**Anthracite**—Hard coal dealers saw a decided slackening of late ordering this week, when rather spring-like temperature arrived. The thoughts of the coal men are largely turning toward spring, and there are many underground rumors that there will be no spring cut this year, especially if the wage proposition is not worked out in satisfactory manner. There are already visions here of \$14 and \$15 coal unless the workers make decided concessions.

The local dealers met the past week to consider means to fight a bill introduced in the Maryland General Assembly which is designed to create new inspection rules for coal deliveries. At present the police have power to stop coal trucks and order the loads weighed, and the law provides for three per cent variation of scales.

### Eastern-Inland

#### PITTSBURGH

Little information on Robinson commission report. Car shortage as bad as ever. No definite information in local coal circles regarding the coal wage commission's reports beyond the meager information contained in the statement given out in Washington.

Several days previous to the announcement that the commission had completed its recommendations, there was a well defined rumor in coal circles that a part of the recommendation would be that the price control be taken off coal and coke at once. This may be true, but the fact that the commission has not presented a unanimous decision, as the President urged it to do when making the appointments seems to run counter to the view.

It is regarded as impossible, in any event, that anything at all will occur until the President has had time to study the two reports. Predictions continue that there would be a very sharp rise in coal prices if the control were taken off. This could easily occur, even if all the large and conservative operators should hold their prices down.

The car shortage in general is not relieved to any extent, and in some quarters it seems to have grown worse. This means that on an average the car supply has been less since Feb. 15 than from the first of the year to that time. Return of the lines to their owners has had no appreciable effect, while as to the return of spring, that has been delayed by one belated cold snap after another, though at this writing the weather has been milder for two or three days.

Early improvement in railroad movement, however, is confidently expected. There has been an appreciable improvement in car supplies to steel mills for shipping steel, and it seems that the coal mines are to be the last to receive better service. The market remains quotable at Government limits: Slack, \$2.10; mine-run, \$2.35; screened, \$2.60, per net ton at mine, Pittsburgh district, with a 15c. brokerage in addition in some cases.

#### COLUMBUS

Car supply is slightly better and the coal trade is not as strenuous as formerly. Still an insistent demand for domestic and steam grades. No actual suffering in central Ohio is reported.

**Bituminous**—Some relief from the tightness in the coal trade was experienced last week when the car supply in most of the Ohio fields was improved slightly. On the other hand higher temperatures reduced the need for fuel and consequently the stress is gradually passing away. There is still a strong demand from all localities for fuel, mostly domestic sizes. Steam demand is strong although some of the larger steam users have been able to secure some reserves. The future is not very encouraging however, as any great improvement in the car supply is not expected soon.

Domestic trade is strong and many dealers are clamoring for shipments. Retail stocks in many places are entirely exhausted and some inconvenience has been caused. But with milder weather the stress has been relieved to a certain extent and retailers have been able to make out in some way. Dealers have been delivering only small orders, as they reduced loads to make the available supply reach all consumers. Steadiness characterizes retail prices. Pocahontas is practically out of the market although some West Virginia grades are arriving. Pomeroy Bend and the Hocking Valley fields are supplying the larger part of the trade in Columbus and central Ohio.

Steam business is moving along fairly well, although there is still a marked scarcity in stocks. Large manufacturing concerns have used every possible means to speed up shipments. Iron and steel plants are buying rather heavily. Public service concerns are also in the market for large shipments as their reserve stocks have been depleted. Railroads are confiscating a large number of cars and this is causing some trouble among commercial purchasers.

The Lake season will probably be one of the most active in years. Lake shippers are scurrying around for tonnage and have not succeeded in picking up any large amount. Producers are loath to make contracts, especially in view of uncertainty as to the wage scale. But some few Lake contracts have been made and others are in process of negotiation. The opening of the Lake season is expected to be late.

Retail prices in Columbus are:

Hocking Lump		\$6 50
Hocking Mine-run	5 75 to	\$6 25
Pomeroy Lump		6 50
Pomeroy Mine-run	6 00 to	6 25
West Virginia Splints, lump		7 25
West Virginia Splints, Mine-run	6 75 to	7 00
Pocahontas Lump		8 00
Pocahontas Mine-run		7 50

#### CINCINNATI

Market conditions are still unsettled, due to a combination of causes. The car supply is still about 50 per cent of normal with production on the same level. The demand for domestic sizes was rather heavy.

Railroad control has not been in the hands of the private owners a sufficient time to be of benefit to the coal trade, although much is expected of the return of the roads to the former managements and owners.

Industrial plants are beginning to feel the shortage of fuel and the schools in particular are almost out of tonnage. From present indications stocks are so low that there will be a fairly healthy demand for coal some months to come, although it is a question whether this district will secure a fair car distribution and be able to take on equal advantages of demand with other districts which have received greater favor.

Conditions have been bad here for more than three months and all the operators have received in the way of relief have been vague promises.

Telegrams have been sent to the Coal Association at Washington by operators urging them to hasten payments on confiscated and diverted coal which has caused them indolence.

Although coal operators and distributors are abiding by Government prices there is considerable rebelling against the restriction. The early part of the week saw the terminal congested with coal, but this was relieved before the middle of the week by the re-routing of it to other points.

Receipts by river were larger than they have been for some weeks, due to the navigable condition of the Ohio River. Confiscation was not so general as it has been, distributors, however, were deprived to some extent, thus hindering them from fulfilling orders and taking on new business. No free coal was offered and from the present outlook none will be available for some time to come. Retailers in all sections are still greatly bothered in deliveries by the unprecedented bad conditions of the streets and much is heard about the high cost involved.

It is the candid opinion of the majority of operators that no material improvement will develop in the coal situation here for many months to come. One fact is certain that the operators are not alarmed over conditions but are treating them as they come to light to the best of their advantage.

### Southern

#### LOUISVILLE

Retailers reporting considerable difficulty in getting coal. Conditions at mines showing no improvement. River shipments coming in better. Domestic shortage in Falls Cities.

Louisville retailers have been having considerable trouble in securing coal for several days past, while demand has been heavy due to severe weather and snow as late as March 7, which has resulted in empty yards. Due to the fact that bad weather is reducing stocks carried over winter, consumers are running short and trying to place immediate delivery orders, which retailers can't handle. There is a general domestic shortage in the Falls Cities, and a heavy demand for all grades.

Industrial demand continues heavy, but mine run is in better supply comparatively, as there are many mines that are producing little other than steam. River shipments have been somewhat better. The steamer *Julius Fleischman* came into the harbor with fifteen barges of West Virginia coal a few days ago, and brought conditions around nicely with concerns which have facilities for handling river coal.

In Jeffersonville, Ind., the United Gas & Electric Co. placed its surplus supply of coal at the disposal of the retailers last week in order to fill an acute shortage of fuel at that point. Operations at the mines show very little improvement and merely go from bad to worse. Last week the Harlan field got in two days, due to car shortage. Influenza and smallpox in that field are causing some trouble.

Demand for byproduct and gas coal continues heavy, and Harlan field operators are meeting with a heavy demand for all the coal they can produce. The Hazard field also reports steady car shortage, and excellent demand for all grades, but with labor troubles facing the field. Western Kentucky mines, both on the Louisville & Nashville, and Illinois Central, are short of car supply.

The Louisville & Nashville reports that it is 10,000 cars short of requirements at the present time, and unable to meet demand of the operators.

#### BIRMINGHAM

Car supply from 60 to 65 per cent. Coal industry is badly handicapped. Demand for steam coal exceedingly good, while domestic inquiry is also insistent. Labor shortage and influenza contribute in a small measure in curtailing production.

The activity of the local coal market is practically dominated by the transportation problem. There is an urgent demand for coal from every quarter of the territory, which cannot be supplied, and the lack of coal to meet the requirements is attributable almost wholly to lack of cars to enable the mines to operate efficiently and have their product moved on to the consumer promptly.

The car supply for the past week has been between 65 and 70 per cent of the requisite amount of equipment. Slight relief is expected when the rail lines are working smoothly under private control. The reserve supply of fuel in the hands of consumers is negligible and deliveries are inadequate to meet the full requirements of daily consumption.

Because of the crisp weather domestic stocks in retail yards were well cleaned up and numbers of consumers felt the pinch of cold on account of inability to get fuel but temperatures have risen and the receipts of domestic fuel now, though small, are adequate for the trade. The prevalence of sickness in many sections of the coal field and the slight shortage of labor have contributed to some extent in holding down production.

## Lake Region

### BUFFALO

Still great scarcity of all sorts of coal. No real relief in sight. Complaint of discrimination. Car shortage the reason. No more cars in sight.

**Bituminous**—The situation does not improve as it was expected to after the big snow drifts were gone. The fact is the car shortage is too pronounced for any great increase of movement to take place till there are more cars. Some of the most-favored shippers are now able to report a small improvement, but they even admit that the situation is bad, and they do not look for a fuel supply of coal till the car supply is better. As to that nothing can be done but build more cars. It is a long time since any such a move has been announced.

It is stated that about 30 per cent of the existing cars are crippled and that the car shops are not taking care of them at all fast. That is the real reason for the shortage and it will continue to be till the mines can have cars that are some degree up to their capacity. Day after day the miners are idle for want of cars. Then they are able to report that they are not earning much and demand more pay. The difficulty works out badly in all directions.

Complaints of confiscations of coal by the roads continue. Since the weather has once more become mild the amount taken is much less than it was, but it is still much more than it should be. Shippers are joining together in an effort to stop it, but it is a difficult matter. At the same time this is not the worst of it. If the roads would pay for the coal promptly it would not be so bad, but to keep a shipper's money tied up, as the deferred payments do, is enough to ruin some who are not well supplied and it is an equal injury to all.

The bituminous prices are very unsteady. Some of the shippers are trying to hold to the government prices, which are still nominally in force. The quotations are \$4.70 for Allegheny Valley sizes, \$4.50 for Pittsburgh and No. 8 lump and three-quarter, \$4.25 for all mine-run and slack and \$4.70 for smokeless. The report is common that more and more of the trade is breaking away from these prices. Some operators claim that they cannot make profit on them and if they charge more the jobbers will have to do so or go out of business. As a rule the latter would prefer to abide by the regulations.

And now come reports of preferential shipments and though they do not seem to be enforced to any visible extent everybody fears that they will soon be considered necessary and be enforced as rigidly as they were before. This would be about the last straw and all because the car supply has been allowed to run down so low.

**Anthracite**—The supply has run down so that there is a cry of famine in the city and though shippers and distributors say it is exaggerated all agree that we are in need of much more coal than is coming this way. The Chamber of Commerce has finally taken it up and telegraphed to some of the anthracite operators for an explanation. The claim is that Canada was being supplied to the expense of Buffalo. Some shippers say it is true and it does not appear to be denied by anyone. The reason given is that the car supply is so small that an adequate movement is impossible.

It is not expected that the difficulty will last long, for the weather has now come to the rescue and not much over one-third the coal is now consumed that was during the cold season, which lasted from the latter part of November till March 10, a period never exceeded in the history of the city.

But for the good supply had in last fall the shortage would have been something frightful. It was a narrow risk to run, especially when so many railroads were blocked.

And now comes up the alarmed report that there is going to be a strike next month on the part of the miners and people who have permanent homes are teasing for coal to bridge over a suspension of production. Natural gas can be depended on to help out in mild weather, but it not only runs down badly in cold snaps, but often goes out. On March 15 it will be permissible to put the gas back into the furnaces, but last March there was a cold spell that was hard to meet with gas only.

It is time to begin loading anthracite into lake vessels and make spring rates, but nothing has been done and nothing is likely to be done for weeks yet. The shippers will not be able to secure a surplus for the opening of lake navigation as it looks now.

### CLEVELAND

Shortage of fuel appears less acute because mild weather has drawn attention from it, but with steam coal users the situation still is a hand-to-mouth one. Demand for anthracite is unusually heavy for this time of year.

**Bituminous**—Coming of milder weather has eclipsed the coal shortage in the public eye, but the shortage remains just the same. Because of the higher temperatures demand has been decreased slightly, but not appreciably, as receipts from southern and eastern Ohio mines have not yet increased. Inasmuch as the district was able to operate practically full, though on the ragged edge, all winter, it is believed the present shortage will be outlived within a few weeks. That the worst is now past is the consensus of opinion. More efficient handling of cars and locomotives already can be detected. Domestic bituminous coal demand has tapered off to practically nothing, and all shipments have become available for industrial users. Little diverting, except occasionally for the benefit of the largest local utility, is being done.

Continuation of government maximum prices has quite seriously disturbed the routine of the industry here. At this time of the year contracting negotiations usually are on, but with government prices in effect and the President's Commission on the job neither operators nor consumers know where they are at. Operators are informally booking the needs of regular customers, with the question of price left open for future consideration. Tenders of \$5 and \$3.25 for No. 8 mine-run and slack are reported made to operators. Three dollars is the minimum most operators expect to be getting.

Virtually the only dark spot on the horizon here is the re-establishment of the preference list. That industrial users will suffer most heavily if cold weather recurs, is the general admission. So far, however, the Hines order has had little or no effect here.

**Pocahontas and Anthracite**—Slightly more Pocahontas is coming through just now, but it is only a drop in the bucket and insufficient to meet more than one-fifth of possible business. Anthracite, however, is holding up well and receipts are not far below normal for this time of the year. With rumors of an anthracite strike afloat, demand has increased and dealers are putting next winter's supply in the cellars of regular customers. Others still are limited to two tons. Prices of Pocahontas continue nominal, in the lack of sizeable trading. Anthracite quotations, while firmer, are unchanged. There are hints of advances, however.

**Lake Trade**—Prospects of an early opening have gone glimmering with the news that ice in upper Lake harbors is almost of a record-breaking thickness. In Duluth harbor the ice is 26 in. thick and the fields extend solidly 47 miles out in Lake Superior. Two Harbors has 21 in. of ice, Ashland 32 in., Escanaba 34 in., Port Arthur 24 in., while the St. Marys river is frozen over solidly its entire length and at Whitefish point the ice is 24 in. thick. Last season the first bulk freighter locked through the Soo canal on April 10 and reached Duluth April 11. Last season there was practically no ice, hence the belief that it may be the last of April before any lake coal can be carried this season. While considerable lake coal has been placed, the price has been left open.

Prices of coal per net ton delivered by dealers in Cleveland are:

Anthracite—Egg, \$12.20@12.40; Chestnut, \$12.50@12.70; Grate, \$12.20@12.40; and Stove, \$12.40@12.60.  
Pocahontas—Shovel lump, \$9.00@9.25; and mine-run, \$8.00@8.25

Domestic bituminous—West Virginia split, \$8.30; No. 8 Pittsburgh, \$6.85@7.00; Massillon lump, \$7.40@7.65; Canal lump, \$11.00, and Coshocton lump, \$7.35.

Steam coal—No. 6 slack, \$5.75@6.00; No. 8 slack, \$5.80@6.00; Youghiogheny slack, \$5.25@6.10; No. 8 $\frac{1}{2}$ , \$6.35@6.60; No. 6 mine-run, \$6.30@6.85; and No. 8 mine-run, \$6.30@6.85.

### DETROIT

**Indifference of Federal authorities to Detroit shortage of coal arouse Board of Commerce to action.**

**Bituminous**—Detroit Board of Commerce is acting for a conference with similar organizations from other towns of the state to determine what can be done to bring a more liberal supply of bituminous to Detroit and Michigan. This action follows failure of an attempt to obtain relief through a direct appeal to representatives of the Federal government in Washington.

An appeal to Washington was made by E. J. DuBois, fuel commissioner of the Board of Commerce, who sought to stimulate action by presenting to the fuel authorities the information gathered in a survey of Detroit industries. This investigation disclosed that many of the large manufacturing plants are being kept in operation by the coal they are receiving from day to day and that numerous important industries are daily confronting the contingency of interrupted shipments forcing them to close down.

Mr. DuBois also informed the Federal officials that an investigation of 125 coal yards in Detroit has shown their combined stock to be only about 1,570 tons of bituminous or less than 15 tons apiece. He emphasized the fact also that the Detroit Edison Co. having daily consumption of about 4,100 tons, has reduced its reserves to something like 14,000 tons in contrast with a usual reserve of about 100,000 tons.

Government representatives gave Mr. DuBois no encouragement to expect improvement. H. B. Spencer, chairman of the Central Fuel Committee, told Mr. DuBois that while perhaps it would be possible to provide coal for household consumers and for public utilities, no assurance could be given that Detroit industrial plants would not be forced to close.

Jobbers say the railroads are continuing the confiscation of coal sent to Detroit, despite the protests of consumers and the trade. The present shortage of supply is ascribed principally to the action of the railroads in seizing and diverting shipments sent to Detroit.

**Anthracite**—Very little anthracite is coming into Detroit, but dealers are of the opinion that temperature conditions will moderate speedily and that household consumers will be able to provide for their requirements without hardship.

## Middle West

### MIDWEST REVIEW

**Big consumers of coal in the Middle West are beginning to be worried because they are having great difficulty in getting contract propositions from either operators or distributors.**

Operators cannot, most certainly, afford to take on big contracts on a basis of the present Government prices, nor can they afford to take on contracts over and above the Government prices. Consequently, they are selling their output almost entirely on a day-to-day basis. This proves very unsatisfactory both from the standpoint of the operator and consumer.

The car situation is improving slowly in Illinois and Indiana, although mines on the Pennsylvania lines, in Indiana, are reporting a very much better car supply than any other mines in that territory. The railroads, it appears, are not going to follow the tactics inaugurated and carried out by the late lamented U. S. Railroad Administration. In fact, we know that several mines who worked on railroad contracts last year have been approached, within the last few weeks, by the railroads, asking that their contracts be renewed, and of course on a different basis. So far we have not heard of any large contracts that the railroads have made.

The market continues very strong on domestic sizes, and steam coals. Apparently the coal shortage in the country is very much more serious than at first supposed. That there should be a shortage of steam coal can be easily understood, both on account of the strike, and the tremendous industrial activity in the West.

The shortage of domestic coal is hard to understand, because normally at this time of the year, dealers are not buying at all, but are cleaning out of their bins what has been left of their winter coal supply.

We have been having some very mild weather, but, irrespective of this, dealers are buying coal as fast as they can place their orders, and it appears that the public is buying coal from the dealers just as fast as it arrives. It is predicted that the domestic trade will boom right straight through the summer months, because the public is showing a desire to stock coal this year, in order to avoid future uncertainties and difficulties. If this trend of early buying continues, it will be a very satisfactory thing for the whole industry.

**CHICAGO**

**Railroads still confiscate coal. Shippers' situation is bad. Demand for domestic coals.**

During the coal strike, and continuing from the end of the strike up to now, it is said that the Pennsylvania R.R. has been confiscating a large number of cars of coal. The shippers of this coal claim that they are unable to get payments from the railroad, and have bills against that railroad dated as far back as October, 1919. They claim, in addition, that the Pennsylvania R.R. does not even answer their letters asking for payment, let alone forwarding checks for confiscated coal.

The situation is growing so bad, we understand a number of Chicago shippers and wholesalers have made up their minds to send a delegation to Pittsburgh to call on the proper authorities of the railroad, and see if something cannot be done. Market conditions in Chicago differ very little from the general conditions existing throughout the Middle West. All domestic coals are in great demand, and very hard to get. Buyers of steam coal are placing orders wherever they can, and it looks as if a strong market will continue for some time.

**ST. LOUIS**

**Car shortage in all fields continues and coal is more scarce than at any time in years, excepting in strike periods. Much dissatisfaction among miners.**

Car shortages instead of getting better apparently seem to be the reverse. Throughout the Standard and Mt. Olive fields, with the exception of one or two roads, conditions have been worse the past week than at any time in many years as far as car shortage is concerned.

Two exceptions were the Vandalia and the Baltimore & Ohio, which roads showed considerable improvement. There was a slight improvement on the Wabash, but the other roads fell down with the exception of the short line coal roads, which held to about where they had been for the past week or two.

There is much dissatisfaction among the miners throughout these districts,—first because of the short working time, and secondly because the commission appointed to look into the new wage scale have up to the present failed to make any satisfactory progress. On the Illinois Central and Mobile & Ohio two days a week seems to be about the maximum.

Railroad contracts are behind and nearly all railroads are short of fuel and are taking anything they can get. From the Mt. Olive districts the movement of coal North and West for the railroads is heavy.

The steam call exceeds the supply on everything. Domestic demand is easy, as far as the demand is concerned, but the supply is so short that deliveries are way behind, as much as three weeks on Mt. Olive coal.

The domestic demand in the country is many weeks behind, with no chance of getting caught up until April first or after, unless something unforeseen develops. Steam country business is exceptionally good if it could be taken care of.

In the Cartersville field of Williamson and Franklin County the car shortage is playing havoc with tonnage. The mines on two or three roads are faring fairly well, getting as much as three and four days a week, but the mines located on the Illinois Central along or the Missouri Pacific alone are in bad shape.

For the first time in several weeks a few cars of commercial coal were booked out this week on contracts. The movement of everything is unusually slow. The weather has changed and is warm and the demand in some sections, while unusually heavy, is easing up, but the mines are many weeks behind on domestic sizes. Steam sizes are also behind and are likely to continue so.

Everything in this field indicates a heavy early buying of coal and the railroad tonnage is heavy and will likely continue so. The miners in these districts do not show as much discontentment as in others.

In the Duquoin district conditions are considerably worse, that section being served only by the Illinois Central. There is much speculation throughout the field on the part of the miners as to what the commission at Washington will recommend in the way of an increase. The miners seem to think that they must have at least thirty per cent.

The twenty-five per cent increase reported on March 11 as being recommended at Washington seems to satisfy some of them, but many are not contented with that and it will take a few days to get any information as to what the majority seem to think about it.

A condition that is confronting the railroads in the Middle West is the substituting of oil for coal if the price of coal continues to go up. Oil is as high now, they figure, as it will be and is likely to come down, but coal will go up and the problem is receiving serious consideration at the hands of the big western roads, and especially those in the southwest.

There is practically no anthracite coming into St. Louis, and no smokeless. The tonnage of Franklin County is still small. There has been no change in prices and, generally speaking, local conditions are satisfactory.

**MILWAUKEE**

**Severe winter weather in March caused a heavy demand on the coal supply and forced dealers to measure out orders gingerly. No change in prices.**

Sub-zero weather during the first week in March put the coal business of Milwaukee into an acute stage from which it was subsequently rescued by a burst of spring-like atmosphere. The market is now entirely dependent upon rail supplies. Cars are scarce and the service in general has been demoralized by cold and snow. The stocks of anthracite are so low that consumers are limited to one ton orders.

No Eastern soft coal is being received at present, Illinois and Indiana being drawn upon for steam coal. Domestic sizes of Pocahontas are as scarce as anthracite, but there seems to be an abundance of mine run. There will be no relief from the present situation until navigation opens. Prices remain unchanged on coal and coke. The suggestion of \$15 anthracite on April 1 is no longer heard.

Prices in Milwaukee are:

Anthracite	
Chestnut	\$12 70
Stove	12 60
Egg	12 40
Pea	11 20
Buckwheat	9 75

Government prices are as follows:

Bituminous	
West Virginia, splint screened	8 00
Hi-Hat	8 00
Hooking, screened	7 75
Pittsburgh, screened	7 75
Pocahontas mine-run	8 75
Pocahontas, screened	11 00
Cheerful Chunks	9 50
Smithing	8 75
Cannel	12 00

**Pacific Coast**

**SAN FRANCISCO**

**Car situation improved. Recovery almost complete. Bunkering business in line shape.**

More railroad cars are available for the transportation of coal from Utah and Wyoming to San Francisco, the main receiving point on the Pacific Coast. Recovery has been just about complete from the conditions at the time of the strike of the coal miners. Following that walkout, there is no longer any diversion of cars, normally used for the Pacific Coast business, to other parts of the United States. Both the bunkering and domestic trade are on a pre-war basis, with business in healthy condition.

The bunker price at present is \$13.55, which has been maintained for some time. For domestic use, bituminous prices from Utah and Wyoming, f.o.b. net ton, are: Stove, \$3.65. Lump, \$3.65.

**SEATTLE**

Quotations at the present time are as follows:

- Seattle—\$6.75 per ton 2000 lb., f.o.b. bunker tips.
- Tacoma—\$6.75 per ton 2000 lb., f.o.b. bunker tips.
- Portland—\$8.75 per ton 2000 lb., f.o.b. bunker tips.

Portland—\$9.50 per ton 2000 lb., in the stream over the ship's rail.

The above rates apply to the standard grades of Black Diamond and South Prairie coal.

Quotations on British Columbia coal in Seattle Harbor are as follows:

- Comox Lump—\$10.00 per ton of 2240 lb., f.a.s.
- Comox Marine Mixture \$9.85 per ton 2240 lb., f.a.s.

**Coke**

**CONNELLSVILLE**

**Market remains stagnant. Rise predicted in event of removal of price control but this might be short lived.**

Coke market continues extremely inactive, as there is only a very limited tonnage offered in the open market at the Government limits, and this is chiefly off-grade coke, though the full price is quoted.

The market presents all the appearance of an extreme scarcity, and it is predicted to quit generally that if the Government control is taken off in the near future, as is thought in some quarters will be the case, prices will soar at once, say to \$8 or \$10 for furnace coke, or even higher.

Price control will not come off, at the earliest, until the President has studied the majority and minority reports of the Robinson bituminous wage commission and acts upon it, for the commission merely recommends in the matter of price control. Meanwhile the transportation situation is expected to improve almost from day to day, if the present mild weather continues, and that will necessarily have a great effect upon coke.

The coke market might advance very sharply, but the situation has elements of eventual weakness in it, there being probably more than 100,000 tons of coke piled in the Connelville region, awaiting cars, while a few of the furnace interests have chanced to accumulate stocks of considerable magnitude, even though others have not had enough for full operation. The furnaces with stocks would probably order contract shipments to be stopped or curtailed, in the event of transportation conditions being permanently improved, and only a few suspensions would be needed to give the coke market a chill.

The market, while practically nominal, remains quotable at Government limits: Furnace coke, \$6; foundry, \$7; crushed, over 3-in., \$7.50, per net ton at ovens.

The *Courier* reports production in the Connelville and Lower Connelville region in the week ended March 6 at 238,286 tons, a decrease of 9,719 tons, and a tonnage slightly under the January-February average.

**BUFFALO**

**The situation does not improve much. Coke has all along been about as scarce as bituminous coal and it will not be readily plenty yet.**

The season's policy does not seem to be determined upon at the furnaces. They are far enough behind their orders, but so many difficulties come up that a bold forward movement seems out of the question. It is expected that a liberal output will be made the coming season, but it is far from assured. Ore has been sold in quantity, but none has been chartered yet. Prices f.o.b. here are \$9.60 for 72-hour Connelville foundry, \$8.60 for 48-hour furnace, \$7 for off grades and \$7.75 for domestic sizes.

**BIRMINGHAM**

**Demand for furnace and foundry coke here is very strong but there is none available for the spot trade or for additional contracts.**

The curtailment in coal production has likewise affected the output of coke, and equipment for the movement of the product is also very short. Yolande foundry is being billed to contract consumers at \$9.75 ovens, which is also the quotation on Brookwood foundry. All grades are quoted at government prices.

# COAL AGE

Volume 17

New York, March 25, 1920

Number 13

## To Be Fair Is To Be Fortunate

BY CARL SCHOLZ

At the Coal Stabilization Conference held in connection with the February meeting of the American Institute of Mining and Metallurgical Engineers it was clearly demonstrated that there is "nothing new under the sun."

Everyone of the measures proposed as likely to be helpful has been tried at various times, and even now the trick is not turned. Nevertheless there is still hope that by closer co-operation between all parties, beneficial results can be obtained.

Most essential is it that any movement to be applied by all the parties at interest be based on doing a fair day's work for a fair day's wage. It is necessary to eliminate selfishness and greed and to substitute fairness and justice in their place. No matter how many papers are read and schemes advocated, until correct principles are applied and practised by the legislators making our laws, by the coal operators and banks providing the capital and by the laborer in converting the raw material into a finished product, the goal will not be successfully reached.

It is only necessary to analyze the cause for the present high cost of production to prove the correctness of the above conclusion. Prior to the war, owing to various causes, the coal industry had reached an extremely low ebb. It was impossible to establish

central selling agencies, as are now advocated, because the law prevented their formation. The railroads could not grant reduced freight rates in the summer because some of the railroad commissions had stated that if low freight rates were made in that season similar rates would have to be maintained during the winter. The storage of coal was not feasible because of the limited credit of the coal companies and the knowledge on the part of the buyer that cheap fuel would be available at the close of the year.

The war converted the surplus coal production into a shortage, with the result that coal operators made up for past losses by advancing their charges, a situation which brought about regulation of prices and increased wage demands. Higher prices for coal, in turn, resulted in a generally increased cost of living, although other commodities were perhaps equally or more responsible because they also had been depressed and needed assistance.

It really seems that the American people are now awakening to the true condition of the coal industry and realize its need, and the present seems the time in which to establish a propaganda, based on justice and fairness to the consumer, the producer and the laborer, of such a character as may eliminate the high peaks and the deep valleys in the curve of production that are so detrimental to true economy.

# IDEAS AND SUGGESTIONS

PRACTICAL SCHEMES THAT MAKE THE DAY'S WORK EASIER

## Safety Device for Shaft Station

AT THE Burnside Shaft of the Philadelphia & Reading Coal & Iron Co. near Shamokin, Pa., an interesting device for the protection of the men and also for stopping the cage at the proper point is installed.

By referring to the accompanying diagram it will be noted that there is a 3-in. pipe on one side of the shaft. This has been slit for a distance of about 8 ft. Through this slit a can projects about 8 in. into the shaft. To the end of the cam within 3-in. pipe a chain is attached which passes over a pulley about 10 ft.

PLAN AND ELEVATION OF SAFETY DEVICES  
 Illustrating the method of automatically raising and lowering the station gates and a new type of keeps.

up the shaft, then over another pulley marked "D," then down to the gate at the shaft bottom. The cage in its descent pushes down on the cam, which automatically raises the gate out of the way.

Besides this device a special seat for the cage is provided so that the cage will always come to the proper position and thereby allow the cage track to exactly register with the track in the shaft station. This cage seat consists of two 90-lb. steel rails which run the long (transverse) way of the shaft. These rails are so arranged that they can be moved by a lever out of the way to allow the cage to pass to a lower

level. When they are moved out of the way a system of levers also changes the position of the 3-in. pipe, mentioned above, so that the cage in descending will not strike the cam and therefore will not raise the gates.

## Wire Cabinet for the Class Room

BY R. Z. VIRGIN  
 Pittsburgh, Pa.

A WIRE netting cabinet similar to the one shown in the accompanying illustration may advantageously be used in the lecture room, either at the mining night school or the college of engineering, to teach the proper method of drilling holes and placing shots. Broomsticks or similar rods pass through the wire and show

Wire netting to show course of drill in coal seam for instructional purposes. Broom handle, used for drills to go through mesh of wire.

WIRE CABINET WHEN COMPLETED

the course and location of each hole throughout its entire course.

When a blind top is temporarily placed over the cabinet an excellent opportunity is afforded the student to display his judgment in effectively directing the drill hit throughout its course so that the bottom of the hole and consequently the explosive charge may be in the proper position.

COAL PILES OF BRIDGEPORT TRANSFER YARD

This yard, unlike that near Schuylkill Haven, is constructed on level ground and operates entirely by direct mechanical equipment, whereas the other installation, forming the main subject of this article, is a sidehill and uses the power furnished by water under pressure. This installation has a total capacity of 520,000 tons of coal on its eight floors and was constructed by the Dodge Engineering Co.

## Reading's Storage Yards Keep the Mines Running Steadily

Coal Storage, Regardless of Type, Has a Tendency to Decrease the Cost of Fuel to the Consumer by Equalizing the Demand—Other Benefits Than Those Which Are of Direct Financial Advantage Accrue to Those Who Operate Such Plants

BY DEVER C. ASHMEAD  
Tarrytown, N. Y.

FOR some years past, in order to partially equalize the demand upon the mines, anthracite-producing companies have introduced storage yards. One of the largest of these is that belonging to the Philadelphia & Reading Coal and Iron Co., located a short distance from the town of Schuylkill Haven, Pa. This is what is known as a side-hill storage yard, and has a capacity of 1,000,000 tons. While it is not possible to state the average daily receipts and shipments to and from this yard, it may be said that the maximum receipts in one day have been 7,870 tons and the maximum shipments 10,195 tons.

Although it has been stated above that the capacity of the yard is 1,000,000 tons, this does not signify that this amount of coal will be handled in any one year. Even during the summer, when production is usually so much in advance of demand that coal is, in general, being stored, the demand for certain grades of coal might be such that the mines would be unable to fill their orders, and, in consequence, resort for such sizes would have to be made to the storage yard. The total shipments during the entire year might exceed 1,000,000 tons, or on the other hand they might not equal this figure.

Coal is brought to this storage yard in railroad cars which are placed upon the track on the upper side of the yard immediately above the place at which it is to be stored. From this point the coal is dumped directly into the pocket and when necessary is washed through steel chutes to its proper place therein. Different sizes of coal are kept separate by means of wooden partition walls, extending down the hill and transversely across the storage yard.

No permanent retaining walls are built to keep the coal in place, but temporary structures of this kind are erected that keep the coal from overflowing the limits of the pocket. These walls also greatly increase the capacity of each individual inclosure. They are often constructed as high as 16 ft.

Coal is removed from storage in either or both of two ways. Small sizes, such as rice and barley, when the bank in the pocket is high, may be washed through chutes directly into cars that are placed upon the track that skirts the lower edge of the storage yard. When such coal becomes low in the pocket it is washed to an elevator, by which it is deposited in the car.

If the coal is of a larger size, such as egg, stove, chestnut, pea or buckwheat, it is necessary to rescreen the material before it is shipped, thus removing the undersize resulting from breakage. In this case the coal from the pocket is washed to a scraper conveyor and taken to one of the screening houses, of which there are four. It is here elevated to the top of the house by means of a 36-in. bucket elevator, which delivers the coal to a shaker screen and it is resized. The resized products then pass for shipment to their proper pockets in the screen house, while the fine material is deposited upon a slush bank.

Besides handling material to and from the storage yards the company at this point also prepares coal from various culm banks, isolated but not remote. This material is brought to the storage yard in railroad cars and dumped into a pocket directly opposite the breaker. From this point it is conveyed to the top of the building by a dragline conveyor and is prepared by jigs and screens, the clean coal going to

SCHUYLKILL STORAGE YARD TAKEN AT THE HEIGHT OF THE

This yard has 16 main compartments with a maximum capacity of 1,000,000 tons of coal. Some of the separating walls can be readily seen but others where two sizes are stored

in adjacent pockets are suffered to be wholly covered by dumped coal. At the time that this photograph was taken about 860,000 tons of coal were in the yard. The unused

capacity can readily be seen, as the ends of the separation walls of such pockets near the bottom of the hill are not covered by a mantle of coal as are the others. In the

the various pockets in the breaker and the rock to a rock dump. The breaker is so arranged that it may be used solely as a screen house, the coal going direct to the pockets for shipment being bypassed around the jigs by a system of chutes. Thus one building serves two entirely distinct purposes.

The plant at Schuylkill Haven is about a mile long and comprises 16 pockets, built to accommodate different sizes of coal. Such sizes as do not require reparation before shipment are usually stocked in the pockets farthest from the screen houses, thus allowing the larger sizes to be stored in compartments adjacent to the screening plants. This reduces the distance over which any size must be handled, and

consequently the degradation of the coal. Of course, a large amount of water is required in the operation of this plant, as the transference of the coal from place to place is largely secured by hydraulicking methods.

The supply in this case is secured from Mohannen Creek, the pumping station being located about a mile below the storage piles. The water is forced from the station by two pumps having a capacity of 1,200 and 1,400 gal. of water per minute. These pumps are of the centrifugal type and are electrically driven. The main pipe line is 12 in. in diameter and discharges into a small reservoir near the power house which has a capacity of 180,000 gal.

Thence the water is forced by a Jeanesville pump to

SCHUYLKILL STORAGE YARD IN THE WINTER

This shows the storage yard at a time when the stocks of coal have been reduced to approximately 300,000 tons. As a result of this depletion the separating walls of wood

between the open side-hill pockets can be readily seen passing like huge snow-fences from railroad to railroad dividing one size of coal from another. The large coal banks

shown at the extreme end of the yard consist of fine coal. The larger sizes are dumped within easy reach of the rescreening and breaker house, which is shown in the middle

SUMMER SLACKNESS—ITS MAMMOTH POCKETS ARE ALMOST FULL

middle foreground is the breaker. To the right is the boiler house and immediately to the right of this is the power plant. At the extreme left are the screen houses while im-

mediately under the trestle along the bottom of the coal piles will be seen the conveyors and on the top of this trestle will be seen one of the water supply lines, which during

the winter is kept hot and so can be used to thaw the frozen coal for hydraulicking. Note the barricade at the foot of the coal slope, which is described on page 599 of this issue.

all parts of the plant. An 8-in. pipe line skirts the lower edge of the storage plant while a 6-in. line is laid along the upper side. The water from these pipe lines is used for hydraulicking the coal into place in the pocket or for washing it down the chutes to the cars or to the elevators or draglines, as already referred to.

Since coal in the pocket is liable to freeze during severe weather, it is necessary to make provision for thawing this material so that it can be loaded out from storage. This is accomplished by heating the water used for hydraulicking. To this end the water flowing through both the upper and lower pipe lines is heated in the power house to a temperature rang-

ing from 115 to 120 deg. F. Although the pipe lines are uncovered and carried upon trestles, the temperature of the water in the remotest parts of the line even in severe weather is usually about 83 deg. F. By this warm water the coal to be reclaimed from storage, even though frozen solid, is quickly thawed out and washed down the chutes to its destination at the lower edge of the yard.

In addition to the water supply already referred to, water for drinking purposes is also furnished. This is secured from a horizontal borehole 800 ft. long, near the top of the mountain, and is piped to all parts of the plant.

The power plant at this storage yard is a concrete

WHEN THE SUPPLY OF COAL HAS BEEN DEPLETED

foreground, as it is necessary to rescreen the larger sizes of coal, which, owing to their storage, have been subject to degradation. The difference of elevation of the unloading

and reloading tracks is 154 ft. at the breaker house. While the cars just above the breaker are unloading culm, those immediately to the right are unloading pea coal, for which at

the time the photograph was taken there was a lack of orders. To the left of the center bridge can be seen a long flume which conveys the slush to a slush bank.

structure with an asbestos-covered roof. It contains a 500-kw. General Electric turbo-generator, furnishing alternating current at 440 volts for the operation of the plant. For lighting, another Westinghouse turbo-generator delivering alternating current at 440 volts, having a capacity of 125 kva., has been installed. A 125-kw. General Electric motor-generator set furnishes direct current at 250 volts. The motor element of this machine takes alternating current at 2,300 volts which has been stepped up from the 440-volt potential at which it is generated. High-tension current also operates the pumps at the pumping station.

In addition to these units there is also installed a Jeanesville pump having a capacity of 150 gal. per minute which supplies the yard and two boiler-feed pumps as well as two pumps supplying the breaker. These latter machines are identical in size, being

floors and has a capacity of 520,000 tons. It was built by the Dodge Engineering Co.

It will be at once perceived that the expense of such storage yards as those above described is great both as regards installation and operation. The matter of wages alone amounts to a considerable sum. An average of 85 men per day at the Schuylkill Haven plant makes a payroll of \$100,000 a year or more. To this must be added the interest charge upon the value of the stored coal and the degradation of the fuel as well as the expense of running the machinery and heating the water in winter. These latter figures are difficult to estimate. Another item of expense is the freight involved in bringing the coal from the mines to the storage plant. This varies considerably with the distance the coal is transported. The shortest haul to the Schuylkill Haven plant is about eight miles and the longest is approximately 40 miles.

PHILADELPHIA & READING COAL AND IRON CO.'S

With a storage capacity of 1,000,000 tons of coal this yard is one of the largest storage yards in this country. Sixteen large open pockets are provided for handling the different sizes of coal. The yard has a total length of one mile. The coal is dumped from railroad cars directly into the pockets on the uphill side

6 x 10 x 12 in., and were built by the coal company in its own shops at Pottsville, Pa. A 13-panel switchboard is installed in the plant for handling the electric current.

#### STORAGE PLANT NEEDS 85 MEN TO OPERATE IT .

The boiler house contains four Stirling boilers of 300 hp. each, making a total of 1,200 hp. These are hand fired with fine coal produced in the breaker, which fuel is conveyed to the boiler house by means of a dragline scraper

On an average throughout the year 85 men are employed to operate this plant. The maximum number of hands employed was 125, while the minimum during the extraordinary conditions prevailing during the recent war was about eight men, the plant at this time being practically abandoned. During one of the years of the conflict only 26,000 tons passed through the plant.

In addition to this storage yard the Philadelphia & Reading Coal and Iron Co. has a second plant, known as the Bridgeport Transfer. This yard is of an entirely different design, as may be seen in one of the accompanying illustrations. It is provided with eight

of the yard, and the coal is handled by hydraulicking in the pockets and from the pockets, to the railroad cars, for reshipment. Four rescreening houses reprepare some of the coal before it goes to the market. Pocket No. 4 is used for the dumping of the culm from isolated banks, where it is retained for preparation in the

It is logical to suppose that the advantages derived from storage are commensurate with the expense involved. It is doubtful, however, if all the advantages secured can be measured accurately from a strictly financial standpoint, and the element of increased service to both the miner and the public must be taken into consideration.

It might be well, however, to take up first the financial phase of the storage problem. How is the operator benefited financially by storage? It will first be necessary to consider how coal is disposed of. Coal is sold through agencies and sales offices, and at certain times there is a greater demand than at others. In the winter, for example, there is a strong demand for prepared sizes, that is domestic coal, while in summer the call for such fuel falls off considerably. Then again in cold weather manufacturing plants require greater amounts of fuel for the generation of power than during the summer. Furthermore, heating plants, of course, are always most anxious for coal in the winter, but unfortunately despite these facts the capacity of a mine is lower in winter than in summer, because of the difficulties in operation and transportation.

Production thus tends to decrease just when the demand increases. This is most acutely felt in the prepared sizes and in some instances in buckwheat, but it is not particularly troublesome in the case of the smaller sizes, which are used for fuel purposes exclusively.

On the other hand in the summer the demand for the larger coal is small, but in order to produce the sizes to fill fuel contracts the mines must operate, and if the orders for coal cannot be evenly distributed throughout the various grades one of three things must occur: (a) The larger coal must be crushed down to the smaller sizes. (It is impossible to consider this method because of the great difference in price between the large and small sizes of anthracite.) (b) The mines must shut down and production of coal cease or (c) Those sizes for which there are insufficient orders must be stored.

that is periodically forced to shut down, soon gets a bad reputation, and it is difficult to hire men when, at last, orders are such that the company again becomes desirous of operating.

Another loss that the operator would sustain is that of his contracts. If he cannot fill a contract he must lose it, and if he escapes without a lawsuit for damages he is lucky. Furthermore, violation of a contract or its non-fulfillment renders the consumer timid about placing new orders with the producer, lest those orders should, similarly, fail of fulfillment. This naturally increases the difficulty experienced by the producer in disposing of his product.

The loss occasioned by a shutdown of the mine is one of which the public must assume a portion. If a mine with a certain output ceases operations, this decreases the amount of fuel placed upon the market, thus lessening the visible supply. When the demand

SCHUYLKILL HAVEN SIDE-HILL STORAGE YARD

breaker-screenhouse. The slush bank does not have to be held by walls or barricades. A low embankment about a foot high is built of dirt, and later the necessary height is secured by throwing dried slush on the top of the earth. This slush acts as a filter and permits the water to percolate through it and pass

away. The material is easy to handle because the volume of slush to be deposited is not large. As a result the slush in the bank is in all stages of dryness dependent on the length of time it has been deposited and some of it is always in condition to act as a low dam.

Since the first condition is impossible of fulfillment it is unnecessary to consider it further. If the mines are shut down huge losses will occur, one of which arises from a continuance of overhead expense. This cannot cease, since it is necessary to continue ventilation and pumping in order to avoid irreparable damage. Repairs must be kept up whether the mines run or not, and, as for the machinery, it must be remembered that it frequently deteriorates quite as rapidly when idle as when in operation. Monthly men must be kept on the payroll as well as some of the day laborers. The interest charge on the investment continues, as does also the depreciation. The Government, furthermore, does not reduce taxes on an idle plant. In other words everything will be going out and nothing coming in under such circumstances.

increases this means that the price must increase, because price depends upon supply and demand. The closing of a single mine will not, of course, appreciably affect the market, but it frequently happens that many operations are simultaneously closed down tight, while others work only part time. As far as the public is concerned it can relieve this situation to some extent by so regulating its demands that they will be more evenly distributed throughout the year. Thus the consumers might place their orders in the summer, when the demand is low, and lay in a winter's supply of fuel, thus making the consumers' cellars the storage yards of the country.

This condition may last only a day or two or may continue for months. Shutting down the plant causes a loss to both the miner and laborer, which means that their work and with it their incomes cease. If such a shutdown were short, the men probably would stay at the plant, as they would wish to avoid the expense of moving from place to place, but if long continued, they would be compelled to move or starve. A mine

Only the last alternative remains for consideration. How does the storage of coal affect the operator, the employee and the public? As previously stated, the demand for coal is not regular but highly intermittent—greater in winter than in summer, although even in winter the demand is not uniform, frequently being insistent for certain particular sizes, while for others it may be almost nil. Individual mines cannot store their output since it would require too much space, and the cost of storage at any individual plant would run into prohibitive figures.

A large mining company, on the other hand—one operating a large number of mines—can resort to commercial storage with good results. The cost of operation of such a storage plant when distributed to a considerable number of mines, each having a large output, is not excessive, and the savings resulting from continued working of the mines will aid to a large extent in paying the cost of operation of the storage plant.

The benefits of storage are threefold—(1) Continuous operation of the mine; (2) Ability to produce coal for which there are no existing orders; (3) Opportunity to ship to the consumer those sizes which he requires and to ship to the storage yard those sizes for which orders are lacking, until a demand for such sizes of coal may be developed.

Continuous operation of the mines has a strong influence upon the price of coal, permitting the output to be greater during the summer or during those months when demand is ordinarily flat, but when the cost of operation is less than during the winter. Storage has a tendency to meet the requirements of an increased demand at a time when it is at the peak, and, as is well known, the nearer the supply comes to the demand the cheaper will be the coal. It reduces the overhead expenses that would arise from shutting down the mines because of a lack of balanced orders, consequently although the expense of storage may be greater than the actual saving in overhead, this saving tends to pay a part of the storage costs and therefore reduces the total expense.

The miner is benefited by storage as it has a tendency to make his work more regular and continuous, regardless of the season of the year. This tends to render him better satisfied since it shows that his employer is working for his advantage. It has a direct financial bearing on the cost of operation, for it reduces the labor turnover. A more efficient mine force is assured when men are retained long enough to become familiar with the work at the mine at which

SMALL COMBINATION BREAKER FOR CULM AND RESCREENING HOUSE FOR STORED COAL

This breaker serves for the preparation of the culm from a number of nearby waste banks and for the rescreening of the stored coal without further preparation. In the background will be seen railroad cars dumping culm for preparation in the breaker.

storage yards, as built and operated by the various anthracite companies, do not pay a direct financial return to their owners, they do perform a definite service to the producing companies, to the public and to the mine worker.

**Injury Through Fall of Rock.**—Where a coal miner sued his employer for injury sustained through a fall of rock in an entry, and the employer relied on a claim that the injured man was guilty of contributory negligence in failing to discover that the roof was in defective condition, or assumed the risk, it was proper to receive evidence at the trial showing existence of a smoky condition in the entry, following a firing of shots.

This evidence was admissible as tending to show that the danger was not apparent and was hard to detect. (*Arkansas Supreme Court, Smith vs. Southern Anthracite Coal Mining Co., 215 Southwestern Reporter, 719.*)

**Contracts to Sell Coal in Place.**—If a consideration be paid for an option to buy coal in place, with a time limit fixed for exercise of the option, it cannot be withdrawn during that period without consent of the option holder. But if no consideration be actually given for the option, although one be recited in the contract, it is subject to withdrawal any time before acceptance. However, if the holder exercises the option before its withdrawal, a binding contract of sale results.

The holder of an option to buy coal in place will not be denied the right to a court decree requiring the other party to convey in accordance with the accepted terms of the option on the ground that the holder has invested nothing, being a promoter who would not have accepted the option except for having obtained a purchaser to whom he can sell the coal at a profit.

But a decree requiring conveyance under an accepted option will be denied where the option provides for a warranty deed containing provisions used for similar property in certain counties, and the evidence shows that there is no established and uniform form of deed so used, and where the option holder has not waived, as he might, any further provision than for an ordinary warranty deed. In such case there is no sufficient agreement as to the character of deed to be given. (*Illinois Supreme Court, Threlkeld vs. Inglett, 124 Northeastern Reporter, 368.*)

INTERIOR OF SCHUYLKILL POWER PLANT

Showing the turbo-generator in the rear and the large Jeanesville pump which supplies the plant with water in the foreground. Large quantities of water are used, for the coal is moved from place to place largely by hydraulic methods.

they are employed. When the men are constantly changing from place to place, because of the slack work afforded at various times during the year, little dependence can be placed in their efficiency.

Therefore the conclusion is obvious that although

# Hydrocarbon Gases Found in British Columbia Mines

BY JAMES ASHWORTH\*  
Alberta, Canada

**I**N THE report of the Minister of Mines for 1918, many pages are devoted to the subject of "Mine-Air Sampling," in both coal and metal mines. Perhaps, the most unusual feature appears on page 336 of the report, in giving the analysis of a sample of air that was probably taken in the Beta Tunnel of the Britannia mine after blasting, although it is not so stated.

According to the analysis given, this sample of air contained 0.11 per cent carbon monoxide, which alone would mean a dangerous condition; but, besides, there is present in this air 0.73 per cent carbon dioxide, while the oxygen content is given as 19.49 per cent and nitrogen 79.67 per cent. A most notable feature is the presence of a "trace of ethylene" reported in this sample.

The chief inspector of mines, George Wilkinson, reports, page 319, the taking of 510 mine-air samples during the year, many of which were obtained from the mines of the Crow's Nest Pass Coal Co., adding further that much valuable information regarding the outflow of gas from coal seams and the effect of breaking the coal was secured.

It was claimed by the officials of the Miners' Union and the men that the adoption of a single-shift system would lower the flow of gas in these mines. In order to prove or disprove this claim many mine-air samples were taken during the months of April, May and June, 1917, when the mines were idle in the Crow's Nest district. These samples were taken regularly each month to determine what outflow of gas took place while no coal was being mined. The results obtained were surprising, frequently showing as large a flow of gas from the coal at the end of 70 days as when the mine was being worked.

## ANALYSES OF MINE AIR TAKEN TO SHOW OUTFLOW OF GAS UNDER VARYING CONDITIONS

It is of interest to note the seeming discrepancy regarding the volume of methane generated, per ton of coal mined, as recorded in the last column of the table giving the data for the Corbin Colliery, p. 330. Comparing the results shown in the first two tests at this colliery when the same tonnage was mined, the outflow of methane is given as 362 cu.ft. per ton in the first test (Jan. 8), the percentage of methane in the sample being 0.53 per cent, and the reading of the barometer 24.5 in. In contrast with this, the second test (March 26) gives the outflow of methane as 749 cu.ft., per ton of coal mined, the percentage of methane in that test

being 0.50 per cent, and the barometric reading 24.7 in.

The reason for this difference is not apparent, although we note the temperature of the first test was 50 deg. F., and advanced in the second test to 64 deg. F. In these tests the outflow of methane per min. is given as 63 cu.ft. in the first test, and 130 cu.ft. in the second.

Much the same condition is shown in the Michel Colliery when comparing the two tests taken May 9 and Aug. 10, respectively, p. 329, the output for this air split being 200 tons on each date. The first of these two tests showed 1,173 cu.ft. of methane generated, per ton of coal mined, the percentage of methane in the sample being 1.78 per cent, and the barometric pressure 25.9 in., temperature 53 deg. F. In contrast with this the second

test showed 2,354 cu.ft. of methane generated, per ton of coal mined, the methane then being 1.81 per cent, barometric pressure 25.6 in., temperature 55 deg. F. The outflow of gas in the first test was 163 cu.ft. per min., and that in the second test 327 cu.ft. per min.

## MUCH METHANE IS TRANSPIRED

At Coal Creek, p. 327, a test taken in No. 1 East Mine, main-return airway, Jan. 24, when 600 tons of coal were mined, gave 3,712 cu.ft. of methane generated, per ton of coal mined, the methane being 1.28 per cent, barometric pressure 25.7 in., temperature 49 deg. F. A second test taken (July 23) in the same airway, when 500 tons of coal were mined, showed 5,120 cu.ft. of methane generated, per ton of coal mined, the methane being 1.27 per cent, barometric pressure 25.9 in., temperature 56 deg. F. In the first of these tests the volume of methane generated was 1,547 cu.ft. per min., and that in the second test 1,778 cu.ft. per min.

I will cite but one other instance along this line, namely, the two tests, p. 328, taken July 12 and Aug. 6, in the south level split of No. 3 mine, the coal mined being 200 tons and 220 tons, respectively. The first of these tests showed 7,704 cu.ft. of methane generated per ton of coal mined, the proportion of methane being 0.57 per cent, barometric pressure 26 in., temperature 59 deg. F. The second test showed the volume of methane generated as 3,888 cu.ft. per ton of coal mined, the amount of methane being 0.61 per cent, barometric pressure 26 in., temperature 58 deg. F. The gas generated in the first instance was 107 cu.ft. per min., and in the second instance 108 cu.ft. per min. These citations show that the production of methane does not depend entirely on the amount of coal displaced.

Interesting facts relating to the outflow of gas into the mine, as influenced by periods of idleness and periods when the mine was working normally. These facts were determined by the results obtained in an extended series of analyses of mine air carefully taken, at different times, and analyzed in the laboratory, under the direction of the Minister of Mines, and tabulated in his Annual Report for the year 1918.

\*Consulting Mining Engineer, Livingstone, Alberta, Canada.

Quoting from p. 320 of the report, the following statement is made:

In No. 1 South Mine there is an increase of 0.22 per cent in 21 days, with the mine idle and the same quantity of air passing, and a decrease is shown when the mine is operating again, during the first nine days, with the same quantity of air passing.

The report continues, p. 321:

From the results obtained it would appear that the breaking of coal has not much bearing on the gas flow in these mines, and from the results shown in the returns from samples taken every two hours, it is apparent that the conditions are not changed by the working of two shifts, the maximum raise at any time during the 24 hours being less than 0.3 per cent, while samples taken every half-hour, in No. 3 mine, showed a maximum raise of a little over 0.5 per cent.

There is no doubt that a single shift inaugurated in some of the Crownsnest Pass mines would have very beneficial results on the dust conditions, and in any mine beneficial results for the prevention of accidents due to other causes at the working faces.

This last statement will not meet with general approval, since it is quite commonly held that the more quickly a working face is advanced the more safely the work is performed, in respect to accidents due to falls of roof and coal.

Robert Strachan, senior inspector of mines for the East Kootenay district, in his report, p. 447, states, "Since the resumption of work after the idle time, it has been very hard to obtain a fair test made of the outflow of gas under the single-shift conditions," but adds, "It has at no time reached the height shown under the double-shift system." Mr. Strachan says further: "Twice during the year has methane been reported as found in the analyses, both cases being in the High Line split of No. 2 mine, Coal Creek, Sample No. 308 showing 0.13 per cent, and Sample No. 396, a trace, while in some cases of blowout we have recorded 84 per cent of methane and no trace of ethane."

In his second report on the No. 3 explosion at Coal Creek, George Wilkinson, chief inspector of mines, remarks as follows, p. 347:

Mr. Lane, who worked in the main level, stated in his evidence given at the inquest that on the morning of April 5, when he went in his place, there was a  $\frac{1}{2}$ -in. gas cap in it and this was gradually increased to 3 in., at the end of the shift. He also stated that this was no unusual condition, since the double shift was put on. (The double shift was put on to place the men thrown out of work by the "bump" in No. 1 East Mine last November.) He also admitted that Inspector O'Brien had withdrawn him, owing to there being a 1-in. cap of gas in the air. Lane, who is an old experienced miner, had worked for many years as a fireboss.

#### METHANE INCREASES WITH COAL BROKEN DOWN

This reference of the chief mine inspector, notwithstanding his previous conclusion to the contrary, p. 319, would seem to support the alleged claim of Inspector Strachan that a series of tests made in one of the mines showed that the production of methane increases and decreases directly as the work of breaking down the coal. The presence of the  $\frac{1}{2}$ -in. gas cap referred to in the Lane evidence was confirmed by the examination of the place by the district inspector, the morning of the explosion.

To understand better the situation regarding the explosion in the No. 3 mine, at Coal Creek, it is necessary to note the statement made in the chief inspector's second report of this explosion, page 348, where he states:

From evidence given at the inquest, it was brought out that almost continuously for 30 days there had been from a half to a three-quarter inch gas cap present in these places. At the time of the inquest it was taken [for granted] that a half-inch gas cap was equal to  $2\frac{1}{2}$  per cent of gas. From experiments made since in measuring flame caps and taking samples for analyses, and checking with the Burrell gas detector, it has been proven that a quarter-inch cap in the Wolf safety lamp is equivalent to  $2\frac{1}{2}$  per cent of gas, and that a one-half inch cap equals about  $3\frac{1}{2}$  per cent.

Following this statement, the chief inspector concludes that "If there was a three-quarter inch cap at the end of the morning shift, there must then have been upwards of 4 per cent in the current."

The chief inspector's report also shows, p. 348, that the district inspector had realized the danger of the double shift before the explosion occurred, and had suggested to the management "that only one shift of 8 hours out of the 24 be worked." This important suggestion of the chief inspector would appear to be ample justification for the adoption of the single-shift system, under the conditions stated. The suggestion is also supported by the senior district inspector and the officials of the Miners' Union, p. 319.

**Controversy regarding the danger of double-shifting the mines in the Crownsnest district hinged largely on the question as to whether the generation of gas, in the mine, increased with the amount of coal broken, as claimed by the Miners' Union. Statements of the senior inspector of mines and of the chief inspector, appearing in the report on the No. 3 mine explosion, Coal Creek, seem at variance with the conclusions of the chief inspector, who recommends a  $2\frac{1}{2}$  per cent withdrawal limit to be embodied in the Coal Mines Regulation Act.**

Referring to the explosion in No. 3 East Mine at Michel, Aug. 8, 1916, the senior inspector reiterates his opinion, p. 446, that the explosion originated in No. 17 room, No. 6 East Level, and was caused by the "ignition of gas at a defective lamp, the coal dust on the roadways and sides propagating it throughout the mine." He concludes his suggestion relating to mine accidents with the following statement, p. 448:

In dealing with these blowouts or "bumps," the greatest danger, now that electric lamps are in use, is the likelihood of the workmen getting overcome by gas and asphyxiated, and I should like to suggest that investigation be made along the lines of either solving the problems or providing mine-safety apparatus for each individual workman employed in suspected areas.

Regarding the procedure permitted where electric lamps are used by the miners, neither the chief nor the senior inspector mentions how a miner examines his working place, as required by the rules; or whether the miner has any knowledge of his place being clear of gas while at work. This is an important matter, as the number of electric lamps in use at the end of 1918, in the province, was 2,665, or over 61 per cent of the total number of lamps in use. It is a matter of regret that the inspector does not explain in what way the lamp that caused the explosion was defective, and whether the defect should not have been detected before the lamp was given to the miner.

Before closing allow me to quote a paragraph from the report of the chief inspector of mines, p. 337, which reads as follows:

From the evidence brought out at the inquest, in connection with explosion at No. 3 Mine, Coal Creek, and the subsequent tests made regarding the percentage of methane in the air cur-

rent, [and its relation] to height of flame cap on a safety lamp. It is apparent that some rule should be embodied in the "Coal Mines Regulation Act," compelling the withdrawal of men when the percentage reaches a fixed quantity. The limit set by the British Act is  $2\frac{1}{2}$  per cent. A rule has been established by the management of the Crowsnest Pass Mine, at the suggestion of the Mines Department, to the effect of establishing the withdrawal percentage at  $2\frac{1}{2}$  per cent or  $\frac{1}{4}$ -in. gas cap, but this rule should be embodied in the "Coal Mines Regulation Act."

It is with some satisfaction that I read this recommendation of the chief inspector, which follows up my own suggestion regarding the need of more exactly defining what is understood in the reports of "Gas" by firebosses, made in my own report on the Reserve Mine explosion of May 27, 1915, which report will be found on pp. 352-363 inclusive of the Annual Report of the Minister of Mines, 1915.

In transmitting my report to the Minister of Mines on that occasion, I inclosed a print of the card issued by the British Home Office, relating to the matter of reporting gas. Similar cards were issued by Sir Richard McBride, and the first of these were in the hands of the officials at Coal Creek as early as 1911; but no official ruling or alteration was made in the British Columbia Mines Regulation Act and, to the best of my knowledge, no provision of this nature is made in any act or rule to enforce its observance.

The chief inspector includes among his recommendations, p. 338, the request that there be placed a limit on the percentage of gas allowable in the mine air when blasting is permitted. It appears further that he is not satisfied with the "standardization of the ventilation in mines as to what an adequate amount of ventilation means" in the reading of the Coal Mines Regulation Act.

Mining men will quite generally agree that these are important matters and should be clearly defined so as to leave no room for doubt. Permit me to express the opinion that few will agree with the views of the chief inspector on standardization, if it is his meaning that the provisions of Rules 1 and 2, Part XI, of the Coal Mines Regulation Act, is not sufficiently explicit when they read as follows:

**RULE 1:** Every mine while being worked shall be thoroughly ventilated and furnished with an adequate supply of pure air to dilute and render harmless noxious gases to the intent that the working places of the shafts, levels, stables and workings of such mine, and the underground traveling roads to and from such working places shall be in a fit state for working and passing therein.

**RULE 2.** An adequate supply of pure air shall mean not less than 100 cu.ft. per min. for each man or boy, and not less than 300 cu.ft. per min. for each horse or mule employed in a mine, and as much more as the inspector of mines may direct, which shall sweep the face of each working place, and a notice stating the quantity of air required shall be kept posted at the mouth of the mine by the inspector of mines whenever he directs that more air should be furnished in a mine.

At the inquest, following the Mine No. 3 explosion, no one was found willing to justify the presence of gas, which was admitted to be in excess of the minimum ventilation required by Rule 2 to which I have referred. If this rule authorizes the inspector to require any amount of air that his judgment may dictate for the safe operation of the mine it does not appear to me that the rule requires any alteration. However, it has been the custom for many years, in British Columbia, to use the words "explosive gas," in making out a report, instead of the words used in the Mines Regulation Act, "inflammable gas."

That being the case, it may be claimed by the mine inspectors that the danger point is not reached until explosive gas is found. In concluding, allow me to state

that a Davy lamp will pass flame in about 11 sec., in an air current containing 4 per cent of methane and having a velocity of 6 ft. per sec., whenever there is coal dust in the air to the extent that this small velocity will raise the dust from the floor without artificial means being used to disturb it.

## Nottinghamshire Coal Fields

BY MARK MEREDITH  
Liverpool, Eng.

For some time boring operations have been in progress beyond the eastern border of the present known coal field in Nottinghamshire, England, with the object of proving, if possible, an extension of the valuable beds now being worked. This exploration and research work is being carried out entirely by private enterprise, the Butterley Co. and the Stanton Ironworks Co., Ltd., who own collieries nearby, taking a prominent part in this important undertaking.

An important discovery has now been made. The top hard bed has been reached at the boring at Boulton, about two miles east of Ollerton in the Dukeries. The bed is here nearly 2,000 ft. deep. The thickness of the seam is not known. Reference was made to the further development of the Nottinghamshire coal field at a meeting of the Midland Counties Institution of Engineers at the University College, Nottingham, on Nov. 22 last.

G. A. Longden, prior to reading a paper on "Recent Borings in the Nottingham Coal Fields," made reference to the absence of H. E. Mitton of the Butterley Co. He stated that Mr. Mitton was detained at the boring operations at Boulton, which place he himself had left to attend that meeting. The paper read by Mr. Longden contained notes on the strata which had been proved by the three borings carried out for the Stanton Ironworks Co., Ltd., at Kirklington, Nilsthorpe and Wellow. In the Kirklington boring, which was commenced on April 24, 1915, gas was given off at a depth of 1,911 ft., indicating the presence of a coal bed. At the Bilsthorpe boring, which is upon Lord Savile's property, it was found that the coal measures above the top hard bed were considerably less in thickness than they were at the adjoining colliery of Rufford. The bore hole at Wellow was the first to be made to the east of Bentinck and Kirkby collieries, where lower mines had been proved. This showed that three at least were good, workable beds extending over a large area where the top hard bed was being worked, thus providing an immense tonnage for the district.

A record was also given of the deep borings at Kelham and South Leverton. The Kelham boring, which was commenced in Sept., 1918, had determined beyond all doubt that the coal measures had ceased their easterly dip and were now rising. The successful results obtained by that historic boring had led to the further boring operations at Farnsfield, Kirklington, Bilsthorpe and Wellow.

The South Leverton boring was commenced in March, 1913, and had proved the whole ground down to the middle coal measures, and was probably within a short distance of the Barnsley coal bed. The outbreak of war in Aug., 1914, led to a stoppage of operations at this point, but these were about to be resumed again when it was expected to prove the extension of the productive coal measures to that point.

## NEW APPARATUS AND EQUIPMENT

### Single-Horn Car Feeder

A Mechanically Operated Device That Permits Only One Car At a Time to Enter the Cage

ONE of the new devices being manufactured by the G. M. J. Manufacturing Co. of Pittsburgh, Pa., is a single-horn car feeder. This apparatus is of simple but rugged construction. It depends for its operation entirely upon mechanical means and requires no over-seeing. Primarily the device is intended for use at shaft bottoms but may be used at a dump on the tippel, or wherever it is desired to feed one car at a time.

The principal parts include two horns, an actuating lever, the operating mechanism, and a tripper. The last named part is a lever with a section that fits into a recess in the rail. The distance from the tripper to the horn is arbitrary, and is determined by the length of the wheelbase of the mine cars in use. The apparatus in its entirety is securely bolted to a structural-steel base with dimensions of 5 ft. 8 in. x 5 ft. 2½ in. x 24 in.

The device is installed by making an excavation that will allow the base to be buried. It is then surrounded with concrete or masonry or suitably supported on the tippel or other structure. The rails then lie flush in line with and against the rails of the adjoining track. This type of construction prevents the device from

the actuating lever and forces it downward. This action is transmitted to the horns and they are forced outward and away from the rails. The obstruction against the front wheels of the incoming car has now been removed and it moves forward toward the cage. When the right front wheel reaches the tripper, this is depressed into the recessed rail causing the horns to again assume a vertical position. The horns are now in proper place to arrest the progress of the car directly behind, in which position they remain until the cage has been raised and again lowered, when the action described is repeated.

The horns are of solid steel and operate in bearing plates that lie flush with the rails. Coil springs absorb the shock resulting from the incoming cars striking the faces of the horns. The tread of the car wheels that lie against the horns is directly on and over the bearing plate of each horn. Any severe impact against the horns is thus transmitted from the wheels to the bearing plate. The mechanical advantage of this type of construction is manifest since the ends of the bearing plate near the car wheel are kept from working upward and becoming loose.

### Head Protection in Mines

A Hat Strong Enough To Stop a 1-lb. Bolt Falling 40 ft. and To Hold Up a Light Person

BY GEORGE J. YOUNG

Pacific Coast Representative of *Coal Age*

IT IS an interesting fact that outside of the Michigan Copper Mining district, head protection in mines is seldom thought of. The ordinary felt hat and cloth cap, it is true, afford a certain amount of protection to the wearer, but for falling rocks of any size, little can be expected from them. In Freiburg, when that district was active, German miners made use of a visorless cap, something like a polo cap. It was made with a thick felt top with felt of somewhat less thickness on the sides. While it afforded good head protection, it had the disadvantage of being hot and uncomfortable.

In Cornwall, England, the Cornish tin miners invented a hat, shaped like a low crowned derby, which was light enough to be handy and stiff enough to stop stones up to fist size. Wherever Cornish miners went, the "hard hat" was used in situations where any considerable amount of "rock fallings" took place in the workings. In the Michigan copper district, the use of the hat is common, but in other mining districts of the United States, it is seldom seen.

Conditions which necessitate head protection are not common in coal and metal mines, but occasionally in steep pitched coal seams and in steep-pitched open stopes where small rocks or tools can fall, considerable distances and acquire sufficient momentum to become

SUBSTANTIAL MOUNTING MAKES THE FEEDER RIGID. The horns are opened by the descending cage and close when it leaves the landing.

creeping forward toward the shaft bottom or dump which might ordinarily be brought about by too great a pressure against the horns opposing the force of the incoming cars. A grade of 5 per cent should be given to the track adjoining the apparatus in order that ease of operation may be assured against stiff-running cars.

When the device has been installed at the landing stage of a shaft bottom, the downcoming cage strikes

dangerous, some kind of a protective hat is highly desirable. The latest effort to meet this need is a miner's cap made by the Wagner's Protective Cap Co.\* The cap weighs 7 oz. It is stiff enough to permit of a light person standing upon it. A machine bolt weighing a pound and falling from a height of 40 ft., is said to scarcely dent it. It is as light and comfortable as such caps can be made while the visor affords protection to the eyes. The cap is also said to be a nonconductor of heat and electricity. It is waterproof and will resist sulphuric acid. It would appear that the manufacturers of this cap have succeeded in incorporating into their design practically all the essential requirements save the one of cost. The price at which this hat is marketed, cheap enough when considered from the standpoint of safety, is so high that it is doubtful whether miners will purchase it.

For working in mines generally, in shafts, in the construction of buildings, the type of hat described appears to be worthy of consideration. Its use is advocated for superintendents, engineers, foremen, surveyors, headmen and footmen, pumpmen and miners.

## Automatic Battery-Charging Equipment for Locomotives

This Device Renders Attendance at the Charging Station Almost Negligible

FOR the automatic charging of mine locomotives having Edison storage batteries the new C-H charging panel shown in the accompanying illustration has been designed by the Cutler-Hammer Manufacturing

Front View of Charging Equipment

The switchboard is supported well above the floor and protected from mine drippings by a suitable gable roof.

Co., of Milwaukee and New York. This may be connected to a 250- to 275-volt direct current circuit since this is the potential available at most mines. The

equipment consists of a slate panel supported by a floor-type mounting frame having the charging resistance self-contained. A sheet-metal roof protects the charging resistance and the magnetic switches on the panel from mine drippings. The switch equipment on the front of the panel consists of a main-line knife switch with renewable fuses, magnetic main-line contactor, voltage relay and shunt trip relay.

The main-line contactor, which connects and disconnects the battery from the line, is controlled through the voltage relay and the shunt trip relay. The former prevents it from closing unless the line voltage is of sufficient value for charging, and causes it to open if the power fails or the line-voltage drops below a predetermined value, thereby guarding against the batteries discharging back into the line. On restoration of the current after a power failure the main-line contactor automatically recloses, and the charge is continued.

The shunt trip relay is connected to the ampere-hour meter on the locomotive and when the battery is fully charged the ampere-hour meter will energize the relay which, in turn, causes the main-line contactor to open and disconnect the battery from the line. This relay also opens the contactor should the line-voltage become too high. Thus the voltage and shunt trip relays permit charging only when normal conditions prevail on the line, that is, the supply voltage must lie between the limits for which the two relays are set.

## Authority to Demand Monthly Coal Reports Challenged

National Coal Association Seeks Injunction Against Federal Trade Commission

AUTHORITY of the Federal Trade Commission to demand coal-mining companies to make the monthly reports now being required has been challenged by the National Coal Association. An injunction has been asked in the Supreme Court of the District of Columbia. The suit is brought in the name of the Maynard Coal Co. and it is contended that the commission exceeds its authority in requiring coal-mining companies to file monthly reports showing costs, income and tonnage, and an annual report of financial condition.

It also is contended that if the act be construed as vesting authority in the commission to require these reports, the act itself must be held unconstitutional as being beyond the power of congress to grant such authority under the constitution. The bill of complaint also states that any power that was vested in the Federal Trade Commission to require such reports was transferred to the Fuel Administration by the President's executive order of July 3, 1918.

Before filing the suit officials of the National Coal Association conferred with members of the Federal Trade Commission. The commission recognizes that the suit was brought in a friendly spirit so that the courts may pass upon the fundamental questions of law involved. It is believed that the commission itself is not unwilling to have these questions determined by the courts.

Rush C. Butler, of Chicago, will direct the legal battle. In addition to members of his firm, Frank E. Harkness, former solicitor for the U. S. Fuel Administration, and Karl D. Loos have been engaged to assist in the handling of this and other cases which will be filed.

# Alternative Propulsion Fuels Widely Sought in Britain\*

Oil Fuel Is Already Replacing Coal to a Large Extent in Trans-Atlantic Liners—Its Use for Inland Transport and Industry Is Being Developed—Other Alternative Fuels Are Suggested

COAL shortage, resulting from strikes and shortened hours of labor in Great Britain, is leading to more intensified efforts to find substitutes for propulsion fuels so that the country's industries can be maintained. A development of considerable interest in this direction may lie in the application of pulverized fuel to railroad locomotives. Trials of this form of fuel have already been made in the United States, Sweden and Brazil, and locomotives also have been built for the Great Central R.R. which are adapted for this type of fuel. A further development is now projected in the application of colloidal fuel, which is a mixture of powdered fuel suspended in heavy oil. Oil, however, continues to be the most important fuel, and an active research is going on for all sources of oil production in Great Britain, under schemes approved and financed by the Government. Nor are foreign fields being neglected.

An earnest attempt appears to be under way to remedy Britain's dependence on other parts of the world for supplies of oil. In Mesopotamia, for instance, important developments are reported to be under the serious consideration of the Government in connection with the granting of oil concessions to such companies as the Anglo-Persian, its subsidiary the Burmah Oil Co., and the Shell Combine. No definite steps, however, can be taken there until the ratification of the Treaty of Peace with Turkey.

In the meantime, interest in oil research in the British Isles themselves shows no signs of slackening. Geological reports from Scotland are not of a favorable character, but in England a colliery at Retford, which has given indications of oil reserves, is about to be tried and developed on the same lines as the wells at Hardstoft, from which a steady, if small, supply of oil has been forthcoming since operations first started after the armistice.

The most promising indications in the line of oil fuel in Britain, however, come from the discoveries of oil shales in enormous quantities in Norfolk. These quantities are estimated at 2,000,000,000 tons, so that the development of a large British industry in that centre is confidently anticipated, as the prospects reported indicate yields of 30 to 60 gal. per ton. A seam of shale 11 ft. thick has been cut on property of English

Oilfields, Ltd. It has given over 90 gal. of oil per ton of shale, or about four times the quantity obtained from Scottish shales.

In spite of these encouraging signs, British industries will remain for a long time dependent on foreign supplies of oil. A heavy demand continues for oil tankers of 20,000 tons capacity, such as are being constructed in America.

Of interest in this connection are the large works in course of construction at Swansea, by the Anglo-Persian Oil Co., for the refining of imported crude oil.

From Liverpool also comes the report that the Mersey Docks and Harbor Board have decided to spend half a

million sterling in the acquisition of the Dingle Bank Estate, where they propose to have installations erected to supply oil fuel to vessels. It is intended to prepare an oil distributing centre on a large scale, 20 acres of land having been set aside for this purpose.

This step is, of course, the outcome of a great development of oil fuel for shipping purposes. Five leading oil companies, including the Anglo-American, will participate, and they are starting without delay the erection of huge storage tanks designed to provide a capacity for many millions of gallons. Having in mind that oil is destined to play an important part in the industrial development of Great Britain, the Mersey Board proposes to link up the projected oil installations with the Liverpool railroad, so that tank wagons may be loaded on the spot for transport to inland centers.

The French Government is understood to have sanctioned the construction of a double-pipe line for oil between Havre and Paris, a distance of about 150 miles. One of the pipe lines, with an internal diameter of 10 in., is to be used for heavy fuel oils, and above it, the Chamber learns, will be a smaller pipe line of 4 in. for petroleum and motor spirit.

It is anticipated that 4,500 tons of heavy, and 1,000 tons of light oils and spirit can be pumped through those lines daily, thus materially lightening the difficulty of supplying Paris with coal by facilitating the use of heavy oils in its place. It is hoped to complete the lines in time for next winter.

The construction work, the Chamber is advised, will be carried out by a French company—the Compagnie Française des Mazouts et Petroles—which will also build a wharf at Havre for vessels bringing the oil, erect reservoirs with a total capacity of 60,000 tons, and provide pumping stations, etc. The estimated cost is

Pulverized coal and colloidal fuel are being considered. Search is being made for oil. Oil shales, some of which yield 90 gal. per ton, are being tested. Further arrangements are being made in Great Britain to store oil for vessels and in France to pipe fuel oil and gasoline from Havre to Paris. Use of steam, gasoline and producer-gas as propellants for motor trucks compared.

\*From *Anglo-American Trade*. With exchange at \$3.655, a penny is equal to 1.523c., a shilling is equal to 18.27c., whereas at normal exchange a penny is equal to 2.029c. and a shilling is equal to 24.35c.

about three millions sterling at the normal rate of exchange.

An adequate and cheap supply of fuel being essential to the development of Britain's expanding motor industry, a great deal of attention is being devoted to finding a suitable substitute for petrol, the price of which is now 2s. 10½d. a gallon, to which a further increase of 8d. per gallon has been made. In 1919 the United States automobile output totalled 2,000,000 cars, which alone absorbed an oil consumption of 400 million gallons, and although between 60 and 70 per cent of the world supply of oil comes from the United States, no marked increase of yield there is reported.

Economy in the use of oil has been tried, but the one effective method of economizing would seem to be to run heavy cars on solid fuels. This is where the producer-gas motors are likely to receive favorable consideration. It is known that except in the case of an-

thracite all the solid fuels now in use involve a loss of byproducts.

D. J. Smith, of the Institute of Automobile Engineers, has been giving careful consideration to this problem, and is believed to have evolved a design which opens up new and wide possibilities in motor traction. In his opinion one ton of coal should propel a 5-ton steam-driven wagon 160 miles, whereas if subjected to distillation it would produce 13,000 cu.ft. of gas, of which 250 cu.ft. (the equivalent of one gallon of petrol) would propel a 5-ton wagon equipped with an internal combustion engine 312 miles. In making a comparative analysis of the cost of moving the same vehicle by steam, petrol, and producer gas, Mr. Smith works out a proportional cost which stands at 1s. 6d., 3s., and 2s. 8d. respectively, taking as bases for estimate coal at 50s. a ton, petrol at 3s. a gallon, and coke at 55s. a ton.

## What Changes I Would Like to See in McAuliffe's Plan

Wants Inquiries Directed by Individual Effort Under Bureau of Mines—Would Have Differential Periods Shorter and More Numerous

BY M. L. O'NEALE  
Gouverneur, N. Y.

I WAS much interested in reading, in your issue of March 11, the paper by Eugene McAuliffe, entitled "Stabilization of the Bituminous Coal Industry," which was delivered before the February meeting of the Institute of Mining & Metallurgical Engineers in New York. I have not devoted sufficient time to this subject to justify a criticism of this estimable paper. However, one or two features of the remedies suggested struck me as possible of improvement. First, as regards the appointment of a General Coal Commission of seven members with a term of office of seven years, this commission to be largely a statistical and fact-gathering organization: This commission, according to the plan outlined, would be neither a judicial nor legislative body, and for that reason I see no object in dividing its authority and directive force between seven men. Concentration of this authority in one man, in my opinion, would better fix responsibility, secure better results and cost less in operation. This concentrated authority would lend itself to a division of duties among subordinates, each charged to collect data in a particular field of endeavor and responsible for its work in that field.

A publicity department would make known such facts and conclusions as the department head should deem advisable. This entire organization should be a part of the Bureau of Mines, and not a loose end dangling from the already overworked presidential hand.

Unfortunately in some respects and fortunately in others, the coal resources of this country are so enormous that it is difficult, if not impossible, to hold the developed capacity of the mines within reason, particularly when bankers, lawyers, merchants, and others unfamiliar with the game are all too ready to put money

into the development of a new property. An engineer may make the most accurate report on the cost of development of a coal property, figure out the mining cost in detail, give the prevailing selling price of this coal and the estimated profit per ton, but what avails all this if the market will not take care of this production, or if the railroad cannot

**Being merely an advisory body and not judicial or legislative, a head with subordinates would give better results than a council of seven. Such a plan would be less expensive and more productive of result. Seasonal freights with only two differentials annually would bulk purchases at, or near, the date at which the change in rate is made.**

furnish sufficient equipment, or if the labor market is already overbought, any or all of these factors resulting in running part time or at reduced capacity? If this commission could only keep capital and the public warned of the pitfalls in the coal industry, it would do a great service in tending to discourage the opening up of new mines with consequent overproduction.

The second feature of Mr. McAuliffe's treatise I would like to discuss is his plan of seasonal freight rates. With some modifications, I think this the most practical way yet evolved to reduce the seasonal fluctuations in demand. Of course any change of this kind, which alters the competitive status of established industries, is bound to hurt some and benefit others, no matter how fairly designed. A uniform percentage increase

or decrease of freight rates has the same effect. Some will gain and some will lose. Some will favor and some will oppose. The problem is one of the greatest good to the greatest number. The industry whose coal cost is small relative to the total cost of its product, may, by the very reason of its small coal consumption, be able to gain the benefit of storing coal in summer, the physical problem of storing and the capital tied up being relatively small matters, while another industry, whose coal bill is a large percentage of the cost of its product, would not be able to spare the capital or find the room for storing sufficient coal to be of material benefit. Thus we have on the one hand an industry saving a percentage of a small cost item, and on the other an industry saving nothing on a large cost item. However, there may be enough of the first kind to somewhat equalize the seasonal demand, which is the object sought, industries adjusting themselves to the new conditions just as they do when freight tariffs are changed, or when import duties are revised, or when there is a change in any other of the many factors affecting a particular line of business.

I think, then, that seasonal changes in freight rates on coal is a step in the right direction. However, I am of the opinion that the plan proposed by Mr. McAuliffe may be bettered. He divides the year into two periods, March 1 to Aug. 31 inclusive, and Sept. 1 to Feb. 28 inclusive. It is highly improbable that industries would store coal in March, paying the same price that they would pay for the same coal in August, so that the tendency would be toward a weak demand in the spring and a heavy demand the latter part of the summer, resulting in the same congestion and crippling of railroad service that we now have in the

winter. My idea would be to maintain the regular rates on coal in the spring and fall, with a 15 per cent higher rate in the winter and a 15 per cent reduction in summer. The rates then would stand in percentages thus:

January .....	115	July .....	85
February .....	115	August .....	85
March .....	100	September .....	100
April .....	100	October .....	100
May .....	100	November .....	100
June .....	85	December .....	115

The working of a seasonal-rate plant of whatever kind presupposes that the coal operator will charge substantially the same price for his product at the mine the year round, the transportation cost being the variable, this obviously being much easier of accomplishment than a seasonal schedule of prices at the mine under the scattered and disorganized state of the bituminous industry. The largest and most substantial operators would doubtless maintain this uniform price, but there would be nothing to prevent the advantage of a lower freight rate in summer being nullified by the price at the mine being raised at this season, which conceivably might be done, particularly if a strike or other contingency in the winter or early spring forced an unusual demand in the summer. For this reason also I think the rate changes should be at three-months intervals, as suggested above, rather than at six-months, as suggested by Mr. McAuliffe. The very inertia of the market would act as a stabilizer over the shorter period of three months, when it might not be effective over the longer period of six months.

This subject should bring forth more comments from your readers. Through discussion the best ideas can be presented for consideration and thereby the matter may be kept in the foreground ready for suitable action.

## Precautions To Be Taken Against Lightning Where Shot-Firing Systems Are Used

An Inductive Charge of the Wire Will Do Little Harm if a Gap Is Provided, but,  
if the Wire Is Struck by Lightning, Accidental Discharge  
of Explosive May Be Apprehended

BY GEORGE S. RICE AND L. C. ILSLEY

A REMARKABLE explosion of firedamp caused by a discharge of lightning at the new shaft at the Sitalpur coal mine has been reported by the Chief Inspector of Mines of India, who gave the following details:

"The explosion occurred during a thunderstorm, and the evidence showed that a flash of lightning had, to all appearances, passed down the shaft, causing disruptive discharges at certain points between the guides and the winding rope, rending the latter at two places situated respectively 228 ft. and 278 ft. from the surface. The distance between the winding rope and the side of the shaft was 5 ft. 4 in., indicating a spark gap of this width, and an intensity of discharge which could not fail to ignite the explosive mixture of gas and air known to be present in the shaft."

\*Article entitled "Electric Sparking in Mines from Lightning" in *Monthly Reports of Investigations*, by U. S. Bureau of Mines.

*Compressed Air Magazine*, January 1920 issue, which contained the above extract, also goes on to state:

"In 1915 M. Ferey described phenomena of a similar character to the above in a paper read before the Société de l'Industrie Minérale. In a pit liable to sudden outbursts of gas, for the sake of safety shots were fired from the surface. In regard to this pit we read in the *Colliery Guardian*, of London, that during a storm in the year 1905 shots went off in two places after the detonators had been connected to the conductors.

These shots were situated respectively 1,400 and 1,410 m. from the firing station. Realizing the possible danger from this cause, the precaution was taken to cut the conductors at the bottom of the shaft and to connect them just before firing. Even under these conditions a shot went off spontaneously, owing, it is believed, to lightning."

The Bureau of Mines, when it was investigating shot-

firing from the surface some years ago, found a number of cases where lightning had passed underground. In one case, in a shallow mine in Pennsylvania, lightning entered, following the roots of a tree, and caused the death of a man in the main entry. In another case, in the Pratt City mine which came under the observation of the Chief Mining Engineer, lightning entering on shot-firing wires caused premature ignition. This led to the recommendation of making a gap of about 5 ft. in the shot-firing line, which was not to be closed by the flexible cable until the men had all been withdrawn from the mine.

Another case reported was that of a mine, temporarily abandoned, belonging to the United States Coal and Coke Co. at Gary, W. Va., where an explosion occurred following a flash of lightning which evidently entered the shaft and ignited the firedamp.

#### LIGHTNING ARRESTERS ARE NOT SUFFICIENT

A system by which lightning will be prevented from entering the mines is difficult to arrange, especially in mines where electric shot firing is practised on an extensive scale. Ordinary types of lightning arresters are satisfactory protection against static electric currents produced by lightning discharges, but if a "lightning bolt" actually hits the circuit, there is such an enormous amount of energy to be dissipated that the ordinary devices do not suffice.

Following out the same reasoning, a gap of sufficient length to afford protection for static electric discharges resulting from electric storms would not necessarily be a proper protection if the circuit were hit by a "lightning bolt" and consequently received the full energy of the lightning discharge. There would seem to be need of still greater precautions than are suggested in the following paragraph from Technical Paper 108, Bureau of Mines:

"A suitable gap may be provided by inserting in each side of the circuit, near the bottom of the shaft or the slope, or about 100 ft. inbye from the mouth of the drift, a flexible conductor about 6 ft. long. Each of these conductors can be permanently joined to the end of the solid incoming conductors and the other end of each flexible conductor can be provided with a lug for fastening to one of a pair of screw studs in which the outgoing solid conductors should terminate. A similar pair of dummy studs should be installed 6 ft. distant from the live studs so as to provide a place for fastening the flexible conductors out of circuit. The dummy studs should be provided with a locked clamp or similar device for locking the flexible conductors out of circuit."

#### DISCHARGE MAY BE PREVENTED FROM JUMPING GAPS

It might be feasible to so arrange a firing circuit that the incoming lines could be connected to a high resistance ground at the same time a gap was made in the circuit. Such a ground would tend to dissipate extraordinary discharges and to prevent such discharges from bridging or jumping the gap in the firing lines.

Again, it might be possible to so arrange the ground, the gap and the direction of the incoming and outgoing shot firing lines with reference to the gap that the direction of the circuit to the ground would be a straight line, while the direction of the circuit through the outgoing lines through the gap made a right-angled turn. Since lightning tends to follow straight lines, this arrangement would probably be an added safeguard.

Finally, care should be taken that all metallic circuits, such as pipe lines of other power circuits entering the mine, be kept at a proper distance from shot-firing lines in order that they would not serve as possible paths for lightning discharge. If such precautions are not taken it is conceivable that a lightning discharge in a mine through a metallic circuit which is close to a shot-firing line may be partly communicated to the shot-firing lines at a point beyond the lightning gap.

It is thus evident that there are many things to consider in protecting outside shot-firing systems from lightning discharges, especially if the discharge actually hits a metallic circuit entering the mine.

## Claims of Italians for Losses at "Ludlow Massacre" Rejected

### Committee Holds That Remuneration Would Place Premium on Disloyalty

AT THE request of Governor Shoup, a committee was named by the last legislature to make investigations into the claims of the Italian Government because of losses to its citizens during the strike which prevailed in the Colorado coal fields during 1912-14 and particularly for the loss of life and property at the so-called "Ludlow Massacre."

The report of the committee filed with the Governor on March 5, rejecting the claim of the Italian Government and setting forth a brief of the testimony, states in conclusion: "This committee believes that to encourage, by remuneration, any citizen of any country to take up arms against the state or to pay those who lost because they took up arms against constituted authority would be to strike at the very foundation of our government and to undermine both the State and Federal Constitutions.

"From its investigations, conducted with an open and unbiased mind, and from all the evidence submitted, this committee is unanimously of the opinion that whatever loss these claimants sustained was the result of an attack on the State; that each one of the claims is unfounded and should be definitely rejected. Should payment be made on any such claims it would be nothing more or less than placing a premium upon disloyalty, rebellion and treason."

**Mine Safety Measures in Iowa.**—"It is a matter of common knowledge, as is illustrated in nearly every mining case coming before the courts of this state, that the organization and duties of workmen in coal mines are to a very great extent defined by customs and rules which are the outgrowth of long experience, and have come to be recognized and observed as the law of the mine by both miners and operators.

"Among them none is better established than that which, while requiring the miner to prop or otherwise protect the roof of his own room or other place where by his own excavation he is removing the natural support of the overlying rock, imposes upon the owner or operator the duty to make reasonably safe the entries by which communication between the shaft and the various rooms is maintained and passage is afforded for miners and laborers moving from place to place in discharge of the tasks assigned to them." (*Iowa Supreme Court, Owens vs. Norwood-White Coal Co., 174 Northwestern Reporter, 851.*)

# New Electrically-Driven Hoisting Equipment at Kilton Collieries

A Cylindro-Conical Drum Hoist, Driven Through a Flexible Coupling and Back Gears by an Alternating-Current Motor and Giving a Rope Speed of 1,300 Ft., Was Installed at an English Colliery During a Week End

BY M. MEREDITH  
Liverpool, England

RECENTLY there has been put to work at Kilton Collieries, an interesting example of an electric hoist, representing the latest practice in geared alternating current hoisting equipment in Great Britain. The hoist has been designed to suit the following conditions:

Depth of shaft	720 ft.	Turns on small	
Net load (rock)	3.5 tons	diam. ....	6 (three dead)
Weight of cage		Turns on scroll	4
and chains	3 tons	Turns on large	
Decks per cage	1	diameter ....	9.7
Cars per cage	2	Drum speed	27.6 r.p.m.
Weight of one		Rope	4½ in. circumference
car	0.65 ton	Maximum rope	
Output per hour	180 tons (iron stone)	speed	1300 ft. per min.
Time of hoisting	45 sec.	Motor rating	370 hp.
Discharge		Motor peak load	440 hp.
interval	15 sec.	Motor speed	255 r.p.m.
Total time of		Ratio of gearing	9.25 to 1
each hoist	60 sec.	Supply	3 ph., 2750 v., 40 cy.
Drum, cylindro-		Auxiliaries	3 ph., 440 v., 40 cy.
conical	11 ft. to 15 ft. dia.		

The hoist was built to replace a beam-type engine with overhead drum, which, although somewhat expensive to run as regards steam consumption, was on the whole free from costly repairs. Lately, however, this engine developed defects, and its replacement became increasingly urgent. It was imperative that the steam hoist should remain on duty until the last pos-

sible moment, and that the change-over should take place during a week-end.

FRONT VIEW OF ELECTRIC HOISTING ENGINE

Power is transmitted to the hoist through a flexible coupling and an enclosed herringbone pinion and gear that dips into oil.

sible moment, and that the change-over should take place during a week-end.

This was successfully accomplished, and the electric hoist started work promptly on Monday morning without any hitch. The new hoist house is built (relative to the head gear) immediately behind the old engine house; this incidentally resulted in the distance between the head sheaves and drum being increased in the rope

plane, thus favorably affecting the angling of the ropes. By this arrangement of buildings, the rapid transference of the ropes to the new drum, and the clearing of a way for them through the upper part of the old engine house were greatly facilitated, while at the same time no alterations whatever to the head sheaves were necessary. The new hoist house is constructed of reinforced concrete, with ample accommodation for the machinery, and adequate floor space has been allowed. Daylight is freely admitted from windows of large area. As a result, inspection of all machine parts may be easily made and perfect cleanliness is insured.

## DOUBLE HELICAL GEARS DIP INTO OIL

The induction motor is geared to the drum shaft, the driving pinion being mounted on an extension shaft supported by two bearings, the connection to the latter shaft being made through a flexible coupling of the "pin" type. The gearing is of the double helical variety, and is mounted in a dust-tight gear box where the main gear dips into an oil bath. This wheel, which is about 10 ft. in diameter, is split in halves for the purpose of facilitating its erection and also its removal from the drum shaft should this ever be necessary.

In order that high peaks may be eradicated and the hoist cycle equalized to a considerable extent, a cylindro-conical drum was designed and installed. It is perhaps unnecessary to point out that the shorter the landing period can be made, the more efficient becomes the hoisting cycle. The discharge period in this case is 15 sec. Further equalization is not called for in this case, especially as the power company has installed within a short distance of this particular colliery a synchronous motor for correction of the power factor in the district. The drum brakes are operated by means of a compressed air engine that raises or lowers the main-brake lever, which is of the usual weighted type.

In the event of the operation of any emergency trips—for instance, when an overwind occurs—a solenoid-released trigger causes the main brakes to go into the "on" position immediately. The interlocks are such that the brakes remain in this position until the emergency condition is rectified or restored to normal and the power put on again.

The air compressor for the brake engines is of the two-stage type driven by a 10-hp. motor. It is supplied with energy from a 3-phase, 440-volt auxiliary transformer, which also supplies the solenoid and controller-pump motor. The hoistman's platform is placed at such a height as to give the operator a clear view of all the machinery under his care, a condition which is perhaps too often overlooked. The motor is

controlled by a liquid controller of the weir type, fitted with oil-immersed reversing switches.

During the time the controller is in circuit, a continuous flow of electrolyte is pumped into the upper tank, returning over the sluice gate into the lower tank. The movement of the operating lever throws the reversing switch in one direction or the other, according to the direction of rotation, and at the same time raises the sluice gate. This causes the level of the liquid in the upper tank to be raised, and consequently the resistance between the electrodes to be decreased. When the operating lever is returned to the "off" position, the sluice gate is lowered again and the level of the resistance liquid is also lowered, this increasing the resistance in the rotor circuit. Just before reaching the "off" position, the primary circuit is opened on the reversing switch.

When it is desired to run at a slow speed, the sluice gate is lowered to an intermediate position only thus increasing the resistance as found necessary. Owing to the fact that the resistance liquid cannot follow the raised sluice gate faster than the pump can deliver the liquid into the upper tank, a certain minimum accelerating period of the motor must be adhered to, although it is possible to obtain a longer acceleration period. The duration of the acceleration period is adjustable within limits by means of a stop-valve in the delivery pipe of the pump.

When hoisting men, it is often necessary to adopt a different rate of acceleration than when raising stone, and the necessary adjustment may be quickly effected. The reversing oil switches are fitted with safety interlocks, which are so arranged that the oil containers cannot be removed without tripping the main oil switch.

#### OVERSPEEDING IS PREVENTED

An electric overspeed-preventer device has been fitted to this machine. In this case this device consists of a direct-current series-wound generator, chain-driven from the motor extension shaft, and arranged to deliver its output through a bank of resistances, a relay, and an ammeter. These resistances are inserted into the generator circuit in a number of equal steps, each of which corresponds definitely to a certain number of completed turns or fractions of turns of the main drum during acceleration.

The resistance inserted will only maintain the current in the small series-generator circuit constant up to full speed, provided the generator speed or drum speed rises at a definite set rate. Put in another way, the drum speed as taken at short intervals must only reach certain values relative to the position of the rheostat. Should it exceed these, the resistance previously inserted would be insufficient to keep the current through the relay within safe limits.

In such a case the result would be that owing to too high a rate of acceleration having been permitted, the relay would trip the main oil breaker, and the equipment would be temporarily shut down. Similarly, when approaching the end of the hoist, the operator must not neglect to slow down his machine at the point for which the device is set, otherwise the resistances will be cut out more rapidly than the generator speed and voltage drop, which would cause the excess current to open the breaker.

It is therefore obvious that a hoist fitted with this device must always be driven in such a manner as will

insure the maximum of safety, the hoistman being compelled to follow a definite accelerating and decelerating curve within safe limits. The governing device acts as an efficient overspeed preventer during the constant full-speed running time of the hoist, and also

REAR VIEW OF MOTOR AND HOIST

This 370-hp., 3-phase, 40-cycle, 2,750-volt, British Westinghouse motor operates at 255 r.p.m. Suitable control devices are of course installed.

in the case of a loaded cage being lowered on the brakes only, and beyond "safe" speed.

The overwind switch is of the friction-driven type, being fitted with a flexible steel-rope drive working in a grooved pulley mounted on the switch spindle. The rope is attached to a lever which is struck, when an overwind occurs, by tappets provided for that purpose on the depth indicator. The flexible cord pulls the switch open and shuts down the hoist, but as the drive on the grooved pulley is by friction only, the switch may be reset quickly by hand, the rope slipping in the groove to permit this. It will therefore be perceived that should the hoist be started in the wrong direction following an overwind no risk is incurred, as the switch will always shut the machine down before the cage has moved one foot upward.

**Existence of Employment Relation—Status of Certified Mine Foreman.**—If a company chartered to mine coal and produce salt transferred the coal-mining business to its president and general manager for his own account, but that fact was not disclosed to employees, who were thereby induced to believe that they were working for the company, being employed and paid under the same conditions as the company's men engaged in the work of producing salt, an employee injured in the mining operations is entitled to hold the corporation liable on proving negligence toward him producing the accident.

A mine foreman who, in addition to his statutory duties, and by authority of the operator, employs and discharges miners and has general charge of the mining operations, is to that extent the representative of the operator, rendering the latter liable for injury to a miner resulting from a negligent order given by the foreman to throw a switch, thereby causing a train of empty coal cars to be diverted into a side entry and to strike a miner who, ignorant of the danger and obedient to a prior direction by the foreman, was shoving a loaded car from his place of work onto the siding. (*West Virginia Supreme Court of Appeals, Ward vs. Liverpool Salt & Coal Co., 92 Southeastern Reporter, 92.*)

# Is the Health of Mine Workers Adversely Affected by Mine Conditions?

Mine Workers, if Anything, Enjoy Better Health Than Other People—Tuberculosis Does Not Seem as Prevalent Among Them as Among Other Workers—Nystagmus Is Apparently Unknown in Illinois, Where Investigation Has Been Made

BY C. L. GREEN  
Fairmont, W. Va.

CASUAL observers would be fully justified in pronouncing the occupation of coal mining one liable to affect adversely in a marked degree the health of the workers engaged in it. The miner works underground, shut off from the light of the sun, in places that are often damp or even wet, and in an atmosphere impregnated with coal dust. Every condition would seem to favor the growth, if not the propagation, of tubercular germs, and the promotion at least of respiratory diseases such as asthma, bronchitis, etc.

That things are not always what they seem is clearly illustrated by the facts relative to the health of the mine worker, which facts have been proved by surveys, examinations and the close observation of mine workers by medical practitioners and specialists.

During the anthracite coal strike in Pennsylvania in 1902 the question of the miners' health was raised, and a health survey of that region and of a central Pennsylvania farming region was conducted. It was found, according to Prof. H. H. Stoek, that tuberculosis was far less prevalent in coal-mining sections than in farming communities.

In "Preventative Medicine and Hygiene," by M. J. Rosenan, professor of preventative medicine and hygiene, Harvard University, that authority says: "De Crocq speaks of the rarity of tuberculosis among Belgian coal miners. Arnold reports that in Germany tubercular diseases are rare among such men and that there is a prevailing opinion that anthracosis is antagonistic to tuberculosis. Goldman attributed the freedom of the coal miner from tuberculosis to an antiseptic action of the coal dust."

In "Occupational Diseases," by W. G. Thompson, professor of medicine, Cornell University Medical College, we find the statement: "Coal miners are fairly healthy workmen, despite the large quantities of dust inhaled, and are found to be less susceptible to diseases of the lungs in general than many other classes of workmen, provided they do not drink heavily. In fact, among the coal miners of England and Wales, the mortality from these diseases is actually less by one-fifth than the mortality among males of all other classes in general."

Professor A. C. Callen, professor of mining engineering, West Virginia University, College of Engineering, tells us: "Miners' nystagmus seems to be a common dis-

ease among coal miners abroad, as may be readily inferred by a study of various bulletins published on the subject. The consensus of opinion is that in the United States it is very rare. For example, Lane and Ellis, in their report on behalf of the Illinois Commission on Occupational Diseases, January, 1911, say: 'Of the

30,194 pick miners in Illinois, we examined the eyes of about 5,000, or one-sixth of the entire number, without finding a single case.'

George S. Rice, in U. S. Bureau of Mines Bulletin 132, tells us: "However, as to the effect of coal dust upon the lungs, two opposite opinions are held—one that the dust is not only harmless, but even conducive, to health, and the

other that it is a danger to health. These discordant opinions are due to the fact that some workers are exposed to the inhalation of pure coal dust and others to the inhalation of shale dust with the coal dust, and frequently shale dust contains much free silica."

Here we have a number of well-known authorities agreeing almost unanimously that the inhalation of coal dust is not to be regarded as a menace to health. "These are opinions only," the reader may say. Let us, therefore, examine certain surveys that have been made by insurance companies which throw light upon the effects of the coal-mining industry upon the health of mine workers, as compared with the effects of other occupations and callings upon workers engaged in them.

Insurance companies made these surveys for business reasons, and upon the results of the surveys are based the rates for insurance. Being of greatest importance from a business point of view, it is reasonable to suppose that every means available is utilized to make the surveys accurate, and we are therefore justified in accepting them as records of facts.

The Metropolitan Life Insurance Co.'s survey of 579,197 white persons of both sexes and all ages over one year discloses that sickness so serious as to be disabling affects an average of 188 persons in every 10,000. This same survey showed sickness from tuberculosis among these 579,197 persons to be 7.5 persons per 10,000. Statistics which follow show a rate of sickness of 173.6 per 10,000 for bituminous miners and a rate of 140.6 per 10,000 for anthracite miners (accidents not included), and for tuberculosis cases a rate of 6.5 per 10,000 persons.

Where 188 in every 10,000 persons of divers occupations were found ill of diseases only 173.6 per 10,000 bituminous mine workers were ill from such causes and only 140.6 per 10,000 anthracite mine workers were likewise incapacitated. The general sickness from tuberculosis ran 7.5 per 10,000 while the bituminous and anthracite sickness ran 11.6 and 4.3 per 10,000 respectively.

A sickness survey was made in March, 1917, by the Metropolitan Life Insurance Co. in Pennsylvania and West Virginian cities adjacent to the mining areas. The workmen in those cities were engaged in widely diverse industries. The survey compares the health of these men with that of coal miners.

Two main coal-mining areas were reached by the survey—anthracite and bituminous, the former located in northeastern Pennsylvania and the latter in fields situated in southwestern Pennsylvania, and near Fairmont and Wheeling, W. Va. The bituminous survey also was extended to a few coal miners and their families located near Parkersburg and Huntington, W. Va.

Facts as to sickness were secured in 17,110 families, representing 85,320 persons. Of this number, 22,235 were miners, 16,201 being employed in the anthracite and 6,034 in the bituminous mines.

Illness or incapacitation due to accidents is not included in the results of the survey as shown in the tabulation that follows, for this article deals with general health conditions only, and not with hazards. The results of the survey show as follows:

SICKNESS RECORDS OF 22,235 MINE WORKERS

	Bituminous	Anthracite	Rate per 10,000 Bituminous	Rate per 10,000 Anthracite	
Persons examined.....	6,034	16,201	.....	.....	
Ill from all diseases....	105	250	173.6	154.1	
Typhoid fever.....	0	2	0.0	1.2	
Influenza.....	10	24	16.5	14.8	
Rheumatism.....	10	30	16.5	18.5	
Tuberculosis.....	7	7	11.6	4.3	
Pneumonia.....	5	16	8.2	9.8	
Pleurisy.....	1	8	1.6	4.9	
Asthma.....	9	34	14.9	21.0	Respiratory Diseases
Miners' asthma....	6	42	9.9	25.9	
Other respiratory diseases.....	4	5	6.6	3.1	
Other diseases and conditions.....	53	82	87.8	50.6	

The rate per 10,000 persons of diseases of the respiratory system shows 41.4 for bituminous miners and 64.7 for anthracite miners. This difference is accounted for by the fact that anthracite coal is harder and more flinty than bituminous coal and therefore the action from the dust of anthracite is more harmful to the respiratory system.

The findings clearly confirm the well-known facts from mortality statistics, which have shown for many years low death rates from tuberculosis among coal miners. The facts elicited from the survey strongly suggest the desirability of further and more intensive clinical study of pulmonary tuberculosis among coal miners. Such study may well serve to disclose the factors of environment which protect coal miners, and in a measure create an immunity from the disease.

48 MINERS' ASTHMA CASES IN 355 SICK MINERS

It will be noted that but 6 of the 105 sick bituminous miners had miners' asthma, or a rate less than 10 cases to 10,000 men, or one in a thousand, while in the anthracite miners, one in every 400 had this disease. This is accounted for by the difference in hardness of the coal and the more flinty nature of the dust.

Among the families of the miners—persons not exposed to the effects of the mines—the sick rate was 162 persons to each 10,000, as against 173.6 per 10,000 among the miners, showing a difference of only 11.4 persons per 10,000 whose illness might possibly be attributed to the industry.

A tabulation of diseases of miners' families (not including the miners) shows as follows (disabilities resulting from accidents being excluded from the list):

SICKNESS RECORDS OF MINE WORKERS' FAMILIES

Persons examined ..	Cases per 10,000 Persons	
	Bituminous	Anthracite
Ill from all diseases and conditions ..	19,416	43,669
Typhoid fever ..	306	597
Influenza ..	7	2
Rheumatism ..	27	47
Tuberculosis ..	20	36
Pneumonia ..	11	18
Asthma ..	13	61
Other respiratory diseases ..	1	13
All other diseases, etc ..	15	31
	212	389
	157.5	140.6
	3.6	4.6
	13.9	10.8
	10.3	8.2
	5.6	4.4
	6.7	14.0
	0.5	3.6
	7.7	7.1
	109.2	88.8

A little less than 2 per cent of the coal-mining population, including the miners and their families, reached by the survey in Pennsylvania and West Virginia were found to be seriously sick. Among the miners themselves the sick constituted 2.7 per cent of the total canvass, the excess in the rate being largely due to the high incidence of the respiratory diseases and of accidents and injuries.

The bituminous miners showed a slightly lower sickness rate than did anthracite miners. Bituminous miners' families, however, showed a higher sickness rate than the families of anthracite miners.

Pulmonary tuberculosis was extremely rare among workers in the anthracite mines. On the other hand, miners' asthma and other diseases of the respiratory system were prevalent. This phenomenon points to the necessity of more intensive study of the factors involved in the apparent immunity of the anthracite miners to tuberculosis. The diseases and conditions recorded among members of coal miners' families do not differ essentially from those found in previous sickness surveys.

I would conclude that serious sickness is no more prevalent among miners and their families than among families previously studied in other industrial communities of the United States. Accidents play a great part in incapacitating coal miners, and statistics show that the percentage of accidents in coal mines is greater than in many other industries and occupations.

Taken all in all, the occupation of coal mining is as healthy as the average industry or calling, the accident hazard is no greater than in many industries and the remuneration for the work compares favorably with the most lucrative of occupations.

**Scope of Miner's Employment—Contributory Negligence.**—Although an employer is not liable for injury to an employee while the latter has stepped aside from his line of employment, thereby exposing him to a danger which the employer could not have contemplated, the fact that a miner temporarily passed from his working place to a crosscut to await clearing away of smoke in his place of work cannot be deemed to be a departure beyond the scope of his employment; nor can the fact that he went into the crosscut to take a drink of water, or to advise a fellow employee of the placing of a can of powder, or to test a fuse.

The employer must anticipate the employee's acts in stepping aside from the place of his actual work in such circumstances. One employed to load holes and attach fuses for blasting acts within the scope of his employment in testing the fuses, since that is for the mutual benefit of the employer and the employee.

When an employer asserts that the direct cause of a worker's injury was the latter's own carelessness, he has the burden of proving that fact by the preponderance of the evidence. (*Colorado Supreme Court, Micheli vs. Rapson Coal Mining Co., 164 Pacific Reporter, 311.*)

# COAL AGE

## Coal at \$40 Per Ton

HOW MUCH coal do you think you could sell a railroad fuel agent at \$40 per ton f.o.b. your mine? "Not much!", you'll answer. And yet that is the estimated cost to one system for the fuel it bought in the wild scramble for coal during part of the recent strike period. Just how this cost came to be is the moral of our tale.

As all of us now know, even including the worthy ex-members of the Federal Railroad Administration's purchase section, the failure of the railways to buy and stock coal early last year was a big mistake. But without recrimination as to who was to blame let's see the consequences to one road.

This system had no coal in stock when the threat of a miners' strike became serious; worse than this, it could not get any surplus above its daily needs, for every one else was grabbing all that came their way. This line, therefore, for most of the strike period lived from hand to mouth, never quite sure from which point its next week's fuel was to come, in some cases even in doubt whether it would come at all. It was thankful for most anything that "was black and looked like coal"; and it got just that kind of stuff.

And the results—. No trains on time; many firemen and enginemen quit because the coal was impossibly bad; and over-time had to be paid for those who stayed on the job. Freight trains were cut down in size and even then they could only limp along because the best of enginemen could not get results with the fuel supplied. And anyone knows what a limping freight train does to the rest of the traffic on a busy division. Only a week of this thing and you can see the chaos wrought in the traffic of this road, how junctions with other lines became choked with freight and how everyone in the organization became disgusted with his job. You can see the *real* cost mounting to the aforesaid \$40, even though the coal man got only his "government price."

When you talk with the railroad-fuel agents about their next year's stock, just ask them what they think of this case. Perhaps it will help persuade them to buy and stock a bit more coal than at first planned. Don't try to make us prove a \$40 cost to them, for maybe the fuel agent with whom we talked was a bit too pessimistic when he told his story. But even a quarter of that is bad enough to be convincing to your man. He knows that the best coal he can buy is the cheapest for his road no matter what the price. Show him how to get it now and why he won't be sure of it if he waits till next November. Just remind him, too, that when the snow flies next fall he'll not have the U. S. Fuel Administration authority to divert his coal for him, nor any "government price" to help him either. Storage is insurance; the man who does not keep a supply of coal on hand for the winter is as foolish as the man who fails to take out an insurance policy against the possibilities of accident, disease, fire or lightning.

## Stabilizing Effect of "Ship-by-Truck" Movement

IN NO PERIOD of the year is the coal trade more stagnant than in the spring. Usually it is a time of no orders and many cars. Summer is little better. What is wanted in the spring and summer is not more transportation but more orders. Why talk therefore of shipping by truck in that period of the year? Just because during those seasons, as in autumn, good roads are admirably suited for travel, and coal can therefore be shipped in many cases more cheaply by truck than by railroad.

Where the railroad track extends from the tippie of the producer to the plant of the manufacturer, and the latter has an elevator or a trestle to take care of the coal as it arrives, there is much to be said on behalf of the railroad, whenever the cost of shipping by truck is greater than the freight rate, which is the case where the distance is long and roads bad; but when the person receiving the coal does not have a railroad siding, the coal, if to be transported by the railroad, must be unloaded and perhaps stored, loaded from storage into a motor truck or horse wagon and hauled perhaps some miles and put onto the recipient's storage pile.

Clearly in many cases it would be cheaper to provide for but one form of transportation—carriage by truck. The greater flexibility of this unit as compared with the railroad is readily apparent. The seller is not held down to his own line of railroad, he is not obliged to follow where his own or some other railroad has gone. Within limits he is free to place his coal where he will. He can make the price *right*, because there is only one handling to pay for, there is no yard service, no demurrage, no pilfering of coal.

The possession of a motor-truck, of the right type of course, and a truck- or wagon-loading-chute, which practically all mines possess, will give him a chance—provided he has a few good roads to important towns—to keep his mines working when others are closed. The business will be in a degree seasonal—best suited to the summer. It will balance the railroad activity which is greatest in the winter. It will be obtained solely on the merit of the contention that with a good truck, good roads and good weather, coal can be transferred from the tippie to the bin or storage ground of the purchaser more cheaply than with the help of the railroad company. "From mine to cellar" may be the slogan of coming coal companies, at least during the favorable months of the year.

## Shortage of Houses Disturbs Coal Market

LAST YEAR the shortage of houses caused many sales of metropolitan real estate. When a property was sold over the head of a tenant, he tried to secure a home by buying another house. Upon securing it, he promptly turned out the tenant. In consequence, dwellings were changing hands with great rapidity.

The man who expects to sell a property does not fill his cellar with coal. He knows, or thinks he does, that he can sell his property for the same amount whether the cellar is stocked with fuel or is swept bare. Many landlords and most tenants avoided buying coal, for they did not know just how long they would own or occupy the building in question.

This had a bad effect on the trade in coal early last year and may have some important influence on buying this year. Many people are purchasing houses and expecting to hold them just long enough to raise the rents. After that is done they will sell the house for a price much above the purchase rate. This practice is greatly retarding coal storage.

As the tenant is wholly at the mercy of the landlord, the latter can easily impose on the former, refusing early in the year to heat the building any longer. If the tenant complains, he is politely evicted. That the landlord is going to renovate the house, is the reason given. There are laws and fines for landlords who fail to supply the heat which is specifically or impliedly promised. But if the officials of the Health Department step within the doors and, after examination, decide to summon, or even upbraid the landlord, he suddenly declares it is necessary to have the house vacated that necessary repairs may be effected. As soon as the tenants have vacated, he looks for other tenants who will pay a higher rent and who are docile enough not to trouble the Health Department. Only the other day a man was refused a lease till he had passed the scrutiny of a two-month occupancy and had shown himself willing to be satisfied with almost any treatment.

This situation will result in quite a saving in the consumption of coal. It may result in a general custom of keeping houses during winter as frigid as those in Great Britain. The cry of "Save Fuel" during the war was hardly as competent to reduce consumption of coal as is the present economic situation.

Against this conclusion must be placed the fact that apartment houses are not in general being built. Two-family houses are more customary. Undoubtedly the apartment house, with its large heating unit and its greater depth and height, should be more economical in the use of fuel per occupant, but on the other hand in two-family houses the owner is usually one of the occupants, and he stokes the furnace with a more watchful eye than does the janitor in a series of apartments.

Certain it is that the uncertainty as to the duration of real estate holdings will delay summer purchases of coal. The effect of the new-found independence of the formerly unfortunate landlord is not quite clear. He will save coal but may, by his profiteering, indirectly cause the construction of many well-appearing but hard-to-heat two-family houses, which will add to the fuel bill of the nation. The anthracite year of 1920-1921 may be looked to with interest. Will it start haltingly and will it show itself as a whole less active than the years preceding it?

### Troubles of Our Own Making

ALL the labor troubles of the coal industry that the country is now facing have arisen from the fact that when the mine workers were well and truly beaten in December of last year, A. Mitchell Palmer proposed an armistice, and the Bituminous Coal Commission was formed. If it had not been for the parlor-car conference—that "secret agreement clandestinely arrived at"—peace would reign today in the coal industry, the anthracite operators having nothing to do but grant the same advance as was conceded to the bituminous mine workers.

But Mr. Palmer, so bold before, became weak in the presence of assured victory. He had a good argument before the courts, but would it advantage him at the polls? Did he have at that time a premonition that he was going to be a candidate for President?

Another mistake was the failure to make clear just what authority the Bituminous Coal Commission was to wield. Proof of course is impossible but does it not seem certain that it was planned that the award should bind the operators while merely making a suggestion as far as the mine worker was concerned? Certain it is that no effort is being made to coerce the mine worker into acceptance, Washington seeming to be afraid to declare itself satisfied that the verdict of the majority of the commission is correct.

### Every Mine Should Have Its Dollar Storage

Where the Miner Can Shovel His  
Winter Dollars for His Summer Needs

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Dead-End in Trolley Haulage

*Letter No. 1*—From the reading of the inquiry of "Assistant Foreman," regarding the proper distance of the dead-end of a trolley line from the face of a heading, I would assume that he has reference to the use of gathering locomotives.

In my experience in mines, I have frequently found the trolley line carried up to the last crosscut in a heading. It would not be good practice to carry the wire further than that point and it would certainly be unnecessary, as the cable, wound on the reel on the locomotive, will reach a distance of 300 ft., or more than double the distance that a heading would ever be driven beyond the last crosscut, unless it is for the purpose of prospecting the seam. Ordinarily, a heading will not be advanced more than 50 or 60 ft., though the Bituminous Mine Law gives the maximum distance allowable as 35 yd. beyond the last open crosscut.

The point that must be borne in mind, in this connection, is the expense and annoyance of cutting the trolley wire into short lengths and splicing them, whenever it is necessary to extend the trolley line. The more splices that are made in a trolley wire, the greater the risk of a break occurring and causing a possibly fatal accident.

If the mine is generating gas, I would much prefer keeping the dead-end of the trolley line as far back from the face of the heading as convenient, and depend on the length of the cable reeled on the locomotive for hauling the cars from the face of the heading. A 300-ft. length of trolley wire can be put up more perfectly when it becomes necessary to extend the line; and this will give better satisfaction than when the extension is made in shorter lengths, all of which goes to make for efficiency and economy in mine haulage.

SAMUEL MCKAY.

Burgettstown, Pa.

*Letter No. 2*—Referring to the question of how far the dead-end of a trolley wire should be located from the face of a heading, in mine haulage, allow me to say that, as a mine official, it has been my practice to consider this problem much as I would that of ventilation.

Section 64 of the West Virginia mining laws plainly states that the mine foreman "shall not permit any room to be opened in advance of the ventilating current." In my opinion, this is a good rule to apply to the extension of a trolley wire in a heading. The West Virginia law makes no mention of how far a trolley wire may be carried in approaching the face of a heading.

However, the mining law of Ohio states (Sec. 947) as follows: "No trolley wire shall be extended into or maintained in any room while being used as a working place; no trolley or feedwire shall be extended

into any entry beyond the outside corner of the last breakthrough." It will be seen that this statement, in the Ohio law, supports my practice in regard to the dead-end of a trolley line.

DICK.

Oak Hill, W. Va.

### Supporting Mine Roof

*Letter No. 4*—The question of adopting suitable means of saving timber, which is of growing importance throughout the Pittsburgh district, will soon be of equal importance in all mining districts. Before considering other means of supporting the roof than by the common method of timbering, it would seem best to draw attention to the need of adopting a systematic method of timbering that is designed to meet the particular conditions in each mine.

While I am a firm believer in systematic timbering, let me say that there is no hard-and-fast rule that will apply to every mine. For that reason, the question of timbering the working places must be left to the judgment and experience of the mine officials in charge. Such a system must be used as will best meet the conditions of roof, floor and coal, in the seam mined. These conditions are constantly changing with the varying character of both roof and floor. They are not constant, even in the same mine; and must be carefully watched to determine what changes, if any, should be made in the style of timbering in use.

#### RULES THAT APPLY TO EVERY MINE

There are some general rules that will apply to every mine and district; such are the following: 1. Rules and regulations regarding timbering must be enforced and strictly obeyed. 2. The distance apart and the manner and time of setting the posts in working places must be clearly specified. 3. A plentiful supply of timber of the right size and length must be kept on hand, in each working place. 4. The timbering, in each place, must be regularly inspected by the foreman or his assistant, in order to see that the rules regarding timbering are obeyed. 5. There must be no haphazard methods employed where posts are set in the most convenient place, because the miner is allowed to follow his own inclinations and permitted to use his own judgment. 6. The setting of a post must never be left until the roof is plainly loose and unsafe. Such a practice entails an avoidable risk. Delay in posting and lack of judgment are the cause of many accidents.

Turning, now, to the question of steel timbering, the use of steel girders and posts has proven a most effective means of supporting the roof on roads and entries. For this purpose, different shapes and sizes of steel are used for posts and girders. These consist of I-beams and channel bars, either single or combined. Some special form of chair is generally employed where the girder rests on the head of the post. These steel sets

are cut to the right length and properly fitted together at the shop where they are manufactured, and are ready to be placed in position when sent into the mine.

When steel timbering is used in the rooms, heavy cap-pieces of wood are placed on top of the posts and against the roof to give better support to the latter. In the accompanying figure, I have illustrated the plan of setting steel posts with wood caps, in a room turned off an entry. As shown in the figure, a row of posts is set at

STEEL TIMBERING IN A ROOM

the side of the track, these posts being spaced 3 ft. apart and surmounted with cap-pieces 3 ft. long, which project well over the rail. The caps are 4 in. wide and 3 in. thick. It is frequently necessary to set two or three rows of posts in the gob, to support the roof while the room is being driven up to the limit. These caps are 30 in. long and have the same width and thickness as those at the roadside. The cap-pieces in the gob are set at right angles to those along the road and, as shown in the figure, the posts can be spaced 6 ft. apart and 5 ft. between the rows, where the room is driven a clear width of 8 yd.

Rolled-steel posts of the girder pattern are used for propping the longwall face in a few mines in England, and have given satisfactory results. Cast-iron props were extensively used at the large collieries of the Stavely Co., Derbyshire, England, and at a few other mines; but these have not given satisfaction, as they break without warning, under certain pressure. On the other hand, rolled-steel props will bend under the pressure of the overlying strata and can be taken out, straightened and used again. The steel posts set in rooms are taken out when the rooms are abandoned, and these drawn posts are used over and over again, in driving other places.

WILLIAM DICKINSON, SR.

Oak Hill, W. Va.

## Tamping Dynamite

*Letter No. 3*—In his letter, *Coal Age*, Jan., 29, p. 244, Gaston F. Libiez does not agree with the answer given to the question, "Is it necessary to tamp holes charged with dynamite?" The answer referred to appeared in *Coal Age*, Dec. 25, p. 941. It stated that it is not necessary to tamp such a charge, owing to the fact that the

detonation of the dynamite is instantaneous and the force of the explosion is radiated equally in all directions from the charge.

In regard to this question, I wish to say, that my experience of more than 30 years as a miner, in the handling of dynamite, has been that the untamped hole gave the same results as the one tamped. I have worked with miners who persisted in tamping their dynamite holes hard, hammering and pounding the stemming down on the charge. I have also observed that these heavily tamped holes gave no better results than those not tamped so hard. I find that, as a general thing, a wad of paper pushed in on the charge to hold it in place gives as good results as hard tamping.

Mr. Libiez says, "The full tamping of a dynamite charge should be recommended if only for the purpose of stopping the practice of miners who use a short fuse, light and shove it into the hole and then run like the devil to get out of the way." Allow me to say, I do not approve of the use of the short fuse, as practiced by some miners; but, while I regard it as more or less dangerous, I do not think it is any more so than the heavy tamping of dynamite charges.

I recall one instance where a miner persisted in tamping his dynamite charges so hard that other miners did not like to be in his place while he was tamping. He was warned time and again of the danger of the practice and told it was unnecessary; but he would not be convinced of that fact. One day miners working next to him heard him pounding the tamping in on a dynamite charge, which exploded, killing him instantly.

Mr. Libiez thinks it a pity that practical miners will use so little judgment in using the short fuse. To me it seems equally as much a pity that practical miners will not learn that it is not only dangerous but unnecessary to tamp dynamite charges hard.

JOHN ROSE,

Dayton, Tenn. Former District Mine Inspector.

*Letter No. 4*—Referring to the question of the need of tamping a charge of dynamite, the discussion of which grew out of the reply to an examination question that was answered in *Coal Age*, Vol. 16, p. 941, my opinion is that the tamping of dynamite is advisable, although it cannot be said that it is absolutely necessary; because, as stated in the reply to the question, the detonation of the charge is instantaneous and the force is distributed equally in all directions.

It is well known that an explosion of a charge of any explosive acts in the direction of the line of least resistance. In my experience, I have had some large boulders to break and have always found that the work was performed more safely, economically and efficiently, by drilling a hole toward the center of the rock and inserting from a half- to one entire stick of dynamite; instead of placing from eight to ten sticks of the explosive on top of the rock, as is sometimes done in order to save the work of drilling. The smaller charge, located in the heart of the boulder, will do more work than the greater charge placed on top of the rock; because the force of the latter reacts only against the air, which offers small resistance.

### PERMISSIBLE POWDERS SHOULD BE TAMPED

Now, the permissible powders that are being so much used in mining resemble dynamite but are considerably weaker. In their use it is necessary to tamp the hole if

good work is expected. It is my belief that all holes should be tamped full to the top or mouth of the hole, with incombustible material, which will make the charge do far better and safer work than when no tamping is placed in the hole.

The writer of Letter No. 1, *Coal Age*, Jan. 29, p. 244, speaks of the practice of miners of using a short fuse, lighting and shoving it back into the hole and then running to safety. I have seen men cut an 18-in. length of fuse, put a cap on the end of it, light the fuse, shove the primer into the hole and run. It is such practices that keep the accident list increasing. It is a careless and reckless manner of shooting.

The most efficient and safest way of firing either dynamite or permissible powder, in blasting coal in mines, is to employ competent shotfirers, who should use nothing but electric caps and batteries for firing. The work should be done after the men have gone.

Johnstown, Pa.

SAK.

## Effect of Wire Gauze on Flame

*Letter No. 2*—Referring to the interesting letter of R. Z. Virgin, assistant professor of mining, Carnegie Institute of Technology, Pittsburgh, Pa., which appeared in *Coal Age*, Feb. 12, p. 324, the author prefaces his remarks with the statement that "the effect of the wire gauze. . . is a question that always creates much interest in the minds of young men who are studying the science of mining." Let me suggest that the same question is interesting, also, to older and more experienced men, which is my apology for commenting on the letter mentioned.

Professor Virgin will pardon me in saying that, reading carefully, he will observe that the question he quotes, as being one "often asked in mining examinations," calls for the conditions under which flame will pass through the gauze of a safety lamp; and, in his explanation, the professor gives but one condition that will allow the passage of flame, namely, the heating of the gauze to a temperature approaching the ignition point of the gas, which he states is 1212 deg. F. The question quoted appears in *Coal Age*, Dec. 11, p. 902, where the reply given by the editor enumerates four or five conditions under which flame will pass through the gauze of a safety lamp.

In this connection, I recall an interesting experiment performed by M. Marsaut, a few years ago, in France. The experiment is a simple one designed to show that flame will pass through the mesh of the gauze of a safety lamp, owing to an explosion within the lamp and when the gauze is perfectly cool. In this experiment, an inverted belljar was filled with pure gas (methane) and a safety lamp raised quickly into the gas filling the jar. The fresh air contained in the combustion chamber of the lamp now forms a highly explosive mixture with the gas entering the lamp and an explosion follows that forces the flame through the gauze.<sup>1</sup>

The Marsaut experiment has not received the attention that it deserves, although its author explains that

<sup>1</sup>Regarding the work of testing for gas, attention has frequently been called, in *Coal Age*, to the fact that the moment of greatest danger occurs when withdrawing a flaming lamp from a body of firedamp. The combustion chamber of the lamp, in this case, is filled with the gas and the entrance of fresh air, as the lamp is being withdrawn, creates a highly explosive mixture within, which is liable to explode and force the flame through the gauze. This illustrates the same idea as that brought out by the Marsaut experiment.

the result was "due to the cannon effect set up by the explosion within the lamp, the force of which, being confined within the chimney, can only escape at a high velocity through the mesh of the gauze and cause the failure of the lamp."

### CONDITIONS IN MINING PRACTICE THAT MAY CAUSE A LAMP TO PASS FLAME

Again, the Prussian Safety Lamp Commission proved that a Clanny gauze with a smoke cap was more dangerous than one without the smoke cap, owing to the top of the gauze chimney becoming more clogged with smoke particles, which are liable to transmit the flame through the mesh. Likewise, a lamp exposed to a dust-laden atmosphere may pass flame at a very low velocity, owing to the accumulation of the fine dust on the mesh of the gauze.

A mixture of 4½ per cent of gas in the air, when dust is present, has been found to pass flame, at a velocity of only 6 ft. per sec., in the short space of 10 sec. This occurred in a Davy lamp, but it is probable that the same is true of a Clanny lamp. It cannot be claimed that experiments performed in the laboratory, showing lamp failures, do not prove like results in ordinary coal-mining practice, since there are on record a number of actual failures of safety lamps when in use in the mines.

### EXPERIMENTAL VS. PRACTICAL TEST OF LAMPS

My observation leads me to conclude that a lamp is more liable to fail when in actual use in the mine than when subjected to an experimental test in the laboratory. A lamp that was known to have failed in the mine did not pass flame when subjected to a later test, under a similar velocity, in the testing chamber of the laboratory. The cause for this was probably due to the presence of dust in the mine air and its absence in the test made in the laboratory.

I am drawing attention to these facts relating to the passage of flame through the mesh of a safety lamp to show that there are numerous conditions other than the heating of the gauze that will cause the failure of the lamp when in use. M. Marsaut was so convinced of the danger attached to a single-gauze lamp that he added a second superimposed gauze, and even a third gauze, for increased protection in a highly gaseous mine. The double and triple gauzes are the characteristic features of the Marsaut safety lamp.

It would seem that the subject of safety lamps has not received as much official attention from the Federal Bureau of Mines as we could expect. However, when the Miners' Lamp Committee of the British Home Office makes its report, these matters may be shown to have more than an academic importance. Let us hope that such will be the case.

JAMES ASHWORTH,  
Consulting Mining Engineer.

Livingstone, Alberta, Canada.

## Promotion of Ambitious Workers

*Letter No. 10*—The subject of promotion of workers is one that appeals to all classes, but more particularly to the young coal miner who is ambitious and anxious to get away with a good start in life. In the discussion of the subject in *Coal Age*, it is interesting to note the many viewpoints expressed. These varying views are educational in a way, as they give us an insight into

the difficulties many young men experience when trying to better their condition; and the narration of these should assist mine managers to gain a broader understanding of the merits of promotion for their workers.

Turning the matter over in my mind, it appears to me that the difficulty of the situation is the natural shortage of responsible positions and vacancies. As compared with the number of aspirants for these positions, the number of places available to them is relatively small. This aspect of the case, however, is not as serious as it was a few years ago; because of the higher wages now paid for general labor, which gives men less incentive to strive for higher positions.

#### IN FILLING VACANCIES, THE QUALIFICATIONS AND FITNESS OF EACH APPLICANT SHOULD BE CONSIDERED

It is a difficult matter, at times, to fill a vacancy without causing disappointment to someone. However, in order to maintain an efficient organization and encourage a spirit of mutual co-operation among the employees, it is necessary that every applicant for the position should be fully considered. Family connections or influence of any kind should not control the selection of the man for the place. On no account, should an outsider be chosen to fill one of the minor vacancies underground. Such positions should be open only to the men working in the mine, and the choice should be determined by the qualification and fitness of the several applicants.

In a mine where these conditions do not prevail, however, I would advise the ambitious young man to seek employment in another field where his capabilities will receive just recognition. There is always a demand for capable men, and the experience gained by working under varying conditions in different mines will always be an asset that will prove valuable to the man, in his future career.

True merit has always had its reward. If the ambitious worker will only realize this and keep pegging away, fully determined to gain recognition, success will assuredly come to him. Competition is so keen that no coal company can afford to hold a man in a responsible position who is not thoroughly efficient. For that reason, every worker must stand on his own feet, knowing that his rise or fall will depend on the results of his work.

#### SUCCESSFUL MANAGEMENT RECOGNIZES THE HUMAN ELEMENT IN THE TREATMENT OF MEN

The mine manager's ability, today, is not measured by his knowledge of mining alone; he must be a man who understands that running a coal mine is no one-man's job, and that his own success or failure is governed to a large extent by the work of his subordinates. The human element must be considered and fully understood. Unless there is a measure of co-operation between the mine manager and his subordinates, and between these subordinates and the other employees, it is impossible to get efficiency. When all has been said and done efficiency is simply having the right man in the right place.

Let me say, here, that it is not good policy for any company to appoint an outsider to an official position if the said position can be filled by promoting some ambitious employee. The mere fact that the ability of one man has been recognized and rewarded will give others encouragement to study and prepare themselves for future promotions. In every such case, the organization is strengthened and improved. In order to get

results, under present-day conditions, the mine manager must have his entire force, in and around the mine, working in one direction; and, to accomplish this, he must take a personal interest in every employee, from the trapperboy up, and assist in every way possible those who are anxious to improve their position in the mine.

#### IMPORTANCE OF REWARDING ABILITY AND PUSH WHEN OBSERVED IN A SUBORDINATE

The competent mine manager is never afraid of the ability or push of any of his subordinates; and where it can be proved that the mine foreman actually discharges a subordinate who shows initiative, the company should lose no time in filling his place by giving it to the subordinate. The same rule applies to the subordinate's dealings with the men who are working under his charge.

Where a man is capable he is never afraid of losing his position. The position should, without exception, seek the man and, invariably, the capable man can get his price. To attain this enviable position, however, means many years of hard, conscientious work and study, and strict attention to duty. Loyalty to one's company is also a big factor. The path to success is open to every man who has the grit to smile at disappointments and rise above them. The man must have faith in himself; no man is a failure, until he decides so himself. The young man who relies on his family connection or influence for advancement is going to meet with many disappointments. Let me advise him here to get some well-defined object in view, and go after it fully determined in his own mind that he is going to reach his objective, and he most assuredly will.

J. H. MCMILLAN, Supt.,  
Jasper Park Collieries, Ltd.

Pocahontas, Alberta, Canada.

[This letter will close the discussion, "Promotion of Ambitious Workers."—EDITOR.]

## Lawful Examination of a Mine

*Letter No. 12*—I have been greatly interested in the discussion running in *Coal Age*, regarding the lawful examination of a mine. For the past nine years, I have worked under the ruling contained in the mining laws of Ohio and believe that there is no better system in use anywhere, in any coal-mining state. At the present time, the mining of coal, in Ohio, is regulated and controlled by the Industrial Commission, who are responsible for the enforcement of the state mining laws.

Under the heading, "Competent Person or Persons Shall Be Designated as Fireboss," Sec. 925 of the mining laws of Ohio, reads as follows:

"The owner, lessee or agent of a mine generating firedamp so as to be detected by a safety lamp shall designate a competent person or persons as fireboss or firebosses, who shall make a thorough examination of each working place in the mine every morning with a standard safety lamp, not more than three hours prior to the appointed time for employees to enter the mine. As evidence of such examination, the fireboss shall mark with chalk upon the face of the coal, or in some conspicuous place, his initials and date of the month upon which the examination was made. If there is any standing gas

discovered, he must leave a danger signal across every entrance to such place."

My opinion is that the requirements of this section far exceed those of any system of mining laws that will permit a fireboss to enter a mine and start his examination from six to eight hours before the time appointed for the men to enter for work. Mention has been made of the mining laws of Illinois, which permit the fireboss to start his examination of the mine "within eight hours preceding the time the dayshift goes on duty." In my judgment, such a law should be revised, and the sooner it is done the better.

#### MINE FOREMEN AND MEN MUST RESPECT AND OBEY THE INSTRUCTIONS OF A FIREBOSS

Another important feature in the work of firebossing is the carrying out of the orders of the fireboss. When the examination has been completed and the fireboss has entered his report in the book kept for that purpose, and has informed the mine foreman of the conditions in the mine or section of the mine he has examined, he should have the full assurance that his suggestions are respected and his orders are carried

out and obeyed. It must be admitted that numerous accidents have resulted, in different states, owing to some persons having been dilatory in not performing their duties, or where the orders given by the fireboss have not been obeyed. This is a matter that calls for the earnest consideration of mine officials.

I can fully endorse what is said by "Ben," of Thomas, W. Va., in his letter, *Coal Age*, Feb. 26, p. 415. He states, "Each section should be of such size that an assistant foreman could have complete supervision of its working places in each shift"; and adds, "At a large mine all section foremen should meet two hours before starting time, enter the mine at the same time, and again gather on the outside to compare notes of their examinations, before permitting the men to enter the mine." While this system would require more mine examiners and increase the expense, I fully believe that, if required by law, it would have the effect of reducing the number of accidents, especially where bad conditions exist.

JAMES H. TAYLOR.

Poston, Ohio.

[This letter will close the discussion, "Lawful Examination of a Mine."—EDITOR.]

## INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

### Short-Circuiting or Obstructing Air in Fan Ventilation

A short time ago the question came up, at one of our mine foremen's meetings, regarding the effect produced on the water gage and the speed of the fan by either short-circuiting the air current or obstructing its flow in the airway. This question was referred to *Coal Age*, at the time, and the reply given stated that the short-circuiting of the air cut out the mine resistance and reduced the water gage, but the air volume was largely increased, assuming the power on the air remained constant. On the other hand, obstructing the airway *increased* the resistance and the water gage and *decreased* the volume of air passing.

In response to an inquiry sent to the manufacturers of the fan, a bulletin was received bearing on the point in question. Inasmuch as some of the statements in this bulletin appear to be at variance with the generally accepted theory as set forth in textbooks, I desire to make a few quotations from this bulletin, hoping for a thorough discussion of the matter. One statement reads as follows:

There also seems to be a misunderstanding, among certain mining men, regarding the operation of a fan under certain conditions. For instance, some men keep a watchful eye on the water gage, in the hope that they will detect falls in their airways. This practice comes from their belief that as soon as the airways become clogged, the water gage goes up. But this is not true, for a fan when running at normal capacity, and at a constant speed, produces a constant pressure, and to look for falls in the airways with the fan running at normal capacity is misleading.

Again, the bulletin states:

To illustrate: Let us suppose a fan of given dimensions to be running at a certain speed and producing, say, 3 in. water gage in the fan drift. Now, if the fan drift leading to the mine is closed off, any increase of water gage will show that the intake or discharge area of the fan is too small. This condition is described by saying that the fan is working above its normal capacity and is therefore mechanically inefficient. If the intake and discharge areas of a fan are properly proportioned to its other dimensions, or when a fan is not working above its normal capacity, the same speed of fan will produce the same water-gage reading in the fan drift whether or not the air is passing.

Again, if the air current is short-circuited when the fan is working up to its normal capacity, so that the circulation does not pass through the mine but is discharged from the fan drift into the atmosphere, a larger volume of air will pass through the fan and, as a result, a greater portion of the depression due to the fan's action, will be absorbed within itself. The reading of the water gage will then be lower than when the air current is circulating through the mine, the speed of the fan being the same in each case. Notice, however, that if the fan is not running up to its normal capacity when the air is short-circuited, no appreciable effect will be observed in the reading of the water gage, until enough air is short-circuited to bring the fan up to its normal capacity.

After a discussion of the statements just quoted, it was decided to experiment, for ourselves, on the fan in question. Accordingly, the first day that the mine was idle, the mine foreman, electrician, two assistant foremen and myself started for the fanhouse. The assistant foremen were sent to the bottom of the shaft, while we took readings of the speed of the fan and the water gage and quantity of air produced, in the fan drift.

It should be stated, here, that there were three roads leading to the bottom of the shaft. The men had already blocked up two of these roads with brattice

cloth, but there was, no doubt, air leaking through these stoppings, as they were by no means tight. The results were as follows:

	Speed of Fan r.p.m.	Quantity of Air c.f.p.m.	Water Gage in.
Normal working.....	147	56,000	1.2
Two roads blocked.....	147	46,000	1.4
Opening 25 sq. ft.....	148	21,750	1.5
Airway closed.....	150	.....	1.6
Air short-circuited.....	145	.....	0.6

These results appear to show that when the air-course was obstructed the water gage was increased and the air volume diminished. The fan running normally at a speed of 147 r.p.m. produced 56,000 cu.ft. per min., against a water gage of 1.2 in. Blocking off two of the roads reduced the air volume to 46,000 cu.ft. per min. and increased the water gage to 1.4 in., the speed of the fan remaining practically the same.

Now, when the opening in the third airway was reduced to 25 sq.ft., the air volume was reduced to 21,750 cu.ft. per min., and the water gage increased to 1.5 in., while the speed of the fan was increased to 148 r.p.m. Finally, when the last airway was closed as completely as possible so as to cut off the air, the water gage rose to 1.6 in. and the speed of the fan increased to 150 r.p.m. The leakage of air through the improvised stoppings could not be measured in the fan drift.

In the last test, all of the airways were open and the air short-circuited, by opening the doors at the foot of the shaft. The result was a large increase of air volume, for which no satisfactory measurement was obtained. The water gage dropped to 0.6 in. and the speed of the fan decreased to 145 r.p.m. This is in exact accordance with the theory that has often been stated in *Coal Age*, but it appears to be at variance with the statement I have quoted from the bulletin of the manufacturer of the fan.

May I ask if *Coal Age*, or its readers, can throw some further light on this interesting subject and explain what is meant by "normal capacity of a fan." This should lead to an interesting discussion.

McIntyre, Pa. THOMAS HOGARTH.

The results obtained in the experiments performed by this correspondent agree with the claim often made in *Coal Age*, that when the air current produced by a centrifugal fan is short-circuited at the foot of the shaft, the water gage drops and the air volume is greatly increased. The passage of this larger quantity of air through the fan causes an increased resistance and a larger proportion of the power is absorbed within the fan itself, which leaves a less power available for turning the fan and causes it to run slower.

On the other hand, any obstruction in the air-course, as a considerable fall of roof or otherwise, increases the resistance in the mine and the water gage rises accordingly. In this case, the air volume is reduced, less power is absorbed within the fan and a larger amount of power is thus available for turning the fan, which then runs faster.

Referring to the statements quoted from the bulletin, it appears that reference is there made to a particular type of stepped, multiblade fan, whose water gage and air volume are rated on a certain so-called "normal capacity." It would seem that this normal capacity is an arbitrary rating, depending on the speed of the fan that will give a maximum mechanical effi-

ciency, according to the size of its intake and discharge openings.

Judging by the statement quoted from the bulletin, the claim appears to be made that where these openings are properly proportioned to the other dimensions of the fan, the water gage is a function of the speed, regardless of whether the fan is circulating any air or not. This statement does not accord with our practice in fan design, which has been to regard the water gage as a function of the mine resistance. To eliminate the resistance against which a fan must operate is to eliminate the water gage in the fan drift.

However, it is quite possible that the type of fan referred to in this inquiry does not conform to the

principles that govern a fan whose dimensions are proportioned in accordance with and dependent on the mine potential or resisting power of the mine, as determined by the ratio of the area of passage in the mine, to the cube root of the rubbing surface of the airways, or the ratio of the quantity of air in circulation to the cube root of the power on the air. The two methods of computation are so radically different that there is no comparison to be made between them. The author of the bulletin, in explanation, writes as follows:

I term 100 per cent as the normal capacity of the fan; that is, the fan will work efficiently 20 per cent above and below this point. If the airways are entirely closed off, of course no air will be passing and the efficiency of the fan will be zero; but a certain static pressure will be produced in the drift.

Now, if the drift is opened up so that, say, 30 or 40 per cent of the normal capacity of the fan can pass, the water gage will rise a little; but this is scarcely worth while taking into consideration. In fact, the average mine man would not detect it on his water gage reading. If we keep on opening up the mine, until sufficient air is passed to bring the fan up to its normal capacity, the water gage will be about the same as when the mine is entirely closed off.

Beyond this point, however, if we keep on lessening the mine resistance, by short-circuiting the air, naturally part of the depression produced by the tips of the blades will be consumed in drawing the air through the fan itself, which causes a fall of the water gage in the mine drift. This will continue, until the mine is thrown wide open and the static gage is reduced to zero, as is also the efficiency.

According to the bulletin, in the former case, the fan would be working above its normal capacity and, in the latter case, it would be working below its normal capacity. The same author presents a diagram representing the characteristic curves of a stepped, multi-blade fan, which we have reproduced here for a better understanding of the author's meaning, in the quotations from the bulletin mentioned. The diagram shows that, at normal capacity, the fan has a mechanical efficiency of 77 per cent and a manometric efficiency of 83 per cent. The question is worthy of thoughtful discussion that it is hoped will reveal some new principles in fan ventilation.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Indiana Firebosses' Examination Held at Indianapolis

(Selected Questions)

*Ques.*—(a) Give a full description of a safety lamp. (b) What is its essential characteristic? (c) In what condition and under what circumstances may a safety lamp be unsafe?

*Ans.*—(a) A mine safety lamp consists of an oil vessel of brass, aluminum or steel, surmounted by a glass cylinder, forming the combustion chamber of the lamp, above which is a wire-gauze chimney that permits the escape of the hot air and gases formed in the lamp, but prevents the passage of flame through the mesh of the gauze, by reason of the cooling effect of the wires of the gauze. In the Davy lamp, the glass cylinder is omitted and the wire-gauze chimney is attached directly to the oil vessel. A small rod or "pricker" runs up through the oil vessel for use in raising or lowering the wick. Practically all other types of safety lamps, like the Clanny, have a glass cylinder surrounding the flame.

(b) The essential characteristic of all safety lamps is the isolation of the flame by wire gauze, which protects all openings to the lamp.

(c) A safety lamp is unsafe when any part is defective; the lamp improperly assembled or carelessly handled; the gauze dirty or allowed to become heated by too long exposure to gas; or the lamp exposed to a strong air current or blast of air. A safety lamp should never be entrusted to an incompetent person.

*Ques.*—(a) Describe in full your whole procedure in the inspection of a gaseous mine. (b) What unsafe conditions would you observe other than the presence of firedamp?

*Ans.*—(a) Before entering the mine, inspect and prepare the safety lamp for use. Observe that the ventilator is working properly and note the reading of the water gage as indicating a normal condition of the circulation underground. Then, having entered the mine, proceed to the bottom of the downcast shaft or the main intake air-course and observe that the usual volume of air is passing into the mine.

Beginning at the intake end of the section of the mine to be examined, follow the air current while inspecting each working place, travelingroad or airway. Examine each place for gas and other dangers that may be present. Write the date at the face of each place examined, as evidence of your presence, and observe what timber is on hand and coal loaded.

When the examination is completed, on returning to the shaft bottom, enter in the book kept for that purpose a full report of the examination, stating what dangers, if any, have been found and where located. Date and sign the report, after which remove from the board the checks of those men whose places contain any danger. This must be done before permitting the

men to enter the mine. The checks taken from the board are given to the mine foreman, who is informed of the conditions as they exist in the mine.

(b) Besides making the usual examination for gas, the fireboss should carefully inspect the roof and working face to detect any bad top or loose coal that may be dangerous, and observe if any timbers have been discharged by a shot the previous night.

*Ques.*—(a) Give the essential requirements for a well ventilated mine. (b) Why is it necessary to take measurements of air at certain intervals throughout the mine?

*Ans.*—(a) The volume of air in circulation must be sufficient to comply with the requirements of the state mining law and as much more as may be necessary to dilute and sweep away the gases generated in the mine and make it safe for work. The air current must be conducted so as to sweep each working face and all void places and falls, so as to prevent the accumulation of gas. To do this will require air-tight stoppings, doors and air bridges and the building of brattices wherever this is necessary to carry the air forward to the face or make it sweep the falls.

(b) Air measurements taken at different points on the air-courses and throughout the mine serve to show where air is leaking through poorly built stoppings, doors, etc. These measurements also show the proper distribution of the air between the several sections or districts of the mine.

*Ques.*—(a) What elements determine the ventilating pressure in a mine? (b) What determines the resistance? (c) How is the resistance measured?

*Ans.*—(a) The ventilating pressure ( $pa$ ) is the total pressure producing the circulation and is determined by the resisting power of the mine. The ventilating pressure is equal to the unit pressure (lb. per sq.ft.) multiplied by the area of the airway, in square feet.

(b) The resistance of a mine or airway is determined by the extent of its rubbing surface and the velocity of the air current, which, in turn, depends on the power producing the circulation.

(c) The resistance is measured by observing the reading of the water gage in the fan drift. This reading, in inches, is multiplied by 5.2 and that product by the sectional area of the fan drift, in square feet.

*Ques.*—What is a booster fan? Do you consider a booster fan practicable? Give reason.

*Ans.*—A booster fan, in mine ventilation, is a small secondary fan, installed at some point in the mine where the circulation of air is deficient. Its purpose is to assist the work of the main fan on the surface.

A booster fan is only practicable as affording a means of reducing the leakage of air through poor stoppings, in a section of a mine that is about finished, and where it is cheaper to install a booster than to repair the stoppings, which will be needed but a short time.

## Freight Cars Are More Widely Scattered Than Ever

Car Service Commission Invested with Plenary Powers in Efforts To Secure Return of Cars of Special Type

**R**AILROAD freight cars have fallen into worse need of repair and are more widely scattered than at any time since Jan., 1918, when the railroads came under Federal control, according to an article appearing in the current issue of *American Railroads*, the official organ of the Association of Railway Executives.

Regarding the efforts being made by the Commission on Car Service of the American Railroad Association to reassemble scattered rolling stock the article states:

"The Commission on Car Service, acting under an agreement signed by the various railroads to abide by and enforce the car service and per diem rules and authorizing the Commission on Car Service to act as its agent in all car service matters, is making an effort to secure the return of special types of cars as expeditiously as is practicable in view of all the conditions, but in order to meet emergencies it is invested with plenary power to suspend or permit departures from the rules requiring the return of cars to the home roads and to transfer cars from one railroad or territory to another when necessary to meet traffic conditions.

"It is also authorized to exempt when necessary cars of any type from the provisions of the rules and to provide other regulations under which such cars shall be handled and it is directed to co-operate with the Interstate Commerce Commission in all car service matters.

"Normally, approximately 50 per cent of the freight cars are away from home, but usually the bulk of them are on the lines of direct connections which are likely to use them for a return load. At the beginning of Federal control, according to the recent annual report of the Division of Operation of the Railroad Administration, 44 per cent of the freight cars were on home lines. On January 1, 1919, the figure stood at 26.6 per cent.

"Special attempts were made in the early part of 1919 to relocate cars more in accordance with ownership, with the idea of getting the cars to the home road so that extensive repairs and betterments might be completed, and also in part because of the prospective return of the railroads to private management.

"By July 1, 1919, 31.7 per cent of the cars were on home lines, but at the present time the number of cars on home lines has again declined to about the same point as January 1, 1919, or approximately half of what may be considered the normal condition. The other 75 per cent of the cars are scattered throughout all parts of the country.

"Exact information as to the present condition of the equipment is not available because the roads have not seen many of their own cars for a long time, and the entire subject is a matter of dispute between the railroad companies and the Railroad Administration, which was obligated by its contracts as well as by the Federal Control Act to return the property of the railroads in the condition in which it was taken over or to pay for any deficiency.

"During January of this year out of 2,453,227 freight cars on the lines of the railroads under Federal control

6.6 per cent were reported as unserviceable, as compared with 5.8 per cent during January, 1919, and 5.4 per cent in January, 1918, according to the reports of the operating statistics section of the Railroad Administration. These figures did not include 19,300 cars set aside and classified by the Railroad Administration as condemned cars, which it would not repair, but held out of service until the owning companies should agree to their dismantling."

## Railroads Call Meeting To Arrange To Continue Soft-Coal Pool

Lines Using the Ports of Baltimore, Philadelphia and New York Contemplate Voluntary Plan of Control

**A**S President Wilson's proclamation requiring all bituminous coal for transshipment to be consigned to the pools of the Tidewater coal exchanges at Atlantic ports will expire April 30, the various railroads transporting bituminous to the ports of Baltimore, Philadelphia and New York have called a meeting of interested shippers and carriers to be held in the Bellevue-Stratford Hotel, Philadelphia, at 2 p.m. Wednesday, March 31.

Consideration will be given at this meeting to the question of continuing by voluntary action the handling of bituminous coal for transshipment through the several pools after April 30. As this is of great importance to shippers and receivers as well as the railroads, a large attendance of the various interests involved is expected.

The Wholesale Coal Trade Association of New York, Inc., sent the following notice to its members calling attention to the proposed meeting: "Pursuant to the following resolution adopted at a meeting of the principal Tidewater bituminous coal railroads using the Ports of Baltimore, Philadelphia and New York, a meeting of shippers and transshippers of bituminous coal through these ports and of the railroads serving them is hereby called for Wednesday, March 31, at 2 p.m., at the Bellevue-Stratford Hotel, Philadelphia, Pa.

"Whereas, by the withdrawal from the Tidewater Coal Exchange after April 30, 1920, of the railroads serving Hampton Roads, it is necessary to consider the result as to the Tidewater Coal Exchange at the Northern Ports:

"Resolved: That Tidewater and originating bituminous railroads serving the ports of Baltimore, Philadelphia and New York, believe that an effort should be made to continue the pooling of Tidewater bituminous coal.

"While these railroads are averse to continuing the sole financial support of the exchange, as at present, they are willing to bear a fair share of the cost of operating it, if it can be continued with assurances of sufficient tonnage.

"To this end a meeting of Tidewater bituminous coal shippers and transshippers using the ports of Baltimore, Philadelphia and New York and of the railroads serving those ports and originating the coal, should be called at the earliest practicable moment to consider what arrangements can be made between the railroads and the shippers and transshippers, for the continuance of pooling."

# Railroads Ordering Much Equipment with Return to Corporate Owners

Inquiries Indicate More Extensive Orders Are About To Be Placed—Huge Terminal Projects Are Expected Soon—Steel Work Delayed by Car Shortage—Prices Holding Many Orders Back

**I**NQUIRIES forecasting extensive purchases of equipment are making their appearance with the return of the railroads to their corporate owners. A flood of orders was expected with the relinquishment of federal control, but this expectation has not yet been realized. The volume of orders for equipment has been delayed by the following factors:

1. Expectation of a drop in iron and steel prices. It is the opinion throughout the country that the prices now holding have reached their peak and will take a final downward turn shortly. In fact, a few orders have been placed recently in the steel trade in which it was stipulated that the price should be that quoted at the time of delivery.

2. Decision as to freight increase shortly to be handed down by the Interstate Commerce Commission.

3. Extension of credit for the purpose of purchasing new equipment. It is believed this extension of credit will be somewhat increased by the decision handed down recently by the Supreme Court to the effect that the properties of carriers are to be valued at present prices.

4. Present wage situation and scarcity of labor. The present wage is to be maintained for six months longer by act of Congress, but the scarcity of labor is expected to be relieved by a reduction of wages in other quarters.

The withdrawal of the dissolution suit against the U. S. Steel Corporation has not been a market factor. While exports of iron and steel showed an increase in February in the face of unfavorable rate exchanges so far this month the situation has reversed. In fact, European business is almost at a standstill.

## CAR SHORTAGE IS AN IMPORTANT FACTOR

Production is now at the highest rate it has been in a year and the prospects for a further increase are good. Of the finished products, sheets are the scarcest.

In the Pittsburgh district one of the greatest factors operating right now is the shortage of cars—the car supply being about 40 per cent of normal. This acts directly on the pig iron output, as the deliveries of coal to the blast furnaces are away below normal.

Although the making of extensive purchases of railroad equipment is being held up, necessary purchases have been made or are in way of being negotiated. Since the first of the year about 1,200 locomotives have been bought or are being negotiated for at the present time. Contracts for 25,000 cars are expected at an early date.

There are three great terminal projects, one already under process of construction and construction on the others is expected to start soon. Of these, the Chicago Union Station program, which has been under way for some time, will involve an outlay in construction costs alone of some \$20,000,000, and the purchase of 17,000 tons of fabricated steel for the main structure.

The Markham freight yard of the Illinois Central, which is now under construction, is a \$4,000,000 improvement and is regarded as a prime need of the business world. Electrification of the Illinois Central lines in Chicago and the construction of new passenger and freight station facilities involving \$80,000,000 is under way. This expenditure will, however, be spread over a period of years—the completion of the electrification program having been set for some 20 years hence. Also the Cincinnati Southern R.R. has drawn up tentative plans for the construction of union terminals in Cincinnati, which they will shortly submit to the officials of other roads entering that city. This project, if carried through, calls for an initial expenditure of from twenty to thirty million dollars.

## LARGE ORDERS FOR FREIGHT CARS TO BE PLACED

The general opinion holds that upward of 100,000 freight cars will be ordered within the next month or two. The market for locomotives and passenger cars is expected to be proportionate. Among car purchases recently made are to be noted the following: Atchison, Topeka & Santa Fe, 2,500 refrigerator cars and 500 gondolas; the Erie, 1,000 box cars; Southern Pacific will construct 1,000 box cars; Canadian National Railways have ordered 1,000 box cars from this country and 1,000 from Canadian firms; Canadian Pacific has placed an order for 1,500 box cars with Canadian firms.

Among purchasers of locomotives are St. Paul, 100; Canadian National Railways, 55; Great Northern, 45; St. Louis Southwestern, 10; Santa Fe, 50; New York Central, 280.

Compared to the above are to be noted these prospective purchases: Illinois Central, 1,000 gondola cars; Missouri Pacific, 2,000 box cars; Elgin, Joliet & Eastern, 700 gondola cars; Seaboard Air Line, 2,000 fruit and vegetable cars; Canadian Pacific, 1,000 box cars; Midland Packing Co., 1,000 refrigerator cars; Missouri, Kansas & Texas, 40 passenger cars; Roger Ballast Car Co., 500 freight cars; Union Pacific, 65 passenger cars; American Refrigerator Transit Co., 2,028 refrigerator cars; Grank Trunk, 3,000 automobile cars and 2,000 flat cars; Rock Island lines, 325 freight cars and 75 cabooses; N. Y. Central lines, 15,500 freight cars and 261 passenger cars; Northern Pacific, 1,000 ballast cars.

The St. Louis, San Francisco and St. Louis Southern expect to be in the market for 1,000 box cars each; the Louisville & Nashville will construct 1,000 box cars; the Chicago, Burlington & Quincy is in the market for 4,000 freight cars and 40 passenger cars, and the Fruit Growers Express is in the market for 500 refrigerating cars. As for locomotives, the Chicago & Northwestern contemplate the purchase of a large number, the Illinois Central, 110; the Missouri Pacific, 5; Santa Fe, 25. The Pennsylvania R.R. has already let contracts for 186,000 tons of rails and the Big Four for 36,000 tons.

## Union Said To Be Back of Armed Raid Against Guyan Region

Governor Cornwell Appoints Investigating Commission—Testimony Heard March 13

WHEN another hearing was held, on March 13, by the commission appointed by Governor Cornwell of West Virginia to probe conditions in the Guyan region and to investigate the attempted invasion of Logan County by armed miners last September, only four witnesses out of about forty summoned put in an appearance. Members of the commission are Major T. B. Davis, acting Adjutant General, and Colonel George S. Wallace.

The testimony of witnesses heard on March 13 tended to show that in many instances where organizers of the United Mine Workers had called meetings of the Kanawha locals these locals had called out the miners as a preliminary to a march on the Guyan field.

The first witness heard was W. H. Morris, superintendent of the Cabin Creek Consolidated Coal Co.'s mines at Kayford. He said on the stand he had had no previous notice of the men being called out but had asked Tarretta, president of the local union, why the men were ceasing work. Tarretta told him that the men were going to the Guyan Valley because women and children were being killed in that field. When Tarretta was asked the source of his information he named "Keeney and Mooney." Morris said he supposed Tarretta was speaking of C. F. Keeney, the president of the United Mine Workers of America in that district.

According to the testimony of H. H. O'Neal of St. Albans, superintendent of the Sharlow mine of the Sharlow Gas Coal Co., on Big Coal River, on the day prior to that on which he was officially notified that the miners proposed to drop their work, he had observed Charles Workman, connected with the headquarters of District 17, United Mine Workers, talking with the mine workers. Shortly afterward he was waited upon by a committee who notified him that the miners would not report for work.

Notice was given him by a committee that the miners were going to cease work for several days, according to the testimony of W. A. Otey of the Acme operations of the Cabin Creek Consolidated Coal Co. He added that following such notice the men actually quit work and that the mines were closed down for three days.

## Bulkhead for Retaining Coal Piles

Bulkhead is Easily Constructed—Can Be Taken Down and Material May Be Used Over Again

A RATHER interesting revetment has been devised by the Philadelphia & Reading Coal & Iron Co., and is used at its storage yard near Schuylkill Haven, Pa. As will be seen from the accompanying illustrations the bulkhead is simple but strong. Only two men are required to construct it as no planks longer than 12 ft. are used and since these are only 2 in. thick the work of construction is easy. The planks are 10 in. wide and are set on a batter of 4 in. to the foot. The back braces themselves are 4-ft. long and

A BULKHEAD THAT IS PRACTICALLY FINISHED  
This bulkhead 16 ft. high retains a bank of coal in one of the pockets at the Schuylkill Haven Storage Yard.

are spaced on 3-ft. centers horizontally while vertically they are on 12-in. centers.

Bulkheads of this type are built as coal is filled in behind them, since it is necessary that the back supports should be firmly imbedded in the coal. As the coal rises a man with a shovel sees to it that the coal is packed tight underneath the back braces since otherwise when weight comes on the bulkhead these members will have a tendency to settle, causing bulges in the retaining wall.

As the coal fills in behind it the bulkhead is built up until it reaches the maximum height of 16 ft. In

BUILDING A BULKHEAD TO RETAIN COAL  
Showing the simple method used to construct these light bulkheads. This work is done by two men.

one of the illustrations it will be noted that the bulkhead has apparently reached its maximum height in the center and at one end, but at the other there is not as yet sufficient coal in place to allow the wall to be built higher.

It will be noted in the illustration in which the bulkhead is just being started that temporary braces are used to assist in keeping the face of the wall straight while in the figure showing the almost completed bulkhead, extra outside bracing at the bottom may be plainly seen.

One exceptionally advantageous feature of this bulkhead is that it can be taken down as easily as it is erected. The material may then be laid away and used over again. Except in placing the auxiliary braces no spikes or bolts are employed, the coal itself performing this function.

# Is Canada Able To Fill Its Coal Needs Without Help from the United States?\*

F. W. Gray Answers the Question with a Bold Affirmative—From Fort William, Westward, Canadian Rocky Mountain Coal Will Fill All Demands—Other Consuming Areas Can Be Supplied from Nova Scotia Mines if Canals Are Deepened To Accommodate Ocean-Going Vessels

**T**HE political division of North America, as it finally evolved from the conflict of races and the divergent search for an identical ideal by two branches of the English-speaking peoples, bore no considered relation to the balancing of the mineral resources of Canada and the United States; and, in so far as coal supply is concerned, the boundary line was fixed before the national importance of coal in peace and in war was realized, and in ignorance of the coal resources of what used to be known as a part of the Far West, and is now known as the Canadian provinces of Alberta and British Columbia. If no national issues had arisen, and North America had developed its resources as one nation, then in the East the coal fields of Nova Scotia would have supplied the Atlantic seaboard with bituminous coal; British Columbia and Alberta would have supplied the Pacific seaboard and the Northwestern States, and the central territories would be supplied entirely from the great central coal field of Pennsylvania and the adjoining coal-yielding states.

"This is the natural scheme of distribution. Under such circumstances, however, it is certain that the territory which is now included within our own borders would not have reached so advanced a development as is the case, as the independent impulse of our own nationality would have been absent in the North, and industry would have concentrated itself further south and nearer the great central coal field. Also, it may be surmised, the coal production of Nova Scotia would have been upon a much larger scale than it is, while Sydney, N. S., would have been of greater importance and Montreal of lesser importance than is the case today.

## CANADA WOULD LIKE TO BE SELF-SUFFICING

"But the national issue did arise. Canada is a nation, so acclaimed and recognized in the councils of the world powers, and although the boundary line between ourselves and our good friends in the United States has certain disadvantages to ourselves, we must make the best of accomplished facts.

"Our unevenly distributed and deficient coal resources, and to a large extent also their backward state of development, are a consequence of this country's determination to be a nation within the British Empire. We

have desired national independence, and have achieved it, and as our coal problem is an outcome and a concomitant of this desire and achievement, it becomes a principal duty of Canadians to work for the solution of our most pressing internal problem—the country's coal supply. North America is favored above the nations of Europe in having a supply of anthracite, a most desirable fuel, more especially for congested centers of population, because of its smokeless character and great heat value. Unfortunately, Canada has no anthracite, so far as is known, with the exception of some anthracitic metamorphosed coals of relatively small tonnage in the West.

**Argues that anthracite coal is a luxury and that Canada, like Europe, can do without it. Alberta alone has as much coal as the remainder of the western half of North America. Nova Scotia if adequately financed could mine twice as much coal as now and supply all Canada from its own mines to Lake Superior.**

Therefore, if we use anthracite it must be imported.

"Large parts of Canada use bituminous coal and have never found it necessary to import anthracite. In many parts of Canada the burning of anthracite is not understood, and all grates and furnaces are adapted to the burning of bituminous coal. This being the case, and seeing that Europe gets along with bituminous coal, it can hardly be argued that anthracite is indispensable in those districts of Canada that can be supplied with bituminous coal from Canadian mines, and it follows that anthracite, under such circumstances, no matter how desirable, is a luxury.

"Assuming therefore that bituminous coal can entirely replace anthracite in Canada, we have only to consider over what extent the bituminous coals we have can be distributed, or how we can extend the zones of distribution of Nova Scotia and Western coal so that they may approach, and, if possible, meet.

## PENNSYLVANIA SHOULD NOT CUT OUT ALBERTA

"So far as Canada west of Fort William is concerned, it surely can be equally well supplied with bituminous coal from the Western mines in Canada as with bituminous coal brought from Pennsylvania. Transportation distances do not enter into the question in the same grave manner as they affect Nova Scotia coal.

"West of the longitude of Lake Superior, there is as much bituminous coal in the province of Alberta alone as in the remainder of the western half of North America.

"Canada has not yet apprehended all the implications of the vast concentration of coal, and probably oil also, that exists in Alberta, and there is no compelling reason why the zone of distribution and use of Alberta bitumi-

\*Synopsis of an article read by F. W. Gray, editor of the *Canadian Mining Journal*, on March 9, 1920, before the Canadian Mining Institute and entitled "Coal Supply of Canada."

ous coal should not be as extended as that of Pennsylvania and West Virginia. West of Fort William, Canada is more than capable of providing itself with all possible requirements of fuel.

"There remains for our consideration the possible radius of distribution of coal of Nova Scotia, but first something should be said as to the extent of the maritime coal deposits and the costs of mining them. The coal fields of Nova Scotia, while they are not relatively large, forming as they do only one per cent of Canada's coal resources, have never been worked to full advantage because of divided interest and scattered operation.

"The consolidation of operation that followed the formation of the Dominion Coal Company was the salvation of the Sydney field, but, unfortunately, consolidation did not go far enough to insure the maximum cheapness of production that it only can make possible. Sporadic, unco-ordinated, haphazard, and in some in-

on the part of the railways and large purchasing interests in Canada, and the failure of the Government in successive administrations to understand the paramount influence of coal supply on financial, military and naval security.

"For many years it was the policy of the Canadian railways to screw down the Nova Scotia coal operators to a minimum selling price, American competition being skilfully used to effect this. As an instance, it may be mentioned that Cape Breton coal was sold to the large railways in Canada delivered at Montreal at \$2.40 per ton, a figure that was—when the costs were correctly calculated—below the cost of production. The American coal, against which the Cape Breton coal competed on a rigorous basis of monetary cost, was itself sold at prices below the cost of mining to the American operator, a fact that the statistics of the United States Fuel Administration have since abundantly demonstrated.

SURELY BY THIS THE CANADIANS SHOW THEMSELVES TO BE OUR BLOOD KIN  
For They Exhibit the Same Readiness to Sell and Chariness to Buy That Is Ours in Generous Measure

stances unwise operation of the coal deposits of Nova Scotia, have conspired to prevent a healthy growth in the annual production of this province.

One who, say in 1907, had looked forward to an annual coal production in Nova Scotia of ten million tons by 1920, could not have been regarded as unduly optimistic. Indeed, the objective of the Dominion Coal Company alone was at that time seven million tons annually, as those who refer to the late Mr. James Ross's remarks on this matter may confirm for themselves. The disappointingly small production of Nova Scotia during the past six years is chiefly a result of the war, and in that respect is a passing incident, but underlying, and altogether apart from the temporary effects of war, coal production in Nova Scotia has shown a recessive rather than an advancing tendency. What is the reason for this lack of vigor in the maritime coal industry?

"Without attempting to excuse the faults of operation that have hindered coal production in Nova Scotia, it may be answered that the non-progressive character of the industry is due to a general lack of encouragement

"Coal must always cost relatively more to mine in Nova Scotia than it does in the uniquely favored deposits of the United States, but a considerable part of the abnormally high mining costs in Nova Scotia at the present time is a result of too small a production of coal in relation to the capital invested in mine properties and transportation equipment. Nothing can so effectively lower the unit costs of production in Nova Scotia as an increase in the output of coal.

"The coal companies there possess equipment sufficient to handle from two to three million tons annually of additional coal so far as transportation and marketing facilities are concerned. Given a sufficient expenditure and the necessary lapse of time to open new collieries and extend the existing collieries, there is no reason why Nova Scotia cannot produce twice its present output of coal. Such a program, however, is possible only through the thorough-going consolidation of the operating coal companies, unification and concentration of direction, and very large capital expenditures on new mines and transportation equipment.

"Before investors can be induced to undertake the

heavy commitments indicated there must be a change in the attitude of the public and the railways toward the coal trade. C. A. Magrath, the fuel controller, in his final report, suggested that the railway companies should give contracts for their coal supply for a term of years, at cost, plus a fair percentage of profit, provided the coal companies make the necessary expenditure to equip and maintain properties with all appliances to enable production to be carried on at a minimum of cost.

"There is much to be said for this suggestion. It should be obvious that if in times of plenty our Canadian railways choose to starve our domestic coal mines by buying coal in the United States, or by demanding that the domestic producers meet United States competition, even though that involve a profitless transaction or an actual loss to the Canadian producer, our coal trade must live a precarious life, and will always be unready to meet the national emergency which may at any moment arise through political, social or diplomatic occurrences, or by reason of physical hindrances.

"Canada cannot be run as a successful economic whole if we ignore the obligations of nationality and insist on buying goods in the cheapest market merely because they are cheap. That way lies loss of independence and national disintegration.

#### NOVA SCOTIA'S UNDISCOVERED COAL RESOURCES

"The apathy of public opinion, if not actual hostility toward the struggling coal trade of Nova Scotia is not the less effective because it is based on ignorance and is against the best interests of Canada, for not only has it discouraged the expansion of the known coal fields, but it has deterred the search for the hidden coal fields, the existence of which is much more than a presumption.

"It would be entirely incorrect if we were to assume that the known coal deposits of Nova Scotia comprise the whole of the coal resources of that province, and here again there is reason to complain of lack of interest on the part of our governments, for no part of Canada has been so neglected during the past thirty years in the matter of geological exploration and mapping as Nova Scotia.

"As a case in point, one would mention the Springhill coal field, which has an unknown but extremely probable southward extension. The port of Parrsboro, which now serves the Springhill coal field, as known, is distant by water only some 90 miles from St. John, N. B., which place by the direct line of the Canadian Pacific Ry. is about 380 miles from Montreal. There is nothing insuperable in sending coal from this field to Montreal even by rail. Much longer hauls are made from the mines to the great cities in the United States.

"There is, however, no necessity to send coal by rail. It has in the past gone from Nova Scotia to Montreal by water at the rate of two million tons in the season of navigation, and could be sent in very much greater quantity by providing additional transportation equipment.

"The feasibility of sending coal by water from Nova Scotia to Montreal being already demonstrated, what can be done to cover the gap between Montreal and Fort William that is now entirely dependent upon United States coal? The cheapness of transportation from the United States central coal field to the Great Lakes and the adjoining territories arises from a combination of water transport and a preferred inland freight rate from the mines to the Great Lakes ports.

"The carriage of coal to Canada gives an outward load for the cars carrying iron ore from the Lake Superior ranges to Pittsburgh, which otherwise would make the outward journey in an empty condition. From such points as Ashtabula and Cleveland the transportation of coal to Canadian ports is cheaply effected by the water routes.

"Apparently the only way by which the radius of distribution of Nova Scotia coal can be greatly extended east of, say, the eastern extremity of Lake Ontario is by deepening the St. Lawrence channel so as to give access to ocean-going vessels to the Great Lakes.

"In such event Nova Scotia coal could compete on fairly even terms so far as cost of transportation is concerned with United States coal, as the all-water route from Nova Scotian ports to the point of unloading in a Great Lakes port would offset the preferred rail rate from the United States mines to the point of transshipment on the Great Lakes. This project is under investigation. So far, all the protests that have been made against the project are such as, if conversely applied, constitute arguments for its carrying out, so far as Canada is interested.

"It may be submitted that if the project is pronounced feasible it offers to Canada the opportunity to become thoroughly self-supplying and self-contained in bituminous coal supply. By affording to Nova Scotia a cheap water route for coal shipments, the coal miners there would be able to so enlarge outputs as to effectively reduce costs of production, and soft coal from Nova Scotia could be shipped far enough west to span the country and meet Canadian soft coal shipped from the western mines.

"The deepening of the St. Lawrence waterway is, however, not an immediate possibility, while the necessity to make Canada more independent in bituminous coal supply is indeed a most immediate urgency. What is feasible in the enlargement of distribution of Nova Scotia coal today? We can at least get back to the pre-war shipments to St. Lawrence ports of some two million tons annually.

#### NEED TO WIDEN RADIUS OF NOVA SCOTIA COAL

"Further, the same factors of increase in the cost of coal production have been at work in the United States also. There is also some encouragement in knowing that the Canadian people have to some extent awakened to the serious handicap we suffer from such entire dependence on the United States for coal, the danger of dislocation of our business, the threat of discomfort and physical danger that are always impending whenever interruptions to our coal supply occur. These new conditions suggest that an extension of the pre-war radius of distribution for Nova Scotia coal may be possible at the present time if energetic effort is made by the operators to recover and extend the St. Lawrence markets.

"The present moment offers an opportunity to the coal interests of Nova Scotia, and the transportation interests of Eastern Canada to work together to secure the future permanency of the coal trade of Nova Scotia, which, whether they appreciate it or not, is something on which the railways, the public and the government of Canada are equally interested with the coal operators and the mining population.

"The equipment of the Nova Scotia collieries is modern, and, apart from the duplication inseparable from divided interests, no grave criticism can be made of the

technical or business management of the operating properties, but some changes will be necessary before the most efficient production is possible.

"In particular, the present system of single shifts will have to be replaced by multiple shifts. The present practice of working the collieries for only eight hours in each 24 hours, often for only five days a week, does not permit of full returns from the capital invested, or the extent of underground territory developed.

"With regard to bituminous coal supply we may conclude that the problem is not so much one of a source of supply in Canada as it is one of deficient and difficult transportation. Canada has sufficient bituminous coal for its own needs, but the country has never undertaken to become thoroughly self-supporting from a conviction that this was not only desirable, but actually essential to national independence. It cannot, therefore, be said that our capacity to be self-supporting in bituminous coal supply has even been tested.

#### CANADA IS LOSING ITS HOLD AS COAL PRODUCER

"Far from expanding our coal output we are not even holding our own, and every year's record of Canadian coal outputs is more disappointing than the one preceding. How is it that the worst examples of dishonored bond issues in Canada are connected with coal-mining enterprises, and that in at least two well-known instances the capital invested by Canadian and British interests has been lost, and reorganization has been effected by United States capital?

"While a good many reasons could no doubt be advanced in explanation, the lack of any well-defined policy to foster production in Canada, *because of its national importance*, will explain the ill fate of many well-intentioned and promising coal mining flotations on this side of the line.

"It may be necessary to explain that this presentation of the Canadian side of the coal problem is not made in any spirit of hostility toward the United States. On the contrary, the generous and wholehearted manner in which the U. S. Fuel Administration co-operated with the Fuel Controller of Canada in the desperate conditions of fuel shortage in 1917-1918 is gratefully remembered here.

"In this instance the United States shared its inadequate supplies of fuel with Canada in a manner worthy of all praise. The people of the United States, however, are the last people in the world to excuse a lack of enterprise in another people, and if they should criticise the backwardness of our fuel policy, it would be criticism well deserved."

#### Farrington Declares Insurgent Strikers Sought to Destroy Union

The insurrection of the southern Illinois miners in August, 1919, was a deliberate plan of the Socialist Labor party to wreck the organization of the Illinois United Mine Workers, according to a declaration made by Frank Farrington, Illinois president, in an address before the Twelfth District Convention at Springfield. He said: "Starting at a mass meeting held in Belleville, the trouble spread through the Springfield and Peoria district until 20,000 of our members were involved in a movement in positive defiance of every law and principle of our union.

"Some of the instigators of the trouble said it was a move to force the calling of a special district convention, while others asserted it was to force the operators to concede a new and improved wage agreement. Still others said it was to force the resignation of your district officials. As a matter of fact, it was an attempt deliberately planned by the Socialist Labor party to wreck our union.

"In the course of the rebellion local unions were looted of their funds and accredited leaders insulted, slandered and defied. Irresponsible committees rushed madly over the State, creating prejudice and dissension. Marching bands were sent out to mold destructive sentiment.

"If this union of ours is to survive we must have discipline in our ranks. Discipline is the very essence of unionism. Unionism does not mean individualism, where each shall have license to do as he will. Instead, it means that all shall be bound to act in unison. Where there is no law, there can be no unity, and where there is no discipline, there can be no law."

#### Some, in West Virginia, Expect General Coal Strike

Just how the majority report of the Bituminous Coal Commission appointed by the President will be received by the United Mine Workers in West Virginia has not so far become apparent, officials of the union refraining from making any comment on the majority decision.

Inasmuch as the union is insisting upon a substantial increase in wages and working conditions more favorable than those enjoyed by the men in any other industry and is insisting that nothing short of that will be acceptable, there is much speculation in West Virginia fields as to whether there will be another strike in case the unanimous decision of the Coal Commission, if indeed, there is one, should not be up to the expectations of the miners.

What leads some to believe that preparations have been made for another strike was the announcement made the latter part of January by John L. Lewis, president of the United Mine Workers, that it was the intention of his organization to unionize the five non-union fields in West Virginia, such fields having furnished the bulk of production during the November strike and having been the weak spot in the armor of the United Mine Workers.

Selling price of *Coal Age* will on and after April 1 be 20c. for domestic circulation. The foreign subscription rate will be \$6 per year, or 25c. a copy.

President Wilson has removed the regulation of bituminous coal prices, to become effective April 1, and has transmitted the report of the majority of the Bituminous Coal Commission, notifying the mine workers and operators that this must be the basis on which the wage settlement must be made.

# Is Price Regulation Any Longer of Legal Force?

Cushing Tells Wholesalers Progress Is Being Made in Meeting the Lever Act by Proof that It Is Unconstitutional, That Even If Still of Force It Must Be Enforced Reasonably—Legislation To Annul Act Is Being Promoted

ON WEDNESDAY, March 17, the New York Wholesale Coal Trade Association held a luncheon at the Whitehall Club, New York City, and discussed the various phases of the Lever Act. About 80 coal operators, sales agents and other trade representatives were present. C. Andrade, Jr., president of the association and treasurer of the Matlack Coal and Iron Corporation, presided and introduced George H. Cushing, of the American Wholesale Coal Trade Association, who gave an extended review of what had been done in reference to relieving the coal trade of the incubus which it carried as an outcome of the passing of the Lever Act during the war. Mr.

Cushing said that with certain officials in Washington "nothing smells so bad as a wholesale dealer in coal."

He stated that when the matter of providing coal to concerns who were unable to obtain fuel supplies arose, he offered to give the time of the staff of the American Wholesale Coal Trade Association and to supply the necessary money to provide for a proper distribution of the coal output, but he soon found that the attitude of the Administration was so strongly against the wholesaler that it was impossible to obtain a hearing.

In fact, the average man engaged in a Washington bureau felt perfectly safe in turning a deaf ear to any proposition that was made to him because he knew that his chief was as busy as is a lawyer who is conducting 50 or 100 suits at one time and hence could not spare the time to give any outsider a hearing. Every bureaucratic chief was disposed to leave matters to his subordinate, because he was so terribly rushed he could not attend to the matters himself.

Another attitude he found prevalent was that the Railroad Administration handled all the coal that was produced in the country and, therefore, knew more about the coal business than the operator, the wholesaler or consumer, and for that reason was more competent than any other to handle problems relating to the coal industry.

He stated on the other hand, that his dealings with the Federal Reserve Board afforded him no little gratification. When he called on W. P. G. Harding, the Governor of that board, he anticipated that he would barely be granted a hearing, but he was surprised to note the extreme alacrity with which that official acted when the matter was introduced to him. Mr. Cushing declared to him that he could not expect the Federal Reserve Board to do anything in regard to the confis-

cation of coal by the railroads, despite the fact that they had not paid for the coal that they had confiscated. He could not give him any relief in regard to the coal that had been diverted and had not been paid for, because these were matters between the coal companies and the railroads and between the coal companies and the consumers. He could, however, take action to relieve the owners of coal from the great difficulties they were in by reason of the fact that the railroads had held coal on the tracks and so had tied up about \$30,000,000 of the coal companies' money.

Mr. Harding called upon the banks to be extremely careful not to call any coal man's loan, in view of the

fact that the situation of the coal men was extremely precarious, owing to the action of the Government in confiscating and diverting coal. He extended the rights of the banks to loan 25 per cent instead of 10 per cent of their reserves to coal companies, and thus further relieved the necessities which the occasion had created.

He said that from \$40,000,000 to \$50,000,000 was paid within three days to the coal companies, largely by reason of action that was taken by Mr. Harding. He alleged that there were two ways of overthrowing the Lever Act; one was by showing that it was unconstitutional, and the other was by obtaining legislation which would abrogate the Lever Act. The American Wholesale Coal Trade Association was endeavoring to do both.

First, with reference to the constitutional enactment of the Lever Act: The legislation was passed before the armistice, when the nation was engaged in war. The need for it passed with the signing of the armistice. Mr. Cushing said that the validity of the act terminated with the need for its enforcement. But even supposing that the state of war or peace did not bear in any way upon the question, it still remained true that the act called for reasonable prices. He declared that instead of it costing 15c. to market a ton of coal, the amount allowed, the expense involved amounted to between 18½c. and 20c., and this did not include any buying cost. Consequently the regulations of the Fuel Administration were really in violation of the Lever Act.

In reference to the political method of obtaining relief, he stated that a bill to repeal the Lever Act had been introduced by Representative U. Q. Tilson on behalf of the consumers of coal who found that the provisions of the law hindered rather than helped them. This bill, the Representative thought, would do much to wipe out the injustices from which the pur-

Wholesalers, says Gibbs L. Baker, can sell safely for cost plus a profit without violating the Lever Act. Government had no right to refix old prices without inquiry. Coal is not on all fours with spiritous liquors. George H. Cushing states that the purchaser does not break the law when he pays more than Government prices.

chaser of coal suffered as a result of the arbitrary powers which the President possesses, or believes himself to possess. The bill had been referred to the proper committee and he expected that a similar bill would be introduced into the Senate.

Gibbs L. Baker, who is the attorney for the American Wholesale Coal Trade Association, in his remarks which followed declared that the Lever Law was unconstitutional, and that in any event its validity was largely destroyed by the fact that the prices set upon coal on Oct. 30 were fixed without any inquiry as to any changes in costs of materials or efficiency of labor, and, therefore, without due knowledge of the facts upon which a price could be based. It was not in accordance with the law that the Fuel Administration should place a price without due inquiry and then resign, leaving no opportunity to protest and no provision for investigation. He quoted in support of his viewpoint the opinion which former President William Howard Taft prepared for the Smokeless Coal Operators' Association.

#### PROHIBITION NO PRECEDENT FOR COAL CONTROL

It is true, he said, that in the matter of spirituous liquors Justice Brandeis had declared that the President was still in possession of his war powers, regardless of the signing of the armistice, but alcoholic liquors have always been regarded as subject to police powers of governing bodies, and the right to buy and sell spirituous liquors has never been regarded as a property right but as one which is revocable at will on the part of duly constituted authorities. He declared that the members of the American Wholesale Coal Trade Association would be perfectly justified, legally and morally, in selling coal at the price it stood to them, plus a reasonable profit, and he advised them so to do. He believed that no court would hold them liable for such action.

Mr. Baker said it might be possible that the present control of the situation would cease to exist at midnight on April 30 if the railroads had by that time signed contracts for the next year's supply of fuel, otherwise it might again be extended by executive order.

Mr. Cushing in his further remarks stated that the American Wholesale Coal Trade Association would stand back of any member who took action on this account. He was not in favor of giving notice to the Attorney General that such action would be taken, because that would be tantamount to admitting that some might think that action of this kind was illegal.

#### ONE MAY SAFELY BUY COAL AT PRICE OFFERED

Mr. Cushing remarked that there is nothing to prevent any man buying coal at any price at which he can secure it. There is nothing in the Lever Act to require a man to pay only the Government price. If the operator believes that he is justified in selling his coal above the price set by the Government, or is willing to take his risks with the Lever Act, that is his business and there is nothing to prevent a wholesaler from buying coal at the seller's price, for there is no fine or threat of imprisonment attached to such act. This is true whether the Lever Act is in force or invalid.

Charles S. Allen, secretary of the Wholesale Coal Trade Association of New York, who recently returned from several days' stay in Washington, told the members of the trade that the coal men had the support of United States Senators Calder and Wadsworth of New

York State in their fight to have the law repealed and that he had spoken to several Congressmen, some of them from the Southern States, who also had expressed their approval of the efforts being made by the industry. He said that the support of many civic and other organizations had been sought to aid in the fight and that so far such support had been promised by more than 200 bodies located in various sections of the country. He also said he was in receipt of telephone messages from nearby Boards of Trade promising support and then he read extracts from several letters he had received in reply to a letter sent out by the local association asking help.

