7,000 tons in its various yards. This concern says if it receives and unloads 225 cars per day from now until Nov. 1, the company will go into the winter months without any appreciable surplus on hand.

The coal trade and those interested in the trade, are earnestly hoping that the proposed plan of the Interstate Commerce Commission to pool all coal-carrying equipment, will result in a much better car supply at the various mines.

If all the Illinois and Indiana mines receive a 50 per cent supply and only that for the next 90 days, it is pretty generally conceded fancy prices will disappear from the market, coal will be selling at reasonable prices, and there will be enough for everybody.

**South**

**LOUISVILLE**

*Buyers Force Up Prices by Strong Demand for All Grades—Production Continues Light—Priority Ruling Expected to Improve Conditions.*

Prices have advanced sharply during May as a result of buyers from Chicago and other points entering the Kentucky fields and bidding up the markets; being badly in need of immediate shipments, and not caring much about the price apparently.

There is a strong demand for all grades of coal. Retailers' yards are empty and they are buying steadily. Steam consumers are also buying and there is also a Lake region demand.

Practically no contracts are being made. Present selling is on a spot basis for immediate use, as lower markets are predicted.

Production in some sections of the state is on a 33 per cent basis, others doing as well as 45. Car shortage continues bad, but the new regulations and priority rulings are expected to aid materially.

Movement of solid trains of empties back to the mines may mean a much better fuel supply at an early date. However, much mine labor has deserted and it is a question whether mines can use a full car supply.

Quotations at mines are as follows: Western Kentucky block, \$3.50@3.75; mine-run, \$3.25@3.50; nut and slack, \$3@3.25; pea and slack, \$2.75@3.

Eastern Kentucky coals are selling at \$4.50@6.75 a ton, good byproduct mine-run and block selling at around \$6.50@6.75 except among a few operators who have restricted prices on block to \$5, having advanced from \$4.50. There is no material difference between mine-run and block prices in most instances today on the Eastern Kentucky market. Nut and slack in some instances has been quoted at \$4.50 but

it would be hard to find much under \$6 a ton.

One concern reports quotations of \$3.60 a ton for 14-in. Western Kentucky nut; \$3.75 for 2 1/2 in.; \$4 for run-of-mine; and \$5.25 for 4-in. lump, at mine.

Retailers have advanced prices fifty cents a ton on all grades. Eastern Kentucky block sells for \$9.25; mine-run, \$8.75; nut and slack, \$8.25; steam mine-run, \$7@7.50; screenings, \$6.50@7; West Kentucky lump, \$7.50; mine-run, \$7; screenings, \$6.50; steam mine-run, \$6@6.50; screenings, \$5.50@6.

**BIRMINGHAM**

*Car Supply Irregular, with No Improvement Over Last Week—Stiff Demand for All Grades—No Spot Coal—Steam Coal Users Quite Short of Fuel—Mines Operate 80 Per Cent Normal.*

Conditions in general affecting the coal trade in this district have shown little change during the past week. The car supply has improved little, if any. Production is badly demoralized by the irregular and uncertain car supply, at least one and two days per week being lost in many instances.

Although there is a stiff demand for all grades of coal, there is little to offer the spot trade and this comes mostly from the small mines. The larger companies are applying the restricted output they obtain to orders in hand in an endeavor to keep their customers going; they have no coal to offer and are, therefore, taking on no new business.

Industries, public utilities and railroads are all quite short on fuel and are operating on a practically hand-to-mouth basis. Premium figures of from 75c. to \$1.50 per ton can be easily obtained for spot coal, but conservative interests are holding down quotations and not taking advantage of trade conditions to sky-rocket prices.

The Southern Ry. has placed some contracts the past week for fuel for the next 12 months, paying \$2.85 to \$3.20 per net ton mines for Big Seam mine-run coal. Its fuel contracts do not expire until June 30. Quotations for steam coal are as follows per net ton mines:

	Mine-Run	Prepared
Big Seam	\$2.95@3.25	\$3.45
Black Creek	4.00	4.45@4.50
Cahaba	4.00@4.35	4.35
Carbon Hill	3.35@3.50	3.50
Nickel Plate	3.35@3.50	

Domestic schedules are as follows per net ton mines:

	Lump
Big Seam	\$3.50@3.60
Black Creek	5.00@5.75
Cahaba	4.60@6.00
Carbon Hill	3.60@3.85
Monteville	7.15
Corona	5.65
Straven	6.75

The output of the Alabama field, for week ended May 8, was approximately 329,000 tons. Labor is working irregularly, averaging about 80 per cent full time. There is also a shortage in some sections.

# News From the Coal Fields

## Northern Appalachian

### FAIRMONT

*Car Supply Uncertain and Much Idleness Results—Pennsylvania Moves Big Tonnage—P. & L. E. Badly Crippled—Tidewater Shipments Heavy—Railroads Take Half of Output.*

The car supply in the Fairmont and other northern West Virginia regions, during the week ended May 15, was quite uncertain. Consequently much idleness resulted. For a time mines on the Monongahela R.R. were almost entirely without equipment. Throughout the northern part of the state transportation conditions were such that few if any mines were able to load to 50 per cent of potential capacity.

Monday's supply of empties on the Monongahela division of the Baltimore & Ohio amounting to 1,451 cars, enabled mines to load a fairly large tonnage but did not permit mines to load to capacity. Monongahela mines fared better with 314 cars than they did at any other time during the week, it being the largest supply vouchsafed the mines in some time.

Much congestion still existed at Brownsville, Pa., the northern gateway for all mines on the Monongahela R.R. While the Pennsylvania R.R., was moving a large volume of coal freight out of Brownsville, Pittsburgh & Lake Erie was still so badly crippled that it was unable to handle any coal, a strike on the part of additional switchmen and yardmen tending to further complicate matters.

The tonnage consigned to Lake docks during the week was extremely limited, due in part to the meager car supply and in part to the heavy tonnage going to tidewater.

While tidewater shipments continued to be unusually heavy, it was reported toward the end of the week that stocks of coal on hand at tidewater were growing low. Notwithstanding that fact, pool 18 (Curtis Bay) low-volatile coal, was under embargo. Shipments to Western markets in general were slim.

There were days, during second week of May, in northern West Virginia when only about half the cars furnished were being loaded with coal for commercial purposes, the other half of the output going for railroad fuel. The railroads obtained such fuel by assigning cars—a practice denounced by operators.

It was also reported that some of the coal from Fairmont region was being confiscated in transit. It was stated in some quarters that eastern railroads were closing contracts for railroad fuel at \$3.50 a ton.

### PITTSBURGH

*No Improvement in Rail Coal Movement—Car Shortage Acute—River Mines Working Full—Shortage of Coal Everywhere—Fancy Prices for Gas Coal.*

There has been no improvement in coal movement in the Pittsburgh district in the past week, or probably in the past fortnight. The river mines are working full. Rail shipments in the whole Pittsburgh district are not over about 25 per cent of normal.

The two main difficulties are, the car shortage in general and the fact that the Pittsburgh & Lake Erie is not functioning to any extent. The Pennsylvania and Baltimore & Ohio are operating moderately well, so far as the freedom of their rails is concerned, but they are quite short of cars.

The condition in this respect is different from that existing in the first two or three weeks of the rail strike, when there was fairly heavy loading, but many of the cars when loaded did not travel any distance. At the present time nearly all the coal loaded out gets through to destination.

The old congestion remains, and it will be one of the efforts of the railroads, under direction of the Interstate Commerce Commission, to clear this congestion. This in itself would give consumers a considerable tonnage of coal.

### CONNELLSVILLE

*Production Low, Regulated by Car Supply—Much Coke Going by Water—Demand Limited at High Prices.*

Production in the past week has been about the same as in the previous period representing a slight decline from the maximum reached during the strike, and about two-thirds the rate prevailing before the strike. Production is regulated entirely by car supply, which is extremely poor.

The Pittsburgh & Lake Erie is scarcely functioning at all and it normally furnishes one-half the cars for the Monongahela R.R. The Pennsylvania and Baltimore & Ohio are operating fairly well so far as shipping is concerned, but are quite short of cars.

A quite considerable part of the output of the Connellsville region is going by water, and unusual efforts are being made to secure additional barges for this work. There is little stocking of coke now, and the "push ovens" cannot stock at all.

Nearly a week ago the spot furnace coke market advanced to \$15, per net ton at ovens. Demand since then has been limited in point of tonnage, most of the furnaces that need coke refusing to pay such a price and preferring to slacken operations or bank entirely.

Foundry coke has sold in the open market at \$15, but two or three important producers refuse to price their coke at above \$12, and sell to regular customers what they can spare at not above this figure. There are no negotiations for contract coke, leaving the market quotable at \$15 for furnace and \$12@15 for foundry, per net ton at ovens. The *Courier* reports production in the Connellsville and Lower Connellsville region in the week ended May 15 at 154,400 tons.

## Middle Appalachian

### POCAHONTAS AND TUG RIVER

*Mines Work 40 Per Cent—Heavy Eastern Demand and Uncertainty of Return of Cars from the West—Customary Coke Output.*

During the second week of May the Norfolk & Western car supply was much curtailed due to lack of cars from the West. Under ordinary conditions, the Norfolk & Western supplies all the mines on its lines from Williamson to Wilcox with empties obtained from the West, other parts of the system being supplied from eastern sources. The car shortage was so acute in certain fields during the last of the week that no mines except those producing railway fuel were able to operate. Even in the Tug River, Pocahontas and Clinch Valley regions cars were insufficient to keep the mines running for more than 40 per cent of the full working time.

Few producers, took advantage of the opportunity to consign coal to the Lakes, because of the heavy Eastern demand, higher prices in the East and the uncertainty as to when the cars used for Lake and Inland West shipments would be returned.

So long as conditions remain subnormal in the West, insofar as the movement of coal is concerned, there is apt to be a continuance of unusually heavy tidewater shipments, from the Tug River field.

Irregularity of operations followed in the wake of a continued shortage of cars in the Pocahontas district in the week ended May 15.

Production was still not over 40 per cent, with the car shortage still in excess of 250,000 tons. The usual amount of coal, however, was coked, amounting to about 13,000 tons. The long haul from tidewater complicated with other troubles made it difficult even to secure cars from the East.

### NEW RIVER

*Little Improvement in Output—Coal Goes to Tidewater and to Inland East—Small Lake Shipments—Gulf Works Under Half Time.*

Though there was still a material shortage of cars in the New River field, during the second week of May, a slight increase in the output of that field was recorded. The production for the entire week was about 110,000 tons. Aside from the larger production on Monday, there was no real improvement in the transportation situation in the New River field.

Since few cars were being received from Western markets, shipments were limited to that part of the country. The bulk of New River production was finding its way to tidewater and to Inland East markets; tidewater points receiving the major portion of the coal which was intended for export and for bunkering purposes. Little coal was

being consigned to Inland West markets so the tonnage for the lakes was also small.

The higher scale of prices prevailing at tidewater had something to do with the larger eastern consignments. The heavy movement of both smokeless and high-volatile coal to the East tended to slow up the movement owing to crowded side-tracks between the mines and tidewater. The movement of New River coke to Western markets had grown in volume somewhat and was slowly returning to normal.

Less coal was loaded in the Winding Gulf field during the week ended May 15 than during the previous week; mines on the Virginian Ry., having only a three-day car supply; on the Chesapeake & Ohio, mines operated only two days out of the six.

### KANAWHA

*Decreased Production Due to Acute Car Shortage—Tonnage Goes to Tide Rather Than West—Price and Movement of Cars Influence Shipments.*

Less coal was produced in the Kanawha field, during the period ended May 15, than in the preceding weekly working period, production being limited to about 85,000 tons, or between 40 and 50 per cent of potential capacity.

A most acute shortage of cars was entirely responsible for the greatly curtailed output. The shortage in empties was directly traceable (in part) to the fact that not more than 300 or 350 cars a day from Western lines were being received for distribution by the Chesapeake & Ohio.

Tidewater tonnage preponderated over every other class of shipments from the Kanawha field, tending to cut down the tonnage available for Western shipment due to the difficulty in getting coal through to the West.

### LOGAN AND THACKER

*Long Eastern Haul and Few Cars from the West; Reduce Output—Logan Works One-Third Time—Logan and Thacker Coal Goes to Tide.*

So acute was the car shortage in the Logan field, during the second week of May, that production was reduced to about the level of the last week of April when the full effect of the strike was being felt. The output reached 173,000 tons during the first week of the month, but it dropped to about 133,000 tons during the week ended May 15. For the final week of April, 155,000 tons were produced.

The long haul from Eastern terminals and the meager supply of empties from the West were chiefly responsible for a reduction in the output. Logan mines were only producing at the rate of about 35 per cent of capacity.

Of course with the car supply so greatly restricted, it was difficult to comply with contract requirements for Western consignment; hence sales and shipment of spot coal were almost insignificant, insofar as Western markets were concerned; that being equally true as to Lake shipments. The

greater proportion of the Logan output was finding its way to the seaboard.

While Thacker district mines had managed to speed their output up to 119,000 tons, or about 46 per cent of potential capacity, during the week ended May 8, production fell behind that mark to quite an appreciable extent during the second week of the month, due to a most pronounced shortage of cars. The only mines operating during the last of the week were those holding contracts to furnish railroad fuel.

Cars were scarce, because so little equipment was finding its way to this territory from the West. Virtually the entire output of the Thacker field was being sent to tidewater.

### NORTHEAST KENTUCKY

*Mines Operate Half Time—Output Largely Under Contract, with Little Spot Coal.*

The output for the week ended May 15 slumped from 126,000 to 122,000 tons, car-shortage losses climbed from 143,000 tons to 165,000 tons, an increase of 22,000 tons. Mines were being operated only about half the week.

While there had been a recovery on lines operating in northeast Kentucky, connecting lines were still suffering from the effect of the switchmen's strike. Lake shipments were disappointingly small. There was a heavy demand for byproduct coal.

Fully 80 per cent of the output of the northeast Kentucky field is under contract at figures prevailing more than a month ago; the high prices now being offered for spot coal only applies to a limited portion of the output of the field.

Unless there is a material improvement in transportation conditions, operators in the field are not sanguine that mines generally will be able to work more than 50 per cent of potential capacity for some time to come.

### VIRGINIA

*Output Decreases as Car Supply Grows Worse—Men Leave for the Farms.*

Production in the Virginia fields during the week ended May 15 reached only 101,700 tons, showing a decrease, as compared with the previous week, of nearly two thousand tons, which went to show that the car situation had grown somewhat worse. The poor car supply was responsible for a loss of 68,000 tons, while the loss from a labor shortage amounted to only 9,800 tons. The tidewater movement of coal, after being embargoed for a time, was renewed under permit. At the same time prices on spot coal climbed to \$5 a ton with little free coal available to meet the open market demand.

Labor troubles were lacking but few mines, however, had a full complement of men owing to the desertions to the farm for the summer months. Producers found it impossible, owing to limited transportation facilities, to keep pace with the demand.

## Middle Western

### INDIANA

*State Mine Inspector Submits Plan to Governor — Considerable Legislation Proposed.*

That a commission be created to codify Indiana mining laws and to have other powers, is proposed in a letter Cairy Littlejohn, state mine inspector, has submitted to Governor Goodrich.

Indiana mining laws are in a disjointed condition, says Mr. Littlejohn, and they should be worked into a harmonious whole. He would have additional legislation covering the use of electricity in mines; providing for the revocation of mine and fire-boss licenses, now held for life; regulations regarding the troublesome washhouse problem and other new legislation to accomplish what many mine inspectors fruitlessly have recommended to legislatures.

Mr. Littlejohn believes the state mine-inspection force should be increased and have a more adequate fund. Also that strip and small mines should be placed under the jurisdiction of the state inspection department.

It is possible that considerable legislation may be proposed regarding coal mining in Indiana. Just now Mr. Littlejohn is said to be having considerable difficulty with some coal and mining companies that are paying little or no attention to providing the inspection department with information it wishes.

### SOUTHWEST ILLINOIS

*Merger of Standard Field Mines Proposed—About \$10,000,000 of New York Capital Involved—Field Supplies Half of St. Louis Fuel.*

An effort is being made, it is said, to consolidate under syndicate ownership the 40 coal-mining companies in the Standard field, adjacent to St. Louis

(operating 70 mines), with the object of eliminating trade abuses, limiting production and stabilizing prices. The deal is said to be financed by New York interests, and is being promoted by the Stifel-Nicolaus Investment Co. of St. Louis. Options have been obtained on about 40 per cent of the plants in the Standard field, including some of the largest mines in the district, with an output in excess of 50 per cent of the total. Between \$8,000,000 and \$10,000,000 are involved in the deal. The total production represents between 60,000 and 75,000 tons a day, most of which is marketed in St. Louis.

Elimination of competition in the Standard field, resulting from the merger, would place the entire coal output in the St. Louis district in the hands of a few operators. The Carterville field in southern Illinois is controlled by an association and the Mount Olive field, adjoining the Standard field, is controlled by two or three operators.

The Standard field supplies about half the coal consumed in St. Louis. It is claimed that a consolidation of Standard plants will stabilize the price of coal.

if fails on its weak point. Engineering advertising cannot afford to have a weak point." At this meeting also W. Frank McClure gave a brief history of the National Advertising Commission, of which he is chairman, and explained its functions.

### Northern West Virginia Operators' Association

Claiming that northern West Virginia mines supplied by the Pennsylvania, Pittsburgh & Lake Erie, Monongahela and Morgantown & Wheeling railroads are short 16,338 cars for the period between July 1, 1919, and March 1, 1920, George T. Bell (executive vice-president of the Northern West Virginia Operators' Association) recently filed a petition with the Interstate Commerce Commission, praying that a pre-emptory order be issued by the commission requiring the roads named to furnish the mines on the Monongahela 100 per cent of the orders for cars until the shortage had been overcome. The Commission is also asked to make final award of reparation.

### Central Pennsylvania Coal Producers' Association

The annual meeting of the Central Pennsylvania Coal Producers' Association was held in Altoona recently, officers for 1920-21 being elected as follows: President, James H. Allport, Barnesboro; vice president, M. J. Bracken, Gallitzin; secretary-treasurer, Charles O'Neil, Altoona; statistician, W. A. Jones, Altoona; counsel, J. E. Evans, Ebensburg. Announcement was made of the withdrawal of the Berwind-White and several companies in the Buffalo, Rochester & Pittsburgh R. R. district, following the Central Pennsylvania Association consolidating with the Association of Bituminous Operators. Harry Boulton, of Clearfield, is the retiring president. The mines of the association produced 45,970,156 tons of coal last year.

## Association Activities

### Engineering Advertisers' Association

At the May 11 meeting of the Engineering Advertisers' Association, William Bethke, secretary and editorial director of the La Salle Extension University, and president of the Executives Club of Chicago, addressed the association on the subject, "What Makes Advertising Effective for the Engineering Advertiser?" Mr. Bethke emphasized the importance of making engineering advertising stand on its own merits by giving positive and dependable data regarding the product or service advertised. "Much advertising today," said Mr. Bethke, "has nine strong points and one weak point, and

## Report of Operating Conditions at Coal Mines in Indiana, April, 1920

PREPARED BY JONAS WAFFLE, SECRETARY INDIANA COAL TRADE BUREAU.

Railroads on which Mines are Located	District	No of Mines	Tons Produced	Full Time Capacity (Tons)	Total all Causes	Tons Lost and Car Shortage	Causes Thereof Labor Trouble	Mine Disability

- (1) Includes all mines South of Terre Haute.  
 (2) Includes all mines on St. Louis and Michigan Divisions.  
 (3) Includes all mines on Vincennes Divisions and Dugger Branch

# Mine and Company News

## GEORGIA

**Savannah**—The Taggart Coal Co. is having plans prepared for the construction of a large new coaling dock on its river front property recently acquired under lease. The proposed new dock will have a frontage on the river of about 750 ft., a depth of 600 ft., and be 65 ft. in height, arranged to accommodate two steamers, and will have a bunkering capacity of about 1,200 tons per hour. Complete coal-handling machinery will be installed, to be electrically-operated.

## ILLINOIS

**West Frankfort**—A fire, starting from an oil explosion, damaged mine No. 18, controlled by the Peabody Coal Co., of Chicago, to the extent of \$150,000, on the night of May 12.

## KENTUCKY

**Lexington**—The following Kentucky coal companies have increased their capital stock recently:

The Standard Elkhorn Coal Co., of Garrett, increased from \$50,000 to \$200,000; the Defiance Coal Mining Co., of Lexington, from \$100,000 to \$200,000; the High Splint Coal Co., of Williamsburg, from \$400,000 to \$600,000.

**Louisville**—A recent report from Jellico, Tenn., was to the effect that the Consolidated Fuel Co. had purchased the properties of the Smoot Creek Coal & Coke Co., Jellico (Charles P. Price, principal owner), at a cost running into seven figures. The same interests recently purchased the West Virginia & Kentucky Coal Co. properties. It is planned to improve the Smoot Creek properties, installing electrical equipment throughout.

## MONTANA

**Belt**—An order has been placed by the Merkle Coal Co., of this place for machinery and equipment for the tippie of the Merkle mine from Chicago. Plans for the installation of the machinery were drawn up by R. R. Vaill, the company engineer, who recently made a survey of the ground. The shipment will include modern bar screens, crushers, and picking tables. A three-ton weighing pan will also be installed for convenience in coaling Great Northern locomotives.

When this equipment has been installed, the plant will probably be one of the best equipped coal mines in the state. The coal will be prepared more economically and the quality of the fuel will be much improved; it can be utilized for commercial and domestic trade.

## NORTH DAKOTA

**New Salem**—Government aid having been given the development of the lignite coal industry in North Dakota, its promoters declare it will become the most important coal industry in the Northwest. A model briquetting plant is to be erected at New Salem by the Government, with an appropriation of \$100,000 for the erection of the plant and experimental work. By the process of carbonizing the lignite perfected in the U. S. Bureau of Mines, a lignite briquet will be manufactured to compete with high-grade anthracite.

## OHIO

**Columbus**—The Panhandle Collieries Co. has increased its capital from \$125,000 to \$250,000 in order to provide additional capital for the development of the property of the company on the Pennsylvania R. R. in Jefferson County. The company is a subsidiary of the Hisylvania Coal Co., of Columbus, and J. W. Blower is at the head.

## PENNSYLVANIA

**Johnstown**—Two thousand acres of coal land along the Potomac, in West Virginia, have been purchased by the A. B. Crichton Coal Co., of Johnstown, for \$500,000. The plant is on the Western Maryland R. R., near Vindex, Md., extending to the West Virginia border. The output is 700 tons daily. The new owners will operate the plant under the name of the Manor Coal Co., with the following officers: President, A. B. Crichton; treasurer, John M. Crichton; secretary and general manager, H. A. Crichton, all of Johnstown.

**Wilkes-Barre**—The Laffin breaker, one of the largest plants of the Hudson Coal Co., located at Laffin near Wilkes-Barre, was entirely destroyed by fire recently. The total loss will amount to approximately \$300,000 and will cause more than 500 men to be temporarily out of work.

The fire had gained such headway near the top of the breaker that the fire fighting organizations from nearby towns accomplished little except saving other buildings. Traffic on the Delaware & Hudson and Central railroads was delayed for a time.

An investigation was started by officials of the company who declare there was no one in the plant after 6 o'clock at night. Charles Dorrance, general manager of the company, intimated that the breaker will not likely be rebuilt. Coal from this mine will be sent to the Baltimore colliery for preparation.

The breaker was of wood construction and built nearly 26 years ago. Recently it had been modernized by the installation of 12 new jigs and other repairs at a cost of more than \$60,000. It had a daily capacity of 2,500 tons and was insured for about \$100,000.

**Washington**—John A. Bell of Carnegie, Pa., owner and developer of extensive coal acreages in northwestern and western Washington County, recently purchased the interest of Cyrus Ferguson, in the Cedar Grove mine of the Verner Coal Co. in the Avella district, northwest of this place. The reported price in the transaction is \$600,000. It is one of the largest workings in the Avella district, and the acreage to be developed through it totals close to 1,000.

An important development in connection with mining in the Avella district is the completion of a survey by the West Penn Power Co., for the purpose of installing a high-tension line through that section. It is understood that it will be run from the Beach Bottom power house and that current will be furnished to mines throughout northwestern Washington County.

**Whitesburg**—The Consolidated Fuel Co., of Pittsburg, Pa., which recently purchased the mines of the West Virginia & Kentucky Coal Co., has just purchased the property and mines of the Smoot Creek Coal & Coke Co., of Jellico, Tenn. The properties are owned by Charles P. Price and the consideration is said to have been \$70,000,000.

The purchaser will install electric mining machinery and electrify the mines, including the installation of electric lights in all employees' homes. E. Stewart arrived here recently to arrange for the building of 100 homes for the employees.

**Greensburg**—The Humphrey Coke plant, in the old Connellsville basin, near here, has been purchased from the J. H. Hillman & Sons interests by the American Radiator Co. The Humphrey Coal & Coke Co. has been organized as a subsidiary by the American company, the president being A. A. Landon; the vice president, E. F. Fitch; the secretary, W. D. Freyburger; the treasurer, W. H. Hill, the first two being of Buffalo and the other two of Chicago. A. B. Kelley, of Greensburg, will be assistant treasurer and general manager.

**Lynchburg**—The Ivy White Ash Coal Co. has increased its capitalization from \$150,000 to \$300,000, to provide for general business expansion. F. E. Turner, Jr., is secretary.

## WEST VIRGINIA

**Williamson**—It is understood that the Pond Creek Coal Co. and the Williamson Coal Co., in which Captain E. L. Bailey, of Bluefield, was largely interested, have been sold to Charleston people, though whom the purchaser or purchasers were has not so far been developed, but it is stated that the sum paid for Captain Bailey's holdings in the two concerns named was more than \$1,000,000.

**Morgantown**—The sum of approximately \$200,000 was involved in the purchase of about 750 acres of Pittsburgh and Sewickley coal on Indian Creek, Monongalia County, W. Va. (near Arnettsville), by the Whyel Coke Co.

**Beckley**—Operations on a large scale in Shady Spring district of Raleigh County, W. Va., are to be undertaken by the Welton Smokeless Coal Co., organized by men identified with the production of smokeless coal. The new company has a capital of \$350,000. Prominently identified with the new company are: J. B. Clifton, C. H. Meador, F. L. Conway, and Ashton File, all of Beckley; J. W. Wilson, of Wyco, W. Va.

A majority interest in the Bacontown Coal Co. and in the High Knob Coal Co. has been acquired by John W. Wilson, of Wyco, W. Va., and J. B. Clifton, of Beckley, the interest of C. M. Lilly and others having been purchased. The two companies, adjoining each other, will be reorganized and operated under the name of the Welton Smokeless Coal Co.

The purchase of the two concerns and their consolidation under one management, is regarded as one of the important events of the year in the Winding Gulf field, where the two properties are located.

John W. Wilson, of Wyco, and J. B. Clifton, of Beckley, recently acquired control of the coal properties of the Bacontown Coal Co., and the High Knob Coal Co., both in the Winding Gulf field, purchasing a majority of the stock from C. M. Lilly and associates. A more rapid development of the properties may be looked for.

**Bluefield**—At an estimated cost of \$4,000,000, a branch line of the Norfolk & Western (18 miles in length) will be constructed from Lenore, W. Va., along Rockhouse Fork of Pigeon Creek, in Mingo County, opening up about 25,000 acres of coal land for development. While negotiations for the construction of the branch line have been pending for a month or more, it was not until the last of April that negotiations between the United Thacker Coal Co. and the Norfolk & Western were completed. The acreage to be made accessible carries the Thacker, Winifrede, Chilton and Coalburg seams of coal. It is hoped to have the new branch line in operation by July 1, 1921.

It is believed that development work on coal and timber properties on the new branch line will involve an expenditure of about \$2,000,000. The United Thacker company has leased large acreages to A. B. Rown, general

manager of the Solway Collieries Co.; to Garner Fletcher, of the Elkhorn Piney Coal Mining Co.; to George S. Wallace, president of the Union Bank & Trust Co. and to H. H. Morris, president of the Standard West Virginia Coal Co.

## CANADA

**Montreal**—The consolidation of nine steel, coal and transportation companies of Canada into the British Steel Corporation, with a capital of \$500,000,000, was announced recently by Colonel Grant Morden. He said it was the largest merger of its kind in the British empire and second only to the United States Steel Corporation.

Colonel Morden declared the consolidation will associate the iron and coal deposits of the Atlantic seaboard of the Dominion with the steel making experiences and financial resources of Great Britain.

Included in the consolidation are:

Dominion Steel Corporation and its subsidiaries; Nova Scotia Coal Co., Ltd., and its subsidiaries; Canada Steamship Lines, Ltd., and its subsidiaries; Canada Foundaries and Forgings, Ltd., and its subsidiaries; Maritime Nail Co. and its subsidiaries; Collingswood Shipbuilding Co., Ltd.; Port Arthur Shipbuilding Co., Ltd.; Halifax Ship Yards, Ltd., and Davie Shipbuilding and Repairing Co., Ltd. Negotiations are in progress with several other enterprises to enter the consolidation, according to Colonel Morden.

## Industrial News

**Cincinnati, Ohio**—The owners of the J. M. Macdonald Coal Mining Co., who had leased their three mines at Rosebud, Harrison County, W. Va., took back these properties on April 1 and will operate these mines themselves. The properties are on the Baltimore & Ohio R.R.; the mine office is at Rosebud and the main office is in the Union Central Bldg., Cincinnati, Ohio.

**Philadelphia, Pa.**—Members of the Motive Power Battery Sales Department of The Electric Storage Battery Co. of Philadelphia, gathered recently in this place, for their first annual convention. Sixty men were present from points as far west as Denver, as far south as Atlanta and on the north from Canada. The sessions were given over to a close study and review of the storage battery possibilities in connection with the propulsion of electric street trucks, electric industrial trucks and electric mine locomotives. The convention was held in the Green Room of the Bellevue-Stratford Hotel, April 29, 30 May 1.

## Personals

**L. W. Fogg**, general manager of the Tower Hill Connellsville Coke Co., has been retained temporarily by the new owners, the Hillman interests. Mr. Fogg is essentially a builder of coke plants, and when the new owners of Tower Hill complete the reorganization, it is understood he will resume his chosen profession as construction engineer.

Mr. Fogg came to the Connellsville region in 1899 as an engineer for the American Steel & Wire Co. to report on the property now developed as the Leckrone, Footdale and Buntington plants of the H. C. Frick Coke Co.

Mr. Fogg was construction engineer for the American Steel & Wire Co., built the Edenborn, Gates and Lambert plants in 1900 and the following year was made

general superintendent of operations. In 1903, after the absorption of those plants by the H. C. Frick Coke Co., he became division engineer for the mines south of Connellsville.

In 1904 he commenced the construction of the Brier Hill Coke Co. plant. He became general manager of the Tower Hill copany in 1907, building the present two plants.

## Coming Meetings

**West Virginia Coal Mining Institute** will hold its annual meeting June 7 and 8, at White Sulphur Springs, W. Va. Secretary, R. E. Sherwood, Charleston, W. Va.

**American Wholesale Coal Association** will hold its annual meeting June 1 and 2, at Pittsburgh, Pa. Secretary, G. H. Merriweather, Washington, D. C.

**The Colorado Retail Coal Dealers' Association** will hold its annual meeting June 8, at Colorado Springs, Col. Secretary, E. Hopper, Denver, Col.

**Southwestern Interstate Coal Operators Association** will hold its annual meeting June 8 at Kansas City, Mo. Secretary, A. L. Johnson, Kansas City, Mo.

**National Conference of Business Paper Editors** will hold its next meeting June 4 at the Congress Hotel, Chicago, Ill. Secretary, R. Dawson Hall, 36th St. and 10th Ave., New York City.

**American Institute of Mining & Metallurgical Engineers** will hold its fall meeting about Aug. 20. It is proposed to leave Buffalo by steamer and cruise through the Lakes, the first stop being at Houghton, Mich., after which the party will visit Duluth and the Iron Ranges of Minnesota. Secretary, Bradley Stoughton, 29 West 39th St., New York City.

**Mine Inspectors' Institute of America** will hold its annual meeting July 13, 14 and 15 at Cleveland, Ohio. Secretary, J. W. Paul, Pittsburgh, Pa.

**Pennsylvania Retail Coal Merchants Association** will hold its annual meeting June 23, 24 and 25 at Reading, Pa. Secretary, W. M. Bertolet, Reading, Pa.

**The Rocky Mountain Coal Mining Institute** will hold its annual meeting in Denver, Col., in conjunction with the National First Aid Meet on Aug. 20 and 21. Secretary, F. W. Whiteside, Denver, Col.

**M. O. I. Coal Association** will hold its annual convention June 16, 17 and 18 at Cedar Point, Ohio. Secretary, B. F. Nigh, Columbus, Ohio.

**National Retail Coal Merchants' Association** will hold its annual meeting June 10-12, Detroit, Mich. Secretary-manager, Ellery Gordon, Philadelphia, Pa.

**Kentucky Mining Institute** will hold its annual meeting June 4 and 5 at Lexington, Ky. Secretary, C. W. Strickland, Huntington, W. Va.

## Obituary

**George A. Strehel**, of Springfield, Ill., for many years superintendent for various mines in the Belleville district, Illinois and well known among Central Illinois coal leaders, died recently at his home as a result of a paralytic stroke. He was, at the time of his death, inspector for the Mine Operators' Indemnity Exchange of Illinois. He was sixty-six years of age and was born in Switzerland.

**John Franklin Kiser**, a well known coal man of central Ohio, died at a local hospital recently from a carbuncle. He has been connected with a number of operating concerns, the last being the western office of the Elk River Coal & Lumber Co. He leaves a brother and a sister. He was 60 years of age, most of which was spent in Columbus. The funeral and burial took place at West Liberty, Ohio, his former home.

**Edward Devoy**, age 73 years, one of the most prominent and best known retail coal men in the middle west, died suddenly of heart failure at his home in St. Louis on May 10. For over 40 years he was engaged in the retailing and who coal in St. Louis—formerly with Kuhn Coal & Coke Co., and for six or seven years as president ward Devoy Fuel Co.

# COAL AGE

The Weekly Journal of the Coal and Coke Industries

Volume 17

NEW YORK, THURSDAY, JUNE 3, 1920

Number 23

## *National Coal Association Meeting*

WITH more than two years of accomplishment behind it, the National Coal Association has just held its third annual convention. We publish in this issue the report of the retiring president, Mr. H. N. Taylor, a record that everyone should read to realize the extent of the activities of the association. The National Association is shown to have played a very important part in shaping the destinies of the coal industry in the past year, for through this organization the government and the public as represented at Washington has been kept informed of the condition of the industry.

The testimony given by members of the association before the Senate committee investigating the high price of coal was such as to give the coal man a clean bill of health last year. The work of the section on railroad relations did much to keep up a spirit of active co-operation with the carriers, with attendant good results. The value of proper cost accounting has been preached and the use of the standard forms adopted by the association has been extended to cover many fields.

That the association is gaining in strength is shown by the fact that despite the resignation of several large producers because of the stand of the majority on the questions of assigned and privately-owned cars, the proportion of total production of the country represented in the membership of the national organization has increased in the last year.

Throughout the meeting there was an undoubted feeling that now, if ever, is the time for the coal men to stand together in a united organization. Good-natured contests over the elections of officers only serve to indicate the whole-hearted interest of the members and do not show a lack of solidarity. President Taylor's call for co-operation as a means to success and the evident desire of the members for even better teamwork than in the past in solving the problems facing the industry are plain evidence that the National Coal Association has a good year ahead.

## *Daniel B. Wentz*

WITH a multitude of able men from whom to make a selection, the directors of the National Coal Association wisely chose D. B. Wentz, of Philadelphia, as president for the coming year. Not so widely and intimately known in the industry as his predecessors in this office, to his friends and associates, who regard Col. Wentz as a lovable and pleasing personality and as a coal producer and business executive of wide experience and broad ideas, his election is extremely fortunate for the association.

We recall him first as a national figure with the Committee on Coal Production in 1917, when he was one of the few appointees to that work who gave their whole time to the tasks and who really gave constructive help to the chairman, Mr. Peabody, in the days when the trial

of the coal industry began. Cool, patient and courageous, his invariable courtesy never fails to win for him his point. His record with the American Expeditionary Force has never been told. It is sufficient to say that in the face of apparently insurmountable difficulties and official red tape he gave our forces coal as Atterbury gave them transportation.

He brings to the leadership of the coal industry an international as well as a national viewpoint. As an operator in union and non-union coal fields in the South, East and West he will appreciate the problems of all sections and from his wide experience will lead where others will be willing to follow. We congratulate the National Coal Association on its choice of Colonel Wentz for president.

## *Cheap Transportation with Cheap Coal*

TRANSPORTATION cheaper than in any other country in the world is what the railroads of the United States are giving us, A. H. Smith, president of the New York Central R.R., told the coal operators at Atlantic City last week. The answer came from the audience that the railroads are getting their coal cheaper than in any other country in the world.

Coal operators are opposing assigned cars for fuel coal because the roads use the cars to pay in part for the coal; that is, they thereby lower the price of railroad fuel coal. Now, that might not in itself be a bad thing but for the fact that necessarily and inevitably the cost of producing coal at mines not accepting assigned cars is materially increased, and because these are the mines that supply the general public the price of coal for all users other than the railroads is raised. The public is required to pay more for coal in order that the railroads can pay less.

The people of the United States are willing to pay value received for what they get and we are sure that did they but understand this situation fully they would tell the roads to pay for coal what it is worth and put it on the transportation bill. The railroads can pay the same for coal as others and still give this country cheaper transportation than in any other country, because even then they will be getting cheap coal.

## *A Fit Place to Live*

HOUSES for labor are a part of the plant of most coal mines. These houses should be homes, but one reading the description of company housing in the bituminous coal fields printed in *Coal Age* of May 20 will understand why they are seldom homes and why mine labor is prone to shift. In the past anything that kept out the rain and weather was good enough for a company house. Rows of frame shacks of a monotonous sameness, depressing to the eye, were the habitations offered mine labor and still are the only houses available in many camps today.

For years the rents charged for these houses have not changed from about \$2 per room per month, but that is all they have been worth. Such dwellings rouse none of the home building instincts that lie in the breasts of all normal men. Under such conditions a man is more likely to keep on the move—to shift from one place to another—than to settle down.

This thought is not new—it has been preached for years. The new thought is that as new housing is built it shall conform to modern ideas of what constitute American homes. Despite the high cost of materials and labor, some very large bituminous coal mines are now being developed and houses planned and built. The answer to the extra cost of building the right kind of houses is that you can capitalize that extra cost in better-satisfied labor and more efficient, steady men.

### *Vindication of the Railroads*

MINING interests have conflicting sentiments regarding the railroads. Indubitably, coal operators have suffered much from the abuses incident to the practice of assigning cars and from the evils of railroad competition with private concerns. They have been annoyed and even robbed by the confiscation of coal—a confiscation that has not been marked by any consideration of the needs of either the operator or his clients. Nevertheless the coal operator still realizes that the necessities of the railroads have accounted for many of their exactions. Not being allowed to live, the railroads have not been advocates of a "Live and let live" principle.

However, the unpleasing relationship with railroad companies has not entirely blunted the mind of the mine executive to the injustice to which railroad management has been subjected by the unfair judgment of the public. He knows that only by allowing the railroads to make money can they be efficient. Few are there that do not know that during the war the German machinations did the country less harm than had already been done by the overdrastic regulation of the railroads by the Interstate Commerce Commission. We went to war with a wrecked railroad system and there was nothing that more sadly held up our war preparations. The railroads continued operating with difficulty, their attempts being bolstered by the patriotism that the war evoked. When the war ended and business revived it was found that the railroads could not fill the nation's needs.

Seeing then that the railroads suffered by restriction, it is gratifying to learn that the policing we gave them was unfair. It is disclosed now that we have not a true bill against them. They are not vastly overcapitalized, as was said; instead their physical property is worth immensely more than their stock would suggest and far and away more than their stock and bonds could be purchased for in the open market.

In the early days most of the railroads failed to make dividends. They were bought in for a fraction of their value by syndicates or by larger railroads which enjoyed a better traffic. There was no watering of stock at that time but rather a frying out of fat. Furthermore the work on the earlier roads was done with cheap labor. Only as far back as 1893 common railroad labor could be obtained for 80c. to \$1 per day, and it was often rendered by men anxious to give service and ready to work ten or more hours a day. Naturally, with wages and

hours what they are now or even what they were before the war the roads could not be duplicated at the price of construction.

Again many railroads steadily made improvements out of capital earned. Some paid no dividends, it is said, because they wished to freeze out small stockholders; others desired to put their roadbeds in better condition and spent their earnings on that work, though they might well have borrowed the money. Watered stock there undoubtedly was, but many of the companies were developing their properties and they were fast becoming far more valuable than their books showed. Appreciation of property and ploughed-in capital was making the railroads more valuable year by year.

Thus it happened that on May 27 the Interstate Commerce Commission was informed that the railroads were physically worth over two billions of dollars more than their capitalization and that their bonds and stocks could be purchased in the open market at present prices for six billions of dollars less than money that would provide for the replacement of the roads at the wage and land rates now ruling.

Figures were given for 51,853 miles of roads in all parts of the country, the valuation being based on the lower wage scale obtaining in 1914. They cover one-sixth of the total investment in American railroads. Yet the older and stronger Western properties are not included, nor are the Pennsylvania and New York Central railroads in the East. The reports as summarized run as follows:

Roads	Cost for reconstruction and land	Investment on carriers' books	Difference
18 Eastern.....	\$1,205,407,829	\$1,014,807,254	\$190,600,575
14 Southern.....	366,288,043	335,647,336	30,640,707
18 Western.....	1,632,086,671	1,807,820,506	—175,733,835
50 Roads.....	\$3,203,782,543	\$3,158,275,096	\$45,507,447

Railroads that have been continually beset by public aspersions nevertheless show up well on valuation. Thus the New York, New Haven & Hartford inventory proves to be worth \$124,000,000 in excess of the company's statement of its investment, the Boston & Maine has an excess of \$80,000,000; the Rock Island, of \$47,000,000; the Great Northern, of \$34,000,000, and the Big Four, of \$15,000,000.

Inquiry into railroad values proves that they are conservatively estimated by their owners and that the railroad companies are well justified in demanding that they receive a fair profit on the basis of those valuations until the Interstate Commerce Commission completes its own estimate. If the dividends paid railroads are to be limited by law they should be based on the actual value of the property involved and they should not be less than can be earned by other safe investments. Even mortgages today bring more than 5½ per cent, which is the railroads' limit.

In the case of the railroads muckraking is doing its perfect work, so that today we cannot run our industrial plants for want of raw material and inability to reach markets. It is busy on the electric railway systems. Soon we shall walk to work if we cannot afford to buy an automobile and pay for gasoline, tires and garage charges. It is destroying our electric power companies and before long we shall be in darkness if the dark influences of the muckrakers are not controlled. When the railroads were first criticized we had too many railroads; now after two decades of condemnation our railroads are inadequate. No state is so strong that it can weather successfully the powers of persistent lying.

FIG. 1. HOIST ENGINE AT NO. 4 MINE AS IT APPEARS WHEN HOISTING BAILING BUCKETS

As may be seen, this is a heavy, substantial machine at many a mine plant for hoisting coal. It was repaired by the oxyacetylene torch.

# Oxyacetylene Promptly Clears Shaft and Repairs Engine Bed After an Overwind

As the Result of an Overwind the Bedplate of the Hoisting Engine Was Broken and Its Foundation Bolts Were Sheared—Two Bailing Buckets, Several Hundred Feet of Rope and an 8-In. Pipe Were Wedged Together at the Bottom of the Shaft — Repairs Were Made by Means of the Oxyacetylene Torch

BY CHARLES C. PHELPS  
Montclair, N. J.

IT IS indeed a coincidence that the two most important factors in and about a mine—men and machinery—should be rescued, when necessity arises, by one and the same agency—oxygen. In one case the oxygen respirator performs the work of resuscitation; in the other the means employed is the oxyacetylene flame, by the aid of which metals are cut and welded. This article will deal with the use of the oxy-

acetylene process in the repair and clearing away of the wreckage after a remarkable accident at a large anthracite mine.

About three years ago the hoisting engine of this company was badly wrecked. This engine, Fig. 1, was employed for bailing water, two 3,000-gal. tanks being used as the bailing buckets. Fig. 2 shows in the foreground the top of a similar tank with guide shoes on

FIG. 2. PAIR OF BUCKETS FOR BAILING OUT SUMP

Each of these huge bailers is five feet in diameter and thirty feet long. It is discharged by the cam at the top acting on the valves in the bottom.

FIG. 3. BADLY FRACTURED BEARING PEDESTAL

The entire end of the engine frame has been cracked completely off by the violence of the racing engine. The gage is read in inches.

FIG. 4. WELDING THE ENGINE FRAME IN THE SHOP

This casting weighed approximately twenty tons. During the welding operation it was necessary to lift and turn the bed-plate several times to make a perfect weld, yet the job was completed between Saturday and Monday mornings.

the side and valve-tripping mechanism on the left. In the background appears the lower end of a tank where the flap-valves for its prompt emptying are to be seen.

The accident in question began with an overwind. The ascending tank, filled with water, failed to stop at the end of its normal travel and continued its upward flight until it reached the sheave wheel. The cable then snapped and the tank went crashing to the bottom of the 1,000-ft. shaft. On its way it met its mate, breaking its cable, both falling in a common wreck to the sump below. The impact of the blow was so great that the sheave-wheel platform was thrown over at an angle of 45 deg.

FIG. 5. HOLDING IN PLACE PARTS TO BE WELDED  
It was necessary that the two pieces should be held firmly in place in order that the finished job would be suitable for use.

FIG. 6. WELD MADE BUT STILL IN THE ROUGH  
This shows the two pieces of the frame welded together. The weld has not yet been finished by grinding

With its load released the hoist engine immediately started to race. The automatic control device naturally failed to arrest the rotation of the engine because it operated upon the throttle. The brake bands became

**FIG. 7. ANOTHER VIEW OF THE SAME WELD**  
The pieces were so held during welding that the finished job was only  $\frac{1}{2}$  in. smaller than the original casting

**FIG. 8. CYLINDERS CONNECTED BY MANIFOLDS**  
As the welding job was a long one the cylinders were joined to obviate the need for changing cylinders when exhausted

red hot and tore apart. Finally the engine's mad career was ended when the right bed frame broke in two, directly under the main shaft. In the meantime, however, the cable on the right drum was whipped about the room, scattering debris right and left, while the cable on the left drum was wound up in the reverse direction.

**TORCH CUTS ROPE AND STRUCTURAL IRON**

The oxyacetylene cutting blowpipe was first brought into play to clear away the masses of rope. The concrete wall of the building nearest the drums was cut away to enable workmen to get at the cables and to provide an opening for removing the wreckage. Here the blowpipe was used to good advantage in cutting through the structural iron of the wall. In spite of the many strands in a rope the cutting blowpipe severed them all quickly and easily.

When the engine was examined the bed frame on

either side was found to have shifted and sheared off the anchor bolts. These bolts were later welded together, which saved an immense amount of work that would otherwise have been required to embed new anchors in the concrete foundation. The right bed frame was cracked entirely across beneath the 22-in. shaft, as may be seen in Fig. 3. The main bearing cap was broken also.

To give an idea of the size of the job it may be said that the over-all dimensions of this engine are: Width, 35 ft.; length, 45 ft. The cylinder bore is 42 in. and the stroke 60 in. The broken bed plate was 22 ft. 6 in. in length and weighed approximately twenty tons. Figs. 3 and 4 give an excellent idea of the extent of the break, while Fig 5 shows how the fracture was opened up by chiseling out a V-groove preparatory to welding.

The latter view also shows how the two parts of the bed frame were clamped together to preserve the align-

**FIG. 9. SECTIONS OF THE 8-IN. AIR LINE THAT FELL DOWN THE SHAFT**

The battered ends and flanges of some of these sections give evidence of the force with which this pipe was precipitated into the sump. Note how one of the tubes which fell on a timber sank deeply into it so that it closed the end of the tube as a cork closes a bottle. The air line was cut by the oxyacetylene torch, and the pieces were passed out and piled in the gangway.

ment while the welding was being performed. It became necessary to cast an entire new end piece for the bed frame. This was done in the mining company's foundry after making the pattern from the drawing of the engine.

#### ENGINE FRAME WELDED IN ABOUT TWO DAYS

Operators from the Newark welding department of the Oxweld Acetylene Co. were engaged to do the actual welding of the bed frame. In joining the new casting to the old frame it was highly important that the opening for the shaft be kept within the original dimensions so that the bearing wedges would fit securely. As a matter of fact the welding was done so expertly that the opening was just  $\frac{1}{2}$  in. less than the distance calculated. Compensation for this discrepancy was easily made by planing off one of the wedges to fit.

The superintendent of the Oxweld Co.'s Newark welding shop and three of his operators performed the work, assisted by several of the coal company's helpers. The operation of welding started Saturday morning and was finished on the morning of Monday following, the men working in shifts each about four or five hours in duration. Fig. 4 shows how the bed frame was supported and handled. It had to be turned three times during the progress of the work. Several layers of asbestos paper retained the heat of the preheating fire and acetylene flame and also shielded the operator.

Fig. 6 is a view corresponding to Fig. 3, showing the completed weld, while Fig. 7 shows the reverse side. In each case they show the work as it appeared before it was finished by grinding away excess metal.

To insure an ample supply of oxygen and acetylene and thus avoid the delay and inconvenience of frequently changing cylinders, several of these containers were connected in battery by means of manifolds as illustrated by Fig. 8.

#### CLEARING AWAY WRECKAGE IN THE SHAFT

In falling down the shaft the water tank did much damage to the casing and to the 8-in. compressed-air pipe which, set snugly in one corner, extended down the full depth of the shaft. Here again the oxyacetylene process was put into operation.

About four hundred feet of the lower end of the pipe was ripped out by the impact of the falling tank and piled up in heaps at the bottom of the shaft. The difficulties of removing this tangled mass may be imagined when it is considered that a tank 30 ft. long and 5 ft. in diameter, part of its hoisting rope and chain, 400 ft. of 8-in. pipe and other miscellaneous débris had become wedged into the 7 x 11-ft. compartment of the shaft and into the sump, which extended about 70 ft. below the landing. All of this material had to be removed through the narrow gangway at the bottom of the shaft.

The first step was to make secure against falling the 600 ft. of pipe which still remained in the upper part of the shaft. This was done by lashing it to the shaft timbers, the men reaching the pipe from the adjoining compartment. Next a temporary roof was built over the wreckage to protect the emergency crew from water and falling objects. The sump was pumped dry and the tank was loosened by dynamite.

The tank was then pulled up to the level of the gangway and was cut by the oxyacetylene process into pieces of a size suitable for handling; likewise the steel cable was cut into short sections and the pipe was cut into pieces averaging 8 ft. in length. Three helpers removed

all this wreckage through the gangway and piled it into cars in an adjoining mine passage. Fig. 9 shows a pile of this pipe, its distorted flanges and bent walls conveying some idea of the force that demolished the line. It will be noted that one piece of pipe was driven into a shaft timber, filling the end with a plug of wood.

The next step was the removal of the 600 ft. of pipe remaining in the upper part of the shaft. First a new tank was installed and lowered to place. A platform was built on the top of it as a stage from which men could work. Proceeding from the lower end upward, the pipe was cut into pieces as long as practicable. These pieces were lashed to the tank and lowered to the bottom of the shaft.

#### PIPE WAS CUT AT THE SHAFT BOTTOM

The lengths of pipe thus removed were cut into pieces about 8 ft. long at the bottom of the shaft. It is easy to understand that the work of cutting could be more conveniently performed there than suspended in mid-air between the surface and the landing. The men worked under many difficulties, not the least being the water which fell in torrents down the shaft. The operator and helpers each wore two oilskin suits, as a single outfit would have afforded little protection in the continuous downpour.

In spite of all the difficulties encountered, the entire job of cutting away the wreckage and pipe was completed in thirty-two working hours. It was estimated that at least three weeks would be required to accomplish the work by means of sledges and chisels. Furthermore, the oxyacetylene method was much safer, as the jarring necessarily arising from hammering might have introduced additional hazards, for it might have so loosened the pipe as to cause it to fall.

Although the oxyacetylene process is actually more economical than other means of accomplishing such work, as has been above described, an even greater advantage is often secured in times of emergency, because it enables the regular production to be resumed with minimum delay. Self-contained oxyacetylene units consisting of an oxygen and a dissolved-acetylene cylinder, blowpipes, hose, gages, etc., all mounted on a two-wheeled hand truck are found to be highly compact and convenient for use in an emergency.

### Will the Government Acquire Coal Mines?

NOTING the diminishing oil supply, forcing the use by army transports, naval and merchant vessels of coal, with the possibility that available coal fields may be exhausted or advance in value, Senator Cummins, of Iowa, has introduced S. Res. 361 for an investigation by the Senate Naval Committee to cover the following points:

Is it probable that government vessels equipped for oil will be compelled to use coal?

Where are the coal fields from which coal of proper quality for ships can be mined situated?

What is the transportation cost of moving coal from fields to United States ports?

Would it be good policy for the government to acquire such of these coal fields as may be necessary to furnish supply that will be needed for government ships and merchant marine; and what would be the probable cost of acquiring them at this time, assuming that it is desirable that the country be assured of an adequate supply of coal for these purposes for a reasonable period?

# What Barrier Coal Has Been and Should Be Left to Protect Anthracite Mines—II

Various Formulae Have Been Developed for Determining the Size of Barrier Pillars — While These Do Not Exactly Agree with Each Other They Give Vastly Better Results Than Mere Guesswork

By W. B. RICHARDS\*  
Hazleton, Pa.

AS to the method to be employed in determining the width of barrier pillars, mining authorities differ considerably. An arbitrary rule for the width of these pillars adopted by a number of coal companies and the state mine inspectors of the anthracite districts of eastern Pennsylvania is as follows: Multiply the thickness of the bed in feet by 1 per cent of the depth below drainage level, and add to this five times the thickness of the bed. This rule applies chiefly to flat beds. Table I shows the size of barrier pillars required by this rule.

FIG. 8. VERTICAL SECTION OF IDEAL PILLAR

This illustrates the width of pillar necessary for various thicknesses of beds and for varying depths of cover as based on Table I. It is an arbitrary table adopted by a number of coal companies and state mine inspectors of eastern Pennsylvania.

\*Consulting Engineer, Cranberry Creek Coal Co.

FIG. 9. LONGITUDINAL SECTION THROUGH A THEORETICAL BARRIER PILLAR

This pillar is assumed as existing between adjoining mines and extending parallel with the inclination of the bed.

In the Southern and Western Middle anthracite coal fields of Pennsylvania the beds incline anywhere from zero to 90 deg. and at many places have an inverted dip, particularly along Sharp Mountain, which lies on the southern rim of the Southern coal fields. In flat beds the size of the pillar required depends chiefly on its depth from the surface and to a less extent upon the thickness of the coal.

In such beds lateral draw does not complicate the situation as much as in tilted beds, where the inclination increases the uncertainty as to what will be the effect of that draw on the strata overlying the bed. Inclination also gives the roof a tendency to slide over

FIG. 11. A BARRIER PILLAR ESTABLISHED BETWEEN ADJOINING MINES

This shows clearly how the pillar width increases or should increase with the depth of cover. The pillar takes a turn to suit a twist in the land line.

should have as has been deduced from pillars that have been tested in mines that were filled with water. Some of the pillars tested, as noted above, were watertight, while the water percolated through the others in large quantities. It gives, as is to be expected, greater widths than were provided in those cases where the water percolated through the pillar.

The accompanying table (Table IV) shows the width of barrier pillars to be reserved between adjoining properties in anthracite mines. The widths shown in this table are to be used solely for determining the pillar thickness in flat or lightly inclined beds pitching from zero to 25 deg., and where the coal is hard and firm. Where the beds slope from 25 to 90 deg., or where they are dirty or shelly, or where the coal though hard contains slips or fractures and again where the coal tends to run across the pitch, and thus decrease the resistance of the established pillar, a 5- or 10-per cent allowance should be added to the width of the pillar specified in the table. Water under pressure will percolate for some distance through dirty, shelly, slippery or fractured coal or through coal running across the pitch.

Where the beds are in a heavy or inverted dip, as in Sharp Mountain, and where the coal also is dirty and shelly from 10 to 20 per cent should be added to the width shown in this table. By comparing the figure for pillar width in Table IV with the actual pillar in case No. 5 of Table II it is found that whereas the pillar is 175 ft. wide, Table IV calls for 160 ft. Likewise in

case No. 4 of Table II the pillar was 185 ft. wide, whereas Table IV would call for a width of 250 ft. In case No. 3 of Table I the width of the pillar provided was 300 ft., whereas Table IV calls for a width of only 235 ft. These pillars were all watertight.

The pillar in case No. 2, Table II, was 130 ft. wide. Table IV would require the providing of a 200-ft. pillar. The water percolated through this pillar in large quantities, and it was doubtful if enough coal had been left for safety.

According to Eytelwein, the strengths of pillars vary as the cube of their breadth. By comparing the actual pillar which is 130 ft. wide with the tabulated pillar of 200 ft. width it will be seen that the latter would give a factor of safety of about 3. Taking the pillar No. 4 of Table II, which is 185 ft. wide, and comparing its width with the call of Table IV, which is 250 ft., and assuming that this width is safe, the factor of safety of the pillar as given in Table IV would be 2.

By checking the conclusions in Table IV with the pillars reserved under tunnels that have been tested and were not affected by the lateral draw, I found that the table agreed closely with these pillars, and that the widths shown in the table were safe as far as the lateral draw was concerned.

In determining the proper size of barrier pillars it is impossible to give exact rules or formulæ that would be universal in their application. Each mine is a special problem, and it is well to ascertain the successful practice in the field where the mine is located or in similar fields under the same conditions. Practice, however, even where conditions are similar, should not be followed blindly.

Since the width of pillars as shown in the table agrees closely with the general practice in the Southern anthracite field, I believe it can be used as a guide, with modifications, of course, to suit local conditions. Any modification, however, should be based on the experience and the judgment of the person in charge of the work. Great care should be exercised in determining the size of these pillars, and a large margin of safety allowed where experience has not already determined the best dimensions. A barrier pillar should be fixed

FIG. 12. CROSS-SECTION SHOWING PILLAR ESTABLISHED LENGTHWISE WITH THE STRIKE

This is the pillar shown in plan in Fig. 11. A depth of about 900 ft. has been attained.

TABLE IV. WIDTH OF BARRIER PILLARS TO BE RESERVED BETWEEN ADJOINING PROPERTIES

THICKNESS OF BED	VERTICAL DISTANCE FROM THE SURFACE TO THE LEVEL IN THE MINES WHERE PILLARS ARE TO BE ESTABLISHED																			
	100'	200'	300'	400'	500'	600'	700'	800'	900'	1000'	1100'	1200'	1300'	1400'	1500'	1600'	1700'	1800'	1900'	2000'

FIG. 13. LONGITUDINAL SECTION OF THE PILLAR SHOWN IN FIG. 11

from a safety standpoint, but care should be taken not to render unrecoverable any more coal than is necessary. Barrier pillars contain a large tonnage, varying from 100,000 to 2,000,000 tons.

Vertical section, Fig. 8, was constructed from Table I, and illustrates the increased width of pillar required for different thickness of beds from 3 to 60 ft. in thickness and for each 100 ft. of vertical depth from the surface to a limit of 2,000 ft.

Longitudinal section, Fig. 9, illustrates the theoretical barrier pillar required between adjoining mines that are divided by a line running parallel to the inclination of the bed. The pillar should gradually increase in width as the thickness of cover increases. This pillar was constructed from the cross-section shown in Fig. 15. The thicknesses of the beds were assumed to be as follows: Diamond, 4 ft.; Orchard, 9 ft.; Primrose, 12 ft.; Mammoth, 50 ft.; Skidmore, 4 ft.; Seven-Foot, 6 ft., and Buck Mountain bed, 13 ft.

The thicknesses of the strata at right angles to the dip are as follows: Between the Diamond and Orchard, 150 ft.; the Orchard and Primrose, 175 ft.; the Primrose and Mammoth, 260 ft.; the Mammoth and the Skidmore, 30 ft.; the Skidmore and the Seven-Foot, 50 ft., and the Seven-Foot and the Buck Mountain, 110 ft.

The pillar needed at each level was established by a consideration of the conditions. As the Skidmore, Seven-Foot and Buck Mountain beds are underneath the Mammoth, the pillar established in those beds for the protection of that upper bed has to be increased, and the increased thickness required was determined by using the thickness of the strata between the beds at right angles to the dip, and using Table No. I for the increased width required for the bed under the Mammoth.

Fig. 11 shows a barrier pillar that has been established between adjoining mines. It will be noted that, because of a change in the direction of the land line, part of this pillar runs lengthwise with the strike of the bed, but the pillar for the most part runs in the direction of the dip.

At the water level a width of 100 ft. was established, while at a vertical distance of 260 ft. below the surface the width was increased to 150 ft.; at 560 ft. the width

FIG. 14. LONGITUDINAL SECTION OF A BARRIER PILLAR OF VARYING WIDTH

Because of the greater thickness of the Mammoth bed the pillar is made from 100 to 150 ft. wider in this measure than it is in the Primrose bed

FIG. 18. LONGITUDINAL SECTION OF SHAFT PILLAR

In order to afford protection to the water-level tunnel this pillar will temporarily be kept wider on one side of the shaft than on the other.

of the district mine inspector this thickness is necessary for the safety of the persons working in the mine.

By this rule for various heads of water the following thicknesses of pillar will be required:

Head of Water in Feet	Thickness of Pillar Required in Feet
100	80
200	160
300	240
400	320
500	400
600	480
700	560
800	640
900	720
1,000	800

Fig. 16 shows the method of driving a chute along the pillar in thick beds on heavy dips where there is danger of the bed running and encroaching on the established pillar. This chute is driven through to within 75 ft. of the surface, where a battery is put in and a breast driven. After this breast is finished the breast pillar is extracted, and the work drops back 75 ft. down the chute. Then another battery is erected, another breast driven and the breast pillar extracted, and so on until the coal is mined to the airway. By this method the bed can be controlled and little damage will be done to the pillar by the coal sliding off.

A shaft pillar is the coal reserved on either side of a shaft. This should be of such a width that when the coal is extracted the lateral draw or subsidence will not extend to the shaft nor to the buildings on the surface around the shaft. This coal can be extracted only when the mine is worked out and robbed back to the shaft pillar. Thus it is the last coal to be extracted from the mine.

In determining the width of shaft pillar necessary to protect the main openings and buildings on the surface an engineer can ascertain the nature of the overlying

strata by making columnar sections through the shaft and in the tunnels driven to develop the beds, and can establish a pillar to suit the conditions found.

When the location of a new shaft is decided upon, boundary lines should be established around the shaft, approximating to the proposed shaft pillar. The buildings required for the operation should be located within these lines. If the buildings are placed haphazard, their proper protection will make necessary the leaving of a larger pillar and this will tie up much coal, and later some of the surface structures may have to be removed at appreciable expense, in order to permit of reducing the unnecessarily large size of the pillar.

A shaft pillar is reserved to protect the shaft from the lateral draw, while a barrier pillar must not only be sufficiently wide that the lateral draw will not connect through the strata but must also be of sufficient width to withstand a considerable water pressure. A shaft pillar can therefore be 10 to 20 per cent less in thickness than that shown on the table for barrier pillars. This will depend on the thickness of the bed and the depth from the surface.

Fig. 17 shows a shaft pillar that has been established to protect a combined coal and water shaft, water-level tunnel and buildings on the surface. The pillar for the water level is only temporary, and will be required only until the water-level coal has been mined out, when the tunnel can be abandoned. The old slope, water level and second level appearing on the plan were mined years before the shaft was sunk. The present pillar line was established for all levels below the second down to the basin. The cross-section shown in Fig. 10 is on line with this pillar. The longitudinal section, Fig. 18, shows the pillar line in relation to the shaft, tunnel and buildings on the surface.

In the mines of the Lehigh Coal & Navigation Co. fire pillars are provided by leaving every eleventh breast unworked. Chutes are driven on 60-ft. centers, and breasts are made 24 ft. wide. This provides a solid fire pillar 96 ft. in width. A dam can be constructed at such a pillar and in case of a fire that portion of the mine can be sealed off or flooded without the balance of the mine being affected. Such pillars have been found valuable also in localizing squeezes, should they start in that section of the mine. The fire pillars are left standing until the gangway is being robbed back. When the robbing of the gangway approaches toward the fire pillar, a breast is driven in it, so that the breast can be driven up and the breast pillars extracted by the time the stumping of the gangway reaches that point.

### Buyer's Default in Payment Authorizes Seller to Cancel Contract

ON FAILURE of the buyer, under a contract for sale of coal to be delivered in monthly installments, to pay for an installment previously delivered within the time agreed upon, the seller was entitled to cancel as to further deliveries.

And the fact that the seller afterward accepted payment of the amount due did not reinstate the contract, in the face of his continued refusal to make further deliveries, since the seller was entitled to recover for the fuel actually delivered whether the contract was cancelled or not. (*Illinois Supreme Court, Chicago Washed Coal Co. vs. Whitsett, 116 Northeastern Reporter, 115.*)

# Duplex Water-Tube Boiler Adds Efficiency To Quick-Steaming Qualities

Boiler Has Water-Box Headers and so Omits Sectional Headers and Mud-Drums—Most of the Tubes Are Bent and Thus They Meet the Expansion Strains Which Arise Whenever the Boiler Is Heated

**A** BOILER recently put on the market seems suitably designed for the production of a maximum of steam with a minimum of trouble. It is a water-tube boiler with two water drums, one in the front and one in the rear. Water tubes pass from the rear drum downward to a water-box header, or water leg, in the front of the boiler, while other tubes criss-cross these, passing from the front drum down to a water-box header at the rear.

Short circulating pipes extend between the drums and the water legs, and these, as will be noted, are protected by insulating material from the heat of the fire. Their purpose is to provide for that circulation of the water in the boiler that is so desirable. The water in the drum is colder than in the water tubes and consequently passes down the circulating tubes to the water legs and replaces in the water tubes the hot water which tends naturally to rise toward the drums. A rapid circulation is thus started which might be impaired if the circulating pipes were allowed to share in the heat from the fire. It is for this reason that they are insulated.

This is known as a one-pass boiler, since the furnace gases pass the tubes once only, but as the criss-cross arrangement of tubes breaks up the gases and prevents them from following their natural course, deflecting

them toward the water legs and drums, and as baffles are suitably placed on the water tubes, the boiler gases are well spread and do their work thoroughly, finally delivering their heat to the superheater which is placed immediately over the space left vacant by the criss-crossing tubes.

The designer of the boiler, T. Howard Burton, has for years been identified with the manufacture of a single-drum water-tube boiler of the old Worthington type. In this new boiler, although the criss-cross arrangement of the tubes of the older boiler has been retained, the sectional construction has been eliminated, and, as stated, instead of placing individual headers at either end of a tube section, the lower ends of the tubes enter a large water-box header extending the full width of the boiler. The tubes lead obliquely upward across the path of the gases and enter their respective drums. The header is thus eliminated at one end, and the arrangement gives maximum liberating surface for the steam generated, as each tube delivers its contents directly to the drum, thus eliminating the nipple connections between the heating elements and drum common to many types of water-tube boilers. The water legs, being arranged at right angles to the tubes, slope upward and outward at each end of the combustion chamber. An extension of the water leg with blowoff connections eliminates the necessity for a mud drum.

Water connection from the drum to the water leg on the same side and immediately beneath it is made by curved circulating tubes, one end leaving the drum radially and the other end entering the top of the water leg approximately in line with it. The curved tubes are easy to place and make a flexible connection, as they will bend slightly under the contraction and expansion of the boiler parts.

Fig. 1, a sectional elevation, shows how the tubes are arranged in vertical rows of eleven each, adjacent rows sloping in opposing directions. As most of the tubes are curved, they allow for expansion and contraction and tend to reduce the movement at the joints that often causes leakage. The tubes may be cleaned from within the drums and, instead of pulling them out through handholes in the header, they may be removed in the combustion chamber. Both features are big time savers and tend to reduce the time it is necessary to keep a boiler off the line for cleaning or tube removal. An outer shell is provided which may be varied considerably in construction and design.

This design of boiler can be installed in exceptionally low headroom, and the heating surface per square foot of floor space covered is unusually large. By leading the tubes into the drums one-half the header requirement is eliminated and maximum steam-liberating surface is provided. As a consequence the boiler steams rapidly. In the water legs key caps are provided opposite each tube, but the latter may be removed within the combustion space and may be cleaned from

FIG. 1. VERTICAL SECTION OF BURTON BOILER

The multiplicity of water tubes and the even distribution of heat in the boiler provide for a rapid generation of steam and consequently make the boiler compact.

FIG. 2. ELEVATION OF ONE DRUM, THE TUBES AND WATER LEG

Showing the tubes, much foreshortened; passing from the front water leg to the rear drum and also the dry pipe in the drum, which is designed to collect steam free of entrained water.

the drum, so that the frequent removal of caps is avoided. The superheater is conveniently placed and, being in the path of the outgoing gas, tends to insure a low exit temperature. Being centrally located and extending the full width of the setting, the uptake induces an even distribution of the gases over the heating surface. Three soot-blowing elements are provided, and so placed that the soot removed by them falls directly on the grate and is automatically removed with the ashes. The boiler is manufactured by the De Pere-Burton Co., of De Pere, Wis.

## Pros and Cons of Low-Temperature Distillation of Coal

Capacity of Retort Is Low—Coke Made Is Weak  
Oils Are Apt to Become Resinous—Gas Yield  
Low Though Gas Is Good

AMONG the many carbonizing processes the low-temperature process has for the past ten years been subjected to a strong searchlight of scientific investigation and public criticism. It has many merits but some of the claims made for it still need the confirmation that can only come by larger-scale operation under the actual working conditions of an established industry.

Its greatest impetus, as stated in *Coal Age* April 29, was received in Germany during the war. That country, being shut off from all outside oil supplies, was constrained to seek and use coal-distillation methods that would give the maximum yield of liquid products, which requirements were met by the low-temperature process.

Under normal conditions, however, this process has

been relatively slow in application and practical extension, because it is approached by most with considerable prejudice. It is highly improbable that it will ever supplant or rival the present high-temperature coke- and gas-making methods; first, because it does not produce a metallurgical coke, but a soft and friable material of poor structure and containing volatile matter from 8 per cent up. This coke would have to find its outlet in the domestic field and in water-gas plants. Secondly, the mechanical operations and speed of coking would militate against its use in competition with the modern byproduct coking plant.

Temperatures employed vary with the different systems. They range between 450 deg. and 650 deg. C., and to produce the best results it is essential that the distillation take place in an oxygen-free atmosphere. The retorts used are either inclined or vertical. Some provide for continuous feeding and others for distillation in a closed retort. Some are made of firebrick and others are of cast iron. The coal capacity of brick retorts for this process as developed to the present probably will not exceed twelve tons per twenty-four hours. Small cast-iron retorts will carbonize 1½ tons of coal in 4½ hours.

The outstanding value of this entire process is found in the increased yields of byproducts, that is, motor benzol, ammonia and tar. These yields may be two or three times as great as those obtained in coke- and gas-making plants. The increased value of byproducts alone, however, will not pay for the process unless a good and steady market is found for the so-called smokeless fuel it produces. The cost of purification of the oils is considerable and unless the oils are so treated they are apt to become resinous in character and be of no value. Cracking of these oils also is a field for investigation.

As the coke produced by this process is a semi-coke, a good coking coal is necessary if a good coke is desired, consequently low-temperature carbonization of high-ash and non-coking coal probably would not be a commercial possibility.

The nature of the tar produced is paraffinoid in character and in many respects resembles petroleum. The free carbon is low, generally less than 2 per cent, with practically no naphthalene present, because that substance is not formed at low temperatures.

The yield of gas is only about half that obtained in gas works, averaging not in excess of 6,000 cu.ft. per net ton of coal. The calorific value and illuminating powers of the gas are, however, 60 per cent greater, making it possible to dilute the gas if it is to comply with the ordinary specifications for gas to be used for lighting purposes.

The low-temperature process has a future in that it tends to produce what the older and present carbonization processes were not designed to do. Future economic conditions may arise which will push this process to the front, and all possible encouragement and consideration should, therefore, be given to its continued development.

## Inspects Tennessee Coal Deposits

DAVID White, chief geologist of the U. S. Geological Survey, in company with L. C. Glenn and W. A. Nelson, is conducting an examination of coal deposits in Tennessee. Mr. Nelson is the state geologist of Tennessee.

# Where Stripping Is Regarded as a Regular Adjunct to Underground Mining—I

Coal Is Stripped by Steam Shovel from the Outcrop to the Contour, Where the Depth of Overburden Makes Open Mining Prohibitive—From That Line, Which Is Set Where the Cover Is 45 Ft. Deep, to the Boundary Line of the Property Underground Mining Methods Are Employed

BY DONALD J. BAKER  
Pittsburgh, Pa.

ONE of the largest operators of combination strip and underground mines in the State of Indiana is the Rowland-Palmer Consolidated Collieries Co. It is fully abreast of the times, which have inexorably decreed that stripping operations shall continue to become larger. Market conditions during the past year

Today a strip pit in Indiana must minimize its use of labor, for is not time work remunerated at the rate of \$6 per day? The coal must be most scrupulously prepared, for the Indiana trade is insistent on clean coal and on coal of many sizes. In consequence the initial outlay must be large and to overcome prejudices

Loading Standard Steel Gondolas  
At No. 9 Strip Pit

The coal is hauled from the pit in standard cars. The locomotive, however, is a "dinkey." Note the caterpillar tractors that make it independent of railroad tracks.

Stripping Cover at No. 9 Mine  
With a Big Steam Shovel

This shovel is full-revolving and has a veritable "boarding-house reach." Shovels such as this have made "double shoveling" unnecessary.

have demanded greater economies in labor and a better preparation of coal, and only large and well equipped mines can successfully meet the competition. During our participation in the war and prior to that time the smaller operations, because of imperfect equipment for preparation and lack of care in the excavation of the coal, delivered to the market much poor fuel. It has been hard to overcome the unenviable reputation resulting from this lack of care. The larger pits were never accused of such inadequate preparation, yet to some extent the large amount of poorly prepared coal delivered by small strip pits affected even the reputation of the larger operations.

the preparation must be such as to defy complaint, for the trade has not yet received stripped coal into its good graces. But preparation such as that given the coal from the pit of the Rowland-Power Co. will before long give to strip coal the good repute to which it has title.

At its mines the quality of the prepared strip-pit product so closely duplicates that of the coal from the underground workings that the difference is scarcely discernible except where the coal is taken near the outcrop, and in Indiana the difference even here is not as marked as in coals mined by stripping at points further east.

EXTERIOR VIEW OF MINERS' BATHHOUSE

Wings upon either side of the building house the showers while the main portion serves as a dressing and clothes room. The gable entrances make possible the double doors that shield the bathers from drafts.

SUMP HOLDING WATER FROM STRIPPING

Water is voided from this reservoir by the periodic operation of the steam-driven pump on the left. Steam is provided from a locomotive temporarily detailed for that work, the unwatering taking not over two hours.

A 6-CU.YD. BUCYRUS STRIPPING SHOVEL

This machine is here shown working in shallow cover at the No. 3 operation. Note how it makes the men who operate it appear as mere pigmies. To misquote Shakespeare: "It doth bestride the narrow earth like a Colossus and we petty men walk under its huge legs," etc.

One of the largest operations of this company, and incidentally one of the largest of its kind in the state, is located at Staunton, about twelve miles east of Terre Haute. Here 1,000 acres of the No. 3 bed of Indiana coal, averaging 8 ft. in thickness, is under development, partly by stripping and partly by underground mining methods. The bed outcrops along one side of the property and dips in a general southwesterly direction, the inclination averaging about 30 ft. to the mile, or a little less than 0.6 per cent. While the bed is thus relatively level and permits stripping on an extensive scale, yet it can be seen that a point will be reached where stripping will be impractical by reason of the ever-increasing overburden.

This region of Indiana is fairly level, and the cover over the coal increases uniformly with the dip of the bed. As a result, the coal is stripped from the outcrop line to a point where the overburden becomes approximately 45 ft. thick. When this stage is reached stripping methods are abandoned and the balance of the coal is removed through a shaft that has been sunk at the center to that part of the coal area that is so deep as to forbid stripping.

There are three separate operations at Staunton, two of which are strip pits. These lie on either side of the tract, but are approaching each other as they near the far end of the territory assigned to them. An output of somewhat over 4,000 tons daily is averaged by the three operations. Half of this is credited to the No. 6 mine, which is a shaft development, and the rest to the two strip pits known as Nos. 3 and 9.

The acreage, it will be noted, is a comparatively

COAL-LOADING SHOVEL AT NO. 3 STRIPPING

As in No. 9 operation the smaller shovel is employed only for loading coal onto standard railroad cars that are operated only between the strip pit and the tippie. It will be noted that the material on the bank is such as the stripper seeks and the underground miner would wish to avoid.

small one and the life of the property will not be long. Nevertheless great care has been taken in the selection of modern and complete equipment for preparing the output. All structures, it is true, are of wood, so that no large amount of capital is tied up in the surface buildings themselves. It would have been folly to construct buildings of a more or less permanent nature; that is, of either steel or brick. The type of construction chosen in no way interferes with the efficiency of the plant, and the equipment within belies the exterior aspect. Stripping operations are at the best only temporary and the adjoining underground mine at this plant also might be called temporary on account of the small size of the acreage available.

The three operations are situated almost in a line with each other and each is about a half mile from its nearest neighbor. The big shovels at both plants started at opposite ends of the outcrop and worked toward each other. Though the operations at the two strip pits are carried out in a similar manner, the equipment employed differs considerably.

At the No. 3 mine a 225B Bucyrus steam shovel with an 80-ft. boom and a 6-cu.yd. dipper is handling the overburden. A cut about 60 ft. wide is made by this shovel from one end of the territory to the other. The machine then works its way back in the opposite direction. Of the 60-ft. width of coal bed exposed by the stripping shovel only 45 ft. are lifted by the coal shovel, 8 ft. being left to accommodate the railroad tracks and another 7 ft. being provided between the tracks and the bank that is to be worked on the return journey. The leaving of this part of the bench

### General View of No. 9 Pit

Both shovels are here seen in operation, the larger moving the overburden and the smaller loading coal. The size of the shovels can be judged when it is recalled that the seam of coal being lifted is eight feet thick.

makes it possible to lay the track for the return trip with minimum delay. The coal shovel is a 35B Bucyrus with a  $1\frac{1}{2}$ -cu.yd. dipper.

After the larger shovel has removed the cover the top of the coal is cleaned by pick and shovel, brushed with a wire broom and finally washed clean, so that when the small machine reaches the coal it finds it quite clean on top. Throughout the tract a fireclay bed overlies the coal. This is the reason why great care must be taken to clean the top of the bed. The bottom is a firm sandstone and gives no trouble. Holes for shooting the coal loose are put down on 8-ft. centers. At both pits the drilling of these holes is accomplished by means of jackhammers.

#### COMPRESSOR ON SHOVEL SUPPLIES AIR DRILLS

In No. 3 mine compressed air for these drills is supplied through a 1-in. hose line from a Westinghouse compressor installed on the shovel. One stick of explosive suffices to bring down an 8-ft. block of coal. The shots are fired by a storage battery. In both

strip pits standard-gage track is used and the small shovels load the coal directly into steel gondolas. Vulcan "dinkey" locomotives haul away the cars from the pit. Two of these are 20-ton while the third is a 30-ton locomotive. By reason of the firm floor on which fortunately the coal rests the product is clean when loaded into the car and but little of the bottom is ever disturbed.

In most strip-pit workings much surface water has to be removed, and this operation is no exception. Here, however, the dip of the bed aids in the solution of the problem. A large sump has been excavated and it serves to collect and hold all this water. At No. 3 pit the water is elevated by a Fairbanks-Morse centrifugal pump to a small stream running near the sump.

The pump is installed on the berm that has been left to sustain the railroad tracks which lead into the pit. This pump is equipped with an 8-in. suction line and a 6-in. discharge. It is operated by steam supplied by one of the locomotives, of which there are more than

### One of the Big Shovel Cuts

Compressed air used in sinking shot holes in the coal is supplied by a compressor on the smaller shovel. The sandstone in the floor makes a good pavement for the caterpillars.

the haulage system demands. By use of the boiler of this locomotive is obviated the loss of steam that would be sustained if the pump were fed from the power plant at No. 6 mine.

Such pumps might be driven by electrical energy, but after all the work is intermittent and it leaves the locomotive free for other work when it is needed. If an electric motor were used for this purpose it would be subjected to all sorts of inclement weather and would be liable to frequent breakdowns because of the abnormally severe usage with which it would meet. It is necessary to operate this pump only one or two hours daily. Under these circumstances steam can be furnished with ease by the spare locomotive.

At No. 9 pit, on the other side of the tract, the operating methods are quite similar. The big, or stripping, shovel is of Marion make of the 300 type. It has a 90-ft. boom equipped with a 6-cu.yd. dipper. The coal shovel is a No. 36 Marion of the caterpillar-tractor type and has a bucket capacity of 1½ cu.yd.

#### IN NO. 9 COMPRESSOR IS ON LOCOMOTIVE

The coal is cleaned and the shot holes drilled in much the same manner as noted in preceding paragraphs. The compressor supplying the air for the drill, however, is not located on the shovel but has been installed on the locomotive assigned to this pit. By this arrangement the compressor is operated whenever the locomotive is waiting for the filling of a car and the coal is shot down during the time the locomotive is engaged in removing a loaded car from the pit.

The loaded gondolas from both strip pits are removed to a centrally-located tippie. Here the cars are placed, one at a time, over a hopper in the shed at the rear of the building. The bottom gates of the cars are opened and the coal passes into the hopper and is distributed evenly upon a housed-in flight conveyor that leads up an incline to the head of the tippie, that structure being built of wood. It was designed and erected by the Link-Belt Co., as was also all the equipment it contains. The exterior appearance of this tippie and its appointments on the inside are quite similar to the plant described in *Coal Age* April 8.

From the head of the flight conveyor on the tippie the coal drops into a second hopper, or conveyor discharge chute, from which point it is delivered to a second conveyor, or picking table, where dirt and refuse coal are removed, the extraneous material being thrown into wooden chutes that lead to one central point at which the rock and slate are loaded into dump cars for removal over one of the railroad tracks beneath the building.

The picking table is located on the upper of the two tippie floors. On the lower floor are mounted horizontal shaker screens, to which the coal from the picking table is delivered. Here the coal can be divided into three sizes or into a combination of any two or more of them. By the proper manipulation of a gate placed ahead of the screen plates the coal may be shunted to a crusher installed on the second floor of the tippie. It may thus be shipped as stoker fuel.

As a result of the careful preparation given in this building the coal loaded is of a high standard of excellence. From the appearance of the loaded cars it is hard to tell the stripped coal from that prepared at the tippie of the No. 6 mine. As a matter of fact some of the stripped product has at times commanded

a higher figure than that produced by underground mining from the same bed. Some of the coal under light cover in certain sections of the tract has a higher calorific value. Few strip-pit plants could make a similar claim and one as well substantiated. The tracks under the tippie connect with a spur of the main line of the Pennsylvania R.R. which leads out of St. Louis.

(To be Continued)

## Avoiding Inaccuracies in Moisture-Content Determination

Solvents Prevent Oxidation and Retain Volatile Matter and So May Aid in Determination of Moisture in Coal

A NEW method for the determination of moisture in coals is proposed by A. Renfred Myhill in the *Gas Journal*, Vol. CL, No. 2,969, page 21 (April 6, 1920). The method claims increased accuracy and rapidity.

Objection is made to the customary method of drying from one to five grams of coal for one hour at 100 deg. C. The statement is made that "most coals, particularly when in fine powder, evolve a fair amount of volatile matter (other than water) when heated for any length of time at 100 deg. C.," and that "certain oxidizing actions take place." It is admitted, however, that "this error in many cases is not serious." Bodies that will dissolve the volatile matters evolved have been proposed to meet these difficulties and the reviewer agrees that they would prevent oxidizing actions, but is of opinion they would not totally inhibit evolution of volatile matter from the mixture.

The new method offered consists in distilling a mixture of 100 grams of coal with 200 cc. of either benzol, toluol or xylol. The solvent selected must be free from water and must contain fractions boiling at not less than 110 deg. C. The distillation is carried on up to at least 110 deg. C. and the water collecting at the bottom of the receiving cylinder may be isolated and weighed or the volume may be determined and converted into grams by consulting a specific gravity table for water at the temperature of the resulting distillate.

One method employed by the U. S. Bureau of Mines for the determination of moisture in coal consists in drying a small coal sample in a weighing bottle for one hour at any temperature ranging from 104 deg. C. to 111 deg. C. This fact would seem to indicate that the inaccuracies due to the evolution of volatile hydrocarbons from coal at 100 deg. C. is regarded as negligible.

The author states that "the whole test can easily be carried out in from twenty to thirty minutes." It should be pointed out that the apparatus would need constant attention during the entire distillation which is not now required in the generally accepted method.

The method proposed by Mr. Myhill would frequently be inapplicable because one hundred gram samples are not always available, and the action of the solvent employed might render the sample unfit for subsequent detailed analyses. It is known that organic solvents under some conditions will alter the structure of the original coal. The effect of this procedure on the constituent of coal requires investigation. Further, the greater amount of apparatus required, the more cumbersome manipulation and the added cost of water-free solvents are objectionable features of this method.

# Urges Coal Operators to Meet Problems Through Organization

President Harry N. Taylor in His Address as Retiring President of National Coal Association Tells Coal Men That Their Body Is the Keystone of the Industry—Problems of the Year Reviewed

BY H. N. TAYLOR

**I**N APPEARING before you for the last time as the president of the National Coal Association it is with a feeling of great pride that I look back over the accomplishments of the past year and the splendid record the National Coal Association has made.

Great as were the achievements of the association during the war period, the National has been called upon to face far greater questions, more vitally affecting the welfare of its members, during the past year of reconstruction than even the great questions which confronted it during the period of actual hostilities.

The war problem was largely one of increased production. During the past year we have been called upon time and again to defend ourselves against attacks which threatened the very life of the industry. Never has the need of organization been so manifest, and never has the fact that we have so powerful an organization as the National so justified its being.

## LOCAL COAL ASSOCIATIONS STRENGTHENED

I desire to point out as briefly as possible some of the principal efforts and accomplishments of the association.

Shortly after the annual meeting of the association in Chicago Mr. Morrow, your vice-president, and myself made a trip into West Virginia and Alabama, meeting with the operators in that section for the purpose of strengthening their local association and their relationship with the National. These organization trips were followed up by Mr. Morrow and myself, visiting the Iowa Coal Operators' Association, and, together with Mr. William Henderson, the chairman of the Membership Committee, we made an extended trip, meeting with the operators of Missouri, Kansas and Arkansas in Kansas City; with the operators of Oklahoma at Muskogee, the operators of Texas at Dallas, the operators of Colorado and New Mexico at Denver, and the operators of southern Wyoming and Utah at Salt Lake City. Mr. Morrow extended his trip to the State of Washington, returning by way of Montana, so that by personal contact we have reached the operators in almost every section of the country, and have added largely to our membership, and from reports received have aided the strengthening of the local associations which ultimately became members of the National.

Early in June of last year it became evident that there would be a serious shortage of coal in the fall and winter of 1919-1920. Advance information from the miners of their intent to strike in November caused the association to form a committee to place these facts before the public, and this committee put on a campaign, laying these facts before the public through advertisements in the principal journals of the country, and for this purpose expended \$94,447. This campaign yielded almost immediate results, and stimulated the placing of

orders at the mines. The Geological Survey reports show an immediate increase in production—I believe largely due to this advertising campaign. It had the further effect of developing the fact that with the normal movement of coal there was an actual shortage of cars.

The association, through its railroad committees, put forth every effort to compel the U. S. Railroad Administration to give proper attention to the transportation of coal, and by co-operating with the Railroad Administration succeeded in obtaining a more effective use of the equipment for the hauling of coal.

## INTRODUCED STANDARD ACCOUNTING METHOD

I desire to call especial attention to the work of our Cost Accounting Committee, of which Mr. Thomas Brewster was chairman. It concluded its work, and a standard method of cost accounting for coal mining companies was adopted at the meeting in Kansas City on July 9, and this system has become generally recognized as the best accounting system yet developed for any of the mining industries in the United States. It has been adopted widely by individual companies and has been of the greatest value to the industry as a whole. Especially has it benefited by the approval of this system by the Treasury Department for taxing purposes.

On July 18, 1919, the U. S. Senate passed a resolution introduced by Senator Freylinghuysen, authorizing the investigation by a sub-committee of the conditions of the coal mining industry, alleging that prices had been advanced and production curtailed, against public interest. The National Association quickly compiled the facts, and showed conclusively through evidence of its witnesses before this committee that there had been a decline instead of an advance, and that the real trouble was lack of transportation and improper functioning on the part of the Railroad Administration. The result was that this investigation soon switched from an investigation of the coal industry to an investigation of the Railroad Administration, and through this investigation much publicity was obtained, which put the coal industry in a better light before the public.

## INVESTIGATORS DISCLOSED STRIKE PLANS

This investigation developed the fact that the miners had intended using what they term "economic force" to bring about an increase in their wages, even though the public should be frozen out to enforce their demands. The fact that the coal operators had clearly pointed out this situation to the public through their advertisement in June relieved them of stigma when the strike actually occurred in November.

Through the efforts of the National Association in connection with the investigation of the governmental

agencies, production, which had been running at about eight million tons a week prior to August 1, was increased to about thirteen million tons a week prior to the strike on November 1; and this increased production, much of which was in storage on November 1, faded over what would have otherwise been a national calamity due to the nationwide strike put into effect by the miners' union.

#### FUNDS SUPPLIED FOR PRODUCTION REPORTS

Because of the failure of Congress to provide sufficient funds for the continuation of the U. S. Geological Survey weekly coal production reports, this association quickly stepped into the breach, and from July 1, 1919, until the present time, has provided the funds to keep this all-important report alive. Your directors realized that a break in this report from July 1 to any subsequent date would throw the production information into a chaotic condition and prevent comparisons in the future for all time to come. Inasmuch as it was vital to the industry that these reports be kept continuous the effort of the association which made possible the continuation of this report for the general information of the industry has been one of its most important works.

The officers of the association have been constantly desirous that the public have a better understanding of conditions in the production and distribution of coal. The U. S. Bureau of Mines called upon the association for financial assistance in the preparation of a moving picture film portraying the operation of coal mines as an educational feature. Your Board of Directors appropriated \$8,000 to cover a portion of this expense. This film has been prepared and arrangements have been completed by which it will be shown during this year in the moving picture theaters throughout the country, and it is estimated that 52,000,000 people will see the operation of a coal mine.

The average consumer of coal has at best a vague idea of the items which make up the total cost of production. What is paid the miner per ton is his idea of cost. The fact that there are over two hundred items of cost other than the amount paid the miner is overlooked. The National Association has given wide publicity to a chart showing these two hundred items of cost, and has obtained splendid results in an educational way.

#### STATISTICAL BUREAU A MEANS OF DEFENSE

On Dec. 11 of last year your Board of Directors established a statistical bureau for the assembling of information which should at all times be available for the defense of the industry whenever it might be attacked, as well as for the better information of coal operators and the general public. For this purpose your board made an appropriation of \$50,000, and the services of C. E. Lesher, who has been with the Geological Survey, were obtained, and he was established as the head of this bureau. It was through the medium of this bureau that it was possible to assemble the enormous amount of statistical information necessary for the submission of the coal operators' case to the President's coal commission. Although Mr. Lesher has resigned to become editor of *Coal Age*, this bureau is still being maintained and is a vigorously helpful part of the association's organization.

The assembling of current information regarding market conditions, which has been obtained by the association from local associations, has been somewhat disturbed, and has been resumed only in part. Many local

associations have not as yet re-established their daily market report, for one reason or another; but the importance of having authentic information properly compiled on hand at all times is vital, and I would urge that the local associations resume the compiling of this information and sending it to the headquarters of the National Association at Washington at the earliest date possible. This information can be compiled and published in the *Coal Review*, the official organ of the National Association, so that it can be in the hands of all coal operators as a barometer of trade conditions.

Figures compiled by the Bureau of Internal Revenue show that in 1918 something like 22 per cent of the companies mining bituminous coal had net losses, and almost a third of this class showed losses averaging 49 per cent on capital invested. At the same time 11 per cent had net income of less than 5 per cent on invested capital and averaged but 1.94 per cent after paying taxes. In fact, 40 per cent of the companies had net profits which, after payment of taxes, left less than 11 per cent on invested capital. Half of our bituminous coal was produced by the 62 per cent of companies that either had deficits or showed less than 11 per cent in profits after paying their taxes to the United States.

#### AUTHENTIC INFORMATION SUPPLIED TO THE PRESS

The daily press is prone to call attention to the high prices in spots here and there. Nothing is ever said of the millions of tons of coal that are sold at low prices. Correct and authentic information as to the average selling price should be obtainable at all times, and this can only be accomplished through the work of the statistical department of the National. The machinery for this great work has been established by the National Association, and it now is in the hands of the local associations to take the benefit of the organization provided for this purpose by the National. Correct and authentic information is a duty that we owe to the industry and to the public.

Your Board of Directors has set aside \$75,000 for educational work. An educational or publicity committee, of which A. M. Ogle is chairman, which committee is working under the supervision of the Finance Committee of our association, of which Mr. J. J. Tierney is chairman, jointly agreed that the *Weekly Digest*, which has been a constant adviser of the coal industry, should be published under the name of *Coal Review*, and become the organ of the National Coal Association and the coal industry. The details of their endeavor will be put before you in the report of the committee.

On Feb. 16 the directors authorized the institution of test suits to ascertain the authority of the Federal Trade Commission to require coal operators to furnish reports of production, cost and income, which the commission had ordered them to submit. The first of a series of actions for this purpose has been brought in the Supreme Court of the District of Columbia, in the name of the Maynard Coal Co., and in the first instance the association has been successful in securing a temporary injunction restraining the commission from requiring the filing of these reports by the Maynard Coal Co. The case will be carried through to establish definitely the rights of the industry with respect to governmental regulation. This case has attracted wide attention, as the findings are vital to many other industries. Congress during the past year has given much thought to, and many resolutions and bills have been introduced, having for their purpose, the investigation of the indus-

try. Construction, rather than reconstruction, is the great task confronting Congress. There is too much Government in business and not enough business in Government. Uncle Sam must be pried out of the coal business, the lumber business, the transportation business, and all other businesses which have been invaded. His right hand must be taken from the throat of private enterprise, while his left hand must be taken out of the pockets of the taxpayers. There is plenty of work for both hands if employed in the administration of legitimate business of governmental affairs.

Every effort toward government ownership must be discouraged and contested. Private capital uncovered and developed the resources of the United States. Private capital opened up to settlement, use and prosperity the places that had been wasted and idle. Private capital footed the payrolls of the laborers who built and ran the railroads. Private capital built and operated the factories. It was the private capital of the farmer that bought and tended the farms and made them productive. Private capital is the foundation and superstructure of all American business. Wages are the biggest bills that private capital pays. The prize for which private capital is competing is general prosperity. It cannot hope to win the race hampered by government control as a weight on one leg and with unreasonable domination of union labor as a weight on the other.

Organized labor seems to have adopted the theory that to work too hard will spoil the job. Their leaders say: "Why increase production when a shortage in supply is the very thing that keeps business alive?" They further assert: "If you allow an over-supply of commodities to develop, we will at once be thrown out of our jobs." This argument is a fallacy. The fallacy lies in confusing individual production with the production of the plant as a whole.

#### INCREASE OF MEN, BUT NO GREATER OUTPUT

To maintain output during the past four years coal operators and manufacturers have had to employ more men to do the same work. This means higher costs, first, in payrolls; second, in additional mining machines, clerk hire and overhead cost. The higher cost is generally passed on to the consumer in the form of higher living expenses. Still the shortage in production continues, so new companies are induced to start mining or manufacturing, sinking new mines, building new plants and creating what in normal times would be an excess of producing capacity. The effect is plainly seen in the distress of excessive living costs, overstrained credits and over-expanded business. Increasing individual production is quite another thing.

If each workman, by more effective work, adds 25 per cent to his daily output, he supplies the goods that are needed; but he does not add to the producing cost; in fact he cuts down the cost per unit, for he helps get a greater output from the same mine, the same machinery, the same equipment, without increasing the overhead charges. He benefits himself either through higher wages or by lowering the cost of living to consumers, of which he is one. He is able to buy more things, and consequently he increases the demand for goods at the same time that he increases the supply and cheapens the cost.

History does not record an instance where business depression was caused by labor increasing its output of goods per man. The unnatural condition forced by the

false logic of shorter hours and less production creates a situation of higher cost, which, in turn, is responsible for the wave of labor unrest, which again in turn breeds Bolshevism. Bolshevism is merely a lazy man's envy of the prosperity of a hustler. The often repeated claim of the Socialist that labor creates the world's wealth is another utter fallacy. The wealth of the world has always been created primarily by intelligence. It is the brain of man that leads in production, and not the brawn.

Capital, after all, is only crystalized labor. Manual labor without the guidance and inspiration of brains has never accomplished anything for mankind beyond a bare existence. When the world gets down to work again we will cure our economic ills, and not until then.

#### COLLECTIVE BARGAINING PRODUCES HARD BARGAINS

The coal industry was the first basic industry to recognize the principle of collective bargaining. Since 1898 this method of dealing between the employer and the employee has been in force. Each wage period finds it more and more impossible to reach a settlement. The miners have fully recognized the importance of organization, and with the expanding of their efforts along these lines it becomes more and more difficult for the operators to meet and successfully maintain their position.

Organization is the keynote of industry; 100 per cent organization on one side must be met by an equally well organized body on the other if fair results are to be obtained.

The National Coal Association has made wonderful progress. It has achieved many things; but it must go forward in its effort. Not the least of the association's achievements during the year has been a further growth of mutual sympathy and understanding among coal operators in all parts of the United States, through their association in this organization. The association is not perfect by any means, but if it is to render the service that such a national organization should render it must continue to grow and we must give our serious thoughts to its improvement.

If some of us become dissatisfied because it has not accomplished all that we had hoped, the proper remedy is not to find fault and threaten to withdraw but to take off our coat and go to work and make the organization the powerful instrumentality that this industry ought to have in its national association.

To me it is unthinkable that the coal operators of the United States should ever consider leaving their industry without such an organization as this when the social and public problems which this business must face are so pressing and so serious as they are at the present time. Therefore, I look upon this association as an established institution. Through it the coal business has advanced beyond the dark ages of utter disorganization into the light of union for common purposes and achievement.

#### To Consider Advisability of Government Acquisition of Coal Fields

OWING to the oil situation and the possibility that Government vessels may be compelled to use coal, Senator Cummins, of Iowa, has introduced in the Senate a resolution directing the Naval Committee to consider the advisability of Government acquisition of coal fields.

# Report of Railroad Administration Reveals Financing of Over Four Billions

Statement of Difficulty of Persuading Roads to Accept Allocated New Equipment Complicates Sentiment on the Present Car Shortage—Companies Unable to Pay Cash May Settle with Equipment Trust Notes

A COMPREHENSIVE account of the financing of the United States Railroad Administration, a task involving billions of dollars, is given in the report of Swagar Sherley, director of the Division of Finance, made public May 24 by the Director General of Railroads. Mr. Sherley sketches the history of the financing of the railroads from the beginning of Federal control on Jan. 1, 1918, to date.

One of the interesting features of the report, bearing upon the present situation of the railroads as to equipment shortage, deals with the efforts of the Railroad Administration to induce the railroads to accept the equipment that had been ordered for them. Because of the failure of the Railroad Administration appropriation in March, 1919, construction of equipment of all classes had to be delayed and expenditures kept to a minimum.

After money had been made available, and cars and locomotives had been constructed and allocated, many of the railroad corporations protested strongly, claiming that the cost was excessive and represented a war cost that the Government should bear and that they did not need the equipment. While it is now evident that this and more equipment is needed and that costs are as high or higher, it was not until late in 1919 that the Railroad Administration was able to persuade these roads to accept the equipment.

## GOVERNMENT WAS OBLIGED TO ADVANCE MONEY

The estimated balance sheet of the Railroad Administration at the conclusion of Federal control on Feb. 29, 1920, after twenty-six months of Government operation of the railroads, carried totals of \$4,493,972,125. Because of the practical inability of the railroad corporations to float bonds or borrow money during and immediately after the war, the Government itself was obliged to advance nearly all money needed for capital expenditures and other purposes. At the end of Federal control, Mr. Sherley's report shows, there was due to the carriers in unpaid compensation and other large items, including all gross interest accruals, \$1,476,928,805.60, while there was due from the carriers to the Railroad Administration, including similar interest accruals, \$1,677,243,077. Of the amount due from the carriers it is estimated that \$815,379,145 properly may be used under the terms of the Transportation Act, 1920, as an immediate offset against the amount due by the Government to the carriers.

Congress appropriated for the Federal control of transportation systems \$1,250,000,000, and the Transportation Act of 1920, under which the properties were returned to private control, carried an additional \$200,000,000. The following table from Mr. Sherley's report summarizes the loss sustained by the Government in operating the roads:

ESTIMATED EXCESS OF OPERATING EXPENSES AND RENTALS OVER OPERATING REVENUES	
Class 1 railroads.....	\$677,513,151.56
Other privately-owned properties (smaller railroads) sleeping and refrigerator car lines and steamship lines) .....	43,011,129.36
Inland waterways .....	2,449,738.69
Total .....	\$722,974,019.61
Expense of central and regional organization....	13,954,979.69
Deficit, American Railway Express Co.....	38,111,741.60
Adjustment of materials and supplies in settlement with railroad companies on account of increased prices .....	85,204,618.26
Net interest accruals for deferred compensation, open accounts, and additions and betterments..	37,558,162.01
Deductions from gross income.....	10,118,034.36
Miscellaneous profit and loss items.....	4,894,056.38
	<hr/>
	\$912,815,611.91
Less non-operating income.....	12,336,855.35
Total .....	<hr/> \$900,478,756.56

"The operation of the roads by the Government for the year 1918, together with expenses incident to the water-way operations of the Government, resulted in a deficit for the year of approximately \$236,000," says Mr. Sherley's report. "On Jan. 1, 1919, there was to the credit of the Railroad Administration a total of \$78,188,531.69, exclusive of the working funds with Federal treasurers. There had accrued as compensation due to railroads a total of approximately \$945,017,848 and there had been paid to them either in the form of loans or direct payment on account of compensation the sum of \$375,475,412.

"It became apparent that additional appropriations would have to be made by the Congress in order to enable the Railroad Administration properly to carry forward Federal control of the railroads and provide the additions and betterments needed if the roads were to perform their full duty to the public and be enabled to pay the sums necessary to enable the various carrier companies to meet their obligations to their bond and stockholders. Accordingly, there was submitted upon Jan. 24, 1919, by the Director General of Railroads to the Congress an estimate for an additional appropriation in the sum of \$750,000,000. This appropriation was passed by the House, but failed to pass the Senate.

"During the pendency of the estimate the slender resources of the Administration were husbanded to the last degree, with the necessary result of the postponement of payment of many bills due, and with payment to the roads of only such sums as might be necessary to enable them to meet their necessary fixed charges, etc. Calls upon the Federal treasurers were made for surplus funds in their hands, and during the month of January nearly \$14,000,000 was thus placed to the credit of the central treasury. Calls were made on various carrier companies to whom money had been loaned to repay such loans, and during the months loans were repaid by some of those corporations amounting to \$57,000,000 in round figures of principal, and \$393,000 of interest. The total of these various sums

for that month amounted to \$81,835,000, that was placed in the central treasury, and in February from various sources \$31,300,000 additional was obtained.

"During the months of January and February, however, expenditures in the way of compensation and loans of carriers were made amounting to \$89,930,000, and moneys were advanced to Federal treasurers to enable them to take care of vouchers and other pressing obligations amounting to some \$36,139,000, while manufacturers of locomotives and cars were paid on account of indebtedness to them sums aggregating \$48,125,000, and there were other payments amounting to \$2,340,000. The result was that the balance in the central treasury amounting to \$78,188,531 was reduced at the end of February to \$14,795,894, and it was estimated that the Federal treasurers had on hand outstanding vouchers and payroll checks aggregating approximately \$258,000,000, and they had cash on hand to pay them amounting to only about \$129,500,000.

"The failure of the appropriation asked for presented, therefore, a very acute situation and required drastic steps to be taken. One of the first methods adopted was to get the War Department to pay to the Railroad Administration \$100,000,000 on account of services performed by the Railroad Administration for the War Department, but which had not been vouchered. It was perfectly apparent that there was at least \$100,000,000 of indebtedness from the War Department to the Railroad Administration, and in order to relieve the latter of the embarrassing situation which confronted it, without waiting for the vouchers to come in due course, the War Department paid on account the sum stated. Subsequently, as the vouchers came in and were audited, the War Department took and was given credit on account of the sum thus advanced; \$10,000,000 was obtained from the Navy Department; \$50,000,000 was borrowed from the War Finance Corporation.

#### CERTIFICATES OF INDEBTEDNESS ISSUED

"By these methods a total of \$160,000,000 was added to the \$14,500,000 that still remained in the central treasury. The money thus obtained in these various ways did not, however, provide anything like enough money to take care of the demands that were being made by the various railway companies for advances to them on account of compensation in order that they might in turn pay their corporate expenses, fixed charges, taxes and in certain instances their dividends. Conferences were had with them and it was agreed that as the Railroad Administration was unable to pay them on account of compensation due in cash, it would issue to them certificates of indebtedness in amount sufficient to enable them to obtain the money so needed and only in such amount.

"Conferences also were had with prominent bankers over the country and with the War Finance Corporation to the end that the banks and the War Finance Corporation might come to the help of the companies by loaning them money upon their obligations with these certificates as collateral. Under this plan there was issued to the carrier companies in March \$47,842,500 worth of such certificates; in April \$79,517,300 worth; in May \$57,831,500 worth, and in June \$8,081,675, making a total of \$192,272,975 worth of certificates of the Railroad Administration.

"During the summer and early fall the earnings of the roads sufficiently improved to warrant the hope that

no further deficits would be incurred, but the situation that looked so very promising in August and September shortly thereafter was greatly affected by virtue of two chief factors, one of which had an indirect effect, and the other a very direct effect. The steel strike affected the earnings of the Railroad Administration by slackening business. The uncertainty that existed in the country as to what might be the developments growing out of it served to affect traffic which was immediately reflected in the earnings of the roads. The coal strike had a very direct effect in this regard, as well as increasing greatly the cost of operation during the remainder of Federal control.

"Earnings fell off very materially and the deficit in operation from month to month grew in volume. The estimate of \$1,200,000,000 which was presented to Congress in May, 1919, though predicated upon the belief that there would be no further deficit incurred through operation of the railroads, as previously stated, was not allowed in its entirety, and the \$750,000,000 that Congress voted, together with the reduced earnings from operations, resulted in the Railroad Administration's being at all times restricted in the amount of moneys available for capital expenditures, for the payment of its operating obligations and compensation to the carriers.

#### CONGRESS APPROPRIATES LESS THAN ESTIMATE

"Upon the convening of Congress in an extraordinary session, estimate was submitted for \$1,200,000,000 in order to enable the Railroad Administration not only to redeem the certificates of indebtedness that it had issued, but to enable it to pay promptly all past due indebtedness on account of compensation, all outstanding vouchers and to have available sufficient working capital to enable it to efficiently and economically administer its affairs. Estimate was submitted upon May 24, 1919, and Congress promptly considered the same, but appropriated the sum of \$750,000,000 in lieu of the \$1,200,000,000 asked for. The bill was signed by the President upon June 30, and immediately steps were taken to call in and pay outstanding certificates of indebtedness. Through the generous and active co-operation of the Treasury Department and the Federal Reserve banks arrangements were made for presentation of these certificates at and payment by any Federal Reserve bank on July 15, and on that day out of a total of \$285,308,172.26 face value of certificates outstanding there was paid \$245,938,808 worth, and this without appreciable disturbance of money balances in any part of the country.

"The failure of the Congress to appropriate moneys requested in the latter part of January, 1919, prevented any large undertakings in the way of additions and betterments during the first quarter of the year and the reduction by \$450,000,000 of the amount requested of the Congress at the special session, with the limited funds being received from operations, together with almost complete inability of the carriers to pay for any additions and betterments, made necessary the elimination of all projects for capital expenditures not of the most necessary and pressing character. The details of such expenditures are set out in his report. Exclusive of allocated equipment, such expenditures for the year 1919 and January and February, 1920, amounted to a total of approximately \$419,821,000.

"In 1918 there was ordered 100,000 freight cars and

1,330 locomotives, and in the early part of 1919 there was an additional order of 600 locomotives, the estimated cost of all of the equipment being \$402,000,000. This equipment was allocated from time to time to various railroads according to the estimate of their need for such equipment. While some of the roads early accepted the allocation of this equipment, many very strongly protested against the allocation. They based their objections on two grounds—one was that the cost was excessive and represented a war cost that the Government should bear, and the other was that they did not need the equipment that was being purchased; and some roads protested that they did not need the type that had been ordered.

"The Railroad Administration insisted that the cost was not excessive and that the quantities ordered were, if anything, inadequate to the need and that it was the duty of the railroads to supply themselves with the equipment necessary to perform their services as public carriers. Unfortunately, these views were accepted by only a limited number of the railroads in the first instance, and it was not until late in the year 1919, and after arrangements had been made for the carrying by the Government for the carriers of the cost of the equipment, that all of the equipment was accepted by the roads.

#### NEW EQUIPMENT EXPECTED TO BE COSTLY

"In view of the fact that it is now plainly patent that similar equipment will cost at least as much as this equipment has, and that the roads are badly in need of considerably more locomotives and cars, it may not be amiss to recite the conditions that confronted the Railroad Administration in connection with the acceptance of this equipment and which conditions, together with the limited funds at its disposal, prevented the Railroad Administration from undertaking the procurement of additional equipment although fully alive to the conditions that were confronting the railroads and the country as a result of the scarcity of locomotives and cars.

"On April 7, 1919, there had been accepted, 46,800 cars; there were allocated and not accepted 47,950, and there were unallocated 5,250; on May 9 there had been accepted 48,800; on June 11, 48,300; on July 14, 54,750; on August 7, 62,350; on September 9, 66,350; on October 8, 68,300; on November 12, 73,600; on December 10, 83,800. In January there were accepted 94,850; on February 9, 99,000, and by March 1 all of them had been accepted.

"Of the locomotives, it is the same story; accepted in April, 891; in May, 913; in June, 997; in July, 1,345; in August, 1,390; in September 1,564; in October, 1,709; in November, 1,740; in December, 1,869; and so on down to a final acceptance of all of them.

"The amount of compensation accruing monthly to the carriers for their properties under Federal control approximates \$75,000,000. With the exception of four months—July, August, September and October—the net operating income from month to month was much less than this sum, and with the need to pay the cost of current additions and betterments as well as take care of those coming over from the previous year, it was necessary at all times to husband the moneys of the Railroad Administration. The carriers have been paid the sums necessary to enable them with their other resources to meet the corporate needs and fixed charges

specified in the contract as above set out and dividends where the financial strength of the road warranted, but payments have practically been confined to such needs in the case of all carriers.

"As a result as to some few of the stronger roads whose standard compensation with other resources are considerably in excess of their fixed charges and dividends and for whom addition and betterment expenditures have been light the Director General is in debt over and beyond any indebtedness of such roads to him. As to the great majority of the roads, however, notwithstanding the conservation policy pursued as to compensation payments to them, they on a complete settling up of accounts, are indebted to the Government. From June 1, 1919, to the end of Federal control on March 1, 1920, there was paid, on account of compensation, to the carriers the sum of \$776,825,760.71, the amount so paid being about equal to the compensation accruing for the same period."

Mr. Sherley describes in detail the arrangement made under which railroad corporations which are not in a position to pay cash for allocated equipment may meet such obligations with equipment trust notes. The total of such notes will amount to not more than \$374,647,756 nor less than \$345,875,352, according as the actual cost of the equipment may finally be determined.

The report outlines the reorganization of the Boston & Maine R.R., tells how the Government apparently has saved several millions of dollars by assuming its own fire risk, with the exception of marine property, and summarizes the provisions of the Transportation Act of 1920 under which funds are provided for liquidation of the Railroad Administration and winding up of questions growing out of Federal control.

### Illinois Law-Makes Provision for Mine Surface Support

UNDER the law of Illinois, as by the general common law, where underlying minerals are conveyed, the grantor retaining the surface, he has a clear right to have the surface supported in the removal of the minerals. This right of support, being vital to the owner of the surface, is not presumed to have been given up by a conveyance of mining rights, in the absence of some express or strongly implied waiver on his part.

"The word 'surface' in mining controversies means that part of the earth or geologic section lying over the minerals in question, unless the contract or conveyance otherwise defines it. It is not merely the top of the glacial drift, soil, or the agricultural surface." A clause in a conveyance of coal mining rights excepting from the grant of underlying coal that lying beneath that portion of the surface occupied by buildings does not warrant an inference that it was mutually understood that the grantee of mining rights was under no obligation to support the remainder of the surface.

"A clause providing for removal of the underlying coal 'without entering upon or injuring the surface,' etc., requires the mining to be so carried on as not to let down the surface. Injunction lies at the instance of the owner of a stratum of limestone which he is mining to restrain the owner of underlying coal mining rights from letting down the surface to the former's damage. (*United States District Court, Northern District of Illinois; Marquette Cement Mining Co. vs. Oglesby Coal Co.; 253 Federal Reporter, 107.*)

## To Merge Forty Coal Mining Companies In Illinois Standard Field

ANOTHER attempt to merge the ownership of forty coal mining companies operating in the Standard Illinois fields, operating in the inner group of coal mines in Central Illinois, is being made by St. Louis and New York capitalists. The merger will involve a consideration of between \$8,000,000 and \$10,000,000.

The purpose of syndicating the ownership of the mines, according to those interested, is to increase, not limit, production; to eliminate trade abuses and to stabilize prices. By limiting production the purpose of the amalgamation would be defeated, those interested in the new organization say. It has been said that a number of large coal operators have been solicited to pool their interests, but those concerned said their plans were not complete and that information of the details of the merger would be announced later.

Louis J. Nicolaus, vice-president of the Straus-Nicolaus Investment Co., said that his company was interested in the deal in conjunction with New York interests. He said options had been obtained on about 40 per cent of the mines in the Standard field. These mines produce about 15 per cent of the total coal mined in that section. The daily production of the inner mine group is about 50,000 tons, most of which is sold through St. Louis. About half of the coal produced in the Standard field is sold to St. Louis.

The details of the merger are to be completed in July. The options which have been obtained will expire within thirty days. This is the fourth large merger of Illinois coal interests which has been proposed during the last twenty years. All three previous ones have failed.

Because of the conditions beyond the control of operators, the marketing of coal through the St. Louis gateway presents difficult problems to such an organization. The method used in selling the product of such a number of mines by a single organization is an extremely intricate one. It is because of these difficulties in adopting an efficient system of distribution that the failure of the other mergers resulted. The largest of these proposed mergers was launched just prior to the panic of 1907. It failed when it had been under way only a short time.

The new consolidation would give the purchasing syndicate control of most coal mines adjacent to the Illinois Central R. R., all Illinois mines on the Louisville and Nashville, the Baltimore and Ohio, East St. Louis and Suburban lines and mines on many other roads. The O'Fallon, Suburban, Troy and Eastern and Litchfield and Madison systems are the only roads on which mines in the Standard field would not be affected by the merger.

The Illinois Central mines, the output of many of which is consumed entirely by the road itself, extend forty miles east of East St. Louis. The elimination of competition in the Standard field, which will result from the merger, will place the entire coal output in the St. Louis district in the hands of a few operators. The other Illinois fields, which produce a better grade of coal than the inner group in the Standard field, also are controlled by a few operators. The Carterville field, in southern Illinois, is controlled by an association, and the Mount Olive field, adjoining the standard, is controlled by two or three operators.

The merger is expected to eliminate the selling of coal

at lower rates in the summer months and to regulate the price of coal so as to have a uniform scale for both summer and winter. Consumers are now paying about 25 cents a ton below the normal price when they purchase in the summer and about 50 cents a ton higher than normal when they buy in the winter.

### Text of Seasonal Rate Bill

THE text of the bill providing for seasonal coal freight rates which appears as an amendment to the Interstate Commerce Act, as reported by Senator Frelinghuysen on behalf of the sub-committee to the full committee of the Interstate Commerce Committee of the Senate, is as follows:

"That section 15 of the Interstate Commerce Act, as amended, is hereby further amended by inserting after paragraph (6) thereof a new paragraph to read as follows:

"(6a) When used in this paragraph, the term "coal" includes anthracite and bituminous coal, lignite, coke, including petroleum coke, and briquets and boulets made from anthracite and bituminous coal and from coke. From and after thirty days immediately following the enactment of this amendment, no carrier by railroad subject to this act shall demand, collect, receive or enforce, for the carriage of coal, any individual, proportional or joint rate which is greater or less than—

"(a) 5 cents per ton more than the schedule base rate then in effect therefor for shipments made during August,

"(b) 15 cents per ton more than such rate for shipments made during September,

"(c) 25 cents per ton more than such rate for shipments made during October, November and December, or

"(d) 10 cents per ton more than such rate for shipments made during January, or which is greater or less than

"(e) 10 cents per ton less than the schedule base rate then in effect therefor for shipments made during February,

"(f) 25 cents per ton less than such rate for shipments made during March, April and May,

"(g) 15 cents per ton less than such rate for shipments made during June, or

"(h) 5 cents per ton less than such rate for shipments made during July.

"Whenever, after full hearing upon complaint or upon its own initiative, the commission is of the opinion that any such individual, proportional or joint rate as so reduced or increased is or will be unjust or unreasonable or unjustly discriminatory or unduly preferential or prejudicial, the commission is hereby authorized and empowered to determine and prescribe what will be the just and reasonable individual, proportional or joint rate to be thereafter observed during the months to which the proceeding relates, and to make an order that each carrier affected shall cease and desist from demanding, collecting, receiving or enforcing a different rate than that so prescribed for the carriage in question.

"Whenever, after full hearing upon complaint or upon its own initiative, the commission is of the opinion that any of the increases or deductions in rates for the carriage of coal, as prescribed by this paragraph, or by order of the commission hereunder, cause or will cause shipments of coal to be made in such disproportionately large or small quantities during the months in question

as to prevent the carriers affected from handling their traffic properly, from using their equipment and facilities most uniformly and efficiently, or from receiving just and reasonable revenue from such coal traffic as a whole, the commission is hereby authorized and empowered to determine and prescribe what increases or deductions in rates for the carriage of coal above and below the schedule base rates in effect therefor for the carriers affected and for the months in question will be just and proper, to be thereafter observed, and to make an order that each carrier affected shall cease and desist from demanding, collecting, receiving or enforcing a different rate than that fixed in conformity with the increases and deductions in schedule base rates so prescribed for the carriage of coal.