Mr. Allen said other means of aiding the fight were in contemplation and that the trade would be advised of them shortly.

A letter had been sent broadcast by the association, over the signatures of President Andrade and Secretary Allen asking the recipients that if they favor a discontinuance of governmental control of fuel, to write their Senators and Congressmen to vote for the repeal of the Lever Law. The letter reads:

"The war has ended and the emergency legislation growing out of the war also should end. Our citizens have submitted patriotically to the regulations of the Fuel Administration and lately to the Central Coal Committee, which is a branch of the Railroad Administration.

#### EXCESSIVE CONTROL MAKES PRODUCT SHORT

"Government control of the railroads is a demonstrated failure; and with equal certainty, government control of coal is a demonstrated failure. It is the direct cause of the present shortage and congestion in the handling and transport of coal. There is plenty of coal-mining facilities and labor but the administrative red tape now in vogue will not let the coal reach the consumer.

"The business of the coal trade is to supply the country adequately with coal. If left to itself, the coal trade will do this, as it did before the war. If you favor a discontinuance of governmental control of fuel, ask your Senators and Congressmen to repeal the Lever Law, and write us when you have done so."

The meeting ended without any action being taken; in fact no action was intended. Under date of March 18 a letter was sent out disclaiming any purpose on the part of the officials of the New York Wholesale Coal Association to advise the members as to the course they should take as regards the Lever Law and stating that they personally found themselves in disagreement with Mr. Cushing on many points.

**Duty Concerning Highly Charged Electric Wires.**—A coal mining company may be held responsible for death of a miner resulting from negligence of the company in permitting a cable heavily charged with electricity to become and remain uninsulated at a point exposing employees to danger.

A miner is not to be charged with contributory negligence for failure to disconnect an electric wire before working near it in the absence of a rule or prevailing custom requiring him to do so, unless he appreciates or should appreciate the danger under the circumstances of the particular case. (*Kentucky Court of Appeals, Kitchen vs. Hillside Coal Co., 194 Southwestern Reporter, 791.*)

# Termination of Federal Control of Coal and Coke Industry Sought

Senator Frelinghuysen Introduces in Senate Bills Providing Seasonal Transportation Rates and Appointment of Commissioner with Advisory Powers—Confiscation of Coal by Railroads Prohibited

**T**ERMINATION of the Federal control of the coal and coke industry, appointment of a Federal Coal Commissioner, and the designation of reasonable rates for the transportation of coal are being sought by Senator Frelinghuysen of New Jersey. Bills looking to the above ends, representing the conclusions of the subcommittee of the Committee on Interstate Commerce, which has conducted an extended inquiry as to the coal situation, have been introduced by Senator Frelinghuysen. In offering these bills to the Senate Mr. Frelinghuysen pointed out many of the conclusions of his committee.

The proposal as to the reasonable freight rate is that it be made compulsory for railroads to handle coal from April 1 to Aug. 31 in each year at 15 per cent less than the regular rate and that during the remainder of the year 15 per cent be added to the rate charged for the movement of coal.

The bill terminating Federal control of the coal industry also amends the act to regulate commerce so as to expressly prohibit any railroad to confiscate or divert any coal which may be in its possession solely for the purpose of transportation and which the owner has not voluntarily transferred to the railroad. The bill providing for the appointment of a Federal Coal Commissioner gives that official only advisory powers. Senator Frelinghuysen takes the stand that the Government has not taken proper interest in the coal industry and that no agency of the Government has been authorized to study and keep track of its progress.

The bill provides that the commissioner shall compile statistics and inform himself as to prices and cost and form a clearing house for the coal industry. The salary of the commissioner is fixed at \$10,000. The bill also provides a \$5,000 salary for a secretary to the commissioner. The commissioner is given ample powers to demand information, facts, and figures from all those concerned in the coal industry. Among the provisions of the bill are the following sections:

"Sec. 7. That the commissioner shall investigate, from time to time, the organization, management, and practices of dealers and operators, costs and profits in connection with the mining, sale, and distribution of coal, the terms contained in leases of coal mines, the prices demanded or received for coal, the distribution, storage, and sale of coal, and the methods and processes employed therein, the consumption of coal, and the transportation of coal in commerce, including the distribution of coal cars.

"Sec. 8. That the commissioner shall investigate, from time to time, the wages, working conditions, terms of employment, and the living expenses of miners and other workmen employed in mines from which coal is transported in commerce.

"Sec. 9. That the commissioner shall investigate,

from time to time, methods and processes for the storage of coal, and conduct such experiments and researches as he may find advisable to determine the most efficient means for such storage.

"Sec. 10. That the commissioner shall file, analyze, and compile all data and information obtained under sections 7, 8, and 9, and shall keep such data and information revised currently and available for immediate reference. He shall publish from time to time, in such form as he deems proper, such portions of the data and information obtained thereunder, except trade secrets or names of customers, as he may deem advisable in the public interest.

Sec. 11. That the commissioner shall, on request, and to the extent that he deems proper in the public interest, place at the disposal of any private or public board, commission, or other group engaged in the arbitration, conciliation, or settlement of any labor dispute arising in any mine from which coal is shipped in commerce, all data and information in the files of his office relating to the matter in controversy. The commissioner shall cooperate with the Interstate Commerce Commission in promoting the proper distribution and most efficient use of coal cars in commerce. He shall also cooperate with dealers, consumers, and others to encourage the construction of facilities for the storage of coal.

Sec. 12. That the commissioner shall investigate the desirability and practicability of prescribing statutory standards for various kinds and grades of coal, and shall submit a report thereon to Congress before April 1, 1921, accompanied by such recommendations as he may deem proper.

Sec. 13. That the commissioner shall investigate the desirability and practicability of a statutory zoning system defining the distance from the mine within which coal therefrom may be transported in commerce, and shall submit a report thereon to Congress before April 1, 1921, accompanied by such recommendations as he may deem proper."

## Fear That Operators Will Be Jailed If They Meet Miners in Collective Bargain

**M**UCH indignation is felt by the Pittsburgh coal operators at the decision in Washington that the findings of the Bituminous Coal Commission are to be regarded merely as a report and not as an award, the whole question to be threshed out in a conference between the mine workers and operators. With 125 men under indictment for just such a conference the operators feel little inclined to meet in another such session, even at the pleasure of the Washington administration, fearing that what they are begged to do today they may be jailed for doing tomorrow if fickle Washington does not happen

to register its approval of the terms on which agreement is reached.

What did the conference do before but try to provide for just such a bargain as the majority of the Bituminous Coal Commission has recently awarded, or rather, as it seems, has merely suggested? Yet that provision, or suggestion—whichever it may be—of the majority is less than would satisfy the minority member of the commission, John P. White. It is said that the present indictment is being brought because of the wage discussion in the past conference. Whether that is so remains to be seen when the indictment is a matter of public knowledge.

But if it is indictable to try to make an agreement in accord with that advised by a majority on a Government commission and to raise wages 25 per cent, how much more indictable it would be to put oneself in an agreement with the minority member of that commission and raise wages 35 per cent! Consequently, when a meeting is held the operators must concede more than 25 per cent and look forward to incarceration or hold to 25 per cent and fail to make any headway.

They prefer to refuse to put their heads into the noose until they are assured by a lifting of the indictment that a conference will not be held to be in the nature of a conspiracy. With a few exceptions the names of the indicted are not known, but it is surmised that the list includes many prominent coal operators and in particular all the members of the scale committee. The operators would prefer to wait and let the mine workers get into a more amenable state of mind such as would make it possible to obtain from them an agreement to accept the rate of pay proposed by the majority of the Bituminous Coal Commission. It is believed that the mine workers have no disposition to go the length of striking on April 1, their present declarations being merely bluster.

## Several Operators Arrested in Indianapolis for Conspiracy

Violation of the Lever Act Charged—Allegation Made That Indictment Is Brought on Ground That Joint Wage Conferences Are Illegal

AT LAST arrests have been made in connection with the inquiry of the Federal Grand Jury at Indianapolis into the alleged conspiracy to enhance the price of coal. Those arrested on March 20 were E. D. Logsdon, George A. Van Dyke, B. E. Neal and W. B. Tobin, all of Indianapolis, Ind., and William Zeller of Brazil in the same state. Mr. Logsdon and Mr. Zeller surrendered to the officers, while the others were served with capiases. It appears that Carl A. Fletcher, also of Indianapolis, surrendered to the U. S. Marshal on March 19. Each of the operators gave a bond for \$10,000 and was released till May 4 pending arraignment on that date.

At the marshal's office the statement was made that capiases for the arrest of 51 Indiana men had been placed in the hands of the officers and that it was the intention to serve them as soon as possible. The capiases to be served on men in Illinois, Ohio and western Pennsylvania who are involved in the charges will be mailed to those States for service locally.

E. D. Logsdon, after his arrest, prophesied that as a result of the prosecution there would be a tie-up in the bituminous coal industry after April 1. In his statement he asserts that, according to information that the operators have received, the Government is making its prosecution on the ground that joint wage conferences are and have been illegal. This theory of the illegality of joint wage agreements is said to be the basis for a part, at least, of the charges against the coal operators and mine workers.

If the Government questions whether such conferences and pacts are legal and tries to convict the operators and mine workers for taking part in them, the former, at least, will be indisposed to try to enter into the conferences or sign the agreement, according to Mr. Logsdon. He declares that the Government is inconsistent, for President Wilson as late as March 19 urged that the operators and mine workers get together again and make a collective bargain, thus giving Government sanction to just that practice which the Government by its action appears to be trying to condemn in the courts.

The Federal authorities, it must be conceded, do not admit that the prosecution is based on any such ground and they declare that they will not divulge the details till all of the men accused have been arrested.

On March 22 the list of the indicted was increased by 20 more names: J. S. Riddle and Harold Henderson, attorneys for the United Mine Workers of America; Ed Stewart and William Mitch, president and vice-president of the Indiana or No. 11 District of the same organization; John Heslar, Robert Perry, John Little, F. McQuaid and Harry Lents, members of the Executive Board of District 11, and Will J. Freeman, Homer Talley, former president of the Indiana Bituminous Coal Operators' Association; George Watham, coal operator; M. L. Gould, J. C. Kolsem, Phil H. Penna, secretary of the Indiana Bituminous Coal Operators' Association; Hugh Shirkie, A. M. Ogle, David Ingle, Charles Fettinger and U. G. Hall.

Jabez Wooley, an Evansville coal operator, was arrested at that city at about the same time. As in the other cases the bond was set at \$10,000 and was furnished in every instance. By noon March 23, the number under arrest had reached thirty-one, mostly of Terre Haute and Evansville.

## Will Hold Over Convention Till Scale Committee of Mine Workers Has Met

Pending a final decision from the Bituminous Coal Commission, the annual convention of the miners of the Fifth Sub-District of Ohio will not be held. Tuesday, March 9, was the date originally set for the convention, but when it was apparent that the report of the coal commission would not be available by the time set for the convention, the convention was postponed, it evidently being the intention of the miners at their convention to pass upon the decision of the commission and to indicate whether its decision was satisfactory or not. President Ray of the sub-district has indicated that the sub-district convention will not be held until after the General Scale Committee of the mine workers meets at Washington.

## All-Year-Round Work Demanded by Anthracite Miners

Steady Employment as Well as 60 Per Cent Wage Increase Sought in Wage Conference

AT THE conference of representatives of anthracite miners with a sub-committee of the operators at the Union League, the miners demanded all-year-round work as one of the conditions of the new wage agreement the conference seeks to reach. No decision had been reached when the conference adjourned.

An increase of 60 per cent in pay and work throughout the year were declared by the miners to be the least concessions with which they would be content. The operators insisted that present conditions in the anthracite fields offer an opportunity for steady work, but the miners contended such conditions are only temporary, due to effects of the war.

Family budgets showing increased costs of living were presented by the miners in support of their demand for more pay. Philip Murray, international vice-president of the United Mine Workers, stated that the work of the conference was proceeding satisfactorily. He said the operators had offered no counter proposals.

The existing wage agreement expires April 1, but it is not anticipated there will be a strike called on that date, even if a new one has not been arrived at. The miners take the position, however, that any wage increase decided on after April 1 be made retroactive. To this the operators take exception, pointing out that they cannot make retroactive any increase in the price of coal made necessary by higher wages.

## Anthracite Miners Quote Living Costs To Justify Wage Increase

Operators Say That Advances Granted Since 1915 Have More Than Kept Pace With Prices

THE second week of the Anthracite Wage Conference between the sub-committee of mine workers and operators going on at the Union League Club, New York City, was devoted almost entirely to a discussion of statistics dealing with the cost of living and other economic conditions.

International President John L. Lewis was absent in Washington all week and his place at the conferences was taken by Philip Murray, vice-president of the International Union. The sessions last week began on Tuesday and continued over Saturday, instead of adjourning on Friday, so that the members could return to their homes over Sunday.

At the session on March 16 the earnings of the miners and the demand for a 60 per cent wage increase were discussed. The operators, it was learned, made known their objections to wage increases at this time, declaring that the advances granted the workers since 1915 have more than kept pace with the high cost of living.

When the session finished on March 17 a statement was issued saying that the sub-committee had discussed the opportunities of anthracite mine workers for employment, their earning capacity and the increase in the cost of living.

As at the previous day's conference a mass of statistics was presented by both operators and miners, and it is said that the operators produced reports showing that the workers have been making a "living wage."

The longest statement issued during the present conferences was given out at the close of the session of March 18. It read:

"The production of coal under the present agreement both as to the total amount produced and the per capita production of the miners was taken up at today's meeting. Various arguments were advanced by both parties as to the bearing of the figures shown upon the demands of the mine workers. The representatives of the operators contended that the anthracite industry offers an opportunity for steady employment to the workers, while the miners' representatives argued that the present steady employment in the anthracite regions is largely due to the abnormal conditions arising out of the war.

"The mine workers presented figures showing increases in rent, coal and clothing from 1914 to 1920, also compilations of increases in the cost of living in the anthracite regions and compiled from family budgets secured from anthracite mine workers and their families. Both miners and operators have at their command large statistical data to fortify their debate."

### EFFORT BEING MADE TO PREVENT A STRIKE

The session on March 19 was largely devoted to the presentation of additional data by the miners in support of their claims. During the week there were rumors that the conference was waiting for some word from Washington regarding the bituminous wage controversy. It is not expected that any definite action can be taken on any demand until the soft-coal situation is settled.

Every effort is being made to prevent a suspension of work by the mine workers. With this end in view it is said that the operators have asked the miners to continue to work after April 1 if an agreement cannot be reached previous to that time. In reply to this request, it is said, the miners stated that this might be possible, provided that whatever agreement might be reached would be made retroactive from April 1. It is believed the miners will hold out for this provision.

The scale committee of the union, appointed at the tri-district convention held in Wilkes-Barre, considered the request of the operators at a three-hour session on March 20 at the Continental Hotel. Further consideration of the request took place on March 23.

The action of the scale committee in postponing definite action on March 20 was later reported to the sub-committee at the Union League Club. After a brief session it was stated that the sub-committee had continued the consideration of the mass of figures presented by the miners covering the increase in the cost of living and its relation to the request of the miners for an increase in wages. The miners argued that the figures justified their claims for higher wages. Copies of all of the data submitted were read into the record and will be considered by the operators.

Philip Murray, international vice-president, who is attending the sessions of the sub-committee during the absence of President Lewis, has said that every effort will be made to reach an agreement before the expiration of the one now in force. "We have a contract to

make and we are going to make it before the present agreement expires if it is possible," he has said.

It is believed that there would be quicker action by the sub-committee if the bituminous wage controversy was settled. President Lewis is now in Washington working on this situation. Notwithstanding all the time devoted to a discussion of the demands, it is said the miners are determined to make the strongest kind of a fight for the recognition of the union, which has always been refused by the operators.

The sub-committee devoted its session on Monday, March 22, to a consideration of the earnings of the mine workers. Figures were presented by the representatives of the miners showing the full time earnings of the various classes of labor in and about the mines during the past four years.

The sub-committee did not resume its conferences until the afternoon and after a two-hour session adjourned to the next day. It was thought likely that the Scale Committee of the miners would on Monday give further consideration to the proposal of the operators that the men remain at work after April 1 in the event that a new wage agreement is not agreed upon, but it was said at the Continental Hotel that no session was held and that further discussion of the proposal would not take place until the morning of Tuesday, March 23.

This session of the Scale Committee was considered the most important yet held by that body since the beginning of the present negotiations. It was understood that the officers of the union would advise the men to move slowly before framing their reply to the operators' proposal.

## Seasonal Freight Rate Would Obviate Car Shortage

Senator Frelinghuysen's Bill, by Promoting Regularity of Movement, Would Eliminate Fall and Winter Rush

**P**ROBLEMS that have long vexed the coal industry are promised a solution by the seasonal freight rate bill introduced by Senator Frelinghuysen. The measure reflects the ideas of Commissioner Clark of the Interstate Commerce Commission, Mr. Frelinghuysen said. Some of the beneficial results expected from the bill were summed up by the Senator from New Jersey as follows:

It would stabilize the price of coal. The capacity output of all the coal mines in the United States, assuming fairly constant operation, would far exceed the present consumption. The output of all these mines working, as at present, only intermittently during the spring and summer months, and working to capacity during the fall and winter months, is barely sufficient to supply the current needs and the greatly increased cold-weather demand for coal.

During the winter the demand so nearly equals the currently available supply that scarcity prices prevail. In addition to this, the actual cost of production per ton is unduly enhanced because the operator must, during the time his mine is closed down or working intermittently, keep together his organization and expend money for the upkeep and maintenance of the property, all of which must be added to the price of coal which he mines and sells during the rush season.

If the demand for coal were reasonably constant throughout the year, many of these costs based on holding plant, capital, and personnel idle for a large portion of the time would disappear, and the price of coal would more nearly represent only current costs of production plus a reasonable profit, leaving no opportunity for charging scarcity prices during the months when the greatest amount of coal is consumed.

Such legislation would obviate very largely the pressing necessity for more coal cars. The present supply of coal cars, while totally insufficient to handle the fall and winter rush under existing conditions, would be fairly adequate to carry all the coal desired by consumers if this equipment could be kept moving with greater regularity throughout the year, as would be the case if the advantage of lower summer and spring freight rates could be held out to induce consumers to receive coal shipments in advance of their winter needs. Under the present system thousands of coal cars lie idle during the spring and summer, while the whole available supply of coal cars is entirely insufficient to handle the fall and winter emergency.

Such legislation would remedy the present inadequacy of terminal facilities. The large amount of coal which must now be transported within a comparatively short time in each year tends to glut already overcrowded terminals. The increasing inability of existing terminal facilities to handle extraordinary seasonal demands without entailing serious delays and disproportionate terminal costs is one of the most glaring weaknesses in the present American railroad transportation system.

## All Mines To Share Orders Equally

Seek Also To Have Insurgent Strikers of Belleville, Ill., Reinstated

A movement for the equal distribution of orders among all the soft-coal mines of the United States was inaugurated at a sub-district meeting of the United Mine Workers a few days ago in Belleville, Ill. James Mason, secretary-treasurer of the Belleville sub-district, was instructed to ask John P. White, miners' representative on the National Coal Commission, to induce the commission to incorporate in its decision on the miners' wage a provision that coal orders be distributed equally among the mines, to the end that a more even distribution of employment may be secured.

It was stated at the meeting that some mines work steadily while others operate only part time because the railroads concentrate their purchasing at a few large mines. It also was charged that these mines were favored by a larger delivery of coal cars. The allegation also was made that the southern Illinois miners were being deprived of employment because the railroads were purchasing largely from the non-union mines of Kentucky.

Reinstatement of Belleville miners who were discharged for activity in the insurgent strike at the Southern Coal Co.'s mines last summer, or an order to strike at those mines until the discharged men are reinstated, was demanded in a resolution adopted at a meeting of the Belleville sub-district of the Illinois United Mine Workers.

## Movement to Tide During January Largest in Five Years

Bituminous coal dumped at North Atlantic ports totalled 3,185,000 net tons during January, 1920, according to the U. S. Geological Survey. This was a large increase over November and December, when many mines normally shipping to tide were closed by the strike. In fact, the movement was the largest attained in any January during the last five years. The total tonnage dumped during the first ten months of the present coal year was 32,793,000 net tons. Compared with the preceding coal year (1918-1919) this was a decrease of 4,471,000 tons, or 12 per cent.

### BITUMINOUS COAL SHIPPED TO TIDEWATER (Net Tons)

	Coal Year, 1919-20	Coal Year, 1918-19
November.....	2,235,000	3,270,000
December.....	2,036,000	3,206,000
January.....	3,185,000	2,954,000
Coal year to Jan. 31.....	32,793,000	37,264,000

Coastwise shipments to New England during January amounted to 804,000 net tons. This was the largest tonnage reported since last September, and except for that month and for August, the largest since December, 1918. In comparison with January of last year it represented an increase of 83,000 tons, or 11.5 per cent. Cumulative tidewater shipments to New England from the beginning of the present coal year now amount to 7,424,000 tons, as compared with 13,329,000 tons during the corresponding period of the year 1918-19.

### BITUMINOUS COAL SHIPPED TO NEW ENGLAND VIA TIDEWATER (Net Tons)

	Coal Year, 1919-20	Coal Year, 1918-19
November.....	703,000	1,162,000
December.....	674,000	876,000
January.....	804,000	721,000
Coal year to Jan. 31.....	7,424,000	13,329,000

Overseas exports from North Atlantic ports during the month were 896,084 net tons, which may be quite roughly distributed as follows:

New York.....	.....
Philadelphia.....	103,000
Baltimore.....	174,000
Hampton Roads.....	591,000
Charleston.....	29,000
Total.....	897,000

As compared with the 230,325 and 182,664 tons exported from these ports in November and December, respectively, this was a marked increase. It was, however, less than half the tonnage sent overseas in October, before the strike necessitated restricting exports.

## Danzig Is Short of Housing Facilities and of Fuel

As in most other cities, there has been for some time a marked shortage of housing facilities at Danzig, which has been aggravated by the fact that many quarters suitable for dwellings have been rented as offices by new firms coming to the city, says *Commerce Reports*.

The authorities have endeavored to relieve the situation by converting barracks, officers' clubs and other buildings into dwelling houses. Two official boards, the Wohnungsamt (housing office) and the Mietsinigungsamt (office for settlement of ques-

tions pertaining to rentals), are charged with finding dwellings for the population and settling disputes and adjusting rentals between landlords and tenants. The powers of both boards are extensive.

The fuel shortage has constituted another serious problem for the Danzig authorities. In January, 1919, the tariffs for gas and electricity, which are both furnished by municipal plants, had to be materially increased. Fares collected by the company operating the street railway lines were raised in February. The services of the company had to be restricted in the course of the year.

As a further means of saving fuel restaurants and moving-picture theatres were ordered closed at 9 p. m., although they are now permitted to remain open until 11, provided they have their own lighting, for which benzol is widely used. With few exceptions, stores have to be closed at 4 o'clock.

## Heavy Export Coal Traffic at Charleston, W. Va.

The *Charleston Gazette* states that coal that is moving through Charleston is probably better known to people in towns along the Southern Ry. than to people of Charleston. For some time long coal trains have been hauled into the Charleston yards, just above the city boundary, and many more are on the schedules.

A Spartanburg man who had observed these long coal trains cross Main street in his town, said that it looked as if all the coal in the world was moving down to the seaboard. He said that people in that section were wondering what became of the coal after it reached Charleston.

For months, the movement of export coal through Charleston has been steadily growing, the several companies expanding their business. A considerable quantity has been sold to the Paris-Lyon-Mediterranean Railroad in France, this being transported in the railroad's own steamships. Other vessels have also carried coal from Charleston to European ports. Several cargoes have been taken to Boston.

Coupled with a heavy freight business generally, this movement of coal has added considerably to the burdens of the office of the division superintendent, Clifton P. King, but the matter of arrangements for storage tracks has been handled without a snarl. Mr. King is widely known as an expert in solving problems growing out of heavy traffic and Charleston has had its freight moved over the Southern Ry. as promptly as possible in all the circumstances.

While it has been reported that the Southern Ry. has been considering the construction of another unit at its coal terminal on the Cooper River, near the Country Club, nothing official has been announced and it is said that nothing will be said about the matter for some time. When the terminal was built, it was designed so that additional units could be installed if the expansion of the business warranted.

## Czech Industries Retarded by Coal Shortage

A partial shutdown of Czecho-Slovakia's industries is threatened because of the scarcity of coal. The demand for Czech products is so great that the coal requirements of industries exceed pre-war requirements. The situation is complicated by falling off in supply due to the difficulties of working the mines and the treaty with Austria requiring them to give up a large part of their supply.

Anthracite coal production last year was 10,000,000 tons, which is nearly 4,000,000 tons below the normal. The output of

bituminous in the same period was 16,500,000 tons as compared with 23,000,000 tons before the war. Of this supply 1,000,000 tons of anthracite and 3,500,000 tons of bituminous were surrendered to Austria, leaving only 56 per cent of the former and 67 per cent of the latter coal available for domestic consumption. The Government has carefully apportioned the supply to the various needs of the country.

## Coal Output in Nova Scotia Is Not Up to Average

The production of coal in Nova Scotia for the last three months of 1919, Consul Charles M. Freeman, Halifax, Nova Scotia, Canada, states, was hardly up to the other months of the year. The output for the period was over 1,000,000 tons, an average of about 11,000 tons daily. There is practically no reserve stock on hand; all the surplus production from the coal fields of Cape Breton has been taken by steamships calling for bunker, except a quantity sold to the Netherlands Government.

No new mines have been developed, although the Dominion Coal Co. has in view the opening of new collieries during the coming year. Labor conditions have curtailed production.

## Price of British Bunker Coal Continues To Be High

The following cablegram has been received from Consul General Robert P. Skinner, London, regarding the price of bunker coal and the movement to advance the outward freight rates:

Bunker coal at the port of London is selling at 155s. per ton. Coal for British industrial works is selling at the controlled price of 40s. per ton, and equivalent quality bunker coal at 140s. per ton. Since last May the price of bunkers has risen by 100s. per ton, while ordinary cargo freight rates are practically unchanged. There is a movement in progress to advance outward freight rates from the United Kingdom by 50 per cent if bunker prices cannot be lowered.

## Coal Conservation Regulations in Force in Denmark

So serious has the coal situation in Denmark become that the government has found it necessary to formulate stringent regulations of the hours of business. Even the temperature that may be maintained in houses is prescribed. For instance, no private house is permitted a temperature in excess of 53 deg. F.

Restaurants must close at 10:30 each night, street car service ceases at midnight. All theatres and moving picture shows open at 6:30 and all stores and offices must close on four days of each week at 5 o'clock. Copenhagen, being far north, has very short days during the winter months. The population must get up in the dark, even if they rise at 10, and dusk begins to gather at 3 in the afternoon. Consequently laws governing early closing make life very dreary.

## South Wales Collieries Agree to Fixed Maximum Prices

The South Wales collieries have agreed to a fixed price for bunkers—large, £4, small £3 per ton, to be effective April 1. The new prices will apply on all shipping, home and foreign. It is expected that other ports will meet this cut.

## Scranton, Pa.

### Spectacular Mine-Cave Developments —Engineers Investigate Oxford Working—Mayor Connell and Police Assist

West Scranton was a storm center during the second week of March in regard to the mine-cave agitation which has been such a prominent issue in Scranton and vicinity for the past few months. The city council of Scranton recently authorized the expenditure of \$10,000, to investigate mining conditions under the municipality. Accordingly Mayor A. T. Connell appointed five engineers to inspect the Oxford mine of the Peoples Coal Co. James Smith, city mine-cave engineer, is chairman of the board of engineers; and Arthur W. Long, engineer of the Scranton Mine-Cave Commission, is to act as advisory head to the engineers and also to give assistance in the investigations of mine workings.

The area underlain by the workings of the Oxford mine has been the scene of great disturbance for the past few months. The surface and the buildings on it have been seriously damaged; the gas mains have been broken, with the result that explosions occurring not only did considerable damage but further incensed those living in the vicinity. The Surface Protective Association of Scranton has been especially active in efforts to obtain relief from such conditions. In addition certain apparently incriminating information reached the city authorities and doubtless influenced Mayor Connell to order an examination of this particular mine. The mayor stated that he wanted an exhaustive, unbiased, unprejudiced and uninfluenced inspection made; he believes that when the inspection is completed, that the public will better know what steps to take to prevent further damage to surface and property and possibly to life and limb.

In pursuance of this plan the board of engineers entered the Oxford mine to verify certain information and to obtain a definite idea as to underground conditions in the West Scranton section. Here they met with forcible resistance, especially when they attempted to dig through a wall in the mine, behind which it was suspected mining operations were being carried on, despite an injunction of court. This section is underneath or near North Main Avenue. Mayor Connell himself was refused admittance to the Oxford mine on the first day of examination and a number of sensational incidents marked the attempts of the engineers to gather information in the workings.

### Effect Entrance to Mine With Armed Force

On the following day Mayor Connell made another effort to enter the mine in company with 45 armed patrolmen. Not often in the history of the city has there been as much excitement around a mining operation, as when the mayor and patrolmen fought with officials and employees of the Peoples Coal Co. around the entrance to the mine. During the days following, sensational scenes attended the efforts of the engineers to gain admittance to the Oxford mines and to certain parts of the workings. Entrance was effected through old openings and by means of connections with an adjoining mine of the Delaware, Lackawanna & Western company.

Apparently the engineers have unearthed evidence which may have an important bearing on the situation affecting the West Scranton section. No official statement has been made by those having the inspection in hand, and several weeks may elapse before the examination is completed. Many physical difficulties are presented to those inspecting the workings and reports state that strangely enough the Peoples Coal Co. is placing many obstacles in the way of those examining the Oxford mine. Mayor Connell has issued a proclamation covering the situation in which he orders the Oxford

mine closed and that no further mining of coal will be allowed; also that no persons will be allowed to enter the mine except fire bosses, pump runners and those of like occupation, whose presence is necessary to the safety of the mine, until examination has been completed.

The city of Scranton authorizes and will enforce this order. The matter of surface protection is to be brought to a head. It is claimed that the Davis law, enacted in 1913, has been violated. The matter will undoubtedly be carried to the courts, upon whom those directly interested seem to place reliance for a final decision.

## Charleston, W. Va.

### About All Chesapeake & Ohio Coal Cars Missing—Mine Supply Serious Problem—Confiscation of Kana- wha Coal—New River Ex- ports at Low Ebb

Time was being marked by many mines in this section of West Virginia during the second week of March while operations awaited cars which never came. Production was seriously retarded in fact by the inability of railroads to supply cars even approaching mine ratings. This scarcity of cars, therefore, made it impossible to make any gains in the output over previous weeks. In fact production was less than half of what it ought to have been and less than half of what it could have been had the car service been at all satisfactory.

No causes other than a shortage of cars operated to hold back production. Nearly a full production was possible at the beginning of the week, largely through a two-day car supply combined in one; then the output was lowered to 45 per cent and finally down to 35 per cent. During most of the week the supply was just about 45 per cent of requirements.

### Months Before Car Shortage is Over

Although the Chesapeake & Ohio R.R. has about 40,000 coal cars, most of such rolling stock is now in use on other roads and some of it in the far West. As a matter of fact fully 35,000 coal cars are missing from the home line with little prospect that they will be returned for several months to come; so that the Chesapeake & Ohio is confronted with quite a serious problem in endeavoring to supply its mines with cars. Of course under such conditions, it is useless to attempt to operate in many instances, and little hope is held out for anything better than a 50 per cent supply for some time to come.

Little progress has been made so far in this part of West Virginia in closing contracts for the new coal year; companies are far behind on contract deliveries for the present year, being not only utterly unable to supply the spot demand but also to furnish the coal which they are under obligations to deliver. It did not require embargoes to prevent coal shipped from reaching its destination. Confiscation accomplished the same purpose, and the widely advertised cessation of confiscation is described by producers as a myth; since coal consigned to tidewater points for export is being gobbled up, even after it is in the pools ready for cargo loading, and it is then handed over to the railroads and to New England utilities. Naturally then export shipments were reduced to the very minimum.

Continued control over the coal industry is not only exasperating coal men in West Virginia, but it is also arousing keen indignation, as operators feel that Government officials are openly discriminating against the industry. With the Government still maintaining its hold on the industry and with everything at sixes and sevens, few contracts are being made under present uncertain conditions.

### Heavy Kanawha Production Loss

Less coal was produced in the Kanawha region between March 8 and 13 than during the first six days of the month, and the inability of the mines to secure cars was almost solely responsible for the heavy production loss sustained. At only one time during the week did loadings approach normal and that was on Monday when production was 28,000 tons; Coal River mines on the same day having a production of 15,000 tons. As soon as Monday's cars were loaded out, mines began marking time once again, the supply on Tuesday being only 44 per cent of allotment. There was a slight improvement on Wednesday, but on the day following there was only a 36 per cent supply.

Contrary to general expectations, much Kanawha coal was still being confiscated during the second weekly working period of the month. The mere fact that coal was being shipped under permit to tidewater, did not protect such coal from confiscation even after being dumped into the pools at tide.

### New River Output 37 Per Cent

New River mines failed during the second week of the month to regain any of the ground lost in earlier weeks, suffering to an even greater extent than had been the case in the period between March 1 and 6; a scarcity of cars was the chief factor in holding production to a ridiculously low figure. In fact mines were not working more than half time during the week, and the car supply was, during five out of the six days, much under 50 per cent.

Production fluctuated between 35 and 45 per cent of potential capacity. Under the circumstances producers were finding it impossible to keep pace with the demand. Export shipments were at about as low a point as they had been for some time, confiscation of New River coal in transit, as well as at tidewater, having as much to do with that condition of affairs as anything else. It was stated at the end of the week, that smokeless producers would disregard Government prices and charge what was considered a fair market price for smokeless coal. There was nothing to mar the labor situation in the New River field during the second week of the month.

## Bluefield, W. Va.

### Mines Idle in Southern West Virginia— Virginian Ry. Places Big Car Order —Acute Pocahontas Car Short- age—Tug River Increases Output

The second week of March found the conditions much worse on the Norfolk & Western, from a transportation standpoint, than had been the case during the previous week; while on the other hand, mines on the Virginian had a supply slightly more liberal than during earlier weeks. Idleness was quite general throughout the extreme southern mining fields of the state during the greater part of the week. As a matter of fact the end of the week found the car supply almost at zero. For two days, or during one-third the weekly working period, there was not more than a 20 per cent supply of cars available for most mines on the Norfolk & Western. In the face of such discouraging transportation conditions, optimism had given way to pessimism as a hoped for improvement in the car supply had not materialized. It is extremely doubtful if the average mine in the southern part of the state was able to operate more than three out of the six days, and some of the smaller mines were affected to an even greater extent.

Under such conditions coal costs were mounting quite rapidly, since the overhead expense is going on just the same. Not only was the meager car supply, during

the weekly period ended the thirteenth, embarrassing from a transportation and financial standpoint, but it was breeding much discontent among the miners, and was driving them away in great numbers, owing to the irregularity of work and the small amounts they were able to earn.

Another drawback to satisfactory coal movement was poor motive power, the movement of coal being extremely slow. However it was Government regulation of distribution and of prices, which was also seriously affecting the business of mining during the week ended the thirteenth, since coal was being confiscated in just as large a volume as ever, whether it was for export or not, so that there was virtually no coal at all being exported during this period. As a matter of fact on March 11, at all three tidewater terminals—Sewell's Point, Lambert's Point and Newport News—there was only 16,000 tons of coal available for export loading.

Until the Norfolk & Western succeeds in securing the return of more of its own equipment than it now has on hand, a continuance of the car shortage is expected. As the influenza and other factors which affected labor conditions, during a part of February, have been eradicated, the man power available in southern West Virginia is such as to make a large production possible, although during the first two weeks of March, inability to secure work was causing many miners to seek employment elsewhere.

#### Winding Gulf Works Three-Quarters Time

Slight gains were made in the output of the mines of the Winding Gulf field, during the week ended March 13, not through any improvement in the Chesapeake & Ohio car supply but largely through a more liberal distribution of cars on the part of the Virginian Ry. The supply of cars from the latter road was such as to enable mines to work about 4½ days during the week. On the other hand mines dependent upon the Chesapeake & Ohio for empties had to content themselves with about a half week's supply.

Operators in the Winding Gulf field have been advised that the Virginian Ry. has placed an order for 1,000 120-ton open-top cars for delivery during the present year. Proposed export shipments from the Winding Gulf field have fared the same as exports from other fields, not being treated as exports at all but as subject to Government interference and confiscation; so that coal from the Winding Gulf region actually exported during the second week of the month was quite small in volume.

#### Pocahontas Car Supply 50 Per Cent

Pocahontas production continued to suffer in the second week of March as it has since the first of the year, with losses outweighing the output and with a car shortage counting as the most serious source of this loss. As during the few preceding weeks, the acute shortage of cars cost a production of more than 200,000 tons of coal; the supply of empties, taking the week as a whole, not being more than 50 per cent at the most. Hence, on an average, Pocahontas mines were idle about half of the week, and on the twelfth and thirteenth the quota distributed to various mines averaged just about one-fifth of requirements.

There was little sickness among miners but mine workers were becoming restless and were leaving the field because of the frequent idleness at operations. While priority regulations did not affect export shipments, confiscation did, and by the middle of the month export shipments of Pocahontas coal were few and far between.

Although still seriously handicapped by inability to secure cars, mines in the Tug River field were not affected to as great an extent during the week ended March 13, as other fields in southern West Virginia, therefore the output was increased from about 77,000 to 72,550 net tons, the highest production reached in a period of three months.

With the contract season right upon them, Tug River producers are very much at sea as to next year's contracts, owing to the continuance of Government price control. Indeed the plight of producers is a serious one and they are confronted with the necessity of either shutting down, or else of paying no attention to Government prices.

In view of the opinion vouchsafed by Ex-President Taft it is generally believed that many smokeless operators will disregard Government prices, and it is therefore possible that there will be an advance in the price of smokeless coal within the next 20 or 30 days. It is impossible, operators say, to operate mines at the pres-

ent price of coal as fixed by the Government. Owing to adherence to the rule of the American Car Association, that coal cars be returned empty to home lines, a more serious car shortage than now prevails is looked for in the Tug River and adjoining fields.

### Huntington, W. Va.

#### Car Shortage Losses Far Exceed Output—Confiscation of Coal—Double Tracking of Guyan Branch Requested

There was a downward trend to production in the Logan field during the period ended March 13, production reaching little more than 150,000 tons, with car-shortage losses mounting skyward and far exceeding production. As a matter of fact the loss from transportation disabilities was well over 200,000, it being one of the worst weeks in recent months from a production standpoint; despite the fact that the car supply was better and the loadings larger on Monday (the eighth) than at any time in recent weeks, amounting on that day to 50,000 tons.

Less than half that amount of coal, or 22,300 tons, were produced on the ninth, there being a slight increase on the tenth however when the output was 25,700 tons. However on the eleventh, production had dwindled to one-third of normal, being only 19,850 tons. Logan mines wound up the week with an output of only 17,650 tons, weather conditions being highly unsatisfactory and operating to cut down both the production and movement of Logan coal.

Although confiscation of coal was assumed to have ceased with the passing of the railroads back to their former owners nevertheless Logan producers reported quite a large tonnage still being confiscated, part of it at tidewater. However, the volume so confiscated was far less than was the case when the railroads were under Government control.

Tidewater shipments, especially during the latter part of the week, were running unusually heavy, but so far as could be learned only a small proportion of the coal going to tide was being shipped overseas, not only because of export regulations but also because of the confiscation at tidewater. Western markets were drawing heavily on the Logan field for a coal supply, some of the product of the field also being consigned to southeastern markets.

Logan operators were represented by a delegation who attended a conference at New York (on the nineteenth) between directors and officials of the Chesapeake & Ohio and representatives of various Kentucky and West Virginia coal fields, at which time the double tracking of the Guyan Branch of the Chesapeake & Ohio (in addition to the double track already built) was requested, in order to take care of the additional tonnage from the Guyan field.

### Fairmont, W. Va.

#### Meager Car Supply on Baltimore & Ohio—Other Roads Hard Put—The Reason—Late Lake Season Opening Welcome

While the Baltimore & Ohio R.R., operating in northern West Virginia, appeared to have more cars for the mines on its lines than other roads in the state, even the supply on that road during the second week of the month was, most of the time, below 50 per cent; so that it may be imagined how hard put mines on other roads were for open tops. In all fields, Monday brought a large quota of cars. However, that was the only day out of the six, in which there was anything like a full day's work, for by the second day, even on the Baltimore & Ohio, the quota furnished had dropped to less than half; the West Virginia mines on the Monongahela R.R. were forced to be content with a 30 per cent supply. As a matter of fact that road distributed only 75 cars even on Monday.

Production, it is believed, reached the lowest level on the tenth in the Fairmont as well as in other northern West Virginia fields. In the Fairmont field, the Wednesday distribution was less than 500 cars. With no cars available, to speak of, it was not surprising to find 112 mines not in operation. While idleness was not so general Thursday, nearly 90 mines found it

impossible to operate on that day. Other fields in the northern part of the state, as may be surmised, were not doing even as well as the Fairmont field, and consequently idleness was quite general.

One reason for a more plentiful supply on the Baltimore & Ohio was the fact that that road was not releasing as many cars to connections as were other lines. Furthermore in order to secure coal, the railroad had to deliver cars. While the supply was exceedingly poor even on the Baltimore & Ohio, it was somewhat better than had been observed while the road was under Government control, during recent months.

Western shipments were comparatively limited as compared with eastern consignments. Of such coal as was flowing westward, the bulk of it was being consigned to Michigan and Ohio points. Export shipments were extremely meager in volume during the week. A considerable tonnage of the northern West Virginia product was being used by the railroads. In fact, under a sort of quasi-agreement, about 20 per cent of the fuel produced during the second week of the month, was being furnished the Baltimore & Ohio and other railroads.

#### Lake Season Not to Open for a Month

Little preparation so far has been made by northern West Virginia operators to take care of any Lake business. In the first place it is generally believed that it will be fully 30 days before the Lakes are open to navigation. Although it is believed that little coal remains on hand from last year, and consequently that there will be a pressing demand when the Lake season is opened, yet the demand and the shortage in the East is such, that it will be necessary to equalize the supply and demand before being able to ship coal on a large scale to the Lakes, for next year's reserve stock.

Furthermore northern West Virginia operators rather welcome a late opening of the Lake season, since it is almost impossible to arrive at a proper basis for making contracts under present conditions, and consequently contract-making is far behind that of other years. A year ago producers were eager to find contract customers. Generally speaking, at the present time producers are waiting developments before making contracts.

### Norton, Va.

#### No Let Up in Coal Confiscation—Output 60 Per Cent of Capacity

Despite repeated protests there is no abatement in the confiscation of coal produced at Virginia mines. At least such was the case during the second week of March when fully half the output of the mines was seized by the railroads, not in transit, nor at tidewater but at the mines, with entire disregard of the arrangements between producers and consumers.

This indiscriminate confiscation left very little coal available for commercial purposes, especially when it is taken into consideration that there was a production of only 114,000 tons, or 60 per cent of potential capacity. The other 40 per cent was lost entirely because of the inability of the mines to secure cars.

There was an output of 32,000 tons, in addition to the figures just given, for which there was no cars; but this 32,000 tons was used in making coke. Including the tonnage used in the manufacture of coke there was a total of 145,210 tons produced in the field. Spot coal was not available even in the smallest quantities, owing to the fact that the limited output, less the tonnage confiscated was not such as to enable producers to meet contract requirements.

### Ashland, Ky.

#### Kentucky Mines Big Capacity Increase—Campaign for Improved Car Service—Ex-President Taft's Recent Opinion

Production was punctured to some extent during the week ended March 13 in the northeast Kentucky field, a ten per cent loss, as compared with the previous week's production, being sustained. In other words the output dropped to 124,910 tons, or 51 per cent of a potential capacity (246,000 tons), with the car shortage responsible for a loss of 116,505 tons, or 47 per cent. In the same period of 1919 the output was 109,027 tons.

The car supply to the mines served by the Chesapeake & Ohio and its branches, during the week, afforded 56 per cent work-

ing time, or a little better than three days; while on the Louisville & Nashville a 46 per cent working time was permitted the mines, or a little better than 2 1/2 days for the week. The production on Monday, March 8, was by far the largest one day's loading in the history of the field and had the car supply continued to the same extent during the week, the district would have loaded well in excess of 200,000 tons.

**Large Development in Mine Capacity**

A careful survey of the situation in the northeast Kentucky field, during the second week of the month, disclosed an increase of 57 per cent in the potential capacity of the mines since March, 1918. The increase separately by railroads was as follows: Chesapeake & Ohio mines, 53 per cent; Sandy Valley & Elkhoru mines, 22 per cent; Louisville & Nashville mines 38 per cent; Ashland Coal & Iron mines 5 per cent; marked gains were made in the other local districts, especially along the Long Fork, which was not opened for service two years ago. Quite limited improvement in railroad service was made during the period mentioned so that it is easily explained why the railroad service at this time falls far short of the demand placed upon it.

Increased development has also taken place along the other branches of the Chesapeake & Ohio although possibly not relatively so great. Furthermore, considerable contemplated new development has been retarded by the failure of the railroads to take care of their present business. It is safe to assume that had proper encouragement been given to new operations in the way of satisfactory car supply the productive capacity of the northeast field would easily have been doubled in two years. With the new development now under way it is expected that within a year the double mark will have been reached.

**Aggressive Campaign for Improved Car Service**

Northeast Kentucky operators, in cooperation with those from the other Chesapeake & Ohio districts have started an aggressive campaign for the improved service they feel they are entitled to; it is expected that the entire question will be aired before the Interstate Commerce Commission, if the Chesapeake & Ohio management does not show greater assurance, that they have the matter under consideration; furthermore that they will do everything in their power to improve conditions and at the earliest possible date.

A more liberal treatment of the mine ratings for the ensuing month has been granted by the Chesapeake & Ohio Allotment Commission, so that the new ratings for the northeast Kentucky district show an increase of approximately 10 per cent over the previous ratings. Nevertheless, many of the northeast Kentucky operators are still far from satisfied, and are pressing their claims energetically for additional increases, which they feel they are entitled to.

Former President Taft recently submitted his opinion before the smokeless operators meeting, during the second week of the month, wherein he held that the confiscation of coal by railroads was illegal and the enforcement of price regulations under the Lever Act null and void. In consequence of this many operators in eastern Kentucky contemplate entering the markets with a view to securing the best price offered them for their production; so that it would not be surprising to see quite a general increase in prices within the next two months. The only alternative to price increases, many operators claim, is either a suspension of operations, or bankruptcy.

**Birmingham, Ala.**

**Operators Refuse to Reinstate Miners—  
—Umpire Sustains This Decision—  
Other Miner's Complaints  
Dismissed**

Alabama coal companies, including the Pratt Consolidated Coal Co., Aetna, Liberty, Sloss-Sheffield Steel & Iron Co., Gulf States Steel Co. and the Corona Coal Co., won the first battle in this state in the complaints of miners who claimed that coal operators refused to reinstate them, in violation of the Garfield agreement, following the coal strike last November.

Judge E. H. Dryer, umpire between the coal operators and the miners in Alabama, ruled that the Garfield agreement did not provide that operators must reinstate men who voluntarily quit their jobs, either during a strike or at any other time, but only

where union affiliation was the cause. The umpire held that the men had voluntarily given up their jobs in the coal strike, and the question of reinstatement was a matter of company policy on the part of the coal corporations.

Frank S. White, Jr., acting counsel for the United Mine Workers, declared himself unfamiliar with the contentions of the miners petitioning reinstatement, as he was substituting for his father, Frank S. White, Sr. who was ill. Following the ruling he announced that as the cases of 104 other miners petitioning reinstatement with nine other coal companies, set for hearing March 19, involved the same principle, that they should be dismissed. It was so ordered by Judge Dryer.

The following statement regarding the contentions of the miners was given out by Judge Dryer:

"Wyley Davis, Walter Chism and Will Chism complain that they are denied reinstatement by the Pratt Consolidated Coal Co. for service as employees at the Gamble mines. As members of the United Mine Workers they obeyed the general strike order, effective Nov. 1, 1919, and voluntarily quit the service of the employer. The strike ended, they claim to be entitled, as of right, to re-enter the service of the company, which refuses to re-employ.

**Strike Illegal, Reinstatement Refused**

"The umpire concurs in the public declaration made by the President, and in the opinion of United States District Judge Anderson, of Indiana, that the strike was illegal, and the question presented is, whether or not a member of the union who obeyed and participated, may now rightly demand to be placed in his former position without the consent, and against the wishes, of his former employer. The contention, in its essence, is that an employee may leave and return to the service as and when he pleases; and that this right exists even where the abandonment of the service was without just cause.

"Neither in law, nor in morals, may one escape individual responsibility for the consequences of his acts in obeying the orders of a union of which he is a member. What the union does, with his participation, is his act. If he leaves a service under the orders of the union, he leaves of his own volition. Having left, he cannot, as against his employer, claim any privilege or immunity he could not claim if he had not been a union man and had left the service of his own free will and accord. A union man cannot rightfully claim the benefits, and repudiate the burdens and responsibilities, of concerted action.

"No one would contend that a non-union man may leave a service, without good cause, and be entitled, as of right, to reinstatement against the consent of his former employer. A union man occupies no higher station.

**Practical, Businesslike Ruling**

"The prime object of the Garfield agreement is for increased production of coal. When a strike occurs, in order to continue operations, it is necessary to call in new men, and promote those remaining (who are competent) to places made vacant by those who have walked out. It would be unjust to discharge, or demote these men in order to restore the old men to their former positions whenever they may be pleased to return and demand reinstatement. No business could long survive a practice of that nature; and the true interest of the working man is not advanced by insistence upon it. The agreement, in terms, eleventh section, provides:

"The operator and his superintendent and his mine foreman shall be respected in the management of the mine and the direction of the working force. The authority to hire or discharge shall be vested in the mine superintendent or mine foreman."

"It follows, that these applications for reinstatement should be denied. It is so ordered.

"It being admitted that the several complaints against Sloss-Sheffield Steel & Iron Co., Corona Coal Co., Aetna Coal Co., Liberty Coal Co., Birmingham Trussville Iron Co., Central Coal & Iron Co., Eureka Coal Co., Supreme Mining Co., Red Eagle Coal Co. and Rodney Coal Co. are of like character, and cannot under the ruling be sustained; they are, each, for the same reason, denied and dismissed."

The decision in this test case establishes an important precedent which should be invaluable in future similar disputes. The umpire in the Pennsylvania anthracite field performs a similar service, which dates from the time of appointment of the Conciliation Board.

**Vancouver, Wash.**

**New Coal Field 80 Miles from Portland—Large Deposit of Fine Coal—Good for Coke and Power—Importance of District**

Investigations are now under way, according to A. L. Haley, an engineer of Vancouver, Wash., which may result in the development of coal fields, heretofore dormant, within easy access of the Columbia River basin; this field, it is stated, would supply Portland and the ports of the Columbia River, with an unlimited quantity of cheap fuel and place them beyond the necessity of depending upon outside sources for their coal.

"Within the Columbia River basin, about 78 miles from Portland and Vancouver," said Mr. Haley, "there are available large deposits of coal suitable for ship's bunkers and fuel for industries.

"Southwestern Washington, 78 miles from Portland and Vancouver, has been known for a long time to have large areas of bituminous, sub-bituminous and lignite coal. Near Cinnabar, however, an extensive deposit of bituminous and sub-bituminous coal has been exposed; glacial action having eroded the lignite formation from the surface, bringing into view the earlier sandstones, and exposing seams of coal said to be equal to the best discovered anywhere in the West. The surface croppings had been the source of supply for different military posts in western Washington, for many years before the country became settled, and that the properties have been dormant so long a time, is due to the fact that there has been concerted effort on the part of the coal and transportation companies, to keep prices at as high levels as possible by discouraging development of new fields.

"Shipments of this coal sent to Connellsville, Pa., and made into coke, showed that the coke had a hard body, carried a heavy burden and stood fast driving in a blast furnace for the making of iron.

"A number of tests for byproducts made from shipments averaging about 30 per cent volatile matter, showed that it compared favorably with other coals produced in the United States in regard to yield of tar, oils, pitch, benzol, phenol, ammonia, creosote and gas. Tests made at Sacramento and San Francisco for steam purposes showed that it was of excellent quality for locomotives and steamships.

**Big Coal Development Expected**

"Development of the Pacific Coast has been much retarded by lack of good coal for steam purposes and for coke for smelting ores and manufacturing iron and steel. Most of the coke has been brought here from a distance. A number of attempts have been made to establish steel works in western Washington, but these projects had to depend upon imported coke, and failed. With the development of this large deposit of good coking coal, suitable for the manufacture of iron and steel, the future of the manufacturing industries of the Pacific Northwest is said to be assured.

"It is almost inconceivable the vast quantity of coal that exists upon a 1,200-acre property here. The U. S. Geological Survey Bulletin 424, on the valuation of coal lands, states that a bed of bituminous coal one acre in extent and one foot thick contains approximately 1,750 tons of coal. Under good conditions of mining (about 86 per cent recovery) it should yield over 1,500 net tons per acre. There is a total thickness of 146 ft. of coal on the property, and a yield of 1,500 tons to the acre-foot would make an acre yield of 219,000 tons, or a total of 260,829,000 tons underlying the 1,200 acres. Seam croppings on the east and west, and development in the center indicate that the whole area is underlaid with coal of which about one-third is blocked out.

"It is believed that the eastern portion of Lewis County and upper Cowlitz Valley are destined soon to become one of the most important districts of Washington. Through this region, 75 miles east and west by 30 miles north and south, beginning at Cinnabar and extending to the summit of the Cascades, with Carlton Pass and Nesqually River on the north and Cowlitz Pass and Cowlitz River on the south, there extends a ridge of mountains in which, it is said, nature has a vast storehouse of coal and iron ores.

"On Summit, Carlton, Muddy and Skull creeks, the extreme head tributaries of the Cowlitz River, are found the anthracite coal deposits. At the headwaters of the Tilton River, on Lightning or Devils' Mountain, is a large deposit of hematite ore."

## PENNSYLVANIA

## Anthracite

**Hazleton**—The West Hazleton council is arranging to create a bureau of mines in that place, as authorized by the act of 1913. This bureau is empowered to send an engineer into underground workings at any time, and the company must furnish maps of all operations under the municipality. The object of this is that the city might get proper returns in taxes from coal mining.

The G. B. Markle Co., one of the largest independent anthracite operators, having an annual production of over 1,000,000 tons, will on and after April 1 will sell its coal direct to the trade. This company's well-known Jeddo and Highland Lehigh coals have been handled by the Lehigh Valley Coal Sales Co. for many years. Harry Hosford, who for many years has been connected with the Lehigh Valley Coal Co., will be the sales agent for the Markle company, with headquarters in New York. The official announcement issued by the G. B. Markle Co. says: "On and after April 1, 1920, G. B. Markle Co. will sell direct to the trade its celebrated Jeddo and Highland Lehigh coals, as its sales arrangement with the Lehigh Valley Coal Sales Co. will expire March 31, 1920. We ask that your orders for shipment after April 1 be promptly submitted direct to us for our consideration, addressed to G. B. Markle Co., Jeddo, Pa. We cannot tell you at this time what the prices for our coal f.o.b. mines will be in view of the fact that the wage contract with the anthracite mine workers expires March 31, 1920. Negotiations with the mine workers are now going on, and as soon as agreement is entered into, we will advise you our prices at the mines. We solicit your orders in advance, and any orders you may thus submit which are accepted by us will be contingent upon the acceptability to you of the prices we then name."

## Bituminous

**Pittsburgh**—One hundred leading mining men of western Pennsylvania, including the examining boards for mine foremen and fire bosses of the various bituminous districts, met at the Seventh Avenue Hotel recently and discussed the questions which will be asked at the coming examination. The dates set for the examination are April 6 and 7 for the second-grade mine foremen, April 8 for the first-grade mine foremen and April 9 for the fire-boss tests.

**Creighton**—A property known as the Wainwright holdings consisting of 37 acres of coal lands was reported sold recently. The tract went to a manufacturing company which will erect modern buildings on it. The consideration was approximately \$100,000. The property lies between the Pennsylvania Railroad and the Allegheny River in Allegheny County. The identity of the purchaser was not disclosed.

## WEST VIRGINIA

**Longacre**—Fire on the night of March 8 did damage to the extent of \$60,000 at the plant of the Kanawha and Hocking Coal Co. at this place in Fayette County. In the fire, the machine shop, store and office of the company were destroyed; records and accounts of the company in the office at the time of the fire going up in smoke. It was impossible to save any of the property destroyed, owing to the fact that the fire had gained such headway before being discovered. Increased gas pressure in a sleeping room above the store is generally ascribed as the cause of the fire.

**Huntington**—The Logan Operators' Association held its monthly meeting here on March 13. As illustrating conditions in the Logan field, figures were submitted to the members of the association, showing that wages had been advanced in the field about 125 per cent since 1911, yet since 1914 the cost of living had been advanced only 60 per cent. Other statistics submitted showed that the average working time for miners in the Logan field had been 97 hours for January and only 92 hours for February, a scarcity of cars during the two months having materially reduced the working time. The association agreed to an increase in power rates of 15 per cent for the Kentucky & West Virginia Power Co., whose application is now pending before the Public Service Commission; the power company desiring the increase so as to be able to double its capacity by the installation of a \$2,000,000 plant.

**Charleston**—Smokeless coal operators of West Virginia, in session at Washington for two days during the second week of March, devoted their attention in the main to the question of further control of the

coal industry, with particular reference to the re-establishment of the tidewater pool, the confirmation by the President of the powers delegated to the Director General of Railroads and to price control. A special committee was delegated to make a report as to the right of the Government to continue price-control regulations. The committee referred to submitted a report and as a part of that report the opinion of William Howard Taft, in which the latter held that the Railroad Administration is without legal authority to exercise control over the coal industry, and that there was no validity to orders issued under the Lever Act since October 30, 1919. A committee of the smokeless operators held a conference with the Attorney General and were informed by him that he would feel it necessary to prosecute if there were any infractions of the Lever Act. The committee appointed at the February meeting of the association, to take up with the Railroad Administration the question of securing payment for diverted and confiscated coal, made a report stating that considerable headway had been made in securing settlement for coal, about which there had been disputes, and that in the future more prompt payments might be expected.

**Charleston**—The properties of the Monte Coal Co., on Little Coal River, in the Kanawha district, changed hands on March 10, being purchased by the Buffalo-Thacker Coal Co., at a consideration of about \$1,000,000. L. R. Feese, president of the Buffalo-Thacker Coal Co., with headquarters in Huntington, acting on behalf of his company, consummated the deal for the purchase of the Monte company, at Philadelphia. The Monte company operated three mines at Ottawa on Little Coal River, the three mines having in the aggregate a capacity of 30,000 tons a month. With the purchase of the Monte mines the Buffalo-Thacker Coal Co. will have a monthly capacity of 50,000 tons a month. Identified with the Monte company were: Paul Hurdy, J. M. Moore, Charles M. Gohen, E. J. Heiner, J. K. Onex, J. H. LeBlanc, H. O. Aleshire, Thomas W. Harvey, R. P. Aleshire and W. G. Lax.

## ILLINOIS

**Springfield**—Many local mines in this district are being closed on account of car shortage. The situation is becoming more critical every day. The Auburn mine has been closed several days and the Riverton, Junction and Capitol mines were able to run only a few hours a day, while the Divernon, Sherman, Sangamon and Citizens' mines are also closed some days. The operators and miners both feel that this car shortage is growing more serious and that instead of relief, greater difficulties may be expected. The Great Lakes docks have estimated that they will need 30,000,000 tons of coal and the Eastern operators are confident of the fact that they will be able to supply more than 10,000,000 tons of this amount. The Western operators seem quite confident that they will not be able to make up the deficit.

**Duquoin**—Reports have been circulated of the purchase of the Wabash, Chester & Western R.R., which runs through Tamaroa, north of here, by Jessie Diamond, president of the Southern Gem Coal Co. The report certifies that Mr. Diamond at least has an option on the road for the sum of \$500,000. This road has been changing hands quite frequently during the past four years and, in the event that the Southern Gem Coal Co. takes it over, it is practically assured of future operation, which up to this time has been dilucult. The line passes through the heart of large acreages recently acquired by the Southern Gem and other large concerns, and it is understood that, with numerous extensions and switches, the road would furnish sufficient means of transportation for the product of the many new mines which are under consideration. Drilling is now in progress in many locations by various companies, and as far as can be seen good results have been shown by such prospecting. The Wabash, Chester & Western connects with the Illinois Central R.R. at two different places, also with the Chicago, Burlington & Quincy, these two being the largest shippers from the Southern Illinois fields.

Several hundred acres of coal lands were recently deeded by the West Frankfort Coal Co. and others to the Southern Gem Coal Co., most of which is located in Elk Prairie, Bald Hill and McClellan townships. The total consideration of the deeds filed was \$218,000. These new tracts will add to the already enormous holdings of the company.

One of the largest deals in the mining history of this section was recently consummated between the Peabody Coal Co. and the Franklin Coal & Coke Co., of Roy-

alton, 18 miles southeast of here. The deal included the two mines owned and operated by the Franklin Coal & Coke Co., also the large store of the Franklin Supply Co., 8,000 acres of coal lands and over 100 houses in the town. The amount paid by the Peabody Coal Co. for this property was approximately \$2,000,000.

The Rentchler Station mine located near Belleville, in Madison County, owned by the Enterprise Collieries Co., was recently sold to R. B. Clark, of Harrisburg, Ill., for \$35,000. The mine is located on the Louisville & Nashville R.R. It is not definitely known just what corporation Mr. Clark represents, but it is thought that, owing to the fact that the Aluminum Ore Co. recently bought the Southern Traction property and is buying up other coal properties along its right-of-way, this purchase would give the controlling power of this mine also to the Aluminum Ore Co.

Announcement has been made of the purchase of the Taylor and Carbon mines near O'Fallon, north of here, by the Perry County Coal Co., of Pinckneyville. The former owners of the two mines were J. Edward Yoch and Jacob B. Yoch, of Belleville, going under the business name of the Mutual Coal & Mining Co. The deal was made for a consideration of \$150,000.

The O'Gara mine No. 12 of the O'Gara Coal Co., located near Muddy, Saline County, has been closed down, and from appearances will be abandoned at once, as workmen are now busy removing all of the machinery both on the surface and below ground. The company intends to take out the remaining coal belonging to No. 12 through No. 1 shaft, which is about half a mile north. The air shaft is also being filled in to prevent the sinking in of land surrounding.

## ALABAMA

**Birmingham**—It is reported that the Ricton Mine, of the Big Warrior Coal Co., has begun shipping coal. This operation is located near the Warrior River, in Walker County, and the output will be handled by barge. New houses have been provided for employees and other improvements made.

It is also announced that the Corona Coal Co. is constructing a modern bath house for its employees at its Coal Valley operation, near Cordova, Walker County.

About 600 acres of coal lands belonging to the Gaston estate, located in St. Clair County, has been sold to Watt T. Brown, of Ragland, Ala. Mr. Brown now owns approximately 7,000 acres of coal lands in that section which, it is understood, he will develop at a later date.

## Personals

**George A. Miller**, formerly southwestern sales manager for the Peabody Coal Co., of St. Louis, is now holding the same position with this company at Sheridan, Wyoming.

**J. R. Hudelson**, general manager and treasurer for the Franklin County Coal & Coke Co., of Royalton, Ill., recently shot and killed himself. He was a prominent man in mining circles in that district.

**T. O. Sloan**, formerly head of the office force of the Peabody Coal Co., at West Frankfort, Ill., has been promoted to traveling auditor for the company and will have charge of this work at the various plants owned by the company in southern Illinois.

**Fred G. Campbell**, formerly chief clerk for the Peabody Coal Co., at Marlon, Ill., has resigned to accept a better position in Wyoming, that of auditor of a big group of mines in that state. For some time he was also traveling auditor for the Peabody Coal Co.

**A. H. McLaren**, general superintendent of the chain of mines in southern Illinois, owned by the O'Gara Coal Co., of Chicago, has resigned, effective at once. This announcement was made together with the report of a serious operation which was recently performed upon the superintendent. His successor has not yet been named.

**John J. Mulvehill** has resigned as chief clerk to Frank R. Lyon, vice president of the Consolidation Coal Co. to become identified with the J. C. McKinley Coal, Oil and Gas Co., at Wheeling, W. Va. For several years Mr. Mulvehill was secretary to Geo. T. Watson while the latter was vice president of the Consolidation company.

**Arthur Evans**, for several years chief clerk of the Jefferson & Clearfield Coal & Iron Co. at McIntyre, Pa., has been promoted to a similar position with the Rochester & Pittsburgh Coal & Iron Co., at Lucerne mines, near Homer City, Pa. The Lucerne plant is the largest in Indiana County.

Charles C. Werner, of Somerset, Pa., who has been the acting chief engineer of the Consolidation Coal Co. in the Maryland district, has resigned to accept an important post with the Penn-Mary Coal Co., with headquarters at Reedsville, W. Va., the Penn-Mary company being a subsidiary of the Bethlehem Steel Corporation.

Major Samuel D. Brady, of Fairmont, W. Va., has been elected a director in the Upper Potomac Coal Association, operators of mines in the upper Potomac field composing the association. The officers of the association are: T. M. Dodson, of Bethlehem, Pa., president, and Howard P. Brydon, of Cumberland, Md., executive secretary. Major Brady operates mines in the Fairmont field as well as in the upper Potomac, or Western Maryland field.

D. S. Hanley has announced his resignation as general manager of the Pacific Coast Coal Co., of New Castle, in Kings County, Wash. He leaves the service of the local company to become assistant to the president of the East Ohio Gas Co. at Cleveland, Ohio. Mr. Hanley has for many years been associated with Martin B. Daly, president of the concern to which he now goes, in fact, he came to the Pacific coast some years ago to manage Mr. Daly's coal property at Bayne; the property was in operation until the recent coal strike, at which time the machinery was taken out and the mine closed. It is said that the property will not be reopened until the operators and miners can agree on a basis permitting of running the plant at a profit. Mr. Hanley will be succeeded by Wylie Hemphill, assistant to the vice president of the Pacific Coast Coal Co.

National Retail Coal Merchants' Association will hold its annual meeting June 10, 11 and 12 at Detroit, Mich. Secretary-manager, Ellery Gordon, Philadelphia, Pa.

Kentucky Mining Institute will hold its annual meeting June 4 and 5 at Lexington, Ky. Secretary, C. W. Strickland, Huntington, W. Va.

American Society of Mechanical Engineers will hold its spring meeting May 24, 25, 26 and 27 at St. Louis, Mo. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

Chamber of Commerce of the United States of America will hold its eighth annual meeting April 26, 27, 28 and 29 at Atlantic City, N. J. Assistant Secretary, D. A. Skinner, Washington, D. C.

## Industrial News

**Kemmerer, Wyo.**—The old Star coal mine, eight miles from this place, has been secured by Utah capitalists and soon will be in the producing class. The Star Coal Mining Co., capital stock \$500,000, is to be organized to operate the property.

**Bekley, W. Va.**—A branch office has been opened in this place by the Fort Dearborn Coal & Export Co., of Chicago, the same company having offices in New York, Chicago, Cincinnati and Norfolk. M. B. Hoffman will be placed in charge of the Bekley office of the company.

**Reading, Pa.**—At the annual meeting of the Reading Iron Co., W. W. Williams, formerly general manager, was appointed vice president in charge of sales and operation, and J. M. Callen, former second vice president, was appointed vice president in charge of purchases and distribution of materials. Other officers re-elected are: L. E. Thomas, president; G. W. Delany, secretary; H. N. Yost, treasurer; R. J. Wenger, assistant treasurer.

**Philadelphia, Pa.**—Madera, Hill & Co., a miner and shipper of anthracite and bituminous coal, with headquarters in this city, has acquired the property of the Rockhill Iron & Coal Co. in Huntingdon, Blair and Fulton counties. Included in the deal is control of the East Broad Top R.R. & Coal Co., operating a line 50 miles long and connecting with the Pennsylvania R.R. at Mt. Union. Six mines with an annual output of about 750,000 tons are involved, and it is said the annual capacity will be increased to 1,000,000 tons.

**Charleston, W. Va.**—Action has been taken by the directors of the Greenbrier & Eastern Ry. Co., looking toward the opening of about 120,000 acres of coal and timber land in Greenbrier County. The directors' of this road have reached a decision to initiate work in the near future in the road, which will be nearly nine miles in length, and which will be constructed from Rainelle, along Meadow Creek, penetrating the large area of coal lands owned by the Gauley Coal Land Co. Those active in promoting the building of the new road are John B. Laing, R. M. Bell, John Raine, J. Wade Bell, Agnew Morten and a number of others.

**New York, N. Y.**—Final argument in the tidewater demurrage complaint instituted by the Wholesale Coal Trade Association of New York, Inc., was heard recently by the Interstate Commerce Commission, at Washington. The arguments for the complaining association were made by Charles D. Drayton of counsel, and by Charles S. Allen, its secretary, and were listened to by the eight members of the commission. More than \$1,250,000 in demurrage charges are involved in the suit, which is to recover alleged excessive charges incurred for the most part as a result of the various local harbor strikes, and pending the rendering of the final decision the association several months ago succeeded in having suspended the payment of charges aggregating about three-quarters of a million dollars. Commissioner McChord has already rendered a tentative report, and it was on this report that the entire commission heard oral argument last week. It is expected that the final decision will be handed down within sixty days.

**Huntington, W. Va.**—Directors of the Norfolk & Western R.R. at a recent meeting, indicated that they would be willing to construct a branch line from Lenora, on the Twelve Pole Branch of the road up Pigeon Creek in Mingo County. During the second week of the month, negotiations concluded at Huntington, which insure the early development of a virgin coal area, in which development fully \$10,000,000 is involved. In the first place the railroad will make an outlay of \$2,000,-

000 for the construction of a branch line, if final approval is given the project for the extension, as now seems highly probable in view of the fact that a deal closed between March 8 and 13, between the United Thacker Coal & Land Co. (largely dominated by Kountze Brothers, bankers of New York) and a number of Huntington parties, large areas of the Pigeon Creek territory were leased by the company named, to the following: H. H. Morris, president and general manager of the West Virginia Standard Coal Co. and the Kentucky-Elkhorn By-Products Co., 2,800 acres; A. B. Rawn, general manager of the Consolidated Collieries Company, 2,500 to 3,000 acres; Garner Fletcher, general manager of the Elkhorn Piney Coal Co., 11,750 acres. Companies will be formed at an early date to develop the land leased and such companies will vary in capitalization from \$300,000 to \$1,000,000. It is estimated that more than \$5,000,000 will be expended within the next few years in the development of coal land in the Pigeon Creek territory.

**Logan, W. Va.**—Capitalized at \$2,000,000, the Guyan Collieries Corporation has been organized for the purpose of purchasing and later developing 11,000 acres of coal land on the Guyan branch of the Chesapeake & Ohio; the tract to be purchased being located on the southwestern side of the Guyan River about 37 miles from Logan, near Gilbert. It is proposed to issue \$1,000,000 in 8 per cent preferred stock and \$1,000,000 in common stock. The company will have six workable seams available for development, such seams being the Cedar Grove, Alma, No. 2 Gas, War Eagle, Bens Creek and the Lower War Eagle. That portion of the 11,000 acres already reached by railroad is to be developed at once. By 1924 the new company hopes to have a production of 300,000 tons per year. The leading men in the new company are, W. P. Tams, of Tams, and J. B. Clifton, of Beckley. The former will direct the development work of the company. Besides Mr. Clifton and Mr. Tams, those interested in the new corporation are: J. H. Hatcher, W. H. McGinnis, of Beckley; G. E. Vaughan, of Lynchburg, Va. Officers of the company are W. P. Tams, president and general manager; J. B. Clifton, vice president.

**Huntington, W. Va.**—Fifty million dollars will be expended in opening mines and making improvements in the Big Sandy, Logan, Kanawha and New River fields, if provision is made by the Chesapeake & Ohio R.R. to handle the additional output, according to an announcement made here on March 13 by J. J. Ross, head of the Logan Operators Association, as the result of a conference of operators representing the fields named. Mr. Ross declares further growth of the coal industry in the territory reached by the Chesapeake & Ohio is entirely dependent upon transportation facilities furnished by that road, which are even now inadequate to take care of present tonnage. A committee was appointed at the meeting here on the thirteenth to hold a conference with directors of the Chesapeake & Ohio at New York on the nineteenth, at which time the directors will be asked to obtain from the Government a loan of from \$30,000,000 to \$50,000,000 for improvements, so that adequate provision may be made for handling 50,000,000 tons annually. Should the directors of the Chesapeake & Ohio decline to acquiesce in the requests for improvements the Interstate Commerce Commission will be asked to cause the railroad to provide the additional transportation facilities. It is desired to have the Chesapeake & Ohio install double track for a distance of 20 miles on the Guyan branch, and the road will also be asked to construct a third track from Barboursville, W. Va., to Russell, Ky. The opening of new mines on the Chesapeake & Ohio, during the last two years, with no increase in equipment, has only served to cut down the number of cars for each mine.

**Louisville, Ky.**—The Pittsburgh Coal & Coke Co., capitalized at \$1,000,000, and the Pittsburgh Fuel Co., capitalized at \$100,000 have been incorporated as Kentucky concerns and will take over local interest of the Pittsburgh Coal Co. The incorporators are Charles O'Connor, R. B. Hickman, M. W. Ades, George E. Bohmer, B. A. Leonard and others. They are all Louisville men. Negotiations for formation of the company and purchase of the Pittsburgh Coal Co.'s holdings have been in progress several weeks. The granting of a charter was delayed temporarily because of the similarity of names between the old and new companies.

A. J. Carroll, attorney for the incorporators, said permission to use a similar name had been granted by the Pittsburgh Coal Co. along with the "good will" transferred with the property.

## Obituary

**Morgan Llewellyn**, died on Feb. 17, 1920. He was the active vice-president of the Walsh & Weidner Boiler Co., of Chattanooga, Tenn.

**James J. Flannery**, president of the Montour & Lake Erie Coal Co., and a prominent manufacturer, died at his home in Pittsburgh, Pa., on March 6. Mr. Flannery was also a member of the board of directors of the Wharton Steel Co. He is survived by his widow and nine children.

**J. R. Hudelson**, aged 40, general manager and treasurer of the Franklin County Coal & Coke Co., at Roylton, shot and killed himself. The sale of the Franklin County company properties to the Peabody Coal Co., of Chicago, is being negotiated, the consideration being \$2,000,000. Mr. Hudelson was one of the influential business men in the mining circles of Franklin County. Worry over the sale of the property is believed to have caused him to take his life. A widow and one child survive.

**Frank C. Smith**, former president of the Reading Iron Co., and a prominent figure in the development of Reading as one of the centers of the iron industry, died on March 3, of a complication of diseases, at his home in Reading. He was 74 years of age. After an early training with the Philadelphia & Reading Ry. Co. and in Reading banking circles, Mr. Smith in 1873 entered the service of the Reading Iron Works as business manager, and remained as such until the organization of the Reading Iron Co. in 1889, when he was made treasurer, and later vice president and general manager, under the presidency of the late George F. Baer, whom he succeeded in 1902. He was a director of the Penn-Mary Coal Co., and a number of other organizations.

## Coming Meetings

National Coal Association will hold its annual meeting May 25, 26 and 27 at the Traymore Hotel, Atlantic City, N. J. Secretary, W. B. Reed, Commercial Bank Building, Washington, D. C.

The American Association of Engineers will hold its annual convention at the Planters Hotel, St. Louis, Mo., May 10 and 11. C. E. Drayer, secretary, Chicago, Ill.

National Foreign Trade Convention to be held in San Francisco, Cal., May 12, 13, 14 and 15.

Chicago Coal Merchants' Association will hold its annual meeting April 13, at Chicago, Ill. Secretary, A. H. Kendall, Chicago, Ill.

American Chemical Society will hold its annual meeting at St. Louis, Mo., April 13, 14, 15 and 16. Secretary, Dr. Charles L. Parsons, 1709 G. St., N. W., Washington, D. C.

## Weekly Review

*Slight Improvement in Car Supply—Much Interest Is Shown in Results of Bituminous Commission—Export Business Continues Under Permit System—Floods Interfere with Anthracite Production*

UNDER private operation the railroads are already showing a better car distribution. Where it had required from ten days to two weeks to bring cars of coal from mine to tide under Government operation, the time has been reduced to from three to four days in many instances. Empties from the Eastern territory, especially in New England, have been returned in increasing volume, as the railroads are making every effort to return cars to their respective home lines. It is asserted that operators will be satisfied with the number of cars supplied to the mines during April and May. However, a well-informed operator is of the opinion that the shortage of cars next October will be greater than at any previous date.

The President's action on the report of the Wage Commission is being especially awaited by operators over the entire country, both anthracite and bituminous. The feeling that price restrictions should be removed or some other workable plan adopted other than now existing is spreading more and more. Just what will result from

Senator Frelinghuysen's bill before the Senate, in which he suggests a Fuel Controller for the whole country to be paid by the Government, is hard to predict.

Few operators feel inclined to obligate themselves to ship until after May 1 or May 15 and some have decided to suspend operations entirely until they may secure the right to sell their product with profit. Although much is heard of price violations the Government has not as yet interfered.

A good business continues at tide, especially in the bunkering trade, and there seems to be quite a liberal offering of tonnage for this business. Under the permit system, the export business also continues, though moderately, as it is easier to secure permits than it is to obtain bottoms for loading, thus causing great annoyance.

In New England the old-line companies are at last beginning to make quotations for lump gas coal to be delivered during the coming coal year, the price being from \$3.85 to \$4.25. Up to this time they have hesitated to quote a price owing to the prevailing

uncertainty as to legislation and labor troubles.

Owing to the wage parleys, the outcome of which will inevitably be that the consumer will have to pay higher prices for coal, the retailers are in an unsatisfactory position. They have not been soliciting business for summer fillings, as had been their custom, for they are not in a position to quote a definite price. To make matters worse, consumers of domestic sizes are fully alive to the possibilities of the situation and in consequence are growing quite anxious. As a result, inquiries to the retailers are being made by the hundreds.

Much to the disgust of both operator and wholesaler, floods have been prevalent during the past week in the anthracite region and many of the collieries were forced to shut down, thus curtailing production considerably.

Coke production in the Connellsville region has varied not more than a few thousands of tons from week to week since the first of the year and practically the entire output is moving out on contract.

### WEEKLY PRODUCTION

The weekly report on the production of bituminous coal, anthracite, and beehive coke, compiled by the Geological Survey, Department of the Interior, March 20, 1920, states that complete returns from the coal-originating roads indicate that production of soft coal during the first week of March was smaller than at first reported, amounting to only 10,009,000 net tons. The output during the following week (March 7-13) is estimated at 10,125,000 tons. This was a slight recovery over the preceding week and brought production up to almost exactly the level of the last week of February.

The daily average during the first half of March was 1,752,000 tons. During January and February it had been 1,766,000 tons. The decrease was due in part to the severe blizzard which moved from the Great Plains to the Atlantic Coast during the latter part of the first week of March and the beginning of the second. The cumulative production during the first 62 working days of the past four years has been:

	Production first 62 working days
1917	111,543,000
1918	108,690,000
1919	89,126,000
1920	108,950,000

The tonnage so far produced in 1920 exceeds 1918 and 1919, but is 2,593,000 tons behind 1917.

The mines of the country lost on the average 2.1 per cent of full time because of labor shortage.

Rail shipments of beehive coke declined slightly during the week ended March 13. Reports received from 26 carriers originating approximately 97 per cent of the total tonnage shipped by rail indicate a production of 409,000 net tons, a decrease of 3,000 tons, or 0.7 per cent, when compared with the preceding week. The decrease occurred in the Middle and Southern Appalachian regions. The production of Pennsylvania and Ohio, on the contrary, was slightly larger, rising from 313,000 tons during the preceding week, to 315,000 tons; and from the Connellsville region a somewhat greater increase was reported. Production for that region is reported by the Connellsville Courier at 241,470 tons, an increase of 2.5 per cent over the week of March 6.

An active demand continues for beehive coke, caused to a large extent by scarcity of coal at byproduct ovens. Production is restricted by a shortage of coke cars. The cumulative production since the beginning of the year now amounts to 4,529,000 tons, a decrease when compared with the corresponding period in 1919 amounting to 590,000 tons, or 11.5 per cent

### Atlantic Seaboard

#### BOSTON

Car supply light, much interest in contracts. High grades hard to cover. Little coal available at piers. Hampton Roads shippers suffer from car shortage. Pressure strong for domestic sizes. Buckwheats less in demand.

Bituminous—Congestion on the New England roads has now been pretty well cleared up, although there are still hundreds of cars on sidings waiting for power to move them. Through the gateways movement continues to improve. The intervening roads, notably the New York Central, are also gradually clearing up their lines and receipts here are enough greater to help the current situation very materially. The milder weather has also had its effect and there is much less anxiety than was the case a fortnight ago.

For the most part the railroads have ceased grabbing coal in transit and so far as we are aware coal shipped the first two weeks in March is coming through practically without interruption. Shipments the past week, however, have shown a distinct falling off. Two bridges on one of the main arteries of the New York Central near

the region were swept away by floods and this has so seriously held up the return of empties that car supply for the whole week has been very light.

Water damage has caused a large number of mines in Central Pennsylvania to suspend operations, and this together with car shortage has meant a heavy loss in tonnage. Large producers have had their mines idle for two and three days at a time and this certainly is not encouraging for New England industrial plants that are going to be in need of fuel during April.

Empties from this territory, however, are being sent back in increasing volume and cars should be in much better supply by the end of the month. The railroads are also making every effort to return the cars to their home lines, and operatives feel that this will have a tendency to increase the supply during April and May.

There is still much interest in contracts. Several large buyers find it difficult to arrange for supply, especially of the better grades. In some cases they have been able to cover but 10 to 20 per cent of expected requirements. They now feel they should have bought more actively a month ago when coal was being more generally offered. At that time it was not so difficult to buy fair coals at very close to present Government price, but today it is unusual to get an offer of less than \$3.75 or \$4 per net ton at the mines, plus wage increases, etc.

The trade is anxiously awaiting the President's action on the report of the Wage Commission. The feeling grows that price restrictions should be removed, or some more workable plan devised than that now in effect. Few operators will be inclined to obligate themselves to ship beyond May 1 or May 15 under the present price regulations; in fact there is a very general feeling that they will suspend operations altogether, if they cannot in some way secure something like the present authorized price for export and bunker trade.

In consequence, buyers here find it more and more difficult to get contracts, even though they undertake to pay a competitive price for use if and when restrictions are withdrawn. Moreover, the Pennsylvania shippers are anxious lest they lose any present foothold in the export market. Coal from Hampton Roads has distinctly the advantage in the offshore cargo business and it will be necessary for those who ship from Philadelphia or New York to keep themselves as strongly represented as possible.

One of the largest factors is actively canvassing for low-volatile coal of recognized quality and this shows the extent to which the Pennsylvania operators are following this more lucrative trade. Under the circumstances, it is easy to see that New England will not get much of this coal unless it bids a competitive figure.

At the New York and Philadelphia piers only small tonnages are available. These are either on contract or held for export. Of spot coal there is a great scarcity. At the same time it is a matter of comment in the trade that relatively so few premiums are exacted, even though premiums are against the regulations. Much is heard of price violations all-rail. Should these continue it almost seems as if the Government would have to take cognizance.

At Hampton Roads the situation has changed rapidly for the worse. Car supply on all three roads has been light, and the number of bottoms waiting has steadily increased. At Newport News on March 15 there were 168,000 tons of boats waiting, with but 25 per cent of the coal on hand. Heavy demurrage has accrued the past week and at this writing there is no prospect of better car supply. Most of the delay has been borne by steamers chartered for overseas; coastwise boats have not suffered to the same extent.

So far, the Hampton Roads agencies have made no moves on contracts. The authorized price is much too low and until authority is given for an advance in keeping with the export price, offerings of Pocahontas and New River in this market will be relatively small.

**Anthracite**—Demand continues urgent for all the domestic sizes. Retail dealers are not only short on supply, but they are much impressed with the advantage of getting forward coal under present circular. There are rumors of advanced harge freights, effective April 1, if not before, and there is also a feeling that railroad freights will also be marked up before many weeks have elapsed. Consumers are putting in their orders for refills to a greater extent than in any of the recent years and there is every indication that trade will be very brisk, at least until prices are lifted in the spring.

The steam sizes are somewhat less in

demand than earlier in the month. Some contracts have been made at last year's price, plus the wage increase, the amount of which is to be figured later. Other shippers are disinclined to make prices on any basis until the present wage conference reaches a conclusion. While the movement into New England the past thirty days has been heavier than at any time since 1918, yet the aggregate tonnage has been much smaller than during the spring months of that year.

**NEW YORK**

No let up in demand. Floods in the mining regions curtail production. Bituminous operators move slowly in making contracts. Car supply poor. Longshoremen's strike injures bunkering. Railroads continue to confiscate coal.

**Anthracite**—Instead of the usual lull in the anthracite market which usually precedes April 1 the demand this month remains strong and heavy. Usually dealers and consumers take the month of March to clean out their bins in anticipation of the spring reduction of 50c. per ton on domestic coal prices, but that situation is absent this year. Instead both dealers and consumers are not anticipating any lower prices on April 1 and are willing to refill their bins.

Contrary to custom, the public appears to be little concerned in the negotiations now in progress in this city between the mine owners and their employees and which will undoubtedly mean an advance in wages to the workers and higher prices for the consumers. This unconcern may be due to the little publicity given the conferences by the daily newspapers. Heretofore during these conferences there has been much said about the probability of the suspension of mining and the lack of coal. This year, however, there has been very little of this kind of publicity, and as a result there is not that rush for coal that usually occurs.

However, shippers have no trouble to get rid of their tonnage, whether it be domestic or the smaller sizes. The heavy storms of the past few weeks did considerable damage to many of the mines in lower Luzerne and parts of Schuylkill counties, with the result that production and shipments were considerably curtailed. It was reported that some of the smaller mines had suffered greatly because of the thawing of the heavy snows along the mountain sides.

There has been no relaxation in the demand for the larger sizes and where one shipper might be easy with one or another of the coals his neighbor might be short of those sizes. Stove coal appears to be on a par with egg so far as shortness goes. Chestnut and pea are easier but there is no surplus.

The steam coals are higher because of the cut in receipts due to the floods in the mining regions. There is not that supply of barley that was present a week back, and shippers have little trouble in getting rid of the better grades at company circular or slight advances. Buckwheat and rice are in good demand, the former being mixed with bituminous by consumers in many instances. Quotations vary according to grades and in some cases the urgency of the occasion.

Current quotations for company coal per gross ton at mine and f.o.b., tidewater, at the lower ports are as follows:

	Mine	Tidewater
Broken	\$5 95	\$7 80
Egg	6 35	8 20
Stove	6 60	8 45
Chestnut	6 70	8 55
Pea	5 30	7 05
Buckwheat	3 40	5 15
Rice	2 75	4 50
Barley	2 25	4 00
Boiler	2 50	4 25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

**Bituminous**—The market here waited all week for some word from Washington regarding the acceptance or rejection of the Bituminous Wage Commission's report. Late on Friday newspaper dispatches stated that President Wilson expects the operators and miners to work out their contracts for the new coal year on the basis of the majority report.

Operators and shippers are moving carefully in making contracts for the next year's supply of coal and are particular to specify that the price after the end of government control is subject to change after the Wage Commission's report has been accepted. The repeal of those sections of the Lever Law relating to the coal industry will, the trade believes, do more to stabilize the industry than anything else at this time.

The failure of the car supply to improve has not helped the local situation. There is a lack of free coals and spot buyers have little success. The bunker business has received another setback because of a longshoremen's strike which affected principally the coastwise vessels. More than 7,000 workers were reported out along the Atlantic Coast, tying up many ships. However, because of the slow shipments dealers in these coals did not complain of an oversupply.

Railroads continue to confiscate considerable coal and frequent complaints are made by shippers because of this. Considerable dissatisfaction is also caused by the long wait for payment.

Many operators are refusing orders for shipments, especially if intended for tide-water, they preferring to ship to line points. There is a brisk demand for coal for export but as heretofore bottoms are scarce.

The government price still holds good for quotations for free coals but there is none to be had here, practically all the available coal being taken for bunkering purposes where the selling price is \$1.35 above the \$2.95 mine price. Government prices prevail on all coal not shipped on contract. They are as follows:

	Mine-Pre-	Run, paid-	Slack
Central Pennsylvania	\$2.95	\$2.95	\$2.95
Western Pennsylvania	2.35	2.60	2.35
Fairmont (Gas)	2.50	2.75	2.25
George's Creek, Upper			
Cumberland and Pied-			
mont Fields	2.75	3.00	2.50

**PHILADELPHIA**

**Anthracite market tightens up.** Floods in the region cut down production. Little stove and nut arrive. Pea coal in strong demand. Consumer anxious for spring prices. No wage decision yet. Steam sizes scarce, especially buckwheat. Premiums offered on all sizes.

**Anthracite**—There has been a decided tightening up in anthracite. With April fast approaching and no definite understanding with the miners, there seems to be a scramble on to get as much coal on hand as possible. Whereas a few weeks ago many of the smaller companies were glad to take orders for sizes from pea down to and including barley, the situation has changed to the extent that there is really no coal offering at all.

With the situation as it is it is not surprising that the market has tightened up, although there are few who really believe that the miners will cease work. However, this is such an uncertain proposition that no one is taking a chance.

To complicate matters the mines have been almost drowned out for the past week and one of the big companies alone had thirty collieries idle on three successive days, with not less than ten down for the entire week. Some independent operations have been closed for even longer periods, particularly washeries. The offices of the shippers began to assume the appearance of war times, with the retail men on hand in numbers to urge more deliveries.

With the exception of pea coal the local retailers have the most meager supply of coal on hand and even this size is in extremely strong demand. There is no question now that pea has come into its own again. Many consumers whose supply of the larger sizes has run out need no urging to take pea, especially since the milder weather enables them to burn this size with little trouble. There is hardly a shipper in the city who is not anxious to get more pea and is actually urging his shippers to let it come out as fast as possible. As it is the market must depend entirely upon fresh-mined coal, as there is no tonnage of this size in the storage yards at all. With the scarcity of all sizes of coal the premiums on family sizes in many instances have run up well upon the standard 75 per cent of the leading independents. To be sure, these increases are being asked mostly by the brokerage houses, but they have little difficulty in getting their prices. It is also believed that much of the high-priced coal is going into New England, as the call from there is particularly strong.

Due to the wage parley with the miners the retailers are in an unsatisfactory position, as all of them have been accustomed at this time of the year to begin soliciting business for summer filling. Now they are afraid to go after this trade, as they are not in position to quote a price. To make it worse the consumers are fully alive to the possibilities of the situation and are making inquiries by the hundreds as to when they can have their cellars filled.

Many of such inquirers are under the impression that all they need do is to give their order to the dealer and that will insure them the present price. It is quite a shock to most of them when the retail man is compelled to advise that he cannot

take any orders at a price. Of course a few of the dealers will make deliveries, if they can get coal to the best of their trade who are worthy of credit, with the understanding that the price is to be based upon whatever retail price will be established following the announcement of prices by the shippers after the wage settlement.

There is the strongest kind of activity in the steam trade. For new customers to get buckwheat is almost out of the question, except that there is a limited amount of tonnage offering by some shippers at premium prices. If any proof were needed of the boom in steam sizes it would be in the fact that individual producers will not take any new business on the smaller steam sizes, rice and barley. These two latter sizes have been selling off price for the past six to eight weeks, but have now decidedly tightened.

It would seem that most of this tonnage is going to tide, where the report has it that neat premiums are being offered. The big companies have heavy tonnages of both these sizes in their storage yards, but they are working on the piles as heavily as their equipment will permit. Due to the heavy floods in the rivers throughout the anthracite region practically all of the river washeries are out of commission and this has taken quite a little tonnage of steam coal out of the market.

**Bituminous**—There is not the least easing off in the demand for coal and all consumers are eager to get hold of tonnage. Unfortunately there has been no increase of fuel to the local industries this past week and a great many plants are simply running from day to day with the hope that they will soon be able to accumulate some kind of surplus.

Of course, the chief explanation of the shortage continues to be car supply, but the fact that the New England railroads are once more in position to take good shipments, diverts much tonnage from this territory. Shipments to that point seem to be increasing and this also ties up a considerable number of cars, as since boat freights got to such a high point the all-rail shipments have been growing.

Naturally with the coming of softer weather both shipper and consumer had been hoping for increased production, but so far, despite milder weather all the circumstances have been against relief. The consumer is growing more anxious each day and they are fearful of the outcome of the wage dispute, especially since it was learned late in the week that the President had favored the report of the majority on the commission, as against the minority or miners' representative.

One thing is certain, and that is should the miners decide to stop work the country would face the worst condition in its history, as the amount of coal above ground at this time is the lowest for years. So it can easily be seen why the consumers are particularly anxious to get ahead. Even the utility plants hereabouts who have been accustomed for the past few years to carry stocks enough for three and four months are down to a 40 to 60-day basis.

There is still a certain amount of contract activity in the trade, but the tenders by the shippers are only being made to the cream of their trade, and seem to be more of an effort on their part to keep their good trade in line rather than to fix upon a price. To be sure, they are quoting prices from \$3.50 to \$3.75, but all figures are subject to whatever wage scale is agreed upon with the miners. Up to that time coal is simply to be shipped at the prevailing Government price. With the situation inclined to grow somewhat tense, there is more of a tendency on the part of the consumer to consider contract offers, yet on the other hand there has also been something of an easing up in the efforts of the producer to talk contract.

An odd part of the present situation is the fact that many concerns are apparently able to get quite a plenty of coal, while other equally strong consumers are riding on the edge of a short supply. Some consumers in the latter class are inclined to become bitter in the criticism of this condition and intimate that the Government figures are not being lived up to.

Whether this is true or not it is a known fact that the shippers are becoming of the opinion that the law controlling prices will not stand the test of law, and it might be that those concerns most loudly proclaiming this fact are proving the courage of their convictions and getting a better price for their coal. Some local consumers, in this connection, have received letters from shippers calling upon them to use their influence in having the Lever act repealed.

There has lately been something of an increase in the number of confiscations by the railroads of fuel in transit. This has been another bone of contention between the consumer and the transportation line.

While the former does not deny the necessity for such acts, the claim is made that the fuels officials should use at least a little judgment in their seizures.

A case has been cited where a plant had only two days' supply on hand, but had two cars in transit within a day's run of the plant, but before they arrived they were taken for motive fuel. The obvious thing to do in such an instance would be to ascertain the condition of the plant whose fuel it was intended to take.

There continues to be good business at tide, especially in the bunker trade and there seems to be quite a liberal offering of tonnage for this business. The fact that bunker prices are hovering around \$3.40 @ \$3.60 accounts in a measure for this. As to export shipments, the embargo levied weeks ago is still on, but the permit system is still in vogue and a good many shippers seem able to secure permits. It would seem, if anything, it is easier to procure a permit than it is a bottom for loading.

#### BALTIMORE

Much coal sold above government price. Majority of handlers refuse to follow until question is legally settled. Car supply still short. Better time between mines and tide aids considerably. Decided demand begins for hard coal for next winter.

**Bituminous**—Inquiry around the trade in Baltimore brings little news of any government priced coal. On the other hand there are undoubtedly a number of sales of coal above the government price, from sources that have formally notified the government that they would so sell and in which cases no action has been taken to stop such sales, and from sources that are "just selling." This does not mean that anything like a majority of dealers here are selling coal above the maximum; the fact is that most of them are abiding strictly to schedule through the fact that they are not selling coal in the open market but are confining their efforts to deliveries on contracts, as the reduced car supply and movement from mines prevents their getting more than enough fuel to take care of this more profitable end of the business.

All are praying for the day when it will be legally correct to sell coal to best advantage in a competitive market. The car supply remains short and loadings much below normal. About a fifty per cent run was shown on the Baltimore & Ohio last week starting at 81 per cent and running down to 38 per cent. The daily loading high was on Tuesday, 3,768 cars but other days of the week merely ran between 1,940 cars a day to 2,089, the next high twenty-four hour loading.

Under private operation the railroads are already showing a much better delivery time, however, and the time of ten days or two weeks so recently experienced by the coal trade in getting a car from mines to tide has been cut to three and four days in many cases. An exceptional delivery was made last week in less than two days. The reserve at Curtis Bay grows steadily better, starting with less than 500 cars the first of the week and running up between 500 and 600 at present, the daily run to the piers being between 200 and 350 cars, while dumpings for the most part do not exceed 150 cars a day because of stoppage of exporting and almost complete cutting off of foreign bunkering.

**Anthracite**—The trade is in a state of uncertainty as to spring prices—and with April only a few days away. It knows not whether there will be a spring reduction at all, whether the miners' demands will be granted in a way to seriously advance all prices, whether premiums will grow still greater on independent coal, or whether freight rates will be reduced in order to induce summer purchasing.

It is certain of one thing, however, and that is that coal is not going to be any lower than the present schedule; at least that is a moral certainty to insuring dealers, as many of the public see the handwriting on the wall. Orders are not only still coming in for the end winter business (because it has grown quite cold again at times) but because consumers are asking that full deliveries for storage for next winter be made at once.

A number of dealers who have been fortunate enough to get through considerable coal are making considerable deliveries on orders for next winter consumption. Most of the dealers have already begun to weigh the situation carefully, and at present a near-spring spectacle of unusual kind is to be witnessed, namely apportioning of coal and delivery of but part of orders.

Much interest is centered on the outcome of the wage parley now in meeting at New York. No wage agreement is hardly expected until all of the grievances between

both miner and operator have been threshed out. Just how long this will take none can tell.

### Eastern-Inland

#### PITTSBURGH

Rumored evasions of price limits. High prices expected later.

Reports are being circulated more freely that the price restrictions on coal are being evaded, but if there are evasions they are practiced with considerable secrecy, there being no open transactions at above the set limits. There is no secrecy, however, about the fact that the operators are greatly annoyed that the price restrictions continue, as they see a shortage of coal and many buyers willing to pay high prices for coal.

Some references are being made to former President Taft's legal opinion, recently rendered, that confiscation of coal is not justified by the Lever act, but the awkward feature in using this opinion as an argument that the price fixing is illegal is that Mr. Taft's opinion has some reference to the question whether the country is at war, and when the wage dispute arose the operators took the position that the state of war still existed.

Some well-posted coal operators hold very strong views as to high values of coal in the coming spring and summer, and indeed for the remainder of the year. These operators point out that consumers have had such trying experiences in the past few months with coal shortage that they are certain not to forget them, and there is therefore expected a heavy demand for coal for stocking purposes, sufficient to maintain much higher prices than the present set figures.

It is commonly assumed that the wage settlement will involve either recommendation or tacit approval of higher prices, and the trade has no definite information as to the status of the wage award except that the President has been seeking to bring about a unanimous recommendation by the Robinson Commission.

The market is quotable practically nominal at Government limits, \$2.10 for slack, \$2.35 for mine-run and \$2.60 for screened, per net ton at mine, Pittsburgh district, with 15c brokerage allowed in addition in certain cases.

#### COLUMBUS

Higher temperatures in central Ohio have relieved the stress in the domestic trade. Steam business is active. Car shortage is still the bad feature.

The stress of the domestic trade has been relieved to a large degree by milder weather which has succeeded the cold wave of the early part of March. As a result, dealers have been able to secure some reserve stocks and are taking care of their customers in good shape. The relief is the most pronounced in Columbus and central Ohio points while the northern part of the state is still experiencing a shortage of domestic sizes.

With the coming of milder weather the natural gas pressure has been bettered, and that has aided in solving the problem. Retail prices are firm in every way, still governed by federal figures. The business is tending largely toward small orders to fill out the winter's requirements. Pocahontas is quite scarce, while certain West Virginia grades are coming in fairly well. Hocking and Pomeroy lump constitute the large part of the Columbus supply.

Steam business is active to the extreme and the milder weather has had very little effect on that department of the trade. Steam plants are buying actively not only for present needs but for future requirements. Some have been securing a small reserve to guard against emergencies. Rubber plants are perhaps the best buyers at present, although iron and steel concerns are good customers.

Public service corporations have caught up in their fuel supply and are looking forward by laying in a large tonnage and that is hindering shipments to the usual line of commercial customers. Practically no contracting for the coming year has been done owing to the uncertainty of the wage scale.

Out of a production of about 40 per cent in the eastern Ohio field railroads are taking more than half of the tonnage produced and that situation is fraught with much evil. Some of the large users are still short of fuel despite strenuous efforts made to secure shipments.

In the Hocking Valley and Pomeroy fields the output has been about 50 per cent although the car supply is not becoming

better but worse if any change is reported. Little hope for an improvement in the car supply is held out by railroad officials as cars are not being returned to their home lines very rapidly. On the other hand, many coal cars needing minor repairs are lying idle on the side tracks.

The Lake trade is becoming more and more a matter of concern as the time for the opening of the Lake season approaches. Because of the uncertainty in the wage situation, only a few Lake agreements have been made in Ohio territory. These agreements, as they do not approach the stability of contracts, provide for the sale of a certain tonnage, subject to all changes in the wage scale and mining conditions. The Lake season is expected to be unusually strong right from the start.

**CINCINNATI**

Dealers are having difficulties in getting fuel shipments from mines. Plan to buy their troubles before the reconstituted Coal Administration Committee. Interest is being displayed in urging on the consuming public early storage of coal.

All sizes and grades are in keen demand, with the supply meager. Many concerns are anxious to enter into contracts for their coal for the coming year, but while conditions are as unsettled as now they do not seem likely to meet with much co-operation on the part of the dealers. Considerable tonnage arrived in the terminal the first half of the week, but this was soon distributed among dealers and shipped to other points along the line for distribution.

Enough coal to supply the city for one day came down the river last week. This did not last long as it soon found its way to its hungry industrial consumers. The general opinion is that coal will cost enough more next year to cover an increase to the miners and probably to give a good rate increase to the railroads.

Never in the history of the coal trade, dealers unanimously agree, have conditions been worse than during the past week. A procession of fuel beggars passed through the coal offices the entire week, pleading in some instances for a single car to take care of their patrons. The car supply has shown little improvement, being a little less than 50 per cent. While embargoes were not in evidence, yet there was still much confiscation of coal, though in more limited quantities than had been the case during most of last month.

Although government prices still prevail there are hints and rumors floating about the market that some operators are selling above the fixed price. Domestic trade is strong although the edge of the market is now off. Retail stocks are low and every effort is being made to replenish them. In many instances retailers in certain localities were entirely out of fuel and some suffering resulted.

From present indications the situation in this district is approaching famine although not apparent in the city and surrounding territory immediately contiguous. Many industrial concerns are yelling for fuel to keep their plants in operation. The railroads still continue to confiscate and divert, thus putting the operators and dealers to more discomfort.

**Southern**

**LOUISVILLE**

Mild weather and late season result in quiet demand for domestic coal. Production still about 60 per cent normal.

Starting March 15, spring weather descended on Louisville and vicinity, after several weeks of raw weather. This has resulted in demand falling off rapidly with the retail trade, which reports dull business. There is a good demand for car lot coal for industrial use, and a fair demand from local steam plants.

Production at the eastern Kentucky mines continues on an average of three full working days, due to car shortage, although on some railroads the percentage is better, and in western Kentucky shipping is better over the Illinois Central lines.

Many contracts between retailers and producers for block coal at \$4 a ton and up are now expiring, which means the closing out of profitable block business for the operator, and a return to Government price on practically all shipments, as very little block business is held that wasn't taken prior to October.

Some reports are coming in concerning operators charging over Government prices for coal. However, the operator apparently is now charging more than Government prices, but is accepting premiums or bonuses for immediate delivery. It is held that some big industrial consumers in the North

are freely offering the Government, plus a premium of 25c. or more a ton to secure placement.

One jobber was complaining over this condition, stating that when trying to buy coal he found cases where operators were getting a premium on the side, and not willing to sell on any other basis. He charged that this prevented the jobber from buying such coal, where he desired to live up to regulations. It seems that the plan is a secret one, under which the producer bills out at the regular Government price, but receives a separate service payment which doesn't show on the invoice.

A number of coal men report that they have heard of such methods, and there isn't any longer a real secret concerning the plan within the trade circles. While this may be open defiance or defiance under cover of regulation, it is something that can't be helped much longer.

It is held that many operators are sitting still in the boat, and awaiting the outcome of the efforts of the National Association to set aside coal price control. Unless such efforts bear fruit, indications are that there will be open defiance of control, which will carry test cases to the higher courts for decision.

**BIRMINGHAM**

Car supply at mines shows improvement over last week. Heavy rains flood number of mines and delay movement of coal by washouts. Requirements of the trade far in excess of present output, the market showing great strength in all grades.

There was a marked improvement in the number of cars supplied the mines the past week over the previous one, and consequently production improved to some extent, as did also movement of fuel from the district. However, exceedingly heavy rains fell during the first few days of the present week, and a number of mines were flooded and production suffered considerably on this account. These rains also interfered with traffic by causing washouts and other damages to roadbeds. The car supply was probably 75 per cent of the requirements at the mines.

The trade is experiencing the most active demand that has developed since the strike, Nov. 1 last year, all grades being sought. Almost every coal-consuming interest is short on stock and the mines and distributors are being swamped with orders and urgent pleas for shipments. The railroads are still confiscating some coal, the Southern reducing its order 25 per cent for the current week. Other lines are taking over fuel only as occasion arises—where it is essential to do so—consequently the movement to consignees is more satisfactory than heretofore. Sales are practically confined to spot trade, as the present unsettled conditions bearing on the coal industry generally are not conducive to contract-making. The supply is far from being adequate to meet the needs of the trade for either domestic or steam fuel.

**Lake Region**

**TORONTO**

Supplies coming forward more freely. Dealers busy. Consumers anxious to lay in stocks. Bituminous supplies much below demand.

Coal has latterly been coming forward more freely, owing to the improvement in transportation conditions, and some of the yards have fair stocks of anthracite on hand. Large consumers are generally desirous of laying in stocks early for fear of shortage, and business is active, though more or less still hampered by labor shortage.

Supplies of bituminous are far below the demand and many industrial plants only getting enough for temporary requirements. Much anxiety is felt over the prospective shortage in case the threatened strike of bituminous coal miners takes place.

Quotations for short tons are as follows:

Retail—	
Anthracite, egg, stove, nut and grate .....	\$13.50
Pea .....	12.00
Bituminous steam .....	11.00
Slack .....	10.00
Domestic lump .....	12.00
Cannel .....	13.00
Wholesale F.O.B. cars at destination—	
Three-quarter lump .....	9.00
Slack .....	8.00

**CLEVELAND**

Demand in general has receded. Shipments have increased 100 per cent. Domestic demand has fallen off. Prices of all grades except Pocahontas show a rising tendency.

**Bituminous**—With demand shrinking because of the milder weather, and mine and railroad operations increased because of it, approximately 60 per cent of the demand is now being met at Cleveland. Not only are all industries getting an adequate supply for their spot requirements, but some slight stocking also has been made possible. The 40 per cent of demand that remains unfilled is largely for stocking. In fact, No. 8 operators have seen their way clear to begin dumping for the lake trade at Toledo. The leading utility in Cleveland now has about a week's supply ahead, which contrasts with a two-day "rubber" recently. Steam-coal users are unanimous in seeking to stock, and it will be months before there is any surplus upon the market.

Operators are desirous of contracting, and so are consumers, but the uncertainty as to prices is proving a barrier. Regular customers have spoken for their supply and verbal assurances have been given by operators. The trade is waiting for some large interest to cut its way through the wilderness; then the rest will follow suit. Three dollars for No. 8 mine-run and slack—an increase of 65c over government prices—still represents the general price idea here.

Meanwhile, prices are slowly but surely mounting. No. 8 Pittsburgh below \$7 for domestic delivery is almost unobtainable, and some domestic bituminous is commanding as high as \$7.50. Every item on the steam coal list has been advanced. No. 8 slack now holds at \$6.00@6.25, an advance of about 25c, while No. 8 mine-run is quoted at \$6.45@6.60, or an increase of 15c. All dealers report prices firming up.

**Anthracite and Pocahontas**—With the advent of milder weather receipts of both grades have increased, while demand is falling off, with the result that almost all dealers have a slight surplus. Dealers have more anthracite than Pocahontas, although the latter is coming through in fair shape. Dealers look for big buying this spring and summer on the part of domestic consumers. The minimum on shoveled-lump Pocahontas continues at \$9 and on mine-run at \$8. Stove anthracite is up 10c a ton, to \$12.50.

**Lake Trade**—The first bituminous-coal cargo of the season has been loaded at Toledo. The Pittsburgh Steamship Co., which has the largest Great Lakes coal and ore fleet, has ordered its engineers to its boats April 5. This means a start not earlier than April 20, and prospect of any coal reaching the head of the lakes before May 1 is slight. Iron-ore carrying rates have been fixed at 20 per cent over 1919, equivalent to restoring the 1918 rates. This forecasts what will be done to coal rates.

Prices of coal per ton delivered by retail dealers in Cleveland, are:

Anthracite—Egg, \$12.20@12.40; chestnut, \$12.50@12.70; grate, \$12.20@12.40; and stove, \$12.50.

Pocahontas—Shoveled lump, \$9.00@9.25, and mine-run, \$8.00@8.25.

Domestic bituminous—West Virginia splint, \$8.30; No. 8 Pittsburgh, \$7.00@7.50; Massillon lump, \$7.40@7.65; Cannel lump, \$11.00; and Coshocton lump, \$7.35.

Steam coal—No. 6 slack—\$6.00@6.25; No. 8 slack, \$6.00@6.25; Younghiogheny slack, \$5.40@5.75; No. 83, \$6.60@6.85; No. 6 mine-run, \$6.35@6.60; No. 8 mine-run, \$6.45@6.60.

**DETROIT**

Security of bituminous coal supply continues to menace consumers of steam and domestic stock. Little anthracite moving.

**Bituminous**—With very little bituminous coal arriving in Detroit the situation continues to arouse anxiety among consumers of steam and domestic coal as well as among the jobbers and wholesalers. Owing to the insufficient receipts the demand from all classes of consumers continues urgent and is inadequately supplied.

Jobbers say that there is no free coal on tracks in or around Detroit and that shipments are sold before their arrival, while the confiscation and diversion of shipments by the railroads reduce the supply to an extent that threatens to force a number of large industrial establishments to discontinue operation.

The continued confiscation of shipments is made more troublesome because of the curtailment of supply due to inability of the railroads to supply sufficient cars or motive power to enable the mines to maintain continuous production at anything like normal capacity. With many mines reporting car supply of 50 per cent or less, the confiscation of a large part of the coal consigned to Detroit creates a shortage of dangerous proportions.

Volume 17

New York, April 1, 1920

Number 14

## Government Control Is Removed

BY R. DAWSON HALL

**P**RESIDENT Wilson is to be congratulated on having ended Government control of coal with all its many inefficiencies. He was beginning to see that if it were not removed, it would be wrested from him by Congressional or Court action. The last few weeks of the Railroad Administration showed an orgy of absolutism and a complete collapse, such as will long convince us of the dangers of bureaucracy.

"Two heads are better than one" and "In a multitude of counselors there is wisdom," but the wisecracks of recent years have planned to concentrate power in a few bureaucratic heads, which, nevertheless, they have chosen without using the best of judgment. These bureau heads, to the great detriment of industry, have frequently held up everything till they could make their investigations and arrive at their decisions.

When Washington was urging councils or soviets of workmen to control other people's business, it was introducing absolutism in its own. No one received a hearing. It was thought that all business men were necessarily without a spark of patriotism and unimbued with common sense, whereas it was felt that workingmen were of so noble an impulse and so high an intellectuality that they could safely be trusted to manage a business in which they had made no investment and in which they had but little interest of any kind. All that the workman jeopardizes by inconsiderate voting in a works council is the permanence of his job, and most of them can readily leave and go somewhere else where an

equally good job can be obtained. So they really have no permanent interest to conserve.

Still industrial democracy rightly makes an appeal to human nature. And it not only appeals, it sometimes succeeds. There are some workmen who have a large degree of industrial consciousness and fit well into a "works council," many who would have such a consciousness if left to themselves and some who have not and so mislead the others. Unfortunately just of late there has been little disposition to call producers into councils of this sort when considering the nation's affairs.

Little groups of theorizers have been allowed to handle matters as seemed best to them. Snap judgments have been the general order. Dr. Garfield, who during the war was willing to submit to advice, came out like a jack-in-the-box on Oct. 30 of last year, delivered his decision relative to prices and then resigned. The operators would have liked to have had a "works council" with Dr. Garfield, but he was gone, but in the meanwhile he bound the coal industry beyond protest.

It has been a principle of Mr. Wilson that the workman should always have the right to present grievances and drive a collective bargain but these operators were deprived of the opportunity to protest singly or collectively to anyone and were forbidden to meet in a "works council" to discuss their compensation.

Control is now removed. Matters should soon adjust themselves. Let us hope that neither the project of Frelinghuysen to create a new controller, nor the scheme of Calder to give the power to the Federal Trade Commission, will find any backers.

# Coal Shortage Threatens Industrial Crisis in Germany

Decreased Production Creates Grave Menace—Only Careful Retrenchment Will Enable Industries To Continue—Apprehension Is Felt Lest There Be a Shutdown of Bavarian Blast Furnaces

WITH reference to the coal conditions now prevailing in Germany the Bavarian National Coal Depot is authority for the statement that the country is in the midst of a crisis which is chiefly due to the lack of coal, and that the seriousness of the hour demands that wide publicity be given to the true facts of the situation, John Q. Wood reports from Munich.

According to the above-cited authority, while Germany produced in peace times 200,000,000 tons of coal annually, the production in the last few years has diminished to 100,000,000 tons. The requirements of the country, on the other hand, on a basis of the requirements for the year 1913, making allowance for a smaller Germany and the obligatory delivery of coal to the Entente, amounts to about 140,000,000 tons.

Of the actual annual supply of coal 20,000,000 tons are required for the Entente, 10,000,000 tons for the requirements of the mines themselves, 18,000,000 tons for transportation purposes, 3,000,000 tons for the food and provision industry, and 23,000,000 tons for household use and for gas, water, and electric works. Deducting this minimum from the supply there remains only 26,000,000 tons annually for the use of industries and trade.

## SUPPLY FROM RUHR DISTRICT IS DIMINISHING

The requirements of industry and trade, reckoned according to the consumption in 1913, amount to 85,000,000 tons, so that already in the year 1918 there was a deficiency of 59,000,000 tons. It would be possible with great retrenchment to maintain activities of German industry with the present coal supply. Any derangement in this supply, however, must lead to a crisis.

Since December, 1919, the coal supply from the Ruhr district has been constantly diminishing, first owing to the low water and then to the high water of the Rhine, which almost completely tied up Rhine navigation. At the same time, due to the railway strike in Elberfeld and Essen and to the still continued passive resistance, the railway deliveries have been extraordinarily hindered.

Owing to the inadequate transportation facilities, the supply from Silesia for several months has been devoted almost exclusively to moderate deliveries to gas works and the most essential industries. The supply is also in part still tied up owing to the railway strike in Upper Silesia. The supply of coal from Saxony and

middle Germany in itself is not large; fortunately, however, it has in the past few months been maintained at a constant level.

Already in December the supply of coal from Bohemia, owing to transport difficulties and the Christmas holidays, diminished to about half the usual quantity,

and the situation has been further aggravated on account of high water, which flooded the most important districts (for Bavaria) of the Falkenau and Brück territories and thereby affected such mines as formerly supplied coal to Bavaria. Moreover, on account of the strike in the Ostrau-Mährisch district, Bohemia

has been obliged to furnish coal to Mahren and German Austria, so that the greater part of its output is required for home consumption. As a result of these conditions the export to Bavaria from Bohemia has diminished about one-half.

In Upper Bavaria—as in all other coal-mining districts—the output in the first half of January was still suffering from the after effects of the numerous holidays. Also, because of unfortunate accidents and owing to the change of explosives due to the issuance of new blasting regulations, the output has diminished somewhat. Besides, coal must now be supplied to the State railway in order to maintain the necessary provision and coal transportation facilities.

In Upper Pfalz the coal mines have been materially affected by the heavy rainfall and high water, especially in Schwandorf, through the giving way of a dam; the supply in consequence fell off to less than half, and the briquet factories were closed for several weeks. In Schwarzenfeld the supply was affected by a strike, and at Stockholm there has been only about 50 per cent of the normal output.

As a result of all these circumstances, the supplies of coal required by the State railways have been entirely insufficient, as the suspension of freight and passenger traffic has abundantly shown. The gas and electric works are continually face to face with a shutdown and operate only from hand to mouth as regards their supply of coal. Particularly is this true in the cities of Munich, Nuremberg and Augsburg.

Industry all along the line is in the direst want. Especially grave is the threatened closing down of the Bavarian blast furnaces in Amberg and Rosenberg, on which the entire iron industry of Bavaria depends. The introduction of cement, especially required for repairing water-power installations, is almost impossible.

Before the war Germany's coal production was 200,000,000 tons annually, but in the last few years the yearly output has diminished to 100,000,000 tons. As the requirements of industry and trade are about 85,000,000 tons per year, any further derangement of supply would be critical. Constant level has been maintained during the last few months.

# Distributing Pulverized Coal to Small Plants\*

Using Pulverized Coal From a Central Plant Is Getting To Be Common Practice In West  
—Pulverized Sub-Bituminous Coal Must Be Kept Dry and Air So Far As Possible  
Excluded If The Fuel Is To Be Handled Safely

BY B. J. CROSS†  
Washington, D. C.

WITH the increasing use of pulverized coal as a fuel and with the extension of its field of application, problems connected with its transportation and storage are becoming more important. The preparation of this fuel, especially high-moisture sub-bituminous coals and lignites, for use in pulverized form is an involved and expensive process, and, in general, is economically possible only for plants of large capacity.

As far as combustion itself is concerned, there are advantages and economies of pulverized fuel apply, of course, to small as well as to large installations, so that

manager of the powdered coal department, and Ralph Galt of the Fuller Engineering Co., for their courteous assistance and co-operation.

The pulverizing plant, which is situated near Renton, about 15 miles south of Seattle, consists of two 15-ton rotary driers (hourly capacity) and two 5-ton pulverizing mills. The large drier capacity is necessary because of the extremely wet coals sometimes used, running as high as 25 per cent of moisture. The pulverized coal is brought by rail to the central distributing bin at Seattle and from there delivered to the consumers' plants by motor trucks of special design.

FIG. 1

## Powdered-Coal Car Elevator, Bin and Auto Truck

Pulverized fuel is here dumped, elevated, stored and finally spouted into the truck for delivery to the consumer with little if any exposure to the air and consequently no chance for the powder to either heat or blow away.

a central plant for preparing and delivering pulverized coal would evidently supply a need and make this fuel available to small-scale operations.

The Pacific Coast Coal Co., of Washington, has established such a central station near Seattle, which has been in operation for over two years. In the belief that it may be of value to those interested in this subject, the following brief description has been made from data generously furnished by this company. Acknowledgement is also made to George N. Calkins,

The railroad car for hauling the coal from the pulverizing plant to the central bin at Seattle is shown in cross-section in Fig. 2 both in its original form and as later remodeled. The body of the car is of wood lined with asbestos board except for the hopper bottom, which is lined with sheet iron. The car has a capacity of 30 tons when completely filled.

The intake openings at the top of the car and the discharge openings at the bottom are made with special castings and can be tightly closed. The density of the pulverized coal varies considerably with the degree of settling. An average figure is 40 lb. per cubic foot. This car, in its present form, is giving

\*Published by permission of the Director of the Bureau of Mines.

†Assistant Physical Chemist, Bureau of Mines.

satisfactory service, and others, to be added as the traffic demands, will be of the same design but, of all-steel construction.

The dry pulverized coal flows quite readily and with the proper devices is easily handled. After being ground the coal is drawn from the pulverizers by

connection between the top of the bin and the top of the truck tank. This greatly facilitates dumping and renders the operation entirely dustless, since the air displaced from the bin by the coal enters the emptying tank.

In filling the truck the tank body is tilted in the

FIG. 2. LONGITUDINAL AND TRANSVERSE SECTIONS OF THE COAL CAR

This car as first built was unsatisfactory. After being redesigned, however, it now satisfactorily serves the purpose for which it was intended.

means of screw feeders and carried by two horizontal spiral conveyors a distance of 60 ft. to a point over the railroad car, into which the coal is discharged through large canvas tubes.

The conveyors are inclosed and their operation can be made entirely dustless. At Seattle, the car dis-

same position as shown for discharging. The 45-deg. elbow at the top of the tank then makes a tight connection with a spout from the bin. In Fig. 3 the truck is shown under the bin, but not in position for filling. The intake and discharge openings of the truck are closed by tight-fitting ratchet gates. Two trucks of this type are now in use.

The main storage reservoir of the system is in the stockpiles of untreated coal. Just enough of the pulverized product is held in storage at the various bins to insure an uninterrupted supply to the customers in the event of breakdowns at the plant or delays in

FIG. 3. FEEDING APPARATUS UNDER CONSUMER'S BIN  
Fuel is drawn from the bin by a screw conveyor and delivered on top of the air current leading to the furnace.

charges into an inclined continuous bucket elevator and the coal is carried to the top of a storage bin, from which the delivery truck is filled by gravity as later described.

The motor truck used in delivering the pulverized coal to the consumers' plants presents some novel and interesting features. This truck is of an original design and was built in the company's own shops. Fig. 4 is a sketch of the truck body in position for discharging into a bin or bunker. The small pipe (A) makes an air

A canvas sheath and the air pipe "A" are details that have done much to make the delivery of pulverized fuel to the consumer's bin easy and successful.

transit. No pulverized coal is stored at the plant. The ground material is delivered directly from the pulverizers to the car.

The central distributing bin at Seattle has a capacity of 80 tons, and on an average 60 tons are held in reserve at this point. The bins at the consuming plants are all of the same type. They are built either of steel or concrete, and hold from 10 to 25 tons. These bins are usually kept full and the coal is probably in storage here longer than at any other point in the system.

Sub-bituminous coal is employed and this readily absorbs moisture from the atmosphere. Ordinarily this

## Coal Resources in Arizona

BY PAUL CLOKE  
Tucson, Ariz.

**D**EVELOPMENT of Arizona's coal resources has been a matter of but passing interest hitherto, since it was overshadowed by the tremendous output of the state's metal mines. There are at least three places in the state, however, where coal occurs in large quantities, and when the Gallup fields of New Mexico commence to give out and there is a local demand for power for manufacturing and for agricultural purposes there is bound to be activity toward the development of these deposits.

The great possibility offered by these deposits would seem to come from erecting power plants at the mines from which energy could be transmitted by high tension lines to other parts of the state for various purposes, including artificial refrigeration. Some energy might also be used to recover nitrogen from the air right at the plant.

The Black Mesa coal field lies in and around Black Mesa in the Hopi and Navajo Indian Reservations in Coconine, Navajo and Apache Counties of Arizona. At present the field is difficult of access. The Santa Fe Railroad lies 70 to 90 miles south. As the name implies, the coal field lies almost wholly on a mesa which is the most conspicuous feature of the topography of the region. Its general altitude runs from 6,000 ft. at the south to 8,000 ft. at the north and from 500 ft. to 2,000 ft. above the general level. This coal belongs to the sub-bituminous class, a high ash being its chief drawback. The available tonnage is estimated at 14,000,000-000 short tons. It is thought that this is a low estimate. This coal is as good as or better than that of Gallup mines.

The Pinedale coal field is in two beds from 10 to 15 ft. apart, the upper reaching a maximum thickness of 12 ft., the lower 3 ft. The upper is a dirty deposit while the lower is a fairly clean sub-bituminous fuel.

The Deer River coal field lies on the south side of the Gila River just east of Dudleyville, at the junction of the San Pedro and Gila Rivers. It is about 85 miles northeast of Tucson. The eastern end is accessible from San Carlos through Hawk Canyon. The coal field is located near the center of the great copper-producing region of the state.

The field extends 10 to 12 miles in an east-west direction and it is known to have a breadth of 4 miles in Deer Creek basin. The coal is also found in Ash Creek basin so it is possible that the bed will extend to the limestone outcrop west of Saddle Mountain. Coal beds are also reported in Hawk Canyon. The coal runs about 2 ft. in thickness and the total tonnage is estimated at 30,000,000 short tons. The coal is, generally speaking, of two qualities.

The first is hard block coal adaptable for transportation for commercial use and for coke making. The second is a soft coal badly crushed and is of little use for marketing although it offers possibilities for manufacture of gas and for use in a power plant at the mine. The fact that these fields occur on Indian reservations interjects a point of difficulty, but efforts are being made by prominent engineers of Arizona, among whom is Dean G. M. Butler, Director of the Arizona Bureau of Mines, to have appropriate legislation enacted so that these mines may be developed.

FIG. 5. DELIVERING FUEL TO A HEATING PLANT

variety of coal from this region is quite susceptible to heating and spontaneous combustion when stored in the open.

All of the handling and conveying machinery employed in the various operations here described is inclosed and in every way designed to prevent exposing the dry pulverized coal to the atmosphere. The storage bins are as far as possible made airtight in order to prevent circulation or the renewal of the inclosed air.

It is worthy of note, even as a coincidence, that the only three occasions of serious heating of the powdered coal in bins occurred when the material had accidentally been wetted. In spite of any conclusive evidence, the idea exists that in ordinary storage, moisture is a factor tending to foster the heating of coal piles. The experience here gained in the storage of powdered coal tends to substantiate this belief. As long as the coal is kept quite dry, no heating occurs.

**Validity of Corporate Transfer.**—Where a mining company conveyed practically all of its property to another company, leaving nothing which could be subjected to liability for death of a person through negligence of the first company, it became necessary for the second company, in order to avoid a setting aside of the transfer as being fraudulent, to prove that the transfer was made in good faith, and for a valuable consideration. (*Alabama Supreme Court, Setzer vs. Burnwell Coal Co., 83 Southern Reporter, 139.*)

## Lowering Splint Coal Down a Mountain with Minimum Breakage

Degradation Is Avoided by Causing the Coal To Slide from the Car into a Tube, from the Tube into a Monitor, from the Monitor into Another Tube and from Thence to a Conveyor

BY JOSIAH KEELY  
Kayford, W. Va.

**A**T OLD ACME the splint coal was one of the first coals on Cabin Creek, W. Va., to attract the attention of buyers of high-grade domestic fuel. For many years the coal was produced on a making basis, and the miners became proficient in making a large percentage of lump. As other operations were developed in this bed it became their aim to equal the reputation of Acme. To this end loading booms, Marcus equipment, and shakers were introduced, but still there was too much small material—too great a proportion of slack to lump.

If it was attempted to use bins for storage, even in moderate quantities, the breakage became excessive. The result was that any delay in dropping in cars on the lump track caused a similar delay all the way to the mine partings. As the Acme bed is from 1,100 to 1,700 ft. from the tippie, various plans have been devised for transporting the coal down the long planes and into the railroad cars without undue breakage and in such a manner as to keep the mine haulage in operation in spite of delays at the tippie; also to keep the tippie going while there is a delay in the mine or on the plane.

One of the earliest attempts at solving this problem was made a dozen years ago on Paint Creek, which runs parallel to Cabin Creek and where some of the same beds are worked. An operator from the anthracite fields of Pennsylvania attempted to use the method employed for lowering anthracite down steep grades by means of a chute. An open trough about 1,500 ft. long,

16 ft. wide and 6 ft. deep was lined with sheet iron from top to bottom, and filled the entire distance between headhouse and tippie. The pitch of the chute was not uniform but followed the contour of the mountain. Also, I believe, there were one or two changes in direction. Anyway, the idea was to fill this big trough up and then draw off the coal from the bottom as it was filled from the top.

It seems that even the angle of repose of the coal had not been taken too carefully into consideration, for part of the chute must have been on not over a 25-deg. slope. Anyway, I am told that when this chute was filled it took weeks to dig it out. The coal came down at terrific speed in the steep places and kept on going over the lesser grades. It filled the chute all right; but it refused to move as a whole when drawn off from the bottom.

When this scheme failed it was attempted to put in checks and doors and let the coal slide dump by dump from top to bottom. After a fashion, considerable coal was run in this way, but it came like a bombardment of the tippie; sometimes the larger lumps left the chute and flew clear over this building. The degradation was frightful, but the lumps that survived defied any further breakage and might have been sold under the caption, "Indestructible Iron-clad Splint." The company went into the hands of a receiver.

Tubes and chutes have been used under favorable circumstances for the softer gas coals, but it seems that operators generally have avoided long chutes for

### Monitor Receiving Its Load

As the monitor is pulled up under the lower end of the storage tube the gate on the tube end is lifted permitting the coal to flow into the monitor until it is full. Lowering the monitor shuts the gate and stops the flow.

splint. Some monitors are employed but the usual method of handling splint coal is by running the mine cars, from two to four to a trip, directly from the mine down the plane to a tippie landing. It is true that a few have ventured to install long conveyors of the disc type, but it is doubtful if the up keep of these will stay within low limits.

Running mine cars over a plane is not only hard on the cars but every car has to be inspected and kept in perfect repair for each trip. It is almost impossible to prevent some runaways, and unless the coal is carefully cribbed much is lost on the plane. Furthermore the landing at the tippie requires a longer and more substantial building. Finally, broken trips running

away have, on reaching the tippie, been the cause of an appalling number of serious accidents.

The usual type of monitor is filled from a bin, the coal falling several feet into the top of the monitor. This, added to the breakage in the head-house bin and that caused from discharging into the tippie bin, makes an excessive deterioration before the coal is screened. However, there are so many considerations in favor of monitor transportation that careful attention may well be directed toward eliminating the attendant breakage. It was with this in mind that the rather novel equipment of Acme 2 was designed. It was desired to maintain the reputation of Old Acme for good lump coal and at the same time increase the capacity, reduce the cost,

### Monitor Discharging Its Load

At the lower extremity of its travel the end of the monitor enters the upper end of the lower storage tube. This opens the monitor gate and allows the contents to discharge into the tube.

### Tipple Frame and Machinery in Place

This picture was taken during the time that the equipment was being installed. The conveyor and transformers can be plainly seen.

and eliminate the danger of cars running away onto the tipple. About everyone on the job had a hand in making suggestions which W. W. Venable of the Kanawha Manufacturing Co. has attempted to incorporate in his designs for this equipment.

First, an attempt is made to have the coal slide from point to point at all successive stages from top to bottom, instead of falling into bins and pouring into and out of monitors. Thirty-three degrees was chosen as the angle at which this coal would move from rest, and the equipment is a combination of monitors, steel tubes and conveyors. The monitors are especially designed, and shuttle between two 36-in. steel tubes, a receiving tube 104 ft. long and a discharge tube 220 ft. long. The short conveyor simply feeds the coal onto shaker screens from the lower tube.

Starting from the mine, the coal is loaded into 2-ton cars and weighed on a Fairbank scale with a Streeter-Amet automatic weighing device, after which it passes over a Phillips cross-over dump. Instead of dumping into a bin, the coal runs out of the car into the receiving tube, which is installed at the same pitch as the car bottom in position of dumping. The first dump rushes

down the tube with considerable velocity and a good deal of breakage against the hooded door at the lower end results. However, the next dump cushions against the coal already in place and makes a fairly easy landing.

Each dump that rushes down the tube is spread out by friction so that there is a "tail" of coal in front and a similar tail behind. In other words, the tube is filled quite loosely and with much less breakage than a bin would be, because there is just enough momentum to the strung-out coal to bunch it up together at landing, making the tube full but not packing it. It is contemplated to not empty this tube until the end of the day, but to operate at all times with at least several dumps in the tube. It holds about 30 tons. A bin to hold 30 tons would have to be twice as large, unless coal were dumped with a fall of 10 or 15 feet.

Next, the monitor instead of having an opening in the top is open ended like a cartridge. It is rectangular in cross section and the upper end is designed on such a slope as to raise the hooded door of the receiving tube, taking its load automatically. As it opens this door it is on the same slope as the tube. The whole

TIPPLE COMPLETED, WITH FIRST RAILROAD CAR AWAITING ITS LOAD

Tipple is designed so as to reduce breakage. A large slack bin is provided, but the capacity of the tubes is relied on to furnish the storage. They hold about 100 tons.

bulk of coal in the tube simply moves downward and with enough thrust to entirely fill the monitor, with the exception of that part occupied by the end of the tube which projects into it. As the monitor withdraws the hooded door drops, cutting off the coal, not suddenly but allowing enough to come through to finish the monitor load by the time it is clear of the tube.

It is 700 ft. on a 25-deg. slope to the receiving end of the lower tube. The monitor, with 10 tons of coal, descends, operating the ordinary drum rigging until it reaches the 220-ft. tube, which is used instead of the ordinary receiving bin. The upper end of this tube is designed to receive the lower end of the monitor, which slides into it on an angle of 33 deg., the sides of the tube being constructed on such a slope as to raise the door of the monitor. The discharge of the coal is, of course, reciprocal with the receiving of the coal into the other monitor at the top.

The first monitor full rushes down the tube and against its hooded end with appreciable breakage, but

trestle. And also the cut makes a safety ditch which will effectually prevent any runaways from ever coming into the tippie. With heavy 10-ton monitors coming clear down to a tippie there will inevitably be a time when one of them will run away and smash things up. In this connection, it might be well to call attention to the fact that the first joint of the receiving tube is telescoped so that a heavy bump against it will not be communicated along the whole tube to the conveyor or tear the tube from its foundations. It is hardly necessary to explain that both monitors do not land at exactly the same point, there being four or five inches difference to take care of the four rails which are all brought in together from a frog, but with no latches to bother with.

Probably the most serious objection to the installation is the precaution that must be taken in freezing weather. This was, of course, considered when designing the equipment. The tubes should not be left full over night in cold weather, and too long a delay during the day might cause a stoppage, but as far south as this,

Dumphouse at  
the Top of  
the Plane

Mine cars are here discharged to the upper end of the upper storage tube. A jointed material skip is shown in the foreground.

after this the succeeding dumps cushion on account of the coal being spread out up the tube. Each dump leaves a "tail" instead of presenting a solid bank for the next monitor load to break against. Although after the first dump there is less breakage than in a bin, still the intention is to operate with the tube well filled. It holds about 70 tons.

When the conveyor starts, the coal feeds from the tube at the rate of 2,000 tons per day, or, in fact, at about any rate desired. Thus the coal *slides* from the car into the upper tube, *slides* from this tube into the monitor, *slides* from the monitor into lower tube, and *slides* down this as the conveyor takes it away from the discharge opening.

Of course, in the whole design advantage has been taken of the contour of the ground. It just happens that the last 220 ft. of the plane is the steep portion, making the tube practical. It just happens that the grade between tubes is approximately uniform so that there are no knuckles to make sheaves and rollers necessary.

It happens, also, that running a tube over the Coal River railroad cut at this place saves a double monitor

the advantages in other respects outweigh the chances of these occasional delays in cold weather.

In the present installation the tippie is equipped with a large slack bin emptied by a conveyor in order to get all the capacity, but there is 100 tons of storage carried in the tubes without breakage and which could not otherwise be provided for.

It would appear, to sum up the advantages: (1) That this is a cheap installation, (2) that it can be cheaply operated, (3) that breakage has been reduced, (4) that by shortening the monitor run 300 ft. the capacity of output is much increased, (5) that the danger to tippie and men from the runaway trips is practically eliminated, (6) that there is a maximum of storage in a minimum of space, (7) that by confining the monitor run to that part of the plane that is of uniform grade the number of sheaves and rollers is reduced and a correspondingly longer life given the ropes, which have been shortened 300 ft. by reason of the installation of the tubes, (8) that the monitor fills automatically and cannot be run over, wasting coal on the plane.

# What Should Be Done To Provide a 300-Day Working Year\*

Summer Storage of Coal Has Been Urged as a Stabilizer of the Industry—Of all Consumers of Fuel, the Railroads Are the Most Readily Able to Store Their Winter's Requirements

BY EDWIN LUDLOW  
New York City

AT THE recent meeting of the American Institute of Mining and Metallurgical Engineers, the open forum on the subject of the stabilization of the bituminous coal industry that was called by Mr. Hoover brought out a large number of able papers, and a full discussion of the problems involved. The criticisms of the bituminous industry were:

That it was overdeveloped with a possible output nearly 50 per cent in excess of the present requirements; that during the summer there were plenty of cars and no orders, and during the winter there were plenty of orders but no cars; that the mines were not properly developed from an engineering standpoint, and that the recovery of the coal varies from 50 to 95 per cent; that this industry, employing over 600,000 men, could, if running full time, release 100,000 men for other work; that the studies made by the engineers of the Fuel Administration showed that the cost of production increased with a loss of time and that with a 50 per cent operation the increase in cost was about 40 per cent.

There is much truth in all of these criticisms but the remedies suggested were all met by objections and no clearly-defined policy was formulated at the meeting. This was left for a committee to be appointed by Mr. Hoover consisting of the 15 members of the coal and coke committee of the Institute with 15 others not necessarily connected with the Institute but whose assistance would be of value in formulating a definite plan for the stabilization of the bituminous industry.

## TWICE DOMESTIC CONSUMPTION COULD BE PRODUCED

It is true that with full running time the mines could produce nearly a billion tons per annum as against a domestic consumption of 500 million. It is not possible, however, to change immediately from half time to full time and any improvement will be gradual. In the meantime every year shows an exhaustion of some mines and the demand increases at the rate of 20 million tons per annum.

The criticism that a large proportion of the tonnage of bituminous coal is not produced under the direct control of engineers is perfectly true. The history of a majority of bituminous mines, especially of a large number of small ones that go to make up the aggregate tonnage of the country, is that some successful sales agent who has been selling coal on a commission for other mines feels the necessity of having an operation of his own to stabilize his own business and arranges either by the formation of a company or through his own capital to purchase or open up such an operation. He then appoints a good practical man to take charge.

In the majority of cases this means the appointing of a superintendent who has been a foreman at some other mine. He is not an engineer, and as he is expected to mine coal at the least possible cost, he works the mine on that basis, taking out the best portion of the bed and leaving coal for a roof when it is cheaper to do so than take it down and set timber. He usually works without definite plan. The engineers who go into such a mine are simply surveyors who record what work has been done and are not employed to project the future workings.

## PROFITS HAVE LAIN IN SALES, NOT PRODUCTION

The selling end of the bituminous business has been the money-making end, and the majority of mining companies are only adjuncts of a sales company. The exceptions to this are, of course, the mines opened up by the United States Steel Corporation and other steel companies for the purpose of mining coal for their own coke ovens. The large landowning companies have also done much good work in the way of conservation by employing engineers and insisting that the leases shall be worked in conformity with the instructions of these men and the workings planned out ahead. The recovery in all fields worked in this way with definite plans and laid out by engineers runs from 90 to 95 per cent, while the other class of mines obtain from 50 to 75 per cent extraction.

The anthracite industry is much better stabilized than the bituminous, due to three reasons: First, the railroads operating in that field recognize the importance from the standpoint of their own revenue of maintaining full working time at the mines. As a consequence car shortage is almost unknown, while this is the cause of the greatest loss of time in the bituminous field.

Second, the companies give a summer discount to encourage stocking, amounting to 50c. per ton in April and which is taken up at the rate of 10c. per month until September when the full circular price is charged until the next April.

## LOWER-PRICED COALS ARE STORED

Third, storage is provided by the large companies to take care of such sizes as are not in demand during certain periods. This storage had to be added to the price reduction in order to make that effective and is used largely for the lower-priced steam sizes that find their maximum demand in winter for steam-heating plants in the cities.

The domestic sizes are now readily absorbed at nearly all times of the year, but until these storage plants were built the spring reduction in price did not show any great results in increasing the working time during the summer. The fact that anthracite can be stored without

\*Paper presented before the New York section of the American Institute of Mining and Metallurgical Engineers, March 3, 1920, entitled "Stabilization of the Bituminous-Coal Industry."

danger of fire and with only a small loss from degradation makes stocking it a much simpler problem than the similar treatment of bituminous.

The unionization of the coal mines has made labor unnecessarily costly through the unions refusing to allow any man to fill two positions even when it was perfectly possible for him to do so without overwork. This has caused a 25 per cent increase in the number of men with no corresponding increase in tonnage. The union also frowns upon individual effort and openly advocates

Labor unionization has greatly and unnecessarily increased mining costs. Nationalization of mines is favored by the miners because they believe that there is no bottom to Uncle Sam's pocketbook and that the Government could produce coal and sell it below cost indefinitely. To force nationalization they make excessive demands.

that all must hold themselves down to what the average man can do, and is continually preventing any rules being enforced calling for a full day's work.

Claims were made that the strike of last November was due to the short working time of the mines. This was not the reason as the strike was called in accordance with an agreement made in England a year ago by which coal miners of all countries were to demand the nationalization of the mines and in order to obtain it they were to ask a 60 per cent increase, a 6-hr. day and a 5-day week.

The English miners have not obtained nationalization of the industry, but have secured a shorter working day. The result has been so disastrous to the British industry that the men will probably never get any further demands. The Nov. 1 strike was called at the beginning of winter, in violation of contracts, with the expectation that the mines would be taken over by the Government. That short working time was not the reason for the strike is shown by the demand of the anthracite miners, who have never suffered from short time, that they shall be granted a 60 per cent increase, a 6-hr. day and a 5-day week when their contract expires on April 1.

The statistics show that each increase given the miners in the last few years has reduced the tonnage per man-day and if the anthracite miners receive any part of their demand there will not be enough anthracite mined to supply the requirements of the country.

I talked with a district president of the miners in the anthracite region and asked why they wanted Government ownership of the mines when they knew that Government operation of the railroads had been a failure. He said, "Yes, that's true, but look at the high wages and short hours the men get. That's what we want. We know that the mines could not pay their overhead and sell the coal mined in the shorter hours at a price that the public would stand for, so we want the Government to take the mines and sell the coal at any price it pleases, and if it is at a loss the United States Treasury can stand it."

A study of the various addresses made at the recent meeting indicates that the greatest difficulty in the coal industry is a lack of co-operation between the bituminous mines and the railroads. The railroads use 155,000,000 tons or 28 per cent of the entire output of

bituminous coal in this country. The curves as shown in Mr. Smith's paper indicate that their heavy demands for coal are in the winter at a time when output is most difficult to produce, and when the demand from the domestic trade is at its maximum. The public utilities, electric lines, etc., consume 33,000,000 tons or 6 per cent and have their maximum demand in winter.

The domestic consumption naturally shows the greatest fluctuations in its demand curve, dropping from 10,000,000 tons for the month of January, to 2,500,000 tons for July and August and going up again to 9,500,000 tons in December. This total tonnage, however, is only 67,000,000 or 12 1/2 per cent of the entire output. The coke ovens absorb 85,000,000 tons or 15 per cent of the output, but their low period is December, January and February, forming a potent factor tending toward equalization.

The other consumers shown by Mr. Smith's paper all have variable curves with a larger consumption in summer than in winter.

Prof. Stock's paper showed that it was entirely possible to store bituminous coal without danger of fire if the storing is done properly. The safest storage of all is under water as that is not only fireproof but also prevents any loss of volatile matter and deterioration in the coal, while storage can be continued an unlimited time. It would not be practicable for the domestic consumer to do any large amount of storing as his facilities would not be such as to enable him to do it in a proper manner. He would always have the danger of spontaneous combustion and the degradation which would be unavoidable. The amount that he would have to store would not warrant him in going to any appreciable expense in preparing a proper storage.

#### RAILROADS COULD RENDER MOST ASSISTANCE

The electric utilities could and should store to a much larger extent than they do, but the ones who could help the whole bituminous trade by co-operating with it and storing during the summer a three month's supply which could be drawn upon during the winter months, would be the railroads. They could do more toward stabilizing the industry than anyone else, and no other industry could so well afford to store coal as the railroads since they have at their terminals sufficient ground on which this coal could be put down and they have in their equipment the locomotive cranes necessary to pick it up when it is needed. Thus the only capital expense required would be the proper preparation of the ground on which the coal is to be stored so as to avoid the danger of picking up the surface when recovering the fuel.

The railroads could better afford to do this than anyone else for the reason that it would enable them to have their equipment free to handle their domestic trade in the winter and their freight trains would not be loaded down with coal for their own consumption or that of other railroads during the period of most difficult operation, when the demand for coal is the greatest.

Suggestions were made that freight rates should be adjusted, giving low rates in summer in order to encourage stocking. This would not be necessary if the railroads themselves would do the stocking. The mines also should be willing to assist in this stocking movement by agreeing in their contracts that coal delivered to a railroad or to any other industry in excess of the average monthly requirement should be at a sufficiently lower price to pay for the stocking.

Such contracts are now in existence with the electric companies by which in providing for, say 120,000 tons per annum, the mining company has the right to double the monthly average in any month or ship 20,000 tons in a month, but that excess over the average monthly requirement of 10,000 tons would carry a discount of 5, 10 or 15c., as may be agreed upon. With this sort of contract the mining company could fill the full contract in six months if it desired and the electric company would have to take it.

An objection to a reduction in rates is that it is a complication that would work an injustice on the railroads in their shipments to the Lakes, where a great proportion of the summer tonnage goes and which cannot be forwarded to its final destination excepting during that season. And the same would also be true of tide-water shipments which are usually heavier in summer than they are in winter. It would only take about 50,000,000 tons extra shipped during the summer months to practically stabilize the industry. This the railroads with a consumption of 155,000,000 tons could easily absorb.

The objection to the dealers storing the coal is the cost of such storage to them. They have to pay for the freight as well as the coal. They have to stand the loss in degradation and the danger of fire, and all of these losses would have to be added to the price to the retail consumer so that the public would have to bear the entire cost of this storage. It would also give an opportunity to the dealer who had these storage yards to charge an exorbitant profit when coal was scarce under the claim that he would have to have such an amount in order to absorb his storage charges.

The stabilization of the bituminous industry must cover the question of the price to the consumer as well as the operation of the mines. Attempts to store by the wholesale and retail dealer would not accomplish the desired result even if a seasonal freight rate was allowed.

Transportation in this country is in a serious condition. The railroads have just come back to their original owners after three years of government control, depleted as to cars and rolling stock and with their roadbeds in worse condition than when they were turned over to the government, with wages up at so high a figure that the majority of the roads are not able to earn the guarantee that the government gave them based on the three years' earnings before they were taken over.

It is going to take billions of dollars to rehabilitate the carriers. Unless they can show an earning capacity it will be extremely difficult for them to borrow the money with which to do this. We have to face, therefore, a utilization to the best advantage of the rolling stock and equipment that the railroads have at the present time and this can only be arranged by eliminating as far as possible the haulage of coal for railroad purposes during the winter months.

The congestion of population in the cities and the large increase in manufacturing industries, with a continually increasing cost of obtaining sufficient freight terminals in these cities, make the problem of future operation one from which we will have to learn a lesson from Europe and utilize to a larger extent the waterways of this country. This is already being done in the Pittsburgh district, where the Monongahela River is now becoming the great carrier of coal from the mines to the by-product ovens and manufacturing plants of Pittsburgh.

To utilize this river to its maximum, the mines are being connected underground by haulage roads extending back as much as 11 miles so that coal may be hauled to a river loading point. Furthermore, the river is being kept open all winter by ice breakers to prevent any interruption of a steady movement of coal to the by-product ovens.

The Kanawha and Ohio Rivers have always been gateways for the outlet of coal and this movement would be greatly stimulated if the public utilities would locate their plants near the river and make provision for sufficient storage so that they could obtain the bulk of their supplies by water.

In the anthracite field the greatest development in that direction would be the making of slackwater navigation from Trenton to Easton, permitting the barges that now carry coal to Sound ports as well as those for the Southern ports to be loaded at Easton, Pa., which is at the junction of the Delaware and Lehigh rivers and is reached by nearly all the anthracite roads. This would mean a short haul from the mines to the loading docks and would avoid the congestion of the crowded New York Bay terminals, where nearly all of the coal, not only for New York but for the waterfront of New England, is now loaded.

We are faced at this time with what is almost a coal famine and yet the mines are not working an average of three days a week. The coal that is being shipped in those three days is to a large extent being confiscated by the railroads. During the last five days of government operation at Newport News all the coal was confiscated irrespective of its destination and cars were even taken away from a vessel that was partly loaded and at the dock.

Provision should be made in the new regulations of the railroads, prohibiting this confiscation, and making the railroad that does confiscate, responsible not only for the price at which this coal was billed to the consumer but responsible for damages to the party to whom it was consigned, providing the non-receipt of this coal produced a loss in production or a shutdown of his plant.

As long as it is easy for the railroads to supply themselves through confiscation with the fuel that they need they will not take the trouble or go to the expense of buying sufficient stock to tide them over, and now that the railroads have gone back to individual ownership we should see that the bad practices instituted

We are faced with a fuel famine, yet the mines work only about three days per week—and much of what coal is shipped has been commandeered by the carriers. Bad practices instituted during Government control should not be indefinitely continued under private ownership. Confiscation by carload should be prohibited.

under government control are not allowed to continue.

The stabilization of the bituminous-coal industry can not be accomplished without co-operation of the railroads and the railroads cannot obtain their full returns without utilizing to the fullest extent the cars and motive power they now possess. Now is the psychological time for the two parties to come together and formulate a plan to that end.

## A Small but Efficient Tipple

Arrangement of Tipple and Machinery Is Such That Ready Access May Be Had to All Machinery—Three Sizes in Addition to Run-of-Mine Are Secured—  
Simplicity Is the Keynote of Entire Installation

BY WILLIAM BRASACK  
Fairmont, W. Va.

**T**HE Birch Fork Coal Co. recently opened a new operation called the Birch Fork mine. This is located at Birhton in Raleigh County, W. Va., on the Coal River branch of the Chesapeake & Ohio R.R. The coal bed worked is the Dorothy Seam, which at this point has an average thickness of 6 ft. The coal is fairly hard and dry, is a good domestic fuel and well suited for steam purposes.

The mine is a drift operation located well toward the top of the mountain, while the tipple is placed in the valley. This arrangement called for a monitor plane about 1,800 ft. long. The coal is dumped at the top into a bin of about 500 tons capacity and loaded through undercut gates into monitors which lower it down the hill and discharge it into another bin of 25 tons capacity at the tipple.

The tipple equipment has a capacity of 200 tons per hour and is housed in a substantially designed wooden structure. One of the accompanying illustrations shows the tipple after the machinery was erected and while the first railroad car was being loaded, but before the siding and windows were put in place.

An oscillating feeder operating under the tipple bin delivers the coal uniformly to the shaking screens.

FIG. 1. MECHANISM OPERATING RECIPROCATING FEEDER  
A flywheel on the main shaft assures a smooth oscillatory motion to the feeder plate.

This feeder is driven from a 5-hp. squirrel-cage motor through one belt and one gear reduction and runs at 75 complete oscillations per minute. The oscillating plate is driven from an adjustable eccentric while a flywheel

FIG. 2. LOOKING UP THE SHAKING SCREEN

These screens are built in two sections the oscillations of which are almost directly opposed, so that vibration is greatly reduced.

insures steady motion. This type of feeder produces a practically even feed and leaves a cushion of coal about 12 in. deep on the feeder plate which protects it when a monitor load is dumped into the empty bin.

The shaker screens are made in two sections, closely balanced, and are of the continuous bottom and gate type. They separate the coal into three sizes, slack, egg and lump. These can be mixed through a suitable setting of gates. Fig. 2 shows the shaking screens set for run-of-mine coal. The screens are suspended by adjustable hanger rods from overhead supports, the hanger rods being well braced sideways in order to avoid wobbling. A special bevel discharge lip deflects the lumps when going to the picking table and prevents

FIG. 3. THE SCREEN-ACTUATING SHAFT

In order to reduce friction and the speed of surface rubbing, cranks have been here substituted in place of the usual eccentrics.

them from being struck on the return stroke of the screen. The lower screen is provided with a veil plate for making run-of-mine. This is bolted to the screen, and when not in use can be lifted bodily out of place by a system of hooks and counterweights, thus avoiding unnecessary weight upon the shaking screen.

The screens are driven at 100 strokes per minute through wooden connecting rods with suitable bearing heads from a crankshaft on which a heavy flywheel is fastened. The crankpins on account of their slow surface speed avoid the excessive heating sometimes encountered with large eccentrics. The crankshaft is

driven from a 15-hp. slip-ring motor through an endless belt provided with a tension idler. This forms an elastic connection between the armature and crankshaft.

Another novel feature is the Fairmont patent spring connection between the two sections of the shaker screens. These springs are shown in Fig. 5. They are alternately compressed and expanded and store part of the energy of the screens during the retardation period, giving it up again during the acceleration period. The effect is a saving of power and an absence of shocks and vibrations on the driving mechanism and the tippie

FIG. 4. PICKING TABLES FOR THE LARGER SIZES

These are of the traveling-apron type and terminate in hinged loading booms that may be raised or lowered to suit loading conditions.

structure. Tests taken recently show that these screens consume only 6.7 horsepower.

Slack is discharged over a chute into car on the slack track, while egg and lump coal are discharged onto picking tables with hinged loading boom extensions. The picking tables consist of apron conveyors with

FIG. 5. BALANCE SPRINGS ON THE SHAKING SCREENS  
Heavy spiral springs join the two sections of the screen; these alternately absorb and give up energy thus equalizing the load on the driving device and rendering operation much smoother.

S-shaped carrying pans attached to steel thimble roller chain running at a speed of 40 ft. per minute. The table for lump is 5 ft. wide while that for egg is 4 ft. wide. Both picking tables are driven from a single 10-hp. squirrel-cage motor through three gear reductions. The first or motor gears are cut and a bakelite noiseless pinion is used. The egg table may be disconnected by a special wide-angle jaw clutch which may be operated while the machinery is running.

The loading boom hoists are self-locking in any position and each one is independently driven through

whole being mounted on the cage platform, which is set on a 5 per cent grade. The track utilized in holding the empty cars at the shaft bottom should be, of course, on a like grade. Assurance is given by this construction that the cars will automatically release and cage themselves by gravity.

For purposes of illustration, the device assumes on a downcoming cage the position shown in Fig. 1. The operating lever is in a vertical position and the tread of the front and rear wheels of the car fits snugly against the horns, holding the car steady on the cage. When the cage has reached the shaft bottom a loaded car is ready to press against the operating lever with its bumper.

This lever is actuated easily and is depressed, as

FIG. 6. BOOM-HOIST JACKS

These devices are belt driven and self-locking. They are controlled from the trimmer's platform above the loading tracks.

a bevel friction and a common belt drive from a 7½-hp. squirrel-cage motor. (The gear guards have been removed in the accompanying illustration in order to show the mechanism.) The friction drives are operated through hand lines which are carried to the trimmers' platform. The loading booms are partially counterbalanced.

This tippie was designed and the mechanical equipment built and erected by the Fairmont Mining Machinery Co. of Fairmont, W. Va. The designers' aim was to produce a simple and yet effective and modern equipment with all the latest improvements and perfections. Special pains were taken to make all machinery easily accessible, and one may inspect all parts and walk around the tippie without bumping his head or being forced to climb over chutes and shafts, as is the case in some of the older structures designed for coal preparation.

## Automatic Caging Device

A Mechanism That in Most Cases Replaces Two Men

**A**N AUTOMATIC stop, lock and release caging device is being manufactured by the G. M. J. Manufacturing Co. of Pittsburgh, Pa. This apparatus is intended for use on self-dumping cage platforms, and supplants the two men at the shaft bottom employed for caging the cars. The new device is primarily a labor saver and by reason of its dependable mechanical action is much speedier in its operation than the methods commonly followed in caging cars.

Built entirely of steel, the apparatus consists principally of four horns and the operating mechanism; the

HORNS ON THIS DEVICE OPERATE ALTERNATELY This device will feed cars to the cage, one at a time, as long as the trip being fed lasts

shown in Fig. 2. This action is transmitted to the operating mechanism, which forces the horns on the discharge end of the cage outward and away from the rails. The obstruction to the wheels of the empty car having been removed, it proceeds on its way by gravity. As soon as the rear bumper of the loaded car has passed over the operating lever it is returned to the vertical position by recall springs. The horns are returned to

OPERATING LEVER THROWN The horns are now set in the opposite position from that shown above.

position over the rails and arrest the progress of the incoming car.

The pair of horns at the entering end of the cage are operated entirely by pressure from the wheels of the incoming loaded car and assume a vertical position as soon as these wheels have passed through them.

**Lessee's Liability for Coal Royalties.**—Under a coal mining lease binding the lessee to pay specified minimum royalties in certain years, regardless of whether sufficient coal was mined in those years to justify the payment, he became liable for such royalties by continuing to assert rights under the lease until after the royalties had accrued; although no coal was mined, he retained the lease for speculative purposes. (*Iowa Supreme Court, Saylor Park Land Co. vs. Glenwood Coal Co., 162 Northwestern Reporter, 203.*)

# An Oddity in Washhouses

**Miners and Laborers Prefer Tubs to Showers—Tubs of Concrete Can Be Made Which Are Serviceable and Yet Can Be Inexpensively Built and Installed**

**A**T MINE 4 of the Kingston Coal Co., Kingston, Pa., a washhouse of rather odd design has been constructed. The exterior of this building is of attractive design, as is shown in the accompanying illustration. When the washhouse was first built it consisted of only the central bay and was only one-half of its present total length. The first enlargement consisted in extending this building to its present depth. The demands

are painted as often as necessary with white enamel, keeping the interior light and clean. All of the floors are of concrete, which is easily washed and taken care of.

The central part of the building is used as the washroom proper and possesses some unusual features, the most important of which is the use of tubs instead of showers.

## Interior of Washhouse Showing Washroom

The unusual feature of this washhouse is the use of the bath tubs instead of showers. A group of men on entering will almost always use the tubs in preference to the showers.

upon the washhouse soon exceeded its capacity and it was doubled in size by the addition of the bay on the right. For only a short time did this building meet the requirements and it was necessary to add the third bay shown on the left. At present the washhouse is filled almost

Bathtubs, thirty-six in number, are provided, but for those who prefer this method of bathing, six showers are installed at one end of the room. These bathtubs and showers together with the wash basins are well shown in one of the illustrations.

Miners and laborers at this operation seem to prefer the bathtub to the shower. While I was in the washhouse about twenty-five men used the bath tubs, while not one used the showers, showing a rather strong preference for the tubs.

When the company decided to use tubs it found the price of a good enamelled article prohibitive and since it was believed that the men would prefer the tubs it strongly desired to secure them. After careful investigation and trial it was found that a satisfactory tub could be made of concrete at a small cost, and all tubs for this purpose are now thus constructed.

Down the center of the washroom extends a line of thirty-six wash basins. As can be seen in the illustration, these rest on a bench made of iron while the water-supply line is between them. Hot and cold water is furnished for the showers, bathtubs and wash basins.

On each side of the washroom there are two locker rooms each containing 240 lockers, making a total of 480 in all. These lockers are built of steel, are double decked and well ventilated.

Plenty of heat is furnished the men so that there is

**EXTERIOR VIEW OF WASHHOUSE AT KINGSTON, PA.**  
This building has been enlarged three times to accommodate the demands of the men. The original washhouse was the front half of the middle bay.

to its capacity and it probably will not be long before it will be necessary to make further enlargements.

The building is of brick with steel trusses supporting the roof. Interior walls and roof are unfinished but

little danger of their catching cold while cleaning up after a day's work in the mines. This heat is furnished by radiators on each side of the room. The foul air is carried away through the ventilators in the roof.

Light is furnished by the ventilators as well as by large windows on all sides of the building. At night the building is lighted by electricity. Twenty-four-hour

INTERIOR OF WASHHOUSE, SHOWING LOCKER ROOM

There are two of these locker rooms, one on each side of the washroom, each having a capacity of 240 lockers.

attendance is arranged for, a man being in charge of the building all the time. Every morning and evening the building is thoroughly cleaned to remove all dirt carried in by the miners when coming from their work.

By law every mining company is required to furnish a washhouse. This could be easily and cheaply done, but the Kingston Coal Co. was not satisfied with barely living up to the letter of the statute but went further and studied out what its employees desired and built the washhouse accordingly. Its ideas concerning the preferences of the men seem to have been vindicated as about 90 per cent of the mine workers prefer the tubs to the showers and three enlargements have been made to the original washhouse for the accommodation of the men who desire to use the building. There is no law compelling the men to use the washhouse as there is for the company to furnish one. So from that fact the demand for accommodation indicates the satisfaction of the men in their building.

## Large Possibilities in the Coking of Our Coal

By R. S. McBRIDE

Engineering Representative,  
McGraw-Hill Co., Inc., Washington, D. C.

COKE production in 1919, as announced recently by the United States Geological Survey, shows the tremendous possibilities of the United States in that direction. Twelve per cent of our entire coal output last year was coked, and it is of great interest to note what may have been obtained from this coal, though figures on the output of byproducts have not yet been announced.

We are told that, roughly, twenty-five million tons of byproduct coke and nearly twenty million tons of beehive coke were made last year in this country. If

we assume that the same percentage yield of coke from the coal was obtained last year as during previous years this means that about thirty-five million tons of coal were used in the byproduct process and thirty-one million in beehive ovens.

This is the first time that we have had a larger tonnage of coal used and coke produced by the byproduct process than in beehive ovens, and nationally we can congratulate ourselves on this evidence of real progress. The exact figures show the total byproduct coke production increased from 46 per cent in 1918 to 56 per cent in 1919.

It has been estimated, however, that only about 70 per cent of the possible byproduct-oven capacity was utilized in coke production last year. That the percentage was low is, of course, chargeable to the coal and steel strikes, which greatly added to the usual interruptions and other causes of low-capacity operation. It is rather interesting to see just what it would have meant if the byproduct ovens could have operated at full capacity. If this had been possible the coal consumption for the year in this process would have been fully fifty million tons, and the coke production over thirty-five million tons, or 80 per cent of the total coke produced and used last year.

Of course no one believes that 100 per cent capacity will ever be obtained in any such industrial process, but 85 to 87 per cent has been demonstrated as entirely feasible and even 90 to 92 per cent has been attained in certain plants or for certain periods throughout the whole country. If 90 per cent capacity had been attained forty-five million tons of coal would have produced about thirty-two million tons of byproduct coke, or over 70 per cent of the actual production for the past year.

If we make the assumption that the byproduct output per ton of coal will be the same as in previous years, we obtain for the various byproducts the results that are indicated in the following tabulation:

### COKE OVEN BYPRODUCTS IN 1919\*

	Assumed yield per ton of coal	Total yield	Assumed value	Total estimated value
Ammonium sulphate 18 lb.		315,000 tons	5c. per lb.	\$31,500,000
Light oils (crude)..... 2.4 gal.		84,000,000 gal.	15c. per gal.	12,500,000
Equivalent toluol.....		12,000,000 gal.		
Equivalent benzol.....		42,000,000 gal.		
Tar..... 7 gal.		245,000,000 gal.	3c. per gal.	7,500,000
Surplus gas..... 5 M		175 billion cu. ft.	12c. per M	21,000,000

\*Estimated from known coke production assuming recovery in all plants to give the same yields as known for previous years.

These products, together with the metallurgical coke, were worth, at the plants where they were produced, something in excess of \$300,000,000.

It is specially interesting to note that of the sixty-six million tons of coal used in making coke last year, nearly a million tons could have been saved had it been possible to utilize the byproduct process to 90 per cent capacity instead of only 70 per cent, and have the beehive operation correspondingly curtailed. Naturally, geographical distribution of the ovens and various company connections make any such change as this rather unlikely, but the great economic significance of such change cannot be safely ignored by anyone concerned in the coal business. It is only a question how long such an economic waste as the loss of a million tons of coal and the still greater loss due to the failure to recover byproducts from fifteen million tons of coal which might just as well have been coked in byproduct as in beehive ovens, will be allowed to continue without a radical change in practice.

# Brief of Majority Report of Bituminous Coal Commission on Wages

Increase in Wage 27 Per Cent—Contract Begins April 1, 1920, and Expires March 31, 1922  
—Miners Get 24c. More Per Ton—Adult Day Men Receive \$1 More Per Day—  
Yardage and Dead-work Is Advanced 20 Per Cent—Eight-Hour  
Day at Working Place

IT MAY be well to make a prefatory note to the effect that the majority report of the Bituminous Coal Commission on mine workers' wages makes no decision on the question of prices. Its decision may be summarized as follows:

(1) Unless otherwise ordered the terms and conditions of the Washington Agreement of 1917 continue. (2) The 14 per cent increase in wages fixed by the Fuel Administration is eliminated on March 31 and replaced by this award (which is on a 27 per cent basis). (3) The agreements drafted under this award are to take effect April 1, 1920, and continue until March 31, 1922 (in other words, the miners do not get their demand for termination of contracts in the fall). (4) The prices for mining mine-run coal, pick and machine, are advanced 24c. (5) All day labor and monthly men are advanced a dollar a day, except trappers and other boys, who are advanced 53c. a day. (6) All rates for yardage, dead-work and room turning are advanced 20 per cent. (7) The fulfillment of all joint and district agreements is to be guaranteed by the officers of the international organization. In the discussion of this particular award the commission stated:

## AGREEMENTS MUST BE BINDING ON BOTH SIDES

"We recognize that joint agreements resulting from conferences should be carried out fully and frankly by both parties, and that every proper assurance to this end should be given, since it is obvious that all attempts at amicable settlements of controversies will now and forever be futile unless the principle is once and for all established that agreements entered between employers and employees are binding upon both parties and are not to be considered as mere scraps of paper. For that reason we believe that the fulfillment of joint agreements, entered into in any given district, should also be guaranteed by the national officers of the United Mine Workers of America, and that it should be the duty of the officers of the national organization, as well as that of the officers of the district, to see that all such agreements are carried out both in letter and in spirit."

(8) The six-hour day and the five-day week are not granted; the eight-hour day is retained. In the discussion of this award the report states:

"We have gone fully into the mine workers' demand for a six-hour day and a five-day week, equivalent to a reduction of working hours from 48 to 30 per week. In considering this demand we were influenced in arriving at our decision by the fact that steady work on the part of all workers is urgently required by the entire world during the period of reconstruction and reorganization, when the enormous destruction and disorganization wrought by the World War in all countries and affecting

all industries must be counteracted by unusual industry and perseverance. To make any restriction affecting the output would be an economic crime.

## REDUCTION OF HOURS WOULD CURTAIL OUTPUT

"It is claimed by the miners, on the basis of experience after previous reductions of hours of labor and of the effects of reduction of hours in other countries, that curtailment of working time would not reduce the output in anything like a corresponding proportion. It is our view that arguments based on the effects of a reduction from 10 to 8 hours can hardly apply to a reduction from 8 to 6 hours, or from 8 to 7 hours. Production in countries where there has been a reduction in hours is less than before the hours were reduced. We feel that our responsibility to the nation will not permit us to make an award that would curtail appreciably the productivity of the workers in a basic industry.

"Each coal company endeavors to have enough men on its rolls to carry it over the peak of the rush season; the operators want coal mined while there is a demand, each company realizing that if it is unable to satisfy its customers they will turn to other producers and the sale will be permanently lost. A labor supply sufficient for the needs of the rush season is excessive during the rest of the year, part-time employment results and the nation will ultimately have to pay in its fuel bills the cost of maintaining this larger army of only partially employed workers.

"We are convinced that a reduction in hours of labor would only make a bad situation worse, that the miners' demand on this point is clearly uneconomic, and that no grant it would be detrimental to their own interests.

## CONSTRUCTIVE PROPOSALS MADE IN THE REPORT

"Another result that would flow from a reduction in hours, with the wages that it is proposed should be paid, would be to increase the number of men who would seek employment at the mines on account of the shorter hours and the full pay, and this in turn would result later in further demands for the shortening of hours in order to give employment to the men who would thus be added to an industry that is already overmanned. We cannot, in view of our responsibilities, agree to a demand that would lead to such disastrous results. At the same time we hope to accomplish something in the direction of the stabilization of the industry by means of constructive proposals discussed elsewhere in this report.

"While we are in full sympathy with the miners in their aspiration for a fuller life, we cannot help but feel that eight hours a day is not too much to work under present circumstances.

"The contention that the extra hazardous nature of the mining industry makes it desirable to reduce the risks run by the miners by reducing the time during which they are exposed to this risk is inconsistent with the claim that the miners wish to work the same number of hours per year as they are working now, provided the hours are more evenly distributed through the year, for if they work as many hours they will be exposed to the same risks.

"We also have considered the fact that contractual hours of labor apply only to day workers, and that more than 60 per cent of the miners work on a tonnage basis. To reduce the number of earning hours during the year, particularly when one of the chief complaints of the miners is that they do not have sufficient hours of work and consequently cannot earn adequate wages, would clearly not be consistent with the commission's conception of its duty. Therefore, our conclusion is that, under all the conditions, the eight-hour day should be maintained."

(9) The practice of car pushing stands, but with recommendations for careful consideration of ways and means for the introduction of ameliorating practices. (10) Rules are set up under which new machinery can be introduced in the mines and thoroughly tested. (11) A commission is set up for the Central Competitive field to handle questions of differentials in rate and certain other matters. (12) If the recommendations of the President's Industrial Conference are adopted in regard to industrial tribunals and boards of inquiry, this machinery is to be put into use in the coal industry. Otherwise a special board is to be set up.

#### FEDERAL AGENCIES ADVISED TO STORE COAL

(13) Explosives are to be furnished miners at cost, cost to include handling and insurance. (14) House coal is to be furnished to the miners at the tippie at the price they were paying on Oct. 31, 1919, plus the average percentage allowed as an increase on the wage scale; i.e., 27 per cent—the miners to pay for delivery at cost. (15) Charges for blacksmithing are not to exceed three-quarters of one per cent of the miners' earnings. (16) Special boards are to be set up for the Kanawha, Paint Creek and Cabin Creek fields; for District 12, Ill., including Assumption and Decatur, Ill.; also for the State of Washington, each commission to handle specific local conditions.

The report also recommends:

That an executive order be issued instructing departments and Federal agencies to buy and store their winter's supply of coal before July 1 of each year, and that the Council of National Defense assume the duty of obtaining the support of the general public for coal storage.

That an executive memorandum be issued to the Interstate Commerce Commission to the end that the commission may aid in the solution of the transportation problems outlined, with particular attention to the question of seasonal freight rates, car supply and car distribution, as well as the problem of railway coal purchase for storage.

That the Governors of the various states be asked to issue executive orders to state institutions and departments for the purchase and storage of winter coal during the summer months. Also that state railway and public utility corporations use their influence with the various utility commissions to induce the purchase and

storage of coal by those corporations, reflecting, if necessary, the cost of such storage in the rates.

That a copy of this report go to the railroads, to the end that they may co-operate in regard to coal storage, car construction and distribution, and the reduction to a minimum of the practice of commandeering coal, and that a copy of this report be transmitted to the Federal Reserve Board, to the end that Federal Reserve Banks may favor as eligible for rediscount paper drawn against coal in storage.

#### HOUSING CONDITIONS SHOULD BE IMPROVED

That the Interstate Commerce Commission, state railway and public utility commissions within their jurisdictions issue rules controlling car distribution among mines, to the end that no particular mine or mines may be permitted to obtain, through a practice of car assignment and car guarantees, preferential car service.

That the practice whereby purchasing agents of carriers can use company control over car supply to force down the price of railway fuel, be abolished. That operators avoid the use for railroads of coal whose properties make it more valuable for other purposes; that camp and housing conditions be improved.

That the good offices of the miners' international organization be exercised to maintain their expressed position favoring the introduction of labor saving devices and machinery, and that the making of advances on miners' pay be discouraged in every way, but, if made, that they be made without discount, either directly or indirectly.

The following statement is included in the report: "In submitting this report particular attention is called to the fact that herein every effort has been made for the protection of the public, not only for the period under which this protection can be guaranteed by the Executive under the powers granted him by the Lever Act, but it has been our effort to go into the underlying causes for high costs and to offer some remedy therefor; this, in order that in the future, when the government relaxes its control over prices, there may be a continuing force at work in the public interest.

"We believe it is obvious that unless some changes can be made toward the end of reducing costs in coal production and distribution no act of Congress, no order of the Executive nor any other regulation by constituted authority can in the end provide against the continuing high costs. It is for this reason that we believe that this industry should be placed upon the proper basis for more continuous and thus more economical production and distribution, with the result that the cost of coal to the people will be reduced."

The report also states:

#### REDUCING COST BY CONTINUOUS PRODUCTION

"We believe it is fair for us to report that in the neighborhood of 80 per cent of the total tonnage that has moved since Oct. 31, 1919, has moved under contracts which carried what is generally known as the standard wage clause, providing for an increase in cost to the purchaser equivalent to the increase in costs resulting from an increased wage scale. This statement was made in order that there may be no misunderstanding on the part of the public and the public rate making authorities."

The annual value of bituminous coal is \$1,300,000,000. The labor cost is 57 per cent and totals \$741,000,000.

Twenty-seven per cent of this amount is approximately \$200,000,000, which is the additional sum that would be paid to the miners as a result of the award, above what they were receiving on Oct. 31, 1919. It must be borne in mind that the award is based on the status prior to the application of Dr. Garfield's 14 per cent. The 14 per cent itself involved a cost of over 104 millions, to which the present award adds approximately another 96 millions.

Wage advances granted to miners between 1913 and Oct. 31, 1919, averaged 43 per cent for tonnage workers and 76 per cent for day men. Wage advances to tonnage workers after this award will amount to 83 per cent since 1913, while the advances to day men will average 111 per cent. This difference is due to the fact that day men were relatively underpaid before the war. The 27 per cent increase was apportioned to the miners along the lines of the award.

The coal industry is a part-time industry, the average number of idle days out of a possible 308 working days each year during the past thirty years being 93. In 1918, when the demand for coal was at the maximum, the principal cause for lost time was car shortage. This accounted for a total of 49 per cent of all time lost. In 1919, when the war demands had ceased, "no market" accounted for 50 per cent of the idle days.

The report states that for many years the railroads, and especially the coal carrying railroads, have depended on a practice of commandeering coal assigned to other customers. In some degree public utilities have counted on this form of priority. The railroads are consumers of about 30 per cent of the total coal production of the country. We have presented to certain of the executives of the larger systems a request that the railroads accept the principle that it is their duty to the public to move coal in the months that normally are months of low movement, to consumption terminals, such movements to be in excess of their then needs, thereby gradually accumulating a three months' supply before the winter, the railroads to come out at the end of the winter with possibly twenty or thirty days' supply on hand. This movement would be more economical than the movement in the winter, and, from the standpoint of the coal railroads at least, the lower cost of movement would to a great degree offset any cost of storage.

The acceptance of this principle by the railroad executive heads has been general. The Pennsylvania R.R. and the New York Central lines expressed their acceptance in an especially liberal spirit. The report states that this is a duty of the railroads and that some method should be devised under which they will provide such storage.

The report states that it is the commissioners' belief that the public utilities, too, have a duty to perform to the public and that they should not rely on any form of priority when the pressure comes in the winter, and to his end that they should be called upon to move and store coal in the summer months in excess of their needs, going into the winter months with sixty days' supply in storage. The commissioners feel that these two groups

owe this as a duty, and that in both cases, if there is an increased cost, it will be recognized by the rate-making authorities. In the case of the public utilities it was in effect stated by a representative that he believed this plan or principle was sound.

The next largest group of coal consumers is the steel industry. The commissioners have presented the problem to certain of the heads of important steel concerns, including the United States Steel Corporation, and they express an intention of increasing storage of coal and movement of the same in the months of low movement along the lines of the plan here suggested. It is believed that the Federal Reserve Board and the several Federal Reserve Banks will favor considering as eligible for rediscount paper drawn against coal in storage.

In addition to these groups the report recommends strongly that all Government institutions—national, state, municipal and local—purchase, receive and store coal during the spring and summer

months in anticipation of the winter's requirements.

The commissioners state as their belief that if the various groups mentioned carry out the plan of storing from two to three months' requirements, beginning the winter with this supply on hand, the result will be a decided stabilization of the coal industry, a considerable measure of relief to the carriers, and a general economic saving to the public and the nation, and, further, that the practice will result in the minimizing of the commandeering and confiscation of coal on the theory of priority. The commissioners also feel that unless some plan of this kind is adopted we are bound to have recurring conditions of coal shortage in the winter months, and that no need for such a situation exists.

The commission not only made its recommendations in regard to purchase and storage, but has taken up with railways and public utilities the questions involved. It has already received the written approval and promise of support of the New York Central and Pennsylvania lines, the endorsement of the Association of Public Utility Commissions of the United States, and it is believed that the Federal Reserve Board will co-operate by favoring the rediscount of paper drawn against coal in storage.

### Button Strikes Still in Operation

At the Pine Hill Colliery, near Minersville, Pa., in the Southern anthracite coal field, a button strike was declared March 14 because two men working at that plant had not paid the last quarter's dues and lacked the button which, according to the union contention, is necessary if a man is to be allowed to work in the mines.

**Injury Caused by Defective Coupling Hook.**—A coal operator may be held responsible for injury to an employee caused by uncoupling of cars, due to a defective condition of a coupling hook, if the defect had existed so long that the operator was guilty of negligence in failing to discover and remedy the condition. (*U. S. Circuit Court of Appeals, Sixth Circuit; Elmore vs. Westress Coal & Coke Co., 240 Federal Reporter, 328.*)

Labor cost is 57 per cent of the value of bituminous produced annually, to which the 27 per cent wage advance must be added. The railroads, by moving coal in excess of needs in low movement months, could relieve car shortage. Public utilities should store sixty days' supply.

# Disadvantages Urged Against Seasonal Rates Held To Be Untenable

Power Given Interstate Commerce Commission To Change Differential Where Necessary—  
Frelinghuysen Believes That Few Open Tops Are Likely To Be Purchased

**T**HAT the disadvantages customarily urged against the feasibility of seasonal freight rates for the transportation of coal are untenable was asserted by Senator Frelinghuysen in presenting his measure to the Senate. While recounting the many advantages of such an arrangement Mr. Frelinghuysen directed his arguments to disproving the validity of ground for opposition. Some of his arguments in this connection are as follows:

No confusion, either for carriers or shippers, would result from changing the rate on coal twice every year. The proposed legislation prescribes that the carriers shall file their tariff rates on coal in the same manner as at present, and, instead of requiring them to alter these tariffs semi-annually, provides an automatic statutory differential below the tariff rate for one portion of the year and above the tariff rate for the remainder of the year, with discretion in the Interstate Commerce Commission to change the amount of the differential where it finds it necessary.

## SOME COAL WILL STILL BE MINED IN WINTER!

The revenues of the carriers would not be affected. A large amount of coal would still have to be mined and shipped in fall and winter to consumers who lacked the capital, credit, foresight, or storage accommodations to enable them to secure their supply during the warmer months. If the 30 per cent differential in favor of the months between April and August, inclusive, should prove an unnecessarily large inducement, so that too great a proportion of coal were shipped during this period, the Interstate Commerce Commission is authorized to change the percentage so as to balance the summer and winter shipments properly.

The transportation of coal in the spring and summer would not embarrass the railroads in handling other seasonal movements—for example, crops. In some localities cars carrying grain are loaded only in one direction, returning empty to the point of origin because of lack of shipments moving in that direction. If coal could be encouraged to move at the same time, this wasteful practice of hauling empty cars might be at least partially eliminated. Operating conditions during the clear weather of the spring and summer months are much more favorable, so that railroads can better withstand heavy demands for transportation at that period of the year than during the fall and winter months, when coal has heretofore moved in greatest volume. The cost to the railroads of transporting coal is also much less in warm weather, when locomotives can haul heavier trains, when they consume less fuel, and when fewer employees can handle more traffic.

The acquisition of more coal cars does not afford a practicable and complete remedy for existing difficulties. Under the transportation act recently approved the Interstate Commerce Commission is given the power to

require carriers to provide themselves with sufficient cars. But most of the railroads have neither the money nor the credit with which to buy a supply of coal cars adequate for current needs under the present system of large seasonal shipments, so it would be useless for the commission to order them to purchase this equipment. On the other hand, most of the railroads which have enough money or credit to finance such purchases already possess an adequate number of coal cars to care for the needs of their own patrons, and they could not reasonably be required by the commission to purchase additional cars to take care of the traffic of other lines.

## FEW OPEN-TOP CARS WILL BE PURCHASED

The transportation act also appropriates \$300,000,000 as a revolving fund from which loans may be made to the railroads. In view of the fact, however, that this money will very likely be used only in small part for new equipment, and that of the portion which is spent for equipment much will go for new locomotives, refrigerator cars, and other types of urgently needed rolling stock, it is not probable that any considerable number of coal cars will be purchased out of this fund. It has been estimated that 100,000 new coal cars will be necessary to handle properly the usual seasonable demand. These alone would cost the entire amount of the appropriation mentioned above.

The same statute also provides for creating a general railroad contingent fund, made up of a portion of the excess earnings of prosperous railroads, out of which loans may be made to the railroads, and out of which the commission may purchase equipment and facilities to be leased to the railroads. This fund will, however, be wholly an expectancy for many months to come, and at least one more winter, with its heavy demand on the present totally inadequate coal-car supply, would elapse before any relief could be had from this quarter.

## LIMIT TO ABILITY TO BUILD RAILROAD CARS

Even if funds were immediately available with which to purchase coal cars, and only coal cars were to be built, the car shops in the United States could not turn out sufficient cars between now and next fall to handle properly the coal shipments during the winter of 1920-21, assuming that the proposed legislation is not enacted in the meantime. Finally, even if this money were obtainable and cars would be turned out in sufficient quantity, the acquisition of cars which, under the present system of uniform freight rates on coal, would stand idle the greater part of the year would entail enormous depreciation and capital charges, all of which would have to be borne by the coal transported during the rush season.

It may be urged that the Interstate Commerce Act now contains ample provisions to permit the commis-

sion or the carriers to institute lower summer freight rates for coal. The conclusive answer to this contention is that during the many years that the same provisions have been law this practice has never been introduced. When the carriers have been asked to initiate such seasonal rates on coal, the request has usually been coupled with a demand that while rates might be lowered in summer, they should not be raised in the winter; and the carriers, facing a consequent depletion of their revenues, have declined to co-operate on this basis.

The shippers and consumers, motivated by their individual needs, have been by no means unanimous as to the amount of the difference in rates or the seasons in which lower or higher rates should prevail. In the very nature of the case, it is a subject for legislation, where Congress, representing all the people, may enact rules which will take into consideration the interests of all the people.

The Interstate Commerce Commission, while it might feel justified in approving schedules initiated by the carriers instituting such seasonal rates, could not make such percentages of difference in rates permanent. The carriers, pressed by coal operators or consumers, might at any time file new schedules abandoning or modifying these seasonal rates. General confusion would result.

It is understood that the commission does not believe that it possesses the power to require the establishment of such seasonal rates on coal. It has never attempted to exercise this power, and it is known that it does not contemplate doing so in the future in the absence of further legislation. The commission assumes that in prescribing rates and practices it is not empowered to initiate new systems of rate making designed principally to remedy general economic situations.

Even if the carriers, the shippers, and the commission could and did institute such seasonal rate schedules, their action in this matter would be the subject of interminable litigation. It would be contended that no power had been delegated to the commission to approve or initiate such seasonal rates, and the action of the commission in this connection would most likely be enjoined until the matter had been decided by the United States Supreme Court. The result would be that two or three winters might elapse before this urgently needed practice could be put into effect. Definite legislation, such as that proposed, will remedy the situation at once. In view of the fact that the courts have upheld similar differences in rates, based on no less cogent economic reasons—e. g., under the so-called long-and-short-haul clause—there should be no doubt as to the constitutionality of the measure proposed.

## What Stabilizing the Coal Industry Will Save Mine Workers\*

THE annual output of the coal industry is valued approximately at \$1,300,000,000. It is estimated that by making the demand for coal spread evenly through the year, not less than 60 days can be added to the operating time of the mines. Sixty days represents about one-fifth of the total possible working days. Broadly speaking, such a saving would result in reducing the cost of the coal at the mines by one-fifth. At present the capital and labor engaged in the production

\*A piece of publicity given to the public under the misleading head, "Estimate of Savings to the Nation as a Result of Stabilizing the Coal Industry."

of coal, while they must be maintained throughout the year, are employed only less than four-fifths of the working time.

A saving of one-fifth of the value of coal represents \$260,000,000 or, allowing for the increased labor cost that will result from this award, \$300,000,000. To this amount should be added the saving on the car equipment, which under present conditions needs to be sufficient to take care of the peak of the demand, while a large part of it remains idle during the period of slack demand. In addition to this, when the car equipment is utilized throughout the year, there will be a saving on the storage space required for the idle cars. While an accurate estimate of the saving under this head is not possible, the evidence shows that there are about 27,000,000 car days cost a year through car surplusage in the spring months, and it is a conservative estimate to place the loss at \$100,000,000.

The aggregate saving that would result from the addition of 60 days to the operating time of bituminous coal mines is thus about \$400,000,000 a year or one and one-fourth millions a day. This amount is twice as large as the increased labor cost resulting from the commission's award and more than four times as large as the amount added by the cost of the 14 per cent advance granted by Dr. Garfield.

## Executive Order Proclaiming End of Coal-Price Restrictions

ON MARCH 19 the President of the United States issued the following order suspending price regulation under the Lever Act but continuing in force the rules relating to the operation of the Tidewater Coal Exchange:

"Pursuant to the authority vested in me by the Act of Congress of Aug. 10, 1917, entitled "An Act to provide further for the national security and defense by encouraging the production, conserving the supply, and controlling the distribution of food products and fuel," and other powers thereunto me authorized, I, Woodrow Wilson, President of the United States of America, do hereby order and direct that from and after 12:01 a. m., on the first day of April, 1920, the order issued by me on Oct. 30, 1919, restoring certain rules, regulations, orders and proclamations therein referred to, relative to the price of bituminous coal and other matters and things therein described, shall be suspended until further ordered, and that all other Executive Orders subsequent thereto issued by me, except the Executive Order of Feb. 25, 1920, relative to the Tidewater Coal Exchange, and all orders subsequent thereto issued by the U. S. Fuel Administrator, or any person acting pursuant to authority conferred upon him either by me or the United States Fuel Administrator, shall be suspended until otherwise ordered, on and after 12:01 a. m., April 1, 1920, it being the intent and purpose of this order to restore at 12:01 a. m., on April 1, 1920, the rules and regulations of the United States Fuel Administration to the status existing immediately prior to the aforesaid Executive Order of Oct. 30, 1919, but not in any wise to affect the validity of any act or thing done under any of said orders or regulations prior to 12:01 a. m., April 1, 1920, or the Executive Order of Feb. 25, 1920, relative to the Tidewater Coal Exchange."

# Kendall Seeks To Annul President's Powers Under Lever Act

Declares That Prices Were Not Based Squarely on Production Costs, and That if Fair When Set, Could No Longer Be Fair After a 10c. Reduction and 14 Per Cent Wage Increase

**C**ONTINUATION of Government prices on coal was denounced on the floor of the House, March 20, by Representative Kendall of Somerset County, Pennsylvania, who in the course of his remarks declared that "The bituminous operators were sandbagged further by Dr. Garfield when he advocated the increase of 14 per cent in the wages paid coal miners. Extracts from Mr. Kendall's remarks are as follows:

"The prices fixed on coal at the mines by Dr. Garfield were in many cases most unjust and unfair. I have the honor to represent one of the largest bituminous coal districts in the United States. In my home

county, Somerset County, Pa., Dr. Garfield fixed the price of bituminous coal at the mines at \$2.95 per net ton; in Fayette County, immediately west of Somerset County, he fixed the price at \$2.35 per net ton; in northern West Virginia, adjoining both Fayette and Somerset Counties, the price was fixed by Dr. Garfield at \$2.50 per net ton; in western Maryland, also adjoining Fayette and Somerset Counties, the price was fixed at \$2.75 per ton; and these prices are still in force today.

"No coal operator has ever been able to understand upon what legal or just basis Dr. Garfield fixed these highly discriminatory prices for my locality. The living expenses and the value of coal lands in Fayette County are higher than in the other localities mentioned, and yet Dr. Garfield in his wisdom saw fit to fix the prices in Fayette County 60c. per ton less than in Somerset County, notwithstanding that living expenses and the coal lands are much higher than in Somerset County.

"In northern West Virginia, where coal lands and living expenses are much lower than in Fayette County, he saw fit to pay the operators 15c. per ton more, and in western Maryland, where the living expenses are cheaper and the cost of coal lands one-fourth of what they are in Fayette County, Pa., he fixed the prices 40c. per ton higher than in Fayette County.

"The labor conditions in all these sections are practically the same, the distribution of cars is on the same basis, the cost of production is practically the same; therefore no coal operator can fathom where Dr. Garfield obtained the figures which justified him in establishing and fixing these plainly discriminatory prices for the operators in these four adjacent sections.

"The coal operator who has a mine in Somerset County pays the same mining rate, mines identically the same vein of coal, and has the same car supply as the man who operates a mine in Fayette County, but he receives 60c. per ton more for his coal than his neighbor in Fayette County. The same holds

good of the man operating a mine in West Virginia or in western Maryland. Any intelligent man actuated by high principles of fairness and justice to the coal operators of the country can readily see that such a scale of prices is discriminatory and deserves the condemnation of all fair-minded people. There should be an immediate

cancellation of this unjust, unwarranted, and illegal scale of prices.

"Dr. Garfield originally fixed the prices which should be paid to the operators of bituminous coal 10c. per ton higher than the prices just mentioned, but one day, without any notice, the coal operators discovered that a reduction had been made by Dr. Garfield of 10c. per ton on all bituminous coal. When he arrived at the prices he originally established he stated that he did so after consulting the figures prepared by the Federal Trade Commission as well as through conferences with a large number of coal producers throughout the country, and that, in his judgment, the prices arrived at were fair, just and equitable.

## QUESTIONS JUSTIFICATION FOR 10C. CUT

"Therefore, after having arrived at these prices, I fail to understand what occurred to the mind of Dr. Garfield that would warrant or justify him in making a cut of 10c. per ton, when no other manufacturing concerns in the country had reduced their prices.

"As you are aware, the railroads, the steel trust, the oil refineries, the munitions plants are all large consumers of coal. None of these large industries had reduced the prices of its products, so that when Dr. Garfield deliberately reached his hand into the pockets of the coal operators throughout the country and took therefrom 10c. for every ton of coal produced and put it into the pockets of the railroads, the steel trust, the oil refiners, the powder trust and other large corporations, he committed an unwarranted act of unfairness and injustice.

"Dr. Garfield knew that the coal operators throughout the country were intensely patriotic and would submit to and carry out all orders issued by the Gov-

Under the recent delegations of Fuel-Administration authority loaded coal cars were kept idle on the railroad tracks, as many as 253,000 loads being kept standing, according to one statement. Coal has been kept at a uniform price while pig iron has increased in price from \$33 to \$41.50 per ton. Cost of supplies used in mining has risen 10 to 60 per cent.

ernment—right or wrong—and of course the railroads and other large corporations extended their heartfelt thanks to Dr. Garfield for the munificent gift handed them in reducing the price of coal, of which they were large consumers, 10c. per ton, without even a request by them for such reduction.

"The bituminous operators were recently further sandbagged by Dr. Garfield at the time that he came to Washington to settle the coal strike by granting an increase in wages to all bituminous coal miners of 14 per cent—equivalent to an addition to the cost of production of 28c. per net ton.

"Dr. Garfield congratulated himself and the country that he had settled the coal strike without placing the burden of a single cent upon the consumers of bituminous coal by compelling the coal producers to absorb the increase of 28c. per ton, not caring whether by so doing he would drive the operator into bankruptcy or not. During the second visit which Dr. Garfield made to the coal producers he again injected his hand into their pockets—this time taking 28c. for every ton of coal mined, and turned this sum over to the railroads, the steel trust, the powder trust, and other large institutions—none of which had made any reduction in the price of its products, but, on the other hand, advanced prices from 75 to 85 per cent.

"So the bituminous operator today not only receives 38c. per ton less for his coal than the price which was fixed by Dr. Garfield during the war, which at that time he stated was fair, just and equitable, but he is also forced to pay an advance of from 75 to 85 per cent for the material he must buy for his mine, which adds another 10 to 20c. per ton to his cost of production.

#### FOREIGNER IS MADE A PREFERENTIAL BUYER

"Now, when Dr. Garfield originally set the prices on bituminous coal he either made them exorbitant or the price that the operator receives today is entirely inadequate and unfair, and relief should be granted him from this unwarranted price-fixing oppression, which ultimately means confiscation of his property.

"Another most unfair order issued by Dr. Garfield permits exporters of coal to pay \$1.35 per ton more than domestic consumers are permitted to pay. This order permits foreign nations to come to this country and pay \$1.35 more per ton for coal than Dr. Garfield permits our own manufacturers and consumers to pay. Therefore the foreigner is made a preferential buyer and is always able to purchase coal where in many cases it has been impossible for the American consumer and citizen to do so on account of price restrictions.

"Why Dr. Garfield should issue a preferential order, which naturally tends to take the coal out of our own country, where it is so badly needed, and supply the requirements of foreign nations, is more than the American people can understand. The shortage of coal in this country has always been largely due to the fact that many of the large producers are exporting their coal in order to secure \$1.35 per ton more than they would receive if they sold it to our citizens. This order may be constitutional and legal, but as a citizen of the United States I do not hesitate to state that it is not American and should be severely denounced by all patriotic citizens having at heart the welfare and development of our nation.

"The coal committee recently appointed by the President to fix the wages of the bituminous coal

miner made a report recommending an additional advance of 11 per cent. This will add another 22c. per ton to the production of bituminous coal. I have no doubt that under the power of the Lever Act the Fuel Administration will again see that this increase in wages to the miner will not be added to the cost of coal to the consumer, but will compel the producer again to absorb the increased cost.

#### CONDEMNNS DIVERSION OF COAL BY GOVERNMENT

"The most pernicious, illegal, unwarranted and discriminatory usurpation of the power of the Lever Act since the signing of the armistice has been and is today the diversion of coal which was bought by the consumer engaged in legitimate business activities, employing large numbers of men, who is compelled to close down his plant because the Government took his coal and gave it to someone to whom it did not belong and who was not entitled to it.

"The assumption of arbitrary distribution and diversion was granted to the President whenever or wherever, in his judgment, it was necessary for the efficient prosecution of the war. No such necessity now exists. There is no prosecution of the war, and there should be no diversion of coal and no further interference with legitimate business on the part of the Government."

Representative Kendall then read a letter from G. W. Thompson, secretary to S. J. Harry Co., general contractors, of Shandaken, N. Y., who, in the sinking of a shaft, had lost \$5,000 for lack of coal to continue work under their contract. On Jan. 26 two cars were shipped from Shapnack, Fayette Co., to S. J. Harry Co., at Grand Gorge, N. Y. One was confiscated by the Pennsylvania Railroad Co. at Altoona and the other cannot be located.

On Feb. 10 the company telegraphed Mr. Walls, of the U. S. Fuel Administration in Philadelphia, Pa., calling attention to the fact that the confiscation of the coal had laid 100 men idle. Up till noon of Feb. 18 no coal had been received, the men employed by the company were leaving, and the company was paying the board of such men as were left to induce them to remain at work.

Mr. Kendall read a letter from H. H. Lineaweaver, president H. H. Lineaweaver & Co., Inc., which stated:

"This [the need for the ending of Federal control] must be plain to you from the fact that when the Fuel Administrator, Dr. Harry A. Garfield, relinquished his position some time ago it was an admission on his part that the control of coal was no longer necessary, and there is now no head to the Fuel Administration, and no one to appeal to. We further believe that any law, such as the Lever Act, which suspends the Constitution of the United States, is illegal."

#### REGULATION IS STRANGLING THE COAL INDUSTRY

One from Jennings Coal & Coke Co. read as follows: "The industry is being strangled to death; the miner is forced into idleness; factories are compelled to shut down or run on short time; the railroads are losing millions in freight rates; production, the very thing that is needed to bring down the cost of living, is being curtailed instead of increased, due to the lack of fuel, and the higher costs are passed on and saddled onto the public. If this act was doing anyone any good anywhere it might be cited as a justification, but there is none. Instead the far-reaching effect of its evil

influence is beyond estimation. Home trade is ruined, our export trade is lost, and billions of dollars' damage is being done to the nation's one prime industry.

"The unwise schemes employed to handle the fuel situation during the coal strike resulted disastrously, to say the least. They confiscated, diverted and held loaded cars for from 60 to 90 days, until at the end they had over 253,000 loads on the track. Many of these are still standing. This has resulted in the greatest car famine that any industry has ever witnessed."

A letter from Uniontown ran:

"As we understand it, our products—coal and coke—are the only products in which the Government has ruled on a fixed price, making that price the same as had been established during the war period. If the Government was fair and just in the action it took in regulating prices during the war, when it fixed prices on most all commodities, it certainly is inconsistent now, when it has removed price restriction on all other commodities except our own, and further ordered an advance of 14 per cent to be paid all labor.

"The price of basic pig iron was fixed at \$33 in 1918; today it is \$41.50, and the advance in price not only of iron and steel products but of all supplies that go into mine operations is 10 to 60 per cent over war prices.

"I inclose a clipping taken from the *Connellsville Courier* of March 11, which states that byproduct coke is being shipped into our competing territory at a price of \$12.55 per ton, f.o.b. ovens. Can you explain to me why I, as an operator, should not receive the same price for a like commodity? The government price is \$6."

---

## President Wilson Approves Coal Commission's Report and Frees Coal Prices

ON MARCH 19 President Wilson transmitted the following letter to the operators' associations and the union officials:

"I am transmitting to you herewith a copy of the report and award of the Bituminous Coal Commission appointed to adjust matters in controversy between the bituminous coal miners and operators of the country.

"In accordance with instructions in my letter of appointment to the Commission and memoranda attached thereto and the agreements by mine workers and operators to abide by the report and award of the Commission, this report and award is the basis upon which the wage-schedule agreements between the mine workers and operators shall be made.

"Operators and miners should, therefore, make arrangements for convening the necessary joint conferences as soon as possible to make such changes in the terms, provisions and conditions, mining rates and wage schedules as are set forth in this report and award.

"It is essential to the public welfare that the agreements be concluded at the earliest date practicable so that the uncertainty as to fuel supply may be ended and that consumers may be able to make contracts for their coal supply and also that the recommendations contained in the report as to the storage of coal by consumers may be of service this year.

"I also inclose as information copy of minority report by one member of the Commission. This minority report concurs with the report of the Commission as to the wage for miners, though dissenting as to the wage for day workers, and in part concurs and in part dissents on other points. I regret that the members of the Commission were not unanimous on all points, as I had expressed the hope they would be, but the report of the majority is none the less the report of the Commission and binding as such.

"I take it that neither party will raise any question, and I am sure that no question can properly be raised, as to the binding character of the award, notwithstanding the fact that it is not unanimous. On Dec. 10, 1919, the miners, without qualification, agreed to submit all questions to a decision of a commission of three persons to be appointed by me, the report of such commission to be made the basis of a new wage agreement. This definite and unqualified acceptance did not in any way limit the power which any such commission is always understood to have, in the absence of agreement to the contrary, that it may reach a decision by majority vote. The acceptance of the operators was equally unqualified on this point. This condition was in no wise changed by my subsequent action on Dec. 19 in expressing a belief as to the desirability and importance of unanimous action.

"My appointment of the Commission indicated that the power to fix the price of coal would not be conferred upon the Commission except for its unanimous action and therefore it is clear that such power to fix coal prices should not be conferred on the Commission.

"I have carefully considered the question whether the war power of the Lever Act should be temporarily invoked by me—despite the absence of any action of the Commission so recommending—to continue temporarily the control of prices, and have concluded that it is not expedient for me to exercise any such price-fixing control, so that on and after April 1, 1920, no Government maximum prices will be enforced.

"There is at present no provision of law for fixing new coal prices for peace-time purposes, and unless and until some grave emergency shall arise, which in my judgment has a relation to the emergency purposes of the Lever Act, I would not feel justified in fixing coal prices with reference to future conditions of production.

"I am aware that at present, as a result of the shortage created by the coal strike, and of the consequent interference with transportation, and as a result also of the exceptionally unfavorable winter, the demand for coal continues active. I desire to impress upon the coal operators the extreme importance not only of their complying to the fullest extent with the laws against combinations in restraint of trade and against profiteering but also of their exerting themselves affirmatively to prevent exacting of unreasonable prices for coal. I am sure the public fully appreciates the desirability, where practicable, of leaving commercial transactions untrammelled, but at the same time I am satisfied the public will find ways to protect itself if such liberal policy shall appear to result in unreasonably high prices."

Address all communications to COAL AGE

Volume 17

April 1, 1920

Number 14

## An Opportunity for Profit

SHIPPING direct by truck promises a large opportunity to coal men who live on good highways near urban centers. The freight rate to these points may be small, say 70c. per ton. The cost of unloading and reloading into wagons or trucks may be about \$1 per ton. Delivery may cost another dollar. The price of coal f.o.b. may be \$3, making the total charge \$5.70. Profit to the retailer may make the price \$6.

With a direct-by-truck delivery it may be possible to deliver at a profit, charging only the cost of coal plus, say, \$1.50 a ton, or \$4.50, leaving a difference between delivery by rail and delivery by truck of \$1.50 a ton. Some part of the \$1.50 may be surrendered by the operator in order to encourage early buying and to pay costs and risks of storage, but even if all were surrendered to get business it would be profitable to make the surrender in order to make the coal purchaser come early to market and so keep the mines at work.

However, it is not likely that it will be necessary to make any surrender so large as \$1.50, for the costs of storage to the recipient probably would not exceed 50 or 75c. per ton and might be negligible or, at any rate, not realized by the purchaser. But even if the surrender of 50c. to 75c. were necessary, from 75c. to \$1 would be realized by the operator and the mine would be speeded up at a good profit.

With the 30 per cent seasonal differential in railroad rates provided in the Frelinghuysen bill, the saving derived from buying in the summer would be only 21c. on a 70c. freight bill and that would not pay for storage, but even if the storage did not cost anything, this would be a saving of only 21c. on \$6, or less than 4 per cent. This would be such a small economy that storage would barely pay except as a measure of fuel insurance. A saving of 50 or 75c. would be more worth while, as it would amount to 8 to 13 per cent on the cost of the coal as delivered by rail through the retailer. Shipping by truck therefore gives great promise. It has the further advantage that with it there is not the same loss from stolen coal as is to be apprehended with rail-borne fuel.

Consequently, shipping by truck will encourage buying just where the rail differential is most ineffective. The towns near or in coal regions are usually the last to store their fuel. The United States public looks to the distant Northwest, Northeast and Canada to balance production, but with shipment by truck it may look with confidence to summer storing at consuming points near the mines.

Trucks have a large place at every mining operation, and it is certain that their use will become increasingly common. Many retailers' yards receive coal of varied quality. By buying direct of the producer the purchaser can be surer of the quality of his coal than when buying through a dealer.

If \$663,000,000 is to be spent this year on good roads, in place of the \$137,000,000 expended last year—and we are told that this is true—much shipping by truck will doubtless be necessary, for there will not be enough open-top cars to fill the immense demand for such equipment. The demand for open cars to fill the call for building material—sand, steel, lumber, paving and common brick, etc.—will make it, in a still further degree, difficult to meet the demands of the coal companies.

## Now for the Foolish Figurers

AN INTERESTING statement under the head "What Stabilizing the Coal Industry Will Save Mine Workers" is printed on another page of this issue. As circulated it bore the misleading head, "Estimate of Savings to the Nation as a Result of Stabilizing of Coal Industry." It starts well with the statement that "The annual output of the coal industry," meaning doubtless the bituminous-coal mines, "is valued at \$1,300,000,000." That was probably the value in 1919 if the average price received was the same as in 1918, when according to Dr. Garfield the sales realization was \$2.61 per ton. What coal sold for in 1919, when figures above and below Government prices were paid, was still possibly approximately \$2.61.

The statement goes on to say that by working five-fifths instead of four-fifths of the year the production would be increased a fifth. It represents the increased production as a saving to the nation. But will the profit fall to the public? According to the commission the mine workers get 57 per cent of the return. As their wages would be the same under steadier operation as under the past irregular work, the increased income to them would be 57 per cent of one-fifth of \$1,300,000,000, or \$148,200,000. Adding 27 per cent to that, the amount of the present award, the one-fifth would be raised by \$40,000,000 roughly, making the increased return to the mine workers \$188,200,000 per year.

In this the public would not share. Nor would the American people share in much of the 43 per cent of one-fifth of \$1,300,000,000, or \$111,800,000, for some of it must go to pay for royalties and to meet such selling costs as are based on the tonnage sold. A portion of the \$111,800,000 would doubtless accrue to the public; how much, of course, it is hard to say.

As for what would become of the \$100,000,000 assumed in the article as being the saving from steadier work on the railroads which haul the coal, it is equally hard to come to any certain conclusion. The Interstate Commerce Commission, in making its rates, may be only too ready to figure on savings resulting from steadier work. If, however, the probability of more regular operation is not allowed by the Interstate Commerce Commission to take part in the determination of freight rates, it will be easier for the railroads to earn their 5½ per cent dividend as well as the ½ per cent for equipment and development. Some will make more than 6 per cent and the excess will be divided between the railroad credit revolving fund and the railroad, the railroad using it as the law directs to guarantee against any losses in operation in future years. If the Interstate Commerce Commission makes its rates assuming steady work some, or even much, may go to the public, but if it does not the railroads

will get it as dividends, improvements or increased credit.

But will steady work be achieved? The buying, it is true, may be better distributed over the year by reason of the better policy adopted by Government bureaus, railroads and banks. But the bituminous industry has in past years fallen into an unfortunate state which cannot be immediately rectified. There are altogether too many mines, and while there are not too many men per mine, there are too many men. A few years of progress in demand and production, without excessive development, and then the full value of distributed buying will be realized. In fact evenness of market will steady the fever of production and make the opening of mines tally well with the nation's distributed needs.

If the mines are going to work henceforth about as much one month as the next (of which, of course, we cannot be sure) then, if the total tonnage is not to increase, the mines will work irregularly all through the year and there will be the same degree of lost time as in the past. The mine worker will be helped, and so in a degree will be the operator, by the fact that the work is distributed, for the income will be regular and no longer spasmodic. Regular work will make it possible for both mine worker and operator to get along without so much invested capital as was needed though not always provided in the past. The mine operator and employer will gain also by the fact that from henceforth new and needless competitors, both for orders and for employment will be eliminated.

In the anthracite region the mine workers declare that they want the same wages as in the bituminous, despite the irregularity of work in the latter field. This shows that if bituminous mines are made regular in operation the mine workers will not consent to a wage reduction schemed so as to bring their annual wages to the same figure as they now are.

Hence we cannot look for the fulfillment of the forecast recently published in the *New York Evening Sun*, which we shall quote to show that the foolish figurers are hard at work. No reflection is intended against the reputable daily about to be quoted. It is in general an extremely fair paper. Its correspondent is merely voicing the opinions of Washington which are erroneously based on the piece of publicity around which this editorial is written and which is quoted by the correspondent at the close of his message. The statement which appeared under date of March 24, runs as follows:

"President Wilson, it was learned today, will soon sign an executive order directing all departments of the Federal Government to purchase and store up a three months supply of coal during May, June and July. State and county Governments and public-utility corporations will be urged to do likewise.

"The result will be, in the opinion of experts of the Bituminous Coal Commission, that the mines will be kept busy during the dull season, the frantic rush of work in the mines as winter comes on will be eliminated and there will be such a saving that the 27 per cent wage increase granted the miners by the commission will be absorbed and not passed on to the public."

Another danger is that the papers will say that as the miner gets only a 24c. per ton increase, the price of coal per ton should rise only 24c., overlooking all

that multitudinous body of day workers and monthly workers whose wages are advanced \$1 per day by the committee's award and forgetting also the loss which frequently results from the dirt which has to be removed from the coal, the increased costs of deadwork and yardage and other incidentals in the award that look harmless enough but are quite important.

John P. White appeals to this natural error of the public in his minority report when he notes that the retailer and operator increased prices more than the tonnage rate was increased to the miner.

## The Right Use for Every Coal

FOR EVERY particular use there is a suitable product; for every particular product a right and seemly way of use. To be more specific, there is a right use for every coal and a right coal for every use. The experienced coal man knows this. He understands the importance of the proper coal selection and of the proper application of each type of coal. However, all too often he stops with the simple recognition of the fact and does not put his idea into practice.

More and more frequently these days we see evidence that large companies realize that they must sell service as well as commodity. One way in which this is accomplished is by advertising the characteristics and the limitations in use of the particular product which they wish to market. But in a great many lines much more than this is necessary. Expert judgment is needed and, especially in the case of fuels, each problem is a special case in itself. Many private companies under similar circumstances find it advantageous to afford their customers service facilities by sending experts who will advise them regarding their products. Everyone is familiar with announcements such as are made by electric-lamp manufacturers, makers of rubber belting, those who market chain-drive equipment, and many others. One large corporation doing national business says, for example, "If you will write to our nearest office in regard to ———, the matter will have the prompt attention of experienced engineers. This service is free for the asking. If you want better ———, this department can greatly assist you." This is not a new policy and from the increasing frequency with which it is observed, it is evident that the policy is one which is profitable.

*Coal Age* has already advocated this thought of selling service in the coal business and again we urge the idea. It is of greater importance every year that coal should be efficiently and effectively applied in our industries. The only way in which we can offset increasing costs for coal production is to teach the user how to make a smaller tonnage do the work which he desires to accomplish. If we achieve this ambition, the purchaser is able to pay for the higher cost and to reward the coal operator by a reasonable profit for services rendered. The industry does not suffer, therefore, through the increases of labor cost and the rising costs of material, as would otherwise be the case.

We urge, therefore, that steps be taken at once to educate the purchaser by expert advisers, who will go out and aid our large users of coal. The coal man's interest will be served by this effort most effectively. It is the coal man's job to accomplish this education. It is time that our producers and jobbing associations got busy on this problem.

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Authority of Shotfirers

*Letter No. 4*—The instance cited in the inquiry, *Coal Age*, Jan. 1, p. 26, where a mine committee assumed to dictate to a shotfirer regarding his authority for refusing to fire shots that had been charged in a manner of which he did not approve, is an example of how the employment of shotfirers has often operated to decrease the efficiency of the work.

There are mines where the conditions are such that the employment of shotfirers is certainly a long stride toward greater safety. But, where shotfirers must be employed, they should be men of such character that will insure freedom from any dictation by a mine committee. They must also be able to satisfy the state mine inspectors and required to pass an examination as difficult as any given mine foremen and firebosses. They should be employed as monthly men, which would give them more freedom, in the exercise of their authority, in the performance of their duties and the enforcement of the law.

In the instance referred to in this inquiry, the trouble arose regarding the charging of a hole with two or more cartridges. The practice of the miners was to open the ends of the cartridges where they came together, so as to insure the direct contact of the powder. The practice was dangerous, in the opinion of the fireboss, as the powder was apt to be scattered along the hole. I believe in bursting the first cartridge, after it has been pushed to the back of the hole. There certainly is danger of a charge having a double concussion when much paper intervenes between two cartridges. The paper may smolder for a time and a hangfire result, with the possibility of a blowout shot being caused. This is to be avoided because of the danger, aside from the loss in the efficiency of the work.

#### NEW SHOTFIRER'S LAW IN INDIANA

Only recently, I read a paragraph, in *Coal Age*, to the effect that the best way of avoiding the necessity of employing shotfirers was to give more time, thought and care to the proper ventilation of a mine, which I consider is good advice. In Indiana, a new shotfirer's law takes effect April 1, 1920. The law will require the employment of shotfirers, on and after that date, in all gaseous mines and wherever more than 2 lb. of powder is used in a charge. The law will affect practically every coal mine in the state.

It has always been my practice and desire to charge and fire my own shots, since there is a great loss in efficiency when shots are exploded out of their order, which may easily happen where shotfirers are employed. The matter costs me about 12c. a day, work or play. The mine where I work has never been known to give off gas, and my shots will average less than 2 lb. per charge. It is my hope that we will be exempt from

the shotfirers' law, as it is less trouble for a miner to fire his own shots than to notify the shotfirer.

Moreover, shotfirers are exposed to greater danger than the miners, in the performance of their work, as they have no knowledge of how the holes are charged, and may mistake the proper order in which the shots should be fired. Again, a shotfirer proceeding to the next room, after lighting the shots in the room he is leaving, may be caught by a shot blowing through the pillar. Therefore, it is my belief, except in gassy mines, the employment of shotfirers is not a step in the direction of securing greater efficiency, as far as the production of coal is concerned.

We will never attain the highest efficiency, through the medium of state laws, until we realize the need of discriminating between mines that generate gas and others where no gas is generated. The law that takes effect April 1, in Indiana, I believe to be a good law for mines generating gas; but, in its present broad application, I fear that it will have the effect to decrease the efficiency of coal production. It is my opinion that the charge limit of 2 lb. per shot should have been at least 4 lb., which would have afforded a greater margin. Few, if any, miners use less than 2 lb. of powder per charge.

W. H. LUXTON.

Linton, Ind.

### Avoidable Degradation of Coal

*Letter No. 3*—The subject of this article would, I believe, be more clearly understood and it would have received closer attention if the title had read Avoidable Production of Inferior Coal, which is its real meaning. I know of one reader who passed over the letter of William Wesnedge, *Coal Age*, Feb. 26, p. 416; but when his attention was called to the same he read it and commented on its contents. In that letter Mr. Wesnedge seems to be emphatic on the point of possibly slowing up the quantity of coal produced and incidentally lowering the earning capacity of the men at the face, but does not suggest a remedy.

To begin, let me say what I have said before that a closer co-operation is needed between the men and the officials. My idea is that there should be sufficient assistants in any one mine that the men, especially those working at the face, might be visited often during the day, by competent officials and given all the help necessary to insure an efficient organization.

This plan would fall in line with that expressed by Richard Bowen Oct. 2, p. 586, who contends that "more attention should be given the miner who must be taught to use more judgment and skill in the performance of his work." It is too true that present day methods of many large corporations are inefficient in this respect. A large mine will seldom have sufficient foremen or assistants to properly look after the men employed, who are never visited oftener than once a

day, and then so hurriedly that a miner hardly has time to bid the official the time of day.

For that reason, I feel that the advisability of visiting the men at the face as often as possible should always be taken into consideration. As has been truly stated, time and again, it is not always the poor, inexperienced miner that is injured; but just as often it is the man who is experienced in the mining of coal. Statistics frequently show where the experienced man "took a chance" and was caught. It is therefore, not only desirable but necessary to visit every working place where the men are at work.

#### EXPERIENCED MEN NEEDED TO INSPECT THE WORK

An experienced man thoroughly acquainted with the handling of men and the different problems that arise at the face, should be employed in this capacity, and when the men know he is coming around so often they would not take the chance of doing the "wrong thing" but would invariably stick to safe and proper methods. By these means, I believe, miners would be taught the necessity of loading clean coal.

Some may recall that, for the lack of such a system, a large coal company in Pennsylvania, a few years ago, studied their production sheets for some time and made lengthy investigations before they determined conclusively the source of their trouble. It was found that the difficulty started at the face where the miners were gobbing their slack and loading the lump coal and slate. The reason was that scales were used and the miners paid on a basic agreement for the screened product.

#### EFFECT OF THE WAR ON COAL PRODUCTION

Now, to go back to the period leading up to the war, we find that the problem of getting out clean coal was studied from every view point possible, and companies vied with each other in the market. Consequently, generally speaking, the coal was clean. Why? Because the miners were given to understand that clean coal was all that would be accepted. Drastic rules were laid down and the men made to understand that they would be paid for clean coal only. Each man's production was inspected and he had no redress. There was nothing to be gained by curtailing his production. Only recently have statements been made that miners would be curtailed in their producing and earning power by the introduction of a clean-coal program; when, as a matter of fact, this basic agreement has always "been on the map."

When the war broke out, as the records will show, whatever came out of the mine was sold. The miners were quick to learn this fact and took advantage of it to gradually increase their producing power and earnings; but they overlooked the fact that the inferiority of the coal they mined was a crime. As a result, we find that, even to-day, miners have drifted so far from their former cleanliness that they find it difficult to return to their former ways.

The miners, however, are not alone to blame as the operators were neglectful also. True, the watchword then was "Coal, coal and more coal," till it seemed that anything black answered the call. Yes, there is much to be said on both sides, although in those trying times it was always literally understood that clean coal was the order of the day and must be respected. Today, these same men are paid on the same definite

understanding based on their loading clean coal and they have no redress. It is also true that the production need not be diminished if the miner works the number of hours assigned for a day's work.

#### MINERS MUST BE TAUGHT JUDGMENT AND SKILL

To teach the miner to use more judgment and skill, which will increase their safety and efficiency, to my mind, is the one big factor. Surely a man with such knowledge will be able to systematize his work in a manner to benefit himself and all concerned. There is no more truth in the statement that a miner's interests depend on the quantity of his output, than to claim that the demand for increased tonnage defies the laws of safety. A miner who is efficient in all mining problems concerning his particular work will never lose in production.

When an experienced miner questions an official's right to teach him better ideas and methods of mining it is time for that miner to seek another occupation, or go into business for himself. I recall a recent instance where an experienced miner complained to the superintendent that the foreman was trying to tell him when and where to place a prop. He explained to the superintendent that he knew when and how to set a post and did not like the idea of taking orders from the foreman, as he felt he had had as much experience as the foreman. A little later, the miner admitted that he was wrong, when he was shown that the foreman was only complying with the laws of the state. That man is not an efficient miner who feels that he "knows it all."

In conclusion let me say that I am of the opinion that closer co-operation between the men and their employers will greatly strengthen and benefit this condition. Let them work together and adjust such differences as arise daily in the operation of the mine.

Thomas, W. Va.

BEN.

## Co-operation Among Mine Officials

*Letter No. 5*—Speaking of the co-operation that is needed among mine officials, it has occurred to me that this co-operation should be extended to include others than those directly in charge of the mines. For the past 40 years I have been employed in different capacities, in and around the mines, in several mining states.

We hear very much said regarding the need of conservation of coal and avoiding the disasters that occur so frequently in our mines. It would seem, however, that little has been attained along the line of preventing either the great loss of coal or the occurrence of these disasters.

#### TO REGULATE METHODS AND SYSTEMS OF MINING

To my mind, our entire system of mining needs regulation in such a manner that it will be impossible to have the mines shot to pieces by a haphazard, hit-or-miss, or go-as-you-please method of mining. Kindly permit me to make one or two suggestions of a plan that I believe would develop more system in the planning of mines and their later operation.

My idea is that there should be appointed a state board of practical mining men and engineers, to work in connection with a similar federal board located at Washington. When a coal tract or lease is to be opened

up by a company, their engineer should be required to run out the boundary lines of the property and prepare a map showing the acreage and the place where it is desired to open the mine. This should then be submitted to the state board.

#### PLANS INSPECTED BY STATE AND FEDERAL BOARDS

The engineer of the state board would be required to study the conditions and to draw a plan of mine, showing the direction and size of entries, width of crosscuts, breakthroughs, size of pillars, both entry and room pillars, width and length of room, distance between crosscuts and other data. The plan should show the ventilation of the mine and indicate all doors, stoppings, air bridges and brattices. The dimensions and capacity of the ventilating fan should also be indicated, the calculation being based on the future requirements for the development of a given acreage.

When the state engineers have finished their work, and it has been approved by the board, blueprints are sent to the federal board, at Washington, for their inspection and approval. This plan will enable any necessary changes to be made in the plan, before the same is put into execution in the mine. On approval, the federal board returns the plan to the state board; and it is then turned over to the company, with instructions to follow the blueprint in every detail. Should a mine inspector find that the foreman fails to do this, he should be authorized to notify the company to get another foreman.

In my opinion, this is the only sure and safe way of guarding life and property in the mining of coal. It will probably be a long time before such a plan or system will come into use; but I hope the suggestion will meet with general approval. It would have the effect of putting all mining operations on a systematic basis, the plan and operation being determined by skilled practical mining men; instead of, as at present, being open to the choice and inclination of men who often have no practical knowledge and skill of the work they undertake.

Such a plan would tend to eliminate disasters and conserve millions of tons of coal that are now lost beyond recovery. When going into a mine that I find is unsafe, I often wonder if we will ever get away from the conditions that surround coal mining, today.

Warrior, W. Va.

J. A. RICHARDS, Supt.

*Letter No. 6*—If I understand rightly, the object of this discussion is to bring about greater efficiency in coal-mining operations, through more social relations whereby a better understanding will be established between employers and employees, on what may be termed "a brotherhood" in which men will have and take a deeper interest in each other's welfare. It is to be hoped that the discussion will reveal those conditions, local or otherwise, that exist in and about the mine and obstruct efficiency in operation.

One of the first and most important elements involved in such an undertaking is to establish a feeling of confidence and trust in both parties. This will depend very largely on the hearty co-operation and association of employers with their men, who must be knit together in a true bond of friendship and possess a kindly feeling toward each other that will create harmony. Every cause has its effects; and, in this case, the *cause* is the true friendship and harmony that should exist, and

the *effect* will be a higher production efficiency throughout the organization. This will mean increased tonnage and a reduced cost of operation and production, as all will be on the alert to discover a leak and avoid friction and trouble.

The remarkable coal production during the war is an example of that loyalty, friendship and trust so necessary to the producing of results. The trust of employers in their men and the confidence of the men in their employers was not betrayed and results were produced, even in the face of labor shortage and other adverse conditions. The mine produced a greater tonnage, per man, which exceeded anything previously known.

#### KIND TREATMENT INSPIRES TRUST AND CONFIDENCE

May I ask, Why should not the same spirit of loyalty to the industry and trust in one's fellows exist, now that war is over and the work of reparation is in hand? It cannot be denied that mine officials are striving, by every means in their power, to increase the safety of the mines and produce a larger tonnage; but let it be remembered that a word of encouragement and a kindly act invite the trust and confidence of their men and avoid trouble and disaster.

It must be admitted that some officials are quick tempered, stubborn and exercise discipline in a wrong way. There are officials who have the bearing of an exalted being, with a divine right to govern and control, which is not the attitude of co-operation, as the latter involves association and close contact with their men.

By this means the official builds a firm foundation that will enable him to use discipline and authority, effectively, in a humane manner. Few will deny that officials of the exalted type are not adapted to the handling of men successfully. They are a natural hindrance to the future welfare of the operations in their charge.

#### UNDESIRABLE TYPE OF MINE SUPERINTENDENT

My meaning is that a mine official may be an efficient and well qualified man, in every other respect, owing to his experience, knowledge and skill in the mining of coal; yet, owing to an overbearing, self-asserting disposition, he is a miserable failure in the handling of men and is an undesirable man to place in charge of operations in the mine. My reference to such attitude on the part of a mine official is intended to show that the day is past when workers will stand for abusive methods. They are looking for and appreciate co-operation and kind humane treatment.

The present is an era of reconstruction and the successful official must have reconstructive ideas, which are necessary to produce a higher tonnage at a lower cost. The rapid development of our mines means increased danger, to meet which mine officials must have greater knowledge and skill requiring careful thought and study. They must develop progressive methods that will insure success; in other words, they must keep pace with progress and not stand still.

Now, let me urge that we all act the part of human beings; avoid being radical; use honest methods in all our dealings, believing that the time is not far distant when a reaction will take place in the readjustment that is sure to come.

JOHN E. AMBROSE.

Fairmont, W. Va.

## Working Kanawha River Coal

*Letter No. 1*—In answer to the inquiry of Arthur L. Sheldon, *Coal Age*, Feb. 26, p. 419, regarding the working of coal in the Kanawha River district, allow me to present the following general plan, as suggested by my own experience under similar conditions:

In the working of the coal in the three seams mentioned, I would advise sinking a shaft to the lowest seam and starting the work, in this seam, by driving the usual entries at the shaft bottom. Then, at a point 200 ft. from the bottom of the hoisting shaft and on the same side of the heading as the ventilating shaft, drive a place a distance of 180 ft., and, start an upraise or incline leading to the second seam.

This incline should have a pitch just sufficient that cars will run by gravitation from the top to the bottom. The width should be such as to permit the laying of double tracks. Build a sidetrack at the bottom of the incline and another at the top in the second seam. When this is done, drive straight ahead 100 ft., in the second seam, and connect with the ventilating shaft; or this connection can be driven at the time of sinking the ventilating shaft to the lowest seam.

In the development of the three seams, it is important to keep the working in the bottom seam slightly ahead of that in the second seam; also, the working face in the second seam should be kept slightly ahead of that in the top seam. I have seen this method worked successfully in a mine having three seams one above the other; also, the same method was followed in another mine where five overlying seams were worked at the same time. For the purpose of ventilation and for convenience in the handling of supplies and refuse, I would drive a slope from the surface to the top seam. This would also serve as an escapeway in case of accident.

JOSEPH DOVER.

Stotesbury, W. Va.

*Letter No. 2*—Referring to the question of working three seams of coal in the Kanawha River bottom, let me suggest the plan of driving a slope to the first seam and erecting a rough temporary tippie, having an incline connecting with the mouth of the slope.

My plan would be to work out the coal from this upper seam first. If found advisable, I would double-shift the work in this seam, and when this development was well underway, I would select the best possible place to sink two shafts to the lower seam. As quickly as these shafts reach the second seam, entries should be driven, and work started in that seam, so that it will be kept in advance of work in the lower seam.

In the same manner, when the two shafts have been sunk to the lowest seam, entries should be started in that seam immediately under those driven in the seam above. My idea is to keep the development, in each overlying seam, well in advance of that in the seam next below. At the proper time, I would connect the workings in the top seam with the shaft and hoist the coal from that seam through the shaft, instead of hauling it out of the slope.

Permanent arrangements for loading the coal coming from the three seams can now be made at the top of the shaft, after which the temporary tippie can be removed, or it can be used for a slate dump, if desired. It may be that conditions will make it advisable to com-

plete the extraction of the coal in the two overlying seams before starting to take out any coal in the lower seam. This, I think, will depend very largely on the question of finding gas in the lower seam.

W. J. LYKE,  
Mine Foreman.

Midway, Pa.

## Barometer re Depth of Shaft

*Letter No. 1*—Kindly permit me to refer to the answer given to the second question in *Coal Age*, March 4, p. 458, where it stated "This is a question that cannot be answered with any degree of accuracy, except by the use of a logarithmic equation, and, for that reason, it should not be asked at a mine examination." The question reads as follows:

The barometer at the top of a shaft is 30.2 in. and the temperature of the air, 64 deg. F. The depth of the shaft is 1,100 ft. and the thermometer at the shaft bottom reads 75 deg. F. Calculate the difference of pressure on the air between the top and bottom of the shaft, and the difference in the readings of the barometer at these two points.

It seems to me that the proper way to answer this question is to find the weight of a cubic foot of air, at the given temperature and barometric pressure, at the top of the shaft. Then calculate the increase of the barometric pressure due to the depth of the shaft, assuming this increase is 1 in. for each 900 ft. of depth. Then having found the barometric pressure at the bottom of the shaft, calculate the weight of a cubic foot of the air at that point, for the given temperature and for this pressure; and subtract the unit weight of air at the top of the shaft from that at the shaft bottom and multiply by the depth of the shaft.

According to my calculation, the weight of air at the top of the shaft is

$$\frac{1.3273 \times 30.2}{460 + 64} = 0.07650 \text{ lb.}$$

Approximately, the decrease in barometric pressure, for a depth of 1,100 ft., is  $1,100 \div 900 = 1.22$  in., making the reading of the barometer at the bottom 31.42 in. The unit weight of air at the shaft bottom (temp. 75 deg. F.; bar. 31.42 in.) is then

$$\frac{1.3273 \times 31.42}{460 + 75} = 0.07795 \text{ lb.}$$

The difference in pressure between the top and bottom of the shaft is therefore

$$1,100 (0.07795 - 0.07650 = \text{say } 1.6 \text{ lb. per sq.ft.})$$

Freeburg, Ill.

STUDENT.

[The result obtained by this solution should show its falsity if nothing else. The difference in barometric reading between the top and bottom of the shaft, corresponding to this difference of pressure, would be  $1.6 \div (144 \times 0.49) = 0.0227$  in., which is too small for practical consideration.

However, the last few lines, at the bottom of the first column, p. 458, should read as follows:

That assumption would increase the pressure from  $30.2 \times 0.49 = 14.8$  lb. per sq.in., at the top of the shaft, to 15.42 lb. per sq.in. at the bottom; and give a barometric reading, at that point, of  $15.42 \div 0.49 = 31.4$  in., making the increase of barometer  $31.4 - 30.2 = 1.2$  in.

The actual increase in barometric pressure is, as shown at the top of the next column, on the same page, 2.8 in. owing to the density of the air increasing with the depth of the shaft.—EDITOR.]

## INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

### Changing Pulley on Generator

We are operating a direct-current generator that is rated at 100 kw., 250 volts, 435 amp. at a speed of 200 r.p.m. The generator has a 10-in. pulley, which is belted to the driving pulley of the engine. The rating of the engine is not known, but it appears to be overloaded.

The question I want to ask is, How much would it lessen the load in horsepower on the engine if a 24-in. pulley is put on the generator, in place of the 10-in. pulley now in use, assuming that the engine can be run enough faster to drive the generator at 200 r.p.m.

Scranton, Pa.

CONSTRUCTION BOSS

The change from a 10-in. pulley to a 24-in. pulley on the generator would reduce the load (tension) on the belt in the ratio 10:24; but would require the speed of the engine to be increased in the ratio 24:10, which is very doubtful of accomplishment. Ordinarily, a plain, slide-valve engine is designed for a piston speed of, say 600 ft. per min.

If this engine is now running with a piston speed of only 250 ft. per min. the change from a 10-in. to a 24-in. pulley would enable it to run at a piston speed of 600 ft. per min. and give better service. There would result, however, no change in the power developed, as the increase in belt speed would exactly balance the decrease in the load (tension) on the belt.

The output of the generator when operated at full capacity is  $(260 \times 435) \div 746 = 145\frac{1}{2}$  hp.; and assuming its efficiency as, say 90 per cent, the engine should develop  $145 \div 0.90 =$  say 160 hp.

### Carbon Dioxide and Oxygen Content in Mine Air

Referring to the reply given to the inquiry of "Mine Foreman," *Coal Age*, Feb. 26, p. 419, I would like to ask for further information regarding the carbon-dioxide content of mine air. The answer to the inquiry states that "the presence of the carbon dioxide causes a corresponding depletion of the oxygen in the atmosphere." Let me ask, Does the depletion of the oxygen in the mine air, of necessity, mean a corresponding increase in carbon dioxide?

For the purpose of illustration, let us take the following example: Assume that a section of a mine in which the air is generally good has become so bad that an oil lamp will not burn in that section. There is a current of air moving and the section contains no abandoned workings that would generate carbon dioxide. However, for the purposes of this inquiry, let us eliminate the probability of a gob fire and excessive powder smoke. Under these conditions, assuming that the failure of the lamps to burn is due to a depletion of the oxygen, does that mean a corresponding increase of carbon dioxide or oxygen?

Again, for the purpose of this discussion, let us assume that the carbon dioxide content, from natural causes, will not exceed 1 per cent and the oxygen content is 2 per cent below normal, giving an atmosphere containing oxygen 19 per cent and nitrogen 81 per cent, in round numbers. Then, should a further drop in oxygen of 1 per cent occur, would we have 18 per cent oxygen, 1 per cent carbon dioxide and 81 per cent nitrogen? And if another drop of 2 per cent in oxygen took place, would we have 16 per cent oxygen, 1 per cent carbon dioxide and 83 per cent nitrogen.

This atmosphere, or conditions approaching this state of affairs, would not be nearly as deceptive as one in which the depletion of oxygen was accompanied by a corresponding increase in carbon dioxide; because the combined lack of oxygen and increase of nitrogen in the air would make breathing difficult, while a corresponding increase in carbon dioxide would be generally fatal, owing to the toxic effect of the carbon dioxide.

It is my understanding that work in an atmosphere where there is an addition of carbon dioxide, with no other means of warning than a carbide light, would be many times more dangerous than work in an atmosphere in which the decrease in oxygen was accompanied only by a corresponding increase in nitrogen. The mere decrease in oxygen would cause a much more labored breathing and be ample warning that all was not well. But the same decrease in oxygen, when accompanied by a corresponding increase in carbon dioxide, owing to the toxic effect of this gas, would certainly work its havoc on a person. Kindly explain.

Portage, Pa.

JEROME C. WHITE.

In answer to this inquiry, it is only necessary to state that the addition of carbon dioxide to air containing a normal percentage of oxygen (20.9 per cent) dilutes the air, which naturally decreases the percentage of both the oxygen and the nitrogen.

For example, assume 100 volumes of pure air consists of 20.9 volumes, oxygen; and 79.1 volumes, nitrogen. Then, suppose 10 volumes of carbon dioxide are added to this air, making 110 volumes of mixed oxygen, nitrogen and carbon dioxide. The mixture would then contain

Oxygen,	$100(20.9 \div 110) =$	19.00 per cent,
Nitrogen,	$100(79.1 \div 110) =$	71.91 per cent,
Carbon Dioxide,	$100(10 \div 110) =$	9.09 per cent.

The oxygen content has been reduced, in this case, by the dilution of the air when the carbon dioxide was added. In other words, the oxygen content is depleted. The oxygen in mine air is often depleted, however, in other ways than by dilution caused by the generation of carbon dioxide or other gases. The oxygen is consumed by the various forms of combustion taking place in the mine. The depletion of the oxygen does not therefore, "of necessity mean a corresponding increase in carbon dioxide."

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Indiana Firebosses' Examination, Held at Indianapolis

(Selected Questions)

**Ques.**—Explain the effect of barometric pressure in mines giving off methane (CH<sub>4</sub>).

**Ans.**—A common belief prevails, to a considerable extent among mining men, that a fall of barometric pressure is accompanied with an increased outflow of gas from the coal and other natural strata; but proof is lacking to establish this claim. There is no doubt but that there is frequently observed a general increase in the percentage of gas in mine workings, following any considerable drop in barometric pressure. This increase of gas, however, is due to the expansion of the gas-charged air, accumulated in the abandoned workings and other void places in the mine, because the volume of air and gases varies inversely as the pressure.

The conditions under which occluded gases are held in the strata make it extremely doubtful if there is any increased emission of gas from the pores of the strata, owing to an observed decrease in barometric pressure. On the other hand, it is possible and quite probable that the flow of gas from pockets and crevices in the strata, which constitute feeders, is increased when the barometer falls.

**Ques.**—What difference, if any, is there in the quantity of air passing through two splits from a main air-course, the first split being 4 x 9 ft., 4,000 ft. long, and the second split, 6 x 6 ft., 5,000 ft. long?

**Ans.**—Assuming equal pressures in these splits, the quantity of air passing in each split, in natural division, is proportional to the pressure potential for such split, which is expressed as follows:

$$X_p = a \sqrt{\frac{a}{l_0}}$$

In this case, the sectional areas are equal, as  $a = 4 \times 9 = 36$  sq.ft., and  $6 \times 6 = 36$  sq.ft.; and the area can therefore be ignored in calculating the potential values for these splits. Also, the solution is much simplified by using the relative potential and calling the relative lengths of the airways 4 and 5, respectively; and the relative perimeters, 13 and 12, respectively, which gives for the relative potentials of the two splits, the following:

Split 4 x 9, 4,000 ft.;  $X = \frac{1}{\sqrt{4 \times 13}} = \frac{1}{\sqrt{52}} = 0.1387$

Split 6 x 6, 5,000 ft.;  $X = \frac{1}{\sqrt{5 \times 12}} = \frac{1}{\sqrt{60}} = 0.1291$

Since these values represent the natural division of the air between the two splits, they show that for every 13,870 cu.ft. of air passing in the first airway, there is 12,910 cu.ft. passing in the second airway.

**Ques.**—How much pure air must be circulated through an entry giving off 2,500 cu.ft. of methane (CH<sub>4</sub>), per min., in order to render it nonexplosive?

**Ans.**—The lower explosive limit of pure methane is reached when the proportion of gas to air is 1:13. Hence, in this case, the volume of air required to render the gas nonexplosive must be somewhat greater than  $13 \times 2,500 = 32,500$ ; or the quantity of air entering the mine should not be less than, say 33,000 cu.ft. per min. In actual practice, this volume should be much greater to insure safe working conditions.

**Ques.**—If, on inspecting a pair of entries, you observe two or three rooms having a trace of firedamp at the face, what would you do in order to warn the men working in these rooms?

**Ans.**—Much would depend on the conditions existing in the mine, the nature of the coal, amount of ventilation at the working face, and the experience of the men. In anthracite mines, it is quite common for men to continue to work in places generating gas in small quantities. In the mining of soft coal, however, more caution is needed; and, while a small trace of gas found at the working face may not be sufficient cause for withdrawing the men, care must be taken that the place is free from accumulations of dust and the men keep their lamps on the floor and at a sufficient distance from the face of the coal. However, it is not wise to take chances in this respect, and the safest course to pursue would be to provide the men with safety lamps or withdraw them from the place.

**Ques.**—What are the dangers to be watched for and guarded against, in a mine giving off large quantities of explosive gas?

**Ans.**—In a mine generating much gas, danger arises from the accumulation of the gas on pitches, in rise workings, and on falls, in pillar workings, or in cavities of the roof and other void places in the mine. Danger arises, also, from maintaining large standing areas in abandoned sections of the mine that are not thoroughly ventilated. There is also danger arising from the accumulation of fine coal and dust on the roads and in the working places. The operations of blasting must be carefully safeguarded by the use of permissible powders and the enforcing of strict regulations in reference to blasting coal and rock. It is generally safer to employ shotfirers to inspect, charge and fire all holes drilled by the miner, where the holes are found to be safe for shooting. No shots must be fired in a place, without first making a careful test for gas.

**Ques.**—What effect does the presence of coal dust have in a firedamp mixture?

**Ans.**—The presence of the dust lowers the explosive limit of the gas and renders the mixture more easily ignitable, besides increasing the force of an explosion should that occur. These effects are increased in proportion to the fineness of the dust and the inflammability of the coal forming the dust.

# White Advocates Larger Concessions Than Soft-Coal Commission Recommends

**Wants Day Men Conceded Further 35c., and Boys 22c. Per Day with Bank-to-Bank Time Reckoning—Urges Also Joint Agreements on Car Pushing and That Blacksmithing Be Provided at Cost**

**I**N MAKING his minority report as member of the Bituminous Coal Commission, John P. White, former president of the United Mine Workers of America, may be quoted as follows:

The inability of the Bituminous Coal Commission to agree upon fundamental issues compels me to set forth my viewpoint clearly and briefly. I have in mind the duty and obligation I owe to you, the industry, and the country. My report and award embody this principle, with the expressed hope of enabling you to so determine and act that stability to the industry may accrue, justice and equity be established, and unrest displaced by contentment in such a full measure as to bring a long period of essential well-being to all.

The testimony and evidence submitted to your commission brought forth all the elements entering into the controversy between the coal operators and miners that caused the deplorable and disastrous condition that led to the creation of this commission. If this commission was to succeed in its work, a calm, dispassionate, judicial decision, unanimous in its findings, should have resulted. That this was not accomplished is, indeed, regrettable, which I deeply deplore.

## WAR-TIME METHODS APPLIED TO WAGE INCREASES

I have carefully analyzed the majority report as a solution of the main and principal issues, with some of which I am in accord. To subscribe to their plan of reference of many major problems I cannot agree. To do so would only leave unsettled many of the clearly defined issues that have caused so much contention and controversy of long standing.

The majority in arriving at its conclusion was guided mainly by the theory of war-time methods in applying wage increases, namely, the increased cost of living. To this principle I cannot subscribe. The great outstanding fact developed by this commission's hearings in which every citizen is interested is the increased cost of coal.

From 1913 to Oct. 31, 1919, the mine workers' rate per ton increased 23c., the operators' receipts increased \$1.41, and the retail dealers' receipts increased \$2.10. The mine workers' pre-war earnings did not permit a subsistence wage. While the 24c. per ton increase on pick and machine mining recommended in the majority report will not reflect a reasonable standard of living in health and comfort into the lives of the mine workers, it will materially improve their condition, and in the interest of honorable compromise I assent thereto.

The following recommendation for the increase to day men provides the same percentage increase given tonnage men and follows a time-honored practice of the past. Reducing to a minimum the grave and disputed points that, in my judgement, must be adjudicated, I

submit the following plan by which final and complete adjustment may be obtained and peace established in the industry:

## RECOMMENDS PLAN TO BRING PEACE TO INDUSTRY

That the mining rates and wage schedules in effect on Oct. 31, 1919, in what is known as the Washington agreement applying to the Central Competitive field and the outlying districts, except as hereinafter provided, shall be subject to the following increases and conditions.

1. *Wage Increases to Pick and Machine Miners.*—That the mining prices for mining mine-run coal, pick and machine, shall be advanced 24c. per ton of 2,000 lb. In the block-coal field of Indiana and in other localities that are still on the screen-coal base, the usual methods of applying the tonnage rates shall continue. This also has its application to districts that have a joint understanding in applying wage increases to low coal.

2. *Wage Increases to Day Men.*—That all day labor and monthly men, except trappers and other boys, be advanced \$1.35 per day, trappers and boys receiving less than men's wages to be advanced 75c. per day.

3. *Wage Increases Applying to Yardage, Dead Work, and Room Turning.*—That all yardage, dead work and room turning be advanced 20 per cent. Nothing shall prevent the representatives of the miners and operators in any district in joint conference from taking the flat equivalent of 20 per cent and applying it to yardage, dead work and room turning if by so doing they will make for uniformity and maintain the differentials. Failing, however, to agree to such application, then the 20 per cent shall be applied on the existing rates, effective Oct. 31, 1919.

## SUGGESTS METHOD TO ADJUST DIFFERENTIALS

4. *Central Competitive Field Differentials.*—The differentials existing in western Pennsylvania as between the thick- and thin-vein pick and machine mining, the 12c. machine differential in Indiana, and the 4c. differential in southern Illinois are disposed of in the following manner: The miners' international officials shall select two representatives and the officials of the Coal Operators' Association of the Central Competitive Field shall select two representatives and the Secretary of the U. S. Department of Labor shall select the fifth and disinterested member, and the selections herein enumerated shall constitute the tribunal for the purpose of determining the disposition of the equities involved in the claim of adjusting the foregoing differentials. This tribunal shall be selected and enter upon its duties not later than June 1, 1920, and its awards shall become effective the first day of the month following the determination and conclusion of its findings.

5. *Special Application for the Payment of Soapstone.*—Payment for handling soapstone directly overlying the No. 8 seam of eastern Ohio and the Pittsburgh district of Pennsylvania shall be subject to the increase provided herein; and that part of the stone up to and including the 12 in. is referred to the operators and miners of these two respective districts, and 2c. a ton is to be allowed, to be paid upon the ton, or converted to a yardage basis if desired. The principle of determining the flat rates for the payment of yardage and dead work may be applied in these two fields in fixing and establishing pay for the handling of soapstone.

6. *Western Kentucky Differentials.*—The differentials existing in what is known as the western Kentucky coal fields, involving day wage, pick and machine mining, shall be referred back to the joint conference of operators, and miners of that field for the purpose of mutual adjustment, and failing to agree, the matters in dispute shall be referred to a commission composed of two operators and two miners from that district, and the fifth and disinterested member shall be selected by the four so chosen. Failing to appoint, the Secretary of the U. S. Department of Labor shall make the appointment. Under no consideration shall the mines cease operation pending the investigation and findings of this commission.

#### OLD WORKING HOURS RETAINED UNTIL 1921

7. *Car Pushing.*—We refer this important matter back to the various district joint conferences to be worked out in accordance with mutual understanding, taking into consideration the conditions that obtain in each of the districts from which these complaints emanate.

8. *Eight-Hour Day.*—The present arrangement regarding the working hours of mine employees shall continue in effect until March 31, 1921. Beginning April 1, 1921, the maximum hours for employees shall not exceed eight hours underground per day and six days per week.

9. *Fulfillment of Award.*—The award becomes the base upon which all wage agreements shall be predicated. The specific awards set forth shall not be subject to negotiations, but shall apply automatically in such agreements or schedules of wages. Latitude to unify or to enter into mutual arrangements is authorized; provided, however, that specific awards and references as well as principles are adhered to and in all other respects the agreement as of Oct. 31, 1919, will be continued in effect and the application of this award shall be arranged mutually and without recourse to strikes or suspension of mining. This basic award substitutes and absorbs the 14 per cent average wage increase and becomes effective April 1, 1920, and will continue in effect until March 31, 1922.

The differential now existing between the thick and thin seams of western Pennsylvania was established years ago in order to compensate the operators for privately owned locks in the upper pools of the Monongahela River. The United States Government took over these locks with proper reimbursement to the owners.

The differential in Indiana of 2c. per ton on machine mining coal below the Danville (Ill.) basing point is of long standing. The pick rate is in accord with the Danville basing point. The southern Illinois differential of 4c. per ton was established mainly through freight rates and inadequate transportation facilities; this reason no longer exists. The western Kentucky differential,

like southern Illinois in character, should receive the same consideration.

Each of the districts with these differentials has enjoyed the Government selling rate f.o.b. mine as has its competitors, which now continues to exist. Any change in these differentials to their proper base can under no circumstances add any to the cost or burden to the public or consumer. The majority report evades adjustment of these issues while this report definitely and finally points a way to a conclusion determined on the merits of these issues.

#### THINKS OPERATORS COULD ABSORB INCREASE

It is acknowledged in the majority report that 80 per cent of the increase of 14 per cent granted to the mine workers at the time of the establishment of the commission has already been carried on to the public through increase in prices by the operators.

If the 27 per cent increase is granted, as recommended by the majority report and concurred in by me, this would leave only 13 per cent which the operators would have to absorb. As Dr. Garfield stated originally that they were able to absorb an increase of 14 per cent, and this increase is acknowledged not to have been absorbed, it seems apparent that the additional 13 per cent now called for could be taken care of by the operators, assuming that Dr. Garfield was correct in his original statement.

The principles and suggestions embodied in this section of the majority report are commendable. In this connection attention should also be directed to some grave evils which still exist. Some coal companies still maintain what is known as the "closed camp." In these camps the companies dominate all the conditions of life of the people. On the slightest opposition of the miners to the living and working conditions offered, the coal companies are in a position to evict them from their houses and impose upon them almost any conditions they may desire, including discrimination against them on account of membership in the United Mine Workers or any other labor organization. These conditions are un-American—economically, socially, and politically—and cannot be too strongly condemned.

#### WANTS OLD PRICE OF POWDER MAINTAINED

The findings of the majority report would be acceptable with two additions which are of fundamental importance: (1) That the price to be charged for powder in the future shall under no conditions exceed the prices charged on Oct. 31, 1919; and (2) that detonators shall be furnished to the miners without charge.

As a substitute for this section of the majority report, I would suggest the following:

The price in effect on Oct. 31, 1919, for house coal furnished to the miners at the mines shall be increased by adding the labor cost only. No stipulation should be made as to the cost of delivery of coal to the miners' house for the reason that this provision may be abused by excessive charges.

The simplest and most direct method of handling this problem would be to substitute for the findings of the majority report a recommendation that "the charge for blacksmithing be made on a basis of actual cost." By sanctioning charges as of Oct. 31, 1919, many excessive charges would be perpetuated. In some instances miners are now arbitrarily charged for blacksmithing in machine mining.

The statement made in the majority report that car pushing is a natural condition of the industry is without foundation in fact. The joint report is contradictory. The first paragraph states that the complaint has no foundation, the second reciting that it has foundation. The Government itself in the central Pennsylvania field allowed miners during the war 5c. a ton for pushing cars. The majority report states there is not sufficient information on this subject to form a correct conclusion. The commission is, therefore, admittedly incompetent to pass upon the question. It should, therefore, be referred to the various joint conferences to be worked out through mutual understandings and agreements.

The price-fixing policy should be continued until June 1, when the operation of the laws of supply and demand will be such that it will no longer be necessary.

The majority report is objectionable in its recommendation relating to the Central Competitive Field, because it leaves unsettled those vital and all-important issues which have caused so much of the existing unrest and intensification.

The method provided by the joint report merely means a continuation of the conflict, as neither side, as experience has shown, will yield. This situation can only be effectively handled by the creation of such a commission as I have already in the beginning of my report recommended. The recommendations of the majority report as to northern Illinois are acceptable.

As a substitute for the recommendations of the majority report for the State of Washington I would recommend the following: The situation in the State of Washington, as presented by briefs and oral statements of the operators and miners, reveals one of the most unusual and complex problems submitted to this commission for its determination. The operators show by their briefs that in many of the commercial mines of the state, which produce the majority of the state's tonnage and sales realization, the price is below the production cost. They also show that foreign coal and fuel oil enter in a large degree into the future life of the coal industry in that state.

The miners in rebuttal attack the figures in the briefs of the operators, declaring the depreciation, depletion, and miscellaneous items of production cost are excessive and unwarranted.

In view of the vital issues involved and the lack of time and funds for this commission to make a survey and enable them to deal adequately with the problem, we recommend the following:

That the representatives of the miners and operators of the State of Washington, at the earliest possible moment, select one operator and one practical miner, the two selected to agree upon a disinterested mining engineer as the third member, and, failing to agree upon such a person, the Secretary of Labor shall make the appointment. This local commission shall make a survey of all the mines in the state to develop the facts underlying the whole problem as it applies to this industry in the State of Washington and at the earliest possible moment submit its report to the joint conference of operators and miners of that state. Pending this investigation the miners and operators shall jointly agree on what basis the mines will operate while the survey is being made. The expenses incurred by this commission shall be borne equally by the operators and the miners of the state.

I would also recommend the substitution for the sec-

tion of the majority report entitled "Alabama, Tennessee, eastern Kentucky, and Maryland" of the following: The representatives of the miners from these states filed briefs citing the wages and conditions of employment, but, as the records show, none of the operators from these districts appeared before the commission, merely filing letters with the commission to the effect that they have no joint relations with the mine workers in their districts.

In each of these districts during the war wage increases were adopted and put into effect by the U. S. Fuel Administration and tribunals were set up for the adjustment of the usual complaints common to mining. These tribunals included a permanent umpire in each district, and the commission would recommend that the operators arrange to meet with representatives of the miners in those districts and to put into effect the award of this commission, and to adjust the differences that may prevail in the industry in their respective localities, to the end that industrial peace and tranquillity prevail.

The recommendations of the majority report as to "Kanawha, Point Creek, and Cabin Creek districts, in West Virginia," are acceptable.

## At Last, List of 125 Indicted Is Made Public

FEDERAL officials revealed on March 27 the names of the persons indicted at Indianapolis for alleged violation of the Lever Act and the conspiracy sections of the Federal Criminal Code. The mine workers include John L. Lewis, the president of the United Mine Workers of America; William Green, secretary and treasurer, and Percy Tetlow, chief statistician.

Indiana seems to have an excessively large number of indicted, for there are 55 Indiana mine workers' representatives and operators under indictment. The operators include Thomas T. Brewster, of St. Louis, chairman of the operators' Scale Committee; Phil. H. Penna, of Terra Haute, spokesman for the operators in the Washington conferences; F. S. Peabody, of Chicago, head of the Coal Board in the early part of the war and later in control of explosives.

Illinois operators indicted include besides F. S. Peabody, Rice Miller, C. M. Moderwell, J. E. Rutledge, E. C. Searles, Thomas T. Brewster, George B. Harrington, John Connory, Walter S. Boyle, Theodore Keller, H. A. Huskey, H. C. Perry and J. W. Spencer. The Illinois union men indicted include Frank Farrington and Harry Fishwick.

Ohio is represented by Michael Gallagher, W. H. Haskins, E. G. Maurer, Joseph Pursglove, S. H. Robbins and G. C. Weitzell among the operators, and George Cecil, William Roy, G. R. Savage, John Sexton and William C. Thompson among the mine workers.

Western Pennsylvania operators indicted include W. K. Field, president of the Pittsburgh Coal Co., Pittsburgh, Pa.; James M. Armstrong, John A. Donaldson, William Henderson and James G. Patterson, while the union men include Thomas Hughes, Frank Leithold, Philip Murray, Robert Gibbons and John O'Leary.

Other indicted persons are Ponas Waffle, secretary of the Coal Trade Bureau, of Terre Haute, and R. W. Couffer, representative of the National Coal Association.

There are 18 counts in the indictment all alleging some form of conspiracy. One count sets out ten overt acts which are alleged violations of the Federal laws.

# Anthracite Wage Conferees Agree To Make Settlement Operative from April 1

Miners Agree To Remain at Work Pending Settlement of Negotiations—  
Efforts To Establish Closed Shop and  
Check-Off Are Defeated.

IN THEIR efforts to negotiate a new working agreement to take the place of the one expiring at midnight, March 31, the sub-committee of operators' and miners' representatives put in a busy third week. Daily sessions were held at the Union League Club and although no announcement was made that any of the demands had been settled, the operators accepted the proposition of the miners that they remain at work after April 1, providing the new agreement would be made retroactive as of that date.

This proposition was believed to be the stumbling block in the early stages of the negotiations. The operators' representatives during the closing days of the previous week had proposed to the miners that they remain at work after the expiration of the present agreement pending the outcome of the negotiations. This proposal was considered by the Scale Committee of the miners when it was presented and again on the morning of March 23. After a session lasting more than four hours, during which there were some heated arguments, the resolution as presented to the operators later in the day was agreed upon.

Efforts were made by some members of the Scale Committee to amend the resolution to include the closed shop and check-off, the latter to become effective on April 1 regardless of when a new agreement should be signed. The district presidents and international vice-president argued against this amendment and it was finally defeated.

The resolution was presented to the sub-committees during the afternoon and after a brief discussion was taken under consideration by the operators' representatives, with a promise to have their reply ready at 8 p.m. on the evening of March 24. After a session lasting more than two hours on the evening of March 24 it was announced that the operators had agreed to make the award retroactive. The resolution as adopted read:

"Whereas, the negotiations now pending between the anthracite mine workers and operators may require additional time to reach a mutually satisfactory conclusion; and

"Whereas, it is to the public interest that the supply of coal be not diminished; therefore

"Be it Resolved, That *pending* conclusion of negotiations there shall be no cessation of work, and that by mutual consent the working conditions of the agreement of May 5, 1916, and the war allowances supplemental thereto, be continued during negotiations, and that whatever agreement is finally reached shall be retroactive to April 1, 1920."

At the conclusion of the session International Vice-President Murray predicted that the sub-committee would now get down to real business and thoroughly discuss each of the various demands. He believed that

the work of the conference would now be speeded up.

The next morning, March 25, Mr. Murray and the three district presidents drew up a letter embodying the resolution adopted by the sub-committee, directing the mine workers to remain at work after the expiration of the present agreement and until a new agreement is reached.

A letter to the officers and members of Districts 1, 7 and 9, United Mine Workers of America, reads as follows:

"On March 18 the representatives of the anthracite operators submitted a proposition to your Scale Committee which provided for a continuance of work after April 1 pending negotiations, without any retroactive provision. Your committee refused to entertain the operators' proposal, and on March 23 a meeting of the full Scale Committee, consisting of the three district executive boards, three mine workers from each district and the international officers, was held to discuss and outline a policy to govern after April 1.

"After discussing the matter from every angle and with the advice and consent of our International officials the full Scale Committee authorized the sub-committee to provide an arrangement for the continuance of work after April 1 pending negotiations, with the understanding that whatever agreement is finally reached it should be retroactive to April 1. This action of the full Scale Committee has been agreed to by the operators, as evidenced by the adoption of the following resolution, which fully protects your interest while at work pending settlement."

(Here follows the resolution adopted by the sub-committee and which is printed above.)

The letter then continues:

"In view of the above facts you are officially notified to observe, as in the past, April 1 as a holiday by remaining away from work, but after that day work is to be resumed, pending negotiations, and in these negotiations it will be our aim to bring the matter to a conclusion as soon as possible.

"On account of the short period before April 1 this official circular will be published in the press and copies forwarded to the secretaries in order that our membership may be advised of the action.

"With the hope that we may be able to secure an agreement that will meet the requirements of the anthracite mine workers, we remain on behalf of the General Scale Committee:

"John T. Dempsey and John M. Mack, District 1.

"Thomas Kennedy and John Yourishin, District 7.

"C. J. Golden and James McAndrew, District 9 and

"Philip Murray, International vice-president."

The sessions on March 25 and 26 were taken up by a discussion of the wage demands of the miners, the operators presenting statistics showing the earnings of

the men in the bituminous fields. It was predicted that with the return of John L. Lewis, the International President, to this city the sub-committee would work faster.

With the return of International President John L. Lewis from Washington it is expected that the sub-committee will get down to hard work. Mr. Lewis said his reports of the situation were optimistic and he felt confident that an agreement will be reached speedily.

He has been in Washington for the past two weeks in connection with the Bituminous Coal Commission's report and returned to New York on March 27 to make arrangements for the conferences between the bituminous operators and the miners' representatives at which a contract will be negotiated.

While no definite announcement has come from the sub-committee regarding the wage demands excepting the original demand of 60 per cent increase, the miners have said that while they will continue to press for the full increase demanded they will not accept less than 45.7 per cent. The men claim that they are entitled to 18.7 per cent more than the 27 per cent increase granted the bituminous mine workers by President Wilson's Commission.

The miners' leaders say that until recent years the anthracite mine workers received more pay than the men working in the bituminous mines but that this difference has not been maintained and they believe that now is the time to regain the loss. It has been declared that they must get the maximum figure in order to make their wages keep pace with the high cost of living and with the scale of wages received by the men in the bituminous fields.

The sessions on March 26 were devoted to a continuation of the offering of arguments and statistics by the operators in answer to the miners' arguments and statistics presented some days ago covering the comparison of time worked and earnings in the anthracite and bituminous-coal fields, after which the meeting adjourned.

A short session was held on Saturday, March 27, after which the sub-committee adjourned until 2 p.m., Tuesday, March 30. At its conclusion this statement was made: "The sub-committee of anthracite operators and mine workers met today. The time of the session was occupied by the operators in the presentation of statistics compiled by them in answer to the data heretofore submitted by the miners."

## Operators Consider Byproducts of Award Especially Valuable

Settlement Believed to Constitute a Precedent That Will Reduce Wage Adjustment to Exact Science—White's Minority Report Considered Unfair and Misleading—Income of Bituminous Concerns Refutes Allegation of Enormous Profits

WITH the full text of the reports of the Bituminous Coal Commission before them, operators are now inclined to view the majority report with much more favor than they did when they were cognizant of only a few of the high points of the decision. The feeling that there is no justification for saddling the people with a new living cost running high into the millions is none the less strong, but the byproducts of the award are regarded as splendidly valuable.

Sight is not being lost of the fact that this award constitutes a precedent which is likely to be followed and which will ultimately reduce wage adjustments to an exact science. Many believe that the day is past when wages in the coal industry will be fixed by bargaining alone without careful attention to the necessity for developing all the facts.

There is some fear on the part of the operators that the plan for a seasonal freight rate will not be as attractive in practice as it appears. It is certain that it will work to great advantage in some fields, but many operators think that certain districts will be affected adversely. There is a general feeling that a step of such importance should be taken only after its probable effects have been studied from all angles.

In some districts, for instance, the stimulation in the movement of the larger sizes will be such that it will make it extremely hard to take care of the screenings. In many localities the seasonal freight rate may well have an important bearing on the type of coal that will be used. Important readjustments will unquestionably

be necessary, and the hope is expressed that the plan will not be put into effect too drastically until its operation is somewhat better understood.

One of the principal causes of satisfaction on the part of the operators is the evident fact that the majority members followed the Garfield principle in arriving at their conclusions as to wage. It is apparent that the majority of the commission made its calculation in exactly the same manner as did Dr. Garfield with the exception that it had much more complete data with which to work and had later figures on increases in the cost of living.

As indicated in John P. White's report, the living cost, on which the calculation was predicated, showed an increase of 97 per cent over that obtaining during the pre-war period. The important increase in the cost of living since the time of Dr. Garfield's calculation tends to refute the Attorney General's contention that the Administration's drive is holding prices on an even keel.

The minority report comes in for severe censure on the part of the operators. They state that it is a return by labor to its old methods of securing wage adjustments. It has been its habit to resort to oratory rather than to deal with facts. It is pointed out that Mr. White's statement is in large part not constructive but merely an argument against the majority report. Many instances are cited in which it is alleged that he has used unfair examples in an effort to substantiate his point. A conspicuous instance, to which operators point is the following statement of Mr. White: "From

1913 to Oct. 31, 1919, the mine workers' rate per ton increased 23c, the operators' receipts increased \$1.41 and the retail dealers' receipts increased \$2.10."

The unfairness of that statement is held to be obvious. Another example is when he cites average earnings in northern Illinois as being indicative of the general condition. The contention of the operators is that he should have mentioned that the northern Illinois district is not typical and should have pointed out that miners there earn important additions to their yearly income in occupations other than mining.

A source of great satisfaction to the operators is the tabulation of the net-income returns filed by bituminous coal-mining concerns. This tabulation effectively refutes the statements made by Messrs. McAdoo and Glass through which the public has been led to believe that coal operators in general have been making enormous profits. This tabulation shows that the average per cent of net income to invested capital was 9.72—a small return when the hazard of the investment is considered.

The decided conflict between the showing made by the Treasury Department's tabulation and the claims of Mr. White in his argument under the sub-heading of "Profits of Bituminous Coal Companies" is held to be striking. Mr. White's recourse to Senate Document 259 is pointed to as another glaring instance of unfairness. His reference to the 32 companies cited by the mine workers also is held to be unfair since they constitute only 32 companies out of 7,000 and include those engaged in the anthracite trade, in retail dealing and in the lumber and coke business.

That section of the majority report which deals with the six-hour day and five-day week is regarded as being of the greatest value in meeting an unsound tendency which might have had far-reaching effect had the majority been misled by the rather plausible argument that had been made in behalf of that proposal.

## Hines Gives Out Text of Order Suspending Coal Diversion

THE full text of the order issued by the Director General of Railroads in regard to the diversion of coal is as follows:

"I, Walker D. Hines, Director General of Railroads, acting, with respect to control of the distribution of coal, under authority delegated to be by certain orders of the U. S. Fuel Administrator, dated Oct. 31, 1919, and Dec. 8, 1919, and by certain Executive Orders of the President of the United States dated Feb. 28, 1920, March 5, 1920, and March 19 1920, hereby order and direct as follows:

"That all rules, regulations, orders or directions issued by me or under authorization from me under and by virtue of the aforesaid delegation of authority to me shall be and until further notice shall remain suspended from and after 12:01 a. m., April 1, 1920; and especially a certain order made by me on March 5, 1920, establishing a certain preference or priority list and designating as my representatives certain Regional Coal Committees with power, within the limits and for the purposes therein specified, to make diversions of coal in the possession of railroads operating in the United States as common carriers."

Commenting on the order, the Director General states that "H. B. Spencer as chairman of the Central Coal

Committee, today instructed all regional and district coal committees through which the control of the Director General over the distribution of coal has been exercised, to cease functioning as the Director General's representative at 12:01 a. m., April 1, 1920, and to give notice to all parties concerned that on and after 12:01 a. m., April 1, any and all orders issued by the committees will cease to have force or effect.

"The activities of these committees, which since March 5 have been charged with the duty of protecting the emergency fuel requirements of railroads, public utilities and other consumers in the first five classes of the Fuel Administrator's preference list, will be confined to carrying out the conclusion settlements for coal diverted prior to April 1.

"The committees have been advised that during the period remaining in which the Director General will exercise control over the distribution of coal, it is imperative that diversions shall be held at the absolute minimum necessary to meet current requirements of consumers in the first five classes and they have been instructed to exercise the greatest possible vigilance in seeing to it that no railroad, public utility or other consumer is permitted to build up a reserve supply of coal through diversions."

Brice Claggett, assistant to the Director General of Railroads, has been placed in charge of the work in connection with winding up matters relating to the distribution of coal by the Railroad Administration.

## Southern Illinois Wants All Concessions It Struck To Obtain

Remembering that southern Illinois was the earliest, loudest and most disorderly in making a demand for the shorter day, the abbreviated week and increased pay, it is not to be wondered at that much dissatisfaction is being expressed by local leaders as well as by the men themselves in Franklin and Williamson, as well as other southern Illinois counties, over the majority report of the coal commission.

The men continue to fondly hope for that six-hour day and five-day week, along with the sixty per cent wage increase, and claim they will not be satisfied with anything less, and unless they get it there will be a general strike when the present contract expires in April.

## Good Housing at Fair Prices

ONE of the leading dicta of the majority report of the Bituminous Coal Commission gives the operators, who have been renting good houses at less than fair rents, no little gratification.

"We therefore recommend that when houses are to be constructed by operators, houses of a modern type, with good sanitation, shall be built, the type of house to be based on the probable life of the mine; that rentals shall be based on the actual investment in houses and land; that the return should include no profit to the operator; and that the rentals should be only sufficient to maintain the structures in good condition, provide for the amortization of the investment cost and proper insurance, and return not to exceed 6 per cent on the invested capital while such sum is invested.

"Where the expected life of the operation exceeds 25 years the period of amortization shall be 25 years, but in no other event shall the amortization period be less than the expected life of the property."

# New England Retailers Favor Price Control

One Dealer Declared That Now Price to Him Is Unregulated He Will No Longer Be Able to Make \$3 a Ton as He Always Has Done—Retailers Opposed to Frelinghuysen's Federal Coal Commissioner and to His Freight Differential

**R**ETAIL coal men from Greenwich, Conn., to Eastport, Maine, assembled in Springfield, Mass., March 24. Each year gives a new record of attendance and there are only a few now who are willing to withhold their support from this active organization. Springfield, Mass., is convenient to the greater number, but the Auditorium is better adapted to larger gatherings, and the association might well consider whether in future it would not be better to meet in a hall where speakers could more easily make themselves heard. The meeting was a success, however, in spite of some disadvantages; the discussions were well led, were interesting, and in the plans that were unfolded was much of great promise for the coming year.

William A. Clark, Northampton, Mass., long the president of the association, opened the session on Wednesday by presenting Mayor Adams of Springfield, who made a cordial address of welcome. After routine business, the election of officers, etc., the convention settled down to coal discussion. Edward W. Parker of the Anthracite Bureau of Statistics had been announced to speak on "The Anthracite Question," but he was unable to be present. The prospect of hearing this paper was a great drawing card and real disappointment was expressed at Mr. Parker's absence.

## URGES OPPOSITION TO FEDERAL COMMISSIONER

The meetings are purposely held near April 1 because of the great interest of coal men in the anthracite spring program, and to an unusual degree that was true of the convention just held. Ellery B. Gordon, secretary-manager of the national Retail Coal Merchants' Association, had a hard place to fill, for not only was he called upon to speak on his own topic, "National Matter," but it was also put up to him to cover Judge Parker's time as well. This he did most acceptably, giving the members a graphic account of legislation now pending in Washington.

Specifically, Mr. Gordon dwelt upon the three proposals of Senator Frelinghuysen's committee. The association received sympathetically Mr. Gordon's strictures on the first and third of these, the 15 per cent summer reduction in railroad rates as an incentive for purchasing coal early and the creation of a new Federal commissioner with inquisitorial powers. Coal men were urged to oppose vigorously both measures, and particularly the latter.

In Mr. Gordon's judgment the control sought would be altogether too high-handed and far-reaching and of a piece with legislation which provided for the Federal Trade Commission, the rulings of which are now being

brought to question in the courts. As compared with the new plan the Lever Act, Mr. Gordon felt, was relatively harmless, for after all it applied only to the period of the war. Mr. Gordon emphasized the injury such overregulation would be certain to work in the trade. The second proposal, to draw the teeth of the Fuel

Administration as now administered, was generally approved, although recognized as unnecessary in view of the recent Executive order. There was lively comment from the floor, and the outcome, a formal resolution, met with instant approval. For the interest of coal men in other sections we print the text:

With characteristic breadth of mind the retailers don't care who regulates the operator or how low his prices are placed, so long as no one constricts the sacred liberties of the retailer. In fact, the Lever Act and Dr. Garfield's attempt to use it for the purpose of compelling the operators to absorb wage increases do not seem subversive of the liberties of any one—in New England.

"Whereas, we, members

of the New England Coal Dealers' Association in convention assembled, recognize our responsibility of service to the coal purchasing public; and whereas for the period of the war we have done our duty, having rendered our service with the consciousness of bearing our part of the burden for the best interests of all, under government restrictions that have been vexatious and costly, both to ourselves and to consumers; and whereas we have now arrived at a time when we feel that government supervision of our business is unnecessary and that continued supervision will prove costly both to the retail merchant and to those we serve, the public; and whereas the distribution of coal under government regulation has been a decided failure and the re-establishment of such regulation must work harm to all; and whereas the idea that there have existed in the coal business tremendous margins that have permitted extraordinary profit on the part of the retail coal merchant is not founded on fact, as has proven by government investigation; therefore, be it RESOLVED, that the New England Coal Dealers' Association do hereby protest against further government regulation of the retail coal industry and oppose absolutely the favorable report of Senate bill 4089 by the Senate Committee on Interstate Commerce, and that the secretary be directed to send copies of these resolutions to Senator Frelinghuysen, to all members of the Committee on Interstate Commerce, to the National Retail Coal Merchants' Association and to the New England Senators and Representatives in Congress and to every Chamber of Commerce in New England."

The President's announcement of unrestricted prices April 1 also came in for free comment. There was manifest a distinct sentiment favorable to the clamps staying on, but there was no vocal prophet present to point out just how steam coal would reach New England should the fixed price be continued and the operators be required either to meet all wage increases out of their own pockets or sell their coal abroad. It should be

remembered that by far the greater number of New England retail dealers distribute only small tonnages of bituminous and do not realize in what volume it must be secured if our industries are to be kept in operation. One dealer in a small town was heard to say he had always been able to clear \$3 a ton on soft coal, but if the lid was lifted he didn't see how it could be done hereafter!

Thursday forenoon there was a series of papers on such topics as "Degradation," "Cost of Doing Business," "Advertising in a Small Community," and "Application of Truck Costs." The general discussion disclosed bits of information that the members appreciated. A lot of note-taking was observed, and that is a good sign.

President Clark's formal address, after the municipal organ had shown its power and range, was a review of New England's peculiar situation with regard to anthracite since 1916. He complimented railroad management on the service during the worst succession of snow storms visited upon this region in many years, but his references to anthracite shippers in general were anything but complimentary. Save for the dull period in February and March of 1919, when, by the way, retailers could not be induced to order coal, Mr. Clark made it plain that for four years coal has sold itself. The chief complaint seemed to be "the indifference of the producing companies" to the needs of an area like New England, which easily absorbs 15 per cent of the entire output of anthracite. Mr. Clark doubtless meant that New England is willing to take 15 per cent of the output of egg, stove and chestnut, especially chestnut.

There was a further address on "The Experiences of a Retail Coal Merchant," this by Frank H. Beach of New York. The set program came to an end with a characteristically snappy speech by George H. Cushing. Needless to say, Mr. Cushing dilated upon the sins of the authorities, but his remarks were followed with the closest attention. Coal men came away in hearty agreement that Mr. Cushing knows coal and is rightly placed as director of the American Wholesale Coal Association.

The usual exhibit of coal-handling fixtures and supplies, always a feature of these meetings, was liberally patronized. The available space was disposed of months ago, and this speaks well for the growing effectiveness of the association.

Wednesday evening at the Hotel Kimball there were 560 seated for dinner. The entertainment was elaborate and was followed by dancing. There was some evidence that the great drouth was not so pervasive as some are led to think, and this fact should never be lost sight of in listing the attractions of a retail coal dealers' convention.

## Many Labor Trials in New River

Ten Union Workers Charged with Perjury—  
Union Seeks Conviction of Nine Men—Gov-  
ernment Aiming to Deport Murderer

TEN persons prominently connected with the United Mine Workers of America in District 29, which embraces the New River field of West Virginia, were indicted during the third week of March by a grand jury in the Intermediate Court of Raleigh County. The charge upon which the ten stand indicted is perjury in

connection with the evidence given in the recent trial of Tony Stafford, who was found guilty the latter part of February of the charge of attempted murder for having tried to shoot up the Glen White plant of the E. E. White Coal Co. in November, 1917.

Those against whom indictments were returned were as follows: J. R. Gilmore, president of District 29, U. M. W.; Lawrence ("Peggy") Dwyer and Joe Patton, board members; John Gatherum, secretary of District 29; Marshall Price, colored organizer; G. F. Parsons, Socialist editor; Tony Stafford, J. E. Brooks, Lizzie MacMillen and John Keeney.

### INDICTMENTS BROUGHT UNDER "RED MEN'S ACT"

The same grand jury which returned the indictments against these men also returned a number against certain mine workers under what is known as the "Red Men's Act" of West Virginia, the indictments for conspiracy growing out of the labor troubles occurring at Willis Branch in January, during which, it is alleged, members of the Willis Branch local of the United Mine Workers of America banded themselves together to prevent certain miners from working during a strike. In furtherance of this conspiracy, it is alleged, attacks were made on the night of Jan. 20 against Lee Kidd and Charles Treadway.

Under the name of the United Mine Workers of America, indictments for felonious assault have therefore been lodged against the following men: Frank Lafferty, Norman Maynor, Jesse Lilly, Walter Romine, Chas. Lafferty, Ezra Godbey, Nemiah Daniel, Elmer Collins, Demsey Vass. It is understood that indictments of a similar nature are to be returned by the Fayette county grand jury when it meets next week. Much property on the Fayette side of Willis Branch was destroyed during the trouble.

The hearing of deportation proceedings against Tony Stafford, which have been conducted at Beckley, W. Va., by Inspector of Immigration M. F. O'Brien, of Pittsburgh, came to rather an abrupt end, at least in so far as the inspector was concerned, March 18. Mr. O'Brien left on that date for Pittsburgh without making a report as to his findings in the proceedings, it being understood that his report will be filed with the chief inspector there.

### MINE WORKERS ARE EJECTED FROM COURT ROOM

No one appeared at the hearing for the government except Inspector O'Brien. At the beginning a large number of mine workers filled the court room, but before work was started the inspector ordered the room cleared except for the attorneys, the deputy marshals and Herman Pugh, of Huntington, a court reporter for the government.

At the conclusion of the testimony of several witnesses, Inspector O'Brien announced that the case was closed as far as the government was concerned. The defense is understood to have had about forty or fifty witnesses to be heard, but Inspector O'Brien is said to have informed the attorneys that if this was the case, and more than ten witnesses were to be called, the witnesses must submit their evidence in the form of affidavits to the office of the chief inspector in Pittsburgh.

West Virginia has now to contend with a number of troublesome characters. Fortunately it has good citizens who respect the peace, as for instance, the grand jury herein referred to and its competent Governor, John J. Cornwell.

# McAdoo's Statements of Big Operating Profits Not Sustained

Figures from Internal Revenue Bureau Show That in 1918 the Group of Operators That Produced the Most Coal Were Those Who Made from 15 to 20 Per Cent Profit

FROM the Majority Report of the Bituminous Coal Commission is taken the table, charts and comment contained in this article. It reassuringly shows that the coal operators made satisfactory but not exorbitant profits from coal production during the closing year of the war.

"A table is shown herewith based on the returns made by coal operators to the Bureau of Internal Revenue for the year 1918. In this table are included

for coal was unlimited, will be unable to remain in business in normal times, and that many of the companies making net returns of only 5 per cent during that banner year will also decide to discontinue operations under competitive conditions.

"The two groups of companies reporting net losses and incomes of less than 5 per cent constitute about one-third of those for which returns are available, but represent only about one-seventh of the total invested capital and about one-ninth of the total tonnage. It is believed that the nation's coal requirements can ordinarily be met by the operation of those collieries alone which have advantages resulting in lower production costs and consequent larger returns on invested capital.

"The figures show that 36 per cent of the operators represented, having about 62 per cent of the total invested capital and producing about 48 per cent of the total tonnage, made net incomes of between 5 and 25 per cent on their investment, while other companies, still more fortunately situated, made even higher returns. The companies, however, that showed net incomes of over 25 per cent represent in the aggregate

CHART 1. INVESTED CAPITAL OF GROUPS MAKING CERTAIN PERCENTAGES OF PROFIT

The group earning between 10 to 15 per cent had the largest amount of invested capital, slightly exceeding \$95,000,000. The next important group from point of view of invested capital, that earning 15 to 20 per cent being followed closely by that earning 5 to 10 per cent.

returns from 1,551 operators, representing about one-third of the coal tonnage produced in 1918. We have the assurance of the U. S. Geological Survey that the relative figures would not be greatly different if all the operators were included in the returns. Of the 1,551 companies 337, or 22 per cent, reported net losses in 1918, and 168 companies, or 11 per cent, reported net incomes of less than 5 per cent on invested capital. Two charts illustrating this table are also presented.

"It is to be expected that companies which were not able to operate profitably in 1918, when the demand

CHART 2. TONNAGE PRODUCED BY GROUPS MAKING CERTAIN PERCENTAGES OF PROFIT

The most productive group earned 15 to 20 per cent profit, the next lower group earned 5 to 10 per cent, the group below that 30 to 40 per cent and the fourth group 5 to 10 per cent.

NET INCOMES OF 1,551 BITUMINOUS COAL MINING CONCERNS FOR 1918

	Number	Capital Stock	Invested Capital	Net Income	Taxes			Net Income, Tax Deducted	Average Per Cent of Net Income, Tax Not Deducted	Average Per Cent of Net Income, Tax Deducted	Tonnage
					Income Tax	War and Excess Profits Taxes	Total Tax				
<b>A. Returns reporting income:</b>

\* Loss. From Majority Report of U. S. Bituminous Coal Commission of March 10, 1920.

less than one-fourth of the total investment and two-fifths of the tonnage, while the companies making returns of 100 per cent or more represent a total investment of only about \$4,000,000 and a total tonnage of about six millions.

"The average returns of all the reporting companies were 18.86 per cent on the investment before payment of the income and excess profits taxes and 9.72 per cent after deducting the taxes. The companies reporting very high rates of return upon investment are all small concerns with investments of only a few thousand dollars, whose net income represents to a large extent the earnings of the owners for their own labor and management."

In chart 1 the capital invested by companies making, in the year 1918, 0 to 5 per cent, is plotted in a heavy black line, the invested capital of those losing from 0 to 5 per cent in a cross-hatched line. Similarly the invested capital of those making 5 to 10 per cent is plotted in a black line and the invested capital of those losing 5 to 10 per cent is plotted in a cross-hatched line. The invested capital of other groupings are similarly plotted.

In chart 2 instead of the capital invested the production is used for a basis of comparison.

### Mines Bureau Would Have Miners Examined Periodically

PHYSICAL examinations at regular intervals are advocated for mine workers by the United States Bureau of Mines, and it adds that if such examinations should be applied to mine workers everyone should be similarly examined.

"Every miner and his family should keep in the best possible physical condition," declares the bureau. "A good miner always takes care to keep his working tools in excellent shape, in order that he may do effective

work. He also carefully observes the danger signs that are seen at various places.

"In order to keep in good physical condition, every person should undergo a thorough physical examination at least once every year; better still, once every six months. This applies not only to the miner but to every member of his family as well. These periodical physical examinations should be made even if the person is apparently in good health. The physical examinations of young men by the draft boards showed that one of every three men examined was unfit for military service. The same condition of general health probably exists among the young women of the country.

"Many diseases begin without sufficient symptoms to attract attention. Tuberculosis, Bright's disease, and some diseases of the heart may progress for some time before the victim is aware of it. Thorough physical examination at regular intervals is the best means of detecting diseased conditions. Such periodic physical examinations show whether grown persons are in satisfactory physical trim, and also show the growth and the physical development of children.

"Early knowledge of a disease coming on enables the person affected to take the proper steps in the correction of diet, habits, or occupation to arrest the progress of the disease. Early treatment of tuberculosis affords a much better opportunity of checking the disease."

### Government Will Buy Coal Early

In connection with the award of the Bituminous Coal Commission the President has requested each Federal department and other Government agencies to "purchase, transport, and store at the point of consumption before July 1 of each year, or if that is not practicable, as soon thereafter as may be feasible, an estimated three months' winter supply of coal."

## Bituminous Mine Workers Will Not Strike April 2

Joint Meeting Held in New York City, March 29, Agrees Unanimously to Accept Majority Report of Commission—Men Ordered Not to Strike

ON April 1 the bituminous mine workers will begin to reap the benefits of the 27 per cent increase in wages granted them by President Wilson's Bituminous Wage Commission and will remain at work pending the adoption of a new working agreement. This was decided upon at the meeting of the bituminous operators and mine workers' representatives on March 29 at the Waldorf-Astoria Hotel, when the first session of the conference took place that will put into effect the recommendations of the report of Messrs. Robinson and Peale of the Commission, to which John P. White, former International President of the United Mine Workers of America, the third member of the commission, made a minority report.

It was also decided at Monday's conference to refer the work of the conference to a sub-committee of eight miners and eight operators, which will work out the terms of the new agreement on the basis of the Commission's finding.

The miners' representatives, numbering about one hundred, held a meeting in the morning in Bryant Hall, at which John L. Lewis, international president of the miners' union, read the award, explaining it paragraph by paragraph to the miners.

So confident was he that a temporary agreement would be reached and that the men would remain at work after April 1 that he announced early in the afternoon that orders would be sent to all locals to continue work. It also was announced that efforts would be made to secure an increase for the day laborer of \$1.25 per-day instead of \$1.00 and it was intimated that efforts would be made to make the increase 31 per cent instead of 27 per cent as granted by the award.

The sub-committee that will draft the new working agreement is composed of the following:

For the mine workers: John L. Lewis, international president; Phillip Murray, international vice-president; William Green, international secretary-treasurer; John F. Moore and G. W. Savage for the Ohio district; Robert Gibbons and William Hargest, representing western Pennsylvania; Edward Stewart and William Mitch, representing Indiana, and Ben Williams and Richard McAllister, representing the Illinois miners.

For the operators: P. H. Penna and M. L. Gould for Indiana; C. E. Maurer and Michael Gallagher, for Ohio; E. C. Searle and Herman Perry for Illinois, and J. H. Donaldson and William Henderson for western Pennsylvania.

Upon the completion of the work of the sub-committee it will make its report to a general conference of miners and operators for a ratification of the new agreement. It was decided to meet again at 10 a. m. on the morning of March 30. Following the session President Lewis sent telegrams to all union officers and locals advising them of the action taken by the conference and instructing them to continue at work after April 1.

## National Coal Association Shows That Miners Make Good Wages

Under the above caption there appeared in *Coal Age* of March 18, 1920, a series of three tables showing the earnings of miners in various fields and deductions made for smithing and explosives. The tables following are continuations of those above referred to and show mine workers' earnings in additional coal fields. Table I in this issue is a continuation of Table III in the issue of March 18 and Table III here presented is a continuation of Table II previously published.

It will be observed here, as in the previous issue, that the miners that worked reliably not only received greater remuneration per month but also bigger wages per day than those that worked with irregularity. In mining as elsewhere punctuality pays.

### Table I. Earnings of Steady Miners

AS REPORTED BY THE OPERATORS OF BITUMINOUS COAL MINES IN VARIOUS FIELDS OF MEN WHO WORKED THE FULL NUMBER OF DAYS THE MINES LOADED COAL, AND ONE DAY LESS, IN THE TEN MONTHS, JANUARY TO OCTOBER, 1919

a Less than one.

\*As reported by 18 bituminous operators whose reports did not cover the full 10 months, January to October, 1919.

†As reported by 36 bituminous operators whose reports covered the full 10 months, January to October, 1919.

**Table II. Earnings of Mine Labor Based on Occupation and Willingness To Work**

AS REPORTED BY OPERATORS OF BITUMINOUS COAL MINES IN VARIOUS FIELDS DURING THE TEN MONTHS, JANUARY TO OCTOBER, 1919

The number of calendar days each mine loaded coal is taken as 100 per cent opportunity for labor to work. Table shows average earning of men in various fields per day per month working specified percentage of full opportunity. In some cases as noted in the last column of the table some men worked more days than the mine loaded coal into the railroad cars.

Occupations	Less than 25 per cent	25 to 49 per cent	50 to 74 per cent	75 to 100 per cent	More Days Than Mine

# FOREIGN MARKETS AND EXPORT NEWS

## Export Coal Chartering Is More Active

W. W. Battle & Co.'s coal trade freight report of March 15, 1920, states that export coal chartering was very much more active during the past week than in the recent past, and numerous boats were chartered for many of the destinations named below at or about rates quoted.

These charters vary as to conditions, some of them being subject license; some, laydays to commence when vessel is in berth; some, laydays to commence 48 hours after vessel is ready at loading port, permit or no permit; and others, laydays to commence 96 hours after vessel is ready at loading port, permit or no permit. The more favorable conditions the shippers are willing to grant, the lower freight rate they can secure.

The Shipping Board has discontinued freight rates to European and South American ports, but is still quoting freight rates as mentioned below to West Indian ports. The quotations to other destinations are rates now current.

## Belgian Industries Show Remarkable Revival

An investigation conducted jointly by the Administration of Mines and the Labor Inspection Service of the status of the unemployment and of the extent to which various Belgian industries had recovered in December, 1919, indicate the remarkable industrial revival already commented upon by all recent visitors to Belgium. Trade Commissioner C. E. Herring, Brussels, reports. The effect of the general introduction of the eight-hour day and of the large amount of

work necessary to restore plants and mechanical equipment in some industries is shown by the following figures:

In December, 1919, the coal mines produced 91 per cent of the 1913 output, although labor employed amounted to 104 per cent of the pre-war figure. Coking plants were producing 37 per cent of the pre-war output while employing 53 per cent of their 1913 personnel. Plants for making briquets for the railways and other industrial uses attained 98 per cent of the pre-war production, with an increase of 9 per cent over the pre-war labor force.

According to the finding of the Administration of Mines, 115 establishments, including coal mines, coke and metallurgical plants, and quarries of various kinds, gave war destruction as the chief reason for subnormal production, 80 plants specifying lack of transportation facilities, 52 lack of adequate coal, 49 labor shortage, 30 reduction of working day, 23 lack of raw materials other than fuel, and 33 (all quarries) lack of orders.

## Exports and Imports of Coal During January

In January of this year exports and imports of coal, as reported by the Department of Commerce, show marked changes in bituminous as compared with the same month of last year. Anthracite, however, shows less striking variations.

Exports of bituminous totalled 1,249,167 tons compared with 1,207,634 in 1919, while the amount of anthracite exported was 306,069 tons, over 62,000 tons less than during the first month of the preceding year. Total imports of bituminous were 110,258 tons, an increase of nearly 38,000 tons, while 7,404 tons of anthracite were imported, compared with 7,269 tons a year ago.

The figures in detail for January, 1919, as finally revised, are as follows:

EXPORTS (IN TONS)		
	Jan. 1919	Jan. 1920

## Shipbuilding in Canada Shows 90 Per Cent Growth in Five Years

According to the Journal of Commerce, Canada's shipbuilding industry now employs about 25,000 men and approximately another 25,000 are engaged in the manufacture of marine equipment and supplies, Consul General John G. Foster, Ottawa, states. It is asserted by the same authority that the industry represents an investment of about \$50,000,000 of capital, and that more than 90 per cent of this progress has been achieved within the last four or five years.

The Dominion Government has already appropriated about \$70,000,000 for shipbuilding and some further appropriations are said to be under consideration. There is discussion of the expediency of giving out contracts for steel freighters and passenger ships for the National Merchant

Marine, to be bonused on the basis of \$10 per ton for all steel ships built in Canada that conform to certain standards of construction. The Government also has offered to aid wooden shipbuilding in British Columbia by loaning 75 per cent of the capital cost of vessels built there.

During the first three or four years of the war and up to May, 1918, contracts were given out by the Imperial Munitions Board for 42 steel steamships aggregating 207,800 tons dead weight and 46 wooden steamships aggregating 129,360 tons dead weight. All of these ships have been launched, completed and delivered to the British Government.

In March, 1918, the Dominion Minister of Marine inaugurated the Canadian National Merchant Marine. The first contract was given to the Canadian Vickers (Ltd.) for a 4,300 dead-weight steel freighter. Since then the Government has given out contracts for 58 ships of 343,100 tons, 23 of which have been launched and the greater part of the remainder completed and delivered. The Minister of Marine recently announced that the Government planned to build some combined passenger and freight boats of 15,000 tons gross. It is also stated that many of the leading Canadian shipyards have executed orders from France, Norway, Greece, Australia, Belgium, and other countries.

The Dominion Iron & Steel Co. has made arrangements for rolling ships' steel and for this purpose has erected a mill at Sydney, Nova Scotia. They have contracted to supply 50,000 tons of ships' steel annually for a period of five years. The plant will be in operation the early part of this year.

## French Industries Are Crippled by Ruhr Crisis

French industries are suffering acutely because of the curtailment of coal supplies from the Ruhr district of Germany. The cessation of shipments from the Rhine Valley due to Spartacist activities, in fact, is literally starving France's manufactures.

This disordered industrial situation seriously is understood to have impelled the Allies to agree to the proposal of the Ebert government that it be permitted to settle the problem in the Ruhr Valley with a German military force.

The French government would have preferred inter-Allied action in the occupied zone, while the British and the Italians favored granting permission for operations by the German army. The French gave way on this point in view of the acuteness of the fuel situation in France and the dependence of that country on supplies of coal from the Ruhr district.

The annual coal requirement of France is 65,000,000 tons, and official figures place the amount that must come from the Ruhr district at 2,000,000 tons monthly. French coal production has decreased from the old figure of 40,000,000 tons to an average of about 18,000,000 tons yearly. By the terms of the Treaty of Versailles Germany is bound to cover the deficiency up to a total of 20,000,000 tons a year. She has never approached that rate of deliveries, however.

English coal, which has been received at the rate of 1,250,000 tons a month, now costs 450 francs a ton wholesale. Belgium is furnishing coal at the rate of 3,000,000 tons a year. With the German deliveries reduced to about 150,000 tons a month the fuel deficit of France is now about 25,000,000 tons.

The experiment of procuring coal from the United States was tried by France, but proved unsuccessful because of the high freight charges and the high rate of exchange. On the restoration of order in the Ruhr Valley, therefore, depends largely the continuation of the French industries. Without a continuous and growing supply of fuel from that source they will be greatly hampered.

# COAL AND COKE NEWS

## Scranton, Pa.

### Governor Sproul at Mine-Cave Zone— Chief of Mines Also Takes a Hand— —Tax on Coal to Settle Damages

Pennsylvania's chief executive and the Chief of the State Department of Mines were in Scranton in the early part of the third week of March, looking into the mine-cave situation. This support to Mayor Connell, for such it proved to be, judging from opinions expressed by the state officials, gave the matter more dignified tone. Governor William C. Sproul made a tour of the mine-cave zone in West Scranton and later attended a conference at which were present Mayor Connell of Scranton, Chief of Mines Button, local district mine inspectors and other interested parties. It is needless to say that any interest that Governor Sproul manifests in the mine-cave problem, will appeal strongly to those having in mind an early and definite solution of a menace of such long standing.

The sentiments expressed by the governor indorsing the action of the mayor in exercising the police power and the Davis law provisions, are heartening. The presence of the state Department of Mines is also encouraging, as it is claimed that mine laws have been violated in the case of the Oxford colliery. Furthermore, the matter is said to be beyond the province of district mine inspectors.

While on his tour of inspection, Governor Sproul gave frequent expression to his opinion about conditions in the Mine-cave area, stating that some remedial action must be taken at once. The governor is quoted as saying that "We have got to go through with the taxation proposition to solve this matter. I think it can be done now. The new constitution is being prepared and a greater tax can be put on coal."

#### How to Solve Mine-Cave Problem

Mayor Connell considers that the question of taxation on anthracite, through the proposed new state constitution, will ultimately solve the mine-cave peril; but such legislation will take too long to be put into effect, and something else must be done at once to apply to the emergency that exists. The mayor commented on former bills, which were drafted to care for mine-cave damages by taxation, and stated that they were bitterly opposed by the bituminous operators of the state, on account of the position such a handicap would place them in, when competing with the soft coal interests of other states. Mayor Connell's final plan, it is reported, includes a commission, appointed by the state, which shall distribute the fund that will come from the larger tax on coal, in event the taxation program goes through.

Chief Seward E. Button, of the Department of Mines, was in conference with the mine inspectors of the Scranton section and requested that special attention be given the Oxford mine, where conditions should be made safe. The inspectors were further instructed to ascertain all the facts at the Oxford and to make a complete report to the Department of Mines. In the event that mining laws are being violated, action will be taken by the state authorities having this matter in hand.

Progress is also expected to be made in settlement of the mine-cave question, when the coal corporation representatives meet the conference committee on mine-caves, which is scheduled to take place about the time this issue of *Coal Age* appears. It is said that the corporation representatives, who will meet in conference, will probably be the men who negotiated the present agreement. This has proved unsatisfactory and a broadening of the agreement is hoped for. During the last few months, the provisions of this agreement have been discussed at conferences, and submitted in their changed state to local operating

heads of the mining corporations. The latter discussed the matter and again turned it over to the executives in New York. Representatives of these executive heads are now to meet with the Scranton conference committee to arrange an amicable settlement.

## Charleston, W. Va.

### Tonnage Declines—Dearth of Cars— Coal at Tidewater Confiscated—Kanawha Output 40 Per Cent—New River Coal Goes to Tide

Less coal was mined on the line of the Chesapeake & Ohio, in that part of the state around Charleston, during the weekly period ended March 20, than during the preceding week, the decline in the tonnage being due to a somewhat more pronounced scarcity of cars, making it plain that there was little to be hoped for from a transportation standpoint, even under private ownership, until more equipment is provided. In addition to the quite acute car shortage (in one field at least), a slide seriously retarded the shipping of coal, preventing at the same time the distribution of cars to the field affected.

On the entire Chesapeake & Ohio system, in fact, there seemed to be a dearth of cars, the shortage being apparent at the opening of the week, when only 132,000 tons were handled, the supply on Monday equaling about 70 per cent of requirements. With only 1,500 cars on the Chesapeake & Ohio for distribution to all its mines on Tuesday, or about a 43 per cent supply, the output dropped to about 77,000 tons.

It was on Wednesday, however, that production reached its minimum. The output on that day fell to 57,000 tons, the run of cars for all Chesapeake & Ohio mines being about 1,200. There was a slight increase on Thursday, another decrease on Friday, and Saturday's placement was only 40 per cent of allotment for the entire Chesapeake & Ohio system.

Actual movement of such tonnage as was produced was rather encouraging, except that slides were rather frequent and that, of course, held back traffic, especially that to the East. Much of the coal produced in this section was consigned to tidewater. A quite considerable tonnage in fact was being assembled at tidewater for export, yet despite the fact that boats were held for such coal, it was being confiscated and diverted in wholesale quantities under very aggravating circumstances to say the least. Indeed, operators saw little difference in the confiscation of coal, whether under private or Government control of the railroads.

#### Prices and Wages Hold up Contracts

In the negotiating of coal contracts for the new year in this part of West Virginia, producers found conditions such as to make it impossible for them to make any headway. So long as Governmental regulations concerning prices remained in effect, contract making was halted; although another factor in the contract situation has been the uncertainty as to just what may develop in regard to the wage question. At no time in the recent history of the coal industry of West Virginia had so few contracts been made as was the case when the new coal year was ushered in on April 1.

Price restrictions and a shortage of cars, as the coal year was brought to a close, were such as to make mining in this area of the state highly unprofitable, despite the fact that there was an unusually heavy demand. The prediction was being made that unless the situation, as it now stands, underwent some improvement soon, it would result in a serious curtailment of operations at many mines.

#### Grievances of Kanawha Field

Not so much Kanawha coal was mined in the week ended March 20 as was produced in the preceding week. The only factor responsible for the decrease was a

growth in the car shortage. It had reached more serious dimensions at the very outset of the week, than usual. The best the mines were able to do on Monday was 26,000 tons, having received only a 70 per cent car supply on that day. However, on Saturday the supply had slumped to 193 cars, or 26.9 per cent of allotment. The average quota of cars furnished Kanawha mines for the week, it is believed, was not much over 40 per cent.

The movement of Kanawha coal was free enough up to a certain point. In other words, embargoes imposed no barriers but confiscations and diversions served the same purpose, confiscation being most marked at tidewater piers, to which there was quite a large tonnage shipped. But confiscation at tide was rather ruthless, it was reported, and consequently shippers were inclined to believe that little coal was finding its way onto boats for foreign ports.

#### New River Export Coal not Exported

Operations in the New River field, during the third week of the month, were on a smaller scale than was observed in the preceding week, the complaint at all mines being a shortage of cars. It is questionable if mines were able, on an average, to work as much as three full days. Averaging the supply of equipment for the week, it hovered right around the 45 per cent mark.

Most of the product of the New River field was consigned to tidewater for the coastwise trade. Some of the product was being shipped for export. Not all of the export coal was exported, however. In common with the product of other fields it was being confiscated. Between such confiscation and continued price restrictions, New River producers were being reduced to rather straitened circumstances. That they proposed to fight continued Government control was evident on every hand. The perpetuation of such control had effectually brought the contract business for the new coal year to a standstill.

## Bluefield, W. Va.

### Removal of Government Price Control— —Serious Norfolk & Western Problem— —Tug River Loading Increases— —Pocahontas Decreases

Just at a time when operators in the smokeless fields of West Virginia had about reached the limit of financial endurance, under Government prices, relief came in the removal of all restrictions concerning such prices, it having become apparent, through court action instituted during the third week of the month, that smokeless producers were becoming desperate. Quite a large factor in making it impossible to even produce coal at the price fixed by the Government was the car shortage and the resulting irregularity in operation, the shortage being at quite an acute stage in southern West Virginia during the third week of March.

Production losses were just about offsetting the output. In other words, mines in general were being operated to just about half of capacity, or three whole days during the weekly working period. To aggravate the car shortage somewhat, there were frequent interruptions to traffic, slides, derailments, and so on, preventing prompt movement of coal and also affecting the car supply to some extent.

Carriers were confronted with a serious transportation condition. Equipment belonging to the Norfolk & Western is still on other lines; as a matter of fact this road is seriously deficient in equipment. Under such circumstances this carrier has been forced to go the rounds in supplying various fields, giving one field an adequate supply one week, and supplying another field the next week.

Not only was the inability of southern West Virginia mines to work with any de-

gree of regularity enhancing the cost of production, but it was also demoralizing the labor situation, since miners are earning scarcely enough to make both ends meet.

With the average company mining coal and receiving a price less than cost, financial conditions among the operators in the extreme southern part of the state (as the month drew to a close) were such that numerous suspensions of operations seemed imminent, unless some action was taken to relieve the situation. Operators were desperate, the new coal year was almost upon them and they were unable to complete new contracts. Consumers of smokeless coal were also suffering from such conditions.

#### Coal Shipped to Tide Diverted

To make matters still worse, most of the coal shipped to tidewater was not being allowed to be exported, but was being taken over by the Tidewater Coal Exchange and diverted; this caused further confusion and financial embarrassment, owing to the delay usual in securing settlement for confiscated coal.

The Taft opinion has strengthened the determination of producers to go into the courts to secure relief, when the President revoked all orders governing the price of coal and removed the industry largely from government control. Following the President's decision, the opinion was expressed that conditions would undergo rapid improvement and that there would possibly be a material increase in exports and an advance in prices sufficient to yield a fair return. However, much will depend upon what carriers are able to do in furnishing the necessary transportation facilities.

#### Pocahontas and Tug River Situation

Coal loading in the Tug River field during the week ended March 20, reached a total of 81,000 net tons, an excess of loading for any similar period since last December. However, conditions were much better in the Tug River than in adjoining fields. While there has been a steady decrease in production in the Pocahontas field since the first of the month, the contrary is true as to the Tug River field, where there has been a steady increase. The report from the Tug River field is that empties are becoming somewhat more plentiful on the Norfolk & Western. Word was received in the Tug River field on the twenty-third, advising that President Wilson had issued a proclamation suspending all price restrictions and orders respecting coal, except as to the Tidewater Coal Exchange, which controls export business and which will continue to function. For the first time in many months, Tug River operators begin to look ahead hopefully. The comment in this river region on the President's order was that though tardy it would create deep satisfaction.

A car shortage was still checking production to quite a material extent in the Wind-ing Gulf region during the week ended the twentieth, although there had been a slight improvement at least as to the run of cars on the Virginian Ry. Mines on that road were able to work between four and five days during the week.

On the Chesapeake & Ohio, however, the supply was hardly equal to 50 per cent of requirements. The supply in the district as a whole, moreover, was such during the week that a strong committee of operators had been delegated to go to Washington with a view to seeing if a better car supply could not be obtained in the future, mines being seriously crippled in operation through the shortage of empties.

#### Huntington, W. Va.

##### Logan Output Lowest Since the Strike—No Cars—No Promise of Improvement at New York Conference

At no time during the last year have the mines of the Logan field labored under more serious handicaps than they did in the week ended March 20, production during that period reaching the lowest point in many a month. Certainly at no time since the end of the strike has production been so low and has there been so much to contend against at the mine and on the railroad.

Mining was crippled during a part of the week by a power shortage which affected operations on Coal River. However, it was principally because of lack of adequate coal-carrying equipment that the output was so slim. With the production reaching only 151,000 tons, there was a decrease of 12,000 tons.

As a matter of fact cars were so scarce during most of the week that loadings amounted to only 37 per cent of capacity.

That meant a total production loss, of course, of 63 per cent, such losses heretofore having averaged from 50 to 55 per cent at the most. Because of the shortage of cars it is estimated that the loss from that source alone was in the neighborhood of 225,000 tons.

It became evident at the very outset of the week, when only 44,000 tons were loaded, that this period was to be one of small production. The worst fears of operators were realized by Wednesday, however, when with only 122 cars supplied the mines, production dropped to 6,100 tons or about a 12 per cent production.

Not all the coal which was shipped was finding its way to the original destination, to which it had been consigned, for a large tonnage was confiscated during the course of the week, principally after it had reached tidewater. In fact one case had come to light of a large company which had shipped 2,000 cars of coal to tidewater for export, even having vessels waiting for such coal. That made little difference, however, for the bulk of such coal was confiscated and diverted to the New England trade. So far it has not been established as to who will be called upon to pay the demurrage, arising from the fact that vessels were held awaiting the arrival of such coal at tide.

Because of the reasons just set forth, a very small portion of the Logan output shipped to tidewater was actually exported. Up until the twentieth of the month, scarcely any contracts had been entered into for the coming year, and owing to continued price control, Logan operators were finding it difficult to make ends meet.

With price control removed on the twenty-third, however, it is believed that conditions will be somewhat improved in the Guyan Valley. Although so far producers of that field have been able to secure no definite promises of any improvement in transportation facilities from the Chesapeake & Ohio, even though a conference was held with the directors of that road in New York on the eighteenth and nineteenth.

#### Fairmont, W. Va.

##### Little Work at the Mines—No Cars—Few New Contracts Made—Who Pays Demurrage in Export Tangle

Conditions in all northern West Virginia fields during the third week of March were more non-conducive to a large production than in earlier weeks of the month, lack of adequate transportation being the principal obstacle to a larger output, although other causes, to a limited extent, were also responsible for the decrease in production as compared with the previous week.

Taking the week by and large, aside from Monday and Tuesday, northern West Virginia mines were forced to accept a supply of empties which limited the output to about 35 per cent of potential capacity. The movement of empties on the Baltimore & Ohio was affected to some extent by a slide, curtailing operations at fourteen different mines, on Monday, the fifteenth.

By a peculiar coincidence, a derailment on the Monongahela Ry. on the same day, blocked coal traffic for virtually the entire day and prevented the distribution of empties to mines on that road to a large extent. The supply of empties on the Western Maryland, as well as on other roads, was greatly restricted throughout the week, so that curtailment of output, by reason of a scarcity of cars, was quite general throughout the entire northern part of the state.

The acute shortage of cars on the Monongahela R.R., throughout the week ended March 20, was generally attributed by operators to the failure of the Pennsylvania R.R. to turn over to the Monongahela the number of cars to which the latter road was entitled; while on the other hand, the Pittsburgh & Lake Erie was apparently furnishing the Monongahela road with an equitable proportion of cars. The Monongahela R.R. is owned jointly by the Pennsylvania and the Pittsburgh & Lake Erie railroads.

Efforts were made during the week, by northern West Virginia operators, to keep the Baltimore & Ohio supplied with fuel under a pro-rata arrangement, that road having found it difficult to secure enough fuel to meet all its needs. While it was possible, during the early part of the week, to furnish railroads a fairly large tonnage, the drop in the car supply during the last half of the weekly working period cut down the railroad tonnage quite materially.

##### Difficult for Railroads to Make Fuel Contracts

Railroads are now sending their representatives into the coal fields of northern West Virginia to place contracts for the new

coal year; but the railroads are experiencing a good deal of difficulty in making contracts, owing to the treatment accorded the operators in previous years, and especially in view of the negligence of certain railroads in the matter of payment for coal diverted to them. However, producers realize that the railroads must have fuel, and are disposed to be fair but are in no hurry to tie up their output until the price situation is clarified.

Wholesale diversion of coal at tidewater intended for export, and for which boats were waiting, has thoroughly provoked northern West Virginia operators; it has raised an interesting question, as to who is going to pay the demurrage on the boats held for such coal. Most of the coal diverted was sent to New England, and operators were beginning to grow somewhat skeptical as to the necessity of sending so much coal to New England points.

Little tonnage from northern West Virginia points was being exported, because most of such export coal was being seized, and operators were not hopeful of a resumption of export business on a large scale until the yoke of Government regulation is thrown off. In that connection, northern West Virginia operators have adopted a resolution urging the repeal of the Lever act.

#### Norton, Va.

##### Serious Virginia Coal Confiscation—Operators Up in Arms—Hope to Increase Exports

The confiscation of coal in the Virginia fields, during the week ended March 20, was even more serious than it had been in previous weeks. Of the total amount of coal shipped, no less than 70 per cent was being confiscated, leaving only 30 per cent for commercial consumption, or approximately 38,220 tons. Those figures were based on the fact that there was a commercial mine production of only 127,400 tons during the week.

Through a car shortage alone in the same period the production of 44,000 tons was lost, that being a 27 per cent loss. In addition to the tonnage for which there were cars, 29,000 tons were mined for coke manufacture. Taking the field as a whole, the car supply did not equal more than 30 per cent of allotment.

Operators were up in arms over the confiscation of their output, for which they felt there was no justification; the operators also considered that the railroads were not within their legal right in taking such coal. Should confiscation continue, in view of the fact that the President has rescinded all regulations governing the price and distribution of coal, it is believed that those responsible for any further confiscation will be held to a strict legal accountability.

In view of the fact that the President holds that the emergency no longer exists, under which the Government or those representing it can appropriate coal and divert it, it is believed that export shipments from the Virginia fields will be materially increased, and that there will be no further delay in consummating contracts for the output of the Virginia fields for the coming year.

#### Ashland, Ky.

##### Small Output in Northeast Kentucky—Railroad-Fuel Mines Favored—Old Vicious Practice

The situation generally in the northeastern Kentucky field, during the week ended March 20, was described as one of the worst since last November, when strike conditions were responsible for a greatly reduced production. The output during the third week of the month reached only 106,185 tons or 42 per cent of capacity, while on the other hand the total loss was 148,180 tons or 58 per cent of capacity. Virtually all of such loss, or 144,225 tons, equivalent to 56 per cent, was due to a car shortage.

The output during the period above stated represented a decline in production, as compared with the previous week, of 15 per cent; it was less than the output for the corresponding week of last year, when the production was 112,000 tons. This was a time when many of the northeastern Kentucky mines were closed down entirely, and others working on part time on account of poor markets.

While both the Chesapeake & Ohio and the Louisville & Nashville railroads showed

a marked falling off in the car supply, the mines on the latter railroad were particularly affected, as they did not average more than a two-day run for the week.

In the face of the poor service on the part of the Chesapeake & Ohio, operators report that that road had attempted before and did attempt again, during the third week of the month, to return to the vicious practice of the use of assigned cars for mines, in the northeastern Kentucky district, supplying the road with fuel.

Until numerous slides, resulting from heavy rains throughout the past week, interfered with transportation conditions, railroad-fuel mines were being given cars in excess of their daily allotment, with the result that empty cars were constantly standing behind such tipples at the day's close.

It is stated that such cars could have been utilized to excellent advantage by other mines, which were able to work only about half time owing to the dearth of cars. Formal complaint was made to the proper authorities at Washington, with the hope of securing an immediate stoppage of the assigned-car practice.

The operators in the district, it was said, familiar with the new transportation act, in which the assigned-car practice is forbidden, were surprised to find the Chesapeake & Ohio attempting to violate the law. Furthermore, the operators expressed the opinion that there was every reason to expect that the Chesapeake & Ohio management would be severely criticized by the Interstate Commerce Commission for its defiant attitude.

A delegation of the more conservative operators of the field left for Washington on the twenty-second to attend a meeting of the board of directors of the National Coal Association to discuss several quite important questions relative to the constitutionality of the Lever Act as applied to present-day conditions.

## Victoria, B. C.

### Settlers' Rights Act Again Considered— Minister of Mines Active in Matter —Situation Reviewed

For the third time since the present Government of British Columbia came into power, an effort is being made to obtain for the settlers within the Esquimalt & Nanaimo Ky. belt, on Vancouver Island, the right to advance evidence to prove the validity of their claims to the coal deposits within the limits of their homesteads.

"An Act to Amend the Vancouver Settlers' Rights Act 1904" has been presented to the Legislative Assembly by Hon. William Sloan, Minister of Mines. It proposes giving the settlers twelve months from the date of the coming into force of the act to apply for and obtain a hearing on their claims. If they are able to prove the justice of their claims, Provincial Licenses to the coal rights will be issued.

This is as much as the Provincial Government can do. Their Acts of 1917 and 1919, both of the same character, were disallowed by the Dominion Government; notwithstanding that they differ in no particular from the legislation of 1904, passed by a former Provincial Government and sustained on appeal by the Privy Council of the Empire.

The Act of 1917, however, was not declared invalid by the Federal authorities, until after the lapse of almost the entire twelve months allowed the Department of Justice for the consideration of enactments of the Provinces. In that interval several Provincial coal licenses were issued to settlers, with the result that one of the largest coal industries of Vancouver Island, namely that of the Granby company at Cassidy's, is in operation. This company acquired some of these licenses, which carried considerable areas of coal lands, and in their development, the installation of necessary plant, etc., made necessary investments running into millions of dollars.

The legislation of 1919, however, never took a place among the statutes of British Columbia, the Lieutenant Governor withholding his signature. Finally, shortly after the opening of the present session, announcement of its disallowance was received by Premier Oliver, from Ottawa.

It appears to be conceded that the Hon. William Sloan's action, in asking the Legislature to re-enact the measure, will receive the endorsement of the House. The hope is expressed that the Dominion Government will be persuaded to reconsider the policy heretofore adopted. In this case it is recognized that the Government is determined to maintain its legislative rights, as set out under the British North America Act; also it is appreciated that it is the

Government's intention to continue the effort for the establishment of the just claims of the settlers within the railway belt.

## WEST VIRGINIA

**Williamson**—Fire completely destroyed the large tipple and washery of the Howard Collieries Co., near this city, on the night of March 17, entailing quite a heavy loss. The fire was first discovered in the roof of the tipple. The blaze had gained such headway, however, when discovered, that the structure burned rapidly. A make-shift tipple was constructed the day following the fire and only about a week's work was lost. The company will erect another tipple without delay, installing machinery.

**Keyser**—A reorganization of the old Upper Potomac Coal Operators' Association, which ceased to exist several months ago, was effected at a meeting held at Cumberland, Md., on March 19. The new organization is known as the Upper Potomac Coal Association operators of the Upper Potomac field on the line of the Western Maryland Ry. composing the new organization. The roster of officers elected is as follows: President, T. M. Dodson, Bethlehem, Pa.; vice president, James A. Brown, Frostburg, Md.; treasurer, Howard P. Bridon, of Cumberland, Md.; executive secretary, Daniel M. Carl, of Bethlehem, Pa., formerly of Cumberland.

**Fairmont**—Officers and directors for another year were chosen at the annual meeting of the Consolidation Coal Co., held in Baltimore on March 17. C. W. Watson again being chosen as the head of the company. In addition to Mr. Watson, the following officers were elected: Vice presidents—Frank R. Lyon, S. D. Camden, Arthur Hale, F. W. Wilshire, W. L. Andrews and E. M. Moncourt; general auditor, A. K. Bowles; secretary, T. K. Stuart; treasurer, S. L. Watson; assistant treasurers—H. H. Snoderly, T. K. Stuart, Walten Miller and D. P. Cary. According to the report of the president, the company at the end of the year had a net surplus available for dividends of \$3,207,422. Gross earnings of the company were \$23,507,556.64. The profit and loss account and special surplus on Dec. 31, 1919, was \$56,923,729. The following are the directors: H. Crawford Black, Starr J. Murphy, Geo. C. Jenkins, Van Lear Black, S. Davies Warfield, Brooks Fleming, Jr., Frank Altshul, Samuel McRoberts, A. W. Calloway and Geo. T. Watson.

**Charleston**—Accidents in West Virginia mines during February resulted fatally in 22 instances, according to figures compiled by the West Virginia Department of Mines. Ten deaths out of the 22 followed falls of roof and slate. One death was due to a mine-car accident, two to motor accidents and one to electrical shock. Three miners were killed, however, in an explosion of local gas, there being in all 18 deaths inside the mines, including a death caused by a premature explosion. Of the four other fatalities, three were caused by mine cars. Nearly one-third of the mine fatalities were in McDowell County, there being seven in that county; Kanawha and Marion counties coming next with three deaths. In the counties of Boone, Fayette and Logan, there were two deaths each. In the counties of Harrison, Mercer and Ohio, there was one death each.

No definite plans were evolved at a conference between the coal operators of Kentucky and West Virginia and the directors of the Chesapeake & Ohio R.R., held in New York on March 18. At this conference the directors were requested to authorize the expenditure of approximately \$50,000,000 upon equipment and the extension of facilities for handling the vast tonnage of the coal fields along the Chesapeake & Ohio. While the railroad directors professed a desire to co-operate with the coal men in aiding in the development of the industry; nevertheless, it was stated that funds were not now available for undertaking improvements on such a scale as had been suggested. It was indicated, however, that the road would probably make arrangements at an early date for additional equipment in order to try to relieve the car shortage. Another conference is scheduled to be held in April.

## ALABAMA

**Birmingham**—Fire of unknown origin destroyed the commissary of the Tennessee Coal, Iron & R.R. Co., at Ishkooda, with an estimated loss of approximately \$100,000. Owing to lack of water supply, little could be done to fight the flames and the building was burned to the ground with total loss.

Officials in Birmingham coal industries are taking the initiative in meeting the coal-car shortage by the purchase

of cars on their own account to meet their individual needs. The industries propose to supply their own cars and pay the railroad companies a revenue for the hauling, thus relieving the situation to a considerable degree. Morris W. Bush, president of the Birmingham By-Product Co., Shelby Iron Co., Coosa Pipe & Foundry Co. and the Majestic Coal Co., is the first to adopt this plan to make sure of keeping his mines as well as his byproduct plants going. He has just purchased steel hopper-bottom, self-cleaning coke cars from the Delaware, Lackawanna & Western company, which will be immediately put into service between the Majestic and Bradford coal mines and his new byproduct plant near Birmingham. Railroad officials in this city have commented on this step as going far in relieving an acute situation in the Birmingham district and expressed the hope that other heads of industries would follow Mr. Bush's example.

The big byproduct plant of the Sloss-Shellfield Steel & Iron Co., at North Birmingham, representing a cost of some \$1,000,000 to \$5,000,000, is nearing completion, and the drying-out process will begin in a few weeks. The construction of power transmission lines and sub-stations and the installation of electrical equipment at the mines of the company and at the power plant at North Birmingham is also practically finished. When the byproduct plant begins operations, electric power will supplant steam at all mines of the company in the district.

## OHIO

**Crooksville**—The machine shop, tool house and blacksmith shop of the San Toy (Sunday Creek) Coal Co. at San Toy, Perry County, was totally destroyed by fire recently. The blaze originated in the blacksmith shop, presumably from sparks from an anvil. The loss will total many thousands of dollars. A large quantity of valuable machinery was destroyed, which it will be difficult to replace.

**Columbus**—Following an inspection trip of President George W. Stevens, of the Chesapeake & Ohio R.R., which controls the Hocking Valley Ry., announcement was made by M. S. Connors, general manager, as follows: The work of double tracking between Columbus and Toledo, which was stopped by the war, will be resumed at once and pushed to completion. The first work will be done on sections between Marion and Morral and between Meredith and Prospect.

**Columbus**—There is said to be considerable doubt if the plan of the the Ohio Mining Department to establish five mine-rescue stations in the mining fields of Ohio can be carried out. The Ohio Legislature adjourned recently without making the necessary appropriation for the stations; now interested parties, including State Mine Inspector Watson, are working to have the State Emergency Board provide sufficient money to start the sub-stations. It was proposed to establish two of the stations in the eastern Ohio field, one in the Hocking Valley, one in the Pomerooy Bend field and one in the Cambridge field.

Plans are being made for holding the annual convention of the Michigan-Ohio-Indiana Coal Association some time in June, the exact date to be announced later. The board of directors and Secretary B. F. Nigh, of Columbus, have been in communication by letter to set a time and place for the meeting. The 1919 convention was not held because of the unsettled condition of the trade. Members are looking forward to a most interesting convention this year, and Secretary Nigh has already started on the preparation of the program.

## INDIANA

**Princeton**—The Royal coal mine, at Francisco, east of this place, was unsealed recently after air tests had shown but 12 per cent of oxygen. Both exhaust fans are working and it is believed that there will be no difficulty about placing the mine in operation shortly. The mine was sealed the latter part of January, when a windy shot, which killed Moron Wall, a shotfirer, set fire to the shaft.

## ILLINOIS

**Benton**—There is a rumor in Franklin County that Jesse Diamond, a large coal operator and the Southern Gem Coal Corporation (the latter operating several mines in Franklin County) are negotiating for the purchase of the Wabash, Chester & Western R.R., which recently went defunct. Mr. Diamond and the Southern Gem company own a large acreage of coal land in Jefferson and Franklin counties, and it is thought they want the road in order to give them an outlet for the product of their mines.

**Duquoin.**—A number of large coal operators in this field are urging Senator Medill McCormick to present an amendment to the income-tax law. They contend that the application of the law to coal operators is discriminatory, and a feature to which they particularly object is that affecting the liability fund. They want the law so amended as to allow companies, who carry their own liability insurance, the same latitude as those who do not. It is planned to have a number of operators go to Washington to appear before the Senate committee on income tax.

Drills are at work on a tract of land a few miles from Tamaroa in Perry County, Illinois, and a depth of 360 ft. has been reached. It is expected that a workable seam of coal will be found at a depth of between 400 and 450 ft. Options have been secured on 5,000 acres in this vicinity, and should the first test hole prove favorable, other holes will be sunk. Should the company holding the options decide to buy the coal rights, it is said it will pay the owners \$25 per acre. The Southern Gem Coal Co. is stated to be behind the parties securing the options. It is also rumored that the Chicago, Burlington & Quincy R.R. is considering a line from the Franklin County fields to St. Louis, and should this road be built, it will tap the Tamaroa field.

**Springfield.**—According to records, more than four times as many men met death in mining accidents in Sangamon County during the year ended March 1, 1919, as compared with the year ended March 1, 1920. The records show that 17 inquests were held to determine the cause of death of men injured in the mines during the year ended March 1, 1918; twelve inquests during the next year and only four during the year just closed. The decrease is said to have been due to the strenuous campaign the coroner has waged during his term of office for a strict compliance with the state mining laws and obedience to the safety rules by both mining officials and the miners.

**Sesser.**—The Old Ben Coal Corporation is preparing to erect a new wash house at its No. 16 mine at this place, in Franklin County, Illinois. The building will be of brick construction, modern in every detail and strictly sanitary. It will be commodious enough to take care of the present employees, as well as any increase in their number, which will gradually take place as development progresses.

#### COLORADO

**Purcell.**—A new coal field is said to have been discovered in Weld County, just five miles east of here on lands where a company of Eaton and Purcell capitalists have been drilling. They secured a five-year lease on 640 acres of land and started prospecting for coal. At a depth of 101 feet they struck a seam of coal four feet thick. Continuing the drilling, they went through eight in. of slate and found another seam three ft. thick. A company has been formed to develop the new coal field as soon as it is proved, tipples will be built in a short time and actual commercial mining of coal started. A spur of the Union Pacific R.R. will be built to the mines.

#### Foreign News

**Wellington, B. C.**—The Nanoose-Wellington Coal Co.'s collieries at Nanoose Bay, Vancouver Island, were inspected recently by Louis Williams, the president, and a party of the directors and shareholders, all of whom are Americans. The visit was made in order that those who are directly interested in the development of the property, might obtain a personal knowledge of what is being done and what is proposed. In view of the increasing demand for the product, the output of these collieries is to be increased to 500 tons a day. The tract includes about 4,700 acres of coal lands situated four miles northeast of Wellington; the seam under development is a part of that originally worked by the James Dunsmuir interests, as the old Wellington mine. The mine is to be electrified in order to do away with animal haulage underground. This is the only Vancouver Island coal property which can be worked with open lamps, there being no gas. A new shipping wharf has just been completed at Nanoose Bay and a permanent breakwater, 600 ft. long is under construction. The company has secured an almost unlimited amount of fresh water for domestic and commercial use, and the plant adopted for improving the housing accommodations of the employees, as well as for beautifying the surroundings, will make the conditions under which the workmen live as satisfactory as exists anywhere in this province.

#### Obituary

**Culpepper Exum**, prominent in industrial and civic affairs of Birmingham, Ala., for the past twenty-five years or more, died March 14, after an illness of several years, influenza being the immediate cause of death. Mr. Exum was president of the Crescent Coal Co. and an ex-mayor of the city.

**J. R. Hudelson**, treasurer of the Franklin Coal & Coke Co., which operates two mines at Royalton, in Franklin County, Ill., accidentally shot and killed himself recently, while at a trap-shooting contest at Royalton. In addition to being treasurer of this company, Mr. Hudelson was also general manager of the mercantile department of the concern. He resided at Royalton. Mr. Hudelson, together with his father, developed the No. 1 mine of this company, later selling to the Franklin Coal & Coke Co.

#### WILLIAM D. OWENS

William D. Owens, of West Pittston, Pa., died on March 12, of pneumonia, which developed from a complication of diseases of long standing. He was widely known as a mining man, who had worked his way up from one of the lowliest places in the mines to that of division superintendent of the Lackawanna division of the Lehigh Valley Coal Co. A reproduction of a photograph of Mr. Owens and a sketch of his life appeared in the April 28, 1917, issue of *Coal Age*. However, a brief statement, giving the main facts about his mining career, will be given here for the benefit of those who may not have seen the other account.

William D. Owens was born in Cynffig, near Pyle, South Wales, Nov. 10, 1846, and was 73 years of age at the time of his death. He began work in the mines of his native place at the age of nine years. When about 12 years old he moved to Briton Ferry, and at 18 to Gwmdare, near Aberdare, South Wales.

In 1876 he obtained a certificate as colliery manager under the British Government, and acted in this capacity at Fernhill colliery, Blaen, Rhondda. He had now gone through practically every department of mining, from door boy to manager, and had worked in bituminous, anthracite and semi-anthracite mines, with both long wall and chamber systems of mining.

In 1878, Mr. Owens landed in the United States with his family and settled in Plains, Luzerne County, Pa., where he was employed by the Lehigh Valley Coal Co. as a miner and company man. In 1884 he was made mine foreman for this company.

Mr. Owens' success with the Lehigh Valley Coal Co. is attested by his promotion in 1894 to the position of district superintendent, with headquarters in West Pittston, where he lived until the close of his life. Another promotion came to him in 1905, when he was made superintendent of the Lehigh Valley Company's Lackawanna division. He continued in this position until ill health necessitated his retirement about three years ago.

Mr. Owens was prominent in mining affairs. In 1912 he was appointed by Governor Tener a member of the State Commission to revise and codify the anthracite mine law of the State. He was a member of the North of England Institute of Mining and Mechanical Engineers, of the American Institute of Mining Engineers, and of the Northeastern Pennsylvania Society of Mining Engineers. He had often been called on to act in a consulting capacity in important mining cases. Mr. Owens gave valuable assistance on the occasion of the Twin Shaft disaster in Pittston, on June 28, 1897. He had taken an active interest in the training of choirs for over 42 years and had the honor of serving as adjudicator of music at 19 eisteddfods.

#### Coming Meetings

**National Coal Association** will hold its annual meeting May 25, 26 and 27 at the Traymore Hotel, Atlantic City, N. J. Secretary, W. B. Reed, Commercial Bank Building, Washington, D. C.

**The American Association of Engineers** will hold its annual convention at the Planters Hotel, St. Louis, Mo., May 10 and 11. C. E. Drayer, secretary, Chicago, Ill.

**National Foreign Trade Convention** to be held in San Francisco, Cal., May 12, 13, 14 and 15.

**Chicago Coal Merchants' Association** will hold its annual meeting April 13, at Chicago, Ill. Secretary, A. H. Kendall, Chicago, Ill.

**American Chemical Society** will hold its annual meeting at St. Louis, Mo., April 13, 14, 15 and 16. Secretary, Dr. Charles L. Parsons, 1709 G. St., N. W., Washington, D. C.

**National Retail Coal Merchants' Association** will hold its annual meeting June 10, 11 and 12 at Detroit, Mich. Secretary-manager, Ellery Gordon, Philadelphia, Pa.

**Kentucky Mining Institute** will hold its annual meeting June 4 and 5 at Lexington, Ky. Secretary, C. W. Strickland, Huntington, W. Va.

**American Society of Mechanical Engineers** will hold its spring meeting May 24, 25, 26 and 27 at St. Louis, Mo. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

**Chamber of Commerce of the United States of America** will hold its eighth annual meeting April 26, 27, 28 and 29 at Atlantic City, N. J. Assistant Secretary, D. A. Skinner, Washington, D. C.

**West Virginia Coal Mining Institute** will hold its annual meeting June 7 and 8, at White Sulphur Springs, W. Va. Secretary, R. E. Sherwood, Charleston, W. Va.

**American Institute of Mining and Metallurgical Engineers**, New York section, will hold its regular monthly meeting April 7 at the Machinery Club, 50 Church Street, New York City. Secretary, E. L. Gruver, 29 West 39th Street, New York City.

#### Trade Catalogs

**Giant Grip Traction Equipment for Motor Trucks.** The Challenger Co., Oshkosh, Mich. Booklet. Pp. 16; 3 1/2 x 6 in.; illustrated. Information concerning equipment of interest to truck owners and operators.

**Smooth-On Home Repairs.** Smooth-On Manufacturing Co., Jersey City, N. J. Booklet. Pp. 31; 3 1/2 x 6 in.; illustrated. An explanation of how to repair leaks in boilers, cracked water jackets, leaky radiators, etc.

**Reversing Drive for Planers, Slotters, etc.** General Electrical Co., Schenectady, N. Y. Bulletin 48,029. Pp. 14; 8 x 10 1/2 in.; illustrated. A description of a motor application to machine tools. Its various applications noted.

**American Steam Conveyors.** American Steam Conveyor Corporation, Chicago, Ill. Folder. Pp. 4; 8 1/2 x 11 in.; illustrated. A steam ash conveyor. Some 50 trade marks or trade names of concerns using the American Conveyor are shown.

**Wahl Dewaterer.** H. W. Wahl & Co., engineers, Chicago, Ill. Bulletin D-1. Pp. 19; 6 x 9 in.; illustrated. A description of a machine which elevates, drains off the water and discharges solids from the device automatically.

**Is this Sound Reasoning?** The Westinghouse, Church, Kerr & Co., Inc., 37 Wall St., New York, N. Y. Folder. Pp. 3; 6 1/2 x 9 1/2 in.; illustrated. An explanation of why the oldest organization of its kind in the country thinks its way of doing business is fairest to its clients and to itself.

**Steam Tables for Condenser Work.** The Wheeler Condenser & Engineering Co., Carteret, N. J. Pp. 32; 4 x 7 in.; illustrated. A handbook of steam tables, with pressures below atmosphere expressed in inches of mercury referred to a 30-in. barometer.

**Corona Discharge.** By Earle H. Warner with Jakob Kunz. University of Illinois Bulletin. Engineering Experiment Station, Urbana, Ill. Bulletin 114. Illustrated; pp. 138; 6 x 9 in. A theoretical consideration of certain electrical phenomena.

**Modern Mining Transportation.** Enterprise Foundry & Machine Works, Bristol, Va.—Tenn. Bulletin. Pp. 23; 6 x 9 in.; illustrated. Devoted especially to mine-car wheels; their construction is noted, also some interesting facts of importance to the user in and about mines.

**Racks.** Pp. 16; 6 x 9 in.; illustrated; metal racks for storage purposes in buildings. **Sanitary Washbowls;** pp. 8; 6 x 9 in.; illustrated; individual or in batteries. **Sanitary Drinking Fountains;** pp. 8; 6 x 9 in.; illustrated; bubbling and special fountains. **Victory Washbowls;** pp. 4; 8 1/2 x 11 1/2 in.; illustrated; sanitary washbowls in batteries.—price list on separate sheet. Made by the Manufacturing Equipment & Engineering Co., Boston, Mass.

## Industrial News

**St. Louis, Mo.**—Cosgrove & Co., of Chicago, has opened up an office at 703 Central National Bank Building. D. M. Cohen in charge. This office will take care of the business from Cosgrove & Co.'s Illinois mines that will move through the West.

**Salt Lake City.**—It was reported here recently that the Western Pacific Railroad had taken over the Utah Fuel interests from the Denver & Rio Grande road in part payment of a judgment for \$35,000,000 held by the Equitable Trust Co.

**Kenton, Pa.**—The Union Collieries Co. has awarded a contract to the J. G. Fullman Co., Pittsburgh, Pa., and inaugurated active work on the construction of a total of 30 two-story and basement dwellings for miners' service. The cost of the structures ranges from \$2,000 to \$5,000 each.

**Adrian, W. Va.**—The Buckhannon River Coal Co. has adopted plans to open another mining plant at this place, in Upshur County, and to build 150 miners' dwellings. The company is producing about 250 tons a day and is employing about 100 men. It has resumed the manufacture of coke after its ovens had been idle for about two years.

**Centralia, Wash.**—The Lincoln Coal Co. has started shipping coal from its mine at Galvin. The latest mining equipment has been installed by the company. The coal is mined from a nine-foot seam and screened over shaker screens. The officers of the Lincoln Coal Co. are T. E. Martin, president; J. O. Humbert, secretary, and M. H. Humbert, vice president.

**Shinnston, W. Va.**—Shinnston business men have organized the Hood Coal Co. with a view to the development of coal property, near that place, in the early future. The new company has an authorized capital stock of \$50,000. Instrumental in effecting a preliminary organization of the new company were: C. P. Hood, C. A. Cole, Marion Riley, F. A. Barnett and W. M. Burnett, all of Shinnston.

**Crawfish, Ky.**—The Clay County Coal Co. recently increased its capital to \$50,000, and is having plans prepared for the development of about 160 acres of coal properties in the Crawfish district. Complete equipment and machinery for all features of operation will be installed, to provide an initial capacity of about 200 tons daily. I. H. Buchanan is general manager.

**Charleston, W. Va.**—Charleston people have launched the George Creek Coal Co., with a capitalization of \$50,000, holdings of the company being in Malden district of Kanawha County. No plans for development, so far as can be learned, have been made. Actively identified with the new company are: A. G. Lovett, J. P. Bouchelle, C. P. Miller, Berkeley Minor, Jr., P. G. Jefferson, all of Charleston, W. Va.

**Fairmont, W. Va.**—A tract of 1,000 acres of coal land, 12 miles west of this city, has been purchased by C. B. Turner, of Pittsburgh, Pa., it is reported, although it has not become known yet whether the property was acquired merely as a real-estate investment, or for development. Mr. Turner has in the past, however, been successful in developing properties in Kentucky and in the southern part of West Virginia.

**Huntington, W. Va.**—It is understood that the Solvay Collieries Co. contemplates the construction of storage bins at both its Marytown, W. Va., and Big Sandy, Ky., operations. If such bins are constructed, as now seems to be probable, it will permit the mines at the points mentioned to run full shifts to take care of the available car supply and avoid the necessity of utilizing part shifts only.

**Clarksburg, W. Va.**—A large company, for the development of coal lands, in Harrison County, has been formed by prominent business men of Clarksburg as follows: Fred C. McIntyre, Olandus West, Carl L. Hornor, J. Hornor Davis and E. B. Templeman. This company has been capitalized at \$150,000. Mines are to be opened in Clark district, of Harrison County, near Clarksburg, the mines to be on what is known as the Charles B. Stout property.

**Wilkes-Barre, Pa.**—City solicitor Charles F. McIngh announced on March 7 that the recent decision of Judge J. B. Woodward, of Luzerne County, in the case of the Scranton-Pittston Coal Co. against Pittston city, in which he held that the ordinance of Pittston city, regulating coal mining within the city limits, gives Wilkes-Barre the right to take steps to prevent coal companies from causing mine caves. Wilkes-Barre council is to act accordingly.

**Columbus, Ohio**—In order to facilitate handling the growing business in California, Arizona, Nevada and the state of Sonora, Mexico, the Jeffrey Manufacturing Co., of Columbus, Ohio, has opened up a branch office in Los Angeles, Cal. This office will be in charge of F. R. Field, who has been the manager of the company's Denver office. Mr. Field is well known in this territory and has a thorough personal knowledge of the West and the requirements of its buyers.

**Princeton, W. Va.**—Work has been initiated on the new plant of the Monticello Coal Co., at Herndon, Wyoming County, W. Va., and contracts awarded for the construction of 50 dwellings for miners. The company was organized shortly before the first of the year for the purpose of mining smokeless coal at the point named, the capitalization of the company being \$400,000. The president and general manager of the company is V. M. Lee, of Princeton, W. Va.

**Morgantown, W. Va.**—Monongalia County is to be the seat of operations of the Connellsville Big Vein Coal Co., of Point Marion, Pa. However, development work may be undertaken in other counties of the state. This corporation is capitalized at \$200,000. The company will mine and sell its own coal, according to the terms of its charter. Incorporators of the new company were: J. L. Kendall, of Pittsburgh, Pa.; S. A. Kendall, of Washington, D. C.; J. L. Kendall, Jr., of Cheat Haven, Pa.; D. H. Horton, of Connellsville, Pa.; A. A. Arison, of Point Marion, Pa.

**Charleston, W. Va.**—Another new coal combination has been launched to be known as the Elk River Coal Association. It is to be composed of operators with mines on Elk River, principally in Clay and Kanawha counties. The association will have a capital stock of \$5,000. Incorporators of the new association were: C. L. Vogelsang, B. C. Barber, C. L. Hall, of Clay; A. J. Fay and John B. Hart, of Charleston. The probabilities are that the association will have its headquarters at Weston, W. Va., the division headquarters of the Coal & Coke R.R.

**Williamson, W. Va.**—There is to be no change after all in the ownership of the Red Jacket Consolidated Coal & Coke Co. and the Red Jacket, Jr., Coal Co. Nevertheless, it appears that there have been negotiations in progress for the sale of the properties named, and it was even reported on reliable authority that the Red Jacket holdings had been sold to Colonel T. E. Houston. However, officers of the company now announce that all such negotiations have been abandoned, and that the ownership will continue as heretofore. At the same time, it is also announced that it is the intention of the company to take the necessary steps immediately to greatly increase production.

**Bluefield, W. Va.**—The Co-operative Fuel Co., of this city, has been organized for the purpose of conducting a general sales business, handling the product of the mines in the Pocahontas and Tug River section as well as in Kentucky. The company will handle both coal and coke. Its capital stock has been fixed at \$25,000. Officers of the company are Geo. S. Strader, president and treasurer, and Jas. P. Cofer, vice president and secretary. Mr. Strader is a capitalist of Bluefield, having been identified with a number of mining and shipping companies, and having had a number of years experience in the selling and operating line. Vice president Cofer has for the last seven years been with the Tierney interests at Powhatan, W. Va., in the operating end of the business and has also been handling the sales for one of their mines.

**Morgantown, W. Va.**—Extensive improvements on the Morgantown & Wheeling R.R. are to be undertaken in the quite near future, or as soon as weather conditions permit. Under a new rating, just effective, mines on the Morgantown & Wheeling R.R. are entitled to 250 cars a day, equivalent to about 3,500,000 tons a year. It is stated that nearly one-half the fuel handled by the Monongahela R.R. between Fairmont, W. Va., and Brownsville, Pa., originates on the Morgantown & Wheeling. Development of territory on that road has been so rapid, it is said, as to necessitate numerous improvements and additional facilities and extensions for the handling of more tonnage.

**Huntington**—The Exeter Shaft of the Solvay Collieries Co. is, in the future, to be operated independent of the other Hemphill operations of the same company. Although work was recently suspended at the Exeter shaft, for the time being, on account of high water, it is indicated that in the near future the company will be getting out coal on a large scale at its Exeter shaft.

**Huntington, W. Va.**—For the time being at least the headquarters of the Central Coal Association, composed largely of West Virginia and Kentucky operators, will remain at Cincinnati, Ohio. The directors of the association, at a meeting held in Cincinnati during the third week of the month, decided to leave the question of the removal of the headquarters to Huntington in the hands of the members of the association as a whole. A general meeting is to be held in the near future at Huntington, at which time officers and directors will be elected and a decision made as to the future headquarters of the association.

**Chicago, Ill.**—The American Steam Conveyor Corporation, of this place, announces the appointment of the Brooks-Fisher Co., Candler Bldg., Atlanta, Ga., as the southeastern representatives of the American corporation. The Brooks-Fisher Co. is a comparatively new concern, organized to carry on a business of manufacturers, agents and contractors. Of this firm, Mr. Fisher was for 15 years in the erection department of the Babcock & Wilcox Co., the last six of which he was district superintendent for the Atlanta territory. The other member of the firm, Mr. Brooks, was assistant sales manager for the Atlanta office of the Babcock & Wilcox Co.

**New York, N. Y.**—M. F. Burns, of Burns Brothers, of New York; P. S. Peabody, of Chicago; and Harry F. Peters, of Williams & Peters, of New York, are members of the board of directors of the United States Distributing Co., of this city, recently formed to distribute essential commodities, as coal, ice, lumber and building materials. George F. Getz, president of the Globe Coal Co., of Chicago, is the president; L. J. Hunter, vice president, and Walter L. Whittlesley, secretary. The other directors are Henry J. Fuller, Mr. Getz, Harvey D. Gibson, G. M. P. Morphy, J. Ernest Richards, S. M. Schatzkin, E. V. R. Thayer, H. E. Ward and W. C. Watt. The company has \$25,000,000 authorized stock, of which \$5,000,000 has been issued.

**Huntington, W. Va.**—Further progress was made by the Chesapeake & Ohio R.R., in the movement to establish large yards at Danville, in Boone County, for handling the large coal tonnage originating in Coal River territory when (during the second week of March) negotiations for rights-of-way were completed by representatives of the company. The company plans an initial outlay of about \$1,000,000 for the establishment of a 12-track yard, the erection of a round house, repair shops, a Y. M. C. A., and other buildings. It is proposed to assemble coal produced on the Spruce and Pond forks, of Little Coal River, at Danville. By providing increased facilities for handling coal at Danville, the Chesapeake & Ohio will materially contribute to the further development of the coal territory in the Little Coal River area. West Virginia has made wonderful progress in mine development in the last 12 months.

**Clarksburg, W. Va.**—The Clarksburg Engineering Co., whose offices in the Goff Building, in this place, have been closed during the past year, on account of the absence of C. P. Collins and W. S. Bayer, was reopened on March 1. Messrs. Collins and Bayer were in the service of the Government. Mr. Collins was employed by the engineering branch of the Passenger Transportation and Housing division of the Emergency Fleet Corporation, at Washington and Philadelphia, as senior engineer in charge of designs of the sewerage and drainage for the various housing projects built to serve the employees of the merchant shipyards. Mr. Bayer entered the service of the Government as a sanitary engineer, and is still in the service as a First Lieutenant in charge of sanitation at Camp Benning, Ga. The new firm will be known as The Clarksburg Engineering Co., Inc.

**Washington, D. C.**—A suit to test the powers of the Federal Trade Commission was instituted on March 10 in the Supreme Court of the District of Columbia by the Maynard Coal Co. of Columbus, Ohio. This was the first of several legal actions planned by the National Coal Association to determine how far the commission may go in requiring private corporations to furnish information of their business. An official announcement by the association said the suits were started in a friendly spirit and in no way constitute an attack on the commission. An injunction was requested on the following three grounds: First, that the order of the commission requiring the reports exceeded the authority vested in the commission by Congress; second, that if Congress gave the commission authority to require such reports the act is unconstitutional, and third, that any power vested in the commission to require such reports was transferred to the Fuel Administration by presidential order.

## Weekly Review

*Government Price Regulation on Bituminous Coal at an End—Production Increases with Car Supply—Early Movement in Lake Trade—Export Business Shows Little Increase*

**E**FFECTIVE today (April 1) price regulation by the Government on bituminous coal is at an end. This announcement, made by the President March 19, was received favorably by operators throughout the country, for had those prices been continued together with the increase recommended by the Commission, it would have been impossible to run any mine at a profit.

Salesmen are now, or soon will be, in a position to quote prices for contract coal. It is expected that the coal which heretofore had been mined in March will this year not be mined till April and this will keep the mines working steadily, and with an improvement promised in car supply, operator, wholesaler and jobber are well satisfied.

Shipments from the anthracite mines during the past week have been light, because floods and washouts in certain sections of the country interfered with the flow of empties. It is a notable fact that hundreds of cars which left the mines in January are just reaching New England gateways, so great has been the congestion on the intervening

and originating roads. More urgent requirements have been met during the past week by means of diversions, but this practice also is at an end, for the President has taken this right away by doing away with the Fuel Administration.

With the arrival of spring and much milder weather, the ice in the Lakes has almost disappeared and there has been a slight movement of ships plying between lake ports. Shippers have been notified of increases in freight rates, but these increases have not been excessive. For example, where in 1918 the rate to the head of Lake Superior from Cleveland was 42½c. per ton, the present rate is 50c., an advance of 7½c. Some shippers had hoped that the rates for 1918 would still be maintained in 1920.

Some interest has been shown in the President's effort to stabilize the coal industry. He has directed the various Federal departments to place their orders and store coal supplies for next winter. This will assist in keeping the mines working steadily and assure the

administration of a constant supply of coal.

New contract prices for both bituminous and anthracite have not as yet been made public, but the indications are for a sharp advance. Steam sizes of anthracite are somewhat less in demand. A large tonnage of rice and barley has been moving recently, but this is likely to slope off with the coming of the new coal year.

Coke production also has shown an increase because of improved car supply. As promise of larger profits is evident, coke operators are likely to hold coke and pay demurrage until after April 1. It is thought that after that time there will be an excited market and that coke will sell at varying prices. With the removal of limitations on the byproduct industry, producing an open market, byproduct operators can bid up the price of coal considerably. The customary one-day holiday observed today, together with the usual time taken off because of Easter, will have a marked effect on this week's production.

### WEEKLY PRODUCTION

The weekly report on the production of bituminous coal, anthracite, and beehive coke, compiled by the Geological Survey, Department of the Interior, March 27, 1920, states that for the third week in succession production of soft coal has averaged 1,715,000 tons per working day. Incomplete reports from the carriers indicate a total output during the week ended March 20 (including lignite and coal coked) of 10,281,000 net tons, almost exactly the same figure as that for the preceding week. These estimates, however, are subject to revision as changes in organization attending the return of the railroads to private operation have necessarily disturbed the system of reporting.

Little change in the production of anthracite occurred during the week ended March 20. Shipments reported by the nine principal carriers—in part estimated—are placed at 31,291 carloads. On this basis the total production, including mine fuel and local sales, is estimated at 1,607,000 net tons, an increase of 4,000 tons over the preceding week.

Production per working day in January was at the rate of 280,000 tons. In February the daily rate declined to 264,000 tons, and during the first three weeks of March it has averaged about the same. The decline in February was due to the bad weather, which delayed the return of empty cars from New England and elsewhere. At present the output is being curtailed at some of the collieries by floods caused by the exceptionally heavy snows of the past win-

ter. With only a week and a half of the working year remaining, the cumulative production of the coal year 1919-20 to date is 3,976,000 tons behind its predecessor.

Production of beehive coke during the week ended March 20 is estimated at 446,000 net tons, the largest reported for any week since the last of January. This estimate is based upon telegraphic reports of coke loaded by 26 railroads which originate approximately 97 per cent of the beehive coke transported by rail. All districts except West Virginia reported an increase.

### Atlantic Seaboard

#### BOSTON

**Movement all-rail continues to improve. Shipments increase. Withdrawal of fixed prices a hopeful sign. Contracts still being made. Tidewater Coal Exchange to be discontinued. Hampton Roads despatch better.**

**Bituminous**—Spring weather has enabled the railroads very much to improve deliveries. It is a notable fact, however, that hundreds of cars that left the mines in January are just now only reaching the New England gateways, so great has been the congestion on the intervening and originating roads.

The receipt of this coal at various industrial centers has relieved many of the emergency needs, although for the next few weeks it is likely that the larger consumers

will be anxious about supply. Efforts are being made through diversion and otherwise to meet the more urgent requirements, but latterly these efforts have happily been confined to regular shippers and not to railroad channels.

Shipments from the mines the past week have continued very light. Floods and washouts interfered for a time with the flow of empties, but recently there has been a distinct improvement. The smaller originating roads, after weeks of indifferent car supply, are now getting cars in daily quotas and production should soon show an upward curve.

The President's announcement that all price restrictions would be withdrawn April 1 has been received very favorably. To have continued the present price basis would soon have meant an impossible situation, and the fact that consumers may now arrange for supply without fear of transgressing the law will go a long way to remedy the current shortage. In itself it is a hopeful sign and even though this action has been discounted for several weeks it is now fairly certain that New England's needs will now begin to be taken care of.

Most of the high-grade output of central Pennsylvania, so far as it can be spared from export and bunker trade, has now been sold and at what should be considered lucrative prices. The quality coals have sold from \$1.50 @ \$5 per gross ton, plus increases, and from those figures the medium coals have ranged down to \$2.95 @ \$3.50 per net ton, also plus increases. Naturally, in this market, the lower grades have

been little heard from, many buyers continuing their old policy of waiting to see how the market turns.

At the New York and Philadelphia piers there is still very little coal available for the open market. Pler shipments have been confined largely to contract obligations. Permits for export cargoes have been distributed closely and the aggregate tonnage has been relatively small. All efforts to continue the Tidewater Coal Exchange have come to nothing and it was announced on March 22 that, effective May 1, no coal is to be consigned to the Exchange at any of the piers.

It appears that several of the railroads after making exhaustive studies of their records are clear that the experiment has by no means proved the blessing it was claimed to be. Possible saving in switching has been offset by disadvantages and there are no tears shed either by railroads or shippers.

The Hampton Roads situation shows only gradual improvement. Car shortage, together with floods, drove output down to minimum tonnages, with expensive steamer detention in consequence. Several coastwise bottoms were held 10 to 12 days at Norfolk, with Newport News making almost as poor a showing. Average delay is now 4 to 5 days with car supply increasing gradually.

Contract prices on Pocahontas and New River have not yet been made public. Rumors that appear to be well founded are to the effect that certain of the agencies have already named \$4 per net ton as a contract basis f.o.b. mines, but as yet confirmation is lacking. At \$4.48 per gross ton it would mean \$6.54 f.o.b. vessel at Hampton Roads, or about \$9.50 alongside, Boston. Deliveries all-rail from Pennsylvania, as to price, will continue therefore to have a marked advantage in this territory.

**Anthracite**—The important news of the week is the advance on March 25 of Philadelphia & Reading Ry. barge freights on anthracite. The new rate to Boston points is \$2.10 alongside, compared with \$1.55 prevailing hitherto for several months. To points like Bangor, Me., the advance is \$1, making the revised rate \$2.80.

Taken together with the expected increase in the price of coal and in railroad tolls the new delivered costs are mounting to high figures. Yet there is no sign of any slackening demand in any direction. On the contrary, retail dealers are lining up for their season requirements very much as in other years.

Steam sizes are somewhat less in demand. Buckwheat some of the anthracite roads are confiscating in transit, presumably because of expected increases in price. A large tonnage of rice and barley has been moving recently, but this is likely to slope off with the opening of the new coal year.

**NEW YORK**

Dealers start new coal year with empty bins. Demand continues strong for all sizes. Production reduced because of flooded mines. New England wants coal and objects to retroactive agreement with miners.

**Anthracite**—Although the new coal year begins today (April 1) the month just ended has been almost on a par with the coldest month of the past winter. There was no easing up in demand, especially for the domestic coals, and dealers start the new year with their books well filled with orders while retail dealers cannot boast of full bins.

Production continues in reduced measure because of the numerous floods, causing many mines in various parts of the coal regions to remain idle while others are only able to operate on a part time basis. As a result shipments from some of the smaller mines are of a negligible amount.

More interest is being taken in the outcome of the wage conferences and consumers look for an increase in prices. The taking of orders for April delivery has been active although no one knows what the prices might be. The adoption of the resolution providing for a retroactive wage agreement to date from April 1 has made the price situation uncertain and many producers are selling coal for April delivery subject to the new prices. There are, it is said, some others who are naming prices high enough to cover any advance that might be granted the miners. In many instances dealers are so anxious to get coal that there is little hesitation over the prices to be paid.

Demand is not restricted alone to the Metropolitan district. Dealers from New England, which has been under partial embargo for some time, who are flocking here, describe conditions in those states as serious and want coal. Retail yards are said to be almost empty while consumers have little or no coal in their bins. As coal-

consuming temperatures are likely to continue for several weeks longer, the dealers point out the necessity for fuel. They, however, object to the uncertainty of the price to be paid because of the agreement of the mine owners to make the new wage scale retroactive.

**Bituminous**—The local situation has been uneasy. The removal of the Government maximum prices to take effect today (April 1) was received with considerable enthusiasm by the trade and since then breathing has been easier. While some dealers seem to be excited over what might happen under private control and when it is known just what wage increases the miners will receive as a result of the Bituminous Wage Commission's report, others are counselling moderation.

Some dealers predict that with a good demand throughout the summer, the early fall will find the market flooded with a lot of cheap priced coal. Orders are being blocked for deliveries after April 1 at prices showing a wide divergence, namely: \$3.25 to \$4.50, according to grade.

The closing of contracts is not as easy as some consumers anticipated it would be. Many operators are determined not to sign up their entire output and are not willing to take on any new business in this way. Most of them are willing to take their chances with the free coal demand. Prices vary considerable but a good range is from \$3.75@4.50 for good coals. Some of the better grades are being held at higher quotations.

Government prices prevail on all coal not shipped on contract, and are as follows:

	Mine-Run	Prepared	Slack
Central Pennsylvania.....	\$2.95	\$2.95	\$2.95
Western Pennsylvania.....	2.35	2.60	2.35
Fairmont (gas).....	2.50	2.75	2.25
Georges Creek, Upper Cumberland and Piedmont Fields.....	2.75	3.00	2.50

**PHILADELPHIA**

**Anthracite prices fixed temporarily. Old winter schedule until new wage scale is effective. Buckwheat and rice increased. Heavy demand for all prepared sizes. Premiums increase. Dealers flooded with orders. Miners to work during interim of wage parley. Bituminous price control lifts April 1.**

**Anthracite**—Late in the week, on March 26, one of the big shipping companies made a most important announcement as to prices, pending the wage negotiations with the miners, which it is expected will be carried far into April. This company announced to its customers that on all prepared sizes shipped during April the present winter circular would apply, that is, the price for egg will be \$6.35, stove \$6.60, nut \$6.70 and pea \$5.30, and these prices are not to be retroactive, despite any wage advance that might be granted the miners.

Steam trade continues very active and the increases made by the shipping companies have had no effect on the demand; as a matter of fact the independent shippers promptly advanced their steam coal prices and then exacted an even greater premium than before, as sales of buckwheat are being quoted around \$4.25. Rice is also selling at premium prices. \$3.25 being common. Barley is the one size that can be had at company circular and even below.

In this connection it is also well to state that all sales of broken coal are being made by the company at \$6.35. It will be recalled that the company had made contracts on this size last year at \$5.95, but later advanced the spot price to \$6.35 when egg coal reached that level last fall. With all broken contracts expiring on April 1 shipments of broken will be priced at \$6.35, which is virtually an increase of 40c., as little tonnage of this size was sold on the open market.

The prices in accordance with the above changes per gross to f.o.b. cars mines for line delivery and f.o.b. Port Richmond for tide are as follows:

	Line	Tide
Broken .....	\$6.35	\$6.20
Egg .....	6.35	8.20
Stove .....	6.60	8.45
Nut .....	6.70	8.55
Pea .....	5.30	6.90
Buckwheat .....	3.75 - 4.80	
Rice .....	3.00	3.90
Boiler .....	2.50	3.50
Barley .....	2.25	3.15

**Bituminous**—Of course the big factor affecting the soft-coal trade was the announcement of price removal on April 1. In a manner this action by the Government was discounted some weeks since, it would appear, by the reports of prices at which

sales have been made, until by the time of the issuance of the statement a large number of shippers were asking prices at a fair premium in excess of the Government figure.

Now that the control is to be taken off there is a decided tendency in the market to run wild, as even now we have reports of coal being offered at \$4.50 and from then up to \$5.25. Now while it would perhaps be difficult to point to actual sales being made, it would appear that so long as offerings were being made at high prices it is not at all unreasonable to surmise that sales have been made at such figures.

It will be recalled that before the Government took control at the beginning of the war figures had closely mounted to the \$6 level and it would be no surprise that they will again touch that point within a week or so after April 1, despite the caution of the Government.

With the lifting of control definitely in sight the contract business took a new spurt, with figures increased over previous offerings. Whereas when contracts were offered three weeks ago the price range for the high grade coals was \$3.25@3.50, it has now advanced by gradual steps until at this writing \$4 is the favorite price, with a tendency to advance beyond that point.

Even then most contracts are being made with the understanding that these figures will be subject to an advance should the miners receive an increase above the 14 per cent which they received in February, and as this is a foregone conclusion the consumers in closing contracts realize that they will have to pay even more than is shown in the agreement.

For one thing the settling of the price question, partially at least, puts the trade in position to go ahead with more certainty, since the shippers are in position to assure them that coal will now reach you after it has once been consigned from the mines and will not be subject to the vagaries of a distribution committee.

There is a general tendency throughout the trade to store all the coal possible at this time, but before any storing can be done there must be a heavy tonnage shipped into this market to allow the big consumers to accumulate a comfortable margin of fuel, as practically all of the heavy users have exhausted their reserves.

There can be no doubt that it will be an extremely busy summer, especially since the railroads have announced it as their intention to store a three months' stock before July 1. It is quite doubtful whether they will be able to accomplish this in that period, as the needs of industry are so great that it is believed that it will be a job for the entire summer to take care of their demands.

In a general way there has been a somewhat heavier tonnage arriving lately, but not anywhere near what the consumer desires. A spot market is once more springing up and the small consumer who uses but four or five tons a year, or less, is coming in as usual and endeavoring to have his needs taken care of in the spring. It is this class of trade that will have to pay the heavy spot price and as a matter of fact it is his anxiety to get coal now that has had much to do with the rapidly increasing price.

With the lifting of price control it is also believed that the export trade will take on a heavier tone, as many shippers have big orders on their books and have been waiting for months to ship them. The one drawback to this trade, of course, is the scarcity of carriers.

**BALTIMORE**

Confusion as to the basis of trading after April 1 is sharply evident. The few contracts being made are running around \$4 to \$5 mine basis, with the wage rate increase problem included as an extra in most cases. Export permits allowed where vessel and coal are at tide.

**Bituminous**—The market is in a confused state of mind. No one seems to be able to figure just what prices are to be after April 1. On contract the lowest guess for the new basis is around \$4 and the top price usually quoted as around \$5, mine basis, although some are talking of \$6 coal. The spot market guess runs all the way from \$1.50 to \$6. But all this is largely guess work. For the present the trade is shipping only "bunker and export coal at bunker and export prices."

Meanwhile industries here are growing desperately short. Coal shipped to local plants, and indeed many cars of coal consigned to the piers under the export ruling, has been confiscated by the railroads. The roads are apparently bent on confiscating every pound of coal possible before April 1. The result is that while the export ban

has been lifted—at least for shipments where the handler can show both coal and ships at the piers—there is no great movement. The reserve at the Curtis Bay pier, for instance, while increasing gradually, is only around 25,000 to 30,000 tons on any one day. With thousands of coal cars still tied up in the West and New England as a result of the government policy of extensive diversions, the car supply in the mining regions continues so poor as to prevent any prompt relief. Both movement and production are now at ridiculously low figure. The car supply on the entire B. & O. system the past week only ran around 50 per cent. The daily movement averaged around 2,500 cars, although 3,521 were loaded on one day.

**Anthracite**—The hard-coal men are not much surer of their ground than are the soft-coal producers and handlers. The retailers here are being urged now by many customers to deliver at once on the existing price schedule, the public awakening to the belief that much higher rates are to be paid this summer, rather than a spring reduction being in order. Prospective miners' raises and freight rate jumps are making everybody guess that from \$1.50 to \$2 per ton is likely to be added to the present schedule.

The receipts here continue comparatively light, however, and the coal men are necessarily cautious in taking orders which they cannot see a prospect of filling promptly.

## Eastern-Inland

### PITTSBURGH

Leading operators insist they will be conservative in matter of prices, but premiums for early deliveries, over contract prices, are expected.

With a wide-open market scheduled for April coal operators have been carefully considering the situation from all angles. The common report is that conservative counsels are going to prevail, and that large operators will hold the market from advancing as it was claimed it would if the usual practice were followed of each seller seeking the highest price he could obtain.

Interpreted into figures, the conservative price referred to is about \$3.50 for mine-run, per net ton at mine, Pittsburgh district. While buyers may not consider this a conservative price coal operators do. While the restrictions are nominally in effect until the end of March there has been some negotiating resulting in definite sales understandings even though contracts may not be signed formally until April 1. In one instance cited 3-in. gas coal of good grade has been sold at \$4 to the end of the year.

Even if the general market, particularly on contract, is held by the action of large operators within certain bounds, it is thought probable that fancy prices will be obtained by some of the smaller operators for some time to come, and a wild market may characterize the first few days of April. The circumstances may duplicate those obtaining before the Peabody agreement in June, 1917, when the steel industry was conspicuous for bidding up prices.

Not a few steel mills, particularly in the Youngstown district, have had curtailed operation of late from coal shortage, entailing increased cost of output per ton and great loss of profits through restricted output, so that these mills can well afford to pay almost any price for coal to insure full production of steel.

Technically, the market at this writing is quotable at Government limits, \$2.10 for slack, \$2.35 for mine-run and \$2.60 for screened, per net ton at mine, Pittsburgh district. Practically, the new market may be forecast at something like \$3.50 for mine-run on contract, and \$3.50 and higher for prompt lots.

### COLUMBUS

Speculation as to what price will prevail after April 1 is the principal feature of the Ohio coal trade. Larger producers and shippers will make an effort to prevent a runaway market. Good demand for all grades and varieties.

With the government regulation as far as prices are concerned lifted after April 1 the Ohio coal trade has suddenly taken on a new aspect. With price levels fixed for the past six months, producers and shippers have been plugging away to get as much coal mined and shipped as possible. They have been worrying more about car supply and labor shortage than about prices or contracting. But with the lifting of the price regulations, the market has

suddenly become active in every way. Buyers immediately appeared, offering high prices for tonnage to be produced after April 1.

The question of price is now attracting a larger part of the attention of coal men. Everyone concedes that higher prices will prevail, which are entirely justified by the increased cost of production, but just where the levels will remain after the first flurry is the momentous question. Offerings of \$5.50@\$6 for Pocahontas lump were made immediately after the lifting order was published. Those prices are expected to prevail for some time at least. In the other West Virginia fields the prices are expected to be about \$5 for lump and \$4.50 for mine run. Hocking lump prices are expected to be about \$3.75@\$4, mine-run about \$3.25@\$3.50, and possibly higher and screenings around \$3. This is expected to include both the thin and thick-vein regions. Pomeroy Bend prices are expected to be about the same as Hocking.

Milder weather has taken the edge off the domestic demand, which has been the outstanding feature of the trade for several months. Retailers have been able to secure some stocks and are generally in a position to supply their customers with fuel. This is true more especially of central Ohio while there is still some shortage in domestic stocks in northwestern and western Ohio. Retail prices are still unchanged but heavy advances are expected immediately after April 1. Instead of charging \$6.50 for Hocking lump, prices are expected to be \$7.25@\$7.75 and possibly higher. Other advances accordingly are expected in West Virginia grades and Pocahontas.

Steam demand is becoming extra strong, as some of the larger users are making strenuous efforts to secure some reserve stocks to guard against emergencies. But the continued confiscation of cargoes for railroad fuel has prevented much of the stocking desired. Most of the steam plants are being operated from hand to mouth as it were. Active preparations are being made for an early opening of the lake trade and already some tonnage has been tied up. But producers are loath to contract under present uncertainties of the market.

### CINCINNATI

**Situation unsatisfactory. Car supply only 30 per cent. Public Utilities running on small reserves. No free coal to be had.**

An increase in the wholesale and retail price of coal is certain to come on April 1. The price fixed by the government was below the cost of production at the mines in most instances. L. A. Colter of the Coal Exchange said that if the miners accept the increase of 27 per cent in their wages fixed by the majority of the Bituminous Coal Commission in their report, the increase of \$200,000,000 in their wages will have to be passed on to the consumer according to the President's recommendation.

The situation in Cincinnati during the past week has been very unsatisfactory. Car supply was around 30 per cent. The high stage of the Ohio river prevented shipments reaching Cincinnati, which combined with the crippled railroad traffic made matters unpleasant for the operators and dealers. The domestic trade was very small, owing to the warm weather here during the past ten days. Industrial plants are still clamoring for fuel, while confiscation and diversion still are in evidence.

Investigation conducted by the Cincinnati Coal Exchange shows that a large number of manufacturing plants here are without reserves and are almost wholly dependent on receipts from day to day to enable them to continue in operation while in many of the coal yards the supply of bituminous is so small that household consumers often find it difficult to obtain it. The demand from that quarter has dropped off some with a rise in temperature.

Reports have been circulated about the city that certain dealers are charging in excess than the Government rules allow. However none could be found, while a majority of the dealers would welcome an increase to help them clear their overhead expenses. The local trade is of the opinion that only the repeal of the Lever Act can bring conditions back to normal.

Now with the opening of spring weather, jobbers, wholesalers and distributors believe the warm weather will help relieve the intensity of the situation. There is practically no free coal on the market even of the poorer grades. Every grade is scarce and dealers who even two or three weeks ago had pretty well caught up on certain grades are now unable to give their customers any definite promises regarding shipments.

A steady stream of buyers passed through the coal offices the past week all crying

for fuel, some asking for at least a car. However they left the city with about the same hopes they entered. Dealers are impressing upon the public the advisability of buying next winter's fuel early. Many of the concerns are enlarging their coal bins in hopes of receiving large shipments and thus enabling them to lay away enough tonnage in case of an emergency.

## Southern

### LOUISVILLE

**Domestic demand quieter, due to mild weather. Industrial demand continuing keen. Mines operating on usual short run basis due to steady car shortage. Prices expected to advance.**

Due to much milder weather retail demand for domestic sizes has slumped off considerably, but retailers' stocks are very low, and there is a good demand upon the jobbers and producers for block and lump, as well as smaller sizes.

Industrial demand for coal is very keen, especially for byproduct and gas coal, and producers report that buyers are active in the fields, and doing everything they can to secure immediate deliveries.

Mines are operating about three to three and a half days a week, although some slight improvement is being noted in car supply as a result of good weather and better traffic conditions.

As a result of announcement to the effect that Federal control will be lifted on April 1, prices are expected to advance sharply. Producers have been taking orders for some time past subject to market advances in event control was lifted, while many have been taking orders only for immediate delivery. With much production tied up on contracts coal available for immediate delivery will probably soar considerably due to car shortage and small production, creating a keen demand.

At this time last year demand was dull due to the country being well stocked. Conditions are different this year, and coal men claim that it is a sellers' market.

Louisville retailers recently asked the High Cost Commission for a 65 cent increase on the ton over the \$2.20 gross margin allowed by the Fuel Administration. Indications are that unless the commission allows the increase, it will be taken. Otherwise retailers expect to base prices on mine price, plus freight, war tax and a \$2.85 allowance. Jobbers will probably advance the brokerage slightly to take care of increased operating expenses.

So far it is too early to figure out what effect lifting of Federal control may have. Producers haven't had time to decide just what they will do. Retailers feel that domestic demand will be dull for some months, and that it may be hard to advance prices, especially in view of keen river competition.

### BIRMINGHAM

**Coal market showing great strength, as demand increases for steam and domestic grades. Car supply on about the same basis as a week ago. Shortage of equipment prevents mines from producing sufficient coal to meet the trade requirements.**

The supply of coal from this district continues to be woefully short of meeting the needs of the trade, the market being exceptionally strong for all grades. The shortage in production at the mines is attributable almost wholly to the car situation, as there is ample labor to get out sufficient coal for all needs if the equipment was available. As it is, the scant supply has to be distributed to the trade in the most equitable manner possible.

The Louisville & Nashville, Central of Georgia and Seaboard Air Line have requested bids on the Alabama quota of their fuel supply for the next twelve months, the contracts of the two former expiring April 1st, and the latter July 1, 1920. All lines are short on fuel supply and the Central of Georgia has been reported as confiscating practically all coal passing to its tracks. The Southern is also taking over some coal for use on its lines.

The lifting of price control April 1 is expected to be followed by some increase in mine prices over the Government schedules, some operations being forced upon a very small margin of profit in absorbing the 14 per cent increase in wages put into effect Dec. 1. A meeting of all Alabama operators has been called for March 27, to discuss the award of the wage commission and consider the action to be taken thereon. The indications are that the present schedule of wages and working conditions will be continued in effect in this field, as any

further advance would have to be passed on to the consumer in increased coal prices.

The production for the week ending March 20 will fall short of the previous week due to excessive rains which flooded mines and interfered with transportation. The output for the week of March 13 was approximately 325,000 net tons.

### Lake Region

#### RUFFALO

Still the car shortage and coal confiscation. No real improvement yet. Look for higher prices with the dropping of restrictions. Anthracite more plentiful, but demand heavy.

**Bituminous**—Demand is not very heavy, so the light supply manages to keep ahead of it, but the margin is small and does not appear to grow much. It is probable, now that the storm shut-downs are over, that there will be coal enough to keep all the factories going, so that by midsummer the trade will assume something like a normal condition.

Still there is far from a normal car supply and if that does not improve it will be no easy matter to keep everybody in coal. There is not the big surplus in consumers' hands that has sometimes met a shortage of supply. The shippers have done what they could, but never before have they been obliged to meet so many difficulties at one time. It seems as if every possible trouble had come upon them at about the same time. If they were not all at once they followed in such a train that it amounted to that. How the consumers were kept from running out entirely in many districts is a wonder.

The new problem now is the throwing off of the Government restrictions. Whether the authorities think the worst is over or have doubts as to the value of outside regulations is not reported, but the trade is agreed that the best thing to do is to drop them and try to forget them. The one thing to strive for is a better car supply. Most of the difficulties would disappear in a day if the movement could be brought back to the normal, so that a shipper could be sure when he filled a consumer's order the coal would be delivered in a reasonable time.

Of mining difficulties, coming out of the annual fixing or soaring wages, nothing can be said now, except that the prospect of suspension does not seem as great as it was. The miners will get an advance and if it is granted without the usual war it may be as well. The going up of wages continues everywhere, so that the cost of living must be greater right along. Not till workmen are made to see that they are the chief promoters of general expense and lack of industrial operations will they stop demanding mere wages.

The Buffalo bituminous trade is in anything but a satisfactory condition, but it may be on a par with most others. Shippers have a way of going to Pittsburgh for comfort and information whenever they get to the end of their own resources, but they have for some time come back with little of value in either direction. As to bituminous prices it may be of account to quote the Government prices again, \$4.70 for Allegheny Valley sizes, \$4.50 for Pittsburgh and No. 8 lump and three-quarter and \$4.25 for all mine run and slack, but they have been anything but well kept lately.

**Anthracite**—The late scarcity is not made up yet, but the danger of a famine is over, although coal does not come in as fast as it should. Receivers do not seem to know what is done with it and are as anxious as anyone, for they could sell much more coal than they are getting. Sometimes the Eastern trade takes all the surplus, but that territory seems to be as short as we are.

Everybody is ordering coal for next season, as the idea is general that prices are going to be higher soon and not come down. Anthracite is not going to be plentiful always and will never be cheap again. What is going to take its place cannot be said, but people are looking to oil or electricity among other things. An effort is making to consolidate the two gas companies here, natural and illuminating which shows that neither of them promises to meet the requirement alone. Electricity has badly hurt gas for lighting here, for it is one of the few things that are both cheap and efficient.

The lake coal trade will open late, even if the ice goes soon, for there is no coal to ship by that route yet. The fleet is getting ready, for there are other things to move. A rate of 60c. net from Ohio ports to Chicago has been made and of 50c. to Duluth

This means 10 or 16c. more to the lesser ports. This port has not yet accepted the rate, but is expected to do so, as it generally does.

#### CLEVELAND

Negotiations for large tonnages of No. 8 coal have been opened as the result of the lifting of Government price control. Sentiment seems crystallizing on mine-run and slack around \$3. Lake coal is talked of at \$3.25. Great Lakes coal freight rates for the 1920 season have been fixed at a considerable advance over the 1919 ones.

**Bituminous**—Announcement of the terms of the new bituminous-coal wage scale is all that is necessary to set off the largest contracting movement since pre-war days. While several large blocks of No. 8 coal have been "spoken for," no actual contracting yet is reported. Negotiations, however, have been opened and if miners accept the 27 per cent award some tonnage will be placed at \$3@3.25. It seems probable that \$3 will be the minimum f.o.b. mine for No. 8 mine-run and slack, with \$3.25 the top figure mentioned here so far.

It is believed most lake coal will go also at these figures. The larger operators, realizing that Government prices have been suspended and not abrogated, say they will make every effort to prevent a runaway market, and to this end will seek to keep as large a tonnage as possible out of brokers' hands. Hereafter, it is announced, No 8 slack and mine-run will be quoted on the same level with 3-in. coal 26c. higher and 1 1/2-in. coal 15c. still higher.

Milder weather and more expeditious handling of cars have combined to bring local receipts up to 70 per cent. In the past week stock piles have begun to rear their heads, and in some cases as much as a three-week's supply has been thrown down. Demand exists for every ton of slack and mine-run that can be had. The leading utility is now 15 days ahead, compared with two days two weeks ago. Some coal is going to the lake-front docks, but this movement has not yet really begun. Mine operations are gaining slowly but steadily. All interest, however, is not centered on contracts.

**Pocahontas and anthracite**—Domestic demand for these grades, as well as domestic bituminous, has fallen so low dealers' yards are showing sizable piles. Some domestic users are buying for next winter, but they are in the minority. Prices on both grades show no softening.

**Lake trade**—A Cleveland vessel interest has taken 1,000,000 tons of No. 8 coal at 50c. a ton to the head of Lake Superior and 60c. to Milwaukee. In 1919 the rates were 42c. to Lake Superior and 47c. to Lake Michigan. In 1918 48c. to Lake Superior, and 55c. to Lake Michigan. It was thought that the 1918 rates would rule for 1920, but they did not prove high enough to meet shippers' ideas. A large lake shipper says he is hopeful that the lake coal maximum will be \$3.25 for No. 8 coal. Slow start is looked for, both because of heavy ice in upper lake harbors and the car shortage.

Prices of coal per net ton delivered by retail dealers in Cleveland are:

Anthracite—Egg, \$12.20@12.40; chestnut, \$12.50@12.70; grate, \$12.20@12.40; and stove, \$12.50.

Pocahontas—Shoveled lump, \$9.00@9.25; and mine-run, \$8.00@8.25.

Domestic bituminous—West Virginia splint, \$8.30; No. 8 Pittsburgh, \$7.00@7.50; Massillon lump, \$7.40@7.65; Cannel lump, \$11.00; and Coshocton lump, \$7.35.

Steam coal—No 6 slack, \$6.00@6.25; No. 8 slack, \$6.00@6.25; Voughloheny slack, \$5.40@5.75; No. 3 1/2 in., \$6.60@6.85; No. 6 mine-run, \$6.35@6.60; and No 8 mine-run, \$6.45@6.60.

#### DETROIT

Shortage of car supply and confiscation of shipments continue to reduce Detroit's receipts of bituminous to an inadequate minimum. Active inquiry for both steam and domestic sizes.