#### PROVISIONS TO PREVENT DISCRIMINATION

"Nothing contained in this paragraph shall be construed to authorize or require any carrier to demand, collect, receive or enforce (a) any rate which is less than its schedule base rate for the carriage of coal which has already been carried by it, or by any other carrier, under a rate as reduced under the provisions of this paragraph or by order of the commission hereunder, unless a carriage by water has immediately preceded such subsequent carriage by rail, or (b) any charge which is greater or less than that shown in its schedules for switching and other incidental services performed in connection with the carriage of coal, or (c) any rate which is greater or less than its schedule base rate for the carriage of coal, when such schedule base rate is .75c. or less per ton for the carriage in question. For the purposes of this act the schedule rate for the carriage of coal, except as otherwise provided herein, shall be considered to mean the schedule rate therefor as increased or reduced under the provisions of this paragraph or by order of the commission hereunder."

Amend the title so as to read: "A bill to further amend the Interstate Commerce Act, as amended, to provide for seasonal rates for the transportation of coal."

#### Cushing Attributes Traffic Congestion To Lack of Locomotives

IN connection with the efforts of the Interstate Commerce Commission to relieve traffic congestion, George H. Cushing has submitted a statement authorized by the American Wholesale Coal Association. In that statement he points out that there are three causes for the predicament in which the railroads find themselves. A portion of his statement is as follows:

"1. Unwillingness to work shown by the railroad employees.

"2. That the railways have fewer cars than necessary.

"3. That the railways have fewer locomotives than are needed to move trains, or have not properly distributed their locomotives.

"The railway employees will disclaim responsibility for the failure of transportation. Their statement is too hard to prove or disprove for the question to command serious consideration at this time.

"Whether or not we have enough cars cannot be proved until we have the maximum daily movement of cars in service, and that admittedly we are not getting

today. In fact, the movement per day is decreasing rather than increasing.

"This analysis seems to put emphasis upon locomotives rather than upon cars and men. We believe that is where the emphasis should properly be placed.

"Our recommendation is that since the congestions which are killing cars and transportation capacity are in class 1 and 2 cities and since congestion always is an index of a shortage of motive power, it should be recommended to the railways that they subtract from engines employed in cross-country hauls to switch the terminals in class 1 and 2 cities. This means that we believe more emphasis should be placed upon engines in switching service than engines in cross-country hauls, because it only adds to confusion if you ship commodities to terminals but lack the motive power in terminals to do the switching.

"If by this simple change you avoid congestion, you will increase the mobility of cars and very soon determine whether you have enough engines on the railroads. If you have not, then the simple answer to the traffic question is to get more engines. At least a different distribution of motive power would serve to fix the responsibility and to localize the trouble."

#### House Committee Favors Byproduct Coke Ovens

MANUFACTURE of ammonium sulphate at the government plant at Muscle Shoals in relation to the byproduct coke industry is discussed in the majority report of a House committee which is investigating war expenditures. The committee says:

"During the war the War Department, through a large expenditure of public funds—amounting to many millions—by loans, contracts for the products and by building, caused the erection of approximately 1,500 byproduct coke ovens. There are now in operation in the United States about 11,000 of these byproduct coke ovens engaged primarily in the manufacture of coke and producing as one byproduct approximately 500,000 tons of ammonium sulphate during the present year. The ammonium sulphate produced by these byproduct coke ovens is largely in excess of any amount of ammonium sulphate ever used heretofore in the United States for agricultural purposes.

"The committee finds that no better single method of conservation of our national resources can be adopted than to encourage the supplanting of beehive coke ovens by coke ovens of byproduct type to that point where all coal carbonized for coke shall be so carbonized in ovens that will conserve the immensely valuable byproducts of the coal, now permitted in large degree to waste in the atmosphere. The building of such byproduct ovens is encouraged and stimulated by the prospect of a reasonable selling price for their byproducts, one of which is ammonium sulphate, an excellent nitrogen fertilizer material, and another toluol, a motor fuel of great excellence.

"If the War Department, or some agency of the Government acting under or through the War Department, should engage in the manufacture of ammonium sulphate for commercial purposes at Muscle Shoals in competition with private industry, it would have a decided tendency to retard the future conversion of cheap beehive coke ovens into the more expensive but vastly more efficient and conserving byproduct ovens."

### Co-operation of a Kind That Spells Success

REFERRING to the question of co-operation among mine officials, to my mind, John E. Ambrose has summed up, in a few words, the real object and purpose of such co-operation, when he says it is "to bring about greater efficiency in coal-mining operations, through more social relations whereby a better understanding will be established between employers and employees, on what may be termed a brotherhood in which men will have and take a deeper interest in each other's welfare." *Coal Age*, April 1, p. 662.

In my opinion, there can be no question but that a brotherhood of miners and operators, based on co-operative principles, would have a strong tendency to bring them close together. By this means, the operator would become more interested in the social, sanitary and financial welfare of his employee, and the latter would take a greater interest in the financial success of his employer. The successful operation of the mine would then be shared, in common, by both. The interest of one would become alike the interest of the other.

#### CO-OPERATION MEANS WORKING TOGETHER FOR THE COMMON INTERESTS OF ALL

Co-operation is the foundation principle on which labor and capital will be best able to adjust all their real differences. When capital and labor meet each other in a co-operative spirit and adopt the Golden Rule as a standard, all their differences will cease to exist. It is a regrettable fact that far too many employees take little or no interest in the success of their employer's business. Seemingly, many would rather see their employer fail than to see him prosper. I have known men to work for the same company for years and receive good wages, but never speak a favorable word for the company who employed them. Instead they were most always ready to say something against the company.

Co-operation of mine officials and mine workers may well be defined as a working together for the common interest and success of the undertaking, from the general manager down to the boss driver. They should all have the same object in view; namely, the successful operation of the plant. I am sorry to say, some high officials become selfish and autocratic in their official relation to their subordinates. By that means they hinder or destroy the spirit of co-operation, instead of fostering it as they should.

As has been stated, a mine official may be well prepared to fill the position he is holding, from the standpoint of his experience and knowledge; but, because of his selfish disposition and the lack of a spirit of co-operation with his brother officials, he may prove a complete failure. Again, there is a kind of selfish co-operation that is manifested only when greater benefits are to be received than those given. Co-operation, to be effective and beneficial, must be mutual.

In my opinion, instances are numerous where companies have suffered financial loss for want of better co-operation on the part of some of its officials. As an illustration of this fact, I will cite an instance that came under my own observation at a mine where I was employed. In some way the superintendent of the mine and the railroad official's handling the cars for that mine were at outs with each other.

It will cause no wonder that, as a result, the mines were frequently idle for an hour or so during the day, on account of the railway officials not shifting the cars when they knew that they were loaded. In this case, it was not the mine official who suffered the financial loss, but the company who owned both the mine and the railway. One official of the same company cannot work long against the interest of another official, without doing an injury to the interest of the company.

In conclusion, permit me to say that I do not much favor the plan or idea of a state and Federal board, suggested by J. A. Richards, on page 661 of the same issue, requiring the submission of plans of proposed mines before they are opened. In my opinion, such a system would involve much red tape, cause many needless delays and could not be applied to all coal seams. In uniform seams, prearranged plans might be feasible; but, owing to the geological formation of many irregular coal seams, such a plan would not be practical. An instance of this is the Nelson seam, located deep down under Walden's Ridge, in this state. This seam cannot well be operated on any prearranged plan or method, but the plan must await the development. The geological conditions will determine the method of operation in that case, as the development proceeds.

Dayton, Penn. Former District Mine Inspector.

### Can Coal Be Cleaned By Flotation?

REVIEWING the article presented under this caption. *Coal Age*, April 22, p. 795, prompts me to venture some personal views regarding this particular method of improving the quality of coal for shipment. In direct answer to the question, preliminary experiments made indicate that bituminous coal under this treatment will show favorable reductions of ash, sulphur and other impurities, but when the same treatment is applied to anthracite, more particularly to culm product, the results obtained are negative.

The procedure in floating coal, as compared with floating mineral substances, is a reversed one. For example, when treating 2,000 lb. of mineral, an average of 200 or 300 lb. of concentrates is raised by the froth, leaving, say 1,700 lb. of tailings to go to the bottom of the machine. But, in the case of the treatment of coal, 1,700 lb. has to be raised by the froth, and 300 lb. remains at the bottom as tailings or refuse.

It is therefore evident that, since the air bubbles in the flotation machine furnish the actual lifting medium and lift the material several feet high, it is necessary to supply a comparatively large volume of air. For this reason, it is plausible to assume that a pneumatic type of machine would be better suited for the treatment of coal than is the agitator type, considering the cheaper operating costs of the former machine.

Coal to be treated by the flotation principle would, necessarily, have to be finely ground, and it is doubtful if coal coarser than what will pass through a 30-mesh sieve can be raised by the ordinary frothing medium. As to the amounts of the reagents necessary for this treatment, much will depend on the re-use of circuit waters in the system. Then, there is the air consumption required, so much per ton of coal, which estimate is not available. Moreover, the dewatering of the treated product, of this fineness, would present no little problem, as all coal workers are familiar with the difficulties in handling coal of this state and fineness.

The use of proper frothing reagents and their presence in the finished product (even in small quantity) and their effect on the apparatus must also be studied and carefully considered. Experimental work, so far, with the flotation method, does not show a more efficient extraction of the impurities than the present perfected types of gravity separation. There are possibilities, however, in its application and the technicians in this particular field should give the matter its fair share of consideration and study. A time will come when portions of our coal will have to be treated by other methods than the straight, water-gravity type.

### Working Kanawha River Coal

HAVING read the request of Arthur L. Sheldon asking for suggestions in regard to the best plan for working three overlying seams of coal, and having had considerable experience in the working of contiguous seams, I venture to give an opinion on the matter.

First, regarding the relative advantages and disadvantages of shafts and slopes, in the operation of these seams, I am in favor of a slope opening.

A shaft, to give an output of one thousand tons a day, would require the installation of a fairly large and powerful first-motion hoisting engine and this in turn would require a correspondingly large boiler plant. Also, to use a hoisting tank having a capacity of from five to ten tons, would require an engine capable of handling this output in a comparatively small part of the working day, since the tank system is of advantage only when a tank of large capacity is used and the output is sufficiently large to justify a high-powered hoisting equipment.

The belt or conveyor system mentioned might suit for the top seam if that seam was to be worked alone but I would not advise depending on a conveyor to handle an output from a depth of 160 ft. As previously stated, I would prefer a slope opening and this should have a dip of from 15 to 20 deg. I would lay two tracks so that the descending empty trip would help to balance the ascending loaded trip. This would greatly reduce the power required for hoisting and call for an economical power plant.

Another important advantage of a slope opening is that the men will not require to be hoisted, which makes

for greater safety and the saving of time. The weighing of the coal underground should be considered only in the event of arrangements being made to empty the cars on top without uncoupling them or detaching them from the haulage rope, as is being done at several mines where the whole trip is hauled onto a rotary dumper and dumped in one operation.

This property is mentioned as being below the level of the Kanawha River, and I would consider it unsafe to work the coal under the river, with but 50 ft. of cover; although the lower seam could be worked and sufficient pillars left to support the roof, under the river, and, say for 200 ft. on either side. But the top and center seams I certainly would not work beneath the river, except for the purpose of driving narrow roads through to connect with any property that may be on the other side.

#### WORKING FOR A MAXIMUM RECOVERY OF COAL

Assuming that the maximum recovery of coal from all three seams is an essential factor in this operation, my plan of proceeding would be as follows: The required output of one thousand tons can be obtained, with but a few months' development, from the lower seam, which is from 6 to 9 ft. thick. I would work this seam on the pillar-and-stall plan, but would not take out any of the pillars, until the boundary was reached. My reason is that to take out the pillars from a seam 9 ft. thick, the subsequent caving would damage the center seam, which is only 60 ft. above. The amount of damage will vary according to the nature of the strata separating the seams, and may be anything from a little inconvenience to absolute ruin.

While the required output is being secured from the operation of the lower seam, I would start work in the center seam. This seam, being from 3 to 5 ft. thick, it would be very suitable to use the longwall system. If the seam is worked before the pillars are taken out in the seam below, it should make an ideal seam in which to employ some type of longwall cutting machine.

However, I would not start longwall operations at first; but would drive a three- or five-entry system toward the boundary. When that was reached I would open out on the longwall system. The coal, being from 3 to 5 ft. thick, would require the roof to be ripped on the roadways and this rock, together with the débris from the ordinary working of the seam, would serve to build packwalls for the support of the roof.

#### IMPORTANCE OF WELL BUILT PACKS

Well built packs will reduce the settlement of the strata so that the top seam, which is 50 ft. above, will not be damaged. The work in the center seam should be driven faster than that in the bottom seam, so that by the time the bottom seam reaches the boundary the coal will have been worked out from the center seam in that area.

The top seam can probably be worked from the haulage roads of the middle seam, by means of several rock drifts driven up from the center seam. This appeals to me as a more economical method of working the top seam than by driving a separate haulage system for the top seam alone, especially as the required aggregate output from all the seams is only one thousand tons.

I would work the top seam also by the longwall method, whether it is worked in conjunction with the center seam or by itself. The effect in the bottom

seam would not be sufficient to do any damage to the top seam, as they are 160 ft. apart and, in addition, the working of the center seam will act to distribute these effects.

In working the center seam it may not be necessary to reach the boundary before starting the longwall work; but that should not hinder the progress toward the boundary. The pillars in the bottom seam, under those areas where the coal has been worked in the center seam, will be available for any emergency; but, unless such conditions arose, I would go right to the boundary, before pulling the pillars.

No mention is made of the extent of this property. If it is extensive the operations should be carried forward in several directions, at the same time; and if the boundaries are a great distance from the outlet it will be best to arrange for a main haulage system that will concentrate the output of all three seams. The best seam in which to carry this main haulage can only be determined by local conditions, such as the position of the face line in the different seams, and the nature of the roof strata. These have an important bearing on the expense of maintaining permanent haulage roads. The lower seam, having 30 ft. of sandrock for a roof, should give an opportunity to drive haulage roads that would last during the life of the mine, providing sufficiently large pillars are left to support the roof and prevent the occurrence of a squeeze.

The question of drainage has an important bearing, especially on the top seam. If there is any probability of this seam letting surface water into the mine, it may be best to leave it, until the other two seams are worked out. However, no mention is made of this factor.

### Barometer re Depth of Shaft

SOMETIME ago I remember seeing a question answered in *Coal Age*, regarding the increase in barometric pressure, in a shaft 1,100 ft. deep, with an initial pressure of 30.2 in. of mercury, at the top of the shaft, and temperatures of 64 and 75 deg. F. at the top and bottom, respectively. Being busy at the time, I merely noticed that the answer given, namely, 2.8 in. seemed somewhat higher than I had ever observed in practice. A further mention of it, in a recent issue of *Coal Age*, again brought it to my attention and I started to calculate what change of pressure would result by reason of the depth of the shaft and the increase in temperature.

As a rough check on the given figure, I think no one will deny that the densest air will be found at the bottom. Then, if the estimated increase (2.8 in.) is correct, the barometric reading at the shaft bottom would be  $30.2 + 2.8 = 33$  in.; and the weight of a column of air a foot high and 1 sq.in. in section would be (bar. 33 in., temp. 75 deg.)

$$\frac{1.3273 \times 33}{144 (460 + 75)} = 0.00056855 \text{ lb.}$$

Now, even assuming this maximum density held all the way up the shaft, which we know is not the case, the increase in barometric pressure due to a depth of 1,100 ft. would only be

$$\frac{1,100 \times 0.00056855}{0.491} = 1.27 \text{ in.}$$

Having gone this far, I proceeded to work out the following solution, and would appreciate the opinion of *Coal Age* as to its being correct:

Let  $p$  = Pressure (lb. per sq.in.);

$x$  = Distance from top of shaft (ft.).

Then, since the temperature increases 1 deg. each 100 ft. of depth; or 0.01 deg. per foot of depth, we have for the increment of pressure,

$$\delta p = \frac{2.7 p}{144 (524 + 0.001x)} \delta x; \text{ or}$$

$$\frac{\delta p}{p} = \frac{2.7}{75,456 + 1.44x} \delta x$$

Integrating the last expression, we have,

$$\log Cp = \frac{2.7}{1.44} \log (75,456 + 1.44 x)$$

Knowing the value of  $p$  when  $x = 0$ , we can determine the value of  $C$ , the constant of integration, in this case; thus,

$$p_0 = \frac{30.2}{29.921} 14.697 = 14.834 \text{ lbs. per sq. in.}$$

Then,

$$\log C = \frac{2.7}{1.44} \log 75,456 - \log 14.834$$

$$= 9.1456759 - 1.1712583 = 7.9744176$$

To determine the value of  $p_{1,100}$ , at the bottom of the shaft, make  $x = 1,100$ , and  $1.44 x = 1.44 \times 1,100 = 1,584$ , which gives,

$$\log p = \frac{2.7}{1.44} \log (75,456 + 1,584) - 7.9744176$$

$$= 9.1625931 - 7.9744176$$

$$= 1.1881755$$

Hence,

$$p = 15.423 \text{ lb. per sq.in.}$$

The increase in pressure is therefore  $15.423 - 14.834 = 0.589$  lb. per sq.in., which is equivalent to  $0.589 \div 0.49 = 1.20$  in. of mercury.

JAMES A. BLOCK.

Welch, W. Va.

[We are glad this correspondent has drawn attention to the error that occurred, inadvertently, in our reply to the question to which he refers. The method by integration he presents is correct, showing an increase in barometric reading of 1.2 in. for a depth of 1,100 ft., under the given conditions.—EDITOR.]

### Reasons Why Shotfirers Should be Employed in Mines

READING the suggestion of a recent writer, in *Coal Age*, who seems to think that the employment of shotfirers in a mine might be considered as harmful or dangerous surprised me greatly. For myself, I would not care to even consider any attempt that had for its object the elimination of shotfirers, whom I regard as important factors in making and keeping mines safe for work. There are several important reasons why shotfirers should be employed in mines where the coal is blasted, and I will mention a few of them.

First, the employment of shotfirers makes it necessary to have always in the mine one experienced and reliable man who is charged with the oversight of from 40 to 50 miners, a comparatively few of whom can be said to be safe workmen if left to follow their own habits and inclinations.

Now, suppose for a moment that there was no shotfirer employed, in order to secure the same degree of safety each of these 40 or 50 men would need to have an equal amount of experience and be equally reliable as the one shotfirer. Even then, the foreman would be obliged to take many chances on the experience and reliability of these men, while the shotfirer's capabilities are well known to him.

Our records show that, among miners, about one man in five is killed by a premature explosion or a misfire, or the careless handling of powder in making up a charge, or other similar cause growing out of his lack of knowledge or skill in the handling of explosives and the shooting of coal. On the other hand, a comparatively few shotfirers are killed; and the most of these are caught by a fall of roof or coal, or die from some similar cause not directly connected with the work of blasting. This fact results not only from their knowledge and experience in the firing of shots, but is due to their constant vigilance and care to detect unsafe conditions, in firing, especially where gas is present.

#### A MINE EMPLOYING SHOTFIRERS REQUIRES TO BE WELL VENTILATED

Second, generally speaking, the employment of shotfirers in a mine insures good ventilation. No trustworthy and reliable shotfirer will fire a shot where conditions would make it unsafe; and the ventilation of places where shots are to be fired is an important factor in respect to safety. I have seen shotfirers refuse to shoot coal, and the miner thought he was being discriminated against until the shotfirer pointed out the danger, after which the miner would apologize for his lack of foresight in placing the hole. It was made clear to him that the firing of the shot would not only have killed the miner and the shotfirer, but have caused the death of others in the mine.

Another feature to be considered is the economy effected by the employment of shotfirers. If I was an operator, I would rather spend \$6,000 in the payment of wages to three shotfirers, than to have one miner killed in charging and firing his own holes. My reason is that the payment of wages to live healthy men is better than the payment of compensation to widows and orphans. I am thankful that there are operators who are progressive enough to view the question of employing shotfirers from this standpoint.

#### BLASTING COAL OR ROCK BY THE USE OF FUSE AND CAPS IS UNSAFE

While we are speaking of blasting coal, there is one practice in particular that should be entirely stopped. In my opinion it is the cause of the death of more miners than any other agency employed in the shooting of coal or rock. I refer to the old fashioned cap and fuse. My preference is to employ nothing but electric caps and a firing battery, for this work, and to use permissible powder. The employment of experienced shotfirers will practically eliminate most or all of the dangerous practices of miners.

As long as we have all classes of miners, speaking different languages, and understanding little regarding the requirements of the mining laws, it would seem that the employment of shotfirers is an absolute necessity. The presence of reliable shotfirers in the mine will give to every mine foreman an added assurance of safety, since he knows it is a common trick of miners to attempt to pull one over on the foreman whenever the miner has

the chance. It goes with out saying that any miner will keep his place in better shape, owing to the more frequent inspection by the foreman, assistant foreman and shotfirer, than when there is no shotfirer making his rounds.

It is my conviction that there should be shotfirers employed in more mines than is the case today. To my mind, they are as important to the safe operation of a mine as the mine foreman himself. As well might the latter be eliminated, as to throw out the shotfirer. The work of the latter concerns the most dangerous conditions that exist in coal mining.

F. W. S.  
Johnstown, Pa.

### What the Employment of Shotfirers Has Accomplished

SOMEONE has been asked the question, "Are shotfirers harmful?" This seems an idle question in view of all the shotfirer has accomplished in reducing the number of accidents and making the mining of coal safer and more efficient. My answer to such a question is that, if crime could be legalized, then might we be able to consider the work of the shotfirer as harmful; because then his employment would interfere with practices that are now crimes and make the perpetrators punishable by law.

In my opinion, where a shotfirer complies with the requirements of the mining law, I can see no grounds for thinking that his work can be harmful in any respect. To my mind, such a suggestion appears to be the height of folly and must have come from someone having no practical experience.

Let us look, for a moment, at what the efficient shotfirer has accomplished and what dangerous practices his employment in a mine has eliminated. Even a madman, it cannot be assumed, would be willing to take the chances of again reverting to the custom of a few years ago, when miners fired their own shots when and where they pleased. Such a practice would be far more dangerous today than formerly, because a large majority of the men now employed are not experienced miners.

For this reason alone, the employment of shotfirers is a means of greatly reducing the chances of mine fires and gas and dust explosions. It can be truthfully said that the work of the shotfirer has preserved the lives of a large number of miners and there is but one answer to the question, Is the shotfirer harmful? The only way in which a shotfirer can be harmful concerns himself. In his haste or disregard of necessary precautions, he may make his work dangerous; whereas, with good judgment and skill, he can render his vocation reasonably safe. His own safety rests largely with himself.

Another thing that has increased the safety of mining coal where blasting must be performed is the advent of permissible explosives. One has only to look back to the time when black powder was universally used for blasting coal in mines. The miner would drill a hole, often on the solid, and charge and fire it with squib or fuse taking many chances with an overcharge of powder, a tight shot, short fuse and other practices that endangered not only his own life but the lives of all in the mine. The rules regulating the use of permissible powders have greatly reduced accidents by eliminating many of these chances, but the shotfirer has accomplished even more. Surely, no man with common intelligence would say that his work is harmful.

# Inquiries of General Interest

Answered by  
James T. Beard

## Room and Pillar Vs. Longwall Advancing and Retreating

**K**INDLY explain, in *Coal Age*, the advancing and retreating methods of working coal by both the room-and-pillar and the longwall systems, showing their comparative advantages. **THOMAS ANDERSON.**  
Barnesboro, Pa.

In the accompanying figure, are illustrated both the advancing and retreating methods of working, in the room-and-pillar and the longwall systems of mining coal. The two upper sections show the room-and-pillar system and the two lower sections, the longwall system of mining.

In each case, the left-hand figure is the advancing method, while the right-hand figure represents the retreating method, in the same system of mining. It will be observed that the general features of the room-and-pillar system of mining consist in driving rooms off the butt heading. The rooms are turned narrow for a short distance, from say 3 to 5 yd., and then widened out to a width of 6

or 8 yd., depending on conditions in the roof and floor of the seam, depth of cover, etc. The narrow portion is called the "neck" of the room.

In the advancing method of room-and-pillar work, the rooms are driven up in regular order, starting from the entry pillar, which is left for the protection of the main haulage road and air-course. The illustration shows the first five rooms as having been driven up, and the work of drawing back the pillars between the rooms as now in progress.

In the retreating method shown on the right, it will be observed that the butt headings have been driven to the boundary line, a distance of about 1,300 ft. from the main heading, which provides for the turning of 30 rooms on 40-ft. centers, and allows for the necessary barrier pillars protecting the main heading. The illustration shows the work of drawing back the pillars

between the rooms in progress in rooms 23 to 30, inclusive. Room 22 has reached the limit and the chain pillar at the head of this room has been attacked. The illustration shows rooms 19 to 21 as not yet having reached the limit. There is a break in the figure at this point, the rooms outby from No. 19 not being shown.

In the lower figure on the left is shown a section of a mine worked on the longwall advancing system. As there shown, a solid pillar of coal is left for the protection of the shaft, the main roads being driven through this pillar and the longwall face started by encircling the pillar with an entry. The longwall face is then opened up by extracting the coal forming the outby rib of this entry.

As this coal is taken out, packwalls are built and gateroads are maintained by building solid roadside packs. As shown in the figure, diagonal roads are extended at an angle of 45 deg. in each direction from the main road. The gates or gateroads are opened off the diagonal roads, and these gates are cut off from time to time by other diagonals. By means of this system the coal is hauled from every part of the working

(Advancing) (Retreating)  
ILLUSTRATING THE ROOM-AND-PILLAR AND THE LONGWALL METHODS OF MINING

face to the shaft bottom by the easiest direct route.

In the longwall advancing system, it has been found an advantage in many mining districts to maintain the working face in a series of arcs of circles, as indicated in the figure. By so doing it is frequently the case that the coal breaks better, while the roof pressure is under better control than where the working face is kept in a regular or uniform line. However, where the coal breaks freely, care is required to avoid crushing at exposed points.

To the right of the section just described is shown an outline of the longwall retreating system, the extraction of the coal in this case being made in panels. The work is started at the boundary line and is carried back from the boundary line toward the main heading, the coal in each panel being extracted in turn. As the coal is taken out the roof settles on the waste.

# Examination Questions

Answered by  
James T. Beard

## Mine Managers' Examination Held at Springfield, Ill., Feb. 17, 18, 1920

(Selected Questions)

*Ques.*—What pressure would be required to produce and maintain an air volume of 150,000 cu. ft. per min., in an airway 8 x 10 ft. and 3,000 ft. long?

*Ans.*—The rubbing surface of this airway is  $2(8 + 10)3,000 = 108,000$  sq.ft., and the sectional area  $8 \times 10 = 80$  sq.ft. The unit pressure producing the circulation of 150,000 cu.ft. per min. is, therefore,

$$p = \frac{k s q^2}{a^3} = \frac{0.0000002 \times 108,000 \times 150,000^2}{80^3} = 95 \text{ lb. per sq.ft.}$$

This pressure is far greater than what is used in mining practice, and the circulation should be divided into two equal splits, which would reduce the required pressure to one-eighth of the amount calculated or  $95 \div 8 = 12$  lb. per sq.ft., nearly; or, say a 2½-in. water gage.

*Ques.*—In the last question, what would be the total power exerted by the fan engine, if 70 per cent of the power was expended on the air?

*Ans.*—The circulation of 150,000 cu.ft. of air per minute, under a pressure of 95 lb. per sq.ft., allowing an efficiency of 70 per cent, would be

$$H. = \frac{Q p}{K 33,000} = \frac{150,000 \times 95}{0.70 \times 33,000} = 619 \text{ hp., nearly.}$$

Circulating this air in two splits, would require but one-eighth of this power, or say 77 hp.

*Ques.*—With a fan 8 ft. in diameter, making 250 r.p.m. and passing 62,000 cu.ft. of air per minute, under a water gage of 1 in., what is the equivalent orifice?

*Ans.*—The "equivalent orifice" is a term sometimes used in mine ventilation to indicate the ratio that the quantity of air in circulation (cu.ft. per min.) bears to the square root of the water gage expressed in inches. In this case, the equivalent orifice of the mine is

$$A = \frac{0.0004 Q}{1 \text{ w.g.}} = \frac{0.0004 \times 62,000}{1} = 24.8 \text{ sq.ft.}$$

The diameter and speed of the fan does not enter the solution.

*Ques.*—On going to the mine Tuesday morning, you find the fan making 80 r.p.m., the steam gage shows a pressure of 75 lb., and an air current of 45,000 cu.ft. per min. is passing down the shaft, the water gage showing a reading of 0.4 in. On Wednesday morning, you find the steam gage is 80 lb. the water gage 0.5 in. and the quantity of air passing only 40,000 cu.ft. per min. What would you think was wrong?

*Ans.*—Both the steam and water gages show an increase, in this case, while the quantity of air in cir-

ulation is considerably decreased. It is natural, therefore, to assume that the cause is some obstruction in the mine airways, which increases the mine resistance, thereby reducing the quantity of air in circulation but increasing the water gage, while the power on the air remains unchanged. Under these conditions the speed of the fan will be slightly increased, owing to the fact that less air is flowing through the fan and the power absorbed within the ventilator is less than before, which makes a larger proportion of power available for driving the fan.

*Ques.*—What gases enter into the composition of fire-damp, and in what proportion?

*Ans.*—The term "firedamp," in American practice, refers to any mixture of gas and air, in inflammable or explosive proportions. It is generally understood as referring to an inflammable or explosive mixture of methane or marsh gas and air. The lower inflammable limit of pure methane and air is reached when the proportion of gas to air is about 1:40, while the mixture becomes explosive when the proportion is 1:13; and the maximum explosive point is reached when there is just sufficient air present to completely burn the methane. The proportion of gas to air is then 1:9.57. The higher explosive limit of this gas is reached when the proportion of gas to air is 1:5; and the higher inflammable limit is attained when the proportion is 1:2.4, assuming normal air and pure methane in each case.

These proportions of gas to air vary somewhat with the character of the gas, the purity of the air and the method of inflammation or the source of ignition, which last concerns the volume and intensity of the flame producing ignition. When a firedamp mixture is ignited by the passage of an electric spark through it the intensity of the initial impulse is much greater than when the ignition is caused by contact with the flame of an open light.

*Ques.*—We have, in a mine, a sump 62 ft. long, 8 ft. wide and 7 ft. deep; it is full of water. How long will it take a 6-in. pump to empty this sump, the piston speed being 100 ft. per min., the resistance and leakage of valves being 10 per cent? There are 9 two-inch pipes running full of water into the sump, at a velocity of 100 ft. per min.

*Ans.*—The capacity of this sump is  $62 \times 8 \times 7 = 3,472$  cu.ft. The piston displacement of a 6-in. pump running at a piston speed of 100 ft. per min. is  $100(0.7854 \times 6^2) \div 144 = 19.635$  cu.ft. per min. Assuming a velocity of 100 ft., per min., the water flowing into the sump through 9 two-inch pipes is  $9 \times 100(0.7854 \times 2^2) \div 144 = 19.635$  cu.ft. per min. In this case, therefore, since the quantity of water flowing into the sump is equal to the piston displacement of the pump, the pump cannot empty the sump, which will overflow when account is taken of the loss by leakage in the pump.

# National Coal Association Holds Convention

Organization at Its Third Annual Meeting at Atlantic City Re-counts Progress of the Year and Adopts Helpful Resolutions—Advocates Increased Rates for Railroads and Separate Action on Coal

CONVENED on the playgrounds of Atlantic City, the bituminous coal operators met on May 25, 26 and 27 for serious discussion and frolic. The subjects of serious discussion were relations with the railroads and with the Government, and as the meetings were held only in the mornings, the afternoons and evenings were largely available for pleasure. The size and enthusiasm of the gathering were reduced by the absence of the Indiana delegation, to which Judge Anderson had refused passports for the trip. The first day was devoted to the address of the retiring president, H. N. Taylor, which is printed in full in this issue of *Coal Age*, and to preliminary consideration of reports of various officers and committees. The report of the Railroad Relations Committee on the assigned car question met with full approval, but a resolution to the Interstate Commerce Commission putting the association on record as favoring the rate advance asked by the roads was not so easily passed. Some contended that as the coal producers are not the ones who pay the freight on coal they are not the ones to endorse an advance in freight charges. The broader view, that the coal industry needs the railroads and should give this measure of support, prevailed, however, and on the last day of the convention the resolution was passed.

Tuesday afternoon found many of the visitors on the golf links at Sea View, the country club having extended the courtesy of the course to the delegates. In the evening a meeting was held, at which the topic again was assigned cars. It is now clearly understood that the only hope for a release from this practice lies in legal action, the railroads standing on their rights as defined by Commissioner Clark of the Interstate Commerce Commission. Notwithstanding the pressure that is being brought to bear on the commission by interests opposed to the assigned car practice, those in touch

with the situation are not hopeful for a change of attitude by that body.

Election of directors at large, which was held by secret ballot, occupied the early part of the morning on

Wednesday. A spirited contest had been in progress from the previous day to gain these positions, of which four were to be filled. Interest in the outcome of the ballot did not interfere with the attention given to the speaker of the morning, Eugene Meyer, Jr., managing director of the War Finance Corporation. Mr. Meyer told in simple language the story of how and why the world has been financed since the war began in 1914, and made it plain that conditions cannot remain as they now are and crops be moved next fall. Throughout the country, Mr. Meyer said, there is a manifest disposition on the part of those engaged in industries and great business enterprises to bring about an adjustment of the economic situation. He pointed out that economy in these enterprises is as immediately essential as is economy with the individual. Not alone must the United States make sure that it produces enough for its own market, Mr. Meyer went on to say, but it must endeavor to create a surplus to meet foreign demands. All of Europe,

he said, is looking to the United States for products, and if financial relations between this country and Europe are to be improved America must sell commodities in great quantities abroad. The whole world, he said, will need products from the United States for some time to come.

It has become more apparent than ever in the last few months, Mr. Meyer said, that the Government must take a greater interest in industry, and he urged at the same time that industry "must have a greater interest in the Government."

Wednesday evening the new officers for the coming year were announced, having been earlier selected by

Daniel B. Wentz

President of the National Coal Association, 1920-1921.

the newly-elected board of directors. Moving pictures of the new mining machine that cuts, picks down and loads coal all in one operation were exhibited by the Jeffery Machine Co.

The last morning was the best of all. To begin, A. H. Smith, president of the New York Central, told the assembled operators of the tasks that confronted the transportation system of the country when we entered the war and how the roads, though lacking equipment

President Taylor, in his closing address, said: "There is too much Government in business, and not enough business in Government." Eugene Meyer, Jr., managing director of the War Finance Corporation, however, thought that the Government should take a greater interest in industry, urging at the same time that industry "must have a greater interest in the Government."

and facilities for which they had been refused the revenue, met the demands of the war period.

In his speech Mr. Smith told the convention that the railroads of the country, in order to build the car equipment urgently needed, must spend approximately \$700,000,000 at once. The New York Central lines in the last month, he said, had authorized the expenditure of \$50,000,000 to buy coal cars and locomotives.

"We have a tremendous problem ahead of us in furnishing the transportation needed by the country's industries," said Mr. Smith. "Unless we can get the money with which to do it, the critical situation confronting the industry today will become worse. The people do not realize how acute the situation is today. Industries are in deep distress, all for the want of transportation. The coal industry is in distress; the steel mills are in distress. This country is in more trouble, I think, than it ever has been in, even in time of war, because of the need of this vital necessity, transportation.

"I know we are going to have a great deal of trouble during the coming winter because of this transportation problem. You can be pretty sure of it. We need co-operation everywhere if this country is to find the way out. The whole transportation system of the country is 'stymied,' but I am optimist enough to believe we will be able to work out the difficulty. To do it we must raise the money we need—we have simply got to do it."

#### TRANSPORTATION TROUBLES TO CONTINUE IN 1921

Dr. Charles A. Eaton, editor of *Leslie's Weekly* and famed as a student of men and a speaker to men, spoke last. It is putting it mildly to say that he brought the house to its feet—he did that and more, for he left impressions for good with every one that heard him. The next best thing to hearing Dr. Eaton is to read what he said, and we will publish his address in full in *Coal Age* in a coming issue. Some of his remarks should be noted at once.

"The one supreme thing that we are up against in industry is to get production," said Dr. Eaton. "The outstanding difficulty right now in industry is the lack of disposition of a great number of individuals to do the

work that is ahead of them. The country is under a frightful nervous distraction as a result of the war. Mountebanks and demagogues are leading unthinking workmen astray. Antagonism to organized industry, hatred and suspicion have developed under a false leadership. What we must have is a better understanding all around.

"We must have a leadership that will educate. We must have leaders in industry as well as in governmental life who will show the people the evils of the existing trend and who will help the country pass out of the age of chaos and into a period of success. We must develop the human element among our working people. We must develop an appreciation of the responsibilities that confront those who govern our great industries. The leaders of industry themselves must get closer to their own men. If they do not, the men will go elsewhere for leadership.

"We can no longer leave this nation in the hands of the demagogue, the self-seeker and the ignoramus. Need of production today is so appalling that I fail to see how any one can sleep over it, and yet agitators are constantly demanding more wages, more wages and putting into the heads of the workers the idea of less work. Next year will see food prices higher than ever, and unless there is advanced production in other commodities, there can be no lowering of prices for anything.

"Unless all of us get down to the idea of increased production and abstaining from buying things that we don't actually need this country within the next twelve months will find itself worse off than it has been at any time since the war began.

"Conservative leadership all along the line is needed. Moral cowards who are spreading discontent must be put down. People must quit theorizing and get to work. We will win this fight for the readjustment of our economic life if we gird ourselves for the great fight ahead of us. It will take courage and strength to do it."

In the effort to end the freight tie-up and to help the railroads out of their difficulties the following resolution was adopted:

"Whereas, The present insufficient production of coal is directly due to the lack of adequate transportation facilities, and

"Whereas, The quickest way to rehabilitate the railroads and enable them to secure the needed equipment and give the service which will tend to reduce the cost of production of all commodities, including coal, is to re-establish railroad financial credit,

"Therefore be it Resolved, That the coal industry recognizes the need for an immediate increase in the revenues of the railroads, sufficient to insure their solvency and prosperity, by means of an increase in freight and passenger rates. However, the coal industry desires assurance from the Interstate Commerce Commission that this endorsement of an immediate increase in all freight rates will not prejudice the right of any parties interested to obtain redress hereafter, first if the differentials are inequitable as between different mines or different producing districts, and second, if rates themselves are excessive, unreasonable or discriminatory.

"The coal industry desires to call attention to the fact that coal consumers have already borne more than their share of increased cost of transportation and that the public welfare might be conserved by adopting a higher percentage of increases on freight of greater

### Profits in the Coal Industry

With an average investment in developed coal lands and working plant of \$2.62 per ton of output in 1918, the best year the industry ever had, the total investment in the bituminous coal industry is indicated to be more than \$1,500,000,000, on which, according to the Bureau of Internal Revenue, earnings were made of 9.72 per cent. The total investment in the bituminous industry was but slightly greater in 1919 than in 1918, but the output was 21 per cent less.

value and a lower percentage of increase than proposed on coal, which is the basis of industry."

In reference to the nationwide shortage of coal the association went on record as follows:

"The National Coal Association deplors the existing shortage in coal production and declares that present conditions are due solely to the lack of empty railroad cars in which to load coal at the mines, and to delays in transporting coal to destination."

The operators also expressed themselves as in favor of publicity in regard to the affairs of the coal industry, as shown in the following:

"The National Coal Association welcomed the opportunity afforded by the Frelinghuysen Committee of the United States Senate to present the facts before a fair and impartial tribunal in such a way as to better advise the people of the country as to the problems of the industry, because it recognizes the fact that many of the difficulties of the industry arise from lack of information on the part of the public."

To bring about the more general adoption of the standardized accounting system of the association this resolution was adopted:

"It is the sense of the members of the National Coal Association that the officers thereof use their influence for the general acceptance by the Government of the principles adopted by this organization for cost accounting so that there can be no disputes as to returns made to the Government or duplications thereof, thereby eliminating confusion and expense to the coal industry as well as to the Government."

In the matter of government regulation of industry the sentiment of the organization is clearly expressed in this resolution:

"The coal industry of the United States, represented by the National Coal Association, is unalterably opposed to the enactment of any legislation imposing additional regulation upon commerce and industry and is especially opposed to legislation which singles out any one industry for regulation by special commission."

Officers of the association elected to serve for the year 1920-1921 were as follows:

President, D. B. Wentz, Philadelphia, Pa.; Vice-Presidents, A. M. Ogle, Terre Haute, Ind.; Erskine Ramsay, Birmingham, Ala.; J. G. Bradley, Dundon, W. Va.; J. D. A. Morrow, Washington, D. C.; Treasurer, J. J. Tierney, Philadelphia, Pa.; Secretary, W. B. Reed, Washington, D. C.

Directors at large, Philip Penna, Terre Haute, Ind.; Michael Gallagher, Cleveland, Ohio; J. P. Walsh, Pittsburgh, Pa.; D. B. Wentz, Philadelphia, Pa. Directors

by fields, G. H. Barker, Ohio; C. E. Bockus, Virginia; W. D. Barnum, Washington; T. T. Brewster, Illinois; W. J. Carney, Montana and So. Wyoming; Ira Clemens, Kansas; E. M. Gray, Iowa; T. W. Guthrie, Pennsylvania; T. H. Watkins, Pennsylvania; W. H. Huff, Colorado and New Mexico; A. M. Ogle, Indiana; Erskine Ramsay, Alabama; C. W. Taylor, West Kentucky; R. T. Price, Arkansas, Oklahoma and Texas, and J. J. Tierney, West Virginia.

Geo. W. Reed succeeds F. S. Peabody (resigned), and C. W. Watson succeeds J. H. Wheelwright (deceased).

### BUREAU OF COAL ECONOMICS

Work of the Bureau of Coal Economics of the National Coal Association was endorsed by the convention and a resolution was adopted promising the continued support of individual members and local associations in this work. It was pointed out that the need for accurate, comprehensive data on coal is greater today than ever before and that the key to success is the co-operation of the men in the field. The bureau can do nothing unless the figures are sent in to Washington. Vice-President Morrow said that the statement recently made by Commissioner Wooley of the Interstate Commerce Commission that with the 27-per cent increase in wages the operators had added \$2 to the mine price of coal could not be refuted because the local associations had not furnished the National

What became of the Operator's Dollar in 1916.

Distribution of Mining Cost

tional with the figures on realization, though they had repeatedly been called for.

Large scale charts showing the investment and profits of the coal industry, time worked and lost because of car shortage and for other reasons, the division of cost as between labor, supplies and other items and of receipts between various items of cost and profit, and one showing the relation of the increase of cost of production and short running time, were exhibited on the wall of the convention room. Some of these are reproduced herewith. The bureau has in preparation numerous other diagrams of distinct educational value and will

have a permanent exhibit at the headquarters in Washington.

Last year the National Coal Association had approximately 2,150 member companies. This year, 1919-1920, there are under 2,100 member companies. The decrease is primarily due to the number of small companies that went out of business in the past eighteen months. In 1918 the paid membership of the National represented 60 per cent of the total production of the country, whereas in 1919 it was 61.5 per cent, showing that there has been no decrease in the strength of the organization.

A measure of the work done by the Washington office of the association is found in the record of correspondence for last year. Mr. Morrow reported that more than 1,300 letters asking for information and advice were received from coal operators. In answer more than 1,400 letters were sent out, in addition to which some 12,000 circular letters were mailed to the membership and a vast amount of other material was furnished. It is estimated that about 40,000 letters of all sorts were mailed out by the Washington office in the year just closed. More than 5,000 telegrams were received asking for immediate service from the Washington staff. In reply 6,334 telegrams were sent out. The Washington office answered more than 800 long distance telephone calls on important matters and called 981 times.

Having completed its third and most successful year, the association expressed its appreciation and thanks to its officers and directors for their contribution to the accomplishment of such splendid results.

### Reserve Board Lays Low Coal Supply to Inadequate Car Supply

**I**N reviewing the general business situation for May, the Federal Reserve Board comments on the coal situation as follows:

"Coal conditions have been particularly important in connection with iron and steel, as with other industries. The state of things in regard to coal is now very acute in some districts. In district No. 2 (New York) the supply is far below the demand and consumers are bidding against one another. Railroads 'are more or less the victims of systematic sabotage at their terminals.' Car supply at the mines is only 30 per cent of normal, while the labor situation there also is unsettled. The situation as a whole 'is such as to cause considerable concern among conservative coal men' and transportation is regarded as a fundamental factor requiring improvement.

"In the Middle West (district No. 4—Cleveland) coal shipments have fallen off. At Lake ports during April they were about one-third of what they were in April, 1919. Lake shippers will pool their coal in order to increase the movement, but this is only a partial remedy. Fuel prices are the highest on record in the Lake trade. Not only does a general shortage of coal exist now but a shortage is foreseen for next winter which may curtail production of iron and steel at interior furnaces.

"In district No. 6 (Atlanta) coal production is being held down, mines being able to get an insufficient number of cars. Labor, however, shows no discontent and there is small movement of coal in foreign trade. Railroads throughout the district have placed orders for

fuel for the next twelve months, 'the amount in every instance being larger and the price higher than ever before.'

"Production of bituminous coal for the country at large during April amounted to 32,006,000 tons, as compared with 46,792,000 tons during March and 32,164,000 tons during March, 1919, the respective index numbers being 86, 126 and 87. Labor difficulties, although sporadically existing, appear to be a relatively minor factor in coal production as compared with the influence of car shortage. No reduction of prices is in sight."

### Ten Million Barrels of Oil a Year Required by the Navy

**N**AVY requirements for fuel oil for the next fiscal year will be in excess of 8,000,000 barrels. This is in addition to 2,621,000 gallons of lubricating oil needed. This is the estimate of Admiral R. S. Griffin, chief of the Bureau of Steam Engineering. In connection with a statement as to the navy's oil requirements Admiral Griffin said:

"The demand for oil for the navy alone looks very formidable in comparison with the requirements of two or three years ago. When it is considered that a large number of merchant ships completed during the last three years also burn oil, and that many industrial establishments recently have converted their power equipment to oil burning, the question of an adequate supply of fuel oil for the navy becomes one of great concern.

"I share the view of many regarding the national importance of conserving our oil. Without an assured supply our navy would be practically useless, and I shudder to think what the result would be if anything should occur that even remotely would threaten this supply.

"We now have in commission seven battleships of a combined horsepower of 204,000 which burn oil only. In addition to these we have building twelve other battleships of 533,000 hp.; six battle cruisers of 1,080,000 hp.; and ten scout cruisers of 900,000 hp.; making a total under construction of these three classes of ships aggregating 2,513,000 hp.

"In oil burning destroyers we have actually completed 234 with an aggregate horsepower of 5,626,000, and have under construction eighty-seven others which will be completed during the next fiscal year and will bring the total horsepower of destroyers up to 7,975,000.

"Our submarines already completed aggregate about 80,000 hp. in Diesel engines, and those under construction will more than double this figure.

"Besides these vessels of a purely military character, we have others such as mine sweepers, tugs, destroyer and submarine tenders, and fuel ships in which oil is used as fuel, whose horsepower aggregates 173,400.

"To sum up, we actually have completed and ready for service vessels aggregating more than 6,000,000 hp. in which oil alone is used for fuel, and have under construction other vessels which will bring this total up to nearly 9,000,000 hp."

H. Mortimer Lamb, secretary of the Canadian Mining Institute, owing to ill-health has been obliged to resign his position as secretary of the Canadian Mining Institute. His resignation, on being conveyed to the Council, was regretfully accepted.

WOOTON

## Senate Passes Bill to Sell Government-Owned Ships to Private Buyers

ON May 21 the Senate—no record of the vote being given—passed the House Merchant Marine bill providing for a permanent merchant marine policy. The measure provides for the sale of Government-owned ships to American citizens or corporations as soon as advisable and, pending such sale, for their operation either by the Government or under lease.

## Trade Commission Reports Producing Costs in Alabama, Tennessee and Kentucky

COAL producing costs in Alabama, Tennessee and Kentucky have just been made public in the Federal Trade Commission's latest report. It is the fourth report of its kind. The first report covered the production of bituminous coal in Pennsylvania; the second report covered the production of anthracite in the same state, while report No. 3 covered the production of bituminous coal in Illinois.

The tabulation of costs in Alabama refute most decidedly the sensational charges of profiteering made last year by Representative Huddleston. The compilation shows that for district No. 1 sixty-three cents of each dollar paid for coal at the mine went to labor, fourteen cents for supplies, thirteen cents for general expenses, and ten cents went to the operator, from which ten cents sales expense, interest and Federal taxes must be deducted. The remainder is the operator's profit. Similar divisions of costs for the other Alabama districts are shown.

One point in the report, the unreliability of averages, is brought out with particular clearness. One of the tables covering operations in Tennessee district No. 1 shows a drop of forty cents in the sales realization for September as compared with August. It happened that a strike closed down the mines in the district which had been receiving the higher average sales realization. Those which continued in operation happened to have comparatively low sales realization. As a result the average sales realization was in no way typical for the field.

Among the new features brought out in the No. 4 report are figures having a bearing on the coking of coal by producers. One of the tabulations compares costs, sales realizations and margins between operators who coked different proportions of their output.

The report points out that diverse conditions exist in the districts covered and that there is danger in applying widely some of the generalization drawn. In that connection the commission says:

"It is desirable to point out the diverse conditions which have existed during the past three years between

the different coal-producing districts in Alabama, Tennessee and Kentucky. There were districts where a period showing a lower margin than the preceding period had an increase of output. There also were districts where a period showing a higher margin than its preceding period had decreased production.

"The explanation of such different results must be sought in the particular conditions which have existed in each producing district. There is great danger in applying widely some of the generalizations drawn from the experience of particular districts or states. The collecting of definite up-to-date information covering the whole industry and making it readily available for use is, therefore, highly desirable."

## Walter Durand Takes Charge of Coal Cost Compilation

WITH the Federal Trade Commission's coal activities in the limelight there is particular interest at this time in the man who actually handles the cost figures and who directs the compilation of the reports

WALTER DURAND

on costs of production. Since June 1 Walter Durand has been in charge of this work. He succeeded David L. Wing, who has opened an office as a consulting economist. Mr. Durand is well known among anthracite operators, as it was he who had charge of the anthracite investigation conducted by the Federal Trade Commission shortly before

the war. Mr. Durand was born in Romeo, Mich. His early education was obtained in the public schools of South Dakota and Ohio. He was graduated from Oberlin College in 1896, and did his post-graduate work at Harvard. He devoted several years to teaching and was a member of the faculty at Phillips Andover Academy at Andover, Mass., and at Oberlin College. He entered the Government service in 1908 as an economist in the Bureau of Corporations, which was absorbed later by the Federal Trade Commission. He was in charge of the foreign trade investigation from which the Webb-Pomerene Act was an outgrowth. For several years he has occupied the position of assistant chief economist of the Federal Trade Commission.

## Miners' and Operators' Trial Set for November 8

Judge Anderson Overrules Hughes Demurrer and Motion to Quash Indictment, Declaring Section 9 of Lever Act Constitutional

WITH the decision May 26 of Judge A. B. Anderson, of the Indiana District Federal Court, that section 9 of the Lever Act is constitutional and the overruling of a demurrer presented by Judge Charles Evans Hughes on behalf of the indicted mine workers' officials, the case of fifty-seven bituminous operators and miners was set for trial Nov. 8. All those indicted pleaded not guilty. The judge's decision was made on a motion by Judge Hughes to quash the indictments.

The decision as to the constitutionality of the Lever Act overruled the motion to quash in so far as the five counts of the indictment based on Section 9 were concerned. Section 4 and Section 26 of the original Lever Act and Section 4 of the amendment of Oct. 22, 1919, upon which thirteen other counts of the indictment were based, were held unconstitutional and void by the Court in his ruling.

Argument on the demurrer to the indictment was begun by Mr. Hughes immediately after the ruling on the motion to quash. Passing the question of the validity of the section upon which the remaining counts were based, Mr. Hughes contended that Section 9 of the act did not apply, but was superseded by the action of the President in regulating the fuel industry under the powers granted him by Section 25 of the same act.

He held that during the time regulation of the coal industry was effective under section 25, the general statute, section 9, did not apply, but was overridden by section 25, which was specific in regard to the coal industry.

Mr. Hughes' second line of attack upon the indictment was the contention that the counts of the indictment were defective and insufficient in that they were couched in such vague, indefinite and general terms as to not inform the defendants of the charges against them. He said the Government had no right to come into court with a general "omnibus" statement that the defendants had limited facilities. He cited a parallel case under the Espionage Act in which a demurrer had been sustained because of the vagueness of the averments, which he asserted were no more indefinite than those in the present case.

In a supplemental argument Samuel D. Miller, in defense of the operators, stressed the contention that Congress had not meant section 9 to be applicable during the period in which section 25 was in effect.

"Why didn't Congress say so?" queried the Court.

"I was not a member of Congress at that time, your Honor," Mr. Miller replied.

"Well you haven't got that to answer for," rejoined the Court.

Pleas of not guilty were entered by the following Indiana operators: H. M. Ferguson, David Terhune, Robert J. Smith, Henry Smith, Archibald Spears, George A. Anthony, William J. Hamilton, John A. Templeton, William Epperson, Banus E. Neal, Valentine Martin, Alfred M. Ogle, Jabez Wooley, William P. Zimmerman, Thomas Byers, M. E. Mogg, David Ingle, W. H. Tobin, William Zeller, Edward Shirkie, Edward Hackett, George A. Van Dyke, William J. Freeman, Edwin D.

Logsdon, Phil H. Penna, G. H. Richards, Hugh Shirkie, Homer B. Talley, Walter D. Talley, Warren F. Smith, Frank Thorpe and John Kelly.

The following Indiana mine worker officials entered similar pleas: John L. Lewis, president of the United Mine Workers of America; Philip Murray, vice-president of the United Mine Workers; William Green, secretary-treasurer of the United Mine Workers; William Raney, William Mitch, John Hessler, James A. McKinney, Harry Such, Charles Fettlinger, Harry Lentz, U. G. Hall, John Little, Jack McQuade, John Chesterfield, Robert Perry and Ed Haverkamp.

Pennsylvania miners who entered pleas of not guilty are: William C. Cavanaugh, P. T. Fagan, Robert R. Gibbons, William Hargest, Thomas Hughes, Frank Leithold, John McWee and John O'Leary.

Those indicted from Illinois and Ohio were not in court pending a settlement of their suits to prevent prosecution in the Indiana court.

The ruling by Judge Anderson is expected to have a material effect on the prosecution of alleged profiteers in the Indiana district. Section 4 of the act as amended was one of the sections held unconstitutional and it was under this section that Charles P. Tighe, special agent in charge of the Bureau of Investigation, made affidavit against an Indiana company recently.

## Indiana Strip Mine Operators Grant Most of Workers' Demands

AFTER granting most of the mine workers' demands the joint convention of the strip miners and the strip mine operators of district No. 11 adjourned May 25. All matters not decided were taken under advisement by a joint committee. First of the miners' requests, that which gave the mine committee jurisdiction over the mine engineers, was granted with little discussion. The fourth demand, making the time and one-half pay for over-time work apply to pumpers, night watchmen and boiler cleaners, also was granted. The fifth, which had to do with an increase in the death benefits, was granted and it was agreed to rewrite section 19 regarding the promotion of men according to seniority.

The sixth demand, however, which asked that steam shovel men be increased to \$225 a month and that all other monthly men be brought up to the 20 per cent increase awarded by the national commission, was denied in part by the operators. They refuse to give any increase except that awarded by the commission.

Regarding a recent rumor to the effect that the organization was about to be dissolved Phil H. Penna, secretary of the Indiana Bituminous Coal Operators' Association stated emphatically that there was nothing to the rumor. "When the scale committee, composed of representatives from every sub-district in the state, made the wage scale," said Mr. Penna, "there were some who did not agree with the scale. In an organization of one hundred members it is always impossible to please every member on every point. In this connection there were four operators, Ed Shirkie, Grant Coal Co., Stewart Shirkie and the W. S. Bogle Co., who paid the increase asked by the shotfirers. But they paid it from the start and have never closed down their mines because of any controversy with the shotfirers. The report that they have resigned from the organization or that the organization is going to be abandoned is ridiculous."

## Public Utility Power Efficiency Shown in Geological Survey Reports

REPORTS of the U. S. Geological Survey show a very interesting relationship between the power production and the efficiency with which the fuels are used in the various public utility central stations throughout the country. The following tabulation shows the total power output and the efficiency expressed in kilowatts per ton of coal used for each of the seven months for which reports have been made. Some of the variation is undoubtedly due to seasonal factors, but the principal factor probably is the greater percentage load factor during recent months as compared with the period about a year ago. These figures, of course, cannot be taken as absolute in their significance, but are a good indication of the general practice.

Month	Millions of Kilowatt Hours	Efficiency Kw.-Hrs. per Ton of Coal
1919:		
February	1,834	586
March	1,842	580
April	1,718	594
July	1,929	636
October	2,240	645
1920:		
January	2,575	643
February	2,327	632

Another interesting point shown by the figures is the relatively greater average efficiency of central stations in states where most of the power is generated at large plants. For example, in Pennsylvania, Illinois, Ohio and other states where large cities predominate the efficiency is about 600 kilowatt hours per ton of coal or even higher, being nearly 800 in the case of New York and Michigan.

On the other hand, in more sparsely settled states, such as North Dakota and Montana, the average is only 150 to 200 kilowatt hours per ton. This is a striking illustration of the great advantage which the proposed super-power plants will have if installed to substitute for existing central stations. When we see the average for whole states five times that for other states we can readily believe that the estimated saving of 50 per cent of the coal now used in all central stations would be feasible if all were replaced by a super-power system.

### Record Petroleum Output in March

IN SPITE of constantly increasing domestic production of petroleum, consumption is increasing at an even faster rate, and stocks continue to be correspondingly depleted. The March production of petroleum, amounting to 36,491,000 barrels, a daily average of 1,177,129 barrels, is the greatest on record for any one month. These figures compare with a daily average of 975,290 barrels in March, 1919, and of 956,903 barrels in March, 1918. If production continues for the rest of the year at the rate established in the first quarter the total for 1920 will be in excess of 410,000,000 barrels, according to the Geological Survey.

Stocks of domestic petroleum held by pipe-line and other marketing companies at the end of March amounted to 125,291,000 barrels, marking the continued withdrawal of stocks which has been in progress since September, 1919. The greatest decrease (1,132,000 barrels) occurred in California, where the large drafts on stocks which have been reported in recent months continues. Gulf Coast stocks also were depleted 445,000 barrels during March.

It should be observed, however, that these large withdrawals of stocks of heavy oil were in part counterbalanced by small gains in stocks in other fields, the most notable being a gain of 323,000 barrels in the Appalachian field. Stocks of Mexican petroleum held by importers have not been collected for a long enough period to show significant results, but a reduction of stocks of imported oil is also reported.

Imports for March established a record, the total amounting to more than 6,500,000 barrels, exceeding the imports for March, 1919, by more than 3,000,000 barrels. Exports of crude oil, amounting to 861,486 barrels, were almost four times the quantity exported in March, 1919.

Total consumption of petroleum in March, 1920, exceeded total consumption in March, 1919, by more than 12 million barrels. If consumption continues for the rest of the year at the rate established in the first three months the total will be in excess of 495 million barrels. The March daily rate of consumption exceeded the daily rate of domestic production by more than 240,000 barrels.

### Manning Opposes Transfer of Fuel Yard to Non-Technical Bureau

IN connection with a bill which has been introduced by Representative Wood of Iowa, Director Manning of the Bureau of Mines has written the author of the bill explaining why in his opinion the Government Fuel Yard should not be transferred to the proposed Bureau of Supplies. Extracts from his letter follow:

"I am especially interested in the provision in the bill to transfer the Government Fuel Yard work to the new Bureau of Supply. During the period of nearly two years since the establishment of the Government Fuel Yards no Federal or District government heating or power plant has been obliged to let its fires go out, or curtail its coal consumption because of the failure of its coal supply.

"I think you will agree with me, in view of the coal situation and different strike conditions during that period, that this is a particularly good record. The point I wish to make is that I do not think this record could have been established, and I do not believe it can be maintained, upon a basis of simply earnest, hard, overtime work by the Government Fuel Yards as a separate, purely business organization.

"There are certain of the established duties of the Bureau of Mines that tie into the Government Fuel Yard work to spell, in my opinion, the difference between only a fair or perhaps poor handling and an efficient and successful handling of that work. The bureau is the Government authority on the subject of the selection of coal for different fuel-burning equipment and the adaptation of fuel-burning equipment to different kinds of coal. The engineers engaged in this work as the general supply committee, a purely business organization, did not see several years ago the advantage and economy to the Government in arranging for the selection, purchase and distribution to the Government establishments in the District of Columbia of the coal needed by such establishments.

"The services of these engineers in the regular coal work of the bureau have been of the very greatest value in the guidance and handling of the Government Fuel Yard work. The handling of that work has been, and

will continue to be, not a purely business matter of purchasing and distributing coal, but also a matter of applying engineering knowledge and technical skill to the reduction of the Government coal bill.

"At the present time, when the Navy Department is able to fill its coal requirements outside of Washington only by commandeering coal, the Bureau of Mines is obtaining, through the assistance coal mine operators are rendering upon the basis of the co-operation developed in mine safety and other work during the past ten years, sufficient coal for the needs of the Government Fuel Yards.

"I strongly favor the main purpose of your bill. I think that a central purchasing agency can purchase and deliver desks, file cases and other office supplies more economically than individual departments and government establishments can; but the purchase of this one commodity, coal, is already centralized in a single agency in the Government Fuel Yards, and I have endeavored to indicate my firm conviction that the selection of coal for the Federal and District governments in Washington, the purchase of this coal, its storage and its distribution, can all be handled to the best advantage by the retention of this work in the Bureau of Mines."

### Commission Grants Coal Association Request On Coal Freight Charges to Canada

THE Interstate Commerce Commission has granted in its entirety the request of the American Wholesale Coal Association with regard to payment for coal transportation between the United States and Canada, dissatisfaction having arisen because of unsettled rate of exchange. To the existing ruling in regard to payment for transportation the commission has ordered that the following be added:

"The existing difference in exchange value between the moneys of the United States and the Dominion of Canada, while continuing to bear the same denomination, has been productive of confusion and uncertainty as to the construction to be placed upon tariff schedules, division sheets and accounts in respect of traffic crossing the international boundary.

"We are of opinion that where transportation of persons or property or transmission of intelligence by wire or wireless takes place partly within the United States and partly within the Dominion of Canada, the tariff charges or divisions thereof accruing for the part which takes place within the United States are payable only in lawful money of the United States, irrespective of the money in which tariff charges or divisions thereof accruing for the part which takes place in the Dominion of Canada may be payable under the laws there in force.

#### RATE SCHEDULES MAY INCLUDE REGULATIONS

"Adjustment should be made in accordance herewith by carriers subject to the act in settling their accounts with connecting carriers. Appropriate rules or regulations to give effect to this ruling may also be included by such carriers in their tariff schedules, if they so desire.

The practice, which has grown up since development of said difference in exchange values, of requiring prepayment of charges in cases where not customarily required theretofore tends to embarrass shippers and impede foreign commerce. Carriers subject to the act will be expected to refrain from such unusual require-

ments in cases where they are not justified by other considerations."

The regulation to which the foregoing was added reads as follows:

"Nothing but money can be lawfully received or accepted in payment for transportation subject to the act, whether of passengers or property, or for any service in connection therewith, it being the opinion of the commission that the prohibition against charging or collecting a greater or less or different compensation than the established rates or fares in effect at the time precludes the acceptance of service, property or other payment in lieu of the amount of money specified in the published schedules."

## New York Lighting Companies Use 3,453,408 Tons of Coal a Year

Gas Companies Also Consumed 88,785,797 Gallons of Gas Tar and 218,018,831 Gallons of Gas Oil— Made 378,438 Tons of Coke

MORE than three million tons of coal and coke was used in the manufacture of gas and electricity by the various gas and electric lighting companies in New York City in 1919, according to reports filed with the Public Service Commission. Of this tonnage the gas companies used 1,645,619 short tons of coal and coke, and the electric lighting companies used 1,806,789 short tons of anthracite and bituminous, a total of 3,453,408 tons.

#### COAL AND COKE CONSUMPTION BY GAS COMPANIES

	Boiler Fuel Coal	Coke	Gas Coal Carbonized (Bit.)	Under Retorts Coke	Generator Coal	Fuel Coke
Consolidated Gas Co.	10,603	9,519	406	513	80,998	39,398
Astoria Light, Heat & Power Co.	27,302		468,268	48,612	120,200	C.&C.
New Amsterdam Gas Co.	17,477	C.&C.			103,320	C.&C.
N. Y. Mutual Gas Co.	9,440				54,515	C.&C.
Standard Gas Light Co.	4,695	C.&C.			40,816	C.&C.
Central Union Gas Co.	9,139	C.&C.	80,421	10,637	45,165	C.&C.
New York & Queens Gas Co.	2,478					
	562	gas coal			6,573	
Brooklyn Borough Gas Co.	3,185				11,031	
Kings County Lighting Co.	14,698				25,304	
Brooklyn Union Gas Co.	55,179				299,852	C.&C.
Bronx Gas & Electric Co.	10,416				3,343	
	130	gas coal				
Queens Borough Gas & Electric Co.	4,323				8,835	
New York & Richmond Gas Co.	6,414				11,852	
Totals	176,041	9,519	549,095	59,762	811,804	39,398

In addition to the consumption of coal and coke the gas companies in Manhattan and The Bronx used 14,254,558 gallons of water-gas tar and 129,233,034 gallons of gas oil in the making of gas, while the companies in the other boroughs of the city used 12,305,157 gallons of water-gas tar and 88,785,797 gallons of gas oil, a total of 26,559,715 gallons of water-gas tar and 218,018,831 gallons of gas oil.

Three of the gas companies made 378,438 tons of coke during the year, of which they sold 119,479 tons for \$669,660.03, an average of \$5.59 per ton.

The reports show that the various electric lighting companies consumed the following tonnages:

	Anthracite	Coal	Bituminous
New York & Queens Electric Light & Power Co.	6,441		1,770
New York Edison Co.		948,651	
United Electric Light & Power Co.		334,553	
Flatbush Gas Co.	21,242		1,657
Brooklyn Edison Co.	16,428		427,618
Queens Borough Gas & Electric Co.			15,154
Richmond Light & Railroad Co.	33,275		
Totals	77,386	1,283,204	446,199

# The Labor Situation

Edited by  
R. Dawson Hall

## Railroad-Shop Strike Makes Coal Mine on Virginian Line Lie Idle

A STRIKE of shopmen and car inspectors on the Virginian R.R. at Princeton, W. Va., an important divisional point of the road, during the third week of May not only interfered with transportation but also played havoc with coal production on the road. In many instances production was brought to a standstill owing to the road's inability to supply cars and move coal trains, the railroad company being short of motive power. Twelve hundred men were involved in the strike, which grew out of the fact that the company had discharged a boilermaker. Shop employees demanded his reinstatement. When the company refused the shop employees went on strike.

## Claimed Right to Load Pyrite as Coal

A STRIKE at the plant of the Consumers' Coal Co., located at Downs, in the Marion County (W. Va.) field, was declared by miners employed at the plant on Wednesday, May 19, following the discharge of three men. Fully 250 miners failed to report for duty on the date named, taking such action following a meeting the night before at which it was decided to strike unless the three men discharged were reinstated.

The company claims that they were discharged for persisting in the loading of dirty coal though they had been cautioned time and again to abstain from doing so. It is even said that one of the three men discharged loaded sulphur balls weighing as much as 250 lb. each in his cars. The miners assert that the company had issued no warnings against loading "dirty coal" but fined men when they loaded it and added that it was easier to pay the fines than to separate the impurity.

The strike was finally settled during the latter part of the week in which it began, officials of district 17 conferring with the miners and the latter as a result agreeing to go back to work provided the men discharged were reinstated. That was agreed to and the striking miners returned to the mines.

## Star Chamber Proceedings Against Peters

MUCH mystery surrounds the bringing of charges by C. F. Keeney and the District Board of district 17 against H. E. Peters, president of sub-district 4, an area covering a part of northern West Virginia. Peters is charged with having circulated false statements about the president of district 17. So far Peters has authorized no statement for publication, declaring that any statement to be made public should come from the district board which is trying the case.

Keeney, the district president, has declined to give any publicity to the charges against Peters, stating

that the matter is purely an internal affair and therefore what transpires should be kept within the organization and not given to the public. He has heretofore stated that nothing will be given out in connection with Peters' trial.

There has been more or less friction between Peters and Keeney for some time and the charges against Peters, whatever they may be, are not therefore regarded as surprising. As Keeney will act as judge and appoint the jury, the verdict, it is predicted, will hardly be favorable to Peters.

## Employees Strike at Raymond City, W. Va.

OPERATIONS at one of the large coal plants in Raymond City, Putnam County, West Virginia, were almost totally suspended on Tuesday, May 18, when about five hundred miners went on strike. They objected to an order of the superintendent of the plant governing the mining and loading of coal and promptly proceeded to register their dissatisfaction by quitting work. It was believed, however, that the strike would be of short duration.

## Wage Agreement Concluded in Wyoming

AFTER several days of joint session at the Plains Hotel, Cheyenne, Wyo., a wage agreement was reached on May 22 between mine operators and mine workers of district No. 22, which covers the State of Wyoming. The minimum wage for men underground is \$6.28 and for workers on the surface is \$5.44. An increase of 24c. per ton is granted on all coal produced and of \$1 per day for all daymen. An advance of 20 per cent is given all hands for deadwork and yardage.

## Mingo Operators Have Not Closed Mines

ALTHOUGH it was stated that all mines in Mingo County, W. Va., would be shut down pending a settlement of the labor trouble in that county it is learned that only about half a dozen companies have shut down entirely. Other companies, of course, have been operating with curtailed forces and production in the field naturally has been materially reduced as a result of the labor difficulties in the Williamson field.

## Labor Department Has 28 Strikes to Settle

H. L. KERWIN, Director of Conciliation, in issuing a report of labor disputes for the week ended May 8, states that on that date there were twenty-eight strikes before the Labor Department for settlement, and in addition fifty-seven controversies which had not reached strike stage.

## Anthracite Wage Dispute Will Be Submitted to Arbitration

Operators Offered Increase of 65 Per Cent. on 1916 Wages and 17.8 Per Cent on Wage Scale Existing Prior to April 1

AFTER declaring that they would not submit the anthracite wage dispute to arbitration the mine workers at their tri-district convention in Wilkes-Barre on May 27 finally decided that it was the only way to secure a better settlement than their leaders had been able to obtain. Waging a successful strike, the representatives of the mine workers say, has been made "almost humanly impossible" because of "class legislation." Therefore they accepted President Wilson's offer to appoint an arbitration committee for the adjudication of the matter.

Meantime they will remain at work "under the retroactive understanding agreed to between the operators and miners and reiterated by the President, which will protect the mine workers in wage increases as from April 1." The contract that Secretary of Labor Wilson submitted, which was the maximum offer of the operators, was rejected without an opposing voice. Yet this offer had received the approval of the international officers of the United Mine Workers of America. This agreement would have provided for a 17.8-per cent advance above the wages now being paid and would have given the mine workers at least a part of that recognition for which they have long craved.

James Gorman, secretary of the Board of Conciliation and secretary also of the wage conference, was informed of the decision of the tri-district convention and was also requested to arrange for a meeting of the scale sub-committee of mine workers and operators on Monday or Tuesday of the present week.

It was announced by Thomas Kennedy, now and for many years president of district No. 7, that the President would be informed that Neil J. Ferry, of McAdoo, Pa., would be a satisfactory member of the commission to represent the interests of the mine workers. The President has expressed himself open to a suggestion of this kind.

The convention recommended that the President "take such action as will permit the United States Government to take possession of four anthracite coal mines and one coal washery." The delegates desire that an investigation be made by the light of the operation of these mines so as "to protect the consumer against excessive charges," while paying the mine worker, if possible, a scale that will be uniform throughout the anthracite field and compensating the miners on the legal-ton basis such as is used by the operators in the sale of their coal.

The terms of the agreement submitted to the convention and rejected by it were as follows:

1. Agreement to be made with the United Mine Workers of America of the first part.
2. Agreement to run for a period of two years.
3. Contract rates at each colliery to be increased 65 per cent over the 1916 basis. This means an increase of 17.8 per cent over the present gross earnings, or an increase of 19.5 on net earnings.
4. Increase for outside and inside day men who receive from \$1.54 up to be 65 per cent on the 1916 basis, plus an increase of \$1.20 per day, with a minimum rate of \$4 per day and a maximum of \$6 per day. This means an increase of from 66c. to 75c. per day over present wages.

5. Employees receiving less than \$1.54 per day to be increased 30c. per day over present wages. (This provision refers solely to boys.)

6. Contract miners' laborers to receive the same increase as company laborers, and the companies to bear their share of the increase, as is now the case.

7. Monthly men to receive an increase of 65 per cent on their 1916 basis plus \$30 per month, it being understood that the increase over present rates shall not be less than \$20 nor more than \$30 per month.

8. Employees of stripping contractors to receive the same increase as received by those in similar occupations at the collieries.

9. Increases to be applied on the work day established in 1918, whether eight hours or more.

10. Inside pumpmen and outside and inside hosting engineers working twelve hours to be put on an eight-hour basis, the conciliation board to work out the new eight-hour rates. Until this rate is fixed by the board the men affected to continue on present basis of increase and hours.

11. Board of conciliation to act as a commission to study and report to the next conference on uniform day rates.

12. Tools lost by contract miners through squeezes, caves, etc., to be replaced by company.

13. Contract miners when reporting for duty and shut out of work shall be given opportunity for other places of work at the established rates for such work, provided such work or places are available.

14. Permitting contract miners to report deficient or abnormal conditions to the foreman and if they disagree the case to be taken up as other grievances are handled.

15. Agreement to be signed by the officers of the United Mine Workers of America and the coal operators.

## Arrest Mine Worker for Matewan Massacre

THE first arrests in connection with the death of seven Baldwin-Felts detectives and three others were made on Monday, May 24, when Sidney Hatfield, chief of police of Matewan, and nine others were taken into custody and removed to Williamson, where they were arraigned before Judge James Damron in the Mingo Circuit Court, being charged with the murder of L. C. Felts and other Baldwin-Felts detectives. All those arrested waived examination and were released on bond in the sum of \$5,000 each. In addition to Hatfield the following were arrested: Reese Chambers, Clare Overstreet, Charley Kiser, Douglas Mounts, a man named Chambers, Ezra Fry, Billy Bowman and two others.

The arrested men were taken to Williamson in the custody of Colonel Jackson Arnold and other members of the state police force. In addition to those already arrested warrants have been issued for fifteen miners and for the four surviving members of the party alleged to have been at Williamson during the shooting.

## Would Keep One-Armed Man on the Job

MINERS employed by the Deaker Coal Co. near Kingwood, W. Va., were on strike for several days during the third week of May, objecting to the discharge of a one-armed engineer who had been relieved of his work as engineer and given work more suitable to his physical capacity. The striking miners, however, after being on strike for several days finally agreed to return to work pending a permanent settlement of the trouble.

Owing to lack of space it will be impossible to publish the scale of subdistrict No. 5 of the Ohio district in this issue. It will appear next week.

# Foreign Markets and Export News

## Montreal Loses Line of Coal-Carrying Vessels

The Black Diamond line of freighters, which before the war brought to Montreal 2,000,000 tons of coal annually from Nova Scotia, will not run on that route this season. The reason assigned is the greatly increased consumption of coal by the steel companies of Nova Scotia, combined with a falling off of coal production at the mines. Another important factor is the high cost of bunkering in Britain, which compels British vessels to fill their bunkers at Sydney, thus further reducing the supply for Canadian consumption.

## Spain's Coal Mines Urgently Need Tariff Protection

Chester Lloyd Jones, commercial attaché at Madrid, Spain, reports that the great natural resources of industrial energy possessed by the Kingdom are neglected. The coal mines are inefficiently exploited. There is only a rudimentary development of water power. There is no system by which the two are used in co-operation for supplying energy for national industry. Without some method of utilizing these resources industry cannot prosper, for they are the sources of its life under modern conditions. In turn they will be the consumers of the products of many other lines of industry. This indicates that once they are developed they will not only make other industries possible but create a demand for their products.

The coal industry should be given greater tariff protection. It has had assistance supplemental to the tariff rates, such as exemption from taxes on exploitation and the grant of special bounties in certain cases. All these were suspended during the war. Although the exceptional circumstances created by the war cut down foreign competition and brought Spanish coal mines to a state of abnormal prosperity, a ruinous foreign competition is now faced, which demands not only the re-establishment of all the assistance formerly granted, but its increase.

It is to be noted that during 1919 the coal industry was, in August and September, anxious to secure authority to export coal. This condition, it is alleged, was transitory, and the exhaustion of the surplus produced during the abnormal conditions just passed would make it impossible for the local mines to compete with foreign trade.

In spite of the fact that mining is

one of the oldest and best-developed branches of industry in Spain, the country profits little from the exporting of its resources. Even those branches the fostering of which is demanded for national defense, are unworked. They are favored by special legislation in the law of July 22, 1918, and the royal order of July 25 of the same year, but as yet no real advance has been made. It has also been sought to stimulate all branches of the mining and metal industries through the provisions of the tariff, but thus far without success.

## Germany Exploits Synthetic Fuel Oil

Bergbau (mining) reports, according to an announcement from the European Division of the U. S. Bureau of Foreign and Domestic Commerce, state war-time experiments in Germany showed that the distillation of lignite at a high temperature gave a liquid coal tar which contained certain ingredients suitable as a substitute for gasoline, kerosene and lubricating oils.

Through a new process benzene and kerosene can be obtained from liquid coal tar, which has been distilled from lignite at a lower temperature, and all industries using lignite are urged to set up facilities for generating this liquid coal tar and thus secure synthetic products to supply the lack of the natural products.

It is interesting to remark that, at this time when there is a shortage of fats in central Europe, German newspapers are advertising a liquid tar soap containing a percentage of alcohol, for shaving purposes. This is undoubtedly a byproduct.

## Plan to Increase Coal Output in Ireland

Industrial expansion in Ireland, *The Statist* (London, England) states, is undoubtedly very seriously retarded by the relative insignificance of its coal-mining output. Dependence on Great Britain is practically universal in this connection, as the import figures eloquently testify. In 1918 imported coal totaled 4,301,083 tons, while the output of the home mines was 92,001 tons.

That the latter figure can be increased is the confident expectation of Irish colliery managers. Now that the Leinster and Arigna fields are fairly well served by railway communications and additional mining plant and pumping machinery have been installed, there is every hope that this expecta-

tion will be justified. Well over 90 per cent of the Irish coal raised is anthracite, and engineers, from practical experience, find that for gas production it answers all their purposes admirably.

## France Faces a Coal Deficit of 40,000,000 Tons

Consul Ernest L. Ives, Paris, reports that the coal resources of France contained in deposits lying at a depth of not more than 3,937 feet are estimated at 13,143,000,000 tons, and at a depth of 5,905 feet, at 17,600,000,000 tons.

France's coal production in 1913 was 40,844,000 tons (including 793,000 tons of lignite), and consumption, including coke expressed as coal, 63,904,000 tons; the additional 23,060,000 tons being imported from England, Belgium and Germany. The future estimated French deficit of coal, due to the return of Alsace-Lorraine and the increased industrial activities, is estimated at 40,000,000 tons.

Relatively, France is in the same position as before the war in regard to iron and coal, having a superabundance of iron and insufficiency of coal; Germany, on the other hand, has a superabundance of coal and only a limited supply of iron ore. This shortage of coal on the part of France will necessitate the importation of large quantities of fuel and the exportation of iron ore.

## Despite High Costs, Electrification of Swiss Railways Proceeds

In spite of the present high cost of materials and labor, Trade Commissioner H. Lawrence Groves, Zurich, reports, the program for the electrification of the Swiss national railways is being pushed along as rapidly as possible, and Swiss firms are now holding contracts for the delivery of forty-odd electric locomotives within the next year. It is stated that the cost of one locomotive is about three times pre-war figures.

## Poland's Coal Production Lags Behind That of 1913

Coal production in Poland in 1919, Trade Commissioner Louis E. Van Norman, Warsaw, reports amounted to 6,145,027 metric tons, as compared with 8,988,580 tons in 1913. Of the 1919 production, 4,614,710 tons came from the Dombrowa Basin, 1,408,983 tons from the Krakow region, and 121,334 tons from Silesia. Lignite was produced in the Zawiercie region to the amount of 173,798 tons in 1919, an increase of 18,716 tons over the 1913 figures.

# Production and the Market

## Weekly Review

*Production of Bituminous and Anthracite Is Far Below Requirements, with No Relief in Sight — Orders Lacking in the West—Canada and New England in Severe Straits—Northwest Awaits Lake Shipments—Traffic Conditions Improve at Pittsburgh*

**N**O RELIEF in sight is the report from all quarters. Production hovers around the 9,000,000-ton mark for bituminous and has not varied greatly from a 1,700,000-net ton figure per week for anthracite. This output is entirely too low for the needs of the country and demand continues to press and prices to remain high and indeed to mount in some fields. West of the Mississippi the summer buying movement has not begun and the mines are losing some time each week because of a lack of orders for coal. The loss is noteworthy only by comparison with the situation in the East. Compared with last year and with normal years, business is good even in the Far West.

Canada and New England are in severe straits for lack of coal and the Northwest is marking time waiting for Lake shipments to get under way. Senators from New England have introduced measures in Congress to prohibit foreign exports of coal in order to insure a larger supply from the southern West Virginia fields.

Improvement in traffic conditions is reported from Pittsburgh, Conne'sville, Cleveland and Chicago, but the measure of the improvement is not yet seen in more

coal. Milwaukee has a fair supply of anthracite, but the lack of soft coal is described as little less than critical. From the smokeless fields the movement west has increased and thereby relieved a serious congestion at tide. Southwestern Virginia, where during the two years of war little or no trouble with car shortage was experienced, now is as hard hit as any other field.

Rising prices and labor dissatisfaction with the short running time are in evidence in the Middle West, and are noted particularly in the news from Cincinnati, St. Louis and Columbus. At Chicago so erratic is the steam market that poor grade coals are bringing higher prices than the best coal from the Southern field.

Anthracite is holding the interest of the trade, principally because of the wage controversy and the lack of certainty of prices for the season. The supply appears to be adequate for the demand, when it is realized that the demand this summer is unusually good for domestic coal. Shipments of anthracite on the Lakes are in better shape than are those of bituminous and New England is carrying on a brisk trade in hard coal, with no complaint of shortage in supplies.

Average Daily Production of Bituminous Coal\*

\*From weekly report of Geological Survey

## Reports From the Market Centers

### New England

#### BOSTON

*Trade Apprehensive of Outcome—Traffic Situation Shows Only Slight Improvement—Hampton Roads Situation Unchanged—Panic Prices Prevail Among Speculators—Anthracite Trade Brisk—Price Discussion Gives New Note of Anxiety—Demand for Steam Sizes Uneven.*

**Bituminous**—Several weeks ago it was felt that spot prices were on an unduly high level. For a time the export market was almost a controlling feature but that is no longer the case with the steam grades from Pennsylvania. It is active and insistent buying that has forced spot prices to their present high range.

Remedial measures by the railroad authorities so far seem only to reduce car-supply and to be generally restrictive. After a blue week of tight embargoes, effective for several days against all five New England gateways, the embargo against the Boston & Albany was cancelled on May 27. The New Haven embargo was lifted a day or two earlier, and it is now announced unofficially that the Boston & Maine embargo will probably be raised by June 1.

A great difficulty in New England is the lack of locomotives and the generally run down condition of equipment on most of the roads. Embargoes are certain to be intermittent during the summer.

The railroads are still seizing heavy tonnages. Buyers are getting restive over losing so much low-priced coal and being obliged to replace it at spot prices, with no good prospect of collecting the difference from the commandeering roads.

Movement to the Philadelphia and New York piers has decidedly improved. There are occasional sales at high prices, but the bulk of coal available is moving on contract, whether for foreign bottoms or for local use.

At Hampton Roads there seems no material change. Despatch is about normal for those who have the coal available; agencies that are short of prompt coal find it extremely difficult to make up cargoes. Sales of spot coal at prices around \$13.50 have been reliably reported.

Current prices on bituminous at wholesale range about as follows:

	Cambrias and Soosierets	Clearfields
F.o.b. mines, net tons.....	\$7.00@ \$8.40	\$6.25@ \$7.35
F.o.b. Philadelphia, gross tons.....	9.70@ 11.25	8.85@ 10.10
F.o.b. New York, gross tons.....	10.10@ 11.75	9.20@ 10.50

On cars Providence and Boston Pocahontas and New River are quoted from \$11.00 @ \$15 per gross ton.

**Anthracite**—The situation here continues to be a sellers' market. There is steady pressure to get all sizes down to pea. Even egg is in strong demand at this season, and retail dealers are not at all disposed to grumble over the assortments they receive. Movement by water is still in fair volume.

### Tidewater

#### NEW YORK

*Anthracite Situation Shows Slight Improvement—Demand for Domestic Coal Easier—Buckwheat in Heavy Call—Bituminous Moving Easier, but Prices Remain Strong.*

**Anthracite**—A slight improvement is noticeable. Receipts are larger and the general situation shows a better feeling. One more announcement has been made showing additional increases in wholesale prices. The demand continues strong with no hesitancy in the market absorbing all the coal available.

Shipments from this market to New England by water continue slow because of harbor difficulties. Shippers report a strong demand from the north and west, but as the railroad difficulties continue, coal movements are slow.

The demand for the steam sizes goes on. weather conditions making no apparent change in the situation. Dealers are finding a ready market for all the buckwheat they can obtain. Rice and barley are also in good demand. Quotations for independent buckwheat ranged from \$4 to \$5 at the mine, rice \$2.75 to \$3 and barley \$2 to \$2.50.

Current quotations for company coal per gross ton at mine and f.o.b., tidewater, at lower ports, are as follows:

	Mine.	Tidewater.
Broken .....	\$5.95 @ \$7.50	\$7.80 @ \$9.35
Egg .....	6.35 @ 7.35	8.20 @ 9.20
Stove .....	6.60 @ 7.70	8.45 @ 9.55
Chestnut .....	6.70 @ 7.70	8.55 @ 9.55
Pea .....	5.30 @ 5.75	7.05 @ 7.50
Buckwheat No. 1 .....	3.40 @ 4.19	5.15 @ 5.85
Rice .....	2.75 @ 3.25	4.50 @ 5.00
Barley .....	2.25 @ 2.50	4.00 @ 4.25
Boiler .....	2.50	4.25

**Bituminous**—With many factories in the Metropolitan district and throughout the territory covered by New York houses closing down, because of the lack of demand for their wares, conditions here are not to the entire liking of the trade. Demand is not as urgent as it has been and holders of coal contracts, while willing to take their requirements, are not as anxious to receive their tonnage as they were.

Due to the heavier receipts of con-

tract coal at the piers and the delay in moving it because of labor difficulties, most of the piers here are affected by embargoes. So far the efforts of the Interstate Commerce Commission to relieve the jam have been of no avail, probably because the time has been too short.

Empty cars have been started for the mines, but the car supply remains at a low level at the works. Mines along the New York Central report a 46 per cent car supply, with about the same or slightly lower percentages reported along the Baltimore & Ohio and Pennsylvania lines.

Buyers continue to bid against each other and prices are higher than they were last week. Quotations on loaded boats at the piers range from \$13.50 to \$14. Quotations for the various pools ranged from \$7 to \$8 at the mines.

#### PHILADELPHIA

*Anthracite Demand Strong for All Sizes—Stove and Nut in Heaviest Call—Strength in Steam Coals, Especially Buckwheat—Rice in Good Demand, but Barley Off—Bituminous Shows Slight Improvement—Strike at Tide Releases Coal for Domestic Trade.*

**Anthracite**—With the weather approaching normal conditions, the retail dealers are devoting their entire energies to their summer deliveries. The dealers seem to be receiving fairly good shipments. But all producing companies are being urged daily for increased consignments.

The consumer demand is held close to stove and nut. The demand for egg, which has been increasing during the past few years, continues to be strong.

Pea coal is in stronger than the usual summer filling demand. Heavy shipments of pea are being received and most dealers are receiving more of this size than they are delivering.

As to prices now prevailing some of the independent shippers quote from \$9.50 to \$10 on egg, stove and nut. Usually the higher price is asked when the buyer refuses to take any pea coal; quotations on this size have run from \$6.25 right up to \$7.

There is a strong demand from the West to take coal at heavy premiums, as due to the slow delivery of coal to that region the people there are displaying considerable anxiety as to their ability to get sufficient fuel.

The steam sizes are in a strong position and no trouble whatever is experienced in getting \$4.25 for buckwheat and plenty of sales are made at figures 25c. higher than that. Rice clings close to \$3.25, but barley is occasionally shaded down to \$2 and less and is the one size hard to move.

**Bituminous**—There seems to be some improvement in the bituminous situation. A number of producers report more cars received, but no one is getting anything in the way of cars to keep them going full time; most of the working time is around 50 per cent.

## BALTIMORE

*Soft-Coal Prices Moving Upward—But Drop in the Market Is Predicted—Hard-Coal Men Restive Under Price Uncertainty.*

**Bituminous**—The price of soft coal keeps moving up in this section under active selling. Best coals sold at times readily as high as \$8.25 and \$8.50 f.o.b. mines the net ton, this price being recorded on sales of both steam and high-volatile gas coals.

The eight-dollar figure was quite frequent for almost any kind of coal under emergency purchasing. Probably the lowest prices recorded in this active market, for even the least desirable coals, was \$7.25 f.o.b. mines the net ton.

It is predicted that the market is about due for a drop. The effect will not be immediate, as a number of consumers still need coal, but the accumulation, along with a betterment in the car run generally is expected to have the effect of breaking down prices somewhat from the exceptionally high standard.

At this writing there is a large number of ships here, there being 37 at the Curtis Bay piers or astream off the piers, for a total of about 205,000 tons of coal; and five or six at Canton or off the Pennsylvania pier for some 35,000 tons. At Curtis Bay to meet this there are 1,800 cars of coal and at Canton about 750 cars; the daily dumpings at the Baltimore & Ohio showing a healthy increase lately, running between 400 and 500 cars, while the Pennsylvania is dumping about 125 cars a day.

**Anthracite**—Hard-coal men here are growing restive under the delay in settling the wholesale prices because of the slow work of the Washington wage conference. Many of them report that the prices now charged at wholesale are far in excess of the retail advance of one dollar, which was set above the old October schedule as a temporary stop-gap. Consumers too are restive under the fact that they cannot get a definite word on what their coal will cost them when delivered.

---

## Lake

---

## BUFFALO

*Car Supply Controls Coal Situation—Bituminous Prices Chaotic—Shortage of Steamboat Fuel—Anthracite More Plentiful—Lake Shipments Good—Coke Quotations Irregular.*

If a fairly good car supply could be obtained the situation would improve at once. Many Eastern coal cars have been observed on the Pacific Coast and Federal relocation orders have been issued for their return.

Bituminous prices are in a chaotic state, shippers as a rule refusing to make any quotations. If there is no contract the consumer is likely to pay

from \$6 to \$8 at the mines, but with a good car movement these prices would disappear in short order.

The worst feature here is the shortage of steamboat fuel. It seems to be difficult to get any and yet one coal-shipping line has fuel enough and sells it at \$6.50.

**Anthracite**—There is complaint of scarcity in the city still, but the supply is much more adequate than is the case with bituminous. Consumers all tried to get a supply before the prices advanced. It should be remembered that it was the summer buying that saved the situation last winter.

Lake shipments are good, though the late start will count against the totals. All the upper-lake ports of account have been covered but they still have little coal. It is not expected that the shipping companies can make much of a showing under present conditions.

It has been impossible so far to fix Lake-coal freight rates; some cargoes paid 50c. to leading Lake Superior ports; 65 to 70c. to Chicago; 60c. to Milwaukee and 55c. to Sheboygan. Shipments for the week were 75,000 net tons, of which 37,400 tons cleared for Duluth-Superior, 18,600 tons to Milwaukee, 13,000 tons to Chicago, 4,000 tons to Detroit and 2,000 tons to Sheboygan.

**Coke**—The coke trade is fast following bituminous coal and prices are most anything that the shippers demand. Jobbers are not quoting it regularly, merely saying that it costs them as high as \$20 at the ovens for both foundry and furnace, with other sizes and grades not in the market. To this must be added the Buffalo freight rate of \$2.60.

---

## CLEVELAND

*Bituminous Situation Improving, But There Is Little Spot Coal—Pocahontas and Anthracite Unchanged—Pooling Arrangement Planned for Lakes.*

**Bituminous**—Receipts of coal are gradually improving, but the movement is still far below normal. Empty cars for the coal mines are beginning to arrive from the West, in response to the Interstate Commerce Commission's relocating order, and marked improvement is expected soon in mine operation and receipts of coal.

Operators with headquarters in this city report that they are bending all their energies to take care of the Lake needs and their regular contracts, with the result that spot coal is almost unobtainable. For the little available prices are wild, as high as \$6 a ton having been the figure for some sales of small tonnages this week.

Labor troubles on the Baltimore & Ohio are retarding operations in the No. 8 district, but there has been some freight improvement on the Pennsylvania lines. Retail dealers remain short of stocks but most plants are being kept in operation. Prices are strong.

**Pocahontas and Anthracite**—Quotations for Pocahontas and anthracite,

which increased last week, remain unchanged. Receipts continue abnormal and the demand from domestic consumers is heavy.

**Lake Trade**—There is an effort to effect a pooling arrangement to prevent a fuel famine in the Northwest. Last week the coal shippers agreed to the plan to be placed in operation under the 1918 regulations. A meeting with ore and vessel men disclosed opposition from those sources, however.

Large ore interests are especially opposed to the plan. Herman M. Griggs, chairman of the Ore & Coal Exchange, is preparing a statement of the facts to be presented to the Interstate Commerce Commission. The railroads have agreed to the plan. Receipts at Lake ports are better, and Lake freight business is now said to be about 75 per cent of normal.

Retail prices of coal per net ton delivered by dealers in Cleveland are:

Anthracite—egg, \$13.20; grate, \$13.20 @ \$13.50; chestnut \$13.50; stove, \$13.50.

Pocahontas—shoveled lump, \$11.75; mine-run, \$9.25.

Domestic bituminous — West Virginia splint, \$9.50; No. 8 Pittsburgh, \$7.75; Millfield lump, \$9.10; and cannel lump, \$11.50.

Steam coal—No. 6 and No. 8 slack, \$8.60; No. 6 and No. 8 mine-run, \$8.60; No. 8 3-in. lump, \$8.60.

---

## MILWAUKEE

*Soft-Coal Situation Critical—Crisis If Receipts Fall Away—Fair Supply of Anthracite on Hand—No Change in Prices.*

The soft-coal situation at Milwaukee continues critical. Receipts continue sufficient to keep all industries moving, but unless they are speeded up and maintained at a good volume the fuel supply of the city will be exhausted before winter sets in. Should receipts fall away the crisis will be reached during the summer.

Milwaukee needs to have fully 3,000,000 tons of coal on the docks at the close of navigation. This requires a steady flow of cargoes, and receipts by Lake thus far have been quite disappointing. There is a fair supply of anthracite for the season and deliveries are being steadily made. The demand could be improved upon, however. Consumers do not take kindly to present prices, with summer weather prevailing.

Gas coal seems particularly scarce, and several companies in interior cities face complete suspension of operations. Some are carbonizing ordinary grades of coal at the expense of an inferior quality of gas.

No change has been made in the schedule of prices on hard and soft coal, but an advance all around is expected before long. Receipts of coal thus far this season include 105,452 tons of anthracite and 131,458 tons of soft coal, against 158,538 tons of the former and 560,750 tons of the latter in 1919. Complaints of too high a price in some instances have been heard.

## Inland West

### DETROIT

*Coal-Carrying Roads Embargo Michigan—Situation Most Serious—Anthracite Outlook Also Bad—Little Lake Improvement.*

**Bituminous**—Bituminous coal is coming into Detroit in small amount only, and yet a further reduction of shipments into the state is threatened. It is stated that the Hocking Valley, Pennsylvania and Toledo & Ohio Central railroads have given orders that their coal cars be kept out of Michigan. This action is said to mean that fully half the coal handled over those roads will be held in Toledo.

Michigan used to get 75 per cent of its coal from West Virginia and Kentucky, according to a Detroit wholesaler, but since the war opened, that coal has been diverted to the sea coast and Detroit has to depend on Ohio to make up the deficit. If the railroads that carry most of this Ohio coal forbid the movement of their cars into Michigan, it will be most serious for Detroit.

Except for the coal from Ohio, Detroit's supply is limited quite closely to small shipments from Illinois and Indiana. Prices on Ohio coal are quoted as \$5 to \$5.25 at the mines for lump in short tons, \$4.75 to \$5 for mine-run and \$4.75 for slack.

**Anthracite**—The situation in the anthracite trade is causing considerable apprehension to dealers as well as consumers. Little anthracite is being brought into the city and practically no supply remains in the yards. The dealers not only have no coal to deliver but are also without information as to prices.

**Lake Trade**—While coal is reported moving somewhat more freely to some of the Lake loading docks, there is little improvement at other points. Lake vessels are still having great difficulty in obtaining fuel in sufficient quantity to meet their needs and in many instances vessels have to be shifted from port to port to get coal.

### ST. LOUIS

*In General Conditions Grow Worse—Car Shortage Shows No Improvement—Prices Higher Than Ever Before at This Season—Miners Dissatisfied—Future Does Not Look Good.*

In St. Louis proper steam coal seems to be the cause of much concern. Many plants are unable to get any. Coal is not available for shipment from the mines because outside markets are offering unheard-of prices.

In the past few days screenings have been going at from \$5@5.25. But the demand for railroad coal in mine-run form has taken a large tonnage of screenings off the market.

The domestic demand is good, in both city and country, with little coal to be

had. The price of Standard coal makes it prohibitive. Mt. Olive is coming in for one-tenth of the demand, with little Carterville.

Standard lump, egg and nut, are bringing from \$3 to \$4; \$4.25 in the city and as high as \$5 outside. Screenings are bringing anywhere from \$3 to \$5. Mt. Olive prices on domestic sizes range from \$2.75@4, while Carterville domestic sizes are from \$3.50@4.25, with as high as \$4.50 and \$5 asked.

In the Standard district some mines are working one day a week. Others loading railroad coal get as many as four days. In the Mt. Olive field similar conditions exist and there is much dissatisfaction among the miners.

In the Carterville field the mines work about two days a week on commercial coal.

On the Missouri Pacific lines almost no commercial coal is being loaded, the railroad demanding everything for its own use and still trying to force operators to sell coal at the railroad's price or go without equipment.

The retail prices in St. Louis have advanced as follows: Carterville, \$7.50; Mt. Olive, \$6@6.25; Standard, \$5.50@6. Anthracite, grate and egg, \$14.20; stove and chestnut, \$14.45. West Virginia smokeless, \$11.50@11.75. By-product coke, \$12.50. No gas house coke is available.

### COLUMBUS

*Active Bidding Advances Prices—Reduced Car Supply Curtails Production—Steam Market Hard Hit—Domestic Trade Lively—Lake Business Still Slow.*

The striking feature of the coal trade in Ohio is the active bidding which has caused higher prices in all producing fields. Michigan and northern Ohio consumers have buyers in the Hocking Valley and Pomeroy Bend fields bidding for available tonnage, and extra high prices are offered.

Mine-run and slack is sold between \$5 and \$6 per ton at the mines and in some instances prices are higher. Mine-run appears to be higher than lump. With the output still curtailed to about 40 or 45 per cent of normal, it would not be surprising to see still higher prices.

The steam market is by far the most important department of trade. Northern Ohio and Michigan points are hard hit, while those in central Ohio have been able to make out with what fuel they could obtain. Reserve stocks are entirely exhausted, and most of the plants and utilities are operating from hand to mouth.

The domestic trade is also lively, but the strength exhibited in steam circles is lacking here. Retailers are clamoring for shipments. Retail stocks are low. Some West Virginia splints are arriving, but Pocahontas is scarce and little is coming west. Hocking and Pomeroy grades constitute the larger part of the supply for domestic purposes.

The Lake trade is still slow. The

reduced production and rail embargoes have worked against Lake shipments. Records show only about one-fifteenth of the tonnage moved to the Northwest, in comparison with a year ago.

Prices at the mines for coals used in central Ohio are:

Hocking lump	\$5 00 to \$5 75
Hocking mine-run	5 00 to 6 00
Hocking screenings	5 00 to 6 00
Pomeroy lump	5 25 to 6 25
Pomeroy mine-run	5 00 to 6 00
Pomeroy screenings	5 00 to 6 00
West Virginia splints, lump	6 00 to 6 50
West Virginia mine-run	6 00 to 6 50
West Virginia screenings	6 00 to 6 50
Pocahontas lump	7 00 to 7 50
Pocahontas mine-run	6 50 to 7 00
Pocahontas screenings	6 50 to 7 00

### CINCINNATI

*Operators' Difficulties Righted Only by Better Transportation—Little Progress Made in Lake Situation—Embargoes Increase Coal Prices.*

The big factor in the local coal situation is that of transportation. Labor can take care of the conditions as they are today, but there seems to be no relief in sight until the transportation difficulties begin to right themselves. The coal men say there is only a 30 per cent car supply.

In speaking of coal for Lake shipment, the operators say that already three good months of production and two good months of Lake delivery have passed, with little progress made in filling the current demand, to say nothing of piling up a reserve.

Prices in this district have taken a jump. Contract delivery is the only one desired. Auction sales of coal are always taken at prices that never before were dreamed of here.

The Louisville & Nashville has placed an embargo, refusing to accept shipments off its own lines, explaining that as soon as its cars return in fairly good supply, the embargo will be lifted.

The Norfolk & Western has placed an embargo, east and west, off its lines.

In view of the embargoes, Ohio coal is reaching the suburban industrial plants, but it has been increased in price at both mines and plants. It is hoped that orders given to rush cars to the L. & N. and N. & W. will cause the embargoes to be lifted.

The shipments down the Ohio River, as always, are aiding in relieving the local situation. Retailers report that demand from domestic consumers continues brisk.

Wholesale prices are as follows, f.o.b. mines: West Virginia, block, \$4.50; run-of-mine, \$4; slack, \$3.75@4.

Jobbers have jumped their prices up to \$6.50, \$7 and in some instances as high as \$8. Gas and byproduct coal in the past week have been increased to \$6.50 and \$7.50 and steam mine-run to \$6.50 to \$7. These prices cover the Kentucky side of the question also, with 25c. to 50c. better for domestic.

Retail prices of soft coal, delivered, are as follows: Lump, \$8 to \$8.25; nut, \$6.75 to \$7.25; run-of-mine \$6.50 to \$7. Smokeless, lump, \$9.25; run-of-mine, \$8.50. Anthracite, \$14.

## CHICAGO

*High Prices with Demand Strong—Poor-Grade Coal Sells at Fancy Prices—Little Relief from Car-Pooling Plan Yet—Expect Improvement Soon—Some Anthracite Arrives, but Little Bituminous Comes from W. Va.*

The Chicago coal market is steadily going up and high prices may be obtained for all kinds of spot coal no matter how poor in quality or preparation. The coal buying impulse which siezed the public 60 or 90 days ago is showing no signs of abatement, but on the contrary the markets here are flooded with frenzied buyers, or would be buyers, of coal.

Paradoxical as it may seem, poor-grade coals are selling at from one to two dollars per ton more than the higher grade and better prepared coals from the Franklin, Williamson, or Saline counties. There is, however, a noticeable and growing tendency on the part of a great many operators to disregard the circular prices which were sent out to the trade April 1.

A restoration of the car-pooling plan by the Interstate Commerce Commission has to date brought no improvement, but whether or not the car supply at mines in Illinois and Indiana will improve, is a question which will have to be decided by developments during the next three or four weeks.

The freight embargoes and delays which were the direct result of the switchmen's strike are now not as unsettled as they were a few weeks ago, although conditions are far from normal at the present time.

The various holding yards in and about Chicago are now in fairly good shape and it is hoped that from now on there will be a decided improvement. It is said that coal-carrying equipment is being returned to originating lines in larger numbers and at a greater speed than at any time during the past four or five weeks.

With the exception of anthracite, little eastern coal is coming into Chicago and anthracite shipments are nowhere near normal. There is a divergence of \$1.25 per ton between quotations made by the various operating companies who produce and sell hard coal in this city. All of these people are not taking on new business but are concentrating their efforts in taking care of the demands of their established trade.

Relative to bituminous coal from the east, it is generally believed that Chicago cannot compete with tidewater on West Virginia splint and smokeless coals. Consequently but little soft coal is coming in from the east.

A careful investigation into the retail situation shows that a great many Chicago coal yards now have a fairly adequate supply of soft coal on hand and are therefore able to take care of their trade to some extent.

The householder is still quite panicky about his coal and is buying his winter's supply to be delivered into his cellar during the summer months. Even if

the operating districts of Indiana and Illinois receive an excellent car supply, it will take at least from 30 to 60 days for the market to reach an easy state.

## South

## BIRMINGHAM

*Steam-Fuel Supply Low and Demand Strong—Domestic Coal Also Scarce—Transportation but Slightly Improved.*

There is practically none of the higher grade steam coals to be had in this district at the present time, and only quite a limited tonnage of Big Seam and other low and medium grades available for the spot market and there is strong competition for every ton offered, Big Seam mine-run being good for \$4.25 to \$5 per net ton mines.

However, a run-away market will not likely develop, since the amount of surplus coal is so negligible, the principal operators having sold ahead a much larger tonnage than they are able to produce under existing conditions and their entire output is being applied against orders in hand, at a reasonable margin of profit.

Domestic coal is also scarce but is not featured by as strong a demand as steam, though there is not sufficient tonnage to meet the needs of the trade. Deliveries on contracts are being made rather slowly but retailers are making some progress in stocking.

The car supply on the Southern Ry. has been slightly better for the past few days, and there has been less coal confiscated by this line than during the first part of the week. Piper, Marvel, Garnsey, Coleaner and other mines in the Cahaba field continue on strike and this has increased somewhat the number of cars apportioned to the mines in operation.

The car supply on the Louisville & Nashville is reported as poor while the Friseo road has furnished a fair quota, but materially short of the number needed. Mine labor is working in a rather lax and indifferent manner, though there is no labor unrest except at a few small operations.

## LOUISVILLE

*Prices Climbing Steadily Due to Heavy Steam Demand—Few Mines Screening Coal—Local Supplies Light—Higher Prices Predicted.*

A runaway market barely expresses the way in which all bituminous fuels are climbing upward in the Kentucky fields today. The demand for steam grades is so keen that few operators are screening coal, preferring to ship mine-run. This results in a big shortage of screenings for plants equipped with mechanical stokers, and small deliveries of block coal to retailers.

Local supplies are quite light and very little coal is being bought by retailers under existing conditions, and many retailers are advising consumers to wait.

Coals of the Harlan grade are selling at a premium for gas and steel mill use, the fair price being from \$6 to \$7 a ton, while run-of-mine, on a premium basis, is selling at \$7.25@7.50 a ton at mine.

Hazard and some other coals are selling at \$6 a ton and up for mine-run, and meeting with a steady demand. Prices of Alabama and Southern coals are well in line with Kentucky and East Tennessee fuels, and such coals are selling freely in the South.

Price advances have been more severe in the Western Kentucky field than elsewhere, due to the heavy buying forcing up the market.

Western Kentucky mine-run is today quoted at prices around \$4.50@4.75 a ton, and block is quoted at as high as \$5.50 a ton. It is believed that Western Kentucky will shortly be selling mine-run at \$6@6.50 a ton if conditions continue.

There has been some slight improvement in car supply, and mines in some districts are operating at 40 per cent capacity or better.

Retail prices in Louisville have again advanced 40c. a ton. River coal is retailing at around \$9 a ton; and Eastern Kentucky rail coal is selling at \$9.25@9.50 for block in most retail offices. Western Kentucky block is selling at \$7.50 a ton retail.

The following are quotations for Eastern Kentucky: Block, \$6.50 to \$7.50 a ton at mine; mine-run, \$6; nut and slack, \$6 and up. Western Kentucky prices are: Block, \$5.50 and up; mine-run, \$4.50 and up; nut and slack, \$3.50 and up.

## Canada

## TORONTO

*Great Shortage of Coal, Owing to Freight Charges—Matter Reported Settled.*

The coal situation has been practically unchanged for the last two weeks, importations by rail having almost completely ceased, owing to the difficulty over the payment of freight to Canadian destination in New York funds.

Many earloads of coal originally billed for Toronto have been re-assigned to American points, owing to the refusal of local dealers to pay the increased freight charge. It is stated that a settlement of the difficulty has been arrived at and that coal will be coming forward freely in a day or two.

Some small supplies of anthracite are being received by water. Bituminous is quite scarce, and many industrial plants have reduced their force or are running on short time.

Quotations for short tons are as follows: Retail—anthracite egg, stove, nut and grate, \$14; pea, \$12.50; bituminous steam (nominal), \$11; domestic lump (nominal), \$12.50; cannel (nominal), \$14.

# News

## From the Coal Fields

### Northern Appalachian

#### FAIRMONT

*Pronounced Car Shortage in Northern W. Va.—Congestion at Brownsville, Pa., Somewhat Reduced—Operators Incensed at Assigned-Car Practice.*

There was a pronounced shortage of cars throughout northern West Virginia during the third week of May as a result of which in the Fairmont region, for instance, there were not less than 60 mines idle on any one day, the shortage in cars continuing to average more than 50 per cent.

Operations along the Monongahela R.R., in both Marion and Monongalia counties, were as short of empties as in all other parts of northern West Virginia.

The congestion at Brownsville, Pa., was reduced to some extent by efforts of the Pennsylvania railroad, but the Pittsburgh & Lake Erie found it impossible to move a single car of coal from Brownsville, as had been the case for several weeks. The Interstate Commerce Commission has not afforded any practical relief as yet.

Neither Lorain (a Lake point) nor Curtis Bay, at tidewater were under embargo during the third week of May. But both Lake and Inland West shipments were extremely light in volume considering the demand.

The assigned-car privilege has been so greatly abused in northern West Virginia that the Northern West Virginia Association has decided to take the matter into the Federal Courts and to the Interstate Commerce Commission unless action is taken by the National Coal Association at Atlantic City.

#### PITTSBURGH

*Traffic Conditions Slowly Improving—Bessemer Road Operating Again—Fancy Prices Offered for the Small Spot Tonnage.*

In the past week there has been a distinct, though slight, increase in the movement of Pittsburgh district coal. Almost the best that can be said of the situation is that the trend is in the right direction, but hopes are entertained that a really measurable improvement will soon occur. Operations may still be estimated at about 25 per cent of normal for the mines depending entirely on rail shipments, while those with river connections are working to the limit of the shipping facilities.

The improvement in movement noted thus far is chiefly in connection with private cars, the supply of railroad-company cars not having increased ma-

terially. Coal operators believe the orders of the Interstate Commerce Commission as to diversion or return of empty coal cars, if complied with promptly, would bring about a great improvement, but have doubts whether the compliance will be very prompt. Operators assert that railroads have a way of discovering obstacles when it suits their convenience to do so.

The Bessemer & Lake Erie R.R. has been functioning normally since about May 20, and coal production on that line is now fairly heavy again. This has enabled the Republic Iron & Steel Co., at Youngstown, which has mines on the line, to resume nearly full operation.

#### CONNELLSVILLE

*Transportation in the Region Improves—Production May Now Be 75 Per Cent—Fancy Spot Prices Continue.*

Car supplies in the Connellsville region have been improving more or less steadily for nearly a fortnight. The Pennsylvania and Baltimore & Ohio are functioning still better, while the Pittsburgh & Lake Erie is now doing something, although not a great deal.

The Monongahela R.R. taps a large part of the productive capacity of the region, and is operated jointly by the P. & L. E. and the Pennsylvania—each road being supposed to contribute half the cars. On an average in normal

times the P. & L. E. has supplied about two-thirds, while during the strike until quite recently it has supplied practically none.

For the first six weeks, during which the rail strike affected the Connellsville region, the coke production was at about 65 per cent of the rate obtaining before the strike; but with the recent improvement, this week should show 75 per cent or more of the former rate.

The movement of coke (once loaded) is improved, and as the amount of coke en route decreases, then the receipts at furnaces exceed the shipments from ovens. One large valley interest found that for some time it had en route to its furnaces just three times the normal quantity of coke.

There is practically no contract market, neither consumers nor producers caring to negotiate when conditions are so uncertain. The spot market is quite a narrow affair. The offerings are small, nearly all the coke made being by producers or by merchant ovens having regular contracts. The disposition of consumers to buy is also limited, many consumers simply refusing to pay the fancy prices now obtaining.

However, there is enough absorption to prevent a decline, and in open market transactions \$15 per net ton at ovens is practically the market for both furnace and foundry coke. Some transactions in furnace coke between friends are probably put through at lower prices; while two or three important foundry-coke producers are holding their price down to \$12 and making sales only to regular customers.

The *Courier* reports production in the Connellsville and Lower Connellsville region, in the week ended May 22, at 178,250 tons, an increase of 23,850 tons.

### Estimates of Production

FROM THE WEEKLY REPORT OF THE GEOLOGICAL SURVEY

#### BITUMINOUS COAL

## CHESAPEAKE & OHIO

*Operators Act to Secure Better Service from C. & O.—President Stevens Comments on Situation.*

About 75 operators representing the Kanawha, New River, Coal River, Guyan and Big Sandy fields of West Virginia gathered in Huntington recently to take appropriate action to secure service commensurate with their needs. It was decided to go into the courts if necessary in order to compel the Chesapeake & Ohio R.R. to furnish enough equipment. The sum of \$400,000 was pledged to back up the efforts of the coal people to secure better transportation service and a committee of five was selected to perfect arrangements for carrying the plans of the operators into effect. No representatives of the Chesapeake & Ohio were present at the meeting, but George W. Stevens, president of the road, while in Huntington, at a later date, said: "The Chesapeake & Ohio is doing all that it possibly can do to relieve the car shortage on its lines. Our road has ample equipment to care for the needs of all of its shippers if the cars were returned to us promptly. All control over our rolling stock is lost as soon as the cars leave our rails, and there are no means at our disposal to secure their return." Mr. Stevens also said negotiations were now under way for the purchase of 1,000 100-ton coal cars to be used exclusively in handling coal for tidewater.

## NORTHERN PAN HANDLE

*Majority of Mines Idle Here and in Eastern Ohio—No Cars—River Transportation Helps Out Industries—Railroad-Fuel Mines Work*

Between May 10 and May 22 the car shortage in the Northern Pan Handle of West Virginia, or Wheeling district, was so acute that fully 60 or 70 per cent of the mines here were idle two-thirds of the time.

Instead of the situation showing improvement, at the beginning of the last week of the month it grew worse owing to the strike of switchmen and yardmen at the Holloway yards of the Baltimore & Ohio, near Bridgeport, Ohio, that being the road's northern gateway to the Lakes.

While through trains were moved, it became necessary to impose embargoes on all shipments requiring switching at the yard named. The only thing that prevented greater idleness to industry was the fact that river transportation of coal was possible.

The greater part of the supply of empties available was assigned to such mines as had contracts to furnish railroad fuel. In some instances mines were accepting railroad-fuel contracts to keep their mines in operation. The assigned-car system is said to be used as a club here as elsewhere to force coal companies to supply fuel to the railroads at prices fixed by the latter.

Mines in the eastern Ohio regions were loading only a small part of potential capacity owing to poor transportation conditions.

## Middle Appalachian

### POCAHONTAS AND TUG RIVER

*Car Shortage Acute, Reducing Production Below 50 Per Cent—Western Shipments of Smokeless Increase and Relieve Tidewater Piers—Tug River Output Cut to the Quick.*

While labor troubles affected production in the Thacker field during the weekly working period ended May 22, owing to the tragedy at Matewan, as well as to a political campaign of unusual bitterness, yet the lean production in other Norfolk & Western fields was due to a continued acute car shortage and to the derangement of the sources of car supply in the West. Reports from all smokeless fields supplied by the Norfolk & Western showed that car shortage and other causes reduced production to a point below 50 per cent of potential capacity.

The only new development in Norfolk & Western smokeless fields was an increase in Western shipments due to a desire to avoid overcrowding tidewater piers with more coal, the heavy movement to tide during previous weeks having brought about much congestion there. There was much talk of the prospects of having to utilize privately-owned cars in order to augment tidewater shipments. In the Pocahontas field the loss from a car shortage was in the neighborhood of 300,000 tons, as against which only about 240,000 tons were produced, other sources of loss being comparatively negligible. Heavier shipments were made to western points for the reasons previously noted.

Tug River production was still on a discouragingly low level. As most of the cars for this field had to be distributed from such a supply as was received from tidewater, the total number of cars available when pro-rated among the very mines cut the supply almost to the quick.

### VIRGINIA

*Shortage of Equipment Retards Output One-Third—Large Tidewater Tonnage at High Prices.*

Inability to secure an adequate supply of cars was still materially holding back production in the Virginia fields for the week ended May 22, the output reaching only 119,000 tons, aside from the 43,000 tons coked in ovens.

There were no losses to speak of from any shortage of labor, which was considered equal to a large production, but a shortage of equipment, applying to the entire region, did retard the output to the extent of about one-third of the capacity of the mines.

The mines served by the Clinchfield R.R., however, sustained even heavier losses, leaving a shortage of cars running as high as 56 per cent.

The bulk of production was still being shipped from Virginia fields to tidewater, spot prices for such coal being

on quite a high level, owing to the comparatively limited supply. Coke was bringing from \$12 to \$14, the former price being quoted for furnace and the latter for foundry coke. The price for mine-run at the mines was ranging from \$5 a ton upward.

### KANAWHA

*Car Supply Better on K. & M. Than on C. & O.—Kanawha Coal Goes to Tide—Difficult to Obtain Empties from the West.*

During the first half of the week ended May 22 in the Kanawha region, transportation conditions showed a slight improvement over the preceding week, but production during the last half did not average over 15,000 tons a day at mines on the Chesapeake & Ohio.

However there was a somewhat more marked improvement on Coal River. The Kanawha & Michigan at the same time kept its mines fairly well supplied with empties, the quota fluctuating from 38 to 82 per cent.

There was a steady pressure for coal for delivery at the Lakes, but buyers were unable to secure any tonnage to amount to anything for delivery at such points, Kanawha producers shipping the larger part of their product to tidewater, where somewhat higher prices prevailed.

The fact also that it was difficult to secure the return of empties from Western markets, seemed to deter producers to some extent in consigning coal to the West. Assigned cars continued of course to reduce the supply of empties available for the loading of commercial fuel.

### NEW RIVER

*Mines Operate Two Days in Third Week of May—Shipments to West and to Lakes Low—Strike on Virginian Ry. Stagnates Production in the Gulf.*

Lack of cars reduced mines to a critical condition in the New River field in the week ended May 22, many mines operating only about 15 hours during the weekly period. The entire output for the field for the week was not over 100,000 tons, running approximately 25,000 tons behind the output for the period ended May 15.

As had been the case in earlier weeks, the tonnage moving westward was low in volume, coke alone being consigned to Western points to any extent. It was not attempted to ship much coal from the field westward, owing to the fact that so few cars were being received from Western points. For the same reason Lake shipments were virtually negligible.