**Bituminous**—With an active inquiry for both steam and domestic sizes of bituminous, Detroit jobbers are encountering much difficulty in getting coal to supply their customers regularly and promptly. Though some coal is being brought into the city, the amount is said to be wholly inadequate for requirements of the local trade.

Failure of the railroads to supply cars and motive power in sufficient quantity to enable the mines to maintain full-time production is held to be responsible for the inability of the mines to send out a normal tonnage. The amount of coal ultimately arriving in the market is still further reduced, the jobbers assert, by the continuance of the railroads' policy of confiscating shipments at the mines, en route

and even after arrival on local terminal tracks.

With the present uncertainty and irregularity of supply, the jobbers find it very difficult to provide for the needs of their customers, and feel they are working against discouraging odds in an uphill fight to continue in business. Their dissatisfaction is increased by the retention of the government-fixed margin of 16c. a ton allowed them on sales. Since the margin was fixed at that amount, office rentals have advanced, wages of office employees have been raised and the cost of all supplies and accessories of the business has been placed on a higher level. Jobbers feel that the Government's attitude in ignoring the change in working conditions renders them the victims of a serious injustice.

**Anthracite**—Receipts of anthracite are very light and lack regularity. In prospect of labor trouble in the anthracite districts, demand from consumers has been sharply stimulated. Because of the long period of very low temperatures since Jan. 1, stocks in the yards of retail dealers have been worked out to near the vanishing point and with little coal arriving the outlook for consumers is far from bright.

**Lake Trade**—Shortage of cars on the roads handling rail-lake shipments and the strong demand in markets at the lower end of the route seem to preclude the possibility of shipments over the lake route attaining very large volume early in the season, though docks at the head of the lakes will have little stock remaining at the opening of navigation.

### Middle West

#### MIDWEST REVIEW

No radical increase in prices expected. Removal of Government control pleases operators. Market is still strong.

On Tuesday, March 23, the public was informed that effective April 1 price restrictions on coal, and Government supervision of the coal industry, would be removed. This, however, does not apply to expert coal. President Wilson's statement came as a pleasant surprise to coal men in the Middle West, although they were hoping and expecting that the Government would take its hands off of the coal industry soon. It is too early yet to make any predictions as to what the price of coals produced in this territory will be after April 1. It is pretty generally thought, however, that the price will be very reasonable and fair, taking into consideration the car shortage and the advance already being paid to the miners.

Practically all of the coal-producing companies and distributors in this territory have made up their minds that there will be no radical increase in their prices. It is said that domestic coal from Franklin County will be offered to the public at a price of \$3.35 per ton f.o.b. mines for the month of April. This price will advance ten cents per ton until September, thus putting into effect, in a modified manner, Senator Freylinghuysen's idea.

This sliding scale price is nothing new in the Franklin County fields, as they have followed this procedure for the last few years. The southern Illinois coal fields will probably follow in the footsteps of the Franklin County operators, although some southern Illinois coal men will probably give out an opening price of ten cents or so less than the Franklin County prices. As we mentioned above, the tendency is not to increase prices too sharply. It is feared, however, that a number of smaller and less experienced operators, feeling grieved over the suppression of the industry and having lost considerable money during the last price restriction era, will feel that the opportunity has come to them to recoup their fallen fortunes.

The trade has watched with considerable interest the press notices appearing from day to day relative to the removal of price restrictions. If the daily press is a true reflection of public opinion, the coal operators and the coal industry are very unpopular with the public. It is pretty generally thought that a group of men, say for instance, the National Coal Operators' Association, ought to undertake a campaign of publicity in the daily papers, educating the public and justifying the prices which the public will be asked to pay. There is no denying that the coal industry has been the goat for a number of years, and that this position is undeserved. The industry has been so poorly and loosely organized that they have not been in a position to fight off any press attacks.

Coal operators in the Middle West have had an opportunity to think over Senator Freylinghuysen's plan providing for a 25c. decrease in freight rates on coal during the summer months, and an increase of 25c. in the winter months, as well as a like decrease and increase in the cost of coal, to the public, during the two periods. Considerable opposition has resulted to this plan. Operators claim that the railroads are opposed to it, as in normal periods of operation during the summer months there is no surplus of coal cars, but that on the contrary there are sometimes extreme shortages.

In addition, the plan, if carried out, will result in a great disturbance of differential rates which will necessitate the opening of a new market on some grades of coal and throwing out other grades from their established markets. In short, the industry does not take very kindly to Senator Freylinghuysen's plan, so far as a summer and winter differential in freight rates and the price of coal is concerned.

The market on all kinds of coal has kept up very strongly. We have been told by both buyers and distributors that the situation of coal today in this territory is more precarious and in a more critical condition than it has been at any time, even during the war, or during the strike. So far it has been almost impossible to place a contract with an operator, but it is hoped that after April 1 the industry will settle down to look over the situation, and map out what can best be done to serve the public.

#### CHICAGO

Retail trade at this time of the year is chiefly concerned in contracting and buying anthracite coal.

Lucky indeed is the dealer who has been buying from one firm regularly, as he is sure of being taken care of this season. Shippers and distributors of anthracite coal are not looking for new business, as they are having considerable difficulty in taking care of their own trade, already established. This is equally true of the Pocahontas operators who normally take care of this territory. We understand no prices have been given out as yet on Pocahontas coal, but some dealers have prevailed upon their usual connections in West Virginia to take care of them during the year on a basis of price current at time of shipment.

If one is to judge the coal situation in Chicago from the state of its various retail yards, it would be decided that Chicago was in pretty good shape, as there is a tremendous amount of coal and a lot of it has been spotted at the various yards. The public is showing an inclination to stock coal early, and one of our retail friends tells us that it is impossible to keep certain grades of coal on hand, no matter how quick he has it shipped to him. This is especially true of Eastern coals such as Pocahontas and south-eastern Kentucky coal, rather than on Illinois and Indiana coal. The best grades of Illinois and Indiana coal, however, cannot be shipped fast enough to take care of the demand.

Steam-coal buyers continue to come into Chicago in a vain endeavor to place contracts. Operators are holding out some hope to them that they will be able to cover their needs after April 1, when the price question can be finally decided upon. Operators who have small mines—mines too small to maintain a sales organization—are having no difficulty in selling their product to the wholesale trade in Chicago. It is pretty generally conceded that the present strenuous demand for coal will continue for some time.

#### ST. LOUIS

Car shortage continues. Coal scarce and demand for everything exceeds supply. Buying good on account of anticipated shutdown and increase in cost.

The local situation is just a trifle tense. The feeling here is that there may be a shutdown of from one to two or three weeks on the part of a great many of the operators, but the more conservative operators hold that the miners will continue work pending an adjustment.

In any event, the demand exceeds the supply on all kinds. The local trade is pretty well taken care of both on domestic and steam sizes, but the country end still continues to suffer.

Shipments for Chicago have been good the last few days from the Standard district. The mines still continue to work about two to two and a half days in this field. On March 25 one operator with ten mines had nine of them idle and this represented tonnages on the Illinois Central, Louisville & Nashville, Baltimore & Ohio, Missouri Pacific and Belleville Electric.

That condition is a sample of what the field is going through. The miners still show a dissatisfied feeling. This is more pronounced in some sections than in others. In the Mt. Olive field somewhat better working time has prevailed during the past week, but this is largely on account of railroad coal which moved north and west. The operators in this field seem to think that there will be no suspension of work.

In the Cartersville field of Williamson and Franklin County there has been a slight improvement in cars on all roads with the exception of the Missouri Pacific, and the same old incompetent railroad tactics prevail now on this line as heretofore. This road has no coal ahead and seems unable to keep any supply on hand, with the result that it is taking practically everything produced on its own rails.

Other roads are showing up better in the way of cars and movement and in a general way the field is producing heavier this past week than heretofore.

The railroad tonnage on all roads out of this field is heavy. Everything produced finds a ready market. It is understood that on April 1 the Franklin County prices will start off at about \$3.40, with a ten per cent increase every month for the domestic sizes. Nothing definite has been announced as yet on steam.

The feeling here is that there will be an advance of about 75c. per ton on everything in the Standard and Mt. Olive fields, which will bring these prices up to about \$3.25 at the mines for lump, egg and nut, but competition, if cars are plentiful, will soon cut this price, inasmuch as there is an overproduction if eighty per cent cars are furnished.

There has been no change in the retail prices in St. Louis. The situation here is easy, although some anthracite is moving in, but small in comparison with what will be needed, and no smokeless at all. No anthracite is promised for this market after April 1.

The wholesale prices on coal are the same as last week:

	Williamson and Franklin Counties	Mt. Olive and Staunton	Standard
Prepared sizes (lump, egg, nut, etc.)	\$2.55@2.70	\$2.55@2.70	\$2.55@2.70
Mine run	2.35@2.50	2.35@2.50	2.35@2.50
Screenings	2.05@2.20	2.05@2.20	2.05@2.20

Williamson-Franklin rate to St. Louis is \$11.00 other rates \$0.95.

#### MILWAUKEE

Coal supply down to a very low ebb. Lifting of the ice blockade on Lake Michigan permits a meager flow of car ferry. No relief promised until navigation can be resumed.

Coal dealers are "scraping the dish," so to speak, and will continue to do so until navigation between the upper and lower lakes is resumed. The ice blockade on Lake Michigan has lifted, however, and the meager flow of coal by rail and car ferry, which was cut off on that account, is in evidence again. Some small dealers have not been able to deliver anthracite for the past two weeks.

The dwindling soft coal piles on the docks represent supplies held to cover iron-clad contracts. Soft coal is coming from Illinois and Indiana, but car facilities are short of the needs of the service. Warm weather prevails, but the demand for coal would be heavy just at present under any circumstances, because of the anticipated advance in prices in April. Coke screenings are being advertised at \$9.50, delivered. Prices of the other grades of coke, and of anthracite and bituminous coal remain undisturbed, however.

### Pacific Coast

#### SEATTLE

Quotations at the present time are as follows:

Seattle	\$6.75 per ton 2000 lb., f.o.b. bunker tips.
Tacoma	\$6.75 per ton 2000 lb., f.o.b. bunker tips.
Portland	\$8.75 per ton 2000 lb., f.o.b. bunker tips.
Portland	\$9.50 per ton 2000 lb., in the stream over the ship's rail.

The above rates apply to the standard grades of Black Diamond and South Prairie coal.

Quotations on British Columbia coal in Seattle Harbor are as follows:

Comox Lump	\$10.00 per ton of 2240 lb., f.o.s.
Comox Marine Mixture	\$9.85 per ton 2240 lb., f.o.s.

#### SAN FRANCISCO

Pending a settlement of the controversy as to the increase in wages to be given the miners, dealers in San Francisco are worrying along with the stocks they have on hand.

Coal men look for no drop from the \$3.65 f.o.b. net ton, wholesale, on stove and lump coal at the Utah and Wyoming mines, and a raise may come any day. The hunker coal situation is very satisfactory. More ships than in years past are calling at the Golden Gate on the way to the Orient from the Atlantic for replenishment of their bunkers and many cargo carriers discharging and loading at San Francisco are taking on large amounts to be burned on voyages to the Seven Seas. The King Coal Co. has a sufficient supply in its bunkers at its depot for all needs of the ocean fleet. No vexing car problem exists, as the coal is shipped to San Francisco by the U. S. Fuel Co., of Salt Lake, which owns its own cars.

The bunker price at present is \$13.55, which has been maintained for some time. For domestic use, bituminous prices from Utah and Wyoming, f.o.b. net ton, are: Stove, \$3.65; Lump, \$3.65.

### Coke

#### CONNELLSVILLE

Predictions of \$9 coke with open market. Byproduct output to increase. Much second quarter coke for negotiation.

With the Government price restrictions still nominally in effect, but an open and higher market certain for April 1, there is no quotable market at the moment. If the strict letter of the law were not evaded, an operator would be still better off holding coke, paying demurrage to sell April 1. Just why the common prediction is that furnace coke will go to about \$9 is difficult to ascertain, but that figure represents the general run of the predictions.

Some reference is made to the price that would be realized for coke at this time on a contract calling for a ratio of 4½ to 1 on basic pig iron, valley, which is now quotable at \$41.50 or \$43 according to different authorities, but a difficulty is that contracts now in force are rather at 5 to 1, which would mean only a trifle over \$8 for the coke.

In the past three months the appearance has been that practically all the coke produced in the Connelville region went out on contract, but as a matter of fact much of this contract tonnage was either on contracts made for the quarter only or was against general understanding that the coke be shipped and billed at the ruling market. In either case there will be coke released for actual sale and an active market is expected. Removal of the price restriction will not increase production, which hinges upon car supply, but larger production is in prospect as transportation conditions continue to improve, now that spring has come.

The production of byproduct coke will undoubtedly increase materially, as the operators will be in position to bid whatever prices are necessary to secure coal, and thus coke supplies will be increased. Despite this prospect it is predicted that high prices will rule for Connelville coke. Pittsburgh district coal is predicted to sell at about \$3.50, and that would perhaps justify a price of about \$8 for furnace coke. At the moment the coke market is unquotable.

The Courier reports production in the Connelville and the Lower Connelville region in the week ended March 20 at 249,240 tons, an increase of 4,770 tons. Previously, since the first of the year, production had been reported at an average of about 240,000 tons weekly.

#### BUFFALO

The situation follows that of bituminous coal, the demand being quite equal to the supply. The furnaces have had some difficulty in getting as much as they needed, but no special complaint has been heard lately. Prices remain nominally at \$9.60 for 72-hour Connelville foundry, \$8.60 for 48-hour furnace, \$7 for low grades and \$7.75 for domestic sizes, per net ton, f.o.b. Buffalo. It is expected that more ore will be brought down by lake this season than was last and it will begin to move as soon as the ice is out of the lakes.

# COAL AGE

New York, April 8, 1920

Volume 17 Number 15

## Forward—With the Industry

An Announcement to Our Readers

**C**OAL producers today are facing many problems in both the technical and the economic phases of the industry.

The war and its aftermath of industrial reaction and readjustment have developed to a marked degree what some would call the ailments of the coal industry, and have focused public attention on the three-sided relationship of the operator, the miner, and the consumer. Added to the technical problems of mining have come labor problems, transportation questions, distribution difficulties. Even if the coal producer desired to hold himself aloof from these problems, he could no longer do it. Concerned, as he is, with a basic industry there are few of the practical problems in our complex industrial life which have not been put squarely up to him during the last few years.

The way out in answer to these problems, which are age-old in principle, but new in complexity, lies in the study, exchange of thought, development of ideas, education, and the application of sound economic principles—in a word, just plain commonsense.

**C**OAL AGE has been from its beginning, and will continue to be, the leader in all the engineering and technical features of coal production. With the ever mounting cost of production comes a greater need of sound, efficient engineering and mine management. Coal Age has always stood foremost as a medium of exchange of advanced technical and scientific thought in the industry.

Coal producers are facing today, with executives in other industries, a new kind of labor problem. The engineers and managers

who stand between capital and labor, and friends of both, are the men on whom will largely fall the task of solving this labor problem. Coal Age will maintain its position of authority on this question.

**B**UT in addition to the technical and labor problems of efficient, low-cost and safe production of coal are the problems of profitable production, of transportation, of distribution, and of merchandising. Coal Age is broadening out to meet these new needs, just as in the past it has met the engineering problems of the producer.

Coal Age will make its pages a forum for the discussion and the interpretation of the practical ways to meet these new economic problems of the industry. Just as we have, as a result of the war, replaced the map of the United States with the map of the world, so as coal operators, we have learned to think in terms first of national, then of world fuel problems. The hard knocks of the past year or so have brought us together in a community of interest, at times with our backs to the wall, in an attitude that augurs well for the future exercise and further progress of the industry.

**C**OAL AGE proposes to bring to the men of the industry the news of the industry, interpreted as to its effect on their business. It proposes to bring to them the views of other operators, those whose experience and judgment command respect.

Coal Age believes in the opportunities of the coal industry. It is broadening its field in the same spirit that has built it in the past. With the growing problems of transportation, of

distribution, of markets, of prices, has come the need of sound and efficient marketing methods.

**T**HE coal question is national. It concerns every one. The problems are local, national, and world-wide. Coal Age approaches these problems in the spirit of service for each reader, whether he be miner, superintendent, engineer, operator, distributor, or banker.

Coal Age is associated with a group of technical magazines of other industries. It has opportunity through nation-wide organization to keep in touch with the industrial progress of the country, to pass the news on to its readers.

In common with the associated publications, it will serve under this banner: "Live for your industry, not on it."

## New Editorial Plans—and a New Man

By R. DAWSON HALL

**C**OAL AGE, to fill its mission, must consider the industrial problems as well as the technical, and it must work out its plan of campaign with the right sort of leadership. If this is to be so, a man must be sought who will adequately fill such a need as this. One does not have to look far. Conditions have marked out the man so unerringly that but one remains for choice.

When Edward W. Parker left the U. S. Geological Survey, leaving behind a marvellous record of the statistics of production, we all wondered who would be found to succeed him, for Parker had filled the place with distinction. He had been one of the Anthracite Coal Commission and had been influential in framing its valuable decisions, and he left to be Director of the Anthracite Bureau of Information.

**I**N his place came C. E. Leshner, then little known to any one but the Survey chiefs. A native of Colorado, he had attended the state's celebrated School of Mines and spent a few years professionally in British Columbia, Illinois and New York State. He then entered on the work of the Survey and was assigned to collaborate with the Coal Land Classification Board of which he later became chairman.

From this position he was called to fill the place vacated by Edward W. Parker, which gave him charge of the Coal Statistics in the Survey's Division of Mineral Resources. While there, the volumes of "Production" originated by Mr. Parker, not only continued to appear as well edited and reliable as before but supplemented by a smaller annual volume on "Distribution." Mr. Leshner was already broadening as far as the purse of the Geological Survey would allow him. He was

Harris & Ewing, Washington, D. C.  
C. E. LESHER

unconsciously laying the foundations for his great war work, and when the war arrived he had both the knowledge and the well-developed judgment that enabled him to be of service to his country.

**W**HEN the Council of National Defense was formed it was able from the first to plan intelligently its course in regard to coal, because it had Mr. Leshner on whom to rely as a guide in regard to the affairs of the coal industry. Before long Mr. Leshner became in effect the technical advisor of the Peabody Committee on Coal Production. During the strenuous days of that short-lived committee he found time also to take a leading part

in the formation of the National Coal Association.

Mr. Leshner soon after became head of the apportionment division of the U. S. Fuel Administration, and there he directed expenditures which were made at the rate of \$400,000 annually and guided the work of 500 employees. It was then that the country first got reliable figures on coal consumption.

The statistics gathered by the Fuel Administration, in an effort to get the maximum benefit from every ton of coal consumed, were by far the most comprehensive statistical compilations of this character ever gathered in any country. The charts of weekly production, the weekly analyses of mine idleness from car shortage, strikes, mine disability and lack of orders are a monument to his industry and ability.

After the war, when he was about to be designated head of Mineral Resources branch, Mr. Leshner resigned his position with the U. S. Geological Survey that he might accept the Directorship of the National Coal Association's Bureau of Economics. In filling this important charge he prepared the statistical compilations which were presented by the National Coal Association to the President's Bituminous Coal Commission.

**N**EXT week Mr. Leshner will officially join our staff as co-editor with me of *Coal Age*. Our journal has set for itself even higher standards of accomplishment in the technical and engineering sides of coal production, over which I shall have jurisdiction, and the staff welcomes Mr. Leshner in the added field of development in the industrial and distribution phases of the paper that it will be his privilege to direct beginning with the issue of April 22.

## Working Both Freeport Beds Together

At This Operation the Upper and Lower Freeport Beds Are Separated by Six Inches of Boney—Both Beds Are Therefore Worked Simultaneously—Some of the Boney Is Burned for Fuel—A Record of the More Notable Mechanical Details of the Plant

BY DONALD J. BAKER  
Pittsburgh, Pa.

**M**INES in Allegheny County, Pennsylvania, are not confined entirely to the Pittsburgh coal bed, since there are several operations where the Upper and Lower Freeport beds are under development. One of the most up-to-date plants in the western end of the state is situated at Bairdford, on the Bessemer & Lake Erie R.R. out of East Pittsburgh. This operation is known as the Berry No. 3 mine of the Ford Collieries Co. It is here that the Upper and Lower Freeport beds of coal attain their greatest thickness and adaptability for mining.

The Ford Collieries Co., which is a subsidiary of the Michigan Alkali Co., was organized in 1909, at which time the coal properties now held were purchased. It was not until 1915, however, that the Berry No. 3 mine was opened and the surface buildings completed. The company has an unbroken tract of 8,000 acres of coal in this section of northern Allegheny County, all of which lies in a nearly rectangular tract. For the development of this coal acreage three shafts have been sunk on the property—the Benjamin No. 1, at Curtisville; the Francis No. 2, which is situated about a mile north of Curtisville, and the one already mentioned, which is located about 2½ miles west of Benjamin No. 1.

It is possible that a fourth shaft will be sunk to the north of Berry No. 3 at some time in the future, although this is still problematical and will not be done until the development work in the three mines already mentioned has reached a stage that will clarify the pos-

sible haulage problems to be encountered. The No. 1 and No. 2 mines were opened the same year that the company was organized.

The Freeport beds of coal in this locality average a

LOADING COAL UNDER THE TIPPLE  
The car is partly loaded with lump coal and the lead of a car retarder may be seen attached to this car.

little more than 6 ft. of workable thickness. The upper bed runs about 42 in. thick and the lower about 34 in. A 6-in. layer of boney separates the two beds, while

GENERAL VIEW ON THE DUMP FLOOR OF THE TIPPLE

The crossover dump, a portion of the tracks leading to and from the klick-back and the car haul are plainly visible.

directly over the upper a bed of cannel coal is encountered that varies from 12 to 28 in. in thickness.

The two beds are worked as one. The boney does not mix readily with the coal when the two beds are shot down, and consequently it can readily be gobbled. All the boney has to be handled in gobbing and in that respect is a dead waste, but that disadvantage is offset by the fact that the roof is firm, the cannel forming the best kind of material to work under. No trouble is ever experienced with air-slacking or weathering—a condition that causes much trouble in the Pittsburgh bed, where a soft friable roof is encountered more often than a firm one.

The layout of the Berry No. 3 plant, which is the best

direction, the sides of which are supported by steel sets with tile walls between.

The cages in use were made at the machine shop of the No. 1 mine. In connection with the making of the cages it might be mentioned that the officials of the company are unusually resourceful men. Much of the apparatus and equipment that has been installed around the mine was made at the shops. In many cases manufactured apparatus has been so largely rebuilt in order to secure better service that the parent design is almost lost in the present one. Many ingenious safety devices have been constructed. W. D. Thomas, superintendent of the Berry No. 3 mine, who is a mechanic of no small ability, is credited with having built many of the devices. While much of this apparatus is not universally known, the company has obtained patents on most of it. This has been done merely as a protection from unscrupulous manufacturers. A separate article describing and illustrating some of the many devices that have been installed at these mines will be presented to *Coal Age* readers next week. Each can be made at the ordinary mine blacksmith or machine shop. In this article only passing mention will be made of this apparatus.

#### CONCRETE LINING PROVIDED IN BOTH SHAFTS

The air and material shaft is of the same depth as the hoisting shaft and is concrete-walled to the bottom, excepting in a few places where solid rock was encountered in the sinking. It is divided into three compartments, one of which serves as an airway, another as a hoist compartment, while the third is utilized for a stairway and contains a steel staircase.

The headframe is of steel and was erected by the Dravo-Doyle Construction Co., of Pittsburgh, which also supervised the sinking of the shafts. In the hoist compartment there is one cage which is counterbalanced by weights running on guides in the air compartment. One of the details in the construction of the headframe tending toward efficiency is the installation of an electric chain hoist permanently suspended. By this means all heavy supplies that are to be taken underground are handled in the easiest and most efficient manner.

The hoist serving the air and material shaft is located

SIDE VIEW OF MAIN HOIST HOUSE

This building admirably illustrates the substantial brick and concrete construction employed in the surface buildings.

equipped of the three operations, is highly compact. The general construction of the surface buildings is of a substantial type as well as an artistic one. All of the buildings are of brick construction with concrete foundations. As can be noticed in Fig. 1, there are two shafts, one of which is utilized for hoisting the coal while the other serves as an airway and a material shaft. The main hoisting shaft is 210 ft. deep and is concrete lined. It is 29 ft. long by 10½ ft. wide in dimensions. At the bottom a concrete archway extends 7 ft. in each

in the power-plant building. This is divided by a brick partition so as to house the boilers in one room and the generating units and hoist engine in another. This engine is a steam-driven Vulcan machine with a single 6-ft. drum. It is of the balanced type and is equipped with a steam brake, a hand brake and a Nicholson engine stop.

The balance of the engine room contains three direct-current generating units. Each is of General Electric make and of the same capacity, viz: 200 kw. A direct-current voltage of 250 is delivered for use within the mine and around the plant. Each generator is direct-connected to a Ball steam engine. In one section of the room a separate unit provides the current that is used for lighting the town. This is a General Electric machine of 50-kw. capacity. This generator delivers 2,200 volts alternating current. A four-panel switchboard completes the electrical installation at this point. Incidentally, the water-gage fan register has also been placed here.

The boiler room contains three batteries of horizontal tubular boilers set in pairs, each having a capacity of 200 hp. These are hand-fired. Coal is delivered from the tippie by a flight conveyor to overhead bunkers and thence fed to the floor through steel chutes. Mine water is used for boiler feed. It is pumped from the underground pumping station to a tank on one of the hillsides and flows from this point to the boiler room by gravity. A Cochrane heater has been installed for heating the feed water.

Between each pair of boilers a forced-draft fan driven by twin engines has been installed. The draft is automatically regulated and maintains the steam pressure at approximately 100 lb. to the square inch. The boney coal that finds its way to the surface is crushed at the tippie and mixed with about 25 per cent of clean slack, and this mixture is used under the boilers. Thus the fuel costs are kept down, as little marketable coal is burned. A concrete bin beneath the boiler room collects the ashes. They are then loaded into a trolley-type larry that passes through a concrete tunnel extending under the railroad tracks and dumped from a drift opening.

Another unit of the plant buildings is the main hoist-house. This contains a double 36 x 22 in., conical-drum, steam-driven Vulcan hoist engine. This machine is equipped with automatic safety devices and winds a 1 1/2 in. steel cable. The tippie was designed and constructed by the Heyl & Patterson Co., of Pittsburgh. It is built with a steel framework covered with corrugated steel siding, and was designed to accommodate a daily output of 3,000 tons.

The mine cars, which are of 2-ton capacity are hoisted to the top of the tippie in plain cages built at the company shops. From this point they run by grav-

FANHOUSE AND MATERIAL HEADFRAME  
One compartment of the air shaft is employed for lowering men and materials into the mine.

ity to a horn type of crossover dump. After discharge the car is held in place by the horns until the next loaded car to the rear depresses the dump "grass-hopper," forcing the horns away from the rails. The standing empty is thus released and passes on, after which the horns assume their normal vertical position. The car travels by gravity to a kick-back and is engaged by a chain haul, which raises it to a point higher than the cage landing. From that point it runs to a second kick-back and thence by gravity to the opposite side of the shaft, where it is lowered.

As the coal is dumped it passes over a dead plate, by

ONE BUILDING HOUSES BLACKSMITH, CARPENTER AND MACHINE SHOPS  
This shop building, as may be noted, is in close proximity to the main shaft. This is advantageous from several points of view.

which it is spread for even distribution to the screen bars. When a car of boney coal is brought to the surface the dead plate is raised and the boney passes directly into a storage hopper. Some of this boney coal is sold when there is a demand for it. The greater portion, however, is loaded into electric larries and transferred to a nearby dump. A small amount of the boney is crushed and mixed with slack to enter a conveyor that leads to the overhead bunkers in the boiler room. When the boney storage hopper is empty steam coal may be dumped into it. The same larry is then utilized for collecting the coal and discharging it into wagons for domestic needs.

The larger portion of the coal that is shipped from the tippie is loaded as mine-run since it goes to the parent organization eventually to be crushed and used under kilns. However, some is loaded as 1½-in. lump and slack.

opposite side of the tippie from the power plant. The blacksmith shop, which is separated by a partition from the other two, contains forges and blowers. An electrically driven line shaft runs lengthwise through the building and operates various machines by belt connection. All of the saws and drills are made safe by wooden guards constructed around them. The Ford Collieries Co. is one of the leaders in the safe-practices movement, and the results accomplished are readily apparent to anyone who visits any of its mines. As has already been mentioned, the more important of the mechanical devices for eliminating danger will be taken up in a succeeding article.

The lamphouse is situated near the air and material shaft and is of the same characteristic construction as the other surface buildings. Little gas is encountered within the mine, yet electric cap lamps are employed.

### Map Showing Underground Workings

Projection is made on a modified triple entry system, with main headings driven four-entry; rooms are developed in panels. Thirty rooms are turned off each butt entry, these passages being driven 300 ft. apart.

This passes over a traveling picking table, where it is given careful preparation.

There is not much of the boney mixed with the clean coal underground despite the fact that a 1-in. layer of this material divides the two Freeport beds. The utmost vigilance is exercised over the loading at the face by men who are known as boney bosses—a term that is somewhat of a localism, by the way. Whether clean coal is being loaded can be gaged with fair accuracy by the thickness of the boney in any particular room and the consequent size of the gob pile.

One of the chief surface buildings is the blacksmith, carpenter and machine shop, which is situated on the

Those in use were made by the Witherbee Igniter Co. and are of two-volt capacity. The recharging racks are so constructed as to accommodate 370 batteries at one time. The charging room also is used in repairing and rebuilding the batteries. One of the advantageous features of the Witherbee type of lamp is that the batteries can be rebuilt at the mine.

A nominal fee of 4c. per day is charged against each miner for the use of a lamp. This is a lower rate than that charged by most companies in the Pittsburgh district. It is needless to say that this fee does not cover even the cost of maintenance.

A novel and effective method of handling the lamp

checks is employed. Seventeen wooden cleats have been nailed lengthwise on a board that measures 32 x 26 in. Horizontal slots are sawed in the cleats and each check is held to the board by placing it in the cleat slots. A board of this size will accommodate 800 checks. Each check slot is numbered and as the man returns his lamp, he is given the check as a receipt. All check numbers must be accounted for at the end of each day.

The fanhouse is located close to the air and material shaft and contains a 16 x 6-ft. reversible Jeffrey fan. This is connected by belt to a steam engine. A concrete tunnel leads from this building to the air and material shaft.

A bathhouse with accommodations for 100 men also has been installed. A janitor is in charge, and it is his duty to keep the place clean as well as to guard the clothes of the men. Equipment within this building comprises 24 lavatories, 4 showers, the necessary urinals, etc. Rectangular-shaped wire baskets, with hooks beneath, serve to hold the clothes of the men as well as individual towels and soap. The showers are separated by slate panels. Plumbing fixtures, which were supplied by the Speakman Mfg. Co., include shower heads of the cantonment type which are fitted with a ball-joint connection.

The remaining unit of the surface buildings is a combination first-aid dressing station, mine-foreman's office and supply house. There is nothing that deserves more than casual mention in this building and it consequently will be passed over lightly in lieu of the more interesting sections underground.

The layout around the shaft bottom is different from that usually found. A double track has been laid on either side of the shaft for a distance of 500 ft. One side handles the loaded cars and the other the empties. An automatic switch-throw, devised by Mr. Thomas,

allows the cars to be caged rapidly by a Bowerston caging apparatus. As trips of loaded cars are brought to the shaft bottom the locomotives cut off to a parallel entry and swing around to the empty storage yards, where a trip of empties is made up.

A rest room has been provided for the men at the bottom of the air and material shaft. Benches have been provided in this room for the waiting men. The caging arrangement is such as to give what might be called a turnstile effect, since only one man can enter the cage at a time. This arrangement eliminates crowd-

**TIPPLE SEEN FROM THE EMPTY CAR TRACKS**  
This is a view of the tippel from the opposite side to that shown in the frontispiece.

ing at the bottom at the end of the day and also assures each individual a trip up the shaft in the order in which he arrived at the bottom with respect to his fellow workers. Thus there is small chance for an accident to occur from crowding on the cage or around the landing.

Near the bottom of this shaft a hospital has been built. It is 30 x 20 ft. in dimensions and is electrically lighted and equipped with hot and cold water. A lavatory, benches and first-aid supplies are arranged con-

Two generating units may be seen as well as the material hoist in the background.

veniently. This is the only first-aid station within the mine. The common practice of locating such stations throughout the workings has been abandoned in favor of the plan of having one spacious room near the shaft bottom.

An electric locomotive ambulance, which was designed and constructed at the company shops, is kept in readiness at the motor barn for hurried calls. It is nothing more than a converted locomotive, but the idea is distinctively original and of this device more will be said in a subsequent article.

The main sump is located at the shaft bottom. A 14 x 10 x 18-in. single-plunger, horizontal, steam-driven Dean Bros. pump suffices to void the water to the surface through a 10-in. discharge line, although a 10 x 7 x 12-in. pump of the same type and make is used as a spare.

Each pump is equipped with an Ohio Grease Co. lubricator. Grease has been found more effective than oil in lubricating the cylinders. It has not been necessary to refill the lubricator oftener than once in 44 hours. Each lubricator will hold from one to two quarts of grease.

There is but one pumping station underground. However, portable field pumps are utilized in some sections where local dips are encountered. The pump room is 26 ft. long by 15 ft. wide and is constructed with tile siding. Six 10-in. I-beams support the roof. The steam used in driving the pump passes from the cylinder to condenser coils outside of the room, where it is utilized in drying sand for the locomotives. From the condenser coils the hot water passes to the hospital room and is again used, this time in heating the water that must be constantly available at this point. The sand is

INTERIOR VIEW OF THE MAIN HOIST HOUSE

The Tulean Hoist here installed, as may be seen, carries double conical drums. This form of drum possesses many advantages for heavy continuous hoisting over those of a cylindrical shape.

brought down the air and material shaft and is screened underground after having been dried.

The electric current that is used within the mine is brought down the air and material shaft by a 1,000,000-circ.mil cable. It is distributed to different sections of the operation from a switchboard located at the shaft bottom and containing four single-pole knife switches. A Streeter-Amet automatic scale recorder has been installed in a room near the hoisting shaft. It is of 5-ton capacity.

As can be noticed in the accompanying map of the underground layout, the coal is developed by a variation of the triple-entry system with a panel scheme applied to the rooms. The main shaft was located square with the railroad tracks beneath the tippie. The main entries were then driven square with the shaft. This has placed them at an angle of about 13 deg. from a north and south line. After the bottom layout had been established the main face entries were driven 30 deg. northeast and southwest. The butt entries were then driven perpendicular to these, which places them at an angle of 30 deg. northwest and southeast. The main haulage entries are quadruple.

The face entries are 1,800 ft. apart, which permits a development of 30 rooms off each butt entry. The butt entries are driven 300 ft. apart. All entries are 12 ft. wide and spaced on 50-ft. centers. The rooms are 25 ft. wide and likewise spaced on 50-ft. centers. Barrier pillars 100 ft. in thickness have been left to protect all of the main entries and bottom construction. Few of the pillars within the panels have been removed to date but this work will proceed wherever surface conditions will permit.

#### COAL UNDERCUT BY NINE SHORTWALL MACHINES

All of the mining machines and locomotives in use are of Goodman manufacture. There are two 13-ton series-parallel control locomotives for use on the main haulageways. Each is driven by a 278-hp. motor. Eight 6½-ton gathering locomotives of the low 30 type with parallel control are used in making up the trips in the face entries. The coal is undercut by nine 50-hp. shortwall mining machines, of which but seven are actually in use, the other two serving as spares. Where the rooms are driven with the dip, the cars are removed to the butt entry by the gathering locomotives, which are equipped with auxiliary crab reels and wire rope.

Sixty-pound rails are laid on the main haulage entries and 40-lb. steel in the face entries. The butt entries as well as the rooms have been laid with 20-lb. steel. Steel ties have been employed practically throughout the mine.

One of the most important features of the underground work is the common-sense application of safety principles, which has been given special attention. The Ford Collieries Co. has proved that efficient operation can go hand-in-hand with safe practices.

The main offices of the company are located at Curtsville. A. R. Pollock is general manager of mines; W. G. Shallcross, general superintendent; G. G. Long, chief engineer, and J. H. Byers, purchasing agent. W. D. Thomas is superintendent of the Berry No. 3 mine, as has already been mentioned, while Mr. Flenner is mine foreman. The hearty co-operation of these men has aided materially in the collection of data for this article, and *Coal Age* gratefully acknowledges the many courtesies extended by them.

The article that will follow this one, which will be descriptive of numerous safety devices, will also take up the first-aid and rescue program of this company. This important phase of mine operation is under the direction of M. S. Murray, safety engineer, who has also developed a first-aid program that is as effective as it is original. Steady production is possible only where the workmen are not subject to accident. This the Ford officials have long recognized. To be among the leaders in the safety movement requires persistent application of safety principles. Only where such persistent application is given to safety will results be obtained and the industry find that its safety labors yield the immunity from accident that is desired.

## Low-Temperature Carbonization Gives Huge Byproduct Yield

By Method Being Employed in Great Britain 640,000,000 Gallons of Fuel Oil Would Be Obtained from 50,000,000 Tons of Bituminous.

A SMOKELESS fuel known as coalite, which is claimed to be a natural briquet, generating as much heat per unit as coal, is being manufactured by a British company recently organized, Consul H. C. Claiborne, London, reports. The volatile constituents of the coal are collected by a process of low-temperature carbonization, recent experiments establishing the following products obtained at one time from one ton of bituminous coal:

Three gallons of motor spirit—nearly double the usual yield of motor spirit from processes where coal is distilled at a high temperature. This spirit is refined and is suitable for motor cars, aero engines, tractors and every purpose for which petrol (gasoline) or benzol is used today.

Sixteen gallons of oils for burning, lighting and lubricating. This oil is similar to crude petroleum. It can be burned without refining, direct under boilers for naval and maritime purposes generally. If distilled the products obtained are even more valuable and find a ready market for many purposes. The crude oil may be separated into motor spirit, cresylic oils, burning oils for lamps, lubricating oils, oils for Diesel engines, and pitch of superior quality for insulating and other purposes.

Seven thousand cubic feet of gas. This gas is of higher quality than that made by gas works and is of great value for lighting, heating and power purposes. Its heat value is 600 B.t.u. per cubic foot, after removal of the light oils, whereas that of ordinary coal gas, similarly treated, is about 500 B.t.u.

Twenty pounds of sulphate of ammonia, for fertilizers and high explosives.

Fourteen hundredweight of smokeless fuel.

The coal output of the United Kingdom in 1913 was estimated at 280,000,000 tons, valued at \$973,300,000. Between 40,000,000 and 50,000,000 tons are devoted to domestic consumption, and if this amount were converted into smokeless fuel by low-temperature carbonization some 640,000,000 gallons of fuel oil would be obtained annually. If this system were applied to all coal consumed in the United Kingdom the quantity of byproducts recorded would be enormous.

## A Coal Tippie for a Stripping Operation

This Tippie Is Extremely Simple Yet Any Size or Combination of Sizes Can Be Made by Merely Changing the Setting of Two or Three Gates—Provision Is Made for Future Crushing

BY FRANK J. SCHRAEDER, JR.  
Chicago, Ill.

**A** COAL tippie of marked simplicity in construction, equipment and flexibility in loading various sizes of coal and their combinations is that at the Allied Coal Co.'s stripping operation at Sonora, Muskingum County, Ohio. A description of this installation will undoubtedly be of interest to many operators since balanced horizontal picking-table screens are here used as well as a novel provision for future crushing facilities. The tippie is designed to handle 250 tons of coal per hour. It consists broadly of a housed receiving hopper of 35 ton capacity, a feeder, a steel apron-type elevating conveyor, a set of Jacobsen balanced horizontal picking-table screens combining coal-preparation and refuse-disposal facilities, a refuse storage, a lump loading boom and a compact power plant.

The coal is brought from the strip pit to the tippie in trains consisting of an 18-ton dinkey locomotive and Western side-dump cars of 4-cu.yd. capacity that discharge into the wooden steel-lined receiving hopper of 35 tons capacity. The receiving hopper is provided with a reciprocating feeder for uniformly feeding the coal onto the lower end of the steel apron conveyor, which extends into the waterproofed concrete pit supporting the receiving hopper. Power is imparted to the feeder by a chain drive from the conveyor foot shaft, while a clutch is provided for disengaging the feeder so as to permit operation of the conveyor independently of this device. Thus, most conveniently, the conveyor, at the close

of each day's work, may be left entirely free from coal. The apron conveyor elevates the coal for direct discharge to the tippie screens. It has a capacity of 250 tons per hour, is 36 in. wide and approximately 105 ft. long and is belt-driven from the countershaft indicated in the accompanying line drawing. The discharge end of the conveyor delivers the coal at a uniform rate over a chute directly to the horizontal shaker screens.

The Jacobsen balanced horizontal picking-table screen as here installed consists of a pair of horizontally reciprocating troughs, an upper screen section and a lower steel

trough section. The screen and the trough section have relatively reverse conveying motions, and as they are mounted on floating-type rollers, there is no vertical motion in the movement of the screen, so that coal can be readily hand-picked directly on the screening surface. The two screens, or troughs, are so arranged that the vibratory effect of one is balanced by the counter effect of the other.

The operating mechanism for driving the reciprocating screens is shown in one of the illustrations. Two pairs of oppositely mounted ordinary eccentrics are driven from a shaft, each pair operating one of the screens. A uniformly rotating, power-driven, differential fly-wheel pulley is so arranged as to impart to the shaft a motion that is slow at first, gradually accelerating toward the end of the stroke, then quickly reversing and flowing down toward the end of the return stroke.

Stripping coal is getting a bad name in the market because too many strippers believe that nothing more is necessary than to provide for uncovering, digging and loading the coal. Because the coal comes from an open cut is no reason why it should not be as carefully prepared as any other fuel and with as much care as is taken in this tippie.

FIG. 1. CROSS-SECTION OF PREPARATION PLANT

Side-dump cars deliver the coal to a hopper from which it is fed to a conveyor that delivers it to the screening plant. Almost any combination of sizes can be delivered to almost any track under the tipples.

All parts of the machine are carefully designed and constructed. The eccentric straps and all the important elements are castings of steel. Bronze bushings are used in the bearings. The whole driving mechanism is mounted on a cast-iron base, and the equipment is all placed on one floor. This not only makes possible a more simple and less expensive tipples structure but also affords greater accessibility.

The upper screen is 5 ft. wide and approximately 45 ft. long. It is arranged to receive the coal directly from the conveyor chute, under which it extends and reciprocates. For removing the slack the coal is first passed over 12 ft. of 3/8 x 7/8 in. lip screen. Part of the slack coal is caught on the short horizontal deck under

this screen and conveyed forward to the slack chute, which is flared at the top to receive the remainder of the slack. This delivers the fine material to the center compartment of the lower trough, which, as above stated, has a reverse conveying action and will therefore carry its contents a short distance back for discharge into the slack hopper. A standard rack-and-pinion gate controls the discharge of the slack from the hopper into the slack car.

The lump-and-nut coal, which has been relieved of the slack, can now be picked as it passes over the blank plate and then over the 6 ft. of 1 1/4 x 1 1/2 in. lip screen for removing the nut. The nut coal is received on the lower deck, and is lowered through a gate onto an ele-

FIG. 2. TWO SHOVELS AT WORK IN THE STRIP PIT

This stripping is not particularly different from others except that Western side-dump cars are employed for removing the coal. Both shovels are full-revolving and the smaller is mounted on caterpillar trucks.

vated trough, which is rigidly supported on the lower trough and will therefore convey the nut coal backward for discharge into the nut chute which is provided with a special hinged apron discharge for proper loading into the nut car.

The lump coal in its travel is slightly deflected to one side of the screen trough and then discharged with practically no drop through a gate into a short chute and thence onto the apron-conveyor loading boom. This Webster loading boom, which is employed for lowering the lump into the car without breakage, is 48 in. wide, has a 20-ft. horizontal section and a 24-ft. hinged section which is so pivoted that it can be raised and lowered for careful loading and trimming of the cars. When first loading an empty car the discharge end of the boom is placed a short distance above the car floor. The loading boom is belt-driven from a countershaft.

Simple manipulation of a pair of cables from the trimmers' platform will operate either one of a pair

of the upper screen and discharged into the lower trough compartment, in which both sizes are conveyed backward for loading on the nut track.

In loading picked run-of-mine the nut and lump after being picked on the screen are by-passed as above explained to the lower trough. It is obvious that if the nut gate is closed the lump and nut coal will be conveyed farther back for direct discharge into the slack hopper.

The present installation provides for future crushing of the nut or lump coal by the simple addition of a suitable frame structure as shown dotted on the drawing and the installation of a crusher to receive the coal from the end of the upper screen. It may be readily perceived that the lump coal can be discharged onto the loading boom for careful loading on the lump track and that the nut, or, in other words, all sizes between the slack and the lump, can be passed directly into the crusher by closing proper gates. In this operation the crushed coal is discharged directly onto the extension

FIG. 3

### Mechanism Driving the Shaking Screens

A uniformly rotating, differential, flywheel pulley drives the eccentric shaft at a non-uniform speed of rotation. The screens are thus given unequal or conveying oscillations.

of clutches that control the operation of the small hoisting drum, which is connected to the boom drive and arranged to raise and lower the hinged section as desired or to stop or start the conveyor.

If it should be desired to mix the nut with the slack, it is only necessary to open a gate in the upper section of the shaker. This will discharge the coal directly into the center compartment of the lower trough. With the gate in this section closed, the nut coal will be conveyed back toward the slack hopper, where, preceding its discharge thereto, it is mixed with the slack coming from the upper screen through the slack chute.

Lump and nut can be loaded over the loading boom by the proper manipulation of the gates controlling the movements of these sizes. This will permit the discharge of the lump and nut over the chute to the loading boom. If it is desired to load the lump and nut on the nut track a different setting of the gates can be made so that both sizes will be conveyed toward the end

of the lower trough and is conveyed backward for loading either on the nut track or for mixing with the slack and loading on the slack track as picked, crushed run-of-mine.

In crushing, the closure of the proper gates permits the lump to pass directly into the crushed and over the lower trough for loading on either the nut track or for mixing with the slack. The nut coal in this case is discharged onto the loading boom for loading on the lump track. The entire equipment is so flexible that a simple manipulation of gates will readily afford the loading of the various sizes and their combinations as indicated in the drawing.

The conveying action of the coal over the upper screen is such that the refuse can be conveniently removed by hand. The pickings are dropped into chutes which feed into the two narrow refuse troughs formed integrally with the lower coal trough and of course have the same backward conveying action. This causes the

FIG. 4. SCENE IN THE PICKING ROOM

The pickers are seen at work on the upper deck of the horizontal conveying screen. The lump coal is pushed to one side of the shaker before delivery.

refuse to discharge into the refuse storage bin, whence it can be conveniently removed at desired intervals.

This horizontal screen gives better preparation and more thorough screening than is possible with similar devices of the inclined type. The sizes are delivered from the screen to the cars with less degradation than with an inclined screen, because the distance traversed is shorter.

The entire tippie and power plant is of frame construction built on concrete foundations. The power plant consists of one 150-hp. 72 in. x 16 ft. Erie City high-pressure stationary boiler, and 16 x 18 in. "Vim" heavy-duty, center-crank, automatic engine rated at 125 hp., manufactured by the Ames Iron Works.

This article would not be complete if it did not make reference to the group of men whose vision and effort have made possible the complete development of this project. These include Edward A. Langenbach, president and general manager; A. J. Tice, vice-president and director of sales; A. A. Serva, assistant general manager, secretary and treasurer, and C. H. Flynn, general superintendent. The entire plant was designed and built by Jacobsen & Schraeder, Inc., engineers and constructors, Majestic Building, Chicago, Ill.

## Need For Study

By J. T. BEARD

The answers given below were selected from replies made to various questions which were asked at recent mine foremen's examinations. The examiners did not penalize for either poor spelling or bad grammar. How would *Coal Age* readers grade these answers?

*Ques.*—What are the dangers of blasting coal "on the solid"?

*Ans.*—(1) It is liable to fly back and hit yo.  
(2) Danger of atermaten into loss of lives,  
(3) It is tight shots.

*Ques.*—In what velocity of air is a safety lamp unsafe?

*Ans.*—It would not be safe in 20,000 cu.ft. of air.

*Ques.*—How would you handle a safety lamp when found full of flame?

*Ans.*—A safety lamp should be removed with precaution to where they was a curant of air consealed under your coat

*Ques.*—Describe the various systems of mine haulage with which you are famillar.

*Ans.*—(1) Split and continerous.  
(2) Sum has muls: sum has motors: sum has dinkes.

*Ques.*—In opening a new mine what are the principal questions to be considered?

*Ans.*—(1) Ventlashum.  
(2) That depen on the lokng of the seam the most serious question is shipping point.  
(3) In the opening of new mines is to open it at the least expense posibell.

*Ques.*—Which are preferable overcasts or undercasts?

*Ans.*—A overcast is bettir than a undercast for the reason the air will go up better than down.

*Ques.*—Which should be the larger, the upcast or the down-cast shaft?

*Ans.*—(1) The upcast should be the largest on account of havng largest area for returnng of air.  
(2) The upcast should be the larger because the air going up should have more room will pull better.

*Ques.*—How would you ascertain the quantity of air passing through an airway?

*Ans.*—If there is a small quantity of air it will move very slow if at all wher there is a larg quanlty it circulates fast.

*Ques.*—How may each of the mine gases be detected, etc.?

*Ans.*—(1) By a flame cap, brilliancy of light, sweet taste and pains in the back, headache and by suffocation.

(2) Carbon Dioxide is detected by putting the light out. If mixed with 7 times as much air will cause explosion.

(3) Carbon dioxide is on the bottom and is brathed slowly untill an offell ackng of head and back and limbs and will kill if not removed.

(4) Marsh gas at a certain % will explode and will kil or else burn him up.

(5) Marsh gas is litar than air in large quanites may cause sleepns and probley death. White damp is the oction taken from carbon and it will cause sleepness and dizyness. Marsh gas will be detect by headache. Several mine gases may be detected by headache are by getting your breath hard are by getting weak in your joints.

*Ques.*—Describe the anemometer and explain its use.

*Ans.*—(1) A anmometer is a vary fine piece of machinery that a safe current of air will cause it to oprate.

(2) Is a small thing round in the shape of a dollar clock and each revelation of this long hand registers one hundred feet of air.

(3) Is an ensterman in the shape of a wach case with hands to shoe the pressher of the air.

*Ques.*—What is the difference between a true fault and a fault of erosion?

*Ans.*—(1) A fault of erosion come unexpected and a true fault is where the coal plays out.

(2) A fault of erosion is where the coal stoped or was no more.

*Ques.*—What does the law require relative to the handling of powder and the charging and firing of shots?

*Ans.*—Handlig of powder sould bee handlid with care and charign and faring of shots a miner should his best gugement charigen and faring of shots.

It is not unusual to find answers such as these in the papers submitted by candidates in examination. The fact is evidence of the ever present necessity of mining companies organizing and maintaining educational classes for giving instruction in English, spelling, arithmetic and the rudimentary principles of coal mining.

Instruction should be free to ambitious workers, on recommendation of the foreman. The results will show on the cost-sheets of the mine if the instructors and their methods are of the right kind. Superintendents should take notice.

# Official Report of Coke Industry in 1919

Production Decreased but Capacity of Byproduct Ovens Increased—Number of Ovens Under Construction Falls from 1,815 in Beginning of 1919 to 853 in Beginning of Present Year—11,232 Ovens Are Now Built and Building

**O**UTSTANDING features of the coke industry during the year 1919 were the great slump in demand that followed the armistice and a remarkable increase in the proportion of byproduct coke made as compared with beehive coke. According to preliminary estimates made by F. G. Tryon, of the U. S. Geological Survey, the total production of coke in 1919, including beehive and byproduct but excluding gas-house coke, was 44,821,000 net tons, a decrease, as compared with 1918, of 11,657,000 tons, or 20.6 per cent.

The decrease was confined almost entirely to beehive coke, the production of which fell off 36 per cent. The output of byproduct coke decreased only 3.2 per cent. The output of byproduct coke consequently exceeded that of beehive coke for the first time. In 1918 about 46 per cent of the total coke made in the United States was produced in byproduct ovens and 54 per cent in beehive ovens. In 1919 the proportions were reversed, 56 per cent coming from byproduct and only 44 per cent from beehive ovens. The year 1919 thus marked a turning point in the history of coke manufacture in the United States.

## COKE MANUFACTURED AT GAS PLANTS

The quantity of coke manufactured in 1919 at illuminating-gas plants, not included in the figures given above, was about 3,200,000 tons. The total quantity of coke produced in 1919 was therefore about 48,000,000 tons. The figures for beehive coke are estimated from shipments by rail. Those for byproduct coke are based on reports collected from producers in a preliminary canvass. The figures for both are subject to revision and will be revised when the annual statistical canvass is completed.

The blast furnaces are the great customers of the coke industry. In 1918, according to the statistical report of the American Iron and Steel Institute for 1918, they consumed 45,704,000 net tons of coke, or 81 per cent of the total output of beehive and byproduct coke combined. In 1919 the production of pig iron fell off 22 per cent and the demand for coke declined in proportion. The reaction was especially felt by the producers of beehive coke. With the growth in the output of byproduct ovens, the beehive coke industry is likely to become more and more an auxiliary source of supply, carrying the peak load in times of extreme activity and correspondingly restricted in times of depression. This fact makes the current output of beehive coke a highly sensitive business barometer.

## BEEHIVE COKE OUTPUT FOLLOWS PIG IRON SUPPLY

Table I shows in parallel columns the monthly output of pig iron and of beehive coke in 1919. The post-war slump in the demand for both began to be seriously felt about March 15. The low point for the year was reached in May. Thereafter production slowly recovered, only to be further interrupted by the steel workers' strike, which began Sept. 22, and the coal strike of Nov. 1 to Dec. 10.

TABLE I. ESTIMATED MONTHLY PRODUCTION OF BEEHIVE COKE AND OF PIG IRON IN THE UNITED STATES IN 1919

Month	Beehive Coke (Net Tons)	Pig Iron (a) (Gross Tons)
Monthly average, 1918	2,540,000	3,255,000
January	2,384,000	3,306,000
February	1,787,000	2,948,000
March	2,091,000	3,088,000
April	1,343,000	2,474,000
May	1,103,000	2,108,000
June	1,148,000	2,114,000
July	1,482,000	2,424,000
August	1,699,000	2,742,000
September	1,755,000	2,481,000
October	1,521,000	1,864,000
November	1,647,000	2,407,000
December	1,690,000	2,630,000
Totals	19,650,000	30,586,000

( ) Figures for 1918 quoted from American Iron Steel Institute; those for 1919 from *Iron Trade Review*.

As a result the production of beehive coke fell off 10,831,000 tons, or 36 per cent, from 1918 to 1919. The total output in 1919 is estimated at 19,650,000 net tons (Table II). All districts shared in the decrease. The production in Pennsylvania and Ohio is placed at 14,861,000 tons, as compared with 22,276,000 tons the year before.

TABLE II. ESTIMATED PRODUCTION OF BEEHIVE COKE, BY GROUPS OF STATES, IN 1919, WITH COMPARATIVE FIGURES FOR 1918 IN NET TONS

	1918 <sup>a</sup>	1919 <sup>b</sup>	Decline Per Cent
Pennsylvania and Ohio	22,276,000	14,861,000	33 29
West Virginia	2,717,000	1,061,000	60 95
Alabama, Tennessee, and Georgia	2,042,000	1,695,000	17 00
Virginia and Kentucky	1,535,000	1,201,000	21 76
Colorado, Oklahoma, and New Mexico	1,401,000	558,000	60 17
Washington and Utah	510,000	274,000	46 28
United States	30,481,000	19,650,000	35 54

(a) Final figures. (b) Estimates.

## BYPRODUCT COKE

The total output of coke produced in byproduct ovens in 1919 was 25,171,000 net tons, a decrease, as compared with 1918, of 827,000 tons, or 3.2 per cent. The effect of the decline in demand for byproduct coke upon production was largely counteracted by the completion of new plants. The rate of production was higher during January, February and March than during the remainder of the year.

TABLE III. RATE OF PRODUCTION OF BYPRODUCT COKE PER 30-DAY MONTH IN 1919

	Net Tons
First quarter	2,260,000
Last three-quarters	2,043,000
Year	2,098,000

The dull season in the steel industry was most pronounced from April to July. During the last quarter of the year the byproduct coke industry suffered from the combined effects of the steel strike, which restricted the demand, and of the coal strike, which curtailed the supply of coal.

The output by states is given in table V. The figures show a general decrease as compared with 1918, which affected all states except New Jersey, Ohio and Pennsylvania. The producers in Ohio reported an increase of 4 per cent. A larger increase (16 per cent.) was made in New Jersey, and the largest of all in Pennsylvania, where the completion of new ovens caused an increase of 25 per cent.

TABLE IV. BYPRODUCT OVENS UNDER CONSTRUCTION JAN. 1, 1920

Operator	Location of Plant	No. of Ovens	Type of Oven	Probable Date Operation
Birmingham Coke & Byproducts Co	Birmingham, Ala	50	Koppers	Mar. 1, 1920
Sloss & Sheffield Steel & Iron Co	Birmingham, Ala	120	Semet-Solvay	May 1, 1920
Tennessee Coal, Iron & R.R. Co	Fairfield, Ala.	77	Koppers	Feb. 1, 1920
St. Louis Coke & Chemical Co	Granite City, Ill	80	Roberts	June 1, 1920
Dunbar-Union Coke Corporation	South Buffalo, N. Y.	150	Koppers	June 1, 1920
Lackawanna Steel Co.	Lackawanna, N. Y.	60	Semet-Solvay	July 1, 1920
Cambria Steel Co.	Johnstown, Pa	60	Cambria-Belgian	June, 1920
Jones & Laughlin Steel Co	Pittsburgh, Pa	60	Koppers	Apr. 1, 1920
Pittsburgh Crucible Steel Co.	Midland, Pa	100	Koppers	June, 1920
Domestic Coke Corporation	Fairmont, W. Va	60	Koppers	May 1, 1920
Steel & Tube Co. of America	Mayville, Wis	36	United-Otto	Jan. 1, 1920
Total		653		

In order of rank Pennsylvania came first, with 5,747,000 tons; Ohio second, with 5,445,000 tons; and Indiana third, with 3,691,000 tons. Pennsylvania has thus regained first place as a producer of byproduct coke, a position held by that state from 1915 to 1917 but lost to Ohio in 1918. Pennsylvania is now supreme in the coke industry. It is not only the largest producer of both beehive and byproduct coke, but it supplies much of the coal consumed by byproduct ovens in other States.

TABLE V. BYPRODUCT COKE PRODUCED IN 1918 AND 1919, BY STATES, WITH INCREASE OR DECREASE IN NET TONS

State	1918		1919		Increase (+) or Decrease (-) Tons Per Cent	
	Ovens	Tonnage Produced	Ovens	Tonnage Produced	Tons	Per Cent
Alabama	847	2,634,451	906	2,255,000	- 380,000	-14
Colorado	120	(a)	120	(a)		
Illinois	626	2,285,610	714	1,705,000	- 581,000	-25
Indiana	1,026	3,898,215	1,216	3,691,000	- 207,000	- 5
Kentucky	108	517,749	108	408,000	- 110,000	-21
Maryland	180	474,368	360	356,000	- 118,000	-25
Massachusetts	400	556,397	400	393,000	- 163,000	-29
Michigan	269	(a)	389	(a)		(a)

West Virginia	214	603,393	214	393,000	- 210,000	-35
Wisconsin	268	(a)	232	(a)		(a)
Combined States(b)		2,523,684		2,519,000	- 5,000	-0.2
Total	9,279	25,997,580	10,379	25,171,000	- 827,000	- 3

(a) Included in combined states. (b) Includes Colorado, Michigan, Missouri, Rhode-Island and Wisconsin, combined to avoid disclosing operations of individual companies.

BYPRODUCT OVENS COMPLETED IN 1919

In 1919 a total of 1,228 new byproduct ovens were completed, of which 718 were new plants and 510 were extensions at existing plants. Pennsylvania put the largest number of new ovens in operation—478. Indiana came second, with 190, and Maryland third, with 180. One new state, Rhode Island, entered the ranks of byproduct coke producers in January, when the Providence Gas Co.'s plant was completed.

During the year 128 ovens were abandoned or were so rebuilt as to be classed as new ovens.

Table IV summarizes returns made to the United States Geological Survey from byproduct operators on

new ovens in construction at the beginning of 1920. In all 853 ovens are scheduled to come into operation by July 1, 1920. Of these ovens 247 are in Alabama, 220 in Pennsylvania, 210 in New York, and smaller numbers in Illinois, West Virginia and Wisconsin. They are distributed among 11 projects, 6 of them new plants and 5 of them additions to existing plants.

Summing up ovens under construction 497 are Koppers, 180 Semet-Solvay, 80 Roberts, 60 Cambria-Belgian and 36 United-Otto ovens.

The completion of these projects will mean an increase of 8 per cent in the total number of byproduct ovens in the country. Construction is more active now than in the years immediately before 1914, when the European war began, but is less active than it was during the war. Much of the construction now under way was projected before the armistice. The number of byproduct ovens under construction in recent years has been as follows:

TABLE VII. BYPRODUCT OVENS IN CONSTRUCTION, JAN. 1, 1914-1920

1914	504	1917	2,084
1915	644	1918	2,260
1916	1,191	1919	1,815
1920			853

The following table shows the number of ovens of each type in existence on Jan. 1, 1920, the number on Jan. 1, 1919, and the number now under construction. Of the ovens put in operation in 1919, 860 were of the Koppers type; 240 were Semet-Solvay, and 128 were Wilputte.

TABLE VIII. OVENS IN USE AT BEGINNING AND END OF 1919, BY TYPE

	In Existence		Building Jan. 1, 1920
	Jan. 1, 1919	Jan. 1, 1920	
Koppers	4,829	5,659	497
Semet-Solvay	2,035	2,275	180
United-Otto	1,840	1,754	36
Rothberg	281	257	...
Wilputte	78	206	...
Cambria-Belgian	90	90	60

Total			1,228		

(a) Completed but not put in blast.

country, defined as "the maximum quantity of coke of the grade desired by the operator which can be produced when all conditions are favorable, with all ovens active," has been as follows:

TABLE IX. MAXIMUM CAPACITY OF BYPRODUCT COKE OVENS IN THE UNITED STATES, JAN. 1, 1918-1920, NET TONS PER ANNUM

1918.	27,000,000
1919.	33,700,000
1920.	39,500,000

In the year 1918 there was thus an increase in the annual capacity of coke ovens amounting to 6,700,000 tons, or 25 per cent. The increase during the year 1919 was somewhat smaller—5,800,000 tons, or 17.2 per cent.

The annual capacity of the plants completed and in operation at the beginning of 1920, including ovens temporarily idle, was 39,500,000 net tons. This figure represents the output at full capacity—operation of 100 per cent. In actual practice an average operation above 90 per cent cannot be assumed for the country as a whole. Weekly reports received from the byproduct plants during the war show that from Dec. 28, 1917, to Feb. 1, 1919, the highest percentage attained for the entire country was 92.2, the output reached in the week ended Sept. 28, 1918. The average for the year 1918, when every effort was being made to speed up the recovery of byproducts, was 86.9 per cent of maximum capacity. The average for 1919 appears to have been about 70 per cent.

#### ESTIMATE OF COKE AND BYPRODUCTS RECOVERABLE

In estimating the coke or the byproducts recoverable from the country's existing byproduct ovens the assumed percentage of operation should therefore not exceed 90 per cent. Indeed, the safer figure of 85 per cent would appear better justified by experience. The present capacity of the byproduct ovens of the country in net tons per annum would therefore be that shown in table X, the yield of coke from coal being taken as 71.2 per cent. the average for 1917-18.

TABLE X. CAPACITY OF BYPRODUCT COKE OVENS IN 1920, IN TONS

	Coke	Coal for Charge
Assuming 90 per cent operation...	35,500,000	49,800,000
Assuming 85 per cent operation...	33,600,000	47,100,000

The completion of the plants now under construction may raise the capacity to a maximum of approximately 43,300,000 tons, or 36,800,000 tons under an operation of 85 per cent. In connection with the supposition that a limit to the production of byproduct coke may be reached, it may be noted that this quantity is 65.2 per cent of the coke produced in 1918, the largest quantity ever used by the country in one year. It is 69 per cent of the coke required for producing 49,666,000 gross tons of pig iron, the annual capacity of the coke-burning blast furnaces completed or building on Jan. 1, 1919, according to the annual statistical report of the American Iron and Steel Institute, the coke consumption being taken at 2,375 lb. per gross ton of iron. It is 61.7 per cent of the country's total requirements for coke in the war year 1918, as estimated by the United States Fuel Administration, less sales of gas-house coke, amounting to 1,814,000 tons.

Final statistics showing the quantity and value of byproducts recovered in 1919 are not yet available, but an idea of the quantity may be obtained by multiplying the number of tons charged into the ovens in 1919 by the average quantity of byproducts recovered in 1918 per ton.

TABLE XI. AVERAGE RECOVERY PER NET TON OF COAL CHARGED INTO BYPRODUCT OVENS IN 1918

Ammonia (all forms) expressed in terms of equivalent ammonium sulphate, pounds.	18.9
Tar, gallons.	7.1
Crude light oil, gallons.	2.4
Gas, 1,000 cubic feet.	10.4

The figures, if multiplied by the 35,353,000 net tons of coal charged in 1919, as estimated from known coke production on yield of 71.2 per cent—the average for 1917-1918—would give 668,200,000 pounds of ammonium sulphate or its equivalent, 251,000,000 gallons of tar, 84,800,000 gallons of crude light oil, and 367,700,000 cubic feet of gas.

For purposes of comparison the actual production of byproducts in 1918 is reprinted below.

TABLE XII. BYPRODUCTS OBTAINED FROM COKE-OVEN OPERATIONS IN 1918

Product	Production	Sales	Value of Sales
Tar..... gal.	263,299,470	200,233,002	\$6,364,972

Solvent naphtha..... gal.	3,540,162	3,123,815	439,983
Other oils..... gal.	636,707	571,752	53,880
Crude naphthalene..... lb.	10,614,799	10,403,758	287,581
Refined naphthalene..... lb.	5,472,699	5,486,689	362,648
Other products (b).....			1,756,345
Total.....			\$74,602,458 c

(a) Includes liquor and sulphate sold by pound of ammonia.  
(b) Includes sodium ferro-cyanide, pyridin oil, nut coke, drip oil, spent oxide residue, coal-tar paint and wash oil.  
(c) Does not include value of 1,999,370 net tons of coke breeze.

If the figures showing the recovery of byproducts per ton are multiplied by the number of tons given above as the annual coke capacity of the ovens now built and building in the United States, namely, 36,800,000 tons—a moderate estimate, assuming 85 per cent operation—the annual capacity for the recovery of byproducts by the end of 1920 will become 977,100,000 pounds of ammonium sulphate, or its equivalent, 367,000,000 gallons of tar, 124,000,000 gallons of crude light oil, and 537,300,000,000 cubic feet of gas.

## Harlan Miners and Guards Fight

**B**ANDS of mine workers are searching the woods of Harlan County on the Kentucky-Virginia border for the operatives of a protective agency who were alleged to have started a fight at Wallins Creek on Saturday night, March 20, which resulted in the death of three persons and the wounding of several others.

It is said that the Kentucky Steam Coal Co. imported onto their mine holdings a number of guards or detectives, to take care of the property, a strike of the mine workers being in progress, and that a clash resulted in which Bud Taylor, a miner; Deputy Sheriff John Burke and James Hall, a detective, tried to arrest a son of Bud Taylor. This precipitated the battle, which at first was a duel between Taylor and Hall, but soon became a general mêlée as the result of mine workers and guards arriving on the scene.

More than one hundred shots were fired before the detectives were driven to retreat. Much ammunition is said to have been received by the mine workers and a general strike was expected on April 1.

# Safe Plan for Taking Powder Into Mines

Powder Is Placed by the Shaft Tender in Non-conducting, Tight Boxes, Each Holding Five Kegs—  
The Boxes Are Lowered One at a Time in an Otherwise Empty Cage Trip.

BY DEVER C. ASHMEAD  
Tarrytown, N. Y.

**S**AFETY FIRST is one of the slogans of the Kingston Coal Co. of Kingston, Pa. Handling powder at a mine is probably one of the most dangerous of operations and one in which every possible precaution should be carefully considered. Ways and means therefore should be provided for reducing the danger

at the Baltimore Tunnel, where 92 men were killed.

At the mines of the Kingston Coal Co. the greatest care is taken to prevent accidents of this character. Rules, regulations and instructions are provided so that the men will take the proper precautions, willingly, if possible, but if not willingly they are made to be reasonably cautious by the mine officials.

In the morning, when going to work, the men who have powder orders take them to the magazine, where they are filled. Each man is given a large red tag on which the word powder appears in white. Strings are attached to this sign and it is hung around the man's neck. In one of the accompanying illustrations a miner is seen at the powder magazine receiving his sign preparatory to hanging it around his neck. As may be observed in the same illustration the magazine is well and attractively constructed of concrete.

After the miner has received his powder and his

**COAL COMPANY'S IMPOSING POWDER MAGAZINE**  
Miner receiving his powder supply. He is here given the powder sign, which he has already around his neck, so as to give proper warning to all around him that he is handling explosive material.

**FILLED POWDER BOX READY TO BE LOWERED**  
Note the box on the floor of the otherwise empty cage. No men are permitted to ride on this trip, thus avoiding danger from the falling sparks of the mine works' exposed lights.

of accident arising from explosions. Unfortunately, there have been in the past numerous instances where, from some cause or other, explosions have occurred causing very serious loss of life. Probably the most disastrous recent occurrence of this nature was that

**SHAFT TENDER RECEIVING POWDER FROM MINERS**  
The miners are required to deliver the powder to the shaft tender who places it in specially prepared box which holds five kegs.

sign he proceeds to the shaft down which the powder is to be sent. The explosive is delivered by the miner to the shaft tender, who places it, as shown in one of the illustrations, in a specially constructed box. This is just the proper size to hold five kegs of powder and has handles on each end for convenience in carrying.

There is a well-built and strong cover for the box to protect it from falling articles or flashes of fire. The box is a non-conductor and protects the contained explosive from electric discharges. Both sides of the box bear the word "Powder" painted in large red letters, while on the top also in red are the words "Safety First."

The next illustration shows the box containing the powder placed on the platform of the cage ready to be

lowered into the mine. No men are allowed on the cage while the powder is being lowered. This removes the danger incident to the men carrying lighted lamps while on the powder cage. If there is an accident from other causes there are no men on the cage to be

MINERS WAITING ON CAGE TO BE LOWERED

On the next trip to the one on which powder is sent down the miners are lowered and when they reach the bottom their powder is given them to carry on foot to the working face.

hurt and in that case the damage will be done only to the company's property.

The last illustration shows the men, whose powder has been sent below on the previous trip, just about ready to descend into the mine, where they will receive their kegs of powder and will surrender their tags. Underground the men are not allowed to transport their powder on trips, but must carry it by hand to their working places.

## With Decline in Tonnage, Fatal Accidents Decreased in 1919

Fatality Rate Per Ton Increased Slightly—Surface Fatalities Declined 25 Per Cent; Mine Cars and Locomotives, 28 Per Cent; Coal and Rock, 15 Per Cent

A COMPLETE statement of the coal-mine fatalities occurring throughout the United States during the calendar year 1919 has just been issued by the Bureau of Mines, Department of the Interior.\* The reports received from the inspectors for the year just closed show a reduction of 10.58 per cent in coal-mine fatalities as compared with 1918, while in 1918 the reduction was 4.5 per cent from 1917 figures. The total number killed was 2,307 in 1919 and 2,580 in 1918, a reduction of 273.

There was a decrease of 128, or 25 per cent, in fatalities resulting from mine cars and locomotives, and a decrease of 198, or 15 per cent, in the fatalities due to fall of coal or rock. Surface accidents show a decline of about 25 per cent as compared with the previous year. There were, however, increases in accidents due to gas and dust explosions and also explosives. There occurred during the year nine disasters in which five or more men were killed, representing a total of 201 fatalities.

\*Copies of this publication may be obtained free of charge by addressing the Director of the Bureau of Mines, Washington, D. C.

The worst disaster of the year was the one occurring at the Baltimore Tunnel 2, Wilkes-Barre, Pa., resulting from the explosion or burning of a number of kegs of powder, by which 92 lives were lost. This disaster emphasizes the need for stricter regulations relating to hauling men and explosives into the mine at the same time. The question of whether electricity was responsible or not does not affect the consideration of the various dangers which arise in underground transportation and handling of explosives.

At best the handling and hauling of explosives is hazardous, and such being the case, no one, other than the necessary attendants, should be permitted to ride in cars or cages transporting explosives. As a result of this disaster, the report of the coroner's jury to the Governor of Pennsylvania brings out some important dangers to be avoided in the use and transportation of explosives.

The conditions under which the mines were operated in 1919 were not normal, as the country had not become adjusted to the new commercial conditions brought about as a result of the war. There were numerous labor troubles during the year and on Nov. 1 a strike almost completely shut down the central bituminous field, with the result that but little coal was mined during the month of November and the early part of December.

According to the preliminary estimates of the U. S. Geological Survey for the year 1919 the total production was 458,063,000 tons of bituminous coal, which is a reduction of 121,323,000 tons as compared with the previous year. The anthracite production is estimated by the U. S. Geological Survey as 86,200,000 tons, or a reduction of 12,600,000 tons from the preceding year.

While the actual number of fatalities is considerably less than in 1918, the ratio, on a tonnage basis, is slightly higher. The number of tons produced per fatality in 1918 in the bituminous mines was 285,552, as compared with 275,000 tons per fatality in 1919. In the anthracite field the production per fatality in 1918 was 262,873 tons, as compared with 135,700 tons per fatality in 1919. The average for the entire coal-mining industry was 235,900 tons per fatality, as compared with 262,873 in 1918, 241,618 in 1917, 265,094 in 1916, and 234,297 in 1915.

Complete figures showing the number of men employed are not available, but estimates received from the inspectors total about 765,000. Although the number of names on the payrolls may be slightly in excess of 1918, the actual number of days' labor performed during the year will be much less than in the preceding year because of the irregular working of the mines on account of car shortage, strikes and the unsettled demand for coal.

When the number of employees is properly weighted on the basis of full-time workers, the reduction in accident rates may not be as great as first appears. This rate on a tonnage basis does not show any improvement; in fact, the contrary is indicated.

## Even Today Uncertainty Rules

MOST of the operators in the East are marking time, awaiting the settling of conditions before naming contract prices. The general feeling is one of hesitancy. The operators are asking: Are the prices being contracted for likely to be stable and would it be well to follow them in making other con-

tracts? There is a fear on the part of the smaller operators that the large companies may "bear" the market. The large companies, however, are afraid that the little fellows, by reason of an incorrect knowledge of costs, will undercut prices.

In a few instances, quotations have been made to large consumers, of \$3.50 for r.o.m. and \$4.00 for 4-in. lump from the Pittsburgh District; and \$3.75 to \$4.25 from central Pennsylvania. These prices are basic for April 1, and subject to whatever increase in mining rates may be applied thereafter.

Several large contracts have been closed in recent weeks "at the government rate while the same lasts, and a price be agreed upon thereafter," thus protecting the consumer's tonnage. It does not appear probable that definite prices may be expected in all districts before another week.

## Alaska Lignite Makes as Much Steam Per Pound as Cord Wood\*

After 14 Months It Had Lost 6.08 Per Cent in Weight, Mostly Moisture—Weathered Only Where Unprotected by Lignite in Pile

THE Fairbanks (Alaska) Station of the Bureau of Mines has recently completed two series of tests designed to determine, first, the comparative steaming value of Alaska lignite and spruce wood, and second, the resistance of lignite to weathering when stored in piles in the open. The tests were made under the direction of John A. Davis, superintendent of the station, who was assisted by Paul Hopkins and John Gross. These investigations are of special interest to Alaska, since much has been written about the large lignite fields of the Nenana district and their possible value as a fuel supply.

The steaming tests were run to determine the relative value of lignite and spruce wood in the small boilers commonly used in the mining camps of Alaska. Spruce wood has been used for steaming purposes almost exclusively in the past, but the price has risen from \$7 to \$20 per cord in the last 15 years, and other sources of fuel are sought. The lignite used in the tests was not of the highest quality, since it was obtained near the surface. Both the wood and the lignite were carefully weighed, sampled and analyzed, so that the results of the tests could be accurately compared. The boiler used was one of a battery of two horizontal water-tube boilers, each rated at 125 b.hp. Two grades of lignite, one from the Lynn mine and one from the Burns mine, and one grade of wood were tested.

The results showed that under the conditions of these tests, when compared pound for pound, the value of spruce wood lay between the values of the two samples of lignite. The relative water evaporations per pound of fuel were: Lynn lignite, 3.06; Burns lignite, 3.99; spruce wood, 3.68 lb. However, in comparing a cord of wood with a ton of lignite, it was shown that a cord of wood is equivalent to more than a ton of lignite from either mine.

In the weathering tests several hundred pounds of Nenana lignite were used. It was first carefully sampled for analysis and then sized through a series of rings from 3/8 in. to 2 in. in diameter; 80 per cent of the sample was retained on a 1-in. ring. The lignite was

then spread in shallow trays and placed on the roof of the station, where it was allowed to remain, fully exposed to the weather, for fourteen months. At the end of a week it was noticeably weathered on the surface and at the end of a month it had broken up into small pieces.

At the end of the test period it was found that the surface portion, immediately exposed to the atmosphere, was entirely disintegrated, while that farthest from the surface was only partly disintegrated, although very fragile. Over 50 per cent would then pass through a 3/8-in. ring and 85 per cent through a 1-in. ring. The average loss in weight through weathering was 6.08 per cent, mostly moisture.

The weathering at the end of 14 months, however, seemed only slightly more than that at the end of one month. In large piles only, the surface to a depth of 4 in. to 6 in. would weather badly and the material beneath would be so protected as to suffer little change. These tests show that the behavior of these lignites is substantially the same as that of North Dakota lignite.

## "Right" of Strikers to Obtain Reinstatement

ON MARCH 25 was reported in the "Coal and Coke News" department under Birmingham, Ala., the decision of Judge E. H. Dryer, umpire between coal operators and mine workers, to the effect that when a man goes on an illegal strike he cannot demand reinstatement. A case in the West Virginia mines shows to what extravagant lengths such reinstatement claims are stretched.

For declining to reinstate a check-weighman who had refused to report for work even after the conclusion of an illegal strike the Price Hill Coal Co., operating at Price Hill, Fayette County, has been subjected to a somewhat prolonged strike at the mine mentioned. Its mine workers to the number of 85 went on strike in the first instance, not over the appointment of a check-weighman but because the company failed to employ two brakemen on its coal trains.

Upon the failure of the company to provide these two men a strike followed. It lasted only a few days, however, when 75 men out of the 85 returned to work. The old check-weighman was not among those so reporting and consequently another check-weighman was chosen. When, after the lapse of about a week, the old check-weighman appeared and demanded his old job the company refused to displace the new man.

Upon the refusal of the company to make the change the mine workers went on strike again. Heretofore there has been little friction between the miners and the management of the Price Hill Company, that company having been one of the companies which early put the check-off system into effect.

## Resent Reduction in Mining Rate

FOR several days the mine workers at No. 10 mine of the Big Muddy Coal and Iron Co., near Murphysboro, in Jackson County, Illinois, have been on strike, the men, who number 130, declaring that the company has endeavored to reduce the rate of pay for the mining of low coal.

President McAllister, of the 8th Sub-District, United Mine Workers of America, advised the men to return to work pending adjustment of the matter, but they

\*U. S. Bureau of Mines Monthly Reports of Investigation.

refused to do so. Company officials say they will not undertake any adjustment while the men remain out of the mine, and the men refuse to return to work until the matter has been satisfactorily adjusted.

It may be gathered from the action of the union officials that the strike is not against the violation of a definite scale but for the perpetuation of some alleged concession relating to a small portion of the mine.

## Mobile Protests Against High Coal Export Rates

Differential of \$1.50 Less Than South Atlantic Ports Has Not Been Put in Effect

**M**AINTEINING that the differential of \$1.50 on export coal from Mobile to South American ports below the rate applying from Charleston and Norfolk has never been put into effect, T. C. McGonigal is preparing to go to Washington within a few days to take up the matter with the Shipping Board officials there.

Exporters are claiming, it is said, that the schedule published by the shipping board Jan. 9, said to be the last received by the local office, does not allow the differential. According to information given out at the Shipping Board office the matter of whether this is provided in the latest schedule is being investigated.

Through the efforts of Traffic Manager Cobb of the Chamber of Commerce and coal exporters the Shipping Board several months ago ruled that Mobile was entitled to a lower rate than South Atlantic ports, but failed to publish the rates. After a time a committee from Mobile went to New Orleans to see M. P. Billups, then in charge of this division, in regard to putting the rates into effect and was assured by him that they would become operative at once.

That was on Jan. 5, and as the decision was made even earlier, it has been the opinion of local shipping board officials, according to J. G. Santa Cruz, in charge of the local office, that the rates published for Jan. 9 included this reduction. Mr. Santa Cruz stated that he is making an effort to have the matter cleared up.

## Public Should Not Buy Too Early Is Opinion in Washington

May Cause a Runaway Market—Middle West Market Is Weak Already—Not Advisable to Store Coal Subject to Spontaneous Combustion

**W**ITH an open market and with the "buy early" legacy left by the President's Bituminous Coal Commission, coal specialists in Washington fear a runaway market. As nearly as it can be calculated the amount of coal stored in the country is negligible. Since no one is under the delusion this year that coal prices will be lower in the fall very heavy buying is expected. This tendency is being influenced markedly by the President's request that Federal, state and municipal authorities set the example by storing three months' supply of coal.

The consensus of opinion among those following the coal situation in Washington is that the abnormal rise in prices will be of short duration. It is pointed out

that the bidding up of the price of the more desirable coals is not general, as is indicated by the rather soft market in the Middle West. One factor which is expected to check buying for a month or two at least is the fact that a large percentage of the consumers are not equipped to store a three months' supply of coal.

It is also pointed out that those of the consumers whose use of coal is seasonal hardly can be expected to go more heavily into storage than they did during the war. It also is known that coal men themselves are fully alive to the inadvisability of putting out for storage purposes the class of coal that will not stock. As a result many will not be able to get the class of coal which can be stored profitably until December.

## Freight-Rate Differential Strongly Opposed in the Senate

Railroads Might Hamper Low-Rate Summer Shipments—Frelinghuysen Coal Commissioner Looked On with Little Favor

**S**ENTIMENT on Capitol Hill is not such as to insure the early passage of the Frelinghuysen bill which makes mandatory a differential of 30 per cent in railroad rates in favor of coal moved in the summer against coal moved in the winter. Already members of Congress have been hearing that there are two sides to the seasonal-rate question, and it is certain that extended deliberation will precede the enactment of any statute to that effect.

The desire and need for this method of encouraging summer buying was originated in the West. The East, which represents the greater part of the coal production, is still to be heard from, with some indications that it may have an entirely different opinion as to the beneficial results of special rates. The opportunity which would thus be offered to the railroads to use their influence to delay as much of the coal movement as possible until fall, when there would be a difference in the freight rates of as much as 40c. a ton, also is being considered. The temptation would be great to find ways of keeping as many cars as possible out of coal transportation during the low-rate period.

Even in the Middle West an important economic factor would have to be met in attempting to keep the coal mines working steadily throughout the summer. If these mines were to be kept busy throughout the spring and summer some are of the opinion that the Middle West would be forced to discontinue the greater part of its farming. It is said that with abundant opportunity for men to work in the coal mines at the present high rates of pay it would be impossible for farmers to secure labor.

Despite the argument against the seasonal variation in railroad rates the probabilities point to the application of the idea in some modified form. Any step in that direction, however, is not expected to be immediate, and even Senator Frelinghuysen, who is an enthusiastic champion of the seasonal regulation of rates, says that nothing much can be done in the matter just at present. The Interstate Commerce Committee of the Senate has made no provision for a hearing on the Frelinghuysen bills.

Nor is the bill providing for a Coal Commissioner meeting with favor. Many are of the opinion that it would be impossible to administer a law setting forth duties of such a far-reaching character.

## Tilson Would End Lever-Act Powers of President Wilson

Leaves Federal Trade Commission Power to Make Inquiry as to Production Costs—Gives President Thirty Days to Wind Up Regulation

IN ORDER to end the excessive regulation of coal by the President, Representative Tilson introduced on April 1 H. R. 13,405, terminating "certain powers of the President in respect of fuel." Section 1 repeals the provisions of Section 5 of the Lever Act in so far as they apply to fuel, including fuel oil and natural gas. Section 2 modifies Section 25 of the same act giving the Federal Trade Commission the power to "make full inquiry, giving such notice as it may deem practicable, into the cost of producing coal and coke under reasonably efficient management at the various places of production," exercising such powers as were given it under the act creating the commission approved Sept. 26, 1914.

Section 3 extends "the powers of the President, the Federal Trade Commission and any other agency of the Government to fix the price or to regulate the method of transportation, sale, shipment, distribution, apportionment and storage of coal and coke for 30 days after the passage of this act, to the extent that may be necessary to complete the shipment and regulate the price of coal or coke in transit at the time of the passage of this act, in accordance with the provisions of any regulation or order issued in the exercise of such power with respect to diversion of such coal or coke." The President is authorized and required to wind up "all matters arising out of the exercise of the powers terminated thereby" in 30 days.

Section 4 prevents the act from being regarded as pardoning offenses committed against the Lever Act when in full force and effect, whether committed prior to the passage of this act or during the 30 days sequent on its approval.

## West Virginia Will Not Strike

No Conferences Will Be Held Until Settlement in Central Competitive Field—27 Per Cent Increase Probably Will Be Paid

OPERATORS and miners in both District 17 and District 19, United Mine Workers of America, though belonging to what is known as the outlying districts, are expected to ratify the action taken in New York on March 29 when a 27 per cent increase in wages was agreed upon, and in fact to ratify whatever agreement may be made as to working conditions, etc. However, no conferences looking to an agreement on a wage scale and other matters requiring agreement will be held between operators and miners of the organized fields of West Virginia until negotiations between the operators and miners of the Central Competitive Field are consummated.

No statement has been made by West Virginia operators as to whether the 27 per cent increase agreed upon in New York would be paid in the organized fields of West Virginia, but it is taken for granted generally that they will do so, although when all wage contracts in West Virginia except those of the New River field and

of the Kingston Wesley districts on Paint Creek expired on April 1 there was no cessation of work on the part of miners except to celebrate the anniversary of the establishment of the eight-hour day, nor, in the opinion of Fred Mooney, secretary of District 17, U. M. W., and of T. L. Lewis, former national president of the United Mine Workers, but now secretary of the New River Operators' Association, will there be any cessation.

Any agreements which may be reached in District 17, covering the Kanawha and northern West Virginia fields, and in District 29, covering the New River field, will be modeled largely after the agreement for the Central Competitive Field. Indictment of Central Field operators and miners for entering into "check-off" agreements may have a bearing on the continuance of the check-off system in West Virginia, although so far there has been nothing whatsoever to indicate that outcome.

## Bill to End Federal Coal Control

Measure Introduced in the House Also Provides That No Railroad Shall Seize or Divert Coal

JOHN M. ROBSION, of Kentucky, introduced into the House of Representatives March 23, 1920, a bill to terminate Federal control of the coal and coke industry and to end the confiscation and diversion of coal and coke by common carriers (H. R. 13,231).

It terminates "the power and authority to license the importation, storage, mining and distribution of coal or coke; to requisition coal or coke; to requisition or operate the plant, business or any appurtenances thereof belonging to any producer of, or dealer in, coal or coke; to fix prices for coal or coke; to regulate the production, sale, shipment, distribution, apportionment or storage of coal or coke, and all powers and authority incidental thereto, conferred on the President, or on any other agency of Government in pursuance" of the Lever Act, except that such powers shall continue in effect for 30 days after this act becomes law to the extent that may be necessary to settle up all matters, affairs and transactions growing out of the exercise of such powers and authority and the execution of the provisions of the Lever Act.

This termination of the power and authority of the Lever Act shall not affect any act done, or any right or obligation accruing or accrued, or any suit or proceeding commenced in any civil case before the date this new act becomes law; but all rights and liabilities under the Lever Act, arising before the termination of its authority shall continue and may be enforced in the same manner as if such powers and authority had not been terminated. Any offense committed, and all penalties, forfeitures, or liabilities incurred prior to such termination may be prosecuted or punished in the same manner and with the same effect as if such authority had not been terminated.

Section 1 of the Interstate Commerce Act is amended by adding the following paragraph: "Hereafter no carrier by railroad subject to this act shall confiscate, seize, or divert for its own use, or for any other purpose, whether with intent to make proper compensation therefor or not, any coal or coke of which it is in possession solely as a common carrier, and which the owner has not voluntarily sold or transferred, or entered into a contract to sell or transfer, to such carrier by railroad."

# Open-Price Bureau and Scheme to Sustain Price Declared Unlawful

American Hardwood Manufacturers Association Conducted "Plan" for Open Prices, Reports on Stocks on Hand, Output and Circulated Statements Prophesying and Urging High Prices

ONE of the leading activities of the National Coal Association has been to establish a practice of reporting the price of coal as sold by members who were willing to divulge this form of information just as stock exchanges report sales of stocks, grain, cotton, etc., for the good of the public and the information of members. Since the National Coal Association is about, with the end of Federal control, again to keep a record of its selling prices it naturally inquires—Are the courts likely to adjudge such actions as being an attempt to sustain prices and to "restrain trade and commerce" in violation of the terms of the Sherman Act?

In this connection the judgment of John E. McCall, United States District Judge, who as an outcome of hearings on March 8, 9 and 10 held at Memphis, Tenn., filed an opinion granting a preliminary injunction to the United States in the case against the American Column and Lumber Co. and 332 other defendants, is of great interest. The counsel of the National Coal Association believes that its new Bureau of Economics is not in violation of the law, being unaccompanied by an attempt to maintain prices and being conducted as a bureau of record without any sinister intention of any kind.

The Government showed in the case of the American Hardwood Association, the association of which the American Column and Lumber Co., and the 332 persons enjoined were members, had an "Open-Competition Plan" under which the members of the plan continuously exchanged with one another, through a common secretary, reports showing their respective rates of production and stocks on hand, and also showed the prices which each member had received on actual sales of lumber.

Notwithstanding the affidavits of practically all of the defendants that there had been no agreements between them to increase prices, Judge McCall held that—

It cannot be with reason denied that defendants formed a combination to promote the interests of the members of the plan by maintaining price levels, and it is difficult, if not impossible, on this record to escape the conclusion that the purpose and intention of the plan was to suppress competition among its members in the hardwood-lumber manufacturing business, wherein the production of hardwood lumber was to be kept low enough to maintain prices on an ascending scale but not so low as to drive prices to such heights that consumers

would be induced to use substitutes. These two objectives mark the margins of the channels through which the members of the plan conducted by its manager of statistics were to steer interstate commerce in hardwood lumber and through which it was successfully steered on up to the filing of this bill.

Therefore he enjoined the defendant from continuing to exchange the reports in question.

This proceeding was of a civil character; but the Department of Justice considers that the law as applied in the case is clearly established. The members of other similar organizations will not be considered by the department as entitled to conduct operations of a like

nature in future because they may have filed papers at Washington, or because of other similar reasons; and the department will, if necessary, institute proceedings of an appropriate character to enforce the law. The judge in his opinion said:

The bill of complaint is brought under section 4 of an Act of Congress, 26 Stat. L., 209, by the United States of America against the American Column and Lumber Co. and 332 other manufacturers of hardwood lumber, residents and citizens of some 16 different states, charging the defendants with combining and conspiring together to suppress competition among themselves and to enhance their selling prices for such lumber, in restraint of interstate commerce, in violation of section 1 of said Act of Congress, which is as follows:

Every contract, combination in the form of trust or otherwise, or conspiracy in restraint of trade or commerce among the several states, or with foreign nations, is hereby declared to be illegal.

It is alleged that the defendant companies comprise the most important manufacturers of hardwood lumber in the United States and have been engaged for a long time in cutting down trees of the hardwood varieties and converting them into logs; in moving such logs to saw-mills and lumber factories; in manufacturing them into lumber; and in the selling and shipping of such lumber, in interstate commerce, to manufacturers of sashes, doors, flooring, mill work, etc., and to other manufacturers and to wholesale and retail dealers for the purpose of resale. It is charged that at the beginning of the year 1919 the defendant companies were still demanding for their lumber approximately the same prices that had prevailed before the signing of the armistice in the war with Germany, and that manufacturers and wholesale and retail dealers were buying from the defendants only in small quantities, for the purposes of immediate necessities, in the belief that the prices de-

National Coal Association is about to resume the practice of reporting coal prices with the end of Federal control. Counsel of the association believes its new Bureau of Economics is not in violation of law, as it is being conducted solely as a bureau of record. The decision of Judge McCall granting a temporary injunction in Hardwood Association case is of much interest in this connection.

manded were too high. The latter expected to largely increase their purchases of such lumber from the defendants, in interstate commerce, as soon as the prices should be reduced by competition among the defendants to more reasonable levels.

Under these circumstances, in January, 1919, and continuously thereafter to the present time, it is further alleged that the defendant companies and individual defendants unlawfully combined and conspired together, in restraint of interstate commerce in hardwood lumber manufactured by them, to maintain the prices demanded in said month of January, 1919, for their lumber and to double and treble the prices, in violation of the said Act of Congress and against the public policy of the United States, by suppressing competition in prices among the defendants; by substituting therefor co-operation and agreements among themselves having the purpose and effect of maintaining and increasing prices.

The bill then proceeds to state the means resorted to by the defendants to accomplish the purpose of the alleged combination and conspiracy, which are in substance as follows (hereinafter referred to as overt acts): By joining together as members of a so-called "Open Competition Plan" under the slogan "Co-operation, not competition, is the life of trade"; and by providing and financially supporting at Memphis, Tenn., a suite of offices, clerical force and the defendant, F. R. Gadd, as manager of statistics, for the successful operation of said plan; by dividing the members of the plan into four geographical groups and holding meetings of each group each month; by printing and causing to be distributed among the defendants recommendations to make oral agreements at such meetings to eliminate competition among these defendants who had been competing.

#### MEMBERS REQUIRED TO MAKE STOCK REPORTS

By this means parties to the plan proposed to suppress "evil practices," meaning thereby the practice of competing in prices so as to secure business, by requiring each member of the plan to make monthly "stock reports" to the manager of statistics, showing the normal stock, the entire actual stock, the unsold stock, of each defendant company; and also to make to said manager "production reports," showing the normal monthly production, the actual monthly production, and the estimated future production of each defendant company; and also "sales reports," showing separately each actual sale of hardwood lumber made by each defendant company, giving the name of the buyer, the kind of lumber sold, the destination, and the selling price; by having these reports tabulated by the manager of statistics and distributed among the members of the plan.

The bill also charges that the plan provided for distributing among the defendants printed recommendations to discuss prices at their monthly meetings, and orally discussing at such monthly meetings said stock reports, production reports, and sales reports, so as to produce at each of such meetings a mutual exchange of oral statements of approval of high prices reported in the sales report as assurances that the defendants would further sustain such prices by maintaining prices as high as or higher than such prices; the mutual exchange each month through the manager of statistics in connection with the production reports, written predictions by the several defendants that high prices reported in the sales report would continue to be maintained and enhanced, so as to thus furnish further assurance that the action of each defendant in maintaining and enhancing

such prices would be supported by like action on the part of other members of the plan.

A further feature alleged to be part of the plan was the practice of the manager of statistics to distribute among the defendants printed expositions of the theory of each defendant, to be observed as a guide to prices reported as received by other defendants, to the effect that knowledge regarding prices actually received was all that was necessary to keep prices at reasonably stable and normal levels, there being no agreement to follow the practices of others, although members naturally followed their most intelligent competitors if they knew what their competitors had been actually doing, this being the theoretical proposition at the basis the Open Competition Plan.

#### EDITED REPORTS TO DISCOURAGE LOW PRICES

Questionnaires are said to have been sent out by the manager of statistics to each member of the plan asking for information showing how the theory of the open competition plan worked in practice, and the manager of statistics edited these answers and caused to be distributed among the members such parts of them as tended to show that it was successful in producing a steady advance in the prices of their products. The manager of statistics is said also to have printed and caused to be distributed among the defendants arguments against low prices, on the ground of shortage of lumber disclosed by the stock reports, and explaining how the disclosure of such shortage in the stock reports prevented prices from being lowered, followed by arguments for still higher prices on the ground of the shortage disclosed, for continued co-operation to secure higher prices on the ground of shortage in stocks, and the elimination of competition, causing to be reprinted with approval and distributed among the members statements emphasizing the advance of prices following the shortage of lumber and urging the defendants against increasing production by night work, which would in effect "kill the goose that laid the golden eggs" and would be criminal folly.

The arguments were coupled with the suggestion made in the sales report that the combination or association called the "Open Competition Plan," to maintain and enhance prices, would not be prosecuted; that prices would continue to advance so long as the shortage of lumber was maintained, and that the Sherman Law, designed to prevent the restraint of trade, should be repealed.

#### COURT ASKED TO ENJOIN PRICE CONTROL

It is further alleged that similar means are still being employed and are about to be further employed by the defendants, at Memphis and elsewhere, in consummation of their alleged unlawful combination and conspiracy to maintain the prices of hardwood lumber at and enhance it beyond the present high levels, in restraint of interstate commerce in such lumber. It is the doing of these things by the defendants, characterized as overt acts, that the Court is asked to enjoin.

The defendants file a sworn answer, in which they substantially admit doing these things charged in the bill, characterized as overt acts. They deny that they were wrongful acts and assert that the defendants were clearly within their rights under the law in the course which has been pursued, and especially do they deny every charge or intimation in the bill of any unlawful combination or conspiracy and that the doing of those

things did not and does not restrain trade in interstate commerce, but on the other hand it is asserted that the Open Competition Plan promotes competition in interstate commerce and especially among the members of the plan in that it furnishes them with information by which they can more intelligently and effectively conduct the management of their business as manufacturers of hardwood lumber.

#### MANAGER OF STATISTICS SUPPLIED DOCUMENTS

They deny that the defendants, by their course of conduct as charged in the bill, curtailed production, suppressed competition in, or maintained and increased prices of manufactured hardwood lumber. Much documentary evidence and many affidavits were introduced in support of the contention of the respective parties, all of which were documents coming from the office of the manager of statistics or affidavits of the defendants themselves, except a certain line of affidavits by parties who were not members of the plan but who were dealers in hardwood lumber, or furnished supplies to the defendants for the manufacture thereof.

In the view the Court has taken of the case these later affidavits, in so far as they are material to the question to be decided, are but expressions of opinion of the party making the affidavit. It should be said that the affidavits made and filed by the defendants do not controvert the allegations made in the bill of overt acts, but they do deny that affiants were parties to any combination or conspiracy or agreement to restrain trade in interstate commerce in the hardwood manufacturing business, by suppressing competition in prices among themselves or otherwise.

As the Court understands this record, there is no conflicting evidence to reconcile, since it comes entirely from the defendants and, whatever the case is for the Government, it is made such by the acts and words of the defendants, or some of them, themselves. It, therefore, remains for the Court to determine whether the conclusions drawn from the evidence of the Government, as stated in the bill of complaint, are in its judgment warranted.

#### QUESTION OF CONSPIRACY CONSIDERED

The first question arising is, whether the defendants in associating themselves together under the so-called "Open Competition Plan" thereby formed a combination or conspiracy. In other words, was there in the minds of two or more of the defendants a design to accomplish by and through the plan a common purpose? If so, there was a combination or conspiracy, since a combination or conspiracy consists only in a mere meeting of the minds of two or more persons to accomplish a common purpose.

A combination or conspiracy is not necessarily unlawful, but if unlawful, then anything done or said by a party thereto to consummate the unlawful purpose need not in itself be unlawful. So, also, a combination or conspiracy in itself lawful may be made unlawful by acts in furtherance thereof which are themselves unlawful. An unlawful conspiracy, when proven, may be brought under condemnation of law by proof of facts and circumstances done in furtherance thereof which are not in themselves unlawful. So a conspiracy which has for its object the accomplishment of a lawful purpose may be brought into condemnation of the law by doing unlawful things to consummate that purpose.—(*Pettibone vs. United States*, 118 U. S. 203, *Bouvier's Law Dictionary*, Vol. 1, p. 621.)

It cannot be with reason denied, nor indeed do I understand that it is denied by the defendants, that they formed an association, a combination, or an agreement to promote the interests of the members of the plan who were engaged in the manufacture of hardwood lumber, by maintaining price levels.

The second and more difficult question is, did and does

this combination or association restrain trade in interstate commerce, within the meaning of the law? If so, it is unlawful, and any act done or anything said or written by any member of the plan in furtherance of its object was the act of all and the injunction should issue.

The evidence shows that the defendants were members of the American Hardwood Manufacturers' Association (hereinafter called the association), but that all the members of said association are not members of the "Open Competition Plan." Query: What benefits did those members of the association who joined the plan expect to derive from it which were not equally available in the association alone? There must have been some additional advantage contemplated and expected. That purpose, I think, can best be determined from the evidence tending to show what the members of the plan said and did from the time of its formation and on up through the months until this suit was filed.

#### A NEW DEFINITION OF THE LIFE OF TRADE

As has been seen, this evidence was created by the defendants themselves, and it is uncontroverted. We come now to consider it. It appears that in the early months of 1919 the stock of hardwood lumber on hand was low, the demand was light, and prices at a comparatively high level. The first sales report by Mr. Gadd, as manager of statistics, was issued on Jan. 25, 1919, and issued weekly thereafter. Quoting from the first one we read:

Co-operation, not competition, is the life of trade. Membership in the plan is not compulsory but members who enter into the plan and practise the idea of a fair deal for all, eliminating suspicion and acting with good will toward each other, will find that returns come back to them with added interest in dollars and cents.

#### February 3:

Before the organization of this plan the members in a majority of cases were competing with each other, even when neighbors without a personal acquaintance.

#### February 8:

The matter of price is the principal point at issue between the buyer and seller. Buyers who have been looking for a downward revision of prices are going to be disappointed. \* \* \* It is no longer merely a question of who can or will hold out the longest—that condition no longer exists. Buying has been resumed after a period of waiting and uncertainty, and it is confidently expected that the move in this direction will long be continued. The tendency to buy only for current needs is less apparent than at any time since the armistice was signed. \* \* \* Stocks remain below normal. Total stocks on hand in the Southern territory are two million feet less, all grades combined, as compared with last month. \* \* \* Production in the Eastern territory, however, is not more than sixty per cent of normal at the present time. \* \* \* The car supply is ample. \* \* \* It must be apparent that the outlook on the whole is favorable for a strong market for all the lumber that can be produced during the coming months.

#### February 15:

There's a reason for everything, and the reason of an association is more than good fellowship, though getting to know the other fellow is usually the first step in the direction of correcting trade abuses.

#### March 1:

The report of stocks on hand sold and unsold as of Feb. 1, 1919, develops a situation that we believe is unparalleled in hardwood lumber industry. In no single month within our recollection has there been such a large and general decrease in stocks on hand as shown by this report. The chief factors contributing to this situation are curtailed production and increased volume of sales. \* \* \* At this rate, it will not be long before there is a famine of hardwood lumber. We hear a great deal about the waiting attitude of the buyer with the expectation of price recession, but with such conditions as are above recited it is difficult to understand why holders of hardwood lumber need worry as to the future. \* \* \* With stocks low and ill-assorted, and with no prospect for restoring them to even last year's meager quantities, the outlook for strong prices on all hardwoods could not be better.

March 8, quoting with approval an article from the *Southern Lumberman*, the report says:

For instance, at the recent meeting of the Open Competition Plan of the American Hardwood Manufacturers' Association in Memphis, the fact was developed that the production of mills embraced in that group of manufacturers is at the present time only fifty-six per cent of normal, and that practically the same situation exists through the hardwood producing territory. \* \* \* Certainly in any other industry the buyers could never expect anything but an advance in price when the supply is below normal, the production is far below normal, and the demand is improving.

March 22:

It is one thing for men in a meeting to say, one after another: "My price is so and so," with the result that after the meeting all their prices prove substantially the same as the figures mentioned. It is quite a different thing for the same men to come to a meeting and each report: "My actual sales for the past month have been so and so, and I have reported the details of each transaction to the association."

In the statement there is no direct or implied agreement to maintain prices, no obligation of any kind to refrain from cutting. The theoretical proposition at the basis of the Open Competition Plans is that: *Knowledge regarding prices actually made is all that is necessary to keep prices at reasonably stable and normal levels.*

March 29:

Naturally the situation ought to have an important bearing on the plans of every hardwood lumberman if the facts were better understood; offers of business now at shaded prices would get scant consideration and there would not only be no good reason to cut prices but there would be every reason why they should be held at reasonable profit-making levels.

With the low stock of hardwood lumber on hand and the reduced production during the first few months of the year, as indicated by the sales reports, the plan, through its manager of statistics, on April 5, began a propaganda to encourage home building, for the purpose of creating a greater demand for hardwood lumber. On the first page of the report of that date there appeared in bold letters the words "Build Now."

Thereafter on June 7 following this propaganda the weekly sales report begins: "The Open Competition Plan to the American Hardwood Manufacturers' Association has arrived; it is an unqualified success and any member or any manufacturer who does not think so is simply overlooking the most important of our several association activities. \* \* \* Read the following excerpts from letters written by members."

I quote only a few:

"We believe we have profited from \$500 to \$1,000 during the past 30 days by being *correctly* informed relative to the prices stock is really being sold at.

#### FINDS PLAN PRODUCES HIGHER PRICES

"The very first report which we received under this plan enabled us to increase our price \$6 per thousand on a special item in oak."

"Since we became members we have been selling out lumber at several dollars per thousand more than formerly."

"I consider the report of actual sales of great help in determining the market value of hardwood lumber and believe that the plan is a stabilizing influence, which tends to raise the prices of those who are inclined to cut their prices to the top market prices."

"It is obvious that no one wants to sell his lumber for less than the other fellow is actually getting and your reports of actual sales enable the manufacturer to see what his neighbors are getting for their lumber, and through this course of education, I might say, all those who have access to your reports bring their prices to the top."

"There seems to be a friendly rivalry between members to see who can get the best prices, whereas under the old plan it was cut-throat competition. Now it is a pleasure to sell because we know what we are doing and have information at our finger tips that enables us to know these things before the other fellow does."

There is much other documentary evidence to like effect, but this is enough to indicate the common note running through it all, and that common note is "increase of prices." It is difficult, if not impossible, on this record, to escape the conclusion that the purpose and intention of the plan was to suppress competition among its members and create and perpetuate a condition wherein the production of hardwood lumber was to be kept low enough to maintain prices on an ascending

scale, but not so low as to drive prices to such heights, under the stimulating influence produced by the propaganda to "Build Now," that consumers would be induced to use substitutes.

These two objections mark the margins of the channel through which the members of the plan conducted by its manager of statistics, Mr. Gadd, were to steer interstate commerce in hardwood lumber and through which it was successfully steered, on up to the filing of this bill, until prices of hardwood lumber had increased from 150 to 250 per cent within a period of twelve months.

I do not doubt that some of the defendants, if not all of them, were advised that the plan was lawful and that their participation in its operation was lawful, but their conduct must be here considered in the light of results.

It would serve no useful purpose to analyze the evidence or to enter into a discussion of the decided cases which have heretofore arisen under the Sherman Act. Each case must be determined upon its own facts and if these facts establish the proposition that the combination entered into unreasonably restrains trade in interstate commerce, by suppressing competition in prices, it falls within the condemnation of the act.

Competition and co-operation by and with those engaged in the same business is not necessarily inconsistent. Successful business will likely result from a proper balance of the two, but too much of either may lead to disaster. Competition without co-operation means destructive competition. Co-operation without competition means the destruction of competition—price fixing.\* The latter is the state of the Open Competition Plan, as disclosed on this record.

It results from what has been said that temporary injunction will issue as prayed for in the bill of complaint.

\*Hurley's "Awakening of Business."

## Rules Framed for Prospecting and Leasing Government Coal Lands

Not More Than 2,560 Acres—Lessee May Hold Only One Lease in Any One State—Prospecting Permits To Be Granted

SECRETARY Payne has approved rules and regulations for the prospecting for and leasing of coal deposits of the United States under the act of Feb. 25, 1920. The act provides for the disposition of all coal deposits owned by the United States, except in national parks, military or naval reservations, and in the Appalachian Forest Reserve. Known coal deposits are to be divided into leasing units of not exceeding 2,560 acres each, and one person or corporation may hold but one lease in a state.

Leases for the units are to be offered for competitive bidding at a royalty fixed in advance, not less than 5c. per ton, and awarded to the qualified person bidding the highest bonus. The Secretary of the Interior is authorized to grant prospecting permits to qualified citizens to search for unknown coal deposits or to explore undeveloped lands where preliminary work is necessary to determine the existence or workability of the deposits. In such cases the permittee who finds or demonstrates workable coal deposits may have a lease on such royalty as may be fixed by the Secretary of the Interior.

## Has The Public a New Heart?

AUSPICIOUS indeed is the news that the Public Utilities Commission and the City Council of Norfolk, Va., have each severally established a platform which reads "Capital legitimately invested in public-utility properties must be safeguarded and protected by municipalities, both as to principal and as to a just and inviting return to the company for expenses incurred in providing service." The resolution was unanimously adopted. Norfolk wants strong corporations to build and maintain public accommodations, and it knows it must pay them a just price or go unserved or badly served. It has showed its faith in the principle that it has enunciated by finding officially that the City Gas Co. of Norfolk was entitled to a price for gas of \$1.64 per thousand cubic feet. However, as the company only asked for \$1.60 the petitioned price was allowed it with the proviso that the rate should be varied to accord with the price of oil used in the manufacture of the gas. Thus, gradually, the United States is getting back the kindly heart to public utilities which it had in earlier days.

## Minority Report of Bituminous Coal Commission

JOHN P. WHITE'S minority report is an odd sort of document. It is not a calm, judicious setting forth of facts from the record and a drawing of conclusions therefrom. It is chiefly a criticism of the majority report, and to bolster up these criticisms and demands it resorts to *prejudicial* citations of facts. One reads it through in the hope of finding something constructive, but lays it down at the end with a sense of disappointment. Evidently it was written after the majority report had been completed and hence took advantage of the fact that Messrs. Robinson and Peale would have no opportunity for reply. The value of the statements in the report are indicated by a few salient features.

Mr. White gives the impression that he accepts the figures covering earnings which were submitted to the Commission by the coal operators. Then he proceeds to cite only those figures which relate to northern Illinois, a small district in which employment conditions are not at all representative of most producing fields in the industry and in which the earnings of men in the coal mines are supplemented by their earnings from other occupations in which they work during the remainder of the year. There is no citation at all of the figures of earnings for such districts as southern Illinois or Pittsburgh, which would give the reader a more complete and fairer knowledge of the earnings of the miners under the Washington agreement.

Another example is the accusation of profiteering which is brought against the bituminous-coal producers. That question is dealt with in the majority report sim-

ply by submitting tabulations from the operators' tax returns to the Treasury, which show that in 1918 the bituminous-coal producers, after paying their taxes, earned only about 9 per cent on their capital invested in the business.

The majority showing here is a simple incontrovertible statement from authentic sources. Mr. White attempts to *twist* these figures to his advantage by resorting to compilations based on "capital stock" instead of capital actually invested, although such compilations would be misleading. The only further information on the subject which he offers is a reference to one of the miners' exhibits, a table of returns of some 32 companies which publish annual statements.

Examination of the names of the companies in that exhibit shows it to be a ludicrous mixture of anthracite operators, lumber manufacturers, byproduct coke makers, bituminous-coal producers, jobbers and retail coal dealers. Yet this hash is gravely submitted as proof of profiteering on the part of the soft-coal operators. Worse yet, it is offered as counterbalancing the authentic Treasury figures on over 1,500 producers. That is astounding stuff to appear in a presumably impartial report of a semi-official agency set up by the Administration to deal with basic problems of industry and labor.

The arguments advanced for the six-hour day cannot impress any serious-minded reader. Mr. White's very presentation of reasons for this demand proves clearly that it is simply an effort to maintain in this industry a greater number of workers than would be necessary if the production conditions were stabilized. The majority report moves to eliminate the occasional need for these surplus men, freeing them for work in other industries. That purpose is really constructive and has the welfare of workers, operators and consumers at heart. Mr. White's proposal would keep these surplus miners in the industry by paying them for their idle time without regard to the cost to the public.

Consideration of the minority report would be incomplete without examination of its theory of wages. Reduced to clear exposition, Mr. White is not content with an advance to keep pace with a generous estimate of increased living cost; he wants the earnings of the miners increased still more to elevate their position. Here again there is a frank disregard of the interests of labor generally and of the consumer of coal. This is essentially a selfish demand, an advantage to be wrested from fellow laborers in other walks of life. If the common lot of all who toil is to be bettered it can be accomplished not by a mere redistribution of the things now produced. We must have greater production of all the essentials and luxuries of life if more of us are to enjoy them. Shorter hours and higher wages otherwise are only another effort to lift ourselves by our bootstraps.

---

*Because, in his wage demands, the mine worker showed no sense of obligation to the public, he is told to go back to work at a fixed wage—while the operator is free of legal obligation as regards prices. How long will that liberty be continued if the operator asks an unreasonable price increase? Instead of using the freedom of the market as an opportunity to outvie one another in prices, coal operators should figure on a satisfactory profit and rely on the justice of their cause to prevent a renewed imposition of government control.*

## Coal Replaces Oil In Gas Making

**A** GAIN it is oil vs. coal, and the score is proving to be very large in favor of coal. Two large gas companies have just announced plans for coal-gas installations to replace carburetted water gas, thus replacing anthracite or coke and oil by bituminous coal. And this is only a beginning of the change.

The latest printed U. S. Geological Survey reports on municipal gas supplies give figures for 1915. In that year 550 plants produced 136 billion cubic feet of water gas, using for that purpose more than 550 million gallons of oil and two million tons of coke and anthracite coal. Much of this production will be eliminated in the near future, and coal gas, manufactured with the use of bituminous coal, will be substituted. The reason for this is not difficult to find when one knows the decided upward tendency in price of all petroleum products.

The Washington Gas Light Co. on March 18 announced that it was planning to build a coking plant with a capacity of ten million cubic feet of gas per day in order to permit the substitution of coal gas or coke-oven gas for much of the water gas which is now supplied. This will mean that from one thousand to two thousand tons of bituminous coal will be required per day, according to the processes chosen, or in other words from one-third to two-thirds of a million tons of bituminous coal will annually find a new market in the capital city. The immediate cause of this change was the large increase in price for gas oil, which has advanced from 7½c. a gallon on the last contracts to offerings at over twelve cents a gallon, and some uncertainty as to whether adequate deliveries can be expected. The coking plant thus finds a large advantage which was not previously enjoyed, and bituminous coal comes into its own as a fuel from which the city gas supply will be made.

Another somewhat similar plant was announced a few weeks ago in Chicago by the Koppers Co. of Pittsburgh. This company has made public the plans for building in Chicago a combination coke-oven and water-gas plant, which will be located in the western part of the city to augment the gas supply of the People's Gas Light and Coke Co., which supplies all of Chicago. In this case, too, it was desired to build only a coke-oven plant in fact extensive plans were prepared several years ago to this end, but the plans for construction were interrupted by war. Now the situation is such that some water-gas installation must be made immediately in order to increase at an early date the output of gas,

but the coke-oven installation is planned in such a way that great extensions will probably be made later with the idea of ultimately replacing much of the water gas by coke-oven gas. These changes in the city of Chicago represent plans for 12 million cubic feet per day of coke-oven gas, representing about 650 thousand tons of bituminous coal per year.

Similar changes to these two are inevitable in many places if the petroleum market stays as now, and we, therefore, can confidently look forward to changes within the next few years which will mean that perhaps a hundred billion cubic feet of gas now made by water-

gas process will be produced by other means, principally through coke ovens or coal-gas plants. The production of gas in byproduct or retort processes varies from five to ten thousand cubic feet of gas per ton, averaging perhaps seven thousand feet per ton of coal carbonized under the conditions which are indicated by present plans of installation. On such a basis, we can foresee at these plants a prospective additional demand for about twelve to fifteen million tons of bituminous coal.

Byproduct production will be a large factor, too, as eight to ten million tons of coke, 125 thousand to 150 thousand tons of ammonium sulphate or its equivalent in other forms of ammonia, 100 to 120 million gallons of tar, and thirty to forty million gallons of light oils will be entering our markets as the result of such changes.

It behooves the coal man to keep watch on these plans, especially if he is interested in gas or byproduct coals. Big things are on foot and bigger still are to come. It appears more than likely that the invasion of the coal industry by oil will be met by advances by coal on what has come to be regarded as coal territory.

Already it is found impossible to provide the oil that construction of oil-burning ships has made necessary.

### Keep Prices On a Fair Level

BY JOHN H. JONES  
President, Bertha Coal Co.

Present times are so critical that all the business and financial interests of the country should be satisfied with a minimum profit, and coal companies should not advance the selling price of coal more than the actual increase in cost of production over the Government rate in effect in 1918, except in some districts where prices were entirely too low. For certain high grades of coal I would consider a fair price at the present time would be: Fairmont and Pittsburgh steam mine-run and coal of the same quality from other districts, \$3 per ton; gas mine-run 25c. per ton more; or \$3.25. In the Central fields the prices should run from \$3.50 to \$3.75 for thin-vein low-volatile coal.

I realize, in making the above statements, that I shall be criticised by many coal operators who have lost money during the past eighteen months and who insist that they should take advantage of the present opportunity to recoup their losses; but I feel confident that the standard companies owe it to themselves to do all they possibly can to discourage pyramiding of prices at the present time—first, because it is unfair to take advantage of the public at a time like this when there is a great shortage of coal; second, because it is the patriotic duty of every good citizen to help lower the cost of living and to take no advantage of his fellowmen; third, because the coal men are on trial.

Will they rise to the occasion? If they do not the penalty will be a loss of self-respect, a loss of prestige, and they will convince the public of their irresponsibility and will cause great unrest among workmen in general, who will be compelled to purchase coal at abnormal prices. It will also arouse a spirit of unrest among mine workers, who will feel that they are not getting their share of the price paid. I am heartily in favor of the enactment of legislation permitting the coal operators to agree on a fair price to be charged for coal, subject to the approval of a proper agency for safeguarding the public.

*Easy is the assumption of Attorney-General Palmer that Dr. Garfield's war estimates of the cost of producing coal are well warranted in peace time. With steady work and every mine worker doing his utmost the rates fixed during the war, even with the 10c. for steady work deducted, were doubtless enough to provide profits to mines managed with a reasonable degree of efficiency. But with 50 per cent full time, day workers soldiering and miners leaving the mine early, a different condition confronts the industry. An increase in wages of 14 per cent capped the climax and only the sale of contract coal at increased rates made operation possible in all but a very few greatly favored mines.*

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Working Kanawha River Coal

*Letter No. 3*—After an experience of 37 years in the mining of coal, most of which has been at the end of a pick handle, I have been much interested in the question of Arthur L. Sheldon, *Coal Age*, Feb. 26, p. 419, regarding the best method of extracting the coal from three seams underlying the Kanawha River. If the information given is correct, these seams lie at depths of 50, 100 and 160 ft., respectively, below the surface, of Cedar Grove, W. Va. Taking these in the order named, I will assume that No. 1 seam is 3 ft. thick, No. 2 seam, 5 ft., while the thickness of No. 3 seam varies from 6 to 9 ft.

In the first place, having selected a suitable point on the surface, I would drive a steep slope, say a slope having an inclination of 10 or 12 in. per foot of depth, cutting the three seams. The size of the slope must be determined in accordance with the territory to be developed; but I will suppose it to have an area 6 x 12 ft. inside of the timber, which will provide ample room for the installation of a conveyor system should that be deemed advisable, in the later development of the mine.

Where the slope cuts No. 1 seam, I would drive a gangway or level in that seam, for a distance of 100 ft.,

SHOWING STEEP HAULAGE SLOPE AND GANGWAY LEVELS IN THREE SEAMS

before turning off cross-entries. Likewise, where the slope cuts No. 2 seam I would follow the same plan and repeat the operation in No. 3 seam. As I have endeavored to indicate in my sketch submitted herewith, it will then be possible to build large concrete bins, below each level, and arrange these bins so as to load coal into a skip or discharge it into a conveyor in the slope.

It has been my experience, in the working of overlying seams similar to these, better results are always obtained by keeping the extraction of the coal in the upper seam some distance in advance of the working faces below. Thus, in this case, the working face in No. 1 seam should be kept a short distance in advance

of that in No. 2 seam; and the face in No. 2 seam, likewise, a short distance in advance of that in No. 3 seam.

I have found that it is almost impossible to work the coal in an overlying seam when the extraction in a seam lying but a few feet below, is in advance of that in the upper seam. Not only does the caving of the intervening rock strata destroy the roads in the upper seam, but there results no end of trouble in the seam below. For the sake of economy and safety, therefore, I prefer to develop the upper seam in advance of that lying below, in every case.

Speaking of the concrete bins, these should be built by shooting the bottom in each level. Each bin should have a capacity of, say from 50 to 100 tons, or sufficient to fill a railroad car. I would use mules or locomotives to haul the cars to each seam, employing these as the increasing development required.

In the ventilation of the mine, I would make the main slope a downcast and carry the air in two splits, the first split entering No. 2 seam and then circulating through No. 1 seam, before returning to the air-course, which should parallel the slope. The second split is conducted directly to the foot of the slope and made to ventilate No. 3 seam, after which it enters the return air-course and is conducted to the surface. I forgot to mention that, at the inner end of each bin, a cradle dump should be erected provided with a kickback, and the levels laid with double track.

J. B.

Cranberry, W. Va.

*Letter No. 4*—Referring to the inquiry on this subject submitted by Arthur L. Sheldon in the issue of *Coal Age*, Feb. 26, p. 419, I believe that if the pillars are to be drawn and a maximum recovery of coal is expected it will be necessary to work the upper seam first, the middle seam next and the lower seam last. By this I do not mean that it will be necessary to completely exhaust the overlying seam before the next one below is attacked.

The point I wish to emphasize is that the workings of an upper seam should generally be kept in advance of the one next lower. If any ribs are drawn in a lower seam, before an overlying seam is exhausted, care must be taken not to draw any such ribs in the lower seam till the corresponding rib immediately above in the upper seam have been drawn.

The reason is that, with only fifty feet of strata between the two seams, the drawing of ribs in the lower seam will undoubtedly break the strata between it and the upper coal, making the mining of the upper seam difficult, owing to the coal and rock below it being broken and crushed. If two or more seams are worked simultaneously it may be, and probably will be advisable to lay out the entries, in the different seams, one above the other and keep the upper ones ahead.

No pillars should be drawn under the river, unless possibly this might be accomplished with the exercise of due caution, on the wind-up in the lower seam. Only narrow entries, with the roof well supported, should be driven under the river, in the upper seam; and even this should not be attempted, unless there is a good slate or rock strata overlying the coal. Even then, considerable water is liable to find its way into the mine, especially if there are faults or slips extending to the surface or river bed.

PROVIDING FOR AN OUTPUT OF 1,000 TONS A DAY

Regarding the kind of opening, I believe a slope opening will be the most economical; and, while the upper seam is being developed, the sinking can be continued down to the next seam. For a mine with a capacity of 1,000 tons per day, I believe it would be more economical to bring the cars to the surface, than to install bins below ground and bring the coal to the surface by means of conveyors, elevators or skips. An installation of that kind would be somewhat expensive for an output of only 1,000 tons a day. However, for a capacity of from 3,000 to 5,000 tons a day, such an equipment, I believe, is well worth considering.

In this connection, let me suggest that, for the production of only 1,000 tons per day, one or at most two seams would be all that would be necessary or advisable to work at one time, and this plan would be more advantageous, as the work could be kept more concentrated, which is always desirable. The lower seam or seams can be developed while the upper ones are being wound up, and a constant output will thus be maintained during the change from one seam to the other.

In regard to the method of working, this would depend largely on the size and shape of the tract to be developed; but, in a general way, I believe that the panel system would be best. In adopting the panel system, the butt or room entries can be driven to the boundary or end of the panel and the rooms turned and the pillars drawn on the retreating plan.

The number of entries to be driven would, again, depend largely on the size and shape of the tract; and the width of entries, rooms and pillars would depend on the amount of cover, roof conditions and hardness of the coal.

Brownsville, Pa.

## Dead-End in Trolley Haulage

*Letter No. 3*—Referring to the question asked in *Coal Age*, Feb. 19, p. 367, regarding the distance that the dead-end of a trolley wire should be located from the face of a heading, my answer is as follows: The trolley wire should never be carried beyond the last breakthrough in the heading, whether gas is generated in the place or not.

There are two reasons, in my mind, why it is not well to extend the trolley line beyond the last breakthrough. In the first place, there is more traveling, back and forth, between the last breakthrough and the face of the heading than anywhere else; and the men engaged in driving the heading are more careless, in passing to and fro, there than they would be if traveling the haulage road.

Hence, it must be admitted that there is every liability of the men coming in contact with the wire if

carried beyond the last breakthrough. Especially in a mine generating gas, the trolley wire should be kept outside of the last breakthrough, because there is more chance of gas accumulating in that portion of the heading and greater danger of the gas being ignited by a flash from the trolley.

It seems to me that the mining law of Pennsylvania, or one of the other coal states, specifies that the trolley wire must not be extended inside of the last crosscut or breakthrough in the heading. I notice that this inquiry comes from West Virginia, and I am anxious to see what conclusions will be reached and to learn the opinion of others.

MINE ELECTRICIAN.

Conemaugh, Pa.

*Letter No. 4*—In connection with the question of how near to the head of an entry the trolley wire should be carried, it may be of interest to cite a case that I have in mind where the conditions were such as to necessitate carrying the trolley wire closer to the face of the heading than would otherwise have been done. The circumstances were somewhat as follows:

The main headings in a large mine were being driven for development and, at the time of my story, the head of these entries had been advanced about 1,000 ft. beyond the last pair of crossheadings. In the sketch I submit, the general plan of the cross-entries, butt-

headings and rooms is shown on the right; while an enlarged detail plan of the main heading and tracks is shown on the left.

In order to insure the continuous future development and maintain the output of the mine at its usual standard, it was important to drive the main heading and its air-course steadily without intermission. In this mine cable-reel locomotives were used to gather the coal from the rooms on the butt-headings, and haul the cars to the sidetracks marked *B* and *C*, in the figure; while a small trolley locomotive was used to haul the cars from these sidetracks to *A*, and then to the tippie.

The gathering locomotives were kept exceedingly busy as each of them served a large number of men. For this reason, it was found impracticable to take one of these motors and run it a thousand feet up the main heading, to clean up the coal produced at that point. This would have to be done several times during the day and there would necessarily have been much delay and loss of time to the men driving the main headings. The haulage locomotive, on the other hand, had but a short haul and spent considerable time, each day, waiting at the partings for coal.

To obviate these difficulties, it was decided to extend the trolley wire up the main heading and use the haulage locomotive to serve the men driving that pair of headings. At first, the locomotive took the cars only as far as the end of the trolley wire, which I have marked *D* in the sketch; and the two miners, assisted by the motorman and brakeman, switched them by hand and placed them in position for loading at the head of the entry and its air-course. Later, however, owing to adverse grades in the heading, it was found necessary for the motorman to push a train of empties ahead of his locomotive so that the machine could handle the cars to a point nearer the face of the entry.

It is quite evident that this scheme was only a make-shift, and it soon became necessary to adopt a different plan, in order to expedite the work. Referring to the detailed sketch on the left of the figure, the dead-end of the trolley wire was now extended to a point just outby of the last open crosscut, which is marked *E*. As soon as this crosscut was driven through to the air-course, a switch was laid on the main heading and the track carried through the crosscut and extended to the face of the air-course. The old switch and track, indicated by the dotted line in my sketch, was then torn up and a permanent stopping built in that crosscut where a canvas curtain had previously been hung.

By following out this plan, the dead-end of the trolley wire was kept from 80 to 150 ft. from the face of the main heading, and it was about the same distance through the crosscut to the face of the air-course. By the use of the cable on the reel, the locomotive was always able to handle the cars in both of these headings, although it was necessary to advance the trolley wire in short lengths of 70 or 80 ft., which was the distance between crosscuts, center to center. However, the dead-end of the trolley wire was kept back a safe distance, as the miners seldom came out past the open crosscut, except on their way to and from work.

Huntington, W. Va. C. W. STAFFORD.

*Letter No. 5*—I was interested in the question raised by an assistant foreman, of Rawl, W. Va., who asks at what distance from the face of a heading should the anchor bolt holding the end of the trolley wire be driven. Let me say that the dead-end insulator and pin should never be brought closer to the face than the last open crosscut. No rule can be given expressing the distance, in feet, from this dead-end of a trolley system to the face of the heading, as this will vary, from time to time, with the varying conditions.

One thing is important in extending a trolley wire. Great care should be taken to hang the wire in such a way that it cannot swing or jump sufficiently to reach either the rib or the roof of the entry, since contact of the wire with the natural strata might cause sparking and ignite gas. For this reason, if for no other, a trolley wire should not be extended too close to the face of a heading where gas is being generated.

The suggestion that "the dead-end of the trolley line should not approach closer to the face of the heading than the length of the cable on the locomotive," if carried out, would barely enable the locomotive to reach the load that it must pull from the face of the heading.

Referring to the statement quoted by this correspondent, the meaning intended was that the trolley wire should not be extended, until the distance from the face of the heading was equal to the length of the cable on the machine; or, in other words, until the reach of the machine approached its limit. We are glad to have attention called to this oversight.—EDITOR.

Such a rule is not practical, moreover, since wire extensions would have to be made frequently, and this would necessitate numerous splices and unnecessary expense. My practice is to arrange to hang about 200 ft. of wire at a time, in an entry where the locomotive carries 250 ft. or more of cable.

L. L. NEWMAN.

West Frankfort, Ill.

## Widening an Airway

*Letter No. 1*—Referring to the inquiry in regard to the widening of an airway, *Coal Age*, Jan. 29, p. 245, it may be that the following method of solution will be of interest, as supplementing that already given by the editor, in reply to the inquiry. The question states that there are two airways, each 6 x 8 ft. in section, their lengths being 900 ft. and 3,600 ft., respectively; and it is desired to find the required width of the longer airway that will enable it to pass the same quantity of air as the shorter airway, under the same pressure.

In the following solution, I will call the perimeter and the sectional area of the widened airway, *o* and *a*, respectively, and write the original equation given by the inquirer thus:

$$\frac{2(6 + 8)900}{48^3} = \frac{3,600 o}{a^3} \quad 1.$$

$$\text{and} \quad a = 25.092 \sqrt[3]{o} \quad 2.$$

Then, since the height of the airway to be widened is 6 ft. and calling the required width *w*, we have  $w = a/6$ , which gives for the perimeter of the widened airway,

$$o = 2(6 + a/6) = 12 + a/3 \quad 3.$$

Combining equations 2 and 3 and solving with respect to *o*, we have for the perimeter of the widened airway,

$$o = 12 + 8.364 \sqrt[3]{o}$$

$$\text{and} \quad o - 8.364 \sqrt[3]{o} = 12 \quad 4.$$

Observing Equation 4, it is possible to find quickly the value of the perimeter (*o*) that will satisfy Equation 4, by referring to a table of cube roots and solving by trial. It is also evident that the perimeter of the widened airway must be greater than 28, which is the original perimeter.

To find the value of *o*, by trial, first assume  $o = 38$ .

Then, since  $\sqrt[3]{38} = 3.362$ , we have  $38 - 8.364 \times 3.362 = 9.88$ .

This value being too small, try  $o = 41$ ; and, since  $\sqrt[3]{41} = 3.448$ , we have  $41 - 8.364 \times 3.448 = 12.16$ .

Finally, this value being but a trifle too large, the exact perimeter is then ascertained by interpolation:

$$41 - \frac{16}{1216 - 988} (41 - 38) = 40.8 \text{ ft.}$$

Hence, for the required width of the airway, we have

$$w = \frac{1}{2}(40.8) - 6 = 14.4 \text{ ft.}$$

## Unaccountable Explosion

*Letter No. 2*—Referring to the inquiry of "Superintendent," *Coal Age*, Jan. 22, p. 197, I quite agree with the reply made by the editor, that it is more than probable that the gas in question is marsh gas or methane coming from the floor of the workings.

When gas is generated in this manner, coming from the floor, it diffuses into the air and forms an explosive mixture that would readily be ignited on the open lamps of the men who enter the place.

Of the other mine gases that form explosive mixtures with air, carbon monoxide and hydrogen sulphide, the first could not be present, in sufficient quantity to cause an explosion, without its fatal effect on the men being in evidence. On the other hand, the presence of hydrogen sulphide would at once have been detected by the smell of the gas. This gas being heavier than air, specific gravity, 1.1912, it would naturally accumulate at the floor. But, my opinion is that the explosion was due to marsh gas coming from the floor and diffusing rapidly into the air, as stated previously.

Rawdon, Quebec, Canada.

C. MCMANIMAN.

*Letter No. 3*—The instance of a mysterious explosion mentioned in the inquiry that appeared in *Coal Age*, Jan. 22, p. 197, is one that should attract the serious attention of mining men, because of its affording an opportunity for the exchange of views and opinions, which are always a source of education in matters pertaining to scientific mining. Our aim, in this connection, should be to reach a solution that will afford greater protection to human life and property.

In my opinion, it happens too frequently that undue pressure is brought to bear on the underground officials, who are often induced to over-reach their standards of safety in an effort to increase the output of the mine. This pressure comes from higher officials of the company whose occasional and hurried visits to the mines afford them but a meager understanding of the conditions that surround the work in the mine.

#### RELATION OF BUSINESS END TO THE OPERATING END IN THE COAL INDUSTRY

Mining is a *business* as well as a science, and it is evident that these two elements seldom function properly together and their true relationship is too often unknown or wholly disregarded. Successful mining, however, is dependent on the equal consideration of both of these factors, which must be co-ordinated to produce results. The business end concerns itself with the amount and cost of production, and the marketing of the product; while the operations of mining the coal require careful investigation of conditions and the devising of means for the safe and efficient extraction of the coal and its preparation for the market.

While it is true that the requirements of business demand the exercise of the strictest economy, it is also true that there are limits beyond which economy cannot be forced without the sacrifice of efficiency and even safety. The result is that underground officials are often in despair with respect to satisfying both the requirements of business and the mining law. The result is much confusion and loss to the company because of these conflicts and cross-purposes. The evils that must follow in the trail of such mismanagement are: Improper methods of mining, which result in loss of valuable coal areas; disregard for the requirements of the law respecting safety, causing avoidable accidents; and increasing the cost of production.

#### FIXING RESPONSIBILITY FOR MINE EXPLOSIONS

With this preamble defining my position, let me say in respect to the instance cited in the inquiry mentioned, that the aim and value of this discussion will not be advanced by merely stating that the explosion was probably due to gas, coal dust, or oily vapor coming in contact with an open light, as this is common knowledge.

While the reference to these factors is well, it will generally be more profitable to consider those agencies and influences that are indeed really responsible for the creation of unsafe conditions in the mine.

It serves no useful purpose to under-rate the ability or condemn the laxity of any mine official. That has been the prevailing custom in the past, with the result that accidents still happen in spite of this criticism and censure. There is nothing mystifying about mine explosions. The strange thing is that, with our knowledge of conditions existing in mines and which make such occurrences possible, no more effective means are yet used for their prevention. It cannot be denied that the business end is largely responsible for this lack of prevention.

To my mind, there is nothing extraordinary in the case under consideration, as sufficient data are given to enable one to come to a reasonable conclusion as to what caused this accident. We know that carbon and oxygen are the elements that unite with explosive violence, under certain conditions and in the presence of an open light. The carbon is a constituent of marsh gas, coal dust and oily vapor, all of which were present in varying quantities, while the oxygen of the air made their combustion possible and an explosion took place when the loader went to the face with his carbide light.

#### VAPORIZED OIL A CONTRIBUTING FACTOR

The suspicion that oily vapor may have played a part or even may have been the chief factor in this explosion is not amiss, although authorities affirm that oil seepage does not occur in coal measures to such an extent as to cause apprehension of danger. From our present knowledge, we can only remark that vaporized oil may yet be shown to play an important part in mine explosions, since crude oil is said to vaporize at the low temperature of 60 or 65 deg. F., and have a vapor density of 0.855, while its flashing point ranges between 200 and 400 deg. F.

It is also stated that an explosive mixture is formed when the proportion of vapor to air is 2 vol. of the former to 100 vol. of the latter. These data, if correct, are worthy of careful consideration in connection with mine explosions. The presence of oily vapor, in mine air, has the effect of rendering explosive, mixtures of gas or dust that would not otherwise be dangerous.

In the instance cited, pillars were being cut with machines; the air current had little velocity, which is very probable in a working place under these conditions. Little gas had been found previously, or at least reported, as carbide or open lights were in use in the mine. A cave had occurred in the gob after the fire-boss had examined the place two hours before and reported it as "free from gas."

In considering these facts, we know that it is possible for unsafe conditions to have developed, in this place, within a short space of time; besides, much gas may have been released by the roof fall in the gob. As a result of this fall, the fine dust of the machines would be blown into the air by the concussion, and it is possible that this cloud of dust was ignited, even in the absence of any gas. The ignition of dust is dependent on the inflammability of the coal, the fineness of the dust and its free suspension in the air. My conclusion is, therefore, that these conditions made possible this explosion and there is nothing mysterious.

Ladysmith, B. C., Canada.

WILLIAM WESNEDGE.

# INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

## The Water Gage and an Open Door

In discussing the question of finding a mine door set open, *Coal Age*, Jan. 22, p. 196, John H. Wiley has questioned my previous statement that a fireboss can often detect an open door in the mine, by the reading of the water gage. In order to decide this question once and for all, I want to ask *Coal Age* to answer the following questions:

Suppose the air current in a slope has a velocity of 600 f.p.m. when traveling 5,000 ft. down the slope to the face and returning the same distance up the slope to the fan, which is exhausting. If both the intake and the return airways, in this case, are 6 x 10 ft. in section, I want to ask: 1. What should be the water gage reading when the air is circulating the entire length of the slope? 2. Assuming a door is set open between the main slope and the return air-course, at a point 2,000 ft. down from the mouth of the slope, so that the air is short-circuited at this point, what should then be the water-gage reading? 3. What effect would the short-circuiting of the air have on the speed of the fan?

My contention is that the resistance of the mine is determined by the size and length of the airways through which the air is circulated, and this resistance determines the pressure and the water gage, but not the speed of the fan. Assuming the power applied to the fan shaft remains constant, my belief is that the fan will run at a constant speed and produce a certain velocity in the airways, depending on their size and length, and the resistance set up will develop a certain water gage.

Now when this current is short-circuited, the velocity of the air will, of course, be increased; but, even so, the mine resistance will be decreased, because the rubbing surface is made much less by the short-circuiting of the air current. As a result, there is a drop in the water gage, which indicates the short-circuiting of the air. Let me ask, of what benefit is the water gage to the fireboss if this is not true?

Farr, Colo.

ROBERT A. MARSHALL.

Replying to these questions in the order asked, we answer as follows:

1. The water gage produced by a velocity of 600 f.p.m., in an airway 6 x 10 ft., 10,000 ft. long, using the Fairley coefficient ( $k = 0.00000001$ ) is

$$\text{w. g.} = \frac{k l v^2}{5.2 a} = \frac{0.00000001 \times 10,000 \times 32 / 600^2}{5.2 \times 60} = 3.7 \text{ in.}$$

2. Neglecting a slight change in the efficiency of the fan and assuming that the power on the air remains constant when the current is short-circuited at the door, 2,000 ft. from the mouth of the slope, we observe from the formula for water gage that, since the unit

resistance ( $k$ ), perimeter ( $o$ ) and sectional area ( $a$ ) are constant, the water gage varies directly as the length of the airway, and the square of the velocity of the current, or as  $lv^2$ . When the air is short-circuited the length of the airway is reduced to two-fifths of the original length; but it is still necessary to find how much the velocity is increased by thus shortening the distance the air must travel, assuming the power on the air remains constant. To do this, first write the formula for power on the air ( $u$ ) expressed in terms of the airway, length ( $l$ ) and perimeter ( $o$ ), and the velocity ( $v$ ) of the current: thus,

$$u = k l o v^3$$

Regarding this formula it appears that, for a constant power on the air,  $k$  and  $o$  being constant,  $v^3$  varies inversely as  $l$ ; and therefore the velocity, in this case, varies inversely as the cube root of the length. In other words, the velocity ratio is equal to the cube root of the inverse ratio of the length of the airway. Calling the original velocity  $v$ , for a length 5, and finding the velocity  $x$ , for a length 2, we have

$$\frac{x}{v} = \sqrt[3]{\frac{5}{2}} = \sqrt[3]{2.5} = 1.357$$

That is to say, shortening the length of the airway to  $\frac{2}{5}$  of its original length will increase the velocity 1.357 times; and, since the water gage varies as  $lv^2$ , we have for the increased gage,

$$3.7 \times \frac{2}{5} \times 1.357^2 = 2.7 \text{ in.}$$

Therefore the short-circuiting of the air, in this case, whereby the rubbing surface was reduced to two-fifths of the original amount, causes a drop of water gage  $3.7 - 2.7 = 1$  in. It should be observed, however, that the setting open of a door back in the workings and controlling but a comparatively small split of air in respect to the entire circulation in the mine would often have but slight effect to lower the water gage in the fan drift. The effect produced on the water-gage reading in the fan drift by the setting open of a door will depend on the amount the distance of air travel is shortened by the short-circuiting of the current, assuming, of course, that the size of all the airways is the same. In that case, the power on the air remaining constant, the unit pressure or water gage will vary as the cube root of the length of the airways.

3. As has frequently been stated in *Coal Age*, the short-circuiting of the air current producing any considerable drop in the water gage would be accompanied with a corresponding increase in the volume of air in circulation, the power remaining constant. The increased volume of air flowing through the fan increases the resistance of the ventilator and a larger proportion of the power is absorbed within the fan itself, which reduces the power available for turning the machine, and the fan runs slower as a result.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Miscellaneous Questions

(Answered by Request)

*Ques.*—What effect does the presence of carbon dioxide have on a firedamp mixture?

*Ans.*—Carbon dioxide is an extinctive gas, owing to the fact that it contains no available oxygen to support combustion. On this account, its presence in a firedamp mixture not only dilutes the mixture so as to reduce the percentage of methane present, but the mixture is rendered less explosive by its presence. When a firedamp mixture at its most explosive point contains one-seventh of its volume of carbon dioxide, the presence of the latter gas renders the mixture nonexplosive.

*Ques.*—What is the range of explosive mixtures of air and methane?

*Ans.*—The lower explosive limit of pure methane and air is reached when the proportion of gas to air is 1 : 13. The percentage of gas present, at this point, is  $100 \div (1 + 13) = 7.14$  per cent. The higher explosive limit of pure methane and air may be taken as indicated by a proportion of gas to air 1 : 5. At this point, the percentage of gas present is  $100 \div (1 + 5) = 16\frac{2}{3}$  per cent.

*Ques.*—A tank that is full of water measures 8 ft. in diameter at the top, 12 ft. at the bottom and is 12 ft. deep. How many pounds of coal will it take to evaporate this water into steam at 70 lb. gage pressure?

*Ans.*—This tank being a frustum of a cone, its volume is calculated as follows, calling  $h$  the height and  $D$  and  $d$  the respective diameters of the tank:

$$\text{Vol.} = 0.2618 h \frac{D^2 - d^2}{D - d} = 0.2618 \times 12 \frac{12^2 - 8^2}{12 - 8} = 955 \text{ cu.ft.}$$

The weight of water in the tank is then  $955 \times 62.5 =$  say 59,690 lb. With a fair coal and boiler, it is customary to estimate on a consumption of  $4\frac{1}{2}$  lb. of coal, per horsepower, per hour. But, taking the equivalent of 1 boiler-horsepower as the evaporation of 34.5 lb. of water, per hour, from and at 212 deg. F., it may be assumed that 1 lb. of coal, under fair conditions, will evaporate  $34.5 \div 4\frac{1}{2} = 7\frac{2}{3}$  lb. of water, per hour, from and at 212 deg. F.

At sea level, a gage pressure of 70 lb. corresponds to an absolute pressure of, say 85 lb. per sq.in. Referring to steam tables, the total heat above 32 deg. F., in steam generated at this pressure is 1,183.4 B.t.u. Now, assuming the water in the tank has a temperature of, say 60 deg. F., the heat required to convert this water into steam at 70 lb. gage, at sea level, is 1,183.4 + 32 - 60 = 1,155.4 B.t.u. Again, the heat above 32 deg. F., in steam generated from and at 212 deg. F., is 970.4 B.t.u., which makes the factor of evaporation in this case  $1,155.4 \div 970.4 = 1.1906$ .

Now, if 1 lb. of coal will evaporate  $7\frac{2}{3}$  lb. of water into steam, from and at 212 deg. F., the same pound

of coal will evaporate  $7\frac{2}{3} \div 1.1906 = 6.44$  lb. of water, from a temperature of 60 deg. F. to steam at 70 lb. gage, at sea level.

Under the assumed conditions, therefore, the weight of coal required to evaporate the water in this tank would be  $59,690 \div 6.44 = 9,270$  lb., or, say 4.6 tons.

*Ques.*—Give the force of a blownout shot when 8 lb. of powder made up the charge. Assume that 6 lb. of the powder expanded on the air current when the shot was fired at a point in the intake 4,500 ft. from the fan. The size of the intake is 8 x 10 ft., in section, and the velocity of the air current 700 ft. per min.; temperature, 60 deg. F.; barometer, 30 in.

*Ans.*—This question cannot be answered from a practical standpoint and possesses no value, either theoretical or practical.

*Ques.*—Give the size and kind of engine required to hoist 2,000 tons of coal up a shaft 600 ft. deep, in 8 hr. The weight of the empty car is 1,200 lb. and its capacity, 4,500 lb. of coal. The size of the rope is  $1\frac{1}{4}$  in.

*Ans.*—Since a 1-in. rope weighs 1.58 lb. per lineal foot, the weight of a  $1\frac{1}{4}$ -in. wire rope is  $1.58 (1\frac{1}{4})^2 = 2.45$  lb. per ft. The weight of rope hanging in the shaft is, therefore,  $600 \times 2.45 = 1,470$  lb. Then, assuming a double hoist in which the weight of the cages and cars balance, the unbalanced load on the engine is as follows: coal, 4,500 lb.; rope, 1,470; or, say a total of 6,000 lb. Adding  $\frac{1}{5}$  for friction gives for the total load, in a single hoist, 6,600 lb.

The rate of hoisting, for an output of 2,000 tons in 8 hr., is  $(2,000 \times 2,000) \div (8 \times 4,500) = 111 +$  hoists per hr. Making due allowance for unavoidable delays, we will estimate on 120 hoists per hr. or two hoists a minute, making the time 30 sec. per hoist. Now, taking the average speed of hoisting as 25 ft. per sec., for the entire depth of the shaft, gives  $600 \div 25 = 24$  sec., which allows 6 sec., per hoist, for dumping or changing cars and accelerating the speed.

Assuming an efficiency of 80 per cent, the horsepower of the engine required for this service is

$$H = \frac{6,000 \times 25 \times 60}{0.80 \times 33,000} = \text{say } 340 \text{ hp.}$$

In order to determine the size of engine that will develop this horsepower, we will assume that the mean effective steam pressure ( $p$ ) in the cylinder is, say 60 lb. per sq.in.; the ratio of stroke ( $r$ ) to diameter of cylinder, ( $d$ ) 1.2; and the number of strokes ( $n$ ), per minute, 300. The diameter of this cylinder, in inches, is then calculated by the formula,

$$d = 80 \sqrt[3]{\frac{H}{p r n}} = 80 \sqrt[3]{\frac{340}{60 \times 1.2 \times 300}} = 20 \text{ in.}$$

The length of the stroke of this engine is  $20 \times 1.2 = 24$  in. The size of this duplex engine is calculated on the basis of the entire power being developed in one cylinder, which is safe practice in hoisting calculations.

## Coal Strippers Gain a Point in Anthracite Wage Conference

As the outcome of persistent demand, the 10,000 stripping employees in the anthracite region, who are mostly engaged in the southern part of the field, have obtained an arrangement by which any increase in wage granted at those operations will be made of force as of April 1, regardless of the date at which the agreement is reached. This concession was granted during a session of two hours' duration on the first day of the fourth week of the conference and it was the only advance toward a settlement which that week had to announce.

The resolution adopted by the sub-committee on March 30 at the Union League Club, New York City, read as follows:

"Resolved, that the resolution adopted by this committee on March 24, providing that any agreement reached here be made retroactive to April 1, 1920, be construed to include the employees of stripping contractors."

## Railroads Advocate Successor to Tidewater Coal Exchange

Railroads Propose to Carry Half the Burden—Sixty Per Cent of Coal Transshipped to Go Through Exchange—No Increase in Number of Pools

ABOUT one hundred shippers of bituminous coal and representatives of various railroads attended the meeting held at the Bellevue-Stratford Hotel, Philadelphia, on March 31 to consider the action to be taken as to the pooling of Tidewater bituminous coal upon the withdrawal of the Tidewater Coal Exchange on April 30.

The meeting was held in pursuance of a resolution adopted at a meeting of the principal Tidewater bituminous coal railroads using the ports of Baltimore, Philadelphia and New York, and was presided over by G. N. Snider, chairman for the railroads, who is also coal freight agent for the New York Central and Hudson River R. R.

Elisha Lee, of the Pennsylvania R. R., spoke at length on the proposition of continuing the pooling arrangement, after which there was a general discussion.

It was finally decided to appoint a Committee of Fifteen which is to meet with a committee representing the railroads to discuss plans and arrangements for continuing the work now being performed by the Tidewater Coal Exchange. This committee will consider the plans already mapped out for the organization of the Tidewater Transshippers Association, Inc., of New York City. In its plan the committee will also incorporate the following propositions submitted by the railroad representatives:

1. That the railroads propose to the shippers and transshippers of coal through the ports of Baltimore, Philadelphia and New York to pro-rate the expense of conducting a new exchange, if formed, on the basis of 70 per cent chargeable to the railroads and 50 per cent to the exchange.

2. This recommendation is to be conditional upon shippers and transshippers of Tidewater coal giving

reasonable assurances that at least 60 per cent of the total coal transshipped at these ports shall be handled through the exchange. (The tonnage handled through the present Tidewater Coal Exchange during the 10 months ending Jan. 31, 1920, as well as the tonnage for January itself was approximately 60 per cent of the total Tidewater coal handled at these ports.)

3. It should be understood that at least 60 per cent of the total Tidewater shipment will be retained for handling through the exchange without increase of the total number of classifications or pools. It is also recommended that special pools now in existence in favor of certain individuals shall be abolished as soon as possible.

4. Supervisory officials in charge of the exchange should be men of railroad experience and acceptable to the railroads.

5. The members of the exchange by methods which may seem to them best will, of course, be responsible for the quality and characteristics of coal going into each pool.

6. The railroads shall assume no financial responsibility of any kind except for their agreed proportion of the cost of conducting the operation of the exchange.

## Monongalia County Mines Unionized

Officials of District 17 in northern West Virginia estimate that during the last two weeks of March no less than 1,200 miners were enrolled as members of the United Mine Workers of America at ten different mines on Scott's Run in the Monongalia field, the Scott's Run field, or at least a large part of it, having been heretofore unorganized.

As the field is undergoing rapid development, officials of the U. M. W. expect further large accessions to their ranks from time to time. Mines at which the miners are said to have been organized are the Davis Coal Co., Liberty Coal Co., Berry Coal Co., Agreement Fuel Co., Soper & Mitchell, Anchor Coal Co., South Penn Coal Co., Scott Run No. 1, Randall Coal Co. and Elkins & Stone.

## Daily Versus Annual Wage

Anthracite Mine Workers Want 18.7 Per Cent Greater Increase Than Bituminous Mine Workers

WHEN the bituminous mine workers met their employers, they talked about the importance of adequate *annual* wages. What was to be gained, they said, from a large *daily* earning, if the industry was to be continually faced with short time and the incomes of the mine workers were to be frittered away by idle days? Now the anthracite mine workers meet the anthracite operators and talk day wage, saying that for so much work they are entitled to so much pay. It shows that until the bituminous coal field works as steadily as the anthracite there will be continued trouble. First the bituminous mine workers will ask a wage large enough to enable them to live during idle days and hours, and then the anthracite mine workers will want equal daily pay for their steady time.

At the session of March 31 the mine workers pre-

sented a comparison of the earnings of anthracite and bituminous mine workers. Figures were offered by the operators upon the same subject, and the whole matter was discussed. So far, it is stated, there has been no discussion on the closed shop, the check-off and the shorter work day, all of which form a part of the demands.

At the session held on Thursday, April 1, the agreement signed on the previous day by the bituminous miners and operators was discussed, and it was said, unofficially, that the wage clauses of the new bituminous wage agreement were read into the records. The mine workers' representatives regarded this as additional evidence—surely there is enough without it—that the anthracite operators intend to argue strongly against the mine workers' demand for a wage increase that will be 18.7 per cent higher than the bituminous mine workers have just secured.

The official statement issued at the conclusion of the session did not say anything about the bituminous agreement, simply reading:

"The operators presented arguments and figures answering the statistics presented by the miners last week, which statistics had reference to the increase in the cost of living as compared with the increase in rates and wages in the anthracite and bituminous regions from 1916 to 1920."

John L. Lewis, international vice president of the union, has announced that, now he has completed the negotiations with the bituminous operators, he will devote his time to the sessions of the sub-committee until an agreement is signed.

The sub-committee adjourned from April 1 until April 5, most of the members going to their homes over Easter Sunday.

The sub-committee resumed conferences at the Union League Club on the afternoon of April 5. While no official statement was forthcoming it is known that some of the miners' officials express the opinion that an agreement will be reached within the next two weeks.

The official statement given out at the conclusion of the session read:

"The sub-committee of anthracite operators and miners met today and resumed consideration of the demands of the anthracite mine workers. The operators made their reply to the demands of the mine workers for a standardization of the rates paid to men in various occupations and presented their argument in refutation of certain data based upon statistics of the Pennsylvania Compensation Commission that had been presented to the committee by the representatives of the mine workers."

## Palmer May Again Indict Coal Men Declares Price Rise Should Not Exceed Wage Rise and Perhaps Should Not Be Over 20c per Ton

FEDERAL district attorneys were instructed by Attorney General Palmer on April 3 to receive and consider complaints of profiteering in bituminous coal "which may arise in your district under the Lever act."

Mr. Palmer's telegram was prepared after some bituminous coal operators had stated publicly that the new wage scale agreed on under the terms of the award by the coal strike settlement commission would result in

an increase of from 60c. to \$2 a ton on bituminous coal.

"Now that the government regulation of prices has been discontinued," Mr. Palmer's message reads, "there are indications of an excessive increase in the price of bituminous coal. Our total annual production is approximately 500,000,000 tons. It is estimated that the total increase in wages (to mine workers) will be approximately \$200,000,000 per annum. If this entire amount is added by the operators to the price, it would only make an increase of 40c. per ton.

"If however, the operators absorb the 14 per cent increase which became effective in December, there will be left only \$96,000,000 to be passed on to the consumer. In this event, the increase in the price of coal at the mine would amount to 2½c. a ton.

"I understand that an exaggerated estimate of the demand for export coal is affecting the market price, particularly from Illinois east, this demand having been estimated at as much as 100,000,000 tons. But I am advised that our port facilities are only adequate for the export of 30,000,000 tons per annum—that is to say, only 6 per cent of our total production.

"This should not be made an excuse for raising the price for domestic consumption. It is probable that normal conditions will be shortly restored and fair prices will follow.

"In the meantime, please receive and consider complaints of profiteering which may arise in your district under the Lever act."

## Strikes Against Wage Decision Mine Workers Strike for More Favorable Contract in Kansas, Southern Illinois and Eastern Ohio

KANSAS mine workers are always first to strike and it is hardly surprising to read that on April 5 two thousand of them went on strike despite the fact that the state invoked the powers of the new Court of Industrial Relations and that subpoenas prepared by Attorney-General Hopkins summoned the presidents of all the local unions of the United Mine Workers of America to appear in court, April 6. Judge W. L. Huggins presides over the court which is empowered to deal with all industrial controversies, to issue orders, and which, when any strikes endanger public health or welfare, may take over the industry involved.

The mine workers oppose the day-wage provisions and the deadwork allowances as being inadequate and are opposed to automatic penalties, higher supply costs and the working conditions provided. Alexander Howat, the president of the district union, declared some time ago that there would be a strike on April 1 regardless of the industrial-court law.

Not being pleased with the wage increases granted by the Bituminous Coal Commission, 400 Columbiana County mine workers in northeastern Ohio refused to go to work on April 2. Three mines were crippled in consequence. Two hundred Tuscarawas County mine workers, also discontented with the decision, suspended work on the same day. In eastern Ohio also 3,000 coal mine workers struck, April 2, despite the efforts of union leaders.

In southern Illinois the company men are discontent and at twenty mines have discontinued work, the \$1 per day increase not being satisfactory to them.

# Oil, Being Already in Short Supply, Cannot Displace Coal

Shipping Board and Navy Cannot Secure Enough Oil—Prices Offered Three Times As High As a Year Ago—May Commandeer Oil and Demand Oil As Royalty

BY J. H. DODGE\*  
Washington, D. C.

FUEL oil will not be available in sufficient quantities and at prices economical enough to warrant industrial plants now employing coal as a principal fuel to convert to an oil-burning system. This is the conclusion reached following an investigation of the subject made by the Federal Trade Information Service at the behest of the owners of a plant contemplating the conversion of a coal-burning plant into an oil-burning one, should the prospects prove favorable. Probably the most striking single expression on the subject from an authoritative source is that of Dr. George Otis Smith, Director of the Geological Survey, who says: "Personally, I do not believe a barrel of fuel oil should be burned where coal is available and will serve the same purpose." This opinion seems to be concurred in by practically every person qualified to express an opinion, not excepting some of the large companies directly engaged in the oil industry.

In the course of its inquiry, the Federal Trade Information Service sought advice from one of the largest producing companies in the country. This company, though reputed to be dominant in the oil field and to be seeking business, reported that the fuel-oil situation is such that it does not feel itself to be in a position to take on new obligations for fuel oil. Other oil companies are in the same position, as evidenced by the difficulty of the Shipping Board and the Navy in obtaining bids on their requirements. Neither of these agencies has been able to attract bids for quantities large enough to cover their needs and those tenders made are at prices about three times former prices.

There is much talk of Government commandeering of oil supplies in order to obtain sufficient oil for the Shipping Board and the Navy. The Department of the Interior in drawing the regulations under the oil-lands leasing bill is to avail itself of the option to take the Government royalties in oil rather than in cash.

Another large oil company—a refining concern—approached, reported: "That, since at the present time, due to a combination of circumstances, there is really a world shortage of available petroleum, we do not feel that it is the right time for any one to change from coal to oil consumption for steam-making purposes."

Perhaps the expressions of the companies which normally would be eager for new markets for their products are even more convincing than the reports of Government agencies on the subject, but the Government experts are by no means lukewarm in their opinions as to the advisability of abandoning coal for fuel oil.

"It should be realized," says the Geological Survey, "that for a number of years the domestic production of petroleum has been insufficient for the demands, and importations, chiefly from Mexico, have steadily increased since 1912. In 1919 imports of crude oil into the United States amounted to more than 52,000,000

barrels. The obtaining of sufficient supplies of fuel oil to meet future demands for the Navy, the merchant marine and for general industrial use is causing much concern." Students of the situation from the engineering point of view believe that at prevailing prices coal is the more economical fuel. Ex-

**Oil companies refuse to take on new obligations in view of oil shortage. Fuel oil is only a third as efficient as coal when price is considered. Oil saves, however, in transportation and storage. Great Britain and Holland are getting oil control. Domestic supplies are found to be unequal to home needs.**

periments with the two fuels at prevailing prices result in reported conclusions that fuel costs about three times as much as coal for the same efficiency. While oil has some advantages from the point of view of transportation and storage, still its fugitive quality and its susceptibility to accidental destruction by fire is such that they nearly balance the advantages.

## OUTLOOK FOR FUTURE OIL PRODUCTION

Opinions differ as to the probability of enlarged oil production. Some scientists believe we are approaching maximum production while others feel that the stores of petroleum are practically unlimited. The appearance of salt water in so many Mexican wells and also in many in this country, has been a discouraging element. On the other hand, new and improved methods of production and handling and, above all, improved measures for the prevention of waste, an item which in the past has been stupendous, have bettered the outlook.

One source of alarm to oil men and consumers is the circumstance that oil reserves apparently are getting out of American control. Foreign countries—principally Great Britain and Holland—have cornered vast reserve supplies of oil in all parts of the world, whereas the United States has scarcely made a move to obtain preference anywhere.

The seriousness of the situation has been pointed out by the Navy Department, the Geological Survey, the Bureau of Mines and other well informed agencies.

Upon all these questions turns the advisability of the adoption by American industry of fuel oil in place of coal. Vastly increased oil production and the gaining of control over extensive petroleum reserves might very conceivably bring the price of fuel oil down to a point where it would prove more economical than coal, but the best information available is that coal, rather than fuel oil, today is the most available industrial fuel and is likely to remain so for some time.

\*Secretary, Federal Trade Information Service

# Central Competitive Field Makes New Basic Agreement

Operators, Afraid to Meet Mine Workers for Fear of Conviction Under Lever and Sherman Acts, Are Reassured by Assistant Attorney-General Ames—Make Basic Agreement in Accord with Majority Report of Bituminous Coal Commission.

**R**APID progress was made in the negotiations between the bituminous mine operators and workers when they resumed their conference at the Waldorf-Astoria Hotel on the morning of March 30. Before meeting to take action that might involve them in an indictment similar to that just filed against 123 operators and miners in Indianapolis, the operators wanted to receive, through their Attorney, Ralph Crews, of 55 Wall St., New York City, a letter from the Department of Justice, which came from the pen of Judge C. B. Ames, Assistant Attorney General. He assured them that it would not be a violation of the law for the operators and miners to make the contract which was recommended by President Wilson's commission. The letter, dated March 27, read as follows:

Becoming afraid that the joint agreements advocated by the President and urged on the operators in certain sections of the country by Government officials are of doubtful validity, and subject those taking part in them to fine and imprisonment, the Central Competitive operators insist before meeting with the mine workers and accepting the Government's proposals that they be assured that there is no prosecution in contemplation.

"You advise me that pursuant to the request of the President, representatives of the bituminous-coal operators and miners are to meet next Monday for the purpose of negotiating a new wage agreement, pursuant to recommendations by the U. S. Bituminous Coal Commission submitted to the President on March 10, 1920. You further advise me that because of the indictment which has been returned by a grand jury to the U. S. District Court for the district of Indiana, a question has been raised by some of the parties concerned as to whether such an agreement as has been recommended by the commission would be regarded by the Department of Justice as a violation of the law.

"While the Department of Justice is not authorized by law to give advice to private citizens, under all the circumstances I think it is proper for me to authorize you to say to the representatives of the miners and operators that the department does not think it would be a violation of law for the miners and operators to make the contract recommended by the U. S. Bituminous Coal Commission."

The sub-committee, after hearing the letter read to them, held a short session Tuesday morning, and it was decided to appoint a committee of two to draw up a tentative contract to be presented to the full sub-committee at 10 a.m. on the morning of March 31. This special committee was composed of P. H. Penna, of Indiana, representing the operators, and William D. Green, secretary-treasurer of the United Mine Workers, representing the mine workers.

The committee devoted the entire afternoon to the

consideration of a tentative agreement, and late at night it announced it was prepared to make its report to the full sub-committee when it convened the next morning.

Operators attending the conference declared that the increase in wage granted the workers by the President's commission would mean an increase of from \$1 to \$1.25 per ton in the price of bituminous coal at the mine, with the exception of Illinois coal, where, due to local conditions, which lessen the cost of production, the advance will not be more than 65c. at the mine.

The telegrams sent by President Lewis of the United Mine Workers of America to more than 3,000 locals notifying them of the action of the conference in putting into effect as of April 1 the increase of 27 per cent granted by the majority report of the Bituminous Coal Commission, and instructing the men to remain at work after April 1, cost the union between \$4,000 and \$5,000.

## OPERATORS AND MINERS SIGN AGREEMENT

After considering the report of the special committee appointed to prepare the tentative agreement, the sub-committee accepted it, and it was immediately signed by the International representatives of the mine workers and by two operators and two miners from each of these states—Indiana, Ohio, Illinois and Pennsylvania.

At the conclusion of the conference shortly after 5 p.m. on March 31, a copy of the agreement was made public. It follows:

"Pursuant to instructions of the President of the United States, as communicated to Thomas T. Brewster, chairman of the Coal Operators' Scale Committee of the Central Competitive Field, and John L. Lewis, president of the United Mine Workers of America, in a letter dated March 19, 1920, and which in part reads as follows:

"I am transmitting to you herewith a copy of the report and award of the Bituminous Coal Commission appointed to adjust matters in the controversy between the bituminous-coal miners and operators of the country.

"In accordance with instructions in my letter of appointment to the commission and memoranda attached thereto and the agreements by mine workers and operators to abide by the report and award of the commission, this report and award is the basis upon which

the wage-schedule agreements between the mine workers and operators shall be made.

"Operators and miners should, therefore, make arrangements for convening the necessary joint conferences as soon as possible to make such change in the terms, provisions and conditions, mining rates and wage schedules as are set forth in this report and award."

"We hereby agree:

"First—All coal shall be weighed and paid for on a mine-run basis, except that the Block Coal District of Indiana shall continue upon the present screen coal basis and that the usual methods of applying tonnage rates shall continue.

#### NEW PICK-MINING RATES

"Second—The pick-mining rate in the thin-vein district of western Pennsylvania and in the eastern Ohio, Hocking, Cambridge and Amsterdam-Bergholz districts of Ohio shall be \$1.1164, and throughout the balance of Ohio the pick-mining rate shall be advanced 24c. per ton upon the pick-mining rate in effect Oct. 31, 1919; in the bituminous district of Indiana \$1.03 per ton, and in the Danville district of Illinois \$1.08 per ton.

"Third—The machine-mining rate in the thin-vein district of western Pennsylvania shall be 94c. per ton; in Ohio, 94c. per ton; in the bituminous district of Indiana, the chain-machine mining rate shall be 96c. per ton and the punching-machine rate 98c. per ton; in the Danville District of Illinois 98c. per ton.

"Fourth—That all day laborers and monthly men (the advance to monthly men to be based on an average of the usual number of days he is required to work in a month), except trappers and other boys, be advanced \$1 per day. Trappers and boys receiving less than men's wages to be advanced 53c. per day.

"Fifth—Dead work, yardage and room turning is advanced 20 per cent on the prices being paid Oct. 31, 1919.

#### DEFINITION OF A DAY'S WORK

"Sixth—That the eight-hour day in effect Oct. 31, 1919, shall continue. An eight-hour day means eight hours' work in the mines at usual working places for all classes of inside day labor. This shall be exclusive of the time required in reaching such working places in the morning and departing from the same at night.

"Drivers shall take their mules to and from stables, and the time occupied in so doing shall not be included as any part of the day's labor, the work of drivers beginning when they reach the change at which they receive empty cars, but in no case shall the driver's time be docked while he is waiting for such cars at the point named.

"When the men go into the mine in the morning they shall be entitled to two hours' pay, regardless of whether the mine works the full two hours. But after the first two hours the men shall be paid for every hour thereafter by the hour, for each hour's work or fractional part thereof. If for any reason the regular routine work cannot be furnished the inside labor for a portion of the first two hours the operators may furnish other than the regular labor for the unexpired time.

"Seventh—All internal differences are hereby referred to the various districts for settlement, with the understanding that only by mutual consent shall anything be done in sub-district, district or wage-scale conventions that will increase the cost of production or decrease the earning capacity of the men. All rules now incor-

porated in existing contracts shall remain in force until changed by agreement between operators' and miners' representatives.

"Eighth—The practice of voluntarily paying more than the contract price, either by bonuses or otherwise, which is done ordinarily for the purpose of enticing employees from other mines, and thereby creating discord and disorder in the coal industry, is condemned. It will therefore be assumed in future joint conferences convened for scale-making purposes that all bonuses or advances in excess of wages provided in the contract were paid because of physical conditions in or around mines where such methods are practised, and the wages so paid shall be considered the base price for such mines, all on the wage scales in effect Oct. 31, 1919.

"Ninth—Whereas stoppage of work in violation of the agreement has become so serious as to menace the success and perpetuity of the United Mine Workers of America and our joint relations, this conference instructs the respective district executive boards to meet the operators in their various districts for the purpose of agreeing on a penalty clause where none now exists, and if necessary to meet also to amend and strengthen existing clauses so as to make the penalty more effective in preventing strikes and violations of agreements.

#### PENALTY IMPOSED FOR FAILURE TO COLLECT FINES

"All fines provided for in all agreements shall be automatically collected, and any operator failing to collect and forward to proper parties such fine shall pay a penalty of \$2 for each employee subject to be fined, the same to be collected and retained in the miners' district organization. And in no case shall any fine be refunded except by mutual agreement of the accredited representatives of the operators and miners.

"It is further agreed that where any employee enters suit in the civil courts to recover any fine collected in accordance herewith the district organization shall reimburse the operator for expense incurred on account of such suit.

"Tenth—That the fulfillment of this agreement is guaranteed by the international union, and the fulfillment of joint agreements entered into in any district shall also be guaranteed by the officers of the international organization, as well as by the officers of the district, and it shall be their duty to see that all such agreements are carried out both in the letter and in the spirit.

"Eleventh—The pushing of cars, loaded or empty, by the mine workers is natural to the industry and is an integral part of the day's work, and in the negotiations of 30 years this work where practised, has been paid for in general in the tonnage rates.

"Twelfth—The prices at which house coal shall be furnished the mine workers at the tippie shall be determined by adding to the price in effect on Oct. 31, 1919, the average percentage allowed as an increase on the wage scale to wit: 27 per cent, and when the coal is delivered to the miners' houses by the operator the actual cost of delivery shall be added.

"Thirteenth—For the purpose of the new agreement the prices charged the miners for blacksmithing shall be on the basis of existing contracts, providing, however, that the maximum charge shall not exceed three-fourths of 1 per cent of the miner's gross earnings.

"Fourteenth—Explosives shall be furnished the miners at cost, which cost is to include handling, transportation and insurance.

"Fifteenth—This contract is effective on April 1, 1920, and shall remain in force until March 31, 1922.

"Resolved, That an interstate joint conference be held prior to April 1, 1922; the time and place of holding such meeting is referred to a committee of two operators and two miners from each state herein represented, together with the international officers of the United Mine Workers' organization.

"Section 11 is not designed to interfere with existing arrangements relating to car pushing or prevent miners and operators from working out mutually satisfactory arrangements with reference thereto."

Claims by the bituminous operators that the increases granted in the new working agreement would result in the price of coal at the mines being increased from \$1.25 to \$1.50 per ton resulted in a statement being issued by Ellis Searles, editor of the *United Mine Workers' Journal*, on April 1, in which he said the increase does not justify the advance in the price of coal and that it was unfair to charge the miners with the responsibility. Mr. Searles is in New York with the officers of the international union.

#### OPERATORS REPLY TO SEARLES' STATEMENT

The operators through Chairman Brewster of the operators' committee, replied to Mr. Searles' statement the following night from their headquarters in this city. Mr. Searles' statement says:

"When Dr. Garfield granted the miners a 14-per cent increase in wages last fall he said the 14 per cent could and should be absorbed by the operators and that they could afford to pay it out of their profits, but the operators did not pay the increase out of their pockets. Instead, by increasing the selling price, they passed the increase on to the public in respect to at least 80 to 90 per cent of the coal. The present increase in wages adds 13 per cent to the pay of the miners above the 14 per cent granted by Dr. Garfield. If Dr. Garfield was right in saying they could absorb and pay the 14 per cent out of their profits, then they certainly can absorb at least the 13 per cent now instead of passing it on to the public.

"We see operators quoted as saying they will advance the price of coal \$1.25@ \$1.50 a ton because of the increase of wages granted to the miners. Such an increase would not be justified by the increase in wages. The wage increase was 27 per cent. This means that the increase in the cost of production cannot exceed 40 to 50c. a ton. Then why should the operators boost the price \$1.25 or \$1.50 a ton even if they pass all of the increase on to the public?

"If the operators make an unreasonable or unnecessary increase in the price of coal, the miners want the public to know they are not responsible for it."

The reply of the bituminous operators, made through Mr. Brewster, reads:

"Insinuations that the coal operators are going to gouge the public because of the recent 27-per cent advance in wages, as put out by the United Mine Workers' spokesmen in the guise of protest in the public interest, are sheer nonsense.

"During the coal miners' entirely unwarranted and unlawful cessation from work all stocks of coal were depleted and a shortage now exists throughout the

country. The replenishing of stocks has been retarded by a serious car shortage. Consequently, large consumers of soft coal are competing for the available supply, which has resulted in the offer of higher prices than the operators are willing to accept.

"All responsible operators will condemn unwarranted prices or any profiteering policies. The Bituminous Coal Commission having awarded the miners a wage scale giving them very high earning power, the public now has the right to demand more work, with advanced coal production, and less talk."

#### WANTS EIGHT HOURS' WORK FOR EIGHT-HOUR DAY

Before leaving for Indianapolis last Saturday night, April 3, Ellis Searles, editor of the *United Mine Workers' Journal*, said: "The operators are endeavoring to justify the high prices they are asking for coal by saying that the increase in wages granted to the miners and a shortage of coal are responsible for it. They say large consumers are offering higher prices for soft coal than the operators are willing to accept. If the operators will operate their mines eight hours a day, six days a week the miners will gladly dig enough coal to meet all demands and keep prices down to a reasonable level. This will relieve the operators of their terrible embarrassment of being compelled to accept larger profits than they think they are entitled to. The operators fought to retain the eight-hour day and succeeded in holding it. Now let them give the miners eight hours' work six days a week."

No question exists that there is a fear on the part of many bituminous-coal operators that coal prices will rise to inordinate levels if a great deal of self-repression is not used. The public is ready, though not willing, to pay almost any price for coal, and it is as hard to prevent the average bituminous operator from selling for all he can get as it is to stop him from giving coal away when orders are scarce. Until recent years it has been considered permissible to let supply and demand govern prices, but a new point of view in regard to the conduct of the producer's business now obtains.

#### MINERS SEEK TO SECURE EXCESSIVELY HIGH WAGES

While the operator is being condemned for accepting prices set by the market fluctuation, the mine workers have been trying by combination and a strike in restraint of interstate commerce to put up wages above the level set by supply and demand and to fix them at that excessive level by a collective bargain. This is quite different matter from the charge brought against the operator, who merely accepts what is offered. For the operator to accept such offers may be wrong, and just now certainly inexpedient, but it is a privilege that has never been denied the worker in the history of the United States, though it is one that has not always been conceded in foreign countries.

As to the opportunity to work full time, the mine worker in a majority of cases refuses to avail himself of it and if he were willing to do so, it would not be possible to satisfy his desire as cars are frequently lacking, and when they are obtainable orders are not to be secured. Furthermore the wage of the mine worker has just been fixed on a liberal basis with the shortage of time in full view, but the mine worker is, nevertheless, demanding full time as his right as if such liberal increase had not been made.

## Freight Rates to Europe Advance

Freight rates to Europe have advanced slightly, but rates to other destinations are unchanged, according to W. W. Battle & Co.'s coal trade freight report.

Rates by steamer are as follows:

	Rate	Tons Dis- placed
Stockholm....	\$22.00/22.50	800
Gothenburg....	about 22.00	1000
Antwerp/Rotterdam	about 19.50	1000
Hamburg.....	21.00/22.00	1000
French Atlantic		
excluding Rouen	about 19.50	800
Lisbon.....	18.00/19.00	1000
Barcelona....	21.50, 22.00	1000
Algiers.....	21.50, 22.00	800
Marseilles....	21.50, 22.00	1000
Genoa, Leghorn	about 22.00	1000
Spezia/Savona....	about 22.00	1000
Piraeus.....	about 25.00	1000
Trieste/Venice....	about 26.00	1000
Port Said.....	about 26.00	1000
Pernambuco....	about 15.50	500
Bahia.....	about 15.50	500
Rio.....	about 14.50	1000
Santos.....	15.00, 16.00	600
Buenos Aires or		
La Plata or		
Montevideo....	13.00, 13.50	1000
Paraná.....	about 14.50	500
Rosario.....	15.50, 16.50	750
Bahia Blanca	about 16.00	1000
To Nitrate Range	9.00, 10.00	750
Havanna.....	6.00, 6.50	600
Sagua or Car. Tejas	8.00, 8.50	300

Demerara.....	13.00	400
St. Thomas....	about 8.00	500

All above rates gross form charter.

## British Coal Output Estimated at 217,000,000 Tons

There has just been issued an official report of the British coal industry, in which are set forth the findings of Alfred Tongue & Co., chartered accountants, on the estimates of the Coal Control Department with special reference to figures on which that department based the increase of 6s. a ton in coal prices last July, and the further figures on which the reduction of 10s. a ton in the price of coal was based last December, Consul General Robert P. Skinner, London, states: [The values in United States currency are based on normal rates of exchange (\$4.86 to the pound sterling). The present value of the British pound is \$3.83.]

In July, 1919, the then coal controller put the estimated production for the year ending July 15, 1920, at 217,588,000 tons, and, taking the ascertained profits of 3s. 6d. (\$5.82 at normal exchange) per ton for the third quarter of 1918 as the starting point, arrived at an estimated deficiency of \$46,800,000 (\$226,778,900), equal to 4s. 3d. (\$1.031) per ton on the whole output and 5s. 9d. (\$1.199) on that part of the output on which an increased price would be effective. The findings of the accountants in regard to these figures are summarized as follows:

The estimates contained in them were in respect of a year's working of the industry from July 16, 1919, to July 15, 1920 (ignoring any loss prior to July 16, 1919), and being estimates so far ahead in such a

complicated industry could not reasonably be expected to be accurate in view of events and circumstances arising after the date the estimates were made.

Viewed in the light of the data then available, however, we are of opinion that: The estimated output of 217,000,000 tons was fair and reasonable.

The rate of profit taken as the basis for computation, viz., 3s. 7d. per ton raised, was also fair and reasonable.

The cost of production was underestimated, especially in respect of wages, this cost being estimated at £209,000,000 (\$1,017,100,000), as compared with our figure of £216,000,000 (\$1,051,200,000).

The revenue was underestimated to the extent of about £30,000,000 (\$146,000,000), mainly due to an undervaluation of the proceeds to be obtained from exports and bunkers.

In response to the personal request of the Prime Minister, the accountants present their own provisional estimate of the results for the year ended March 31, 1920, in the light of the facts so far as they are known today, and report: "It will be seen that in our opinion and so far as can be estimated the surplus remaining on the working of the industry for the current financial year will be approximately £6,000,000."

This estimated surplus of £6,000,000 (\$29,199,000) as at March 31, 1920, includes the gain accruing on the advance of 6s. per ton on inland coal made in July, 1919, less the loss in revenue resulting from the reduction of 10s. per ton on domestic and household coal, and the reduction of coastwise bunkers, from Dec. 1, 1919.

A cablegram from Newcastle, Australia, announces that 240,000 tons of coal were mined during the month of February. Bunker coal supplied to overseas vessels amounted to 34,380 tons, and 65,271 tons

were exported overseas, excluding bunkers. The balance of coal was used for consumption in Australia. Several British vessels have been engaged to take coal to West Africa to which the freight rate is 97s 6d. The marine engineers' strike ended Feb. 26.

## Danish Fuel Imports Are Less Than Half Those of Pre-War Days

Denmark's total imports of coal, coke, cinders and briquets in 1919 amounted to only 2,616,997 tons, which is about 300,000 tons more than in 1918, but far below the imports in 1914, which were 7,000,000 tons. Of the imports in 1919, only 383,196 tons came from Germany, the rest coming almost exclusively from England.

Denmark's supply of coal is still very limited and a number of the war-time restrictions have been reintroduced. The resumption of American coal export is not expected to have any material influence upon the general situation, the high dollar rates preventing a large-scale import of American coal.

## Public Tipple at New Orleans Will Operate May 1

With the early completion of a huge public tipple now in course of construction, New Orleans will be able to offer greatly increased bunkering facilities to shipping in addition to exporting a considerable amount of coal. This tipple, which is costing the state \$500,000, will put the port in a position to send 500,000 tons a year to the Panama Canal, as well as large quantities to Mexico, Cuba and South America.

## Coal Exports from New York During February

There were 2,933 tons of anthracite, 2,856 tons of bituminous and 1,924 tons of coke with a valuation of \$63,672 shipped to foreign countries through the port of New York in February of this year. This was a gain of \$8,293 in valuation and 1,951 tons, when compared with the exportations in the same month of 1919 when the shipments were 615 of anthracite, 3,561 of bituminous and 1,586 of coke with a valuation of \$55,379 or an average cost per ton of \$9.61, as compared with \$8.25 for this year's shipments.

Shipments of anthracite were made to 8 countries in February of this year, as compared with 5 countries in 1919, while bituminous was sent to 6 countries in 1919 as compared with 4 countries this year. The valuation of the 1,924 tons of coke shipped last February to 7 countries was \$19,299, while 1,586 tons shipped in February, 1919, was valued at \$22,608, a decrease of 338 tons, but an increase in value of \$3,309.

The following tabulation shows the shipments in February of this year compared with the same month last year:—

	Anthracite		Bituminous		Coke					
	1919	1920	1919	1920	1919	1920	1919	1920	1919	1920

# COAL AND COKE NEWS

## Charleston, W. Va.

### Chesapeake & Ohio Mine's Big Gain—Monday's Record—Contracts Closing Slowly—Letup in Coal Confiscation

More coal was mined in central southern West Virginia during the week ended March 27 than during any other weekly period of the month, it is believed, the output being in rather marked contrast to the preceding week. While gains were made, therefore, in production, it still left the output far from normal, transportation troubles still being the principal factor in preventing a large output.

Increased production for the week was made possible largely because of an almost normal car supply on the first day of the week; the car supply during the remainder of that period was in rather sharp contrast to Monday. There was a larger supply of cars on hand in all Chesapeake & Ohio fields on the twenty-second than has been observed for the first day of the week in recent years. With nearly 3,300 cars distributed to the mines, the output was almost equal to potential capacity, reaching 163,000 tons.

While Chesapeake & Ohio mines had a somewhat larger run of cars than usual and were able to increase their output, the reverse was true as to mines located on the Kanawha & Michigan throughout nearly the entire week; a slide and a wreck combined, virtually shutting off the car supply for three days. In fact it was not until Saturday that Kanawha & Michigan mines were able to load anything like a normal output, the supply of cars previous to that day amounting to little more than a handful. In this section of the state, at least, the month's average of cars furnished is just about the same as that for February or from 53 to 55 per cent.

### New River Record Smashed

The curve of production was upward in the New River field in the week ended March 27, that being a reversal of conditions prevailing in the week ended the twentieth, an increased car supply making a larger output possible. However, it was the favorable car supply at all mines at the outset of the weekly period, which made it possible to ship more coal than during the preceding week, for after Monday there was scarcely more than a 50 per cent run of cars. With a production of nearly 29,000 tons on Monday, the twenty-second, recent records for Monday loadings were smashed. The total production for the week reached about 125,000 tons, representing an approximate gain of 25,000 tons.

Time was being taken by producers in closing contracts, and it was doubtful, as the month closed, if there was more than 40 or 50 per cent of the New River output for the coal year under contract, many operators having reached a decision to hold a part of their output for the open market. It is the desire of New River producers to hold down prices as much as possible and not to encourage speculation. With that end in view only a price sufficient to cover an increase in wages and to afford a reasonable return will be charged.

Not only was confiscation of coal becoming less general as the month ended, but outstanding accounts for coal taken during the strike were being rapidly liquidated. With permits still being required for export shipments, the overseas consignments from the New River field were rather limited despite the heavy movement to tidewater.

### Improved Kanawha Car Supply

Impetus was given the production of the Kanawha field in the last week of March, through a greatly improved car supply on Monday, March 22. In fact on that day production broke all records in recent months, the total output reaching nearly 37,000 tons. That became possible when nearly 740 cars, or virtually a full supply was furnished the mines, and it was largely

because of this greatly increased supply that the Kanawha field was able to forge ahead of other weeks in point of production.

As far as the contract situation in the Kanawha field was concerned, producers here seemed to be waiting to get their bearings before closing many contracts, although there were many buyers in the field. Indeed producers hardly know just what a fair price is, being so used to having the Government make the price for them. Some operators believe that after the first of April Kanawha mine-run coal will average about \$4 a ton.

While some coal from the field was being confiscated, yet it was stated that such confiscation was not so general as it had been in previous weeks. Much of the output of the field was moving eastward but only a limited amount of Kanawha product was being exported.

## Bluefield, W. Va.

### Little Change in Smokeless Production.—Operators Slow About New Contracts—Strike of Railway Clerks

Transportation trouble still held production down in the extreme southern part of the state in the period between March 22 and 27. Little improvement was shown in the car service over the previous week, although on the other hand it is not believed that the transportation was any worse. Even with a slightly better run of cars in all fields, it is doubtful if the output of such fields as a whole was more than 55 or 60 per cent, if that much; maximum working time at most of the mines being about four days and in some cases three days.

While sending foreign cars home with dispatch and getting its own cars back to some extent, the Norfolk & Western still had by far the larger proportion of its own equipment on other lines. Despite the fact that there is known to be a shortage of coal cars, railroads are permitting the use of coal-carrying equipment for other purposes, particularly for the transportation of automobiles, and it is believed that such coal cars will be out of the coal-carrying trade for several weeks. Coal cars are being used for shipping automobiles into the coal fields, and they can be loaded with coal on the return trip.

### Many Buyers After Smokeless

The week in southern West Virginia was featured by the advent of many buyers seeking smokeless coal for delivery during the new coal year. Producers, however, were not to be stampeded, and it is not believed that many large contracts were closed. In fact southern West Virginia coal men are biding their time, until conditions become somewhat more settled; the larger agencies especially having no desire to precipitate a reign of unduly high prices. Furthermore, southern producers apparently do not propose to tie up their entire yearly output in contracts, but will hold a part of their output for spot sales.

Reports from various sources indicated that indebtedness, in connection with strike coal shipments, was being liquidated with greater celerity, toward the end of March, than earlier in the year; though large amounts were still outstanding, despite the fact that more than three months had elapsed since the end of the strike.

Despite heavy tidewater shipments from various southern fields, exports were not running as large in volume as might be expected, owing to the continuance of restrictions. Complaint of confiscation, however, was less general than in previous weeks.

Lack of adequate transportation facilities was still preventing anything like a normal production in the Pocahontas region, in the period ended the twenty-seventh. As a matter of fact the inadequate car supply was responsible for about a 40 per cent loss, mines being limited to about four days

of operation during the week. While the Norfolk & Western appeared to have a few more empties on its lines than during the preceding weekly period, nevertheless, the increase was so small as to make no appreciable change in production.

It has been found impossible for the Norfolk & Western to have as many of its own cars returned as had been hoped and as the road had made an effort to do. It was becoming more and more apparent, also, to Pocahontas producers, that railroads were careless in the use to which open top cars were put. Coal men in the southern regions felt that open top cars ought to be confined to the coal-carrying trade, in view of the general shortage of coal throughout the country.

With Government prices out of the way and with producers free to make contracts, there was a bevy of buyers in the Pocahontas region toward the close of the month; however coal companies were awaiting further adjustment of conditions and not precipitately entering into contracts. Only a small proportion of Pocahontas coal was under contract by the end of the month, no particularly large contracts having been reported closed between the twenty-third and the thirty-first.

Cold water was being thrown on the enthusiasm of numerous buyers, jobbers and speculators seeking tonnage, such would-be purchasers having little chance of success except in a small way, as the heaviest producers were evidently not contracting, and were endeavoring to heed the President's request as to prices. During February, shipments from the Pocahontas field were the lightest in five years, amounting to only 927,137 gross tons.

### Better Car Supply on the Gulf

There was an upward curve to production in the Winding Gulf field in the period ended the twenty-seventh, chiefly because of a somewhat better car service furnished by the Chesapeake & Ohio; the mines on this road having about a 50 per cent car supply, were able to work about four days out of the six. The car supply on the Virginia was running just about 70 per cent. Winding Gulf producers were in line with other smokeless operators in regard to making contracts, apparently awaiting developments such as the condition of the market, wage advances and so on. Owing to permit regulations, not a large quantity of Winding Gulf coal was being exported as the month drew to a close. Plenty of opportunities were offered for the disposal of the entire Gulf output, but part will be held in reserve for sale in the open market especially in view of the likelihood of quite a heavy demand.

During the week ended March 27, the mines of the Tug River field loaded 82,700 net tons of coal, 1,700 tons in excess of the output for the previous week. With Government supervision almost entirely removed, it is probable that contracts will be largely entered into as of April 1. Buyers were scouring the Tug River field for available tonnage and are offering considerably in excess of the best export price (\$4.10). This may have considerable influence on the volume which has been seeking export channels.

### Norfolk & Western Railway Clerks Strike

The strike of railway clerks, starting at Roanoke on the twenty-sixth, was assuming serious proportions during the last few days of March. On March 30 it was reported that all the clerks on the Sejota division went out. All clerks at the Bluefield scalehouse were on strike during the last three days of the month, but volunteers had been able to keep the movement of coal normal.

At such large weighing points as Portsmouth more difficulty was apprehended and it was considered probable that volunteers would have to be sent from Bluefield. It was stated that the public was not in sympathy with the movement to hamper the railways. Business men in the coal fields were offering any assistance necessary to the transportation company.

## Huntington, W. Va.

### Logan Output Down to Very Minimum —Export News—Wages to Advance

Car-shortage losses in the Logan field had, in the week ended March 27, reached unprecedented heights, there being no less than 258,000 tons lost from that source alone, cutting down production to the very minimum. In fact the total estimated output for the week in question was only a little more than 175,000 tons, or approximately 35 per cent of potential capacity.

Conditions were just about as unsatisfactory as they could be in the field at the end of the month, chiefly because of a transportation handicap. Not in a long time, however, have cars been more plentiful than they were at the advent of the week. With 1,052 cars on hand Monday, March 22, the mines here were able to produce and ship more than 52,000 tons of coal; that production was far in excess of any previous week since the end of the coal strike.

Logan producers and shippers were declining to be hurried in the matter of completing contract arrangements for the new year, mainly waiting to see what wages and prices generally would be; while rather fancy prices were being offered for Logan coal, this failed to tempt the mine owners, who are unwilling to see prices become unduly high. While Logan fuel is in much more demand in export markets, and enjoys a larger market in the East than in previous years, the quantity for trans-Atlantic shipment was rather limited, although somewhat larger than was the case earlier in March.

There was no question but what the wages in the Logan field will be raised at the proper time in order to meet the advances made in union fields, that having already been done, it is reported, in some instances.

There was a material increase in the tonnage handled by the Chesapeake & Ohio as a whole during the week ended the twenty-seventh, as compared with the previous week, the increase amounting to 1,736 cars or \$6,800 tons. In other words, total loadings, during the period ended the twentieth, amounted to 9,792 cars (or 489,600 tons) as against 11,528 cars (or 576,400 tons) for the following week.

## Fairmont, W. Va.

### Less Idle Mines in Northern Fields— More Coal Goes to Tide—Its Further Destination

Production in northern West Virginia fields, though falling far short of normal, during the week ended March 27, was still much better sustained than during earlier weeks of the month and especially during the week immediately preceding. Even with cars more plentiful, however, there was not much more than a 55 per cent output. As usual the chief obstacle to a larger production was the scarcity of cars.

The initial supply of the week especially on the Baltimore & Ohio Railroad, was such as to swell the week's total production, the first day's supply being the only one at all approaching normal. Monday's car supply on this road was equal to about 89 per cent of requirements, there being in excess of 1,400 cars available for loading on the day mentioned.

While Baltimore & Ohio mines were fairly well supplied on Monday, such was not the case as to Monongahela mines, the quota furnished to mines on that road amounting to only about 50 per cent of requirements. Mines on other roads in the northern part of the state were not so fortunate, having only about a fifth of the required number of cars on hand.

Throughout the week ended the twenty-seventh the run of cars, on the Baltimore & Ohio at least, did not run much below 50 per cent at any time; on other roads there was a gradual improvement, idleness at all mines being less prevalent than during the previous week. Another factor in building up the car supply, during the week ended the twenty-seventh, was the fact that the Western Maryland had resumed handling coal from a part of the Fairmont region—that part of the field on Helen's Run.

More coal was shipped from northern West Virginia points to Curtis Bay and other tidewater piers for export, and it was believed that more coal was really being exported than had been observed during the previous part of the month. A stop had been put to coast shipments

from Curtis Bay piers early in the month; but so much complaint was made against prohibiting export shipments from that point, while permitting other tidewater piers to ship coal in the export trade, that toward the latter part of the month restrictions were lifted.

One effect of the removal of restrictions was to increase the loadings to Curtis Bay from northern West Virginia very materially as the month drew to a close. In the absence of exact figures it is believed that the number of cars consigned to the Curtis Bay terminal, in the week ended the twenty-seventh was in the neighborhood of 1,000 or more.

During the greater part of the week above mentioned railroad fuel shipments were running ahead in volume of those of the previous week, no doubt because of the increased number of cars available. While the Baltimore & Ohio was securing a large tonnage from mines reached by it, there was also a heavy tonnage being shipped to New England roads. Not only were New England roads securing a large volume of northern West Virginia coal but other classes of consumers in the New England area were getting large consignments, part of which were being routed by water.

While the President's proclamation, suspending Government price control and Government distribution, was the signal for buyers to invade the northern West Virginia field, yet most producers were feeling their way, being unwilling to close any deals for the delivery of coal, until a general price basis was reached. It was also apparent, as the month drew to a close, that operators did not propose to tie up their entire output in contracts.

It is believed in the northern West Virginia fields, that there will be a heavy demand in the Lake trade this season, and northern West Virginia operators are looking forward to the opening of the Lake movement with a feeling of optimism. The operators will be fully able to take care of Lake business if transportation facilities are satisfactory.

## Louisville, Ky.

### Coal-Tonnage Tax Urged in Kentucky —Legislative Action—Governor Morrow's Statement—Report of State Geologist

Coal taxation on a tonnage basis has been up for discussion for some time in the Kentucky Legislature. On the night of March 15, an effort was made to amend the Omnibus License Tax Bill, by placing a 2c. per ton tax in this amendment. Lieutenant Governor Ballard ruled the amendment out of order, and on an appeal the decision of the chair was sustained by a 22 to 11 vote.

Mr. Ballard is a coal operator himself, and, while declaring his advocacy of the proposed tax on coal, held that the amendment was out of order as it was not germane. Senator Smith offered an amendment which was killed by a vote of 21 to 16, and which provided for a tax of \$5 a day on 25 to 50-ton mines; \$10 for 50 to 100-ton mines; \$20 for 100 to 200-ton mines; \$40 for 200 to 500-ton mines, and \$75 for mines over 500 tons a day capacity.

### Coal Tax To Be Scientifically Planned

Senator Antle, in opposing the Smith amendment, stated that Governor Morrow was planning a coal-tax law to be enacted before his term of office shall expire. Governor Morrow when asked concerning the statement said it was true, but that the administration planned to go about it in a broad way, realizing that one of the largest state industries is at stake.

He said: "We will not go about it in the slipshod, hap-hazard way, as indicated by the amendments offered here tonight, and by other measures offered at different times during the session. There is too much at stake. We are going to make a scientific survey of the situation and then pass a measure accordingly. Every measure offered so far has been the result of guesswork. No account whatsoever has been taken of differentials in different parts of the state, or other details that have to be considered for the right kind of tonnage-tax bill."

This statement was approved, as no consideration apparently was taken of high and low-grade coal and profitable and unprofitable mines; and placing a flat tax of 2c. a ton on all grades, from every district, would do a vast injustice to the industry.

W. R. Jillson, State Geologist, in a recent report on the coal conditions in the state, showed that from 1911 to 1918 Kentucky

produced 176,105,234 tons as against 157,971,800 tons from 1828 to 1910. Production started in 1828, but in 62 years (from 1828 to 1890) the state produced less coal by several million tons than is produced now in a single year. It now produces as much coal in two years as during the period between 1898 to 1907, when 70,000,000 tons were mined.

The Senate Committee of the Legislature secured some facts in arguing for a tonnage production tax, and figured 1919 coal output at 31,000,000 tons, which is probably about two and one half million tons higher than actual production during the year. In southeastern Kentucky, Pike, Bell, Letcher and Harlan counties have led, and in western Kentucky, Muhlenburg, Hopkins, and Webster. The Hazard district has been growing rapidly, and also the Elkhorn district. During the past ten years, Kentucky has just about made a good start, as a big coal-producing state, and has a great prospect before her.

## Ashland, Ky.

### Railroad Fuel in Hands of Committee— National Associations Handle Matter —Wages, Prices and Markets

The week ended March 27 was the first period in several months, in the northeastern Kentucky field, when the week's output exceeded the output for the corresponding week of 1919. A "no-market" condition was still quite prominent during the week of the earlier year, production for the period named in 1919 having been 115,500 tons; whereas, during the week ended the twenty-seventh, it had been increased to 122,545 tons or 47 per cent of the total full-time capacity (259,115 tons), the total loss being 136,570 tons, or 53 per cent of potential capacity.

A total of 131,290 tons or 51 per cent was lost during the period above stated, the loss from other causes reaching only 5,280 tons or 2 per cent. The tonnage given represented an increase in production of about 15 per cent and placed the production on a parity with the second week in March.

A quite marked improvement in the car supply was in evidence along the Chesapeake & Ohio and its branch lines, mines being able to work about 60 per cent of the time. To offset that improvement, however, the Louisville & Nashville supply became even worse than that for the previous week, and in many cases the mines were permitted to work only one day during the week, the average supply being approximately 23 per cent.

### Vicious Practice To Be Abolished

The Chesapeake & Ohio management, recognizing the unfairness of its position, with respect to preferential car supply, to mines supplying the roads with its fuel, cancelled such instructions and once more placed all mines on an equal distribution basis. In fairness to the railroads, every effort is being exerted by certain operators, in the northeast Kentucky district, to arrange for an adequate supply of fuel for the railroads, in order that carriers may not find it necessary at any time to resort to the assigned-car practice.

In connection with the railroad fuel supply, the Northeast Kentucky Coal Association will support the action taken at Washington recently by the National Coal Association, in appointing a committee to deal directly with the American Railroad Association and the individual railroads, for the purpose of securing full requirements of the railroads in the various districts.

Such an arrangement is predicated, however, upon the railroads paying the regular market price for their purchases. Once the railroads agree to that, there is no question but that they will be amply supplied; if finally effected, this plan will remove for all time the evils resulting from the employment of arbitrary methods by the railroads.

Many sighs of relief were given by the eastern Kentucky operators, about the twenty-third, when news reached Ashland that President Wilson had lifted the ban (effective April 1); the belief was expressed that eastern Kentucky operators would meet fully the wage advance recommended by the majority report of the Bituminous Coal Commission.

Some quite attractive prices have already been made for contract business during the ensuing year, and jobbers' representatives are becoming active in the field with a view to completing their contract negotiations at an early date. The splendid reputation established for the Elkhorn coals, for by-

product, coking and gas purposes, has resulted in many such companies looking to the eastern Kentucky field, thus opening up new markets to the eastern Kentucky producers.

**PENNSYLVANIA**

**Anthracite**

**Wilkes-Barre**—The Stanton mine of the Lehigh & Wilkes-Barre Coal Co. has been partly flooded, due to a breakdown of the pumps, and as a result 400 men have been idle for a few days. At present there is 14 ft. of water in the shaft. Large water tanks are being used to assist the pumps. These tanks have an estimated capacity of 1,000 gallons each and are being hoisted at the rate of about 110 per min. Only the lower level of the shaft, which is about 1,000 ft. deep, is affected. The upper levels are still being worked.

**Scranton**—The recent thaws have done considerable damage to the mines in this region by causing floods, which have temporarily caused a number of the mines to close down, including the Greenwood and Jermya No. 1. In the former mine the water is said to be forty feet deep. The Delaware, Lackawanna & Western Company has had considerable trouble at its Bellevue mine, where the water has backed up so that it has overflowed into the Oxford mine of the Peoples Coal Co. The water in this mine was six feet deep at the shaft bottom. The Pennsylvania Coal Co. and the Lehigh Valley Coal Co. have two of their mines near this place flooded. The Temple Coal Co. has had a little difficulty from water but it is reported that conditions at its mines have again become normal. Considerable difficulty has arisen in the handling of the water at some collieries due to a shortage of pipe.

A resolution has been adopted by the Scranton City Council recommending that an excise tax on all anthracite mined in the state be included in the new constitution.

**Hazleton**—Mine-examining boards report few applicants for miners' certificates, a condition which has brought forth a number of comments. There is a dearth of miners in the Hazleton field; this may be explained by the earnings of "company men" who receive nearly as much wages as the average contract miner and whose duties are lighter. As for laborers, they are not applying for jobs; the places are looking for the men.

The Raven Run Coal Company, a Wentz subsidiary at Raven Run, near Mahanoy City, has let a contract to the Central Pennsylvania Stripping & Quarrying Construction Co., for a large stripping. It is estimated that it will take about ten years to complete the work. The Wentz interest has let another contract to the same contracting company for a stripping east of Hazle Brook near Buck Mountain. This latter stripping will take five years to complete. Several reservoirs must be abandoned to permit the work to proceed.

The Lehigh Valley Coal Co. is contemplating starting some large new strippings, one of which will be at Buck Mountain, where Coxie Bros. & Co. stripped years ago, but where more coal has recently been discovered. Another stripping will probably be near Jeansville and a third close to the Coleraine colliery.

The G. B. Markle Company is considering the purchase of the mines of the Harleigh-Brookwood Coal Co., which is controlled by the Madera-Hill Co. No decision has been reached in the matter as yet. The mines of this company at Harleigh are at present flooded; these workings adjoin the old Ebervale mines. The Harleigh mines could probably be readily dewatered by means of the drainage tunnel at the Ebervale workings.

Considerable difficulty has been encountered by the various coal companies in this region, due to the flooding of their mines with water; a difficulty the G. B. Markle Co. escaped, due to the fact that its mines are drained by a tunnel 15,000 ft. in length. The other mines in this district are not similarly equipped and, as a result, have been forced to shut down either wholly or in part. The Markle company would have had no difficulty at all, if it had not been for the fact that a large drainage canal on the surface overflowed, and the water ran into the mines at the rate of 36,000 gal. per min. for a number of hours. The drainage tunnel successfully handled this water only causing a shut down for about 24 hours.

**WEST VIRGINIA**

**Charleston**—Instances having arisen where West Virginia producers have shipped coal to bankrupt concerns, under orders from the U. S. Fuel Administration, Congressman S. F. Reed, of the Third West Virginia district, has indicated that he will

either introduce special bills, providing for the relief of those who have been unable to secure settlement for coal shipped, or that he will introduce a bill creating a commission, to pass upon claims of those who are in the same category with a constituent of his. Congressman Reed was unable to make any headway, in aiding in the collection of a bill for a large shipment of coal consigned to a bankrupt firm at the instance of the Fuel Administration, there being no Fuel Administration any longer. The Director General declines to assume any responsibility for the acts of the Fuel Administrator, and the Department of Justice is also unable to furnish any relief, or to make any suggestion as to how the West Virginia shipper might be reimbursed.

**Huntington**—The headquarters of the Logan Operators' Association has been moved from Logan to Huntington, the change in the location of headquarters having been made about March 27. J. W. Colley, secretary of the association, and R. J. Manley, traffic manager, will both have their headquarters at Huntington. C. J. Neekamp, who will look after the car supply, will have his headquarters at Logan. Many of the operators of the Logan field live at Huntington, the distributing, supply and banking center of the Logan region.

**KENTUCKY**

**Whitesburg**—Reports are to the effect that many miners are going back to the farms as tenants or laborers, due to steady car shortages, which are resulting in mining being a poor money-making occupation. Such reports are being received from both the Elkhorn and Hazard fields.

**Louisville**—A report from Letcher County, Ky., is to the effect that the recently organized W. E. Deegans Consolidated Coal Corporation (a \$5,000,000 company of West Virginia), will start two extensive eastern Kentucky developments; one on the Louisville & Nashville, in the Elkhorn field, and the other on the Chesapeake & Ohio, in the Big Sandy field. It is claimed that the company plans two big developments with a capacity of 1,000,000 tons eventually, and that two mining towns will be built.

Estimated production for 1919 in Kentucky has been given at 28,500,000 tons, as compared with 31,612,617 tons in 1918 and 27,807,971 in 1917. The strike last fall more than offset losses occasioned in the fall of 1918 by influenza, while dull business in the early part of 1918, and car shortage from July to the close of the year, reduced tonnage considerably.

While numerous reports have been received concerning plans of the Louisville & Nashville R.R., for improved terminals, longer sidings and double trackage in sections of eastern Kentucky, later reports are to the effect that nothing much will be done this year, due to high costs of material and construction, high money market and difficulty in financing new projects, with rates low and earnings unsatisfactory. The Hazard field today has a production capacity of almost twice the physical capacity of the road to handle, and improvement is needed badly in that field.

**OHIO**

**Columbus**—The Southern Ohio Coal Exchange has given out the following figures on car supply in the district for the first three weeks in March: Supply in first week of March—Hocking Valley R.R., 76 per cent; Toledo & Ohio Central R.R., 50 per cent. Supply in the second week in March—Hocking Valley R.R., 71 per cent; Toledo & Ohio Central R.R., 50 per cent. Supply in the third week in March—Hocking Valley R.R., 59 per cent.

**ILLINOIS**

**Duquoin**—Coal was recently struck northwest of this city by the Southern Gem Coal Co., under the direction of Jesse Diamond, of Chicago. The Southern Gem people have been doing some extensive drilling throughout this section recently, and this is announced as the first strike of coal in this individual district. The land on which the coal was found lies directly east of Tamaroa, a small town north of here, and the coal is said to be practically of the same quality as the famous Franklin County coal. The seam at this place is six ft. and eight in. in thickness and 469 ft. below the surface.

The Export Coal Co., a newly organized corporation, has announced its intention of erecting a modern coking plant in connection with the mine of the Orchard Coal Co., near Pittsburg, southeast of here. This will give employment to several hundred more men in this district. Coal will also be coked at this plant from many other mines in southern Illinois.

**TEXAS**

**Dallas**—According to the officials of the Texas Coal Operators' Association, the mine owners of the state prefer to let the price of coal remain unchanged, rather than to increase the cost of production by raising the pay of the owners as well as the margin of profit, as proposed under the majority report of the wage commission appointed by President Wilson. The Texas operators say, however, that any advance in wages to miners must be taken care of in added cost to consumers, for the coal is now being handled on such a close margin of profit that the operators cannot stand the added cost of production.

In connection with the present coal situation, announcement is made by the Missouri, Kansas & Texas Ry. (the "Katy" system) that it will change nearly all its engines from coal to the oil-burning type. The change is being made, it is announced, because of the increasing demand and growth-scarcity of coal, resulting from the continued demands for higher wages on the part of miners and the resulting strikes and tie-ups of the mines. It is estimated that the change in "Katy" engines will mean discontinuance of the consumption of approximately 10,000 tons of coal a day. This railroad system has recently enlarged and improved its mine at Coalgate, Okla., at an expense of \$50,000. The mine now has a daily capacity of 600 tons and this was to have been doubled by the end of the summer. The change to oil-burning locomotives by the "Katy" will put fully 1,400 coal miners and coal handlers in Texas and Oklahoma out of employment.

**Personals**

**Nen Fagan**, formerly manager of the Marion Insulated Wire Co., Marion, Ind., will be the manager of the Rome Wire Co.'s Diamond branch at Buffalo, N. Y.

**W. L. Abbott**, chief engineer of the Commonwealth Edison Co., Chicago, was a recent lecturer at the University of Illinois, Urbana, Ill., speaking for the topic "The Art of Burning Coal."

**Harry Bissell** recently resigned as superintendent of the Cambria Collieries Co., at Bellaire, Ohio, a George M. Jones int-rest. He is now superintendent of the Simpson Creek Coal Co., at Simpson, W. Va.

**R. E. Roush**, general manager of the West Virginia-Pittsburgh Coal Co., has resigned, announcement to that effect having been made during the second week of March. D. F. Bird, assistant manager, has also tendered his resignation.

**J. W. Sidell**, who has been superintendent of the Harco mine of the Harrisburg Colliery Co., in Saline County, Ill., has tendered his resignation, effective April 1. Mr. Sidell retires to take a much needed rest.

**W. H. Burke**, for the past five years fuel agent for the Illinois Traction System, the largest electric railway in the state of Illinois, has been appointed fuel agent of the Frisco Railroad with headquarters in St. Louis.

**C. D. Boyd**, traffic manager for the Southern Appalachian, Harlan and Hazard operators associations, has been in Washington, D. C., attending the public transportation hearing, at which railroads, shippers, and so on, have been airing their views on transportation matters.

**Joseph Shimmell** resigned as assistant mine foreman with the Carnegie Coal Co., at the Atlas mine, Atlasburg, Pa., and accepted a position as mine foreman for the W. H. Shinn Coal Co. at Joffre, Pa. Both of these operations are in Washington County.

**J. W. Sidell**, superintendent of the Harco mine near Harrisburg, Ill., owned by the Harrisburg Colliery Co., recently resigned from active business life. He has been associated with the company many years. No successor has as yet been appointed to fill the vacancy.

**Oral L. Garrison**, formerly of Marion, Ill., recently received an appointment as private secretary to John L. Lewis, president of the United Mine Workers of America, and will have his headquarters in Indianapolis, Ind. This position will carry him into practically every mining district in the United States and probably some fields in Canada.

**George W. Vaux** has resigned as general manager of the Zeigler Coal Co., at Zeigler, Franklin County, Ill., and has gone to Toronto, Canada, where he has accepted a position as general agent of the Union Pacific, Oregon Short Line and the Oregon-Washington R.R. & Navigation Co. Mr. Vaux held this position prior to the gov-

ernment taking over the railroads in May, 1918.

**Ralph D. Brown**, who has been with the O'Gara Coal Co., in Harrisburg, Saline County, Ill., for ten years as chief engineer has been made general superintendent of this company, succeeding **A. B. McLaren**, who recently resigned. **Dennis B. McFiehee**, formerly chief clerk and assistant to the general superintendent of this company, which position he has held for a number of years, has been made assistant to the vice president, and will have charge of the accounting department, workmen's compensation, taxes and the lands of the company.

**Joseph Lewis** has been made general superintendent of the Chicago, Wilmington & Franklin Coal Co.'s mines in Franklin and Williamson counties, Illinois, taking the position made vacant by the death of **Thomas F. Holmes**, several weeks ago. Mr. Lewis has been superintendent of the Orient mine of this company since its development, and has been with the company many years. He is one of the competent mining men of the southern Illinois field. The Orient mine holds the world's record for single-car hoisting, having hoisted 6,008 tons in eight hours. Mr. Lewis will have headquarters in Benton, Illinois, where the company maintains general offices.

**B. F. Nigh**, secretary of the Michigan-Ohio-Indiana Coal Association, should be given credit for the wording of the recommendation in the recent report of the U. S. Bituminous Coal Commission where it asks the public, and especially the large users, to lay in their winter's supply of fuel between April 1 and August 1. In many ways it is said the recommendation follows almost verbatim a recent letter written by Mr. Nigh to the coal commission calling attention to the fact that many users, especially public utilities and public institutions, have not been in the habit of storing coal during the summer months, when such should be done.

**George H. Cushing**, managing director of the American Wholesale Coal Association, is making a speaking tour during which he is discussing the current problems confronting the coal industry. His itinerary is as follows: Toronto, Can., April 8; Grand Rapids, Mich., April 9; Kansas City, Mo., April 12; Omaha, Neb., April 13; Chicago, Ill., April 15; New York, N. Y., April 20. His New York speech will be before the Purchasing Agents' Association.

## Obituary

**Captain Darwin G. Case** died at his home 466 Fifty-fifth St., Brooklyn, N. Y., on March 27. Captain Case was a large owner of coal barges and had a wide acquaintance in the transportation and coal circles of New York City.

**Stewart W. Calder**, 40 years of age, assistant to the president of the Kentucky River Coal Corporation, died of pneumonia on March 22. Mr. Calder came to Kentucky from Norfolk, where he was with E. A. Langhorne, of Lynchburg. He had resided at Lexington, Ky., for five years prior to his death.

**Malvin B. Newcomb**, aged 31 years, chief engineer of the Rubber Machinery Department of The Wellman-Seaver-Morgan Co., died recently after a short illness, at his home in Akron, Ohio. He received his mechanical engineering education at the University of Wisconsin. Mr. Newcomb has been engaged in engineering work with various industrial concerns. He joined the Wellman-Seaver-Morgan Co. in January, 1918. He leaves a wife and two young daughters.

## Trade Catalogs

**Pratt Ballast Cleaner**. The Link-Belt Co., Chicago, Ill. Folder. Pp. 4; 6 x 9 in.; illustrated. Gasoline engine operated machine.

**Metallurgical Service**. New York Testing Laboratories, 80 Washington St., New York, N. Y. Folder. Pp. 4; 4 x 9 in.; illustrated. Announcement.

**Simplex Truck Jacks**. Templeton, Kenly & Co., Ltd., Chicago, Ill. Bulletin 820. Details improvements in a truck jack of interest to track maintenance men. Pp. 4; 8½ x 11 in.; illustrated.

**Rubber Insulated Wire**. Hazard Manufacturing Co., Wilkes-Barre, Pa. Booklet. Pp. 16; 3½ x 6½ in.; illustrated. A general description of the manufacture of rubber

insulated wire, calling special attention to the Hazard method.

**Carrick Combustion Control**. Carrick Engineering Co., 538 South Clark St., Chicago, Ill. Pp. 10; 8½ x 11 in.; illustrated. Some facts about power-plant control and description of the device made by the Carrick company for combustion control.

**Power Factor Recording Instruments**. The Esterline Co., Indianapolis, Ind. Bulletin 395. Pp. 16; 8½ x 11 in.; illustrated. A graphic recording instrument. Fundamental considerations and causes of low-power factors; prevention and correction. Description of instruments.

**Superheated Steam in Industrial Service Plants**. Bulletin T-3 and T-4, respectively. **Superheaters for Stationary Power Plants**. Bulletin T-5. Pp. 8. These three bulletins are all 8 x 10½ in. in dimension and are illustrated. They are distributed by the Locomotive Superheater Co., New York, N. Y. Bulletins T-3 and T-4 describe the application of the Elasco fire-tube superheater to steam shovels. Bulletin T-5 covers the advantages of superheated steam from a new point of view.

## Industrial News

**Cullman, Ala.**—The capitalization of the Stouts Mountain Coal Co. has been increased to \$200,000 to allow for general business expansion.

**Youngstown, Ohio**—The Uniontown Coal Co. has been incorporated with a capital of \$15,000, by Louis S. Baldwin, Arthur M. Lyon, R. H. Kallmerten, Helen E. Jones and J. H. C. Lyon.

**Syracuse, Ohio**—E. H. Holmes, president of the Brocals Chemical Co., of Indianapolis, Ind., will soon establish a branch office in Columbus to look after the development of a tract of about 600 acres of coal land near this place.

**New York, N. Y.**—The Hyatt Roller Bearing Co. announces that its new office location is Sixth Ave. at 41st St., New York City. All letters, telegrams and other communications for the Hyatt company, should be addressed to this location.

**Nelsonville, Ohio**—Holderman & Nelson, of this place, has purchased the lease on what is known as the Globe mine No. 3, on the Hocking Valley near Nelsonville and will operate in the future. The lease was formerly held by the Globe Coal Co.

**Logan, W. Va.**—The McCall Coal Co. has been incorporated with a capital of \$500,000 to engage in the development of coal mining properties in the Logan district. J. C. Sullivan, Tralee, W. Va., is named as the principal incorporator.

**Charleston, W. Va.**—In connection with the purchase of the mines of the Monte Coal Co., on Coal River, the Buffalo-Thacker Coal Co. has increased its capital stock from \$550,000 to \$1,000,000. L. R. Reese, of Huntington, is the president of the company.

**Huntington, W. Va.**—A \$100,000 tippie and washery is to be built by the Thomas Coal Co., of Bramwell, W. Va., one of the large companies operating in the southern smokeless field of the state; contract for the construction of the tippie having been awarded to the Stevens-Adamson Co.

**Montgomery, Ala.**—Carl T. Montgomery and associates are understood to be having plans prepared for the installation of machinery and equipment in connection with the proposed development of a total of about 1,000 acres of coal properties located in Merce County, W. Va.

**Stamford, Conn.**—The Yale & Towne Manufacturing Co. has moved its general offices from 9 East 40th St., New York City, to Stamford, Conn., where all company communications should be addressed. This move effects a consolidation of the company's selling organization with the factory.

**Logan, W. Va.**—Extensive developments of coal and timber lands in this region are proposed by W. C. McCall and associates, all of Logan. The McCall Coal Co. has been chartered with \$2,000,000 to undertake the enterprise. H. A. McMillster, J. R. Slack and W. H. Lilly are among the incorporators.

**Petersburg, Ind.**—The Big Four railroad is arranging to build coal yards in this city and sufficient trackage will be laid to accommodate 1,000 coal cars. Coal trains will be made up at Petersburg and a number of train crews will be held here.

From two to three train crews are held here now.

**Philadelphia, Pa.**—The Brown Instrument Co., of this place, announces that the company is erecting two new buildings, one for the manufacture of recording thermometers, and second a research department, at a cost of \$100,000. These facilities will enable the company to materially increase the output of Brown pyrometers and recording thermometers.

**Columbus, Ohio**—The Queen Shoals Collieries Co., has been incorporated with a capital of \$150,000 to develop a large tract of coal land in West Virginia. The incorporators are D. H. Armstrong, William A. Lama, E. B. Hughes, M. R. Weltner and R. M. Snetzer. The company will complete its organization by the election of officers within a short time.

**Cleveland, Ohio**—Word has been given out that the Lake Ore & Coal Exchange, which has been operated with headquarters at Cleveland, under the charge of H. M. Griggs, will be continued by the railroad officials of the interested coal-carrying lines. The exchange has jurisdiction over Lake movements at all of the Lake Erie docks and ports.

**Charleston, W. Va.**—Capitalized at \$75,000 the Mountain Eagle Collieries Co. has been organized to mine coal in Big Sandy district of Kanawha County adjacent to Elk River. Leading figures in the organization of the corporation were: Harold P. Tompkins, W. A. Alexander, S. V. Morris and P. H. Holman of Charleston; Lee Stone, of Lexington, Ky.

**New York, N. Y.**—Announcement has been made that the Sheridan-Wyoming Coal Co., Inc., a subsidiary of United States Distributing Corporation, has just completed a contract for the sale, to a large Western trunk line railroad, of 600,000 tons of coal per annum for a period of 7½ years. The contract is on a cost plus basis, and is said to be one of the largest ever placed.

**Nelsonville, Ohio**—E. W. Coyle, manager of the Southern Ohio Coal Co., of Columbus, has purchased the stock of the Meeker Run Coal Co., of Nelsonville, which operates a mine on the Hocking Valley. The purchaser will operate the mine. The property consists of about 1,000 acres of virgin coal lands and in addition a considerable acreage of pillars and work-d-over land which will produce a fair amount of coal.

**Morgantown, W. Va.**—The program of improvements of the Penn-Mary Coal Co. for the next year contemplates the expenditure of \$1,000,000 on the various plants of the company in the counties of Monongalia and Preston, West Virginia. Until last October the Penn-Mary company, or what it now represents, was the Elkins Coal & Coke Co. At that time the Elkins estate sold the company to the Bethlehem Steel Corporation. Since then many improvements have been made at different plants, so that the \$1,000,000 to be expended is in addition to improvements already made or under way. While the improvements will be made largely with a view to securing a larger production, yet the company also expects to build a large number of miners' dwellings, and to improve the community life generally at its several plants. The maximum output of the seven mines of the company under the old ownership was 750,000 tons a year. Plans made call for increasing the maximum to 1,500,000 tons a year. However it will not be possible to complete all improvements within the period of a year. Within recent months the company has purchased and put in service, seven 5-ton locomotives and 12 new mining machines. Among other improvements to be made is the construction of a large tippie at the Richard mine, the tippie there having been destroyed by fire several months ago. A large storage bin is also to be constructed.

**St. Louis, Mo.**—The Medart Patent Pulley Co., Inc., of this place, was founded 40 years ago with the Medart steel-rim pulley as the nucleus. Since that time the company has concentrated on the mechanical transmission of power, and today the name Medart is synonymous with everything in line-shaft equipment. Pulleys constitute but a small percentage of total production, which embraces a complete line of the many devices used in power transmission.

**Fairmont, W. Va.**—The Forest Coal Co. has been launched by Fairmont people, and is capitalized at \$200,000. The new concern will have its principal operations in Marion County. Associated in the preliminary organization of the company were: S. D. Brady of Fairmont, well known in the Marion field; A. P. Brady, H. E. Engle, E. M. Showalter and H. W. Showalter.

**Knoxville, Tenn.**—The Rich Mountain Coal Co. has filed articles of incorporation with a capital of \$75,000 to engage in general coal mining operations in the Knoxville district. H. G. Croley, T. P. Wither- spoon, and H. B. Lindsay are the incorporators.

**Charleston, W. Va.**—Pennsylvania coal operators will organize a \$5,000,000 corporation for the development of coal land in Monongahela County. They have chartered the Connellsville Big Vein Coal Co., of Point Marion, Pa., to undertake the enterprise. The incorporators are A. A. Arlson, of Point Marion; D. H. Horton, of Connellsville, Pa.; J. L. Kendall, of Pitts- burgh; J. L. Kendall, of Cheat Haven, Pa.; S. A. Kendall, Washington.

**O'Fallon, Ill.**—A charter was recently granted the O'Fallon Coal Co., of this place, the purpose of the company being to develop and operate bituminous coal mines, the sale of coal and acquiring options and leases for mining purposes. The capital stock was announced at \$1,000,000. The incorporators of the company are: C. G. Omstead, Samuel Meister, E. C. Warron, Wm. A. McDonald, P. C. Pardee, W. S. Fletcheringham, Frederick Mohr and A. W. Black.

**Louisville, Ky.**—G. C. Atkinson, president of the St. Bernard Mining Co., Earl- ington, Ky., was in Louisville for several days during the week, following a trip to the Nashville properties. While in Louis- ville he visited the Louisville & Nashville offices, in an effort to secure a better car supply. The company mines on the Louis- ville & Nashville lines are working about 45 per cent of capacity; while those on the Illinois Central are working on quite a fair basis, but loading out considerable coal for the railroad.

**Huntington, W. Va.**—The Overseas Coal Corporation, with headquarters in this city, has been organized with a capitalization of \$30,000 to mine coal in four counties of West Virginia—Cabell, Lincoln, Logan and Boone. Most actively identified with the new company are: J. W. Feague, John S. Marcum, J. R. Marcum, C. P. Marshall, Jr., H. K. Fox, all of Huntington. The same people have also organized the Westkole Fuel Co., with a capitalization also of \$30,000, and also for the purpose of oper- ating in the counties already named.

**Cumberland, Md.**—The Georges Creek Coal Mining Co. is having plans prepared for extensive operations at its coal prop- erties to provide increased capacity. It is proposed to abandon the use of the steam shovels now in operation, and commence at once on the development of numerous drift openings, including the driving of en- tries to reach coal in the vicinity of the Jackson workings. The company has recently concluded negotiations for the acquirement of the property formerly held by the Green Coal Co., adjoining its site.

**Akron, Ohio**—The Goodyear Tire & Rubber Co., of this place, has acquired a large acreage of coal land in Belmont and Har- rison counties, together with the going operations of the Somers Coal Co. in those counties, the sale having been consummated about the end of March. The sale price of the mines and holdings of the Somers Coal Co. is said to have been \$385,587.96. It is proposed by the rubber company to enlarge the scope of operations by opening a new mine and establishing a new town, of which the mine will be the nucleus.

**Williamson, W. Va.**—The Tug Valley Fuel Co., organized by local business men with a capital of \$50,000, will deal in the output of the Williamson field, having already closed several large contracts cover- ing export shipments. The company, in addition to acting as a fuel agency, also operates its own mines. The incorporators of the company were P. A. West, E. L. Bailey, J. T. Johnson, W. P. T. Varney and Dr. W. M. York. P. A. West, formerly weighmaster of the Norfolk & Western, at Portsmouth, has been selected as manager of the company with headquarters in Williamson.

**Fairmont, W. Va.**—Authorized under its charter, just secured, to engage in the mining of coal and the manufacture of byproducts, it is believed that the Ayr- shire Corporation of Pittsburgh, a non- resident corporation with \$100,000 capital- ization, will have quite extensive operations in the Marion field before long. No defi- nite plans have so far been announced. Under this charter it is authorized to hold and control 22,000 acres of coal land in West Virginia. The incorporators of the company are: Laurence T. Saunders, Samuel McClay, L. Raymond Martin and John A. Irwin, all of Pittsburgh, Pa.; Wil- liam Seifert of McKeesport, Pa.

**Lester, W. Va.**—The Neale Coal Co., which recently filed articles of incorpora- tion with a capital of \$25,000, is arrang- ing plans for the immediate development of coal properties in the vicinity of Lester, Raleigh County. Equipment for all features of operation will be installed. E. L. Bow- ling, E. V. Neale, and J. W. Lester, all of Lester, and A. M. Herndon and G. E. Hart- sook, Goodwill, W. Va., are the incorpor- ators.

**Bridgeport, Conn.**—The Curtis & Curtis Co., of this place, manufacturers of the Forbes pipe threading and cutting machine, is one of the few concerns in this city to receive a "Certificate of Merit" from the War Department for the company's patri- otic service during the war. This citation is expressly for "making prompt deliveries and otherwise co-operating with the Con- struction Division of the Army." During the war Forbes pipe threading and cutting machines were supplied for pipe- fitting work in the cantonments, battle- ships and navy yards.

**Huntington, W. Va.**—Largely to replace equipment destroyed during the ice jam of 1917-1918 in the Ohio River, the Island Creek Coal Co. has taken over the river equipment of the Pittsburgh Coal Co., pay- ing for such equipment approximately \$500,000. Announcement of the sale was made here during the week ended March 27. Included in the equipment purchased were steamers, barges and repair docks heretofore located at Burlington. How- ever, the purchasing company is having the repair dock moved to Coal Haven, Ky., and rebuilt there.

**Huntington, W. Va.**—The W. E. Deegans Consolidated Coal Co., which recently filed articles of incorporation with a capital of \$5,000,000, has perfected its organization and is planning for active operations at an early date. The company has acquired under lease a total of about 15,000 acres of West Virginia and Kentucky coal properties, and is having plans prepared for the installation and operation of a total of ten mining plants. Modern ma- chinery and equipment for all features is planned, and electric power for operation will be arranged for wherever possible.

**Peoria, Ill.**—The Peoria, Hanna City & Western Ry. has petitioned the Illinois Pub- lic Utilities Commission for authority to issue \$125,000 in capital stock. The rail- way is four miles long and runs from Hollis Junction, a mile and a half west of this place and then up to Le March Creek, where the Newsam Brothers and the M. E. Case mines are located. The road was built to carry coal from the mines, and the capital stock is to be issued to pay the cost of building the road. The stock in the road is owned by the Newsam Brothers and several other stockholders.

**Charleston, W. Va.**—Recent details learned in connection with the organization of the Callan Coal Co. indicate that this concern will develop about 300 acres of coal land on Campbells Creek near Dana in Kanawha County. As the tract is a small one, the daily capacity will be limited to about 350 tons per day. However the property will be immediately developed. Officers of the Callan company just elected are: A. D. Calahan, of the Logan field (operating mines in that field), president; P. E. Gallagher, secretary.

**New York, N. Y.**—The United States Dis- tributing Corporation, of this City, has announced that under a contract recently consummated, the Peabody Coal Co., which is operating the mines of the Sheridan- Wyoming Coal Co., Inc., a subsidiary of the United States Distributing Corporation, has become responsible for the sale of the entire output of the Sheridan mines. By this arrangement the United States corpo- ration announces that a single selling agency replaces the six selling organiza- tions previously maintained for the several mines involved with resulting substantial savings to the Sheridan-Wyoming Coal Co., Inc.

**Clarksburg, W. Va.**—The Peacock Coal Co., organized by Clarksburg people, has elected officers and arranged to develop a tract secured on March 27. The officers of the company are: Olandus West, pres- ident; J. Hornor Davis, vice-president; P. M. Robinson, treasurer; Carl Hornor, general manager; E. B. Templeman, secretary. The Peacock Coal Co. closed a deal with the Fairmont Big Vein Coal Co. for the pur- chase of a tract of coal land near Nor- wood, W. Va., on Nutter's Run. Develop- ment work on the newly acquired prop- erty will begin at once and within a short time the company expects to produce coal.

Headquarters of the company are in this city.

**Fairmont, W. Va.**—The Laurel Hill Coal Co. has completed negotiations for the purchase of the plant and holdings of the Eyer Coal Co., located near Philippi, Bar- bour County, W. Va. It is understood that the new owner is arranging plans for im- proving and enlarging the plant, with con- sequent increase in production. Included in the property is a tract of about 400 acres of Kittanning coal. J. E. Gaskill and Howard I. Connors, Fairmont, are prominent in the company.

**Kingston, W. Va.**—Production will be largely increased by the Solvay Co., at its plant at this place, through the opening of a mine in the Powellton seam. The company for some time has been develop- ing the Eagle seam. The Powellton seam here is about 150 ft. vertically above the Eagle seam, and it will be necessary to construct an incline, 1,200 ft. of railroad track and a headhouse. Under present plans it is also proposed to build a stor- age bin of about 100 tons capacity. Exten- sions and improvements are to be made to the company's power house so as to pro- vide for the additional load required. As many more miners will be employed, it will be necessary to construct about 100 new dwellings for miners.

**Chicago, Ill.**—Announcement is made that the general offices of the Chicago Pneumatic Tool Co., of this place, were transferred on March 31, to the Chicago Pneumatic Building, a new 10-story struc- ture erected for the exclusive use of the company at the corner of 14th St and Fifth Ave., New York City. This move- was accomplished without appreciable in- terruption to business; arrangements were so carefully planned in advance that the jump of this large organization, across half of the continent, was made with practically no interference to the normal routine of business. The Chicago district sales branch of the company, previously in the Fisher Building, has been moved to commodious new quarters at 300 North Michigan Boulevard. The Chicago service branch of the company, formerly at South Dearborn St., has been consolidated with the sales branch at the new address. Both departments will be under the direction of J. L. Canby, as district manager.

**New York, N. Y.**—Of general interest is the combination recently announced of the organization of Westinghouse, Church, Kerr & Co., Inc., engineers and constructors, of New York, and Dwight P. Robinson & Co., Inc., constructing and consulting engineers of New York. The new company will be called Dwight P. Robinson & Co., Inc., and will occupy executive offices at 61 Broadway, and the engineering and designing offices in the Grand Central Palace, 125 East 46th St., New York. Dwight P. Robinson, the president of the new company, was for many years president of the Stone & Web- ster Engineering Corporation, and formed his own company in 1918. He has had an unusually extensive experience in the design and construction of industrial plants, the Stone & Webster company specializing in work of this nature. The Westinghouse, Church, Kerr & Co.—established 36 years ago—has also specialized in the design and construction of industrial plants of all kinds. In a way the activities of the two companies are largely supplemental, each making its own specialized contribution to the new company.

**Charleston, W. Va.**—During February 14 new companies were organized in West Virginia, the combined capital of all such companies being \$6,465,000. Besides the new companies formed, 15 coal companies already in existence increased their capital stock to the extent of \$2,500,000. The principal companies formed were as follows: Prowagstep Coal & Coke Co., of Cleveland, capital \$200,000; W. E. Deegans Consolidated Coal & Coke Co., of Hunt- ington, capital \$5,000,000; Meadow Creek Coal Co., of Charleston, capital \$100,000; Dear- born Coal Co., Stonewall, W. Va., \$125,000; Little War Creek Coal Co., of Tralee, capital \$500,000; Hooper Mankin Fuel Co., Huntington, capital \$100,000; Tygarts River Coal Co., Philippi, \$150,000. The prin- cipal companies in the state increasing their capital stock follows: American Fuel Co. to \$2,500,000; Kanawha & Hocking Coal & Coke Co. from \$3,500,000 to \$5,000,000; Alvah Coal Co. to \$2,500,000; Flat Top Fuel Co. to \$200,000; Wolf Summit Coal Co. to \$750,000; Cade Ridge Coal Co. to \$100,000; Rich Black Coal Co. to \$150,000; Rhodell Coal Co. to \$200,000; Ivy Branch Coal Co. to \$100,000; West Virginia Eagle Coal Co. to \$150,000; Lewiston Block Coal Co. to \$150,000; American Eagle Colliery to \$800,000; Chaplin Collieries Co. to \$400,000.

# MARKET DEPARTMENT

## Weekly Review

*Freedom from Control of Bituminous Brings with It Sharp Advance in Prices—Many Buyers in the Market—Few Contracts Closed—Car Supply Still Hovers Around 50 Per Cent Mark—Coke Prices Advance Considerably*

**G**REAT interest has been manifested during the past week in regard to the new prices that will become effective with the return to freedom from control in the bituminous-coal industry. The coal market has been in an excited condition and prices have advanced at a great pace. It is to be feared that the development of a steady market is still far off.

Some of the larger operators set out with a determination to hold their prices to conservative limits, but in few instances were these limits adhered to. This was due largely to the eagerness of the smaller operators to sell at the highest prices bid. Taken as a whole, there was not much contract business transacted.

Buyers were in the market in large numbers, but they were in there apparently to obtain quotations only. Large consumers did not seem to be in a hurry to refill their bins with spot coal. They preferred to wait until contract business could be transacted.

Production of both bituminous and anthracite did not show any marked increase. Some of the mines in the anthracite region that were affected by floods and were forced to shut down have not yet resumed operations.

In the Pittsburgh district a level seems to have been found for coking coal, which was selling for \$4.50 and quite a number of small-lot sales have been consummated. The steel interests have been the principal buyers, as their needs are greatest and they are in the best position to pay fancy prices. An additional price of coal is but a small item if by paying it the production of steel is thereby increased.

Coal-car supply is not as satisfactory as could be desired. It hovers about the 50 per cent mark, but in the district around Pittsburgh it has fallen as low as 40 per cent. In southern Kentucky also a poor car supply is reported, the Knoxville division of the Louisville & Nashville reporting the extremely low figure of 9.8 per cent. Under such unfavorable conditions labor is deserting mine work.

In Missouri, Iowa, Nebraska and southern Illinois it is interesting to note that the opening prices on Pocahontas coal are almost prohibitive. As a result the retail trade in the states mentioned has turned to Oklahoma smokeless fuel, which the retail dealers consider as good, if not better than the West Virginia product.

The coke market opened with considerable vigor during the past week, at prices far above the Government price limits. Coke has advanced on an average about a dollar a day, but such conditions cannot last long, and a reaction seems inevitable. The market should stabilize at some reasonable level. With an average improvement in car supply in the coke region of about 10 per cent, the production rose to 254,552 tons, the highest point for the year to date.

At Norfolk and Newport News dumping proceeds slowly and for a full fortnight in March, coastwise steamers were on demurrage, as high as \$2 per ton having been paid. Export business continues under permit.

### WEEKLY PRODUCTION

The weekly report on the production of bituminous coal, anthracite, and beehive coke, compiled by the Geological Survey, Department of the Interior, April 3, 1920, states that the production of soft coal during the week ended March 27 increased 5.5 per cent. Preliminary estimates place the total output (including lignite and coal made into coke) at 10,914,000 net tons, an increase of 568,000 tons over the preceding week.

The cumulative production since the beginning of the year is shown in the following table with comparative figures for the three years preceding:

	Production First 24 Working Days
1917	133,466,000
1918	130,530,000
1919	104,202,000
1920	130,658,000

The year 1920 is thus about 2,800,000 tons behind 1917, but is slightly ahead of 1918, and leads its immediate predecessor, 1919, by 26,150,000 tons.

Shipments of anthracite by the nine principal carriers—in part estimated—amounted to 36,394 cars during the week ended March 27. Allowing for mine fuel and sales to local trade, this indicates a total production of 1,865,000 net tons, an increase of 312,000 tons, or 20 per cent, over the preceding week.

The cumulative production of anthracite from the beginning of the coal year to March 27, 1920, amounted to 87,766,000 net tons. During the corresponding period last year it was 92,360,000 tons. With only three working days remaining, production for the current year is thus about four and a half million tons short of that of the year 1918-19.

An increase of 7 per cent in the production of beehive coke during the week of March 27, is indicated by the shipments over the 26 principal coke-originating roads. The total output is estimated at 501,000 net tons, as compared with 467,000 tons during the preceding week. This was the largest tonnage reported in any week since February, 1919.

The cumulative production since the beginning of the year is now 5,494,000 tons. Compared with the corresponding period of 1919, this is a decrease of 392,000 tons, or 7 per cent.

### Atlantic Seaboard

#### BOSTON

Embargoes interfere with shipments. Movement improves very slowly. Spot prices firm and hard to control. Fewer contract offerings. Active demand at piers. Despatch again slow at Hampton Roads. Anthracite retail prices advance. Steam sizes in less request.

**Bituminous**—The New York Central embargo against the Boston & Maine and against the Boston & Albany has effectively shut off practically the whole of New England, so far as concerns coal either originating on or moving via that line to the all-rail gateways. Steam coal emanating on the Pennsylvania can reach certain points, either via the New York, New Haven and Hartford or the Boston & Maine except that the Delaware & Hudson was embargoed by the Boston & Maine on March 29.

The New York Central embargo placed on March 25 is now expected to be lifted by April 5. The trade certainly hopes so, for there is increasing anxiety over the failure to get coal forward for April and May needs. The larger buyers, especially, are worried: an embargo of this kind, due to congestion because the Boston & Maine in particular is short of motive power, is regarded only as a forerunner of other and perhaps more serious traffic difficulties later on.

The differential is so much in favor of the all-rail route that there is bound to be a great effort on the part of consumers, railroads included, to get coal through channels from central Pennsylvania. Undoubtedly, there will be frequent tie-ups because of railroad congestion.

Coal that was started prior to March 26 is coming through reasonably well, although the improvement is anything but rapid. There are hundreds of cars now reaching destinations that were shipped

April 8, 1920

around Jan. 15, certainly a record for slow movement into New England. Less is heard from confiscations, although there are rumors that the railroads intend to buy very sparingly for the present, relying upon their power of seizure in case they need coal before prices have receded.

The fact that shipment is now restricted so largely to coals originating on the Pennsylvania has led to what might almost be described as a buoyant market for spot coal. Poll 9 coals have been offered at as high as \$1.75 per net ton, but takers have been few. Coals of medium grade are ranging from \$1.40 to \$1.25, although there is a growing feeling among the more far-sighted operators that it would be a mistake to allow prices to soar. Under the award of the Coal Commission the prices quoted afford a handsome return in most cases, and it would be poor policy to invite new and drastic legislation this coming season.

At the same time there are the greedy few who want to reap while the harvest is good. They form the element that is extremely difficult to control. The attitude of several of large anthracite-producing companies in favor of granting their men a retroactive advance from April 1, but at the same time withholding any advance in price to the trade until the wage increase is agreed upon, is an instance of greater breadth of mind.

There have been distinctly fewer contract offerings the past week. The quality grades, or so much of the tonnage as could be saved for this territory, have now been placed, and buyers are not yet interested in buying the cheaper grades. There is also the feeling that if coals of lower quality will have to be bought the market will be more favorable to the buyer in July than it is now.

All grades are in good request at the Philadelphia and New York piers. The New York Central embargo has resulted in better movement to New York, but the market is readily absorbing all that comes on. On Long Island Sound there is an active market. From Hampton Roads, as well as all-rail, deliveries have been interrupted and were the weather colder there would be a great deal of anxiety over light stocks that are now the rule. Textile and other manufacturers are so prosperous that they will take no chance of shutting down and they are willing in most cases to pay the prices asked.

At Norfolk and Newport News despatch is still very slow. For a full fortnight in March coastwise steamers were on demurrage as high as \$2 per ton having been paid. This makes the on-car price at Providence or Boston very close to \$1.75. The retail price in Boston is now \$1.12, and retailers acknowledge that at this rate per net ton this price is not adequate to cover costs. A strike of clerks on the Norfolk & Western has also had its effect on movement. Despatch is now from five to eight days at all the piers.

**Anthracite**—Domestic sizes continue in very strong demand. Even at higher barge freight rates retail dealer is bringing the strongest kind of pressure to get coal. Shippers have slowed up materially the past few days, dumpings at Philadelphia and New York having suffered because of car supply. All-rail the New York Central embargo has cut off several large sources supply and there is much anxiety over the outlook for April.

Meanwhile, the public is clamoring for next winter's fuel and even advanced prices do not lessen the demand. Effective April 1 Boston retail prices on egg, stove, and chestnut were increased \$1, making the new price \$14.50 per net ton delivered. In Providence, R. I. the new price is \$15 including housing, and in Portland stove coal was fixed at \$16.

Less is heard from the increased opportunity to get bituminous there has been less inquiry for steam anthracite. This is only natural and could have been foreseen. At the same time the producing companies apparently have an ambition to advance the price on these coals.

## NEW YORK

Retail dealers have not advanced prices. Buyers swarm the coal fields and bid against themselves. Bituminous market strenuous. Demand strong with supplies short. Operators endeavoring to keep prices down.

**Anthracite**—The situation remains strong and domestic coals are in heavy demand and while the supplies have been coming forward in fair shape there is not much free coal on hand. Wholesale dealers are heavily booked, some producers being sold ahead for several weeks.

Receipts have not been anywhere near normal because of the suspension on April 1 to celebrate the eight-hour day, and Good Friday, but the tonnage produced on the days the mines were operated show that the miners will follow the advice of their leaders and play their part in keeping up the output during the wage conferences.

Not all of the mines affected by the floods of several weeks ago have been restored to normal conditions and as a result tonnage remains below normal. There has been no general announcement made as to what all the big producing companies will do with regard to billing coal sold after April 1, while the wage conferences are unfinished; that is whether it will all be billed at the regular winter prices or whether it will be sold subject to the new price to be fixed, inasmuch as the wage agreement is to be retroactive.

The retail dealers in this city have not changed the prices in force during the winter and are not likely to do so until the wholesale prices are altered. Most of the retailers in accepting orders for future delivery do so with the understanding that the coal is billed at the price current at time of delivery.

Demand for the domestic sizes is strong. Stocks with the retail dealers are not large and they are delivering steadily to their customers. Some dealers are employing extra trucks.

While the majority of independent operators are sticking closely to the 75c differential there are reports that some of the small operators are quoting as high as \$9 at the mines. The mining regions are being constantly visited by buyers who are bidding against themselves and forcing higher quotations.

Steam sizes continue in good demand, the call for buckwheat being due in good part to the lack of bituminous. Rice is strong but the demand for barley is easier. One of the big producers has already announced increases in price of 35c for buckwheat; 50c for rice and 25c for barley, making the mine prices \$3.75 for buckwheat; \$3.25 for rice and \$2.50 for barley. No announcements have as yet come from other big producers. Independent product is in heavy call with quotations in some instances about 25c higher than the company figures.

Current quotations for company coal per gross ton at mine and f.o.b. tidewater, at the lower ports are as follows:

	Mine	Tidewater
Broken	\$5.95	\$7.80
Egg	6.35	8.20
Stove	6.60	8.45
Chestnut	6.70	8.55
Pea	5.30	7.05
Buckwheat	3.40@3.75	5.15@5.50
Rice	2.75@3.25	4.50@5.00
Barley	2.25@2.50	4.00@4.25
Boiler	2.50	4.25

Quotations for domestic coals at the upper ports are generally 5c higher on account of the difference in freight rates.

**Bituminous**—With the wage conferences ended and the operators knowing what the increases are going to be the bituminous situation has been clarified to a certain degree. The return of the industry to private control on April 1 did not cause any stir, the move having already been discounted.

There are as many different quotations heard as there are sizes of coals. Shippers have no great amount of coal to spare and in most cases the quotations given are subject to change within a few hours.

Buyers are around in large numbers and it is apparent that the quotations obtained are on a secondary consideration, with the result that they bid the market up among themselves.

Notwithstanding this effort on the part of some buyers to get coal at any prices no exorbitant quotations are heard and the great bulk of free coal obtainable is moving at fair prices considering the situation.

Many more contracts have been reported as closed and it is now thought that most operators have gotten all of this kind of business they want for this year. Many producers look forward to a good brisk market in free coals this summer and with better prices than now obtainable.

The producers are doing their best to keep prices within bounds when the high cost of production is considered. It has been pointed out that with the new wage scale in effect coal selling at \$3.75 per ton will net the producer about the same as he received when the government maximum price of \$2.95 was in force.

Quotations were numerous and varied during the couple of days last week following the removal of Federal control and

shippers were not anxious to make them because of the uncertainty of deliveries. For Latrobe coals quotations of \$4.25 were reported while Connellsville coal was quoted about 25c higher. Good Central Pennsylvania coals ranged from \$3.75 to \$4.

## PHILADELPHIA

**Anthracite demand without limit.** Retailers besieged by orders. Tonnage cut down by holidays. Increase in steam sizes fails to affect demand. Bituminous eagerly sought after. Government price off.

**Anthracite**—The strongest kind of demand exists for practically all the anthracite sizes. The decision of the miners to work after April 1 was thought likely to produce some cessation of ordering on the part of the consumers, but the contrary seems to be true. The fact that the companies decided to make all shipments up to the time of deciding upon the wage scale at the circular prices in effect all winter, has stirred the buyers to the point that they are besieging the retailers to take their orders.

The retail men are almost a unit in refusing to take business far in advance at a price, for the manner in which the companies announced the continuance of the present schedule leads to the opinion that the issuance of a new circular will come without further warning. This may be a few days, a week or maybe a month, although it is not thought generally it will be deferred beyond the end of the present month.

Most dealers do have a good tonnage of pea on hand, but are sending out more of this size than they are receiving. It would appear that users of this size who have not been accustomed to store it away are making efforts to put in a few tons, feeling possibly that the size will not be sold after a few weeks.

The trade is beginning to feel that the anthracite production reached its peak two years ago, when with the heavy tonnages yielded from the culm banks, the shipments reached the highest point in the history of the trade. Most dealers under these circumstances, realizing also the condition of labor at the mines, will be almost satisfied if they can keep their tonnage up to the past year. One thing is certain and that is that all companies will make their shipments on the allotment basis and already dealers who have complained about lean deliveries have been told they have had their proportion to date.

While the fact has not gained public attention, it is well known among the retail trade that the labor proposition with them is growing most difficult. Concurrently with the general unrest in labor at this time the laborers about the yards are quietly insisting on a higher rate of pay and, in many instances, dealers have privately increased wages. It is quite likely that with the coming of new wholesale rates the dealers will also be compelled to add quite a little to their gross margin to cover the rapidly increasing overhead, and coal is likely to come close to \$15 a ton retail.

The increase in the price of buckwheat and rice coal has not had the least deterrent effect in the demand for those sizes. With the mounting prices of bituminous-steam coals, the call for all anthracite-steam sizes increases from day to day, until even barley is being taken in extremely heavy tonnages. Rice has been almost cleaned out of the big storage yards and while heavy tonnages of barley are still there, they are fast melting away and it is believed that with another three or four weeks of the present demand the yards will be absolutely bare of all sizes.

The individual shippers were quick to increase the price of buckwheat and rice following the lead of the companies and many of them went even higher, with sales of buckwheat close to \$4.25 and rice \$3.50.

**Bituminous**—With the removal of the Government restrictions as to prices on the first of the month the prices quickly mounted and the Government price of \$2.95 was soon left in the background. There can be no denying that a good many houses were so anxious for business that the Government price had ceased to interest them for some weeks prior to April 1. Of course, various subterfuges to cover sales were taken advantage of.

As was predicted the spot market after being merely a name for a year came right back, with plenty of tonnage offering. Early in this week it was possible to buy good Pennsylvania steam coal at \$3.75, but this quickly changed to \$4 and from then on it moved up by gradual stages until at this time \$5 a ton is common and some sales reported at \$5.25, and a few even higher. Fairmont gas coals are being sold on

an average from \$4.75 for slack up to about \$5.50 for 3-in., while slack sales are around \$4.25. It is really difficult to quote prices and in the few instances that houses are making quotation they notify the consumer that they are for immediate acceptance.

Already there is quite a little criticism of the operators being made by the big consumers, particularly those who a few weeks ago were eagerly solicited to enter into new contracts. Many of them are extremely short of coal and felt the pinch the moment the spot market came into existence again. They feel that the shippers are taking advantage of the higher prices again and neglecting their contract obligations.

However, it is only fair to say for the more important elements in the trade that they are making serious efforts to curb the tendency to a runaway price market. These larger shippers have informed consumers that while they cannot quote a firm price for immediate shipment they will be willing to make purchases in the interest of the consumer at a fair commission over the figure at which they can procure coal. Time will only tell whether their efforts to curb the rising prices will be successful. At any rate it looks at this time as though the \$6 spot price will soon be attained, in view of the short working time at the mines during the holiday season that is now upon us.

#### BALTIMORE

Trade enters April unable to make extensive contracts. All agree that both hard and soft-coal prices will advance. Domestic bituminous scarce in this district, while run of export coal improves.

**Bituminous**—The coming of April has so far not brought a definite basis of trading to the coal men here. While some contracting is being done the majority of coal handlers are holding off until the wage question and any other immediate factor that is likely to seriously touch soft-coal selling prices are settled.

The few contracts being made are on a basis of \$4 or better, with the wage left open to add new mining cost charges thereto. The trade has no doubt that the new price schedule will show an advance. While a number of handlers here say they expect to see coal selling in the spot market at a mine basis of from \$4@5, there are others who predict that it will go considerably beyond those figures.

#### Poor Car Supply Curtails Production

The short car supply and poor production in nearby coal districts is being reflected here in the light receipts of coal for consumption of plants in this territory. The coming of the Holy Week lay-off at the mines added a further immediate complication, but allowed an accumulation of empties for reinforcing the run of cars to the mines that should soon show beneficial results. The entire car supply in the coal regions touched by rail feeders here last week was around 50 per cent, a decrease from the previous.

The high run of cars on any day on the Baltimore & Ohio as a whole was 3,892 cars, and the low 981, with an average of around 2,300, excluding Good Friday lay-off. While many local plants were having difficulty in getting coal, the supply of fuel at Curtis Bay on export and bunker trading showed an increase, the total by days there running between 1,000 and 1,400 cars, while dumps were from 123 to 254 cars per day. For the last week in March a total of about 40,000 tons of export coal was loaded here, and the figures for the first week in April promise to be slightly in excess of this.

**Anthracite**—Watchful waiting is now largely the policy of the local hard coal trade. This is not because they have not plenty of orders that they could fill at the existing schedule of anthracite prices, as many consumers are now urging quick deliveries because they realize that the price of hard coal is sure to go up. The trouble is that the coal is not coming through from the mines in sufficient quantity to meet this demand promptly.

#### Eastern-Inland

#### PITTSBURGH

Excited market for prompt, with high prices. Operators holding off from contracting.

Naturally the coal market has been a very excited one in the past week, and not a great deal of progress has been made towards the development of a regular

market. Large operators set out with a determination to hold their prices within what they considered conservative limits, but having doubt whether the market as a whole would stay within such limits they have been reserved about making sales, and thus the statements of large operators of what they expect in the market are not a sure criterion of what will occur.

#### High Prices Seen in Prompt Market

As to the prompt market, the resumption of trading at open prices saw high bids from consumers at the outset, and however conservative may have been the policy of large operators there were many small operators who were glad to sell at the highest prices bid. Sales of prompt lots have been made in the past few days at \$4@4.50 depending on various circumstances, including the grade of coal. Gas coal has readily brought somewhat more than steam coal. Just how long consumers will bid prices like these remains to be developed, but it seems quite possible that this prompt market may last for some time.

As to contracts it does not appear that any business has been done. Ten days ago, leading operators stated, on the basis of the report of the majority of the Robinson wage commission, that they expected to hold the contract market down to about \$3.50, at the same time allowing it to be assumed that they had no doubt they would easily be able to secure such a price.

With the slightly higher wage rates that it now seems are to be paid some of the operators are disposed to think of \$3.75, particularly for gas coal. There is no doubt, furthermore, that operators are disposed to hold off from the making of contracts in fear, apparently, that if they should sell at their present idea of prices other operators would secure higher figures, and this would be objectionable. We quote the prompt market for mine-run, steam and gas, at \$4@4.50, and contract coal nominal at \$3.50@3.75, per net ton at mine, Pittsburgh district.

#### COLUMBUS

**Uncertainty as to prices still continues in the Ohio coal trade. Producers and shippers are not making quotations and are holding off to see the trend of affairs. Demand for all grades continues good.**

Contracting is being held in abeyance for the time being until it is seen what trend the market takes. Some bidding of high prices for coal is reported although on the whole, there is little doing in the way of taking orders. Producers as well as shippers are content to wait until the market settled to see "where they are at" so to speak and to get their breath.

Domestic demand is growing stronger and a large majority of the retailers are in the market for immediate shipment. The campaign to "buy early" is already bringing fruit and some householders are laying in their supply for the coming winter. Retail stocks are not large and with a good demand in sight dealers are rather anxious to secure extra stocks.

Dealers are trying to get Pocahontas and West Virginia splints. Pocahontas is coming in to a small degree while splints are coming in better than formerly. The large bulk of the trade is still in Hocking and Pomeroy grades. Retail prices are very uncertain as dealers announce that the usual margin of \$2 over and above the price at the mines plus the freight will be changed.

Steam trade is active in every locality. Demand is good from rubber concerns, iron and steel factories and general manufacturing. In addition there is a movement to buy on the part of public service concerns and some state institutions will be supplied for six months in the future. Taking it all in all the steam trade is firm in every way with some bidding for choice steam grades.

Railroads are still using a fair tonnage and a large part of it is being confiscated. This restricts shipments to commercial users to a certain extent.

Production has not been improved in any of the Ohio fields. Car shortage still continues and as a result the output in the Hocking Valley has been but 50 per cent of normal. Pomeroy Bend, Cambridge and Crooksville have produced from 45 to 50 per cent during the past week. In eastern Ohio the official statement shows that the car supply was 44 per cent during the week.

No contracting for Lake shipment is reported as producers are still holding off to see what happens. Lake shippers are anxious for tonnage as there will be a good demand at the head of the lakes. April 1 was a holiday in every mining field and this still further reduced the output in all sections.

#### CINCINNATI

Early advances in coal prices are predicted, as the result of the miners' new wage scale which went into effect last week.

Retail dealers refuse to quote any prices because of the present uncertainty. They have not the least idea as to what they will have to pay the operators. It is the opinion of many operators that bituminous coal will sell around \$8 a ton retail and smokeless lump will be around \$10, because there is a scarcity of smokeless and this city will receive only 25 per cent of its normal smokeless coal supply this year.

It is said that the 27 per cent increase in wages allowed the miners will cause the prices of coal in this city to advance at once. The situation during the past week has changed little, the car supply still remaining the prime factor hindering production. While transportation conditions in various other sections of this state may be somewhat improved there is still a most marked shortage in this territory.

Producers generally have refrained from making contacts owing to the uncertainty of wages and also owing to the government price restrictions. With a prospect that a wage scale may be adopted at an early date and with government price restrictions no longer in existence there is believed that much tonnage will soon be under contract.

Up until the proclamation of the President terminated all control of the coal industry, except as to exports, coal produced in this vicinity was being confiscated on an unprecedented scale without any apparent reason and frequent effort to put a stop to such confiscation had proved to be unavailing.

Now that no more Regional Committees are functioning it is reasonable to suppose that the wholesale confiscation of coal, continued after the railroads were returned to private ownership will cease. However operators still report this practice in evidence and say they will take legal steps if it is not stopped immediately.

The market is very strong at the present time not only to take care of current needs but for storage purposes, industrial concerns desiring to store coal before there is material advances in prices. However it is possible for utilities and industries to secure fuel only in limited quantities owing to the inability of producers to ship.

The supply of coal for domestic purposes has been so small that dealers have been and are still unable to meet the demand even though warmer weather is prevailing. At the present rate of supply difficulty is being experienced by producers even in keeping contract customers supplied with enough tonnage to continue operation.

#### Southern

#### LOUISVILLE

Car supply in Kentucky so far this year has been the worst ever known. No hopes for much improvement in April. Mine working about half time as a whole. Demand keen.

Figures secured on car supply in Kentucky on the Louisville & Nashville, and throughout that system, show a deplorable condition. In February of this year supply over the system was 56.65, and in March it is believed that it will not run over 50 per cent, although all figures are not in yet. April is not expected to show any improvement over March, due to increased demand. The Hazard field up to and including March 27, averaged 40 per cent supply for the month. For the week of March 22, average working time at most of the mines was one and eight-tenths days. The Knoxville division of the Louisville & Nashville, on one day of the same week had 9.8 per cent car supply.

Under such conditions production is very low, and labor is deserting some fields to go into farming and other lines. There is a good demand for all grades, but it can not be supplied. Due to mild weather retail demand for block should drop, but consumers are expecting higher prices, and are ordering, and also asking prices for stocking.

Retailers plan advancement on April 1, of 55c, a ton gross margin, making the gross \$2.75, instead of \$2.20. This increase had been asked of the High Cost Commission before control was lifted.

It is reported that western Kentucky operators will absorb the 27 per cent wage increase in advancing block coal from \$2.60 to \$3.15@3.25, with other grades on the usual differential.

Eastern Kentucky is saying very little, although there is a meeting this week of Hazard operators at Lexington, at which numerous matters will be discussed. It is believed that the eastern Kentucky people will advance prices anywhere from 50c to \$1 a ton, as coal has been selling at considerably below what operators have felt that it should bring, especially the high-grade gas and byproduct coals which have been in strong demand in the Harlan field.

While some traffic experts believe that car supply will be just as bad in April as it was in March, this view is not held by all operators. During March heavy snows, freezing engines, embargoes, blocked terminals, and general congestion held back movement of both empties and loads. From now on traffic should be much more open, and cars should function much better.

**Lake Region**

**BUFFALO**

**Bituminous market wild—Prices changing rapidly. Jobbers return home from Pittsburgh dazed—Almost anything to be expected—Not likely to last—Anthracite very scarce.**

Bituminous—All members of the trade are lost in an effort to size up the market and if possible, get something out of it before the collapse comes. If the car supply should increase to any great extent the present conditions will not last long. Some predict that prices will go up for a week or ten days and then slack off but nobody really knows what will happen. With prices going up a dollar or so every day or two in Pittsburgh this market is mostly looking on.

In fact there is no market here worth the name, if there is one anywhere else. It was only by a special effort that jobbers just back from Pittsburgh could be induced to say anything as to quotations. They protested that if they gave anything out it would not be likely to mean anything in 24 hours. With the beginning of the week Pittsburgh had no prices, as everybody was waiting for someone else, but by Tuesday quotations began to rise above those former government figures and in a day or two they were asking anywhere up to \$5 at the mines for Youghiogheny gas coal and corresponding prices for everything else. It is agreed that this means a market gone crazy.

With the utmost reluctance was anybody induced to speak of the market in figures. What was given out was this: \$3 for Pittsburgh slack, \$3.25 for mine-run and \$3.50 for lump, with Youghiogheny \$4.50. To this add \$1.75 freight for Buffalo. Of course at such a time as this Buffalo has nothing that approaches an independent market. The buying is practically all on orders received from consumers. If they agree to pay producers' prices then it is safe to buy, but nothing otherwise. The amount of what may be called eager caution necessary to do business is exceedingly great.

What the jobber wants to do is to get a line of production right away and then follow the rapid changes that are sure to follow. There is quite a fair natural demand, but consumers will not of course buy more than they need now. Cars are about as scarce as ever and they do not promise to become any plentier right away. It takes a bold and an experienced shipper to do anything satisfactory now.

**Anthracite—**Without assuming anything of the wild type of the bituminous market the hard-coal situation is anything but tranquil. No April prices have been given out yet, although they are expected any day. All that the shipping agents will say is that coal will be sold right along and no retroactive prices will be asked. That an advance will be put on in a few days is expected.

At the same time anthracite is very scarce. Everything but the weather has prompted consumers to buy and they are taking every pound that comes in. It will be sometime before the demand is satisfied. Coal will not be plentiful as yet for mining is sure to be light through the Easter season and the scarcity of cars adds further complications. All that the consumer can do is to find a friend in the retail trade and stick to him until he gets coal. Shippers will not need to reduce the prices before midsummer. It will be difficult to meet the demand. Still there is one comfort in that, for but for the summer buying last year the winter supply would have been exhausted, and it came near that as it was.

The prospect of anthracite for the Lake trade is very small yet. It is time that the loading began, but there is no coal to spare. At the same time the supply on the upper-Lake docks is little or nothing and if there is no new supply by May 1 somebody will go without coal.

**TORONTO**

**Serious shortage of coal especially bituminous—Dealers behind in deliveries and refusing orders—Fuel Administrator regards outlook with anxiety.**

There is a serious shortage of both anthracite and bituminous coal the shipments coming forward from the mines being quite inadequate to the demand. Dealers are overwhelmed with orders from consumers desirous of laying in supplies early in the season which they are unable to fill, and are generally refusing to accept new orders until they can overtake delayed deliveries.

The situation as regards bituminous is the worse. Industrial plants using coal are unable to lay in stocks and can only obtain hand-to-mouth supplies. H. A. Harrington, Fuel Administrator for Ontario has issued a statement to the effect that the outlook for the coming coal year gives call for grave anxiety and calls for prompt and efficient action.

He says that Ontario is 6,000,000 tons short of bituminous coal and though 35,000 tons should come in daily only 20,000 tons are actually arriving. He estimates the season's requirements at 18,000,000 tons. Quotations per short tons are as follows:

Retail	
Anthracite egg, stove, nut and grate	\$13.50
Pea	12.00
Bituminous steam	11.00
Slack	10.00
Domestic lump	12.00
Channel	13.00
Wholesale f.o.b. cars at destination	
Three-quarter lump	9.00
Slack	8.00

**CLEVELAND**

**The question of price advances is wholly one of "how much?" Receipts are slowly but steadily increasing. No. 8 coal is now moving to Lake Erie ports for the Lake trade.**

Bituminous—Price quite naturally appears to be the chief consideration at the moment, and it now develops that the new price schedule will be the result more of what buyers bid than what operators ask. The more conservative operators, who claim to be trying to restrict the increase to moderate size, say the advance will at least cover the entire 27 per cent wage advance. This would make No. 8 mine-run and slack, under the government schedule, \$2.35 f.o.b. mine, at least \$3. But \$3.50@ \$4 are reported freely bid, while one operator is known to have been offered \$5. In the face of these offers, which seem to be a surprise even to operators, \$3@ \$3.50 mine-run and slack appears most conservative. How much headway these so-called conservative interests will be able to make in the face of \$4@ \$5 offers at this moment is still a matter of opinion.

Thus far practically no contracting has been done. The attitude both of operators and buyers confirms the belief that prices will mount up as the summer wears on and that a freight advance of at least 20 per cent is a certainty about Sept. 1. Buyers are more anxious to contract than operators are to sell. Steam-coal users are feverish in their efforts to place tonnage, virtually "shopping" from one operator's office to another's. Others are more cautious, fearing their offers may be used by operators in forcing up other bidders.

A Baltimore & Ohio purchasing official has vainly canvassed Cleveland operators in the last few days. In some quarters it is asserted that the railroads will put the brakes on a sky-rocketing market. That the carriers will provide a large car supply for operators who pass their needs by in the rush for soaring prices is asking too much.

For the present, No. 6 and No. 8 slack may be said to be going at \$6@ \$6.25, No. 6 and No. 8 mine-run at \$6.35@ \$6.60, and No. 8 3-in. at \$6.60@ \$6.85. These prices are mere fill-in ones, to tide over the gap between the controlled market and the wide open one, than they are representative of new business. For domestic consumption No. 8 Pittsburgh coal still stands at \$7 a ton, delivered, West Virginia splint is \$8.30 and Massillon lump is \$7.40 @ \$7.65. No. 8 district mines report car supply at about 60 per cent. Stocking continues at most Cleveland steam-coal users' plants, though on a limited scale. Domestic bituminous buying is a negligible quantity.

**Poconantas and Anthracite** Practically none of either grades is moving at present. Dealers, though, look for heavy summer buying. Prices on both grades are unchanged. Anthracite egg and grate may be had at \$12.20 and chestnut and stove at \$12.50. The minimum on Poconantas shoveled lump is \$9 and on mine-run \$8.

**Lake trade—**Carrying charges for this season have been firmly established at 50c a ton to Lake Superior and 60c to Lake Michigan, and all contracting is being done on this basis. Some No. 8 coal is being loaded at Lake Erie ports, though, so far, not more than half a dozen Great Lakes freighters have been loaded. If the first cargo of the season reaches the head of Lake Superior before the last week of April the lake trade will be surprised.

**DETROIT**

**Jobbers fear the frenzied buying by consumers will precipitate a run-away market. Market is in an unsettled condition.**

Bituminous—Among some of the Detroit jobbers and wholesalers the fear is expressed that the coal trade will be brought into disrepute and perhaps under some form of restrictive regulation in consequence of the way prices are being advanced through efforts of some of the buyers to round up coal. These buyers, disregarding the usual trade channels have sent representatives to buy coal direct from producers in various fields.

In their excessive eagerness to supply their needs the men in the field are reported to be bidding against each other thus forcing prices to a level that is alarming to the more conservative jobbers, who believe that only great caution can avert a serious condition.

It is pointed out that the better class of jobbers and the leading operators do not desire to see a run-away market; that they believe such a development, particularly at this time, would work lasting injury to the trade. With the buyers rushing into the market and competing with each other in the attempt to get early coal shipments, jobbers say there is almost no limit to the level to which prices may be carried. The jobbers do not feel that the operators can be justly criticised, the fault for present conditions, in their opinion, resting with the buyers.

With the market in its unsettled condition and with very little coal being brought into Detroit, jobbers say it is impossible to give quotations that would possess any degree of stability.

**Middle West**

**MIDWEST REVIEW**

**Interest centered this week in April prices, and on the day this market report is being written, but few operators in the Middle West territory are in a position to give to the trade an accurate quotation on the various sizes produced at the mines.**

It is thought that all of the coal fields in Illinois and Indiana will establish their prices from the Franklin County operators, who have set their price on 6 in. lump, 6 x 3-in. Furnace, and 3 x 2 in. Small Egg, from \$3.55@ \$3.40 f.o.b. mines. As it is to be expected, the producing mines in the Springfield and other districts, not so favored as the Franklin County field, will probably quote an opening price five or ten cents below Franklin County prices.

The demand for coal, both on the part of steam-coal buyers, retail coal merchants, and the public in general, keeps up in an unprecedented manner. A call was received a few days ago, from a retail dealer who has a large yard in central Iowa. This man has been in the retail coal business for twenty-seven years, and he stated that in his district the buying public had absolutely stampeded, and were in a panic for coal.

As this retailer was fortunate in having a big supply of coal on hand, he did more business in the month of March than ever before in any one month in his career in the coal business. We are giving this as an example of the state of mind of the coal buying public, out here in the Middle West. This dealer's experience so far as the demand for coal is concerned, can be duplicated in countless cases, but unfortunately most of the dealers have but small supplies of coal on hand. The opening prices on Poconantas coal are so high that this grade of coal is becoming almost prohibitive in the Middle Western states, such as Missouri, Iowa, Nebraska and southern Minnesota.

As a result, the retail trade in the states just mentioned have turned to Oklahoma smokeless coal. It is claimed by many retailers that Oklahoma smokeless coal is as good if not better, than Pocahontas coal, as it resembles it very closely in appearance and burning qualities, with the exception that it holds its fire far longer than New River or Pocahontas. This coal can be produced and sold in the above states at prices under New River and Pocahontas. The high prices of the West Virginia operators have served to introduce in a very large scale, coals which were formerly but little known.

The car supply in the Indiana and Illinois producing fields is still very poor, although it is hoped that conditions will better themselves during the early part of April. The demand for coal, from both states, has kept up very strongly. In fact it looks as if it would take several months run, on a 100 per cent basis, to catch up for the time lost during the strike and that period after the strike when the car supply was, and still is, inadequate.

Every coal man knows that last February it was almost impossible to give away coal, let alone sell it. The public had so much coal on hand they were not interested in coal even at reduced prices. It is believed that the rest of the charges are just as unreasonable as the one mentioned above. It is safe to say that the men under indictment have the backing and sympathy of the entire coal industry in the Middle West.

**CHICAGO**

Coal is arriving in Chicago in fairly satisfactory quantities, although but few dealers have been able to get enough coal on hand to stock their bins.

The public is buying coal just as fast as it arrives. The steam and retail trade are very anxious to place their orders and are having some difficulty in so doing. While no definite prices have actually been established by circular for the month of April, we are publishing herewith what we believe will be the opening prices for the month, f.o.b. mines

Region	Prepared Sizes	Mine-Run	Screenings	Freight (Chicago)
<b>Illinois</b>				
South rn Illinois				
Franklin, Saline and Williamson Counties				
Prepared Sizes	\$3.15 @ \$3.40			\$1.55
Mine-Run	3.00 @ 3.10			1.55
Screenings	2.60 @ 2.75			1.55
<b>Central Illinois</b>				
Springfield District				
Prepared Sizes	\$3.00 @ \$3.25			\$1.32
Mine-Run	2.75 @ 3.00			1.32
Screenings	2.50 @ 2.60			1.32
<b>Northern Illinois</b>				
Prepared Sizes	\$4.00 @ \$4.50			\$1.24
Mine-Run	3.50 @ 3.75			1.24
Screenings	3.00 @ 3.25			1.24
<b>Indiana</b>				
Clinton and Linton				
Fourth Vein				
Prepared Sizes	\$3.00 @ \$3.25			\$1.27
Mine-Run	2.75 @ 2.90			1.27
Screenings	2.50 @ 2.65			1.27
Knox County Field				
Fifth Vein				
Prepared Sizes	\$3.00 @ \$3.15			\$1.37
Mine-Run	2.75 @ 2.90			1.37
Screenings	2.50 @ 2.60			1.37
<b>Brazil Block</b>				
	\$4.25 @ \$4.50			\$1.27
<b>Eastern coals</b>				
Pocahontas and New River Coals				
Prepared Sizes	\$5.00 @ \$6.00			\$2.65
Mine-Run	4.00 @ 4.50			2.65
<b>West Virginia Splint and Gas Coals</b>				
Prepared Sizes	\$4.25 @ \$4.75			\$2.65
Mine-Run	3.75 @ 4.25			2.65
<b>Southeastern Kentucky</b>				
Hazard, Harlan and Big Sandy Fields				
Prepared Sizes	\$4.50 @ \$4.75			\$2.45
Mine-Run	3.75 @ 4.25			2.45
Smelting Coal	\$4.50 @ \$5.25			\$2.60

In collecting these prices widest differences of opinion in regard to Eastern coals were found especially coals from the New River and Pocahontas fields. Some sales agents and producers state that they believe the price on Pocahontas prepared coal will be from \$5.00 to \$6.00 per ton f.o.b. mines, while mine-run will be anywhere from \$4 to \$4.50 per ton.

Kentucky prepared coals will doubtless be in the vicinity of \$4.50 to \$4.75, as we understand some dual interests have bought a very large tonnage of 14-in. Lump from a south eastern Kentucky field on a basis of \$4.50 f.o.b. mines. If this is true, it will probably bring the price of fancy domestic sizes up to \$4.75. It is not believed that operators with mines in southeastern Kentucky will ask more than \$4.75 for their domestic coal, but we have heard that some jobbers are asking from \$5.00 to \$5.25.

**ST. LOUIS**

Work has resumed April 2 in a general way throughout the Illinois field.—Car shortage still prevails. Demand eased up. Country domestic demand fair.

The uncertainty that came with April 1 still prevails to a certain extent. Throughout the field there was no work on the first, but with the second perhaps two-thirds of the miners responded at mines where there was work. The feeling is that the entire force will return after the Easter holidays.

The operators are somewhat at sea as to what the increased cost in the Illinois field will amount to. It is figured that it will average about 50c. per ton on the mines that work full time and may be as high as 75c. per ton on mines located on railroads that furnish cars for one and two days a week.

The shortage of cars is still as severe as it has been for sometime. There is nothing to indicate unless the demand lets up that cars will become any more plentiful. As a matter of fact, looking far enough ahead, it is doubtful whether there will be as much equipment tonnage in use in September and October for the movement of coal as there is today in the Middle West.

The local steam demand is pretty well taken care of on storage coal. Locally the domestic demand is easy excepting on storage coal for next winter of the higher grades, such as anthracite, smokeless, coke and Carterville. There are no prices fixed as yet on the anthracite or coke retail.

In the Standard field there is likely to be an easing up on all sizes in the very near future. The easing up will be more pronounced in this field than elsewhere in Illinois, but it will not be sufficient to force a surplus of empty equipment.

In the Mt. Olive field conditions are expected to be considerably better than in the Standard field. The chances are that these mines will find a place for the tonnage every day the cars are furnished, for all sizes.

Car shortage still prevails in all fields. There is every reason to believe that most of the railroads will begin early buying this year. The Missouri Pacific is still in bad shape for coal and continues its policy of confiscating coal because of its inability to purchase. It is the one unfortunate blot at the present time in transportation circles in the Middle West.

It is anticipated that not more than twenty per cent of the anthracite needed for this market will be shipped this year and practically no smokeless. The prices effective April 1 retail were:

Standard lump	\$5.00
Mt. Olive lump	6.00
Carterville lump and egg	\$6.75 @ 7.00
The prices f.o.b. mine effective April 1, were:	
Standard 2-in. lump	\$2.75 @ 2.85
6-in. lump, egg and nut	2.75 @ 3.00
Screenings	2.50
Mt. Olive lump, egg and nut	3.00 @ 3.25
Carterville lump, egg and nut	3.25 @ 3.40
Mine-run from all fields	2.65 @ 2.80

	Williamson and Franklin Counties	Mt. Olive and Staunton	Standard
Prepared sizes (lump, egg, nut, etc.)	\$3.25 @ 3.40	\$3.00 @ 3.25	\$2.75 @ 3.00
Mine-run	2.65 @ 2.80	2.50 @ 2.80	2.65 @ 2.80
Screenings	2.50 @ 2.65	2.50 @ 2.65	2.50
Williamson-Franklin rate to St. Louis	\$1.10;		
Other rates	95c.		

**MILWAUKEE**

Coke prices advanced 75c. per ton. Coal handlers decide to postpone action on coal advance until May 1. Coal scarce, but some anthracite is now coming by rail.

The expected advance in coal prices on April 1 did not materialize as far as Milwaukee is concerned. The present supply of coal here is practically all sold and no change will be made in the price schedule until May 1. Coke took a jump of 75c. per ton, however, egg, range and nut sizes selling at \$13.25 and pea coke at \$10.25. "We expect a general raise in the price of coal here," said Edw. A. Uhrig, president of the Milwaukee-Western Fuel Co., the leading dock company, "but it is impossible to estimate what the increase will be."

"A large percentage of the coal used here comes from Eastern and Southern fields and there is strong competition at these points at present between American and foreign buyers. European buyers are offering fancy prices, which will naturally boost values all along the line." The market at Milwaukee is normal for this season of the year. The supply is poor, but fortunately mild, spring weather prevails.

**Pacific Coast**

**SEATTLE**

Quotations at the present time are as follows:

Seattle—\$6.75 per ton 2000 lb., f.o.b. bunker tips.

Tacoma—\$6.75 per ton 2000 lb., f.o.b. bunker tips.

Portland—\$8.75 per ton 2000 lb., f.o.b. bunker tips.

Portland—\$9.50 per ton 2000 lb., in the stream over the ship's rail.

The above rates apply to the standard grades of Black Diamond and South Prairie coal.

Quotations on British Columbia coal in Seattle Harbor are as follows:

Comox Lump—\$10.00 per ton of 2240 lb., f.o.s.

Comox Marine Mixture \$9.85 per ton 2240 lb., f.o.s.

**SAN FRANCISCO**

Dealers are much encouraged by the newly-acquired habit of householders putting in stocks of coal in the spring and summer for next winter. The practice was begun in the war period under the impression that it was patriotic and has gone over into these days following the great conflict. Factories and manufacturing plants hereabouts mostly use oil but those burning coal try to keep quite a stock on hand.

The weather is so mild there is no difficulty in either getting the coal here from the mines of Utah and Wyoming or in distributing it when it comes. Prices are unchanged at this writing.

The bunker price at present is \$13.55, which has been maintained for some time. For domestic use, bituminous prices from Utah and Wyoming, f.o.b. net ton, are: Stove, \$3.65; Lump, \$3.65.

**Coke**

**CONNELLSVILLE**

High opening prices after ending of Government control, and still higher prices afterward. Trading confined to April shipments.

The Connelleville coke market had a wild opening after the removal of Government price restrictions. While the limitations did not come off until the end of March, trading began before that time as it was for shipment and invoicing April 1 and later. There had been practically no coke to spare after contracts had been taken care of, but a great deal of business expired at the end of March, and this seemed to leave more uncovered consumption than unsold production.

The opening transactions were at \$9 for furnace coke. One or two sales for April were made at this figure, together with a few odd lots and one contract for a small monthly tonnage to the end of the year. While predictions had been made that the market would find itself at about \$9, it began to advance immediately after the opening transactions, from 50c to \$1 a day, until a fairly steady level has obtained in the past two or three days, this being at \$11 @ 12 for furnace coke and \$13 @ 14 for foundry coke, per net ton at ovens.

Furnaces might possibly have been willing to contract for the remainder of the year at \$9 or thereabout, but when the market advanced so far above that level the trading settled down to April delivery exclusively, and most of the unsold production of the month has now been taken up. Of course many contracts had been made for the half year, that tonnage having nothing to do with the present market.

The Courier reports production in the Connelleville and Lower Connelleville region in the week ended March 27 at 254,552 tons, an increase of 5,312 tons.

**BUFFALO**

The coke market partakes fully of the wildness of bituminous coal, the latest quotations being \$12 for 72-hr. foundry at the ovens and \$10 for 48-hr furnace. To these prices add \$2.60 freight for Buffalo. No low grades are offered. Buffalo is preparing to do a good amount of smelting this season and ore will begin to come in just as soon as the ice is out of the lakes. The present warm weather promises an earlier opening of the Lakes than was expected, but the ice is still heavy. Work on the Donner-Union coke plant on Buffalo creek in the city progresses, but a report this week states that no coke is likely to be made there before fall.

Cleveland.....	.17	St. Paul.....	.495
Kansas City.....	.59	Pacific Coast (all rail).....	1.25*

Note—Add 3% transportation tax. \*Minimum carload, 80,000 lb.

# COAL AGE

New York, April 15, 1920

Volume 17 Number 16

*Would a Department Store Put Up a Sign Like This?*

WE ARE PROFITEERS  
LAST YEAR WE MADE  
9.72% ON INVESTED  
CAPITAL

What department store would be assailed if it made less than 10 per cent profit per year? Most of them make much more than that on every sale, and nobody is disposed to inquire into the matter.

## Public's Duty to Coal

"The coal operators' duty to the public." That phrase has been constantly on the tongues of politicians, uplifters, profiteers, common folks and others. They seemed to feel that the duty runs all one way—from the industry to the public. The idea probably never occurred to them that the obligation is two-fold and that the public owes a duty to the bituminous-coal industry, but the majority report of the Coal Commission jams that fact into the conscience of the public with a directness that ought to enlighten and convince.

The observations and recommendations of the majority in this respect are calm and sane. First of all, they turn a curing flood-light of information and sound reasoning upon mischievous misapprehensions which have been fostered in the public mind by designing and prejudiced persons. Such information ought to dispel that dangerous fog of misunderstanding and satisfy the public that the various proposals for far-reaching, un-Ameri-

can regulation and control of the coal industry are wholly unnecessary.

There have been widely heralded charges of profits varying from 100 to 300 per cent and in some instances running up to 2,000 per cent on the capital invested in the mining of coal. Such charges from the high officials responsible for them had to be considered by the commission. In respect to these allegations we are shown a compilation of the self-same Treasury reports that were so blatantly cited.

That compilation shows that all the bituminous producers reporting, after paying their taxes, made only 9.72 per cent on their investment in 1918, while "the companies reporting very high rates of return upon investment are all small concerns with investments of only a few thousand dollars whose net income represents to a large extent the earnings of the owners for their own labor and management." Only a little over 9 per cent return on invested capital for an enter-

prise as hazardous as the mining of bituminous coal!

Then Messrs. Robinson and Peale shift the spotlight of common sense onto the threadbare scarecrow of "a combination to maintain coal prices." The consumer is reassured by their conclusion that "such a combination, besides being illegal, is quite impractical, in view of the 7,000 companies involved, located as they are in some 26 or 27 coal producing States."

Accordingly, there is no occasion to doctor the industry with governmental strong medicine designed to cure illegal combination and profiteering. The nation is told plainly that these are not the diseases which afflict the patient. The physicians then proceed to give the correct diagnosis and to prescribe a proper method of treatment.

### Consumer Not Without Fault

The consumer of coal is told bluntly that most of his coal troubles are his own fault, springing from the fact that he has been heedless of his duty to the men who dig and ship his coal. He is shown that his dereliction causes injury to the coal industry. After pointing out the fact that irregularity of mining operations is the primary cause of high coal prices and dissatisfaction among the miners, the report says "it is evidently the public's duty to aid in the stabilization of the coal market by purchasing and storing as much coal as possible during the spring and summer."

The report goes on to point out the overdevelopment of mining facilities, the overmanning of the industry, and the excess transportation required to care for the fall and winter peak demand, when belated coal buyers are all in the market at once. At the other extreme are idle mines, idle men and idle coal cars in spring and summer, when these same buyers are "waiting a while" to buy their coal. Prices fluctuate widely and the coal business becomes merely a gamble.

Worse yet, those are most hurt who can least bear the injury. The poor and needy small consumer, who, as a class, buys but a fraction of the nation's coal and who is unable to buy and store coal in the spring and summer, is the chief victim of the high prices brought about by big belated consumers bidding up the market to obtain at the last

minute what are to them comparatively small quantities of needed coal. To the poor householder or struggling manufacturer, with no place to store coal, even if he had the funds, that is a most serious hardship. On the other hand, when the spring slump comes and the bottom drops out of prices, small struggling operators are the individuals hardest hit.

The commission faces this situation unshrinkingly. It says unhesitatingly that the railroads, the iron and steel producers, the public utilities and the other big consumers of coal must shoulder the large share of the responsibility for these conditions. It puts the job of effecting a remedy squarely up to them as a duty they owe the coal operators, the miners and the other coal consumers. In this connection it condemns frankly the traditional coal purchasing methods of the railroads and warns them that in the light of fair dealing and broad public interest, preferential car supply as part payment for coal is unconscionable.

The duly authorized branches of government are shown the necessary steps to obtain the full co-operation of the coal industry, the carriers and the consumers in stabilizing the business. Moreover, the commissioners have shown the practical way to accomplish results by going out and getting powerful consumers to accept their public responsibility and to start better methods of handling their fuel supply.

### A Return to Common Sense

This way of telling the public of its own shortcomings and advising it to remedy its own faults instead of choosing fantastic theories of economic betterment seems strangely new and refreshing. As a matter of fact, it is a return to cool, American common sense in dealing with our great economic and social relationships, but after the welter of confused thought and strange doctrines that have surged about us how epoch-making the simple findings and practical recommendations seem.

Perchance we have here the herald of a better day. The consumer owes some duties to the producer which he must discharge if our social and industrial conditions are to be remedied. Just consider for awhile the application of that idea to the relations of the public and big businesses.

# Ford Collieries Co. Reduced Its Accident Insurance Cost

When a Safety Committee, Composed of All the Officials Who Supervise Work, Is Induced to Function Actively, Tangible Results Are Forthcoming—Only One Fatal Accident for an Output of 3,000,000 Tons

BY DONALD J. BAKER  
Pittsburgh, Pa.

WHEN the announcement was made by the Pennsylvania State Department of Mines a short time ago that the Ford Collieries Co. was the first coal producer to receive the benefits of the 40 cent credit under Item 1 of General Safety Standards of the Compensation Rating Schedule, more than passing significance was attached to the statement. In fact, there was a ripple of surprise manifested by some four thousand or more companies throughout the commonwealth.

Who is the Ford Collieries Co. is a fair question? To those who are familiar with the coal-producing firms of the Pittsburgh district the question is readily answered, for this company has been known for some time as a progressive one, one that leans heavily toward providing adequate safety measures in its mines. But to those who are not so familiar with the Pittsburgh region it might be pertinent to mention that the Ford Collieries Co. is a subsidiary of the Michigan Alkali Co.

The mines of the firm, three in number, are located in northern Allegheny County near the Butler County line. The company was organized in 1908 and development of a 2,200-acre tract of the upper and lower beds of Freeport coal was commenced the same year. The main offices of the company are at Curtisville, which is a central location for the three mines. A. R. Pollock is

general manager of mines and M. S. Murray is safety engineer. To the latter, of course, falls the lion's share of the credit for the signal recognition of these mines by the state for the practical application of safety principles therein.

How has this company, which is relatively young and comparatively small—having an estimated output of 1,500,000 tons yearly—succeeded in capturing the leading position in a competition of progressiveness? Certainly no company could hope to receive such honor by merely following stereotyped methods that have long been laid down and accepted as standards in the safety movement. There must have been a keen initiative spirit shown. Innovations must have been made in safe practices, and any safety devices that have been installed must by necessity be highly practical. This, in sum and substance, is exactly what the Ford Collieries Co. has done under the guiding hand of the safety engineer. No standards have been accepted until assurance has been given of their practicability.

The entire safety program of the Ford Collieries Co. is centralized around the safety engineer. This is in accordance with article (a) under Item 1 of the General Safety Standards, which provides that the safety inspector have charge of the safety activities. He is at the head of a central safety committee which includes 50 officials of the company's three mines. This com-

FIG. 1. MOTOR-DRIVEN MINE AMBULANCE

This machine seats four people and carries two stretchers. Note the canvas hood over the end of the stretcher to protect the patient's face and prevent his eyes from following the roof, thus causing nausea.

aid and mine-rescue training period is long drawn out and by the time the men who are qualifying for certificates have completed the course they have had their interest in the work dulled to an extent that promises no appreciation of the problems that might arise in case of actual accidents.

If the mines are to be made safer, the officials must be quick to sense a potential source of danger. Too often the paths of least resistance are followed. In preference to eliminating the danger points these are allowed to exist and men are instructed in first-aid treatment, in order that accident victims may be given a chance for their lives, which should never have been risked in the first place.

A description of some of the practical safety devices that have been installed within the three mines of this company will show to some extent just why the State Department of Mines has selected this operator as one of the leading exponents of safe practices and has allowed it the full credit under the compensation law. All of the ideas and suggestions of which these devices are

FIG. 5. MINING MACHINE CABLE ATTACHMENT  
This device holds the cables securely in place yet releases them easily under proper manipulation.

the outcome have been the direct result of the functioning of the central safety committee. No pretense is made toward seeking any material gain from the placing of any of these devices on the market. All have been patented, however.

M. S. Murray, safety engineer, and W. D. Thomas, superintendent of the No. 3 mine, are credited with the evolution of the ideas. Without exception, all of these devices can be made at the ordinary blacksmith shop. They are offered to the readers of *Coal Age* for adoption wherever there may be need for such equipment. They well illustrate the progress that can be made toward safer practices if a certain degree of con-

centration be given to the solution of the many problems that naturally arise from day to day in any mine.

What is believed to be the first locomotive ambulance ever constructed for underground service was recently installed within the

Berry No. 3 mine. Two other machines of the same model are now under construction and when completed will be placed in the other two mines of the same company. The use of an ambulance underground in caring for injured employees is a decided innovation. Since all motor trips within the mines of the Ford Collieries Co. are dispatched by telephone from the mine-foreman's office near the shaft bottom, this ambulance is quite practical in event of an emergency. When an accident has been reported, a full right-of-way is assured for the ambulance along those

FIG. 6. CAGE APPROACHING GROUND LEVEL.

The cam on the side of the cage is about to strike the roller on the vertical level, movement of which will open the shaft gate.

portions of the mine track that will be traversed. From actual tests, any section of the mine can be reached within 15 min. An underground ambulance places mine accidents in a new light and it is a safe prediction that first-aid training will in the near future center around this valuable addition to first-aid equipment.

The frame of the ambulance is of 4-in. channel iron 10 ft. long and is mounted on pressed steel trucks which support it by means of cantilever springs. The machine is driven by a 5-hp. direct-current motor. The trucks are chain driven and so geared as to give a maximum speed of 7 miles per hour. Control is supplied through a mine-locomotive controller and a band brake.

FIGS. 7 AND 8. A MOVABLE POINT FROG  
Cars frequently "pick" ordinary frogs. In this device the frog point swings with the switch points; therefore wrecks are few and far between.

Headlights, gong, trolley pole and seats for four complete the equipment proper. Upon the sheet-iron casing that incloses the moving parts and guards the wheels cleats have been placed so as to hold in position two

FIG. 9. BRACKET FOR SUPPORTING SMALL WIRES

By the aid of this bracket two telephone or light wires as well as feed cable, if desired, may be supported from one expansion bolt or lag screw set in a roof plug.

stretchers. These are provided with hoods to protect the face of the patient while he is being transported. Within a compartment of the ambulance body is a 20 x 26 x 6-in. galvanized-iron case containing two woolen blankets, one rubber blanket, splints, bandages, compresses, aromatic spirits of ammonia, iodine and absorbent cotton.

The ambulance is kept in a stall at the shaft bottom and a trained first-aid man is constantly available in case an accident is reported. The idea of attempting to establish first-aid stations throughout the mines has been abandoned. There is but one first-aid room underground, and this is located near the shaft bottom. This room is utilized for treating patients before they make the trip up the shaft. A switch off the main haulage road allows the ambulance to run directly into the room.

FIGS. 10 AND 11. WIRE ATTACHMENTS TO TROLLEY AND RAIL

These simple devices give much better results than the common practices of hooking the positive lead over the trolley and winding the return around the head of a track spike.

An ingenious shaft gate has been devised and installed at the ground landing of the main shaft. This is of simple construction and depends for its operation on the changing of the inclination of the track supporting the gate. A horn may be placed over one of the rails that lead toward the landing as is shown in Fig. 4. This

latter device prevents any car from running into the gate when it is closed. When the gate is open the horn is not over the rail and no obstruction is present to prevent the passage of a car. Fig. 6 shows the cage suspended about 18 in. from the landing and about to make contact with the roller that operates the gate supports.

When the cage strikes the roller, its movement is transmitted through a series of rods, bellcranks, etc., to the tracks supporting the gates and their inclination is changed. The gates then open by gravity. The reverse of this action takes place when the cage moves down the shaft.

One of these gates has been in operation for three years and has required no attention during that period. There is no jar or shock in operation, which is the chief drawback with many shaft gates. One of the advantages of this gate is the fact that it can be constructed at the blacksmith shop. While it has been patented by

FIG. 12. A PLATELESS FROG

This frog has the advantage of light weight and the fact that any worn portion can be renewed independently of the others.

the inventor, W. D. Thomas, the mechanical principles involved are worthy of a more general use. No such gate is now on the market.

A movable-point frog was designed to overcome derailments which arose from cars with a short wheel-base "picking" an ordinary frog. Where there is difficulty in keeping the car wheels rigid and in proper alignment, the picking of a frog is more common than the picking of a switch. In construction, the frog point is so made as to extend onward from the point where the balls of the converging lead and transfer rails touch. This portion of the frog is separate and movable and pivots in its base. It is attached by connecting rods to the switch throw and conforms to the movements of the switch points. For a car traversing the curve and passing onto the straightaway while the switch is set for the straight, it functions like any spring switch, as

FIG. 13. SPECIAL FIRST-AID PACKET

First-aid packets are usually inclosed in tin containers that are liable to dent, thus injuring the contents. This packet is free from this defect.

there is a yoke and a pair of springs on the connecting rods which allow the frog to open and close.

One important factor of economy is introduced when a frog of this style is used and that is that no guard rails are needed. This appears to be an advantageous type of frog construction and particularly adapted to those points in a mine that receive the greatest amount of traffic. It might be mentioned that one of these frogs has been installed within the No. 3 mine at a place where over 900 cars pass daily. Before the movable point frog had been put in place there had been frequent derailments that averaged nearly one a day. However, since the new frog has been in place there has not been a single derailment. This is sufficient proof of the efficiency of the device.

A mining machine cable attachment has also been devised. This consists of two metal plates, each of which has one edge turned back upon itself for a distance of about 1 in. A groove has thus been formed for the contact of the cable leads. Both plates are mounted on a wooden block and each has a terminal attached for the reception of the positive and return wires. Fastened to each plate is a dog or grip, the face of which

For efficiently making a good connection from a trolley wire, a small spring clamp with an insulated handle may be used to advantage. The handle is composed of rubber or a composite substance and is attached to the spring by means of a screw. The wire is hooked around

FIG. 15. A NEAT AND EFFICIENT CHOCK  
A pair of these chocks are carried on each locomotive and will hold a car or a trip without the aid of sprags.

the screw between the handle and the clamp and held firmly by tightening the screw. When the clamp is in position on the trolley wire it is clear of the locomotive trolley wheel and is rarely displaced.

The rail-return attachment is a spring clamp that fits under and grips the base of the rail. It is attached by bringing pressure on the curved part of the clamp by hand. The return wire is placed between the edge of the rail base and the hook of the clamp. This wire is connected to the clamp and attached to the return wire by the usual splice. Both of these attachments can be easily made and give a better connection than that allowed by the usual practice of wrapping the positive wire around a hanger and the return wire around the head of a rail spike.

An unplated frog was constructed, so as to have all of the rigidity of a plated frog but lacking its weight. However, the chief reason for its use is an economic one, since it can be assembled at the point of installation and any defective part can be removed and another part substituted without lifting the whole frog. It consists of the usual point, straight and transfer rails, all of which are solidly joined together by channel irons bolted to the webs of the rails. Only one size of bolt is used on both fishplates and channel irons and only one wrench is necessary in assembling. As can be noticed in the accompanying illustration, any part of the frog can be removed by taking out four bolts.

FIG. 14. SAFETY SWITCH USED ON ROOM PARTINGS  
This is an ordinary spring switch with certain improvements. The switch remains open unless held closed.

is "V"-shaped and provided with teeth. These grips are so adjusted on the plates that they will always fall into the groove that has been made for the wire.

In making a connection, the cable terminals from the machine are placed in the groove of each plate. By a slight downward pull, the teeth of the grip are made to engage the cable and push it into close contact with the sides of the "V"-shaped groove. To disconnect, the cables are pushed upward and outward and drawn out quickly.

A bracket for telephone or electric light wires has been constructed as follows: A channel-shaped bracket made of strap iron and carrying two small insulators at the extremities is drilled at its middle point for the insertion of a lag screw that fits into a plug in the roof or rib. This effective method of supporting the wires has the advantage of carrying the wires at a uniform distance apart. Only one plug is needed for the support of both wires. By means of a hook, the eye of which is placed under the head of the lag screw, this arrangement can be made to support a lamp and socket by taking the stress of its support off the wires. If it is desired to suspend the wires from the rib, the eye of the hook is placed under the head of the lower insulator bolt.

FIG. 16. A SAFE SHOT-FIRING DEVICE  
A quarter turn of the key terminal makes the connection and fires the shots; release or withdrawal of the key opens the contact.

An efficient first-aid packet also has been designed. Practically all of the packets of this kind on the market today are contained in a metal case. When these are supplied to the miners they are usually carried in a hip pocket. In a short time the case is bent and dented and quite frequently the sealing wrapper of the supplies is torn. In such a case when the supplies are needed they are liable to be dirty and damp and in a condition that may permit infection to result from their use.

A first-aid packet has therefore been made for the use of the Ford Collieries Co. that will withstand the hard usage to which it is subjected by the miner. The case is a piece of tire casing that will conform to unusual pressure made upon it and at the same time be practically waterproof. The contents of the case embrace items somewhat different from those found in most first-aid packets, including a triangular bandage, a large compress bandage, two muslin finger cots, two gauze roller bandages and a strip of adhesive tape. Compactness has been sought in the size of the case. The supplies are adequate for any ordinary injury, yet as a rule do not include more materials than can well be utilized.

#### A SAFETY SWITCH FOR ROOM PARTINGS

As may be noticed in the accompanying illustration, the safety switch for use on room partings here employed is a standard spring switch with certain additions or attachments. A spring has been added to the straight point which keeps the switch set for the open unless intentionally held for a curve. Two levers have been attached, the extremities of which lie a little above the rail and parallel to it, the opposite ends being joined loosely. One of these levers is provided with a downward-projecting lug that drops into a recess in a plate that is attached to the end of the bridle bar when the switch is thrown for a curve.

The switch point butts are nicked near the end of the base on the inside and are placed in chairs which have a rivet that engages this nick. The butts are then held in place by "V"-shaped channels which are driven between the curves and the straight rails. A spike is placed behind each channel to keep it in place.

When it is desired to pass a trip of cars onto the curve, the switch throw lever is pulled over until the curve point is against the rail. When the trip has passed the lever is released. The switch is then made to assume the position for the straight by the first car passing along the straight track. The throw is made by the wheel depressing one of the levers and allowing the spring to function.

The old adage that "Neatness is an outward sign of inward efficiency" becomes more and more apparent around coal mine plants. A frequent sight underground is the promiscuous scattering of props and sprags along haulage roads. Heretofore there has been a certain degree of method in this madness, although the method has been woefully inefficient. If a motorman desires to block a trip of loaded cars on a grade, he commonly hunts around for sprags to throw into the car wheels or as a last resort places a post across the track. By the use of a simply-constructed device there will be no need for cluttered haulageways in those mines that do not use brakes on their cars.

This device consists of a triangular block of wood that has one face curved to fit the face of a car wheel. An iron handle is attached to the block and an iron clip or

bracket that fits around the flange of the wheel. One extremity is fitted with a fork to hold the chock on the rail. Two of these blocks are carried on each locomotive and are used in making up a trip or in blocking a trip inside of a door. The necessity for finding a sprag or using any available piece of timber thus has been overcome.

Many shot-firing devices are available today, but it is doubtful if any combine more practical features than the one used in these mines. This is composed of a small box that contains two contacts for the current and a rotor on a broken shaft, one end of which is square. The rotor is held in a non-contact position by a spiral spring. The apparatus in its entirety depends for current upon a cap-lamp battery or an ordinary dry cell.

#### WIDEAWAKE SAFETY COMMITTEE GETS RESULTS

To operate it the terminals of the lead or shot-firing wire—one end of which is a square key—are placed upon the ends of the rotor shaft. The key terminal is given a quarter turn, which is sufficient to bring the contact points of the rotor in touch with the contact points of the current supply, thus firing the shot. When pressure is removed from the key the shaft will rotate in a reverse direction under the action of the spring and assume the non-contact position, thus making accidental contacts impossible.

The practical devices here described show quite clearly the results of a wideawake central safety committee. It is doubtful if many other such committees that have come into existence under the compensation laws can show the same tangible results of conscientious effort as this one. After all, it is not in "getting by" that progress is achieved, but only through honestly seeking a definite goal. From the success that has attended the initial efforts of this company, it has been spurred on to even greater ones.

Numerous other safety devices that go hand in hand with more efficient operation are under construction by this company and will be taken up at a later date in *Coal Age*. For the present, this article, it is hoped, will demonstrate the practicability of the plan pursued and encourage other companies to make the competition keener. As to the number of fatal accidents occurring in the three mines of the company during the past two years, there has been but a single one. This was the death of a man on the surface who had been trimming cars underneath the tippie. It was purely accidental as the facts in the case prove. One fatality for approximately 3,000,000 tons of coal is a record of which any company might well be proud. This is sufficient cause in itself for the allowing of the full 40-cent credit. More and more does coal mining cease to be a gamble with death.

### Wholesalers Will Consider Coal Reconsignment Charges

The annual convention of the American Wholesale Coal Association is to be held in Pittsburgh June 1 and 2. The program has not been outlined as yet, but reconsignment charges will be an important feature of the discussion at the convention. At the same time plans will be perfected for a formal presentation of the reconsignment matter to the Interstate Commerce Commission. The Executive Committee of the American Wholesale Coal Association will meet in Chicago April 15.

# Some Methods of Suspending Electric Power Cables

Power Cables in Many Instances Must Be Suspended in Bore Holes or Shafts—They Can Be Supported from the Top Only and Auxiliary Carrying Cables Sometimes May Be Necessary

BY R. P. HINES  
Fairmont, W. Va.

**I**N ORDER to transmit electric energy from the surface into a mine, cables are extensively used. The type of cables to be employed, of course, depends upon the exact purpose to be served. Some of their main uses are for supplying underground transformer, synchronous-converter or motor-generator substations, alternating-current, motor-driven centrifugal or reciprocating pumps, alternating-current motor-driven hoists, and to feed the usual direct-current distribution circuits throughout the mine.

Various transmission voltages and systems are employed and the cables used therefore embrace bare cables (usually employed for the negative conductor in grounded direct-current systems) as well as those with various degrees of insulation, to suit the voltage of the system on which they are used, and which may be either

One or more methods of suspending such type of the different varieties of cables under the two general subdivisions as above will be described, while the illustrations accompanying this article show typical suspensions for some of the different classes.

In considering single-conductor, bare cables, it will be found that they, in general, possess sufficient mechani-

FIG. 1. THREE CABLES CARRIED DOWN THE SAME SHAFT. Two of the cables, A and B are held by clamps, the third cable is threaded through a cast-iron block, the strands spread, and spelter, or solder, poured around them. This method is applicable only for bare cables at earth potential.

single- or multi-conductor. Only methods of suspending cables vertically in shafts and bore holes will be here considered. The mechanical make-up of such a cable will of course be influenced by the depth of the shaft or bore hole, but within the range ordinarily found in most bituminous coal mines no special or unusual features are required to obtain the necessary mechanical strength.

The usual types of cables employed may be classed as follows: Class I—Single conductor cables, (a) bare; (b) insulated, braid covered; (c) insulated, lead covered; (d) insulated, lead covered, wire armored. Class II—Multi-conductor cables, (a) insulated, braid covered; (b) insulated, lead covered; (c) insulated, lead covered, wire armored.

FIG. 2. INSULATED CAST-IRON BLOCK SUSPENSION. This is a modification of C, Fig. 1, adapting it to cables carrying appreciable voltage. The cast-iron block into which the cable is soldered is insulated from its surroundings.

cal strength to carry their own weight with a considerable factor of safety. Of course, 'engineers' opinions vary regarding the safety factor necessary. This feature is determined therefore largely by the opinion of the engineers responsible for the installation. Inasmuch as where bare cables are used they are almost invariably employed for the negative conductor of a direct current grounded system, these cables are at the potential of the earth, and it is not necessary to provide means of insulating them from the ground either at the point of suspension or elsewhere.

FIG. 3. POTHEAD SUSPENSION TERMINAL. Since the eye of this device is "alive," that is, at the cable potential, its support must be insulated. This is accomplished by means of a strain insulator.

This renders the problem of supporting them at the point of suspension by clamps or other means a comparatively simple one. A method similar to that shown at "a" (Fig. 1) has proved satisfactory during several years of service. The conductor is suspended in a fiber conduit placed in the concrete side of a shaft. The clamp

in Fig. 1 shown attached to an insulated armored cable, but which works equally well upon a bare conductor, is of cast iron split in two parts, similar to the one shown in Fig. 8, and is arranged to bolt tightly around the cable, the clamp being bored out to just the right diameter to firmly grip the conductor when the eight bolts are drawn up.

The lower end of the clamp is provided with a flat bearing surface to rest on the top of the pipe, or bore hole casing, and has a round projecting element extending below the flat portion. This projection is turned

FIGS. 4 AND 5. A POTHEAD SUPPORTED ON A FAN HOUSING

An iron tripod placed on top of the fan-casing supports, through a strain insulator, the pothead terminal of a cable suspended in the air shaft.

down so that its outside diameter is such as to just allow it to fit snugly inside the conduit. This clamp is about 18 in. long and is designed to give a large contact area for gripping the cable. At "c" (Fig. 1) is shown a method which is extremely simple. The conductor in this case is a 1,000,000 circular mill, 61-wire concentric-strand cable and is suspended in a 4-in. inside diameter fiber conduit, imbedded in the concrete side of the shaft, the depth being 517 ft. The clamp for holding the cable at the top consists of cast iron in the form of a truncated cone, having a tapered hole through the center. This casting is 10 in. in diameter at the bottom, 8 in. in diameter at the top, and is 8 in. high. The diameter of the hole at the bottom of the casting is just sufficient to allow the cable to pass through, but gradually increases to a considerably larger diameter at the top.

After the top end of the cable is passed through this hole, the strands are opened out and babbitted or leaded solidly into the casting, the opening of the strands allowing the molten material to penetrate into the interstices, filling them thoroughly.

Other methods which might be employed would be to lead or babbitt the end of the cable into a regular wire-ropes socket eye, such as is commonly used with steel hoisting cables, or to employ the two eye halves of the regular feeder-cable clamp. Neither of these two methods has ever been used by myself, although each is entirely feasible.

In considering methods for suspending cables of the insulated, braid covered, single-conductor type, since these cables are practically always at considerably above earth potential, it will be necessary to provide suitable

insulation between the ground and the clamp used, in case the clamp is in contact with the metallic portion of the cable. In case the clamp is applied over the insulation and braid no additional insulation will ordinarily be required. For use where the clamp is in contact with the metallic portion of the cable, the method illustrated in Fig. 2 may be used. This is an amplification of the method shown at "a" (Fig. 1), in that means of insulating the clamp proper from the ground is provided.

The means of suspension consists of a cup-shaped casting which is placed over the bore hole and which may be bolted to the concrete in which the casting is imbedded. A block of suitable impregnated wood or other insulating material is placed between this cup-shaped casting and the cone-shaped cast-iron block, which is fastened directly to the metallic part of the cable. The outer braid and insulation are removed from the cable near the upper end, in sections, as indicated, and the bare cable passed through the hole in the cast-iron block. The strands of the cable are then opened and filled with solder or babbitt metal. This fastens the cable securely in and to the casting, which rests on the insulating block in the cup-shaped casting.

The space between the insulating block and the wall of the cup-like casting is filled with the regular type of insulating filling compound generally used to fill end bells on cables. This is a semi-liquid substance, which is readily poured when heated but assumes a semi-solid plastic condition on cooling. Another method of suspending a cable of this type, and embodying both a support and a pothead or terminal, is shown in Fig. 3. It is believed that the cut will be practically self explanatory, except that it may be specially pointed out that the top ring or eye bolt, being in contact with the metallic core of the cable, will be "live," and suitable strain insulators should be inserted in the stranded guy cable or other means employed to support this eye. The photographs, Figs. 4 and 5, show a suspension of this type, indicating clearly the strain insulators.

For use in cases where the clamp is applied over the

FIG. 6. A POWER CABLE AND ITS SUPPORTING WIRES  
Where vertical cables are too long to sustain their own weight auxiliary wires may be attached to the cable at suitable intervals. These wires take much of the weight off the main conductor.

insulation and braid the type of clamp as already referred to and shown at "a" (Fig. 1) is suitable, but must be accurately bored out, so that sufficient pressure on the core of the cable to support it may be obtained, yet not enough applied to damage the insula-

tion. In suspending lead covered cables, as included in class 1, the added weight of the lead covering and means of satisfactorily supporting it must be considered.

Although the method of support already referred to and shown in Fig. 3 is designed primarily for non-lead-covered cables, it may be used without modification for cables so sheathed where the length of the cable is comparatively short. In such a case the lead sheath will not have to be separately supported. This type of support used with a lead-covered cable suspended in an air shaft about 140 ft. deep is shown in Figs. 4 and 5, already referred to. The iron tripod from which the special clamp and end bell are suspended is set on the top of the wind box from the ventilating fan, built over the air shaft, in which the cable hangs. The entire weight is carried by the clamp.

When using lead-covered cables in deeper shafts or bore holes it is necessary to support the lead sheath separately and a usual method is to lash the cable to two or more copper or steel supporting strands. These are fastened to the cable by a wrapping of several turns of wire carefully soldered, the wrappings being spaced every 15 to 25 ft. (See Fig. 6.)

Another type of suspension for lead-covered cables is commonly called the "sheave wheel" method. A stan-

may be obtained by fastening the cable every 15 or 20 ft. to steel supporting strands, which are in turn connected to the frame supporting the sheave wheel. Adjustable bolts, eye bolts or turn buckles should be used with the steel strands in order to properly take up the stress. This type of suspension is shown in Fig. 7.

Conductors of the 1-d class mentioned above consist

FIG. 8. A CAST-IRON CLAMP ON AN ARMORED CABLE. The clamp fits around the cable, grips it tightly and rests upon the top of the bore-hole casing. The armoring wires may be brought out of the insulating sheath and bent over hook-shaped.

of lead-covered cables, over the lead sheath of which there is placed a bedding or layer of asphalted jute, and over this a spiral wire armor. Over this armor there is usually, though not always, a layer of asphalted jute, to protect the armoring wires as much as possible from corrosion by the acid mine water and air.

Cables manufactured especially for vertical suspension in shafts and bore holes and called by most cable manufacturers bore-hole cables, are included in this classification. Bore-hole cables are armored with galvanized steel wire, the same as submarine cables, except that one of the wires of the armor is omitted, so that when the service of the armor wire is put around it (which is done while it is in the process of armoring and under tension) it compresses the armor so as to grip the cable tightly, and as this wrapping or serving of armoring wires is placed around the cable every 25 ft., there is no danger of the cable slipping out of the armor.

These cables are designed so that the total weight may be safely carried by the armor wires. The upper end of the cable is so finished as to permit its easy suspension. A wrapping is placed over the armor wires, which are brought out at different points and bent over in a hook. A clamp designed to grip the cable tightly, and also to support it by the wrapping resting on it at the top, is used. This clamp and also the method of finishing the armoring at the end of the cable is shown in detail in Fig. 8. Figs. 10 and 11 show an installation of this type, except that all the armor wires are brought out and bent over at one point.

Another method of supporting wire-armored cables is sometimes used, in which a clamp somewhat resembling two pipe flanges is employed. This has a hole in the center of proper diameter to allow the cable to just pass through. The edges of this hole in the lower half are rounded, so that there will be no cutting or abrading of the cable. The lower half of the clamp is placed over the cable, then the armor wires are untwisted and bent out over the clamp radially.

The upper half of the clamp is then placed over the cable and the two halves tightly fastened together by means of bolts, thus clamping the armor wires securely between the two halves. The ends of the armor wires are then usually bent down over the outer rim of the clamp. This clamp rests on the end of the bore hole casing, thus supporting the cable, practically the entire

FIG. 7. SUSPENDING A CABLE FROM A SHEAVE

The cable is passed one or more times around a sheave, then lashed to itself. Clamps and auxiliary supporting wires or cables may also be used to advantage.

ard sheave wheel, such as is usually employed for hoisting cables, is carried between suitable bearings on a timber or steel framework erected over the shaft or bore hole. The cable is passed one or more times over the sheave wheel and the free end is lashed to the side of the cable emerging from the mine. This is done to prevent the cable from slipping back over the sheave.

In the case of heavy or long cables additional safety

weight being carried by the armor wires. Fig. 9 illustrates the clamp in detail.

We next come to the multi-conductor cables, and in considering the methods for their suspension it will be found, generally, that the means employed for the different subdivisions of single-conductor cables may be adapted to give satisfactory results when employed with multi-conductor cables of the same subdivisions or gen-

clamp in excess of that which might be applied without injury to the braid covering or other insulation. In deeper shafts and bore holes some additional means of support may be employed, such as two steel strands lashed to the cable by wire wrappings at frequent intervals. The sheave-wheel method would also undoubtedly be satisfactory where the depth of shaft or bore hole was not excessive.

FIG. 9. DETAILS OF A FLANGE CABLE SUPPORT

The armoring wires are unwrapped and brought between the two flanges, which are then drawn tightly together with the bolts. The cable is thus supported by its armor.

eral construction. Due to the fact that the single-conductor cables are most commonly used on circuits of low or medium voltage and multi-conductor cables on high voltage circuits, the cross-sectional area of the conductors in the first class will be considerably larger than those in the second class.

For suspending multi-conductor, braid-covered cable, a clamp of the type already described and illustrated in Fig. 1 and in Fig. 8 for single-conductor cables of this

For lead-covered multi-conductor cables most of the methods of suspension adaptable to the corresponding type of single-conductor cables are applicable. Among these are: the sheave-wheel type, either with or without the additional supporting strands; the four-bolt clamp, as per Fig. 8 (especially for moderate depths), while in some cases supporting strands only may be employed something after the idea shown in Fig. 6.

Cables of the lead-covered, wire-armored type are usually considered by most engineers and cable manufacturing companies as the conductors "par excellence" for vertical suspension in shafts and bore holes. In a properly designed and constructed cable of this type the matter of suspension is an easy one, since excellent devices are available for this purpose, by means of which the whole weight of the cable is carried by the armor wires, thus relieving the main copper conductors of practically all stress. At the same time the armor wires give excellent protection to the lead sheath and conductors from mechanical injury.

With a properly applied and compounded asphaltic jute covering over the wire armor this is in turn protected from the injurious effects of the sulphur in the mine water. The suspension of the multi-conductor lead-covered, wire-armored cables is effected in exactly the same manner as in the case of the single-conductor cables of the same type. Actual installations, as shown in the photos accompanying this article, cover a wide range of voltage and size of cable as well as depth of bore hole or shaft. Each of these installations has, in its own sphere, served the purpose in hand admirably and given years of satisfactory service.

FIGS. 10 AND 11. A POWER CABLE INSTALLED IN A BOREHOLE

This is a clamp support placed upon the borehole casing. The casing rises three to four feet above the ground to prevent the entrance of rain or snow.

same construction will be entirely satisfactory in shafts and bore holes of moderate depth, where the weight of the cable is not such as to require a pressure from the

### No Gas Mask Suited to Mine Use

A recommendation with regard to the use of gas masks in coal mines has been issued by the Committee on Safety of the Bureau of Mines, of which George S. Rice is the chairman. The recommendation reads as follows:

"The Bureau of Mines disapproves the use of any military or industrial gas mask so far developed, in fighting mine fires or in recovery work after explosions in any kind of mine, because there always is likely to be carbon monoxide present, or a deficiency of oxygen existing, or both. Self-contained oxygen breathing apparatus should be used under these conditions."

### Seasonal Rate Bill in House

A bill identical with the measure introduced in the Senate by Senator Frelinghuysen, providing for seasonal railroad freight rates for the shipping of coal, has been introduced in the House by Representative Cooper of Ohio.

## "Agglutinating Curve of Coal"

Laboratory Experiments Disclose Interesting Characteristics in the Coking Properties of Coal When Mixed with Inert Material

BY BYKEM

AN ARTICLE discussing the effect on the coking agglutinating properties of coal when mixed with varying proportions of inert material is printed in the *English Gas Journal*, vol. CXLIX, No. 2961 (Feb. 10, 1920, p. 313), under the title—"The Agglutinating Curve." In the experiments described the inert materials employed consisted of sand, anthracite and carbon. The influence of the degree of fineness of the inert substance was studied and reference was made to the "agglutinating curve," showing "the proportion of inert material of varying degrees of fineness a particular coal could sustain and still yield coherent coke." These curves are not included in the published article. Pulverized electrode carbon is recommended as the best inert substance for this test. Coke buttons were obtained by the standard American method for determining volatile matter.

After reading the article referred to, in order to observe more closely this interesting behavior of coal, numerous coke buttons were prepared in the laboratory on three different coals. These tests were undertaken to determine: (1) The maximum per cent of inert material which could be blended with the different coals; (2) the influence of the degree of fineness of the inert material; (3) the crushing strength of the buttons obtained; (4) the agglutinating curve, plotting the per cent of inert material against the crushing strength.

The coals selected were samples of Pocahontas, eastern Kentucky and Illinois coals. All the coals passed a 40-mesh sieve, no effort being made to secure a definite size. The inert materials used were pulverized electrode carbon passing 100 mesh, and sand passing 40 and remaining on 60 mesh, also sand passing 100 mesh.

The maximum proportion of carbon which could be used was found to be 80 per cent. The resulting Pocahontas and Illinois buttons could be easily crushed with the fingers. The Kentucky button was considerably harder than the other two. The results obtained with 50-mesh sand were quite similar to those just described, except that the buttons were somewhat harder. With 100-mesh sand the buttons were somewhat more fragile.

With 80 per cent of 100-mesh sand the Pocahontas and Illinois buttons were practically powders and the Kentucky button was easily crushed with the fingers. In this latter case the Pocahontas button was slightly more coherent than was the Illinois button. In all other cases the Illinois buttons appeared to be as coherent, under similar conditions, as the Pocahontas buttons. One Pocahontas button containing 20 per cent of 200-mesh sand which was made was easily crushed with the fingers.

Efforts were made to determine the crushing strength of the various series of buttons obtained, but no satisfactory method could be devised. Some of the poorest buttons sustained a weight of about 70 grams, while an Illinois button containing 20 per cent of electrode carbon sustained a weight of 66 lb. Since the crushing strengths of these coke buttons were not determined agglutinating curves could not be prepared.

Conclusions reached were as follows: The limiting proportion of inert substance is the measure of the agglutinating value of a coal. This value differs for

different inert substances, and decreases with increase of fineness. Hence a given inert material of a definite fineness should be used in comparing all coals in order to secure concordant results.

## February Tidewater Shipments Largest in Five Years

Daily Cargoes of Coal to North Atlantic Ports During Month Averaged Nearly 100,000 Net Tons

TIDEWATER shipments continued in large volume during the month of February. The total quantity of bituminous coal dumped at North Atlantic ports was 2,899,000 net tons. Although smaller than the tonnage of January—3,185,000 tons—this was at nearly the same rate per day. Compared with February, 1919, the month showed an increase of 362,000 tons, or 14 per cent. In fact the movement was the largest attained in any February during the last five years. The total amount dumped during the first eleven months of the present coal year was 35,692,000 net tons. Compared with the preceding coal year (1918-1919) this was a decrease of 4,109,000 tons, or 10 per cent.

BITUMINOUS COAL SHIPPED TO TIDEWATER  
(Net tons)

	Coal year 1919-20	Coal year 1918-19
December.....	2,036,000	3,206,000
January.....	3,185,000	2,954,000
February.....	2,899,000	2,537,000
Coal year to Feb. 29.....	35,692,000	39,801,000

Coastwise shipments to New England during February were reported as 793,000 net tons, as compared with 804,000 tons in January. Although smaller in total quantity, the February movement was thus at a higher rate per day, in fact at the highest rate since December, 1918. The cumulative shipments to New England for the coal year, which began April 1, 1919, are far behind the record of the preceding coal year, 8,218,000 tons as against 13,883,000 tons.

BITUMINOUS COAL SHIPPED TO NEW ENGLAND VIA TIDEWATER  
(Net tons)

December.....	674,000	876,000
January.....	804,000	721,000
February.....	793,000	554,000
Coal year to Feb. 29.....	8,218,000	13,883,000

Overseas exports during February were 718,000 net tons, a decrease of 179,000 tons, compared with January. Exports fell off sharply at Philadelphia and Baltimore, and decreased at Hampton Roads. Exports from Charleston, however, rose from 29,000 to 64,000 tons, viz.:

	January	February
New York.....	.....	.....
Philadelphia.....	103,000	43,000
Baltimore.....	174,000	58,000
Hampton Roads.....	591,000	553,000
Charleston.....	29,000	64,000
Total.....	897,000	718,000

## Records of Coal Commission Go to Bureau of Mines

President Wilson has issued an executive order transferring all records and files of the Bituminous Coal Commission to the custody of the Council of National Defense. On June 30 they are to be turned over to the Bureau of Mines for consolidation with the files of the Fuel Administration.

# Breaker-Chute Linings That Last

Vitrified Clay Pipe Makes a Lining That Will Outwear Twenty Ordinary Linings of the Iron-Sheet Variety, with Practically the Same Cost of Installation

BY DEVER C. ASHMEAD

Tarrytown, N. Y.

ORDINARY blue-annealed sheet iron used in the lining of breaker chutes wears out so quickly that several coal companies have been investigating other materials for lining the chutes in their breakers. In the issue of *Coal Age* for Feb. 19, 1920, I called attention to the use of galvanized sheet iron, underground and in the breaker, describing its advantages over the use of blue-annealed sheet iron. Since that

article was written I have had the opportunity of examining another lining for breaker chutes which seems to have some advantages over the galvanized sheet iron, especially in troughs of smaller cross-section.

At the breaker of the Mt. Jessup Coal Co. near Peckville, Pa., the company has been using vitrified clay pipe for the lining of small chutes, and remarkable results have been obtained, particularly as concerns the life of the lining.

As an example, in one of its breakers the company has two chutes lined with vitrified clay pipe. These chutes are each between 40 and 50 ft. long.

One chute carries all the coal in the breaker under pea size, as well as half of the pea coal. The coal drops into the chute from a hopper, the fall being about 3 ft. The material thus lands directly on the clay lining. From this point the coal is carried by the chute a distance of about 50 ft. to a set of shaker screens for sizing. For a period of two and one-half years this lining has been in place, has given continual service and has not been renewed or repaired. At the present time it shows comparatively little wear, indicating that its life will be as long again. This chute with its lining is well illustrated in Fig. 1.

The other chute, shown in Fig. 4, which carries rice coal to a pocket, does not handle as much material as the one just described nor is it quite as long, having a length of only about 40 ft. It will be noted that near the lower end one of the pieces of the lining is broken. This sec-

FIG. 1. VITRIFIED CLAY-LINED CHUTE

A 50-ft. chute from the hopper to shaker screens which carries all the fine coal produced in the breaker. This chute has been in service for two and one-half years without renewal of lining.

FIG. 2. LOWER LINING SECTION DEPRESSED

This arrangement of lining parts results in unnecessary wear in the lower pipe length.

tion was broken accidentally, and the company has not as yet procured the proper size of pipe to replace it.

In a short time the coal company intends to line with vitrified clay pipe all the chutes handling the small sizes of coal, since by experience so far it has found that such a lining will last at least ten times as long as will a lining of blue-annealed sheet iron, while present indications are that it will outwear twenty linings of the iron-sheet variety. From two chutes in this breaker that have been lined with the vitrified clay piping the coal company has received 24 and 30 months of wear, respectively, whereas linings handling the same character of material, and much less of it, but composed of blue-annealed sheet iron have to be renewed every two or three months.

The first cost of the two types of lining was approximately the same, and there is practically no difference in the expense of installation. The cost of upkeep, however, in the case of the clay pipe is much less than that for the sheet iron. The only outlay for upkeep with the clay-pipe lining is when some accident occurs whereby one or more sections are broken. No attention is required after the first installation of the vitrified clay pipe, but with the sheet iron constant attention is necessary as wear is rapid, and the lining must soon be replaced. The Mt. Jessup Coal Co. estimates that it has to reline its sheet-iron chutes on an average once every three months.

Vitrified clay pipe lining is nothing but a good grade

FIG. 3. LOWER LINING SECTION ELEVATED

This results in a tendency to block the chute, with heavy wear on the protruding edge of the lower section.

of sewer pipe with the bell end removed and the pipe cut in two lengthwise. At times the coal company has had to purchase the pipe whole and do the cutting itself, but upon other occasions it has been able to secure it already prepared for use. When the pipe has been received whole and has had to be cut this work has been done with a diamond-pointed chisel.

Great care has to be taken in the installation of the vitrified clay pipe in the chutes to see that the joints, which come about every 2 ft., exactly match. The lower end of the upper section should not be higher than the upper end of the adjacent lower section. If they should not match and the upper one be higher than the one below, the constant passage of coal over this slight drop will have a tendency to wear a hollow in the lower joint of pipe. This is shown diagrammatically in Fig. 2.

By referring to Fig. 4 it will be noticed upon close examination that there are little hollows below a number of the joints. These were caused by the above-described process. Inequality of lining makes a point of wear that could have been prevented if the joints had been properly matched. No matter how close an examination is given to Fig. 1 no hollows will be found, as these joints match accurately, except one or two at the upper end of the chute, where the chute makes a vertical bend. This vertical bend also makes the chute appear in the illustration to have a horizontal curve, but this appearance is only an optical illusion, since the chute lies in a vertical plane throughout its entire length.

If the condition is exactly the reverse of that assumed above and the lower end of the upper joint of pipe is lower than the upper end of the adjacent lower joint, a ridge is formed in the trough or chute which will have a tendency to retard the material as it flows downward. If the chute has only a slight pitch this will tend to stop the coal and possibly clog the chute. This case is illustrated in Fig. 3. In this instance if the retardation of the coal is not sufficient to block the chute this

ridge becomes a point of wear and may considerably decrease the life of the lining.

As far as its experiments have gone in the use of vitrified-clay pipe lining, the coal company has come to

FIG. 1. DIFFERENT LININGS COMPARED

The chute on the left carries all the rice coal produced in the breaker. This lining has been in use for two years without repairs, the one broken section having been fractured by the accidental dropping of a wrench. The chute on the right is supplied with blue-annealed steel lining, and it has been found that this chute material needs to be replaced four times a year.

the conclusion that coal will slide on this substance at the same, or approximately the same, angle as it will on blue-annealed sheet iron. The longer the lining is used the more polished it becomes (as is the case with the sheet iron) and the more readily will the coal move upon it.

At the present time the company above mentioned is using the lining only for the small sizes of coal, employing only 8 and 12-in. pipe for its chutes. It has not attempted to use this material for larger sizes of coal, but may do so at some future date.

# Susquehanna Collieries Co.'s Improvements Near Shamokin, Pa.

Coal Will Be Discharged Underground by Rotary Pump and Hoisted by Skip—This Has Not Been Tried Before in the Anthracite Region—Pulverized Coal Will Be Burned in the Power Plant

MANY new improvements have been made by the Susquehanna Collieries Co., Shamokin, Pa. New shafts are being sunk, miles of new tunnels are being driven, and a new power house is being constructed as well as a new breaker. The *modus operandi* of carrying on the mining was prohibitive because of excessive hauls both underground and on the surface. Consequently some new scheme had to be devised and it was decided to sink the two new shafts—the Pennsylvania and the Richards.

These shafts are only 2,400 ft. apart, but one is in the Pennsylvania, the other in the Richards Basin. To have brought all the coal to one shaft would have meant the expenditure of money for tunnel driving, and would have concentrated so much coal at one shaft as to have interfered with the hoisting.

The Richards shaft is 15 x 23 ft. outside of the timbers and is to be sunk to a depth of 1,000 ft. It is a

the shaft. On Jan. 16, 1920, the shaft had been sunk to a depth of 110 ft. A plan of the shaft appears in Fig. 2.

The Pennsylvania shaft is different in design from the Richards shaft. It consists of 4 compartments, the outside dimensions being 16 x 22 ft. 10 in. Instead of using cages in this shaft the intention is to use skips,

FIGS. 2 AND 3. CROSS-SECTIONS OF THE RICHARDS AND PENNSYLVANIA SHAFTS

The first cross-section is of the new Richards shaft, where two regular cages are to be used, while the second cross-section is of the Pennsylvania shaft, in which skips are to be installed. The use of skips makes it necessary to provide a compartment for handling of such crippled mine cars as have to be sent to the surface for repairs.

FIG. 1. PROPOSED SHAFT STATION AT PENNSYLVANIA SHAFT

The Susquehanna Collieries Co. contemplates the use of skips in place of cages, and this will make it necessary to dump the coal underground. For this purpose a rotary dump is proposed.

three-compartment shaft, two for cages and one a combination manway, column and cableway. An electrically driven hoist will be used to operate this shaft. Four levels will be worked from it and 3,000 ft. of tunnels will be driven to connect it with present and new workings. The timbering in the shaft is 12 x 12 in. set on 4 ft. centers. A concrete casing down to a depth of 85 ft. is now in place. Ordinary cages will be used at this shaft to bring the coal to the surface, as it must be transported on a narrow-gage track to the Pennsylvania Colliery breaker. This is at a distance of 2,400 ft. from

which have not been previously employed in vertical hoisting in the anthracite region. These skips will have a capacity of two mine cars each. The two skip compartments extend across the end of the shaft and at right angles to the man- and timber-way. A central compartment between the skip- and man-way is to be used for a pipe- and column-way. Thirteen thousand feet of tunnels will be driven from this shaft to reach all parts of the present workings and connect them with the new shaft. These tunnels are on four different levels. A plan of this shaft is shown in Fig. 3.

The Pennsylvania shaft as completed will be sunk to a depth of 1,030 ft. and concreted to a depth of 50 ft. If No. 2 bed is found to be of a suitable depth it will be reached by slopes, but the shaft will not go below the No. 3 bed. The skip will dump directly into the rock-separating house. A steam hoisting engine will be used at this shaft for raising the skips.

The tunnels in this shaft had on Jan. 16 been driven to a total distance of 1,490 ft., the No. 2 level 730 ft. and the No. 3 level 760 ft. No. 2 tunnel was driven 730 ft. between July 21, 1919, and Jan. 16, 1920. This tunnel is 12 ft. wide, 7 ft. high above the rail and carries a ditch 1½ ft. deep below the top of the rail. The tunnel was driven through sandstone and slate. Ingersoll-Rand, water-line, Dreadnaught drills No. 248 are being used in this work. Three of these drills are employed to each tunnel. Thirty holes 8 ft. in depth are drilled to a round and between 100 and 150 lb. of 60 per cent dynamite is used to one shot. The drilling crew consists of six men and the mucking crew of five or six men.

Progress on No. 2 tunnel was retarded to some extent while some coal beds were passed, as trouble in sup-

porting the roof was encountered and concrete roof arches had to be put in place. No. 3 tunnel was driven 760 ft. between the same dates as those given for the No. 2 tunnel. No. 3 tunnel has been driven entirely through conglomerate and is the same size as No. 2 tunnel. Nos. 1 and 4 tunnels are to be driven from the shaft when it reaches the proper point. At the present time sinking operations on the Richards shaft have stopped because of the erection of the permanent headframe. The Pennsylvania shaft has reached a depth of 210 ft.

#### SERIOUS PUMPING PROBLEM DEALT WITH

The pumping problem is going to be rather a serious one, as the company estimates that the Pennsylvania shaft will make 3,000,000 gal. of water per day and the Richards shaft half of this amount or 1,500,000 gal., making a total of 4,500,000 gal. Two pumping stations will be installed in each shaft, one on the bottom or fourth level and one on the second level. A centrifugal pump will transfer the water from the sump at the bottom of the shaft to the second level, where another pump will pick it up and force it to the surface for use in the breaker. These pumps will be electrically driven.

The general pumping situation at both shafts is rather unusual. At the Pennsylvania shaft the normal pumping requirements are 2,743 gal. per min., while at the Richards shaft there will be handled 1,138 gal. per min. The maximum pumping requirements will be 7,184 gal. per min. at the Pennsylvania and 2,379 gal. at the Richards shaft. The minimum quantities of water at both of these shafts will be handled by direct-acting pumps in two lifts. The excess water will be handled by batteries of centrifugal pumps which will be cut in one at a time according to the requirements. Less water is encountered at the Richards shaft due to the fact that a drainage tunnel takes care of a large part of the water at this mine.

Coal from the Pennsylvania and Richards shafts will be brought first to the rock-separator house, which will be of steel. Coal from the Pennsylvania shaft will be directly dumped at the top of the separator, while that from the Richards shaft will be hauled by a 15-ton electric locomotive to the foot of a car haul, which will take the cars to the top of the separator. After leaving the separator the coal will pass by means of a drag-line scraper to the top of the new breaker. This building will also be of steel construction. This will replace the breaker at the Pennsylvania and Richards shafts.

All of the improvements are immediately over large pillars underground with the exception of the breaker and it may be necessary to "slush" the workings under this building. This breaker will have a capacity of 3,000 tons of clean coal per day.

Probably the most interesting feature of the whole development will be the new power house, which will use powdered anthracite coal as fuel. The Susquehanna Colliery Co., after a period of experimentation, decided definitely to employ this type of fuel for this plant. The power house will have a hoiler capacity of 12,000 hp. and an electrical capacity of 9,000 kw. Steam turbines and the latest improvements in all equipment will be used. The transmission line will be double and will have a total length of 40,000 ft. The purpose in having two separate transmission lines is to provide a reserve line in case of accident to the main line. Wooden poles will be mainly employed but steel towers will be used at all important crossings. Alternating

current will be transmitted at 23,000 volts, 3 phase, 60 cycle. All hoists, fans, compressors, haulage motors, etc., will be electrically driven.

One timber yard, as well as one shop and one warehouse, will serve both of these collieries.

When the mines are operating to their normal capacity the Pennsylvania shaft will have a minimum of 8 and a maximum of 12 electric locomotives underground while the Richards shaft will have a minimum of 6 and a maximum of 10. Forty-five pound rail with a track gage of 44 in. will be used on all haulage roads.

Next to the use of powdered fuel, the most interesting feature of this improvement is the use of the rotary dump underground. This is shown in Fig. 1. The coal is discharged from the car into a coal pocket directly underneath the dump, and from here it is run into the skip for hoisting to the surface. Two cars are discharged simultaneously and the pocket has a capacity of eight cars, or four on each side. The cars are placed on the dump by means of a Barney and after discharge they proceed by gravity.

## Steamship-Fuel Supplies at Vladivostok

CONSUL David B. Macgowan, Vladivostok, Siberia, Dec. 6, 1919, states that the principal fuel dealers in Vladivostok are two Russian firms and a Japanese firm, which supply launches and small boats only, the Russian firms using for the most part coal shipped to Vladivostok from the Island of Sakhalin, and the Japanese firms using coal shipped from Japan. The Standard Oil Co. has a branch there, which supplies oil and some gasoline for motor boats and motor cars, but oil-burning vessels that have visited Vladivostok always have had sufficient fuel for the round trip or have called at Hongkong for fuel.

The firms referred to can hardly be considered as regular dealers, inasmuch as their supplies are limited, and in the case of the Russian firms fuel is only a side line of their regular business.

The quantity of coal, fuel oil, Diesel oil, and gasoline ordinarily carried in stock is exceedingly small and not to be depended upon for shipping purposes. The average minimum stock of coal probably would not be more than 2,000 tons.

On account of the fluctuations in the ruble-exchange rate and the present unsettled conditions, prices are continually changing. The average price of coal is about \$20 per ton, while a few years ago, before the war, steamer coal could be obtained for \$5 or \$6 per ton f.o.b. As a result of the European war prices of fuel have been multiplied about four times.

The only varieties of coal worth mentioning are "Sakhalin coal" and the Japanese "Ochi lump." These supplies are not used by foreign naval vessels stationed at Vladivostok. Such vessels are supplied with coal by their respective colliers. Neither the Sakhalin nor the Japanese coal is of the highest quality, Sakhalin coal averaging a little better than Japanese. The coal from Sakhalin contains about 8,400 calories per ton and Japanese coal about 7,250 calories; and as coal containing less than 7,200 calories is not considered suitable for steamers it will be seen that the quality of Sakhalin and Japanese coal is little above the minimum for shipping purposes.

# U. S. Steel Corporation Acquires Large Coal Acreage

Purchases 8,933 Acres of Steam Coal in Pittsburgh District and 15,662 Acres of Surface in Kentucky—  
Decrease in Tonnage Mined Last Year as Compared with 1918—Low Accident Record Maintained

**D**URING the year 1919 the U. S. Steel Corporation made large purchases of coal lands and obtained extensive mining rights to supply its tremendous needs for fuel in its multifarious activities. During the year the Corporation purchased 8,933 acres of steam coal located in the Greene County field, which is in the extreme south of the Pittsburgh district, while in the Connellsville region it purchased some small parcels of coking land aggregating 96 acres of fee and 133 acres of mining rights. In Letcher and Harlan Counties, Kentucky, it acquired 15,662 acres surface and in the Illinois coal fields 153 acres coal land.

The total expenditure of the coal and coke company subsidiaries of the corporation was \$12,958,647.86. The inventory of Dec. 31 showed the value of coal, coke and other fuel on hand to be \$7,517,024 as compared with \$12,526,191 on the corresponding date in 1918.

The report for the year ended Dec. 31, 1919, shows that the corporation mined 28,893,123 tons of coal as compared with 31,748,135 tons the year previous. Of that tonnage 22,955,636 tons were used in the manufacture of coke and 5,937,487 tons for steam and gas and other purposes. During the same period there were 5,933,056 tons of coke manufactured in beehive ovens and 9,530,593 tons in byproducts oven, a total of 15,463,649 tons as compared with 17,757,636 tons the year previous.

## LARGE OUTLAY FOR HOUSING AND EQUIPMENT

In the Connellsville district there were expended during the year \$385,841.22 for additional housing facilities. At Footedale works an electric-driven hoist and haulage system were completed, at Phillips works an electric system is being installed and at Colonial No. 3 works additions to the electric power plant were completed.

An additional high tension power line from Colonial power plant 3 to works 4 was completed. Pumping equipment to remove mine water is being installed at Leisenring 2 works and additional mine pumps at Dearth and Collier works were completed. At Ronco works additions are being made to the tippie and 100 steel mine cars were acquired. At the Bridgeport works on account of the extension of the electric haulage system a 500-kw. generator and a 20-ton locomotive were purchased.

In the Pocahontas Field, W. Va., on account of additional housing facilities at Nos. 2 to 12 works, there were expended \$455,680.52. For a new steel tippie and mine equipment, 108 tenements and an emergency hospital works 8, \$230,266.19 were expended. For a coal mining plant and town site at Lynch, expenditures aggregating \$2,926,935.40 were made. This development is now practically completed and the new mine is being operated. For 424 steel side dump cars for transport

of coal and for 294 mine cars expenditures were made amounting to \$534,903.32. For the coal mines at Sygan, Pa., 6 short-wall coal mining machines were purchased.

The corporation's force of employees showed a decrease of 16,000 in 1919 compared with 1918, the report showing 252,106 last year, whereas in 1918 there were 268,710. Of this number 24,595 were employed on the coal and coke properties, while 28,378 were engaged on the same properties in the previous year. On the other hand, the total salaries and wages paid shows an increase of about \$27,000,000, the total paid in 1919 aggregating \$479,548,040 as compared with \$452,663,524 in 1918.

## NEARLY 15 PER CENT INCREASE IN AVERAGE WAGE

The average salary or wage per employee per day of all employees exclusive of general administrative and selling forces was \$6.12 as compared with \$5.33 in 1918, while the average salary or wage per employee per day of all employees was \$6.17 as compared with \$5.38 the previous year.

The corporation in its Northern coal and coke property has 251,433 acres of coking coal; 123,443 acres of steam and gas coal, and 94,718 acres of surface; 68 coke plants; 21,107 beehive ovens; 2,558 byproduct ovens and has 29 coal plants not connected with coke plants. Of this number there are in the Connellsville region 60,543 acres of coking coal, 23,140 acres of steam and gas coal and 23,988 acres of surface, 53 coke plants, 18,970 beehive ovens and 8 coal plants not connected with coke plants.

## WORKS HAS A BENZOL RECOVERY PLANT

Its Southern coal and coke property, known as the Tennessee Coal, Iron and R.R. Co., consists of 191,773 acres of mineral interests and surface, 143,146 acres of mineral interests only, and 14,746 acres of surface only. There are located on developed sections of the above property 9 coal-mining plants, comprising 15 operating mines, producing coal for manufacture into coke and to meet the steam- and gas-coal requirements of the manufacturing plants of the company. In connection with these operations there are 8 coal washing plants and 7 coking plants, the latter comprising a total of 2,974 beehive coke ovens. At Fairfield, Ala., there is located a byproduct coke works consisting of 434 ovens. A benzol recovery plant is connected with this works.

The water supply plants of the subsidiary companies in the Connellsville coke region consist of 13 reservoirs, six pumping stations and pipe lines aggregating 92 miles in length and with a daily capacity of 18,000,000 gallons, furnishing water for use in manufacturing coke and in addition supplying water to three cities.

The total expended by the Corporation and the subsidiary companies during the year for safety work was \$1,131,446, compared with \$1,110,064 in the preceding year. No material reduction in the number of serious and fatal accidents per 100 employees was made in 1919, but the low record of 1918 was maintained. This showed a decrease in serious and fatal accidents of 46.47 per cent as compared with the record of 1906. The entire time of 112 employees is devoted to safety work, while 5,694 employees are now serving on safety committees.

The total amount disbursed by all companies during 1919 in connection with work accidents was \$4,267,355. Of this amount 83.28 per cent was paid directly to injured employees or their families or in taking care of them. To provide prompt and adequate treatment for employees in case of accidents the subsidiary companies have built and are maintaining 286 emergency stations, 25 base hospitals with a staff of 162 surgeons and physicians whose entire time is given to company work, and 104 outside surgeons retained on a salary—all without charge to employees. There are also being conducted 63 stations for training employees in first aid and rescue work.

In furtherance of the established policy of providing modern sanitary facilities for the health and comfort of the employees, much additional equipment was installed throughout the plants and mines during the year. To date 1,496 comfort stations have been installed with 16,999 washing faucets or basins, 2,619 showers and 113,291 lockers. The cost of sanitary work during the year 1919 was \$3,208,661.73.

## Operators Combat Hysteria in Effort to Stabilize Prices

REPRESENTATIVES of the coal-operating industry in Washington are calling the attention of members of Congress and Government officials to the difficulties which beset the operators in their efforts to hold down the price of coal. To begin with the Sherman Act precludes them meeting and agreeing to reduce prices to levels which would be regarded as fair. In addition, companies accustomed to placing contracts during January, February and March postponed action until the expiration of Government control, so that with the President's request to all Government agencies to make early purchases there is now a clamor for coal.

Despite earnest requests for postponement the Navy insisted upon calling for bids for 1,500,000 tons. As was expected, much less than the quantity required was offered. To be specific, only 400,000 tons was tendered. The announcement far and wide that the Navy cannot get coal even at prices ranging from \$1.30 to \$1.92 above the Government maximum price in force up to April 1 adds to the hysteria which the operators, compelled to act as individuals, are trying to counteract.

To make the matter worse, law makers and other officials are informed that the railroads are unusually handicapped in their efforts to supply coal cars. The diversion of some 3,000 cars daily so that the interior may be supplied with coal during the strike, coupled with the return of the roads to private operation, has made it extremely difficult to secure the return of these cars to normal channels. Inability to secure cars, it is declared, has added more to the price of coal

since the commission's award than did the 27 per cent wage increase.

It is admitted that prices since April 1 have risen more than the increase in the cost of labor and of expenses due to inability to secure cars, but it is pointed out that quite contrary to custom the coal-mining districts are being overrun by buyers who are bidding against each other and making it extremely difficult to prevent the rise of prices to artificial levels. It is said that automobile and luxury manufacturers are particularly to blame for frenzied efforts to buy coal at any price. Little reason is believed to exist for these hysterical efforts to make coal contracts.

It is reasonable to believe that if a car supply equal to that available just prior to the strike, when a weekly production of 12,000,000 tons was attained, were to be made available production would be abreast with demand within ninety days. As there is no immediate hope of adequate car supply, however, it is argued that this is not the time to make contracts.

The Attorney General is being criticized for aggravating the situation to some extent by his statement in regard to the export situation. In his statement to district attorneys he said that our port facilities are adequate to the export of only 30,000,000 tons per annum. This has given the impression that with the lifting of the ban on exports coal at the rate of 30,000,000 tons will begin to leave the country.

As a matter of fact ocean tonnage is not available for more than one-third of that amount, even if a market were available.

Another obstacle to stabilized prices is the practical certainty that freight rates will be substantially increased before next winter. This fact is spurring large consumers to greater efforts to obtain as much coal as possible before the increase goes into effect.

## Stafford Gets Five-Year Sentence and May Be Deported

After refusing to grant a new trial, Judge T. J. McGinnis at Beckley, W. Va., on April 5, sentenced Tony Stafford to serve a term of five years in State Penitentiary at Moundsville, W. Va. Stafford was convicted at the January term of the Criminal Court of Raleigh County as one of the ringleaders of a gang of armed men who shot up the mines of the E. E. White Coal Co. at Glen White in November, 1917.

The State charged that Stafford was a national organizer of the United Mine Workers and caused him to be arrested in February, 1919, more than a year after the crime with which he was charged had been committed, and had eleven others taken into custody at the same time. The twelve men were indicted and Stafford was tried at the October, 1919, court, the jury being unable to reach a verdict. At the January term of court he was convicted of attempted murder in the first degree, the maximum penalty for which is five years in the penitentiary. Stafford therefore received the maximum sentence. Deportation proceedings also are pending against him.

As related heretofore, four of the men under indictment with Stafford confessed at the March term of court and each was sentenced to serve a year and a day in the State Penitentiary. The trial of Ed Snider, who was one of the leaders of the attack on the Glen White mine, began on April 6.

# Cushing\* Says Frelinghuysen Commissioner Will Raise Price of Coal

Department of Agriculture Spends a Million a Year Ascertaining Prices—As a Result Farmers Sell at Highest Prices—Commissioner Has Powers but No Money—Financial Support Will Come Eventually

A GROUP of men in Washington believes that the Government should control the distribution of all necessities of life. This proposal was given voice a year ago when it was suggested that we should re-form our Government to have two cabinets. One cabinet was to take care of the political matters. The other cabinet was to control the industries of the United States. This second, or industrial, cabinet would be nothing but the old War Industries Board elevated to a position of permanency by legislation, with each member in the new body being detailed to the control of some one raw material.

In Washington recently the advocates of the industrial cabinet recognized that their proposal was premature. So they are now ready to accept a compromise provided they get something which will head in the direction they want and will land them ultimately at their goal. The resultant compromise is the bill introduced by Senator Frelinghuysen in the Senate in March advocating the appointment of a Coal Commissioner.

His proposal at first seems so innocent and so good that it is easy to say that there is everything in its favor and nothing against it. It rests upon the old saying from Holy Writ: "Ye shall know the truth, and the truth shall make you free." That is, if we know what a miner earns and what he spends or must spend to live decently, we can figure what his wage ought to be. If we know what an operator's costs are and what his selling prices are, we can figure his profits and know whether it is a reasonable profit. If we know what the consumption is and what the production is and how it is distributed we can know whether there is any partiality shown to any consumer. The plan looks good.

Fortunately, it is not necessary to imagine only what this sort of program will mean to prices. We have a concrete example in the current prices of food. The Department of Agriculture conceived something like four and a half or five years ago that it would be an admirable thing for it to undertake to stabilize the prices of food. It built up an organization which now spends annually a million dollars in collecting and disseminating market information alone. It works as follows:

Shipments of vegetables begin in Florida about Jan. 15. The center of production moves north at the rate

of about fifteen miles a day. As soon as this crop movement starts the Department of Agriculture sends an agent into that field. He has an office always in the center of production. He gathers facts as to the volume of production, the volume of shipment, and where these vegetables are going. At the same time the Department of Agriculture has in each of the large cities a market-reporting agency. It collects data as to the demand and the prices. The market reporters in New York, Philadelphia, Boston, Pittsburgh, Cincinnati, Cleveland, Detroit and Chicago telegraph every day their figures to the department in Washington. It in turn transmits all its data to the

man who is at the center of production. The man at the center of production transmits to the market reporters in the large cities his data on shipments through exactly the same channel. If I am not mistaken, the Department of Agriculture uses on this service in disseminating this information 15,000 miles of leased wire.

Under that system of governmentally regulated distribution of food, I ask any business man to tell me how it is possible to avoid the stabilization of prices upon a higher than normal level. The high cost of food today—when you know this method—is not hard to understand. In other words, the people of the United States are paying through their Government a million dollars a year in order to have the prices of their food held up on themselves.

## LARGE EVENTS GROW FROM THE SMALL

We come back now to Senator Frelinghuysen's proposal that we shall establish a Coal Commissioner presumably to do precisely the same thing in coal. The experience of every man in Washington is that everything starts out small and grows. Perfect examples of that are the Department of Agriculture and the Post Office Department. The most conspicuous example of it is the Interstate Commerce Commission. That is, everything starts out apparently without any money but overloaded with power. Rather than abandon the thing because it is unworkable, the tendency is in time to give it enough money to allow it to be workable.

The proposal for a Coal Commissioner is to give him enormous power over the coal trade. However, the first appropriation is only \$50,000. Yet, if he were to do what he is supposed to do, it would cost at least

Some men want two Cabinets—a political and an industrial body. They want a commission for every raw product. When the price is known, no excess product reaches the market and prices rise. Why use Government funds to support such a development? Commissioner would need two millions of dollars a year to carry on work.

\*George H. Cushing, managing director, American Wholesale Coal Association, in the course of an address entitled "Ruining in an Effort to Cure," delivered before the Albany Chamber of Commerce, April 7, 1920.

\$2,000,000 a year. Naturally, the Coal Commissioner, when once established, will be harmless and a joke. But his office will not be abolished because it is a joke. On the contrary, he will plead for an appropriation which will allow him to do what he is empowered to do.

When he gets the money we will have the same old process in coal that we are now having in food. That is, we will get governmental information as to where is the best market and it will be distributed to the producers. We will receive information from the market reporters as to where coal is bringing the best price. Governmentally regulated distribution, therefore, will stabilize the coal price, and stabilization always means a higher price level.

I am perfectly willing to admit that from the coal man's standpoint this prospect of sure profit is highly attractive. It gives a man a profit as the result of governmental interference which he has not the wit or the business ability to get for himself in a highly competitive market.

However, from the standpoint of the consumer it strikes me as rather amusing for the people to pay taxes to hire their own servants to sit in Washington and maneuver to put up commodity prices.

---

## Anthracite Wage Conference Expects to Reach Agreement Soon

SO rapid has been the progress of negotiating a new working agreement with the anthracite mine workers that the sub-committee of operators and miners' representatives has nearly finished its work. The sub-committee held longer sessions last week and statistics covering the cost of living and comparing the earnings of the anthracite and bituminous mine workers were considered.

At the session held on Tuesday, April 6, the operators replied to the figures heretofore read into the records by the miners, purporting to show the average full-time weekly earnings in the anthracite mines. The miners are said to have presented statistics showing \$900 to be the average yearly earnings of a day worker in the hard-coal region and \$1,300 to \$1,600 to be the average wage each year of a contract miner.

Consideration of similar statistics occupied the time of the sub-committee on April 7, while at the conclusion of the session held on April 8 it was announced that the operators had continued the presentation of their case, offering statements of the average earnings of various classes of mine labor obtained from the payrolls of 80 per cent of the operating companies in the anthracite region during both 1916 and 1919. The operators and miners' representatives then discussed the application of these figures to the problem before the committee. The operators contend that the average yearly wage is much higher than the miners state it to be.

At the conclusion of the session held on Friday, March 9, this statement was given out:

"At the session of the Sub-Committee of Anthracite Operators and Mine Workers held today the operators read into the record data concerning anthracite operators' analysis of earnings of employees in relation to rates and opportunities for employment; a statement showing actual average earnings of employees by occupation with the increase as compared to 1914, and

statements giving comparisons of these earnings with the earnings of mine workers. Following this the miners introduced statistics upon the cost of maintaining a family at the prices prevailing in March, 1920, being a summary of the most important authoritative studies of family living costs and standards of living."

The submission of statistical data seemed to have been completed at the Friday session, but on the following day, Saturday, March 10, the miners' representatives insisted on reading into the records data covering the relation between wages and production, costs, prices and profits in the anthracite coal mining industry.

There was a heated discussion before the data were allowed to go into the records of the conference, the mine workers contending that since the operators had introduced statements showing bank accounts they were justified in introducing figures showing operating costs and their relation to earnings.

---

## Canadian Retail Coal Dealers Meet in Annual Convention

The Canadian Retail Coal Association held its sixteenth annual convention April 7 and 8 at the King Edward Hotel, Toronto, with a large attendance. Mayor Thomas L. Church, in welcoming the delegates on behalf of the City of Toronto, expressed appreciation of the good work of the National Coal Council of the United States in regulating the supply of coal during periods of shortage.

The principal feature of the convention was an address by Ellery B. Gordon, a prominent member of the National Coal Council, on "Things Worth Knowing." He dwelt on the necessity of mining coal in the most scientific and efficient manner and described the methods followed at large American mines. He also touched on the labor situation, stating that the National Coal Association was co-operating with the Government to find a solution of the labor problem, working in the interests of the coal trade not only in the United States but in Canada as well. There was at present, he said, no congestion in the shipping of coal to Canada.

Douglas Mallock, of Chicago, known as "the poet of the woods," gave an inspiring and witty address, which delighted his hearers. He made a plea for more sentiment is business and a wider appreciation of the finer things of life.

At the second day's session George H. Cushing, managing director of the American Wholesale Coal Association, gave an address on "Shippers," and John E. Lloyd, president of the National Retail Coal Merchants Association of the United States, spoke on "What Has Been Done," giving an instructive account of the activities of the association. Officers were elected as follows: John M. Daley, London, president; J. A. McLean, Wingham, vice-president; B. A. Caspell, Toronto, is permanent secretary-treasurer. A banquet at noon brought the convention to a close.

---

A survey of the Government's coal storage facilities is being made by the Bureau of Mines. A necessary preliminary to the early purchase of coal, as requested by the President, is the ascertainment of the maximum storage facilities available. An estimate is to be made of the facilities which it would be practical to create.

# Why Do American Mine Workers Produce More Coal Than British?\*

Questions Whether Machinery or Thick Coal Is the Cause—  
Regards Room-and-Pillar Mining as an Undoubted Explanation  
of Cheap Coal—Low Cost<sup>†</sup> Is Not the Outcome of Cheap Labor

BY GEORGE S. RICE†  
Washington, D. C.

FROM time to time statements have been published comparing the coal-mining practice in the United States with that in Great Britain. A recent article in a British journal points out that the American miner produces two and a half times as much coal per shift as the British miner, at one-half the cost per ton, and then proceeds to explain the natural, industrial and engineering causes which have led to this result. Among the causes advanced is that the American coal miner has the advantage of working seams of coal the operation of which presents less difficulty owing to the fact that the coal-mining industry in the United States is of more recent date than that of Great Britain.

The latter surmise is not correct, because where these advantages exist they will persist regardless of the time during which mining continues. The coal beds of the United States are not buried deeply, except in the remote parts of the country, as in the Uinta Basin of Utah. The article to which reference is made states that many of our miners are still employed on outcropping seams reached by "adits" (which we term drifts) or by vertical shafts of moderate depth. It is probable in fact that the great bulk of the coal of the United States is taken from a depth of less than 400 ft.

The article adds, "In either case [whether the coal comes from drift mines or from working with shallow shafts] the cost of hauling and hoisting is reduced greatly, and more coal can be extracted in a given time, with less consumption of mechanical power, than when the coal is raised from a great depth." As to hauling, this is not correct, as coal in the United States usually is mined at any given operation from only one bed, hence that bed is worked out rapidly and the average haul is far greater than in British collieries.

On the other hand, most of the coal is hauled over roads that are comparatively level and the same motive power—electricity—often hauls the coal from the rooms direct to the tippie, and the cars are not handled by a number of intermediate systems, as in the mines of Great Britain. The relatively cheap method of hauling by trolley locomotive is one of the largest single factors tending to the production of cheap coal and in lessening the number of men employed in hauling.

Great Britain has considerable disadvantages in the greater overburden of its deep coal, in the difficulties resulting from shattered roof, in the irregularities in the floor of the mine and in the cost of operating longwall. By the time the well-conditioned Appalachian, Central and Interior fields of the United States are exhausted British coal-mining history will have been ended.

In Great Britain trolley hauling is forbidden on account of the danger from electric sparks. It appears to me that, while there is danger, yet if such hauling were done only on those roads by which the air enters the mine, electric haulage could be safely introduced in many mines in Great Britain, especially if the roads were lined.

The lesser consumption of mechanical power due to the shallowness of the mines is a small item. Depth, of course, has a tendency to limit output, but that difficulty in turn can be taken care of by increasing hoisting facilities. In many mines in Great Britain a number of

auxiliary underground incline hoists have to be used, and this no doubt adds in an appreciable degree to the production cost and lowers the productivity of each man.

It is stated that another natural advantage enjoyed in America is the greater proportion of thick seams of coal, which make it easy to employ mechanical coal cutters and conveyors. While no doubt there are thinner beds worked in Great Britain than in the United States, and perhaps the average is thinner, yet greater thickness of coal does not play so important a part in reducing the use of labor as does the method of mining by the room-and-pillar system, which is that usually followed in America.

In the mines of the United States the burden on the coal is so much less than in Great Britain and the geologic disturbances have in such lesser degree weakened the measures that the roof will stand well in wide places with comparatively light propping. Room-and-pillar work is far better adapted to the use of undercutting machines than longwall, particularly where the coal is at all irregular in dip and in faulty condition, as is apt to be the case in Great Britain.

The disadvantage from a national standpoint of the room-and-pillar system is that unless the pillar withdrawal is systematically done there is great loss of coal, and the top or roof seam, where any such coal is present, is apt to be lost. In Great Britain longwall is the prevailing system, and practically all the coal is recovered, whereas in the United States, owing to the fact that some pillars are lost and others, as in Illinois, intentionally left unmined in the interest of safety, the loss of pillar coal together with the loss of roof coal reaches from 30 to 40 per cent.

The writer of the article declares that conveyors

\*Article entitled "Comparison of British and American Coal Mining" appearing in Monthly Reports of Investigations of U. S. Bureau of Mines.

†Chief mining engineer, U. S. Bureau of Mines.

greatly assist in the operation of thick beds. This is not so. Conveyors are of no advantage in the working of thick seams of level coal, for in such cases the cars can readily be taken direct to the face. Only where coal is thin are conveyors advantageous. In longwall work they are particularly useful.

The article quoted states as a second cause of the American ability to produce cheap coal the fact that coal mining in this country "is regarded as a low-class industry calling for no special ability, and a large number of miners employed underground are agricultural immigrants." While the latter statement is in a measure true, the argument is unconvincing in that these immigrants receive double or triple the wages of the British miners, and therefore, in my opinion, cheapness of labor is in no sense conclusive explanation of why coal is produced more cheaply in the United States than in Great Britain.

#### PICK MINES COMPETE WITH MACHINE PLANTS

The third cause assigned for the cheaper mining of coal in this country is the more extended use of mechanical appliances below ground. While the use of mechanical appliances, other than mechanical haulage, does explain some part of the lower cost, it is by no means the whole cause, since one can find almost side by side with machine mines, and entering into competition with them, the so-called "pick" mining plants. Pick mines are not rightly so termed, for in them explosives and not picks are made to do the work of mining.

"Shooting off the solid," a dangerous practice, has replaced undercutting by picks, though real pick mining still survives in a few places. The difference in cost is important competitively, but is not sufficient to explain the far lower cost in the United States than in Great Britain, because it is only a difference ranging from 5c. to 15c. per ton, as shown by the scale agreements made between operators and mine workers. Mechanical undercutting machines, however, permit concentration of work and increased production. There would not be, in fact, enough miners to serve the mines if the machines were removed. A little over one-half of the coal produced in this country is undercut by machines—50 per cent of the bituminous coal in 1917 and a little thin-vein anthracite.

The article quoted says: "The introduction of machinery has been hastened and has removed the handicap imposed by the employment of unskilled labor underground." This is undoubtedly true, but of course does not account for the much lower costs in the pick mines in the United States as compared with mine costs in Great Britain.

"The thicker seams and wider working stalls and roads, or galleries, of American mines also have favored the introduction of machinery underground." This is true, as pointed out above.

#### THINKS AMERICAN ADVANTAGES WILL CEASE

"The natural advantages at present enjoyed by the American coal-mining industry, however, will in time be lost, for the outcrop seams of coal and the more easily worked thick seams will in a few years be worked out, and the conditions under which the mines are operated will approach more closely those existing in our own country [Great Britain]." I think that the hope expressed in this statement will be dashed, as in the great mining districts of the country the coal, as pre-

viously stated, is shallow, and while increased costs come from attempts to lessen the waste in the mining of coal and also will result from the use of improved safety appliances, yet the natural advantages will continue at least until the time when the Appalachian, Central and Interior fields are worked out. By that time the British fields of coal will be exhausted.

## Illegal Strike Cost Illinois Mine Workers \$27,299

Farrington Urges Punishment of the Guilty, Declaring That Discipline Must Be Maintained if the Union Is to Last

It cost \$27,299 to settle the "wildcat" strike of miners in the Belleville, Springfield and Peoria districts last summer, according to the report made at Peoria by State Treasurer Walter Nesbit to the state convention of the United Mine Workers of America in Illinois. Nesbit bitterly scored the "insurgent element of the miners," who, he said, "camouflaged themselves under the banner of democracy and free speech," while spreading reports that the funds of the state organization were being illegally spent.

"They advocated disobedience to our constitution and violation of the written terms of contract," he said. "We spent \$27,299.58 to defray the expense of subduing this unwarranted and illegal strike. I believe we would have been justified in spending every dollar we have rather than to allow the organization to fall into the hands of those who were leading the rebellion."

President Frank Farrington referred to the strike as "a movement that was in positive defiance of every law and principle of our union." In his report Farrington devoted much attention to the recent strike and to the injunction suit against the officers. "Some day," he said, "we will have to resist this procedure. Our right to strike must never be forfeited, else, like serfs, we will be bound to our task. We shall have to demonstrate by resistance that we are going to sustain our freemen's right to strike, to redress wrongs if need be, no matter what the cost."

Farrington, in discussing the rebellion of some of the miners last summer, urged punishment for the guilty, declaring that discipline must be maintained in the ranks if the union is to stand. He denounced the insurgents as trying to deliver the organization over to the socialists.

The insurgents demanded that those of their number who had been discriminated against since the unauthorized strike be reinstated, with a strike as the alternative. They were voted down by 480 to 123, and by the same vote the convention adopted a resolution for a peaceful settlement of the controversy over the men who are said to have suffered from the discrimination.

Samuel French, a Socialist Labor Party leader, was refused permission to address the convention. French gathered his followers about him and held an "outlaw" meeting, at which he denounced the state officials of the United Mine Workers as "biological throw-backs, herdsmen and collie dogs." Frank Hefferly of Maryville contributed to the interest of the occasion by denouncing Farrington for defeating him at the recent election.

# Operators, Shippers and Railroads Form New Tidewater Coal Exchange

New Body Will Make Prompt Reclassification—Will  
Protect Quality of Coal Shipped and Suspend Shipments  
When Quality or Preparation Falls Below Proper Standard

WHEN the Tidewater Coal Exchange passes out of existence as a Government bureau at midnight of April 30 it will be succeeded by the Tidewater Coal Exchange, Inc. About two hundred operators and shippers of bituminous coal and representatives of the tidewater railroads reached this decision at a meeting held at the Bellevue-Stratford Hotel, Philadelphia, on April 7. They also adopted a report prepared on April 6 by the committee appointed for that purpose. Charles A. Owen, of the Imperial Coal Co., of New York City, was the chairman of the committee and Charles S. Allen, secretary of the Wholesale Coal Trade Association Inc., also of New York City, was the secretary.

The new organization, which will succeed to the work now performed by the Government bureau, will be a non-stock corporation incorporated under the laws of the State of Delaware. It will have a directorate of twenty-three to be chosen from the membership of the exchange or otherwise, as may be deemed advisable. Membership in the corporation will be open to all shippers, transshippers and consignors on the same terms and conditions.

## COMMISSIONER TO HAVE COMPLETE CHARGE

The meeting opened with G. N. Snider, of the New York Central Lines, presiding. After a few introductory remarks by Mr. Snider, Henry M. Payne assumed the chair and presided during the remainder of the session.

The rules of the new organization provide that any member violating them may, after due hearing, be deprived of membership in the exchange by the Executive Committee. The secretary-treasurer of the exchange is to be designated by the Executive Committee as the commissioner in charge of all its affairs and there will be a deputy commissioner at Philadelphia and one at Baltimore.

The carriers have been invited to appoint members of an advisory committee, to be composed of one person from each of the following railroads: New York Central; Pennsylvania; Philadelphia & Reading; Central R. R. of New Jersey; Buffalo, Rochester & Pittsburgh; Baltimore & Ohio; Western Maryland, Erie and such other roads as the Executive Committee shall elect, said advisory committee to meet from time to time with the Executive Committee of the exchange, but may not vote in the meetings.

The members decided to continue for the time being the classification now employed by the Tidewater Coal Exchange for bituminous coal as well as the designated pools, and directed that the work of reclassification be prosecuted with due diligence and completed as soon as possible.

The commissioner and deputy commissioners, according to the rules of the new exchange, shall at all times protect the quality of coal shipped to the exchange,

through a system of inspection and analysis, if necessary in their opinion, and they may at any time suspend shipments into any pool when, in their judgment, the quality or preparation of such coal is below the proper standard.

Cars containing coal which has been rejected from any particular pool by the inspectors of the exchange, shall be designated as "unclassified" and, upon notice mailed to the registered address of the member, shall be eliminated from the records of the exchange. Responsibility for disposition of such coal shall revert, with all charges from the day following the date notice is so mailed, to the member for whose account the cars were shipped.

The rules of the exchange provide that each member make an initial deposit, not as dues but for working capital, based upon  $\frac{1}{2}$  c. per net ton on all tonnage shipped or dumped by him at tidewater ports in the year 1919. This deposit shall not be less than \$100 and it shall be subject to revision, based upon shipments Jan. 1 and July 1 of each year, or at more frequent intervals and at any time, in the discretion of the Executive Committee.

The rules of the exchange become effective on coal shipped from the mines on and after May 1.

The headquarters of the new organization will be located in New York City. Rembrandt Peale, the well-known operator, is to be the president; C. A. Owen, vice-president, and J. W. Howe was chosen as temporary secretary and treasurer. Mr. Howe is the present Commissioner of the Tidewater Coal Exchange. Gibbs L. Baker, of Washington, was named as general counsel.

## BOARD INCLUDES OPERATORS' REPRESENTATIVES

The Board of Directors is composed of C. A. Owen, W. G. Townes, E. Kelly Downey, W. S. Alden, Wilbur A. Marshall, and Le Baron S. Willard, all of New York City; G. R. Gabell, W. L. Scott, C. H. Jacobs, Medford J. Brown and Noah H. Swayne, 2d, all of Philadelphia; John C. Lewis, Howard Adams, C. F. Kerchner and C. W. Hendley, all of Baltimore; George W. Anderson and E. Russell Norton, representing New England, and the following representatives of the operators: Rembrandt Peale, W. F. Coale, George H. Francis, Senator T. L. Eyre, Henry M. Payne, J. H. Hillman, Mr. Bolton and Telford Lewis.

The Executive Committee members are C. A. Owen, W. G. Townes, E. Kelly Downey, Wilbur A. Marshall, G. R. Gabell, C. H. Jacobs, Howard Adams, C. W. Hendley, Henry M. Payne, G. H. Francis and W. L. Scott.

There will also be working committees at each port. The New York Committee will consist of Messrs. Owen, Downey, Marshall and Townes. The Philadelphia committee will be Messrs. Gabell, Scott and Jacobs and on the Baltimore committee will be Messrs. Hendley, Adams and Lewis.

## Clear the Air

THE indictment by the Government at Memphis of the American Hardwood Manufacturers' Association has brought to the fore the question of the legality of open market reports. Coal operators should realize that the question in the Memphis case is befogged by the introduction of trade letters and statements of opinions of secretaries and others on future prices and market conditions, so that the issue as to whether it is legal or illegal to report a closed transaction is still in doubt. The coal industry has never been able to get the Department of Justice to rule on this point.

Local coal operators' associations from the first have adopted an open, frank policy toward the Government and have volunteered copies of all circular matter issued to members; a standing invitation to the Department of Justice to object to or criticize any practices. Rush Butler, general counsel of the National Coal Association, has carefully schooled the secretaries of that organization in the proper way to travel and we know his method has not been to see how close to the line the operators may go and still keep within the pale of the law. Rather he has broadly interpreted the spirit of the law and has regularly and conscientiously advised the officers of locals as to their duties in this respect.

We do not believe the coal operators' associations have anything to fear in the continuation of their reports of closed transactions. The indictment and arrest at Indianapolis of R. W. Couffer, the trade reporter of the National Coal Association at Chicago, gives the national association a splendid opportunity to get a clear-cut decision on this very important question of the legality of market reports.

Mr. Couffer has never sold any coal; has never attended any wage-scale conferences, and has never, to our knowledge, written or disseminated any opinions or trade letters on market conditions. He is, therefore, on trial only because he compiles figures of quantities and values of coal sold in the past. He has prepared these reports and has given them out to the public as well as to the coal operators who are members of the association.

## How the Public "Gets By"

IF ONLY Dean Swift were with us to look us over and laugh us out of those foolish notions that cause us to exalt small matters into large ones and to bring down our large matters into infinitesimal compass, he would find us just as mirth-provoking as he found his English neighbors in the reign of Queen Anne. The average community obsessed with an idea views it no longer in its proper relations but plays it up out of all proportion to its importance.

Watch a lot of copper, zinc, lead and precious-metal men gathered to stabilize the coal industry and hear these men, who complacently work their own mines only a quarter to half time, deplore the instability of the coal industry that works as much as two-thirds of a full year. Get among a crowd of department-store or hotel men and hear them denounce profits in the coal business that average less than 10 per cent per year in prosperous times and are nothing or a loss in other years which are less fortunate. Yet these men, in their own business, regard 10 per cent on a single sale too low a profit and calculate to turn over their capital many times in a year. In the hotels

particularly the visitor has to pay a bribe of 10 per cent or more if he would get prompt and proper service.

The light has not been turned on the department stores and it never will be, for they advertise too liberally in the daily newspapers to make it safe to throw the spotlight on their misdoings. The proprietors of dailies have too keen a sense of business prudence to submit these, their commercial supporters, to the gratuitous misstatements of those uninformed paragraphers who earn

their daily bread by attacking the coal industry. These full-page advertisers in the daily press pass easily for national benefactors. They fill places of honor in our political system and preach doctrines to others that they deftly evade applying to themselves. The people who read the public newsprints by that very act save the merchant from investigation and abuse.

If one-half as much attention were given to the profiteering in general merchandising as to the profit making, alleged and actual, in the distribution and sale of necessary products, the public would replace in its reprobation the coal man, the railroad man and the packer by the large storekeeper. The wholesale producer and the distributor have no manner of defense. Baiting them furnishes fun for the public, which likes to see the basal industries plunging in fury from side to side, prodded and pierced by the banderillas of unfriendly journalists.

The biggest offender of all, the department-store baron, quite readily escapes criticism because it is his

purse which supports the daily press. All the power of daily newspaperdom is used to inveigle the public into spending itself poor in the purchase of its luxuries. So much is this true that now the people are not satisfied unless they pay a big price.

They pride themselves not on the excellence of their clothes but on the cost of them. No one is satisfied with the comment that a garment looks and fits well unless the compliment is known to be accompanied by a silent thought that the price paid was somewhat higher than others could afford. The public is hypnotized into visiting the higher-priced stores by the subtlest of suggestions. The people are as a goose that glories in its own plucking.

When restrictive legislation is passed it relates only to basal industries. This practice is justified on the ground that the people must have the product in question while other articles are merely luxuries. The real reason is that the basal industries have been made subjects of attack whereas the others have not. Furthermore the country cannot well handle such employments as the millinery or the garment trades but can to a degree manage to control simpler industries having less varied products.

There are problems in all industries and the most general are perhaps those of seasonality. Nothing is more seasonal, and more senselessly seasonal, than the garment industry, and the clothing trade is continually striving to accentuate that condition. It does not try to spread the business over the year. It endeavors rather to set seasons for buying. It likes a feverish market before Christmas and in the fall, so that high prices can be charged.

It is the people profiting by these industries who exclusively term themselves the general public and write the word with six capital letters. A goodly number of shameless profiteers hide their unconscionable identity under that title "The Public," and they find the mask covers them quite satisfactorily. After all, "the public" is, in common parlance, everybody outside of the industry in question, and the people outside utility industries are largely parasitic, and they are not entitled to have their rights considered as paramount to the rights of those in basal industries.