A strike of shopmen and car inspectors at Princeton, in which 1,200 men were involved, had the effect of almost completely stagnating production at mines on the Virginian Ry. in the Windy Gulf field, the railroad being unable to furnish any considerable run of empties throughout the week. Another factor in holding down production on the Virginian, was the great accumulation of cars at Sewell's Point.

**NORTHEAST KENTUCKY**

*Decrease in Output Fault of Louisville & Nashville—Heavier Tonnage to the Lakes, Inland West and North.*

Ground was lost in the Northeast Kentucky field during the week ended May 22, as compared with the previous week, only 118,960 tons being produced as against 122,000 tons for the previous week, full time capacity being 291,760 tons. The greater part of the loss of output was attributable to a shortage of cars chiefly on the Louisville & Nashville R.R., the supply on that line being nearly ten per cent under that of the previous week.

On the other hand mines on the Chesapeake & Ohio managed to secure about as many cars as they had during the previous week, or approximately 44 per cent of requirements. The mines on the Louisville & Nashville had a supply of only 32 per cent. There was little to warrant the belief that there would be any material improvement in transportation.

There was quite a perceptible increase in the movement of coal to the Lakes as compared with previous weeks. It was also believed that more coal was being shipped to Inland West points and to the North.

**LOGAN**

*Production Losses Heavy, Due to Car Shortage—Much of Logan Output Goes to Tide—More Than Half of C. & O. Coal Cars on Other Lines.*

As during the previous week, production losses were quite heavy in the Logan field during the week ended May 22, mounting well above 250,000 tons; while on the other hand the output remained at the same figure as that of the previous week. Logan district mines could not produce more coal on account of lack of cars. While for the first two weeks of the month there had been about a 45 per cent car supply, during the week ended May 22 the supply was on even a lower level.

The larger part of the output of the Logan field was being shipped to tide-water, still under special permit, however. Producers generally were not consigning a very large tonnage either to Lake points or to Western markets, one reason being the inability to secure the prompt return of empties.

While labor-shortage losses were on a somewhat larger scale than heretofore, owing to friction between miners and operators over the organization of the Williamson field, nevertheless not more than six mines in the entire field were shut down during the third week of May because of labor trouble, the mines chiefly affected being those in the vicinity of Matewan.

Car shortage losses far exceeded those from labor shortage, the former entailing a loss in production of about 100,000 tons, or approximately 45 per cent; labor shortage losses, on the other hand, equalled only about ten per cent of potential output.

Shipments to the Lakes this year are estimated to be about 1,500,000 tons

short for the present lake season, insofar as the Chesapeake & Ohio R.R. is concerned. Officials of that system point out that the haul is short and the road is able to control the movement to the Lakes and back to the mines. However, less than 20,000 of the 42,000 coal cars belonging to this railroad are now on that company's lines.

**Southern Appalachian****SOUTHEAST KENTUCKY**

*Activity in Coal-Land Sales—Big Deals Reported—Byproduct Concerns Interested.*

Several transfers of coal properties have recently been made in this field. Owing to the suitability of the coal in this region for byproduct purposes, a number of large gas companies have been acquiring properties. Among these are the following: Coal lands owned by T. J. Asher, known as the Lick Branch property, leased and operated through the Harlan Coal Co. and Williams Bros., to the Koppers Coal Co. of Pittsburgh, Pa., for a consideration said to be around \$1,500,000. It is reported these people will make extensive development of this property, putting in their own railroad equipment, and so on. The McComb Coal Co., near Harlan, sold its holdings to the Detroit Gas Co., at a figure understood to be \$800,000. The Kentucky King mine, in the Harlan district, has been reported sold at \$600,000.

**Middle Western****INDIANA**

*Great Scarcity of Fuel—Car Shortage on Account of Embargoes—Domestic Demand Due to Cold Weather.*

Demands for steam coal by industries, public utilities and railroads upon the operators of Indiana are only matched by the demands for domestic coal. Railroads are not getting a sufficient tonnage. Public utilities and industries all over the state are shutting down entirely because of lack of coal.

The principal cause is the car shortage. Indiana operators looked for embargoes to be lifted, but conditions appear to be no more favorable than they were a week ago. It is practically impossible for an Indiana operator to get a car of coal out of the state or to get an empty in.

Cold weather during April and May caused a steady demand for coal for domestic use. In many of the smaller cities, which have never fully recovered from the strike of last November, suffering was reported.

The prevailing price per ton for screenings for steam coal is \$2.75; mine-run, \$3; lump, \$3.50. Indiana egg and nut are sold at retail at \$7.50 a ton and mine-run from \$6.75 to \$7 a ton.

**SOUTHERN ILLINOIS**

*Office Building for Coal and Railroad Interests—Byproducts Coal Co. Fire—Development of Extensive Coal Lands by New Railroad.*

Jesse Dimond, of Chicago, president of the Southern Gem Coal Corporation, which operates several mines in Franklin County, Ill., is said to be contemplating the erection of a five-story building to cover an entire block in Mount Vernon, Jefferson County, Ill. The building will contain the offices and headquarters of the Wabash, Chester & Western R. R., recently purchased by this company, together with the offices of the Dimond coal interests.

An explosion of oil in a transformer in the engine room of mine No. 18 of the Byproducts Coal Co., near Benton, in Franklin County, caused a fire which damaged the surface plant to the extent of \$150,000. The mine has been idle about ten days, but work will be resumed shortly, as equipment has been received and a large force of workmen are now engaged in installing the new machinery and repairing the buildings.

According to an announcement by General Manager Barbour, arrangements have been made for financing the extension of the Marion & Eastern R. R., which runs from Marion, in Williamson County, to Fulton, in Saline County, and from the latter place to Carrier Mills in the same county. This road traverses one of the richest coal fields in Southern Illinois.

**INDIANAPOLIS**

*Without Priority Order for Coal, Utilities Must Close—Acute Car Shortage—Coal Sold at Contract Prices—Preferential Distribution of Cars Asked.*

Public service corporations from all over Indiana are besieging the Public Service Commission for assistance in securing a priority order for coal. They declare that unless something is done quickly, scores of gas, water and electric utilities will be forced to close.

John W. McCardle, vice chairman of the Public Service Commission, is directing the fuel investigation at the request of the Interstate Commerce Commission and recently appealed to that body to re-establish the wartime priority orders at once.

Recently the car shortage at the mines was 60 per cent, whereas the greatest car shortage at any previous time in the history of Indiana mining was only 38 per cent.

Operators much prefer to sell contract coal at the agreed prices, if cars can be obtained, and deplore the soaring of "free coal" prices resulting from competition.

The American Coal Mining Co. has asked various state public organizations to see that concerted action be taken to get preferential distribution of cars to the coal industry, stating that the mines of the country can produce all the coal required but for the restricting deficiency in transportation.

## Canada

### BRITISH COLUMBIA MINES' CHIEF

*James McGregor Succeeds George Wilkinson, Resigned—Provincial Inspector Goes With Pacific Coast Coal Mines, Ltd.—Life Story of Mr. McGregor.*

George Wilkinson, Chief Inspector of Mines for British Columbia since early in 1917, has resigned and the appointment to the vacancy of James McGregor, senior member of the Mine Inspectors' Staff of the Province, has been announced. His term of office has been marked by signal advances, especially in respect to the improvement of underground working conditions.

Mr. Wilkinson, who has accepted the position of general superintendent of the Pacific Coast Coal Mines, Ltd., succeeded Thomas Graham (now general superintendent of the Canadian Collieries, Ltd.), as chief inspector. At the time of his appointment he was the manager of the Reserve mine of the Canadian Western Fuel Co.

Mr. McGregor has been connected with the Department of Mines for 22 years. He is a native of British Columbia, his parents having come from Scotland in 1849; his father being one of a party of eight coal miners engaged by the Hudson's Bay Co. to open up coal mines at Prince Rupert, Vancouver Island.

The boy McGregor went to work in the Nanaimo mines. Ambitious to qualify himself technically for higher positions, he attended both day and night schools; later he received private tuition under C. C. McKenzie, then Superintendent of Education for British Columbia.

While overman at the South Field collieries of the New Vancouver Coal Co. in 1888, he qualified for a first-class mine manager's certificate. In the year 1894 Mr. McGregor represented Nanaimo in the Provincial Legislature.

Later he was appointed to the position of Inspector of Metalliferous and Coal Mines for the Kootenays, which position he held at the time of receiving his present well-earned preferment.

## Association Activities

### Northern West Virginia Coal Operators' Association

Severe condemnation of the assigned-car system represented the action taken by directors of the Northern West Virginia Coal Operators' Association at a meeting held in Fairmont during the second week of May. It was pointed out at the meeting that the assignment of cars has been used by the railroads to secure an undue supply of fuel, seriously curtailing the production of fuel for commercial purposes. Legal action will be resorted to by the association to secure relief from the present intolerable assigned-car

evil if relief can be secured in no other way. Action of the scale committee of the Northern West Virginia operators in reaching a wage agreement at Baltimore in April was ratified by the directors of the association.

### Elk River Coal Association

The Elk River Coal Association has perfected its organization by electing officers and establishing headquarters at Weston, W. Va. Although the membership of the association is confined to coal operators on Elk River and Dundon, yet Weston was selected as headquarters because it is also the headquarters of the Coal & Coke division of the Baltimore & Ohio R.R.

On the roster of officers are: C. L. Voglesang, of Clay, president; B. C. Barber, of Clay, vice-president; E. V. Shorr, secretary. The board of directors includes J. G. Bradley, Walter Wood and C. L. Voglesang. Mr. Shorr's appointment as secretary became effective on June 1, when he assumed charge of the offices of the association. He heretofore held an important position on the Kanawha & Michigan R.R.

### Upper Potomac Mining Institute

The meeting of the Upper Potomac Mining Institute held early in May at Thomas, W. Va., largely attended by members, was featured by a paper prepared by William H. Noone, on the subject, "Timbering and the Prevention of Accidents."

The Upper Potomac institute has adopted the plan of having all papers read to the institute printed in pamphlet form, and distributed to members before the meeting at which they are to be read. The next following meeting of the institute was held at Piedmont, in the lower end of the Upper Potomac field, on May 29, when in addition to two papers read there was a musical entertainment.

### Mine Foremen's and Fire Bosses' Institute

At the second meeting of the Mine Foremen's and Fire Bosses' Institute, held in Belington, a constitution was adopted and new members were admitted. A paper was read by Thomas Davis of Mabie, W. Va., on "Safety and the Mining Law"; this paper was well received by the members and was followed by an interesting discussion. The next meeting of the institute will be held at Junior, W. Va.

### Smokeless Coal Operators' Association of West Virginia

In order to avoid the commandeering of coal by the Navy, as became necessary last year, the Smokeless Coal Operators' Association of West Virginia made arrangements in the course of a meeting at Washington, D. C., during the second week of May, to take care of the requirements of the Navy.

As the first step, a committee of members was selected to take this matter in charge and to work out a plan

with Navy officials and with the coal operators of the various smokeless fields. The Navy tonnage may be obtained by allocating the amount of fuel to be supplied among the various smokeless companies.

After studying pending legislation proposing further regulation of the coal industry, members of the association considered that it was useless to hope for any relief from shortage of production until the railroads secured the necessary equipment. A special committee of operators was selected to cooperate with the railroads in securing certain changes in the law.

### Wholesale Coal Trade Association of New York

Shippers to the tidewater piers at New York are facing heavy demurrage charges owing to the strike of the marine and railroad workers, and the facts in the case will be presented to the Interstate Commerce Commission in an effort to effect a cancellation, or at least a suspension until an investigation can be made. The Wholesale Coal Trade Association of New York has called the attention of the Interstate Commerce Commission to the accrual of demurrage charges on tidewater shipments in the month of April, brought about by various strikes. The Interstate Commerce Commission has ruled that a strike is not an adequate reason for the cancellation of demurrage charges, yet conditions in this regard have materially changed since that ruling was made. The Wholesale Coal Trade Association states the facts surrounding the present situation are of so different a character and so widespread in their effect as to justify a modification of the commission's attitude. While the New York association makes this protest on behalf of shippers to the New York tidewater port, it is proposed to enlarge the scope of the application to cover the ports of Philadelphia, Baltimore and Hampton Roads if strikes have resulted in the accrual of demurrage charges at these ports.

### Michigan-Ohio-Indiana Association

The program for the annual convention of the Michigan-Ohio-Indiana Coal Association, an organization of retailers of the three states, which will be held at Cedar Point, Ohio, June 16 to 18, inclusive, has been completed by Secretary B. F. Nigh, of the association. The attendance is expected to be about 1,200. Prominent among the topics to be discussed will be the car supply and costs of doing retail business. Homer C. Gill, of Columbus, president of the association, is preparing a lengthy statement of retail costs. Addresses will be made by Tom L. Lewis, formerly president of the United Mine Workers of America, now secretary of the New River Coal Operators' Association of West Virginia; H. G. Ciabaugh, of the Peabody Coal Co., of Chicago, chairman of the Illinois Fair Price Commission; A. L. Allais, an executive of the Hazard Coal Operators' Association.

# Mine and Company News

## COLORADO

**Craig**—D. E. Evans, of this place, has completed preliminaries which will result in the opening of a coal mine at the southwest limits of Craig, in Moffat County, and cause the expenditure of a quarter million dollars to this district in the coming year. Mr. Evans obtained options on a total of 480 acres. for a coal company headed by George A. Levy, of Denver.

The company plans to sink a 500-ft. shaft on the property and begin development work at an early date in order to have the mine producing by the time the proposed Salt Lake & Denver R.R. is built to the west, thus giving an outlet for the coal.

## IDAHO

**Wallace**—Three men were killed and one narrowly escaped death from gas in the Marsh mine near Burke, Idaho. The bodies of Fred L. Baron, superintendent of the mine; Charles Johnson and another miner yet unidentified were found beneath the water in the bottom of a shaft by a rescue crew.

## ILLINOIS

**Benton**—It is said that the largest price given for coal land in Franklin County, Ill., was paid recently when the W. P. Rend Collieries Co., which operates a mine at Rend City in that county, purchased 600 acres, paying \$75 per acre for same.

A big deal in coal lands is being negotiated between Bell & Zoller Mining Co., of Zeigler, and the W. P. Rend Coal & Coke Co., of Rend City. The deal involves ten sections of coal land in Franklin County, Ill., which the Rend company proposes to transfer to the Bell & Zoller Co. for nine sections in Williamson County, Ill.

**Duquoin**—A new mine is to be sunk near the old Lincoln operation, south of the town of Lincoln, which is expected to connect with the old workings of the mine, which has been closed down for years. The mine was abandoned after vain efforts had been made to smother a fire in the workings; later the tippie and other top works were torn down. It is intended that the new plant will enter the old mine's territory from another position and get the larger part of the coal which remains untouched. Lincoln (Ill.) men are backing up the scheme.

The united efforts of the various local unions around O'Fallon, northwest of here, have succeeded in purchasing the Taylor Opera House, which they will use for their meeting hall. The price paid for the structure amounted to \$31,000.

The work at the Hallidayboro mine, five miles south of here, owned by the Jackson Coal Co., of Chicago, is progressing nicely and it is planned to hoist coal from the main shaft into the temporary tippie. This tippie is to be used during the time required to erect the big steel tippie which is now being shipped to the mine. The mine top works was recently totally destroyed by fire. The effect of this fire is especially felt in this district as the railroad, which uses much of the coal from this mine, finds it unusually hard to procure enough fuel to supply its many trains.

## INDIANA

**Evansville**—A \$150,000 plant will be erected by the Indiana Atomized Fuel Co. on its newly acquired property near the Crescent coal mine. The purchase of five acres of land near the mine has been completed. The company will manufacture a fuel product similar to powdered coal.

## OHIO

**Hecking**—The Hoeking Valley Mining Co., recently chartered at Columbus with a capital of \$400,000, has started pumping out an abandoned mine on a 2,000-acre tract recently acquired by the company. It will require about six months to dewater the mine, after which a modern electrically-operated tippie will be constructed. It is expected that loading will start some time in September. The product will be sold through the Essex Coal Co., of Columbus.

**Steubenville**—Coroner T. H. Kirk of Jefferson County, who has been investigating the recent mine fire at Amsterdam in which 20 miners lost their lives, has rendered a decision that no one is guilty of negligence in the fire. He finds that the fire came from the fan room, and was caused by the explosion of a motor. In the inquiry the coroner called about 35 witnesses.

## PENNSYLVANIA

**Uniontown**—The Hillman Coal & Coke Co. recently purchased a controlling interest in the Tower Hill Connellsville Coke Co. The Hillman interests now have 23 mines with an annual capacity of 6,000,000 tons.

Control in the company was formerly held by J. R. Nutt and associate capitalists of Cleveland. The company has approximately 1,500 acres of coal unmined and the two plants with 714 ovens are among the most modern in the region. L. W. Fogg, present general superintendent, who built the

plants in 1907, will continue with the owners.

**Connellsville**—Connellsville and Uniontown men, organized as the Republic Coal & Coke Co., completed a deal with the Republic Iron & Steel Co., taking over the latter's plant at Atcheson, between Smithfield and Pt. Marion, in Fayette Co. The price is said to have been about \$200,000, or about the same consideration the late John F. Atcheson, builder of the plant, received for it 22 years ago.

The officers of the new company are J. Fred Kurtz, president; Bruce F. Sterling, vice-president; W. D. McGinnis, treasurer, and Ross S. Matthews, secretary.

## WEST VIRGINIA

**Bluefield**—Negotiations for the sale of the American Coal Co., operating in the Pocahontas field, were consummated during the first week of May, the sale price of the company being in excess of \$3,000,000. The new owners of the American company are James A. McQuail, William McQuail, Edward J. Ennes, Wm. C. Atwater and others, of Bluefield, W. Va. The purchase of the American Coal Co. also covers 7,000 acres of coal land in the Pocahontas region. The American company operates at four different points, the mines so operated being known as the American, the Piedmont, the Crane Creek and the Pinnacle.

**Morgantown**—W. H. Warner & Co., of Cleveland, Ohio, operating mines in a number of bituminous regions, has entered the Marion County field, having acquired all the plants, acreage and assets of the Har-Mar Coal Co., the price paid, it is stated, being close to \$500,000. The Har-Mar company owns Pittsburgh coal and a small acreage of Sewickley coal. The purchasers have already taken possession of the property.

## VIRGINIA

**Lynchburg**—The Banner Fork Coal Corporation is understood to be planning general business expansion for increased operations. The company has increased its capital from \$1,000,000 to \$1,200,000.

## CANADA

**Fernie**—A blowout in No. 1 East mine of the Coal Creek colliery of the Crow's Nest Pass Coal Co. occurred at noon May 14, forcing down 200 tons of coal and filling the mine with gas. All the workmen withdrew without injury.

## Industrial News

**New York, N. Y.**—The Imperial Brass Manufacturing Co., with headquarters in Chicago, announces that on and after May 1, the New York office of the company will be located in the Longacre Bldg., 2nd St. and Broadway, New York City.

**New York, N. Y.**—Burns Brothers Coal Co.'s annual report for the year ended March 31, 1920, shows net profits after expenditures and Federal taxes of \$1,027,955, equivalent to \$11.41 a share on the \$8,086,100 common stock outstanding, after allowances for dividends for the preferred issue. The Burns Brothers of New Jersey and the Burns Brothers of New York consolidated income account reported net sales of \$24,053,980, against \$21,286,870 in the year preceding.

**New York, N. Y.**—Goodin-Reid & Co., of this place, announces the reorganization of its Cincinnati branch under the direction of Charles W. Taylor with offices in the Pickering Building. A full line of Goodin-Reid bratticing materials will be carried in stock for prompt shipment to the local and Western trade. Under present freight conditions, this should be a special convenience to users of the company's products.

**New York, N. Y.**—The Worthington Pump & Machinery Corporation announces that it has completed preparations to furnish improved water-power machinery of all capacities, for low, medium and high-head service, including oil pressure system, water governors and other auxiliaries. The company has supplemented its staff with competent designers in hydraulic problems with experience gained in years of service in such lines.

**Chicago, Ill.**—The Webster Manufacturing Co., with executive offices here and works at Chicago and Tiffin, Ohio, makes the following announcement: Since the purchase of the Skillin and Richards Manufacturing Co., in June, 1918, a new building has been erected, which will increase the capacity of that plant about 50 per cent. The receiving and shipping facilities have been improved, and the plant made thoroughly up-to-date in all respects.

The sales offices formerly in the McCormick Building, and the general offices and engineering staff, at Tiffin, Ohio, now occupy the new office building, at 4500 to 4560 Cortland St., Chicago, Ill., to which office all correspondence should be addressed.

## Personals

**John L. Kemmerer** was recently elected chairman of the board of directors of the West Virginia Coal & Coke Co.; Everett Drennen was made president.

**D. Gleisen**, manager of the Industrial Bearings division of the Hyatt Roller Bearing Co., has appointed W. P. Myer to be directing transmission engineer. In his new position Mr. Myer will be responsible for the sale of Hyatt line-shaft roller bearings; he has been doing field work with the Hyatt agents throughout the country for over two years.

**C. P. Broadhead**, wholesale anthracite and bituminous coal, announces removal to new offices at 29 Broadway—room 1020.

**W. R. Davis**, brother of T. B. Davis, president of the Island Creek Coal Co., and three other men were killed recently at mine No. 3 of the Mallory Coal Co., on Huff Creek, Logan County, W. Va., when a rock rolled down and crushed them. Five others were injured. They had taken shelter from a rainstorm in a mine opening.

**Charles H. Chase**, research expert of the Council of National Defense, regrets that he has been compelled to cancel his engagement to give an address before the Kentucky Mining Institute on June 4 and 5.

**William H. Sterling**, superintendent of the Doceña mine of the Tennessee Coal, Iron & Railroad Co., between Pratt City and Adamsville, Ala., has been spending a few days in the Connellville, Pa., coke region looking into matters connected with the mines and ovens of the field.

**R. H. McGinley** has been appointed manager of the Fairmont branch of the Tidewater Coal Co. Mr. McGinley was connected with the brokerage office of the company and prior to that was with the Antler and Robinson coal companies.

**H. C. Drum**, formerly manager of the Fairmont office of the Tidewater Coal Co., has completed arrangements for engaging in the coal brokerage and export business, having opened offices in the Hutchinson Building, at Fairmont, W. Va. Among other companies he will represent the William R. Seaman Co., of Baltimore, and the Wiley Deyes Fuel Co., of Uniontown, Pa.

**M. H. Tomb**, of Charleston, has been appointed district manager of the Raleigh Smokeless Fuel Co., his district comprising Norfolk & Western territory. Mr. Tomb's headquarters will be at Bluefield. For the last two years he has been the secretary of the Kanawha Coal Shippers' Association. The Raleigh Smokeless Fuel Company has offices at New York, Norfolk, Huntington and Beckley.

**C. M. Roehrig**, formerly secretary of the Northeast Kentucky Coal Association, with headquarters at Ashland, Ky., on June 1 severed his connection with that association to accept an important post with a company now in process of organization by New York capitalists. This company is negotiating for the purchase of mines in Kentucky and West Virginia. Mr. Roehrig's headquarters will be in Huntington, for the present in the office of the Tuttle Coal Co., a concern also having a sales office in Cincinnati.

**Carl G. Barth**, who was a pioneer in the machine building industry and to whom many other industries owe modern principles of production and management, has been elected an honorary member of the Taylor Society, with headquarters at 29 W. 39th St., New York, N. Y. Only two other men have been thus honored by this society, which is the national organization for the promotion of science in management; these men being Frederick W. Taylor, himself, and Henri Le Chatelier, the prominent engineer who developed scientific management in France.

**Phillip Konrad** has been appointed general manager of all the properties of J. C. Sullivan in southern West Virginia. Mr. Konrad will have under his direction mines in Raleigh, Wyoming and McDowell counties in addition to a large amount of development work. He will establish headquarters at Tralee, Wyoming County, W. Va. Mr. Konrad has been a civil and mining engineer in Fayette County, W. Va., for the last 20 years.

**L. W. Sydner**, assistant to the president of the Lake & Export Corporation, of Huntington, W. Va., and Miss Eva Dietz of Charleston, W. Va., were united in marriage in that city on Saturday, May 1. They will live for the time being at Beckley, W. Va.

**E. W. McCullough**, for nine years executive secretary of the National Implement & Vehicle Association, with headquarters at Chicago, has been named manager of the new Industrial Production Department of the U. S. Chamber of Commerce. In the departmentalization plan of the National Chamber, the Industrial Production Department occupies an important place.

**George F. Germain**, proprietor of the Corning Mining Co., has sold his oil interests in the mining property and will devote his entire attention in the future to developing the mining end of the business.

**I. H. Keim** has been appointed general sales manager of the R. D. Nuttall Co., gear manufacturers, of Pittsburgh, Pa. Mr. Keim came with the company in 1911 as engineer in charge of erection work and the installation of equipment. Later he was assistant chief engineer, designing and developing heavy-duty railway and steel mill gearing. In 1916 he developed a standard tractor transmission unit and was soon placed in complete charge of this new field with headquarters in Chicago, Ill. From this work Mr. Keim has been brought back to the main office at Pittsburgh, to take charge of his present duties.

**George M. Rowland**, architect, has become associated with the engineering and surveying firm of Blum, Weldin & Co., of Pittsburgh, Pa. Mr. Rowland has practiced his profession for over 20 years, the last 12 of which he has been in the employ of a prominent architect of Pittsburgh, and has had responsible charge of the design and supervision of construction of some important buildings. Blum, Weldin & Co. has recently moved its offices to the seventh floor of the Bakewell Building, Pittsburgh.

**George E. Long** recently resigned as senior vice president of the Joseph Dixon Crucible Co. Shortly before his resignation, he celebrated his seventieth birthday. Mr. Long thereby terminates 43 years of active service with this company, beginning in the capacity of stenographer and advancing to the offices of secretary, treasurer and vice president, respectively. Mr. Long will

continue as a director of the Dixon company. He was prominently connected with the growth of this company and was widely recognized as the "father" of graphite lubrication and of silica-graphite paint for protective purposes.

## Recent Patents

**Electrical Connector**, George A. Mead, Mansfield, Ohio, assignor to Ohio Brass Co., Mansfield, Ohio, 1,336,475. April 13, 1920. Filed Jan. 5, 1918. Serial No. 210,523.

**Pipe Wrench**, Wasył Zadorozny, Meacham, Sask., Can., assignor of one-half to Tony Zygiel, Hamilton, Can., 1,336,710. April 13, 1920. Filed March 13, 1919. Serial No. 282,465.

**Rail Bond**, William C. Starkey, Mansfield, Ohio, assignor to Ohio Brass Co., (a corporation of New Jersey), Mansfield, Ohio, 1,336,932. April 13, 1920. Original application filed June 26, 1916. Serial No. 105,943. Divided and this application filed Sept. 21, 1917. Serial No. 192,456.

**Motor Control System**, Eugene R. Carichoff, Schenectady, N. Y., assignor to General Electric Co. (a corporation of New York), Schenectady, N. Y., 1,337,040. April 13, 1920. Filed May 6, 1918. Serial No. 232,726.

**Mechanism for Operating Reels of Mine Locomotives**, Frank B. Deans, Sharon Hill, and Benjamin K. Kirk, Philadelphia, Pa., assignors to the Baldwin Locomotive Works (a corporation of Pennsylvania), Philadelphia, Pa., 1,337,048. April 13, 1920. Filed Dec. 5, 1917. Serial No. 205,572.

**Grease Cup**, Leon N. Bourdeau, Rock Island, Ill., assignor of one-half to John G. Sorenson, Davenport, Iowa, 1,337,432. April 20, 1920. Filed Feb. 7, 1919. Serial No. 275,484.

**Process for Treating Coal**, John N. Wingett, Denver, Col., assignor to Warren A. Haggott, trustee, Denver, Col., 1,337,496. April 20, 1920. Filed May 2, 1915. Serial No. 25,636.

## Coming Meetings

**Mine Inspectors' Institute of America** will hold its annual meeting July 13, 14 and 15 at Cleveland, Ohio. Secretary, J. W. Paul, Pittsburgh, Pa.

**Pennsylvania Retail Coal Merchants Association** will hold its annual meeting June 23, 24 and 25 at Reading, Pa. Secretary, W. M. Beretolet, Reading, Pa.

**The Rocky Mountain Coal Mining Institute** will hold its annual meeting in Denver, Col., in conjunction with the National First Aid Meet on Aug. 20 and 21. Secretary, F. W. Whiteside, Denver, Col.

**M. O. I. Coal Association** will hold its annual convention June 16, 17 and 18 at Cedar Point, Ohio. Secretary, B. F. Nigh, Columbus, Ohio.

**National Retail Coal Merchants' Association** will hold its annual meeting June 10-12, Detroit, Mich. Secretary-manager, Ellery Gordon, Philadelphia, Pa.

**American Institute of Mining & Metallurgical Engineers** will hold its fall meeting about Aug. 20. It is proposed to leave Buffalo by steamer and cruise through the Lakes, the first stop being at Ioughton, Mich., after which the party will visit Duluth and the Iron Ranges of Minnesota, spending a day or two in Minneapolis on its return. Secretary, Bradley Stoughton, 29 West 39th St., New York City.

**American Institute of Electrical Engineers** holds annual convention at White Sulphur Springs, W. Va., June 29 to July 2. Secretary, F. L. Hutchinson, New York, N. Y.

**The Colorado Retail Coal Dealers' Association** will hold its annual meeting June 8, at Colorado Springs, Col. Secretary, E. Hopper, Denver, Col.

**Illinois and Wisconsin Retail Coal Dealers' Association's** annual meeting Aug. 4 and 5 at Milwaukee, Wis. Secretary, I. L. Runyan, Chicago, Ill.

**Indiana State First Aid Meet** at Clinton, Ind., July 5, under the auspices of the Indiana State First Aid Association, with the co-operation of the Clinton First Aid Association, Chamber of Commerce, Indiana Coal Operators' Association, United Mine Workers of America, Bureau of Mines, and State Mine Inspection Department.

## *Engineers Advance in Organization*

AN epoch-making step in engineering organization was taken in the Washington conference of technical society representatives which decided upon the formation of a federation of these technical associations. This is the first all-embracing movement of the engineers to place their activities upon a full professional basis comparable with that of the other learned professions of law, medicine and the clergy; and as such is of the greatest importance.

For a number of years the several larger national engineering societies have been affiliated through the Engineering Council and other channels, but the work thus done is limited in many ways. It is a happy development, therefore, that gives us the larger agency which is now assured.

The element of public service and of greater participation in the constructive thought of the nation were stressed many times in the organization meetings and the application of these ideas will go far to inspire and support the effort that is now beginning. Indeed it was the clear recognition that these ideals must govern more fully the major professional activities that was most convincing as an argument for the comprehensive organization.

At the outset of the conference it was apparent that there would be considerable difference of opinion as to whether there should be an organization made up of representatives of the various societies now functioning or only an organization of individuals, such as the American Association of Engineers.

The latter scheme was at first advocated by a few of the delegates, but a full discussion soon developed a unanimous vote in favor of the former plan. Apparently the determining factor in this decision was the realization that two major activities confront the engineers as a group: First, advancement of the professional work to a proper plane both in action and in adequate recognition of the importance of the profession by the public; and second a service for the individual engineer in the matter of salaries, working arrangements, and other relations particularly with the employer. The latter group of needs is being covered most actively by the American Association of Engineers, and it seems to be the thought that this is the proper agency to continue in this work. The professional problems, on the other hand, have not had the broad attention that all technical men would wish, and it is for these responsibilities that the new body will no doubt most effectively function.

Thus far coal mining engineers have not been participants as a group in the plan of co-operative effort. But this does not by any means signify that they are either not needed or not welcome. They should through every available agency in which they are active give their support to the larger ideals that seem now within the possibilities of realization. It is a duty as well as a privilege to take this part in the advance of the profession.

Their civic consciousness and the sense that all parts of engineering are interdependent serve to bring the engineers into a common body. Specialization has done a good work, but engineers need to supplement it by association. Their interests, in many ways variant, are and should be in large degree united.

## *Let New England Face the Facts*

OUR coal is now in the markets of the world. The present situation in which consumers in New England are forced to bid against the world at large for their coal, or that part of it that reaches them by water, is not of the making of the coal man. There is a tremendous shortage of coal in the world—a shortage created in some countries by depleted man power, in others by lack of transportation, in some by both causes. The situation was plainly forecast by many competent observers a year ago. Today coal is being carried from British colonies as far away as South Africa and India, to supply the demand in the Mediterranean market. The English coal trade has a clientele that is worldwide, and what is more natural or right than that British coal shippers, failing to get supplies in England for their trade, should turn to other producing countries to piece out their shortage?

A year ago we were seeking by every means to establish an export trade in coal. Today we have it. We intend to keep it, too. It happens that the sudden expansion in offshore shipments comes at a time when production is below normal because of the shortcomings of the railroads. Were we not thus handicapped, the export movement would cause hardly a ripple on the surface of the American trade.

Other parts of the country have just as much right to demand an export embargo on cotton and cotton goods, shoes and other products from New England, on the ground that the price to them is excessive through the bidding up of prices by needy foreigners as New England has to demand that coal be cut off from foreign shipment because unless that be done, the price to her will be too high. We have just as reasonable basis to ask that no more wheat be shipped to hungry Europe because that demand on top of our domestic need makes us pay too high a price for bread. And so with other food and manufactured products, including gasoline.

An export embargo on any commodity today would be but thinly-veiled price regulation, and the coal industry wants no more price regulation. We doubt if any section of the country, or any industry really favors further governmental regulation of business. The recent disclosure of profits in textiles in New England gives cause for scant sympathy on the price these same manufacturers are now required to pay for the coal which they use.

Embargoes on foreign shipments have been proposed before as remedies for high prices at home and have always been discarded as poor national policy. We have no wish to engage in sectional legislation.

## Futility of Embargoing Exports of Coal

EMBARGOING coal for foreign export, as proposed by congressmen from New England, is another attempt to discriminate against coal. Had the scheme the slightest possibility of achieving the results that its sponsors hope for, it would deserve consideration. But let us examine into the merits of this latest move to pick out coal for such particular and drastic treatment. The basis for the proposal is that the coal that New England needs is being taken away from this country by foreign buyers. The figures for April show that an exceptionally large proportion of the coal dumped at the Atlantic tidewater ports has gone to export markets and that New England has received a correspondingly small share. About 2,000,000 net tons of bituminous coal were exported in bottoms in April and but 700,000 tons shipped coastwise to New England. This is at the rate of 24,000,000 net tons of offshore export, compared with from 4,000,000 to 6,000,000 in pre-war normal years, and less than 9,000,000 net tons by water to New England, compared with requirements of from 12,000,000 to 15,000,000 tons. Something has gone awry. The reason is well known. The buyer on foreign account has offered more money for the coal and it has gone abroad. Plainly New England is forced to bid in the world market for coal by water, to the extent of more than half of her requirements. There is nothing involved but the price. New England has coastwise freight rates that are fixed and, if anything, that are discriminately low in her favor. Boats are available. The Shipping Board will supply all the boats for this service for which there is call. It is unquestionably true that New England is against a hard situation, due to the congestion of the rail gateways through which come in normal times from one-third to one-half of her soft-coal supply from the all-rail suppliers located in the northern Appalachian coal fields.

But though she is in a hard case, would it be bettered if, to accord with her wish, exports were prohibited?

What might be expected to happen should export of coal be prohibited from tidewater ports? If the step is taken it will be solely for the relief of New England and

cutting off exports to Canada would be of no assistance. An absolute embargo on foreign sales at tide would at once cause a drop in price. New England would get all exported. It is not required and if it were bought and the coal she desires, because aside from ship bunkers there would be left no other large buyer. But New England could not begin to take the coal that is now being

shipped, the port facilities would limit its receipt. Furthermore, the conditions on the railroads in New England are no better than elsewhere and these roads could not carry such quantities of coal from tidewater ports inland to consumers. At the most, from 300,000 to 400,000 tons per month of the 2,000,000 that are going to foreign countries, added to what is already going coastwise, would break the New England demand. And what of the remaining 1,600,000 tons that would be cut off from the export market? Who would get that? No one. The railroads could take no more west from the southern West Virginia fields that are furnishing the bulk of this export tonnage. If exports are cut off, production of coal will be automatically curtailed. The same is in large measure true with respect to the railroads serving the port of Baltimore. Beyond question, Europe is in desperate straits for coal or the demand would not be so strong. To deprive foreign consumers of the

fuel they need so badly in order to satisfy the desires of a small section of our domestic consumers would involve the United States in a breach of good faith. Italy is one of the heaviest foreign purchasers of our coal. It is somewhat difficult to conceive the administration acquiescing in a move to thus adversely affect that country with which our diplomatic relations are now proceeding so unpleasantly.

An attempt to stop exports was made during the coal miners' strike last November and December. Not a pound of coal was to be spared to foreign consumers in November and the lid was clamped on tight by the Central Coal Committee acting for the Fuel Administration. The emergency was great and the decision had the support of the country and was not opposed openly by foreign governments. Individual pressure, however, was so great that coal was exported in considerable volume. Permits were issued one at a time, for good reasons in each case. The total was over 700,000 tons in one month.

### Another War Cripple Who Needs National Rehabilitation

SECOND LIEUTENANT I. C. C. (Loquitur): Salute! Don't you see my shoulder straps?

The railroads, permitted to make dividends of only 5½ per cent and graciously allowed to borrow money from the revolving fund at 6 per cent, are truly the sorriest of war cripples. In fact the strongest of them that are now in the market to sell bonds are offering to pay 7 per cent for the accommodation and to get it have to give the best of security.—*News Item.*

# Gunite Forms an Excellent Material for Covering Mine Buildings

Frame Buildings with Gunite Covering Possess Many Advantages Over Similar Structures Covered with Sheathing and Clapboards— They Are Cheaper in First Cost, Nearly Fireproof and Only the Trim Requires Repainting

**M**UCH has been written about the use of the cement gun around coal-mine plants, but most such articles have dealt with its utilization underground. One of the most important places where the gun can be employed to advantage is in the construction of the buildings comprising the surface plant.

The cement gun is a relatively new addition to coal-mine equipment, albeit a valuable one. There are so many reasons why a gunite-constructed building is well adapted to coal-mine plants that it is natural to inquire why this type of building has not been more frequently constructed. The answer is that the cement gun is a newcomer as a piece of mine equipment and the production problems that it has aided in solving have been located underground, where no other solution was feasible.

Let us cite a concrete case—this is not intended as a pun—where gunite has been used in the construction of buildings—the plant of the Valley Camp Coal Co. This concern is located at Parnassus, Pa., and is operating in the Thick-Freeport District that lies adjacent to the Allegheny River.

## EXPERIMENT WITH GUNITE COATING SUCCESSFUL

While the steel tippie at the plant of the Valley Camp company was under construction it was realized that the time was not far off when some thought would have to be given to the construction of the remaining surface units. The officials of the company had practically determined to construct these buildings of cinder-concrete blocks and some of this material had already arrived on the ground. It was finally decided, however, to alter the plans and construct frame buildings with a

gunite exterior, utilizing for that purpose a cement gun that had already been purchased.

As there was no mining town nearby that the company officials could visit in order to make inquiries as to the effectiveness of this type of construction, and learn what advantages, if any, it had over other types, it is apparent that the buildings were constructed more or less as an experiment. A recent conversation with the officials at Valley Camp proved that they are highly pleased with the result of their experiment.

Why are gunite buildings peculiarly adapted to coal-mine plants? In the first place, this is the only type of low-cost construction available today wherein an ideal dead space between the exterior and interior walls of a building can be assured. This dead space is desirable in any construction in order to prevent the entrance of cold air in the winter and assure the exclusion of heat in the summer.

## WALL SPACE MUST BE VOID OF AIR CURRENTS

The stagnant air acts as an efficient insulator, but to be most effective it is imperative that no contact be permitted between it and the outside atmosphere lest a current be set up, causing the dead air to fail to function properly. Furthermore, it is highly desirable that no means of entrance for the outside air be left open since in the summer months the moisture carried by warm air entering from the outside will condense on the cool interior surface of the walls, thereby making the building not only damp and unhealthy for habitation but simultaneously hastening decay of the timbers.

Effective dead-air space is a most important factor in the construction of buildings where the means of heating

## Gunited Tenement

House comfortably shelters seventeen families. The walls are inexpensive, fireproof and attractive. They keep the house warm in winter and cool in summer, as neither the heat of the inside in winter nor the heat of the outside in summer can pass through them.

WALL PREPARED FOR RECEPTION OF GUNITE

Over the studding is spread two- or three-ply tar paper, applied by using ordinary carpet tacks. Over this again No. 15 gage galvanized poultry wire of a 2-in. mesh is stretched and lightly fastened with fence staples.

during the winter months is scant or inclining toward the inadequate. This type of construction is, therefore, particularly suited to those plants where power for operation of the mine is purchased and steam heat is not available or where it is necessary to conserve heat if the buildings are to be comfortable during the cooler months.

Another factor of considerable import is that the upkeep expense connected with a building of this type, such as the periodical application of some sort of protective paint, is small. This feature was recently made the subject of a special investigation by the authorities of the Nashville, Chattanooga & St. Louis Ry. This company constructed of gunite the side walls of a large number of section houses along its lines.

The report made in this investigation shows that the painting of such houses at present prices would cost \$312 every six years on a house wood-wall with about 2,600 sq.ft. of surface, against a charge of \$171 for painting the trim on the gunite-covered buildings. The original cost of the gunite houses was 22c. per square foot, or \$253 for the gunite and \$95 for painting the trim, making a total of \$348, against a cost for a single shiplap will of \$105 for the sheathing and \$173 for the

painting, or a total of \$278. It will thus be seen that in six years this railroad will have saved \$71 on the gunite building over the cost of a single-wall wood building. The latter type, incidentally, is ill adapted to a rigorous climate such as that of the Pennsylvania coal districts. Apart, however, from the economy of the gunited building is its attractive appearance.

#### APPLICATION OF GUNITE REDUCES FIRE RISK

Still another consideration favorable to gunite is the fact that a cheap insurance rate can be procured where this type of construction has been used. Most present building codes have not provided for the gunite structure, as it is relatively new. In comparison with other masonry walls the exterior coating of this type of building is thin. However, the same end has been achieved as that reached with the thicker walls, although the construction is entirely different. Permanence and strength are present, for a reinforcement of expanded metal or some other suitable mesh is always employed as a background for the cement. The advantage of this type of building around the mines lies in the fact that the gun is always available for quick construction, as the mine equipment and regular operators are employed on this outside work.

All the buildings at Valley Camp are of simple frame construction except the repair shop, which is built of cinder block. For such frame structures three-ply tar paper was fastened to the studding with ordinary carpet tacks. This paper was applied horizontally, beginning at the bottom of the wall and working upward. At the vertical joints of the paper the ends were overlapped 3 in., while at the horizontal joints a 2-in. overlap was employed. It is essential that the ends and sides of the paper courses overlap slightly in order to more fully guarantee the existence of an effective air space between the outer and inner walls. Care was taken to see that the paper was drawn taut so as to avoid sagging.

#### WIRE MESH COMPLETELY INCLOSED BY GUNITE

Over the paper No. 16 gage galvanized poultry wire with a 2-in. mesh was stretched. This was also drawn tight and fastened with 1½-in. galvanized fence staples. The netting was overlapped about 4 in. at the vertical and horizontal joints, and the adjacent courses or sheets were securely fastened together. When the staples were applied they lacked about ¼-in. of being driven home. This was to allow the cement mortar to entirely inclose the wire.

In building the repair shop at this plant the cinder blocks were used which have already been referred to as having been purchased. These blocks were laid with rough-cut flush joints ½ to ⅝ in. thick. The surface was then covered with gunite until a thickness of ¾ in. had been attained. It was necessary to wet the walls before applying the cement in order to prevent a too rapid absorption of the water in the gunite such as would occur if the blocks were dry. This coating has assured an absolutely dry interior although the dead-air space is not as prominent a feature in this type of building as it is in one of frame construction.

The cement and sand were mixed dry, one part of cement being used to three of sand. After mixing the material was passed through a ½-in. mesh screen before being placed in the gun. It was found that sand that contained a small amount of moisture gave better results than one that was perfectly dry, as it hydrated more easily and at the same time did not cause so much dust.

**Rear of the Tenement**

The building stands, as is characteristic of Pennsylvania, on a steep hill. Consequently entrance in the rear can be made to a ground floor which is beneath the level of the road in the front of the building.

This mixture also gave a more uniform flow through the gun. Where any of the dry mixture was allowed to stand over night it was rescreened the following day. Many finishes can be given to a stuccoed surface,

but perhaps the best and most practical one for mine buildings is that which is left by the gun itself or the so-called "stipple" finish. This was the type chosen at Valley Camp. A smoother finish, such as one left by a trowel or float following the gun, gives less surface for the ever-present dust and soot to settle upon, but on the other hand is a little more costly. As the finished wall can be easily cleaned with water, no matter what the character of the final surface, it is, of course, more practical to use the cheaper construction.

Cost data on the Valley Camp construction would be interesting, but unfortunately no records were made by the officials. It is believed, however, that the completed buildings have not cost any more than similar structures having weatherboard sides. Estimates made for other building work show the comparative costs of gunite and wood-covered houses, respectively, are about as estimated in the accompanying table; the figures being computed in costs per square foot of wood-covered wall surface:

**WOOD-COVERED HOUSE COSTS**

	Cents
2 x 4-in. studding spaced on 16-in. centers at \$70 per M. . . . .	4.2
Carpenter work placing studding at 60 per cent. of lumber cost . . . . .	2.5
Sheathing at \$70 per M (making no allowance for waste) . . . . .	7.0
Placing the sheathing (\$30 per M) . . . . .	3.0
Building paper over sheathing . . . . .	0.5
Placing building paper . . . . .	0.5
Siding at \$100 per M . . . . .	10.0
Allowance of 20 per cent for lapping and cutting . . . . .	2.0
Placing siding (\$40 per M) . . . . .	4.0
Painting . . . . .	7.0
<b>Total cost per square foot for wood . . . . .</b>	<b>40.7</b>

The following figures are computed per square foot of wall surface covered with gunite 1 in. thick:

	Cents
Studs and carpenter work (same as for the wood-walled buildings) . . . . .	6.7
Wire placed behind tar paper and over studs to prevent sag . . . . .	0.5
Tar paper (2-ply Barrett specification) . . . . .	2.5
Placing tar paper . . . . .	1.0
Reinforcing mesh . . . . .	3.0
Cost of placing mesh . . . . .	2.5
Gunite material: One bag cement, 75c; 3 cu.ft. sand, 25c. . . . .	4.5
(This amount will cover 22 sq.ft. of surface 1 in. thick.) . . . . .	
Cost of placing gunite (labor, \$40 per day) . . . . .	3.0
(An average of 1,300 sq.ft. 1 in. thick was covered daily) . . . . .	
Power and engineer . . . . .	1.0
Depreciation of equipment . . . . .	1.0
<b>Total cost per square foot . . . . .</b>	<b>25.7</b>

In addition to the saving in first cost, amounting to 15c. per square foot of wall surface, there is no comparison between the completed gunite buildings and those of a similar design but constructed entirely of wood.

**CLOSE-UP OF A CORNER OF THE BUILDING**

As this type of building is not so subject to dust and soot as are the structures around the tipple the finish is made rougher. The natural or "stipple" finish is, from an artistic point of view, much preferable to one which is smoother. It is, needless to say, a trifle cheaper also.

The gunited structures at Parnassus are nearly fireproof. They are warm in the winter and cool in the summer. They present an attractive appearance, being decidedly neat, while there is practically no periodic upkeep expenditure.

One detail in the application of the cement that should not be overlooked is that of securing a uniform color over all of the building. On one of the buildings at Valley Camp the coloring is not uniform. This resulted from the moving of the operating scaffold to a lower level and the renewal of the guniting process without first using a brush wet with water to remove the dust that had settled upon the previously "shot" gunite.

#### MINE WATER SO CLEAN IT COULD BE USED

An N-O gun model, as manufactured by the Cement Gun Co., Inc., of Allentown, Pa., was used for the guniting. An ordinary type of mine compressor supplied the air, which was delivered to the gun at a pressure of about 30 lb. to the square inch. A pump situated in the fan house furnished the water, which was supplied at a pressure of 65 lb. to the square inch. Ordinary water from the mine was used as at this operation this is unusually clean. It is important that clean water be employed. At most mines it would be impractical to use mine water because of the sediment ordinarily carried, which might interfere with the operation of the gun and at the same time discolor the mortar.

Gunite construction compares even more favorably with buildings made of brick. The gunite structures are not as costly, have the same relative fireproof qualities, are warmer than the brick in winter, and present an appearance that is fully as attractive. They possess the added advantage that they may be cleaned at any time at practically no expense.

## Carrying Out Burdensome Contracts

Release from Performance of Terms Agreed To Must Be Provided For in Contract—Damages May Be Recovered for Misrepresentation

BY A. L. H. STREET  
Minneapolis, Minn.

A FIRM holding a contract to mine coal lands for a lessee asks the legal department of *Coal Age* for information as to its legal rights under the following stated circumstances:

The land contained two coal veins—one containing "very good coal," and the other being very low, ranging from 2 ft. 4 in. to 2 ft. 6 in. When the better vein had been worked the firm was practically out of debt and owned a valuable plant. Then the firm asked the other party for a new contract or an advance on the price of coal, "as we were not able to work this low vein at the old price as there were faults to cut, and it naturally cost more for labor." But the other party insisted that the firm proceed to work the coal, which was done. This compliance with the other party's demand has entailed heavy indebtedness.

"They insisted upon our working this unworkable coal," adds our correspondent, "which is the direct cause of our indebtedness. We would like your advice on the matter, as to whether we are lawfully forced to stand all or part of debt, and as to what procedure we should take in the matter. Also we would like advice as to the position of our personal property in

case of a foreclosure and as to how we could protect it."

No matter how burdensome performance of the contract may be, the correspondence discloses no legal ground on which the firm is entitled to release from the terms of the agreement or to reimbursement for any part of loss entailed in working the coal.

"The general rule is that, where a person by his contract charges himself with an obligation possible to be performed, he must perform it, unless its performance is rendered impossible by the act of God, by the law, or by the other party, it being the rule that in case the party desires to be excused from performance in the event of contingencies arising, it is his duty to provide therefor on his contract. Hence, performance is not excused by subsequent inability to perform, by unforeseen difficulties, by unusual or unexpected expense, by danger, by inevitable accident, by the breaking of machinery, by strikes, by sickness, by weather conditions, by financial stringency, or by stagnation of business. Nor is performance excused by the fact that the contract turns out to be hard and improvident, or even foolish, or less profitable, or unexpectedly burdensome." 13 Corpus Juris, 635-637.

One clause of the contract held by our correspondents provides that they shall "mine all of the coal that is practicable to mine," etc. Under this clause the operator is not permitted to work a bed of good coal and then avoid the obligation of the terms of the contract which provide so far as "practicable to mine" the poorer coal. If it was not "practicable" to mine the poorer vein, that would be good excuse for not doing so. But the firm could not work it and then hold the other party for any part of loss in doing so, in the absence of special agreement to that effect, which we do not find in the contract in question.

Apparently the only respect in which the firm has protected itself at all in the contract against increased cost of production is in the following quoted paragraph appearing after the schedule of prices to be paid the firm for mining coal:

"It is understood and agreed that the above prices are based on present mining scale and that in case of any changes in the future the price will be increased or decreased sufficiently to meet the changes in the cost of production made necessary by such change."

This will authorize an increase in the price of the coal to cover increasing labor costs commensurate with advancing mining scales. But it will not authorize recovery on account of cost of production merely entailed by unexpected difficulties encountered in carrying out the contract.

What has just been said, however, should be qualified to the extent of saying that if the other party to the contract misrepresented the character of the coal veins, the firm could recover damages based on a difference between the cost of working the veins had the land been as represented and the actual cost and the actual cost of working them.

Should the chattel mortgage referred to by our correspondents be foreclosed, title to the mortgaged property would be lost unless redeemed before sale of the property by payment of the debt, interest and costs of foreclosure. Should the partnership debts exceed the firm's assets, with no fair chance of putting the concern on sound footing again, voluntary bankruptcy proceedings would appear to afford the best means of "wiping the slate clean" before starting in upon a more promising venture.

# Successful Methods of Working Two Coal Beds Separated by Six Feet of Slate

A Scheme of Mining Developed to Suit Conditions in One Part of a Mine Failed in Another—Methods Were Then Worked Out Suitable to Each Portion of the Operation

By DEVER C. ASHMEAD  
Tarrytown, N. Y.

**A**MONG difficult mining problems is that of working two coals separated by only a few feet of strata—adjacent or superincumbent beds, they are often called, but both the names are inaccurate and only excusable because of the inadequacy of our vocabulary. Such beds can be found both in the anthracite and bituminous regions, and the difficulties they present are variously met, or not met, by the companies which are confronted with them. The Connell Anthracite Mining Co. at its mine at Bernice, Pa., has solved this problem for its own operation, and a recital of its methods may be of assistance to the managers of other mines who are confronted with like difficulties.

The Connell company has at Bernice two beds of coal so close together that they cannot be mined separately, and yet they are too far apart to be worked profitably as one. The lower seam is seven feet in thickness and

is overlaid with six feet of slate, on top of which is another bed of coal varying in thickness from two and one-half to three and one-half feet.

The thickness of the slate between the two beds of coal is too great to be handled profitably. Over the upper bed lies a sandstone roof forty to forty-five feet thick, above which is slate and surface soil. The minimum cover is sixty-five feet, but a maximum cover of about 165 ft. is at times reached. Other difficult features that have to be contended with are the numerous fissures filled with mud that are found in the sandstone.

Practically every method of mining that was suggested by anyone was given a fair trial, but without satisfactory results, until the idea was conceived that it might be possible after mining the lower bed to drop the upper one and load out the coal. The success of this scheme depended entirely on the sandstone roof

VARIOUS SCHEMES TRIED FOR WORKING TWO ADJACENT BEDS  
Procedure successful in one part of the mine failed where heavier cover was encountered

remaining up until artificial support could be provided. The first experimental work was done where the coal had the lightest cover. At this point the method employed was an entire success, but considerable difficulty was encountered when the cover became heavier.

The procedure followed consisted in robbing two adjacent pillars for a distance of twenty-five to thirty feet from the end of the room and supporting the roof by numerous props. The robbing of two pillars made the total span of the roof equivalent to a distance of 130 feet on the first two pillars and on the second two and thereafter 100 feet, provided the rooms were thirty feet wide and driven on fifty-foot centers, thus making the pillars twenty feet wide. This procedure is shown in the accompanying illustration under section 1.

While the robbing is in progress it is necessary to support the roof with props. As soon as the two pillars are drawn back the proper distance the props are drilled and the holes in them loaded with dynamite and fired. This removes all support to the roof, which falls, and all the overlying strata, as far up as the sandstone, come down. This, of course, includes the slate and the small bed of coal.

The next step is to build a series of cogs on top of the fallen slate to support the new roof. These cogs are about five feet square, are placed on twelve and one-half feet centers and are filled with rock. Whenever it is necessary, because of mud seams in the roof, two cogs are placed, one on each side of the fissure, but ordinarily it is sufficient to build the cogs on twelve and one-half foot centers, as already stated.

After the coal has been dropped mine tracks are laid to the fall, and whenever possible these are carried on top of the fallen slate. This considerably lessens the distance that the coal must be moved. The coal is next loaded into mine cars and taken to the surface.

It would be a comparatively simple matter to carry on this method of working if the conditions of the roof remained the same in all parts of the mine. Unfortunately, however, the thickness of the overlying strata does not remain constant but, as has been previously stated, greatly varies, much augmenting the weight to be supported.

At first the coal company, in the extraction of coal where the overburden was heavier, attempted to employ the system that it had used successfully under light cover. The sandstone roof, however, would not stand up under the greater weight arising from the wide and comparatively lightly supported span. It broke and fell when the props were shot, making it impossible to remove the small bed of coal. As this scheme failed it was necessary to try another. The middle portion of the illustration shows what this method was.

A row of cogs was built on each side of the pillars to be robbed, the pillars were then removed and the coal dropped by removing the cogs one at a time. This did not work successfully. Because of the long span the roof rode the cogs and when one or two were removed the remainder could not withstand the load and failed, causing the roof to break.

It was therefore necessary to try another method. This time instead of robbing two pillars at a time it was decided to try robbing one. A row of cogs was built on each side of the pillar to be removed, to take care of the weight, and sufficient cogs were placed in the room the roof of which was to be supported. A total span of 50 ft. resulted instead of the 130 ft. span.

After removing the coal from the pillar the cogs on one side were removed, allowing the upper coal to drop, after which the sandstone was supported by another set of cogs in the manner previously described under the method used for light cover. In this case, as in the first instance, a set of cogs was placed on each side of any mud fissure that might be discovered. So far this system has been successful but it has not been in use a sufficient length of time to determine definitely whether or not it will continue to be satisfactory. This method is well shown in the third section of the illustration.

Having made the first cut under light or heavy cover, a second cut is made on the same pillar or pillars. The third cut is then made on the adjoining pillars and thereafter the work is carried on in steps with the idea of keeping the retreating face across a number of pillars in a line of steps at about an angle of 45 deg. to the direction of the rooms. As soon as sufficient roof has been undermined so that it will break properly it is allowed to do so, relieving the pressure on the remaining supports.

In the past a great many mines have been abandoned as failures, properties have been condemned, and much coal has been lost because of the difficulty encountered in operating two closely adjacent beds of coal. Various systems have been tried and in a few cases have been successful.

The success of the system of mining just described, it is hoped, will lead other operators who are confronted with a similar problem to seek its solution. It is quite possible that an adaptation of this method may be found that will be as successful in their operations as it has been in those of the Connell Anthracite Mining Company.

---

## Coal and Coke Lead Advance in Wholesale Prices During April

**L**ARGE increases in the wholesale prices of many important commodities again took place during the month of April, according to information collected in representative markets by the U. S. Bureau of Labor Statistics. The bureau's weighted index number, which registered 253 in March, rose to 265 in April. This represents an advance of nearly 4½ per cent.

The most notable examples of price increases were found in the group of fuel and lighting materials, the increase in this group as a whole being 11 per cent. Bituminous coal and coke were responsible in large measure for the result shown. Food followed next, with an increase of 9½ per cent, due largely to the recent sharp advance in sugar and potatoes. In the group of lumber and building materials prices continued steeply upward with an increase of 5½ per cent over March. The groups of farm products and chemicals each showed an increase of over 3 per cent, while smaller increases were recorded for metals and metal products and for housefurnishing goods.

## Experimental Mine Has Foreign Visitors

**H**IKECHI, a mining engineer in the service of the H. Mitsubishi Mining Company of Tokio was a recent visitor at the experimental mine of the Bureau of Mines at Pittsburgh. Other foreign visitors were Kjell Lunde and Florin Wahl, of Christiania, Norway.

## Where Stripping Is Regarded as a Regular Adjunct to Underground Mining—II

This Concluding Article Has Reference to the Underground Mine at the Rowland Power Co.'s Plant—While Much Money Has Been Spent at That Three-Unit Operation, No Capital Has Been Needlessly Wasted in Building Permanent Structures for an Impermanent Industry

BY DONALD J. BAKER  
Pittsburgh, Pa.

**A**T NO. 6 mine of the Rowland-Power Consolidated Collieries Power Plant near Terre Haute, Ind., which takes out the coal which is too deeply covered to be redeemed by strip pits Nos. 3 and 9, the surface equipment is of such odd nature as may be required to meet the exactions of the trade for which the Illinois and Indiana fields have to compete, a trade that is periodically most discriminating. In this trade region the usual sizes of cleaned coal are generally in greater demand than others, but there are many times when certain less usual sizes are desired.

In the matter of tippie design the Indiana operators must pay careful attention to their trade, as competition is keen and the product must be well-nigh perfect. Furthermore they must compete with western Pennsylvania and West Virginia coals in the open market. The going is therefore not of the easiest.

The tippie at No. 6 mine, like those of the stripping operations, is constructed of wood. A two-compartment shaft measuring 19 ft. 6 in. x 12 ft. has been sunk to the coal, which at this point is 60 ft. from the surface. Mine cars are hoisted up this shaft on Prox self-dumping cages. During odd hours of operation this shaft is used also for lowering materials to the mine. No great amount of water was encountered in sinking, and as a result the shaft is not concrete-lined but curbed for a distance of 22 ft. from the top with 6 x 8-in. timbers. The balance of the distance is lined with 4 x 12-in. planking. Thus at minimum expense a good type of temporary construction is provided.

The site of the tippie was determined by the proximity of No. 9 strip pit. In order that the railroad

tracks which serve this operation might be used also for No. 6 mine a cut was made giving a suitable and easy grade between No. 9 mine and the tippie that prepares the stripped coal. This cut, which is shown in the illustration of No. 6 tippie, was made by the large Marion shovel on its way to its destined work at No. 9 pit.

The cars as they are brought up on the cage discharge their contents into a weigh basket. The coal

INTERIOR OF A ROOM IN NO. 6 MINE

Here the coal comes down in chunks so large that they must be broken up before they can be loaded and hauled to the surface. No need in this mine for a miner to bend his back when moving about the room.

GENERAL VIEW OF THE STRIPPING TIPPLE, UNLOADING TRACK AND LOADING YARDS

In this building the coal from the stripping operations is given careful preparation before it is loaded upon railroad cars for shipment to market. The coal comes and goes in standard railroad equipment.

after being weighed passes into a hopper that feeds a 10-ft. shaker screen. The screening equipment has a capacity of 5,000 tons in 8 hr. The tippel was designed by the Link-Belt Co., which also furnished the tippel equipment. The sizes usually loaded are 1½-in. egg, 4-in. lump and screenings. Arrangements have been made whereby, in the event of a breakdown, the tippel can still be operated, run-of-mine, however, then being the sole product. The screens are operated by engine.

Adjacent to the tippel and the wood head-frame is a building housing the boiler house and engine room. This building also is of wood construction. For the operation of the cages a 20 x 40-in. Crawford & McCrimmon hoist engine has been installed. This unit has a 6-ft. drum which winds a 1½-in. cable and is equipped with steam and foot brakes. The mine cars used are of 4-ton capacity.

The power-generating equipment, which is in the same room as the hoist, consists of one unit of 160 kw. capacity. This is a 250-volt direct-current generator of General Electric make and supplies energy for the operation of trolley-type locomotives. The needs of the mine foreshadow a larger installation and a second unit of 200 kw. capacity is now being installed. Both of these generators will be driven by Ball & Wood steam engines.

#### REMOVAL TO ANOTHER MINE IS KEPT IN MIND

In the adjacent boiler room a battery of two Brownell boilers has been erected. These deliver steam at a pressure of 110 lb. per square inch. At present additional installation is here being made to assure successful operation of the new direct-current generator. The new boilers are duplicates of the other two. All will be hand-fired with coal delivered to the boiler room

PROVING THAT "INDIANA LUMP" IS NO MISNOMER

Looking at the level ground it is easy to see that the topographical conditions are as favorable as the nature of the material to be stripped

by mine cars taken off the cages at the surface landing.

The equipment at this plant cannot be considered as being of a permanent nature. The life of the mines is not a long one, yet an installation has been sought that will continue to be highly efficient until all the coal has been removed. The Rowland-Power Consolidated Collieries Co. plans to install such equipment as will be suitable for erection later at some other point. It is already operating ten mines located in five different sections of the state. Staunton Mines is the largest but not by any means the only operation of the company.

The airshaft for this operation is situated about 300 ft. from the main hoisting shaft. Here a 16-ft. reversible Crawford & McCrimmon fan is direct connected to an 8 x 16-in. steam engine of the same manufacture. This unit also is housed in a wood structure. Here is situated the manway, which is a vertical stairway from the foot of the airshaft.

**MINERS' BATHHOUSE SIMPLE BUT SUFFICIENT**

The bathhouse—under the law every mine in Indiana must have one—is an exceedingly well-designed building, but had it been built of brick with concrete floors it would not have been in keeping with the other buildings of the plant. It is, in consequence, a simple frame structure. As can be noticed in the accompanying illustration, a bay abuts each long side of the

building. Nine shower heads have been installed in each bay, and water is delivered through the feed lines at a uniform temperature. This is accomplished by simply regulating the temperature in a mixer that feeds each shower supply line. Both bays are concreted, the floor being about a foot lower than that in the main building.

The advantages of this design are apparent. It has materially reduced the cost of building, for by this arrangement the main floor can be constructed of wood. The showers are adjacent to the benches and these are arranged crosswise to the main diameter of the building. A partition incloses each set of shower heads and there is no possibility of the water splashing out onto the floor proper. Coils of steam piping keep the building heated. These are situated in each bay but above a level that would permit accidental contact with them by the men while bathing. Hooks in the ceiling are provided for the clothes of 175 men.

One room of the building is used for the storage of first-aid and mine-rescue supplies and apparatus. Indiana does not have state insurance and as a result dressing stations have not enjoyed the attention that they receive in certain other localities where these buildings are quite frequently veritable hospitals.

First-aid and welfare work in this district is not as far advanced as in regions farther east. The absence of the compensation schedule is in a large degree

**GENERAL LAYOUT OF STRIP PITS NOS. 3 AND 9 AND UNDERGROUND MINE NO. 9**

This shows the underground and surface plan, the dotted lines clearly indicating the movements that the steam shovels have so far made in excavating the overburden

to blame for the slow progress of these activities. However, interest in these important phases of operation is spreading and it may not be long before Indiana operators appreciate to the same extent as their Eastern brethren the place psychology holds in the safe operation of a mine. Perhaps, too, the labor shortage has not been as keenly felt here as in other soft-coal districts.

This seems strange also, for throughout the Middle West the mining population is not such a cosmopolitan one as it is in the East, and the absence of foreigners is quite noticeable. It may be that the union is strong through the Central Field because community work in the Middle West is not on as firm a footing as elsewhere.

This will serve to describe the surface plant, but something should be said as to the underground workings. The floor of the coal underground is the same sandstone rock already mentioned, while the roof is fireclay. This formation is quite uniform throughout the tract. Despite the fact that the coal is not under a great amount of cover, especially in the acreage developed to date, the mine is dry. The general development scheme followed is the double-entry system with the rooms worked in panels.

#### WIDE PILLAR KEEPS WATER FROM STRIP PITS

Where the rooms approach the stripping operations they are driven to within 50 ft. of the open. This provides a pillar such as will amply protect the mine against the entrance of surface water from the strip pits. After the mine has been worked out this pillar will be removed by the steam shovels. The width of the pillar was made such as to be consistent with the amount of coal that can be removed by the small shovel in a simple bench. A smaller pillar might have been left but it was feared that if less were provided it might not be a sufficient barrier against the entrance of the surface water that collects in such abundance in the open pits.

The main haulageways were so laid out as to afford maximum ease of developing the tract. "Butt" and "face," two terms well known where Eastern coals are mined, do not hold great significance in Indiana. Here the coal to a considerable degree lacks cubical cleavage, breaking rather with a conchoidal fracture. As a result the direction of the rooms is regarded as of secondary importance to that of the main haulageways, since the coal is as easily cut and shot down in one plane as another, and no appreciably increased resistance to air currents is offered.

This type of coal allows the mine to be laid out with great regularity. The room entries are at right angles to the main haulageways and the rooms at right angles to the room entries. The dip of the coal is practically negligible and but little water is encountered. These conditions allow the rooms to be developed in both directions off the room entries. A scheme like this could not be followed in the Pittsburgh bed, where gas is encountered and more splits of air are needed to sustain the ventilation.

The panels between room entries are about twice as wide as in more eastern mines. The rooms are carried to a length of 200 ft. and have a width of from 20 to 25 ft. To provide a pillar 8 ft. of coal is left between rooms. Speed of production is the predominant consideration and maximum recovery suffers as a result. Sixty-five per cent recovery is considered

fair in this district, the room pillars being abandoned at the same time as the panels. When the rooms have been carried to their full length and have broken through on each other the whole panel is abandoned. By this time the roof has started to squeeze the small room pillars and drawing them would be extremely dangerous.

If maximum recovery is to be attained, fewer rooms should be allotted to a panel and a larger pillar left to sustain the roof until such a time as it can be withdrawn safely. Indiana, however, has plenty of coal at present and is not worrying much over the future.

### Planer Made from Material on Hand At Mine Blacksmith Shop

IN many instances it is unnecessary for the coal operator to spend good money for tools and equipment of a simple nature if those needing these appliances have the proper inventive ability. The men in the carpenter shop at the Silver Creek Colliery of the Philadelphia & Reading Coal & Iron Co. wanted a small planer. When the planer was not forthcoming, the men "got busy" and built their own.

The accompanying illustration shows the arrangement and some of the details of the machine thus evolved.

PLANER WITH DETAILS OF MANDREL

The mandrel is a piece of steel three inches square and was finished in the machine shop. The cutting blades are thirteen inches long and are cap-screwed to the mandrel. The boxes are ordinary pillow blocks such as may be found in the scrap heap or around the works of many mines. The pulley is turned up integral with the shaft.

In operation this planer is run at 3,200 r.p.m. Two men, one at either end of the table, pass the work across the machine. Although the entire outfit is improvised, the results obtained are entirely satisfactory.

### Secretary Payne Advises Coal Burners To Conserve Oil

BECAUSE of the acute oil situation, Secretary of the Interior Payne has requested the Navy Department and Shipping Board to provide coal-burning instead of oil-burning vessels, and the conversion of oil burners into coal burners.

# Burning Eastern Coals Successfully on a Conveyor-Feed Type of Stoker\*

Coking Coals Burn with Some Difficulty on Chain Grates—By Alternating Chain and Tuyere Elements and Making Ignition Temperatures High These Fuels Have Been Successfully Burned

BY LOYD R. STOWE  
St. Louis, Mo.

FOR the past two years the Laclede-Christy Clay Products Co. has been experimenting on a new forced-draft stoker for use with any of the many kinds of fuel found in this country. The boiler house of this company's Christy plant at 4600 South Kings-highway, St. Louis, has been, and still is being, used for experimental, testing and development work. Fig. 1 shows the test boiler and stoker.

The stoker used employs the conveyor method of feeding, i.e., it uses progressively moving chain-grate conveying elements to feed the coal through the furnace and to discharge the refuse to the ashpit.

At the outset it is necessary that we realize the full import of the term "conveyor feed." When the conveyor-feed grate is used the fuel is continually moved forward with the grate. The fuel bed, being supported on these moving grates, is positively conveyed from the stoker hopper, where fresh coal is introduced, to the discharge end, where the refuse is rejected to the ashpit.

## CONVEYOR-FEED STOKER DOES NOT DISTURB COAL

The feature of the conveyor feed that particularly commends its use is its handling of the fuel bed in a positive, definite fashion. By striking off the fuel evenly under a feed gate and then literally carrying it on through the furnace and over the point of ash discharge, this mechanism prevents in a large measure the evils of less positive feeding devices, namely, uneven fires, balled-up spots, and immovable clinker formations. So important are these advantages which the conveyor-feed provides and so thoroughly have the underfeeds demonstrated the great advantages of mechanical draft, that there are many builders who are now experimenting on and developing forms for forced-draft conveyor-feed stokers.

It is well known that there have been many failures in attempting to burn Eastern coal on chain grates. In fact, some have gone so far as to maintain that the undisturbed fuel bed of the conveyor feed is so poorly adapted to Eastern coal that it is useless to proceed further along these lines. Others have in all sincerity advised manufacturers to stay with the Western coals, where the conveyor feed rightfully belongs.

Now, one of the characteristics of the conveyor feed, it will be observed, is that the fuel bed is undisturbed

during the so-called coking period or, more properly speaking, the period of destructive distillation. It is largely because of this feature that I have elected to relate specifically what has been learned about Eastern coals with conveyor feed—coals high in heat value and low in ash and including those termed semi-bituminous

and caking. And it may be as well to state at this point what may be considered as the conclusion of this paper, namely: that the results of the experiments undertaken indicate that conveyor feeding can be used successfully with Eastern bituminous fuels.

For many years it has been quite clearly estab-

lished that nearly every requirement of a successful stoker is lacking when burning caking fuels on chain grates with natural draft. The coal cakes almost immediately upon entering the furnace, high rates of burning cannot be secured, the combustible content of the ash is high, the admission of the air is not properly graduated to the requirements of the various stages of combustion, and the expense incurred for the maintenance of links is excessive. This is indeed a complete indictment, and with the sole exception that the automatic features are always in evidence, it may be said that the performance of chain grates on Eastern bituminous coals violates every requirement of a successful stoker.

It is well known that the caking property of Eastern coal is the most serious obstacle in the way of the successful use of this fuel on chain grates. In endeavoring to burn Pocahontas and similar coals it is observed that tarry oils flow through the fuel bed as a result of the application of heat at moderate temperatures. It is further observed that the coal under the arch is caked or coalesced by these tarry oils, and forms a sticky blanket that prevents the entrance of air through the coal and hence checks combustion and heat generation under the arch.

## CAUSES OF COKE FORMATION ON STOKER GRATES

In attempting to remedy this situation the most natural thing to do is to employ mechanical means to break up the caked fuel bed, and this is the course which the inventor almost invariably takes. In fact, the idea is prevalent that "a mechanical agitation of the fuel bed, for the purpose of breaking up the coke, is necessary or advisable when burning Eastern coals." So many statements have appeared similar to the one just

Declaring that coals in which the resins are oxidized (that is, weathered) are little disposed to cake, an attempt is made to rapidly weather the caking coals on the grate by exposing them to currents of air under high temperature. Over twice as much air is delivered to the fire at the feeding end as is provided near the point of ash discharge.

\*Paper presented before the spring meeting of the American Society of Mechanical Engineers, St. Louis, Mo., May, 1920.

quoted that mechanical engineers have come to accept it as a basic fact. The results obtained at the experimental plant, however, have disproved this contention.

All bituminous coals have a small quantity of resin that flows when heat is applied. In certain varieties this resinous material has marked adhesive or binding properties and hence when it flows under the application of heat it agglomerates the coal particles into a primary mass. This mass is the starting point of coke formation and out of it true coke may be formed by further actions that take place in the fuel bed. It must be noted here that while *all* bituminous coals have this resinous content its adhesive or binding property is lacking in the Western or free-burning coals.

It appears that the higher the oxygen content of the coal, the less pronounced will be the primary caking tendency. Analyses on a moisture-and-ash-free basis show that Eastern coals contain less than half as much oxygen as Western coals of non-caking characteristics. Furthermore it is well known that Eastern coking coals lose their caking properties by weathering, and it has been determined that weathering causes coal to absorb oxygen and to increase in weight by an amount equal to the weight of oxygen absorbed.

#### COAL CAN BE WEATHERED ON STOKER GRATE

The absorption of oxygen can be accelerated and be made to take place in the boiler furnace by producing high coal temperatures and accompanying these with a plentiful supply of air. In other words, this feature of weathering can be artificially carried on in an exceedingly short time. The oxygen absorbed apparently destroys the adhesive qualities of the resinous material referred to above and hence the primary mass from which the coke structure is later formed is not produced.

Again, when heat is applied to *any* bituminous coal a chemical rearrangement or breaking down to certain of its compounds takes place. This action produces the greater part of what is termed "volatile matter," the remainder coming from the resinous content. The initial product of this chemical rearrangement is no doubt further decomposed into a fixed gas and a tarry residue. This tarry residue has not in itself the properties of a strong binder, but it does build up and materially strengthen any primary coke structure that may already be present by leaving a film of carbon behind when the final breaking down into this carbon and fixed gas has taken place.

#### HEAT AND AIR PREVENT CAKING TENDENCY

The foregoing theory would account for the non-caking performance of Eastern coals in the experimental work referred to in the present paper, and in its essentials seems to be the theory most commonly accepted by coal and coke analysts.

In the experiments with the new stoker the ignition temperatures are extremely high and at these temperatures considerable amounts of air are forced through the fuel bed, thus providing for the absorption by the coal of sufficient oxygen in a short time to destroy the initial caking tendency. Moreover, it is reasonable to suppose that these unusually high temperatures at the same time cause a quite different procedure during destructive distillation than that which obtains with lower heat intensities. That is, these extremely high and unusual temperatures completely decompose both the resinous excretion and the remaining or major part of the volatile-forming matter before the former can

set up an appreciable primary structure, and before the carbon of the latter can have time to impregnate any slight primary structure that may have formed.

The absence of coke formation changes completely the character of the fire under the arch and has almost as marked an influence on the rear half of the fuel bed. It is clear that if coke is not formed in the distillation zone the cemented coke lumps cannot be present in the final stages of combustion. The individual pieces of coal retain their identity exactly the same as when Illinois coal is used, with the result that the fuel bed has the soft, incandescent and fluffy appearance which every chain-grate fireman realizes means economy and high rates of burning. The absence of coke formation in the final stages of combustion will be mentioned again.

#### DESCRIPTION OF THE NEW ANTI-CAKING STOKER

A description of the final apparatus decided on is advisable at this point for the purpose of showing how the high initial temperatures are obtained. Fig. 2 is a view of the grate surface, its general inclination being 20 deg. The arrows indicated by *A* point to narrow chain-grate or conveying elements, which are about 4 in. wide and placed on 7-in. centers. In the intervening 3-in. spaces are placed stationary tuyères indicated by arrows at *B*. At the lower end of the grate surface the tuyères (*B*) terminate in short pivoted bars (*C*) which are made automatically to rise above, then drop below, the surface of the conveyor chains. This action takes place slowly. *E* is a feed grate, adjustable to give various thicknesses of fire exactly as on a chain grate. Partly overhanging the vibrating bars (*C*) is the bridge wall *F*, shown cut away in the center. An ignition arch is shown at *D*. This latter provision conforms to chain-grate practice except that with the greater incline of the grate the arch is farther away from the fire. Fig. 4 shows a cross section side elevation of the stoker and boiler.

Close study of chain-grate practice has revealed much in the art of building up high-ignition temperatures. A great expanse of bridge wall (see *A* in Fig. 4) extending from a point level with the arch down to or nearly down to the fuel bed is known to be of utmost value in directing heat onto the incoming fuel. The steep incline of the stoker in question permits this dimension (*A*) to be greatly extended over that possible with the ordinary chain grate. Moreover, it exposes the fuel bed more directly to the intense heat reflected from the bridge wall and the flame in front of it.

The form of arch also was taken from chain-grate practice, and its design and placement has, of course, contributed its part toward the building up of the high fuel-bed and ignition temperatures that play so important a part in preventing the caking and ultimate coking of the fuel.

#### MOST OF THE AIR ADMITTED ON BED BELOW ARCH

As to the admission of a generous supply of air (the second requirement for coke prevention), the greatest percentage of the total air supply is furnished under moderate pressure through that part of the fuel bed which is under the arch. This air supply, coupled with the high fuel-bed temperatures obtaining, quite effectively destroys any inherent caking tendency of the fuels thus far tested, and makes it possible to burn Eastern coal with a considerable degree of satisfaction.

In view of the troubles arising from the burning of

FIG. 1. TEST BOILER AND ANTI-CAKING STOKER

Boiler erected at St. Louis for the purpose of devising a conveyor-feed stoker that would burn successfully coals which cake as soon as they are heated and so admit air to the fuel bed at only a few points, thus causing imperfect ignition and a waste of fuel in the ashpit.

Eastern fuels with stokers that convey the fuel undisturbed into the furnace it is perhaps advisable to give a further description of the stoker in question. Table I presents the entire situation at a glance, and, farther on, each of the items therein is briefly considered.

Rather exhaustive surveys of the gas composition in various parts of the furnace were made frequently during the development work. These surveys showed that the fuel in the zone of destructive distillation yields far greater quantities of combustible particles than does that well-spent portion of the fuel bed near the bridge wall. It follows, then, that air distribution must be regulated to supply large quantities of air to the coal during the early stages of combustion and limited quantities as the fuel nears the place of ash discharge.

#### REFUSE HAS LOW PERCENTAGE OF COMBUSTIBLE

It will be generally admitted that in order to burn completely all the fuel with a minimum of air it is of prime importance to provide each particle of combustible just as it rises from the fuel bed with its own quota of oxygen-giving air. The tuyere construction is well suited to such a requirement and lends itself admirably to these experiments. The tuyeres are cast in interchangeable sections containing varying percentages of air openings. This feature permits the making of any desired gradation in air spaces between the two extremes noted in Table II.

It is important at this point to recognize that the wind-box pressure is uniform under the entire grate. This provides high draft intensity and high air-jet velocity for all parts of the fuel bed.

The reduction of the combustible in the refuse to a satisfactory figure was brought about by taking advantage of the four following factors that have a vital influence on the character of the refuse: (1) Ready ignition; (2) a free-burning fuel bed; (3) thickened fuel bed near the discharge end of the stoker; (4) high draft intensity through the nearly-spent fuel.

Reference has already been made to the high ignition temperatures. On the conveyor-feed type of stoker the coal burns from the top downward during the early stages, and from the bottom upward during the remainder of its travel. The higher the ignition temperature, the quicker this reversal is established. An early burning from the bottom upward is recognized even in chain-grate practice, as being most effective in providing for the attainment of a low-combustible content in the refuse.

#### AIR FILTERS EVENLY THROUGH FUEL BED

In a caked fuel bed of Eastern coal the air breaks through only at the fissures or cracks. Naturally the burning starts only at these fissures, and as it continues holes are formed in the fuel bed. As the holes increase in size the rate of burning decreases, due not only to the cooling effect of large columns of cold air but also to the lessening intensity of draft occasioned by the increase in the effective air openings. This action results in a fuel bed characterized in the final stages by isolated lumps of coke surrounded by patches of bare grate. To prevent exceedingly low carbon dioxide content in the furnace gases the operator must run these bare patches out of the furnace and consequently dump the intervening or accompanying coke lumps into the ashpit.

With coking prevented and with each individual par-

FIG. 2. DETAILS OF THE CONVEYING ELEMENTS

These elements are marked A in Fig. 3. They are about 4 in. wide and are set at 7 in. centers, the intervening spaces being taken up by stationary tuyeres. Most of the air comes through the tuyeres and but little through the conveying mechanism.

**Fig. 3. Grate Surface and Furnace**

As seen from the broken bridge wall in the rear, where the grate, in rolling downward, precipitates the ashes into the ashpit. On the right three deadplates are raised so as to hold back the nearly spent coal on the fire. Thus a deep bed is secured and the ash is rendered relatively free of combustible values.

title of coal preserving its identity, the air filters upward evenly throughout every part of the fuel bed. Freed from localized burning, the fire now appears soft, intense and highly luminous.

**TABLE I. PRESENT-DAY REQUIREMENTS OF AN AUTOMATIC STOKER COMPARED WITH THE PERFORMANCE OF CHAIN-GRATE AND CONVEYOR-FEED STOKERS, EACH USING EASTERN COALS**

Requirements of the Present-Day Stoker	Results Obtained with Eastern Coals	
	With Chain Grates	With Conveyor-Feed Stoker Described
It should completely burn all combustible that arises from the grate, and perform this task under the great handicap of using no more air than is required.	Thin fires spotted with upstanding coke result in excess of air and low carbon dioxide due to the fact that the air supply is not graduated down to a minimum at the rear of the stoker and to influences attending the coking of the fuel bed.	Graduation of air supply and thickening of fire near point of ash discharge and the prevention of coke assure a consistent 10 to 12 per cent carbon dioxide content with positive assurance of an intimate mixture of air with combustible gas.
It should bring about low combustible in the ash.	Combustible in the ash from 30 to 50 per cent.	Combustible in the ash from 16 to 24 per cent.
It should burn coal at high rates of combustion—not only to obtain high capacities but to widen the range of economical rates of burning as well, in order that great flexibility may be assured.	Rates of burning from 25 to 35 lb. of coal per sq. ft. of grate surface per hour.	Rates of burning up to 60 lb. of coal per sq. ft. of grate surface per hour.
It should be as nearly automatic in operation as possible.	Successful in the matter of automatic operation.	Successful in the matter of automatic operation.
It should not entail unreasonable expense in the upkeep of the grate surface or of the furnace brickwork.	No unusual maintenance cost for furnace brickwork, but a very high one for grate links.	Use of mechanical draft imposes a more severe condition for furnace brickwork, requiring a higher grade of refractories, but maintenance of ironwork is not excessive—in fact, may be considered quite satisfactory.

**TABLE II. AIR-SPACE DISTRIBUTION ADOPTED FOR CONVEYOR-FEED STOKER**

Air Space in Each Element at Feeding End		Air Space in Each Element at Discharge End	
	Per Cent		Per Cent
Conveying elements	8.0	Conveying elements	8.0
Tuyere elements	22.0	Tuyere elements	2.0
8 per cent of 60 per cent	= 4.8	8 per cent of 60 per cent	= 4.8
22 per cent of 40 per cent	= 8.8	22 per cent of 40 per cent	= 0.8
Total air space	= 13.6	Total air space	= 5.6
Conveyor elements, about 60 per cent of total grate surface.		Tuyere elements, about 40 per cent of total grate surface.	

The thickened fuel bed near the discharge end is brought about by the retarding mechanism described. (See Fig. 4.) When elevated the short pivoted bars

**FIG. 4. SECTIONAL ELEVATION OF STOKER**

Boiler has 2,500 sq. ft. of heating surface and the stoker 40 sq. ft. of grate surface, a ratio of 62½ to 1. Note the elevation (A) of the top of the bridge wall above the grate, a height that is secured by the inclination of the stoker bed.

(C) raise the nearly spent fuel above the chains, thus holding it back, and when depressed permit the conveyor elements to carry the ash out of the furnace. The relative duration of these two influences can be controlled by the operator and the fuel bed near the discharge end of the furnace can be held back and thickened to any desired depth.

The high-draft intensity in connection with this thicker fuel bed has already been mentioned under the paragraph on air supply. Full wind-box pressure at this part of the grate forces high-velocity air jets into the thickened bed and hence is particularly advantageous in burning out the remaining particles of combustible.

#### HIGH RATES OF BURNING ARE SECURED

From the foregoing references to mechanical draft it is quite apparent that high rates of burning are attainable with this new type of stoker. The replacement of the typical plastic fuel bed with the free-burning, intensely-active bed obtained with the new equipment materially assists in securing higher rates of coal consumption. A high carbon-dioxide content results quite naturally from (a) the proper air distribution described; (b) the thicker fuel bed, particularly at the discharge end; (c) the higher fuel-bed temperatures that cause increased chemical activity; and (d) the impinging jet action on the fuel particles produced by small air spaces and forced draft.

In the matter of automatic operation it is only necessary to recall the basic principle of the conveyor-feed stoker—a positive feed from coal hopper to ashpit. The only action that interferes with this automatic and continuous performance and requires more than a minimum of attention from the operator is the formation of clinker on the side walls. This clinker accumulation is no more serious than with chain grates, but experiments are under way to still further minimize the evil.

Eastern coals require less side-wall slicing than do those from the Middle West, probably because of the lower ash content and the higher fusing point of the ash of the Eastern coals. Such coals likewise have higher heat value and hence greater firing stability than Illinois coals. Because of these two advantages, the firemen of the experimental plant prefer Eastern coals to those from the Central West when firing on the new stoker.

#### EVEN FUEL BED AND OPEN DAMPER SAVE REPAIRS

The thin uneven fuel bed at the discharge end of a chain grate combined with the low ash of Eastern coal exposes the grates to the heat of the furnace. Moreover, with caking coals and chain grates the procedure of partly closing the damper to raise the carbon dioxide content of the gases is too often resorted to, and such a practice invariably results in overheated grate links.

The stoker herein described, by employing a deeper fuel bed and a thick layer of refuse near the bridge wall, effectively protects the grate from the heat of the furnace. In addition, full advantage has been taken of the cooling action of the incoming air. The small air spaces and the employment of mechanical draft produce high air velocities, and this makes for cool links. An excellent idea of the very different character of the new link for Eastern coal and forced draft is obtained from Fig. 3.

High rates of burning and high furnace temperatures of course subject the furnace brickwork to severe service. However, the wind-box pressures are low (less

than 2-in. water column), and this combined with the large number of uniformly distributed miniature air openings causes the impinging flame or blow-pipe action to disappear quite near the surface of the fuel bed, thus minimizing to some degree the brickwork deterioration.

The problem of more severe furnace conditions has thus far been met by employing refractories of a higher grade. The side and bridge walls have been made with standard 9-in. shapes and I am advised that the higher refractoriness of the brick used is in part due to its higher percentage of alumina and its low content of fluxes. Regarding the ignition arch, both the process and the mixture are new in stoker work. The material is highly refractory and porous and its performance under the harder usage bids fair to rival the ordinary arch maintenance in chain grates.

### Priority Regulation of Coal Distribution Sought in Indiana

**F**OLLOWING a conference in May of the Indiana Public Service Commission, coal operators and railroad officials, members of the commission have received word from Washington that Indiana will receive some coal cars. Despite this assurance, little hope of immediate relief is expected.

Important developments at the conference were:

Disclosure that coal cars have not been ordered east from Indiana to take care of Lake port shipments, as reported.

Diversion of 39,000 coal cars to the East from Western territory will not materially relieve the situation in Indiana.

The Interstate Commerce Commission will take immediate steps to stop the use of coal cars for other products.

From two-thirds to three-fourths of all commercial coal now produced in Indiana is being commandeered by the railroads for their own use. Utilities and industries get the rest of the decreased production.

The railroad men promised to make every effort to keep utilities and state institutions provided with coal by giving them railroad coal in urgent cases.

The railroad representatives advised the commission to wait a week or two before requesting the Interstate Commerce Commission to re-establish wartime priority regulations and also declared that any attempt on the part of the state to establish priority regulations would prove futile.

During the conference John W. McCardle, vice-chairman of the commission, received a telegram from the Interstate Commerce Commission in reply to the suggestion that the practice of using coal cars for commodities normally shipped in box cars be stopped. The telegram read as follows:

"Action suggested by you concerning alleged misuse of coal cars being taken. Terminal committees at important terminal points are being organized. Among other things they will take action to prevent the misuse of cars."

The point was made by Carl J. Fletcher, secretary of the Knox County Coal Operators' Association, that more than a normal supply of coal is being shipped out of the state. Ordinarily, 6 per cent would represent these foreign shipments, he said, whereas now about 20 per cent, including railroad coal, is going out of the state.

He said this results from the fact that railroads operating outside the state are induced to send cars to Indiana to get coal. Railroad officials declared the operators were making more demands for cars this year than at any previous year at this particular season.

#### COAL PRIORITY TO HELP SITUATION

Following the conference the commission decided that a coal priority order alone would help the situation. On May 26 the following telegram was sent to the Interstate Commerce Commission:

"Conference of representatives of coal carrying roads and representatives of coal operators held Monday. Conference developed three-fourths of coal mined is taken by railroads, leaving one-fourth for all other purposes, which does not meet demands and no opportunity for accumulation on account of winter.

"Indiana conditions large on account of Chicago congestion. It developed in two instances that 90 per cent of coal equipment is out of state. This commission has directed its railroad inspectors to investigate coal cars loaded, destination and all information so as to expedite movement.

"Commission recommends priority order. After railroads, coal should be given to state institutions and public utilities. Coal of state institutions exhausted and several utilities closed. Will co-operate with nearest interstate committee for movement to and from mines."

### Erie Road Ordered to Repay Excessive Freight Charged on Coal

ON MAY 3 the Interstate Commerce Commission ruled in favor of Henry E. Meeker, coal dealer, in his complaint against the Erie Railroad. The complainant charged that the road's freight rates on anthracite coal, pea size and smaller, in carloads, from Wayne washery, Clemo, Pa., to Undercliff, N. J., were unreasonable, discriminatory and prejudicial, and asked reparation.

The commission decided that the rates charged on

pea coal were unreasonable, but disallowed the claims on sizes smaller than pea. The railroad company was ordered to make reparation, with interest.

### Shafts Replace Trace Chains in Kingston Coal Co. Mines

AT THE mines of the Kingston Coal Co., Kingston, Pa., a large number of mules are employed underground. Instead of hitching them to the mine cars by the ordinary trace chain this company uses a pair of shafts which make a rigid connection between the mule and the car. The type of shaft thus employed can readily be seen in the accompanying illustration.

A number of advantages result from the use of shafts instead of the old type of hitching and the Kingston Coal Co. finds shafts best meet the needs of its haulage system. With the former type constant danger existed that the car, when coming down-grade, would run into the mule's heels and either cut his legs or break them if he could not get out of the way quickly enough. There are usually many places in a mine where there is insufficient room for mules to get out of the way of cars.

With shafts it is possible to use a breeching on the mule, and as a result he has a direct control over the speed of a car by holding back in the breeching. Furthermore with this device it is practically impossible for a mine car to run over a mule since there is a fixed distance maintained between the car and the mule because of the rigid shafts. More efficient effort can be exerted on the draw bar as the shaft can be so designed that the pull is horizontal rather than at an incline, as is the case with the old-fashioned type of hitching.

The Nova Scotia Steel & Coal Co., in its operations at Sydney Mines, N. S., employs a somewhat similar device. This latter firm, however, uses ponies instead of mules. The advantage the Canadian company seeks to attain is precisely that sought by the Kingston Coal Co., namely, the interposing of a hitching of fixed length between the animal and the load to which it is hitched.

#### Mine Mule Working Between a Pair of Shafts

This type of hitching enables the mule to hold back on cars on down-grades. It also gives the animal a better purchase upon the car he draws.

# Leadership and Education the Cures for Our Industrial Ills\*

Employer of Workingmen Should Make Himself Their Actual Leader—  
Failure To Do So Makes Possible the Demagogue and Self-Seeker—Mis-  
representative Government Due to Neglect of Working Constituency

BY DR. CHARLES E. EATON

**W**HILE you are at work I do not want to talk to you in language that you cannot understand, but I will talk to you today simply as a brother American citizen, and I want to talk about the human element in your business and in all business that you are associated with.

The war was supposed to have been fought to make the world safe for democracy. Now that peace has come we find that we are in greater straits than we were even during the war. We have a democracy, but what we are going to do with it, or what it is going to do with us, remains to be seen. But two things are absolutely fixed—you cannot have a democratic system of life, including government, unless you have an intelligent and moral peace. Public opinion is the last court of appeal, and public opinion will go wrong unless it is created by men who know how to think and who have moral restraints to govern and guide their thinking. For that reason the human element in all our life is the chief element, and that is exactly what we have turned down. We have neglected the one element that in the last analysis is responsible for success in every calling in which we occupy our energies.

## COUNTRY IGNORANT OF INDUSTRIAL MATTERS

I suppose that no country in the world is more ignorant than our country at the present time of the great industrial processes that men are engaged in who are in business at all. Take, for instance, the railroads. For thirty years before the war every government in this country spent all its spare time hounding the railroads, passing restrictive legislation, confiscating property, and making it practically impossible for the railroads to equip themselves for the future, and that movement was backed by public opinion; otherwise it could not have been put across. When the Government took over the railroads the first thing it did, with one stroke of its pen, was to advocate the repudiation of the legislation of thirty years. In other words, the taking over of the railroads by our Government was a monument to the colossal hypocrisy and stupidity of the American people for a whole generation.

Now the one supreme thing that we are up against in industry is to get production. As to my interest in that, perhaps I had better tell you where I come in on it.

We went into the war as we go into everything—hindsight first. We announced that we were going to lick the Germans, three thousand miles across the sea, and we did not have enough ships to carry coal across New York Harbor. We had no development in the shipbuilding industry. In 1917 practically every ship-

building yard in this country was broke; many went out of business and those that remained were those that owed so much money that the bankers could not afford to bust them.

With that as a start we proceeded to organize the greatest shipbuilding campaign in the history of the civilized world. We got our shipyards and then got our men together, and then the men would not work. So the Government immediately solved the labor problem—a practice which it has followed up to this time—by paying the men three times as much as their work was worth; in other words, where a man used to get \$25 for a week's work they found that they could get that much for two days' work and quit four days in the week. So the average work of the shipyards in this country at that time was about two days per man per week, and they did not work desperately hard at that. It got to be such a serious condition that a great meeting was called in New York of ship architects, marine engineers and shipbuilding associations on the different coasts. They asked me to come over and speak.

My theory was that the trouble with these men was one that you could not reach with money. I have spent my life dealing with what is inside of a man rather than what is outside. I have a firm faith in human nature. It is very seldom you can find the man who is normal at all who will not be amenable to reason if he is shown. Sometimes you have to show him in polysyllabic language and sometimes in words of one syllable. Sometimes you have to hit him once or twice gently to make him see the point. But if you go to work and show him reason the ordinary man will respond.

## PLAIN TRUTH-TELLING GETS RESULTS

So I went to this meeting and told these men that if they would put in the shipyards somebody who had no axe to grind, no favors to ask and no interest to defend, but would simply represent Uncle Sam and tell these men the truth, I believed they would respond. Immediately the boss of the situation got up and commandeered me and I had my first and last government job. I reported to him the next morning at nine o'clock and was in for two years.

Before the war was ended I had about seven thousand industrial plants and two hundred shipyards under my care. I never used a single instrument except man-to-man talk—a moral intellectual appeal. I used to stand up and talk to those men in language that would forever put me out of the Church, but I believe they needed it. I was telling the truth.

Now today we confront terrific conditions and I want to place your business against this background which moves and molds all of us. In the first place, we come to a time of frightful nervous distraction as a result of

\*From an address by the editor of *Leslie's Weekly* before the third annual convention of the National Coal Association, Atlantic City, May 27, 1920.

war. Everybody is irritated; everybody is critical. Then we have an enormous suspicion everywhere. We have a cynicism that is intolerable.

Your welfare is the welfare of the nation, but nobody believes that. The whole nation looks upon you as a champion assortment of thieves and sharks. The whole nation, on the other hand, looks upon the railroads as another assortment of thieves and sharks. Our chief industry is calling each other thieves and sharks and rogues. The fact is we are not. Nobody is. There are infinitely more honest people in this country than dishonest people, and in your business, as in every other business, you cannot succeed in it unless you are men of character and intelligence. We all know that and that it is only the mountebanks and demagogues that are stirring up strife.

#### DIVERSITY OF RACES COMPLICATES PROBLEMS

In industry in this country we have a tremendous racial diversity that makes it difficult to allay the suspicion and hatred engendered by false teaching. We have to deal with that. Do you realize that 58 per cent of the workers in our American industry were born in other countries, and in many industries as high as 85 per cent? As high as 85 per cent of increase in this country today is either foreign-born or children of foreign-born parents, and they are segregated into racial groups because of our indifference and stupidity to their presence in our midst in the past generation, and in addition to that they take their fundamental ideas from the countries from which they have come. They take their leadership from their own races across the seas. They have their own leadership and their own thought circles and their own motives and impulses, and many of them are as far removed from America today as if they had never left the land of their birth. You have to deal with them in your business and it complicates your task enormously.

Then there is a vast misunderstanding between the employer and the employee, representing interests and groups, and that has been accentuated and developed by all sorts of teaching and leadership until it has become now a national calamity.

We have got to remember that the human element is more important than the financial or economic. If you do not handle the human element from now on in America, not matter how perfect your management may be, you will not be able to make a success. Now what I have to say to you as the nub of my address today is this: I have no theory to exploit. I do not believe in any method or system that is invariable or will cover all cases, but there are two ideas that I desire to impress upon you—one is leadership and the other is education. Those are the two things that we must have in American industry in all branches if we are to pass out of this age of chaos into a time of success.

#### LEADERSHIP OPPORTUNITIES ARE NEGLECTED

First, leadership. My proposition is that the man who employs labor is a normal leader. That is the next great revolution that is going to come in American industry. The man who employs the workingman is the normal leader of the workingman. Now you, I suppose, in common with all other industrial operators, have neglected that side of your work. How many of you men here are leaders of the men in your employ? I judge very few. You have got to beat the professional deliverer to it and become your own deliverer.

If you do not lead your men someone else will, because they are divided into two classes, the led and the leader. They are both here. You have to accept it as a fact, and if you do not take the responsibility for leading your own men, the same as you handle your own machinery and your own financing, then they will go elsewhere for outside leadership, and when that leader arrives on the scene he can only retain his position by carrying on a campaign to deliver your working people from you, their oppressor, and every advance he makes he makes by depreciating your standing and helping his, as their deliverer, and the moment he gets out of that he gets out of a job.

The average workingman would rather be led by a big boss than by anybody else. The average workingman looks upon his employer a little like a boy looks upon his father, or a political follower looks at his leader, or a church member looks upon his pastor, or a student upon his teacher.

We have got to have leadership. We have got to have leadership not only of you employers in business, but have got to find time some way to come out into the public and help lead the masses of men. We cannot any longer leave the business in the hands of the demagogue and self-seeker and the ignoramus.

#### OURSELVES TO BLAME FOR POOR GOVERNMENT

We talk about the low order of our representatives in Washington. If they are a low order of being they are that because they represent another low order of being, namely, you and me; and if we want better men in Washington we cannot ask George to do it; we have got to do it ourselves. But you say, "I could not be elected." No, you could not because you neglect a constituency that normally would elect you, but if you go to it with the same acumen and same honor and same intelligence and same determination with which you go to other tasks, in a short time you will have educated a constituency that will believe in you, and if they believe in you as they believe in other fellows they will elect you. Do not be discouraged, because after you see the kind of men who can get away with it in this country it seems to me that almost anybody could do it if he tried.

Now as to the matter of education. To begin with, the education is in your work with your people, and you as the chief educator. And in what will you educate these men? First, you have got to educate the workingman of today about your business. I do not know what your average employee thinks about that, but I would be willing to wager that he thinks you are just rolling in wealth.

Now you cannot meet a bad idea by calling it names. The only way to get rid of a bad idea is to put a good idea in its place. The only way to drive out a small idea is to put a big idea in its place, and that is a process of education, and of course that process will have to be determined by the individuals themselves in each individual plant in each individual district. These men have to know about your business—what it will cost you, what you are up against. Actually, gentlemen, the trouble is that they do not think of you as anything except a lot of parasites playing golf eight hours a day and trying to recover from your exercise with rest.

That is not an extravagant statement of the case. They think of every big man in business as just drifting along a stream of golden prosperity while the rest of

them are starving and toiling for a mere pittance. You have got to educate the workers of your own industry and take them out from that and educate them upon the larger forces that are flowing around you.

Take two things—and I will just use these two as illustrations—take, for instance, the need of production, which is so appalling that I cannot understand how anybody can sleep over it; and yet the average appeal to a workingman to produce will be met with this answer, and met with it time and time again, "Why should I? Why should I work harder to make more money for the boss?" That is the answer one gets, and the argument with which that is met is usually feeble. Let me ask you if this argument would go across? I have spoken with hundreds of workers with the big boss beside me and the men from the machines around me and I have gotten the same result.

If you could see the production of the world's food and goods placed in a great heap, it is an absolute fact, easy of demonstration, that that complete mass of the food and goods of the world is never more than two years in advance of the world's needs—never in normal times. In spite of all of our machinery and of all our productive capacity, the world has never been more than two years ahead of its consumption in the mass of food and goods created by industry.

#### CUMULATIVE CAUSES FOR PRICE INCREASES

Now in the last five years the chief business of the civilized world was to destroy food and goods and men, with the result that the world's stock of food and goods is lower today in proportion to the world's population than it has been in one hundred years. The inflation of the currency has increased prices and profiteering has increased prices, whether done by the employer, the employee, or both. But after you have made due allowance for all these secondary causes of high prices, and consequently the high cost of living, the fact remains things are dear because they are scarce and they never will be cheap again and cannot be cheap until by work and thrift we increase the world's stock of goods to a larger relationship to the needs of the people. That is self-evident.

Now, when you go to the workingman and tell him that he must work and his employer must work and everybody must work and save until we get this heap of food and goods bigger than it is today, and for the reasons which I have named, he may make some response.

We have got in some way to co-ordinate the masses of the city with the production of the farms and get some help out on the farms or we never can bring down the high cost of living, Mr. Gompers to the contrary notwithstanding. He is a great and wise man, I have no doubt, but he says the way to bring down the cost of living is to put the profiteer in jail and increase the wages of the workers. Well, you can go on to some certain extent in those interesting directions, but arithmetic is still on the throne and you cannot get more meat out of an egg than there is in it. It cannot be done, gentlemen, and unless you and I, and your wife and my wife and your children and my children go to work and produce, or produce by abstaining from the consumption of things that are not necessary until we get in a normal condition again, we are going to have to have a condition in this nation in a way worse than anything we had to face during the war.

Something has gone out of the American people.

They have quit work. Men tell me in the factories that their production has been reduced 50 per cent as compared with before the war, while wages have increased 200 to 300 per cent in many cases.

The day is coming, soon when the man that can work and won't work cannot depend on some labor union to get him a big wage for the two or three days he does work. He will have to work or starve. You cannot bring that to your man by sprinkling him with rose-water or using a powder puff on him. You have got to tell him the truth and you have got to enlist with you the great conservative mass of workingmen in this country. I know the American workingman thoroughly. I worked myself with a pick and shovel for years and can do it again, and would be glad to do it if I had to.

#### AVERAGE WORKINGMAN LACKS COURAGE TO BE FREE

I believe every man ought to work, and it is God's blessing and not God's curse to mankind to work with his hands. And 90 per cent, certainly 75 per cent, of the average workingmen of this country normally are conservative, sane human beings. The trouble is that they are terrorized. They don't dare to do anything else than go with the crowd. They are just like you and me. We are just the same. We are moral cowards. We have got to have the backbone to say, "I won't be the slave to a labor union. I will starve first. I won't be a slave to a capitalist. I will starve first. I won't be a slave to a despotic government or anyone else. I am going to be free." And the only way to be free is to be able to make your own living at any cost of sweat and sacrifice.

The average high-class foreigner, if you could get him away from the maggots that have been put into his system by the breeders of maggots, you would find, is a fine fellow. He wants his children to have a better chance than he had; he wants a home; wants to be a human being, and if you act as his champion and say, "Yes, that is an American desire, but you will have to pay the American price of hard work and thrift, and if you will I will guide you and help you," you will find that he will follow.

As for the nationalization of the mines, a year ago, when I was in England, that was the great big thing with the laboring people, but they have found since that it was an empty dream; the British Government and the British people said, "No, you shall not nationalize the mines." And they will not do it, nor will they have nationalization of mines in this country, because it cannot be done and at the same time have any coal. We would be infinitely worse off than now, and we have a preference for coal.

#### STATE SOCIALISM NOW A DEAD ISSUE

Now, you hear an enormous argument about socialism, and with this I am to close. We have all gotten rid of this subject. Hardly anybody in this country but realizes that state socialism is absolutely dead. What is socialism? Socialism was an invention or discovery of a very brilliant German Jew, Karl Marx, eighty years ago. The thing he discovered was that all of the economic ills could be traced to a variety of economic causes. He gathered the whole thing into the realm of materialism and said that if you could get rid of the economic causes you would usher in the millennium. In tracing up the causes he discovered a trinity of evils—private capital, wages for work and corporate investment. He felt that if he could get rid of those three

he would solve the problem. So he looked around for an instrument big enough to uproot this stump, and the only instrument he found big enough to do the job was the political state government, the oldest institution of civilization except the home.

#### GOVERNMENT CONTROL OF INDUSTRIES A FAILURE

For sixty years the argument went back and forth and up into the skies as to whether that could be done or not, but they never had a chance to try it out on what you are accustomed to call a commercial scale until the war. As soon as the war started they discovered that it was a struggle between industries and peoples instead of between governments, and in those free countries the governments had to introduce dictatorships and in this country we adopted the fundamental principles of state socialism. Our Government, for instance, took over the entire maritime industry of this country, and is still fooling with it. The Government took over the railroads and operated them and is still operating on them now. The Government took over the telegraph and the telephone, and now look at the poor things!

Our Government fixed prices of commodities, fixed wages of labor, fixed the profit on capital, and then, by a process of economic revolution, it took, through the rates of income tax, immense steam shovels of income and redistributed it among the poor by excessive wages for work that was not done.

What was the result? The result is that two years later we may have had some lingering tendencies to state socialism, but after two years of actual trial, with an absolute dictatorship at Washington, which could make it go if anything could, we are cured of socialism, and the socialists themselves, intelligent and intellectual men like John Spargo, realize that that is the situation. Spargo has recently written a book in which he tells us state-controlled industries are worse than private capital, because they are more expensive and tend to create a formidable bureaucracy.

#### RUSSIA'S EXPERIENCES IN GOVERNMENT

Russia is supposed to be the kingdom of God on earth in some circles. Russia had an economic revolution set up by Kerensky, a socialist. Kerensky was not equal to the task and out of that revolution there came two very keen but unscrupulous men, Lenine and Trotzky. Lenine is one of the ablest men in the world. He was able to see what we did not see—that state socialism was an absolute failure, that it could not be administered except by a perpetual dictatorship in the government, and no dictatorship could be successful in communities that had had a thousand years of free government, and when he saw that we were going to scrap state socialism as were also Italy, Belgium and France, he decided he would start something else, and he had the courage to take the political state of Russia and tear it up by the roots and scrap it.

Russia is the only great state in the world that has no political state government. He substituted for it the soviet. It begins in the individual factories by a group of the workers. They get together and take the owner by the scruff of his neck and kick him out and they organize an economic organization, and they join with their fellows in other industries into a town soviet, which heads up in a state soviet, which in turn heads up into a national soviet, and the whole thing rounds up in twelve commissariats in Moscow. Russia has

been an economic government since Trotzky took charge. It is failing there like it is failing here, because it is contrary to the laws of human nature. After a thousand years of sacrifice, of experiment and struggle, in which we tried to learn how to govern ourselves, you cannot expect the English-speaking world, at least, to turn away from the results of those thousand years of effort and take some wild and theoretic scheme which destroys the very foundation of things, and so I say socialism is a dead one as a practical proposition. Of course we will hear from it, but it will not work and the strongest men in that movement know that it cannot work.

These are stormy times, and are going to be stormy, but if we will make our economic institutions at the same time agencies of education and educate by fearless and able thinking and get to the bottom of every proposition that is haunting the minds of the masses of men, workingmen will not go back to their situation in the world before the war. I do not want to see them go back. I want to see a wider distribution of wealth. I want to see every home in the land where a man works and the family works, with musical instruments and education for the children and a good nurse if they are sick, and a little laid by for a rainy day. The country that has that kind of distribution of wealth is going to weather the storm, and those countries that fail in that respect must go down.

#### EDUCATION NEEDED IN PLACE OF THEORIZING

But you will not reach that point unless people stop their theorizing and nonsense and rebellion and go to work, and they will not go to work until they are educated either by a touch of starvation or educated by your leadership, and so, gentlemen, gird yourself for the fight; gird yourselves for a great fight. Do not be afraid. You can put your money on this country without fear of losing it because we will not lose in the long run, but we have to have men like you, good citizens like you, as educators to help the rest of us, even though you lose money in the undertaking.

It will be a good thing if you do not lose yourselves and the country and the consciousness that you are free men regardless of what comes against you, and therefore go out to your task and gird yourselves for the struggle as brave and free Americans. Believe in yourselves and in our resources, our resources of brain and character; believe in your God and make it a sacrifice and worship; believe in your fellow man, in his reason and honor; believe in your country, in its greatness and glory and strike what you think is wrong a fair and square blow in the front and stand up for what you think is right. Although it will be a stormy day, at the sunset there will be a time of peace.

#### Seek Revocation of P. R. R. Prepayment Requirement on Coal

THE Tidewater Coal Exchange, Inc., and wholesale coal trade associations are seeking revocation of the requirement of the Pennsylvania R. R. for prepayment of freight on coal shipped to tidewater. This is the only road requiring payment of freight in advance, other tidewater carrying roads collecting from the dumper. As cars reaching tidewater lose their identity, being handled on a tonnage basis, it results in bills being rendered on cars forwarded for other shippers, causing in many cases over-payments by shippers.

# Rise in Coal Prices Is Attributed to Government Regulation\*

Federal Interference with the Industry, This Authority Asserts, Brought About Such Uncertainty of Supply That Uniformly High Prices Were Inevitable — Cost Figures Gathered to Justify Extravagant Prices, He Thinks, Rather Than to Reveal Where Cost Could Be Cut

BY GEORGE H. CUSHING

THE U. S. Geological Survey has no record of any measurable production of coal in the United States prior to 1821, although some coal was produced in 1807 or even earlier. In 1821 our output was less than 1,500 tons. In the ninety-three years between 1821 and 1914 the annual increase in production was 5,630,000 tons. The annual production did not equal this annual increase until 1848.

For the fifty years ending in 1914 the annual increase in production was 9,799,507 tons. The annual production did not equal the annual rate of increase for this fifty years until 1852. For the twenty-five years ending in 1919 the annual rate of increase was 18,700,000 tons. The total production of the nation did not equal this annual rate of increase until 1863.

## SURPLUS OF SUPPLY MADE PROFITS UNUSUAL

There is no record of consumption to match these production figures. The folklore of the trade is that from 1807 until the fall of 1916 the current production of coal was steadily in excess of current consumption. That is, production was almost invariably in anticipation of need rather than being timed nicely to meet demand. In consequence there was as a rule a comfortable visible supply of coal above ground. Indeed, this visible supply has as a rule been so large that only in rare instances did the sales prices on coal rise to the level where more than a third of the producing companies were making money. The only recorded period when prices were generally profitable for as much as nine months in any one year was during and immediately following the anthracite strike of 1902.

Prior to 1916 it was the rule that high prices for a few months brought such a quick increase in production that the prices dropped below even the normal low level. Hence the profits of one abnormal period were turned into losses in the depression which immediately followed the flooding of the market.

A practice persisted in through practically a century may properly be said to constitute the natural routine of the industry, so we may say that the normal state of coal is to have abundant production and prices which fluctuate freely, leaving an assured margin only to the few.

Coal prices rose in the fall of 1916, but have not declined since. They have been uniformly profitable for nearly four years. There was no opportunity to determine whether the rise in price which came in 1916 would be followed by the customary depression due to overproduction, because at the end of nine months the Government undertook to regulate coal. Therefore an artificial force was introduced into both production and

distribution, serving to freeze prices at the high level they had reached. These four years therefore stand alone in a hundred years of coal history. It is the only period when the coal business was uniformly profitable without bringing quickly a great overproduction of coal.

## INEFFICIENT RAILWAY CONTROL LIMITED SUPPLY

The only possible deduction to be drawn from these facts is that detailed governmental interference with the coal industry reverses its normal practice by bringing a period of uncertain supply and results in a sustained period during which uniformly profitable prices apply.

In passing it is significant that this abnormal period in coal was co-extensive with the period of detailed control of transportation by the same forces. It is undoubtedly true that the failure of coal to express itself naturally by overproduction in response to high prices was due to the failure of the Government-controlled railways to carry the easily possible output of the mines.

There never has been a dependable record of coal prices. There is none now. There are, however, two outstanding facts about coal prices:

First, American coal prices fix the cost of power to the American manufacturer. The mine-mouth price of coal in Great Britain fixes the cost of power for the rest of the world. The price of English coal has, as a rule, been two and one-half times the price of the American coal. That relationship to all practical purposes still exists. Therefore, the cost of power in the United States has been and is the low cost of power for the world. This is one big reason for the commercial supremacy of the United States.

Second, the increased cost of coal at the mine mouth is less on a percentage basis than the increased cost at the source of manufactured articles. Therefore the relation of cost of power to the value of manufactured product has not increased. Rather it has decreased. Thus the American manufacturer is not at a disadvantage in the world markets on account of his cost of power. Instead he maintains and increases his advantage.

## PROFITS ESTIMATED ON INVESTED CAPITAL

This means that the American coal price in relation to coal prices elsewhere is and has been subnormal rather than abnormal. The same is true of the relation of coal prices to the cost of manufactured articles. If, however, you take the position that the cost of other things is abnormal, then the price of coal is abnormal. The fact is that when the coal man goes into the open market to buy other things with his ton of coal he gets less for his coal than he did in the pre-war period.

Nevertheless it is commonly said that the profits of

\*An address by the managing director of the American Wholesale Coal Association before the Kentucky Mining Institute at Lexington, Ky., June 4, 1920.

the coal men have increased on a percentage basis. That is true only because the percentage is figured on the invested capital, rather than on the working capital. One has stood still; the other has increased. If the percentage were figured on the working capital, it would be found that this percentage had decreased rather than increased. Therefore, the profit of the coal company seems to have increased—but has not—merely because the capital of the company has not been expanded commensurately with the amount of money invested in the business.

No conscious effort was made prior to 1914 to collect statistics on coal consumption. Naturally there was no exact information as to the uses to which coal was put. The folklore of the trade was that prior to 1910—with the exception of the bituminous coal from Pennsylvania—the output went 60 per cent to the domestic trade and 40 per cent to the steam trade. There was a guess figure that 25 per cent of the coal went to the railroads. If this division was even approximately accurate it indicated that only 15 per cent of the coal in those days went to industry.

I mention these figures not because they are accurate but because they express what was then the belief of the industry. About 1910 there was a revision of figures. I heard it estimated that the steam trade was taking more of the coal and that—outside the bituminous district of Pennsylvania—it was moving 50 per cent to domestic trade and 50 per cent to the steam trade. This would indicate that industry was taking 25 per cent instead of the 15 per cent previously accredited to it.

#### PROFITS FROM PRICES FOR DOMESTIC COAL

These percentages had, naturally, their influence upon the price policy. So long as there was considered to be even an approximately equal division as between the three major users—the householders, the railroads and industry—it was considered possible that steam coal could be sold for cost or less and the profits, if any, of the industry could be made up by prices charged for domestic coal.

It was in those days common for coal men to stress the importance of car supply and cold weather upon the profitableness of the industry. Thus, we often heard at the beginning of the fall the remark: "From now on it is a weather market. If we have blizzards, we will have good prices and make money. If we have an open winter, there will be no chance to make money."

Such a conception of the market could rest only on the theory that the only profitable size in coal was the domestic size and that the only hope of making money was in the price charged to the householder through the retail dealer.

Beginning with September, 1915, the coal man began to feel that some new but rather mysterious force had entered the market. Bituminous coal prices began to rise in the East and then in the West. It was known that the East did not use bituminous coal for domestic purposes. So it was the steam demand that was boosting prices. By degrees, but slowly, the trade came to understand that coal for industry was assuming a dominant position.

For three years, however, the trade did not appreciate the tremendous change which had taken place. It had attributed this leadership of industrial coal to the war and believed it to be temporary. This belief persisted even during a greater portion of 1919. If, however, the

trade had been closely and carefully analytical it would have been prepared for the assumption of that permanent leadership by the so-called steam sizes which has now come.

#### INDUSTRIAL DEMAND GROWS IMPORTANT

In fact, the trade had been placarded for years with many signs pointing to this change. For example, I remember when slack coal or screenings sold on contract for 30c. and 35c. a ton. We can all remember when, in off seasons, this same coal sold at 10c. or 15c. a ton. We saw, however, that by 1914 the average or contract price on "fine" coal was 80c. to a dollar a ton. Even in 1914 we were not prepared to accept the real truth, namely, that the industrial demand was growing in importance. Instead, in rummaging about for an explanation we found it to our satisfaction in the fact that industrial plants were installing automatic stokers and were therefore switching their demand from run of mine or steam lump to the smaller sizes of coal. We saw only a shift in demand when it was, in fact, a growth in demand.

It was not until the fall of 1919 that the coal man really realized the truth, namely, that the big increase in demand for the last twenty years has been for coal in industry. It amazed all of us to find that a reasonably accurate estimate of demand for bituminous coal in 1920 would result in a division of the total productions about as follows: Household coal, 65,000,000 tons; railroad coal, 135,000,000 tons; industrial coal, 325,000,000 tons.

In other words, we were not prepared to find that the old or imagined equal distribution among the principal users had disappeared, never to return; that the railroads were using twice as much bituminous coal as the householders, and that the industrial demand is taking nearly two and one-half times as much as the railroads and one and two-third times as much as the railroads and householders combined.

The growth of the demand for coal for industry has eclipsed the demand for railroad coal and domestic coal. Domestic coal has so shrunk in importance that instead of taking 30 to 50 per cent of the output of mines it is now taking only 12 per cent. Railroad demand has so shrunk in importance that it is now taking only 25 per cent. Coal for industry has grown from 15 per cent to the point where it takes 62½ per cent.

That automatically reverses our price policy. It is impossible to sell 88 per cent of the coal at cost or less and make all the profit on 12 per cent of the coal. It is impossible even to lose money on 62½ per cent of the coal and make up the profit on the 37½ per cent of all the coal which goes to railroads and householders.

#### RAILROADS WERE ONCE OVEREQUIPPED

Briefly industrial coal is going to occupy the dominant position in production and must be the dominant influence on prices. The profits, if any, in the industry must be figured on the price of the steam coal—as it has been for years in Pennsylvania—instead of on the railroad and household coal. We have an entirely new basis for coal prices. The monitor of the trade is the industrial demand. The others are side issues—by-products.

Prior to 1910 there was still left in the railroads a semblance of the competitive spirit. The railroads knew that to make money they must carry freight. To

carry freight, they must have transportation facilities. Therefore, they overequipped rather than underequipped themselves. In those days the matter of getting transportation was not serious. On this account there was always plenty of coal at the market.

Because there was plenty of coal the price of coal was low and the trading margin on it was narrow. When the margin was narrow, a difference of a few cents in the freight rate determined the sale. Therefore, in those days the coal man was not interested in transportation problems of the railroads, but he was deeply interested in traffic problems. He needed to have rates nicely adjusted so that he would never be out of line with his competitor even a cent a ton. He knew that to be out of line by 3c. a ton meant to be out of that market.

#### FUTURE OF COAL BUSINESS UNCERTAIN

Today the competitive spirit of the railroads is gone. The railroads are stall-fed. If they do not get revenue from their own exertion the Government gives it to them. They do not earn money by carrying freight, necessarily. They are guaranteed that there will be a return on their capital regardless of any effort on their part. They have become a ward of the nation; a public charge; an incipient pauper; beggars before the appropriations committee of Congress. As a corollary they have less than enough equipment.

This is having a direct effect upon the point of view of the coal man. He is no longer interested much in the matter of freight rates. He has consented to one increase after another. When a new proposition comes to give a new increase in rates he gives it his instant approval. And he is not seriously disturbed now by a differential against him of 10c. or 15c. or even 20c. a ton. He knows that the distant competitor may have the advantage in rates, but that he can't get the cars. In a word, the coal man has lost his interest in traffic matters. He has gained an interest in transportation matters. He is no longer talking rates; he is talking cars, and engines, and service.

I have sketched the coal history. I have nodded to a few of the big problems of yesterday and today. What does this mean about tomorrow? I wish I knew. I wish I could put my finger as unerringly upon even the near future of the coal industry as it is possible to do upon what has happened and is happening. However, it is possible to speak only in generalities. Rather than giving the reasons for these conclusions I shall have to be content with merely the conclusions themselves:

1. The Government has been led to believe in the wisdom of the commission form of government for the railroads. It believes in rate control to assure morality of railroad practices. Having undertaken rate control, it must try to control the cost of operation and income. It is wedded to that idea. It has made the legislative experiment. It is not going to abandon it, short of a revolution.

#### CUTTING DOWN COMMERCE TO FIT RAILROADS

2. The Government recognizes that the railroads are no longer adequate. Despairing of building more roads and of improving the present systems under present conditions, it is setting out studiously to build auxiliary transportation systems by reviving abandoned waterways and by pioneering in ordinary road building that we may encourage auto-truck haulage.

3. The Government recognizes that these expedients

are of doubtful value. Hence we are approaching a cataclysm arising from the fact that the stall-fed railroads cannot carry the commerce of the nation and we will have nothing to take their place. Therefore there is a studied effort today to put business under regulation to the end that the volume of commerce may be whittled down to the size of the carriers. One of the first steps in this interesting program is the return of detailed regulation of coal as outlined in the proposals of Senator Frelinghuysen.

It is the definite understanding in Washington that this is but the overture to the larger program, which is to put all business under similar control. I do not speak in any ill-advised fashion. I know what I am talking about. I have put this proposition squarely and plainly before those who are advocating control of coal. They admit frankly that the program which I outline is the one upon which they have entered deliberately. With unblushing audacity these advocates of governmental control admit that their proposal is for the commission form of Government for everything in order to protect the commission form of government upon the carriers.

#### COAL MEN ADVISED TO LEARN SELF-GOVERNMENT

4. The coal trade is going to be policed. Somehow the information which is demanded of coal is going to be reduced to a definite record. Somehow the distribution of coal is going to be adjusted to the new situation in which the carriers find themselves. So the coal trade must be policed. If coal men can do the job themselves they may avoid for a little while the exercise of that police power by the nation. The length of time elapsing between now and another Fuel Administrator will be directly proportional to the capacity of the coal man for self-government.

5. Washington believes that the coal trade is tricky. That is, it gathers production information for the purpose of deceiving students of coal rather than for the purpose of reforming itself. It gathers figures on the cost of production to justify extravagant prices rather than to serve as an index as to where to cut the cost of production. It gathers information about prices for the sole purpose of controlling them on a high level instead of using this information to reduce the coal trade to sanity. And, in the Washington opinion, it is adopting the labor union practice of trying to increase the profits of the efficient by justifying a profit to the inefficient.

If it is to evade for long detailed exercise of the police powers of the nation, it must, in my opinion, reverse its practices in all these particulars. In a word, seeing the situation by which we are faced, the coal trade must "come clean" or stand by to see the slate, so far as it is concerned, wiped clean of any coal influence upon the coal industry.

### United States Said to Have }7,000 Years' Coal Supply

SUFFICIENT coal supplies to last about seven thousand years are still unmined in the United States, S. M. Darling, of the U. S. Bureau of Mines, told the twelfth annual convention of the International Railway Fuel Association in Chicago, May 25.

He estimated the supply of minable coal at 3,553,637,100,000 tons. Last year's consumption, he said, was 530,000,000 tons.

Edited by  
James T. Beard

### Contract System of Mining Coal

REPLYING to the question of "Mine Superintendent," in *Coal Age*, May 6, p. 959, concerning the contract system of mining coal in Pennsylvania, I thought that probably some information from another field would not be amiss and might prove of value.

In many parts of Kentucky, the operator gives an entry or section of pillars to some capable experienced miner, at a fixed price for delivering the coal on the sidetrack, or in some cases to the tippel. In practically all cases, the operator supplies everything just as though he had charge of the work himself.

The contractor hires and plans the work for his men, and turns in their time just as though he was a boss, instead of a contractor. The only advantage, in a system of this kind, in these parts, is that the hope that more pep will be put into the production of coal in that section when a single individual is given charge, who is striving to make extra money through his own initiative, which is not usually the case in the average section boss.

The contractor puts into the work the necessary personal flavor that is necessary to get a good working spirit started among his men, who, as a rule, feel that to fail in their work is a personal blow to a man who is a friend.

The principal drawback to this manner of working is that an unscrupulous contractor will, in a short time, get a section of the mine in poor condition. So to overcome this, most operators hire a foreman, who holds the contractor closely to good mining practices and the articles of his contract; and sees that the mining law is strictly complied with, in general.

Pikeville, Ky.

G. E. DAUGHERTY.

### An Amusing Incident in the Charging of Storage-Battery Locomotives

RECHARGING storage-battery locomotives, in mining practice, is an important subject. The reference made to it in the inquiry answered in *Coal Age*, Apr. 29, p. 874, recalls to my mind a curious experience that I had with the first storage-battery locomotive I designed for the Jeffrey Manufacturing Co.

The locomotive was designed in 1899 and built for a large operation in Pocahontas, W. Va. The machine was a five- or six-ton, gathering locomotive, the battery being charged from the trolley wire while hauling the trips out and in, on the main haulage entry. The battery was a Willard type. The machine being the first of its kind was regarded as an experiment and we were watching it with great interest, keeping a trouble man constantly on the ground, though he actually knew very little about storage batteries, being one of our own men.

The machine started out well enough and reports were satisfactory, until one day we got a telegram

informing us that the battery had exploded. I at once got in touch with Mr. Willard, who expressed his desire to go down to the mine with me for the purpose of making a thorough examination, as this was a new experience to him.

Upon our arrival at the mine we were told that the battery had "blownup" while pulling the trip on the main entry, charging in the regular way off the trolley wire. The "blowup" had so scared the operator that he deserted the locomotive, taking to his heels for dear life, and sprinted for daylight.

In his excitement, the man overlooked turning the controller handle to the "off" position, with the result that he had a worthy competitor in his race to safety. He must have gone some, because he won the race, although with a very small margin. When that marathon runner got to the mouth of the mine and, all out of wind, rolled off to one side of the track, safe and happy, the locomotive came rolling along as though nothing had happened, wondering in its own way what possessed the operator to cause him to run away from a friend in distress.

#### AMUSEMENT AT THE MOTORMAN'S EXPENSE

We all had a good laugh over the incident, as it struck us all as being very funny. But the sprinter could not see the funny part, and expressed himself freely about electric locomotives in general and this battery experiment in particular, in terms that were intended to put an effective stop to the merriment at his expense.

After the hilarity had worked off a bit, we examined the innocent cause of this prank played on the indignant operator. We found six or seven of the battery jars cracked and the acid flooding the wooden box that housed the 88 or 90 cells. The box being lead-lined no damage had been done to the locomotive. The box had a heavy wood cover over the cells to protect them from curious fingers and falling slate.

The cover had mysteriously disappeared and no one had given it a thought, until, on our asking for it, someone came forth with the information that a wood cover of some kind had been unloaded from one of the mine cars at the tippel on the day of the "blowup." We looked for it, later, and sure enough that was the battery cover all right.

#### EXPLOSION EXPLAINED AS BEING CAUSED BY THE IGNITION OF HYDROGEN IN THE BATTERY BOX

Mr. Willard soon explained the cause of this "blowup" by saying that, the battery, being charged from the trolley wire at a very fluctuating voltage, must have generated more gas than the openings under the battery-box cover were capable of removing. A probable short-circuit, due to condensation on top of the cells, must have caused a spark and the explosion of the confined hydrogen resulted, blowing the cover off the box, which struck the roof. The sudden stop in its flight added to

the noise of the explosion and it is no wonder that the combination put our friend to flight.

The result of this experience convinced us that charging from the trolley wire, while the locomotive was running, was not desirable; but it was some years later before motor-generator or even resistance-charging sets came into use. As a matter of fact, the experience became noised about and the battery locomotive got a set-back in the opinion of many mine managers and engineers.

**BATTERY COMPARTMENT MUST BE WELL VENTILATED**

The experience also showed that there should be plenty of ventilation over the cells, when the battery was being recharged. To avoid the necessity of lifting off the cover every time this was done, I devised a plan of exhausting the gas generated, by installing a small fan driven by a motor. I also provided a rubber-sheet acid-catcher over all the cells, in such a manner that only the filler and the gas-escape openings projected above the sheet, while all electrical connections were below the sheet and out of danger. These improvements were later patented, in my name, and assigned to the Jeffrey company. Whether the scheme ever came into actual use or not, I am unable to say, since I was no longer connected with locomotive building when the storage battery finally became popular.

I thought this bit of history would be of interest as well as serving to answer, in a way, the question asked in the inquiry, in regard to whether an explosion had ever occurred in recharging batteries in the mine.

ALEX. PALMROS,  
Consulting Engineer.

Syracuse, N. Y.

**Concrete Example of Labor Turnover**

HAVING read with deep interest the statistics compiled by Mr. Crews, for the Bituminous Coal Commission, and published in *Coal Age*, Feb. 12, p. 316, I beg to submit the following brief regarding the earnings of men in the mining of coal.

We hear much, in these days, about the increased cost of living; rising standards of living; decreased production, per man, per hour; etc. More and more, the daily papers and trade journals publish articles with concrete illustrations couched in percentage figures, rates and ratios. I often think how meaningless these articles must be to those who do not understand the intricacies of higher mathematics; and what an opportunity the writer of such an article has to phrase his statement with an inflection that entirely misconstrues the facts indicated by the figures.

**MUCH OF THE PROPOGANDA IN THE DAILY PRESS IS MISINTERPRETED BY THE PUBLIC**

In these days of scientific advertising and salesmanship, the reader is inclined to mistrust these articles as being creatures of the brain, employed to bolster up propaganda for one side or the other. How can we discern between the real and those distorted facts intended to misguide some particular group or class of readers.

I refer more particularly, now, to the many articles that were written during and since the recent strike of the bituminous coal miners. Articles written by both sides, supposedly representing the miners, or the operators, quoted all sorts of figures and percentages, apparently based on facts but given an inflection meant

to turn the reader from the figures to the conclusion reached by the writer.

Mere propaganda cannot be trusted. The only figures that one can really trust are those compiled by himself, where all the influencing factors are thoroughly known and understood. Fortunately, I have since found time to do this and herewith present the results and my interpretations and conclusions to the readers of *Coal Age*. The work, to be comprehensive, is so tremendous a task that a small operation, employing an average daily working force of about a hundred men, was chosen.

**ANALYSIS OF A YEAR'S PAYROLL**

To my surprise, I discovered that to maintain a force of 100 men, daily, no less than 598 names appeared on the payroll, during the course of the year 1919; and 239 of these worked less than a month while only 56 of them worked the entire twelve months. Of these 56, all but four made over \$1,000. The average was \$1,524.87, for the year, which showed a monthly rate of \$127.07. The four who earned less than \$1,000 worked only two or three days during several months, but their names appeared on every payroll throughout the year.

The following table shows how irregularly the men worked during the year and the earnings of each group:

Period Worked	Number of Men	Total Amount Earned	Amount Earned per Man	Per Man, per Month
Less than one month	239	\$ 9,263.01	\$ 38.76	\$ 38.76
From 1 to 2 months	96	12,374.66	128.90	64.45
2 to 3 months	48	11,472.88	239.02	79.67
3 to 4 months	30	10,491.07	349.70	87.43
4 to 5 months	20	9,734.99	486.75	97.35
5 to 6 months	21	11,638.31	554.20	92.36
6 to 7 months	19	13,855.97	729.26	104.18
7 to 8 months	19	13,694.92	720.78	90.10
8 to 9 months	14	12,152.14	868.01	96.45
9 to 10 months	20	23,821.38	1,191.07	119.11
10 to 11 months	16	21,001.24	1,312.58	119.33
11 to 12 months	56	85,392.57	1,524.87	127.07
Totals	598	\$234,893.14		

Following is a table showing the earnings of the 239 men who each worked less than one month. It will be observed that one of these men earned, in that time, \$320.05. The table is of interest by way of comparison.

Number of Men:	Amount Earned per Man
56 earned	Less than \$10.00
48 earned	\$10.00 to 20.00
33 earned	20.00 to 30.00
22 earned	30.00 to 40.00
17 earned	40.00 to 50.00
15 earned	50.00 to 60.00
12 earned	60.00 to 70.00
8 earned	70.00 to 80.00
5 earned	80.00 to 90.00
4 earned	90.00 to 100.00
13 earned	100.00 to 150.00
5 earned	150.00 to 200.00
1 earned	320.05
239 men	Total earnings, \$9,263.01

Truly the question of labor turnover is one of vital interest to every operator, when out of 598 men employed only 56 remain at the end of a year. This was at an operation located just outside of a good-sized city. Of the 56 steady employees, two-thirds were married men.

During the same year, 85 men made a taxable income; two cutters made \$2,925.92 and \$2,896.62, respectively. The mine being nonunion was in operation all of November and December when so many coal mines were idle by reason of the strike.

It is one thing to compile figures but much more important to be able to read them intelligently. One might charge that the men who work in this mine average only \$38.76 a month, and ask if that is a just

wage. The answer would be, emphatically, No! It is true that 239 men, who worked there less than one month, averaged that low rate; but that includes all the men who worked from one hour to thirty days, many of them earning less than \$10, and quit.

Some might divide the total payroll (\$234,893.14) by the number of men employed (598) and say that the average monthly earnings for these men was \$32.73. True; but what a gross misconception of the truth to interpret figures in that way. For an average is valuable only when the figures approach similarity. An average is of no account when the variation is large, as in this case where the total includes men working anywhere from one hour to one year.

It is easily seen how readily one falls into difficulties in interpreting statistics; and statistics are worse than worthless if wrongly interpreted. In determining the true monthly wage of these men, a *weighted* average must be used and the total accrued from month to month. Thus, by re-reading the figures, we find that:

Number of Men	Months Worked	Total Amount Earned	Average per Man, per Month
56	12	\$ 85,392.57	\$127.07
72	11	106,393.81	125.49
92	10	130,215.19	124.25
106	9	142,367.33	121.26
125	8	156,062.25	117.69
144	7	169,918.22	116.39
165	6	181,556.53	114.55
185	5	191,291.52	113.53
215	4	201,782.59	111.79
263	3	213,255.47	109.42
359	2	225,630.13	105.38
598	1	234,893.14	98.68

Thus we see that the true average monthly pay increases directly with the length of time the man worked; and that the steady miner earns a fair living wage, and one that compares favorably with the wages paid men in other occupations. These figures would indicate that the miners do not need an increase of the wage scale nearly as much as they need steadier work. The reduction of labor turnover would be a large factor in increasing their average pay and in decreasing costs to the operator. Anything which would tend toward this end should be welcomed by both the labor chiefs and the operators.

It is a common saying that figures do not lie, and they don't. They tell the truth, until some human brain uses them as illustrations to prove his theory, which is generally predetermined. If one formulates statistics with a foregone conclusion as to what they will show, any figures indicating the contrary will not change his preconceived notions. While figures do not lie, so many people lie about figures that it behooves us to take them all with a "grain of salt" and make our own interpretation, instead of allowing someone employed for the purpose to do the interpreting for us.

Philadelphia, Pa. WILLIAM RUSSELL RORER.

### Car Supply the Determining Price-Factor

COAL prices may be rightly gaged, today, by the car supply available at the mines; and there is little hope of seeing lower prices until that situation is remedied. The quickest and most effective way to stop the so-called "profiteering" in coal is to insure 100 per cent of car supply, at all mines. Rabid-price investigations and legislative regulations accomplish little and are mostly misleading.

Few persons, outside of the coal business, understand why price of coal fluctuates so widely, from week to week; the range even reaching two dollars a ton; but

a study of the mine reports will furnish the answer. Since the month of October, the car supply at the mines has varied, weekly, from 20 to 60 per cent, and most of the time has shown a very low percentage of the normal requirement.

As a result of this condition, the cost of producing coal one week is, perhaps, double what the cost will be the week following. The reason is that a mine is something that cannot be locked up and again opened on a day's notice. There are certain costs that continue even though not a pound of coal is mined; and these costs cannot be overlooked when figuring the price of coal.

### INCREASED EFFICIENCY COUNTS FOR LITTLE

It is indeed a problem how to pass on to the consuming public the results obtained by the increased efficiency in the mining of coal, today, when these results are more than counteracted by the inefficiency in railroad management. Since the destiny of the coal-mining industry is so closely linked with that of railroading, on which its success depends, the fact must be recognized that the troubles besetting the latter react most seriously on the former.

Coal operators are not only subject to their own industrial troubles; but are likewise affected by those of another and what is generally supposed to be an entirely separate industry. The handicap that such a condition imposes on the coal industry any man of business can readily understand, inasmuch as no intelligent or efficient plans for the production of coal can be formulated or carried out on a car-supply basis that fluctuates as it does today, and has been doing since October.

Perhaps, if the public were more familiar with this important problem of car supply, it would better understand why coal mining is regarded as a hazardous industry, not alone for the miners, but for the mine owners and operators as well. Furthermore, what may seem like "profiteering" is, in reality, nothing but the result of a condition over which operators have no control; namely, car supply.

### Co-operative Merchandising

REGARDING the question of the high cost of living prevailing much to do with the social unrest prevailing in the country, I do not think there is a dissenting voice. But, what does not seem to be so generally known, is the fact, easy of verification, that, high as is the cost of living in cities and districts bordering on the highways of trade, it is still higher in the more or less remote regions where coal mining is generally done.

The time is past and gone when the company store, unhampered by competition, charges as high prices as customers will stand. Even where no competing store is to be found within walking distance of a mining camp or village, the coal operator no longer thinks it good policy to get back, through the store, the largest possible proportion of the men's earnings.

It is true, of course, that where competition is lacking, the prices asked at the company store are much higher than they would be otherwise. But, no matter what competition there may be, the miner must always pay more for his food, clothes, shoes, etc., than he would pay if he lived within reach of the average city stores where market prices more generally control.

It seems strange that the miners' unions have not done what like organizations, similarly situated in other countries, have been doing for many years, to the great pecuniary benefit of their members. I refer, now, to the establishment, by those unions, of co-operative stores where all their members can, not only get their goods at cost plus a small percentage, but become partners in the business, participating in the profits in proportion to their dealings.

LABOR UNIONS IN AMERICA SUFFER BY COMPARISON WITH THOSE IN EUROPE

Surely, there must be, in the unions of workingmen in America, the same kind of honesty, goodwill and business talent that has enabled the unionized workingmen of Europe, for nearly fifty years, without any let up in their fight for social recognition, to keep the cost of all necessities of life at the lowest possible level, while at the same time raising the standard of existence to a higher plane.

Let those who are interested in this subject study what has been accomplished by such workingmen's unions as "Voruit," at Ghent, and "Maison du Peuple," at Brussels. One should not be misled by glib talkers and amateur economists who tell us that the American workingman is different from the workingmen of other civilized lands. Like measures adopted for similar purposes, under similar circumstances, and similarly conducted, are bound to give, in this country, results similar to those attained in Europe. There is undoubtedly a difference between America and Europe; but in this as in many other things, the advantage is in favor of this country. What took fifty years to accomplish in the land of precedent and prejudice, where, as was the case in Belgium until a couple of months ago, the unions of workingmen were only tolerated, can be done here in one tenth of the time.

Installing a Power Cable in a Shaft

AFTER reading the interesting and instructive article entitled "Some Methods of Suspending Electric Power Cables," by R. P. Hines, *Coal Age*, Apr. 15, p. 749, from which I gained much useful information, I am inclined to give a little of my own experience along the same line.

Although I am not an electrician, it fell to my lot to install a power cable in a hoisting shaft 365 ft. deep. The cable was armored and designed to carry alternating current, at a pressure of 2,300 volts, to operate a motor-generator set for charging storage-battery locomotives in the mine.

AN INGENIOUS METHOD

Instead of lowering the cable in the shaft, which might seem to be the natural way to make such an installation, I adopted the plan of starting from the bottom and hoisting the cable to the surface as it unwound from the reel at the shaft bottom. The reel was placed on the cage and lowered to the bottom of the shaft, where it was mounted on a steel bar and blocked up so that the reel would turn freely.

It should be stated, here, that the switchboard to which the cable was to be connected was located in the powerhouse, at a distance of 90 ft. from the shaft. It was necessary, therefore, to make allowance for this length of cable, which would enable it to be extended

from the shafthead to the switchboard in the power house. For this purpose, the required length (90 ft.) was measured off on the cable, which was then doubled back on itself and clamped, using a cable thimble at the bend, to avoid injuring the cable, as shown in the accompanying figure.

The next step was to rig a 12-in. sheave on the tittle, about 15 ft. above the ground level at the surface. This being done, I employed a  $\frac{5}{8}$ -in. wire rope, which had formerly been used as a means of retarding the movement of cars on an incline, and passing it over the 12-in. sheave lowered it into the shaft. The end of the rope was now put through the cable thimble previously mentioned, bent back on itself and clamped, as shown in the figure. The position of the 12-in. sheave, at the surface, was such as to allow the cable when hoisted to hang a few inches clear of the shaft curbing.

CABLE HOISTED IN THE SHAFT BY MEANS OF THE DESCENDING CAGE

When all was ready, the upper end of the  $\frac{5}{8}$ -in. wire rope was fastened to the cage waiting at the surface. The lowering of the cage had the effect to hoist the cable slowly in the shaft. When the cable had thus been drawn to the proper height it was secured in that position by clamping the  $\frac{5}{8}$ -in. wire rope to itself under the sheave. The cable was thus held fast in the position in which it was needed in the shaft.

On the right of the accompanying figure is shown the detail of the suspension of the cable after clamping the wire rope to itself and detaching the end of the rope from the cage. On the left of the same figure is shown the manner of protecting the armored cable, after it had been hoisted into position in the shaft. For this purpose, pieces of 4 x 4 in. yellow pine were sent to a planing mill where they were milled out on one side, the entire length of each piece. The milling was sufficient to give a snug fit for the cable, which was 1 $\frac{3}{4}$  in. in diameter. When these pieces were clamped tightly over the cable, in the shaft, there was sufficient friction to give it the needed support.

This shaft being lined with cement, it was necessary to drill holes, in the cement curbing, for the expansion bolts that were to hold the clamps or bands, as shown in the figure.

When all was complete, I arranged an emergency clamp, in the form of two blocks milled out and bolted together around the cable, a short distance above the top of the 4 x 4 in. guards. Although it is now nearly two years since the installation was made, this emergency clamp has not taken any of the weight of the cable, which is slightly slack below the clamp.

SHOWING DETAILS OF THE INSTALLATION

# Examination Questions

Answered by  
James T. Beard

## Illinois Mine Inspectors' Examination Springfield, Sept. 18, 1916

(Answered by Request.)

*Ques.*—What is the difference between a coal seam and a mineral vein?

*Ans.*—A coal seam is a bedded deposit and conforms with the original stratification of the formation. It is, in other words, a sedimentary deposit. On the other hand, a mineral vein has been formed by the filling in of a crack or crevice in the rock formation. Not being a bedded deposit, a vein may have any direction with respect to the stratification. The crack or fissure may have been filled by intrusion of volcanic lava from below; or by the infiltration of water carrying mineral matter in solution and coming either from the surface or from the inclosing rock strata, the mineral matter crystallizing, later, and forming a solid incrustation on the walls of the fissure or completely filling the same.

*Ques.*—A steam jet and a fan, both acting together on the air in an upcast shaft, produce 75,000 cu.ft. per min. When the fan is stopped, the jet produces 15,000 cu.ft. per min. What quantity of air would the fan give alone?

*Ans.*—Assuming that there is no change made in the circulation of the air in the mine and the shaft, the mine potential or the resisting power of the mine is constant. In that case, the power producing the circulation is proportional to the cube of the quantity of air circulated. Then, since the total power on the air, due to the combined action of the fan and the steam jet, is equal to the sum of the powers due to the action of each of these agencies alone; and since the power on the air is a function of the cube of the quantity of air circulated, it follows that the cube of the total quantity circulated by the combined action of the fan and the steam jet is equal to the sum of the cubes of the respective quantities circulated by each of these agencies acting alone. Therefore, calling the quantity of air due to the action of the fan alone,  $x$ , since the quantity produced by the steam jet acting alone is 15,000 and the two agencies acting together produce 75,000 cu.ft. per min., we have

$$\begin{aligned} 75,000^3 &= x^3 + 15,000^3 \\ x^3 &= 75,000^3 - 15,000^3 \\ x &= 1,000 \sqrt[3]{75^3 - 15^3} \\ &= 74,800 \text{ cu.ft. per min.} \end{aligned}$$

which is the quantity of air that the fan would produce when acting alone, the conditions in the mine remaining unchanged.

*Ques.*—How many tons of coal underlie a square field containing five acres, the seam being six feet thick and lying at an angle of fifteen degrees, the specific gravity of the coal being 1.325?

*Ans.*—An acre of land contains 43,560 sq.ft. The cubic contents of a 6-ft. seam of coal underlying five acres and inclined at an angle of 15 deg. is

$$\begin{aligned} &5(43,560 \times 6) \div \cos 15^\circ \\ &= 1,306,800 \div 0.96593 = 1,352,900 \text{ cu.ft.} \end{aligned}$$

Then, taking the specific gravity of the coal as 1.325, referred to water as unity, since the weight of a cubic foot of water is 62.5 lb., the weight of coal in this five acres is

$$(1,352,900 \times 62.5 \times 1.325) \div 2,000 = \text{say } 56,000 \text{ tons.}$$

*Ques.*—What would be the variation of a plan's meridian when the bearing of two objects thereon with its meridian is N 13 deg. E, and the bearing of the same two objects on the surface is found by an instrument whose needle has 19 deg. of west variation, to be N 8 deg. E.

*Ans.*—If the needle has a variation (declination) of 19 deg. W, and the magnetic bearing of the line joining the two objects is N 8 deg. E, the true bearing of this line is found by subtracting the magnetic bearing, which is east, from the declination of the needle, which is west. The difference ( $19 - 8 = 11$  deg.), being an angle to the west, the true bearing of the line is N 11 deg. W. The accompanying figure shows the relative positions of the true meridian, the line of observation joining the two objects, the magnetic needle and the assumed meridian of the plan. It will be observed that, since the line joining the two objects has a bearing of N 13 deg. E, referred to the assumed meridian of the plan, the angle between this assumed meridian and the true meridian is given by adding this bearing referred to the assumed meridian to its true bearing, which gives an angle of 24 deg. to the west of the true meridian, and the bearing of the assumed meridian is N 24 deg. W.

meridian is given by adding this bearing referred to the assumed meridian to its true bearing, which gives an angle of 24 deg. to the west of the true meridian, and the bearing of the assumed meridian is N 24 deg. W.

*Ques.*—What is the difference between a horseback and a step fault?

*Ans.*—What is known as a "horseback," in mining, is a hump or swelling, generally occurring in the floor of the seam, and causing the thinning out of the coal for a short distance. On the other hand, a step fault is a true fault, being an actual dislocation or slip in the strata. In that case, a break has occurred, crossing the stratification at more or less of an angle with the bedding plane. The strata on one side of the fault line has been thrown up or down, producing a sudden break in the continuity of the seam. The fault is called an "up-throw" or a "downthrow," according to the direction the slip has taken. In either case, it is a step fault.

## Wholesale Coal Association Brief Opposes Seasonal Coal Rates

Such Legislation If Passed, the Organization Contends,  
Would Be But a Prelude to Further Inter-  
ference with the Coal Trade

**B**ECAUSE no member of the Frelinghuysen sub-committee disapproved of the bill providing for seasonal rates on coal, no minority report was available for the use of the full Committee on Interstate Commerce of the Senate. With the idea of placing some of the opposing views concisely before the full committee the American Wholesale Coal Association submitted a brief on the subject to the full committee. Extracts from the brief are as follows:

"The advocates of the bill, except two associations of operators in the far West, have had no experience as producers, consumers or distributors of coal. The opposition to the bill was by those who have had the broadest experience with coal.

"The experience of the nation during the last four years proves that it is impossible to regulate part of the coal business without regulating all of it. And, it is impossible justly to control coal without controlling all allied industries. That proposition rests upon our knowledge and belief that you cannot control the distribution of coal without influencing the price.

"If by statute you influence the price of coal you must soon so control that price that the coal man may avoid bankruptcy. If by statute you control the price of coal you must undertake to control the cost of production. You must naturally assume control of the wages of miners and regulate competition of the coal producer.

"If by statute you undertake to control the competition of the coal producer you must control all of the coal land of the United States to such an extent that you may say by law who may and who may not open coal mines and when and where those mines may or may not be opened.

"As a rule it is the common practice of all legislatures to try to correct a mistake not by repealing the law but by undertaking another and larger experiment. Thus, when the first and second experiments prove at fault, the common practice is to try a third experiment. Thus, if this statute is passed it will, we believe, be but the overture of a program.

"In support of our contention that this proposed legislation cannot be final but must be merely the initial step in a long chain of legislative acts we refer specifically to the history of the Interstate Commerce Commission. It started out to supervise rates. It progressively came to control rates, cost of operation and finally financial return.

"This measure cannot be effective without coal storage, which is so difficult and expensive as to be practically impossible in any general sense.

"As a matter of fact the storage of coal is a very difficult and delicate undertaking. If it is to be done successfully, it must be done according to the most scientific methods. Some coals will store in the open if not piled higher than a limited number of feet. Other coals will store safely in the open if protected against the infiltration of water from below. A few selected coals will store in the open if the sizes are very carefully segregated. Still other coals will store safely in the open if they are practically hermetically sealed.

"Some sizes of coal will not store at all unless free

from alternate wetting and heating by the rain and sun. In some coals the larger sizes will store under certain conditions, while the smaller sizes of the same coal will not store at all.

"Regardless of all these technical niceties which have to be observed, the hearing before the sub-committee proceeded on the theory that no precautions whatever were necessary. The whole matter was passed over so lightly that there was not called before the sub-committee a single witness who could qualify or who tried to qualify as an expert on coal storage questions.

"The railways have today less than enough cars to move the coal even though all cars are employed steadily throughout the year. Under such conditions—known to all coal users—we cannot believe that summer movement of coal needs any legislative stimulant.

"Besides, there is known to be a coal shortage today. In fact, the high prices now charged for coal are directly attributable to a shortage of cars and to the competition of users for the less-than-sufficient amount of coal produced. We fail to see wherein there is any danger that coal cars will be idle unless freight rates are reduced by law. The current information is, on the contrary, that the coal mines are losing two million tons of production per week merely because the railways have not cars enough to move the coal.

"The bill is presented as an amendment to the Interstate Commerce Act. However, it is neither designed nor intended primarily to be a regulation of the carriers or of interstate commerce. Its essential purpose is to reform the coal industry and the practices of the people respecting their coal purchases.

### LEGITIMACY OF REGULATION QUESTIONABLE

"We wish to call to the attention of the committee the doubt which will exist as to whether such a purpose falls legitimately within the scope of the Interstate Commerce Act.

"We are disposed to hold that if it is either desirable or necessary to regulate or reform the coal industry by statute, the intention to regulate and reform it should be labeled for what it is. Especially are we disposed to say that this thing, if done at all, should be done under the powers which Congress has over private business rather than under its powers over commerce.

"If Congress has under the Constitution no power to regulate a private business we contend it is an immoral invasion of the rights of coal merchants and producers to seek to exercise such control under the subterfuge that an attempt is being made to simplify transportation by an amendment to the Interstate Commerce Act.

"We most respectfully direct the attention of the committee to the fact that the studied effort of this nation for a long period of years have been to divorce the coal industry and the transportation companies. And yet by this statute they are united for the purpose of enabling the carriers to try to reform coal. We contend that this amounts to a reversal of the nation's fixed program. We are convinced that it is a measure to which if understood the people will not give their consent.

"Finally, we wish to suggest to the committee that the issue raised in this proposed legislation amounts to such a reversal of our public policy since the establishment of this Government that it is an undertaking which should not be entered upon without the whole matter being first placed before and decided by the whole people."

# The Labor Situation

Edited by  
R. Dawson Hall

## Strike of Shopmen on Virginian R.R. Curtails Coal Production

**T**HE strike of shopmen at the Princeton (W. Va.) shops of the Virginian R.R., in which about 1,200 men were involved, had not been settled up until the last of May. On the contrary, it had extended to the piers of the Virginian R. R. at Sewalls Point, Va., and had brought dumping of coal at such piers almost to a standstill. As a result of the shopmen's strike practically no coal at all was mined on the Virginian R. R. during the last week of May.

Notice was served on the strikers toward the end of the week that unless they returned to work at once their places would be filled by others. It is stated that a number of striking shopmen have left the city of Princeton and that others have sought new employment.

## Seven Alleged Union Organizers Arrested In Pond Creek

**S**EVEN men, all of them said to be union organizers, were arrested on Pond Creek, Wednesday afternoon, May 26, by officials of Pike County, Kentucky. At the time the alleged organizers were arrested they were on their way from Williamson to Stone, Ky. A movement is now in progress having for its aim the organization of the Pond Creek mines in Kentucky, adjacent to Williamson.

It is charged by the deputy sheriffs making the arrest that the men were extremely suspicious in their actions and that when searched pistols were found on them. The men arrested were: Lee Hatfield, Lindsey Tackett, Dave Connoly, James Parsons, Joe Hatfield, Martin Justice and Fred Hatfield. Those arrested were given a hearing at Pikeville on May 27 and were bound over to await the action of the grand jury, the charge against them being conspiracy. All the men furnished bond.

## Though Organization Is Incomplete, Union Tries to Control Williamson Field

**O**FFICIALS of the United Mine Workers in the Williamson field have already begun to say who shall work and who shall not work, even though that field has not yet been entirely organized.

The Burning Creek Coal Co. is just completing construction work on a new plant at Kermit, W. Va. While the tipple has not been completed and the siding is not ready for use, the company has decided as a part of its development work to haul coal by wagons to the railroad and ship coal pending the completion of its plant. It had not had any trouble with miners because it had not attempted to operate.

When, during the last week of May, the company indicated that it would begin mining and shipping coal, a notice was served on the company by Don Vinson,

president of the local at Kermit, that it could not operate. Vinson, it might be mentioned in passing, is not a miner but a farmer.

## Fine for Failure to Report for Work Causes Strike near Terre Haute

**M**INERS employed by the Vandalia Coal Co.'s mine east of Terre Haute struck May 24 because the company had assessed and collected from them a fine of \$1 each for failing to report for work Saturday, May 15.

The company asserts that the men took concerted action to observe their Saturday holidays, while the miners contend that each miner acted on his own initiative and that there was no agreement to remain away from work. Heretofore the Saturday holiday trouble has been confined to district No. 11, but it spread to district No. 8 May 23, when about 250 miners failed to report for work. All these men will be fined \$1 by the company, officials stated.

## French Coal Miners Return to Work

**C**OAL miners of France, who have been on strike intermittently for several months and recently supported the railwaymen in their strike for nationalization of the roads, are now reported to be all at work.

It is computed that the 120,000 miners affected lost wages totaling 40,000,000 francs and caused a loss in production of nearly 800,000 tons of coal, which must be replaced by imports. It is also pointed out that production will be lessened another month because of the long idleness of the miners, and there will be a further economic loss to France in sending money out of the country for imported coal.

## Clinton Shotfirers to Receive Wage Increase

**S**HOTFIRERS at a number of coal mines around Clinton, Ind., who have been idle since May 6, refusing to work for the scale of \$8 a day, all returned to work May 24. It is said their demands have been met by the operators and, although no official announcement has been made as to the basis of settlement, it is understood that they will receive an increase of 13 per cent over their former pay, which was fixed by the miners at each mine and which ranged from \$10 to \$15 a day.

## Adjust Strike of Raymond City, W. Va.

**A** TEMPORARY adjustment has been reached in a strike of about five hundred miners employed by the Otto-Marmet Co., Raymond City, Putnam County, West Virginia. The strike is reported to have followed the arrest of one of the miners for violation of the mining law of West Virginia in shoveling from the solid.

## Williamson Operators Decline to Co-operate in Organization

Enlist Service of Sheriff to Suppress Intimidation and Begin Newspaper Propaganda Campaign to Combat Efforts of Organizers

OPERATORS of the Williamson field have declined to negotiate with the United Mine Workers for the organization of the Williamson field and in an interchange of communications with officials of the United Mine Workers have made it plain that they believe no useful purpose could be served by any meeting with the miners.

The suggestion for a meeting was made on Thursday, May 27, by Fred Mooney, secretary of district 17, and C. H. Workman, a board member of the same district, the communication from Mooney and Workman being couched in the following language:

"To the Coal Operators of Mingo County and Vicinity:

"Learning that you are in session in the City of Williamson, and desiring to bring about a feeling of good will and comity between the coal operators of this section, and desiring especially to receive your co-operation in assisting the legally constituted authorities of the city, county and state in maintaining peace and upholding the supremacy of the law, we hereby propose that you meet us, the representatives of the United Mine Workers of America, representing the bulk of the miners of this immediate field, in joint conference. We feel that the mutual interests of all parties concerned would be materially promoted by such a meeting."

On the same day a committee of operators sent a response to the above communication as follows:

"A number of the coal operators of the Williamson field were in consultation today with the Sheriff, soliciting the activity of his office in the preservation of law and order in Mingo County. They were brought to this necessity largely, if not wholly, because persons not residents of this county have busied themselves during the past few weeks provoking discord and hostility between them and their employes.

"We have reported to the sheriff the fact that large numbers of men are parading the county, armed, and are menacing and threatening workmen engaged in the mines, and preventing them by threats and menaces from performing their work, and we have solicited him as the peace officer of the county for the protection of our employes. In consequence of this state of public outlawry numbers of workmen in the county are terrorized and are afraid to go to and from their places of work, and the mining industry in the county, at many places, is in a state of suspension.

"As citizens and property owners of Mingo County, we are hopeful that the officers of the county will, by the exercise of their constituted powers, be able to restore order in the county and maintain the law. With them in this aim we expect, as citizens, to co-operate to the very limit of our capacity, and trust that all law-abiding people of the county will feel a similar interest.

"We find no objections to your having similar consultations with the sheriff, if it should appear to you as non-residents that your concern in Mingo affairs is sufficient to warrant the presumption, but, replying to your invitation to meet you in conference, we must beg to believe that no useful purpose can be served by the arrangement.

"The concern of the people of Mingo County is in upholding the law, protecting property and preserving life as well as the reputation of our community."

Counter propaganda is a part of the program of the operators to offset the propaganda of the United Mine Workers circulated in Mingo County in an effort to organize that field. As the first step in the campaign of counter propaganda the operators have procured space in the newspapers published in Mingo County in order to present their side of the case.

It is pointed out by the operators in the initial statement made to the miners and other citizens of the district that the operators have property in the field valued at from \$30,000,000 to \$40,000,000, that they pay the taxes largely through which public institutions, public schools and public roads are maintained, and that they employ in their own industry more than five thousand of the best-paid workmen in the land. The operators also assert that "These operators are a permanent part of this community, and claim the right, above all question, to take their own part and to speak upon the welfare of the neighborhood and their business.

"The operators propose to show that the organization of this coal field by the United Mine Workers would prove hurtful to the coal industry and therefore damaging to the entire community. They ask their employees and all citizens to keep an open mind on the subject until they shall have fully stated their case."

## President Wilson Names Anthracite Wage Commission

PRESIDENT Wilson has announced the appointment of an Anthracite Coal Commission, composed of three members, which will arbitrate the points in controversy in reaching a wage agreement between the anthracite coal operators and mine workers.

The members of the commission are Dr. William O. Thompson, president of Ohio State University, representing the public; Neal J. Ferry, of McAdoo, Pa., a member of the Executive Board of the United Mine Workers, representing the miners, and William L. Connell, an independent coal operator, of Scranton, Pa., representing the operators.

The appointment of the commission was announced by the President in a long proclamation reviewing the efforts to negotiate a new wage scale. A decision is to be rendered within sixty days, if possible, which will be made "the basis of a new wage agreement between the anthracite operators and miners in such manner as the commission may determine," to be effective from April 1.

As both sides have signified their willingness to accept and abide by the award of a commission thus constituted, a satisfactory settlement of the matters in dispute is confidently expected at an early date.

Officials of the United Mine Workers of America have expressed themselves as being well pleased with the men named as members of the Anthracite Commission. Ferry's name was suggested for membership by the mine workers and Connell has always been considered a friendly operator by the miners. Therefore while the mine workers know little about Dr. Thompson, they feel sanguine that they will get a square deal from the commission.

Before adjourning, Congress appropriated \$10,000 for the expenses of the commission.

# West Virginia Coal Managers Discuss Their Operating Problems

Suggestion That Railroad Equipment Be Transferred to Holding Corporation--  
Visiting Nurse and Mining Education Are Discussed Lessee Ought To Be as  
Interested as Lessor in Conservation of Coal, for He Has Most at Stake

**O**WING to the labor unrest along the Tug River and in the Guyan region, the West Virginia Coal Mining Institute's' twenty-second semi-annual session at the Frederick Hotel, Huntington, W. Va., was not as largely attended as usual, though its discussions did not seem to suffer from the dearth of members. On the opening day there were 37 present, among whom could be numbered not a single coal company man living in the city in which the meeting was held. This was perhaps quite natural in view of the fact that the operators who live in Huntington and Williamson are just now the objective of a concerted attack from the United Mine Workers, and they are quite busy coping with it.

In place of D. W. Brown, an attorney of Huntington, the address of welcome was given by Mayor Campbell, who emphasized the importance of the transportation needs of the country and the difficulties under which coal operators labored by reason of car shortage. He added that the Association of Federal Reserve Banks at a recent meeting, held within closed doors, had suggested that this problem be met by the turning over of all railroad equipment to a holding company which would hereafter provide for the equipment needs of the whole country, placing cars wherever at any time they happened to be in demand.

On this suggestion the mayor made little comment. It may be said, however, that it has certain somewhat obvious advantages. Cars are placed where there is need for them and it is done without the probability that the pooling will result in indifference as to the purchase of cars. As it is today, the pooling arrangement have taken cars from railroads which provided them and have given them to railroads which made only indifferent provision for the purchase of cars. This discouraged both railroads from buying cars, for it does not pay a railroad to buy equipment if in time of greatest need it does not have the use of it, and if a railroad, not having enough of its own equipment, can depend on a pooling arrangement to give it the cars of others, it has no incentive to buy in adequate quantities. While a holding company for car equipment would be unjust at the start, as tending to the disadvantage of provident companies, it might perhaps work no further injustice, and the incentive to buy would not be impaired as it is when ownership of a private corporation is fully recognized during a car plethora and denied as soon as there is a car famine. As it is now, the responsibilities of ownership are more obvious than its privileges and in consequence ownership of railroad

property and equipment is no longer sought by any one.

J. R. Cameron, of Bluefield, responded in a few words to the Mayor's cordial address. As usual, the vice-presidents and the members of the executive board were called on for remarks, Frank A. Haas, of Fairmont, and E. D. Knight, of Kayford, responding briefly. A

committee on resolutions was appointed, composed of R. Dawson Hall, Frank R. Haas, V. E. Sullivan and Lee Ott.

Dan Sowers, superintendent of welfare work, Portsmouth Solvay Coal Co., Edgerton, W. Va., and his promised substitute, Mr. Mackintosh, not being present, W. A. Craven, of the S. J. Patterson Pocahontas Coal

**Operators in a large section of West Virginia continue to question whether it pays to provide for an extraction of 90 per cent or more. They still believe it cheaper not to invest a dollar now in early entry development but to throw away a dollar or more in waste of development later and a number of operators in other states have a similar point of view.**

Co., Arista, W. Va., gave an impromptu address on "Does Welfare Work Help Production?" Mr. Craven said that he felt that it did, yet that at the same time there were adverse influences tending to decrease production, and in consequence the increased productivity might not be forthcoming, no matter how diligently welfare work was pursued. He remarked that what is looked upon one day as a luxury becomes shortly after a necessity, demanded by the employees and perhaps incorporated in state law as a positive requirement. A few years ago the Weyanoke Coal Co. opened a bathhouse for its men. It was perhaps the first bathhouse in the state, and the mine workers had hardly any use for it. They preferred to perform their ablutions at home. But now bathhouses are beginning to be no longer classed as welfare provisions but as operating necessities.

J. W. Bischoff declared that welfare work was most successful when it was most diplomatically approached. He had introduced the Young Men's Christian Association activities into his camp, but he felt and the association felt that the first work should be recreational and that the impulse to use the facilities for religious meeting should be the outcome of the better class sentiment in the neighborhood.

V. E. Sullivan declared that he believed that welfare work to be successful must include the women and children in the homes; that only in that way would the advantage of the work be reformatory enough to be truly lasting. The pride of the foreigner in the institutions of this country and in the opportunities it afforded him would only be apparent when his wife and children shared with him in its benefits.

Along the same line and in favor of the village nurse were the remarks of R. Dawson Hall. He said that it would be found that the work of the village nurse was only secondarily nursing; that once nurses were intro-

duced their influence would be felt in the better feeding, housekeeping and hygiene of the neighborhood. The byproducts of nursing were as valuable as the main products. He emphasized, also, the mischievous part often played by the mine clerk and the company doctor. Many mine clerks become greatly harassed by their multifarious duties and in consequence are not diplomatic in dealing with payroll disputants and many a doctor with his bluntness and lack of sympathy with the sick creates enmity in camp where harmony would ordinarily prevail.

Mr. Hall advocated the greater employment of women as assistant mine clerks. Not usually so perturbed as men by their many disturbing duties, they tend to meet payroll difficulties rightly in the beginning before feelings become unduly exasperated. With a woman clerk the employees are disposed to discuss quietly and sanely whatever errors they may think they have detected in the fortnightly statement. The work also offers something of a career to the girls of a mining village. It is well recognized that there are few, if any, careers for women folk around such communities and the tendency should be as far as possible to find such places for those who are competent to fill them, giving practical experience and finding executive positions for those who are clerical work.

#### COMPANY PROVIDES CHURCHES AND DANCE HALLS

J. N. Schweitzer, general superintendent, Lundale Coal Co., Lundale, W. Va., referred to the introduction of a Red Cross nurse into the Lundale village. He said that now, when there is sickness in the home, the man is still able to go on working, which is good for him, his family and the company. The nurse does not necessarily stay in constant attendance on the patient but she finds somebody who will, and thus the man is released for his work. The company with which he was connected had built three churches for its employees—a Catholic, a Protestant and a church for colored people. It had a dance hall for white people and one for colored and baseball teams and playgrounds for both classes. It started a local mining institute which met once a month and discussed such questions as "Motor Haulage versus Mule Haulage for Gathering," "Best Way to Maintain Room Tracks," "Best Method of Disposing of Slate" and "Timbering." The company had a dairy with thirty cows and was providing good milk. It had a farm of twenty or thirty acres, so as to have the freshest vegetables for sale.

Frank Haas spoke in favor of the visiting nurse. He declared that there was a degree of suspicion when the nurses entered the work, but the diplomacy and sacrificing devotion they displayed soon overcame all the malicious criticism. They were extremely welcome now at all homes. He confirmed the idea that nurses did not serve simply in the capacity that their title designated. It was perhaps the least important of the services they rendered, excellent and useful as it was.

In a few words, E. D. Knight, chief engineer of the Cabin Creek Consolidated Coal Co., Kayford, W. Va., then appraised the value of the "indirect approach" to mine problems through the school and the home and instanced the cordial and even financial recognition by the men in the Cabin Creek Valley of the work of a minister and school teacher whose community work had been gratefully received. The chairman, J. R. Cameron, having appointed as members of the auditing commit-

tee H. E. Gray, W. E. Fohl and J. S. Walker, declared the meeting adjourned.

In the afternoon A. C. Callen, professor of mining, West Virginia University, Morgantown, W. Va., spoke briefly and well on "West Virginia's System of Mining Education," adding the contents of an excellent paper on the subject. Mr. Callen urged that the operators of the state show a greater interest in the school, which with an annual appropriation of \$10,000 a year is utterly unable to meet all the needs of the second greatest coal-mining state in the country.

He spoke of the three forms of instruction—the four-year course, the six-weeks' summer course and the courses in the field and of the need there was that the field instruction should be supplemented by addresses given by local men. Unfortunately, many local mining authorities are not good instructors. The cleverest men, he said, are quite apt to speak over the heads of their classes and merely mystify and tire them.

The discussion on this subject went somewhat adrift, for the breadth of the teaching at the West Virginia University and its extension work is so great that the specialized aims of the various parts of it are apt to be overlooked. The four-year college course is for engineers, superintendents and managers. The six-weeks' course is for mine foremen and putative mine foremen. The extension course is for the subordinate officials and for those who are seeking—on their way upward doubtless—such positions. There is a degree of commingling of purpose doubtless. A good way to become a competent manager is via a mine foremanship and consequently it is probably true that some college men have this foremanship in view or at least it might be better if they did, whether they do or not.

#### PRACTICE A NECESSARY SUPPLEMENT TO STUDY

But while college work needs supplementing by practice there is other practice besides that of work at the face, loading, dumping, ditching, slate picking and what not. Surely, practice in surveying needs a certain period of apprenticeship. Laying out railroad tracks, mine tracks, switches, following coal outcrops, designing houses, evaluating properties, studying coals, boring, locating dips, laying out plants, calculating stresses, loading and unloading machinery, building foundations, etc., etc.—are not these also things needing experience just as long and as painstaking as should be given to shoveling and handling the pick? The so-called "practical" men were present who regard the manual as the only occupation needing the skill that time alone can give. The college, they believe, can develop ripened judgment as to the largest of mine operations but cannot inform the scholar how he should tap the roof, hold a bar when taking down slate or drill a hole and tamp it.

Josiah Keelay said that he was afraid that few individuals around the mines would wait sixteen years to go into the mines, spend five years underground to get a certificate and the four years at college, and after all this painful experience and expensive training be content with a mine foreman's certificate. He would like to see the age limit for entering the mine set at fourteen instead of sixteen. A boy around the mines between fourteen and sixteen, if normal, could hardly do otherwise than get into trouble in those two years when the law thought him too young to work but somewhat too old to be compelled to attend school. He feels

to be too important to be doing nothing and as all the avenues of employment around a mining village are closed to him there is no other course than for him to spend his latent energies in bedevilment.

The chairman remarked that in leaving college he had gone to work in the machine shops and for only 18c. an hour, but he would have hesitated if that part of his practical experience had been lengthened to five years, hence he thought that a college man should be allowed some reduction in time when seeking a certificate of competency as a mine foreman. Surely the five-year period should be cut in two or even reduced to two years.

#### DESIRE TO ESCAPE HARD WORK IS WIDESPREAD

J. E. Vaughan, state mine inspector, said that one of the great drawbacks today was the desire of everyone to escape the burden of physical labor and to seek jobs as managers without having the competency of the workingmen whom they presumptuously undertook to direct. He defended the law which required that a boy be sixteen years of age before he went to work and the requirement that five years' experience at the face be required of men who are to be mine foremen. As one man remarked after the meeting, "We are faced with a condition. Mr. Vaughan may desire to set the world right. Let him do it if he can, but my judgment is that if the present standards of experience are required no college man will try to become a mine foreman, and if it is made obligatory that he become one on his way to higher executive positions, then the coal industry will have no college-trained engineers."

W. A. Craven wanted to know of Mr. Callen what effort was made in the six-weeks' course to teach costs of production. Mr. Callen replied that such training was regarded as merely incidental though it was emphasized in all the various departments of work. H. E. Gray and C. K. Brown, one the West Virginia University instructor at Elkins and the other occupying a like post at Moundsville, who also spoke, emphasized the work they are doing in that direction, the former saying that many of the students came to the work impressed with the idea that the cost of coal was practically the cost of loading it into the mine cars.

Messrs. Vaughan, Sullivan and Golden, state mine inspectors, then discussed safety and the necessity of the mine foreman's replacing his recommendations as to safety by commands which he personally sees are obeyed. R. Dawson Hall remarked that the state had a lot of men in its employ to whose duties might have been added the work of mine inspection. The legislators believed it best, however, to leave the work to men specially equipped and specifically paid for that office.

When, on the other hand, it wanted the operator to provide for safety it laid the burden on an executive officer who was already busy enough and whose work was daily becoming more burdensome—the mine foreman. The law required him to find time for safety inspection out of the multifarious commitments which his position as mine foreman—that is the executive officer of his mine—entailed on him. What wonder he neglected possible danger, a mere policing of the mine, for duties that were immediately necessary, which the economic needs of the mine demanded in no uncertain voice!

Successful supervision can never be obtained from

men with recognized economic functions to perform, men responsible for the tonnage, men who are called to solve the actual difficulties which must be met as and when they present themselves. Patrolling the mine is not work for men of this kind. Better make tax collectors and tax appraisers mine inspectors, for taxes can be collected at definite times, but mine difficulties—a wreck, a broken engine, a loosened water tube, a fallen fire arch, a stopped fan—must be immediately attended to; meantime the inspection of the company's employees is suspended. Specialization is needed if mine inspection by the operators' employees is to be made a success.

The morning session of the second day opened with a discussion on local mining institutes, the president saying that he had under instructions of the executive committee, which met April 17, invited each local mining institute to send two representatives of the meeting to discuss co-operation between the West Virginia Coal Mining Institute and their local organization. As none of the local institutes had held sessions since that time they did not have an opportunity to arrange an acceptance of the offer made and this meeting had to be content to listen to what the members of the West Virginia Coal Mining Institute thought would make the best line of co-operation.

#### PUBLICITY TO SUSTAIN INTEREST IN MEETINGS

A little pamphlet advising as to the recent and coming meetings of the locals apparently has been decided on as a means of sustaining interest by competition and publicity. It was suggested that the appointment of a paid secretary would be a positive service that would be appreciated and that though funds were inadequate a worthwhile secretary would take care of that difficulty. But no one seemed willing to have the association shoulder the risk even within the limits of its present surplusage and no one was mentioned who was likely to accept the proposed secretariat. Besides, what money was on hand was needed for publishing the proceedings. After talks by Bischoff, Vaughan, Reed, Craven and Hall the chairman left the matter to a committee on local institutes—Carson, Vaughan, Reed, Haas and Craven.

Discussing the matter of the "Relation of Percentage of Extraction of Coal Area to Cost of Mining," R. F. Carson read a short paper on the advantages of high-percentage coal recovery. W. E. Fohl, who followed, declared that the percentage of recovery regarded as somewhat generally feasible was about 90 per cent. Such a percentage gave about 1,500 tons per acre-foot. With a 60 per cent extraction only about 1,000 tons could be obtained for each acre per foot of coal thickness.

Where one desired to get as much coal with a 60-ft. extraction as he would get out of a 1,000-acre plot with a 90 per cent extraction he would be compelled to buy not 1,000 acres but 1,500 acres, or 500 acres more than what with frugal coal getting would have supplied his needs. If this is 6-ft. coal and the price is \$50 per acre-foot the coal land will cost \$300 per acre, or \$150,000. This will be quite a burden in the cost of coal production. Moreover, the larger acreage in the mine will involve more haulage cost, more drainage charges, high cost for ventilation, more timber, more rails, ties and electric wiring, in fact, an innumerable number of costs, many by no manner of means small.

It was suggested by another that the cost of coal in the hill was raised by the amount of money expended in its development, that the more coal a given plant produced the greater the saving on first cost, that it was profitable to take out near-hand coal clean even if the work were barely profitable, for the near-hand coal had at least the benefit of a short haul and waiting on its extraction delayed the inevitable expenditure of money for mine extensions and the charges for long hauls, expensive ventilation and what not. Moreover, an excessive land purchase at the commencement of operations involved large interest charges and taxes. It would pay best to buy less and use all of the coal purchased.

Mr. Kealey had a word about leased coal, but leased or not leased there are still development charges, and leased coal should not be wasted, the saving being based not so much on a desire to spare the property and salve feelings of the lessor as because to waste the lessor's coal is to waste the development of the lessee and make further operations more expensive.

#### PROPER EXTRACTION NECESSARY TO ECONOMY

Operators rarely have the matter of the economy of complete extraction put up to them in the proper light. It is to be pursued not only to save the expenditure for acreage but to save the outlay for development and to cheapen operation. The expense of driving advance heading enough to make a panel retreat is not so great as to overbalance all the economies of complete extractions when that extraction is made at the most favorable time and in the proper manner.

Frank Haas said that the recovery of coal pillars in the old workings of the Georges Creek region had been abandoned, but with much regret. At first the Consolidation Coal Co. obtained its output partly from new workings scientifically laid out to secure a maximum recovery and partly from the pillars of the old workings. The coal from the latter was extremely expensive, but the price obtained for the coal still made it possible to take the bitter with the sweet and run the mine with a proper degree of profit.

Gradually the new workings grew less and old workings formed a larger percentage of the whole. The outcome was, of course, not favorable, and with regret the recovery of old pillars was abandoned, but the means of access was left as before, and when it is feasible to pay the price the coal can be and will be recovered. No steps have been taken that will prevent recovery or make it difficult when the time for the work arrives. In fact the idea is merely to delay till a more favorable market makes work on the pillars profitable.

G. S. Jaxon, of the Link Belt Co.'s, Huntington branch, then read a paper on "Outside Coal Equipment." He stated that the plant should in every case be suited to the characteristics of the market to be entered and of the coal to be loaded. Figures should be given to the manufacturer, of the approximate percentage of each size to be accommodated, though with well-adapted equipment there is a certainty that the percentage of large coal will be increased considerably, and for this the designer will make full allowance. The operator should not ask for an hourly capacity based on a full eight hours' run, for no tippie works steadily for the full eight hours of running time. There are always delays more or less important due to wrecks and arrested transportation.

A six-hour day is about all that can be figured on. The hourly capacity should therefore be assumed as one-sixth of the daily capacity. Operators should not be satisfied merely to meet the present-day demands of the market they are entering or have entered for there is a growth in the demand for preparation and sizing, and consequently what is not demanded today is apt to be required tomorrow. But if the equipment is shaped to today's needs and not to those of tomorrow the outcome will be failure, for the equipment will have to be entirely overhauled and the tippie itself modified. Mr. Jaxon declared therefore that the operator must anticipate the future as far as he can, or he will have to rebuild every few years.

In the afternoon Joseph W. Reed, director of safety, Consolidation Coal Co., Fairmont, W. Va., read a paper on "Organization Methods and Results of Safety Departments," emphasizing the importance of a disposition toward safety as against a reliance on organization as if the latter were in itself an ameliorant of unsafe conditions. Safety work should be of two kinds, constructive and instructive. Every part of the plant should be made as near safe as construction can make it. Then officials and workers should each be trained in the needs of safety. He said the first dollar per man spent in instructive work with two dollars per man spent in constructive work will save five dollars in compensation. Another dollar in instructive work and no further expenditure in safety construction will save three dollars more and another still two more dollars. Thus the three dollars for organization and two dollars for construction will save ten dollars in compensation.

#### MACHINERY VITAL DURING LABOR SHORTAGE

J. W. Knowlton, of the West Virginia Coal & Coke Co., Elkins, W. Va., read a paper on "Mechanical Coal Loaders" in which he expressed forcibly the need which exists for the development of these devices in an age when labor is at a premium and skill more readily than ever obtainable. Labor with the large muscles of the back is being replaced by labor with the small muscles of the forearm backed by machinery and electric power.

The committees then presented their reports. The committee on resolutions presented a motion urging the legislature of West Virginia and the governor of the state to provide \$25,000 or more per year during the next biennium for the support of the mining courses, regular, shorter and extension, provided by the West Virginia University; it also laid a resolution before the meeting advocating the appointment of more inspectors.

The auditing committee approved the accounts in a report which was accepted by the institute, and the committee on local mining institutes introduced a resolution granting to such institutes the right to take out from two to ten memberships in the name of such institutes, paying for each membership \$5 per year, the number of memberships thus taken being limited to one for every ten members in the local institute. The delegate members would have the right to vote. It was hoped that at the next meeting there would be a number of delegates present who could then make the wishes of the locals known and suggest ways in which more complete co-operation could be satisfactorily arranged. After J. W. Bischoff had presented a motion expressing the regret of the institute in hearing of the unfortunate illness of its former secretary, E. N. Zeru, which motion was unanimously adopted, the meeting adjourned.

# Federated American Engineering Societies Formally Organized

All-Inclusive Engineering Organization, Embracing National, Local, State and Regional Society Membership, Is Founded to Promote Professional Consciousness and Co-ordination of Effort and to Encourage Participation of Engineers in Public Service

**P**UBLICITY, class consciousness, co-operation and public service formed the major chord of engineering harmony developed at the organization conference of the national, local, state and regional engineering and allied technical organizations which met in Washington June 3 and 4. Vigorous discussion and active debate, with numerous differences of opinion prevailed, but in every case majority rule and good sportsmanship for the common cause led to agreements that give promise of general support by the societies represented.

A joint conference committee representing the founder societies—the American Society of Civil Engineers, American Institute of Mining and Metallurgical Engineers, American Society Mechanical Engineers and American Institute of Electrical Engineers—had labored for many months in the formulation of a program of organization which served as a basis of the call for this meeting. In its work this committee was supported by the accredited representatives of about sixty other technical organizations. The initial step in the conference of these representatives was the adoption of a resolution favoring the formation of an organization which should be made up not of individuals but rather of technical societies.

The question which required the most extensive consideration of the conference was whether or not the individual or the society should be the unit of membership. The American Association of Engineers, whose delegates represented a membership of nearly twenty thousand, advocated the individual basis of membership. After the majority's opinion became evident, however, even the American Association of Engineers joined in the adoption of the following resolution:

"That it is the sense of this conference that an organization be created to further the public welfare where technical knowledge and engineering experience are involved and to consider and act upon matters of common concern to the engineering and allied technical professions, and that it is the sense of the conference that the proper organization should be an organization of societies and affiliations and not of individuals."

There seemed clearly to be a realization that two distinct national functions must be served by the engineers collectively: (1) Welfare work, which in all comment should be left to the American Association of Engineers, which is already effectively serving the needs of the individual engineer in this way; and (2) Professional activity, for which it seemed necessary to have a new agency formed. This professional activity was advocated for the development of class consciousness of a professional type among engineers, the co-ordination of engineering effort, the accomplishment of publicity needed on behalf of engineers so that others will recognize this professional position, and most of all, encouragement of the engineer in his participation in public service and the politico-economic life of the nation.

Numerous splendid addresses developed important aspects most forcefully, but space permits only a bare

recital of the topics and the speakers who thus contributed to the formal program:

"Functions of the Engineer in Public Affairs," Arthur P. Davis, President, American Society of Civil Engineers; Philip N. Moore, War Minerals Relief Commission, Washington, D. C.; and Leroy K. Sherman, President, American Association of Engineers.

Co-operation of the Engineer in State Affairs—"State Registration of Engineers," Theodore L. Condron, Chairman, Committee on License, Engineering Council, Chicago, Ill. Public Highways—"Federal-Aid Roads," Thomas H. MacDonald, Chief, Bureau of Roads and Rural Engineering, Washington, D. C.; "Economic Value of Good Roads," William D. Uhler, Chief Engineer, Pennsylvania State Highway Department, Harrisburg, Pa.

"Co-operation of the Engineer and the Business Man in Public Affairs," Homer L. Ferguson, President, Newport News Shipbuilding Co., Newport, News, Va.

"Value of Publicity for the Engineer," James H. McGraw, President, McGraw-Hill Publishing Co.

"The Engineer and National Prosperity," George Otis Smith, Director, U. S. Reclamation Service, Washington, D. C.

"Rendering Service," Frederick H. Newell, Professor of Civil Engineering, University of Illinois, Urbana, Ill.

"Co-operation of the Engineer in Local Affairs."—(a) Need of Local Affiliations; (b) Relations of Local Affiliations to Local Government, Civic, Business and Other Welfare Organizations; (c) Duties of Local Affiliations to National Council. Discussion opened by Marshall O. Leighton, Chairman, National Service Committee, Washington, D. C.

"The Executive in Engineering," Samuel M. Vauclain, President, Baldwin Locomotive Works, Philadelphia, Pa.

"Education of the Engineer for Public Service," Robert S. Woodward, President, Carnegie Institution, Washington, D. C.

"Engineering Research and National Progress," James R. Angell, Chairman, National Research Council, Washington, D. C.

Membership is to be by national, local, state or regional organizations or affiliations, either local or state, made up of any of several sorts of subsidiary bodies. Representatives of these will form the American Engineering Council, from which an executive board of thirty will be selected.

The Engineering Council, whose activities will ultimately be superseded by the new organization, is to serve ad interim to bring into real being the new federation.

Four important resolutions adopted were:

1. Urging payment of adequate salaries for the teachers of engineering in technical institutions.
2. Advocating adequate salary for engineering and other technical services to the Government.
3. Endorsing the bill for the creation of a Department of Public Works.
4. Expressing appreciation of the work of the Engineering Council, especially in making effective and operative the plan of organization; and expressing thanks to the Washington Society of Engineers and the Cosmos Club for their courtesy and assistance during the sessions of the conference.

# THE CAPITOL

BY PAUL

WOOTON

## Will Urge That Assignment of Cars Is Only Available Alternative

**T**HE Interstate Commerce Commission expects to report immediately on the Harding resolution which amounted to a challenge of the commission's right to use assigned cars for railway fuel. Probably the report will claim authority under the previous Supreme Court decision authorizing assigned cars, with the interpretation that the new law applies only to commercial coal and would be impossible of enforcement with respect to railroad coal, as the only alternative to it would be confiscation, which under the law is even less desirable.

## Inquiry Into Profits Must Wait Awhile

**A** RESOLUTION proposed by Senator Harris of Georgia relative to the publication of excess profits in the coal industry passed the Senate and was referred by the House of Representatives to its Ways and Means Committee. This was practically the last legislative act of the session which closed June 5. This resolution provides that the Secretary of the Treasury furnish from income and excess profits tax returns of 1918 the following information for all corporations which earned in excess of 25 per cent of their capital stock: Invested capital, capital stock, net income, taxes, ratio of tax to income, and other items calculated to bring out in detail any large profits either calculated as percentage of net income or percentage upon invested capital. In view of the fact that the House did not act on this matter, no further developments can result until next session.

## We Will Soon Know What Coal Is on Hand

**I**N COMPLIANCE with the request of the Bituminous Coal Commission that it make an immediate inquiry, the Geological Survey has sent out 5,500 inquiries regarding the present stocks of coal and the probable demand existing for bituminous coal. Replies by June 12 from this representative list are expected to develop facts regarding mine production needs for the balance of the year. The inquiry will cover the stocks of anthracite in dealers' hands.

A resolution was presented by Senator Walsh, and accepted by the Senate, requiring the Interstate Commerce Commission to ascertain the following important items:

"(a) What amount of bituminous coal mined in the Pennsylvania and West Virginia fields during the months of March and April, 1920, was dumped over tide-water piers;

"(b) What is the probable amount of the coal mined in these fields that will be shipped to tidewater in the next six months;

"(c) What percentage of the coal dumped at tide-water during March and April was used for foreign bunkers and export cargo;

"(d) From what ports were these exports made and how much from each;

"(e) What percentage of the coal dumped at tide-water in March and April moved coastwise;

"(f) How many railway cars were used in these months to carry the coal which went offshore for foreign bunkers and cargo;

"(g) To what extent has the price of coal for locomotive use on American railroads been raised due to the upbidding of coal prices by foreign buyers;

"(h) To what extent does the eastern coast section of the United States depend on shipments of bituminous coal by water; and

"(i) What is the total tonnage of bituminous coal shipped by water in normal times to supply the necessary requirements of the Eastern coast sections."

## Trade Commission Not to Insist On Reports Unless Maynard Injunction Is Vacated

**N**ELSON B. GASKILL, head of the Federal Trade Commission, has notified J. D. A. Morrow, vice-president of the National Coal Association, that the commission will not serve notices of default in filing coal production cost reports against such of the bituminous coal operators as may choose not to file such reports, nor will it proceed by way of mandamus or otherwise to compel such operators to file these reports, unless and until the injunction order issued by Justice Bailey in the Maynard case shall be vacated.

"The commission regards itself as bound by the Maynard decision only to the extent of the order therein issued," Commissioner Gaskill states, "but it believes that it would be unfair to those who stand on the same footing as the Maynard Company, to institute either penalty or mandamus proceedings against them and compel them to elect between additional litigation and the accumulation of penalties dependent upon the final result in the Maynard case."

The statement was made in response to the suggestion of Mr. Harkness, that such an expression on behalf of the commission would relieve a considerable uncertainty which exists among coal operators.

The commission, Mr. Gaskill said, had the hope that the value of these reports and the bulletins which are based thereon would continue to appeal to a sufficient number of the bituminous coal operators and that without regard to the Maynard decision or this expression of purpose to refrain from penalty or mandamus proceedings, the work might go on, the continuity of reports be unbroken and the body of statistics increase rather than diminish.

## Doubts Authority of Commission To Forbid Coal Exports

Chairman Clark Recounts Events That Caused Acute Coal Shortage—Seeks Data That Would Justify Preferential Treatment

CHAIRMAN Clark of the Interstate Commerce Commission is not satisfied that the commission has the power to prohibit exports of coal. This and other very important statements are contained in letters written by Mr. Clark to Senator Lodge and to Senator Kellogg.

In that connection a further blow was dealt the embargo proposition by the refusal of the Committee on Interstate and Foreign Commerce of the House to report out a bill forbidding the exportation of coal.

Senator Lodge wrote Commissioner Clark concerning the shortage of coal in New England. In his reply Mr. Clark said:

"There is no disputing the fact that the fuel situation in the country is in a deplorable condition and that the necessities of various localities are most acute.

"In prewar days the New England supply of coal moved largely from tidewater ports such as Hampton Roads, Baltimore and Philadelphia by water. The rates were lower that way than they were all rail. During the war the price of water transportation increased so much that the rail-and-water rates became substantially higher than the all-rail rates. A vigorous effort was made to supply New England, with the result that when the armistice was signed there was an unusually large supply on hand in that section. Shipments immediately fell off to almost nothing. Now there is a serious shortage and every reasonable effort is being made to relieve it.

### POWERS CONFERRED BY TRANSPORTATION ACT

"The Transportation Act confers upon the commission broad powers with regard to service and preferential movement. I confess that I am not entirely satisfied that we have power to prohibit export shipments in order to enlarge the domestic supplies unless it can be fairly based upon a transportation emergency. The export coal is what is commonly called spot coal and purchasers of it are bidding far higher prices than underlie the contracts for domestic coal. If export coal is embargoed the spot coal will move to those places where the highest price can be secured.

"We should be very glad indeed to see New England amply supplied with coal and to see that supply moved by water from the tidewater ports, because there is every reason to desire relief from the badly congested conditions of the railroads.

"Largely as a result of the strike in the bituminous coal mines last winter large quantities of coal were moved from the East to the West out of the normal current of traffic and of trade. When the men resumed work under the agreement to abide by the decision of the Bituminous Coal Commission a great deal of this coal that had been sent west to supply imperative needs and avoid suffering and distress was refused by the consignees because cheaper coal could then be purchased nearer at home. This had the effect of very seriously delaying a large number of cars and the railroads have been struggling with the effort to secure relocation of these cars; in other words to get them sent to the Eastern roads, where they are badly needed for fuel

movement and where because of car shortage bituminous mines are producing much less than they would otherwise produce.

"The carriers finally decided that they were unable to effect this movement without the support of a service order by the commission. Several days ago we issued such an order and at the present moment large numbers of empty coal cars are moving from Western roads to Eastern roads, frequently in trainloads, and this movement is to continue from day to day until some 30,000 empty coal cars have been so relocated. This ought to improve the situation. I may mention that in like manner we are relocating some 20,000 empty box cars by sending them from Eastern roads to Western roads.

"It is true that we authorized the use of assigned cars for railroad fuel. This is the policy which obtained under a decision of the commission made some twelve years ago, contested by the railroads and sustained by the Supreme Court, until during the war the Railroad Administration set it aside. It rests upon the fundamental principle and fact which none can deny, that the railroad must have fuel or it can serve no one.

### DIFFICULTIES NOT UNDERESTIMATED

"I do not underestimate the difficulties of the situation. I am inclined to think that the importance of the volume of movement of export coal is rather exaggerated. Of course, a million tons a month is a large amount when there is an acute shortage but it is only a small percentage of the normal production when the mines are fairly supplied with cars and the miners are at work.

"In addition to the relocation of cars, to which I have referred, we have issued a service order directing the rerouting of freight via open routes when the routes designated in the billing are congested and the freight is unable to move promptly.

"We have organized committees at the more important commercial and railroad centers of the country consisting of an employee of the commission, an official of the railroads and a representative of the shippers. These committees are actively engaged on the ground in doing everything they can do to facilitate the movement of freight and the release of cars, and the situation is being closely and carefully watched under an organization that it prepared to deal from day to day with new conditions or developments.

There is a shortage of equipment due to the fact that during the war period the units of cars acquired did not equal the normal number of retirements. The railroads find it extremely difficult to finance the acquisition of new equipment. We are endeavoring with due regard to business principles to utilize the fund provided for loans to railroads under our certificates in the Transportation Act. We are doing and shall do everything humanly possible to get the highest degree of efficiency out of the available facilities, but under the very best that can be done there will necessarily be inconvenience and a shortage of effective transportation as long as the volume of business offers and until the railroads can get to a more effective basis of operation and secure the construction of additional equipment.

"The switchmen's strike that has been on for a number of weeks has interfered much more with the movement of traffic than the public generally appreciates. Many roads are operating far below normal because of their inability to secure men to perform the switching service. They also are handicapped by inability to get

men in their machine shops and car works to make repairs upon equipment.

"Presumably the Railroad Labor Board will in the not distant future hand down decisions on the wage questions that are before it. If they grant substantial increases in wages it is quite probable that more men will be attracted to the railroad service, but there is another side to that and that is that operating expenses of the railroads will be correspondingly increased and their demand for further increase in rates to compensate them for this increased expenditure will not be very welcome to a considerable part of the shipping public. The general sentiment of the country is, I think, in favor of granting the generally increased rates that are necessary under existing conditions. That is evidenced by thousands of expressions that come to us and by the indications that opposition to the proposal will be voiced in the proceedings now in progress before us by only a limited group or number of shippers."

Senator Kellogg's letter dealt with a similar situation in the Northwest. Chairman Clark's reply to Senator Kellogg in part is as follows:

"We are and for some time have been sensible of the situation and of the importance of getting the largest possible quantity of coal up the Lakes during the season of navigation. We have been and are striving in every way to augment the car supply on the Eastern coal carrying roads. There are, however, some conditions on the railroads which are entirely beyond our control. For example, the Pittsburgh & Lake Erie, one of the heaviest coal carrying and producing railroads in western Pennsylvania, has been functioning intermittently and to a fraction of its normal condition for several weeks on account of labor troubles. The same troubles have operated in a lesser degree upon other of these coal carrying roads and at some of the principal Lake ports.

"Several days ago we issued orders for the immediate return from Western roads to Eastern roads by continuous daily movement of about 30,000 empty coal cars. Yesterday instructions were issued to discontinue the use of open-top coal carrying cars for loading automobiles and other commodities that can be shipped in box of other kinds of cars. We are doing everything possible to increase the facilities for the movement of this coal.

"The fuel situation all over the country is acute. The New England interests are, as you know, pressing with equal vigor for movement of coal to New England. We hope to have a marked improvement in the situation promptly and trust that will continue, but, as I have said, we cannot control the labor difficulties. We have organized committees at the more important railroad and commercial centers throughout the country, each consisting of an employee of the commission, a representative of the shippers and a representative of the carriers, to keep actively in touch with the local situation, keep us fully advised and exert every effort for prompt loading, unloading and movement of cars.

"I was told something with regard to the coal situation at the head of the Lakes which seems disturbing and which ought to be cleared up, that is that while there was a great deal of anxiety about the supply of Lake cargo coal and because the season of navigation is wearing away, the usual dealers or purchasers of this coal have so far refrained in large measure from making contracts or placing orders because of their dissatisfaction with the prices which they could obtain. I am wondering if you can get at the truth of this matter and ascertain which of those dealers or purchasers has

placed his contracts and orders, with what producing corporations or operators, from what mines, the roads on which those mines are located, and in what quantities. That information will be of substantial help in further consideration of the request for preferential movement."

## Inspectorates of Pennsylvania Bituminous Field Are Redistricted

CHIEF SEWARD E. BUTTON of the Pennsylvania Department of Mines has just completed the redistricting of the bituminous mining region of the State.

Owing to the gradual changes that have taken place in the region, by which certain parts of it show increased mining operations, while other parts show a decline, a redistribution of the mines was necessary to the end that the work of the thirty inspectors might be made more equitable as well as more effective.

The bituminous region of Pennsylvania, comprising about 15,000 square miles, is the greatest coal-mining territory in the United States, producing annually about 160,000,000 net tons with an army of approximately 180,000 employees.

The work of redistricting the region and re-arranging the lines of the thirty districts was quite a task, requiring not only engineering and drafting skill but a thorough knowledge of the region and of mining conditions generally. The capability and versatility of the inspection force are evidenced by the fact that a committee of three, selected from their number, accomplished the task in a manner thoroughly satisfactory to the department. With their intimate knowledge of conditions in the different districts they were enabled to accomplish the work within a week without expense to the state, thus saving the necessity of employing engineers and draftsmen for the purpose.

## Lake Coal Shipments Increase, but Are Still Below 1919

ON Saturday, May 1, the Lake season was formally opened. Complete figures given by the Geological Survey show that the dumpings of bituminous coal at Lake Erie ports during April amounted to 329,202 net tons, of which 27,630 tons were vessel fuel and 301,572 were cargo coal. Cumulative dumpings up to May 22 were about 1,159,000 tons, as compared with 4,269,000 tons and 4,945,000 tons for the corresponding periods of 1918 and 1919, respectively.

Dumpings of bituminous coal for the first three weeks of May have been as follows:

Week Ended	Cargo Coal	Vessel Fuel	Total Dumped
May 8	243,190	21,931	265,121
May 15	221,775	33,187	254,962
May 22	278,487	31,618	310,105

The total tonnage for the week of May 22 represented an increase over the preceding week, but was barely one-third of that of the corresponding period of last year.

Dumpings during the first three weeks of May, shown in the following table, were only 37 and 33 per cent respectively of those of the corresponding weeks of 1918 and 1919. Vessel fuel is included.

Week Ended	1918	1919	1920
May 8	723,294	718,366	265,121
May 15	796,727	911,309	254,962
May 22	713,126	906,201	310,105
Totals three weeks	2,233,147	2,535,876	830,188

# Cokeburg Shaft, Just Sunk Into Coal, Explodes, Causing Death of Six Men

While Engaged in Constructing Airways and Setting Buntons of a New Shaft in the Ellsworth Field a Violent Explosion of Gas Occurred, Throwing Three Men Out of the Shaft and Hurling a Sheave Wheel 900 Yards

**A**T TWENTY minutes to nine on the morning of June 2 an explosion occurred in the airshaft of the Ontario Gas Coal Co. near Cokeburg, Pa., causing the death of six men. This mine is on the Pigeon Creek branch of the Monongahela Division of the Pennsylvania R.R.

Officials and owners of the Ontario Co. are all Pittsburgh men, and this operation is one of the latest attempts at further development in the so-called Ellsworth Field. The Ontario Co. owns about one thousand six hundred acres of coal of the Pittsburgh bed, which throughout this section averages 5 ft in thickness. To date activity has been confined solely to constructing the surface buildings and to the sinking of the main hoisting and air shafts. H. K. Knopf, of Pittsburgh, has had charge of both sinking operations, which have been under way since last November.

## SIX MEN WERE AT WORK IN THE SHAFT

About a week before the accident occurred the coal bed was reached in the airshaft at a depth of 430 ft. The shaft measures 14 x 14½ ft. in inside dimensions and is concrete lined, the walls having a thickness of 16 in. A bucket was used for the hoisting and lowering of the men and materials. The men were employed mainly in driving four arched airways which will connect later with the main aircourses that have been planned. Work at the bottom was confined to the primary stage and when the explosion took place none of the headings had been driven more than 15 ft. from the shaft.

On the morning of June 2 three men were working at the bottom and a like number about half way down. These latter were placing buntons for the support of the stairway. Mines in this district are highly gaseous and the men had been frequently warned against carrying into the shaft either open lights or smoking materials. Especially was this impressed upon them after the coal had been exposed. Superintendent E. J. Hackett had personally cautioned Foreman A. H. Sweeney, one of the victims, not to let any of the men at work in the shaft or at its foot take any chances of this nature.

## EXPLOSION BROKE WINDOWS THREE MILES AWAY

The explosion lasted about half a minute, and its force was sufficient to break windows in houses at Ellsworth, which is located some three miles distant. A 30-in. sheave wheel was torn loose from the temporary headframe at the top of the shaft and hurled for a distance of 900 yd. Upon landing this wheel buried itself in the ground past its axle. All six men in the shaft at the time were killed; the three who were working about half way down were ejected as if from the mouth of a cannon.

The following is a list of the victims:—Alva H. Sweeney, Tom Silak, Ignatz Sulitz, Eli Yonish, Charles Johnson (colored) and Steve Moloryski. Silak, Sulitz and Sweeney leave families. All of the men were from

Cokeburg with the exception of Johnson, who made his home in Pittsburgh.

H. Klingensmith, who trained the mine-rescue team that won first place in the national contest at Forbes Field, Pittsburgh, last fall, was one of the first to hear of the accident. He immediately enlisted the services of Mark Jones, captain of the team; N. Moore and H. D. Scott to aid him in removing the bodies from the shaft.

In the afternoon J. T. Ryan of the Mine Safety Appliances Co. of Pittsburgh, arrived. He assumed control of the work and placed several trained men at the disposal of the company. It was late in the evening before the last body had been recovered.

It appears that but one conclusion can be drawn as to the cause of the explosion, namely that a large pocket of gas was liberated from the coal at the bottom. While the coal is but 5 ft. in thickness the men were driving a heading 7 ft. in height. A foot of drawslate overlies the coal and an equal thickness of roof coal occurs above this before a firm sandstone roof is encountered. The men at the bottom had been supplied with air through a line running down the shaft.

## GAS BELIEVED TO HAVE BEEN LIBERATED

It is believed that much gas had been liberated at the bottom unnoticed by the men there engaged and that the gas in moving up the shaft encountered an open light of some kind held by one of the men placing the buntons.

The bodies of the men recovered from the bottom bore no marks indicating that they had been subjected to the main force of the explosion. All, however, showed evidence of subjection to heat. That the first and most violent explosion probably began about half way up the shaft appears to be the most plausible theory. In such a case the men at the bottom may well have been exposed to much less violence than those in the shaft. They were doubtless either killed by small explosions succeeding the first, in which event they probably met death from flame rather than through concussion, or succumbed to the blackdamp that settled at the bottom.

While the force of the explosion was great, no damage was caused to the buildings on the surface other than the breaking of glass by concussion and some minor damages inflicted upon the power- and boiler-house roofs by falling pieces of timber ejected from the shaft. Around the concrete collar of the shaft some of the effects of the explosive force can be clearly noticed. In many places the concrete wall has been cracked entirely through, and it is apparent that this portion was subjected to the full concussion.

That the gas was ignited from shooting at the bottom does not seem probable. If that had been the cause the bodies of the heading men would have shown to a greater degree than they did the effects of having been in the path of the expanding wave and indeed they might have been thrown out of the shaft altogether as were the bodies of the three men who were nearer the surface.

## American Wholesale Coal Association Holds Annual Convention

Maintenance of Prices on a Reasonable Basis Is Keynote of Meeting—Taxes, the Transportation Act, Railroad Rates, Legislation and Wholesaling Are Among the Important Topics Treated—Association Adopts a Platform

WITH more than 80 per cent of the eligible membership represented by registered attendants, the American Wholesale Coal Association held its third annual convention June 1, 2 and 3 in Pittsburgh. Not only was the registration excellent, but deep interest was demonstrated by an attendance estimated at more than three hundred at every session. The success of the meeting was assured, as the program included many matters of vital concern to the dealer.

As a keynote to the convention activities Noah H. Swayne, 2d, president of the association, emphasized the importance of price maintenance upon a reasonable basis. He made clear that any wholesaler who advanced his prices beyond a figure that could be convincingly defended was only subtracting from the ultimate total income of the industry over extended periods.

The business reports of the session were covered by the secretary-treasurer, Mr. G. H. Merryweather, and the managing director, George H. Cushing. From these reports it was easy to realize the extended activities and the large importance to the coal dealer of the problems which have been handled in the Washington offices of the association. Federal regulation, many details of control of coal, transportation tax on exports, the merchandising margin, port embargoes, assigned cars, prepayment of freight on Canadian shipments, and other equally important topics were given their deserved attention in Mr. Cushing's report.

### SMOKELESS COAL DEPENDENT UPON CAR SUPPLY

The problems of smokeless coal supply and exports were covered at length by E. J. McVann, secretary of the Smokeless Association. The whole problem was regarded by this speaker as one of transportation, and emphasis was particularly placed on the low car supply of the Norfolk & Western, between 50 and 60 per cent now being normal, instead of the former 100 per cent car deliveries which operators had come to expect from this railroad.

Tax gathering was entertainingly described and the problem of the tax gatherer effectively set forth by C. B. Hurrey, of the U. S. Internal Revenue Bureau. The speaker described in an interesting manner the large increases in taxation and the greatly aggravated problems in all lines of business and expressed sympathetic appreciation of what he now considers "a controlling factor" in business.

Naturally transportation appealed to the wholesalers as one of the most important factors affecting their business. Discussion of the Transportation Act of 1920 by E. J. McVann therefore commanded considerable interest. As a résumé of this act the association has prepared a circular summarizing the salient features of this legislation as it affects coal. This emphasizes, as was effectively pointed out by Mr. McVann, that the Interstate Commerce Commission now dominates the transportation problems in every aspect, with powers far beyond that realized by those who have not

thoroughly studied this act. The speaker therefore urged that even greater attention be given to this important subject than it has thus far received by most coal interests.

To make clear the machinery by which legislation is developed in Washington, a discussion was prepared by Mr. George H. Cushing which elucidated the complicated system of congressional law-making. It was particularly emphasized that Congress rarely, if ever, is really responsible for the legislation; the blame or credit usually should go to the small sub-committees or more frequently to the chairman of the committee handling the legislation before it is reported to the houses of Congress.

### WARTIME LAWS MAKE GOVERNMENT A TRUST

As a review of the present legal situation, Judge Milton C. Elliott, of Washington, addressed the convention on the subject "The Laws Which Control Private Business." Judge Elliott placed special emphasis upon the tremendous scope of governmental activity which was indispensable to the successful prosecution of the war, but which now leaves us in the hands of what may be characterized as the greatest trust which the world has ever known. The address afforded an excellent résumé by one who is thoroughly conversant with our present economic legislative situation.

William B. Colver, chairman of the Federal Trade Commission, addressed the convention on the subject of "Wholesaling." He developed the analogy of ordinary human relationship to the operations of the common carrier, emphasizing that one may justifiably demand from society in proportion to what he contributes. From this theme he outlined the regulation by the Federal Trade Commission which, in his opinion, should most concern the problems of the dealer interests.

Speaking on the subject of "Association" George D. McElvane, secretary of the National Association of Sheet and Tin Plate Manufacturers, dwelt particularly on open competition as affecting price problems.

### TIDEWATER EXCHANGE ACTIVITIES DESCRIBED

The problems and activities of the new Tidewater Coal Exchange were described by Chas. A. Owen, who is chairman of the board of directors of this new organization.

The problems of reconsignment, diversion, and other analogous coal regulations were developed by a symposium in which L. W. McClennan, E. J. DuBois, W. R. Coyle, H. H. Morris and others participated. The importance of this subject has also led to the preparation by the managing director of the association of a comprehensive résumé of rules now in force on these subjects. This has been formulated in a pamphlet entitled "Present Diversion and Reconsignment Rules and Charges on Coal" issued under date of June 1 and distributed to the membership at that time. The resolutions on this subject set forth below make clear the stand of the association in these matters.

The membership of the organization in formulation of its resolutions desired to recognize the continuing importance of reconstruction activity and the combined opportunity and obligation of each industry to clearly develop the part which it proposes to take in these matters. Instead of conventional resolutions, it was therefore decided to adopt a comprehensive platform for the guidance of association activities and effort in the coming year. This took the following form:

We, the members of the American Wholesale Coal Association, in order to effect a reconstruction in our country, establish equality of opportunity and obligation, and retain the common heritage of liberty, do publish and declare this platform to be a true expression of certain of our rights, privileges and obligations as coal men and as Americans.

#### REPEAL OF WAR LAWS NECESSARY TO PRODUCTION

"The powers not delegated to the United States by the Constitution nor prohibited by it to the states are reserved to the states respectively or to the people." (Constitution of the U. S. A.)

The waiver of rights in time of war, done for the common good, should not continue after the victory has been won, and the speediest return to a period of ample production and industrial prosperity is gained, not by new restrictive measures, but by the repeal of those laws which by the violation of sound economic principles have served to stifle and restrict rather than to foster and encourage.

We re-affirm and reiterate the position of the Cleveland convention (1919) that this association opposes any legislation tending to return coal to Federal control.

Specifically, it stands opposed to Senate Bill 4,087 (known as the Frelinghuysen Seasonal Rate Bill) and Senate Bill 4,089 (known as the Frelinghuysen Coal Commissioner Bill) and any other measures of similar purport as tending to return coal presently to Federal control.

While conceding to the railways the right to declare embargoes on account of congestion and for the duration of the congestion only, we insist that all embargo notices shall be so drawn as to restrict shipment to the congested district, and not to discriminate unfairly against any of the shippers who habitually use that terminal or district.

"To the efficiency and the permanency of our Union, a Government for the whole is indispensable. No alliances, however strict, between the members can be an adequate substitute." (Washington's Farewell Address.)

We believe this to be true of our nation and also to be true of our industries. We believe that coal can and will find intelligent and coherent expression when three great national associations, each being truly representative of its part of the coal trade, shall, through delegates properly appointed, meet and discuss all matters affecting the good of the industry and the welfare of our country in its relation to the coal industry, and we authorize the proper officer of this association to appoint, at any time, a committee to meet with similar committees from the other associations, for the purpose of advancing the interest of its members and the good of American industry.

#### ADVOCATES FINANCIAL HELP FOR RAILROADS

It recognizes that the railways need speedily vast sums of money, both as capital and as revenue, if they are to discharge properly their obligation to supply transportation to industry. It recommends that the railways be put in position to maintain a proper margin between operating cost and revenue.

"But let there be no change by usurpation, for though this in one instance may be the instrument of good, it is the customary weapon by which free governments are destroyed. The precedent must always greatly overbalance in permanent benefit any partial or transient benefit which the usage itself can at any time yield." (Washington's Farewell Address.)

It authorizes the Executive Committee, if at any time in its judgment it deems such action necessary, to assume in the name of the association the defense of any of its

members who are prosecuted for alleged infringement of regulations, which in the judgment of the Executive Committee and its counsel are improper, invalid and unconstitutional.

This association is opposed to a further continuance of the theory that the right of contract between buyer and seller is subject to approval of and alteration by administrators.

It re-affirms the action of the Cleveland convention (1919) that the coal industry can never be properly profitable until a separate margin is added to the mine price to cover the cost of wholesale merchandising of coal, and paid to whoever earns it.

It endorses the recommendation of its officers that 8 per cent of the quoted basis should, under present industrial conditions, be considered the minimum wholesale merchandising margin.

This association disapproves of the existence of any necessity for the wholesale seizure of private property on the part of common carriers who happen to be custodians of that property. Should necessity for such seizure, in the opinion of the common carrier, arise in the future, the law existing as of January, 1917, is amply sufficient to determine the right and obligation which exists between the owners of the property on one hand and the common carrier on the other hand.

The association instructs its Executive Committee and other officers to use every proper effort to establish firmly the principle that when coal is confiscated by any transportation company it is taken with the merchants' rights attached.

This association approves the theory of a uniform set of rules regarding the presentation of claims and the settlement of claims between the shippers and the common carrier, and in order to open an intelligent discussion on this subject, it calls upon those officers of the Railroad Administration who are custodians of a certain set of rules covering the presentation of these claims, which rules were carefully drawn up by a joint committee of shippers and railroad claim agents, to publish these rules and to send them with the endorsement of the committee to the Interstate Commerce Commission or the proper tribunal for approval and promulgation.

#### RECOGNIZES NEED OF HANDLING TRAFFIC PROBLEMS

It takes cognizance of suggestions from several local associations that it should undertake to handle traffic questions of importance which need immediate and vigorous attention.

It endorses the recommendation of the Executive Committee that for the immediate future the employees of this association be used to gather all needed information on any national traffic question and that to the Executive Committee be left the employment of such experts as may be necessary to present any formal protest or institute other proceedings.

Having received from its officers a report that, owing to the rules and regulations of the Central Coal Committee and the U. S. Railroad Administration, many coal men were in December, 1919, dangerously near to bankruptcy, and having received from the same officers the report that this disaster was prevented largely by the good offices of W. P. G. Harding, Governor of the Federal Reserve Board, who procured payment to coal men of vast sums of money and other relief, it expresses itself profoundly grateful to Mr. Harding and his associates on the Federal Reserve Board and the War Finance Corporation for their disinterested action and timely helpfulness.

For the coming year the following officers will serve the association; President C. L. Couch, Weaver Coal Co., Buffalo, N. Y.; vice-president, Borden Covel, Northern Coal Co., Boston, Mass.; secretary-treasurer (re-elected), G. H. Merryweather, Waubun Coal Co., Chicago. These three officers, with twenty-five others elected to the Board of Directors, will select from their number the Executive Committee of ten to function for the same period.

# Production and the Market

## Weekly Review

*Car Supply Changes Slightly for the Better—Buyers Make Offer Which Demoralizes Market—Anthracite Trade Featureless—Coke Somewhat Better—Demand Rising That Exporting Cease and Coal Be Reserved for American Factories*

S LIGHT improvement in the car situation marked last week's business. The car movement is expected to improve slowly, but prophecy is not safe with so many uncertainties ahead. The Baltimore & Ohio Ry. seems the best equipped of any. It is running about 40 per cent of full strength, but the Pennsylvania R.R. is giving the poorest of car service and Pittsburgh & Lake Erie, if anything, less. Business on Lake Erie has made some improvement and much is needed, for fears are becoming quite acute as to what will happen next winter and even earlier if transportation facilities do not improve. Coal is still being commandeered by the railroads.

It is usually charged that operators conspire and combine to raise prices. The fact is that whenever prices rise spectacularly it is the buyer who furnishes what advances are made. Last week a firm startled the Pittsburgh market by offering \$12.50 f.o.b. for 10,000 tons of coal when spot coal was selling around \$8 and \$9 per ton and smokeless entering pools 9, 10 and 11 was selling between \$9 and \$9.25. The effect on prices was

distinctly bad. With such offers what chance has the conservative element to keep prices down?

Similarly in the Guyan region an exporting firm has been seeking coal at \$9 per ton and it is hard for the producer not to accept what is so strongly urged upon him. There will always tend to be profiteers when there are profit offerers around.

Much feeling exists about the purchase of railroad cars by coal corporations in the southwestern section of West Virginia. It is felt that in a short time, if this is allowed, only millionnaires will be able to operate mines, for without private cars it will be impossible to do business.

Anthracite receipts are, of course, more adequate than bituminous, though in New York the tonnage does not meet with market demands. Philadelphia is better supplied. The coke situation is somewhat cleared and the byproduct ovens are receiving more nearly their requirements. A burning question in New England is whether coal exports shall be forbidden till the United States is supplied.

Average Daily Production of Bituminous Coal\*

1228

# Reports From the Market Centers

## New England

### BOSTON

*No Change Is Noted in Bituminous Situation—Prices Continue Upward Swing—Gateways Are All Open—Trade Discounts Talk of Embargo Against Export—Hampton Roads Dispatch Continues About Normal—Anthracite Is Unchanged.*

**Bituminous**—There are few signs now of any marked change for the better in the steam grades. The pressure to get spot coal continues quite strong and the extent to which railroad seizures continue adds much to the general anxiety. Admittedly, the problem is one of adequate transportation.

Continued light shipments all-rail and a general lack of cars and motive power will throw an increased demand upon the tide-water piers, and it is by no means certain this would have any favorable result.

In every direction there is a buoyant market. In Central Pennsylvania, especially, prices continue their upward swing. The demand is broad enough to take in practically all grades, which share in the most active market seen since August, 1917. In the Fairmont district \$9 per net ton has been freely paid for spot shipment.

The Boston & Maine road lifted its embargo on May 29 and for more than a week now all the New England gateways have been open. A somewhat increased tonnage is already in transit.

Much has been said the past week about stopping the export of steam grades. The trade here is not taking any such move with any great seriousness, for it is realized it would not be much more than a quack remedy.

The State of Massachusetts has appropriated \$25,000 to re-establish a State Fuel Administration and it is understood that J. J. Storrow will soon take charge. If the same energy could be directed toward curtailing non-essential industries here and elsewhere, it is the judgment of the trade that more good would result.

At Hampton Roads despatch continues about normal. Export prices are still soaring. Those consumers who decided early in the season to take Hampton Roads coals are getting their contract quotas.

Steam grades at wholesale are quoted about as follows:

	Clearfields	Cambrias and Somersets
F.o.b. mines, net tons	\$6 75@ \$8 25	\$7 25@ \$8 50
F.o.b. Philadelphia, gross tons	9 40@ 10 00	10 60@ 11 35
F.o.b. New York, gross tons	9 80@ 10 40	10 40@ 11 75

Poahontas and New River are quoted on cars Providence and Boston at from \$11.60 \$14.50 per gross ton for inland delivery.

**Anthracite**—In domestic sizes there is no material change. Barge movement continues with fair regularity, the aggregate tonnage comparing favorably with that of the last two years. Current receipts are somewhat better.

Notwithstanding the advance in the price of steam sizes, the latter continue in good request. There is so much difficulty this season in arranging for supplies of bituminous, that an increasing number of consumers is considering the use of the buckwheats for at least a portion of their supply. Buyers have learned to discriminate between grades, and fresh-mined rice coal is finding a ready market.

## Tidewater

### NEW YORK

*Demand for Anthracite Is Strong—Receipts Are Below Requirements—Bituminous Situation Is Active—Supply of Coal Does Not Meet General Requirements.*

**Anthracite**—There has been no let-up in the demand for coal. Receipts for the week just ended show a slight improvement, but the volume of coal coming to the New York tidewater is still small. The harbor situation continues to be bad.

Production is reported to have recovered slightly. Demand is strong in all sections. Inland dealers between New York tidewater and the mines are said to be well stocked, while embargoes on shipments to New England are in the main removed. The West and Canada are in the market for heavy tonnages.

The market continues to be hazy. Price schedules are tentative and subject to alteration following the award to be made by the anthracite coal commission appointed recently by President Wilson.

Locally the situation is far from normal. Retail dealers are not receiving enough coal to keep all of their equipment busy and are short of stove coal. There is a good demand for the steam coals. Spot quotations at the mine for these sizes range about as follows: Buckwheat, \$4.25 to \$4.75; rice, \$3.25 to \$3.50; barley, \$1.75 to \$2.25.

Current quotations for company coal per gross ton at the mine and f.o.b. tidewater, at the lower ports are as follows:

	Mine	Tidewater
Broken	\$5 95 \$7 50	\$7 80 9 35
Egg	6 35 7 35	8 20 9 20
Stove	6 60 7 70	8 45 9 55
Chestnut	6 70 7 70	8 55 9 55
Pea	5 30 5 75	7 05 7 50
Buckwheat	3 40 4 10	5 15 5 85
Rice	2 75 3 25	4 50 5 00
Barley	2 25 2 50	4 00 4 25
Boiler	2 50	4 25

**Bituminous**—Little improvement if any can be noted in the situation. Receipts are far below the requirements necessary to meet the demand, causing quotations to go higher. Car supply appears to be the stumbling block to larger production.

There is no great amount of coal at the local docks. Demand is strong at inland points and shippers are placing their tonnages there instead of sending them to tidewater to be held up because of labor troubles.

While there is considerable talk of \$8 coal here, the major part of the spot buying is being done around \$7.50. The larger portion of production is moving on contract and manufacturers are getting enough coal for their temporary needs.

Quotations heard on spot business at the mines ranged about as follows per net ton: Pools 1, 9 and 71, \$8 to \$8.25. No. 11, \$7.25 to \$7.50; No. 18, \$7 to \$7.25; and Pool 34, \$8 to \$8.25. Fairmont gas coal was quoted around \$8 at the mines. Loaded boats were quoted at from \$12.25 to \$13.25 alongside within the harbor limits.

Local houses shipping from Southern ports were quoting Pools 1 and 2, (New River and Poahontas coals) at from \$8.50 to \$8.75; and Pools 5, 6 and 7, (high-volatile gas, steam and byproduct coals) at from \$8 to \$8.50.

### PHILADELPHIA

*Anthracite Prices Increase 10c. for June—Fair Tonnage Coming In—Domestic Demand Continues—Chief Call Is for Stove—Steam Trade Is Quite Active, with Barley Only Slow Size—Bituminous Is Scarcer Than Ever, and Prices Soaring, Even on Slow Buying.*

**Anthracite**—The biggest shipper recently advised the trade of an advance of 10c. a ton on egg, stove, nut and pea. All other sizes were allowed to stand at the previous figures. Soon most of the other producers followed the lead of the big company, a few even putting on more than 10c. The following table notes the comparison between company individual average prices on domestic sizes:

	Egg	Stove	Nut	Pea
Company	\$7.30	\$7.55	\$7.65	\$5.85
Individual	8.35	8.60	8.60	6.50

All the shippers continue to notify their trade that the prices as given are subject to withdrawal at any time without notice.

The consumer demand continues unabated and the dealers are receiving a fairly good volume of coal.

On some sizes there is a tendency toward a slight accumulation. This is particularly true of egg and pea coal. Stove coal is in greatest demand which complicates deliveries.

The steam-coal trade is extremely active, especially since the prices of soft coal continue to trend upward. The company price on buckwheat is still \$4.10 and contracts are being made at this figure. The independent shippers have no difficulty in getting 25c above that price.

Rice coal is in good call and even barley is strengthening, but has not yet reached the point where it is being

taken without an effort on the part of the shippers to move it.

The company prices per gross ton f.o.b. cars mines for line trade and f.o.b. Port Richmond for tide delivery are as follows:

	Line	Tide
Broken	\$7 50	\$9 35
Egg	7 30	9 45
Stove	7 55	9 40
Nut	7 65	9 50
Pea	5 85	7 45
Buckwheat	4 10	5 15
Rice	3 00	3 90
Boiler	2 50	3 50
Barley	2 25	3 15
Culm	1 50	2 40

**Bituminous**—Another upward movement is evident in the soft-coal market for spot coal. Recent quotations on steam coal from Pools 10 and 11 have been around \$8.75, with no coal offering whatever from Pool 9. Even at the prices quoted the houses were not soliciting business. Gas coals are still higher in price, with most offerings close to \$9. Despite these high prices the local demand for coal is not particularly heavy, as the consumers seem to be playing a waiting game.

The textile industry in this district is slowing down which lessens the demand for coal. The strongest call comes from outside territories and sales at even higher figures than those quoted are reported.

It is reported that the large consumers are considering a plan of a general closing down until the coal situation improves. Producers state that the car supply runs from 15 to 20 per cent of their assigned capacity. There is a heavy accumulation of coal at tide, with much delay in loading cargoes on account of labor troubles. A heavy tonnage is being contracted for export.

**BALTIMORE**

*A Feverish Market Marks Soft-Coal Trade — Prices Are Around \$9 at Mines — Local Business on Lower Schedule at Times — Hard-Coal Men Resigned, but Consumers Are Restive.*

**Bituminous**—One of the most feverish markets in the history of the soft-coal trade is noted here. At this writing few if any coals can be obtained, either steam of gas, below \$8 for lowest grades, while the best coals are gobbled up in most cases around \$9 and over f.o.b. mines the net ton.

It is said that as high as \$10 a ton at the mines has been paid for coal to make up a ship cargo. With at times close to 40 ships astream here waiting cargoes of coal, some of them under demurrage running into hundreds of dollars a day for weeks at a time, there is small wonder that efforts are being made to get coal aboard at any price.

Local coal men and the railroads entering here are endeavoring to take care of the immediate needs of local plants, and considerable coal has been released at prices far below the reigning market quotations. On the other hand some consumers here have had to pay fancy prices when caught short. In such a market it is almost impossible to set a genuine selling price.

Car supply has improved somewhat, the Baltimore & Ohio reporting a movement generally over 50 per cent and the daily number of cars loaded has jumped over the 3,000 mark on that system. The pier dumping for all the railroads has gone up heavily too, some 800 or more cars being dumped daily at tide, and the general pool handling is more satisfactory.

The official figures for May show a total export coal loading here of 523,251 tons, of which 466,784 tons was cargo and the balance bunker coal.

**Anthracite**—The appointment of an anthracite commission in Washington merely means to the local hard-coal man that he has a considerable period of waiting ahead before he can do business on anything like an assured basis. Meanwhile he is urging his supply connections to sell as much coal as possible under the schedules now in vogue.

Consumers are urging deliveries and having no assurance as the the price they must pay when delivery is made, they are restive. Receipts here continue comparatively light.

**ANTHRACITE PRICES**

The following quotations are from a number of prominent anthracite producers for the month of May at the mines:

	Egg	Stove	Chest-nut	Pea
Philadelphia & Reading Coal & Iron Co.*	\$7 20	\$7.45	\$7 55	\$5 75
Lehigh Coal & Navigation Co. ....	7 35	7 70	7 70	6 50
Whitney & Kemmerer	8 25	8 50	8 50	6 50
Markle & Co. (Jeddah)	8 35	8 70	8 70	6 80
Markle & Co. (Hightland)	8 55	8 80	8 80	6 90
Parlee & Co. (Lattimer)	8 25	8 50	8 50	6 50
M. A. Hanna & Co.	8 10	8 45	8 45	6 30
Madeira, Hill & Co.	8 10	8 45	8 45	6 50
Wentz Co.	8 10	8 45	8 45	6 50
Linenweaver & Co.	8 35	8 60	8 60	6 25
Weston, Dodson & Co.	8 50	8 50	8 50	6 50

\*Prices of The P. & R. C. & I. Co. date from May 11. Prior to that date shipments were billed at former winter circular or 85c. less for egg, stove and nut, and \$5.50 for pea.

It will be noticed that the variation runs up to as much as \$1.35 on egg. Also with the exception of the Philadelphia & Reading the prices for stove and nut are on a parity. The Reading still maintains a difference of 10c a ton between the two sizes.

It should also be remembered that the above figures are for the gross ton of 2,240 lb. at the mines, although the bulk of the tonnage is sold at retail on the net ton basis of 2,000 pound.

Even in Pennsylvania, where the gross ton is established by legislative enactment, the dealers in many communities retail the coal on the 2,000-lb. basis. In Philadelphia and the surrounding territory for a radius of about 60 miles, coal is billed as so much per ton.

In regard to Pocahontas and New River coal at Hampton Roads, the situation continues remarkably even. Movement is good and enough coal is available at all times to keep the piers busy. Despatch continues normal, few steamers coastwise being detained more than one or two days.

Clearances for New England are still light, the great volume of Hampton Roads coal being moved elsewhere. Only

relatively small tonnages are being sold at spot prices, most of these sales being made to piece out cargoes.

At Providence and Boston the regular agencies are charging their trade, even for spot coal, only the contract base price plus the actual charges. The result is a price around \$11 on cars, under the conditions quite a moderate figure.

Current quotations on bituminous at wholesale range about as follows:

	Clearfields	Cambrias and Somersets
F.o.b. mines, net tons.	\$5 25@ \$6 25	\$6.25@ \$7 00
F.o.b. Philadelphia, gross tons.	7 75@ 8 90	8.90@ 9.75
F.o.b. New York	8.10@ 9.25	9.25@ 10.00

Pocahontas and New River are quoted at \$7.50@-\$9 for spot loading, Norfolk and Newport News, Va.

**Lake**

**BUFFALO**

*Slight Improvement Shown in Bituminous Trade—Fancy Prices Still Hold—Anthracite Movement Is Much Better—Lake Trade Is Active.*

**Bituminous**—The trade does not improve much, though the slightly better movement is much appreciated. It is easy for certain mines to ask enormous prices for their coal. There is no longer any quotable price, for it is just what the consumer can be made to pay. A good many are getting contract coal on the basis of about \$3.50 at the mines, some of the larger mining companies being practically tied up to such prices; but the consumer who has no reliable contract and must buy coal on single orders must sometimes pay for it as high as \$8 at the mines.

**Anthracite**—The anthracite movement is much better. Not only is the movement by Lake good, but probably more coal is distributed through the city than usual at this time of the year. The switchmen's strike seems to be mostly a matter of history. The yards are active and trains move, not as freely as they should, but so that business can be done.

Anthracite prices have not settled down to an exact uniformity, but the differences are small, amounting to 15c. or so retail. One leading retail company gives out the following retail prices: Grate and egg, \$11.75; stove and chestnut, \$12; pea, \$10.40; buckwheat, \$9, at the curb, per net ton.

The Lake trade is active, with all shipping agents eager to hurry the coal forward. A late start makes the total look small, the amount to June being 461,121 net tons to 793,202 at the same time last season. May, 1920, ran ahead of the previous May, the amount being 382,500 tons to 370,776 tons in May, 1919.

For the week the shipments were 110,600 tons, of which 42,400 cleared for Duluth and Superior, 28,200 tons for Milwaukee, 27,100 tons for Chicago, 2,900 tons for Green Bay and 1,000 tons for Sheboygan. Freight rates are unofficially 65c. to 70c. to Chicago, 60c. to

Milwaukee, Green Bay, and 55c. to Sheboygan.

**Coke**—The coke trade is following coal in wild prices, though but little is handled outside of the contracts. Prices asked are on the basis of \$20 at the ovens, for either foundry or furnace, the Buffalo freight being \$2.60, all per net ton.

**CLEVELAND**

*Transportation and Conditions at Mines Are Slowly Improving—Lake Shipping Pool Is Being Formed to Prevent Distress in the Northwest.*

**Bituminous**—Gradually improving labor conditions on some of the railroads are being reflected in somewhat better mine operations and shipments.

Operations in the No. 8 district continue at between 40 and 45 per cent of normal. Operators report that only scant lots of spot coal are available, for which unheard-of prices are being obtained.

Operators are concentrating upon supplying their contract customers and the Lake trade, but deliveries are far behind. An embargo on all but train loads is still in force on the Baltimore & Ohio, and this situation, due to labor troubles, is helping keep down operations in the No. 8 district.

**Pocahontas and Anthracite**—The supply of Pocahontas is estimated at about 10 per cent of demand. New orders are being taken subject to ability to get coal. Recently the shipments to dealers have been confiscated in part by the railroads. Anthracite receipts show a slight improvement, but prices remain firm.

**Lake Trade**—Figures compiled by the Ore & Coal Exchange show that the total of coal loaded at docks for the Northwest to June 1 was 1,639,607 tons, as compared with 4,934,040 tons for the same period one year ago. Plans for effecting a shipping pool arrangement are being speedily rushed to completion. This is considered necessary in order to prevent acute distress in the Northwest. The pooling arrangement is considered to be the only possible hope for a bad situation.

In 1918, when the pool was in effect, less than 8,000 cars daily were required to handle the same amount of coal at the docks as was handled in 1919, when from 14,000 to 15,000 cars were in use. Coal is now coming forward to the docks a little more freely. The supply of bunker coal is short of the demand.

Retail prices of coal per net ton delivered in Cleveland are as follows:

Anthracite — egg, \$13.20; grate, \$13.20 and \$13.50; chestnut and stove, \$13.50.

Pocahontas—Shoveled lump, \$11.75; and mine-run, \$9.25.

Domestic bituminous—West Virginia, splint, \$9.50; No. 8 Pittsburgh, \$8.75; Millfield, lump, \$9.50; and cannel lump, \$11.50.

Steam coal—No. 6 and No. 8 slack, \$8.25; No. 6 and No. 8 mine-run, \$8.25; and No. 8 3-in. lump, \$8.25 to \$8.50.

**Inland West**

**CINCINNATI**

*Fuel Situation Improves But Little—Prices Continue Firm with Domestic Demand Good—Ohio River Furnishes Best Transportation.*

Little improvement in the local fuel situation was noted during the past week. The car supply to the mines continues low but with enough betterment to give hopes to the coal man that a decided improvement is not far off.

Prices continue firm both in the wholesale and retail ends of the trade. Many domestic consumers wait until they can get smokeless coal, but the small industrial user is buying where and what he can get at retail prices.

A good deal of business is being done with buyers from the Lake and Canadian districts who are eager for the best grades of gas coal and in some instances it is reported they have paid as high as \$7.25 a ton for anywhere near immediate delivery.

It was generally supposed that with the first of June there was to have been an increase in the price of coal from the retailer, but the change did not occur. The demand from the householder continues good, many orders being taken for delivery during June and July.

It is next to impossible to gage the prices for coal at the mines. The range of prices varies greatly. In some cases as high as \$7.25 for best grades is being paid at the mines for spot cars.

The retailers are being favored with continued shipments down the Ohio which highway is still furnishing the one best transport for the local trade.

Retail prices are as follows:

Bituminous lump delivered	\$8 00 to \$8 25
Bituminous nut delivered	\$6 00 to 7 50
Bituminous run-of-mine delivered	\$7 25
Smokeless lump delivered	\$9 25
Smokeless run-of-mine delivered	\$8 50
Anthracite delivered	\$14 00

**COLUMBUS**

*Reduced Car Supply and Embargoes Hold Up Production—Industrials and Utilities Are Hard Pressed for Fuel—Domestic Trade Is in Bad Shape—Prices Are Advancing.*

The Ohio coal trade shows little change from the previous week as far as production is concerned. Reduced car supply and embargoes are holding up both production and shipments, and commercial users are suffering as a consequence. Available tonnage is quickly snatched up and purchasing agents from large users are scouring the country for fuel. Little hope of improvement in the car supply is held out, although it is promised that a better run of cars will be had during July.

Manufacturing concerns in northern Ohio and in Michigan are on short fuel rations and in some cases the plants

are on part time. Public service concerns are operating from hand to mouth. State institutions and hospitals are fairly well supplied. But on the whole the steam trade is in a straitened condition and many industries are on the point of being suspended.

Domestic trade is also in bad shape. Retail stocks are so light and dealers are now booking orders for delivery when the coal is available and at the prices prevailing at that time. Retail prices are increasing as the price at the mines advances.

The usual margin now taken by dealers, over and above the cost at the mine and freight charges, is \$2.25 per ton. Pocahontas is quite scarce and little is coming into the Columbus market. Other West Virginian grades are more plentiful although the tonnage is not large. Hocking, Pomeroy and Jackson grades constitute the large part of the coal for domestic purposes.

In general production in Ohio fields is said to be about 45 per cent of normal. For the various fields production is as follows: Eastern Ohio, 42½ per cent; Hocking Valley and Pomeroy Bend, 45 per cent; Jackson, 40 per cent; Cambridge, 35 per cent; Crooksville, 50 per cent.

Prices at the mines of the principal coals used in Ohio are:

Hocking lump	\$5 00 to \$5 75
Hocking mine-run	5 00 to 5 75
Hocking screenings	4 75 to 5 50
Pomeroy lump	5 25 to 6 25
Pomeroy mine-run	5 00 to 6 00
Pomeroy screenings	5 00 to 5 75
West Virginia splint lump	5 25 to 6 25
West Virginia mine-run	5 00 to 6 00
West Virginia screenings	4 75 to 5 75
Pocahontas lump	6 50 to 7 50
Pocahontas mine-run	6 25 to 7 25
Pocahontas screening	6 00 to 7 00

**MILWAUKEE**

*Improved Rail Conditions Serve To Make the Coal Situation Somewhat Easier—Anthracite Receipts by Lake Are More Liberal Than Those of Soft Coal—Prices Hold Steady.*

The coal situation at Milwaukee has become somewhat easier, due to a better movement by rail, and dealers now talk more hopefully of being able to meet future demands. The supply of anthracite by Lake is more satisfactory than that of soft coal and many consumers are taking advantage of the opportunity to put in their supplies for next winter.

There has been no opportunity thus far to accumulate either hard or soft coal in the yards, as the outward movement keeps about an even pace with receipts. Small dealers are accorded coal quite sparingly and it is difficult for them to meet their orders. The spring price schedule is adhered to, despite the temptation to take advantage of the situation and give prices a lift.