---

## British Versus American Practice

GEORGE S. RICE, in an article appearing in this issue, ventures to question whether the larger production per man in the United States over that secured in Great Britain is the outcome in any large degree of the use of coal-cutting machinery. He points out that so-called "pick mines" are still running in successful competition with machine mines and that the differential in the price of coal—fixed by the unions—is only from 5 to 15c. per ton.

As a matter of fact, as he points out, coal is mined in pick mines by powder and not by pick. Consequently it may be true that one reason why coal production is so large per man in the United States is that nearly all the coal produced in the United States is mined either by machinery or is shot out of the solid, whereas in Great Britain it is mined by pick, with the powder serving merely as a secondary help.

Miners cannot be secured to mine coal at the pick rate unless they are allowed to blow their coal out of the solid, and the machine mine would have long

ago displaced the pick miner if that worthy had been required to adequately undercut his coal. Blasting out of the solid made it possible for the "pick miner" to continue at his trade even after the machines increased the area undercut per man and lowered the cost of producing coal. Steadily the pick miner has contrived to induce the manager to let him do less undercutting and use more powder. The just scruples of the mine inspectors have been similarly overcome.

The coal-cutting machine has had certainly a great part in adding to the output of the American miner and has done much also to keep up the standard of the product despite the necessity for increased output and the steady indifference of many of the miners to the quality of the coal they are loading.

Mr. Rice rightly denies that American labor is cheap, but it is certain that the declaration of the British writer would be much more justified if the miner were being compelled, at the regular rate for pick mining, to undercut his coal the full depth calculated to reduce the need for powder to a minimum. Mr. Rice objects to the ascription to undercutting machinery of the large output per man. His stand should be to insist only that we give powder a similar credit. This stand he probably is loath to take because shooting out of the solid has been the cause of a multitude of accidents and is still a reprehensible practice.

---

## Barring Lack of Cars.

### Conditions Are Favorable

NEVER were conditions more satisfactory in the coal business than today, barring a lack of cars. Stocks are small; buyers are disposed to stock, knowing that there will be a coal shortage the year round; mine workers are not striking and are anxious for work; the weather is reasonably favorable and industry is as active as the car shortage will allow it to be. There is no difficulty other than the car shortage and the unwillingness of the consumer to buy at excessive prices.

Clearly it is possible to sell at a fair price if only transportation can be secured, and it may be pointed out that in many places motor trucks will help to supply the deficiencies of the railroads. Around Terre Haute, which has mines in its western suburb almost within the city limits, coal is being hauled thirty miles by motor trucks. If the West Terre Haute mines were not so close, possibly the range of ship-by-truck service would not be limited to thirty miles.

There are wonderful opportunities for those who will develop motor-truck direct-from-mine-to consumer service via the public roads. During the freight congestion of 1917 435,000 motor trucks hauled 1,200,000,000 tons of materials. Why should not the congestion of 1920 be similarly met? The opportunity to fill the needs of the near-by communities during rail strikes—which are increasingly common—makes shipping by truck an extremely attractive proposition. Return cargoes will help in reducing the cost of the service. What these will be will depend upon the kind of truck used and the conditions at the mine and in the town to which the coal delivery is made.

Out of the present strike of railroad men will come further demoralization of the railroads. Conditions were bad enough before the strike started; they will be much more severe when the full effect reaches the mines.

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Are Shotfirers Harmful?

*Letter No. 1*—All progressive mining laws require the employment of shotfirers in gaseous mines. The Bureau of Mines recommends the same. Apparently progressive and well posted mining men would consider it an idle question to ask if the employment of shotfirers can be expected to increase the safety in mining. It is therefore strange to read in *Coal Age*, Feb. 12, p. 309, an article saying: "Of all the archaic, moss-grown, semi-modern, so-called safety ideas, that of employing shotfirers is probably one of the most harmful and dangerous." The article then concludes with the advice: "Spend just half as much money in real ventilation and make the mine really safe."

The writer wisely refrains from signing his name. If he is in any position of authority about a coal mine he'd be a fit subject for investigation by the state mine inspector or the coal company who employs him. That such advice gain no converts, it should not be allowed to pass unchallenged.

The Canadian Collieries (Ltd.) keep their board brattices, at all times, within six feet of the working face. Other mines in British Columbia are even more gaseous. Gas issues and collects in falls of the roof which occur during the working hours. Pockets and blowers of gas are frequently struck as the work advances, and these conditions occur in many places in these mines.

#### CONDITIONS THAT MAKE SHOTFIRERS NEEDFUL

The Edison electric mine lamp is now being generally adopted where any new installation of lamps is made, at a gaseous mine, or an old system is replaced by a new one. Methane can not be detected with these lamps. Under such circumstances, how can even a careful miner tell that no gas is present before he fires his shot. If no shotfirers are to be employed, what is to prevent a careless miner, who uses a flame safety lamp, from firing a shot where gas has collected in a cavity in the roof, because his brattice is broken down or not up to the working face?

Gases and lack of ventilation are not the only dangers met with in firing shots and handling explosives in a coal mine. The U. S. Coal & Coke Co. requires that all the "bugdust" from the cutting machines be loaded out of the working places, before the shotfirer shoots the coal. Some of the mines in eastern Kentucky require that the places be swept clean with a broom, so that all the dust is removed before a shot is fired.

The Pennsylvania Mining Law, under certain conditions, requires the dust to be wet down before shots are fired, and the shotfirer must see that these rules are obeyed. He superintends the loading of the hole, determines the kind and quantity of powder and tamping material used, and directs the placing of the hole and the general safety of the place, both before and

after the shot is fired, looking for fire, gas or other dangers. The shotfirer must see that the coal is properly mined. Many explosions have been traced to blownout shots where no gas was found in the mine. A single mine explosion may cost the operating company more money than the wages of ten shotfirers.

The shotfirer reduces the danger of missfires or hang-fire shots, by shooting with a battery and cable. He also lessens the dangers incident to loading and shooting the holes. The H. C. Frick Coke Co., mining the highly explosive coal of the Connellsville region, has greatly reduced the number of mine disasters by the employment of shotfirers, in addition to other safety measures they have adopted.

#### MINERS HABITUALLY RECKLESS AND CARELESS

Miners work in more or less danger at all times and usually alone. It is human nature for them to, at times, take a chance and fire a shot that is not safe. No one sees it but themselves, as all traces are removed before the boss visits the place. It is somewhat different with a shotfirer. He gains no benefit whatever from an improper shot, as does the miner, and the improper shot is not fired.

Some miners, with limited experience and unfamiliar with a particular coal field, will drill holes straight into the face of the coal, without mining the coal whatever. They then charge the holes without any tamping and tell the shotfirer they are ready to shoot. They had, perhaps, been accustomed to shooting coal that had been undercut by a mining machine. The supervision of a competent shotfirer prevents such dangerous shots from being fired.

The carelessness that familiarity with handling explosives breeds in some men who are ignorant of the real danger is almost beyond belief. It is not uncommon to see men carry their sticks of powder loose in their pockets while riding into the mine in a trip pulled by an electric motor. They will take the detonating caps out of their pockets with the heads of matches sticking into them, all being carried loosely together in the same coat or vest pocket. Miners will crimp the cap onto the fuse with their teeth, cut the fuse ten or fifteen inches long, light and shove it into a six-foot hole. A few dummy cartridges previously filled with coal dust may be hastily rammed on top of the fuse, and the miner runs to a place of safety.

#### BAD PRACTICES ELIMINATED BY THE EMPLOYMENT OF SHOTFIRERS

All these practices are done away with when a competent shotfirer is employed. He has the caps in his charge and distributes them. The powder is issued from a powderhouse, in small boxes made from nonconducting material. No fuses at all are used, as the shots are fired electrically. No caps or powder are carried into the homes of the miners, where the children can get

hold of them and become possible cripples for life. Some mining towns have explosives enough stored in the homes to blow the town to kingdom come. The miners have nowhere else to store it, and the company will sell it only in unbroken packages; so that it becomes a menace not only to the miner's family but to the entire town.

The article to which I have referred, speaking of the shotfiring system, states that "with the increase of real safety departments, mine after mine is abolishing it." It would certainly be interesting to learn the names of these mines and the names of the companies operating them. All men should entertain an open mind for new ideas; but with all our past experience, reports of mining commissions, bulletins of the Bureau of Mines, methods of operation of the most up-to-date coal-mining companies advocating the employment of shotfirers, and our state laws compelling their employment, it would appear that the general consensus of opinion was that to employ shotfirers is abundantly justified. Fewer men are exposed to the dangers of a possible explosion when all the men but the shotfirers are out of the mine when the shots are fired.

RALPH W. MAYER.

California, Pa.

## Location of Regulators in a Mine

*Letter No. 1*—The question asked by R. W. Lightburn, *Coal Age*, Feb. 19, p. 367, having reference to the advantageous location of regulators placed in air-courses, in coal mines, is a question that mine foremen and firebosses have been studying carefully for many years.

The mine described by Mr. Lightburn, lying at a depth of 550 ft. and passing 200,000 cu.ft. of air per minute, is a mine above the average size. At so great a depth, a mine requiring so large an amount of air traveling would likely prove an unprofitable venture, unless a good sized output is obtained, say an output ranging from 2,500 to 3,000 tons of coal per day of eight hours.

To meet these requirements and hoist this tonnage from such a depth the cages would probably be in the shafts 50 per cent of the working time, which would cause the fan to operate largely against a dead-end resistance, so to speak. The movement of the cages in the shaft will add materially to the water gage that would be required to circulate this air current through an unobstructed airway.

### HIGH PRESSURE ON STOPPINGS AND DOORS

Moreover, this mine is said to be very extensive, which means a tremendous pressure on brattices, stoppings, doors, etc., requiring skill and attention to keep them tight. No matter how well these are built, if constant inspection is not maintained, the drying and shrinking of the cement, the action of the air on the coal and roof, due to the seasonal changes in temperature and the humidity, the yielding of the pillars to the overlying weight as extraction proceeds in the immediate vicinity, and the jar and concussion caused by shots, are all agents that operate to destroy the efficiency of the circulation.

In mining practice, therefore, the highest efficiency will be attained with the smallest possible number of stoppings and keeping these stoppings absolutely tight. It follows that the nearer air-courses can be made con-

tinuous, without breakthroughs, the more efficient will be the air current. These considerations show that there is quite a material difference as to where regulators should be placed in mine airways, and mine foremen, today, are rapidly seeing that there is a choice in the location of regulators.

Suppose, for example, the regulator is placed at the intake of mouth of a split and there are say 50 brattices or stoppings on the split. The difference of pressure between the two sides of each stopping is then only the pressure caused by the split itself. None of these stoppings bare the total pressure of the current after the split is made.

But, on the other hand, if we assume that the position of the regulator is now advanced along the intake of the split to a point about midway between the mouth and the inby end of the split, the intake side of each stopping outby from the regulator will receive the full pressure, while beyond the regulator the pressure will be reduced to that caused by the remaining portion of the split. It is clear, in this case, that the difference of pressure on the two sides of the outby stoppings would increase the air leaks if any occurred.

Again, suppose the regulator was placed at the last open crosscut in the split, each of the 50 stoppings outby from the regulator would receive the full intake pressure due to the mine resistance, while the return pressure on all these stoppings would be only that due to the resistance of the return airway. This would greatly increase the difference of pressure on the two sides of the stoppings and would be responsible for very large leakage of air.

### STUDY CONDITIONS WHEN PLACING A REGULATOR

It should be said here that, in a split with live workings, which are often equipped with wooden stoppings, the vibration of shots, passing trains, roof falls, and numerous other causes make it almost impossible to keep these stoppings absolutely airtight and these causes should be anticipated in choosing the location of the regulator.

It would be impossible to prescribe the correct location for a regulator that would apply with equal results to all mines. It is a problem that needs individual treatment at each mine. The foregoing, however, are actual conditions as I have found them in my coal-mining practice.

If the regulator is placed at the return end of an air split it would have the same effect as placing it at the intake end of the same split, in so far as efficiency was concerned, but it should be placed outby from all the brattices or stoppings.

I have found it very convenient to place regulators close to overcasts, on the main roads, and have small air-tight, plate doors opening into the inside of the overcast. One inspection will then serve both purposes, that is, to ascertain the condition of the top of the overcast and the regulator. Measurements of the quantity of air passing can be made at the same time, without the necessity of traveling a good distance in a high air current, often in zero weather.

The pulsations of the current caused by the movement of the cages is quite a factor in efficient mine ventilation. It makes little difference whether the blowing or exhaust system of ventilation is employed, the results are the same. In a new mine, the chart of the pressure gage will show a very irregular line, which gradually smooths out as the development of the mine increases.

because the elasticity and compressibility of the current modifies this effect in a large mine.

In shafts from 500 to 700 ft. deep, in the process of development, the action of a force or blowing fan is to create a high pressure when the cages block the shaft. On the other hand, an exhaust fan acts to create a vacuous condition, at such times. Each of these conditions, however, is relieved suddenly, as the cages approach the landings when the shaft compartments are separated by air-tight partitions.

At times, I have seen the current so changeable in the mine, due to this cause, that it was quite difficult to split the air with any satisfaction. In a few instances, the current would be almost at a standstill, and again there would be an abnormal rush of air; and I think it can be safely said, in such cases, there is much choice in the location of a regulator. ROBERT Z. VIRGIN.

Pittsburgh, Pa.

## Growing Scarcity of Mine Timber

*Letter No. 1*—The indirect reference to the growing scarcity of mine timber, in a recent inquiry that appeared in *Coal Age*, Feb. 12, p. 327, suggests an important subject for consideration. It is a question of concern to everyone, inasmuch as the falling off in the timber supply, in mining, will eventually increase the cost of production of coal; and that, in turn, will make the cost of living still higher.

In the study of the question so far, we have turned to the use of steel and concrete to take the place of the wooden supports so commonly used in mining. It is to be hoped that some more economical and practical means will be found that will prove equally effective and less expensive than the materials just mentioned. This is not to say that there will not be problems arising in mining practice where the use of concrete and steel will be the most practical and economical means to adopt, which is amply proved by experience.

### STEEL AND CEMENT FOR PERMANENT CONSTRUCTION

Steel and cement construction is durable and must continue to be employed for the supports of the roof on main haulage roads that require to be kept open a number of years. These materials are also useful in the construction of car tracks, shaft bottoms, pump-rooms and other permanent work underground. Where the scarcity of mine timber will be most felt is at the working face, in rooms and short entries, and in pillar workings. For these purposes alone, large mines require timber in carload lots, and a constant supply is necessary to insure a maximum extraction of the coal, with a maximum degree of safety.

In view, then, of the coming shortage of mine timber, it is clear that a practical and economical substitute must be found, or improved methods of working adopted, that will not require so profligate a use of timber. The longwall method of mining, with its packwalls and its complete extraction of the coal together with the use of a minimum amount of timber, suggests a solution worthy of the most careful consideration, with a view to determine the conditions under which that method of mining can be successfully employed.

In mines where conditions require the use of timber in the workings, much should be accomplished by employing experienced timbermen and making every effort to recover all the timber possible, when drawing back the

pillars and abandoning rooms and entries. At times it may prove advisable to drive rooms on a yardage basis, with wide pillars between them, and drawing back the pillars on the retreating plan, with a minimum requirement for timber. In most cases, however, the real problem will be met in the matter of drawing back pillars under a frail roof that demands adequate support to insure safety. Especially is this true where the roof pressure threatens to crush the coal in the pillars, and more timber is needed for their protection.

### PRESERVATION OF MINE TIMBER

Another point worthy of consideration is the treatment of mine timber for its preservation. This includes not only seasoning the timber before it is taken into the mine, by adopting proper methods of stacking props on the surface and protecting them from the weather; but suggests the advisability of chemically treating mine timber, to render it less liable to decay and less subject to destruction by insects. The life of timber is greatly prolonged by immersion in creosote, oil, or a preservative salt solution. The cement gun has also proved an effective means of prolonging the life of mine timber. It should be stated here that green timber taken into the mines is subject to dry rot and rapid decay within a year or eighteen months, while timber properly seasoned and treated will last four or five years or longer.

An interesting reference has been made to forestry and the establishment of timber preserves. While it is not a paying investment to attempt to raise timber on a small acreage, there are numerous hilly and mountainous regions that are of no value except for the growth of timber; and this should be encouraged with proper care and attention. Every precaution should be used to keep fires from destroying the young trees. At the present time, it would seem that there is not enough attention given to the cultivation of timber tracts, outside of what is done by the government in this direction. Every state should have adequate laws for the protection of its timber lands. The damage done to timber tracts, especially second growth timber, is appalling. For the purposes of mine timber, trees, according to their size, usually attain sufficient growth in from ten to twenty years. Hence, mountainous regions adjacent to coal fields should be re-forested, which would seem to be a practical solution of the problem of the impending scarcity of timber.

W. H. NOONE.

Thomas, W. Va.

## Health and Industry

*Letter No. 2*—I read with interest the letter of John Rose, *Coal Age*, Feb. 19, p. 364, and feel like him that it is an impossibility for a man to do justice to himself if he is not healthy and strong. Many times the officials of coal companies are largely responsible for the unhealthy conditions that surround the mines, and which are so much in evidence in a great number of our mining towns; although I am glad to say this is not always the case. An instance comes to my mind just now, where the company would not permit a piece of loose paper to lie about the streets and yet there was much sickness in the town because of the unsanitary conditions within the homes.

What is needed along this line is an effective effort to educate the people in respect to their habits of living. We can clean up the town and the outside of the houses;

but if the inside of the home is neglected, all our efforts are in vain. It is the same way with our bodies. We can wash and put on clean clothes; but if we neglect to eat good wholesome food, all our bathing will be of no avail. In the same way, efforts to make workers strong and healthy, by cleaning up the town, will be useless, unless families are taught right ways of living.

Observation leads one to believe that a large proportion of the foreign-speaking people, in our mining towns, think that they are doing the right thing, but they need to be taught the first principles of health and good living. How often do we find a man, his wife and three or four children living together in a house with as many boarders, and only four or, at the most, five rooms in the house, while the windows are closed most of the day and night. Think what the condition of those people must be after spending a night in such an atmosphere.

Before closing, I want to refer to one point mentioned in Mr. Rose's letter. He quotes R. B. Babson as saying, "The need of the hour is more religion. . . . The solving of the labor situation is wholly a question of religion." It is strange that people often think that the discussion of this side of the subject has no place in the business of life; but my idea is, if our religion will not mix with our business, it is a poor thing to have around the house. The sooner we apply its principles to our everyday life, the better it will be for all concerned.

THOMAS HOGARTH.

McIntyre, Pa.

## Shifting the Worker

*Letter No. 4*—Having had a similar experience to that described by "A. H." in the inquiry, *Coal Age*, Feb. 12, p. 327, I was much interested in his recital, although the circumstances connected with my own experience were somewhat different from those he describes. However, being a worker, I am proud to say that it has been my good fortune to rise, by degrees, to a position where I hire and discharge my own men and, I hope, treat them in a manner different from that which I received.

In my opinion, the mine superintendent or foreman who will allow a man to quit his employ just because he asks to better his conditions is far from being progressive and should not be retained in the employ of the company. I would fire such a man so quick that his head would swim.

The present unrest among the laboring classes, today, is owing to the high wages that are paid for different kinds of work. There are men who will quit a job for another where they can get more pay, regardless of whether or not they are fitted for the place. Others will start studying or training to prepare themselves for filling a higher position. A third class are satisfied to hang onto their jobs; and, while they envy the man that gets ahead, they have little ambition to make the attempt themselves.

The man who has too much confidence in his own ability often finds that he is not fitted for the position he would like to fill. Not infrequently, men get the notion in their heads that the company cannot do without them, only to find another man put in their place, because of their disregard of instructions.

When I hear a man boasting that he "cannot be beat," in the work he is doing, I always feel that, while the speaker may be a good man, there is a better than he,

somewhere, and I have found this generally true. My own experience as a worker taught me to approach my boss with respect. I would talk to him as man to man; and I found this attitude made him trust me.

As an employer, I endeavor to treat my men with consideration, with due regard to their working conditions and wages. My motto is, Never ask a man to do anything that you would not do yourself, and I have found this is a good rule to remember when some difficult work is to be done.

### THE SUPERINTENDENT NOT ALWAYS TO BLAME

It is not always a superintendent's fault that he cannot give a man everything he wants. I heartily endorse the words of the editor in reply to this question. He states that, "All cannot be firebosses, or motormen, or drivers. It is up to the worker to earn his advancement." A superintendent is unable to help a man who is too lazy to help himself. Such a one is worthless as a worker. He should lay down and let someone bury him. We must acknowledge the truth of the old saying, "Every man is the architect of his own fortune." At the foot of the ladder by which a few mount to success, there are millions of aimless, helpless ones waiting for someone to give them a hand. Many of these think that the world owes them a living.

In closing, let me say that my thought is that mine officials and their men should hold get-together meetings, for the purpose of becoming better acquainted with each other. Such meetings, if properly conducted, cannot fail to win the confidence of the men in their employers; and the response made by the men will increase the confidence of the employers in their men. Each will come to know the other better, and this will result in better and more efficient work in the mine.

In regard to shifting a worker, it is my opinion that mine officials should study the capabilities of each man in their employ and try, in every way practicable, to find the place where a man can do his best work; in other words, to find the work for which he is best fitted. Certainly, this question is one well worthy of discussion by superintendents and foremen as well as by their men.

Johnstown, Pa.

SAK.

## Dead-End in Trolley Haulage

*Letter No. 6*—The question was asked in *Coal Age*, Feb. 19, p. 367, by an assistant foreman of Rawl, W. Va., concerning how far a trolley wire should be carried toward the face of an active entry. In reply, let me say that, in development work, it is common practice to keep the trolley wire within such distance from the face as can be conveniently covered by the cable on the reel of the gathering locomotive.

In gaseous mines, however, special care must be taken to keep the wire on the fresh intake air, and never extend it beyond the last open breakthrough in any entry, nor within fifty feet of the neck of the first room in which pillars are being drawn.

The wire terminals should be protected by guard-boards, or rubber hose, for a distance of three feet from the end. Care must also be taken to cut the end off and fasten it with an insulated turn-buckle.

Pikeville, Ky.

G. E. DAUGHERTY.

[This letter will close the discussion "Dead-End in Trolley Haulage."—EDITOR.]

# INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

## Double Fan Circulation

We are desirous of obtaining some information regarding a double-fan circulation. As shown in the sketch, herewith, we have installed two fans of the same type and dimensions, exhausting the air from the mine. The two circulations, or air currents, are separate and distinct, one of the fans ventilating the right side of the mine and the other the left side.

Assuming that the two circulations are equal and each fan is passing 100,000 cu.ft. per min., what quantity of air could be expected to be circulated in the entire mine should one of the fans break down. The

doors are so arranged in the mine that they can be readily adjusted to turn the two circulations into two or more splits ventilating the entire mine.

Manifold, Pa.

GEORGE HALEY.

In replying to this question, we will assume that the arrangement is such that when one fan is thrown out of commission or disabled the current produced by the other fan can be split so that half of the air will travel each side of the mine. Assuming that the power applied to the fan shaft remains unchanged and considering but one fan is operating and circulating the air in two equal splits that ventilate the two sides of the mine, respectively, it is evident that this fan is now working against double the amount of rubbing surface, and the area of passage is also twice what it was when the fan was ventilating one side of the mine only. But, for a constant power on the air, the quantity of air in circulation varies as the mine power potential ( $X_u$ ); and we have in this case,

$$X_u \text{ varies as } \frac{a}{r^3 s}; \text{ or as } \frac{2}{r^3/2} = \frac{2}{1.26} = 1.587$$

That is to say, if a single fan will circulate 100,000 cu.ft. per min. on one side of this mine, when charged with the circulation for both sides of the mine, in two splits, representing twice the rubbing surface and twice the sectional area, the air volume will be increased 1.587 times the original circulation, which gives, in this case,  $100,000 \times 1.587 = 158,700$  cu.ft. per min., equally distributed between the two sides of the mine.

Another method of solution is to consider the mine potential ( $X_u$ ) as constant and the power reduced to one-half the original power, by the breaking down of

one fan. In this case, the quantity of air in circulation varies as the cube root of the power and we have,

$$Q \text{ varies as } r^3 U, \text{ or as } r^3 \frac{1}{2} = r^3 0.5 = 0.7935$$

That is to say, one fan working alone and representing one-half the power will circulate 0.7935 times the quantity of air circulated by the two fans, in the same mine, which gives  $200,000 \times 0.7935 = 158,700$  cu.ft. per min.

## Powder Flask in Pillar Working

An incident occurred today that I would like to relate for the benefit of *Coal Age* readers, and learn their comments regarding the same. At present, I am engaged in drawing back a straight pillar, under a strong top that crushes the coal, throwing it from the rib for a distance of several yards ahead.

The crushing effect of the overburden resting on the pillars is so great, that, at times, cars have to be loaded a considerable distance from the end of the pillar. It has been necessary to reinforce the pillar on which I am working by extending a row of posts along the ribs, the posts being set 5 ft. apart. Other posts are then put back of these as lagging to support the coal and hold it in place until it can be taken out as the pillar is drawn back. The pillar is 16 or 18 ft. in width and is reinforced in the manner I have described, for a distance of 30 yd. from the face.

While I was at work, today, the mine foreman and an inspector came into my place and, looking around, discovered my powder flask where I had laid it on the gob. I think the inspector was an insurance inspector. They asked me why I did not keep my powder flask in a cubbyhole. I told them that I thought it was safer where it was, under the conditions in my place.

My experience in drawing pillars, in straight pick-work, has convinced me that the practice I have adopted of stowing away my powder flask in a safe place in the gob, is far better than putting it in a cubbyhole cut into the pillar. When driving a room or entry, I agree that it is all right to put your powder flask away in a cubbyhole in the rib; also, such practice is safe when the conditions in drawing pillars are such as to allow of the use of electric machines; but, under the conditions described it is safer in the gob.

Houston, Pa.

WILLIAM B. JACKSON.

If we understand the conditions described by this correspondent, it would be practically impossible to find a cubbyhole, in the rib of this pillar, where a powder flask would be safe. A place well selected in the gob would probably afford better protection for the flask than any niche or cubbyhole in a pillar that was being crushed by the weight of the overburden in the manner here described. We shall be glad to learn of the opinions and practice of others in this regard.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Miscellaneous Questions

(Answered by Request)

*Ques.*—How would you proceed to enter a mine, for rescuing persons, after an explosion had occurred; and would you reverse the fan?

*Ans.*—As quickly as possible, call for volunteers and select and equip, under competent leadership, those who are more experienced and familiar with the mine workings. Having ascertained that the ventilating apparatus is still working, enter the mine on the intake air and proceed with caution. Make no advance ahead of the air, unless with approved and reliable breathing apparatus.

Only in extreme and exceptional cases should it be allowed to reverse the fan, as the reversal of the air current would confuse the calculations and expectations of the men entombed in the mine and might prove fatal to them by driving the gas down upon them from workings where it had accumulated.

*Ques.*—If a water gage shows a  $\frac{1}{2}$ -in. depression, what is the velocity of the air, in feet per minute, when a cubic foot of air weighs 0.076 lb.?

*Ans.*—The formula giving the theoretical velocity of air, corresponding to any given head of air column ( $h$ ), is  $v = 60 \sqrt{2gh}$ . For a water gage of  $\frac{1}{2}$  in. and taking the weight of air as 0.076 lb. per cu.ft., the corresponding head-of-air column is

$$h = \frac{5.2 w. g.}{w} = \frac{5.2 \times 0.5}{0.076} = 33.94 \text{ ft.}$$

Then, the theoretical velocity of air corresponding to this head-of-air column is

$$v = 60 \sqrt{2gh} = 60 \sqrt{64.32 \times 33.94} = \text{say } 2,800 \text{ ft per min.}$$

*Ques.*—Calculate the number of tons of coal in a ten-acre block, the seam being six feet in thickness and assuming the coal to have a specific gravity of 1.4 referred to water as a standard, taking the weight of water as 62.5 lb. per cu.ft.

*Ans.*—Since the number of square feet in an acre is 43,560 and the seam is six feet thick, the cubic contents of this seam underlying ten acres of land is  $10(6 \times 43,560) = 2,613,600$  cu.ft. Again, taking the weight of a cubic foot of water as 62.5 lb. the weight of a cubic foot of coal having a specific gravity of 1.4 is  $1.4 \times 62.5 = 87.5$  lb. Then, the weight of coal in this seam underlying ten acres is  $(2,613,600 \times 87.5) \div 2,000 = 111,345$  short tons.

*Ques.*—The return airway of a mine has  $1\frac{1}{2}$  per cent of methane in the ventilating current, the velocity of which is 220 ft. per min. while the size of the airway is  $7 \times 10.8$  ft. The hygrometric reading gives the temperature of the dry bulb 50 deg. and that of the wet bulb 48 deg. F., while the barometer reads 25.7 in.

If the output of coal is 150 tons in eight hours, what is the quantity of methane given off: (a) in cubic feet per minute; (b) per day; and (c) per ton of coal mined. (d) What is the weight of methane, in pounds and tons, per day?

*Ans.*—The sectional area of this airway is  $7 \times 10.8 = 75.6$  sq.ft., and the volume of air passing is, therefore,  $220 \times 75.6 = 16,632$  cu.ft. per min. Assuming that all the readings are taken in the return airway at the point where the percentage of gas is measured, the volume of methane in the air current is: (a)  $0.015 \times 16,632 = 249.48$ , say 250 cu.ft. per min.; or (b)  $250(24 \times 60) = 360,000$  cu.ft. in a day of 24 hours. (c) The output of the mine being 150 tons per day, the volume of methane given off per ton of coal mined is  $360,000 \div 150 = 2,400$  cu.ft.

(d) At a temperature of 50 deg. F. and a barometric pressure of 25.7 in., the weight of a cubic foot of air is

$$w = \frac{1.3273 \times 25.7}{460 + 50} = 0.0669 \text{ lb.}$$

Taking the specific gravity of methane as 0.559, the weight of this gas produced in 24 hours is  $360,000(0.559 \times 0.0669) = 13,460$  lb., or 6.73 short tons. The reading of the wet and dry bulb of the hygrometer do not enter the calculation of the required data, as the moisture in the air does not materially affect its weight.

*Ques.*—If a weight of one-half ton is to be lifted by applying a force of 75 lb. to the end of a lever  $4\frac{1}{2}$  ft. long, how far must the fulcrum be from the point of application of the load, assuming it is between the load and the force applied?

*Ans.*—By a principle of mechanics, the moment of the load is equal to the moment of the applied force. Therefore, calling the distance from the load to the fulcrum  $x$ , the distance from the fulcrum to the applied force is  $54 - x$ ; and the length of the lever being  $4\frac{1}{2}$  ft. (54 in.), we have, for the equality of moments:

$$\begin{aligned} 1,000x &= 75(54 - x) \\ 1,000x + 75x &= 75 \times 54 = 4,050 \end{aligned}$$

$$x = \frac{4,050}{1,075} = 3.76, \text{ say } 3\frac{3}{4} \text{ in.}$$

*Ques.*—What is the weight of 125 cu.ft. of carbon dioxide, at a temperature of 35 deg. F., at an atmospheric pressure of  $13\frac{1}{2}$  lb. per sq.in.?

*Ans.*—In this case, the atmospheric pressure being given in pounds per square inch, the weight of a cubic foot of air is calculated as follows:

$$w = \frac{p}{0.37T} = \frac{13.75}{0.37(460 + 35)} = 0.07507 \text{ lb.}$$

Now, taking the specific gravity of carbon dioxide, referred to air as unity, as 1.529, the weight of 125 cu.ft. of carbon dioxide, at the given temperature and pressure, is  $125(1.529 \times 0.07507) = 14.35$  lb.

## Kansas Mine Leaders Defy Industrial Relations Court

ALEXANDER HOWAT, president of District No. 14, with others of his staff refused on April 6 to obey a summons to appear before the Industrial Relations Court upon an order issued by Judge Andrew J. Curren of the district court.

The other persons ordered to appear and refusing to obey were August Dorchy, vice-president, Thomas Harvey, secretary, Thomas Cunningham, traveling auditor and R. B. Foster, auditor. Mr. Howat made the following statement of his attitude:

"We officials of the United Mine Workers of District No. 14 do not recognize this Industrial Court. Let its members go down into the mines and dig coal and learn the business the same as we did. If they do not know the coal-mining business they are unfitted for the position and are wholly incompetent.

"Instead of a court composed of politicians and corporation lawyers, drawing a salary of \$5,000 a year, the men should have been chosen from the industrial ranks as the judges who are competent to deal with the question in hand. We may be dragged into court, but we will absolutely refuse to answer any questions, as we do not recognize the court's authority or existence."

Mr. Howat estimated the strike involved between 1,500 and 2,000 workmen and declared that they had struck not under orders but "of their own volition." As a result of this contempt of court Alexander Howat and his associates were arrested and sent to Crawford County Jail, April 9, by the judge to stay there until they consent to appear as witnesses before the court and answer questions or until they are released on bond if an appeal is made to the Kansas Supreme Court.

Mr. Howat stated when arrested:

"Our position is unchanged. We stand where we stood. We refuse to testify before this court because we do not recognize the court. It is an institution founded to enslave the workingman."

## Logan Operators Make 27-Per Cent Wage Increase Immediately Effective

The Logan Operators' Association of West Virginia is said to have been the first to put into effect the increase in wages recommended by the U. S. Bituminous Coal Commission. The association did not even await the result of the deliberations of the scale committees at New York. The Logan operators promptly adopted the wage increase though, not being in a union field, they are under no obligation to increase wages.

No announcement as to the increase made by the Logan association will be made pending action by the associations of other fields, such as the Kanawha, Big Sandy and those on the Norfolk & Western, the Logan association being in doubt as to the meaning of some of the recommendations in the coal commission's report and desiring to see how the operators of other districts will interpret them.

As soon as it was announced that the operators and miners of the Central Competitive Field had reached an agreement as to the 27-per cent wage increase, representatives of the operators of West Virginia and Kentucky announced that they also would put into effect the new contract in their territory. It is stated

that in the Logan field wage increases granted since before the war aggregate 115 per cent, so that it is probable that the scale already paid is in excess of the 27 per cent increase recommended by the commission.

The only cessation of work on the part of miners in any organized field of West Virginia on or about April 1 was that occasioned by a celebration of Mitchell Day on April 1 in all union fields. The suspension of work, however, lasted only one day, miners returning to work on April 2.

## Hines Quickly Settles Claims for Diversion of Coal

Director General Hines is taking an active part in the work of clearing up all outstanding obligations of the Railroad Administration to shippers of coal. With the ruling that the Director General could pay the 14 per cent increase pending, accounts for railroad fuel are being paid rapidly, and claims arising from the diversion of coal are being met much more rapidly than had been expected. In fact, settlements have been made for all the diverted coal with the exception of some 10,000 cars.

The great majority of the remaining claims present no unusual difficulties and prompt payments are promised. No coal was delivered, it is believed, before adequate arrangements had been made for payment. In a large number of cases railroad-station agents demanded certified checks.

It is known that the Federal Trade Commission is watching the situation with particular interest. Some operators fear that the present situation may furnish new arguments to those who look with favor on Governmental regulation or even the nationalization of the coal industry.

## Strikers in Eastern Ohio Field Refuse to Return to Work

Contrary to general expectations, 3,000 miners out of the 14,000 in sub-district 5 of the eastern Ohio field, after being on strike since April 1, failed to report for work on Monday, April 5, though urged to do so by William J. Ray, president of the sub-district. The strike of the 3,000 mine workers, mostly foreigners, was not authorized by officials, who characterized it as an expression of the miners' dissatisfaction with the size of the wage advance which became effective on April 1. Miners in Belmont County, Ohio, on the Ohio River and on the line of the C. L. W. division of the Baltimore & Ohio R.R., were affected most by the refusal of the foreigners to return to the mines.

As soon as it became apparent that the foreign miners did not propose to return to work on Monday, April 5, as had been anticipated by President W. J. Ray of the sub-district, officials of the mine workers organization set to work to try to induce the men to report for duty. Owing to the fact that so large a percentage of the striking miners were foreigners the services of many interpreters were required. Officials of sub-district 5 hoped to have the miners back in the mines before the end of the week. Many operators believe that dissatisfaction among the miners was due as much to the limited car supply, restricting working time to about half a week, as to disappointment over the size of the wage increase.

## Herbert Hoover Addresses New York Section, A. I. M. E.

Attributes High Standard of Living to Engineers—  
Urges Collective Bargaining with All  
Workmen Represented

ADDRESSING the New York Section of the American Institute of Mining and Metallurgical Engineers on Wednesday last, April 7, Herbert Hoover said that he pinned his faith on engineers because they were as he expressed it idealists soaked with realism, and were not idealists of the impractical type who disconnected their ideas from the facts that had to be faced.

Asked like the other speakers to condemn the lack of civic responsibility in engineers he said he was unable to join with those who thought engineers neglected the duty they owed to the nation. The application of science to industry which was the work of the engineer had done more to advance the standard of living than any of the idealisms of political dreamers.

Troubles in the close of the eighteenth century arose from the demand for a better distribution of land, while our troubles in this, the early part of the twentieth century, were the outcome of the demand for a better distribution of the profits of industry. The worst way to meet those demands was by a complete refusal. We must admit of trade unions and of the collective bargain, but that bargain should be not with a part only of the operatives but with all of them whether union or non-union. Labor must be fully and not partially represented. While there is an obligation on the part of the employer to enter into a bargain there is at least an equal obligation for the employee to keep the bargain when made. As Mr. Hoover saw it, there was no disposition on the part of the workman to take over the plant, for the employee recognizes quite clearly that there are worries involved that he would avoid and abilities and experience needed that he questions his power to supply.

As for industrial courts, Mr. Hoover declared he did not favor them. Lawyers believed that law was the panacea for all human ills, but he was of the opinion that economic relationships could not be regulated by legislation. The mind of a lawyer is qualitative only.

The quantitative-qualitative mind of the engineer-manager is needed to solve such difficulties. The best kind of settlement is one made by employer and employee in council. Nine states have brought forward or passed bills for compulsory arbitration of disputes between workmen and their employers but in Mr. Hoover's opinion they will have no more success than Australia and other countries have had when experimenting with such legislation.

A guaranteed wage leads to guaranteed profit and this inevitably ends in a nationalization of industry. Commissions stifle capital and are usually more militant to labor than they are to the capitalist. The important consideration with any measure is: "Does it preserve initiative?" Only a few of us can be moved to action by a desire to afford a social service, and consequently an award for effort must be provided. This must be the touchstone by which we determine the value of any form of legislation: "Does it leave the desire of the individual to produce unimpaired?"

Other speakers were Thomas F. Darlington, secre-

tary of the Welfare Department of the Iron and Steel Institute and former Commissioner of Health of New York City; Eugene Meyer, Jr., of the Department of Foreign Trade in the War Finance Corporation; Cornelius Kelley, president, Anaconda Copper Mining Co.; and W. L. Saunders, past president of the Institute and president of the Ingersoll-Rand Co.

## Mine Workers Secure Hughes As Counsel in Conspiracy Case

CHARLES E. HUGHES, a former Supreme Court Justice, has been engaged by the United Mine Workers of America to defend the indicted officials who, with certain operators, are charged with having been guilty of a conspiracy in restraint of trade. One of the charges is that the "check-off" system of collecting union dues was established.

Most of the indictment charges are so general that it is of no advantage to refer to them. They allege violations of those parts of the Lever Act and its amendments which condemn the limiting of facilities for transporting, producing, manufacturing, supplying, storing or dealing in any necessities; forbid the preventing or limiting of the supply or distribution of any necessities; prohibit the preventing, limiting or lessening of the manufacture or production of any necessities or the exacting of excessive prices therefor or the aiding or abetting the doing of any of the acts specified.

The eleventh count states that John L. Lewis and William Green prepared, issued, mailed and distributed a strike order and held a conference with other defendants concerning the cessation of the work of mining coal in Indiana and elsewhere, that from January to August of 1919 certain defendants refused to sell coal and demanded a price higher than the current price of that commodity, that a certain mine at Hymera, Ind., was closed down by J. C. Kolsem, that a copy of an agreement between the Clinton Coal Co. and the Falenz Coal and Dock Co. was sent to H. M. Ferguson and distributed by Jonas Waffle, that Walter D. Talley made a contract with the Citizens Mutual Heating Co., Terre Haute, for 10,000 tons of coal at a price of \$2.05 at the mines, the following proviso being contained in the contract: "This condition means that if there is a reduction of any of the items mentioned during the term of this contract, the buyer is to have the benefit of them, and if there is an increase in any of them, the buyer is to pay such increase, but it should be fully understood that during such times as prices are fixed by the U. S. Government, nothing contained in this condition shall be construed on the one hand to authorize the exaction of any price in excess of the Government's maximum price, nor on the other hand to require delivery by the seller at a price below the cost of production of coal, as shown in the required report to the Federal Trade Commission, plus a reasonable profit . . ."; that the defendant caused to be shipped and delivered to the said company under the contract coal for which \$2.30 per ton was charged; that Walter D. Talley refused to sell or ship coal to the Citizens Mutual Heating Co. for storage purposes; that Warren J. Smith charged 25c. per ton in addition to a contract price; that the "check-off" system of collection and payment of dues, assessments and benefits of miners to their separate unions was put in force.

# Governor Allen May Seize Mines

WITH 11,000 mine workers idle as a protest against the incarceration of Alexander Howat for contempt of court, Governor Allen is meditating the taking over the mines of Kansas, the public of Kansas being wholly unfavorable to the mine workers of that state who have been guilty of continued violation of contracts and have had a disposition to strike for every cause and no cause.

Mr. Howat does not spare the head of the state, whom he describes as "a skunk of a governor," and he declares that "we [the mine workers] won't recognize this court," meaning the new court of Industrial Relations. Governor Allen is, however, determined to get the mines back into operation. On April 12 he said: "In the event that it should be necessary [for the state] to operate the mines I believe at least 40 or 50 per cent of the workers in the district would be loyal to the state and would work for us. I do not want to talk before I act but the industrial court law is going to be enforced. The man or woman who violates it will be prosecuted."

The officials of the state expect that wholesale arrests will precede the seizure of the mines, officials who are

to blame for the suspension of the work at the mines being charged with felony and those who have quit work being charged with a misdemeanor. The industrial court on April 12 issued subpoenas for men whom they desired to question and the court will put in jail all those who mistakenly follow the lead of Alexander Howat.

It seems from evidence that Howat has been using union funds to spread Communist propaganda. Certain it is that the mine workers include many men who have I. W. W. affiliations. As there is risk of violence if the mines are operated by the state it will be necessary to protect the workers by troops, and these will be called out.

It is estimated that 90 per cent of the mine workers in Kansas are on strike. Sheriff Webb allowed Howat to speak for an hour to the assembled crowd who thronged around the entrance to the jail and cheered his utterances. The men were orderly and carried American flags and even went so far as to pass a vote of thanks to Sheriff Webb for the courtesies shown to them and to Alexander Howat in allowing the latter to address them from the balcony of the Crawford County jail. The mine workers of Kansas cannot believe a conspiracy in restraint of trade to be a crime.

## Many Are the Woes of the Mine Foreman

CARL SCHOLZ TELLS THAT THIS IS HOW THE JOB OF MINE MANAGER LOOKS TO THE LAMPMAN

# FOREIGN MARKETS AND EXPORT NEWS

## France's Coal Supply Awaits New Pumping Machinery

Trade Commissioner Charles P. Wood reports that it has been estimated that 60 per cent of the French pre-war production of coal came from the territories that were invaded by the Germans. If these coal mines had not been damaged by actual fighting, they were worked as long as possible by the Germans and deliberately wrecked before being given up. To compensate for this loss, the Peace Conference awarded to France the output of the Saar Basin in Germany, but this is not enough and the annual deficit in France is estimated at 20,000,000 tons.

As the consumption of iron ore in France and Germany is controlled by the coal supply, which for some time will be short, the necessity for the earliest possible rehabilitation of French coal mines is evident. This will be pushed to completion with all possible speed, but much remains to be done before it will be necessary to place orders for new mining machinery.

The destruction of coal mines occurred in the departments of Nord and Pas-de-Calais. The center of this mining district is Lens, which was the scene of terrific fighting. This city, which had originally 30,000 inhabitants, was leveled to the ground and flooded. It was part of the German front line until 1918 and was constantly under fire long before the decisive battles that resulted in its capture by the Allies.

Many mines around Lens suffered the same fate as the city, in that all equipment above ground was demolished by artillery fire, but every mine that could possibly be operated on either side of the line was kept in operation. When it became necessary for the Germans to retreat, they put the remaining mines out of service with the same thoroughness and scientific efficiency that characterized their operations generally.

From the surface it can be seen that all the mines are flooded and all superstructure has been wrecked. Further observation will be impossible until after the water is out of the way. It is thought that these mines were not flooded entirely from the surface but that the shaft casings were wrecked from below by demolition charges cleverly placed, and that pumping out will have to proceed at a rate beyond the rate of inflow until after the wrecked portion of the casing has been exposed for repairs. This greatly increases the magnitude of the pumping problem. Hydro-electric power not being available in the Lens area, pumping equipment must include large power plants.

Plans for pumping out the mines have proceeded with celerity, and pumping equipment has been ordered. It is estimated that at least two years will be required for pumping out mines so that the installation of machinery can begin. This will give French machinery manufacturers the opportunity to build the machinery required.

There may be emergency orders for mining machinery in other mining districts which are being worked intensely to supply the present shortage. There have been reports of badly worn cables and demand for new haulage equipment. Inquiries for pneumatic locomotives also have been in evidence.

American engineers have commented on the excellence of French mine hoists. This machinery is built in France, and probably all the new hoists for the wrecked mines will be built in France, except for such purchases as the French may consider it advantageous to make in Germany.

The tonnage of French coal mines seems low compared with corresponding results obtained in America, and this may have been misleading to some who thought that the comparatively low French tonnage could be increased by the installation of American equipment. The French problem is to take out all of the coal from a thin seam. American methods would result in too much waste both under ground and above ground. Economy is the primary

consideration in French practice. Thin seams (some of them at great depth), re-filling and other conditions peculiar to French coal mines prevent extensive blasting, the use of undercutting tools and other American methods designed primarily to increase tonnage.

## Government Control of Mines Instituted by Belgium

A Belgian royal decree is published instituting a commission of 10 persons, under the direction of the State Department of Mines, to study the methods to be applied to the available coal beds—that is to say, those not yet conceded—and the status of the mines to be operated by the Government. The latter are known as the Wandre coal mines, which are at present being operated under sequestration.

An experiment in Government direction is to be made with these first, and will take place as soon as the Government's bill regulating sequestered property is passed. The decree points out the necessity of having a well-established program regarding mines, in view of their importance to the country. The question of nationalization and other problems of operation will be considered.

Two groups of mining lands are actually available for Government control—reserves in the basin of Campine and a new basin in Hainaut—for which there are numerous demands for concessions. The commission is composed of two engineers and a jurist of the mining administration, two representatives of the mine owners, two of workers' associations, and a delegate from each of the ministries interested, i. e., Finance, Railroads, and Economic Affairs.

## Fuel Situation in South China Continues To Be Acute

There seems to be little prospect of any easing of the South China fuel situation, Consul General George E. Anderson, Hongkong, reports, although during the past year the supplies of coal from Japan, which controlled the trade entirely before the war, were again brought up to something like their former comparative proportion of the trade of the port and imports of fuel oil increased greatly. However, prices continue very high and many industries in Hongkong and South China continue crippled by a lack of fuel at a reasonable price.

The total imports of coal for the year 1919 amounted to 920,107 tons, valued at \$15,162,758 (at normal exchange of the pound sterling), as compared with 678,852 tons, valued at \$12,163,190, in 1918. The exports amounted to 214,968 tons, valued at \$2,969,670, as compared with 196,291 tons, valued at \$3,240,595, the year before. The imports were derived from the various producing countries as follows:

Country of Origin	1918	1919
	Long Tons	Long Tons
North and Middle China	269,780	128,360
Japan	360,754	658,572
Indo-China	48,118	120,806
Other Countries	200	12,369
<b>Total</b>	<b>678,852</b>	<b>920,107</b>

Of the exports in 1918, amounting to 196,291 tons, South China took 142,270 tons, while in 1919 South China took 209,609 out of the 214,968 tons exported. The rest of the imports went into local industries or ship's bunkers, by far the larger portion going into ships.

At present the local situation is improved so far as supplies are concerned, for there is a freer movement of coal from the Japanese mines and there is plenty of tonnage to move it at current rates of freight, which, of course, are very high. Cheap, soft Japanese coal—little more than "slack"—

retails for from \$26 to \$32 gold per ton.

Imports of fuel oil during the year amounted to about 85,000 tons compared with 38,596 tons of the year before. The much larger portion of the imports of liquid fuel was for bunkering vessels, and of the imports during the past year about 21,000 tons were imported from the United States almost exclusively for American vessels, which have to depend upon supplies of oil from Sumatra and Borneo, whence most of the Hongkong supply now comes.

Larger imports have been prevented by a lack of tank tonnage available for bringing supplies from Sumatra and the United States and by a shortage of tank capacity in Hongkong compared with the demands of the trade. It is understood that important developments in storage facilities for liquid fuel in the plants of the large concerns importing fuel oil in Hongkong are to be made during the current year, and it is anticipated that the situation will materially change before 1921.

## Panama Canal Quotes Prices on Coal and Fuel Oil

At the Panama Canal coal is being supplied to steamships, including warships of all nations, delivered and trimmed in bunkers, at \$13.50 per ton of 2,240 pounds at Cristobal and \$15.50 at Balboa. For ships in transit through the Canal, which are directed to take coal at Balboa, for the convenience of the Panama Canal, the quotation is \$13.50 per ton at Balboa. For ships taking less than carload lots from plants or less than 25 tons from lighters, the price is \$15 per ton at Cristobal, \$17 at Balboa. Crude fuel oil is delivered to vessels at either Cristobal or Balboa for \$1.50 per barrel of 42 gallons. Diesel oil is not sold by The Panama Canal, but may be obtained from private concerns at approximately \$3 per barrel. Cable arrangement should be made in advance of arrival of vessel.

## Europe Imports Alcohol for Fuel Owing to Coal Shortage

Scarcity and high prices of coal and petrol in European countries, and incidentally enforcement of the Eighteenth Amendment, were responsible for large exports from the United States of alcohol for fuel and industrial uses during January, 1920. Exports for the month, mostly to Europe, were 6,467,728 proof gallons, valued at \$2,065,539, an average of 32c. per galloa. The countries of destination are shown below:

Exported to—	Proof Gallons	Value
Belgium	218,427	\$79,650
Denmark	167,527	59,293
France	10,450	5,500
Greece	285,107	91,777
Italy	2,483,078	605,060
Malta	32,815	13,160
Netherlands	2,026,524	655,952
Norway	37,816	18,251
Switzerland	34,042	24,400
Turkey in Europe	215,270	85,241
United Kingdom	35,366	36,728
Canada	208,520	103,437
Costa Rica	38,988	17,000
British West Indies	28,128	32,204
Dutch West Indies	5,408	2,660
Dominican Republic	9,361	5,593
Aden	3,500	3,300
China	19,400	8,830
Japan	10,216	11,285
Russia in Asia	18,392	7,000
Turkey in Asia	221,985	95,271
New Zealand	41,236	10,046
French Africa	37,700	16,277
Italian Africa	9,663	3,880
Morocco	4,280	2,200
Egypt	251,023	66,275
All other countries	13,506	5,269
<b>Total</b>	<b>6,467,728</b>	<b>\$2,065,539</b>

# COAL AND COKE NEWS

## What Happened in March

March 1—Franklin K. Lane resigns as Secretary of the Interior. He is succeeded by John Barton Payne, chairman of the Shipping Board, and formerly general counsel of the Railroad Administration [XVII, 362].—Federal control of railroads comes to an end with their return to the owners.

March 3—The New York section of the American Institute of Mining and Metallurgical Engineers meets and hears paper by E. A. Holbrook on "Coal Versus Ore Concentration" and discussion by members [XVII, 495]. Shipping Board drops fleet operation. Turns over all its vessels to private operators as agents; cancels all its tariffs. Managers will be allowed to fix own rates to meet conditions—Frank C. Smith dies at his home in Reading, Pa. He was president of the Reading Iron Co. and a director of several coal companies [XVII, 627].

March 5—Walker D. Hines outlines a new distribution policy in a statement which says that coal is to be diverted in the future only in cases of the most absolute necessity. New regional committees are appointed to look after diversions in the different regions. The Central Coal Committee, at Washington, continues general control through committees [XVII, 509].

March 6—Mining men of McDowell County, W. Va., organize the McDowell County Mining Institute with charter membership of 51 [XVII, 571].

March 8—Twenty-second Annual General Meeting of Canadian Mining Institute assembles at Toronto, Can., and plans to continue in session on two following days. Papers read and discussions following, commented upon [XVII, 545-550].

March 9—United Mine Workers of America makes statement that nothing short of substantial increase in wages and working conditions will be acceptable [XVII, 564].—Anthracite operators and miners meet in New York City for consideration of new wage agreement to become effective April 1. Demands are referred to a subcommittee [XVII, 561-562].

March 10—President's Bituminous Coal Commission makes report and dissolves. Chairman Robinson and Rembrandt Peale hand majority report to President Wilson. John P. White still working on his minority report [XVII, 563].

March 11—President Wilson appoints Walker D. Hines an agent for service in lawsuits growing out of Federal control of railroads—Indictments are brought against 125 bituminous operators and miners, at Indianapolis, Ind., charging conspiracy under Lever Act [XVII, 564].

March 11-12—Important meeting of the Smokeless Coal Operators' Association of West Virginia is held in Washington, at which William H. Taft's opinion relative to Federal control of the coal industry is read.

March 12—William D. Owens dies at his home in West Pittston, Pa. He was an official of the Lehigh Valley Coal Co. for over 9 years [XVII, 682].—Representative of wholesale coal dealers, asking restraining order against W. D. Hines and Central Coal Committee from further interference with distribution of coal, is notified of postponement until March 19.

March 13—Estimated list 800,000 French coal miners are on strike [XVII, 563].—Hearing is held by commission appointed by Governor Cornwell of West Virginia, to probe conditions in the Guyan coal region and to investigate attempted invasion of Logan County last September [XVII, 611].

March 16—At session of Anthracite Wage Conference in subcommittee of operators and miners, in New York City, earnings of miners and 60 per cent wage increase are discussed [XVII, 620-621].

March 17—New York Wholesale Coal Trade Association holds luncheon in New York to discuss various phases of the Lever Act [XVII, 616-617].

March 18—Coal operators of West Virginia and Kentucky and the directors of the Chesapeake & Ohio R.R. fail to agree on plans for better handling of tonnage along line of this road [XVII, 681].—Senator Frelinghuysen introduces three bills in the Senate, one of which provides for a Federal coal commissioner to control organization, administration, transportation and mining of coal.

March 19—President Wilson issues an order suspending price regulation under the Lever Act, but continuing in force the rules relating to the operation of the Tidewater Coal Exchange [XVII, 654].—President Wilson transmits a statement to operators' association and union officials, approving report of his Coal Commission [XVII, 657].—Upper Potomac Coal Association organizes, being a reorganization of old Upper Potomac Coal Operators' Association [XVII, 631].

March 20—Representative Kendall, of Somerset County, Pa., denounces, on the floor of the House, the continuation of Government prices on coal [XVII, 655-656].

March 24—Anthracite operators' wage conference in New York agree to make the settlement operative from April 1. Miners agree to remain at work pending settlement of negotiations. Efforts to establish the closed shop and the "check-off" are defeated [XVII, 669-670].—New England retail coal men favor price control in meeting at Springfield, Mass. Papers are read [XVII, 672-673].

March 29—President Wilson orders control of coal by Governmental agencies to cease, on and after April 1, 1920.—Bituminous operators' and miners' representatives at New York, agree to accept the majority report of the President's Coal Commission. The miners agree to remain at work pending adoption of a new wage agreement [XVII, 672].

## Charleston, W. Va.

Production Hampered by Mitchell Day—Also by Car Shortage—Bulk of Smokeless Goes East—High Volatile West.

The principal factor, aside from a continued car shortage, in lowering production in this area, in the weekly period ended April 3, was the celebration of Mitchell Day. That cost virtually an entire day's production in the union fields tapped by the Chesapeake & Ohio R.R., since there was little work done by any union miners on April 1. The first of April was the only day on which the miners did fall to work despite the fact that the old wage scale had expired and no new wage scale had been agreed upon by the operators and miners of the organized fields in this section of the state.

There was, of course, the usual shortage of cars, but even car-shortage conditions were reversed in this respect; for although the supply at the advent of the week was somewhat under the supply for the early part of the previous week, on the other hand the supply for the remainder of the week was fairly well sustained.

Even with the improved supply, mines were hardly able to work more than 60 per cent of full-time capacity, owing to the shortage of cars. On the first day of the week the output was only 154,600 tons, nearly 3,100 cars being furnished mines on the Chesapeake & Ohio system. When the number of cars furnished dropped to around two-thirds of Monday's car supply, then

production fell in proportion. A large supply of cars was not necessary on Thursday, the first, but of course April 1 made no difference in non-union fields nor even in the "open-shop" section of the organized New River field.

## Two-Thirds of High Volatile Goes West

While there was a reasonably large movement of high-volatile coal eastward, principally to tidewater, it is estimated that fully 70 per cent of the output of high-volatile coal was going to inland western markets during the week ended the third. There was a slight increase, in the actual export of coal produced in this area, during the first three days of April, but the Chesapeake & Ohio did not appear to be able to dump its tidewater coal with any degree of promptness.

While it is true that the Lake season, which it is believed will be ushered in by the fifteenth unless weather conditions delay the opening of the season, may increase the demand somewhat for coal in this section, nevertheless many operators incline to the belief that under the present large output, there is not as much of a scarcity of coal as is generally pictured and that, therefore, export restrictions should be removed.

Until April 1, contract negotiations were being held up principally by producers. After the first and during the first three days of April, contracts were consummated on a somewhat larger scale. While producers had been holding up the consummation of contracts, in order to stabilize the market and prevent speculation, the general belief expressed was that the best way to avoid speculation and sky-high prices was to contract their coal, so that a large volume of free coal might not be left with which to speculate just as soon as the new wage agreements would make it possible to figure costs.

## New River Output Increases

Dents were made in production, to some extent, both by a shortage of cars and by a general suspension of mining activities on April 1 in the New River field. It might have been possible, but for the holiday on the first, however, to have increased production slightly over that of the weekly period ending the twenty-seventh, since after Monday the car supply was holding up better than it had been during previous weeks. With many open-top cars being utilized on the Chesapeake & Ohio, in handling army trucks, slag and cinders, the supply of empties for the mines was of course reduced.

Of the coal moved from the New River field, the bulk of it was shipped eastward, principally to tidewater; yet with the permit system still in force as to exports, overseas shipments were still limited and moreover inefficiency in dumping at Newport News, also hampered the exporting of coal to a certain extent. After the first of the coal year, there was a somewhat larger volume of contract business, and it is now believed that little smokeless coal will remain for the open market.

Although the car supply in the Kanawha field at the outset of April was far below normal, it was fairly well sustained throughout the week and it might have been possible to increase production somewhat over the week ended the twenty-seventh if there had not been an almost total suspension of mining operations for the day April 1.

## Slow Dumping of Tide Delays Loading

Fully 70 per cent of Kanawha coal was consigned, during the week ended the third, to markets in the West. Of the coal shipped eastward, most of it was for tidewater, and it was said that export permits were being somewhat more freely issued, yet slow dumping at tide was retarding the loading of vessels to some extent.

In the last three days of the week more

coal from the Kanawha field was disposed of under contracts covering the yearly period. The prevailing price for mine-run in the Kanawha field, it was stated, was about \$4.00 a ton for coal for the domestic market, export coal averaging about 50c. a ton more.

**Bluefield, W. Va.**

**Norfolk & Western Strike Halts Output—Mines Lose Half Week—Miners Go to Farms—Other Roads Improve Service—Exports Larger.**

Production almost reached the zero point in such southern West Virginia coal fields as were dependent upon the Norfolk & Western R.R. as the new coal year was ushered in, owing to a strike involving about 12,000 men. Approximately 3,000 clerks have gone on strike, and various shop crafts on the system declared a sympathetic strike about April 1; the strike of the clerks began on Friday, March 26, and the disturbance soon spread over the whole system.

At first the checking of baggage was abandoned. For a few days temporary clerks made it possible to weigh coal passing over the various scales on the system, but by the middle of the week, it had become almost impossible to even handle coal, so that during the last three days of the week, there was a decided lull in production throughout all the southern West Virginia regions. From Wednesday until Saturday virtually no eastbound coal was moved. In fact all freight traffic to the east after Wednesday was suspended.

The road was partly successful in moving freight from Bluefield and points west of Bluefield for a day or so, but on Friday it became necessary to annul all freight service. While a few empties were moved into the various districts Thursday night, the supply was extremely meager, and it was found impossible on Friday, the second, even to move such coal as had been loaded. Between Thursday night and Saturday morning no empties were furnished any of the fields and of course it was impossible to load any of the cars furnished on Saturday.

**General Disturbance Due to Railway Strike**

Thus it will be seen that virtually a full half week was lost just at a time when transportation facilities seemed to be gradually undergoing improvement. But for the strike, it is believed it would have been possible to eclipse the output of the week ended March, 27, that is if the improvement in the car supply for that week could have been taken as a criterion of what might have been expected; there having been about a 60 per cent output during the earlier week in question with evidence of further improvement up until the time the strike made it impossible to operate at all.

While losses from a labor shortage have not so far been apparent to any appreciable extent, yet on April first miners owning farms began to desert the mines for their farms, and as the car supply underwent improvement then the labor shortage was felt, and it began to be apparent that the most serious problem a little later in the season would be a serious shortage of miners, unless it is possible to recruit additional miners from other occupations.

If one may judge from their activities in southern West Virginia, speculators have more to do with advancing prices than producers as the latter are not encouraging fancy prices and are continuing to handle coal through former selling agencies, instead of taking contracts from speculators and jobbers who offer a premium. It is pointed out by operators that it is the buyers of coal and not the producers who are responsible for hoisting prices. After the first of April there was a rather marked increase in the volume of 1920 tonnage placed under contract but prices governing such contracts were along conservative lines. The export business has attained a somewhat larger volume insofar as southern West Virginia mines are concerned, though still restricted by permits.

**Pronounced Improvement on the Gulf**

A pronounced improvement in the car supply on both the Virginian and the Chesapeake & Ohio railroads in the Winding Gulf field, during the week ended April 3 was observed. Mines on the Virginian during the period mentioned were able, on an average, to operate five out of the six days or about 80 per cent of the time. Transportation facilities afforded by the Chesapeake & Ohio made it possible for the mines on that road to operate about four days

out of the six. With exports running somewhat heavier in volume and with prices commensurate with increased production costs obtaining, conditions were extremely satisfactory in the Winding Gulf Region at the beginning of the coal year.

Coal loaded in the Tug River field during the week ended April 3 totalled 68,000 net tons, a drop of 14,000 tons below the loading of the previous tie-up of the Norfolk & Western due to the strike initiated by railway clerks. From a close-to-normal loading of 330 50-ton cars on Monday, March 29, the loading dropped to 38 cars by the following Saturday, and on Monday, April 5, only 17 cars were loaded in all the mines of the Tug River field.

Although the strikers were all to be reinstated by Sunday, the condition they had created will take a number of days to untangle. The trouble on the Norfolk & Western progressed just far enough and involved a sufficient number of shop-men and yard men at important points and terminals, to halt the movement of coal and hold up incoming empties. Empties that would ordinarily have come into the Pocahontas region were diverted elsewhere, and normal relations had not been restored with connecting lines.

**Pocahontas Heavy Loser from Railway Strike**

The loading of the first full week of April was certain to be even lower than that for the week ended the third, although it was hoped that by the tenth conditions might have again been somewhat normal. No empty cars were delivered in the Tug River field on April 1 and 2, and by the second of April freight movement of all kinds had been entirely suspended on the Norfolk & Western, so that no coal to speak of was loaded in the field during the last three days of the week.

Being a larger field, losses suffered in the Pocahontas region, in the week ended April 3, were even of larger proportions than those in the Tug River field; the strike of clerks and of shop crafts on the Norfolk & Western, crippling production for several days and completely wiping out the gains made toward the end of March.

Increases in the export tonnage have been observed since April 1, but export shipments are still far below the insistent demand. Progress is being made in completing contracts for the year's tonnage although a large tonnage is being reserved for the open market.

There was a decided decrease in the production of mines in the Kenova-Thacker district, during the period ended the third, owing to the interruption to Norfolk & Western operations through the strike of railroad clerks. In the week previous to that ended the third, the Kenova-Thacker field had a production of nearly 140,000 tons, or about 60 per cent of capacity. So far as can be learned the output of that week was cut in two because of the strike. Such a marked decrease was unfortunate in view of the heavy demand and the increased price being paid for coal. Even though the exporting of coal was limited, it was impossible for producers to fully meet the demand for overseas shipment.

**Huntington, W. Va.**

**Logan Output 40 Per Cent—Few Cars—Coal Demand Insistent—Coal Goes to Inland West and to Tide.**

The beginning of the new coal year brought no relief to operators of the Logan field through any increase in the car supply; the output in the region reaching only about 165,000 tons, as against 172,000 tons for the previous week; losses from railroad disability alone being not far from 250,000 tons for the week. In other words production was not much more than 40 per cent, in the face of what may be termed an insistent demand, and during the first three days of the second week of the month, still further losses in production through a limited car supply, were observed.

While inland west markets were securing more than half the output of the Logan field, there was still a steady movement of Logan fuel to tidewater, much of it for export, with restrictions as to export shipments much less rigid than they had been.

Pending definite action by scale committees in other non-union fields, it had been impossible for producers to arrive at any definite conclusion as to the actual cost of production. For that reason many producers, up until April 3, had held aloft from making contracts, desiring to determine exact production cost before con-

tracting for deliveries over the period of a year at any certain price.

With the opening of the Lake season about April 15, Logan producers will look forward to the movement (during the season) of a large tonnage to Lake ports, and an effort was being made through a conference of Lake shippers, held at Cincinnati on April 8, to devise ways and means for the pooling of coal at Lake points in order to avoid holding coal at the docks.

While operations in the Logan field were not affected on April 1 by the observance of Mitchell Day, nevertheless, production was on a lower level than during the previous week, the supply of cars from the very beginning of the week being leaner than had previously been the case. On April 5, 6 and 7, the supply was even worse. Logan loadings on the fifth, for instance, totalled less than 40,000 tons as against normal Monday loadings of 52,000 tons.

A compilation of loading figures for all fields reached by the Chesapeake & Ohio, for the week ended April 3, discloses the fact that during that period 572 cars less were handled than for the week ended the twenty-seventh, the loss in tonnage moved amounting to 28,600.

**Fairmont, W. Va.**

**Output Drops in Northern West Virginia—Coal Confiscation Continues—Export Shipments Increase.**

Mines of northern West Virginia did not get away to a very auspicious start on the new coal year, from a transportation standpoint, as a scarcity of cars made it impossible to equal the output for the week ended the twenty-seventh, when, with a production in the Fairmont region alone of 308,550 tons of coal, the best week in two months was enjoyed. What also contributed to bring production to a lower level, was almost complete idleness at the mines on April 1, observed by union miners as Mitchell Day.

The car supply at various times in the week fluctuated from 30 to 85 per cent. The quota never reached the last named maximum except on Monday when for instance there were in excess of 1,500 cars available for loading on the Monongah division of the Baltimore & Ohio R.R. However, even that supply was somewhat reduced by late placements. On the same date the Monongahela R.R., had only a 44 per cent car supply for its mines. In other northern West Virginia regions the supply averaged anywhere from 50 to 80 per cent on Monday.

**Coal Seized at Tidewater**

That the confiscation of coal had not been altogether abandoned, became apparent when instances of seizure of fuel by the Baltimore & Ohio, at both Brunswick and Curtis Bay, were reported at Fairmont, confiscations being made of export shipments. Of course such confiscation was not on as large a scale as had been the case during the early part of March, yet it was apparent that railroads were helping themselves to coal at least to some extent before the end of Government distribution of coal, though of course it will be impossible to tell just how coal was confiscated during the last few days of Government control.

There was a noticeable increase in the eastern movement of coal from northern West Virginia points, the increase being due largely to increased tidewater shipments. Likewise with the increase in tidewater shipments, there was an increase in exports, it is believed.

While the number of cars sent to Curtis Bay from the Monongah division, during the week ended the twenty-seventh, was slightly in excess of 1,000, during the following week at least 200 more cars of coal were consigned to tidewater. With a growth in the tidewater movement, there was a decrease in the western movement, Ohio and Michigan points getting less northern West Virginia coal. When the Lake season opens, however, there will be a material increase in westbound coal.

Railroad-fuel shipments were rather heavy, especially during the early part of the week ended the third. Northern West Virginia operators are endeavoring to work out a plan, under which railroads may be able to secure an adequate fuel supply. However, price may prove to be a stumbling block.

Prices advanced somewhat in northern West Virginia fields, as was natural, after the first of the coal year, not through any special effort on the part of producers but

because of the heavy demand for coal. Following the agreement on a wage scale, contract negotiations were in many instances consummated, buyers having been exceedingly thick in the Fairmont and other northern West Virginia regions for several days previous to the end of the coal year. There was produced in the Fairmont region, during the month of March, a total of 1,345,100 tons of coal and 432 cars of coke.

### Ashland, Ky.

#### Output Half of Capacity—Normal Conditions in a Month — Preferential Car Supply Continues.

Production in the northeast Kentucky field, for the week ended April 3, was 51 per cent of potential capacity; the output being 133,840 tons, out of a possible 262,000 tons, the total production loss amounting to 128,085 tons, or 49 per cent of capacity, 120,195 tons of such total being attributable to car shortage. The output of 133,840 tons represents an increase of 11,000 tons over the preceding week, the result of a betterment in the car supply on the Louisville & Nashville, the above production surpassing the output for the corresponding week of 1919, by 30,000 tons.

Production for the entire month of March was 585,000 tons, which, compared with a total of 408,000 tons in February and 517,000 tons in January, indicates that the railroads are gradually returning to an improved condition. By the end of another month they should find themselves practically normal, especially if the Lake shipments reach such proportions that a much better average movement will immediately result.

#### Satisfactory Outlook for Next Six Months

Eastern Kentucky operators, therefore, contemplate that unless the plowing season results in no unusual depletion of their forces, that the long drawn-out period of excessive car shortage will end; and with demand and orders sufficient to cover a full year's work at the mines, they are making complete plans for the year. At this time the outlook for the next six months at least is quite satisfactory.

A quite limited number of contracts for the ensuing coal year have been so far accepted, some of which carry with them the recent wage increase. The disposition to reject such offers is not due so much to a desire to receive a better figure, as it is due to the desire on the part of the operators to tie up permanently with those industries only which will insure them full running time.

The export demand is having a distinct bearing upon the prices offered in this field, as large exporters have found themselves short of sufficient tonnage to complete cargoes and are forced to offer a premium on the necessary spot shipments.

The practice of preferential supply of equipment to railroad fuel-contract mines continues intermittently, and it is understood that the railroads have appealed to the Interstate Commerce Commission for the privilege to continue this practice, pending satisfactory arrangements being made to assure them an adequate supply of fuel.

### Benton, Ill.

#### Diamond Drill Proves Coal in Hamilton County—Old Ben Activities—Ambitious Plans of Southern Gem Corporation

In the March 4, 1920, issue of *Coal Age*, an account was published in the "News" department under "Benton," in which was noted the proposed proving of a large territory in Hamilton County. Some of the results of this examination are now made available in the following report:

One of the test holes has just been completed on the large acreage recently optioned in Hamilton County. Just east of here and the drillers have begun sinking another hole on a different portion of the property. It is said the showing of the first hole was not as satisfactory as was expected, as only a 5-ft seam was found. The quality of the coal has not been fully determined, although the sample was said to show a low sulphur content. At least two more holes will be put down, and should the showing prove satisfactory, the first mine in this county will be sunk.

There is great activity in southern Illinois at present, not only in connection with new properties but further development and combination of going mines. This is evidenced by the following account of improvements contemplated by the Old Ben Corporation

"The Benton Commercial Club has requested the Illinois Central R.R. to put on a miners' train to run from Benton to Buckner, to accommodate miners who work at Buckner and live in Benton. This was done at the request of the Old Ben Coal Corporation, which owns the Buckner mine.

The Old Ben company also notified the club that it would gladly entertain any housing plan which the club might foster, for the purpose of securing more housing facilities for miners wishing to come to work in the mines. The club has housing plans now under consideration, in an effort to secure sufficient men to properly operate the mines.

Furthermore the Old Ben Coal Corporation, which operates eight mines in Franklin County, with a daily capacity of from forty to fifty thousand tons, is considering a storage yard of large capacity, in which to store coal during the summer months, when orders are scarce. Full details have not been made public, nor has the location been disclosed, but it is supposed it will be located convenient to the large coal consuming centers in the northern part of the state

### Southern Gem Buys Railroad

When coal development is contemplated, one of the first considerations is an adequate outlet for the mines. This problem apparently has been solved in the purchase of the Wabash, Chester & Western R.R., by the Southern Gem Coal Corporation, which operates mines in Franklin County, and has large coal holdings in Jefferson County. This company had in mind not only the added advantage of having this line already in operation running through its properties, but also an outlet for its product to a water route.

This road runs to Chester, which is on the Mississippi River, and the company expects to be able to secure a more extensive field thereby for its output, by being able to ship by water. The Wabash, Chester & Western also crosses ten other roads and branch roads, and the company contemplates erecting rescreening plants at junctions, thus securing a greater car supply.

Southern Gem people can carry the coal to these plants in their own cars, and by this means they expect to maintain continuous operation, as a rescreening plant is entitled to the same car supply on its daily capacity as the mine where the coal is hoisted.

## PENNSYLVANIA

### Anthracite

**Scranton**—On Saturday night, March 27, the official and employees of the Pennsylvania Coal Co. and the Hillside Coal & Iron Co. held their second annual banquet at the hotel Casey. About 500 men were present. Joseph P. Jennings, general superintendent, acted as toast master.

**Pottsville**—The mine fire in the Wadesville colliery of the Philadelphia & Reading Coal & Iron Co., which started last January, has been successfully extinguished and operations in that part of the mine affected will probably be resumed shortly.

**Lansford**—Owing to the tremendous amount of work that has been placed upon the nurses attached to the main medical office of the Lehigh Coal & Navigation Co., at this place, the company has been compelled to employ another nurse therefore increasing its staff of nurses at this office to four. The new nurse is Mary Mulhearn.

**Hazleton**—Owing to breakage of machinery in the breaker, the Hazleton Shaft colliery of the Lehigh Valley Coal Co. has been forced to shut down temporarily.

It is reported that the Sandy Run colliery of M. S. Kemmerer & Co. will probably resume operation within the next two weeks.

**Harrisburg**—Members of the City Council recently approved the suggestion that this city should get some material return from the local river coal industry. The form the ordinance should take has not been determined, but it may include a tax on the coal recovered or a wharf rental; some 170,000 tons are produced annually. One of the city commissioners stated that the proposition should receive attention.

**Wilkes-Barre**—The output of coal in the whole anthracite field will be greatly restricted for the seven days ending April 7, due to the number of holidays. Thursday, being April 1, the miners will lay off due to it being the anniversary of the Eight-Hour Day; Friday, April 2, being Good Friday, is a church holiday, and Saturday the men will have to rest due to their hard

work in celebrating the previous two days Monday also being a church holiday, there will be no work. So no material output of coal can be looked for before Tuesday April 6, and probably not before Wednesday will the full output be reached again.

**Carbondale**—The Birkett Hill Coal Co. is ceasing operations in the mine-fire zone, where coal was being removed in the hope of checking further spread of the fire under the residential section. Some of the property owners thereabouts have sent in a plea to council to take action and compel the company to continue its work or fill the excavations made. For nearly a month there has been no work done, and the trench which was dug in the center of the street remains open. This trench is the entire width of the street and runs as deep as 30 ft. Cave-ins have occurred in the trench and are responsible for the suspension of work, according to G. W. Giles, manager of the coal company. Until the frost is out of the ground and the danger of the slides caving is passed there will be nothing done, he says. The Langan Construction Co., whose machinery is being used in the excavating, is preparing to remove its shovels and other machinery from the ground, and this leads the property owners and residents in that section to believe that there will be nothing further done. The permit to open the streets and do surface mining was granted by council, and it is expected that it will take action at its next meeting.

### Bituminous

**Charleroi**—Another block of over 600 acres of coal lands, located in Independence and Hopewell townships, in the western part of Washington County, was transferred recently to Avella coal operators. The prices paid for the coal are \$150 to \$175 per acre.

**Waynesburg**—More than 1,110 acres of coal land in Whiteley, Perry, Cumberland Morris and Green townships, Green County were conveyed to the Greene Improvement Co., of Pittsburgh, recently. Prices ranged from \$250 to \$500 an acre. Most of the land sold for \$500 an acre, is near the Monongahela River.

**Waynesburg**—Deals were closed recently for the coal underlying two Greene County farms. Elizabeth J. Stephens, of Waynesburg, conveyed to John D. C. Miller, of Pittsburgh the coal underlying a tract of 192 acres in Whitely Township. The purchase price was \$200 per acre. Lewis L. Haney, of Monongahela Township, conveyed the coal underlying his farm of 88 acres in Monongahela Township to George B. Vance. The price in this deal was \$100 per acre.

**Albion**—The mine of the Albion Coal Mine Co., located north of this city, was reopened recently after a shutdown since Nov. 1, when the mine filled with water after the men walked out on the nation-wide strike. New pumps and boilers have been added and the mine enlarged so that 150 tons will be turned out daily. The force of miners will be increased to 75.

**Tarentum**—The Pittsburgh Coal Exchange recently held a special meeting at this place in Allegheny County, at which Captain W. B. Rodgers, president, Captain J. Frank Tilley notified the members that a number of improvements are being contemplated on the rivers in the Pittsburgh district, among them the building of a new boat yard by the Eicheley company at Hays station, also ice breakers, coal tipples and abutments for the Diamond Coal & Coke Co., at Barking station. Plans for these improvements were approved.

**Uniontown**—One of the most important coal deals in the southern Connellsville field in many months was completed recently when the Southern Connellsville Coke Co. purchased 100 acres of coal from Altha Moser, of Uniontown (the trustees in bankruptcy of J. V. Thompson), the coal lying near Cheat Haven. The purchasing company will pay \$100,000, or \$1,000 an acre. Charles Detwiler, president of the purchasing company, negotiated the deal, and it is probable that this means further development in that section of Fayette County.

**Waynesburg**—The sale of 1,170 acres of coal land in Cumberland Township for \$700 an acre, a total of \$819,000, became known here recently when the deed consummating the deal was placed on record in the Greene County court house. The coal was sold by the Prospect Coal & Coke Co. of Uniontown, William A. Stone, A. Plumer Austin, Theodore D. Bliss, Richard W. Austin and the executors of the estate of John Gilmer. The purchaser was the Buckeye Coal Co. The Buckeye company already owned a large acreage in Cumberland Township and is operating at Nemolon

**Pittsburgh**—The Tri-State Coal Striping Association, W. J. Sampson, of Youngstown, Ohio, president, representing 25 coal companies in western Pennsylvania and eastern Ohio, with an annual production of about 5,000,000 tons, held a special meeting here recently in the William Penn Hotel. Reports showed production during the year ending April 1, has been greatly hampered by shortage of cars, but that production was fair. The companies have orders for coal booked that will keep plants running full during the summer and fall. Prices were discussed, but no definite schedule was adopted, it being considered advisable to let the market values of coal regulate the prices. It was stated that the supply of coal cars is becoming more plentiful and that by May 1, it was believed, the supply would be almost normal.

**Benezett**—This old town in the Bennett's Valley of Elk County is about to take on new life as coal operations of some importance will be opened here during the coming summer. Parties from Ridgway, Brockwayville and Reynoldsville are making plans for the opening of a large mine around the Winslow estate one mile above Benezett on Trout Run. Plans are now perfected for a tippie and for an extension of the Buffalo & Susquehanna RR to that point. This operation will eventually be one of the chief industries of Elk County. It is said, as the company has purchased or leased the 6,000 acres included in the Winslow estate. The company has already contracted for the removal of 50 houses from Pardus, Jefferson County, to Benezett and for their construction at the last named place. The Ridgway parties connected with this enterprise are R. A. Cartwright and H. S. Thayer.

**Uniontown**—It is reported in local coal and coke circles that an appropriation will be made soon for the erection and completion of a huge underground carrier system, whereby coal mined from Colonial mines Nos. 3 and 4, of the H. C. Frick Coke Co., will be conveyed to the Monongahela River, where it will be taken by barges to the byproduct ovens of the Carnegie Steel Co., at Clairton, Pa. It is proposed to carry the coal on a series of great 1,000-ft. belt lines, through the old Alice mines, formerly owned by the Pittsburgh Coal Co., for a distance of about 4 1/2 miles. G. W. Mathews, of Kentucky, who at present is temporarily assigned as assistant superintendent at the Bridgeport mines of the Frick interests, will superintendent the operations and the erection of the carrier system through the Alice mines. The underground carrier system through the old mines is one of the most pretentious plans undertaken in this section of the coke region, it is declared, and will entail the expenditure of a considerable sum of money.

#### WEST VIRGINIA

**Grafton**—Fire totally destroyed the power house, machinery and tippie of the Sterling Coal Co. at Cecil, near this place. The fire originated in the power house. The loss is placed at \$50,000. A large number of men will be kept out of employment until the buildings can be replaced.

**Huntington**—At a meeting of the Logan Coal Operators' Association, held in this city on March 31, John A. Kelly, one of the operators of the Logan field, was elected secretary of the association, succeeding W. P. Ellis, who resigned a month or more ago. Mr. Kelly is one of the executives of the Main Island Creek Coal Co., his headquarters being at Omar, W. Va. J. W. Colley was chosen at the same meeting as assistant secretary of the association, being in charge of the association offices recently moved to Huntington.

**Wheeling**—The Wheeling District Motor Coal Association has been organized by operators and owners of mines in Wheeling and vicinity, who deliver their coal by motor from the mines to nearby consumers. There are about 35 motor coal mines in the Wheeling district, the daily output of such mines being about 3,000 tons, in the production of which about 800 men are employed. These mines represent an investment of about \$1,000,000. Officers of the new association are: J. F. Gebbart, president; R. J. Cotts, vice president; C. H. Ebberts, treasurer; George A. Blackford, secretary. The above officers and James Ralston, M. E. Cartwright, R. W. Hall and Frank Hailstone constitute the board of directors.

**Maedonald**—All miners in the vicinity of Fayette County are invited to attend the meetings of the Fayette County Mining Institute, and they are especially recommended by R. M. Lambie, Chief of the State Department of Mines, to those who contemplate taking the state examinations,

inasmuch as subjects of benefit are brought up at these occasions. About 75 were present at the meeting held recently in the school building at Maedonald.

Those taking part in the discussions were: Edward Graft, R. M. Lambie, Robert Lilly, Thomas Cochran, John Mallabone, George Lehman, Ben Wakefield and others. Owen Fitzpatrick read a paper upon the subject of "Pure Air Is Essential to Good Health," and William Ward, a paper upon the subject "Dangerous Practices in Mining."

**Morgantown**—An important meeting of the Northern West Virginia Coal Operators' Association was held in this city on April 1 and largely attended by members from various sections of the state, the meeting having been called largely to stimulate interest in the activities of the association. The principal address was made by J. D. A. Morrow, executive vice-president of the National Coal Association. Other speakers were President Brooks Fleming of the association, executive vice-president G. T. Bell and F. C. H. Jenkins, former president of the association. Mr. Morrow in his address told of the work of the National Coal Association, at Washington, emphasizing the results accomplished which would have been impossible had coal men not had a strong organization to speak through.

**Charleston**—Representatives of the West Virginia Department of Mines having made a thorough examination of the No. 1 mine of the Buffalo Thacker Coal Co. at Ottawa in the Coal River field, which caught fire on Jan. 26, and which has been out of commission since then and have found the fire extinguished, the department about the first of April gave its approval to the reopening of the mine which is now in commission once again. Inspectors Masen and Lilly and H. M. Black, Director of Mine Rescue Stations, represented the department in making an inspection. The fire at the No. 1 mine was extinguished after every other means had been resorted to by sealing four entries to the mine, shutting off all oxygen and leaving the mine sealed until the inspection was made during the week ended April 3.

#### MARYLAND

**Cumberland**—The discovery of a virgin coal field, a southward continuation of the Georges Creek and Elk Garden fields of Maryland and West Virginia, has just been announced by the U. S. Geological Survey. It is known as the Abram Creek-Stoney River field and it is estimated that the recoverable coal of the field amounts to 422,000,000 tons.

It contains low-volatile, semi-bituminous coal and is nearer tidewater than any other Appalachian field except the Georges Creek and Upper Potomac. The coal is at present entirely undeveloped and the area is without railroads, but it would require only a few miles of branch roads to reach lines running to Baltimore or Newport News. Interest has been aroused in this area because of the advancing exhaustion of neighboring districts.

#### ALABAMA

**Birmingham**—The byproduct coke ovens of the Birmingham Coke & By-Products Corporation at Boyles, near here, are now in operation. The first coke made at this plant was ready for delivery the last of March. The byproduct plant consists of 50 Koppers ovens, with a daily capacity of 700 tons of coke. The construction of these ovens began in the fall of 1918. In addition to the coke large quantities of ammonia and byproduct gas will be produced, the former sold in the market and the latter utilized in the operation of the plant and in generating power for other industries in the vicinity. The Dixiana mines at Bradford and the Majestic mines coal is being shipped in steadily to the plant and it is understood that some of the Woodward coal will also be used at the plant. The byproduct coke-oven plant at Boyles is the largest of the independent development of the district in years. It is a plant erected without any direct connection with another industry. Industrial circles are informed that the Woodward Iron Co., in taking coke from this plant, will shut down some of its bee-hive ovens and also take up repairing of a portion of its byproduct plant.

#### ILLINOIS

**Edwardsville**—The surface works of the Henrietta coal mine at Edwardsville, owned by the I. X. L. Coal Co. of St. Louis, and operated under lease of the Beck-White Coal Co. also of St. Louis, collapsed a few days ago after having been

weakened by a wind storm. The mine had been idle for some time. The tower carried down with it the shakers and loading chutes. The shaker engine plunged to the bottom of the shaft. The damage is placed at between \$20,000 and \$30,000.

**Belleville**—Fire of undetermined origin caused approximately \$30,000 damage at the Senter mine just outside of this place recently. The fire was discovered in the engine room near the mine shaft, by the night watchman. The Belleville fire department responded but lack of water prevented its giving much assistance; the flames had extended to the boiler room and the tippie over the shaft. The three structures were completely destroyed, but the shaft escaped much injury. Some 150 miners were thrown out of work. L. Senior, of Belleville, owner of the mine stated that the property had a daily capacity of 700 tons, and that efforts would be made to rebuild at once.

**Duquoin**—Recent reports from the Kathleen mine, at Dowell, five miles south of here, indicate that a marked improvement has been shown in tonnage during the last two months. The local management of the plant is held by Superintendent Robert Medill, who recently succeeded Edward Bottomley. The development is shown by the daily tonnage which has jumped from 1,100 to around 1,800 tons. The mine will operate steady all the coming summer as the owners, the Union Colliery Co., have a ready use for the coal which will be used in St. Louis to furnish power for their numerous power plants.

The new washhouse and office building at the Kanawha Fuel Co's mine at this city was recently completely destroyed by fire. The fire which is said to have originated in the lockers of the wash house became uncontrollable before anything could be done toward saving the contents of the office. Besides the loss in the office, practically every miner working at the mine lost a complete set of clothing.

**Duquoin**—One of the largest and most disastrous fires in the mining history of southern Illinois occurred on March 30 when the tippie of the Jackson Coal Co., at Hallidayboro, six miles south of here, was burned to the ground. The fire was discovered about 12:45 a.m. and burned until long after daylight. The cause of the fire has not been determined. The mine has been in operation for over 25 years and was one of the oldest in this part of the state. The tippie, which was of wood, a large coal washer and rescreening plant, coal bins, which were used to coal railroad engines, the blacksmith and machine shops together with other buildings around the mine were completely destroyed. The only remaining structures around the plant are the engine and boiler rooms and the far house which is about one half mile away from the rest of the main surface plant. Plans were at once announced, by the officials of the company, for the erection of a new and modern steel tippie to replace the one which was destroyed and the inauguration of other improvements in and around the mine. The burning of this mine destroys what has recently become an old land mark throughout southern Illinois; at one time it ranked high among the big producers of coal. At the present time its capacity is in the neighborhood of 2,000 tons daily. The main offices of the company are at Chicago. The estimated loss of the fire is over \$150,000.

#### SOUTH DAKOTA

**Aberdeen**—Dr. S. M. Darling, of Washington, D. C., fuel engineer of the United States Bureau of Mines, was a business visitor in this city, conferring with the officers of a coal company, whose headquarters are in Aberdeen. He is a Government representative in North and South Dakota relative to the development of the lignite fields of the sister states by the Government. Dr. Darling stated in an interview: "The Bureau of Mines proposes to co-operate with one of the lignite coal mining companies of the West in extensive work in a large, specially devised carbonizing and briquetting plant, to clearly demonstrate to private capital the commercial practicability of carbonizing and briquetting lignite coal, and to make clear the handsome profits that can be made on capital invested in such an industry. It is planned to build at one of the larger coal mining centers, a carbonizing and briquetting plant to cost \$150,000 to carry on the demonstrations determined upon. The plan to be followed will be to briquette and carbonize lignite coal, each briquette to have a fuel value equal to the best anthracite coal and to be marketed for all purposes that anthracite coal is now used."

## Personals

**W. S. Wilker**, of St. Louis, has succeeded George A. Miller, former sales manager of the Peabody Coal Co., St. Louis, Mo.

**Jacob M. Holt**, formerly superintendent of the Kehley's Run colliery of the Madeira Hill Co. has been assigned to other duties on account of ill health.

**T. J. Lewis** has been appointed mining engineer of the anthracite operations of the Madeira Hill Co. at Frackville, Pa. His appointment became effective April 1.

**George Lovell** has been appointed superintendent at the Kehley's Run colliery of the Madeira Hill Co. The appointment took effect on April 1.

**Harry Smith**, superintendent of the Archibald colliery of the Delaware, Lackawanna & Western company, is transferred to the Bliss colliery of this company, near Scranton, Pa.

**Starr J. Murphy** has been elected a director of the Consolidation Coal Co. to succeed the late Jere H. Wheelwright, and **A. W. Calloway** was elected a director to succeed Carl R. Gray, resigned.

**Charles D. Barry**, of Fairmont, has been named as chief clerk of the West Virginia Division of the Consolidation Coal Co., succeeding Chester C. Shinn, promoted. Mr. Barry was the division shipping clerk.

**E. J. Buegler**, formerly consulting engineer of the Westinghouse, Church, Kerr Co., has been elected a vice president of the Foundation Co. and will be in charge of the engineering department of the company.

**Rosecoe Crozier**, of Bluefield, has been appointed field agent for the Lake & Export Corporation, of Huntington, and will be in charge of the Bluefield office of that company. He has been connected with the Pocahontas Fuel Co.

**A. E. Brachny**, assistant purchasing agent for the Lehigh Valley Coal Co., has resigned. He is going into business for himself in New York. His fellow employees presented him with a handsome travelling bag.

**Newton Bayless**, formerly of Harrisburg, Ill., has accepted the position as mine manager for the large Kathleen mine at Dowell, Ill. The vacancy was recently made by the resignation of William Stevenson, who has departed for England.

**Howard W. Ferrin**, formerly manager of anthracite sales of M. A. Hanna & Co., Commercial Trust Building, Philadelphia, Pa., has been elected vice president of the Susquehanna Collieries Co., controlled by the Hanna interests.

**E. T. Miller**, district superintendent of the Greenwood division of the Lehigh Coal & Navigation Co., in Schuylkill County, Pa., resigned on March 15 to take the position of chief engineer of the Woodward Coal & Iron Co. at Woodward, Ala.

**J. K. Voshell**, of Baltimore, Md., has been elected a member of the board of directors of the Davis Coal & Coke Co., Baltimore, at the annual meeting held on March 21. Mr. Voshell succeeds E. R. Stewart, recently resigned.

**Joseph Koerner**, formerly with the Illinois Sixth Vein Coal Co., has accepted the position as payroll clerk for the Equitable Coal & Coke Co., of Duquoin, Ill., operating two mines, one at Duquoin and the other at Johnston City.

**Joseph D. O'Brien**, formerly vice president and chief engineer of the Central Construction Corporation and before that for 15 years with the Westinghouse, Church, Kerr Co., has been appointed chief engineer of The Foundation Co.

**E. J. Jones**, formerly assistant to Mr. Nold the mining superintendent of the Lehigh Coal & Navigation Co., has been appointed district superintendent of the Greenwood district, in the Southern anthracite region of Pennsylvania. C. D. Robert formerly superintendent of strip-pings of the Lehigh Coal & Navigation Co., has been appointed district superintendent of the Bain district, in Schuylkill County.

**E. B. Reiman**, who has a coal and coke sales office in Pittsburgh, Pa., was the former representative of the U. S. Fuel Administration in the Pittsburgh section. He was also at one time the secretary of the Northwestern Pennsylvania Coal Operators' Association.

**David Lloyd**, who has been superintendent of the Audin colliery of the Delaware, Lackawanna & Western company, has been transferred to the Scranton district and will be in charge of the Archi-

bald, Hyde Park and other operations in the Northern anthracite field of Pennsylvania.

**Archibald Hamilton**, transit man in the St. Clair division of the Philadelphia & Reading Coal & Iron Co., at Pottsville, Pa., has resigned to take a position as traveling salesman with the Williamsport Leather Goods Co., Williamsport, Pa., manufacturers of leather belting.

**Wayne Carruthers**, superintendent of the Bliss colliery of the Delaware, Lackawanna and Western company, has been transferred to the same position in charge of the Auchincloss, Loomis and Avondale anthracite collieries in the Wyoming Valley of Pennsylvania.

**Chester C. Shinn**, of Fairmont, has been appointed chief clerk to Vice President Brooks Fleming, Jr., of the Consolidation Coal Co. Mr. Shinn was formerly chief clerk of the West Virginia division of the Consolidation company. Mr. Shinn has been in the service of the company for 22 years.

**John Blizard**, formerly of the mines branch of the Canadian Department of Mines, has recently been appointed as a fuel engineer at the Pittsburgh Station of the United States Bureau of Mines. Mr. Blizard has done a great amount of work on fuel testing, having published recently an elaborate report of the results of steaming tests conducted at the fuel testing station, Ottawa. This is report No. 496, of the Canadian Department of Mines. He has quite recently assumed his duties in the new position.

**Albert L. Gately**, for several years master mechanic at the Klein mine of the Republic Coal Co., near Roundup, Mont., has been appointed superintendent of the property to succeed **William Redshaw**. The announcement was made by **James H. Needham**, general manager. Mr. Gately has spent his entire life in the vicinity of and associated with the coal industry. Mr. Redshaw has left for Roek Springs, Wyo., where he will take charge of coal properties for the Megeath interests.

**John D. Rockefeller, Jr.**, retired as a member of the board of directors of the Colorado Fuel & Iron Co. when the annual stockholders' meeting chose John C. Mitchell, a Denver banker, to succeed him on the board. Mr. Rockefeller had served on the board for 17 years. In the letter in which Mr. Rockefeller requested that he be not elected he asked it in pursuance of his policy of retiring from the directorates of all concerns with which the Rockefeller interests are connected. The majority control of the stock of the corporation is retained by the Rockefeller interests.

## Obituary

**Colonel William W. Cae**, a prominent railroad official and coal operator, died at his home in Charleston, W. Va., recently aged 73 years. For a number of years he was chief engineer at the Shenandoah Valley R.R. and later became general manager of the Pocahontas Coal & Coke Co.

## Coming Meetings

**The Rocky Mountain Coal Mining Institute** will hold its annual meeting in Denver, Col., in conjunction with the National First-Aid Meet., on August 20 and 21. Secretary, **F. W. Whiteside**, Denver, Col.

**National Coal Association** will hold its annual meeting May 25, 26 and 27 at the Traymore Hotel, Atlantic City, N. J. Secretary, **W. B. Reed**, Commercial Bank Building, Washington, D. C.

**The American Association of Engineers** will hold its annual convention at the Planters Hotel, St. Louis, Mo., May 10 and 11. **C. E. Drayer**, secretary, Chicago, Ill.

**National Foreign Trade Convention** to be held in San Francisco, Cal., May 12, 13, 14 and 15.

**National Conference of Business Paper Editors** will hold its next meeting June 4 at the Congress Hotel, Chicago, Ill. Secretary, **R. Dawson Hall**, 35th St. and 10th Ave., New York City.

**M. O. I. Coal Association** will hold its annual convention June 16, 17 and 18 at Cedar Point, Ohio. Secretary, **B. F. Nigh**, Columbus, Ohio.

**National Retail Coal Merchants' Association** will hold its annual meeting June 10,

11 and 12 at Detroit, Mich. Secretary-manager, **Ellery Gordon**, Philadelphia, Pa.

**Kentucky Mining Institute** will hold its annual meeting June 4 and 5 at Lexington, Ky. Secretary, **C. W. Strickland**, Huntington, W. Va.

**American Society of Mechanical Engineers** will hold its Spring meeting May 24, 25, 26 and 27 at St. Louis, Mo. Secretary, **Calvin W. Rice**, 29 West 39th St., New York City.

**Chamber of Commerce of the United States of America** will hold its eighth annual meeting April 26, 27, 28 and 29 at Atlantic City, N. J. Assistant Secretary, **D. A. Skinner**, Washington, D. C.

**West Virginia Coal Mining Institute** will hold its annual meeting June 7 and 8, at White Sulphur Springs, W. Va. Secretary, **R. E. Sherwood**, Charleston, W. Va.

**American Wholesale Coal Association** will hold its annual meeting June 1 and 2 at Pittsburgh, Pa. Secretary, **G. H. Merryweather**, Washington, D. C.

**Retail Coal Dealers' Association** will hold its annual meeting April 19 and 20 at McAlester, Okla. Secretary, **C. R. Goldman**, Dallas, Tex.

**Southwestern Interstate Coal Operators' Association** will hold its annual meeting June 8 at Kansas City, Mo. Secretary, **W. L. A. Johnson**, Kansas City, Mo.

**Mine Inspectors' Institute of America**. Annual meeting July 13, 14 and 15 at Cleveland, Ohio. Secretary, **J. W. Paul**, Pittsburgh, Pa.

## Coal and Coke Patents

**Byproduct Condenser**. **Arthur Roberts**, Evanston, Ill., 1,333,631. March 16, 1920. Filed April 17, 1915; serial No. 22,146. Renewed Jan. 7, 1918; serial No. 210,772.

**Rail Bond**. **Edward M. Deems**, Forest Hills, N. Y., 1,333,904. March 16, 1920. Filed Jan. 8, 1919; serial No. 270,149.

**Mine-Shaft Safety Device**. **George M. Johnson**, McDonald, Pa., 1,333,921. March 16, 1920. Filed July 23, 1918; serial No. 246,367.

**Safety Device for Mine Cages**. **Slave Peskulich**, Butte, Mont., 1,334,116. March 16, 1920. Filed Aug. 7, 1919; serial No. 315,943.

**Treating of Lignite**. **Walter Runge**, Orange, N. J., assignor to International Coal Products Corporation, Richmond, Va., 1,334,170. March 16, 1920. Filed April 30, 1919; serial No. 293,829.

**Method of Manufacturing Briquets**. **Charles Howard Smith**, Short Hills, N. J., assignor to International Coal Products Corporation, Richmond, Va., 1,334,180. March 16, 1920. Filed Feb. 18, 1918; serial No. 217,758.

**Hoisting Apparatus**. **Henry Kenyon Eurch**, 1,334,220. March 16, 1920. Filed Nov. 8, 1916; serial No. 130,242.

**Apparatus for Mining Purposes**. **Edmund C. Morgan**, New York, N. Y., 1,333,627. March 16, 1920. Filed April 28, 1913; serial No. 763,962. Renewed Nov. 7, 1919; serial No. 336,470.

**Light-Coke Product and Method of Making Same**. **Hugh Rodman**, Edgewood, Pa., assignor to Rodman Chemical Co., East Pittsburgh, Pa., a corporation of Pennsylvania, 1,334,404. March 23, 1920. Filed June 22, 1915. Serial No. 35,592.

**Method of Utilizing Fuel**. **Hugh Rodman**, Edgewood, Pa., assignor to Rodman Chemical Co., East Pittsburgh, Pa., a corporation of Pennsylvania, 1,334,405. March 23, 1920. Filed June 22, 1915. Serial No. 35,594.

**Centrifugal Pump**. **Charles V. Kerr**, Aurora, Ill., assignor to the American Well Works, Aurora, Ill., a corporation of Illinois, 1,334,461. March 23, 1920. Filed Oct. 29, 1917. Serial No. 198,981.

**Pent Drier**. **William S. Jackson**, Toronto, Ont., Canada, 1,334,495. March 23, 1920. Filed May 6, 1918. Serial No. 232,833.

**Concentrating Apparatus**. **Emil Diester**, Fort Wayne, Ind., assignor to Diester Machine Co., Fort Wayne, Ind., a corporation of Indiana, 1,334,524. March 23, 1920. Filed April 21, 1917. Serial No. 163,609.

**Pipe Joint**. **William H. Flint**, Birmingham, Ala., 1,334,530. March 23, 1920. Filed Aug. 15, 1918. Serial No. 249,993.

**Carbide Lump**. **Thomas Thompson Howe**, Okla., 1,334,570. March 23, 1920. Filed May 13, 1918. Serial No. 234,154.

**Rail Joint.** John C. Elkins, Santa Rosa, Cal., 1,334,602. March 23, 1920. Filed Sept. 20, 1919. Serial No. 325,240.

**Air-Lift Pump.** Ralph H. Tucker, Los Angeles, Cal., assignor of one-third to Edgar S. Cameron and one-third to Charles M. Tucker, Los Angeles, Cal., 1,334,638. March 23, 1920. Filed Feb. 24, 1919. Serial No. 278,804.

## Industrial News

**Moundsville, W. Va.**—Twelve hundred acres of coal land in Green County, Pa., was purchased 13 years ago at \$300 per acre. This property was sold recently for \$1,000,000, or an average of \$833 1/3 an acre.

**Laurel Creek, W. Va.**—The Pen-Mar Realty Co. has acquired a total of about 175 acres of coal lands in the vicinity of Laurel Creek, and is arranging plans for the immediate development of the property.

**Habersham, Tenn.**—T. P. Witherspoon, of Knoxville, and G. G. Crowley, of Jellico, have completed negotiations for the purchase of mining properties at Habersham, and are arranging plans to increase the present capacity to a total of 300 tons daily.

**Blackey, Ky.**—The Woodburn Coal Co. is understood to be having plans prepared for the immediate construction of a new tipples at its plant for increased operations. Arrangements are also being made, it is understood, for the erection of about 30 dwellings for miners' service.

**Henryetta, Okla.**—The Creek Coal & Mining Co., of this place, is sinking a new shaft and installing equipment, at what is to be known as No. 2 Creek, between mine No. 1 and Victoria mine. An entry is being driven to meet mine No. 1 which has only about 80 ft. to go.

**Winchester, Ky.**—R. D. Baker, J. M. McLemore, and associates have acquired a large local coal and timber tract and will arrange for immediate development. Complete equipment for all features of operation will be installed.

**Pittsburgh, Pa.**—The Iron Trade Products Co., of this place, has been appointed exclusive sales agent for the Connellsville-Fairmont Coal Co.'s mines at Worthington, W. Va. The property is located on the Baltimore & Ohio R.R. and produces a steam coal.

**Welch, W. Va.**—Coal will be mined by the Vauclaire Coal Co., organized about the first of April by Welch business men, with a capitalization of \$25,000. Instrumental in organizing the company were: W. W. Hughes, I. J. Rhoades, L. A. Osborn and T. F. Henritze, all of Welch; R. R. Fairfax, of Roanoke, Va.

**Logan, W. Va.**—The general headquarters of the Lundale Coal Co. and of the Amherst Fuel Co. are to be moved from Huntington, W. Va., to Lundale, W. Va. George M. Jones is the president of each of the above companies. The Amherst Coal Co., of which H. R. Jones is president, is to move its general office from Huntington to Amherstdale.

**Morgantown, W. Va.**—Plans have been formulated by the Dellslow Coal Co., of this city, to mine coal in the Morgan district of Monongalia County, the capital stock of the new company being \$50,000. Leading figures in organizing the company were: Thomas J. Watring, J. M. Wood, F. E. Sapp, Nick Patt, Pietro Fantucci, all of Morgantown, W. Va.

**Philadelphia, Pa.**—Coal operators, shippers and carriers, at a meeting held here recently, appointed a committee of 15 to draw up rules and regulations, with a view of continuing the soft coal pools at the various Atlantic ports north of Baltimore after April 30. The present arrangement for the transshipments of the fuel expire by proclamation of President Wilson.

**Huntington, W. Va.**—The Lake & Export Coal Corporation, of this city, has just consummated a contract for the delivery of 960,000 tons of coal from the West Virginia fields to one of the large shipping concerns in the United States, the coal to be delivered during the present coal year, presumably at the rate of 80,000 tons of coal a month.

**St. Clairsville, O.**—The Goodyear Tire & Rubber Co. has completed negotiations for the purchase of the coal property of the Somers Coal Co., located in Harrison and Belmont counties, for a consideration of about \$385,587.96. It is understood that

the Goodyear company is planning for the opening of a new mine and the construction of a mining town in the vicinity of New Athens.

**Huntington, W. Va.**—Arrangements have been completed by the W. E. Deogans Coal Co., of this city, for the delivery to European markets within the next 12 months of 1,000,000 tons of coal. While heretofore the company has sold coal for the export trade, it has not undertaken delivery of such coal. In the present instance the company has chartered vessels and will make its own deliveries.

**Mt. Vernon, Ill.**—It is reported here that the Wabash, Chester & Western R.R. has been sold to Henry Dimond, a Franklin County coal operator. Mr. Dimond is said to have had an option on the road for \$500,000 and recently made a trip of inspection over it. The road runs from Mt. Vernon to Chester, 65 miles, and is an outlet for a considerable coal territory. The Dimond interests have recently bought several thousand acres of coal lands in the territory served by the road.

**Sheridan, Wyo.**—The Sheridan-Wyoming Coal Co., Inc., a subsidiary of the United States Distributing Corporation, has just completed a lease of (with an option to buy) all of the coal lands near this place, owned by the Kendrick-Irvine Corporation. United States Senator John B. Kendrick is president of the Kendrick-Irvine Corporation. The lands involved embrace approximately 1,420 acres bearing coal deposits operated through the Acme mine of the Sheridan-Wyoming Coal Co., Inc.

**Wheeling, W. Va.**—A coal deal involving considerably more than a million dollars was consummated here recently, when the Elm Grove Mining Co., in Ohio County, W. Va., became the owner of the Glendale mine of the Hitchman Coal & Coke Co., of Benwood, near Wheeling, and the Security mine, at St. Clairsville, of the Security Coal Co. The latter mine was owned by David Thomas and Judge John C. Nichols, both of St. Clairsville. The company making the purchase is said to be associated with the Valley Camp Coal Company, of Cleveland, Ohio.

**Williamson, W. Va.**—It is understood that the Norfolk & Western R. R. owns about 5,000 acres of coal land in addition to going mines, and will in the near future undertake the development of the acreage alluded to in order to increase its fuel supply. With the full development of this acreage owned by the railroad, through the operation of about ten mines, it will be possible for the Norfolk & Western to increase its fuel output about 1,500,000 tons per year. Mines now operated by this railroad are located at Mohawk, in the McDowell County; and Vulcan and Chattanooga, in Mingo County.

**McAlester, Okla.**—One of the results of the demands of coal miners for increased wages was the announcement by the Missouri, Kansas & Texas R.R. that practically all of its locomotives will be changed from coal to oil burners. In this change the Oklahoma mining industry, and also that of Texas, will lose a standing order of a tonnage that amounts to millions of dollars a year. This is a blow to the coal industry of Oklahoma, operators here say, as the railroad's order for coal was for every day in the year. Many mines, not yet recovered from the effects of the recent strike, will become stagnant, it is said.

**Thacker, W. Va.**—The Buffalo-Thacker Coal Co. is having plans prepared for extensive increased operations to develop an ultimate capacity of approximately 600,000 tons per year. The company holds a total of 1005 acres of coal properties as well as leases on 2580 acres in the Kanawha field, with six complete mining operations, including electric power plants for works service, miners' houses, townsites, and so on, located on the Norfolk & Western and Chesapeake & Ohio roads. It is proposed to issue bonds for \$550,000, the proceeds to be used for the proposed expansion. L. R. Reese is president.

**Beachley, Pa.**—The Beachley Coal Co., operating four mines at this place in Somerset County, has contracted for the building of 20 new, fireproof houses on the company's property. The work on these houses will start at once so that they will be ready for occupancy about the middle of summer or perhaps earlier. The dwellings will be of a size sufficient to comfortably house the miners. The company has recently secured the services of John Auld (formerly superintendent of the Thermal Smokeless Coal Co.), as superintendent of the Beachley mines and he will assist in pushing the work of the construc-

tion of the houses so that they may soon be ready for occupancy.

**Bluefield, W. Va.**—In opening a branch office in this city, the West Virginia Coal Co. has selected Arch S. Booker of this city as its local manager. The general office of the West Virginia company is at Richmond, Va., although the company maintains a large branch office at Huntington, W. Va. Mr. Booker was at one time associated with the firm of Castner & Curran.

**Huntington, W. Va.**—The West Virginia & Kentucky Coal Co., of Letcher County, Ky., the Acup Creek Coal Co., of Perry County, Ky., and the H. J. Jones & Sons Coal Co., of Jonesville, Ky., have been sold to the Consolidated Fuel Co., of Pittsburgh, Pa. The purchase price for the properties, it is understood, was \$525,000, the deal having been consummated on April 1 by H. P. Jones, of Huntington. The purchasing company is headed by Isaac J. Jenkins of Pittsburgh. The Consolidated operations will be under the direction of Charles A. Miller, of Pittsburgh, as general manager. In addition to the above, James R. Jones is to be assistant general manager; Harry P. Jones, Jr., auditor, and William A. Phillips, manager of stores. The total acreage owned by the companies which were sold, aggregated 5,200 acres, all of which are now under development.

**Baltimore, Md.**—Action has been taken by the board of directors of the Pittsburgh & West Virginia Ry. (the stocks of which are largely held in Baltimore), looking to the separation of the West Side Belt R.R. from the Pittsburgh Terminal R.R. & Coal Co., which controls and operates bituminous properties. This merger of the West Side Belt R.R. with the Pittsburgh & West Virginia Ry. Co. will put all the railroad properties and operations under one corporate organization. The question of merging these properties will come before the stockholders at their annual meeting in May. The planned rearrangement of the Pittsburgh & West Virginia properties will put all the railways in one company, which will in turn own the coal properties through ownership of all the capital stock and consolidated mortgage bonds of the coal company. It is understood that the action now taken is preliminary to a further step to separate the railway from the coal properties.

**Charleston, W. Va.**—With the awarding of a contract for the building of the Greenbrier & Eastern R. R. (10 1/2 miles in length) from Rainelle, along Meadow Creek, penetrating the coal lands of Greenbrier County, an impetus will be given the development of large tracts of coal land. In a number of instances companies have not waited for the construction of the railroad before beginning development work, having already started the driving of entries. The new railroad will open up for development about 10,000 acres of coal land, eight companies having much of that acreage under lease. Eventually the new railroad will be 50 miles in length and will penetrate a coal area containing about 175,000 acres of smokeless coal, much of which contains the Sewell, Fire Creek, Beckley and Pocahontas No. 3 seams. Construction work on the first ten miles of the railroad will be completed by Dec. 1, 1920, and by Jan. 1, 1921, several companies expect to be in a position to begin the shipment of coal.

**Great Falls, Mont.**—Rapid development of the coal properties it owns in Spring Creek is planned by the Anaconda Copper Mining Co. As soon as the railroad situation will permit of extensions being made, the company will ask the Great Northern Railroad to build a track of some six miles from the road to the Spring Creek Mines. The new operation will be about 4 1/2 miles from the present Tracy mines, but the branch which will reach the Spring Creek property will be a different one from the line which goes to Tracy, Sand Coulee and Stockett. The coal of the new property is said to be substantially the same in quality and the seam is about the same in thickness, as the one which has been so successfully worked by the company at Tracy and Sand Coulee. It is not expected that the mine will be opened to any great extent for several months, as it is thought probable that it will take 18 months to bring the railroad to the proper development to handle the output of the mine. The Spring Creek properties are made up of the acreage secured by purchase several months ago by Dan Tracy, who acted as the agent for the company. They embrace something like 1,400 acres. F. W. C. Whyte is in charge of the coal properties of the company as general manager, and John Gillie is superintendent of mines. The general office is at Butte, Mont.

# MARKET DEPARTMENT

## Weekly Review

*Strike of "Outlaw" Railway Employees Interrupts Coal Industry—Midwest Operators Forced to Shut Down—Tidewater Exchange to Be Continued After May 1 as Voluntary Organization.*

**B**ECAUSE of the "outlaw" strike of switchmen and other railway employees, shipments from the mines to tidewater were greatly interfered with, and though output continued to improve the product could not be moved to market.

During the early part of the strike embargoes were ordered by some of the coal-carrying roads in the Mid-west, but now the strike has spread virtually throughout the East. Coal-mine operators in Illinois and Indiana feared the possibility of being forced to shut down because of lack of cars. The shortage of cars became even more acute than in the preceding week, and in southern Illinois some mines have been closed since April 9. On that day 94 mines in Indiana, with a total daily production of close to 100,000 tons, closed, which caused nine furnaces at Gary, Ind., to go out of blast because their fuel supply was cut off.

For other reasons cars were in short supply in other sections of the country. In New England, for instance, some of the roads found themselves lacking motive power. Locomotives which were borrowed from one railroad for use on another had to be returned

after the discontinuance of Government control, and these railroads will be unable to procure new locomotives from the manufacturers for some time to come.

Bunkering hampered by the permit system found itself beset with many other difficulties. Not only were shipments from the mines held back by the inadequate service of the railroads but also by reason of the strike of marine engineers and pilots. The ports on the Atlantic Coast are only moderately supplied with fuel.

Threats—direct and implied—from Washington that a campaign is to be waged against fuel-price extortioners is apparently not being heeded by some coal concerns as is evidenced by the fact that the prices of certain coals which under Government control had been selling for \$2.95 have reached \$8, as was the case with West Virginia splints, a high-grade gas coal.

There is still a considerable difference of opinion in all districts regarding the actual effect of increased costs on prices. In the Pittsburgh district there has been a marked shortage of slack due to the increased call for mine-run for railroad and other steam purposes.

This is a temporary condition, however, which will be corrected as soon as normal supplies for steam purposes have been received and Lake shipments of screen coal have begun.

Central Pennsylvania prices have been running from \$3.50@4.75 at the mines, Pool 10 running about \$4, Pools 1 and 9, \$4.10@4.50, while the poorer grades have in some instances been contracted for at \$3.50.

In the export market a few orders of low sulphur gas coal have been placed for April shipment as high as \$7 at the mines, but these are exceptional cases. The average price for April, May and June shipments through 33 and 37, has been \$4.70 at the mines with mine-run 20c. less. Very little central Pennsylvania smokeless has been exported, mine prices being \$5.35@5.40.

The continuance of the Tidewater Coal Exchange as an incorporated body after May 1, with the continuance of the present pool numbers and the gradual reclassification of certain mines, in co-operation with the advisory committee of the railroads, will tend to stabilize the market and make possible firm quotations at established rates within the next few weeks.

### WEEKLY PRODUCTION

The weekly report on the production of bituminous coal, anthracite, and beehive coke, compiled by the Geological Survey Department of the Interior, April 10, 1920, states that the year 1920 proved no exception to the rule that production falls off during the first week of the new coal year. As far back as the weekly production records extend the transition from the old to the new coal year has been registered by a downward jog in the production curve. The depression this year was less marked than usual, however, and for the first time since January the 1920 production has passed all three of its predecessors.

Preliminary estimates place the output of soft coal during the week ended April 3 at 9,858,000 net tons, a decrease of 11.5 per cent when compared with the preceding week. The cause of the decrease was twofold. The normal break at the beginning of the new coal year was this year reinforced, as in 1917 and 1918 also, by the observance of Good Friday and other holidays.

The total production of bituminous coal during the coal year just ended is estimated at 487,000,000 tons, as compared with 504,100,000 tons in the pre-war year 1916-1917. The decrease was, of course, caused by the great strike of last November. Production since Jan. 1, 1920, however, compares favorably with the record of even the war years. It now amounts

to 140,600,000 tons and is 29,400,000 tons ahead of 1919; 900,000 tons ahead of 1918, and within 1,850,000 tons of the record of 1917.

The production of Pennsylvania anthracite during the week ended April 3 fell off sharply. Shipments by the nine principal carriers—in part estimated—were 24,786 cars, indicating a total production of 1,273,000 net tons. This was a decrease, when compared with the preceding week, of 596,000 tons, or 32 per cent. The decline is attributed to the observance of Good Friday and other holidays of the Easter season.

Preliminary estimates place the production of anthracite during the coal year just closed at 89,434,000 net tons. The output in recent years has been as follows (in net tons): Coal year April 1 to March 31—1916-1917, 87,947,000; 1917-1918, 100,372,000; 1918-1919, 92,402,000; 1919-1920, 89,434,000.

Although much smaller than its two immediate predecessors, the output for 1919-20 was thus greater than that for 1916-17.

The production of beehive coke declined slightly during the week ended April 3. The total output is estimated from railroad shipments as 493,000 net tons, a decrease when compared with the preceding week of 8,000 tons, or 1.6 per cent. All districts except West Virginia reported a decrease. Production in the Connellsville region, as reported by the Connellsville Courier, declined from 254,552 to 248,005 tons.

The cause of the decrease is believed

to be the observance of Good Friday. At many plants the absence of workers was more important in curtailing production than car shortage.

For the third week in succession the current production was greater than that for the corresponding period a year ago, 493,000 tons during the week of April 3, 1920, as compared with 350,000 tons in 1919. The cumulative output since Jan. 1, 1920, is thus rapidly overtaking the lead of last year. It now amounts to 5,987,000 tons, or only 249,000 tons behind the record of the corresponding period in 1919.

### Atlantic Seaboard

#### BOSTON

Rail movement still hampered by embargoes.—Lack of motive power a factor in New England.—Prices strong but conservative operators try to prevent high figures.—Tidewater Coal Exchange to continue.—Hampton Roads despatch continues poor.—Pressure to get anthracite forward.—Outcome of negotiations in doubt.

Bituminous—Since March 25 practically all of New England has been bottled up by embargoes. In April, the New York City embargo against shipments via West Albany was modified, but at this writing deliveries for Boston & Maine R. R. destinations are still under the ban. The ac-

accumulation of freight cars at or en route to the Boston & Maine gateways had been diminished only one-half in two weeks and it is easy to see that with the coal season starting out in this fashion the outlook for the next 60 days is none too favorable.

Car supply is improving in most parts of Central Pennsylvania and if soon these New England embargoes can be raised there will be much better volume than was really looked for a month ago. Local labor troubles are gradually being smoothed over as the mine-workers come to understand the bearing of the recent wage settlement.

An important element in the Northeast is the poor shape in which some of the roads find themselves on motive power, 450 cars daily, all kinds of freight, are about all the Boston & Maine is able to take away from the New York City under present conditions and it is doubtful if this can be materially increased until more engines can be had. Certain locomotives borrowed from the New Haven during Government operation have now been returned, and certainly the New Haven needs all the power it can get if it is to serve industries on its line. The harbor strike in New York has had the effect of shutting off shipments via Harlem River, thereby closing that important gateway. For most of the past fortnight therefore there has been but one all-rail avenue open, that via Maybrook, and even there much congestion is in evidence.

Meanwhile, those steam-users dependent upon the all-rail channel are fast depleting their reserves. Steam anthracite taken during March has served to extend stocks of bituminous measurably, but there will be an acute situation if receipts continue light another three or four weeks. For a time, Hampton Roads shipments, in a sense, came to the rescue, but delays at the Virginia terminals have made such shipments of rather doubtful dependence. Demurrage has raised the delivered cost to such high levels that buyers, many of them, prefer to take their chance of getting coal all-rail.

The rush for rail coals of acceptable grade continues insistent; both New York and Philadelphia agencies are beset with New England would-be purchasers and it is a matter for serious thought what will be the outcome. The railroads, themselves, are distressed about the difficulty of securing contracts and it is persistently rumored that the old custom of assigned cars will be reinstated. Operators say they will sell railroad fuel at "the market," but prices on their present range are not attractive to railroad purchasing agents.

Quotations continue very firm. The more reasonable operators are trying hard to prevent anything like a runaway market. It is realized this is a political year and that on very small provocation some kind of drastic control could be exercised. The result is that several producers have set for themselves a top price both for contract and for spot sales and the many smaller shippers are being counselled not to attempt pyramiding on coal.

It is understood that the Tidewater Coal Exchange will be continued as a voluntary association of shippers, the expense to be shared by the railroads. Railroad management is by no means a unit on the advantages of such an arrangement, but enough factors have agreed to a program to warrant putting the plan into operation at all the piers except at Hampton Roads.

The New York piers are only comfortably supplied with coal, mostly for bunkering and New York requirements. Port Reading piers are embargoed temporarily because of the harbor strike, only a comparatively few barges and floats having been delivered alongside the dumping facilities.

On Pocahontas and New River the Hampton Roads situation has improved very little. Several bottoms destined for New England have earned from \$1 @ \$2 demurrage and delivered prices have had to be marked up. Car supply is improving and movement is more regular, but it will take several days to catch up and restore normal loading. Contracts are being taken for Pocahontas agencies on the basis of \$4 per net ton f.o.b. mines, plus charges.

Quotations at wholesale, for spot shipment, range about as follows, at the points indicated:

	Cambras and Somersets	Clearfields
F. o. b. mines, net tons.....	\$4.25 @ \$4.85	\$3.75 @ \$4.50
F. o. b. Phila., gross tons....	6.60 @ 7.25	6.05 @ 6.85
F. o. b. New York, grs. tons	7.00 @ 7.60	6.40 @ 7.20
Deliv'd alongside Boston..	9.00 @ 9.85	8.55 @ 9.45
All-rail, delivered at Lawrence, Mass..	8.90 @ 9.55	8.32 @ 9.16

Pocahontas and New River are quoted at \$6.54@6.90 f.o.b. Hampton Roads, and at \$9.40@9.85 delivered alongside Boston. On cars Pocahontas has been sold as high as \$11.50, demurrage included.

**Anthracite**—Unremitting pressure is exerted to get forward domestic sizes. The dealers have very light stocks and the public is buying as freely as allowed. Retail prices have been generally advanced, due partly to increased rates on water coal and partly to new wage scales for teamsters and coal handlers. There is much criticism, and investigations are both rumored and in progress, but the retailers can show mounting costs that justify the prices made.

The trade is keenly interested in developments between mine-workers and operators. There have been rumors that an agreement would be reached April 15, but it is only clear that the mine-workers want to be restored to the pre-war differential they enjoyed over the bituminous miners.

NEW YORK

**Anthracite continues short at tidewater with demand strong.**—Line dealers receiving prompt shipments.—The West is in need of fuel and dealers send many inquiries to local dealers.—Situation in New England reported as serious.—Bituminous deliveries affected by so-called "outlaw" strike.—Railroads place embargoes on shipments.—Producers expect several months of active business.

**Anthracite**—The efforts of buyers to place orders has resulted in some spirited bidding for coal at the mines, and the result has been that some high prices have been heard of. All the companies and many of the independent producers, especially the largest adhere closely to the regular schedule but it is reported that some of the smaller operators are receiving around \$9 for the domestic sizes.

Production is reported as being well maintained but receipts at tidewater are far from normal. Dealers, dependent upon deliveries here, say that coal is arriving slower than for many weeks back. They claim that line shipments are being kept up in better shape.

There is a decided lack of coal as far West as Minnesota and many inquiries are being received here for prices and prospects for early deliveries. Similar inquiries are being received from the Canadian trade. Wholesale dealers are sending the information wanted but are not making any promises of quick shipments.

Most shippers look for a shortage of cars this summer which with the expected constant heavy demand for the domestic coals makes the outlook anything but rosy for the consumer. Another factor in the situation will be the increase in the use of anthracite by the railroads covering the hard-coal fields. This is made necessary by the continued shortage of bituminous. Some railroads have already issued a circular letter to their engineers and firemen calling attention to the lack of bituminous and requesting them to use anthracite more freely by increasing the quantity in the mixture with bituminous. The trade looks for a change in conditions as soon as a new working agreement between the operators and miners is reached.

New England continues to be badly in need of coal and considerable is being sent to the dealers in those states. In the Metropolitan district the demand continues heavy while supplies are short. Retail dealers complain of slow deliveries and predict an active summer season. Their books are filled with unfilled orders, some dealers telling their customers they may receive their coal about the middle of May or July 1.

The call for the steam coals is easier. There has not been so active a market and quotations are slightly easier. Buckwheat has been quoted during the week from \$3.65@\$4., grade and quality entering into conditions. Rice and barley are easy but there is no surplus coal lying about.

Current quotations for company coal per gross ton at mine and f.o.b. tidewater, at the lower parts are as follows:

	Mine	Tidewater
Broken.....	\$5.95	\$7.80
Egg.....	6.35	8.20
Stove.....	6.60	6.45
Chestnut.....	6.70	8.55
Pea.....	5.30	7.05
Buckwheat.....	3.40@3.75	5.15@5.50
Rice.....	2.75@3.25	4.50@5.00
Barley.....	2.25@2.50	4.00@4.25
Boiler.....	2.50	4.25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

**Bituminous**—While the trade has been upset because of the lack of coal and the uncertainty confronting the market, dealers are optimistic and expect steadier conditions as soon as all of the mining regulations have come to some agreement regarding working conditions.

The so-called "outlaw" strike of switchmen and other railroad workmen has resulted in a set-back for the market. Embargoes were ordered by some of the coal-carrying roads in the bituminous fields the first day of the trouble in the East and it was expected that similar action would be taken by other companies. The continuance of the coastwise strike has cut a big gap in the bunker tonnage, but it is now expected that with the trouble petering out, conditions will soon become normal as far as this port is involved, unless the strike of the switchmen affords encouragement to the striking unions to prolong the conflict.

Producers look for several months of active business. Supplies are short, most large consumers having been forced to use their reserve stocks during the past few weeks. With weather conditions becoming reasonable there will be a reduction in consumption with an increase in stocks, enabling a quicker distribution of coal.

Buyers are finding it harder to pick up free coal. On account of the poor car supply and the resultant cut in production available coal is becoming scarcer. Contract coals continue to be mined freely.

The demand has been such that many operators and shippers are booked ahead for some time to come. The making of contracts has about been completed with running from about \$3.50@4.50 for the good grades. Gas coal is in good demand and short. Producers and shippers are not making promises as to deliveries and quotations range from \$4.50@5 for good Pittsburgh coal. Quotations on the various grades range from \$3.75 to \$5.00 according to quality.

PHILADELPHIA

**Anthracite trade stirred by return of cold weather.**—Dealers have small tonnage on hand except pea.—Price question still undecided by some shippers.—Wage-scale adoption hoped for soon.—Steam coals still taken.—Bituminous deliveries do not increase.—Active spot market.—Price climb slightly halted.

**Anthracite**—There has been a week of unusually cold weather prevailing in this district and the result has been a heavy call upon the dealers for immediate deliveries in small lots to tide their customers over to warmer weather. For four days in succession the temperature dropped below freezing and this with windy days has caused the consumption of much coal. Outside of pea there has been very little coal to deliver, as the tonnage of large sizes arriving in the city has been extremely light.

The stocks of pea coal are fast dwindling and at the present rate there will soon be little of this size left in the yards. Due to the lack of the larger sizes the dealers are in position to make deliveries of pea in good volume to such of their customers who want to put it for the next winter.

Despite the action of the larger companies in making their sales to date at the old schedule, the dealers are in some instances badly upset, especially those getting a large proportion of their supplies from certain individual shippers. These latter concerns are delivering their coal on the retroactive basis as to price and as a consequence those dealers receiving this coal are put to a great deal of annoyance. Usually they deliver the coal to their choice trade with the understanding that no bill will be sent until they know definitely what the coal is to cost them.

As yet there are no signs of a greatly-increased tonnage from the mines. While the car supply is all that could be desired, still the men are slow to take up their work after the holiday season, which is usual at this time of the year. Taking advantage of this situation many of the breakers in the region are undergoing repair now, and running as they have for an entire year almost without stoppage, it becomes necessary to make an overhauling. This also has cut into the tonnage.

The dealers have all ceased to advertise for business, the only announcements recently being those from the more progressive concerns endeavoring to explain to the public the present conditions and their inability to make deliveries of all summer orders as soon as placed. As a matter of fact all dealers have adopted the practice of delivering small tonnages where coal is urgently needed for immediate use, and apportioning the balance of their tonnage on the summer orders in the same rotation as adopted last year.

The demand for steam sizes goes merrily on. All sizes are in strong demand and it seems to be the desire of all users to lay aside as heavy a tonnage as possible before the prices become increased following the adoption of a new wage schedule. There are practically no contracts in effect on the steam sizes and the consumer considers any excess stock that he may get now as just so much of a bargain.

**Bituminous**—At this time there seems some indication of a checking in the high price tendency of the market. Spot coal, of course, remains quite high, but the upward movement has not continued at the pace of the last week. It is believed a good bit of this effect is due to the stand taken by the larger shippers to keep the market from becoming a runaway, with the resultant adverse criticism following the release of Government control. Many buyers also refused to take on additional tonnage at the top prices, quite a few going almost to the point of suspension in their refusal to pay limit figures.

We do not think the tonnage of coal coming into the market has appreciably increased, but there are no plants that are suffering for the lack of fuel. The scarcest coal this time is high volatile, particularly the Fairmont coals. The steel mills are short of gas coals and have come into the market and are taking many grades that ordinarily they could not use on account of high sulphur content, but in their stress for fuel they are overlooking this factor. Added to this, the railways, always large users of high volatile fuel, are sharing with the manufacturers the limited production. As a result of this the spot market on Fairmont coal is running from \$4.95 to \$5.40 and this class of coal for the time holds the unusual distinction of being higher in price than many of the high grade Penn. steam coals. On ordinary high volatile Penn. coals similar to Greensburg, the prices quoted have run \$4.40 @ \$4.65, while good qualities of steam coal such as Pools 10 and 11 have been quoted \$4.65 @ \$5.

Contracting has almost ceased. On the part of the sellers it would seem they have come to the conclusion that they were too quick to close as much tonnage as they did at the contract prices running at \$3.50 @ \$4, with the bulk nearer the latter price. In the face of the good prices realized in the spot market very few are willing to consider contracts, yet it is a mutual feeling, for the consumer who is not under contract is inclined to take his chance with coal at the market for a while, with the idea of being able to contract to a better advantage later in the season. Even with those concerns who have contracts there is an inclination to complain of the light shipments being received by them.

#### BALTIMORE

Great inducements for export shipping have sent a flood of coal to tide beyond capacity of quick handling and piers are embargoed.—Line conditions easier despite poor car supply reported.—Market remains excited.—Hard-coal men in state of uncertainty.

**Bituminous**—The great inducements offered for export movement both as to price and methods of payment have sent a flood of coal to the piers here beyond the capacity of absorption of vessel supply with permits to send out coal on foreign account. The close of the week found 2,311 cars at Curtis Bay alone, with 1,789 more running on the Baltimore & Ohio and Western Maryland for Curtis Bay, while the dumpings were running only 250 to 275 cars a day.

The general car supply on the Baltimore & Ohio system, which started the week at from 65 to 70 per cent dwindled to around 35 per cent, with less than 45 per cent on the Eastern end of the system. The accumulation at tide came despite a loading for export cargo of coal of more than 50,000 tons for the week, and the situation at the end of the week was such that a temporary embargo was placed on further shipment to the pier here. The line situation here is improved as to supply, although some consumers are still more or less feverish in the market for immediate coal, and the entire trading remains excited.

The car supply on the Western Maryland has run good the past week and the coal thus received has done much to relieve the tenseness of the situation. The situation seems to be that plenty of coal is coming in at high price, but the somewhat easier market has so far not broken spot prices, coals of good grade demanding all the way from \$4.60 @ \$5.50 for bituminous steam varieties, and around \$4.50 @ \$5.25 for gas

As predicted in these letters there is a tendency to shade down prices from first contracting figures. Contracting is not even now general, but some closings are being made all the way from \$3 @ \$4.50 for from fair to best coals. There is a wide range, however, even for coals of the same grade, and no schedule of prices can be set within a reasonable range of surety.

**Anthracite**—The hard-coal situation still hangs over awaiting final action along wholesale lines. Very little coal of any size is now coming through. This makes it necessary for cautious acceptance of orders for delivery at any other price than that to be fixed at the time of delivery.

Up to April 1 there was some acceptance of orders on the basis of existing prices irrespective of the time of delivery of the fuel, but the light receipts and the fact that yards here are but meagrely supplied in most cases caused a general change in the method of dealing.

### Eastern-Inland

#### PITTSBURGH

Wage matters practically settled.—Leading operators favor holding prices down.—Gas coal brings high prices.—Prices to vary with quality.

At this writing the operators and miners of the Pittsburgh district have not reached a complete agreement on wages and conditions but there is every prospect that a full agreement will be reached very shortly.

All wage rates are agreed upon, on the basis of a general 27 per cent advance from the war time scale, the disagreement being only upon rents. The miners contend that there should be no rent advances at all, while the operators wish to advance rents, and at the same stating that there are repairs and improvements to be made, which should be taken into consideration.

Taking account of both pick-and-machine mining in the proportions in which they obtain in the Pittsburgh district, it is computed that the 27 per cent advance over the original scale means about 40c. per ton in direct labor cost, not counting advances to foremen, clerks and various minor officials, the labor cost having averaged about \$1.40 under the old scale. Attention is directed to the fact that the cost of day labor per ton of coal mined has increased in the past few years in considerably greater ratio than that by which the tonnage rate has gone up, by reason of day men working less assiduously, and for other reasons.

There are rumors that leading operators of the district, with some co-operation on the part of operators in nearby districts, are endeavoring to formulate plans where-by coal prices can be held down to a moderate level, the idea that this should be done originating with banking interests. The market itself has not yet become clearly defined. It is reported that contracts for the twelvemonth have been made at \$3.25, \$3.50 and perhaps slightly higher figures for steam coal, while there are reports of some gas coal contracts made at much higher figures, up to \$4 and in one case, for a period of a few months, at \$5 or thereabouts. The Pittsburgh Coal Co. is seriously considering what would be a great departure from previous practice in the Pittsburgh district market, involving the establishment of a differential between its Panhandle and its up-river coal.

Throughout the market there is seen a decided tendency to make price distinctions according to quality, distinctions which, operators say, ought to have been established long ago. As for prompt coal, it has brought a wide range of prices according to circumstances. Operators assert that considerable tonnages have been sold at less than \$4 but buyers of \$4.50 and even higher zation can be made as to the market now, prices not being clearly defined, as follows: Contract steam, \$3.25 @ \$3.50; contract gas, \$3.75 @ \$4; prompt coal, \$4 @ \$4.50, per net ton at mine, Pittsburgh district.

#### COLUMBUS

Question of price is still unsettled, although some regularity in quotations has appeared.—Some of the jobbers are still asking higher prices.—Active bidding for the available supply of coal.—Car shortage still hampers production.

With the lifting of Federal restriction on price, some confusion appeared in the coal trade in Ohio. Operators and jobbers were at a loss to estimate the new price list and accounting departments were put on figuring up the increased costs of production.

Some of the companies have not yet finished this work, so the price question is still up in the air to a certain extent. But a number of prices were quoted, showing a wide range.

As most of the larger producers have their tonnage tied up for some time, they are not concerning themselves about quotations to any great extent. The usual prices prevailing in the Hocking Valley are \$3.65 @ \$3.80 for lump, \$3.40 @ \$3.60 for mine-run, and \$3.15 @ \$3.30 for nut, pea and slack. Pomeroy Bend prices are about the same as Hocking.

Eastern Ohio prices are slightly higher with lump selling in the neighborhood of \$3.85 @ \$4 and mine-run around \$3.50 @ \$3.75. West Virginia prices are higher than those prevailing in Ohio with splints around \$5 and possibly higher and Pocahontas about \$6 for lump and \$5.50 for mine-run.

Demand from all sources is extra good. Retailers are buying briskly as many of the householders are laying in their supply of fuel for the coming winter. Retail stocks are not heavy, especially in the northern and western parts of Ohio. Michigan dealers are also buying actively. Dealers are selling at a margin of about \$2 over the cost at the mines plus the freight charges. There is a good demand for Pocahontas and West Virginia splints, with the former rather scarce.

Demand for steam sizes is also strong in every locality. Manufacturing concerns are trying to secure some surplus stocks but have not been successful in that direction. Railroads are taking a fair tonnage, some of which is confiscated which reduces the tonnage shipped to commercial users.

There is a general movement for cities, public institutions and schools to secure their fuel supply early and that is visibly stiffening the market. Practically no steam contracts have been made as costs have not yet been figured to the satisfaction of producers.

Lake shippers are strong after tonnage but very few agreements are reported. Some coal is being loaded at Huron from eastern Ohio mines for shipment to Lake Michigan points, but the upper passages will not be opened for some time. May 10 is the date now set for resumption of Lake traffic in Lake Superior. Stocks in the Northwest have been largely used and the Lake season promises to be unusually active.

Car shortage on all Ohio coal-carrying roads still continues and consequently production is still held down to a rather low point. In the eastern Ohio field the output has been less than 40 per cent of capacity. Hocking operators had to be content with a 50 per cent or less supply and the same is true of Pomeroy Bend and Crooksville. Recent orders on the part of the Interstate Commerce Commission for the return of 325 coal cars daily from the Northwest are expected to help the situation in Ohio.

Retail prices per ton in Columbus are:

Hocking lump	7.50
Hocking mine-run	7.25
Pomeroy lump	7.50
Pomeroy mine-run	7.25
West Virginia splints, lump	8.50
West Virginia splints, mine-run	8.25
Pocahontas lump	10.50
Pocahontas mine-run	10.00

#### CINCINNATI

Retail coal prices were \$1 and \$1.50 a ton higher last week than they were the week before.—Variation in the increase depended on the dealer quoting and the kind of coal quoted on.—Advance followed giving up of government coal control.

Operators first announced increases and these immediately were passed on to the public by retailers here and in other cities. The worst is yet to come, however. Bituminous lump coal was selling at \$8.50 and \$9.00 delivered on the hilltops with prices about 25c. less for downtown deliveries. Quotations on smokeless coal were difficult to obtain because there is little smokeless available, and it is believed that smokeless coal probably will become more abundant now, because operators will be able with removal of government restrictions to fix a price on it for domestic American consumption.

Dealers are not tying themselves up with contract prices until they see how the situation shapes up, and now that government restrictions are the thing of the past, dealers believe that operators will sell to them more readily than for export trade, as a better price will be paid. Dealers are buying all the coal they can lay their hands on without binding themselves to contract. They believe it is a good time to buy under present price condition, as higher prices are a certainty.

April 15, 1920

The situation in this territory is easier, due largely to the return of mild weather. Some coal is being delivered by river and the railroads have delivered sufficient for the period here, although the big demand outside the territory has not yet been relieved. Although domestic demand is very slow, dealers say there is every indication that the public will do more spring and summer buying than during any previous year.

The car supply was satisfactory and ran as high as 70 per cent the first half of the week, but fell off a little toward the end. Operators here are hoping that continued warm weather will help the roads bring their motive power back to a point where it will be able to handle 50 per cent more traffic.

The familiar procession of buyers from outlying districts has begun and they are trying in every way to get contracts formulated and signed. Operators and distributors do not care to enter contract with them because of the uncertainties of the market.

## Southern

### LOUISVILLE

Prices rising rapidly as a result of continued car shortage, and high cost of low production.—Demand fading somewhat as result of high quotations.

Kentucky operators after shipping on existing contracts have very little surplus coal to offer as a result of a very low car supply, and prices are advancing rapidly on such supplies as are available. Demand is not quite so keen for domestic sizes, nor is steam being bought except for immediate demand. Railroads are buying emergency coal, and demand from gas and byproduct plants continues heavy.

Car supply for the month ending March 31, was the worst ever known in the state, or in most any section, the Louisville & Nashville system showing only a 46.85 per cent of car supply, out of which the Hazard district had but 40 per cent, and Cumberland Valley but 42 per cent supply, neither reaching the general average of the road.

Prices have jumped about \$2 a ton on eastern Kentucky grades as a result of the scarcity of all grades. Harlan operators are opposed to allowing block coal to go over \$4.50 a ton, claiming that it is not fair to the domestic consumer, but mine-run is selling at \$4.50 and up, and indications are that very little block will be produced for the time being. Reports are being received of Straight Creek quotations at \$5.25, and of some other eastern Kentucky grades at similar figures.

Quotations in the Harlan field are on a par with Hazard field quotations at the present time. Lump being quoted at prices ranging from \$4.50 to \$5 a ton; mine run, \$4@4.50; and nut and slack at \$3.50. Western Kentucky is asking \$3.25 for lump; \$2.85@3 for mine-run; \$2.50@2.60 for nut and slack, and \$2.25@2.40 for fine screenings. In some cases quotations are running above these figures and some operators are getting less. Although demand is not heavy, production is so light that what little coal is available can command a fancy price.

Operators claim that in event of a good car supply prices will drop fast, as competition will force prices down. A 75 per cent car supply would force lump coal down anywhere from one to two dollars a ton. Small mines and wagon mines are springing up fast again as a result of high prices and control having been lifted. That coal mining hasn't been profitable for months past has been shown in the absence of these small mines. However, they will still further scatter labor and car supply, and do no good.

Retail prices are out of sight, with eastern Kentucky lump at \$9.50@9.75; mine-run, \$8; nut and slack, \$7.50; western Kentucky \$7, \$6.50 and \$6. These prices are somewhat lower than prices which will be when retailers begin receiving \$5 per ton of coal, which will be sold on the \$2.75 margin for block and \$1.75 margin for steam, just the same as if low prices prevailed.

### BIRMINGHAM

Market remains strong, with inquiry very active and insistent.—Car shortage holds production to a figure very much below the news of the trade.—Heavy rains have also flooded mines and handicapped output to some extent.

All energies of operators and sales agencies are now being directed toward an increased coal production and an acceleration in the movement of coal to the consumers. There is no need for activity in the selling line, the demand being almost unprecedented for all grades. The problem is securing a supply to meet the trade requirements.

There has been little if any improvement in the amount of equipment furnished in the past week, the average supply of cars being about 60 per cent of the carrying capacity needed. There are no stocks in the bins of consumers, who have to depend on current receipts to keep their operation going and, as a consequence, there is a constant urging for more liberal shipments, which cannot be made without an improvement in the transportation facilities.

If the cars are furnished there is sufficient labor to produce the necessary coal. Railroads are very short on fuel and continue to confiscate or order mines to bill to them such of their output as is needed. Discrimination in the allotment of cars to mines on the Southern railway is charged, claim being made that contract mines and a subsidiary operation of the company are receiving a 100 per cent supply, other operations getting their pro rata share of the remaining equipment, and temporary injunctions have been obtained by two coal companies to restrain this practice.

Quotations have not yet become stable under the increased mine cost, due to 27 per cent increase awarded to mine workers and granted by operators effective April 1, ranging about as follows, per net ton mines for the month of April:

	Mine-Run	Prepared
Big Seam	2.95@3.25	3.45
Black Creek	4.00	4.45@4.50
Cahaba	4.00@4.35	4.35
Carbon Hill	3.35@3.50	3.50
Nickle Plate	3.35@3.50	

Domestic quotations range about as follows:

	Lump
Big Seam	3.25@3.50
Black Creek	5.00@5.50
Cahaba	4.50@6.00
Carbon Hill	3.50@3.75
Montevallo	7.00
Montevallo	
Straven	6.75
Corona	4.50

Production for the week ending March 27 totaled about 333,000 net tons as per figures tabulated by the Alabama Coal Operators' Association. Heavy, incessant rains and labor shortage affected production slightly.

## Lake Region

### BUFFALO

Not much farther change to bituminous.—Supply only fair. Speculation over the car supply.—Light mining lately. Coal movement unsteady.—No anthracite surplus.

**Bituminous**—The situation is about as it was last week, and the supply of coal also is much the same. Shippers will get a big consignment one day and then none for awhile. Every effort is being made to keep the ordinary run of the business, but with so many uncertain elements in it the task is a hard one.

The principal difficulty is lack of cars. They are about as scarce as they were, but the trade is afraid they will before long unset everything by becoming too plentiful, just as they have for so long by being scarce. A leading shipper said yesterday that the reports gave figures for a large output last month, so that the miners are ready to dig the coal if the cars will remove it. No new cars are building of account, but repairing is said to be general, so that a prompt delivery of coal mined would be quite possible at almost any time and then coal would soon be heaving for a market.

But it is all conjecture. So many elements of doubt come into the count. The Lakes are soon to open and then there is a hungry West to supply for a year in only eight months. The export lists are crowded with coal and that trade alone may take all the surplus. But for the terrible rates and prices it surely would, so all that the shipper can do now is to exercise great caution. He must mostly sell his coal before he buys it and he must know his customers. Sometimes a car is refused, for the apparent reason that a reduction is looked for. The jobber's margin is small and yet for the most part and he cannot afford to risk many losses. There are those who look for an early decline in prices and their guess is as good as anyone's.

A comparison of individual process at present evolves the following as the best average quotations: Allegheny Valley (all average-run at present), \$5.75@6; Pittsburgh and No. 8 lump and three-quarter, \$6.25@6.50; mine-run and slack, \$6@6.25; smokeless, \$6.50; Pennsylvania \$6.25; \$6.75 per net ton, f.o.b. Buffalo. These prices are exceedingly flexible and will be governed by the car supply mostly. At present the trade is affected by light

Easter mining and a switchmen's strike that may last sometime.

**Anthracite**—The receipts are held up at present by the switchmen's strike and no one knows. This increases the existing shortage so visibly that all the coal offices in the city are beset by a host of consumers. The telephones are such a burden that there are threats of suspending some of them. What the actual shortage is cannot be told, for many consumers are trying to lay in winter coal, while all that the dealers are trying to supply are those who are out of coal.

Nothing is said yet of prices, beyond the giving of promises that all prices are spot and there will be no back charges. The failure to fix the mining scale is costing the operators much money. Speculations as to what the new prices will be look to an increase of \$1.50 a ton or so. Just now a cold April requires much coal. The natural gas gives out at every cold snap, which is a great hardship to all consumers. For five days up to the present the temperature has not been above freezing, and this after the hardest winter on record.

The Lake trade is waiting for coal. There may be some bituminous to go when the ice is gone, but there is no anthracite in sight. The city would complain bitterly if any coal were shipped West with the local supply as short as it is. So the shippers do not even talk of Lake shipments, though they are usually loading briskly at this time. Still, with the report of severe shortage in mining last season it is remarkable that the severe winter, with less natural than for a long time, was gone through safely.

### CLEVELAND

Fair-sized contracting has been done in No. 8 mine-run and slack at \$3.25.—For No. 8 coal for the Lake trade \$3.50 has been done.—Retail dealers are paying \$1 for spot tonnages of No. 8 slack and mine-run.—Excepting anthracite, all prices have been marked up.—An increasing volume of No. 8 coal is moving to Lake Erie ports.

**Bituminous**—Definite contracting is known to have been done in No. 8 slack and the mine-run at \$3.25, f.o.b. mine. Two the district operators have named this No. 8 district quotation-making business with a figure in quotation-making consumer. Other northern Ohio steam coal consumer, operators, still holding off from contract operators, are reported in favor of pegging the ing, are reported in favor of pegging the market at \$3.25, an advance of 90c over the government maximum. Well-informed operators believe \$3.25 will rule for the spring and early summer at least. Whether it will hold for late summer and early fall, when production is near normal, is a question with some operators. Every effort is to be made to prevent a runaway market. That is the word being passed along "coal row" and an investigation of profits accruing from a \$3.25 price is welcome.

With No. 8 slack and mine-run at \$3.25 for lower Lake trade, the usual differential of 25c brings the Lake trade figure up to \$3.50. Some business is known to have been done at this price. On a basis of \$3.25 for the lower Lake trade, No. 8 3-in. coal will bring \$3.50 and 1 1/2-in. \$3.65. Most of the business being done by retail coal dealers in No. 8 slack and mine-run is at \$4. This is not contract business, but represents mostly spot sale. A break is looked for and dealers expect to pay not over \$3.50 within a month. This is 25c higher than operators say they will ask.

Dealers have with the exception of Cannel lump, which remains at \$11, delivered. West Virginia split, No. 8 Pittsburgh lump from \$8.30 to \$7.75. No. 8 Pittsburgh lump has been increased from \$7@7.50 to \$7.75. Coshocton lump, formerly \$7.35, now is placed under the No. 8 Pittsburgh lump classification and will take the \$7.75 price for the present. Massillon lump, now called Millfield lump, goes from \$7.40@7.65 to \$8.50. On steam coal the new price schedule still is indefinite because dealers average their sales at the close of the month. They say, however, they are paying \$4 for most of their No. 8 slack and mine-run. Adding \$1.40 freight and \$2.08 for margin (the margin allowed by the Fuel Administration) and the retail delivered price is brought up to \$7.48. No. 8 slack has been bringing \$6@6.25, and mine-run \$6.45@6.60. Probably No. 8 slack and mine-run will settle around \$7, delivered.

Demand for all steam-coal grades continues abnormal. The past week has been the worst of the year, so far as production is concerned, with the Easter holidays cutting working time to a minimum. Even so, car supply for the past week has been increased only a trifle. Labor is reported extremely short. Railroads are not well supplied, and much coal consigned to Lake Erie ports has been diverted to railroad use.

**DETROIT**

Competition of domestic consumers attempting to buy coal at the mines is credited with being a price-advancing factor.

**Bituminous**—Despite the attempts of reputable jobbers and producers to maintain a price equilibrium that will be in harmony with the increases in production costs, the bituminous market is in a more or less unsettled condition while prices display a rising tendency that is viewed with disapproval by men prominent in the local trade.

The unrestrained eagerness of many consumers of steam coal to stock up early is said to be the influence back of the rising prices. Buyers representing these consumers are reported to have gone into the producing districts, where they are bidding against each other for the limited supply that is to be had. The shortage of car supply and consequent restriction of production creates a situation that renders the market very susceptible to price-advancing influences.

Jobbers and wholesalers say it is not reasonable to criticize the operators who accept the highest price offered for their coal, but believe the consumers who have thus undertaken to interfere with the regular system of distribution are the ones at fault. Had these consumers placed their orders with jobbers, the latter, with a better knowledge of the trade, would have been able, they say, to obtain the coal, without creating a situation so unsettling to the market.

**Middle West**

**MIDWEST REVIEW**

Buying mania on the part of the public is continuing strong and will continue until the car supply is large enough to take care of the demand to some extent.—In Michigan, West Virginia operators who last year were glad to get from \$1.60@1.75 for their screenings, are now asking \$4.25.

Illinois and Indiana operators, in our opinion, are to be commended in the highest terms for the stand they have taken in regard to their April prices. These operators have set a flat price running from \$3 @ \$3.40 for their prepared coals, and are sticking closely to this price scale, when, as a matter of fact, the demand for coal is so great that they could get at least a dollar per ton more, should they desire to do so. In taking the stand mentioned above, these men are endeavoring to show the public that they are worthy of trust, and are not taking advantage of the temporary situation, to increase the price of coal beyond all reason. Operators in the East, especially in the West Virginia, Ohio, and Pennsylvania fields, could well afford to follow their example.

**CHICAGO**

Within a short time, Chicago, for the second or third time this year, will be on the ragged edge of a coal famine.—Cause of present predicament is the strike on the part of the switchmen.

While this outlay strike situation has hurt Chicago, it has helped other portions of the territory, as all coal shipments for Chicago are embargoed, and this means that operators with business in Chicago will have to apply their coal elsewhere in the state. The strike will have its sunny side in that it will give the retail dealers, as well as manufacturers in Illinois, outside of Chicago, an excellent opportunity to accumulate a little surplus.

Of course the demand for all kinds of coal for shipment to Chicago is keeping up very strongly, with one or two exceptions. When the local trade saw the prices which were being asked for certain grades of Eastern coal, and we have in mind particularly some Pocahontas and New River products, they realized at once that prices were so high that it would be impossible to market this coal in this city. Therefore, they made arrangements to handle other grades of coal, and as a result, the demand for Franklin County coal from Illinois, and the higher grades of coal from Indiana, are in constant demand, and will probably replace some of the Eastern fuels.

Prices of coal per ton are as follows

Illinois	Freight rate
Southern Illinois	Chicago
Franklin, Saline and Williamson Counties	
Prepared Sizes	\$3 15 @ \$3 40
Mine-Run	4 00 @ 3 10
Screenings	2 60 @ 2 75

Central Illinois	Freight rate
Springfield District <td>Chicago</td>	Chicago
Prepared Sizes	\$3 00 @ \$3 25
Mine-Run	2 75 @ 3 00
Screenings	2 50 @ 2 60
Northern Illinois	
Prepared Sizes	\$4 00 @ \$4 50
Mine-Run	3 50 @ 3 75
Screenings	3 00 @ 3 25
Indiana	
Clinton and Linton	
Fourth Vein	
Prepared Sizes	\$3 00 @ \$3 25
Mine-Run	2 75 @ 2 90
Screenings	2 50 @ 2 65
Knox County Field	
Fifth Vein	
Prepared Sizes	\$3 00 @ \$3 15
Mine-Run	2 75 @ 2 90
Screenings	2 50 @ 2 60
Brazil Block	\$4 25 @ \$4 50
Eastern coals	
Pocahontas and New River Coals	
Prepared Sizes	\$5 00 @ \$6 00
Mine-Run	4 00 @ 4 50
West Virginia Splint and Gas Coals	
Prepared Sizes	\$4 25 @ \$4 75
Mine-Run	3 75 @ 4 25
Southeastern Kentucky	
Hazard, Harlan and Big Sandy Fields	
Prepared Sizes	\$4 50 @ \$4 75
Mine-Run	3 75 @ 4 25
Smithing Coal	\$4 50 @ \$5 25

**ST. LOUIS**

An improvement in car supply the first time in many months.—Some little dissatisfaction among miners.—Switchmen's strike has demoralized conditions and everything is uncertain.—Demand has been good on everything, especially steam.

At some mines in the Standard district there was dissatisfaction to the extent that some of the miners refused to work and some of the mines were idle for a few days, but eventually it seemed to be settled. The drivers in many places were not contented with their arrangements and they were some other little coal differences that have been pretty well adjusted. Other than that the Standard field showed improvement.

Cars were more plentiful, some mines working five days straight and the tonnage was heavy, especially for railroads. The steam call has been good and there was a demand that the supply could not take care of, both in the city and outside. A heavy tonnage of coal has been moving north to the Chicago market from this field.

The same conditions apply to the Mt. Olive district, although the car supply has not been as good there as in the Standard field.

The Missouri Pacific is still up against it as far as fuel is concerned. It is beyond the understanding of anyone in this part of the country, either the railroad man or the coal man, why a road like the Missouri Pacific is always short of coal and obliged to confiscate several hundred cars a month, to keep its trains moving. Several operators in the field are refusing to sell coal to the Missouri Pacific and others are asking as high as \$3.15 for Cartersville mine-run.

Conditions in St. Louis are quiet. There is a little demand for domestic storage coal. Steam coal is good on account of the industrial activities. There is no anthracite coal coming in to speak of and no smokeless. There is no change in retail prices, and the wholesale prices are as follows:

Cartersville and Franklin County lump, egg and nut sizes	\$3 35 @ 3 40
Cartersville mine-run	3 00
Cartersville screenings	2 75
Mt. Olive lump, egg and nut for outside shipments	3 00
Mt. Olive lump, egg and nut for local shipments	2 75
Standard lump, egg and nut	2 75 @ 2 90
Mt. Olive mine-run and Standard mine-run	2 75 @ 2 85
Mt. Olive screenings and Standard screenings	2 50 @ 2 60

The price conditions here started off fairly well, but the Mt. Olive and Staunton Coal Co. broke up the Mt. Olive price of \$3 when they made their price for St. Louis customers \$2.75.

**MILWAUKEE**

Coal market continues active, owing to prevalence of cold weather.—All kinds of soft coal advanced 50c. per ton.—Anthracite unaffected.

The anticipated advance in coal prices materialized at Milwaukee since last week's report, the entire bituminous list being marked up 50c. per ton. Anthracite was not disturbed, however. The market is active, owing to the prevalence of raw, spring weather. Coal is scarce, because of bad transportation conditions, and dealers

are parcelling out the meager supply as judiciously as is possible. This condition must prevail until the opening of lake navigation and the consequent arrival of supplies in large quantities. All bituminous coal, domestic and steam, are 50c. higher per ton. Anthracite remains unchanged. Coke cost \$13.25 for large sizes and \$10.75 for smaller sizes.

**Pacific Coast**

**SEATTLE**

Quotations at the present time are as follows:

Seattle—\$6.75 per ton 2,000 lb., f.o.b. bunker tips.

Tacoma—\$6.75 per ton 2,000 lb., f.o.b. bunker tips.

Portland—\$8.75 per ton 2,000 lb., f.o.b. bunker tips.

Portland—\$9.50 per ton 2,000 lb., in the stream over the ship's rail.

The above rates apply to the standard grades of Black Diamond and South Prairie coal.

Quotations on British Columbia coal in Seattle Harbor are as follows:

Comox Lump—\$10 per ton of 2,240 lb., f.a.s.

Comox Marine Mixture \$9.85 per ton 2,240 lb., f.a.s.

**SAN FRANCISCO**

The increase in wages of miners, in accordance with report of President Wilson's commission, has had no effect on coal coming here from Utah and Wyoming.

Notification has been sent to dealers of the price remaining the same for April as for last month. As to the future, following April, the situation is a problem, but on account of the summer slump impending, opinion prevails there will be no increase, and if any, but slight. Coals from Utah and Wyoming, f.o.b., net ton, wholesale, stove and lump, \$3.65.

Some of the supply for the San Francisco market comes from New Mexico. One company has ordered increase in price to \$5. Dealers say this isolated raise will have tendency to reduce demand for this variety and increase demand for Utah and Wyoming, which virtually control the market.

**Coke**

**CONNELLSVILLE**

Prices substantially unchanged, with market quiet except in contract foundry coke.—Full car supplies would only slightly increase coke production.

Market prices are about the same as at the time of last week's report. There is very little activity in furnace coke, substantially all the available tonnage for April being applicable on regular contracts or being tied up on sales for the month. The market in general is quotable at \$11@12 for furnace coke and \$13@14 for foundry coke, per net ton at ovens. There are various exceptions, however.

The new wage scale for the region has not been published, but notices were posted some time ago that a general revision would be made on the 27 per cent basis settled upon for the union bituminous fields. The Courier reports production in the Connellyville and Lower Connellyville regions in the week ended April 3 at 248,005 tons, a decrease of 6,547 tons.

**BUFFALO**

Coke supply is still short and prices are high.

Jobbers get but little business, for sales are mostly on contract. Quotations are \$12 at the ovens for 72-hr. Connellyville foundry, and \$10 for 18-hr. furnace, to which add \$2.60 for freight for the Buffalo prices. Domestic-size coke is not moving to any extent at present. The Lake fleet is eager to resume the iron-ore trade, but the lee has not disappeared much lately. It promises to be a late opening.

**BIRMINGHAM**

Coke market here is very active and inquiry good, but there is very little foundry or furnace coke available above contract needs.

High-grade foundry coke is quoted at \$10 @ \$11 per net ton ovens, though the prices have not become stable and thoroughly adjusted to the increased cost of production account advance in wages at mines and coking plants. The output is curtailed to some extent by car shortage where coal has to be transported to the ovens in railroad cars.

# COAL AGE

New York, April 22, 1920

Volume 17 Number 17

## More Trouble for Coal

**N**O sooner do we begin to feel confident that the relief from Government interference with coal shipments and the problems of bad winter weather are well past, than the coal industry finds itself confronted with a new and perhaps equally serious situation through the unwarranted strike of railroad workers. Just where it will all end we would not venture to prophesy. We know the immediate result has been increasing difficulty in the movement of coal which cannot be entirely obviated for several weeks, even though the strike situation is promptly and completely cleared up. We are beginning to believe that Job had an easy time of it as compared with the traffic man dealing with the present season's coal problems.

**T**HERE is one element in this present coal situation, however, over which the producer has control, and that is the price. We trust that this present complication will not tempt the operators to increase prices beyond reason. The industry clearly owes it to itself to have the prices adequate to provide fair and generous returns upon invested capital. However, it is the equal responsibility of the industry to refrain from exacting excessive profit in time of emergencies or complication as thereby a permanent disadvantage to the industry results which really far outweighs the temporary financial profit. A run-a-way market is one of the things likely to be most disastrous and we trust that the present railroad crisis will not serve to aggravate the condition in this direction.

**A** PUBLIC clamor is easily roused and when the public mind is disturbed, the demands become loud and insistent. Moreover

the President still has legal authority to step in and regulate the affairs of the coal men. Certainly the spirit of our national as well as state and local legislators is not any too friendly to the coal industry just now.

**W**E are confident that the producer has in general not been the one primarily at fault in these matters. However the producer is the one most seriously affected if the brakes are not put upon these wild wheels of the industry at once. Fortunately the operators have the leverage whereby they can readily and immediately apply these brakes. However, if this adjustment is attempted in one single stroke, we can see only evil consequences in store. It is necessary that we should "keep our feet on the ground," and not be stampeded into a period of wild price fluctuation.

**A** SANE, rational movement of prices to a suitable normal level will aid all good substantial properties, but the sudden irrational jumps which seem to have prevailed thus far this month can cause only harm to these interests. The speculator will thrive and grow rich on a run-a-way market but not so the conservative producer or dealer.

**I**T is essential in view of the present situation that the producers not only be conservative in their own price adjustments but that they see to it that their customers are also in the proper spirit. If you can not hold the jobbers and wholesalers with whom you deal to a reasonable basis, it is up to you to tie up with someone else who will consider the permanent good of the industry and not seek to take undue advantage of the great public need for coal and of the shortage of coal in the market.

# IDEAS AND SUGGESTIONS

PRACTICAL SCHEMES THAT MAKE THE DAY'S WORK EASIER

## Self-Closing Gates

The Philadelphia & Reading Coal & Iron Co. has a custom of sending foremen and others holding supervisory positions upon trips from their mine to other operations of the company, whereby they may acquire ideas for changes in their own mine that will be conducive to efficiency, safety and convenience. Such ob-

THE GATE IN OPERATION AND DETAILS OF ITS SUPPORT

ervation tours also have a tendency to keep the men keyed up to the mark, for they are continually alert to secure and perfect new ideas that they may develop to their own and the company's advantage. As a result probably no other mines have so many special devices worked out as are to be seen at the operations of this company.

An excellent example of this enterprise is a self-closing gate devised by the blacksmith at the Silver Creek Colliery. The gate operates by gravity. Fastened to the ground is an iron shoe through the center of which is fastened permanently a post or guide, over which the center post of the gate fits. To the bottom of this post are fastened two rollers which fit and roll upon the shoe.

When the gate opens these rollers run up on the high part of the shoe, lifting the gate with them. When anyone passes through the gate and releases it the rollers naturally roll down hill again, automatically closing the gate.

## Water Gage in the Power House

A convenient method has been devised by the boiler-house foreman at No. 14 mine of the Pennsylvania Coal Co., near Wilkes-Barre, Pa., to show the level of the water in the supply tank. This tank is located about 1,000 ft. away from the boiler house, consequently it is rather inconvenient to traverse this distance in order to ascertain the condition of the water supply.

As a result the foreman tapped the water main and connected it to a 4-in. standpipe made sufficiently high to be above the top of the water tank. In this standpipe a float is placed to which is attached a string that passes over a pulley as shown in the accompanying diagram and is attached to an indicator that works on a scale. As the water rises and falls in the tank it also moves correspondingly in the standpipe and therefore actuates the indicator in a similar manner.

An indicator of this kind is cheap and easy to install. Placing it within the boiler room permits the man in charge to have a visual indication of the water conditions before him at all times.

To those familiar with power plant work the advantage of placing an indicator in such a position is readily apparent. It saves the man in charge innumerable steps since it is then unnecessary to make periodic trips to the tank or even go to the door of the boiler room and strain the eyes to read a distant indicator.

TANK GAGE AND ITS INSTALLATION

## Transportation and Preparation System at Nanty Glo

Cars Are Hauled from a Slope by a Hoisting Engine, Brought to the Foot House by a Locomotive, and Elevated to the Tipple by a Chain Haul—The Cars Are Discharged One by One by a Revolving Dump and the Coal Is Picked on Ring-Shaped or We Might Say "Doughnut" Picking Tables

BY DONALD J. BAKER  
Pittsburgh, Pa.

ONE of the most interesting coal-mine plants in western Pennsylvania is that of the Nanty Glo Coal Mining Co. at Nanty Glo, in Cambria County. The interest lies rather in the method of handling the coal on the surface than in the general layout of the buildings or in the equipment they contain, though these compare favorably even with the newer mines of the Pittsburgh district.

At the ordinary shaft, drift or slope mine the transportation of coal from the face to the railroad car is of a more or less stereotyped character, every installation being almost identical with the others except for a few variations arising naturally from local topography and the seam level.

At Nanty Glo the opening to the slope lies at the foot of a hillside, along which run the railroad tracks that lead to the tipple. The slope passes under the tracks, and the mine cars must be elevated to tipple height before they can be dumped. The conditions that have been responsible for the surface layout have been in the main topographic, for the time has not yet arrived when surface contours may be artificially altered to suit the economic conceptions of the mining engineer.

A tract of coal of over 3,500 acres is being developed at the Nanty Glo mine. This coal is the "B" or Miller Bed, which is the main stand-by in the Somerset and Cambria county fields. The tract lies in nearly rectangular form with the main haulage entries, which run as butt headings, lying parallel with the shorter

side of the rectangle. Thus the main face entries are at right angles to them or parallel with the longer sides of the same quadrilateral.

It has been proved by numerous drill holes on the property that the coal lies in a small basin, the bottom of which is approximately 8,000 ft. from the slope mouth, the coal at this point being under a cover of about 500 ft. From thence the coal rises, but after following it a distance of 4,000 ft. the property lines of the company are reached.

One might question why, in developing a tract of coal that lies in a formation such as this, a shaft was not sunk to the lowest point of the basin and the mine developed from both sides of the shaft bottom. Numerous factors enter into the selection of a plant site, and Nanty Glo was chosen as the best location for the following reasons: First, if the coal was to be developed from a shaft located over the bottom of the basin the plant would have been situated in a hilly section of country well removed from railroad connections. Also such a shaft would have been about 500 ft. deep. Second, the town of Nanty Glo is relatively old and well established and over 40 per cent of the men employed by the coal operator could be, and are now, housed in dwellings other than those owned by the company. House construction is a big factor in initial cost and in this case by suitably choosing the location of the mine much of the cost could be avoided.

Initial construction of this plant began in February

COAL REACHING THE REVOLVING TABLES FROM THE SCREEN

Although the coal from this operation is sold as run-of-mine it is nevertheless sized and picked, then remixed for shipment.

of 1916. It was estimated that the life of the mine would be approximately fifty years. Because the approach to the mine is from the side and not at the center of the territory the main haulage entries will some day be over two miles long. The main face entries will be driven off these on either side and will extend between 8,000 and 10,000 ft. Thus, at the time when the mine reaches its period of greatest development, the cars will have to be transported underground a distance of over four miles.

The coal dips about 5 per cent much of the way from the entrance of the main slope to the bottom of the basin. Present data indicate that it rises at the same grade from that point to the property line toward which the main slope is directed. Eight headings have been driven from the foot of a hillside toward the basin, these being driven, as stated, parallel with the shorter side of the tract. Four of these entries are used for haulage. The two outer entries are utilized as air courses. These passages were not driven from the outcrop but from a point well above it. In consequence they had to be driven through rock for a distance of 1,000 ft. before coal was encountered. They slope, where they pass through the rock, on a grade of 10 per cent.

From the point where the coal is reached the entries follow the bed and in consequence dip thereafter on a grade of 5 per cent. The underground workings are now in a decidedly undeveloped state as compared to what they will be after a period of, say, 20 years. To date few pillars have been removed. So far the work underground has been confined principally to opening up the development system that has been planned for the future.

The main haulage entries are 4,000 ft. in length, 3,000 ft. of which distance is on a slope of 5 per cent. This is the distance over which the hoist engine now operates. However, the entries have been driven another 3,500 ft. A little over 500 ft. is yet to be driven before the bottom of the basin will be reached. Thirteen-ton Westinghouse barsteel locomotives are used on such sections of the main haulageways as are

not reached by the cable. These must, of course, haul the loaded cars on the upgrade.

When the bottom of the basin has finally been reached the loaded cars will be hauled from this point to the surface by the hoist engine. Trolley locomotives will bring the loaded cars to the bottom from the opposite side of the basin and they will be able to haul back an equal number of empty cars up the same grade.

Trolley locomotives will haul the cars along the main face entries as well as on the extension of the slope up the opposite side of the basin, while Iron-ton, Mancha and Goodman storage-battery locomotives will be employed in the butt entries and within the rooms. Hockensmith Wheel and Mine Car Co. "solid" or gateless cars of 2-ton capacity are in use.

The power plant is located in the building on the left of the slope and about 200 ft. from the slope portal. One room in the building is utilized in housing the 800-hp. Vulcan twin-cylinder steam-driven hoist engine. The cylinders measure 30 x 24 in. and the drum is 6 ft. in diameter and capable of holding 8,000 ft. of 1½-in. cable. Trips of empties averaging 35 cars each are dropped down the slope at a speed of 1,800 ft. per minute. The loaded trips are brought out at a speed of 950 to 1,000 ft. per minute. The hoist is designed to handle 200 tons per trip, but at present the trips rarely exceed 150 tons each, as a heavier car train is not yet needed.

From the drum on the hoist engine the cable passes to a bullwheel located 500 ft. away and on a projection of the main haulage slope. Thus there is a distance of approximately 600 ft. from the top of the knuckle at the slope opening to the bullwheel. The loaded trips are brought to the landing above the knuckle, where the cable is disconnected. A 15-ton Westinghouse trolley locomotive takes the trip from this point to a foot-house which is the bottom approach to the tippie. The distance to the foot-house from the landing above the knuckle is about 1,500 ft., most of which is on a slight grade in favor of the loads. The storage yards adjacent to the foot-house will accommodate 125 loaded cars. After the locomotive has hauled a trip to the foot-house it

switches off to parallel tracks that serve to hold the empty cars. Then a trip of empties is made up and the locomotive returns to the landing near the slope opening.

The foot-house is of simple steel construction, as can be noticed in one of the illustrations, and serves merely to cover the trip-making and car-feeding mechanism and protect the man in charge of its operation from inclement weather. As the first car of a loaded trip enters the foot-house it is engaged by one of the dogs on the chain-haul and the entire trip is moved forward one car length, after which the operation of the car-haul is suspended by the operator in charge.

The first car is now clear of the car-haul mechanism and is in the opposite entrance of the foot-house. It is uncoupled from the trip at this point, and proceeds by gravity for a distance of 75 ft. into a check rail at the foot of the incline which forms the approach to the tippie. This check rail is so adjusted that the loaded car is held by it and does not pass through. A 15-hp. Westinghouse motor operating on a 440-volt alternating current drives the trip-making and car-feeding devices.

The loaded car is now in position in the check rail, where it remains until the next dog in the uphaul chain engages it and starts it up the incline. The head sprockets of both up haul and down haul are placed upon a shaft which is driven through a geared connection by a 75-hp. Westinghouse motor. Both chains are operated by the same motor and are controlled by the man in charge of the car dump at the head of the tippie.

The raising of the loaded cars from a point that is lower than the railroad tracks beneath the tippie to a position at the top of this structure by means of an endless chain over an inclined plane gives this tippie somewhat the appearance of an anthracite breaker—

a design that is quite uncommon in the Pittsburgh district. The incline is constructed on a 27-per cent slope and is 220 ft. long, which makes the distance from the bottom to the tippie about 212 ft. in a horizontal direction.

Fifteen loaded cars can be accommodated on the uphaul chain, each car weighing about 6,100 lb. This chain has a speed of 74 ft., thus feeding the loads into the tippie at the rate of four per minute.

The downhaul and the uphaul chains, while driven by the same motor, are connected by different gears so that the speed of the downhaul chain is greater than that of the uphaul. This arrangement causes the empty cars to be handled with greater dispatch than the loaded ones and so prevents congestion within the tippie. About 76½ ft. per minute is the speed of the downhaul chain, which allows six empty cars to be returned each minute if need be. The incline itself is constructed with a wooden platform which is supported by steel bents.

As the loaded cars reach the top of the incline they are disengaged from the dogs of the chain, which passes over the sprocket to return to the bottom on the under side of the plane. The cars drop by gravity into two horns which are located at the front end of a rotary dump. This dump is operated by a separate 15-hp. motor. The horns over the track within the dump are released automatically as the operator throws to one side the horns that lead to the dump. The loaded car then assumes the position in the dumping mechanism that was occupied by the last empty car. The horns holding the car within the dump are, of course, returned to their vertical position after the empty car has passed out.

The new or loaded car is then inverted by a com-

ROTARY DUMP IN THE TIPPIE AT THE HEAD OF THE INCLINE

This power-driven dump has made possible the use of solid or gateless cars, thus not only simplifying car construction but preventing waste and spillage from loose or ill-fitting end gates.

A PORTION OF THE NUT TABLE

One of the plows used for removing carloads of slate or refuse may be seen in the foreground.

plete revolution of the dumping mechanism, which has a speed of 9.5 r.p.m. This type of dump is operated by a pinion engaging in the geared circumference of the revolving portion. The rotary dump has made permissible the use of solid mine cars, and this has resulted in a considerable saving in their first cost. It has also reduced the cost of their maintenance to a low figure. Certain economies have been effected through a reduction in the coal spilled on the haulage roads, since cars of the old type allow the contained material to leak out around the end gates.

When the empty car is released from the dump it travels down grade to a kick-back in the rear of the tipple, and thence by gravity to the head of the incline, where it runs into a check rail and is held until the next dog in the downhaul chain pulls it out, when it starts down the incline.

The empty cars on the downhaul chain are released at the lower end of the incline and drift into the foot-house by gravity. At this point the car is engaged by the trip-making mechanism. The dogs on this haul are of solid construction and serve to push all the empty cars in the storage yard ahead one car length by forcing the last empty from the incline through the foot-house. In this manner both empty and loaded trips are made up as well as broken up at the foot-house. The empty cars, however, are not coupled together until they reach the storage yard.

This system of handling the loaded cars from the slope portal to the tipple has given entire satisfaction. By it 2,500 tons of coal are dumped daily at this tipple, which incidentally is its capacity.

The tipple, which is of steel framework with corrugated-iron siding, in the arrangements adopted for preparing coal is vastly different from similar buildings encountered in this district. Although practically all of the coal loaded is shipped as run-of-mine, it is first thoroughly sized into lump, egg, nut and slack in order to insure efficient picking. After being picked the various sizes are collected upon one loading boom.

This is the first tipple to be equipped with circular picking tables for preparing the coal. The complete structure was designed, fabricated and erected by Heyl & Patterson, Inc., of Pittsburgh.

To descend to details, the coal from the rotary dump

is passed to a reciprocating feeder that delivers it at a uniform rate to a double-decked balanced shaking screen, which causes the lump and egg sizes to be delivered to opposite sides of one picking table. The nut size passes to a separate picking table while the slack goes to a chute and thence by gravity direct to the loading boom. Both feeder and shaking screens are driven by a 25-hp. Westinghouse motor, while the screen has a 6-in. stroke, and the eccentric shaft makes 110 r.p.m.

The circular or "doughnut" picking tables are built up of structural steel shapes and plates. Each has an outside diameter of 25 ft. and an inside diameter of 15 ft. and each is mounted on 70-lb. rails that move upon 12-in. double-flanged car wheels carried by shafts supported directly from the tipple frame. Both tables are driven by a 20-hp. motor through a vertical shaft pinion and segmental gear. The rotating speed of the tables at the center is 40 ft. per minute. Should a car of rock or inferior coal accidentally be delivered to either picking table, a plow is lowered which directs the undesirable material direct to the refuse hoppers.

The arrangement within this tipple—providing as it does for the thorough preparation of the coal—immediately impresses one. There is but little machinery and an entire absence of conveyors. These details lessen the chance for delay to operation that might arise from breakdowns in machinery. The resultant economy in upkeep is noteworthy. Compactness also is apparent and leads to efficient supervision by a picking boss who is able to see the work of the pickers and the condition of the tables at all times. Intelligent supervision in the preparation processes is a highly important factor if the equipment is to serve the purpose for which it was built.

To take care of cars containing rock—and many such cars must be handled at any mine that is working the Miller bed—a hinged gate that is operated by compressed air is provided. When rock is dumped this gate is reversed so that the contents of the car are dropped directly into a rock bin. Slate and other foreign matter are removed from the coal by men stationed around the tables, who toss the extraneous material into steel chutes which lead to one general hopper, from which point it is removed by car to a dump on a hill-

GENERAL VIEW OF THE LUMP TABLE

The two tables are exactly similar but are installed upon opposite sides of the room.

side to the rear of the tippie. The capacity of the rock bin is 20 tons. The rock is removed to the dump by the same car that handles the slate pickings.

An emergency run-of-mine chute has been provided which may be utilized in the event of the picking tables being temporarily out of order. After the large lump sizes and the nut have been cleaned they are united with the slack on the loading boom as cleaned run-of-mine. Most of the output from the Nanty Glo mine goes to tidewater to be used on steamships and little of the product is loaded as separate sizes.

As has already been mentioned, the surface equipment at this plant is all high class. Other units must be passed over at this time, with the exception of a power plant that imperatively demands a short description. Interest in this building centers in the boiler room, where three 446-hp. Badenhausen boilers have been installed. These were manufactured by the Combustion Engineering Corp. Each boiler is equipped with a type "E" automatic stoker and forced draft. Entering water is heated to a temperature of 208 deg. F. Overhead bunkers with a capacity of 180 tons feed directly to the stokers. The bunkers are supplied by cars from the tippie for which track is provided over the rock dump to the rear of the tippie and thence to the boiler room over a trestle.

The officials at Nanty Glo speak highly of the Badenhausen boiler as a quick producer of steam. While only clean coal is used for firing at present, it is probable that the near future will see the installation of crushing apparatus and the utilization of cleanings from the picking tables. In the dynamo and engine room direct current at 250 volts is generated which is used within the mine. Alternating current at 2,300 volts is reduced to 440 by transformers and used in general around the surface plant.

The officials at Nanty Glo include John W. Harrison, superintendent, and Roy Sharpless, chief engineer. Both these men were connected with Berwind-White interests before taking up the supervision of the Nanty Glo Coal Mining Co.'s plant. Both are well known in the Cambria and Somerset County fields. I wish to acknowledge their generous assistance in preparing this article on the Nanty Glo operation.

## Can Coal Be Cleaned by Flotation?

THE flotation process consists in the forming of an emulsion of oil and water by agitation and the floating of certain mineral bodies away on the surface of the liquid thus produced, leaving the impurities to sink to the bottom. It has been used hitherto only to separate metallic minerals from their earthy impurities, or "gangue."

Some time ago J. R. Campbell, chief chemist of the H. C. Frick Coke Co., in an article read before the American Institute of Mining and Metallurgical Engineers spoke of flotation in the cleaning of coal as a remote possibility. Now word comes from the London Stock Exchange to the effect that investors are all agog over the remarkable advance of the shares in the Minerals Separation, Ltd., which holds, here and in Great Britain, the most important patents relating to flotation. It is said that a few weeks ago the stock sold for £9 and is valued now at £200.

With the value of the stock *Coal Age* readers are not concerned, but they will be interested to know that by

this process the total cost of recovering a ton of coal for conversion into briquets is said to be only about 5s. (\$1.21 at normal exchange, or about 99c. at present rates). The briquets can be sold at 30s. (\$7.30 at normal or \$5.94 at present rate). It is said that while the mine owners are not permitted to make more than 1s. 2d. per ton (28c. normal exchange and 23c. at present) for coal newly mined, they are permitted to make all they can on coal rescued from the dump. The company has, it is said, purchased large quantities of coal waste, while numerous collieries are contracting for the right to use the process, which has proved so valuable in the extraction of copper. Report adds that the specific gravity of coal being low, the quantity of flotation oil needed is small compared with the amount that is used in the process when metallic ores are being prepared.

## Export of Coal from Scotland Shows Increase

Output During 1919 in Fifeshire Was Nearly 10 Per Cent Greater Than in 1918—Greater Promise Shown for 1920

COAL output during 1919 in Dunfermline, Scotland, according to a report by Consul Howard D. Van Sant, has shown an increase, with prospects that extensions in the coal fields of Fifeshire will make for further improvement in 1920. At Methil, the largest coal shipping docks in the Dunfermline district, the coal exports for January amounted to 52,000 tons, while in December of 1919 the monthly export totaled 169,000 tons. The total coal exports for the year 1919 from Fifeshire ports amounted to 2,567,400 tons, an increase of 215,700 tons over 1918.

In pre-war days a 100,000-ton shipment of coal was the usual weekly average but during the war the total fell to about 40,000 tons weekly. There appears to have been a shortage of coal wagons, making frequent the stoppage of work at the collieries of several hours daily, yet from 5,000 to 8,000 more men have been employed in coal mining in the district than during 1918.

A new pit has been sunk at Lochore to provide better ventilation for the more important Mary pit close by, and when in full working order this improvement should largely increase the output of that pit. Early in the summer the surface buildings of the Lindsay pits at Keltie were destroyed by fire. Now the proprietors, the Fife Coal Co., are constructing the most up-to-date plant, much of it on the American concrete construction plan.

The Saline Valley coal district, comparatively non-productive to any extent for many years, has again changed hands and promises are made that the northwest corner of Fife will again become a large and busy coal field. Retail coal of the best quality has been selling in Dunfermline at the rate of \$10 per ton, including cost of cartage, during the past year, being rationed according to the need of the householder. At times it has been difficult to obtain at any price.

It is said the war, the loss of tonnage resulting from the coal strike, the shortage of men and coal wagons, and the increased demand of shipping, both foreign and domestic, are the principal causes of the coal shortage. Dunfermline adjoins some of the finest and most important coal fields of Scotland, yet frequently coal has been almost unobtainable during the past few years.

# Correct Method of Trolley-Wiring Mines\*—I

How, Under the Various Conditions in the Mines, to Plan Dead-Ends and Suspensions so as to Reduce Maintenance Charges and Secure Satisfaction

BY M. W. BEDDOW  
Lundale, W. Va.

IN compiling the following instructions covering the installation of trolley wire within the mines, the various fixtures are described one at a time. Under the description of each fixture is a discussion of the reasons for standardizing that particular fixture. The separate parts making up these fixtures are numbered and by referring to Table I it can be easily seen what materials go to complete each unit. The instructions here given deal only with the hanging of trolley wire in the mines and have no reference to its support above ground, the construction of feeder lines, telephone lines or bonding.

(1) The dead-end fixture (Fig. 1) is used at the end of the trolley wire and is made up of materials Nos. 1, 2, 3, 4, 5, 6, 7, 8 and 31.

The wedge grip fastens onto the trolley wire itself

FIG. 1. PREFERABLE DEAD-END FIXTURE

In this fixture the various elements are so arranged that when it becomes necessary to extend the trolley line the whole combination may be moved bodily to its new location.

and does away with the necessity of putting a bend or kink in this conductor and fastening it with wire-rope clips. When it is necessary to extend the wire, the wedge grip is easily knocked loose and the entire dead-end fixture is carried ahead to the new termination of the trolley wire, where it is again used in dead ending. Thus the end of the wire is always left in good shape so that the splicer may be slipped on quickly and easily. Waste and kinks, which are common when the trolley wire is bent and fastened with clips, are thus avoided.

In purchasing the strain insulators (3) care must be taken that the eye of the insulator will fit into the clevis on the wedge grip and that the eye of the turnbuckle will fit into the clevis on the strain insulator. Several different kinds of 3-bolt guy-wire clamps are upon the market, but the one that has a square hole in one piece and uses a carriage bolt is the easiest to work with and should be specified.

The expansion bolt (8) should be put in so as to slant slightly forward or away from the end of the wire. The hole should be drilled at least 9 in. deep for an expansion bolt 6 in. long. Then in case it is

desired to take the expansion plug out, there is room to knock the bolt, together with the expansion plug, up into the hole, thus loosening the expansion shell in the hole and permitting it to be withdrawn without difficulty. The shoulder of the eyenut (7) should be screwed up to or even into the hole so that the outside diameter of the eyenut rests firmly against the roof. Otherwise when stress comes on the eyenut the expansion bolt probably will bend.

As the wire is extended this dead-end fixture may be used repeatedly. This necessitates the use of a thimble. Otherwise the strand would be kinked and when moved ahead it would be kinked at another point, and after a few moves it would quite possibly break at one of the kinks.

About 10 ft. of  $\frac{3}{8}$ -in. galvanized steel-wire strand (5) is used in this fixture—enough so that if the end of the wire reaches just past an expansion bolt regularly spaced, the eyenut can be screwed on the next expansion bolt and the  $\frac{3}{8}$ -in. steel strand will be long enough to go through the eyenut, thus eliminating the necessity for placing another expansion bolt half way. One end of the  $\frac{3}{8}$ -in. steel strand is spliced into the eye of the uninsulated turnbuckle; the other end passes through the eyenut and is fastened back on itself with the 3-bolt guy-wire clamp (6).

These dead-end fixtures are made up in the wireman's shop, which may well be conveniently located within the mine itself.

There are no sufficient reasons why figure-8 wire should be used instead of grooved wire or vice versa. Most of the reasons advanced, now for figure-8 and now in favor of grooved wire, are "office chair" arguments and do not amount to much in the mines.

It is claimed that 4/0 grooved wire offers a larger bearing surface to the trolley wheel than the same size of figure-8 wire. But put a trolley wheel in its harp

FIG. 2. SUSPENSION USED WITH MODERATELY HIGH ROOF

A single wooden plug driven into a hole drilled in the roof serves to support this fixture.