During April and May last year the various dock yards received 162,033 tons of hard coal and 644,010 tons of soft coal by Lake. This year the record of receipts by Lake for the two months show 127,100 tons of anthracite and 154,962 tons of soft coal. The combined loss of coal tonnage for the two months, as against last year, is 523,981 tons.

## ST. LOUIS

*Conditions Show Improvement, but Car Supply Is Short and Tonnage in Demand—High Prices Prevail—Labor Troubles in All Fields.*

This week shows considerable improvement in the matter of transportation, especially in the St. Louis terminals, although conditions are not yet normal.

A few embargoes are still on. Car supply is about 35 per cent, excepting for mines that run on railroad coal and the railroad demand for coal is heavy in all fields, with its usual abuses. The mines that do not load railroad coal do not get many cars and in time lose their organization.

In the Standard field commercial mines get about one and a half to two days a week. The prices in this district are as high as \$5 for lump, egg, and screenings, and \$4.50 for mine-run. Some of the regular operators hold their prices down to about \$3.50@\$.4.

In the Mt. Olive field conditions are somewhat similar, with the exception that the prices are from about \$3@\$.3.50. The railroad tonnage from both of these fields is heavy.

In the Cartersville field mines are idle excepting where railroad coal is being loaded, especially on the Missouri Pacific. Other roads show fairer treatment for commercial loading.

The mine prices in this field are close to about \$3.75 for domestic sizes. Here and there some operator disregards contracts and orders and sells on the open market, especially in the Duquoin field, at whatever it will bring.

In St. Louis proper the domestic demand is easy, while the steam requirement exceeds the supply. This condition prevails throughout the country districts, excepting that domestic coal is quite good, especially on Cartersville, which is not available.

Very little anthracite is coming in and something like 20 cars of smokeless in the past week, with no Arkansas. The coke supply is exhausted here, excepting a little byproduct. There is no change in retail prices.

## DETROIT

*Movement of Coal Into Detroit Is Curtailed by Deficiency of Transportation—Industrial Plants Are on Quite Short Supply—Soft-Coal Supply Comes from Ohio—Anthracite Situation Is Not Improved.*

**Bituminous**—While the railroads report that coal is coming into Detroit rather more freely, local jobbers and wholesalers are still finding it difficult to provide stock for their customers. The steam-coal situation is apparently somewhat easier than a few weeks ago, though the shortage of transportation facilities continues to prevent movement of anything like a normal volume of shipments into the local market.

Users of steam coal, in most instances, have little more than three or four days' supply ahead, while many of the industrial plants are practically dependent on a hand-to-mouth supply.

Jobbers say there is scarcely any free coal to be found on terminal tracks in and around Detroit. Nearly the entire supply now available is coming from mines in Ohio with a small amount from Illinois and Indiana.

The Ohio coal is quoted at the mines on a short-ton basis at about \$5 to \$5.25 for lump; \$4.75 to \$5 for mine-run and about \$4.75 for slack. With the present condition of car supply, many of the sizes that formerly found favor with various local consumers are not being produced at the mines, the operators being content to load available cars with mine-run.

**Anthracite**—No improvement is apparent in the supply of anthracite, delivery of the stock in Detroit being long deferred and uncertain. Meantime orders are accumulating on the books of the retailers and household consumers are complaining at their inability to obtain coal ordered for delivery in April and May. Uncertainty concerning prices adds to the unsatisfactory aspect of the situation.

**Lake Trade**—Coal for movement to the northwest is arriving at Lake loading docks in somewhat larger quantity, though the supply is still restricted by shortage of railroad facilities. Many of the carriers are obliged to make the upbound trip for ore, without cargo and in numerous instances considerable difficulty has been experienced in getting coal enough to fuel the ships.

## South

## LOUISVILLE

*Market Advances Steadily, with Gas and Domestic Fuel in Strong Demand—Car Supply Improves Little—Local Domestic Stocking Is Light.*

Prices continue advancing steadily at the Kentucky mines, with Western Kentucky showing an especially strong market on account of heavy buying from the Chicago, and Northwestern district. Gas coal from Eastern Kentucky is in quite strong demand, and production is far short of requirements.

Production of block coal continues light in view of the strong market that has been experienced for mine-run gas coals. Other than gas coals are meeting with a strong demand in domestic sizes, although non-gas steam coal is not quite so actively sought after as other grades.

Retailers report that business is practically at a standstill as the public is not stocking on the present market, and is waiting for steam and gas stocks to be filled, and for a production increase to force lower prices.

There has been little improvement in car supply, although transportation for May has been slightly over 40 per cent, which is better than conditions in April.

All Eastern Kentucky lump coal is now quoted at around \$7.50 to \$8 a ton, while mine-run gas coal is quoted at \$8, some being bought at around

\$7.75. Screenings from gas coal are quoted at around \$7.25. Non-gas coal from the same district is quoted at \$7.50@\$.8; mine-run, \$7@\$.7.25 and screenings, \$5.50@\$.6. Western Kentucky lump is selling at \$5.25@\$.5.50 at mine; mine-run, \$5@\$.5.25; screenings, \$4.25@\$.4.50.

## BIRMINGHAM

*Car Supply Is Poorer Than for Previous Week—Some Public Utilities Face Shutdown—Little Spot Coal Is Obtainable.*

The activity of the trade in the Birmingham section is regulated entirely by the supply of cars available for the mines; the percentage of equipment furnished the past week has been lower than for the previous period.

The Louisville & Nashville furnished from 33½ to 40 per cent of the equipment needed, the Southern Ry. about 50 per cent and the Frisco road approximately 75 per cent. This condition disrupted working schedules at the mines and seriously affected production.

Very little fuel is to be had in the spot market. Inquiries from abroad continue to be received for heavy requirements. Considerable bunkering coal is moving by rail and water to Pensacola, Mobile and New Orleans. Quotations on mine-run coal are as follows per net ton f.o.b. mines:

Black Creek .....	\$4.00@4.50
Cahaba .....	4.00@4.50
Big Seam .....	2.95@3.50
Nickel Plate.....	3.35@3.50
Carbon Hill.....	3.50@4.00

Domestic prices are as follows, f.o.b. mines for lump sizes:

Big Seam .....	3.50@3.75
Cahaba .....	4.70@6.00
Black Creek..	4.70@5.00
Carbon Hill...	3.70@3.95
Montevallo.....	7.30
Corona.....	5.65

## West

## SAN FRANCISCO

*Many Steamships Bunkered Here—Coal and Bunkering Facilities Satisfactory.*

Steamships coming here in good numbers are bunkered by the King Coal Co. with fuel shipped from Utah. Some of the vessels are from the Atlantic, some from South American ports, and others from the Orient. These steamships are in addition to the cargo carriers that steam from this port to every part of the globe.

The big craft come here for fuel on account of the satisfactory quality of the coal, and state that no other variety of fuel is obtainable here which is as high in heat units as the Utah product; also by reason of the expeditious manner in which they are bunkered. In other years the vessels either called at Honolulu or used up valuable space in carrying extra coal.

The bituminous prices, f.o.b., mines, wholesale, Utah and Wyoming, per net ton, are as follows: Stove and lump, \$4. The bunker price is \$13.55.

# News From the Coal Fields

## Northern Appalachian

### FAIRMONT

*Poor Production Is Due to Dearth of Cars and Absence of Men from the Mines—Output One-Third of Capacity—Tidewater Is Embargoed Again—P. & L. E. Begins To Move Coal.*

Production was as poor in the Fairmont and other northern West Virginia fields during the final working period of May as it had been at any time during the entire month, a dearth of cars being the principal factor in curtailing production. On Tuesday, May 25, many miners absented themselves from the mines in order to be at the polls so that comparatively little coal was produced.

For the first few days of the week, there was a better run of cars on the Monongahela R.R. than usual, but toward the end of the week the supply dwindled to quite material extent. The number of mines idle on the Monongah division of the Baltimore & Ohio during the last three days of the week averaged about 100 or more per day. Taking the week as a whole, northern West Virginia mines were not receiving more than enough cars to enable them to work more than 35 per cent of potential capacity.

Curtis Bay was under its periodical embargo again so that tidewater shipments were more or less limited; the embargo resulting from heavy shipments to tidewater during the week ended May 22.

Despite the tidewater embargo most northern West Virginia coal was being shipped to eastern markets, Lake shipments showing no material increase in volume over previous weeks.

It was possible to ship more cars over the Monongahela road in the last week of May than during the previous week, owing to the fact that the Pittsburgh & Lake Erie had begun to move coal from Brownsville for the first time in a month and a half.

Between privately owned cars and assigned cars, mines in northern West Virginia found it impossible to ship much commercial fuel during the last week of the month, the railroads securing the bulk of production for their own use.

### PITTSBURGH

*Better Car Supplies Are Promised—Spot Market Offerings Are Light.*

According to estimates made in Pittsburgh coal circles, compliance with last week's instructions of the Car Service Commission to the railroads, in the matter of furnishing coal cars, would result in an increase of at least one-third in the number of cars fur-

nished the mines in this district. Car supplies had been running at about 37 per cent of full quotas, while the order calls for priority up to 50 per cent.; cars beyond that amount were to be furnished to other industries up to 50 per cent., any surplus that might then be left being applicable to coal.

Pittsburgh coal operators were somewhat irritated by some of the statements made at last week's convention here of the American Wholesale Coal Association, particularly the statement that since coal is being produced in the United States at the rate of 9,500,000 tons weekly and the current requirements are 8,000,000 tons then there is a surplus of production. The correctness of both figures is denied, while it is pointed out that coal is largely a local matter; coal may be extremely scarce in the Pittsburgh district, while it may be plentiful at some Southern or Western points.

It is plain that quite small quantities of coal are being offered in the Pittsburgh market, with buyers, both on the part of industries and exporters, ready to pay more than \$7 to get coal. If the limited offerings are due to producers shipping large tonnages on contracts, then the operators involved cannot be blamed, as the contract shipments realize very much less than the spot market. Market prices for spot shipment range within the limits of \$7 and \$8 per net ton at mine, Pittsburgh district, for mine-run.

### CONNELLSVILLE

*Car Supplies Improve Slowly—Coke Reacher Furnaces and Coal Is Supplied to Byproduct Ovens—Negotiations Are Beginning on Furnace—Coke Contracts.*

Car supplies in the Connellsville region have continued to increase, though at a decidedly slow rate. In the delivery of coke there is a greater improvement, as much coke that has been stalled en route for a long time is now reaching the blast furnaces.

While this clearing of the tracks represents in itself only a temporary gain to the furnaces, it of course releases cars which, if returned promptly to the region, will increase the supplies further. The Pennsylvania and Baltimore & Ohio are now functioning almost normal, as regards the Connellsville region, while the Pittsburgh & Lake Erie is doing better, particularly in the movement of solid train loads.

There has been a distinct improvement in supplies of coal to the byproduct ovens, particularly those in the Mahoning and Shenango valleys, and the increase in byproduct coke manufacture in the past three or four weeks is probably greater than the increase in the Connellsville region.

Taking the blast furnaces of the country as a whole, they are now operating at the rate of about 37,000,000 gross tons of pig iron a year, against a 40,000,000-ton rate in March and a rate of less than 30,000,000 tons when the rail strike was at its worst.

Offerings of Connellsville coke for spot shipment continue quite light, so light that former prices are easily maintained even though many consumers prefer to do without rather than pay such prices. The market is quotable at \$15 spot furnace and \$16 for spot foundry coke.

## Estimates of Production

FROM THE WEEKLY REPORT OF THE GEOLOGICAL SURVEY

### BITUMINOUS COAL

	1920—		1919 (a)—	
	Week	Calendar Year to Date	Week	Calendar Year to Date

### BEEHIVE COKE

United States Total

Week Ended	Week Ended	May 31	1920	1919
May 29	May 22	1919	to Date	to Date
1920	1920	1919	to Date	to Date
428,000	415,000	256,000	8,937,000	8,382,000

a Less than one day's production during New Year's week to equalize to number of days covered for the two years. b Revised from last report. c Subject to revision.

(All figures in net tons.)

Negotiations on furnace-coke contracts for the second half of the year are being resumed, but in very reserved manner, neither bids nor offers having yet been made. It is a question whether most of the business will be done at flat prices or on a ratio basis, relative to the current price of basic pig iron at valley furnaces. Some operators have intimated that they might be willing to do business on a 4-to-1 basis, which would make nearly \$11 for coke at the present quotation of \$43.50 for pig iron. Some other operators, having in mind the possibility of a decline in pig iron, would prefer to close at a flat price of \$10. In foundry coke there is a little inquiry on contract, but not much.

The market is quotable at \$15 for spot furnace, \$16 for spot foundry and \$11@ \$12 for contract foundry, per net ton at ovens.

The *Courier* reports production in the Connellsville and Lower Connellsville region in the week ended May 22 at 185,728 tons, an increase of 7,478 tons. Before the rail strike production was running at about 245,000 tons weekly.

## Middle Appalachian

### POCAHONTAS AND TUG RIVER

*Better Car Supply from the West Permits Larger Production at N. & W. Mines—Increased Shipments Go to the Lakes and West—Congestion Continues at Tide.*

An impetus was given to production in the smokeless fields of southern West Virginia on the Norfolk & Western at the end of May by virtue of a somewhat better car supply, the improvement being due to a larger run of cars from Western territory. Because of the larger number of cars from the West, it was not necessary to use empties returned from tidewater and other eastern terminals for all the fields on the Norfolk & Western. The western supply was used largely for Tug River territory.

While tidewater terminals were securing by far the larger part of the smokeless product originating on the N. & W., yet there was a growing volume of smokeless moving westward. A part of the west-bound shipments was destined for Lake dumping.

Improvement from a production standpoint was more noticeable in the Tug River field, in the week ended May 29, than in the neighboring Pocahontas field, chiefly because of the increased number of cars from the West, Tug River mines usually depending on the western supply.

While there was greater regularity in work at the mines, still Tug River plants were not producing more than 50 per cent of potential capacity. However, with larger loadings it was possible to increase western shipments and especially Lake consignments, without in any way decreasing tidewater and

Inland East shipments. Prices at tidewater markets remained about on the same level.

Production losses far outstripped the output of the Pocahontas field at the end of May and conditions were not as satisfactory as they might have been. Production was much below 50 per cent. There was coked in the Pocahontas field 11,863 tons of coal.

A return to normal conditions at some of the western points of interchange was reflected in an increased western movement of Pocahontas coal. Continued congestion at tidewater impeded to some extent the return of equipment from the seaboard.

### LOGAN AND THACKER

*Transportation Situation Is Serious in the Logan Field—Logan Coal Will Go West When Cars Are Returned from That Section—Thacker Mines Are Shut Down by Labor Agitation.*

No headway was made by the mines of the Logan field in increasing the amount of coal mined during the final working period of May, production still being under 140,000 tons. The situation in the Logan field was serious from a transportation standpoint, the limited supply of cars from the West being a large factor in reducing production here. It was believed however that the first week of June might bring some relief in the way of more coal cars delivered to eastern lines.

No relief during the latter part of May had been obtained from the efforts of the Interstate Commerce Commission. Little increase in production may be looked for until more Western cars are received; nor is it likely that there will be much Logan coal shipped westward until there is some assurance that cars will be returned for re-loading. On the other hand Lake shipments from the field did appear to be on the increase.

Virtually the entire output of the Guyan mines found its way to tidewater during the entire month of May, partly because of transportation conditions described and partly because of higher prices prevailing at the seaboard.

Between a car shortage and labor agitation in the Thacker field in the last week of May, there was a heavy production loss, there being fully a 35 per cent loss from a shortage of cars, or in the neighborhood of 85,000 tons. Many mines had been shut down as a result of labor trouble, now impending.

The output of the field as a whole was not much above 40 per cent during the final week of May. Organizers and agitators are even dictating to new companies just preparing to begin operations as well as to established companies, and the prospect for a large output in the Thacker field is not bright.

Nearly the entire output is being shipped to tidewater although there has been a slight growth in Lake shipments and in shipments to the Inland West.

### NEW RIVER AND WINDING GULF

*Production of Gulf Mines Is Seriously Curtailed by Virginian Ry. Strike—Idleness Is Also Quite General at C. & O. Mines Throughout the New River Field.*

New River and Winding Gulf production was cut down to quite a material extent in the final week of May not only by a car shortage on both the Virginian and Chesapeake & Ohio railroads but also by other causes.

When Sewell's Point (the tidewater pier of the Virginian Ry.) became affected by the railroad strike at Princeton, W. Va., production on the Virginian was brought almost to a standstill.

The little coal which was shipped over the Virginian found its way to tidewater. The new Sewell's Point Coal Exchange was put in commission on June 1 and it was believed that this exchange would prove quite beneficial in making increased dumpings possible.

While there was no strike on the Chesapeake & Ohio, yet mines on that road had a poor car supply throughout the week; absence of a number of miners from work on election day also affected production to some extent.

Idleness was quite general in the New River field throughout the last week of May. Insofar as the limited production permitted, tidewater consignments were heavy, so heavy in fact that no New River coal remained for Inland Western markets and for the Lakes. Little effort was made, however, to send much coal westward, owing to the difficulty in getting cars back into West Virginia for reshipment.

Coke shipments to Western markets were much larger than coal shipments. Prices offered for New River smokeless at tidewater were from \$7 and upward.

### VIRGINIA

*Mines Produce Half of Capacity—Cars Are Held Due to Overloading—Coal Goes to Tide.*

Car shortages forced production downward in the Virginia fields during the last week of May to an appreciable extent, the output amounting to only a little over 104,000 tons; on the other hand lack of cars had entailed a loss reaching 72,000 tons.

With car-shortage losses running so high, mines were unable to produce as much as half of potential capacity, car shortage losses alone accounting for a 51 per cent loss. Labor-shortage and car-shortage losses combined amounted to about 80,000 tons; a shortage of man power entailing a loss of 7,300 tons.

From the figures given it will be apparent that there had been no increase in the supply of empties as a result of the Interstate Commerce Commission's transportation order. In order to take advantage of the scant supply, all cars were loaded to the utmost. That resulted in a number of instances, however, in cars being held for overloading, shipments in consequence being somewhat impeded.

### NORTHEAST KENTUCKY

*Output Is About 45 Per Cent for the Field—Lake Shipments Show a Gain—Demand for Steam and Byproduct Coal Is Unusually Strong.*

Out of a potential capacity of 300,540 tons, only 136,650 tons were produced, during the week ended May 29, in the Northeast Kentucky field; the gross loss being 163,890 tons or 55 per cent. A loss of 159,725 tons was directly attributable to a scarcity of cars.

Although it was possible to produce little more coal than had been the case during the previous week, nevertheless there was a further gain in Lake shipments; one-fourth of the output being sent to the Lakes during the week mentioned. The tonnage to the Lakes was increased still more at the beginning of June, approximately one-third flowing to the Lakes during the first day or two of June.

Little screened or lump coal was being handled, most of the output being mine-run, inasmuch as this grade of coal commanded about as high a price as special sizes. There was little demand for domestic fuel, but on the other hand the call for steam and by-product coal was running unusually strong.

### KANAWHA

*Slight Increase in Cars Does Not Swell Production—Output Is About 40 Per Cent on C. & O.—Continued Shortage of Equipment from Western Connections.*

There was a slight increase in the number of cars available at mines in the Kanawha field during the final week of May, but production was less than it had been in the preceding week, because on May 25—primary election day—most of the miners went to the polls. During the week in question there was a total output of less than 90,000 tons at the mines in the field supplied by the Chesapeake & Ohio.

Production was not more than 35 or 40 per cent of normal, except at mines served by the Kanawha & Michigan road, the increased number of empties at such mines being due them because of a previous existing deficit.

The continued shortage of equipment in the field was largely due to the small number of cars received from western connections. While there appeared to be a somewhat larger Lake movement, still far below that of the corresponding period for previous years, shipments in general to Western markets were limited because of embargoes on certain roads in Ohio and Indiana.

### Middle Western

#### SOUTHERN ILLINOIS

*Record Time Made in Reconstructing Mine No. 18—Car Supply Is Still at a Standstill—Sunnyside Mine Resumes Operation.*

The work of rebuilding the engine and generator rooms at mine No. 18, of

the By-Products Coke Co., located at West Frankfort, is progressing rapidly and Superintendent W. B. Ward has announced that a resumption of mine operation can be expected shortly. The fire caused much damage, practically destroying the engine room, the generator room and several smaller adjacent buildings.

With slight repairs the generators and hoisting engines will be almost as good as new. Brick masons and workmen from the entire surrounding community were at once put to work on the reconstruction work. The damage done was estimated at over \$150,000.

The car supply in southern Illinois is still at a standstill with no prospect of a change in sight. With the exception of a few mines in Saline County, near Harrisburg, there is not a single mine averaging over 16 to 20 hours per week, actual working time.

The mines at Sesser and Valier in Franklin County had been getting a little the best of the argument in car supply, but they too fell back with the rest during the month of May. The mines in Saline County, which are mostly controlled by the O'Gara Coal Co., of Chicago, are getting four days and better per week.

Operations at the Sunnyside mine, near Herrin, have been resumed after a shutdown of several months. The tibble has not yet been completed, however it is in such a state as to permit the hoisting of coal. The fire destroyed the washhouse, tibble and other buildings around the plant.

Another large deal has been under negotiation near Zeigler, east of here, whereby the W. P. Rend Coal Co., of Chicago, proposed a trade with the Zeigler Coal Co., of Zeigler, for ten sections of land in Franklin county owned by the Rend people, for nine sections of land in Williamson owned by the Zeigler Coal Co.

### Canada

#### VANCOUVER ISLAND

*Important Coal Development on Vancouver Island Noted—Pacific Coast Coal Mines, Ltd., Will Spend \$500,000 on Its Morden and Squash Plants—Big Tracts of Coal Held by the Company.*

Recently on assuming the position of general superintendent of the Pacific Coast Coal Mines, Ltd., George Wilkinson, late Chief Inspector of Mines for British Columbia, announced that his company had adopted a plan for the development of its Vancouver Island coal properties that will mean the expenditure immediately of some \$500,000.

Already the company has invested over \$2,000,000 in the opening up of its Morden Mine which is to develop 1,600 acres of coal land, underlaid by the Douglas, Newcastle and Wellington seams. The plant is thoroughly modern, the pit head and screening plant

being constructed of steel and reinforced concrete.

It is about five miles from the mine to the shipping point at Boat Harbor, transportation being furnished by a standard gage railway. At Boat Harbor bunkers have been erected with a capacity of 5,000 tons and washing plants also have been installed. The loading is done by a conveyor of a capacity of 750 tons an hour.

The Morden mine now is producing about 400 tons of coal a day and it is expected that the daily output will reach 1,000 tons by the end of the year. It is estimated that the area held by the company at this point will yield 250,000 tons a year for 90 years.

The Squash holdings of the Pacific Coast Coal Mines, Ltd., are situated on the east coast of Vancouver Island, about 200 miles north of Nanaimo. The coal field there is one of the largest undeveloped proved areas on the Pacific coast and the Pacific company owns some 10,000 acres of these lands.

Three workable seams have been located at a moderate depth. The mine workings on the second seam now are developed to a point where from 300 to 400 tons daily can be produced, when a second opening is made and permanent shipping facilities are provided. If the coal seams run as evenly and consistently over the whole area, as indicated by drilling and other development on a portion of the property, then the company will have sufficient coal here to yield 500,000 tons a year for 264 years.

The Squash mine was closed down with the beginning of the war, but it is the intention of the company to resume operations here without delay. A modern plant will be installed.

#### NICOLA-PRINCETON COAL FIELD

*Considerable New Development Is Planned—Coalmont Collieries, Ltd., Will Construct Branch Line to Market Larger Output.*

The Nicola-Princeton coal field of British Columbia has been attracting attention of late and responsible parties report that there is to be considerable new development in this section. The Harvard Coal Co., of Princeton, recently sold some of its product in Spokane, Wash., and it is said to have given satisfaction.

The property of the Coalmont Collieries, Ltd., also is to be extensively developed, a bond issue of \$600,000 having been floated among Vancouver City and Calgary citizens to finance the undertaking.

A tramway is to be constructed for a distance of 2½ miles between the Kettle Valley Ry. and the mine shaft, and quarters will be provided for officials and men at the mine.

This work will be prosecuted with vigor during the summer, to the end that transportation facilities may be available to permit a much larger production than at present. This coal is to be marketed at Vancouver and elsewhere next winter.

# Mine and Company News

## ILLINOIS

Harrisburg—The officers and employees of the O'Gara Coal Co. had a get-acquainted meeting and general conference at the company's offices in Harrisburg, Saline County, Ill., recently. Among the officials present were vice president Frank A. Manley; D. B. McGehee, assistant to the vice president, of Chicago; General Superintendent, Ralph Brown and all the superintendents of the company's various mines in Saline County. This was the first of a series of such meetings to be held at stated intervals in the future.

Announcement has been made that O'Gara mine No. 12, near Harrisburg, which has been shut down for some time to have extensive repairs made, will resume operations as soon as a sufficient supply of cars can be secured. The improvements included concreting the shaft, overhauling the mine cars, building a new cage, improving the blacksmith shop and installing new shakers and screens.

## INDIANA

Indianapolis—Governor Goodrich of Indiana and members of the state purchasing committee recently discussed the possibility of the state buying a coal mine, from which it could produce, partly by prison labor, the 150,000 tons of coal needed each year by the state penal and benevolent institutions. No decision was reached, but it is known that the governor is giving the matter some consideration. It was stated that officials of the United Mine Workers of America will fight the movement.

## NEW YORK

New York—Andrade-Eyre, Inc., has been organized to carry on an export trade in coal and coke. The officers are C. Andrade, Jr., president; T. Lawrence Eyre, vice-president and Wallace D. Eyre, secretary-treasurer. Mr. Andrade until recently was treasurer of the Matlack Coal & Iron Corporation and is the president of the Wholesale Coal Trade Association of New York. He is also chairman of the Committee on Shipping of the American Manufacturers' Association and is prominently identified with the National Coal Association.

Mr. Eyre, the vice-president of the new corporation, is a state senator in Pennsylvania and is well known in the Central Pennsylvania Bituminous field. Wallace D. Eyre is the son of Senator Eyre and has been associated with his father in the management of the Eyre

Fuel Co. He will continue with the latter company. The offices of the new company which will specialize in the coal export business are located at 80 Broadway, New York City.

## OHIO

Pomeroy—The largest deal occurring in the Pomeroy Bend field was consummated recently when the Ebersbach interests of this city disposed of their big coal and mining properties to the Great Lakes Mining Co., which has large dock facilities and boats on the Lakes.

The deal includes all the coal holdings of the Martin Ebersbach Co. and Peacock Coal Co., together with all the mining equipment and power plants used in connection therewith.

In the properties sold is included the leases on the Charter Oak and Rolling Mill mines containing about 500 acres of coal, the Forrest Run and Dark Hollow mines containing about 2,000 acres of coal, together with about 600 acres of land where their big Forrest Run power plant is located and the Peacock Coal works located at Syracuse in connection with which there is about 4,000 acres of valuable coal land.

The consideration is stated to be not less than \$2,500,000, with one-third of the amount cash in hand.

## PENNSYLVANIA

Pittsburgh—The Westmoreland Coal Co., of Philadelphia, Pa., is preparing to install a revolving dump, conveying machinery and other improvements at its Export mine at Export, Westmoreland County, Pa. This is one of the largest mines in the Irwin gas-coal basin. A. J. Cameron, of Irwin, Pa., is general superintendent of the company.

Uniontown—George Whyel purchased the plant of the Superior Connellsville Coal Co., including 330 acres of Pittsburgh seam coal in Luzerne Township, Fayette County. He also obtained options for 180 additional adjoining acres. The plant will be electrified and 25 houses erected for workmen. Mr. Whyel paid \$1,175,000 for the Superior holdings; and options on the 180 acres, known as the Porter and West tracts, will be exercised for \$350,000. Electrification of the plant and the erection of the workmen's houses will mean an additional expenditure of \$100,000, making the entire property a total investment of \$1,625,000 by Mr. Whyel. The plant is between Uniontown and Brownsville on the Monongahela R. R. Mr. Whyel is a member of the Whyel

Coal & Coke Co., of Uniontown, operating in Fayette and Westmoreland counties.

Johnstown—The Guaranty Coal Co., of Butler, Pa., has passed into the control of Messrs. R. T. Marsh, A. E. Koehler and Wm. Murphy, of Windber, Pa., and Wm. Morley, of this city. The Guaranty company is a Pennsylvania corporation with a capital stock of \$80,000 and controls two seams of coal on 630 acres located near Worthington, Armstrong County. It is served with a 12-car siding on the Buffalo, Rochester & Pittsburgh R. R. The company, under its new management, contemplates extensive improvements and additional development.

## VIRGINIA

Dante—The Clinchfield Coal Corporation is completing arrangements for extensive enlargements and improvements at its local mining properties. It is proposed to equip completely two additional plants; considerable machinery and equipment will be installed, including shaker screens, conveyors, picking tables, loading booms, etc., as well as the construction of a new tippie. The improvements will cost about \$150,000.

## WEST VIRGINIA

Bluefield—One of the large deals recently consummated in southern West Virginia was that involving the purchase by the Pocahontas Fuel Co., one of the largest producing companies in the state, of all the holdings of the Pulaski Iron Co. which has also been operating on a large scale. The Pulaski company only a short time ago acquired the holdings of the Shawnee company in McDowell County. The purchase includes the Shawnee and Pulaski collieries, the furnaces and iron properties at Pulaski and elsewhere, as well as the undeveloped Bouter tract.

Wheeling—Arrangements have been completed by the Bethlehem Steel Co. for the purchase of all the surplus coal produced in the West Virginia mines of the Monongahela Traction Co. The agreement provides for the delivery to the steel company of approximately 7,500 tons of coal monthly. The mines of the company are located in the Fairmont field, Monongalia, Marion, and Harrison counties. The same company is also securing the entire output of the Consolidation Coal Co. mines on Helens Run and on the Bingamon branch of the Western Maryland. From

reliable sources it is learned that the Bethlehem company proposes to increase the capacity of one of its Penn Mary mines in Preston County to 15,000 tons a day which, if true, will make it the largest producing coal mine in the world.

**Stockholders of the Glendale Coal & Gas Co.**, including Davis Thomas, Judge John Nichols, J. H. Anderson, John Bentley, C. W. Hill and others, have perfected plans for the organization of the Reymann Farm Coal Co., and arrangements are now being made for immediate development of coal property in the vicinity of Elm Grove. Machinery and equipment will be installed.

**Maybeury**—The Norfolk-Angle colliery is understood to be considering plans for the rebuilding of its tippie and washery recently destroyed by fire, with a loss estimated at about \$200,000.

**Beckley**—The High Knob Coal Co. and the Bacontown Coal Co., of the Winding Gulf field, have been purchased by John W. Wilson, of Wyco, W. Va., and J. B. Clifton, of Beckley, from C. M. Lilly and associates. The Bacontown company has 700 acres of smokeless coal land under lease. The new owners of the companies have decided to operate both properties under one management and name, the new company to be known as the Welton

Smokeless Coal Co., with a capitalization of \$350,000. John W. Wilson is president and J. B. Clifton vice president. Mr. Wilson is closely identified with the Tams interests while Mr. Clifton is president of the Raleigh Smokeless Fuel Co.

**Fairmont**—Machinery and material have been ordered for the new plant of the Chesapeake Coal Co., which will develop a slope mine on the Andrew Lee farm in the Fairmont field. The work of opening the mine, which will form a part of one of the best plants in the Fairmont field, has been started. This company recently acquired 700 acres of Pittsburgh and Sewickley coal. The company will have a model mining town for its employees, houses to be built in units of 20. The president of the company is T. H. Johnson, of Bellaire, Ohio, and the vice president is J. A. Paisley, of Cleveland, Ohio.

Well-known business men have launched the Hite Barnes Coal & Coke Co. which will operate in the Marion County field, this company being capitalized at \$200,000. The following had an active part in the organization of the company: R. M. Hite, Glen F. Barnes, Marcus C. Hite, Ray C. Hunsaker and W. H. Conway.

**Cecil**—Work on the reconstruction of the coal plant of the Sterling Coal Co., at this place, destroyed by fire about two months ago, is progressing. This

fire destroyed the tippie, office building and a number of miners' dwellings. The company mapped out a new town site and is building a number of houses on the new site. Office buildings are nearing completion. The general offices of the Sterling Coal Co. are in Altoona, Canada, the Sterling company being a Canadian concern with 15 mines in Ohio and West Virginia.

**Charleston**—Although the Alabama Bound Co. will operate in Alabama, most of its stockholders are Charleston people, this company having been organized with a capitalization of \$200,000, for the purpose of mining coal, iron and other minerals. Those actively identified with the new company are: W. G. MacCorkle, J. E. Chilton, J. H. Moore, T. S. Clark and A. W. Taylor, all of Charleston, W. Va.

Three West Virginia coal companies have increased their capital stock quite appreciably since May. The Elm Grove Mining Company, of Pittsburgh, Pa., of which J. A. Paisley, of Cleveland, is president, increased its capitalization from \$900,000 to \$1,000,000. The Atlantic Smokeless Coal Co., headed by George Wolfe and operating at Davy, W. Va., has increased its capital stock from \$150,000 to \$200,000. The capital stock of the Camilla Red Ash Coal Co., of which T. B. Bryan, Jr., is president, has been increased from \$75,000 to \$300,000.

## Association Activities

### West Virginia Department of Mines

It is planned to encourage first aid and rescue work and to stimulate interest in such work. The West Virginia Department of Mines, under the direction of R. M. Lambie, State Mine Chief, is preparing to hold a state-wide first-aid and mine rescue meet late in the summer, probably in August.

So far the department has not attempted to arrange any details of this meet, owing to examinations to be held during June and July in order to permit miners to qualify as mine foremen and fire bosses.

On July 29 an examination is to be held at Mullens for the benefit of miners in Raleigh and Wyoming counties. Still another examination is to be held at Morgantown on July 30, following on the heels of the completion of the miners' short course there.

All emergency certificates issued by the department, permitting miners in certain cases to act as mine foremen, will be rescinded as soon as the coming examinations are completed and all papers graded.

### Tidewater Coal Exchange

In order to relieve congestion at Sewell's Point, the tidewater terminal of the Virginian Ry., shippers on the Virginian and trans-shippers from Sewell's Point held a meeting at Norfolk, Va., recently and formed a tidewater coal exchange.

Nearly the entire tonnage shipped over the Virginian was represented at the meeting, and it was the opinion of nearly 70 per cent of those present that pooling arrangements were an imperative necessity at Sewell's Point.

As long as the old Tidewater Pool Exchange functioned, it was possible to keep cars under load down to 500 at a time, but with the discontinuance of the tidewater exchange the average number of cars under load at Sewell's Point had grown to 1,600.

Tratic officials of the Virginian were of the opinion that by re-establishing the tidewater exchange it would be possible to add fully 1,000 cars to the available supply and

to increase the running time of mines by at least one day.

A special committee was appointed to draft plans toward establishing the exchange, consisting of C. H. Mead, of the C. H. Mead Coal Co.; W. W. Houston of the Pan Handle Coal Co. and J. T. Sneed of the Payott Smokeless Fuel Co.

### Northern West Virginia Operators' Association

Operators of northern West Virginia have decided on a definite course of action in connection with the abuse of assigning cars by the railroads. Recently a special committee was appointed by the Association.

The railroads, in assigning cars to certain mines, have refused to count these cars against the number to which such mines are entitled, under their allotment.

The committee reached a decision to institute proceedings not only before the Interstate Commerce Commission but also in the Federal courts in the event no action should be taken by the National Coal Association.

In the event that proceedings in the Federal Court should be instituted the case would be tried before Judge Aston Dayton in the United States District Court of northern West Virginia.

At the same time another committee was appointed to organize a local association within the larger association for the purpose of dealing with local freight rates, car supply, etc.

### Washington State Fuel Dealers' Association

Plans for conducting a "buy-your-coal-early" campaign this summer, and the sending of a large representation from Seattle and other near-by cities to the State convention at Spokane, were discussed at a meeting and dinner held by 60 members of the Washington State Fuel Dealers' Association recently. The banquet was attended by members of the Seattle Retail Coal Merchants' Association and many fuel dealers from Tacoma and other cities near Seattle.

The western Washington fuel men intended to have a large delegation at the Spokane state convention, which was held June 3, 4 and 5, and the meeting in question was primarily to stimulate interest in the state conference.

A campaign similar to that conducted last year, which is fostered by the Government Coal Commission, will be undertaken again this summer.

The objects of the early ordering of coal by consumers is for the employment of miners on an all-year basis, and also for preventing a sudden shortage of coal-hauling equipment at certain times.

### Knox County Coal Operators' Association

Carl J. Fletcher, secretary of the Knox County Coal Operators' Association of Indiana, recently informed the Interstate Commerce Commission that under existing regulations the operators can not discriminate but must deal impartially with utilities, state institutions and industries in making shipments. Should priority regulations be instituted, it is said, enough coal could be shipped to provide utilities and the state institutions.

Reports from the Knox County field show that, during the first five days of the week beginning May 17, the railroads had billed to them 42 per cent of the coal mined. Officials of the mines declared that this amount, added to the coal confiscated for railroad use, would bring the figures up to at least 50 per cent. The ordinary percentage allowed or taken by the railroads is about 33 per cent.

## Coming Meetings

**American Institute of Electrical Engineers** holds annual convention at White Sulphur Springs, W. Va., June 29 to July 2. Secretary, F. L. Hutchinson, New York, N. Y.

**Pennsylvania Retail Coal Merchants' Association** will hold its annual meeting June 23, 24 and 25 at Reading, Pa. Secretary, W. M. Berkelet, Reading, Pa.

**The Rocky Mountain Coal Mining Institute** will hold its annual meeting in Denver, Col., in conjunction with the National First Aid Meet on Sept. 9-11. Secretary, F. W. Whiteside, Denver, Col.

**M. O. I. Coal Association** will hold its annual convention June 16, 17 and 18 at Cedar Point, Ohio. Secretary, B. F. Nigh, Columbus, Ohio.

## Industrial News

**Chicago, Ill.**—The report of the Trustees of the Fairbanks-Morse Pension Fund, for 1919, shows eight members pensioned, death benefits of \$11,675 and net resources of \$505,000, practically all invested in high-grade bonds. The fund was established on Jan. 1, 1917, and at the close of 1919 had 1,139 contributing members.

**New York, N. Y.**—The Mine Safety Appliances Co., of this place, opened its new office at 82 Fulton St., on May 1, where it will continue to handle a complete line of safety equipment for mine and industrial safety.

**Philadelphia, Pa.**—Carl A. Baer & Co., engineers, announced that on and after June 1, the firm's business will be conducted under the name of Baer, Cooke & Co., with offices in the Land Title Building, Philadelphia.

**New York, N. Y.**—What is said to be the largest concrete building ever erected on Manhattan Island is now going up, for occupancy by the Western Electric Co. and the New York Telephone Co. The building, partly an 11-story office building and warehouse and partly a 5-story and basement warehouse, will occupy the entire block surrounded by Hudson, West Houston, Greenwich and Clarkson Sts. The construction will cover an area of 338 by 200 feet and will be throughout of reinforced concrete, with the exception of a veneer of brick on the exterior walls. Work was begun on the first of May. It is expected that the owner will occupy the building by May 1921. The cost of the whole operation will involve nearly \$3,000,000.

The Telephone company will have a garage and warehouse, while the Western Electric Co. will use the building for its local New York territory sales and distributing forces. Executive offices will be located on the upper floors and there will be dining rooms, handball courts, shower baths and the like, provided for Western Electric employees. This follows an established practice of the Western Electric Co.—to make working conditions as comfortable as possible.

It is said that there is no reason why New York City should adapt concrete in its entirety including the columns in all stories. The Middle Western, South Western, Southern and far Western cities almost exclusively use structural concrete instead of structural steel for buildings under 12 stories in height.

## Personals

**William Wignall**, Division Engineer of the Greenwood division of the Lehigh Coal & Navigation Co., in Schuylkill County, Pa., has resigned to accept a position with the Hudson Coal Co. at Scranton, Pa. Herbert Seitzinger, a draftsman, has succeeded Mr. Wignall in his position with the Navigation company.

The Lehigh Coal & Navigation Co., of the Pennsylvania anthracite field, has created a new position, that of Accounting Engineer. This official will co-operate with the mechanical engineer on new appropriations involving abandonment of present equipment; with the construction superintendent, electrical engineer and district superintendents on cancellation of appropriations, abandonment of equipment and transfer of equipment or material applying to any capital appropriations. He will also be responsible for any inventory change. **W. E. Davis**, who was formerly head draftsman of the mechanical department, has been appointed to this position.

**James Haslip** has been appointed superintendent and general manager of the McDonald Coal Co., with headquarters in Clarksburg, W. Va. Prior to accepting his new post Mr. Haslip had been the superintendent of the Rosemont Coal Co. for a period of 12 years, and when he severed his connection with the Rosemont company he was presented with a handsome gold watch by the employees of the company.

**John G. Pollock** has been appointed by the Jamison Coal & Coke Co. as its chief electrician for its West Virginia division, as successor to O. R. Ely who has in turn been made the chief electrician of the Marion division of the Penn-Mar Coal Co. Mr. Pollock had been in the service of the Marion Gas Coal Co.

**James J. Waldeck** has been named as the head of the Charleston, W. Va., branch of

the Imperial Coal Corporation, of New York. Mr. Waldeck was until recently connected with the Tidewater Coal Exchange as an inspector.

**W. A. Field**, of the Johnston City Coal Co., of Chicago has resigned his position to accept one with the Lake & Export Coal Corporation.

**R. R. Atkins**, formerly with the Stonega Coal & Coke Co., of Virginia, has assumed his new duties as general manager for the Liberty Coal & Coke Co., Straight Creek, Ky., in the place of William N. Ewald, resigned.

**W. D. Duncan**, president of the United Mine Workers of America, district 23, has tendered his resignation and has been appointed a member of the International Executive Committee, succeeding George Baker, who has accepted a position as secretary of the Western Kentucky Coal Operators' Association. Lonnie Jackson succeeds Mr. Duncan as president of the miner organization in this district.

## Trade Catalogs

The Wellman-Seaver-Morgan Co., of Cleveland, Ohio, has recently issued the following bulletins showing some of the notable installations made by this company: **Coal and Ore-Handling Machinery**; bulletin 41; pp. 36. **Special Cranes**; bulletin 42; pp. 22. **Hydraulic Turbines**; pp. 20. **Hoisting and Mining Machinery**; bulletin 44; pp. 26. **Coke Oven Machinery**; bulletin 46; pp. 12. **Port and Terminal Equipment**; bulletin 47; pp. 20. These bulletins are all 8½ x 11 in. in dimension and all illustrated. The scheme of each of these bulletins is to show, on facing pages, a picture of a particular installation and a working blueprint of each machine.

**Roebing Wire Rope and Wire**. John A. Roebing's Sons Co., Trenton, N. J. Catalogue for 1920. Pp. 176; 3½ x 6 in.; illustrated. Complete information about the Roebing products and some of the company's installations.

**Climax Coal Handling Machinery**. The Good Roads Machinery Co., Inc., Bulletin Building, Philadelphia, Pa. Catalogue 6. Pp. 64; 7 x 10½ in.; illustrated. Description of coal handling machinery for retail coal yards, mills, factories, public buildings, etc. Numerous installations shown.

**Wagon and Truck Loaders**. Gifford-Wood Co., Hudson, N. Y. Bulletin 400. Pp. 32; 6 x 9 in.; illustrated. Description of loaders and bagging machines for handling coal, ashes, coke, stone, sand, etc.

**Coal Handling Machinery**. Gifford-Wood Co., Hudson, N. Y. Catalogue 19. Pp. 160; 6 x 9 in.; illustrated. Devoted to description of coal-carrying machinery, coal storage and related auxiliaries. Numerous installations shown.

The Specialty Engineering Co., of Philadelphia, Pa., is distributing the following publications together with a folder to contain them: **Specialty Boiler House Equipment for Handling Coal and Ash**; pp. 8. **Car Unloader**; bulletin 2; pp. 4. **Wagon Loader**; bulletin 5; pp. 1. **Coal Crushers**; bulletin 6; pp. 4. **Specialty Wagon Loaders**; bulletin 1-A; pp. 4. These bulletins are 8½ x 11 in. in dimension and illustrated. Apparatus is described and installations are shown.

**Columbian Rope and Twine**. Columbian Rope Co., Auburn, N. Y. Catalogue. Pp. 95; 6 x 9 in.; illustrated. History of how fiber twine and rope are made from plant to factory. An unusually fine publication as regards appearance.

**Oil-Firing for Boilers**. Alldays & Onions, Birmingham, England. Catalogue 461. Pp. 1; 9 x 11½ in.; illustrated. Shows diagrams and gives full particulars of a number of characteristic conversions to liquid fuel.

**Davis No. 1 Blaster**. The Atlas Powder Co., Philadelphia, Pa. Folder. Pp. 8; 3 x 6 in.; illustrated. Full information and description of a small light weight blasting machine.

**Trade Channels from Europe Open**. B. K. Elliott Co., Cleveland, Ohio. Wall poster. Pp. 1; 22 x 28 in.; illustrated. Shows engineering supplies with description.

**Worthington Motorship Machinery Announcement**. Worthington Pump & Machinery Corporation, 115 Broadway, New York, N. Y. Four-page announcement; 8½ x 11 in.; illustrated. Statement about the new Worthington marine oil engine.

**Electric Hoists, Chain Blocks, Cranes and Trolleys**. The Franklin Moore Co., Winsted, Conn. Catalog. Pp. 8; 3½ x 6 in.; illustrated. Descriptive, with price list.

**Suggestions for Retail Coal Yard Equipment**. Specialty Engineering Co., Trenton and Allegheny Aves., Philadelphia, Pa. Catalogue 4. Pp. 48; 6 x 9 in.; illustrated. Description of apparatus for handling coal by modern methods. Installations shown.

**Brass**. The Bridgeport Brass Co., Bridgeport, Conn. Bulletin. Pp. 78; 8 x 10½ in.; illustrated. A brief history of the ancient art of brass making and its early (and recent) method of production; contrasted with the method of the electric furnace process—a twentieth century achievement. An artistic publication.

## Publications Received

**New Provisions for Compensation and Medical and Surgical Care and Supplies Under the War Risk Act**. Treasury Department, Bureau of War Risk Insurance, Washington, D. C. Circular L19-30. This circular is addressed to former service men; a copy may be obtained from the Bureau of War Risk Insurance. Full instructions are given to service men eligible for compensation. A warning is sounded to obtain a certificate of injury within one year from the date of discharge or resignation.

**Twenty-sixth Report of the Board of Directors of the Lehigh & New England R.R. Co.** For fiscal year ended Dec. 31, 1919. Illustrated; pp. 27; 9 x 12 in. Of interest to railroad and anthracite men, particularly to those interested in affairs of the Lehigh, Coal & Navigation Co.

**Recent Developments in Oxygen Cutting**. By Stuart Plumley and F. J. Napolitan. Reprint of paper presented at a meeting of the American Welding Society. Published by Davis-Bournonville Co., Jersey City, N. J. Not illustrated; pp. 2; 6 x 9 in. On the subject of cast iron cutting with the gas torch.

**Metallurgy of Iron and Steel with Reference to Oxygen Cutting**. By F. J. Napolitan. Published by Davis-Bournonville Co., Jersey City, N. J. Not illustrated; pp. 3; 6 x 9 in. Paper connected with the cutting of iron by the gas torch.

## Obituary

**Edmund Gyblon Spillsbury**, who was president of the American Institute of Mining Engineers in 1896, died in New York on May 27. Mr. Spillsbury was born in London in 1845 and was educated in Liege, Belgium, and in the University of Louvain, from where he was graduated in 1862. After taking a course at Clausthal, Germany, he came to this country in 1870. Mr. Spillsbury was a former president of the Engineers' Club of New York and a member of the American Society of Mechanical Engineers, the Institution of Mining and Metallurgy of Great Britain, the Mining and Metallurgical Society of America, and the American Electrochemical Society.

**Dwight Hunkil Coble**, aged 46, secretary of the H. C. Frick Coke Co. died on May 23 of pneumonia in his home at Pittsburgh, Pa. A week previously his only son, Dwight S. Coble, aged 16, died of the same disease. Mr. Coble was born in Steubenville, Ohio. Before coming to Pittsburgh in 1896, he was associated with various steel companies, now a part of the United States Steel Corporation. In 1900 he became private secretary to the late James Cayley. In 1902 he joined the service of the H. C. Frick Coke Co. Mr. Coble studied at Princeton University. He was a member of various clubs and societies. He leaves a widow and his parents, Mr. and Mrs. Hugh S. Coble, of Steubenville.

**James V. Morris**, a prominent coal operator of Cleveland, died recently in his residence, Euclid Ave., Cleveland, Ohio, following an extended illness. Death was due to apoplexy. Mr. Morris had spent the winter months in the South in the hope of benefiting his health and had returned only a few weeks ago.

For the last 30 years he had been located in Cleveland. Mr. Morris owned large coal mines which he had extensively and successfully operated.

**Phillips G. Matheny**, president and secretary of the West Side Coal Co., Springfield, Ill., died recently at his home in Springfield. He was quite a prominent man in Illinois coal circles and was affiliated with the Central Illinois Coal Operators' Association.

**STRUCTURAL MATERIAL**—The following are the base prices, f.o.b. mill, Pittsburgh, together with the quotations per 100 lb. from warehouses at the places named:

	Mill Pittsburgh	Current	New York One Year Ago	St. Louis	Chicago
Beams, 3 to 15 in.	\$2.45 @ \$4	\$3.97 @ \$5	\$3.47	\$4.04	\$3.97
Channels, 3 to 15 in.	2.45 @ 4	3.97 @ 5	3.47	4.04	3.97
Angles, 3 to 6 in., 1/2 in. thick	2.45 @ 4	3.97 @ 5	3.47	4.04	3.97
Tees, 3 in. and larger	2.45 @ 4	4.02 @ 5	3.52	4.04	4.02
Plates	2.65 @ 4	4.17 @ 5	3.47	4.24	4.17

**BAR IRON**—Prices in cents per pound at cities named are as follows:

	Pittsburgh	Cincinnati	St. Louis	Birmingham
	4.25	5.50	4.50	5.00

**NAILS**—Prices per keg from warehouse in cities named:

	Mill Pittsburgh	St. Louis	Chicago	Birmingham	San Francisco
Wire	\$4.00	None	\$4.15	\$5.75	\$6.00
Cut		None	7.00		8.50

**TRACK SUPPLIES**—The following prices are base per 100 lb. f.o.b. Pittsburgh for carload lots, together with the warehouse prices at the places named:

	Pittsburgh	Chicago	St. Louis	Cincinnati	San Francisco	Birmingham
Standard railroad spikes 1/2-in. and larger	\$4.00	\$3.62	\$5.34	\$4.25	\$5.65	\$6.00
Track bolts	6 @ 6.50	4.62	7.50	5.50	6.65	7.50
Standard section angle bars	3 @ 4	3.02	Prem.		4.90	

**COLD FINISHED STEEL**—Warehouse prices are as follows:

	New York	Chicago	Cleveland	Cincinnati	St. Louis
Round shafting or screw stock, per 100 lb. base	\$6.25	\$5.80	\$6.00	\$6.50	\$5.90
Flats, squares and hexagons, per 100 lb. base	6.75	6.30	5-6.50	6.85	6.40

**HORSE AND MULE SHOES**—Warehouse prices per 100 lb. in cities named:

	Mill Pittsburgh	Chicago	St. Louis	Birmingham
Straight	\$5.75	\$7.00	\$7.00	\$7.00
Assorted	5.85	7.15	7.15	7.25

Cincinnati—Horseshoe nails sell for \$4.50 to \$5 per 25-lb. box.

**CAST-IRON PIPE**—The following are prices per net ton for carload lots:

	Current	One Month Ago	Year Ago	Chicago	St. Louis	San Francisco	Dallas
4 in. and over	\$79.30	\$75.30	\$60.70	\$78.80	\$78.00	\$93.55	\$74.30
6 in. and over	76.30	72.30	57.70	75.80	75.00	90.55	71.30

Gas pipe and 16-ft. lengths are \$1 per ton extra.

**STEEL RAILS**—The following quotations are per ton f.o.b. Pittsburgh and Chicago for carload or larger lots. For less than carload lots 5c. per 100 lb. is charged extra:

	Current	One Month Ago	Year Ago	Chicago	St. Louis	San Francisco	Dallas
Standard Bessemer rails	\$45 @ 60	\$45.00	\$45.00	\$55.00	\$45.00		
Standard openhearth rails	47 @ 60	47.00	47.00	57.00	47.00		
Light rails, 8 to 10 lb.	2.585* @ 3.75	2.585*	2.585*	3.75*	2.835*

First grade	20%	Second grade
		30%
		Third grade
		45%

LEATHER BELTING—Present discounts from list in fair quantities (1/2 doz. rolls):

	Light Grade	Medium Grade	Heavy Grade
	30%	30%	20%

RAWHIDE LACING—(For cut, best grade, 25%, 2nd grade, 30%, For laces in sides, best, 79c per sq. ft.; 2nd, 75c. Semi-tanned: cut, 20%; sides, 83c per sq. ft.)

	Price per pound
Rubber and duck for low-pressure steam	\$1.00
Asbestos for high-pressure steam	1.70
Duck and rubber for piston packing	1.00
Flax, regular	1.20
Flax, waterproofed	1.70
Compressed asbestos sheet	.90
Wire insertion asbestos sheet	1.50
Rubber sheet	.50
Rubber sheet, wire insertion	.70
Rubber sheet, duck insertion	.50
Rubber sheet, cloth insertion	.30
Asbestos packing, twisted or braided, and graphited, for valve stems and stuffing boxes	1.30
Asbestos wick, 1/2- and 1-lb. balls	.85

MANILA ROPE—For rope smaller than 1/2-in. the price is 1/2 to 2c. extra; while for quantities amounting to less than 600 ft. there is an extra charge of 1c. The number of feet per pound for the various sizes is as follows: 1/2-in., 8 ft.; 3/4-in., 6 ft.; 1-in., 4 ft.; 1 1/4-in., 3 ft.; 1 1/2-in., 2 ft. 10 in.; 2-in., 2 ft. 4 in. Following is price per pound for 1/2-in. and larger, in 1200-ft. coils:

Boston	\$0.35	Birmingham	\$0.32
New York	.29	Atlanta	.295
St. Louis	.265	Kansas City	.301
Chicago	.275	New Orleans	.301
Minneapolis	.275	Seattle	.28
San Francisco	.27	Los Angeles	.31

PIPE AND BOILER COVERING—Below are discounts and part of standard lists:

	PIPE COVERING	BLOCKS AND SHEETS	
Pipe Size	Standard List Per Lin.Ft.	Thickness	
		Price per Sq.Ft.	
1-in.	\$0.27	1-in.	\$0.27
2-in.	.36	1-in.	.30
3-in.	.45	1 1/2-in.	.45
4-in.	.60	2-in.	.60
6-in.	.80	2 1/2-in.	.75
8-in.	1.10	3-in.	.90
10-in.	1.30	3 1/2-in.	1.05
8 1/2% magnesia high pressure		List	
		4-ply	40% off
		3-ply	42% off
		2-ply	44% off

WIRING SUPPLIES—New York prices for tape and solder are as follows:

Friction tape, 1/2-lb. rolls	55c. per lb.
Rubber tape, 3-lb. rolls	60c. per lb.
Wire solder, 50-lb. spools	46c. per lb.
Soldering paste, 2-oz. cans	\$1.20 per doz.

COPPER WIRE—Prices per 1000 ft. for rubber-covered wire in following cities:

	New York	Birmingham	Cincinnati
	Single	Double	Single
	Double	Single	Double
	Braid	Braid	Braid
	Solid	Stranded	Duplex
	Solid	Stranded	Duplex
14	\$12.00	\$13.90	\$28.50
10	18.30	23.85	41.50
8	25.54	32.70	56.70
6	51.40	60.60	67.25
4	70.00		93.41
2	101.80		120.40
1	131.86		155.23
0	160.00		188.77
00	193.50		229.19
000	235.20		278.64
0000	288.60		338.41

FREIGHT RATES—On finished steel products in the Pittsburgh district including plates, structural shapes, merchant steel, bars, pipe fittings, plan and galvanized wire nails, rivets, spikes, flat sheets (except planished), chains, etc., the following freight rates per 1000 lb. are effective:

Boston	\$0.30	New Orleans	\$0.385
Buffalo	0.17	New York	0.27
Chicago	0.27	Philadelphia	0.245
Cincinnati	0.23	St. Louis	0.24
Cleveland	0.17	St. Paul	0.495
Kansas City	0.59	Pacific Coast (all rail)	1.25*
*Note—Add 3% transportation tax. *Minimum carload, 80,000 lb.			

# COAL AGE

The Weekly Journal of the Coal and Coke Industries

Volume 17

NEW YORK, THURSDAY, JUNE 17, 1920

Number 25

## *Beware of the Bankrupts*

EVERY time that the price of coal has to go up to meet wage increases comes the cry that the railroads, the electric companies or the gas companies cannot afford the increased price. Why cannot they afford it? Because the public in its zeal for its own profits—many of them profiteering profits—have bankrupted the public utilities. If the public would be fair to these utilities they could be fair to the coal industry. Is it not reasonable to suggest that the coal operator and mine worker would be wise to wish luck and bespeak kindly the public utility, so that when increases in the price of coal are necessary the public utility companies can pay the advance and pass it on?

Bankrupt concerns have been the cause of the pressure to keep the price of coal below or at cost. Bankrupt railroads have been successful advocates of assigned cars. Bankrupt plants have been slow to store coal. Bankruptcy in a client means bankruptcy of the merchant to whom he is client. Success in a client means success to the producer who does business with him. For this reason let the coal operator never cease to boost for the public utilities, to which division of society indeed he rightly belongs.

## *Geological Survey Will Inventory Coal Requirements*

IN CO-OPERATION with the Council of National Defense, acting for the old Bituminous Coal Commission, the Geological Survey is making an inventory of the stocks and requirements of coal in the country as of June 1. This is the sort of investigation regularly made by the Fuel Administration during the war, which the Survey asked Congress to appropriate funds for maintaining subsequent to July 1, last. Fortunately, the remnant of the appropriation for the coal commission is available for the work this year at a time when such information is sadly needed.

The Survey has sent inquiries to a representative list of industrial consumers, public utilities, retail dealers and railroads, and from the data thus obtained will give us a comprehensive view of the stocks of coal as of June 1 and of requirements for the remainder of the year. The belief is general that the country is very short of coal, but no one can say with assurance just what is required to meet the emergency, except that it is evident that today the need is for more than the roads can transport from the mines to consumers.

It is becoming evident each week that the railroad strike and the general incapacity of the railroads are having a slowing-down effect on industry, and, as we pointed out several weeks ago, such a slowing down is reacting on the demand for coal. Consumers who must close their plants for a part of each week use less coal and have in the same measure less anxiety for

supplies. An official investigation into the situation will dispel much of the present uncertainty and enable all to proceed to meet the demands of the country for coal with the dispatch the situation demands.

## *Will We Have Government Control of Coal Again?*

THAT so many are apprehensive that this country is about to have a financial panic is good evidence, we are told by students of history, that no catastrophe will occur. So many are working to avoid trouble that their combined efforts and the warnings given will cure the trouble. So may it well be with the specter of Government-control of coal. Operators gathered last month at Atlantic City, jobbers recently at Pittsburgh, and now the retail coal dealers at Detroit have been solemnly warned by their leaders that if they do not one and all behave, the Government will again step in and dictate to them how to run their business.

There is reason for the belief and cause for the fear. The effort to frame a coal commissioner bill for action by the Senate stirred the coal trade as has nothing since the strike. We do not believe that Senator Frelinghuysen sees in his proposal as much danger to the coal industry as he sees benefit to the public. The Senator tried to get at the facts a year ago for the very helpful purpose of aiding all concerned, from the producer to the consumer. He found a vast lack of the kind of information needed for study of the problem. His proposal for a coal commissioner is to meet that lack. The coal industry sees it as an opening wedge for Federal interference with the coal business, and we have no doubt that once such a commissioner were in action there would be increasing meddling with the coal industry, not all of which would be harmful but some of which would be distasteful to coal men.

How to forestall such action by the Government and the demand for regulation by the public is troubling the leaders of coal today. No weapon is available except exhortation, for there is no legal or other means by which recalcitrant operators, jobbers or retailers can be held in line. John E. Lloyd, president of the retailers' association, told his members at Detroit to have always in mind that they serve the public and that they must have its confidence and support.

We are often reminded by the coal men that the public does not understand us, but the same man balks at letting the public learn anything about his business and never offers to tell his story to ears that are really sympathetic. The coal industry has about three months in which to educate the public to the reasons for the present coal situation. With the first cold weather the public without coal will not have patience to listen. The first move is to line up solid with your associations, next support them by money and figures, trust the leaders and hold your prices in line with reason.

## Shippers Agree to Pool Lake Coal

AT THE request of the Interstate Commerce Commission the Lake shippers have voluntarily agreed to pool bituminous coal for transshipment by lake for the season of navigation of 1920, subject to rules and regulations that follow very closely those prevailing in the war year of 1918. The necessity for this action has been apparent for several weeks, and meetings were

### Lake Coal Dumped Season to June 12

(NET TONS)

	Cargo	Fuel	Total
1919.....	6,704,000	303,900	7,007,900
1920.....	2,199,000	216,600	2,415,600

held in the first half of June that resulted in the shippers making the request that Federal support be given the movement. This action took the form of an embargo on all lake shipments except those under permit from the Ore and Coal Exchange, to head which the Interstate Commerce Commission officially appointed (without compensation) Herman Griggs, who has managed the exchange for more than two years. Rules and regulations have been agreed upon and shipments under the program began on Monday, June 14.

No figures on car detention at Lake ports are available yet for this year, but it is certain that among the causes of low dumping have been the innumerable classifications. It is understood that no one expects pooling, which means the elimination of the majority of classifications and the speeding up of car movement, to solve the problem of getting sufficient coal up the Lakes this year. But pooling is the first necessary step and it is to the credit of the coal men that they agreed to bury their personalities in a pool, and proceed in the spirit of 1918.

## National Coal Association Attacks Assigned Cars in Court

SENATOR HARDING asked the Interstate Commerce Commission to inform the Senate why there was apparent discrimination between coal operators in the matter of car supply—that is, why assigned cars were being permitted. The answer, recently given out, is a legal defense of the commission's position. The National Coal Association has announced that legal action will be instituted at once to settle once for all the right under the Transportation Act of the railroads to use assigned cars in securing fuel coal.

The reply to the Harding resolution, dated June 11, states with reference to the Transportation Act of 1920, "The act does not attempt to define in detail . . . what is a just and reasonable distribution of cars or rating of mines. The commission is authorized to determine . . . what are just and reasonable rules . . ." Futher it is pointed out that the commission can suspend such rules in any case of emergency and under the new act can establish new practices with respect to car service such "as in its opinion will best promote the service in the interest of the public and the commerce of the people."

The commission also points out that no other plan has been proposed which is workable and also preferable

to the assigned car practice. It even says: "It seems not inappropriate to say that the coal operators are not able to entirely agree among themselves as to the advantages or disadvantages of the assigned-car practice." In effect the report is a defence of the assigned car rules as now practiced and gives no hint of any change so long as the commission is of the opinion that the fuel and transportation emergency continues.

Answer to the opinion of Chairman Clark of the Interstate Commerce Commission on the legal aspects of assigned cars was prompt and to the point. The National Coal Association has filed a suit against the Baltimore and Ohio R.R., with the Lamberts Run Coal Co. as plaintiff, alleging illegal discrimination in the distribution of empty cars for coal loading. The suit was filed on June 12 at Fairmont, W. Va., with hearing set for June 19. The finance committee of the National will meet this week to determine on instituting additional suits.

## Steel Companies Obtain Injunction Against Trade Commission Requiring Cost Data

ON JUNE 12 Justice Bailey of the District of Columbia Supreme Court granted an injunction asked for by more than a score of steel companies, restraining the Federal Trade Commission from requiring monthly cost reports. At the same time the Trade Commission is proceeding in the New Jersey courts against certain of the steel companies in an effort to secure cost reports. It is reported that the more recent decision of Justice Bailey will not interfere with the New Jersey suit.

## Coal Rate Hearings Begun

INTERSTATE Commerce Commission hearings on freight rate increases are continuing daily in Washington. Monday, June 14, was set as the date for consideration of the coal and coke rates and at that time many of the important aspects of these rates were to be covered. Not only rail rates but also coastwise rates were expected to be under discussion.

## Consumers Report Stocks of Coal

MANY replies have been received by the U. S. Geological Survey in its census of stocks of coal on hand and of estimated needs. The final date for these reports was indicated in the call as June 12, but the Survey urges that all who have received forms reply even though they were not able to do so before that date. Co-operation in this is very important for all coal interests.

## Will Settle Anthracite Wage Dispute

ON June 21 the Anthracite Coal Commission will meet at Washington to settle the wage controversy. The members of the commission are William O. Thompson, president of the Ohio State University; William L. Connell, a large anthracite operator of the Bernice field, and Neal J. Ferry, a member of the Executive Committee of the United Mine Workers of America.

The Anthracite Coal Commission expects on June 21 to outline its work and determine the time and place for the holding of hearings. It is likely that it will conduct these session in the anthracite field.

# Retail Coal Dealers Advocate Open Shop

Annual Convention of National Retail Coal Merchants' Association at Detroit Takes Strong Position on Labor Question — Opposes Further Regulation by the Government — W. H. Williams Says Railroads Are Not Efficient — Harry Taylor Commends Support Given National Associations — John Lloyd Re-elected President

**R**ETAIL coal dealers from nearly every state gathered at Detroit on June 10, 11, and 12 in the largest, most representative and enthusiastic gathering of coal men held this year. The sessions were characterized by earnestness of purpose and the talks and discussions were so directed at the problems of the retail dealer that no one who attended could fail to gain a larger view of the duties, responsibilities and difficulties of the retail coal dealer. The retailer is the representative of the coal industry who comes in closest touch with the public, because he is the one who meets the everyday problems of the coal-consuming householder. The keynote of this convention was service to the public—service that will put the public on the side of the coal man.

After the delegates were given a welcome to the City of Detroit by James A. Ballard, sales manager of the Semet Solvay Co., the president, John E. Lloyd, opened the convention, the third held by this association, with an address that inspired every man with the public responsibility of his calling and that set a high standard for the future activities of his associates. Service to the consumer that will gain public confidence and will bring public support for the coal man, he pointed out, is more important now than it has been at any other time in the history of the trade. Coal faces a crisis today, because we are sure to have a hard winter with plenty of trouble. The public blames the retailer when the fault is really with the railroads today. Mr. Lloyd said that if the dealers do not help to hold down prices, the Government will step in and do it for them.

"If we do not manage our business right, the Government will take it and manage it for us. A bare 5 or 10 per cent of the men in the trade can so misconduct their affairs that the whole structure will be made to suffer," was in part the warning conveyed by President Lloyd. He urged the dealers to unite more strongly than ever, to support their association by money and assistance and thereby help to regulate their own business and remove any necessity for Federal interference.

Direct shipments to consumers for domestic use, particularly through industrial plants, were opposed as uneconomic and because the replacement of a part of the regular trade of the dealer by this practice results in increasing the costs of handling the remaining tonnage and the price to the other consumers. Such forms of distribution of household coal were compared to the condemned system of rebates by railroads. Mr. Lloyd urged that the association be developed to the point where it could have a voice in legislative matters and be in position to make forceful opposition to such measures before Congress as the Coal Commissioner bill. He advocated a model Government but one that would not attempt to run the coal trade or any other industry.

A ringing declaration for the open shop, severe condemnation of the closed-shop principle and the statement that business men are too prone to discuss labor problems in hushed tones and too loath to tackle the question in characteristic American fashion brought the convention to its feet in applause. John Lloyd believes that labor can be trusted, he has confidence in the good sense and loyalty of the majority of the workingmen,

BANQUET OF NATIONAL RETAIL COAL MERCHANTS' ASSOCIATION, HOTEL STATLER, DETROIT, MICH., JUNE 11, 1920  
Homer D. Jones was toastmaster and the addresses were delivered by W. R. Coyle and James Schermerhorn. Music was furnished by the Masonic Temple Chanters and Symphony Orchestra. There were more than 400 guests at the banquet.

but he deploras the kind of leadership labor has had for the last few years. He sees in the temper of the country at this time a set of laws to control labor that will be more drastic than those, such as the Sherman law, passed by Congress in the past to control capital. Labor is today using its power in a more drastic manner than capital ever did, and the reaction will be the stronger when it comes. He is not afraid to put himself and the retail dealers' association on record as ready to face the issue.

#### SECRETARY GORDON REPORTS A GOOD YEAR

Ellery B. Gordon, secretary-manager of the association, in his report to the convention told of the growth of the organization and the activities of the national officers during the past year. He pointed out in particular the necessity in 1919 for almost constant contact with the Federal Government at Washington, and forecast this year as one of contact with transportation interests. The office of the national association publishes a monthly paper called the *Coal Merchant*, described by Mr. Gordon as not a general news journal but one endeavoring to summarize for quick reading everything of immediate interest to the trade national in its significance. This paper carries no advertising. He commended the regular trade papers, which have a place of their own, with columns always open to the trade, and urged the support of the coal trade to the standard coal journals.

Mr. Gordon declared that the retailers' organization has one large aim—to establish a reputation for fairness—and is in the position of being willing to accept nothing less from others. To attain the position it deserves and can reach—of responsibility, influence and strength—moral support and financial assistance must be given in greater measure than heretofore. Education of the public and of the members of the trade was urged, the latter by better and more vigorous local associations.

W. H. Williams, vice president in charge of mining of the Delaware & Hudson R.R. and chairman of the board of directors of the Wabash R.R., addressed the meeting Friday morning. The feature of his talk was his description of the plight of the American railroads today and his expression of belief that they can overcome their present predicament by more efficient operation and management.

Mr. Williams' contention, supported by a volume of statistics that without effort or notes he quoted throughout his talk, is that if the railroads would this year increase the average car-miles per day to the figure reached in 1915, which was 26.9 miles per day, and would increase the average loading per car to the comparatively low figure of 71 per cent of rated capacity, a figure reached in 1916, the cumulative effect of this increase in efficiency in the use of transportation would be sufficient to meet the present needs of the country. To accomplish the same ends by investment in more cars that would be loaded and moved no faster than cars are loaded and moved today and to add motive power, labor, trackage and terminals to accommodate and handle such an increase in equipment would require from six to seven billions of dollars.

He declared that without question the solution of the transportation problem rests with the railroads themselves and with no one else. The railroads are not broken down, Mr. Williams declared, but they are

not performing their functions as they should. He further pointed out that the railroad plant is not materially smaller than it was in 1917 and 1918, when vastly greater volume of traffic was handled with less effort than appears being made today.

Next winter's supply of anthracite was touched on but lightly by Mr. Williams, who said that the shipping companies are doing the best that they can to meet the orders of the retailers, but as long as it is so difficult to make delivery there will be shortage in supply at the points of consumption. Coal reserves in the ground are ample and the mine capacity is sufficient to meet our needs, but the problem this year is to get the cars of coal to the man who wants them.

He reviewed the advances made the past few years in mining methods. In the northern anthracite field machines have been successfully introduced; in the lower and thinner veins, where headroom for hand loading had to be made by taking down roof or lifting floor, loading machines are being tried out and in the preparation of fine sizes great advances have been made. Wet methods of cleaning have reduced breakage and the use of such machines as the Dorr thickener and the Deister tables has permitted the preparation of fine coal much lower in ash than any heretofore obtained.

#### EMBARGO WOULD AFFORD TEMPORARY RELIEF

But temporary relief would be afforded the country by the proposed 90-day embargo on exports of coal from the Atlantic seaboard, declared Harry N. Taylor, in answer to inquiries from the floor of the convention, following his address. The immediate result would be lowering of prices of those coals that are now being shipped abroad, but at the expiration of the proposed 90-day limit conditions would be far worse than now, and Europe needs the coal. He further stated that with the present short running time many mines are showing a deficit in their operation, and with labor getting the highest wages ever offered coal-mine labor relief stations in the coal fields today must assist the needy miner who is denied the opportunity to work because there are no railroad cars in which to load the coal.

Despite the fact that wages are the highest and prices beyond reason, both miners and operators are realizing the smallest profit they have had for several years. Bearing out the statements of Mr. W. H. Williams in a previous address, Mr. Taylor said that whereas cars of coal in 1918 had been moved from the mines in the Kansas field to Kansas City and the empties returned in four days, the same round trip now requires twelve and a half days. There is enough railroad equipment in the country today, if put in repair and properly used, to meet the transportation requirements of the country.

In answer to an inquiry regarding the Lake situation, Mr. Taylor said that there is no question but that the Northwest will be short of coal this year, but that even if there was a larger supply on hand it could not be moved off the docks to consumers because of a lack of railroad equipment. The result this winter will be that a tremendous load will be thrown on the coal fields in Illinois that can reach the Northwest by all rail routes.

Resizing of anthracite, trade relations, cost accounting, Governmental relations and transportation were the subjects of special committee reports.

# Indiana Operating Problems as Illustrated By the Black Betty Mine

Keen Competition and an Exacting Trade Make Close Sizing and Careful Preparation Necessary—Roof Scales Badly, Keeping Roads Covered with Rock Dust—Coal Bed Being Dry and Level, Rooms Are Driven in Opposing Directions

BY DONALD J. BAKER  
Pittsburgh, Pa.

**C**OALS from every section have each a degree of individuality in appearance that they can readily be recognized by the local expert. Not less marked a characteristic of each is its specific action in the furnace. In consequence of this individuality each finds its appropriate uses and each needs grate settings suited to its characteristics.

"Indiana Lump" is a coal of marked individuality. There is no question mark to be put after the word "lump" such as one would be disposed to put after the large coal from some other districts. It is a coal well suited to domestic use, while its slack has a non-caking quality which has its advantages. Due to its low-sulphur

content it is peculiarly adapted to steel making and the ceramic industries. It is free burning, contains little sulphur as compared with coals from the other beds and leaves but a small amount of ash. An analysis of the No. 4 coal will show approximately the following constituents: Fixed carbon, 41.19; volatile matter, 37.80; ash, 7.05; moisture, 13.96; sulphur, 1.12. The heat content averages about 12,000 B.t.u.

## SIX DEPOSITS IN WESTERN INDIANA

Notable among the varieties of the Indiana coal is the No. 4 bed, which is the most valuable of the group of the six distinct deposits found in western Indiana. Vigo County is the greatest producer of this coal, but Pike and Knox counties are rapidly opening up and it is highly probable that one of these counties will soon surpass the present leader, for in Vigo County there is now no longer much opportunity for development.

Other Indiana coals will in the future be more extensively mined, but at present they do not have the repu-

TIPPLE AND HEADFRAME OF BLACK BETTY MINE, NEAR TERRE HAUTE, IND.

Headframes in the Middle West are made lighter than in the Eastern mining regions, doubtless because the air in the hoisting shaft is not so humid and corrosive in the former instance. Owing to the fact that timber has to be brought in from some dis-

tance the Mid-West tipples are nearly always of steel, thus greatly decreasing the probability of fire and making more accessible all points under the structure. Four tracks pass under the Black Betty tipple, making it possible to load that number of

sizes at any one time. Trifling changes in the screening apparatus make it possible at any moment to load any related four varieties of the twenty-one different sizes that the market demands. Note on the left the boiler-coal conveyor.

### Underground Workings of the Black Betty Mine

The whole mine could be laid off with a tee-square and triangle, for all lines are north and south or east and west. In most cases rooms are driven both ways from the heading to meet rooms from the adjacent heading, the exception being along the main entries, which for a space have rooms on one side only, but which in general are kept free of any rooms whatsoever. Note the narrow pillars and the high percentage of coal secured in first mining. Unfortunately, as is usually the case where first mining is so complete, there is no second mining. Union restrictions make it necessary to provide short crosscuts and inadequate room necks. The mine shaft is 350 ft. deep, so there is plenty of roof pressure to be dealt with. In general, the dotted lines mark actively producing workings.

### Undercutting the Seam

There being no marked cleating in the coal, the rooms are driven regardless of the structure of the bed but in rigid accord with mine layout. The bottom is a hard rock.

tation that the No. 4 bed enjoys. The fact that it is now impossible to purchase any acreage in the No. 4 bed testifies to its value and popularity with the consumer.

Located about 12 miles from Terre Haute and situated at a low point in the rolling country of the Wabash Valley is a representative mine that is developing a 1,000-acre tract of the No. 4 bed. This is the Black Betty operation of the Zimmerman Coal Co. This firm broke ground for its plant in December of 1916 and the following year began operations, sinking a 350-ft. concrete-lined main hoisting shaft.

#### FLOODED WITH WATER AND FILLED WITH DÉBRIS

Scarcely had the work of driving the main haulage entries from each side of the bottom been started, when a "cloudburst" occurred and filled the entire excavation with water and débris. For a considerable distance on either side of the bottom the roof came down as high as 35 feet.

The outlook for the eventual opening of the mine at this period was indeed dark. There is little question but that it would have been cheaper to have sunk a new

shaft and begun all over again; however, there was no location on the tract that offered the same advantages for developing the coal. Accordingly the water was pumped from the opening and the best made of an unfortunate circumstance.

#### HEADING UTILIZED FOR HAULAGE PURPOSES

Fortunately, the cave did not extend over the parallel aircourse heading, and in order that the work of developing the mine might not suffer this heading was utilized for haulage purposes while the construction of a brick archway over the caved regions progressed. This archway, which is shown in one of the illustrations, was built of paving blocks made three blocks thick. It was constructed in 10-ft. lengths, each of which is 10 ft. high.

As each section was completed the débris ahead of the next section was placed above the finished arch to act as a cushion in resisting any future falls. The completed archway extends for a distance of 350 ft. upon one side of the bottom and 100 ft. on the other side. The longer portion of the arched way spans the loaded storage tracks, which are on a 1½ per cent grade. This

### This is "Indiana Lump"

Free-burning, non coking and low in sulphur, the coal from No. 4 bed finds favored place in steel smelting, ceramic work and steam raising wholly aside from its recognized value as a domestic fuel.

### Landing at Black Betty

In the early days of development Black Betty filled with water and debris and the landing caved till the heading roof was 35 ft. above the old floor. The landing had to be arched and the debris was piled as back filling over the archway as fast as the arch was constructed.

inclination permits the cars to run by gravity to an automatic caging device, which feeds them to the cages.

The opposite, or south, side of the shaft accommodates the empty cars as they leave the cage. The grade on these tracks is, of course, in favor of the empty cars and they are here made into trips before being removed by locomotives. As most of the development today is on the north side of the shaft, the trips pass along a heading that is parallel to the loaded storage tracks and emerge onto the main haulageway at a point directly north of the end of the archway.

#### TWELVE-FOOT ROOM PILLARS ARE NEVER DRAWN

The method of developing the mine is a variation of the triple-entry system, with a panel scheme applied to the working of the rooms. All entries, including main haulageways, are single tracked. A parallel heading serves as the aircourse. In the accompanying mine map it will be noticed that the mine was laid out to square with the points of the compass. As a result, the north and south sections of the mine are reached through true north and south main haulageways. Sub-entries running due east and west are driven every 1,320 ft. off these. From these sub-entries and at right angles to them room headings are driven every 450 ft. Thus a block of coal 1,320 x 900 ft. constitutes a panel and is developed by rooms 200 ft. long. The coal seam is 5 ft. 2-in. thick.

Except for a few local depressions No. 4 bed is practically level and rooms are driven from both sides of the entries. This is possible in a mine that is unusually dry and where the bed has no dip. Furthermore the mining law of the state permits ventilating this entire mine with two splits.

As fast as each panel is worked out it is sealed off and abandoned. Some gas is encountered in development, this being chiefly apparent immediately after the shooting of the coal. While open lamps are used throughout the mine, some gas is generated when the roof falls in the worked-out panels, and great care must be used in sealing off such workings.

The room pillars are 12 ft. thick, the roof over the coal at the time of its removal being quite reliable and the coal being strong. No attempt is made to draw these pillars and much good coal is thus lost by reason of the sealing off of the panels when the rooms have been carried to their full length. The coal thus abandoned approaches 40 per cent of that available.

In this section of the country the temptation to mine in the easiest possible manner is strong and it has resulted not only in leaving coal in the seam operated but in leaving undeveloped and unmined two other workable and valuable beds on this same property. No. 5 bed overlies No. 4 by some 100 ft. and No. 3 underlies it at an interval of 120 ft. Separated by such intervals, in the opinion of most people, No. 5 coal should be removed first, provided, of course, that all the beds were not to be operated concurrently. No. 4 coal could then be removed and there would then be some assurance that the floor and roof of each bed would present their natural resistance to crushing.

There is no drainage problem at this mine and the only water encountered is that which finds its way down the shaft. The floor of the coal is a firm sandstone. The roof is a sandy shale with some lime in it. Because of the dryness of the overlying seams this roof is quite firm when first exposed. In the winter months, when the circulating air is cool, no trouble is experienced; but during the summer the warm air which enters is chilled and moisture condenses in small globules on the roof. The action of the water on the lime is immediate and the roof starts to slack and flake off. No great amount of trouble is caused through this seasonal activity in the roof, and no measures have been taken in this mine to combat it. In other localities, however, a cement gun has been used advantageously.

#### MINE USES DIRECT CURRENT EXCLUSIVELY

The coal is cut by a Goodman shortwall mining machine and though this bed is harder than the Pittsburgh, no difficulty is encountered. Two-ton mine cars are used and mule haulage is employed within the rooms and along the room entries that are connected with the east and west headings. The locomotives are of the trolley type and operate on direct current. Incidentally only direct current is used both within the mine and around the surface plant.

Quite a number of the mines situated in the Wabash Valley purchase their power from the high-tension lines of the Terre Haute, Indianapolis & Eastern Traction Co., but inasmuch as the initial cost of constructing a transmission line from the nearest point appeared prohibitive, a power plant was built at this operation. The building is of brick construction, the roof being supported by steel and wooden trusses on brick columns. A brick partition divides the boiler from the engine room.

This latter also houses the hoisting engine. This building is situated adjacent to the tippie and is floored throughout with cement.

#### SPARE POWER UNIT SELDOM NEEDED

The main generating unit is a 22 x 25-in. Chuse non-releasing corliss engine direct connected to a 300-kw. 550-volt Westinghouse direct-current generator, a 450-hp. Skinner engine that drives a 200-kw. 550-volt Westinghouse generator by direct connection being installed as a spare unit. This latter generating set is seldom used as the first mentioned unit supplies ample power. The hoist engine is of Lane & Bodley manufacture. The drum is 9 ft. in diameter and winds a 1½-in. cable. The cylinders of the driving engine are 24 x 42 in. in size, and the machine is equipped with a steam brake and a steam-operated reverse. A 10-in. steam line from the adjacent boiler room supplies all units in the engine room.

The boiler room houses five 150-hp. Frost boilers, each of which is equipped with hand shakers. The boilers are hand-fired with screenings. These are conveyed direct from the tippie to the floor by a button conveyor. The ashes are removed to a nearby dump by a steam jet which drives them through an 8-in. pipe line laid beneath the boiler-room floor. There are separate steam lines to both blacksmith shop and fan house, operation of these units being thus independent of the engine room.

Water for the boilers is secured from a small reservoir located near the surface buildings. This is fed from a large reservoir that is located at some distance from the mine. From the auxiliary reservoir the water flows by gravity to a cistern at the boiler house, whence it passes to the boilers through a feed-water heater.

The tippie was designed, fabricated and erected by the

Wisconsin Bridge & Iron Co., the Eagle Iron Works of Terre Haute supplying all the interior equipment. The apparatus for preparing the coal is elaborate and was designed and installed with the purpose in view of pleasing a discriminating trade.

In fact there are in all twenty-one sizes prepared, as occasion demands, four of which can be loaded at any one time. These sizes vary from slack to a 6-in. lump and range through variations of pea sizes that run from ¼-in. to 1-in., thence through a nut size up to 2½-in. and lastly egg up to 6-in.

Why, it will be asked, should such a range of sizes be prepared? And is each of the different sizes actually made? The latter query may be answered in the affirmative, although many sizes are quite uncommon. In answering the first question it may be said that, owing to the keenness of competition in the Indiana field, the sales representative of a company that is not prepared to furnish any required size of cleaned coal finds himself under no small handicap.

#### LOADING BOOMS ARE USED AS PICKING TABLES

The tippie building is a steel frame with corrugated iron siding, while the headframe is of structural-steel construction. The cars as they come to the head of the tippie discharge their contents into a weigh basket, after which it passes into a hopper and is thence fed to a short apron conveyor. From the conveyor the coal passes over 30-ft. shaker screens. The different sizes are secured by changing the plates and employing those that contain the desired size of perforation.

Three loading booms and a slack chute permit four different sizes to be loaded at one time. From the end of the shaker screens the large lump enters one loading boom while the smaller sizes are distributed to two others. The slack travels by gravity to a chute beneath

LOOKING EASTWARD AT THE BLACK BETTY TIPPIE

On the right can be seen the small rock dump or, rather, bank. The coal being 62 in. thick, there is no need for room rock to be brought to the surface, but, as the time in the roof causes it to scale whenever

the damp and warm air entering the cool mine condenses on it, rock falls occur in the heading, and have to be removed. But the dumps are not as pretentious and costly as in some sections, where the rock han-

dling in trips and on the dump makes an additional charge to the cost of deadwork, the importance of which is not always fully realized by those even who face these difficulties from which others are exempt

the screens and is loaded without a boom. All the booms are used as picking tables as well as conveyors. Platforms have been constructed along the side of each, and here three men are stationed. Thus the coal is thoroughly cleaned before it enters the car.

No. 4 bed is mined unusually clean by reason of the firm floor, and no great amount of refuse is discovered in the tippie. All of the equipment within this structure is electrically driven from motors operating on direct current. In case the power is temporarily off at the power plant, the coal may be dumped over gravity screens beneath the shakers and loaded either as run-of-mine or as 1½-in. lump and slack.

While the hoisting engine and the tippie were designed to accommodate a capacity of 3,000 tons in 8 hr., this figure is rarely attained. Perhaps 2,000 tons would be a fair average, although 2,500 tons have been loaded with ease when the cars were available. Car shortage has dealt this mine a severe blow, as it has many others in the Indiana field.

The mines in Vigo County are utilizing motor trucks in many cases to deliver domestic fuel. In this manner the shortage of railroad cars is alleviated. Hauls up to thirty miles are not uncommon and in this way the domestic and manufacturing needs of the surrounding industrial district may be filled. However, coal from the plant described is seldom delivered by truck and today it is operating at less than 50 per cent of capacity. This feature of intermittent operation is extremely trying.

#### NO HOUSING ACCOMMODATIONS PROVIDED

Houses for accommodating the men have not been built at this mine and as a result most of the employees live either in Terre Haute or Clinton and take a train to the plant. While the car allotment is less than 50 per cent of normal, production is further made more difficult by reason of the men not being available on short notice. Either the mine works an entire day or it does not work at all, and in either case the decision must be made the evening before.

Materials are taken down the shaft during odd times and the men use the coal cages before and after working hours. The airshaft is located near the tippie. Here a temporary wooden structure encloses a 20-ft. reversible fan that is driven by a twin-cylinder Bullock steam engine. The air is delivered at the rate of 217,000 cu.ft. per minute. The fan is one of the most important units of the surface equipment because the circulation of air must be always sufficient to immediately sweep away any gases that may escape from the abandoned panels. Some gas is encountered during the shooting of the coal and burning feeders are not uncommon. As a result, the firebosses must at all times be unusually vigilant. A few fires have occurred from these feeders; none, however, has been of serious consequence.

In a mine of this character that is exceedingly dry the possibilities of a dust explosion might appear to be considerable, but the action of the air on the roof during the summer months has caused a covering of rock dust to be deposited on the floor of the entries and this is believed sufficient to guard against the occurrence of any such accident. Mine fires and dust explosions are uncommon in the Indiana field despite what appears as a natural setting for such accidents. The dust along the entries at Black Betty is sprayed frequently from a water tank that is mounted on a mine truck.

Other surface and underground units at this operation do not differ markedly from those found at plants in western Pennsylvania. There is a motor-repair shop underground where locomotives and cars may be given light repairs or those of a nature that do not necessitate the removal of the equipment to the surface. Above ground there is the typical combination shop. For the operation of drills, lathes and other machines located in this building an engine is provided which operates a long shaft, and from this the various machine tools are driven by belt connection.

## Automatic Car Stop for Crossover Dumps Prevents Breakage and Shutdowns

BY G. E. DAUGHERTY  
Pikeville, Ky.

**M**OST mining men are familiar with the damage and delay that result from running a car or trip into an upended dump. Of course, such accidents do not occur when an automatic car feeder is employed which functions properly. Unfortunately, however, such devices as a rule are expensive and where the

DIAGRAMMATIC VIEW OF THE DUMP AND STOP

amount of material handled is small the operator is prone to question whether it would pay to introduce a car feeder.

G. C. Wood, manager of the Tierney Mining Co., of Stone, Ky., has devised an attachment for crossover dumps that is intended automatically to prevent a car from running into the dump sword. This is in reality a bumping block that rises when the dump end goes up and drops back into place when the dump returns to its normal position. This attachment is shown in the accompanying illustration. Since it has been in operation at the mines of the above-named company it has frequently prevented the dump to which it was attached from being damaged and has saved the running of the mine from interruption.

## Nova Scotia Men Demand Electric Lamps

**M**INE workers in Nova Scotia are protesting against the continued use of the flame safety lamp. The men claim that not only would the air be purer and the work more safely performed if electric lamps were in use, but that the company would benefit also, for the output would be increased by the better light, the mine worker being better able to go about his work if so favored. The matter was taken up at the Phalen local, and the men charged that the coal company, which had promised to look into the matter, had been overlong in reaching a decision. They threaten a strike if nothing is done to replace their present lamp equipment.

# Estimation of Quantities Removed in the Stripping of Anthracite\*

Estimating Overburden Removed Is a Monthly Operation Devolving Upon the Engineer—Three Methods, the Square, Prismoidal and Average-End, May Be Employed for Calculating the Extent of Excavations, but the Latter Usually Is Preferred

By THOMAS F. KENNEDY  
Scranton, Pa.

HAVING determined on paper the economic limit of any stripping proposition the next important step is to decide upon the method by which the overburden is to be removed. This must be known in advance if monthly estimates of the overburden handled are to be efficiently made. In connection with the fore-

“square” is calculated by multiplying the average of the four depths by the area of the “square.” The total volume removed is then the sum of the volumes of all the excavated squares.

As a rule a plan is provided only when the square method is used, the elevation of each corner being marked monthly thereon. The chief disadvantage of this method of calculation is that the elevations must be taken upon fixed points or corners, so that a true and representative average cut over the square area cannot be obtained if the interior of the square should happen to have a deep hole or high point in which the corner elevations do not partake.

The well-known prismoidal formula is used in calculating the long and narrow cuts found in railroad work, when a close approximation is required. It is not generally applicable to stripping problems. The most practical and favorite method used by stripping engineers seems to be the average-end formula.

In order to explain the application of this formula, as

Section A  
H. I. - 100,000

+5.0	6.0	5.5	6.1	6.1	6.1	+7.0

## Sample Stripping Summary

Showing Plan of Area to be Stripped, Cross Section of Stripping Operations and Notes on Yardage Removed per Month.

Month	Year	B and C etc.	
		No. of Sections removed	Yd. removed
Jan.	1919	1155	
Feb.	"	1430	
Mar.	"	1366	
Apr.	"	1476	
Total		5427	

going statement it is pertinent to remark that the method for calculating the excavation also must be decided by the engineer as it may or may not be adversely affected by the plan of removal.

Several good and practical methods have been planned for the estimation of the overburden removed. These include the square, prismoidal and average-end formulæ. In the application of the square method the surface of the proposed stripping is staked out in 20- or 25-ft. squares, and elevations are taken at each corner. After excavation the elevations are again taken at the same points and the volume of earth removed from each

applied to monthly estimates, a typical problem will be assumed as shown in the accompanying sketches. By referring to the plan, let it be supposed that a stripping has been projected beyond a mined-out and robbed area, and that after an exhaustive study of the problem involving the staking out of the economic stripping limit the engineer has decided that the steam shovel will work most efficiently in a northwesterly direction. The question of cross-sectioning the proposed stripping is next in order.

In order to arrive at the most probable volume of the overburden removed it is necessary to have as many sections as possible, since the greater the number of sections the smaller is the probable error. It can be easily seen, therefore, that the greatest number of sections can be obtained by running the profiles perpen-

\*A series of five articles by the same author entitled "Anthracite Coal Strippings," was printed in *Coal Age*, beginning Oct. 3, 1918. The series was interrupted by the fact that the author joined the army. Article V of the series was actually written in camp.

dicular to the path of the shovel, as shown on the plan. This may not be true when a steam shovel is making short cuts perpendicular to the greater dimension of a stripping, but when possible it is advisable to have the shovel operate parallel to the longer sides of the stripping so as to avoid shifting the machine, which means additional expense to the contractor.

Generally, a main base line with a secondary reference line is laid out and section lines  $A_0-A_1$ ,  $B_0-B_1$ , etc., are run every 20 or 25 ft. with stout wooden stakes placed every 100 ft. at points  $A_0$ ,  $A_1$ ,  $A_2$ ,  $A_3$ ,  $B_0$ ,  $B_1$ , etc. The method is delineated upon the plan of the proposed stripping and the base and section lines are then staked out in the field. The stakes marking the overburden stripping limit are likewise placed and the elevations of the cross-sections are then taken.

With one set-up it is advisable to take all possible elevations on all decided breaks, being careful to run all points on each line separately. In order to reduce all possible errors to a minimum, the number of set-ups should be as few as possible. An iron pin 3 ft. long and  $1\frac{1}{2}$  in. in diameter, located a safe distance from the proposed stripping, should be used as a permanent bench mark. To check work ties should be run.

After all data concerning the elevations of the cross-sections have been collected the information is plotted upon cross-section paper to some convenient scale, as 1 in. to 10 ft., both vertically and horizontally, the scale depending upon the magnitude of the work, but as a rule the foregoing scale is generally used. The scales employed in the accompanying cross-sections are adopted for illustrative purposes only.

#### WOODEN STAKES OR ROCK SLABS TO MARK POINTS

Referring to the plan and cross-sections, sections "A" and "B", showing the surface line, are plotted with the position of the bed previously determined from information that has been gathered from boreholes. It will be further assumed that the steam shovel began operation in January, 1919, and finished the removal of the overburden after four months of activity. In order to calculate the amount of overburden removed during January, the following method is proposed: After the January cut has been made the 100 ft. points as  $A_1$ ,  $A_2$ ,  $B_1$ ,  $B_2$ , etc., or points whose locations have been destroyed by the shovel operations, should be re-established and properly marked. Wooden stakes or even flat rock slabs may be used in establishing the identity of each point. The use of the flat slabs as markers is practicable and economical and by their adoption speed in estimating the yardage removed is obtained; moreover, wooden stakes are as a rule disturbed and sometimes removed during the activities of the stripping operation and must be replaced, so the use of small flat slabs is advisable.

After the 100-ft. points have been re-established the elevations on the cross-sections are taken, one man running the level or transit and taking the notes while two assistants handle the tape and level rod. For measuring distances from the reference points a 100-ft. steel tape may be employed. It gives good results as far as precision and speed are concerned. The transit which must be used in re-establishing the cross-section points can be and usually is employed in place of a level for taking the elevations, while a 7-ft. level rod, a small hand or Locke level, a few plumb bobs and a notebook, etc., make up the rest of the necessary equipment.

In keeping the notes, each transitman has his own methods and short cuts, but in general there are two systems, which I term respectively "vertical" and "horizontal." In the vertical system the points are recorded vertically in the first column on the left page of the notebook, while in the next column the back-sight readings are placed. Then follow in order the height of instrument, the fore-sight readings on the points and then finally the calculated elevations. In order to show additional information and assist the draftsman in plotting, a sketch drawn upon the right-hand page usually accompanies the notes.

In the horizontal method the left page of the notebook is used to carry the elevations, such as bench mark, turning points, heights of instruments and connections, while on the opposite page a set of notes, as shown by section "A", is kept. By studying the form of notes shown by the foregoing section, the height of instrument, which is assumed to be 100, is first recorded, while point  $A_0$  is next noted, but as the cut does not involve this point, no elevation is determined; the distance from point  $A_0$  to the top of the cut, 30 feet in this particular case, is next measured and a "zero" reading of plus 5 is obtained by holding the bottom of the level rod in the same horizontal plane of the line of collimation of the transit. The plus elevation to the nearest tenth is then recorded, while the rodman moves to the next point, which is shown to be the bottom of the cut, when a reading is taken and the distance from  $A_0$  measured.

The foregoing operation is followed out on the section line until the transitman has secured all the necessary information on that particular cut that can be obtained from a single set-up; then the same procedure is carried out on the remaining sections. The letters "T" and "B", indicating top and bottom of cut, placed below the reference distances may be used in assisting the draftsman in plotting. The location of each point on each section line should be determined by measuring the distance from each lettered point used as a base.

#### PLANIMETER METHOD FOUND PRACTICABLE

After sections are plotted the areas are found, preferably by the planimeter, although this result can be determined by dividing the plotted area into triangles, squares, trapezoids, rectangles, etc., and finding the summation of each individual area. The planimeter method is more practicable and economical. After determining the area of each sectional cut, the monthly cut should be tinted with water color, using the same tint for the same month on the different sections, which idea is shown in a conventional manner upon the accompanying cross-sections. In addition the month, year and number of square feet of cross-section in the excavation removed should be lettered upon the tinted area. Likewise a different color for the next succeeding month should be used.

To show the progress of the stripping, boundary lines describing both the area of overburden excavated and of the coal area exposed should be delineated monthly upon the plan.

To find the amount of overburden removed, the average-end formula is then applied: for example, in calculating the cubical contents between sections A and B for the month of January, the average of the area on both sections is multiplied by the sectional interval, which is in this case 25 ft. Using the different end

areas between the different sections, the amounts removed between the various sections can be calculated. The total amount removed is the summation of the sectional quantities.

In order to keep a record of the quantities removed a good scheme is to tabulate the results as shown with the accompanying cross-sections. The last column shows the sectional yardage for each month and also the total contents removed between particular sections when stripping is finished.

If the superimposed overburden is composed of clay and hard rock, which in some cases is to be estimated separately, the elevations should be run at the proper time and the line of demarcation shown upon the plotted cross-sections.

The number of cars removed by the contractor, allowing for a certain percentage of swelling, will furnish information by which the number of cubic yards of overburden may be checked. In calculating the final volume removed the total area on each section should be run and verified, making an allowance for cleaning the top of the coal. Above all good judgment and common sense should be used in making the final estimate of the work done at any stripping operation.

## Roads Mulcted for Excess Profits on Maintenance and Betterments

W. Jett Lauck Says Continuance of Recent Profiteering Will Cost Railways a Billion Dollars Additional During Next Three Years

THAT profiteering in coal, petroleum, steel and steel products has cost the railroads of the United States at least \$600,000,000 during the last three years and, unless checked, will cost them more than \$1,000,000,000 additional during the years of 1920, 1921 and 1922 is the crux of a supplementary report by W. Jett Lauck, consulting economist for the railroad labor organizations, transmitted to the Railroad Labor Board.

"Next to wage earners, the salaried class and people of fixed incomes, the railroads have been the greatest victims of the profiteers," says this report, "and the most serious aspect of this phase of the profiteering problem is that it means a fixed charge upon the public of millions of dollars annually for all time to come, for if the railroads are mulcted of a billion dollars in undue profits in the expenditures for maintenance and betterments during the ensuing three years, that amount necessarily becomes a part of the capital investment upon which the public must pay a fair return.

"In this connection it should be stated that if the railroads were protected against the profiteers, reasonable and necessary advances could be made in the wages of railway workers without material increases in transportation rates, and attention may be also called to the fact that in such legal steps as have been taken to punish or restrain profiteering not a move has been made against the profiteers in steel and steel products, coal, petroleum and railroad equipment and supplies."

The Lauck report fixes 12 per cent as the profiteering tribute which the railroads have paid to the producers of coal, petroleum, steel and steel products, car and locomotive manufacturers and others.

"This figure has been arrived at," states Mr. Lauck, "only after the most thorough and painstaking analysis of railroad expenditures and the profits of the corpora-

tions from which they buy. For instance, during the three years of 1917, 1918 and 1919 the railroads of the country combined bought 451,113,935 tons of coal at a total cost of \$1,225,610,793. The companies from which this coal was purchased made an average profit of 52.6c. per ton, or \$237,179,652, after paying all taxes and other charges. A survey previously made shows the average net profit of coal companies for the pre-war years to have been 21c. per ton, which would have netted them \$94,733,926 in profits upon this tonnage. The amount of profiteering in coal for the three years, therefore, is ascertained by deducting the normal profit from that actually taken, which adduces an excess profit of \$142,445,726 in coal alone, or practically 12 per cent.

"During the three years mentioned the railroads bought 4,508,213 tons of rails at an average price of \$45.19 per ton, on which the steel companies made net profits of at least \$11. For a great many years before the war steel rails had sold at exactly \$28 per ton, on which the manufacturers realized about \$4.69 in net profits, after paying interest and other charges. The total excess profit on this one item for the three years amounts to approximately \$30,000,000, or more than 14 per cent of the cost."

Comparatively little money was spent by the transportation companies for extensions, improvements or new equipment during the period 1917-1919. The total was slightly more than \$2,000,000,000, about \$1,000,000,000 of which was for materials. Operating expenses, including salaries and wages, were approximately \$10,000,000,000, about 40 per cent of which, or \$4,000,000,000, was spent for fuel, supplies and equipment. The total expenditure for commodities was, therefore, about \$5,000,000,000, 12 per cent of which, or \$600,000,000, went into excess profits.

"A very exhaustive analysis of the amount needed for the rehabilitation of the railroads during the coming three years made by experts for the *Railway Age* estimates that, in all, \$6,000,000,000 should be spent for new equipment, extensions, additional lines, grade revisions, buildings, and so forth. About one-half of this amount will go to purchase cars and locomotives. Of the remaining \$3,000,000,000, it may be assumed that at least 50 per cent will be paid for materials, making a total of \$4,500,000,000 of capital expenditure for commodities. Assuming that operating expenses remain the same as in 1918, another \$4,500,000,000 will be expended for materials and supplies, a grand total of \$9,000,000,000. And also assuming that the ratio of profiteering does not increase, it is easy to see that something over \$1,000,000,000 will go into excess profits during the years 1920, 1921 and 1922. This huge sum will, of course, be an addition to the investment in railroad property, on which the public will have to pay 5½ per cent for evermore.

"A very good reason why the estimate is low is that prices of coal and steel products have advanced greatly within the past few months. This will result in increased profits to the producers and manufacturers. Coal, for example, is selling for at least \$1 more per ton at the mines than it was in March. Authoritative information has reached me of railroad contracts for coal made recently at prices as much as \$7 per ton over the former figure. Even \$1 a ton increase is exorbitant. It has been conclusively shown that the recent wage increase to miners adds less than 40c. to the cost of producing a ton of coal. If the selling price is advanced \$1 it means 60c. additional profit to the coal operator."

# Bureau of Mines Proposes to Use Airplanes In Its Mine-Rescue Work\*

Can Be Used Only in Fairly Level Country When Snow Does Not Disguise Ground and During the Day—Bureau Will Use the Planes Belonging to the Air Service Which Are Located on an Average 150 Miles from Safety Stations

BY F. J. BAILEY†

**I**N THE fall of 1919 the U. S. Bureau of Mines began an inquiry as to the possibility of utilizing airplanes for quickly transporting engineers and oxygen rescue apparatus to mine disasters.

It was realized that this proposed use of airplanes has serious limitations, and that if it were feasible, the Bureau would have to rely on the co-operation of the established aviation fields of the U. S. air service for furnishing airplane service. Therefore Van H. Manning, then director of the Bureau of Mines, under date of Oct. 28, 1919, wrote the director of air service, outlining the rescue and first-aid organization of the bureau, the location of headquarters of district engineers, the distribution of safety cars and stations, and other essential details, and asking whether the air service could co-operate with the bureau in the event of serious mine disasters. Major-General Charles T. Menoher, director of air service, responded that the air service would be glad to co-operate as far as possible, and designated those air service stations which, being nearest the district engineers' headquarters, might be best able to assist.

The Bureau of Mines has ten mine-rescue cars and eight mine-safety stations distributed throughout the mining regions of the United States. The cars are each equipped with sets of oxygen mine-rescue breathing apparatus and first-aid supplies. The car personnel consists of a mining engineer, surgeon, foreman, first-aid miner, clerk and cook. A foreman miner is in charge of each station and at five of the eight stations are mine safety trucks. The work of the cars and stations is twofold: (1) Assisting in rescue and recovery work at mine disasters, and (2) training miners in mine-rescue and first-aid methods, and in investigations looking to prevention of mine accidents. The country is divided into nine safety districts, an engineer in charge of each.

## DAYTON AIRPLANE STATION WILL ASSIST

A preliminary survey has indicated that airplane service might be effectively utilized in the flat-lying coal-fields of Illinois and Indiana, and a co-operative agreement has been made whereby McCook Field, Dayton, Ohio, will maintain in readiness planes for assisting the Bureau of Mines safety station at Vincennes, Ind., in its rescue work. The Bureau of Mines district engineer

at Vincennes will collect data on possible landing fields near the mines in this district, with maps indicating these landing places, their proximity to mines, or to towns and railway stations.

When the Vincennes station receives word of a serious mine disaster at a mine where a nearby landing field is available, or where a landing field is so situated that train or auto connection could be made with a decided saving of time, a call for planes could be sent to McCook Field. The planes could land at the Vincennes municipal landing field, where the district engineer or foreman miner of the bureau's station would

**For a mine to avail itself of the airplane service, should it be installed, it will have to find nearby a field 1,800 ft. square or thereabout. Such a field will be about a third of a mile long and a third of a mile broad and will have an area of about seventy-five acres. Invention may yet lessen these requirements.**

be waiting, could take on gasoline and other supplies needed from the Bureau of Mines service station which is maintained there, and could carry the bureau's engineer with sets of rescue apparatus to the landing field near the scene of the disaster.

The engineer from the bureau would thus be on the ground early. The preliminary steps to be taken in the organizing for recovery work he could assist in directing. In the meantime a fully equipped Bureau of Mines rescue car or auto truck could be rushed to the mine, and on arriving there would find an adequately directed organization already functioning. This will conserve valuable time and might result in saving lives of entombed men that might otherwise be lost, as every minute is precious.

Much remains to be done before any decisive statements can be made as to the extent and effectiveness with which airplanes can be utilized in mine-rescue work throughout the country. The difficulties and problems involved are many and some of these will be discussed in the following paragraphs.

The distance of the air service stations from the safety stations, and thence to the mines, is a prime consideration. The air service stations are on an average of 150 miles from the safety stations, but some of them are much farther. Information as to flying time compared with time of travel by railroad or auto service is needed to predict whether airplane service or combined air and surface service could be utilized with advantage.

The greatest problem is that of suitable landing fields. First, fields must be available at the town where the safety headquarters are situated; second, fields must be established at the mines. As regards establishing landing fields near mines, careful survey is necessary to

\*From article entitled "Use of Airplanes in Mine-Rescue Work," U. S. Bureau of Mines Reports of Investigations.  
†Assistant to director, U. S. Bureau of Mines.

determine where level places are available that could be prepared for landings without much difficulty. In mountainous mining districts there are at many mines no level places suitable for landing. Such conditions are found in metal- and coal-mining districts of the Rocky Mountain states and the Pacific Coast states, and in a number of the coal fields of the Appalachian region.

The present types of airplane require a landing space about 1,800 ft. in extent in both directions. The development of planes capable of ascending from and descending to a landing of limited area would overcome the present lack, at many mines, of safe landing areas, and there is good promise of the development of such planes in the not distant future.

The service stations must have planes suitable for the work. Some air service fields are not at present equipped with types of planes suitable for carrying additional load, such as a passenger and rescue apparatus, or with planes having a sufficient gasoline supply to provide a good flying radius.

**OBSTACLES TO THE UTILIZATION OF AIRPLANES**

Flying at night, especially in mountainous country, would not be feasible. Neither could airplanes safely take the air in stormy weather. In regions of heavy snow, as in the Lake Superior district, planes could not be used in winter months, because the obliteration of landmarks by a deep blanket of snow makes it difficult for the aviator to pick his route with certainty.

An aerial map of the mining districts, showing safe landing fields, established aerial routes, and similar data is essential. The civil operations branch of the air service has made much progress on the mapping of commercial landing fields and the development of a system of aerial routes. The Bureau of Mines engineers in their field work will be able to compile data on the surface conditions near each mine visited, and map places suitable for landing fields. This data will be submitted to the air service as fast as accumulated.

In conclusion it should be remarked that too much should not be expected for the present in the use of airplanes in mine-rescue work. The prospects for such utilization in the mountainous districts of the West or in hilly regions of the East are not bright. In the mining regions of Illinois, Indiana and other Middle Western states where the surface is comparatively level there are excellent prospects that airplanes can frequently be used with advantage. If such use should result in the saving of lives at even one disaster, it would amply justify all the time and effort expended in this work. Moreover, as the commercial use of the airplane expands and improved types capable of landing in a small area appear, the field of application of airplanes to mine rescue work will be greatly broadened.

**Commerce Commission Awards Red Ash Coal Co. Reparation for Unreasonable Rates**

**I**N THE complaint of the Red Ash Coal Co. against the Central Railroad of New Jersey, charging that unreasonable rates were exacted for the transportation of anthracite coal, in prepared and pea sizes, in carloads, from Red Ash Colliery, in the Wyoming coal region of Pennsylvania, to Elizabethport, N. J., for reshipment by water, the Interstate Commerce Commission has ruled in favor of the plaintiff, ordering reparation in the sum of \$12,863.58, with interest amounting to \$1,165.17.

**Movement of Bituminous to Tide During April**

**B**ITUMINOUS coal dumped into vessels at North Atlantic ports in April amounted to 4,056,000 net tons. Of this, 717,000 tons were shipped by vessel to New England. Forty-seven per cent of the total dumped was destined for export. Five thousand tons were exported from New York, 149,000 tons from Philadelphia, 417,000 from Baltimore, 1,258,000 from Hampton Roads, and 74,000 from Charleston. The total exports—1,903,000 net tons—were somewhat larger than those of October, 1919 (1,819,000 net tons); hitherto the record for one month.

COASTWISE MOVEMENT TO NEW ENGLAND, AND EXPORTS AT NORTH ATLANTIC PORTS (IN NET TONS)

Month	New England	Exports	Total Dumped at Tide
<b>1919</b>			
January	721,000	456,000	2,954,000
February	554,000	334,000	2,537,000

<b>Totals, 1919</b>	<b>8,385,000</b>	<b>8,291,000</b>	<b>37,062,000</b>
<b>1920:</b>			
January	804,000	897,000	3,185,000
February	793,000	718,000	2,899,000
March	954,000	1,033,000	3,965,000
April	717,000	1,963,000	4,056,000

**Commerce Commission Expected to Enforce Car Service Rules**

**O**BSERVANCE of car service rules by the railroads is not likely to be the simple matter it now is when the Interstate Commerce Commission takes a real hand in this important phase of railroad operation with the board of powers of regulation and control contained in the Transportation Act.

Lax interpretation of the existing car service rules has been one of the reasons for the improper distribution of freight equipment as it existed some weeks ago and exists today. Some railroad operators favor the adoption of a per diem charge on all cars when off home lines sufficient at least to pay interest on the home line's investment as well as depreciation.

At present the per diem charge is only 90c. a day, and the temptation to reroute foreign equipment when business has offered that promised to yield a return far in excess of 90c. a day has proved too great to be ignored. Consequently freight equipment has been scattered widely. It is hoped that the increased powers of the Interstate Commerce Commission will bring about a strict observance of the car service rules in the future.

**Substitute for Gasoline Sought by Congressman**

**R**EPRESENTATIVE Knutson has introduced a joint resolution in Congress providing for the appropriation of \$250,000 to be used by the bureau of chemistry of the Department of Agriculture in the discovery of a suitable substitute for gasoline.

# How Age and Occupation Affect Frequency And Duration of Disabilities\*

Men Whose Records Have Been Noted Lost on an Average 6.6 Days Per Year—The Disabled Lost an Average of 28.1 Days—Frequency of Disability of Those Under Twenty Exceeds That of Any Other Group, but They Are Soon Cured of Their Ills

BY W. W. ADAMS†

FOR many years people have questioned whether it is the experienced or the inexperienced miner who is most frequently injured in mine accidents. A satisfactory answer has never been forthcoming because of the absence of sufficient basic information. Any data, however incomplete, bearing upon this subject should therefore be welcomed by everyone interested in the matter. Two recent reports published by a Federal bureau set forth, in a limited way, the relationship between the age or occupation of an individual and the likelihood of his being disabled by accident or illness. The reports are based on a group of 185,018 men (whose ages varied from 16 to more than 70 years) engaged in 42 wage-earning occupations, during the five-year period 1912 to 1916. These men, who were members of a mutual-benefit association, formerly had been residents of Central Europe, and upon their immigration to this country entered employments of a wageearning character, principally in the industrial centers in the Eastern part of the United States. Of these 185,018 men, 43,485 were disabled for a period of time equivalent to 1,223,324 days. This represents a loss of 28.1 days for each disabled person, or 6.6 days for each of the 185,018 persons who were liable to accident or sickness.

number of days lost, 293,600 days, or 24 per cent, were due to injuries. Unfortunately, these figures cannot be segregated to show the industries to which they apply nor the ages of the persons disabled. Therefore the following remarks relate to disability caused mainly by sickness rather than accident. The 185,000 persons

are shown in 5-year age-groups, beginning with those between 16 and 19 years of age, with the number of men in each group who were disabled and the length of time their disability continued. Sickness and accidents occurred most frequently (312.8 per thousand) to men under 20 years of age, whereas those between 30 and 34 years of

**Mine workers have a higher disability rate, both as to frequency and as to duration, than the average workingman and this is true of all periods of five years into which statisticians have divided the life of the worker. In no age-group, however, do miners have the greatest disability frequency and only between 35 and 44 do they have the largest number of disability days of all occupations.**

age were disabled less frequently (222.2 per thousand) than any other group. From this point, however, the tendency to disability showed an almost unbroken increase with the age of the individual, although in no group did it reach the high record of those under 20 years old.

There was a marked difference between the number of cases of disability in each age-group and the loss of time caused by such cases.

Persons under 20 years old, although incapacitated more frequently than those of any other age, lost little time from their work, the average being 5.2 days for all wage earners of this age. The average time lost is even less for men between 20 and 24 years old, but from this point the period of disability, like the number of cases of disability, increases with advancing age, this increase becoming especially noticeable among men over 50 years of age.

Of the total number of disability cases, 12,200, or 28 per cent, were due to accidental injuries; of the total

DISABILITY CASES AND DAYS OF DISABILITY PER 1,000 MEMBERS, BY AGE-GROUPS

Age Group	Total Members		Cases of Disability			Days of Disability		
	Number	Per Cent of Total	Number	Per Cent of Total	Per 1,000 Members	Number	Per Cent of Total	Per 1,000 Members
Under 20 years	406	0.22	127	0.29	312.8	2,108	0.17	5,192.2
20 to 24 years	7,168	3.87	1,778	4.09	248.0	34,296	2.80	4,784.6
25 to 29 years	15,267	8.25	3,574	8.22	234.1	76,619	6.26	5,018.6
30 to 34 years	21,886	11.83	4,862	11.18	222.2	106,162	8.68	4,850.6
35 to 39 years	27,496	14.86	6,197	14.25	225.4	155,209	12.69	5,644.7
40 to 44 years	30,746	16.62	7,104	16.34	231.1	196,206	16.04	6,381.5
45 to 49 years	31,579	17.07	7,150	16.44	226.4	206,860	16.91	6,550.5
50 to 54 years	25,484	13.77	6,044	13.90	237.2	189,850	15.52	7,449.8
55 to 59 years	16,229	8.77	4,168	9.58	256.8	146,777	12.00	9,044.1
60 to 64 years	6,689	3.62	1,859	4.28	278.0	80,459	6.58	12,028.5
65 to 69 years	1,843	1.00	557	1.28	302.2	25,361	2.07	13,760.7
70 years and over	225	0.12	65	0.15	288.9	3,417	0.28	15,186.6
Totals	185,018	100.00	43,485	100.00	235.0	1,223,324	100.00	6,611.9

CHART SHOWING NUMBER OF DISABILITY CASES AND OF DISABILITY DAYS FOR AGE PERIODS

The experience of the insurance company makes it clear that the mine worker insured by it had more occasions for idleness due to sickness and accident than the man in the average occupation and that, for the mine worker the length of layoff was also longer. The duration of his disability and its frequency increased also with increasing years as was the experience with the average worker.

When the employees of a particular age among the 185,018 men are further classified to show the number employed in each of the 42 occupations, the number of persons in each group becomes so small that any accident or sickness ratio based thereon loses much of its value. Furthermore, the occupations are vaguely defined and the classes of employees included cannot be stated. Moreover, many occupations are not listed, some of which, notably deep-sea fishermen, would probably show a high disability rate. The figures should therefore be used merely as helpful guides until it is possible to obtain larger and more representative figures for each group.

With this observation as a caution, it may be pointed out that freight handlers between 25 and 29 years old were disabled more frequently than men of any other age or occupation (423 per thousand) while the greatest freedom from disability was enjoyed by jewelers between 50 and 54 years of age (107 per thousand).

As regards the length of time lost from disability, railway employees between the ages of 55 and 59 years lost the most time (19.4 days for each man so employed), and tanners between 25 and 29 years of age the least (1.4 days per man employed).

In the foregoing and all other comparisons persons employed in the professions are excluded as being of a distinctly different class as regards liability to accident and illness. The figures show that this group enjoys a

low disability rate both in the number of cases that occur and the period of enforced idleness.

Taking each of the seven age-groups under separate consideration one occupation in each will stand out most prominently as having the larger number of disability cases among its members. For this part of the study the only information available applies to men between 25 and 59 years of age. As stated before, among men between 25 and 29 years of age the freight handlers were the workers most frequently disabled; between 30 to 34 years of age, the molders; between 35 and 39 years, railroad employees; between 40 and 49 years, drivers and between 50 to 54 years the blacksmiths led, being more frequently disabled than men of any other occupation in the same age-group.

In like manner we may learn in which occupations and at what ages disability occurs with the least frequency. The number of persons disabled in each age-group reached its lowest point in the following occupations: Age 25-29, tanners; age 30-34, plasterers; age 35-39, printers and engravers, and employees of clay-product manufacturing establishments, the length of disability for these two classes of employees being equal; age 40-44, dyers; age 45-59, jewelers.

DISABILITIES MAY BE FREQUENT YET NOT LONG

Employees of a particular age or occupation most frequently affected by sickness or accident are not always the employees who lose the greatest amount of time from their work. For example, among wage earners between 25 and 29 years of age disability occurs most frequently, as previously stated, to employees handling freight, but men of this age employed as barbers are idle over a greater period of time, although in these two groups the difference is but slight. In the other occupations and age-groups the employees losing the most time by reason of disability are: Age 30-34, employees of clay-product manufacturing establishments; age 35-44, miners; age 45-49, miscellaneous building-construction employees; age 50-54, freight handlers; age 55-59, railway employees.

As regards time lost from disability, the following occupations stand out most prominently in the respective age-groups as enjoying the greatest freedom from lingering periods of recovery; Age 25-29, tanners; age 30-34, leather workers; age 35-39, electrical workers and barbers, the rate for these two classes being equal; age 40-49, jewelers; age 50-54, electrical workers; age 55-59, jewelers.

DISABILITY AMONG MINERS ABOVE THE AVERAGE

Among the 168,687 men between the ages of 25 and 59 years whose occupations have been divided into 42 classes, 6,484 men were employed as miners. It is unfortunate that a larger figure is not available to serve as a basis for more trustworthy comparisons between disability among miners and that among persons engaged in other industries. In the absence of more reliable data, however, the statement may be made that out of the total number of men in the 42 occupations 39,099 were disabled and lost 1,077,683 days from their work through illness or accidents, or an average of 6.4 days for each of the 168,687 persons.

Of the total number engaged in mining 2,012 were disabled and lost about 59,300 days, or an average of 9.1 days for each miner employed. Thus the disability among miners caused by accidents and illness appears

to be much higher than the average for all occupations combined; also among the employees of all occupations accidental injuries cause about 28 per cent of the disabilities and 24 per cent of the disability days, but among miners accidents are perhaps responsible for an even greater proportion of disability than illness.

Accidents and other causes of disability among miners could be more intelligently studied if similar detailed information could be obtained for a much larger number of persons. Many mining reports give information regarding persons injured or killed in mine accidents, such as age, nationality, specific occupation, and length of experience; but similar information regarding the total number of men employed in each of these groups is usually lacking. If such information were uniformly given for all employees, more accurate conclusions could be made as to the causes and severity of disability, especially that due to accidents. Greater accuracy along this line would doubtless be an aid in reducing the number of disabilities from industrial causes, as well as the compensation for loss caused by such disabilities.

### North Atlantic Exports for 1918, 1919 and 1920 Compared

COAL exports from the United States in the calendar year 1918, as reported by the Bureau of Foreign and Domestic Commerce, amounted to 22,351,000 net tons of bituminous and 4,968,000 net tons of anthracite. Ninety-nine per cent of the anthracite and over 80 per cent of the bituminous coal went to Canada, by rail or lake.

In 1919 the exports of anthracite were 4,968,000 net tons, again almost exclusively shipments to Canada. The bituminous exports for that year were 20,126,000 net tons, of which 12,064,000 tons went to Canada and Mexico, and the balance were oversea shipments to Europe and other countries, largely from North Atlantic ports.

### Power Produced and Fuel Consumed by Public Utility Plants

FIGURES of production of electric power and consumption of fuel by public utility power plants in the United States for the months of January, February and March, 1920, as compiled by the Division of Power Resources, U. S. Geological Survey at Washington, are printed below.

The figures are based on returns received from about 2,800 power plants of 100-kilowatt capacity, or more, engaged in public service, including central stations, electric railways, and certain other plants which contribute to the public supply. The capacity of plants submitting reports of their operations is about 90 per cent of the capacity of all plants of the country listed by the survey.

The mean daily output for the first quarter in 1919 was 105.3 million kilowatt-hours and the mean daily output for the first quarter of 1920 was 122.2, an increase of 16 per cent.

The curve of mean daily output for 1920 indicates a marked increase in the output for March. The April figures will be of special interest as they will show if this increase is maintained.

This report is subject to revision in subsequent statistical reports of the United States Geological Survey relating to power production.

In some of the States electricity is produced by the use of wood as fuel. During March about 17.0 million kilowatt-hours, or 0.4 per cent of the total for the month, were produced by wood-burning plants. The following list gives the States and their output in millions of kilowatt-hours, which produces the larger amounts of electricity by the burning of wood: Oregon, 7.4; Minnesota, 1.7; Wisconsin, 1.3; Idaho, 1.3; Washington, 1.1; California, 0.5; Louisiana, 0.6; and Florida, 0.4

# Coal-Mine Compensation in Kentucky\*

Inspection Reports, Safety Engineering Service, Low Cost and Checking Up of Experience Records Are the Features of a System Designed to Exceed the Possibilities of Mutual or Self-Insurance

BY HERBERT M. WILSON

THE subject which you have assigned me infers a rather large commission and makes it necessary that I hastily review the history and underlying principles governing the operation of the workmen's compensation law at coal mines. You will, therefore, pardon me for repeating what many of you already know—that the Kentucky law requires insurance or the protection of self-insurance so as to make certain the payment of compensation benefits which may run over a long period of years; that because of the high loss rate from normal accidents as well as from catastrophes in coal mining, insurance carriers were at first unwilling to cover this line of risks; that in order to demonstrate the ability of stock insurance companies to protect their customers in every line, however hazardous, they organized the Associated Companies for the purpose of pooling the losses on this business. The Associated Companies at once organized an inspection and safety engineering force and developed a standard system of recording conditions revealed by inspection, and through them the modifying of premium rates so as to give credits or charges according as safety conditions within a mine are better or worse than the average.

## FIRST SCHEDULE RATES NEARLY CORRECT

The history of schedule rating under this plan has had its ups and downs, with slowly gained knowledge of the requirements by the insurance carriers, mine operators and state officials, with the following general results:

For the first year of the law the actuaries and safety engineers of the Associated Companies computed a base rate of \$4.24 per hundred dollars of payroll, including medical benefits, as necessary to pay the costs of compensation insurance for coal mines. That their first effort was not far from right is evidenced by subsequent experience. The first year of schedule-rating inspection developed the fact that while the coal mines of Kentucky had an excellent official record for fatal accidents, they produced in fact a relatively bad non-fatal experience and were in decidedly sub-standard condition as respects the causes of normal accidents. It was at once evident that for the then conditions of mines the rate \$4.24 was too low, and in 1917 the Workmen's Compensation Board, unwilling to increase this rate, directed a modification in the method of determining the schedule rate, with a view of earning a return premium rate of \$5, which rate it was computed was necessary to carry the business with solvency. The result was to produce an increase in all schedule rates.

In consequence more intensive study was given the situation by mine operators and better safety service and co-operation were required from the inspectors

of the insurance carriers, with the result that a rapid improvement was made in the safety conditions of Kentucky mines and there was a correspondingly rapid drop in premium rate in 1918.

Recently, as a result of prolonged and intensive study of the accident experience in Kentucky mines under workmen's compensation by the board, by the insurance carriers and by the National Council on Workmen's Compensation Insurance, a base rate for Kentucky coal mines was recently promulgated, effective January 1, 1920, which is also the estimated average return rate needed to carry the business, namely, \$3.65 per hundred dollars of payroll. This base rate is believed to reflect the present safety condition of the mines as compared with the standards adopted. It is equivalent, as compared with the former base rate of \$4.24, to an average improvement in the safety condition of the mines of from five to six of the physical hazards found in mines.

## RATIO OF LOSSES TO PREMIUMS SHRINKS

During the period in which the law has been in operation—namely, the policy years 1916 to 1919 inclusive—the ratio of losses incurred to premiums written has diminished from 112 per cent in 1916 to 69 per cent in 1919. This latter loss ratio is the maximum at which the business can be conducted without loss; for the cost of conducting the business, including taxes, inspection and agents, service, claims, settlements, etc., is 33 per cent of the premium earnings, not to mention the cost of catastrophes. It is, evident, therefore, that prior to 1919 the business was carried by the insurance carriers at a loss, and that to conduct the business at the present rate it is necessary that there be further improvement in the safety condition, with corresponding reduction in loss ratio and cost.

It is particularly worthy of note that while the cost of every other commodity entering into our living and business conditions has greatly increased during the period, the cost of workmen's compensation insurance has diminished. And this is in spite of the fact that during the same period the wage scale, has greatly increased, while during part of the period the safety conditions have not improved because the unsettled labor conditions in several states other than Kentucky, notably in Pennsylvania, the compensation benefits have in the same time been increased by amendments to the law.

Since I last addressed you, a year ago, a material change has been made in the system of inspecting and schedule rating coal mines, not only in Kentucky but in other states. This has been the natural outcome of the entrance into the field of competing insurance carriers and of the consequent desire of state authorities that the method of inspecting and schedule rating shall be so standardized as to eliminate as far as possible any likelihood that unfair competitive practices

\*A paper by the general manager of the Associated Companies, Hartford, Conn., presented at the meeting of the Kentucky Mining Institute, Lexington, Ky., June 4, 1920.

shall develop. This standardization has been effected through an organization having headquarters in New York City known as the National Council for Workmen's Compensation Insurance.

Membership in the council and the direction of its affairs is by state insurance departments or boards, state inspection and rating bureaus and all compensation insurance carriers, stock, mutual and reciprocal. The council has recommended, and the State of Kentucky has adopted, a system whereby all inspection is done by a bureau jointly managed by the state officials and insurance carriers, known as the Southern Coal Mine Rating Bureau, of which W. B. Johnston, formerly with the Workmen's Compensation Board of Kentucky, is manager, with offices in Louisville. All inspections are made and are schedule rated by the bureau in the same manner for all carriers.

#### RATE ADJUSTED AFTER SECOND INSPECTION

The safety standards are practically identical with and were developed from those of the Associated Companies, so that there is nothing in them with which you who have previously been insured are not familiar. The same is true of the schedule rating system, the effect of which must be to reproduce the average return rate sought, \$3.83, which is the present average rate resulting from the inspection of your mines by the Associated Companies. But the effect of inspection by bureau employees will undoubtedly be a much closer adherence to the literal wording of the safety standards. The inspector will not be able to use his skilled judgment in not charging an item which is no real hazard, though it may be a violation of the standard. He must, in other words, charge every item regardless of whether for the particular mine the standard does not truly apply. As a result the average schedule rate of your mines after the first bureau inspection will produce an increase on an average of perhaps 50c. So soon as the exact amount of this increase is determined to reproduce the proper average premium rate the excess will be returned so that no mine will be unjustly charged. Wherefore as soon as your policy is renewed at the preliminary bureau rate, you will be entitled to a re-inspection, the result of which will be retroactive to the policy date.

It is presumptive that you will at once improve as far as possible any sub-standard conditions revealed by the preliminary bureau inspection, with the consequent result that the re-inspection should show a material reduction in charges and should consequently keep down to its present level or perhaps reduce your schedule rate below that last promulgated.

I have chosen at random a few examples of the practical operation of schedule rating inspection for the Compensation Insurance of Kentucky coal mines. These examples are typical of many in the various coal mining districts and were selected not because their experience was unique but only because they had continuous history of schedule rating from 1916, when the law went into effect, to 1919 inclusive and with rather uniform payroll throughout this period.

The first example is of a mine in the northeastern coal field, employing from 160 to 180 men; audited payroll \$120,000 to \$190,000 per annum. When first inspected in August, 1916, the mine was in excellent safety condition and reflected a good moral hazard, with the result that the first schedule rate was below the base rate, namely, \$3.34. During this policy year there

were accidents and the loss ratio was exceptionally good. In the second policy year, 1917-1918, and so far as audited for the year 1918-1919, equally good experience was developed; only one non-fatal accident in the second and five in the third year.

This condition is indicated by and only reflects the evidence of the schedule-rating inspections. The first re-inspection of 1918 showed improved safety conditions and reduced the schedule rate to \$3.16. That of 1919 reduced the schedule rate further to \$3.01. The last schedule rate promulgated shows still further reduction, viz., \$2.83. At this time experience rating became effective and this assured earned an experience credit of 19c., making his present adjusted rate \$2.64, one of the lowest adjusted rates developed for any mine in Kentucky. In view of the excellent record of safety work by this mine operator and co-operation with and by our inspectors, I feel that there can be no impropriety in stating that the mines referred to are those of the Northeastern Coal Co., of which Henry LaViers is manager.

#### SCHEDULE RATE A TRUE INDEX OF SAFETY

It is evident from the above that the improved safety conditions, as disclosed by inspection, and the reduction in schedule rate resulting therefrom have been a true index to the accident ratio of this mine, for though there has been no material reduction in the loss ratio, because it was already low, there has, on the other hand, been no increase and no abnormal accident experience. To offset this low compensation cost there has resulted a reduction in schedule rates from \$3.83 in 1916 to \$2.63 per hundred dollars of payroll in 1919, and a corresponding reduction in the total premium paid by the assured, even though in the same period there has been a very material increase in the wage scale and total payroll.

To go further into detail, the first inspection of this mine showed it to be sub-standard in about half a dozen features; among others, first aid supplies, obstructions in clearance and shelter holes, location of magazine, guarding of trolley wire, poor handling and storage of explosives. The inspection of the second year showed the removal of several of these conditions; viz., improvement in first aid, no obstructions in clearance and shelter holes and the guarding of trolleys. The last inspection showed practically all unfavorable conditions removed with the exception of location of magazines, storage of explosives underground and some insufficient timbering. Further reduction can be earned by this assured for improvement of physical hazards still remaining, by earning additional experience credits, and finally by earning the new credit above referred to, for perfection of safety organization, education and inspection, which latter credit alone may result in 40 cents further reduction.

A typical mine in eastern Kentucky, employing seventy-five men throughout the three years, had payroll ranging from \$86,000 in 1916 to over \$180,000 in 1919. This large increase was due to wage-scale increase and more active production. In 1916-1917 the audited premium was over \$2,300. There were this year two fatalities and twenty-three non-fatals, wherefore the insurance carried paid in compensation claims over \$6,600, or nearly three times the premium earned. The loss ratio was 285 per cent. This is a good illustration of the hazards of compensation, as a fatal is often as likely to occur as a non-fatal. The only

effect of this bad record on the Associated Companies was a more intensive effort by inspection and safety engineering to improve the experience. That this was effective and that the mine operator heartily co-operated is evidenced from the fact that in the next year, 1917-1918, with an audited premium of \$8,470, there were no fatals, a few more non-fatals, viz., 28, and a material reduction in the compensation costs, viz., \$2,300. For the year 1918-1919 the premium and losses are not closed, but they show about the same result as for the previous year but with 24 non-fatals, some of which may prove to be expensive.

#### RATES DECREASE DESPITE GROWING PAYROLL

This cost history is closely paralleled by the schedule-rating record. First schedule rate, 1916, \$3.88; the next, at the end of 1917, which the schedule-rating system was changed to produce increases, \$4.51; inspection made only a few months later in 1918, \$4.30; first inspection 1919, \$3.40; last inspection, 1919, \$2.65, a drop from the maximum of \$1.86. The experience of this mine not having been good, because of the fatal costs, the last schedule rate was modified by an experience charge of 46c., thus making the final adjusted rate for the last period \$3.40. There is every likelihood that in this case there will be further reduction on schedule rating and improvement in the experience-rating modification and there may be credits for safety organization. During this period the assured has earned reductions in his premium rate corresponding with the reduction in schedule rate, also reduction in the total premiums paid, in spite of the material payroll increase to double that of the first year. At the same time, while there has been little improvement in the loss ratio, there were no further fatals and no increase in number of non-fatals.

I assure you that the above are typical records illustrating a very large number of the medium and larger mines insured in Kentucky, and this record is encouraging to the Associated Companies and I believe also to the Workmen's Compensation Board and is doubtless equally encouraging to the mine operators.

In the industries in general other than coal mining the best information indicates that from 70 to 80 per cent of the accidents are due to carelessness, indifference or recklessness. Only the remaining 20 to 30 per cent is due to physical conditions which may be safeguarded. In coal mines, we have, however, for schedule-rating purposes generally accepted 40 per cent as the portion due to safety organization and have accepted 60 per cent of the accidents as being due to physical causes which may be safeguarded. In fact we now insure many mines in which nearly everything has been done to correct so-called sub-standard physical conditions, and these mines are practically perfect in this respect, yet the number of accidents and the severity have not been reduced from 60 per cent.

The best available statistics would indicate that of this moral hazard which we place at 40 per cent of the total, about one-half, or 20 per cent, of the accidents, are due to what we may call bad discipline—that is, carelessness, indifference and negligence of the mine officials, and is due to the same causes among the mine employees. The latter we usually call disobedience of orders, carelessness or ignorance. The former may be due to indifference or neglect of the foreman or of some other official.

Rarely if ever is the management deliberately in-

different or the foreman deliberately negligent. In but few cases, however, have either yet come to realize the importance of compensation as an element in the cost and efficiency of the operation. Gradually with experience this is coming home to them. Many are the cases where we have urged the mine operator year after year to carry out some simple safety improvement costing little money or time, but without result until some higher official or the owner himself was personally impressed with the loss he was incurring by the indifference of his management to these matters. Suddenly in case after case it has been borne in on the mine operator that recommendations for safety improvements should be carried out, with the result that the underground management has got busy and produced results which were promptly reflected in a decreased accident rate and a reduced premium and rate.

#### EXPERIENCE RATING HELPS MORAL HAZARD

The addition a year ago of experience rating as a further modification of the schedule rate has been helpful in producing a better moral hazard, that is, a more lively interest by the management in safety measures. A new and third feature has been added to the schedule this year, consisting of credits for the perfection of safety organization, education and for the more intensive inspection at the face. This has resulted in still other mining companies becoming interested more actively in safety measures. Until every mine operator makes it perfectly clear to each subordinate in his mine by his own actions and interest in their performance that he, "the old man," personally wants everything done that is proper to promote safety just as sincerely as he wants economy in operation, there can be no material improvement in the loss ratio from accidents or in the premium rate for insurance.

Taken in the gross the loss ratio in Kentucky in 1916 was 112 per cent. It was this which caused the change in schedule rate for the next year. The loss ratio in 1918 was 88 per cent, still on the debit side for the insurance carriers. Last year the loss ratio was 69 per cent, just on the edge of paying expenses. These results indicate to me clearly that coupled with independent bureau inspection and the consequent spur to added safety service by the insurance carriers, there will be a still further steady improvement in the physical and moral condition of the mines so far as safety is concerned, and a correspondingly steady reduction in the premium rate and in the total premium costs, with a diminishing accident record.

The mine operators of Kentucky will not find it advantageous either to self-insure or to insure partial coverage. Under such quasi-insurance protection they will not have the frequent impartial inspection reports concerning what their employees are doing to keep down their accident rate, which they do have from the schedule rating of the state bureau, nor the independent safety engineering service they get from full-coverage compensation-insurance carriers. Nor will it be possible for them otherwise to protect themselves at any less cost, for the reason that it is the duty of the Workmen's Compensation Board and of its agents, the National Council and the Rating Bureau to check up their experience from year to year, and to see if the rates charged are only such as will carry the business with a minimum margin of profit. The

Associated Companies ask only 1½ per cent profit, and with such a close margin of figuring it is evident that stock insurance, because of its absolutely gilt-edge protection, should be quite as attractive as any plan for mutual or self-insurance.

### Coal Prices in England Increased

THE maximum price of industrial coal in England, the *Colliery Guardian* reports, was raised on May 12 by 4s. 2d. per ton, and that of household coal by 14s. 2d.

Sir R. Horne stated in the House of Commons on May 10 that the necessity for an increase would have arisen apart from the recent wage advance to miners; but the wage advance increased the cost of production by about 2s. 10d. per ton, and the increases necessary to place the price on an economic basis was made greater by that amount. The Government, he stated, thinks it essential that the present system of controlling inland distribution should be altered as soon as possible, and this could only be done if the artificial differentiation between the prices of household and industrial coal were removed.

The following extracts from a statement issued on May 10 explain the reasons for the increases in coal prices:—

The figures of cost of production and selling price of industrial coal are as follows:—

COST PER TON:		s.	d.
Wages, stores, together with owners' pre-war standard of profits .....	30	5	
RECEIPTS:			
Average price per ton realized for inland disposals (excluding sales to workmen) .....	29	1	
Deficiency .....	1	4	

In the case of household coal, this deficit is greatly increased by the concession under which the allowance of 10s. per ton was made to the domestic consumer as a temporary alleviation of the price of coal during last winter. In the result the deficit on household coal is 11s. 4d. per ton. These deficits have hitherto been made up by the profits made on coal which has been exported. The recent advance of wages to the miners will now increase the adverse balance by 2s. 10d. per ton—that is to say, to 4s. 2d. per ton in the case of industrial coal, and 14s. 2d. per ton in the case of domestic coal.

With regard to the price now proposed for domestic coal, it is to be observed that the artificial differentiation between the price of household coal and that of industrial coal has caused great burdens in administration. Further, the control of inland distribution of coal has, in the view of the government, weakened supervision and retarded development in the industry, and they have decided that, in the interest of efficiency and production, it is desirable to remove the present system of controlling inland distribution as soon as possible. In these circumstances, an artificial discrimination between the price of household coal and that of industrial coal cannot be maintained. It therefore follows that the price for both sets of consumers must be placed on a uniform basis. Only by taking this action will it be possible to bring the industry back to normal conditions.

The prospects of the export trade, and the profits to be derived from it, cannot be accurately estimated. Whatever the surplus may be the view of the government is that it should go to the exchequer. It is obvious that if the coal trade were like other industries at present free of control, sums much greater than any that can be derived from profit on the export trade

would accrue to the exchequer in the shape of excess profits duty. By the arrangement now proposed, the consumers of all classes in this country will still obtain coal at a cost very much cheaper than the world market price. This result, however, is effected not only by restricting the profits of the coal owner, but also at the expense of the exchequer, which will lose a substantial portion of the revenue which would otherwise go to it from the coal trade as excess profits duty.

[At the normal rate of exchange a shilling is worth 24.3c.]

### Denver First-Aid and Mine-Rescue Contest Now Planned for September

A FIRST-AID and mine-rescue contest which in a way will be international in its aspects, in that miners of Canada and Mexico as well as those of the United States will be invited to participate, will be held in Denver, Col., Sept. 9, 10 and 11, under the auspices of the Bureau of Mines, Department of the Interior. It had been previously announced that this meet was to take place in August, but plans have since been rearranged and the events will take place in September on the dates above given.

These contests under the auspices of the Bureau of Mines are rapidly becoming the event of the year in mining circles. Last year, when the contests were held in Pittsburgh, Pa., more than one hundred first-aid and mine-rescue teams from mining companies participated for the cups and medals. So great was the general proficiency among those teams in life-saving methods that the judges of the contests had difficulty in picking the winners. A number of teams in different events were tied and it was necessary to run off the events again.

So many mining companies throughout the country now have their own teams at the mines that state contests are being held yearly and the best teams are generally sent to the Bureau of Mines events. At present the teams in the principal mining states are preparing for preliminary meets to select their best teams for the big affair. Last year teams were present at Pittsburgh from Colorado, Montana and Washington.

### Trunk Lines to Relieve Coal Shippers of Prepayment Charges to Canada

TRUNK line carriers expect to decide very soon on the action they will take in regard to relieving shippers of coal to Canada of the requirement of prepayment of charges. The Canadian situation is becoming critical. The Dominion must have 18,000,000 tons of Eastern coal to keep warm and to keep its industries going. With the shortage of car supply and other difficulties the prepayment situation has added materially to the problem of moving coal to Canada.

Liability for Minimum Royalty.—Where a coal mining company took a lease on land supposed to contain coal, agreeing to pay "as a minimum annual royalty the sum of \$1,000 per year," commencing three years after execution of the lease, the company could not avoid liability for the annual payments on the ground that no coal had been removed, in the absence of proof that no merchantable coal existed under the land in merchantable quantities. (*Iowa Supreme Court, Rowland vs. Anderson Coal Co., 162 Northwestern Reporter, 321.*)

# The Engineer's Part in the Shaping of National Prosperity\*

His Unremitting Efforts for Safety Make the Engineer an Insurance Agent of the First Magnitude—Production and Distribution, the Index of Industrial Prosperity, Largely Depend on Engineering Foresight

BY GEORGE OTIS SMITH

**N**O PROFESSION can claim exemption from citizenship. The constitutional privileges of citizenship also are constitutional obligations, for democracy distributes broadcast duties as well as rights. The engineer cannot dodge his responsibility as a citizen unless he is a conscienceless slacker. Moreover then, a reconnaissance survey of the subject is enough to show that the engineer has the making of a good citizen.

The best American citizen is and always has been he who lives not for today so much as for tomorrow. The pioneer and the volunteer soldier alike choose hardship and danger that there may be a larger measure of comfort and safety in the future. Regard for the future is not only a good definition of civilization but it is a practical kind of simple test to apply to our every-day motives. Are you and I seeking an easy today or a safe tomorrow?

## THE ENGINEER LIVES FOR TOMORROW

Now, as I understand the requirements of effective citizenship, the engineer measures up to the specifications: he is forward-looking, he seeks to safeguard the future, and he is constructive by training and habit.

Need I say much to convince you that while to look backward is a large part of the lawyer-statesman's code, to look forward is the professional habit of the engineer? Where could be found better evidence of the vision of the engineer than this city of Washington? Our first President was successively a civil engineer, a military engineer, and a nation builder; and his vision of the America-to-be was so far-reaching that his contribution to city-planning has proved no less adequate than beautiful, even though since he selected this site for the new Nation's capital the population of the United States has increased more than twenty-five fold. Washington the engineer planned for national prosperity and planned well.

The engineer of today also thinks in terms of the future, and because he ever keeps the factor of safety in mind as he works I have chosen to call him an insurance agent of the first magnitude. National prosperity will not satisfy us unless it is backed up with guarantees of permanence, and so it is that I appeal to the engineers to help write this nation-wide endowment policy to run to the benefit of our children's children. My political conviction is that the future of our nation will be largely what you engineers make it, and national prosperity must be worked out in terms of the nation's industry. The public questions of the day are largely matters of production and distribution, and however

humanistic or idealistic or altruistic you and I may wish to be, the future of America can be safeguarded only as the plans are drawn up by citizens like you, who trust to the eternal laws of matter and energy rather than to the broken reed of political expediency. This industrial nation needs citizens who will patiently lay solid foundations of fact and erect upon them structures of just action in which there is a factor of safety large enough to safeguard the nation's future prosperity.

The third link that connects the engineer and national prosperity is his constructive habit. It is not enough to know the truth; we have to translate it into action, and herein lies the distinction I draw between science and engineering: what science has discovered engineering must apply. Take this thought over into politics, and the peculiar usefulness of the engineer-citizen becomes almost self-evident. He has no use for the abstract except as the formula or the equation may affect his working plan. The engineering habit of mind is to trust implicitly the constants determined by science and tested by experience, but such faith is only the point of departure—works, not faith, is the engineer's creed, and it is his task in life to construct.

## CONSTRUCTIVE METHODS OF THE ENGINEER NEEDED

Now it is just this constructive tendency that we need more of in American politics. In political procedure we use practical engineering simply as a source of figures of speech—the terms “log-rolling” and “wire pulling,” “steam roller,” and “side-tracking” are suggestive of the world of work, but only suggestive. In keeping our political institutions in running order, the legislative habit is to putty up any cracks in the structure that indicate weakness, without making any inspection of the foundations. And I regret to record my observation that in our legislatures, whether State or Federal, we find too little confidence in experts, possibly because the best of our scientists and engineers are rarely if ever seen or heard by those who control matters of statecraft.

The skillful fakir has had a standing in Washington that he could not get in business circles. However, there has been some improvement in the status of the specialist, though even now a well-displayed sensational news item about a new motor fuel is likely to seem to the legislator a more acceptable basis for a governmental investigation than a well-considered and therefore conservative statement by a chemical engineer of world-wide repute. Nor is the perpetual-motion variety of optimist without a hopeful following. Now it is this condition, this need of light, that demands a larger interest in politics on the part of our engineers, not so much through their great national organizations as in the capacity of individual citizens.

\*Address delivered by the Director of the U. S. Geological Survey at the organization conference of the Federated American Engineering Societies, Washington, D. C., June 3, 1920.

Our political temper today puts too much stress on legislation and too little on execution—we do not even reach the stage of a working plan. A new law is offered as the cure-all, whatever the evil that appears, and in devising the new law often the chief feature sought is novelty; at least the remedy proposed must look new. The engineer's methods are different, both in planning his new structures and in putting them to use. To meet new requirements he usually adopts well-tested plans; he naturally seeks the safety of experience. And his structure, once erected, his machinery installed, or his process perfected, he provides for its operation in accordance with his plans. This reliance upon well-tested facts of experience, this attention to the many details which taken together provide the requisite factor of safety, this "seeing the thing through"—are all working habits that the engineer-trained citizen can well take over into his political life.

AN ENGINEER THE BEST TYPE OF PRESIDENT

As I read American history, I believe that the intensely practical yet altogether progressive leadership of George Washington in affairs of state was possible because he was thoroughly a man of affairs—an explorer and pioneer, a leader in experimental agriculture, an administrator of business, a promotor of interstate waterways, and even a drainage engineer. The earliest precedent that we have here in America, then, is that an engineer makes the best type of President; but most of us can only aspire to be useful private citizens, and more useful if active in public affairs.

The constructive habit is sadly needed in these days of change. The critic is abroad in the land, and he attacks our institutions as the wrecker rather than as the builder. My own conception of political reconstruction is best illustrated by what we have all seen, the erection of a new railroad bridge. The bridge-engineer may well be taken as the type of worker we need in public life. You have seen how, with his plans prepared to the last rivet, he has replaced the small and inadequate and possibly weakened bridge with the larger and stronger and up-to-date structure, and he has done this without interruption to traffic. His plans provide for one essential that is lacking in too many Utopian schemes; the bridge workers build up faster than they tear down, and therefore there is always a bridge to use.

This nation of ours is a going concern; indeed, the rate of our progress is much more rapid than many of our statesmen realize. Changes must be made to meet the demands of the heavier traffic, new structures must be erected, new motive power must be provided, and the effective citizen of today is one who can see ahead of the present moment, who can plan to meet safely the demands of the future, and who has likewise the will to build the needed structures, without tearing down too rapidly the house of state in which we live. I believe the engineer is a citizen of just that type.

Long Ton Made Mandatory in Sale of Coal In District of Columbia

UNDER the weights and measures bill which was recently passed by the House of Representatives it is specifically mandatory that coal must be sold in the District of Columbia only by the long ton, which is 2,240 pounds.

April Domestic Coal and Coke Exports From the United States

APRIL exports of domestic coal and coke from the United States by countries and by customs districts and the bunker coal supplied to vessels in the foreign trade at specified districts, according to figures compiled by the Bureau of Foreign and Domestic Commerce, were as follows:

EXPORTS OF U. S. FUEL IN GROSS TONS

	Coal		Coke Tons

# NEWS FROM

# THE CAPITOL

BY PAUL

WOOTON

## Railroad Incomes Increase Under Private Control

A PARTIAL summary issued by the Interstate Commerce Commission records the net operating income of the railroads for March, 1920, the first month after the return to private control, as practically a million dollars greater than that of March, 1919. The figures are: For March, 1920, \$10,206,576; for March, 1919, \$9,396,592.

## Carrier Representatives Ask an Increase in Freight Rates

RAILROAD representatives appearing before the Interstate Commerce Commission at the increased freight rate hearing presented a proposal for an increase of from 24 to 31 per cent in inter-territorial joint rates between the Chicago switching district and shipping points in the West, Southwest, South and Central West.

Rates on bituminous coal from Illinois and Indiana mines would be advanced 27 per cent to all points east the Mississippi river, including St. Paul and Minneapolis; to all points west of this territory, 24 per cent.

Rates on commodities originating at Mississippi river crossings and points west thereof in southern Missouri, Arkansas, Louisiana, Oklahoma, and Texas, and sent to all points except the Pacific coast and intermountain territories would be increased 31 per cent.

Increased freight rates, to take effect at the same time rail carriers are granted higher rates, were asked by steamship companies in a petition presented to the commission. The lines asking these increases are engaged in Chesapeake bay and coastwise transportation. They include the Baltimore Steam Packet Co., Chesapeake Steamship Co., Clyde Steamship Co., Mallory Steamship Co., Merchants and Miners' Transportation Co., Ocean Steamship Co. of Savannah, Southern Pacific Co., Atlantic Steamship Lines and Southern Steamship Co.

## Government Fuel Yard Announces Opening Of Bids for 1921 Supplies

CAPTAIN C. A. Dravo, chief of the raw materials branch of the Quartermaster's Corps, in charge of the Government fuel yard, announces that at 10 a. m., July 15, bids on Government coal requirements for 1921 for the stations enumerated below will be received and opened:

Zone 1, on all requirements less coke, smithing coal and wood.

Zone 2, on all requirements less coke, smithing coal and wood.

Zone 3, on the following stations: Tullytown Arsenal, Neville Island, Schuylkill Arsenal, Constructing Quartermaster Terminal, Philadelphia, Pa.; Pier No. 78, Philadelphia, Pa.

Zone 4, on all requirements less coke, smithing coal and wood.

Zone 5, on all requirements less those for Ft. Screven, and less all coke, smithing coal and wood.

Zone 6, on all requirements except coke, smithing coal and wood.

Zone 7, on all requirements except coke, smithing coal and wood, less 3,900 tons of bituminous lump over 2 in. screen for Columbus Barracks, less 10,000 tons of bituminous run-of-mine for McCook Field, and less all requirements at Fort Thomas, Ky.

Zone 8, submit bids only for Park Field, Scott Field, Warehouse No. 1, St. Louis General Supply Depot, Camp Zachary Taylor, and Camp Henry Knox, omitting therefrom coke, smithing coal, and wood requirements.

Zone 16, on all requirements except smithing coal, coke and wood.

Bids opened May 14 for similar requirements have been rejected.

## New I. C. C. Members Receive Recess Appointments

PRESIDENT Wilson on June 9 announced recess appointments of Henry Jones Ford of New Jersey, Mark W. Potter of New York and James Duncan of Massachusetts to be members of the Interstate Commerce Commission.

These appointees were nominated some weeks ago, but the Senate failed to act on them. When they take office all vacancies on the commission will have been filled, including the two new places created by the Transportation Act, which increased the membership from nine to eleven.

## Modification of Reading Decree Asked

THE Reading Coal Company has asked the Supreme Court to modify the decree recently handed down in the Reading anthracite coal case so as to permit the Reading company to retain stock of either the Philadelphia & Reading Coal & Iron Co. or the Philadelphia Railway Co., and that the Central Railroad of New Jersey be allowed to retain stock of the Wilkes-Barre Coal Co.

The request is based on the injury to minority stockholders and the public and the existence of heavy obligations by the companies which would be affected by the original decree. The Department of Justice has opposed the request on the ground that it would reopen the case and nullify the dissolution decree.

# Opportunities for Reducing Mine Costs by Standardizing Equipment\*

Uniform Mine-Track Gages and Tipple Clearances Advocated to Reduce Accidents and as Beneficial to Operator and Manufacturer — Co-operation Indispensable to Results — Standards Adopted Should Follow Established Good Practice

BY WARREN R. ROBERTS†  
Chicago, Ill.

THE subject of "standardization" of equipment and machinery, whether for use by the coal mining industry, for metal mining, or for any other industry, is one which must be given careful consideration before its advantages will appeal to those who are to use this equipment and machinery, or to those who are to design and manufacture it.

This statement is based on a very considerable experience by the writer for the past two years, during which time he has had occasion to present the subject to various groups of men representing the different branches of the industry to which the improved equipment or machinery was expected to be applied.

When the desirability of standardization of any equipment is first mentioned to one who has not yet thought of the matter, it is perfectly natural that certain objections to any attempt to standardize the equipment in which he is interested should first present themselves, and only by a careful discussion of the subject and the pointing out of the definite benefits to be derived from standardization, will he be convinced that the advantages to be gained by standardization of any line of equipment very greatly outweighs any objections to such standardization.

This statement also is based on the experience of the writer, and may be accepted by the gentlemen of this convention, pending the arguments in favor of the standardization which will be presented later. It will be best, however, to first define both the scope and the limitations which any program on standardization should embrace.

It has been found advisable, in planning for the standardization of equipment or machinery for any particular industry, to establish certain general lines of procedure and to begin with the adoption of certain principles which are recognized by both the profession and the industry as good standard practice. Then, having established these fundamental principles and standard practices, we can gradually branch out and bring under standardization certain equipment on which there is the most general favorable opinion towards standardization.

To illustrate what we have in mind, it is conceded by

all concerned that in designing a tipple for a mining plant, for instance, there are certain track clearances; certain overhead clearances; certain clearances above the point of dump for over-wind, etc., which are recognized as good practice and for the safety of operation. However, we have all observed many plants on which

these well-recognized standards are not followed and due to the violation of which many accidents occur. It would therefore seem to us easy to reach an agreement as to the desirability of the adoption of certain standards along these particular lines, such standards, of course, to follow established good practice as far as is possible.

**Standardization of machinery or equipment should not be attempted simply for the sake of uniformity, but only when standardization will simplify operation and lower the cost of production. To be successful, any program contemplated must show advantages to mine operators, manufacturers of mining machinery and equipment and engineers and builders interested in the coal mining industry.**

We believe there are few connected with this industry who would not agree to the desirability of some reasonable standardization of mine track gages. At present we have gages varying 18 in. up to 48 in. Without doubt some standardization of mine track gages would be of great benefit, both to the operator and the manufacturer, as affecting mine cars, mine locomotives and coal cutting machines. To one who has given much thought to this subject, such illustrations could be multiplied indefinitely. These few plainly show the scope which our program of standardization may assume.

Now, to define the limitations: It is important, both on behalf of the operator and the manufacturer, that attempts should not be made to standardize any machinery or equipment just for the sake of standardization which will in any way add expense either to the operation or the manufacture of such machinery, but only when standardization will simplify operation and cheapen production.

## BENEFITS THAT WILL ACCRUE TO THE OPERATOR

Having in mind these well established lines of standardization, let us now point out very briefly some of the benefits to accrue to the various interested parties:

Any program of standardization must have in mind first the benefits to accrue to those operating the equipment or machinery to be standardized. Some of these benefits which occur to the writer are as follows:

The adoption of standards of clearance in the tipple structure as mentioned above would not only facilitate operation but lessen expensive accidents, and thereby prevent delays to operation and expensive repairs.

Standardization of mine track gages after once

\*Address delivered at the meeting of the Kentucky Mining Institute, Lexington, Ky., June, 1920.

†Chairman of General Committee of Standardization of Mining Equipment, American Mining Congress, Washington, D. C.; President, Roberts & Schaefer Co., Chicago, Ill.

adopted would not only facilitate the use of cars from one mine to another—a very material advantage to an operator owning several mines—but would reduce the cost of his mine cars, his haulage motors, and his coal cutting machines.

The standardization of certain other lines of machinery used by all operators would in time reduce the cost to the purchaser for such standardized machinery. Standardization of any line of machinery very greatly reduces the cost of the repair parts which an operator must carry in stock to insure the continuous operation of his mine. Standardization of the equipment and machinery for a mine not only reduces its cost but lessens the time required to secure such standardized equipment and machinery as against the time required to buy unstandardized machinery.

#### BENEFITS TO THE MANUFACTURER

The next most interested party in any scheme of standardization is the manufacturer of the equipment or machinery to be standardized, and before such manufacturer can be persuaded to join a standardization movement he must be shown the benefits that will accrue to him. These may be enumerated briefly as follows:

All that has been said regarding the benefits to the operator by the standardization of mine-track gages would apply equally to the manufacturer of mine cars, mine locomotives and coal cutting machines, or any other variety of mine equipment which must run on a mine track.

It is clearly apparent that a standardization of mine-track gages which would enable manufacturers of all such equipment to adopt standards would very greatly reduce the cost to the manufacturer in maintaining plans, patterns and shop room for handling through his factory machines for a few standard gages, as compared with a multitude of machines of various gages.

The very large saving in the cost of manufacture of machinery to a few standards as against miscellaneous sizes cannot be calculated. But any manufacturer will admit that the saving is very material and very beneficial from his viewpoint.

The advantage of standards to the operator in reducing the number of repair parts which must be carried to insure the continuous operation of his mines applies equally to the manufacturer, for the reason that to enable him to furnish repair parts for a multitude of sizes of any line of machinery necessitates his having patterns for all such sizes, and manufacturing and shipping of a few of each of these various sizes instead of a greater number of the few standard sizes.

These are only a few of the advantages to the manufacturer which have occurred to me at this moment, but many others could be mentioned.

#### ADVANTAGES TO THE ENGINEER AND BUILDER

It may appear at first thought that any program of standardization of mine equipment and machinery would be a disadvantage rather than an advantage to the engineering profession interested in the designing and building of mining plants. However, such conclusion is incorrect. Any engineering profession worthy to endure must be based on advantageous service rendered to those who pay for such service. Only by making such service of value will it continue to be employed. It is therefore to the interest of engineers and builders of mining plants to promote standardization as outlined

above, and thereby indicate to operators not only their desire but their ability to promote his interests at every opportunity that presents itself.

#### NECESSITY FOR CO-OPERATIVE PROGRAM

The above discussion makes it apparent that if any movement looking to the standardization of mining equipment is to be successful it must have the hearty support of men representing the operating end of the mining industry; of men representing manufacturers of equipment and machinery used by the industry, and of engineers and builders interested in this line of work.

There are also several other outside interests which must be consulted and whose co-operation should be secured in connection with the adoption of standards that affect such interests. This applies to the interest railroads may have in tippie clearances or other features of a mining plant as affecting the operation of their roads. Certain states also have laws regulating tippie clearances, some of which laws are unnecessarily severe and should be revised to meet good standard practice. Other states which have no such laws should be encouraged to pass laws establishing the standard practice for such clearances.

A brief statement of the progress which has been made on standardization by certain national technical societies and by certain departments of the U. S. Government may be of interest to this convention. I will therefore outline the work already accomplished by such agencies.

#### NATIONAL ENGINEERING SOCIETIES

All five of the national engineering societies have for several years been interested in the standardization movement. Certain of these societies have had standing committees which have devoted a great deal of time to studying the question of standardization as applied to their particular profession and the industries in which they were interested. Some of these committees have made a very considerable progress in adopting standards of practice as well as standards for certain equipment and machinery.

However, as progress was made by these national technical societies acting independently it was discovered that often certain equipment and machinery as standardized by one society did not meet the approval of some other society which might be interested in the same equipment or machinery. A careful study of this particular situation led these five national engineering societies to establish an independent agency in which they were all interested.

Somewhat more than a year ago, after a very considerable discussion of the matter, these five national engineering societies established the American Engineering Standards Committee, which was to be a joint agency representing all of these engineering societies, so far as standardization was concerned. In establishing this joint agency it was agreed by the founder societies that standards adopted by any one of these societies should be referred to this joint committee for approval and adoption, after which it would become a "national standard."

This was a most excellent progressive movement and has given great impetus to standardization. At the same time it will safeguard the movement and avoid duplications and conflicts in adopting standards.

The U. S. Government has long been interested in the

adoption of standards. Many years ago a Bureau of Standard Weights and Measures was established, which has gradually grown into the present National Bureau of Standards, operating under the Department of Commerce. This bureau has very extensive laboratories with ample equipment and an able staff of engineers and scientists for carrying on the investigations, making tests and otherwise effecting standardization.

During the late war, by the advice of and under the direction of General Goethals, Assistant Chief of Staff, a consolidation of all the purchase and supply agencies of the War Department was made. This consolidation became a necessity as the war progressed, to enable the War Department to supply the increasing demands of the army.

Soon after this consolidation became effective, in the spring of 1918, many difficulties arose in trying to harmonize the requisitions furnished this now consolidated purchasing agency from the various corps and divisions of the War Department. To harmonize and co-ordinate these requisitions and the specifications accompanying them it became necessary to establish a branch in the purchasing agency for the standardization of the requisitions and accompanying specifications. The writer had charge of this branch of the service from the time it was established until the close of the war.

#### STANDARDIZATION OF SUPPLIES USED BY ARMY

The advantages and economies that resulted from this standardization of the Government's specifications for many of the largest commodities used by the army was very great. Production and transportation also were facilitated by the methods of standardization as adopted. These facts are recorded here simply to indicate the advantages of standardization as applied to this great enterprise of carrying on the war.

At the time the above-mentioned American Engineering Standards Committee was established by the national engineering societies the War Department and the Navy Department were asked to join this "committee." After a careful investigation and on the advice of the writer these two governmental departments, as well as the National Bureau of Standards, joined this committee and became active agents in promoting its work.

During the past year other engineering, technical and industrial societies have been invited to join this standardization movement as represented by the American Engineering Standards Committee, and several such societies, including the American Mining Congress, have joined in the work of this committee.

#### COMMITTEES WORKING OUT A PROGRAM

It may be of interest to the gentlemen of this convention to learn that the American Mining Congress has during the past year been carrying on an extensive program for the standardization of mining equipment. To accomplish this work two general committees were organized, one representing the coal-mining industry and one representing metal mining.

These general committees in turn established sub-committees to take charge of and direct the standardization for certain classifications of machinery and equipment. There are seven such sub-committees working under the general committee, standardizing coal-mining equipment and machinery. These sub-committees are composed of men representing the coal operators, the manufacturers of coal-mining equipment and machinery,

mining engineers, etc. Several of these sub-committees have made very considerable progress in their work and their reports will be presented through the general committee at the annual convention of the American Mining Congress next November.

It is hoped that the presentation of this subject to your convention will awaken a lively interest in the standardization program by your members. Any information desired on the subject may be secured by addressing the writer, who is chairman of the general committee, having charge of this standardization work on behalf of the coal-mining industry.

### Dock Interests Seek Government Help To Move Coal on the Lakes

REPRESENTATIVES of dock interests at the head of the Great Lakes are in Washington seeking relief from the situation which is resulting in an alarmingly small movement of Lake coal. The representatives point out that shipments during April were 700,000 tons below normal, while May forwardings are expected to be fully 3,500,000 tons less than normal.

Official attention is being called to the fact that grave danger exists of not having enough coal in the Northwest to meet next winter's needs. Because of the high prices which are being paid for coal, the tendency is to distribute it directly to the consumers rather than store it at the docks.

### Trade of the United States with the Orient Makes Giant Strides

THE share of United States in the rapidly growing trade of the Orient has increased from less than 10 per cent in the year before the war to over 20 per cent in 1919. The total trade of the Orient, including in this term Asia and the adjacent islands, aggregated, says a statement of The National City Bank of New York, about \$5,200,000,000 in 1913, of which about \$475,000,000 was with the United States; but in 1919 it had advanced to \$8,750,000,000, of which \$1,880,000,000 was with the United States.

While the general trade of the Orient nearly doubled during the war period, that with the United States quadrupled. Our exports to Asia and the Philippines, which in 1913 amounted to only \$158,000,000, were in 1919 \$775,000,000, and in the fiscal year about to end will exceed \$800,000,000. Our imports from the section in question, which amounted to only \$300,000,000 in 1913, were \$1,100,000,000 in 1919 and probably will aggregate \$1,200,000,000 in the fiscal year ending with next month.

### New York Skyscraper to Use Oil Instead of Coal Fuel

BELIEVING that oil is superior to coal as fuel, the owners of the Singer Building in New York are about to adopt oil for providing steam. Two of the five boilers in the steam plant have already been converted and the other three will be changed soon, it is understood. About one hundred barrels of oil will be needed daily for the building, it is believed, and a contract has been let for supplying oil needed the first three years.

## Expect Commerce Commission to Give Data on Assigned Cars

Correspondence Discloses Adverse Effect on Miners Earnings and Other Evils Resulting from Inequitable Carrier Distribution

**J**UST before adjournment an ineffectual effort was made to secure action in each house in questioning the Interstate Commerce Commission in regard to assigned cars. The measure passed the Senate, but failed of passage in the House. It is expected, however, that the information called for will be furnished by the Interstate Commerce Commission in compliance with the Senate resolution:

"Whereas the railroad companies are making assignments of freight cars; and

"Whereas the said railroad companies, or a part of them, are making such assignment in a manner alleged to be discriminatory and prejudicial to the common public welfare; and

"Whereas authority for making assignments of cars by said railroad companies is predicated upon an order of the Interstate Commerce Commission, dated April 15, 1920, and entitled 'Notice to carriers and shippers,' and is in the following words and figures:

"The commission recommends that until experience and careful study demonstrate that other rules will be more effective and beneficial, the uniform rules as contained in the Railroad Administration's Cars Service Section Circular CS31 (revised) be continued in effect, except that rule 8 as contained in said circular should be amended to read:

### DIRECTED TO CITE AUTHORITY FOR ORDER

"Private cars and cars placed for railroad fuel loading in accordance with the decision of the Interstate Commerce Commission in RR. Com. of Ohio et al. v. H. V. Ry. Co., 12 I. C. C., 398, and Traer v. Chicago & Alton Railroad Co. et al., 13 I. C. C., 451, will be designated as 'assigned' cars. All other cars will be designated as 'unassigned' cars":

"Therefore be it resolved, That the Interstate Commerce Commission be directed to inform the Senate upon what authority, if any, said order was issued."

In that connection correspondence was introduced in the record of the proceedings, the first a letter addressed to Representative Roscoe C. McCulloch by John Moore, president of the Ohio Mine Workers, and Walter J. James, legislative representative of the United Mine Workers of America, as follows:

"On behalf of all the bituminous miners of the United States, particularly the miners of the State of Ohio, we desire to call your attention to the fact that a large number of miners and their families in every coal-mining district of Ohio are in a deplorable condition because of their lack of work, due primarily, as we understand it, to a recent order issued by the Interstate Commerce Commission which gives preferential car assignment to certain mines, making it possible for those miners to work almost continuously, while the miners employed at other mines are working, in many cases, less than 25 per cent time.

"The miners, as a rule, do not measure their earnings by the amount of money that is in their pay envelope, but rather by comparison with the earnings of their neighbors, and when the men working in one

mine are making \$2 more than the men working in some other mine it creates a condition of dissatisfaction and unrest at both mines. The man earning the most money is usually more dissatisfied than the fellow earning the small amount. This condition is prevalent throughout all the bituminous mining districts, and no doubt will result disastrously unless some correction is made.

"The Bituminous Coal Commission, created and appointed by the President of the United States, made the recommendation in their report that the preferential car assignment be discontinued, as it was discriminatory to the mine operator and to the coal miners, as well as to the general public. The miners in accepting the award of the commission believed that this recommendation, with the other recommendations, would be complied with; and no doubt would have been had it not been for the order of the Interstate Commerce Commission to the contrary.

### CONSIDERED PREFERENTIAL TREATMENT ABOLISHED

"Our understanding of paragraph 12, section 402, of the Esch-Cummins Act is that the preferential car assignment was forever abolished, and we ask that you join with other Congressmen from our State in passing a resolution, or by some other legislative means correct the abuses as complained of above, making it so plain that the Interstate Commerce Commission will be compelled to recall the recent order."

The second communication, also addressed to Representative McCulloch, was from C. H. Bryson, secretary of the Federated Boards of Trade of South-eastern Ohio, as follows:

"Our commercial bodies wish to direct your attention to violations of the provisions of a recent act of Congress by the present management of the railroads under an order of the Interstate Commerce Commission. The violations are of paragraph 12, section 402, of the Transportation Act.

"The practice now engaged in by the railroads in violation of this act is the inequitable distribution of cars known as the assigning of cars for the loading of railroad fuel, which cars so assigned are not being distributed to mines on the basis of each mine's ratable share of cars.

"Many evils result from this practice; in fact, nothing has done so much injury to the people generally in the mining regions, and nothing has caused so much discontent as the assigned-car practice. It is altogether unfair and unjust.

### UNFAIR DISCRIMINATION DUE TO THE PRACTICE

"It gives to some of the men nearly full-time employment and pay, while others are permitted to work but one or two days per week. Much suffering as a result is inevitable. It makes all of the citizens—laborers, business men, and others—of one town or community prosperous while an adjoining town or community dependent upon mines not favored with an assigned-car supply is barely able to exist. It keeps the men constantly moving from one town to another in the hope of securing work at a mine favored by the railroads, only to find perhaps after securing such employment that the railroad-fuel contract and consequently the car supply had been shifted to some other mine. Such intolerable conditions cannot be allowed to continue.

"We happen to be located at the source of the trouble,

and consequently are the first to suffer. But the suffering will soon be extended to those dependent upon us for next winter's coal supply.

"In this connection we are advised that 30,000,000 tons of coal must go up by way of the Lakes to the people of the Northwest for next winter. This amount is essential to their comfort under normal winter conditions and must go during the navigation season of seven months.

"Due to lack of cars but 1,500,000 tons, or 5 per cent of this amount, has been shipped to date, whereas 6,000,000 tons, or 20 per cent, of the amount should have been shipped.

#### INSUFFICIENT COAL CAR SUPPLY IN WINTER

"While the railroads are getting their own fuel under the assigned-car practice, they are not furnishing cars to transport the winter fuel supply of the public. Those coal cars which should be carrying the public's coal are being used for transporting automobiles and various other articles and materials which produce more revenue for the carriers than the transportation of coal would produce.

"The assigned-car practice has received adverse comment by every individual and group not interested in railroad revenues who have studied the question deeply. This includes the Bituminous Coal Commission, the Railroad Administration, the Fuel Administration, and both labor and commercial organizations. A perusal of the history of the practice shows it to have been universally condemned.

"The writer has interviewed personally many members of both the House and the Senate who were intimately connected with all the legislative activities leading up to the passage of the act referred to. Without one single exception or shadow of doubt in the minds of any of them, all are agreed that it was the intent of Congress in this legislation to get rid of the assigned-car practice and its many evils. A correct interpretation of the language of the act is in accord with that intent.

"The Interstate Commerce Commission refuses to interpret the language of the act correctly, and therefore refuses to carry out the clear and express intent of Congress. We can be heard fairly in the matter only by you who have undertaken to remedy these evils. What is to be done?"

### Retail Prices of Food Made Record Increase in April

ACCORDING to reports received by the Bureau of Labor Statistics of the U. S. Department of Labor from retail dealers in fifty-one cities, the average family expenditure for twenty-two articles of food increased more than 5 per cent in the month from March 15 to April 15. This is the largest percentage increase in any one month except April, 1917, immediately following the entrance of the United States into the great war, when the increase was 9 per cent over March, 1917, prices.

The cost of food in April, 1920, reached the highest point yet attained, being 5 per cent higher than the heretofore record high point of January, 1920. The figures for April, 1920, show an increase of 16 per cent as compared with April, 1919, and an increase of 115 per cent as compared with April, 1913.

### Car Service Commission Issues Rules Governing Use of Coal Cars

W. C. KENDALL, chairman of the American Railroad Association's Commission on Car Service, on June 2, 1920, issued the following, designated as circular CCS-33, to railroads:

"The production of bituminous coal during April and May has been averaging two and one-half million tons per week less than what is necessary for the country's adequate fuel supply and particularly to permit a sufficient movement up lake to the Northwest and ocean and rail to New England to protect next winter's consumption in those sections. The average placement on bituminous coal loading roads has been approximately 50 per cent.

"In order that coal production may be increased and discrepancies in placement as between commodities made up it is necessary that:

"1. Railroads must distribute available coal cars for loading coal to a minimum of 50 per cent of actual requirements before distributing coal cars for loading other commodities.

"2. Railroads may distribute available coal cars for loading other commodities requiring open cars to an extent not exceeding 50 per cent of actual requirements based on ability to load and ship, and any surplus as available shall be applied to increase the supply for coal loading.

"3. Railroads having no coal loading will restrict the supply of coal cars for loading of other commodities requiring open cars to an extent not exceeding 50 per cent of actual requirements based on ability to load and ship. Foreign cars used in this manner must be loaded strictly in accordance with car-service rules, and must not be back hauled for loading.

"4. Coal-carrying cars must not be used for the loading of automobiles and other commodities which can be transported in box cars and other types of equipment."

### Supreme Court Denies Peterson Petition for Mandamus Against Judge Hand

IN AN opinion delivered by Justice Brandeis, the U. S. Supreme Court on June 1 denied the petition of Walter Peterson, as receiver of the Interstate Coal Co., Inc., for a writ of mandamus against Judge Augustus N. Hand of the U. S. Court for the Southern District of New York.

Peterson had brought an action in the latter court against Arthur Sidney Davison to recover a balance of \$21,014.43, alleged to be due for coal sold and delivered. The answer substantially admitted the items set forth in the schedule filed by the plaintiff, but denied that it represented a full account of the transactions between the parties, alleging that there were other deliveries of coal and other payments which the defendant had made, and also that he was entitled to additional allowances. It further alleged, by way of counter claim, that the plaintiff was indebted to him for failure to perform its contracts for coal in the sum of \$9,999.10. In response to a demand for a bill of particulars, defendant filed schedules containing more than two hundred items which he proposed to establish by way of defense.

Upon motion of defendant and against the objection of plaintiff, Judge Hand appointed an auditor with in-

structions to make an investigation of the facts with a view to simplifying the issues for the jury which was to make final determination of all issues of fact.

Thereupon application was made to the Supreme Court for leave to file a petition, praying that Judge Hand and the auditor named be prohibited from proceeding under the order appointing him and that Judge Hand, or such other judge who may at the time hold the trial term of that court, be commanded to restore the case to the trial calendar and that the same be tried in the regular way.

Justices McKenna, Pitney and McReynolds dissented.

### Committee Chairmen of Mining Congress To Discuss Program for Year

COLONEL WARREN R. ROBERTS, chairman of the coal mining section of the Standardization Committee, and Chairman Mitke, of the metal mines division of the American Mining Congress, expect shortly to call a meeting of all sub-committee chairmen of both coal and metal mining committees in Denver to discuss the program for the year in connection with the reports to be made at the twenty-third annual convention at Denver during the week of Nov. 15 next.

## Movements of Coal and Coke by Fourteen Leading Railroads During February 1919 and 1920

SHIPMENTS of coal and coke carried over fourteen leading railroads during February, 1919 and 1920, and during the two months ending with February for the same respective years, compiled by the division of statistics of the U. S. Department of Commerce, are as follows:

Coal and Coke Shipments for February, 1919, and February, 1920, Compared

Classes and Railroads	Originating on Line		Received from Connections		Total	
	1919	1920	1919	1920	1919	1920
<b>For Revenue Only</b>

NOTE.—No report was received from the Baltimore &amp; Ohio R.R.

## Favors Acquisition of Tract for Coal Experiments

DIRECTOR MANNING, of the Bureau of Mines, has recommended Government acquisition of a tract of 77 acres covering a coal mine near Pittsburgh at a cost of \$19,000, for coal experiments, so that the experimental station at that point may not be disturbed by possible future mining, although the bureau does not plan to mine coal. At this station coal dust from all parts of the country is tested to determine its explosibility.

Based on experience of the government fuel yard in the District of Columbia, which supplies government departments with coal, Director Manning favored centralized coal buying for the entire government service throughout the country under one agency. Chairman Good of the committee said there was merit in the suggestion. The fuel yard had saved the government from 39½ to 70 cents a ton on the 300,000 to 350,000 tons used annually by government departments in Washington,

and had reduced business of private dealers about 20 per cent.

Director Manning said the bureau would co-operate with State or municipal governments, corporations, associations or individuals on scientific work with the understanding that the results of experiments should be for the benefit of the general public. At present the bureau is co-operating with thirty-three agencies, among them the Sinclair Refining Co., on fuel development with a view of saving oil and bringing about more efficient use of coal.

## Advocates Mine Exhibit in Celebration of Sesqui Centennial of Independence

REPRESENTATIVE DARROW, of Pennsylvania, has introduced a bill favoring the celebration of the 150th anniversary of the signing of the Declaration of Independence by holding an international exhibition of arts, industries, manufactures and products of the mine, soil and sea, in Philadelphia, in 1926.

# Kentucky Mining Institute Meets at Lexington

Important Moves Made to Increase Interest and Value of the Meetings—  
 Provision for Company Membership Expected to Strengthen Organization—  
 Well-Filled and Skillfully-Contested First-Aid Meet Features the Conclave

**M**EETING for the first time in more than a year, the Kentucky Mining Institute gathered at Lexington, Ky., on June 4 and 5 for reorganization on a peace basis and for a grand get-together convention. The meeting was well attended, particularly by the

the International Coal Products Corporation of New York, read a paper describing the Smith process of low-temperature distillation of coal and the briquetting of the product. In his paper Mr. Eshrick pointed out the waste in burning raw coal, indicated that the de-

## First-Aid Contest

Owing to a severe rain the Kentucky Mining Institute authorities decided that the Stoll Athletic Field would not be dry enough for the contest of the following day and so decided to use an empty tobacco warehouse for the purpose, an excellent idea which if followed regularly would relieve much anxiety from the minds of all concerned in such events.

## Here Are the Winners

The Pioneer Coal Co. of Kettle Island took the honors with a team comprising J. D. Wyatt, captain; H. E. Grace, Joseph Lowe, Wesley Lowe, J. G. Gross and Dewey Brock. This team received the engraved plaque which is the leading prize of the Kentucky Mining Institute's annual event. Its rating was 99.2 per cent.

operators from the eastern part of the State. The two days were filled with the meeting and the first-aid meet in the afternoon of the last day.

Several important changes were made in the organization that are certain to strengthen the work and increase interest on the part of the members, as well as add to the membership. The position of secretary was made a salaried one, dues were increased from \$3 to \$5 per year, and provision was made for company memberships, without voting power, each at \$10 per year. These steps will place the institute on its feet financially and with a paid secretary able to devote more time to the work than any volunteer has so far been able to give, the membership can and will be materially increased and the operators in the State be kept informed of the activities of their institute.

The opening meeting on Friday, June 4, was well attended. Mr. George Eshrick, Jr., fuel engineer with

mand for smokeless coal was in excess of the combined production of the anthracite and smokeless fields and informed his audience that from high-volatile Kentucky coal a smokeless product can be prepared by this process that will have all the good points of the present well-known brands of low-volatile fuel. The vision of plants at the coal mines in Kentucky producing hard coal briquets, with benzol, tar and ammonia as side lines, appealed to the operators present and the paper was the subject of much discussion and the speaker was called upon to answer many questions.

Mr. Herbert M. Wilson, the director of inspection and safety of the Associated Companies, read a paper on the practical operation of coal-mine compensation insurance under the Kentucky law. The paper, which will be found in this issue of *Coal Age*, answered the questions of many regarding the operation of the law and showed by examples from the records of cases in Kentucky the

advantages in decreased cost of insurance of the inspection and help offered by the inspection service of the insurance companies. Cost of insurance was shown to be in direct ratio to the risk offered by the mine, and improvement in mining practice and observance of the rules of safety progressively reduces the cost.

General disappointment was felt at the unavoidable absence of John Callahan, of the National Coal Association, and George Cushing, of the Wholesale Coal Dealers' Association. Mr. Callahan was to have talked on the new Transportation Act, but was called to Chicago for consultation on the subject of assigned cars. Mr. Cushing sent his paper on the history of the coal industry and although the absence of the author was regretted the paper was read and enjoyed by all present. The paper was printed in the last issue of *Coal Age*.

The evening of the first day was spent in a business session and smoker at the Phoenix Hotel. The last session of the institute was in the morning of the 5th. Two papers were read, one by C. E. Leshner, editor of *Coal Age*, on "Some Wage Problems" and the other on the "Use of Combination Battery and Trolley Mine Locomotives," by John B. Hicks, assistant superintendent, Consolidation Coal Co., Jenkins, Ky. Both papers will be reprinted in *Coal Age*.

#### FIRST-AID CONTEST A SUCCESS

No Kentucky State Institute meeting would be complete without a first-aid contest. The contest, held June 5, was highly successful in point of interest, number of contesting teams and excellence of the work of the men. Eight teams were present, all from the eastern part of the State. The contest was originally scheduled for Stoll Field, at the State University, but rains the preceding day rendered the field unfit for the contest, which was held instead in a large warehouse. Preceding the meet the teams, in uniform and with their equipment, and the visiting members of the institute gathered to have their photograph taken and to march to the gathering place, led by Prof. Norwood, newly-elected president of the institute.

Mr. G. E. Daugherty, chairman of the first-aid committee, pronounced the meet the best he had ever attended. Each of the eight teams competing in the five events made a total of more than 90 per cent. The teams in the order of their record were as follows:

First prize, Pioneer Coal Co., Pineville, Ky., 99.2 per cent; second prize, Consolidation Coal Co., mines 204-205, Jenkins, Ky., 98.8 per cent; third prize, Consolidation Coal Co., mines 212-213, McRoberts, Ky., 97.4 per cent; fourth prize, Pond Creek Coal Co., Stone, Ky., 97.2 per cent. The remaining four teams in order were: Kentucky Coke Co., Echols, Ky., 96.1 per cent; Edgewater Coal Co., Hellier, Ky., 95 per cent; First Creek Coal Co., Blue Diamond, Ky., 94.2 per cent; Lechies Collieries Co., Aflet, Ky., 93.6 per cent.

The winning team was awarded the engraved plaque of the Kentucky Mining Institute, which is awarded each year to the winning team; the Phoenix Hotel Cup, which will become the property of the team winning first place two years in succession; bronze medals from the American Red Cross and medals from the National Safety Council. The second team received fountain pens for each member of the team. Lamps were awarded to the members of the teams standing third, fourth, fifth and sixth. Pins were given all contestants.

More than usual interest centered in the selection of the officers of the institute for the coming year. On

every hand H. M. Ernst and C. W. Strictland, president and secretary-treasurer respectively the past year, were praised and commended for their faithful and excellent work. Both, however, begged off from another year and the nominating committee made the happy choice of Prof. C. J. Norwood for president and Mrs. Elizabeth C. Rogers for secretary-treasurer. In making the nomination the chairman of the committee said that presidents had been selected from the north, east, south and west, but it remained this year to take a man from the center.

Prof. Norwood has been identified with mining in Kentucky for many years and as chief of the Department of Mines is well and favorably known to every mining man in the state. Mrs. Scott has been recorder for every meeting held by this institute. She knows the work, is popular with the members and by reason of her location in Lexington, home of the new president, will be able to render the best possible service.

The desirability of better attendance and more lively interest in the institute on the part of mine superintendents and foremen was discussed, and as a result steps were taken to encourage district meetings of the institute at which these men could attend without great loss of time from their work. Vice presidents were elected with the particular purpose in view of encouraging this development. The new vice presidents are A. G. Spellman, Earlington, Ky.; A. L. Ware, Hazard, Ky.; Joe Cane, Stearns, Ky.; W. E. Davis and W. H. Davis, both of Lexington, Ky.; C. W. Conner, Esco, Ky., and J. T. Bradley, Pineville, Ky.

#### Strike Idleness Extends in Thacker Field

**M**ORE mine workers in the Thacker field have been induced by the United Mine Workers to join the union. As many of these are at plants which have not hitherto had locals and as the men as fast as they join the union are called upon to cease working and obey the admonition, mines are continually closing down.

So many mines are now affected that the weekly loss from lack of man power and because of idleness at mines is running above 50,000 tons. The purpose of the organizers in closing down the mines is to make the operators enter into negotiations with a view to recognizing the United Mine Workers. Thus far there is no indication that the operators will do this.

So far the campaign for the organization of the Thacker field has not only failed to be of any advantage to the miners but, contrariwise, has been detrimental to their welfare in that it has resulted in a total loss of income among all the miners who have joined the union. It is claimed by the operators that the rate of wages paid is higher than the rate paid in union fields.

In connection with the organization of the Thacker field the United Mine Workers are also attempting to organize Kentucky mines across Tug River from the Williamson field and reports of intimidation in connection with such organization work are not uncommon.

#### Coal Road Declares Extra Dividend

**T**HE Mahoning Valley Coal Railroad Co. has declared a \$15 extra dividend on the common stock, payable July 1 to stock of record June 21. This is in addition to the regular semi-annual dividends of \$5 on the common and \$1.25 on the preferred stocks.

## Discussion by Readers

Edited by  
James T. Beard

### Posting Entries and Roads

BEING interested in the Nova Scotia coal fields, I desire to add a word to the excellent reply given to the inquiry of "Mac," *Coal Age*, April 29, p. 874.

Some years ago, while I was assistant to the general mining superintendent of one of the large coal companies operating in Nova Scotia, I had reason to study the timbering problem in that coal field. The cost of this timbering was excessive and the amount of broken timber was beyond all reason.

In order to arrive at an intelligent conclusion, I examined the working places in each of the mines operated by our company. I took exact measurements, made sketches and noted particulars in respect to the timbering in every place visited. This field was working a submarine area, which had been developed to a distance, under the sea, of about two miles out from the coast line. The thickness of strata at the working face was about 1,500 ft. and in addition to this weight was that of the sea water above.

Some idea of the pressure on the pillars will be understood when it is stated that, although large pillars were left for the support of the overburden, these were forced into the roof or floor about two-thirds of their height. Where the original thickness of the seam was 5 ft. 9 in., this was reduced to about 2 ft. by the time the pillars were to be withdrawn. In this instance, we experienced no trouble in taking out all the pillars and withdrawing the timber. There was no inflow of water, but the workings were very dry.

#### INVESTIGATION SHOWED SYSTEM OF TIMBERING TO BE GENERAL IN THE MINES

The method of posting entries suggested by "Mac" and illustrated on the right of his sketch is exactly what I found in my examination of the places. This system of posting, however, was giving no end of trouble and the cost of timber and labor in replacing broken parts was such that something had to be done to reduce the expense.

After considering the situation carefully, I recommended shifting the track close to the rib and taking out the rib posts on that side of the entry. Two rows of posts were set staggered, on the other side of the entry, between the track and the lower rib. Where the floor was hard these posts were sharpened or tapered at the bottom, which fact permitted them to burr, under the great roof pressure, and prevented their breaking. The plan not only required less timber but diminished the cost of labor for resetting broken posts and the expense was greatly reduced.

I fully agree with what was said in the reply to this inquiry regarding the danger of standing posts on a haulage road. As there stated, where the roof needs support, booms or crossbars should be used and, if possible, the legs supporting these crossbars should be cut short and set in hitches cut in the ribs.

Another plan is to rest the bar in two hitches cut in the ribs close to the roof. A hitch is cut in one rib, about six inches deep, and one end of the bar being first inserted, into this, the other end is slid into a sliphitch cut in the other rib. A narrow wedge is then driven at that end of the bar to hold it in place. This narrow wedge will yield under the side pressure that may come and prevent the breaking of the bar.

I also agree with what is said regarding the driving of wedges between the crossbar and the roof. No wedges should be driven in the center of the bar; but, a wedge should be driven near each end which has the effect of overarching the weight of the roof and throwing it on the rib on either side of the road.

McKeesport, Pa.

ANDREW O. BAIN.

### Working With Carbide Lamps Where Oil Lamps Cease To Burn

SOME time ago a mine foreman stated an instance that occurred in the robbing of pillars in a mine where the generation of carbon dioxide increased to such an extent that the oil lamps of the miners would not burn, and it was necessary to give them carbide lamps instead. He asked, "To what danger, if any, were the miners exposed when working with the carbide lamps?"

In my opinion there are two dangers to which men are exposed when working in an atmosphere in which an ordinary oil lamp will not burn. First, the men may be overcome with blackdamp, which means not only the presence of carbon dioxide in the air but a deficiency of oxygen on which the health and life of the miner depends. Second, the carbide light does not, in my opinion, indicate the possible presence of blackdamp, for which purpose the Haldane tube is the best test.

#### MEN SHOULD HAVE BEEN WITHDRAWN

What should have been done, in the case cited by this mine foreman, is to have withdrawn the men from the place and not allow them to return until the atmosphere would support the combustion of an oil-fed flame. The fact that the oil lamps failed to burn shows that there may have been, perhaps, 15 per cent of carbon dioxide in the atmosphere; but there is no guarantee that there was not sufficient of this gas present to have caused the death of a man in a short time.

It is true that a man can breathe a much greater percentage of blackdamp present in the air than what is required to extinguish an oil-flame lamp. However, my conviction is that it is never safe to remain long in an atmosphere where these lamps will not burn. As I remarked before, the men should have been withdrawn from the place, which is the only safe practice to follow on such an occasion.

In discussing this situation, Jerome C. White, *Coal Age*, Apr. 29, p. 870, advocates strict compliance with the mining laws, which require the adequate ventilation of mines, or sufficient air to dilute and sweep away the gases formed therein and make the mine safe for work. In my opinion, our mining laws should go still further and make it an offense against the act when the oxygen in the air of a mine is permitted to fall below 20 per cent. Then, and only then, will there be a less number of accidents resulting from poisonous gases.

Scranton, Pa.

MICHAEL STARRS.

## To Conserve Mine Timber

CONSERVING mine timber is one of the most important problems in the operation of a coal mine today. To those who have not, as yet, come to appreciate this fact, it will soon become evident through their failure to obtain timber from outside sources at a reasonable price, when the local supply has been exhausted.

The fact is plain that more timber is being used in the mines, at the present time, than is being cultivated. Aside from the efforts made by the Forestry Commission, little attention is being given to the growth of young timber. It is true that there are some exceptions to this, as large mining companies have, in a few instances, planted acres of trees that will go far toward replenishing the timber supply in a few years to come. However, it occurs to me that there should be a more general effort made to cultivate timber for mine use, and that this should be enforced by statute at the earliest possible moment.

### ECONOMIZE IN THE USE OF TIMBER

In considering the growing scarcity of mine timber, there is another phase of the subject that demands as much attention as that of replenishing the timber supply. I refer to the adoption of such methods of mining as will require the use of less timber and be less destructive of what timber is used in the mines. Where such methods are in use it has been possible to recover much of the timber and use it again and again to good purpose.

In order to fully appreciate what an enormous amount of timber is wasted in mines, consider for a moment, the number of props that are required when driving up a 300-ft. room, under fairly normal conditions. When driving a room two posts are commonly required every four feet of advance, which means 150 posts to drive the room 300 ft. Then, when drawing back the pillars at least three times this number will generally be necessary to make the work safe.

### ESTIMATING THE AMOUNT OF TIMBER USED

Where the timber is not recovered or conditions are such that it cannot be used again, it will mean that 600 posts will be required for the extraction of the coal in a single room. Assuming there are 30 rooms on a heading and allowing for those recovered and used a second time, we must estimate on, say half this number of posts or  $30 \times 300 = 9,000$  posts, on a single heading.

Practical men familiar with mining conditions will readily admit that this is a conservative estimate of the amount of timber required when mining coal under fair conditions. But, when the conditions are less favorable, one is almost paralyzed to think that 25,000 or 30,000 posts may be required to take out the coal from a similar area. The conclusion is pressed forcibly

home on our minds that improved systems of mining coal must, of necessity, be adopted and made to replace the wasteful methods now employed.

The use of mining machines in place of the hand pick, for under-cutting the coal, demands greater support for the roof, since the machine cuts deeper and faster than is possible in pick mining. As a consequence, there is a greater roof pressure on the face of the coal, and this must be met with the use of more timber. In hand-pick mining, the miner sets the posts where his judgment tells him they are needed; and, often, the standing of a post is only temporary and in a short time it is taken out and used again. In machine mining, it is necessary to set the posts to facilitate the operation of the machines. A larger number of posts are then required and the same care is not exercised in their use.

I remember the time when a mine wagon containing 30 or 40 posts was given to a man when he started to take out a pillar, and when the pillar was drawn back to the entry there would still be some few posts left. Such a thing is not known today. At that time there was no pillar boss or rib boss.

### DOES NOT CONDEMN THE RIB BOSS

Now, in saying this I am not condemning the rib boss of today. On the contrary, let me say, he is more needed now than ever before, as the coal is being mined more rapidly and the proper use of timber to make the work safe, requires every possible precaution being taken. This calls for a very careful man to fill the position of rib boss, and his work is almost indispensable.

The question is, what can be done to make the mining of coal more efficient and safe and, at the same time, conserve the fast diminishing supply of timber suitable for mining. I feel confident that something *can* be done and *will* be done along this line, if those who have the power take the necessary steps for that purpose. Many of the readers of *Coal Age*, no doubt, have plans and methods that are practical, and no time is more appropriate for their employment than the present.

Perryopolis, Pa.

R. W. LIGHTBURN.

## The Miner and His Powder Flask

THE instance cited by William B. Jackson, *Coal Age*, Apr. 15, p. 771, describing a mine foreman and a mine inspector as finding fault with a miner who had stowed his powder flask in what he considered a safe place in the gob, instead of putting it in a cubbyhole in the rib of the pillar that he was drawing back, is an interesting illustration of how frequently a mine official will not appreciate the real conditions existing in a miner's place.

No one will deny that in driving a room or entry, it is a good idea for a miner to stow his powder flask in a cubbyhole cut in the rib of the entry or room, at a safe distance back from the face. But, consider for a moment the conditions described by this correspondent, who was engaged in drawing back a pillar, which he says was overlaid with a strong top that crushed the coal, often throwing it from the rib into the road, for a distance of several yards ahead. It is probable that neither the mine foreman nor the inspector took into consideration these conditions that were well known to the miner who worked on the pillar.

Judging from the description given by Mr. Jackson, it would have been unsafe for him to have placed his

powder flask in a cubbyhole in the rib of the pillar when working under these conditions. At any moment, the flask would have been liable to have been crushed and the powder spilled on the bottom, which would have been dangerous where open lights are in use, or where there are electric wires in the place.

In my practice, I have used wooden kegs in which the miners placed their powder flasks and stowed them away in the gob, a safe distance, say six or eight feet back from the track. At another time, I have had wooden boxes made for the men, to be used for the same purpose. Each box had a strong lid and made a good safe place for a miner to keep his powder flask while he was at work. The box was kept on the gob side of the road, in a safe place away from the track and electric wires.

Not to be misunderstood in this matter, let me say that I would never place a powder flask in the gob, without it was first put in a box or other strong container. However, in the present case, it is probable that Mr. Jackson had no other choice than to select what he thought was a safe place in the gob. My conclusion is that the mine foreman would have done better had he had strong wooden boxes made for the men in which they could keep their powder flasks. He would not have been obliged, then, to find fault with his men for doing the best they could under the circumstances.

Oak Hill, W. Va.

WILLIAM DICKERSON, SR.

### Was the Explosive Needed?

**D**RAWING back pillars under a heavy roof pressure when the conditions were such as described by William B. Jackson, *Coal Age*, April 15, p. 771, suggests a doubt as to whether it was necessary for the miner, in that case, to have a powder flask, which he is said to have placed where he thought it would be safe in the gob. Mr. Jackson states that the coal was often thrown from the rib into the roadway for a considerable distance back from the end of the pillar.

Assuming that the coal was being crushed in the manner mentioned, I fail to see why he required to keep a powder flask with him in the mine. Surely, it would not be necessary for him to blast the coal from the pillar when the roof pressure was breaking it down, it would seem, as fast as it could be loaded and taken out of the mine. It appears to me there was no necessity for the use of powder in this place.

My own idea is that the inspector was testing the miner, in order to ascertain if it was his habit to keep his powder flask in the gob; or whether he knew that it should be kept in a cubbyhole in the rib, on the opposite side of the road from the trolley and other electric wires.

### MUST COMPLY WITH THE LAW

It seems to me quite probable that both the inspector and the mine foreman observed and realized the conditions in the place, and knew that it would not be practical to keep the powder flask in a cubbyhole in the rib, except it was placed at a safe distance back where it would not be affected by the crushing weight of the roof as the pillar was drawn back. These men probably had in mind that the keeping of a powder flask unprotected in the gob was not in compliance with the requirements of the mining law regarding explosives.

From a safety point of view, it must be remembered that conditions in the gob when pillars are being drawn

are liable to change with scarcely a moment's warning. What this miner thought was a safe place when putting his flask away, might soon become unsafe for such keeping.

My conclusion is that if it was at all necessary to have a flask of powder for this work, the explosive should have been kept in the prescribed cubbyhole, at a point sufficiently far back from the end of the pillar to be out of danger. It would certainly pay to take a little trouble and time in going back for the powder when it was needed, rather than to run any risk of danger.

"Safety first" is the great cry today and, yet, the law permits loose powder to be taken into the mine, although compressed powder is handier and safer in every respect. Considering the carelessness that exists in the handling of loose powder in the presence of open lights, it is surprising that so few accidents occur, and I have seen miners who could speak little English, in violation of the mining law of Pennsylvania, make up a cartridge of loose powder, with their lamp on their head, thus endangering not only their own lives but that of others about them.

SAFETY INSPECTOR.

McKeesport, Pa.

### Powder Flask in Pillar Workings

**A**NSWERING the inquiry of William B. Jackson, of Houston, Pa., *Coal Age*, Apr. 15, p. 771, concerning the safe storage of explosives at the working face, with particular reference to black powder in flasks, permit me to say that the description he gives of the working conditions is worthy of careful consideration and inclines me to think he probably was not far wrong in placing his flask on the gob.

As a general condition, however, the things to be considered in regard to storing the daily supply of explosives are: First, that they are placed at a safe distance from the working face; out of the way; up off the bottom; and out of the direct line of blast. Second, that they are stored separately and away from carbide, fuse, paper, squibs, caps, oil and tools. Third, that the container is in a safe condition.

If these considerations be given to the storage of the day's supply of explosives many accidents would be avoided.

MINER.

Pikeville, Ky.

### Trolley-Wire Guards

**O**NLY recently, my attention was attracted to the inquiry of "Triprider," regarding the proper width apart of the guardboards protecting a trolley wire in a mine, *Coal Age*, March 11, p. 506. He suggests that the requirement of five inches, in compensation-insurance regulations, should be made five and one-half inches to avoid, as he says, the trolley wheel becoming wedged between the wire and the board should the wheel jump the wire.

When placing a guardboard the first thought should be the purpose of the guard, which is: (1) The protection of the lives of workers in the mine by preventing accidental contact with the wires; and (2) permanency of construction. The opinion of the average motorman is that a guardboard is more trouble than it is worth and, with proper care on the part of the men working in the mine, there should be no necessity for such protection. The motorman would be right.

in this regard, if the rules of safety did not demand the proper protection of all points of danger that are liable to cause accidents owing to the carelessness or lack of caution on the part of workmen.

Good workmanship is required to construct trolley guards at a distance of even five inches apart and to increase this width would make the construction still more difficult. The danger of contact with the wire, moreover, would be much greater should the width be increased even one-half inch, as suggested. A man coming under the wire and suddenly raising his head would have little protection if the boards were spaced too wide apart.

The trouble mentioned by the correspondent is generally due to the loose jointing of the boards, which would allow one or more of them to come close to the wire and catch the wheel as it passes or cause it to jump the wire. In my opinion, the five-inch requirement, affords little chance of the trolley wheel jumping the wire and, at the same time, gives the necessary protection.

In my practice, I have found that the most satisfactory trolley guard is one made of damaged water hose, three and one-half inches in diameter, split on one side and placed over the clamp supporting the trolley wire. A hole is cut in the hose for the expansion bolt. In putting up the hose, it should be stretched with a turnbuck'e or block so as to hold it out taut and keep it from sagging and in place. This provides the nearest approach to a 100 per cent efficient guard. It lays close to the wire and will not permit a person to come in contact with the wire, even though directly under it.

G. E. DAUGHERTY.

### American vs. British Mining Practice

WITH deep interest I read both the article of George S. Rice, entitled "Why do American Mine Workers Produce More Coal than British?" *Coal Age*, April 15, p. 762, and the editorial commenting on the same, under the head, "British vs. American Practice," page 766 of the same issue. It is by no means the first time that the subject of the greater production, per man, in American mining as compared with that in the mines of Great Britain, has been discussed.

Only recently, a Colorado mining man contributed a paper, to the Institution of Mining Engineers in England, in which he ascribed the larger production of American miners as due largely to the size of the mine cars in this country. He supported his opinion by giving a large number of facts and showed by sketches the style and dimensions of the cars used.

Strange as it may seem, Mr. Rice does not refer to the question of the size of the cars used in mines. He calls attention to the influence of the depth of the coal, stating that the average of American coal mines do not lie at a greater depth than 400 ft. below the surface, while most modern British mines lie at a depth of 2,400 ft. He also compares the longwall system of working, which is so general in the mines of Great Britain, with the room-and-pillar system of mining commonly employed in this country.

The comparison is unfavorable to the British mines. It is not made clear, however, why the working of a longwall face should have the effect to reduce the output, per man, and make it harder for him to mine the same tonnage of coal as he is able to do in the room-and-pillar system of working.

Depth, of course, will influence the proper control of the roof in mine workings and, on this account, mines lying at a less depth below the surface have the advantage over deeper mines. In the former case, there will generally be lesser quantities of explosive gas with which to contend, and the timbering be less difficult and require a smaller outlay for that purpose. The supervision of the work in the shallower mines, also, will require a smaller number of officials and bosses than is necessary for the same service in deeper mines, per ton of coal mined.

### SAFETY THE FIRST CONSIDERATION

Where safety is made the first consideration there can be no doubt but that the longwall system of working presents a decided advantage. In that system, the practice of blasting off the solid is impossible. In British mines, the practice would not be permitted under the Mines Regulation Act. On the other hand, shooting off the solid prevails in many American mines worked by the room-and-pillar method of mining.

Particular attention is drawn to the method of shooting the coal, in the editorial I have mentioned, which regards this as a more important factor in the larger tonnage, per man, produced in American mines than the employment of improved mining machines. Doubtless, machine mining in American mines accounts largely for the difference in man tonnage, as compared with British practice where pick mining is mostly employed. Pick mining, in Great Britain means the use of the pick for undermining the coal and not putting in a little cut and then shooting the coal off the solid, which is so common in many of the mines in this country.

Reference is also made to the relatively lower cost of underground haulage, in American mines, as compared with the same item of expense in the mines of Great Britain. In few British mines could electricity be employed for haulage purposes in the manner in which it is used in this country. On this point, however, Mr. Rice appears to be quite optimistic, stating that hauling by the trolley system is forbidden in the mines of Great Britain because of the danger of electric sparks causing the ignition of gas in those deeper mines.

### HAND LOADING IN BRITISH MINES

The output, per man, in British mines is also greatly influenced by the fact that in most of those mines the coal that can be loaded with the bare hand is the only coal sent out. The fine coal and slack is left in the mine, except where the coal is of such a quality that it can be used for the manufacture of coke. It is obvious that this fact alone is sufficient to account for a considerable portion of the deficit in the tonnage, per man, in British mines.

In summing up the advantages possessed by American mines, which enables them to show a larger output, per man employed underground, than is possible in the mines of Great Britain, I would add to the items already mentioned, the greater average thickness of the coal seams in this country; also, the fact that they do not show the same frequency of bands of rock and shale interspersed with the coal. The absence of these bands makes the preparation of the coal for market much easier, as there is less work required to separate the clean coal from its impurities. This fact is one well worthy of consideration in drawing a comparison in the tonnage, per man, in the mines of these two countries.

# Inquiries of General Interest

Answered by  
James T. Beard

## Caring for the Water in a Wet Shaft

WE ARE starting to sink an air shaft 10 x 14 ft. deep, in the clear. The strata through which the shaft must be sunk are rather hard and contain lots of water. In order to prevent this water seeping through the curbing into the air shaft, which would give much trouble from freezing in winter, it is my intention to encircle the shaft with water-rings, at frequent intervals, and connect each ring with a drillhole eased with 4-in. pipe. This hole will be located about 4-ft. from the side of the shaft and drain into a sump at the shaft bottom.

I want to ask if the readers of *Coal Age* can suggest any better means of handling this water. I would also appreciate suggestions as to the best design, in detail, regarding the construction of a permanent water-ring that would prevent the water from flowing into the shaft.

CHARLES F. SHERMAN, Gen. Supt.,

Peoria, Ill.

Groveland Coal Mining Co.

Who, among the practical readers of *Coal Age* will be able to give this desired information, out of their experience in the successful handling of water in wet shafts. The plan suggested by the correspondent is good, provided the watery strata continue practically

SHOWING TWO TYPES OF WATER RINGS FOR DRAINING A WET SHAFT

throughout the depth of the shaft, which would make it necessary to drain all the water to the shaft bottom. On the other hand, if the watery strata lie near the surface and over a hardpan it is always advisable to save the extra power that would be required to pump water from the bottom of the shaft.

This can be done by making an excavation for a sump of sufficient capacity in the hardpan and installing a pump, at that point in the shaft, for the purpose of pumping the water to the surface. The latter will mean a considerable saving in the cost of pumping, over what would be required if the water must be drained to the bottom of the shaft and then pumped to the surface.

In the accompanying figure, we offer suggestions on the construction of water-rings, but these will vary with

the conditions in particular cases. On the left of the figure is shown the excavation of a simple water-ring in reasonably hard strata, each ring being connected with a 4-in. column pipe, as described by the correspondent. Where the strata are sufficiently self-supporting, water-rings of this kind can be excavated all around the shaft. A good plan is to line the excavation with a good hydraulic cement. It is important to give the ring a sufficient inclination to enable the water to drain properly into the column pipe.

At the right of the figure is shown a type of water-ring that is better adapted when strata are not self-supporting, and are pervious to the water. In that case, a concrete dam is formed around the shaft and the excavation lined with concrete to prevent the leakage of the water into the shaft. Here, the drain pipe leading from the water-ring to the bottom of the shaft is shown as being conducted down the outside of the shaft curbing to the sump at the bottom. We hope to hear from others regarding their experience and practice.

## Estimating Weight of Coal Required for Hoisting in a Shaft

KINDLY answer this question: From a shaft 400 ft. deep; we are hoisting 1,000 tons, in four hours. How much coal should be burned, assuming that 7 per cent of the heating value of the coal is available in the production of steam?  
STUDENT.

Cambria, Ill.

It is only possible in this case to estimate the weight of coal burned per hour, in a very general way. For example, the work performed in hoisting 1,000 tons of coal, in 4 hr., in a double-compartment shaft where the weight of the cage and car is balanced, allowing an addition of, say 10 per cent for the friction of the hoist, is

$$1.1 \frac{(1,000 \times 2,000 \times 400)}{4} = 220,000,000 \text{ ft.-lb. per hr.}$$

Now, assuming the hoisting engine has an efficiency of, say 83 1/2 per cent it will be necessary to add one-fifth more to this work to allow for the operation of the engine making the hoist, which shows the gross work performed, in that case, is 264,000,000 ft.-lb. per hr.

Again, assuming the heating value of the coal as, say 12,000 B.t.u. per lb. and taking the efficiency attained in burning the coal as 7 per cent, the available heat in the coal is  $12,000 \times 0.07 = 840$  B.t.u. per lb. of coal burned. But, one B.t.u. is equivalent to 778 ft. lb (mechanical equivalent of heat) and one pound of this coal, on the assumed basis will develop  $840 \times 778 = 653,520$  ft.-lb.

Finally, if the gross work required, in this hoist, is 264,000,000 ft.-lb. per hr. the weight of coal required to be burned per hour is  $264,000,000 \div 653,520 =$  say 404 lb. per hr.

# Examination Questions

Answered by  
James T. Beard

## Miscellaneous Questions

(Answered by Request.)

*Ques.*—Explain the law of the diffusion of gases and its effect on their behavior in mines. Give the rules and an example showing how to find the comparative velocity of the diffusion of different gases?

*Ans.*—According to Graham's law, gases and air diffuse into each other in the inverse ratio of the square roots of their densities. The lighter the gas, the more rapid is its rate of diffusion. For example, the specific gravity of methane or marsh gas being 0.559, referred to air as unity, its rate of diffusion into air is  $1/\sqrt{0.559} = 1.3375$ ; that is to say, while 10,000 cu.ft. of air is passing into the methane, 13,375 cu.ft. of this gas will pass into the air.

The specific gravity of the resulting mixture is found by multiplying each of these relative volumes by the corresponding specific gravity and dividing the sum of the products, by the total volume of the mixture, thus

$$\frac{(10,000 \times 1) + (13,375 \times 0.559)}{10,000 + 13,375} = 0.747$$

In other words, the mixture resulting from the diffusion of methane into pure air is practically three-fourths of the weight of pure air.

*Ques.*—Suppose that, in a fiery mine, the quantity of air in circulation is 175,000 cu.ft. per min., measured in the return current, which contains 4 per cent of marsh gas when the barometer is 30 in.; what quantity of gas is given off in the mine?

*Ans.*—If the return air contains 4 per cent of gas, the quantity of gas generated in this mine is  $175,000 \times 0.04 = 7,000$  cu.ft. per min.

*Ques.*—(a) In the last question, what is the least decrease in the quantity of air that will render the return air explosive? (b) What increase of gas will render the return air explosive?

*Ans.*—(a) The lower explosive limit of pure methane mixed with pure air is reached when the proportion of gas to air is 1:13. In that case, the gas is one-fourteenth of the mixture. Then, since the mine, in this case, is generating 7,000 cu.ft. of gas per minute, the total volume of gas and air when the mixture first becomes explosive is  $14 \times 7,000 = 98,000$  cu.ft. The decrease in the quantity of air passing on the return, necessary to render the current explosive is  $175,000 - 98,000 = 77,000$  cu.ft. per min.

(b) Since this mine is generating 7,000 cu.ft. of gas per minute, the volume of air in the return current is  $175,000 - 7,000 = 168,000$  cu.ft. per min. Then, if the lower explosive limit of the mixture is reached

when the proportion of gas to air is 1:13, the quantity of gas required to make this volume of air explosive is  $168,000 \div 13 = 12,923$  cu.ft. per min. Therefore, the increase of gas that will produce this condition is  $12,923 - 7,000 = 5,923$  cu.ft. per min.

*Ques.*—What first-aid service would you render a person suffering from: (a) compound fracture of limb, (b) electric shock, (c) powder burns, (d) fractured rib?

*Ans.*—(a) Having ascertained that the injured man suffers from a compound fracture of limb, the first-aiders must use the best means at hand to adjust the injured limb in the easiest possible position, and bind it there very carefully to prevent further injury from the fractured bone cutting into the flesh and causing fresh bleeding. The injured man should be carefully placed on a stretcher and removed to better air or taken to the mine hospital to await the arrival of the physician, if his removal is practicable.

(b) Where a man has received an electric shock, the first duty is to shut off the current, or short-circuit it at a point between the man and the powerhouse; or else to remove the person from contact with the wire. It is not always possible to shut off the current quickly; but a short-circuit can generally be effected by dropping a bar or drill across the wire, on the side of the person toward the power. Avoid standing on wet ground or handling the wet clothing of the person; but with a quick movement push or drag him from the wire by means of a dry pole or a dry garment. No time must be lost in needless delay.

After removal from the wire, apply artificial respiration, by stretching the victim at full length on the ground, with his face downward but turned slightly to one side to permit easy breathing through the nose and mouth. See that the mouth is clear and the tongue drawn forward. Then, straddle the man's thighs and, placing the palms of the outstretched hands across the back, alternately press forward to expel the air from the lungs and draw backward to allow air to again enter, keeping up this motion at the rate of natural breathing, say fourteen times a minute. This should be continued until the victim shows signs of returning life and consciousness, or until he is pronounced dead by a physician.

(c) Burns from powder should be treated to exclude the air from the burned surface, by applying a thin paste of baking soda, starch or flour, mixed with water. Vaseline, olive or castor oil, fresh lard or cream, are all good when available. These should be gently applied to the surface and covered with light cloth.

(d) In the case of a fractured rib, tie a large handkerchief or a triangular bandage firmly around the chest and bind with a large towel or garment suitable for the purpose, so as to limit the motion of the chest and diminish the pain. Use great caution and care in removing the patient to another place, while awaiting the doctor.

# Some Wage Problems\*

Definition of a Living Wage Difficult, to Begin With—Increasing Wages to Meet Living Cost Fails to Compensate for Shortage of Goods—Distinction Between Wages and Earnings Is Significant

BY C. E. LESHER

THE title of this paper—"Some Wage Problems"—is rather broad. It might better have been "Wages—Some Problem." Wages and the high cost of living are the two questions of paramount interest to all people today; they are so inter-related that one can hardly think of one without calling up the other. In this paper I shall attempt to outline a few of the wage problems as they apply to the question of coal-mine labor.

We all agree, of course, in the fundamental proposition that the wage paid labor, whether a wage or a salary, should be a living wage, and that American labor should be given the opportunity to earn such a wage. The difficulty comes in agreeing upon the definition, in dollars and cents, of a living wage. A wage by the hour, day, week or month, is a definite thing with which we may compare the cost of living and thereby arrive at some conclusion as to whether it is adequate. A piece-rate wage—the tonnage wage of the coal mines—must be interpreted into possible earnings per day, week or month before we can make such a comparison.

## WANTED—AN EFFECTIVE STABILIZER

The one big problem that confronted us with the rise in the cost of living in the past few years has been the adjustment of wages to meet that increase in the cost of living. Nearly all the wage adjustments in the past three years have centered about that fact. Inquiries and statistics on the rise in the prices of essential commodities and in the cost of maintaining life have been the starting point in nearly all important wage adjustments. On this basis wages in all industries have again and again been boosted upward, but we are no better off today than we were a year ago. Further advances will be made for the same reason until something happens to bring us to a condition of stable equilibrium.

To quote George E. Roberts, vice president of the National City Bank: "It seems reasonable as a proposition standing by itself that wages should increase to correspond to increases in the cost of living; but nothing is more certain than that a general advance in wages cannot compensate for a shortage in goods. If you were to double all wages in the United States today, it would not give you another bushel of wheat, or pound of sugar, or yard of cloth. It would simply give everybody the means with which to compete for what he wants, with the result that prices would rise to absorb the additional purchasing power. The only remedy for a scarcity of goods is more goods."

We must have clearly in mind the distinction between wages and earnings. Earnings are the measure of the adequacy of wages. The distinction is by no means equally significant in every occupation. For instance, in occupations such as the building crafts and pro-

duction of bituminous coal, the larger rate of pay or wage may be offset by unemployment or shorter hours. On the other hand, low rates may sometimes be brought to relatively higher earnings by excessive overtime or period of continuous employment. Neither rates nor earnings should, therefore, be taken alone on a study of the wage situation.

The range or variation in wage rates, as well as in earnings in various geographic areas, for many similar kinds of work and sometimes for a specific occupation, is so broad that conformity to the prevailing wage does not mean a great deal. Illustrating these two points in the coal industry, we note that the tonnage man has a wage that gives him a higher daily earning capacity than the dayman, but the company man, because of steadier employment, approaches the monthly earning of the higher-paid direct labor. Rates of pay for the same work as between districts vary because of local conditions. We may well illustrate this by a table of tonnage rates from some of the more important coal fields.

The most striking thing about these rates is the variation in the differentials, both as between fields and as between pick and machine rates. The districts selected by no means represent extremes, but may be considered as representative of the industry. They include fields both large and small and union and non-union. The variation in pick rates is explained, of course, by the difference in mining conditions, or should be so explainable. In the figures cited we find a range in pick mining rates from about 71c. per ton in Harlan, Ky., to \$1.13 in Iowa. These figures are those of the Washington Wage Agreement, in effect before the strike last Novem-

\*Address delivered at the meeting of the Kentucky Mining Institute, Lexington, Ky., June 4, 1920.

ber, which were increased 24c. per ton by the Coal Commission. Though not those in effect today, they serve equally well to illustrate the differentials.

Loading rates range from about 46c. per ton in the Fairmont and Hazard fields to 85c. per ton in Iowa. These differences are the field differentials and are more or less fixed. You appreciate the reasons for wanting field differentials in given cents per ton, and why when changes are made in wages these changes are not accomplished by percentage adjustments. A mining rate in the Hazard field averaging about 75c. per ton is 5c. lower than this corresponding average in northeastern Kentucky of about 80c., and, all other things being equal, the cost of production is 5c. less. Oklahoma pays a pick rate on the average of \$1.03, which is about 10c. less than in Iowa; Hocking pays 6c. less than in the Jackson field. These field differentials are the net result of years of wage agreements, adjustments and trade requirements. They have become so fixed that to both miner and operator they are almost sacred.

#### DIFFERENTIALS MUST BE CAREFULLY CONSIDERED

Nevertheless, one of your wage problems is either to maintain these differentials, or such of them as are in your favor, or to break down such as are not in your favor. The effort to change may come from the field that has a high rate, but more generally the agitation comes from the miners—witness the demand for the abolition of the differential between the thick- and thin-vein rates in the Pittsburgh field, made last winter by the United Mine Workers. In fact, the miners, according to the record, would have opened the whole question of differentials before the wage commission.

Machine differentials are the differences between the pick mining rates and the total rates for cutting, shooting and loading behind the machine. This type of differential is calculated to represent the element of cost accruing to the operator because of his investment in the machines. The variation in machine differentials from field to field is more difficult to analyze. It ranges from 7c. in the southern Appalachian and many of the Illinois fields, 16 and 17c. in Ohio and western Pennsylvania and the Harlan fields, to 20c. in northeast Kentucky, 21c. in Kanawha and 33c. in central Pennsylvania.

Now, these figures are either the contract scale of prices or, in the non-union fields, averages of actual rates. At each mine there may be local variations, the result of peculiar conditions, such as hard coal, abnormal thickness or thinness, desirability or undesirability of working conditions. These local variations are settled in each case by agreement between the men at the mine and the operators and are usually carried forward year after year in much the same manner, and the settlement in each case represents a wage problem for each of you—a problem that must be settled on its merits; let us hope always in a spirit of fairness to the wage earner.

As a result of investigation made by the coal operators working through their local and national organizations we have available representative figures on the earnings of coal-mine labor under the pre-strike wage rates. Those for the union fields have been made public in the records of the Bituminous Coal Commission, so that we are able to make certain valuable and interesting comparisons.

The first conclusion of the disinterested observer of

these data is that by all means a wide readjustment of wage rates in bituminous coal mining is necessary on the theory that rates should afford comparable monthly earnings. One does not, however, delve far into the subject until he realizes that wages are not thus scientifically determined, that though labor is not a commodity its price is based on the law of supply and demand just as surely as is the price of coal.

These differences in wages and the earning power under them are not lightly to be cast aside. You will recall that the President's Bituminous Coal Commission recommended that, as the question of differentials was too large a subject for its short endeavors, a commission be selected in the Central Competitive Field to make a study of this burning question and report to the joint conference in 1922. We have heard nothing of the appointment of that commission and we will hear nothing, because neither side cares to open the subject. It is plainly not safe to open the question until such time as wages and relations with labor are determined by impartial tribunals, and not, as now, by barter and trade, charge and counter charge.

We are all aware that the only result of the efforts of the Bituminous Coal Commission was to reaffirm the principles laid down by Dr. Garfield the day before Thanksgiving. He found, from the information at hand, that 14-per cent increase was due mine labor to equal the increase in the cost of living. The commission had later data indicating the necessity of 27-per cent increase to reach the same level. The weeks of hearings, the volumes of speeches, and truckloads of statistics were wasted, unless we consider it essential that each side be given a chance to get into the "record." Perhaps in our present state of civilization and development of industrial relations, there is no other way to settle wage disputes except, in the last analysis, by force.

#### LEADERSHIP AMONG OPERATORS PRESSING

The outcome of the wage dispute and strike of last winter was the largest increase the bituminous miners ever gained at one time, with which they have agreed to be satisfied for two years. The victory went to the miners; the operators have never told their story. The miners have a common leadership that leads, that can speak for them, and in the presentation of their case both to the public and to the commission they were more effective than the operators, who were divided in every detail and a unit on only the main question. Have any of you seen or heard a clear-cut statement of why the operators were willing to give the miners 20 per cent, and why they did not consider 31.61 per cent reasonable? Did the operators at any time present their case as have the miners? I am making this reference to recent history because the development of leadership in the coal industry, as pressing on the one side as on the other, is one of the problems that concerns wages and labor.

To my thinking there is no reason why the operators, union and non-union, should not join in wage discussions and settlements. Such a course was proposed for the National Association last winter and was defeated largely by operators from the non-union fields. Our non-union production is none too great as matters now stand, and the coal industry should unite on a policy that will keep for the country this bulwark of protection, the one-third of our output that is not to be called out on strike. The miners have their protection and

MINING RATES AND DIFFERENTIALS

Graphic presentation of mining rates showing field differentials and machine differentials in certain bituminous coal fields, as of October, 1919

more, in the union that represents two-thirds of the mine labor in this country. We are not safe with less non-union production than we now have. To join on this policy—giving non-union miners the same advantages that are afforded union men as a result of their collective bargaining, to prevent the spread of the union beyond its present limits with the un-American check-off, but never to lag behind the standards of wages and working conditions set by this arbiter of labor—is one of the complex wage and labor problems of the coal industry.

The most general and important characteristic which we observe in the study of war-time and post-war wage increases is that the wages of the lowest paid increased in markedly greater percentage than did those of the better paid. These increases, when considered in money rather than in percentage, present a different aspect: the low-paid received a greater percentage of increase during the war and since than did the high-paid, but the actual money increase has been about equal. We see this illustrated in the coal industry by the relatively greater advances given the daymen than the tonnage men. The base rate in the Central Competitive Field of \$2.84 per day for company men was increased from 1914 to 1919 by 76 per cent, or \$2.16. During the same period the tonnage rate for pick mining was increased only by some 40 per cent, which percentage gave the miner almost as large a money increase in earning power. That is, a miner who was earning \$5 per day under the old scale, was enabled by the 40 per cent increase to earn \$7, or \$2 more, which gave him about the same money increase as the dayman.

This observation is important because when the turn comes and you are obliged to propose to the miners that they accept a decrease in wages, in order that you may continue to operate and they to have work, for such a time is coming, the question of relative changes in high and lower paid labor will be of greater importance. Whether day-paid labor drops back to its relative position of before the war will depend on the relation of supply and demand for common labor at that time. It is most certainly true that today the indirect labor cost—that is, the per-ton cost of day labor—is too high, and the only way it can be reduced is for the men to work more efficiently or for reduced wages.

### Operators and Transshippers Inspect Jersey Central's New Equipment

COAL operators and transshippers were the guests of the Central Railroad of New Jersey last week on a visit to the new pier 18 of that road, to inspect dumping facilities and equipment, thawing sheds, classification yards, etc. General Superintendent J. W. Meredith and Assistant Engineer Zabriskie met the party with a special tug boat and acted as hosts. Among those present were W. Hartmann, of the Hartmann-Blanchard Co.; Dr. H. M. Payne and George N. Reed, of the Bertha Coal Company; W. P. Harriman, Export Department, Irving National Bank; C. K. Sutton, Debevoise Anderson Company; Charles S. Allen, N. Y. Wholesale Coal Trade Association; V. N. Heermance, Kentucky Coal and Navigation Co.; H. T. S. Ellison, Armstrong Transportation Co.; Mr. Koenig, Alden Coal Mining Co.; Mr. McGowan, B. Nicoll & Co., and C. Andrade, of Andrade-Eyre, Inc.

# Foreign Markets and Export News

## Turkey Offers \$100 a Ton for Alabama Coal

Export coal merchants of Birmingham, Ala., have received inquiry from an American business house in Constantinople with the statement that the Constantinople consumer is prepared to pay as high as \$100 per ton delivered there.

Spain, also, wants Alabama coal. So do Italy, France, South America, Cuba and Switzerland wish it. Likewise one of the largest yard men of Atlanta city has been in Birmingham to place orders. His yards, which usually at this time of the year have large stocks on hand for summer delivery, have none.

A capitalist who has been considering the purchase of three ocean-going barges to ply out of Mobile to Cuba and the east coast of Central America, in the export coal trade, came to Birmingham to see about a supply of coal. As he could get no guarantee, he may not purchase the barges.

The ships are in Southern waters, but the shortage of gondola cars prevents the moving of coal from Alabama mines. There would be several more blast furnaces in operation were there cars to move the output.

The steam and domestic demand for coal is as strong as that for export, but car shortage prevents filling that demand.

## Aden Imports South African Instead of British Coal

Aden, Arabia's trading center in the Red Sea district, Consul Addison E. Southard reports, is an important coaling station and the item of coal is always a considerable one in the annual imports. A feature of the last two years has been an almost total cessation of imports from England and India, and very greatly increased imports of South African coal. In 1918-19 there were imported 77,171 tons of coal, valued at \$2,421,897. During 1913-14, the last normal year, the imports, more than half of Welsh coal, amounted to 126,482 tons, valued at \$849,670.

According to these figures the coal imports in the last year before the war had an average value of \$6.71 per ton, and for the year under discussion the average value per ton was \$31.38. At times during the current year there has been an almost complete exhaustion of private, as distinguished from Government, coal supplies in Aden, and many ships have been turned away which normally depend upon Aden for coaling. At the time this report was written

one of the two leading coaling companies in Aden had exhausted its stocks and probably would have to wait some weeks for new supplies.

The Interstate Commerce Commission has ordered the originating railroads to return cars to the owning roads. This has at once affected car supply at numerous operations. Various plans for direct routing are suggested, but it is hard to see how this will possibly benefit New England.

## Tonnage Supply to Europe Is Plentiful

W. W. Battie & Co.'s coal trade freight report announces that numerous steamers for export coal are being offered. During last week a number of prompt boats were offered each day at \$18 Antwerp/Rotterdam and to other destinations at rates quoted below. To the West Indies and to South American ports the situation remains unchanged. Shipping rates are:

	Rate	Tons Displaced
Copenhagen	\$21.00 22 00	1,000
Stockholm	22 00 23 00	800
Gothenburg	21 00 22 00	1,000
Antwerp Rotterdam	17 75 18 00	1,000
Hamburg	18 00 19 00	1,000
French Atlantic, excluding Rouen	'bout 18 00	700
Algiers	21 00 21 50	800
West Italy	'bout 21 00	1,000
Marseilles	'bout 21 00	1,000
Piencs	'bout 23 00	1,000
Trieste Venice	'bout 23 00	1,000
Port Said	'bout 24 00	1,000
Constantinople	'bout 24 00	500
Gibraltar	'bout 18 50	1,000
Pernambuco	14 50 15 00	500
Bahia	14 50 15 00	500
Rio	14 50 15 00	1,000
Santos	16 00 16 50	600
Buenos Aires or La Plata or Montevideo	13 50 14 00	1,000
Para	'bout 14 50	500
Rosario	'bout 13 00	750

Manzanillo	'bout 9 00	300
Bermuda	'bout 7 00	300
Bermuda p.e. and d.s. free		
Kingston	About 8 75	400
Barbados	'bout 9 50	500
St. Lucia	'bout 9 50	500
Santiago	'bout 8 00	500
Port of Spain, Trin	'bout 9 50	500
Curacao	'bout 9 00	500
Free p.e. Curacao		
Demerara	13 00	400
St. Thomas	8 50 9 00	500

All above rates gross from charter.

## France To Receive British Coal Exports

France will receive 45 per cent of British coal exports, according to the London *Evening Telegram*, under an agreement reached by Premier Lloyd George and Premier Millerand in their recent conference at Hythe.

## Prices Quoted at Panama Canal On Coal and Fuel Oil

Coal, according to the Panama Canal Record, is being supplied to steamships including warships of all nations, delivered and trimmed in bunkers, at \$13.50 per ton of 2,240 pounds at Cristobal and \$15.50 at Balboa. For ships in transit through the Canal, which are directed to take coal at Balboa for the convenience of the Panama Canal, \$13.50 per ton at Balboa. For ships taking less than carload lots from plants or less than 25 tons from lighters, the price is \$15 per ton at Cristobal, \$17 at Balboa.

Crude fuel oil is delivered to vessels which utilize that form of fuel, passing through the canal in either direction, at either Cristobal or Balboa for \$1.50 per barrel of 42 gallons.

## Natal To Market Byproducts From Low-Grade Coal

Vice Consul Charles J. Pizar, Cape Town, reports that the manufacture of byproducts from second-grade coal which is hardly good enough for steam purposes is about to be commenced in the Province of Natal by the South African Carbide & Byproducts Co., of Burnside. This company has an authorized capital of £250,000 (\$1,217,000). A carbide and byproducts plant is now in the course of construction. The seams of this second-grade coal are very thick, and consequently the raw material is easily obtainable. Tests made some time ago show that the coal is high in nitrogen and yields over 120 lb. of sulphate of ammonia, 2½ gal. of benzol, and 16 gal. of tar oil per ton of coal.

## Southwest Africa Is Without Workable Coal Beds

A considerable amount of prospecting done in Southwest Africa, Vice-Consul Charles J. Pizar, Cape Town, reports, has failed to uncover any coal seams which could be mined on a profitable basis. Some years ago small lenticles of coal, up to 4 centimeters [centimeter = 0.3937 inch] in thickness, were struck in dark Dwyka shale near Keetmanshoop in the course of sinking a well. Prospecting pits and boreholes were at once put down, some to a depth of almost five hundred feet, but the results were negative. In no other parts of Southwest Africa, as far as authentic records show, have any traces of workable seams been found.

## Reports From the Market Centers

### New England

#### BOSTON

*Active Spot Market Establishes New High Levels—Car Supply Shows Some Improvement—Hampton Roads Slowing Up—Urgent Demand for Gas Coal Develops—Anthracite Car Supply Is Threatened—Domestic Sizes Are in Strong Demand.*

**Bituminous**—Each week sees spot prices mount to new high levels. The industries here are clamoring for prompt shipments and they are indifferent as to price, for the most part. The great urgency in the present situation is to keep supplies coming forward. The New Haven embargo has been restored, as of June 15.

There are no signs of a receding market. Nothing whatever has come of the attempt of the Massachusetts state government to interfere in the coal situation. Meanwhile, mills and other large buyers are placing orders through middle houses, and in some cases are sending their own representatives to central Pennsylvania to bid for spot coal.

The railroads here are also actively in the market. There are enough conservative operators who are still selling at prices around \$6@\$7 to furnish such buyers with a moderate supply of spot coal, and there are still others who are willing to make contracts with railroads at \$3.75@\$4 where the railroads will furnish assigned cars.

In car-supply there has been some improvement the past week. Sections near Pittsburgh have shown a better yield of railroad fuel, and to such extent has this proved true that the New York Central, for instance, has reduced the number of cars that were being confiscated each day at the scales.

Despatch at the Virginia piers has been slowing up the past week, due largely to slow handling at the piers. There has been no appreciable increase in movement to New England, buyers here being content for the present to confine themselves to securing emergency supplies all-rail.

Receipts are up to contract quota. There is a sharp local demand for Pocahontas and New River at re-handling points like Boston, Providence, and Portland.

There is especially urgent inquiry for gas coal. Prices have risen to \$9.50 for screened high volatiles and there is vigorous competitive buying among different industries requiring these grades. The amount of coal still being confiscated in transit adds to the anxiety of buyers who are using their best efforts to get coal forward.

On cars Providence and Boston, Pocahontas and New River are quoted at \$11.50@\$15. At Portland \$15 is a representative figure. At Hampton Roads f.o.b. vessel there is a wide range of prices, as high as \$14 having been realized on special sales.

**Anthracite**—The trade has been anxious the past week over the anthracite roads having been directed to withhold a certain percentage of cars from anthracite collieries to help out the bituminous situation.

Domestic sizes continue in quite strong demand. The prices of independent coals are strong and no real improvement in supply is expected. The renewed embargo on the New Haven road makes the outlook for that territory very serious. Steam sizes are in slightly better request.

### Tidewater

#### NEW YORK

*The Anthracite Situation Improves Slightly—Domestic 10c. Increase Becomes Effective—Domestic Demand Is Strong—Bituminous Market Active, with Good Demand and Quotations High—Car Supply at Mines Is Poor.*

**Anthracite**—Receipts of anthracite at this tidewater are heavier and the general situation shows a slight improvement. Shippers do not look for any let-up in the demand for many weeks to come.

All producers have now advanced their mine prices to the rates announced by some of the large producers in May, and in addition (with a couple of exceptions) have added an increase of 10c. per ton to the original prices for the domestic sizes, effective June 1. These prices, however, are tentative pending the outcome of the award to be made by the President's Anthracite Commission.

The demand for domestic coal remains strong. Dealers are receiving plenty of coal for their immediate requirements but have little surplus. Egg, stove and chestnut are most in demand, with a strong call for broken. Deliveries from the docks are slow because of the harbor troubles.

The producing companies have many orders ahead and efforts are being made to distribute the tonnage satisfactorily. Independent quotations ranged as high as \$9.50 at the mines. Buckwheat was being quoted by some shippers at \$4.65 at the mines.

Current quotations for company coal per gross ton at the mine and f.o.b. tidewater, at the lower ports are as follows:

	Mine	Tidewater
Broken.....	\$7.45-\$7.50	\$9.30-\$9.35
Egg.....	7.30-7.45	9.15-9.30
Stove.....	7.55-7.80	9.40-9.65
Chestnut.....	7.65-7.80	9.50-9.65
Pea.....	5.85-6.25	7.60-8.00
Buckwheat.....	4.00-4.10	5.75-5.85
Rice.....	3.00-3.50	4.75-5.25
Barley.....	2.25-2.50	4.00-4.50
Boiler.....	2.50	4.25

**Bituminous**—The bituminous market is active. Orders are plentiful but the continuance of the harbor troubles so delayed deliveries that toward the end of last week embargoes were in force at South Amboy, Port Reading and Arlington, the first named port being entirely closed to shipments, while at the other docks shipments were subject to permits.

Poor car supply is a big factor in the present situation. Reports from the mines fail to show any improvement. Along the Pennsylvania road the mines report about a 25 per cent supply; while those along the Baltimore & Ohio and the New York Central fare slightly better.

This Port continues to lose considerable bunker and export business because of the local harbor troubles. Coal for export is in heavy demand with prices firm.

Early in the week quotations were easier than they were at the end of the week when quotations for loaded boats ranged from \$11.75 to \$13. Mine quotations were around \$8 to \$8.75. The railroads continue to confiscate coal but are paying for it at the prices on which it was originally billed.

#### PHILADELPHIA

*Stocks of Anthracite Are in Fair Volume Here—Retailers Stock Up—Stove and Nut Are in Demand, with Steam Sizes Quiet—Bituminous Supply Is Unimproved—Cars Withdrawn from Other Industries.*

**Anthracite**—The dealers in this vicinity continue to be moderately well supplied with the various sizes and this market is well above the average on the amount of tonnage received. Embargoes against anthracite shipments by connecting lines has served to throw increased shipments to the city all spring.

While the car supply in the anthracite region has been all that could be desired, the supply will probably be cut, in order to relieve the car shortage in the bituminous region. Some of the retailers accordingly are taking in as much coal of all sizes as they are able to procure.

Stove and nut have lost none of the pressure of demand for these two sizes, with the call slightly in favor of the former. Egg and pea, while not so active, are giving no dealer any difficulty in moving them.

The steam sizes are in a fair position. Buckwheat is moderately well taken care of. Rice is only in fair demand, with barley very quiet, if not dull. Most of the dealers are putting buckwheat back for the winter so as to have a stock on hand when the real demand comes.

**Bituminous**—Of course car supply is the ruling factor in the bituminous trade, and there is hardly a shipper who will admit receiving more than a 25 per cent supply. The prices for Pennsylvania steam coal in the spot market run from \$8.50 to \$9.25, with very little offering. Gas coals of the Fairmont grades are selling spot from \$8.25 for slack up to \$9.50 for 3.

While the car supply has improved very little of late, it is understood that open-top equipment is to be immediately withdrawn from every other industry until the soft-coal trade reaches a 50 per cent supply, even the anthracite trade being cut in the same manner.

### BALTIMORE

*Bituminous Market Is Making New High Levels—Ten-Dollar Coal at Mines Is Recorded—Export Demand Heavy—Railroads Cannot Deliver Coal to Market—Anthracite Prices Move Up.*

**Bituminous**—With a growing demand for fuel at fancy prices the market here is again making new high levels. Ten-dollar coal, f.o.b. mines, on both steam and gas production, the net ton, has come to be a fact.

However, the real market price for best steam coals is probably around \$9 to \$9.50, and for best high-volatile screened from \$9.25 to \$9.50. Even the least desirable coals are bringing \$8 at the mines, the net ton, or better. Most coal handlers here report that such coals readily command \$8.25. Intermediate coals sell closer to the high marks than to the low at present writing.

This high-priced fuel at the mines, means between \$13 and \$14 a ton delivered to some of the plants here, who are not fortunate enough to get part of the railroad coal that is being distributed to some plants at lower figures to keep them going, or who are not being kept running by coal-firm connections of long standing at prices closer to the real market value of products.