\*In the preparation of this article I have been greatly assisted by D. M. Lambert, electrician, and John Pack, inside wire chief, of the Lundale mine, whose energy and experience were of great value in the work and study that led to the adoption of the standard fixtures described.

FIG. 3. SUPPORT ATTACHED TO TIMBER

Where timber sets are employed to hold up the roof the trolley support here shown is simple and effective.

and fit it against a piece of 4/0 grooved wire, sight between the trolley wheel and the wire and notice the arc of contact. Do the same with a piece of figure-8 wire of the same size, and it will be immediately apparent that this argument does not mean anything. It is claimed that the figure-8 wire keeps the trolley wheel away from the clamps better than the grooved wire and there is not so much arcing at the suspensions when this shape of wire is used as when grooved wire is employed. Give this the same test with the trolley wheel and you will see that this is not entirely true.

Arcing at the suspensions frequently arises from the trolley spring being too weak, the trolley pole being crooked or the harp bent, a bad wheel or bushing or perhaps from the trolley clamp being out of alignment with the wire. Figure-8 wire can be held more firmly in the clamps than grooved wire, consequently it is not so easily jarred loose or forced out of the clamps when a small scale of slate falls upon it. There is no possibility of figure-8 wire being placed in the clamps wrong, while it frequently happens that grooved wire, especially when it has been knocked down a few times by slate falls, gets so badly twisted that it has to be placed in the clamps in the same manner as round wire—that is, the jaws of the clamp are not placed in the grooves. With figure-8 wire, notice how the groove comes out of the jaws of the clamp.

This discussion covers 4/0 grooved and figure-8 wire only; 2/0 grooved wire should not be used at all in the mines. It soon gets so badly twisted that the grooves cannot be put in the clamps properly and it is hung similarly to round wire but of course not as efficiently as round wire can be suspended.

If a new mine is being opened nothing but 4/0 grooved trolley wire should be used. If a mine has been opened for some time and an appreciable amount of 4/0 figure-8 wire is in place, its use should be continued without change. I do not believe that anything smaller than 4/0 trolley wire should be used, and in these instructions it is understood that all fittings and material are for 4/0 grooved wire.

(2) Suspensions are used to hold the wire in place. There are different types, depending on the height of the coal and whether they are fastened in the roof or to timber.

(a) In high coal 5 to 7 ft. in thickness, and where the roof is used to support the wire, the fixture (see Fig. 2) composed of parts 8, 9 and 10 is used.

(b) In low coal 3 to 4½ ft. thick, where support is from the roof, the fixture composed of parts 3, 10 and 11 is used.

(c) In high coal where timber is installed as a support the fixture composed of materials 9, 10 and 12 is used.

(d) In high coal where support is from the roof and where a cheaper suspension is desired a fixture composed of materials 9, 10, 12 and 13 may be employed.

(e) In low coal where timber is used as a support the fixture (see Fig. 3) is composed of materials 10, 14 and 15.

(f) In extremely high coal or where the top is taken down or falls, leaving a distance between the top of rail and the roof of over 8 ft., or where more than two hangers are necessary to bring the wire into vertical alignment on account of inequalities of the roof, the fixture composed of materials 9, 10, 16, 17 and 18 is used.

Remarks.—The holes for the expansion bolt must be drilled the correct size, i.e., 1½ in. in diameter and 9 in. long. If the holes are drilled too large the plug will be drawn down in forcing out the expansion case and therefore will have but little holding power.

The hole should be driven at least 9 in. long so that when it becomes necessary to reclaim the expansion bolt it can be driven upward into the hole, thus loosening the expansion case, which can then be easily extracted. The diameter of the drill bits used should be checked up daily so that holes of the proper size will be drilled for the expansion bolts.

The universal mine hanger (9) is a strong, substantial and easily installed device. Its broad, hexagonal surface affords room for a wireman to use his wrench without risk that it will slip off and cause him to scrape his fingers against the top. The hanger is screwed onto the expansion bolt until the expansion case is sufficiently swelled to fasten it into the roof. With many hangers it is difficult to tighten the expansion cases. There is not enough square or hexagonal surface upon them to afford a secure hold for a wrench. With some hangers I have seen it is necessary to screw

FIG. 4.

Trolley Support Used with High Roof

Where the roof is high pipe extensions are employed to bring the trolley clamp to its proper elevation above the rail.

upon them another hanger with a broad surface where the wrench can be applied in order to secure them upon the stud of the expansion bolt and tighten the expansion case securely.

The "Sure Grip" clamp is strong, possesses tremendous holding power and is easy to apply. In place of the expansion bolt (8) a wooden plug (13)  $1\frac{1}{2}$  x 4 in. can be used, as indicated in suspension (d). This plug requires a hole  $1\frac{1}{2}$  x 5 in. It does not make as good a job as the expansion bolt, for under stress the lag-screw support will pull out or give to one side. The material cost, however, is less.

Where the lag-screw support is used a hole is drilled either in the timber or in the wooden plug, whichever the case may be, with a brace and a  $\frac{1}{2}$ -in. auger bit. In fastening the type "P" mine hanger (14) to the timber it is better to drill these holes also for the lag-

port or extended suspension that is hard to surpass. If the pipe becomes bent or if, for some other reason, it becomes necessary to take it out, this is easy to do. Loosen the bolts in the expansion case and the pipe clamp and the pipe is released and the whole thing can be taken down.

Where two hangers would bring the wire down into alignment a pipe suspension is not used, but where more than two hangers are necessary a pipe suspension (Fig. 4) should be provided. When, in an emergency such as a slate fall or the right material not being on hand, it is necessary to use three or more hangers to bring the wire down into alignment, these hangers should be promptly replaced with a pipe suspension.

In mines where the roof is extraordinarily high, so that suspensions of this sort cannot be used satisfactorily, the wire can be supported by means of cross spans of  $\frac{1}{4}$ -in. galvanized steel-wire strand fastened to the rib on each side with straight-line hangers such as are used to support trolley lines on surface tram roads.

TABLE I. MATERIALS USED IN HANGING TROLLEY WIRES IN MINES

1. 410 Grooved trolley wire
2. Wedge grip, O. B. No. 12,634, opening in clevis  $\frac{1}{4}$  in., diameter of clevis bolt  $\frac{1}{2}$  in. Will take 410 grooved or  $\frac{1}{2}$  in. round strand
3. Giant strain insulator,  $2\frac{1}{2}$  in. diameter with large eye and clevis
4. Uninsulated turnbuckle, O. B. No. 7,554, 12 in. opening;  $\frac{3}{8}$  in. eyebolts with 1 in. eyes
5.  $\frac{3}{8}$  in. galvanized steel wire strand
6. 3-bolt guy wire clamp, O. B. No. 3,206, length 4 in. with square hole and square head on bolt
7. Hubbard eye-nut, drop forged, to screw on  $\frac{3}{8}$  in. bolt; inside diameter of the eye is 1 in.
8. Expansion bolt, O. B. No. 10,073, 6 in. long
9. Universal mine hanger, O. B. No. 11,309, form 1, 2 in. high
10. Sure grip trolley clamp, C. W. No. 7,039
11. Type K mine hanger, O. B. No. 11,554, form 3, 1-5116 in. high
12. Lag screw support, O. B. No. 8,771
13. Wood plug, japanned, O. B. No. 8,770; diameter  $1\frac{1}{2}$  in., length 4 in.
14. Type "P" mine hanger, O. B. No. 11,032,  $1\frac{1}{2}$  in. high
15.  $\frac{1}{2}$  in. fetter drive thread lag screw, 4 in. long
16. Expansion case, G. E. No. 125,328
17.  $\frac{1}{2}$  in. galvanized iron pipe
18. Pipe clamp, G. E. No. 125,332
19. Type N hanger, O. B. No. 11,650, single curve, complete with separable arm
20. Wooden plug, diameter  $1\frac{1}{2}$  in., length 12 in.; to be split out of ash or other soft wood
21. Detroit trolley clamp, O. B. No. 10,972; 4-screw clamp
22. Type N hanger, double curve, O. B. No. 11,651, complete with separable arm
23. Clevis attachment, O. B. No. 11,104
24. Single Brooklyn strain insulator, O. B. No. 9,995;  $\frac{3}{8}$  in. eyebolt
25. Type D trolley frog, malleable iron with renewable bronze tips, 8 degree, 410 grooved; right hand O. B. No. 11,892; left hand O. B. No. 11,897
26. Type M mine section insulator switch, O. B. No. 11,600
27. Detroit double strain clamp, O. B. No. 10,370
28. Wooden plug,  $1\frac{1}{2}$  in. x 18 in., split at end with a wedge fitting in the split; to be made out of ash or other soft wood
29. Boards, 1 in. x 4 in. x 14 ft.
30. 8d nails
31.  $\frac{1}{2}$  in. rope thimble
32. K-I splice, 15 in. long, O. B. No. 8,573
33.  $\frac{1}{2}$  in. galvanized steel wire strand
34. No. 6 galvanized iron wire
35. Dngs for K-I splice, O. B. No. 5,700
36. Renewable bronze end tips, O. B. No. 11,277, for type D frogs.

screws. A  $\frac{3}{8}$ -in. bit is used in this case. Fetter-drive lag screws are used because they do not tear the wood when driven, and if they are given a few turns of the wrench at the finish they will have a greater holding power than the other types of lag screws that have been screwed up with a wrench from the start.

The  $\frac{1}{2}$ -in. pipe extension with the G. E. expansion case and pipe clamps is easy and inexpensive to install and is as strong and enduring as any other type.

The expansion case (16) requires the same size of hole as the expansion bolt (8), that is,  $1\frac{1}{2}$  x 9 in. The expansion case is first inserted into this hole and the pipe driven into place, expanding it against the sides of the hole. The bolts are then tightened, the expansion case gripping the pipe securely. If the pipe is too long and would bring the wire down too far out of alignment, it can be sawed off with a hacksaw to the proper length.

The pipe clamp is then bolted on the lower end of the pipe, the hanger screwed upon it and the clamp screwed on the hanger, thus forming an extension sup-

## Large Gas Plants Planned

In the western part of Chicago, on the site where the People's Gas, Light & Coke Co. had planned to erect its large byproduct plant, the Koppers Co. has perfected plans for the construction of a coke oven and water-gas plant. The output of the proposed works will be 12,000,000 cu.ft. of coke oven gas and 30,000,000 cu.ft. of water gas each day. This gas will be sold to the People's Gas, Light & Coke Co. for the city supply of Chicago. The plant will be built by the Koppers Co. itself and its subsidiary, the Western Gas Construction Co.

The byproduct works will be built according to a new plan which provides for 100 ovens with a new type of triangular flue. Each oven will be 16 in. wide and considerably higher than the normal. It is expected that the plant will burn 20 tons of coal per oven per day, making the total plant capacity 2,000 tons of coal.

The kind of coal to be used has not been definitely determined as yet. The larger part of the coke which is of suitable size will be used in the production of water gas. However, it is planned to build in the future a number of producers which will supply the gas for heating the ovens, and then a considerable portion of the coke produced in the byproduct plant will be available for sale.

## Fusible Plugs in Air Lines

G. Chester Brown, Chief Mining Engineer of California, recommends in the *California Safety News* that a fusible plug be placed in the air line between the compressor and the air-receiving tank as a means of avoiding a serious disaster.

"The fusible plug should be filled with a fusible metal which should melt when the temperature of the air in the space in which the plug is located reaches 500 deg. F. The plug should be of such construction as to give warning when the fusible metal melts, and when such warning is given the compressor should be stopped immediately, and a thorough correction made of the dangerous condition.

"The operator should ascertain that the safety valves are in good condition and are tested daily, that proper lubricating oil is used for the compressor, and that each tank is thoroughly drained of all accumulations of oil and water, at least once in each working day."

## When Pulverized, Even Lignite Can Be Satisfactorily Burned\*

Lignites, Especially Those Having Large Ash Content, Are Difficult to Burn on Grates — Pulverizing Provides Not Only for Excellent Burning but for Easy and Accurate Control

BY ROY N. BUELL  
Battle Creek, Mich.

**I**N ORDER to carry California over the period of excessive need of fuel in 1918 the U. S. Fuel Administrator organized a corps of engineers and inspectors to see that every possible source of supply was surveyed and that every pound of oil, coal or wood consumed was burned with a maximum of efficiency. The consumption of fuel oil was exceeding production by over 5,000 bbl. per day, and notwithstanding the fact that many non-essential plants had been entirely cut off, the shortage threatened to become more and more acute as time went on, unless some new source of fuel supply could be discovered.

With a view of finding some practical auxiliary for oil it was decided to make a general state survey of all fuels and among the many possibilities to receive serious attention was California lignite. Large deposits of this material were known to exist in the Priest Valley, in which the Stone Canyon mine is situated; at Corral Hollow, where the Tesla mine is located; near Mount Diablo, at the old Black Diamond mine; in Dos Rios County, which was merely a good prospect, and in Amador County at the Ione coal mine. Experts from the U. S. Bureau of Mines and the technical staff of the State Fuel Administration were sent to examine these properties and report the possibility of using their output as an immediate source of domestic and commercial fuel.

The report submitted by these engineers was thor-

ough and complete, but hardly as reassuring in respect to the available fuel supply as had been anticipated. The Stone Canyon mine, while it contained by far the best coal in the state, could not be put in a workable condition for several months, and then at great expense. The Tesla mine, which has been worked many years before to a depth of about 900 ft. at three different levels, was found to be filled with water to within 300 ft. of the top, and aside from this a large amount of money would be required to replace tracks, elevators, tipples, etc., that had previously been either removed or destroyed. Other small deposits around Livermore, in the Mount Diablo district, were either undeveloped or completely worked out.

In Dos Rios County several test holes were drilled and much preliminary work was accomplished, but no large veins were discovered that would warrant further continuation of the work on a large scale. It was proved, however, that this particular deposit in Dos Rios County was a high grade variety of semi-bituminous coal, equal in B.t.u. content to the Stone Canyon product. Private parties have continued to explore this field and some well-known geologists have ventured the opinion that a large coal deposit will eventually be located.

One of the last mines to be explored was that at Ione, and here the engineers found that coal was actually being mined and that the plant was prepared to turn out about 500 tons per day. In the old days, before the advent of fuel oil and the discovery of bet-

\*Article published under the title "Pulverized Lignite Fuel in California" in *Chemical and Metallurgical Engineering*.

ter coal in Wyoming and Utah, a large portion of the fuel consumed by the locomotives of the Southern Pacific R. R. was obtained from this mine. Many an old locomotive fireman can still be found in California who can tell you many interesting incidents concerning his experience with Ione coal.

After much discussion and careful consideration of the final report submitted by the engineers, the Fuel Administration decided that the lignite from the Ione mine, although of inferior quality, offered the best possibilities for immediate service. The next step was to determine the best method to be pursued in burning the lignite. The consensus of opinion seemed to be that the best efficiency in combustion could be obtained by drying, crushing and afterward burning the lignite in a pulverized state, properly mixed with air.

Among the advantages of burning the lignite in pulverized form, the one that stood out above all others was the fact that no matter how much ash the fuel con-

lignite, containing an average moisture of 40 per cent, as mined, was allowed to air-dry for seven days in shallow piles at the top of the mine shaft, when it was shipped to San Francisco, in open cars, for treatment.

As received at the plant, the analysis was as follows:

	Per cent As received	Dry Per cent
Moisture .....	22.41	00.00
Volatile .....	43.37	54.60
Fixed Carbon .....	20.41	26.32
Ash .....	14.78	19.08
	100.00	100.00
B.t.u. per lb.	9,322	12,016

The fuel, as unloaded from the cars, was first crushed to about one-half inch. It was then dried in a semi-direct, artificially fired drier until the moisture content was reduced to approximately 6 per cent. One of the most important operations in the preparation of pulverized lignite is the drying process. At the San Francisco plant about one-sixth of the weight of the raw material was carried off as vaporized moisture, and to accomplish this, 50 lb. of pulverized lignite was consumed as drier fuel to every ton of dried product.

The average temperature maintained inside the drier was 250 deg. F., and great care had to be taken that the heat did not rise above this point, which is apt to cause spontaneous combustion or perhaps explosions. After the lignite had been dried as described, it was pulverized to about 175 mesh, separated by air and stored in a concrete bunker, ready for use.

One of the big bugaboos always brought forward in every argument against the use of pulverized lignite is that it is impossible to keep this material in storage for more than a few days without danger from spontaneous combustion. My experience, however, seems to refute this claim, as I have known of one particular instance in California where several tons of powdered lignite was stored in a metal hopper for six months with apparently no ill effects whatsoever.

The general layout of the combustion equipment used at the San Francisco plant is shown herewith. The pulverized lignite drops by gravity from the bunker into the feeder, where a screw conveyor, driven by a variable speed electric motor, carries the fuel to the mixer chamber. Between the feeder and mixing chamber is situated a cross, with the upper connection left open, through which induced air may be drawn, aiding materially in stabilizing the pressure. An air compressor of the rotary type furnishes the necessary energy to transport the powdered lignite from the mixer to the combustion chamber, and supplies about 40 per cent of the air required for proper combustion, the other 60 per cent being obtained by induction.

The average air pressure employed at this plant was 3 lb. at the compressor and about 12 oz. at the burner. The powdered lignite, after meeting the compressed air at the mixer, is carried along through a 3-in. pipe to the burner, the most sensitive piece of apparatus in the whole plant, although very simple in construction. The focusing sleeve, on the end of the burner, is so arranged that the flame zone can be lengthened or shortened, as desired.

A secondary air line, taken off the main line near the compressor, extends completely through the burner,

VIEW WITHIN THE LIGNITE MINE AT IONE, CAL.

tained it could be burned efficiently. Coal and lignites, having a large ash content, are difficult to burn on grates, owing to the fact that as soon as combustion commences the ash collects all around the carbon and completely shuts off the air. Besides this, the high volatile content of the lignite does not thoroughly mix with the air, so that the combustion of the gases is not complete without admitting a large amount of excess air, and even then the efficiency is poor. When the lignite is pulverized, however, the particles are so fine that approximately the proper amount of air to insure complete combustion surrounds each little atom of fuel, which condition not only guarantees high efficiency in the burning but permits of easy and accurate control.

#### TRIAL PLANT ERECTED IN SAN FRANCISCO

To carry on the necessary experimental work preliminary to installing the process in large commercial power plants it was decided to construct a small demonstration plant in San Francisco. Accordingly, a 50-hp. "Kewanee" return-tubular boiler was equipped with the Buell-Santmyer pulverized-coal system, which was considered best to burn the California lignite. Ione

with orifices near the extreme end looking back toward the front of the boiler, which acts as a brake on the main body of forced air and lignite. In actual combustion this secondary air brake causes the flame corona within the furnace to expand or contract, as desired. A half-inch steam jet was used to deflect the cutting flame away from the under side of the boiler plates.

The burner was lighted instantaneously with a torch through an opening in the boiler front. These openings were used also to allow more secondary air to enter the combustion chamber if required. About 15 per cent excess air was generally employed in com-

dampers were so adjusted that the vacuum in the rear of the combustion chamber was 0.02 in.

Fifty per cent of the ashes was carried out of the stack in suspension with the waste gases, 3 per cent lodged in the tubes and was removed by the soot blower and 47 per cent dropped either into the ash trap in the rear of the setting or onto the floor of the ash-pit in front. The latter portion of the ash proved upon analysis to be largely silica and to contain about 0.005 per cent unconsumed carbon.

Many tests were carried out at this experimental plant for the benefit of California fuel engineers, and as a result of these successful demonstrations with

DIAGRAM OF THE EXPERIMENTAL PULVERIZED-LIGNITE PLANT IN SAN FRANCISCO

By burning pulverized lignite under an ordinary horizontal multitubular boiler rated at 50 hp. an evaporation of 9 lb. of steam from and at 212 deg. F. per pound of fuel was secured.

bustion, although when the boiler was under peak load, this amount might be slightly increased. No changes worthy of note were made in the settings of the boiler, the object being to demonstrate how readily this system could be adapted to any ordinary boiler at small expense. The grate bars were removed, and later on an inclined fill was placed in front of the bridge wall to reduce back pressure.

To remove and collect the ash a permanent soot blower was installed in the front end of the tubes and an ash trap constructed under the rear end of the boiler, near the clean-out door. A complete set of instruments was installed to record the temperatures of the feed water, the live steam, the combustion chamber and the waste gases, to determine the vacuum of the stack draft, to weigh the feed water and to measure the steam flow.

Although the conditions for efficiency at the plant were far from ideal, some good results were obtained, both as to combustion and boiler efficiency. The average evaporation per pound of dry fuel burned was 9 lb. of water from and at 212 deg. F. The average temperature in the combustion chamber was around 2,300 deg. F. and that of the waste gases in the breeching above the boiler about 550 deg. F. The CO<sub>2</sub> content in the waste gases averaged 14.5 per cent. The stack

lignite fuel plans were drawn early in 1919 for a large steam electric generating plant at the site of the old Tesla lignite mine and three industrial power plants at Stockton to use lignite from the Ione field. A small plant has been completed at Stockton, where gratifying results have been obtained, the powdered lignite being burned under Heine boilers equipped like those at the initial plants at San Francisco.

When the plants now under construction in California are in actual operation and the efficiency experts have noted the great economy that will result in the generation of steam and for metallurgical purposes as well, the production of California pulverized lignite as an auxiliary to fuel oil and hydro-electric power will have received a great impetus and will without doubt soon take its proper place as a recognized and valuable California industry.

### Postpone Opening of Bids on Army Coal

The War Department announces a postponement of the opening of bids on coal for army requirements during 1921. The proposals provided that bids be opened April 30, 1920. Owing to the car shortage and failure to adjust wages, however, it is deemed advisable to defer opening of bids until May 14, 1920.

# New Uses Found for the Geophone\*

Geophone Is a Small Seismograph—Works Better on the Rib Than on the Roof—Sounds Will Not Travel Along Pipes or Rails if They Are Covered

BY ALAN LEIGHTON

**T**HE GEOPHONE is an instrument invented by the French during the war to detect, through the earth, the sapping and underground mining operations of the enemy. It was improved by the United States engineers, and more recently has been further improved by the engineers of the U. S. Bureau of Mines, and its use in connection with special sounds has been developed.

The instrument, though small, works on the same principle as the seismograph, the ponderous apparatus by which earthquake tremors are recorded. It consists of an iron ring about 3½ in. in diameter, within the center of which is suspended a lead weight that is fastened by a single bolt passing through two metal disks (pure nickel disks 0.025 in. thick are used), one of which covers the top and the other the bottom of the ring.

There are two brass cap pieces, the top one having an opening in the center to which is fastened a rubber tube leading to a stethoscopic ear-piece. These cap pieces are fastened with bolts to the iron ring and serve also to hold the metal disks in place.

We then have really nothing but a lead weight suspended between two thin disks that extend across a small airtight box. If the instrument is placed on the ground and anyone is pounding or digging in the vicinity, energy is transmitted in wave motion through the earth, and the earth waves shake the geophone case.

The lead weight, on account of its mass and because it is suspended between the disks, remains comparatively motionless. There is thus produced a relative motion between the instrument case and the lead weight. The result is that in the thin space over the disk a compression and rarefaction of the air alternately takes place which is magnified at the small outlet.

Since the rubber tube leading to the stethoscopic ear-piece is connected with this space in the geophone, the vibrations are transmitted to the ear drum and, like other rapid air waves, produce sound effects. Usually two instruments are used, one for each ear.

When the observer is so equipped it is found that the sound is apparently louder from the instrument that is nearer the source of sound, even though the geophones are placed not more than two feet apart. It is evident that by moving the instruments a point can be found where the sound will be of the same apparent intensity in both ears. The direction of the point of origin of the sound is then on a perpendicular to the line connecting the centers of the two instruments,

either in front of or behind the observer. Further observation will show which side. Direction is quite accurately determined in this way.

The sound is not actually louder in one ear than in the other, but the ear is capable of distinguishing the slight differences in time at which the sounds arrive in the two instruments. Since this is the case persons who are slightly deaf in one ear are able to determine direction with the instruments.

The Bureau of Mines has conducted an investigation to determine the conditions of operation under which the geophone will give the best results when used for rescue

and survey work in both metal and coal mines.

In coal mines it has been determined that the geophones should rest on a solid shelf of coal or on the floor of a niche cut into the coal. The floor of the mine is likely to be covered with dirt, and is seldom solid enough to transmit sound well. In metal mines the geophones will, of course, be held against or placed upon the natural rock.

If the geophones are held with the hands against the coal, vibrations are set up by the circulation of the blood within the hands, which greatly interfere with successful observations. On the other hand, rock appears to withstand these vibrations, and successful results can be obtained by simply holding the instruments in place upon the rock.

## AID TO THOSE HOPING TO BE LOCATED

If a man is pounding in the hope that he may be located by means of geophones, he should strike heavy and slow blows upon the coal or rock. The best results are obtained with a sledge or heavy stick of timber. This is true even if the man expects to be located by a party operating upon the surface. There is no advantage in pounding upon the mine roof. The sound transmission is not so good and the process is more fatiguing.

It is of course known that sounds are transmitted clearly along rails and pipe lines. The investigation has shown that while sounds may be transmitted great distances if the rails are laid upon ties or the pipes are suspended, on the other hand if they are buried in loose dirt for even a distance as short as 15 ft. the sound vibrations may be completely damped. For this reason a man should never pound a pipe line or the rails unless he is certain that they are entirely free from any covering. Since the sounds are so well transmitted through rock or coal, pounding on pipes would seldom be advisable.

**Sledge pounding can be detected in mined-out areas at least 1,500 ft., through solid coal 2,000 ft., and through solid rock about one-half mile. Blows of a pick, tamping bar or heavy rock can be detected at two-thirds of those distances. Talking can be understood fairly well through a 50-ft. coal pillar and can be detected about 150 ft. away.**

\*"Observations with the Geophone," from Monthly Reports of Investigations, U. S. Bureau of Mines.

In making observations from the surface above a mine the geophones must be pressed firmly into place upon the earth after the sod has been removed. Experiments were conducted with the geophones placed upon stakes driven into the earth, but this method was found not to possess any advantage.

In regard to the distances that sounds can be detected through the earth, sledge pounding can be heard in a mined-out area of a coal mine at least 1,500 ft., through the solid coal 2,000 ft. and through solid rock about one-half mile. Blows from a pick, tamping bar or heavy rock can be detected about two-thirds as far.

The geophone is of great value for rescue work in mines. It frequently happens that after a disaster men barricade themselves in some portion of the mine where the air is still good and await rescue parties. In such a case if they keep up a continuous pounding it may easily be possible to locate them by means of the geophones. Otherwise it is possible that the rescue party may come near them without discovering their place of refuge. The same is true of metal mines, where men may be imprisoned behind falls or even be barricaded in some portion of the mine to which they have retreated in order to protect themselves from the fumes of a fire.

The geophone also has been proved of value for rough survey work in both coal and metal mines, for purposes of checking positions of headings, winzes or raises, being driven, sunk or raised to make a connection. It is perhaps of more value under the conditions usually prevailing in metal mines since direction has been found to be more easily determined through rock than through coal.

#### DATA RELIABLE IF STRATA ARE HOMOGENEOUS

It is easily seen that geophones are of value when the headings of tunnels difficult to survey are coming together. Direction determinations should be made from each tunnel, and if the results are consistent the operator can be sure of his data. The results may not agree if the strata between the two tunnel heads are not homogeneous, and of course in this case little reliance can be placed upon them.

That the instruments are of practical value in this connection can be seen from the following instances. The Bureau of Mines engineers were present in a metal mine at the time when a drift and a raise had "missed." A few minutes' observation in the drift and of pounding in the raise showed that the raise had gone up past the drift about 6 ft. in from the face and to the right. Observations made from the raise upon the sounds of the drill operating in the drift showed that the raise extended to a point 6 ft. above the drift and that the drift was in the direction indicated by the first set of observations. A survey showed these conclusions to be correct.

Again, observations were made of another raise which was being driven to the side of a drift, six to eight feet from it. Observations were made of the sounds from the drill, and a point located on the side of the drift behind which the drill in the raise was apparently operating. The survey mark was then ascertained to be from two to three feet to the right of this mark. A drill set up and operated into the survey mark did not hole through into the raise. A hole drilled at the point indicated by the geophones reached the raise, and proved the geophones to be correct within a few inches.

This instance also illustrates another application of the geophone. The surveyors had given the miners the location of the raise with regard to the drift in order to prevent accident in case a blast broke through. The geophone could have located the point easily, and frequent observations, if necessary, would have shown the progress of the work within the raise and before a blast was to be fired.

#### INSTRUMENT REPRODUCES SOUND WELL

One of the advantages of the instrument is that it reproduces sound so well. Talking can be understood fairly well through 50 ft. of solid coal and can be detected 150 ft. away. The sounds from mining machines are all characteristic. In fact, a bureau engineer through 300 ft. of coal was able to name nine out of ten tools which were being operated upon the coal.

In one mine where observations were being made from a tunnel heading the mine foreman heard the workmen in another tunnel preparing to blast, and ordered the bureau engineers to retire until the blast was fired. The sounds were so clear that he did not realize at the time that the tunnel headings were then over 300 ft. apart.

Observations have been made at two mine fires, where it was found that the fire made noise enough to be heard some distance, either because of its drawing air or the breaking off of bits of coal and slate. At one fire burning about 40 ft. below the surface all of these sounds could be heard, and an area was located within which they were audible. The fire could not be approached from within the mine, but the one point inside at which similar sounds could be heard was found to be the nearest point to the fire area.

Later observations made around the base of a large burning culm pile were of interest because the same kinds of sounds were audible there. At the second fire, which was burning 300 ft. below the surface, only the sounds from dropping rock could be heard.

It is the custom in some localities to put down churn-drill holes from the surface to ventilate blind stopes and to carry pipe lines. These holes often come down in the solid, and much expense is incurred in locating them and driving tunnels to them. Geophones will be of great value here, and there would be no question of faintness of sound as churn-drilling can be detected nearly a mile away.

#### MAY REVEAL COURSE OF DIAMOND DRILLS

It is a well known fact that when the bit of a diamond drill has drilled a considerable distance below the surface there is no simple method for determining the course it may have taken, although there are survey methods used that give approximate results. As these bits nearly always drift away from a straight course, it is evident that any instrument making it easily possible to determine their course will be valuable. There is some possibility that the geophone may be useful for this purpose. To date, however, this possible use of the geophone has not been thoroughly studied.

Observations have been made upon but two vertical drill holes. These holes, about a quarter of a mile apart, were penetrating strata consisting of alternate layers of gneiss and "black rock," pitching at an angle of approximately 45 deg. One hole has reached a depth of approximately 1,000 ft., the other 600 ft. At each hole it was found possible to hear the bits cutting when the geophones were placed upon the rock surface.

The observations were somewhat disappointing in that the sound of the bits could be heard within but a limited area, a circle whose radius was approximately 100 ft., with its center at the drill. Since the area was so small, and presumably directly above the bit, no direction determinations could be made in the usual manner. It is believed, however, that had the bit drifted this area of audibility would have been directly above the bit and away from the drilling machinery. Observations must be made on inclined holes in order to prove this point. It is certain that should a drill-hole be put down ahead of mine workings there would be no difficulty in locating it from the workings.

Very satisfactory results have been obtained also in attempts made to locate leaks in water mains. The water circulating in the ordinary city main can be heard with the geophones when they are placed on the surface, 10 to 12 ft. above the pipe. In the business district of Pittsburgh one leak was located within a few minutes although the water department had been trying to find it for two weeks. The leak could be heard from the surface from any point within a circle 60 ft. in diameter, and was located in the joint of a "T" connecting a 10-in. with a 15-in. main. The geophones were also used successfully to locate a leak in a one-inch pipe serving a residence.

## Who Can Beat This Sinking Record?

Illinois Shaft 263 Ft. Deep Is Completed  
and Timbered by the Johnson City  
Coal Co. in 35 Days

**T**HIRTY-FIVE days for the complete sinking and timbering a 263-ft. shaft is a recent achievement of the Johnson City Coal Co., at its No. 2 mine at Johnson City, Ill. The speed and economy attained is believed by those who did the sinking to be a record for the state. A description of the work and method of procedure are therefore here given.

The shaft is 10 ft. 6 in. x 15 ft. 6 in. inside and is divided into two compartments. Of these the manway is 4 ft. wide and the air shaft proper is 11 ft. wide. A 6-in. wall is placed between these compartments.

A concrete lining extends down the shaft for a distance of 22 ft. from the surface and rests upon solid rock. This lining is 12 in. thick and is reinforced vertically with  $\frac{1}{2}$  in. rods on 12-in. centers and horizontally on 8-in. centers. The foot of the shaft also is concrete lined for a distance of 30 ft. upward from the top of the coal bed. Footing is made upon the limestone underlying the coal. The lining here also is 12 in. thick and is reinforced in exactly the same way as the lining at the top.

The shaft timbers are 6 x 6 in. long leaf yellow pine treated with carbolineum. Bearing sets are 12 x 12 in. yellow pine resting on a 5-in. ledge of rock throughout their entire length and set into the rock for 2 ft. at their ends. The partition between the manway and air shaft is of 4-in. yellow pine extending between 4 x 6-in. wall plates. The shaft walls between top and bottom concrete linings are covered with expanded metal lath upon which has been placed 2 in. of gunite.

On Aug. 5, 1919, surveys were made to locate the top and bottom of the shaft, the transference of tools and equipment to the shaft site was begun and work on the headframe, the setting of the hoisting engine and the

laying of the steam line was started. On Aug. 16, 1919, shaft sinking was commenced and three shifts per day were kept at work continuously thereafter. Work was also begun from underground in driving the shaft upward, a few men being kept steadily at this work. This upward driving finally attained a height of 60 ft.

On Sept. 17 the two portions of the shaft (upper and lower) were joined by sump shots in the upper section. On Sept. 20 the two places were completely connected and timbered. The total distance sunk was 263 ft. and the time consumed was 35 days.

The manway is now completed and equipped with a steel stairway in compliance with the Illinois state law. It should be noted also that in spite of the speed attained in sinking this shaft not a man was injured throughout the entire operation.

The work of sinking and completing the shaft was in charge of J. L. S. Dowell of De Soto, Ill., while the engineering work was done under the direction of Willard J. Reintjes, chief engineer of the Johnson City Coal Co.

## Coal Shortage Halts German Industries

**I**NSUFFICIENT coal supply is greatly hampering the rejuvenation of Germany's industries that was expected to follow the cessation of hostilities. All the largest cement works have been closed for some time. The iron industry suffers above all, on account of the entire lack of grade coke and coal. Particularly bad are the conditions at Schweinfurt.

The glass industry, because of the insufficient supply of coal from Bohemia, has been forced to close its works for the greater part of a month, and the ceramic industry will come to a complete standstill if the Bohemian coal does not arrive soon. The situation of the textile industry at Hof likewise is very bad.

It is due only to the comparatively mild winter weather that the adverse conditions as regards the coal supply for heating purposes have been less felt. In Munich the conditions have become very much worse in this respect. The Bavarian State Government, according to the *Muenchener Zeitung*, is giving this question of the coal supply its most careful attention, and is endeavoring, with all the means at its disposal, to meet the situation.

One must not believe, however, that the conditions above noted prevail only in Bavaria. Discouraging reports are coming from all parts of Germany. In the Rhineland and Westphalia the heavy industries are, in a large measure, at a standstill; even such works as formerly depended upon their own coal mines for their requirements. In Hamburg the fishing steamers are ready to put to sea, but cannot do so because they have no bunker coal. Similar conditions prevail in the nitrogen and potash industries, whose products are particularly necessary in agriculture.

In Westphalia the following factories, whose products are of especial importance to the mining industry, have been obliged to close for lack of coal: Westphalia Explosive Co., in Sinsen, since Jan. 10; Schlebusch Dynamite Factory, since Jan. 12; Witten Cast Steel Works, which manufactures hauling cables for mining purposes, and Jacoby Rolling Mill, since Dec. 1, 1919.

If this stoppage of work is not speedily checked by an increased supply of coal, it is only a question of time when the working of the mines themselves must cease for want of operating materials.

## Operators Lose Fight on Assigned Cars

RAILROAD fuel supply has been cut by the Interstate Commerce Commission as a Gordian knot in its order of April 16, re-establishing assigned cars. For weeks the National Coal Association has been struggling with the problem of giving railroads the coal they need and will take, whether or no, without giving in on the question of assigned cars. The fight which began, with the support of Mr. Garfield, in 1918, has been carried on past the period of government control. But a few weeks ago it appeared that the operators would be able to develop sufficient co-operation among themselves to give the railroads the protection they require. The action of the Interstate Commerce Commission in setting aside a rule of two years' standing in order to permit the carriers to buy their fuel coal with cars must be due to pressure from the roads themselves.

Technically the operators have lost, but it remains to be seen whether they have not after all achieved more than they realize. It will be good policy for the roads to use their regained power with care, avoiding the abuses of the past, for the operators no doubt will renew their pressure for equal running time for all mines at the first opportunity.

## Why Costs Are Higher

A STRIKING point demonstrated by the figures of the Federal Trade Commission for January, 1920, on the operation of coal mines reported this week in our Washington correspondence is the relationship between the rate of production and the f.o.b. mine costs. It is clear from the comparisons set forth in this first monthly summary that the decreased rate of coal production has been an important factor in this matter and in part has been the cause of an alarming decrease in the so-called "margin per ton" from which the operators are expected to get their profits as well as return upon the investments.

From the report we are led to conclude that the cost to the operators of the 14 per cent wage increase was about 25 cents per ton on the average. This figure is about what would be expected from the fact that the labor item is in total \$1.49 for 1918. The costs reported for supplies and general expenses and the sales realization for January do not differ materially from the results of the year 1918, during much of which the same government prices were in vogue as in January. As a consequence the margin per ton is about the same or decidedly smaller in all districts except the Rocky Mountain field, where a bare 10 per cent increase is noted.

On the average of all the territory covered the margin is 42 cents per ton. Those who have looked

for the reason of the increases in price that followed the removal of Government restriction April 1 can look at this low figure for their answer.

The influence of the lowered rate of output in some mines on the increase in costs is shown in these figures. On the average there is an increase of 23 cents per ton, which is, it happens, exactly the figure found for the group of plants which report within 5 per cent of the same rate of production for the month as their average for 1918. Other plants with increases in rate of production show somewhat smaller increases in cost, as would be expected as the result of the possibilities of greater efficiency at greater rates of output. When the rate of output is 25 per cent or more below that of 1918 we find a tremendous increase in costs, which is reported as \$1.17 per ton for this group. The penalty of low production is thus most strikingly set forth.

Such cost studies cannot be other than interesting and valuable. We lose them almost as soon as they start, for the Federal Trade Commission has been enjoined their further collection.

## Inquisitors Curbed

THE decision rendered by Justice Bailey of the District of Columbia Supreme Court grants a temporary injunction which restrains the Federal Trade Commission from requiring monthly reports of costs of production from the coal operators. It thus in the very first round registers victory for the National Coal Association. A permanent injunction is yet to be sought and finally the Supreme Court will be called upon to pass judgment. It is expected that in the course of two or three months the permanent injunction will issue, the Federal Trade Commission preferring to renew its fight before the court of last resort.

It is more than significant that Justice Bailey based his decision on constitutional grounds. He appears to differentiate between the producing of coal and its selling and shipping, and holds that producing is always intrastate business and therefore not subject to such investigation by the Government as has been attempted by the Federal Trade Commission. Such an opinion, if sustained, will seriously curtail the activities of the commission, which result, of course, is just what the coal operators desire.

What is more noteworthy perhaps is the change of heart on the part of the coal industry made evident by its purpose to trim the wings of the commission. But a few short years ago, when Edward Hurley was chairman of the Federal Trade Commission, the mine operators met with open arms his propoganda on cost accounting and as late as 1916 the operators willingly gave these same monthly cost reports to the commission.

The fall from grace can be blamed on none other than the Federal Trade Commission itself. This government body, first a star of hope, is now in sad disfavor with American business generally. In this particular instance the coal industry does not so much object to being singled out for investigation of costs and profits as to the arbitrary manner in which it has been ordered about and to the doubt whether it will receive fair treatment afterward, a distrust bred of experience with the publicity given by the commission to its previous cost investigations.

## Wrong Time to Urge Storage

THE COUNCIL of National Defense recently issued a statement, which is reprinted elsewhere in this issue, severely criticizing the bituminous coal operators for recent increases in prices. Comment on this utterance seems called for. In the first place we doubt much that the Council of Defense has actual evidence that prices have made any considerable advance. The Attorney General issued a broadcast warning, but he has accused no one in particular. Here and there, it is true, operators and jobbers are asking, and consumers are offering, absurdly high prices for special grades of coal or for exceedingly prompt delivery, but it is more than doubtful whether the practice is general.

But these relatively few cases must be singled out from the general advance in price made on April 1 to offset the wage increase of 27 per cent. Based entirely on that advance, costs of production were augmented about 20 per cent over those current last year, and no one has any right to expect the coal operators to absorb all or any part of this increase in production costs.

So long as the operator does not have the right to discuss prices the producer who would be reasonable has no control over those operators who are disposed to call for and accept all the market will stand. In one Eastern field a policy has been adopted of preventing the spread of news or gossip about "\$5 coal" on the theory that if such a story spreads many will be incited by example to boost prices unduly.

It will be remembered that the Bituminous Coal Commission urged a "buy-early" campaign. Mr. Shenton now says that he meant that consumers should not buy until May 15, the date on which he concludes prices will go down of their own accord. Some *attachés* of the commission, Mr. Reynolds in particular, were so enamoured of the "buy-early-and-store" plan that they tried to get the coal operators behind it.

The National Coal Association, having tried it last summer, when the market was poor, is wise enough to keep hands off this spring, when demand is at a peak. The Council of Defense, in urging buying, seriously erred in its judgment of conditions and now apparently does not wish to be held to blame for any rise in prices that may well be charged to that unfortunate advice.

## Portage Protests

A COAL OPERATOR in Portage protests against the editorial entitled "What Other Earnings Do Miners Make?" that appeared in *Coal Age* some little while back. He objected to the statement that mine workers worked on farms and elsewhere during idle periods.

Probably he is not the only one who felt in the same way about the matter. There are some sections, of course, where the mine workers do not farm when their mines are idle, and operators in those sections who care more for the truth than for winning the strike—and many of them really do though they get little credit for it—are apt to think that the editorial exaggerated, if it did not misrepresent, the facts.

However, it is true that there are many localities, especially those in which mining is a newly entered craft and where the operation is mainly by American-born citizens—whether intelligent citizens or mere "sagers"—where there is a disposition to leave mining for the plow. In some sections the men are sons of

farmers who were bred on the farm and have relatives still cultivating the soil. This may not be true of Portage, and it cannot be asserted of foreigners whose failure to understand English makes them undesirable farm operatives, for on the farm they cannot be placed under immediate supervision, and furthermore they cannot be paid on the basis of the work they actually perform.

But it is true that mine workers do quite a little farming in many of the central Pennsylvania fields. Mines in such regions have frequent strikes in the summer. The men like to strike, for then they can go a-harvesting and sometimes draw strike pay besides. One year an operator near Foxburg, Pa., shut down his mine altogether because the men were constantly laying off for one excuse and another, the real animating cause being a desire to help the Brousiuses and Kellersmans gather in the grain or hoe the corn.

At another mine a strike lasted for months, the dispute having a clearly defined day for settlement—namely, Harvest Home. Many a strike has a direct connection with the twin occupation of mining—namely, farming. The fields stretch down almost to the mine mouth and on an idle day the men are up and away fixing their fences, building a pen for the hog or scalding him in the yard, plowing, seeding and doing other chores at home or in the house of a relative, a friend or a neighbor.

## "Doughnut" Picking Tables

WE PRINT on page 791 of this issue a description of the surface works at Nanty Glo, Pa. To many coal operators more than ordinary interest attaches to the preparation appliances here installed. Here for the first time revolving circular, annular, ring-shaped or what might from their form be termed "doughnut" picking tables have been tried.

A revolving doughnut-picking table unquestionably possesses some interesting possibilities. In the first place the construction is extremely simple. The plate ring, suitably stiffened and reinforced with structural shapes, is supported upon double-flanged wheels and is driven through a large segmented level gear and pinion from a motor. Thus with the table set level the only power required for driving will be that necessary to overcome friction and that consumed in removing the coal from the table platform.

This type of picking table, aside from the motor and gearing that drives it, has in its simplest form a minimum of moving parts, these being confined to the bed and the requisite supporting rollers. The simplicity of construction is immediately apparent.

On the other hand, this type of table requires a somewhat different arrangement and shape of picking room than does the ordinary apron. Naturally the building must be wider in order to accommodate the circular table. Obviously also the picking room need not be as long as would be necessary for the installation of a traveling apron.

For loading the larger sizes of prepared coal from such picking tables as these either the traveling-apron loading boom or the shaking chute could doubtless be used to advantage. In all probability either of these devices might be so arranged as to give only a small drop and consequently a minimum of degradation.

# Secretary Payne Denies Government Liability for Diversion of Coal

In Letter to the Graff Mining Co. Secretary of the Interior Cites Opinion of Attorney General That the United States Is Not Liable to Pay for Diverted Fuel

**A**N important opinion in connection with the adjudication of claims against the Fuel Administration has been expressed by the Secretary of the Interior in a letter to the Graff Mining Co. at Blairsville, Pa. In a letter dated April 14, Secretary Payne says:

"Your letter of March 20, 1920, addressed to the Bureau of Adjustments, Fuel Administration, Washington, D. C., has been referred to this department for consideration.

"It relates to your claim in the amount of \$151.93, for a car of coal, C. & O. No. 55,545, shipped on Sept. 28, 1918, to the American Mills Co., Waterbury, Conn., and diverted by order of the U. S. Fuel Administrator for the State of Connecticut to the Barnum-Richardson Co. of East Canaan, Conn., which is now in the hands of a receiver. You state that on Feb. 14 you received a check for \$6.44 from the receiver in full payment for this car, and that you refused to accept it.

"The records show that you were in correspondence with the Fuel Administration with respect to this claim, and that on May 13, 1919, you were advised that nothing could be done for you in the matter, pending further advice from the Department of Justice, and that the Fuel Administration had no funds which could be legally disbursed for the payment of such claims.

## CONSUMER IS LIABLE FOR PAYMENT

"All shipments of coal, whether f.o.b. mines or otherwise, and all shipments of coke f.o.b. ovens or at place of storage or otherwise shall be made subject to the diversion of such coal or coke by the U. S. Fuel Administrator or any persons acting under his authority, to any persons or consumers, and for any of the purposes heretofore or hereafter authorized by him. The title of the purchaser, consignee or consumer, in the case of any such shipments of coal or coke, which by custom or law might become vested at the time and place of such shipment, shall from and after the effective date hereof be subject to the condition that the coal or coke so shipped may be diverted as aforesaid, and that in case of any such diversion, the title and interest of such purchaser, consignee or consumer with respect to any coal or coke so diverted shall be completely divested and terminated and his liability to pay therefor shall cease.

"The person or consumer to whom any such coal or coke is diverted shall become liable as of the time of such diversion to pay to the shipper thereof the price in force at the date of shipment as fixed therefor by or under authority of the President of the United States, plus transportation charges thereon and plus a handling charge of 15c. a net ton to cover costs of rebilling, collection and replacement. If such handling charge is made, no jobber's commission shall be added to the mine's price. If the coal or coke so diverted was shipped under a valid and enforceable contract, the quantity thereof so diverted shall not be charged against the amount to which the contract applied.

"The Fuel Administration is no longer in existence and by Executive order of March 20, 1920, the Secretary of the Interior was authorized and directed to adjust, liquidate and pay claims against the Administration. Under this order the authority of the Secretary of the Interior is limited to the allowance of claims for which the United States is legally liable, and for which appropriations have been provided by Congress. No such appropriations have been made for losses arising from the diversion of coal under the orders of the Fuel Administration, and the Attorney General has rendered an opinion that in cases of this character the United States is under no legal liability to pay for the coal.

## DEPARTMENT HAS NO AUTHORITY OR FUNDS

"From the foregoing you will see that this department is without legal authority or funds to adjudicate or pay your claim. Authority to so adjudicate and pay can only be had by act of Congress."

In connection with the letter to the Graff Mining Co. the ruling of the Attorney General on this subject is of interest. In a letter to the Fuel Administration dated June 6, 1919, the Attorney General says:

"This will acknowledge receipt of your letter of May 29, relative to the liability of the United States for coal diverted by order of the Federal Fuel Administration.

"The only question discussed in your letter which seems to require answer is what course should be taken in those cases in which bankruptcy or other judicial proceedings are known to be pending against the person to whom the coal was diverted. This involves the question of the liability of the Government for coal diverted by order of the Fuel Administration under Publication No. 14 of Jan. 14, 1918. This publication is as follows:

"This was issued, as we understand, pursuant to the first paragraph of Section 25 of the Food and Fuel Control Act, which confers upon the President authority to establish rules for the regulation of and to regulate the method of production, sale, shipment, distribution, apportionment or storage of coal.

"By this regulation it is apparent that the Government assumed no liability for the purchase price of the coal but was merely acting as an agency to secure the proper distribution as between consumers.

"As this was a valid regulation the liability of the Government must be measured by its terms. It being clear from the terms of the regulation that there is no liability assumed by the Government, we think none arises.

"If the regulation is beyond the power of the Fuel Administration, it, of course, could not impose any liability upon the Government; and we therefore suggest that in the cases under consideration you should deny the existence of any legal liability."

# NEWS FROM THE CAPITOL

BY PAUL WOOTON

## Commission Authorizes Assigned Cars

**A**SSIGNED cars became a reality again on April 16, when the Interstate Commerce Commission issued the following notice:

"The supply of cars available for the transportation of coal continues insufficient to meet the demand. In view of the cessation of Government control of coal production and distribution, effective April 1, 1920, and in order that railroad fuel requirements may be reasonably met without the necessity of carriers resorting to confiscation of commercial coal, it becomes necessary to amend our notice to carriers and shippers dated March 2, 1920, and our recommendation therein to read as follows:

The Commission recommends that until experience and careful study demonstrate that other rules will be more effective and beneficial, the uniform rules as contained in the Railroad Administration's Car Service Section Circular CS 31 (revised) be continued in effect, except that rule 8 as contained in said circular should be amended to read:

8. Private cars and cars placed for railroad fuel loading in accordance with the decisions of the Interstate Commerce Commission in *R.R. Com. of Ohio, et al. v. H. V. Ry. Co.*, 12 I.C.C. 398, and *Traer v. Chicago & Alton R.R. Co., et al.*, 13 I.C.C. 451, will be designated as "assigned" cars. All other cars will be designated as "unassigned" cars.

"The commission is of opinion that an emergency exists requiring immediate action, and in exercise of the authority conferred by paragraph 15 of Section 1 of the Interstate Commerce Act, as amended by Section 402 of the Transportation Act, 1920, hereby suspends the operation of the existing rule 8 and directs the observance by all carriers by railroad subject to the Interstate Commerce Act of rule 8 modified as above, effective April 16, 1920, and until the further direction or order of the commission."

## Federal Trade Commission Begins Series of Monthly Coal Costs

Returns of Operators Taken, Without Revision of Figures, Accentuate Increased Production Cost

**V**ARIOUS statistical deductions compiled from the monthly reports made to the Federal Trade Commission by bituminous coal operators appeared under date of April 20 in bulletin form, issued by the commission. This bulletin is to appear monthly in the future. In addition, final and more comprehensive figures will be issued quarterly. In bringing out its first bulletin the Trade Commission states its object is to "make public the essential facts concerning changes of cost with the least possible delay."

The commission calls attention to the fact that the figures are taken from the operators' returns, without having been subjected to any critical analysis or revision.

It was stated, however, that the experience of the commission indicates that the revision will reduce by not more than a few cents per ton the costs claimed.

An interesting portion of the report is as follows:

The average increase here shown for the United States for January, 1920, was 23c. per ton, or an average increase of 11 per cent over the 1918 total f.o.b. mine cost. This increase is attributable to two chief causes: (1) The higher wage scale put into effect November, 1919, as a result of the Fuel Administrator's recommendation of 14 per cent increase in the wages of mining labor, and (2) the small decrease in the January, 1920, output from the average monthly output of 1918. The changes in the supplies and general expense costs were of minor importance.

The great diversity in mining conditions between the different districts, both in regard to thicknesses of seam mined and the relative use of machinery in mining the coal, caused the wage increase to affect to a different degree the labor costs of the various districts. In the Federal Trade Commission's coal cost reports for 1918 much detailed information on these diverse conditions is available.

To throw light on the effect which a diminished production has in increasing the costs, the following tabulation for 1,272 operators has been carefully made. Taking their average monthly production in 1918 as a base, they have been grouped according to the relative decrease or increase of their production in January, 1920; and their total f.o.b. mine cost increases are thus shown in relation to changes in production. A 14 per cent increase (the Garfield recommendation) over the wage scale in effect throughout 1918 was made in November, 1919, and was in general effect during January, 1920.

DISTRIBUTION OF TOTAL F.O.B. MINE COST INCREASES ACCORDING TO CHANGES IN PRODUCTION TONNAGE OF 1,272 OPERATORS, JANUARY, 1920, FROM AVERAGE MONTHLY PRODUCTION, 1918

Change of January, 1920, Production from 1918 Average Monthly Production	No. of Operators	Production January, 1920 Tons	Increase of Jan., 1920, Claimed Cost Over 1918 Annual Claimed F.O.B. Mine Cost Per Cent
Decrease over 25 per cent	3	8,114	\$1.17 33
Decrease 16-25 per cent	132	2,270,419	.29 15
Decrease 6-15 per cent	410	7,374,005	.28 14
Decrease 0-5 per cent			
Increase 0-5 per cent	312	4,546,242	.23 10
Increase 6-15 per cent	210	2,784,344	.19 9
Increase 16-25 per cent	127	2,651,976	.15 7
Increase over 25 per cent	78	996,127	.12 5
Total	1,272	20,631,227	\$0.23 11

As far as can be judged, therefore, from the returns at present available, the increased cost attributable to the increased wage scale is about 23 cents per ton, or 10 per cent (the increased cost shown in above table for the group where production changed least—5 per cent or less—and where the effect of the wage agreement is consequently best seen). For the total—1,272 operators—the average decrease in tonnage was 2 per cent and their average increase in cost 23 cents per ton, or 11 per cent. This increase of about 23 cents per ton, or 11 per cent, was the result in January, 1920, of the "Garfield" 14 per cent wage increase, which it should be noted is about one-half of the total increase (27 per cent) recently recommended by the United States Bituminous Coal Commission.

The figures of the Trade Commission accentuate the influence of increased production on costs. For instance, there were 86 operators in eleven districts whose increase in production was so great as to more than absorb the wage increase. Their costs in January, 1920, were lower. The figures cannot be regarded as typical because the amount mined was less than 750,000 tons. These instances were as follows:

Field	Operators	Tonnage
No. 1, Ohio	3	10,920
No. 3, Ohio	16	84,336
Pittsburgh seam, W. Va.	8	150,616
No. 2, Ohio	14	47,770
No. 4, Ohio	5	16,375
No. 7, Ohio	6	49,519
No. 2, Illinois	21	219,361
Michigan	4	73,398
M-M-I, Iowa	4	73,036
Ex-Logan, Arkansas	3	5,020
Anthracite, Arkansas	2	5,635
Total	86	735,986

# Federal Trade Commission's Cost Order Held Unconstitutional

Decision of Justice Bailey of District Supreme Court Sets Aside on Constitutional Grounds the Right of Government to Compel Coal Operators to Make Cost Reports—  
Federal Trade Commission Will Appeal to Supreme Court.

JUSTICE Bailey, in the Supreme Court of the District of Columbia, in a decision handed down April 19, in the case of Maynard Coal Company against the Federal Trade Commission, held that the Commission had no authority to require from coal operators reports concerning cost of production, amount of tonnage, and financial condition as prescribed by the order of the Federal Trade Commission and the accompanying form of reports and detailed instructions which were sent coal operators throughout the country in January of this year.

In this litigation, which was instituted by the National Coal Association as a test case about a month ago, it was contended by the Federal Trade Commission that they had the power to require such detailed reports concerning all of the business of any coal operator—both that portion of its business which had to do with the mining of coal and its intrastate shipments as well as its interstate shipments, provided such coal company shipped any portion of its coal to points in States other than the State of its production.

## DECISION HAS FAR-REACHING EFFECT

If the contention of the Commission had been sustained it would have necessarily followed that the Commission had the right to require such detailed reports not only from coal operators but from all manufacturing and commercial concerns throughout the country which ship any portion of their product in interstate commerce. Justice Bailey's decision affects the interests of practically every mining, manufacturing and commercial house in the United States.

In this decision Justice Bailey held that the effect of the Commission's order would be to force the coal operators to change their bookkeeping methods and to report in detail not merely concerning their interstate commerce transactions but concerning their intrastate sales as well, and their purely intrastate business of producing coal. Justice Bailey held that it was beyond the power of the Commission to require reports of that character, and that it was beyond the power of Congress to authorize the Commission to require such reports.

He held that under the commerce clause of the Constitution of the United States, Congress might authorize the Commission to require such reports with reference to the interstate business of the coal operators and that the Federal Trade Commission Act must be construed as limiting the power of the Commission in this regard to such interstate commerce transactions in order to render it constitutional. In this opinion he said: "And the information required in this case is such as would apply as well to a corporation whose business was wholly intrastate as to the plaintiff—that defendant unquestionably is demanding information as

to intrastate commerce and as to coal production, and frankly asserts the right to do so."

He then asserts: "That there is radical distinction between production and commerce is clear," and cites in support of this proposition a long line of decisions of the Supreme Court of the United States: "In order for the Federal Trade Commission to have the power to require the plaintiff to make reports as to the mining of coal and as to its intrastate shipments, it must appear that this information is necessary to or connected with some object over which the general Government has power. There is no claim made that there is any proceeding pending involving the Anti-Trust Act or unfair methods of competition, or under the Clayton Act, but in its order defendant demands reports in all the business of the plaintiff."

In concluding that portion of his opinion dealing with the fundamental constitutional questions involved Justice Bailey said: "But did Congress undertake to vest such power in the Commission? It is the duty of the courts, if possible, to give the statute a construction which would not conflict with the Constitution. The corporations referred to in the Act are, by its terms, limited to those engaged in 'commerce' as defined in the Act, and all the powers vested in the Commission should be and it seems may be construed with this limitation. *But the Commission has undertaken to construe the Act otherwise, and to take steps under its construction of the Act to require information and reports not relating to interstate commerce, but relating chiefly or wholly to production, and under its order the information which it has the power to demand cannot be separated from that over which it has no control.* While as to other matters Congress may authorize the Commission to obtain information upon any subject which in its judgement it may be important for it to possess, it may not *compel* the production of such information in respect to matters over which the Federal Government has no control."

## NO DECISION ON TRANSFER OF POWER

With reference to the contention made on the part of the plaintiff that any powers that the Federal Trade Commission may have at any time possessed to require reports from coal operators was transferred to the Fuel Administration by the Executive order of the President of July 3, 1918, made under the provisions of the Overman Act, Justice Bailey said that it was unnecessary for him to pass upon that question in view of his conclusion as to the lack of power on the part of the Commission.

Justice Bailey held that a temporary injunction should issue in accordance with the prayer of the bill, and such order is now being drafted by counsel and will shortly be submitted to the Court for entry.

## Text of Injunction Decision Against Trade Commission

**T**HIS is an application for an injunction to restrain the Federal Trade Commission from taking steps to collect a penalty for failure on the part of the plaintiff, The Maynard Coal Company, to make certain reports called for by the Commission. The bill is supported by several affidavits of expert accountants. The defendant Commission has filed its answer, but on account of insufficient verification, it cannot be treated as an affidavit. It has also filed with its answer several affidavits, which will be noticed hereafter.

The plaintiff is a corporation engaged in the mining, production and sale of bituminous coal. It owns and operates mines in Kentucky and Ohio. Practically all of the coal mined in Kentucky and about one-half of the coal mined in Ohio is shipped to points without those states, and the remainder of that mined in Ohio to points in that state.

On Jan. 31, 1920, the defendant Commission served upon a large number of coal mining corporations, including the plaintiff, an order requiring them to report "monthly cost of production and other data," as set out in specification accompanying the order, for each calendar month of the year 1920 and until further notice. The information and reports required are very full and detailed as to production, sales, management, financial condition, depreciation, etc., and all to be calculated as prescribed in the specifications. The plaintiff claims, and from the affidavits filed such appears to be the fact, these reports cannot be made without a large change in the plaintiff's method of bookkeeping and accounting, and at a very considerable expense.

The Commission claims that it may require these reports under the authority placed in it by the Act of Congress creating the Commission approved Sept. 26, 1914, and that Congress has the authority to so empower the defendant under the clause, known as the Commerce Clause of the Constitution of the United States.

"Congress shall have power \* \* \* \* to regulate commerce with foreign nations and among the several states with the Indian Tribes."

The part of the Federal Trade Commission Act pertinent to this inquiry are substantially as follows:

Commerce is defined, Section 4, as "commerce among the several states or with foreign nations, or in any Territory of the United States or with foreign nations, or between any such territory and another, or between any such territory and any state or foreign nation, or between the District of Columbia and any state or territory or foreign nation."

Section 5 provides that unfair methods of competition in commerce shall be unlawful, and empowers the Commission to take steps to prevent such unfair methods and prescribes the procedure for carrying out such purpose.

Section 6 of the Act provides: "That the Commission shall have power—

*a* To gather and compile information concerning, and to investigate, from time to time the organization, business, conduct, practices, and management of any corporation engaged in commerce, excepting banks and common carriers subject to the Act to regulate commerce, and its relations to other corporations and to individuals, associations, and partnerships.

*b* To require, by general or special orders, corporations engaged in commerce, excepting banks, and common carriers subject to the Act to regulate commerce, or any class of them, or any of them, respectively, to file with the Commission in such form as the Commission may prescribe annual or special, or both annual and special, reports or answers in writing to specific questions furnishing to the Commission such information as it may require as to the organization, business, conduct, practices, management and relations to other corporations, partnerships, and individuals of the respective corporations filing such reports or answers in writing. Such reports and answers shall be made under oath, or otherwise, as the Commission may prescribe, and shall be filed with the Commission within such reasonable time as the Commission may prescribe, unless additional time be granted in any case by the Commission."

Subsection *c* empowers the Commission, when a final decree has been entered by a corporation under the Anti-Trust Acts, to investigate the manner in which the decree is being carried out.

Subsection *d* authorizes the Commission upon direction of the President of either House of Congress to investigate alleged violations of the Anti-Trust Act.

*f* To make plans, from time to time, such portions of the information obtained by a recorder, except trade secrets and names of customers as it shall deem expedient in the public interest, and to make annual and special reports to the Congress

and to submit therewith recommendations for additional legislation; and to provide for the publication of its reports and decisions in such form and manner as may be best for public information and use."

*g* "From time to time to classify corporations and to make rules and regulations for the purpose of carrying out the provisions of this Act."

*h* "To investigate, from time to time, trade conditions in and with foreign countries where associations, combinations or practices of manufacturers, merchants, or traders, or other conditions, may affect the foreign trade of the United States, and to report to Congress thereon, with such recommendations as it deems advisable."

The defendant in its answer admits "that no complaint had been filed by or before it charging the plaintiff with unfair methods of competition or with the violation of the Federal Trade Commission Act or the Anti-Trust Acts and admits that the information sought to be secured from the plaintiff may not throw any light or have any bearing upon any possible violation of any of the acts aforesaid, but asserts that such information is sought for the lawful purpose within the scope of the powers conferred upon the defendant by Section 6 of the said Commission Act.

The authority of Congress to enact this legislation is claimed under the power to regulate commerce above set out. The reports demanded of the plaintiff are not limited to questions connected with the shipment of coal in interstate commerce or the contracts in reference to, or the prices of coal so shipped, but relates almost entirely to the mining of coal and the price at which it is sold, and the financial condition and operations of the company, and all without any attempt to limit the inquiry to matters pertaining to the coal shipped in interstate commerce.

In fact the Commission in its answer "denies that the plaintiff has the right to segregate its business and to say that part of its business is interstate and part is intrastate, but in order to ascertain if defendant is engaged in commerce, the Courts will look to the entire business transactions of the plaintiff, and if any part of its business is intrastate and a part interstate and the whole business is conducted under one organization as is set forth and admitted in the plaintiff's bill, then the defendant insists that the plaintiff, considering its business as a whole (is engaged in) interstate commerce and the defendant has the right to ask the information sought.

And the information sought in this case is such as would apply as well to a corporation whose business was wholly intrastate as to the plaintiff. The defendant unquestionably is demanding information as to intrastate commerce and as to coal production, and frankly asserts the right to do so.

That there is a radical distinction between production and commerce is clear.

In *Kidd vs. Pearson*: 128 U. S. 1, Mr. Justice Lamar said, p. 20.

"Manufacture is transformation—the fashioning of raw materials into a change of form for use. The functions of commerce are different, the having and selling and the transportation incident thereto constitute commerce; and the regulation of commerce in the constitutional sense embraces the regulation at least of such transportation. The legal definition of the term, as given by this court in *County of Mobile vs. Kimball*, 102 U. S. 691, 702, is as follows: "Commerce with foreign countries and among the States, strictly considered, consists in intercourse and traffic, including in these terms navigation, and the transportation and transit of persons and property, as well as purchase, sale, and exchange of commodities." If it be held that the term includes the regulation of all such manufactures as are intended to be the subject of commercial transactions in the future, it is impossible to deny that it would include all productive industries that contemplate the same thing. The result would be that Congress would be invested, to the exclusion of the states, with the power to regulate, not only manufactures, but also agriculture, horticulture, stock raising, domestic fisheries, mining—in short, every branch of human industry. For is there one of them that does not contemplate, more or less clearly, an interstate or foreign market? Does not the wheat grower of the North-west, and the cotton planter of the South, plant, cultivate, and harvest his crop with an eye on the prices at Liverpool, New York, and Chicago? The power being vested in Congress and denied to the States, it would follow as an inevitable result that the duty would devolve on Congress to regulate all of these delicate, multiform, and vital interests—interests which in their nature are and must be, local in all the details of their successful management."

In *United States vs. Knight*: 156 U. S. 1, page 12, Mr. Chief Justice Fuller said:

"Doubtless the power to control the manufacture of a given thing involves in a certain sense the control of its disposition, but this is a secondary and not the primary sense, and although the exercise of that power may result in bringing the operation of commerce into play, it does not control it, and affects it only incidentally and indirectly. Commerce succeeds to manufacture and is not a part of it."

In *Addyston Pipe & Steel Co. vs. United States*, 175 U. S. 211, which involves the Anti-Trust Act of July 2, 1890; Mr. Justice Peckham, after holding that Congress had the power to regulate interstate commerce could regulate any agreement or combination that operated upon the sale, transportation and delivery of an article of interstate commerce, on page 27, said:

"Although the jurisdiction of Congress over commerce among the states is full and complete, it is not questioned that it has none over that which is wholly within a State, and therefore none over combinations or agreements so far as they relate to a restraint of such trade or commerce. It does not acquire any jurisdiction over that part of a combination or agreement which relates to commerce wholly within a State, by reason of the fact that the combination also covers, and regulates commerce which is interstate. The latter it can regulate, while the former is subject alone to the jurisdiction of the State. The combination herein described covers both commerce, which is wholly within a State and also that which is interstate.

"In regard to such of these defendants as might reside and carry on business in the same State where the pipe provided for in any particular contract was to be delivered, the sale, transportation and delivery of the pipe by them under that contract would be a transaction wholly within the State, and the statute would not be applicable to them in that case. They might make any combination they chose with reference to the proposed contract, although it should happen that some non-resident of the State eventually obtained it."

In *Delaware, Lackawanna & Western Railroad Co. vs. Yrukonis*, 258 U. S., 439, a case involving the Federal Employers' Liability Act, Mr. Justice Day, page 444, said:

"The averments of the complaint as to the manner of the receiving of the injury by plaintiff showed conclusively that it did not occur in interstate commerce. The mere fact that the coal might be or was intended to be used in the conduct of interstate commerce after the same was mined and transported did not make the injury one received by the plaintiff while he was engaged in interstate commerce. The injury happening when the plaintiff was preparing to mine the coal was not an injury happening in interstate commerce, and the defendant was not then carrying on interstate commerce facts essential to recovery under the Employers' Liability Act."

In *Coe vs. Errol*, 116 U. S. 517, it was held that logs out in New Hampshire and hauled to Errol, N. H., to be transported to Maine were not in interstate commerce, Mr. Justice Bradley, page 525, said:

"When the products of the farms or forest are collected and brought in from the surrounding country to a town or station serving as an entrance for that particular region, whether on a river or a line of railroad, such products are not yet exports, nor are they in process of exportation, nor is exportation begun until they are committed to the common carrier for transportation out of the State to the State of their destination, or have started on their ultimate passage to that State. Until then it is reasonable to regard them as not only within the State of their origin, but as part of the general mass of property of that State, subject to its jurisdiction, and liable to taxation there, if not taxed by reason of their being intended for transportation, but taxed without any discrimination, in the usual way and manner in which such property is taxed in the State."

On page 528, he said:

"It is true, it was said in the case of the *Daniel Ball*, 10 Wall, 557, 565: Whenever a commodity has begun to move as an article of trade from one State to another, commerce in that commodity between the States has commenced. But this movement does not begin until the articles have been shipped or started for transportation from the one State to the other. The carrying of them in carts or other vehicles, or even floating them, to the depot where the journey is to commence is no part of the journey. That is all preliminary work, performed for the purpose of placing the property in a state of preparation and readiness for transportation. Until actually launched on its way to another State, or committed to a common carrier for transportation to such State, its destination is not fixed and certain. It may be sold or otherwise disposed of within the State, and never put in course of transportation out of the State. Carrying from the farm or forest, to the depot, is only an interior movement of the property, entirely within the State, for the purpose, it is true, but only for the purpose, of putting it into a course of exportation; it is no part of the exportation itself. Until shipped or started on its final journey out of the State it is a matter altogether in *ferri*, and not at all a fixed and certain thing."

In order for the Federal State Commission to have the power to require the plaintiff to make reports as to the mining of coal and as to its intrastate shipments, it must appear that this information is necessary to or connected with some object over which the general government has power. There is no claim made that there is any proceeding pending, involving the Anti-Trust Act, or unfair methods of competition, or under the Clayton Act, but in its order defendant demands reports on all the business of the plaintiff.

The defendant relies upon the visitatorial powers of Congress over corporations. In this connection it must be borne in mind that the power of Congress over an instrumentality of commerce, such as a common carrier, is far different from its powers over an ordinary business corporation which merely ships its products or a portion of its products over such carrier.

In fact, as said by Mr. Justice Holmes in *Smith vs. Interstate Commerce Commission*, 245 U. S. 33, on page 45, "It is not far from true—it may be it is entirely true, as said by the Commission (referring to the Interstate Commerce Commission)—that there can be nothing private or confidential in the activities and expenditures of a carrier engaged in interstate commerce."

Apart from the fact that plaintiff is a corporation, it is clear that Congress could not compel the production of the private books and papers of a citizen, except in the progress of judicial proceedings:

*Filbourne vs. Thompson*, 103 U. S., 168;

*Harriman vs. Interstate Commerce Commission*, U. S. 211; U. S., 407.

Mr. Justice Field, then sitting on the Circuit Court, in the case re *Pacific Railway Commission*, 32 Federal Reporter, 241, said: (page 250)

"And in addition to the inquiries usually accompanying the taking of a census, there is no doubt that Congress may authorize a commission to obtain information upon any subject which, in its judgment, it may be important to possess. It may inquire into the extent of the productions of the country of every kind, natural and artificial, and seek information as to the habits, business, and even amusements of the people. But in its inquiries it is controlled by the same guards against the invasion of private rights which limit the investigations of private parties into similar matters. In the pursuit of knowledge it cannot compel the production of the private books and papers of the citizen for its inspection, except in the progress of judicial proceedings, or in suits instituted for that purpose, and in both cases only upon averments that its rights in some way dependent for enforcement upon the evidence these books and papers contain."

(And again on page 254)

"But in accordance with the principles declared in the case of *Filbourne vs. Thompson*, and the equally important doctrines announced in *Boyd vs. U. S.*, the commission is limited in its inquiries as to the interest of these directors, officers, and employes in any other business, company, or corporation to such matters as these persons may choose to disclose. They cannot be compelled to open their books, and expose such other business to the inspection and examination of the commission. They were not prohibited from engaging in any other lawful business because of their interest in and connection with the *Central Pacific Railway Company*, and that other business might as well be the construction and management of other railroads as the planting of vines, or the raising of fruit, in which some of these directors and officers and employes have been in fact engaged. And they are entitled to the same protection and exemption from inquisitorial investigation into such business as any other citizen engaged in like business."

But the commission claims that, inasmuch as the plaintiff is a corporation, it has the authority claimed under the visitatorial power of Congress. That the power sought is visitatorial in its nature is clear. For in order to give the information and make the reports required, it will be necessary (that it is, so appears from the affidavits on file) for the plaintiff to keep records and books in addition to those now kept by it and by other corporations engaged in a like business, at a considerable expense, and to make monthly reports based on calculations made from such records.

This is not the simple obligation of a witness under a subpoena *duces tecum*, to answer questions and to produce books and records for inspection, but in addition to keep records and make calculations and reports. Such a burden cannot be imposed upon an ordinary witness:

*Northern Pacific Railway Co. vs. Keyes*, 91 Federal Reporter 47; 4 Wigmore No. 2203, page 2989.

The Commission contends that the order served upon the plaintiff does not undertake to prescribe methods of bookkeeping, nor to keep additional records, but under the allegations of the bill and the affidavits filed, I am of the opinion that this contention cannot be sustained.

The plaintiff cannot comply with its orders of the Commission without changing its methods of bookkeeping. That the Act undertakes to vest such powers (certainly as to matters connected with interstate commerce) in the Commission is clear from Section 10 of the Act which provides penalties for any person who shall wilfully, "neglect or fail to make or cause to be made, any false entry in any account, records or memorandum kept by any corporation subject to this act, or who shall wilfully neglect or fail to make full, true and correct entries in such accounts, records or memoranda of all facts and transactions appertaining to the business of such corporation." These powers could only be justified under visitatorial power.

It has been held that Congress has such visitatorial power over corporations engaged in interstate commerce in *Wil-*

son vs. U. S. 221 U. S., 361, and in *Ellis vs. Interstate Commerce Commission*, 237 U. S., 434, but in these cases the power was limited to that portion of the business which was under the control of the Federal Government.

No such power would seem to exist however as to other matters, and the two cases referred were cases in which subpoena *duces tecum* has been issued, requiring the production of a corporation's books in the one case before a grand jury investigating charges of fraudulent use of the mail and in the other before the Interstate Commerce Commission. And in the latter case the Court, through Mr. Justice Holmes, on page 444 (237 U. S.) said:

"If the price paid to the Armour Car Lines was made the cover for a rebate to Armour & Co., or if better cars were given to Armour & Co. than to others, or if, in short, the act was violated, the railroads are responsible on proof of the act. But the only relation that is subject to the Commission is that between the railroads and the shippers. It does not matter to the responsibility of the roads whether they own or simply control the facilities, or whether they pay a greater or less price to their lessor. It was argued that the Commission might look into the profits and losses of the Armour Car Lines (one of the matters inquired about) in order to avoid fixing allowances to it at a confiscatory rate, but the Commission fixes nothing as to the Armour Car Lines except under No. 15 in the event of which we shall speak."

"The appellant's refusal to answer the series of questions put was not based upon any objection to giving much of the information sought, but on the ground that the counsel who put them avowed that they were the beginning of an attempt to go into the whole business of the Armour Car Lines—a fishing expedition into the affairs of a stranger for the chance that something discreditable might turn up. This was beyond the powers of the Commission. In *re Pacific Railway Commission*, 32 Federal Reporter 241, *Interstate Commerce Commission vs. Brimson*, 154 U. S. 447, 478, 479, *Harriman vs. Interstate Commerce Commission*, 211 U. S. 407. The Armour Car Lines not being subject to regulation by the Commission its position was simply that of a witness interested in but a stranger to the inquiry, and the Commission could not enlarge its powers by making the Company a party to the proceedings and serving it with notice. Therefore the matter to be considered here, subject to the qualification that we are about to state, is how far an ordinary witness could be required to answer the questions that are before the court."

In the case of a corporation doing a wholly intrastate business, could it be said that Congress had any visitatorial power under the Commerce Clause of the Constitution of the United States? Clearly it has not. The fact that it happens to be the same corporation in this instance which mines and ships the coal does not give Congress any greater powers to regulate production and the intrastate commerce of such corporation. The visitatorial power of Congress is limited to that part of the business over which it has control, and which under the Constitution it has the power to regulate.

In *Hammer vs. Dagenhart*, 247 U. S. 251, it is said (page 260):

"While the power to regulate commerce among the several States is in the same grant and in the same terms with the power over foreign commerce, yet there is a difference with respect to the extent of that power growing out of the difference in the relation of the United States to the two kinds of commerce, and the difference in the right of the citizen of the United States and the foreigner to engage therein. As to foreign commerce, the United States possesses and exercises all the attributes of sovereignty. As to the interstate commerce, it exercises only that portion of sovereignty delegated to it."

(And again, page 261.)

"However much the Knight Case, 156 U. S. 1, may be weakened by later decisions, its distinction between production and commerce is still effective to prevent direct Congressional regulation of production as distinguished from sale and transportation."

The power claimed by the Commission is vast and unprecedented. The mere fact that a corporation engaged in mining ships a portion of its product to other States does not subject its business of production or its intrastate commerce to the powers of Congress. Doubtless the business of every coal mining corporation, whether engaged in interstate business or not, to some extent affects interstate prices and commerce, but, as stated in *U. S. vs. King* 156 U. S. 1 (above.)

"The power to control the manufacture if a given thing involves in a certain sense the control of its disposition, but this is a secondary and not the primary sense."

No sound reason is given why there is any difference in the business of coal mining of a corporation which ships its coal to another State and that of a corporation which does not. Interstate commerce is not affected any more in the one case than in the other.

In the case of *United States vs. Basic Products Co.*, 260 Federal Reporter, 472, in which it was urged that Section 6 of this Act was unconstitutional, not only in so far as it authorized investigation and compulsory disclosure of

matters which are beyond the commercial powers of Congress, but also in so far as it attempted to authorize a search or seizure by an administrative agency of the Government without charge or suspicion, Justice Orr of the District Court of the Western District, Pennsylvania, said:

"While the contention of counsel is probably sound, this Court does not deem it necessary to go further than to hold that the Commission has not the power to carry on investigations which it has assumed in the present case."

In the same decision he also said:

"Imagination, if not experience, can suggest that persons, partnerships, and corporations may be engaged in interstate commerce by the transportation of merchandise solely by water; that their activities may give them their income from lighterage; or they may be engaged in the sole business of forwarding goods, with no interest in the vessels or wagons on which they are transported. The foregoing are merely the illustrations of activities which may perhaps be within the scope of the powers granted to the commission by the act as found in the fifth section thereof."

"Imagination, however, cannot suggest such an extension of constitutional limitation as may justify the investigation undertaken by the commission in this case. Indeed, so far as it has been brought to the attention of the court, no such assertion of power has ever been made to the courts. Investigation under Subdivision A, Section 6, is limited to corporations engaged in interstate commerce. The defendant is engaged in manufacture."

I am of the opinion, therefore, that no such visitatorial power as that claimed by the Commission in the instant case has been vested in Congress by the Constitution, nor could Congress delegate such power to the Commission.

But did Congress undertake to vest such power in the Commission? It is the duty of the courts, if possible, to give the statute a construction which would not conflict with the Constitution.

*Knight Templar Co. vs. Jarman*, 187 U. S., 197, 205.

The corporations referred to in the Act are, by its terms, limited to those engaged in "commerce" as defined, the Act, and all the powers vested in the Commission should be and it seems may be construed with this limitation. But the Commission has undertaken to construe the Act otherwise, and to take steps under its construction of the Act to require information and reports not relating to interstate commerce, but relating chiefly or wholly to production, and under its order the information which it has the power to demand cannot be separated from that over which it has no control.

While as to other matters, as stated in *re Pacific Railway Commission*, supra, Congress may authorize the Commission to obtain information upon any subject, which, in its judgment it may be important for it to possess, it may not compel the production of such information in respect to matters over which the Federal Government has no control. It follows, therefore, that the Commission cannot compel the making of reports it has demanded of plaintiff.

The plaintiff further contends that this power of the Commission has been taken away by Presidential order. Much proof, in the form of affidavits, has been introduced by the defendant to show contemporaneous constructions of this order, and that the power claimed by the Commission in this case was not taken from it. The order is ambiguous, but, in view of my opinion as to the power of the Commission, it is not necessary to decide this question in passing upon application for a preliminary injunction.

Section 10 of the Act provides that "if any corporation is required by this Act to file any annual or special report shall fail to do so within the time fixed by the Commission for filing the same, and such failure shall continue for thirty days after notice of such default, the corporation shall forfeit to the United States the sum of \$100 for each and every day of the continuance of such failure, which forfeiture shall be payable into the Treasury of the United States, and shall be recoverable in a civil suit in the name of the United States brought in the district where the corporation has its principal office or in any district in which it shall do business."

The plaintiff has failed to file the report demanded and the Commission has notified it that steps will be taken to recover the penalty prescribed above. The jurisdiction of a court of Equity is not questioned by the defendants, and as I am of the opinion that the commission has not the power to exact the reports and information sought, the injunction prayed for will issue upon plaintiff executing bond with surety to be approved by the Court in the penalty of \$5,000.

Sgd. JENNINGS-BAILEY,  
Justice.

# FOREIGN MARKETS AND EXPORT NEWS

## Finland Neither Produces Nor Exports Coal

Commenting on the coal situation in Finland, Consul Leslie A. Davis, Helsingfors, states that that country produces no coal, lignite, nor coke, and exports none. The amount of coal and coke consumed in Finland during the period from 1913 to November, 1919, corresponded with the amount imported into the country during the same period.

The principal consumers are electrical and gas works, shipyards, and steamers. The factories have consumed some, but most of them, although equipped for burning coal or coke, have been obliged to use wood. Practically no coal has been used by private persons for heating purposes since 1913, as it has not been obtainable in sufficient quantities. Peat is used more or less for heating houses, especially in the northern part of the country; but wood is the kind of fuel in general use throughout Finland.

All the coal and coke imported comes from England. The greater part has come to Helsingfors, but some has been brought to Ilango, Abo, and Viborg. The only special discharging facilities are those of the gas works at Sornas (Helsingfors), which can discharge about 500 tons a day. Coal is unloaded elsewhere by wheelbarrows. All the coal and coke brought to Finland is consumed in the ports of entry. Consequently, there is no transportation of coal by land.

Imports of coal and coke from 1913 to November, 1919, were as follows:

Years	Coal		Coke	
	Long Tons	Value in Finnish Marks a	Long Tons	Value in Finnish Marks a
1913	528,518	13,424,381	4,787	1,459,154
1914	212,916	5,422,150	12,243	373,187
1915	4,490	684,609	2,843	742,151
1916	17,357	3,526,971	11,980	6,085,948
1917	8,988	734,350	7,130	3,622,152
1918	24,846	10,057,562	1,263	663,059
Jan.-Nov., 1919	29,401	14,423,591	5,060	1,885,631

a The normal exchange value of the Finnish mark is 19 3 cents. It is greatly depreciated at present.

Owing to the non-production of coal in Finland, and to the limited amount imported, there are no questions of capital and labor. Coal consumption and trade will be considerably increased by the resumption of normal shipping, as there is a persistent demand for coal at almost any price.

## Coal Exports for February Show Large Increase

Exports of bituminous coal totaled 1,168,806 tons during February; of anthracite, 272,368, a noteworthy increase compared with the same month of 1919. The classification of February exports as well as figures for February, 1919, have been compiled by the Bureau of Foreign and Domestic Commerce. They are as follows:

Coal:	Feb., 1919	Feb., 1920
	Tons	Tons
Anthracite	216,018	272,368
Bituminous	683,708	1,168,806
Exported to (in part):		
Italy	4,933	81,739
Netherlands	15,076	49,634
Canada	446,429	541,270
British West Indies	13,256	17,906
Cuba	40,644	130,846
Argentina	38,993	70,902
Brazil	67,825	47,241
Coke	48,806	59,866

The following tables show exports of domestic coal and coke from the United States by countries, as well as by customs districts, and also bunker coal supplied to

vessels in the foreign trade at specified districts during February, 1920:

## COUNTRIES TO WHICH U. S. COAL WAS EXPORTED

## Freight Rates to Europe Advance

Freight rates to Europe, according to W. W. Pattie & Co.'s coal trade freight report, are higher than a week ago but to other destinations they are unchanged. Rates by steamer are as follows:

	Rate	Tons Displaced
Stockholm	About \$23 00	800
Gothenburg	22 00/22 50	1,000
Antwerp/Rotterdam	19 50/20 00	1,000
Hamburg	21 50/22 00	1,000
French Atlantic excluding Rouen	19 50/20 00	800
Lisbon	18 00/19 00	1,000
Barcelona	21 50/22 00	1,000
Algiers	21 50/22 00	800
Genoa/Leghorn	22 50/23 00	1,000
Spezia/Savona	22 50/23 00	1,000
Piraeus	24 00/25 00	1,000
Trieste/Venice	About 24 00	1,000
Port Said	About 26 00	1,000
Constantinople	About 26 00	500
Pernambuco	About 15 50	500
Bahia	About 15 50	500
Rio	14 25/14 50	1,000
Santos	15 00/16 00	600
Buenos Aires or La Plata or Montevideo	13 00/13 50	1,000

Bermuda	7 00/7 50	300
Bermuda p. c. and dis. free		
Kingston	About 9 00	400
St. Lucia	About 9 50	500
Barbados	About 9 50	500
Santiago	About 8 00	500
Port of Spain, Trin	9 50/10 00	500
Curacao	8 50/9 00	500
Free p. c. Curacao		
Demerara	13 00	400
St Thomas	8 50/9 00	500

All above rates gross form charter.

## Turkey Plans to Increase Production of Lignite

Turkey's lignite mines are a striking illustration of that country's mismanagement of coal matters, according to the *Tasfirri Efkiar*, a Turkish newspaper. During the war these were exploited by the Government and the people, but after the armistice was signed work at the mines almost ceased.

The president of the "Commission d'Appropriation" declares that the lignite mines of Agatchli are in bad condition and that the Ayazma mines alone are being exploited by the "Direction des Usines de Guerre 'Imalati Harbié." The commission has studied this matter and has decided to employ all possible methods to increase production. For this purpose it has been decided to employ about two hundred Chinese laborers in the mines. The Ayazma mines are producing forty metric tons daily, but efforts will be made to increase this output.

## British Guiana Imports Coal

All coal consumed in British Guiana, states Consul McCunn, has to be imported, as none is produced in the colony. The quantity imported from the United States and Great Britain in 1918 was 86,600 tons, whereas in 1919 only 11,000 tons were received because of the lack of coal importations from the United States and the curtailment of those from Great Britain. In February the market was bare of all supplies. Georgetown is not a coaling station, and ships expecting to bunker there will generally meet with disappointment or be obliged to pay very high prices for any coal procurable.

# MARKET DEPARTMENT

## Weekly Review

*Demand for Coal Is Keen Everywhere—Western Conditions Are Improving—Hampton Roads Handles Cars More Speedily Than Before—Assignment of Cars for Railroad Use Seems Certain—Runaway Market in Evidence—Hard-Coal Situation Is Alarming*

WHEN the railroad strike is at an end, and from present indications it soon will be, many operators foresee the danger of a wild opening of the coal market and much speculation, together with fancy prices. It is hoped that this may be avoided, for if it is not the Government probably will resume price control.

Conditions in the West have improved in the past week. A better car supply has been reported, the "outlaw railroaders" having returned to work in that region. However, the effects of the acute shortage can still be seen in the cities, some of the large manufacturing plants having been forced to close, thus causing many men to be laid idle. Few dealers have been fortunate enough to renew last year's contracts for Eastern coal, and as a result these coals have practically disappeared from the Western market.

At Hampton Roads car supply has improved to such an extent that bottoms for which coal has been arranged

are being loaded with almost normal dispatch, and coal continues to be in active demand. In that locality more than a few signs are seen of a runaway market, \$9 having been paid for spot coal.

In New England the situation is possibly worse than in any other part of the East, and coal traffic is almost at a standstill. For quite some time the railroads have been operating on narrow margins and, no relief being in sight, a large portion of coal moving on the lines of the New York, New Haven & Hartford R.R. was confiscated by that road, thus leaving those plants to which the coal was destined in a serious plight.

Because of the tactless methods used by the railroads last year many of the operators in the coal industry have refused to renew last year's contracts, even though the purchasing agents are willing to pay higher prices. With conditions such as now rule furnishing an excuse, the practice of "assigning

cars" for railroad service will undoubtedly be restored, but even at that the railroads will have much difficulty accumulating reserves.

With the continuance of the boatmen's strike and embargoes still effective as a result of the switchmen's strike, conditions in the hard-coal industry are becoming alarming. Barges and tugs are tied up at the loading ports, and because of the few destinations to which shipments are permitted the tonnage shipped has been small.

The railroad strike has hit both the byproduct and beehive coke industry. On account of the unusual car shortage the byproduct ovens have been unable to secure stocks of coal such as they usually carry when conditions are normal, and these ovens are now suffering from an extremely severe shortage. Some fancy prices were paid for foundry coke, some reaching \$15 a ton, but most of the operators are resisting such increases and regard \$15 as a limit that should not be exceeded.

### WEEKLY PRODUCTION

The weekly report on the production of bituminous coal, anthracite, and beehive coke, compiled by the Geological Survey, Department of the Interior, April 17, 1920, states that the rate of production during the week ended April 10 was almost exactly the same as that of the preceding week. The total output of soft coal, including lignite and coal made into coke, is estimated on the basis of railroad shipments at 9,772,000 net tons. The line of 1920 production continued its course above the years 1917 and 1919 but failed to recover from the depression attending the advent of the new coal year as promptly as did the 1918 line.

The cumulative production in tons since the beginning of the calendar year follows with comparative figures for the three years preceding:

	Production first 86 working days
1917	152,013,000
1918	150,274,000
1919	118,730,000
1920	150,255,000

The year 1920 is thus within 1,760,000 tons of the record of 1917, has overtaken 1918 and has passed 1919 by 31,525,000 tons.

The production of anthracite during the week ended April 10 recovered slightly from the depression of the preceding week but failed to reach the level recorded in the last week of March. The total output (including sales to beehive coke and mine fuel) is estimated on the basis of reported railroad shipments at 1,177,000 net tons. This was an increase of 1.5 per cent over the week of April 3. Also, the observance of Good Friday and of St. Patrick's Day natu-

ally reduced the output. It was, however, 26 per cent less than that of the week of March 27.

The cumulative production since Jan. 1, 1920, now amounts to 23,043,000 net tons, an increase of 2,680,000 tons over the corresponding period last year, when the dull market prevailed which affected the coal after the armistice.

Production of beehive coke during the week ended April 10 is estimated at 477,000 tons, an increase of 1,000 tons over the revised figures for the preceding week. These estimates are based upon shipments reported by the principal carriers. Because of changes in organization attending the transfer of the railroads to private operation, the returns have in some instances been delayed and the figures presented are therefore subject to revision.

Compared with the corresponding week last year, when the post-war slump in demand had set in, the week's production showed a substantial increase. The cumulative production from Jan. 1, 1920, to April 10, amounted to 6,427,000 tons, as against 6,554,000 tons during the corresponding period last year.

### Atlantic Seaboard

#### BOSTON

Coal traffic almost at a standstill.—Railroads in need of fuel.—Industrial consumers anxious.—Dumping at New York and Philadelphia piers much curtailed.—Hampton Roads dispatch improved.—High prices prevail at rebundling points for inland delivery.—Anthracite receipts extremely light.

Bituminous—Except to points on the Boston & Albany and on the New Haven

there is only a very light volume of coal moving. The New York Central embargo against the Boston & Maine is still in effect, with no material improvement in sight. The New England roads are short of motive power and it will probably be several weeks before they can catch up. The fact that the railroads in this territory in themselves have been practically unaffected by the switchmen's strike is favorable for an earlier clearing up than would otherwise have been the case.

It develops that the railroads here are operating on very narrow margins of supply. Certain of them are removed to be down to 10 days, in any case, they have renewed wholesale confiscation of commercial coal in transit. On some of the railroads practically all of this coal was shipped prior to April 1, either on last year's contracts or on the recent Government price. The result is that a large number of consumers who have been deprived of their low-priced coal are irate over the necessity of now replacing this fuel at much higher prices.

The railroads are naturally finding it very difficult to arrange new contracts. Operators, many of them, are inclined to resent the tactless methods used a year ago and while some railroad purchasing agents are intimating their willingness to pay market prices they are at their wits' ends to know what to do to secure coal. "Assigned cars" are certain to be restored under present conditions, but even at that there is every prospect that railroads will have a lot of difficulty accumulating their reserves.

Steam users are so well aware of the general fuel situation that the trade is hearing very little from them. It is realized that shippers are helpless for the most part, and that until traffic is again being handled by the roads to and about

New York there will be very little chance of relief. Those who took advantage of opportunities a month ago to get steam anthracite are in that much better position.

At New York and Philadelphia dumping practically ceased on April 12. One of the New York piers has been worked spasmodically, but the Philadelphia and Reading piers at Philadelphia were out of commission the whole week. Coastwise tugs that ordinarily bunker at New York have been held at New London or Providence awaiting adjustment of present difficulties.

Hampton Roads coals are in active demand. Car supply and movement have improved to such extent that bottoms for which coal has been arranged are meeting with almost normal despatch. Very high prices are reported for spot coal. No. 3 has been realized per gross ton f.o.b. vessel, and this nets very close to \$7 at the mines. At the piers there are more than a few signs of a runaway market. Retail dealers here with important requirements dependent upon them and not enough Pocahontas or New River due them on contract are at a loss which way to turn.

Correspondingly high prices are being realized at this end. \$10.50@11.50 is still quoted on Pocahontas and New River on cars Providence and sales have been made at \$12 per gross ton f.o.b. Portsmouth, N. H.

Pocahontas and New River on contract are being sold at \$4.25 per net ton f.o.b. mines plus the 13 per cent wage increase. Spot coal is quoted f.o.b. mines at \$5@6.75.

**Anthracite**—Because of embargoes and the switchmen's strike at the piers the volume of domestic sizes headed for this territory is extremely light. Barges and tugs are tied up at the loading ports and all-rail there are so few destinations to which shipments are permitted to be made that the aggregate tonnage is small.

Another week of such conditions and the public will be getting alarmed. Not in years has the first half of April passed with so meagre a record of shipments.

**NEW YORK**

**Railroad strike depletes coal stocks at the New York Tidewater.**—Anthracite situation is serious.—Local yards are nearly bare of coal.—Steam sizes scarce.—Government and railroads confiscating coals.—New England situation improves.—Towboat owners get high rates for towing boats.—Local public utility corporations receive supplies.

**Anthracite**—Receipts at New York Tidewater have been seriously affected by the railroad strike. The loading piers are nearly bare of coal and what remains cannot be moved because of the refusal of the loaders to work while the railroad employees are idle. Another factor in the situation was the strike among the towboat men. This seriously interfered with deliveries and the few who remained at work were not willing to take the chances necessary to get the loaded boats from the loading piers to the retailers' dock.

The local situation is quiet. Coal is wanted but dealers cannot get it, although it is said there are many cars on sidings between here and mines. Retail dealers are in a serious condition. The smaller yards are nearly bare of coal and a continuance of present conditions for another week would find the city yards almost, without an exception, bare of supplies.

The smaller sizes are extremely short. Because of the strike of the railway employees no coal has been coming forward and the yard stocks have been reduced considerably because of the heavy consumption due to the unseasonable weather conditions. Buckwheat and rice are practically out of the market while the only available of the smaller sizes were barley and birdseye.

Current quotations for company coal per gross ton at mine and f.o.b., Tidewater, at the lower ports are as follows:

	Mine.	Tidewater.
Broken .....	\$5.95	\$7.80
Egg .....	6.35	8.20
Stove .....	6.60	8.45
Chestnut .....	6.70	8.55
Pea .....	5.30	7.05
Buckwheat .....	3.40@3.75	5.15@5.50
Rice .....	2.75@3.25	4.50@5.00
Barley .....	2.25@2.50	4.00@4.25
Boiler .....	2.50	4.25

Quotations for domestic coals at the upper ports are generally 5c. higher on account of the difference in freight rates.

**Bituminous**—The local bituminous market is upset because of the railroad troubles and the scarcity of coal at this Tidewater. Supplies at the loading piers are down to rock bottom, with no prospects of betterment until the labor troubles are at

an end and cars are moved, which is a deplorable condition.

Although there are several hundred thousand tons of coal on the railroad sidings between the docks and the mines the railroads cannot move it because of the strike of the switchmen. Then conditions have suffered from the refusal of the loaders at the piers to load the boats waiting for cargoes. Another difficulty has been the failure to secure tugs to bring loaded docks to the city at reasonable rates. In some instances it is said that buyers have been quoted as high as \$250 to have a loaded boat towed to this city from the lower docks. Because of these high rates many of the ordinary consumers have run short of fuel and are on the verge of being forced to close their plants.

Supplies at the loading docks have become so small that the Federal Government is reported to have decided to confiscate what remains for its own use or for the use of public utilities. The coaling of tugs was also stopped at some of the docks. The railroads are also confiscating coal.

Reports from the Lake ports indicate a serious lack of coal due to the railroad strike. The situation in New England has improved considerably the past week and a general industrial shut down was averted. The harbor strike shut off shipments to New England points by water routes and via the Harlem river.

Local stocks are low, the receiver of coal on contracts being in no better position than the buyer of free coals. Because of conditions there are many shippers who refuse to quote prices on the ground that it would be impossible to make deliveries.

Of 81 boats at the lower ports the early part of last week, 61 had been taken away up to Friday. Quotations on loaded boats ranged from \$10@15, depending upon the quality of the coal, while those who had coal at the docks made quotations ranging from \$4.25@5.25, according to grade and quality.

Production slowed down because of the lack of cars and mine quotations were hard to obtain. Local public utility corporations are well supplied with fuel and are receiving their daily allotment.

**PHILADELPHIA**

**Anthracite trade upset by rail strike.**—Retail stocks soon depleted.—Embargo against shipments into city.—Consignments to line points, but deliveries few.—Plants running short of fuel.—Bituminous trade almost at standstill.—Orders taken subject to delivery by railroads.—Little price change.

**Anthracite**—The railroad strike has badly crippled the anthracite industry. At this writing the yards in the city after one week of the strike are practically empty and even should the strike be settled at once, it will take the biggest part of another week before they will get enough coal to keep them going. The dealers who have had some sort of stock on hand are doing their best to parcel it out to the utmost advantage of their trade.

Inasmuch as April to date has been unusually cool, coal burning continues and there is a strong demand for small lots of coal for immediate use. Retail dealers are almost a unit in deciding not to let any one customer have more than a ton of coal at a time, and are of course giving special preference to consumers with illness in the home. Even under these conditions the people, still beset by the fear of high prices, are endeavoring to accumulate stocks of coal.

With the oncoming of the strike the city proper was soon embargoed against receiving consignments from the mines and the only coal that has gotten on the market has been a few stray cars that had reached the freight yards before the trouble began. In a few instances volunteer switching crews have made deliveries of such shipments to the dealers, until at this time there is very little fuel near the city.

During the first few days of the strike its effects were not nearly so noticeable in the mining region and the movement of cars was continued there with a fair degree of certainty.

This condition also gave the dealers an opportunity to move the accumulation of screenings which usually reached the top at this time of the year and which ordinarily the coal man is glad to have moved at a nominal price. There was also a good tonnage of steam sizes in transit, but this is fast being diverted to the public utility plants, such as city water works, and also is being taken by the railway companies for engine fuel.

The bituminous trade is almost at a standstill. Many of the houses still continue to solicit orders at prices ranging from \$4.75@5.25 f.o.b. mines for Pennsylvania steam coals, with gas coals

around \$5.50 f.o.b. mines, both Pennsylvania and Fairmont. However, all orders are taken subject to the ability of the railroads to make delivery. As is natural under present conditions the car supply at the mines is quite meagre and it is only a question of a short time before they will be compelled to close entirely, as with no supplies moving in the direction of the region this can be the only result.

There are just a few lines of railroad in this vicinity that are not entirely embargoed and manufacturers able to receive delivery on such lines are having coal offered to them by brokers around \$5.50 f.o.b. mines, regardless of quality, and usually it is not difficult to make a sale, as no concern wants to shut down and is willing to take a chance on what offers. With the market in its present state no shipper is anxious to make contract, although some consumers who have been slow in this respect are still seeking to cover themselves.

**BALTIMORE**

**Strike tie-up on railroads makes fuel situation desperate.**—Curtailment of plants but no big closings at time of writing.—Movement and car supply dwindle steadily.—Most firms here stop open selling.—Hard-coal men can afford to drift.

**Bituminous**—With Baltimore and vicinity in the grip of an almost complete suspension of railroad movement because of the strike the fuel situation here this week has been desperate. Up to this writing no big closings have been noted of industrial plants, but a number have been near the danger line and some curtailments have been noted. In one case a big water company which supplies a large part of the suburban territory of Baltimore had but a few hours supply of coal but got relief when the Baltimore & Ohio apportioned some of its own fuel to keep the public utility running.

This railroad at this time reports a car supply at the mines of only 12 per cent and on the Eastern lines, only 10 per cent. The number of cars loaded daily now is below the thousand mark, while the supply at the Baltimore & Ohio and Western Maryland pool at Curtis Bay has dropped to 2,015 cars. There are less than 500 cars at the Canton pier of the Pennsylvania, and the line points near the city have been swept clear of reserve fuel. With twenty-one steamers in the stream here waiting to take on about 98,000 tons of coal the issuance of permits is being tightened, and another tie-up of export movement is in sight unless the relief comes quickly.

A conference in Baltimore this week to adjust wages, etc. as between the Northern West Virginia Coal Operators' Association and the officials of District 17, United Mine Workers of America, worked out a plan of adjustment which promises to settle any chance of controversy in that section.

There is not much talk of stable prices in this section just at present. Contracting is going on at rates ranging from \$1.50@3.25 f.o.b. mines for various grades of both steam and gas coals. The spot market is some 50c. higher in most cases, where there are any sales at all at present. Most of the big concerns here are refusing to sell in the open market and are devoting their attention to getting the meagre supplies received into the hands of old consumers on old or new contracts.

**Anthracite**—The hard-coal men are mainly lying back and waiting in the present crisis. The fact that deliveries have practically ceased does not worry as it would in days of cold weather. There is practically no urgent demand here for immediate delivery and what is in evidence can be cared for from stocks in the city, although they are by no means liberal.

**Eastern-Inland**

**PITTSBURGH**

There was full production last week by the river mines of the Pittsburgh district while there was very little production by the rail mines, on account of the railroad strike.

Monday there was rather light placement of empties, but the mines had considerable numbers left over from the preceding week, and the day's production was but little below normal, and there was some production Tuesday, but in the rest of the week, and up to this writing, there has been practically no operation of the rail mines. The coal loaded early in the week was moved by the railroads to sidings or to scales at yards and did not get any farther.

As the rail strike ends the railroad

agements will devote their first attention to the movement of foodstuffs and perishables, coal probably coming next. Quick return of empties is improbable, and for perhaps two or three weeks after the rail strike is really over, car supplies may be poorer than they were just before the strike.

Eventually an inadequate car supply is expected, of course, and while that will uncover a labor shortage, leading operators of the district predict that there will be enough coal for all regular requirements, including current demand and lake demand, with probably a little for stocking at the rates previously observed by large consumers, but the common feeling is that there will be no coal for the extra stocking that is being urged.

Operators admit the principle may be good, in general, but hold it is not applicable to the Pittsburgh district, on account of the lake business of the district. Not infrequently the district has shipped more coal in summer than in winter.

There has been practically no market the past week, but prices may be regarded as nominal on the same level as last quoted: Contract steam, \$3.25@3.50; contract gas, \$3.75@4; prompt coal, \$4@4.50, per net ton at mine, Pittsburgh district.

**COLUMBUS**

With the switchmen's strike on, practically no coal is being mined in Ohio.—Car supply has been gradually reduced to a point where none are available.—There is a good demand for all grades and prices continue strong.

Just at the time when details of the new wage scale were being worked out and some betterment in the car supply was noted, the switchmen's strike occurred, and, as a result, production in Ohio fields is almost nil. The strike did not have its full effect until early in the week of April 12, when empties stopped coming into the mines. By the middle of the week every mine in Ohio was completely tied up and will remain so until the strike is settled and the trainmen resume work.

The cutting off of the fuel supply is already affecting many industries, more especially public service concerns. Their reserves were small, because of continued car shortage and many were operating with less than two weeks' supply. Hospitals were also rather short of fuel and some special effort was necessary to supply them. Manufacturing concerns were not very well stocked with the exception of rubber factories which were not affected. Some factories were compelled to go on a half-time basis to conserve fuel.

The domestic trade is also active, as dealers are in the market for stocks to take care of householders who desire to lay in stocks early. All coals are in strong demand with Pocahontas the strongest feature. With only 50 per cent of former Pocahontas tonnage allotted to this territory there is a scramble for available tonnage.

Retail prices are strong at the levels which have prevailed for several weeks. Most of the Columbus dealers have small stocks to take care of current business. Hocking lump sells at \$7.50, delivered with mine-run at \$7.25; Pomeroy lump and mine-run are quoted at the same figures. West Virginia splints sell at \$8.50 for lump, and \$8.25 for mine-run while Pocahontas is about \$10@10.50 delivered.

Prices at the mines of the principal coals sold in Ohio are:

Hocking lump	\$3 75
Hocking mine-run	3 50
Hocking screenings	3 25
Pomeroy lump	4 00
Pomeroy mine-run	3 75
Pomeroy screenings	3 50
West Virginia splints lump	4 50
West Virginia mine-run	4 25
West Virginia screenings	4 00
Pocahontas lump	5 75@6 00
Pocahontas mine-run	5 50@5 75
Kentucky lump	4 75
Kentucky mine-run	4 50

**CINCINNATI**

Railroad strike has had little effect on the situation here.—Enough fuel is arriving daily from the fields in Kentucky and West Virginia by way of the Ohio River to keep the domestic and industrial consumers supplied.

Had not the industrial plants purchase a considerable tonnage before the advance in price, there might have been a shortage with the present railroad strike.

Another advance in price before May 1 is the general opinion of operators who claim they are not making expenses, with the present prices. Retail dealers are holding off from buying, believing that the price will decline during the next sixty days. This hardly seems possible, as wages for workmen are going higher daily.

More than 100 shippers of lake coal from Kentucky and West Virginia representing the output of many mines, assembled last week for a conference with H. M. Griggs of Cleveland, Chairman of the Ore and Coal Exchange Commission, and the heads of seven railroads in an effort to arrange better traffic and shipping conditions between the fields and ports of the great lakes.

**Southern**

**LOUISVILLE**

Production very light, with car shortage chronic.—Retailers buying practically no coal except for immediate use; and industrial consumers buying only where they have to.

Due to continued car shortage production continues very light, and due to the switchmen's strikes in various cities, movements of cars has been further checked. Embargoes have been numerous, and this has probably aided somewhat such districts as are not suffering from strikes or embargoes.

While general demand for coal at present prices is comparatively light, even a light demand is more than operators can expect to fill and at the same time fill contract orders under existing condition. The result is that such new business as it taken must carry a price to offset the present heavy operating costs.

Contracts are not wanted and not even discussed to any extent as neither retailer nor industrial consumer has any idea of stocking coal at present markets. Everyone feels that a near normal value will be re-established in event of a 75 per cent. car supply. However, there is no real reason for expecting a good car supply for some time to come under existing conditions.

Prices of industrial coal are too high for buying except of needed coal by byproduct and utility plants, and manufacturers and users who are close to the bottom of their supply. Many of these still have contracts.

There really is not much of a market as prices are not at all standardized, and it is merely a question of how much coal an operator has to offer, and how badly the buyer needs it. Very few operators have much surplus production at best.

Prices show practically no change other than that some individual operators are getting even more money, than they were last week. Quotations at mines show that Eastern Kentucky is quoting around \$4.50 @ \$5.25 for lump; mine-run, \$4.00 @ \$5; Natchez & Southern, \$3.50 @ \$4. Western Kentucky, lump, \$3.25 a ton; mine-run, 2.85 @ \$3.00; Natchez & Southern \$2.50 @ \$2.60; fine screenings, \$2.25 @ \$2.40.

**BIRMINGHAM**

With transportation facilities slightly improved, coal is moving more satisfactorily and production is showing some increase.—Market continues to show great strength for all grades coal.—Some contracts have been executed with domestic dealers, but contracting for steam coal has not assumed any proportions as yet.

The movement of coal is slightly smoother and more satisfactory than last week, some improvement being made in the car supply furnished by the coal-carrying lines. Following the institution of injunction proceedings against the Southern Ry. for preferential car supply to contract mines on its lines an amicable adjustment of the trouble has been reached whereby non-contract operations are to furnish the railway company the deficiency in tonnage received from mines holding contracts for fuel coal at an advance of 50c. per ton above government prices for the respective grades, which will about equal present quotations.

Proposals furnished on fuel requirements of the Louisville & Nashville, and Frisco RR. for the year ending April 1, 1921, have not yet been acted upon by these lines, the price of fuel furnished since April 1, being subject to adjustment on basis of figures agreed upon when contracts are executed. Contracting for steam coal has not made much progress as yet, awaiting stability in mine prices. Spot demand strong. Quotations are as follows per net ton mines:

Coal District	Lump	Prepared
Big Seam	\$2 95@3 35	\$3 45
Black Creek	4 00	4 45@4 50
Cahaba	4 00@4 35	4 35@4 50
Carbon Hill	3 35@3 50	3 50
Nickel Plate	3 35@3 50	

Some domestic contracts are being made on an April 1 base price, providing for an increase of 10c. per ton through September, and in some instances a maximum

price has been fixed for deliveries after September, there being a desire on the part of the larger representative distributors and producers to throw some safeguard about a runaway market, which is a natural probability account of the strong demand and short supply, which conditions will likely exist throughout the year, both as to domestic and steam coal. April quotations are as follows per net ton mines:

Coal District	Lump
Big Seam	\$3 25@3 50
Black Creek	4 50@5 50
Cahaba	4 50@6 00
Carbon Hill	3 50@3 75
Montevallo	6 75@7 00
Corona	4 50

**Lake Region**

**BUFFALO**

No coal of account moving.—Striking switchmen are cutting out all traffic.—Promise of an early return to work.—Pittsburgh standing still.—Next to no anthracite.

Bituminous.—It seems that the coal trade is beset by either one thing or another continually. If it is not car or price complications, it is something worse. At present scarcely a wheel is turning in the freight lines of the railroads from the switchmen's strike which came this way from Chicago, and at present is tying this city up worse even than the centers further West. It is said that Buffalo and Pittsburgh are now the center of the difficulty, which means that it will not last much longer.

So far there has not been much real distress from the lack of coal. Quite a good many factories have had to shut down, but there is still coal for public use and it is likely to hold out to the end of the strike. If the failure of the strike, as seems to be certain now, would lessen the evil and menace of that sort of thing it would be worth all it has cost.

In a time like this prices mean little, so that the following list will have to be taken as mostly a reminder of what coal did sell for when we had any to sell: Allegheny Valley, all as mine-run, \$5.75 @ \$6; Pittsburgh and No. 8, lump, \$6.25 @ \$6.50; same, mine-run, \$6 @ \$6.25; Youghiogheny gas, \$6.50 @ \$6.75; Smokeless, \$6.50 @ \$6.75; Pennsylvania smithing, \$6.75 @ \$7, per net ton, f.o.b. here.

Anthracite.—The trade is at a standstill, or pretty nearly, for all supplies are sidetracked somewhere outside, where it will remain till the strike is over. At the same time shippers and retailers have managed to keep some business going and are even delivering some coal. The weather has not been up to normal warmth, so that natural gas gave out, much as it used to do in zero weather. Some furnaces that were refitted for gas when the prohibited period passed, had to be restored to coal-burning.

**TORONTO**

Receipts very light owing to railroad strike.—Dealers refusing orders.—Bituminous increasingly scarce.—Industrial plants facing crisis.

Owing to the railroad strikes in the United States coal has only been received in very small quantities since April 7. The domestic demand was largely increased by the unseasonably cold weather, but dealers owing to the shortage were unable to accept orders except in cases of emergency.

Bituminous is increasingly scarce but so far the industrial plants have been kept in operation though unless a speedy improvement takes place it is feared that many will have to close down, as a crisis is rapidly being reached.

Quotations for short tons are as follows: Retail—

Anthracite egg, stove, nut and grate	\$14.00
Pea	12.50
Bituminous steam	12.50
Domestic lump	12.00
Canal	13.00

**CLEVELAND**

Movement of coal into Cleveland virtually stopped on April 10, the two chief coal roads of Cleveland being the hardest hit by the strike.—Biggest stock piles in the district, at the outset of the strike, promised only two weeks' operations. Spot coal prices appear ready to sour.—First lake coal cargo of the season is on its way to Lake Michigan.

Bituminous.—Practically no No. 3 coal has moved into Cleveland or northern Ohio

since April 10. Although some improvement is noted in the strike situation on the Pennsylvania, New York Central and Erie railroads, no wheels are turning on the Baltimore & Ohio while the Wheeling & Lake Erie's sole crew is composed of office employees. Since the last two roads are the city's chief coal roads, the movement has practically ceased. A fair tonnage of No. 8 coal, estimated from a week's to ten days' supply, is on track between southern Ohio and Cleveland, and will be moved into the district once railroads again operate.

But the real pinch is looked for about ten days after the strike has been ended. Movement of empties toward the mines has come to a dead stop. The result is No. 6 and No. 8 district mines are operating at from 10 to 15 per cent of capacity. Were the strike to come to an end immediately—and the outlook for a long or short strike is about equal—operations at the mines for the remainder of April will be dangerously low, operators fear. Industrially, coal is the chief factor in the strike, and when present supplies are exhausted operations will cease.

Contracting has been almost completely checked by the strike, as operators are more uncertain than ever of their production over the remainder of the year. The longer the strike lasts the fewer are the chances that the present contract levels of \$3.25 @ \$3.50 f.o.b. mine, will sag in the latter part of the summer, operators declare. To date most of the contracting has been done at around \$3.25, f.o.b. mine, for No. 8 slack and mine-run. In one instance \$4 is reported done on contract.

**Anthracite and Pocahontas**—These grades, like bituminous, have been shut off by the strike, but the effect is scarcely noticeable. Slightly better demand is reported for anthracite, with which dealers' yards are heavily stocked. On Pocahontas, dealers are about three weeks' behind in deliveries.

**Lake Trade**—Two Great Lakes freighters, one laden with bituminous coal and the other with anthracite, are forcing their way through the ice at Mackinaw, bound for Lake Michigan ports. The anthracite cargo will go to Milwaukee; the bituminous cargo will be split among Green Bay, Sheboygan and Manitowoc. Bituminous coal is acutely short at Lake Michigan ports and some lake freighters wintering at Manitowoc cannot move until they are coaled.

Prices of coal per net ton delivered in Cleveland by dealers are:

Anthracite—Egg, \$12.20 @ \$12.40; grate, \$12.20 @ \$12.40; chestnut, \$12.50 @ \$12.70; and stove, \$12.50.

Pocahontas—Shoveled lump, \$10.50; and mine-run, \$9.25.

Domestic bituminous—West Virginia split, \$8.75; No. 8 Pittsburgh, \$7.75; Millfield lump (formerly Coshocton lump), \$8.50; Cannel lump, \$11.00.

Steam coal—No. 6 and No. 8 slack, \$7.50; No. 6 and No. 8 mine-run, \$7.50; and No. 8 7-inch lump, \$7.75.

**DETROIT**

With shipments cut off by the railway strike, Detroit experiences serious coal shortage.

**Bituminous**—Once again, Detroit is being subjected to a policy of rigorous conservation of fuel. This situation is brought about by the strike of railway switchmen, which has cut off practically all shipments of coal into the city, as well as other freight. The cutting off of railroad transportation facilities came at a time when neither the steam-coal users nor the retail dealers had much stock on hand, as shipments since termination of the mine strike had lacked sufficient volume to make possible the restoration of depleted reserves, and at times were scarcely adequate to meet requirements for current consumption.

With a shortage virtually existing, the railway strike quickly brought the city into difficulty. The Detroit Edison Co. found it necessary to discontinue power service to all industrial plants, April 12, with the exception of those manufacturing food products, to conserve its current as far as possible for the use of homes. The company has only a few days supply of coal. The Detroit City Gas Co., also was caught with short supply and has appealed to customers to avoid unnecessary use of its product, warning them also against using gas for household heating purposes.

**Anthracite**—Few of the retail yards have been able to fill orders for anthracite. Shipments prior to the railway strike were light and stocks on hand are about exhausted. Though still uncertain as to the prices for the year, some of the dealers are placing orders to make sure their customers' requirements will be safeguarded.

**Lake Trade**—Owing to the railway strike, loading of coal for the lake trade is vir-

tually at a standstill. The steamer "William A. Reiss," leaving Huron Ohio April 15 for Lake Michigan ports carries the season's second cargo.

**Middle West**

**MIDWEST REVIEW**

Stories are beginning to come in from some of the Middle West states that a number of manufacturing concerns and public utility plants are closing down, and throwing men out of work, on account of the coal shortage.

It can be seen from the above that the market for coal is very strong, and growing stronger every day. Illinois and Indiana operators are continuing to keep their prices at very fair levels, in fact we do not know of any advance over the prices for Illinois and Indiana coals as published in these columns a few weeks ago.

Operators have had an opportunity, in spite of poor running time, to figure just how much the increase granted the miners will influence the selling price of their coal, and, therefore they have closed some contracts with their preferred customers. Operators and wholesalers alike, however, are not seeking new business, but merely renewing old contracts that expired March 31. Contract prices are ranging very closely around the April circular prices given the trade by the operators during the first week of April. Some railroad contracts have been closed, but not many.

During the last week there have been numerous small and ineffectual strikes reported in the producing fields of Illinois and Indiana. These strikes in nine cases out of ten, arose from some trivial situation which meant nothing much either to the operators or to the men themselves, except that it indicates the general spirit of unrest which is prevalent in this territory among practically all labor groups. This spirit of unrest has permeated the wholesalers as well as the operators and consequently is felt by the buying public who are extremely nervous over their coal supply, and are doing all possible toward making their purchases early in the season.

**CHICAGO**

Coal yards on the Illinois Central and the Chicago, Burlington & Quincy R.R. were lucky in receiving some fuel this week.

This is also true of yards on any of the other big coal carrying roads coming into Chicago. Those, however, who operate retail yards on non-coal roads have had to discontinue business for the time being.

The writer was in this yard, on April 20, and all of the coal left in the yard was represented by a small pile of anthracite, about two tons, which was being closely watched by the owner of the yard. Other gangs of workmen in and about the yard were salvaging coal dust and screenings and loading it into the wagons to deliver it to their customers. The switchmen's strike is most certainly far reaching.

A number of manufacturing plants in the city have been forced to close down because they have received no coal, and unless the strike is settled definitely and completely very shortly, other plants will have to close, thus throwing more men out of work. The rebel switchmen are rapidly losing ground as they are very unpopular, first, with the regular unions, and, second, with the general public. In addition to this countless laborers who have been thrown out of work feel that the switchmen have been extremely selfish in their demands.

**ST. LOUIS**

Railroad strike has suspended work in almost the entire field.—A little tonnage produced and railroads taking it.—Local conditions critical.—Prospects of conditions easing up, however.

Practically every railroad in the St. Louis district has been hit by the strike of the yardmen who took with them much force of the other crafts. With the exception of the Missouri Pacific all lines were abandoned by their yard crews at the beginning. The Missouri Pacific have a few crews remaining at work and the condition as the week ends shows improvement on other roads. For a few days officials of the Terminal and office employees took care of switches and handled a few cars of perishable matter, as well as coal for plants that had to have it.

At the end of the week a few crews went back on practically all roads, but this had not helped the coal shortage to any extent, other than to move what was in the terminals.

In the Standard district the mines on the St. Louis, Troy and Eastern worked a little every day. This coal was brought to East

St. Louis on their own road, the trades manned by their office help who unloaded it at their yards, where it was transported to St. Louis in trucks and wagons.

At a few other points in St. Louis where there was coal the dealers and industrial plants managed to get to it, but in a general way the railroads grabbed most of the coal in sight.

On the Mobile & Ohio, Illinois Central, Vandalia and Baltimore & Ohio a mine here and there worked a day or two, loading railroad company coal. On the Illinois Central a little coal was shipped on commercial business south. In the Mt. Olive field the Illinois Traction System worked their line every day bringing their coal into St. Louis. There is no strike on this road.

**MILWAUKEE**

Cold weather makes a lively coal market.—Little to sell.—Pea anthracite advanced 50c. per ton.—Railroad strike hampers receipts.

Because of a scarcity of supplies of all kinds, the coal market at Milwaukee is very unsatisfactory. A continuance of raw, spring weather increases the number of empty bins daily, and the demand from householders grows correspondingly urgent. The inflow of rail coal was meagre enough before the strike began, but now there is practically no coal coming. A strike of coal handlers at several of the yards still further complicates the situation.

No boats have arrived as yet and the outlook in this respect is not promising, as the ice in the Straits of Mackinac shows no sign of weakening. One steamer with 9,000 tons of anthracite was forced to winter in the Straits. This cargo should be the first to arrive. Last year the first cargo was received on April 20, and by the end of the month 59,535 tons of anthracite and 92,652 tons of soft coal had been unloaded on the docks. Pea anthracite has been advanced 50c. per ton, but prices of all other grades of coal continue the same.

**Pacific Coast**

**SAN FRANCISCO**

Prices advance.—Further increases expected by some.

The expected has come to pass, following the increase in the wages to miners awarded by the President's commission and dealers here have been notified by the operators of Utah and Wyoming of an advance in price from \$3.65 @ \$4 f.o.b. net ton, wholesale, on stove and lump coal at the mines. Whether or not a further raise will come after the summer lull in business is a deep puzzle to dealers.

Hopes are held out by the more sanguine of the fraternity that things will be soon be stabilized, both as regards the operators on the one hand, and the public on the other. Under present conditions, dealers are very much "up in the air." Little effort is being made for consumers to put in stocks this summer for the winter. For domestic use, bituminous prices from Utah and Wyoming, f.o.b. net ton, are:

Stove, \$4; Lump, \$4; Bunker price, \$13.55.

**Coke**

**CONNELLSVILLE**

Connellsville coke market has been at a standstill, there being no coke to sell or buy.

While the rail strike was strong at the beginning of last week there was a fair supply of empties, largely placed Sunday, with some cars held over from the previous week. There was full drawing in the region Monday, and some drawing on Tuesday, with cars left over, but afterwards there were no empties. As a rule operators had a chance to recharge their ovens and put them on the lightest possible draft so as to hold the charge. By skillful operation the charge can be held about a week and still produce fair coke.

The coke loaded moved only to sidings or railroad scales, but shippers have received a good many weights, showing that some coke did reach yards. A fair movement of empties is expected to follow immediately the ending of the rail strike, also good dispatch to furnaces since the railroads realize that their iron and steel freight business hinges upon their getting the blast furnaces in operation promptly. Practically all the blast furnaces dependent on Connellsville coke are banked, also quite a number dependent on byproduct coke, as the byproduct ovens had little coal in stock received scarcely any since the rail strike started.

# COAL AND COKE NEWS

## Charleston, W. Va.

### Railroad Strike Creates Serious Situation in the West—High Volatile Delayed—Smokeless Reaches Tide—Contracts Being Placed

The most serious situation which confronted the coal industry in this section of the state and in fact throughout the length and breadth of the Chesapeake & Ohio R.R. system, as the week ended the tenth drew to a close, was the railroad strike in the West, which was materially affecting western coal shipments, through numerous embargoes and which was at the same time affecting the coal supply.

The strike not only shut off the movement of coal west of Russell, Ky., on the Chesapeake & Ohio, and west of Columbus on the Kanawha & Michigan and Toledo & Ohio Central, but also prevented east-bound cars from passing through the western gateways.

During the greater part of the week the car supply was under rather over 50 per cent. Production was materially reduced in this area with no prospect of any immediate improvement, at least until order had been restored in connection with the strike of railroad trainmen.

#### Unfortunate Traffic Interruption

Interruption to traffic came just at a time when producers were making preparations to begin shipments to the Lakes. Inasmuch as nearly all gateways leading to the Lakes were embargoed, insofar as shipments from West Virginia were concerned, no attempt was made to initiate Lake shipments. It had been hoped that when Lake shipments were begun they might tend to some extent to remedy the car shortage inasmuch as cars would have a short distance to travel in making a round trip.

The larger proportion of high-volatile coal was moving westward, so it will be seen just what the barrier at Russell and Columbus meant to the West Virginia coal trade. Smokeless coal originating at Chesapeake & Ohio mines was for the most part moving eastward to tidewater, so that the strike had not until the close of the week exerted any perceptible effect on such shipments; early in the following week with the strike spreading, it was anticipated that smokeless coal for tidewater would be to a large extent embargoed.

It is realized by operators that tidewater pools are essential in order to insure prompt dumping of coal, yet there are many producers who are reluctant to see their coal lose its identity, so that there is some opposition to the continuance of the tidewater pools.

#### Kanawha Coal Fails to Reach Destination

Ground was lost by Kanawha mines, during the week ended the tenth, owing to an extremely poor car supply, in comparison with the production of the previous week. While fully two-thirds of the Kanawha output was being shipped to western markets little of such coal was reaching its destination after the middle of the week owing to the embargo at Russell and at Columbus applying to shipments off the Kanawha & Michigan.

It was believed, after careful inquiry, that about 65 per cent of the year's output by the Kanawha field was under contract by April 10, \$1.00 a ton appearing to be the prevailing price for run-of-mine.

Although faced with a continued shortage of cars during the week ended the tenth, New River mines managed to secure more empties than the adjoining Kanawha had possibly because of a larger movement of empties from the East. Even though receiving a larger share of empties, the supply was still on a lower level than during the previous week. Mines were still forced to be content with less than a 50 per cent supply of cars. The period ended the tenth marked an increase, to some extent at least, in the volume of export tonnage from the New River field,

though it was stated by some operators that export shipments were being halted somewhat by slowness in dumping at tidewater. It is also believed that more contracts for New River coal were completed during the week, with a view to relieving uncertainty as to prices. While of course the embargo at Russell, Ky., affected New River shipments somewhat, it was not to as great an extent as was true of coal from high-volatile fields.

## Bluefield, W. Va.

### Norfolk & Western Recovers from Clerks' Strike Only to Meet Switchmen Trouble—Little Coal Goes West—Eastern Shipments Fair

Inasmuch as the Norfolk & Western was slow in recovering from the effect of the clerks' strike, production in the southern part of the state was still about on a par with that of the previous week, mines being short of cars for fully half the week. Indeed it was not until well on toward the end of the week that the supply of empties was at all adequate, so that production did not reach even the swing to which it had been accustomed during weeks antedating the strike.

There had been a decrease in all districts served by the Norfolk & Western during the week ending the third, of approximately 200,000 tons. In the first place it required some time to prepare engines for operation, the fires having been banked in many locomotives when it was believed the strike would be prolonged. Next, the run of empties from the West was slow in reaching normal, owing to the fact that cars originally intended for the Norfolk & Western had been sent elsewhere during the strike.

On the other hand, the flow of empties from the East was not so greatly affected, so that there was a larger supply from that source than from the West. Still another factor interfering both with the car supply and with the movement of coal, in the week ended the third, was the switchmen's strike.

#### Embargo and Strike Stop Shipments

Inasmuch as there was no flow of empties through the usual channels, and inasmuch as the Norfolk & Western had placed an embargo on coal movement west of Columbus and Cincinnati, of course there was an accumulation at those points and no empties were being received from sections west of those places.

While it is anticipated that the car supply will show improvement under normal conditions, especially as the season advances, for the time being at least mines on the Norfolk & Western are running far behind schedule for the reasons assigned.

Pocahontas and other points on the Norfolk & Western were the mecca for numerous buyers during the week ended the tenth, there being manifest an insatiable demand for coal. While a large number of contracts have been consummated since April 1, and while a considerable part of the year's output is now under contract, deliveries will be made at prices in keeping with the desire of producers to hold prices down to a level commensurate with production costs plus a reasonable profit. On such a basis numerous contracts calling for the delivery of large tonnages have been closed.

There was during the first ten days of April a growing demand for export. It was possible to meet only a part of such demand owing to the continuance of the permit system, the shortage of cars and inability to load ships fast enough. Owing to the heavy export demand and the short route to tidewater, the tonnage left for Western markets, in so far as could be learned, was comparatively small.

No progress was made by Pocahontas producers in catching up with the demand for their product in the week ended the tenth, there being a decided dearth of cars in the field, especially during the first half

of the week when officials of the Norfolk & Western were striving to restore conditions to normal following the strike.

To further complicate matters, just about the time transportation conditions were beginning to take on a normal semblance, the switchmen's strike closed many western gateways to coal from the Norfolk & Western.

There was for the reasons assigned, therefore, not more than a half week's production in the entire Pocahontas field. Under existing conditions production and loss is now about a "fifty-fifty" proposition.

Coal loading in the Tug River field, during the week ended April 10, reached only 55,450 net tons, a decrease of no less than 27,250 tons, as compared with the output for the week ended March 27. Without having an opportunity of recovering from the effects of the labor trouble initiated at Roanoke last month, the outlaw switchmen's strike at Chicago had spread to the East quite rapidly, and, during the period ending the tenth, was affecting Portsmouth, Kenova and Williamson.

#### Empties Tied Up in the West

On the tenth the Norfolk & Western put into effect a strict embargo on all shipments West, owing to the inability of the road to handle coal in that direction, and by the thirteenth absolutely no empties were being received through the western gateway. The absence of the Western car supply just about cut Tug River production in two, empties received from the East being apportioned and distributed to the western limits of the railway system. There was absolutely no difficulty in handling to the East all coal that could be mined in fields of the Norfolk & Western under a limited car supply.

The Williamson field was affected to as great an extent as other fields depending upon the Norfolk & Western for transportation facilities, and to make matters worse, switchmen and yardmen employed at Williamson joined the ranks of "outlaw" strikers on Wednesday, April 14, making it certain that there would be a serious reduction in production before the end of the week; the output having suffered quite appreciably, during the week ending April 19, for reasons already described in connection with conditions in the Tug River and Pocahontas fields.

Production in the Winding Gulf area was somewhat larger than usual, during the period ended the tenth, owing to a slight increase in the number of cars available. However, Winding Gulf mines were being affected during the following week by the strike which was expected to cut down the district's output. A large part of the district's production was reported as being under contract for the present coal year.

## Huntington, W. Va.

### Car Shortage Serious in Logan Field—Little Coal Under Contract With Lake Season Opening—Strong Export Demand

Production was seriously retarded in the Logan field, during the week ended April 10, because of a continuance of the shortage of cars, with which the mines of the field have been afflicted since the first of the year. There has been during recent weeks a car shortage loss of not less than 225,000 tons every week, and in the week ended the tenth, the loss was just as serious as it had been during previous weeks of the year, it seemingly being impossible to boost production above 175,000 tons a week.

The car shortage was even more pronounced, during the week ended the tenth, than it had been in preceding weeks; the production for the entire week reaching only about 160,000 tons. As showing just how serious railroad disabilities have proved to be in the Logan field, a total of 1,008,525 tons were lost through that source alone during the month of March, as

against only 768,953 tons produced here during the same period. In other words, the car-shortage loss for the month of March in the Logan field amounted to 53 per cent of the potential capacity (1,801,322 tons) of the entire field.

There was at the end of the week ended April 10 quite a considerable tonnage of the Logan region still under contract, it was stated, operators awaiting final decision on the wage scale in various non-union fields. However, it was expected that as the season advanced, progress would be made in the closing of contracts. Comparatively little coal for the Lakes was under contract, however, although it was rather anticipated that there would be a large movement of fuel from the Logan region to the Lakes during the season.

There was a pressing demand from export sources for Logan gas and splint, although a larger proportion of Logan fuel was being shipped to inland West markets than to tidewater, despite the fact that export permits were not so hard to secure. However, the railroad strike necessitated, toward the end of the week, the cessation of shipments from the field to many of the western markets, having a tendency to drive more coal eastward to tidewater.

The embargoes, which prohibited a large part of the western movement, also made it impossible to begin the shipment of coal to Lake points, even as a part of numerous spot orders pouring into the field.

According to figures compiled by the Chesapeake & Ohio Allotment Commission, there was little difference in the amount of coal handled by that road during the week ended April 3 and during the week ended April 10, there being 81 cars more moved during the last-named week than during the previous one, the total gain amounting to 4,050 tons; total loadings for the week ended the tenth being 11,037 cars, equivalent to 551,850 tons.

### Fairmont, W. Va.

**Delay in unloading coal at Curtis Bay.—Embargo cripples shipments to tide.—Lake season starts.**

Northern West Virginia operators were principally concerned in the week ended the tenth by the failure of the railroads, over which their coal was shipped, to function at tidewater piers, necessitating an embargo against shipments to all tidewater points except Port Richmond. As Curtis Bay is the principal tidewater terminal, to which coal from the Fairmont region is shipped, the embargo, coming just when it did, seriously interfered with arrangements made by the operators of nearly all northern fields.

There had been a steady growth in the volume of coal shipped to Curtis Bay and the tonnage to that point (much of it for export) was reaching fairly normal proportions. The fact, however, was that when the Curtis Bay shipments did reach a large tonnage, the Baltimore & Ohio was unable to handle it, and found it necessary to embargo further shipments. This was not particularly pleasing to operators who had been assured by Federal Manager Galloway a few months ago that the road would like to be tested as to its ability to handle tidewater coal at Curtis Bay.

It was stated, however, that the delay in unloading coal at Curtis Bay was due to a breakdown in the unloading facilities. Right on the heels of an embargo as to eastern shipments came the embargo on shipments of coal to certain western markets, although the effect of western embargoes was comparatively insignificant during the week ended the tenth. However, it was generally believed that there might be serious interference with Lake shipments if the strike should spread much further.

### Improvement in Car Supply

Taking northern West Virginia fields as a whole, the car supply was somewhat better than for the previous week, although not averaging much over 50 per cent after the large run of cars for Monday and Tuesday had been exhausted. Mines on the Monongahela R. R. enjoyed a larger run of cars than has been true for many a month, the supply being almost equal to full requirements throughout the week. No doubt this was the result of a special effort of the new executive of the road to improve the service.

At the rate at which tidewater shipments were being made from the Fairmont region at the beginning of the week, a new high-water mark for tidewater tonnage would probably have been established, more than 600 cars of coal having been started on their way to Curtis Bay Monday and Tuesday. When the embargo was clamped on, it put an end to the bulk of tidewater ship-

ments, although innumerable vessels were riding at anchor at Curtis Bay.

Two large consignments of coal from northern West Virginia mines were made to the Lakes, during the week ended the tenth, the shipments in question being the first of the season, it is believed. This coal so shipped was from the mines of the Consolidation Coal Co.

### Norton, Va.

**Southern Railway resorts to assigned car practice.—Coal coked to relieve car shortage.**

The Virginia fields were suffering heavy losses during the week ended April 10 through a car shortage, while at the same time many mines in the fields of this state were placed at a serious disadvantage, because of the fact that the Southern Ry. was resorting to the assigned car practice in order to obtain fuel; in fact this road was characterized as the worst offender in the South in that respect.

While confiscation of coal had largely ceased, the Southern Ry. was falling back on the assigned car system to achieve the same end. The car system of this road was denounced as being extremely unsatisfactory, it being pointed out that the policy of the Southern Ry., in favoring certain mines (furnishing it with fuel) with a preferential car supply, was working a hardship on the small producing mines.

For the week ended the tenth, the output in the Virginia fields had been reduced to 90,000 tons, the loss from a car shortage running up to 75,000 tons. In other words there was a 40 per cent loss from a car shortage alone, production being, manifestly, only 60 per cent of potential capacity. Mines managed to go ahead with production, over and above that made possible by a limited car supply, through coking in all 37,258 tons.

### Ashland, Ky.

**Northeast Kentucky Output Gains.—Switchmen's Strike Sends Coal to Tide.—Private Ownership of Coal Cars**

Gains were recorded in the output of the northeast Kentucky field for the week ended April 10, the output reaching 54 per cent of production or nearly 145,000 tons, out of a possible full-time capacity of 265,000 tons. The gain scored over the previous week's production amounted to 10,000 tons and was principally due to a somewhat improved car supply on the Chesapeake & Ohio; mines on that road being operated about 3½ days out of the six, with mines on the Louisville & Nashville able to make only 2½ days, or less than 50 per cent of normal.

Production in fact during the period referred to was about on a par with the best week so far during the present calendar year, and a further growth in the output was looked for, unless the switchmen's strike in the West should affect transportation conditions. During the same period of 1919, the output for the field was 117,000 tons, that being about 20 per cent below the 1920 production.

Even though there was not a full car supply and, therefore, no special reason for a labor shortage, the loss from lack of men at all the mines in the district reached 10,000 tons. This increase in the tonnage loss from a shortage of labor is believed to be due to an exodus to the farms on the part of many miners, who follow mining during the winter months only. There is little chance of the miners, who have left the mines for their farms, returning during the summer season, especially if an inadequate car supply makes for irregularity of operations and no opportunity to work.

With railroad officials pessimistic as to any improvement in the car supply, it is not generally anticipated that there will be any decline in prices in the near future; that belief only having been confirmed at a meeting of Lake shippers at Cincinnati on April 8, when railroad officials held out no hope for any improvement in transportation facilities.

The belief was quite generally entertained by northeast Kentucky operators that the strike of switchmen would have the effect of driving coal eastward to the export trade, especially in view of the fact that Kentucky operators are securing much export business and have been shipping a generous tonnage to tidewater.

Of more than passing concern to northeast Kentucky operators was the question of private ownership of coal cars and its effect on the general car distribution. It was expected that that particular question would receive attention at a meeting at

Huntington, on April 13, between coal operators and the executives of the Chesapeake & Ohio. Impetus has been given to the development of new mining properties by favorable weather conditions and under such conditions a number of new companies hope to be able to begin operating before the lapse of many months, although carriers are unable to take care of existing operations.

### Birmingham, Ala.

**Corona Coal Co. Secures Injunction Against Southern Ry.—Coal Car Discrimination Case**

A temporary injunction restraining the Southern Ry. from discriminating in the matter of furnishing coal cars to the Corona Coal Co., has been granted here by Judge Dan A. Greene in the Circuit Court, in a case of the Corona Coal Co. against the Southern Ry.

The injunction restrains the Southern Ry. from any practice working a discrimination upon the complainant in the supply of coal cars, according to the just and reasonable rating of the complainant's mine, as ascertained and promulgated by the respondent for distribution of cars during times of car shortage.

The injunction as granted by the court also restrains the respondent from ordering or enforcing a preferential distribution of cars to the Southern subsidiary, the Railway Fuel Co. or others, or any distribution of coal cars in violation of the provisions of Subdivision 12 of Section 402 of the Transportation Act of 1920.

The petition for the injunction was filed by attorney Johnson and Coker representing the Corona Coal Co. The bill alleges that the complainant is a corporation organized under the laws of the state of Delaware, but maintaining general offices in Birmingham, and that the respondent is a corporation organized under the laws of the state Virginia, and is engaged in a general transportation business. The respondent is alleged as a common carrier to be subject to the Transportation Act of 1920.

According to the allegation of the bill the Southern Ry. is the only direct connection for the transportation of the output of the Corona Coal Co., and that complainant is exclusively dependent upon the Southern Ry. for its car supply and initial transportation. For some time there has been an acute car shortage, and the complainant alleges that it has not been furnished with its full requirement of cars and that, furthermore, other mines have not been furnished their full requirement of cars.

The complainant further contends that it has outstanding contracts for its output, and that the failure of the supply of cars tends to disorganize and dissatisfy its employees, forces its mines to suspend, causes losses to its customers, through demurrage and delay in receiving fuel at the proper time.

The petition prays that a temporary injunction be issued against the defendant restraining it from enforcing the rules referred to and from continuing its discrimination against the complainant.

### PENNSYLVANIA

#### Anthracite

**Hazleton**—The heavy rains of the first part of the week, ended April 10, failed to make much difference in the water levels of the flooded mines in this section. The region was just recovering from the effects of the previous heavy rains and thaw when the recent rains came. The reports state that the water has made little material gain on the pumps.

On April 6 the Hazleton and Mahanoy division of the Lehigh Valley R.R. moved 650 railroad coal cars from the mines, against 128 cars on Easter Monday. The record for the sixth compares favorably with the war record from the same district, which was about 700 a day. Even with the big tonnage the coal companies cannot meet the demand and the Lehigh Valley Coal Co. has just put into operation again a large locomotive crane loading steam sizes from storage.

**Wilkes-Barre**—A complimentary dinner was given to Truesdale colliery officials at Hotel Redington, Wilkes-Barre, on a Saturday evening recently, by William W. Ingles, vice president and general manager of the Delaware, Lackawanna & Western company.

Truesdale colliery is in Hanover Township, in about the center of old Luzerne Grove, near the end of Wilkes-Barre & Wyoming Valley R.R., Askam and Warrior Run branch.

The plant was named in honor of William

H. Truesdale, president of the Delaware, Lackawanna & Western R.R., in 1889, and had led all the collieries in the anthracite field in coal production from 1913 to 1919, inclusive.

The following guests attended the dinner: John Allen, John Bobeck, James H. Brown, Dr. C. E. Bennett, James Bryan, Martin Brennan, Patrick Blewitt, Joseph Chervock, James Connell, Wayne Caruthers, Ted Corrigan, S. D. Dimmick, Frank Dobrowski, Edward P. Davis, P. H. Dever, John Driscoll, Arthur Davis, William T. Dixon, John H. Davis, Anthony J. Early, Thomas J. Evans, Herman Fruehan, Joseph Foley, John Frew, Raymond Gottshall, Frank Gleason, David Girvan, Charles Gallagher, Hugh E. Hughes, Joseph Hocken, Harry E. Harris, Frank Hildebrand, Cyril Hammonds, William W. Inglis, John Ingram, William L. James, John R. James, Frank Kishel, Frank H. Ketrick, George Keller, Robert E. Love, Thomas H. Lewis, Patrick Lenahan, Thomas P. Long, David Lloyd, Frank Law, Samuel Mayers, John Mould, William Mullahey, Joseph Motley, William Mchale, Eleazar Morgan, Karl Miller, Con McCole, Bernard McKee, N. N. Nichols, Stanley Nowak, George F. O'Hara, Henry Ormanowski, Edward S. Powell, George Phillips, William F. Powell, John Rapadowski, Joseph Ruddick, William Roachford, John O. Richards, Joseph Richards, Joseph L. Reynolds, M. L. Roper, Bradford Samson, Frank H. Samson, Joseph Schappert, Patrick A. Shovlin, Martin Stamer, Charles Sperry, James Sweeney, Harry Smith, William S. Taylor, William B. Thornton, Zigmond Tomkiewicz, Frank Trimble, Ivor Vincent, H. M. Warren, William E. Walters, William E. Williams, Owen S. Williams, William E. Watkins, John Williams and John Walsh.

#### Bituminous

**Chambersville**—The Peterman mine of the Eliza J. Smith & Brothers Coal Co. here has been sold to the Clark Coal Co., of Barnesboro. The mine was opened up in 1915 and has a considerable development with a daily capacity of 300 tons. The sale price has not been made public.

**Johnstown**—The Penn Public Service corporation, operating in Cambria, Indiana and Somerset counties, will start on May 1, the extension of the high-power lines, arranging for a length of 18 miles of wire. The line will extend from the southern limit at Hooversville, Somerset County, to the northern limit at Hellwood, Indiana County. The wires will be carried on 200 steel towers. The lines should be in operation by October when the new power plant at Seward, which will generate 40,000 kilowatts as the minimum, will be completed. This line passes through some of the most active coal territory of western Pennsylvania.

**Indiana**—The largest class of applicants for certificates of qualification for bituminous mine foremen and fire bosses ever taking these examinations here, was in attendance recently when the examining board of the Twenty-fifth Bituminous district, composed of Thomas S. Lowther, inspector and chairman, W. B. Wardrop, representative for the operators and D. J. Jones, representative for the miners, held the annual examination. There were 59 applicants for second-grade foremen, 48 for first-grade foremen and 29 for fire boss. Several of the applicants were young men who had seen service in France in the world war and are now working themselves up in the mining industry.

**Pittsburgh**—The bi-monthly meeting of the mechanical section of the Engineers' Society of Western Pennsylvania was held on the evening of April 6 in the auditorium of the Union Arcade Building. E. B. Bailey, president of the Bailey Meter Co. of Cleveland, O., read an interesting paper on "Power Plant Instruments and Meters." Various meters that show the relation between the steam inflow and the energy input, as well as other types, made clear the importance of this type of installation around power plants. The paper was illustrated with lantern slides and actual chart records of performance.

A meeting of 150 members of the American Institute of Mining & Metallurgical Engineers, who are located in the Pittsburgh district, will be held on April 30 in the auditorium of the Pittsburgh station of the Bureau of Mines. Sentiment in favor of a local chapter of the institute is the cause of the meeting, at which time a decision will be reached as to whether or not a Pittsburgh branch will be formed.

The American Association of Engineers, a newly organized national society, met in the auditorium of the Bureau of Mines, at this city, on April 16. The meeting was an open one and many engineers in the Pittsburgh district attended. The principles and

plans of the society were outlined in addresses and the possibility of organizing a Pittsburgh chapter was discussed. E. A. Holbrook, superintendent of the Pittsburgh station of the Bureau of Mines, offered the freedom of the buildings to the society members and others. Inspection of the buildings was one of the entertainment features as well as the showing of the Bureau of Mines film, "The Story of Coal."

#### WEST VIRGINIA

**Charleston**—New officers were elected at the annual meeting of the New River Coal Operators' Association held in this city on April 12. C. C. Beury, of Charleston, after a service covering a period of four years as president of the association, declined re-election. The roster of new officers includes: G. H. Caperton, of Charleston, president; S. A. Scott, of Maconald, vice president; T. L. Lewis, of Charleston, secretary. A special committee was selected by the association, consisting of C. C. Beury and G. H. Caperton to work in conjunction with like committees from other districts in an effort to secure a better car supply.

Much concern is being manifested by operators in southern West Virginia, over the increasing number of privately owned coal-carrying equipment. Extensive use of such cars, it is claimed, works a hardship on companies not owning their equipment, particularly on the small producer in that, with so many individual cars in use, it is impossible for many companies to secure an equitable car supply. It is said that the number of individual cars owned by the larger coal companies, by public utility companies and by many byproduct concerns is constantly on the increase. This situation, it is contended by some operators, is becoming serious. It is only a question of time, declares J. J. Ross, president of the Logan Operators' Association, until fully half the motive power of a road, such as the Chesapeake & Ohio for instance, will be required in transporting private coal cars. According to Mr. Ross, it is believed that the number of private coal cars this and other roads are permitted to transport should be limited.

#### KENTUCKY

**Madisonville**—If plans were not changed, the hospital committee of District 23, United Mine Workers, assembled at Central City, Ky., recently. President W. D. Duncan, of District 23, United Mine Workers of America, expected to issue a call for the committee to meet after the wage committee conference was held, and the members should be ready to submit their report by May 15. As soon as the committee outlines its policy, various towns in western Kentucky, who are seeking the proposed \$100,000 miners' hospital, will be visited and inducements these towns offer for the location of the institution will be ascertained. After the committee makes its report, the matter will be in such shape that mine workers' locals can petition President W. D. Duncan to hold a referendum vote of the members of the mine workers. Should the union miners not request a referendum vote, the hospital committee's report will not be acted on until the United Mine Workers' district convention is held which will be in October.

#### OHIO

**Stenboville**—An official investigation will be begun looking into the accident, in which two coal miners were killed and three others injured (one probably fatally) at the LaBelle Iron Works. A motor train carrying miners out of the mine collided head-on with a string of empties. Brief reports of the company attribute the accident to a misunderstanding of signals.

**Columbus**—The Eastern Hocking Coal Co. has filed suit against the Blk Coal Co., of Columbus, for damages in the sum of \$1,369,000, alleged to have been suffered when the defendant "secretly" mined 880,000 tons of coal under the plaintiff's lands in Muskingum County. The action was brought in the Franklin County Common Pleas Court.

Ohio soft coal operators, especially those operating in the Hocking Valley, Pomeroy Bend and Crooksville districts of the state, were much gratified at the news from Washington that the Interstate Commerce Commission is going to help the car supply on the Hocking Valley, the Kanawha & Michigan, and the Toledo & Ohio Central railroads. The mines have been operating at less than half capacity because of car shortage, and numerous complaints were made to the Interstate Commerce Commission. The announcement from Washington was to the effect that orders had been issued to deliver 425 cars per day to the Hocking Valley; 400 cars per day to the Toledo & Ohio Central, and other cars to smaller lines. In the North-

west it is said that railroads hold 43,000 cars in excess of their ownership and it is planned to bring them back to the owning lines.

#### INDIANA

**Clinton**—The Miami Coal Co. has set a new high record for total output in its five Clinton mines during the month of March. The total was 216,585 tons, as compared with the former record of 180,000 tons for one month. The average number of days the five Miami mines worked in the month was 24. Miami mine No. 8 produced 63,133 tons, the largest output in the field for the month. The Miami company ranked second in Indiana in last year's output; the Vandalia Coal Co. was first. The Miami company has discontinued the "drag" or pre-pay day for miners, a system under which the men who get their money in advance pay 10 per cent to the company for the privilege. The company officials say the action is taken in conformity with the recent recommendations of the coal commission. In the days when the saloons were operating, hundreds of miners took advantage of the "drag." Now the "drag" has fallen to less than half the former proportions.

#### ILLINOIS

**Duquoin**—Damage which has been estimated at \$80,000 was done recently in the big storm that swept the Middle Western states, to two coal mines and a coking plant near Belleville, in St. Clair County, north of here. Among the mines damaged was the Senior Coal Co., the entire top works being destroyed, partly by wind and partly by fire, which originated during the storm; the other was the Henrietta mine of the I. X. L. Coal Co., of Edwardsville. In the latter case, the tippie was blown down and the large shaker engine dropped into the shaft, falling 300 ft. to the bottom. The third concern which received unusual damage was the plant of the St. Louis Coke & Chemical Co., which was only built last spring. Fifteen out of the 17 towers at this plant were blown down, some of them being as high as 164 ft. Other mines through this district received minor damages but none so severe as the three noted.

**Benton**—With the exception of the Middlefork mine of the U. S. Fuel Co., every coal plant in Franklin County, Illinois, is at a standstill on account of the yardmen's strike all over the country. The Middlefork mine owns its railroad cars, and is thus able to run, and the cars are taken directly from the mine to their destination. For more than a week the other mines have not been working, and the miners are beginning to chafe under the enforced idleness. Saline County, Illinois (southeast of Franklin County), operators are pleased over the arrangement recently completed between the Big Four and New York Central lines, whereby the latter agrees to furnish the Big Four a large number of coal cars each day. This arrangement is expected to enable the Saline County mines to operate practically every day. The car supply heretofore has been wholly inadequate in that county as well as all other counties in the southern Illinois field.

#### CANADA

**Toronto**—An important consolidation of steel, coal, shipbuilding and shipping enterprises, promoted by the Dominion Steel Corporation, of Sydney, N. S., is now under way. The proposition for a merger of the Dominion Steel Corporation and the Nova Scotia Steel & Coal Co., which has for some time been under consideration, has, since the acquisition of a large interest in the Dominion Steel by British capitalists, been extended so as to include the Canada Steamship Lines, Ltd., and the Halifax Shipyards, Ltd., with other allied enterprises. The first step, involving the merger of the Dominion Steel and the Nova Scotia Steel, is understood to be nearing completion. Negotiations which have been in progress in Montreal for some weeks are to be continued in New York when a final decision will be arrived at. Expert accountants and appraisers have for some time been at work on the books and properties of the companies involved. When their reports are completed offers will be made to the shipping and shipbuilding companies of the terms, on which their properties will be taken over. The acceptance of these conditions, it is understood, will be little more than a matter of form, owing to the fact that the steel interests are largely identified with the other enterprises. Extensive plans for the expansion of the industries to be included in the merger are being matured, which will require additional capital to an amount estimated at between \$20,000,000 and \$28,000,000, which it is anticipated can easily be raised.

## Personals

**Walter C. Hess**, formerly assistant mining engineer of the Temple Coal Co., of Scranton, has been appointed mining engineer of the same concern to take the place of Geo. W. Engel, deceased.

**Tudor Aston**, superintendent of the Mt. Lookout colliery of the Temple Coal Co., has resigned to go into business for himself.

**Bruce Welr**, superintendent of the North West colliery of the Temple Coal Co., has been transferred to the superintendency of the Mt. Lookout colliery at Wyoming, to take the place of Tudor Aston, resigned.

**James McAndrew** has been appointed assistant superintendent to John Mellow, superintendent of the Lackawanna, Sterrick Creek and North West collieries of the Temple Coal Co., northeast of Scranton.

**D. S. Wolfe**, division superintendent of the Lehigh division of the Lehigh Valley Coal Co., with headquarters at Hazleton, has resigned to become the general superintendent of the McTurk operations in Schuylkill County.

**George Wood**, formerly division engineer of the Lehigh division of the Lehigh Valley Coal Co., has been appointed to the position of division superintendent of the same division. His headquarters will be at Hazleton.

**Fred Holderman**, formerly a mining engineer of the Lehigh division of the Lehigh Valley Coal Co., has been promoted to the position of division engineer of the same division.

**P. Borgger, Jr.**, has just been promoted to the position of assistant mine foreman of the Tomhicken colliery of the Lehigh Valley Coal Co., in Luzerne County.

**David Flemming** has resigned as general superintendent of the Colver mines of the Ebensburg Coal Co., at Colver, Pa. Mr. Flemming will remove to Greensburg, Pa., and retire from the active mining industry.

**E. S. Brooks** has been appointed general manager of the Union Pacific Coal Co., with headquarters at Rock Springs, Wyoming, to succeed Geo. B. Pryde, acting general manager, effective April 1. The president of the company is E. E. Calvin, with offices at Omaha, Neb.

**R. L. Rogers**, formerly sales manager for the Chicago, Wilmington & Franklin Coal Co., and until recently with the Clinton Coal Co., has been appointed general sales manager for the Sterling-Midland Coal Co., of Chicago, which has various operations around Duquoin, Ill., and other places.

**William P. Rend**, a son of Joseph Rend, of Chicago, president of the W. P. Rend Coal Co., which operates two large collieries in Franklin County, Illinois, has been sent to these mines by his father, in order that he may learn the business from the ground up. The younger Rend is about 21 years of age, and is said to be taking a keen interest in the mining business.

**M. L. O'Neale**, graduate mining engineer of Columbia University; member of the American Institute of Mining & Metallurgical Engineers; 7½ years superintendent of coal and coke properties in Alabama and West Virginia, and one year superintendent of pyrite mines and concentrating plant in New York, announces the opening, at Morgantown, W. Va., of an office for consultation in matters of mine operation, plant design and installation, examination of properties and reports.

**S. W. Taylor**, formerly president of the Cement Gun Co., Inc., whose main office is at Allentown, Pa., has recently taken over the duties of chairman of the board of directors of this company. **W. J. Roberts**, president of the Traylor Engineering & Manufacturing Co., has been appointed to the presidency of the Cement Gun Co., Inc. Another advancement in the Cement Gun organization is that of **R. C. Collier** to the position of vice president, in addition to his continued duties of general manager.

**W. B. Wardrop** has resigned as superintendent of the Iselin mines of the Pittsburgh Gas Coal Co., at Iselin, Pa., and has removed to Indiana, Pa., where he has purchased a property and will take a much needed rest. **James Patterson** has been placed in charge, temporarily of the Iselin mines. He has been general mine foreman for these mines for several years.

**L. N. Ridenour**, in charge of the manufacturing sales department of the Wellman-Seaver-Morgan Co.'s Akron office, moved his department to the company's general offices at Cleveland, Ohio.

## Obituary

**Roy Hart**, vice president of the Oakland Coal Co., and a well-known figure in coal circles in the Middle West, died recently at his late home from a complication of diseases. He had been in ill health for the past two years.

**W. L. McDonald**, general superintendent of the Mather Collieries since the opening of the mines in Greene County in 1917, died in a Pittsburgh hospital on April 11, after undergoing an operation for mastoid. Mr. McDonald's illness was of but short duration and his death was a distinct shock to many friends in western Pennsylvania and Ohio. He was connected with the coal industry in the latter state before coming to Pennsylvania.

**William K. Martin**, foreman at the Annabelle mines of the Four States Coal Co., in Marion County, W. Va., died on April 14 in the Fairmont, W. Va., State Hospital, from a fractured skull. The day before his death, Mr. Martin was struck by a trap door in one of the mine headings, after it had been rammed by a locomotive and sustained a fractured skull. Mr. Martin who was 36 years of age, leaves a widow and son.

**Geo. W. Engel**, for many years the mining engineer of the Temple Coal Co., died as the result of an attack of pneumonia. His death was a shock to his friends, for while he had been ill for a number of weeks, when recovering rapidly from his illness, when a sudden change in his condition took place and in a few hours he died. Mr. Engel was born in Fountain Springs, Pa., but for more than twenty years was a resident of the city of Scranton, Pa. He was considered one of the leading engineers in the coal industry in this section of the country. He was often called into consultation with the larger companies of the anthracite regions.

### ELIAS ROGERS

Elias Rogers, a prominent coal operator and merchant, and identified with many other large business enterprises, died on April 11 at his home in Toronto, Canada, in his seventieth year after a few days illness. He was born in Newmarket, Ont., and he purchased the first mines opened in Jefferson County, Pa.; in 1876 he came to Toronto and, in partnership with his brother Samuel, established the business afterward incorporated as the Elias Rogers Coal Co., Ltd. In 1909 he became president of the Crows Nest Pass Coal Co., which under his management rapidly expanded. He was prominently associated with numerous other important industrial and financial enterprises, being president of the National Life Assurance Co.; president of the Electric Light & Power Co., of British Columbia; vice president of the Imperial Bank of Canada, and a director of the Dominion Iron & Steel Co.; the National Trust Co., and the Carrington Air Brake Co.

Mr. Rogers took an active interest in public affairs. In 1887 he was elected to the City Council, and in 1898 was president of the Board of Trade. He was a prominent member of the Society of Friends and identified himself with a number of religious and philanthropic activities. He retired nine years ago from active connection with the Elias Rogers Coal Co., his eldest son Alfred succeeding him as president. He is survived by his wife, four daughters and two sons; his third son Clarence, who served overseas with distinction in the Royal Flying Corps, having been killed in action.

## Coming Meetings

**Chicago Coal Merchants' Association** will hold its annual meeting April 13, at Chicago, Ill. Secretary, A. H. Kendall, Chicago, Ill.

**American Chemical Society** will hold its annual meeting at St. Louis, Mo., April 13, 14, 15 and 16. Secretary, Dr. Charles L. Parsons, 1709 G St., N. W., Washington, D. C.

**National Coal Association** will hold its annual meeting May 25, 26 and 27 at the Traymore Hotel, Atlantic City, N. J. Secretary, W. B. Reed, Commercial Bank Building, Washington, D. C.

**The American Association of Engineers** will hold its annual convention at the Planters Hotel, St. Louis, Mo., May 10 and 11. C. E. Drayer, secretary, Chicago, Ill.

**The Rocky Mountain Coal Mining Institute** will hold its annual meeting in Denver, Col., in conjunction with the National First Aid Meet., on August 20 and 21. Secretary, F. W. Whiteside, Denver, Col.

**National Conference of Business Paper Editors**, will hold its next meeting June 4 at the Congress Hotel, Chicago, Ill. Secretary, R. Dawson Hall, 36th St and 10th Ave., New York City.

**M. O. I. Coal Association** will hold its annual convention June 16, 17 and 18 at Cedar Point, Ohio. Secretary, B. F. Nigh, Columbus, Ohio.

**National Retail Coal Merchants' Association** will hold its annual meeting June 10, 11 and 12 at Detroit, Mich. Secretary-manager, Ellery Gordon, Philadelphia, Pa.

**Kentucky Mining Institute** will hold its annual meeting June 4 and 5 at Lexington, Ky. Secretary, C. W. Strickland, Huntington, W. Va.

**American Society of Mechanical Engineers** will hold its spring meeting May 24, 25, 26 and 27 at St. Louis, Mo. Secretary, Calvin W. Tice, 29 West 39th St., New York City.

**Chamber of Commerce of the United States of America** will hold its eighth annual meeting April 26, 27, 28 and 29 at Atlantic City, N. J. Assistant Secretary, D. A. Skinner, Washington, D. C.

**West Virginia Coal Mining Institute** will hold its annual meeting June 7 and 8, at White Sulphur Springs, W. Va. Secretary, R. E. Sherwood, Charleston, W. Va.

**American Wholesale Coal Association** will hold its annual meeting June 1 and 2 at Pittsburgh, Pa. Secretary, G. H. Merryweather, Washington, D. C.

**The Colorado Retail Coal Dealers' Association** will hold its annual meeting June 8, at Colorado Springs, Col. Secretary, E. Hopper, Denver, Col.

**West Virginia Freeport Coal Operators' Association** will hold its annual meeting June 3 at Kingwood, W. Va. Secretary, A. T. Carnahan, Akron, Ohio.

## Publications Received

**Coal.** The Federal Trade Commission, Washington, D. C. Cost report, No. 2, Pennsylvania—anthracite. Illustrated; pp. 145; 6 x 9 in. Cost of production of anthracite for years 1917 and 1918.

**Coal.** No. 3 Illinois—bituminous. Federal Trade Commission Washington, D. C. Illustrated; pp. 127; 6 x 9 in. This report is the third of the series on the cost of producing coal; covers data for year 1918.

**Twenty-eighth Annual Report of the Colorado Fuel & Iron Co.,** of Denver, Col. For the year ended Dec. 31, 1919. Not illustrated; pp. 15; 6 x 9 in. Report to the stockholders.

**Thirty-Second Annual Report of Bureau of Mines, Mining and Mine Inspection, State of Missouri, for 1918.** Not illustrated; pp. 82; 6 x 9 in. Statistical information about the coal, lead and zinc mines of the state for the year 1918.

**Annual Report on the Mines—1919.** Province of Nova Scotia. Department of Public Works and Mines. Halifax, N. S. Illustrated; pp. 74; 5½ x 9½ in. A report on the mines of the province for the year ended Sept. 30, 1919.

**Ninety-ninth Annual Report of the Board of Managers of the Lehigh Coal & Navigation Co.,** of Philadelphia, Pa. For the fiscal year ended Dec. 31, 1919. Not illustrated; pp. 26; 9 x 12 in. Report to the stockholders.

**Transvaal Chamber of Mines.** Report. Monthly Analysis of Gold Production in the Transvaal, October, 1919. With Transvaal Output of Coal, Silver, Copper Ore and Tin Ore for September, 1918 and 1919. Not illustrated; pp. 9; 14½ x 20 in.

**Report of Engineers Committee, 1918-1919.** U. S. Fuel Administration, Washington, D. C. Illustrated; pp. 194; 9 x 11½ in. Results of the work of the Engineers Committee of the U. S. Fuel Administration connected with price fixing and costs of coal.

**Absorption as Applied to Recovery of Gasoline Left in Residual Gas from Compression Plants.** By W. P. Dykema and Roy O. Neal. Department of the Interior, Bureau of Mines. Technical Paper 232. Petroleum Technology 53. Illustrated; pp. 43; 6 x 9 in.

**Explorent Stations of the Bureau of Mines.** By Van H. Manning. Department of the Interior. Bureau of Mines Bulletin 175. Illustrated; pp. 106; 6 x 9 in. Notes about the 11 different field stations of the Bureau of Mines and the work done by them.

**Waste and Correct Use of Natural Gas in the Home.** By Samuel S. Wycor, Department of the Interior, Bureau of Mines, Technical Paper 257. Illustrated; pp. 23; 6 x 9 in. Practical hints to householders.

**Eight Annual Report of the State Inspector of Mines to the Governor of New Mexico.** For the year ending Oct. 31, 1919. Not illustrated; pp. 74; 6 x 9 in. Considerable space is devoted to statements relative to time worked and wages paid coal mine employees.

**Coal, No. 2, Pennsylvania Anthracite.** Cost reports of the Federal Trade Commission, Washington, D. C. Illustrated; pp. 145; 5 1/2 x 9 1/2 inches. Data for 1917 and 1918 covering output of practically total anthracite produced; also details of operations of operators producing about half the anthracite tonnage for 1913-1918.

**Boiler and Furnace Testing.** Prepared by Rufus T. Strohm, Department of the Interior, Bureau of Mines, Technical Paper 240. Illustrated; pp. 23; 6 x 9 in. A description of what the author calls the simplest and best way of finding out how efficiently a boiler is working by means of an evaporation test.

**Miners' Safety and Health Almanac for 1920.** Compiled by R. C. Williams, Department of the Interior, Bureau of Mines, Miners' Circular 26. Illustrated; pp. 51; 6 x 9 in. Useful as a calendar and giving information on different diseases and how kept from starting; notes common accidents in mines.

**Geology and Natural Resources of Ruthersford County, Tennessee.** By J. J. Galloway, State of Tennessee Geological Survey, Nashville, Tenn. Illustrated; pp. 81; 6 x 9 in. Report based on survey made in 1915, the purposes of which were (1) to determine the natural resources of the country; (2) study of the geology; (3) study of the soil.

**Results of Forty-one Steaming Tests Conducted at the Fuel Testing Station, Ottawa.** By John Blizard and E. S. Malloch, Canada Department of Mines, Mines Branch. Illustrated; pp. 83; 6 1/2 x 9 1/2 in. Includes the results, and comments thereon, of all the steam-boiler trials conducted at the fuel-testing station at Ottawa, Canada, since this class of work was first undertaken.

**Products, Mines and Facilities of the Hillman Coal & Coke Co.** Main office, First National Bank Bldg., Pittsburgh, Pa. Bulletin. Illustrated; pp. 48; 8 x 11 in. A finely illustrated description of the plants and shipping facilities of the Hillman interests together with maps showing the location of the mines of the company. Interesting historical data about the coal regions in question noted.

**The Industrial Outlook.** By Guy E. Tripp, Chairman, board of directors, Westinghouse Electric & Manufacturing Co. Not illustrated; pp. 15; 6 x 9 in. An address delivered before the alumni of the Stevens Institute of Technology, at New York, Jan. 15, 1920. Takes up the industrial situation from the war to date; shows what labor has done and is now doing. Exposes tendencies of social unrest and necessity to speed up and get down to more productive work again. Excellent reading for the man in the shop and the president or manager in his office; any one who desires an insight into the present social and economic problems, will find in this address abundant material for serious consideration.

## Trade Catalogs

**Anti-Corrosion Engineering.** Distributed by the National Tube Co., Pittsburgh, Pa. Circular. Pp. 4; 8 1/2 x 11 in.; illustrated. A reprint of a short article which appeared in the Jan. 31, 1920, *Scientific American*.

**Jeffrey Shredders.** The Jeffrey Manufacturing Co., Columbus, Ohio. Catalog 259. Pp. 36; 6 x 9 in.; illustrated. Description of the Jeffrey Type "E" swing hammer shredder, for reducing wood chips, bark and other fibrous materials.

**Coal Mining Lubrication.** Keystone Lubricating Co., Philadelphia, Pa. Bulletin 26. Pp. 27; 8 1/2 x 11 in.; illustrated. Some facts about lubrication, around mines in general, and the Keystone system in particular. An interesting story.

**Why Bituminous Coal is Cheaper Than Fuel Oil.** Distributed by Peole Peacock & Kerr, Inc., North American Bldg., Philadelphia, Pa., and Grand Central Terminal,

New York, N. Y. Pp. 15; 5 x 7 1/2 in.; illustrated. Some statements covering the cost of substitution of fuel oil in plants now operating with bituminous coal.

**MacWhyte Wire Rope.** The Macomber & Whyte Rope Co., Kenosha, Wis. Folder. Pp. 4; 6 x 9 in.; illustrated. An announcement calling attention to the quality of the wire rope manufactured by this company.

**Deming Pumps.** The Deming Co., Salem, Ohio. Catalog 26. Pp. 254; 6 x 9 1/2 in.; illustrated. Bound in cloth. Catalogue is divided into sections, each embracing a certain class of pumps of accessories. The engineering tables and information relating to hydraulics should be useful to dealers in pumps. Hand and power pumps for general service.

**Public Utilities City of Nitro, W. Va.** Distributed by the Charleston Industrial Corporation, operating the City of Nitro. Booklet. Pp. 21; 9 x 12 in.; illustrated. A technical description of the various public utilities of Nitro, erected during the war, and which are now in constant operation. Built for a city of 35,000 people, their tremendous reserves stand ready to be put to immediate use and to serve a community ten times the size of the present population of Nitro.

## Industrial News

**Blackey, Ky.**—The Woodburn Coal Co. is considering plans for the immediate construction of the proposed new coal tipples and bins at its plant, to facilitate operations.

**Cincinnati, Ohio.**—The Callaway Coal Co. has been chartered with a capital of \$25,000, by S. D. Duckler, F. H. Callaway, W. K. Neuding, G. H. Sibball and R. M. Plympton.

**Bloomington, Ind.**—The Arbutus Coal Co. has been incorporated with capital of \$10,000, with Edgar Fish, George Dodson and T. E. Adams, as directors.

**Eagle Pass, Tex.**—The International Coal Mines Co. is planning to increase the capacity of its local mines. It is proposed to make enlargements and improvements at its plant for this purpose.

**Herndon, W. Va.**—The Monticello Coal Co., recently organized with F. M. Lee as president and general manager, is planning for the construction of about 50 miners' dwellings at its local properties.

**Bramwell, W. Va.**—The Thomas Coal Co. has awarded a contract to the Stevens-Adamson Co., Bramwell, for the construction of a new coal tittle and washery at its local operations. The work is estimated to cost about \$100,000.

**Louisville, Ky.**—A report from Whitesburg, Ky., is to the effect that the Consolidation Coal Co., in the Jenkins-McRoberts field, is offering prizes this year for the best gardens, and best varieties of produce grown by the miners in its employ to encourage home growing.

**Hamden, Ky.**—The Kenmont Coal Co. is understood to be considering plans for the immediate construction of a large new coal tittle, to be used in connection with the development of additional mining properties. The plans also include the erection of approximately 30 dwellings for the miners.

**Chehalis, Wash.**—The Sheldon coal mine on Coal Creek, near this city, has been leased by Bert Hill of Chehalis; A. Hall, of Omakaska, and George Love, of Tacoma. The property has been developed by Olson & Guy, of Tacoma, who had it under lease, and it is now ready to produce coal for market. The lessees will at once enter the local market with their product.

**Charlottesville, W. Va.**—The Late-Kooper Coal Co. has recently been organized under a state charter to operate in the vicinity of Newburg, Preston County. The concern is capitalized at \$50,000. Those principally interested in the new company are: Gordon R. Late, Addie Ruth Late, Joseph Van Zandt, J. Ray Smoot and D. B. Kooper, all of Newburg.

**Henderson, Ky.**—On March 31 the Southland Coal Co., operating the largest mine in Henderson County, secured control of the Mid West Fuel Co. properties, the consideration being around \$120,000. Both mines are within the city limits of Henderson. W. L. Hughes, vice president of the Mid West company, will continue in active charge of the properties.

**Prize, Ky.**—The Kanawha Elkhorn Collieries, of Buffalo, N. Y., is arranging plans for the installation of new electrical equipment for increased operations at its local mining plants. The company is developing about 4,800 acres in this section with a capacity of about 1,200 tons daily, and the new equipment will include three new gen-

erating units. R. C. Simpson is general superintendent.

**Jeff. Ky.**—The Carr's Fork Coal Co. is having plans prepared for the installation of machinery and equipment for the development of about 3,000 acres of coal properties in the vicinity of Hamden, Ky. Henry E. Bullock, of Lexington, Ky., is president.

**Columbus, Ohio.**—The Northland Coal Co., of Columbus, has increased its capital from \$25,000 to \$300,000 for the purpose of taking over a large tract of 7,000 acres of coal lands in Wayne County, West Virginia, on the Norfolk & Western R.R. The tract has one working mine. It is planned to open three or four more mines and increase the output to about 5,000 tons daily. The offices of the company are in the Clinton Bldg., Columbus.

**Pocatello, Ida.**—The Idaho Coal Mining Co., backed by Vice President Simpson of the Lincoln Trust Co., of Spokane, which is preparing to operate in the Teton basin near Driggs, will open headquarters in this city at once, according to E. H. Clarke, president of the Chamber of Commerce, which has endorsed the coal-mine proposition. The properties are said to contain over 13,000,000 tons of coal and their opening will prove to be a large undertaking.

**Ithaca, N. Y.**—The Morse Chain Co., of this place, announces the change of address of its Greensboro (N. C.) office, which has been moved to Charlotte, N. C., with headquarters in the Commercial Bank Building. George W. Pritchett, the company's southeastern manager, has found this change advisable owing to the increase in the use of Morse chains, necessitating the building of new mills and also increasing the capacity of others. H. E. Matthews continues with the company answering questions and showing Morse drives to all inquirers.

**Duquoin, Ill.**—The Elder-Bixler Coal Co., of Carrier Mills, Ill., southeast of here, has announced a change of location to Harrisburg, Ill., and an increase in stock from \$25,000 to \$100,000.

The Sangamon County Mining Co., has increased its capital stock from \$10,000 to \$200,000 and announces that it will make large extensions on its mining property in the near future.

The Polonia Coal Co., with offices in Chicago, has increased its capital stock from \$110,000 to \$150,000.

**Charleston, W. Va.**—The Mountain Eagle Collieries Co., Charleston National Bank Building, recently incorporated with a capital of \$75,000, has perfected its organization, and plans are being prepared for the immediate development of about 2,250 acres of coal properties in the vicinity of Heathman, W. Va. Complete machinery and equipment will be installed and electric power drive will be utilized wherever possible. It is proposed to have an initial capacity of 140 tons daily, to be increased ultimately to 600 tons. The work also includes the construction of a power plant for plant service. Lee Stone is manager.

**Bristol, Va.**—The Hazard Blue Grass Coal Corporation, which recently filed articles of incorporation with a capital of \$1,000,000, has perfected its organization and plans are being made for the installation of machinery and equipment in connection with the proposed development of a total of 3,000 acres of coal properties in the Hazard district, Ky. It is planned to have an ultimate capacity of about 2,000 tons daily. Included in the development plans is the erection of a number of miners' dwellings for employees. S. R. Jennings is president; F. A. Garth, vice president, and F. Zulantz, secretary-treasurer, all of Johnson City, Tenn.

**Louisville, Ky.**—The Hazard-Blue Grass Coal Corporation, with a capital of \$1,000,000, is offering \$350,000 worth of preferred stock, through investment houses. This concern was recently incorporated under the laws of Virginia, as a consolidation of the Hazard Coal Co. and Blue Grass Coal Corporation. The mines are located in Perry County, near Hazard, and the general offices are at Johnson City, Tenn. The directors are principally bankers of Kentucky, Tennessee and Virginia. Leases cover 5,000 acres of coal land, the highest royalty rate being 10 cents per ton. The properties are estimated to contain 35,000,000 tons of coal. These mines are laid with good steel, have more than 500 mine cars and ten electric locomotives; ten electric mining machines, three substations, two conveyor lines that cost \$25,000 each; two modern tipples with shaker screens that would cost not less than \$75,000 to erect; electric fans, electric pumps, machine and blacksmith shops. The plant is one of the most complete in the state. J. F. Hatfield, of the Reliance Coal & Coke Co., Cincinnati, Ohio, is one of the incorporators.

## DISCUSSION *by* READERS

EDITED BY JAMES T. BEARD

### Roller Bearings for Mine Cars

*Letter No. 7*—The discussion, in *Coal Age*, regarding the merits of plain and roller bearings, for mine cars, has been very interesting. However, I seriously question the figures presented by Richard W. Harris, in the issue of Mar. 4, p. 455, respecting the cost of lubrication for mine cars equipped with plain bearings.

Last year, we used 746 mine cars, which were scattered among six different mines. These cars were equipped with the Eureka wheel made by Hockensmith. The cars were oiled on an average once every six weeks, using for that purpose No. 119 Keystone grease

For the ten months extending from January 1 to October 31, the grease for lubrication cost us \$1,370.71. The labor cost for applying the grease to the cars was \$204.15 which made a total outlay, for lubricating the 746 cars, during the ten months mentioned, \$1,574.86. Adding one-sixth to this amount, to reduce to a basis of a year, gives a total estimated cost for the lubrication of these cars, \$1,837.34, which makes the average cost, per car, per year,  $\$1,837.34 \div 746 = \$2.46$ , as against  $\$4,380 \div 700 = \$6.25$ , per car, per year, by Mr. Harris' estimate. This is only slightly above his estimated cost for lubricating cars equipped with roller bearings, which was  $\$1,400 \div 700 = \$2$ , per car, per year.

Let me say in addition, that all of our cars are drawn by rope haulage, with speeds that run as high as eighteen miles per hour.

R.

Robertsdale, Pa.

*Letter No. 8*—Referring to the letter of Richard W. Harris, *Coal Age*, Mar. 4, p. 455, relating to roller bearings for mine cars, allow me to say that his reference to the cost of lubricating both plain- and roller-bearing cars has interested me greatly, as I have been operating trucks equipped with both types of bearings.

Our plain-bearing trucks have the cavity-type wheels, which require greasing every 90 days, while the roller-bearing equipment requires greasing but once in eight months. Each roller-bearing car requires eight pounds of grease at 10c. a pound, making the cost for grease 80c. per car, in eight months, or \$1.20, per car, per year.

Two men will grease thirty of these cars a day. They are paid \$5.42, each, for this work, which makes the labor cost, per car,  $2 \times 5.42 \div 30 = \$0.36$ , in eight months; or 54c., per car, per year. This makes the total cost for labor and grease  $1.20 + 0.54 = \$1.74$ , per car, per year.

On the other hand, the plain-bearing, cavity-type wheels, require greasing four times a year, using four pounds of grease per car; or sixteen pounds, per car, per year, at 10c. per pound, which makes the total cost of grease \$1.60, per car, per year.

Two men will grease 50 of these cars, per day, each man receiving \$5.42 a day, which makes the cost for labor  $2 \times 5.42 \div 50 = \$0.22$ , per car, each time they are greased, or 88c. per car, per year. This makes the total cost for labor and grease  $1.60 + 0.88 = \$2.48$ , per car, per year; and shows a saving, in favor of roller-bearing cars of  $\$2.48 - 1.74 = \$0.74$ , or 74c., per car, per year.

Mr. Harris gives the cost of labor for greasing roller-bearing cars four times a year, as taken from his records at the mine, as 40c., per car, per year, or 10c., per car, each time they are greased. At this rate, my cost for grease and labor, for roller-bearing cars, greased once in eight months, would be \$1.20 per car, for grease and 15c., per car, for labor, making the total cost for grease and labor \$1.35, per car, per year.

However, I am satisfied that roller-bearing cars cannot be greased for ten cents, per car, when the car has to be sidetracked, and the cast-iron plug removed from each wheel, the grease put in with a grease-gun, the plugs replaced and the car returned to service again. At the rate of wages paid for this work, this operation would have to be completed in four-and-one-half minutes to reduce the cost to ten cents, per car.

Staunton, Ill.

B. F. MEYER

### Tamping Dynamite

*Letter No. 5*—Referring to the letter of Gaston F. Libiez, on the subject of the need of tamping dynamite, *Coal Age*, Jan. 29, p. 244, I am glad to see that he emphasizes what I have always found an important factor in gaining efficiency in the shooting of coal. Aside from the danger to the health and lives of miners, there are many thousands of dollars wasted annually through ineffective shooting, and the loss in tonnage from the same cause is immeasurable.

Aside from the proper mining of a shot, one of the strongest—in fact I may say *the* strongest argument, in behalf of the effective use of dynamite and permissible explosives, is the proper tamping of the charge. My own personal experience, as well as data gathered from every reliable source, has convinced me that the most effective results are obtained when a charge is tamped full to the mouth of the hole. The almost invariable custom of using short lengths of fuse and tamping the hole to a fraction of its depth only, gives inferior results.

It was my pleasure to witness a series of comparative tests of black powder and permissible explosives. These tests were made for the purpose of demonstrating the effectiveness of the latter in the blasting of coal. In the course of the demonstration, it was shown that when a permissible powder was tamped to the end of the hole, the results exceeded those that could be obtained by the use of black powder, and there was less hazard or risk

to the miner. Other tests made with partly tamped charges of permissible powder proved that there was a considerable loss of time and energy, which gave unsatisfactory results.

While the fully tamped charge brought the coal down in an excellent manner, the same charge but partly tamped only broke and sprung the coal, and fifteen or twenty minutes of hard muscular effort was then required of the miner to loosen or break down the shot. This was far more time and effort than would have been necessary to properly tamp the charge. Perhaps the fully tamped hole would require a little longer fuse and consume a minute or so more for the fuse to burn to the powder; but the rest and relaxation in that time would do the miner no harm.

#### TESTS NEEDED TO SHOW THE EVIL OF POOR TAMPING AND USE OF SHORT FUSE

The tests to which I refer were necessary at that time, to discourage the use of black powder in shooting coal, which practice has been the direct cause of numerous fatal accidents and gas and dust explosions. At present, it is just as necessary to show the evil attending the use of short fuse and improperly tamped holes, with a view to discouraging such practices.

The miners' chief objection to the use of permissible powders was their increased cost, amounting to about two cents. To offset this, miners resorted to the use of short fuse and improperly tamped holes. But, saving two cents in this manner meant the loss of dollars in effective shooting. Notwithstanding the success of these demonstrations, which showed the effectiveness of fully tamped holes, the practice of using short fuse and half-tamped charges still prevails in many localities, and these will require greater effort to show the fallacy of such methods.

In the explosion of nitroglycerine, as in dynamite and highly nitrated powders, the action is very quick. While it is possible to break a rock by placing the explosive on its flat surface, it cannot be denied that far better results are obtained when mud or dirt is placed over the dynamite. While it is readily admitted that the force of the exploding charge is radiated in every direction, it is only reasonable to conclude that the expansion of the gases is greatest in the line of least resistance; which, in a poorly tamped hole, is along the axis of the hole. On the other hand, a fully tamped hole presents almost equal resistance in the line of the hole as in the solid coal, which will be broken down by the force of the explosion.

Because apparently good results are obtained in an untamped hole charged with a high explosive, many are deceived and led to think that the tamping of such powders is not required. Comparative tests are needed to show that a smaller charge will produce equal results in a hole that is fully tamped. No careful and intelligent miner can fail to profit by such demonstrations. Where the honest miner has made these tests for himself, he has saved time, powder, energy and money, whether he uses a 15 per cent or a 60 per cent dynamite.

Aside from the effective results obtained in shooting coal, the factor of safety in the matters suggested is of equal importance. According to statistics compiled by the Bureau of Mines, about 25 per cent (24.80 per cent) of the fatalities due to blasting coal occur from premature blasts, and only about 3 per cent (2.97 per cent) are ascribed to tamping the holes. Those familiar with

the practice of blasting in coal mines will agree that accidents described as "premature blasts" are chiefly the results of the use of short fuse. The latter tabulation, however, is avoided, as it is a practical admission of the violation of the mining laws. It will also be agreed that many of the accidents due to tamping result from hurriedly trying to get the powder back into the hole with a short fuse, already lighted, attached to it. Let us hope that these practices, which are so dangerous, will be discarded and the reckless habits of miners will give place to a deeper regard for safety.

Thomas, W. Va.

W. H. NOONE.

## Shifting the Worker

*Letter No. 5*—Reading the letters written on this subject calls to mind a statement made by one of our greatest manufacturers and financiers who remarked, "It is easier to finance the building of a large plant than it is to find a man big enough to manage it."

Reflecting on this truth, one is brought to face the fact that the success of any undertaking will depend largely on the ability and judgment of the boss, in selecting and placing competent men in the various positions. Therefore, a boss's business, first and last, is to select the right man for the right place; and to do this he must be familiar with the general order of things, and reserve the power of employing and dismissing every man under his supervision who fails to show the required capability and fitness.

When a change is made from one department to another, or from one job to another, the same care must be exercised. Some of the most serious accidents and numerous breakdowns, causing fluctuations in production, have been due to unwise changes. To overcome the necessity of placing inexperienced men at certain work, which is a common occurrence at a coal mine most any morning when the regular man fails to report, extra men should always be in training.

#### TRAINING WORKERS FOR FILLING HIGHER POSITIONS

A good rule is to train brakemen for motormen, trackmen for brakemen, timbermen for drillers, scrapers for cutters, etc. This should be done on idle days or whenever an opportunity is offered that will not interfere to any great extent with the general order of production. In this way only, can a safe and uniform output be maintained. A common cause of accident is allowing a man to do certain work just because he wanted to do it. The boss is the judge as to whether or not a man is physically or mentally fit for the work he desires. I know of many instances that illustrate this point, but one will suffice to explain. It is as follows:

A young man who was helping on a rockdrill wanted to change to braking on a motor. He was of the right build, but unfortunately had a nervous, excitable temperament. He was given a trial and proved the most anxious man on the job; but it soon developed that he could not keep his head when anything out of the ordinary happened. For that reason the boss put him back on the drill, much to the surprise of the motorman and some others acquainted with the matter. The mine committee took it up with the boss, but quickly agreed with him when it was shown that his first thought was to prevent accidents. Later, however, a new boss put this same young man back on the motor,

with the result that he was killed inside of the first month.

Another case was that of a trackman who was put on braking, a work in which he had had no previous experience. Not being used to running and being continuously on his feet, he tired quickly. I regret to say that this man also was killed when gathering the last trip, before quitting for the day. The accident might have been avoided had the motorman given him plenty of time toward evening. But, as it was, he drove the new man the same as the regular man in trying to quit early.

Still another accident, on the same class of work, occurred when a miner was called out of his place to brake; he was not dressed for the work and was killed by having his ragged trousers caught in a rail joint. An experienced brakeman keeps his trouser legs inside of his socks and wears high shoes.