Transportation has caused this situation. For six months the Baltimore & Ohio R.R. in many mining sections has not made a record of better than 40 per cent, and the Pennsylvania and Western Maryland, while better for a time, are now about in the same class.

Export demand keeps up and the reports for the first five days of June showed a total of about 90,000 tons of cargo and 13,000 tons of bunker for the same vessels loaded for foreign delivery here.

**Anthracite**—Hard coal men have again seen several wholesale advances. The independents have advanced prices 15 to 25c. a ton over the May delivery rates. Company prices have gone up 10c. a ton. However, little coal is coming through.

Coal men here are beginning to worry over the situation, realizing that the Government preferential treatment for cars for delivery to the Lakes, just announced, will further delay receipts of hard as well as soft coal here.

## Lake

### BUFFALO

*Spot Bituminous Is High and Scarce—Anthracite Supply Is About Normal—Lake Movement Active—Coke Trade Is Badly Demoralized.*

**Bituminous**—The main feature of the trade is the mounting of prices. The situation looks bad, but the tonnage of high-priced coal is small in comparison with the full amount moving. So much of the output has been contracted for that many of the larger operators are selling next to no coal on single orders. Consumers who have scant contracts are paying about \$7.50 at the mines for their extra coal, though the asking price is sometimes a dollar more.

A good many of the jobbers, unable to control the trade in any way, are striving to get coal as cheaply as they can and as much of it as they can for their old customers and they are finding the task no easy one. If any coal can be bought the cars are scarce and the movement is slow. If the customers have contracts the task is still harder.

The Buffalo switchmen's strike has died out, but it is found that a good many other railroad centers are tied up more or less by a similar strike and that adds to the complications. The harbor men have declared their strike off and are back to work.

**Anthracite**—The supply of anthracite is much better than that of bituminous, so that city distributors are of the opinion that more has been delivered to customers than ever before to date. This means a good winter supply.

The situation at the mines is not good, but the men work and the car supply is sufficient to keep this market and shipping center busy. Independent mines are still asking premiums of from \$1.50 a ton up, but the demand is not heavy in that direction.

In the Lake trade the movement is as large as it usually is at this time of the year. The Lake fleet is active.

**Coke**—The trade is in a pretty badly-demoralized condition, owing to the uncertain condition of the car supply and the consequent fluctuation of prices. The oven price for foundry and furnace coke is \$20. One shipper who sells a good amount of it quotes domestic chestnut coke at \$9.10 f.o.b. Buffalo, and breeze at \$5.60. The furnaces are not buying coke on single orders to any extent, depending on their contracts for supply.

### CLEVELAND

*Ohio Operators Are Not Receiving Cars Ordered from the West by I. C. C.—Industrial Stocks Continue Extremely Low—Pooling Plan Is Approved and Priority Given to Lake Coal.*

**Bituminous**—The recent geological survey, which discloses coal production almost 2,000,000 tons short of normal, shows that the bulk of this shortage is concentrated in the mines which pro-

duce for Cleveland and for Lake shipment.

Much complaint is being voiced by operators (with headquarters in Cleveland) to the effect that they are not receiving the anticipated number of cars ordered east by the Interstate Commerce Commission. An effort is being made to have the Cleveland district given a preference for a month until the shortage is relieved.

Industrial stocks continue extremely low. Some factories in order to obtain coal are paying as high as \$8 a ton for small lots of spot fuel.

**Pocahontas and Anthracite**—As the season progresses the demand for Pocahontas increases apace, but retailers are unable to meet anything like the demand. Prices remain firm. Anthracite receipts continue to show a slight improvement, although they are still far below normal.

**Lake Trade**—The Interstate Commerce Commission has approved plans for pooling Lake shipments on the 1918 basis. Instructions are being sent to all railroads to give priority to all coal consigned to the Ore & Coal Exchange. Embargoes will be placed against any Lake coal except that covered by permits authorized by the exchange. Cargoes will be dumped faster under the pooling plan. Retail prices of coal per net ton delivered in Cleveland are as follows: Anthracite—egg, \$13.20; grate, \$13.20 and \$13.50; chestnut, \$13.50; stove, \$13.50. Pocahontas—shoveled lump, \$11.75; mine-run, \$9.25. Domestic bituminous—West Virginia splint, \$9.50; No. 8 Pittsburgh, \$8.75; Millfield lump, \$9.50; Cannel lump, \$11.50. Steam coal—No. 6 and No. 8 slack, \$8.25; No. 6 and No. 8 mine-run, \$8.25; No. 8 3-in. lump, \$8.25 to \$8.50.

### MILWAUKEE

*Better Supplies Cause Easier Market, but Stocks Received Are Below Normal—Situation Causes Anxiety—Prices Are Maintained.*

The coal situation at Milwaukee is temporarily easier, because of a betterment in the flow by rail. Deliveries of anthracite are being freely made, the small dealers being allowed more liberal allotments.

This reduces the clamor for the present, but those upon whom the burden of maintaining the general supply rests are not in a very complacent state of mind.

With the month of June well advanced and the supply of soft coal thousands of tons behind the amount received last year up to this time, coal men are naturally fearful of the outcome of the season's receipts and the resultant howl from the public when the coal bins become exhausted.

Everybody connected with the coal-handling trade is busy trying to loosen up channels of supply. April prices continue to be maintained. Receipts thus far this season aggregate 170,278 tons of anthracite and 213,492 tons of soft coal, against 177,980 tons of the former and 828,853 tons of the latter during the same period last year.

## Inland West

### DETROIT

*Shortage of Coal Continues — High Prices Cause Steam-Coal Users To Delay Buying — Domestic Trade Is Uneasy.*

**Bituminous**—Wholesalers and jobbers say there is no improvement in Detroit's coal supply. The amount of bituminous coal arriving in the city is insufficient for the steam and domestic trade and in consequence very little of the stock is finding its way to retail yards.

By far the larger proportion of the shipments are coming from mines in Ohio with a small quantity from Illinois and Indiana fields. Ohio lump is quoted at \$7.50 per short ton at the mines, with mine-run holding at about \$7.25 and slack obtainable at \$6.75 to \$7.

With the coal trade in its present condition and the transportation situation in such shape that many months must elapse before anything like adequate car supply will be available, the jobbers feel that the buyers who hold off hoping for lower prices are destined to meet with disappointment.

**Anthracite**—Few shipments of anthracite are arriving in Detroit. Stocks in yards of retail dealers have been wiped out. With distribution of next winter's supply set back and no immediate prospect of deliveries to dealers in quantity, that will permit an early start on catching up, the prospect is far from encouraging for the household consumers.

**Lake Trade**—Owing to insufficiency of car supply, the movement of coal to Lake loading docks continues to fall short of requirements. Vessels are also having much difficulty in getting fuel coal.

### ST. LOUIS

*Transportation and Working Conditions Show a Little Improvement — Strong Call for Steam Coal, but Domestic Demand Is Light — Heavy Buying from the North and Northwest Recorded*

The past week has shown a little improvement in the matter of transportation and car supply. The car supply in the past week has averaged from 35 to 40 per cent on the trunk lines, but the greater portion of this has been railroad tonnage.

Short working time continues to cause unrest among miners. The mines in the Standard field on commercial coal average 2½ days and in the Mt. Olive field a trifle over 3 days.

Embargoes were effective against some Western lines this past week. The terminal at St. Louis is gradually getting over its strike troubles and while conditions are not normal, they show considerable improvement. Abuse of coal equipment still continues.

In the Carterville field a better ton-

nage of domestic came out the past week, especially to points north, quite little moving to the St. Louis market.

The railroad still takes nearly all the coal produced at Missouri Pacific mines and local points on this road in the South are hard pressed for fuel.

Locally St. Louis is strong for steam coal, but domestic demand is somewhat light. Buyers from Michigan and Indiana, as well as Chicago and Northwestern points, have been buying coal here the past week at from \$4.50@ \$5 for every size from all fields.

The prevailing prices on outside shipments from the Standard field have been \$4.50 to \$5 on all sizes. The local price averages about \$3@ \$3.50 on domestic sizes, and \$3 on steam, from both Mt. Olive and Standard fields.

Carterville prices range anywhere from \$3.60@ \$4.50 on domestic sizes and from \$3.25 upwards on steam, depending upon what the traffic will bear and who the seller happens to be.

Retail prices advanced 25c. on Mt. Olive, making Carterville \$7.25@ \$7.50; Mt. Olive \$6.25; Standard \$5.50.

### CINCINNATI

*Good Stocks of Coal on Hand but Demand Has Slackened — Ohio River Furnished Transportation — Prices Are Steady with Little Spot Coal Available.*

All dealers in Cincinnati have good stocks of coal, but the warm weather has slackened the demand. The Ohio River has enabled them to stock up to a great extent. However, the business with the retailers, who supply the household demand, is not as brisk as during the first months of the spring.

The average daily car supply at the mines is only 39 per cent, with more than a normal demand. Furthermore, only 50 per cent of the amount of coal that went to tidewater last year has been shipped to this territory during the present year.

Coal men state that as a result of the Ohio River transportation, Cincinnati buyers are paying from two to three dollars a ton less for coal than consumers in other cities.

Operators with headquarters here see a faint shadow of hope in the report from the West Virginia fields where production in the past ten days has improved, although the car supply is away below normal.

Prices seem to be more steady, there being no reports of advances, although they still are on quite a high level. There is little spot coal available and that is being sold at \$7 for mine-run gas coal. The demand for steam, gas and byproduct coal is enormous. Companies are now only loading mine-run, as special sizes bring little more than this grade.

There has been no increase in prices in the retail field, the prices quoted on coal delivered during the past week being as follows:

Bituminous lump	\$8 00@	\$8 25
Bituminous nut	6 75@	7 50
Bituminous run-of-mine	\$7 25	
Smokeless lump	9 25	
Smokeless run-of-mine	8 50	
Anthracite	14 00	

### COLUMBUS

*The Coal Trade Does Not Improve — Lake Situation Is Deplorable — Steam and Domestic Business Active and Prices Are on the Upgrade.*

Instead of getting better, the coal trade in Ohio appears to be getting in worse shape. Car supply in all of the producing fields is still reduced to below 50 per cent and as a result production is at a low point. Stocks are being depleted and large users are unable to accumulate any surplus.

The Lake trade is attracting the attention of producer, shipper and consumer alike. Government officials are also taking cognizance of the situation with the likelihood of preferential orders for equipment for Lake shipment. Records at all of the lower Lake docks show that scarcely 20 per cent of the usual tonnage being moved up to this time has been started to the Northwest.

This presages an acute shortage in that section with the likelihood of all-rail shipments later on. Railroads are not equipped for a heavy all-rail movement and if it is necessary other sections of the country will suffer because of lack of equipment.

Steam business is active in every way. Large consumers are continuing their practice of bidding for available tonnage with the result that prices are still on the upgrade. Plants are unable to get sufficient fuel to run on full time and in many instances have had to close down entirely.

Prices for Hocking mine-run on the open market range from \$5 to \$7.50 while other grades are the same. All grades command about the same figure and many of the large producers are still endeavoring to hold down the price. Such operators cling to a price of \$4.50 for all grades. Some prices are soaring. West Virginia prices are higher than those in Ohio.

Domestic trade is also active and prices are advancing in sympathy with the rates at the mines. Hocking lump and mine-run retail in the neighborhood of \$8.50. West Virginia splints retail at \$9.50 and Pocahontas if available around \$10.50 to \$11. Practically no Kentucky coal is coming in.

Production is slow as the car supply is generally less than 50 per cent of normal. The Hocking Valley produced about 45 per cent last week while Cambridge, Jackson and Crooksville report less than 40 per cent. Pomeroy Bend had a slightly better run with 50 per cent. Eastern Ohio is running about 35 to 40 per cent with a large part going to railroads and to the Lakes. Commercial users have only a small percentage of the reduced output.

Prices at the mines are as follows:

Hocking lump	\$4 50 to	\$6 50
Hocking mine-run	4 50 to	6 25
Hocking screenings	4 50 to	6 25
West Virginia splints, lump	5 75 to	8 00
West Virginia splints, mine-run	5 50 to	7 75
West Virginia splints, screenings	5 50 to	7 75
Pocahontas lump	7 00 to	8 00
Pocahontas mine-run	7 00 to	8 00
Pocahontas screenings	6 75 to	7 75
Pomeroy lump	5 00 to	7 50
Pomeroy mine-run	5 00 to	7 50

**CHICAGO**

*Coal Supply Improves Materially—Anthracite and Eastern Coal Moves More Freely Into Chicago—The Switchmen's Strike Has About Straightened Out Here.*

Chicago's coal supply today is very much more substantial than it was two weeks ago, or even a week ago, as nearly every retail yard, as well as practically every factory, has enough coal on hand to run them at least two or three days a week.

This is quite a great change for the better, when one considers it was only two weeks ago when retailers had practically no coal whatsoever, and manufacturers had just enough coal to run from hour to hour.

Anthracite coal is moving into Chicago more freely than heretofore and this is also true of certain high-grade Eastern coals which are generally used in large quantities in the city. The congestion of the Eastern seaports is probably responsible for this. However, it is not arriving in large enough quantities to take care of the great demand for it.

Railroad authorities state that the congestion brought about by the switchmen's strike practically has now been straightened out and that freight is moving in a fairly normal manner through Chicago terminals. This ought to benefit the coal industry as during the strike and the consequent congestion following the strike a great number of coal cars, both loaded and empty, were stranded in Chicago.

**MIDWEST REVIEW**

*Coal Experiences Slight Lull in Active Demand—General Car Situation Does Not Improve—Long Hauls Do Not Benefit Matters—The Price Situation Changes Little.*

Owing to a spell of hot weather and the Republican convention in Chicago, the fuel problem, during the past week, no longer occupies the center of the stage.

With the exception of one or two spots in Indiana, and the Central district of Illinois, the car supply has been just as poor as ever. The average for the fields, not including the Central district, will show about a 33 per cent supply. The reason why the Springfield district is getting a better supply than the rest of the field may be because it is the first one to feel the effect of the Interstate Commerce Commission's ruling that all Eastern cars are to be returned.

At this writing operators in the Middle West are not very optimistic as to an improvement in the car situation on account of the recent rulings of the Interstate Commerce Commission.

The present great shortage is due to a number of interesting things. Inquiries from Eastern states, requesting quotations on Illinois and Indiana coals have been fairly common. Illinois and Indiana coals, all grades, have been moving into Michigan, to points in the

western part of Ohio and to Canada, either through Minnesota or the Detroit gateway.

Operators, as a rule, frown on this long-haul business as they believe it would be for the best interests of everybody to avoid long hauls and widespread distribution of coal-carrying equipment.

There has not been much change in the price situation. Some of the coals, however, which were selling at around \$6 per ton a couple of weeks ago, are now moving at lower levels. Some of the Franklin County operators are said to be asking \$3.90 per ton f.o.b. mines for their prepared sizes.

**South**

**BIRMINGHAM**

*Transportation Conditions Show No Improvement—Operations Handicapped by Lack of Cars, Local Strikes and Labor Delinquency—Coal Is in Strong Demand with Prices Steady.*

The condition as regards car supply remains about stationary. This field is expected to receive some benefit in this respect from the order of the Interstate Commerce Commission, instructing the delivery to eastern lines from western roads of 39,600 coal cars.

About 2,500 of these cars will be available to the Louisville & Nashville for use in the Kentucky-Tennessee and Alabama fields, and the supply to the former section should relieve to some extent the constant drain on the Birmingham district to enable the Kentucky-Tennessee mines to equalize operating time with Alabama.

Delivery of cars from foreign lines to the Illinois Central at New Orleans and Chicago will also enable that line to maintain a better equalization with the Frisco and Southern in serving the Alabama mines. Mines on the Southern and L. & N. have been receiving a fair quota of cars where fuel contracts were held, but commercial mines have only received about a 50 per cent supply. Frisco mines have been served better.

Local strikes in Walker, Bibb and Tuscaloosa counties have some dozen or more mines partly or entirely closed down, and idleness at these operations is curtailing coal production considerably. Labor is slow in reporting for work at active mines, while there is some shortage of men at some plants which are attempting steady operations.

Steam coal requirements are much larger than the district can supply, and the mines are taking on but little new business, as they are unable to take care of what they now have in hand. Prices are remaining practically stable, the small tonnage available for spot buying not being sufficient to affect market conditions, though almost any price named can be obtained for such coal. The market for domestic sizes holds good and the same general conditions govern the trade for this grade of fuel as in the case of steam coal.

**LOUISVILLE**

*Car Supply Is Much Improved—Gas and Byproduct Coal Is Moving Freely—Domestic Demand Light—Western Ky. Steam-Coal Market Weakening—Export Trade Light.*

During the first week of June the Kentucky operators had the best car supply of months, securing a 50 to 60 per cent supply, and getting in three full days.

The principal fuel demand at the present time is for gas and byproduct coal which is moving freely. There is also a stocking demand from Canadian, Northwestern and Lake regions. There is also a good demand for coal from public utilities, railroads and general industries.

There is no contracting being done on present markets, and practically all coal is sold for spot delivery, and most of it for cash. Demand for western Kentucky steam coal has been slumping off somewhat, and the market is weaker.

Export movement is comparatively light due to shortage of facilities at Southern ports for handling, with the result that not much over 100,000 tons a month is moving from Kentucky, Virginia and Tennessee to Charleston and Savannah.

Mines continue to turn out little other than mine-run. Screenings are quite scarce and in big demand. Coal prices at the mine are as follows:

	— Eastern Kentucky— Gas Coal		— Non-Gas		Western Kentucky	
Lump.	\$8 00@	8 75	\$7 75@	8 40	\$5 25@	5 50
Mine-run	8 00@	8 75	7 50@	8 00	4 75@	5 00
Nut and slack.	7 75		6 75@	7 00	3 75@	4 00

**Canada**

**TORONTO**

*Moderate Supplies of Anthracite Are Coming Forward—Bituminous Is Still Scarce—Fuel Administrator Says Industries Must Use Anthracite—Prices Unsettled and Increasing.*

Since the lifting of the railway embargo conditions have shown improvement. Moderate supplies of anthracite are coming forward, but dealers are still much behind with deliveries and are only accepting orders at the price prevailing when delivered.

Little bituminous has been received and the situation as regards the supply for industrial plants remains serious. H. A. Harrington, provincial Fuel Administrator, made a trip to the American coal fields in order to secure enough coal to keep the gas plants in Toronto and other cities in operation, otherwise they would have had to close down.

Prices are variable with a decided upward tendency. Present retail quotations for short tons are about as follows:

Anthracite egg, stove, nut and grate	\$15 00
Pen	13 50
Bituminous steam	14 00
Domestic lump	15 00
Canal	14 00

# News From the Coal Fields

## Northern Appalachian

### FAIRMONT

*Production Decreases—Embargo Is Placed on Curtis Bay Coal—Railroads Take Large Part of Coal Output.*

Lowered production still featured the week ended June 5 in northern West Virginia, a pronounced shortage of cars still being at the seat of the trouble. An added source of shortage, however, was a suspension of work on the part of miners on Decoration Day.

Tidewater shipments were somewhat retarded during the week due to an embargo covering coal for Curtis Bay, owing to an accumulation of about 1,000 cars at the piers. Although numerous vessels were on hand awaiting cargoes, it was found impossible to load coal as fast as it arrived. By the end of the week nearly all the tidewater piers of the Baltimore & Ohio were under embargo.

Since traffic has been resumed on the Pittsburgh & Lake Erie R.R., it has been found possible to move more coal through Brownsville, Pa., so that more cars were being received in the early part of June on the Monongahela R.R. than during the greater part of May, though the supply was still far short of requirements.

Railroads were showing no disposition to cease assigning a large part of the limited car supply to mines loading railroad fuel, and consequently during the first week of June, in the Fairmont as well as in other northern West Virginia fields, the carriers were securing the lion's share of the coal produced, leaving a comparatively small volume available for shipment to commercial consumers.

There was little or no increase in the volume of western or Lake shipments.

### CONNELLSVILLE

*Furnace Coke Contracting Begins on 4-to-1 Ratio—Spot Prices Remain High—Byproduct Oven Production Increases Faster Than Beehive.*

Contracting in furnace coke for the second half of the year has begun, with the closing of about 25,000 tons a month on the basis of a 4-to-1 ratio, against basic pig iron at valley furnaces, now quotable at \$43.50, a price that would make the coke on such contracts \$10.87.

These contracts provide for a maximum of about \$12, so that if iron went above \$48 there would be no further advance in coke, while there is also a minimum for coke.

Some sellers would quote a 4-to-1 ratio but would refuse to have any

maximum specified. Two or three sellers have quoted a flat price of \$12.

The spot market is a shade easier in tone, but prices are not quotable at materially lower levels. The spot market is quotable at \$14.50@ \$15 for furnace and \$15@ \$15.50 for foundry, per net ton at ovens, against \$15 for furnace and \$16 for foundry quoted a week ago.

Car supplies in the Connellsville region continue to increase, but at quite a slow rate. The supplies of cars at coal mines furnishing byproduct coals seem to have increased more than the supplies for loading coke in the Connellsville region, for the byproduct ovens are now operating fairly well.

The *Courier* reports coke production in the Connellsville and Lower Connellsville region in the week ended June 5 at 189,580 tons, an increase of 2,852 tons. The showing is quite favorable in its way since the week included Memorial Day.

### PITTSBURGH

*Empty Cars Are Not Being Moved Promptly—Little Coal Offered in Open Market—Coal Consumers Are Buying Railroad Cars.*

Car supplies in the Pittsburgh coal district continue to increase, but at a slow rate. All the railroads are functioning better, the Baltimore & Ohio nearly normal, the Pennsylvania not far from normal, and the Pittsburgh &

Lake Erie at a much better rate, though still quite far from normal.

There is still complaint among shippers that railroads are not getting the best results from their equipment, the difficulty not being wholly a shortage of ordinary labor. For illustration, a certain fairly large blast-furnace interest in the valley has had no trouble in shipping pig iron, or in getting iron ore in and little difficulty in getting coke, but it has had a great deal of trouble in getting the railroad to remove empty cars after unloading.

While coal production has increased, the insistence of buyers has also increased, and producers are so well tied up by contract requirements that they have little coal to offer in the open market, the consequence being that prices have soared still higher.

There have been times in the past few days when buyers were not certain of finding even steam coal at under \$10, while \$9 seems to be about the lowest price that has been secured on any grade.

Promises of early deliveries might be had at considerably lower prices, but the buyers who make the market now require car numbers, and for spot shipment (with car numbers) the market is quotable at \$9@ \$10 per net ton at mine, Pittsburgh district.

The feeling among large coal consumers that there is no assurance of good railroad service, even when the roads are fully manned and in command of their equipment, is shown by the following car orders lately placed by coal consumers: Koppers Co., 1,000 cars; Youngstown Sheet & Tube Co., 500 cars; Bethlehem Steel Co., 1,000 cars; International Harvester Co., 500 cars; Weirton Steel Co., 200 cars. All these concerns operate byproduct coking plants.

## Estimates of Production

## Middle Appalachian

### NORTHEAST KENTUCKY

*Cars Are Far Less Plentiful on L. & N. Than on C. & O.—One-Third of Big Sandy Tonnage Goes to the Lakes—Use of Assigned Cars Disturbs Operators.*

Less coal was mined in the Northeast Kentucky field at the outset of June than was the case for a similar period during the greater part of May, only 110,240 tons being produced out of a possible total of 294,760 tons, leaving a gross production loss of 184,520 tons. A scarcity of cars was responsible for a loss of 179,530 tons.

While there was little change in the car supply situation on the Chesapeake & Ohio R. R., there was a decided change in the situation on the Louisville & Nashville, cars being far less plentiful on the latter road than on the C. & O. It is stated that L. & N. mines were limited to a supply equal to about one-third of requirements.

An increased Lake movement was in evidence throughout the week in the Northeast Kentucky field, it being estimated that fully one-third of the Big Sandy tonnage at least was being billed to Lake points. As the result of the increased Lake movement, not so much coal was shipped to tidewater.

What continued to disturb many companies in the field was the large number of assigned cars, all mines loading railroad fuel having an ample supply of empties; while on the other hand commercial-loading mines in many instances were forced to shut down because of lack of equipment for loading.

### LOGAN AND THACKER

*Car Supply Improves in Second Week of June—Lake Shipments Increase and Tonnage to Tide Is Embargoed—Efforts to Organize Thacker Field Interfere with Output.*

While no direct benefits were derived from the new Interstate Commerce Commission regulations governing the movement of cars to the East, during the week ended June 5, in the Logan field, there was unquestionably an improvement during the following week in the car supply.

However, it was impossible to produce any more coal in the first week of June than it had been during a similar period in April and May, the output for the entire week reaching only 142,000 tons; while on the other hand production losses amounted to between 250,000 and 275,000 tons. In other words there was only about a 35 per cent output.

Slides on the C. & O. leading into the Logan field, as well as on the main line, were factors in reducing production in addition to the poor car supply, eastern shipments of course being entirely suspended toward the end of the week.

More than 92 per cent of the working time of mines in the Logan field was taken up in loading assigned cars.

There was a perceptible increase in Lake shipments during the first week of June, but at the same time tide-water tonnage was heavy. However, early in the second week of June, Logan coal was debarred from tide-water because of an embargo growing out of the slides (of the preceding week) on the C. & O.

Losses in production were steadily mounting in the Thacker field at the advent of June largely because of the organization campaign which is being waged here by the United Mine Workers, total losses aggregating in the neighborhood of 150,000 tons.

There has been a suspension of operations at many mines as a result of the attempt to organize the field and that was responsible during the first week of June for a loss in production said to be in excess of 50,000 tons. However, the loss was even larger from a car shortage, amounting to approximately 80,000 tons.

Production on the Chesapeake & Ohio system as a whole was beginning to show signs of improvement during the first week of June though still below normal. During this period the road handled on its system a total of 9,528 cars, or about 476,400 tons.

### NEW RIVER AND WINDING GULF

*Car Supply Averages About 40 Per Cent for First Week of June—Coal Goes to Tide—Coke Is Shipped West—Transportation on the Virginian Is Subnormal.*

Operators of the New River and Winding Gulf fields found little or no encouragement during the first week of June, since satisfactory operation of the mines was possible only twice during the weekly period, cars being so scarce during the other four days that it was impossible to operate more than the fraction of a day.

The car supply for the week did not average over 40 per cent, that measuring the production of the field. On Saturday a slide at Montgomery had its baneful effect on operations in the field.

As far as the movement of New River coal was concerned, shipments were mostly for tidewater, Inland East shipments consisting mostly of prepared sizes. No attempt was made by producers to ship enough coal westward to amount to anything, not even to the Lakes, and it is stated that there will continue to be a small western movement until it is possible to secure the quick return of equipment from the West.

Coke was being shipped, however, mostly to Western markets. Some operators were of the opinion that coke prices might recede, owing to lowered prices on pig iron. If such was the case it had no effect on New River coal, no reduction in the price of that coal being recorded.

Mines in the Winding Gulf field were still handicapped owing to the fact that transportation conditions on the Virginian Ry. were sub-normal following the strike of Princeton shopmen. However

it was stated that the strike situation had undergone improvement.

### POCAHONTAS AND TUG RIVER

*Empties Come in from the West and Increase N. & W. Output—Fancy Prices Are Offered for Spot Coal—Contract Coal Sells for About \$5—Properties Change Hands.*

Production in Norfolk & Western territory was on a somewhat larger scale during the first week of June than had been true at any time since the middle of April, the improvement in conditions following an augmented car supply, resulting from an increase in the delivery of empties from the West.

Coal Loading in the Tug River field for the week ended June 5 totalled 75,450 net tons. It was pronounced the best output in two months.

Prices even in excess of \$9 a ton are reported as having been offered for coal to tidewater but there is only an exceedingly small amount of coal not under contract. Operators say that by far the greater bulk of the best coal in the Tug River field is tied up at a price not in excess of \$5 a ton.

Spot coal from the Pocahontas field was bringing at least \$9 a ton. However, there was little spot coal available even at that amount. Contract coal was being shipped at approximately \$4 a ton less than the spot prices offered. There was at the outset of June no let up in the demand.

### KANAWHA

*Slides on C. & O. and Decoration Day Cut Down Output—Shipments to Tide Decrease, and More Coal Goes to Lakes.*

Slips and slides on the Chesapeake & Ohio R.R. at the end of the first week of June played havoc with production in the Kanawha field, as it was impossible to furnish any mines with cars on Saturday or to move any coal in the area affected.

Not only was traffic completely blocked on the main line of the C. & O. but branch lines were also affected so that production was seriously affected in the Cabin Creek area and in the Logan area. Between a holiday partly observed on May 31—Decoration Day—and the slides already mentioned it was an extremely poor production week in the Kanawha field.

Tidewater shipments were not quite so heavy as they had been in previous weeks, but on the other hand there was an increase from some mines at least in the amount of coal being shipped to the Lakes, the percentage of Lake shipments being estimated at 23 or 24 per cent. General western shipments, however, were slightly retarded by embargoes applying to consignments to certain Western markets.

What further cut down the equipment for use at mines shipping commercial coal was the large number of cars being assigned for railroad-fuel loading, the assigned-car practice in the Kanawha region as well as in other regions having become extremely pernicious in the opinion of operators.

## Middle Western

### SOUTHERN ILLINOIS FIELD

*Jefferson County Men Are Drilling for Coal—Franklin County Operators Are Erecting Houses—I. C. Strike Affects Franklin County Fields.*

Drilling for coal in a field that has never been prospected is now in progress in Jefferson County. The hole is being sunk a few miles west of Mt. Vernon, and the prospecting is being done on land under lease to local parties. The sale of the field is assured should the seam prove to be thick enough to pay for mining. A good seam of coal has been found in the extreme southern edge of this county, but the test hole there was the first ever sunk in the vicinity of the Mt. Vernon operations.

The Bell & Zoller Mining Co. is erecting a large number of houses at Zeigler, in Franklin County, to take care of the increasing number of miners needed by the rapid development of the No. 2

shaft of this company. Other large operators in the Franklin County field are considering this method of providing homes for their men, as local parties are not inclined to invest money in rental property under the present excessive cost of construction.

The strike of the Illinois Central R.R. switchmen at Duquoin, Carbondale and Centralia, who came out the second time recently, has resulted in shutting down many mines in that section, and has affected the already serious car shortage in the Franklin County fields. The repair men and clerks have also joined the switchmen and the walkout is seriously affecting all mines depending on the Illinois Central for a car supply.

The Lewis mine at Pinckneyville, in Perry County, property of the Hale Coal Co., was destroyed by fire of unknown origin recently. The tippie and superstructure were a total loss. This property was recently remodeled and improved, and was the main source of supply for local dealers. It is undecided at this time whether the property will be rebuilt.

### SENTIMENT OF ST. LOUIS COAL MEN

*Frelinghuysen Bill Is Discussed—Members Are Opposed to It as Outlined—Straw Vote Is Taken.*

As to how the coal men in the Middle West feel in connection with the seasonal rates on coal, as proposed by the Frelinghuysen bill, was evidenced at the last meeting of the St. Louis Coal Club, when a straw vote was taken to ascertain the sentiment.

Only one member of all those in attendance at the meeting was in favor of the bill as proposed.

Many of the members were of the opinion that something along those lines might be worked out to advantage, but not as outlined in that bill. It was the opinion of those present, as taken in the straw vote, that the railroads and the distribution of coal should be let alone and not interfered with by the Government until the railroads and the coal men were unable to properly conduct their own business. This bill was favorably reported by the sub-committee of the Senate Interstate Commerce Committee.

## Important Events of the Coal Industry During May

[The bracketed figures in the text refer to the number and the page of the volume in which references to the matter may be found and should the reader desire further information he can obtain it in the place indicated].

May 4—A wage-scale agreement is reached at Cleveland, Ohio, between the scale committees representing the operators and miners of the eastern Ohio field [XVII, 1017]—Freight-train crews on the Morgantown & Kingwood R.R., a coal carrier in northern West Virginia, go on strike demanding an 8-hr. day [XVII, 1058].

May 5—At a meeting of the Senate Frelinghuysen sub-committee, Middle-West consumers support seasonal freight rates [XVII, 1000]—Illinois coal operators who were indicted at Indianapolis a few weeks ago, for violating the Lever Act, bring individual suit in Chicago, asking that the U. S. Government be restrained from prosecuting them further [XVII, 1001].

May 7—Operators and miners meet at Fairmont, W. Va., to consider scales for deadwork in northern W. Va. [XVII, 1059].

May 8—President Wilson issues an order directing the Council of National Defense to take over the records of the War Labor Board and complete any unfinished business [XVII, 1037].

May 12—The sub-committee of the Senate Interstate Commerce Com-

mittee favorably reports the Frelinghuysen bill to establish seasonal coal transportation rates [XVII, 1042].

May 13—The sub-committee of the Senate Interstate Commerce Committee reports favorably the Poindexter anti-strike bill for railroads [XVII, 1042].

May 19—Miners at plant of Consumers' Coal Co., at Downs, Marion County, W. Va., strike following discharge of three miners for loading dirty coal [XVII, 1169].

May 20—Interstate Commerce Commission issues orders to relieve freight congestion. Of special importance is the order relating to the relocation of open top cars from western to eastern territory [XVII, 1116].

May 21—U. S. Senate passes the House Merchant Marine bill [XVII, 1165].

May 22—President Wilson issues ultimatum to anthracite operators and miners forbidding strike in anthracite mines. He will appoint a commission to consider a wage increase if necessary [XVII, 1116]—A wage agreement is concluded at Cheyenne, Wyo., between the mine operators and mine workers [XVII, 1169].

May 24—Matewan men implicated in connection with death of Baldwin-Felts detectives and others are arrested [XVII, 1170]—Director General of Railroads makes public a report of the financing of the U. S. Railroad Administra-

tion. History of the financing of the railroads is given from the beginning of Federal control on Jan. 1, 1918 [XVII, 1150]—Miners employed by the Vandalia Coal Co., at Terre Haute, Ind., strike because the company assessed and collected from them a fine of \$1 each for failing to report for work Saturday May 15 [XVII, 1215].

May 25-27—National Coal Association holds its annual meeting at Atlantic City, N. J. [XVII, 1161-1164]—Joint convention of district No. 11, strip mine operators and miners of Indiana, adjourns. Most of workers' demands granted [XVII, 1166].

May 26—Judge A. B. Anderson, of the Indiana District Federal Court, overrules demurrer of Charles E. Hughes to quash indictment in case of 57 bituminous operators and miners, declaring Section 9 of Lever Act constitutional [XVII, 1166]—Seven men said to be union organizers are arrested on Pond Creek Pike County, Ky. [XVII, 1215].

May 27—Officials of United Mine Workers of America request the operators of the Williamson, W. Va., field to negotiate with them regarding the organization of the Williamson field [XVII, 1216]—Mine workers at tri-district convention in Wilkes-Barre, Pa., accept President Wilson's offer to appoint an arbitration committee to settle the anthracite wage dispute [XVII, 1170].

# Mine and Company News

## ALABAMA

Gadsden—W. L. Smith, of Gadsden, and associates, are understood to be arranging plans for the development of a coal mine in the vicinity of Boaz, Ala. Modern machinery and equipment will be installed, and electric power will be utilized wherever feasible. The plans include the construction of a large number of homes for miners' dwellings.

Birmingham—The remaining block of 60 Semet-Solvay ovens at the plant of the Sloss-Sheffield Steel & Iron Co. has been charged and is now producing coke and byproducts. The 120 ovens at this plant will provide sufficient coke for the separation of all the furnaces of the company, consuming 2,500 tons of coal per day; the plant will displace about 1,500 beehive ovens located at the different coal mines of the company in this district. The oven plant will also generate electric power for the equipment at all the coal and ore mines of the Sloss-Sheffield company, transmission lines now being strung and machinery placed at all its operations in the district to supplant steam power.

## ILLINOIS

Chicago—Contract for the new steel tippie for the Jackson Coal Co., at Halldayboro—the old structure of which was recently destroyed by fire—was placed with the Roberts & Schaefer Co., of Chicago, who has already erected a steel head frame and temporary weigh box and screens.

This piece of reconstruction work has been one of the fast jobs of the State. The new tippie when fully completed will be equipped with Marcus screens and shaker loading booms, and will be one of the fine installations of the State.

## INDIANA

Indianapolis—The Globe Coal Mining Co., operating at Rogers, six miles east of Petersburg, Ind., is building a railroad switch half a mile long in order to get into its coal property. The company also is constructing what is said to be one of the largest coal mines in southern Indiana. Two stripping machines are being used to move earth away from the railroad right-of-way.

The Gladstone Coal Co., near Petersburg, Ind., is installing electric haulage and power, which will increase the daily capacity of the mine from 400 tons to 1,500 tons.

Officials of the Wulfman Coal Co., operating near Winslow, Ind., have been given the right to build a steam

tramway through the eastern part of the town to connect with the Southern Ry.

## KENTUCKY

Manchester—The Cumberland & Manchester R. R. Co., which is operating a line tapping rich coal fields, has increased its capital from \$50,000 to \$500,000, and plans eventually to construct several spurs.

Louisville—Among the new coal companies formed recently in Kentucky are the following: The Jacks Creek Coal Co., of Prestonburg, with a capital of \$200,000, has been incorporated by, A. J. Johnson, James Sailsbury and J. W. Shoher. The Porter Mining Co., of Ashland, with a capital of \$150,000 has been incorporated by, S. S. Porter, J. E. Long, Fred Blackburn, and Dr. M. M. Collins. The Apex Coal Co., of Whitesburg, of which R. F. Haskins, of the Diamond Block Coal Co., near Hazard, Ky., is the head, is planning to install a plant with a daily capacity of 500 tons, on the Craft property near Millstone, Ky., in the Elkhorn field.

Lynch—Converting a mountain wilderness of Kentucky into a thriving and modern mining town in less than three years was the achievement of the United States Coal & Coke Company here, a subsidiary of the United States Steel Corporation.

Some 18,000 acres of coal lands were purchased by the company and on Sept. 1, 1917, the first workmen arrived to lay out the town and open the mines. The company built its own railroad out of Benham.

One of the features of the operation is that the mines are electrically lighted.

The projects planned by the company include two miles of concrete streets from the Benham line to the upper end of Lynch. Macadamized roads will be built in the town, fences constructed around the houses, sewerage installed, and a large grammar school and bank built. A hospital has been recently built for the benefit of the 7,000 or 8,000 employees of the company.

It is estimated that there are about 500,000,000 tons of coal to be worked here. The capacity of the plant is 2,500,000 tons of coal a year.

## PENNSYLVANIA

Pittston—William P. Jennings, superintendent of the Pittston division of the Pennsylvania Coal Co., recently appeared before members of the Mine Cave Bureau of Pittston and assured that organization that the company will not

only repair all damage occasioned by recent surface subsidence in upper Pittston, but will see that no further damage is done streets of the city and will likewise file maps of its underground workings as required by a city ordinance.

A warrant was issued under Section 6 of the Davis act of 1913, which makes it unlawful for any person or corporation engaged in the mining of coal to damage streets or public thoroughfares by surface subsidences through failure to leave adequate supports.

Conviction under the act calls for a fine of \$1,000 or a maximum sentence of 90 days in the county jail or both at the discretion of the committing magistrate.

The cave which resulted in the issuing of the warrant occurred recently in the Curtis Street slope of the No. 9 colliery of the Pennsylvania company and damaged Wilford Street.

Three months ago the Scranton-Pittston Coal Co. was brought into the Luzerne County Court for failure to file maps. The court held that the ordinance was legal and directed the company to comply. To date the company has not filed its maps and as a result operations have been suspended.

Wilkes-Barre—Extensive improvements are now under way by the Susquehanna Collieries Co., including sinking new shafts at the Richards and the Pennsylvania collieries, the construction of a large new breaker to prepare coal from both operations and the erection of a new power plant. The breaker, which will be of steel construction, will have a capacity of 3,000 tons of clean coal a day and will replace the breakers at the Pennsylvania and Richards collieries. The power house will have a boiler capacity of 12,000 hp. and an electrical capacity of 9,000 kw. The transmission line will be double and will have a total length of 40,000 ft.

Uniontown—The sale of 2,600 acres of Greene County coal, for a consideration of almost \$3,000,000 to the W. J. Rainey interests by the Youghiogheny & Ohio Coal Co., is reported to have been concluded in Pittsburgh. The property, located in what is known as the Clarksville tract in the northern section of Greene County, brought \$1,180 per acre which is said to be a new high figure for coal lands in that section of Greene County. The tract is located along Ten Mile Creek. The purchase is being made by the W. J. Rainey interests, it is understood, to provide a reserve source of fuel for the byproduct plant of the Rainey-Wood company in the eastern Pennsylvania territory.

**Johnstown**—The A. B. Crichton Coal Co. is understood to have completed negotiations for the acquirement of the holdings and property of the Chaffee Coal Co., in the Upper Potomac field, located in the vicinity of Westernport, Md., for a consideration of about \$500,000. The property comprises about 2,000 acres of coal lands, and it is understood that the new owner is planning for extensive improvements and enlargements to provide a capacity of about 1,500 tons daily, or more than double the present output.

**Mercer**—Enoch W. Filer and William Jenkins, who have been operating the Pardoe mines under charter held by the Mercer Mining Co., for the past three years under a lease, have purchased the mines from the Mercer Mining Co. and are planning to make improvements including a new shaft and other developments.

#### WASHINGTON

**Bellingham**.—Additional men have been employed by the Bellingham Coal Mines Co. and its output increased to 500 tons. By next fall the daily output is expected to be 700 tons. The market outlook is promising and the company's product is growing in popularity. The company is constructing a car shop and repair house and is building its own mine cars. It is also extending its spur track.

#### WEST VIRGINIA

**Williamson**—The Williamson Coal & Coke Co. has been purchased by A. H. Land, J. L. Dickinson and others. The purchase includes all the holdings of the company in the Williamson field and in Kentucky. The consideration involved was approximately \$150,000. The present output of the mines of the Williamson company amounts to about 30,000 tons a month. The new owners, however, will probably make a number of improvements with a view to increasing the capacity of the plant.

**Morgantown**—The Gaston Run Coal Co. has increased its capital from \$50,000 to \$100,000, for general business expansion. Ernest H. Gilbert is president.

**Fairmont**—The Tarr Coal Co. is getting ready to make improvements that will increase the production of its mine on the West Fork River between this city and Monongah. The Tarr company operates six mines in Pennsylvania and West Virginia.

**Glen White**—The E. E. White Coal Co., the largest producer on the Virginian Ry., announces that it expects to sink four shafts in Raleigh and Wyoming counties.

**Huntington**—Operations on a large scale will be conducted in both West Virginia and Kentucky by the Logan-Elkhorn Coal Corporation. The capitalization of the company has been fixed at \$1,500,000. It will operate in Logan County, W. Va., and in Letcher County, Ky. Those principally inter-

ested in the new company are: J. K. Parsons and A. R. Parsons, of Mallory, W. Va.; A. F. Parsons and Ettie Parsons of Huntington, W. Va.; W. S. Peters of Seco, Ky.

The Overseas Coal Co., First National Bank Building, has been incorporated with a capital of \$50,000 to engage in general coal mining operations in Lincoln, Cabell, Logan and Boone counties. It is understood that machinery and equipment will be installed for active work at an early date. H. K. Marcum and J. W. Tague head the company.

**Charleston**—Smokeless coal land in Fayette County is to be developed by the Kettle Run Coal Co., with headquarters in this city, the new concern having a capitalization of \$150,000. Principally interested in the new company are: T. C. Beury, J. A. Thayer, A. S. Guthrie, E. H. McNeil and John W. Fry, all of Charleston, W. Va.

Three companies to act as selling agencies for Pike County, Ky., coal, and Mingo County, W. Va., coal, have been organized by E. L. Bailey, of Williamson; E. H. Sudduth, of Welch and others. The new corporations are: The Bailey Fuel Co., of Charleston, W. Va., with a capitalization of \$100,000; the Sudduth Fuel Co., of Charleston, with a capitalization of \$100,000, and the Williamson Fuel Co., of Charleston, with a capitalization of \$200,000.

Companies whose capitalization has just been increased are the Ashford Coal & Coke Co., of Charleston (headed by Frank D. Barron), from \$25,000 to \$50,000; and the Delmar Coal Co., of Fairmont, W. Va. (John T. Phillips, president), from \$300,000 to \$1,000,000.

### Association Activities

#### Western Coal Operators' Association

In order to better co-ordinate the coal-mining industry in the Province of Alberta, Canada, from the viewpoint of the operators, an amalgamation has been effected which will bring under the jurisdiction of the Western Coal Operators' Association, six sub-district organizations, including the Red Deer Valley Coal Operators' Association.

While each sub-district will deal with questions inside its own association, all matters of policy will be referred to the Western Coal Operators' Association. The officials of the new organization are: President, O. S. White-side; first vice president, Jesse Gouge; second vice president, John Shanks; secretary-treasurer, W. R. McNeill.

#### Sewell's Point Tidewater Exchange

Producers and shippers of coal on the Virginian Ry., many of them in the Winding Gulf field of Southern West Virginia, put the finishing touches on the new Sewell's Point Tidewater Exchange on May 28 at Washington,

D. C., where a meeting of the shippers was held, G. H. Caperton acting as chairman of the meeting.

Of the entire tonnage originating on the Virginian Ry., 70 per cent of it will hereafter be shipped to Sewell's Point so as to facilitate handling the tonnage. The following board of governors for the new coal exchange was elected: C. H. Mead, S. A. Scott, W. P. Tams, G. H. Caperton, P. M. Snyder, Frank Ellison and J. B. Clifton.

Coal to the exchange at Sewell's Point will be classified as follows: Low-volatile coal from mines on the Navy acceptability list, run-of-mine, Pool 1; other high-grade low-volatile coal, run-of-mine, Pool 2; low-volatile slack, Pool 3; other low-volatile coal, not classified in pools 1 and 2; run-of-mine, Pool 4; high-volatile byproduct, run-of-mine, Pool 7; low volatile, Eagle seam, Pool 8; low-volatile lump, Pool 44.

#### Logan Coal Operators' Association

The Logan Coal Operators' Association, at a meeting held in Huntington on May 31, arranged to file an appeal with the Interstate Commerce Commission for the early return of coal cars needed in shipping coal to the Lakes.

It was pointed out at the meeting that unless cars, now in the far West and usually utilized in transporting coal to the Lakes, are returned to the Chesapeake & Ohio and to the Hocking Valley, then there will be an unparalleled shortage of coal in the Northwest during the coming winter.

Lake shipments which up to this time should be 7,000,000 tons, have only reached the 1,000,000-ton mark thus far, although it is estimated that the Northwest will need 30,000,000 tons to meet requirements. While the Chesapeake & Ohio and the Hocking Valley are prepared to handle Lake coal expeditiously, refusal of connecting lines to return empties has greatly limited such shipments.

During the last week of May only 24 per cent of the tonnage of the Logan field was shipped to the lakes, and it is estimated that if the relief asked for is given by the Interstate Commerce Commission, then it will be possible to increase Lake shipments to 50 per cent of the region's output.

#### West Virginia Coal Operators' Association

Suit of the Northern West Virginia Coal Operators' Association against certain railroads in northern West Virginia, including the Pennsylvania, Pittsburgh & Lake Erie, Monongahela and Morgantown & Wheeling railroads, was planned to be heard by the Interstate Commerce Commission on June 11, owing to the inability of the railroads named to have their evidence ready before that time. The case was to have been heard on May 28. It was brought by the operators to require the carriers named to furnish a sufficient number of cars to overcome a deficit of about 16,000 cars covering a period of a year.

# COAL AGE

The Weekly Journal of the Coal and Coke Industries

Volume 17

NEW YORK, THURSDAY, JUNE 24, 1920

Number 26

## *Commission Acts Decisively*

WHATEVER may be your viewpoint on the present coal situation all must agree that the Interstate Commerce Commission has acted quickly and decisively. A virtual embargo for a time on foreign exports of coal and an actual embargo on the use of open-top cars in the area east of the Mississippi for any purpose other than loading coal is a program that reminds us of war days. We may next expect a Lake car-priority order, for the Northwest will expect treatment equal to New England's.

The tidewater order will lower prices offered New England, expedite contract shipments coastwise, quickly satisfy the New England demand and raise export prices. Positive assurance of supplies will take the edge off the Boston appetite for coal.

The general order affecting the use of open-top cars in Eastern territory, coupled with the previous mandate ordering such equipment across the Mississippi is drastic and shows how seriously the situation is viewed at Washington. Before the end of the thirty days provided in the order production of bituminous coal will reach 12,000,000 tons and may go higher, *unless* railroad labor troubles again break out in protest against the delay in the award of the Railway Wage Board.

The stoppage of foreign shipments can be but temporary. Mr. Storrow, we are advised, will be satisfied with less than 1,000,000 net tons a month, an increase of about 300,000 tons over what New England is getting now. And having satisfied the preference for coastwise movement and the navy, the agents of the commission are free to permit bunker and export cargoes to load.

It is worth noting in passing that we are now following in effect the policy of Great Britain in the control of coal. The Board of Trade through the British coal controller restricts exports of coal from the United Kingdom to the extent necessary to protect the requirements of consumers at home, which, of course, is just what the commission has done in its order of June 19.

## *Coal Freight Increases*

JUST because the freight rate has little or no influence on coal movement today and differentials have for the time ceased to determine markets, the coal men are not neglecting the opportunity to put in the record on rate increases now being taken by the Interstate Commerce Commission their conflicting views. The Commission is gathering evidence on which to base a general rate increase sufficient to afford the railroads a "living wage." The National Coal Association put into the record the resolution passed at its third annual convention last month (*Coal Age* June 3, page 1162) endorsing the plea of the roads for increased revenues. Individual operators and representatives of producing fields, however, have appeared before the Commission

and befogged the issue by selfish claims. What the Commission needs in these troublesome days is help, not more tangles to untie.

How much better it would have been for the operators to have joined through the National Coal Association in a presentation to the Commission that showed clearly the main contention that the first consideration should be to restore the old differentials in coal rates, disturbed by the more or less uneven advance of June, 1918! What has happened, it appears, is that such fields as suffered by the change of that date have asked for readjustment, and those fields that were not affected or were favored have asked even better treatment.

It would seem that the way could have been left open to settle these local differences at some future date and to have now put forth a united front on the question of coal rates. How can anyone accuse the coal industry of being a trust and to represent a monopoly when every national issue finds such a lack of common purpose and lack of common leadership? The presentation of the coal man's case to the Commission is so confused by local contentions that the decision when given cannot be other than disappointing.

## *The Significance of the World Market for Coal*

IN the new order of things, participation in the affairs of the world is inescapable, the Republican party to the contrary. A year ago the State Department was seriously debating the advisability of our attempting to participate in the export coal business on a large scale. It was pointed out that notwithstanding the control of foreign business by the British and despite our national desire to save the best of our coal for use in this country, the United States would soon find itself in the position of the only dependable source of coal for the world. Whereas in 1913 the United Kingdom produced some 320,000,000 net tons of coal and exported 106,000,000 net tons or nearly 33 per cent of the total, in 1919 production was but 257,000,000 net tons of which about 52,700,000 net tons or 20.5 per cent was export cargo. The average per month in 1919 was 4,400,000 net tons compared with which we learn that 2,200,000 net tons were shipped from the United Kingdom in the month of April, 1920, or less than 12 per cent of the total output that month.

In the meantime exports by sea from the United States have been increasing. From the low figure of 3,740,000 net tons or less than .7 per cent of the output of the country in 1918, off shore export cargo shipments increased to 8,291,000 net tons or 1.8 per cent of the total in 1919. In April, 1920, cargo shipments from Atlantic ports reached the high figure of 1,903,000 net tons or 5 per cent of domestic production. The present rate of dumping for export is at the rate of nearly

24,000,000 net tons a year. The maximum performance of the railroads and piers at Atlantic ports was in 1918 when 44,500,000 net tons of bituminous coal were dumped at these piers for all purposes.

British opinion on the question of the world market in coal is well expressed by the editor of *The Compendium*, who says that "The [British] export trade has been arbitrarily suspended to insure necessary supplies of coal at home. Never was there such an opportunity for our export coal trade as at present. But the country is impotent to grasp it, and, meanwhile America has stepped in the breach and is literally sweeping the coal trade of Europe into her lap." This authority also states that "old time customers in Europe are weary of trying to get coal from Britain. They are sick to death of strikes, delays, and control confusion, and they turn gladly to America for relief." But not to America alone, for Indian and Natal coals are reaching the Mediterranean and in far off Australia coal has been sold for use in France.

Compare \$10 or \$15 a ton at Hampton Roads with 140s. in May at Cardiff. At the present rate of exchange 140s. is about \$28. The difference in shipping rates from the two sources to Continental ports is all that will prevent prices on this side from climbing still higher.

The wise policy for the United States is to stay in the world market for coal, for no sooner is the railroad situation straightened out than we will find ourselves with overproduction of coal again and need the foreign outlet as never before. The lack of output here and in Great Britain is due to different causes—there to lack of mine capacity and man power, here to deficiencies in transportation. We can and will overcome our failing long before England can recuperate her productive capacity, and in the meantime the world needs our coal.

### *What the Mine Pump Has Done for Industry*

INDUSTRY has forgotten what it owes to the mine pump, yet mining with its pumping needs gave industry no less an instrument than the steam engine. Newcomen's engine, invented in 1705, was in 1711 employed for pumping mines. Not until it was applied to this purpose did it have any useful outcome. Humphrey Potter's invention for opening and shutting the valves on the engine was made on a mine pump and Henry Beighton's plug-tree with tappets was invented in 1718 for the same purpose. Then came Smeaton, the great mine-pump builder. James Watt busied himself with a model of a mine pump in 1763.

Not until 1781 did Watt introduce the "sun-and-planet" device that turned the reciprocating motion into one of revolution and converted the mine pump into a steam engine suited for varied industrial purposes. Thus, for fifty-two years the mine pump led the way in the utilization of steam for power purposes. In 1769 came the discovery that steam could be used expansively and in 1782 a patent was issued to Watt covering its use in this manner. In the same year he developed the use of steam by applying it to both ends of the cylinder. From then on the mine pump became an engine for a multitude of industrial uses. Thus is the mine pump father to the factories and the factory systems of the world.

The work of pumping, with reciprocating motion, which is most economically performed at a low rate of

speed, just suited the gait of the single-acting atmospheric engine with condensation provided first of all by conducted heat, and then by a spray which lowered the temperature of the cylinder walls and made the action of the piston slow. The work of pumping seemed to be ideally adapted to steam power. It was often proposed, it is true, to use the steam engine to drive mills, but how? By raising water and using the water to turn a wheel. Denis Papin, as far back as 1690, proposed this use of his embryonic invention.

But when we celebrate the mine pump as the father of steam engines, we must not forget how much mining has owed to the mine pump. Without any satisfactory data to back the statement, it may be asserted without fear of contradiction that little of the coal in Europe and 50 per cent of the coal now being mined in America would have to remain underground if there were no mine pumps. There are large areas in mines that are roughly described as self-draining which are dependent on the mine pump for their development and operation. With what difficulty would coal operations be conducted if it were not for this necessary adjunct of coal mining?

### *Service and Servitude*

IN THE three-hour debate between Governor Allen and Samuel Gompers on the rights of the public and of the union members in labor disputes the paramount question was propounded by the Kansas executive thus:

"When a dispute between capital and labor brings on a strike affecting the production or distribution of the necessities of life, thus threatening the public peace and impairing the public health, has the public any rights in such a controversy, or is it a private war between capital and labor?"

Mr. Gompers did not give a satisfactory answer to this question. In fact he carefully evaded it, directing his efforts to proving that abridgment of the right of men to quit work made slaves of them.

After an interval of ten days Mr. Gompers gave out a carefully-prepared supplementary reply. In this, however, particularly for such an earnest, forthright spokesman, Mr. Gompers was scarcely any more satisfactory than in the debate with Governor Allen, being still insistent that "the public has no rights which are superior to the toiler's right to live and defend himself against oppression."

The fundamental issue is not the right to quit but the right to strike—matters apparently similar but actually different.

The inference that Mr. Gompers draws—that any man would or could be forced to work against his will—is peurile. The right of any man to quit work at any time is unquestioned. Carefully-planned strikes like those of the railroad switchmen and coal miners are another matter. Impending paralysis of industry, threats of starvation and freezing, intimidation of those willing to work, unless the demands of labor leaders are met, are what Governor Allen seeks to prevent.

By such methods the public is made an unwilling accessory to as vicious a conspiracy in restraint of trade as the Sherman anti-trust act was ever invoked to suppress. Through appeal to the primary instinct of self-preservation the consumer is enlisted as an unwilling but potent ally, who to prevent a calamity must bear the burden of the cost.

# Commission Takes Drastic Steps to End Coal Shortage East of Mississippi River

New England Given Preference and Priority in Transportation of Coal to Tidewater—J. J. Storrow Named as Consignee—Open-Top Cars Denied to All Commodities Except Coal for Thirty Days

**E**FFECTIVE June 24, the Interstate Commerce Commission has ordered that coal for New England shall have priority in transportation. The order was issued June 19. With that order came another providing for the preferential use of open-top cars for coal loading. The latter order became effective June 21 and is to continue for thirty consecutive days.

## EMBARGO ON COAL EXPORTS WAS FEARED

While considerable relief is felt that the commission did not order an out-and-out embargo on coal exports, it is believed that a modification of the priority order will have to be made in the very near future. With the Shipping Board order assigning 500,000 tons of additional shipping to the New England coal trade and with the priority order insuring the prompt loading of all vessels which are made available, it is expected that great congestion will ensue at New England ports. It is stated that dock capacity and means of inland distribution are entirely inadequate to handle the volume of coal which is certain to move to New England ports under these orders.

The priority order is the direct result of a visit to Washington of James J. Storrow and five New England governors. In fact, Governor Coolidge of Massachusetts was the only New England governor who was not a member of the party. Massachusetts, however, was represented by Mr. Storrow, who was fuel administrator for New England during the war.

## UNSETTLING INDUSTRIAL EFFECTS FEARED

It is feared that the priority order in favor of New England will have dire effects in depriving industries of coal. Carrying out of the New England order may shut down a large proportion of byproduct coke ovens. Textile mills are almost certain to have to close, along with many other industries which secure their coal from the regions which will be drawn upon most heavily by New England.

It was a great relief to coal men when the New England order was accompanied by instructions to give coal mines first call on open-top cars. This will insure an adequate car supply at most mines and is expected to bring out the maximum production during the period of the order. It is understood, however, that the thirty-day period will be extended if conditions warrant.

The order, of course, has called forth tremendous protest from other industries using open-top cars. The constructional industries are particularly vehement in their representations. The housing situation is such as to have resulted, it is asserted, in a nationwide demand for the government to embark in the construction of houses, so as to insure shelter for the population.

During the war, it is pointed out, constructional materials were placed at the bottom of the preferential list. Since then, the Interstate Commerce Commission is informed, cars have been available to handle only ten

per cent of the building materials offered for transportation. Second to the pressure being brought against any further curtailment of cars available for building materials, it is the demand that road construction be allowed to continue. Because of congestion on the railroads, highways are being used to an unprecedented extent, and have come to form a transportation channel second only to the railroads themselves. To cut off materials for their maintenance and extension is only to aggravate the situation still further.

Other industries using open-top equipment are working tirelessly to have set aside the preferential assignment of open-top cars for coal. The commission is being told that cars are not used efficiently in the coal trade. Even an aeroplane has been employed from which to make photographs of long lines of coal cars which have been standing for long periods under load. Figures are being gathered at many points to show that coal cars are neither promptly loaded nor unloaded.

## COMPLETE TEXT OF THE PRIORITY ORDER

The text of the Interstate Commerce Commission's service order No. 6, which covers priority for New England coal, reads as follows, in its entirety:

It appearing in the opinion of the commission that because of a shortage of equipment and congestion of traffic, aggravated by unfavorable labor conditions which continue to exist upon the lines of each and all common carriers by railroad within official classification territory and Southern classification territory subject to the Interstate Commerce Act, and further because of the inability of said common carriers properly and completely to serve the public, and especially in the matter of transportation of bituminous coal to New England, an emergency exists which requires immediate action, particularly with respect to the transportation of bituminous coal to tidewater coal transshipment piers at and north of Charleston, S. C., for transshipment by water to coastwise points within the United States:

It is ordered that the common carriers by railroad hereinbefore described be, and they are hereby, authorized and directed, effective June 24, 1920, and until the further order of the commission, in the transportation of bituminous coal consigned to any tidewater coal transshipment pier at or north of Charleston, S. C., and in the supply of cars therefor, and in the movement of such traffic, (a) to give preference and priority to earloads of such coal consigned to James J. Storrow, whose address is Boston, Mass., as a part of a pool or pools of bituminous coal at any such port for transshipment by water to any New England coastwise destination, or consigned as a part of a pool or pools of bituminous coal at any such port for transshipment by water to any United States coastwise destination other than New England; and (b) to furnish transportation of bituminous coal and cars therefor, consigned to any of said ports either for bunkering or for cargo purposes, only upon a permit and direction therefor issued by J. W. Howe, commissioner, Tidewater Coal Exchange, Inc., New York, for piers within New York Harbor, Philadelphia, Pa., and Baltimore, Md.; by E. I. Ford, commissioner, Newport News Coal Exchange, Newport News, Va., for piers at

Newport News, Va.; by E. M. Graham, manager, Lamberts Point Coal Exchange, Norfolk, Va., for piers at Lamberts Point, Norfolk, Va.; by S. T. Snead, commissioner, Sewells Point Coal Exchange, Norfolk, Va., for piers at Sewells Point, Norfolk, Va.; and by Frank McCabe, general agent Southern Railway Co., Charleston, S. C., for piers at Charleston, S. C., each of whom is hereby designated as an agent of the commission therefor; which permit and direction shall be issued only upon a showing that the destination of the water movement of such coal is a United States coastwise point, or if otherwise that the preference and priority hereby directed will not be impeded thereby, and in any event that the shipper or consignee will be able to unload such coal at the port of transshipment without delay to the rail equipment.

It is further ordered that each of said common carriers by railroad shall establish such rules and regulations respecting the placement of cars for unloading and of vessels for loading at such piers as will effect the preference and priority in transportation hereby directed, including the dumping of cars.

#### TERMS OF THE PREFERENTIAL ORDER ON CARS

Service order No. 7, in regard to the preferential use of open-top cars for coal, reads, in full, as follows:

It appearing in the opinion of the commission that because of a shortage of equipment and congestion of traffic, aggravated by unfavorable labor conditions which continue to exist upon the lines of each and all the common carriers by railroad subject to the Interstate Commerce Act within the territory east of the Mississippi River, and because of the inability of said common carriers properly and completely to serve the public in the transportation of coal, an emergency exists which requires immediate action:

It is ordered that such common carriers by railroad in the aforesaid territory which serve coal mines, whether located upon the line of said railroad or customarily dependent upon it for car supply (herein termed coal-loading carriers), be and they are hereby, authorized and directed for the period of thirty consecutive days beginning with June 21, 1920, to furnish such coal mines with open-top cars suitable for the loading and transportation of coal (herein termed coal cars) in preference to any other use, supply, movement, distribution, exchange, interchange, or return of such coal cars, provided that such coal cars may be used in service moving in the direction of the mine or mines to be supplied on the return movement, after the discharge of the coal lading thereof, upon a route not materially out of line and to points not beyond such mine or mines.

It is further ordered that all common carriers by railroad within said territory other than coal-loading carriers (herein termed non-coal-loading carriers) be, and they are hereby, authorized and directed during said period to deliver daily to a connecting coal-loading carrier or carriers empty or loaded coal cars up to the maximum ability of each such non-coal-loading carrier to make such deliveries and of each such connecting coal-loading carrier to receive and use the coal cars so delivered for the preferential purposes herein set forth.

It is further ordered that all such common carriers by railroad within said territory be, and they are hereby, authorized and directed forthwith and during said period to discontinue the use of coal cars for transportation of commodities otherwise than as hereinbefore specified (a) as to each coal-loading carrier, so long as any coal mine remains to be served by it with coal cars, and (b) as to each non-coal-loading carrier, so long as deliveries of any coal cars to connecting carriers may be due or remain to be performed under the terms of this order.

It is further ordered that all common carriers by railroad within the territory hereinbefore described be, and they are hereby, authorized and directed, effective June 23, 1920, and until the further order of the commission, to place an embargo against the receipt of coal by any consignee, and against the placement of coal cars for consignment to any consignee, who shall fail or refuse to unload coal placed for unloading within twenty-four hours after such placement, until all coal so placed has been unloaded

by such consignee, provided that this authorization and direction shall not interfere with the movement of coal under permit to any coal pool or pools when authorized by any order heretofore or hereafter entered by the commission.

It is further ordered that all rules, regulations and practices of said carriers with respect to car service are hereby suspended in so far only as conflicting with the directions hereby made; and that the authorizations and directions herein contained are to be considered as not conflicting with or superseding any service order heretofore entered by the commission.

## Northwest Asks for Lake Car Priority Order

W. H. Groverman, for Northwestern Dock Interests,  
Says Assigned Cars Are Essential to  
Supply Coal Required

**F**EARING that the arguments of the five New England governors might induce the Interstate Commerce Commission to divert coal to New England at the expense of the Lakes, W. H. Groverman, secretary of the Northwest Coal Operators' Association, presented the claims of the Northwest immediately following the representations made by the New England interests. He told representatives of the Interstate Commerce Commission that the matter of securing coal for the Northwest is much more urgent than the problem which confronts New England, since the Lakes are open for traffic an average of only 165 days per year. One-third of the season of navigation has passed and only an insignificant proportion of the coal needs of the Northwest has been transported. Mr. Groverman delivered to Commissioner Clark what he termed the ultimatum of the Northwest, which was a demand for assigned cars for Lake shipments so as to insure 100-per cent car supply for the mines supplying this fuel.

#### LAKE SUPPLIES FAR BELOW REQUIREMENTS

On June 1 only 1,800,000 tons of coal had been dumped at lower Lake Erie ports. On the corresponding date of last year 5,225,000 tons had been dumped. Moreover last year a surplus of 2,000,000 tons was left on the upper Lake docks at the close of winter. The coming of spring this year found those docks entirely bare of coal and they are still bare. The 250,000 tons which have reached Lake Superior ports passed immediately to consumers. The same is true of the 150,000 tons which were moved to Lake Michigan ports. These figures do not include, of course, shipments made for the account of steel and copper companies.

Mr. Groverman pointed out to Commissioner Clark that it is physically possible to move the requirements of the Northwest after July 1 but that it is inadvisable to delay the movement of this coal a single day. Mr. Groverman estimates the requirements of the Lake Superior commercial docks for the coming winter at 15,000,000 tons and those of Lake Michigan at 8,000,000 tons. This is in addition to the tonnage required for the industrial docks.

There is no demand in the Northwest for an embargo on the exports of coal. It is felt that New England should be willing to take its coal later in the season, if necessities require, since with two or three insignificant exceptions the New England ports do not become ice-bound. Moreover it was pointed out that New England already is a month in advance of the average year in the matter of fuel stocks.

# How the Valier Shaft Mine Was Quickly Developed for Large Daily Output—I

Ultimate Production Will Be Eight to Ten Thousand Tons Per Day—Coal Is Hoisted in 15-ton Skips the Coal Being Dumped Out of the Mine Cars Near the Foot of Shaft by a Two-car Rotary Dump

BY CARL SCHOLZ  
Charleston, W. Va.

**S**AFETY, conservation and economy were the three cardinal objectives which the owners of the property sought, when I was placed in charge of this new development, to have embodied in the Valier Mine

This seam ranges in thickness from 8½ to 12 ft. and lies at a depth of 620 ft. The coal is of quality as high as any found in Illinois, and the fuel requirements of the Chicago, Burlington & Quincy R. R.

Plant of Valier Mine

On the right is the tippel of the airshaft; in the center, the track-scale house and transformer station; in the background, the shops, and on the left, the office building.

Temporary Tippel

Rough structure built over main shaft and used for the hoisting of coal till the airshaft was lined. The hoist used for sinking served temporarily for winding, and a temporary skip transported the coal.

of Franklin County, Illinois. To be more detailed, the ends sought were safety for the men and property above all else, conservation of the coal supply (meaning a maximum extraction) with an equipment that would permit of the greatest economy and provide a large daily production.

The company owns the coal rights on some 13,000 acres of land which is underlaid with the No. 6 bed.

Co.'s fuel are largely supplied from this field. All the existing conditions called for a mine with a large production—large even for Franklin County, where more mines of big output are now located than in any other equal area in the United States.

The mine site lies on the southward side of a ridge the crest of which is one mile north of the town of Valier, which occupies the opposite hillside. The slope

affords natural drainage and grade for the railroad yards, while the town site also is favored with exceptional drainage for a flat country. Power for operation is purchased. This solution of the power problem was largely influenced by the absence of a suitable water supply.

Shaft sinking was started in September, 1917, and the coal was reached in May, 1918. The shafts were temporarily curbed with wood, but were later lined from top to bottom with well reinforced concrete lining, varying in thickness from 8 to 26 in., this thickness depending upon the nature of the strata penetrated.

#### MAIN SHAFT TO PRODUCE 6,500 TONS PER DAY

As soon as the bed was reached in the main shaft, hoisting of coal was started, the sinking engine by means of which the shaft had been sunk and a temporary skip being used for that purpose. Simultaneously the airshaft was receiving its concrete lining and being equipped with a tippie and permanent hoist. This hoist was put into service on Nov. 1, 1918. The main shaft was then concreted and equipped with permanent machinery. This permanent equipment was put in service on Oct. 1, 1919, and prior to the strike which commenced Nov. 1 of that year a production of 3,000 tons per day was attained. Up to the present date the maximum output has been 3,500 tons per day, but by the end of the present calendar year the production will have risen to 5,000 tons. The

normal production of the mine is to be about 6,500 tons per day, although by hoisting from both shafts, 8,000 or even 10,000 tons of coal can readily be raised with the equipment and track layout available.

Considering the serious obstacles encountered, such as the severe winter of 1917-18, the shortage of men arising from the army draft and the "flu" epidemic, also the difficulties in obtaining material, it is believed that this mine has reached a larger tonnage in less time than has heretofore been attained in the district.

While no radical departures were made in the way of equipment and methods, the plant as constructed represents machinery of the most modern type, and it is believed that it will be economy to extract at least 6,000 acres of coal through the shaft. The accompanying illustrations show the mine in its various stages of development. In the brief description of the plant which now follows special attention is called to the exclusive use of steel, concrete and brick, both in the surface structures and underground.

#### MAIN SHAFT BIG ENOUGH FOR TWO 15-TON SKIPS

The dimensions of the main shaft are 11 x 19 ft. in the clear. It is built with two compartments each large enough to accommodate a 15-ton overturning skip. The guides are 85-lb. track rails. Those which are at the sides are bolted directly to the end walls, while those in the center are supported by pre-cast concrete bun-

#### Tippie Airshaft

This sturdy headframe was built of old bridge steel on account of the high cost and scarcity of iron products during the war period. The photograph from which this illustration was made was taken when the tippie was still under construction. The shaft is 13 x 30 ft. in the clear and has four compartments. It had to be built wide enough to accommodate mining machines, electric locomotives and the standard Valier mine cars, which are 10 ft. 9 in. long.

tons. At the bottom of the shaft is located a two-car rotary dump, the coal being spilled directly from this into the skips, its flow being directed by a butterfly valve. The sump extends some 50 ft. below the level of the coal and is equipped with a conveyor for the removal of waste, as well as with a small pumping station.

The airshaft is 30 x 13 ft. in the clear and contains four compartments. The air compartment, 9 ft. wide, is separated from the others by a 12-in. concrete wall so that ventilation of the mine can be effected through the airshaft, allowing the main shaft to remain entirely neutral. A steel stairway occupies the second compart-

in the concrete lining. They are thereby protected from injury should any material or other objects fall down either of the shafts.

#### SURFACE BUILDINGS SUBSTANTIALLY BUILT

The tibble at the main shaft is a 5-track steel structure. It is equipped with a large hopper from which the coal is discharged by means of a feeder to the shaker screen. Two picking tables and loading booms are provided for the handling of lump and egg. The tibble also contains a coal crusher and a box-car loader.

The airshaft tibble is a two-track structure, equipped with a bar screen and 50-ton hopper and contains a

#### Washhouse Interior

Here is seating room for 500 mine workers and clothes hangers for some 600 men. Note the "bubbler" over against the wall to supply drinking water to the thirsty and three wash troughs for those who desire only partial ablutions.

ment. A single-platform cage counterbalanced by a two-story hoisting cage, on which men and counterweights can be handled, is installed for the hoisting of men and material and also can be utilized for the hoisting of coal.

#### SHAFT WILL ACCOMMODATE LOCOMOTIVES

The shaft was made as wide as 13 ft. because it had to accommodate long mine cars and locomotives. The equipment and cages are heavy enough to permit the hoisting of motors, mining machines and other machinery to the surface shop without dismantling. In this shaft are also installed the necessary pipes for water and air as well as electric cables. The signal wires in both shafts are installed in 3-in. pipes imbedded

single-car rotary dump. It can be utilized for the hoisting of coal for local sales as well as for the raising of rock, but is primarily intended to handle the men and materials to and from the mine.

The other surface buildings are built of brick and roofed with asbestos shingles. They have been located with a view to serving their purpose most conveniently. They are so placed that increases in sizes can be made should the expansion of the mine require it. All buildings are heated by steam supplied from the washhouse boiler.

The washhouse, with a change room accommodating some 600 men, is equipped with overhead clothes hangers and comfortable benches. It is well heated and venti-

#### First-Aid Station

A corner of the bathhouse has been set apart for a first-aid room which is simply but appropriately equipped for the reception of anyone who may be injured about the plant.

### Lamphouse

Valier mine lies 630 ft. or more below the rolling prairie and so it makes gas. A lamphouse has been constructed as an adjunct to the bathhouse and here 800 electric safety lamps are housed and tended.

lated and provides a most convenient place wherein employees may wash up and change their clothes. The two shower rooms, separated from the main change room, are equipped with twenty shower baths. The washhouse also contains a foreman's office, with showers and lavatories; a timekeeper's office where employees are checked in and out of the mine; a lamp house containing some 800 storage-battery lamps and a first-aid room.

#### COMPLETELY EQUIPPED REPAIR PLANT PROVIDED

The machine and repair shop, 35 x 100 ft. in ground plan, is equipped with the necessary tools for repairing mining machines and locomotives. A 35 x 100 ft. warehouse has been constructed. This is provided with a track running through the center of the building and leading directly to the shaft. The office building has the necessary accommodations for the general office force and engineers.

The fan house contains a 5 x 14 ft. fan driven by a 250-hp., 2,300-volt motor as primary drive and a steam engine connected by a clutch to keep the ventilation going in case of power trouble.

*(To Be Continued.)*

### Governor Does Not Want Troops at Matewan

SENATOR JOSEPH I. FRANCE, of Maryland, having introduced in the Senate on Friday, June 4, a resolution calling upon the President to consider the advisability of sending Federal troops into West Virginia "to suppress domestic violence and prevent civil conflict," Governor John J. Cornwell, of West Virginia, in a telegram told Senator France that his impudence was exceeded only by his ignorance of the Federal Constitution.

At the same time that the Maryland Senator introduced his resolution he asked that it be allowed to lie on the table so that he could call it up for the purpose of making a speech on what he termed were the conditions existing in West Virginia. Data for the speech he was to deliver were furnished, it is charged, by the United Mine Workers.

Following the trouble at Matewan, W. Va., the United Mine Workers called upon the War Department and the Department of Justice to interfere. When the miners were told that no report of a dangerous situation had been received and that troops could not be sent into West Virginia unless the Governor of the State requested it, representatives of the miners became highly incensed at the Department of Justice.

### Washhouse

This building contains two shower rooms each with twenty shower baths, hooks for 600 men, a foreman's office, a lamp-charging and first-aid station. Illinois has a number of excellently-appointed bathhouses. In that state the mine workers nearly all bathe and dress before they leave the plant.

### A Tight Place

If we could get shoveling machines into the narrow passages and low head room into which we can get our undercutting machines, a larger field would be opened for their operation, especially in the British Isles, where this picture was taken.

## Economy and Safety Are Secured by Use of Alternating-Current Coal Cutters

Savings in Equipment Cost, in Power Expense and in Maintenance Charges as Well as Greater Safety Accrue from the Use of Alternating Instead of Direct Current for Driving Undercutters

BY CHARLES B. OFFICER  
Chicago, Ill.

**A**LTERNATING-CURRENT motors were first applied to continuous coal cutters in America during the fall of 1912. At that time a Sullivan continuous-cutting chain machine fitted with an induction motor was put into operation by the Star Mining

Co. at Rugby, Col. Shortly afterward a second machine identical with the first was started by the Gordon Fuel Co. at Walsenburg, Col. These machines differed from the standard "CE-7" equipment in that an induction motor with suitable starting apparatus replaced the direct-current motor with its starting mechanism. The induction motor and the direct-current machine it replaced were of the same rated horsepower.

From the start the operation of these machines was closely watched. It soon became evident that the application of alternating electric current to coal-cutting equipment was, and would be, successful and economical. Since that time there has been a constant increase in the number of mines which use this form of energy for the operation of cutting machines.

### WHY ALTERNATING CURRENT IS FAVORED

The largest single installation employing alternating current underground is at the mines of the Nokomis Coal Co. at Nokomis, Ill. Here thirty-two Sullivan "Ironclad" machines are being operated with 220-volt 3-phase 60-cycle current. The Nokomis Coal Co. was the first in the State of Illinois to use continuous coal cutters equipped with alternating-current motors. It began the operation of these machines in 1913. Since that date the proportion of coal mined in Illinois with alternating-current equipment has increased till now about one-fifth of the coal produced by machines is cut by such equipment.

While there probably are more alternating-current coal cutters in use in the Central and Western States than in the East and South, the satisfaction that the alternating-current machines are giving is leading to their adoption in these older fields in constantly increasing numbers. In foreign lands also alternating-current

CONNECTION TO FEED LINES IS READILY MADE BY DROPPING THREE HOOKS OVER THE THREE CONDUCTORS

It is just as easy to connect up the cable with alternating current as with direct, except for the fact that there are three contacts to be made instead of two.

### An Unpretentious Device

A motor-generator set would make a handsomer illustration, but with alternating-current it is not required. A transformer sunk into the wall of the entry is all that is necessary for stepping down the current. It does its work without an attendant, and does it well. Being so simple, it is inexpensive in first cost, operation and maintenance, readily portable, space saving and in every way desirable.

cutters are increasing in popularity both in longwall and in room-and-pillar mines.

From the above some idea can be gained of the increase in the use of alternating current. The causes that underlie the preference for that form of electric energy are briefly: (1) Saving in initial equipment, (2) saving in operating power charges, (3) greater safety in operation, (4) saving in maintenance expense.

The saving made in the initial equipment cost is the result of the difference between the electrical characteristics of alternating and direct current. It is a known fact that in a 3-phase alternating-current system only 75 per cent of the total weight of copper is required for the circuit that is needed for the installation of a direct-current line of the same voltage and line losses. When the amount of underground wiring necessary for a cutting machine is considered the saving in copper cost alone is an important factor. As it is considered good practice in many localities to run a feed line and use a bonded-rail return where direct current is employed, the statement above should be corrected somewhat, for the figures covering necessary copper refer to a two-wire direct-current circuit.

#### • EXCESS COPPER USED TO OFFSET RAIL RETURN

However, it does not follow that where a bonded-rail return is used a direct-current circuit of this type employs only one-half the copper necessary for a two-wire circuit of the same capacity. The reason for this is that in order to incur only the same power-transmission losses in the circuits it is necessary to install a much larger feed line on the single-wire circuit than is necessary if two wires are used.

This compensates for the larger losses of power in the return side of the circuit, which is composed of bonded rails having a much higher resistance than an all-copper return. It has been found in actual mine

practice that a 3-phase alternating-current circuit of the same voltage requires from 5 to 10 per cent less copper than a single-wire direct-current circuit having the same power-transmission losses.

It has been argued in favor of the direct-current installation that in all coal mines some form of haulage system is necessary; up to the present no suitable alternating-current mine locomotive has been designed and it is consequently necessary to use direct current for this purpose. Trolley lines for the haulage system therefore must be installed. Since these lines are necessary, mining machines can be operated from them and it would seem that it would be merely a duplication of expense to install the series of wires necessary for carrying alternating current to the machines.

#### LINES FOR LOCOMOTIVES AND FOR CUTTERS

This viewpoint is contrary to the best mine practice of today. It has been found by experience that with a mine equipped with direct current only, greater economy has been secured where power lines have been installed for the mining machines independent of those for the haulage motors. The reason for this is that when locomotives and mining machines are on the same power lines the former may draw so much current that the voltage maintained on the mining machine is fluctuating and often low, so that the undercutter slows down and stalls, with resultant loss in coal output. This loss in output more than counterbalances the added cost of a separate power line for the cutting machines.

Not only is the above loss in coal output incurred through having two classes of machines on the same power lines but it has been found also that because of fluctuating voltage the repairs to the cutting machines are increased. This means further loss of production. From the above, the desirability of using independent circuits for haulage and cutting is apparent.

There is, moreover, an additional saving to be made with alternating current. This arises from the fact that by its use it is possible to carry energy at high potential, with a corresponding saving in copper, close up to the point of application and there transform it to a lower voltage suitable for the machines installed.

#### CAN BRING HIGH TENSION NEAR WORKING FACE

This latter economy can be secured in either of two ways—the high-tension current can be carried underground and stepped down to a voltage suitable for the machines at transformer stations, placed within 500 to 1,500 ft. of the face, or the transformer stations may be placed on the surface and low-tension conductors dropped through boreholes to the working face.

In this latter case the transformer stations above ground should be moved forward from time to time as the face advances. In most installations the transformers will be so proportioned as to reduce the voltage to between one-fifth and one-tenth of its original value. Since the weight of copper required for a circuit is inversely proportional to the voltage carried, the saving that can be made in copper expense by the use of these transformers is at once evident.

The second main reason for the growing preference for alternating-current mining machines lies in the cost of producing power. A saving may be made here through the installation of a central power plant for several mines or by the purchase of power from a central generating station. In a large power plant economies of operation can be realized which are impossible with smaller operations. The nature and method of securing these savings have been reviewed so many times at length in the various technical journals that

no necessity exists for going into details regarding them.

The ease with which alternating current can be transmitted long distances and transformed with only slight losses renders possible still further savings. A direct-current plant does not lend itself to easy and efficient transformation of voltage and precludes long transmission at high potential. Moreover, the use of direct current necessitates a substation with rotary converters, or motor-generator sets, which always require attendance, whereas with an alternating-current installation the transformer requires no attention.

The third consideration favoring alternating current as against direct is the greater safety attained in operation. In comparing the safety of a direct- with an alternating-current circuit it is necessary to remember that in all parts of the direct-current system there is always a difference in potential between the line and the ground equal to the voltage carried. Should anybody come in contact with the feed line or any part of a live direct-current circuit, he would be subject to a shock from a current of this potential.

#### PROPER GROUNDING REDUCES SHOCK LIABILITY

On alternating-current installations when the secondary side of the circuit is not grounded it is necessary for a person to come into contact with two out of three wires in any part of the circuit before he would receive a shock. He would then receive the same voltage that he would from a direct-current system. Where alternating-current systems are properly grounded there exists between either of the live wires and the ground a difference in potential equal to approximately one-half the voltage of the full line circuit. This cuts down by 50 per cent the shock which can be received by making

USING A SHORTWALL ALTERNATING-CURRENT COAL CUTTER IN A THICK SEAM

Note the cable in the rear of the machine by which three conductors without any complication bring the electric energy to the induction motor. The connections are quite simple and readily made. The mine in which the photograph for this illustration was taken is located at Nokomis, Ill.

contact with this wire and the ground. Moreover, when alternating current is used it is possible to carry the wire through air courses or passageways seldom frequented by the men.

With an alternating-current circuit also, since the size of each wire is considerably less than that required on a direct-current circuit and it is possible to employ insulated conductors, it is the general practice to install insulated cables. This secures a still greater degree of safety and favors alternating-current.

The fourth item tending to make an alternating-current installation preferable to one employing direct current lies in the saving made in maintenance expense. As far as the mechanical end of the cutting machines is concerned, the cutter bar, feeding mechanism and gearing are identical with those employed in the direct-current machines.

The difference in construction consists merely in replacing a direct-current motor with one utilizing alternating current. The alternating-current motor lacks the commutator, brushes, resistance coils, etc., that a direct-current motor requires. The necessary repairs and renewals on such parts are therefore eliminated. In fact, a well-designed induction motor is extremely simple and durable.

#### OVERLOADED, THE A.-C. CUTTER WILL STALL

The operating characteristics of an induction motor (in comparison with those of a direct-current machine) are such that less severe stresses are thrown by it upon the mechanical parts of the undercutter. With a direct-current motor should the voltage fall any considerable amount, or should the operator of the machine be careless and run the cutter with full bits the motor will continue to drive the cutting mechanism at reduced speed, putting heavy and excessive stresses on all parts of the device.

When similar conditions arise with an alternating-current installation (that is, either a voltage drop or the existence of a great number of dull bits in the cutter chain), thus placing an excessive load on the motor, it will stall, calling to the runner's attention the fact that there is either something wrong with the voltage or that he needs to reset his cutter bits. It naturally follows that at all times the bits are kept in fair condition, thus preventing excessive stresses from being thrown on the mechanism. It has been found also in operating cutting machines of either the direct- or alternating-current variety that when the runners keep their cutter chains always properly filled with sharp bits, they increase their cutting capacity, with a corresponding increase in the daily coal output.

#### LOW INSTALLATION COST AN ADVANTAGE

The induction motor is a much more nearly constant-speed machine than is a direct-current motor. When conditions are encountered in mining that put a heavy load upon the undercutter the slight reduction in speed caused thereby gives an increased torque to the motor, thus enabling it to carry the overload up to a certain limit. Once this point is passed, however, the motor stalls.

To sum up, alternating current for driving coal cutters is growing in favor. This is due to its lower initial cost for installation, the saving its use makes possible in operating expense, in power and in maintenance, as well as an increased factor of personal safety which its use renders attainable.

## Ed. Snyder Found An Accessory to Murder

THE case of the state against Ed Snyder, charged with complicity in the shooting up of a party of miners at Glen White mines in Raleigh County, West Virginia, in November, 1917, was put on trial in the Circuit Court of Pocahontas County on Friday, June 4, the case having been removed to Pocahontas County from Beckley, Raleigh County. The first day was taken up in hearing the motion of the defendant for continuance, which was overruled by Judge Summers H. Sharp; but little time was taken up in getting a jury.

The opening for the state was made by Captain S. B. Avis, of Charleston, and for the defense by W. G. Barnhart, former U. S. Attorney, also of Charleston. The case grew out of the shooting at a cage full of miners, as they came from their work in the mine at Glen White. A party of men ambushed on the mountainside nearby fired hundreds of shots at them, but no one was hurt. A number of the men implicated have been convicted or have confessed.

The charge against Snyder is that, in the fall of 1917, when the government was requiring that every coal mine produce its limit of coal or be taken over by the Fuel Administration, he planned and furnished the arms and ammunition for the ambushade, though he was not one of those who actually took part in the shooting.

A strike had been called at the Glen White mine and 50 of the 400 miners employed had quit work, but the mine continued to turn out its full quota of coal. The Fuel Administrator refused to interfere and the strikers then resorted to force and violence, and the bushwhacking party of Nov. 16, 1917, was the result. Snyder was an officer of the local miners' union, which called the strike.

More than a year went by before sufficient evidence could be found to back indictments which were filed in the Criminal Court of Raleigh County at the March term of 1919. Four indictments were returned, eight men being indicted jointly. The defendants elected to be tried separately and Tony L. Stafford was put on trial. A hung jury resulted, but the second trial in January ended in a conviction of the defendant. He was charged as an accessory before the fact with an attempt to commit murder and a felony. Witnesses estimate the number of shots fired at the miners fleeing from the cage to shelter at as high as 300, yet no one was hit. The distance fired was 900 ft., and the bullet holes were numerous in the buildings around the mouth of the mine. The weapons used were Winchesters, Mausers, shotguns and pistols.

One of the witnesses for the state, Mrs. Maggie Lethco, of Lester, who has been under guard, was attacked at a hotel in Bluefield and stabbed in the left side, the assailant making a wound four inches long, but missing vital parts. She was able to go from Bluefield to Marlinton in a car, but collapsed on getting there and is now in a hospital at Bluefield.

The witness had retired for the night, the guards being in an adjoining room. Two men went up the elevator and knocked at her door. When she opened it the attack was made. Two men are under arrest who are believed to be the assailants.

After a seven-day trial Ed. Snyder was convicted by the jury on the first ballot and ordered to serve a five-year term in the penitentiary. The armed miners who drifted into Marlinton when the trial commenced quieted down when the state police arrived.

# How the "Grand Push" Determined Present Character of Pennsylvania Coals

Most Geologists Lay Stress on the Geologic Horizon—This Monograph Deals, However, with What Is Perhaps More Important: the Relation of Quality to Geographic Location

BY GEORGE H. ASHLEY\*

**I**F IT was hard for the average doughboy who first saw northern France torn and trampled by war to picture to himself those same regions as they were before the war, how much harder it is for the average man to picture Pennsylvania before the grand shove changed the surface of that great State from a smiling plain to an impassable sea of ridges and that at the same time changed its vast buried swamp deposits, which had been but recently laid down, into many different types of coal!

Let us go back a few years, say 200 odd million—that is the latest and best estimate of the geologists. If that is too much, cut it down to suit

suit yourself, only leave a plenty. For a long time, say 75 million years, more or less, a spirit of unrest had been over the land of William Penn. The land lay near sea level, sometimes above, sometimes below. From time to time peace settled over the region, and vast swamps were formed, some of these being scores or hundreds of feet deep. Then the spirit of unrest would set in and the land would sink and be overrun by the sea; at first by the open, salt sea, and later by fresh waters that probably came from some great inland sea lying to the westward. Deposits of mud and sand were carried widespread over the submerged surface, until the filling again reached water level and another vast swamp formed.

This was repeated time and again with all sorts of variations until the district became a graveyard of old swamp deposits which stretched far to the southwestward. At times the land was raised a bit, and running water carried away part of the mud so recently laid down; in places even parts of the marsh deposits themselves were removed. But the general movement was downward, and after each such rise came a sinking and the half-eroded gulleys were soon washed full of sand and the sinking process went on.

But this marshy period was near the close of long ages of sinking, covering hundreds of millions of years, that had been going on through the Appalachian region until the old rock surface had been bowed down in places

as much as 40,000 ft. in a long belt where now stand the Appalachian Mountains. During this time the filling in with new rock material had about kept pace with the sinking until the whole mass had been blanketed with the buried swamp deposits.

Then came the grand push! Just what happened or

how it happened I shall not attempt to describe, but after such a great accumulation of rock material something was bound to happen. You cannot stretch a rubber indefinitely, nor can the earth's crust sink indefinitely at one place without upsetting the crustal balance. The conditions might be likened to the collapse of a

When the measures over the coal along the line of the Appalachian Mountains were eight miles deep something gave way and the "Grand Push," or pushes, occurred, moving the earth's crust scores of miles, carbonizing coals and distilling shales. Measures near the mountain line folded most and the coal in that region is more completely carbonized.

long, low, arch bridge. Not suddenly, though probably with endless earthquakes, the part of the earth eastward from Pennsylvania began a grand push on the part of the earth's crust to the westward. How long the push lasted I do not know, but probably for millions of years.

When the push was over what a sight was there! In place of the great wide stretching plain or the shallow sea there was now but a sea of ridges. The whole surface of the earth had been shoved northwestward scores of miles and bent into folds that made ridges that may have dwarfed any of the mountain ranges now to be seen in America. It is possible or probable that the push took so long that the ridge tops were eaten down as they rose, and never became nearly as high as they would have been had the uplift been made suddenly.

The rocks and marsh deposits, the latter now changed to coal beds, were more strongly affected at the east and less strongly at the west. The rocks at the east were, so to speak, in the front-line trenches. In fact, along what is now the Allegheny front, just west of Williamsport, Lock Haven and Altoona, the rocks seem to have made a final stand as if, to carry through the simile, their "backs were to the wall." West of that line the rocks were crowded back on themselves and slightly folded, but in general held their places. This line of holding is nearly straight from Alabama to central Pennsylvania, at which point it turns eastward. The northeastern part of Pennsylvania appears to have formed a hinge or buttress that held in place. Whether the rocks there were more resistant or whether the force of the push had lost its energy, which had been expended further south, I do not know.

Then came a long period of quiet, through what has

\*State geologist of Pennsylvania, formerly geologist in charge of coal investigation in Eastern States, U. S. Geological Survey, and one time chairman Coal Classification Board of the same Survey.

The illustrations in this article are taken from one of a series of state maps of the U. S. Geological Survey. There are nine of them and the price is 10c. a piece. The maps are, of course, larger and more detailed, giving not only the coal areas, towns and counties but the villages and railroads also.

COAL FIELDS OF EASTERN PENNSYLVANIA

All the coals mined in this section of the State have some title to be known as anthracites, though in some of them, notably those in the Bernice basin and on the horns of the Southern and Western Middle Fields, which extend west, the coal is a soft anthracite which Mr. Ashley designates as "Bernicite," after the field of that name. Pennsylvania was at one time covered with coal and she might bring action for trover against the other states which apparently have stored away acres of her coal in places unknown.

been called the Age of Reptiles, during which time such great reptiles as are shown in the Carnegie Museum at Pittsburgh, and in all of the other large museums, roamed the earth. During this time the mountain ranges were being eaten down by rain and running water, until Pennsylvania was again a great rolling plain. But in this eating away of the mountains the rocks were carried away by the cubic mile, including a large part of the coal beds laid down there such a short time before. Here and there a little coal escaped, being carried away because it lay in the bottom of a fold that had been folded below the level of the new erosion plain. It was thus that the coal in the anthracite fields, the Bernice and the Broad Top fields, escaped being carried away and remains to this day.

What has become of the rest of the coal? The fixed carbon and the volatile matter returned to the air, and the ash washed down the rivers. When Washington marched to Fort Pitt, Pittsburgh, the Pittsburgh and other coal beds of that region were being carried away by rain erosion, but probably none of those coals ever reached the Ohio River in such form as to be recoverable. Coal outcroppings which occur along or across the bed of a creek having a steep profile may be recog-

nized as "float" for a few hundred feet below the outcrop, but seldom more than one-fourth of a mile. It may therefore be put down as fairly certain that this coal removed long ago has not been accumulating somewhere waiting for someone to come to dig it up.

After the upfolded ridges had been eroded nearly to a plain, over which rivers flowed southeastward to the sea, there came a broad movement of uplift centering in the Appalachian region. As the land rose the rivers became more active, and continued to eat their way downward, chiseling their old channels across the hard layers which now form the ridges, while side branches of the main rivers cut out the softer layers, until central Pennsylvania became again a sea of flat-topped ridges of hard sandstone, separated by wide valleys where the rocks were shales of limestone, until the surface became as it is today.

BLACK SHALE LOST MUCH BITUMINOUS MATTER

But the grand push did more than fold the rocks. In the process of folding the rocks were compressed and fractured, and possibly or probably were heated to some degree, the final effect of which was to drive out of the black shales their bituminous matter, as if it had been distilled out, and to drive out of the half consolidated marsh deposits more or less of volatile matter or gas, at the same time helping to consolidate it into coal. As with the folding, the effect was most pronounced at the east and decreased westwardly.

In the region where the anthracite is now found nearly all of the volatile matter in the coal was driven off, and the coal was compressed until almost as hard as a rock leaving the "hard anthracite." At the western end of the Southern and Western Middle fields and in the Bernice field the action was less severe and a little of the volatile matter remained in the coal which was not so hardened by compression, giving us our "soft anthracite" or "Berneite" (as I have recently suggested calling this type of coal) in which the fuel ratio, that is, fixed carbon divided by volatile matter, is between 7 and 10. Further west the coal was affected still less. In southern Cambria County, most of Somerset County and in the Broad Top field from 15 to 20 per cent of the volatile matter remained in the coal. Most of the coals of the Johnstown, South Fork, Somerset and Meyersdale fields, as shown on Map No. 2, are of this type. This coal is of the same type as the Pocahontas coal, and has therefore been called Pocahontite, as Pocahontas coal has been shipped and is known the world over.

The coal of the northwestern part of Cambria County, in the Moshannon and Snow Shoe fields, and most of that in Tioga and Bradford counties is of the next type, in which there is left from 20 to 25 per cent of volatile matter. This type has been called "Sewellite," from the type of coal found in the Sewell bed of the New River district of West Virginia. The fuel ratio of this type is from 2.5 to 3.5.

Going still further west the effects of the grand push were less pronounced and there was left about half as much volatile matter (by weight) as of fixed carbon, the fuel ratio being about 2 or from 1.85 to 2.5. This includes the famous Connellsville coking coal, from which the type has been named "Connellsite." It includes also most of the coals in the same belt to the northeastward, including the coal in the Latrobe basin, western Indiana County and the Punxsutawney field.

West of the belt just indicated is found the typical

Pittsburgh gas and steam coal, to which the name "Pittsite" has been applied. This coal differs markedly in its physical character from the coals further east. It is a strong coal, mining and shipping in large blocks or cubes, these blocks being the result of vertical joints in the coal combined with bedding plains. Further to the east the vertical joints became more pronounced and nearer one another until in Clearfield, Cambria and Somerset counties the coal is all split up, with such close-set vertical joints that it tends to mine in long blocks or "sticks," the long side of the blocks lying vertically in the bed. These joints are the result of the

pressure to which the coal has been subjected. Pittsite has a fuel ratio of from 1.4 to 1.85.

In the coals of the northwestern part of the State, including the Beaver, the Mercer-Butler, and the coal fields in the adjoining counties, a still higher percentage of volatile matter is carried, commonly from 35 to 40 per cent. That part of the state was less affected by the grand push. This type, which has been called "Belmontite" (from Belmont County, Ohio) has a fuel ratio of less than 1.4 and usually has more than 35 per cent of volatile matter.

As just described, there appear to be seven types of

COAL FIELDS OF WESTERN PENNSYLVANIA AS THEY ARE POPULARLY KNOWN AND DESIGNATED

In the right-hand corner are a number of counties without any coal whatsoever, though a remarkable exception is the Broad Top field in Huntingdon, Bedford and Fulton counties. The coal area with this exception appears to fall within a rude quadrant with the lower right-hand corner of the map, near Gettysburg, as approximate center. Along that quadrant the coal has a semi-bituminous character and as the geologist travels further away from Gettys-

burg, reaching points toward the west and northwest, the coal gets more and more truly bituminous, getting richer in bitumen as each anticline is crossed. The folds, which near the quadrant are quite stiffly marked, become less and less deep as points to the northwest are reached. It is not safe to try to regard location and structure as the final test of the volatile content in the coal. Some other influences, which science may yet satisfactorily explain, ap-

pear to exist, forming a problem which demands solution. As we leave the quadrant and go northwest the needlelike coals of the Moshannon Valley give way to the blocky coals of the Pittsburgh, Freeport, Kittanning and Low-Grade Division coal areas showing that the "Grand Push" affected the quality of coal not only in volatile content but in structure also, and some have contended in pyrite also, though Mr. Ashley does not deal with this feature.

coal in Pennsylvania, with possibly an eighth type barely recognized in recent analyses. These are as follows, the fuel ratio being the basis for the classification:

TYPES OF COAL IN PENNSYLVANIA

Type Letter	Type	Fuel Ratio	B.t.u.	Moisture	"Standard Analyses"			
					Volatile Matter	Fixed Carbon	Ash	
A	Anthracite							
	"Hard Anthracite" . . .	10	13,850-13,250	3	5	86	6	
B	Semianthracite							
	"Soft Anthracite" . . . . .	10	0-7.0	14,000-13,650	3	9	82	6
*C	Brushymontite . . . . .	7.0-5.0	14,600-12,000	3	13	78	6	
D	Pocahontite . . . . .	5.0-3.5	14,850-14,250	3	17	74	6	
E	Sewellite . . . . .	3.5-2.5	14,650-14,000	3	22	69	6	
F	Connellsville . . . . .	2.5-1.5	14,350-13,750	3	27	64	6	
G	Pittsboro . . . . .	1.85-1.4	14,250-13,700	3	33	58	6	
H	Belmontite . . . . .	over 1.4	13,750-13,000	3	40	51	6	

\*Not represented in Pennsylvania except by a very few samples, especially from the Broad Top fields.

Space does not permit of a detailed study of the character of the coal of Pennsylvania, nor are the data available at this time sufficient for such a study. Plans have been made by the State Survey in co-operation with the Bureau of Mines for starting a comprehensive sampling of the coals of the state.

PLACE AND STRUCTURE NOT THE ONLY FACTORS

The work already done shows that even in the same districts the coals are not altogether of the same type. For example, in southeastern Washington County the Pittsburgh coal at Marianna shows 34.6 per cent of volatile matter to 57.7 per cent of fixed carbon, giving a fuel ratio of 1.66, while the Waynesburg coal of the same region shows about 33 per cent of volatile matter to 47 per cent of fixed carbon, giving a fuel ratio of 1.42. In the same way it is found that fields which structurally and geographically appear to be similar may be quite dissimilar in the type of coals therein contained. Thus the Johnstown and South Fork fields contain coal of the Pocahontas type, while the Barnesboro-Patton field in the northwestern corner of Cambria County contains coal of the Sewell type. But coal in the Mountain field lying east of the last-named tends to the Connellsville type, which is much lower in percentage of fixed carbon, showing that by some cause not yet recognized the coals in that field were not as deeply affected by the grand push as the coals further to the west.

SHOW COMMERCIAL, NOT SCIENTIFIC, GROUPINGS

It is therefore not possible to designate the coals in each of the fields as of a single rank, though as sampling becomes more complete it will be possible to give the general rank of the coal in each of the fields shown on the map.

It should be added further that the designation of fields on the map is not quite in accord with that which has been adopted by the State Survey in a forthcoming report. In that report the fields are separated primarily on the basis of the rank and character of the coal.

Thus, according to the map, the Clearfield field includes in one basin not only the Moshannon coal but the coal along the west branch of the Susquehanna River where it passes the town of Clearfield. As a matter of fact, the two areas are distinctly separated by the Laurel Hill anticline and the coal of the Moshannon field has a much larger percentage of fixed carbon than that around Clearfield town and further up the river.

In the same way, the South Fork and Johnstown districts are separated by the Viaduct anticline and not as shown in the map. Practically all of the fields shown

on the map as having a long northwestern-southeastern diameter contain a different rank of coal at the southeast from that found at the northwest. The grouping of the fields on the map shows rather a grouping of mines with reference to transportation than with reference to the character of the coal.

SELECTED TYPICAL ANALYSES OF PENNSYLVANIA COALS (Analyses by U. S. Bureau of Mines)

Fields (as per map)	B.t.u. (As rec'd)	Moisture	Volatile Matter	Fixed Carbon	Ash	Type of Coal
Northern Anthracite . . . . .	13,830	2.2	5.7	86.2	5.9	A
Southern Anthracite . . . . .	13,300	2.8	1.2	88.2	7.8	A
Bernice . . . . .	13,380	3.1	8.5	78.0	10.1	B
Blossburg . . . . .	13,810	1.7	21.5	67.6	9.2	E
Snowshoe . . . . .	13,862	3.5	22.1	66.6	7.8	E
Moshannon . . . . .	14,150	3.1	21.0	69.0	6.2	E
Mountain . . . . .	14,072	1.1	25.6	64.4	8.2	E
Barnesboro-Patton . . . . .	14,175	3.0	22.5	67.9	6.2	E
Nanty Glo . . . . .	14,620	1.2	20.5	72.1	6.0	D
Johnstown . . . . .	14,081	2.0	14.4	75.3	8.1	D
South Fork . . . . .	14,278	3.5	17.3	73.2	5.8	D
Broad Top . . . . .	14,414	2.4	18.2	73.4	6.2	D
Somerset . . . . .	14,170	3.0	15.5	74.5	6.8	D
Meyersdale . . . . .	14,290	2.7	19.3	71.2	6.6	D
Ligonier . . . . .	13,370	3.3	23.0	62.5	11.2	E
Conemaugh (eastern part) . . . . .	13,820	2.5	17.9	70.4	9.2	D
Clearfield (western part) . . . . .	14,000	4.1	23.0	66.8	6.1	E
Connellsville . . . . .	13,990	2.8	30.0	60.0	7.2	F
Indiana . . . . .	14,310	1.3	26.7	64.4	7.6	F
Glen Campbell . . . . .	14,054	3.4	23.1	67.2	6.3	F
Punxsutawney . . . . .	14,300	2.5	27.8	64.0	5.7	F
Bennett Br. . . . .	14,020	2.7	32.4	58.6	6.3	G
Shawmut . . . . .	13,280	2.9	34.7	52.8	9.6	G
Klondike . . . . .	13,270	4.2	32.3	54.0	9.5	G
Greensburg . . . . .	13,610	2.7	30.3	57.8	9.2	F
Irwin . . . . .	14,150	2.0	33.6	58.1	6.3	G
Freeport . . . . .	13,100	2.7	35.7	50.9	10.7	G
Sagamore . . . . .	13,510	1.0	34.1	54.1	10.8	G
Pittsburgh . . . . .	14,000	2.6	34.9	56.3	6.2	G
"Thick Vein" Freeport . . . . .	13,940	1.2	35.9	55.4	7.5	G
Kittanning . . . . .	13,310	1.4	36.2	52.5	9.9	G
Low-Grade Division . . . . .		3.3	33.8	56.8	6.1	G
Clarion . . . . .		4.8	37.9	50.3	7.0	H
Greene County (western) . . . . .		2.8	36.0	48.4	12.8	H
Washington Co. (central) . . . . .		1.4	37.1	53.8	7.7	G
Washington Co. (northern) . . . . .		2.2	39.2	52.6	6.0	H
Beaver . . . . .	13,770	2.5	38.0	54.5	5.0	G

The analyses given are actual analyses made by the U. S. Bureau of Mines, but selected as far as possible on the basis of low ash. To that extent the analyses may not be fair averages of the several fields, for in one field the analyses given may contain the typical amount of ash and in another the ash given may be much lower than the average. In the same way the heat values given reflect the ash and moisture contained. The several analyses given are not intended to show the grade of the coal, that is the typical ash and moisture contained, but rather the general relation of the several component parts and the relation of the volatile matter to the fixed carbon. To compare the heat value of the coal from different fields regardless of ash and moisture, the B.t.u. value given should be multiplied by 1 plus (ash plus moisture in percentage).

McLachlan Would Reduce Output One-Half

IF THE advice of District Secretary J. B. McLachlan is taken the miners of Nova Scotia will cut down their output until the Minister of Labor changes his announced decision that he will not name a collective board to consider grievances. In an informal talk to the men he declared that one way to bring coal operators "to their senses" was for the men to decrease their production one-half and thus strike while they are working. The mine workers present took no action on receiving the suggestion.

The mine workers want \$1 a day more for all day workers, a 24c. raise in tonnage, and a 25-per cent increase on all deadwork such as timbering, etc. The wage-scale committee will go to Halifax and discuss grievances with the McKinnon conciliation board.

# Matters That Must Not Be Overlooked If Mining Machines Are to Do Their Best

Bits Must Be Sharp and Have Clearance at the Back - This Will Preserve the Motor as Well as Save Power - Chains Should Be Reasonably Tight - When One Gear Is Renewed Its Fellow Gear May Well Be Renewed Also

BY F. E. VAN SLYKE\*

**T**O INSURE economy and success in the operation of mining machines, provision must be made for a number of details. Unless particular attention is given to them it is difficult to secure entire satisfaction. First and most important of these is the care of the bits, chain and cutter arm. The bits should always be sharp, even if this necessitates frequent changing. The loss of time incurred in putting sharp cutters in place is not nearly so serious as the increased stresses put on the machine when operating with dull bits. Not only do dull bits cause excessive stresses but they sometimes overload the motor as much as 100 per cent, and the wear on all parts is much increased. The only way to insure sharp bits is to keep an adequate supply on hand, taking them from place to place with the machine. It is also highly important that the bits be so shaped that they will have sufficient clearance at the back, for a parallel-sided bit materially increases the consumption of power. The forms sent with the machine show the correct shape, and the bits should occasionally be checked up with these so that the mechanical engineer, or whoever may perform his function, may feel assured that they are being made correctly. The back part of the bit should be at least  $\frac{1}{8}$  in. less in width than the front.

## SET BITS TO CLEAR CUTTER ARM AND LINKS

The bits should be so set that they extend the proper distance out from the chain in order to insure clearance for the cutter arm and the links. All set screws should be kept absolutely tight. Dull bits with inadequate clearance at the back and so set as to afford insufficient space for the cutter arm in the kerf are a prolific source of trouble on coal-cutting machines of all kinds. It is therefore highly important that such conditions be avoided.

The chain should be kept moderately tight, but not so tight as to bind. In the first few hours of running, the chain on new machines sometimes gets quite slack, a fault which may be overlooked. The slackness arises from slight irregularities in the holes in the chain which become smooth as soon as the machine is put into operation. The smoothing down of even 0.001 in. on a large number of links will add an appreciable length to the chain. Therefore the chain tension on new machines should be watched carefully.

The chain should be tightened up as far as it will go, and then slacked off about one turn of the adjusting screw. If the operator gives this matter careful attention he can soon arrive at the proper chain tension by observing how it acts under different conditions. It takes a little time to note the operation and experiment

a little with various tensions. Such trials are well worth the trouble they entail. The hardened strips and wearing parts of the cutter arm should be renewed as soon as the center line of the chain gets out of true with the center of the cutter bar. When this occurs it causes a reduction in the width of the kerf and makes the cutter

Sharp bits with proper clearance, the right shape of link in the right place, a chain tight but not too tight, gears that mesh smoothly without excessive wear, rubbing surfaces not unduly worn are necessities if satisfactory results are to be obtained. The bits must cut and not rub their way through the coal.

arm bind. This condition is easily detected by trying to lift the chain when it is not running. If it can be raised from  $\frac{1}{4}$  to  $\frac{3}{8}$  in. the parts should be immediately renewed. It will be observed that the proper width of the kerf is entirely dependent upon the chain being held in a central position.

In replacing broken links always be certain that the new part gives the same bit position as that of the one taken out. In many cases machine runners put in a new link without paying any attention to this consideration and in a short time a number of the positions in the chain are entirely eliminated, so that the machine is not cutting uniformly across the full kerf width. This leaves portions of coal which are broken out by the chain links instead of by the bits, causing increased power consumption and wear and tear on all parts.

Another serious matter in connection with the operation of undercutters, which in a good many cases is not looked after properly, is the renewal of gearing. Gears are sometimes replaced without renewing the pinions, or pinions are replaced without renewing the gears. This is bad practice, since a worn gear or a worn pinion never operates satisfactorily with a new part. Unless one of the members is practically new it should never be left in place when renewing the member meshing with it. This is most serious with worn gears, for when one is badly worn it tends to destroy the other rapidly.

When renewing bearings all the bearings for a train of gears should be replaced at one time in order to insure correct gear meshing. It is of little advantage to replace the bearings on a shaft when the shaft carrying the meshing gear is running in a worn journal.

Another detail that cannot be brought out too strongly is the necessity of keeping accumulations of dirt out of the motor and gearing.

# Mine Shops at Kingston Build Storage-Battery Locomotives for Colliery

Small Work Segregated from Large Work to Prevent Misappropriation of Property—Work on Locomotives Maintains Working Force During Slack Summer Period, thus Maintaining Morale of Men

BY DEVER C. ASHMEAD  
Tarrytown, N. Y.

**B**ECAUSE of their arrangement and the completeness of their equipment as well as the volume and quality of work they turn out, the shops of the Kingston Coal Co., at Kingston, Pa., are worthy of more than casual attention. These shops comprise two buildings. Of these the larger houses the machine,

hammer can be seen in the lower right-hand corner of the illustration.

The equipment of the shops is fairly complete and practically any kind of repair work can be done except the making of castings. The machine shop is equipped with a 24 x 84-in. planer, an 18 x 30-in. shaper, a 22-in.

Machine and Carpenter Shop

Part of the Kingston Coal Co.'s shop where cars are repaired by machinists, carpenters and blacksmiths and where in spare time new equipment is constructed.

## Electrical Repair Shop

Here armatures are rewound and other repairs made without the delays incident to the shipment of parts to distant machine shops.

carpenter, car-repair and blacksmithing departments, while the smaller serves as the electrical repair shop.

Both the buildings are constructed of brick and have concrete floors, but that the electrical building is of later construction than the other can be readily seen by comparing the two illustrations showing the interior of the shops. The roof of the electric shop is supported by steel trusses and I-beams, whereas in the older building the roof trusses are of wood.

Well lighted during the day by numerous windows and at night by large incandescent lamps, these shops are desirable working places. Tracks for handling such mining equipment as is in need of repair extend into the buildings. In the machine shop turntables are so placed and the tracks so arranged that all parts of the shop are easily accessible. In Fig. 1 the carpenter shop is in the immediate foreground. To the rear may be seen the machine shop, the photograph being taken from the blacksmith shop. The foundation of the steam

swing lathe, an emery grinder, a 24-in. Barnes drill press, a 1½-in. bolt cutter and a 10-in. Cox pipe machine. The carpenter shop has a 24-in. Greenlee cut-off saw, two Greenlee post drills, a mortising machine, a 24-in. surfacer, a Greenlee rip saw, a Colliday 3-ft. band saw and a wood-turning lathe. The blacksmith shop is provided with a 600-lb. steam hammer, a portable crane and four forges.

The blacksmith shop is divided into two parts. One portion is used exclusively for work done for the mine, while the other is employed for repairing and sharpening the miners' tools. The part devoted to this purpose is fenced off completely from the rest of the building and has a separate entrance from the outside. This arrangement is made in order that there may be no necessity for the miners to pass through any other part of the shop, such passage sometimes meaning a reduction in the company's tool supply. People are to be found everywhere who regard tools as common property

and who think that for safe keeping they should remove them to their own home.

The electrical shop shown in Fig. 2 is well provided with apparatus necessary for the maintenance and repair of electrical equipment. Because of the weight of motors and armatures a traveling crane has been provided to move these parts about the shop.

In shops of this size it is often necessary to maintain a larger force than is ordinarily required, in order to take care of peak demands. Such demands occur more frequently in winter than in the summer because of the more exacting working conditions then encoun-

BATTERY LOCOMOTIVE BUILT BY MINING CONCERN

This 5-ton storage-battery locomotive was constructed during slack time at the blacksmith and electric repair shops of the Kingston Coal Co.

tered. Such a condition means that during parts of the year there is an excess of men in the shop and a lack of work. No coal company desires to lay men off during periods of slack work, for it realizes that when the demand for men returns it will be unable to secure them, as the other companies in the vicinity probably will be in the field at the same time. A slack-work period must, however, be met. If the company cannot afford to discharge or lay off its men, it must provide some way of using them, for men who are not continuously employed lose their morale and as a result become worthless to their employer.

During the past few years there has been a great increase in the use of mechanical haulage, particularly in those fields where the use of the storage-battery locomotive is permissible. A demand for this type of machine has arisen that has been far in excess of the supply. This condition contrasts greatly with a time not over five years ago when some companies would not consider such locomotives at all. One firm actually demanded a contract agreeing that the company would be protected against all damage that the storage-battery locomotive might do to the mine.

Conditions in the mines served by these shops were such that storage-battery locomotives could be used satisfactorily, but the company found it almost impossible to secure such machines. Having a surplus of skilled mechanics during part of the year it decided to assemble its own storage-battery locomotives. The assembling of the frames was done in the machine and carpenter shops, while the electrical installation was performed in the electrical shop. Fig. 3 shows one of the storage-battery locomotives thus constructed. These machines are all of 5-ton size and have forty-eight 23-plate ceils.

## Compensation Results Achieved in Illinois and Pennsylvania\*

Mines Insured Show Consistent Improvement of Physical Condition and Safety, with Lowered Premium Cost—Low Accident Rate Reported

BY HERBERT M. WILSON

A TYPICAL mine in central Illinois insured from 1915 to 1919 inclusive, with from 190 to 270 employees and premium earnings from \$8,800 in 1916 to \$14,800 in 1917 and \$21,200 in 1918. These premium increases were due in part to increased number of employees and partly to increase in wage rate. During the same period there was an increase in the number of accidents; in 1916 there were 73 non-fatals, costing over \$1,200; 3 fatals and 156 non-fatals in 1917, costing \$10,300; 1 fatal and 174 non-fatals in 1918, costing \$15,000. The margin of profit on the business was negligible.

The schedule-rating history showed a base rate of \$4.50 increased by the first schedule rate to \$5.21, which reflects the correspondingly bad safety condition. The next schedule rate showed material improvement, \$4.36; the last a still further improvement, \$3.86. Within the last year there was correspondingly good experience, which earned a credit of 13c., making the adjusted rate \$3.70, as compared with the first, which was \$5.21.

A mine in northern Illinois, where the fatal-accident record is good and the base rate correspondingly low, viz., \$3.60, had a payroll for the two years 1918-19 averaging 390 men, premium earnings the first year \$12,000 with 156 non-fatals and compensation costs of \$7,800, giving a slight margin of profit. In 1919 the premium was only \$9,600 with a material increase in non-fatals to a total of 257 and corresponding increase in compensation costs of \$14,400.

At the same time the first schedule rate was above normal, namely, \$3.76; the next \$3.06 and three were reported during 1919, respectively, \$2.79, \$2.38 and \$2.34. This operator has nothing to complain of, since for everything he has done to safeguard his mine he has had a reduction in his premium rate and corresponding reduction in his total premium costs at a time when his payroll was mounting on account of wage increases and his losses were also mounting, probably because of a poor moral hazard.

A mine in southern Illinois in the gaseous and fiery district, with about 225 employees, had a premium in 1917 of \$13,800 with one fatal and 14 non-fatals and loss costs of \$7,300. Premium in 1918 was \$11,500; one fatal and 17 non-fatals, with lost costs in excess of premium, namely, \$12,100. There was a corresponding change in schedule rating results, viz., first schedule rate \$4.47, the next \$4.38 and the last \$4.11.

I hesitate to give you illustrations from Pennsylvania. They are too numerous, and would but be a monotonous repetition of the above. All show practically the same relative trend as illustrated for Kentucky and Illinois but with greater emphasis because the period of insurance has been longer. There has been on the whole a marked improvement in the physical condition of the mines as reflected by the schedule-rating inspections. Many mines are now given nearly or quite perfect safety scores with a few or no charges.

\*At the request of *Coal Age* the general manager of the Associated Companies contributes these typical examples of the workings of the Compensation Act, supplementing his article on "Coal-Mine Compensation in Kentucky," which appeared in a previous number.

# Opportunity for Coal Men to Note Mining Methods of a Kindred Industry

A. I. M. E. Will Study Mines of Michigan Copper Country, the Ishpeming, Vulcan, Norway and Iron Mountain Iron Mines and the Strippings of the Mesabi Range -- Deep Mines, Difficult Pumping Problems, Immense Strip Pits and Golf Principal Attractions

**M**INING is still mining, whether in copper, lead, zinc or iron mines, and from any type of mine much may be learned that will serve as suggestions for the operation of mines in the kindred industry of coal mining. Solutions forced on the owners of one type of mining property offer valuable suggestions to operators of another type.