Occasionally we find men who can do more than one thing well. They should always be encouraged, for they are the most valuable workers and will never be satisfied to continue doing but one kind of work. Changes of occupation on laborious work is the best cure for staleness, which is the greatest detriment to progress. A thinking foreman, with a plan in his head, gets results by keeping his men contented.

Pikeville, Ky.

G. E. DAUGHERTY.

## Are Shotfirers Harmful?

*Letter No. 2*—It was with much surprise that I read a short article in *Coal Age*, Feb. 12, p. 309, in which the writer claims that the employment of shotfirers and the use of shotfiring systems are most harmful and dangerous. The article is unsigned, but apparently the writer is viewing the subject from what he considers would be a saving effected by spending the money that would be used to employ shotfirers, and apply it to the better ventilation of the mines. His concluding statement is "spend just half as much money in real ventilation and make the mines really safe."

If by "shotfiring systems" is meant the electric system of shooting, I agree that this is unnecessary and might well be discarded, whether the firing is done by hand batteries or from the surface. However, there are several reasons why shotfirers should be employed to shoot down the coal after all the miners have left the mine and gone home for the day.

### MINING LAW IN COLORADO

Though not familiar with the requirements of the mining laws of other states, the law of Colorado (Sec. 149) requires the use of permissible powder in all coking-coal mines and mines where safety or electric lamps are exclusively used because of the presence of explosive gas, and in such mines as the chief inspector believes the dust to be highly explosive.

My opinion is that if miners were permitted to do their own shooting in any of the mines mentioned here, it would not be long before some one of them would blow up the entire mine. The law further states (Sec. 158) that, where permissible powder is used, the primers shall be handled only by the shotfirers or shot examiners, who alone shall prepare the charge and fully tamp all shots before firing them.

Speaking of poor ventilation in mines, the employment of shotfirers would eliminate this trouble, as no

competent shotfirer will undertake to fire shots in a mine that is improperly ventilated. The argument advanced by the writer of the article mentioned assumes a condition in the mine that will permit the use of open lights. If the mine is generating gas in any quantity whatsoever, the ventilation must be sufficient to assure safety. In the presence of open lights and the probable use of black powder and squibs or fuse, there is always the possibility of the occurrence of a windy or a blown-out shot, owing to the improper tamping of the powder, overcharging the hole, or a badly placed shot or other cause. Any or all these things are liable to result when miners do their own shooting.

### FATALITIES DUE TO CARELESS HABITS OF MINERS

Many miners have been killed by the explosion of their powder when preparing a cartridge, the accident being caused by a spark from their open light falling into the powder. Frequently the miner will tamp his hole with an iron bar and pay for his heedless act by the loss of his life; or he will cut off the end of the match from his squib, in order to shorten the time of the explosion of the shot, and, as a result, be caught by the flying coal before he can reach a place of safety.

A practice that has often proved fatal to the miner is that of returning to the face to ascertain the cause of a delayed shot, which may explode about the time he has reached the coal. Or, if that does not happen, the miner may be overcome by the smoke and gases of other shots. The practice of shooting off the solid has often produced a blownout shot, and perhaps a local explosion of gas or dust has occurred with fatal results.

### NO ECONOMY IN ELIMINATING SHOTFIRERS

My opinion is that any person who desires to do away with the employment of shotfiring has had no practical experience in the mining of coal in mines generating much gas, or where the coal is friable and contains a high percentage of gas and makes much fine dust. Although in Colorado we have a good mining law that is second to none, it cannot be denied that there is a tendency on the part of mine officials to overstep the law in many ways, and the ventilation of our mines cannot be said to be modern, for which the high cost of operation is responsible.

Shotfirers, here, obtain \$7 a day and ordinarily earn an amount approaching \$2,000 a year. In eight hours a shotfirer will examine, prepare, and charge the holes, and shoot about 400 tons of coal; but he must have good ventilation to insure safety. Let me ask if it would be a saving of time and labor to eliminate the shotfirer, and allow the miners do their own shooting, when a single fatal accident will cost the company about \$3,000. Will anyone say that it will be possible to operate a coal mine a single year and not have some miner blown to pieces by reason of his own or another's carelessness, ignorance or reckless disregard of danger.

In closing, let me say that we have some "honest to goodness safety men" on the inspection staff of this state, and they cannot be classed as "porch lizards." Also, we have superintendents, foremen, firebosses, shotfirers and timber safety men, who know safety from A to Z in respect to mining coal. Somebody would have an awful time in attempting to eliminate from the mining laws of Colorado the requirements relating to shotfirers.

Farr, Col.

ROBERT A. MARSHALL.

## Co-operation Among Mine Officials

*Letter No. 7*—I have been reading the many interesting letters on this subject that have appeared in *Coal Age*; and the discussion is most timely, as co-operation is, to my mind, one of the greatest factors in a coal-mining organization. Without it, it is practically impossible to acquire the highest efficiency.

My own experience in the operation of mines is one that exhibits a marked contrast between one organization where there was harmony and co-operation on the part of every official, and another where there was a great lack of such co-operation. The recital may prove of interest to many others who doubtless have had similar experiences.

### HARD-LUCK STORIES TOLD THE SUPERINTENDENT

A few years ago, it was my fortune to be employed by a coal company, in the position of mine foreman. The superintendent was a man who knew nothing about a coal mine and had no desire to learn. He seldom came to the mine, and never ventured underground.

As will be readily understood, this type of superintendent was always ready to listen to any hard-luck story that a miner was ready to tell him. Not being a practical man, he accepted as truth these tales of miners claiming they had a "bad place, very wet, low hard coal." where they could not earn a living.

In reply, the superintendent would say "Never mind, I'll fix that on pay day"; and, sure enough, when pay-day came these fellows would find, \$10, \$15 or \$25 extra money in their envelopes. This was too good to keep and the fellow thus favored would make his boast at the hotel when drinking, and show his pay envelope. The result was that my best men began to accuse me of giving these fellows a higher rate that enabled them to make the money they did. The trouble was soon traced to its source, however, with the result that the superintendent blamed me.

About this time the president of the company advanced the superintendent to the position of manager, and I was made superintendent and given full charge of the operating end of the business, with instructions to report to the manager.

### CHANGES MADE GIVE INCREASED EFFICIENCY

My first visit to the different mines of the company brought about numerous changes, and others were recommended. Naturally, this stirred the ire of my already cross boss, and caused him to ignore many of my reports, and he also made some effort to start a crusade against me. However, the changes made in the mines, and my treatment of the different foremen and the men brought them to my side; and they always greeted me warmly and expressed themselves as glad to get someone to whom they could talk and who understood their plans and would co-operate with them.

The result of these changed conditions wrought a large increase in the daily tonnage of the mines, while the operating expenses were reduced at the same time. It was not long before the mines were getting in fairly good shape and everything was running smoothly on that end of the business. At this juncture, however, it so happened that I was offered a position with another company, which I gladly accepted. In contrast with the conditions under which I had been working, I will

recite briefly the conditions which surrounded the work in my new position.

The manager of this company was well acquainted with mines and mining conditions, having been associated with the mining of coal from his boyhood. He took a deep interest in every detail. Any change to be made, or any recommendation offered, received his careful attention. The result was that the mines were worked on a paying basis. The company was satisfied and the men likewise. Good feeling prevailed not only throughout the organization but likewise among all with whom the company did business.

I need not say that it has been a pleasure to be associated with a company where the officials' one desire was to co-operate with each other and with their men. From the manager down, each man was on the job doing his best at all times; and there were no idle days, except when there were no cars. It had been the habit of one of the company to invite different ones among him men for a short stay at his hunting camp where they were treated on terms of equality and made to enjoy their trip.

Outsiders have frequently failed to understand why this company has had no labor troubles or strikes to mar the harmony that exists among the workers in their mines. Though my former manager has often tried to get me back, there is no desire on my part to return to the old conditions.

S. D. HAINLEY.

Osceola Mills, Pa.

## Growing Scarcity of Mine Timber

*Letter No. 2*—Regarding the question of how mine roof can be supported without the use of timber, it would seem that the proper answer, or at least, the answer most readily made, would be to advise the use of iron or steel supports, which is not new in mining practice. However, the question of cost is an important one and must be considered in this connection.

The relative cost of different materials that can be used to support mine roof can only be determined by experimenting, for a sufficient time, in order to enable a correct judgment to be reached in regard to the practicability of their use. The results should then be tabulated so as to show the minimum cost per ton of coal mined in the use of each material.

It is common to speak of the "life of mine timber," by which is meant the duration of service up to the time when the wood becomes so rotten or decayed that it is of no further use; or the post is crushed or broken under the weight it should support. The life of mine timber can be lengthened by such treatment as creosoting and other methods known in mining practice. Many of these have been described, from time to time, in the pages of *Coal Age*, and need not be repeated here.

Another method of prolonging the life of timber is to adopt such a method of working as will lessen the load resting on the timber supports, by throwing much of the weight of the overburden over onto the solid coal and by leaving adequate pillar supports that will prevent the crushing of the coal and reduce the liability to squeeze, which is so destructive of timber. These and other methods of conserving timber must be carefully studied. It is of chief importance to draw all timbers from abandoned places, and use these again.

Linton, Ind.

W. H. LUXTON.

# INQUIRIES OF GENERAL INTEREST

ANSWERED BY JAMES T. BEARD

## Feedwire in Locomotive Haulage

Kindly permit me to submit a rough sketch of our trolley wire, showing the present installation in the mine. My desire is to ascertain what gain there is, if any, in the extra feedwire shown as running a distance of 700-ft. from A to B. As indicated in the sketch, power is supplied to the trolley wire from a large cable to which it is connected at the shaft bottom. Branch lines extend into the back entry, as I have shown and tried to make clear in the drawing.

We are operating two 6-ton Goodman locomotives. One of these runs into the south entry while the other operates on the straight west, besides hauling coal from the north entry. The locomotive running south travels a distance of 3,000 ft. from the shaft bottom to the inside parting, which makes 6,000 ft. for a round trip. The locomotive operating in the west and north entries must run a distance 5,000 ft. each round trip. The voltage is 250 volts.

As shown in my sketch, an extra feedwire 700 ft. long has been installed for the purpose, as our elec-

PLAN OF A TROLLEY-HAULAGE SYSTEM

trician says, of enabling the locomotives to operate with greater efficiency. This feedwire is attached or cross-connected to the trolley line by common cast-iron trolley hangers bolted together with short pieces of copper wire. Both the main trolley line and the feedwire are No. 0000. Kindly state if there is any necessity for maintaining this extra length of feedwire.

La Salle, Ill. ASSISTANT SUPERINTENDENT.

The electrician is right in stating that the feedwire mentioned is required for the more efficient operation of the two locomotives. A 6-ton locomotive operating on a 250-volt circuit will require a current of about 100 amp. The two locomotives, operating at the same time, will call for a current of 200 amp. Both of these locomotives may chance to be at the end of their respective lines at the same time.

In that case, making due allowance for a return either by wire or through the rails, which must be well bounded, the transmission of a current of 200 amp. through a 0000-wire, a distance of 1,200 ft. to the mouth of the south entry, shows a drop of 10 per cent, in voltage, or a loss of 25 volts, reducing the voltage at that point to 225 volts.

Again, the transmission of a current of 100 amp. to the face of the south entry, a distance of 4,000 ft., in-

cluding the return, the round trip from the shaft bottom to that point being 6,000 ft., would mean a further drop of 8 per cent, or a loss of 18 volts, which would reduce the voltage available at the face of the south entry to 207 volts.

Likewise, the voltage at the face of the west entry would be reduced to 212 volts. Owing to this drop in voltage, locomotives would operate at a greatly reduced efficiency.

On the other hand, the 700-ft. length of extra 0000-wire provides an additional 8 volts at the faces of the south and west entries, respectively, affording an increased efficiency of about 4 per cent at each of those points. This increase in the voltage available at the extreme end of the trolley system will be appreciated by experienced motormen, who realize what a drop of pressure means in the operation of a haulage locomotive.

## Arkansas Mining Law

A question has arisen here that has caused considerable discussion of late, in respect to the requirements of the Arkansas State Mining Law, as it relates to men entering the mine when one or more places have been "marked out" as being dangerous for work. Some say that if there are two places marked out by the fireboss when making his examination of the mines, in the morning, it would be a violation of the mining law to permit men to enter the mine. Others say that if but one place is marked out by the fireboss as being dangerous, it is sufficient to prevent the men from entering the mine. Still others claim that there is no requirement of this kind in the law; but that the law is silent on the subject of men being permitted to enter the mine after the fireboss has completed his examination of the workings. I want to ask what the law says regarding this matter.

Russellville, Ark.

J. P. HILL.

The mine regulation specified in Act No. 225 of the Arkansas law, describing the duties of the fireboss reads as follows:

SECTION 10. In all mines where a fireboss is employed, all working places, and worked-out places adjacent to working places, shall be examined when it can be done at least once a day by a competent fireboss, whose duty it shall be to enter a report of the existing conditions of such working places and worked-out places in a well-bound book to be kept by him for that purpose, and all dangerous places that are marked out shall be marked on a blackboard furnished by the company, before any other employees enter the mine.

From the reading of this section, it appears that there are no restrictions placed on the men being permitted to enter the mine, after the fireboss has entered the report of his examination in the book kept for that purpose, and has marked on the blackboard those places where he has found danger. It may be reasonably supposed that men who work in the places reported as dangerous would be instructed not to proceed into the mine, until their places have been made safe.

# EXAMINATION QUESTIONS

ANSWERED BY  
JAMES T. BEARD

## Mine Inspectors' Examination Pottsville, Pa., March 30, 31, 1920

(Selected Questions)

*Ques.*—Name and describe the four electrical units in common use.

*Ans.*—The four common electrical units are the ampere, volt, ohm and watt. The ampere is the unit used to express the strength of the current flowing in a conductor. The ampere, in electricity, corresponds to *volume* in ventilation, it being an expression for quantity.

The volt is a unit used to measure the electromotive force, and expresses the pressure of the electric current. It corresponds to pressure in ventilation.

The ohm is the unit used to measure the resistance offered by a conductor to the flow of an electric current. A resistance of one ohm requires a pressure of one volt to pass a current of one ampere through a conductor.

The watt is the unit of electric power. It is the power required to pass a current of one ampere, under a pressure of one volt. Seven hundred and forty-six (746) watts are equivalent to one horsepower.

*Ques.*—How is electric current generated before it is transmitted, and how is the transmitted electric power utilized?

*Ans.*—The current is generated by an electric dynamo or generator. The transmitted current is utilized in the operation of an electric motor.

*Ques.*—A current of air entering a mine is 150,000 cu.ft. per minute, at a temperature of 40 deg. F. The air at the outlet measures 165,000 cu.ft. per minute, at a temperature of 65 deg. F. What is the percentage of mine gases present in the air leaving the mine?

*Ans.*—In this case, ignoring the effect of the reduced pressure at the discharge opening of the mine, and calculating the increase of volume due to rise of temperature, we have for the estimated volume of the return air, from this cause,

$$\frac{x}{150,000} = \frac{460 + 65}{460 + 40} = \frac{525}{500}$$

$$x = \frac{150,000 \times 525}{500} = 157,500 \text{ cu.ft. per min.}$$

Then, since the measurement on the return airway shows 165,000 cu.ft. of air and gas, the volume of gas present in that current is  $165,000 - 157,500 = 7,500$  cu.ft. per minute. The percentage of gas present in the return current is, therefore,  $100(7,500 \div 165,000) = 4.54$ , say 4½ per cent.

*Ques.*—Name and describe the different gases, common to the anthracite mines. What are their dangers to life and their injurious effects on man? Give also

their symbols, specific gravities and properties. Where are they found? How are they produced? Give their effects on combustion.

*Ans.*—Methane or marsh gas ( $\text{CH}_4$ ); specific gravity 0.559, is combustible gas. It is not poisonous, but when breathed in an undiluted state produces death by suffocation. This gas forms an explosive mixture with air. Being lighter than air, it accumulates at the roof or at the face of steep pitches and in rise workings where it may be found in large quantities. Methane is produced by the slow metamorphosis of carbonaceous matter, in the absence of air and the presence of water. This gas is occluded in the coal formations. Having no available oxygen, the gas extinguishes flame, except when mixed with air in proportion to form either an inflammable or an explosive atmosphere.

Carbon monoxide (CO) specific gravity, 0.967 is a combustible gas and very poisonous, small percentages present in the mine air producing instant death when breathed. This gas is formed by the slow combustion of carbonaceous matter in a limited supply of air. It is found in abandoned workings where there is little or no ventilation. It occurs also in the return from a mine fire. The effect of carbon monoxide on combustion is to increase the activity, the gas itself being combustible.

Carbon dioxide ( $\text{CO}_2$ ), specific gravity 1.529, is an extinctive gas, heavier than air. It accumulates at the floor and in swamps, dip workings and other low parts of a mine. It is produced by the various forms of combustion that take place in the presence of a plentiful supply of air; as, for example, the burning of lamps, breathing of men and animals and other forms of active combustion. With the nitrogen of the air it forms the blackdamp, which always accumulates in poorly ventilated mine workings and in abandoned places that are unventilated. Having no available oxygen, it will not support combustion.

Olefiant gas ( $\text{C}_2\text{H}_4$ ) specific gravity 0.978 is a heavy, hydrocarbon gas often associated with methane. Its properties are much the same as that gas. This gas and ethane ( $\text{C}_2\text{H}_6$ ) specific gravity 1.0366, also a heavy hydrocarbon gas, like methane, has been produced in the formation of coal. But unlike methane, both of these gases have been produced in the absence of air and water.

Hydrogen sulphide ( $\text{H}_2\text{S}$ ) specific gravity 1.1912 is a combustible and poisonous gas, having a strong disagreeable odor resembling that of rotten eggs. The gas is formed by the disintegration of iron pyrites in the presence of moisture. The gas seldom occurs in quantity to be dangerous in the mines, although like methane it forms explosive mixtures with air. Having no available oxygen, it is not a supporter of combustion.

# F. G. Tryon Heads Mineral Fuels Division of Geological Survey

Receives Permanent Appointment as Successor to C. E. Leshner — Assisted in Economics Section at Peace Conference

F. G. TRYON has been formally appointed as head of the Mineral Fuels Division of the U. S. Geological Survey. He has been acting head of the division since the resignation a few months ago of C. E. Leshner. His appointment is now made permanent.

Mr. Tryon is a native of Indianapolis, where he acquired his early education. Later he attended the University of Minnesota, where he specialized in economics, economic geology and mining engineering. He was graduated from that institution in 1914. He took a two-year post graduate course, however, and earned a master's degree. He was elected Rhodes scholar for Minnesota, but owing to the imminence of the war he did not undertake that work.

He spent a short time in the Mid-Continental oil field, where he did work as an oil geologist. While engaged in that work war broke out. He was denied

admission to the army because of physical disability. Determined to do some sort of war work, however, he went to Washington and secured employment as assistant geologist on the staff of the U. S. Geological Survey.

Shortly thereafter he was transferred to the Council of National Defense to take charge of statistics of mineral raw materials, chemicals and explosives. After several months of that work his return was requested by the Geological Survey in order that he might assist in the increased work being done by that bureau in the collection and compilation of mineral fuel statistics.

A few months later Mr. Tryon was commissioned as captain and assigned to the statistical division of the General Staff, where he was placed in charge of statistics on chemicals, fuels and explosives. His duties in this connection made it necessary for him to join the American Expeditionary Forces, where he was attached to headquarters at Chaumont.

After the signing of the armistice Mr. Tryon was transferred to the staff of the Peace Commission in Paris, where he was assigned to the economics and statistical section. Later he became American secretary of the raw materials section of the Supreme Economic Council. With the completion of his work in the economics section he was ordered to return to Washington, where he spent two months completing his statistical duties. On being released from the army he resumed his work with the Geological Survey.

F. G. TRYON

For many years Mr. Tryon has made a special study of matters pertaining to the conservation of mineral fuels. He is convinced that this problem must combine the points of view of economics and engineering. While he realizes that the conservation of fuels is essentially an engineering problem he also is aware of the inability to carrying out policies in that connection in disregard of the dollars and cents consideration.

## Have Fatal Accidents Been Reduced by Increased Sobriety?\*

W. W. Adams, U. S. Bureau of Mines, Mine Accident Statistician, Presents This as a Problem as Yet Unsolved

A GRATIFYING decrease is noticeable in the number of men killed in the coal mines of the United States during the past six months as compared to the quantity of coal produced. During July last year, when 221 men lost their lives, the production of coal was over 50 million tons. In January, 1920, the production had increased to 56 million tons, or 11 per cent, while the fatalities, instead of increasing proportionately, actually decreased to 188, or nearly 15 per cent. Nor is this decrease a mere accident or coincidence peculiar to the month of January, as may be seen from the following table:

	Production (short tons)	Men Killed	Number Killed per Million Tons
July, 1919	50,501,000	221	4 38
Aug. 1919	50,805,000	223	4 39
Sept. 1919	54,735,000	179	3 27
Oct. 1919	64,702,000	243	3 76
Nov. 1919	26,389,000	94	3 56
Dec. 1919	44,527,000	169	3 80
Jan. 1920	56,043,000	188	3 35

From the figures shown above it may be observed that the average monthly production for January and the five months immediately preceding was 49,500,000

HAS LACK OF SPIRITOUS LIQUORS DEPRESSED THE FATALITY CURVE?

\*"Decrease in Coal Mine Accidents," in Monthly Reports on Investigations, U. S. Bureau of Mines.

tons, or only 2 per cent below that for July, while the average number of men killed was 183, or a decrease of over 17 per cent.

The improvement is more clearly shown by the accompanying diagram, based upon the percentage of increase or decrease in the output of coal and the number of men killed, as well as on the actual number of deaths for each million tons of coal produced. The month of July, 1919, has been used as a standard for this comparison because it is fairly representative of the average number of men killed each month since 1911.

It will be noted that during the last six months the accidents have by no means kept pace with the increasing production of coal and that during the coal strike last November the decline in the output of coal was accompanied by an even greater decline in the number of lives lost. It is interesting in this connection to note that a number of large municipalities report an equally important decrease in the death rate from tuberculosis during 1919 and the hypothesis has been advanced that this decrease is due to the effect of prohibition.

## New York Anthracite Wage Conference Still Without Result

Union Officials Profess Difficulty Holding Men in Line  
—Expected That Conference Will Be  
Concluded This Week

ANOTHER week of conferences by the sub-committee of anthracite operators' and miners' representatives has failed to bring about an agreement. These conferences have been going on since March 9 and as a result of their duration many workers in the mining regions have become disgruntled and talk of remaining away from the mines until an agreement is reached.

In order to pacify some of the workers members of the Wage Scale Committee who happened to be in New York City last week were sent back to their home towns to tell the workers that substantial progress was being made.

A meeting of the Wage Scale Committee was held at the Continental Hotel of this city on April 14, at which the members were made acquainted with the progress made in the negotiations. The utmost secrecy is being maintained by both operators and miners regarding the progress made and as to what discussions take place in the conferences.

During the session on March 15 the Sub-Committee discussed six demands of the miners and made what was regarded as the first actual start toward a new agreement. These demands as set forth in the official statement given out following the conference were:

"The term of years of any agreement that might be reached; the question of abolishing individual contracts; the increase in wages; the establishment of a uniform wage scale so that like occupations would carry the same rate; the demand that shovel crews operating for coal companies be paid the rates paid by contractors to shovel men; and the reduction in hours of pumpmen, engineers, fan runners, stablemen and watchmen."

The sub-committee at the conclusion of its conference on Friday, April 16, issued a statement denying the correctness of figures published in some of the newspapers on April 16, purporting to show profits of coal-mining companies.

The official statement issued by the sub-committee read:

"At the meeting of the sub-committee of anthracite operators and mine workers held today the mine workers submitted a rejoinder to the operators' exhibit relating to rates, opportunity for employment and earnings. A general discussion followed upon the matter of earnings and increase in wages demanded by the mine workers.

"The committee has not at any time had before it figures and data carried as news by the Associated Press purporting to show excessive profits or profiteering by the anthracite operators."

Further discussion of the increase in wages demanded by the miners took place at the session of the sub-committee held on Saturday, April 17. The sub-committee also gave consideration to the expense of maintaining an average family in the anthracite region because of increases in the cost of food, clothing, rent and coal.

While no official announcement was made, the operators are expected in a few days to issue a statement of the action they will take in regard to the demands of the miners.

The sub-committee of anthracite mine workers and operators met on April 19 and resumed consideration of the matters pending before the committee. Upon the question of increase a large part of the session was devoted to an effort to reach a basic conclusion upon which to predicate an adequate wage scale to the anthracite workers.

That there is much unrest among the radicals in the coal fields was stated by some of the Miners' Union officials upon their return to this city on Monday. They say the delay in reaching an agreement is giving the radical elements a chance for agitation and that this is especially true in the Schuylkill County region. So far the union officials have been able to hold the men in line.

It is reported that the check off and other questions raised by the Bituminous Coal Commission have been under discussion.

## Retail Prices of Coal by Cities from 1913 to 1920

Figures Are Given Only for Cities Which Quoted Prices for Food and in Years When Food Prices Were Scheduled

AVERAGE retail prices of coal on Jan. 15 and July 15 of each year from 1913 to 1919, inclusive, and on Jan. 15, 1920, by cities have been published by the *Monthly Labor Review* of the Bureau of Statistics of the United States Department of Labor. The prices quoted are those that were charged by the retail trade for fuel for household use.

In addition to the prices for Pennsylvania anthracite, prices are shown for Colorado, Arkansas and New Mexico anthracite in those cities where these coals formed any considerable portion of the sales for household use.

The prices shown for bituminous coal are averages made on the several kinds. The coal dealers in each city were asked to quote prices on the kinds of bituminous coal usually sold for household use.

The prices quoted are for coal delivered to consumers but do not include charges for storing the coal in cellar or coal bin where an extra handling was necessary.

Prices are shown for coal only in the cities in which prices are scheduled for food and are shown for the years when food prices were obtained.

## Council of Defense Criticizes High Coal Prices

Government Official Takes Position that Buy-Early Campaign and Car Shortage Should Not Boost Prices

PRESENT high prices of bituminous coal were characterized as inexcusable on any theory of supply and demand or on any economic principle in a formal statement issued by Herbert N. Shenton of the Council of National Defense and formerly secretary of the U. S. Bituminous Coal Commission. Mr. Shenton concludes that neither the advice of the commission to buy and store coal early, the requirements of the export trade, the status of car service, the daily output of the mines, the weather conditions nor supposed shortage of supply explains in any manner the rise in prices, which are out of all relation to the increase in the cost of production caused by higher wages granted by the commission. Mr. Shenton thinks that prices will soon decline.

"The present rise in the price of bituminous coal," says the statement, "can in no way be attributed to the campaign for early buying and storage recommended by the U. S. Bituminous Coal Commission to be carried out by the Council of National Defense. The commission had thoroughly in mind the fact that, owing to bad weather conditions and various other reasons, the removal of fixed prices would doubtless cause a flurry in coal prices for several weeks even after the usual annual drop in consumption of coal.

"The recommendation for the campaign of early buying and storage was that such buying and storage should be urged to commence on or about May 15, when, at the present rate of production, there was reason to believe that production would be in excess of market demand. The plans for this campaign are, therefore, being rapidly developed, and the heartiest co-operation of the largest consumers in the country has been enlisted and pledged.

"There are various causes for the present, and probably very temporary, upward trend in the prices of bituminous coal. Consideration must be given to the fact that there was a rearrangement in the distribution of coal after April 1; that the first week in April happened to include the low production period always associated with Easter, and that high cost production mines, which have for past years been able to operate only because of the fixed price conditions, are making a last effort to obtain what they can.

"A widespread feeling has developed throughout the country that there is going to be a scarcity of coal for domestic consumption owing to the foreign demand. Some persons point to Senator Frelinghuysen's statement of the foreign need for coal. Doubtless a great deal of coal is badly needed in Europe this year, and such as cannot be supplied from other sources will come from the United States, in so far as it can be shipped; but there are very real limitations to our ability to make foreign shipments, and the present large foreign demand is not likely to be continuous enough to warrant the permanent enlargement of dock facilities and the diverting into the coal trade of a large portion of our merchant fleet.

"In spite of the fact that the fleet which was supplying the American Expeditionary Forces was one of the greatest that the United States has ever gotten

together, the total number of short tons conveyed by this fleet to Europe was not in excess of 7½ million tons of cargo from our entrance into the war through April, 1919. During 1919 we exported overseas 7,198,000 long tons of coal. This record was better than that of any other year with one exception. During the first ten months of 1919 we were exporting coal overseas at a greater rate than ever before. It is therefore safe to say that on this basis our coal exports overseas in 1920 cannot exceed 10,000,000 tons, which is only 2 per cent of our total production.

"There seems also to be a misapprehension in regard to production. The weekly reports of the Geological Survey show that in the first quarter of the present year our production was decidedly in excess of the production last year and slightly in excess of the production under high pressure in 1918. There is, therefore, no reason based on the past few months for the skyrocketing of prices.

"The fear of immediate suffering from car shortage seems also to figure in the reasons for the flurry. There were sufficient cars and motive power to distribute this unusual production of the past few months, on account of careful and energetic car distribution. These cars and motive power are practically all available, and, while there is definite need for more of both in order to stabilize the industry, there is no immediate serious threatening of a car shortage such as has not existed during the winter, unless it is necessary, because of emergencies, to divert coal cars for other purposes. The more open weather conditions and the efforts to improve allocation of cars by the Car Service Commission of the American Railway Association give promise of a greatly improved car situation in the near future.

"Frenzied bidding up of prices on the part of coal buyers seems, therefore, at this time to be entirely unjustified. There is no reason to believe that there will be a limited supply of coal for the domestic market or that there will be an increased shortage of cars in the near future, save as it is a part of the general transportation difficulties of the present time. Efforts are being made to stabilize prices through regulations of the Interstate Commerce Commission and by special legislation. The educational campaign for early buying and storage will also tend to stabilize the market."

### Dynamite Home of Manager Laing

As the outcome of a strike which has lasted since Sept. 1 and which arose because the mine workers insisted on closed-shop regulations, attempts have been made to blow up the homes of T. K. Laing, general manager, and John Gilkerson, mine foreman of the Willis Branch Coal Co., at Willis Branch, a point situated two miles from the town of Pax—a name suggestive of a condition that the mining towns of West Virginia cannot be said in general to enjoy. Pax, be it said, is in the southern end of Fayette County.

Striking mine workers are thought to have been the perpetrators of the crime. A heavy charge of dynamite was placed in front of the homes and as a result all the front of the Laing house was blown down, while the Gilkerson house, which sustained less injury, escaped with the breaking of all the windows. The occupants of the residences, which included three women and five children and Mr. Lang and Mr. Gilkerson, were not injured.

## Senate Will Hold Hearings on Frelinghuysen's Coal Bills

Government Officials and Coal Operators Will Present Views in Seasonable Coal Rates and Coal Commissioner Plan

**P**UBLIC hearings on Senator Frelinghuysen's bills providing for a seasonal freight rate and for a coal commissioner will begin April 22. Early witnesses will be Eugene McAuliffe; Commissioner McChord, Interstate Commerce Commission; Commissioner Clark, Interstate Commerce Commission; George Otis Smith, Director, U. S. Geological Survey; Van H. Manning, Director, U. S. Bureau of Mines, and J. D. A. Morrow, Vice-President, National Coal Association. In addition, representatives of the local coal associations will appear.

Senator Frelinghuysen expects to continue the hearings until every angle of the questions raised in the bills have been presented. Senator Frelinghuysen already is convinced that it would be better to have a graduated increase in the rate rather than have an abrupt change which would be certain to result in great congestion during the latter part of the summer rate.

So far as the coal-commissioner bill is concerned, Senator Frelinghuysen is not altogether convinced that the provisions of the bill should be administered in the way specified in the bill which he has introduced. He admits the possibility that it may be better to turn over the administration of the matter to one of the existing departments. There seems to be a widely-held view that there is no need for a new and independent official. It is suggested that the Bureau of Mines could be given whatever new duties are provided in the bill. This would interfere in no way with the existing coal work of the Geological Survey or of the Federal Trade Commission, it is pointed out. If such a plan were adopted, undoubtedly the responsibility would be fixed directly with the Secretary of the Interior.

It is pointed out that the work already in progress in collecting the facts of the coal industry and in planning for improvements in the mining, storing and using of coal largely comes under the Department of the Interior and the new work proposed would be aided by the forty years of experience of the Geological Survey and the ten years of experience of the Bureau of Mines. The machinery already in operation could continue to function without interruption or lost motion under the Secretary of the Interior.

## Business Men Will Gather To Increase Production

**B**USINESS men generally are showing a deep interest in a great gathering of business men from all parts of the country to be held at Atlantic City, April 27 to 29, under the auspices of the U. S. Chamber of Commerce for the purpose of making a comprehensive study of means to stimulate production in industry.

The National Coal Association has delegated a representative group of operators from the bituminous fields to attend the conference and this committee is taking considerable interest in preparing to tell the business men of the country that the coal industry is producing to the limit of its ability with a limited supply of cars.

In calling the business men of the nation together to

discuss this subject the National Chamber announces that lack of production in all lines of industry is a big factor in our present towering prices and that high prices breed social unrest. Many economists and business men are convinced that once production is speeded up and the supply is greater than the demand, there will be an appreciable cut in the prices of necessities.

With this thought as a background, the convention will consider the question of maximum production from its manifold angles. Finance, labor, agriculture, transportation and numerous other phases that enter into the scheme of production will be studied according to their relative importance to a greater output.

Men prominent in each of these lines of industry and commerce will present their views to the convention. The banker will explain the need of extending a helping hand to Europe in order that Europe may become once more a producer rather than a consumer. For more than four years Europe has been depending largely upon the United States for its commodities. The demand has been greater than our industries could meet. The result has been advanced prices. If European industries can be put back on their feet again by supplying them with raw materials and credit, then the strain will be partially relieved, and American industries will be better able to meet the domestic demand.

## Government Officials Oppose Federal Coal Control

Government Scale of Salaries Would Not Secure Men of Sufficient Experience and Ability to Perform Duties

**S**O FAR as official opinion can be judged at this time, it appears that the main features of the coal commissioner bill are regarded as justified. The consensus is that the consuming public is the chief party in interest and needs to be informed as to the facts of the coal situation. There are scarcely any important officials in Washington who are not opposed to unnecessary interference with the coal industry, but they do believe that the Government must have closer contact with it than has been the case in the past.

The average Government official regards the consumer as having a more important interest in the correct conduct of the coal business than have the operators or labor. It may be stated, however, that with the interest of the consumer at heart they are anxious to save him from Government operation of coal mines. The Government only with difficulty can find enough men of experience and ability, at the Government's scale of salaries, to perform the task of exercising some degree of public control of public utilities and it is regarded as entirely impossible for it to undertake to equip railroads and industries with operating executives who would get the results that private initiative and enterprise can secure.

Since it is feared that nationalization of coal mines, with costs enormously higher than at present, is likely to come unless the Government exercises that type of control that joins with the owners, operators and miners in lowering costs, and enforces upon the operators that relation of prices to costs that recognizes the partnership of the consuming public in the industry, there is a generally held belief that authoritative publicity of facts will tend to avert such a calamity.

# Wage Scale Drawn Up In Kanawha Field

Second Important Field to Accept Coal Commission Awards—Adopts Recommended 60-Day Commission to Adjust Differences

**A**N amicable agreement, conforming to the findings of President Wilson's coal commission, has been reached by the scale committees of the Kanawha field operators and miners, after a conference which began in Charleston, W. Va., Wednesday morning, April 7. Much of the delay was caused by the attention the conference found it necessary to devote to various differentials and inequalities.

The memoranda provides that "all internal differences are hereby referred to the various districts for settlement with the understanding that only by mutual consent shall anything be done in sub-district, district or wage scale convention that will increase the cost of production or decrease the earning capacity of the men."

Provision is also made for the creation of a commission to investigate conditions in regard to tonnage rates, differentials, inequalities and dead work, and to make report within 60 days from date. The findings of this commission are to be the basis of adjustment of these matters.

The practice of paying bonuses for the purpose of enticing employees from other mines is condemned, and it is agreed that all fines provided for in all agreements shall be automatically collected under penalty of fine.

The text of the agreement follows:

**FIRST**—Resolved, that the award of the Bituminous Coal Commission be accepted and the prices written into our agreement, the advances to be applied on prices in effect on October 31, 1919 the advances to be as follows:

Pick mining .....	24c.
Machine cutting .....	4c.
Machine loading.....	20c.
All room turning, yardage and dead work, 20 per cent increase.	

The award of the commission to apply to all day men, monthly men, and trapper boys.

**SECOND**—Dead work, yardage and room turning is advanced 20 per cent on the prices being paid Oct. 31, 1919.

**THIRD**—The eight-hour day, in effect on Oct. 31, 1919, shall continue. An eight-hour day means eight hours' work in the mines at usual working places for all classes of inside day labor. This shall be exclusive of the time required in reaching such working places in the morning and departing to and from the same at night.

Drivers shall take their mules to and from stables, and the time required in so doing shall not include any part of the day's labor, their work beginning when they reach the change at which they receive empty cars, but in no case shall the driver's time be docked while he is waiting for such cars at the point named.

When the men go into the mine in the morning they shall be entitled to two hours' pay, whether or not the mine works the full two hours. But after the first two hours the men shall be paid for every hour thereafter by the hour, for each hour's work or fractional part thereof. If for any reason the regular routine work cannot be furnished the inside labor for a portion of the first two hours, the operators may furnish other than the regular labor for the unexpired time.

**FOURTH**—All internal differences are hereby referred to the various districts for settlement with the understanding that only by mutual consent shall anything be done in subdistrict, district or wage scale convention that will increase the cost of production or decrease the earning capacity of the men. All rules now incorporated in existing contracts shall remain in force until changed by agreement between operators' and miners' representatives.

It is further resolved that a commission be created by this committee to investigate conditions in regard to tonnage rates, differentials, inequalities and dead work, and to make report of their findings to this committee within 60 days from date, the findings of said commission to be the basis of adjustment of the matters which have been referred to it.

**FIFTH**—The practice of voluntarily paying more than the contract price, either by bonuses or otherwise, which is done ordinarily for the purpose of enticing employees from other mines, and thereby creating discord and disorder in the coal industry, is condemned. It will therefore be assumed in future joint conferences convened for scale-making purposes that all bonuses or advances in excess of wages provided in contract were paid because of physical conditions in or around mines where such methods are practiced, and the wages so paid shall be considered the base price for such mines.

**SIXTH**—Whereas, stoppage of work in violation of the agreement has become so serious as to menace the success and perpetuity of the United Mines Workers of America and our joint relations, this conference instructs the respective district executive boards to meet the operators in their various districts for the purpose of agreeing on a penalty clause where none now exists, and if necessary meet to amend and strengthen existing clauses so as to make the penalty more effective in preventing strikes and violations of agreements.

All fines provided for in all agreements shall be automatically collected, and any operator failing to collect and forward to proper parties such fine shall pay a penalty of \$2 for each employee subject to be fined, the same to be collected and retained in the miners' district organization. And in no case shall any fine be refunded except by mutual agreement of the accredited representatives of the operators and miners.

It is further agreed that where any employee enters suit in the civil courts to recover any fine collected in accordance herewith the district organization shall reimburse the operator for expenses incurred on account of such suit.

**SEVENTH**—That the fulfillment of this agreement is guaranteed by the international union, and the fulfillment of joint agreements entered into in any district shall also be guaranteed by the officers of the international organization, as well as by the officers of the district, and it shall be their duty to see that all such agreements are carried out, both in the letter and in the spirit.

**EIGHTH**—That the price at which house coal shall be furnished the mine workers at the tipple shall be determined by adding to the price in effect on Oct. 31, 1919, the average percentage allowed as an increase on the wage scale, to wit: 27 per cent, and that when the coal is delivered to the miners' houses by the operator the actual cost of delivery shall be added.

**NINTH**—That the prices charged the miners for blacksmithing shall be on the basis of existing contracts; providing, however, that the maximum charges shall not exceed three-fourths of 1 per cent of the miners' gross earnings.

**TENTH**—That explosives shall be furnished the miners at cost, which is to include handling, transportation and insurance. To furnish a basis of charges until the correct figures can be determined, it is understood that for a period of 90 days the price of black powder to the miners shall be \$2.25 a keg, and that for permissible explosives and other blasting material be at cost plus 10 per cent allowance for handling.

**ELEVENTH**—This contract is effective on April 1, 1920, and shall remain in force until March 31, 1922.

## Large Flat Rate Increases Granted in New River District

While there has been some delay between the operators and miners of District 17 in formulating a new wage agreement operators and miners of District 29, which takes in the New River field, were able to reach an agreement in short order at a joint scale meeting held at Charleston on Thursday, April 8. It is stated that the increases granted the New River miners will average as much as 41½ per cent, which is the actual increase for machine mining. The increase in the wages for pick miners, according to Secretary T. L. Lewis of the New River Operators Association, amounts to about 40½ per cent.

Under the terms of the new scale pick miners will receive an advance of 24c. per ton, increasing the rate for pick mining in the Loop Creek fields to 83.11c. per ton of 2,000 lb., as against the former rate of 59.11c. per ton. Under the old contract machine cutting was at the rate of 10.71 c. per ton. The new rate agreed upon is 16 cents per ton.

As against the old rate of 47.32c. per ton, the new rate for loading and scraping, rooms and pillars is

66.03c. a ton, an increase of 18.71c., making a total advance for loading and cutting of 24c. a ton. The new rate agreed upon for loading and scraping, rooms and pillars where the loader pushes cars and lays the track is 70.9c. a ton.

For all employees working in the day time, both inside and outside the mines, the wage advance agreed upon was \$1 a day except as to trappers and boys receiving less than the wages allowed men, the latter class receiving an advance of 53c. a day. For yardage and dead work the increase agreed upon was 20 per cent. Instead of percentage rate advances the increases in the New River field are calculated on a flat rate.

## Granting Injunction, Court Says Sections of Lever Act Are Unconstitutional

Judge Lewis Restrains U. S. Attorney from Presenting  
Alleged Evidence to Grand Jury — Coal  
Companies Contend Prices Were Fixed  
Without Investigation

**I**N A SUIT brought in the United States District Court to test the constitutionality of the Lever Food Control Act and the legality of U. S. District Attorney Harry B. Tedrow's proposed grand jury investigation into charges of profiteering by Colorado Coal companies, Judge Robert E. Lewis, on April 8, granted an injunction restraining District Attorney Tedrow from presenting his alleged evidence to the grand jury.

The coal companies questioned the constitutionality of the Lever Act and its application at this time. The companies contended that the prices fixed during the war by the President were without investigation, and that the President was incompetent to fix prices; that the war is over; that between the discontinuance of the Fuel Administration in January, 1919, and its re-establishment in October, 1919, costs of production materially increased and no new investigation was made.

The companies also contended that the revival of the Fuel Administration was for a domestic emergency and not in furtherance of the war; that the Government prices were unfair and unjust and that District Attorney Tedrow proposed to prosecute them regardless of these facts.

In granting the restraining order Judge Lewis expressed the opinion that at least certain sections of the Lever Act are unconstitutional and have ceased to function, that the Lever Act was emergency legislation and as such it was extremely doubtful that it had application now to private business.

Upon the handing down of the decision District Attorney Tedrow announced his intention of taking an appeal to the Supreme Court of the United States.

## Bureau of Mines to Hold First-Aid and Mine-Rescue Contest

An international first-aid and mine-rescue contest is to be held in Denver, Sept. 9, 10 and 11, under the auspices of the Bureau of Mines. This event, the bureau points out, is of direct interest to an industry which is second only in importance to agriculture and employs in this country more than a million men in hazardous work.

An idea of the general interest of miners in this practical, humanitarian work is had when it is pointed out that more than one hundred thousand miners already have taken the training course of the Bureau of Mines in first-aid and mine-rescue methods.

## Logan County Fixes a New Scale 135 Per Cent Over Pre-war Rates

In addition to advances previously given voluntarily, the operators of the Logan field have announced advances in wages applying in the Logan County (West Virginia) field running from 20 per cent to 31 per cent, the increase in the pay of miners for the Logan field alone amounting to \$6,000,000. This will bring the annual payroll of Logan mines up to \$26,000,000 a year.

Increases granted by the Logan operators since pre-war days aggregate 135 per cent. The latest advance in the Logan field, effective as of April 1, will mean an increase of 20 per cent for day workers and a 31 per cent increase for loaders. It is estimated that under the new scale now prevailing in the Logan field the earnings of machine men will be approximately \$12 a day and of loaders approximately \$10 a day.

Logan operators are now of the belief that wages paid in the field in which they operate are on a par with wages in the highest paid mines in the country. Miners of the Logan field appear to be well satisfied with the increases granted them.

## Choctaw and Chickasaw Coal and Asphalt Deposits To Be Sold

Coal and asphalt deposits aggregating 394,577 acres in the Choctaw and Chickasaw Nations, Okla., will be sold at auction by the U. S. Government June 15 and 17. Only the coal and asphalt minerals—not the land—will be offered for sale, in tracts of 960 acres each, the sale to take place at McAlester, Okla.

There are 456 tracts, practically all located near cities, towns and railroads, and some are crossed by railroads, so that they are easily accessible and desirable for mining purposes.

The coal is bituminous and semi-bituminous, mostly low volatile bunker coal for steamship use, high-grade domestic coal, railroad steam coal, high-grade black-smith coal and coking coal. The seams average four feet thick and have an average dip of from 10 to 15 deg., outcropping at the surface and extending to an estimated depth of 2,300 ft. at the deepest part of the basin.

## Convention Discusses New Wages in Fifth Ohio Sub-district

Sessions of the 22nd annual convention of the United Mine Workers of America of the Fifth sub-district of Ohio were begun at Bellaire on Tuesday, April 13, with William H. Roy, president of the district, in the chair. The date originally set for the convention was in March but the convening of the convention was postponed at that time owing to the fact that the Bituminous Coal Commission had not submitted its report. Sessions of the convention were expected to consume the entire week and it was apparent at the time the delegates assembled for the convention that wage questions would consume the major part of the deliberations of the convention since day men employed at many of the mines in eastern Ohio had been on strike claiming that they had not received the full 27 per cent increase.

# COAL AGE

The Weekly Journal of the Coal and Coke Industries

Volume 17

NEW YORK, THURSDAY, APRIL 29, 1920

Number 18

## *Coal Miners Should Help the Farmer*

SECRETARY MEREDITH of the Department of Agriculture has issued an appeal to city men, college students and others to spend their vacations working on farms, particularly as helpers in harvest fields. He states that shortage of hired farm labor is as acute as in 1918 and the labor situation on farms threatens to curtail food production. Herbert Hoover in a recent published article drew particular attention to the growing disparity between the growth of our industrial and rural populations and prophesied that if labor continues to abandon the farm for the factory, we will become a food-importing nation.

In years of slack demand for coal there is a steady movement of coal-mine labor from the mines to the farms in a number of important centers. This year, however, with the prospect of all the work at the mines for which cars can be had, and with the recent considerable increase in wages of miners, the farms may not see as many miners as, for instance, last summer. If the farms can offer the inducement to labor to attract them from the mines, the country will be better off, for more food will be produced and no less coal will be mined.

## *Buy-Late Campaign Needed This Year*

HOW generally does the public at large realize the speed at which we are drifting into a serious condition of coal supply? Prosperous industry and cold weather combined to make the demand for coal exceptionally strong last winter. The miners' strike cost us 40,000,000 tons of output; storms blocked traffic and prevented the mines and railroads from making up the loss even in small degree and now the "outlaw" railroad strike is having a serious effect on production.

According to the Geological Survey production of bituminous coal during the week of April 17 was 7,668,000 tons, compared with 7,411,000 the same week a year ago. The total production January to date is 157,797,000 tons, somewhat below the figures established in the war years 1917 and 1918, but well above the 126,141,000 tons in the same period of last year.

These production figures however, do not tell the whole story. Last year at this time the country was still burning coal from storage piles accumulated before the armistice. The railroads had abundant stocks, the lake docks were carrying coal over from 1918, and exports overseas were limited by ship shortage. There was on every side utter indifference to coal.

Today consumers' stocks are low or gone, the railroads have just been forced to resort to assigned cars to get coal for current use, the upper Lake docks are bare, with the trade talking about 30,000,000 tons up Lakes this season, and offshore exports are gaining in volume every month.

The situation has its serious aspects because for months to come consumers will not be able to get as much coal as they demand. If for 1920 total requirements plus exports greatly exceed 500,000,000 tons we are going to be short of coal. Prices of bituminous coal are advancing and the one certainty is that they will not soon come down.

Last year the consumer could help by buying and storing coal; this year he can help only by staying out of the market except for necessary requirements.

Let us have clearly in mind that the remedies to stabilize coal industry proposed by Senator Frelinghuysen, the American Institute of Mining Engineers and others, really are for the purpose of equalizing demand. No treatment is needed this summer to boost demand. In considering the arguments pro and con on seasonal rates, storage and stabilization generally, think in terms of 1919 conditions that may possibly be repeated in 1921 or 1922. No need to stabilize the industry this summer; rather should producers and consumers bend all their efforts toward steadying the market.

## *College Graduates for Miners Promise Solution of Labor Problems*

MACHINES to take the place of men is the constant aim of our engineers. This country's pre-eminence in industry is due to our ability to make the work of a man go farther than in other countries. The high average annual per capita consumption of coal here compared with European nations is often taken as an index of this very fact.

Compared with manufacturing, mining has been backward in this regard, and in the mineral industries, coal, with its greater opportunities still has a vast field to explore. Although several decades have passed since the first coal-mining machine was used, but little more than half of our coal is undercut by machine. Undercutting the coal, however, is only one operation in the getting. Two machine runners can now keep from eight to ten loaders busy with hand shovels.

When machines to cut and load coal are perfected the miner will be supplanted by the expert mechanic. Two, three or four highly trained men will do the work for which from twelve to twenty are now required. The wages that operators can afford to pay such men will attract the best there are, and some observant and far-sighted mine managers are looking forward to employing young graduates of mechanical engineering colleges in their mines. The reasons prompting such a selection are obvious.

A class of men above the average, less liable to radical labor influence, seeking advancement through individual effort rather than through organization, which holds all down to the level of the less able, is the aim of the future. College-trained mechanics will always tend to further perfect their machines. Prac-

tice will supplement theory with these miners of the future, and the progress of the industry will be even faster than now. Perhaps the day is not far distant when Paddy the miner will send his son to college to learn his trade, instead of taking him to the face.

### *Improvement Through Borrowed Lenses*

**M**OST machines today embody a long series of separate improvements and adaptations. In some instances improvement has been carried so far that the fundamental or original idea has been largely if not entirely lost. Thus, it is a far cry from the fire-spitting bamboo tube employed in Chinese pyrotechnics to the modern high-power rifle, yet the two are linked together by a long and complete chain of evolution. In such an extended series of developments ideas spring from their own primordial elements or they may be borrowed from any source whatsoever.

A large manufacturing company has built a new design of electric mine locomotive that embodies at least two details of construction apparently borrowed and adapted from the automobile industry. These are the method of spring mounting intended to secure equal wheel pressure and the detachable tire. One of these refinements will reduce the frequency of derailments and the other will make it easy and rapid to renew worn tires.

It matters little to the operator who buys and uses mine equipment from what source the designer received his inspiration or from what corner of the universe or what age of civilization he got his idea so long as the detail worked out in a real improvement upon existing practice.

Any mining man who has almost broken his neck and possibly one or two of the commandments in trying to lift on a mine car after it had derailed simply because no provision had been made in its design to compensate for inequalities in the track or any small permanent "set" taken by the car frame or box as the result of a wreck or collision, can appreciate the advantage of a "motor" that will safely traverse such track inequalities.

### *Low-Temperature Coal Distillation in Germany*

We print on page 850 a short article entitled "Coal, a Hardened Petroleum." This sets forth that two German experimenters by trials conducted during the war were enabled to secure by means of low-temperature distillation of coal all of the products usually obtained in the refining of petroleum. Thus in addition to the gas, coke and ammonia compounds ordinarily secured these men were able to produce gasoline, lubricating oils, paraffin and a tar differing somewhat in composition from that normally obtained from the so-called destructive or high-temperature distillation of coal in the ordinary byproduct oven.

Unfortunately the article referred to does not go into any detail whatsoever and give the quantity of each product secured per ton of coal coked. It is at least interesting, however, to know that, as the writer of the article phrases it, coal is "in a sense hardened petroleum."

The results secured by these German experimenters closely parallel those obtained in this country by the Greene-Laucks and other processes of low-temperature distillation. American experimenters, however, while

possibly slightly less successful in the segregation of light or volatile oils, have apparently attained a greater degree of efficiency in coke production. The securing of a commercial solid residue (coke) is claimed by American operators to be among the least of their troubles, while it is stated that the structure of the German product is so defective as to require additional treatment and to form at the present time one of the problems of the process as yet unsolved.

That we in America burn our coal raw, wasting all of the byproducts contained, has long been regrettable. The time may come, and possibly at no remote date, when we will no more think of burning freshly-mined coal than we will think of eating raw, whole wheat or corn. Most coals produced in this country can be improved as fuels—weight for weight of raw and treated products—by low-temperature distillation. This process of treatment, provided it can be perfected and economically applied upon a commercial scale, will be highly interesting to the general public, since it bids fair to bolster up the decreasing supply and in a measure appease the constantly increasing demand for that all but universally used propulsive fuel, "gas."

In somewhat lighter vein it appears well within the range of possibility that future advertisements of fuel may display prominently a legend that has already become familiar to straphangers and others who make pilgrimages by street car or interurban, namely, "It's toasted."

### **Trade Commission Renews the Demand for Cost Reports**

On April 26 the Federal Trade Commission announced the following policy in connection with its monthly reports:

"The Commission has received numerous inquiries recently as to whether, in view of the recent decision in the Maynard Coal Co. case, it would continue to require monthly reports from coal mining companies. The Commission believes that this information is useful and important.

"To the general public and also to the coal operators, it seems that a large number of the operators realize this situation. Therefore, the Commission will continue to require these reports, except from the Maynard Coal Co., in the manner provided by the Federal Trade Commission Act, until the appeal in the Maynard Coal Co. case is decided by the U. S. Supreme Court."

The order recently made by the District of Columbia Supreme Court in respect to the Maynard Coal Co. put that company under bond to pay the penalties provided for by law in the event the final decision should be in favor of the Commission, and meantime the Commission is restrained only from proceeding against that company.

# World Production of Coal in 1919 Fell to Level of 1910

Compared with 1913, Decrease of Output in United Kingdom and Belgium Was 20 Per Cent, in Germany 40 Per Cent—Reduction in French Production Was Due to Destruction of Mines by Germans

**W**ORLD production of coal in 1919 seems to have dropped back to the level of 1910. Preliminary estimates, necessarily rough, place the total output of all kinds of coal in 1919 at 1,170,000,000 metric tons, or 1,290,000,000 net tons. This is 162,000,000 metric tons less than the production in 1918, the

it is the prevailing unit in non-English speaking countries.

It is pointed out by the Supreme Economic Council that from 1913 to 1919 the output of bituminous coal in the four European countries shown in the table has fallen from 532 millions to 386 millions, the decrease being about 20 per cent in the United Kingdom and Belgium, and nearly 40 per cent in Germany. In the Saar Valley, whose output appears to have fallen from 12 million tons in 1913 to about 8 millions in 1919, the percentage of decrease was over 30. The reduction in the French output is mainly due to the destruction of the mines in the Nord and Pas de Calais.

The output of lignite in Germany in 1919, though less than in 1918, was still greater than before the war, being 94 million tons, as compared with 87 millions in 1913.

In the break-up of Austria-Hungary the bulk of that country's coal and lignite, the production of which amounted before the war to about 55,000,000 tons, was inherited by the Republic of Czecho-Slovakia. The 1919 production of Czecho-Slovakia was about one-third less than the same territory produced in 1913.

Comparative production in millions of metric tons in five of the belligerent countries before and after the war is shown in the following table:

	1913	1919
United Kingdom.....	292	237
France (present boundaries) <sup>a</sup> .....	44	22
Belgium.....	23	18
Germany (present boundaries) <sup>b</sup>		
Bituminous.....	173	109
Lignite.....	87	94
United States.....	517	494

<sup>a</sup> Includes Alsace-Lorraine. <sup>b</sup> Excludes Alsace-Lorraine and the Saar.

Year	Production (in Part Estimated)	Per Cent Produced by United States
1910.....	1,160,000,000	39.2
1911.....	1,189,000,000	37.9
1912.....	1,249,000,000	38.8
1913.....	1,341,000,000	38.5
1914.....	1,208,000,000	38.5
1915.....	1,190,000,000	40.5
1916.....	1,270,000,000	42.1
1917.....	1,336,000,000	44.2
1918.....	1,332,000,000	46.2
1919.....	1,170,000,000	42.1

last year of the World War, and about 171,000,000 tons less than that of 1913, the year before the war began.

This estimate is based by F. G. Tryon, of the Geological Survey, upon reports to the Supreme Economic Council from countries which contribute about 85 per cent of the world's output. Obviously, returns from the other countries may materially alter this figure; if anything, they probably will reduce it still further.

The above table shows the estimated production of the world for each year from 1910 to 1919. Because of disturbances and interruptions in the compilations of Government statistics, particularly in central and eastern Europe, the figures since 1913 are not to be regarded as final. The metric ton of 2,205 lb. is used because

<sup>a</sup> Figures from the Monthly Bulletin of Statistics of the Supreme Economic Council for February, 1920, except that figures for the United States are corrected and those for the United Kingdom in 1919 are converted from a weekly to a monthly basis.

<sup>b</sup> Includes output of Alsace-Lorraine in 1919.

<sup>c</sup> Includes bituminous output of the Ruhr, Upper and Lower Silesia, Saxony, and Aachen districts. Excludes the Saar and Alsace-Lorraine. In addition Germany has a large production of lignite which amounted in 1919 to nearly 8,000,000 tons per month.

# Supreme Court Dissolves Reading Company

Separation of Coal and Railroad Companies Not Expected  
To Have Important Effect on Anthracite Coal Situation

**B**Y A four to three opinion the U. S. Supreme Court on April 26 sustained the Government's charges of illegal combination against the Reading Company because of its holdings in various coal companies and in other roads. The combination was held to be a violation of the Sherman anti-trust act and was ordered to be dissolved.

The decision reversed Federal Court decrees rendered in Philadelphia in 1915 refusing to sustain the Government's charges of monopoly, but directing the separation of the Central Railroad of New Jersey from its subsidiary, the Lehigh and Wilkes-Barre Coal Co.

The court's opinion was delivered by Justice Clarke. Chief Justice White and Justices Holmes and Van Devanter dissented from the majority opinion, stating that their views coincided with those of the three judges of the lower court. Justices McReynolds and Brandeis took no part in the decision. Justice McReynolds was Attorney General during the time the Government prosecuted the suit, which was instituted in 1913.

The decision came on appeals by the Government and a cross-appeal by the Reading Company, the ruling of the lower court being unsatisfactory to both parties.

Dissolution was ordered of the combination of the Reading Co., the Philadelphia & Reading Railway Co., the Philadelphia & Reading Coal & Iron Co., the Central Railroad of New Jersey and the Lehigh and Wilkes-Barre Coal Co., so that they would be entirely independent of each other. Disposition of the stock and bonds of the companies held by the Reading Co. also was directed.

The court, however, sustained lower court decrees absolving the Lehigh Coal and Navigation Co., the Lehigh & New England Railroad Co. and the Lehigh & Hudson River Railway Co. on charges as to restrictive covenants in mining lease with respect to the shipping

of coal and refusing to order the dissociation of the Philadelphia & Reading Coal & Iron Co. and the Lehigh and Wilkes-Barre Coal Co. maintained through the holding company.

Charges against the directors of the holding company, who also were named as defendants, were dismissed. Most of them have died since the suit was instituted and their successors in office were not made parties to the suit.

Injunctions restraining enforcement of provisions inserted by the Reading and Wilkes-Barre coal companies in coal leases, requiring the lessee to ship all coal mined by designated rail routes, were made permanent, the court condemning such provisions as unlawful.

The action grew out of the financial reorganization of the Reading and associated lines in 1896. The suit was filed by the Department of Justice, charging a number of railroad and coal companies with restraining and monopolizing the trade of coal. It was filed against the Reading Company and others, known as the anthracite coal combination, on Sept. 2, 1913.

The case was argued in the Supreme Court in October, 1916; restored to the docket for reargument in May, 1917; reargued in November, 1917; restored to the docket for reargument in June, 1918, and in October, 1918, was continued at the request of the Government on account of war conditions.

While the decision seems to be a complete victory for the Government, the court emphatically denouncing the combination of the railroads and the coal companies and declaring that the great power obtained had been used to restrain commerce, the opinion held by legal authorities in Washington is that the effect of the ruling will be to cause the companies affected to do by contract what they have been doing by co-ordination. As a consequence they expect no important net result.

## British Mine Workers Accept a 20-Per Cent Increase

**A**FTER making large demands the members of the Miners' Federation of Great Britain agreed April 15 to accept the Government offer of a 20-per cent increase on gross earnings. As the Miners' Federation rules require a two-thirds majority before a strike can be authorized, it was not expected that any such further misfortune would be visited at this time on the United Kingdom.

Fortunately, not only did the men not vote to strike but they voted by an ample majority of 65,135 in favor of acceptance of the wage offered.

The increase in wage will add £36,000,000 to the mine workers' payrolls, 900,000 men participating in the benefit. The mine workers hoped for a wage which would have raised the rolls £43,000,000 a year.

The miners' delegates, seeing the large amount of profit in exported coal, thought they would like to hear it jingling in their pockets. The Government, however, decided that the price of export coal must be reduced £2 per ton.

## Running Time in Bituminous Mines October, 1917, to Date

**C**ONDENSED figures on time worked and lost at the mines, which the bituminous operators have been furnishing weekly to the Geological Survey, are given in the following table, prepared by F. G. Tryon:

SUMMARY OF REPORTS ON OPERATING CONDITIONS AT SOFT COAL MINES IN THE UNITED STATES, OCTOBER, 1917 TO APRIL, 1920

Figures represent per cent of full time operated and shut down for various causes

Period	Per Cent Operated	Total Lost All Causes	Per Cent of Full Time Lost on Account of				
			Transportation Disability	Labor Shortage and Strikes	Mine Disability	No Market	Other Causes and No Cause Given
1917—3rd Quarter	72.6	27.4	17.1	5.3	3.6		1.4
1918—1st Quarter	66.9	33.1	24.2	2.4	4.1	0.8	1.6

# Price-Pancoast Breaker Relies On Gravity To Do Much of the Work

Only Two Conveyors Are Installed in This Breaker—One of These Handles the Condemned Coal and the Other the Rock—Degradation Is Thus Kept at a Minimum

BY DEVER C. ASHMEAD  
Tarrytown, N. Y.

IN THE effort to achieve economy in operation as well as better preparation, anthracite coal companies have shown a marked tendency to rebuild or remodel their breakers during the last few years. Old-time dry breakers have been extremely wasteful because of the unfavorable working conditions with which the men have had to contend, the unnecessary breakage of the coal, the large force of men and boys required for the operation of the breakers and the incomplete preparation obtained.

Among the coal producers who in the last few years have remodeled their breakers is the Price-Pancoast Coal Co., at Scranton, Pa. This firm's old breaker was of the dry type, and it yielded results that were unsatisfactory, in that a large amount of dust was formed during the treatment of the coal. Besides this the coal was not properly prepared.

No change was made in the building but the machinery and methods were entirely altered. The headframe and the breaker are practically one, as is shown in the accompanying photograph of the breaker. The headframe is of steel construction, while the breaker proper is of wood.

At present the arrangements for handling coal at the top of the headframe and breaker are extremely old-fashioned and dangerous. No accidents have occurred, however. The coal company has ordered and will this spring install self-dumping cages which will dispense with the services of twelve men who are now

required to handle the coal cars at this point, and this will further reduce the likelihood of accident.

It is necessary at present to haul the cars a distance of about 50 ft. from the landing stage to the dump. The cars are moved out by means of a small hoisting engine and are brought back to the cage after dumping by a car haul.

After being dumped from the cars the coal passes

FIG. 1. CROSS-SECTION SHOWING SHAKERS, JIGS AND POCKETS

Great simplification of arrangement marks the remodeled breaker

FIG. 2. FLOW SHEET OF THE PRICE-PANCOAST BREAKER

over a bar screen (see Fig. 2) which separates it into two sizes—steamboat and larger, and grate and smaller. The steamboat coal and larger passes through a picking chute (3), where the rock is separated. The coal then goes through a set of rolls (4) and from them to a shaking screen (5), which separates the coal into grate, egg and fine coal. The grate size from shaker 5 is next picked on a picking chute (6), after which it goes to another set of rolls (7) and from there it passes to another shaking screen (8) having three decks preparing egg, stove, chestnut and fine. The egg coal then passes to the egg jigs (9), where the coal is separated from the rock. Leaving the jig, the egg coal then passes over a small stationary screen (10), which removes the undersize.

The material passing the screen then goes directly

to the egg pocket, while the fine coal is sent to the condemned-coal conveyor (11). In a similar manner the rock from the egg jig (9) passes over a screen and is hand picked in order to catch stray pieces of coal that pass through the jig with the rock. The coal there obtained is thrown in with the egg coal and goes directly to the pocket. The rock from the jigs passes to the rock conveyor (12) and the fine particles which have passed through the screen are taken to the condemned-coal conveyor. The egg coal made on shaker 5 goes directly by means of chutes to the egg jig (9), where it is prepared in a manner similar to that above described.

Coal passing through the main bars (2), grate and smaller, goes over a shaking screen (13) having two decks on which grate, egg and fine coal are sized. The grate coal passes over a picking chute (14), where the

FIGS. 3 AND 4. VIEWS ON THE JIG AND SHAKER FLOORS

Photographs often give distorted views. While both of these pictures partake of this defect, it is particularly noticeable in Fig. 4, where shaker suspensions and columns appear badly out of plumb.

rock is separated from the coal. Passing through a set of rolls (15), the coal then goes over a three-decked shaking screen (16), making egg, stove, chestnut and fine. Added to the coal of this size from shakers 5 and 8, the egg is treated in jigs, as previously described.

Uniting with the stove coal from shaker 8, the stove from shaker 16 passes to the jigs (17) and receives exactly the same kind of treatment given the egg size. The clean coal goes to the stove pocket while the undersized coal passes to the condemned-coal conveyor and the rock to the rock conveyor.

The chestnut coal (from shakers 8 and 16) is handled in the same manner, there being practically no difference in the method between the egg-, stove- and chestnut-coal treatment except that in this case no effort is made to hand pick the slate from the chestnut jigs and to recover any coal that might pass through.

From shaker 13 the egg coal goes directly to a jig (18) which is located near the top of the breaker, and the coal receives at this point exactly the same preparation as was received by the egg coal from shaker 8. The coal from this jig is sent directly to the egg pocket without further treatment.

From shakers 5 and 13 the fine coal is conducted in chutes to the fine-coal shaker (19), which has two decks on which stove, chestnut and fine coals are prepared. The stove and chestnut coal unite with the same respec-

FIG. 4. EGG JIG NEAR THE TOP OF THE BREAKER  
The egg coal, made on the second set of shakers near the top of the building, is jiggd immediately and sent direct to its proper pocket over the loading track.

FIG. 5. CROSS-SECTION OF PRICE-PANCOAST BREAKER

Driving breaker machinery is often a complicated problem. Some of the difficulties involved are here plainly shown.

tive sizes from shakers 8 and 16 and are treated with them as has already been described. The fine coal from shaker 18 is passed to a four-decked shaker (20) on which is also treated the fine material from shakers 8 and 16. Five sizes are made on this shaker—pea, buckwheat, rice, barley and culm. The pea, buckwheat, rice and barley pass directly into their respective pockets, while the culm is returned to the mine for filling purposes.

Rock rolls crush to small size the rock from picking chutes 3, 6 and 17 and it is then delivered to the rock conveyor together with the rock from the jigs (9, 17, 18 and 21). This conveyor delivers the coal at a point where it can be sent into the mine for filling.

The condemned-coal conveyor carries the condemned coal, together with the undersized coal from the jigs and lip screens, back to shaker 8 for treatment. Some of the culm is settled in a slush tank in the bottom of the breaker and then passed over a shaking screen on which No. 2 barley is prepared. This coal is used in the boiler house when mixed with rice and barley sizes.

The Price-Pancoast Co. insists that as far as possible its coal be handled by gravity during preparation. With this idea in view it has so designed this breaker that there are no elevators within it other than the condemned-coal and rock conveyors.

Comparatively little extra height was required to so lay out the method of preparation that it could be operated by gravity, and the cost of this extra construction probably was offset by avoiding the expenditure that the installation of elevators and conveyors would have entailed. As the breaker does not have to be made any higher by reason of this differentiation of the plans from those which are usually adopted in breaker construction there is no extra cost from this source while, by reason of the absence of elevators, a marked saving is made in the power required to operate the breaker and the cost and annoyance from breakdown is reduced. A further economy arises from a reduction in the degree to which the coal is broken in the operation of the breaker. The fewer times coal has to be handled the less will be the degradation.

## Correct Method for Trolley Wiring Mines—II

Standard Methods of Hanging Curves and Placing Frogs, Section Insulators, Anchors, Protection Boards and Wire Splices—System of Salvaging Old Equipment Described

BY M. W. BEDDOW  
Lundale, W. Va.

IT IS the purpose of the article to supply a description of standard and economical methods for the hanging of underground trolley wire, to be followed by mine wiremen. On the final page of this article is reprinted the table giving the various parts used in construction with the numbers by which they are demonstrated in the test. The previous exposition in the issue of April 22 described (1) the dead ends and (2) the suspensions used in trolley-wire work.

(3) The hanging of trolley wire on curves may be accomplished in a variety of ways, viz:

(a) In high coal, single track (see Fig. 5), the fixture is made up of parts Nos. 6, 7, 12, 19, 20, 21 and 33. Where the coal is soft and shelly and the

same as in fixture (a), while in addition the type N hanger, double curve (No. 22), is necessary.

(c) In low coal where curve hangers or pull-overs cannot be used the proper hanger support must be installed and spaced according to the radius of the curve as shown in Table II and illustrated in preceding column.

Remarks—It is always better to use curve hangers or pull-overs when the height of the coal will permit. Curve hangers or pull-overs give the wire that much-desired flexibility which eliminates hard spots, kinks at the points of suspension and which permits the trolley wheel to traverse the wire with the greatest ease and smoothness, thus decreasing the wear on the wire, on

roof not too high an expansion bolt (8) placed in a hole drilled in the roof should be used instead of parts 12 and 20.

(b) In high coal, double track, the support fixture is composed of parts Nos. 6, 7, 12, 19, 20, 21 and 33,

TABLE II.

Radius of Curve	Chord in Feet	Middle Ordinate in Inches	Distance Between Suspension Points
40	10	3 1/2	5 ft.
50	10	3	5 1/2 ft.
60	10	2 1/2	6 ft.
75	10	2	6 1/2 ft.
85	10	1 1/2	7 ft.
100	10	1 1/4	7 1/2 ft.
200	10	1	10 ft.

the trolley wheels and on their bushings. In cases (a) and (b), where the wooden plug is used, it is sometimes split at the end and a wedge inserted so that when it is driven into the hole in the roof the wedge bears against the bottom of the hole and is forced into the split in the plug, expanding it (the plug) against the sides of the hole. The hole in the roof for the reception of the plug is drilled with a breast auger or, if the material is hard, with a Niron ratchet. The galvanized wire strand (33) is spliced into curve hangers (19 and 22) in cases (a) and (b).

(4) Frogs are installed at all switches and turnouts.

FIG. 5. THE CURVE HANGER OR PULL-OVER

It is always advisable to use this fixture where the height of the coal will permit.

(a) The frog fixture complete is made up of materials Nos. 1, 2, 3, 6, 7, 8, 24, 25, 33 and 34.

Remarks—The branch line wire is dead ended over the frog as shown in Fig. 6. There should be little tension in this dead end; not enough to pull the frog out of place. The purpose of this dead end is largely to hold the end of the branch line wire out of the way and to protect the frog in the event that a heavy stress comes on the branch-line wire between the frog and the section switch.

The frog is steadied and held in alignment by means of No. 6 galvanized wire passed through the pull-off rings in the frog. The wire is doubled from the pull-off rings to the strain insulator. The clevis end of the strain insulator is attached to an eyenut, screwed onto an expansion bolt in the roof on each side of the frog and then twisted to get the necessary tension to hold the frog in its proper position. The hanger suspensions supporting the wire on either side should not be too close to the frog as it is not desirable that the frog be held too rigidly.

The type and degree of frog here specified have given good service and even if only located and installed in approximately the correct location it relieves the motormen of the trouble caused by the trolley pole jumping off or getting on the wrong wire at frogs.

(b) Frogs should be placed from the point of the track frog or the point of the track switch the distance indicated in the table below:

30 lb. Rail Degree Trolley Frog	44 in. Gage Distance from Point of Switch	No. 3 Frog	5 ft. Switch Points Distance from Point of Track Frog
8	2 ft. 3 in.		17 ft. 8½ in.
15	6 ft. 6 in.		13 ft. 5½ in.
40 or 56 lb. Rail	44 in. Gage	No. 3½ Frog	7 ft. 6 in. Switch Points
8	4 ft. 6 in.		20 ft. 1½ in.
15	9 ft. 10 in.		14 ft. 9¼ in.

Remarks—The angle of the trolley frog should always be less than the angle of the track frog. In Fig. 7, "A" is the point of intersection of the branch trolley wire with that on the main line. Trolley frogs must never be located between point A and point of the track frog, but must invariably be placed between point A and the point of switch. Before setting a trolley frog place hangers "BB" opposite the track frog at a horizontal distance of 53 in. (gage plus 9 in.) from it. On these hangers is placed the section switch. The hangers "BB" also should be at the regulation distance, 9 in., from the gage of the branch track.

FIG. 6. DEAD END ON A BRANCH-LINE WIRE

Little tension, not enough to pull the trolley frog out of line, should be applied to this dead end.

(5) Section switches or insulators are highly desirable pieces of apparatus. (a) The switch fixture consists of parts Nos. 5, 6, 7, 8, 9, 24, 26 and 27.

Remarks—Wherever a trolley frog is used and a branch circuit is taken off the main line it is necessary to install two section switches (26), one on the main line and the other on the branch. If there is a short circuit or ground on the branch, the section switch on this line can be pulled and work can continue on the main line. If there is trouble on the main-line wire inside of the branch, the main-line switch is pulled and work need not stop on the branch line.

If trouble develops in the mine and a ground or short is reported by the sub-station attendant, by trying one switch and then the other it can soon be ascertained whether the trouble is on the main line or on the branch circuit.

The switches are placed close together so that unnecessary time will not be consumed in walking a hundred feet or more up the branch entry and then back and up the main entry two or three hundred feet. When the switches are placed at too great a distance from the branching point trouble may occur between

FIG. 7. TROLLEY WIRING AT A TURN-OUT

This shows the correct relative positions of frog, section switches, anchors, etc.

them and the frog and it would then be necessary to go to the next pair of switches, 500 to 1,700 ft. away, cutting off a whole section of the mine simply because a switch was not placed correctly.

The switch on the main line should be placed 12 ft. inside the point of the track frog. The switch on the branch line is placed opposite the track frog on the hangers "BB," as previously mentioned.

The switches should be so placed that the handles point toward the outside. If they are set with the handles pointing toward the inside and a motor comes from the inside going outbye and the trolley wheel jumps off as it comes to the switch (which should not happen but which does nevertheless), the chances are that the pole will pull out the switch. The locomotive, however, will roll on toward the outside, and when the wheel is replaced it will be on wire outside of the switch and will give current to the motor. It usually happens upon such occasions that the motor continues on its way without the motorman noticing that the switch has been pulled. In the meantime the motors and machines on the trolley line inside the switch are without power and by the time the trouble is discovered much time may have elapsed.

Of course, when the switch is placed with the handle pointing toward the outside the switch can be knocked out in the manner above described only when the

FIG. 8. A SECTION INSULATOR ANCHORED IN PLACE  
Anchors should be placed on each side of the switch if the pull in the trolley is great.

motor is going inbye, and if it is so thrown it will be discovered immediately because the motor will be found to be on the dead side of the switch. The section switch must be protected by anchors; otherwise an extraordinary stress coming on the wire on either side of the switch would pull it in two. This was a common occurrence before the protection of switches with anchors was introduced. An anchor is placed on each side of the main line switch, while on the branch line switch an anchor is placed on the inside of the switch only. The wire on the outside of the switch extends but a short distance to the trolley frog.

The Brooklyn strain insulator is placed 12 in. from the strain clamp (27), with the insulated holt on the clamp side. This puts the bell or large part of the insulator against the roof—if the roof is low—and thus eliminates the possibility of the device getting grounded thereon. A galvanized strand is spliced into the Brooklyn strain insulator and the Detroit strain clamp. When the Detroit strain clamp is screwed onto the hanger the eyebolt must be taken out of the strain insulator. The galvanized wire strand on the dead side of the insulator has its other end passed through the eyenut, doubled back on itself and fastened with a 3-bolt clamp. The eyebolt of the Brooklyn strain insulator is then tightened up to secure the necessary tension in the wire.

Section switches must always be placed on hangers. Where the top is low it may be necessary to cut a channel in the roof to accommodate these hangers so that the runway of the switch will be in alignment with the trolley wire. Many switches with a downward curve in the wire on either side may be seen. This is because the trouble was not taken to cut a channel in the roof for the hangers. A job of this kind should not be tolerated and should be ordered taken down and installed properly.

Where the roof is high, suspensions (2-f) should be used. All section switches are numbered. A brass check with the number of the switch stamped on it is tacked on each switch. This number, shown in its correct location on the trolley-wire map, is used when orders are given to isolate trouble. The sub-station attendants and section foremen are given detailed

FIG. 9. UNANCHORED SECTION SWITCH  
Two supports are always necessary to support a section switch.

instructions what to do in the event of a short circuit or ground on the trolley lines. Such troubles are speedily found and isolated, the maximum time required for this purpose never exceeding ten minutes.

In some mines, instead of using section switches, section insulators and circuit breakers (automatic or manual) are employed. The section insulators are mounted in the same manner as section switches but a feeder is taken off each side of the insulator and run to the circuit breaker, which is mounted on pipe supports in a convenient refuge hole or breakthrough. However, in the present status of the art of mine wiring I do not think it pays to use circuit breakers in the mines except at points where an attendant is employed and a telephone is installed.

(6) Anchors are built up of parts 5, 6, 7, 8, 24 and 27.

Remarks—Anchors should be installed every 500 ft. on main-line wire. Without the protection of anchors,

FIG. 10. TROLLEY PROTECTION BOARDS  
Protection of this kind should be adequate to prevent contact with the wire anywhere at the turnout.

in the event of a slate fall or other unusual strain coming upon the wire it might be pulled down for a thousand feet or more on each side of the trouble.

When anchors are installed every 500 ft., the wire is divided into sections and any trouble arising is confined to the region in which it occurs. Anchors are installed in the same way as that described under section switches (5).

The manufacturers furnish only screws with the Detroit trolley clamps (27). These screws frequently work loose and render the anchor valueless. Such screws extend through the clamp far enough to permit nuts being employed to jam them. Extra nuts for this purpose should always be used on these devices.

(7) Protection boards are made up of parts Nos. 28, 29 and 30.

Remarks—I have experimented with every kind of a protection board that I could think of or that I ever heard of but have finally come to the conclusion that those here described are the best and the cheapest that can be installed. Wooden plugs are placed and expanded in the same manner as described under curves (3).

Where the roof is low a swinging protection board may be better than a rigid one. Such a board can be made by having the blacksmith make hangers from

FIG. 11

### Nixon Ratchet

This device is extremely useful for putting plug holes into the roof for trolley hangers and the like.

pushed through a curved path, brought out on top and a short-radius curve bent in it. About this time the wire breaks and a few more inches of it must be pushed through and the process repeated. In my experience no K-1 splicer has ever failed under strain. The wire will break first.

Tools necessary for hanging wire are:

- |  |   |
|--|---|
| (100) 2 1/2 in. bits *                             | (116) 1 wire tightener (O.B. No. 8126*)                   |
| (101) 2 1/2 in. bits *                             | (117) 1 chalk line  |
| (102) 1 8-in. file                                 | (118) 2 comealongs with flat grips for 4/0 grooved wire * |
| (103) 1 plumb bob                                  | (119) 10 ft. of 1/2-in. chain *                           |

| (105) 1 piece of chalk *                           | (121) 1 hand saw, 8-point, cross cut                      |
| (106) 1 hanger wrench *                            | (122) 1 brace   |
| (107) 1 clamp wrench *                             | (123) 1 1/2-in. bit with square taper shank               |
| (108) 2 10-in. Stillson wrenches                   | (124) 1 pulling tool *                                    |
| (109) 1 1 1/2-lb. hammer                           | (125) 1 hatchet   |
| (110) 1 10-in. Westcott wrench                     | (126) 1 breast auger *                                    |
| (111) 1 pair 8-in. pliers                          | (127) 1 heavy screw driver                                |
| (112) 1 punch                                      | (128) 1 12-in. monkey wrench                              |
| (113) 1 cold chisel                                | (129) 1 back saw frame for 12-in blades                   |
| (114) 1 pair of wire stretchers (lever and chain*) | (130) 12 12-in. back saw blades *                         |
| (115) 1 1-ton chain block *                        |   |

The tools marked with an asterisk (\*) are furnished by the company; the others each wireman is required to own himself.

Fig. 11 shows clearly how a pipe has been fitted up for use with the Nixon ratchet in order to drill vertical holes. This drill possesses a combination of qualities—lightness, convenience, speed in operation, ability to drill all kinds of top—that I have not seen equalled. The hanger and clamp wrenches furnished by the companies that sell the hangers and clamps are short lived. They are too narrow and too light and the jaws are soon sprung. It is much better to have the blacksmith make substantial wrenches for these purposes.

The wire stretchers (114) shown in Fig. 13 are made in the shop from a piece of flat iron rod, some 3/4-in. chain and two comealongs. Three holes are punched in the flat iron rod, about 4 in. apart, near one end. The center of the main chain—it is about 10 ft. long—is fastened in the center hole. This acts as the fulcrum of the lever.

In each of the other two holes is fastened a short chain about 16 in. long, with a hook at the end which

3/4-in. round iron and putting eye nuts upon expansion bolts placed in the roof and nailing the boards to these hangers. As a general rule protection boards do not extend far enough along the wire at crossings. They frequently extend only from the point of switch to the point of the track frog, but this is not far enough.

In Fig. 10 the protection boards are too short. They should come forward at least 6 ft. No part of the crossing should go unprotected. It should not be possible for a man to bump his head into the wire in turning from one entry into another. In many instances protection boards are placed too far from the wire. They should be located 4 in. from the wire on either side.

(8) Splices or connectors are composed of parts Nos. 32 and 35.

Remarks—The splicer shown in Fig. 12 without a doubt is the one that is quickest, cheapest and easiest

FIG. 12. AN EFFECTIVE TROLLEY WIRE SPLICER

to apply. The trolley wire is held in place by means of tapered steel dogs that are barbed on one side so as to grip the wire and tapered on the other to correspond with the tapered inner wall of the splicer. It is not necessary to solder this connection as the tension of the wire is sufficient to keep the dogs in place.

In using this splicer, the ends of the wire are inserted in each end of the splicer. This is easily done, for the wire goes in straight and no short-radius curves are necessary. The dogs are slipped through the slot in the center of the splicer and placed properly, tension is put on the wire and the connection is made. This procedure is much easier and quicker than that necessary when using an extruded metal or brass trolley wire connector. With such a device the wire must be

FIG. 13. HOME-MADE WIRE STRETCHER

This device may be fastened to either two wires or to one wire and a post or other anchor and the wire quickly tightened

FIG. 14. PULLING TOOL IN USE

This curved bar is extremely useful in removing the lag screws from the wooden support plugs.

is so fashioned as to fit over a link of the long chain. The lever, in tightening wire, is worked back and forth. As it is drawn one way, it loosens the hook on one of the short chains and this is fastened two or three links ahead of its former position on the long chain. The lever is then moved in the opposite direction, and the other chain is loosened and moved up two or three links on the long chain. In this way, the necessary tension on the wire is speedily secured.

The pulling tool (124) shown in Fig. 14 is used in withdrawing the lag-screw support from the wooden plug when the entry is finished and the wire is being taken down.

(10) Trolley wire must be extended periodically. When an entry has advanced to such a distance that the motorman finds that he has barely enough cable on his reel to reach the inside face, he reports this fact to his foreman and orders are given for additional wire to be hung. The wire car—equipped with a reel of wire, tools, necessary material, etc.—is attached to a trip going to this entry. When it arrives the motor pulls the proper length of wire off the reel and it is cut by the wireman and laid down in the clear on the crosscut side of the entry. In pulling the wire off the reel a comealong is used. In no case is the wire allowed to be kinked or looped, as the avoidance of such sharp bends facilitates handling and stretching. A kinked or looped end has to be cut off and is usually wasted.

In the meantime the wiremen put up the suspensions to a point as close to the face of the entry as the top will permit—if draw slate is encountered the suspensions are not put up until it has been taken down or the place otherwise made safe. These suspensions are lined up 31 in. from the center of the track (the track gage is 44 in.). A chalk line is stretched on the center line of the entry and the hangers are placed in a parallel line 9 in. from this center line.

On straight track and where the top is regular the hangers are spaced 30 ft. apart; where the top is irregular, the hangers are so spaced as to secure the best possible vertical alignment of the wire, so that the wire clears the roof and so that the trolley wheel will not touch the roof at any time.

Trolley extensions are usually made in the evening after the motor in the entry has finished for the day. The nearest section switch controlling the "juice" on this particular entry is pulled, making the end of the

wire dead. The dead-end fixture is taken off, advanced and put on the end of the piece of wire about to be installed. The turnbuckle on the dead end is opened up as far as possible. The other end of the wire is connected to the wire already in place, with a splicer.

At the inside end of the new wire a prop or tie is placed on end and wedged between the roof and floor to serve as a pulling post or anchor for the chain blocks or wire stretchers. To this post is fastened with  $\frac{3}{8}$ -in. chain either the chain block (tool No. 115) or the wire stretchers—lever and chain—(tool No. 114). The chain block or wire stretcher, as the case may be, is fastened to the galvanized strand of the dead-end fixture close to the turnbuckle by means of a comealong, and the slack in the wire is taken up.

Before the wire is made tight five or six of the clamps holding the wire outside of where the dead-end installation has just been removed are loosened because when the dead end is taken away the drawing up of the wire ordinarily pulls the nearest hangers out of plumb. The wire is now stretched tight, an eyenut is screwed onto the expansion bolt near the end of the galvanized strand on the dead end, a thimble is placed in the eyenut and the end of the strand is run through the eyenut and around the thimble, turned back on itself and fastened with a 3-bolt clamp.

The chain block or wire stretcher is now loosened and the comealong taken off. The turnbuckle in the

#### MATERIALS USED IN HANGING TROLLEY WIRES IN MINES\*

1. 410 Grooved trolley wire
2. Wedge grip, O.B. No. 12,634, opening in clevis  $\frac{1}{4}$  in., diameter of clevis bolt  $\frac{1}{2}$  in. Will take 410 grooved or  $\frac{3}{4}$  in. round strand
3. Giant strain insulator, 2 $\frac{1}{2}$  in. diameter with large eye and clevis
5.  $\frac{3}{4}$  in. galvanized steel wire strand
6. 3-bolt guy-wire clamp, O.B. No. 3,206, length 4 in. with square hole and square head on bolt
7. Hubbard eye-nut, drop forged, to screw on  $\frac{3}{4}$  in. bolt; inside diameter of the eye is 1 in.
8. Expansion bolt, O.B. No. 10,073, 6 in. long
9. Universal mine hanger, O.B. No. 11,309, form 1, 2 in. high
19. Type N hanger, O.B. No. 11,650, single curve, complete with separable arm
20. Wooden plug, diameter  $1\frac{1}{2}$  in., length 12 in.; to be split out of ash or other soft wood
21. Detroit trolley clamp, O.B. No. 10,972; 4-screw clamp
22. Type N hanger, double curve, O.B. No. 11,651, complete with separable arm
24. Single Brooklyn strain insulator, O.B. No. 9,995;  $\frac{1}{2}$  in. eyebolt
25. Type D trolley frog, malleable iron with renewable bronze tips, 8 degree, 410 grooved; right hand O.B. No. 11,892; left hand O.B. No. 11,897
26. Type M mine section-insulator switch, O.B. No. 11,600
27. Detroit double strain clamp, O.B. No. 10,370
28. Wooden plug,  $1\frac{1}{2}$  in. x 18 in., split at end with a wedge fitting in the split; to be made out of ash or other soft wood
29. Boards, 1 in. x 4 in. x 14 ft.

32. K-1 splice, 15 in. long, O.B. No. 8,573
33.  $\frac{3}{4}$  in. galvanized steel-wire strand
35. Dogs for K-1 splice, O.B. No. 5,700

\* Abridged from table appearing April 22.

dead end is next employed to bring the wire to the proper degree of tautness. The wiremen now go to the outside hangers, where the clamps have not been fastened to the wire, proceed to put the wire into these clamps and draw them securely to the wire. As they perform this bolting-up process they knock the clamps gently toward the outside with a hammer, just enough to barely get the suspension out of plumb. This tends to regulate the spans between hangers. When the clamps are all tightened up there is usually a little slack at the dead end which is taken up with the turnbuckle.

While two men are bolting up the clamps the third man of the wire crew is painting the hangers, clamps and the other sherardized materials with a bright red paint having an asphaltic base. A lead paint should never be used for this purpose. This painting protects these materials from the corrosive action of the mine air and water and increases their life several fold. Finally, the tools, materials left over and any scrap copper that has been made are loaded on the wire car.

# Reading Co. Completes New Mining Town of Lorraine, Pa.

Concrete Sidewalks in Front and Around House, Concrete Gutters and Curbs, Streets Electrically Lighted, Running Water in all Houses, Heat Supplied by Pipeless Furnaces and Ample Closet Room Are Notable Features of Attractive Dwellings Containing Seven Rooms

AT ITS Eagle Hill Colliery, near Pottsville, Pa., the Philadelphia & Reading Coal & Iron Co. has commenced and partly completed the new town of Lorraine. This town now consists of 24 double dwellings and a school house. It will be enlarged from time to time as housing demands may determine. At present there are only three streets in the place but there is sufficient ground to make the town about four times its present size. Each house has large grounds surrounding it, giving plenty of room for gardens and lawn. The grounds are inclosed by a picket fence.

Concrete walks extend from the sidewalk completely around each house. The street is graded and has concrete curbs and gutters. A stretch of lawn about five feet wide lies between the curb and the concrete sidewalk, with another strip between the sidewalk and the fence line. The streets are electrically lighted. Running water is supplied in all houses, and each is furnished with an outbuilding that can be used either as a garage or storehouse, or for any similar purpose. Six fire plugs are placed at regular intervals along the curb line and the town is furnished with a fire house containing a hose cart. The houses are of an attractive design and are uniform in plan. They are painted different colors, however, in order to avoid monotony of appearance as far as possible. All the houses have seven rooms besides the cellar.

The cellar does not extend the full length under the house but is 12 ft. 9 in. x 27 ft. 4 in. and 6 ft. 6 in. in the clear, which gives reasonably ample headroom. A coal bin is placed in the front part of the cellar at a window and within easy access from the street. The flue for the front of the house extends down into the cellar so that a pipeless furnace can be used for heating.

The company has installed a number of this type of furnaces. There is an entrance to the cellar from the outside as well as one from the kitchen, as may be seen by a glance at Fig. 1. The cellar floors are all finished in concrete.

On the first floor, Fig. 1, there are three rooms, the living room, the dining room and the kitchen. They are all 12 x 13 ft. in dimensions. The stairway opens into both the dining room and the kitchen. There is also a front porch 5 x 8 ft. and a side porch 5 x 12½ ft. Plenty of light and sunshine is assured by numerous windows.

The second floor has three bedrooms and a hall. Two of these bedrooms are the same size as the rooms on the first floor but the third is a little smaller, being only 9 ft. 9 in. x 11 ft. One extremely utilitarian feature of these houses is the large number of good sized closets. The attic, or third floor, Fig. 1, extends over only the front portion of the building and has one big finished room 10 x 24½ ft. and one large closet.

Fig. 2 is a good illustration of the outside of the house, which is quite attractive. The roofing is vulcanite slab shingles. These dwellings are placed rather near the street line. The indispensable school house is now in course of construction in the town but is not yet quite finished.

The housing problem, now quite acute the world over, is present in the anthracite region as well as elsewhere and much study is being devoted to its solution. The day and age when a coal miner and his family could be lodged in the "shack" are past and gone, probably never to return. The houses composing a modern mining community must today compare favorably with those of industrial towns and cities or the miners' sojourn

FIG. 2. EXTERIOR OF THE NEW HOUSES AT LORRAINE

Although the exterior of these houses is plain, still, because of their location and varied color scheme, they are quite attractive.

therein will be short and the employing company will be continually looking for men to take the places of those seeking modern homes. The planning and construc-

tion of a complete town present many problems, but more and more the tendency is toward creating buildings with many modern conveniences.

## Coal Is, in a Sense, a Hardened Petroleum

Virtually Devoid of Petroleum Wells, Germany Obtained Practically All Oil Products from Distillation of Coal—Low-Temperature Distillation, Giving Products Such as Are Obtained in Petroleum Distillation, Seems to Be Growing in Favor

CONDITIONS encountered during the recent war rendered it desirable for Germany to utilize to the fullest the coal resources of the nation. Such utilization is perhaps even more necessary now. During the height of hostilities Germany carried on some important scientific work at the Institute for Coal Research in Muelheim. Professors Franz Fischer and W. Glund there made certain discoveries the value of which to Germany and its industries cannot yet be accurately estimated.

The seriousness of conditions at the time compelled the scientists to direct their attention primarily to devising ways and means by which all the constituents of coal could be utilized as directly and efficiently as possible. Both scientists have proved by their investigations and studies that all products of petroleum can be extracted also from coal.

To perfect a distillation of coal under conditions approximating those obtaining in nature, especially in regard to low temperature and atmospheric pressure, had already been attempted by Boernstein in Berlin. Similar experiments were made by Pietet, a Frenchman, and by Wheeler, an English scientist. Fischer and Glund, however, went into the study of coal tar at low temperatures, extracting phenol by the same process as that used in the petroleum industry. By means of distillation with superheated steam they secured oils of pleasant odor and a golden color which proved themselves useful lubricants.

These experiments brought out another important fact. Distillation at low temperature shows that the same products may be extracted from coal that the petroleum industry gains from crude oil: namely, fuel

oil, machine oil, lubricants, paraffin and benzine. It was found, therefore, that coal, in a certain sense, is a hardened petroleum. Simultaneously the fact was established that tar resulting from low-temperature distillation has an entirely different chemical composition from that ordinarily secured. Low temperatures yield combinations like petroleum and benzine, higher temperatures combinations like benzol.

There can be no doubt that these discoveries are of value to Germany's economic life, petroleum being almost entirely lacking in that country. The researches of the scientists will now lead to the development of a second industry for the production of tar which will not be won, as heretofore, through coke furnaces but by a process of distillation at low temperature. Germany and her industries now hope to become independent either entirely, or at least in large measure, of imports of petroleum and its byproducts.

In the same manner as with the usual distillation of tar there remains in the case of the low-temperature process a coke. This, however, is not of the same consistency as that produced heretofore. Experiments to give this coke the required consistency are now under way and have already resulted in a product which is called "semi-coke" and which can be used for fuel purposes. This coke is also termed "smokeless coal," although it still contains a small percentage of an easily inflammable substance, which burns, however, without producing smoke.

Science is now confronted with the task of giving this smokeless coal such consistency that it can be utilized, perhaps in the form of briquettes, as fuel for industry and for domestic consumption.

# What Cars and Bearings Should We Select?

Anti-Friction Bearings Are Rapidly Gaining in Favor Because They Are a Good Investment—Cars Should Be Made as Low as Conditions Will Permit on Account of the "Man Item"

By H. G. NASH  
Huntington, W. Va

FOR the past year or so I have been reading the comments appearing in *Coal Age* and elsewhere on mine cars and roller-bearing wheels of the "pin" and "flexible" types. It is assuredly mystifying to observe the seeming diversity of opinion on a subject that to me appears easily solved, especially so far as regards the roller-bearing car or truck. Because there has been and still is much doubt in the minds of

and labor for applying it to his self-oiling wheels and that he was getting his roller-bearing equipment lubricated for approximately \$1.30 per car per year. As the two companies furnishing these figures are large ones and carefully investigate all types of equipment before they make any statements it seems to me that this saving alone is worthy of serious consideration, since it comes from practical experience.

FIG. 1. QUARTERING END VIEW OF LARGE-CAPACITY LOW CAR

This car is 30 in. high over all and has a struck capacity of 90 cu.ft.

W. H. Noone, in the issue of *Coal Age* dated Jan. 15, 1920, p. 148, "assumes that a large majority of coal mines still have their mine cars equipped with plain bearings." He may be in a measure justified in this assumption, for plain bearings were first put in service simply because there was nothing else to use and the older mines are so equipped through necessity. I believe, however, that he will revise his statement if he will look around at the newer properties—those that have been developed in the past eight years—for he will find an astounding number that use roller-bearing cars. He will also find numbers of companies who equipped their mine cars with plain bearings and are now gradually changing to those of the roller type.

some operators on the above subject, I want to state a few facts that I have picked up from personal observation which have been highly valuable to me and which should go far toward settling in the minds of some doubters two important questions, viz., Are roller-bearing mine cars a good investment? Which does it pay to use, a low mine car or a high one?

## BEARINGS MAY BE SAVED FROM BROKEN WHEELS

I will first take up the subject of roller-bearing mine cars and trucks. For the past ten years the roller-bearing mine car has been a profitable investment. As evidence of this fact it is an easy matter to turn to almost any coal field and see mine cars equipped with roller-bearing trucks that have been giving excellent service throughout that entire period at a saving in power, lubricant and labor for its application, wheel repair and general upkeep cost.

Another statement made by Mr. Noone I want to take issue with is the following: "However, aside from the excessive cost of renewals, the cost of repairing such bearings is excessive." I have in mind a friend who operates approximately 5,000 roller-bearing cars of the flexible type. He tells me that he has yet to purchase a repair bearing and that he has lost practically no bearings from wreck or other cause. He also states that he often has broken wheels, but that he puts the bearing back into another wheel and keeps it going.

## ROLLER BEARINGS INSURE LOW LUBRICATION COST

Some friends of mine have been using roller bearings for a number of years and I will quote one as saying that he produced an output close to a million tons during the specified period. He has a long haul, heavy loads and hard service, but in spite of this fact his expenditure for lubrication and labor for its application has been .00122c. per ton of coal passed over the tipple. In my own experience the least lubricant cost I have seen applying to an improved self-oiling wheel has been .00989c. per ton. The man who gave me this figure stated that the black oil bought was charged both to machinery and cars and he felt that this figure should probably be a little higher as he believed that more oil was used on his mine cars than was charged to them.

In my own experience I was connected with a large company which has both the self-oiling and the roller-bearing wheels, and during a period of five years I

FIG. 2. BOTTOM VIEW OF THE CAR SHOWN IN FIG. 1  
This view shows plainly the arrangement of wheels, journals, brake rigging, etc.

Another friend of mine roughly estimated that it was costing him \$5.68 per year per car for lubricant

failed to see a roller-bearing wheel on the scrap pile because of bearing trouble, although I did see a few with broken flanges, treads and spokes. These cars

received scarcely any attention and the majority (at least 90 per cent) are running satisfactorily today.

In looking over the field I find such experiences as this to be the rule, therefore I cannot agree that the roller-bearing wheel or this type of bearing means "excessive cost of renewals, etc." I have in mind several mines located in West Virginia having long inclines that have found self-oiling wheels absolutely useless. Their planes were long and the cars came down at a high rate of speed. The centrifugal action thus set up caused the oil to be thrown to the circumference of the hub and away from the bearing surface. The wheels therefore rapidly wore out in the bore. The same firms have many roller-bearing wheels that have been going for from four to five years and have not given the least trouble.

It seems to be Mr. Noone's belief that a large part of the rolling stock of a mine will get wrecked in the course of its life and that the wrecking will tear up the mine-car bearings. This I believe is contrary to the experience of most of the operators using roller-bearing mine cars, for the smashing up of a wheel does not mean, necessarily, a broken bearing. In the majority of cases the modern roller-bearing wheel has the bearing so securely housed that it is well-nigh impossible to injure it, and if the wheel be broken the bearing may be taken out and put into another wheel casting. Consequently a higher efficiency will be secured from a roller-bearing wheel in general service, and when an occasional wreck occurs the only loss will be a broken wheel casting. Nowadays, with heavy rail and well-kept track, serious wrecks are far more infrequent than in former years when it was considered good policy to use nothing heavier than 20-lb. mine rail.

#### ROLLER BEARINGS ARE FAVORITES

In spite of the fact that in past years there have been some mighty inefficient types of roller-bearing mine cars put on the market and that even now some roller-bearing trucks are much better than others, nevertheless, in those fields where roller bearings have been tried the demand for them is heavy. I have questioned several mine-car manufacturers with whom I do business as to the percentage of roller-bearing trucks they sell as compared with their total output, and I find that the reputable manufacturers who ship into West Virginia make from 50 to 95 per cent roller-bearing equipment. One prominent manufacturer tells me that he has averaged 90 per cent of this type of equipment throughout a period of several years.

In my section of the state a majority of the companies—a large majority—that produce a million tons or more per annum each are users of roller-bearing mine cars and are gradually getting rid of their plain-bearing wheels and trucks. I noticed some months ago that a certain concern was experimenting on a roller-bearing crankshaft for automobiles and I understand that a large railroad in the East is trying out both ball and roller bearings on railroad cars. Both these firms are working with the hope of perfecting the particular type of bearing suitable to each individual application.

There has always been an effort made to get away from bearing friction and daily we see new applications of anti-friction bearings being used in mine machinery of every sort. A representative of a large company building mining machines tells me that his firm will soon have an undercutter on the market equipped

throughout with roller bearings. The plain bearing is still in use because there are certain applications for which there has not as yet been developed any type of anti-friction bearing that can supplant the plain bearing.

It is, however, merely a matter of time until practically all types and kinds of machinery will be equipped with some form of anti-friction bearing, and the one that is nearest to being fool-proof and most durable, though it may cost most in the beginning, is going to become the accepted type for the purpose in question.

Now we will consider the mine car itself. I was much amused at a miner some months ago. He was loading coal over the side of a car 41 in. high which would hold with a little "cribbing" approximately 3 tons. He said he was going over to another operation, as he could load "two of that man's cars to one of these, and a lot easier." On investigation I found that "that man's cars" were only 26 in. high and that because of their width and length the miner would put approximately 4 tons of coal into each.

#### BIG, LOW CARS ARE MOST ADVANTAGEOUS

It seems to me that this is the answer when the question of the height of a car is under consideration. Make it as low as possible but keep the container so large that with a little coal piled up on top the same load will be had as with the high car level full. Of course there are mines that are unable to "crib" or pile coal higher than the side boards because of conditions peculiar to themselves, but the lower the car the easier it is to load.

I notice in this field that there is a decided tendency to keep the car below 32 in. in over-all height, and several of my friends who have high cars are seriously considering a change to a lower type on account of the "man item" involved in loading the high cars. The two accompanying illustrations show a car recently built by one of the largest companies in West Virginia. It is unusually low, yet at the same time it has a large capacity. It is all steel, 30 in. in over-all height and has a water-level capacity of about 90 cu.ft. and can be "cribbed" to hold about 4 tons without losing coal in transit. This car, by the way, is equipped with the flexible type of roller bearing, and it is my understanding that all of the many hundreds of cars owned by this company have roller bearings of some variety.

The efficiency of mine cars is a problem that is receiving constantly increasing consideration from the operator. This is as it should be, since the mine car is about the most important piece of equipment on the job. The finest kind of a tippie, power house and general plant may be provided, but if a poorly-designed car is in use, coal will not go over the tippie as cheaply as it should.

#### AN EFFICIENT CAR IS NECESSARY

It is "up to" the operator to secure a car that will do the work for which it is intended. The fact that an additional brace here or an inch more (board measure) there, and a good truck equipped with modern roller bearings, all add to the first cost of the car should not be the cause of the operator forgetting that he should get what he pays for, namely, a good car, economical to operate and keep going, and one that will bring back to him in actual dollars and cents its additional first cost by giving "value received."

# Federal Trade Commission Publishes Coal Production Costs for January, 1920

Commission Believes That Garfield's Wage Increase of 14 Per Cent Raises Production Costs 23c., or 11 Per Cent—Shortened Time Also Had Some Effect on Increased Costs, Especially at the Mines with a Slow Run

**B**EGINNING with the month of January, 1920, the Federal Trade Commission resumed the collection of monthly cost reports from the bituminous coal operators. The information obtained is similar to that secured for the Fuel Administration during the war period—August, 1917-December, 1918.

in the various coal-cost reports of the commission, of which reports No. 1 (Pennsylvania-bituminous), No. 2 (Pennsylvania-anthracite) and No. 3 (Illinois-bituminous) has already been issued, and reports No. 4 (Alabama-, Tennessee-, and Kentucky-bituminous), No. 5 (Ohio-, Indiana-, and Michigan-bituminous),

During 1919 the commission did not collect such information.

The January, 1920, statistics herewith presented are preliminary figures only, covering returns from 1,589 operators. They show "claimed costs" only, i.e., figures compiled directly from the returns actually appearing on the operators' reports. The commissioner has not subjected these figures to any critical analysis or revision. This has been left undone to hasten matters so as to present to the public immediately the best available information. The "revised costs" for January, 1920, will appear in a subsequent report. Experience with the 1918 figures indicates that the revision will in most cases reduce "claimed costs" only a few cents per ton.

For the purpose of general comparison, statistics for 1918 are shown. These figures appear in detail

No. 6 (Maryland-, West Virginia-, and Virginia-bituminous) are in press, and No. 7 (Trans-Mississippi States-bituminous) in preparation.

The information obtained by the commission shows minor subdivisions of costs, but the summaries published in this bulletin are (1) the cost of labor, (2) the cost of supplies, and (3) the general expense or overhead involved in mining coal, bringing it to the surface, preparing it for market, and placing it in railroad cars for shipment. The total of these three costs is (4) the f.o.b. mine cost shown by the commission. All costs and sales realizations shown in this bulletin are based on tons of 2,000 lb.

The costs shown are not intended to include selling expense; interest on the investment, including borrowed capital; allowances for income and excess profits taxes, and profit on investment. The difference be-

tween the sales realization and the f.o.b. mine cost per ton is the "margin." This "margin" must not be confused with what is called profit. Selling expense, interest, income and excess profits taxes, as well as other items, must be deducted from it before the net profit from the mining operations available for dividends or surplus can be determined.

In the following table are shown for the principal production regions the claimed costs, sales realiza-

tions and margins of the 1,589 operators from whom complete reports for January, 1920, have thus far been received. With these costs are also shown the costs (as revised by the commission), sales realizations and margins of the 2,483 operators from whom reports were received for the entire twelve months of 1918. The 1,589 operators had a production of 25,365,384 tons of commercial coal during January, 1920, and the 2,483 operators mined 496,960,342 tons of

<sup>1</sup> Decrease.

commercial coal during 1918 (an average of 41,413,362 tons monthly).

In table I only 1,589 operators appear for January, 1920, while 2,483 operators are shown for 1918. Also, revised costs shown for 1918 average about 8c. per ton lower than the claimed costs were for that year, and, consequently, the revised margins for 1918

region in 1918 have been added to the 1918 revised costs of the operators shown in this table. These 1,272 operators mined 252,202,547 tons during 1918 (averaging 21,016,879 tons monthly) and 20,631,227 tons during January, 1920.

As far as can be judged, therefore, from the returns at present available, the increased cost attributable to the increased wage scale is about 23c. per ton, or 11 per cent (the increased cost shown in table VI for the group where production changed least—5 per cent or less—and where the effect of the wage agreement is consequently best seen). For the total 1,272 operators the average decrease in tonnage was 2 per cent and their average increase in cost 23c. per ton, or 11 per cent. This increase of about 23c. per ton, or 11 per cent, was the result in January, 1920, of the Garfield 14-per cent wage increase, which it should be noted is about one half of the total increase (27 per cent) recently recommended by the United States Bituminous Coal Commission.

The great diversity in mining conditions between the different districts, both in regard to thicknesses of seam mined and the relative use of machinery in mining the coal, caused the wage increase to affect to a different degree the labor costs of the various districts. In the Federal Trade Commission's coal cost reports for 1918 much detailed information on these diverse conditions is available.

TABLE VI. DISTRIBUTION OF TOTAL F.O.B. MINE COST INCREASES ACCORDING TO CHANGES IN PRODUCTION TONNAGE OF 1,272 OPERATORS, JANUARY, 1920, FROM AVERAGE MONTHLY PRODUCTION, 1918

Change of January, 1920, Production from 1918 Average Monthly Production	No. of Operators	Production January, 1920, Tons	Increase of Jan., 1920, Claimed Cost Over 1918 Annual Claimed F.O.B. Mine Cost, Per Cent

are that much higher. In order to get comparable operators for the two periods there are presented in table II the figures of 1,272 identical operators, and to arrive at comparisons of increased costs the average amounts of revision found for all operators in each

## Public Utility Consumption of Coal

THE Geological Survey has just issued statistics on the production of electric power at public utility stations that show some interesting relations between water power and steam power. About 63.4 per cent of its total power produced came from the use of fuel—

AVERAGE DAILY PRODUCTION OF ELECTRICITY BY PUBLIC UTILITY PLANTS

coal, gas and oil, equivalent—it is estimated to 38,347,000 tons of coal. Water power represented 36.6 per cent, equivalent in the developed power to 22,140,000 tons of coal.

The interesting feature of these figures is brought out in the accompanying diagram which shows that the seasonal demand for power from public utilities fall

AVERAGE DAILY PRODUCTION OF ELECTRICITY BY PUBLIC UTILITY PLANTS IN UNITED STATES—WATER POWER AND FUEL POWER, 1909

## George Otis Smith Approves of Seasonal Coal Rates

GEORGE OTIS SMITH, director of the Geological Survey, commenting on proposed seasonal coal rates, said: "I often have put it before engineers that what is proposed in the way of seasonal coal rates is the most promising method of improving the load factor of the soft-coal industry, and incidentally, of helping in our great transportation problem of moving too much freight with too little equipment. I recently have figured the increased burden put upon our railroads by the whole mineral industry as 3,000,000 carloads a year, comparing the years 1913 and 1918."

The National Coal Association is leaving to the local associations such presentations as they may care to make in regard to the seasonal coal rates. Since such rates will affect each district differently, it was thought not to be a matter in which the national association could take a position.

# Engineers and Railroad Presidents Study Stabilization of Coal Industry

Committee Is Appointed to Present to the Senate a Substitute for the Frelinghuysen Seasonal Freight Rate Bill — Storage of Bituminous Considered To Be Practicable

A PRELIMINARY conference at which the stabilization of the bituminous industry was the chief topic of discussion was held at the headquarters of the American Institute of Mining and Metallurgical Engineers, New York City, on April 6. It was attended by a committee of railroad presidents representing the American Railway Association and the Coal and Coke Committee of the institute. Herbert Hoover, president of the institute, presided.

One definite result of the conference was the appointment of a committee to appear before the committee of the Senate having in charge the Frelinghuysen bill on seasonal freight rates and to present a substitute bill.

While the meeting was in favor of seasonal freight rates, it did not believe that the bill now under consideration covers the subject in a complete enough manner. This committee, appointed by President Hoover, consists of S. A. Taylor, Eugene McAuliffe and E. W. Parker.

The storage of coal during the summer months for use in the following winter, the stabilization of labor, the better control of mining by greater employment of engineers, with suggestions as to how the numbers of engineers available for this work might be increased, and coal economy were other matters discussed.

Samuel Rea, president of the Pennsylvania system, was the chairman of the committee representing the American Railway Association. The other members of the committee were F. D. Underwood, president of the Erie R.R. Co.; A. T. Dice, president of the Philadelphia & Reading R.R.; E. J. Pearson, president of the New York, New Haven & Hartford R.R., and C. H. Markham, president of the Illinois R.R., who was represented by J. F. Porterfield of that company.

## RAILROADS DISCUSS SUMMER STORAGE

The summer storage of coal by the railroads was discussed fully by the conference from the viewpoint of both the railroads and the operators. The discussion was extremely helpful in giving a better understanding of the difficulties to be overcome and the part the railroads can play in the solution of the problem of stabilization.

The Committee on Storage of Coal reported that storage of bituminous coal is practicable beyond doubt. It has been successfully carried on for years on a large scale at the docks on the Great Lakes, in New England, at many industrial and public utility plants throughout the country, at the Panama Canal, and at many of the

Government bases of supply. For the domestic trade, the committee said, the best storage is in the bin or cellar of the consumer, and consumers should be encouraged by every means possible to purchase their winter's supply early in the preceding season.

So far as the domestic consumer is concerned, the cost of doing this would be practically nothing, and if a reduction in price or in freight rates were made practically all the reduction would represent a gain to the consumer. The committee told the conference that the chief points in favor of the storage of coal were fully set forth in the paper on the subject read by Prof. H. H. Stoek at the February meeting of the insti-

Engineers get behind movement to stabilize bituminous-coal industry and offer constructive suggestions to improve labor and transportation conditions. Railroad presidents lend counsel and offer to assist, but it is apparent that there is a limit to what suggestions can do. Read this and figure out where and how you can help the cause along.

tute and in the majority report of the United States Coal Commission, which awarded a 27-per cent increase in wages to the bituminous mine workers.

Including all charges excepting degradation, the cost of storage in well designed plants should not exceed from 30c. to 50c. a ton, and where used for steam or coking purposes, the degradation would be of no consequence, as the heat value of the coal, or its value for coking, would not be appreciably affected.

Seasonal prices and a proper adjustment of freight rates to encourage delivery and buying during the spring and summer months will be large factors in the storage of coal, and the committee believes that prompt action that will result in bringing these matters to the attention of the public will be of great help. It believes that publicity and an educational campaign should be started through the Council of National Defense, the various coal associations and by every other agency possible. This publicity campaign should emphasize the importance of stabilizing the industry, helping the railroad situation, bettering the working conditions of the miner and the benefit to be derived by the consumer.

With regard to the suggestion of Governor Harding of the Federal Reserve Board that loans might be made against coal in storage under certain warehousing restrictions, it was thought that while these restrictions were perhaps suitable for other commodities as they stand, they might be prohibitive for the storage of coal. It was believed that if the situation were properly presented to the Federal Reserve Board modifications might be obtained which would make the rulings more favorable to application to the storage of coal. If this is done it should remove the one great objection to the storage of coal, viz., the amount of capital tied up.

To obtain the engineering talent needed in the bituminous industry it was the belief of the conference that

the operators must make the first move by establishing scholarships in technical schools having mining courses. If the operators can be induced to establish such scholarships they should be awarded to the sons of mine employees who have the necessary preliminary education and who show talent and predilection for the profession.

More and better engineers are needed in the bituminous industry, and to secure this additional help now it was suggested that there be a consolidation of the engineering work of regions, districts or groups of operators on the lines already adopted in safety work, thus making available the talent obtainable and increasing the efficiency and reducing the cost of engineering work.

An extended publicity campaign of the facts already available concerning the economical use of fuel for heat, light and power was advocated by the Committee on Conservation in the Use of Coal. Some of the important points brought out by the Committee on Economy in Coal Consumption Through Electrification of Industries and Railroads were:

Electricity is the most efficient agency for power distribution. Power in the form of coal is maximum in bulk and minimum in efficiency. Power in the form of electricity is minimum in bulk and maximum in efficiency.

Within the territory of the so-called Boston-Washington zone there is consumed 40 per cent of the total coal produced. The area of this zone is less than 5 per cent of the total area of the United States.

Coal represents 30 per cent of the total freight tonnage transported by the railroads. In congested districts this rises to 40 per cent.

The yearly load factor in the above zone today is not greater than 15 per cent, and the coal consumption is in excess of four pounds per kilowatt-hour. The machine capacity is seventeen million horsepower; ten millions at industrial plants and seven millions on railroads.

The present coal consumption can be reduced one-half and machine capacity conserved to the extent of three-fold in this zone through the adoption of a super-power system or systems, which, briefly described, consist of large high economic steam electric stations erected at tidewater and at the mouth of mines, both supplemented by hydro-electric stations constructed on the rivers, all interconnected with a high voltage system of transmission and distribution. The amount of money required to construct such super-power systems will be very much less than that required for the expansion of the present relatively small systems. The committee proposes that coal be transported by preferred routes from the mines to tide and thence to the power stations by ocean tugs and barges, thus relieving the railroads of this burden.

In conclusion the committee says that the country's prosperity depends upon its ability to speed up production, and in order that it may do so, the essential associates of production—power and transportation—must be provided. The method outlined, the committee says, while furnishing adequate power will automatically serve to greatly facilitate transportation.

During the conference President Hoover appointed the following committees:

Committee on Conservation in the Use of Coal—L. P. Breckenridge, David Moffat Myers, R. M. Atwater.

Committee for Stabilization of Labor—S. A. Taylor, E. W. Parker, Rembrandt Peale.

Committee on Storage—H. H. Stoek, George S. Rice, Howard N. Eavenson, H. N. Shenton.

Committee for Co-operation with the Railroads—J. D. A. Morrow, Eugene McAuliffe, J. G. Puterbaugh, C. E. Leshner, Edwin Ludlow.

Committee on Economy in Coal Consumption Through Electrification of Industries—W. S. Murray, W. S. Barstow, George Otis Smith, E. R. Welles.

Committee for Better Control of Coal Mining Through Greater Employment of Engineers—R. V. Norris, James H. Allport, Erskine Ramsay, Van H. Manning, L. E. Young.

## Harlan and Hazard Operators Seek Better Car Service

Bring Action Before Interstate Commerce Commission Requesting That Body to Compel Railroads to Restore Cars to Louisville & Nashville

**F**INDING that the Louisville & Nashville Railroad Co. has been deprived of its open-top cars by the railroads with which that company's lines are connected, the Harlan County Coal Operators' Association, the Hazard Coal Operators' Exchange, the Southern Appalachian Coal Operators' Association and the West Kentucky Coal Bureau have made complaint to the Interstate Commerce Commission, in which the Louisville & Nashville Railroad Co., et al., are defendants.

The complainants state that the mines served by the Louisville & Nashville R.R. in the States of Kentucky, Alabama, Tennessee, Illinois and Virginia produce annually 23,000,000 tons of bituminous coal, of which about 17,000,000 tons are mined and shipped from mines located in the States of Kentucky and Tennessee. Of the total annual production of 23,000,000 tons of coal, between 3,000,000 and 4,000,000 tons are taken by the Louisville & Nashville Railroad Co. for its own fuel requirements, and of the commercial coal which constitutes the remainder fully 65 per cent is marketed at points on or reached by railroads connecting with the Louisville & Nashville Railroad Co. These connecting carriers have not been for many years returning Louisville & Nashville coal cars promptly, and the outcome has been that mines along that railroad have been supplied with an inadequate number of cars for the loading of coal.

Since the strike of the bituminous coal miners, which ended on Dec. 13, 1919, the coal-car supply, according to the complainants, has become worse. The Louisville & Nashville Railroad Co. furnished its mines during the month of March, this year, only 46.85 per cent of the empty coal cars ordered, which is approximately 10 per cent less than during February of this year, which was the month of the greatest shortage of coal cars on the Louisville & Nashville R.R. lines up to March 1, 1920.

The complainants declare that the Commission on Car Service appointed by the American Railway Association issued an order to the connecting lines to deliver to the Louisville & Nashville Railroad Co. each day 245 more empty coal cars than they received loaded coal cars from the Louisville & Nashville Railroad Co., specifying where the empty coal cars should be delivered by each line. During the period March 20-28 of this year, inclusive, there became due under said order to the Louisville & Nashville Railroad Co. 4,619 coal cars at the various junctions specified by the

Commission on Car Service, with the natural outcome that since that time the supply of coal cars has been much worse than before, which demonstrates that the orders of the Commission on Car Service, which body has no mandatory powers, have not received serious consideration, and certainly have not been observed by lines connecting with the Louisville & Nashville Railroad Co. with whom the orders were filed.

Past experience has demonstrated that unless the Louisville & Nashville R.R. has in its possession the equivalent of 83 per cent of its ownership of coal cars mines cannot be furnished with even a reasonably fair supply of cars.

The complainants address the prayer to the Interstate Commerce Commission, asking that the commission recognize the present shortage of equipment and the emergency existing at mines served by the Louisville & Nashville Railroad Co. and that peremptory orders be issued requiring defendant carriers to return promptly to the Louisville & Nashville Railroad Co. the open-top cars belonging to that company now in their possession. They request that the commission make effective the order of the Commission on Car Service just referred to, and take such other action as in the opinion of the commission would best meet the emergency and serve the public interest.

## Strike Curtailed Washington State Production

State Mine Inspector Gives Statistics for 1919, Showing a General Decrease in Coal and Coke Output

THE strike of coal miners last year curtailed production in the State of Washington approximately 25 per cent, according to the annual report of James Bagley, state inspector of coal mines, which has just been forwarded to Governor Louis F. Hart. Coal production for the year 1919 was 3,059,580 short tons, as compared with 4,128,424 tons in 1918, a reduction of 1,068,844 tons.

"British Columbia coal has always been a factor in the Washington market, and during the last two years shipments of coal to this state from Utah and Wyoming have increased materially," says Mr. Bagley. "It looks as if the commercial mines of the state will work only half time during the summer months, making the present year one of the most unsatisfactory the coal industry has had in recent years.

"While fuel oil, which replaces coal as fuel on many of the railroads and steamers of the Pacific Coast, has advanced in price materially during recent years, the selling price of coal also has advanced, due to the high cost of production.

"The substantial advance in wages paid to miners in the last few years and the high cost of material have prevented coal from replacing fuel oil to a great extent. Electricity is replacing many thousand tons of coal in the State of Washington. The Chicago, Milwaukee & St. Paul R.R. is now using it exclusively on the division from Seattle to Othello, Wash."

The coal-producing counties of the state, with the exception of Whatcom county, showed a decrease. In Whatcom county an increase is shown due to the operation of the Bellingham mine, which was under development most of the year.

The national coal strike closed down the mines of the state from Nov. 1 to Dec. 15, 1919, and the mines of Kittitas county did not resume operations until December 23.

Mr. Bagley's report also shows nineteen fatal accidents in Washington coal mines last year, fourteen of which occurred inside of the mines and five outside. The amount of coal mined per fatal accident was 161,030 tons, and 3.79 persons were killed per 1,000 men employed in the industry. "The state has gone about as far as is possible in passing laws to safeguard the mine workers," says Mr. Bagley. "Education of the mine worker and mine official to 'think safety' and avoid danger is the only way accidents can be reduced."

The state reached its maximum coal production in the month of October, when the mines were rushed with orders on account of the impending strike. In that month 4,760 employes working 26.3 days produced 373,198 tons of coal. During part of the year, especially from February to July, many of the miners were idle part of the time due to lack of demand for coal. The average value per ton at the mine was \$3.59 in 1919, compared with \$3.53 in 1918. Total value at mine was \$10,997,733.

The coke output for the state also shows a large decrease during the last year, the report shows. The output of coke for 1919 was 65,332 tons, as compared with 144,349 tons for the previous year, a decrease of about 55 per cent. Of the total output 35,888 tons was manufactured at the coke ovens at the mines located at Carbonado, Fairfax and Wilkeson. The remainder was manufactured at the plants of the Seattle Lighting Company at Seattle and the oven operated by M. S. Allison Co. at Croker, near Carbonado. The total value of coke at the ovens was \$565,356 and the average value at the ovens, \$8.65.

"The reason for the decrease in the coke output is that less coke is being used at the Tacoma smelter than formerly and there is less demand for Washington coke from smelters located in British Columbia," says the report. "The exports of coke to British Columbia show a gradual decrease during the last few years.

"During 1916 the exports of coke to British Columbia through customs district No. 30 were 47,560 tons. The exports for 1919 were 1,431 tons. British Columbia is now manufacturing practically all its own coke, which accounts for the decrease in demand for Washington coke. With the large decrease in output during the last year the future of the coal mining industry of the state is problematical."

## Commission to Adjust Wages and Working Conditions in Washington State

FOUR members of the coal commission, who, with a fifth member to be selected by themselves, will review the coal mining situation in the State of Washington, with a view to covering working conditions and wages and act as an arbitration board, recently met in the offices of the Washington Coal Operators' Association, 608 Lyon Building, Seattle.

The commissioners are N. D. Moore, acting representative of the mine operators; D. F. Buckingham, general manager of the Roslyn Fuel Company, representing the mine owners, and Robert S. Harlin, president, and Ernest Newsham, secretary of District No. 10,

United Mine Workers of America, representing Washington miners. The four will select a fifth member, who must be a mining engineer of experience.

The commission was provided for in a government plan developed after last winter's strike. The wage findings did not affect Washington and provision therefore was made for the commission. The commissioners did not expect to do more than hold a preliminary discussion of the problems confronting them.

## To Investigate Alaska Coal For Navy's Use

Engineers Deny Reports That Cost of Mining and Transporting Fuel for Pacific Fleet Would Be Greater Than from West Virginia

IT IS the intention of the Navy Department to make a thorough investigation of coal in Alaska suitable for navy use. The work is to be begun immediately after July 1, when the appropriation of \$1,000,000 for that purpose becomes available. Plans have not been completed but are being discussed by representatives of the navy, the Bureau of Mines and the Geological Survey. The Secretary of the Navy has announced his intention to send a geologist, an engineer and a naval officer to Alaska, and it is probable that they will undertake extensive prospecting with the idea of determining something of the extent of coal in the Matanuska field suitable for the navy.

Secretary Daniels admits that some reports have reached him to the effect that the cost of mining and transporting coal from Matanuska for the Pacific fleet will be greater than the cost of West Virginia coal brought through the Panama Canal to Pacific stations. He points out, however, that the reports made to him by the engineers who have actually investigated the coal are quite different. The Secretary called particular attention to the conclusions of a commission headed by Captain Kittell. In its report to Secretary Daniels the Kittell commission said in part:

From its investigations this commission draws the following conclusions and indicates various lines of procedure that may be undertaken by the department in order to locate, mine, transport to seaboard and ship coal for use of the navy, viz.:

That there is sufficient coal of navy quality underlying the Matanuska region to warrant definite and active development.

That the whole Matanuska region, beginning with the Chickaloon section, should be thoroughly and scientifically investigated by a force of mining engineers and geologists, by means of diamond drilling, shaft sinking, tunnel and slope driving, to ascertain the quantity of navy coal present in the earth strata and to determine the best practical and economical method of mining this coal.

Organize an expedition with mining engineers and geologists, together with all necessary apparatus and helpers, to thoroughly examine leasing units Nos. 8 to 15, inclusive, and definitely determine what quantity of navy coal is present and how it lies relative to the surface. In the meantime these leases should be set aside for the use of the Navy Department. At present leasing units Nos. 10 and 11 are held by the Chickaloon Coal Co. and leasing unit No. 12 by the Alaskan Engineering Commission. It is believed that the Chickaloon Coal Co. will be willing to part with its lease for a consideration.

Having determined the amount of navy coal present in leasing units Nos. 8 to 15, both inclusive, proceed to mine the same, providing necessary equipment, labor and transportation facilities to the railroad.

Under the department's instructions two plans are considered for getting coal from the Matanuska mines, transportation to the seaboard and loading it upon naval vessels. These plans are:

1. Mine coal at Chickaloon mine (leasing unit No. 12), other mines to be opened later, and pending the development of some other port of shipment (a) to temporarily utilize Anchorage during the open season of the year, using present facilities, including the deep-water pier and wharf which are in process of construction, including a temporary coal-loading apparatus which the Alaskan Engineering Commission intends to construct upon the deep-water wharf. This calls for relatively slight expenditure by the navy and can be put into operation without any loss of time; (b) utilize Anchorage as a permanent shipping port during the open season, and erect there such navy terminal facilities as may be necessary for the shipment of coal.

2. Mine coal as in plan 1 and transport it over the railroad to Seward. Utilize Seward (a) as a permanent port of shipment for navy coal throughout the year, or (b) so utilize it only during the season when Anchorage is closed. Construct at Seward (1) the necessary coaling plant on the Naval Reservation and connect the same with the railroad, or (2) construct the necessary coaling plant on the eastern water front of the Seward town site.

The present naval commission has also incorporated a third plan: Mine coal as in plan 1 and transport it over the railroad to mile 64; build a railroad from mile 64 of the present road over a distance of 11.4 miles to Portage Bay, on Prince William Sound, Alaska, and there construct wharves and a coal-handling plant. Coal could then be delivered by railroad direct from the mines to Portage Bay quickly, cheaply and over negligible grades for the all-year-around shipment of navy coal.

There is no doubt in the minds of Secretary Daniels and of the engineers and geologists of the Interior Department who are familiar with the coal already prospected in the Matanuska field that it will meet the navy's requirements. In fact, an actual test was made some years ago on the Battleship Maryland, and the results were entirely satisfactory.

## Government Salaries Too Low to Attract Engineering Graduates

ON ACCOUNT of serious difficulty in filling vacancies in its engineering staff the U. S. Geological Survey recently sent out a letter to twenty-one engineering schools calling attention to a civil service examination which may be taken by senior students who expect to be graduated this year. The salary of these positions is \$1,200 per year.

The presidents of most of the schools stated that they would post the notices and call the students' attention to the matter, but expressed grave doubts about their being interested in such positions. One reply contains this statement: "In view of the number of more attractive openings which are abundant at this time, I do not anticipate that many of the young men will seek positions with the Government where the opportunities for rapid promotions are less than in a number of industrial lines at the present."

Another states that "it will not arouse much interest on account of low entrance salaries," and still another calls attention to the fact that men with such qualifications find "no difficulty in getting \$1,800 per year."

Yale University calls attention also to a recent civil service examination announcement for the position of highway engineer at \$1,800 to \$2,400, the specifications for which call for "at least five years' responsible experience." The letter further states that "we do not know of a man who has been out of college long enough to meet these qualifications who would accept such a salary." A man with such training and experience, they assert, "probably would be rewarded in business by a salary of not less \$4,000."

It is evident that any candidates certified as a result of these examination announcements will not be up to standard.

# NEWS FROM

# THE CAPITOL

BY PAUL WOOTON

## Hines Resigns Office of Rail Director

**W**ALKER D. HINES has resigned the office of Director General of Railroads and President Wilson has accepted his resignation, effective May 15. The work of settling the affairs of the Railroad Administration will be assumed by Mr. Hines' successor.

Max Thelen, now in charge of the claims department, probably will be named. Mr. Hines is said to favor his appointment and news from the White House is to the effect that the retiring director will name his successor.

Mr. Hines is reported as having contemplated returning to the practice of law in New York with the return of the railroads to private control. It is likely, however, that he will take a vacation abroad immediately upon retirement from office.

In accepting the Director General's resignation President Wilson wrote Mr. Hines that he had "personally valued and admired the quite unusual services you have rendered the Government and the country."

Mr. Hines has served with the Railroad Administration since its creation in December, 1917, when the Government assumed control of the railroads of the country. He was appointed then as Assistant Director General, and when Secretary McAdoo retired to private life on Jan. 11, 1919, Mr. Hines was made Director General.

## Secretary Daniels Seeks Competitive Bids In Supplying Navy Coal

**I**N AN effort to get away from obtaining coal under Navy orders, Secretary Daniels has issued a statement in connection with a notice that bids will be reopened May 18 for the Navy's coal requirements, in the hope that the practice of awarding contracts after competitive bidding may be resumed. In his statement Secretary Daniels says:

"Because of the failure to receive satisfactory bids for naval coal requirements, and in keeping with advices received that a reopening of bids would result in more satisfactory tenders, proposals are again issued under an opening set for May 18, 1920, at 10 A. M.

"This decision is also prompted through the desire to return to the practice of awarding contracts after competitive bidding, thereby making it feasible to discontinue obtaining deliveries under navy orders; although the latter must, of course, be continued in effect until provision of the required needs can be assured.

"In this connection, and for your information, it is considered desirable to advise that of a total of about 2,300,000 tons of bituminous coal and 60,000 tons of anthracite coal on which bids were invited, quotations were offered on only 522,300 tons of bituminous coal and 25,400 tons of anthracite coal. Of this tonnage it

appears that it will be practicable to accept 108,000 tons of bituminous coal and 21,700 tons of anthracite coal; furthermore, only a very few points of those at which deliveries were called for were covered in the bids received, and then for but an inappreciable quantity of the coal needed.

"In the absence of information to the contrary, it is assumed that the form of proposal issued is in general satisfactory, the periods of delivery as specified contemplating either fractions of a year or annual contracts. If however, because of uncertainty of conditions, a modification in the period for which contract is to run is desired, bids for different periods will be considered.

"Attention is again invited to the desire to comply with the recommendations of the Bituminous Coal Commission that storage space be stocked during the summer months."

## Appropriation Needed for Payment for Cars Requisitioned by Fuel Administration

**I**N a letter to Senator Frelinghuysen in regard to Fuel Administration claims the Secretary of Interior says:

"For your information, I beg to advise that some three hundred carloads of coal have been traced and settlement arranged for. Vouchers to the number of one hundred for supplies, stationery, equipment, freight, expressage, telegrams, etc., amounting to \$3,170.99, have been approved and forwarded to the auditor for the State and other departments to give preference and to expedite payment.

"There is another class of claims which are coming for which we have no appropriation—for cars shipped under requisition of the Fuel Administration and remittance made for less than the invoice price because of a lack of hauling or other charges and other matters of this general character. It is suggested that we let these claims accumulate until December and then report them to Congress for an appropriation."

## Government Coal Yard Opens Bids

Bids for coal for the Government departments in Washington for the coal year beginning April 1, 1920, were opened on April 12 by the chief engineer of the Government fuel yards. Requests had been made for proposals either to furnish coal for the coming three months or for the entire coal year, the total estimated need being in excess of 300,000 tons. Only three bids were received, for a portion of the quantities desired in each case.

None of the bids has been accepted, and, because of the limited quantity offered, it is doubtful whether a decision can be reached in the immediate future.

# Senate Commerce Committee Hears Arguments On Seasonal Freight Rates

Despite Opposition Senator Frelinghuysen Refuses to Believe His Plan Unwise—McAuliffe Enumerates Advantages, but Snider, Representing Railroads, and Hurd, for Operators, Vigorously Oppose Proposal

**O**PPPOSITION to legislation providing for seasonal coal rates developed in unexpected volume at the hearings being conducted by Senator Frelinghuysen's sub-committee of the Committee on Interstate Commerce. Despite the wave of opposition it is apparent that Senator Frelinghuysen has not been convinced by the arguments thus far advanced that his proposal is unwise. Apparently he is willing to accept the suggestion

G. N. Snider says that there will be no surplus of open-top equipment this year, and maybe not for three years to come. He thinks seasonal freight rates on coal should not be tried just to see what will happen, but only after thorough investigation by the Interstate Commerce Commission has indicated that they would be advisable.

of the committee of the American Institute of Mining and Metallurgical Engineers, which advocated a tonnage basis for additions and deductions from the rate which would be graduated.

In the original Frelinghuysen bill the addition to the rate was to be 15 per cent above the existing rate beginning with Sept. 1. The fact that a 15-per cent deduction from the existing rate is provided during the period from April 1 to Sept. 1 would mean a difference of 30 per cent in the charge made for transporting coal as between Aug. 31 and the day following.

Various abuses and evils which would arise from such an abrupt change were pointed out at the hearing by Eugene McAuliffe, who testified as the representative of the American Institute of Mining and Metallurgical Engineers. The fact that he had been in charge of the coal conservation division of the Railroad Administration enabled Mr. McAuliffe to bring out many points of his own experience in support of his argument for seasonal rates.

Seasonal rates, Mr. McAuliffe pointed out, were to be regarded as the natural complement of seasonal coal prices. The strike of Nov. 1 had its chief cause, in Mr. McAuliffe's opinion, in enforced idleness during the spring and summer of 1919. He pointed to the absolute necessity of providing for continuous operation of coal mines, not only in the interest of the mine workers but in the interest of lowering production costs and in providing continuous employment for railroad equipment designed to handle coal. In the normal year uniform production throughout the twelve months automatically would provide one hundred thousand coal cars.

Mr. McAuliffe declared that the coal industry has been kept on the brink of a cataclysm through lack of stabilization and from the tendency of the American coal consumer to buy on a hand-to-mouth basis. With one-half the coal reserve of the world the United States, in the

opinion of Mr. McAuliffe, should put the industry on a high national plane. He pointed out that the United States must furnish more coal for other countries. The need for an orderly production of coal for domestic and export consumption is increasing more rapidly than had been expected, because of the prospect that little fuel oil will be available in the future for steam-making purposes.

Mr. McAuliffe pointed out that the rates in no way would embarrass the railroads and should be of great help to them in reducing by many millions of dollars the investment in equipment necessary to handle the year's coal in five months. The plan of having graded fluctuations, measured in cents per ton, would mean the same revenue to the railroads, but, he pointed out, it would be entirely possible to exempt certain coal from the operation of the seasonal rates.

He suggested that coal for lake shipment and a portion of the tidewater tonnage could well be exempted. He also expressed surprise that there was opposition on the part of the operators, many of whom have changed from warm advocates of the seasonal rates to vigorous opponents of the plan. He expressed the opinion that this change must have been promoted by some belief that local or individual losses would result. It is his opinion, however, that the Interstate Commerce Commission can be relied upon to adjust any local irregularities.

At that point in Mr. McAuliffe's testimony Senator Frelinghuysen asked if the change of heart on the part of the operators could have been caused by the desire to obtain scarcity prices. Mr. McAuliffe replied that it unfortunately is true that a minority in the coal trade look upon coal as something with which to speculate and probably prefer present conditions to those which would make for a stable profit.

One of Mr. McAuliffe's important points was the economic wrong in transporting the bulk of the nation's coal when the actual cost of transportation is 35 per cent higher than in the summer months. He classed the coal industry as next in importance to agriculture. We have reached a point in our national development, he asserted, which justifies the public in demanding an improvement in the coal situation. He urged that this demand be met by voluntary effort.

Unless something is done to better conditions he predicted nationalization of the coal mines within a few years. Since he feels sure that nationalization would not bring the relief which the public expects, he urged that selfish considerations be disregarded rather than that the industry drift into that whirlpool.

The hearing revealed that Commissioner Clark of the Interstate Commerce Commission is of the opinion that the railroads now have sufficient cars to handle the country's coal requirements comfortably if the distribution can be spread over the twelve months.

G. N. Snider, who was later described as one of the best witnesses who ever appeared on Capitol Hill, pre-

sented the views of the railroads in the territory east of the Indiana line and north of the Carolinas. His argument was that there is no necessity for legislation, at this time at least, because there is certain to be no surplus of open-top equipment this summer and possibly will not be for three years to come. The railroads, he said, have no objection to the Interstate Commerce Commission requiring seasonal rates if they should seem advisable after a thorough study has been made of their effects, but there is objection to putting these rates into effect with the idea of seeing what will happen.

This year, in order to get the production the country needs, Mr. Snider pointed out, everything must be done to increase the handling of coal cars. Obviously it is unnecessary to make a reduction of the rates on coal moving to lake ports and to tidewater. If reductions were made to all rail destinations from the fields serving the lakes and tidewater the effect, in Mr. Snider's opinion, would be to take cars from an efficient lake and tidewater trade to put in the all-rail trade.

Vigorous opposition to the seasonal rate proposal came from the owners of the docks at the head of the lakes. It was pointed out that the low summer rate would enable a much larger quantity of Illinois coal to move into the territory which they are serving. At the same time a considerable portion of the distribution from the docks would have to be made when the high rates were in effect. This combined with the suggestion that the coal movement to Lake Erie ports be exempted from the low summer rate would constitute unjust discrimination against the owners of the docks.

D. F. Hurd, the secretary of the Pittsburgh Vein Operators' Association of Ohio, appeared in opposition to the bill. His testimony brought out that the members of his association believe that seasonal rates would:

(1) Precipitate chaos in the coal rate structure and, viewed under the present "Act to Regulate Commerce," result in discriminatory and unfair rates.

(2) It could not be made effective without a serious disturbance in differentials, which differentials have been arrived at after many investigations by the Interstate Commerce Commission and which differentials must be maintained to provide equity between coal-producing groups and fair and reasonable rates to consumers.

(3) Create more long-haul traffic and in consequence decrease car efficiency.

(4) Decrease the earnings of some railroads and enhance the earnings of others, neither of which could be foreseen, and therefore would be uncertain as to future effect.

(5) During low-rate period decrease car supply at the mines by reason of the temptation to supply cars preferentially for the more attractive 100-per cent rate traffic for which open-top cars may be utilized. During high-rate period increase car supply at mines because of the premium rate on coal traffic.

(6) Discourage purchase and delivery of coal in the period immediately preceding the reduction, the difference in a 15-per cent reduction being 30 per cent in the rate as between March 31 and April 1, when the rate increase period becomes effective.

(7) Create excessive demand for delivery toward the end of the low-rate period, viz., the month of September far beyond ability of the carrier to provide cars.

(8) Create heavy demand for delivery of railroad fuel during low-rate period, especially for railroads obliged

to obtain their coal from mines located on other roads, in order to prevent penalty in freight charges during high-rate period.

(9) Cause excessive delivery on contracts during low-rate period beyond ability of producer to supply, or if able to supply, deprive other than contract buyers of delivery during low-rate period.

(10) Create conditions where lake shippers, obligated for heavy tonnage during season of navigation, would be unable to provide industries within their usual marketing field with coal for storage during low-rate period, or if dividing the tonnage, fail to supply Northwestern markets during season of navigation, the deficiency to be made up via all-rail movement during the higher-rate period with a tremendous loss of car efficiency due to the time occupied in movement of cars from mine to the Northwest during the winter season instead of from mine to the lower lake ports during the season of navigation.

(11) Force many industries during lake season to take coal of a quality unsuitable for their purposes, or wait until the lake season is over and then pay the penalty freight rate.

Other points brought out by Mr. Hurd follow:

Dealers will be unprepared to carry any considerable tonnage beyond the amount usually carried, although upon the dealer depends the supply for buildings, apartment houses, hotels and domestic use, and small industries where no storage is available.

Many industries now stock and store coal up to storage capacity. Others do not have nor can they procure storage space. Without exception these industries consume vastly more coal in winter and accordingly the greater portion of their coal would move in the high-rate period.

Domestic consumers of bituminous coal in markets reached by these producers represent less than 5 per cent of the production and if all could and would store during the low-rate period, the volume of tonnage distributed among all of the railroads would be insignificant.

Seasonal rates as proposed would destroy markets that the producer has created under the protection of the Government through the "Act to Regulate Commerce," which has justified him in an investment to provide facilities for handling and storing lake coal at northern points, insuring to him just and reasonable and non-discriminatory rates, and the final purchaser and con-

**The position of the coal operators in the East who are opposed to seasonal freight rates was presented by D. F. Hurd, secretary of the Pittsburgh Vein Operators' Association of Ohio. Mr. Hurd holds that the scheme is not practical, would result in discriminatory and unfair rates and lower car efficiency.**

sumer of that coal may justly claim these same rights and the benefits resulting to him therefrom.

"The honorable chairman of the Interstate Commerce Commission," said Mr. Hurd, "in a communication to Senator Frelinghuysen has expressed the opinion that under the present 'Act' the commission is not authorized to prescribe seasonal rates. Our views are fully in accord with his."

# The Labor Situation

Edited by  
R. Dawson Hall

## Northern West Virginia Miners Get Big Wage Increase

Difficulties were expected in the making of an agreement between the mine workers and operators located in the northern West Virginia fields, which region forms District No. 17 of the United Mine Workers of America, but on April 17 a contract was concluded, thus closing more than a week's discussion.

When the scale committee assembled at Baltimore it found the mine workers seeking an increase of 40 per cent over the wage paid under the October wage scale. It was, however, the consensus of opinion that the differences would all be adjusted and an agreement worked out, though not on the basis proposed by the miners. In the upshot the mine workers received a new scale virtually 45 per cent higher than before. The miners get a flat increase of 24c. per ton over present rates. The rate was 63.7c. per ton and it is now increased to 87.7c.

The sub-committee of operators and mine workers designated to draft the scale consisted of Brooks Fleming, Jr.; E. M. McCullough, Percy Tetlow, E. Drennen, C. J. Ryan, C. H. Tarleton, J. A. Clarke, Jr., S. D. Brady, George Devers, J. F. Forenash, E. W. Rockerstein, R. M. Williams, C. C. Montgomery and George S. Brackett. The new scale will affect about 27,000 mine workers and 750 mines in northern West Virginia. These men work in twelve and a half counties of the state.

## Anthracite Mine Workers Reduce Their Wage Demands

After many sessions lasting since March 9 and bringing no concessions from either party except an undertaking on the part of the anthracite operators that that they would date the wage increase from April 1, a break took place on the part of the representatives of the anthracite mine workers and so brought the meeting of the subcommittee on the wage scale measurably nearer to an agreement.

Seeing the mine workers had so long stood for a 60 per cent increase for contract miners, a \$2 a day increase for day men, a six-hour day and a five-day week it is surprising and comforting to know that on Saturday, April 21, they modified these demands asking only a 27 per cent increase for contract workers, a \$1 per day increase for day men and agreeing to go on with the eight-hour day.

Thus the anthracite mine workers go back to the rate of increase and the working conditions prescribed by the Bituminous Coal Commission for the workers in soft-coal mines. No change was made in the remaining demands which cover working conditions, payment for dead work and several other details.

The statement given out at the conclusion of the day's session said:

"At the session of the Sub-Committee of Anthracite Operators and Mine Workers held today the mine workers' representatives offered two substitutes for two of the original demands presented:

"As a substitute for demand No. 2, calling for a 60 per cent increase in contract rates and \$2 per day increase to day men, the following was offered: We demand that the present wages of the anthracite mine workers be increased to correspond to the increases granted the bituminous mine workers by the Presidential Coal Commission.

"As a substitute for demand No. 4, calling for a work day of not more than six hours from bank to bank, the following substitute was offered: We demand that the eight-hour day be extended to all classes of inside and outside day labor and monthly men, with time and half time for over-time and double time for Sundays and holidays.

"Upon presentation of the modified demands the operators' representatives requested an adjournment until Monday. The Committee will meet Monday." But Monday saw no change. The wage demands as modified were discussed but without any issue. However, the situation has changed for the better and a settlement cannot be far off.

It would be merely trying the patience of the reader to record all the reports made by the subcommittee during last week's conference other than that of Saturday, for Saturday's session easily dwarfed all those that preceded it both last week and since March 6.

## Hicks Interests Sign Wage Contract

No mining properties along the Kiskiminitas River are more important than those of the Hicks interests. These companies operate nineteen thin-vein properties. They have arrived at an agreement with their men, the scale providing an increase of 24c. per ton and a flat advance to their daymen of \$1 a day.

## Radicals To Be Kept Down in Ohio

In order to keep Industrial Workers of the World out of the union, sub-district 5 of district 6 (Ohio) in its conference which closed on April 17 after a six-day session voted to bar anyone from office who had not been five years a member of the organization. This vote was one of the most interesting and significant developments of the 22d session of the sub-district. The region unfortunately contains a number of "I Won't Works" and has suffered from sporadic strikes started solely to prevent the execution of Thomas Mooney for participation in the outrage on a procession in California.

## Ray Says Unauthorized Strikes Anger Public and Impoverish Miner

THAT frequent strikes over trivial differences such as have been witnessed in the eastern Ohio fields in recent months are alienating public opinion, was the declaration of President William Ray of the fifth sub-district of Ohio toward the close of his annual report in opening the 22nd annual convention of the sub-district. He expressed fear that if such strikes were continued the mine workers' interests would suffer. The text of that portion of the president's report dealing with strikes is as follows:

"Strikes are becoming so common in our sub-district that I fear the final results. Long years have we contended that all labor employees in an industry should be organized under one head as we are. I believe it will get us the best results, but when so organized if one branch of labor can and does strike every time something happens that it doesn't like, thereby causing all the others to lose time, we shall draw perilously near the shores of danger. It has been that way in our union during the past months. I sound the warning. Our frequent strikes are not doing us any good but are keeping from making a daily wage many and many a man who is in need of it. Not only that but it is the thing which is turning public opinion of the great mass of people against the mine worker, and it is the judgment of the public that finally determines all questions in a country such as ours."

## Try to Prevent Strike in Kanawha

ACTION has been taken by the officials of United Mine Workers of District 17 (in the Kanawha field) to see that miners continue at work while a joint commission of operators and miners of the Kanawha, Coal River and Cabin Creek fields investigates and works out a scale for deadwork and tonnage rates and adjusts various inequalities now in existence, the text of the instructions being as follows:

"For your guidance find inclosed copy of agreement which will be in effect until the commission makes its report, which will be at the expiration of sixty days. At that time the book of rules will be re-edited and a convention called to act upon the agreement in full. The duties of the commission are to investigate differentials, inequalities and deadwork, in order to arrive at uniform rates for deadwork and tonnage.

"The above arrangements have been entered into so that the members of our organization may receive the advance handed down by the Bituminous Coal Commission until we can work out an agreement satisfactory to all parties concerned. Therefore, the policy is to keep the mines in operation while this revision is being made. We insist upon co-operation in this work by every local officer and individual member to the end that the commission may if possible be able to complete its work sooner than within sixty days from date.

"The Cabin Creek and Coal River operators will meet your scale committee on Monday, April 19. They ask for this continuance in order that they may be able to consult their associates regarding the demands that are being made by the miners. In the meantime they will be guided by the above arrangements. We earnestly request that the mines be kept in operation pending the action on April 19."

## Governor Allen and Samuel Gompers to Debate on Industrial Relations Court

GOVERNOR HENRY J. ALLEN of Kansas has accepted a challenge for a public debate with Samuel Gompers, president of the American Federation of Labor, on the new Kansas Court of Industrial Relations.

In fathering the new court Governor Allen established the precedent that in a controversy between employers and employees the rights of the public are paramount to those of labor or capital. Employers in such essential industries as the transportation or production of fuel are forbidden to close down their business without the permission of the court, and workmen in such industries are forbidden to strike.

This provision of the law, which was a conspicuous feature of the recent strike of Kansas coal miners, caused it to be attacked by Mr. Gompers. Cooper Union probably will be selected as the scene of the discussion, but the date has not been chosen.

## Butler-and-Mercer District Accepts Wage Increase

NO difficulty was found in the Butler and Mercer County sub-district (No. 5) of Pennsylvania in arriving at a wage settlement. The mine workers received, of course, the full 27-per cent increase over the old contract, the new scale being signed on April 15. The scale, which affects eight thousand to ten thousand men in about sixty mines, is operative, like the other, for two years or until April 1, 1922. No changes were made in the working conditions.

Pick mining rates were increased from 93c. per ton to \$1.17 per ton, cutting by punchers from 22½ to 28½c. per ton, cutting by chain-machines from 14 to 18c., loading after punching machine from 54 to 72c., day work from \$5 to \$6, from \$4.84 to \$5.84 and from \$4.51 to \$5.51, according to the grade of work. All yardage and deadwork was increased 20 per cent over former rates.

## Railroad Conductors and Switchmen Seek Wage Increase

Arguments on wage increases demanded by conductors and switchmen were made before the U. S. Railroad Labor Board April 22 by L. E. Sheppard, president of the Order of Railway Conductors, and S. W. Heberling, president of the Switchmen's Union of North America. The demands of switchmen call for pay increases of approximately 58 per cent with time and a half for overtime, Sundays and holidays. Similar overtime allowances are asked by conductors, together with wages sufficient to enable them to live at the pre-war standard.

## Labor Conditions in Canada Improve

Latest reports from the Canadian Department of Labor in Ottawa show considerable all-round improvement in labor conditions, although there was a slight increase in unemployment. During March there were twenty-two strikes, involving about 3,789 workers and resulting in a time loss of about 43,169 working days.

## Mine Workers Attack Senator Harding's Labor Record

AT THE April 15 session of the twenty-second annual convention of the United Mine Workers of Sub-District 5 of Ohio, Senator Warren G. Harding of Ohio was attacked as a candidate for President in a resolution reported by the resolutions committee and adopted by the convention. The labor record of the Ohio Senator was denounced as "black" and miners were called upon to aid in defeating Senator Harding as a candidate for President.

William E. Green, secretary-treasurer of the international organization of the United Mine Workers, in an address predicted that the struggle over what he termed the "Stone" question would rival that incidental to the enactment of the mine-run law.

## Thurmond Board Hears Complaints

THE first meeting of the joint board of coal operators and mine workers of the New River field, constituted under the recent wage agreement entered into by the operators and mine workers of District 29, U. M. W. of A., was held at Thurmond, W. Va., on Tuesday, April 13. Sessions were continued until Thursday morning, April 15, to hear and pass upon complaints and grievances in the relations between the employers and their employees. The joint board is the means provided under the wage contract for arbitrating differences arising between mine workers and operators.

At this session twelve complaints, none of them of a serious nature, were lodged with the joint board and evidence on them was taken. On the new joint board are: G. H. Caperton, chairman; S. A. Scott, of MacDonald; R. H. Morris, of Ansted, representing the operators; J. R. Gilmore and J. H. Sprouse, president and vice-president, respectively of District 29, and Joe Patton, a member of the executive board, representing the miners.

## Car Supply in Kentucky Considered by Railroad Men and Operators

WITH a view of improving the car service situation in the Kentucky coal fields, W. C. Kendal, chairman of the Car Service Commission of the American Railway Association, presided over a meeting of railroad officials held in the office of John A. Morris, chairman of the local operating committee, in Cincinnati, April 19.

Those present at the meeting were C. E. Phelps, Louisville & Nashville, of Louisville; F. M. Lucore, Southern Pacific, Houston, Texas; W. R. Harris, Big Four; J. G. Brooks, Baltimore & Ohio; W. S. Andrews, Cincinnati; D. E. Stangler, Norfolk & Western; W. L. Booth, Chesapeake & Ohio; J. H. Doggrell, Frisco system; G. W. Breece, Missouri Pacific; E. J. Grace, Missouri, Kansas & Texas; G. W. Eskridge, Monon; George McVeagh, Big Four; R. E. Quirk, former chief examiner of the Interstate Commerce Commission; R. C. Buchanan, inspector of the Interstate Commerce Commission, and A. G. Gutheim, member at large of the car commission.

Those complaining about the car shortage were the Hazard Coal Operators' Association, Harlan County Coal Association, Southern Appalachian Coal Operators' Association and Western Kentucky Coal Operators' Association.

It was said after the meeting that as soon as the labor troubles that have existed among switchmen are at an end the loading capacity, now said to be about 55 per cent, would be increased to 75 per cent by the return of empty cars, many of which are said to be in the southern part of Ohio. Meetings such as this one are becoming regular current events. It is generally admitted that but little immediate improvement can be expected in the car supply in these fields for some time to come.

## Lack of Demand for Coke Affects British Columbia Coal Production

THERE has been a marked falling off in the production of the Crow's Nest Pass coal field of British Columbia, due largely to decreased demand for coke. The ovens at Fernie are idle, those at Michel alone being active in this field. In 1918 coke production of Michel and Fernie was about 18,000 tons a month.

The explanation of the slackness of the coke market as far as the Crow's Nest is concerned lies in the closing down of the Canada Copper Corporation smelters at Greenwood, and the Granby Consolidated Mining & Smelting Co. smelter at Grand Forks. The latter company also is now in a position to produce byproduct coke from Vancouver Island coal at the new Anyox smelter. There may be other reasons behind the condition at Coal Creek and elsewhere in that district, where the men have been working little more than half time, but those given may be accepted as chiefly responsible.

On Vancouver Island the situation is different, although there was a period following the strong demand of the winter during which the trade fell off sufficiently to affect to some extent the operation of the mines. During February the Canadian Collieries, Ltd., kept their men at work at the three Comox mines for seventeen days, at Extension for twenty-two and one-half days, and at South Wellington for twenty-three days. The Canadian Western Fuel Co. operated its properties at Nanaimo, Harewood, Reserve and Wakesiah for twenty-four days in February. This also applies to the collieries of the Granby Consolidated Mining & Smelting Co. at Cassidys, the Pacific Coast Coal Mines, the Nanoose-Wellington Collieries, as well as the Coal-mont Collieries in the Nicola-Princeton Field.

What the forthcoming season is going to bring to coal operators in the bunker business remains to be seen, but it is feared that exchange conditions are likely to have such an effect on the mercantile trade of the Pacific that the collieries of this province will find the market unpleasantly quiet. However, the output figures for the island collieries for the month of March indicate that the market has become brisker and that production has increased. This is particularly evidenced in the output of the Pacific Coast Coal Mines and it also is worthy of note that the production of the Cassidy Collieries, Granby Consolidated Mining & Smelting Co., likewise shows a substantial advance.

The British Columbia coal output for the month of February, 1920, was as follows: Crow's Nest Pass district, 67,053 tons; Nicola-Princeton district, 15,289 tons; Vancouver Island district, 137,255 tons; Prince Rupert district, 325 tons.

The returns for March are available only for Vancouver Island and show an increase, due to greater number of working days, from 137,255 net tons to 144,605 tons.

## Car Manufacturers Meet to Discuss Industrial Problems

**M**OST successful and interesting proved the second Annual meeting of the Industrial Car Manufacturers' Institute, which was held in Pittsburgh on April 20, 1920. The following were elected as the Board of Directors for the coming year: Lion Gardiner, vice-president, the Lakewood Engineering Co., chairman; N. A. Doyle, vice-president, American Car and Foundry Co.; W. E. Farrell, president, Easton Car & Construction Co.; J. M. Hansen, president, Standard Steel Car Co.; J. R. Kilbourne, vice-president and general manager, the Kilbourne & Jacobs Manufacturing Co.; R. J. Magor, president, Magor Car Corporation; J. C. Shirer, president, the Star Manufacturing Co. Col. James Miliken was re-elected president of the institute and H. M. Wey, secretary.

The institute is a get-together association of a number of the manufacturers of industrial cars, organized to procure economic results, promote a spirit of co-operation among its members, provide means for interchange of views affecting the interests of industrial car builders, to preserve equitable conditions not only in the workshop but in selling practices, to standardize designs and specifications, and to bring about a uniformity in methods of inspection, purchase, etc. In order to secure the best results the organization has been divided into four groups, according to the class of cars manufactured, namely: Builders of (1) coal-mine cars; (2) standard-gage dump cars; (3) other standard-gage cars, and (4) all narrow-gage cars except coal-mine cars.

After adjournment of the meeting the members were taken to the country home of Charles H. Clark, president of the Clark Car Co., in the South Hills of Pittsburgh. An excellent banquet was served, after which R. J. Magor, as toastmaster, introduced the following speakers: Lion Gardiner, A. L. Humphrey, president of the Westinghouse Air Brake Co.; W. F. M. Goss, president of the Railway Car Manufacturers' Association; C. E. Watts, efficiency engineer of the Berwind-White Coal Mining Co. and who represented the American Mining Congress; N. A. Doyle, and H. E. Chilcoat, general manager of the Clark Car Co.

## A Crime to Burn Oil Under Boilers

**N**OT only is it a crime to burn oil under boilers, but also an unprofitable sin into the bargain, was the testimony of Capt. Douglas E. Dismukes, commanding the Naval Training Station at Newport, R. I., in giving testimony before the Committee on Naval Affairs of the House of Representatives considering the Naval Appropriation Bill. This statement was recently circulated by the Wholesale Coal Trade Association of New York.

It appears that the captain declared that "it is more economical to use coal" than oil. On inquiry he admitted he was using oil at the training station, but only because he had oil-burning plants as well as coal-burning plants and therefore could not avoid burning oil in the former.

Captain Dismukes reported a conversation with Dr. White, of the U. S. Geological Survey, in which that authority declared it "no less than an economic crime to use oil under boilers as fuel," because the supply of oil was so rapidly declining in the United States and

elsewhere and because it would soon be "a very serious problem as to getting the necessary amount of lubricants—which is really the most important part of the rock-oil business."

"I understand," said the captain, "that the Mexican wells supply us with about eight million barrels a year, and the information that now reaches us is that salt water is getting into those wells and there is an indication of exhaustion." Unless it would cost too much to get back to coal he proposed that the plants be changed so as to burn coal. Mr. Padgett stated that coal was found to be much cheaper than oil on the Atlantic coast, but on the Pacific coast oil was much the cheaper. At that time the freight on coal to the Pacific coast was \$6 a ton. He added that Pocahontas and Georges Creek coal cost delivered at the water's edge \$2.10 and \$2.20, but it cost from \$5.20 to \$7.50 to get it around to the Pacific.

## Circuit Court Upholds Mining Company in Important Mine-Tax Case

**J**UDGE DENISON of the Circuit Court of Appeals for the 6th district, has just handed down an important decision in the case of the Mohawk Iron Mining Co., of Minnesota. This company claimed an allowance of \$35,000 for depletion on account of ore taken out subsequent to March 1, 1913, but the Bureau of Internal Revenue declined to allow the deduction because the mining company was operating under a leasehold and not in fee. The lower court rendered judgment in favor of the mining company for the full amount of the taxes.

The company claimed it was entitled to the depletion allowance the same as a fee owner, because the law allowed the allowance to the "taxpayer" rather than to either the owner or the lessee; that it would be natural for Congress to intend that such allowance be made to the party actually suffering substantial depletion; that the lessor would have a depletion allowance which would wipe out the royalty and leave him no tax to pay.

The Court said that when the question of right of allowance arises as between fee owner and lessee it can make no difference whether the claimed allowance is called by one name or by the other. It holds that the provision regarding depletion in real substance and effect pertains to a consumption of capital assets rather than to a business loss.

## Bethlehem Steel Co. Buys 7,000 Acres of Bituminous Coal Land

**F**OLLOWING a meeting of the Board of Directors of the Bethlehem Steel Co., April 22, E. G. Grace, president of the company, announced the purchase of the Jamison Coal & Coke Co., bituminous coal properties in West Virginia.

"The property we have acquired," Mr. Grace said, "is located only fifteen miles away from the property of the Elkins Coal & Coke Co., recently acquired by the Bethlehem interests. The property consists of about 7,000 acres of coal land, having proved up over 65,000 tons of a good quality of low sulphur gas coal. The property is in operation and equipped to produce 1,000,000 tons of coal annually. The Bethlehem Steel interests are now fully supplied with their full requirements of all kinds of bituminous coal."

## Discussion by Readers

Edited by  
James T. Beard

### Itemizing Costs in Coal Mining

*Letter No. 1*—In the issue of *Coal Age*, March 4, p. 437, there appeared an itemized list of coal-mining costs prepared by the Oakdale Coal Co. of Denver, Colo., the purpose of which was, no doubt, to stagger the reader with the immensity of the expense under which the coal operator is laboring.

No one believes more in justice to all than myself, but this reference appears to be slightly overdrawn or, in other words, is extreme in its position with respect to the operator.

It is not my intention to question the items, in fact more could be added than what appears. All the costs or expenditures that an operating company has made or ever will make should be included in such a list. On second thought, however, should not the weight of each item, or its relation to the determination of the price of the product, which in this case is coal, have been made the main feature?

As the list now stands, it would lead the unwary observer to the immediate conclusion that the operator is a philanthropist, and is giving good money away instead of earning it for the investors. In how many instances, let me ask, is this statement of mining costs applicable? Not many, I fear.

Would it not be more to our benefit to have such a table prepared showing the ratio that each item bears to the whole sum. The present showing is a mere conglomeration and its publication effects little of any value in the more economical operation of a mine. It would lead to a clearer understanding of the economics of the situation, and relieve many false ideas in the minds of those outside of the fold if relative values of the items of cost were made to appear.

Golden, Colo.

MINING ENGINEER.

### Carbide Lamps in Pillar Robbing

*Letter No. 1*—Referring to the inquiry of "Mine Foreman," *Coal Age* Feb. 26, p. 419, kindly permit me to present a few considerations relative to conditions that if considered may assist this correspondent in the solution of his difficulty. First, I will mention one or two points regarding ventilation. They are as follows:

1. Owing to the disastrous and far-reaching effects of explosive gases, our mining laws require adequate ventilation to dilute and sweep away the gases and render them harmless and make the mine safe for work. Then, why not use the same precautions with respect to that treacherous atmosphere known to the miner as "blackdamp," which appears to be the direct cause of the trouble in the instance cited in this inquiry.

2. If the proportion of carbon dioxide in the mine air has increased to such an extent as to extinguish an

oil light, there is no assurance that it will not continue to increase to an extent that will render the atmosphere dangerous and extinguish the *lamp of life*.

3. If it is possible to control conditions so as to keep the oxygen content of the mine air above the stated 14 per cent so that the oxygen in the air will range from that point to 18 per cent, why not make still further effort and maintain a percentage of oxygen ranging from 18 to 21 per cent, or normal.

In making these suggestions, I have in mind the eliminating of large areas of abandoned workings in proximity to pillar work. Where the conditions will warrant and such abandoned areas exist and generate much carbon dioxide that is constantly fed into the workings, every effort should be made to drain the gas from such areas.

In the blowing system of ventilation, danger lies in the possibility that any derangement of the ventilating current, relieving the pressure that holds the gases back in the abandoned places, will permit those gases to expand into the workings. The draining of these gases from abandoned areas will eliminate this possibility.

#### WORKING IN "TWILIGHT ZONE" DANGEROUS

4. It should be considered risky business for men to work in what we may call the "twilight-zone" or where the lights of the miners burn dim. The extinction of an oil lamp indicates a near approach to the life-line of the oxygen content of the mine air. Let us consider, then, that the failure of an oil lamp to burn is a sure indication of the *twilight zone* of uncertainty; and the possible increase of carbon dioxide may cause the twilight to fade into darkness and the atmosphere become unsafe.

5. Turning now to the workmen, let us consider how they are affected when compelled to breathe air where the lights burn dim. The manufacturer of a 150 horsepower steam engine does not expect it to give good results when supplied with steam that will generate but 50 or 100 horsepower. In like manner, nature having provided an atmosphere containing normally 21 per cent of oxygen, good results in the performance of work cannot be expected when the oxygen content is depleted to 15 per cent, or even to 18 per cent, as shown by the dim burning or extinction of an oil lamp.

But, the conditions here described involve more than an ordinary element of danger. We are apt to attribute it to lack of ventilation, rather than to the generation of carbon dioxide; and forget that the resulting depletion of the oxygen means a corresponding increase in nitrogen in the air, whereby the atmosphere is rendered more dangerous than if the presence of the carbon dioxide had not depleted the oxygen.

One theory in explanation of the condition described is that it may have been caused by an obstruction of the

ventilating current or an air-leak, either of which is liable to happen in mining practice, and that without warning. In any case, it is clear that the mine foreman in charge had not provided any safe margin to guard against such occurrences.

Another theory suggests a more likely and, incidentally, a more dangerous cause of this condition. It is stated that "the work of robbing pillars was proceeding in an abandoned section" of the mine. This assumes the possibility of the condition to which I referred previously; namely, the close proximity to large abandoned areas generating carbon dioxide, which will expand into the workings whenever there is a slight relief of pressure owing to a falling barometer or a possible derangement of the ventilating system.

In closing, I would only add to what the editor has said in his reply to this inquiry, that the warning given, by the carbide flame, of the presence of a dangerous atmosphere is only observable by experienced eyes. In my own practice, I have seen the carbide light show a reddish tint and an increased length of flame in perfectly pure air, which makes these appearances seem unreliable as an indication of bad air. We know that an oil lamp grows dim or goes out either from a lack of oil or from a lack of oxygen sufficient to support the flame, and it is an easy matter to find out which of these causes exists. I am not disputing the claim that the indications mentioned reveal the presence of bad air, I would emphasize the fact, however, that such indications are often misleading. It is my belief that the action of carbide lights, in bad air, can be summed up in a few words. As remarked by the editor, "They give a safe but frequently unobserved warning of the presence of danger to the men at work."

Portage, Pa.

JEROME C. WHITE.

## Factors in Mine Ventilation

*Letter No. 1*—I was much interested in the article by R. Z. Virgin, *Coal Age*, Feb. 26, p. 395, entitled "Considerations Influencing Mine Ventilation." Having been employed for the past 25 years in the coal mines of Pennsylvania and having served for 12 years of this time in an official capacity, I am inclined to think that the subject of ventilation is not generally given the consideration that it deserves, especially in the planning and laying out of large or gaseous mines.

Where a mine is opened with the intention of working out the coal from a considerable acreage it is necessary to make the main intake and return airways of sufficient size to enable the required volume of air to be circulated at a moderate velocity. If this is not done there will result a great waste of power in the ventilation of the workings. The circulation of a considerable volume of air through airways of small size, means a high velocity and a high pressure or water gage, which can only be maintained by a large expenditure of power.

Frequently, I have observed fans producing, say 100,000 cu. ft. of air per minute, against a water gage of 4 in. or more. At some points in the main airways the velocity of the current would reach 2,500 ft. per min., owing to the restricted area of the air-course and the lack of proper distribution of the air throughout the mine; or, in other words, the failure to provide separate ventilating districts.

In my opinion, a mine should be so planned that the air volume required for ventilation can be circulated in such a manner that the velocity will nowhere exceed, say 1,000 ft. per. min. The ventilating system should be so arranged that the water gage will not exceed two inches in the fan drift. A high velocity of the air current produces a big mine resistance, the latter increasing with the square of the former. For example, if the velocity of the air is twice what it should be, the mine resistance is four times too great; and the power required for the circulation is 8 times what would be required if the velocity was normal.

Another consideration is the fact that a high pressure or water gage increases the leakage of air through the stoppings, with the result that a smaller proportion of the air entering the mine reaches the working faces. This also causes a great waste of power in ventilation. The only way to reduce the resistance of the mine is to provide ample airways so that the required air volume can be circulated at a low velocity.

This is an excellent subject for discussion and will prove of benefit to those who are fitting themselves for a mine foremen's or assistant foremen's examination. I hope to learn the opinion of practical foremen in regard to what they consider the limit of the velocity of air currents in mines; also, the limiting water gage to obtain the best results.

ERNEST KRAUSE,

Adah, Pa.

Mine Superintendent.

*Letter No. 2*—Kindly permit me to refer to a seemingly misleading feature, in the article entitled "Considerations Influencing Mine Ventilation," which appeared in *Coal Age*, Feb. 26, p. 395. The article is written with the evident intention of proving the necessity of keeping all air passages and air-courses clear of obstructions, as far as it is practicable to avoid these. Attention is drawn particularly to the obstruction caused by cars standing in the airway and rockfalls in air-courses, which decrease the sectional area of the passageway or entry.

The writer of the article presents three illustrations, one showing a 6 x 10 ft. airway, clear of all obstructions; another, the same airway obstructed by a mine car; and the third, the same airway obstructed by a rockfall, which is assumed to cause the same reduction of area as that produced by the mine car.

### CALCULATING THE INCREASE OF VENTILATING PRESSURE

For example, the unobstructed airway is shown to have a perimeter of  $2(6 + 10) = 32$  ft., and a sectional area of  $6 \times 10 = 60$  sq.ft. When this airway is obstructed by a mine car 4 ft. high and 5 ft. wide, it is explained that the cross-section of the car has an area of  $4 \times 5 = 20$  sq.ft.; and the sectional area of the airway is thus reduced to  $60 - 20 = 40$  sq.ft. The same reduction of area is assumed to be caused by a rockfall in the airway.

It is further explained that, not only is the sectional area reduced from 60 to 40 sq.ft., in each of these cases; but, the perimeter of the airway, which represents its rubbing surface is increased by the perimeter of the car, which is  $2(4 + 5) = 18$  ft., making the total perimeter when the airway is thus obstructed,  $32 + 18 = 50$  ft.

In the case of the rockfall, however, which rests on the bottom of the air-course, there is presented but

three sides to the air current, and its perimeter is  $2 \times 4 + 5 = 13$  ft., which makes the total perimeter, in that case,  $32 + 13 = 45$  ft. all of which can be accepted as logical reasoning.

However, the features to which I wish to draw attention as being misleading are the following: In order to show the effect of thus obstructing an airway, the author of the article applies the first law of friction, which makes the pressure producing a circulation, vary directly as the rubbing surface or the perimeter of the airway, "other things being equal." But, it is needless to say that, in the cases assumed, other things are not equal.

For example, not only does the perimeter change, but the sectional area of the passage also changes when the latter is obstructed in the manner described. Therefore, the author should have applied another rule of friction, which states that the pressure producing circulation in an airway varies inversely as the cube of the sectional area, for the same quantity of air passing, the length of the airway being assumed constant.

Expressed in other words, the pressure producing any given quantity of air in an airway, varies directly as the perimeter and inversely as the cube of the area of the airway; or, the pressure ratio is equal to the product of the perimeter ratio and the cube of the inverse area ratio. Thus, assuming a 2-in. water gage, giving a pressure of  $2 \times 5.2 = 10.4$  lb. per sq.ft., since the original perimeter of 32 ft. was increased to 50 ft. and the original area of 60 sq.ft. was reduced to 40 sq.ft., and calling the pressure  $x$ , due to the obstruction,

$$\frac{x}{10.4} = \frac{50(60)^3}{32(40)^3} = \frac{25(3)^3}{16(2)^3}$$

$$x = \frac{10.4 \times 25 \times 27}{16 \times 8} = 54.8 \text{ lb. per sq. ft.}$$

This would represent a water gage exceeding 10 in. Cars standing in an airway is a common form of obstruction, but no one ever heard of it resulting in such an increase of pressure. By omitting the effect of the reduction of area in his calculation, the author finds the pressure is increased only in the ratio of the perimeter, 50:32, making the increased pressure 16.25 lb. per sq.ft., or somewhat greater than a 3-in. water gage; but even that would be excessive.

My theory regarding an obstruction in an airway is that its effect is similar to that produced by a regulator that causes the same reduction of area. The pressure due to a regulator is calculated by the formula:

$$A = \frac{0.0004 Q}{\sqrt{w.g.}}; \text{ and } p = 5.2 \left( \frac{0.0004 Q}{A} \right)^2$$

For the sake of comparison, I will assume the airway, 6 x 10 ft. in section, to be of such length that it will pass, say 30,000 cu.ft. of air per minute, under a 2-in. water gage. Then, assuming an obstruction in the airway that reduces its area to 40 sq.ft., and applying the formula for finding the increase of pressure due to this obstruction, treating it the same as a regulator, gives for the water gage due to the obstruction

$$w.g. = \left( \frac{0.0004 \cdot 30,000}{40} \right)^2 = 0.09 \text{ in.}$$

Practically, this is the increase of water gage due to an obstruction such as a car standing in an entry,

which reduces the sectional area from 60 to 40 sq.ft., when the original unobstructed airway would pass 30,000 cubic ft. per minute under a 2-in. gage. The water gage would therefore be increased less than one-tenth of an inch.

JOHN WALLS, SR.

Bayview, Ala

## Health and Industry

*Letter No. 3*—I want to compliment John Rose for the expressions conveyed in his letter in *Coal Age*, Feb. 19, p. 364. The statement he quotes to the effect that solving the labor situation is wholly a question of religion, is a plain and truthful statement and shows the author to be a great and good man. We need more men of the same kind.

The more one observes conditions about the mines, and studies the labor situation, the more he is convinced that the principles of religion form a common platform on which not only nations, but employers and employees can meet and settle their difficulties. Faith in religion means trust in God, which is our national motto and will insure a like trust in one's fellows. Trust is mutual and invites trust in return. The man who fails to trust his fellow cannot be trusted himself; and such a condition makes possible the inroads of Bolshevism and other bad elements.

Trust and confidence must start with the higher officials of coal companies. Confidence in the men employed in the mine will, in time, develop a like confidence of the men in the goodwill and well meaning of their employers. Let us hope that this condition will increase and prevail and that the labor troubles of the past will rapidly disappear under its influence.

Connellsville, Pa.

JOHN W. SWOPE.

## Co-operation Among Mine Officials

*Letter No. 8*—The letters on the need of co-operation among mine officials should be read by all mine foremen, superintendents and managers. Many good ideas have been presented that are worthy of consideration, and the adoption of some of them will certainly prove worth while in building up and strengthening the organization.

One thought that I have in mind is that the relation between a mine foreman and his superior officer should be such that if an occasion arose in the mine that called for immediate and independent action on the part of the foreman, he would not be humiliated later by receiving a severe reproof.

### HUMILIATING THE MINE FOREMAN

It goes without saying that a foreman called to act independently, as occasion may demand, will use his best judgment, though he may err, as results sometimes show. But, when a foreman is humiliated by receiving a severe reproof at such time, one of two things will surely happen if he is a true man. Either he will resign his place, or make up his mind then and there, that he will never again take the initiative.

Foremen should always be willing to submit all matters of importance to their superiors in office. An honest, well meaning foreman will do this, although it cannot be denied that an occasion will arise when he will be compelled to act on his own authority.

There are mines where a foreman seldom meets his superintendent, without being called to task for some

action, trivial though it may be; or asked to explain some increased item of expense on the cost-sheet. These are not auspicious times for making the best showing in the operation of a mine. On this account, it is all the more important that there should be perfect understanding between the officials in charge of the several departments of the work; and this will go far to avoid unpleasant relations between them.

For the success of mining operations, there should be a team-spirit in the organization, from the trapperboy to general manager. A selfish and distant attitude on the part of an official is sure to result, sooner or later, in a large labor turnover, petty strikes and lockouts.

#### FAIR TREATMENT AND GOODWILL ACCOMPLISH MORE THAN FORCE AND COERCION

On the other hand, fair treatment of men will show in the increased production of coal, at a reduced cost per ton. The co-operation needed to effect this can only be secured through goodwill. Formerly, labor was loyal, because it was afraid to quit; but, today, conditions are different and unemployment has no terror for the workman. Labor can only be retained through the cultivation of interest and the expression of goodwill. But, it can be said with certainty that these will not fail to produce results.

Attention has been drawn to the fact that the day of force and coercion is past and the Golden Rule, suggested by John Rose when writing on another subject in *Coal Age*, must now take its place. Without exaggeration, it can be assumed that 90 per cent of men wish to deal fairly with each other; and it is not difficult to suppose that the remaining 10 per cent can be won by an appeal to reason.

Explain to a man who is wasting time and material, that he is throwing away what is not his own. Reason will cause him to understand that, in thus hindering the company who employs him, he is hindering himself. The man who loads slate with his coal, knows that his act will give the mine a bad reputation on the market, and lessen the chances of steady work.

Altoona, Ala.

JOHN JONES.

*Letter No. 9*—It would seem that the need of co-operation was set forth so prominently in the recent discussion, in *Coal Age*, on the "Efficiency of Mine Officials," that further comment would be mere repetition. However, I want to emphasize the fact that co-operation, in its broadest sense, is not an abstract idea but a vital force without which little of real value is to be accomplished.

Reflection on the ideals and accomplishments, in life, causes one to realize that it is easy to speak glibly on co-operation; but a far more difficult matter to put our words into action. Co-operation is a lofty ideal. Its practice means the setting aside of our selfishness and working conjointly with another for a common purpose designed for the betterment of each.

As an ideal, co-operation appeals to us in every way; but its realization is kept at a safe distance, because of the natural selfishness of the human heart, the same now as throughout all time. Self-examination convinces us that we are each a mass of inconsistencies; our acts belie our words, until we are at variance with and strangers to ourselves.

Considering the question of co-operation in mining, from a practical standpoint, one is constrained to inquire as to what the term means and its application in practice. An honest study of industrial conditions makes clear that men of various ideals, temperament and education are brought into close touch with each other. They are associated in a common purpose, each with a selfish end in view; namely his own personal profit. Naturally, there is a conflict of individual interests which develops a restlessness on the part of each one involved in the transaction.

#### WHAT REAL CO-OPERATION MEANS

Here, then, is the opportunity to co-operate. Will either party put this ideal into action? Will they apply the Golden Rule and each treat the other as he would be treated himself? That would mean a sacrifice of possible attainment. It would mean standing, for a moment, in the other man's shoes and getting his viewpoint and appreciating his needs, which would eventually determine a more equitable division of individual rights.

Co-operation is simple. It means going along with another; working side by side in a common cause; drowning personal ambition and profit in feelings of goodwill, sympathy and help, one for another. How many of us can rid our minds of the evil disease that pervades our selfish natures? How many of us can center our efforts on a closer fellowship with our associates in the industries in which we are engaged? We all have the power to make life brighter for a fellowworker when simply a cheery word, timely spoken, will dispel discouragement and bring success out of failure.

#### FACING THE STERN REALITIES OF LIFE

Turning then to the practical side, we face the stern fact that all must work to live. Many have the false notion that they live to work, forgetting the old saying "All work and no play makes Jack a dull boy." Plainly, it is our duty, as individual workers, to contribute our part to the brightening of the lives of fellowworkers, by sharing with them the ups and downs, the successes and failures, common to all industries. Genuine co-operation means the taking of a deeper interest in the work in hand. Where such interest is compelled by regulative measures and forced circumstances, the work and life itself becomes a monotonous routine.

Let me say in closing, that nothing is more certain than the fact that, in whatever way we strive and however well we may succeed in securing our own profit, we can take nothing with us when we go hence. Therefore, the fact remains that there can be no profit whatever in our lives, apart from the enjoyment of fellowship and co-operation that will lift the burden from the shoulders of another.

To reap the greatest benefit, co-operation must be genuine and prompted by a desire to be helpful. To this end, it is necessary to cultivate the simple faculty of human fellowship, which is possessed by all to a greater or less degree. In writing thus, it has been my desire to show that co-operation is not a passing fancy, but a real factor that is being practically considered by eminent men today, and is particularly applicable to coal-mining conditions.

## Inquiries of General Interest

Answered by  
James T. Beard

### Timber Booms or Crossbars

In going about the mines, it is common to see roads, travelingways, rooms and air-courses, having a good shale roof that is free from slips or other faults, where double timber is used, instead of posts. This consists of a boom or crossbar placed against the roof and supported by a prop at each end of the bar.

While such timbering gives a good roomy appearance to the entry, it always seems to me that the use of the boom is unnecessary when driving entries and rooms under a good shale roof. So often I have observed the boom bending under the weight of the strata above, or even broken. At other times, I have seen the ends of the booms crushed where it rests on the heads of the two posts. Often the boom has given away and the road is blocked with great falls, which cause much delay, until the road can be cleaned. I am wondering if a better method of timbering places that are eight or ten feet in width would not be to set posts along the roadside with good cap-pieces against the roof. Would there not be a saving if these crossbars were set as props in the manner I have indicated in the accompanying sketch,

which shows both the method of supporting the roof with a boom resting on two posts and the plan I suggest of posting the entry.

To my mind, timbering with posts gives a better support to the roof, in the place it is needed, than is possible with a boom spanning the entry. The labor of setting timber is much less than that required in double timbering. There is also provided a good traveling space between the rib and the posts at the side of the road. My idea is that this plan would give better support to the center of the entry. I am assuming, of course, that the ribs are good solid coal. Kindly explain what objection there is, if any, to this plan of posting an entry, 8 or 10 ft. wide, under a good shale roof.

Nova Scotia, Canada.

MAC.

It frequently happens that an entry 8 or 10 ft. wide, under a good shale roof will require little timbering when the roof strata is of a nature that does not cut under the action of the air. There is always an objection to standing posts on a haulage road, owing to the danger of the posts being knocked out by a derailed car, or men being caught between a post and a passing car.

These dangers have often been referred to in *Coal Age*, and different methods explained for avoiding the

standing of post timber on roads. One of these methods is to cut hitches in each rib a short distance below the roof, to enable the cross bar that spans the road to be slipped into the hitches. Another method is to support the crossbar on two short legs that rest in suitable hitches cut lower down in the rib.

In the opinion of *Coal Age*, where the roof above a road or entry requires support some form of double timbering is better than the posting described by this correspondent. A substantial form of post timbering is always advisable at the face of a room, but few will deny that double timbering is better on a roadway or entry where haulage is performed. It should be stated that a crossbar must never be wedged at its center. Instead, two wedges should be driven between the roof and the bar, a short distance from each end. This plan avoids throwing the weight of the sagging roof on the center of the bar; tending to arch the weight and throw the roof pressure on the supporting legs at the two ends of the bar.

### Recharging Storage Batteries

Kindly inform me if the recharging of a storage battery on a mine locomotive will generate a gas that is ignitable, and if so, what is the cause and how can it be eliminated? Has there ever been an explosion occurring in a recharging room in a mine.

Canaanville, Ohio.

H. CUNNINGHAM, Supt.

The recharging of a storage battery on a mine locomotive will generate hydrogen gas in sufficient quantity to prove dangerous under certain conditions. The quantity of gas generated will be greater if the recharging is carried too far, which is very liable to happen in mining practice by reason of the person in charge of the work neglecting to give it the careful attention required.

When the batteries are fully charged the current should be at once shut off, as otherwise overcharging will take place and hydrogen gas will be set free in larger quantity. In shaft mines operating storage-battery locomotives, the batteries must be recharged underground, and care must be taken in that case to prevent accident. The recharging of the batteries must be done in a well ventilated place where there can be no danger from a possible accumulation of gas. The attendant must not allow the batteries to become overcharged. In drift and slope mines the locomotives should be run to the surface and the batteries recharged in the open air, thereby avoiding all chance of trouble.

Where recharging of batteries is performed in a recharging room, the place must be thoroughly ventilated and no open lights permitted. We have no record of an explosion having occurred from this cause in a mine, but shall be glad to be informed if such has occurred.

# Examination Questions

Answered by  
James T. Beard

## Mine Inspectors' Examination. Held at Pottsville, Pa., March 30, 31, 1920

(Selected Questions.)

*Ques.*—If the horsepower of an engine is 60 and the water gage 1.5 in., what quantity of air will you expect to get, assuming the horsepower of the engine is 70 per cent efficient?

*Ans.*—The efficiency of the engine being 70 per cent, the effective power on the air is  $0.70(60 \times 33,000) = 1,386,000$  ft.-lb. per minute. A water gage of 1.5 in. corresponds to a pressure of  $1.5 \times 5.2 = 7.8$  lb. per square foot. In this case, therefore, the quantity of air that should be passing under this pressure is

$$Q = \frac{u}{p} = \frac{1,386,000}{7.8} = 177,700 \text{ cu.ft. per min.}$$