Coal mining engineers will be much interested therefore to learn that the American Institute of Mining and Metallurgical Engineers proposes to make its summer trip to the copper and iron mines of the Great Lakes and to view the works, above and below, of that wonderful mining region.

What the Mesabi region is doing today the anthracite strip-pit mines may be doing tomorrow; the pumping problem of the Athens mine may give a hint to a deep mine in eastern Pennsylvania or northern Ohio; the hoisting problem at a mine 12,500 ft. deep may give a valuable hint to a man whose mine is not a tenth of that depth. All forms of engineering bear on one another but especially does one form of mining engineering contain the kernel of experience and experiment which may better the methods of another.

A limited number of Eastern members will leave Buffalo on Friday morning, Aug. 20, by S. S. Tionesta of the Great Lakes Transit Corporation, picking up other members *en route* and reaching Houghton about noon Monday, Aug. 23.

## HOISTING PLANT LIFTING MINERAL 2½ MILES

At Houghton the members probably will take first an automobile trip through the district, seeing in a general way the operations above ground. On Monday evening they probably will have a dance at the yacht club. On Tuesday there will be a visit to the copper mines under ground, a sightseeing and historical trip to Keweenaw, and a trip to see the leaching and milling, the dredging, flotation, smelting and electrolytic refining plant. The members will have an opportunity of seeing mining, descending an inclined shaft that has been sunk with a change in angle under ground. A new hoisting plant to raise mineral from a depth of 12,500 feet will be in operation by the time of the visit. On Tuesday evening there will be further social entertainment and the party will then leave by two special trains, one of which will go to Ishpeming, the other to Vulcan.

At Ishpeming two hours will be spent at the Pioneer Charcoal & Iron Furnace, where not only pig iron and charcoal are made but also many charcoal byproducts, such as wood alcohol, formaldehyde, acetic acid, various acetates, etc. The reinforced-concrete ore-loading dock at Marquette is a model structure of its kind.

After visiting these points lunch will be served at the Wawonowin Golf Club, followed by a visit to the

Athens mine, one of the novel features of which is the electrical pumping of water 2,500 feet in one lift. There also will be an opportunity to see at Ishpeming some interesting and architecturally-attractive reinforced-concrete headframes, concrete-lined shaft, etc.

At Vulcan, Norway and Iron Mountain the other party will see some interesting developments in electric hoisting, including safety devices, and other electrical machinery; also some deep pumping with centrifugal pumps, a hydro-electric plant, a concrete-lined shaft, etc., etc. There probably will be a technical session that evening at Iron Mountain, where the trains will be reassembled, and the party will reach Minneapolis early in the morning of Thursday, Aug. 26.

At Minneapolis there will be sightseeing trips for the ladies and technical sessions at the university, followed by a lunch at the Town and Country Club. The afternoon will be devoted to sightseeing, and the evening to a banquet and addresses.

## BIG STRIP-PIT PROPOSITION, 300-TON SHOVELS

On Friday, when the Mesabi Range will be visited, the guests will awake at Babbitt, where an inspection will be made of the new mine and of the concentrating and sintering plant of the Mesabi Mining Co. Thence they will go to Virginia to see the 300-ton steam shovels, and from there by automobiles through Mountain Iron, where the Brunt ore-drying plant is located. The party will arrive at Hibbing toward the close of the afternoon. At Hibbing there will be a business and social session, and the party will arrive early in the morning of Saturday at Coleraine, where it will inspect the largest ore-washing plant in the world, thus having seen practically everything in the Mesabi district.

Duluth will be reached about 1 p.m. on Saturday, Aug. 28, and a visit will be made to the Minnesota Steel Co's plant, with its model village. This company is a subsidiary of the U. S. Steel Corporation. A visit also will be on the heights far above the city.

The estimated expenses are in part as follows, meals being extra, except as stated:

Railroad fare on special trains, Houghton to Duluth, about	\$45.00
Double lower berth, five days and nights, about	17.00
Upper berth, five days and nights, about	14.00
Compartment for 2 or 3 persons, 5 days and nights, about	50.00
Drawing room for 2 or 3 persons, 5 days and nights, about	60.00
Railroad fare—Chicago to Houghton	13.36
Railroad fare—New York to Chicago	29.42
Railroad fare—Duluth to Chicago	15.21
Railroad fare—New York to Buffalo	14.21
SS. "Tionesta"—Buffalo to Houghton, including berth and meals	39.96
SS. "Junata"—Duluth to Buffalo, including berth and meals	48.60

For further details regarding expenses see the Institute's circular. Reservations should be made immediately.

## Blizzard Heads Survey at Pittsburgh —Kreisinger Will Co-operate

Former Official of Canadian Mines Department Will  
Have Assistance of Predecessor Corporation—  
Lends Financial Aid for Research Work

**T**HROUGH a co-operative agreement entered into between the U. S. Bureau of Mines and the Combustion Engineering Corporation about a year ago, Henry H. Kreisinger, fuel engineer of the Pittsburgh Station, leaves the Government service and is succeeded by John Blizzard, formerly chief fuel engineer of the Department of Mines of Canada. Mr. Kreisinger and Mr. Blizzard will co-operate with each other in their new duties, however, and it is understood that reports of research work made by Mr. Kreisinger for the Combustion Engineering Corporation will be submitted to the bureau for publication before being used by the former organization.

The U. S. Bureau of Mines allots its fuel department approximately \$32,000 yearly. Out of this sum must be paid the salaries of all of the men in the department, which leaves about \$5,000 annually for research work. When these figures are contrasted with \$20,000, which has been allotted for the first quarter year of Mr. Kreisinger's work with the Combustion Co., the financial handicap on the Bureau of Mines can be realized.

Mr. Kreisinger was born in the town of Radnice, in what is now known as Czechoslovakia, but at the time of his birth the town constituted a part of Bohemia. He came to America in 1891, at the age of fifteen. In 1900 he entered the University of Illinois and four years later received the degree of Bachelor of Science. Continuing his studies, he graduated as Mechanical Engineer in 1906.

After gaining the latter degree he entered the Technological Branch of the U. S. Geological Survey, which had quarters in the St. Louis Exposition grounds. Here he was assigned to the fuel-testing plant. In 1910, when the Bureau of Mines was created and took over the work being done by the fuel-testing department of the Survey, Mr. Kreisinger severed direct connection with the Government and became fuel engineer for the Clinchfield Fuel Co., of Spartanburg, S. C.

While with the Clinchfield Fuel Co., Mr. Kreisinger was frequently consulted on combustion problems by the bureau. The acquaintances formed and opportunities offered by the Bureau of Mines for research work were

HENRY H. KREISINGER

JOHN BLIZZARD

so attractive to him, however, that in 1913 he returned as head of the fuel department of the Pittsburgh Station. When the bureau home in Pittsburgh was changed from the old Arsenal Buildings on Butler St. to the new million-dollar buildings in the Oakland district, Mr. Kreisinger was given increased opportunities for the research work of which he is so fond. As a designer of fuel-testing apparatus he has perhaps no peer. The result has been that the fuel-testing laboratories of the Pittsburgh station are the most complete of their kind to be found anywhere.

While connected with the Combustion Engineering Corporation as research engineer, Mr. Kreisinger will make his headquarters at the Bureau of Mines station in Pittsburgh. By this arrangement a closer co-operation between the two institutions will be maintained. The first problem upon which Mr. Kreisinger will center his efforts will be a thorough testing of the powdered-coal plant of the Bureau of Mines at Milwaukee, Wis.

While engaged in this work he will have under his direction four men from the Bureau of Mines fuel-testing laboratories and fifteen others who will be carried on the payroll of the corporation. These men will be chosen from newly-graduated engineers and men who will be seniors in college next year. He will be allowed the full and unrestricted use of any equipment or apparatus owned by the bureau.

Mr. Kreisinger is a member of the Sigma Xi engineering fraternity, the Coal Mining Institute of America, the American Society of Mechanical Engineers and the American Society for the Advancement of Science.

John Blizzard, who succeeds Mr. Kreisinger as head of the fuel department of the Bureau of Mines, was born at Wotton under Edge, England, in 1882. He is a graduate of the University of Durham and for several years was connected with the firm of Richardsons-Westgarth, marine and electrical engineers, of Hartlepool, England. He came to Canada in 1906 to lecture on mechanical engineering at McGill University, Quebec. While at the university Mr. Blizzard became interested in fuel and combustion research work and spent much time with Professor Durley of that institution seeking a solution of combustion-engineering problems.

In 1911 he assumed charge of the fuel-testing department of the Department of Mines of Canada and comes to the U. S. Bureau of Mines directly from this station. While not so well known to mining men as Mr. Kreisinger, he is equally recognized by prominent combustion engineers.

James T. Beard

### Flotation Fails to Clean Coal

RECENTLY, my attention was attracted to the brief article under the caption "Can Coal be Cleaned by Flotation?" *Coal Age*, Apr. 22, p. 795, and I was much interested in the announcement that investors on the London Stock Exchange were showing confidence in the matter, apparently in the belief that the scheme is practicable.

For many years I was engaged in trying to reduce the sulphur content of coal. To accomplish my purpose I washed the coal, using every method of jigging, concentrating tables, etc, but without success.

Later, about three years ago, the flotation process was drawn to my attention and I sent a sample of the coal we were mining and which contained sulphur, to a plant at Victor, Col. This plant was equipped for making a very thorough test by the flotation process. The report came back, however, that the process failed to work on the coal. It was stated that the oil simply formed a sticky mass with the finely pulverized coal, that could not be managed.

If it is possible to clean coal by flotation there is no doubt that the process will prove an important step in the purifying of certain coals for the market and for the manufacture of coke. I am wondering whether the statement made in the article mentioned is really authentic. Has some one found a way to actually clean coal by the flotation process? If so, we shall be glad to hear from him through the columns of *Coal Age*.

### Degenerate Ideas Regarding Mine Safety

AFTER all the measures that have been employed to increase the safety of mining, it is astonishing that anyone would assume to question the wisdom of employing shotfirers where blasting is performed in mines. The suggestion can only be styled as "degenerate" and must come from some one seeking to throw a wet blanket on the efforts of others in the promotion of safety.

Of course, there would be no discussion of a subject if all men had the same opinion; but I claim that no sane argument can be advanced to show that the employment of shotfirers is harmful in any respect, provided the men so employed have a knowledge of the elementary principles of mining and are practiced in the use of explosives and competent to perform their duties as shotfirers.

Assuming it were possible to show that the employment of shotfirers is a menace to safe mining, it would then be necessary to revise our laws regulating and controlling the use of explosives in mines. Mining is progressive, and when a suggestion like this is made, men at once inquire, What safer method or what better system can be adopted for blasting coal?

To say that a mine is safe if properly ventilated shows a lack of experience, since practice teaches that many other matters than ventilation are required to accomplish this purpose. One of the greatest factors contributing to the safe operation of a mine is the exercise of discipline through the authority vested in the shotfirers.

Mining regulations in British Columbia dwell particularly on the requirements in blasting, and attach severe penalties for their violation. Under the law, competent persons must be employed as shotfirers, who are charged with the duty of seeing that the laws are carried out and strictly obeyed. This is not to say that the shotfirer is the only person wise enough to distinguish between what is right and what is wrong; but, in his official capacity, he is empowered to enforce all regulations intended to make blasting safe.

### SHOTFIRERS MUST REMAIN

To eliminate the shotfirer in the mine would be to throw all precaution to the winds and return to the many unsafe practices formerly used in shooting coal. As time goes on the dangers incidental to mining are increasing, and these can only be offset by the exercise of greater care and discipline. There is much satisfaction in knowing that, with the enormous quantities of explosives now used in mines, accidents in blasting are less frequent than formerly, owing to the closer supervision of the work by shotfirers.

It may be true that some unsafe systems of shotfiring prevail. This, however, is the fault of such systems and no argument against the employment of competent shotfirers. Speaking from experience and supported by the requirements of our mining laws, I fail to see any justification for regarding shotfirers as harmful, either from a humane or a material standpoint. To displace the shotfirer would be to transfer his responsibilities to each individual miner, with the result that many bad practices would prevail and confusion take the place of order and safety. This alone should show the folly of such an attempt. In that event, we might as well scrap all our technical knowledge and mine regulations and laws relating to safe blasting.

### SAFETY A DOLLARS-AND-CENTS PROPOSITION

Good business in the operation of coal mines has come to recognize the importance of a reasonable factor of safety as a dollar-and-cents proposition; and any outlay in this direction is looked upon as a wise investment. True success in mining is not indicated alone by the increased profits and a reduction in the cost-sheet; but the health and good-will of the worker has come to be considered as an important asset in the undertaking.

Formerly, the mistake was often made of attaching more importance to the returns of a venture than to its danger. Today, the order is reversed and the safety of an operation is one, if not the *first*, essential to its

success. Experience has shown that where the human side of life's business is overlooked and the dollar is placed foremost, the undertaking proves less successful in the end than where the contentment of the worker and his living and working conditions are considered of the first importance.

It is true there are some mine officials who look on the employment of shotfirers as an increase in the cost of operation; and these are prone to think there would be a saving in permitting the miners to fire their own shots in the manner and where and when they please.

Again, there are some miners who object to the shotfirer's interference in their work and profess to think they could make more money and better progress if they were not compelled to await the shotfirers. Let those who would eliminate the shotfirer say what can be done to insure safety in blasting.

Ladysmith, B. C., Canada. WILLIAM WESNEDGE.

### Often Unfair to Blame the Fireboss When Explosion is Mysterious

MUCH interest has been awakened, in respect to the responsibility of the fireboss in case of a mysterious explosion, by the reading of the excellent letter of W. M. Chambers, which appeared in *Coal Age*, May 13, p. 1010. Mr. Chambers referred to the unexplained explosion that took place in the Buffalo mine in Ohio, some time ago.

Evidently, the letter was intended to impress every mine official with the importance of exercising extreme care and caution in the supervision of a mine generating gas, as many seemingly trivial occurrences lead to dangerous results. Careless practices will, sooner or later, prove fatal if allowed to exist.

#### THERE IS ALWAYS THE POSSIBILITY THAT A FIREBOSS HAS FAILED IN HIS DUTIES

The statement is made that the fireboss had examined the Buffalo mine a short time before and reported it "safe." This leads one to conclude that the explosion was a mystery, or that the fireboss failed to report the true condition of the mine, or had not been thorough in his examination. The fact that the testimony given following other explosions has shown that the firebosses were derelict in their performance of duty, it is reasonable to assume that the same could occur again. But, a fairminded person is reluctant to believe such was the case, until it is proven by the evidence.

True it is that a fireboss, having a large section of a mine to examine each morning, would be tempted to assume that conditions were all right in certain places with which he was thoroughly familiar, particularly if his time was growing short because he had found that a fall of roof elsewhere had broken down the brattice and gas had collected in quantity that required to be removed.

Every fireboss knows that to make an incomplete examination is dangerous and if it becomes a habit he will do it once too often, at the cost of an explosion and the possible loss of many lives. The report of the examination in that case, would show no danger or possible cause for the explosion, which would be thought to be mysterious unless the fireboss was honest enough to confess his neglect. But that is doubtful, owing to the embarrassment it would cause him.

When an explosion is unexplained it is natural to assume that it was due to a sudden outburst of gas for

which the fireboss would not be responsible, rather than to conclude that the man had been negligent in performing his duty. The latter conclusion, of course, would place the blame on the one man charged with the responsibility of making a complete examination of the mine, and one is naturally reluctant to do that, except where the facts point to such a conclusion.

#### NEGLECT OF A FIREBOSS NEEDS TO BE PROVEN

Negligence in a fireboss is surely one of the factors that must be taken into account in the investigation of a mysterious explosion. Considering that, in such a case, he is under a heavy fire of criticism and suspicion, everything should be done to remove this cloud if possible. A competent fireboss who has a good record should not be under suspicion unless the evidence warrants.

There are numerous dangerous conditions and practices in every mine, any one of which may be the cause of the disaster, and the fireboss may be responsible for these if he has done nothing to prevent them. On the other hand, a fall of rock short-circuiting the air or releasing a body of gas; the setting open of a door by a workman or driver; the stopping of the fan by accident, or its speed being reduced without his knowledge would forecast danger. These and similar occurrences would relieve the faithful fireboss of the blame for which disaster might result.

Again, although the time is short between the making of the examination by the fireboss and the entry of the men for work, it is possible for a dangerous condition to arise in a gaseous mine, for which no fireboss could be held responsible.

It must not be thought, however, that an explosion can occur in a mine and no one of the mine officials be to blame, unless they have all, without exception, done everything in their power to make the mine safe for work. Since the responsibility for safe conditions rests mainly on the fireboss, that official should exercise extreme care that his work and demeanor leaves nothing to reflect on his integrity and reliability, both in his official capacity and as a citizen.

The public will be slow to condemn a man who is known by reputation to be safe, painstaking and conscientious, except in the face of facts showing carelessness, incompetence or neglect. They will be more ready to conclude that the cause of the explosion was entirely beyond his control. As a fact, it is seldom we hear of trouble with such a fireboss in charge.

#### AMPLE PROVISION MUST BE MADE AGAINST POSSIBLE DANGEROUS CONDITIONS

Speaking of sudden outbursts of gas, it is often possible to anticipate such occurrences and make due provision for avoiding their consequences. Let me suggest here that the ventilating system in a mine, as far as practicable, should be so arranged that the old workings will be located on the return of the air. The working places generating gas should be carefully bratticed and a sufficient quantity of air made to reach the face at all times.

The possible circulation in a mine should be such as to handle any ordinary outburst of gas with a fair degree of safety to the men. It is usually the incapacity of the ventilating system that is directly responsible for an explosion occurring because of an increased production of gas in the workings. Where the ventilating system is not sufficient the excuse cannot be offered

that a sudden outburst of gas caused the explosion. The fault would then lie at the feet of the mine officials who failed to make ample provision against such an occurrence in the operation of a gaseous mine.

In closing, let me say there are other factors to consider in reference to mine explosions; namely, coal dust, dangerous practices in blasting, use of open lights, etc., all of which naturally come under the supervision and direction of the fireboss, the shotfirer and other mine officials. Neglect to consider these reflects on the competency of the management, in case of disaster.

Thomas, W. Va.

W. H. NOONE.

### Working Three Overlying Seams

THE question of working three overlying coal seams extending under the Kanawha River is a timely one and will doubtless prove of interest to many mining men who have not, as yet, experienced working under the conditions described.

In the case mentioned in this discussion, the two upper seams are said to have a thickness ranging from three to five feet; let us say an average of four feet. The upper seam lies at a depth of 50 ft. below the surface of the valley, the second seam 50 ft. lower and the third seam 60 ft. below that, making the total depth to the lowest seam 160 ft.

My plan would be to work out the two upper seams together, by sinking a shaft to the second seam, which lies at a depth of 100 ft. I would sink the shaft a little below the seam to allow for a good sump at the bottom. I would prefer to arrange to hoist the coal from each seam by a separate cage. While good sump timbers can be placed for holding the cage on the bottom in the second seam, it will be necessary to arrange a set of keeps for the cage to rest on, at the first or upper seam.

If the conditions are favorable, I would adopt the longwall method of mining each of these seams, driving only narrowwork under the river and starting the longwall face beyond. By this means, should water seep through the roof of the entries under the river, they can be protected by a good cement arch where the trouble occurs.

#### ADVANTAGE OF SELF-ACTING INCLINES FOR WORKING THE UPPER SEAM

In adopting the longwall method, some will prefer to keep the development in each seam equally advanced; but, my preference would be to work the upper seam by the longwall advancing method and use the retreating system in the second or middle seam for the reason that pitches can then be driven up from the second seam, on a light grade that will enable the cars to be handled by a self-acting incline.

These pitches can be driven in advance and will always be available for lowering the coal mined from the upper seam. In that case, of course, the work of retreating in the lower seam would not be started until the upper seam was practically exhausted. I have seen such a system in operation where the loaded car descending pulled up the empty, and the plan was successful, the movement of the cars being controlled by a band brake on the sheave wheel.

As quickly as the development has progressed far enough that all the coal from the upper seam is taken out through the inclines leading to the second seam, the keeps at the shaft landing in the upper seam can be taken out and both cages used for hoisting all the coal.

Assuming a thickness of four feet in these two seams, it should be possible to load and hoist 250 two-ton cars from each seam, making 1,000 tons per day.

I am not in favor of any slope opening even for the upper seam, if the conditions are such that high water may occur from the blocking of the river by debris. The shaft should be kept at the highest possible level and safeguarded against such an occurrence. If the room-and-pillar method of mining is adopted the face in the upper seam should be kept a short distance, say 10 or 12 ft. ahead of that in the second seam.

As the work in the two upper seams nears completion and the coal becomes nearly exhausted, the shaft should be sunk to the lowest of these three seams, or to a depth a little more than 160 ft. to allow for a good bottom sump for drainage. The coal in this seam ranges from 6 to 9 ft., which will make it possible to maintain the same output as came from the working of the two upper seams now practically exhausted.

The lowest seam can be worked either by the longwall method or the room-and-pillar system of mining, whichever is preferred and seems likely to produce the best results. Speaking of the inclines, I have seen what is known as the "drop staple" method, where the coal was dropped, vertically, from an overlying or upper seam to the seam below, but I prefer the self-acting incline.

R. W. LIGHTBURN.

### Where Should a Miner Keep His Powder Flask When Drawing Back a Pillar?

KEEPING a powder flask in a safe place in the gob when working under the conditions described by William B. Jackson, *Coal Age*, April 15, p. 771, agrees with my own practice. It is my belief that a flask containing powder or any other explosive should not be placed in a cubbyhole in the rib of a pillar that is being drawn, particularly where the action of the roof is such as to crush the coal.

At the present time I am working where gas is generated, which would increase the danger of placing a powder flask in the cubbyhole where it might be ignited by a possible explosion of gas. I consider it is far safer to hunt a good place in the gob, at a safe distance back from the place where a man is working.

Every miner ought to carefully study the conditions in his place. An experience of several years in the drawing of pillars in soft coal enables me to appreciate what Mr. Jackson has said in regard to the crushing out of the coal and its being thrown down for a considerable distance back from the end of the pillar. When working under top coal and a heavy roof pressure, in a room 20 ft. wide, where the coal was taken out to a height of 12 ft., I have known a fall of coal to cover the pillar 50 ft. back, or more.

Under these conditions, let me ask, what would have happened if I had placed my powder flask in a cubbyhole in the rib. One thing is certain, and that is, it would have been impossible to have recovered the flask until the fallen coal had been loaded out.

My conclusion is, therefore, that the only safe thing for a miner to do with his powder flask is to keep it under cover where it will be protected from a possible explosion of gas, and in a safe place in the gob where it will not be subject to the crushing action of the roof.

# Inquiries of General Interest

Answered by  
James T. Beard

## Three-Way Switch in a Mine

WE WANT to lay a three-way switch on the main entry in our mine and would greatly appreciate a diagram or explanation of how this should be done and how to calculate the length of the latches. I have drawn a rough sketch of what we want. The switches leading to the right and left of the main track start from the same point, as shown in my sketch. I remember seeing something similar to this described in *Coal Age*, some time ago, but do not remember how it was done.

\_\_\_\_\_, Ky. MINE SUPERINTENDENT.

It is impracticable to use latches, in laying a three-way switch, where the switches start from the same point in the main track. In that case, what is termed a "stub-switch" must be used, or one having a single switch-rail that can be thrown into line with any one of the three rails of the main track and the two switches. Such a switch is shown in the accompanying figure.

On the other hand, if it is desired to use latches, one of the side switches must start a little in advance of the other, on the main track. It is evident that both

ILLUSTRATING A THREE-WAY MINE SWITCH

switches cannot start from the same point. A detail of a latch-switch is shown on the right, in the figure. It will be observed that, in this case, the follower rail of a side switch running to the right is one continuous rail, and the latch forms a portion of the right-hand rail in the main track. But, on the other hand, the left-hand rail of the main track is solid, while the latch on that side is made a portion of the lead rail of the switch.

The latch-switch is the common form of switch used in coal mines, as there is less danger of derailment of cars when latches are used. In either of the two kinds of switches tie-rods are used connecting the two latches or switch rails, as the case may be, so that they will each move alike when the switch is thrown. The tie-rods are not shown in the figure.

When laying a mine switch the first question to be decided is the frog number, which can only be determined by the conditions in the mine. Where there is plenty of room for turning the switch, especially in motor haulage, a No. 3 frog, having a spread of one in three, can be used. But where the room for turning the switch is limited, it may be necessary to use a No. 2 frog for a switch leading to a side entry, while a No. 1 frog is frequently used for a room switch.

Knowing the number of the frog ( $n$ ), and the track gage ( $g$ ), the length of lead rail ( $l$ ) is given by the formula,

$$\text{Length of lead rail, } l = 2gn.$$

Thus for a track gage of  $g = 36$  in. (3 ft.), and using a No. 2 frog, the length of lead rail required is

$$l = 2gn = 2 \times 3 \times 2 = 12 \text{ ft.}$$

This is the distance  $PF$ , measured on the rail, from the heel of switch or point of the latch, to the point of frog. The length of latch required, allowing a clearance of two inches, between the latch and the main rail, is found by multiplying the square root of twice the gage, in inches, by twice the frog number. Thus, for a track gage of 36 in. and a No. 2 frog, we have

$$\begin{aligned} \text{Length of latch} &= 2n \sqrt{2g} = 2 \times 2 \sqrt{2 \times 36} \\ &= \text{say } 33\frac{1}{2} \text{ in.} \end{aligned}$$

In the figure, the detail of a latch-switch is outlined on the right or to one side of the stub-switch, which forms the main portion of the figure. With the exception of these details, shown in the lower portion of the figure, the two types of switches are identical. The frogs shown are those known as "rail frogs," and are most commonly used in all mine work. The track rails and guard rails forming the frogs are riveted to heavy plates of sheet iron.

## Combustion of Methane

WHAT weight of oxygen will be consumed in the complete combustion of 150 lb. of methane or marsh gas?  
STUDENT.

La Salle, Ill.

We first write the equation, expressing the reaction that takes place between the gas and the oxygen of the air, in the complete combustion of methane ( $\text{CH}_4$ ); thus,

The figures written below each symbol indicate the weight of each substance, respectively. It is observed that 16 parts, by weight, of methane require 64 parts, by weight, of oxygen, for its complete combustion. In other words, the weight of oxygen consumed is four times the weight of the methane burned. Therefore, the complete combustion of 150 lb. of methane will require  $4 \times 150 = 600$  lb. of oxygen.

# Examination Questions

Answered by  
James T. Beard

## Miscellaneous Questions

(Answered by Request)

**Ques.**—What form of piling would you use to sink through a thick bed of quicksand struck some distance below the surface?

**Ans.**—The best form of piling for this purpose is an interlocking series of channel bars of wrought iron in lengths convenient for driving each series of piling into the quicksand, all around the shaft. The success of the operation will depend very much on the character of the sand and the pressure or head and quantity of water flowing into the shaft. Sets of timber frames will be required to keep the piling from being forced into the shaft by the pressure from behind. At times there may occur a strong rush of water and sand that will cause the bottom to boil, making the sinking both difficult and dangerous.

**Ques.**—There are two airways in a mine, one of these is 6 x 12 ft., in section, and the other 4 x 9 ft., in section. If the first airway is 1,000 ft. long, what must be the length of the second airway so that they shall each pass the same quantity of air, under the same pressure?

**Ans.**—First, write the formula for unit pressure in terms of the airway and the quantity of air in circulation; thus,

$$p = \frac{k l o q^2}{a^3}$$

By the terms of the question,  $p$ ,  $k$  and  $q$  are each constant, and it is clear that  $l$  varies directly as  $a^3$  and inversely as  $o$ . In other words, the length ratio is equal to the cube of the area ratio, multiplied by the inverse perimeter ratio, which is expressed as follows:

$$\frac{l_2}{l_1} = \left(\frac{a_2}{a_1}\right)^3 \times \frac{o_1}{o_2}; \quad \frac{l_2}{1,000} = \left(\frac{36}{72}\right)^3 \times \left(\frac{36}{26}\right) = \left(\frac{1}{2}\right)^3 \times \frac{18}{13}$$

$$l_2 = \frac{1,000 \times 18}{8 \times 13} = \frac{18,000}{104} = 173 \cdot ft.$$

**Ques.**—Two airways of the same length have diameters of 3 ft. and 4 ft., respectively. If a pressure of 5 lb. per square foot will force the air through the 4-ft. airway, what pressure is required to pass the same quantity through the 3-ft. airway?

**Ans.**—For circular airways of the same length and passing the same quantity of air, the unit pressure will vary inversely as the fifth power of the diameter of the airway. In other words, the pressure ratio is equal to the fifth power of the inverse diameter ratio. Therefore, in this case, calling the required pressure  $x$ , we have,

$$\frac{x}{5} = \left(\frac{4}{3}\right)^5 = 4.214;$$

$$x = 5 \times 4.214 = 21.07 \text{ lb. per sq. ft.}$$

**Ques.**—Three boreholes, A, B and C, were drilled from No. 10 seam to No. 9 seam overlying, for the purpose of draining the water that had accumulated in

the upper seam. The boreholes are each five inches in diameter; their lengths are: A, 110 ft.; B, 80 ft.; C, 90 ft. The elevation of the surface of the water is 1,000 ft., and that of the three points of discharge are: A, 900 ft.; B, 800 ft.; C, 850 ft. The elevations are all above sea level. What quantity of water will flow through each of these boreholes, assuming the elevation of the water remains constant?

**Ans.**—Subtracting the elevation of each point of discharge from the constant elevation of the surface of the water gives the following respective heads: A, 1,000 — 900 = 100 ft.; B, 1,000 — 800 = 200 ft.; C, 1,000 — 850 = 150 ft. Now, assuming the entrance head, due to the resistance caused by the crowding of the stream lines of the water entering the mouth of the pipe, is one-half the velocity head; and, allowing that the drill holes are cased with five-inch pipe, and taking the coefficient of friction in the pipe as 0.01, the formula giving the flow of water ( $G$ ), in gallons per minute, in a pipe whose diameter is  $d = 5$  in., length  $l$  and head  $h$ , both in feet, is

$$G = 20 d^2 \sqrt{\frac{2dh}{3.12d+l}}$$

Then, substituting the given values for the diameter and length of the pipe and the head, in each respective case, we have the following:

$$\text{A, } G = 20 \times 5^2 \sqrt{\frac{2 \times 5 \times 100}{3.12 \times 5 + 110}} = 5,000 \sqrt{\frac{10}{125.6}} = 1,410 \text{ gal. per min.}$$

$$\text{B, } G = 20 \times 5^2 \sqrt{\frac{2 \times 5 \times 200}{3.12 \times 5 + 80}} = 5,000 \sqrt{\frac{20}{95.6}} = 2,287 \text{ gal. per min.}$$

$$\text{C, } G = 20 \times 5^2 \sqrt{\frac{2 \times 5 \times 150}{3.12 \times 5 + 90}} = 5,000 \sqrt{\frac{15}{105.6}} = 1,884 \text{ gal. per min.}$$

**Ques.**—The distance between a pair of cross-entries is 500 ft., and from the main entry out to the boundary line is 1,000 ft. The thickness of the seam is 6.5 ft., and the weight of the wastage in slack is 15 per cent. If the specific gravity of the whole seam is 1.3, how many tons of coal can be gotten from this block, leaving 25 per cent for pillars?

**Ans.**—Assuming that the main entries are parallel to the boundary line and the cross-entries driven at right angles to each, the cubic contents of the seam bounded by the main entry, the boundary line and the cross-entries is

$$500 \times 1,000 \times 6.5 = 3,250,000 \text{ cu.ft.}$$

Then, taking the specific gravity of the coal as 1.3 and allowing 15 per cent for waste, which leaves 85 per cent of the seam available, the weight of this coal is

$$0.85(3,250,000 \times 62.5 \times 1.3) \div 2,000 = 112,226 \text{ tons}$$

Finally, leaving 25 per cent or one fourth of this coal for pillars, gives a total extraction of 84,170 tons.

# The Labor Situation

Edited by  
R. Dawson Hall

## Nottingham Drivers Were Soon Pacified

JUST one day was the duration of a strike of the drivers employed at the Nottingham mine of the Lehigh & Wilkes-Barre Coal Co. near Wilkes-Barre, called June 15. A driver had been discharged for a minor violation of the company's rules.

## Maryland Miners Allege Evasion of Award

ALLEGING that the award of the Bituminous Coal Commission has not been lived up to by the operators of the Georges Creek and upper Potomac fields, the United Mine Workers of district No. 16 met in Cumberland, Md., June 15, in a three-day special convention. William J. Trickett, district secretary-treasurer, declared that a majority of the coal operators are not fulfilling their obligations under the ruling of the commission and said that he hoped that the meeting would end in a working agreement being made between mine workers and operators. Meantime, he said the leaders of the union were having much difficulty in preventing strikes.

## Kentucky Miners Want Union Recognized

LABOR is again dissatisfied and, according to some prominent operators, there is a chance of another walk-out in southern Kentucky. One operator of the Harlan region stated that many of the mines were paying more than the 27 per cent increase over the old schedule, but that the workers were still not satisfied. He said: "They are getting good wages and getting in much better time than they did, but now that things are getting good they've got to find something to argue about. The new row is over the refusal of the operators to recognize the closed shop and to collect union dues by deductions on the payroll.

"We have one loader who recently pulled down \$34 for one day's work, and plenty of men who make \$20 to \$25 a day. They'll never be satisfied, however, as they are Bolsheviki at heart."

## Fairmont Region Settles Its Deadwork and Classification Problems

AFTER parleys lasting for a month or more the joint board of miners and operators of northern West Virginia constituted for the purpose of reaching an agreement as to the pay for deadwork and for agreeing upon the classification of certain kinds of labor in various localities finished its work at Fairmont during the second week of June.

General contract interpretations were agreed upon, such interpretations to form a basis for deciding disputes which may arise in the future. While the miners expressed the belief that basket men should be included

in the classification as dumpers, that was not the conclusion of the board and the classification of dumpers remains the same.

The board was composed of the following operators: A. Lisle White, Clarksburg, W. Va., chairman; C. H. Tarleton, Fairmont, and Everett Drennen, Elkins, and of the following miners' representatives: J. F. Forensch, president of subdistrict 3, Grafton; W. F. Ray, and Ira Marks, district board members, district 17.

## Universal (Ind.) Miners Reach Agreement

THE contract between the United States Fuel Co., owners of the mines at Universal, Ind., and the United Mine Workers of Indiana was completed June 9 at Universal without any hitch in the proceedings. Both the miners and the operators went on record as favoring strict enforcement of the present contract. The only difference in the contract signed by the miners with the United States Fuel Co. and the one signed some time ago with the Indiana Bituminous Coal Operators' Association, which has been causing some slight trouble in subdistrict No. 2, is the clause which provides for the settling of disputes. These will be taken up by Ed Stewart, president of the miners, with the secretary of the company.

## Insurgents Would Oust Union Officers

A "RUMP" convention of miners was recently held in Sullivan County, Indiana, at which resolutions were passed against the present wage contract and against the officers of district No. 11. Clinton Local No. 2,446 showed itself firmly in support of the district leaders and the contract.

When Salmond, who had been made chairman of the grievance committee of the "rump" convention, and whose duty as such was to go over the district and assist in organizing against the present officers of the regular organization, went before his local union to make his report he was received quietly but dourly. When he had finished his talk the local advised him to withdraw immediately from the committee and have nothing further to do with the movement.

## Common Viewpoint Ends Indiana Dispute

COAL operators and miners in Clinton, Ind., believe that the trouble arising from the controversy about the lifting of bottom coal and also that regarding the Saturday holiday movement has come to an end. Miners say that the Saturday holiday does not at this time appear to be feasible, as it keeps the railroad cars idle. Many of the miners expect to go to work when the mines are marked up for a Saturday run. The loaders and operators appear to be standing together in the demand that the machine men cut the coal within 3 in. of the bottom at the front of the cut and down to the bottom at the back.

# NEWS FROM

# THE CAPITOL

BY PAUL

WOOTON

## Additional Injunctions Against Assigned Cars Sought

**A**DDITIONAL injunction suits have been filed by the National Coal Association against railroads practicing the use of assigned cars. The new suits are against the Pennsylvania, the Chesapeake & Ohio, and the Southern Railway. The initial suit was filed against the Baltimore & Ohio Railroad. Other suits will be filed soon, as the National Coal Association has determined to press this matter in the most vigorous way possible.

## Coal Men Want Claim Settlement Rules Published

**T**HE American Wholesale Coal Association is taking vigorous measures in order to have the Director General of Railroads publish the set of rules for settlement of claims which were agreed to and adopted over a year ago. The original rules were the result of a conference between the claim agents and representatives of the coal operators, jobbers and retailers, and the National Industrial Traffic League. At the time they were agreed to John Barton Payne, then attorney in charge of these matters for the Railroad Administration, advised against promulgation, and they have been held up by the Railroad Administration ever since.

## Natural Gas Interests Confer on Conservation Program

**D**EFINITE progress was made in the Natural Gas Conservation conference at the Department of the Interior on June 11, when tentative resolutions proposed by the National Committee on Natural Gas Conservation were approved. The conference included representatives of the governors and public service commissions of a number of the important natural-gas producing and consuming states.

One of the most important results of the conference, aside from the adoption of the resolutions, was the tentative agreement by state officials in Pennsylvania, West Virginia and Ohio to hold a conference the latter part of this month in Pittsburgh, with a view to formulation of a policy that will be mutually satisfactory to the gas interests in the tri-state fields. The problem of export of natural gas from West Virginia into Ohio and Pennsylvania for a number of years has been a difficult one. It is hoped that the coming conference will be able to proceed on the basis of the proposed resolutions to more effective measures than have previously been possible.

It is also expected that some regulations will be intro-

duced in the Louisiana State Legislature by Mr. M. L. Alexander, a member of the Conservation Committee of that state, in order to give effect to the conservation measures recommended by the resolutions adopted at the conference.

## Geological Survey to Study Eastern Power Possibilities

**T**HE U. S. Geological Survey has been authorized, by the Sundry Civil bill, to proceed with the super-power survey for the industrial region, Boston to Washington. The bill also provides an appropriation of \$125,000, together with authority to receive additional sums which may be contributed to the work. This survey will include a study of the possibilities of water power compared with coking of coal- and steam-power plants, both at the mine and at seaboard. It is expected that several experts of wide experience will be engaged by the Survey to direct the investigation.

## President Signs Water-Power Bill

**A**FTER thirty years of discussion the nation finally has a water-power policy. Announcement was made June 18 that the President had affixed his signature to the water-power bill previous to June 11, the date of expiration of the ten-day interval allowed for signing bills according to a decision of the Attorney General. This places upon the statute books of the nation a measure dealing comprehensively with water-power developments both on public lands and on navigable waters.

When it is considered that the nation's potential water-power capacity exceeds 60,000,000 horsepower it can be seen that this legislation is likely to have an important bearing on the general fuel situation. At present the country has but 5,000,000 horsepower of developed water powers. While considerable development of water power is expected to begin at once, it is recognized that the conditions laid down by the bill are strict, and it is problematical as to how attractive the development of these power sites may be to capital under its provisions.

Senator Jones of Washington, who is in charge of the legislation in the Senate, is authority for the following statement:

"Every water-horsepower going to waste which could be substituted economically for fuel power would represent approximately five and one-half tons of coal per year, based on an average of twelve hours per day. The labor of one man is released for other uses every time 50 hydro-electric horsepower is developed and every 150 water horsepower developed releases one freight car for other duty.

"This act means a saving of coal and a lower price for that used; a saving of oil and a lower price for that consumed; more efficient transportation and lower cost for service; the development of new industries; the building up of new communities; the creation of new property values, subject to taxation for the support and maintenance of local and state government."

### Attorney General Orders Indictment of Coal Profiteers

AS THE result of complaints to the Department of Justice that soft coal operators are profiteering Attorney General Palmer has ordered the prosecution of the offenders. Instructions were issued June 17 to Federal attorneys throughout the country to investigate the cases reported and to prosecute where the evidence warrants.

The complaints allege that coal prices range from \$7 to \$11 per ton at the mines. According to the Attorney General the cost of production has only increased to \$2.79 per ton. Legal action in the cases would be taken under the Lever act, which prohibits unreasonable profits in coal and other necessities. The Attorney General's instructions to the Government Attorneys follow:

"The department is receiving a number of letters in which complaint is made that bituminous coal prices at the mines now range from \$7 to \$11 a ton, with a further increase imminent. The writers say that operators are attributing the advanced prices to car shortage and export demand, emphasis being placed upon the export demand.

"Production cost figures gathered by the Federal Trade Commission from 1,589 bituminous operators from the principal producing regions, mining roughly about 60 per cent of the annual output, show that during January, 1920, their costs per ton averaged \$2.32 at the mines. Since then there has been an increase of 27 per cent in the cost of labor, enhancing the production cost to \$2.79 per ton. The accuracy of these figures is borne out by information in letters coming to the department from purchasers of coal, from which it appears that prices in May did not greatly exceed those furnished to the Federal Trade Commission for January.

"This situation demands the prompt attention of all United States Attorneys. Please give special attention to this matter and seek indictments where investigation discloses that an unreasonable profit has been taken, advising the department of the action that is taken."

### Movement of Coal Through the Sault Ste. Marie Canals

SHIPMENTS of coal passing westbound through the Sault Ste. Marie canals during the two months ending with May, according to figures prepared by the U. S. Bureau of Foreign and Domestic Commerce, amounted to 212,000 short tons of anthracite and 582,206 short tons of bituminous.

During the same period of 1919 the totals were: Anthracite, 391,127 short tons, bituminous, 2,655,562 short tons.

### Coal Men Endorse Priority Order, but Oppose Assignment of Cars

AFTER having had a few days to study the rather intricate and vague language of the service order of the Interstate Commerce Commission with regard to priority for coal moving to New England, coal men generally are of the opinion that the step is a wise one and probably can be worked out without serious disturbances. Just as service order 5 gave priority to coal moving to pools over coal not moving to pools, order 6 gives priority as between coal moving to New England and coal intended for export.

The order, however, does raise a very serious question, coal men believe, in that it aggravates the practice of assigning cars. No difference can be seen in principle in assigning cars to James J. Storrow as compared with cars assigned to a mine which is producing fuel for railroads.

### War Department Awards Contracts for Coal for Western Posts

AWARDS have been made by the War Department covering 800,000 tons of coal to be used at army posts in the West. Because of the conditions of delivery there was a wide range of prices, but most of the coal on which a mine price was quoted varied from \$2.70 to \$4 per ton. It will be recalled that the army rejected the bids submitted for the coal needed at its Eastern stations. New bids are to be opened July 15.

### Trade Report Requirement Suspended Pending Result of Legal Action

AN AGREEMENT was reached Monday by the Federal Trade Commission and the iron and steel companies contesting its right to require monthly reports whereby no steps will be taken against other companies pending the outcome of the cases to be tried in Philadelphia and Trenton.

### President's Anthracite Committee to Hold First Meeting in Scranton Today

THE Anthracite Wage Commission decided early this week to hold its first meeting in Scranton today and chose for its chairman William C. Thompson. He is president of Ohio State University and represents the interest of the public in the controversy.

### Matewan Tragedy Followed by Marriage

AN AFTERMATH of the Matewan (W. Va.) tragedy of May 19, in which a number of Baldwin-Felts detectives were shot down following an eviction of coal-mine employees, occurred early in this month when Sid Hatfield, chief of police of that town, and Mrs. C. C. Testerman, wife of the mayor, who was killed on the date mentioned, were married. When Testerman and Albert Felts were killed, Testerman, Felts and Hatfield were congregated at the entrance to the village store. Only two weeks later, Hatfield and Mrs. Testerman were married.

## Discrimination in Freight Handling Violates Law, Judge Says

**I**N a decision enjoining certain deep-sea steamship companies from refusing to handle merchandise barred by union labor, Justice Lewis L. Fawcett, New York Supreme Court, says:

"The representatives of the companies who decline to furnish service are violating the law, and the employers where strikes are threatened to compel them to violate the law are engaged in an illegal combination. The carriers have aided and encouraged the unions by seeking to evade their duties to handle plaintiff's goods without discrimination.

"While a man may enter any vocation he chooses, yet if he selects a field indissolubly linked with the rights of the public, such as a common carrier, he must serve his own rights to that of the public welfare.

"The combination violates the United States Shipping Act and Section 5,440 of the Revised Statutes. Under these statutes a refusal of the carriers to transport the plaintiff's merchandise is a crime, and the unions are engaged in an unlawful conspiracy when they induce, aid or abet the carriers in committing the same, and it is no excuse to the carriers that the employees threaten to strike."

## Britain Suspends in Part Government Control of Coal Industry

**I**N announcing the suspension of the operation of the Household Fuel and Lighting Order, 1919, beginning June 7, the London correspondent of the *Journal of Commerce* states that the Government through the Coal Controller controls both the production and marketing of coal. Technically the Government is in possession of the collieries, and while the management has been left free profits the allocation of coal to export and home requirements and the pithead price have been strictly controlled.

The Government also has controlled wages to the extent that it has acted as the final court of appeal. Marketing of coal, wholesale and retail, also has been strictly controlled. Profits have been limited under the Wholesale Prices Order and the Retail Prices Order. So far as household coal is concerned, the Government has controlled the allocation and purchasing by registering merchants and rationing the consumers. Under the Retail Prices Order local authorities and local fuel overseers have adjusted prices from time to time to meet the increased costs. The system has entailed a heavy administrative burden on the Coal Controller's Department.

The country was very near a coal famine once or twice last winter. Supplies were very limited, and there is an enormous increase in the industrial demand. A very large staff has been employed. The local fuel overseers alone have cost £400,000 a year. In addition there have been divisional offices and officers, traffic superintendents, and their staffs.

The Government's intention is for the present to retain control of production, but to wipe out control of marketing. This will give the coal consumers at home complete freedom of action once more, the consumer will be able to get coal of the quality required, and it is expected that cleaner coal will soon be available.

Fuel overseers and the rest of the large staff employed on the marketing side of control will be released,

considerable economies thus becoming possible in the Coal Controller's department, and a very heavy burden of administrative work will be lifted.

Suspension of control becomes effective June 7. This step could only be taken in the summer time, and it is only possible on the present output with a restriction of exports. Exports have been cut down to about 2,000,000 gross tons a month. To provide for the increased demand at home they are now to be cut down to 1,750,000 gross tons per month. The exports committee has agreed to this reduction in view of the necessity for meeting home demands.

In each coal producing area a Board of Trade committee has been sitting under the system of control. With the lifting of control those committees will remain. They will be so arranged as to have on them representatives of the coal owners, the merchants and factors, and consumers. Any complaints as to short supplies in particular districts would by this means be brought to the direct notice of the coal owners. These committees will exercise a supervising interest and will be coordinated by a central committee meeting in London.

There is little prospect of an immediate reduction of price as the result of the lifting of Government control; equally there should be no increase; the removal of control renews competition among merchants and factors, which should tend to lower prices gradually, and the consumer is protected under the Profiteering Act.

The Government through its control experiences is in possession of ample evidence as to cost of production and transport from the pit right down to the consumer, which will be available to the Board of Trade and all profiteering committees. This will exercise sufficient restraint against any attempt to raise the cost of coal to the home consumer.

## Smokeless Operators Ask Revision of Navy Coal List

**R**EVISION of the navy's preferential list of coal mines is likely to result from a full discussion of the subject by smokeless operators with navy officials on June 18. It was pointed out that under present conditions the navy's policy works an extreme hardship on the comparatively few mines which are called upon to furnish this coal at a very reduced price. While the hope is entertained that the preferential list can be abolished entirely, it is regarded as practically certain that at least a more general distribution of the navy's requirements will be secured.

The smokeless operators designated O. M. Deyerle, president of the Flat Top Fuel Co., to represent shippers on the Norfolk & Western, and Frank Ellison, general manager of the C. G. Blake Coal Co., to represent shippers on the Chesapeake & Ohio and the Virginian railways. Mr. Deyerle and Mr. Ellison will work out the details of the revision with Commander Hilton of the Navy Department.

## Indiana Production Decreases Slightly

**P**RODUCTION of coal at 192 mines in Indiana in the week of June 12 is reported as 533,174 net tons, a slight decrease compared with the week preceding. These mines operated 62.4 per cent of full time, with car shortage accounting for 29 per cent of full time lost. The other causes contributing to lack of production were labor trouble, mainly in the Evansville and Linton districts, and mine disability.

## British Coal Exporters Protest New Government Restriction

AT a meeting held June 11 at Cardiff, according to a cable despatch to the *Journal of Commerce*, the Coal Exporters' Association passed the following resolution:—"The coal exporters, while anxious to support the policy of the Government in providing adequate supplies of coal for inland use, protest strongly against the vexatious and unworkable conditions now enforced on shipments of what coal is available."

Newcastle reports that official information has been received that the Durham allocation of coal for export amounts to 350,000 tons per month, each colliery to supply a certain percentage to individual countries. The percentage is apparently based on output, not on grade of coal mined, and it is assumed therefore that all coals will have to be shipped as wrought. In perspective all screening machinery will be scrapped and foreign buyers must take unscreened coals or do without.

The scheme is considered altogether unworkable and a deputation is proceeding to London to discuss the situation with the Coal Controller. It is expected that many mines will remain idle for a while.

## Coal Interests Urge Higher Freight Rates At Commission Hearings

NO SERIOUS objection to an increase in coal rates by the railroads was registered by representatives of the coal industry who appeared before the Interstate Commerce Commission June 16 and 17. In fact, practically every witness expressed a hope that the carriers would be granted an increase which would permit of adequate improvements and replacement of equipment. Practically the entire hearing was consumed in making comparison of rates between the various mining districts. It was asked that the distortions which grew out of general order No. 25 be recognized by the commission in any increase which it may make on coal.

It was argued that it is in the interest of the consumer, the general public, the operators, and the carriers that the well-established differentials be preserved. Many of them, it was pointed out, have been fixed by the Interstate Commerce Commission after litigation and after extensive hearings. To disrupt them would bring about great confusion, it was argued. The relative merits of a flat rate in cents per ton as compared with the percentage increase was presented at length.

One of the contentions made was that short-haul coal is bearing more than its proper proportion of freight rates. It was predicted that any further increase will encourage the production of power at the mines, thus reducing carriers' revenue. It was pointed out that in many cases at present the freight charges to points relatively close to mines already equal the cost of maintaining an overhead line for the transmission of power.

Due to the local nature of the question the National Coal Association took no part in the proceedings other than to introduce as a part of the record the resolution adopted at the Atlantic City convention, which reads as follows:

Whereas, the present insufficient production of coal is directly due to the lack of adequate transportation facilities, and whereas the quickest way to rehabilitate the railroads and enable them to secure the needed equipment and

give the service which will tend to reduce the cost of production of all commodities, including coal, is to re-establish railroad financial credit,

Therefore be it resolved that the coal industry recognizes the need for an immediate increase in the revenues of the railroads, sufficient to insure their solvency and prosperity, by means of an increase in freight and passenger rates. However, the coal industry desires assurance from the Interstate Commerce Commission that this endorsement of an immediate increase in all freight rates will not prejudice the right of any parties interested to obtain redress hereafter, first if the differentials are inequitable, as between different mines or different producing districts, and second, if rates themselves are excessive, unreasonable or discriminatory.

The coal industry desires to call attention to the fact that the coal consumers have already borne more than their share of increased cost of transportation and that the public welfare might be conserved by adopting a higher percentage of increase on freight of greater value and a lower percentage of increase than proposed on coal, which is the basis of industry.

## Predicts Sufficient Coal Next Winter

PLENTY of bituminous coal next winter is predicted by George H. Cushing, managing director of the American Wholesale Coal Association, in an address before the City Club of Washington, D. C., on June 15.

Mr. Cushing cited the following figures bearing on the coal production of the nation:

"Since April 1 we have records of the production during nine weeks. The bituminous output of this year compared with last has been: 1920, 80,521,000 tons; 1919, 72,818,000 tons; gain, 7,703,000 tons.

"The average weekly production since April 1 has been: 1920, 8,946,000 tons; 1919, 8,090,900 tons; gain, 855,800 tons.

"The average monthly production has, accordingly, shown a gain of 3,708,450 tons. Last year, with the smaller production, we had accumulated a sufficient storage to help tide us over the worst miners' strike in history. Running ahead, now, of production of last year, I cannot believe the current statements that we are running headlong into a dreadful shortage of coal.

"I know what is being said on the other side of the question. I do not believe it. The fact is that we have a demand which if it were spread in equal monthly proportions over the year would call for a production of 10,300,000 tons per week. The fact that for nine weeks we have been getting a weekly average of only 8,946,700 tons indicates that we are accumulating a shortage at the rate of 1,353,000 tons per week. That would be bad if it were to continue until the end of the year.

"The fact is that we have never, in peace times, had a serious bituminous coal shortage. Yet never, in peace times, have we moved bituminous coal in equal monthly installments. We have always fallen much below our present level of production in summer and then made up the shortage—or seeming shortage—in the fall months. That is what we did last year. We are going to have less of a shortage to make up this fall than we did last, for the reason that we are moving now 3,700,000 tons of coal more to market per month than we did a year ago.

"The plain and simple fact is that we have other and proper uses for open-top cars in the summer. Those uses disappear in the fall. The cars then revert to the coal trade, and production naturally grows in response. That allows coal production to equal demand at the time of use."

# Production and the Market

## Weekly Review

*Interstate Commerce Commission Orders Preference and Priority to New England Coal Shipments to Tidewater—Production Goes Up and Promises to Climb Higher—Order Confining Open-Top Cars to Coal Will Help—Prices Still Going Up.*

**A**RBITRARILY taking several hundred thousand tons a week out of the supply for export will force prices for foreign delivery to even higher levels. At the same time the high prices at tide are due to drop for New England buyers, and with gradual but consistent gains being made in production each week and the benefit to car supply that is certain to follow the order limiting for the next thirty days the use of open-top cars to coal an easier market is looked for over the East generally.

Prices continue to occupy first place in the interest of the public. The Attorney General has issued instructions to his field force to prosecute those dealing in \$10 coal, mine price. It is noteworthy that in Illinois mine prices are regularly quoted lower for southern coal than for that from central and northern Illinois, although usually selling for higher prices. The operators in the south field seem to be exercising somewhat greater restraint than the others.

Southern West Virginia coal is now moving west and in the next few weeks the situation will be much easier

in the Chicago market. Meanwhile such points as Louisville, St. Louis, Milwaukee and Detroit are struggling to get supplies and are anxiously awaiting the heralded movement of empties ordered in from the West a month ago.

Anthracite is steadily gaining in total output, but whether or not a considerable portion of the increase is washery coal that does not add to the supply of domestic sizes, no information is available. New England has not been concerned until recently about the shipments of hard coal, but the West has been complaining of short movement compared with last year.

### Lake Coal Dumped Season to June 19

(NET TONS)

	Cargo	Fuel	Total
1919.....	7,160,600	325,970	7,486,570
1920.....	2,487,800	245,600	2,733,400

#### BOSTON

*Spot Prices Seem To Have No Limit—Buyers Strive to Get Coal—Federal Aid Is Invoked—Tidewater Piers Are Congested and Hampton Roads Loading Is Slow—Anthracite Movement Slackens, Causing Much Anxiety.*

**Bituminous**—The spot market on steam grades continues its amazing upward swing. Only 60 days ago there was a strong feeling in the trade that operators would hardly dare mark up prices beyond \$6 per net ton at the mines, but at this writing the \$11 mark has been passed and \$12 is near at hand. There is no sign of price recession and there is still the same clamoring for quick coal that has been characteristic for more than six weeks.

Every wholesale office is besieged with eager buyers. Middle-houses are buying of one another, and conservative consumers who were inclined to wait developments are now thoroughly alarmed and seeking coal at the best price obtainable.

The situation has been taken to Washington. Efforts have focussed on the Interstate Commerce Commission and a hearing was recently held. It was urged that some form of priority in car-supply should be granted this territory, such as has been given the Lake market.

One difficulty is that both Hampton Roads and the Lake territory draw quite largely from the West Virginia fields, while New England is now much more largely supplied from central Pennsylvania, as indeed are New York, New Jersey, and Pennsylvania itself, not to speak of heavy consuming districts in Canada.

The car movement is really improving. Cars have reached New England from beyond Pittsburgh in less than ten days, and the railroads are handling coal traffic in much better fashion.

The tidewater piers, especially at New York, show signs of congestion. Some of the embargoes have been lifted, but the labor situation and the great difficulty of shifting cars and boats are together causing such delays as to make terminal conditions almost impossible. Bottoms have accumulated to greater extent than at any time heretofore this season.

At Hampton Roads there have been further delays the past week. Demurrage charges have accrued on most of the boats listed to load on coastwise business, and re-handlers here have been obliged to mark up prices in consequence. Prices on cars Providence have advanced from \$11.50 to \$12.50

within a day or two, and at Boston there have been sales up to \$16.

The New Haven R.R. has resumed seizing coal in comprehensive amounts. But a system of permits has now been worked out and under the close supervision of division superintendents, industries really in need of fuel are enabled to have their coal protected.

Current prices on bituminous at wholesale range about as follows:

	Clearfields	Cumbrias and Somersets
F.o.b. mines, net ton	\$9 75@ \$11 25	\$10.25@ \$11 50
F.o.b. Philadelphia, gross tons	12 80@ 14 50	13 40@ 14 80
F.o.b. New York, gross tons	13 15@ 14 85	13 75@ 15 00

**Anthracite**—Due to renewed urgent inquiry from the Middle West, shipments both all-rail and to tidewater have both appreciably slackened. Domestic sizes are in quite strong demand. The retail dealers are making no secret of their anxiety and by September there is certain to be a mild form of panic to get covered for ordinary requirements.

The weather has interfered with movement by water to a considerable extent during the past fortnight, and as a result receipts here will show quite a falling-off as compared with figures for May. The steam sizes continue in fair request, but there is by no means the buying power to the market for this fuel that might have been anticipated.

### Tidewater

#### NEW YORK

*Anthracite Demand Is Strong and Receipts Are Comparatively Low for the Season—Domestic Sizes Needed Here—Movement of Steam Sizes Is Brisk—Bituminous Demand Increases and Coal Moves in Good Volume—Consumers Look for a Break in the Market.*

**Anthracite**—With the demand remaining strong the dealers here are in the market for heavier tonnages than they now receive. Receipts of coal are not as they should be at this season but the trade is not complaining as they realize that New York is being well cared for when the local harbor labor troubles and the demand from the Lake ports are considered. Demand along the line is also strong.

While production is heavy, some shippers fear that with the efforts being made to secure a stronger movement of bituminous, the car supply at the anthracite mines will be cut down.

In this market the companies are barely able to take care of the immediate requirements of the retail dealers

and the latter in turn are far behind in their orders to their customers. However, nearly all consumers have some coal in their bins.

The steam coals are finding a steady market. Barley is a little sluggish but buckwheat and rice are active. Considerable of the activity is attributed to the high prices quoted for bituminous.

Quotations for other than company product, at the mines, range about as follows: Buckwheat, \$4.25 to \$4.75; rice, \$3 to \$3.75; and barley, \$1.75 to \$2.25.

Current quotations for company coals, per gross tons, at the mine and f.o.b. New York Tidewater, at the lower ports, are as follows:—

	Mine	Tidewater
Broken	\$7 30-7 50	\$9 15-9 35
Egg	7 30-7 45	9 15-9 30
Stove	7 55-7 80	9 40-9 65
Chestnut	7 60-7 80	9 45-9 65
Pea	5 85-6 25	7 60-8 00
Buckwheat	4 00-4 10	5 75-5 85
Rice	3 00-3 50	4 75-5 25
Barley	2 25-2 50	4 00-4 25
Boiler	2 50	4 25

Quotations for domestic coals at the upper ports are generally 5c higher on account of the differences in freight rates.

**Bituminous**—The increasing demand for fuel continues while the quotations for "anything that looks like coal" seem to be seeking new levels. Prices for coal at the mines are higher than a week ago and there has been a corresponding increase in quotations at this tidewater. Much of the high prices are due to the insistency of buyers who are in the coal fields and are bidding against each other.

Water deliveries in this harbor continue to be delayed because of the marine troubles. Heavy towing charges remain in force driving prices for boats alongside to around \$15. Loaded boats are being quoted from \$13 to \$14, with rumors that slightly higher quotations have been made.

Quotations at the mines vary and while they generally show an advance over those of the previous week it is said that some operators are letting their products go at lower figures. Fair grades of Pennsylvania coals were quoted around \$10 with quotations for gas coal at about the same figure. Car supply was slightly better on all roads.

#### PHILADELPHIA

*Dealers Are Unable To Accumulate Anthracite Stocks—Pea and Chestnut Are Short—Stove in Greatest Demand—Steam Coals Are Active, Except Barley—Production at Mines Keeps Up, but Car Supply Diminishes—Heavy Volume of Bituminous Goes to Tide—Record Prices Are Asked.*

**Anthracite**—Moderate tonnages of anthracite continue to reach the city, although dealers so far have been unable to accumulate any reserve stocks. The amount of coal coming in is still sufficient to keep delivery equipment busy, yet the fact that coal is being sent out as fast as it comes in is causing uneasiness among the trade.

Pea coal is actually scarce now;

heretofore it has always piled up at this time of the year. For the past four years the use of this size has extended to an ever-widening territory. At this time the West is taking considerable quantities and among the premium shippers it is stated they are getting as high as \$9.75 at the mines for this size.

The size still called for in greatest volume is stove, but no dealer pretends to be able to meet the demand for it. Chestnut coal is also short. The demand for egg keeps up without any sign of diminishing as the season advances.

The steam coals are moving nicely, with the exception of barley. Buckwheat is actually tight and the companies with prices of \$4 and \$4.10 have all the business they can handle. The independents are getting prices ranging from \$4.25 to \$4.50 for this size and moving all they can produce. Rice is also quite active, due probably to the scarcity of soft coal. Barley continues stagnant. With the big consumer there seems to be a tendency to permanently change a portion of the boiler equipment so as to be able to take advantage of a situation such as the present, with soft coal sky high and an over-production of barley.

**Bituminous**—It is claimed that soft coal has shown an increase in production recently. But all week at the mines, prices have hovered closely around \$10 and sales even at \$11 have not been rare.

However, the big producers have no coal to offer on the spot market, most of them being hard put to try to meet their contract obligations.

As yet the operators will not admit that the car supply has appreciably improved. Those concerns willing to take railway-supply coal, on the basis of \$4 to \$4.25 at the mines, are the only ones thus far who are able to make anywhere near full working time.

There continues to be a heavy volume of coal going to tide to the various pools. There is a particularly heavy tonnage of gas coals in the pools awaiting vessels for export. Due to the long-shoremen's strike, loading has been somewhat delayed and coal has accumulated awaiting the berthing of vessels. The average price for coal at tide is close to \$10, although at times during the past two weeks it is reported sales were made around \$15.

## BALTIMORE

*Transportation Conditions and Terminal Congestion Force Export Embargo—Poor Car Supply and Movement of Loads Keep Price Sky High—Anthracite Receipts Are Slow and Prices Advancing.*

**Bituminous**—A continued poor run of cars at the mines, a poor railroad movement, systems jammed with coal on sidings and terminals at tide also crowded with standing cars, faced the trade here the past week. Since midnight of June 15, the Baltimore & Ohio has operated an embargo against all

shipments to tide on export, and even the outstanding permits were cancelled.

Coal and ships have to be actually at hand to get results at the pier here. At this writing there are more than 2,000 loaded cars at the B. & O. piers, with 24 ships waiting to take on 144,000 tons on export and coastwise hauls, and with dumpings only averaging a little above 300 cars a day at that point.

The secret of the situation seems to be in poor transportation—poor supply of empties and a poor movement of loaded cars.

Best coals are still selling f.o.b. mines the net ton at between \$10 and \$10.50, with both export interests and domestic consumers competing for the fuel. Medium-grade coals readily bring \$9 and better, while the poorest coals are worth from \$8.25 to \$8.50. Exports were running quite heavy up to the time the embargo was put into effect, and even now are large. The first half of June saw a loading of more than 250,000 tons of export cargo coal, with the ships taking more than 60,000 tons additional for bunker use.

**Anthracite**—The receipts of hard coal continue most unsatisfactory. Deliveries to cellars here are far behind this period of last year. And this year those with orders on the books now realize that they will not get the coal at the price at time of order and are urging deliveries, knowing that still higher rates are coming. Meanwhile almost every notice from mine connections shows some advance in wholesale price, and thus overhead costs keep mounting.

## Lake

### BUFFALO

*Slight Improvement in Soft Coal Movement—Demand Is Fair with Most Coal Moving Under Contract—Anthracite Situation and Lake Trade Good—Coke Market Is Unsteady.*

**Bituminous**—The improvement in coal movement is small and complaints from mine owners continue. Allegheny Valley operators especially note poor transportation. If the cars were at all adequate, the present frightful state of prices would last but a short time. As it is the mine prices soar to close to \$10.

The demand is fair. Some jobbers are staying out of the market almost entirely beyond looking after their old customers and seeing that they do not run out of coal. A large part of the coal is moving under contract.

**Anthracite**—The demand continues good and the local supply at least is fair. Never before has so much anthracite been sold here so early in the year. The Canadian supply does not appear to be so good, for a large number of dealers have been here lately, asking for coal.

An odd feature of the trade is the slow sale of the steam sizes of anthracite. It is shown that this coal costs

much less than bituminous and yet it is hard to get firemen to use it.

In the Lake trade the movement is good, with one trestle still idle, the amount loaded for the week being 121,400 net tons, of which 30,100 tons cleared for Milwaukee, 28,100 tons for Duluth-Superior, 25,400 tons for Chicago, 12,700 tons for Fort Williams, 7,700 tons for Port Arthur, 7,400 tons for Escanaba, 7,000 tons for Sheboygan and 3,000 tons for Green Bay.

Freight rates are 65c. to Chicago, 60c. to Milwaukee, 55c. to Sheboygan, Green Bay and Escanaba, 50c. to the Lake Superior ports.

**Coke**—The trade is in quite an unsteady condition, with all sorts of prices asked for single-order shipments. The latest report is of \$15.50 at the ovens for both foundry and furnace, with little demand for the domestic sizes. The few sales reported differ about \$3 per ton within a week. Only a small part of the consumption is outside of the contracts.

## CLEVELAND

*Continuous Operation of Mines Is Urged on I. C. C.—Situation Improves Slowly, but Famine Conditions Threaten—Only Anthracite on Hand.*

**Bituminous**—Following a conference with railroad officials and the manager of the Ore and Coal Exchange, operators in the No. 8 district with headquarters in Cleveland, have sent an appeal to the Interstate Commerce Commission for the means of "continuous operation of the mines." This can only be accomplished through adequate supply of cars at the mine mouth.

Complaint continues that cars ordered East from the Western states have not appeared in appreciable quantities in the coal regions supplying this district. Coal men say that the small improvement that has been seen cannot be traced to the heralded car movement from the West.

Most plants continue to operate on a hand-to-mouth basis with respect to coal and efforts to get sufficient coal to prevent shut downs is almost frantic in numerous cases. There has been some improvement in the railroad labor situation, but conditions are still deplorable. As high as \$8 is still being offered by consumers in dire need but spot supplies even at that price are almost unobtainable.

**Pocahontas and Anthracite**—Anthracite coal is about the only grade of coal on hand in dealers' yards, and most retailers are accepting orders for delivery of anthracite but for nothing else. Anthracite prices remain unchanged. Pocahontas supplies have almost reached the vanishing point and retailers are refusing to quote prices or guarantee deliveries. The supply is said to be about five per cent of the demand at present.

Low operations, unusual shipments to tidewater from the mine districts supplying Cleveland and diversion of supplies to supply the Lake trade, are the chief reasons why retailers are short

of supplies. Some of them are getting coal from the Indiana fields, a novelty in Cleveland.

**Lake Trade**—The new pooling arrangement for shipments up the Lakes went into effect a few days ago, and substantial betterment is already indicated. In the first half of June 18,000 tons of coal were loaded at the docks against 15,000 tons during the last 15 days of May.

Retail prices of coal per net ton delivered in Cleveland are as follows: Anthracite—egg \$13.20; grate, \$13.20 and \$13.50; chestnut and stove, \$13.50.

Pocahontas—shoveled lump, \$11.75, and mine-run, \$9.25. Domestic Bituminous—West Virginia splint, \$11.75; No. 8 Pittsburgh, \$8.75; Millfield lump, \$11.75; and Cannel lump, \$12. Steam coal—No. 6 and No. 8 slack, \$8.50 to \$8.75; No. 6 and No. 8 mine-run, \$8.50 and \$8.75; and No. 8 3-in. lump, \$8.50 to \$8.75.

## Inland West

### COLUMBUS

*Car Shortage Curtails Production—High Prices Still Prevail as the Result of Bidding for Tonnage—Factories Are Forced To Suspend Operations and Domestic Demand is Insistent—Lake Trade Continues Slow.*

The Ohio coal trade has been rather strenuous during the past week, with the demand for all grades stronger than ever, and curtailed production as the result of the car shortage. Prices are still mounting. In fact new high levels have been reached and it is believed that the end is not in sight.

The steam trade is probably the strongest feature at this time. With factories suspending operations because of lack of fuel, purchasing agents are in a mad chase after tonnage.

Domestic demand is becoming more insistent as the public has come to realize that there may be an acute fuel shortage this winter. The price is not the question, but rather the ability to get the tonnage.

A fair amount of West Virginia splint is arriving and quickly delivered. Practically no Pocahontas is obtainable on the local market. Hocking and Pomeroy grades constitute the bulk of domestic business. Retail stocks are short and in some instances almost exhausted.

Retail prices are higher, as Hocking lump retails at \$8.50 and mine-run at practically the same figure. West Virginia splint sells in the neighborhood of \$1.50 and Pocahontas around \$11.

The lake trade continues slow, according to the reports from the docks of Lake Erie. Loadings to date are less than 20 per cent of last year's records and unless some radical action is taken the Northwest will be quite short of fuel. Vessels are plentiful but the tonnage is not available.

Prices at the mines for the principal grades used in central Ohio are:

Hocking lump	\$6.00 to \$7.50
Hocking mine-run	5.75 to 7.25
Hocking screenings	5.50 to 6.75
Pomeroy lump	6.25 to 8.00
Pomeroy mine-run	6.00 to 7.50
Pomeroy screenings	5.75 to 7.50
West Virginia splint, lump	6.50 to 8.00
West Virginia splint, mine-run	6.25 to 7.75
West Virginia splint, screenings	6.00 to 7.50

### CINCINNATI

*Section Is Out of Coal and Dealers Plead for Supply—Industrial Plants Pay Any Price for Fuel—Householders Stock with Available Fuel, as Little Smokeless Is Obtainable.*

The entire country from Cincinnati to the Northwest is out of coal. The long continued cold weather, lasting from early last fall until late this spring, completely used up the stocks and the coal dealers in every city, town, village and hamlet are pleading for even a meager supply. But with only two days' car supply per week at the mines during the last two months, the producers are not sending out much coal.

Dealers in Cincinnati have a limited stock and most of this has come down the Ohio River. It is next to impossible to get smokeless coal in the local field. In fact the market here is extremely short of certain grades of fuel. The large industrial plants, as well as the small industries are clamoring for coal and are paying any price for it.

Futile efforts are being made by the industrial users to get a reserve stock; they are disregarding prices, but are failing to lay in a stock simply because it is not to be had.

While prices at the mines advanced during the past three weeks, the retail price (delivered) in Cincinnati has not, remaining at the following figures:

Bituminous lump	\$8@ \$8.25
Bituminous nut	7.25
Bituminous run-of-mine	6.75
Smokeless lump	9.25
Smokeless run-of-mine	8.50
Smokeless anthracite	14.00

### MILWAUKEE

*Coal Situation at Milwaukee Is Serious—Prices Will Go Higher Unless I. C. C. Interferes—Eastern Coals Are Not in the Market.*

Watching, waiting, worrying—these three words fitly express the attitude and state of mind of the men at Milwaukee who are in a way responsible for the coal supply of a large area of territory. As to the market, there is none. There is no soliciting of trade, and the consumer takes what he can get.

Prices continue to be held at the April and May level. There is no denying that the situation is critical and that the Northwest is confronted with the possibility of a serious coal famine next winter.

There is a fair movement of anthracite, and the liberal deliveries of hard coal tend to allay anxiety on the part of the general public, but heavy users of soft coal are not in as tranquil a state of mind.

There is practically no eastern soft coal in the market, the receipts being absorbed to the limit. Illinois and Indiana coal can be had in limited quantities.

Receipts by Lake thus far this year aggregate 207,460 tons of anthracite and 242,592 tons of soft coal, against 194,653 tons of the former and 995,153 tons of the latter during the same period in 1919.

### MIDWEST REVIEW

*Transportation Is Improving—Coal Prices Are Firm, with Mine-Run on a Par with Prepared Sizes—Embargoes Are Proposed To Relieve New England—Prices Stiffen Toward End of the Week.*

The railroads serving the Middle West coal fields appear this week to be in better shape than at any time since they were returned to private ownership. We hear that the car supply in the Springfield district, as well as the coal-producing districts in northern Illinois, is quite good—in fact, over 50 per cent.

In the southern Illinois coal fields the situation is not so good, although cars are moving to the mines more freely than last week, or the week before. When talking to railroad men, one gets the impression that the c. r.-supply question will improve slowly but steadily from now on.

The market continues to hold up quite strongly and in some cases steam sizes, such as mine-run and screenings, are bringing as high prices as the prepared sizes made for domestic use. This is, undoubtedly, because manufacturing interests are buying coal as fast as they can and in as great quantities as possible.

### CHICAGO

*Coal Comes in Fairly Well, Relieving Situation Somewhat—Best Coals Sell at Reasonable Prices—Inferior Fuels Held at Higher Rates.*

Coal continues to come into the Chicago market in fairly satisfactory quantities. Retailers report that they now have a little reserve on hand and that the mines are making shipments to them in a fairly satisfactory manner, considering conditions in the market and the handicaps at the mines. Steam plants also are in better shape, and are in a position to use a little more discrimination in buying than heretofore.

Prices vary greatly in the different fields. Franklin County coal, perhaps the best coal produced in this territory, is still selling at fairly low prices, while other coals, not so good, either from a standpoint of quality or preparation, are bringing higher prices. Current prices, f.o.b. mines, are approximately as follows:

ILLINOIS		
Southern Illinois		
Franklin, Saline and Williamson counties		Rate to Chicago
Prepared sizes	\$3.50 to \$6.00	\$1.55
Mine-run	3.50 to 5.50	1.55
Screenings	3.25 to 4.50	1.55
Central Illinois		
Springfield District		
Prepared sizes	\$4.00 to \$6.00	\$1.32
Mine-run	4.00 to 5.00	1.32
Screenings	4.00 to 4.75	1.32
Northern Illinois		
Prepared sizes	\$4.75 to \$5.00	\$1.24
Mine-run	4.50 to 5.00	1.24
Screenings	4.25 to 4.50	1.24

INDIANA

Clinton and Linton Pouth Vein		Rate to Chicago
Prepared sizes	\$5 00 to \$6 00	\$1 27
Mine-run	4 50 to 5 25	1 27
Screenings	4 25 to 4 50	1 27
Knox County Field Fifth Vein:		
Prepared sizes	\$4 00 to \$5 50	\$1 37
Mine-run	4 00 to 4 75	1 37
Screenings	4 00 to 4 50	1 37
Brazil Block	4 25 to 4 50	1 27

EASTERN COALS

Pocahontas and New River coals		
Prepared sizes	\$8 00 to \$10 00	\$2 65
Mine-run	7 00 to 10 00	2 65
West Virginia splint and gas coals		
Prepared size	\$8 00 to \$9 50	\$2 65
Mine-run	7 25 to 8 25	2 65
Southeastern Kentucky Hazard, Harland and Big Sandy fields		
Prepared sizes	\$7 00 to \$9 00	\$2 45
Mine-run	7 00 to 9 50	2 45

It will be noted in some cases there is quite a wide variation in prices. This is because some operators are sticking close to their April quotations to the trade, while others have disregarded them. The quotations given, it must be remembered, are current prices, and cover only coal produced and sold from day to day.

ST. LOUIS

*Steam Coal and High-Grade Domestic Are Short—Southwest Plants Are Closing Down—Operators, Dealers and Steam Users Are Alarmed Over the Future.*

Locally St. Louis is short of steam coal and high-grade domestic; in general the domestic demand is not what it should be and this is causing grave anxiety to the retail dealers.

The domestic call from the country is far greater than the available supply can take care of on any kind of coal. In many sections in the southwest, plants are closing down on account of no steam fuel.

In the Standard district the mines continue to get about two days a week on commercial coal and considerably better showing where railroad coal is loaded.

In the Mt. Olive field a little better running time is experienced and the railroad tonnage here is also heavy.

In the Carterville field two days a week is the commercial run on the Missouri Pacific. About three days work a week holds on the other roads, with better time where railroad coal is loaded.

The miners are generally satisfied and there is little or no labor trouble. The movement of cars throughout all fields is slower than normal.

Standard coal is quoted for St. Louis delivery at from \$3.25 to \$4.50 at the mines for domestic sizes and about the same for screenings and mine-run. Mt. Olive still continues to maintain circular prices of \$3.00@ \$3.25 on all sizes, excepting washed, which is about \$3.60.

The Carterville circular of \$3.70 is not held. Some operators are getting \$4.50@ \$5. In the Duquoin field nearly all operators have passed up their contracts and orders and are loading mine-run coal at \$4.50.

DETROIT

*Shortage of All Kinds of Fuel Is Serious Here—Local Soft-Coal Market Is Supplied Chiefly from Ohio—Dealers Are Unable To Fill Anthracite Orders.*

**Bituminous**—In the matter of fuel supply, steam and domestic buyers in Detroit are seriously handicapped. Jobbers say conditions are not improving and that the shortage of bituminous coal is as serious as at any time since the war. There is said to be no free coal on the tracks, practically all of the stock sent here going directly from the mines to consumers.

Though small shipments are coming from Illinois and Indiana, the market is practically dependent on Ohio for its bituminous coal. Slack from that district is reported selling around \$6.75 at the mines per short ton. Mine-run is quoted at \$7 to \$7.25 and lump is offered at \$7.50. There has been some complaint among customers concerning shipments of low-grade coal.

Reports received by the jobbers indicate that shortage of cars is still preventing mines in nearly all districts from turning out more than the equivalent of two or three days' production in a week. Coal from West Virginia and Kentucky has nearly disappeared from the market and is received only in shipments applying on long-standing contracts. This coal, which was formerly the chief supply of Detroit manufacturers, is now being sent to tide-water, while prices are said to be at a level that renders it impracticable for local buyers of steam coal to purchase it.

**Anthracite**—From the viewpoint of the retailer and the consumer, the situation in the anthracite trade is quite unsatisfactory. Retailers are able to get very little coal and in consequence are unable to fill orders which were booked weeks ago. Their customers are becoming anxious over the delay.

**Lake Trade**—With the system of pooling-Lake coal again in effect, as in 1918, shipments are still disappointingly small and many ships are unable to get cargoes for their upbound trips.

South

LOUISVILLE

*Failure of Car Supply in Kentucky Fields Again Drives Prices Upward—Demand Is Heavy—Buyers Force the Market and Make the Price.*

There has never been a time when the situation in the Kentucky fields was so chaotic as it is at the present time. Many operators are making no effort to get business, merely allowing buyers to bid up the price and accepting the highest offer. No contracts are being accepted; on orders taken, prices are open and subject to wire confirmation of the price at time of shipment.

Operators had a three-day supply of cars in early June, the following week showing but two day's operations, while

for the past week many mines have worked less than two days, some only one day.

The prices of lump and screenings are practically the same as mine-run. Buyers are willing to accept any size of gas coal, at prices ranging above \$9 a ton, running up even to \$10.

Conditions indicate that the gas and byproduct companies, the public utilities, the railroads and the big industries are forcing the market. Domestic business is at a standstill as consumers will not pay the price and are waiting for something to happen.

There are practically no quotations on anything but mine-run as that is practically all that is being produced, and prices are about the same for all sizes.

Quotations for mine-run at mines are as follows:

Gas Coal	\$9@ \$9.50
Non-gas	8@ 8.50
Western Kentucky	5@ 5.50

BIRMINGHAM

*Coal Moves Somewhat Easier Due to Less Confiscation—Hot Weather and Strikes Curtail Production—The Little Spot Coal Available Is Taken at High Prices.*

Although there has been no noticeable increase in the number of cars furnished the mines in this district over the previous week, reports indicate that coal is moving smoother and with less delay due to less confiscation by the railroads. Contract-fuel mines are getting about all the cars they need, and commercial operations receive a supply ranging from 45 to 50 per cent.

The extremely warm weather of the past week has brought about increased idleness on the part of mine labor generally, which under normal conditions works with quite a satisfactory degree of regularity. This labor delinquency is greatly curtailing coal production, as mines which have a full car supply are thus prevented from operating to capacity.

There has been no change in the mining regions of Bibb, Tuscaloosa and Walker counties, where local strikes have interfered with production at a number of smaller mines, the men still remaining away from work.

Activity in trade channels is confined chiefly to declining coal orders, which continue to come to brokers and selling agencies in great volume. There is no coal available or in sight, with which to care for additional business, and only a nominal amount is being taken on. The little spot coal that finds its way to market is absorbed at prices ranging from \$4.50 to \$7 per ton mines, regardless of grade.

Receipts of domestic coal are quite unsatisfactory to retailers who are trying to accumulate a supply for winter, as a number of the mines producing domestic sizes have been wholly or partly closed by strikes for several weeks, and transportation facilities are inadequate to move what could otherwise be mined.

# News From the Coal Fields

## Northern Appalachian

### FAIRMONT

*Transportation Conditions Go from Bad to Worse in Second Week of June — Railroads Persist in Assigned-Car Practice — Little Commercial Coal Shipped — Suit Is Entered Against Railroads.*

The second week of June brought many disappointments to operators of the Fairmont, Monongalia and other northern West Virginia regions. Transportation conditions were even worse than they had been during the first week of the month.

While mines on the Monongahela R.R. had a fairly large run of cars on Monday, every one of the 110 cars furnished on Tuesday was assigned. Summarizing conditions it is not believed that mines in northern West Virginia, on an average were able to produce more than 35 or 40 per cent of potential capacity.

With such a short car supply, it was next to impossible to load any commercial coal, since the railroads secured all the coal they wanted by the simple expedient of assigning cars. One effect of such a slim production was to increase the price of mine-run in northern West Virginia fields to about \$9.25 a ton. On some days fully half the coal produced at various points was for railroad consumption.

That accounts for the limited tonnage movement to Tidewater, to Inland East and West markets and to the Lakes. Curtis Bay shipments over the Monongah division of the Baltimore & Ohio did not average more than 150 cars a day.

The climax to the inexcusable assignment of cars in northern West Virginia came on Saturday, June 12, when suit was entered in the Marion Circuit Court, against the Baltimore & Ohio R.R., to put a stop to the further assignment of cars, the suit involving a mandatory injunction as well as a demurrage phase.

### PITTSBURGH

*Lake Pooling Plan Has Not Increased Car Supply — Spot Prices Still Advance — Exports Disturb Market — Local Bankers Are Alarmed Over Situation.*

Even the pooling of Lake coal shipments, together with Lake ore shipments, put into operation June 14, has not materially increased the supplies of cars to Pittsburgh district coal mines, thus far at least. A curious reflection of the pooling, however, is that several steel works in the district found themselves shorter of cars in the first few

days than they had been, the extra shortage being attributed to the establishment of the coal pool.

Everywhere the Lake coal situation is recognized as serious and as absolutely demanding relief. This is admitted even by coal consumers in this district who have closed their works because they cannot secure coal, or cannot afford to pay market prices.

The spot market, and there is practically no other, since the buyer almost invariably requires car numbers, is trending upwards rather than downwards, and may be estimated on an average at nearer \$10 than \$8. The market, however, is narrow, for by far the major part of the production is going against contracts.

The greatest disturbance is caused by dealers seeking coal for export, such buyers being almost reckless in their bids. There is no restraining influence to price advances, since the conservative operators are tied up with contracts and the sellers of spot coal are chiefly small operators, who are not particularly interested in market stability. Some of the banking interests in Pittsburgh are greatly alarmed over the situation.

The spot market in general is quotable at \$8@10, per net ton at mine, Pittsburgh district, steam and gas grades usually bringing approximately the same price, while byproduct runs close to \$10.

### CONNELLSVILLE

*More Furnace Coke is Contracted, but Uncertainty Prevails—Market Value of Coal Should Affect Coke Price—Car Supplies Do Not Improve and Market Continues High.*

In addition to the contracts for second-half furnace coke, reported a week ago, aggregating about 25,000 tons monthly, on a 4-to-1 ratio basis against basic pig iron at valley furnaces, several flat price contracts have been made for the second half, at between \$10 and \$12 per net ton at ovens. Quite a tense situation exists as to furnace-coke contracts, both sellers and buyers being beset with uncertainties, especially the furnacemen.

Thus, \$12 as a flat price for coke for the second half of the year seems like a high one to consumers, but coal is bringing more than \$8 in the open market and it requires 1½ tons of coal to make a ton of coke, so that from this viewpoint \$12 coke is altogether too low.

There has been no material improvement in car supplies, and the region is running at about 75 per cent of the rate obtaining prior to the rail strike and traffic congestion. The heavy production of pig iron, now nearly if not quite equal to the March rate, indicates that the byproduct coke ovens are doing better than the Connellsville beehive ovens.

The spot market continues high, with limited demand and limited offerings, being quotable at about \$15 for furnace and \$16 for foundry coke, per net ton at ovens.

The *Courier* reports production in the Connellsville and Lower Connellsville region in the week ended June 12 at 185,230 tons, a decrease of 4,350 tons.

## Estimates of Production

### LOGAN AND THACKER

*Logan Mines Speed Up Production with More Empties to Load—Cars Come in from the West—Coal Goes to the Lakes and the West—Thacker Output Stagnates Due to Labor Troubles.*

With transportation facilities on the Chesapeake & Ohio superior to those of previous weeks, Logan mines speeded up production during the second week of June.

It is estimated that Logan mines had about 500 more cars at their disposal than they had been able to secure for any weekly period during the two months preceding; it being possible therefore to increase production to about 165,000 tons—a gain of 25,000 tons.

The major part of the increase was due to a large number of empties turned over to the Chesapeake & Ohio by connecting lines, the Logan field, therefore, benefitting by the action taken by the Interstate Commerce Commission.

Even making allowances for the fact that production had climbed upward toward the middle of June not half of the potential capacity of the 115 mines in the field was being produced.

Debarred from shipping to Tidewater during the first half of the week, Logan producers had no recourse other than to increase Western and Lake shipments.

Difficulty was experienced in making contract deliveries because of the fact that so many cars were assigned for railroad fuel loading. It was impossible to produce much coal for spot sale, that being one of the reasons why a price of \$9 a ton and higher was being offered for Logan mine-run at Tidewater.

No settlement of the labor troubles in the Thacker field was in sight by the middle of June. Leaders of the mine workers announced they are making progress in organizing the field but that was controverted by the operators.

Production was greatly stagnated as a result of the labor troubles in the Thacker district. The movement of Thacker coal was largely to Tidewater as it had been in previous weeks, no softening of prices.

### POCAHONTAS AND TUG RIVER

*Tug River Receives Better Supply of Cars—Yet Production is Less Than 50 Per Cent—More Cars Come in from West—Empties Are Scarce in the Pocahontas Field.*

While conditions in the period ended June 12 seemed to have undergone improvement from a transportation standpoint in one part of the territory supplied by the Norfolk & Western, on the

easterly end of this road in the Pocahontas field, mines were experiencing just as much difficulty as they have been doing all along, in securing barely enough cars to keep from shutting down entirely.

While there seemed to be more cars coming from or through Western gateways, yet the increase was not such as to materially increase production and certainly was not large enough for distribution to all fields reached by the Norfolk & Western.

The increase in the number of Western cars turned over to the Norfolk & Western was met by a corresponding increase in Western tonnage.

Mines in the Tug River region occupied a more advantageous position than mines in the neighboring Pocahontas field, the operators reporting a general though not marked improvement in the supply of cars, especially as compared with the same week in May.

The Tug River region received most of the benefit of the increased Western supply of empties. Despite the improvement shown production was less than 50 per cent.

Virtually the entire output was needed to meet contract obligations. The little spot coal available was bid for at \$9 a ton and more; but the major part of the output of the field is under contract at about \$5 a ton.

Little headway was made by Pocahontas mines in overcoming past losses, owing to the fact that cars were still scarce—so scarce, in fact, that as against a production of only about 235,000 tons, there was a loss of over 300,000 tons from a shortage of equipment alone.

Cars were being returned quite slowly from tidewater, where the bulk of Pocahontas coal was being billed. As nearly as can be estimated, Pocahontas mines were operated on just about a 40 per cent basis during the week ended June 12, or less than three days out of the six.

### NORTHEAST KENTUCKY

*Output Changes Little, Being About 45 Per Cent—Commission Should Adopt More Drastic Measures About Coal Cars—More Coal Goes to the West and Lakes—Prices Are Firm.*

The second week of June brought no perceptible change in the Northeast Kentucky field insofar as any increase in production was concerned. Mines in the field named had perhaps 100 cars more than during the previous week, at least in that section supplied by the Chesapeake & Ohio and its branches, including the Big Sandy, Sandy Valley & Elkhorn and the Long Fork.

There was not more than an output of about 45 per cent in the Eastern Kentucky field. Little if any benefit had been derived from the effort of the Interstate Commerce Commission to divert a larger number of empties to eastern coal regions.

The general feeling in Northeast Kentucky coal circles, was that the commission would have to adopt more drastic regulations before securing any results, and would have to stop the promiscuous use of cars for the loading of sand, gravel and other commodities.

Despite the shortage of empties in Northeast Kentucky the run of cars was far and away in excess of May, last year, it being stated that Eastern Kentucky mines received about 1,500 cars more during May, 1920, than during May, 1919.

Kentucky producers shipped a larger proportion of their product than usual to Western markets and to the Lakes. The demand for steam and byproduct coal was running strong and spot coal was quite hard to obtain. As a result of the short supply, prices continued firm, Eastern Kentucky mine-run averaging \$7.50 a ton or better.

The activities of the Kentucky High Cost Commission and Fair Price body are of no avail for the present at least by action of Federal Judge Walter Evans. He recently ruled that the amendment to the Lever Act was too vague to be enforceable, and dismissed a dozen or so cases held over to the Grand Jury following preliminary examination. Judge Evans did not hold the act unconstitutional, as several federal judges have, but did refuse to prosecute under it. This means that the High Cost Commission is powerless to appeal the cases, or do anything further until the Supreme Court finally rules in the matter of constitutionality.

### VIRGINIA

*Lacking Many Cars, Operators Coke Coal to Avoid Interruption to Operation—Railroads Assign Cars and Take Large Tonnage—Spot Coal Scarce and High Prices Prevail.*

Inability to secure anything approaching an adequate supply of cars precluded mines in southwestern Virginia from making any headway in increasing their output during the weekly period ended June 12, there still being an approximate loss of 50,000 tons due to a shortage of empties.

In addition to the tonnage produced for shipment, however, some mines continued to coke a considerable tonnage of coal in order to avoid as much interruption to operation as possible.

Not only was the scant car supply a potent factor in holding back the production of commercial fuel, but assigned cars also interfered quite materially with shipments, railroads taking a very large proportion of the output of the field for their own use.

There was a comparatively small amount of commercial coal with which to meet contract obligations, and scarcely any tonnage to meet the heavy demand for spot fuel.

Prices were held about on the level heretofore existing, \$7.50 and better being offered; higher prices prevailed for spot coal for Tidewater delivery.

Labor conditions in themselves were satisfactory; however, assigned-car plants were able to hold their miners better than plants without a preferential car supply.

**NEW RIVER  
AND  
WINDING GULF**

*Winding Gulf Works Two-Thirds Time, New River Only Three Days Out of the Six—Car Supply Is Limited in All Fields—Tidewater Tonnage Keeps Up and Western Shipments Increase.*

Ground was gained over previous weeks in the tonnage of coal mined in the Winding Gulf and New River fields, during the second week of June, by virtue of a somewhat increased car supply in both fields, the greatest gains being made, however, in the Winding Gulf region. But in neither field was there as large a production as an excellent car supply early in the week led operators to believe would be the case, the run of empties still being sub-normal.

As against a 25 per cent supply of cars during the period ended June 5, plants in the Winding Gulf district had about a 66 per cent car supply during the week following; mines were able to operate about four days out of the six on the Virginian Ry. However, mines reached by the Chesapeake & Ohio had only a 50 per cent supply and were limited to about three days' operation.

The hope of New River producers for three or four full-day operation, inspired by quite a favorable supply of cars on Monday was dissipated by a marked decline in the quota of cars furnished after the first of the week.

Even at mines having individual cars, there was not more than a 50 per cent production in the field, while other mines less fortunate were not able to produce that large a percentage.

Western shipments from the New River region were in somewhat larger volume than during the previous week; at the same time there was no decrease in tidewater tonnage. There was a very insistent demand for New River coal in New England as well as for export.

**KANAWHA**

*Production Changes Little, Being About 45 Per Cent—Kanawha Is Embargoed at Tide Due to Congestion—High Prices Prevail.*

While cars in the Kanawha field during the weekly period ended June 12 were somewhat more plentiful than had been the case during the previous week, the increase was almost negligible, carriers being far short of the mark in the distribution of empties. The production for the week was about 45 per cent.

While the percentage of allotment was running a little larger at mines supplied by the Kanawha & Michigan than by the Chesapeake & Ohio, during

the first few days of the week, even on that road the supply faded away toward the end of the week.

Signs indicated a slight increase in the run of empties from the West but not a sufficient increase to restore conditions to anything approaching normal.

Between June 7 and June 10 the Chesapeake & Ohio west of Handley was closed to all Kanawha shipments for Tidewater. The road found it necessary to impose an embargo until it could relieve the congestion following slides on June 5. With Tidewater points closed for a few days, more coal was of course shipped to Western points, Lake consumers also participating in the increase.

Inasmuch as there was heavy assignment of cars for railroad fuel loading, there was only a little volume of commercial coal for shipment, especially spot, since producers were having a hard time even in taking care of contract obligations.

As a result of the reduced production, as much as \$7.50 a ton was offered for Kanawha mine-run for Western delivery. The price was even higher for Tidewater delivery, running up to \$9 a ton or more.

Nest Pass Field is increasing, the production of Vancouver Island mines is declining slightly.

It is generally predicted that the shortage of fuel oil will increase the demand for coal. The collieries of Vancouver Island anticipate that the present fuel situation will affect their bunker trade.

Freight and passenger vessels are being re-converted into coal burners, and many of those under construction are designed for the use of the latter fuel. Consequently there should be an increase in the demand for coal shortly. Meanwhile the domestic demand has fallen off somewhat and production, as far as the coast mines are concerned, is about stationary.

Production in the Crow's Nest field, on the other hand, is climbing, a good market being found in supplying the Great Northern Ry. Coal is used in pulverized form in the operation of this railroad. The greater proportion of the Corbin coal is shipped to Spokane, Wash., a comparatively small quantity being taken by the Canadian Pacific Railway.

A recent development, the results of which may be of importance, is a shipment of coal to Winnipeg, Manitoba, by the Crow's Nest Pass Coal Co. This is an emergency shipment to meet a shortage caused by the lack of coal usually obtained from the coal fields of United States.

Eastern British Columbia and the Province of Alberta may be called on to meet the requirements of the Canadian Middle West to a greater extent in the future than in the past.

Coke production in the Crow's Nest field still is far below what it once was, the ovens at Fernie being idle and only some of those of Michel being in use. The product of these ovens is absorbed by the Canadian Consolidated Mining & Smelting Co. for the Trail smelter.

**Canada**

**BRITISH COLUMBIA**

*Crow's Nest Output Is Increasing; Vancouver Island Decreases—Coal Is Supplanting Fuel Oil—Coke Production Way Below Former Output.*

An analysis of the latest figures available relative to the coal production of British Columbia shows that, while the output of the mines of the Crow's

# Mine and Company News

## ALABAMA

**Fort Payne**—The Appalachian Coal & Iron Co., is planning for the development of a large tract of coal property in this section, and will acquire machinery and equipment for the purpose. It is proposed to erect a number of homes for miners at the plant. W. L. Smith is superintendent.

## ILLINOIS

**Duquoin**—The Carlinville Mining Co., operating a mine at Carlinville, Macoupin County, north of here, has recently completed the erection of a concrete and steel tippie and hoisting has been resumed after an idleness of several months. The mine has been operating for some years. While the new tippie was being built, a number of other improvements were made around the mine, including repair work in the air shaft. New options have lately been taken out giving the company a larger territory for development. At the present time the plant is served by the Chicago & Alton R. R. but plans have been perfected whereby the Illinois Traction System will begin construction of a switch to the mine, greatly facilitating the problem of transportation. The Standard Oil Co., has also recently finished the sinking and erection of two mines near this plant.

**Mount Vernon**—The Southern Gem Coal Co., has purchased a block in the business section of this place with the intention of erecting a large modern 5-story building which will serve as headquarters for the northern terminal of the Wabash, Chester & Western R.R., a line which they recently acquired. The building also will be the coal headquarters for the company in southern Illinois. The company holds extensive tracts throughout this section, mostly, however, in Jefferson County. In addition to the new office building, the Southern Gem will erect a modern rescreening plant near the outskirts of Mt. Vernon, which will be served by the W. C. & W. and the Chicago & Eastern Illinois railroads.

## KENTUCKY

**Louisville**—It is reported that the Louisville & Nashville R.R. has closed contracts for the entire output of six mines in the Hazard, Ky., field, the total production amounting to about 25 cars daily, this being about all the coal that will be required from the one district for railroad use. It is reported that the contract was closed at a price slightly under \$4 a ton for mine-run. It is also reported that the L. & N., as

well as other roads are buying better grades of coal today than formerly, they having discarded the cheap grades, which they formerly sought.

## MARYLAND

**Baltimore**—The Eagle By-Products Collieries Co., Equitable Building, has incorporated with a capital of \$750,000 to operate coal properties. George R. Curtis, Henry Ortman and Harry A. Mason are the incorporators.

## NEW YORK

**New York**—The Crystal Coal Corporation recently organized under the Delaware laws with a capital stock of \$1,000,000. It is sponsored by the Victor S. Fox interests which recently acquired control of the Consolidated Maritime Lines.

The new corporation is to engage in the sale and production of anthracite and bituminous coal, particularly for export. The close affiliation with the Consolidated Maritime Lines which is said to control over 200,000 tons of shipping, indicates that this new coal company may be a big factor in the export trade. Most of the Fox ships are now actively engaged in carrying coal to Italy, France and Scandinavia.

The new corporation is now acquiring the output of several mines and has purchased two large mines in the Fairmont and New River districts.

A deal is said to have been consummated recently involving the purchase of 25 coal producing properties in Pennsylvania, Ohio, West Virginia and Kentucky, at a cost of between \$10,000,000 and \$12,000,000, by John H. Jones, head of the Bertha Coal Co. and affiliated fuel companies.

It is said that the plan means that big industries of the United States and Canada are pooling their fuel requirements with an independent producing concern, instead of seeking coal as individuals. Mr. Jones admits that such a plan has been formulated.

The production of the Jones interests will exceed 12,000,000 tons of coal a year when contemplated improvements are completed.

A partial list of the newly acquired properties includes: The Sara mines, formerly operated by the West Virginia & Kentucky Coal Co. at Delna, Ky.; Jessie mines, formerly operated by the Smoot Creek Coal & Coke Co., at Delna, Ky., and Isabella mines, formerly operated by the Woodburn Coal Co., at Blackie, Ky. In addition, Mr. Jones has also leased from the Kentucky River Coal Corporation, 10,000 acres of coal lands and is rushing the

development and equipment of the Elsie and Dorothy mines on this property.

In Ohio Mr. Jones acquired 1,600 acres of coal lands, together with a large number of houses in the town of Powhattan, and at Cresaps station, on the Baltimore & Ohio, the coal extending on both sides of the Ohio river at this point. Three shafts are now being sunk on the latter property.

## NORTH DAKOTA

**Dickinson**—The McGillivray coal mine, four miles east of here, has been purchased by E. A. Hughes. Immediate improvements in the mine are planned by the new owner. The mine is said to be the largest on the main line of the Northern Pacific, and is ranked as one of the best lignite mines in North Dakota.

Modern machinery will be installed and the mine will be electrically operated. Electric current will be supplied to the mine from Dickinson.

The mine has been operated for several years, and has employed as high as 100 miners; Mr. Hughes plans to install sufficient machinery to make it possible to employ 200 men next fall and winter and to increase the capacity to 500-tons a day. The shafts now are sunk to a depth of about 125 feet.

The Beulah Coal Co., of which C. B. Little is president and in which Mr. Hughes is heavily interested, plans to open another mine either at Beulah or Hazen in an adjoining county.

## OKLAHOMA

**Tulsa**—"Coal is the fuel Tulsa is going to have to turn to within a short time," John H. Leavall told members of the Chamber of Commerce, in presenting his plan for opening a large strip coal mine between Tulsa and Dawson.

"Fuel oil is now so high that it cannot be used for the generation of steam. It takes four barrels of oil to equal one ton of coal, and that would make \$14 coal on a par with oil."

The company, now being organized by Mr. Leavall, will be capitalized at about \$250,000 and is being financed by local business men. The operation will be carried on under the open shop plan.

## OHIO

**Steubenville**—The Panhandle Collieries Co., which is putting in a large plant on the Pennsylvania R.R. west of here, has just about completed its 8-mile spur. A bridge across Cross Creek has also been finished and the work of

erecting the tipple and power plant will go forward. It is expected to start operations by Oct. 1 if not earlier. The mine will have a capacity of about 1,500 tons daily. J. W. Blower and the Hisylvania Coal Co. interests of Columbus are pushing the development.

#### PENNSYLVANIA

**Pittston**—The Pennsylvania Coal Co. is completing plans for the construction of a breaker near here to cost in excess of \$200,000. William P. Jennings is superintendent.

**Coversdale**—The Pittsburgh Terminal Railroad & Coal Co., Wabash Building, Pittsburgh, Pa., has inaugurated work on a housing development for miners at its coal properties in the vicinity of Coversdale. Sixty two-story homes will be built.

**Pittsburgh**—The Vesta Coal Co. has acquired about 500 acres of coal lands in Washington County, heretofore held by J. C. Work and associates, Uniontown, at a price of about \$550 an acre. Plans are under way to develop the property.

The Consolidated Coke Company, in the Oliver Building, of this place, is said to be planning for extensive work in connection with its coal mining properties. Arrangements are under consideration for the construction of a river tipple at Grays Landing, Fayette County, to be equipped with loading and conveying machinery to provide a capacity of about 4,000 tons a day. It is proposed to utilize the Monongahela River for transportation. The company recently completed negotiations for the acquirement of the Sharpneck mines of the Superior Coal Co. in the vicinity of Brownsville, Fayette County, including a tract of about 600 acres, and plans are being arranged for the complete electrification of this plant. It is proposed to increase capacity to about 2,000 tons daily. The consideration was to be in excess of \$1,500,000.

It is said the Diamond Coal & Coke Co. has been granted a Federal permit for large extensions and improvements in its properties in the Barking Station mine, located on the Allegheny River, for increased capacity. The proposed work includes the construction of concrete ice-breakers, tipple, tipple pier, as well as other extensions.

**Hazleton**—The Lehigh Valley Coal Co., has begun preliminary work at the Stockton mines, east of this place, which have not been operated for some years past, and proposes to operate the property at maximum capacity, bringing considerable increased tonnage to the Hazleton Shaft colliery at Hazleton.

#### SOUTH DAKOTA

**Aberdeen**—Ralph Blair and his father have bought the John Meiger farm of 480 acres lying near this city and will open up the seam of soft coal which was discovered on the property some 10 or 12 years ago.

The Blairs are planning to install

modern equipment and will begin digging coal in the near future.

The seam is said to lie within 70 to 90 ft. of the surface and to be eight ft. thick.

Ralph Blair paid \$75,000 for the farm. His father, Gustave Blair, has also recently bought a farm in Faulk County, paying \$165 an acre for 235 acres.

**Mount Hope**—V. S. Veazey, of this place, owner and developer of the Hi Top Mine, near Sun, W. Va. (operating a New River Seam), recently acquired a lease on the Boone coal on Packs Branch and has begun development; this comprises about 300 acres of the Long Branch seam. He is also sinking a shaft to open a tract of his at Glen Jean, W. Va., which carries the New River measures, this was at one time a part of the Sun lease (New River Collieries Co.). Shipments are expected to be made from one or both mines by August 1, and will be via the Virginian Ry.

#### WEST VIRGINIA

**Wheeling**—Charles F. Bachmann, of this place is understood to have completed negotiations for the purchase of approximately 3,000 acres of coal lands in the vicinity of Cresaps, near Moundsville, W. Va. It is said that plans are now in process of formation covering the installation of machinery and equipment for the development of the tract.

**Fireco**—The Wilton Smokeless Coal Co., recently organized with a capital of \$350,000, is having plans prepared for the development of a total of about 650 acres of coal properties in the Fireco district. It is proposed to have a capacity of about 400 tons a day. J. W. Wilson, Wyco, W. Va., is president; C. H. Meador, vice-president, and J. B. Clifton, both of Beckley, W. Va., is secretary-treasurer.

#### CANADA

**Ottawa**—Coal-mining operations will be commenced in the new coal field near Lampman, Saskatchewan, within the next two months. This field is being developed by the Farmers' Coal Mining Co., Ltd., which is incorporated with a capitalization of half a million dollars.

### Association Activities

#### Washington State Fuel Merchants' Association

The second annual convention of the Washington State Fuel Merchants' Association was held at Spokane, Wash., recently. By a unanimous vote of the convention, A. J. Davis, of Tacoma, was elected president; Roy Bungay, Spokane, vice-president; W. B. Monks, Seattle, secretary-treasurer. The offices of secretary and treasurer, which heretofore have been separate, will be combined hereafter.

The report of the resolutions committee indorsed a state-wide publicity

campaign to awaken the coal consuming public to the necessity of storing their fuel during the spring and summer so that mine operators may keep their men employed more uniformly throughout the year, and that the public may be better protected against suffering resultant from a fuel shortage next winter.

Telegrams are to be sent to all senators and representatives from this state, asking them to work and vote for the passage of a bill providing for reduced freight rates on coal during the summer months.

Following an address on "Destination Weights," by Roy S. Brown, traffic expert with the Western Retail Lumbermen's Association, the question was generally discussed.

An address on "Cost Accounting" was given by Harvey S. Jordan, commissioner of the Retail Coal Merchants' Credit Association of Seattle. C. E. Arney, assistant supervisor of agriculture of the Northern Pacific Ry., also gave a talk on "Traffic Conditions."

Addresses were also given by W. J. Hindley on "Chasing the Profiteer" and by W. T. Prosser, of Seattle, on "Seasonal Coal Business."

#### Northern West Virginia Operators' Association

The validity of the assignment of cars will be tested in the courts. That course was decided upon at a meeting of the Northern West Virginia Operators' Association held at Fairmont on June 4.

Another meeting was planned for June 9 when Rush C. Butler, chief counsel for the National Coal Association was invited to be present to discuss the legal phases of the proposed suit.

Believing that the assigned-car practice is repugnant to the rules and regulations governing car distribution, the Northern West Virginia association proposes to seek relief from the Interstate Commerce Commission, from the federal courts and if necessary from Congress. It has been tentatively decided to bring the suits mentioned against the carriers direct.

Northern West Virginia operators made the charge that there was and had been a failure at Curtis Bay to dump coal promptly, with the result that there had been numerous embargoes and a marked increase in demurrage charges at this port. The association directed its vice-president, George T. Bell, to investigate the dumping situation and to see what it was possible to do.

#### Tidewater Coal Exchanges

Tidewater coal exchanges are now in full operation at Newport News, Sewall's Point and Lambert's Point. At Newport News, to which the Chesapeake & Ohio R.R. ships its coal, the arrangements provide for the railroad paying 75 per cent and the shippers 25 per cent of the expense. At Sewall's Point the expense is divided evenly between the railroad and the shippers.

## Industrial News

**Chicago, Ill.**—The Chicago offices of The Cutler-Hammer Manufacturing Co., of Milwaukee and New York, have been removed from the Peoples Gas Bldg., where they have been located for the last eight years, to the company's own building (323 No. Michigan Ave.) on the new Michigan Boulevard link. Because of the rapidly growing business in the Chicago territory, the fifteen offices in the Peoples Gas Building were no longer large enough so that the new building was necessary. Considerable extra storage space is also available, which will make it possible to carry a larger amount of stock of standard apparatus and parts for ready delivery. H. L. Dawson is manager of the Chicago office, which handles the business of nineteen states with the sub-offices in Cincinnati and Detroit.

**Kenosha, Wis.**—The corporate name of the Macomber & Whyte Rope Co., of this place, has been changed to the MacWhyte Co.—effective June 1, 1920. No change in ownership, management, or policy of the company is involved.

The products of the MacWhyte Co. have for several years been known and advertised under the trade name, "MacWhyte." The change, therefore, brings the name of the company into line with the name of the products. Furthermore, the MacWhyte Co. manufactures not only wire rope, but also str-amine wire, for airplanes, mine-car hitchings, safety detaching hooks for coal mines. George S. Whyte continues as president and general manager; Jessel S. Whyte as secretary, and E. W. Reitzel as treasurer.

**Easton, Pa.**—The Pennsylvania Pump & Compressor Co., of this place, announces the opening of its sales offices in the following cities: New York, N. Y., 50 Church St.; H. C. Browne, manager; Philadelphia, Pa., 2222 Chestnut St.; W. J. Devlin, manager; Pittsburgh, Pa., 631 Fulton Bldg.; C. W. Gelling, manager; Richmond, Va., Mutual Bldg.; W. F. Delaney, manager; Birmingham, Ala., 2027 Jefferson Bank Bldg.; H. I. Kahn, manager; Salt Lake City, Utah, New-house Bldg.; C. H. Jones, manager; Milwaukee, Wis., 604 First Nat'l Bank Bldg.; Coates & Zarling, representatives.

**Orange, N. J.**—The Edison Storage Battery Co. announces the recent appointment of Don C. Wilson as assistant sales manager in charge of its Railroad Department. Mr. Wilson has been active in railroad operating and mechanical affairs for many years, having been electrical engineer for the Union Pacific R.R., at Omaha, Neb., and in a similar capacity with the Central of Georgia at Savannah. The Edison Storage Battery Co.'s works are at Orange, N. J., with offices at 23 West 43rd St., New York City.

## Personals

**Richard H. Williams**, of the firm of Williams & Peters, of No. 1 Broadway, New York City, has been elected as a Class B Director of the Federal Reserve Bank of New York. He succeeds W. B. Thompson. Mr. Williams is a director of the Pennsylvania Coal Co., a director and member of the executive committee of the Equitable Life Assurance Society and a director and member of the finance committee of the Atlantic Mutual Insurance Co.

**A. F. Harper** has resigned his position as division engineer of coal mines with the Woodward Iron Co., Dolomite, Ala., to accept the position of mining engineer with Sloss-Shofield Steel & Iron Co., with headquarters in Birmingham, Ala.

**George E. Land**, who has been advertising manager of the Blaw-Knox Co., Pittsburgh, Pa., has gone into business for himself under the name of the Technical Publicity Co., of Pittsburgh, Pa.

**T. H. Huddy**, a well-known mining man of the Kanawha, W. Va., field, who for a number of years has been the general superintendent of the Boomer Coal & Coke Co. and of the Paint Creek Coal Mining Co., has been appointed general manager of the Williamson Coal & Coke Co. of the Bailey Coal Co. and of the Sudduth Coal Co., operating in the Thacker, W. Va. field, with headquarters at Williamson, W. Va. The companies mentioned have been recently purchased by A. H. Land and others.

**J. L. Coombes**, formerly mining engineer at the Lynch mines of the U. S. Coal & Coke Co., has recently returned to his old position as field engineer with the Fargo Engineering Co., at Battle Creek, Mich. He has spent six months at Temiskaming, Quebec, Can., as engineer for the Kippawa Co., Ltd.

**Howard I. Smith**, mining engineer, serving on the American Commission at Belgrade, Serbia, reports some interesting progress made in mining methods in the Balkan States. He expects to return to America in December.

**F. A. Dalburg**, consulting mining engineer has recently returned from Manila, Philippine Islands, where he was general manager of the National Fuel Co. He will take up consulting work again in this country with headquarters at 40 East 40th St., New York City. Mr. Dalburg's home address is Ralston, Pa.

**Horatio C. Ray**, who has been connected with the School of Mines of the University of Pittsburgh as Professor of Metallurgy and Ore Dressing, has resigned his position to take effect at the close of the present school year. Mr. Ray will become affiliated with the Keystone Consolidated Publishing Co., of Pittsburgh, and will have direct charge of the editing of the metallurgical section of the Coal Catalogue—one of this concern's publications.

Among the honors conferred at the commencement exercises of Columbia University, held recently at New York, was the awarding of the medal of the Class of '89, of the School of Mines, to **Robert Van Arsdale Norris**. The medal is given tri-annually to the alumnus who "distinguished himself most in the field of human endeavor." Mr. Norris received the honorary degree of Master of Science from the University in 1914.

The French society of civil engineers is to have a symposium on "Rational Utilization of Fuels," as a part of its June activities. **M. George Charpy** is in charge of the major plans of the program, and will deliver the principal paper.

**H. H. Boyd**, who has held the position of chief engineer of the Bell & Zoller Mining Co., at Zeigler, in Franklin County, Ill., for a number of years, has resigned to become assistant bridge engineer for the Missouri, Kansas & Texas Lines. He was formerly with the Burlington railroad as engineer.

**Beet Lloyd**, Colorado representative of the Colorado-American Coal Co., of Milwaukee, Wis., is opening an office in Colorado Springs, Col., in which he will conduct a general coal-mining engineering practice.

**John B. T. Jones**, superintendent of the Laffin colliery of the Hudson Coal Co., has been appointed superintendent of the Pine Ridge colliery of the same company, succeeding John J. Walsh who has not been re-assigned as yet. The headquarters of the Hudson company is at Scranton, Pa.

**W. Guy Sroder**, of Charleroi, Pa., who recently resigned as general superintendent of the Diamond Coal & Coke Co., of Pittsburgh, Pa., following the passing of the control of that company to the Hillman interests, has accepted a similar position in charge of the coal operations of the Shennango Furnace Co., at Wilpen, Westmoreland County, Pa. The plant is on the Ligonier Valley R.R., four miles from Ligonier. Mr. Sroder now lives at Ligonier and has his office at Wilpen.

**Joseph H. Beck** has been appointed Traffic Director of the St. Paul Association, at St. Paul, Minn., as Executive Secretary, in the place of Guy M. Freer, deceased. Mr. Beck assumed the duties of this office on June 1.

**R. V. Norris, Jr.**, who has been chief mining engineer of the Lehigh Coal & Navigation Co., of Lansford, Pa., for the past year, has resigned his position to take effect June 1. Mr. Norris is leaving for California and has not as yet decided as to his future activity. The Navigation company has not announced any successor to Mr. Norris.

**Morgan A. Morgan**, who has just been appointed superintendent of the coal mine at Black Diamond, was the guest of honor at a district meeting of the Mount Rainier Sportsmen's Association at Burnett, Wash., recently. More than 150 members of the organization attended. During the meeting Mr. Morgan was presented with a gold watch, the gift of the men with whom he has worked while superintendent of the Burnett mine.

**Fred W. Price**, who has recently been with a large mining company in Colorado and formerly located at Duquoin, Ill., has returned to Illinois to accept a responsible position with the Vletory Collieries Co., operating at Tamaroa, Ill.

## Coming Meetings

**American Mining Congress** will hold its annual meeting at Denver, Col., Nov. 15. Secretary, J. F. Callbreath, Munsey Building, Washington, D. C.

**American Institute of Mining & Metallurgical Engineers** will hold its fall meeting Aug. 20 to Sept. 3. It is proposed to leave Buffalo by steamer and cruise through the Lakes, the first stop being at Houghton, Mich., after which the party will visit Duluth and the Iron Ranges of Minnesota, spending a day or two in Minneapolis on its return. Secretary, Bradley Stoughton, 29 West 39th St., New York City.

**National Exposition of Chemical Industries** will hold its sixth exposition Sept. 20 to 25, inclusive, at the Grand Central Palace, New York City.

**American Institute of Electrical Engineers** holds annual convention at White Sulphur Springs, W. Va., June 29 to July 2. Secretary, F. L. Hutchinson, New York, N. Y.

**Mine Inspectors' Institute of America** will hold its annual meeting July 13, 14 and 15 at Cleveland, Ohio. Secretary, J. W. Paul, Pittsburgh, Pa.

**Illinois and Wisconsin Retail Coal Dealers' Association's** annual meeting Aug. 4 and 5 at Milwaukee, Wis. Secretary, I. L. Runyan, Chicago, Ill.

**Indiana State First Aid Meet** at Clinton, Ind., July 5, under the auspices of the Indiana State First Aid Association, with the co-operation of the Clinton First Aid Association, Chamber of Commerce, Indiana Coal Operators' Association, United Mine Workers of America, Bureau of Mines, and State Mine Inspection Department.

**The Rocky Mountain Coal Mining Institute**, in conjunction with the Colorado Metal Mining Association, the local chapters of the American Mining Congress and the American Institute of Mining & Metallurgical Engineers, and the International First-Aid Meet, will hold its annual meeting Sept. 9, 10 and 11 at Denver, Col. Secretary, F. W. Whiteside, Denver, Col.

**National Safety Council** will hold its 1920 congress on Sept. 27 to Oct. 1 inclusive at Milwaukee, Wis. General manager, C. W. Price, Chicago, Ill.

**Oklahoma Coal Operators' Association** will hold its annual meeting Sept. 14 at McAlester, Okla. Secretary, F. F. LaGrave, McAlester, Okla.

## Obituary

**Robert H. Lindsay**, aged 40, a mining engineer of Seattle, Wash., was killed recently by falling down the shaft of a mine in Butte, Mont. Mr. Lindsay was making an inspection of an old workings owned by James A. Murray of Seattle and Butte, when he met with the fatal accident. He was married 12 years ago in Virginia City, Mont.

**James Dunsmuir**, son of the late Robert Dunsmuir, the first large coal-mine operator of Vancouver Island and former Premier and Lieutenant-Governor of British Columbia, died suddenly on June 5. The name of Dunsmuir is identified inseparably with the development of the coal measures of western Canada. James Dunsmuir sold the Wellington, Comox and Alexandria collieries in 1910 to Messrs. MacKenzie and Mann for approximately ten million dollars. He still retained, however, the coal in the remaining area of the Esquimalt & Nanaimo Ry. land belt, title to which subsequently passed to the Canadian Collieries Ltd., in which concern he was heavily interested at the time of his death.

**Samuel Flory** died of heart failure recently at his home in Bangor, Pa., at the age of 66 years. Mr. Flory was interested in a number of corporations, the principal one being the manufacturing plant founded by him 41 years ago, known as the S. Flory Manufacturing Co., of which he was the head during these many years. The Flory company's suspension cableways and hoists have been in operation in the slate, coal and quarry regions of the United States and Canada for over 40 years. Surviving Mr. Flory are his widow and three children.
